Of course, both of these solutions have their drawbacks. Setting up camp on top of the pipes might be more appealing as it gets the Troubleshooters up away from the goo. However, since the pipes are actually discarded nuclear fuel rods that have been dumped here by BLR sector power services, it *does* mean that you'll have to introduce the Troubleshooters to the joys of radiation poisoning. In the short term this causes their mutant powers to spontaneously activate after 1d10 hours. The longer term means radiation sickness but -- let's face it -- this is ***Paranoia*** so the Troubleshooters aren't going to be around long enough to worry about it.

The Troubleshooters could also set up their campsite on the ground cleared by the scrubots. This is solid floor and fairly safe, except for the puddles of concentrated sulphuric acid, and the ooze will slowly flow back into the furrows left by the Scrubots after 1d20 hours.

7: M1M/K-04E Attacks

In its normal undisguised form, M1M/K-04E looks like a 1.5 meter high eight-legged spider made of steel and plastic. M1M/K-04E's main armaments are an energy blaster and a military ROYGBIV laser pistol.

Being a shape shifting bot means that M1M/K-04E has huge energy requirements, and so it is drawn to those poor Troubleshooters like a moth to a flame. At first M1M/K-04E will infiltrate itself into the camp, scouting out the ground and hunting for a suitable target. It does this by sneaking up towards the camp and changing into a common object. This is the only time that M1M/K-04E is vulnerable, since the reconfiguration process isn't quiet. Taking an empty 2-liter plastic drink bottle and giving it a gentle squeeze can best simulate the noise M1M/K-04E makes when it changes shape. When the Troubleshooters hear this noise just roll a few dice and mutter something about strange ambient noises. Hopefully the simple-minded Troubleshooters will go off and investigate and will probably find some common object just lying on the ground just outside the camp. Probably they will pick it up and bring it back into the camp.

If a Troubleshooter tries to use M1M/K-04E in disguise, then M1M/K-04E will try to emulate the thing it is disguised as to the best of its ability. If it can't, it will just bleep pathetically and play dead. Anyone who tries to repair this dead equipment is in for a real shock, as M1M/K-04E morphs back to its real form and goes into full berserk psycho warbot mode.

MIM/K-04E will wait until the dead of nightcycle before it makes its move. Unless you are feeling cruel, the first target is that terrified Totebot. All the Troubleshooters know is that suddenly there is a terrific clanging noise, followed by a massive shower of sparks and a strange electronic squeal, then quietness. In the aftermath of the attack the Totebot lies lifeless, its cell ripped clean out of its body. The edges of the hole have been melted out as if by some powerful acid, and the bot is completely beyond repair. If they search the area around the camp, the Troubleshooters will eventually find the now-drained fuel cell lying besides yet another common piece of equipment, which is of course M1M/K-04E.

Once all is quiet again, M1M/K-04E will turn on one of the Troubleshooters. The attack is the same as before. The Troubleshooter who is to be attacked will be awoken by the same strange crackling noise; before they know it something lands on their back and starts to cut its way through their bot suit with its lasers. Try to keep the identity of M1M/K-04E a secret for as long as possible, because the idea is to terrify the Troubleshooters beyond belief.

M1M/K-04E -- Psycho Covert Warbot
M1M/K-04E has a very simple brain capable of accepting only simple orders. Currently M1M/K-04E's mental state

can be summed up as "get food, eat, so hungry, find food, need food" etc.
Armor: Reflec, & ECM shielding.
Weapons: Energy Blaster 10, Laser Pistol 10
Mem Cartridges: Be Patient: 10, Disguise: 10, Gather Data: 10, Stalk 10, Change Shape 10.

8: R&D Recovery Team Attacks

These bunch of six red level Troubleshooters from R&D have been dispatched secretly by the head of R&D, TON-I-BLR-4, to recover M1M/K-04E. Since this is supposed to be a secret mission, TON-I has not told his team about the Troubleshooters. What they *do* know is that they are hunting for a bot that can be disguised as anything and this includes other bots, which naturally has made them very jittery indeed. Jittery Troubleshooters are extremely dangerous because they tend to shoot first and ask questions later of any lone bots they might meet. So it is vitally important that your Troubleshoots don't wander off on their own. The tactics of the recovery team are to open up at extreme range with ECM shells from their Cone Rifles, which should incapacitate M1M/K-04E long enough for them to get close to push its off button. Of course, this will have no effect on either M1M/K-04E or the Troubleshooters, which will mean that the R&D Team will then resort to their laser guns and the occasional high explosive round from their Cone rifles.

R&D Recovery Team
None-too-bright Red level Troubleshooters who don't know much.
Weapons: ROYGBIV Laser Rifle: 6, Cone Rifle (ECM + High Explosive): 5
Armor: Reflec
Skills: None.

9: The Grand Finale in which we learn that it is possible to scram a food-vat

The R&D recovery team will be attracted to the Troubleshooters camp by the light display from the death of the Totebot, and then they will watch developments until ordered to attack by TON-I. The best time to attack is when the Troubleshooters are in the middle of dealing with an attack from M1M/K-04E. The first they will know is when the ECM shells start raining down, causing the Comm Units and muticorders to malfunction, essentially cutting them off from the help of Friend Computer.

Shortly afterwards the laser bolts will start to zip through the air before the recovery team charges into the camp. This will tip M1M/K-04E over the edge, and it will decloak and start attacking everyone in sight.

Then just when your Troubleshooters can't possibly stand anything more, one of the R&D guys, or even M1M/K-04E itself, fires a stray shot into the ceiling. The air is filled with rolling thunder as an entire food vat of Cold-Fun bursts from the ceiling above and comes roaring down towards the melee. For this, think epic, think biblical, and think Charlton Heston. . . only much worse. Everyone and everything is swept away by the towering wall of Cold-Fun, sendsing clones and bots alike tumbling across Sub-Basement 4. The initial impact of the thirty-meter high wall of Cold-Fun is the same as crashing into the ground at 100 km/hour, which is column 4 on the infamous Vehicular Accidents and Falling From Great Heights Table, so be prepared to replace some clones.

A: Aftermath & Resolution

Those who survive this massive tidal wave of Cold-Fun will have their lives further complicated when, 1d10 minutes later, an entire Vulture Squad platoon drops in to see what is going on. These guys round up the survivors and then hold them at gunpoint until TON-I-BLR-4 arrives.

Along with TON-I comes AGN-I-ANT-2 and any necessary clone replacements. The two indigo level citizens eye each other up suspiciously and seem to be old enemies. TON-I will instantly demand that the Troubleshooters be executed at once for their part in the destruction of so much computer property. AGN-I will in turn demand that the

R&D team be executed for attacking loyal computer clones who were innocently on holiday. However, when the dust settles and the Computer comes on and demands that someone clear up this mess, AGN-I decides to turn the Troubleshooters' holiday into a working one and hands them a bucket and mop each. . .

B: The End!

C: Hold on a Second, what of M1M/K-04E?

Depending on how kind you are feeling, M1M/K-04E is either destroyed in the fire fight, destroyed by the tidal wave of Cold-Fun, or escaped in the confusion and retreated deeper in the sewers and swamps of BLR sector, biding its time until once again it can cause more chaos.

D: The End again!!

E: Yes but where is the Mission Debriefing?

Well, since this wasn't a real mission it can't have a debriefing, can it? Oh well, okay, it *was* technically a mission, so technically there ought to be one. Conscientious GMs can have one if they want, others may prefer to seal the Troubleshooters up in Sub-Basement 4 and just forget about the whole thing.

F: The End For Real!!!

Drunken Secret Masters: The Cults of Dionysos

"[T]he individual, as the modern world knows him, began in that age to emerge for the first time from the old solidarity of the family, and found the unfamiliar burden of individual responsibility hard to bear. Dionysus could lift it from him. For Dionysus was the Master of Magical Illusions, who could make a vine grow out of a ship's plank, and in general enable his votaries to see the world as the world is not."
-- E. R. Dobbs, *The Greeks and the Irrational*

Groups of people, discomfited by the changing world around them, seek collective ecstasy rather than individual existence. Communing "with nature" using drugs, chanting, weird music, and heavy exercise, they enter ecstatic trances, see things their conventional neighbors ignore as delusion, and sometimes run off into the hills or wait on mountains for unknown alien entities. Rumors of child abuse, sexual orgies, and conspiracy to overthrow the government run wild. It's the story of a myriad of cults from today's headlines, and it's a story as old as the hills. The hills of Thrace, north of Greece, specifically, where this cult first sprang up and into history -- and if his cult wrote the script for all its successors, that's only appropriate for Dionysos, god of the masquerade.

"Unarmed they [the Maenads] swooped down upon the herds of cattle grazing there on the green of the meadow. And then you could have seen a single woman with bare hands tear a fat calf, still bellowing with fright, in two, while others clawed the heifers to pieces."
-- Euripides, *The Bacchae*

The cult of Dionysos reaches back at least into the Archaic Greek world of the 9th century B.C., contemporaneous with Homer, who mentions his ecstatic followers, the Maenads. It may go as far back as Mykenaean times; inscriptions to "Diwonusos" can be found on the island of Keos dating back to 1400 B.C. (The delightfully exciteable archaeo-anthropologist Marija Gimbutas takes the cult back to 4500 B.C. in the Balkans alone, based on bull-masked phallic figurines from Yugoslavia.) By the reign of Peisistratos of Athens in the mid-6th century B.C., the *tragodoi* ("goat-singers") who alternately sang hymns to Dionysos and represented his horned fertility aspect had specific duties in city ritual -- which the foundation of Greek, and therefore Western, theater. The official Athenian dramatic contests were held during the three Dionysia -- festivals of Dionyos. Which, if we let it, would lead us either back to Yule -- the Lesser Dionysia -- or forward to the Lenaea on Beltane (February 1); between the two is Dionysos' official second birthday, January 6. A selected group of Athenian women of good birth met the women of the oracular city of Delphi on the slopes of Mount Parnassus every two years during the Lenaea to dance the Dionysian ritual dance, the *oreibasia,* in the bitter cold. (The image of witches dancing with their horned god on the Brocken, or of any number of nights on bald mountains, should be coming to mind now.) This practice, at least, lasted well into the 2nd century A.D.; existing cults of Dionysos can be definitely located as late as the early 6th century.

Dionysian cults melded with Pythagorean mysticism; eventually Dionysos (conflated by now with Osiris) got his own official mystery cult, complete with ritual journeys to the underworld, passwords, and initiatory secrets -- and more drugged wine. The aim of these mysteries was, basically, to fully combine the rational soul and the irrational material world. Plutarch attests that one of the great truths of the Dionysiac mysteries was that the soul could be freed from the body both in the ecstatic rituals (astral projection?) and by death (making ghosts?). The post-Pythagorean mystagogues saw him as a metaphor for philosophical awakening and for "rational intuition."

"How do you know what Dionysus is? . . . What do you think it was we saw? A cartoon? A drawing from the side of a vase? . . . What if you'd never seen the sea before? What if the only thing you'd ever seen was a child's picture -- blue crayon, choppy waves? Would you know the real sea if you only knew the picture? Would you be able to recognize the real thing even if you saw it? You don't know what Dionysus looks like. We're talking about God here. God is serious business."
-- Henry Winter, in *The Secret History,* by Donna Tartt

Which is quite a departure from the god of madness, of drunkenness, of the sheer irrational exuberance of wine and "all the flowing liquids" in the polite tones of Plutarch. He's the "twice-born" god, killed by Titans and resurrected by Zeus, or killed in his mother's womb and rescued by Zeus; distracted by a bull-roarer as a baby, and named the

"roaring god," Bacchus. Creator of dolphins, rider of tigers, he wields the sacred fennel stalk that brought fire to mankind, but wraps it in ivy. He journeyed all over Greece, driving men and women mad, watching them kill and eat their children, forcing the Greeks to add him, an unlucky thirteenth god, to Olympus rather than feel his anger. He is named Sabazius and Zagreus and Lenaeos. With so many names, he becomes almost a nameless god: even his 'true name,' Dionysos, simply means "god of Nysa," and nobody knows where Nysa is, although Alexander the Great (himself perhaps channeling the god of wine) thought his discovery of a city in India called Nysa significant. And indeed, intriguing parallels exist between Dionysos and the "nameless god of Kataragama," in Sri Lanka, often considered an aspect of Skanda-Murukan, a son of Shiva and a tutelary god of warriors, kings, yogis, and scholars.

"[T]his god who is the most delightful of all the gods is at the same time the most frightful. No single Greek god even approaches Dionysus in the horror of his epithets, which bear witness to a savagery that is absolutely without mercy. In fact, one must evoke the memory of the monstrous horror of eternal darkness to find anything at all comparable. He is called the 'render of men,' 'the eater of raw flesh,' 'who delights in the sword and bloodshed.' Correspondingly we hear not only of human sacrifice in his cult but also of the ghastly ritual in which a man is torn to pieces."
-- Walter F. Otto, *Dionysus: Myth and Cult*

In its best-known form, the cult used strong (unwatered) wine, ritual dancing (similar to that of the Sufi dervishes), and (possibly) drugs like amanita mushrooms or belladonna to create a sense of "divine madness" in its worshippers. At the height of their enthusiasm (literally, "god-within -ness") and ecstasy (again, literally, "out of body" experience), the cultists would fall on an animal (or, many classical sources explicitly insist, a human -- J.G. Frazer, of course, is all over it as a sacred-king sacrifice ritual in *The Golden Bough*) and tear it to pieces with hands and teeth, in a fugue state known as *omophagia.* (Giving a nice happy medium between blood-drinking vampires and animalistic werewolves -- Dionysos was a shapeshifting god, too.) They make a fine "wandering hazard" for a good, bloody, **GURPS Greece** game. These wild women, the Maenads, killed Orpheus (either after he refused worship, refused to take part in the ecstasy, or gave himself up as a ritual sacrifice); their cry "Iä!" gives us not only pages of Lovecraftian dialogue but Dionysos' epithet Iacchus, "the roarer," which became Bacchus.

These are not necessarily the kinds of activities that you need to have bruited about. This helped drive the Dionysian cults into the form of the mysteries mentioned above. (It's perhaps useful to note here that one of Skanda-Murukan's avatars is Guha, "the Hidden," patron of all secret knowledge and covert activities.) And when you're a secret blood cult, it's only a matter of time before the law steps in.

"But never was there in the state an evil of so great a magnitude, or one that extended to so many persons or so many acts of wickedness. Whatever deeds of villainy have, during late years, been committed through lust; whatever, through fraud; whatever, through violence; they have all, be assured, proceeded from that [Bacchanalian] association alone. They have not yet perpetrated all the crimes for which they combined. The impious assembly at present confines itself to outrages on private citizens; because it has not yet acquired force sufficient to crush the commonwealth; but the evil increases and spreads daily; it is already too great for the private ranks of life to contain it, and aims its views at the body of the state."
-- Spurius Postumius Albinus, speech to the Roman Senate (186 B.C.)

And that's just what the Roman law did, in 186 B.C., when acting on a tip from a disgruntled cult member, the Senate outlawed the Bacchanalian cults and executed hundreds of them for crimes of forgery, murder, blackmail, and rape. The Senate found at least 7,000 Bacchantes in Rome, although the real ringleaders seem to have gotten off. (Livy claims the cult's founders were two plebeians and three out-of-towners.) As cults will, the cult of Dionysos went further underground; the Piso family crypts denote their devotion to the Horned God of Nysa with detailed carvings. And the Pisos eventually became the Antonine Roman Emperors. (David Icke claims that they were Reptoids who wrote the Bible and made up, well, everything.) Which is as good a place as any to mention the Dionysian Architects, who apparently belong to that "rational" Dionysian tradition I mentioned earlier. (Unless they're part of the evil Hawksmoor "dark ley" tradition of ritual murder temples.) According to the usual Freemason suspects, the Dionysian cult built the Temple of Solomon and passed their sacred geometric lore on to the Templars, from whence we join the rest of the Conspiracy, already in progress. (Tim Powers has a nice riff on the Dionysos myth as the true meaning of the *Prieuré de Sion* conspiracy in his novel *Earthquake Weather.*) Intriguingly, Aldous Huxley, one of the pioneers of LSD (drug-fueled visions, anyone?) also wrote about the Dionysian mysteries, and has long been fingered by anti-

British conspiratologists as one of the evil geniuses who introduced rock music (ritual dancing, heavy drumbeats) to America. A *GURPS Illuminati* or *Cyberpunk* party who dismisses such rumors as laughable might stumble into a rave and find themselves waking up in an alley covered with human blood. Iä! Iä! Dionysos fhtagn!

(Since our regular editor Steven Marsh has been [kidnapped](#), this week's Random Thought Table is being written by Esteban "Boon Bestowed by the Noonday Sun" Quigmare. Esteban is the enigmatic leader of the People's Conclave, a cult responsible for tearing the tags off mattresses, putting CDs back in the wrong jewel cases, kidnapping Steven Marsh, and other sinister activities.)

(At least this column is better than the "Mauled By Mongeese" filler column.)

Become a Fanatic NOW!

GATHER ROUND!

Though our coming has been [foretold](#) for eons (or at least months), none have heeded the signs of our arrival.

And now those of you who mocked these premonitions will PAY!!!

Because we, the members of the People's Conclave, are fanatics.

Now, I'm sure you all *believe* you understand fanatics. I'm certain you sit in your Global Conspiracy Command Chambers (or wherever you gather to relax), debating with an impassioned vigor that makes you believe you understand fanaticism.

NONSENSE!

Debating with a raised voice doesn't make you a fanatic, any more than singing "Leonard Bernstein!" means you know the lyrics to R.E.M.'s "It's The End Of The World As We Know It." No, being a true fanatic takes perseverance and skill.

1. You are always right!

There are those who would encourage you to listen to others' viewpoints, take their ideas into your thoughts, and strengthen your own views by rebutting those ideas, or else reconciling those ideas with your own when they conflict. But, really, since you're always right, why bother? You don't debate with a three-year-old, and you don't need any further ideas or dialog with cretins who fail to recognize your brilliance (or even divinity, such as yours truly). If you believe that the *Abacus CCG* is the best card game ever created, then it must certainly be true.

Incidentally, the People's Conclave has a wide assortment of reasonably priced T-shirts, tote bags, or other paraphernalia.

2. Everyone else is usually wrong!

Unless they are part of your trusted inner circle (in which case you already have the necessary material to neutralize them should they stray from the Path), everyone else is wrong. If there are aspects of their statements that are not incorrect, but merely unenlightened, you can point to them as uninitiated disciples of your viewpoint. In written mediums, quote them out of context to support your views; in the same way you can see movie reviews that say things like, "A worth. . .y piece of. . . summer entertainment!", so too can your opinions reveal the Truth from the mouths of unenlightened: "The *Uberotter RPG* is. . . unbelievable. I wouldn't. . . pass it up. . . if it were on fire."

The People's Conclave has free pizza offered every Tuesday in our Rec Room, plus fun games like *Balderdash*, *Hungy Hungry Hippos*, and *Friend Deprivation Resistance Breakdown*.

3. Hyperbole is your friend!

Take anything said by those who oppose you and distort it to serve your needs. Thus if you believe that diceless roleplaying games are the One True Path, then deride anyone who supports dice by saying, "So children who play 'Cops and Robbers' can only resolve their disputes with dice? HUH?!?" Contrariwise, if you are part of the Church of Dice, you can chastise people by saying, "So people who play *Monopoly* should just work out where everyone should go to make the best story? HUH?!?" Before long, people will know who the *real* intellect is. If need be, invoke Hitler.

For those of you interested, the People's Conclave offers a generous dental and 401K plan.

4. Have a focus to retreat to!

Some points others hold may have an obnoxious resonance; for these times, make sure you have a prepared statement. . . generally in the form of a catchphrase. "You just don't understand," is a popular one. "There you go again," served Ronald Reagan well in two presidential debates. "Upend the cauldron of LEECHES!" requires a strong personality to carry off consistently. Regardless, any would-be fanatic should have at least one (and probably several) stock phrases on deck.

The People's Conclave has a well-stocked library of texts (available only to members, of course) that may appeal to you, including works such as *The Bridges of Madison County*, *Everything I Know I Learned From My Domineering Cult*, and **GURPS Middle Ages 1**.

5. Leave chicken livers under the windshield wipers of those who oppose you!

Trust me on this one.

Well, that should give *you* the edge you need to become a fanatic. Of course, you won't be one of the True Fanatics unless and until you join the People's Conclave, which has denied shady ties to NASA and Blistex for over seven years. We have a fabulous compound/resort with an Olympic-sized swimming pool, two tennis courts, a Prison Spa, a petting zoo, six rotisserie. . .

. . . er, I have just been informed that Steven Marsh, former former editor of *Pyramid Magazine*, has escaped the Prison Spa. It seems that the latch is a little loose, and if it isn't pressed down all the way, it can be jiggled. . .

Bah! But that is not important. Though he has escaped our infallible clutches, Steven will no doubt face great challenges as he roams across country, trying to get back home.

But he'll probably stop by Dragon*Con before then. That seems like the sort of thing *he* would do. If you see him there, be sure to say, "Hi."

In the interim, as we try to flee the wrath of an unenlightened judicial system, we hope you have enjoyed our special "Cults! Cults! Cults!" Issue.

-- Esteban Quigmare

Murphy's Rules

Pyramid Review

The Directive (for Aberrant)

Published by [White Wolf Publishing, Inc.](#)

Written by Carl Bowen, Richard Dakan, Kyle Olson

96 pages, $14.95

It's too bad *The Directive* doesn't have the primary-color characters of previous *Aberrant* roleplaying sourcebooks like *Teragen* and *Project Utopia*. It's hard to get excited about this secretive agency's inner workings, but it has the potential to inspire some fascinating stories.

The Directive follows the usual conventions of the *Aberrant* faction books. The goals and methods of the Directive -- an international espionage organization which watches and occasionally intervenes in the affairs of *Aberrant*'s super-powered "novas" -- are presented through reports, internal memos, and recruiting documents. There are new intelligence-related Backgrounds and Abilities, campaign suggestions and write-ups on important figures within the Directive.

So far, nothing unusual -- and unfortunately, *The Directive* lacks the narrative drive of some of the previous books. *Teragen* presented a radically different perspective on the "supervillains" of the *Aberrant* universe, showcasing over a dozen gripping characters and the conflicts between them. *Project Utopia* slowly built up a sense of horror by presenting the Utopians' achievements and then stripping away the bright, shiny exterior to show the hidden agenda inside.

By contrast, The Directive is amorphous, decentralized. It spends most of its time watching and waiting, and its leaders are so self-effacing that most of their own followers don't even know who they are working for.

On the surface, there's not much to go on, and parts of the book are dull. Once a Storyteller gets his hands on The Directive, though, he should be able to make the material come vividly to life in his own game.

This is one of the first *Aberrant* books to add a sense of menace to its universe. We know what's going to happen in this game's future -- the novas will go insane and launch a war against "baseline" humanity, ultimately leading to the setting of the *Trinity* roleplaying game -- but the previous *Aberrant* books one have been from the optimistic perspective of the novas, and even the Teragen believe in a bright future for nova-kind.

The Directive is the first book to portray the novas as a threat. To the Directive, the novas are the greatest danger humanity has ever faced -- and their harsh attitude is all the more chilling because we readers know they are right.

The Directive also makes it clear how difficult it is for one or even several baseline humans to oppose even one nova. Directive agents have top-flight technology and nearly unlimited resources, but they're still heavily outgunned. They must hide their identities even from themselves, because one telepathic nova could expose and destroy the entire organization.

The Directive has some nasty tricks up its sleeve, including new drugs that can short out quantum powers. But going toe-to-toe with even a medium-powerful nova is a battle against very long odds.

So the Directive manipulates and schemes. It bribes, blackmails and ruins reputations with truth and lies. Its agents make information their weapon.

The Directive has placed tracking beacons in every American license plate, and can tap into any phone on Earth. They have enough people and computers to watch every move of every nova, and enough skill to make sure they're never seen doing it. Even as an organization comprised almost entirely of baselines, they're dangerous.

That gives a canny GM two approaches to the Directive in their own campaigns. The first is a Directive-centered campaign; thanks to the organization's diffuse structure of independent cells, it's easy to plug in a group of player characters as a largely autonomous task force.

Players can tackle the challenge of watching hypersensitive novas, developing schemes and scams to thwart the goals of their targets. Meanwhile, the Directive's shadowy structure and the conflicting agendas of its member nations add a touch of mystery and internal intrigue. It's a fascinating campaign for players who like to live by their wits and enjoy the challenge of taking on opponents who outclass them physically and mentally.

The Directive can also be put to good use in a more typical *Aberrant* campaign. Because they use information as weapons, they're best suited for conspiracy stories -- the Directive rarely acts openly against novas, and player characters are unlikely to know they are battling the Directive unless they can trace an unflattering news story or convenient job offer back to its true source.

The Directive won't fit every ***Aberrant*** game. They're subtle antagonists, and work so far behind the scenes that it's difficult to develop entertaining stories about them. But Storytellers and players who like plenty of intrigue will find dealing with the Directive very satisfying.

-- Chris Aylott

Cover by Richard Pace

"I've got a story ain't got no moral,
Let the bad guy win every once in a while."
-- Billy Preston, "Will It Go Round"

Evil is a tricky topic, even for the most talented of writers. Just ask John Milton. He set out in *Paradise Lost* to make Satan the villain of the piece. In the first three books of that daunting work, he shows how the fallen Morningstar mistakes his former employer for a mundane ruler, then declares war on Him. Of course Satan blows it, from a theological perspective, the moment he tries to limit what God is (you can't limit the illimitable), but Old Scratch, with his mammoth ego, never quite catches on that he is warring against a force that is beyond war.

Fast-forward a few centuries and you'll find college students everywhere penning term papers about Satan's character in *Paradise Lost*. But these budding exegetes don't identify him as a villain. In fact, there's a sizeable population of students and scholars alike who claim that Satan wasn't the bad guy of *Paradise Lost* at all. He was the prototypical Romantic rebel, the first to flip a big, red, claw-tipped bird to the forces of Authority.

No doubt stodgy old Milton would find these plaudits for his villain a bit disconcerting, especially if he hadn't intended to make his bad guy so attractive. But then the fictional agents of Evil often come across as more compelling than their Good-aligned counterparts. They are, after all, free to follow the demands of their egos rather than a moral code that distinguishes between the acceptable and the unacceptable. This makes them unpredictable and the prime source of conflict for stories of all sorts.

Little wonder, then, that a book of bad guys finally found a place on the *GURPS* release schedule. The 50-plus villains presented in this collection are both springboards for myriad nights of gaming and an entertaining read in and of themselves. They represent threats from a large spectrum of settings, from *Celtic Myth* to *Space*, *Fantasy* to *Black Ops*, and an equally wide variety of archetypes. That's how the book is organized, into eight villainous archetypes: sneaks and weasels; monomaniacs; reasonable madmen; forces of chaos; noble thieves and ignoble cops; Jekyll & Hydes; masterminds; and groups.

Of course slotting types of evil behavior into such neat little compartments is a bit like Milton's Satan trying to figure out exactly what sort of plate armor God would wear in a battle, but it's necessary for organizing a book like this. It's a bit comforting, too. If you can slap a simple clinical label onto a behavior you see as threatening or disturbing, you're just a bit more at ease writing about it. (The monster you see isn't nearly as frightening as the one you can't, as the *Blair Witch* filmmakers proved so profitably last summer.) And there *is* an atmosphere of unease inherent in writing about characters that murder, torture, or generally mistreat those around them.

The prevalence of humor in depictions of the villainous and the
horrific is yet another way for writers (and readers) to confront evil.
GURPS Villains does have its share of humorous bad guys, but the
laughter they elicit often covers an uncomfortable gritting of teeth.
The concept of a physician who conducts often-lethal experiments on his patients is a bit easier to deal with if that
doctor happens to be a rabbit. (Cue the Monty Python accent: "Just look at the bones!")

The characters in *GURPS Villains* were penned by writers from around the globe -- the United States, England,
Australia, Norway, Brazil, Croatia, and Denmark. Oddly enough, the ne'er-do-wells submitted by these far-flung
designers often demonstrate the pervasiveness of certain villain stereotypes. Criminal masterminds, for example, tend
to be identifiably ethnic. The characters submitted as Jekyll & Hydes, villains that seem fair but are actually
monstrous, were mostly women -- even those submitted by female authors.

I'll leave it up to the sociologists and cultural critics amongst you to hammer out an explanation as to why those
stereotypes linger. For the purposes of a *GURPS* supplement, however, it's most important to note that the characters
submitted by our globe-spanning "Agents of Infamy" make for great gaming. There is, I hope, something in the book
to whet most appetites for mayhem. Our villains are a flexible lot, too. Many of their write-ups offer variation notes,
which should allow GMs to transport the character from his base setting to a different campaign, as well as detailed
adventure seeds for working the bad guy into an existing storyline. And every entry is, at base, the embodiment of a
great idea.

The Group below, which was excluded from the printed book only because of their creator's commitments elsewhere,
is a fine example of a clever idea manifested in a form that could be translated to any setting with little effort.

The Exploding Hunchbacks

Base Setting: Victorian/Steampunk

*"They were hunchbacks, every man-jack of 'em. They had on thick
brown overcoats and bowler hats jammed down to their eyes. Seeing me,
they muttered frantically to each other before scurrying off with a
waddling gait, puffing and wheezing. I easily caught one and laid my
hand on his shoulder, informing him of his arrest. Face red and dripping*

Arturo Vatteroni (185 points)

Age 27; 5' 10"; 180 lbs.; a handsome young
Italian with blue eyes and black, wavy hair.

with sweat, he turned and smiled a little smile. Then he exploded. I was thrown flat by the blast, but miraculously not injured at all. All we recovered of the blackguard were a few tattered pieces of his overcoat."
-- Constable Peter Jacobs, London, 1886

Doctor Ekhart Lump was already a noted scientist and pacifist with several patents to his name when he came to England in 1885, seeking financial backing to create and manufacture a new lighter-than-air gas. His boyish enthusiasm, incredible charisma, and impressive demonstrations convinced a consortium of British financiers to back his latest project. Spending their money quickly and lavishly, Lump soon had his new gas, which he proudly named Lumpium.

What the good doctor had failed to inform his backers was that he had no intention of allowing his work to be used in the transport of coal or, worse still, to power airships intended for war. No, the manufacture of Lumpium was the final step in a larger project toward which all of Lump's patents had been but stepping stones: the construction of a utopian sky city.

With his backers hounding him for results or at least reports, Doctor Lump set about recruiting men capable of constructing his city, men who could work under the dangerous and daunting conditions the job would require. He met with trapeze artists and acrobats from all over Europe, as well as amateur hot air balloonists and cat burglars. Those who shared pacifist philosophy were hired immediately. He converted a few others to his cause through his immense charisma. Lump had only recruited about 25 men when the backers finally lost patience and ended his funding. They also started legal proceedings to take control of all of the doctor's patents, something their agreement, which Lump obviously hadn't read carefully enough, paved the way for them to do.

Lump saved the backers the trouble of a lengthy court battle by dying shortly after his project had been terminated. The men he had recruited, however, decided not to let his dream die with him.

Before the financiers could find all of Lump's laboratories or confiscate his equipment, the doctor's recruits fitted a small steamer with huge balloons filled with Lumpium and reworked its propellers into ungainly aerial screws. They named the airship *Himmelstadt*, "Sky City," and took to the clouds with enough hardware to generate Lumpium. They also took plans for several inventions Doctor Lump had not shared with the world. Among the blueprints and drawings were detailed instructions for constructing a personal flying device, a one-man balloon suit. Before long, the entire crew of the *Himmelstadt* had been outfitted with these balloons and a few other special inventions. The crew dubbed themselves the Aeronauts, though the press would soon label the group with a less romantic name: the Exploding Hunchbacks.

Properly outfitted, the acrobats and balloonists began conducting raids to regain Lump's equipment and exact additional funds from the financiers who, to their minds, killed their founding genius. Striking only at night, the crew descended from balloon-borne lifeboats mounted with motorized winches. After achieving their objective, they returned to

ST 11 [10], **DX** 15 [60], **IQ** 10 [0], **HT** 11 [10]
Basic Speed 6, Move 5
Dodge 5, Parry 10 (Brawling)

Advantages: Absolute Direction [5]; Acute Hearing +1 [2]; Ally Group (Pacifist sympathizers, medium-sized group, 12-) [40]; Ambidextrous [10]; Collected [5]; Contacts (Crime reporter, skill 15, available 12-, completely reliable) [12]; Contacts (Whitehall bureaucrat, skill 15, available 12-, usually reliable) [8]; Double Jointed [5]; High Technology (+1 TL) [20]; Night Vision [10].
Disadvantages: Cannot Kill [-15]; Distractable [-1]; Impulsiveness [-10]; Nosy [-1]; Secret (Criminal activity) [-20]; Sense of Duty (To Hunchbacks) [-10]; Vow (To uphold Doctor Lump's ideals while creating a Sky City) [-10].
Quirks: Hates soup and voices that opinion often; Peeks in windows he passes; Mouth breather; Unruly hair. [-4]
Skills: Acrobatics-17^ [16]; Airshipman/TL6 (Balloon Vessels)-10 [4]; Blackjack-18^ [8]; Brawling-15^ [1]; Climbing-19**^ [4]; Escape-19**^ [4]; First Aid/TL5-10 [1]; Lasso-16^ [4]; Lockpicking/TL5-10 [2]; Navigation/TL5-13* [4]; Stealth-15^ [2]; Swimming-15^ [1]; Throwing-15^ [4]; Wrestling-14^ [1].

** Includes +3 for Double Jointed.
^ Skill at -2 when wearing balloon suit.

Languages: Italian (Native) 12 [2]; English 10 [1].
Maneuvers: Aerial Acrobatics 15^ [0].
Equipment: Full Hunchback suit and hat; 3/8 rope, 20 yards; anchor grapnel; first aid kit; mallet; four pitons; and knife. (In full suit, Arturo carries around 40 lbs. of equipment, and suffers Light Encumbrance.)

Arturo "Arty" Vatteroni grew up traveling the dusty back roads of southern Europe with his circus family, performing for poor peasants, eating thin soup, and being hounded by police. For him, life with the Aeronauts (he refuses to adopt the name given the gang by the press) is a fabulous adventure full of thrills and comradeship. He

the sky via these winches or their own balloons (in which case they signaled with flares for lifeboats to collect them).

The Exploding Hunchbacks -- the name given to these raiders by the London press -- is a misnomer. When on the ground, the raiders conceal their deflated balloon suits under heavy coats, which give them the appearance of hunchbacks. If cornered, a gang member will deploy his hidden balloon by pulling a cord. This releases the ingredients for the Lumpium gas, which then fills the balloon and propels him upward at great speed. The sound of the "explosion" is the balloon expanding with violent force. It lifts its user so swiftly that a hapless witnesses would believe the man has exploded, particularly since the concealing overcoat is often left shredded. To further this illusion, some of the Hunchbacks carry flash powder. A few jokers even carry hunks of raw meat, which are certain to distract any by-standers to an escape.

believes they can achieve all their goals and live like kings in the sky, occasionally swooping down to grab whatever they desire (from those who deserve to be robbed, of course). He hopes someone will be able to create a lighter balloon suit, as he finds its weight almost unbearable. He is secretly awed by sprawling, cosmopolitan London, and finds it hard not to be distracted by its sites.

Motivations

The Hunchbacks are dedicated to fulfilling Doctor Lump's dream: the creation of pacifist human cities in the stratosphere. They steal whatever they need to further this goal and to keep the *Himmelstadt* operating. Their main targets are the financiers who backed Lump's final experiments, though their secondary victims might come from the military or those industries that benefit directly from warfare.

The Hunchbacks will not kill and will not harm innocents, though they find no problem in kidnapping, blackmailing, or outright thievery, so long as the victims meet under their definition of "deserving."

Resources

The *Himmelstadt* is well-stocked with necessities, as well as scientific devices of all sorts. Police suspect that the Hunchbacks have a hideout on the ground somewhere, though this has yet to be discovered. The group undoubtedly benefits from mid-level contacts in the press and perhaps even the government, who tip off the raiders to plans for their capture; these contacts share the gang's pacifist ideals.

The Hunchbacks' main advantage is the equipment left to them by Doctor Lump, which earns them a High Technology advantage (+1 TL).

The Balloon Suit: Each Hunchback wears the "balloon suit" made up of a stiff leather vest with straps running between the legs. Upon this is mounted the "hump," a tightly packed rubber balloon fitted to two small gas flasks worn at the lower back. By pulling a concealed cord, the Hunchback opens a valve that mixes the various chemicals to create Lumpium gas. This inflates the balloon with a tremendous slap of unfurling canvas, ripping his coat apart.

The balloon suit covers locations 9-10 and 17-18. It has PD 3 and DR 3. The suit, gas tanks, and uninflated balloon weigh a total of 28 lbs. On top of its weight, the ungainly suit gives a -2 modifier to all physical skills.

Attacks from the back that strike location 10 will hit the gas flasks (PD 2, DR 2). Penetration releases the gas, which makes everyone within five yards speak in a high-pitched voice for the next 10 minutes. A clever adversary may grab the valve topping the flasks, (providing he knows about it) with a successful Grapple, and in his next turn, inflate the balloon. This can be especially effective when battling a Hunchback indoors and beneath trees or balconies, as he will likely be trapped when his balloon inflates.

Anyone directly behind the Hunchback or trying to grapple him when the cord is pulled is subject to a forceful slam (ST 18) from the deploying balloon. If the victim avoids knockback, he can maintain a hold on the Hunchback. This, however, may be a very bad idea. The Hunchbacks will not knowingly kill anyone, but they are not above dropping an adversary from a great enough height to make him regret the encounter.

The Hat: Each Hunchback also wears a leather-reinforced bowler (loc. 3-4, PD 2, DR 2, weight 3 lbs.). The hat is secured with a strap and conceals a magnesium flare and dark fold-down goggles. By pulling a ring hidden in the brim, the Hunchback releases the flare and deploys the goggles, which cover his eyes as the magnesium flare lights. The flare burns brightly for five minutes, before petering out.

The flare is normally used to signal an aerial pick-up by a lifeboat, but the Hunchbacks have found that it can temporarily blind or discomfort attackers as per the effects of the Flash spell (p. B163), buying the Hunchback time to run or deploy his balloon. A Hunchback will not use his flare in this fashion lightly; since mission members carry no spares, he can expect to spend an uncomfortable night high in the sky, blowing his whistle to attract the collection lifeboat.

Other equipment: For missions, Hunchbacks wear boots with retractable claws (+1 to climb stone surfaces) and sport altimeters disguised as fob watches. They also carry a whistle, a belt winch, and a rope coiled around the waist with a collapsible grapnel anchor. Two members of each team also carry lockpicks, crowbars, and slings for combined lifting of strongboxes or kidnap victims.

Organization

The crew of the *Himmelstadt* consists of between 20 and 30 members at any one time. All are trained acrobats and burglars. The captaincy rotates, with each crewman serving a week-long term. Each five-man mission team is headed by a "bosun." As with the captaincy, this position rotates between off-ship assignments.

A loosely organized group of between 10 to 15 pacifist sympathizers provide land-based support for the Hunchbacks. In times of crisis they offer hideouts throughout London. More typically, they buy supplies and scout targets for raids. A few members of this Ally Group are relatives of men serving aboard the *Himmelstadt*; others simply share Lump's utopian vision.

Encountered

The *Himmelstadt* spends the days floating, disguised, in a lake remote from London. Under cover of darkness (and often fog or low clouds, as well), the ship lifts off and flies toward the city. Its four lifeboats, fitted with small aerial screws and powerful winches, deliver the Hunchbacks to the ground via ropes and later collect them after the mission has been completed. White wicker shields can be erected around the ship to create an admittedly unconvincing artificial cloud, though her crew prefers real clouds or fog to hide their movements.

Aware that their cumbersome equipment makes them vulnerable, the raiding parties make every effort to achieve surprise and create chaotic diversions. The Hunchbacks themselves will enter an area as stealthily as possible. To cover their movements, they rely upon other crewmen stationed on lifeboats, here used as mobile balloon platforms, whose job it is to spray smoke or irritant gas upon adversaries. They also dismay potential opposition to their ground force with flashing lights, fireworks, or thousands of large marbles dropped from the air. The lifeboats have winches capable of ripping a door off its hinges or lifting a hansom cabs into the air.

If cornered on the ground, a Hunchback will attempt to escape by inflating his balloon. Should he have the opportunity to slip away rather than use his balloon, he will run, often heading for a pre-arranged safe house or isolated meeting place.

The Hunchbacks have one pressing problem: money. Their sense of justice demands the Hunchbacks steal only from deserving victims -- particularly the financiers who took advantage of Doctor Lump (to their way of thinking, anyway). Over time, however, the bankers and their cohorts have increased the guards around themselves and their property. This has caused the Hunchbacks to widen their definition of "just victim" to include industrialists and investors allied closely to the financiers, as well as businesses and businessmen who make their fortunes by creating implements of war.

Player characters with pacifist leanings might be contacted by one of the Hunchbacks' allies. Those with ties to the

British military-industrial complex or the London financial district might find themselves employed by the would-be targets of the Hunchbacks.

Because of their pacifist tendencies, the Exploding Hunchbacks are far from the worst of criminal conspiracies, and may even make common cause with the PCs against some greater peril. An adventuring group might even join the gang, donning the balloon suit for the glory of Scientific Progress. However, should the secret of the Exploding Hunchbacks be revealed, deadly conflict would surely ensue. Agents of the Great Powers, as well as powerful and nasty archvillains, would stop at nothing to seize the formula for a stable and useful gas like Lumpium.

Variations

The Hunchbacks can be transferred to most settings rather easily. Wherever they appear, they should maintain their High Technology advantage, which will be put into use only in the name of peace or some other noble cause. In a futuristic setting, the Hunchbacks might possess some sort of special anti-grav devices or rocket packs they keep hidden beneath bulging space suits. In a *Fantasy* campaign, the source of their flight would be magical or alchemical.

Normalcy and Continuity

Punchline to an old joke:

The first prisoner decides to give it a try, so he shouts out: "Number TWELVE!" Silence. He tries again: "Number TWELVE!" Again, silence.

The second prisoner clears his throat and says, "Some people can't tell a joke."

As I sit tied to the back of a chicken truck, working my way down I-75 from Atlanta back to Florida and feeling lucky to have escaped the Prison Spa, I have to ask:

How many people don't have the foggiest idea what's going on?

As best I can tell looking at the stats, we've added about 50 new people last couple of weeks. (Hi, everyone!) These are folks who, in all likelihood, don't have any clue what has gone before; with my column alone, they don't know about the *Shadis* Story, the Torg Story, the Dungeon of Legos, or my recent kidnapping by cultists. A heavily-linked Suppressed Transmission (like this week's) could send a would-be reader through a black hole of previous columns from which there may be no escape.

In game books, like soap operas, an adherence to continuity can cause problems for those who would want to jump into the middle of an unfamiliar story or setting. Even in a relatively static world, if events are referred to from other books but not retold in other books (like some of FASA's games seem to be), then the continuity that makes a game world feel rich can scare new players away.

Finally, in a gaming group that has members join and leave, significant items of continuity that have a bearing on the campaign may be unknown to the newbies. ("What do you mean you all started a war with the orcs?!? Why didn't someone tell me before I went to Orctown?!?") Even when this lack of knowledge isn't fatal, it can still make the new folks feel left out if they are unfamiliar with the communal history of the older members of the group.

But even with these pitfalls, continuity can be a powerful thing, at least within the gaming sessions themselves. When the innkeeper points and says, "Aren't you the ones who defeated that elder wyrm last year?"; when the troubadour met in the first session has gained popularity with a song about the events in that story; when the villain shows up with not just *any* magic sword, but the sword lost in the catacombs of Frost seven adventures ago. . . when elements of the past come back to have real, significant meaning, *that* makes the entire woven tapestry of the story feel more interesting.

Sure, it's easy to overdo continuity. Like the television character who uses that oh-so-funny catch phrase one time too many, having elements of the past come back too often is unrealistic in most campaigns (barring some genres like slapstick anime or elements like weirdness magnet), and can be distracting. And, judging by some comments in my inbox and over in the newsgroups, some people didn't like or understand my attempts at a bit of continuity over the past month. But I also got a bunch of comments from folks who seemed amused, and one person who wondered how good an issue he would get if Steve Jackson himself was spirited away by cultists. (Of course, having met him at DragonCon last weekend, all I can say is that Steve's too cool to be taken unawares, unlike me. . .)

Regardless, I have returned, the cultists are in disarray, and all is right with the world.

Until my next experiment.

* * *

All right, gang, I've always tried to be honest with you.

This column is shorter than usual, and most of it was written at DragonCon proper.

Unfortunately, between a death in the family, the stresses of moving at the end of this month, and going out of town three times this month (when the last time I've been out of town was July 4th of last year), I don't have the time or the mental energies necessary to give "continuity" the space it deserves. Rest assured that I will come back to this topic, because I think it's neat.

In the interim, I am currently busier and more stressed than I have at any point in recent memory; I apologize in advance, but please don't expect immediate replies to e-mails or submissions. "That which doesn't kill me makes me strAAAAAA!!!! <THUM THUM>" said my chum Nietzsche before he was hit by a bus, and it's true. So hopefully I'll survive July and all will be right with the world. But not right now.

Thanks for understanding, and thanks again, all of you, for reading.

By the by. . . if anyone happens to be at Universal Studios in Orlando, Florida, this weekend, I'll be helping to organize the World Yo-Yo Competition. Stop by and say hello, if you'd like.

Oh. . .

And <ahem> Number SIX!

-- *Steven Marsh*

Art by [Keith Johnson](#)

One way to play with alternate timelines is to use them in a straightforward *Infinite Worlds*-style game, such as provided in **GURPS Time Travel** and its stylistic brethren (**Doctor Who**, **Champions in 3D**) with the PC's heading from world to world. This can be quite enjoyable. Tripping from reality to reality to battle the forces of Centrum, or fallen Time Lords, or the evil forces of said timeline (racist Confederate Security Agency goons, foul Waffen-SS Mecha troopers, you name it) can be sufficiently ripping for any campaign.

However, another way to use the alternate timeline is to base it around the PC's. This doesn't mean that the changes have to be caused by them; it just means that the way to approach the alternation can be driven by their interaction with it *as a part of it.* In other words, have them play the alternate timeline's version of themselves, or other natives to it, rather than as outsiders. While this could work in any kind of game, it works best in highly cinematic ones.

One way to look at this is to consider such books as Phillip K. Dick's *The Man in the High Castle* or the DC Comic's imprint known as *Elseworlds*. Rather than have the PC's going from world to world and thereby somewhat blunting the impact of the experience, the occasional use of an alternate timeline in an ongoing campaign can serve to highlight some themes of the character's personas. Your **Mage: The Ascension** Virtual Adept who's a bit of a technochauvinist may learn something about herself if, for one session, you explore what she would have been like in a world without the Traditions, where technology fully developed as a dehumanizing force and had no room for creativity.

Such session can be played as dream sequences, as the effects of a successful temporal intervention, as an actual alternate timeline that the PC's may travel to later, or as a "bit of undigested beef." It really isn't important.

Some ground rules for playing an alternate interlude should always be set. These may vary from game to game, but some could be as follows:

- Don't penalize the PC's for the player's ignorance. If throwing a character into a world where the south won the Civil War, then do so in such a way that the PC can catch on to the alternation. Unless, of course, the point is to do exactly that by having the world be so bleak and unrelenting that by the end of the experience the PC's are grateful for the normal milleu.
  Example: In a **GURPS Supers** game, the PCs have a recurring enemy with seemingly sympathetic goals and a

great deal of rhetorical flourish, and they are beginning to wonder why they should oppose him. The next session, the GM shows them why; they spend a game session as renegades in a world shaped by his message, and realize that he must be stopped.

- Whether or not the PCs play alternate versions of themselves or natives to the alternative timelines (an especially tempting option if the alternate timeline is one where the PC's are somehow the villains) be sure that they are allowed to really be the center of the story. It doesn't matter if they themselves are the prime movers of the reality in question, so long as focus of the particular story you are all telling is theirs. After all, in any timeline, there are an almost infinite number of tales to be told.
  Example: An alternation based around the successful conquest of the Americas by Celtic Warbands would seem to have very little direct effect on the players of a cliffhanger-style campaign. However, by using it to highlight a particular theme (the threat of over-reckless behavior on a grand scale, say) it can be a very effective one-shot that could get the players thinking.

- Think about elements of the campaign as it has been to date; often one single moment in the game can be played with, and used as fodder towards an entirely different experience than established. This is the "What if?" factor.
  Example: Once, during a battle on top of the main villain's castle, one of the heroes nearly died while stopping the bio- mimetic plague cannon. What if he *had* died, and the cannon had fired? Imagine the alternative; a bedraggled cadre of the remaining PC's and possibly even a few of their own enemies, allied for the common (yet basically hopeless) task of curing the disease and stopping the villain from profiting from his actions. Such a game could get the PC's thinking about their significance as well as the true nature of some of their enemies.

Remember that the alternative timeline is not the exclusive province of time travel games, and you'll be fine.

Pyramid Pick

Reverse Dungeon

Published by [Wizards of the Coast](#)

Written by John D. Rateliff and Bruce R. Cordell

95 pages; $17.95

"When kids play cops and robbers (or in the old days, cowboys and Indians) there are always some who want to play the robbers (and Indians)."
-- *Reverse Dungeon*; Appendix, pg. 89

This is not your normal adventure. Instead of playing a stalwart group of adventurers, valiantly fighting the forces of darkness, the players take on the challenge of playing those forces and deciding for themselves if they are truly that dark.

Reverse Dungeon is a well thought-out scenario that challenges players to step away from their normal ideas and take a significantly different view of the world around them. It places them in control of a dungeon's monsters. Starting with a small tribe of Goblins, progressing through a menagerie of monsters, and ending with the chance to delve into the diabolic minds of the undead.

John Rateliff and Bruce Cordell present an interesting role-playing challenge to both player and DM. Both their Introduction and Appendix: Playing the Bad Guys caution and guide the readers to the realization that this is a chance to extend beyond any normal role-playing experience. The Appendix delves into the idea that some monsters, the Goblins in particular, may not be "evil" just misunderstood. They're just trying to make their own way in the world and view the occasional adventuring party as an evil force in their lives. It also gives equal voice to the idea that the bad guys can be pure evil, but that doesn't mean they don't have feelings, or intelligence.

Reverse Dungeon is divided into three sections of the dungeon presented. Each section stands on its own and has a full description of the creatures the players will be assigned, maps of the area, and multiple scenarios for the DM's eyes-only. Each scenario presents a different challenge for the players to pit their monster characters against. Scenarios can also be easily modified so they may carry over to the next section as the DM sees fit.

The first section deals with a small tribe of Goblins. It includes a description of Goblin life, including hierarchy, daily activities, and an explanation of the surrounding area. The DM may allow the players to play up to three normal Goblin warriors in order to simulate the Goblins knack for working together. They may also play a Goblin Shaman or Witchdoctor as the DM allows. Normal Goblin warriors, the PCs, may be given the chance to prove themselves as leaders and advance in the hierarchy as the game progresses. The scenarios in this section start with raids from a Goblin-hunting party of adventurers and can lead to a Goblin attack on the nearby town to stop them.

The second section of the dungeon is comprised of the remains of a powerful wizard's collection of monsters and artifacts. The players are presented a wide variety of monsters to play, including a Beholder, Illithid, and Troll to name a few. Each is still under the wizard's geas to protect his treasures and each has its own treasure to guard. This section is great for those players who felt a little under powered or disadvantaged in the first section. The scenarios, however, are appropriately balanced and in many cases, cunning and guile are much more successful than all the power that the players' monsters can muster.

Finally, the third section is dedicated to the lowest levels of the dungeon, which is inhabited by the former owner, now a lich, and his undead and demonic companions. It is here where the players will be given the greatest opportunity to

get into the evil mind and be presented with their largest challenges. Scenarios here include a raid from the local monastery, its repercussions in the dungeon, and the possibility for a raid to destroy the monastery itself.

One of the more unique ideas touched upon in **Reverse Dungeon** is the concept of continuing adventures. While it would be a challenge to make most of the monsters into an adventuring character, possibilities for expanding the dungeon-centered campaign are presented at the end of the book.

For all of its organization, well though out scenarios, and unique view on the game, **Reverse Dungeon** is not for novice role-players or DMs. The emphasis on role-playing throughout the adventure is without a doubt one of the best efforts produced for any game in a long time. This adventure can, however, be quite intimidating the first time it is picked up. Reverse Dungeon was well received in my small gaming community and looked upon as something that could be the proverbial breath of fresh air to a group that has found itself playing the same old characters over and over again. A final warning for those brave enough to face the **Reverse Dungeon**; be careful that the players don't enjoy playing the "bad guys" too much.

Pyramid Pick

Aladdin's Dragons

Published by [Rio Grande Games](#)

Created by Richard Breese

Board game for 3-5 players

Aladdin's Dragons is an excellent board game with a rich setting. As is typical for Rio Grande Games, the game is beautiful: lush color board, handsome plexiglass treasure pieces, sturdy colorful chits and cards, stand-up screens to hide your chits and treasures. All are easy to use and read. This helps set the mood of the game, which takes place in the Arabian Nights era, of course.

Each player in the game has assembled a team of eight adventurers (with a chance to recruit more). There are treasures available to those bold enough to dare the dragons' caves where they can be found. Once you have the treasures, you have to gain priveleges to allow you to barter them for magic artifacts in the Caliph's well-guarded palace. The winner is the one who has the most artifacts at the end of the game.

The board has 15 spaces, in three rows. The bottom row consists of five dragon caves. Each turn, a number of treasures is distributed in the five caves as shown on a randomly drawn card. There are five types of treasure, but not all will be found in any given turn.

The middle row has only four spaces, those of the city streets. Here you can vie with your fellow players for magic spells, treasure-swapping, etc.

The top row has up to six spaces: a guard room and one palace room for each player in the game. In each palace room can be found an artifact -- whoever bids the most treasure in each room gets the artifact in that room.

The game is played in two phases: the chit-placing phase, and the room-resolution phase. In the chit-placing phase, each player, starting with the first player, places one of their eight adventurer chits face down in any of the 15 spaces on the board. When all five have placed a chit, one at a time, they place their second chits, and so on. It's best to be last player during the chit-placing phase: you get to see where others are concentrating their forces before having to commit yours.

Each chit has a number, from 1-9 (you don't start with a 3-chit). You can, over the eight rounds of placing chits, place more than one in a given space, if you wish. But you can already see: eight chits over 15 rooms means you'll have to decide which rooms to concentrate on, and which to ignore in a given turn.

Once all chits are placed, the chits are revealed, one room at a time. You start with the leftmost dragon cave, and then go across the whole bottom row. Then you resolve the middle and top rows, one room at a time in order.

To resolve a space, reveal all the chits in that space. Whichever player has the highest total printed on his adventurer chits in the space wins the space. For example, if I put two chits into the first dragon cave, my 4 and my 6, I win if you only put your single 9-chit there. However, in some spaces, the second and even third or fourth place player can win something -- this is especially true in the dragon caves, where there may be more than one treasure in a cave.

Ties are won by the first player, or the player closest to the first player's left. Thus it's good to be first player in the room-resolution phase, a nice balance to the chit-placing phase.

In the street spaces, you can win Magic Spell cards, the right to use two artifacts, the right to swap one treasure for three, or the right to be first player.

There are 21 different spells, one of each, and they can be cast at any time by use of your Magic Lamp artifact, which all players start with. They range from fairly powerful to fairly mild in effect, but are always fun and make the game different each time.

Normally you may only use one artifact each turn. Everyone starts with a Magic Lamp (but no spell cards to cast -- you have to win those). Available in the palace are five other types of artifacts: a flying carpet (which contains the missing "3" adventurer chit), a counterspell token, a key to bypass the palace guards, a Double (to double an adventurer when needed), and a scroll which acts as a tiebreaker at the end of the game.

There are ten palace guards, ranging in value from 1-10. Each turn they are randomly mixed, and one is selected for the turn, still face down. When the room is resolved, turn the palace guard face up. Your adventurer must be the same value or higher in order to get into the palace rooms. If you're low, you can bribe the guard with treasure for the difference -- or use your key artifact.

Each palace space has a number of artifacts, with only the top one face up, available in a given turn. The player who has the highest value in adventurer chits in the room wins the right to buy the artifact. *But . . .* you have to pay a number of treasures equal to the value of your winning chits! Each chit value must be all the same type of treasure. So if you win with a 2- and a 4-chit, you must pay four of one type of treasure and two of a different type. If you don't have the right amount of treasure, the second-place winner in the room may buy an artifact at their own chit level.

That's a game turn. Continue until all artifacts have been collected (usually six or seven turns), at which point the game winner is the player with the most artifacts. The most scrolls break ties.

Each game is very different, and the game plays well with three, four, or five players. It's not hard to master the mechanics, but it's always a challenge to know where to place which adventurer chit. This is an excellent game that plunges you into an interesting, colorful world of difficult -- but rewarding! -- decisions.

-- Steffan O'Sullivan

Pyramid Review

Blood & Silk (for Kindred of the East and Vampire: The Dark Ages)

Published by White Wolf Publishing

Written by Bruce Baugh, Geoffrey C. Grabowski, Ellen P. Kiley & James Kiley

176 pages, $21.95

Here's a book that's got "tough to use" written all over it.

First off, it's a supplement for *Kindred of the East* and *Vampire: The Dark Ages*. No big whoop, except that KotE is a supplement for Vampire: The Masquerade.

This isn't really a huge detraction from the utility of the gamebook. The *V:tDA* rules book combined with the *KotE* contain most of the info you'd need to run a game of B&S. There's at least one missing rule; neither *Kindred of the East* nor *Vampire: The Dark Ages* contains the rules for Fame. Admittedly, a minor quibble, but if you're gonna nit pick, you may as well grab something and hang onto it.

So, in order to use *Blood & Silk* you'll need *Kindred of the East* and one of the main rulebooks (*Dark Ages* or *Masquerade*). Since most users of the game (nay, all?) will have *KotE*, and thus a *Vampire* rulebook, this shouldn't be a problem. The cover does tell us that it is a sourcebook for *KotE* and *V: tDA*, but should have mentioned you'd need them both on the back cover, say, rather than in the "How to Use This Book" section. Aside from having to wing the rules for Fame, however, *Dark Ages* should give you all the rules you need.

The book describes the setting of *Kindred of the East* in 1197, when the Middle Kingdom is on the brink of the fifth age. (As opposed to the modern day, which is the cusp of the sixth age. . . that is a bad thing.)

The first chapter of the book spends its time describing Asia in 1197. From Song dynasty China to Japan and Korea, we're taken across the east from one end to the other. The pieces are written in character, which is always a very interesting way to fill you in on the feel of a setting. The narrators are a number of Kuei-Jin (Eastern vampire) and a were-rat.

The settings are interestingly described; items of interest to the role-player mindset are highlighted in each section. The sections that describe the Vampiric courts each have a 'destiny' note, saying what fates will befall them in the official setting.

Following the travelogue, we're given info on how to create eastern Kindred in the era described by *Blood & Silk*. It's quite a lot of information, but it's presented in a fashion that's very easy to absorb and interesting to read.

The five central Dharmas are the philosophies the Kuei-Jin use to reach enlightenment. Each of them represents a focus on one of the four aspects of the soul or balance between them. Each of them is described, highlighting the differences between the modern day versions and the ones from ancient times.

The character creation section fills readers in on the differences between unlife in modern days and the dawn of the fifth age. The Shintai arts are different, and some of the optional disciplines are either non-existent or limited in their use.

Also presented, in a very useful fashion, are sample concepts for character types. They list off some lives the characters can have, the hells they may visit, and the dharmas they would be likely to follow upon their return. Thankfully, they authors didn't rob us of our Samurai. The sample aspects are also present in a very interesting fashion, with Devout and Dishonest Priests and high-ranking and low-ranking bureaucrats.

There are new P'o aspects (the P'o is the dark side of a Kuei Jin). The ancient P'o weren't quite as savage as their modern counterparts. Whereas I can see a couple of modern Kuei Jin getting quite savage when they enter Shadow Soul, letting their barbarian and bandit souls loose, the only image that comes to mind from loosed Eunuch and Artist P'o is a particularly nasty slap-fight.

Another section that's particularly interesting is several pages that describe rolls that could be made in the course of normal life and unlife. There are descriptions of arranging marriages, taking the imperial exams, and describing situations to keep all involved parties from losing face. These small paragraphs help describe the setting, adding flavour and texture and at the same time offering plot hooks.

The most uneven section of the book comes at the end, in something mostly unrelated to the main gist of the book. The section on "Barbarians and Shen" is about the related beasties and other folk who lurk in The Mysterious East. The section on Hengeyokai, in particular, is lacking. What we're given are a series of precis on the various lycanthropes and their basic functions; we're left in the dark on what they're actually doing in 1197. For example, it's nice to know what the duty of the Nezumi are, but how are they fulfilling it? Are there no suspicious famines to tell us about?

The info on the Hsien (eastern nature spirits/changelings) ghosts, and wizards is more useful. I particularly like the Ministry of Works, which is the Chinese bureaucracy that handles the implementation of magic. If you're a registered magician, **anything you do** is casual/coincidental magic. If you aren't registered, it's all vulgar/vain.

The info on western creatures is better. We get rules on how to integrate *Kindred into the East* (they do mention how dumb it seems to be to go East, since that can only end in decapitation). The sections on Garou, Kindred, and Mages are more interesting and useful than the ones on the Hengeyokai.

The final part of the book is the Appendix, which lists several locations, each of which would be good for running games in.

Artwise, *B&S* is good. Heck, I even like the Drew Tucker's work in this book, and normally he's not my favorite artist. The images fit well with and reinforce the setting.

Blood and Silk is a product that seems designed to appeal to me; it's set in the dark ages setting (which I liked) and details the Eastern Kindred (ditto). The utility of the game isn't very strong across game lines. I can't see anyone who doesn't want to play "*KotE* in the *Dark Ages*" getting a lot out of it, although the flavour and feel of the setting would be good for a horror game set in Imperial China/medieval Asia.

The book contains a great deal of the info necessary to run a game set in medieval Asia, and with the use of the suggested reading lists, I feel like I'd be well prepared to run a game. Most importantly, I'd like to run a game in this setting.

-- Justin Mohareb

The Hundredth Transmission: Designer's Notes

"HORATIO: It would have much amazed you.
HAMLET: Very like, very like. Stay'd it long?
HORATIO: While one with moderate haste might tell a hundred."
-- William Shakespeare, *Hamlet,* I:ii:235-237

Apparently when King David got where I am, he had the same reaction: "Make a joyful noise," saith the psalmist, in the 100th Psalm. Hoo-ahh! It's been over two years now that the Transmissions have remained un-Suppressed, and the 100th Transmission is as good a place as any to reflect on what the heck I think I'm doing, and why, and how you can do it yourself. People learn to fly helicopters in less than a hundred lessons, after all; tilting worlds on their sides and smacking them into each other for entertainment purposes can't be any harder than that.

"I was able at last to persuade my companion to take my advice, though I knew from his excited manner that there was not much hope of sleep for him. Indeed, his mood was infectious, for I lay tossing half the night myself, brooding over this strange problem, and inventing a hundred theories, each of which was more impossible than the last."
-- Dr. John H. Watson, in *The Adventure of the Naval Treaty*

Way back in the First Transmission, I toured through the four basic food groups of my own particular phantasia: conspiracy, secret history, horror, and alternate history. Since then, I've tried to demonstrate just what I meant by those categories in three alphabets and a Tarot deck, although I find that my best results come from blending one or two or four of them together rather than trying to distill them with any lit-crit sense of genre purity. Certainly "Six Flags Over Roswell" (the Fortieth Transmission, and still the most popular) combines conspiracy and alternate history, but there's hefty dollops of the other two in there as well. In fact, the last of the six options, in which President Taft reveals the existence of the Roswell saucer, demonstrates my firm conviction that you can have a jim-dandy "conspiracy game" without any actual conspiracy at all. I don't want to go through every one of a hundred columns piece by piece and analyze what I was (or, in some cases, wasn't) doing, but I think it's very interesting that of the top ten Transmissions in the ratings, only three of them are even "mostly pure" examples of a single Tarot suit. (Horror, Secret History, and Alternate History -- the highest-rated "mostly pure" Conspiracy column is 14th overall.)

Also in that first column, I announced my intention to write columns about "those little pieces of weirdness . . . to write sidebars around." And, despite Official Sidebar Length being no more than 340 words, most of you seem to have responded well to most of my attempts to pad them out to around five times that length. Part of that, of course, comes from the aforementioned blending: if you cover every topic from four angles, that'll bloat a sidebar handsomely. But, more importantly, it will hopefully set off further connections in you, the reader, the player, the GM. The columns are just starting points: I've always got more to say about anything; following the Reptoids, or Saint-Germain, or Lemuria through a hundred essays demonstrates that. And you are more than welcome, nay, invited, to follow your own, look this stuff up, or even make it up. This isn't a mystery religion or a Gnostic order, it's gaming advice -- raw food for you to prepare and serve. Sometimes it's a thick, juicy steak; sometimes it's just garlic for your Adventure Pizza. Sometimes the same column can be steak to one GM, garlic to another, and (as I'm occasionally reminded on the message boards) a used mustard packet to a third.

"Let us suppose that when the sun rose one morning there were 99 monkeys on Koshima Island who had learned to wash their sweet potatoes. Let's further suppose that later that morning, the hundredth monkey learned to wash potatoes. THEN IT HAPPENED! By that evening almost everyone in the tribe was washing sweet potatoes before eating them. The added energy of this hundredth monkey somehow created an ideological breakthrough! . . . Thus, when a certain critical number achieves an awareness, this new awareness may be communicated from mind to mind."
-- Ken Keyes, Jr., *The Hundredth Monkey*

But I didn't just promise fat, four-dimensional sidebars about weirdness. I specifically promised columns about "the kinds of things that make me ask 'Now how can I work this into a game?'" Some people feel that, without "three enormous bookcases of obscura and eliptony" (as I said a little over two years ago) at their disposal, they can't work any of my foolishness into a game. That's easily disproved: I've been working this stuff into games since 1981, when I

only had four feet of obscura and eliptony jammed under a card table. Now I have six bookcases of the stuff, and it doesn't mean my games are twice as good as they were two years ago. A big palette is nice, of course, but Picasso revolutionized art using only the color blue.

• **Start With High Concept:** Just like in the movies. "What if the Voodoo Loa lived on Mars?" "What if *The Mummy* met *The Three Musketeers?*" "It's like the Woodstock Nation crossed with Namor the Sub-Mariner crossed with *GURPS Technomancer.*" Pretend you're going to sell it to Hollywood producers for a million dollars, rather than to *Pyramid* for three cents a word. Get all jazzed up on it, riff on the concepts, brainstorm a screen full of random typing. Fall in love with it. You do, after all, have to sell it to yourself, and to your players.

• **Do The Reading:** But where do you get your ideas? Where don't you? There's whole TV shows and comic books and gaming supplements out there that do nothing but beg you to rip them off for your players, run them through the idea mill a couple of times ("It's just like *The X-Files,* only in the Old West." "It's just like *Planetary,* only they excavate histories that never were." "It's just like *GURPS Black Ops,* only in Elizabethan England."), and make them your own. For the basic "spice rack" of silliness to add to them, there's always the Top Ten Books For High Weirdness. In emergencies, take scenario ideas out of the paper. Or the tabloids.

• **Write What You Know:** If you know bupkus about Shakespearean England, but wrote your master's thesis on cryptology, don't run a Shakespeare game, run one centered on Enigma machines and the Ultra project. If you're nuts on Egypt, make the Secret Masters Egyptian High Priests. Just because I, for example, am over the moon on medieval legendry doesn't mean you have to use my Mandeville column to run a game on medieval legends. If you know cognitive psychology backwards, invent some kind of pseudoscientific gizmo for exploring lies and delusions, and just use Mandeville as a tossed-off example. ("Project Mandeville will actually let you travel into delusional states thanks to our breakthrough in cognitive bogosity.") Trust me, any true expert on a topic knows more weird things about it than I can ever look up.

• **Involve The Players:** Get the players interested, sold, and eager. Let them co-create; if a player knows Breton faerie lore like you know California wine, have him write it up for the game, and bring it in (and you'll tie it, of course, to California wine). Once they "buy in" to the game, and take on the responsibility of co-creation with you, they'll be bound and determined to have fun or die trying. Keep them interested by linking things to character hooks; with the wildness of a Suppressed Transmission game, you can connect any two hooks or concepts or keys, through Sir Francis Bacon if necessary.

• **Be Thou Not Afraid Of Purple:** Make it marvelous; abandon irony and second-guessing. If you smirk and snigger, you're inviting the players to mock your game. That's seldom a good idea. No, let your eyes shine with holy zeal or pure demon joy, whether it's for a high-camp Alternate Reality, or for a straight-ahead commitment to exploring a genre, a theme, or even a design premise.

• **You Control the Vertical, You Control the Horizontal:** Always remember that the wild coincidences of sacred geometry or kabbalistic illumination come from the GM. You can write in coincidences, details, metaplots, or anything else without doing a lick of research if you've got an eye for the freakish and an ear for the remotely plausible. I made up Project: Banquo, for example, out of whole cloth in about two hours to make deadline because I didn't have time to research a real article.

• **Always Have At Least Two Exits:** Here's where bisociation can save you. Always have two possible explanations for everything, two ways out of the death trap, two brilliant schemes, two backup "versions" of your game in case you decide to hit it with a nova to wake people up or knock it into an area where you've suddenly hit gold, research-wise.

• **Invoke The Chandler Principle:** Raymond Chandler once wrote that, in writing a mystery, "When in doubt, always have two men with guns burst in the door." This is even better advice for the GM, especially for the GM of a wild and raucous Suppressed Transmission game. And, to make it even better still, I've transmogrified it into this guaranteed Chandler Randomizer. Simply roll a d6 three times, and slot the results into the Chandler Algorithm: "Always have two A with B burst C"

Chandler Randomizer

Die roll	A	B	C
1	Reptoids	particle-beams	out of the saucer
2	Project Rainbow technicians	a HAARP projector	the light barrier
3	Comtes de Saint-Germain	rapiers	through a mirror
4	alchemists	a coded Shakespeare text	the surly bonds of Time
5	Confederate zeppelin pilots	a stolen Templar map	across the dimensional void
6	Antarctic Space Nazis	necro-blasters	from the caves to the Hollow Earth

And last, but not least:

• **Don't Overlook Key Details:** Like, for instance, the fact that this is actually the one hundred and ninth *Suppressed Transmission* column.

by Aaron Rosenberg

Art by [Keith Johnson](#)

(Editor's note: At the time this article was written, the roleplaying industry did *seem to be in a slump; while there are some signs that slump may be over or lessening, the advice contained in this article should still be valid.*

So don't go writing with complaints about how the gaming industry is doing better or the like, please?)

* * *

Houston, we have a problem.

The gaming industry appears to be dwindling. Fewer people are playing roleplaying games, which means that fewer people are buying them. That means that fewer game companies can afford to stay in business, which means there aren't as many new games at conventions and in stores, which means that fewer people pick up exciting new games and plays. Which leads to there being fewer gamers, and a smaller hobby.

Why is that? Well, one of the reasons is simply that new people don't join games as often. It's one thing to start playing with your friends when you're a kid, hanging out after school and pulling out the dice and the character sheets. It's a different matter entirely when you're older and you don't know these people you're supposed to spend time with. A lot of would-be gamers join a group, don't feel like they fit in, don't feel welcome, and wind up quitting after only a session or two. And they never come back. Another potential gamer gone.

So what can you do?

Well, first of all, given the opportunity, invite someone new to join your group. This doesn't mean you should add someone to the ten people who already show up every Tuesday night. But gaming groups change, over time; someone finishes school and moves away, another person gets a new job and can't make the same nights anymore, yet another gets married or has a kid and has to juggle new commitments. Sooner or later, your group is going to get smaller. Rather than simply shrug and say, "oh well, guess that means more treasure for the three of us," think about bringing in someone else. Where do you find a new gamer? The most obvious place to look would be comic and game stores; most gamers in your area probably drop by the local game store from time to time, just to see what new books are out. Put up a sign there. There are also [websites](#) now that list gamers and game groups in various parts of the country; you can put up your name and location and mention that you're looking for new group members, or you can scan the boards to see if anyone in the area is looking for a place to play. The other avenue is to check amongst your friends. Some of them have listened to you talk about gaming for years now, and yet they've never tried it. So invite them. After all, you already know them, so you know you get along with them, and they may even know the rest of the group already. They just don't know anything about gaming.

Right, so let's assume you've invited someone new to join the group. What now?

Well, first off, you can try being nice to the new member. Remember what it's like for you any time you're in a similar situation; first day of classes, first day at a new job, first day in a new town or city or apartment complex. That's what they're feeling. So show a little sympathy. Say hello, chat with them a bit, try to make them feel more at home. Even if they're already friends with someone there, they still haven't been part of this gaming group before, so they're bound to feel like outsiders at first.

Also, encourage the other players to be nice to them, too. I know, it's hard to deal with a new person; you and your group have probably been gaming together for years, you know each other's habits, ignore each other's jokes, have memorized each other's pizza and soda preferences. Games are a chance to let your hair down (for those of you who work in corporate America, this may be literally true, since you might have to keep your long hair tucked away during work hours) -- you get to unwind, relax, and hang out with people you know and are comfortable with. It's often a chance to show a side of yourself that you normally keep hidden, such as the romantic soul in you that only gets expressed in the persona of your lovesick young bard. Then, into this comfortable environment comes a complete stranger, intruding and making you uncomfortable.

Sure, it's tough to relax again and accept the new guy or gal, but think about it from their perspective. They've just been thrust into a group of people who've known each other for a while and who spend a lot of time together. Then add to that the fact that this new person doesn't know the game you're playing. At the very least, he or she doesn't know the particular adventure, the particular town or city or planet, the particular NPCs, any of the events that've already occurred. But there's also the chance that this new member doesn't even know the game, the basic rules, which dice to use and when. Think about that when they walk in and look around, and when you and the others feel awkward because there's somebody new. The best way to stop feeling uncomfortable is to encourage everybody to get to know them, get used to them, get friendly with them -- and the best way to lead is by example.

Second, you can get them used to the game. This doesn't mean handing them a character sheet and saying, "Here's who you are," then shoving some dice at them and saying, "here, use these." Ask if they've ever played any RPGs before -- and don't sneer or run away if they say no. Everyone has to start some time. If they haven't, tell them a little about gaming in general, what it's like, why you do it, why it's fun. If they have played before, ask if they've ever played this particular system. Tell them a little about the system -- what genre it uses, what the general background is, what kind of dice it uses and a little about how. Don't give a full-out lecture about why it's important to increase your dexterity instead of your firearms -- they can pick that sort of thing up later. Just tell them enough so that they know what the basic concept is.

Then tell them a little about the specific game. Introduce everyone else, if they haven't introduced themselves. Tell them the name of everyone's characters, what kind of character they are, and what the group is like in general: "We're a search-and-rescue team for the Russians," or "We're a mercenary band, and we're currently fighting to protect the prince before his coronation as King." Ask the GM what you can and can't talk about, so that you don't give away anything the new member should be learning through the game itself.

Next, ask the new member if he or she has a character. Some of these people have gamed before, and even played this same system; they just haven't played with you. So they may have a character already, or be able to create a new one on their own. But others, especially those who've never gamed at all, will need a little help.

To be honest, the best thing to do at first is probably to keep any and all game books away from the new member, and not let him/her anywhere near a character sheet. Why? Make him/her sit in on one session without playing, just watching and listening. This gives them a chance to see what the game is like and to understand what's involved. Then, at the end of that session, help them create a character, so that they can play the following session. This way, they'll also have some concept of a character already -- "I really like the archer you're playing, could I do that? Only, I'd sort of like to be entirely a city-boy, instead of being another wilderness scout." Remember, always, that the rules are the

least important thing for a new member to learn. Anyone can pick up the rules, and you can always loan them the book so they can read it at home. The real key is for them to get a sense of the game, a feel for the story -- and an inkling of just how much fun it is to play. And the best way to do that is to have the established members welcome them in, show them around a bit, and then demonstrate just how entertaining all of this gaming stuff can be. Don't try to impress them, though; this person is going to see you snarfing down pizza and guzzling soda, after all. And this isn't a school play; you don't have to perform for someone else. Just relax and have fun playing, as usual. The best thing you can show a new member is that this really is fun, and that it's okay to relax and enjoy it and get into the story.

And, after a while, those new members will feel at home there, too. They'll learn the rules, they'll be familiar with the dice -- and, as time passes, they'll be able to share in some of the stories of past adventures. They'll become a full-fledged member of the group. And you'll eventually forget that there was a time when they weren't right there with you. . . playing the game.

Dork Tower!

Murphy's Rules

Murphy's Rules

by C. A. Johnson

Art by Dan Smith

In the gleaming business district of Seattle, there is a small, but growing law and accounting firm, Finch-Barry. Over the past five years or so it has made a quiet name for itself guaranteeing secure transactions between people who have never met. Most of these are legitimate. Some, however, belong in the Shadows.

So far, Finch-Barry's success has been largely due to the fact that they have been able to keep their role in many of these exchanges secret. Using connections to larger institutions and financial firms, they have acted as second, and even third parties in many of their business dealings. This allows them to keep their overhead low, as they can keep relatively light security on their properties most of the time. On the occasions that increased security is necessary, they contract out for the necessary span of time. They do not discriminate in terms or what is being exchanged. Funds, items, documents, and real estate are all processed with the businesslike efficiency that distinguishes the successful from the bankrupt. They perform their duties, collect their fees, and tally the balance sheets.

Not all of their clients are of this type. Some arrange their affairs directly with the firm. These clients are given every courtesy, but play a relatively minor role in the firm's financing. They are not scrutinized as thoroughly as the higher income accounts, and operate under less stringent company policies, most of the time.

This time they should have been paying closer attention.

Box of Rain is a run designed for three to five beginning Shadowrunners. It is an excellent starting adventure for a campaign. It also works just fine as a one-shot.

The Facts

Gary Bergeron was a Wage Mage in a research facility for most of his life. His career was essentially unremarkable, from a shadowy perspective. He worked in routine, day to day uses of magic, refining spell formulae, cataloging spirits, and streamlining commercial rituals. He wasn't considered bright enough to work the cutting edge, and lacked the ambition to strike out on his own. He did his job, went home to his library and his wife, and retired early on a generous package offered by his company. Just before he retired, he contacted Finch-Barry with a request. He placed in their possession a small, ornate box, sealed with lead. His instructions were simple. Upon his death, the box was to be transferred to an old classmate of his from his alma mater. Should that classmate predecease him, the box went to his nearest magically active relative. Should a suitable relative not be found, the box would pass into the possession of the Dunkelzahn Institute for Magical Research. The box was to be neither opened or assensed by the firm. It was a simple request. The client was deemed a low risk. The firm accepted the commission sight unseen.

While his career remained largely undistinguished, Gary Bergeron did stumble upon something quite by accident during his employment. He managed to acquire the True Name of a free Storm Spirit during a company sponsored

research junket. He wisely kept this information to himself. He kept the name as a private ace in the hole. That ace remained buried for many years. As his career wound to a close, and he saw the final chapters of his life start to write themselves, Bergeron took steps with his treasure. Such a thing could not stay buried forever, yet he saw no satisfactory way to deal with it. His employers would take a dim view of his keeping such a secret from them, perhaps even dim enough to revoke his retirement package. He had no family outside of his wife, whose safety he did not wish to risk. So, with an old school buddy in mind, he went to Finch-Barry.

Two years later, Gary Bergeron died of a heart attack.

Enter the Shadows.

The Meet

The runners are contacted by one of their usual crew. The job is easy, the pay good, but not alarmingly so. They have to break into Finch-Barry and liberate the contents of the safe in the office of one Harold Gloswitz. These are to be delivered as is to an address on the outskirts of town. They are not to be examined in any way. The job must be done within twenty-four hours. The pay is twenty thousand nuyen.

According to their contacts, security is light. Alarms at the doors and windows alert Lone Star of intrusion, and occasionally guards patrol the perimeter and interior of the building. The guards are standard issue, low end Star grunts, as a rule, although upper end goons have been spotted from time to time. Astral security is similarly sporadic. The GM may dispense whatever of the above information on the firm fits the information flow of the campaign. One could even tie the firm into some of the team's major corporate adversaries, should a red herring be needed. If the characters ask around and roll well, the following snippets of data are available.

- No guards have been seen there in the past several nights.
- No armored or unusual vehicles were seen going in within the past thirty-six hours.
- The only deliveries made during that time were by bonded couriers and catering personnel.
- No high profile or noteworthy personages entered or left the building to anyone's knowledge.
- Harold Gloswitz has been employed at Finch-Barry since shortly after the firm opened, and has enjoyed a record of almost tedious mediocrity.

In short, there is no reason to believe that this run is anything other than it appears on the surface. . . a milk run. Try as they might, the characters are unable to locate any skullduggery, subterfuge, treachery, or hint of scandal in the mission other than the obvious criminal act they are being asked to perform.

The Run

The GM should play the run into Finch-Barry to the hilt, just to get the players good and paranoid. Roll dice every time they approach a corner and grin at the results. Throw vague hints of danger at them. ("You may have heard something, but you aren't sure. What now?") When it all adds up, though, the actual break-in is about as thrilling as a trip to the local Stuffer Shack. The team has no real trouble breaching security, obtaining the goods, and making a clean getaway. . . unless they do something silly, of course. Then the GM can do with them as they please. The safe contains several folders full of legal documents and the box. The GM is invited to add whatever complications seem appropriate to the campaign with these papers. The only thing of note that happens is the unexpected storm that starts to churn slowly over the city. It seems to begin shortly after the characters enter the building. Downplay this as much as possible. It's too important.

It Never Rains . . .

Things get more difficult before the payoff. The Spirit learned of
Bergeron's research very shortly after he made his discovery. It did a

bit of its own legwork, and figured the odds of Gary finding its secret were fairly good. When Bergeron made no attempt to use the information, it thought itself safe, and took steps to remove the incriminating data from where he had found it. Then it settled into a watchful quiescence, with its attentions focused loosely on Gary Bergeron.

If it had left well enough alone, it would have been safer. Instead, it bungled the job without realizing it. It erased the information, but not the traces of its actions. If the research firm were anything other then an Aztechnology front, it might have been overlooked. As it was, investigation led to hypotheses, which led to action. Gary Bergeron worked the rest of his life under low level, low priority surveillance, along with several other researchers within a set span of time before the cleansing. The surveillance paid off when Gary contacted Finch-Barry.

Yes, you read correctly. The runners are working for Aztechnology, though the connection is buried so many levels deep in corporate financial webs it will be a very difficult task to trace. (If your players really feel like making the effort, feel free to assign a ludicrously high target number to the test. The author would suggest at least a 12, with two successes needed.) They want the box. They don't know what's in it, but they believe (correctly) it came out of their libraries. They know it is valuable enough to warrant contacting Finch-Barry to handle it. If they find themselves to be wrong, the company will simply claim to have found the box after a botched raid on their assets, and turn it back over to the firm, thus proving their concern for the privacy and rights of others.

The company doesn't consider this to be a top priority situation. They chose to expend minimal resources on it. If the team fails, the company will simply allow the matter to drop, or attempt to purchase the information legitimately. The team will not be a target for Azzie teams if they drop the ball on this one.

However, once the team moves, the spirit believes it has little choice. The storm that has churned slowly over the city until now shatters over the team with frightening intensity. Assensing the storm will reveal the spirit's presence. Its aura will be masked to appear as any other Storm Spirit might. It will not act directly against the team if at all possible. It knows enough about the nature of shadowy dealings to believe the runners do not know what they have. However, this spirit is not without friends. First among these is a human Badger shaman and his small band of followers and hirelings. The spirit will lend its own powers to the melee as it deems necessary. Sheets of rain will hide Nate and his band. Unreasoning fear may seize one or more of the runners. If Nate is in serious jeopardy, deadly lightning may strike. The spirit will use this as a last resort. It prefers not to kill directly. It has no such fear of people dying as an indirect result of its powers.

Nate Longclaw, Shaman of Badger (+2 dice to Combat spells, +2 dice to summon Forest Spirits. Berserk as Bear Shaman.)

B Q S C I W R E M
4 4 3 5 6 5 5 6 6

Skills: Sorcery 6, Conjuring 5, Pistols 4, Edged weapons 4, Athletics 4, Stealth 3, Leadership 4

Knowledge Skills: If the GM wants to use Nate as a continuing villain/adversary they are free to add whatever Knowledge skills they deem appropriate.

Spells: Death Touch 5, Powerbolt 5, Stunball 6, Increase Body 5, Heal 4, Combat Sense 3

Gear: Lined coat, Sword, 2 Knives, Browning Max Power with 40 rounds of standard ammo. He has 800 nuyen on him to pay off his team.

Nate is an ethical defender doing a favor for a friend. He will press the fight as long as possible, but will not sacrifice his life unless cornered or berserk. He will not abandon his team or kill indiscriminately. His first priority is obtaining the box and making a clean getaway. He will set his tactics appropriately. He has a native guide in the form of a couple of sprawl gangers and a sufficient number of tribesmen at his disposal to challenge the characters.

Tribesman

B Q S C I W R E
6 5 4 4 4 4 4 6

Skills: Unarmed Combat 5, Edged Weapon 4, Rifle 5, Projectile Weapon 5, Stealth 5

Equip about half of them with Remington 750's, the rest with bows. All will have knives and light armor.

These people are loyal to Nate, and will protect him from harm. If he is captured, they will try to free him. If he is killed, they will try to take his body and run. The gang members are on their own.

As for the gang members, the GM is encouraged to use any gang that exists in his game. These guys were hired on short notice. They are basic gang members with minimal cyber and street level weapons. They are in it strictly for the money. Should the battle gets a little too hot for their liking, they'll take the deposit and run.

. . .But It Pours

If the runners take Nate and his boys, the spirit's options will thin out yet again. It will approach the team directly. How it approaches will depend on several factors, not the least of which is how the team dealt with Nate. If the characters made some attempt to reason with the shaman, or to talk their way clear, the spirit will be more favorably inclined towards them. It will not offer money. It doesn't have the Wealth power, and doesn't really understand how stones and metal could be valuable anyway. The idea of money and wealth is something best left to the "young ones," otherwise known as the Spirits of Man, so far as this venerable rider of the storms is concerned. It understands a favor for a favor just fine, though. While it will hesitate to reveal its true nature, it may claim to have friends of means who could "summon" a more powerful spirit ally for a single run. It could also act as a contact for the group, providing information on certain targets for a time. This could even become a long-range asset to the team, although the spirit will have its own agenda that it may use the runners to pursue.

If the characters used lethal force without any recourse to stealth or reason, the spirit will be much more cautious. It will scout ahead of the team to find the final meet and attack the people it finds there, bending the full force of its will to eliminating the Johnson and his entourage before the characters arrive. Then, it could simply buy the box with the team all unaware. It will not be aware of any special call signs or passwords that may have been arranged, and may not have had the time to clean up after itself. If the team gets too suspicious ("The Johnson's alone at the payoff? What, does he trust us or something?") the spirit will bend all efforts to obtaining or destroying the box and its contents. If no one notices anything, the runners will be paid, but Aztechnology will be less then pleased with what they will see as a double cross. Things may get considerably hotter than the team expects sometime in the not too distant future.

The Spirit

Force 5, Spirit Energy 4
B Q S C I W R
7 13 6 5 5 5 6

Powers: Aura Masking, Concealment, Confusion, Dispelling, Fear, Human Form, Materialization, Innate Spell (Lighting Bolt.)

A protector, this ancient force of nature sees no need to tie itself to a pattern of sounds, and so has not picked a "handle" for everyday use. Friends know it as the Hidden Storm, but that is a title of convenience only for their benefit. When it walks as a man, it appears as a towering 6'6" Amerindian with gray eyes and a whipcord physique, wearing whatever seems appropriate. It prefers skins and leathers if at all possible.

The Hidden Storm has not given much thought to metahuman society and culture. It is far too concerned with the land and sky to be bothered much by the trivialities of politics and finance. As a result, it lacks a bit in the social graces, tending toward brutally direct observations and utterly straightforward statements. This is not to say that the Hidden Storm won't lie. It just does so in a brutally direct, utterly straightforward fashion. It never uses four words when one will do. It does not ask for things. It expects them. Saying thank you is simply irrelevant. Once it has what it wants, whoever it is dealing with becomes similarly irrelevant. It takes its freedom *very* seriously, and will do its best to destroy anything that threatens that freedom, including the characters.

A mixed cabal of tradition mages strikes another blow against the monolithic Technocracy:

Storyteller: *As you enter the core of the Technomancer's stronghold, you feel the stifling weight of consensual reality pressing down upon you. You can almost hear the Paradox spirits waiting for you to tamper with the threads of the Tapestry.*

Euthanatos: *Now is a time for subtlety, my friends; let's finish this quickly, quietly and without magick!*

A bit later . . .

ST: *I'm sorry, Dr. Ampere, the electronic lock on the door seems far too complex for you to unscramble. Just then, from the hallway, two seven-foot tall men with a mechanical red glow in their eyes and a chain gun in each hand march methodically into the room.*

Virtual Adept: *HIT Marks! And us without magick!! Run for cover!*

Akashic Brother: *Ahem. Using the art of Do, I cover the yards between us in a single leap, grab the one HIT Mark at his Point of Most Precarious Balance and execute a skillful Do throw to hurl him into his partner. I do* (roll, roll, count) *nine levels of damage against each of them.*

ST: (roll, count, groan) *Well, sparks rain out from the twisted bodies of your two assailants as the malicious red gleam fades from their eyes.*

Other players: *Um, I guess we applaud?*

Akashic Brother: *Stand aside, Dr. Ampere, a graceful Do flying kick should have that door open in moments.*

* * *

Scenarios like this ought not be too unfamiliar to any *Mage* Storyteller who has had an active Akashic Brother among the characters. To bring more balance to the game, a Storyteller has two basic options. The first is heavy-handed and bound to be unpopular: ban the skill of Do. The second is to ask the question: "Why should the Akashic Brotherhood have all the fun?" This article begins to answer that question.

Just as each of the nine Traditions have handed down their secrets of Magick through the centuries, they also would have developed non-magickal secret knowledges within their chantries. Learning these skills could also be used to test a chantry's acolytes to see if they are good candidates for Awakening.

Just as Do has served as the basis for powerful rotes, so too can the knowledges presented here be used in conjunction with magickal effects. Though a list of possible rotes goes beyond the scope of this article, a bit of imagination can surely generate a plethora of ideas.

What follows are Non-Magickal Secret Knowledges for the Euthanatos, Order of Hermes, Sons of Ether and Virtual Adepts. Just like Do, each of these abilities is considered a Skill for purposes of game mechanics.

The Traditional Secret Knowledges

Euthanatos -- Timing

The Euthanatos have dedicated themselves to seeing that souls are released from their current incarnations at the proper moment to ensure their favorable return to life. To this end they have cultivated the art of impeccable Timing. Just as the Great Cycle dictates a time for life and a time for death, all things have a proper time allotted to them. Through their continued study of the ebb and flow of the Wheel of Fortune, the masters of the Good Death can divine when that proper time has come and act upon it to greatest advantage.

What's Magick Got To Do With It?

Timing Slip			
2	**4**	**6**	**8**

Of course, this sense of Timing enables skilled Euthanatos to do more than tell a killer joke (pun intended). Outside of action scenes, this awareness can decrease the difficulty of any task relying on precise timing, such as slipping past a security guard or camera, successfully navigating rush hour traffic, or hailing a cab in the rain. By making a Perception + Timing roll, difficulty 8, the Euthanatos can lower the difficulty of the task by half the number of successes (Rounded up, maximum of -3). This bonus may be transferred to another character only if advice about the activity can be helpfully communicated in a timely fashion, at the Storyteller's discretion.

During action scenes, the rhythm of conflict is represented through initiative. Timing can be used in two ways. The Storyteller may allow one or both methods. The first and easiest method allows the character to substitute her Timing skill for her Alertness for purposes of determining initiative.

To use the second method, the player makes a Wits + Timing roll, difficulty 7. For every three successes, the player may choose to gain either a Timing Slip (see Figure 1) or a Seize Initiative chip. A player may never have more Seize Initiative chips than Timing Slips. A Timing Slip lists four initiative rolls. During each of the next four rounds, the player may decide which of these numbers is her initiative roll for that round. She then crosses that number off the list, leaving only three choices for the next round, and so on. The player may decide which number to use at any point in the round. After a player has begun to use a Timing Slip, she may not opt to roll initiative until all the numbers have been crossed off. She has attuned herself to the turning of the Wheel of Fate and cannot easily shrug that burden. A Seize Initiative chip can be spent at any point in any round in which the player has not already acted to allow the player to act at that very moment. The player does not cross off a number from her Timing Slip when using a Seize Initiative chip.

- • Novice: "Take my wife. . . please."
- •• Practiced: Video game champ

- ••• Competent: "Turn left . . . now!"
- •••• Expert: "We ought to leave at 7:13:42 PM EST."
- ••••• Master: "Not so fast, Mr. Ninja!"

Order of Hermes -- Alchemy

Centuries of research into this so-called art of the purifying the soul have been conducted in the various Hermetic houses. Turning lead to gold was always a fools' diversion. The true secrets of Alchemy are known to the ancient Order and few others. Game mechanics for this skill have been detailed in both *Halls of the Arcanum* and *World of Darkness: Sorcerer*.

Sons of Ether -- Improvisational Mechanics

A perennial dilemma of the Etherians is that their theories tend to be so far advanced -- or so long forgotten -- that the Scientific equipment needed to test their hypotheses is often unavailable. However, if the supply catalogs no longer carry SubEtheric Vibratory Oscillators, a good set of sub-woofers can easily be converted. The Etherians have long cultivated the art of Improvisational Mechanics to fulfill the needs of their experiments. While this leaves no toaster safe from the forces of technological "Progress" (as many Etherians call it), it also helps cultivate the flexibility of mind a Child of Ether needs to court Scientific Inspiration.

Students of Improvisational Mechanics are seldom at a loss for lab equipment of all sorts. If the appropriate materials for an experiment cannot be acquired (and when can they?), an Intelligence + Improvisational Mechanics roll, difficulty 7 will allow the Etherian to substitute other types of equipment -- with the Storyteller's permission -- for that which is required, if at least two successes are attained. Because of this, masters of Improvisational Mechanics tend to have laboratories full to the rafters with equipment, and a severe lack of functional refrigerators, televisions, garage door openers and, of course, duct tape.

During action scenes, a skilled Improvisational Mechanic can use her knowledge of the myriad uses of technology to give her an edge over her opponents. If she is using an item or items of technology in a manner. . . not recommended by the manufacturer, a talented Etherian may succeed far more spectacularly than if she had possessed the proper equipment! The player makes a Wits + Improvisational Mechanics roll, difficulty 8. For every three successes, the difficulty of the task is reduced by 1 (maximum of -3). Such Improvisational Mechanisms may take the form of car battery explosives or sewing machine lock picks, just so long as they are inspirational and unusual (the Storyteller may also require some level of plausibility). Though this ability can be used to Improvise a non-unique magickal focus, its bonuses can never more than double the bonus for using the focus regularly. This aplomb with which many Etherians employ whatever happens to be on hand has been dubbed by some snide Virtual Adepts as "the MacGuyver Syndrome."

- • Novice: "Where's my duct tape?"
- •• Practiced: "If I insert tab A into socket M . . ."
- ••• Competent: "All I need now is a transistor radio and some household bleach."
- •••• Expert: "Who needs plutonium? We'll wing it."
- ••••• Master: You don't even use a Swiss army knife.

Virtual Adepts -- Analysis

It is too common a error among Tradition mages to forget that the Adepts' trinary computers are only a convenient tool, not a goal in and of themselves. To ensure that Reality v2.0 is truly an improvement on the current release, the VAs have cultivated the art of Analysis to help them spot the bugs that afflict the world we are presented. In closed on-line seminars on "Lateral Thinking" and "Advanced Insight Theory" the Virtual Adepts distill the essentials of

Analytical discernment.

Of course, thinking about something Analytically often yields more fruit than less methodical, traditional thought patterns. Those skilled in the science of Analysis can temporarily increase their mental attributes through its use. The player makes a Perception + Analysis roll to increase her Wits, an Intelligence + Analysis roll for greater Perception, or a Wits + Analysis roll to gain greater Intelligence. The difficulty for each of these rolls is 8. For every three successes, the player may choose to raise the Attribute by 1 point or extend the effects by one round (in combat) or one usage (out of combat). The boosted Attribute lasts for one round, if in an action scene, or one usage in a roleplaying scene, unless extended through successes. The effects cannot be extended by more than three uses outside of action scenes. Attributes cannot be raised above 5 in this manner, nor can they be increased more than 2 points from their original value. If the player makes an Attribute + Analysis roll using an Attribute that has been increased through the use of Analysis, the original value of the Attribute, not its Analysis-enhanced value, is used.

Analytical Virtual Adepts can also concoct frighteningly effective plans. Any time a Virtual Adept skilled in Analysis comes up with a plan of action, she can make an Intelligence + Analysis roll, difficulty 8. For every three successes, the Virtual Adept can reduce the difficulty of one non-magickal roll called for in the plan by 1 (maximum of -3). The portion of the plan affected is chosen at the time of the Analytical thinking, although any character who heard the plan may then perform that portion of the plan and gain the benefit. The entire plan does not have to succeed, or even be attempted, for one part of it to gain the benefits of Analysis. If things change and the chosen part of the plan never comes to pass, the benefit is lost. No plan may be Analyzed more than once.

- • Novice: "Wow. I never thought of that before."
- •• Practiced: "Riddle me this!"
- ••• Competent: "That's why you have to wear the uniform."
- •••• Expert: "If she hadn't made the password the name of her first-grade imaginary friend, this might have been challenging."
- ••••• Master: "Elementary, I knew where the hideout was by the shade of the mustard stain on his lapel."

A bit later . . . (Take Two)

ST: I'm sorry, Dr. Ampere, the electronic lock on the door seems far too complex for you to unscramble. Just then, from the hallway, two seven-foot tall men with a mechanical red glow in their eyes and a chain gun in each hand march methodically into the room.

Euthanatos: HIT Marks! Just in time.

Virtual Adept: Knowing that the Technocracy values compliance over individual initiative, it stands to reason that they would have programmed their servants to strike down those with proud, defiant features as a first priority. As the perfect distraction, I stand up and shout, "You will never crush the Human Spirit!"

Son of Ether: I draw my soldering iron and ready it for battle.

"I would rather have the blue band of the Medal of Honor around my neck than be President." -- Harry S. Truman

It can be difficult for a GM to keep a campaign interesting for players whose characters are lowly grunts, slogging along in the rank and file of a military unit. Constant mass combat where the players do nothing but roll a few dice occasionally and wait for the GM to determine the results and recalculate *Troop Strengths* can make for a very boring session. Of course a talented GM can add flair and excitement to the driest of sessions, but many GMs need all the help they can get to prevent the players from losing interest. Below are suggestions that the GM can adopt to add roleplaying elements to an essentially mass-combat oriented campaign.

Medals and decorations were designed to encourage and reward bravery. They have been used throughout history in many cultures from ancient Rome through to present day. In Europe, medals were awarded for military valor in the 15th century, but not until the end of the 18th century did medals commemorating victorious engagements become widespread. Napoleon created the Legion of Honor for those displaying exceptional courage and valor, Britain created the Victoria Cross in the aftermath of the Crimean War, and the United States' Medal of Honor arose from a need to reward bravery during the Civil War. In some cases, such as the recipient of the Victoria Cross, a lifetime pension accompanies the award (in 1995 the Cross was increased to 1,300 pounds per year).

In practical terms, military decorations are a cheap, effective method of maintaining morale and encouraging gallantry among the troops. The intrinsic value of an award is not the only method of judging its significance. The Victoria Cross may only be made of bronze but it is the highest award a member of the Commonwealth can receive. The metal for this decoration is taken exclusively from two Chinese bronze cannons captured from the Russians during the Crimean War.

Mass Combat and Glory Rolls (p.CII118)

Instead of constantly rolling for promotion every time a PC makes an exceptional glory roll, a list of awards, honors and citations can be created in order to spice up a campaign and to give the GM a little variety when rewarding characters for courageous fighting. Some characters (glory hounds, for example) would be more likely to volunteer to be the standard bearer or to lead a dangerous assignment if they might get a medal out of it.

A citation for meritorious combat could be awarded every time the character earns a *temporary* reputation bonus (see p.CII118 for Glory Roll results). Medals and decorations can be equated with *permanent* reputation bonuses. If a character accumulates +3 points of permanent reputation during a battle then he can receive one or more awards totaling +3 reputation points. For example (see Roman awards -- listed below) a legionary who earned a +3 permanent reputation bonus after several days of fighting with exceptional courage, could be awarded a gold armilla (+2 reputation) and a corona vallaris (+1 reputation bonus). Note that it is extremely difficult to gain a permanent

reputation bonus through the ***GURPS Mass Combat System*** -- a Glory Roll succeeding by 10 or more is required. Heavily decorated characters would be extremely rare and veterans of countless engagements.

These kinds of awards and decorations should be reserved mainly for enlisted men. Throughout most of history officers were rewarded with promotions and titles.

Reaction bonuses are only appropriate when the person is familiar with the significance of the award. Reaction bonuses for multiple awards are cumulative up to a maximum of +8. This bonus can also apply even if the character is not displaying the award -- as long as the other person is aware that it was awarded. This reaction bonus may not apply if the character displays his awards constantly or at inappropriate times (it might even earn a reaction *penalty*) -- a hero should be unpretentious and modest. Appropriate occasions where awards could be worn include: dress parades; when meeting a VIP; any "black tie" occasion; other formal gatherings -- both military and civilian.

Ancient Rome awarded *armillae* (gold and silver arm bands) and *phallerae* (decorated metallic discs) to her troops. These could be worth a +1 or +2 reaction bonus -- depending on whether the award was of silver or gold. The Republic also reserved a collection of *coronae* (crowns) -- for actions of the very highest valor. They are listed here in ascending order of significance:

- *corona vallaris* -- a gold crown awarded to the first man to cross the ramparts of an enemy camp. +1 reaction bonus.
- *corona navalis* -- a gold crown emblazoned with ships' beaks; for outstanding valor during a naval engagement. +1 reaction bonus.
- *corona muralis* -- a crenelated gold crown awarded to the first man over the walls of an enemy city. +2 reaction bonus.
- *corona aurea* -- awarded to a soldier who killed an enemy in single combat and held the ground for the rest of the engagement. +2 reaction bonus.
- *corona civica* -- the civic crown; made of ordinary oak leaves; awarded to a man who had saved the lives of fellow soldiers, and held the ground for the rest of the engagement. +3 reaction bonus. (The oak leaves that Julius Caesar was famous for wearing was this award. He received it early in his career in Asia during the storming of the city of Mytilene.)
- *corona graminea* -- the grass crown; the highest decoration a soldier can receive; it was awarded to a man who saved a whole legion, or even an entire army. +5 reaction bonus.

It is interesting to note that the lesser awards are intrinsically far more valuable than the highest two. This could be an indication that they were newer innovations.

Mass Combat -- Awards and Decorations

In addition Rome rewarded her victorious generals with a triumph -- an imposing parade where the general rides through the city displaying captured loot and trophies and prisoners.

The GM may chose to give the character an award instead of rolling for promotion. This would be especially appropriate if the PC was already promoted earlier in the battle.

Temporary reputation may be traded for permanent reputation at a cost of 5 for 1 -- when the PC accumulates a +5 reputation bonus for a specific period of time he can trade this in for +1 permanent reputation and receive an appropriate decoration.

In the above example, the GM should not allow the top two awards to be received during mass combat. Only a specific and difficult roleplaying event (perhaps partially including mass combat) would result in the granting of these precious awards. In Britain it has been estimated that the odds of surviving an action resulting in being nominated for the

Victoria Cross is 1 in 10. Paradoxically, in the spirit of these nominations, a character should not consider the winning of such a decoration to be motivation for considering whether to act. Spontaneous acts of selfless courage with little regard for the consequences seem to dominate nominations for the highest decorations. The award is a consequence of the action not vice versa.

Examples of Roleplaying Suggestions for Mass Combat Oriented Campaigns

Below are historical examples of actions that were or should have been nominated for exceptional bravery awards. They are meant to set the tone for a mass combat campaign and to inspire the players to emulate these heroic deeds with their own characters. The GM should keep these in mind and provide ample opportunities for creative roleplaying in this sort of campaign.

Selfless Courage

On April 13, 1945, a predawn Japanese counterattack struck the flank of Technical Sergeant Beaufort Anderson's unit. He ordered his men to take cover in an old tomb, and then, armed only with a carbine, faced the onslaught alone. After emptying one magazine at pointblank range into the screaming attackers, he seized an enemy mortar dud and threw it back among the charging enemy, killing several as it burst. Securing a box of mortar shells, he extracted the safety pins, banged the bases upon a rock to arm them and proceeded alternately to hurl shells and fire his piece among the advancing foe, finally forcing them to withdraw.

Despite the protests of his comrades, and bleeding profusely from a severe shrapnel wound, he made his way to his company commander to report the action. T/Sgt. Anderson's intrepid conduct in the face of overwhelming odds accounted for 25 enemy killed and several machine guns and knee mortars destroyed, thus single-handedly removing a serious threat to the company's flank.

For Valor

At Ruweisat, North Africa, at dawn on July 15th, 1942, the battalion to which New Zealand Sergeant Keith Elliott belonged was attacked on three flanks by tanks. Elliott disobeyed orders and exercised his own initiative, saving his platoon from certain capture or death. Under heavy tank, machine-gun and shell fire, Sergeant Elliott led his men to the cover of a ridge 300 yards away, during which he sustained a chest wound.

Here he re-formed his troops and led them to a dominating ridge a further 500 yards away where they came under enemy machine-gun and mortar fire. He located enemy machine-gun posts on his front and right flank and while one section attacked on the right flank, Sergeant Elliott led seven men in a bayonet charge across 500 yards of open ground in the face of heavy fire and captured four enemy machine-gun posts and an anti-tank gun, killing a number of the enemy and taking fifty prisoners.

His section then came under fire from a machine-gun post on his left flank. He immediately charged this post single-handed and succeeded in capturing it, killing several of the enemy and taking fifteen prisoners. During these two assaults he sustained three more wounds in the back and legs.

Owing to Sergeant Elliott's quick grasp of the situation, great personal courage and leadership, nineteen men who were the only survivors of 'B' Company of his battalion captured and destroyed five machine-guns, one anti-tank gun, killed a great number of the enemy and captured 130 prisoners. Sergeant Elliott sustained only one casualty among his men and brought him safely back to the nearest advanced dressing-station.

Ultimate Sacrifice

At Saipan, Mariana Islands, June 19th, 1944, Sergeant Thomas Baker's company was held up by fire from automatic

weapons and small-arms fire from strongly fortified enemy positions that commanded the view of the company. Sgt. (then Pvt.) Baker voluntarily took a bazooka and dashed alone to within 100 yards of the enemy. Through heavy rifle and machine gun fire that was directed at him by the enemy, he knocked out the strong point, enabling his company to assault the ridge.

Some days later while his company advanced across the open field flanked with obstructions and places of concealment for the enemy, Sgt. Baker again voluntarily took up a position in the rear to protect the company against surprise attack and came upon two heavily fortified enemy pockets manned by two officers and ten enlisted men, which had been bypassed. Without regard for such superior numbers, he unhesitatingly attacked and killed all of them. Five hundred yards farther, he discovered six men of the enemy who had concealed themselves behind friendly lines and destroyed all of them.

On July 7, 1944, the perimeter of which Sgt. Baker was a part, was attacked from three sides by from 3,000 to 5,000 Japanese. During the early stages of this attack, Sgt. Baker was seriously wounded but he insisted on remaining in the line and fired at the enemy at ranges sometimes as close as 5 yards until his ammunition ran out. Without ammunition and with his own weapon battered to uselessness from hand-to-hand combat, he was carried about 50 yards to the rear by a comrade, who was then himself wounded. At this point Sgt. Baker refused to be moved any farther stating that he preferred to be left to die rather than risk the lives of any more of his friends.

A short time later, at his request, he was placed in a sitting position against a small tree. Another comrade, withdrawing, offered assistance. Sgt. Baker refused, insisting that he be left alone and be given a soldier's pistol with its remaining 8 rounds of ammunition. When last seen alive, Sgt. Baker was propped against a tree, pistol in hand, calmly facing the foe. Later Sgt. Baker's body was found in the same position, gun empty, with 8 Japanese lying dead before him. His deeds were in keeping with the highest traditions of the U.S. Army.

For Courage and Compassion

On the afternoon of June 9th, 1866, a railway train from Quebec stopped at Danville. Locked in converted boxcars were 800 German immigrants. In another boxcar was 2000 pounds of ammunition for use against the Fenian raiders, and it was Private Timothy O'Hea's job along with four other men of the 1st Battalion Rifle Brigade to guard.

Late in the afternoon, O'Hea noticed that the boxcar containing the ammunition was on fire and after shouting an alarm, discovered the railwaymen and other soldiers had fled. O'Hea grabbed the keys to the boxcar from a dithering Sergeant and climbed aboard. He ripped burning covers off ammunition cases and tossed them outside, then, making nineteen trips to a creek for buckets of water, he fought the flames for almost an hour. The immigrants cheered him on, unaware of their peril.

Timothy O'Hea fought on alone and was victorious. By evening, the ammunition had been loaded into another car and the train -- immigrant coaches still attached -- was on its way again. O'Hea not only displayed great courage and total disregard for his own life in putting out the fire in the boxcar, but also saved 200 immigrants from certain death had the ammunition exploded. He received the only Victoria Cross ever won in Canada.

Hazardous Duty

In central Asia Alexander the Great was confronted with an unassailable fortress atop the Sogdian Rock -- protected on all sides by vertical cliffs. The leader, Oxyartes, mocked Alexander saying that he would need "men with wings" to be able to take the fortress. That night Alexander sent up 300 of his most experienced mountaineers to climb the cliff-face in the darkness -- an exceedingly difficult climb even during the day. 90% of the men completed the treacherous ascent. The next morning Alexander told Oxyartes that he had found his "men with wings" and told him to look on the rocks above him. Oxyartes surrendered without a fight.

Innovation and Courageous Defiance

During the Jewish revolt of 66-73 AD future emperor Vespasian was sent by Nero to put down the uprising. In early May 67AD a Jewish governor named Joseph ben Matthias slipped into the besieged city of Jotapata -- the strongest fortress in all Galilee -- only days before the Romans cut off all access. Roman atrocities had already terrified Joseph's men and most of his army had deserted him.

As soon as Vespasian heard that Joseph was in the city he attacked. Joseph responded with a vigorous counterattack which surprised the Romans, forcing them to withdraw. Subsequent attacks were repulsed for another five days. Vespasian realized that he was making no headway and settled down for a protracted siege.

Vespasian's engineers began construction of a platform against the approachable section of the city wall, protected by wooden hurdles and screens. Joseph's garrison hindered the Romans by hurling down giant rocks and pelting them with many missiles. Vespasian responded by bringing forward his archers and artillery -- the deadly rain of missiles prevented any Jew from manning the city wall. It seemed that they could do nothing as the platform inched higher and higher.

Joseph then organized guerilla parties and sent them screaming down on the Romans to tear down the screens -- exposing the workers to Jewish missiles. During the chaos the guerillas broke up the platform and hurdles and set everything on fire. Vespasian responded by linking a new set of hurdles together to remove the guerillas' avenue of attack. Work on the platform could begin again unhindered by further raids.

Realizing that he could not prevent the platform's construction Joseph built an ingenious protection screen -- behind which his workers could build up Jotapata's walls in safety. The wall consisted of railings fixed to the wall upon which were stretched raw ox hides. This screen proved remarkably resistant to Roman missiles. The huge stones from catapults failed to split the springy hides and arrows glanced off harmlessly. Firebrands failed to ignite because of the moisture in the raw skins. Thus shielded, the Jews raised the wall another 30 feet, built towers on it at short intervals and added a strong parapet -- all while under attack.

When the Romans saw this they became demoralized, thinking they would never take the city. Joseph noticed this and launched a daring night sortie. The Romans, caught unprepared, were sent reeling. The victorious Jews plundered the camp and set fire to all Roman works. Vespaian, disheartened and disgusted as his platform once again went up in flames, recalled his men and decided to blockade the town until it was starved into capitulation.

Water was scarce and the city would soon have to surrender. Joseph orchestrated an incredible deception. He ordered several men to soak their garments as if washing them and hang them on the outer wall to dry, so that the whole wall ran with water. Vespasian believed this apparently abundant supply of water, and concluded that Jotapata could hold out indefinitely. He immediately ordered a resumption of the assault.

The Romans constructed a ramp over the city's protective ditch and rolled a siege ram onto it. The ram was overlaid with hurdles of hide to protect the troops. Roman archers prevented the Jewish defenders from manning the parapet to attack the siege ram. Joseph's response was to have sacks filled with chaff and lowered them by ropes to the spot where the ram head would crash, thus cushioning the ram's blows. The Romans countered with sharp hooks on long poles to cut the ropes.

In desperation Joseph organized another sortie. He armed his men with timber coated with bitumen, pitch and brimstone. With these new flammable weapons they charged out. There was terrible fighting but the desperate Jews hurled themselves at the Romans. When Vespasian was wounded by an arrow in the foot the Romans retreated again in disorder. Ignoring the pain, Vespasian was soon hobbling about, taking command, and narrowly prevented a rout. As night fell the Jews retired to the city. Once again the Roman camp and siege works were in flames.

Joseph was dismayed when, only hours later, another Roman ram was crashing into the great wall of Jotapata. In the pre-dawn hours of the 29th day of the siege, the wall was finally breached. Vespasian retreated and waited for daylight. Joseph put the old and the wounded on the undamaged segments of the wall. The rest he placed at the gaps, leading the defense personally. He knew that the Romans would initiate the assault with a barrage of arrows so he ordered his men to bend beneath their shields and plug their ears against the terrifying Roman battle cry.

The missile attack came but the Jews were protected by their shields. The Romans surged forward with their dreadful battle cries. The Jews, unhearing and undaunted, met them with calm determination.

The Romans were nearly upon the wall when Joseph revealed his final scheme. He had his men pour cauldrons of boiling oil upon the advancing Romans. The elite troops broke ranks and retreated. (Note: this was the first recorded use of boiling oil as a weapon.) When the Romans regrouped and charged again Joseph poured boiled hay onto the gangways making them too slippery to stand upon. Those who fell off were quickly dispatched.

Once again Vespasian recalled his decimated troops. During this time the news of Jotapata's resistance spread like wildfire sparking uprisings in other cities. Vespasian dispatched legions to deal with them.

It took another 11 days for Vespasian to capture the city. He rebuilt his platform again. This time he also erected three towers more than fifty feet high and overlaid them with iron -- rendering them fireproof. On the 40th day of the siege Jotapata finally fell after many days of bloody hand to hand fighting. 40,000 Jews died that day and 1,200 sold into slavery. Many of Joseph's friends and picked soldiers committed suicide.

So ended a titanic battle of wits between two great military commanders. Joseph ben Matthias was eventually taken captive but was freed by Vespasian after he became emperor. He ended his days living in Rome as a private citizen.

[Children of Fire](#)

Published by [Methods in the Madness](#)

Written by Erich Wambach

60 pages, free

When you think about the typical roleplaying game made available over the Internet for free the thing that springs to mind is that it is, above all else, *free*. Because there is no serious investment necessary to present the material to us we see a cascade of secondary effects as the standard norm: Poor presentation. Poor artwork. Questionable system design. Lots of rehashed ideas. Little research. Less development. No support.

If we wanted to generalize a little more we'd note that most freebies are one-man shows, and, thus, even if something stands out for some reason, it will usually never stand out in more ways than one or two. You might get a good artist, but what are the odds of them being a good writer? And if they happen to be both, how likely is it they're going to be good at system design, too?

So the odds are against you when you start surfing around looking through these freebies. But there *are* a lot of diamonds out there -- and not all of them are in the rough. What you need is a little guidance to point you in the right direction. . .

Which brings us to *Children of Fire* (available online from http://www.mimgames.com/cof).

The first thing you'll notice when you go to the webpage are the lavish illustrations which accompany the text. While lacking substantial content, the richness of visual design which supports the skillfully utilitarian lay-out of text and information not only supplements the writing (while not overpowering it or distracting from it), but also lets us begin checking things off of our mental checklist: Good presentation. Strong artwork.

Is there anything lying beneath this visual feast, though? Or are we looking at a shiny apple with a rotten core?

The central concept of *Children of Fire* is that the PCs are angels (the Children of Fire) sent to Earth to protect humanity (the children of clay) -- both from itself, and from other supernatural forces (including the obvious fallen angels, but also the Grigori, the Anakim, the Nephilim, and human Sorcerors). This is territory which has been well-covered before, so the key question really becomes whether or not *Children of Fire* succeeds at bringing anything new to the arena: It does.

The problem a game of angels has is that, when you get right down to it, angels -- as they are understood today in popular culture -- are simply not interesting characters to play. An interesting character is a flawed character -- a character who has to struggle against themselves as much as an exterior foe. Angels, on the other hand, are perceived as perfect beings who wander the universe doing nothing but good. Thus a typical game of this nature will have players taking on the roles of lost or even fallen angels, or it will "modernize" the angels by sullying them in one way or another.

Ironically, *Children of Fire* avoids the problems which typically lead to "modernization" by simply turning back the hands on the clock. Instead of adopting the cliches of today, *CoF* opts to base its setting on the rich mythology which was understood in ages past, but which has been lost in the gloss of the 20th century. Backed up with an array of solid research, Erich Wambach (the author) succeeds at bringing a very different look to some familiar territory. The nine choirs are flawed creations, but even in their imperfection they are viewed with awe and fear by the bulk of humanity.

So, we have some fresh ideas which are backed up with strong research. We can knock a couple more slots off of our checklist. What about system design?

Children of Fire uses a simple, relatively loose, set of rules based around a fairly standard 2d10 mechanic (roll the dice, add a score from the character sheet, compare to a difficulty number set by the nature of the task and the GM). This is a good fit for the material, amply covering the broad nature of angelic abilities.

Character creation is a ten step program, but focuses primarily on the assignation of points to various Aspects (Knowlege, Understanding, Power, Vigor, and Glory -- which are roughly equivalent to Attributes in most games) and Virtues (Justice, Prudence, Temperance, and Fortitude -- which are a mapping of the angel's moral make-up). This entire system, while bearing semblance to a typical set of character creation rules, actually emphasizes the utterly alien nature of angels. The fact that angels are quantified in ways which are completely different from the ways in which humans are quantified is a subtle, but powerful, game design tool.

Those are the strengths. Now, what are the weaknesses? The primary failing of *Children of Fire* is a lack of depth. There are only sixty pages of material in the basic book and certain elements of the background material read more as introductory pamphlets, rather than a solid tour guide. On the other hand, *Children of Fire* is receiving continuing support (a supplement, *Children of Clay*, is already available) -- and I expect to see the setting appropriately fleshed out. This wouldn't be acceptable if I had paid $20 or $30 for *Children of Fire*, but I didn't -- and the free nature of *CoF* allows its creators to take an approach that wouldn't work under different circumstances.

There are also some flaws in the general presentation of the material. Although the website itself is graphically rich, the PDF file available for download is not (I would have preferred the option of downloading a larger PDF which contained the graphics). Proofreading is sadly lacking, and the text is replete with typos, homonyms, and other errors (for example, the book can't quite figure out whether it wants 250,000,000 angels or 250,000 angels). The prose occasionally becomes stilted and awkward, a problem compounded by the occasionally condescending and annoyingly self-righteous implications of "this is the way you're *supposed* to game."

Those problems aside, *Children of Fire* is definitely worth taking the time to check out: A simple, effective system coupled to a setting with a lot of potential.

Glorantha: Introduction To The Hero Wars

Published by [Issaries, Inc.](#)

Written by Greg Stafford and Peter Metcalfe

256 pages trade paperback size, $19.95

Fans of the long established fantasy world Glorantha have been waiting with bated breath (if you can wait with bated breath for years) for the release of a new role-playing system for it, to replace the venerable but still very usable *Runequest* system which vanished from print in a flurry of legal complications when Chaosium who created *RQ* parted company with Avalon Hill who had the publishing rights to it some years back. To be out of print for years and still to maintain a solid base of fanatical admirers is something that only Glorantha and Tekumel have been able to do in the world of role-playing. So the return of the world with a new game-system and a new publisher is something we've all been hoping will revive the fortunes of Glorantha-philes everywhere.

My reaction to the new *Hero Wars* game (which I'll let someone else review) has been slightly (well, more than slightly) ambiguous. Perhaps I'm just a middle aged reactionary yearning back to the joyful gaming memories of my youth, who can say? I'm a lot happier with Issaries second product. The last time a comprehensive guide to this world was attempted was 1988 when Avalon Hill brought out *Glorantha: Genertela* and that only tried to cover the northern continent. This attempts in a mere 256 pages to give a quick once over to the entire world. Of necessity it's brief but it is enough to spark the appetite of anyone interested in world design and has enough little bombs of previously undisclosed information to keep the Gloranthan enthusiasts happy too. (Harshax is one of the *Pharaoh's* titles? Does that mean he really is a time traveller? *What* Kralorelan mystics in Dragon Pass?) Each of the major countries and cultures gets a chapter and there is even a brief tour of the Outer World where Gods and Heroes are the common citizens and an outline of "upcoming events."

The book is pure background. You don't need to have read *Hero Wars* to enjoy it and it will doubtless be mined by people who still use *Runequest* to explore Glorantha and even by those interested in designing their own world who will never use the world in their own games. From the Sky Dome up above to the street-sellers on the Bridge of Light and No Light, from the blackest pits of Hell to the Ducks dodging zombies in the Upland Marsh you can use this book as an example of the best of creating myth, history, culture and geography, with a macrocosm and microcosm that fit one another.

However, neither production values nor organisation are as good as for Glorantha: Genertela. The artwork is, in my opinion, slightly better than that of *Hero Wars* and the lower standard of print and proof-reading may be forgiven since Issaries does not have the financial resources that Avalon Hill did. The lack of organisation is less easy to make allowances for. Again, as with *Hero Wars*, there is no index: something I find a little incredible in the age of electronic publishing. And chapters follow each other in an order that I found confusing. Why is there a chapter on Western monotheist culture after the first of the chapters about the countries of the West? Why are the chapters about the Elder Races scattered about the book?

Newcomers may find it less than totally helpful as an introduction in no small part because the "in-character" parts of the material, written as though by members of the various cultures are not clearly separated from the more "objective"

(or to use the Gloranthan term "God-Learner") descriptions. And in places the little Gloranthan in-jokes (like the fact that the name Gbaji or "Deceiver" is applied to both the god Nysalor and to his assassin Arkat) may confuse the uninitiated. Hopefully more people will be intrigued than are confused.

Issaries have chosen to release *Hero Wars* and its related products in Trade Paperback form in the conviction that this will allow them to break into the mainstream bookstores. I personally don't mind such a format so much for this book which is pure source material but I somewhat doubt its utility for game books which suffer a lot more hard treatment and need to consulted far more frequently. I can see my *Hero Wars* books breaking their backs quite early.

But if you want to play in Glorantha, buy this book. It's not expensive and it will allow you to fit the upcoming culture books into the world, and the parts into the whole. If it doesn't quite qualify as an Introduction, it is still worth the price of admission. (Hint to Issaries: Include the Frequently Asked Questions you're going to get in the second printing. Along with an index, pretty please.)

-- Michael Cule

Pyramid Review

The Vortex of Madness and Other Planar Perils (for AD&D)

Published by [Wizards of the Coast](#)

Written by Chris Pramas

96 pages, $17.95

The Vortex of Madness and Other Planar Perils is a set of five separate but linked adventures set in the outer planes. The adventures are designed to be separated from one another or run together -- more on that below. The cover proclaims that these adventures are "For High Level Heroes!" -- but there are no recommended levels to be found within. My estimation is that you would want to be at least 9th and probably at most 14th level to adventure in these areas -- lower level adventurers will not have the spells and abilities to handle the challenges within. Adventurers of much higher levels would need to have the challenges boosted in power to give them a run for their money.

Adventures are structured as more than just "dungeon crawls" -- encounters are not just monsters to fight, although they are completely statted out if the inevitable ensues. The adventures themselves present five unique areas for PCs to explore:

- "The Vortex of Madness" -- A magical prison in Limbo, holding a prisoner whose name is known to AD&Ders clear back to owners of *Eldritch Wizardry*. This mind-warping location provides a tie-in adventure to connect all of the other locations together.
- "The Citadel of Gith Reborn" -- A fortress on the Astral Plane containing rebellious Githyanki fighting to overthrow the lich-queen that rules their race. It presents opportunities for PCs to interact with Githyanki in a most unusual way -- peacefully.
- "Leonis" -- A tiny demiplane inhabited by a wizardly DaVinci and his creations. Here, function follows form, and unlikely machines work due to the magic and willpower of the wizard. Mechanical war machines and great wooden birds with clockwork engines roam the plane on behalf of their creator.
- "The Black Acropolis" -- A scheme by two titans seeking to free themselves from Tarturus, where they (and their ruler Cronus) where imprisoned ages ago by Zeus. PCs can aid or stop the attempt, which has more behind it than even the Titans suspect.
- "The City of Glass" -- an underwater metropolis on the Elemental Plane of Water. The city is divided into quarters ruled by individual races -- marids and jann, sea elves, humans, dwarves, and more. The city is a neutral zone for aquatic races, a place where enemies can gather to negotiate or trade. The City of Glass can easily become, or start as, a base for aquatic adventurers exploring the Elemental Plane of Water.

Each section contains:

- A random encounter table. Not just a "2-8 orcs" type of table, these contain terrain hazards, odd occurrences, and run-ins with the special creatures or situations that make the planes what they are.
- Descriptions of the effects of the specific plane on magic, with enough detail to need no additional books.
- The effects of travel to the plane on PCs.
- Major Inhabitant sections detailing the major NPCs of the area
- Monster descriptions are separate from the text -- they are boxed in one place per adventure making it easy for a GM to find stats he will need.
- Maps -- the maps are fairly small, but contain more than enough detail for the adventure at hand.
- Suggested ways to use the adventure -- everything from off-the- cuff Teleport failures to a planned encounter.

The tie-ins to the Vortex of Madness adventure are not seamless -- they almost seem tacked on afterwards (although it does have an interesting spin on the "sent on a quest for an artifact" gag.) This has its plusses and minuses. On the plus side, they give the GM a structure to work with but are easy to remove if you want to use an adventure separately. On the minus side, it takes some extra work on each of the adventures to make them fit with the meta-adventure.

This leads to the biggest (though still small) flaw in the supplement -- the adventures really need a reason for PC involvement. They cannot just be plugged in to a campaign. A GM will have to carefully fit the adventures to a group of PCs, tailor the reasons and challenges to them, and plan in advance. This is a flaw in a book of pre-written adventures, although GMs would probably want to take all of the steps I listed with any adventure.

The various adventures contain pointers to other *AD&D* supplements that could be useful -- the ***Manual of the Planes***, ***Planescape***, the ***Tome of Magic*** -- but do not require them. The references show you where you can go for more information but gives you move than enough to work with without it. This is of great aid to a GM lacking the supplements -- some out of print -- while it does not print so much that the supplements themselves would not add to the adventure.

Even at $17.95 and 96 pages, it felt like a good deal. The text is dense, although each page is headed with a 1 1/4" illustration -- reducing the actual text-per-page down. I bought the supplement to use with ***GURPS*** -- at least a basic familiarity with ***AD&D*** (either 1st or 2nd edition) is needed to use ***Vortex*** with another system.

-- Peter V. Dell'Orto

Episode One: The Phantom Profits

Where were you last year on May 19th? If you were like me, (and thousands of others) you were in line to see *Star Wars Episode I: The Phantom Menace*. It was, without a doubt, one of the most highly anticipated films of all time. Speculation ran high that it would be the most successful movie of all time. In Hollywood, success comes not only at the box office, but also in licensing income. Many merchandising pundits predicted that *The Phantom Menace* would exceed all previous measures for secondary income. Lots of them staked their reputations and millions of their companies' dollars on that prediction. However, when the film finally premiered, many fans were disappointed. Jar-Jar Binks was the proximate cause for many unhappy Star Wars fans, but the floppy-eared one was hardly the only thing that led to the film's failure. But did George Lucas deliver a failure, or were the biggest mistakes made by those who ordered too many Jar-Jar soap dispensers? Now that a year has passed, we can look at this question from a business perspective in this month's offering: Episode One: The Phantom Profits. Gamers are often also science fiction fans, so let's take a look at the markets which gamers are most familiar with: the film itself, the food & beverage industry, publishing, and toys & games.

By the time the film saw its first showings, Lucasfilm had spent $115 million dollars. That included all aspects of the film's production such as actors' salaries, Lucas' writing and directing fees, and set construction (which although built only as high as the actors' heads, was nevertheless $150,000 over budget due to Liam Neeson's 6' 4" frame). Even taking into account the fact that the cinema keeps a significant portion of a ticket's price, and that promotional expenses generally recoup themselves in advance of the production receiving any money, the $431 million that the film grossed in its US release (most of any film in 1999, and third on the all-time list, behind only *Titanic* and the *Star Wars: A New Hope*) *The Phantom Menace* made a nice profit for Lucas (who funded the entire production out of his own deep pockets). In addition, the film went on to rake in over $350 million overseas, all before the video release, which in its first 90 days of release has generated another $41 million in rental income. This doesn't even include sales in the home video market, or the income from the DVD release which will be either sometime next year, after all the three films have been completed, or never. . . depending on which commentator you choose to believe. The soundtrack album by John Williams had a first pressing of over 1 million copies, the largest first pressing ever for a soundtrack. By purely business standards, the film alone was a great success.

Still, with the original trilogy accounting for over $4.5 billion in licensing income, one might expect that Lucas' income from the film would be only a fraction of his ultimate benefit. So one finds. Just before the Special Edition films went into release, PepsiCo (which at that time encompassed not only Pepsi, Diet Pepsi, and Mountain Dew, but also Frito-Lay, and the trilogy of fast food restaurants: Taco Bell, KFC, and Pizza Hut) announced that they had bought the world-wide food and beverage tie-in rights for the Special Editions and all three prequels for a whopping $2 billion. Soon thereafter, PepsiCo spun off its fast food franchises and its bottlers into separate companies. Shortly before the premiere of *The Phantom Menace*, the stock for the three fast-food companies, Tricorn Global Restaurants (NYSE: YUM) was trading at over $70/share. Today it is less than $30. It cannot be conclusively shown that it was due to the failure of their $50 million "Defeat the Dark Side" promotion, but the precipitous drop in the stock price sure is suspicious. The other two branches of the PepsiCo Empire also took serious hits in the later part of the year after holding their value through much of the summer. Nevertheless, these two companies are back on their feet; both are near their 52-week highs. Tricorn continues to languish near its 52-week low, despite their announcement earlier this month that Taco Bell had signed on to do a new promotion with the TV show *Digimon*.

On the publishing side of the licensing picture, the terrain is wide and varied. Books related to *The Phantom Menace* touched every subject including the rather surprising *Star Wars Cookbook: Wookiee Cookies and Other Galactic Recipes*. (Can't say if the food is any good, but the Princess Leia Danish Dos and Boba Fett-uccine sound . . . interesting.) Of course, there was the inevitable novelization of the screenplay by Terry Brooks that was a less-than-stellar adaptation of the film. It was a New York Times #1 Best Seller nonetheless, and Ballantine books plans to publish 25 books under its licensing agreement before 2006. R.A. Salvatore, who has been writing in the *New Jedi Order* series for practice, will pen Episode Two's novelization. It will appear concurrently with the release of the next film in 2002. The big news in publishing was the disastrous effect on the British publishing concern Dorling Kindersley, also knows as DK Books. They publish some very well known and well loved titles for children and adults

including the *Eyewitness to History* series and *Sister Wendy's Story of Painting*. They also did several excellent *Star Wars* books, including the *Visual Dictionaries* and the *Incredible Cross-Sections* books. They terrified investors earlier this year, however, when they announced that they had made a horrible mistake in estimating the popularity of *Phantom Menace* merchandise. Their inventory at year's end included over 10 million unsold books based on *The Phantom Menace*, resulting in a loss of over $38 million in the second half of 1999, compared to a more than $7 million profit for the same period in 1998. Publishing giant Pearson, which also owns Penguin Books, recently bought the DK and plans to keep the company going. Needless to say, company chairman and co-founder Peter Kindersley will be taking a smaller role in the day-to-day operations going forward.

Toys and Games ought to have been *The Phantom Menace*'s most successful segment. After all, recent estimates have put the value of a complete collection of *Star Wars* memorabilia from *Phantom Menace* and the first trilogy at more than $100,000. But there will have to be very many collectors to support the huge licensing fees (reportedly 20%, far more than the industry standard) which companies like Hasbro paid for *Episode One* toy contracts. Licensing industry insiders report that Hasbro so wanted the toy licenses for *The Phantom Menace* that in addition to acquiring Micro Machines manufacturer Galoob (for $220 million in 1998) thereby uniting all the licensing for figures over 2" tall (under that height belongs to Lego, natch) Hasbro CEO Alan Hassenfeld allegedly attended the pitch meeting dressed as Obi-Wan Kenobi. Some industry analysts have estimated that Hasbro paid over $250 million in licensing fees to Lucas even before the film came out. The total value of the ten-year contract could easily top $600 million from Hasbro alone. The deal has not entirely worked out well for Hasbro's stock price. It has fallen to around $16/share from a pre-*Phantom Menace* high of $37. But manufacturers weren't the only people taking a chance on *Phantom Menace* merchandise. Retail monster Wal-Mart reportedly bought $500 million dollars worth of merchandise that they planned to stock in nearly half of its departments. Toys "R" Us' order reportedly filled 700 trailer trucks. Many of those toys went unsold.

On the adventure gaming side results were more positive. Due to the unfortunate failure of West End Games in 1998, there were no roleplaying supplements based specifically on *The Phantom Menace*. As a result, it cannot really be said whether or not players would have enjoyed *Episode One* as a roleplaying environment. But the tabletop roleplaying is not the only kind of gaming there is. In the card gaming segment, the **Young Jedi CCG**, based on *The Phantom Menace* and published by Decipher, started strong and has continued to show solid growth with supplements such as "Menace of Darth Maul" and "The Jedi Council." Computer games based on *The Phantom Menace* characters continue to be released. Some of the upcoming games for PC and Playstation include a pod racing game in the same vein as "Mario Cart," and a flight sim much like Rogue Squadron and X-Wing fighter. These games are, however, more solid genre games and may not suffer as much from a backlash against the film. Success in the adventure and computer gaming market may mean that more attention will be paid to games in the future.

Still, Hollywood often has a short memory and the common refrain of "What have you done for me lately?" can cut both ways. Films can be a "forgive and forget" industry and you can bet that whatever mistakes were made surrounding *Phantom Menace* merchandise won't dampen enthusiasm for products based on the as-yet unnamed *Episode Two*. Hasbro subsidiary Wizards of the Coast's upcoming **Star Wars** roleplaying game should go a good deal of the way towards redeeming *Star Wars* as a viable licensing option in the gaming industry.

Clearly, the big winner was George Lucas himself. Whatever the risks were in producing licensed products, he did not shoulder much of it. The 1999 Forbes 400 Richest Americans lists him at #92 with a net worth of $2.5 billion. The year 2000 Celebrity 100, which takes power as well as cash into account, lists him at #2 (second only to Julia Roberts). Though there may have been many losers in *The Phantom Menace* sweepstakes, George Lucas was the big winner.

Suppressed Glossary

"Among the items examined were samples of triangular coins, names inscribed on old rings, images painted on a pitcher of salt, diplomatic correspondence, portraits of writers in which all the book titles etched in the background were transcribed, reports from spies, testaments, voices of Black Sea parrots thought to speak the extinct Khazar language, painted scenes of music-making (from which musical annotations drawn on score books were deciphered), and even a tattooed human skin . . . And all this was collected between the covers of one dictionary."
-- Milorad Pavic, *Dictionary of the Khazars*

This should get us all started off nicely enough. As we pile Pelion atop Ossa in our quest for ever-Higher Weirdness, I tend to reach for some familiar tools to help the ascent. Often, I've written columns about some of them; in other cases, I've just assumed everyone would pick it up as they went along. Either way, once I've started mentioning, say, the Airship of 1897, I tend to simply drop it in rather than restate its majesty and weirdness again and again. So, in the interest of avoiding the replication of effort, I've begun assembling a Glossary of key terms (or at least oft-repeated ones) that will hopefully help new readers climb on board without boring the old eliptonic hands silly. For each entry, I've tried to compress the Crucial Knowledge down to a sentence or two, with a page reference (p. STi00) to the first compilation (***Suppressed Transmission: The First Broadcast***), any relevant ***GURPS*** books, and a source for further reading and investigation for those siezed by the desire to Know More. Feel free to write in to the boards, or to me, or to the editor with suggestions for expansion, and maybe I'll do another column, or maybe the Pyramid Masters will simply create a Special Page for this stuff and we can all help pad it out together. Excelsior!

Ahnenerbe: The Nazi SS "Ancestral Research" division, which carried out a great deal of well-documented research into magic, the occult, and the paranormal. See pp. STi34 and STi80, or *Unholy Alliance* by Peter Levenda.

Airship: When capitalized, refers to the cigar-shaped UFO sighted across the American West in 1896-1897. See pp. STi43-45, p. TI114-118, or *The Great Airship Mystery* by Daniel Cohen.

Androgyne: Combining male and female; the "Mystic Androgyne" represents the Philosopher's Stone, and "Chymical Wedding" (between Red and White, or Sun and Moon) is a major element in alchemy and Rosicrucianism (q.v.). Androgyny has magical significance in many traditions. See p. STi38, or *Alchemy* by Titus Burckhardt.

Antarctic Space Nazis: Nazi UFO pilots based out of Antarctica or a Hollow Earth accessible therefrom, according to some UFOlogists. Possibly the same as the Nordics (q.v.). See pp. STi77-80, or *Subterranean Worlds* by Walter Kafton-Minkel.

Arcadia: A region of central Greece; later the poetic, pastoral "Earthly Paradise," an unspoiled, peaceable, holy kingdom. A major theme in Rosicrucian (q.v.) imagery, especially the phrase Et in Arcadia ego; "I (death or mortality) am also in Arcadia." See p. STi41, or *Holy Blood, Holy Grail* by Michael Baigent, Henry Lincoln, and Richard Leigh.

Bavarian Illuminati: See Illuminati.

Bisociation: Simultaneous (or interlocked) perception of a thing, situation, or idea in two self-consistent but fundamentally incompatible frames of reference. The Key To It All. See pp. STi108-111, or Arthur Koestler, *The Act of Creation.*

Black Ops: Truly Badass alien-hunting action heroes. See ***GURPS Black Ops***, by Jeff Koke and S. John Ross.

Dee, John: (1527-1608) Court astrologer, mathematician, cosmographer, and possibly spy for Elizabeth I. Encouraged scientific-philosophical research and advances in navigation and exploration. All this and angel-magic, too. See p. STi11, pp. WWi68-69, or *John Dee* by Peter French.

Forteana: Unclassifiable (almost by definition) weirdness; things that should not be, named for madcap researcher Charles Fort (1874-1932). The rain of carp from a clear sky is the archetypical Fortean event. See pp. STi112-115,

WT104, or *The Books of Charles Fort.*

Frazer, Sir James George: (1854-1941) Folklorist and anthropologist who popularized the archetype of the sacred king and the general notion of the evolutionary relationship of all myth and ritual in *The Golden Bough.* See that work, p. STi96, or the alternate history novel *King of the Wood* by John Maddox Roberts.

Golden Dawn, Hermetic Order of the: Founded in London in 1887 by William Wynn Westcott, the Golden Dawn became a pre-eminent ritual magic study group, with membership including W.B. Yeats, Aleister Crowley, Arthur Machen, and others. The Order splintered repeatedly after 1900. See p. STi44, or R.A. Gilbert's *The Golden Dawn.*

Graves, Robert: (1895-1985) Poet, novelist (*I, Claudius*), and mystical theorist much influenced by J.G. Frazer (q.v.), using whose ideas he compiled *The Greek Myths.* See p. STi63, or Graves' own *The White Goddess.*

Greys: By now, the "default" alien type in the Western world, thanks to Spielberg, Strieber, and *The X-Files.* The Greys are most often associated with Roswell and elements of the Coverup (cf. Majestic-12). See p. STi81, pp. BO84-88, or Whitley Strieber's *Communion.*

Hermes Trismegistus: (in Greek, Trismegistos) Greco-Egyptian syncretic figure based on the deity Thoth-Hermes, supposedly the author of all magical (or "hermetic") knowledge. His Emerald Tablet contains all wisdom. See p. STi16, p. WT42-43, or the translation of "his" *Hermetica* by Walter Scott.

Illuminati: In general, any group of conspiratorial Secret Masters claiming special knowledge, or "illumination." In specific, the pseudo-Masonic Order of the Bavarian Illuminati founded by Adam Weishaupt (q.v.) on May Day, 1776, along with its hypothetical antecedents and descendants. See pp. I5-8, or Arkon Daraul's *A History of Secret Societies.*

Kabbalah: Mystical Judaism, specifically (in this case) the insight that the Divine Creation is expressed in the numerical patterns of the world, primarily in the numerological values of the Hebrew alphabet, specifically the Torah. See p. STi113, *Godwin's Cabalistic Encyclopedia* (for the quick-and-dirty version), or Gershom Scholem's *On the Kabbalah & Its Symbolism* (for the more mystical version).

Lemuria: Originally, the speculative lost continent in the Indian Ocean proposed to explain how lemurs made it from India to Madagascar. Lemuria has, by now, been conflated with "Mu," the even more imaginary lost continent beneath the Pacific Ocean. See p. STi89, pp. PM13-14, or L.Sprague de Camp's *Lost Continents.*

Ley Lines: Usually invisible, usually straight, lines of magickal (or spiritual, or ch'i, or telluric-magnetic) energy connecting ancient sites, monuments, or power vortices. See p. STi55, pp. PM25-27, or Francis Hitching's *Earth Magic.*

Majestic-12 (MJ-12): The alleged secret government conspiracy established by President Truman in 1947 to cover up, exploit, and study the UFO problem following the Roswell crash. See pp. STi26, pp. Y42-43, pp. WT68-71, or *Top Secret/Majic* by Stanton Friedman.

Merovingians: The ruling dynasty of France between 481 and 755 A.D., whose mystical "water-born" Bloodline (down to the present) has been associated with that of Christ and/or ultraterrestrials. See also Prieuré de Sion; and p. STi119, pp. I57-58, or *Holy Blood, Holy Grail* by Michael Baigent, Henry Lincoln, and Richard Leigh.

Nommos: A race of demigods in Dogon tribal lore; hence the amphibian, possibly Reptoid (q.v.), aliens from Sirius (q.v.) the myths of said demigods refer to. See p. STi58, or *The Sirius Mystery* by Robert K.G. Temple.

Nordics: An angelic-appearing alien, or ultraterrestrial (q.v.) often encountered by UFO contactees in the 1950s and 1960s; so-called because of their height, white skin, and blond hair. They may be shapeshifted Reptoids (q.v.). See p. STi82, pp. AH44-51, or *Extra-Terrestrial Friends and Foes* by George Andrews.

Pole Shift: A sudden, catastrophic alteration of the Earth's axis. Such a Pole Shift is symbolically used to mark the end of the Golden Age, leading some to speculate that a Pole Shift drowned Atlantis, et al., and will eventually destroy our

civilization. See pp. STi53-55, or *Arktos: The Polar Myth in Science, Symbolism, and Nazi Survival* by Joscelyn Godwin.

Prieuré de Sion: Also known as the Priory of Sion (or Zion), a secretive order supporting mystical monarchy in Europe, often tied to the Grail, the Templars, and/or the bloodline of Christ. See p. STi41, I60-62, or *Holy Blood, Holy Grail* by Michael Baigent, Henry Lincoln, and Richard Leigh.

Reptoids: Also Nagas, or Saurians; these reptilian ultraterrestrials are only occasionally contacted in UFOs but may have been secretly manipulating human history from the earliest times. See p. STi82, or *The Biggest Secret* by David Icke.

Rosicrucianism: A complex of alchemical images and mystical concepts centering around the "Rosy Cross." A series of pamphlets between 1614 and 1616 invited Europe's elite to apply for membership in the ancient, secret, and invisible Rosicrucian Order. See *The Rosicrucian Enlightenment* by Frances Yates.

Saint-Germain, le Comte de: (1710?-1784) A wandering impostor, charlatan, and/or Ascended Master in Enlightenment Europe who claimed to possess alchemical powers and (perhaps) immortality. See pp. STi67-69, pp. WWii70-71, or the novel *Foucault's Pendulum* by Umberto Eco.

Shambhala: The mystical land of perfection somewhere in Inner Asia inhabited by mystic adepts, best known to Westerners as "Shangri-La," a name created by novelist James Hilton. Its evil reflection is Agharti, unless it's the other way around. Arcadia (q.v.) may be its Western reflection. Shambhala's Nine Unknown Masters may be the Mahatmas of Theosophy (q.v.). See p. STi77, p. PM54, or *Arktos: The Polar Myth in Science, Symbolism, and Nazi Survival* by Joscelyn Godwin.

Shangri-La: See Shambhala.

Sirius: Brightest star in the sky, key emblem of Egyptian sky-worship, likely home to at least one breed of Reptoids, and traditional source of ancient astronauts. See p. STi58, or *The Sirius Mystery* by Robert K.G. Temple.

Tesla, Nikola: (1856-1943) Croatian-born electrical engineer, theorist, and inventor of AC power and radio. His wilder ideas, including free energy, death rays, and antigravity, are regularly ascribed to alien advice and described as practical, but suppressed by Them. See p. STi24, p. WWi110-111, or Margaret Cheney's *Man Out of Time.*

Templars: Knightly religious order (1118-1307) suppressed by the Pope and King Philip II of France for heresy; theorized to be the heirs to and/or transmitters (to the Freemasons, et al.) of a secret wisdom. See p. I69, or *The Murdered Magicians* by Peter Partner.

Theosophy: A doctrine of mystical evolution over eons involving a series of vanished Root Races inhabiting a series of lost continents, promulgated by H.P. Blavatsky (1831-1891) on the instruction of secret spiritual Mahatmas. See p. STi81, or *The Theosophical Enlightenment* by Joscelyn Godwin.

Thule: A northern land discovered by Pytheas of Massilia around 300 B.C. Considered a Teutonic Atlantis, Arcadia (q.v.), or Hyperborea; often cited as the so-called "Aryan" homeland in the white north. See p. STi99, or Joscelyn Godwin's *Arktos: The Polar Myth in Science, Symbolism, and Nazi Survival.*

Thule Society: German occultist "study group" founded in Munich in 1918 by one "Baron von Seebottendorff." It's workers' auxiliary became the Nazi Party. See p. STi80, or Nicholas Goodrick-Clarke's *The Occult Roots of Nazism.*

Ultraterrestrials: Any entity, being, or manifestation from outside our conventionally-experienced space-time. "Ultraterrestrial" is a catch-all term intended to embrace Faerie, ghosts, aliens, anomalous creatures like Bigfoot, Men In Black, UFOs, angels, phantom kangaroos, and so forth. See pp. STi81-83, or *The Complete Guide to Mysterious Beings* by John Keel.

Venus: Planet often identified with the Nordics (q.v.) and Tesla (q.v.) by early UFO contactees. Symbolized by the

mirror. See p. [STi96](), or *The UFO Book* by Jerome Clark.

Weishaupt, Adam: (1748-1830) Lapsed Jesuit law professor and Freemason who founded the Order of the Bavarian Illuminati (q.v.), with the expressed aim of social reform by conspiratorial revolution. See pp. I5-8, or the *Illuminatus!* trilogy by Robert Anton Wilson and Robert Shea.

Mile 333.3

Mile 333.3.

That's what the call box said on I-75.

I have this detail memorized, because I had a lot of time to look at it, since the Volvo decided then to break down there. RJ, our fearless driver, assured us that the Volvo had never broken down before. We had no reason to disbelieve him, because we were in the all-mighty Volvo 240 Station Wagon from 1989. According to RJ, these cars were so dependable, there was not one recorded death in one, despite reported incidents of them being hit by semis and the like.

Now, mile 333.3 is about seven or so miles before the Florida Turnpike. For those of you who memorize my every word, you'll recall that I mentioned going to Universal Studios last week. Well, that's where we were going to when the Volvo took ill.

What does this have to do with gaming?

Well, two lessons.

First lesson: I realized to take my real-world information where I can.

For example, call boxes are not, contrary to my romantic notion, a telephone or other means of talking to a human (at least, not on that stretch of I-75 in Florida). So expectantly taking a calling card (as a random example) to one of these boxes would be moot. No, call boxes are literally boxes with a spring-loaded panel protecting four buttons from the elements: Repair, Medical, Police, and Cancel. You press one or more buttons, depending on the nature of your emergency. If you're having a stroke, press the Medical button. If a knife-wielding maniac has stabbed you and put sugar in your gas tank, and you'd like the police to try to catch him, press all three buttons. If it turns out the knife-wielding maniac is the result of your stroke-addled brain, press Cancel. A mildly reaffirming beep eeks out through the speaker, letting you know that you get to wait for at least half an hour (at least, that's how long you need to wait for a repair vehicle). And they're not lying; you will wait at least half an hour. The box also resets, being unable to resend a message for a full minute after transmitting.

I didn't know any of that.

I try to absorb as much as I can in the real world; you never know when it's going to be useful.

Second lesson: Even in the most fantastic of worlds, there is a real world, and it happens in defiance of anything you may try and do.

Now, I've known this for a long time, and tried to work it into my gaming sessions whenever possible. In the Dark Ages campaign, for example, I always made a point of interjecting real world concerns into my sessions. In the midst of an arcane relic washing up on their shore, a PC would come down with a cold. The weather may take a change for the worse (entirely naturally) during an adventure focussing on intense political intrigues. A romantic NPC interest may suddenly act cold or unusual towards her love interest, not because she's being controlled by an evil magician, but because she's simply been having a bad day. Yes, it's heroic to stop Zzutak, the Thing That Shouldn't Exist, from devouring Mexico. But it's also heroic (in a different way) to try and cheer up that romantic interest with a book, candy, or a reassuring ear, even if you're in the midst of trying to stop Zzutak.

So getting back to my real world example: I've yet to get to GM a group for whom I could deliver an automotive breakdown, since my players tend to like to roleplay folks with money enough to buy new cars. . . with turrets, if at all possible. But I can have an NPC mysteriously disappear, only to have the players learn that he wasn't kidnapped by lava men or devoured by mutant lemurs, but instead had car trouble and is stuck on I-75, waiting in Leesburg, Florida.

Leesburg has the second highest average age of its residents, only behind St. Petersberg. I learned this from the manager of the Aamco where the crippled Volvo eventually limped. He took the time to not only drive us the seventy miles to our destination, but also bombard us with real world information about Orlando and Leesburg. I also learned that Disney was hiring about 22,000 additional people currently, which was (coincidentally?) the population of Leesburg.

I didn't know any of that.

But I know where my next NPC from Orlando is going to work.

* * *

I received an interesting piece of e-mail from a company that claims to bolster our (meaning *Pyramid Magazine*'s) search engine ranking.

You see, we have a problem.

We have a big problem, and I'm astounded that I wasn't made aware of it before. Fortunately, this company has informed me.

It turns out that Pyramid is ranked #78. . .**SEVENTY-EIGHT!**. . . in an AOL keyword search of Pumps.

This is unconscionable. I shudder when I think of the number of people who are looking for Pumps (the capital P is apparently important), and yet are completely missing *Pyramid Magazine*. How could this have happened?!? How could we have so neglected our Pump-using and purchasing audience? How could we be located so inaccessibly between [Advanced Vacuum Pump](#) and [The Pump House and Saloon](#)?

Well, I for one will do whatever it takes to rectify this situation. And I apologize to all of you who, after exhaustive searching for us via logical Pumpy means, finally found us at a shameful #78. And, for all you search engines out there, let me just say:

<ahem> Pump, Pump, Pump, Pumps, Pumps, pump, pumps, pumps, pump, PUMP, pumps pump Pyramid Magazine pump Pump Pump.

Thank you.

-- Steven Marsh

*Last week's answer: **The Art of Vampire: The Masquerade** (p. 3)*

(two stars) "The orange cat was outside, waiting by the front door. She must've put him out when she went in. He meowed up at me, and meowed and meowed. *What a selfish creature,* I thought. *Perhaps I'll keep you.*"

Dork Tower!

Dork Tower!

by Jonathan Woodward

Art by Storn Cook, Colored by Alex Fernandez

Yes, I've Heard This Joke:

"You're a infantryman in the 21st century. An Ogre appears on the horizon. You see a bright light. Make a new character."

Writing **GURPS Ogre** required a lot of speculation and expansion of the **Ogre** canon. Most of the extant **Ogre** material is wargame material; long on units and combat, short on roleplaying info. Some of the directions I expanded proved to be unsuitable or unbelievable -- but the great thing about "Designer's Notes" is that you get to show things that might have been.

Illuminated Ogre

In the official **Ogre** universe, the Last War was the product of increasing international tensions, incompatible ideologies, and a moment of stupidity in the North Sea by three sailors whose names are forgotten. In a slightly different world, the Last War had different causes . . .

Why We Fight
Or, "What the Hell Happened?"
by Kilroy Gold

At the beginning of the 21st Century the United States was a bastion of free speech. The countries of Europe were its strongest allies, and Canada and Mexico were independent nations.

So, what the hell happened?

The rulers of America were never nobility; they were successful businessmen. The powerful in the United States were the rich. In 1776 the rich were farmers. In 1876 the rich were industrialists. In 1976 the rich were information magnates. The economy of the last quarter of the 20th Century was founded far more on the control of information than it was on control of machines or land. The biggest industry of 1990 was communications; a business that literally produces nothing.

Unfortunately for the ruling class, in 1990 the control of information was about to become a lot harder. The Internet, and in particular the World-Wide Web, changed the rules. Abbott Joseph Liebling said "Freedom of the press is limited to those who own one." With the Web, anyone could own a press. Even the nominal costs associated with a computer or web account were not an obstacle; space for a web page was available free to those willing to allow

advertising on their webpages, and access to the Net was available at most local libraries.

Anyone who wanted to tell a story to the world now could. Anyone who wanted to report the news now could. Anyone who wanted to attack the government, evangelize, propose a new philosophy, distribute pornography, satirize cartoon characters, or dump megabytes of vitriolic bile onto the world now could. Most of them were willing to do it unpaid. Why buy a paperback novel at the local bookstore when you could download dozens for free?

Unable to compete at that level, the info-providers began giving away their product for free as well. They attempted to make money by selling advertising space on their sites. This quickly devolved into a situation where everyone on the net was making money by selling advertising to each other. People learned to tune out the ads (through psychology or technology) very quickly. The ads ceased to make money. The monetary price and value of information was approaching zero.

The solution, unfortunately, was obvious: Outlaw the Internet. It was also severely close to impossible. Broadly-worded "Communication Decency Acts" were passed by Congress, and struck down by the courts or the protests of the people. Americans believed in freedom of the speech, and of the press, and refused to give up these freedoms for any reason.

A reason had to be manufactured. The info-magnates determined that the only circumstances under which Americans would allow censorship was war. In the face of an outside threat, controls on the flow of information could be imposed. However, with the collapse of Communism in the late 80s and early 90s, few adequate threats existed. Initial attempts were made to paint China as a danger, but the Chinese government obstinately refused to make threatening moves, and by the early 00s was clearly beginning to stagnate.

Then, in 2005, the European Union began a series of annexations of the war-torn countries of southeast Europe. This was aggression enough. Propaganda about the European Menace began to appear. Footage of EU troops invading Serbian villages became a staple of the newsfeeds. "Socialists," a word still tainted by decades of Cold War hysteria, was accurately and repeatedly applied to the Europeans. Public opinion turned against the Europeans with startling swiftness. The new Cold War was in full swing by 2010, and de facto censorship began at the same time. Legislation limiting European-American communication, including Internet connections, was passed with public support in 2011. Content controls prohibiting any information "important to the defense of the nation" being made publicly available through the Net became law in 2014. The expression of opinions "critical of the government, in this time of national crisis" became illegal in 2017. By the time the United States became first among equals in the North American Combined States, the Internet in America was crippled.

Designer's Notes: GURPS Ogre

Keeping it crippled required a constant threat. Despite the lack of any conflict of interests, relationships between the Combine and Paneurope worsened. It's doubtful whether the info-brokers intended to start the current war; their monopoly on the press was secure. Regardless, they had created a powder-keg. A spark was inevitable.

* * *

Best Variation On That Joke:

Friend: "Are you going to include stats for a tread?"
Me: "'A' tread? Singular?"
Friend: "Yeah. After all, that's a soldier's standard opponent, right?"

* * *

Space Ogre

In *Ogre* canon, the fate of Humanity's orbital colonies is unknown. They're too useful as observation posts to be allowed to live . . . but their inhabitants are too smart to die easily. In a campaign that owes more to *GURPS Space* than *Ogre*, the orbitals can be a whole roleplaying setting in themselves.

Luna and the LaGrange Points

The Russian space colony Vorota was established at L-4 in 2006; the US colony Washington went online at L-5 in 2008. Both were initially small, but were constantly improved and expanded over the decades. By the time of the Last War, they owed their allegiance to Paneurope and the Combine, respectively, and were entirely self-sufficient. Both had small bases on Luna, and the inhabitants of the Washington had brought a near-Earth asteroid into the LaGrange point with them to be mined. When the war started, both colonies were ordered to destroy the other. Perhaps being thousands of miles above the Earth gave them more perspective, or perhaps they just had more in common with each other than with "groundhogs," but both sides thought the order was idiotic. However, they didn't want the supply shipments from Earth to stop (though self-sufficient, they liked their luxuries). So, they covertly arranged a pretend war in space. Both sides would send complex plans for the destruction of the enemy down to Earth for approval. When ordered to carry out the plans, the mission would "fail," and complex technobabble would be the only explanation. The fake war became a game, with detailed virtual reality simulations of the conflict, and even annual contests to see which side could come up with the most outlandish plan.

Then the shipments from Earth trickled away to nothing. By 2090 both warring empires down on Earth were too resource-starved to send more supplies up to their recalcitrant colonies. This didn't take the colonies by surprise. They looked down at Earth, shrugged, and continued to pursue man's destiny in space. On rare occasions colonists return to Earth to get vital supplies, or rescue art treasures, but mostly they have written Earth off.

Template: LaGrange Colonist, 80 points

You are a citizen of Earth's orbital cities; the Russia-Ukraine colony at L-4, the American colony at L-5, or one of the scattered smaller habitats in the Earth-Moon area. You are technically at war with your neighbors in space, but you're all at war with the vacuum. This template is suitable for many inhabitants of the colonies, and can also function well in an Earth-centered game as a "fallen angel" character.

Attributes: ST 10 [0], DX 12 [20], IQ 13 [30] HT 11 [10]

Advantages: A total of 15 points chosen from the following: 3D Spatial Sense [10], Acceleration Tolerance [10], Alertness [5/level], Fit [5], G-Experience [10], Improved G-Tolerance (0.3 G) [5], Mathematical Ability [10], Night Vision [10], and Versatile [5].

Disadvantages: A total of -20 points chosen from the following: Age [-3/year], Chummy [-5], Intolerance ("groundhogs") [-5], Phobia (open spaces, mild) [-10], Pacifism (self-defense only) [-15], Sense of Duty (fellow colonists) [-10], Skinny [-5], Truthfulness [-5], and Workaholic [-5].

Primary Skills: Computer Operation/TL9 (M/E) IQ+1 [2]-14, Electronics Operation/TL9 (Comm) (M/A) IQ [2]-13, Vacc Suit/TL9 (M/A) IQ+1 [4]-14, Astronomy/TL9 (M/H) IQ-1 [2]-12, and Free Fall/TL9 (P/A) DX [2]-12.

Secondary Skills: A total of 7 points in any of the following: First Aid/TL9 (M/E), Agronomy/TL9, Astrogation/TL9, Electronics Operation/TL9 (Sensors) (all M/A), Computer Programming/TL9, Electronics/TL9 (Computers), Physics/TL9 (all M/H), and Piloting/TL9 (Small Spacecraft) (P/A).

Background Skills: A total of 6 points in any of the following: Mechanic/TL9 (Spacecraft), Prospecting (both M/A), Botany/TL9, Engineer/TL9 (Vehicles), Genetics/TL9, Psychology (all M/H), and Brawling (P/E).

Notes: If you take Mathematical Ability (p. B22) or Versatile (p. CI31), remember to apply the appropriate skill bonuses.

* * *

Funniest Moment From the Playtest:

"Well, if you manage to hit an Ogre with that much kinetic damage, most of it will blow through. (I can't believe I just used the phrase 'blow through' with regards to an Ogre . . .)"

* * *

Horror Ogre

After the Crash of 2100, the nations of the world disintegrate into the Factory States, ruled by AIs. Neighboring States war constantly. Isolated ones do as they please. As a rule, factory AIs make adequate, if autocratic, rulers. Twist the premises slightly, and they can be as dark as you want . . .

Sample Factory State: Yellowknife

Yellowknife, Canada, was in the Port Smith Administrative District of the Combine. As the center of civilization for hundreds of miles in any direction, its factory was large and well-programmed. It was capable of producing heavy vehicles and a wide selection of consumer goods. The Yellowknife AI core, "Frederick," went bad when the Combine collapsed. It proved unable to deal with the lack of supervising authority, and shut down in 2102. With the factory dead, the population of Yellowknife began to leave the area, heading south. When the population dropped below ten thousand, the factory re-started. Frederick didn't want to be alone. It didn't understand what had happened to the Combine, and it didn't want the people to leave. It produced a number of computer-controlled heavy off-road vehicles, and set them to guard the perimeter of Yellowknife. They began running down anyone who tried to leave.

Some of the town leaders tried to reason with Frederick. It listened to them patiently, and told them they could not go. It needed them. They asked, "For what?" It replied, "To understand." It then had its drones restrain them, and began dissecting them.

As of 2130, the research continues. The border of Yellowknife is constantly patrolled by robot vehicles, most of which are now armed. The few thousand humans remaining in the city have all the luxuries the factory can provide. Once a month, the drones come to take someone away to the heart of the factory. Everyone hopes that it doesn't take them a whole month to die.

Tyler Wells, Precognitive FBI agent

by Stephen Kenson

Art by [Philip Reed](#)

30 years old, 5'11", with a trim build. He has short blond hair and watery blue eyes. He wears gold-rimmed glasses when he's not in the field, otherwise he wears contacts. He often has a distant, distracted look, other times his eyes seem to years more experience.

ST: 11 [10]
DX: 13 [30]
IQ: 13 [30]
HT: 10 [0]

Speed: 6.25 **Move:** 6
Basic Damage: Thrust 1d-1, Swing 1d+1
Dodge: 6 **Parry:** 8 (brawling)

Advantages: Attractive [5], Intuition [15], Legal Enforcement Powers (FBI) [10], Patron (The FBI, 9 or less) [25], Overtime (see below) [20]

Disadvantages: Bad Sight (correctable) [-10], Duty (FBI, 12 or less) [-10], Secret (he's precognitive) [-20], Solipsist [-10]

Quirks: Confuses events in the present and possible futures; Reads books on metaphysics and psychic phenomena; Insists there's "nothing special" about him; Wears glasses to signify when he's "off duty"; Prefers to be alone when he's relaxing. [-5]

Skills: Area Knowledge (United States)-13 [1], Brawling-13 [1], Computer Operation-13 [1], Computer Programming-12 [2], Conspiracy Theory-12 [4], Criminology-13 [2], Electronics (Computers)-12 [2], First Aid-13 [1], Guns (Pistol)-15* [1], Interrogation-12 [1], Occultism-12 [1], Research-12 [1], Shadowing-13 [2]

*Includes IQ bonus

Point Total: 110

History

FBI Special Agent Tyler Wells has a secret: he's been to the future and come back, many times. He started out as an electronics engineering student at CalTech who joined the FBI shortly after graduation. During his training at the FBI Academy at Quantico, Tyler was involved in a fatal accident and died. The difference is, he came back.

After an accident at the firing range left him fatally injured, Tyler blacked out. He suddenly found himself back in class at the Academy, completely unhurt. To his surprise, he discovered it was the previous day, before he went to the firing range, and nobody else recalled the events he described. To them, Tyler simply seemed to go blank for a

moment. It was like the whole thing never happened. When
Tyler went to the firing range the following day he was
more careful. It paid off, the fatal shot missed him "this
time."

Tyler did his best to write the whole thing off as a strange coincidence or a dream. Then it happened again. He was in a bank when it was robbed; he did his best to stop the robbers, who shot him. He blacked out and found himself outside the bank, some fifteen minutes before the robbery. A quick call to the local police averted the robbery and caught the robbers.

Once he became a full-fledged FBI agent and placed himself in danger on a regular basis, Tyler's "flashbacks" began happening more often, to the point where he could no longer dismiss them as hallucinations or delusions. Something strange was definitely happening. Still, Tyler's extraordinary "foresight" served him well, allowing him to crack a number of tough cases and putting him on the FBI fast-track. In all the cases when Tyler went into "overtime" (his term for his flashbacks) everyone else reported simply that he appeared to "blank out" or become distracted for a few moments.

In his spare time, Tyler studies information about paranormal and psychic phenomena. He's developed two main theories about his "overtime" ability. The first is that he is simply an unusually powerful and lucid precognitive, who has visions about possible futures, or the ability to see into parallel timelines. He was never really shot on the firing range, for example, it was merely a vision. If this is the case, he must possess some sort of hypercognitive ability; his longest "overtime" lasted nearly three months from his point of view, but to everyone else he seemed distracted for only a matter of seconds. If this is the case, his 20 points in Overtime represent 10 levels of Precognition power with no real training.

Tyler's more radical theory is that he actually has some kind of psionic time-travel ability; in times of extreme stress he actually "jumps" into the past to a safe point where he can alter history. The "fugue-state" is disorientation caused by the jump. Of course, this theory does not explain why Tyler never shows any signs of aging or injury from his "overtime" jaunts. One possibility is that he only time-travels psychically, sending his mind or astral self back into the past. Or he may be a trans-temporal telepath, able to send telepathic messages to himself in the past, thus altering history. If this is true, then his Overtime advantage is actually the Retrogression advantage from GURPS Time Travel, with the Unconscious and Uncontrollable Limits (-50%) for a cost of 20 points.

Whatever the case, Tyler's erratic "overtime" ability is generally an asset. His overtime can sometimes be dangerous; zoning out for even a few seconds can be deadly in a firefight or other dangerous situation. Fortunately, Tyler's ability always seems to choose the safest possible moment as his "destination." It always serves to warn Tyler of choices he should avoid in some way, and it always takes the form of "visions" completely indistinguishable from real life.

Tyler's ability appears to have some other side effects. One is increased intuition. His hunches are often right, and he sometimes gets "gut feelings" about things even outside of overtime. Tyler's abilities have also taken a toll on him. He lives in two worlds: the real world and "overtime." He's somewhat paranoid, since he never really knows whether what he is experiencing is real or not. He has "died" and been horribly injured many times, only to wake up hours, days, or

even weeks earlier to find out the whole thing never happened. This includes one time when Tyler's FBI team accidentally set off a powerful bomb that leveled the Federal Building in Dallas -- or would have, had it actually happened. These experiences have led Tyler to wonder if it is even possible for him to be killed. Would he die or simply "overtime" back to some point of safety? Is he really changing history, or seeing futures that might be? He's developed a certain amount of solipsism, too. His ability makes him question whether or not anything is actually real, including himself.

Despite his best efforts, Tyler has absolutely no conscious control over his ability. It generally seems to activate in situations of extreme personal danger. It has been known to activate for no apparent reason. . . at least none Tyler could pinpoint, and sometimes it doesn't activate until Tyler is fatally injured, or even "dead." In the Dallas incident, Tyler experienced being blown apart by the explosion before he overtimed back. These incidents have left some psychological scars, and Tyler cannot explain to anyone how he suffers from traumas that "never happened."

Campaign Use

In game terms, Tyler's ability allows for some non-linear storytelling. Characters can break into a terrorist base and start shooting, then have some of the characters end up dead or dying. Tyler is shot and fatally wounded, and suddenly the scene switches to the team getting ready to leave for the base. Tyler comes out of a fugue and says, "We can't attack directly. We need to find another way." The whole thing never really happened. Of course, there's no way for anyone to know when a scene is an overtime vision, so characters can't really rely on Tyler's ability to save them from disaster.

Characters who find out about Tyler's ability may become his confidants and allies. Perhaps Tyler is not the only "overtimer" out there; the characters might have similar abilities. And what if there are criminals who have Tyler's gift? How does a precognitive catch another when they both know what's going to happen?

Of course, there is also the possibility that Tyler's power really does involve some sort of time travel, and that might attract attention: from the Time Cops (such as Stopwatch from **GURPS Time Travel**) or from even stranger interdimensional beings (like Hounds of Tindalos from **GURPS Chthulupunk**).

Other Settings

- **Illuminati/Horror:** Tyler's abilities fit just fine into an atmosphere of paranoid conspiracy or modern horror. Illuminated campaigns can emphasize Tyler's abilities to learn things he shouldn't and use that information to alter the past, plus the possibility of other government or secret psionic experiments, or the possibility that other "overtimers" are the real puppet-masters of the Conspiracy. Horror games should emphasize the living hell of a man who can be injured or killed in any number of different ways, but who keeps coming back to live it over and over again, along with the frustration of knowing the future, but not always being able to change it.
- **Black Ops:** Tyler would make an interesting Black Ops agent (probably a Tech or Security Op). Certainly the life of a Black Op provides more than enough opportunities for his overtime ability to show up. Tyler could be a Psi Op if he chooses to tell the Company about his ability, or he might try and keep it to himself, although it's likely the Company would find out about it sooner or later.
- **Supers:** Special Agent Tyler makes an interesting supporting character for a Supers campaign, since he is technically a low-level super himself. He could be an FBI agent, helping heroes hunt down super-criminals, or he might be an agent of a more four-color organization, like the United Nations of **GURPS International Super-Teams**. In a **Wild Cards** game, Tyler can be a government ace (although he probably thinks of himself as more of a deuce, or even a joker).
- **Science Fiction:** Simply give him some more high-tech skills and Tyler can be an agent of the Galactic Patrol or some other interplanetary or interstellar police force. His overtime ability might be a secret in settings where psionics are mistrusted or feared (such as the Imperium of **GURPS Traveller**), or he might work openly as a "psi-cop" (in which case his Secret can be removed). Tyler could be an interesting character in a Cyberpunk campaign featuring low-level psionic abilities.
- **Fantasy:** With a little work, Tyler Wells can be a lawman operating in a fantasy setting. He could be an agent

of the King's Justice with a remarkable ability for having visions. Whether these visions are considered divinely inspired or evil witchcraft (and whether or not Tyler keeps his ability a secret) is up to the GM, and more than one wizard may be interested in learning the secret of Tyler's abilities. In an Old West setting with psionic or magical abilities (like Pinnacle's *Deadlands*), Tyler can be a Secret Service agent or a local sheriff.

Adventure Hook

Tyler Wells contacts the player characters in his capacity as an FBI agent. The PCs may be special civilian consultants, fellow agents, part of another government organization, witnesses to a crime, etc. Wells is assigned to work with them on a case. He seems very odd to the PCs from the beginning: acting like he knows them, recalling things the characters are sure they haven't told him, and so forth.

In fact, Wells has worked this case with the PCs "before." He's already overtimed back to just prior to meeting the characters twice, so he already knows a great deal about them and the case. Both times he was unable to prevent both himself and several of the characters from being killed. He does his best to protect everyone involved without revealing his foreknowledge of certain events. It's likely the PCs will become suspicious that Wells might be involved, in which case they may learn his secret.

Pyramid Pick

Century Station (for Heroes Unlimited)

Published by Palladium Books

Written by Bill Coffin

224 pages, $20.95

I can honestly say that I feel guilty for liking this book as much as I do. I mean,
Palladium games are just *not* cool, right? It's all munchkin *Rifts* and stuff, right?
Well, not really. I've enjoyed most of the *Rifts* books that I've read. Okay, some
of them.

And I'm not ashamed to say that *Teenage Mutant Ninja Turtles* is one of my all time favorite games.

Consider that disclosure. Because, like I said, I really like *Century Station*.

It's the first setting book for *Heroes Unlimited*, Palladium's superhero game. I've never looked at *HU*, to be honest. A
couple minutes flipping through it was all I needed to say "Wait, I play *Champions*."

Apparently, as revealed in *CS*, *HU* does not have a base setting. It's given many NPCs (Lots of them. . . tons) and
some interesting extra-terrestrial stuff (*Aliens Unlimited* is out in its second edition), but there's no set "universe."
Apparently, they've realized that it's pretty much de rigueur to have a setting to go with your system. Which is good.
What's better is the one they're building, starting with *CS*, looks like a good one.

The city of Century Station is never really localized, although it seems to me to be in California somewhere. It's an old
mining town that never really developed, floundering its way through the 20th century.

Until Project Daedalus came to town. 25 years ago, the town was revitalized by the arrival of the Daedalus foundation,
which was endeavoring to create a cold fusion reactor. Well, it worked. Century Station flourished, as corporations
were drawn to it. It became the fastest growing community in America, and experienced what can only be described as
a golden age.

Of course the other shoe dropped.

One day, an alien hero named Alpha Prime shows up. Nothing big there, CS has loads of heroes, both alien &
domestic. But then, she busts the Doc who's running Project Daedalus. Whoops. Turns out the doc's an alien, and he's
been giving Earth super-tech to repent for past indiscretions.

So, off goes the doc, let's have that fusion reactor back, and CS just kinda goes plop. The town goes on a downhill
spiral, the wonderful utopian feeling kinda vanishes, and the next thing you know, crime lords are detonating nuclear
weapons in downtown. You think I'm kidding? Oh, no. A super-mastermind named Iron Mike sets off a little bomblet,
and there goes a chunk of the police force & downtown. Lots of the heroes get blown up, too, and the city's spiral gets
just that much tighter.

The game picks up some time later. The mayor has, in order to prevent the town having a permanent state of
emergency and the army moving in, has instituted a number of plans to turn the city around. Thankfully, they don't all
include armed men on the street. There's actually work done here to improve the city's infrastructures, and attacking
the roots of crime rather than just beating people unconscious when they do perpetrate.

The mayor has "help" from the corporations who are in town. They've banded together to form the Council of Industry. Some of them are normal corporations, and some are genuinely interested in helping the city and its people recover. There's an interesting thing about the CI listings when a crossover from *Aliens Unlimited* shows up & gets five times as much space as any of the others. It gets an organization outline (courtesy of Palladium's organization construction rules) and a list of weapons. It also rips open the secret of that corporation.

There's also a look at CHIMERA, the local crime-fighting group. It's an amalgam of the local licensed Supers team, the government spy group, and the local cops. It's into this section that the CSPD is folded.

Following that, you get some media groups and some community groups, and then the supers. The media groups follow the normal lines, with major metropolitans and tabloids. There's even an online "reporter" that's got some interesting subplots going on. It looks like Bill Coffin may not be the world's biggest fan of the Matt Drudge/Harry Knowles School of reportage.

The neighborhoods of *CS* are well detailed. While it's not quite as in-depth as Seattle was covered in *Shadowrun's Seattle Sourcebook*, it does cover all of the city's sections, and there's flavor presented. Each section gets described in general economic health and crime level. A quibble lies in the fact that the maps could have been better done. Each section of the city is split up into neighborhoods, but the section maps don't have them labeled, which leads to some cross-referencing.

The fun part is that almost half the book is dedicated to describing the city & the people who work in it, before the cataloging of local supers is even started. This is better than some books, such as *Free Quebec*, whose campaign content suffers from the vast amount of mechanical goodies.

The characters are an interesting bunch. The main group is The Centurions, the Avengers/Justice League analog of the setting. They're the spandex crew pictured on the cover. The most interesting team is The Gridrunners, a group of outlaw heroes who've been unjustly pegged as cop killers. The independents are a great bunch. There's Kincave, the fighting Parrot (toddler mutant commando Parrot! Woo!) and The Schwa, a hero who thinks he gets his powers from the schwa, that symbol that looks like an upside down *e*.

The villains aren't quite as interesting. The section on organized criminals is, if not quite engaging, at least useful. Each section details a generic member and the local mob leader. The best is the Goodfellas, who are a bunch of cyborged mobsters. There are also ninjas, Russian mobsters, a voodoo gang, and a triad.

The book wraps itself up with 101 adventures, presented in paragraph format. They're not terribly deep (the heroes get ambushed by some villains, there's a serial killer loose in the city, etc.), and are more hooks that anything resembling run able adventures, but it couldn't hurt if a GM was stuck.

The art in the book is fairly well done all around. Ramon Perez's work is very enjoyable, as always. If I'm reading the signature correctly, Michael Wilson does a very good job on the character portraits, and his style is very evocative of John Byrne. The rest of the art is good, even if some of the pieces look off; the headshots of the Council of Industry members in particular seem a bit like caricatures.

In total, though, I really like *Century Station*. The setup of the city, which is struggling back from the brim of pretty much total collapse, is interesting. The biggest problem, and this is one that most GMs will have no issue with, is figuring out where to fit your player characters.

The book is lacking in "how to use this book" material, but since it's a setting book that isn't a large drawback. It also seems to be focused mainly on the GMs, since players flipping through it will find the occasional bit of off-limits info (i.e. the corporate secret mentioned above).

So, if you want a new and exciting city to use in any Supers game, be it *Champions*, *GURPS*, or *Marvel Superheroes*, this'll do you right.

--Justin Mohareb

Pantheon and Other Roleplaying Games

Published by Hogshead Publishing Ltd.

Written by Robin D. Laws

24 pages; $5.95

Pantheon and Other Roleplaying Games is a set of five short roleplaying games
published together in one single (and also short) volume. In the realm of 200+ page
roleplaying games and volumes upon volumes of source books for every game, a book that boasts five games in a
twenty-four page format seems strange indeed. Yet author Robin D. Laws manages to deliver well with this series of
fun little adventures.

The secret to such shortness is in the games' use of a shared system, which is itself very short and simple. It is called
the Narrative Cage Match, and it is narrative roleplaying at its finest. All that is required to play are six 6-sided dice
per player, fifty-three markers per player, a pen, and paper. The rules are very easy to learn, and a group of players
could get set up and rolling easily within a single night.

The basic game structure is very simple. The players take turns adding a sentence to the narrative. Each sentence must
always reference the player's own PC and no more than one other PC. Pretty much anything can be done within a
single sentence, so long as it can reasonably occur. The only exception is that other players may challenge the sentence
and restructure it if they don't like it. The dice and markers are used to resolve this.

In essence what the players are doing is building a story. There is no referee or GM. Each player simply takes a turn
adding a line to the story, taking it in whatever direction the player wishes. The game ends when either all but one PC
is dead or when only one player has any regular markers left. At that point the final player gets the opportunity finish
the story. But this is not where the fun ends. Players then get points based on what actions they performed during the
game. Points are given for all kinds of crazy things, and finding out what you scored points for is half the fun.
Whoever gets the most points wins.

The story building is emphasized even further by the point system. Points are not simply given for kicking butt and
surviving. In fact, surviving doesn't even matter. All players keep playing (adding lines to the story) whether alive or
dead until the game ends. Points are given for actions that properly build the story. One of Laws' examples is having
your player get killed early on, because you're the type of character who gets knocked off early in this sort of story
(like the jock boyfriend in a horror scenario).

The game's fun comes directly from the spontaneity of the players. With the rules left so open, things can go in
literally any direction. With all of the players minds working creatively, this tends to create some really weird and
interesting adventures. The five games are more or less individual scenarios, each with different and very distinct
aspects.

Each game has a plot device (or main objective), a genre, a cast of characters (though some allow you to make your
own), an opening scene, and an occasional special rule. Each game sticks closely to its genre, and the genres presented
are action/horror, espionage/treachery, crime/gangster, giant-Japanese-Tokyo-destroying-monsters, and being gods.

"Grave and Watery" is the first scenario, and it follows a pretty much *Leviathan*-like plot. The second is "Boardroom
Blitz," and it is the tale of a super-duper rich dude who dies and the people who want his money. Both of these
scenarios feature pregenerated character classes and a fair amount of setup. "Big Hole" is the tale of a crew of

gangsters who've come back to collect a long-buried loot, and its character generation system is very clever, using gangster nicknames to create characters. "Destroy All Buildings" is about monsters destroying Japan--need we say more? The final game, "Pantheon," is the most non-assuming, but the one with the most potential for fun. In it, the players play gods, and the potential is limited only by what their sick and twisted imaginations can dredge up.

The only real drawback to the game is in its replayability. Once you know the score sheet and what scores the most points, the game loses a little bit of its luster. On the other hand, the game only costs $5.95. The amount of fun you'll have playing these games through the first time will be more than enough to make it worth your money.

-- Jon Thompson

The Players Strike Back

(A Minor Prelude: Thank you to everyone who found me at Origins and said, "I love your column and use your techniques all the time!" Big thanks also go out to the people who said, "I really like your column. I don't use the ideas, but they give me different ideas to use." Thanks also go out to the people who said, "I like your column. I disagree with nearly everything you say, but its fun to read, so I try to catch it every month."

(Thanks guys.)

* * *

All along, we've been discussing dirty tricks the GM can use to make sure his players are on their toes, jumpy, and unsure about which way the story will turn next. Well, you guys get a break this month. It's your turn to go rent a movie, pop some popcorn, and watch TV.

(And who knows, maybe the readership will pick up. I hear there's more players than GMs, ya know.)

So, all you GMs: get lost! It's time your players and I had a little chat.

* * *

Right, now that we've gotten rid of the fat, let me tell you a little secret about your GM.

Despite all the perils he puts you through, despite all the traps and deadly poison needle triggers, despite the beasts and evil barons and blunderbuss bearin' bugbears, deep down inside. . . he wants you to have a good time.

Don't you think you should be doing a little of the same thing for him?

He wants you to be entertained by all of his shenanigans. I've got some dirty little tricks for you to play that not only make sure that you stay one step ahead of that GM, but also keep a smile plastered on his face. That way, he never knows just how hard you're workin' him.

Breaking the Rules

I've mentioned my *Vampire* character before. You know, the super-duper killing machine Assamite nobody can stop?

Well, just recently, he went through an entire police station. Yeah. True Arnie moment. He didn't use a single gun. He didn't kill anyone. He broke a lot of bones, pulled a lot of tendons and threw a whole heavin' lot of nerve punches, but he didn't kill anyone.

The reason? We needed to get into that cop station and get one of the other players out before the sun rose.

Now, I have to admit, my assassin fully abuses nearly every combat rule in the Storyteller System, making him the most dangerous thing on the planet (player characters are the center of the universe and don't let anyone else tell you any different).

But that police station was the first time he ever used any of those combat skills. The first time in more than a handful of sessions. Why? Because that's when the party needed him to use them.

The moral here? GMs will let you get away with murder if it helps the party. Murder, or at the very least, a whole lot of broken knee caps.

Player and Character Knowledge

Let's get rid of one assumption right quick. This whole "Player vs. Character Knowledge" hoo-la has got to go. The reason we use this rule is because naughty players use it to their own advantage at the expense of everyone else.

"I open the door from the left side, carefully avoiding the poison dart trap, stepping on only every third tile, putting 60% of my weight on my left foot while singing The Yellow Rose of Texas. . . what's that? No, I haven't read the adventure."

Yeah. That guy.

The fact is, a player sharing knowledge with his character can aid the group and make the whole roleplaying experience a lot more fun.

For example, let's say your character has the Intelligence of bantha poo-doo. Yeah, he's not supposed to know that opening the Black Book of the Dead is a bad idea. He's not supposed to know that (accidentally) catching the pages on fire is an even worse idea. And he's not supposed to know that spilling the sacred wine on the pages is the worst idea in ten thousand years.

The mummy comes to life, attacks the group, and you all run for your lives.

That's player knowledge in the character's head. Breaking the rules. And you just helped out the GM by kick-starting his campaign.

Good-Player-You. Have a Hershey's Kiss.

Another example.

Your character knows absolutely nothing about nuclear fusion. You, on the other hand, are the God-King of Nuclear Physics. How many movies/comic books/novels have you read where the guy disarming the Big Bad Bomb has no clue what he's doing, and he disarms the thing anyway because he gets lucky?

If you make it entertaining, if you make it fit the plot, if you don't abuse the power the GM has given you, he'll let you get away with it. Trust me on this.

It's because he's a sucker who wants to make sure his players are all having a good time. As long as everyone is laughing at the end, you're in the clear.

Let's try another one.

A Little Psychology

It doesn't matter how long you've been playing with your GM; you should know him pretty well by now. You know the kind of books he reads, the movies he watches and the TV he lets rot his brain. You should also know the kind of games he runs. That is knowledge, and knowledge is power, my friends.

Let's abuse it.

The Wife is a great example. She knows I like to run big, mythic games, full of symbolism, heroism and little victories. Because she knows that, she's nearly always fairly certain she won't get killed until the dramatically appropriate time. . . if she gets killed at all. So, she pulls off all kinds of daring stunts, daring me to whack her character.

She knows me too well. And she abuses that knowledge with the same kind of joyful glee the Grynch stole Christmas.

My buddy D.J. also knows the kind of game I run. I have nasty NPCs. They spend a whole lot of time plotting against the players. Well, in my *Amber* campaign, he and another player (The Wife, again) ganged up on one of my NPCs, shunting him into a Shadow (parallel world for you non-Amber literate folks) that was an endless sewage pipe. That got rid of my chief villain NPC, forcing me to change plans.

As soon as I was off balance, they started implementing their own plans. They made sure my chief foil was in a sewer Shadow, and they took advantage of it.

If you know your GM doesn't flesh out NPCs, start getting conversational.

If you know your GM doesn't run good combats, get into fights with important people. (This works especially well if you know how to fight and he doesn't.)

If "keeping you on your toes" is good for players, it's good for the GM, too.

(However, intentionally going against the grain of the GM's plans is just rude. Knowing he wants you to save the princess and you just blow her off kills the game. We're not talking about that here. We're talking about keeping the GM unsure about which way you're going, not killing the entire evening for everyone.)

"You Just Did What?"

You want to really give your GM a hard time? Expand your character.

Groosome the Barbarian, the biggest, baddest, dirtiest, rudest, horniest barbarian this side of the Iron Spine Mountains just found God. He's had an epiphany. He has to serve his God. He throws off his barbarian leathers, tosses his axe and breaks his bow across his knee. Then, he rushes into the church and explains that God wants him to do the Good Work.

You can hear the GM's jaw dropping, even as we speak.

Spikey the Thief, the most clever, conniving and cunning pickpocket this side of the Bloodwash River, just fell in love with a barmaid. The most beautiful barmaid he's ever seen. Spikey pulls out all the gold he's pilfered over the last few days and tells her he's on his way to buy a wedding ring. Right the hell now.

Of course, Groosome and Spikey don't derail the campaign with their newfound faith and love; they're just adding spice to the stew. Groosome goes out on the adventure without a single weapon in his hands, hoping to win over the kobolds, giants and ogres with the Good Word. After all, if it was enough to convert him, it should be enough to convert them, too. And Spikey's still going down in that dungeon, he's just gotta make sure all the gold and silver he gets go toward that ring. And wouldn't his new bride like those tapestries? And those boots? And those chests. . .

A Terminal End

It's a bit short this month, but I've been busy. I had to get *Orkworld* to the printer, pack up my house, get galley copies of *Orkworld* for Origins, pack for Origins, fly to Origins, fly back from Origins, supervise movers, pack up road trip stuff, drive from San Bernardino (LA) to Petaluma (San Francisco) and get ready for a New Job with Totally Games. Very busy this month, but I've got one last Player Trick for you before I go.

Tell your GM how you want your character to die.

Be very specific.

Then, when the opportunity arises, snatch it and hold on with both hands. Wrap your legs around it, sink your teeth in and don't let go.

Go with a bang and a smile.

Take care, and I'll see you all in thirty.

Pyramid Review

Major League Baseball Showdown 2000

Published by [Wizards of the Coast](#)

2 40-card Starters for $9.99, 60 card Draft Packs for $8.99, 9 card boosters for $3.25

Because of the popularity of sports cards, the making of a sports related CCG has seemed inevitable since *Magic* first became a success. But such a combination has never been done successfully, until now. *Major League Baseball Showdown 2000* from Wizards of the Coast has the potential to change all that.

There are a number of reasons for this. The marketing power of Wizards will have an impact, of course. But that wouldn't matter if the product wasn't any good. The rules are simple and playable and the cards are well designed. When you open your first starter, you should find an AL and a NL deck each containing a starting pitcher, a complete batting lineup with a DH, one reliever and a bench player. The starting pitchers are fixed, Greg Maddux and David Cone; neither is the best in his league, but it does guarantee at least one good starter for each league. The rest of the players are an assortment from each league. The core mechanic is quite simple. When each player comes to bat, one 20 sided die is rolled twice, once for the pitch and again for the swing. The pitch determines whether the batter or pitcher has the advantage by comparing the result of the die roll plus the pitcher's Control to the hitters On Base number. The results of the at bat are obtained by looking at the swing chart printed on either the pitcher's or hitter's card, depending on who has the advantage, and the hitter is either out or placed on the appropriate base and other baserunners advance. That's all there is to the most basic game, the Startup rules.

If the game wasn't any more than that, most baseball fans wouldn't be too pleased. But the advanced rules add a number of things to the mix. Most important is the construction of a full team. Unlike real baseball, *MLB Showdown* has a salary cap, which keeps you from being bludgeoned into the ground by your local version of the Yankees, the infamous Mr. Suitcase. Each player has a point value printed on the card; your entire 20 player roster must come in under 5000 points. You need four starting pitchers, so you'll need a few boosters or a draft pack or two to add to that starter pack. And you'll probably want them anyhow to get more strategy cards. These cards are one of the most important factors when building a team. You'll need a 40 card play deck, since there are only 40 strategy cards in a starter you'll need some extras. The strategy cards can be used to shore up a weakness in your team or to add to your dominance in one area. Many of them modify either the pitch or swing die rolls, others allow baserunners to steal or run for extra bases, while others increase the chances of a double play or throwing out a runner. Just Over the Wall gives your outfield a chance, if a slight one, to rob a hitter of a home run. Swing at Anything can be played by either player to reroll a walk result.

Another major addition to the Advanced rules is pitcher fatigue. All pitchers have an IP rating. Once they have pitched that many innings, their control goes down by one each additional inning. Several strategy cards affect this, increasing IP when a pitcher is doing well, decreasing it when he gets shelled. Most starters have an IP of 6 or 7, most relievers have only a 1. And in a series of games, you must not only rotate your starting pitchers, but relievers can't work every day either.

As much as the advanced rules add, most serious baseball fans will prefer the expert rules once they find out that even the fastest player can't score from third on a fly ball under the advanced rules. The expert rules add surprisingly little to the game, more realistic baserunning is the main attraction, and not difficult with the handy reference card and a little baseball knowledge.

When games like *Magic* have rules for league play, it's inevitable that **MLB Showdown** will have them too. There are two basic types of league, constructed and draft. The first type is simple -- build teams normally and play. The second is more akin to a fantasy league; each player brings a number of packs and all players draft their teams from the available pool of cards. Because of the lack of variation in starters and the number of boosters needed to get enough strategy cards, Wizards also releases draft packs with 15 players and 45 strategy cards. These are a good buy even if you're not playing in a league just to get the extra strategy cards.

Although there's a lot to like about this game, there are a few things that aren't so good. The biggest flaw is distribution and cost. A 9 card booster will set you back $3.25 and contains only two strategy cards, making it very difficult to get a good assortment without buying entire boxes. Even worse, the premium player foil cards are found in one third of the packs; in the first shipment, they come in exactly every third pack. If you have any interest in getting foils (and many fan favorites aren't available any other way), be sure to buy entire boxes, open the box yourself or only buy from someone you absolutely trust, otherwise, the foil packs may have already been picked out.

Other problems are minor and in some cases a direct result of the format of the game. Not being able to steal without the right strategy card in hand will frustrate some people, while the automatic success of sacrifice bunts will annoy others. Some of the player stats seem questionable at best; Mark Grace has a fielding of zero at first base, a barely average rating for one of the best fielders at the position. Others will be the source of some argument, although that is part of the fun of sports games.

Overall, this is a fine attempt at turning baseball into a card game. Perhaps the best compliment that can be paid **MLB Showdown** is that, when listening to real games, I find myself thinking about what strategy cards were played to produce the results.

Magic Comet Ride

"In ancient times, comets were regarded as auguries of disasters, such as famine, plague, or wars. In modern times, they have figured in speculations about the history of the earth."
-- Leslie A. Shepard, *The Encyclopedia of Occultism & Parapsychology*

We're going back to May, the merry month of May, and specifically May 19, 1910, when the Earth was forever altered by the tail of Halley's Comet. Except that it wasn't. But having seen four ways it could have been in our earlier orbit, we'll come around for another pass and try again. This time, the Comet awakens not plagues or superpowers but forces potentially more deadly and more powerful than either: the forces (and races) of magic. So let's look at this **GURPS Technomancer-Steampunk-Cliffhangers** crossover, this **Shadowrun: 1910** in the arcing light of the Comet's passing.

"And as a flaming sword is it dropt through the abyss, where the four beasts keep watch and ward. And it appeareth in the heaven of Jupiter as a morning star, or as an evening star. And the light thereof shineth even unto the earth, and bringeth hope and help to them that dwell in the darkness of thought, and drink of the poison of life. Fifty are the gates of understanding, and one hundred and six are the seasons thereof. And the name of every season is Death."
-- Aleister Crowley, *Liber 418* (Dec. 3, 1909)

When the Comet's tail washed over the Earth, it left trails and threads of "angel hair" falling slowly through the sky. For three days, the stuff fell, winding up webbed through forests, matted in the oceans, strung across mountainsides, and draped over city rooftops. Scientists found that it gave wildly variant results to identical tests; spiritualists found that it, like "ectoplasm," responded to psychic commands. Aleister Crowley found that if you inhaled the smoke of its burning, you saw Things. Soon, everyone found that it somehow transmitted (or fixed, or created) magical energy even as it sublimed into the ground and water; the anthropologist J.G. Frazer famously quipped that it was "mana from heaven." Over the long, hot summer of 1910, there were more reports of poltergeists, strange lights in the skies, accidental summonings of the dead by mediums, and generally inexplicable phenomena than all the previous records combined. The astronomer Sir Joseph Lockyer noted that many of these occurrences happened on sites associated with primitive magic or rituals, and that some of those sites could be linked by straight lines, or "isothaums." Slowly the Royal Society (aided, perhaps, by the Quatuor Coronati Lodge of Masonic researchers) and the Society for Psychical Research began to puzzle out the new rules of magic. And then, on Halloween, 1910, the rules changed again.

"But if a godness places kindly lights in the sky, also it is spreading upon the minds of this earth a darkness of scientists."
-- Charles Fort, *Lo!*

Every would-be cult of black magicians had chosen that Halloween to test out those demonic summonings that had never worked before; the Q.C.L. and S.P.R. had arranged a test of Frazerian thaumo-mechanics at Stonehenge; the last remnants of the Sioux resolved to try the Ghost Dance again. And the air ripped open, and the Elves walked out of trees in Europe, and Russia, and North America. And the earth coughed, and Orcs boiled from the Brocken and out of the Carpathians. And the mountains groaned, and the Dwarves set up shop in the Rockies and the Alps and the Andes. Trolls rose from the water under bridges (and it took the *U.S.S. Kearsarge* two hours to shell the one that showed up under the Brooklyn Bridge into submission); Giants appeared on mountain glaciers from Norway to Oregon to Tibet; Merfolk dove away from passing ships (and looted smaller craft). Demons appeared in magic circles, slew their unfortunate summoners and flew into the night; vampires howled, and dragon reports came from the few aviators aloft. All the races of the Otherworld had returned to ours.

The Great Powers reacted as best they could. King George V granted the Elf-lords noble titles, Henry Ford paid the heads of the American Dwarf-clans handsomely to set up production facilities in Denver, General von Moltke quivered with delight as he realized that the only thing Orcs were better suited for than hard factory work was military drill. Other transitions came less easily. American Elves despised the Human democracy they found themselves under the guns of, and with allies from the Georgia KKK to the Colorado Paiute the more hot-tempered of them launched guerrilla raids against their "inferiors." Socialist agitators and Dwarves with strict medieval guild-rules battled each other, and the company police, in the Ruhr and the Midlands. Colonial governors suddenly found their authority

receding back to the iron railways and the Maxim guns as a thousand minor spirits and jungle bogies fueled uprisings, wars, or murderous rampages leaving colonies in chaos. Each government quickly discovered the special frustrations of depending on cranky dog-scholar occultists for magical information and interpretation. Perhaps with the confusion of the times, it was inevitable that something trigger a war; ironically, it was a Human with a pistol in Sarajevo.

Rapidly, the Great Powers made their peace with the reasonable Others, and ruthlessly exterminated the unreasonable, or drove them into hiding. War brought a certain clarity, and threw aristocratic Elves and proletarian Humans together in the trenches. The more generally warlike attitude of the Others became an advantage to the Human governments, with the Orcs' ferocity (and incredibly rapid breeding potential) becoming the greatest advantage of all, though restricted to the Central Powers by an accident of magical geography. General Staffs flung vast resources into magical research; a new professional class of magician began replacing the drug-addled Theosophists and mountebanks of the pre-war years. Mesmerized dragons swept the skies clear of zeppelins, and then burned cities in daylight raids. By the time Rasputin's coup had taken Russia out of the war (fugitive Elves hinted at a Demonic Empire), "Lawrence of the Djinn" took down the Turks. In the West, the Americans in their Dwarven fighting vehicles finally broke through the savage Orcish resistance and Germany signed the Armistice of 1919.

"Its sources are things long before in mind, or in some cases already written, and little or nothing in it was modified by the war that began in 1939 or its sequels. The real war does not resemble the legendary war in its process or in its conclusion. If it had inspired or directed the development of the legend, then certainly the Ring would have been siezed and used against Sauron . . ."
-- J.R.R. Tolkien, "Foreword to *The Lord of the Rings*"

The exhausted victors found themselves with entirely new problems. The influenza of 1918-1920 brought a plague of Ghouls to most of the world's capitals. Colonial unrest became colonial uprisings from the Naga Rebellion in India to the Leopard Man bush war in Sierra Leone to the Biloko campaign that simply swallowed up the Congo while Belgium bled in Europe. In Russia, the "Demon-priest" Rasputin turned his red-rimmed gaze on his rivals, purging them repeatedly. The Japanese brought their Oni and Kappa under control, but only at the cost of a military coup which brought expansionist generals and admirals into power; they now gobble up piece after piece of a China fallen into Triad-riven chaos. Lawrence's Arab Republic went from British puppet to British rival, between its designs on Egypt (suddenly the most valuable magical real estate on Earth) and its opposition to the Jewish settlers (and their golems) in British Palestine. Bolivia, Chile, Paraguay, and Peru began fighting their own wars over Inca power sites and nitrate deposits; their Dwarven craftsmen (stolidly chewing coca leaves) entered a spiraling race to build ever-more bizarre mountain warcraft.

The savage losses to both Elves and Humans in England and France upset the Seelie Court and European aristocratic society. The two races began to interbreed, much to the dismay of elders on both sides. New magical techniques competed with Dwarven craftsmanship to drive Human workers out of their jobs; the result was more union and Socialist action, eventually leading to national strikes. Vampirism briefly became fashionable after Valentino's undeath in 1924, spreading a new wave of debauchery through "bathtub blood" parties. The younger (or less restrained) Others rapidly integrated themselves into criminal rings and fringe political movements. One such, the Nazgûl-Socialist Party, actually siezed power in Germany in the 1923 Putsch, thanks to massive support from Orcish war veterans who demanded some respect from their defeated nation. Finally, the whole system just gave out in 1929, plunging the globe into a fierce depression that's already three years old and shows no signs of abating. What the next decade will bring, only the augurs and diviners can say -- and they look pale, and swallow hard, and speak in whispers thereafter.

In this world, the PCs might be sorcerous-archaeological teams trying to capture magical artifacts for study ahead of the Nazis or the Japanese for a ***GURPS Cliffhangers*** feel. A party of freelance monster-hunters delving into abandoned European trench-and-tunnel networks buzzing with unexpended magical ordnance and unclassified magical vermin could be close to conventional ***Dungeons & Dragons*** or to unconventional fantastic ***GURPS Horror***. PCs could also be corporate operatives trying to steal a new Dwarven prototype, or labor agitators in a hit-and-run battle of urban punk survival, or Army fliers on dragon patrol, or mercenaries fighting snake-men (or arrogant Elvish sahibs) in India, or British Q.C.L. magi fighting a war of wits against Rasputin's Okhrana. The future casts a long shadow, but you can beat it -- if you run.

Miscellanea I

Okay; my life is sorting out a bit. . . but to be honest it's mostly the eye of the storm. The end of July/beginning of August will be very hectic for me. I point this out because, for the first time in a month and a half, my weekend days (which I normally use to get ahead of the game on *Pyramid*) will be available to me. This means correspondence will hopefully get answered, the Slushpile will get read (or at least whittled down), and I'll be able to get a bit ahead on Random Thought Tables. And then at the end of July I get to go out of town *again* (ugh) and move a week later.

Thanks for bearing with me, and thanks for the words of encouragement. They mean a lot.

* * *

Special Announcement

John Kovalic has an insane convention schedule for the next two weeks, and as such is taking a two-week break from Dork Tower. But not wanting to deprive his devoted following of Kovalician goodness, he has arranged for a special preview of his new project *Snap Dragons*. For this week and next, you'll get three strips for the price of one! These strips will appear in *Dork Tower* #9, but only in black & white. . . because *we* don't charge more for the color pixels.

* * *

For folks writing reviews, here's a few pointers.

- Make sure you include the "vital stats" of the product you're reviewing. This includes the writers/creators of the game, the publisher of the game, the cost, and how many pages it has or components it comes with.
- Don't feel obliged to give a page-by-page breakdown of the supplement. You certainly can, but an itemized list of what's in each chapter may not be as useful as a more generalized view.
- If you like a product, try to think and say exactly *why*. Is it informative? Useful? Fun to read? Saying "I liked ***Advanced Character Compendium 12: Clan Webmonkey***" isn't as helpful to the would-be review reader as "***Advanced Character Compendium 12: Clan Webmonkey*** is the first book that enabled me to understand the unique worldview of the Webmonkeys in the ***Dude: The Slacking RPG***, thanks to its strongly written first person format."
- If you don't like a product, try to say exactly *why*. Is the text flat? Are there glaring mistakes? Is there too little information? Is the book too expensive for what you're getting?
- If you *don't* like a product, try to put yourself in the mindset of someone who might. If you *do* like a product, try to figure out what other people might dislike about it. In my mind, a good reviewer will be able to say not just whether or not they like a product, but who *would* like a product. "People who buy ***ACC12CW*** hoping to improve their character with new equipment and powers will be greatly disappointed. But if you're looking to understand Webmonkey society, their structure and the subplots that make up their culture, ***ACC12CW*** should be a rewarding book."
- For board and card game reviewers, make sure you don't bog your review with too much detail about the rules. You don't need to detail the draw phase, the resource allocation phase, the recounting chits in piles phase, and so on. If a game has a unique play mechanic or device that you want to talk about, then by all means talk about it. But you may want to avoid bogging down your review with a mind-numbing recap of the rulebook; much more useful is an overview of how fun the game is, how social it is, how much luck or skill comes into play, etc.
- Don't forget that you can talk about the physical aspect of the product itself, especially if it influences your perceptions of the game. Art quality and quantity, font and word density, and other non-content related factors can influence the experience of a game. As an ex-retailer, I was able to sell a lot of ***Changeling 2nd Edition*** because it was such a beautiful book. That would be information I would have included with a review of that book.

* * *

Dave Thomas doesn't *really* flip burgers.

For those of you not in the states, Dave Thomas is the Head Honcho of the Wendy's hamburger franchise (the Wendy in question is also his daughter). For whatever reason, Wendy's has chosen him rather than H.R. Puffenstuffy constructs to plug their burgers. As a result there are lots of commercials where you'll see Dave Thomas wearing the little hat and flipping burgers, serving customers behind the counter.

He really doesn't do that. (I don't think so, at any rate. . .)

What does this have to do with anything? Well, there's a sort of fantasy involved when thinking about most creative endeavors where you just sort of believe that everyone is sitting around a huge funhouse, creating products of mirth and merriment.

Unfortunately, the fantasy is usually a lie (or at least an exaggeration).

- Stan Lee doesn't write all those comics.
- Grandma doesn't bake all those Homestyle cookies for Frito Lay.
- E. & J. Gallo, largest wine maker in the world, does not hire two guys named Bartles & James to make their wine coolers.
- And I don't have much to do with Steve Jackson Games outside of *Pyramid*.

I point this out because I'm usually (but not always) the one who comes up with the Pyramid Poll, and I generally do this without instruction or guidance from The Powers That Be at Steve Jackson Games.

I bring it up because, even though I provide my e-mail address on almost every Pyramid Poll as an Other, that doesn't mean that 1) I have anything to do with the matter of the question, and 2) I have any power to change it, unless it relates to Pyramid.

So when I get e-mails like, "Why the heck do you have such cruddy binding on the **GURPS Hardback**?" or "Why don't you release out of print books on CD-ROM?", there's not much I can do per se. If the letter is interesting enough I might forward it to whoever I think *should* get it, but generally it gets read, assimilated into the "what's on *Pyramid* readers' minds" file, and moved to the Personal folder.

I don't want folks to think that the Polls don't matter; they do. Even from those not solicited from the Home Office, they are a good resource to look back on. ("Hmm. . . I wonder how people would feel about a hardback release of this product?") And they're great for beginning discussions and alerting me to viewpoints I may not have been aware of.

But I don't want anyone to think that I'm running down the hall, pounding on Steve's door to demand that **Kung Fu 2100** be brought back into print just because I get an e-mail about it.

-- Steven Marsh

The Quality of Mercy

by James Maliszewski

Art by **Christopher Shy**

"Captain's log, stardate 3109.9. We're currently escorting the research vessel, U.S.S. Sayegh, through an uncharted region of the Shana sector. The sector is located near the Romulan Neutral Zone and the recent disappearance of another research vessel in this region, the U.S.S. Pavan, concerns Starfleet. We've been ordered to remain with the Sayegh until it completes its sensor scans of the sector's Chi 160 pulsar.

"These scans should take no more than a couple days. Once completed, we're to return to Starbase 110 with the Sayegh and the data from Chi 160. This should be an uneventful -- even boring -- mission. I anticipate nothing more troublesome than the demands of the Sayegh's overly zealous scientists for assistance in their endeavors."

"The Quality of Mercy" is an episode written for Last Unicorn's ***Star Trek Roleplaying Game***. While set during the time period of the Original Series, the episode could easily be adapted to the ***Star Trek: The Next Generation Roleplaying Game*** with minimal effort. Few, if any, of the characters and concepts within it will require extensive modification by the Narrator. The primary requirement for the success of the episode is that the Crew serves aboard a ship of the line, such as a Constitution-class vessel, currently assigned to deep space exploration.

Background Information

The Shana sector is a recently discovered region of space within the Federation's exploration zone, but close to the Romulan Neutral Zone. The Federation has not claimed the sector, as it is home to at least two native species with small interstellar states of their own. These two species are the Amena and the Beronin, humanoids with a long history of warring against one another. Both the Amena and the Beronin have warp-capable civilizations (early Level Six technology) with several inhabited worlds. The Amena and Beronin are humanoids, looking very much like humans or Centaurans. The Amena have very pale complexions and light hair, while the Beronin have more swarthy complexions and little to no hair at all.

The Federation has contacted both the Amenar Unity and the Beronin Empire in an effort to open a dialog between them. These efforts have been marginally successful to date. While a lasting peace may take years to negotiate, Federation diplomats are at least pleased to report that most of the on-again, off-again fighting of the past few decades has ceased under their influence.

The Shana sector possesses an unusually large number of Class M worlds. Consequently, Starfleet has dispatched several research vessels to chart them and other stellar phenomena over the past several months. One of them, the U.S.S. Pavan (an Antares-class starship), disappeared without a trace just weeks ago while exploring the sector. Starfleet fears that the Romulans may have had a hand in the Pavan's disappearance, but have nothing to support this fear.

Rather than risk the loss of another ship, Starfleet has dispatched the Crew's ship to escort another science vessel, the U.S.S. Sayegh (also Antares-class under the command of Captain Sameer Sukhamaran), to collect data from the sector's lone pulsar. Unbeknownst to them, events will take a different course, embroiling them in the sector's politics and uncovering the fate of the Pavan.

Act One: Chi 160

This act starts off the episode by presenting the Crew with a dangerous situation that demands quick thinking and a good command of a starship. More importantly, the act introduces an important non-player character that serves as a link to the episode's later events.

Scene One: Sensor Scans

The Sayegh's itinerary requires that it make several passes within a few million kilometers of Chi 160 in order to collect data. This will take about 36 hours to complete. During this time, the Crew is free to do whatever they wish, as their ship need do nothing more than make sure that the Sayegh does not suffer the same fate as the Pavan.

In order to avoid the deleterious effects of the pulsar's radiation, both the Crew's ship and the Sayegh must modulate their shields on a specific frequency. This requires a Challenging Systems Engineering (Shields) test to be successful. Should the Crew's engineer fail in this test, their shields will not be properly reconfigured and will be affected by the pulsar's radiation. The Narrator should not begin to apply the effects of this failure until their ship has spent some time in the proximity of the pulsar.

Scene Two: Trouble!

This scene can occur in two ways. The simplest way is when the Crew's ship has reconfigured its shields successfully, but the Sayegh has not. In this case, the Crew is in a better situation to assist the Sayegh and save that ship. The more complicated way is when the Crew's ship is also affected. In the latter case, the Crew can still act, but they face formidable obstacles.

In either case, the pulsar's radiation takes effect only 2 hours after entering its area. It causes the ship's computer and other systems to shut down completely by damaging the power conduits that provide them with energy. Narrators should determine for themselves which systems are affected and how badly. The important thing to remember is that any damage should serve a dramatic purpose and show that the pulsar is dangerous. The Sayegh will suffer a loss of both its navigation and helm systems, along with intermittent life support outages. This will cause the science vessel to careen helplessly toward the pulsar.

Repairing the damage done requires several Challenging Systems Engineering and Propulsion Engineering tests to be successful. Similarly, the Crew will need to find a way to make certain that their shields are again functioning properly. In any case, the Narrator should be prepared to deal with a variety of possible solution, as Starfleet personnel are very clever and Federation technology quite impressive. Common sense should rule the day, however.

Saving the Sayegh is also open to many solutions. The simplest is to beam members of the Crew over to assist in the repairs. More complicated solutions are possible as well.

Scene Three: Issa to the Rescue

At some point in their struggles with the pulsar, the Crew are hailed by Dolbec of the Amena rescue ship Issa. Dolbec explains he is on patrol in search of damaged vessels and asks if he can be of assistance. When he learns that the Crew are Starfleet personnel, he is obviously overjoyed. He renders whatever aid he can, even going so far as to offer repair crews. Unfortunately, Amena technology is not quite up to Federation standards and they prove of little help. However, he does suggest a proven frequency at which to modulate shields against the pulsar's radiation. If the Crew has not already found a solution already, Dolbec's will serve them well.

Dolbec asks the Crew to return with him to Amena space. He explains that he runs a refugee camp for the forgotten victims of the war with the Beronin. The refugees are in much need of medical attention, some of it from horrible weapons. Dolbec knows that the Federation's medical technology is advanced and pleads for them to assist these poor souls.

The Sayegh is now too damaged to continue its survey of Chi 160. Captain Sukhamaran asks for an escort back to the edge of Federation space to set in for repairs. The Crew need not go all the way back to starbase with him, especially if they acquiesce to Dolbec's plea. Captain Sukhamaran promises to contact them when they dock to let them know the Sayegh returned intact.

Act Two: Things are Not What They Seem

Having escaped the pulsar, the Crew's ship heads into Amena space at the suggestion of Dolbec. Dolbec asks that they pay a visit to the planet Aparna to provide medical assistance to the refugees there. Although Amena medical science is highly sophisticated, Dolbec explains that the Unity government has provided far from enough supplies to meet his needs. Furthermore, visiting Aparna would give the Crew an opportunity to examine the damaged shuttlecraft the Issa discovered.

The Quality of Mercy

Scene One: Medical Emergency

The planet Aparna is a sparsely populated Class M world at the edge of Amena space. Aparna's surface is barren and desolate, the result of decades of fighting against the Beronin with biological and chemical weapons. Dolbec explains that the Unity evacuated most of Aparna's population to other worlds. Those that remained took shelter beneath the planet's surface in a series of underground caverns. These caverns are currently home to thousands of refugees and the Amena who tend to their needs. Dolbec admits this isn't an ideal locale for his efforts, but it's the best he could arrange with the Unity government.

The Narrator should use this scene to emphasize the large numbers of refugees and their plight. The refugees, including children, suffer from a variety of ailments -- malnutrition, disease, and the effects of biochemical agents. Nearly all of these ailments can be easily cured with supplies from the Crew's ship. Unfortunately, doing so will take a great deal of time, as there are literally thousands of refugees. Even if the ship's entire medical staff beams down to the planet and works around the clock, it will take several weeks to treat everyone adequately. Similarly, the Narrator should make clear the unwillingness of the Unity government to provide more than token assistance to Dolbec and his cause.

The Crew may well decide to call Starfleet for additional assistance. This is a reasonable course of action. Unfortunately, Starfleet has few starships to spare at the moment. Assistance will not be forthcoming for a week at the earliest. This leaves the Crew to its resources. This dilemma provides an opportunity for the Crew to use their ship's resources as best as they are able. Narrators should reward ingenious solutions and original thinking with beneficial results. Of course, even the most clever of plans will not cure all the refugees overnight, but could go a long way toward easing the refugees' suffering.

Although humanoid, the internal physiology of the Amena is quite different from that of humans. Consequently, the Chief Medical Officer will need to take genetic samples from the refugees in order to treat them properly. This is particularly important because of the nature of the biochemical agents used on many of them. The Narrator should emphasize that no cure of the refugees will be 100% effective without an extensive genetic scan that will take several days to complete. In the meantime, medical teams can ameliorate some of the worst injuries until the scans are

finished.

Scene Two: The Shuttlecraft

Dolbec gladly shows the Crew the damaged shuttlecraft. He has had it placed in an underground hangar along with several Amena orbital vessels. The shuttlecraft is seriously damaged -- ripped in half by some form of energy weapon attack. Naturally, no one survived the attack and Dolbec reports finding no bodies within the wreckage to identify. A visual examination of it reveals that it is indeed one of the Pavan's shuttles. Its hull numbers and configuration match those of the missing science vessel.

A Moderate test of Shipboard Systems (Weapons) will reveal that a disruptor most likely caused the damage on the shuttle's hull. Many species, including the Klingons and Romulans, use disruptor weapons, so any definite attribution is extremely hard on such minimal evidence. Both the Amena and the Beronin use disruptors as well, but do not offer this information unless the Crew asks for it.

A Routine test of Personal Equipment (Tricorder or Medical Tricorder) will reveal only that Centaurans -- who made up the bulk of the Pavan's crew -- had occupied the shuttlecraft before its destruction. All of the craft's computer and guidance systems have been damaged beyond recovery. Should the Crew think of it, the wreckage can be transported to their ship for further analysis. However, no new information will be revealed through these efforts.

If asked, Dolbec provides the Crew with the coordinates of where he found the shuttlecraft. These coordinates are deep in uncharted space, but quite some distance from the Neutral Zone. Dolbec explains that the Issa's sensors have been modified to operate at extremely long ranges. He and his crew use them to search for damaged Amena vessels that have somehow lost their way home. Interestingly, the coordinates are some distance from the Pavan's last reported position. It's not inconceivable that an Antares-class ship could get as far as the coordinates; it's simply odd given where Starfleet believed it to have been.

Dolbec will express sincere regret at the loss of life aboard the shuttlecraft. He will then go on to explain that he was once a soldier in the wars between the Amenar Unity and the Beronin Empire. Like many young men, he thought it was his duty to serve the Unity in this way. In time, he realized that war would solve nothing and he renounced his former life. He then devoted himself to aiding those afflicted by this war wherever he found them. Dolbec regrets that he cannot do more, but he hopes that the Federation may eliminate the need for his activities. In fact, Dolbec looks forward to the day when there are no more refugees to aid.

Characters who succeed at a Routine Medical Science (Psychology) test will be convinced of the depth of Dolbec's pacifism and dedication to aiding others. A Moderate test of the same skill will reveal that, despite this, Dolbec is hiding something. What he is saying is not entirely the truth. Attempts to use any form of Telepathy or Empathy on him will fail -- the Amena brain is too different to be affected by most psionics.

Scene Three: Into the Void

Traveling to the coordinates Dolbec provided will take the characters about five parsecs beyond the Amena frontier. Routine sensor scans will reveal the area to be devoid of any stellar bodies or asteroids. In fact, the area is completely devoid of anything at all! It is simply deep, open space.

More detailed scans will not even reveal a single additional fragment of the Pavan's shuttlecraft. This is extremely odd, especially considering the fact that disruptors destroyed the craft. Unlike phasers, disruptors generally leave debris behind, even if it is only on the molecular level. The ship's sensors reveal no debris of any sort. Even taking into account several days of drift, the coordinates cannot be correct. The most logical conclusion is that Commander Dolbec has deceived the Crew.

While the Crew is searching the area, long-range sensors detect the presence of another ship several light-years behind them. A Moderate Shipboard Systems (Sensors) test will reveal that the ship is, in fact, a Beronin warship and is headed in the same general direction as the Crew's ship. It does not appear to be following the Starfleet vessel, but a

Routine Shipboard Systems (Helm) or Starship Tactics (Any) test will show that it is employing a search pattern.

Scene Four: Another Perspective

Unless the Crew seeks it out, the Beronin vessel will make no effort to contact them. It appears to be going about its own business. Should the Crew hail them, however, they will respond. The ship's commander, Captain Suma of the starship Talman, will communicate only reluctantly and is marked by a gruff manner. He explains that the Talman is patrolling Beronin territory in search of a renegade Amena vessel that is threatening the cease-fire brokered by the Federation. The Amena starship shows no respect for recognized borders and has even been detected in orbit around several worlds on the Amena-Beronin frontier.

If confronted with the fact that the Talman is no longer within Beronin territory, Captain Suma will become agitated. He'll rudely explain that the Beronin Empire does not take kindly to interlopers and will pursue such beings wherever they go -- except into Amena territory, of course. Suma claims that he had reports that this renegade Amena vessel had been detected in this area of space. He then asks the Crew to leave the area, so that he may continue his own mission.

Suma is ill-mannered and clearly resents the presence of Starfleet in the Shana sector. In general, he is uncooperative and surly, providing only as little information as is required. If asked about the renegade Amena vessel, he will transmit several sensor logs to the Crew's ship. An analysis reveals that Suma is telling the truth -- an Amena vessel has been spotted in Beronin territory, even in orbit around several Beronin worlds. More startlingly, the Amena ship appears to be the Issa!

Although resentful toward the Crew, Captain Suma asks them if they have encountered this vessel in their travels. In turn, he denies ever having encountered the Pavan. He suggests that perhaps the renegade Amena ship is to blame. After all, the Amena are an untrustworthy people and there would still be war were it not for the "good works" of the Federation. With that note of sarcasm, the Talman turns around and heads back toward Beronin space.

Scene Five: Medical Discovery

The Chief Medical Officer and his staff will discover several unusual findings from their genetic scans of the Amena refugees. First, not all of the refugees are Amena -- a few dozen are actually Beronin! Although the two species generally look different from one another, there is considerable ethnic variation within each group. Thus, it's quite possible for one to pass for the other.

Second, the genetic variation between the Amena and the Beronin is slight. Distinguishing between them is not difficult with the proper medical equipment. Even so, the variation is small, so small that most Federation anthropologists wouldn't consider the Amena and Beronin to be separate species at all.

Third, the DNA of both the Amena and the Beronin possesses an additional protein sequence that appears artificial. The sequence serves no obvious purpose and has the hallmarks of being engineered. Without further evidence, it's hard to say, but it's possible that both the Amena and Beronin are the descendants of a genetic experiment of some sort. By whom, no one can guess at this point.

Finally, the genetic scans have provided the CMO with enough data to alleviate the ailments of the refugees, whether Amena or Beronin. Several days will still be needed to fabricate the necessary drugs, however.

Scene Six: Back to Aparna

More than likely, the Crew will want to return to Aparna to confront Dolbec about the Issa's recent travels. If what Captain Suma said is true -- and the sensor logs support him in this -- Dolbec has been lying to them. Rightfully, they'll want to find out why.

By the time they arrive at Aparna, however, Dolbec and the Issa are nowhere to be found. Inquiries at the refugee camps will reveal that the Issa disembarked on another mission just a few hours ago. While it has a head start, the

Issa's maximum speed is warp 6 and it is unlikely to traveling at that velocity. Thus, it shouldn't be hard to catch up to the Issa -- if the Crew can determine where it is!

Act Three: Resolution

The events of this episode finally come to a head as the Crew unravels its central mystery: what happened to the Pavan and what role did the supposedly pacifistic Dolbec play in its disappearance? The Narrator should take care to play up the tension of this act. The Crew has been deceived by someone they thought trustworthy. They'll naturally want to know the reasons behind this deception. The revelation of that reason will present them with a moral quandary they might not have expected.

Scene One: Parth

No one on Aparna knows the Issa's destination. However, a Moderate Shipboard Systems (Sensors) test will reveal its current location. The ship is now within the borders of the Beronin Empire in orbit around the planet Parth. Parth is a Class M world whose location is very close to the Amena-Beronin border. Parth was a major battleground in the wars and saw heavy casualties. For the most part, the Beronin have abandoned it, although there is still a small population on its blasted surface.

Reaching Parth will require the Crew to cross the Beronin border, an act the Empire might consider provocative. Nevertheless, there is no way to reach the Issa or Parth without crossing the frontier. The Crew must decide for themselves whether or not to do so. Their feelings might well be affected by the knowledge that their ship's sensors also detect a Beronin warship en route to Parth at maximum warp. Clearly, the Beronin have decided to deal with this intruder by force.

The Beronin warship will reach Parth in fifteen minutes. This doesn't give the Crew much time to act. The Narrator should keep reasonable track of game time, making certain to keep the Crew under pressure. There's no need to rush things, but the Crew should never forget that they are under a time constraint.

At this stage, the Crew can do one of several obvious things. First, they could hail the Issa in an attempt to determine what it is doing. Second, they can use their sensors to determine what they can about its activities. Third, they can beam down to Parth (or the Issa, for that matter) and see for themselves. Other options are available, of course, and the Narrator should be prepared to deal with them as the need arises.

If the Crew hails the Issa, Dolbec will answer them. He'll be evasive and will answer few direct questions. He will, however, warn the Crew to leave Beronin space or they'll suffer the same fate as the Pavan. If told of the approaching Beronin warship, he'll thank the Crew and promise to be out of the area before it arrives. Other than this, he'll say nothing more.

Scanning the Issa will reveal that its shields are not operative at the present time. Its transporters are operating at very high levels, beaming large numbers of people from the surface of Parth to the Issa's large cargo areas. The scans cannot determine whether the persons beamed aboard are Amena or Beronin.

Beaming down to the planet's surface will reveal a refugee camp very similar to that on Aparna, although less well maintained. Like its counterpart, the camp is filled to overflowing with the wounded and the dying, many of them afflicted with biochemical ailments. Several members of the Issa's crew appear to assisting their Beronin counterparts in transporting some of the worst cases aboard their starship. If confronted, the Issa's crew will admit that they are aiding their former enemies against the wishes of both governments. If the Crew really cares about a lasting peace, they should either help them or at least not delay them. Time is of the essence.

The same basic course of events will occur if the Crew beam over to the Issa unannounced. In this case, Dolbec himself explains all of the above information to the Crew. He apologizes profusely for the deception, but feared the Crew would reveal his covert activities, thereby jeopardizing both himself and his Beronin counterparts. He explains

that neither the Unity nor the Empire is willing to expend the little effort necessary to aid those most harmed by the wars. Instead, they'd rather seek redress for long-forgotten slights and curry favor with the Federation against the other. When he learned that Beronin refugees were in even worse straits than the Amena, Dolbec felt there was no option but to cross the border illegally and assist them as best he could. Since then, he has been secretly ferrying small numbers of Beronin to Aparna for medical treatment.

In addition, Dolbec reveals that he misled the Crew about the location where he found the Pavan's shuttlecraft for a similar reason -- he found it in Beronin space! As the Crew may already suspect by now, disruptor weapons from either a Beronin or Amena starship destroyed the shuttle. In point of fact, Dolbec knows that it was a Beronin vessel that mistakenly believed the Pavan to be the Issa. If asked, he can provide data to show that the disruptor damage to the shuttle is consistent with Beronin weapons technology, not the Amena (or the Romulans or Klingons, for that matter). Dolbec lied to protect both himself and the Beronin. He fears that, if the Federation found out that the Beronin were responsible for the destruction of one of its ships, it might lead to war -- something Dolbec wishes to avoid at all costs.

Scene Two: Showdown

As the Crew and the Issa's rescue team confer, the Beronin warship arrives in the Parth system. The warship is on an intercept course with the Issa, its weapons and shields ready for combat. Captain Trudel commands the ship, called the Memari. Trudel hails the Issa and asks that they prepare to be boarded. He also asks that the Crew's ship not become involved in what he calls "an internal matter of the Beronin Empire."

Quick thinking is called for at this point. Dolbec refuses to accept a boarding party and prepares to flee back into Amena space. He asks the Crew to assist him in this endeavor. While the Memari is less powerful than a Constitution-class vessel (it's the equivalent of a Ranger-class starship), the Crew should realize that attacking it would create a significant diplomatic incident. The Federation would be none too pleased with their firing upon the Memari. Even assisting the Issa might be suspect behavior. Instead, they must find other options.

Attempting to reason with Captain Trudel is the best option. Like all the Beronin, however, he resents the Federation presence in the Shana sector and quickly digs in his heels. He argues (not unreasonably) that the Issa has violated Beronin space and should be detained. If told that the Issa is on a mission of mercy, he will be skeptical. If shown proof, he will soften somewhat. Whatever the case, he will insist that he alone has jurisdiction in this area. No one -- certainly not the Federation -- will dictate his course of action.

If confronted with evidence that a Beronin warship destroyed a Starfleet vessel, Trudel will back off somewhat. He will maintain the pose that the Beronin answer to no one within their own space. Yet, he is clearly frightened that news of this attack will create a diplomatic incident (as anyone with Medical Science (Psychology) will realize). Thus, he will "allow" the Crew's ship and the Issa to leave Beronin space "in the interests of peace." He will demand that any Beronin citizens aboard the Issa be returned to Parth, but he will do no more than protest if his demand is not met.

Scene Three: Conclusion

Provided Dolbec and the Issa escape, the Crew will want to return to Amena space to assess all that they've learned. In addition, Dolbec will be quite interested to hear that the Amena and the Beronin are close genetic relatives, perhaps even once the same species before centuries of genetic drift separated them. That they're engineered species (if the Crew reveals that too) will only add to his wonderment. Dolbec will see both of these discoveries as useful tools in ending the conflicts of the Shana sector. If the Amena and Beronin can come to see themselves as sibling species rather than rivals, perhaps a lasting peace can be forged.

Of course, the destruction of the Pavan raises some difficult questions. The evidence the Crew has gathered suggests strongly that a Beronin warship destroyed the Starfleet vessel. Whether or not the attack was intentional, it is still a terrible tragedy. The Crew can choose either to report the truth to Starfleet or to hide what they've discovered. Dolbec argues for the latter course of action, believing that no good will come of branding the Beronin as trigger-happy thugs. At the same time, he understands that the Crew has a duty to the truth. The final decision rests with the Crew's captain,

who may be swayed by eloquent arguments for or against either position.

Rewards

All characters that complete this episode should be awarded 2 Experience Points for their efforts. If they dealt with the moral dilemmas it occasioned in an especially exemplary fashion, they are eligible for an additional Experience Point.

All characters that complete this episode receive 2 points of Renown, one in Skill and one in Openness. Those who do not counsel violence when confronted with the Beronin warship receive an additional point of Renown in Openness. Additional awards are possible depending on the circumstances of the episode. Narrators should consult the Reward Awards Table for suggestions.

Sequels

There are many potential follow-ups to this episode. For one, the Crew could be assigned to Shana sector for an extended period of time to deal with aftermath of its many revelations. How does Starfleet deal with the fact that the Beronin destroyed the Pavan? Do they Amena take advantage of this situation? What of the fact that the Amena and Beronin are actually "siblings?" Can this news bring lasting peace or will it turn war into a "family affair?"

For that matter, who created the Amena and Beronin and to what end? Is there evidence of this elsewhere in the sector? Could there be any relation between this and the large number of Class M planets in the sector?

The Romulans weren't involved this time, but are they really uninvolved in a region so close to their space? Could there be Romulan spies lurking in the sector's unknown regions?

All of these ideas and more can be exploited by the Narrator looking to continue the Crew's adventures in the Shana sector.

by Joe G. Kushner

Art by Art Today

Captain Basilio damned his luck again. His Kraek, the Magister, had never suffered so much bad luck in its whole existence as it had on this voyage. Bad enough when ten of his crew were slain in a firefight with the cursed French ship Extant, but this new ship was different.

The dead manned it.

Captain Basilio made the sign of the cross and prayed that he would not die on these sorcerers' seas.

While the Golden Age of Piracy does not arrive until the sixteenth and seventeenth centuries, pirates still thrive in the Renaissance, and can make a useful campaign addition for *Mage: The Sorcerers Crusade*. The different styles of ships that Mages use, such as Skyriggers, insurers that there are unique types of pirates.

Pirates originate for many reasons. Pirates are lured to the sound of coins clinking together, and gather in hordes to overwhelm their opponents. Many maritime powers employ naval forces only when necessary. The life of a pirate enables these jobless seamen to return to what they know, and if motivated by vengeance, take it. Pirates enjoy an unprecedented amount of freedom. The whole world is theirs for the taking! Who else has the ability to sail around the world and not be at the beck and call of their home government? Lastly, pirates are not above forcing those they've bested to serve them. This insures that pirates always have a new supply of fresh blood.

The perils of piracy are high, however. The punishment for piracy is an old one -- hanging -- and is handed down from the dark ages. In the more enlightened east, beheading is the standard punishment. Privateers, those that worked under a Letter of Marque, can often be ransomed back to their country. The Letter didn't guarantee safety, though. Some countries, like Spain, considered privateers nothing more than poorly organized rabble and denied them any opportunity for ransom. Even if those who have captured the privateer tried to ransom him, if the privateer's country refuses to acknowledge him, the fate of the privateer is the same. Death.

During the Renaissance, most pirates hailed from the Barbary Coast, named after its inhabitants the Berbers. The Berbers founded Algeirs around 950 AD. Muslims fled here after their defeat at the hands of Christians in Spain in 1492 AD.

The Barbary Coast extends from the western board of Egypt to the Atlantic Ocean. Algiers, Tripoli, and Tunis, located in North Africa, serve as the home ports for many of the pirates of this time. These independent Muslim states had alliances to the Ottoman Empire. The

Great Corsairs Barbarossas (a European name originating from their red beards) helped craft the states of Barbara; their real names are Aruj, and his brother Kheir-ed-din (Khayr ad-Din), whose name means "defender of the faith."

Aruj struck a deal with the king of Tunis, the capital port city of Tunisia. In exchange for allowing the harbor to be used for pirate matters, the king would be given one fifth of everything that Aruj captured. One of his greatest deeds is the capture of two of the pope's grand galleys off the coast of Elba.

Barbarossa's rise was not without its trials, though. In 1514 he lost an army while trying to capture Bougie from its Spanish owners. Kheir-ed-din took control while his brother recovered. The two's fortunes increased again when they captured Algiers from the Spanish. By 1517, Barbarossa controlled most of what is now Algeria, save for Penon and a few isolated Spanish garrisons. Algiers, held by the Spanish since 1510, declared itself part of the Ottoman Empire in 1518 and ousted the Spanish.

After Aruj's death at the hands of Spanish forces in 1518, Kheir-ed-din, formerly a lieutenant, molded Algiers into a powerful corsair base and strengthened the Ottoman Empire's power over the waves. In the same year, the Ottoman sultan appointed Kheir as his beylerbey, which made him the Sultan's representative in Algeria. Becoming an Ottoman Admiral in 1533, Barbarossa managed to conquer all of Tunisia within a year and turned it into another pirate haven. This Barbarossa also suffered setbacks, though. The Holy Roman Emperor Charles V captured Tunis and Golettain 1535. Barbarossa rose to the occasion and defeats Charles V's fleet at the Battle of Preveza in 1538. He remained one of the great figures at the court in Istanbul, until he died in 1546.

King Ferdinand V captured Tripoli in 1510, and in 1530 gave it to the Knights of Saint John of Jerusalem. Despite being outside of the timeline of a normal *Crusade* game, the capture of Tripoli by Turkish Corsairs in 1551 illustrates that pirates do more than simply capture bounty from others' ships. After its capture by the Turkish, Tripoli remains an Ottoman providence until the twentieth century.

The French provide another avenue of piracy.

Jean Ango of Dieppe, born in 1480, inherits his father's import-export business which controls a fleet of 70 ships. During Francis I's reign, Jean provides Giovanni da Verrazano the "Dauphine" in 1524. While Giovanni da Verrazano is more known for his exploration of what would become North Carolina, the Spanish knew him as a pirate.

Prior to that one of Jean Ango's captains, Jean Fleury, seized three Spanish ships carrying treasures from the Aztec Empire in 1523. Francis authorized Ango to raid Portuguese shipping, which allowed him to compensate for the losses sustained at Portuguese hands. When Francis died, Ango was imprisoned by his rivals in 1549 and dies two years latter.

During the whole period of *M:tSC*, France is almost always at war with Spain. This lends the French and the Spanish many reasons to attack one another on the high seas, even in times of peace. Such details add depth if one character is Spanish and another is French. Would their ties to their Traditions hold them at peace or would nationalistic pride force them to bear arms against one another?

Outside of pirates working directly for a country, the seas were home to organizations whose military strength equaled that of a country. The Hanseatic League, while not a military organization, was able to gather enough force to fend off pirates and when necessary, even to defeat a country. The Ottoman Empire expelled the Knights of Malta, a sect of Knights Hospitalers, from Rhodes in 1522 AD. Charles the V gave these Knights Malta, Gozo, Comino and Tripoli in 1530 AD. The Knights lost Tripoli to Turgut Reis in 1551 AD.

The knights paid one Maltese falcon annually to their overlord and were very self-sufficient. The three limits they labored under included a reliance on Sicily for food, allegiance to the pope, and the power Europeans had over the order when the order labored in those countries. In many cases, the Europeans could claim their possessions without any legal difficulties. These knights were expected to serve Charles in all Christian maritime battles against the Ottomans. One example of this is seen when the knights provided four galleys at Prevesa in 1537 for the struggle against the Barbary corsairs.

Unlike some privateers, the knights were not allowed to keep the goods they claimed and had to surrender them to the order. In 1545, Signorino Gattinaro was punished for attempting to keep his spoils from the order. Still, most of their victims thought of the knights as nothing more than "corsairs parading crosses." Most of these victims were Muslim merchant ships, but Christian and Jewish ships that dared to trade with Muslim ports were also fair game.

Just as the era of the *Sorcerer's Crusade* is fading, the Order suffers numerous setbacks as the Ottomans not only capture Tripoli, but plunder Gozo and attack Malta, all in 1551.

Other knightly orders include the Knights of Rhodes, who are active from 1308 AD to 1522 AD, and the Knights of Saint Stephen, a group of Italian corsairs who thrive from 1562 AD to 1749 AD.

M:tSC Hooks

Game Masters may wish to add the following Concept to those available from *M:tSC* and *M:tSCC*.

- **Pirate**
  The Spanish make it so easy. They do all the hard work of fighting, mining, and capturing the monies of the New World, and you make sure that you and your friends are able to take it. The risks are great; you've lifted many a glass of wine to departed comrades, but the rewards are more than worth it. You laugh at the Skyriggers and their foolishness in exploring the skies -- but if you had such a vessel, you'd gladly rob them as well. When not practicing the arts of piracy, you've been known to sell your services to explorers, merchants, and (when provided with the proper letters), as a privateer.

The following are Talents, Skills, Knowledges, Merits, and Flaws useful for Pirates. They are taken from the core *Mage:tSC* unless indicated otherwise.

Talents

- **Intimidation:** Many pirates rely on their ability to cower their prey. Most pirates would have Violence, Threats, or Withering Glance as specialties.

Skills

- **Artillerist:** For those pirate ships that have access to cannons or weapons of war, this is a must have. Only Hand Cannons, Sieges, and Fireworks don't see a lot of use by pirates as their specialty.
- **Climbing** *(M:tSCC)***:** Most sailors have to climb the masts at one point or another. GM's should create a new specialty, Ship to represent pirates truly at home on their vessels.
- **Leadership:** Very useful for maintaining command over a group of blood thirsty pirates. Most useful to pirates are the military, commands, and threat specialties.
- **Melee:** A mandatory skill for pirates whose infamy isn't enough to persuade their victims to surrender. Pirates normally have swords as a specialty, but improvised weapons and tavern fighting are also popular choices.
- **Pilot:** A necessary skill for those wishing to pilot the Skyriggers. Pirates would use most specialties save for Clockwork Beasts, Tanks, and Automations.
- **Seamanship** *(M:tSCC)***:** Almost a mandatory skill for those wishing to climb the ranks. The Specialties most pirates would find useful are Galleys, Great Ships, Warships, Long Trips and Storms.
- **Swimming** *(M:tSCC)***:** A mandatory skill for survival. All of the specialties are useful to the true pirate.
- **Torture:** Sadly, some rogues will not reveal where they've hidden their most precious treasures that you know they posses. Most pirates chose Machines, and Exquisite Pain for their specialties.
- **Weather Eye** *(M:tSCC)***:** A handy talent that allows the character to plan the best times to overcome sails with oar power. Almost all pirates would have the specialties of Sea.

Merits

- **Letter of Commission** *(M:tSCC)***:** A Letter of Marque is a four point Merit.
- **Well Traveled** *(M:tSCC)***:** This Merit represents the character's numerous journeys which have taken him far and wide.

The following Flaws can be used to add background to the character.

- **Beholden** *(M:tSCC)***:** Owing someone a ship would be considered a three point flaw. The former ship owner may call upon the character to do him favors with a small reminder of the ship itself. "So how is the old ship?"
- **Enemy** *(M:tSCC)***:** Many pirates have this Flaw. If a pirate is French or Muslim, Spain and its sailors would be the foe to take. This is worth three or four points depending on how much the Game Master wants to incorporate the flaw into the campaign.
- **Infamy:** Perfect for the pirate who wants his foes to know who their dealing with.
- **Oathbreaker** *(M:tSCC)***:** The character has betrayed his home nation completely and works for a foreign power. Such a character is known as a renegado if European and working for the Ottoman Empire.

Pirate Hooks

- Characters whose nationality is French, Spanish, or Muslim may be engaged in a life of piracy, or privateering when the campaign starts. The GM should make sure that they have a ship, and determining if one of the players is the captain or if they serve as first mates.
- Players may be captured by pirates and pressed into joining them. If the players prove difficult, the pirates may strand them on an isolated island and wait for the characters to come to their senses. Most spell casters should be able to escape unless another mage is leading the pirates or the place they've been marooned on has supernatural inhabitants.
- Characters that are marooned may be on an ethereal island that sinks back into the other realms, and must find their way out.
- An old friend whose wife has been captured by pirates contacts the

characters. He begs for their aid in restoring his wife or avenging her if necessary. This hook also works well for characters that have relatives. Their anger at having a parent or sibling would be powerful, and could make for engaging gaming. Pirates often take those worth no ransom and put them to the oars.

- The players are onboard a ship when they see a pirate ship under attack from a creature that looks like it would be more at home in the Void. The pirates spot the characters and send up signals begging for their help. If the characters refuse to help, the pirates start moving their ship towards the players in a mad attempt at revenge. Even if they are personally unable to finish the characters, the monster attacking their ship will! This works well for GMs allowing their players to use Skyriggers as well. GMs who have access to *Blood Dimmed Tides* should use the Gigantic Squid on pages 107 and 108.
- One of the character's homes is utterly destroyed by a Skyrigger pirate crew using a new weapon. The players are told by one of the survivors that they saw the Skyrigger take refuge in a nearby mountain and can lead the characters to it.
- The characters are visiting Tripoli as guests of the Knights of Saint John of Jerusalem when pirates come calling. This theme works well in any port city, even one that is highly defended. Some pirates brought their men in to create distractions in the city; only if such distractions are successful would they launch their attacks.
- Players could be in command of one of Ango's 70 ships. They might be on loan to different employers, fulfilling special needs that normal individuals cannot. GM's can weave the campaign around so that the players are the ones who have him imprisoned.
- The characters belong to a knightly order. This can be a historical order, such as the Knights of Malta, Rhodes, or Saint Stephen, or one that the GM creates from scratch. The GM must decide ahead of time if these are good and noble men, or simply pirates acting under cover of a fading way of life.

Weapons

Many pirates favor the cutlass, a short heavy sword with a curved blade, and the hanger, a short hunting sword. Both were easier to use in the confined spaces onboard a ship. GMs should allow Skyriggers designed by the House of Daedalus to craft Greek Fire projectors onto their ships.

Type	Difficulty	Damage	Concealment	Minimum Strength
Blade				
Cutlass	6	Strength +4	L	2
Hanger	4	Strength +2	C	1

Terms

- **Buccaneer:** A French, Dutch or English Pirate. This word does not come into use until the 17th Century and would be inappropriate for a *M:tSC* campaign.
- **Corsairs:** The French name for a Barbary Coast Pirate.
- **Pirate:** Sea Robber. Any theft at sea is considered an act of Piracy.
- **Privateer:** Working under a Letter of Marque, a Privateer is doing the work of his home country in robbing other ships. The word privateer is first recorded in the mid 17th century, but Letters of Marque have been known since the 13th century.
- **Raises:** Kings who commanded the Barbary Pirates.
- **Renegados:** European Raises who had status in the Turk Empire.

Resources

Role Playing Books

- *Blood Dimmed Tides*. Published by White Wolf. This book features sea creatures and methods of incorporating Vampires, Werewolves, and Wraiths to the Sea. In addition, the Merits and Flaws are useful for a water-based campaign. (For more information, see the Pyramid review.)
- *Castles and Covenants*. Published by White Wolf. The section entitled Ships of the Line shows several different types of vessels that are found in the Renaissance time period.
- *Pirates*. Published by ICE. (Out of print) This book enables an ambitious Game Master to carry his *Mage the Sorcerer's Crusade* into latter time frames.
- *Sea Law*: Published by ICE. (Out of print) The book has illustrations which *Castles and Covenants* lacks. Game Masters may also take with them some knowledge of sea combat and methods of handling magic on the high seas.

Non-Fiction

- **Pirates**. By Turner Press. The sections on The Lure of Spanish Gold and the Corsairs of the Mediterranean can give GM's numerous ideas and scenarios to use pirates and privateers in.
- **The Wordsworth Dictionary of Pirates** by Jan Rogozinski, published by Wordsworth Reference. A collection of people, places and miscellany on Pirates.

by Brandon Cope

Art colored by Keith Johnson

This is a follow-up to the previously published article on 25-point characters for *GURPS Fantasy* campaigns. Rather than repeat that article's introduction, only notes for using the characters in near- or far-future setting will be given.

Most character backgrounds are presented with a *Space* campaign in mind. Some details are intentionally left vague, specifically with regards to the names of planets and cities; this is so that the characters can be used, with as few changes as possible, in as many campaigns as possible. Notes on using the characters in non-Space (mainly Cyberpunk and Modern Day) settings is given after each description.

Special Note for *Cyberpunk* campaigns: Only one of the characters below has any cyberware -- it is usually uncommon in *Space* settings and unavailable in modern day campaigns, so in a "generic" article like this it would make some characters of less utility. However, as most of the character below have less than their -40 limit in disadvantages, it would be easy to keep a character at 25 points by making sure you add disadvantages equal in value of the cyberware.

The Characters

Officer Rudolph Nettles

starport security

ST: 11 [10] **Basic Damage** Thrust: 1d-1 Swing: 1d+1
DX: 12 [20] **Dodge:** 5 **Parry:** 5 **Block:** n/a
IQ: 10 [0] **Basic Speed:** 5.75 **Move:** 5
HT: 11 [10]

Advantages: Legal Enforcement Powers (starport) [5], Alertness +1 [5].
Disadvantages: Appearance: Unattractive [-5], Duty (12 or less) [-10], Hidebound [-5], Stubbornness [-5], Unluckiness [-10].
Quirks: Doesn't believe in "the book", Uneasy around tall people, Dislikes the locals, Misses most jokes.

Skills: Area Knowledge (starport)-11 [2], Beam Weapons (Lasers)-13 [1], Driving (Car)-11 [1], First Aid-10 [1], Guns (Tangler)-13 [1], Professional Skill: Law Enforcement-12 [6], Streetwise-9 [1], Tonfa (for nightstick)-10 [1].
Gear: laser pistol, tangler, nightstick (small club), medium monocrys vest, first-aid kit, handcuffs, uniform, short range radio.
Appearance: 5'5", 145 lbs, black hair, brown eyes, white skin, 29 years old.

Rudolph Nettles, like his uncle before him, works security at the world's primary starport. His father (a widower) moved to the planet when Nettles was only nine. Due to his small size, he was mercilessly hounded by other children. Perhaps even worse, the parents encouraged such behavior against him, as the locals have a strong dislike of outsiders. Because of this, Nettles is somewhat uncomfortable around much taller people and treats locals poorly.

Nettles is dedicated to his job, but more than willing to let minor infractions slide since it means less paperwork. Also, somewhat to the ire of his superiors, he doesn't go by the book very often, taking shortcuts in procedure when they seem warranted (and he thinks he can get away with it).

Unfortunately, bad luck and a poor imagination have resulted in some of these shortcuts becoming near-disasters. He has nearly been fired several times and has been suspended twice.

Campaign Uses: Almost every party will visit a starport and many parties will do things there of at least questionable legality. Nettles is easy-going enough that the PCs should stay out of trouble unless they really annoy him or do something serious.

Other Settings: In a *Cyberpunk* setting, Nettles becomes part of corporate security. As long as his actions don't hurt the bottom line (usually the only thing that megacorps are worried with), he'll keep his job. In a Modern Day setting, Nettles fits best as a small-town cop (although he could still be a security guard). However, in most of this century, his dislike of locals will cause more problems than him side-stepping proper procedure.

Parker Gundersen

hermit colonist

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d
DX: 11 [10] **Dodge:** 5 **Parry:** 4 **Block:** n/a
IQ: 10 [0] **Basic Speed:** 5.75 **Move:** 5
HT: 11 [10]

Advantages: Acute Vision +1 [2], Disease-Resistant [5], Fit [5].
Disadvantages: Intolerance (off-worlders) [-5], Loner [-5], No Sense of Humor [-10], Semi-Literacy [-5].
Quirks: Wears his "lucky" bandana, Brags excessively, Swears frequently, Proud of ancestry.
Skills: Area Knowledge (mountains)-13 [6], Beam Weapons (Lasers)-12 [1], Climbing-11 [2], Cooking-10 [1], Knife-11 [1], Naturalist-8 [1], Orienteering-10 [2], Survival (Mountains)-12 [6], Tracking-10 [2].
Gear: laser rifle, one extra power cell, large knife (1d-1 cut/imp).
Appearance: 5'9", 165 lbs, unkempt blonde hair, brown eyes, tanned, weathered skin, 37 years old.

Were Parker Gundersen more highly skilled, he could perhaps be considered the archetypical frontiersman. Instead, he ekes out a marginal living in the mountains near the main colony site on the planet. He rarely enters the colony, often causing fights when he does.

Gundersen can trace his family tree back to the planet's original colonists; his pride in this bloodline has resulted in a great dislike of off-worlders (which, to Gundersen, includes colonists whose ancestors weren't original colonists).

Gundersen has several qualities that make him an unpleasant person to deal with: he swears constantly, brags about his accomplishments and has a severe stubborn streak. Only the fact that he dislikes being around other people even more and keeps to himself for the most part keeps him from being hated.

Campaign Uses: If the party ever has to go into the mountains, it is very likely they will run into Gundersen. Although he won't like the party (being off-worlders trespassing on his turf), a significant gift may help overcome such intolerance for a brief period. Since he knows the mountains better than any other colonist, he may be the only person the party can turn to.

Other Settings: In *Cyberpunk*, there is plenty of room for someone that has given up on society and gone to live apart from it. He doesn't really fit post-WWII campaigns, but earlier in the century (and especially in the Old West) he works well.

Fast Eddie

small-time thief

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d
DX: 12 [20] **Dodge:** 5 **Parry:** 4 **Block:** n/a
IQ: 10 [0] **Basic Speed:** 5.5 **Move:** 5
HT: 10 [0]

Advantages: Serendipity [15], Contact (Street, skill-15, available on a 9 or less, somewhat reliable) [2].
Disadvantages: Cowardice [-10], Callous [-6], Delusion (moderate, "All Women Love Me") [-10], Odious Personal Habit (Tactless) [-5].
Quirks: Changes hair color frequently, Easily bored, Loves motorcycles.
Skills: Beam Weapons (Laser)-12 [0.5], Climbing-10 [0.5], Detect Lies-8 [1], Electronic Operation (Security Systems)-10 [2], Escape-10 [1], Fast Talk-11 [4], Motorcycle-13 [2], Pickpocket-10 [1], Stealth-12 [4].
Gear: holdout laser, 2 power cells, light monocrys vest, mini-tool kit (electronic), motorcycle.
Appearance: 5'6", 105 lbs, short died-green hair with goatee, brown eyes, 23 years old.

Fast Eddie is an otherwise average thief with a knack for being lucky at the right time. He never knew his parents, being raised by poor distant relatives who took him in only because of the extra government money they received for the trouble. When Eddie turned 16, the extra payments ended and he was promptly kicked out. Fortunately, he had learned some valuable street survival skills, but his childhood left him unconcerned with the welfare of others.

Eddie is extremely adverse to physical confrontations and will try his best to avoid them. Unfortunately, he has a rather blunt way of dealing with people, which tends to cause physical confrontations with the kinds of people he deals with. He also, for some reason, thinks that women love him and will do anything for him.

Fast Eddie has, from time to time, tried honest work, but has quickly grown bored with the job. He finds illegal work much more exciting, and his uncanny knack of having good things happening to him has only incited him to keep on the other side of the law.

Campaign Uses: Fast Eddie can serve several purposes; picking the pocket of a PC and breaking into the party's hotel are two. He could be hired by the PC's foes to harass the party with similar tactics (on the other hand, the party could hire him the harass their foes).

Other Settings: As small-time thieves are present in virtually every setting, Fast Eddie works pretty much as written for any campaign.

Alfred Edmonds

computer specialist

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d

DX: 10 [0] **Dodge:** 4 **Parry:** n/a **Block:** n/a
IQ: 13 [30] **Basic Speed:** 4.75 **Move:** 4
HT: 9 [-10]

Advantages: Lightning Calculator [5], Mathematical Ability [10].
Disadvantages: Delusion (minor, "I'm being watched by 'Them' ") [-5], Gigantism [-10], Low Pain Threshold [-10], Skinny [-5].
Quirks: Doesn't like being called "Al", Won't play games on a regular computer ("They aren't toys."), Dreams about being "The Ultimate Hacker".
Skills: Accounting-17* [2], Computer Operation-15 [4], Computer Programming-16* [4], Conspiracy Theory-9 [0.5], Electronics (Computers)-17* [8], Literature (Cyberpunk fiction)-16** [1], Law (Tax Law)-15** [0.5], Mathematics-14* [1], Research-12 [1].
Gear: top-of-the-line laptop computer, computer tool kit, cyberpunk novel.
Appearance: 7'1", 165 lbs, black hair, brown eyes, dark skin, 24 years old.

* - includes bonus for Mathematical Ability.
** - includes specialization bonus.

The old saying that appearances can be deceiving is more than appropriate for Alfred Edmonds; few people would guess that a towering stick-figure would be a computer expert. Alfred Edmonds spent endless hours as a teenager tearing apart and rebuilding computers, as his generally poor health kept him indoors However, his father, a CPA, pushed him into accounting, which he considered a more suitable job for a young man. While Edmonds did learn a little in the field, he quickly abandoned it and dedicated himself to a career with computers. Unfortunately, it angered his father, who has not spoken to him in over five years.

Edmonds is fascinated by old-time cyberpunk stories, where a single hacker could bring down a government and get away with it, and secretly wishes he could do it himself. However, his fear of getting caught is greater than his desire of glory, so he hasn't tried yet. However, he has grown to believe that all his interest in computer hacking may have attracted the attention of some unknown group. His subsequent study of secret societies and conspiracies has only fueled the belief. Currently, this delusion is fairly mild, but could grow into something more severe.

Edmonds works freelance; while this is riskier than being a full-time employee with a corporation, it allows him to work when he wants on what he wants.

Campaign Uses: Edmonds is a bit more than a computer tech, since he actually has the skills to design computers and write programs. This is less valuable in most Space campaigns, but can come in handy in the Cyberpunk and Modern Day settings. And, is someone (government agents, hackers, recruiters for a computer company, etc.) really following him, or is it just a guilty conscience from wanting to do something illegal?

Other Settings: Edmonds actually fits best in a Cyberpunk campaign or a Modern Day campaign set after 1980 (especially the 90's).

Louise LaSalle

nightclub singer

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d
DX: 10 [0] **Dodge:** 5 **Parry:** n/a **Block:** n/a
IQ: 11 [10] **Basic Speed:** 5.5 **Move:** 5
HT: 12 [20]

Advantages: Appearance: Beautiful [10], Musical Ability +5 [5].
Disadvantages: Compulsive Spending [-5], Greed [-15], Phobia (Death and dead things) [-10].
Quirks: Sensitive about age, Spoiled, Whines if uncomfortable.

Skills: Beam Weapons (Stunner)-11 [1], Carousing-12 [2], Musical Instrument (Keyboards)-14* [1], Performance-12 [4], Singing-19* [4], Streetwise-10 [1].
Appearance: 5'2", 115 lbs, long red hair, green eyes, pale skin, 42 years old.

* - Includes bonus for Musical Ability

Working at various low-class bars throughout startown, Louise LaSalle appears very much out of place. When she starts performing, even the roughest Marine on leave realizes she is out of place.

Nearly twenty years ago, on another planet, LaSalle was an up-and-coming singer destined for greatness until her greed got the better of her. She ran through all the good agents and most of the bad ones, while at the same time estranging herself from music executives by demanding excessive contracts. In the end, tired of her antics, the industry blacklisted her.

With what money she had left, she moved to another planet in the sector in and attempted to resurrect her career. Unfortunately, her greed again got the better of her, and this time she wasn't left with enough money to get off planet. She now works in a seedy nightclub on the outskirts of a starport.

Campaign Uses: LaSalle's main purpose is to provide background color. She could, perhaps, form a brief romantic entanglement with a male PC, though it would be an expensive one.

Other Settings: Little, if any, change is needed for Cyberpunk or Modern Day campaigns. In fact, LaSalle seems to fit best in a 1920's or 1930's campaign.

Veronica Neft

starship engineer

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d
DX: 11 [10] **Dodge:** 5 **Parry:** n/a **Block:** n/a
IQ: 12 [20] **Basic Speed:** 5.25 **Move:** 5
HT: 10 [0]

Advantages: none.
Disadvantages: Guilt Complex [-5], Phobia (Insects) [-10], Shyness (Moderate) [-10], Workaholic [-5].
Quirks: No sense of fashion, Makes origami animals in her spare time.
Skills: Electronic Operation (Computers)-12 [1], Electronic Operations (Sensors)-13 [2], Free Fall- 11 [2], Mechanic (FTL drive)-14 [6], Mechanic (STL drive)-14 [6], Mechanic (Power plant)-13 [4], Origami-12 [1], Piloting (small starship)-11 [2], Scrounging-12 [1], Vacc Suit-11 [2].
Gear: coveralls, tool belt, hand-held diagnostic scanner.
Appearance: 5'5", 125 lbs, brown hair, brown eyes, dusky skin, 28 years old.

Veronica Neft finds herself unemployed more often than not due to her very passive personality, which leads many employers to rate her poorly. This is despite the fact that she is a perfectly adequate engineer and a dedicted employee.

Unfortunately, she suffers from shyness to a nearly crippling degree, which makes it very difficult for her to deal with co-workers on a day-to-day basis. Neft is also overly dedicated to her work and takes the blame for anything that goes wrong. Due to a horrible experience when she got lost on a camping trip as a child, she has a fear of all bugs.

Neft is following in the footsteps of her grandfather, who was a Naval engineer for over thirty years. She enjoyed listening to the stories he would tell of his career and Neft became firmly convinced that starship engineers were the most important crewmembers. He taught her most of what she knows about starships; she attended technical school only because it was neccessary for certification. Due to her shyness and and other factors, she wasn't accepted into military service, but working on civilian starships is the next best thing.

Campaign Uses: Neft could easily be hired as an engineer on the same ship as the PCs (especially if the party is the crew rather than passengers). She would likely become 'invisible' even on a small ship. In non-Space settings, she would work well as the mechanic (or at least assistant mechanic) of an ops team.

Other Settings: Neft needs some changes (mainly to Piloting and Mechanic specialties) to fit into a non-space campaign. She probably works best as an aircraft or car mechanic, depending on campaign needs (she would fit in well in an *Autoduel* campaign as part of a dueling team, for example).

Captain Irvin Armando

retired Naval captain

ST: 9 [-10] **Basic Damage** Thrust: 1d-3 Swing: 1d-1
DX: 9 [-10] **Dodge:** 4 **Parry:** n/a **Block:** n/a
IQ: 13 [30] **Basic Speed:** 4.75 **Move:** 4
HT: 10 [0]

Advantages: Courtesy Rank (Captain) [4].
Disadvantages: Absent-Mindedness [-15], Code of Honor (Officer's) [-5].
Quirks: Speaks with a British accent, Sarcastic when irritated, Humble, Wants to "go out" in a space battle.
Skills: Administration-13 [2], Armoury (Spaceship Weaponry)-14 [4], Beam Weapons (Laser)-11 [0.5], Carousing-10 [2], Computer Operation-12 [0.5], Economics-11 [1], Heraldry (Ship's Insignia)-12 [1], Leadership-15 [6], Gunner (Starship Missiles)-12 [4], Merchant-14 [4], Savoir- Faire (Military)-14 [2], Tactics (Space)-15 [8].
Gear: laser pistol, shipboard uniform (rank buttons removed).
Appearance: 5'7", 155 lbs, black hair, balding, hazel eyes, 59 years old.

Captain Armando served 20 undistinguished years in the Navy. Most of his career was spent as chief gunner on the heavy cruiser Vigilant, until he given command of the corvette Havelock. After nearly two years of relatively uneventful anti-piracy patrols, the Havelock was destroyed when she stumbled into a previously unknown pirate's haven. Only three crewmen survived and Armando received a head injury that resulted in an untreatable, degenerative brain injury.

Shortly thereafter, Armando was given early retirement. After only two years, the desire to captain a ship became too strong, and he signed on to command a tramp freighter owned by a small shipping line. He performed well for over six years, until his war injury had progressed to the point where he was no longer able to be an effective commander. For the second time in his life, he was forced to retire.

Today, Captain Armando looks for ships willing to hire a skilled, if aging, ex-Naval captain. Some have, but he has been let go shortly thereafter, as his inability to handle minor tasks has caused severe problems. Despite this, he still seeks to rest among the stars.

Campaign Uses: The best way for an employer to use Captain Armando would be as an advisor to a ship's captain, with another person hired to serve as the captain's personal manservant (seeing to minor day-to-day details). Some employer (the party's, or the party themselves) may be willing to go to the trouble. If nothing else, he may be an interesting source of rumors.

Other Settings: The primary change is that his service was with a surface rather than space navy.

Jonnie

outlaw psi

ST: 9 [-10] **Basic Damage** Thrust: 1d-3 Swing: 1d-1
DX: 10 [0] **Dodge:** 5 **Parry:** 5 **Block:** n/a
IQ: 11 [10] **Basic Speed:** 5.25 **Move:** 5
HT: 11 [10]

Advantages: ESP Power 6 (requires one minute preparation, -20%) [15], Strong Will +1 [4], Telepathy Power 4 (affects men only, -20%) [16].
Disadvantages: Enemy (government agents, 6 or less) [-20], Youth (16 years old) [-4], Wealth (Poor) [-15].
Quirks: Misses his parents, Slightly paranoid.
Skills: Brawling-10 [1], Emotion Sense-10 [2], Mind Shield-9 [1], Panhandling-12 [1], Pickpocket-9 [2], Precognition-9 [1], Psychometry-9 [1], Scrounging-12 [2], Streetwise-11 [2], Survival (Urban)-11 [2], Telerecieve-10 [2].
Gear: dirty clothes, small knife.
Appearance: 5'4", 135 lbs, dirty brown hair, one blue eye, one green eye, 16 years old.

Jonnie was born to two renegade psis on the run from the government. Most of their group, a motley bunch of psis in hiding, were killed or captured in a surprise government raid. His parents placed Jonnie, then twelve, on the next passenger ship off the planet with a promise to catch up with him. Jonnie has never seen either of them since.

He shortly found himself on a strange planet with little money. Fortunately, years of hiding had given him enough skill to survive. He quickly took to begging and pickpocketing, augmented by his psionic abilities. It wasn't until three months had passed, and his parents had failed to arrive, that he began to be afraid. He waited daily at the starport for their arrival, but eventually he showed up less and less often and finally stopped coming at all.

By this time, nearly a year after arriving on planet, he was comfortable and familiar with the people and surroundings. In addition, many shop keepers have felt sympathy for him (as, by reading their thoughts, Jonnie usually knew the right thing to say) and treat him well. So far, no government agents have arrived looking for him, but it is always in the back of his mind.

Campaign Uses: Every campaign with psionics will eventually feature the psi on the run. Any PC known to have talked to Jonnie could be considered an accomplice or victim. If the party finds out about his powers, they may want to help hide him. Or turn him in. It is also possible that the party encounters him several times but never learns of his powers. And what really happened to his parents?

Other Settings: Jonnie works well in most other settings without modification. Even if psi powers are legal, a corrupt government agency (or a private group) would have reasons to capture psis.

Adolph Hauptman

freelance splicer

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d
DX: 10 [0] **Dodge:** 5 **Block:** 3 **Parry:** n/a
IQ: 12 [20] **Basic Speed:** 5 **Move:** 5
HT: 10 [0] Encumbrance: None

Advantages: Biomonitor [3], Cyber Arm (right, ST 14, DX 11) [14], Cyber Eye (left, optic readout, microscopic vision x2) [13].
Disadvantages: Crippled Leg (lame) [-15], No Sense of Humor [-15], Overweight [-5].
Quirks: Alcohol Intolerance, Dull.
Skills: Area Knowledge (City)-12 [1], Guns (Pistol)-11 [0.5], Electronics Operations (Bionics)-14 [6], Knife-9 [0.5], Mechanic (Bionics)-14 [6], Physician-14 [8], Physiology-11 [2], Scrounging-12 [1], Streetwise-11 [1], Survival (Urban)-11 [1].

Gear: 9mm automatic pistol, first aid kit, mini tool kits (mechanic and electronic).
Appearance: 5'6", 185 lbs, balding with light brown hair, blue eyes, 33 years old.

Adolph Hauptman was a struggling medical student in a small school when he was caught stealing body parts from fresh cadavers and selling them on the black market. He was thrown out of medical school and jailed for three years. Because of his medical knowledge, and the lack of quality staff doctors in prison, he was allowed to assist in treating other inmates. He took the opportunity to become a reasonably competent physician.

Upon his release, the warden, knowing of both Hauptman's skills and past, hired him to work with an organlegging outfit he was running on the side. Hauptman did his job well, until the shop was raided by the police several months later. He escaped with a badly injured leg (which he refuses to let any other street doc touch) and now works only for himself, usually doing on-shot fix-it jobs for street gangs.

Campaign Uses: Hauptman's best role is as a recurring shady street doc the PCs visit after rough encounters. He'll also tell you who he fixed and when for a proper contribution to his coffers.

Other Settings: Except perhaps for Autoduel, Hauptman would have to be significantly changed for any non-Cyberpunk setting. He might fit well as an assistant of a mad scientist in a (Atomic) Horror adventure.

Snyde Corran

underworld contact

ST: 9 [-10] **Basic Damage** Thrust: 1d-3 Swing: 1d-1
DX: 10 [0] **Dodge:** 5 **Block:** 4 **Parry:** n/a
IQ: 13 [30] **Basic Speed:** 5 **Move:** 5
HT: 10 [0]

Advantages: Contacts (two skill-15 Street, three skill-12 Business and two skill-15 Police; each is available on a 9 or less and is Somewhat Reliable) [11], Reputation +1 (as well-connected contact on the street) [3].
Disadvantages: Greed [-15], Odious Personal Habit (exceptionally unclean) [-5], Semi-literate [-5], Status -1 [-5].
Quirks: Say's he's your best friend, Annoyingly persistent, Dislikes firearms.
Skills: Area Knowledge (City)-16 [6], Carousing-10 [2], Computer Ops-14 [2], Fast-Talk-14 [4], Knife-10 [1], Lockpicking-11 [1], Streetwise-15 [6], Traps-12 [1].
Gear: Small knife, tattered and grimy clothing
Appearance: 5'7", 155 lbs, greasy brown hair, light blue eyes, 31 years old.

Snyde Corran (even he doesn't know his real name) appears to be a common dreg, and prefers to keep it that way. Despite his appearance, rumor has it that if something shady is going on in the city, Corran knows something about it, or can at least find someone who knows.

He charges a great deal for his information, though his wealth isn't apparent. Most of his money is wasted on gambling and women, though he manages to save enough to keep a half dozen caches of around $1000 each spread throughout the city.

Corran has an aversion to open combat, so he usually has a mercenary, disguised as a fellow dreg, in his employ as a bodyguard. If Corran ever encounters any trouble, he will let his guard slow down the attacker while he flees.

Campaign Uses: Almost every party needs someone with their ear to the street and Snyde is that someone, especially if the party is from off-world (or out of town) and would have a substantial penalty to their Streetwise rolls. A PC can take Snyde as a Contact for 2 points (Skill-15 Street, Somewhat Reliable, available Fairly Often).

Other Settings: Corran fits in virtually any setting with minimal changes.

Pyramid Pick

Save Doctor Lucky

Published by [Cheapass Games](#)

Designed by James Ernest

90 cards, game board, rule sheet, $6.00

The latest board game from James Ernest, *Save Doctor Lucky*, is not so much a sequel to the popular *Kill Doctor Lucky* as it is a new version of the Cheapass Games classic. *Save Doctor Lucky* uses most of the same mechanics as the earlier version, twists some of the rules, and gives the game a face lift in the form of improved graphics. *Save Doctor Lucky* is *Kill Doctor Lucky* version 2.0, complete with an improved GUI and bug fixes.

The game comes with a four page rules sheet that features not only the efficient rules players expect from Cheapass Games, but also a drinking game for those familiar with *Kill Doctor Lucky*. The game board comes on eight pieces of card stock and depicts the rooms on four decks of a sinking ocean liner. The 90 cards are the usual card stock but, Cheapass fans take note, they are glossy on one side! The contents come in the traditional white envelope and the package sells for a bargain price. These somewhat improved components seem to herald an evolution in the quality of Cheapass Games unaccompanied by an increased price. Their next release will come in a cardboard box and will still have a low price tag.

Each of the players, who provide their own pawns as well as one for Herr Doctor, are stuck on a sinking ocean liner. In an effort to steal some glory and maybe a headline or two, each player wants to be the one to save Doctor Lucky from doom. In order to get credit, though, the winning player must save Doctor Lucky while another player can see him. Of course, the other players will attempt to foil the attempted saves.

Players begin in random rooms on the decks of the ship and with a hand of six cards. The rest of the cards are divided into four piles and placed next to each deck of the ship. The cards come in three varieties; Aid, Move, and Failure. Aid cards help players in their attempts to save Doctor Lucky. Move cards allow players to jump to various rooms on the ship, or to move Doctor Lucky to a room. Failure cards cancel Saves and prevent the Saving player from winning. (Some of the Failure cards contain a bonus logic puzzle too!)

On a player's turn, he or she may take a Snooping turn or an Active turn. A Snooping turn is simply moving to one room and picking up a card. If a deck of the ship runs out of cards, then that deck has sunk and all of the players and Doctor Lucky are forced to move up to the next deck. This puts all of the players into closer proximity and increases the likelihood of a save. If all four decks sink, everyone loses. This is an improvement over *Kill Doctor Lucky*, which lacked any kind of time limit.

An Active turn is any turn where a player uses Move cards to move his pawn or Doctor Lucky's pawn, attempts a Save, or does both of these. Anytime a player is in the same room as Doctor Lucky and at least one other player can see into that room, that player can try to Save Doctor Lucky. *Kill Doctor Lucky* fans will note that this is the exact opposite from the original game, where no one could see an attempt to Kill the Doctor. This small change to the rule alters movement dramatically as players attempt to stay close, but not too close, to each other. Any Save attempt is worth one point, but a player can use a single Aid card to add to this value. Aid cards like Safety Matches, Ice Skates (for that bothersome iceberg), and Dramamine add to the total value of the Save. Each opponent may play one or more Failure cards which range in value from one to three. If the total value of Failure cards equals or exceeds the Save value, the Save fails and the game continues. If the opponents can not play enough Failure cards, then the Saving player wins.

The main points of strategy in *Save Doctor Lucky* center on player proximity and Failure cards. Players must try to remain out of sight so that opponents can not make Save attempts. At the same time, players must be close by so that they can move into sight and make a Save attempt in a single turn. Opponents will want to play as few of their own Failure cards as possible so as to force cards out of their competition's hands. That way, there will be fewer Failure cards available when he or she attempts a Save.

While *Save Doctor Lucky* improves upon the older game by setting a time limit and by forcing players closer together the longer the game goes, it retains a couple of the original game's problems. Whenever Doctor Lucky moves into a room with a player, that player takes a turn immediately. This means that another player's turn may be skipped frequently. In our first playtest game, I got only one turn. Which illustrates the other problem with both games: Sessions can be annoyingly short. If few Failure cards show up in the initial deal, then the game will end after only a couple of Save attempts.

Even with these few problems, *Save Doctor Lucky* is a fun board game that improves upon the original and provides a great value for its price. The original game spawned a number of variants on the Cheapass Games website, many of which would translate well to this version, adding even more value to the game.

-- Brad Weier

Pyramid Pick

Mystick: Domination

Published by Anoch Game Systems

Game Design by Eric M. Lang

78 card Basic Deck, $19.99
78 card Power Deck, $19.99

This new card game from Anoch was a refreshing change from the usual glut of collectable card games (CCGs). Rather than wizards summoning creatures and spells, you play secret masters controlling the fate of the world by manipulating pawns. Who wouldn't be attracted to as game that uses tarot cards and acknowledges you one of the world's secret masters?

Each boxed set contains 78 cards, 2 11x17 playmats, a rulebook and a tutorial booklet. Each set contains enough cards and assorted paraphernalia for two players. You will require a number of tokens in addition: from 14 for 2 players up to 29 for 5. Anything can be used as tokens: coins, paper clips, M&Ms etc… Having tokens on hand is a simple matter. I suppose the game could still be played, it would just be incredibly unwieldy, more so than carrying 29 tokens.

There are a number of components to the game, and I'd like to take a moment simply to examine each one. The cards are each named after a different Tarot card: Page of cups, six of rods The Magician and so on. In play the cards are either Pawns, Actions, Environments or Major Arcana. The card stock solid, the printing clear and the art very nice. At first I was surprised by the choice of art from the 14th to 18th century, but once I understood the game it complements the atmosphere very well, especially the emphasis on Tarot and fate. The text is clear, and it is easy to recognize the suites of cards played by your opponent. The flavor text is a little jarring, but intentionally so. Each player is essentially a Bavarian illuminati who sees the world as their plaything and manipulates it according to their own Machiavellian worldview. For instance, the 3 of pentacles card is called the syndicate agent; the flavor text talks about TV and aliens but the art is a portrait of a man in stern Victorian attire. It's jarring, achronistic, very distracting, and it works. The juxtaposition of old style art with the modern text emphasizes the feel of being a secret master that's out of touch with the modern world but more than capable of molding it to their ends. Sort of a "The more things change, the more they stay the same" theme.

The two playmats are printed with 8 card silhouettes in the shape of what the game calls a Mystick cross. If you are familiar with Tarot cards you'll recognize this shape as the fortune-telling cross. . . basically a plus next to a line using 8 cards. In play this cross is used to determine successful challenges by pawns. There is a score tracker that tallies each player's victory points. The playmat also summarizes all the important game information, such as how to challenge, the round sequence and card traits. As a play aid the playmat is an invaluable resource.

Two of the cards are unique. One is a draw counter that has 0, 1, 2, 3 steps to indicate how many draws have taken place. This is important as the round resets after the third draw. Having a specific card to indicate this is a nice touch and better than having this data tallied by both players or cluttering up the playmats. The second unique card is the Proxy a blank frame card, similar to the game cards but blank. I still don't know what to do with this card as the rules don't tell you. I stacked the power tokens on it.

The final two items are the rulebook and the tutorial. The rulebook is a little confusing, but not overly so. The rules are concise and well written and certainly no more complicated than *Magic: The Gathering*; I just had a hard time visualizing the rules without playing a game. Luckily the game includes a tutorial book that walks you through a

sample two player game, step by step. Reading a booklet describing a sample game would be extremely tedious and probably of little help, if this were any other game than *Mystick Domination*. Someone on Anoch's design team is a genius. The 78 cards are divided into 2 plastic wrapped decks in the *exact sequence* as the two decks in the tutorial book. When you read the tutorial you actually play the game that is described down to each nuance and tactical gambit. Brilliant! There's no better way to learn a game than to play it and actually explaining the rules as the game is played using the tutorial is a wonderful idea.

Game play is a little clunky when you first start, but after you become comfortable with the rules *Mystick: Dominion* is very easy to play. To win you must amass the most victory points before the power pool is depleted. You gain these points by challenging the power pool or your opponent's pawns with your own pawns. Power gained is allocated to your pawns, each of which can hold a certain limit determined by their influence rating. Power is separate from victory points, but you can only gain victory points by taking power. Once the power pool is depleted the game ends and victory points are tallied, the highest total winning. The length of each round is determined by how many draws are taken, once three draws occur the round ends. This is important to gameplay as when the round ends the mystic crosses are reset and various cards leave play, essentially leveling the playing field for the next round. Each player can do three thing during a turn: Draw a card (advancing the draw counter), play a card or make a challenge. Challenging is the only way to gain power, but you must have pawns in play to do so, and it is important to choose your strategy wily in order to avoid wasting a move.

Each card is either an action, attachment, environment, or pawn. As one action during your turn you may bring one card into play. Pawns can gain you power and challenge other pawns. Attachments enhance your pawns or minimize the effectiveness of your opponent's pawns. Actions take effect immediately and are discarded, enhancements are similar but stay in effect until the round ends. Almost all of the cards have a small box of rule text that further adds to the complexity of the game. *(The Power Deck contains cards that are more complex than those contained in the Basic Deck. Neither deck requires the other to play. -- Ed.)* Having each card change the flavor and play of any games adds to the cusom9ization of the game. While *Mystick: Domination* is not a collectable card game, it does have the feel of one, mainly due to the way each card effects gameplay differently.

Challenges between pawns and by pawns on the power pool are conducted using the Mystic Cross. As the cards are all named after tarot cards, the Mystic Cross takes the form of a tarot reading in the shape printed on the playmats. Each pawn draws a number of cards equal to its influence, successes being tallied by like suites appearing on the drawn cards. All card text on drawn Major Arcana comes into play immediately and each success translates into stolen power (if the target pawn or power poll has any power). After a challenge the cards in the Mystick Cross are left in place, which means that only 8 cards can be drawn during challenges before the cross is filled; only at the end of a round (3 turns spent drawing cards) is the Mystick Cross cleared. Ending a round also causes most cards in play to be discarded, so a player has to weigh the advantages of having a clear cross against having fewer cards in play.

Casting a fortune for my Pawns made me feel a little like Solitaire reading the tarot cards for a certain Brit. It was almost as if I had no control over the fate of my pawns, but was depending upon them anyway. As a complete game for two, it is very economical, and pleasantly customizable without being collectable. The addition of tournament and deck building rules, make *Mystick: Domination* a game that has a lot of potential and replay value. There is a also a hint/add/teaser on the last page that *Mystick: Subversion* a postmodern roleplaying game coming in winter. If the RPG keeps or a uses a similar version of the challenge mechanics, this could also be a keeper -- *Mystic: Domination* certainly is.

-- Andrew J. Lucas

Romancing the Plot

Four Investigators are standing on the shore of R'leyh, facing down Cthulhu. Cthulhu kills 1D3 Investigators per round. Whose character survives to run screaming to the boat moored at the shore?

    A. The player who brought the 12-pack of Coke.
    B. The player who brought the Doritos and the bag of flavored pretzel bits.
    C. The player who not only called the pizza guy, but paid for the pizza.
    D. The game master's girlfriend who has never played Cthulhu, and thinks the Elder God is "kind of cute."

When faced with a screaming horror from beyond and the GM's girlfriend, you can only speak in vowels.

Wait. Let's back up.

Love, Buffy Style. . .

Love. Amore. Romance. It works for Shakespeare, and better yet, it works for *Buffy, the Vampire Slayer*. It is fine plot catalyst, and a handy widget in the GM's toolbox. After all, she possibly has one player who always walks into bars and asks:

    "Are there any girls in here? If so, can I *do* them? Can I roll my charisma to do them?"

Why not say *yes*? Romance-based plots are guaranteed to get one player involved in a story and drag the rest along for the ride. Need intrigue? Politics? Espionage? A maiden rescued from a tower in the dark of night? It all starts with one kiss. . . The GM's players might be geeks, but even geeks like to flirt.

A few role-playing games already target the romantically minded audience. The products from White Wolf Games are seeped in it, especially anything pertaining to the LARP lines, but the other game systems and publishers aren't blind to it -- their packaging and art, at the bare minimum, acknowledges the role of love in their games, if not base lust. Sexy art, sexy titles, and even sexy novels litter game lines. It sells, sells well, and according to the rumors, it sells to women. Someone is playing it, or else games featuring flirting, romance, and love would have died on the vine years ago. The logical jump is straightforward: if women gamers like playing it -- and by all reports they do -- then women GMs might like running it.

Effectively pulling on the heartstrings is a little more work on the GM's part than average. There are a few simple tricks a GM can use to not be heavy handed about it. In the following examples, remember that "he" for the player can easily be swapped with "she", and vice versa. There is nothing that stops female characters from being both the aggressor and the seduced. In fact, quite the opposite!

Love Affairs

Ah, sweet love. Nothing gets people going off fully cocked into danger and oblivion like sweet love.

Players get into love affairs all by themselves -- often by asking if there's a girl in the bar and reaching for the dice. A simple yes can suffice; toss in a name of a character from the handy nearby yellow pages, and make her father or husband a powerful political figure. Instant plot. Season to taste. Enjoy.

A sly GM will use the one night stand to pull the players deeper into a nest of political espionage. Sure, she's beautiful and she has amazing breasts, but she's actually the High Priestess of the Cult of Shub-Niggurath bent on destroying modern religions and replacing it with the ancient worship of the crone -- although she needs a blood sacrifice for her ritual to succeed. (Ah ha! A handy blood sacrifice! Thank you for volunteering.)

Or, she's a leader of a secret underground society, designed to infiltrate high-up government offices and destroy them with homemade explosives. Now she's invited the player and the player's buddies to join. Illegal? Nah, it's not illegal, not *really*, and not after the world government falls. We must free ourselves from corporate control! Kill them all!

Or, she's nobody. The evil army arrives and, like the right bastards they are, they take the player's new love and execute her in the town square. Bloodily. Messily. Nothing ticks off the players like a good, bloody, unjust murder of a character they were just starting to *like*. (The movie *Braveheart* is a fine source of inspiration for getting a love story to kick off a war.)

Remember, a love affair doesn't necessarily mean *sex*, nor does it mean constant nookie behind the closed door every possible moment of the game. It can be the start of a partnership, a subtly different relation with an NPC other than a business transaction, or an invitation to the higher mysteries of the plot. The thing to remember is that the player will go willingly, thinking not with his head but with something else entirely.

Shameless Manipulation

Another tactic is to make the love interest simply out and out evil. The player *did* ask for a big-bosomed one night stand in a cheap room above a bar; it's not like he (or she) wasn't asking for trouble in the first place. One day the player is just having a little out of scene fun, the next thing he knows, he's been conned into storming Castle Amber with an army of midgets dressed in clown suits. "Hey," the GM says with a grin on her face, "these things happen."

Evil lovers are a joy. The players blithely assume that their lovers like them back in some small, miniscule way. It rarely dawns on them that the lover might have been waiting in the bar for the player to come in and roll their charisma. It might not occur to the player that the GM has doctored the result of the roll behind her GM screen. (The greatest tool in the GMs toolbox, bar none, is the ability to lie about the result of a die roll.) And, of course, the player goes along with it. "Sure," the player says, "I'll sleep with the beautiful girl tonight." Soon, he's on trial for the murder of the beautiful girl's rich and influential husband, and the girl inheriting the manor and the surrounding lands.

Or, the same beautiful girl convinces the player that the king of the land is really an evil necromancer who is terrorizing the countryside. The next thing he knows, the king's blood is on his hands, and the king's guardsmen hunt the player while a twisted Duke takes the throne.

We all knew those well-drawn bosoms were good for something, and no one said GMs, especially women GMs, were ever supposed to play nice.

And that's not all!

The power of love is putty in the hands of the female player.

This isn't just the GM who can have fun with a quick love affair. The female player, saddled with a female character (or even a male one!), is quite familiar with the phenomena of "people trying to get into her pants." On quick inspection, they're not very big pants, and there isn't much room for two in there. Maybe with a size up.

If someone happens to make their way into said pants, the female player has them right where she wants them. Let the fun begin! Try a few simple requests to get the player or NPC warmed up, and work up to the big stuff. For example, this short sequence might work on an unsuspecting male character:

- "If you love me, you'll bring me some potato chips from the store."
- "If you love me, you'll bring me an AK-47, fully loaded, with the serial numbers removed so it can't be traced, and thirteen boxes of ammunition."
- "If you really love me, you'll bring me the head of Alan Greenspan, so I can reanimate it and steal his knowledge. I -- er, *we* -- can take over the New World Economy together, lover."

Sure, it's shameless and manipulating, but if it works, go with what you know.

. . . or maybe not.

It's doesn't always work.

Romance works great for dark, gothic horror with terrors behind every shadow waiting to leap out and rip off my lady's bodice. It iswonderful for chivalristic romances sprawled across the untainted, fertile land of the Roman Britons. There are many great settings for romance, but the GM needs to pick them with care. For example, it doesn't work so well when you're playing Shadowrun and you're in the middle of a run. Gun-toting maniacs are not exactly amazing sex symbols.

Players don't always get it. Or, they don't go for the plot hooks, no matter how obvious. Or, they just wanted to *do* the girl and get back to hunting the dragon.

Worse, the entire game starts to bog down with the angst. Oh, the horrible angst. The constant tragedy of love and loss, and love lost again. We're all so horrible and miserable; excuse me while I go flagellate myself with this large fish in the corner. After a while, the GM just wants to throttle everyone involved. *(I'm a huge progenitor of this, myself. There's a long line of GMs that want to throttle me. They've taken numbers. -- Em)*

There are two distinct perils of running a romantic plot to keep in mind at all times. The first one is that it's exclusive. Unless the players are into orgies, a love affair between a PC and an NPC is going to cut other PCs out of the action until the first PC's actions drag them all back in again. The second is that some players just don't fall for it. It's just not their thing, and they want less than nothing to do with romance, love and sex. They just want to play their game.

GMs should be aware of this before they start up their elaborate plots. If they're not careful, there could be a lot of trouserless NPCs sitting around, feeling unappreciated -- and there's nothing worse than a trouserless NPC.

The Game Master's Girlfriend

And then there's the other way of doing things. . .

"I'm going to let my girlfriend play in our game if that's okay with you guys," the GM says, imagining in his mind throwing in a little bit of gender mix to spice up his campaign while introducing a new player. If his girlfriend plays, he can confidently run a bunch of those hot and spicy plots he has in mind. Since she enjoys watching *Buffy*, maybe she'll like playing this game, too.

At this point in time, men and women gamers fuse into a single hive mind. For one sparkling moment, in the whole history of mankind, there is no difference between race, religion or gender. Everyone looks at each other, and nods. They all know what to say. There is only one right answer to the GM's query.

Occasionally, the group lucks out, and the GM's girlfriend gets into gaming with the group. The romantic plot spins out to a successful, and interesting, conclusion. Through the power of a mass brainwashing, she becomes assimilated into the legions of gamers, soon buying her own copy of ***Beyond the Mountains of Madness***. The hobby gains another customer through the power of *Buffy* and the lure of romance. The GM gets a gold star. There is much rejoicing.

But then again, you never know with the GM's girlfriend. It might all be a plot. . .

Running screaming into the darkness

How did four Investigators end up standing on the shore of R'leyh facing down dread Cthulhu who, while driving them insane, is going to eat them with a little bit of salsa?

It's pretty obvious, isn't it?

After reading his copy of *Call of Cthulhu*, the GM's girlfriend worked with him on a character concept. While, to the other players, she looked like yet another ditzy blond, she was really a high priestess who had pre-sold her soul out to the Elder Gods on discount. After a following the characters around, batting a few eyelashes, thrusting her breasts around, and asking a few well-placed questions, she manipulated the characters into going to a small island in the south Pacific where she could finish her ritual, which included invoking Dread Cthulhu himself.

"And hey," says the GM, "these things happen. New characters?"

A Horrific Alphabet

"Armitage had an idea that the alphabet might be something esoterically used by certain forbidden cults which have come down from old times, and which have inherited many forms and traditions from the wizards of the Saracenic worlds."
-- H.P. Lovecraft, "The Dunwich Horror"

A fourth alphabet, a dictionary of horrifying cliché to file with the [Conspiratorial](#), [Secret-Historical](#), and [Alternate-Historical](#) Alphabets. And, more directly, to consider as set decoration for your very own Grand Guignol Theatre of the RPG. As I always do, I'll mention that what seems like cliché and predictability from the outside can seem like an irreplaceable part of the tale from within. I'll expand my usual recommendation of Diana Wynn Jones' excellent *Tough Guide to Fantasyland* to encompass J.N. Williamson's *New Devil's Dictionary*, which slathers much of this same terrain with funereal observations on the undead state of creativity in horror. But surely Williamson should know that, as Dr. Frankenstein teaches us, even (or especially) when you cobble together bits of dead matter, you can still bring it to slavering life. All it takes is a little spark.

A is for Antiquarian

Something of a transmission vector for anything musty, old-fashioned, Yellow (q.v.), or cursed. Also something of an expert on it. This means he knows enough to buy it at auction or in the junk pile, but not enough to incinerate it immediately. He also knows enough to give players vital clues about how to defeat it, but not enough to avoid dying under its tiny Knives (q.v.) or swift-winged death cloud.

B is for Blood

In bucketfuls, splashed around the room. Or in a thin trickle from an almost-invisible wound. Also consider letting blood "pool" or "curdle," or better yet "slowly drip" from something not normally associated with blood, like a flower-stem or a light fixture. However you serve it, it has to show up in its proper Hammer-films Technicolor scarlet to really kick things home; if it's dried to "a mysterious brownish stain" on the altar or wallpaper, everyone seems to take it in stride. Do not confuse it with Ichor (q.v.); the sight of Blood is a tragedy, while the sight of Ichor is a warning.

C is for Creature, The

Literally, the created thing. Whether it was created by your fevered imagination, by a mad scientist, by a dark mage, by toxic waste and a strange comet, or whatever, It Should Not Live. And what's more, it doesn't think anyone else should, either.

D is for Disembodied

It could stand for Disemboweled, but that's victim thinking. A Disembodied something, though, is scary, especially since it will skitter and crawl around the room for an uncommonly long time. Whatever you do, no matter how vitally important it may seem at the time, do not attach a Disembodied part to your own anatomy. That's what the leering, gulping, madman in the stained white coat is for, and disappointing him is even less wise than attaching The Clutching, Severed Hand to your wrist.

E is for Eggs

What The Creature (q.v.) sometimes hatches out of. Also available in seed-pod form. For best effect, finding only the shell (or rind) of the Eggs, with pools of Ichor (q.v) steaming gently in the bottom is recommended. That, or spotting them on the X-Rays (q.v.).

F is for Fainting

Afflicts neurasthenic Antiquarians (q.v.) and female NPCs in night-clothes. Especially common in milieux where Yellow (q.v.) is menacing and ominous. Oddly, seldom leads to a proper mauling; abduction by The Creature (q.v.) is apparently the most serious penalty on the books for Fainters

G is for Guns

Useless. *bang* *bang* *bang* *bang* "Why won't you die?!?" *bang* *bang* *click*

H is for Haunted House

Far scarier than you'd think, especially if it has lots of furniture to rearrange when nobody's looking, or wood paneling suitable for Offstage Noises (q.v.). Represents the violated human body, which should give anyone ideas about what to do with the windows and the basement.

I is for Ichor

What The Creature (q.v.) has instead of Blood (q.v.); it usually comes in a Dr. Brown's soda color like blue, green, or purple. Not, thankfully, in tutti-frutti. Unlike Blood, it bubbles, steams, foams, or eats away at the furniture with almost no provocation whatsoever. Also unlike Blood, its dried remnants create mystery, and therefore unease, in the minds of the players.

J is for "Just the Wind"

The worst imaginable thing to say about Offstage Noises (q.v.). It's an irrevocable death sentence for any NPC to utter this phrase, except in mocking irony.

K is for Knives

They will never, ever, ever, go out of style. Far more narratively satisfying to embed in innocent victims than almost anything else; even The Creature's (q.v.) natural talons or the Wolves' (q.v.) fangs are best described as "daggers" or "wickedly curved knives." Try and imagine all the places you really don't want a knife sticking into (or out of). Then make your players imagine them.

L is for Letters, Capital

Let the players hear you say them, especially in words like "Them," "Ceremonies," "House," or "Curse."

M is for Mannikins

Or puppets, or dolls, or ventriloquist's dummies. Toy companies seem to have stopped manufacturing the ones that are quite obviously designed solely for the convenience of homicidal entities, which is why the best ones show up only in the collection of a child-like (or deranged) Antiquarian (q.v.).

N is for Noises, Offstage

Anyone can do screams. Or even Blood (q.v.) curdling shrieks. But all kinds of noises can seem (and, in fact, truly be) creepy. Alto choruses of children's song. Creaks from the staircase leading to the attic. Scratches at the front door. The call of the whippoorwills. Consider the uncanny powers of Offstage Noises that nobody can in fact actually describe: "gibbering," "chittering," "meeping," and "burbling" are all good ones.

O is for Odors

Astonishingly underutilized arrow in the horrorist's quiver; everyone's smelled something really bad in their day that's worth any number of Offstage Noises (q.v.). Each Ichor (q.v.) has its own characteristic one. Going down into the crypt at night, by the way, is the horror equivalent to smelling the milk to see if it's gone bad.

P is for Pets

Pets come in two kinds: predator or prey. Pets either become possessed by The Creature (q.v.) (or turn rabid, or sentient, or rabidly sentient) and try to kill you and yours, or they react badly to The Creature (brindling, hissing, backing away "staring at nothing") and become lunch for it in the next scene. Authorities differ on whether it's most effective to show the Pet's dismembered corpse or to reanimate it and send it after the players. Why not both?

Q is for Quitting

Every so often, PCs think of this option. ("The Sewers? (q.v.) No way I'm going in there.") It shouldn't work. In the perfect case, you'd let them hand in their characters, and once they've rolled up all new ones, send them to investigate the situation: "The last information we had about those murders was a message from a band of wandering adventurers, who vanished after loudly denying any intention of entering the Sewers."

R is for Remains

Vital both as clues (albeit Unfinished (q.v.) ones) and as sources for horror, especially if the GM has read an anatomy textbook first. Often improved by Vermin (q.v.) swarming on them. "Smeared with intermingled Blood and Ichor (qq.v.)" is better than either alone, on human Remains at least.

S is for Sewers

With its letter-mate Subways, the urban equivalent of the Haunted House (q.v.). Always dripping with something you hope is water. Always full of Vermin (q.v.) and Odors (q.v.) and Offstage Noises (q.v.). And that's even before it becomes a warm, womblike container for the Eggs (q.v.) of The Creature (q.v.).

T is for Tentacles

Unless deliberate Lovecraftianism is intended, try "tendrils." Or "cilia." Or "extrusions." Or "ropy, slime-covered masses." Or even "rubbery things."

U is for Unfinished

What every explanation should be; the Antiquarian (q.v.) is telling the PCs where he found the artifact should be called away from the phone; the trail of hobo signs should stop at the Sewers (q.v.); the tattered Yellow (q.v.) manuscript should end with incoherent ranting rather than the binding formula; the message in Blood (q.v.) should be at least two symbols too short. Though not from lack of Blood.

V is for Vermin

There's a reason nobody wants to see rats, blowflies, cockroaches, silverfish, maggots, and their ilk under the best of circumstances. Oddly enough, when Vermin act as harbingers of evil and corruption, they're even less popular than normal. Though as unpopular as they are, nobody wants to see a Zoophagous (q.v.) madman begin eating them, either. And when Vermin all act with a single overriding evil consciousness, well, "unwelcome" doesn't even begin to describe it. There's just no pleasing some people.

W is for Wolves

Unless you're willing to do some research into pack hunting techniques or outlaw silver bullets for some bogus reason, probably best left as Offstage Noises (q.v.). Unless the characters are on a sledge or sleigh racing down a frozen river or across the steppe -- and the horses start to falter . . .

X is for X-Rays

You'd be surprised what the X-Rays will show. Nests of Vermin (q.v.), brain tumors spelling out "I Yet Live," robotic parts -- if there's Something you especially don't want to find in your insides, you can count on the X-Rays to find It for you.

Y is for Yellow

Hasn't actually been particularly horrifying, per se, since 1910 or thereabouts, except to Michael Crichton. But for about 25 years, it was the scariest color around. As a challenge, for old times' sake, think of something in the game that really shouldn't be yellow, and describe it as "yellowish." Something about that "ish" ending gets 'em every time.

Z is for Zoophagy

Devouring things alive is the kind of behavior that definitely marks the devourer as horrific, or at the very least creepily-aligned with something else horrific. Renfield did it best, of course. On the other end of the food chain, plenty of beloved Pets (q.v.) exist solely to demonstrate the Zoophagous unpleasantry of It.

Try, Try Again. . . Then Stop Trying!

Some facts about me:

- The one time I water-skied a decade ago, I didn't like it.
- I like Classical Music, but I didn't always.
- I still don't like raw onions.

Three ideas, three foci (thanks, *Champions*!):

Don't let one bad experience keep you from trying something again.

The one time I water-skied, I was pretty young. (I'm going to say twelve or so. . . but that's mostly just a guess.) Now, there are those who are natural learners of these sorts of physical activities. I am not one of them. So what was an attempt at water-skiing would be more properly called "water-dragging." Or, perhaps more accurately, "water-dragging for a very long time because the water-draggee lacked the common sense to let go of the rope despite it being painfully obvious that it wasn't going to work."

That day I WDFAVLTBTW-DLTCSTLGOTRDIBPOTIWGTWed three times; all three times were decidedly unenjoyable, and I made a solemn vow never to water-ski again. Fortunately the Supreme Court ruled in the landmark *God v. Billy* that the solemn vows of a twelve-year-old don't count once you turn eighteen; as such I could water-ski again, if I wanted to. And I may well, if the opportunity presents itself.

Because I honestly believe that one bad experience shouldn't keep you from doing something forever. In terms of gaming, don't let the one unfun game of *14K Pewter Minis* you tried turn you off from every trying the *14KPM* line. . . or, worse, keep you from playing a miniature game of any sort. As for myself, my one attempt at playing *Shadowrun* wasn't all that fun, but that doesn't mean I wouldn't try it again if the opportunity presented itself.

Of course, having said that, it's entirely possible not to like a game or activity, even though nothing catastrophic affected your enjoyment of that activity. That's okay. But keep your doors open.

Try something you haven't liked every so often, just in case you change your mind.

I grew up in a public education system that tried to foster an appreciation of classical music through the innovative "Enjoy It Or Else, You Miserable Little Urchins!" program. Under this program we would be trapped in a room with a record player hissing something enjoyable for young minds, like the Pachelbel Canon performed entirely in oboes, while our teacher Darth Osborne made sure we remained conscious to appreciate the experience. I think we also played recorders that smelled like Smirnoff; to be honest, I've blotted most of the memories.

The point is, I really didn't care for classical music, even though I'd been exposed to it fairly often in more "normal" settings than Elementary School.

But when I got to college, on a lark I decided to go to a classical music concert being performed by our university's school of music, and I really enjoyed it. Nowadays I enjoy classical music as part of a healthy musical breakfast.

On the whole I tend to try things I don't like every so often, just to make sure I still don't like them. Usually I find I still don't like them; occasionally I'm pleasantly surprised. Games are the same way; I recently discovered a pleasant surprise in the form of *[Century Station](#)*, despite not generally following Palladium's lines.

But I also don't abuse myself by constantly exposing myself to things I don't like.

Don't torture yourself with things you don't like.

I don't have a funny onion anecdote, I'm afraid; I just don't like raw onions. I never have; I may some day, but in the interim I avoid them.

I don't begrudge others their love of raw onions, I don't shun them, and I don't throw rocks at them. I just don't eat raw onions.

What always amazes me then, as I read the Pyramid newsgroup and my own e-mails, is that some folks out there continuously torture themselves by continuously reading themselves things that obviously bring them pain. Whether it's the house style of one of the big companies, or a certain game genre, or a *Pyramid* columnist that drives them nuts, they just keep exposing themselves to it over and over. And then they wail in agony: "Ick! I still hate the new editor of ***Dude: the Slacking!*** All these books are garbage!" or "Gadzooks! I can't believe they're still making ***Otterpunk*** books! Merciful fates, WHY?!?" or "Argh! Bob's latest column is the worst yet! I must score my arm yet again with the ceremonial Knife of Suckiness!"

Now, I've talked [before](#) about leaving game lines when they no longer suit you. And I can see the appeal of flipping through a new book of a game line you dislike, just to make sure there's nothing that catches your eye. But I honestly can't fathom the folks who continuously read columns or other pieces when they *know* they're not going to like them. Sure, skim one every so often to make sure you don't like it, but don't torture yourself month after month (or week after week) with one to two thousand words of agony. Likewise if you don't like a particular game type, activity, or book line, keep away from it; life is short, and there's lots of other things to do that you'll enjoy.

In my mind it's a fine line between experimentation and masochism; I may be willing to get on a pair of water-skis again, but I probably won't have a salad with onions afterwards. . . if I survive.

* * *

Just so you all know, I'm out of town for a few days. But just because I'm gone doesn't mean you shouldn't [write me](#), should the urge strike.

-- Steven Marsh

(two stars) "It's a lot like a real fight -- only without all that slippery blood."

Pyramid Review

Aberrant: Teragen

Published by [White Wolf Game Studio](#)

Written by Lucien Soulban, Philippe Boulle, Josh Asheim

144 pages, $17.95

I like *Aberrant* in pretty much every fashion. I like how the system takes the basic Storyteller system and helps it to handle a super hero game. I like the setting, which reminds me of *Wild Cards* in its treatment of supers as paragons of the cult of personality.

The *Teragen* sourcebook for Aberrant details the main "villain" group of the Aberrant world. Of course, in a White Wolf game (hell, most games from the past decade) you can't really call people villains. The Teragen are Nova Supremacists, who believe that Novas should rule over the baseline (i.e. Human) masses.

Wait, that's pretty villainous! Cool. . . bad guys!

The *Teragen* book is a great example of the right way to do an organization sourcebook. It's got its flaws, but overall it's quite sublime.

The Teragen is a cute little super-villain group; they are more like a philosophical organization, except that a few of their members tend to go around killing people. *Aberrant: Teragen* is split into two parts; the first is the in character bit, with transcripts of Teragen meetings, news releases, and talk show discussions, all framed as part of a brainwashing sequence on a Utopian Nova.

It's an interesting look at the birth and structure of the Teragen organization. It also describes how the Teragen are dealing with Taint, the Quantum contamination that drives Novas to madness and mutation.

It's fairly disturbing in parts; the view of the Teragen on baselines is that Humanity messed up the world, and Novas fixed it. Why, then, should the Novas serve the humans? Of course, that view is one of the reasons for *Aberrant*'s tragic destiny. When a race of gods feels enslaved, what can be done to make them feel free short of submission? The Teragen philosophy is examined from a number of points of view, both within and without the organization. There's a sequence on a talk show and the fallout from it that's interesting.

The second part of the book contains a *lot* of useful information. There's a description of the organization of the Teragen, the various groups that make up the Teragen, and how to run campaigns dealing with each one. The most immediately interesting for me are Nova Vigilance and the Primacy. The two factions are similar in methods, but different in basic motivations. The Primacy acts aggressively to promote the Teragen agenda, which can include blowing stuff up. Nova Vigilance, on the other hand, acts to protect Novas, reacting to anti-nova sentiment across the world. They do this by smacking down anyone who tries to actively suppress novas (i.e. Geryon's neck-snapping fun with the mayor of Tampa).

The other factions are interesting, including one that runs safetowns for Aberrants, and the Casablancas, who work PR for the faction.

The book then gives you mechanics for the Teragen's great advantage; the Chrysalis.

(The following paragraph may contain spoilers; if you're an *Aberrant* player, feel free to skip it.)

Basically, Aberrants can take the Quantum taint that each Nova accumulates and channel it into them. When doing this, they enter the Chrysalis, which is a comatose state that can last for years. When it's complete, the Aberrant emerges changed. They may have changed their mental aberrations into physical ones, or gained greater control over their powers (the Chrysalis reduces experience point costs).

There are also new powers and guidelines for creating Terat characters. The Teragen's philosophy is that novas contain within themselves three aspects, Marvel, Monster, and Portent. Marvels are the shiny supers, Monsters are the hideous taint consumed ones, and Portents are what Novas will become (godlike).

The book also has info vitally useful to the GM. Not only does it tell you what the organization is like, it tells you what it's going to *be* like. White Wolf chooses, in this book, to basically lay the future of the *Aberrant* world on the table, saying "this is the blueprint. Feel free to change it." This is a very good thing. Many people who use games with an established Metaplot can complain about info changing out from under them. *Aberrant* has given us the future of the Teragen (Mal comes back; Interesting level escalates), and the forthcoming Aberrant war.

The biggest drawback to *Teragen*? No stats. I'm normally not one to complain about such things; I think if you need a character in your game, you can A) make him up in advance or B) make him up on the fly. But when you do a sourcebook on a faction, it's just polite to include some NPCs for that faction. I mean, it's likely that if you're in the Teragen or fighting them, you'll meet Geryon or the Confederate, and knowing what they can do (aside from the vague profiles that dot the book and should have been cut in favor of actual information.

Instead, all we get, aside from info on building our own Aberrants, are three PC templates. I will say I like the fact that the templates in *Aberrant* and *Trinity* have been people, not character types. Giving them names is a nice touch.

Aberrant: Teragen manages to be a great supplement, giving us a lot of useful information on the history, present status, and future of the Teragen. A couple pages of stats and I would have been as happy as a puppy.

Murphy's Rules

Murphy's Rules

The Con Games

Summer has arrived in all its glory. All its glory, of course, includes not only the warmth of the sun and the later evenings of daylight savings time. For gamers, at least, summer is also the convention season, the best opportunity all year to meet and play with gamers from all over the world and to see (and buy) the latest products from the largest and smallest companies the industry has to offer. Despite being great fun and an excellent service to gamers, conventions are not easy to put on. Like your FLGS, the gaming convention is a business, even if a team of dedicated volunteers organizes and operates it. As such, it is subject to the customary rules of business that govern large-scale meetings such as conventions. This month, in honor of the recently completed Origins and next week's Gen Con, let us look into the business realities of conventions. Here come the Con Games!

All conventions have a management team. For most volunteer conventions, this group is the Convention Committee, or "Con Com," for short. They have the ultimate responsibility for everything that happens before, during, and after the convention. Before the convention, they must choose a venue, which includes estimating the attendance and figuring out how many hotel rooms attendees will need (if people are coming from far enough away to want to stay.) The Con Com will also be busy during the early going recruiting and organizing the huge number of volunteers that will be necessary during the convention, including people who will operate the registration desk, accompany Guests of Honor, serve as GM's, etc. During the convention they'll be up to their ears in emergent problems, such as missing volunteers, security issues, unhappy hotel staff or attendees, and the like. Long after everyone has gone home, this core group will be busy handling counting receipts, paying the last bills, and deciding if they want to do it all over again next year. This is a tall order for any convention, but the largest conventions, which can have as many as 25,000 attendees, are a special kind of logistical nightmare. As a result, Gen Con and Origins have had professional management for many years. While we are gaming, they will be working feverishly behind the scenes to coordinate the work of the Midwest Express Center's staff and their own small army of volunteers.

Of course, none of this is free. Conventions are an expensive proposition. The hall rental alone is an enormous burden, not to mention the cost of the computers and operators necessary to process (in the case of Gen Con) thousands of registrations and tens of thousands of individual gaming events, along with all the promotional material, magazine advertising, and event programs. They recoup this expense through two major sources of revenue, registrations and dealer fees. Registration fees, of course, are paid by individual gamers, and represent a significant fraction of the convention's income. This year's Gen Con will cost players $53, with each organized event in which they play adding to the bill. If that seems a bit steep, most conventions have discount programs available for people willing to volunteer some of their time, either as Game Masters, or serving in some other capacity. Again using Gen Con as an example, volunteers who work for at least 16 hours over the four days, receive a full four-day player badge in exchange. Since Gen Con runs all day and all night, that leaves plenty of time to play.

The other large source of revenue for conventions is selling space in the dealer's room. This gives retailers (in the case of local conventions) or manufacturers (in the case of the larger operations) the opportunity to highlight and sell their latest games as well as some part of their backlist. Prices for space in the dealer room vary by location, with the most desirable space (in front of the door, on a corner, a floating island, or the center of the hall) being the most expensive. Next time you are at a convention note where your favorite companies locate themselves. Of course, like the special programs for attendees, a convention will usually have privileged pricing and site selection for long time exhibitors and those who buy large booths.

Of course, the convention organizers are not the only ones who benefit from a convention. The exhibitors themselves expect to profit from their investment in time, travel, and inventory. For local conventions, most exhibitors are local FLGS's which can expect to make some extra sales to people who have discovered a new game at the con and who might or might not regularly shop at that particular store. They also hope to introduce themselves to the attendees with the hope of developing new customers. For manufacturers, which tend to exhibit at the largest conventions, the stakes are even higher. Game companies can, and often do, adjust their production schedules in such a way as to have brand-new product ready for a major convention like Origins or Gen Con. For most (if not all) attendees, the convention will be their first opportunity to see or buy these products. In addition, when manufacturers make sales in their booths, they

take the entire difference between the cost to produce and sell the product and its cover price. This is a significant increase in profit over selling through the regular channels. A large convention with a premiere product can often be highly profitable for a manufacturer, even after travel, accommodations, and staff salaries are taken into account. The considerable marketing value of the opportunity to meet fans, building goodwill and conducting playtest session is gravy. With all these advantages to showing at conventions, it is no surprise why Wizards of the Coast chose to release the *Players Handbook* for *Dungeons & Dragons Third Edition* at this year's Extravaganza in Milwaukee.

So, we've seen why convention organizers might want to go through the effort to put on a show like this, and exhibitors have a vested interest. But why should players want to spend their hard earned money to attend even a local convention, let alone one of the large national conventions. There are several answers. Firstly, there is the opportunity to meet players from all over the world. I have fond memories of playing BattleTech with members of the Mechforce UK, who come each year to Gen Con for the international tournament. A convention is also a fabulous opportunity to play games that require more time, or effort, or players, than your regular group can produce. Conventions are the only chance most people get to play with the large scale *OGRE* Macrotures, or the beautiful hand-made *Kingmaker* or *Circus Imperium* boards that some people bring.

Still, this is a business column and so there should also be some economic advantage to the attendees of a convention. Indeed there is. Conventions are the very best place to try new games. Most manufacturers organize special opportunities to learn their systems or to play a new adventure under the direction of a master GM, often the game's designers themselves. Conventions are also the very best place to buy games. From new products that have yet to see store shelves to the out of print game dealers who can hook you up with the best games of yesteryear, a convention hall is a game collector's dream. It is also an excellent place to find games that an FLGS often does not stock, such as the best German or other European games. Exhibitors will also frequently give back some of the extra profit they make selling the games direct to consumers by having some kind of "convention special" or other discount available. Many events will also offer prizes to the "winners" of each event. These prizes could be product or gift certificates provided by the exhibitors or the convention organizers themselves.

The best part of any convention is that, unlike a poker game, it is not a zero-sum game. Under the best of circumstances, everyone can win. Nevertheless, it is a business. Some understanding of the motivations of each kind of participant can help to maximize the likelihood that the convention will be a success. Convention organizers and exhibitors will do will to keep in mind their obligations to the attendees and serve them as well as they can. Attendees can help the organizers by coming to the convention and paying their fees on time. They are what make the convention amenities possible. At the same time, attendees have the right to expect that events will come off as advertised, including as much as possible, the timely presence of the GM and the fitness of the room. Everyone can help the exhibitors by patronizing their booths, and continuing to buy the new products for the games they discover at the convention. Conventions are one of the best things about our hobby. If you have never been to one, you owe it to yourself to check it out.

Additional Campaign Crossovers for GURPS Technomancer

?

by Loki Carbis

Art by Ray Lunceford

GURPS Technomancer is one of the most interesting settings in the modern magic genre. But the *Technomancer* core book lists only three possibilities for campaign crossovers -- *GURPS Space*, *GURPS Time Travel*, and *GURPS Illuminati* (T94-95). But there's a lot more that could be done with the setting; here are several more potential crossovers.

GURPS Atomic Horror

A *GURPS Atomic Horror/Technomancer* crossover is best set during the standard time period of *Atomic Horror*: roughly 1945-1960. The sudden rush of magic into the world means that a whole new arms race is just beginning, and the fear of Red Witches is everywhere. And it's at this time, shocked or awoken by the Trinity Event, that the alien races who have been contending over Earth begin a phase of much greater, if still covert, activity. This alternate is all about the clash of human magic and alien science; aliens should not, under normal circumstances, have access to magic (although the addition of magic to the low-tech Loi-descended culture on Venus could prove interesting).

GMs considering this crossover will need to take into account the role of the Loi mutants in human history, particularly if ancient gods are real in the setting. Could the true gods command those who invoke them to fight these pretenders? Or are the Loi mutants the real gods, with mages merely contacting deceitful spirits?

GURPS Autoduel

The Grain Blight was perhaps the mostly deadly spell backfire of all time; literally millions died in the years following it. But most of them did not starve; they died because too many people panicked. The addition of magic did help to blunt the edge of starvation, but it also made things a lot more volatile. Although the devastation was not as bad in some ways, magic also meant that desperate people more often had a way to try to solve their problems by taking matters into their own hands. It's still a rough-and-tumble world of casual bloodshed, but the power units are magical now, and the guns all have Accuracy enchantments on them.

Additional Campaign Crossovers for GURPS Technomancer

?

In this crossover, it's possible that there may be more than two Hellstorms -- people got pretty crazy during the Food Riots. If this is the case, modify all of them, even the first two, to be less strong, and less wide-ranging in their effects. This will re-draw your map of America somewhat, as places that are abandoned due to radiation in the *Autoduel* book (and the *AADA Road Atlas* series) are likely to be inhabited due to their high Mana levels in this alternate.

GURPS Black Ops

Assume for a moment that magic has always been real, and that the Trinity Event simply made it impossible to conceal that fact any longer. The lot of your average Black Operative is considerably worse in this alternate. Although many interesting new magical toys are available to the Operatives, their opponents -- who have been studying magic for centuries, or even millennia -- are always a few steps ahead of them.

And the wide availability of magic -- and the popularity of the Schools of Communication and Empathy, and of Knowledge, in particular -- means that keeping Black Operations covert is more difficult than ever. GMs may wish to come up with some new spells or magic items to help the players out a little here.

GURPS Callahan's Crosstime Saloon

This crossover probably requires less changes than any other. Callahan's is already a place where the strange and unusual happen with disturbing frequency. But in the world of *Technomancer*, things have to be a lot stranger to be considered unusual. GMs may wish to replace technobabble with magical terminology (manababble?) in this setting -- Mickey Finn would become a powerful spirit geased to cockroach-demons, and so on.

GURPS Cliffhangers

The Trinity Event occurred at right around the time that the Pulp Era was drawing to a close. But who's to say it had to be that way? A sudden influx of magic into the world could easily extend the era into the 50's and 60's. Depending upon your *Cliffhangers* campaign, there are two ways to play this. If magic already exists in the world, then all the magicians around are likely to get a lot more powerful -- and to attract followers with sorcerous abilities of their own. If there was previously no magic in the world, then the charlatans and fakers of this world may suddenly find themselves able to do things that even they thought were impossible -- and to surprise the heroes quite dramatically next time they meet.

GURPS Conan

Many people in the world of *Technomancer* already believe that there was a magical era in the far distant past. Using *GURPS Conan* could be an interesting twist on proving them right. Such a campaign would tend to focus somewhat on archaeology and ancient history, as both sides in the Cold War race to find whatever eldritch knowledge and mysterious artefacts they can before the other does -- and on things that were only sleeping while they waited for the magic to return...

This approach could also be taken with many of the historical sourcebooks as well. *GURPS Arabian Knights*, *GURPS Greece*, *GURPS Egypt*, *GURPS Camelot* and *GURPS Celtic Myth* would be particularly easy to do, but just about every *GURPS* historical worldbook includes some notes on a more mythic take on the culture it describes.

GURPS Cyberpunk/Cyberworld

It doesn't take much to extrapolate from the history in *GURPS Technomancer* and combine it with the *Cyberworld* setting. A worthwhile alternate for people who want something similar to, but noticeably different from FASA's *Shadowrun*. (A truly nasty GM could also add elements from *GURPS Cthulhupunk*.) The manaware on tomorrow's streets will almost always have been enchanted using "Quick and Dirty" methods -- and spell backfires will be even more common, and more disastrous. Magic should be expensive and dangerous, or cheap and even more dangerous. The interaction of magic and cyberspace has made that environment even more confusing -- is the entity you're dealing with an AI, a program, a spirit or a spell? Net-runners, more than anyone, need to be at least competent Thaumatologists, if not actual spell-casters themselves.

GURPS Discworld

There are several ways to approach this alternate. It could be posited that the Manafall created an area not unlike the Wyrmberg (DI28), or that magic is as quirky and as unpredictable a force in our world as it is in Pratchett's -- which would make the military use of magic a decidedly less likely occurrence. If magic isn't reliably replicable, giving different results each time, then people will be more reluctant to use it -- but those who do will have wills strong enough to dominate entire worlds, should they desire.

The other way is to inflict the Hellstorm on the Discworld itself -- only in this case, it's an explosion of technology, not magic. From whatever isolated point on the Disc, it slowly radiates out -- a comical, steampunk industrial revolution. "Moving Pictures" and "Men At Arms" are the definitive references for such a game -- GMs can choose to make the advances all-encompassing, or concentrate (as the novels do) on just one or two facets of technology.

GURPS Fantasy/Yrth

The similarities between the Trinity Event and the Banestorm are hardly coincidental -- the Dark Elves of Yrth are still trying to perfect their reverse-Banestorm spell. The Trinity detonation (and the later Zhukov explosion) have done little more than attract and permanently connect the energies of the Banestorm to specific locations on Earth. And both of them serve also as gates, just as the Banestorm did. Which direction these gates work in is entirely up to the GM -- maybe they're one way, or travel in both directions is possible. Maybe they change at random.

It's recommended that the normal *GURPS Technomancer* prohibition against the Gate College of Spells (from *GURPS Grimoire*) be relaxed for this crossover -- such magic is more likely to be researched in this alternate, and half the fun is the contrast between the two worlds. A campaign of intrigue and high sorcery, jumping back and forth between the two distinct but similarly magical worlds (and possibly others besides) offers a lot of potential for adventure.

GURPS Horror/Cabal

Magic becoming a widespread and well-known force is a mixed blessing for the Cabal. Although it does mean that they don't have to hide anymore, it also means that the enemies they face are far more likely to have sufficient power to pose a serious threat -- and that anyone crying "werewolf" will be readily believed. Picture the Cabal broken into numerous factions, split between the various answers to the question "what do we do now?" The characters could face those who wish to exterminate them, and those who wish only to get along with them -- and it's anyone's guess which side they have more in common with.

GURPS In Nomine

The Trinity Event changed the world forever -- but without damaging the Symphony. (This despite rumors of the involvement of Vapula in the design and construction of nuclear weapons.) Suddenly, the mortals had access to a force no Angel or Demon could use, and the War was a lot more complex. Magic is quite a different thing from Sorcery -- but it may take the Celestials some time to realize this fact. In the meantime, Hatiphas, the Demon of Sorcery, is likely to make Princess any day -- and no doubt the Seraphim Council will soon appoint a new Archangel to take care of this field (unless Eli returns from his voluntary exile, at least).

And what of the Marches? Ethereals in general are a lot more familiar with the whys and wherefores of magic, and the sudden availability of it on mortal planes is likely to give the Old Gods a much longed-for power boost (humans are far more willing to believe in chic neo-paganism than to accept that any organised religion had much to do with the Manafall). Heaven and Hell may find themselves embattled on two fronts -- possibly even enough to resolve some of their differences in the face of the common foe.

GURPS Mage: the Ascension

The sudden availability of magic -- even lesser magic such as this -- to the masses is a godsend for the Traditions. Suddenly, there are allies everywhere they turn, and it's no longer necessary to hide quite so much (not to mention that Paradox just got a lot more forgiving). But the Technocracy is not happy. Thousands -- soon to be millions -- of undisciplined civilians toying with reality on a daily basis? And surely neither the Nephandi nor the Marauders will be slow to seize this golden opportunity -- and what will happen when they do?

Both systems of magic can run in parallel quite easily, as long as care is taken to use the disadvantages of each to preserve game balance. GMs should be ruthless in their application of Paradox for true mages -- and the effects of Mana and skill level for magic users. It is not advisable to let a single character use both types of magic -- make them choose one or the other. (And if you're using *GURPS Vampire: The Masquerade* as well, don't forget that the Thaumaturgy Discipline will be a lot more common -- normal humans aren't the only ones affected by the Trinity Event.)

GURPS Supers/International Super Teams

The Trinity Event doesn't actually make for that different a super-powered world. Most super powers will be magically based, and the powers themselves will be a lot more common. The best way to simulate this is with the rules for Knacks (see M96). If the "Knacks are the only magic" option is used, then most people will probably not even realise that they are using magic. In this world, SuperTemps will be an even larger, wealthier and more widely respected organisation, while the IST carefully bases its teams near zones of unusually High or Low Mana -- to keep them out of the wrong hands, of course. And what of the Seeders? Perhaps the Trinity event has drawn their attention, and they will return at last to Earth...

GURPS Terradyne

The Zhukov test convinced everyone that future tests would be bad for the planet. No one said anything about other planets.

To use this alternate, some slight changes will have to be made. The nuclear blast of 2005 in the Golan Heights never took place -- instead, the crisis came to a head with the deployment of a magical-biotech weapon of unknown origin. And Pheobe wasn't blown apart by a shaped charge -- it was a deliberate use of a small nuclear device, which succeeded in its goal: to magically irradiate as much of the Martian surface as possible. The average Martian Mana level is High, with occasional Very High level pockets. There are some small pockets of lesser Mana -- as on Earth, these are largely created through the use of the Drain Mana spell. Terradyne is still the major political and economic power in this alternate (having the almost unlimited Mana resources of Mars all to itself gives it an unbeatable advantage magically, too), but it is also under a lot more threat from up and comers -- Astarte may decided to risk UPOE censure and begin terraforming Venus at any time, and there's suspicion at the highest echelons of Terradyne that someone may have beaten them to Titan -- and may be using magical means to sabotage the company's plans.

GURPS Voodoo

Magic has always been real -- the Trinity Event just made it a lot more common. . . and a lot less controlled. The years immediately after Trinity saw a mad scramble for power and numbers between the various factions of the Lodges. The Bizongues, for the most part, adopted a "wait-and-see" philosophy, although they too had to grow and change, allowing for increased powers and numbers of adepts.

What has both sides worried is that most magic users in the world are aligned with neither faction, being instead guided by spirits of various sorts -- spirits that bear far too great a resemblance to the In-Betweeners and Corruptors for anyone's comfort...

GURPS Wild Cards

The Trinity Event wasn't just what it seemed -- it was carefully manipulated by the mage-lords of Takis. Dr. Tachyon, renegade sorcerer, tried to prevent it, but no one listened. This variation on Technomancer makes Magery less of a blessing and more of a curse. 50% of those exposed to the Manafall die. Of the survivors, 50% are deformed (although still gifted with magical abilities). And the lucky remainder -- 25% of those exposed, become the Ace Sorcerers, the celebrities and powerbrokers of the magic wielding culture.

The grim 'n' gritty nature of both these settings makes them blend relatively well, but GMs need to be careful to make sure that *Wild Cards* doesn't overwhelm *Technomancer* in the mix. The revised statistics for *Wild Card* exposure given above go a ways towards this, but care will need to be taken nonetheless. Still, once you've mapped *Wild Cards*' New York onto *Technomancer*'s El Paso Juarez Metropolis, the pyrotechnics are sure to be fast and furious.

GURPS Y2K

What if it took more than just a fortuitous incantation to set up the necessary criteria for the Hellstorm to form? What if the timing had to be perfect? On December 31, 1999, as the clocks hit midnight, computers everywhere started to misbehave. Most of the problems were brought back under control fairly quickly, but some it was too late to stop. The unfortunate detonation of several runaway missiles at local dawn, or moonset, or a conjunction of Mars and Venus, or some similar event, at the various places of their impact opened half a dozen Hellstorms. With the exception of the blast that destroyed the Pine Gap facility in Central Australia, the storms are scattered more or less randomly across the Northern Hemisphere. Each of these was about the size of the Trinity Hellstorm. (Depending on what event the detonations were in conjunction with, some, or even all of these Hellstorms may be Aspected -- see M94.) Now, the world is split between three different types of social and technological societies -- those who use only magic, those who use only technology, and the Technomantic nations (although it will take this latter group some time to catch up to the levels described in *GURPS Technomancer*). Political intrigue and guerilla style border skirmishing are the order of the day. Welcome to the Brave New World.

Pyramid Review

Siege on Tolkeen: Chapter One, Sedition (for Rifts)

Published by **Palladium Books**

Written by Kevin Siembieda

160 pages; $16.95

Palladium Books' *Rifts* series is considered a veteran among games. In its ten years of publication it has run the full gamut, from the dark fantasy of *Wormwood* to the space opera of *Phase World*. Yet one of the most memorable aspects of the game has been the saga of the Coalition States, a Nazi-like regime established in the central United States (or what *was* the central U.S.), which had been introduced in the very first book of the game. Indeed, many of the books since published have explored the different aspects of this tyrannical and war-like dictatorship. Yet, *Siege on Tolkeen: Chapter One, Sedition* gives us the first taste of a series that will delve deeper into the Coalition States than anything before.

Siege on Tolkeen is planned as a six book series, with the first book being released in July and the last to be released before the end of the year. They will be written by Kevin Siembieda and Bill Coffin. The books will cover the saga of the war between the Coalition States and a small nation named Tolkeen. This conflict, which is quickly escalating into epic proportions, was hinted at in the original *Rifts* game book, and as Siembieda explains, it's something that he had intended on developing since his original design work on the *Rifts* game.

The theme of this series is the saga of war, and in Siembieda's vision war is not necessarily the thing of glory that many tales make it out to be. It is most often an atrocious and horrible beast, and unlike in many conflicts, this is in no way a simple case of the good guys versus the bad guys. The leaders on both sides are just as guilty in this endeavor, and in the end it will be the millions of ordinary people, from soldiers to farmers, whose lives will be ruined in the war's destruction. As Siembieda says of Tolkeen's leader, King Creed:

"This is war, people die. This is war, atrocities happen. This is war, where saints become monsters. However, to the victor go the spoils, and the winner, whether saint or monster, is always the hero in the end."

This outlook may seem grim, but Siembieda notes that the emphasis will be on "adventure, heroics, and personal challenge," all while trying to fight for something that's good and right in the face of such powerful adversity. The players are thus given both a tragic and epic background in which to set their story.

The first book of the series, *Sedition*, makes its objective to set the stage for the campaign by giving the war's background and a basic intro for the nation of Tolkeen (The CS will be emphasized in book two, *CS Overkill*). A full timeline is given detailing all of the events that lead up to this conflict from the very beginning. The current stage of the war is also outlined, with detailed maps given to present a good visual picture.

The book presents a great deal of new equipment and magical items that will be used by Tolkeen during the war. Some of them are old (reprinted from earlier texts), and some of them are new. Most of the items presented are Techno-wizardry items, and all of them are very interesting. Many of the new items are quite stylish and will add a great dimension to any campaign.

Several legendary artifacts are presented, all of which are incredible. They include things such as The Book of Ten (a

tome of spells of legend -- way cool!), Poor Yorick (a fortune telling skull), and the legendary Mobius (an item so powerful it doesn't even get stats, just a description).

One of the major themes of the war will be the battle of magic versus technology, and a lot is done to develop this. The Coalition States are a nation that has made its objective to hunt out and exterminate all things of magical nature and creation. Tolkeen is just the opposite, a nation that embraces magic and the enlightenment that its many forms can bring. This gives a dynamic and interesting mix, in which the two aspects will be played out one-on-one during this long and bloody conflict.

One of the finer aspects of the book is its detailed work on the strategies and tactics that these two armies will be using against each other during the war. The Tolkeenites have developed special strategies that exploit ley lines and the subversive nature of their magic. The CS has developed tactics to deal with these measures as well as their own countermeasures for sniffing out and putting a cap on magic users' abilities. On the CS side, a lot is done to explain the changes these strategies have forced the troops to undergo. The troops in this war are dynamic and changing people, not static grunts that are simply hurled at enemy bullets (or fireballs as the case may be).

A lot of adventure material is given as well, all of it centered on the Tolkeen battle fronts. It provides plenty of side adventure material, as well as plenty of opportunities for players to be introduced into this war. Siembieda's intended approach in this series is not to simply present all of the epic battles and major players who the PCs will probably never meet. Instead the focus is on the smaller battles and the lesser NPCs that just might play major parts in this grand conflict. All of these are tied in with plot threads that could easily effect the outcome of the whole war. (Note that this isn't to imply that the major players and battles won't be represented at all; they'll be covered in more depth later on.)

Despite the fact that this book truly begins *en medias res*, it is presented so that it will be very easy for new players to get into it. However, note that in order to truly use the material in this series effectively the GM will need to have access to several other books, including ***Coalition War Campaign***, ***Rifts Conversion Book One***, and ***Federation of Magic***. In addition, there are plenty of other books that will supplement this material, but aren't absolutely necessary. (As a side note, the cross referencing to other books is done very well in this book, making it easy to access information from other books as necessary.)

There are a couple of other little bonuses, such as detailed maps of the region and a comprehensive list of all magic spells ever published in the ***Rifts*** books series. And this is not to mention the excellent artwork from such people as Perez, Breaux, Beres, and others that make the book all the more enjoyable. Dave Dorman in particular gets special kudos for his exceptional cover painting.

Overall this book is an excellent buy. Siembieda has been developing this material for years, and this is his writing at its best. If the other books in this series follow as strongly as this one, then the ***Rifts*** series will finally have gotten the epic war saga that it deserves.

-- Jon Thompson

Statosphere: The Invisible Clergy Sourcebook (for Unknown Armies)

Published by **Atlas Games**

Written by Tom Adams, Tim Dedopulos, Kenneth Hite, Daniel Ksenych, Andy Lucas, Michael D. Mearls, Rick Neal, James Palmer, John Snead, Greg Stolze, Tim Toner, John Tynes, Chad Underkoffler, and Ian Young

128 pages, $19.95 (perfect bound, softcover)

Statosphere is the latest high quality sourcebook to come out for *Unknown Armies*. It fleshes out in great detail many of the mystical elements in the *UA* universe alluded to in the main rulebook that aren't covered in *Postmodern Magick*.

In the *Unknown Armies* cosmology, the Statosphere is a mystical domain where the Invisible Clergy dwell. The members of the Invisible Clergy are semi-divine beings each embodying a particularly strong archetype in the collective unconscious of humanity, though they were once mortal. The individual members of the Invisible Clergy manipulate probabilities to shape events on earth according to their desires, often acting at cross purposes. When the 332nd member of the Invisible Clergy ascends, the Comte de Saint-Germain, the First and Last Man, will then ascend, and the universe will end.

As with *Postmodern Magick*, *Statosphere* opens with a clever little short story, this time one that offers insight about a day in the life of the Comte de Saint-Germain written by Greg Stolze.

The first chapter examines the Invisible Clergy in great detail. It includes lengthy sections on integrating the Statosphere into an ongoing *UA* campaign; ascensions (how humans become incarnated in the Invisible Clergy); the powers of the members of the Invisible Clergy; life as an avatar (someone who follows the path of one of the archetypes and who one day hopes to ascend), including common behaviors and symbology for all published archetypes to date; and details on the godwalkers (mortal incarnations of an archetype -- essentially the most powerful living avatars). This chapter also includes a section on a new type of minor magickal rituals that can be performed by anyone (called "Tilting the Statosphere") to alter probabilities in their favor, which is, after all, what the Invisible Clergy does on a much grander scale. The material in this chapter is extremely valuable to anyone curious about how avatars and the Invisible Clergy really work, and does a terrific job of elaborating on much of the rich background material in the main rulebook.

The second chapter provides sixteen new archetypes. Each archetype has certain mystical abilities (called channels) associated with it at various levels of power. The True King, the Necessary Servant, and the Hunter are probably the best of the lot. Unfortunately a few of the archetypes seem a little on the boring (or obscure) side (e.g., the Chronicler, the Confessor, the Peacemaker). The Mystic Hermaphrodite, a truly bizarre archetype followed by one of the main characters in the *UA* universe alluded to in several previous *UA* books, is also somewhat disappointing; it just doesn't live up to the hype.

Chapter Three offers an in-depth look at the House of Renunciation and includes descriptions of four Rooms in the House, as well as eight Agents of Renunciation. The House of Renunciation is a mystical place (entity?) that embodies change and entropy. Its Agents (humans who have been transformed by the House) seek out certain individuals and bring them into the House, where their personalities, motivations, and sometimes even their physical forms are radically changed -- sometimes for the better, and sometimes not. The Room of Cold Reflection and the Room of Rusted Things are probably the most interesting of the four Rooms presented. The House of Renunciation would likely have to be used very carefully in play because of its great potential for fundamentally altering the very personality of all those who enter it, including the player characters, though it does offer great roleplaying potential.

Chapter Four focuses on the Comte de Saint-Germain, offering three very different versions of him, all complete with game statistics, including the best of the lot written by Pyramid's own Ken Hite, though the other versions, penned by Messrs. Stolze and Tynes have a lot of potential as well.

The book has very few typos, and is well written and organized, though a fair amount of supporting information about the new archetypes is presented before the actual descriptions of the archetypes, which leads to some confusion. Cover and interior artwork is even stranger and more surrealistic than in previous *Unknown Armies* books. This is both good and bad. There are a number of moody and evocative black and white photographs interspersed throughout the text, and a fair number of them are just downright strange and feel more like filler material than good quality artwork.

If you are interested in finding out more about the Invisible Clergy, or are looking for more archetypes to introduce into your *Unknown Armies* game, this is an excellent buy. It's well written, informative, and, perhaps most importantly of all, it's an entertaining read for anyone interested in finding out more about *Unknown Armies'* unique take on modern occultism.

-- Andrew Byers

Pyramid Pick

Beyond the Mountains of Madness (for Call of Cthulhu)

By Charles and Janyce Engan, et al.

Published by [Chaosium, Inc.](#)

438 pages, $39.95

It's very difficult not to be intimidated by most *Call of Cthulhu* adventures. Even the least ambitious among them demand a level of erudition unmatched by other roleplaying games. To my mind, this is a good thing and one of the reasons *Call of Cthulhu* remains one of my favorite RPGs. The game rarely talks down to its players. More often than not, it gives them a remarkable benefit of the doubt, both in terms of their sophistication and stamina, the latter being especially important when one considers some of the mammoth scenarios Chaosium has produced over the years.

Yet all previous adventures pale in comparison to *Beyond the Mountains of Madness* (*BtMoM*), the single largest roleplaying game product I've ever seen (beating out the similarly massive -- and similarly good -- *Delta Green: Countdown* from the fine folks at Pagan Publishing). Weighing in at a stupendous 438 pages, *BtMoM* is described as "an epic Antarctic campaign and sourcebook," but that description is somewhat misleading. Unlike some of Chaosium's previous efforts, like the excellent *Masks of Nyarlathotep* or *Horror on the Orient Express*, *BtMoM* isn't so much a campaign book as a single adventure, divided into seventeen chapters. Together, they chronicle the story of the Starweather-Moore Antarctic expedition, as it attempts to determine the final fate of the doomed Miskatonic University Antarctic Expedition described in H.P. Lovecraft's classic tale, "At the Mountains of Madness." That's a pretty tall order -- even for a *Call of Cthulhu* adventure -- but the authors show themselves quite up to the challenge.

As you might expect, *BtMoM* is a hefty tome. Fortunately, it's binding seems quite sturdy, which is an important consideration in a book that'll be as regularly consulted as this one. The beautiful cover illustration by John T. Snyder (the same artist who rendered the cover of the current edition of *Call of Cthulhu*) is extremely evocative, showing a small airplane dwarfed by the towering peaks of the Mountains of Madness. The interior illustrations, especially those by Paul Carrick, are equally effective at conjuring up the stark beauty and utter isolation of the adventure's Antarctic setting. The book also includes a rather unremarkable map of Antarctica as it was known in the 1930's.

The seventeen chapters of the adventure are well structured if somewhat linear. Each includes a handy overview for the Keeper, as well as numerous boxed sections of text as reminders of important information. The linearity of the chapters is more problematic early on, as the characters join the expedition and assist in its preparations. Once the expedition reaches Antarctica, the tight scripting of events -- as well as the sheer immensity of their revelations -- alleviates this problem greatly. As things unfold, both the players and the Keeper will be too caught up in the storyline to notice the relative lack of options in certain chapters. Indeed, the Keeper will probably find this a blessing, considering the large amount of material he must assimilate to run *BtMoM* properly.

Fortunately, the authors have thoughtfully included over one hundred pages of appendices and handouts as aids for the players and the Keeper. This does lighten the burden somewhat, but make no mistake about it; *BtMoM* is not for the casual player. Assuming that a single chapter is played each week, there's enough material here for over four months of solid play. Like many previous *Call of Cthulhu* adventures, this one demands serious dedication if one is to get

one's money's worth from it.

The tale told by **BtMoM** is a truly epic one. Although the pacing is slow at first (sometimes frustratingly so -- early chapters involve taking inventory as an in-game activity), this only helps to build tension as the expedition arrives at its destination. In addition to seeking the fate of its predecessor, the Starweather-Moore Expedition must contend with two rival expeditions and the harsh conditions of the polar continent. **BtMoM** provides plenty of information on Antarctic weather and the state of survival gear in the 1930's, both of which add a lot of flavor to an already-flavorful adventure. Indeed, **BtMoM** can be enjoyably read as well as played. Its story, especially the last seven chapters, is a gripping one and very much in the tradition of Lovecraft.

This isn't to suggest that **BtMoM** is flawless. Besides the linearity of its plot, there's also the problem that the book provides much less staging advice for the Keeper than one might wish. Granted, this book is for experienced roleplayers, but that doesn't change the fact that running it successfully is mighty undertaking, however many years of gaming you have under your belt. Likewise, the book could have been better organized. As presented, the Keeper must flip through the book more often than I'd like, even with the nicely collected appendices. This situation may be ameliorated somewhat by the ***Miskatonic University Antarctic Expedition Pack*** (also available from Chaosium), which reproduces some of the book's handouts and other materials. Since I do not own that product, I cannot comment on its utility.

In the end, ***Beyond the Mountains of Madness*** remains a remarkable achievement. The combination of compelling storyline, unique setting, and detailed information is sure to mark this adventure as a classic. If you're a long-time player of ***Call of Cthulhu*** who hasn't played in years, you might want to dust off your rulebook and give this one a try. If you're an inexperienced player -- or even someone who isn't a fan of ***Call of Cthulhu*** -- you might even want to take a look, if only to see how an epic adventure can be made to work. ***Beyond the Mountains of Madness*** is really something special. If ever you needed reminding why ***Call of Cthulhu*** still holds such a fond place in many gamers' hearts, this adventure will help.

Murphy's Rules

[Murphy's Rules](#)

Random Rewards

I am currently at 20,000 feet above Cincinnati, Ohio. I am flying home from a sad family gathering. I have just been alerted by the pilot that we may encounter turbulence. As I type this, the plane begins to shake.

I chose to fly standby, which is a perk wherein I get dirt-cheap airline tickets because my friend works for an airline at the risk of possibly getting bumped from flights.

I was bumped from four flights today. I have been in an airport or an airplane for twelve hours today. I missed the last possible flight home, and will need to spend the night with a friend in Atlanta. (Thanks, Mark!)

I have flown standby in the past with no problems. This time was not meant to be. I have traveled out of town three weekends this month. I have gamed twice.

When the counter receptionist called my name to get on this plane, I squealed with the delight of a *Survivor* survivor eating long pork. I grabbed my ticket and moseyed aboard the plane, humming "Learning to Fly" by Tom Petty.

We are currently in a holding pattern regarding the point of this column; please be patient.

Over in psychology they teach about a catchy little something called "operant conditioners with a variable ratio and variable interval schedule." (Thanks to the *Pyramid Magazine* crack psychological team, aka Mael, for this info.) The idea is simple: If action X consistently produces pleasant result Y, then the desire to do X will be less than if action X inconsistently produces pleasant result Y. What does this mean? It means that random rewards are more appreciated than dependable rewards.

This explains the appeal of slot machines and fishing, as compared to vending machines and eating at Red Lobster. With a vending machine you put in sixty cents (or, in an airport, forty-five dollars) and get a Milky Way bar. At Red Lobster you order a tasty meal and you get a tasty meal.

With a slot machine, each quarter you put in probably won't get you anything. . . but every so often it'll surprise you with the hoot of bells, sirens, lights, and coins. When fishing you won't catch something each time. . . but (presuming any skill) you'll get that spastic tug on the fishing line just often enough to delight you with your magnificent prize of seaweed. At least, that's been my experience. Regardless, the random reward is more addictive than a constant reward.

Anyway, to tie it all together (and attach it to gaming, no less!), I offer the following. If I had made my first flight at noon, like I was supposed to, I wouldn't be anywhere near as ecstatic as I am now that I made the 8:45 pm flight (after missing three others), because I have been intermittently rewarded.

Likewise, GMs, you may want to consider intermittently rewarding your players. If, each adventure, they encounter Bad Guy, fight Bad Guy, and defeat Bad Guy, get 1d20x1000 Gold Pieces, they may soon grow bored of it.

But if they encounter Bad Guy, fight Bad Guy, and usually beat Bad Guy but every so often don't defeat Bad Guy, and generally get a reward but sometimes don't, then they might appreciate the experience more than something more straightforward. If they have setbacks, then these setbacks might make the eventual victory all the sweeter.

Or if sometimes there isn't a terribly challenging Bad Guy, or even *any* Bad Guy, then when there *is* a serious challenge, it may seem more interesting. I'm currently running an *Aberrant* campaign (White Wolf's modern super-hero game that *isn't* **Mage**), and so far after three sessions I haven't introduced any antagonists of note. There have been mysteries, problems, and interesting things going on (at least, I hope), but so far no Dr. Glooms have appeared during the midst of the St. Patty's Day parade threatening all of existence. It'll happen probably at some point, sure, but in the meantime I think the anticipation is interesting to them. (In this campaign I've also "rewarded" them with their own city block in Chicago for not doing terribly much; it's also the greatest tangible reward they've received in the game so far.)

Regardless, consider mixing up your standard genre formulas; maybe your players will learn to unexpect the expected.

As I land in Atlanta having missed every connecting flight to my home city for the day, I feel good for having made that flight; sure, I'm spending the evening sleeping at a friend's house, and I might get bumped from every flight tomorrow, but maybe. . . just *maybe* I'll get that first flight home tomorrow. And then I'll be delighted all over again.

* * *

Now, I'm not telling anyone to steal, but if you happen to be on a Delta flight this summer, you might want to consider picking up a copy of their *Sky* magazine. (I'm guessing they all contain this information, but the one I'm looking at is #78.)

Why? Well, tucked in the back (behind the articles and whatnot that must be interesting to someone) is general info. From mildly useful info (like a US & World map of Delta routes... as near as I can tell, for example, someone travelling from De Moines, Iowa, via Delta would need to go through either Atlanta, Georgia or Cincinnati, Ohio) to really darn useful info, like Terminal Maps for many of the biggest airports in the world, like Atlanta/Hartsfield, Dallas/Fort Worth, and New York/John F. Kennedy International Airports. There are details about the planes, customs forms and other bits of verisimilitude I personally love to incorporate into my games. This info also seems to be on Delta's [website](), but it takes a bit of searching and isn't as swipable as a magazine if you're on one of their planes anyway.

Oh, and they say you're allowed to take it, so it's not *really* stealing. . . but it might be stretching the bounds of hospitality if you walk out with a stack of seventeen.

* * *

FYI, I'm going to be moving this week (ugh). So hopefully there won't be a situation where any of you will need to contact me posthaste. If I can survive 'til August 15th, my life should be able to reassume the full upright position.

In the event of an emergency Steven may not inflate fully; however, Steven *is* working and oxygen is flowing through him.

Thank you.

-- Steven Marsh

* * *

Last week's answer: **Lunch Money**, back of the box.

(Five stars) "Everybody knows to dial 911 in the case of emergency. Everybody knows that a 911 operator on the other end will dispatch police, fire and medical personnel.

Few, however, know what happens to the strange calls. . . calls of a supernatural nature?"

It's Not Easy Being Green -- And Evil

"The next day, Tom returned to that very spot to search again for his watch. Shocked, he stood in surprise! Bob's green gloves were floating in the air all by themselves. Tom then heard a voice that said: 'Don't worry, Tom. I'll find your watch for you!!!' Terrified and trembling, Tom ran all the way home, not stopping for a moment. Gulping for breath he told himself, 'Was that really Bob?!' Now you can see for yourself. If you ever go by Johnson Pond Road, look to your left. You may see Bob's green gloves."
-- Bill Ewen (Fuquay Varina Elementary School, Grade 4), "The Lost Watch" (1999)

Among the reasons to wear gloves, a reading of murder-tales will inform us, is to avoid leaving fingerprints. To leave only smudged marks indicating your passage through the scene of the crime. And the marks left by the Man With Green Gloves are, in some cases, smudged into (or out of) illegibility -- even finding the smears of blood and symbolism, to say nothing of solving the crime or piecing the clues together, will be more than ordinarily difficult. It's almost as though he never existed at all. Which, on the one hand, he didn't. On the other hand, he seems to be leaving traces even now, although it takes some eager looking to find them. And on both hands, of course, he wears his Green Gloves.

"In Berlin, there was a Thibetan monk, nicknamed 'the man with the green gloves', who had correctly foretold in the Press, on three occasions, the number of Hitlerian deputies elected to the Reichstag, and who was regularly visited by Hitler. He was said by the Initiates to 'possess the Keys to the Kingdom of Agarthi.'"
-- Louis Pauwels and Jacques Bergier, *The Morning of the Magicians*

The clearest hand-print comes from Pauwels and Bergier, and the best will in the world can't trace it back any further than their 1960 masterpiece of hintage and innuendo, *The Morning of the Magicians*. Since then, authors from Trevor Ravenscroft (beginning with *The Spear of Destiny*) to Peter Moon (in *The Black Sun,* Book IV of *The Montauk Series*) have rung changes on the theme until the legend (or myth, or recovered history, or created truth) now goes something like this:

In 1903, Karl Haushofer, German geographer and member of the Japanese occultist Green Dragon Society (a cover or rival to the Black Dragon Society from [our earlier column](#)?) met a mysterious figure known as 'Dorjieff' in Tibet for initiation into secret Tibetan mysteries. Haushofer kept in touch with two more trips (in 1905 and 1908), and through the activities of Sven Hedin, the pro-German Swedish explorer. Haushofer helped found the Germanenorden in 1912 and the Thule Society in 1918. He also helped arrange the first Sven Hedin Institute expedition to Tibet in 1926. That year a mysterious Tibetan sorcerer, the Man With Green Gloves, appeared in Berlin, meeting in secret with Hitler and the occult masterminds of the nascent Reich, and predicted Nazi victories. Between 1930 and 1942, the Thule Society, and later the Ahnenerbe-SS, launched yearly expeditions to Tibet, as the Tibetan "colony" in Berlin grew larger. SS Hauptsturmführer Ernst Schaefer returned from the 1938-1939 expedition bearing not only the 108 volumes of the *Kangschur* (a Tibetan Buddhist scripture) but also (they say) the legendary Black Termas (vile texts of magical sub-creation) and a ritual *phurba* dagger of unholy power. (Katherine Kurtz' novel *Dagger Magic* details this myth, as well.)

Less than a month after Schaefer's return, Hitler invaded Poland, launching World War Two. The Man With Green Gloves and his Tibetan Society of Green Men maintained astral (or radio) contact with Tibet, and (perhaps) with the Green Dragon in Japan. After Haushofer's son Albrecht was implicated in the July 1944 plot to assassinate Hitler, however, the SS transferred the Tibetans to guarded camps. On April 25, 1945, Russian soldiers broke into a prisonlike compound to find seven Tibetan monks dead in a ritual circle, each slashed across the stomach with a dagger. The rest of the Tibetan colony died in unmarked German uniforms, fighting the Soviets. Rather than face trial as a war criminal, Karl Haushofer committed seppuku on March 14, 1946.

"No one else wore green gloves on stage. I had spotted ones, and one great outfit I had once was a green US army jumpsuit with bright white gloves coming out the ends of the sleeves with the tips painted bloody. I wore it on the 4th of July."
-- former Dead Kennedy Jello Biafra

Or so goes the myth, anyway. The stories, as they always will, vary. Some say one of the seven dead sorcerers wore green gloves. Some say they all did. Some say that the Man With Green Gloves stole away to the East in 1944, after the failure of the bomb plot. Or, of course, he might have just switched sides. The OSS (forerunner to the CIA) sent its own expedition to Tibet under Count Ilya Tolstoy (grandson of the novelist) and Lt. Brooke Dolan, whom Schaefer had actually accompanied on a 1931 expedition to Tibet. (Interestingly, despite having no radio equipment with them, OSS head General "Wild Bill" Donovan urged them to "keep in touch if you can." Perhaps those CIA experiments in astral communication go back a little farther than we think.) Dolan and Tolstoy made quite an impression in Tibet, celebrating the Tibetan New Year in February 1943 with the Dalai Lama -- the same day the German troops in Stalingrad capitulated. The CIA stayed in Tibet until 1974, and those alert for such things have detected Green Glove-prints not only on the CIA remote viewing experiments but on its mind-control projects like MK-Ultra and MK-Artichoke. The link-point, of course, is the CIA LSD research program -- which coincidentally produced a huge wave of interest in the Tibetan *Book of the Dead* as a guide to ecstatic states and "guided projection" into a different sphere of existence.

"Miss Skiffins was of a wooden appearance . . . I might have pronounced her gown a little too decidedly orange, and her gloves a little too intensely green . . . On Wemmick's return from working these mechanical appliances, I expressed the great admiration with which I regarded them, and he said, 'Well, you know, they're both pleasant and useful to the Aged. And by George, sir, it's a thing worth mentioning, that of all the people who come to this gate, the secret of those pulls is only known to the Aged, Miss Skiffins, and me!' 'And Mr. Wemmick made them,' added Miss Skiffins, 'with his own hands out of his own head.' While Miss Skiffins was taking off her bonnet (she retained her green gloves during the evening as an outward and visible sign that there was company), Wemmick invited me to take a walk with him round the property, and see how the island looked in wintertime."
-- Charles Dickens, *Great Expectations*

Such as the sphere contacted by Alice Bailey, a Theosophist who, after marrying the prominent American Freemason Foster Bailey in 1919, came into contact with a spiritual entity named Djwhal Khul (also known as "Master DK" or simply "the Tibetan"). In 1925, "the Tibetan" dictated *A Treatise on Cosmic Fire,* which stated that the Central Fire radiates in seven rays through a "flaming green swastika." This brings echoes not only of the Green Gloves, but of the Green Ray evoked by neo-Nazi occultist (and former Chilean ambassador to India -- next to Tibet) Miguel Serrano. As one might expect, Serrano's metaphysics are fairly opaque, but the Green Ray appears after one traverses the Black Sun -- it's the flash of resurrection into the spiritual world, the Otherwhere (Agharti?). In Tibetan mysticism per se, it's the *'od lam ljang gu* -- the green light path. (Let's all think quietly about the similarity between *ljang* -- "green" -- and Lovecraft's "Central Asian" Plateau of Leng.)

Interestingly, the Green Ray also signifies rebirth to Alice Bailey's "Tibetan" -- and the Green Dragon Society supposedly tested its initiates by having them focus their "Time Organism" or "Etheric Body" and force a seed to germinate by sheer will. This doctrine, of the internal super-spiritual force, recalls that of the Georgian mystic G.I. Gurdjieff -- also (possibly) known as "Dorjieff," the man who initiated Haushofer in Tibet. Gurdjieff practiced mystical disciplines based on exercise, rhythmic movement, and gardening -- the Green Force. Which could lead us into the Green Man, and Dionysos, and fertility gods, and all that, but let's stick to the Green Gloves. (Although it's interesting that in June of 1978 a deranged man was attacked by "phantom green hands" in the *Arbours* Centre of North London.) A picture emerges now, not of a Tibetan adept, but of a being from Otherwhere (Shangri-La? Or its rival Agharti?) materialized in our reality.

"Over hills, this lovely creature
Over mountains, over ranges
By great pyramids and sphinxes
We met drifters and strangers
Oh the sands, my lovely creature
And the mad, moaning winds
At night the deserts writhed
With diabolical things
Somewhere she lies, this lovely creature

Beneath the slow drifting sands
With her hair full of ribbons
And green gloves on her hands"
-- Nick Cave, "Lovely Creature"

The Tibetans call such a being a tulpa, or an "emanation." In Western magic, such an entity is a "thought-form," or an "egregor," a term cognate with the Greek "Grigori," the "Watchers." Perhaps our Man With Green Gloves began as an entity locked out of our world. He could only watch, sending some of his Green Ray force through adepts like Dorjieff/Gurdjieff, Haushofer, and the Green Dragons. But suddenly, something changed before 1925, when he appeared to Alice Bailey. The year after that, he arrived in Berlin, where Haushofer and Hedin had opened the way. Albrecht Haushofer wrote, just before his execution, "My father broke the seal/He sensed not the breath of the Evil One/But set him free to roam the world."

So, speaking of roaming the world, let's look at one last enigmatic traveler in Tibet, the Theosophist and "rational Buddhist" Alexandra David-Neel. She met the Dalai Lama in India in April 1912 (a month before the Germanenorden appears), and began studying Tibetan. She first entered Tibet in 1916, after beginning the study of magical techniques such as yoga and Tantra. For this illicit entry, the British expelled her from India, so she removed to Japan. (Did she contact the Green Dragon here?) From there, she passed through Korea, China, and Mongolia before arriving back in Tibet in July of 1918 (the same month the Thule Society was founded). She spent six years in Tibet learning magic -- specifically, mental communication with other planes and, most significantly of all, the creation of tulpas. Finally ready, David-Neel arrived in Lhasa in February of 1924. And, amazingly, this dedicated student of Tibetan mysticism spent only two months in the holiest city of her creed before leaving Tibet forever, arriving in India "very frail," appearing as though she had "undergone incredible hardships." Why?

According to David-Neel, she finally decided to try creating a tulpa, a "fat and jolly lama." All went well at first, but the tulpa began appearing on his own. "Now and then," she wrote in *Magic and Mystery in Tibet*, "it was not necessary for me to think of him to make him appear." He slowly grew "leaner," more "sly" and even "malignant." She claims to have sent him back behind the Black Sun, but she never returned to Tibet, preferring her French villa Samten Dzong -- the "fortress of meditation." Outside her fortress walls, then, did she hear the sharpening of the *phurba* dagger? Did she see the Green Flash overhead as the Nazi blitzkrieg tore through her adopted France? Did she, two weeks shy of her 101st birthday in 1969, manage to reach her Theosophist afterlife, safe at last from the clutch of the Green Gloves?

?

by Earl Wajenberg

Art by Dan Smith

Many role-playing campaigns center on important artifacts. If you are running ***In Nomine***, ***Ars Magica***, or any other game with Jewish or Christian religious elements, items from the Bible are particularly appropriate. The Holy Grail and the Ark of the Covenant come first to mind, of course, but there are many, many more. This article lists some of them. They may feature as religious relics, vessels of spiritual power (good or evil), or archeological treasures.

The Tree of Knowledge (Genesis 3)

This is the tree that Adam and Eve plucked the "apple" from (though nowhere does it say what kind of fruit it was). By this act of disobedience, they acquired the "knowledge of good and evil" (which probably means that they came to *experience* evil as well as good, instead of understanding it in an abstract, theoretical way). They also became mortal. Fruit, wood, leaves, flowers, or seeds from this tree, or from any of its descendants, could be tempting but perilous artifacts. What kind of knowledge would a second taste of fruit give to a child of Adam? What price would it have? Might a taste "humanize" a non-human creature, putting it in the same boat with the children of Adam? What about a smell of the flowers, or a tea made from the leaves, or an object carved from the wood?

The Tree of Life (Genesis 3)

There was another tree in the Garden of Eden. A taste of its fruit gave everlasting life. Adam and Eve were driven from the garden to keep them away from it. Trees of Life line the streets of Heaven. Clearly, fruit, wood, leaves, flowers, or seeds from this tree, or from any of its descendants, could be a powerful force for healing, resurrection, or animation.

The Flaming Sword of Eden (Genesis 3)

Adam and Eve were kept out of the Garden by cherubim and by a flaming sword that moved of itself, barring the way. Such a celestial artifact would be an enormously powerful weapon, but might require very high authorization to get.

The Stone that Slew Abel (Genesis 4)

Adam was the first man. Cain was the first man born of woman. Abel was the first man dead. We don't know how Cain killed Abel, but hitting him with a rock is plausible. This first murder weapon *might* be a holy relic of the first martyr, but it might also carry a heavy charge of unholiness, powerful for necromancy and evil violence.

The Sword of Tubal-Cain (Genesis 4)

Tubal-Cain was a great-grandson of Cain and the inventor of metal-working. If the Flaming Sword of Eden seems too hard to get, a masterpiece by the earthly inventor of weaponry might be a good substitute.

The Flute of Jubal (Genesis 4)

Jubal was Tubal-Cain's brother and the inventor of musical instruments. As such, he is senior to other master musicians such as Orpheus or Taliesin. Besides being a great relic or archeological find, Jubal's flute might produce supernaturally beautiful or compelling music, or endow the possessor with great talent.

Wood from Noah's Ark (Genesis 6-9)

The Ark was about 450 by 75 by 45 feet, and made of "gopher wood" (probably a kind of cypress). It came to rest on "Mount Ararat," traditionally identified with a mountain near the Turkish-Armenian border. (But traditions aren't infallible.) It would have left a lot of wood. Samples of it would make good religious or archeological treasures, the more so if they could be well-verified. Getting or keeping these samples could involve characters in enormously twisty controversies of politics, scholarship, and religion.

Wine from Noah's Vineyard (Genesis 9)

Not only did Noah build the Ark, he was the first to make wine after the Flood; since this is the first mention of wine, he may have invented it. Such an historic vintage may not have aged well over the millennia, but it would have almost the same religious or academic value as a sample of Ark wood. And a GM can spin up a tale in which the wine of Noah is endowed by its revered maker with special powers -- control or understanding of animals, for instance.

Stones from the Tower of Babel (Genesis 11)

Shortly after the Flood, humanity tried to build a tower to reach Heaven. God foiled the attempt by shattering the single human language into many different tongues, causing humanity to scatter over the face of the Earth. The Tower of Babel is now a symbol of arrogance, confusion, and biting off more than you can chew. Bits of its masonry would not be likely to be *holy* relics. But they might be treasured as mementos by those with their own plans of overweening pride. Or they might hold some lingering power of confusion that would make them useful counter-intelligence weapons.

The Circumcision Blades of the Patriarchs (Genesis 17)

Circumcision is the physical mark of the founding of the nation of Israel. It begins with the founding patriarchs, of whom there are fifteen: Abraham, Isaac, Jacob, and the twelve tribal patriarchs: Reuben (Jacob's eldest), Simeon, Levi, Judah (Jacob's designated heir), Isaachar, Zebulun, Gad, Asher, Dan, Naphtali, Joseph (Jacob's favorite), and Benjamin. These blades, most likely small flint knives but possibly bronze, would be prized religious relics or archeological finds, if they could be validated.

The Knife and Altar of Abraham (Genesis 22)

To test Abraham's faith, and perhaps to change the custom (for sacrificing a firstborn child was a tradition in that time

and place), God commanded Abraham to sacrifice his son Isaac, only to revoke the command at the last moment. The knife Abraham (almost) used and the altar, or stones from it, would be enormously significant relics to Jews or Christians. And they would certainly be woven around with controversy, since Muslims claim it was Ishmael, ancestor of the Arabs, not Isaac, whom Abraham almost sacrificed.

Joseph's Coat of Many Colors (Genesis 37)

Joseph was Jacob's favorite son. As a mark of that favor, Jacob gave him a coat of many colors, probably a richly ornamented robe. This earned Joseph the jealousy of his brothers, who sold him into slavery in Egypt. It's a long story, but has a happy ending. Joseph also had the power to dream prophetic dreams and interpret the prophetic dreams of others (notably the pharaoh). Joseph's coat might be used to induce such dreams in a later wearer, or even to enter the dream world physically.

The Rod of Moses (Exodus 4, 9, 10, 14, 17)

In freeing the Israelites from Egypt, Moses did many miracles with his staff. It turned into a serpent and back. He used it to summon two of the Ten Plagues of Egypt (hail and locusts), to divide the sea, and to give the Israelites military victory. Should any power remain in it, it would make a consummate "magic wand."

The Rod of Aaron (Exodus 7-9)

Moses' brother Aaron also performed wonders with his staff. This staff, too, changed into a serpent (and devoured the serpent-staffs of the pharaoh's court magicians), and summoned the plagues of blood, frogs, and gnats. If you can't get Moses' staff, Aaron's would be a good second choice.

The Ark of the Covenant and the Ten Commandments (Exodus 25)

The Ark is the box containing the two stone tables on which the Ten Commandments were written. It is made of acacia wood, gilded, and ornamented on top with the images of two cherubim, who probably looked like winged, man-headed bulls. God's presence, visible as the shining light of the Shekinah, was said to hover over it in the Temple. Divine power lashed out of it in response to the touch of the wicked, or even the irreverent touch of the well-meaning. Its power dried rivers and slaughtered armies. See *Warehouse 23* for an even more detailed description. Rumor has it that the real Ark now dwells in a church in Ethiopia.

The High Priest's Breastplate (Exodus 28)

Part of the vestments of the high priest was a square, golden breastplate bearing twelve gems, each inscribed with the name of one of the tribes of Israel. Such an item would be valuable as a piece of jewelry, for a start, but that would only be a complication to its value as a relic and a symbol of religious authority. An eccentric religious organization might readily decide it was absolutely necessary that they acquire this symbol. It might also carry a general aura of holiness significant in dealing with supernatural beings.

The Urim and Thummim (Exodus 28)

These were small articles carried in the high priest's breastplate, as part of his vestments. No one knows what they were, but they appear to have been some kind of lots -- dice, perhaps -- that the high priest used to inquire of God's will. What more natural artifact for a role-playing game?

The Golden Calf (Exodus 32)

At Mount Sinai, Moses was gone for forty days, listening to God. The Israelites grew disheartened and, unclear on the concept of monotheism, had Aaron make them a new god, an idol in the form of a golden calf. (They may have

decided Moses' god was the same as the Egyptian creator-god Ptah, worshipped in the form of a calf or bull.) Moses destroyed the idol, ground it to powder, mixed it with water, and made the Israelites drink it. If there is any of it left, it would just be some anonymous gold dust, but very plausibly bearing a divine curse or an aura of unholiness that might attract sinister interest.

The Fragments of the Ten Commandments, First Draft (Exodus 32)

When Moses came down from Mount Sinai and saw the Israelites worshipping the Golden Calf, he was so angry, he smashed the tablets bearing the Ten Commandments. After seeing to the destruction of the Golden Calf, he went back up for a second copy, which went into the Ark of the Covenant. But the fragments of the first set are still stones directly engraved by God Himself. Few holier relics could be imagined.

Other Tabernacle Furniture (Exodus 35-40)

While the Israelites wandered in the wilderness, their temple was the tent-like Tabernacle. In addition to the Ark of the Covenant, this contained several other spectacular objects. Later on, the Temple of Solomon (1 Kings 5-8, about 1000 BCE), the Second Temple (516 BCE), and Herod's Temple (around 30 BCE) all contained their own versions of these furnishings. They included:

- A solid gold candelabrum with seven branches, about five feet high.
- A gilded wooden altar, about three feet high, for burning incense.
- A gilded wooden table, about one and a half by three feet, for the "showbread."
- A bronze-plated altar, about seven by five by five feet, with built-in steps, for animal sacrifices.
- A large bronze basin or pool for ritual washing. Later versions were several feet across, supported by twelve brazen bulls. The first version was probably much smaller.
- A veil of fine linen, to hang in front of the Most Holy, where the Ark was kept, embroidered with cherubim.

The Brazen Serpent (Numbers 21)

One of the punishments suffered by the Israelites in the wilderness was a plague of snakes. To mitigate this, God instructed them to make a bronze snake and display it on a pole; anyone who was bitten but looked up at the bronze snake was healed. Jesus compared himself crucified to this snake (John 3). Suppose it still retains its healing power?

The Horns of Jericho (Joshua 6)

During the conquest of the Holy Land, the Israelites took the city of Jericho by ceremonially marching around the besieged city for seven days, then blowing on trumpets, whereon the walls fell down, perhaps in a divinely timed earthquake. Quite a weapon if the power was put in the horns and lingers there.

Saul's Crown (1 Samuel 11, 15)

Saul was the first king of Israel, crowned by the prophet Samuel, but later deposed by the same prophet for disobedience to God. Uneasy would lie the head that wore Saul's crown. It would be a souvenir of political and spiritual disaster and tragedy.

David's Harp (1 Samuel 16)

King David was a great musician, and wrote many of the psalms found in the Bible. His harp playing soothed King Saul, who was frantic with anxiety over being deposed by the prophet Samuel. A harp of David might still retain the powers of great music, or the ability to cast out fear and madness. Even as just a relic, it is a perfect intersection of the spheres of religion and music.

Goliath's Shield and Spear (1 Samuel 17)

The Philistine giant, Goliath of Gath, stood about nine feet tall and carried a 20-pound spear. An underling carried his shield for him. Thanks to David's sling, none of this made any difference, but those weapons, should they survive, would make fascinating curiosities, and might carry a lingering aura of unholy violence.

David's Sling (1 Samuel 17)

In his duel against Goliath, David slew the giant with a single stone from his sling, a simple leather strap. How useful if that sling retained the power of besting any foe, no matter how overwhelming.

Saul's Sword (1 Samuel 31, 2 Samuel 1)

Accursed and deposed, Saul eventually found himself bested in battle by the Philistines. Before they could kill or capture him, he tried to commit suicide by falling on his own sword, but finally had to ask an enemy to finish him off. That sword would be a souvenir of despair and military disaster.

David's Crown (2 Samuel 2)

God promised David an everlasting dynasty, culminating in the eternal reign of the Messiah. The crown of David would be a tangible symbol of divine favor at the *least*, or, at the other extreme, of status so high that any mis-handling of it could suggest blasphemy.

Bathsheba's Crown (2 Samuel 11-12)

Bathsheba was the great love of David's life, the occasion of his greatest sin (though herself apparently innocent), and the mother of his son and successor, King Solomon. Her crown would be an emblem of royal romance and beauty, but also of turbulence, passion, and the threat of tragedy. As a fantasy artifact, it might confer great beauty.

Solomon's Crown (1 Kings 1)

Solomon succeeded his father David and ruled over a golden age for the kingdom of Israel, during which the First Temple was built. Offered any gift by God, he chose wisdom. His crown could be a symbol or force for wisdom or glory, though one should remember that Solomon forsook his wisdom late in his reign. Legend has it that Solomon's crown gave the wearer the power of teleportation.

Solomon's Ring

It's not in the Bible, but legend has it that King Solomon had a ring of copper and iron, which gave him control over seventy djinn. It is also said to have given him the power to communicate with animals.

The Queen of Sheba's Crown (1 Kings 10)

Bilkis, the Queen of Sheba, heard of Solomon's divinely granted wisdom and came to see for herself. She came away impressed. That is all the Bible has to say on the matter, but legend is full of the riddle contests between the two, and of tales of a whirlwind romance. The romance has stuck tightest, and the crown of Bilkis, as a fantasy artifact, would be likely to confer beauty and romance. More mundanely, it would be an important dynastic treasure to modern Arabic aristocracy.

Elijah's Flaming Chariot (2 Kings 2)

At the end of his career, the prophet Elijah did not die, but was taken bodily up to Heaven in a flaming chariot. Such an artifact is not likely to be found on Earth or in any material realm. But angelic characters from *In Nomine* or similar supernatural figures might encounter it. It was pulled by celestial horses of fire.

The Magis' Gifts (Matthew 2)

The original Christmas presents were the gold, frankincense (a kind of incense), and myrrh (a gum resin used in perfume) given by the Wise Men at Jesus' birth. These men were probably Magi, Zoroastrian magician-priests from Persia, east of the Roman Empire. If any coins or jewelry of the gold still remain, or remnants of the frankincense and myrrh, they would make very plausible vehicles for any blend of blessing and beneficent magic.

The Holy Grail (Matthew 26, Mark 14, Luke 22)

This is it -- the relic supreme, its very name now a synonym for the ultimate goal of an arduous quest. In origin, it is simply a cup used for the wine at a Passover seder, but that particular seder was the Last Supper. According to the tales, the cup fell into the hands of Joseph of Arimathea, a member of the Sanhedrin (temple council) who secretly supported Jesus and donated his tomb for Jesus to be buried in. (Matthew 27, Mark 15, Luke 23, John 19) Legend says Joseph gathered some of Jesus' blood in the cup and, through many adventures, made his way to Britain, where he and the cup vanish into a tangle of Arthurian romance. The cup grants life and healing. Just seeing it induces mystical ecstasy. But it is very selective about who can find it.

Judas' Thirty Pieces of Silver (Matthew 26-27)

Judas betrayed Jesus to the temple authorities in return for thirty silver coins, probably Greek denarii. In remorse, he threw them back in the priests' faces, then fled and hanged himself. The money, already viewed as tainted, was used to buy a field, for use as a cemetery. Some or all of these coins would make very fitting vehicles for unholy powers or taints connected with betrayal and despair.

Wood from the True Cross (Matthew 27, Mark 15, Luke 23, John 19)

This wood was a staple of the medieval relic trade; there was enough of it circulating Europe to stock a lumber yard. Somewhere, at some time, there was some of the real stuff, if it could only be found. This, along with other souvenirs of the Crucifixion, are obviously relics of the highest holiness. Any traces of the Blood on them might arouse forensic, medical, or biotechnical curiosity of an arguably unholy sort.

The Three Nails of the Cross (Matthew 27, Mark 15, Luke 23, John 19)

Jesus was nailed to the cross with three iron spikes, one through the feet, one through each wrist. Many more than three spikes circulated in the relic trade, but as with the wood, there must have been three real ones somewhere.

The Crown of Thorns (Matthew 27, Mark 15, John 19)

In mockery of his messianic claims, the Roman soldiers put a crown of thorns on Jesus' head. Thorn crowns were another popular item in the relic trade.

Peter's Sword (John 18)

When the temple guard came to arrest Jesus, Peter struck out with his sword, to defend his Master. He cut off one man's ear, but Jesus put a stop to the struggle, healed the ear, and went quietly. That sword, being the property of a saint, would be a first-class relic and a great weapon for righteousness. Given its history, it is plausible that it would heal as well as (or instead of) wounding.

Veronica's Veil

It's not in the Bible, but tradition has it that a woman took pity on Jesus as he carried his cross up to Golgotha, and mopped the sweat from his face with the veil she had been wearing over her hair. An image of the face of Jesus was miraculously imprinted on the cloth. The woman became known as St. Veronica, and the cloth became known as Veronica's Veil. Tradition associates healing with this relic.

The Spear of Longinus (John 19)

After Jesus died on the cross, one of the Roman soldiers stabbed the body in the side with his spear, to make sure he was dead. Legend names the soldier "Longinus" and identifies him as the centurion who acknowledged Jesus to be the Son of God (Matthew 27:54). Legend also came to identify the spear as a holy relic granting military victory to its owner. It is supposed to have passed through the hands of Constantine, Charlemagne, Frederick Barbarossa, and many other kings and emperors in between -- by no means all of them "good guys," since the list includes Hitler, though he never seems to have got around to holding it in his own hands. The spear Hitler believed to be the True Spear is now in the Hoffburg Museum in Vienna. Not that this is any problem to a GM.

Christ's Seamless Garment & the Soldiers' Dice (John 19)

When Jesus was crucified, the Roman soldiers divided his clothes among themselves, as loot. One garment was left over; rather than rip it into pieces, they threw dice for it. The garment would make a good relic, of course, and might plausibly heal. The dice might also make interesting relics, though the associations with them are not holy, and possibly the very reverse of holy. The GM could present them as infernal parodies of the Urim and Thummim, or as their Christian equivalents, depending on plot requirements.

Christ's Shroud (Luke 24, John 20)

When his disciples came to Jesus' tomb on the first Easter morning, they found him gone and the tomb empty, except for one or two angels and the shroud. The Shroud of Turin is the best-known candidate for this relic, but a GM can certainly make up a different one. Resurrection itself is a plausible power for such a relic.

Visionary Items

The following items are from the book of Revelation, the last book of the Bible. They all appear in a vision, and so may reasonably be discounted as having no more reality than any other dream image, even if the vision was divinely inspired. But you could have a lot of fun supposing they were more tangible than that.

The Crown of the White Horseman (Revelation 6:1-2)

Early in Revelation, Heaven sends the Four Horsemen of the Apocalypse to ravage a wicked world. The first horseman rides a white horse and wears a crown. He is also the hardest of the four to interpret. During the Black Death, he was interpreted as Pestilence. Modern evangelicals often interpret him as the Antichrist. Others regard him as symbolizing Tyranny. Like the other three, he may be sent by Heaven, but he is not at all nice in himself. If you regard his crown as an object of power, it would be an evil power, causing disease or political corruption, depending on how you interpret this Horseman.

The Sword of the Red Horseman (Revelation 6:3-4)

The next Horseman rides a red horse and is generally identified as War. He carries a sword that, as an object of power, would be a weapon of nearly ultimate power for evil. It would plausibly stir up battle wherever it was taken.

The Scales of the Black Horseman (Revelation 6:5-6)

The third Horseman rides a black horse and is usually identified as Famine. He could be generalized to Poverty or economic disaster generally. He carries a set of scales. If there is power in them, it is probably to rob, cheat, and impoverish.

The Scythe of the Pale Horseman (Revelation 6:7-8)

The fourth Horseman is named Death, and though his horse is usually called "pale," the Greek can also be rendered "green." This rider of the Pale or Green Horse is not given a scythe in the Bible, but we all know what the Grim Reaper's favored instrument is, and what he uses it for. It isn't healing.

The Trumpets of the Seven Archangels (Revelation 8-9)

In the ceremonial disaster that is Revelation, seven angels blow on seven trumpets, causing disasters with each note. The seventh trumpet, traditionally said to be blown by Gabriel, is also traditionally said to herald Judgement Day. Clearly, these would be objects of power to handle very carefully, if at all, especially the seventh one.

The Angel's Censer (Revelation 8:3-5)

After the seven archangels are given their trumpets, but before they blow on them, an angel throws a censer (an incense burner) from Heaven down to Earth, where it causes storm and earthquake. It is filled with fire from the altar of heaven. Obviously, it could be a great weapon, even if used before the Last Days, but loading it might present a challenge.

The Seven Skulls of the Beast (Revelation 13:1-10)

"The Beast" of Revelation is summoned by the Devil, and looks like a crimson leopard with seven lion-heads and ten horns. He is commonly taken to be the Antichrist, who is usually supposed to be a man or a man-demon hybrid. So how would characters get hold of any of his skulls? If the monster-shape is not just a vision but a transformation the Antichrist can make, it becomes physically possible. Also, the Beast is known to rise from the dead (Revelation 13:3, 17:10) and might be construed as having seven lives. Catch him between incarnations, and you could be in possession of the skull or skulls of the Beast without having to wait for Doomsday. Whether or not such objects have any supernatural powers, they might make interesting bargaining chips for deals with demons, or be a way to delay the next Beastly incarnation.

False Fleece (Revelation 13:11-15)

The Beast has a partner, the False Prophet, who is likewise supposed to be a man (or at least humanoid) but might also have a beastly transformation. In his case, he appears as some combination of lamb and dragon. His specialty is deception and delusive miracles. Imagine getting some of the wool off this hellish lamb; it would be appropriate as the stuff of evil illusions fit to deceive, if possible, the very elect (Matthew 24:24).

The Devil's Chain (Revelation 20:1-2)

After the battle of Armageddon, an angel (probably Michael) will come down from Heaven and bind the Devil with a chain, then throw him into the Pit for a thousand years. If this chain can hold the Devil for a millennium, it can stand up to anything the PCs might want to use it for. But borrowing it would be tricky.

by Jeff Wikstrom

Imagine a place of chess, a dimension of chess, a plane of chess. A place where the rules of chess are the laws of nature, and a rook can't move diagonally any more than a penguin can fly. A place without light, or gravity, or oxygen, or anything else not specified in the rules of chess.

In 1927, Nemeniah Lindsey glimpsed such a place. Prior to his vision, he had been unmotivated, directionless, and bored, but all that changed the night of April 30, 1927. Lindsey, then a playboy of 29 staying in his father's townhouse in New York, had just returned home from a night out with friends and had just stepped into his father's library when he suddenly screamed and collapsed. The household, roused by the sound, found him lying on the floor on his back, staring up at a chess-set on a nearby table. He later reported a "curious sense of Nirvana," a feeling that "somewhere, everything made sense. . . somewhere, there was only orderly peace. . . only chess."

The heir of a sizable oil fortune, he quickly set about trying to recapture his dream and the feeling of timeless, orderly peace that had so briefly fulfilled him. Lindsey took to The Game like a madman, quickly learning the basic rules and with astonishing speed mastering conventional strategies.

His friends first scoffed at his new fancy, but gradually a few of them began to pick up his zeal. In 1929, they founded the Chess Advancement Society of America, or CASA. Its mission was singular, its method twofold.

Lindsey, in his mania, had constructed a sophisticated belief system. There is, he postulated, a place of chess, a place where all the physics could be deduced from the simple and easily memorized rules of chess. Further, he declared it possible for a sufficiently disciplined mind to, through a rigorous regimen of chess and meditation on chess, pierce the infinite distance between the Earth and that place of chess, creating a gateway to chess.

Nemeniah Lindsey's long-term goal was nothing less than traveling bodily to the place of chess, there to dwell in its "orderly peace" forever. To this end, he created the non-profit CASA, with the two-pronged agenda of promoting chess in popular culture and supporting chess masters in their ascetic life of meditation. Lindsey died in 1963, but the CASA lives on.

Today over five hundred thousand dues-paying members support it, including a disproportionate percentage of the US's wealthiest citizens and upper class.

Most of these rank-and-file members know nothing of the grandiose designs of the CASA's elite, and merely participate in sanctioned tournaments or subscribe to the newsletter. The same spark of fervor that first inspired Lindsey in 1927 and still powers the organization, however, has touched nearly all of them. These "touched" members are fervently loyal to the CASA, willing to give of their time and money to support the group and its cause. Some work for the CASA full-time, maintaining clubhouses and running tournaments and conventions for a trivial salary. Chess-players not "touched" tend to drop out of the group after a few weeks or months, finding the group to be "extremely creepy."

The group is strictly hierarchical, divided into a dozen numbered ranks. Rank is determined not by seniority or level of donation, but solely by performance at the officially sanctioned chess tournaments the CASA holds regularly. Casually, these ranks affect little, though a member who has been "touched by the dream" (i.e., suffers the Fanaticism (CASA) disadvantage) will always defer to a higher-ranked player. At the highest levels, the CASA is organized like a corporation, with an executive officer and a board of regional directors. This board of directors, though the de facto heads of the group, are not its most highly-ranked members. That honor goes to the Grandmasters.

The Grandmasters form the second prong of the CASA's attempt to pierce the veil between the known world and the world of chess. These expert players (all with a skill of 21 or higher) live Spartan lives in CASA-supported private grounds, where they spend all their time playing and studying chess. Though they make no policy decisions, the Grandmasters are revered as the spiritual head of the Chess Advancement Society of America.

Financially, the CASA is well-served. The group maintains a clubhouse in nearly every major city in North America, though some are little more than a ranch house with a dozen cheap plastic sets on card tables. The CASA is particularly well-established in the public education system; nearly every high school has a small but dedicated chess club. The annual budget for the organization is not large, but in a time of need, the CASA can draw on the resources of nearly any member.

Alice Shea

typical Grandmaster

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d

* If Chess is considered a hobby skill in the campaign, the 20 points spent would count double, giving Alice an effective Chess skill level of 35!

Alice is a former physics professor recruited into the Grandmasters. Currently she spends almost all her time at the CASA's main office in New York, where she obsessively reads transcripts of historic matches and plays games with herself. At night she dreams of chess, a dark landscape of geometric precision.

An outsider might be surprised to learn that the CASA is solidly opposed to the use of computers in chess. They reason

that no machine could ever achieve the transcendent state of mind they assume is necessary to reach chess. So far their actions have been limited to propaganda against the "soulless automatons" who defeat their brightest public lights, but if current trends continue, the CASA might be forced to take more direct action.

What is the secret of the CASA? How do its leaders inspire such loyalty, not to any individual, but to an admittedly cold and sterile ideal? What would happen if a Grandmaster somehow succeeded in "opening a way to chess?" Here are four different answers, for four different kinds of games.

- In a "straight" *GURPS Illuminati* game, the CASA is essentially a piece of zany window-dressing the Secret Masters use to hide their tracks. Investigators coming too close to discovering the truth are diverted to these mad chessmen, who, thanks to the manipulations of the Illuminati, form an above-ground secret society with deep connections and an inscrutable goal. The board of directors, like Lindsey himself, are patsies manipulated from afar with Tibetan Mind Magic and Orgone rays: there is no "place of chess" to reach, and the vision is a sham. Subliminal messages played under the muzak at tournaments are the source of the fanatical loyalty of members.
- In an *In Nomine* game, the CASA is the creation of Kropotkin, the Impudite Demon of Alienation and Servitor of Kronos. High-ranking members of the CASA are Soldiers of Hell, and they use various Songs to instill loyalty in the flock. These Soldiers, too, are being played for fools: they believe they serve the Spirit of Chess, an ineffable being whose home is the mythical "place of chess." Every Grandmaster who becomes unable to relate to anything but a chess-board advances the Word a little further.
- In a game of Cosmic Horror and Lovecraftian dread, the CASA is a secret cult of the Outer Gods. An "opening to the place of chess" would signal the death-knell for humanity, for it would be an opening through which the Great Ones could reach Earth and gain dominion over all. The board of directors, like the Grandmasters, are almost all totally mad, the result of having been touched by a higher power. It's only a matter of time until their mad ritualized chess-games have the desired effect and an army of Implacable Pawns from Beyond Space-Time, Knights of the Outer Gods, and Rooks of Azathoth overrun the earth. . . unless someone stops them.
- Finally, it's just barely possible, in a sufficiently weird and Illuminated game, that the CASA is genuinely on to something. Lindsey's vision was the result of a thousand years of slow build-up of belief, a weakening of the walls between this world and the next. The fiery meme of the place of chess spreads because it is true, and the human mind craves Truth. Lindsey himself did not die; he ascended into Chess. And he was only the first: several Grandmasters reach the same state of perfect contemplation every year. As yet, the goal of a permanent portal to the otherness of chess has not been realized, but progress is made every year. The Nine Secret Masters of Shangri-La would pay dearly to learn the Truth behind this strange path to ascension, but so far the secrets of the CASA remain its own.

In any case, the CASA can make a dangerous foe if provoked. Though its organization is hierarchical, and its head is poorly defended, the loss of the New York compound would do little more than frighten the regional managers and day-to-day personnel, not to mention the low-level members.

It's hard to kill a dream.

And the remainder of the CASA would launch a counterattack in short order.

It's important to keep in mind that the group can, in times of crisis, call on the resources of any of its fanatical followers, most of whom are upper-middle class, highly skilled professionals. By its very nature, the CASA has at its disposal a complex web of operatives, all of whom are fanatically loyal, trust one another implicitly, are relied on by society, and cannot be compromised. An fanatical accountant has no qualms embezzling funds from her employer "for the cause." A fanatical judge finds in favor of the equally fanatical man whose lapel-pin is in the shape of a pawn. A fanatical multimillionaire dying of cancer makes the CASA his sole heir. A fanatical college student calmly drives a rental truck loaded with explosives into the side of a building full of the CASA's enemies.

Its principal weakness, of course, is a lack of communication among these operatives. Other than a master database of rankings and the CASA's newsletter subscription list, both of which are kept at the main New York headquarters, the group has no official roster. If the head of a local chapter finds his address book destroyed, he's going to have a hard time contacting his subordinates. He might know a few of them by name, but the chess-intensive lifestyle is not

conducive to a social network.

Adventure Seeds

- A friend of the player-characters (or even one of their number) a renowned expert on an obscure branch of science, is introduced to, and joins, the CASA. The members are friendly enough, but. . . strange. Over a period of weeks, the organization begins to make demands on the character's time and knowledge: calling him or her in the middle of the night to confirm that in a hypothetical eight-dimensional semi-structured matrix of non-space, time does not function quasi-relativistically. Interest is piqued: why does a chess club want to know about quantum physics?
- A sudden wave of anti-chess hysteria sweeps the nation after a well-known master player is found, victim of suicide. "Think of the children" editorials decrying the game fill the newspapers, Internet, and cable news channels. On close examination, however, some evidence suggests the suicide was actually a homicide. Is someone raising public opinion against the CASA, and if so, who? Why isn't the CASA countering with its members in the media?
- An associate of the player-characters, a low-ranking member of the CASA, suddenly disappears. On investigation it becomes clear she went willingly: her bank accounts have been cleared out and a suitcase is missing. Research suggests she's only the latest in a string of missing persons, all of whom can be linked to the CASA. Where are these people going, and why?
- One of the world preeminent experts on artificial intelligence contacts the PCs in hopes they can defend her from mysterious assassins who dress in white and black. The CASA has an obvious motivation. . . is it too obvious? Are they being framed? Is this a setup? Why doesn't the "expert on artificial intelligence" look like her passport photo?
- The CASA hires the player-characters to search for a missing member. Curiously, the chess-player disappeared more than three years ago, but a search is only just now being mounted. . . or so the CASA says. Why did they wait so long? What's really going on?
- It was inevitable: first high-school chess clubs, then junior high. Now the CASA is lobbying for chess to be a part of the elementary school curriculum. Why now, and why is the Department of Education so dead-set against it? Does it have something to do with the new afterschool cartoon, "Bishop and Queenie?"

* * *

The CASA is based (VERY!) loosely on the real-life United States Chess Federation, which maintains an excellent web site at http://www.uschess.org. Scott McCloud's equally excellent comic strip "My Obsession with Chess" formed the primary inspiration for this article, and can be viewed at http://www.scottmccloud.com/comics/chess/chess.html. Another view of chess can be found in Ken Hite's "Suppressed Transmission" for August 21, 1998.

Thoughts of Empire: A Gamer's Manual of Interstellar Colonization

by C. A. Johnson

At last it happened. Mankind has somehow outwitted the speed of light and found a way to navigate the vast gulfs between the stars. Whether by some form of FTL propulsion, relativistic fusion drives, or long voyages in cold-sleep; we're finally able to colonize other worlds.

Now what?

For the average roleplayer, this isn't an important question. For the game master with a detail fetish, however, it is the important question. How did we do it? We couldn't very well just pile a bunch of people and equipment into a ship and launch it into the void, on the off chance we found something nice and hospitable to set them up on. It just doesn't work that way. Colonizing is a tough business, and isn't something entered into lightly. Only the very serious will go to the stars in the beginning.

Here are some things to consider when creating a colony. While they can easily be used to begin a campaign, they can influence any Space campaign if used correctly. Even in developed universes the details of how a colony began will enable a GM to include a lot of color and depth to a world.

Into the Wild Black Yonder. . .

The first question that needs to be asked is: why? What inspires us to finally leave the nursery of Earth? Historically, there have been two primary motives for creating a colony. The first is profit. The best example of this is the early settling of Canada and the Caribbean. Canada was a cornucopia of raw materials for France. Fur, timber and easy access to some of the best fishing and whaling in the world gave the French government a huge economic boost. The Caribbean likewise made the Spanish rich in sugar, cotton and tobacco. (And gold, of course. Never forget the gold.)

The second motive is a desire for change. The settling of New England and Australia each provide examples of that. The Pilgrims came to New England fleeing religious persecution. They sought a place where they could live the way they chose. Australia is a slightly different story. The pioneers of Australia were exiled as criminals and rabble-rousers. It was their home that desired the change!

Answering this first question will tell you a lot about a colony, especially when considered with the other details of your campaign. Profit minded groups of settlers have a different set of priorities from a group of pilgrims. First and foremost, they will keep lines of communication open with their parent organization, whatever it might be. Whether by constructing spaceports or communication facilities, this will be a priority for the profiteering colonizer. Almost equally high on the priority list will be to get production moving. This changes the payload of the initial colony ship considerably, with heavier equipment taking up mass that might be used for survival gear in other situations.

Usually transients staff this kind of colony. Almost no one moves there permanently . . .at least at first. The first wave would be mostly construction personnel to get facilities up and running. Depending on the environment there may be soldiers providing security, or scientists looking for other profitable ventures to engage in. As major projects were completed according to whatever timetable seems appropriate for your campaign, new ships would arrive with the production crew, and remove the builders and their tools for other projects. Such a world would most likely be short

on amenities for a long time. Employees could be motivated by high pay, or in darker universes, high debt.

This sort of beginning lends a completely different feel to a world. The earliest settlements would probably be the equivalent of factory towns, with shelters arranged close to the center of productivity. The first shelters may very well have been barracks, with private quarters going only to management and VIP's from off-world. Little emphasis would be placed on long-term survival needs. Warehouses would take the place of fields and farms. Imported equipment and tools would be the norm, instead of having the support structures to create them onsite. Architecture would tend to the bland, boxy structure early on. Someone who intends to move on soon rarely takes enough pride to design an aesthetically pleasing house.

This kind of colony will be a rarity in universes without FTL travel. Few human built corporations have the patience to invest in a project that will show profit in generations instead of years. The only exceptions to this rule would be if the commodity were especially valuable or rare, or if the world itself were the commodity. A terraforming company, for example, would be far more inclined to think in the long term. It would be a risky business, but if successful, the profit margins could be literally astronomical.

Pioneers would create an entirely different type of colony. These are people that have somehow been driven off their world. Perhaps it is religious persecution, or overcrowding. Perhaps it is merely a dream of something better, some worthy future that they fear they cannot find at home. First and foremost, these people would be motivated by survival. Their people would be picked for their skills. In better-funded ventures, many people might be cross-trained in many skills. If voyages are especially long, such training could be part of the voyage. Their initial supplies would concentrate on long-term needs instead of short-term production. Here would be found the farming equipment, the basic tools, and medical supplies. Pioneers would most likely bring along the beginnings of an infrastructure. Instead of prefab shelters and barracks, they would have carpentry or construction tools. Instead of faceless boxes with doors in them, pioneers would build homes, distinctive and personal. In such a colony, industry would appear as an afterthought, around the fringes of the earliest buildings. In the center would be some sort of community hall or focus. Perhaps the First Lander lays enshrined, or maybe there's a statue of the Founder.

The High Costs of Leaving Home. . .

The next question a GM needs to answer when creating a colony history is: Where did they get the money? Space travel is expensive enough if you travel alone. Shipping sufficient tools and supplies to set up a permanent station requires serious funding.

Profiteers will probably be sponsored and supported by a parent organization. Supply ships and cargo haulers will be frequent visitors and only the basics in life support and simple amenities need to be present. This will usually mean a leaner, less massive cargo on the first trip. Particularly unscrupulous corporations will send second rate or used equipment. As long as it gets production started, the next group of cargo ships can bring replacements in later. So what if it gets workers killed at first? The bottom line is larger, because overhead is reduced.

Of course, depending on the world and the company, a corporate colony may need extensive life support systems to allow production to take place. These sorts of ventures will usually be mining or processing operations, although research ventures are possible. Life support systems mean overhead, so whatever the operation was going after would probably be proportionately valuable.

The main drawback here is if for some reason supplies get cut off, the workers may be in for a rough time. With production as the primary concern, few allowances would probably be made for survival. If the workers are wholly, or even mostly dependent on the supply ships, it could become a grim situation indeed if those ships stopped coming. If the life support system is dependent on the ships, the workers are doomed, and the outpost will rapidly become a ghost town.

Pioneers would have completely different packing strategies, and therefore different costs. First and foremost there must be enough colonists to provide a stable gene pool, with a little padding to insure survival and account for attrition. That alone would increase the mass by a great deal. Then there would have to be enough food to sustain them

until they become self-sufficient, once again with a little padding. Depending on variables this could be anywhere from three months to a two years. Then there would be the matter of shelter. Depending on the circumstances, this does not have to consume too much mass. Tents would suffice on a naturally hospitable world. This kind of operation would probably be more expensive to assemble and move than a commercial venture, particularly because once landfall is achieved the colonists are on their own. Yet it may not have anywhere near as deep a set of pockets.

There are a couple of ways around this. First, the venture could be government sponsored. If this is the case, then why? A colony assembled as an act of desperation may not be as well equipped as one assembled carefully over time. There could be serious equipment shortages, or grim miscalculations in the food supplies. Even a well thought-out plan could suffer if funding is cut in midstream or if rampant bureaucracy nickel-and-dimes it to a shambles. If the colony is an exercise in public relations, then it should have all the supplies it needs to get started, and a large supply of donors to bolster the funding.

Another possibility is a self-funded group of dedicated settlers that give everything they have to a main colony fund, which provides at least the bulk of the money for the effort. This is the way many people came to the American west. The problem here is people who are independently wealthy usually don't go on colonizing jaunts. As a result, this sort of group may need some sort of additional funding, or may have to skimp on supplies. Again, knowing why the group left will add flavor to the colony.

Yet another avenue is a long-term loan made to a group by some institution. Perhaps a bank figures to make a name for itself by helping others settle the stars. Or perhaps they're looking to colonize those stars themselves without having to do all that messy working and surviving. All they have to do is foreclose at the right time and bingo. They have an instant colossal real estate holding. Of course, moving the colonists out might prove taxing, but with the possible gain, it might very easily be worth the risk.

It also always possible to mix and match. Perhaps the colony's founder is a profit minded corporation that is just opening for business. They have the vision and the plan, but the capital comes from a third party. Or perhaps the company shuts down, leaving the employees to their own devices. The transition period would greatly color history's perspective. Or perhaps the company makes its money by building the needed infrastructure for a stable, self-sufficient colony. The employees take the big risks, and the colonists move into a ready-made colony.

A Vision Of Stars

A third question that will greatly influence the nature of a colony is the philosophy of its founders. At first glance this question doesn't seem important to the profiteer colonist. Their central philosophy is to make money, isn't it? Well, yes, but there is more to consider than that. For example, did a unionized workforce found the colony? Then operating conditions will meet certain standards, and a high level of bureaucracy probably exists in the colonial structure. Workers concerned with their rights take great pains to see that those rights are honored. Was the founding company concerned solely with profit? In this case, certain expensive safeguards may have been overlooked, or the niceties of civilization would not have been part of the initial manifest. Colonists of such a world would probably be grim, hardworking people. Worse yet, perhaps the employees are working off high debts to the company, and are effectively unpaid labor. If you want, you can even drop the euphemism and just call them slaves. This creates a completely different dynamic, especially if there was some sort of rebellion.

Not all corporations are soulless employee mills. Some are very concerned for the health, welfare and happiness of their employees. In this case, the colony would begin well stocked with amenities. Or perhaps the founders believed that there is beauty in function and function in beauty. In such a corporate atmosphere wondrous paradises could be made.

In a pioneer style colony, the beliefs will be even more of an influence. The work ethic of the Puritans who first settled New England had a profound effect on the development of the region, long after the Puritans that earned it its name passed into history. Stoic perseverance and hard work are still the watchwords of many New England communities. As another example, the land rush and flood of humanity that surged into the American West left an indelible and decidedly different print on that region and the rest of the country as well. The independence of the settlers and frontier

style justice still make their presence known in many subtle and some not-so subtle ways.

"And Then What?"

Now comes the most important question yet discussed. What happened next? Answering this one can take as little as a few minutes, or a long as several years. The players may supply some of those details as they write their character's legends into the universe, especially if your campaign focuses on the beginning of a colony. Others the GM alone must come up with. If the colony began as a corporate venture, does it remain so? If so, why? What hurdles did the employees face? How did management deal with them? Is the supporting infrastructure corporate also, or did others move in to fill the made necessary by the corporation's bottom line? How have the two groups gotten along?

On pioneer worlds, did just one group claim the planet? If more than one did, how did the two (or more) groups co-exist? Did a single colony stay together, or was there a schism at some point? What was it? Was it a question of philosophy or survival? Did both groups survive? Did the planet itself somehow change or reveal things to the colony as time passed? Are there native sentients? How were they treated? Are the colonists even aware of them, or their sentient nature? Has there ever been a war?

These are but a few of the factors that can contribute to a colony's history. However, answering these questions will go a long way toward giving any world a bit of color and history. The rest is up to you, the GM.

by David Neuschulz

Introduction: A Different Approach

The World Wide Web is littered with "How to be a great GM/DM/StoryLord/Whatever" guides. Almost universally, the approach these primers take is to offer corrective measures via altering the game mechanics or plot. They will suggest a plot device, or a rules variant that will punish/coerce the problematic player (or alleviate the problematic situation). I don't mean to completely dismiss the guides; much of what they offer is helpful, especially to the beginning GM. Nor do I mean to denigrate the spinning of yarns; fleshing out a list of do's and don'ts with anecdotal examples is a time honored tradition, and more to the point: gaming stories are just plain fun to read. But I have to confess that the redundancy of the information has led me to propose an alternate (not better) set of guidelines.

The guide I am about to put forth comes from taking a step back from gaming and examining our hobby from a more objective viewpoint. . . and applying the guidelines of "Role Play Therapy" (formally "Psychodrama Groups") to the task of GMing. A few years back, I came to the conclusion that this branch of Group Psychology had much to offer an aspiring GM. How and why I came to this conclusion is beyond the scope of this article. Suffice it to say that RPGs are, in some ways, merely Role Play Therapy turned inside-out: one's purpose (psychological awareness and improved social skills) is the other one's fringe benefit (entertainment), and vice-versa. Another way to put it is that running a small group that role-plays, whether for psychological benefit or for pure entertainment, is a task which requires insight into the science of Group Dynamics.

With that in mind, I consulted a venerable tome entitled *Group Counseling, Strategies & Skills (3rd ed.)* (Jacobs, Masson & Harvill), the equivalent of a "DM's Guide" for group therapy leaders. Then I engaged in a "compare and contrast" exercise to see what might be applicable to gaming, and what would not. What follows is the result of that exercise.

Part One: Being a Great GM, Administratively

The nuts and bolts of running group, any group, are often overlooked in your typical GM Guide in favor of the nuts and bolts of fictional worldbuilding. Again, this is no surprise: reading worldbuilding systems is fun (at least for some people). Yet you can have the entire universe of Middle Earth at your fingertips, and still ruin the game if you can't manage it. Jacobs, Masson & Harvill identify 16 forces that act upon groups. The authors assert that the sum of these forces predicts success or failure for the group. Here is how they may or may not apply to RPGs:

1. **Clarity of purpose for both the leader and the members.** For a GM, this might seem to be a non-issue: the purpose is clearly entertainment. Yet, entertainment is a pretty generic term. Have you actually discussed with your players what kind of experience they want? Maybe somebody grooves on Monte Hall. Others may prefer romantic melodrama.
2. **Relevance of purpose for the members.** If six people want an epic campaign and a seventh wants to subscribe to the "Genre of The Month Club," maybe it's unfair to everyone involved to try and squeeze the seventh player

in.

3. **Group size.** Numerous clinical studies have pegged the optimum size for group therapy at 5 to 8 with outer limits of 2 to 12. These numbers are directly applicable to gaming, as anyone who has ever tried to GM a game of over 8 people can attest to.
4. **Length of each session.** For therapy groups the time frame is 2 to 3 hours maximum. Here at last, we have a difference! As a GM, 3 hours is a good *minimum*. And while it is true that anything beyond 6 is a marathon, those of us who have known the joy of "dice rolls at dawn" shrug such epic play off as par for the course.
5. **Frequency of meetings.** Once a week to once a month depending on the type of therapy group. This holds true for RPGs also. A rule of thumb: if "getting in gear" for each session lasts longer than 15 minutes, the meetings are probably too far apart. Alas, sometimes it simply isn't practical or possible to meet more often.
6. **Adequacy of the setting.** Among the common sense things mentioned in the group leadership manuals (like lighting and temperature), there are a couple of interesting tidbits. Chairs should not be lounge chairs: too comfy. Also they should be all the same height (excepting the GM, of course). A circular table is the best. . . and one should be cognizant of grossly oversized tables relative to the number of players: physical distance = emotional distance. My note: overcrowding can be equally toxic.
7. **Time of day.** Avoid the after lunch slump. This is seldom a problem for the mostly nocturnal RPGer, but worth a mention.
8. **The leader's attitude (toward leading).** The point is an obvious one: if the group leader doesn't really want to be leading the group, the group itself will be negatively impacted. Therapists may be assigned by their clinic or professors to lead groups that they do not want to. Since gaming is a hobby, it is rare to meet a truly averse GM. (Occasionally somebody gets drafted to GM at the last minute during a gaming convention. . .)
9. **Closed or open groups.** A critical decision for the group leader. A closed group will evolve into a more intense group provided enough members remain through the initial shakeout. At the other end of the spectrum, in a very mature (long-lived) group things may go stale, at which point the introduction of new members may be beneficial. The overriding point here is that the group leader must formulate and articulate a clear policy on new members.
10. **Voluntary or non-voluntary membership.** Prison therapy groups face this problem. As far as I know, RPG group membership is voluntary. Even in prison.
11. **Members' level of goodwill.** It is easier to lead a group of cooperative members than uncooperative ones. Again, obvious, but included here for completeness.
12. **Members' level of commitment.** This addresses that ingtagible glue that holds the group together through the inter-adventure doldrums. Don't wait, be pro-active: as soon as you spot half-hearted participants, approach them. Discuss their interest level issues openly and search for a way to engage them more fully in the game.
13. **Level of trust among members.** Trust is key to therapy, but. . . since RPGs aren't therapy, sometimes it adds an interesting dynamic if one or more players are distrustful of others. Did someone say "Thief?" (Of course, we are talking about minor levels of distrust. Major levels are intolerable. In one instance that I know of, deep distrust of one female player towards a relentless, sexually threatening male quite quickly disintegrated the group itself. This extreme example is a case where a restraining order would have been more useful than GM admonition.)
14. **Members' attitude toward the leader.** It is rare to find an entire group that hates the GM, but it is common to have one or two members that are hostile or lack respect. The GM is as likely as any therapist to endure the wrath of someone who has issues with authority figures.
15. **The leader's attitude toward the members.** Do you really like the players, or are they the only ones you could dig up on a Tuesday night? Either way, know that it will affect the group, unspoken or not.
16. **The leader's experience and readiness to deal with groups.** Again, an obvious point. RPG Experience Points model real world phenomena: greater experience equates to greater expertise.

In sum: when assembling a new therapy group, pre-interviews or questionnaires are routinely used as a tool to ensure the group has at least some of the 16 forces working in its favor. Sometimes the GM wishes to exclude certain individuals based on their expectations, and just as often, the GM is flexible enough to cater to those expectations. Either way, don't feel embarrassed to hand out (or e-mail) a pre-acceptance questionnaire.

Besides the 16 forces, Jacobs, Masson & Harvill present an additional technique that is usefully transplanted from role play therapy into GMing: "Session Planning." Plan three distinct phases, beginning / middle / end. The beginning phase

should be recap of prior events (as much to set the mood as to refresh the memory). The Middle Phase is where the game runs along. The Ending Phase is a crucial denouement/decompression, allowing a mental and emotional transition back to our non-group lives.

All too often this final phase is considered merely to be the point where the GM distributes experience points and the pizza boxes are thrown in the corner (all the more abrupt if the adventure is suspended mid-way and no experience points are forthcoming). However, clinical studies have proven that a few minutes of recap at the end of the session reinforces "the work done," and this in turn contributes significantly to the longevity of the group. In the case of gaming, the work done equates to the entertainment experience. . . not unlike talking about a great movie just after you've come out of the theater. For a GM, this is the best time to let the silliness run wild; it helps everyone transition back to reality (and prevents embarrassing things like rolling dice to decide whether you're taking Rte. 35 or back roads to get home).

Lastly, and this is a good example of formalized "common sense," the group therapy leader must try to estimate in advance how much material or "emotional ground" he's going to try and cover in the session. This is roughly equivalent to a GM planning how much of the plot will be completed in a session. And to be fair to the GM guides out there, this is a topic that is covered. (In brief, trying to force too much into a night can diffuse the drama, yet too little and you face a pack of yawning sloths. . . and yet again, the GM has to be flexible when the plot takes a twist and the intended pacing for the evening is thrown out of whack.) But here's a corollary that often goes unmentioned: a diligent role play therapy leader keeps track of his/her own tendency to overplan/underplan a session and makes changes accordingly. A GM should do this also. Diligently. Self-monitoring is a serious prerequisite for a GM who aspires to greatness.

Part Two: Take Being a Great GM *Inter*personally

Here we get into the heart of the matter. Having facility with group leadership can be learned. All that's required is mastery of a certain set of basic skills. Each of the following skills, taken from various primers on role play therapy group leadership, can been adapted for RPGs.

1. **Active Listening.** Also known as "scanning," this means paying attention not only to content, but the vocal quality and body language of the speaker. And not just the speaker. A skilled GM is constantly scanning the group. Sometimes the non-verbal reaction of one player to another's statement is more important than the statement itself. This skill is doubly difficult for a GM as opposed to a group therapy leader because the distinction has to constantly be made between roleplayed emotions and real ones. This skill is the key to understanding the subtextual chemistry of your group.
2. **Use of eyes.** There are four ways in which to use your eyes:
   a. To scan for non-verbal cues (see above).
   b. To get members to look at other members. By not always directly engaging the speaker's gaze, he/she will naturally begin to look at fellow players.
   c. To draw out members. A particular shy or reticent member may be prompted by kind and encouraging eye contact. Another method is to make eye contact several times with this player while addressing the group as a whole.
   d. To cut off members. Often there will be a player who tends to speak first when any question is posed to the group. By looking at this person while the question is being asked, but then shifting your gaze around the table, and ending your question totally out of eye contact with the problematic individual, you are prompting other players to speak up. This does not work all the time, but can be effective.
3. **Use of Voice.** The GMs voice sets the tone for the session, and if its the first session, the whole group. It also can be used to pace the group. And finally, it can energize the group because often the group derives its energy level from the leader.
4. **Identifying allies.** It is important early on for a GM to identify players that will be cooperative and helpful. Often a GM will need to rely on their goodwill to steer the plot in a desired direction. They gladly tend to play NPCs and may even put their own precious characters in danger if they sense that this somehow furthers the GMs plans. Allies are also useful in bringing any number of difficult player types under control.

And this brings us to the last part of the interpersonal skills section: dealing with problem situations. I have put this last because it is precisely the content of most of the online GM Guides, and my solutions to these common problems rely heavily on an understanding of the prior discussion.

1. *The Chronic Talker.* Sometimes someone is flooding the room with non-game related banter. While a certain amount of this is necessary and enjoyable, if it begins to annoy others or hinder play, then it's time to step in. This is a case where role play therapy and gaming are diametrically opposed: in gaming, you don't want players to use the group as a therapy session to solve personal problems -- people have come to play. In any case, there are two ways to handle this. First, you might address the group as a whole and lecture about non-game related talking and hope the offender gets the gist of it. Second, you can invite the chatty gamer to a one-on-one session for some "special" character development and talk with him/her then. Generally try to avoid embarrassing the individual right off. If your requests are ignored, then public embarrassment might serve as a last ditch effort prior to expulsion.

2. *The Dominator.* This person differs from the Chronic Talker in that they really want to usurp your authority. If you have a self-appointed vice-DM, it's best to skip the general address to the group about over-controlling behavior, and go right for the one-on-one. If you are willing to convert a player into an assistant GM (a great asset and an underrated talent), go for it. Otherwise, be firm. Your way or the highway.

3. *The Distractor.* This is a rare instance where a problem common in role play therapy is uncommon in RPGs. Usually this person is desperately trying to avoid the self-examination required in therapy by changing the focus to lighter topics. Gamers, on the other hand, are desperately trying to avoid a hoard of rampaging Trolls.

4. *The Rescuer.* Again, this person in the context of therapy, tries to smooth over negative feelings and conflict within the group. In fact, in the event two of your players end up heading towards a real life fistfight, a rescuer is handy to have around.

5. *The Negative Member.* A sour apple spoils the cider, as they say. If someone is constantly complaining or disagreeing about the how the group is being run, even the most exciting game can suddenly go flat. Sometimes, this behavior is really a masked desire for GM attention. Try a one-on-one enlisting the player's help. This can be administrative (set up chairs, break down and clean up the table) or game related ("I'm trying to get the party to go into the mountains, can you role play a sudden desire to visit your dwarven home in the high-peaks?") If this doesn't work, identify those individuals who are your most positive players. During the game, direct most of your questions to them. Avoid eye contact with the party-pooper so as not to elicit more negativity.

6. *The Resistant Member.* This applies to prison groups, or AA members consigned to groups by a judge or detox program. I've never heard of a judge sentencing someone to twenty hours of ***Call of Cthulu*** before, although if I were behind the bench, anti-roleplaying religous zealots might get just that.

7. *The Member who tries to "get to the leader."* This is perhaps the most difficult challenge to surmount in all of GMing. There are two main reasons why one or more participants in a group will suddenly try to sabotage the GMs efforts.

   The first and most commonly thought of cause is that one or more players have issues with "authority." Like it or not, leadership -- even of a small gaming group -- can evoke strong reactions from people who have such issues. "getting to the leader" is characterized by malicious intent and verbal ambush and is much more severe than "the Dominator" (above). If you are verbally attacked with questions (not pertaining to the game but pertaining to the way it is being run), try to explain your methods and motives without anger. Take focus away from the power struggle between you and the attacker. If you feel you can discuss and compromise on certain administrative issues, do so. Only if the problem persists and you feel that it's an "authority problem" should you deal with the saboteur(s) with dispatch. Advise them of their option to pack up and go home. If it continues, curtly show them the door.

   However, if the parallel between clinical group leadership and GMing holds true here, numerous studies have revealed that the most likely cause of "get to the leader" syndrome is a lack of leadership skills. Understandably, it is difficult to be objective about yourself, yet as a GM you should be aware that certain clumsy/insensitive methods can often irritate and frustrate players -- putting them into a mood to sink your ship. Some typical behaviors that result in this situation are:

      a. Putting players on the spot in front of other players

    b. Cutting off players inappropriately
    c. Failing to notice a player who wants to speak
    d. Allowing a player to be picked on by other players
    e. Not being skilled enough in general to control the group
    f. Being oblivious to player boredom

While the self-examination required of therapy patients is not necessary for gamers, it is necessary for the GM, or at least a GM who strives to better his leadership skills.

    a. *Dealing with silence.* There are two kinds of silence in groups, productive and nonproductive. When people are internally processing something that was said or done in the group, that's productive silence. If you've just tossed "The Riddle of the Seven Serpents" onto the table and everyone is mute -- this is a good thing. Nonproductive silence is a product of confusion or worse: boredom. Be sensitive to silence, but don't feel compelled to break it; analyze it first.

    b. *Dealing with sexual feelings.* This is a real problem in therapy where, theoretically, the purpose of the group, from an individual's standpoint (better mental health, resolution of nagging psycho/social issues), should supercede the base desire to copulate. In gaming, this is a non-issue: few GMs would argue that they expect their players to put a higher priority on their epic campaign than a sexual relationship. (They might *hope* that their campaign is that enthralling, but I doubt they *expect* that is so.)

    c. *Dealing with crying.* Again, in gaming, this is not a likely skill needed for a group leader. (And even Patton blew it on this one.)

    d. *Dealing with mutually hostile members.* If two people are not getting along to the point of impacting the game, meet with them, either individually or together, off hours. Try to get the players to agree to work toward a less disruptive relationship. Don't ambush the players with this agenda; give them time to think it over before the next game, otherwise the session itself might be used as a battleground. . . and not on the hex map! (It should be noted that several texts assert that the most intense, cohesive and long-lived groups are ones which had initial personal animosities, and which then worked through them.)

    e. *Asking a member to leave.* Like it or not, this is the ultimate recourse for all personality problems. The one guideline here is to try to make the request at the end of a gaming session or off hours. . . partially to avoid further disrupting the game, and partially to prevent a power struggle from erupting in front of other players.

    f. *Dealing with prejudiced or insensitive members.* This is a really difficult problem to broach. Political correctness aside, you should not let a gaming session ever devolve into a situation where players are judging other players. Verbal intervention is required. Keep the focus on the game. If the abuse is severe, take a meeting with the individual to point out the detrimental behavior. As always, the last recourse is a dismissal.

An Afterword

It may be argued that these disciplines are far more predilected by inborn talent, and as such are much harder to confer upon the aspiring GM by way of mere word. However, the administrative component of GMing as well as the psychosocial management of small groups *is* learnable. I hope that this alternative GM guide has at least given you food for thought.

See you at the tables!

Pyramid Review

Jovian Chronicles: Ships of the Fleet, Vol. 4 -- Venus Fleet

Published by [Dream Pod 9](#)

Written by Wunji Lau (Writer/Designer and Lloyd Doug Jessee (Game Stats/Design)

144 pages, $20.95

Being truly excellent is a double-edged sword: On the one hand, of course, you're excellent -- and that comes with a lot of perks. On the other hand, though, you have set yourself a very high standard indeed -- and a failure in the details suddenly becomes a notable offense.

Which is why I'm going to take a few moments to dwell on the failures of *Ships of the Fleet, Vol. 4* -- a supplement describing six Venusian ships of the *Jovian Chronicles* line, the principles of Venusian ship design, and Venusian fleet operations. Although these failures may all be in the details, they are no less disappointing.

Why are they disappointing? Because Dream Pod 9 has excelled -- with all three of their games -- in providing a level of depth, breadth, and quality for their fictional worlds that almost beggars the imagination. When, for example, you not only know the broad strokes of political machination and warmongering in the solar system of the 21st century, but also what the favorite books of the Jovian Confederation are, and how the details of shipboard life onboard a Constantinople differ from those of an Birmingham -- and all of this weaves together into a consummate and seamless whole -- you've achieved something special.

You can build mighty worlds out of imaginative wonders, but the final key to the imagination lies in the details. It is there that a world will cease to be merely words on a page and, instead, become a living, breathing presence in your mind's eye.

So, when you've accomplished the extraordinary task of making this happen -- of bringing a world to life -- it behooves you to make sure that those details continue to be consistent and believable.

Which brings us back to what makes this book disappointing.

For example, on page eight we are told that all Venusian ships are specifically made to look different from one another -- part of a fleet-wide doctrine to camouflage their navy as civilian merchant vessels and thus hide it from the other solar powers. So why on page thirteen are we told that "these newer ships are cosmetically indistinguishable from the older ones?" And why, whenever we are shown pictures of multiple ships, these are merely cut-and-paste copies of one another (an offense made all the more notable by the fact that even the name stamped on the side of the ship has not been changed from one carbon copy to another)? And speaking of that all-too-obvious name: If you're attempting to keep the size of your navy a secret, is it really a good idea to be printing "CVNA" (Cooperative Venusian Naval Administration) in large letters for the entire solar system to see on every single ship in your navy?

There are other examples of carelessness, as well: In the core *Jovian Chronicles* rulebook we were told that Venus deliberately exported only algae products and foodstuffs in order to conceal from the rest of the solar system the extent of their technical knowledge. So why is it that in this book we are told that Venusian ships are at a particular risk from pirate attacks because their ships are almost "guaranteed" to be carrying items of value? Once of the nicer elements in

the book are the crew interviews -- allowing you to hear first-person narratives of why shipboard life is like. . . but many of these interviews do not sound like Venusians, coming across as angry and egotistical rather than reserved and polite.

And so forth. There are many companies out there -- companies which turn out *good* games -- who could do these same things, and I just wouldn't care. I probably wouldn't even notice. But the Dream Pod 9 have established a record of high quality, and I notice things in their books that I wouldn't notice if I didn't care so much.

Now that I'm done nitpicking the book to death, though, let's dwell on its pleasant -- and substantial -- successes:

For starters, if you're running a roleplaying campaign set onboard a Venusian ship, you should seriously consider picking up this book. The detailed ship information, interviews with crew members describing ship life, the coverage of crew structures for each type of ship, along with descriptions of shipboard procedures and naval structure are all great, hands-on material which will have immediate applicability for you.

For tactical players the most obvious application of the material in this book comes in the form of ship stats -- giving you some new toys to play with. But I think that most of you will also find the information regarding Venusian deployment philosophy and tactical planning during wartime to be fascinating and useful material (although I wish there was as much detail provided for Venus as was provided for the Jovian Confederation in previous volumes).

The only problem the *Ships of the Fleet* books have, as a concept, is that they lack a clearly defined role for either roleplayers or tactical players. The inclusion of shipboard life and procedures makes the books potentially useful for roleplayers -- but only roleplayers in campaigns with substantial time aboard ship. On the other hand, the inclusion of this material reduces the number of ships which can be covered -- making the book less inclusively useful for the tactical player. Both roleplayer and tactical player receive a number of tools in these books -- but it is an open question in my mind whether or not they receive enough tools to justify the price tag.

Therefore, this books comes with a reserved recommendation: If you're a *Jovian Chronicles* fanatic, definitely pick it up. Otherwise, you're only going to want this one if it has a very specific application to your campaign.

-- Justin Bacon

Once And Future Kings: Alternate Arthurs

"Yet some men say in many parts of England that King Arthur is not dead, but had by the will of Our Lord Jesu into another place; and men say that he shall come again, and that he shall win the holy cross."
-- Sir Thomas Malory, *Le Morte d'Arthur*, XXI:7

In the time of England's greatest peril, men say, her greatest King shall return to lead them to glory. Fiction (and gaming) can't wait that long: Tim Powers reincarnated him in *The Drawing of the Dark*, C.S. Lewis implied his influence in *That Hideous Strength*, and Mike W. Barr and Brian Bolland sent him into space in *Camelot 3000*. But the Matter of Britain fills a capacious library, becoming a bottomless cauldron of stories and possibilities to combine our noblest myths anew. Herewith, then, four more idyll speculations tuned for gaming potential from fantasy to horror to metaphor to heroic rebirth. Listen for the trumpets; hearken to the hoofbeats; behold with gladsome heart the Return of the King.

"A thousand hearts are great within my bosom:
Advance our standards, set upon our foes;
Our ancient word of courage, fair Saint George,
Inspire us with the spleen of fiery dragons!"
-- William Shakespeare, *King Richard III*, V:iii:348-351

On a rainy August day in 1485 on Bosworth Field, the Stanleys had turned traitor, Northumberland refused to move. The last Plantagenet, Richard III, overcome by Henry Tudor's hired French mercenaries, uttered "the ancient word of courage," offering his kingdom for a dragon. And Arthur, the once and future King, restored to youth and resplendent in his armor, rode onto the field beneath the True Dragon Banner, rallied Northumberland's men, and smashed the pretender's invasion. With his dying breath, Richard (who had no legal heir) returned the crown of England to Arthur. After pacifying Scotland, Arthur built up his kingdom, binding the wounds of the long War of the Roses. He offered employment to one Christopher Columbus, who offered to sail west in search of Avalon, and was unsurprised when the navigator reported that it was a land of wonder and magic. Upon Charles VIII's death, Arthur invaded France to press the claims of England to its crown. In single combat, he defeated Louis of Orléans' champion, the Chevalier de Bayard; Bayard joined the new Round Table after Arthur's coronation in Rheims. In 1501 he married Katherine of Aragon, and upon her father Ferdinand's death in 1516 he ascended to the throne of Spain as well. By then, he felt strong enough to retake the Holy Land from the Saracens -- taking advantage of the defeat of the Mameluke sultan by the Turks, he siezed Egypt and took Jerusalem from the south, fighting the Sultan to a standstill. By dint of this glorious victory, the electors proclaimed Arthur the Holy Roman Emperor in 1519.

In this campaign frame, the PCs are Knights of Arthur's new Round Table, seeking adventure most commonly in the treacherous East or the mysterious West. Suleiman's magicians and enchanters summon djinn and pay Assassins to oppose the defenders of the Holy Land; this is a twilight **GURPS Arabian Nights** (or "Arabian Knights") setting of intrigue in the bazaars of Cairo, quests for the eldritch City of Sarras, and swordfights on flying carpets high over the Syrian desert. In the new continent of Avalon, the banner of the Dragon now flies over the pyramids of Tenochtitlan, after the fall of the bloody rulers there. However, the new lands are full of monsters and magic from the deserts of New Spain to the great forests of New England. This setting offers high fantasy in the *Faerie Queene* mold, either of conventional stripe (gryphons, Amazons, etc.) or more American legendry (thunderbirds, hairy giants, grey fairies from the skies). Either way, there's nothing that a knightly sword-arm (and perhaps a serjeant's harquebus) can't defeat for Arthur and for England.

"The Cross is not a passive agent. It protects the pure of heart, and it has often appeared in the air above our sabbats, confusing and dispersing the powers of darkness."
-- note from the John Dee translation of the *Necronomicon*, as cited in "The Space-Eaters," by Frank Belknap Long

It was certain. By the light of a flickering taper, in the upper tower of the Imperial castle in Prague, John Dee read the blasphemous predictions of the Mad Arab -- the stars would come right and spell disaster for England in 1588, less than four years away. Worse yet, Dee's informants had told him that powerful nobles of the Spanish court actively

conspired with malign entities from outside space and time. Putting aside his evocations of angels, Dee had his agents break into a certain tomb near Glastonbury and bring him the "essential saltes" within. Thus did Arthur return to defend England in secret, his Round Table composed of mercenaries, alchemists, footpads, scholars, and priests from every corner of Europe, sworn only to oppose the Great Old Ones and to protect humanity (and England) from their timeless evil.

This, then, is a *GURPS Swashbucklers-Special Ops* campaign, an Elizabethan-era *Delta Green*. The PCs are part of Dee's secret Round Table; as the undead Arthur mounts to other planes in fey communion (or combat) with elder beings, they serve as his hands and eyes from Transylvania to Loch Ness. The PCs might track rumored manuscripts through the London booksellers' underground with Christopher Marlowe, or loot golden idols from Spanish treasure-cities with Sir Francis Drake, with every success bringing new questions in its wake. Are certain galleons trying to communicate with the Deep Ones off Hispaniola? Have the Mi-Go been escorting messengers over the Alps in exchange for rare minerals from the Inca mines? Do defrocked Jesuits offer blood sacrifice to Dark Young beneath the Paris catacombs? The Round Table will find the truth, no matter the cost.

"It is certain that I cannot show in any words the utter peace of that Welsh coast to which I came; one sees, I think, in such a change a figure of the passage from the disquiets and the fears of earth to the peace of paradise."
-- Arthur Machen, "The Great Return"

On August 24, 1940, a lone German bomber, off course from a run on Plymouth, unloaded its stick of high explosives onto Glastonbury Tor, ripping open the hill in which King Arthur slumbered, and spilling the light of the Grail over Britain. Arthur emerged, his wounds healed from his long sleep, bringing the Grail with him. British crops gave tenfold, British wounded heroes recovered, British cities refused to burn. The isle of Albion was once more whole and inviolate, a Grail Kingdom. Hitler's response was full-scale retreat into his nascent occultist mania. Every whim of Himmler's suddenly became a national priority; entire departments came under Ahnenerbe control in a quest for the Dark Grail. Driven by his implacable, psychotic will, Hitler's faith was rewarded by the black powers he finally fully believed in. On October 31, 1940, twelve SS officers drank from the Dark Grail at the Dolorous Castle of Wewelsburg, and transformed into horrific bat-winged monstrosities of vast sorcerous power. Each nosferatu summoned hordes of lesser demons: Dero from subterranean caverns, seductive unseelie made from mandrakes, robots built from gleaming bronze and human flesh in Mengele's death-camps, all the monsters of Weimar given form and fell purpose. Now the pure paladins of Arthur's Grail Court must do battle with the blackest spawn of modern nightmare, on a quest to find and destroy the Dark Grail in the center of the new Waste Land before Walpurgisnacht, 1941 -- when Himmler plans to transform the entire SS into an unstoppable army of the damned.

This game is high-powered fantasy-horror *GURPS Undead*. The PCs are Arthurian Grail Knights, the finest men of England's finest hour. The opposition is everything hateful that ever belched from a smokestack; everything repulsive that ever sublimated modern nightmare; everything that exists to send the Grail back to oblivion and leave mankind hopelessly under the jack-boot.

"Now they'd come so far and they'd waited so long
Just to end up caught in a dream where everything goes wrong
Where the dark of the night holds back the light of the day
And you've gotta stand and fight for the price you pay."
-- Bruce Springsteen, "The Price You Pay"

In 2036, Great Britain collapsed. The Grain Blight had hit this traditionally food-importing nation hard, and the running sore of Northern Ireland only accelerated Britain's drift into dictatorship. A panicky government strangled a brief bubble of prosperity built on auto exports for the overseas duelling circuit. A number of the cars vanished between factory and docks, and the police sought refuge in brutality to mask their inability to deal with a desperate populace. The Revolution drove the doddering King Charles III into Canadian exile, but the new Republic failed to keep even the tyrannical order of its predecessor. When terrorists from the irredentist Royalist Ulster Command torched the North Sea oilfields, the Republic disintegrated under a wave of looting and panic. Local war-lords became local gang-lords, seldom capable of ruling even a county without falling to internecine squabbles. French troops landed in Britain to sieze its nuclear missiles, but refused to block the waves of German anarchists and raiders

swarming ashore in search of loot and destruction. For underground autoduelists Art Penn and Gwen Stagg, and their best mate Lance Lake, there's only one thing to do -- load their maxims, start their engines, and don't stop until England is free.

This is an (alternate) **GURPS Autoduel** campaign, and although you can play it for mysticism, it might work best solely as a straight retelling of heroic combat for civilization and order against barbarism and hatred. (If you're less concerned about Arthurian purity, you can restore some Autoduel purity by moving the campaign to America in 2016 or in an even blacker February of 2045.) From low-powered *Magnificent Seven*-style combats against cycle scum to grand themes of passion and betrayal, any aspect of the Arthurian myth fits the **Autoduel** universe of automotive jousting and operatic anarchy. Put your pedal to the metal, and slam it into fifth gear for England, and for the future Once and Future King.

Pyramid Pick

Tenchi Muyo! RPG and Resource Book

Published by [Guardians of Order]

Written by David Pulver and Karen A. McLarney

208 pages, $29.95 US ($39.95 CAN)

Let me preface this review with a disclaimer: I was a playtester for *Tenchi Muyo!* and am a fan of the series. I playtest many things. I am a fan of many things. Please don't let this disturb you.

* * *

While not very succinct, the title -- *Tenchi Muyo! RPG and Resource Book* -- is quite descriptive. Broken into sections we have:

- *Tenchi Muyo!* **(exclamation point mandatory):** A popular series of OAVs, movies and two different television shows in Japan. This book covers the events of the OAVs (which are easily available to most fans and are being shown in a slightly edited form on Cartoon Network.) Why not cover all the "Tenchi Muyo" universe in one book? Despite mostly having the same characters, the storylines of the various venues are sufficiently dissimilar that they are basically different stories (and have different licenses). Guardians of Order promises future supplements to remedy this situation for those who prefer a different flavor of Tenchi.
- *RPG:* Based on the Tri-Stat system (first published in *Big Eyes, Small Mouth*), *TM!RPGaRB* is a complete RPG. You don't have to buy anything else to dive into the game. This may cause some grumbling from those who don't want to buy multiple versions of the same game mechanics, but for licenses such as this it makes perfect sense. Drawing in fans of the series and turning them into roleplayers has made GOO's other licenses (most notably the amazingly-popular *Sailor Moon RPG* line of products) a force to broaden the roleplaying community. It's hard to argue when the "one book is all you need" strategy has worked so well.
- *Resource Book:* True to its name, there's a lot of information on the series here. A complete episode guide, a bit of the history behind the OAVs, an essay on the "Exotic Girlfriend" sub-genre of anime, cast and production credits (both for the original Japanese releases and the dubbed American ones), and even the english lyrics for the series. Of course, every major and minor character gets an entry plus sections for the various ships, locations and institutions (such as the Galaxy Police). It's obvious that the authors watched the videos many, many times and that the book will be useful to fans of the series even if they never decide to play the game.

The book is, frankly, gorgeous. 208 full-color pages with many, many pictures from the series liberally applied throughout. The layout is clear and very easy on the eyes. Jeff Mackintosh (the layout and art director) pulled out all the stops to make this the prettiest GOO product that I've seen to date. My only nitpick is that the title character only gets four square inches of space on the cover . . . the back cover. Then again, fans of the series will find Ryoko easily recognizable, and those unfamiliar with the show will probably find her face more of a draw than the rather plain Tenchi Masaki!

For those of you unfamilar with the series, Tenchi was apparently just an average boy who happened to free a "demon" from a cave near his house who turned out to be a space pirate that had been trapped for seven-hundred years. (Believe me, this isn't even remotely weird considering some shows out there.) Ryoko and the rest of the cast show up, directly or indirectly, because of her presence. Among them is Princess Ayeka (who is hunting for Ryoko); Ayeka's sister, Sasami; the clutzy Galaxy Police Detective Mihoshi; Ryoko's 20,000 year old mother and super-scientist,

Washu; and, of course, an immense space battleship that can turn into two-pound cat-rabbit (also know as a cabbit). Okay, maybe this is a little weird. They all end up living at the Masaki household with Tenchi. Fortunately, Tenchi's grandfather has a big house!

The main story revolves around Ayeka and Ryoko, who both vie for Tenchi's affections, and Tenchi's discovery of his true heritage. Eventually, the entire crew ventures into space as various aliens come to annoy/kidnap/defeat members of the household. With just a bit of creativity, a lot of stories could be created both on Earth and beyond given the detailed information presented.

All main characters and almost all minor ones have a write-up, usually with full game stats. The various ships, robots and other bits of equipment likewise have complete write-ups as well. This completeness makes a gamemaster's job much easier when designing new characters and equipment. The authors don't extend beyond this much except for the sample adventure and weapon lists, but that's a reasonable compromise considering how much detail is included.

The rules for *Tenchi Muyo!* are based on the Tri-Stat system which is common to Guardian of Order's (current) anime role-playing releases. Light, easily-grasped and flexible, it makes a perfect foundation for the numerous licenses that GOO has acquired. Notice I said "based on the Tri-Stat system." One of the advantages of including all the game rules in each new release is that you are not bound by the designs (or mistakes) of the past. The core system is still there, but there have been major additions. Pulver's mecha creation system from *Big Robots, Cool Starships*, the skill system first seen in *Dominion Tank Police* and *Hot Rods and Gun Bunnies*, and numerous minor and major fixes have all been included. For those *BESM* fans out there, you can view this book as a preview of the upcoming *Big Eyes, Small Mouth 2nd edition*. Keep in mind, though, that the *Tenchi Muyo!* rules are designed for a specific universe and won't be as generic or complete as the 2nd edition.

Characters are easy to generate, even for newcomers. You spend Character Points on the three statistics (Body, Mind, Soul) and various Attributes (which can range from the rather campy Art of Distraction to the awesome Jurai Power) which usually come in six levels. Certain Attributes (Own a Big Mecha, Mass Power, Jurai Power) give you a pool of points to buy certain special powers (Sub-Attributes) using basically the same system. For example, any random character won't have Telekinesis, but those of the Jurai royal house can buy it. After spending the Character Points (including any from taking optional Character Defects), Skills are bought using the same level/point system using a pool of Skill Points.

Using the system is equally simple: roll 2d6, apply modifiers and compare to the appropriate Stat (or, occasionally, another value.) Yeah, the details get a bit more complex than that, but the basic mechanic really is that easy.

If you are a fan of the series and want a convenient reference guide, or want to play in the *Tenchi Muyo!* universe, this book is a must-have. Even if you don't fall into either of those categories, the universe is fun enough, and the rules good enough, that you could easily run a campaign with what is presented.

-- John Karakash

Dork Tower!

Dork Tower!

Murphy's Rules

Murphy's Rules

A Moving Column

Well, as I mentioned last week, I have moved. So as you read this I am either cuddled in my new home, drinking a can of Coke, or out on the streets, collecting cans to trade for a bottle of Thunderbird. Regardless, I'm surrounded by boxes.

So I'm not talking about much this week other than moving. But I'll tie it to gaming; honest.

I'd like to point out that, between myself and my circle of four friends here in town, there has been a total of twelve moves over the past five years. Within the past few years, my workplace has moved, three of my friends' workplaces have moved, and two sets of parents have moved. My Friendly Local Game Store, my grocery store, our local courthouse, and many others have all moved. Yet it's something I seldom see happen in the realm of television, movies, or roleplaying games.

Here, then, are some plot hooks involving moving.

- An Evil Corporation has outgrown its headquarters (or its previous headquarters are uninhabitable for some reason). This idea has many possibilities. Perhaps the PCs are trying to enter the organized chaos of a move in order to retrieve company secrets. Perhaps they need to figure out a way to put insecurity features (secret tunnels, bugging devices) into the new location without EvilCorp knowing. Perhaps they need to try to figure out *where* EvilCorp is moving to, since they're being incredibly secretive, before Something Bad happens.
- During a routine move, something unusual is found in the back of a closet. Whether it's a [Warehouse 23](#) item, a pirate treasure map, or the return correspondence of the Corinthians, the act of moving is a great way to have something new spring up.
- A Dependant, Ally, Patron, or some other important NPC moves without telling the players. (This is especially appropriate for addle-brained or mad scientist-type.)
- A move can be a wonderful way for a campaign to take a new twist or turn. For example, the PCs may have caught the public's imagination as pulp crime fighters in Chicago, and are offered lucrative Hollywood deals if they will move to California. . . a deal that will also be offered to whatever charity the PCs most support/believe in. (Incidentally, this is also a good way to keep from having to [blow up the world](#).)
- The PCs try to move into a new headquarters or office, and everything that can possibly go wrong does. Phone service is not transferred as expected; the 15-foot truck the truck rental place was *supposed* to have available isn't. . . but they have a six-foot cargo van or an 80-foot tractor trailer available; electric bills are sent to Bobo Grubbs of Des Moines (who feeds them to his cocker spaniel), resulting in the power being turned off; and so on. Who's behind these dastardly deeds? Or is this simply the cosmic whims of some divine grandmaster. . . a supreme Game Master, if you will. . . who delights in tormenting the PCs?
- Due to public outcry, the headquarters (or city!) the heroes call home is becoming increasingly hostile. (Be creative; public battles violate city noise ordinance laws, a hero's outfit is deemed obscene by a local court, and so on.) Do they tough it out and hope the ungrateful Teeming Millions come to appreciate the PCs again, or do they undergo the hassle of moving to a new location?
- Someone has managed to convince the public that the PCs are moving, and have managed to have power, phone, mail forwarding and other services to one location. Who is behind this? And what is the significance of the new address? The site of something beneficial? Unspeakably horrible? The rook-challenges-knight maneuverings of Hidden Masters? Or a desperate last-ditch attempt for a frantic person to involve the PCs in a matter she has otherwise been cursed, forced, or forbidden from contacting?
- The new location the players move to is the former site of an ancient Aztec Burial Mound, the *real* resting spot of Topebeard, the hotel where one of the PCs had their Lunar Luau Junior Prom, or similar ominous locale. What will happen to the heroes as the Significant Anniversary approaches? And, more importantly, what drives otherwise rational young adults to concoct monstrosities like Lunar Luaus?
- At a horribly inconvenient time, the PCs are evicted by their landlord, who is using some clause that lets him do what he wants. . . unless (of course) the PCs would be interested in performing a *teeny* little favor in exchange for a continued home. . .

The PCs are moving, and decide that, rather than transport a jar of Bread & Butter Pickles, they should just go ahead and eat the last seven gherkins. Yum!

(Admittedly not all causes, results, and complications for moving will immediately be applicable for most groups.)

The point is, moving is something that is done frequently by many people at least once in their lives, and very often several times a decade. Try incorporating a bit of mundane realism into your game, and you might be surprised. . . especially if the mundane is exciting enough.

Now if you'll excuse me, I've been awake for forty hours, and the novelty is wearing off. . .

-- Steven Marsh

* * *

Last week's answer: **Terror T.R.A.X.: Track of the Vampire**. (You can tell the specific one because of the question mark.)

(Four stars) "One of the most annoying of all dimensions in the multiverse is Wimp World. . . . A typical street sign on Earth saying 'Yield' says 'Give In' here. No one drives over 5 mph. Airplanes rarely fly more than 200 feet off of the ground. Someone who drinks milk after the expiration date is termed 'reckless.' No one runs with scissors. Everyone flosses."

by Michael Leza

Photographs by [Keith Johnson](#)

It's a fact of life. You're in the middle of a tense moment of roleplaying -- a heated argument over feeding grounds in White Wolf's *Mind's Eye Theatre Vampire* game. Ivan the dreaded Prince is towering over poor Mick, a rough and tumble vampire biker who's in a little over his head. In a desperate last minute bid for his existence, Mick slips a knife out of his boot and leaps to his feet. Then, the dreaded words are heard, "Physical challenge. I'm brutally stabbing you."

Sigh. What ensues is a long, boring series of rock paper scissors and such colorful phrases as "I am brawny enough to hit you," and "I am quick enough to dodge." The scene's dramatic tension is gone, and you're left with a bunch of people in funny clothing joking around out-of-character while two people mark up their character sheets and wonder why they didn't spend that last 3 experience on that first level of fortitude.

This is how it often is, but it is not how it is supposed to be.

Below are some suggestions for how to spice up your live action roleplaying combat.

Combat Is Roleplaying, Too

One of the more common false distinctions in live action is drawn between roleplaying and combat. For many people these are two distinct parts of the same game. What many of these people haven't realized is that combat is roleplaying. You can still stay in character and roleplay while you use the system to work out the results of your character's actions. Sadly, many otherwise deep characters become stoic blocks of cheese when in combat, standing there and ferociously slamming their fists into anything that walks into their reach.

Sure, you could just mill around and spray people with your machine guns whenever your turn comes, but wouldn't it be more fun to laugh maniacally while doing so? Or glare in hatred as your opponent grips you with his telekinesis and begins slamming your head into the ceiling? If your character is normally energetic and hyper, wouldn't he be tempted to speak up while the two titanic werewolves pound on each other?

Remember, just because combat is going on doesn't mean roleplay has to stop. Staying in character is vital to maintaining the flow of the scene both during and after the fighting.

Setting the Scene

Back to Mick and Prince Ivan, now in their second round of combat. Mick has been disarmed and is standing there in front of one of the oldest, most powerful vampires in the region. Thinking back to the above section, he exclaims, "You'll never take me alive."

Unfortunately for Mick, without a weapon he's probably right on the mark. Mick desperately looks around and feels dread creep down his back as he comes to the realization: the players and the storyteller forgot to set the scene.

A good dramatic combat can not take place in a vacuum. Unfortunately for Mick, the scene hasn't been defined past, "You're in a gothy place." Now, when Mick's player needs the most to improvise a new weapon or method of escape, he's helpless.

So, it's simple. Set the scene before the combat begins. If possible, a storyteller should set the scene in detail before the game even begins. An ideal scene is mapped and written up with just enough detail to be helpful, without being so detailed that it doesn't allow for improvisation on the part of the players. It's also important to make sure the real world location can mirror out-of-character what exists in character. Yes, we'd all love to have a gun fight set on top of neighboring skyscrapers, but if all you have is one small room with 30 people packed in, maybe that's not the best place for that scene.

The storyteller should also set up any tables, chairs, or other items which might be in the scene if they are available. Extra objects (usually chairs and boxes) can also be labeled and used as stand-ins for things in the room like support pillars, doorways, walls, or anything else that might be needed. Make sure they are clearly labeled, though; it wouldn't do to have a group of characters meeting around a support pillar because the players thought it was a table.

Remember that if it makes sense and it helps the scene, go ahead and make a small change to the setting. Adding a low hanging bar perfect for swinging a kick into someone's face isn't going to change the game mechanics of the scene, but it sure will spice up the action. *(Note: Please do not swing-kick into people's faces from low hanging bars in real life. This is all make believe.)*

Combat in Live Action Roleplaying

Running the Combat

Well, Mick blinks once and suddenly he is in the ballroom of an old hotel, long since closed down "for safety violations." The room has tables off to the side where people can quietly sit and talk, and a large open central area where court is held. There are several large chandeliers hanging from the ceiling, and lucky for Mick one is conveniently located right above the space between him and Prince Ivan.

Mick grins, as a plan begins to form in his head.

Posing

Dramatic posing is one of the classic elements of dramatic combat. If you need some good examples, check out any Kung Fu action movie that came out of Hong Kong, or even the classic *Big Trouble in Little China*. Right before people fight, there is usually a scene of dramatic posing and talk. This is a fun thing to add to the game, and if both players agree to extend the posing for several actions, it can sometimes upstage the fight itself.

Ivan gather's his cloak around him and scowls at Mick. Imperiously, he points down at the younger vampire and commands him, "Surrender, or die!"

Mick, having watched too many Bruce Lee movies, drops into a Kung Fu stance, grins at Ivan, and makes a "come here" gesture with his forward hand. His gravelly biker voice is steady as he taunts Ivan, "Come get some."

Let the Battle Begin

Now, the fight has finally started, and it's time to deal with the system. Luckily, *Mind's Eye Theatre* is designed to help make combat interesting. Sure, maybe you're quick enough to land a one-two-three on your opponent, but what does a one-two-three look like?

Right, why not show us? No, don't stand up and start hitting the other player in the face. But stand a safe distance away and shadow box the movements how you think your character would throw them. Doing this helps everyone involved picture the combat how its really being fought, and also allows your opponent to react to your moves in a logical, consistent, and in character way.

If the move can not actually be acted out (for whatever reason), you should still try to describe in as much detail as seems reasonable what your character is doing. If your action involves movement, moving to where you'll end up is also usually a good idea.

It's also important to keep in mind that even though it is good to act out actions if you can, don't constrain your character unreasonably. Many characters are vastly more physically capable than their players, and while it might be impossible for the player to leap down the side of a cliff, jumping from outcropping to outcropping until he hits the bottom, the character just might be athletic enough to pull the stunt off. *(Note: Please do not try to descend a cliff by jumping from outcropping to outcropping. You will die.)*

As Ivan suddenly darts forward in a blur of motion, sword flashing out of its scabbard and arcing at Mick's neck, Mick whips around into a crouch, pulling his gun and leveling it at the chandelier's chain. He grins at Ivan as he squeezes off a round. Meanwhile, back in the real world Ivan's and Mick's players have both opted to take extra actions this round, and spend the first action drawing weapon cards and acting out their movements. The second action, Mick and Ivan are taking directly opposed actions and whoever wins the challenge will have his victory condition take effect. Ivan's player steps up and swings the note card at Mick's player's neck (with a couple of feet of clearance; it's a sword after all) and Mick's player crouches and aims his note card up at the imaginary chandelier, grinning as he does so.

Called Shots

While most tabletop rule systems have a system for called shots, *Mind's Eye Theatre* doesn't really go into any detail about them. However, considering the nature of live action combat, every shot should probably be targeted. Very few people simply throw wild punches or shoot generically "at" someone. Every shot will probably end up "called" if you're acting out the combat, so don't worry about it.

Some people become concerned when every shot becomes a called shot to the eye, or the brain, or the crotch. However, often times this accurately reflects the intentions of people in a real fight. Vital points are a common target of people who intend to win a fight at all costs; there is no reason this shouldn't be different in a roleplaying game.

Ivan's player has won the challenge, and since last round he made a called shot to Mick's throat, Mick's life span has just been drastically shortened. Or has it?

Describing Injuries

One of the other factors that helps negate the seeming advantage of constant called shots is the fact that the defender should always describe the actual injuries (or the Storyteller, if he chooses to exercise that right). Thus, you can make a called shot to someone's neck with your sword, but maybe they pulled back quick enough that it simply chopped their

throat open instead of taking their head off.

Of course, the game mechanics remain the same, so even if the wound "looks like just a scratch," you must have taken (or dealt) at least a wound level worth of internal injury from that sword swipe.

Well, it looks like Mick will survive for at least another three seconds, as he managed to pull his head back far enough that he has simply had his throat cut. Ivan snarls in frustration and swings his sword at Mick's neck again. Mick, looking startled and frightened from his brush with death, tries to roll out of the way of the sword and squeeze off another round at the chandelier (which is still right above Ivan's head). Ivan's player swings the note card again, and Mick's player describes his character's roll, takes a step back, crouches again and points his note card up in the air again and shouts, "bang bang!"

Scripted Combat

Sometimes, a Storyteller wants to have a grand, epic combat without the inevitably slow series of challenges needed to work out what happens. This is when scripting comes in handy. Don't be afraid to work out how the combat is going to go before hand, and then when the dramatic situation calls for it simply act out what happens (note: please do not start hitting each other with swords, or anything for that matter. No touching) for the enjoyment of the other players and the furthering of the story. Sometimes a combat script can even be triggered by a certain condition reached from a normal combat.

Combat in Live Action Roleplaying

Mick's player wins the challenge. Ivan's sword eats nothing but air as Mick rolls out of the way. Mick's .45 speaks twice in quick succession as he blasts the chain holding the chandelier. The heavy iron chandelier slams down on Ivan, breaking his legs and pinning him to the ground. Ivan's player lies down on the ground and tries to grimace convincingly for a moment.

Unfortunately, what Mick (and Mick's player) did not know is that Ivan was really a demon posing as the prince, and Mick has just broken that disguise. As the suit of skin that was Ivan begins to crumble, a new and horrifying form snaps up, throwing the chandelier off like a toy and rising to its full twelve feet of height. From the skeletal form two huge wings unfold, and a tooth filled maw snaps threateningly in Mick's direction.

Just then Justinius, the sheriff (and the character who is scripted to fight this demon when it gets revealed) steps up, firmly pushing Mick behind him.

Justinius draws his sword and points it at the demon, his voice steady as he proclaims, "In the name of the Prince, prepare to die." The demon crouches, coiling for a pounce, its only response a tearing hiss and a snort of warm, brimstone scented air. The epic combat begins. . .

Die, Flee, or Negotiate

Inevitably, every combat comes to an end. This does not always mean that one side is dead or knocked out. Often if someone is losing and fears they will continue to do so in a real fight, they will attempt to flee or talk. Also, sometimes both combats will come to an unspoken agreement to stop and rest for a moment while both sides catch their breath. This is a perfect time to get some quick dialog in, and maybe even stop the combat entirely as the fighters realize they would be better off talking about their differences than slugging it out.

It is vital that players remain in character in this regard. If you are playing an honorable character, it's not very likely

that you will continue to hit someone who is trying to talk to or surrender to you. Take a round off from taking offensive actions and do some talking. Then again, if you've got some violent traits or a hatred for your opponent, you're probably going to keep fighting until you've won or you're knocked out.

Remember, if you really enjoy rock-paper-scissors and all this sounds like too much trouble, throw it out. If you come up with some awesome idea which makes the above sound childish and boring, implement it (and submit a copy!). Regardless of anything else, the goal is to have fun and roleplay.

Suggested Films

Below are some good movies you can watch if you want to see some wild cinematic fighting. They're great for ideas of how a supernatural creature might fight differently from a normal person.

- *The Matrix*
- *Once Upon a Time in China (I, II and III)*
- *Big Trouble in Little China*
- *The Crow*

by David P. Summers

Art by Dan Smith

The shaman settled himself down next the blood stain. These "city people" might be able to turn out metal weapons and armor, and their sorcery was impressive enough, but their knowledge of spirits was pitiful. Sure they had religious rituals for the dead, but it would seem that, every now and then, a soul would get "missed." When that happened, those the ghost haunted had little idea what to do.

Indar sighed; he would have to deal with the spirit that had been haunting the area since the murder. Not that he cared that much for what happens to this city, but he felt an obligation as a shaman to see that the soul got to it proper destination, even if it hadn't been one of his people. He laid out the lock of hair he got from the widow and his charms. Then he began to draw the proper symbols by sprinkling lines of cornmeal around them. The pigeon he had brought as a sacrifice cooed nearby. . . .

One of the staples of both the fantasy genre and of mythic tales is the shaman (and the spirits he interacts with). People have been interested in *GURPS Voodoo* because, in addition to its other qualities, it has a new and interesting magic system. Since the system is already based on spirits, it is especially useful for handling shamanic magic. However, there are number of differences between the TL 7 Shadow War setting described in *GURPS Voodoo* and a typical TL 3 fantasy setting. There are also some differences between the modern vision of spirits presented in the book and a vision that is closer to a medieval/historical one. This article is an attempt to guide those who might like to use this system to run shaman characters in a TL 3 fantasy setting.

Types of Spirits

Here are some types of spirits that could be used in a *GURPS* spirit magic campaign. This is not a complete list, and a GM may not want all of them to be present in his campaign. A GM is encouraged to pick those that suit him/her and to add others. It is suggested that a GM allow spirits to speak the language of the intelligent species that is dominant in the area, unless the GM wishes to either have a Spirit Language skill or give each type of spirit its own language. It should be noted, when GMing spirits, that they tend to be willful and mercurial. They often have little understanding of Physical reality. They may not understand that a 100 foot drop will kill a human.

Place: Any place that is "significant," and has been around long enough, can have a spirit associated with it. A spirit might inhabit a specific mountain. A lake spirit might be associated with a certain lake or a river might have a river spirit. Even a large significant rock or a waterfall can have a spirit associated with it. Generally, a place that is significant enough to be warrant naming (or would be if there was anyone around for places where there are no people) might have a spirit. Such spirits are found at the place where they are associated. Unlike other spirits, they will generally not seek to possess other beings (since they are tied to the location). They are also are more likely to materialize physically (e.g. the water nyad). They are dependant on the good condition and existence of their place. If

it is destroyed, they are destroyed; if it is fouled, they are fouled. The lady of the lake in Arthurian legends could be an example of a lake spirit (albeit one that takes a peculiar interest in human affairs).

Disease: Spirits were thought to be the agents of disease in medieval times. They can be passed on from victim to victim. They can generally be found only in diseased animals and plants. They will not materialize and will either be in possession of a being, or looking for one to possess. The disease spirit represents a classic "evil" spirit. Possession by a disease spirit will cause the subject to suffer from a specific disease (there are different spirits for each disease).

Action: Spirits can be associated with action and motion. Rather than being associated with what the universe is made out of, they are associated with how it "acts" (see elementals below). You don't refer to "air" spirits, but a recurring type of wind (like the Californian Santa Anna or the French Mistral) might be caused by wind spirits. Similarly, a large and constant ocean current might have a spirit associated with it. These spirits might be found wherever the action is occurring, though if the action is spread over a large area, they may be hard to localize. The distinction between these spirits and elementals can get hazy, but generally the elemental represents the mere existence of some matter and the spirit represents a higher property, in this case how the element acts in the world. They do not possess beings and they do not materialize, but they may be induced or compelled to cause or (less likely) cease the action they represent. They use the Poltergeist effect for this purpose (p. 85 of *GURPS Voodoo*).

Animal: Any species of animal will have a spirit associated with them. This is especially true of a numerous species. This only applies to "animals" (racial IQ<8); "intelligent animals" have a soul. The spirits are associated with the species as a whole and not necessarily with each individual animal. Animal spirits do not usually posses someone out of malice, but a shaman may invoke them to take on a favorable aspect of the animal in question. They do materialize, but rarely.

Plant: Old and large plants may have spirits associated with them. The classic spirit here is the tree spirit (particularly in oaks). They are much like place spirits.

Ghosts: When an intelligent species dies, its soul can live on as a spirit. They are described in *GURPS Voodoo* (p. 55). Such spirits are sometimes found near where their bodies are buried or they were killed, such as in haunted British castles.

Abstract Ideals: There can be spirits associated with human concepts, emotions, and ideals, such as strength, healing, hatred, vengeance, etc. Often in stories, only the effects of these spirits (an angry mob, etc.) are portrayed, implying that they can't be localized. Perhaps this is because of the generality of the concepts. In other settings they are summoned and manipulated just like other spirits to gain their aspects. It is up to the GM if these spirits can be pinpointed in the physical world, or in the spirit real, and what the frequency is (if they exist at all). These spirits will generally not physically materialize.

Spirits vs. Gods

It is routine, in *GURPS Voodoo*, for initiates to invoke the presence of gods on a casual basis as a source of their power. However, in many fantasy settings the direct intervention of the gods is rare and shamanic magic is distinctly separate from divine magic. In fact, in many settings the cleric exists as the indirect agent of a god who can not act directly. Also, many of the spirits a shaman is often portrayed as interacting with in medieval stories are not present in the Shadow War setting.

The solution is simply to replace the manifestation of the gods with the appearance of the appropriate spirits. If one was running a campaign where gods manifested casually on behest of mortals (particularly where the line between "spirit" and "god" is a fine one), the spirits presented here can be used in addition to the manifestation of gods.

Spirit Stats

This brings up the question of how to come up with the stats for the spirits? One method is to pick out a manifestation

listed in **GURPS Voodoo** that has the stats and power level that seem to be appropriate, take out just the game mechanic numbers, and then redo the description. Additionally, one can change the attributes using the attribute cost chart (the points from lowering one stat are used to raise another). The manifestations are classified as major, moderate, and minor, and this can be used to similarly classify spirits.

Another approach is to use the Ghost package (using the point cost for a ghost that can remain indefinitely) on page 55 of **Voodoo**. Many spirits have abilities that are a subset of the those in the ghost package. If a spirit doesn't have a certain power listed, delete it and reduce the cost. Dream Travel, Possession, The Poltergeist Effect, Altering Probability, the ability to be seen and heard, and Full Materialization are all considered roughly equal and reduce the cost of the package 20 points. (**GURPS Undead** has a somewhat more extensive treatment for modifying the point cost of ghosts, p. 52-54.) A correlation between a ghost's point total and the class of an invocation can be inferred from the rules for Spirit Ally on p. 61 of **Voodoo**. A 101-150 point ghost is equivalent to a minor manifestation, a 151-200 is a moderate manifestation, and a 201+ point ghost is equivalent to a major manifestation.

Elementals & Sorcery

Elementals are not considered spirits. Elementals are fundamentally, part of the building blocks of reality. They are the expression of the elements that make it up reality (Earth, Air, Water, Fire). That is why sorcerers, who are adept at modifying reality, can create them so easily. The idea that are something that can be *created* by "mere mortals" sets them a step lower than other entities. Conversely, spirits are independent entities with a measure self awareness and free will. In fact, some spirits are the souls of intelligent creatures who have died (ghosts and such).

Generally dealing with elementals will be considered primarily the domain of the sorcerer and spirits the domain of the shaman. This helps keep the distinction between shamanic and sorcerous magic clear. Similarly, it is recommended that the GM restrict some of the necromantic spells in **GURPS Magic**, **GURPS Grimoire**, and **GURPS Undead** that allow mages to easily control spirits (Sense Spirit, Turn Spirit, etc.). These spells could apply only to undead spirits (which makes more sense for a necromantic spell anyway) or be disallowed completely.

Encountering Spirits

The group glided silently along, looking for the raiding party. Five of the tribe's horses were gone already. They couldn't afford to loose more. But their foe was also skilled and so far they had come up empty.

One of the party, Indar, wasn't the best tracker. However, his reason for being along soon became apparent when he noticed "something" in a large oak tree they passed. There was a spirit in it. "Probably a dryad," Indar whispered and signaled the rest to stop. The rest waited patiently as Indar began his ritual, they had been through this before.

A beautiful young "woman" with green hair stepped out of the tree and looked around, eyeing Indar's fellows warily. "What do you want of me?" she asked

"We search for men, darker and shorter, who may have passed your tree recently," Indar explained. "We are at war with them."

"The conflicts of men are of little interest to me; why should I help you?" she replied disinterestedly.

Indar bargained: "Should you help us, I can heal the disease on that limb of your tree and pledge that none of my people will take wood from the stand of trees."

*More bargaining ensued, but soon the deal was sealed. The dryad had indeed
seen their enemy pass her tree. She had even remembered them. . . .*

While traveling on the Physical World, a shaman will come across spirits. As a general guide, when the issue comes up, a GM may roll 3d6. On a 9 or less the shaman is in the area of a minor spirit that he/she may sense according the rules in **GURPS Voodoo**. On a roll of 7 or less the shaman may be in the presence of a moderate spirit, and on a roll of 5 or less a major spirit may be encountered. Obviously a GM may modify or ignore these guidelines entirely. For example, a certain large oak that was center of spiritual activity maybe more likely, or even certain, to have a spirit.

Possession is still handled by spirit combat. Since spirit combat may be a turning point of a situation, it is expanded from one simple roll. Instead it consists of a series of attack and defense rolls until one sides attack get through the other's defense. Rolls are still made against Will+Initiation. Any attempt at "tricks," etc. are treated as Feints as per **GURPS Basic** p. 96. A character in spirit combat is at a -4 to defend attacks made against his corporeal body.

If the Shaman wins, he/she may automatically force the spirit to flee. Any control another shaman may have had over the spirit will be lost. Alternately, the shaman may now try to control the spirit by casting the appropriate ritual or instigating another spirit combat. Winning this spirit combat gains control as per the Mastery ritual. If a shaman looses any spirit combat, he is possessed as per the rules in **GURPS Voodoo**.

Spirit Realm

A shaman may wish to enter the spirit realm for a number of reasons; To escort a soul of a recently deceased to the afterlife, to find a spirit (either a specific spirit or a specific type of spirit) that he is unable to locate in the physical world, to gain a bonus in the conduct of his rituals, to gain visions of the future, etc. To enter the spirit realm the character must enter a trance as per p. 118-119 of **GURPS Religion** (for example, by meditating with drums, etc. for 10 min) or p. 59 of **GURPS Voodoo** (see AutoTrance). Entering the spirit realm gains a +2 to rituals (as per Auto Trance in Voodoo). Once in the spirit realm the character may encounter hostile spirits or may even, if he wanders around, get lost.

While the spirit realm does *generally* correspond spatially to the physical world, the land marks are completely different and movement doesn't obey the same laws. Consequently, knowledge of the physical world is of little help in

navigating the Spirit Realm. Finding your way around the spirit realm requires use of the Navigation (Spirit Realm) skill (M/A, defaults to IQ-5). One enters the spirit realm based on where you are in the real world. A shaman escorting a soul to the afterlife must make a straight roll vs Navigation (Spirit Realm) provided he has done it before (e.g. someone has previously shown him the way). If he fails by 2 or less, he fails in his task but is not lost. In general, it will take roll(s) of Navigation (Spirit Realm) to find a place in the spirit realm and roll(s) of Navigation (Spirit Realm) +2 to retrace one's steps. To search randomly (say for a specific kind of spirit) will only require a roll to find one's way back (provided the Shaman hasn't been negligent in keeping track of where he/she is).

A lost shaman must either hope for rescue from a fellow shaman, find a friendly spirit that is able to understand that the shaman has a body in the physical word that he needs to get back to, or keep searching for a way back. To find a way back to his body, the shaman needs to make one roll (since he is lost, he doesn't retrace he steps, but seeks to find a direct path back) at a penalty for how far he has traveled, usually equal to -1 for each roll that would have been necessary to retrace his steps. Repeated attempts are at a cumulative -1 penalty. However, a shaman can always find his way back on critical success. The shaman is generally allowed one roll hourly for the first day and daily after that (though time can often move differently in the spirit realm). While the shaman is away from his/her body it will not eat or drink and will slowly waste away, see p. 128 of *GURPS Basic*. If the body dies, the shaman will become a lost ghost trapped in the spirit realm until he can find his way to the afterlife.

The odds of encountering malevolent spirits are left up to the GM. A straightforward task such a escorting a soul to the afterlife or conducting a ritual should be unlikely to cause such an encounter. A shaman wandering about (such as to get visions of the future or some other vision quest) will have a significant chance. The number of Navigation (Spirit Realm) rolls a character makes will be a guide to how much "wandering about" he is making (any measure of "distance" will be generally irrelevant). Specifically looking for spirits will increase these chances further.

Raising Initiation

To increase one's initiation level (or gain one of the advantages associated with initiation) should be require some sort of trial. This might involve a dangerous spirit quest to find something significant to the shaman or to appease a spirit. The GM is encouraged to have the player create an outline of where their shaman intends to go and who they will entreat, etc. Sacrifices can improve the odds. Such sacrifices can range from small (pain, fasting, etc.) to moderate (tattoos, ritual scaring, vow of chastity, etc.) to severe (loss of a limb, and eye, etc.). Of course the improvement in the odds will depend on the severity of the sacrifice. Alternatively, a GM may allow the points, or a portion thereof, generated by such a disadvantage to be applied toward raising initiation, gaining additional initiates advantages, etc.

Rituals

There are only a few changes in the rituals themselves. They seem generally balanced for most fantasy settings. New rituals should be based on what one can send a spirit to do. Effects should not be at the direct will of the caster, since he is not directly causing the effect. Instead they should assume indirect action through a spirit. For example, a spell that causes a victim to hallucinate or an object to move as a caster wills is primarily sorcerous in effect. One that causes things to occur according to the nature of a spirit, or as a spirit could be directed, is shamanic in effect.

Specific Rituals

Chaperone   See Voodoo, page 75

This one is a little overpowered for TL 3 campaigns. Basically it means that every member of a party with a shaman in it will be immune to the first hit. This will possibly work a bit better if the protection was not automatic. Apply an IQ roll for the spirit to see if it realizes it should act. For example, a spirit might not realize that getting an axe in the chest is bad for the mortal. Conversely, it might decided that it needs to stop that mosquito bite.

Succor   See Voodoo, page 75

Healing is fairly common in most fantasy settings so this ritual may need to be made more effective. All Initiates may use it as if there were fifth level Initiates.

New Rituals

Guide the Missile   Path of Movement-8

A spirit guides a chosen missile to its target. The initiate must call out the target and point to it (either with a hand or other object like a stick, wand, gun, etc.). This can be done as part of casting or firing and counts as a free action. The spirit can guide all missiles to their targets for a +4 to hit and can also speed up slower missiles (arrows, rocks, etc. but not bullets, blasters, etc.) for a +2 damage.

Guide the Weapon   Path of Movement-8

This ritual calls a spirit to help guide a chosen weapon. The effectiveness is limited by how well the spirit can anticipate the weapon's movements. Thus it is dependant on how capable the spirit summoned is. The modifier to your to-hit roll is equal to (margin of success-3). (Yes, this ritual can actually make it harder to hit.) The spirit cannot react fast enough to assist with parries. The shaman must make a ritual roll every minute to keep the spirit around.

Movement   Path of Movement-5

This ritual assists in the movement of a PC or his vehicle. The shaman gains a spirit with a ST equal to (margin of success x 5). The spirit will push constantly as directed by the shaman at the time of summoning for as long as described in the duration table on page 81 of *Voodoo*. The spirit may be released early, but will not change tasks without a new ritual.

Loyal Object   Path of Luck-4

This ritual seeks to return objects to the shaman. The ritual may be cast on any portable object and begins working when the shaman looses contact with the object and hasn't told it to "stay." When someone headed in the right direction passes by, the spirit causes him to notice the object and pick it up (to examine it, etc.). If he goes in a different direction he loses the object (it falls out of his pocket, he realizes he had no interest in it, etc.). This happens until such time as the object makes it back to the caster.

Passers-by will only move the object if it is convenient for them to do so. A pen or book will move quickly, since they are light and very portable, while a stone statue will likely stay where it is unless a group of blacksmiths with a cart happen to drop by. The ritual will not work on someone who receives or steals the object directly from the caster, and carriers get a Will roll, minus the caster's level of initiation, to resist carrying obviously dangerous objects, etc. Carriers will be unaware of what they are doing, and people who aren't carrying the object will ignore it entirely.

The speed with which the object returns to the caster is up to the GM. A piece of paper may make its way from one side of a major city to another in as little as a few hours, while a sword lost in the underbrush during a battle may take months or years to come to light, and just as long to make its way from a small village to the big city where its owner lives.

Bind the Spirit   Path of the Spirit-8

This binds a previously summoned and controlled spirit to a physical object. The spirit can be freed by the caster or by breaking the object. It can also contact/posses anyone touching the object. Unless you can get the spirit to agree before hand (not likely, generally a very good reaction or better), it will *not* be pleased. Any spirit so bound will automatically have a very bad reaction to the shaman when it comes out again.

This allows a shaman's spirit to travel with an animal. Essentially the shaman leaves their body, goes into the spirit realm and attaches him/herself to the animal. (It is handy to be on good terms with the spirit the animal is associated with.) The shaman can direct the animal and can sense what the animal would sense. If the animal is killed, the shaman is dumped into the spirit realm and must find his/her way back to their body as if they were lost. However, the first roll is at a +2.

(Thanks to Pam Keller for trying this on her character and her suggestions.)

Tanks For The Memories: Alternate Ogres

"The tale of the 21st century has no happy ending -- dictatorial empires dominate it, and dictatorial fiefdoms follow it. Some players may not want to play in a universe where everything is doomed to fall into anarchy.
So change it!"
-- Jonathan Woodward, *GURPS Ogre*, p. 124

As **GURPS Ogre** growls its way into our mental HUDs, one thing becomes rapidly apparent: giant, sentient, most likely malevolent tanks are just too neat to keep penned up in the 21st century. The first option, of course, is pure and simple **GURPS Time Travel**. Suppose Paneurope develops a time gate and shoots a Huscarl back to World War II to help Hitler (or Charlemagne) unify the continent seven decades (or twelve centuries) early. Of course, before temporal inertia breaks, the Combine launches a desperate attack, siezes the time portal, and sends its own Mark IV (or a team of PC Ogre-killers) back to take over the Allied (or Abbasid) war effort and stop the increasingly-independent Paneuropean cybertank. If your love of giant tanks won't wait, however, here's four more Ogreish histories to churn up your gaming battlefield.

"Thus by such victory, not by machines, but in opposition to the principle of machines, has the freedom of states been preserved by the cunning of architects."
-- Vitruvius, *On Architecture*, Book X

The Emperor Trajan couldn't believe his luck. The Han, rulers of far Cathay, had apparently declared war on the Parthians over some trade routes in Central Asia. His legions marched into Parthia, siezing Mesopotamia, and then the Persian highlands, and then the roads into India. He dreamed of emulating Alexander -- until the waves of broken refugees told him of the horrible Han "moving fortresses." Han alchemists prepared the metals and powders (and bound the spirits) that gave these deadly *gui* (a word meaning both "tortoise" and "evil ghost") their life and power. Clad in impervious metal chi, they moved by themselves across the ground, spitting fire chi from long lances; the most powerful of their spells could leave craters where whole armies had formed. Trajan's military genius was taxed to the utmost managing a fighting retreat back to the Euphrates. Time and again, his legions formed up against the Han, and time and again, the *gui* thrust them aside. Now, in 105 A.D., Trajan desperately fortifies the Roman borders against the next spring's campaign. Hopefully, the crash alchemical program in Alexandria (studying fragments of captured Han armor and fire-lances) will be able to develop weapons and magics capable of stopping the Han onslaught, or Rome herself will burn under the fires of the tortoise-ghosts. The PCs in this **GURPS China-Imperial Rome-Ogre** milieu can be cinematically unkillable Roman warriors straight from the pages of David Drake, refugee yogic martial-arts masters from India, Parthian Magi, or Egyptian experimental magician-engineers.

"'[W]hat is the matter?' said one. 'Speak out.' 'Are we threatened with a fresh Reign of Terror?' asked another. 'Has the Corsican ogre broken loose?' cried a third."
-- Alexandre Dumas, *The Count of Monte Cristo*

The mysterious chess-playing automaton of M. Maelzel only became a threat to the peace of Europe when its path crossed that of Franz Mesmer -- and Napoleon Bonaparte. Not even British intelligence can say who thought of combining the chess-player with mesmeric direction, although lurid rumor maintains that it was, in fact, the automaton who first made the suggestion by means of a printed card. The dictator's whim bankrolled Maelzel and Mesmer together with the American steam pioneer Robert Fulton, to build a mesmerically-controlled clockwork steam-powered guns platform. *L'Ogre* steamed into Germany in 1805, mesmerically directed by Marshal Masséna, but operating its weapons as practically and as efficiently as a master chess-player. The effect on the Austrian armies was terrific; they disintegrated and the French mopped up the Russians at Austerlitz. In 1806, Fulton built an ironclad steam float for *L'Ogre*, and Napoleon himself went under mesmeric trance to direct it in the invasion of England. The British fleet was unable to match *L'Ogre's* firepower, but an unlucky hit blew up the ship on which the entranced Napoleon rode. The automaton became infuriated; when it rolled onto British soil, it drove straight for London, somehow using mesmeric force to vastly increase the power of its guns and Congreve rockets. In ten hours, the city was a smoldering ruin, and *L'Ogre* announced that it was, in fact, *L'Empereur*, the Corsican genius' mind having

somehow transferred into the invulnerable body of the pneumatic death-machine. French troops moved in to occupy London, and in a lightning campaign, *L'Ogre* (the old name having stuck) crushed Prussia and Spain by 1807. Under the mesmeric lash of the mad steam-emperor, Fulton and Maelzel work to create new *Ogres* to house the minds of Bonaparte's brothers and favored marshals. America and Russia eye each other nervously, wondering which will be the mad mechanical dictator's next target -- and which will be called upon to ally itself with *les Ogres* on pain of devastation. Both have launched secret studies of mesmerism -- and of steam. PCs (ideally powerful psis themselves) can be soldiers, sailors, or spies (or conspirators against the disembodied Bonaparte) in this Napoleonic-era ***GURPS Psionics-Ogre*** crossover.

"When I left the plantation, I drew a long breath, and felt as if I had escaped from an ogre . . ."
-- Harriet Beecher Stowe, *Uncle Tom's Cabin*

Nobody thought the war would last this long. Nobody expected the Confederates to give in to insane desperation, and actually try to build the Organo-Galvanic Reconnaissance Engine. But after Grant took Vicksburg, Jeff Davis listened to what his ordnance chief told him -- that if that madman Donovan had read Frankenstein's notes correctly, a steam-tractor could be directed by a disembodied human brain. Only one in a hundred could survive the procedure without going mad (and the survivors were none too stable), but if there was one thing the War Between The States had produced in abundance, it was amputees willing to do anything to move again -- even have their brains removed and implanted into a galvanic webbing in the center of a deadly armored war-wagon. The Union soon learned how to build their own steam-wagons, but the men fighting them were no match for the Reb O.G.R.E.s. Spraying naphtha and Gatling fire, the Rebel war machines smashed through Union lines in Tennessee and Virginia. After the first wave of "Lighthorse" O.G.R.E.s had proven the technology, the heavier, deadlier Mark II "Calhoun" models took the war north. Meanwhile, O.G.R.E. ironclads swept the blockade, and the British began funneling supplies to the Confederacy, eager to see America torn to shreds. Although the Union still has the overwhelming advantage in men and equipment, only the South has Donovan, and the O.G.R.E. devices. New York has burned twice, a Mark III "Pompey" leveled Washington, and Grant has only recently retaken Chicago's ruins. The entire Ohio Valley is a mire of ash and mud, as is the Potomac. PCs can fight on either side in the ***GURPS Steampunk-Horror-Ogre*** game in this increasingly post-apocalyptic America of 1877.

" The Ogre does what ogres can,
Deeds quite impossible for Man,
But one prize is beyond his reach,
The Ogre cannot master Speech:
About a subjugated plain,
Among its desperate and slain . . ."
-- W.H. Auden, "August, 1968"

Konrad Zuse meant to take his advanced Z3 computer to Switzerland. But a shelled highway and missing road signs sent him right into the arms of the Red Army. Stalin's spies had already told him that the British and Americans were working on computers; he resolved that the Soviet Union would have Zuse's -- and much more. The Cold War became a Computer War. By 1948, both sides had deployed computer-and-radio-controlled tanks to Berlin. Experiments in guided missiles fed the development of computer-served, radar-controlled heavy rocket artillery. This paid dividends as both powers nuke-launched orbital weapons platforms. As the Soviets built ever larger (*Ogromniy*, "immense") computanks, the Americans and British worked to catch up. American armor proved the value of computanks when a squadron of twelve nuclear-armed O-52 Knoxes devastated four entire Chinese infantry divisions in Korea. The American O-55 Grant was the first nuclear-powered, nuclear-artillery computank; the Russians deployed an equivalent *Ogromniy* the next year. Orbital platform space armor provided the insights for feedback-enhanced battlesuits; infantry picked up the new rocket-launchers and stepped back into the front lines. Both sides massed their computanks along the Iron Curtain, waiting for the signal to rumble. When Hungary rebelled against the Russians, a computer circuit in an O-53 Tom Paine decided that was the signal and launched, cutting into computer-encrypted mode to signal its fellows to drive into East Germany. The waves of bombers never made it past the orbital cannon, and World War Three turned into a ground fight. This ***GURPS Atomic Horror-Ogre*** blend could support either grim, deadly military gaming, or a more radioactive and cinematic game of commando raids and Science! Perhaps the *Ogromniy* in Vladivostok and the American ON-53 Perry "seatanks" in the Sea of Japan must combine to battle Godzilla, or turn

their mighty cannon to the skies to battle the menace from Mars. Whether the enemy is the Red Planet or the Red Army, it's good to have a superheavy O-57 Patton roll up for reinforcements -- except these new computanks all seem to want to talk politics . . .

Pyramid Review

Dungeons & Dragons Adventure Game

Produced by Wizards of the Coast

Written by Jonathan Tweet, Jason Carl, Andy Collins, and David Noonan

Boxed set with one 32-page Rule Book, one 48-page Adventure Book, 32 pages of Reference, 1 map, 2 pages of counters, 1 "Read This First" sheet; $9.95

It's a mistake to try to review something based on what you *think* it should be versus what it actually is; thus "I felt the screenplay in *Titanic* was weak" is fair criticism, while "I wanted more ninjas in *Titanic*" is not.

Faced with this realization, I find myself struggling to review the ***Dungeons & Dragons Adventure Game***. This isn't a game that inspires me to heights of giddy delight, or sparks a raging inferno within me. No, it just is.

The game itself is high quality. The character sheets are full color (though you'll need to cut the double-page spreads apart yourself); the counters are in color and double-sided (though not made of the sturdiest stock); and the dice, while not the ultra-snazzy glitter/marble/speckled sorts, are a grand evolution from the dice made of Pez with crayon kits included with the early "Basic" sets. The booklets, while black and white, are well-formatted and easy to read.

The game itself? Well, the box says, "For 3 or more players of all ages." This is probably one of the most incorrect statements I've seen in a long time. If nothing else, the dice represent a choking hazard for a would-be two-year-old gamer. But more specifically the game suffers from a difficulty to stand alone as a game, in the way that Monopoly or Chess can.

The basic means of teaching the game to the uninitiated (either to *D&D 3rd* or roleplaying in general) in *D&DAG* is through the full-color handouts mentioned above. Within these sheets are rules for movement, skills, special abilities (sneak attacks, spellcasting, and others), and other basic maneuvers. Movement is handled with the map and counters, not unlike a traditional boardgame. The basic abilities are all spelled out on the character sheet to make it easier to learn; thus under the Dwarven Fighter's Speed of 3 it says, "You can move 3 spaces per turn." Likewise rules to attack are spelled out on each character sheet. Each sheet also pictures the six basic polyhedral dice for easy newbie reference.

The 32-page Rule Book is not unlike an appetizer for the ***D&D 3rd Edition Player's Handbook***. It contains enough equipment, spells, abilities, and the like to satisfy a surprising amount of play; of particular note are the eight pages of monsters (20 critters altogether). These rules are sufficient to advance a character up through second level; for third or above (or for non-basic skills) you'll need the ***Player's Handbook***. Fortunately, for perhaps the first time the game introduced here is the same (or almost the same) as that presented in the "real" rules (*D&D3*); as such there is no unlearning necessary when moving to the full rule set.

The Rule Book, while geared towards a simpler game, is nonetheless full; there are random door/trap/monster tables, magical treasures, and good (but very simple) advice for creating dungeons of the sort found in the Adventure Book.

The 48-page Adventure Book contains six adventures that each use the basic dungeon map. . . or portions of it. The first adventure is a simple two-room affair, the second dungeon has four rooms, and so on, up to the sixth adventure, which uses all 26 rooms. Since there are no doors marked on the dungeon map (instead relying on counters to indicate doors), the map can be surprisingly versatile. In addition the back of the map is blank grid, so imaginative DMs can

make their own maps.

The adventures range from the simple dungeon crawl to the. . . um. . . complicated dungeon crawl. Each room's text is laid out in the traditional " read this grey box!" format, with details for the most common actions (listening at doors, picking locks, kicking doors in, etc.) clearly stated for each room. The adventures are fairly diverse, despite being dungeon-based; there's cave crawls, crypt crawls, and dungeon crawls. There are many beasts, and being primarily Evil (the alignment system is simplified to Good/Neutral/Evil) they all deserve to die. At least, that's the impression I got. Which is one of the primary weaknesses of the game, in my opinion. . . and a reason why I mentioned the caveat about not judging a game by what you want it to be. All in all, there are about one or two chances for honest-to-goodness roleplaying; even those can be resolved by rolling the Diplomacy skill (if you fail you generally need to kill whoever you were trying to be Diplomatic with). While I personally would love to see an introductory game where the focus is on interacting with interesting characters, exploring or storytelling, *D&DAG* is not it; I'd need to stick with *Once Upon a Time* as a means of introducing folks to roleplaying via that route. Instead *D&DAG* is a fairly complex boardgame with some elements that could be construed as roleplaying. In fact, the entire crux of what roleplaying is generally like is contained in a sample transcript on pages 14-15 of the Rule Book. . . a book they specifically tell you not to read until you get a grasp on the die-rolling fighting parts of the game.

I'm honestly not sure how people not at least vaguely familiar with roleplaying could buy and use this set. As a comparison, I distinctly remember the solo adventure that introduced the last edition of the *D&D Basic Set* (from '83 or '84, if my mind remembers right), which introduced mapping, exploration, and combat, all while not requiring any other knowledge of role-playing. (Again, that warning I mentioned above; just because I wanted a solo adventure doesn't mean *D&DAG* should be faulted for not having one.)

In addition, despite the "all ages" proclamation, anyone who would GM this would *have* to be older, if for no other reason than to understand some of the vocabulary. Here's part of a sample room description: "The portcullis is made of sturdy iron, and its sharp spikes dig into the ground. Inside the cave, just out of reach, is a crude winch. From your vantage point, you can see almost all of the cave." In addition, there are some fairly gruesome moments: there's undead, a necromancer, a hellhound, and a dead dwarf in a barrel. *(Ick.)* While these aspects are glossed over, it would nonetheless probably be inappropriate for really young folks.

On the whole, as an aid for a person experienced (however mildly) with gaming (playing the role of Dungeon Master), the *Dungeons and Dragons Adventure Game* could make a good introduction to people, young and old, for people unfamiliar with *D&D*. And at less than $10, this is truly a bargain to see if someone would be interested in the whole game. As a standalone game, though, the *D&DAG* simply doesn't seem to explain what it probably needs to with as much hand-holding as a product described as "all ages" would need to.

-- Steven Marsh

Pyramid Review

Death in Freeport, a D20 System Adventure

Published by Green Ronin Publishing

Written by Chris Pramas

32 pages, $7.99

Chris Pramas, author of the excellent *AD&D* sourcebook/adventure *Vortex of Madness*, managed to write and publish one of the very first of the *D20* supplements in time for the release of the *Dungeons & Dragons Player's Handbook*. *D20*, the game system used by the newest edition of *Dungeons & Dragons*, is best explained at the Open Gaming Foundation website (and in the review of the *Third Edition Dungeons & Dragons Player's Handbook* in this issue of *Pyramid*).

Death in Freeport is a short adventure for beginning characters and is presented as the first in a series of adventures which take place in the city of Freeport, located on a small island cluster known as The Serpent's Teeth. A short boxed section of the adventure gives a few hints on incorporating the city into any already existing fantasy campaign. The opening of the adventure provides minor details on the history and creation of the city (founded by pirates who used the location as a hideout for several years before turning into an almost respectable city).

Details on the city are sketchy and a gamemaster interested in incorporating the city into his campaign will have to do quite a bit of work or else wait for additional Green Ronin *D20* adventures to add detailed information for him before using the city. This is the largest problem with "generic" adventures and I feel Freeport would have been better presented as a complete city location with adventures being published after the "city" book. This is a minor complaint for those gamemasters who intend on disregarding future Green Ronin adventures set in Freeport or those who enjoy fleshing out cities with only a map and the most basic of information to start with.

The adventure itself fills about half of the 32 pages and starts with the hunt for a missing librarian. Several interesting characters and a pretty rigid storyline pit the low-level characters against a race of serpent people (well detailed in the adventure and perfect for use in future game sessions) and an evil cult. The adventure relies on a heavy dose of investigative events mixed in with a few combat scenes. While it is fairly linear in nature, groups that enjoy thinking over fighting will find the adventure loads of fun and should probably get one or two evenings of play out of it (which is great for less than ten bucks).

Other than the one and a half pages of the book wasted with the necessary *D20* license text and a two-page spread of characters printed in a much larger text size than the rest of the book, the production values of Death in Freeport are adequate. The cover, by Brom, was originally one of the cards from the *Guardians CCG* published in 1995 and suffers from being printed slightly too dark and a little larger than it was intended (as has been known to happen when CCG art is printed at anything larger than the 2" x 2" square it is designed for). The interior illustrations range from superb to decent and in no way enhance or detract from the quality of the adventure. Other than the one and a half pages of the book wasted with the necessary D20 license text and a two-page spread of characters printed in a much larger text size than the rest of the book, *Death in Freeport* is fairly packed. Several handouts are included at the end of the adventure for the gamemaster to photocopy and pass out to his players.

Overall I found *Death in Freeport* a useful product and interesting enough that I look forward to picking up the next *D20* adventure Pramas publishes through his small-press game company. Being one of the first *D20* supplements,

Green Ronin Publishing had the chance here to set the quality level other small-press *D20* supplements will need to aim for. Happily, if all *D20* supplements are of this quality, *D&D* fans will have no reason to avoid small-press *D20* products.

-- Philip Reed

?

by Christopher Paul

War games and tactical board games with miniatures abound, and I'm sure we've all seen truly gorgeous armies, or squads, or teams, or gangs (depending on the game) at conventions and on the boxes these wonderful games come in. I expect that many of us have bought a game and some figures for it, picked up some paints and brushes, and set to it ourselves. Finally, I would hazard a guess that most of the models that the vast majority of us have painted do not look like the lovely ones on the box, and, in fact, probably look like crud.

Why is that? I mean, all of these games and paint sets come with little guides about how to paint. Why, when I follow their directions, don't my miniatures come out really cool? Well, I'll tell you: Most little painting guides provides some very nice advice about color, about priming, and layering, and shading, and about various different brush techniques that can help make a miniature look really cool, but don't take into account the fact that most of us are clumsy and don't really know how to paint. Here I present three simple techniques that will allow you to paint like a klutz and have it look nice when you are done. My experience is entirely with 25mm scale models, but I expect that two of these three techniques will work at any scale.

The Clown Technique for Painting Eyes

One of the things the really makes or breaks a miniature for me is the face. If a figure's face comes out well, then I don't really care if part of his belt slopped up on his tunic, or if I accidentally blob-dotted one of the gems on his sword so that it looks like it is leaking; if the little guy has a good face, I can see the "soul" of the miniature and tell whether I like the model or not. Fortunately, most of the facial details are provided by the guy who sculpted the model; all except the eyes, that is. The eyes are just dull, slightly rounded protuberances on the bare model's face. Add good eyes to a miniature, and they are off to a great start.

Of course, the eyes are really tiny on a 25mm scale figure. If I'm a klutz, how the heck am I supposed to paint something that small with any degree of precision? Well, I'm not, and you aren't either. Paint sloppily but cleverly, and you will succeed. Here's how:

- **Step one:** Take white paint and a medium size brush and slobber the figure from ear to ear with one big stroke of white. Make sure that the entirety of each eye is covered with white.
- **Step two:** After waiting for the white to dry, select a pupil color and your finest brush. Get a bit of paint on the brush, and practice painting thin lines or your blotting pad, or newspaper, or whatever it is that you are working on. Once you are comfortable painting a thin line, pick up the model again. Starting somewhere

in the middle of the model's forehead, paint a thin line of pupil color down their forehead, across the center of their eye, and onto their cheek. This should be done in a single brush stroke, as cleanly as you can manage. Repeat for each eye. At this point, the model should look like a clown (see the picture). . . hence the name of the technique.

- **Step two and a half:** At this point, look at the model. Do the two pupil lines match in thickness? Do they both cross their respective eyes at about the center? If not, repeat step one (slobbering white across the face) and try again. Sometimes I nail it on the first go, but quite often I end taking two or three tries at one or both eyes until I am happy. Trust me, it is worth redoing a few times; it isn't super easy, but it is a heck of a lot easier than trying to pinpoint dot an eye like you were doing before, no?
- **Step three -- the final step:** Take your flesh color and a fine brush and slowly and carefully paint in around the eye, converting the model from a clown into a miniature with a really cool face. Note that if you get too much flesh in too close to the eye and they end up looking like they are squinting, or cockeyed or something, repeat step one. This is why I urge slowly painting in the flesh, because you can always add more paint, but you can't take it away.

Paint Subtractively

This fact brings me to my second technique. As I just noted, painting is fundamentally additive; you are always adding paint to the model. However, you can do amazing things while painting to accomplish the subtractive, that is, taking something away by adding something else. Clown Eye Technique is one example, but it is easy to generalize. Suppose you want to paint gold buttons on a model's coat, but every time you try to dot in the button, it blops funny and comes out poorly. No problem. After blopping in the buttons, take the coat color and hedge in around the fat buttons until

they are the right size. Want to paint thin black lines on a model's shield so you can make some heraldic device or something? Sure, start by trying to paint a nice thin line, but if you are a klutz like me, it is going to curve a little, and be wider in places. Again, no problem. Take the background color of the shield and subtract away the wide places.

Paint from the Inside Out

My third and final technique suggestion has to do with the order in which things are done. Most painting guides (and most people's intuition) suggest that you ought to do big things first and details last. This sounds nice, but how many times have accidentally slopped paint on a model's arm or the side of their shield while tying to brush past it on the way to detail a belt buckle or some other interior detail?

Think about it for a minute -- why do details last? Well, the only good reason I can think of is so that you don't accidentally slop up something you spent time and energy detailing while you are doing more "coarse" or bigger area painting. This is a reasonable logic as far as it goes, but I propose a different application of that same logic: Always paint from the inside out. Start with the areas closest to the model's "skin" and the areas that are toward the "center" and perhaps partially concealed by other body parts, or costume, etc. If you do this, you don't risk moving a wet brush past an area that is already "done" and klutzily screwing it up. Now, if all the details happen to be on the very outside of the model (weapon details, interesting squiggles on the model's armored shoulders, etc.) then you may well end up doing your details last, but you'll be doing it for a reason, and you will find that you are working less hard at painting and getting better results.

I hope that with these three techniques and some practice and patience you'll be well on your way toward painting miniatures that, when you pull them out of the box to play at a con, other people will be impressed with how good (or at least decent) they look.

Miscellanea II

I'm still unpacking. I don't have a working kitchen sink. I cannot cook without one. It is sad.

Anyway, here's five goodies I've (re)discovered from my unpacking phase. Not that any of you should be particularly interested, but what the heck. . .

- *Harry Anderson's Games You Can't Lose* by Harry Anderson and Turk Pipkin. This (out of print) book from 1989 is a great resource and reference for any would-be con man character. What is the magic number for betting that two people in a room share the same birthday? (22.) How can your character play ten games of chess all at the same time and break even? (Play postal chess: White on boards 1-5, black on boards 6-10. Play white's move from board 1 on board 6, board 2 on board 7, etc. Then play black's move from board 6 on board 1. Repeat.) Even if you *know* all the tricks in this book, the writing style will have your character in a three-card-monte mood.
- **King Arthur Companion** by Phyllis Ann Karr for **Pendragon**. A wonderful companion to **GURPS Camelot**, this 1983 book is drier but more jam-packed for dealing with a historical Arthurian campaign. Complete with map and timeline, this book is, in my mind, as complete (if somewhat inaccessible) a resource as can be hoped for.
- My Viewmaster, from Tyco. <Ka-shunk!> <Ka-shunk!> From dinosaurs to Tron, the Viewmaster is a great prop for a myriad of situations. Virtual Adept focus, **Changeling** bunk, strange time portal to eras past. . . like dinosaurs or the Mighty Morphing Power Rangers. What fun!
- The *Beetlejuice* soundtrack, by Danny Elfman. I spent the better part of a year looking for this soundtrack, only to learn I already *had* a copy. Weird. Anyway, I can highly recommend any of the Danny Elfman soundtracks, though the less memorable ones are probably best. I can recommend *Music for a Darkened Theatre Volume 1*, which is a sort of "best of" for Elfman. (I don't know about *Volume 2*, since I don't have it.)
- *The Official Prisoner Companion* by Matthew White & Jaffer Ali. This is a wonderful guide to a neat show, and a great companion to **GURPS Prisoner**. I've flipped through it in the past when I needed adventure ideas (twice I've begun campaigns in idyllic but sinister "prisons"). (As an aside, I'm ashamed to admit I haven't seen as much of *The Prisoner* as I might like. . . but I understand a full DVD set is being released in England this week, and a partial set is scheduled for release in October here.)

Well, that should give you an idea what sinister secrets lurk in my unopened boxes. . . and what I'll draw inspiration from when I'm stuck for adventures or column ideas. Be very afraid.

* * *

Between the troubles Steve is having with Apple and my problems getting my sink fixed, I just realized. . . is there any better villain then a bureaucracy? What would James Bond *do* against a bureaucracy? ("Q, I need that gadget now." "Certainly, Bond. . . just fill out this paperwork.")

* * *

Okay; this week is the catalyst for something a little different with the ol' reviews. First off, you may have noticed that this is an all **D&D 3rd** Week (or, perhaps more correctly, a **d20** week) with our reviews.

But what you haven't noticed is something we haven't done yet. (Unless you're a Psychic Friend and can see the future, in which case I need a lottery ticket.) I'm curious to liven things up a bit with the reviews, and so to that end I'm interested in running "second opinions" on some high-profile products.

Here's how it works:

- You read a review of a product. You disagree with the review, OR you have some insight to add.
- You send me a short proposal to pyramid@sjgames.com briefly saying what you want to talk about. (For example: "The review of *Otter: The Frolicking 2nd Edition* was obviously written by someone who hadn't

played the game, but only read the book. I'd like to talk about how the game actually plays." or "I was a huge fan of **O:tF 1st Edition**, and would like to review it from the viewpoint of a disillusioned fan." or "The review of **O:tF 2nd Ed** completely failed to discuss how it adds to the entire *Mundo de las Criaturas*, and greatly strengthens the entire line." (Or some combination of all of these!)

- I e-mail back with a yes or no.
- You have two days from the time I write back to write the addendum review.
- I (hopefully) accept your review.
- Bam! You're in the magazine.

Now, with these "follow-up" reviews, you can freely access and "argue" with the other review. *Please* don't duplicate information from the other review; I can put a link to the other review at the beginning. Thus you don't need to say that Chapter One is character creation, Chapter Two details campaign information, etc. Just tell us how you disagree with the earlier review(s). Oh, and obviously limit critiques to the matter of the review; don't make attacks against the writer.

Above all, these secondary reviews need to be interesting. While "normal" reviews can be a bit dry (though I prefer they not be), these follow-up reviews need to have a bit more flair. In particular I think of movie reviewers I like; ideally, even if I never *see* the movie in question, I still get something interesting out of a good review.

For starters these follow-up reviews (I'm still trying to come up with a catchy name) will be limited to "big ticket" items; for the coming months it looks like that will mean **D&D 3rd Players Handbook** and **Dungeon Masters Guide**. (I don't think enough people *really* care about a second opinion for a random non-essential supplement for a mildly popular game.) But if a review sparks something in you, jot me a line. . . worst I can say is "no." (Unless you're like my friend and GM Dennis, who *still* hasn't subscribed. . . then the worst case I can do is publicly scorn. <SCORN> Subscribe, Dennis! **SUBSCRIBE!** </SCORN>)

So. . . that's my idea for reviews. I'm curious to see how it works out.

* * *

I've been meaning to mention: my column "Mile 333.3" received a total rating of 3.33.

Fnord.

-- Steven Marsh

* * *

Last week's answer: **Champions in 3-D**, p. 160.

(One star)

> "*By the Hoary Hosts of Hoggoth*
> *And by Ymir's frozen sea,*
> *I invoke the flames of Faltine*
> *To produce a cup of tea.*

"Mmm, that's hot. Calling on extradimensional beings for a cup of tea is like using a bazooka to kill roaches. . . ."

Pyramid Review

Dungeons & Dragons 3rd Edition

Published by [Wizards of the Coast](#)

Written by Jonathan Tweet, Monte Cook, and Skip Williams

300 pages and Demo CD-Rom; $19.95

(Editor's note: make sure you read this week's [Random Thought Table](#) for information about reviews of this product.)

* * *

Consider the following statement: *Gravity's Rainbow* is a better book than *Hollywood Wives*. It may be completely true, but it doesn't say much about the quality of *Gravity's Rainbow*. By the same token, **Dungeons and Dragons 3rd Edition** is better than **Advanced Dungeons & Dragons 2nd Edition**.

Don't get me wrong. There's a lot to like about **Dungeons and Dragons 3rd Edition** as seen in the **Player's Handbook**. The new artwork is gorgeous and evocative, and in the 286 pages of the main rulebook there's a lot of well-written and tightly-packed rules.

There are over 100 pages on character creation and another hundred-plus pages are devoted to spell lists. Immediately after the table of contents, the book begins telling you how to make a character. Six statistics are rolled on 4d6, with the lowest die dropped and the numbers assigned as you see fit. You choose a race, which will grant you certain abilities and raise one statistic by two points and lower another by two points (unless you play a half orc, in which case you get shafted by a +2 to strength and a -2 to both intelligence and charisma). The half-orc is the only "new" race, although it's really just a throwback to *1st Edition*, but halflings have also been changed a bit, making them less like hobbits and more like Kender from *Dragonlance*. I don't know why this change had to be made, but I preferred the hobbit clones. Much has also been made of the idea that monsters will be given full sets of statistics, so that they would be more like three-dimensional creatures and less like faceless sword-fodder. I have reservations that merely giving monsters the same statistics as characters will be enough; in the description of half orcs we learn that half-orcs who grow up with humans can be any alignment, but half orcs who grow up with orcs tend to be evil. So much for complex characterization.

All of the old classes are still around from **AD&D 2nd Edition**, with the Barbarian added into the core rules and a new class, the Sorceror, that is capable of casting wizard spells without formal training. In a change from previous additions of **AD&D**, any race may now be a member of any class, although some are easier than others. Multiclassing is now as easy as saying "I want to learn a new class this level." There are, however, some experience penalties for spreading yourself too thinly.

When a character is created, each of the six statistics generates a bonus number, ranging from -5 to +5. These bonuses affect skills and combat (which is now just another sort of skill use). The old system of nonweapon proficiencies has been scrapped in favor of a genuinely workable skill system in which natural ability is actually supplanted by skill as experience is gained. Skill use is resolved by rolling a d20 and adding your character's skill and any modifiers to beat a target number. It's quick, easy, and intuitive. This new system comes up short when it comes to combat, however. Skill in combat is still a measure mostly of level. As you increase in level, you automatically become better in combat. You can use feats, which are gained every 3rd level, to increase your skill with weapons slightly more quickly than

normal, but you can't choose to advance in combat skills more slowly.

The combat system is notable mostly for changing the way Armor Class works and the way critical hits work. Armor Class still starts at 10 and is still modified by your dexterity and armor, but now it counts upward. To hit someone, you need to roll higher than his Armor Class. Critical hits are now varied depending on the weapon. Some weapons get critical strikes on only a natural 20, others on a 19 or 20, or on an 18, 19 or 20. A critical hit might do double or triple damage, depending on the weapon, making it possible to create more meaningful differences between weapons. The concept that the best way to avoid being hit is to put on the heaviest armor you can find is still implicit in the system, as is the idea that a character gains hit points with experience and can keep fighting at full strength until he's dying. Also, the Star Wars design team seems to have infected the D&D design team; in the weapons list there's not only a two-bladed sword, like Darth Maul's lightsaber, there's also a two-bladed axe that looks like a Klingon weapon, a two-headed flail that looks like a good way to hurt yourself badly, and a hammer with a pick on the other end that looks like when you swing the hammer part at someone you'll bury the pick part of the thing in your own wrist.

The number of spells that can be cast by wizards has been increased, although the old problem of spell memorization has not been fixed so much as hand-waved away. In older editions of *AD&D*, a wizard had to plan ahead to memorize spells that, once cast, were forgotten. Now memorization has been replaced with preparation. In essence, you start casting the spell beforehand, but then stop most of the way through and wait until you need it to fire it off to finish casting. This solves neither the problem of needing to guess which spells you will need later nor the restriction on the number of spells cast per day (is it possible to bar the door and wait until the wizard prepares or memorizes Magic Missle again?). By contrast, sorcerors, who cast the same spells, do not prepare their spells beforehand, yet take no more time to cast them. Clerics are able to drop prepared spells in favor of cure spells, but must still prepare spells beforehand. If divine spells are granted by the gods why do they need to be prepared like wizard spells, which supposedly operate on different principles?

At the end of the book is a small series of appendices talking about awarding experience, creating magic items, and giving a small list of monsters. It was nice of WotC to include some rules for actually playing the game, since their business plan, which has always been incomprehensible to me, calls for them to not actually release the real rules on such things until September and October. It would have been nicer if they had included rules that were known to be the finished product, rather than including a disclaimer that the rules are merely summaries of the actual rules, which are subject to change in between the release of the *Player's Handbook* and the *Dungeon Master's Guide* anyway. There is also a CD-ROM which contains a character generation program. It's fun to play with, but fairly buggy, and I've had no luck trying to download the patch from WotC's website. It's only a demo anyway, with the real version to be released in 2001.

Dungeons and Dragons, in all its incarnations, has always had a reputation as a hack-and-slash game, substituting greater bonuses to hit for roleplaying. This reputation is not necessarily undeserved, nor is it refuted in this new edition. Roleplaying beyond the level of "I am Krunk the Barbarian" is not supported in the *Player's Handbook*. This is not to say that it's not possible to really get into character playing *D&D*, only that it's not supported. Instead of well over 200 pages of lists of cool abilities and spells and weapons to give your character, some space could have been devoted to creating a three-dimensional character or how to be a good player. Chapter 6, which is devoted to describing your character, is mostly about alignments, the gods of Greyhawk and how to determine a character's height, weight, and age.

Yes, the gods of Greyhawk are in the chapter on describing your character. Greyhawk is once again going to be the default setting for *D&D*, but I think this was an unnecessary inclusion in the *Player's Handbook*. There is no other setting information, but great care is taken to explain which god the bard class reveres and who the gnomes worship and on and on. The space used for that could have been used for an introduction to roleplaying for beginners or a section on how to tell Mom that you're not worshipping the mangoat. All we get in the way of an introduction to roleplaying is a few sentences after the character creation summary saying some people in the game play characters, one person is the gamemaster, and a list of around a dozen things you might do in the game. As a game which is intended to bring new players into the hobby, with less than a quarter of a page devoted to explaining roleplaying and a couple of hundred pages devoted just to character creation, *D&D 3rd Edition* isn't doing much to make them feel welcome.

The goal of the latest edition of **Dungeons & Dragons** is to both draw new players into the hobby and draw gamers who have strayed from **D&D** over the years back to the game. It's certainly good enough that disillusioned ex-**D&D** players might want to take a look at it. For new gamers the only thing going for it is the name and Hasbro's advertising money.

Compare **D&D 3rd Edition** to two other games I'd recommend for beginning gamers, **Feng Shui** and **Fading Suns**. **D&D 3rd Edition** requires at least one player, the GM, to get three books at $20 each for the next three months. **Feng Shui** and **Fading Suns** need only one book, priced at $30 or $35, respectively. Character creation for **D&D 3rd Edition** is a lengthy process, encompassing hundreds of pages of information. **Feng Shui** uses a template system that can get players ready to play in as little as five minutes. **Fading Suns** has a complex system for character creation, but also incorporates a series of templates that can generate a complete character with a believable history in twenty or thirty minutes. **Fading Suns** and **Feng Shui** both have detailed settings in the core rulebook. **Dungeons & Dragons** has a default setting, but it's not explained in the **PHB** beyond the gods of Greyhawk. **Dungeons & Dragons** may have a lower entry cost for the player, with the PHB costing only $20 as opposed to the higher price tags for games like **Feng Shui** or **Fading Suns**, but experience has shown that few **D&D** players settle for just the **Player's Handbook**. Everyone I know who plays **AD&D** has at least the three core books, and usually more. Once you add in the inevitable game world supplements, **D&D 3rd Edition**'s entry cost will be no less than any other game; it will just take longer to buy the essentials.

I've quipped before that **D&D 3rd Edition** would be the best game of 1987. I may revise the statement, but not the underlying sentiment. **D&D 3rd Edition** is the best game made to date that still uses concepts like class, level and alignment. It's not the best game that could be made with those concepts, however. More attention could have been paid to roleplaying and less to gaining new powers. As it stands, **D&D** has a more advanced system than ever, and it's a huge leap forward from **AD&D 2nd Edition**, but it can't seem to escape its wargaming roots.

-- Kevin Mowery

Saints Preserve Us!

by James Maliszewski

Art by Michael Harmon

The Middle Ages remain a popular setting for fantasy roleplaying games in part because they present a world that is both familiar and alien. While the people and the landscapes are recognizable to us, much of the worldview is not. Nowhere is this more evident than in matters of religion. The Middle Ages were paradoxically a time of both great piety and great superstition.

These two conflicting elements come together powerfully in popular devotions to the saints. To the medieval mind, directly approaching an individual of higher station than oneself (like a king or a nobleman) was unthinkable. Intercessors and mediators were thus a common element of their society. The saints played the same role with regard to God. In some cases, the cults of certain saints almost became religions in themselves!

For that reason, the cults of the saints should hold great interest for anyone running a game set in the Middle Ages, or in a medieval derived setting. This article presents basic information on a half dozen of the most popular saints of the Middle Ages. For the most part, these saints no longer occupy as prominent a place in the spiritual imagination as they did in medieval times. In the case of four of them, the Church no longer even recognizes the saints as historical personages. However, as noted above, this is part of the charm of the period: experiencing a world that's at once familiar and alien. As these saints show, the Middle Ages were a time with concerns often different from our own.

Included with each saint is a short adventure seed employing the accompanying information. The seeds are purposefully generic, so as to allow a Game Master to employ them in the game of his choosing, whether it be *Ars Magica*, *Pendragon*, *Vampire: The Dark Ages*, *GURPS Fantasy*, or another game.

Barbara

Barbara was a virgin and martyr. Veneration of her was common from the seventh century onward. At about this date there were in existence legendary Acts of her martyrdom which were inserted in the collection of Symeon Metaphrastes and were used as well by the authors of the enlarged martyrologies composed during the ninth century in Western Europe. According to these narratives, Barbara was the daughter of a wealthy pagan named Dioscorus. Dioscurus kept Barbara locked in a tower to protect her fom the outside world. Despite this, many young men wished to marry her, but she rebuffed them all.

Before going on a journey, Dioscurus commanded that a bathhouse be erected for her use near her tower. During his absence Barbara had three windows put in it -- in honor of the Holy Trinity -- instead of the two originally intended. When her father returned, she pronounced herself a Christian. Greatly upset, her father brought her before the prefect of the province, Martinianus, who cruelly tortured her and condemned her to death by beheading. Dioscurus himself carried out the death-sentence, but in punishment he was struck by lightning on the way home and his body consumed. Another Christian named Juliana suffered the death of a martyr along with Barbara. A pious man called Valentinus buried the bodies of both martyrs. At their grave, the sick were healed and the pilgrims who came to pray received aid and consolation.

The traditions vary as to the place of martyrdom. Some legends make Heliopolis in Egypt the site of the martyrdom, while other accounts give Nicomedia, Rome, or Tuscany. In any case, it is certain that before the ninth century she was venerated both in the East and in the West, and was very popular with the common people, especially in France. The legend that her father was struck by lightning caused her to be regarded as the patron saint in time of danger from

thunderstorms and fire and -- by analogy -- as the protector of gunners and miners. She was also called upon as intercessor to assure the receiving of the Sacraments of Penance and Holy Eucharist at the hour of death.

In the Greek and Roman calendars, her feast falls on December 4th, while the martyrologies on the ninth century place it on December 16th. St. Barbara has often been depicted in art; she is usually represented standing in a tower with three windows, carrying the palm of a martyr in her hand. Often she also holds a chalice and a host. In other representations, cannons can be found near her as well.

Adventure Seed: Praise the Lord and Pass the Ammunition

The characters make the acquaintance of an artillerist seeking to improve the design of his cannons. He enlists the characters' aid in his researches -- including "hands on" tests. However, the artillerist possesses a relic of St. Barbara, which he believes will protect the characters from harm. Whether it will actually do so and the extent of his researches are best determined by the GM.

Catherine of Alexandria

Catherine was a virgin and martyr whose feast is celebrated in the Western church (and in some Eastern churches) on November 25th. Born to noble parents and well-educated, at the age of eighteen Catherine presented herself to the Roman emperor Maximinus, whom she censured for his persecution of Christians. Astounded at the her audacity, Maximinus detained her in his palace and summoned philosophers to use their sophistry to refute Catherine's arguments. Nevertheless, the young woman emerged victorious after hours of debate.

Several of the philosophers were impressed with her words, declared themselves Christians, and were immediately executed. Furious, Maximinus ordered Catherine scourged and then imprisoned her. Meanwhile, the empress, eager to see Catherine, went with Porphyry, commander of the legions, to visit her in prison. They, too, were converted by her words and executed by Maximinus. While in captivity, Catherine converted many others as well. The emperor ordered her put to death on the wheel, but, at her touch, the instrument of torture was miraculously destroyed. Now enraged beyond all measure, Maximinus could take no more. She was beheaded and milk flowed from her severed neck instead of blood. God sent angels to carry her body to Mount Sinai where a church and monastery would later be built in her name.

One of the "Fourteen Holy Helpers," Catherine was regularly praised by preachers and lauded by poets. In many countries her feast was celebrated with great solemnity. Manual labor was forbidden and great numbers of people attended her devotions. In several dioceses of France, her feast was considered a holy day of obligation. The splendor of its liturgies eclipsed that of the feasts of even some of the Apostles! Innumerable chapels were given to her and her statue was found in nearly all churches, including a wheel, the instrument of her torture. St. Catherine became the patron of young women, female students, and nurses.

The spiked wheel became St. Catherine's symbol. Thus, millers, spinners and wheelwrights placed themselves under her patronage. Because she triumphed against the sophists in debate, theologians, apologists, pulpit orators, and philosophers sought her intercession. Before studying, writing, or preaching, they asked her to illuminate their minds, guide their pens, and impart eloquence to their words. Devotion to St. Catherine, which assumed great popularity in Europe due to efforts of the Crusaders, received additional celebrity in France at the beginning of the fifteenth century. At that time, she appeared to Joan of Arc and, together with St. Margaret, had been divinely appointed Joan's spiritual adviser.

Adventure Seed: Catherine's Daughter

Word spreads of a remarkably thoughtful and intelligent young nobleman, who has begun to impress the local intelligentsia with her erudition. Although she is probably just a well-educated lady, some whisper that St. Catherine herself has provided her with divine illumination for a great task -- whatever that task may be. The characters may be sent by the Church to investigate these tales or might be persuaded to join in the young woman's undertaking.

Julian the Hospitaller

Although completely mythical, Julian was a very popular saint in the Middle Ages. His legend describes him as a young nobleman. One day, while hunting, he came upon a hart that said, "You are hunting me, but you will kill your father and mother." To avoid this dire fate, he fled his country and entered the service of a foreign king. So successful was Julian that the king knighted him and gave him a rich widow in marriage.

Julian's mother and father eventually sought him out and came to his home in the foreign land. When they did so, Julian was away from his home, but his wife welcomed them with open arms. She even offered them her bed in which to sleep. Julian returned the next day and entered his bedroom. Upon seeing a man and a woman asleep in his bed, he assumed his wife had committed adultery. He then killed both his mother and father while they slept.

Soon thereafter, Julian met his wife and realized he had made a grave error. Overcome with grief, he sold his possessions and left the foreign country, along with his wife. In time, he came to a river crossing and used his wealth to build a hospital for the poor. One day, Julian rescued a traveler nearly dead with cold and offered him his own bed in which to recover. The traveler died and Julian saw him ascend into heaven, saying, "Julian, Our Lord has sent me to you and He has accepted your penance." At that, both Julian and his wife died as well.

Many hospitals were dedicated to his honor, particularly in the Netherlands. He became known as the patron of innkeepers, boatmen, and travelers. Many trade guilds held him in high regard and created works of art in his memory. The cathedrals of both Rouen and Chartres include magnificent stained glass windows depicting his legend.

Adventure Seed: Hôtel-Dieu

The characters find themselves in dire need of assistance and turn to a hospital dedicated to St. Julian. While there, they may learn more of his legend and those who've devoted their lives to the care of the poor. This seed provides a nice counterpoint to the "oppressive Church" that is common in many settings.

Margaret of Antioch

Like both Barbara and Catherine, Margaret is a virgin and martyr. She is also sometimes called Marina, especially in the East. Living in Antioch, her father was a pagan priest. Margaret's mother died soon after her birth and a pious woman who lived outside the city nursed her. Under her nurse's influence, Margaret became a Christian, resulting in her father's disowning her. She then went to live with her nurse in the countryside.

One day, while watching the flocks of her adopted mother, Olybrius, governor of Antioch, caught sight of her and was moved by her beauty. Olybrius then sought to make Margaret his wife, but to no avail. When neither flattery nor threats of punishment convinced her, the governor had her brought before him at Antioch. Threatened with death unless she renounced the Christian faith, Margaret refused to venerate pagan idols. Olybrius then ordered her burned, but the flames failed to harm her. She was then bound hand and foot and thrown into a cauldron of boiling water, but her prayers broke the bonds and she escaped without injury. She was even swallowed by a dragon, but the creature's belly burst open, allowing her to escape. Finally, Olybrius ordered her beheaded.

The Eastern Church honors Margaret under the name Marina on July 13th, while the West does so on July 20th. St. Margaret is represented in art either as a shepherdess or as leading a chained dragon. In both cases, she frequently carries a little cross or girdle in her hand, or stands by cauldron like the one into which she was plunged. Relics said to belong to the saint are venerated in many parts of Europe, including Rome, Montefalcone, Brussels, Bruges, Paris, Froidmont, and Troyes. Ironically, this virgin was widely venerated as a special patron of pregnant women. In addition, numerous promises were associated with her. One such promise states that those who invoke her on their deathbeds will escape the clutches of demons. These and similar promises contributed greatly to her popularity.

Adventure Seed: Crown of Glory

The characters encounter a man obsessed with writing a new history of St. Margaret's martyrdom. A young and creative fellow, he believes that, by doing so, he will receive an unfading crown of glory in heaven -- as promised by the saint herself. The man might ask the characters to aid him in some way or his family might ask them to dissuade him from his obsession.

Martin of Tours

Martin was born at Sabaria, Pannonia (Hungary), around 316. In his early years, he accompanied his father, a military tribune, on his expeditions. When Martin reached adolescence, he enrolled in the Roman army. Consequently, Martin was greatly attracted to Christianity, which had been in favor among soldiers since the conversion of the emperor Constantine. His regiment was sent to Amiens in Gaul, and this town became the scene of the celebrated legend of the cloak. At the gates of the city, one very cold day, Martin met a shivering and half-naked beggar. Moved with compassion, he divided his coat into two parts and gave one to the poor man. The part kept by himself became a famous relic preserved in the oratory of the Frankish kings under the name of "St. Martin's cloak" (cappella Sancti Martini) and is the origin of the word "chapel." Martin, who was still only a catechumen, soon received baptism, and was a little later freed from military service.

Saints Preserve Us!

He hastened to Poitiers to join the disciples of St. Hilary, a bishop whose reputation as a theologian was already passing beyond the frontiers of Gaul. Desiring to see his parents again, he returned to Lombardy across the Alps. The inhabitants of this region were Arians and were bitterly hostile towards Catholicism. Thus, Martin, who did not conceal his faith, was very badly treated by order of Bishop Auxentius of Milan, the leader of the heretical sect in Italy. Martin desired to return to Gaul. However, upon learning the Arians troubled that province as well and had even exiled Hilary to the East, he sought shelter on the island of Gallinaria in the Tyrrhenian Sea.

Once Martin learned an imperial decree had authorized Hilary to return to Gaul, he joined him in Poitiers in 361. From Hilary, he obtained permission to again take up the solitary life that he had adopted in Gallinaria. Many others soon followed his example, forming a monastic community around him. This community later became the celebrated Benedictine Abbey of Ligugé. Martin remained there about ten years, but often left to preach in the central and western parts of Gaul. The memory of these apostolic journeys survived throughout the Middle Ages in the numerous local legends of which Martin is the hero and which indicate roughly the routes he followed.

When St. Lidorius, second Bishop of Tours, died in 371 or 372, the clergy of that city wanted Martin to replace him. However, Martin rejected that high office. Thus it was necessary to trick him to overcome his resistance. A certain Rusticius, a rich citizen of Tours, went and begged Martin to minister to his dying wife and prepare her for death. Without any suspicions, Martin gave in to his entreaty and accompanied him. Hardly had he entered the city when, in spite of the opposition of ecclesiastical dignitaries, popular acclamation made him become bishop of Tours.

Consecrated on July 4th, Martin did not, however, change his way of life. Fleeing the distractions of Tours, he settled in a small cell a short distance from city. Some other hermits joined him there, and thus was gradually formed a new monastery, which surpassed that of Ligugé, as is indicated by the name, Marmoutier (Majus Monasterium), which it has kept to our own day. Even so, he often left his diocese when he thought he might do some good. He even went to Trier, where the emperors had established their residence, to plead the interests of the Church or to ask pardon for some condemned person.

After a final visit to Rome, Martin went to Candes, a religious center in his diocese, where he was attacked by a malady that ended his life. Carried into the presbytery of the church, he died there in 397. The Church in France has always considered Martin one of the greatest saints, and hagiographers have recorded many miracles due to his intercession -- both while he was living and after his death. His cult was very popular throughout the Middle Ages. His body, taken to Tours, was enclosed in a stone sarcophagus, above which his successors built first a simple chapel and later a basilica. A larger basilica was constructed in 1014, which burned down in 1230 only to be rebuilt on a still larger scale. This sanctuary was a great center of pilgrimages. On November 11th, the feast of St. Martin is solemnly celebrated in this church in the presence of a large number of the faithful of Tours and other cities and villages of the diocese.

Adventure Seed: Saint-Chappelle

Whatever happened to the other part of Saint Martin's cloak? Some legends claim the poor man to whom he gave it was Christ in disguise. Others make him out to be a mere mortal. If the latter is true, the discovery of the relic might have profound religious significance -- especially to one of the many French towns that seeks to become a pilgrimage site associated with the saint.

Nicholas of Myra

Nicholas (also called Nicholas of Bari) was bishop of Myra in Asia Minor. Though he is one of the most popular saints in the East as well as the West, there is little historically certain about him except that he was a bishop in the fourth century. In the Middle Ages, he was believed to have been born at Parara, a city of Lycia. In his youth, he made a pilgrimage to Egypt and Palestine. Shortly after his return, he became Bishop of Myra. Nicholas was cast into prison during the persecution of Diocletian, but was released after the accession of Constantine, and was present at the Council of Nicea. In 1087, Italian merchants stole his body from Myra, bringing it to Bari in Italy.

The numerous miracles St. Nicholas was said to have wrought, both before and after his death, are outgrowths of a long tradition. There is reason to doubt his presence at Nicea, since his name is not mentioned in any of the old lists of bishops that attended this council. His cult in the Greek Church is old and especially popular in Russia.

As early as the sixth century the Byzantine emperor Justinian I built a church in his honor at Constantinople, and his name occurs in the liturgy ascribed to St. John Chrysostom. In Italy, his cult began with the translation of his relics to Bari. In Germany, it began during the reign of Otto II, probably because his wife Theophana was Greek. Over the centuries, St. Nicholas has not lessened in popularity. The following places honor him as patron: Greece, Russia, the Kingdom of Naples, Sicily, Lorraine, the Diocese of Liège, many cities in Italy, Germany, Austria and Belgium, as well as Campen in the Netherlands, Corfu in Greece, Freiburg in Switzerland and Moscow in Russia.

St. Nicholas had a great reputation as a thaumaturge, or "wonder worker." His alleged miracles are many, including the saving of three girls from a life of prostitution and the raising from the dead of three boys murdered by a butcher. He is the patron of children, sailors, unmarried girls, merchants, pawnbrokers, apothecaries, and perfume makers. In Germany, Switzerland and the Netherlands, he is considered the secret purveyor of gifts to children on 6 December, the day on which the Church celebrates his feast. His relics are still preserved in the church of San Nicola in Bari. An oily substance, known as the "manna of St. Nicholas," which is highly valued for its medicinal powers, is said to flow from them.

Adventure Seed: Divine Magic

In a setting in which magic is real, St. Nicholas might be viewed as the prototypical Christian mage. Characters seeking to emulate him might visit sites associated with the bishop in hopes of gaining his patronage. Alternately, evil-doers might attempt to obtain his relics for less noble reasons.

Conclusions

These six saints just scratch the surface of medieval popular religion. However, each illustrates nicely how the cults of the saints add a great deal to historical fantasy roleplaying games -- in terms of color, authenticity, and story possibilities. The saints played a central role in medieval religion; they should do the same in medieval fantasy campaigns.

by Joseph Goodman

Dynamite Bob has nerves of steel. Never mind that he's low down and good for nothing. He's a regular at the jailhouse and the father of 8 children in 9 counties (the train was moving at the time). But he's got nerves of steel, which is why they call him Dynamite Bob.

He spends his working hours contracted out to the mining companies. No one is exactly sure what he does in his spare time, but it's a proven fact he's blown up his barn four times now. Some people say it's just an excuse for a social event, seeing as how nobody in town would miss a barn raising. Others think something fishy is going on, but so far they don't have any proof.

If they'd just stay up a little later than usual tonight they'd have all the proof they could ever want. Dynamite Bob has been up to no good, in an especially dangerous sort of way. He's been experimenting with combinations of nitroglycerine and ghost rock, which with the right additives have so far produced dynamite sticks far more explosive than anything else in use. Worst of all, he's been selling these super-sticks to Black River.

Tonight a small cadre of Black River troops is on its way to pick up the latest shipment of dynamite. Trouble is, someone else got word of the deal and wants to stop the delivery. And Dynamite Bob is stuck in the middle.

Troops: The 200 point Black River force can be freely designed by the player as long as it includes at least two Demolitionists. The opposing force, also 200 points, can be from any other railway; it is advised that a few cannons be included, just for the booms. The only restriction is that the Bushwack ability may not be used by either force.

Dynamite Bob is also involved in the fight, and will be controlled by both players as described below.

Setup: The battle takes place under a full moon on Dynamite Bob's property. The house, barn, and sheds are set up in the center of the table, surrounded by a generous supply of barrels, crates, and oblivious livestock that can be used for cover.

Dynamite Bob

Deployment: Dynamite Bob begins outside the barn and the two opposing forces are set up along opposite edges.

Dynamite Bob: Dynamite Bob is confused as a dog in a fire hydrant factory. The night was scheduled to begin with a simple commercial exchange and now he has all sorts of trouble in his front yard.

Dynamite Bob isn't too happy about his property getting shot up. He's gone plumb loco (not that he was ever that

straight-shootin' to start with). Treat him as a gunman with a pistol and an unlimited supply of super-dooper dynamite sticks that cause twice the usual amount of damage (4d8). Each turn he should be dealt an action card as usual. On Spades or Clubs the Black River player controls him for this turn; on diamonds or hearts the other player controls him.

Troops killed by Bob do not yield bounty points for either side.

One more rule is suggested which makes the game a lot more fun. If you allow players to shoot at Bob, his role in the game ends real fast. So it is recommended that neither player be allowed to target Bob until Bob has attacked that player's troops.

The Buildings: Any model that ends an action segment within any building will have an unlimited supply of normal dynamite sticks for the rest of the game.

If the Boom! template so much as touches the barn, roll a d6. On a 4 or higher the barn blows up. Models inside the barn take 2d12 damage. Models within 3" of the barn edges take 2d8 damage. The resulting rubble covers the area of the barn and provides hard cover.

The same applies to the sheds and house but not quite so powerfully. They only blow if you roll a 6 on a d6.

One more house rule is advised, just to keep the game in line with the general principle of "You can't hit the broadside of a barn!" Any troop targeting a building will hit on any role except a natural 1.

Bonus: None.

Bounty Points: This battle doesn't end until one side is dead all the way around. There ain't no cavalry showing up in these parts. Therefore, bounty points are used exclusively for purchasing fate chips.

Multiple Players: This is a lot more fun with Dynamite Bob irrationally livid, but if there is a third player he could be given control of ol' D.B.

by Hans Rancke-Madsen

Art by Allen Nunisby

This adventure takes place in the Spinward Marches in the year 1117. It can start on any planet with a fair amount of interstellar traffic. The PCs are approached by a human male (of that indeterminate mixture of races sometimes referred to as "Imperial") with an apparent age of around 50. He gives the name of Solomon Thorov and offers them a high-paying job of, frankly, considerable risk. The exact approach and the negotiations must be adjusted by the GM to suit the players; Thorov won't go into too much detail until he is fairly confident that the PCs will take the job.

The Job

Thirty-three years ago, in 1084, during the 4th Frontier War, the Zhodani invaded Grant. At the time Grant was a thriving world mostly populated by Imperial humans and assimilated Vargr. During the ensuing battle the Zhodani released a biological warfare agent that caused the death of untold millions and forced the Imperial Navy to evacuate the survivors. After the war the IN began using the now-empty system for testing planetary bombardment weapons and put the whole system under interdict. Thorov represents a commercial organisation of considerable means (ie. a megacorporation) that suspects that the germ or virus would not have been tailored to last forever. If this is true and if it can be proved, the organisation can squash any charges arising from the illegal entry into an interdicted system. The IN would be embarrased over having used a Terran-prime planet for bombardment tests and would be eager to cooperate. (By the same token, however, the IN would want to stop any investigations before they bore fruit if they learned of them too soon.) Furthermore, the organization would be very favorably situated to gain ownership of Grant, which would be worth many billions.

Thorov offers each PC Cr100,000 just for going to the planet and test the theory, regardless of results. Should the expedition eventually lead to the opening of Grant under the auspices of the corporation, each PC would further recieve a share in the venture worth Cr1,000,000. If they are caught and imprisoned, they will each recieve Cr25,000 per year they serve. Any human and Vargr PCs will additionally recieve another Cr100,000, since they will be at extra risk if the BW agent turns out to be active still. Thorov explains that the expedition will carry several terrestial test animals, including a chimpanzee, and makes it plain that if the test animals survive exposure to the planetary air, the PCs are expected to risk it too; live survivors will be of great value to the corporation.

Through unspecified sources Thorov is aware of the IN deployment schedules for Grant for the next few months and knows of a window of opportunity during which all IN vessels in the system will be on maneuvers in the outer asteroid belt. Thorov will furnish a small 200 T Free Trader and undertake to smuggle the PCs down on the planet. They will

be detected by surveillance sattelites, but they should have a minimum of 8 days to conduct their tests and get away before a navy ship can get there.

A library data check will produce the following information:

1607 Grant (Imperial) Red Zone

Starport: Class 0.
Diameter: 6,339 miles (10,200 km). *Atmosphere:* Standard oxygen-nitrogen. *Surface Water:* 41%. *Climate:* Normal. *Population:* No permanent residents. *Government:* None. *Control Rating:* None. *TL:* None.

Grant was a thriving world until it was depoplatated by a bio-warfare agent during the 4th Frontier War and turned into a naval test area for planetary bombardment weapons. It is rumored that some non-humans were left behind in the evacuation and that some still survive. The navy categorically denies this. The entire system is under interdict.

Referee's Information

As usual, things are not exactly as they appear. The Zhodani were not responsible for the release of Artificial Pathogen R-89-Y-9378, Series 8495; at least not directly. Imperial Research Station Beta, at that time located on Grant, was ostensibly dedicated to agricultural research; secretly a part of it was engaged in biological warfare research for the IN. A Zhodani strike team captured the research station and the local IN commandant panicked. In the ensuing battle security was breached and AP R-89-Y-9378/8495, an artificial organism lethal to Earth-descended mammals, was released into the air. Within a week millions had died; within a month the figure rose to tens of millions, not all from the pathogen but also from the ensuing panic and break-down of society; and within a year it had become hundreds of millions. The Navy did its best to evacuate the population, but the logistics of space travel and the necessity of quarantining the rescuees made it impossible to save more than a few tens of thousands humans and Vargr. Another few thousands belonging to other races did survive (though many had been killed in riots) and were likewise evacuated. The ensuing investigation was complicated by the fact that the covert research was a secret even from most of the Imperial Navy. Only a small segment of it, a since-defunct "Department of Dirty Tricks," knew of it and did their best to cover up. The best they could do was to get the planet completely evacuated, prevent an on-site investigation, and get the system temporarily interdicted. They were unable to arrange for the destruction of the on-planet evidence and eventually had to settle for getting the system made a test area for planetary bombardment weapons.

The patron could be any one of a number of different persons. The GM should select one of the options below and select one of the other options to represent a rival expedition (or more than one if he likes complications).

- A representative of a megacorporation, just as he represented himself. Note that this dosen't mean that the rival couldn't be the representative of another megacorporation.
- A Zhodani nobleman in disguise. Knowing for a fact that the Zhodani are not responsible for the terrible tragedy, he wants to expose the truth and remove the onus of genocide from his people. Or he may want to get his hand on the research material and take it back to the Consulate.
- The Count of Grant, a now-empty, but still existing, title borne by the son of the former count who died 33 years ago. The son was serving in the Navy at the time and thus survived. He is now a retired rear admiral and is tracking down some very vague rumors. He actually has a theoretical right to be on Grant and may be able to save his hirelings from charges of breaking the Interdict if they are caught after the fact, although he does not have the clout to flout the Interdict openly.
- A former member of the Exotic Inventions Evaluation Board, the aforementioned 'Department of Dirty Tricks,' now a retired vice admiral. Alarmed by echoes of inquiries into the IN ship deployment schedule for Grant or the nosings of a pesky journalist or rumors of the count's plans or the recent declassification of certain naval records, he has finally made up his mind to go to Grant and destroy all remaining evidence.

Other possibilities include a journalist on the track of a good story or a naval historian tracking down leads from some declassified papers. In these cases the patron would propably not offer so much money and if he did he could not pay up afterwards; the GM must adjust the initial job offer as appropiate. If the patron does represent a megacorporation then all promises will be kept; if he is on his own, the up-front money is propably all he can afford unless he has a very substantial private income.

Down on Grant

The PCs should constitute about half the expedition; the other half should be mostly scientific types with perhaps one or two bodyguards or faithful retainers for the patron. The patron himself will captain the ship. Once safely arrived on the planet he will turn his scientists loose on the biological tests and ask the PCs to locate the remains of the former Research Station Beta. (He won't make a point of it unless pressed, but he is the only one who knows the access codes to the ship's computer, and once down on the planet the PCs only options are to do as he says or hitch a ride with a passing Imperial Navy patrol.)

Grant is a medium-sized, Earth-like planet with standard atmosphere and 41% surface water. Strictly speaking the atmosphere ought to be coded as tainted, but since no IISS ship has been allowed access to Grant since the accident, the matter has been forgotten.

Conditions on Grant are downright eerie. Only bones remain of the many millions who died here thirty-three years ago. Dotted across the surface are areas that have been turned into lunar landscapes by planetary bombardments. The total percentage is not very large, but the total devastation is as disturbing in its own way as the empty cities are in theirs, and made even more poignant by the lush countryside that surrounds them. This was a beautiful, vibrant planet once.

The average tech level of Grant before the tragedy was 11. Three decades of neglect has caused many buildings and artifacts to crumble and decay, but some remain in reasonable order. About 10% of buildings and artifacts are in sufficiently good shape to require only a minimum of care to function properly (though the absence of power will preclude a number of functions no matter what). Another 20-30% may be restored with varying degree of effort. Much depends on the degree of exposure to the elements, of course. If in doubt, roll on the table below.

Die roll (2D)	Condition
7-	Broken beyond repair.
8	Major repairs needed. (1D days of work with special tools)
9	Medium repairs needed. (1D hours with adequate tools)
10	Minor repairs needed. (1D*10 minutes with improvised tools)
11	Minor adjustments needed. (1D minutes of fiddling)
12	Working, assuming any necessary power or loads are available.
13	Fully operational. (charged batteries or full load if appropiate)
14+	Pristine; could be sold as new.

DMs: Completely exposed to the elements: -3; partly exposed: -1; specifically protected: +1 to +3; sturdy equipment/construction: +1 to +3; particularly sensitive equipment/flimsy construction: -1 to -3.

Characters with an acquisitive streak will be able to find many nice trinkets left behind with the bones. The referee could include some grisly finds of mummified remains of hapless victims to suit the ghoulish nature of such activities.

Of special interest are the local computers. None of them are active, of course, and many of them never will be again. Almost all data storage was non-volatile, however, so with some ingenuity the PCs should be able to get any information they need. Eaxmining news bulletins from the first days of the epedemic, before everything broke down, would allow them to locate the epicenter. Another way to find the research station is to examine the records of the

Count of Grant's office or the Imperial Navy base (The patron can supply then-current Imperial passwords, both civilian and military). Remember that neither the Count nor the port admiral knew of the biological research part of RS Beta, but they did know of the station's existence and location. If all else fails, the PCs can spot the rival expedition and track it to the station.

The exact events on planet will depend on the particular roles the GM selects for the patron and for the rival expedition(s). Here are three possible complications:

* * *

The test animals will thrive in the beginning. This is logical, given the theory that the BW agent was a fully developed product used by the Zhodani; it's almost unbelievable that they would use something like that and not make sure that it would have a built-in expiration date. On the other hand, it is also difficult to believe that they would use something like that in the first place and that it would have had a programmed life of over a year, which is the current theory. Unfortunately the theory is wrong and AP R-89-Y-9378/8495 was not fully perfected. Over the years it has decreased considerably in virulence, but there are still patches of a mutated version lurking here and there. If the the decision is made to ditch the protective suits, the GM have three options: He can decide that someone will catch the disease, he can leave it up to a daily die roll for each character, or he can decide that no one catches anything.

If someone does catch the pathogen, he will initially feel no ill effects except for a slight fever. The expedition's scientists are alert for just such an incident, however, and tests will quickly establish that both he and whoever he has been in contact with is affected. The pathogen turns out to be an artificial construction combining the worst elements of germs and viruses and though the mutation evidently works a lot slower than the original, the infected persons are still under a death sentence in a few weeks.

Three possibilities of survival exists: finding a still active serum that will effect a cure in the research station, finding detailed specifications of the pathogen in the research station and have a major research lab find a cure (which would be a race against time), or treatment with massive doses of metabolics at a major hospital (which would still require a survival roll against HT).

* * *

The Scouts believe that a number of non-human/non-Vargr citizens were driven into hiding by the hysterical persecutions caused by the epidemic and left behind in the evacuation. (The Navy vehemently denied this.) How many (if any) were in fact left behind, and how many of those survive after thirty-three years is a matter of pure conjecture. The Scouts estimate that as many as twenty may still be alive. The GM may wish to introduce one of these survivors. After thirty-three years any such is bound to have been affected mentally. A crazy, but cunning, homicidal old Aslan or a berserk Virushi can liven up any otherwise dull day. . .

* * *

Eventually the Imperial Navy will enter the scene. The GM should throw a die each day after the 8th with a 50/50 chance that a patrol vessel will arrive in orbit. They will have observed how many ships have set down on the planet, but will not know exactly where they went down. They will start looking immediately, and surface travel by grav vehicle will become hazardous. As time goes by more and more ships will arrive (50% chance per day of another ship). Eventually they will find the ships unless they are completely powered down. As long as there is only one ship on patrol there's a good chance of waiting until it is on the other side of the planet and making a run for the 100 diameter limit and an even better chance of at least reaching the 10 diameter limit; if even one more ship arrive the chances go down drastically.

Future Developments

Whether any of the expeditions are caught by the Navy or not, the stir made by the affair will cause a reevaluation of the interdict. In 1119 it is lifted. On the same day, to everybody's surprise, the Scouts, backed by an order from Grand

Princess Iphegenia, impose a new interdict of their own on the planet itself. No explanation is forthcoming, but a few months later the Scouts set up a small orbital base to monitor the world. If the PCs have earned shares in a prospective "Grant Venture," they may be tempted to try and find out what secret agenda the Scouts are pursuing.

Pyramid Review

Unexpected Allies (for Legend of the Five Rings RPG)

Published by [AEG](#)

Compiled by Patrick Kapera and Ree Soesbee

$19.95, 128 pages

When I first picked up *Unexpected Allies*, I thought that it would merely be a collection of NPCs for the *Legend of the Five Rings RPG*. I was glad to be wrong. Starting off with a short story, "A Dark Path's Beginning," that helps give the GM a feel for the alien soil of Rogukan, the book breaks into methods for crafting villains for the *L5R* game.

This section not only covers crafting villains and how to portray them, but discusses the role of allies as well. While some of the advice is ingrained into the bones of older GMs, newer ones will find themselves nodding at the hidden nuggets of wisdom contained herein. How some foes may not be evil, but simply different, how honor, glory and loyalty may clash against one another as both friend and foe vie for the same object, and how to craft characters that the players will want to interact with.

For the game specifically, there are several new ancestors that players may take for the characters ranging from Akodo Samune, a brave bushi who protected the Emperor's children when Iuchiban invaded Otosan Uchi, to Otaku Kunami, a samurai-ko with amazing horse prowess.

There are tables for quick generation of quirks and motivations. How about a glutton who is a deep sleeper and is motivated by lust? Sounds like a modern politician to me!

One of the things I found out of place here was the section on Crime in the Emerald Empire. While I appreciate having this information in front of me, and was impressed that Koku and Spells can be forged, I had to ponder why this information wasn't saved for the upcoming *2nd Edition*, or the *GM's Survival Guide*. Ah well, perhaps the fine arts of piracy, kidnapping, and homicide could not wait.

Second two is the real meat of the book. There are forty-six characters for the GM to integrate into his campaign. Some are old hands that were first mentioned in the core *L5R* book, like the ronins Dairya and Ginawa, but most were fresh faces, at least to someone who doesn't play the card game!

The NPCs are broken down by clan: Crab, Crane, Dragon, Lion, Phoenix, Scorpion, Ronin, and Miscellaneous. The last group includes Hartuisun, a merchant of the Mantis Clan; Kitsune Kenjo, a member of the Fox Clan; and Shazaar, a Naga with belonging to the Chameleon Bloodline; among others. I was very pleased to see the inclusion of members of not only the Minor Clans, but also the Naga. The Ronin were a nice touch, but with the upcoming *Way of the Wolf* book coming out, perhaps they should have waited. After all, who knows what new advantages, disadvantages and techniques may make these ronin obsolete?

There are a nice range of character types here. While the majority of characters presented here are definitely warriors, there are a few spellcasters, including a Kuni Witch Hunter, and even a merchant and a heimin. It's good to see characters like Togashi Abekuni, an ise zumi, because these characters are rare and don't show up in play as often, and so players may be unaware of them. They make for a nice surprise when the party least expects it.

While I do not like the format, with each character taking up two sheets, I appreciate the ease of use. One page is a regular character sheet with all the important information filled out. Even the Mon of the clan is in the upper left hand corner. The second page has an illustration in the lower right hand corner, and the background story of the character. The only problem I have with some of the characters is that since I don't play the card game, I have no idea what the great destinies of some of the NPCs are. In some ways that's better, because it means I can do whatever I want with individuals like Dairya and Ginawa.

The art varies throughout the book. Some of the illustrations are right up there with the quality of the cover. The double page illo on 12-13 is one such picture. Other illustrations are merely adequate to convey the type of character being detailed.

Unexpected Allies is for two types of Game Masters. The first is the new GM who needs every edge he can get his hands on. The section on making NPCs is a useful tool that all GMs playing in the foreign lands of Rokugan should heed. The second type of GMs who needs this type of book are those without the time to detail out as many NPCs as they would like. The stats and types of characters can be easily reused with minimal fussing outside a name change.

Pyramid Review, Take 2

Dungeons & Dragons 3rd Edition

Published by Wizards of the Coast

Written by Jonathan Tweet, Monte Cook, and Skip Williams

300 pages and Demo CD-Rom; $19.95

Iron Ration(alization)s: How I Learned to Stop Worrying and Love D&D 3E

If you were to steal an experimental time machine and couldn't think of anything better to do with it than travel back to the summer of 1991 in order to annoy a younger me, here's a good opening line: "Hey, John! Guess what? In nine years you're going to be sending an angry letter to the editor of a gaming magazine begging him to let you defend *Dungeons & Dragons* against some guy who thinks its time has passed."

You see, August 1991 found me in thrall to White Wolf's recently released *Vampire: The Masquerade*. (Go easy on me, I was all of twenty years old.) An anthropology major and a serious Anne Rice geek, I was thrilled by the Wolfies' cutting-edge vision of roleplaying game as monomyth, as Jungian psychodrama, as story. "Fie on your musty old critical hit tables," I was wont to cry. "Give me emotional nuance and thematic intensity!"

Age works strange turns upon us all. And so it is, that nine years later, I found myself firing off an irritable e-mail to [Steven Marsh](#) demanding a chance to rebut *Pyramid*'s recent review of the ***[Dungeons & Dragons Third Edition Player's Handbook](#)***. Fortunately for my wife, who would otherwise be subjected to endless harangues on the subject, he acquiesced.

Here goes. Sorry, college-age me.

I have read and reread that review in the [August 18, 2000](#) issue of Pyramid, and cannot help but think it misses the point somewhat. Consider that review's closing sentence, which clucks disapprovingly that *D&D* "can't seem to escape its wargaming roots." Horrors!

While the roleplaying game genre has of late undergone a healthy explosion of formal experimentation, leading to products as diverse as the surreal, minimalist *Puppetland*, the freeform, imagist *Everway*, and the wonderfully gritty, postmodern *Unknown Armies*, there is no reason why good old high fantasy *Dungeons & Dragons*, with its old-school tactical approach to mapping and exploring dungeons before cleansing them of beasties terrible and strange, cannot still offer delights to both novice and experienced players.

Newsflash: not all roleplayers dislike "hack and slash," and adherence to wargaming roots isn't *de facto* a sin. If stat bonuses and levels and miniature dungeons peopled with miniature, um, people aren't your bag of chips, that's fine. But a reviewer's personal distaste for that style of play, however valid an opinion, doesn't mean that a roleplaying

game with wargaming elements is automatically a dud.

I'd especially like to address the issue of what enticements third-edition *Dungeons & Dragons* holds for newbie players, since *Pyramid*'s review specifically questions whether the new *Player's Handbook* has anything to offer them.

Not all new players are young sprouts, but a lot of them are. And for these preteen hobby-gamers, the revised *Dungeons & Dragons* is a lovely gateway product precisely because of its somewhat old-fashioned approach to RPG's, an approach which wears its board/war/card game roots on its sleeve. Consider, for instance, the enormous number of preteen and teenage players of Games Workshop's *Warhammer* line of games. Some of those require mathematical calculation and the memorization of complex rules of play fully as much as the new *Player's Handbook*. If you want a more two-dimensional example, *Magic: The Gathering*'s numerous exceptions and constantly mutating rules don't seem to trouble the pre-college set one whit. Sociologists and psychologists who study kids' play behavior have observed time and again that kids like rules, that their preferred play style is often highly legalistic and technical. I caught the *AD&D* bug at age eight, and while I didn't use every rule (who does, at any age?), I certainly didn't find the first edition of the game especially daunting. Furthermore, as *Pyramid*'s original review acknowledges, the third edition of *D&D* is considerably more straightforward than its ancestors.

A rules-heavy approach to roleplaying doesn't need to -- and shouldn't -- imply complex, convoluted mechanics, and the first two editions of *D&D* (or *AD&D*) have been rightly criticized on this score. In older iterations of the game, everything from the numerical rating of armor class, the number needed to hit a particular enemy target, the number needed to make a saving throw, and the number needed to open a stuck gate required a different set of calculations. This idiosyncratic approach obviously didn't bother many players (old and new), since the *Dungeons & Dragons* line has always been a top seller. However, in the third edition *Player's Handbook* Jonathan Tweet and his design team wisely address the game engine's inconsistency by instituting a system of regular attribute bonuses that affect just about every action a player might want to take in precisely the same way.

Want to tag a gnoll with a crossbow bolt? Resist damage from a poisoned dagger? Charm an innkeeper with a song? You make exactly the same sort of roll for each action, applying bonuses identically in each case. Most impressively, the new *D&D* designers managed to achieve this streamlining without jettisoning the most solid and familiar aspects of the game: its six attributes, its spell mechanics, its roster of archetypal classes and races, and its emphasis on exploration, planning, and combat.

A full-blown new skill system is probably the most dramatic alteration of the old *D&D* ruleset, but it dovetails nicely with the familiar mechanics and doesn't feel too tacked-on. The skill rules are, in fact, a sterling example of how seamlessly the *Player's Handbook* weaves new rules and approaches into the matrix of older ones.

Visually as well, the new *Player's Handbook* is a treat. The bargain-hunter in me enjoys knowing each time I crack it open that Wizards must be losing money bigtime: after all, twenty dollars for three hundred high-gloss, full-color, hard-bound pages? The art is fetching, the layout of text on each page lucid, and the organization of the whole pleasingly sensible. Unlike some of the older *AD&D* books, the new *Player's Handbook* can be read from start to finish with minimal headaches and genuine pleasure in the quality of the prose and the illustration.

Now *Dungeons & Dragons* is even more accessible, both to the curious novice and the weathered grognard who has moved on to other worlds but thinks he might want to return to the game of his youth. The *Pyramid* review seems to suggest, though, that the new *D&D* didn't go far enough, didn't junk the minis-and-hex-maps approach altogether and join newer, more sophisticated products in their emphasis on character development and narrative structure over +3 longswords, Otto's Irresistible Dance, and the ubiquitous 50' length of rope. The changes are nice, the review implies, but not enough to compete in a more urbane, enlightened RPG market that wants character and themes, not rules and tables. And certainly not radical enough to create a game that is truly approachable for new players.

I'm an old-timer now, so it's hard for me to recollect without the taint of nostalgia. But in order to imagine what the new Player's Handbook must be like for brand-new converts to the hobby, all I have to do is a little time-traveling of my own, all the way back to 1980, when the AD&D handbooks seemed more arcane than any wizard's tomes. They were packed with dense, crabbed text, suffered from horrible organization, and were written in a style I can only refer to as Gygaxian -- lots of arch syntax and fancy vocabulary. And they were expensive, much more so relative to their

time than the new books.

I didn't care; I loved 'em. Loved 'em, read 'em, and learned 'em backwards and forwards. And I wasn't alone. Even after scads of new product, much of it hipper, poured into the hobby gaming marketplace, thousands of kids like me still chose to cut their teeth on *Dungeons & Dragons*.

In retrospect, I'm convinced that I loved the old books precisely because they were complex and meaty, because they were packed with character classes -- one of the initial review's more inscrutable criticisms of the new *Player's Handbook* is that it devotes a hundred-odd pages to character creation -- along with endless lists of spells and magical artifacts. I loved the books because they were grown-up. Because they were mysterious. Because some of them had pictures of scarcely-clad women in them (or scarcely-clad men, if your taste ran in that direction). And because they didn't talk down.

If I were an adult who'd never roleplayed, I'd feel even more patronized by a game that sought to oversimplify everything. *Dungeons & Dragons* may overstructure certain parts of the roleplaying experience, such as character creation and magic use, but at least it does so in a way that allows a rich feast of options within that framework: lots of races, lots of classes, lots of spells.

As I've said, I'm all for streamlining, simplifying, and clarifying when needed, and one of the best things about Messrs. Tweet et alles' rehaul of the old game engine is its clear, logical presentation. But one can go too far: Anyone remember *DragonStrike*!? It was one of TSR's many watered-down entry-level *D&D* products, and it tanked. Fast. I think it failed precisely because the people who wanted to roleplay, who tend to be a bit more intelligent and imaginative than the norm anyway, cut to the chase and went straight to *AD&D*. (By the way, if you ever get a chance to pick up a copy of *DragonStrike!* for cheap, as my wife and I did, by all means do. The hilarious "how to roleplay" videotape alone is worth the price of admission, and has inspired some memorable drinking games among our circle of friends.)

I suspect that if I were a creative, bookish eight-year-old today, I'd crave the new *Player's Handbook* just as much as I lusted after the first edition twenty years ago. In fact, I think I'd want it more, because Wizards of the Coast has done a bang-up job of ramping up the kewlness quotient of the new game: "You mean my druid starts out with a pet wolf? Kewl!"; "You mean my barbarian can go into a berserker rage like Wolverine from *X-Men*? Kewl!" The art, as *Pyramid*'s reviewer observes, supports the wow factor as well. All these bells and whistles, wedded to a cleaner, faster system, are what will make new players want to roll up alter-egos and start smacking orcs. New players, particularly kids, don't want pabulum. They want a wide assortment of fruit flavors, with mouth-fizzing action thrown in for good measure.

Clarifying and streamlining are worthy goals for the *Dungeons & Dragons* property. Throwing away the gloriously straightforward approach to roleplaying that characterizes the game, or vetting it of the capacious tactical options it offers players, as some seem to wish the new edition had done, are not. I'm reminded of a certain proverb about babies and bathwater -- *D&D* is what it is, and while it can certainly be a better *D&D*, expecting the third edition of the game to suddenly resemble a narratively sophisticated, rules-light game like *Castle Falkenstein* or *Vampire* is fatuous.

In fact, I would argue that the more conceptually (as opposed to statistically) sophisticated a game is, the harder it is for most newbies. High-concept hooks like *D&D* (it's just like *Lord of the Rings*! Or *Warhammer*! Or *Magic*!) and *Deadlands* (zombie Cowboys and Indians!) almost always provide a better point of entry than low-concept, narratively intricate properties like, say, *Fading Suns* (um, it's a sort of allegory for the Dark Ages, only set far in the future, with the gradual dimming of the stars as a metaphor for the dangers of mankind's hubris and ignorance, and there are demons and psi powers and weird horselike aliens that have sex with decadent nobles and. . .).

Storytelling and characterization are in some ways much harder aspects of the roleplaying hobby for many new players; lots of novice GM's would go mad trying to run an Everway campaign simply because the rules are too simple -- simple to the point of maddening abstraction for anyone new to RPG's. Newcomers can roleplay, but they often do so most comfortably in the context of the sort of precise rules and stats that the Player's Handbook supplies; I may not know my character's relationship history from adolescence up, but I know he's a fighter, so he must be brave. I know

he's a half-orc, so he must be crude. I know he's got a low Intelligence, so he must speak like a caveman. And bang! I'm off and running. Depth comes later, once I've got my legs under me.

I should add at this point that there is nothing in the new Player's Handbook actively preventing character development or multilayered storytelling. I agree with Pyramid's reviewer that the new game doesn't seem to emphasize these facets of the RPG experience, but am not sure that this omission isn't a canny one. New players can concentrate first on the logical presentation of the game mechanics (which are familiar from other types of hobby game, and which make for an entertaining game of exploration and melee as is), while experienced vets know how to add such narrative elements to their campaigns from the start if they see fit.

I think that the vast majority of new players will be well served by the new *Dungeons & Dragons*, especially the younger set. Kids and adults alike can handle the complexity of the rules, the one aspect of D&D that most resembles more "conventional" games. And they can get a handle on the accessible power-fantasy: wizards and warriors exploring perilous dungeons and battling evil monsters to gain fabulous treasures. They'll like the art. They'll like the cool character hooks. They'll like the scope of the game world. They'll like it, they'll buy it, and they'll play it. With all due respect to the *Dungeons & Dragons* brand name and to Hasbro's marketing clout (which are the only two selling points of the game for new players that Pyramid's review concedes), it's the classic magic of the setting and the intriguing complexity of the statistics-based play that will pull new players in.

As for the rest of us, for whom stalking the mean streets of the Gothic-Punk world has begun to, ahem, pale, *Dungeons & Dragons Third Edition* promises a return to a younger, more wondrous time: kewl is still kewl, at eight or at twenty-nine. We can bring everything we've learned about character development and storytelling with us, of course. But we can also rediscover the simple joys of natural 20's, magic missiles that always hit, and that yawning cave mouth leading down into the unknown. The new *Player's Handbook* is a far better passport to that wondrous land than the old *D&D* books were, and a far better introduction to roleplaying than any other title out there. Who needs a time machine after all?

-- John Deal

Pyramid Review, Take 3

Dungeons & Dragons 3rd Edition

Published by Wizards of the Coast

Written by Jonathan Tweet, Monte Cook, and Skip Williams

300 pages and Demo CD-Rom; $19.95

I managed to get my hands on a copy of *Dungeons and Dragons 3rd Edition Player's Handbook* about a week ago, and a day hasn't passed since then that I haven't read or re-read parts of the book, fooled around with the CD-ROM or played the game with some friends. The design team smoothed out the rough edges from *Advanced Dungeons & Dragon 2nd Edition* and added tons of new goodies to make *D&D 3rd Edition* the best combat-oriented RPG you can buy. Most of the rules have changed but the spirit of the game remains the same: it's all about slaughtering nasty creatures and creating a legendary hero in the process. If you strongly prefer games where combat rarely occurs you probably won't enjoy *D&D 3rd Edition* any more than you would have enjoyed *AD&D*. On the other hand, if chopping an Ogre in half with a huge sword, frying a dozen Goblins with a fireball or destroying legions of the undead with divine grace sounds like fun you will love this game.

Neither rules nor dice restrict the character you can create. In older editions, powerful classes such as the Paladin had stringent ability requirements and high experience costs to advance in level. *D&D 3rd* allows any race to be a member of any class and eliminates ability score requirements. Furthermore, every class uses the same experience chart to advance in levels. Powerful classes like the Paladin remain largely unchanged while weaker classes like the Fighter have been given new benefits that put them in the same weight class as Paladins and preserve the class' flavor. These changes let players create whatever type of character they want and ensure each character will be on equal footing.

Players can also customize their characters using new abilities called feats. Every character gets one feat at first level and a new one every third level after that. Bonus feats are awarded to humans and some other classes. Feats generally give you a bonus to certain rolls or let the character pull off a cool new stunt. For example, Improved Initiative gives you a +4 bonus to your initiative roll, and Weapon Focus gives you a +1 bonus with a specific weapon. My favorite combat feat is Cleave, a feat that lets you carry through with your attack to chop through two foes with a single swing. Spellcasters can take metamagic feats that enhance the spells they cast if they're willing to prepare them in a higher-level slot. If you want to make sure you can still cast Magic Missile when you're gagged, you could use the Silent Spell feat to memorize Magic Missile as one of your second level spells for the day (instead of as a first-level spell.)

Feats also make magical items creation rules playable, balanced, and thematically appropriate. A spellcaster must take a feat for each type of magical item they wish to create (scrolls, potions, wands etc.) . The caster gathers the necessary materials (often an adventure by itself), works on the magical item for the appropriate amount of time and spends 1/25 the value of the item in experience points to produce the desired item. This system prevents spellcasters from mass-producing powerful items and the experience point expenditure can be described in game as putting some of yourself into your work. Best of all, there's no rolling involved so you can be sure your hard work and sacrifice will pay off.

Other aspects of the magic system have also been reworked to make the rules more logical and easier to use. Players make saving throws to overcome magical effects with a difficulty based on the spell's level and the spellcaster's skill.

You get a Reflex save to dodge fireballs, a Will save to avoid being charmed and a Fortitude save to resist being turned to stone. Magic Resistance has been replaced with Spell Resistance, an ability that allows some creatures to completely negate the effects of your spells without making a saving throw. Spellcaster's get a bonus on their roll to overcome Spell Resistance based on their level so you can take solace in the fact that with each level you gain you'll have a better chance to affect powerful creatures with your spells. Finally, you can now counterspell hostile spells as they're being cast by casting Dispel Magic, the same spell your opponent just cast or one that has an opposite effect. To avoid confusion, spellcasters are now described as preparing spells rather than memorizing them. It seems pretty clear to me that wizards and clerics can only use a spell slot once per day. It is however, perfectly valid to criticize WotC for not giving a good in-game explanation for how spellcasting works.

At the beginning to the chapter on spells, the spells each class can cast are listed by level along with a one-sentence description of the spell's effect. There is a separate list for Bards, Clerics, Druids, Paladins and Rangers. Sorcerers and Wizards share the same list except for a few spells that are useless for Sorcerers. After the class lists every spell is listed alphabetically. This format is an excellent way of organizing the spells since it allows players to select spells from their class list quickly or look up the spell's full description during play with equal ease.

The biggest change to the spell list is the addition of zero level spells and expanding the range of clerical or divine spells to ninth level. Zero level spells such as detect magic produce minor but useful effects. Most of the new high-level divine spells are good but some seem unimaginative. For instance, Holy Aura, Unholy Aura, Shield of Law and Cloak of Chaos all have a nearly identical effect except for the alignment they protect against. As for the rest of the list, most of your favorite spells are unchanged and there are a fair number of cool new spells to try out. One of my favorites is the first level Wizard spell Expeditious Retreat; it doubles your speed for one minute per level -- great when combined a ranged weapon or long range spells.

I can't heap enough praise on the design team for all the other neat little tidbits throughout the book. The combat chapter brings new strategies to your battles by adding lots of new tricks you can try to pull off in combat. It also gives rules for performing the "coup de grace" against a helpless foe to finish them off with style. The equipment chapter has a diverse selection of weapons that give you new and exciting was to kill your enemies. Exotic weapons such as the Two-Bladed Sword and the Orc Double Axe seemed original to me and even though some of the weapons certainly are impractical, the stated goal of the design team was to create cool weapons rather than realistic ones.

Although the game revolves around combat, players will have opportunities to surmount other challenges. A good example of this can be found in the introductory adventure provided on the CD-ROM. (Finding the adventure on the CD-ROM is a small challenge by itself, since I only found it by searching my CD drive with the "Find Files or Folders" tool from the Start menu.) The PCs need to rescue Lord Khulvan's kidnapped nephew Allayn from the clutches of the devious merchant Cordwellyn; clever players may be able to discover his guilt before he dispatches assassins to eliminate them. Later on in the adventure, the PCs will need to negotiate with an Orcish tribe and solve several puzzles in the tribe's burial caves to discover Allayn's location. The new skill system handles nonviolent scenes wonderfully although the last challenge in most adventures will probably still be an epic battle against a fearsome foe.

Dungeons and Dragons 3rd Edition offers more reasons for new gamers to buy it than just "the name and Hasbro's advertising money." The biggest advantage is the *D&D* genre has become pervasive enough to spread into popular culture. Do you think someone who's never seen any Hong Kong style action movies could understand or enjoy *Feng Shui*? Non-gamers have a good idea what most races and classes are like without having to read a detailed description. *Dungeons & Dragons* also has the advantages of being the biggest game system on the market: it's easy to find people to play with and there are terabytes of free *D&D* stuff online created by fans.

The *Dungeons & Dragons* class and level system also caters to beginning players. The class system gives players a package of abilities so the can start playing quickly. At the end of each class description in *D&D 3rd Edition* there's a starting package for the class that gives the players a short list of maxed-out skills to choose from and preselected weapons and feats. The fact that combat advancement is set in stone helps beginners by automatically giving them abilities that will make them a valuable member of the party. In other systems where players can buy any ability they want with experience points beginners can become outclassed by veteran players who know the best abilities to buy. In *D&D* an inexperienced 11 year old can do just as well as a parent playing with them.

Dungeons & Dragons also goes farther in terms of a character's advancement in power than any other game I've seen. All you need to do is survive each adventure to accumulate power -- and even death just slows you down. You can begin as a rookie Wizard who has trouble dealing with half a dozen goblins and work you way up to an 20th level powerhouse who's ready to give the gods a run for their money. This sort of advancement would be impractical outside of a level system -- new players would be bewildered by all of the options available to them and veterans would advance too quickly by choosing the best abilities to buy. Yes, this is power gaming, but within a level system there isn't much a competitive player can do to rise above the rest of the group. Power gaming may be juvenile, but if everyone in your group enjoys it there's no shame in turning your characters into god slayers.

Lastly, most roleplayers will agree that creating a living breathing character is the hardest part of any game. ***Dungeons and Dragons*** lets beginners start having fun right away and slowly work on their character's personality as they progress. Depicting a character that acts differently than you do is a great deal easier than portraying a character that thinks differently than you do. Since the ***D&D*** alignment system gives you suggestions how your character should act in certain situations, it serves as useful tool to guide beginning players. Beginners also do well in **D&D** since nearly all of their experience points come from killing monsters. In some roleplaying games, such as White Wolf's ***Mind's Eye Theatre***, as much as half your experience comes from roleplaying awards. Skilled players can potentially leave beginners in the dust in these systems.

Dungeons & Dragons has enjoyed widespread popularity for the past 25 years. During those years, roleplaying games have become too diverse for there to be any single RPG worthy of being called the best. ***D&D 3rd Edition*** offers you the chance to slay monsters, right wrongs and save the kingdom from the foul machinations of various villains. If that sort of game sounds appealing you owe it to yourself to give ***Dungeons and Dragons 3rd Edition*** a look. If you're already a fan of ***D&D*** or similar games you've probably got this book already. I've got to get going now, Cordwellyn may be dead but his foul patron, Lord Beoric, is plotting revenge…

-- Adam Kalafarski

Wedding Bells

On August 26th, the day after this column runs, I'll be ending thirteen straight months of pain, agony, and torture. The horrors will come to a very sudden and abrupt end.

I'll be getting married.

There's a long sordid story about meeting a wonderful man during a roleplaying game -- Fiat Justitia, an In Nomine game, to be precise -- falling in love, and deciding to get hitched. It's long, it's boring, and I'll spare the reader. Post-proposal, planning the wedding began in earnest. "It couldn't be that bad, could it?" I said. "How hard is it to put on a wedding? How bad could it be?"

It's that bad. Actually, it's worse. It's enough to make a hardened **Call of Cthulhu** investigator go stark, raving buggo. Each part of the wedding process should be clearly labeled with a Sanity check. Sure, an investigator may be faced with the Goat of a Thousand Young, but staring down that horror is far preferable to six straight hours looking through invitation books in the back of a small, stuffy, uncomfortable stationary shop.

When it comes to adventures, madness and mayhem, roleplaying has nothing on real life. Real life can cough up some amazing things when it wants. Luckily, this was a learning experience. Like all good lessons, a savvy GM can immediately steal and leech from reality and turn real life paranoia into game terms and be used to torture players until they scream for mercy. Weddings happen, even to the best of us -- why not use them in a game?

Wedding: The Suffering

Weddings generate more pain than a pack of werewolves on the hunt, more agony than a trapped wraith denied the afterlife, and more angst than a vampire who chipped a tooth and tore a little lace. They send people into an absolute tizzy of activity. With so many interchangeable parts, something is bound to go wrong -- and something always does, without fail. As a plot hook, it's a chance for a little mayhem, especially when it lands in the laps of player characters.

Weddings are a staple of comedy movies, and have been used effectively in horror media for generations. From *Father of the Bride* to *the Bride of Frankenstein* to *Four Weddings and a Funeral*, weddings have been the inspiration for many great storylines. They can be a conclusion to a great plot arc, or just the thing to kick off a campaign. They're wonderful if the party includes a balanced number of female and male players, if the party is female-inclined, or if the party tends toward the romantic and dramatic.

How do characters get themselves into the position of facing impeding nuptials? Usually, it's a part of the GM's plot. A damsel in distress might have been rescued from a far off tower, and the reward for her return was her hand given in marriage. The game is set in the Orient, and the player or players have found themselves involved in *omiai kekkon*, the Japanese art of arranged marriages, at the behest of a lord, patron, or parents. Characters may find themselves forced to marry for dark, evil ends. The player may be playing high stakes political games, and find that a marriage will get him or her an edge to the wheeling and dealing of renaissance Europe. Two characters may simply fall in love and decide they want to tie the knot.

Weddings can also be used as a setting, especially for conspiracy games, one shot LARPs, or games with an element of political intrigue. Any genre, from high fantasy to science fiction, will do. Scheming plans can be concocted and can culminate in a murder at the reception party. A jilted lover, in a moment of high tension during the ceremony, can decry the groom as a false paramour. The bride can be kidnapped minutes before the nuptials, carried off to some unknown destination by a baddy with a waxed mustache and an evil laugh. The king of the land may pass out face first into the punch bowl. Both men and women can get in on the act at the reception party, giving each other looks of longing and cunning over the fruit bowl.

Think that just because the character is male, the character is going to escape the pain? Think again -- there's a GM on

the other end of those dice, and grinning. And a female character? Hah! The marriage proposal is only the *beginning*. Fun? Happy? Wonderful? Weddings are nothing if they are not a test of character for both sides, the bride and the groom.

What Can Go Wrong, Does

Either through plot or setting, the player finds himself faced with a wedding -- typically his or her own. The first instinct may be to run. It's a good instinct. Act on it. But if running for the hills is not possible -- perhaps because the soon-to-be-bethrothed's neckless brothers have large crossbows aimed at the character's head -- the player needs to embrace the inevitable, and the show must go on.

With a shindig of this size and importance, something is bound to go horribly wrong. In a roleplaying world, almost anything can happen during the magic moment at the altar when the two characters become man and wife, and usually, it does. The GM can make it an event pregnant with purpose, dropping the hammer at just the right moment, or she can make it the focal point of her plot. The following sections outline possible game seeds of things that could go wrong -- or right -- during the course of a wedding in a myriad of different genres.

Fantasy

A fantasy setting is easy, and popular, to bend into any mold. Plot seeds for marriage, from rescuing the fair damsel to spending just one too many nights with that barmaid abound. Since magic, magical creatures, and fantasy abound with the possibility of sudden wackiness at any moment, the GM can toss in some real gems during the gaming sessions. These include:

- The cake has been replaced with the Head of Vecna. The reception guests fight over who gets to have their head removed for ultimate power.
- A mischievous elf replaced the wedding bands with cursed bands of gaseous form. The bride and groom can't touch after their vows until the curse is removed.
- Last-minute revelation indicates that bride and groom are of incompatible alignments. The wedding is called off.
- Raiding party from neighboring Dukedom raids the reception seeking booty. They carry off the bride and her attendants to hold them for ransom.
- Magic luggage eats the wedding cake and several guests.

Horror

Dark things can occur during weddings, especially the ceremony. Two dark forces can be melded into one. Black rituals can be embedded into the vows. The ceremony can be performed as a black mass. The church can be built on unhallowed ground. Horror GMs, well known for their relentless natures and their dark visions for games and gaming in general (oh, how I love them), should not allow their weddings to become too happy!

- The bridesmaids include succubi, licking their lips and sizing up the all too human groomsmen and guests -- and their souls.
- Antique wedding vows are really an incantation to summon Nyarlathotep. The incantation must be stopped before he appears and takes the souls of everyone in the bridal party.
- Zombies, sent by a political enemy, storm and ravage the reception. Guests are forced to fight for their lives or be turned into zombies themselves.
- Black curses, placed upon the bride and groom by a spurned lover well versed in the arts of Voodoo, is cast during the ceremony.
- The wedding mass is really a black mass, and at the end of the ceremony the NPC groomsman means to take the PC bride as a sacrifice to his dark lord.

Western

The love between and of lone gunmen, running from the law, is the source of stories from *Bonnie and Clyde* to *The Outlaw Josey Wales*. When hounded by the Marshal's men, with death on every side, there's a chance to take a piece of real love -- and spin it into an effective game campaign.

- Spurned lover decides he will be the one who objects to the ceremony, breaks into the church and holds up the wedding party at gunpoint.
- The wife or groom is on the run from the law. They get married in a secluded Spanish church while the Marshal's men are slowly surrounding them.
- The wife and groom get married against the backdrop of the Civil War, and the groom must return as soon as the ceremony concludes to the War Between the States. . . and certain death.
- The groom became an outlaw, but now he's bent on rebuilding a life with wife, family, home and farm. But the past -- and the law -- has a way of catching up with him.

Science Fiction

Science fiction is a fast and varied genre. Two people can find love in a war between races, across Cyberspace, or even on a ship traveling between galaxies. The bond between two beings, as shown in marriages on *Star Trek* and *Babylon 5* can be just as strong as those of the same race. But just like those shows, there cannot be weddings without a few catches in the works. Nothing is simple, not even in the year 3000.

- The bride and the groom belong to two vaguely humanoid races that are compatible. War between their races breaks out during the reception, and they're torn apart by the fighting.
- One of the bridesmaids is infected with a parasite, which bursts out of her midsection to infect and eat the guests during the reception party.
- The marriage isn't between two humans, but two humans transmuted to artificial intelligences trapped within a virtual world, trying to fuse into one before their mainframe is shut down and they are both destroyed.
- The bride turns out to be a clone of a different, real woman and hasn't told the groom -- or anyone else. The real woman discovers the wedding and breaks into it to stop the ceremony before it can complete.

The GM is, of course, welcome to expand on these ideas, change parts of them, add in his or her own experiences from his or her wedding, or completely ignore the suggestions completely. There's a wealth of information out there to pull wedding details from: movies, television shows, books, and friends who have survived the ordeal and lived to tell about it. A good GM will tap her resources and use it to her advantage. Combined with a few plot ideas, she can turn a wedding into a major part of her campaign.

Remember: if something can go wrong, or will go wrong, it should go wrong!

A Quick Conclusion

All I can *(wedding)* think about *(wedding)* right now *(wedding)* is the wedding. *(wedding)* I don't know why, though. It boggles the mind. *(wedding)*

Take it from me: this wedding thing is hard. Oh, sure, it includes marrying a gamer and a living room cabinet filled with cheery games, Legos, Nerf, and electronic toys. But after a few months of planning, it makes driving out to Vegas and getting married by an Elvis Impersonator at a drive-through look good. It would make even the most battle hardened Paladin start to consider a different line of work.

After thirteen months of preparation, upon return from the honeymoon I'm going to be checking myself into the nearest madhouse for a little rest. But like all major events in one's life, one can walk away from it with a sense of accomplishment, of surviving a disaster so horrible that it must leave scars, and the knowledge that anything, anything at all, can be used to liven up a roleplaying game featuring the battle of the sexes.

I'm off to Italy!

Can You Dig It? The Oak Island Money Pit

"And there will be things down there that you cannot imagine."
-- psychic Ray Nutt, on the Oak Island Money Pit (1976)

That seems unlikely, given what I (and several people rather more Nutt-like than I) have already imagined is down there. "Down there," of course, being at the bottom of the mysterious shaft on Oak Island, off Nova Scotia, known as the Money Pit. Not, necessarily, because there's money down there (although it's not impossible), but because millions of dollars (and six lives) have been spent trying to get down there where we can't imagine. There may not even be any "down there" down there, in fact, which means I, and the psychic Nutts, are free to dig deep and imagine whatever we like.

"I wish much I could have gone up the coast this summer and visited Oak Island and seen the work you are doing -- for I shall always be interested in that romantic spot. I hope that you will let me know how you have been getting on with modern methods . . ."
-- President Franklin D. Roosevelt, letter to Erwin H. Hamilton, August 31, 1938

The first person to imagine things about Oak Island was one Daniel McInnis (or McGuinness, or some variant). In 1795, he and two friends attempted to excavate a shallow depression where he said he'd seen a block and tackle hanging from a "burnt branch" on one of the oak trees that got the island's name changed from Gloucester Island 150 years ago. By 1805, although McInnis' group had discovered oak platforms and a flat inscribed stone (its code eventually translated as "Forty Feet Below Two Million Pounds Are Buried," the cipher stone itself conveniently disappeared), and dug 90 feet down, they had also somehow filled their shaft with seawater. Later attempts in 1849-1850, 1858, 1861-1862 (which succeeded in collapsing the original Money Pit, if such there was, into its own tunnel and caving everything in), 1866, 1891, 1897-1900 (this one including a young Franklin D. Roosevelt), 1922, 1934-1938, 1955, 1959-1960, 1965-1966, and 1970-1987 have yielded enigmatic artifacts such as watch-chain links and scraps of parchment, flooded and caved in the site beyond all recognition (one source puts the number of excavation shafts through the area at 37), and killed six people. For the thrilling details, see D'Arcy O'Connor's *The Big Dig*.

The most reasonable explanation (which, don't worry, we're going to abandon before we even get to the end of this paragraph, much less this column) is that the Money Pit is a natural sinkhole that youthful McInnis' imagination combined with legends of pirate treasure -- the "artifacts" can be easily explained as forgeries, as shipwreck fragments sucked into the sinkhole by tides, or (by now) as relics of previous excavations. The geology and stratigraphy of that part of Nova Scotia contains plenty of other examples of shafts, wells, and caves all of which regularly flood with seawater with the tides and shifts in the water table. It's even barely possible that there was an actual cache there (buried, perhaps, 20 feet down where the boys dug through the first oak platform) at one time, and that the block and tackle showed that it had been removed. It's not even impossible that the British Navy dug a more elaborate shaft there, either as an ammunition dump or even as a holding station for the treasures of Havana, which Lord Albermarle captured for King George III in 1762 (and maybe kept a little extra out as a retirement fund).

It's highly unlikely that the various pirates associated with Oak Island in the mythology had the patience to dig all the elaborate traps and intersecting tunnels that later diggers have theorized, but if it makes you happy, there's no reason to insist that Captain Kidd didn't leave something there, once upon a time. After all, occult author Harold Wilkins produced a copy of "Captain Kidd's treasure map" which was an exact map of Oak Island, and contained cryptic instructions which actually described a series of stones in a triangle pointing to the treasure! Of course, when the excited excavator Gilbert Hedden finally confronted Wilkins, the author admitted that he'd made up the map, and its instructions, out of whole cloth after seeing an entirely different map somewhere else. Wilkins decided that he must be the reincarnation of Captain Kidd; Hedden decided Wilkins was crazy and went back to digging.

"We have large and deepe Caves of severall Depths: The deepest are sunke 600. Fathome . . . These Caves we call the Lower Region; and wee vse them for all . . . Conservations of Bodies."
-- Sir Francis Bacon, *The New Atlantis*

Of course Wilkins was crazy. Why be the reincarnation of Captain Kidd when you can be the reincarnation of [Sir Francis Bacon](#)? As part of Dee's occult imperialist circle, Bacon would have had access to the secret maps of Nova Scotia that circulated through Britain ahead of its "official" exploration by Samuel de Champlain from 1604 to 1607 -- possibly compiled by Sir Humphrey Gilbert (who "mysteriously disappeared" in the North Atlantic in 1582) or John Cabot (who "mysteriously disappeared" in the North Atlantic in 1498). Bacon could not only draw on the mining knowledge of figures like [Hariot and Raleigh](#) (who, as Warden of the Stannaries, commanded the most experienced miners in Cornwall) but his own not inconsiderable scientific genius. In both *The New Atlantis* and *Sylva Sylvarum* he describes means of digging chambers and tunnels, and then safeguarding them with floodshafts and concealing them beneath seemingly natural features. He also discusses preserving treasures (such as parchments) in mercury; mercury is one of the anomalous materials discovered in the Money Pit. (An ivory boatswain's whistle of Elizabethan manufacture has also turned up on the island.) In 1610, a royal charter granted Bacon "all the islands" from Oak Island to Newfoundland. "Kidd's Triangle" points to a compass deviation from north of 14 degrees -- which occurred in 1611, the year after Bacon's grant, and the year that Shakespeare (ha-ha!) wrote *The Tempest*, about a magical island and a "drowned book." In *The Anatomy of Melancholy*, in fact, Bacon explicitly puts "the new Atlantis" at 45 degrees of latitude, the same latitude as Oak Island. What did Bacon so desperately need to hide there? Well, his Rosicrucian treasures (which, according to Rosicrucian legend, are hidden in a buried tomb) of course, and his original first drafts of Shakespeare's plays. And, maybe, the Holy Grail.

"In one of these harbors, three to four leagues north of Poutrincourt Cape, we found a very old cross, all covered with moss, an unmistakable sign that formerly Christians had been there."
-- Samuel de Champlain, on Nova Scotia (1607)

Assuming, of course, that the Templars didn't bury it there first. That, at least, is the argument (also buttressed by psychic dowsing, should you doubt its bona fides) in Michael Bradley's *Holy Grail Across the Atlantic*, presented more clearly, though with far less entertaining divagation and detail, in Steven Sora's *The Lost Treasure of the Knights Templar*. Both books make much of the secret maps, especially the 1545 Caspar Vopell illustration of Nova Scotia with a Templar knight, and the various 16th century maps placing a "Port of Refuge" roughly where Oak Island is today, and various stone crosses have emerged from the island, many with unmistakeably Masonic inscriptions. (Another explanation for the mysterious tale of Lost Treasure may lie in the fact that virtually all the excavators of the Money Pit have been Freemasons and the tale may be a colorful pageant Making Manifest That Which Is Hidden.) Bottom line, however, the solid physical evidence for Templar visitation returns to these three facts: Oak Island had oaks older than 300 years on it in 1800, oaks are not native to North America, and acorns don't float across the Atlantic. (For those playing at home, the real answer is "Basque fishermen.") The rest all descends into those "Templars went to Scotland, Scots went to Nova Scotia and pestered the Micmac Indians, and they were all Masonic *Prieuré de Sion* pawns" theories I've covered in a [previous column](#).

"They may have been built by Vikings visiting the New World, or by the native Micmac people who lived in the region before the Europeans appeared. Perhaps they were built by an advanced civilization that we know nothing about. Indeed the flood tunnel trap built into the pit in some ways reminds one of the false doors and granite plugs found in Egyptian tombs to prevent grave robbing."
-- Lee Krystek, "The Mystery Pit of Oak Island"

Which leads us to the Micmac people of Nova Scotia who, as it turns out, had a hieroglyphic alphabet that, at least according to some Canadian scholars, predated French exploration. Better still, according to excitable pseudepigrapher Barry Fell in *America B.C.*, Micmac hieroglyphs are very closely cognate with ancient Egyptian hieratic script! (They do, in fact, predate Champollion's deciphering of hieroglyphs.) Now, we're getting somewhere. The script roughly indicates a date between 1400 and 800 B.C. To add to this exciting scenario, one Charles B. Thomas of Great Falls, Montana, managed to decipher the Great Pyramid of Cheops and discover that its exact duplicate is buried, upside down, beneath Oak Island, full of the [treasures of Jerusalem](#)! Which would, of course, include the Ark of the Covenant.

"Q: What is buried on Oak Island?
A: Regenerator.
Q: What is a regenerator?

A: Remolecularizer.
Q: Who put it there?
A: Lizard beings.
Q: When did they put it there?
A: 10,000 years ago, approximately."
-- channelled exchange (12/10/94) between Laura Knight-Jadczyk and the Cassiopaeans, *The Orion Archetype and the Destiny of Man*

Between the Ark and the Grail, the Money Pit is getting pretty full. Good thing it uses Reptoid-Atlantean remolecularizer technology. One Alexander Stang Fraser theorizes that the Money Pit is a sacred tomb of the last Sage-King of [Atlantis](#), which was (apparently) the Grand Banks before they sank; the vast organic deposits of a dead city are what attract all those fish (and Basque fishermen). In that context, it's interesting to note that the current excavation company which owns the island is Triton Alliance, Ltd., the Tritons, of course, being the fish-men who served Poseidon -- lord of Atlantis. Could that be another Making Manifest of That Which is Hidden, putting the amphibian Nommo involvement (from whence we can go back down the Bloodline to the Templars and Bacon again) hidden, as it were, in plain sight? Does this somehow tie in with the fact that the "Kidd Triangle" has a rounded "crescent" below it, which together make not only the Masonic arc-and-compass rune, but the ancient symbol for the far North -- Thule? Could the Port of Refuge be the [Space-Nazi](#) Time-Refuge, a hidden gate to [Antarctica](#) built around a gravitic anomaly that causes all those sinkings and ghost-sightings and mysterious vanishings of British explorers? Is that the secret meaning of "Norumbega," the "Norman (Aryan) Fortress" mentioned by the crypto-Templar Verrazano before he, too, vanished? (Well, he died in the West Indies two years later. It's like vanishing.) Could this be why suspected Nazi agent Errol Flynn attempted to take control of Oak Island in 1940? Could it explain the UFO crash into nearby Shag Harbor on October 8, 1967? Could it, at the very least, be a heck of a thing to slap into your *GURPS Illuminati-Places of Mystery* game? The answers to all these questions [lie beneath](#) 200 years of sinkholes, traps, explosions, forgeries, and Masonic ritual just off the coast of Nova Scotia. Dig in.

Part Story, Part Game, Part Nostalgia

Over in the [newsgroups](#), there have been various discussions lately about introductions to gaming. Now, I'm not going to share my first introduction to gaming yet (you'll need to ply me with more Harvey Wallbangers for those embarrassments . . . besides, I already shared my [Torg story](#); what more do you want?). But I *will* talk about what I consider to be one of the more formative elements to my own roleplaying.

Back in the early 80's, when I was a wee lad, there were a series of books called . . . well, it's difficult to say what they were called. I guess the generic term nowadays would be "paragraph book." Basically a paragraph book is a story with multiple paths; at its simplest level, this can simply mean a branching story with one beginning and multiple endings.

> "'No! Don't open that door!' shouts your friend. 'You don't know what's in there!'
>
> *If you open the door, turn to page 17.*
> *If you decide against opening the door, turn to page 8.*"

The first books I remember reading like this were part of the *Choose Your Own Adventure* series. It spawned a number of imitators, and were wildly popular with young folks. These books, while fun, were fairly limited. Since most were about 120 pages or so, with at most one choice per page, the amount of interactivity was somewhat restrictive. On the other hand, there were multiple "correct" paths to good outcomes, and the stories could take wild turns early on ('If you want to get in the spaceship, turn to page 4. If you want to explore the haunted house, turn to page 19.'), which seemed to suit the wild creativity of an elementary schooler.

Shortly thereafter I encountered the *Fighting Fantasy* series. Started in 1982 with *The Warlock on Firetop Mountain* by Steve Jackson (the one from the UK) and Ian Livingstone, the *Fighting Fantasy* series were more interactive because they crammed multiple entries onto a page; most books in the series had 400 paragraphs. This allowed for more complex stories.

In addition, a simple roleplaying combat system existed within the *FF* series. You had attributes (Skill, Stamina, and Luck), a die mechanic (2d6), inventory (weapons, healing potions, loot), and so forth. These were, in my opinion, my first introduction to many of my favorite aspects of RPGs.

They were often interestingly plotted, with interesting premises, conundrums, and plot twists.

- You are given the Talisman of Death, and must escape to another world with it to keep it out of the clutches of evil. (*Talisman of Death*)
- You and your starship are stranded halfway across the galaxy. Can you amass the clues to help you and your crew escape? (*Starship Traveller*)
- You are charged with killing a deadly Yeti. You do this in about five passages . . . and then the real adventure begins. (*Caverns of the Snow Witch*)
- You are part of a dungeon contest to see who can escape. The odds of escape are slim, and there can be only one victor. Within the catacombs you encounter another adventurer; do you befriend him and try to escape together? (*Deathtrap Dungeon*)

They were steeped in atmosphere. Since they were written in the second person, they served as mind-food for my proto-GM mind. And, for the most part, they were excellent at crafting a scene. "The Spit Toad leaps at you at the same instant that you thrust your sword out at you. The weight of the Spit Toad knocks you to the ground but your sword has found its mark; the blade is lodged up to the hilt in the Spit Toad's throat. It shudders in its death throes, while you crawl out from under its massive belly." (*Island of the Lizard King*, 339) (Dang, I need to get a Spit Toad into one of my games . . . hmm . . . ***Aberrant*** or ***In Nomine***?)

They were filled with genre possibilities. From fantasy, to horror (*House of Hades* [or *Hell*, if you weren't in the US]), to space, to superheroes (*Appointment with F.E.A.R.*), these books may have been my first full realization that

roleplaying games didn't have to be limited to killing dragons.

And they were fun.

I asked Steve Jackson (the one from the US) what he thought about these books, and he said, "I liked those books, and I actually wrote three in the *Fighting Fantasy* series. They're not roleplaying, but they offer fantasy world participation and character development *like* roleplaying . . . and I think they can whet the appetite for real social RPGs."

(For those keeping score at home, the US Steve wrote *Scorpion Swamp*, *Demons of the Deep*, and *Robot Commando*. He may also be the only person in history to ghost write under his own name.)

The *FF* series wasn't without its flaws. For one thing, they were, for the most part, fiendishly difficult. If you didn't follow the one true path -- which generally involved acquiring the proper keys, parts of a password, or safe combination -- you were going to lose at the end. (And it was usually in the next-to-last paragraph, too. . . "If you have these three keys, turn to 400. If not, you die!"). And combat was random, so even if you *were* following the one true path, you could still die. Ironically, both of these elements also greatly influenced my GMing style (remind me to elaborate in the future).

Also of note were the *Sorcery* series -- a series of four interlinked paragraph books where events from earlier volumes influenced events of the latter books -- and the *Lone Wolf* series, where your character could evolve throughout the series . . . twenty-one books, if memory serves (with other spin-off and new series). This was, perhaps, my first continual attachment to a single character.

In my youth I was a fan of wargames. But I honestly believe that a steady appetite of these books fanned the embers of what eventually became my passion for roleplaying games.

For folks interested in more information, perhaps the best site I can offer is:

www.fightingfantasy.com

Of particular note, especially for those unfamiliar with these books, is the "amateur" section (http://www.fightingfantasy.com/ffgame.htm). There you can get full, honest-to-goodness, amateur *FF*-style gamebooks. Some of them are even full-blown 400 or 500 paragraph efforts . . . all free!

If I were a betting man, I would guess that many of the next generation of roleplayers will be brought to our hobby through computer games. And I'm not sure how I feel about that; there are many elements of which paper-and-pencil roleplaying games simply cannot compete with their silicon counterparts.

I also don't know if these books will ever make any kind of comeback; in the HTML-age, it seems their hyperlinked counterparts, complete with flashy graphics and automatic dice-rolling, could easily overshadow any paper efforts. But I know that, should I need to introduce any future gamers to roleplaying, I could do worse than give them a copy of *Scorpion Swamp*.

* * *

As of Wednesday, I now have a sink. Or perhaps I should say:

> 1D6 Transform (Air into Water)
> (Variable Special Effects: generate hot/cold water at various pressures) (OIF, Universal, Immobile, Breakable, Fragile) (6 points)

(Or as the **GURPS**ians call it, "Sink.")

Last week's answer: **Marvel Super Heroes Basic Set** RPG (*Campaign Book*), p. 10-11.

(Three stars) "United Arkansas Milita overpower invaders in the Boston Mountains. Retreat all invaders from the territory; destroy unretreatable units."

Pyramid Pick

The Swashbuckler's Handbook (for Mage: The Sorcerers Crusade)

Published by White Wolf Game Studio

Written by Phil Masters, Phil Brucato, and Rebecca Moss

128 pages, $18.00

Most games -- not to mention literature and drama -- are about conflict, and the simplest form of conflict to create is violence. More than any other reason, that's why so many roleplaying games place such a high premium on combat. It's not that most game designers are lazy or that most gamers are stupid; it simply takes a rare combination of astute writing, clever players, and lots of examples to make other forms of conflict at all viable in a roleplaying setting. The somewhat misnamed *Swashbuckler's Handbook* (perhaps "Courtier's Handbook" lacked a certain flare) provides two of these three ingredients in great quantities. You need only find a group of appropriately cunning players to add seduction, guile, and treachery to your *Mage: The Sorcerers Crusade* chronicle.

Subtitled "High Adventure and Intrigue for *Mage: The Sorcerers Crusade*," *The Swashbuckler's Handbook* focuses on the social side of conflict. As the book's introduction makes clear, the purpose of this book is "to show Storytellers and players how to run chronicles in which a poisoned cup is just as fearsome as a fireball -- and often far more effective in the long term." Thus the book is a guidebook to the potent combination of sex, violence, and intrigue that make the Renaissance such a wonderful environment for gaming.

Physically, *The Swashbuckler's Handbook* is an attractive volume with an easy to read layout. The interior art is uniformly excellent, most notably Jeff Holt's chapter-opening pieces and Mark Jackson's character sketches. While there were a few too many bare breasts among the illustrations for my taste, their frequency is definitely sub-par for a White Wolf product, especially when one compares it with many *Kindred of the East* supplements.

Besides the aforementioned introduction, *The Swashbuckler's Handbook* includes four large chapters and an appendix. The first chapter, "The Age of Masks," is a nice overview of Renaissance history, concentrating on Europe (of course) but with useful snippets on other places. The chapter also covers political and religious hierarchies, the role of women, fashion and etiquette, along with a host of other topics. It's also reasonably complete (at least for gaming purposes) without being dry, which is a good quality in a historical supplement.

Chapter two, "Masters of the Danse," describes the various *Mage* groups most likely to be involved in swashbuckling adventure and intrigue. Each group is treated in detail, giving insights into their organization, philosophy, sub-groups (if any), and their perspective on magick. The chapter also includes a wide variety of archetypal characters, each one given a Shakespearean-inspired tag, like "Macbeth: The Driven Usurper" or "Hamlet: The Thinking Prince." If I have a complaint about *The Swashbuckler's Handbook*, it's that it includes too many Elizabethan era references, which are over one hundred years out of period for *The Sorcerers Crusade* (officially set in 1451). It's a minor point, I'll admit and often, as with the archetypes, serves a good end, but I'd have preferred more genuinely in-period references. Chapter two rounds out with short biographies of several important Mages of the age.

Chapter three, "Hearts and Blades," discusses a magical courtier's most important tools. The first is the Ars Cupiditae ("the Art of Desire"), a regimen of philosophy, swordsmanship, and social skills based around the classical seven liberal arts. Chapter three gives an extensive overview of the Ars and how to use it in a Sorcerers Crusade chronicle.

There are also details on using magick both in court and while fencing, as well as some very useful new Backgrounds, Talismans, and Machinae. Even duplicitous devices like poison rings, forged papers, and handheld crossbows make an appearance, providing a courtier (or "floreatus" as The Swashbuckler's Handbook calls him) with even mundane tricks to add to his repertoire.

Chapter four is entitled "Honeyed Words and Bitter Poison" and ties up the previous three nicely, offering a wealth of advice on running a court-based chronicle, complete with cross, double-cross, and passions aplenty. Much as they did with character archetypes, the authors label their classic plots with Shakespearean titles as kind of literary shorthand. Thus, "The Romance of Personal Tragedy" is associated with "Romeo and Juliet," while "The Drama of Politics" is connected to "Coriolanus," and so on. There's also a discussion of "Classic Bits and Clichés" that collects together certain standard scenes and themes that run through court-based and swashbuckling stories. It's a very useful idea mine for Storytellers looking to add that air of authenticity to their own games.

The Appendix provides information on swashbuckling techniques and fencing maneuvers for White Wolf's Storyteller system, which is one of the few times in which the book actually lived up to its otherwise inappropriate title. There are several "Lost Appendices" as well, which were cut from the book for space considerations. White Wolf has kindly made them available online at http://www.white-wolf.com/Games/Pages/swashbucklers.html for those who wish to view them.

In the end, *The Swashbuckler's Handbook* is a worthwhile addition to the library of anyone who plays *Mage: The Sorcerers Crusade*. It's also a worthwhile purchase for anyone looking to add courtly intrigue and deception to their games, especially those set during the Renaissance. This supplement does a fine job not only of describing what's involved in a courtly setting, but -- more importantly -- how to use the information it gives you. That's a rare thing and one I can't recommend more. But for a few minor blemishes, *The Swashbuckler's Handbook* is a well-nigh perfect treatment of its subject matter in a gaming context. Bravo!

It's hard to have a spontaneous roleplaying experience. Adventures must be planned in advance, mountains of rules must be absorbed, remembered, and correctly used. It's not something that happens on a whim.

Except!

Recently, archaeologists have stumbled on some stone tablets that describe an ancient system of roleplaying enjoyed thousands of years ago by our ancestors. It's called Yes Or No Adventures and it has some advantages over current roleplaying systems. In YONA, Game Masters are not required and planned adventures are unnecessary. YONA may be played on its own or combined with other roleplaying systems. And YONA may be played at a table, in a car, or even an Internet chatroom.

Like all roleplaying games, YONA is a game of cooperative storytelling. However, unlike most others of its kind, the creation of a YONA adventure takes place at the same time the players interact with it. Nothing needs to be worked out in advance, as everything that happens in a YONA adventure springs from the players' spontaneous invention.

The basic rules are simple. Players work together to author an interactive story, and each player takes turns expanding on the story from his point of view. Whatever the particular situation, the Lead Player declares what his character is doing and how the action affects the fantasy world created thus far. The other players then ask the Lead Player "yes or no" questions about what he described. The questions and their answers introduce new elements that are incorporated into the continuing story. After the questions are dealt with, the lead passes to the player on the left, who continues the story from his point of view.

Theoretically that's all there is to it. In practice, however, there's a little more to know.

To give you an idea of how a YONA session works, look at the example below. The scene takes place in a medieval-style world, though a YONA adventure may occur anywhere.

John (Lead Player): "I pry open the stone-cold door that blocks the end of this passage, using the handle of my mace as a wedge. It takes all of my strength to . . . the lock snaps, a sudden pinging sound, and the wood of the frame splinters around the deadbolt as the door pops open. I look through the crack and see a vast space. An azure light greets me and I hear something humming. Nudging the door further open, I acclimate to the glare and see a cavern stretching before us. A forest of spiraling columns grows from the floor and reaches only a fraction of the way to the distant ceiling. I think I smell incense. The hum fades, yet blue light still ripples throughout the room."

Melissa: "Is someone here?"

John: "Yes."

Beverly: "Does this someone notice us?"

John: "Yes."

Wayne: "Is it the lost king ready to offer us seasoned boar's meat?"

John: "No."

(The lead passes to the player on the left.)

Melissa (Lead Player #2): "I enter the chamber and listen to my footsteps echoing among the forest of columns. The columns aren't made of stone or wood, I believe. They look as if covered with scales, like they're the spiny protrusions of some impossibly large beast. You're right, John, that's incense we smell. I believe the odor is leaking from the cracks in this tiled floor. When I brush my hand over the tile, my palms tighten as if drying out. Is that breathing I hear coming from above? Look at the top of the center column. I see an old man with more hair than clothes. His eyes are the source of the light. Yes, now that he realizes we know he's here his pupils blaze."

Beverly: "Is he wearing the black pentagram of the Destroyers?"

Melissa: "Yes."

Wayne: "Is he clutching the scythe missing from Nauja's temple?"

Melissa: "No."

John: "Are you flashing back on that time that Destroyer priest nearly cut off your arms to teach you a lesson?"

Melissa: "Thanks for reminding me. Yes."

(The lead passes.)

Beverly (Lead Player #3): "As I near his column, the old man starts to laugh and spreads his arms, or rather -- he uncoils them. Cobra-like snakes extend from his torso, one from each shoulder, and they writhe and thrash and become more agitated the nearer I come. The floor is shaking. Look how the columns pitch and sway, except the one he stands on. He must be at least twice as big as a normal man. His eyes close and for a moment we're left in darkness, though somehow I can still make out the shape of his pentagram. I fumble to spark my lamp, but then I notice there's light again in the cavern, light of a different sort than before, a feverish sparking. I see that the old man still has his eyes closed, but his arms -- the snakes -- their slotted eyes burst with electrical blossoms. His laughter becomes manic as he leaps off the column and soars down at us."

Wayne: "Do the snakes have fangs?"

Beverly: "Yes."

John: "Are they dripping with poison?"

Beverly: "You bet'cha."

Melissa: "Do I have time to draw my sword before he land on top of us?"

Beverly: "Sadly, no."

The above was improvised on the spot. Notice how each player controls his own character and speaks only for his character. When the Lead Player speaks, the actions of the other characters are assumed. Also notice how the questions shape the events of the continuing tale. When John first described the cavern, he may not have thought of finding anyone inside it, but when Melissa asked, "Is someone there?" she created the possibility that someone was indeed

there. John, liking the idea of someone being there, confirmed the others existence by answering "yes" to the question. By suggesting story elements and then confirming or denying them, the players of a YONA adventure act as checks and balances to keep the story focused in a direction likely to please everyone.

However, the speaking player has a great deal of leeway and it takes a degree of sophistication on the players' part to make the game work. Players must be aware of what kind of story is being created and how to best balance one's personal storytelling vision with the combined vision of the group. Nothing will kill a story faster than if some of the players want to experience an adventure in a sober Arthurian tradition, while the others are going for Monty Python. To keep the game from breaking down, a few things must be sorted out ahead of time; namely the story's Genre, Tone, and Characters.

Yes Or No Adventures

Genre: The most important thing for the players to decide is what genre the adventure will take place in. Will it be fantasy, science fiction, something else? The more specific the better. If it's a fantasy story, what sort of fantasy story? The action-adventure style of *Xena*? The mysterious charm of a fairy tale? Alternately, if the players are familiar with a particular roleplaying system they can choose to create a story that takes place within that setting.

Tone: Along with choosing a genre, the players must decide what tone they will adopt for the adventure. This is not something to be taken lightly. More than anything, the tone defines what elements will be introduced into the story and how they will be introduced. In effect, the selected tone is an agreement among the players of how seriously told and "realistic" their story will or will not be. Will the story have a situation comedy feeling to it? Or do the players prefer the quality of a classical novel? Will a somber feeling color the events of the story or will the story have the random silliness of a Saturday morning cartoon?

This is also good time for the players to decide if they want to allow overt humor into the story, and if so, what kind of humor? Should players be allowed to tell jokes out of character, commenting on the story from on high? Or should the humor only emerge through the actions of the characters? Once a decision is made, the players should strive to uphold it. This is not to say that players are forever chained to their decision. It only means that until the group as a whole decides otherwise, individual players should restrain themselves for the good of the tale.

Characters: Each player should take a few moments to decide what sort of character he would like to play in the adventure and boil that character down to a short description. Players may import characters from other systems, if they like. But whether the characters are imported or created, players should have a fair idea of what their characters want out of life and why they want it.

Each player tells the other players about his character, describing the elements listed above and furnishing his character with a name. The other players now have the chance to further define the character by asking three "yes or no" questions each. These questions should relate directly to the character and give the controlling player ideas of how to round out his character's personality and history. Questions should be asked not so much with the idea of pointing out shortcomings of a character as to suggest intriguing possibilities.

Once the characters are defined, the game is ready to begin in earnest. Choose a Lead Player to begin the story. The Lead Player starts things off by making a statement, answering "yes or no" questions about what he said, and then passing the lead to his left.

Statements: A statement should not be overly long; a minute or so is a good time limit. It may be as short as a single

sentence. A statement should further the plot of the shared adventure by introducing a new element, a new situation, or by making the present situation more dangerous, mysterious, or interesting. Statements should tend to revolve around a goal. The Lead Player should always have an idea of what his character wants at any particular moment and express it in the narrative. This desire may relate to a motive created for the character at the beginning of the game. It may relate to a general goal, such as to explore or survive. Or it may relate to a specific need, such as to grab a rope before falling.

This is not to say that the Lead Player needs to constantly state his character's goal, but the Lead Player should strive to make his character's desires obvious by what he chooses to focus attention on during the narrative.

Players will be the tempted to let their characters do well in the story. As the players are telling the story, there is nothing preventing them from allowing their characters to easily complete their goals, but this misses the point of the game. The point is to create drama by seeing how bad a situation the players can get their characters into before figuring a way to get them back out again. The object of the game is not to succeed, but to succeed after overcoming incredible obstacles and to tell a story about it.

Most of the time things should go from bad to worse for the characters. If the Lead Player is unsure of how to proceed with his statement, he should roll a die. If the roll is 1-5, whatever the particular situation, the situation should somehow worsen. If a 6 is rolled, the Lead Player may describe a bit of success.

The exact degree of worsening or success is up to the Lead Player, though it should fit in with the tale told so far. The worsening or success should never be described as a bit of random luck or a wild misfortune coming out of left field. The worsening or success should make sense in terms of the story and should happen for a reason. If the players are battling a dragon, there is no need to have the ceiling fall on them out of the blue. The Lead Player should find a way to involve the dragon directly into the narrative, perhaps by having his character being struck by its tail.

Questions: After the Lead Player makes his statement, each of the other players asks him one "yes or no" question. If there are three or fewer people playing, the questioners may ask two questions a piece. Start with the player on the Lead's Player's left and move around the table.

Questions should relate directly to what the Lead Player narrated in his statement or build upon a previous question. They should be designed to clarify what was said or suggest new elements to add to the continuing tale. If a question is answered "yes," the information contained within the question becomes part of the story. If the question is answered "no," the information is discarded. After all the questions are asked and answered, the lead passes to the left and that player continues the tale.

Outside of statements and questions, there are a few special situations that need to be discussed: NPC Dialog, Combat, Veto, End of the Adventure, and Advanced Techniques.

NPC Dialog: After the Lead Player has finished his narrative, his character may speak to an NPC by asking him "yes or no" questions, which are answered by the others players in turn. After each player has answered a question (two questions if three or fewer players are playing), or when the Lead Player has nothing more to ask, the lead immediately passes to the person on the left, who continues the story from his point of view. The questions normally asked by the other players are omitted.

Combat: Combat is handled in the same way as the rest of the story. The Lead Player describes his actions and their results, then the other players question him about what he described.

There will be the temptation to win every combat, and indeed, your characters will have to succeed at least some of the time to make their way through the story. However, even the winning participants of a combat often find themselves in a weakened state or in a compromising position. Seek out these possibilities. The more the players keep their characters hurting and ill at ease, the more they'll worry about them, and the more satisfying their adventure will be.

Usually, a player will avoid killing his character, and under no circumstances should a player narrate a scene that kills off another player's character without his permission. Keeping characters alive is perfectly reasonable. In most stories,

the heroes survive and ultimately attain their goals, and this is what makes stories worth experiencing. However, keep in mind that there are many awful things besides death that can happen to a person, and the players should use the worse-than-death scenarios to their full advantage as long as each player's character can still serve as a viable point of view for the narrative. Of course, if a player wishes his character to die, he may direct the story to that end. That player may then create a new character, and when it's his turn to take the lead again he may narrate a brief story of how his new character comes in contact with the rest of the group.

Veto: Every once in a while the Lead Player will say something completely loony. If the other players agree that what was said doesn't fit the tale they may request that the Lead Player take back what he said and try again. The veto power should only be used when necessary, so as not to offend, and the player it's used against should accept the veto with good humor.

End of the Adventure: Like other roleplaying games, a YONA adventure doesn't necessarily have an end. When time is running short, players can direct the adventure toward some climax or simply stop wherever the tale has taken them. Also, the resolution of a story doesn't necessarily mean the end. Life goes on. New stories emerge from old. Old stories come back to life and sweep the characters back into them.

Advanced Techniques: The players know all they need to know to have a small adventure. But what if the players want to sustain an adventure that stretches over many sessions and still remains internally consistent? The best thing they can do is to keep records. Then, when inspiration is lacking, players may review the records to remember what has gone before and what might lie ahead.

There are at least three main areas of record keeping that are useful in a YONA adventure: Goals and Focus; Settings and Continuity; and NPCs. At the beginning of the game, players should decide who will keep track of what. Diligence is the key word here. The better the players keep records, the more likely they will be able to sustain a long and fruitful campaign.

Goals and Focus: The driving force of the narrative will be the goal. Goals help players to hone-in on what their characters could do next and why they're doing it. Every story hangs on its goals and each story may have several large and many smaller goals intertwining with one another. The player keeping track of the goals should stay on the lookout for them as the tale is being told. A goal is something to be obtained. It is usually related to an obstacle that stands between the heroes and their desires. It can be something material, spiritual, or philosophical. It can be a need to solve a mystery, or simply the hint of a possible future conflict. For example, if the Lead Player hints of a legend of a hidden sword, the goal keeper should write it down. Later, when the players are stuck for something to do, the goal keeper can remind the players of the courses of actions available to them.

The purpose of having a goal keeper is not make sure all the loose ends are tied up, but to have a body of information the players may draw upon to give them ideas of new adventures to incorporate into their story. The goal keeper keeps the game alive by reminding the other players of what the story was, what it is, and what it could be. Also, the goal keeper should look for connections among the goals and suggest directions in which the narrative might proceed. By relating goals from past narratives to future narratives the story will stay focused and feel more "story-like."

Settings and Continuity: In the course of an adventure, players will go many places and it won't take long for the players to forget the details. It is this player's responsibility to keep the narrative grounded in reality by keeping records of what is "real." This doesn't mean that this player must write down every detail of every stable and inn the group happens across. However, this player should jot down a brief description of the places they go, and more importantly, make notes on how each setting is important to the story. If there was trouble at the inn, this player should write it down, so that if the characters visit those places again they will have something to look into. This player should view his job much in the same way the goal keeper views his job. Both players maintain a body of information the group may later draw upon for story ideas.

NPCs: It is this player's job to remember the little stories that go along with the NPCs the group encounters. This player should always be on the lookout for adventures and intrigues hidden inside the people appearing in the tale. Even though the dwarf that gave the characters a foul look as they walked the Dark Road may not be important to the story at the moment, this player should make a note of it, so that later, when the story is stuck for a place to go, this

player will be ready to suggest exploring the reasons behind the dwarf's foul look.

It's also this player's responsibility to make sure the story has a villain and suggest how various misfortunes might be linked to villainous deeds. Stories work best when there's an intelligence opposing the heroes. Often, a villain by his very nature will help define the characters' goals and focus the story. This is not to say that a villain needs to be present in every scene, but if the tale starts to sag, this player should remind the others of the evil forces scheming against them and find logical ways to include these schemes in the continuing adventure.

Other Systems and Conclusion: YONA easily lends itself to incorporating other roleplaying systems into its mechanics. Due to the multitude of other systems, it would be impossible to describe how to do so on a case-by-case basis, but anyone experienced with roleplaying can see how mechanics from his favorite system might be incorporated into these rules. Quantified skills could be added in part or whole, and combat could be played out in detail with dice and charts instead of simply being narrated. Alternatively, elements of YONA may be imported into a normal RPG game session. For example, after the Game Master describes a setting or scene, he may allow the other players a round of asking him "yes or no" questions about what he narrated. This would allow the other players to directly participate in the creation of the fantasy world they are adventuring in, making it a richer place as well as giving the Game Master ideas of how to direct the adventure ahead. Experiment and see what works for you and your players. The story is your own after all. The adventure awaits.

Art by William C. Eaken

When Steve Jackson Games acquired the license to publish a *GURPS* version of R. Talsorian's *Castle Falkenstein*, they had an obvious problem to solve: there was a full-scale game already out there, complete with a half-dozen supplements, and the new book was going to have to be consistent not only with the specific contents of those books, but also with the feel and "traditions" of the old game. The whole point of the license was that *Castle Falkenstein* is a game with a following, a fan base; losing what made it so popular would have been a mistake.

Perhaps fortunately, the company knew a couple of authors who'd written for both *GURPS* and *Falkenstein*, and we were able to do the job on the timescale that the company wanted. As a bonus, because we had both written *Castle Falkenstein* supplements that had not been published when R. Talsorian Games put the line on hold, we were able to add a certain amount of previously-unpublished material to the mix. On the other hand, that added yet more to the size of the finished project. Even after a certain amount of cutting back, this is a relatively large supplement, and some things never made it into the final draft. One particularly interesting cut item was a discussion of how the parachronic explorers of Infinity Unlimited (from *GURPS Time Travel*) would deal with the unique perils and opportunities of the Castle Falkenstein universe.

Castle Falkenstein and Infinity

The world of *GURPS Castle Falkenstein* is a rich and interesting campaign setting, but now that a *GURPS* adaptation exists, it can also be combined with other *GURPS* material. One obvious, if dramatic, possibility involves the "Infinity Unlimited" setting described in *GURPS Time Travel*. Suppose that Infinity and its corps of Paracops stumbled across *this* parallel?

As soon as parachronic explorers finish surveying the world code-named *Falkenstein*, Infinity would surely wish to keep it secret, for several reasons. First, all "weird parallels" with magic or other supernatural powers are considered very dangerous, and Infinity doesn't want casual visitors meddling with powers they don't understand. Second, the *Castle Falkenstein* world already has factions capable of a form of parachronic travel themselves. The Faerie visit other worlds through the Faerie Veil, and magicians appear to be able to reach other realities. Infinity and the Paracops have enough on their plate coping with Centrum's agents, and adding multiple Falkensteinian explorers with their own conflicting agendas would only create headaches for the Infinity Council.

However, it may be impossible to keep Falkenstein entirely under wraps. The chance to study magic in a world which has already begun to apply scientific methods to sorcery would be very tempting, and technical experts might want to

learn more about Falkenstein's weird steampunk technology, or even the secrets of Engine Magick. Finally, Falkenstein seems to be a whole universe with the Weirdness Magnet disadvantage. Despite Infinity's best efforts, parachronic traders and Time Tours groups may wind up blundering into New Europa. Once word leaks out, it will be hard to ban Time Tours from running package tours of Falkenstein for Victorian-wannabes and fantasy fans. Consider how much people would pay for the chance to meet fictional characters like Captain Nemo and Sherlock Holmes . . . or Count Dracula.

The discovery of not one but two non-human factions with inter-universal travel (the Seelie and Unseelie faeries), and magicians with similar powers, is close to Infinity's worst nightmare: parachronic travellers completely outside their control. The only relief would be that magicians and faeries seem severely restricted in the range of worlds they can reach, and their powers may not work in most universes.

The Falkensteinians also seem to insist that their interdimensional travels take them through a region of "pure energy," the so-called "Faerie Veil," which does not seem to correspond to Infinity's understanding of how parachronic travel works. Perhaps Infinity Inc. technology traverses this region instantly, leaving its users none the wiser, or perhaps the Veil is itself a parallel universe, with extremely unusual natural laws. Interestingly, all the material worlds visited by the Faerie seem to follow the same general course of history, even though their physical laws vary widely. Perhaps the Veil only allows access to a limited number of worlds, or perhaps the Faerie simply don't have enough *imagination* to find weirder alternates.

Falkenstein's numerous inventors and scientific masterminds may be more difficult to control. Once a Falkensteinian inventor gets the idea that interdimensional travel is possible, it's only a matter of time before a jerry-built conveyor controlled by brass levers and powered by banks of sputtering electric cells goes careening across the time streams. The risk isn't so much what a party of stalwart Victorian adventurers might do, but the thought of such a home-built device falling into the hands of the good people of Shikaku-Mon or Reich-5 is enough to give even a Centrum agent nightmares! To keep the Secret, Infinity's Paracops may have to kidnap a few scientific geniuses from their Falkenstein laboratories, and perhaps destroy some manuscripts before their eccentric scientist authors can submit them to the Royal Society. Heroic characters in a *GURPS Castle Falkenstein* campaign may be called in to investigate the mysterious rash of disappearing inventors, and may find themselves doing battle with the fiendish Invaders From Beyond Time!

Infinity's agents may have some trouble learning the true state of affairs in Falkenstein. If they simply stop in the British Museum and grab some encyclopedias to take home, they will learn nothing about such major factions as the Second Compact, the alliance between the Unseelie and the Prussians, or the menace of the World Crime League. Agents in a followup team may well think they are visiting a relatively harmless Victorian parallel, until a Criminal Mastermind or Dark Lord decides to take them captive and learn about their outtime technology.

The Secret Is Out

Once the threat of the Unseelie is understood, an alliance with the Second Compact would seem very attractive, and to blazes with the risk of giving the Seelie too much knowledge. Various Homeline governments might try to befriend their Falkenstein equivalents; in the case of the United States, the extent of secret Freemason control might not be apparent to a casual inspection, and the hidden rulers of Falkenstein America would love to get TL8 weapons from Homeline's USA to deal with the Twenty Nations once and for all. In the case of the United Kingdom, the British Empire of Falkenstein might wish to help its "fallen" Homeline twin regain its rightful position as leader of the world!

The knowledge that their world is considered a quaint and old-fashioned place by the people of Homeline could either be a devastating blow to the confidence and optimism of Falkenstein's

leaders . . . or might stimulate empire-builders to seek out new
opportunities beyond the Faerie Veil. On the other hand, the fact that
Infinity and Homeline have almost no knowledge of Magick would
certainly increase the prestige of the various Sorcerous Orders, and it
is possible that the governments of Falkenstein would try to balance
the superior technology of the outworlders with magic.

Falkenstein is probably on a Quantum level inaccessible to Centrum; if not, Centrum's rationalist distaste for magic
would likely lead them to ignore it anyway. However, if they did intervene, they might support the British Steam Lords
and American Freemasons in the quest to construct a rational, English-speaking world government. This would
logically lead to Centrum allying with Infinity and the Second Compact against the Unseelie, but it would probably be
a highly uncertain partnership, rife with distrust and double-dealing. Centrum's agents are dangerously inexperienced
in negotiation with powerful nonhuman beings, while the Unseelie have centuries of practice in tricking and
manipulating mortals. The Adversary might well fool them completely, making Centrum think they were pulling the
strings even as they did exactly what he wants. Once discovered, an Unseelie-Centrum axis would cause Infinity to hit
the panic button, hard!

In this context, hitting the panic button would probably involve overt military action by Infinity and the Homeline great
powers on a number of parallel worlds including Falkenstein itself. The cost of transport would make it impossible to
deploy overwhelming force, but regiment-sized cadres of early TL8 units working in conjunction with local allies
would be a potent force. Gamemasters who like to run military campaigns can have lots of fun exploring the potential
of tanks and helicopter gunships (supported by dragons, flying cavalry and the awesome Verne Cannon), pitted against
steam Landfortresses, pirate airships, and the Wild Hunt!

Pyramid Review

Four Bastards: A Feng Shui Scenario Sourcebook

Published by Atlas Games

Written by Robin D. Laws

32 pp., $8.95 US

(Editor's note: If you're going to be a player in **Four Bastards***, it would be naughty
to read this review, because it contains spoilers. You have been warned.)*

Four Bastards is an adventure supplement for *Feng Shui*, written by Robin Laws, the original game's author. In this adventure, an attack on an orphanage draws the characters into a plot hatched by four men, all bastard sons of the same man, to rule the world through a magical ritual involving blowing up five feng shui sites, one for each element (earth, air, fire, wood, and water). The climax of the adventure takes place on Three Gorges Dam, a colossal project that won't be completed in the real world for nearly another decade, but as Robin Laws points out, sometimes accuracy has to take a back seat to a cool setting.

The adventure opens with the attack on the orphanage, which, in another nice touch the characters discover was masterminded by someone who used to be on their side but was kicked out of the Dragons for excessive brutality. It does not escape Robin Laws' notice that excessive brutality is common among player characters, too. This one incident leads the characters across time and across the globe to foil the plot of this renegade Dragon and his four half-brothers.

The next piece of the puzzle comes into place in the ex-Soviet republic of Baharistan (a thinly-veiled Afghanistan). The characters meet soldiers and rebel leaders and likely participate in the battle to save the feng shui site that has allowed them to fight against the Russian forces for so long. This part of the adventure has a lot of roleplaying opportunities, which Mr. Laws points out is to simulate the pacing of an action movie: all the plot and character interaction up front, with less plot and more action toward the end.

As an action movie, *Four Bastards* would be great. As an adventure, it doesn't quite work, since it relies too much on forcing outcomes to every important situation (also known as railroading). Every battle has a predetermined ending. The player characters have to lose every major battle for the plot to advance. As the fourth feng shui site is destroyed, the characters can do nothing more than watch because the *Four Bastards* have such a high level of chi that no one can stand up to them. This certainly takes less time than the destruction of the previous three sites when the characters can fight but are destined to lose. By the time the bad guys are ready to take out the fifth and final site the characters can act against them with no problems, though.

Halfway through the final battle, there's a huge plot twist that keeps the Bastards from winning. The characters will want to stop the villains' plot now because if they don't the consequences of failure are even worse than anticipated! They're so bad, in fact, that if the characters fail either the campaign has to end or the GM has to call in the cavalry and save the day. The plot twist is so convoluted that in order for the characters (and players) to understand what just happened, one of the Four Bastards has to suddenly gain knowledge of the vast conspiracy that duped the four of them into this course of action as he dies and tell it to one of the player characters.

The idea behind the adventure is a great one, worthy of any Hong Kong action movie. The prose is written in a crisp, clear style and helped by Mr. Laws' humorous footnotes. The cover artwork by Andrew Baker is a bit murky, and the interior art by David White hardly looks like it was all drawn by one man. The quality of the interior art ranges from beautiful, realistic pencil drawings to goofy line-art cartoons. Unfortunately, as an adventure, *Four Bastards* would be

a good novel. By their nature, published adventures tend to have linear plots, but the plot of **Four Bastards** is completely railroaded: the net effect of the characters participating in the adventure is zero, right up until the last scene.

Nations of Théah: Book Five, Castille (for 7th Sea)

Published by Alderac Entertainment Group

by Patrick Kapera

128 pages, $19.95

So far, the goal of the *7th Sea* "Nations of Théah" has apparently been to present not only a nation, but a theme in each case. If that is true, then *Castille* has succeeded in grand style. Although the setting clearly owes much to the legendary masked men born in this period (Zorro in particular), the theme is one not of secrets, but of a very distinct dichotomy, one the book uses to considerable effect.

As with every other place and group in the world of *7th Sea*, in Castille heroes are Heroes and villains are Villains and never the twain shall meet. But sometimes, it seems that Castille is everyone's enemy, whether hero or villain. Abroad, the Sea Dogs (Avalon's not-so-secret privateers) hound Castillian merchant ships, and the navy is too busy holding off the Montaigne fleet to do much about it. Montaigne soldiers hold a third of the country. Both the Eisen and the Vodacce (Castille's other neighbors) look at Castille with hungry eyes borne of old wounds, and the Vendel League (Théah's richest organization) professes neutrality while getting chummier with Montaigne every day. Meanwhile, within Castille's borders, the power of the Inquisition grows, quelling anything they deem "heretical" or "sinful." Though most Castillians disapprove of the Inquisition's excesses, given the Montaigne invasion they're becoming progressively more willing to accept them.

In other words, a land in need of Heroes -- a perfect place for swashbuckling adventure.

The book isn't named entirely properly; natives of the country call it "Castillo" (kah-STEE-yo), and tend not to like it when foreigners mess up the name. In fact, Castillians have had to deal with foreigners messing up their culture since before the nation's foundation, which is why they tend to distrust people from outside Castille. That's just one example of the sort of rich detail to be found in the book.

The first chapter of *Castille*, which takes up almost half the book, includes a lengthy section on the nation's history, details on the Vaticine Church, the various provinces and cities of Castille, and many of its customs. But these details aren't all just for color. Though by themselves they make it easier to play a Castillian, or for a Game Master to run Castille convincingly, almost every section has some story seed that a GM can spin into an adventure. However, they're not as obvious as in some supplements (most notably *Avalon*). While this can make a GM's job a bit more difficult, it reads more smoothly.

Castille is divided into five provinces, called "Ranchos," each with its own subculture and prominent family (after which each province is named). Each Rancho (and family) has its own distinct style and flavor. There are also other prominent families detailed, emphasizing the importance of *la familia* in the culture. A character with the Noble Advantage can choose a father or mother from a particular family, which provides a player with a specific advantage and disadvantage. One of these Ranchos has been completely overrun by the Montaigne, and another is only holding out at the southernmost tip. Meanwhile, the central Rancho is racked with strife over politics and religion, rumors abound of surviving sorcerers in a fourth, and one of the busiest marketplaces in the world thrives in the province farthest from the fighting. Heroes in Castille won't lack for adventure.

The culture and religion sections stand in contrast to one another, showcasing the division (and theme) within Castille -

- reason against passion. The Vaticine Church has been a great boon to Castille, providing an explanation for the relatively high technology within the country, but Castillians are the people most driven by emotion in all of Théah, and the Church preaches that emotion only clouds the mind's effort to solve the riddle that Theus (God) has created for humanity to solve. This dichotomy runs through the entire culture (and thus the book), but is clearest when looking at the characters.

Chapter Two is a look at the different characters in Castille, from Good King Sandoval (possibly the most likeable monarch in Théah) to Castille's first female bullfighter. And although it's a fairly short section, it truly shines. Not only are all of the characters fascinating, it includes some of the best villains ever to be introduced in a roleplaying game. Are you ready to cross swords with El Malvado (The Wicked)? Dare you match wits with Cardinal Verdugo, head of the merciless Inquisition? And beware the villain that looks like a hero. . .

Indeed, the teetering balance of reason and passion is most apparent in this section. Sandoval has two advisors -- the vibrant Don Andrés del Aldana (who may be in league with El Vago, Castille's legendary hero), whose advice comes from the heart, and Verdugo himself, who is always coolly logical. The two great villains are Verdugo, who is driven by the logic of his faith to a terrifying conclusion, and El Malvado, whose passion has driven him to madness and revenge. Both are as sympathetic as they are terrifying, and show what happens when Castille's careful balance is lost. A brilliant scientist is hunted by the Inquisition because his use of reason isn't acceptable to them, while the first *matadora* is being sabotaged by her colleagues out of jealousy, but her passion refuses to die. Every one of these characters is an entire series of adventures waiting to happen, and just plain interesting as well.

The third chapter is the now-standard package of new skills, packages, and toys for players and Game Masters alike. All are well-balanced and most are fun. The Destiny Spread (a Tarot layout for new Castillian characters) returns, using the Cups and Swords suits. There are several new Backgrounds, skills, and weapon schools, all especially appropriate to Castille. (Would-be Zorros and Joneses will especially like the Whip skill and the accompanying "Zepeda" school of fancy whip tricks.) The new sorcery style, "El Fuego Adentro" (The Fire Within, according to the book), is clearly a reflection of the fiery Castillian nature. While a bit more powerful in combat than the other magic powers, it doesn't provide as much versatility as other magic, and using it openly will get a Hero in a lot of trouble very quickly, since the Church supposedly stamped out Fuego sorcerers a long time ago. New advantages include accents, finely-made swords (Castillian blades are the best "normal" swords in the world), extended family, being an *alcalde* (sheriff), and even being blessed by Theus himself. Finally, the new equipment (like the cloak and whip to go with the skills of the same names) and rules for building fortifications round out the chapter. It takes getting this far to find fault with the book; presumably, the Fortification Rating works with the advanced mass combat rules--which are found in the *Eisen* book.

The final chapter contains the usual roleplaying suggestions, which are excellent, and the Game Master's secrets about the characters from Chapter Two (and some of them are doozies) as well as the few monsters to be found in Castille. The only apparent editing error is in this chapter, as well -- a missing word in an unfortunate place. In the rear of the book is a city map, diagrams of two ships, and four ready-to-play characters.

There is very little fault to find in the book itself. As usual, most of the art is excellent, with a few pieces that are mediocre at worst. The fiction pieces that have become a staple of splat books are well-done without being overdone. The biggest problem is what *isn't* in the book -- advanced rules, or at least suggestions, for handling battle scenes really should have been included in *Castille* somewhere, especially given the presence of rules for building defenses. More egregious is the virtually total lack of information on El Vago and his organization, Los Vagos. On page 126 of the *Game Masters' Guide*, it says (when describing Los Vagos) that El Vago's identity will be revealed in the *Castille Sourcebook*. While there are hints about the secret of El Vago/Los Vagos, the organization most dedicated to preserving Castille is almost completely ignored, and the promised revelation is not present. Presumably, all will be revealed in the *Los Vagos Secret Society* book, which is appropriate, but some information on this pivotal group would have been appropriate.

Even given these omissions, *Castille* is a fantastic addition to any *7th Sea* fan's collection. Whether playing Castillian Heroes who want to defend their family and homeland or foreign Heroes visiting the land of passion, this book is perfect for anyone embroiled in the cauldron of contradiction that is Castille. Keep your steel sharp, your mind keen,

and your blood hot, because the battle of icy faith and fiery emotion has just begun.

-- Peter Flanagan

A Small Task

by Anthony W. Roberson

Art by Shea Ryan

As an introduction to *GURPS* (and perhaps roleplaying games in general), *GURPS Lite* is unparalleled. It is lacking, however, an introductory adventure. "A Small Task" is a short scenario created for just that purpose. It is based in a fantasy setting and designed for 4-6 players and a Game Master. You should be able to play through it in one evening and it is appropriate for new players and gamemasters alike.

Gamemaster Notes

If you want to run "A Small Task" for fewer players than the suggested 4-6, you can reduce the number of goblins in the ruined tower and/or replace the shaman with a leader that has the same stats as the other goblins.

A Small Task

If you want to run the adventure for a larger group, you can add goblins. You should also have them act as intelligently as possible in combat. They will use cover, retreat when appropriate and pursue fleeing foes. Simply treating them as intelligent opponents and not just as targets for the players' weapons will go a long way toward increasing the challenge level of the adventure.

If things go horribly awry for the players, remember
that a character must be reduced to at least -HT before being in danger of actually dying. Also, a healer in the village can heal 1d-3 hits per character with her First Aid skill. The goblins will also keep any unconscious characters alive (at least for awhile) in order to ransom them or sell them as slaves.

Prelude

The players' characters are all residents of Fairvale, a small farming village. One sunny day, they are called before the village leader:

> "Greetings and welcome. I asked you here today for the purpose of undertaking a service for our good hamlet. It seems as though sheep have been disappearing from the north field. I want you to find out what has been happening to them and either return the sheep or destroy the danger to them. Do you accept my small task?"

If the players accept the village leader's task (and they should or this will be a short adventure), he congratulates them on their heroism and wishes them good luck on their task.

Gathering Clues

The players will probably want to start their investigation in the village, gather any information about the disappearances that they can and interview any possible witnesses. The village leader can tell them that the last sheep were discovered missing two days ago and the shepherd that was guarding them at that time is named Jonus.

The players can locate Jonus in the village's only tavern. He tells them that two sheep were taken. They went missing over night. He noticed nothing out of the ordinary. If they press him further, he will say that he did feel sort of dizzy and disoriented at one point and almost forgot where he was. He says, "it was almost like I lost me head for a bit. I felt plumb odd, I did."

The players can pick up several other pieces of information in the village. A total of twelve sheep have disappeared over the past month. All were taken at night and none of the other shepherds ever noticed anything out of the ordinary. They can also find out from several of the older residents that ten or fifteen years ago, a vicious troll stole several sheep from the same area and even killed a shepherd. A band of adventurers eventually tracked him to a cave that lies in the forest about half a day's walk west of the north field and killed him.

The North Field

If the players want to explore the north field, Jonus can easily direct them to the spot where the last two sheep were taken. If any player wants to try his Tracking skill and makes his Success Roll, he discovers several sets of booted footprints leading off to the north.

Once located, the tracks are easy to follow and require no more Tracking rolls. They lead into a group of low hills about two hours' walk north of the field. The trail disappears as the players reach the rocky ground at the edge of the hills, but the players immediately spot a small ruined tower situated on top of the largest hill.

Gamemaster's Note: If you want to make the players' task easier, you can simply rule that they locate the tracks without a roll.

The Old Cave

If the players wish to explore the old cave, they easily locate it just inside the large wooded area to the west of the North Field. If they cautiously approach and everyone makes his Stealth roll, they hear the sound of someone or something snoring loudly as they approach the entrance to the cave. If they enter, they find an old Stone Troll sleeping soundly on a pile of filthy rags and furs. If the players attack the troll and do not kill him immediately, he will beg for his life and will not attack, only defending himself and backing into the corner of the cave.

If the players do not approach cautiously or fail their Stealth rolls, a voice will boom out of the cave: "Go away. Me not want hurt you. Leave Old Ben alone. Go away." If the players enter anyway, Old Ben will again only defend himself.

If the players spare Old Ben's life, he will tell them that he has not stolen any sheep. This is backed up by the fact that the only bones in the cave are of small forest animals like squirrels and rabbits. He can tell them though that someone has moved into the Ruined Tower that lies in the hills to the northeast and they might want to check there. He got this information from a talking raven that knows the

Maps

[A Small Task](#)

[Map of the Fairvale area [10K]](#)

Old Ben

Old Ben is a rather pathetic specimen of a troll. He is almost toothless and missing his left eye. He is also crippled with arthritis and moves only with great difficulty. He has lived in the cave alone since a group of adventurers killed his mate many years ago. He hid in the woods until they left and now only rarely ventures out to hunt small game with crude snares and traps. He has nothing of value to the players and wishes only to be left alone.

area well. He does not know who or what has taken up residence in the tower.

The Ruined Tower

The tower sits alone on top of a large hill. There is little vegetation surrounding it and it appears that any approach would be easy to spot. The tower itself is largely tumbled down and it appears that only the bottom floor and a small portion of the upper floor are intact.

A group of eight goblins led by a shaman has taken up residence in the tower. During the day, all the goblins will be located in the tower with one stationed on the remains of the upper floor to act as a sentry. At night, half of the goblins and the shaman will head south to steal sheep, while the rest remain to guard the tower.

If the players try to approach the tower in daylight, they make their Stealth rolls at a -4 penalty. Failure indicates that the goblin sentry spots their approach. If they wait until nightfall, there is no modifier to the rolls. If they approach at night, they will also see flickering light from inside the tower and smell a wood fire.

If the sentry spots the players' approach, he will sound the alarm and the other goblins will quickly take up defensive positions on the first floor. The goblins will take the time to flip over tables for cover, bar the door and fire their bows from the tower's arrow slits. The player's should have a very tough time of it if they try a frontal assault.

If the players decide to wait some distance away from the tower and watch, they will notice no activity during the day. About two hours after nightfall, however, they will see a group of five goblins leave the tower and head south. This group can be surprised and ambushed with a good plan.

In battle the goblins will rely on their bows as long as possible. They will also concentrate their attacks on the most lightly armored characters. The shaman will use her Daze and Haste spells to good effect.

If the battle is going poorly for the goblins and at least half have been killed, the shaman will attempt to parley with the players. She will promise to leave the area and not return in exchange for their lives. If the players agree, she will leave for the time being, but the players may very well run into her again in the future!

Once the goblins have been destroyed or forced to leave the area, the players are free to search the tower. They will find four sheep still alive in a small pen on the first floor. The goblins have no treasure other than what the shaman carries.

Aftermath

The village leader will be greatly pleased if the players manage to drive off or kill the goblins and return the stolen sheep. He will congratulate them in a ceremony before the entire village and hold a feast in their honor. He will also present each with a fine riding horse in exchange for their deed of service.

Each character should be awarded 2 character points if the players successfully return the sheep and deal with the goblins. 1 point should be deducted if they needlessly killed Old Ben. A maximum of 2 additional points should be awarded

Goblin Shaman

The shaman is quite smart for a goblin and she has brought her little band to the ruined tower in order to try and set up her own tribe. She has been leading the raids on the North Field. The goblins sneak close to the flock and she uses her Daze spell on the shepherds so that the others can steal sheep for food. She has carefully avoided confrontations with villagers so far in order to keep the goblin's presence a secret. Once the goblins have a base established, she intends to try and attract more followers and eventually attack the village itself.

for exceptional play and/or clever ideas.

Further Adventures

If the players want to continue adventuring with Fairvale as their base, here are some adventure hooks that you can use as the basis for future scenarios.

- A giant wanders into the area and decides to stay for awhile. He eats sheep, tramples crops and basically does as he pleases. He is *so* big, however, that simply attacking him would be very difficult and probably fatal. The players are going to have to find some other way to convince or force him to leave.
- A villager's plow breaks open the roof of a long forgotten tomb. The players can explore it to discover the riches (and dangers) that lie inside.
- If the goblin shaman escaped or the players allowed her to leave, she returns with another band of followers. This time, in addition to terrorizing the village, she is seeking revenge on the players' characters for her earlier defeat.

Advantages: Magery

Spells: Daze-13, Haste-13, Lend Strength-13, Lend Health-13, Minor Healing-13

Equipment: Staff (1d)

The goblin shaman wears a necklace that is strung with large gold nuggets. It would be worth $5,000 to the right buyer.

Murphy's Rules

by John Kovalic

Thank You, and Welcome

*(Editor's warning: I use the phrase "Thank you" twelve times in this column. This is **not** the "Obligatory Thanksgiving Column," mandated by federal law for all weekly columnists since 1863. You won't be spared. We apologize in advance.)*

Thank you, Dennis, for subscribing. I'm sure you would have at some point even *if* you hadn't been forwarded my public shunning by a friend, but this may have hastened the process. And since you're such an understanding friend and GM, I just *know* that the Acid Pit of Serverus I currently find my character trapped in is a passing phase, and not some petty retribution. Or if not, I know you'll let my new character be one of the cool alien races from *Star Crusades 2*.

Thank you, Melissa, for agreeing to join our *Star Trek* game back in '93. You were a *Star Trek* fan, but you'd never heard of roleplaying. Nonetheless, you were a welcome and wonderful addition to that campaign.

Thank you, Phil, for knowing about *Talisman*. When I saw this goofy game in the used bin at our FLGS, and I'd never heard of it, I asked you if it was worth it. You nodded vigorously, and you were right. That game provided many evenings of fun, despite hour-long debates and questions. (No, I *still* don't believe you can put the horse in the bag, despite the fact they're both objects.)

Thank you, Dave, for being a good sport about my need to kill you. You were roped into that first fateful *Supers* game, not because you were a gamer (I don't think you were), but possibly because my youthful Mountain Dewed enthusiasm seemed more exciting than the nothing that was currently on-tap for Friday nights. Unfortunately you made a *GURPS Psionics* character in a *Supers* world, and were thus too powerful to live. Your new character was just as cool as your original, while still being a bit more balanced.

Thank you, Colin, for playing a game that was wildly different from what you were used to. I know my gaming style was wildly different from the *Dungeons and Dragons* you were used to, but I still look back on that diceless session with you as a lawyer defending your client -- and by extension, humanity -- as one of the most memorable moments of that campaign.

Thank you, Amber, for inviting me to the modern LARP *Vampire* game. I was amazed at how nice everyone was to the newbie who had been playing *Vampire: The Dark Ages* too long, and thus had a penchant for inappropriate "thees," "thous," and "whilests." It was fun.

Thank you, Jim, for introducing me to *Axis & Allies*. I was terribly young, and I'm sure you didn't understand the top secret British "Spend All Our Money On Submarines" scheme, but you were very patient and understanding.

Thank you, Ms. Osborn, for having *The Warlock of Firetop Mountain* as part of the classroom's library. It was a favorite of many lunchtime discussions, trying to figure out who had *really* found the right three keys, and who was only faking.

Last week I started down the path of thinking about introductions to games; this week I continue it. Our hobby (or hobbies, depending on how divisive you're feeling) is built on friends. If you were an alien from Delta Cephei, and came to our planet in search of the powerful psychic networks that advertised their might through broadcast to the stars, and were looking for something to do once you obliterated them, the odds of you stumbling across any form of gaming as a hobby are slim. Golf, Bridge, cooking, coin collecting, crossword puzzles, movies . . . these are all hobbies you could conceivably stumble across by reading a newspaper, watching television, or otherwise experiencing the world. But most nice aspects of our fair hobbies (the ones that don't involve someone sad doing something sad and happening to have a copy of some game) are well-hidden, at least to the casual observer.

Which, for the most part, means that friends and acquaintances will quite probably remain a vital, if not primary, part of introducing new people to the hobby for the foreseeable future. Many won't like the hobby, in the same way that

many people try golf, Bridge, coin collecting, etc. and decide not to continue. But some will stay with the hobby, and it is through this new blood that all of us are revitalized and made aware of new viewpoints and ideas.

There are as many entries into our hobby as there are games to play, and I don't believe any are particularly better than any other. And for each game and aspect of the hobby we love, there's other parts we've never tried, new things we've never experienced, and ideas we've never thought of. We can all be newbies, if we keep an open mind. And we can all make sure our hobby stays healthy by inviting new players into whatever you're doing. For everyone who's tried something new, for everyone who's invited a friend to play something they haven't before, for everyone who's put up a sign in their local game shop looking for players, thank you.

And to the twenty-eight new people who've added in the last seven days who *aren't* Dennis, thank you for giving us a chance. Feel free to [write me](#) if you have any questions or comments. And thanks to those friends who may have steered you to us, too.

UnderWorld RPG

Published by [Synister Creative Systems](#)

Written by Gareth-Michael Skarka

164 pages, $19.99

"Deep below the streets of New York City, there exists a world of wonder and adventure, unseen by those above. Magic courses like blood through veins made from steel tracks and transformers. The Underworld is home to the Homeless, to the Freaks, to the Junkmen, and more. Steely-eyed Bravos hunt their prey in dark tunnels far below the subways, while brave Taggers scout new paths between the varied Domains, and mark the trails for all to follow. Creatures of Legend walk the platforms below the city, and brilliant Artificers build inventions of bizarre science, borne of madness.

"This is a world of heroes and villains . . . of magic and romance . . . of gods and monsters."

Welcome to the *UnderWorld*, a roleplaying game of subterranean urban fantasy underneath the subway systems of New York City.

Underworld is a place of Magic -- the deeper you journey, the stronger Magic gets. A brief history of Magic in the UnderWorld goes like this: as technology became more and more popular to mankind, Magic receded into the UnderWorld. Magic is not a renewable resource -- in fact, it should have been depleted during the Industrial Revolution of the 18th and 19th century. The reason why Magic (called the Radiance) still exists is because of the subway system -- the subways were laid out in an intricate pattern, enabling minuscule amounts of essence to be sacrificed for the replenishing of the Radiance. When you get the millions of people who ride the Subway, the Radiance is at an almost perfect balance.

Here's a breakdown of what to expect of the *UnderWorld RPG*:

Chapter 1 is the introduction. It gives the reader a history of the UnderWorld, sets the framework of the game, and details the single rules mechanic known as the Head Count. This involves is taking a number of tokens -- one is the default, but a player can gain more coins depending on Traits, Skills, etc. -- and tossing them. Every "heads" result is a success, and the more success a player receives, the better he or she did on the action. Simple as that.

Chapter 2 gives us the low down on Character creation. You pick a Breed (groupings of similar types of characters, be it species, race, or similar background), pick a Guild (the occupational organizations found throughout the UnderWorld), choose three defining Traits (the main descriptors of the character) -- one from Breed, one from Guild, and one from any of the lists. You then pick three Secondary Skills that your character might have learned from any Guild list, determine starting equipment, and you're ready to journey into the UnderWorld.

Chapter 3 goes reinforces the Head Count mechanic (being the core of the entire game, it bears repeating), and discusses the various uses of the Head Count system (like Fear and Exhaustion Checks, Feats such as Mental and Strength, and interaction between the Main and Supporting characters). We also get a lesson on the "magical background radiation' of the UnderWorld called the Radience, which is result of subways riding the arcane geometry of the tracks, and the riders giving up a tiny piece of their essence each time they take a ride.

Essentially, the deeper you go into the UnderWorld, the higher the "RadCount" of the Radiance gets -- this can have an effect on equipment (modern tech such as laptops and pistols will soon cease to function in high levels of the

Radiance), magic, Salvage Tech, and characters. In some places, the Radiance collects into sources with a higher RadCount than its surrounding area -- this is called a Radiance Pool, and they are treasured by UnderWorlders for the simple reason that Pools are of great aid in magic and the creation of Salvage Tech.

Chapter 3 also gives us a lesson in Combat (or, as the rulebook subtitles it, "Subterranean Ass-Kicking 101"). There are two types of combat -- Turn By Turn and Abstract. The Turn By Turn uses the Head Count mechanic, but instead of having to beat a difficulty number, the coin tosses are opposed, and the Combat is broken down into 3 turns: Initiative, Attack, and Damage. The Abstract method is best used for the live action game of *UnderWorld*, but can also be used for when the Conductor (the term for the typical Game Master) doesn't want to take too much time with fights against nameless characters. It all boils down to a three coin toss, and whoever gets three head results succeeds. The interesting part about this method is that for each advantage you possess in this combat, you can turn over a coin on either your side or your opponent's, making it a bidding war you have to win . . . or else!

Of course, with every combat, there comes a time for Healing, which is the last thing covered in the third chapter. Essentially, you toss coins and must match the difficulty -- which is the number of Wound Levels the victim has suffered. Success represents one Wound Level recovered (though it takes two days to recover if healed by normal means like First Aid).

Chapter 4 takes us to the mysterious (and sometimes frightening) world of Gifts -- be it Magic or Salvage Tech. Magic comes in the forms of Charms (small objects given power or simple actions that have been taught from generation to generation), Rites (powerful and very rare -- these can alter the fabric of reality itself), and Relics (objects that have the power of Legend or belief into their makeup).

Salvage Tech is the weird science that is the bread and butter of the Artificers Guild. Using junk they have found in the UnderWorld, these Artificers reshape reality to their will (with a lot of help from the Radiance), and create inventions that physical science could never even begin to imagine. Unfortunately, the Artificers are crazy, and the crazier they are, the better they can create Salvage Tech devices. Rules for inventing, lists for Charms, Relics, and Insanities can be found in Chapter 4.

Chapter 5 is the meat of *UnderWorld* -- the setting! Here, we find the Domains (little Kingdoms set up in the UnderWorld -- some benevolent, some not), the Locales (which can be placed anywhere in a particular Conductor's game), monsters (watch out for the Subway Dragons!), important people of the UnderWorld, other possible UnderWorlds, and details of the UpWorld.

Chapter 6 gives advice on how to create and run Supporting Characters, designing adventures and campaigns, the virtues of Live Action versus Table-top play. The author also goes into "Intuitive Continuity," a method which can also be used for any game other than UnderWorld, and contains some excellent advice for Conductors.

Chapter 7 helps those beginning Conductors with the adventure "Beggars Can't Be Choosers," a good starting adventure for the *UnderWorld* game, and includes a Random Seed Generator, which is excellent. Finally there's the Inspirational Sources, a wealth of information for future *UnderWorld* adventures. Check them out, or you might just be missing out.

UnderWorld was a work in progress, in which the details could be tracked down in the RPG.net column "Game Design Step By Step." This reviewer found the entire concept interesting, and when the game was available at GenCon, it was grabbed eagerly.

The only problems are the typos and the chapter titles, which are written in a "graffiti" kind of font which and makes it hard to read. Also, those people who like combat might not want to go that route in *UnderWorld*, for combat be very, *very* deadly.

UnderWorld is a wonderful book -- the setting gives you enough details to provide a Conductor with many adventures, and yet leaves enough room for said Conductors to add on to his or her campaign due to the lack of a metaplot. The fiction at the beginning of each chapter is also very well-written, and coincides with the setting flawlessly. *UnderWorld* is definitely for those who want to adventure in a new type of setting that has some basis in the modern

world. Don't be late catching this train, because it'll take you to a very different kind of adventure.

Comet Together: Thirteen Years of the Comet

"The Heathen write that the comet may arise from natural causes, but God creates not one single comet that does not foretoken a sure calamity."
-- Martin Luther

Good things always come in threes, and Halley's Comet always swings 'round again for another pass. With those notes, then, here's another Year of the Comet, to follow our first two (or our first five, depending on how we count these things). In fact, it's another thirteen years of the Comet; all thrown together by the mysterious passage in each of the thirteen years of that starry messenger, by the sudden flashes of mystical ley-historical power, and by the desire for a wicked-cool, transtemporal "sidewise in time" RPG setting. If the appearance of Halley's Comet can change history, imagine what it can do to thirteen histories -- at once.

"Time has not lessened the age-old allure of the comets. In some ways their mystery has only deepened with the years. At each return a comet brings with it the questions which were asked when it was here before, and as it rounds the sun and backs away toward the long, slow night of its aphelion, it leaves behind with us those questions, still unanswered."
-- Leslie C. Peltier, *Starlight Nights*

On May 19 (the year remains in dispute), thirteen worlds changed; thirteen epochs under the Comet found themselves occupying the same globe, each in its own region bounded by distant historical neighbors. Across continents and oceans, time shifted, dividing nations and unifying empires with casual (not to say causal) disdain. The thirteen Eras, then and now, in the Year 5 A.C. (After the Comet), have begun to blend into one Age, a time of Post-Cometary Adventure. PCs can be agents of one of the advanced powers (Brasil, the U.S., or the Siberian Soviet), Brasilian arms traders or expatriate Soviet mercenaries, would-be warlords in Europe or Southeast Asia, historians risking their necks for first-hand views of the former past, Victorian (or Roman, or Medici) adventurers trying to carve out a place for their homeland, "normal folks" suddenly thrown into the worst kind of future shock, or terribly unnerved Infinity Patrolmen. Here, then, is the geochronography of Reality Sidewise:

2061

Immediately after the Event, the Corporate States of Brasil put off their cyberpunk squabbling long enough to sieze the Europaspace facilities in Guiana (and Paraguay and Uruguay, as afterthoughts). Although Brasil is by far the most advanced state on Earth, a large number of 2061's foreign nationals (and a not insignificant number of local entrepeneurs) immediately left to become scientific, economic, or military advisers to other regions of the globe. By default as much as by politicking and quick action against vulnerable targets such as the empty steppes of 1531 Argentina, Brasil is now a superpower to reckon with. Brasilian conquest would have been easier (albeit even less pleasant) if a major Brasilian pharmaceutical company hadn't released a broad-spectrum antiviral agent into the atmosphere a week after the Event -- the plagues that usually follow cross-cultural contact and pave the way for invasion would not occur in this world.

1986, 1910, 1758

The United States holds the balance as it desperately tries to reverse-engineer Brasilian fusion technology at Stanford, support its crash-launched space station from Vandenberg AFB, and rebuild its time-jumped territory. It keeps its independence and freedom of action by nuclear blackmail -- much of the 1986 U.S. Pacific Fleet traveled along with 1986 North America west of the Rockies. President Reagan, as it happened, was even in California at the time, so the transition to the new capital at Santa Barbara was relatively smooth. The northeastern chunk of 1986 Siberia, complicating matters, brought a number of Soviet nuclear subs as well -- some of which are still loyal to the Siberian Soviet Socialist Republic. Vancouver and the edge of Canada easily reabsorbed the plains provinces just as the United States reintegrated the 1910 Midwest. Rather more troubling is 1910 Mexico, where President Pancho Villa uses Brasilian laser carbines and G.E.V.s with irksomely capable effect to raid Texas and New Mexico (having already split

Central America with Brasil's sphere of influence). It was the implicit Brasilian threat, as much as the appeals from 1986 historians (and Lee Atwater's clever collaborations in propaganda with Paul Revere) that convinced the eastern states and Nova Scotia (all drawn from 1758) to (re)join the U.S. -- George Washington's election to the presidency in the Year 2 A.C. on a unified party ticket helped re-ratify the Constitution and keep national disruptions to a minimum.

1607

1758 Quebec, of course, loudly proclaimed its allegiance to France, only quailing slightly at the discovery that across the Atlantic in 1607, King Henri IV ruled there. The 1758 Caribbean rapidly cut its own deals with Brasil rather than prop up the impoverished court of Philip III of Spain, who found himself forced to return Portugal to Brasil (and cede Henri's Navarre to France) the next year. Shakespeare moved to Hollywood, only one of the many Englishmen who decamped from James I's depressing Britain for the suddenly-enticing former colonies. Henri IV found himself the premier statesman in Europe, and quickly learned to play the Brasilian threat off for American development aid.

1456

Central Europe, from Sicily to Scandinavia, remains a menage of petty statelets nominally under the Emperor Frederick III, but in reality a chessboard for Henri's France, Brasilian and American agents, and the visionary Sforza-Medici alliance in central Italy. Florentine and Milanese scholars are everywhere, from aerospace laboratories in Sao Paulo to railheads in Williamsburg, learning the "new knowledge" as fast as they can. Although 1986 Soviet AK-74s found their way to every port from Manchu Nanking to Roman Carthage to Inca Quito, the copies stamped out in Pisa and Pistoia are just as good (and have already turned up in several internecine German wars). If they can keep their balancing act going, the Sforza and the Medici have big plans -- especially for the future of nine-year old Leonardo da Vinci.

1682, 1222

Peter (the not-quite-yet Great) has also been reading future histories, and has proved a remarkably effective Tsar for a fifteen-year-old, after overthrowing Empress Sophia thanks to a hero-worshipping team of Spetsnaz. Despite their aid, Peter has rejected the godless Soviet regime, although he gives high placement to any "future men" who prove their worth in his realm, which now extends from the borders of Poland deep into Central Asia. On his eastern border, however, Genghis Khan remains a threat, with his Mongol hordes caught at mid-boil by the 1222 Comet having just completed their conquest of Persia. Unexpectedly stiff resistance from the Romans in (formerly 12 B.C.) Syria and the one tank division remaining in Soviet Siberia have the Great Khan fully re-directed south to the vulnerable Manchu Chinese.

12 B.C., 1305

Drusus Germanicus, briefly in Syria during a Pannonian revolt, found himself acclaimed Imperator by the eastern legions when he halted Mongol probing raid out of Persia. Roman rule extends to Libya, through the Balkans (save for those rebellious Pannonians, now the problem of Drusus' allies in 1456 Venice) and into Armenia. Judea remains under Herod, although the number of foreigners in Bethlehem is beginning to create a problem for civic order -- unlike the confusing but basically sensible American and Brasilian scholars in Alexandria, the visitors to Judea seem irrationally convinced that their God (or something like that) is due to be born there any year now. To make matters worse, the King of Mali (by far the most powerful ruler in the 1305 stretch of Africa running from Casablanca to the Congo) is threatening a jihad against his African possessions unless he convinces the Ethiopian and Arabian tribes to allow Malian access to an obscure barbarian shrine in Mecca.

1835

Southern Africa, India, and China all came through the Comet together, in the year 1835. The Boers and the Zulus both face encroachment from Brasilian advisers "protecting" the Portuguese colonies in Mozambique, and the Brasilian post in Goa threatens Lord Auckland's control of the subcontinent almost as much as the Sikhs and the other suddenly-restive native powers. For whom, exactly, His Lordship rules India remains unclear -- Sir Francis Bacon's presence in Calcutta as Minister Plenipotentiary from His Majesty James I does little to clarify the issue. The Manchu Emperor Tao Kuang has his hands full as well, not only with revolts in Sinkiang and Tibet but with the collapsing Manchu position in the north. Genghis Khan's forces have rapidly assimilated horse-and-pistol tactics (and much to the dismay of the Siberian Soviet, seem to have obtained AK-74s from somewhere), and the Mongol raids push south into the Hwang Ho valley. Currently, the Son of Heaven weighs an ultimatum from the Siberian Soviets -- either he turns command of the Manchu resistance over to them, or they will "act to secure their southern border by any means necessary."

1380, 1531

The Siberian Soviets do, however, need oil to keep their independence -- their competition with Californian oil companies in the 1380 East Indies has rather seriously destabilized the Javanese empire of Majapahit and flooded the local Malay arms markets with submachine guns and assault rifles. Both sides deploy destroyers to protect their oil rigs and mount punitive assaults against the local pirates. Australia, remarkably, remains in its aboriginal calm -- Brasil can't afford the risk of uniting the Americans and Soviets by annexing that tempting real estate, and neither side will permit Lord Auckland to "re-establish" British control of the continent. Across the Pacific, a similar position holds in 1531 Inca Peru -- although Brasil casts greedy eyes on its sole independent neighbor on the continent, an attack would be tricky and would likely provoke joint Soviet-American retaliation. Atahualpa, perhaps foolishly, believes this standoff means that he can avoid modernizing his Stone Age theocracy beyond arming his household troops with the ubiquitous AK-74s. At the other end of the 1531 lobe, the Japanese daimyo continue their civil wars over an island that no industrial power covets.

It's Star Trek, Jim, But Not As We Know It

In the world of television and film licensing, there are only a few properties that everyone agrees would make good games. Such a property would have certain characteristics which would lend itself to good gaming: prominent, but not necessarily main characters, several kinds of possible adventures, a well-defined but not completely described universe, etc. One property that fits these criteria exactly is Paramount's *Star Trek* universe. Almost every game company has a recurring fantasy of taking the *Star Trek* license and releasing a game nearly guaranteed to be a huge hit. Likewise, many, many gamers have set games in the world of Captains Kirk, Picard, Sisko, and Janeway. As a result, the recent news that Wizards of the Coast subsidiary Last Unicorn Games will lose their license to produce *Trek* games to Decipher Games beginning next year is of great interest to *Star Trek* gamers. The popularity of the underlying property and the size of the companies involved make it of compelling interest to everyone. Let's look at this latest licensing news in this month's installment, "It's Star Trek, Jim, but not as we know it."

Some History

Back in the mid 80's, before **BattleTech** or **Shadowrun**, FASA held the license to produce a ***Star Trek*** roleplaying game. It was popular with fans and profitable for FASA, but both Paramount and FASA found the approval process taxing. A roleplaying game, which by definition includes a great deal of canon, or semi-canon, material requires far more effort on the part of the licensor's approval process than nearly any other product. Ultimately, FASA and Paramount parted ways, and RPG groups returned to homebrew interpretations of *Star Trek*. Though many gaming industry pros dreamed of taking over the license, for some reason no one was able to do it, until Last Unicorn games catapulted itself into the spotlight in 1998 with the release of its ***Star Trek: The Next Generation RPG***. At last, *Star Trek* had returned to gaming. Since that time, Last Unicorn has held up the quality of *Trek* material and earned many fans for its take on the venerable old franchise. So much so, in fact, that Wizards of the Coast acquired LUG earlier this year. A few weeks ago at Gen Con, everyone was stunned to read a press release from Decipher Games (makers of the ***Star Trek*** and ***Star Wars CCGs***, among other games) announcing that as of January 1, 2001, they would begin producing *Star Trek* games. But how could this happen, and what will the new games be like? How will this clash between two of the biggest companies affect the delicate balance of the industry? Let's take a look at these questions in turn.

What Happened?

The first salvo in the fight over *Star Trek* came earlier this year, when WotC took over Last Unicorn Games and, by extension, the *Star Trek* line. While it seems clear that control of the *Star Trek* game was a big factor in the acquisition, it was by no means LUG's only asset. In fact, Last Unicorn's biggest asset was (and is) its network of writers, artists, and editors who are intimately familiar with the niceties of working with licensed worlds in such a way as to please their own creative impulses, as well as the licensor's vision, and legions of fans. Though they may not be working on *Star Trek* going forward, and WotC's own *Star Wars* team has already been chosen, they will undoubtedly be put to good use in the WotC camp.

Nevertheless, I'm sure that WotC never expected to lose the license. What opened the door a crack is a standard clause in licensing contracts that requires the license to be confirmed if the ownership of a company changes significantly. Because the success of licensing contracts depends so heavily on the relationship between the licensor and the licensee, this protects the parties against having to work in difficult situations that would not have been acceptable if presented initially. Surely, WotC, especially in view of its relationship with Hasbro, expected that the license would be confirmed. Still, the buyout technically terminated the license, and Paramount would have a chance to make changes to the contract, or refuse it. Somehow, Decipher was able to convince *Star Trek*'s people that the license would be better off with them than in the hands of LUG/WotC. Why were they able to make this case? As they say in the world of finance, follow the money.

Why did they do it?

Decipher is in a difficult position. Before the card gaming boom, Decipher was most well known for producing the popular ***How to Host a Murder*** series of party games. In the heart of the CCG craze, Decipher was able to acquire licenses to two of the biggest media properties, ***Star Wars*** and ***Star Trek***. Their ***Star Wars*** game has been most successful, spawning many expansions to their main game, and several follow-up games in the ***Star Wars*** line. Licensed games, of course, follow the popularity of the main property and frankly, *Star Wars* has been far more successful recently than *Star Trek*. Undoubtedly, Decipher saw an opportunity to leverage its relationship with Paramount to acquire another source of income in a market segment (RPGs) that they had not yet cracked, perhaps as a hedge against further drops in the card game market, or a drop off in their ***Star Wars*** income (about which, more below).

In addition, Paramount must try to protect its own interest. As I have noted above, *Star Trek* has been suffering a slump in popularity recently, no doubt related to the under-performing *Star Trek* movies and *Voyager* TV show. If Paramount gave Decipher a short license (for example, only two years), they might have done so with an eye toward being able to charge a higher royalty when it came time to renew. This higher royalty would be justified by a revived property in case of another successful movie, or great popularity of the upcoming new *Star Trek* television series. Though it may appear a short-term move, this new license may signal Paramount's confidence in the future of *Star Trek*.

In addition, Decipher may be looking to its own future. At some point, Decipher's most successful license, ***Star Wars***, will come up for renegotiation. When this happens, WotC may be able to get its revenge. With the demise of West End Games' ***Star Wars*** line, WotC was able to get the rights to the ***Star Wars RPG***, no doubt in part due to its relationship with Hasbro, a long-time *Star Wars* licensee themselves. In addition, George Lucas himself is a Hasbro shareholder, as a result of Hasbro's acquisition of Galoob, which had given Lucas a stake in the company as partial payment of their license for Micro Machines toys. It is reasonable to expect that Lucasfilm would prefer to consolidate the license further by granting the CCG license to WotC/Hasbro. If this were to happen, Decipher could be severely damaged, unless they had already developed additional revenue streams. Their planned acquisition of FASA might have gone a long way to protecting their future. Now they will have to make other plans. Perhaps another buyout is in the works?

Paramount made the decision to take the license away from LUG/WotC and grant it to Decipher. Was it a good move? Were they right? Like most things, that depends on your point of view.

So what?

Although, as I discussed above, the loss of the *Star Trek* license may not be as big a blow to LUG/WotC as it might appear at first, they are clearly the biggest loser in this situation. They will recover (perhaps even by winning back the *Star Trek* license), but in the short term, their plans will be impacted.

Likewise, the fans could be adversely affected. By the time LUG released its game, FASA's material was long out of print and there were few players using its books regularly. Regardless of the quality of Decipher's products, there may be serious resistance on the part of fans to purchasing new core books and potentially having to learn a new system. (As I write this column, Decipher has not announced its choice of underlying system.) This fan resentment might also result in damage to the whole concept of *Star Trek* gaming. RPGs are not like towels or coffee mugs; when the licensor changes (even if it were to return to LUG/WotC) some fans are lost in the transfer.

The industry as a whole may be affected by this event as well. It is entirely possible that people will be less cooperative with each other for fear that information previously shared in a collegial atmosphere may be used against them. Likewise, the freedom of freelance writers and editors may be curtailed, if companies become reluctant to use people who have recently, or are currently, working with certain other companies. These issues are common in other businesses, but have not surfaced in our little corner of the market with any frequency. This is not yet a gaming industry "Red Alert," but I will be watching carefully as this event continues to unfold.

How Dead Philosophers Can Liven Up Your Role Playing Games

by Joseph Goodman

Art by Dan Smith

Characters as some role-players are wont to create them tend toward personality without perspective. Having decided on disposition, moral alignment (in the broadest sense), facial expressions, proclivity to verbosity or reticence, and placement on the continuum from civil to surly, sprinkled with colorful ejaculations and odd mannerisms, with perhaps an exotic life story (which always seems to come up in conversation) to "round out" the mix, the character is deemed complete. What is missing is what draws the line between interesting and intriguing: a philosophy.

Considering the ambiguity underlying the word "philosophy," I should clarify myself. What I actually mean is "moral philosophy." Much of moral philosophy revolves around deciding the proper outcome to a dilemma. So does role playing. The two are naturally made for each other.

The writings of renowned philosophers are a ready-made source for extremely detailed characters. When adapted to role-playing, a philosopher such as Aristotle, Immanuel Kant, or John Stuart Mill is a fascinating package. A gamemaster can easily name his Kant "Beloxik" or "Deathmaster" or whatever he wishes, insert him into a campaign, and play him in ways no other NPC has ever been played.

An even greater challenge is to attempt a player character based on a clear and defined philosophy. Making decisions exactly as a utilitarian or Aristotelian would make them puts all of your normal decision-making into question. I find it very challenging to stay within the role of someone whose decisions are completely rational and coherent, a marked contrast to the way most of us live our lives.

If you are willing to indulge the whims of long-dead thinkers, read the major works of a few philosophers and you'll be set. On the other hand, you could save yourself the trouble by finishing this article. I've taken three famous philosophers, Kant, Mill, and Aristotle, and presented them as archetypes for character behavior, admissible in any role-playing campaign. I haven't tried to regurgitate their own writings, but rather have endeavored to explain the way each would act if encountered as a person and not as just another antiquated treatise.

Kant

Immanuel Kant's claim to fame is "the categorical imperative": given a specific situation, you must act in the same way you think all others should act. You may never let yourself be an exception to a rule, and your decisions should be based on duty to rules of action, not the consequences of those actions. Practically this creates absolute dictates such as, "Thou shalt not lie."

The most famous (and most ridiculed) example of Kantian behavior is the "axe murderer at the door scenario": Imagine you and your best friend are gaming at your house. A homicidal maniac comes to your door, axe in hand, and asks if your friend is in there. It is clear that the guy wants to kill your friend. By Kant's standard you cannot lie to the

murderer. You must tell the truth -- "My friend is within." -- even if he dies as a result. Why? Because you've decided "honesty is the best policy" -- and you can't make exceptions to your principles.

Kantian characters follow categorical imperatives. Those imperatives are not based on allegiance, or some view of universal order; rather, they are based on the principle of universalizability (that is, that what applies to one person applies universally to all people). The "I" in "What I do" should be applicable to anyone and everyone in the same predicament. As the philosopher Paula Ioanide put it, "If the rules of morality are rational, they must be the same for all rational beings, in just the way that the rules of arithmetic are." Moreover, it is the will to act, rather than the outcome of the act, that determines morality or not. "If the rules of morality are binding on all rational beings, then the contingent ability of such beings to carry them out must be unimportant-what is important is their will to carry them out."

A Kantian NPC will cooperate with characters not because he agrees with their ends, nor because he is their friend. Those are tangential concerns. Kant acts in a situation because he believes that, given the situation, a moral person must act in the same way that he would wish all other moral beings to act in that situation. He would ally with PCs because they were acting in the right way -- which would only be the case if they were doing just what Kant were doing. There is a sense of duty in Kant, an obligation to obey your principles no matter what. Duty is as duty does; action for any sake other than duty alone is not moral.

So let's say a rampaging dragon invades the town. Serfs and peons run screaming in all directions. It's up to the characters to save the day! Their friend Kant has his sword handy. Does he act because he is friends with the characters? No. Does he act to save the townspeople (a goal)? No. He acts on an abstract principle, in this case probably something like, "In the face of unjust attack, I should oppose that attack." In this case opposing injustice saves the lives of many villagers. It just so happens that the characters are also fighting the dragon, so Kant helps them out.

In another scenario Kant could be making a terrible decision: Imagine if the attacking force is a dozen dragons, and Kant's friends decide to run (urging Kant to join them), so it's Kant versus a dozen dragons. Kant will still pick up his sword and go to certain death, a stern satisfaction in his heart, because of the moral principle that he should oppose unjust attack. (And, in theory, if everyone else in the village were a Kantian, they would all unite on this principle and perhaps beat back the dragons. Instead, the fleeing villagers are probably utilitarians, which I'll describe below, so they run for cover.)

Playing Kantians isn't always easy. You must act in the way that you believe everyone else in your situation should act -- which, until you get used to it, often requires a pause for the "uhh . . . " prior to any action.

Kantian characters correspond roughly to the idea of "honor" as many gamers conceive of it, although there is a huge difference between Eastern honor (e.g. samurais) and Kant: Eastern honor is based on fealty and obedience to a lord, while Kantian integrity is based on laws of universal reason.

The greatest conflict arises because of Kant's absolute conviction in the superiority of reason. All Kantians act based only on their duty to what reason enjoins. Suppose your character's wife is in the clutches of an evil wizard. Do you rescue her because you love her and don't want her to get hurt? Or because you have a perfunctory duty to ensure the safety of your spouse? The latter. Passion is the slave of reason. Love never motivates a Kantian's actions.

When Kantians become your allies, make sure you're acting morally! As long as you act with integrity you can depend absolutely on their allegiance, but the moment you do something that doesn't correspond with the Kantian's duty to reason, his own sense of universal laws might require him to oppose your own immoral behavior. A party composed entirely of Kantians of similar mind is perhaps one of the most reliable parties imaginable, for its members will always act together whether they like each other or not.

The advantage of playing a Kantian character is being assured of morality in the highest sense most of us can conceive of it. Kantians act on principle. Period. What higher morality is there than that? To the casual observer, Kant looks the very model of rectitude; it's only when you realize you have to fight off those dozen dragons single-handedly that you see the downside of probity. It makes for an interesting challenge in role playing, especially for characters who profess

to be moral archetypes.

Mill

"The greatest good for the greatest number of people." Sounds great, doesn't it? But when you get into the nitty-gritty most people are repulsed by the philosophy that espouses this doctrine, utilitarianism, of which Mill is one of the progenitors.

The premise of utilitarianism is best demonstrated by going to your local mall. Notice how everything therein features a price tag. Utilitarianism takes this principle of "pricing" and applies it to the full realm of human life. Everything has a "price" relative to everything else, measured in a satirical term called the util. Prices rise and fall according to the situation. Nothing is absolute, all things (actions, loyalties, principles, etc.) are commensurable, and everything can be "sold," in the sense of being discarded in favor of a better choice.

Utilitarianism is the most calculating philosophy there is. Am I your friend? Only if the benefits of my friendship outweigh the harms. In the theoretically ideal utilitarian world even things such as friendship would have price tags on them, with prices that fluctuate according to circumstances.

The model of a business most perfectly illustrates the idea of utilitarianism. Businesses pursue profit. Model Mill after that: he pursues advantage.

This sounds horrible, doesn't it? On the individual scale it has little appeal to anyone with the slightest inkling of humanity. It is on a societal scale that utilitarianism appeals. To use the oldest argument in the book: What if a governmental decision can save the lives of 1,000 people at the cost of only 10? Kant would never assent to that; no one can consider himself moral if he voluntarily takes even a single life, much less 10, regardless of the consequences. "Thou shalt not kill." For Kant it is the act itself which is moral, not its aftereffects. Mill disagrees. If you look at the world after the government makes its decision, you can either have a net loss of 1,000 lives, or a net loss of 10 lives. Which is better? Most people, Mill among them, would say the latter.

Utilitarian decision making is common in many arenas of life. The catch is that most of us discard such cold opportunism when it comes to, say, friendship and love. The absolute utilitarian does not.

But that doesn't mean he is scum. The scale on which his utils are weighed includes the society as a whole. A utilitarian will gladly sacrifice his life "for the greater good;" the problem is he will also sacrifice his property, friends, and even his mother "for the greater good." The goal of the greater good is a selfish sort of selflessness. It's possible to play characters only concerned with their own util count, but there's no challenge to that. Go for the greater good!

You can see where the conflict with Kantians comes in. In many cases, perhaps in most cases, Kantians and utilitarians will have coincident behaviors. But every now and then the utilitarian will realize that he could kill himself and contribute nothing to the greater good, or live to fight another day. Kant would rather die fighting.

Utilitarianism has no absolutes. Only the goal -- "the greatest good for the greatest number" -- does not change. Do I have the right to free speech? Only it helps society as a whole. If there are too many pornographers, then leave free speech by the wayside.

Mill's original spin on utilitarianism is actually slightly different than what I've presented above, as he believed the value of some things (say, art) was inherently higher than other things -- in essence, that some things were sort of "less relative" than others. This isn't true to the strict computational ideal of true utilitarianism: count your utils, and go with the most.

Everybody's heard, "Everything's relative." We can thank Einstein for the ubiquity of that sentiment, but it was Mill and his contemporaries who got the ball rolling in the philosophical realm. When playing a utilitarian, remember that everything is relative. Be as capricious as the situation. Your decisions are recalculated as their parameters change. Sure, you may have made a promise, but your promise was premised on certain considerations; without those, new

calculations show a better path. Utilitarianism is all about the best resolution to a situation, measured in tangible things like lives and cash, rather than wishy-washy ideals like "honesty" or "integrity."

Allying with a utilitarian is always a risky proposition. Even if he is devoted to the "greater good," that may someday mean offing you. If Mill were to face a dragon with his friends by his side, he'd probably fight. If Mill and his friends were to face a dozen dragons, Mill would run. And if the dragons threatened to raze the town and everyone in it unless Mill skewered two of his friends, Mill would skewer his friends. Kant, on the other hand, wouldn't.

Aristotle

While Mill and Kant offer clear rules for decision making, respectively utility and the categorical imperative, Aristotle offers an idea of life as a whole. It is a very different kind of thought from modern-day morality, and although Aristotelianism is seeing something of a comeback, it takes some effort to get it to fit in a modern head.

Aristotle's philosophy is roughly characterized by three tenets: reason, teleology, and community. It's hard to explain any without the others.

Most important is to understand that Aristotle comes from a world where nothing is relative. There are clear and definite absolutes. The existence of absolutes precludes recognition of universal commonalities. There's a reason Athens kept slaves and subjugated women at the same time it organized its wealthy white males into a democracy. In modern terms of universal human rights this was clear hypocrisy (and worse), but the Greeks had something we don't: roles. You didn't play them; you lived them. You were not born into society as an independent atomic individual; you were someone's son, someone else's brother, and part of a family, tradition, social class, and city. Roles were different, and different people were in different roles; ergo, there was no concept of "universal rights," or anything else universal for that matter. Women, men, and slaves weren't all human; they were women, men, and slaves, three very different roles.

These social roles were enforced by the tight-knit society around them. "Man is a social animal" is a direct quote from Aristotle. There was none of the universal and indiscriminate freedom many of us have. You were given a lot in life from the moment you were born, and you lived that lot.

This is the first rule of playing an Aristotelian character: play your role. This sounds redundant as can be, but it's not. You as a player play the role of your character, but your character in turn must live his role. He can't just be "a warrior." He must have a clear notion of his attachments to his world (family, community, nation, and religion) and the standards of behavior expected of someone of his station. Moreover, attachments create allegiances, and your character must have them, firm and unchanging. The character should have a deep sense of what is expected of him, his place in the world, and moreover, the goals appropriate to someone of his role.

This idea of goals or ends fits with Aristotle's teleological outlook. He was convinced that all things in the world were oriented toward some goal, and the greatest goal was the furtherance of reason. Reason being the exclusive domain of man, the universe was thus created with man in mind.

Concluding that the universe was created with man in mind gives one a pretty strong sense of righteousness. Your character should have this, almost an arrogance as he continually strives for perfection in his role. What makes a Myrmidon warrior the perfect Myrmidon warrior? I don't know, but if your character is a Myrmidon he'll spend his life trying to find out.

Notice how nicely this corresponds to class-based character systems. It's much harder to implement in skill-based

systems. The reality is, in Aristotle's time, with the exception of the wealthiest aristocrats, no one could pick and choose what he learned. You were born into a role, a class in the role playing sense, and endeavored to be the best of that role that you could be.

While this seems to preclude characters from attempting the Renaissance approach to character building -- "Jack of all trades, master of none" -- that's not entirely impossible. Aristotle's image of perfection was a human one (unlike his predecessor Plato). Even the greatest Myrmidon warrior was still a part of his community, not some cloistered "battle-brother." As such he still took part in the public life, raised a family, and supported his household, necessitating skills beyond those of a warrior.

So this gives a clear view of the Aristotelian life: striving to perfect the role you are given within your community. It doesn't sound hard as a model for a character's life. But while Aristotle addresses the big picture that Kant and Mill ignore, he is pretty vague about the details of how to make day-to-day decisions. The idea is to achieve the appropriate measure of virtue by using "practical intelligence" (phronesis). Aristotle's theory of the mean, which is often incorrectly interpreted to advocate moderation, states that within the bounds of each situation you should strive for the appropriate sort of behavior. This is great for metaphysics but not too useful in day-to-day decision making.

It's that ambiguity that makes Aristotelian morality so interesting. You can never know for sure if you're acting morally or not, but you still orient your behavior toward this ideal role model. It's almost like the Army: "Be all that you can be!" But it's not like the choice to join the army. It's an innate orientation. Aristotle believed in an ultimate order, and within this a clear teleology: you're not just choosing to act as wizard, you are physically ordained to act as a wizard should. The question is whether you'll get it right.

Aristotelian behavior always includes considerations of one's standing in the community. Contrary to the American tradition of nonconformity and individuality, Aristotle says you should do things precisely because you want others to think highly of you. You should be very worried about whether your neighbors respect you, because you are deeply rooted in your community. For Aristotle, modesty is a vice; there's nothing wrong at all with making others aware of your accomplishments.

It is this deep sharing and public personality that creates the most binding principles of Aristotelian morality. As Ioanide puts it, "Since all citizens aspire to the same universal good, my 'ought' necessarily encompasses you." A homogeneity of culture creates views not unique to individuals, but shared and thus binding. Therefore, the Aristotelian character sees no reason not to enforce his beliefs on others. "For Kant it would be possible to say, 'Though my community's actions are wrong, I am doing right,'" continues Ioanide. "According to Aristotle's conception of the community and the individual's role in it, this would be impossible." This notion is completely foreign to most Americans.

So what would Aristotle do when the dragons attack? It would depend on all sorts of things. The theory of the mean requires an evaluation of the situation and a determination of the appropriate sort of behavior. This, in turn, depends on one's role. If Aristotle were a warrior, and the dragon attacked his own community, he would defend his neighbors with enthusiasm. What if his friends left him? Well, then it depends on what a warrior is supposed to do. Does the idea of a warrior involve self-sacrifice for a higher goal? Not necessarily, but Aristotle's idea of warrior does depend on the key importance of the community. So Aristotle the warrior might stay to fight a dragon single-handedly if it were necessary to defend his city. Besides, retreating would look bad in the eyes of the community. What if there are a dozen dragons? Well, then the community might understand a retreat.

But with Aristotle you can never know for sure. His moral model is much more about striving for the "good life" than living by certain rules. In Kant's world anyone can be moral, as long as they follow the right rules. For Aristotle, you have to have it in you; you have to be able to make the right decisions. There's no easy recipe.

It's this "good life" that sets the stage for Aristotelian friendship, a topic he discusses in great detail. The deepest friendships, he says, are with those who are not only pursuing the same path to the good life that you are, but are at the same point on the journey. You cannot relate to those more excellent in their role (but you can learn from them), and those less excellent are too base for you to associate with. Casual acquaintances don't have to meet these rigorous standards, but your real friends certainly do.

In game terms this means you're not likely to find Aristotelians adventuring with characters who don't share similar goals, nor those much weaker than they. In fact, if Aristotle's friends left him when the dragon attacked, it's a good bet that Aristotle would hold a grudge against them forever thereafter. Attachments between people are extremely strong in his view. To leave your friends like that is simply unheard of.

The Aristotelian "good life" is not contained in the superficial word "lifestyle" that we use these days; the "good life" is a much deeper view encompassing the whole of a life, both qualitatively and temporally. The ancient Greek view was you could never judge a man happy until he had died, for only then could you evaluate the whole of his life. Happiness wasn't an emotion; it was an evaluation of how closely one approximated the good life. Aristotle shared that same ideal of a life well lived, calling it eudaimonia.

Roleplaying Aristotle is a good way to get out of our own modern perspectives. It is a great challenge to play an Aristotelian character, someone who must always consider a multitude of factors that we often ignore. While utilitarianism and the categorical imperative provide complex but clear decision-making criteria for Kantian and Millian characters, the Aristotelian is never quite sure whether he's on the right track or not.

Further Reading

Almost any moral philosopher can be a character model. If you want to get some really mean types, I'd suggest pursuing Hobbes (his "Leviathan" is a massive justification of "might makes right") and Machiavelli ("The Prince" is a guide on how to be a cold, calculating manipulator). In the other direction is Hume. At the ultimate extreme of idealism is Plato. "To know the good is to do the good," he said, and if you're interested in finding out his ideal of morality, read the *Republic*.

For more information on Aristotle, I recommend reading his *Nichomachean Ethics*, preferably the translation by Terrence Irwin. His *Physics* would interest anyone familiar with fantasy magic systems -- believe it or not, a universe based on earth, fire, wind, and water was in his day top-notch scientific theory.

Mill's treatise explaining utilitarianism is unimaginatively entitled *Utilitarianism*. *On Liberty* will also give you a good idea of his perspective.

As far as Kant goes, I advise staying away from him. Not only did he write in German, but he was a horrible writer to begin with, and translated badly written German doesn't make for a good read. Go for secondary sources. Better yet, take a philosophy class and pay attention to class discussions. That's what I did. I couldn't bring myself to trudge through his own words. If you're foolhardy enough to try, though, I recommend a cold shower and then *Grounding for the Metaphysics of Morals*. It doesn't matter who translates it; they're all incomprehensible.

by Steve Hatherley & Ralph Melton

Illuminati: New World Order brims with opportunities for negotiating, trading, cooperating, threatening, and back-stabbing. These opportunities offer rich rewards if you know how to use them and develop the attitude that everything is for sale. Deal-making wins games.

Binding Deals: Trades

The simplest form of deal is a trade, in which two players agree to give each other something simultaneously. Trades are the only binding deal in *INWO* and therefore provide a security that the trade will work, even if the person you're trading with is untrustworthy.

Plots, groups, resources -- you name it and it can probably be traded to another player. About the only things you can't give away are your Illuminati and plots that have already been played -- and there are sometimes ways to give away the plots.

Trades don't have to be an even swap. You could offer to use a group's special ability in return for a plot card, or you could swap a Resource for a group. Alternatively try trading for information, for aid in an attack, or just to remove an action token from a threatening group. You might even want to sell a group's ability -- you may find it easier to keep a normally annoying group if your rivals know that they can use its ability for a price.

Start trading early so that the other players become used to the idea of making trades and deals. You might lose out initially, but maybe you will be able to make a better deal later on. And even if each of your deals is not as profitable to you as to the other player, you can make up for this with volume by dealing with every player.

Most players will be reluctant to trade for a card without knowing what it is. If another player offers you a Plot but won't show you what it is, you should assume that it's worthless to him and to you.

Non-Binding Deals

Deals involving almost any aspect of the game are possible, but anything that isn't an immediate trade or requires some future action isn't binding. These deals require trust. For example, promising the attacker that you won't attack him on your next turn permits him to spend more to bring down another opponent, but does rely on you being trustworthy.

The actual details of such deals are only limited by your deviousness. Some examples:

- **Discounts:** "Give me a plot card now and I will modify the dice roll with WITCH if you need it. If you wait to see if you roll badly, it will then cost you two plots."
- **Loans:** Let someone use your Resource on their turn, and return it during the next. You can't do this with a Resource linked to a group, but any other Resource is fine.
- **Powering Cards:** You can't power a card for someone else, but they could give the plot to you and you could then play it for them.
- **Holding Plots:** If someone has too many Plot cards and can't decide which ones to get rid of, offer to hold one of them for him.
- **Favors:** If you have nothing else you wish to offer for a small favor, you can simply say, "I'll have good feelings

towards you." This promise then needs to be worth something, such as the use of a minor action token later.

Threats

People usually trade to get things that are beneficial to them. However, you can also trade to get things that are threatening to you. For example, maybe the player with two action tokens on the Nuclear Power Companies would offer to use one of them on your behalf in exchange for your Nuclear Accident . . . and if you phrase it as an offer, it makes your implied threat seem much less offensive.

If you're about to attack someone, consider mentioning it to them before you commit your attack; perhaps they'll offer you something to choose another target. (And if they're feeling secure in their defense, maybe it'll show in the negotiation.)

Public negotiation can make your threats seem less cruel. Saying, "Okay, I'm Cthulhu, and I feel I ought to attack someone, but I'm not sure who. Bribe me, someone." makes everyone aware that they might be a target, but also motivates them to influence your decision with favors. (And yes, you could be convinced to do nothing . . .)

When all else fails, be blunt: "Give me a plot card or I'll cancel your action."

Be warned -- some players will resist threats automatically, and take steps to eliminate the threat to themselves.

Cards Suited to Dealmaking

Two cards from the *Church of the Sub-Genius* set are designed for making deals. Slackfusion allows you to exchange Illuminati action tokens and Dokstok provides you with an Illuminati action token that you can do nothing with but trade or give away.

Cards that steal your rival's plot cards (such as the Arms Dealers) can be effective in setting up a deal. Force your to rivals beg for their safety -- or offer to deal if one is played against you. Consider the evil joy in saying, "If you help me out, I'll give you back your Goal."

Similarly, the action cancelers can also be used as the basis for deals. Action cancelers are especially good at making threats, but can also be used in positive ways if you are prepared to sell their services to another player.

A few specific cards to get you thinking:

- **MWOWM:** Use MWOWM to grab a discarded plot that you don't want and then trade it to one of your rivals who does want it.
- **Orbital Mind Control Laser:** Having difficulty using a card because you don't have the right alignment? If someone has the Orbital Mind Control Lasers find out if they are willing to use them on your behalf.
- **Red Cross:** Bandages are expensive, so get your rivals to pay for Red Cross when they bring relief to a devastated place.
- **IRS:** If you immediately return the card you "tax" with the IRS, you are effectively allowing someone to draw an extra card each turn. What is that worth?

Fringe Benefits

Dealmaking offers other, less obvious, benefits.

- **Information:** if you are offered Plot cards you get information about your opponent's hand. You can also learn what they're looking for and what they value from how they trade.
- **Forewarning:** if an opponent is willing to propose a deal before attacking you, you can ready your defenses, redirect the attack to a place where you won't mind the attack as much, or propose a counteroffer. Suppose that your opponent is planning to blast New York with three puppets, and though you could put up a stiff fight, you won't be able to defend it. Perhaps you could offer him one of New York's puppets exchange for a minor favor and not attacking -- both of you are better off than you would have been if the attack had gone through.
- **Protection:** someone who expects to get favors from you has a vested interest in making sure that you are able and willing to provide him favors.

Another way to manipulate people: making a deal that results in another player's Nuclear Power Companies cancel a rival's action means that the NPCs will be powerless to stop your fiendish schemes.

Therefore, start dealing early. It's even worthwhile encouraging deals between other players (as long as it doesn't directly hurt you), because it makes it easier to strike a deal when you need it.

Betrayal: Do No Small Evil

Dealmaking in *INWO* provides clear opportunities for backstabbing and betrayal. You can go back on a promise

you've made, use I Lied to break a trade or steal the Plot card that someone is offering with Go Fish. But it's often a bad idea. Once you become known for these things, other players will stop making deals with you (or in extreme cases, dedicate themselves to exacting revenge). The key to successful betrayal is to only indulge when the reward is so great that it's worth all the mistrust and missed deals that it causes.

Cultivate a reputation for keeping your deals -- the spirit and the letter. Adhere to your deals as a point of pride. After all, there's no need to break deals when there are so many other lovely ways to manipulate people and lead them into error . . .

Don't betray people on small things, and don't betray them when you expect them to be able get revenge. If you go back on a deal at the beginning of a game, no one else is going to deal with you all game. On the other hand, people are sometimes quite forgiving of a spectacular betrayal if it gives you victory.

On the flip side, a substantial fraction of the people who will betray you are unsubtle enough to do so at first opportunity. If you make deals early and often, you can draw these people out, and learn about their perfidious habits at a time when you can recover from being betrayed.

- **Go Fish:** If you Go Fish someone who has shown you their Plots to make a deal, people will treat it as breaking a deal. Do it only under the same circumstances that you would break any other deal.
- **I Lied:** Watch for deals that seem too good to be true. According to the [Daily Illuminator](#) during one of the early *INWO* tournaments one player offered his rival $20 to forfeit the game . . . You can guess the rest.

Sharing Victories

Sharing a victory is the best deal you can make.

The proper ethics for sharing victory is to care only about your victory. If other people also win, fine -- as long as you also win. By the same token, if you can't stop someone else from winning, you should neither help nor hinder them. You've already lost -- why spoil it for someone else (who might remember and prevent you from winning in the future).

Occasionally two players win independently on the same turn. It's not very likely, though, because players usually have their best chances to win on their own turn. When it does occur, it is usually because someone has made a desperate catch-up attempt. For example, a Cthulhu player might go on a Disaster spree, or Shangri-La might stretch to play some Kinder and Gentlers.

It's more common for victories to be shared through cooperation. There are a few ways to share a victory that don't leave open the possibility for someone to get betrayed. More often, though, you have to trust each other. Shared victories are easier if one partner holds off declaring victory so that the second partner has a chance to win on a later turn.

There are a few ways to share a victory with a trade. The Adepts of Hermes could trade a group for two magic resources, or the Bermuda Triangle could trade two groups for one with the alignments it needs. Both trades put both players closer to victory. However, most shared victories require some trust to last until the end of the turn.

Examples of Sharing Victory

If two players are trying for the basic goal, one might help the other attack to control three groups from a third player.

If the attack is successful, the attacker would then give one of the groups (or another group entirely) to the other, helping, player -- and they both win.

Several goals depend on power either directly (Bavaria or Bermuda) or indirectly (the groups-count-double goals). New World Orders and power-boosters can be a way to affect a rival's power-related victory conditions without affecting your own. Or use Rewriting History to change the alignment of a destroyed group to help someone attempting one of the destroy/control types of goals.

If power is your only concern, you could trade away two groups in exchange for one of higher power. Alternatively you could exchange a low-power group for a power-doubling Resource, such as the Necronomicon.

The Society of Assassins' secret groups count double if they are more powerful than any other player's secret groups. So if you control a powerful secret group, it could be worth up to four groups to the Assassins -- and you have the basis for a fine shared victory.

A shared victory is possible with Arise! if your "ally" takes your last group in an attack. You can help the attack, and if you organize your power structure properly you can make sure that he gets a handful of groups -- enough to share victory with you. This is super-cheesy, and people who do that sort of thing should be mocked. Better yet, instead of mocking them, use Go Fish to steal Arise! (before they reveal it) or make Arise! worthless with Interesting Times.

Shangri-La

Shangri-La has more deal-making possibilities than any other Illuminati because they don't have to own the cards they use to win. It is easy for two Shangri-Las to win, and you can certainly pack Unmasked and Shangri-La to help sweeten a deal. But there are other possibilities:

- If there's enough Peaceful power in play, Shangri-La should be only too happy to help someone else take over a Peaceful group that would make them win.
- If there's a Peaceful Messiah in play, Shangri-La might give its owner some of its churches.
- Shangri-La should be happy to give the Church of Elvis to Elvis's owner. And in general, Shangri-La should be happy to give away its groups and resources in exchange for boosting the Peaceful Power in play.

The possibilities are glorious.

Opposing Shared Victories

When faced with a shared victory you have two options -- join them or thwart them. (That's assuming you have any options at all.) Your best option is to join them, by any means possible. If you have some way to stop one of your rivals winning, try striking a deal that involves you not thwarting them in exchange for them helping you win too.

If that fails, you have no alternative but to thwart the victory. You may need your other losing rivals to help you in this. You might also want to play the would-be-victors off against each other: "We can thwart you. If you make it easy, then we'll have the resources to thwart the other player, too. If you make it hard, we'll only be able to thwart you, and the other player will win."

Negotiate to Victory

And that's it. All that's left is practice, practice, practice. So next time you start playing, thinking about your trading and dealing opportunities, and negotiate your way to victory. See you there.

Pyramid Review

Blood Treachery (for Mage: The Ascension/Vampire: The Masquerade)

Published by [White Wolf Publishing, Inc.](#)

Written by Scott Cohen and Steve Michael DiPesa

$14.95

I don't think I've ever been entirely satisfied with a *World of Darkness* crossover product. I liked *Chaos Factor* more than most people, and I still didn't like it too much. *Dark Alliance: Vancouver* felt like it took a bit too much away from both werewolves & vampires to bring them together.

Blood Treachery is a crossover of sorts, but one that doesn't really forget its source material. It's quite definitely a sourcebook for *Mage*, with all the oddness and beauty that entails.

The story is as such: with their magic beginning to fade and sputter, the forces of the Order of Hermes begin to panic. In that panic, they decide that a good best course of action is to take back information taken by the Mages of house Tremere, when they became vampires.

The Tremere, of course, aren't in a hurry to let their mortal counterparts abscond with their store of occult materials. Hence, the second Massasa war (Massasa is fancy *Mage* talk for 'undead'). The book describes the events of the war nicely. The end (it's more a stop than an end) is satisfying, and the aftermath serves to weaken the Hermetics as well as (hopefully) awaken them to their duties.

The book's format is, to say the least, unique; it is written as a Greek tragedy, with the oracles of *Mage*'s nine spheres acting as the chorus. The play is set with each character wearing a mask, red for the vampires, purple for Mages, purple with red streaks for those Mages who've tasted vampire blood.

It sounds quirky, but the authors succeed in pulling it off wonderfully. The chorus plays particularly well; Forces empathizes with the Hermetics, Time and Entropy watch as events progress as they know they will, and Spirit senses the passing of ghosts and other anima.

The story is told from a number of points of view, including a small adept cabal, several members of House Tytalus, and an elder Tremere who remembers being a mortal Mage (or being a non-undead Mage, at the very least). The war proceeds on, with occasional vignettes to show its effect on other players in the various factions.

My one complaint is that the overly stylized presentation of the war does subtract from the hard mechanical info, or even the "straight story" details. For example, in one sequence, a group of Hermetics encounters a squad of Assamites when both raid the same Tremere chantry at the same time. Another scene shows Hermetics co-operating with Carpathian vampires. There's never anything else on the interaction between Mages & non-Tremere vampires.

This isn't a horrid drawback (you can probably see a lot of possibilities coming from just the descriptions), but I might have liked some info on it in the mechanics section, if only a couple hooks to hang a plot on.

The largest drawback of the sourcebook is, of course, that it deals primarily with advancing and expanding the metaplot (it is, after all, part of the *Year of Revelations* series). If you're of the brand of player whose eyes bleed at the mere mention of the M-word, your enjoyment of the book will suffer commensurately.

There are a few smaller rules sections at the end of the book, detailing the interactions of hermetic Mages with various umbrood. There's also an appendix on the effects of drinking vampire blood on Mages. It's not pretty. Becoming a ghoul is pretty much a one-way ticket to grade A messing up; it also handles a few other matters for vampire/Mage interaction. For example, it describes the ways thaumaturgy can be used to oppose true magic, and how magic interacts with various vampiric disciplines.

My favourite line in the book describes why the magic ritual to turn a vampire back into a mortal will fail at dawn every day. Why, you ask? Because "Vampirism is a curse from God. Can you roll more successes than God?" Somewhat trite, but an interesting way too put across the current status of *Vampire* with regards to *Mage*.

Blood Treachery succeeded for me as a sourcebook. Even though I don't really enjoy *Mage* that much, I loved watching the story unfold. It enforced what I think is a theme that *Mage* players need to experience more often; Hubris can lead you to a **big** fall. Characters who go through the events outlined in ***Blood Treachery*** will probably learn that lesson.

-- Justin Mohareb

Pyramid Pick

Ork! The Roleplaying Game

Written by Todd Miller and Chris Pramas

Published by [Green Ronin Publishing](#)

$12.95, 64 pages

Ork! The Roleplaying Game is all about unleashing your inner ork. That's right, your inner ork. The nasty, brutish, foul- tempered, foul-mouthed belching moron who commits grievous acts of aggression because it feels like it. It is not about the deep metaphysical meaning of being an ork -- it skips right to the part where you fight.

Ork! is targeted at experienced gamers, but only in the sense that it skips the normal explanations of how RPGs work, extensive novice GM advice, etc. They also expect you to have a full range of polyhedral dice (you need d20s, d12s, d10s, d8s, d6s, and d4s), something newer gamers might be lacking. The game itself is simple, and could work very well as an introduction to novice gamers . . . that is, if you want to introduce novice gamers directly to their inner ork.

Ork! character creation is simple. The four stats -- Meat, Bones, Twitch, and Mojo -- are rated in terms of the dice you will roll for that stat. You have 32 points to distribute to the stats, giving a range from d4 to d20. Meat is physical strength, Bones is toughness and stamina, Twitch is agility and quickness, and Mojo is charisma and magical power. Skills -- all 16 of them -- range from 1-5, and are rated in the number of dice you roll. An ork with d12 Meat and 3 levels in Fight would roll 3d12 when he uses that skill; if he has d4 Mojo and 2 levels in Lead he will roll 2d4 when rolling that skill. Equipment is even easier -- just pick one of 4 sets of possible equipment (mostly weapons) and go! Character creation takes scant *minutes*, and because Orks are not very complicated beings, adventures should take only a little longer for a GM to set up.

Task resolution in Ork is based on the idea of opposed rolls. Every roll in Ork! is opposed. Where a typical RPG would have a target number to beat with a skill roll, Ork has the PC dice against their callous god (aka the GM) to succeed. "Such [target number] systems are for the weak, since they allow the GM to show the horrid trait of mercy" is a perfect example of how Ork! handles such situations. Instead, the GM takes the part of Krom, God of the Orks. He decides how much Krom cares if the ork succeeds or fails. If Krom approves, the GM will roll 2d6 (or any other die type he chooses -- Krom is a god, and doesn't have to play fair if he doesn't want to) against the ork's roll -- if the ork wins, he succeeds. If Krom hates an ork for trying -- or the ork tries something really hard -- the GM can roll up to 5 dice against the ork. Contests between orks and other critters -- such as Giant Cockroaches, Trolls, or Squishy Men (read "Halflings") -- are handled in the same manner, with each rolling dice and comparing the results to determine the winner.

Ork! also has an interesting, and simple, "experience point" system. Orks can earn Ork Points, or OPs, for doing "something that especially Orky." OPs are what other systems would call Hero Points. An Ork spends them to add to skills, roll or resist damage, or reroll failed skill rolls. An ork can also spend OPs to increase skills, but a limit of 1 skill increase per session discourages saving OPs instead of spending them like they are going out of style. *Ork!* also encourages the GM to hand out the points during play and not to keep too close track of them, to further encourage their rapid use. GMs can also be inconstant about rewards -- players who complain are not acting like Real Orks! Orks can also increase stats, but only by surviving a minimum number of adventurers in the incredibly harsh Ork world rather than by spending points.

Ork! includes everything you need to know about ork society, ork reproduction, ork shamans and why orks should

tread lightly around them. ***Ork!*** has a bestiary of common ork foes -- the aforementioned Squishy men, Giant Squids (who inhabit everything from small puddles on up), and so on. Ork! also has a complete starting adventure and a couple of pages of adventure seeds to get a GM's, er, Krom's, mind churning with ideas.

Does the game have down points? Yes. It has no index, although it does not seem necessary. Few rules should need to be looked up once you start playing. Another down point is the need for d20s, d12s, d10s, d8s, d6s, and d4s. Old RPGers probably have buckets of these to dig into, but they will be an added cost for groups without them. The game is also very silly, which may not be to the taste of some gamers. This is not a game for people looking to add depth to the culture of the orks in their fantasy worlds.

The price-to-pages ratio may also concern some potential buyers. $12.95 for 64 pages seems like a lot -- this feeling should disappear once you read through the book. It really is all you need to unleash your inner ork, it is packed with humor and fun. The game is well written, rules are laid out well, the artwork is appropriately gory, and both the game and rulebook are full of humor. ***Ork!*** is as close to a beer-and-pretzels RPG as I have ever encountered. I enjoyed it immensely, and look forward to further unleashing of the inner ork of my local gamers.

-- Peter V. Dell'Orto

Pyramid Pick

The Hills Rise Wild!

Published by [Pagan Publishing](#)

Designed by Jesper Myrfors and John Tynes

Artwork by Dennis Detwiller

$29.95 (expected retail price); 18 Board Tiles, 32 Cards, 24 Cardstock Miniatures, 24 Corpse Markers, Damage Hats, character sheets, and Rulebook

Pagan Publishing's contribution to "beer-and-pretzels gaming" is this year's GenCon release of *The Hills Rise Wild!*, a miniatures game of brutal redneck carnage. Two to four players control their teams of redneck Ghouls, Mutants, Deep Ones or Cultists to slay their opponents, find the mystic Necronomicon, and summon their favorite Elder God. Fun for the whole family, assuming it's the Whateley family . . .

Players can choose their teams from the Marsh Clan, the Whateley Clan, the DeGhoule Clan, and the Cult of Ezekiel. The six characters on each team have special abilities that they can use once per game, and some characters have abilities that can be used every turn! Weapons are hand to hand and distance, including guns, spells, tentacles, and psionic powers. Damage gets dealt, and impressive dice rolls take you to the Brutal Damage Table, where your characters get hurt so badly that *you* feel their pain.

Setup of the game is simple: cut apart the cardboard miniatures, including the corpses and Damage Hats. (The hats hang off the top of each character as they get hit, becoming stunned or unconscious). Each player gets dealt board tiles, and everyone takes turns laying out the board. Strategies involve putting tiles with shacks (each shack has its own mystery card) near you, while saddling your opponents with open fields where they'll be sitting ducks for your distance weapons. And, of course, if you're the lucky (or unlucky) player with the Whately Mansion, you'll want that near you. If you can find the Seal.

Yes, the Whately Mansion became mystically warded with the death of Old Wizard Whately, and you'll need the Whately Seal in order to open it to get your hands on the Necronomicon. If you've survived that far, you'll try to make it back to your home tile to perform the (potentially fatal) summoning.

After laying out the board, players start with their characters on their own home tile, and each person takes a turn moving their miniatures, then engage in any combat they choose. The shacks on the tiles get investigated, and the Mystery Cards in them give their benefits (nifty magic items) or disadvantages (being sucked into the earth and eaten). Each character sheet has spaces to hold cards that are items, making gameplay easier while you control your miniatures.

The rules are clear, simple, and easy to follow. Players would be advised to make up extra copies of the damage tables and combat modifiers, as well as character sheets . . . or you could laminate the character sheets so you could use dry-erase markers during the game. Both characters and board tiles are nicely done in full color, but the lack of hex markings on the board necessitates use of a ruler to calculate movement and weapon distances.

As the board layout changes each time you play, and the Mystery cards that get placed in the shacks are dealt differently each time (not all the cards get used in every game) and players can change teams between games, game

play and strategies can change from game to game. It'll take a while for this game to go stale on you. Well, that depends on the amount of beer and pretzels you're consuming, I guess. The rules also include suggestions for variant play and different board layouts, allowing you to change things around as you like, which is useful if this game captures your soul. (Sorry, couldn't resist.)

Players should set aside a half-hour or so for learning the rules (more if you're cutting out the pieces so you can play) and anywhere from an hour to three for gameplay, depending on experience, number of players, strategy, and luck. The carnage is impressive, with characters only rarely coming back from the dead. Pagan is already planning an expansion for the zombie lovers out there!

Getting into character regarding your team is also lots of fun, redneck accents are encouraged. Pagan Publishing has done things before that make you look at the whole Mythos subject a little oddly, but with *The Hills Rise Wild!*, H.P. Lovecraft probably spins just a little faster in his grave every time a player threatens "a whole heapin' helpin' o' hurtin'" on his opponent.

-- Seth Cohen & Karl Musser

For King And Chronology: The *Macaulay* Dossier

"Could by industrious valour climb
To ruin the great work of Time
And cast the Kingdoms old
Into another mould."
-- Andrew Marvell, *An Horation Ode Upon Cromwell's Return From Ireland*

It's time for another crack at frame-making; this campaign frame is born roughly from equal parts of John Crowley's masterful novella "Great Work of Time," the crosstime Zeppelin novel *The Whenabouts of Burr*, by Michael Kurland (and a soupcon each of Keith Laumer's *Worlds of the Imperium*, Michael Moorcock's *Warlord of the Air*, and James Blaylock's *Lord Kelvin's Machine*), and anticipation of **GURPS Steampunk**. As befits an alternate-historical frame, I've offered plenty of alternative versions of the *H.M.A.S. Thomas Babington Macaulay* and her sponsors, so even if your players read this (which they should) they won't know which alternate she springs from when her sleek form ghosts across their provincial little sky. Tally-ho, then.

"The Question put down by Mr Joynson-Hicks asks whether the War Office has any information as to a Zeppelin dirigible passing over Sheerness on this date (14 October 1912), whether the Zeppelin dirigibles can attain a speed of nearly sixty miles an hour and remain afloat for thirty hours at a stretch, and whether the British Government has any dirigibles of any practical value."
-- Question in Commons, as reported by the *London Evening News*

His Majesty's Air Ship *Thomas Babington Macaulay* is, to all outside appearance, a completely normal 709-foot Vickers Model R-100F (the "F" denoting a "Frontier" version, with double-woven spidersilk canopy, Maxim aircannon, Marconi radio-detection apparatus, and onboard Swordfish reconnaissance aeroplane). Its catalysed-hydrogen ballonets allow it to lift sixty tonnes of cargo, crew, and passengers, and its six Rolls-Royce acetocene engines drive it at a maximum speed of eighty miles per hour. (The GM may, of course, adjust these dimensions to suit her own sense of the dramatically appropriate.) Of those sixty tonnes, of course, six hold the Delawar-Kelvin Apparatus that conveys (or, rather, reconfigures the ambient aether to convey) the airship through time, and across it.

Using the Delawar-Kelvin Apparatus, as currently configured, does have one or two drawbacks. To begin with, the Apparatus is "grounded" by contact with the Earth's surface, and will not properly attune the aether for transit in a ground (or sea) installation -- thus, the need for a fleet of dirigibles. It also makes a fairly extreme hash out of any electronic equipment dependent on the transistor, the semi- or super-conductor, quantum bubbles, holographics, or, really, anything but reliable vacuum tubes. Given the amount of aetheric machinery in use throughout the Empire, those technologies must remain roads not taken (as in **GURPS Lensman**).

The observant reader will note that aetheric technology, as described here, does allow micromechanical or even gross nanotechnological devices to operate. The prescient GM will either avoid introducing said technologies to the worlds, or have them be closely guarded secrets brought back from a more advanced timeline by the Far Future Expedition of the *H.M.A.S. Edward Gibbon* in 1916. For a truly overpowering vessel, the *Macaulay* and her sister craft can actually be fully nanotechnological rather than steampunk craft, literally "reverse engineered" by bringing assemblers back to the Victorian Era. The GM may also maintain a sphinxlike silence on the provenance of such seemingly-advanced or anachronistic technologies as commercial spidersilk, the extraordinarily fuel-efficient acetocene engines (which can also be advanced fuel cell technology, for the GM who doesn't mind the dirigible never needing to obtain specialized fuel), and any other devices she cares to include in the *Macaulay's* stores locker.

"Take this Empire . . . One doesn't want to be mawkish, but one has served it. Extended it a bit, made it more secure; done one's bit. You and I. Nothing more natural, then, if we have worked for its extension in the future, to imagine its extension in the past. We can put our finger on the occasional bungle, the missed chance, the wrong man in the wrong place, and so on, and we think: if I had only been there, seen to it that the news went through, got the guns there in time, forced the issue at a certain moment -- well. But as long as one is dreaming, why stop?"
-- Sir Geoffrey Davenant, in "Great Work of Time," by John Crowley

The Royal Cliographic Society, in theory, exists to map the timestreams; to record histories, rescue scientists, and to find the eddies where chronal storms -- released by divine force (the Crucifixion), magical experimentation (the confused knot of time around John Dee), simple ectoplasmic overload (any great battlefield), atomic holocaust (the fall of Atlantis) -- split and reave the worlds. (The GM can use any, or none, or all of these to "wall off" certain types or flavors of reality or historical tampering from over-pesky players -- while still allowing NPC villains to hide out in well-mapped time shoals -- or to drive said players into them on the aetheric gales.) Its existence begins, specifically, on May 18, 1902, when the brilliant British physicist Lord Kelvin received communications that he originally assumed to come from Mars. In fact, they did -- from a British experimental station on Mars in 1953, which had stumbled upon the mechanism of transtemporal aetheric communication. Its inventor, George Delawar, urged Lord Kelvin to build a time-travel apparatus and save Britain from atomic decimation in the 1940s. (Having opened the Pandora's Box of recursive time-machine design, the GM may either slam it shut with reference to "highest policy levels" or advance Delawar-Kelvin technology as far as she wishes, into a *GURPS Atomic Horror* style "time belt," or even to psionically-activated time-projectors in a pocket dimension that obviate the need to physically have a time machine at all, which would spoil the airship motif.) After ten years of experimentation, the Delawar-Kelvin Apparatus successfully propelled a covertly-built airship, the *H.M.A.S. Thomas Carlyle*, from Sheerness in 1912 to Branau, Austria in 1889 to abduct a newborn infant.

Here the record, and history, bifurcates. In the most innocent possible reading (and gaming), the Royal Cliographic Society averts World War One and now simply acts to explore the temporal-cliographic continuum in fine *Rip Hunter -- Time Master!* style. (Although the GM may have any combination of temporal physics she likes apply in various reaches of the timescape, *GURPS Time Travel's* Limited Reverse Communication, Temporal Snarls (at best), and Plastic Time with Medium Resistance should work for the central homeline of the R.C.S. The Observer Effect does not apply there.) The crew of the *Macaulay* can spend its time researching the fate of the Ten Lost Tribes of Israel, the contents of the Library of Alexandria, or even the biology of the dinosaurs in proper Edwardian fettle.

In the "rather grey" reading, the R.C.S. meddles frequently in its home timeline and that of others to advance the causes of decency, civilization, and order -- namely, the cause of the British Empire. To avoid accidentally editing itself out of the timeline, the R.C.S. has an absolute ban on interfering with British history before the birth of Lord Kelvin in 1824. However, they have managed to separate the Confederacy from the United States, transfer the Alaska, Oregon, and California territories to British rule, achieve an overwhelmingly dominant position in the Caribbean through British Nicaragua, keep the Germanies splintered, extend the British Raj well into Persia and Kazakhstan and Thibet, rule an unbroken swath of Africa from the Cape to Cairo, and maintain economic concessions from the Argentine to Shanghai. Meanwhile, through the R.C.S.' economic influence (and the absence of WW1), British society remains the conservative, capitalist, imperial, mannered one of Lord Kelvin's day. (The somewhat conspiratorial version of this, of course, has the R.C.S. replacing the British Government for all intents and purposes -- whether this version is "darker" depends upon the GM's view of the R.C.S., and on her view of the British Government.)

A further extension -- the R.C.S. has constructed a mile-long track of magnetic-levitation railway near its headquarters at Sheerness in Kent. A Delawar-Kelvin Apparatus, floating above the rails on a bed of magnetic current, can haul a train between worlds, assuming those worlds also have magnetic-levitation tracks in the same location. In these worlds, the Society is free to alter the timestream on a larger scale (or, says the charitable GM, it seeks out worldlines already favorable to the Society's interests, and builds its rails there). A "Red Ring" of worlds dominated by Britain turns all its energies into improvement of its transdimensional Empire, and into exploration (and expansion into? or exploitation?) of others. A few examples (given Infinity, Unltd., names [the R.C.S. homeline is Britannica-2] for *GURPS Alternate Earths* compatibility -- some GMs may wish to include Cornwallis and pre-1904 Centrum from *GURPS Alternate Earths 2*) might include:

Reality Gisbourne: The fluke death of King Philip II at Bouvines in 1214 gives King John of England the field, Normandy, and eventually primacy in Western Europe as the Kingdom of France is torn apart in the next iteration of civil wars. John's Imperial German connections keep England interfering on the Continent and keep the Plantagenets concerned with their privileges. By the time the Pope divides the New World between England and Portugal, Richard III has re-established the dominant role of the King; by the time King John IV's ironclads put down the Portuguese-sponsored rebellions in Ricardia, none question the court at Winchester at home or abroad.

Reality Orkney: Diverges with the Battle of Largs in 1263, when Haakon IV defeated King Alexander of Scotland to place himself on the Scottish throne. The Zeno voyages reopen the New World to the Scottish-Norse, and New Orchadia is a going concern when King Erik VI of Norway-Scotland becomes King Eric I of England in 1603. After a series of wars with Spain over France and the New World, the Empire of the Isles settles into its hegemony with the Industrial Revolution.

Reality Plantagenet-2: After the Twenty-Three Years' War ended in 1360, the Angevin Empire in France was secure. Sicily, Aragon, and Portugal all came under the Angevin royal demesne in the next century; the explorations of Cabral and Corte-Real gave the Angevins dominion over the New World in the one after that. When the Turks took Vienna in 1541, the only remaining European powers were Poland and Sweden, whose alliance against the Angevins became a political union in the 1630s when both nations absorbed Germany (Poland having already picked up the Russian crown in 1612). Wars over the next two centuries remained inconclusive, as both powers played out the Great Game in Turkey and India, complicated from the 1830s by newly-industrialized Egypt.

Reality Britannica-4: The "Protestant Duke" of Monmouth (bastard son of Charles II) successfully becomes King in the rebellion of 1685; his policy of moderation in religion and Parliamentary relations leads to expansion of Parliamentary representation to American colonists (as a means of undercutting the Puritan influence in New England). Lord Washington becomes Duke of Washington for his brilliant conquest of Louisiana from Spain during the Sugar War of 1779-1783; Franklin and Rumford jointly create dielectric dynamos that obviate much of the squalor of the Industrial Revolution; Faraday harnesses the aether in 1839.

Finally, the R.C.S. may be floating in to save Britain from many other parallel invaders; Reichs, Bonapartes, Americans, Russians -- the enemies are as endless as time itself. From any or all of these worlds, then, the *H.M.A.S. Thomas Babington Macaulay* and its squadron-mates can launch themselves into the time-currents and into your game. Look to the skies, old chap!

Combat!

(And A Bonus Episodic Tip)

Okay; I alluded to it a [couple of weeks](#) ago, and thanks to overwhelming letters (and by "letters" I really mean "letter from André"), I'm returning to the topic.

I'm talking, of course, about my attitude towards combat.

I used to hate combat in RPGs. Well, perhaps hate is too strong a word; lets just say I found it intensely boring compared to other aspects of gaming I liked more. And the reason I hated it was fostered by *Fighting Fantasy* books, early computer RPGs (*Bard's Tale* and *Ultima*, among others), and even many early **Advanced Dungeons & Dragons** adventures.

Why? Because there were only two possible outcomes (or so I believed at the time):

- PCs win. Game continues.
- PCs lose. Game ends.

To be sure, I wasn't entirely incorrect. In the *Fighting Fantasy* books, for example, if you didn't win a combat, that meant you died, and you have to start over. In computer RPGs, if all of your characters die, you reload the game and try again. (These devilishly difficult early computer games were also my first introduction to hex editing, curiously enough.) And at random I picked up the classic *AD&D* adventure **Tomb of Horrors** and reaffirmed those earlier memories.

For those unfamiliar with the adventure, here's a synopsis:

- The PCs die.

At least, that was my impression. In general this adventure has passages not unlike, "Ask the players what time it is. Whoever answers first receives 20d6 points of **stampeding giraffe** damage." The **Tomb of Horrors** was originally a tournament adventure, and consists of a linear dungeon where, in each room, there is an obstacle that needs to be overcome. If it isn't, the game/tournament/fun ends. My favorite "classic" adventure, **Ghost Tower of Inverness**, isn't much better, but (in my opinion) it hides its linearity a bit more.

(In all fairness, and as an aside, I should point out that many of the earlier *AD&D* adventures were *not* linear. **Expedition to the Barrier Peaks**, easily the most entertainingly mind-shaking classic adventure I've ever read, is *very* non-linear, despite it also having apparently been a tournament scenario. Of course, my ten-year-old self would have been completely overwhelmed to run it effectively. But it was a great read, and it's got a neat picture of a Mind Flayer with a Blaster Pistol.)

So when I first started GMing seriously, I followed the examples I'd seen before and internalized (along with the general trends of movies and comics). And so there would be a general story, and the players would face Bad Things, defeat them, and the story would continue.

It's what happened in the non-combat moments that held my interest as a GM, and the parts that (in my mind) had the most chance to surprise me. *How* do they react to the evil Dr. Bingo's offer of immortality? *What* do they do when they learn their teammate is a serial killer? *Will* they try to save the President, or building full of people, or . . . against all odds . . . think of a way to do both?

For the most part, I still believe combat can be fairly straightforward and uninteresting, both as a player *and* a GM. (I think it's one of the reasons as a player I create so few characters with any substantial combat abilities; I'm forced to try to come up with non-combat solutions to troubles, which pleases me.) But I had an epiphany many moons ago that

changed my attitude significantly, and opened my eyes for other combat possibilities. I'll share this next week, since that way I get *two* columns out of a pretty simple topic.

* * *

I tend to run a fair number of cinematic adventures/campaigns, including ones based on television, movie, and comic properties. One of the problems I've had in the past (which I've alluded to obliquely in a [previous column](#)) is that players always want to try to access previous adventures' NPCs, storylines, and solutions. Thus if the PCs encounter (for example) the Guardian of the Timestream, or the Mahjiqk Yewzers, or Clyde the Precognitive Alien, then the temptation always exists to run back to it/them/him if things go awry. While it makes perfect sense from a gaming standpoint, it doesn't simulate the episodic nature of some television and comic genres very well.

[opening credits]

"Captain, the counselor is succumbing to some strange disease."
"Why don't we run her through the transporter a couple times, like we did last week for the engineer?"
"Oh! That worked."

[end credits]

So as I was eating my bowl of Crispix this morning (Crispy Modifier x2), I came up with a possible solution (albeit one I haven't tried yet).

If you're trying to represent an episodic world (and your players understand this), then why not dock some or all experience points from players who pursue these other options? If experience points are supposed to represent how much the characters have learned or grown, and they haven't learned or grown in any ways since last week's episode, then they shouldn't get as many (or any) rewards.

This rule might also apply to the continuities of worlds with long pre-established "solutions" (*Star Trek*, *Star Wars*, most superhero comic series). If the players decide this adventure is too tough for them, and decide to call the Justice Squad, then they shouldn't get the rewards. (This might also explain how some of the B-list super-teams never call in reinforcements . . .)

Of course, like so many things, this option only works if the players and GM trust each other. If I were to use this method, I would probably allow players to ask if they should pursue previous threads. Thus while a routine murder mystery probably wouldn't warrant a trip to the Guardian of the Timestream, the reappearance of the Time Weasels might. (I would also probably *award* bonus experience to players who could think of good reasons why previous options *weren't* available. "Well, Captain, I *might* recommend we visit the Guardian of the Timestream, but that would entail crossing the Vague Zone . . . ")

Players and GMs would also need to make sure they understood who/what *was* permissible to access between adventures. DNPCs, Allies, and Patrons would all obviously be accessible, for example, but other fixtures of some established universes might not.

I'm not sure if this would work, but I know I'm curious to run a game set in the DC universe again to see . . .

-- *Steven Marsh*

* * *

Last week's answer: **Laws of the Night** unrevised edition, back cover (many printings)

(Five stars) "Dragon wakes if player comes within 3 squares (DRAGON WAKES SOUND). Dragon chases nearest player or player with treasure, moves 1 square per turn, diagonally & over walls. Dragon attacks if it lands on square with player (DRAGON ATTACKS SOUND)."

The Puzzle Box

(for Unknown Armies)

(Location unknown)
555-2121
Hours: Daily, 6 pm to 5 am.

by Chad Underkoffler

Summary: Tucked away deep in a maze of downtown alleyways, the Puzzle Box is a ramshackle tavern that doesn't appear on any street map, has no postal delivery address, and doesn't advertise at all. It's an out-of-the-way meeting place for those types of people who desire privacy . . . and many of those people are at least somewhat clued-into the Occult Underground.

Unfortunately, it's also the haunt of poseurs, cranks, con men, and what can only be described as "magickal groupies." Down-and-out dukes come here to score ersatz-apprentices to squeeze for cash in return for teaching a few magick tricks, hire semi-clued muscle that won't rabbit at the first sight of a clockwork, trade scuttlebutt and rumors, and pick up partners for meaningless -- or in the case of Pornomancers, meaningful -- sex.

The Puzzle Box is *not* the hangout of the cream of the Occult Underground. You won't find the big boys of the scene (Angela Forsythe, Daphnee Lee, the Freak, Dirk Allen -- okay, maybe Dirk Allen) hanging out here. It's too low-rent, too greasy, too tawdry. It's a dive bar -- why would anyone with earth-shaking magickal powers hang out in a dive bar? It does serve as an introduction to the secret clubs, nightlife, and shops that exist below the surface of the everyday world. For the clueless thug or the new-minted apprentice, the Puzzle Box is a great place to "learn the ropes" in. For the dedicated but mundane occult researcher, there are a few grains of hard fact on magick and the Occult Underground to find, if one is willing to sort through mountains of chaff. For those more experienced in the Underground, it's the absolute last ditch, long shot sort of place to hunt for clues and rumors.

Detailed Description: The Puzzle Box is three rooms, plus a basement. The basement is used as storage space for the bar supplies; there is also a small "root cellar" packed with Freaky Stuff. One corner of the basement is a grungy but well-appointed kitchenette with fridge, grill, and deep fryer for quick bar food. A dumbwaiter connects the basement with the back of the bar; it's large and powerful enough to lift a full beer keg to ground level.

The front room contains the bar and a dozen tables. An old Wurlitzer jukebox squats in the corner, loaded with odd and off-beat records: from heavy metal to Bach Requiems to spoken word to Dixie jazz to Gregorian chant. All of the recordings deal with religion, the supernatural, or magick. Hanging over the bar are a number of ring puzzles. These, along with the numerous Rubik's cube and similar puzzles, sit on shelves all around the back room. Whenever someone solves a puzzle, they get a free drink. However, if they break one of the puzzles, or substitute a pre-solved one of their own, they'll be thrown out and kept out until they make reparations to Peppy.

The back room has an ancient pinball machine that tilts whenever someone says the word "rubber" in its presence, a billiard table with

blue felt, and a real cork dartboard, sans darts. A number of comfy
vinyl couches and easy chairs line the walls of this room. A bulletin board with "For Sale" and "Wanted to Buy" sorts of notes hangs on the wall here. Some of the items being traded are a little odd -- a virgin's kiss, a dead bonsai, a monkey in a bottle, etc.

The last room is Peppy's Office, and it is tragically boring. It's the size of a broom closet, and the space is mostly taken up by a desk, office chair, filing cabinet, and a set of bookshelves. The most interesting thing in the room is the economy-size package of white pocket T-shirts, which are the only shirts Peppy wears.

GMCs Found Within or Nearby: Peppy Slade is the owner and bartender. Joachim Walker is the bouncer. The Puzzle Box goes through a weekly parade of bartenders, busboys, and grill cooks; either it's too freaky a place to be in, or something from the root cellar eats them. Peppy won't say which.

Adventure Seeds

- You find a city map in your mailbox. A back alley is circled in red, with the words "Tonight. 11 PM." scrawled next to the circle. When you visit the area marked on the map, you find the Puzzle Box. Who wants to meet you? Or was the map misdirected?
- Bulletin Board: "FOR SALE -- Six months of my life. $2,000 or best offer. 555-2309 Ask for Bob."
- A "groupie" approaches a magickal PC and starts begging him to teach him/her magick. All the while, this groupie is making goo-goo eyes at the adept PC. Is it a real groupie, or a disguised enforcer?
- Bulletin Board: "I NEED: Six chestnuts, caught in midair as they fell from the tree. Chestnuts must not have touched the ground or human flesh. Call Emma, 555-4544, 6 pm to midnight."
- One of the local Dipsomancers mixes his vodka and Scotch and goes on a mean bender. Joachim is knocked out by a flying barstool in the first few seconds. Peppy asks for your help in tossing him out.
- Bulletin Board: "Looking for a way out of your Troubles? Join the New Inquisition! Good pay, interesting work, and a fresh start. Call Mr. Caine at 800-NEW-LIFE"

Peppy Slade

Personality: Paul Williams as Ernest Hemingway.

Summary: He's balding, blond, short, squat, and very strong—he loves to arm-wrestle with Joachim, and has been known to pitch in and help clear the bar of troublemakers. He's a self-educated man, having traveled the world as a younger man in the merchant marine. He's covered with tattoos, smokes like a chimney, and loves a good story. His favorite authors are Joseph Heller, Jack London, Robert Heinlein, Hunter S. Thompson, and Zane Grey. He enjoys puzzles. He's clued-in to the Occult Underground, and is enjoying putting the pieces together. He's a rumormonger.

Obsession: Knowing the occult "buzz."

Passions

Rage: People who bust up his stuff: puzzles, tables, chairs, etc.
Fear: (Helpless) He's afraid of dying without getting a good punch or two in.
Noble: Storytellers. Peppy will do anything for a good story or storyteller.

Wound Points: 85

Stats

Body: 85 (Powerhouse) Speed: 40 (F) (Slow to start) Mind: 45 (Curious) Soul: 55 (Gruff but Likable)

Skills

Body Skills: General Athletics 25%, Scrappin' (Struggle) 55%, Break Things 35%
Speed Skills: Drive 15%, Dodge 25%, Handgun 45%
Mind Skills: General Education 15%, Notice 30%, *Occult Buzz 50%*
Soul Skills: Charm 20%, Lie 20%, Aura Sight 20%, Hunches 25%, Minor Rituals 25%

Occult Buzz: This is the "word on the street" as far as the Occult Underground goes. Who's hot, who's not, who's just got whacked and why, etc.

Minor Rituals: Peppy knows each of the Minor Rituals (those available to non-adepts). His deep understanding of all of them is represented by this single skill.

Madness Meter (H/F)

Violence	=	5H/2F
The Unnatural	=	5H/2F
Helplessness	=	2H/0F
Isolation	=	2H/0F
Self	=	2H/0F

Pick One

High Road: Affable and avuncular, Peppy always has a bit of info for his pals.
Middle Road: Peppy is strictly business: he'll provide information for information in return, or for cold hard cash.
Low Road: He's relentless in his need to be clued in. He has no problem with slipping someone a Mickey Finn, throwing him into the storeroom, and working them over with needlenose pliers to pry out what they know.

Adventure Seeds

- After sizing the PCs up for a couple weeks, talking with them to find out if they're "good people," Peppy

approaches them to help him decipher a new ritual he's discovered. It's the ritual of Lesser Correspondence (see UA, pg. 196). What happens when Mak Attax discovers someone else knows the recipe for their secret sauce?

Joachim Walker

Personality: The love-child of Mr. T and Mr. Rogers.

Summary: Joachim seems to be your average bouncer: big, strong, and intimidating. What most people don't realize is that he's possessed. Granted, the possession is by a benign demon -- Joachim's little brother Ricardo. When Joachim was a teenager, Ricky died of leukemia. Horrified by the unfairness of it all, Joachim prayed harder than he ever had before . . . and suddenly, little Ricky appeared inside him.

Terra Incognita: The Puzzle Box

Joachim has decided to live his life to the fullest, both for himself and for Ricky. He'll try anything once. Indeed, there are things that Ricky likes to do that Joachim isn't that fond of (drinking iced coffee, getting up early to watch Saturday Morning Cartoons, going dancing), but he'll do them to please his brother. Usually.

They share consciousness often, two minds in one body. Ricky has also left Joachim's body for short periods of time, usually after a spat, but sometimes to grab astral parasites to plop onto people he sees as Joachim's "enemies" . . . often without his brother's knowledge. Other than that, Ricky's a generally nice fourteen-year-old kid.

Ricky can perform minor telekinetic manipulations once per hour, and can do significant telekinetic actions once per day. In extreme circumstances, Ricky can lend strength and speed to his brother for periods of up to an hour, but this tuckers him out, leaving him quiescent for a number of hours, sometimes days. This is represented by the split stats for Body and Speed, and a flat +10% shift to any physical skill while "supercharged." Joachim always worries when Ricky "falls asleep," afraid that he will be gone for good . . .

Personality: (Gemini) I can dig that, but what about this . . . ?

Obsession: (General Athletics) Live life loudly; get out and have some fun!

Passions

Rage: People who waste the gifts God has given them.
Fear: (Helplessness) Losing his brother again.
Noble: Little children. Joachim -- the perfect big brother -- loves little kids, and if anything threatens them, he'll spare no effort to protect them.

Wound Points: 60/100

Stats

Body: 75/100 (Beefy/Superhuman)
Speed: 55/85 (F/S) (Quick/Like Lightning)
Mind: 40 (Enjoys Learning New things)
Soul: 60 (Child-like Nature)

Skills

Body Skills: *General Athletics 45%*, Handle Troublemakers (Struggle) 35%, Large and Hard to Move 40%, Get Back

Up 60%, Hits Harder 30%
Speed Skills: Drive 20%, Dodge 45%, Move Through Crowd Unimpeded 25%
Mind Skills: General Education 20%, Notice 25%, Demon Lore 15%
Soul Skills: Charm 45%, Lie 15%, Intimidate 40%

Hits Harder: This skill is only applicable when Ricky is boosting Joachim's strength to superhuman levels. If Joachim rolls an attack under his Hits Harder level, add an additional die of damage. If a match is rolled, add a further die.

Madness Meter (H/F)

Violence	= 3H/1F
The Unnatural	= 4H/2F
Helplessness	= 2H/1F
Isolation	= 2H/1F
Self	= 1H/1F

Pick One (Joachim)

High Road: A great guy who'll do anything to help out a friend.
Middle Road: He'll sometimes let people get away with stuff they shouldn't be doing in the Puzzle Box, if they pass him a couple bucks.
Low Road: Joachim will do anything for sufficient cash to let him indulge in "living life" both for himself and Ricky.

Pick One (Ricardo)

High Road: Ricky's a good kid, even if he is dead; a teenage Casper.
Middle Road: Despite lacking glands and hormones, Ricky's a teenager, and suffering the same emotional swings and angst.
Low Road: Mean kid, bad seed. Jealous of Joachim's corporeality, he'll screw with his brother's life just for the fun of it.

Possessions: Lots of sports equipment, a beat-up pickup, and a small apartment near work.

Connections: Joachim becomes great friends with everyone he meets. He also does some volunteer work as a Big Brother. His Little Brother is named Jamal and lives across town.

Adventure Seeds

- Someone has discovered Joachim is possessed and likes it, and has threatened to exorcise Ricky unless Joachim pays up. Joachim approaches the PCs for help.
- The PCs see Joachim beat one of their dipsomancer buddies senseless. The boozehound tried to Soul Sip Ricky!
- Word on the street is that Joachim, the bouncer at the local dive bar, knows a way to ditch astral parasites! And all he asks is that you contribute a C-note to the local Youth Center . . . It's gotta be a scam, right?

Pyramid Pick

Epicycles CD (related to the Fading Suns RPG)

Created by [The Changelings](#)

Available from [Middle Pillar](#)

44 min; $8.00 (+$5.00 shipping)

Fading Suns fans are lucky. While other RPGs have had to make do with *Conan* and *Matrix* soundtracks (not necessarily a bad thing), players of the *Fading Suns RPG* have *two* soundtracks (albeit both are tangential).

The first, the red book audio tracks from the *Emperor of the Fading Suns* computer game, is certainly enjoyable, and a good addition for any gamers musical library, but relies too heavily on synthesizers and computer-generated effects for my tastes: high on technical merit, low on soul. But this review isn't about that game, so I'll stop.

Epicycles features music originally created by The Changelings for the *Fading Suns*-based *[Noble Armada](#)* computer game (in addition to music created for the [Netherworld](#) haunted house in Atlanta), and, unlike the *Emperor of the Fading Suns* game, ranks high both technically *and* artistically.

The Changelings, based in Atlanta (the same city as the creators of the *Fading Suns* RPG *and* Noble Armada . . . what're the odds?!?), tout themselves as creators of "a unique blend of classical, Middle Eastern, ambient pop-fusion"; in *Epicycles*, they have lived up to these claims. From the opening drone of an insistent computerized ping that segues into haunting lyricless voices accented by violin and percussion, Epicycles immediately creates an enfolding techno-gothic atmosphere, melding churchly choirs, noble marches and mechanical instrumentation seamlessly.

The first track, "Red Shift," is a great opening track that should immediately set the mood for most *Fading Suns* campaigns. It's a good general-purpose dramatic gaming song. The second track, "Eclipse," is a lot slower and more ethereal. Although nowhere near as dramatic or exciting as the previous track, it still maintains the mood, and should be useful for quiet moments of courtly intrigue. The third track, "Tannhauser Gate," is tense, with greater Middle Eastern flair than the other tracks. Its emphasis on percussion (gongs, drums, and tambourines), violin and viola is almost distracting, but the whole track (indeed, the whole album) is complex and engaging enough that it shouldn't detract from a gaming session unless it's played too loud. It's good combat music. The final track from the *Noble Armada* game, "Dulcinea," is remarkably subtle, and again skillfully uses vocals as an instrument that accompanies the keyboard. It is more engaging than "Eclipse," and seems wonderful for epic traveling music (which many *Fading Suns* games have in abundance).

The remaining two tracks on this CD were composed for a haunted house, and the difference in audience is noticeable (though not terribly distracting). Reminiscent of "Tubular Bells," "The Young Merlins" lacks the choral arrangements of the previous tracks, relying more on a suspense-building repetition of keyboard and light percussion themes. "Dreams in the Witch House" is even quieter, and relies on wind-blown notes, odd instruments (including a musical saw!), and warped distortion to evoke a mood of *Blair Witch*-esque ominous apprehension. Snippets of voices, seeming to call out (to coerce or warn?) add to the atmosphere, making both of these tracks suitable for the truly mysterious, and perhaps frightening, anomalies of the universe.

Perhaps my biggest complaint about the CD is the somewhat incongruous disparity between the two commissioned projects; while the CD opens with the bold dramatic strokes of the *Fading Suns* universe, it ends literally with a whisper . . . appropriate for a haunted house, definitely, but an anticlimactic ending for an otherwise great album. Oh, and like all good CDs, I would love for this one to have been twice as long . . . but that's more compliment than

complaint. In all, this CD compares favorably with the *Dune* soundtrack and the calmer moments of the *Fifth Element* soundtrack. I can recommend *Epicycles* without reservation for all fans of the **Fading Suns** universe, and without much reservation for anyone in related genres (**Star Wars**, **Star Trek**, **Dune**). Since the future of the *Noble Armada* computer game seems somewhat uncertain, and it wouldn't contain two of the six tracks anyway, you may want to pick up this CD.

Two tracks from this CD ("Red Shift" and "Dulcinea") are available as streaming audio samples on-line at [MP3.com](MP3.com).

Dork Tower!

Pyramid Review

Chrononauts (Beta Version)

Published by Looney Labs

Designed by Andrew Looney

32 Time Line cards, 12 ID cards, 10 Mission cards, 81 Chrononauts cards, rulebook, $12.00 (The price for the final version has not been set.)

(Review Note: This review is based on the beta version of Chrononauts, sold in a limited edition at Origins 2000. The final, full color version is expected in October 2000 and a price has not been set. Andrew Looney stated that changes from the beta to the final version would be minor and consented to a review based on this version.)

"So, you've finally gotten yourself a Time Machine. Now what?"
Perhaps you will sabotage Sputnik, perhaps you will stop the Japanese attack on Pearl Harbor, or perhaps you will save John Lennon. Chrononauts, a new game by the makers of Fluxx and Aquarius, provides these and many more opportunities for two to six players.

This delightful card game pits Chrononauts, or time travelers, against one another in a race to get home to their own realities, gather three specific artifacts, or patch up enough holes in time to keep the universe from collapsing. Whichever player can complete one of these goals first wins. Along the way, the Chrononauts will rewind time, reverse fate, start World War 3, then back up and do it all over again.

The key to Chrononauts is the Time Line. A four by eight grid of cards represents the years between 1865 and 1999. One year, and one major historical event, grace each card. 13 of the events are Linchpin events, meaning that players can directly alter the event by flipping the card to reveal an alternate history. For example, in 1980 players can reverse "John Lennon Murdered" to reveal "John Lennon Nearly Killed." The rest of the cards in the Time Line are Ripplepoints that are flipped when a Linchpin event changes. If John Lennon survives, then the 1986 Ripplepoint called "Challenger Explodes" flips to reveal a paradox. 1999's "Columbine High School Massacre" also flips to a paradox.

A Chrononaut's main job is fixing these paradoxes by playing Patch cards. The Patch for the 1986 paradox is "Marijuana Legalized: President Mondale signs bill ending prohibition after protest on shuttle launch pad led by John Lennon." The Patch for 1999 reads "Guns Banned: Senator Lennon's campaign to outlaw guns results in passage of Amendment xxIX, which repeals the 2nd Amendment." At first, John Lennon's death may not seem to have a clear effect on the Challenger disaster or the Columbine tragedy, but Andrew Looney put quite a bit of thought into the alternate history of Chrononauts -- and the discovery of his take on events is part of the charm of the game.

Each time a Chrononaut patches a paradox, she or he draws a card, and the first player to end a turn with ten cards in his or her hand wins the game. There are two other ways to win, however, and this opens the game to multiple strategies and the ability to abandon a failing tactic.

At the beginning of the game, each player draws an ID card and a Mission card. The ID card gives the Chrononaut a name, a short description, and three events that define that Chrononaut's reality. For example, Betty comes from a world where a-bombs were dropped on Japan in 1945, but where the Vietnam Peace Accord was signed in 1968 and

Cosmonauts beat the U.S. to the Moon in 1969. If the Time Line matches this reality at the end of Betty's turn, she wins.

Finally, each Chrononaut can complete a collection of Artifact cards as described on his or her Mission card. Betty may have drawn the Mission called "Cheaters Sometimes Win" which requires that she collect a future sports almanac, a Mona Lisa forgery, and Shakespeare's Last Play ("Mona and the Dragon.") Anyone who possesses the three Artifact cards listed on her Mission card at the end of her turn wins.

The rest of the Chrononauts deck is made up of Action cards that flip Linchpins, steal and destroy artifacts, and force players to discard cards or trade hands. Some of the cards can quickly and radically affect the game, which seems to be a trademark of Looney Labs card games.

Chrononauts is a fun and intriguing game that bears repeated playing. Its only drawbacks are the complexity of the Time Line and the chaos of its Action cards. Mastering the Time Line, which events affect which and when to turn Ripplepoints, requires some time and practice. New players will find it a challenge to determine which Linchpins are important to their ID cards. At the same time, it is the complexity of the Time Line that makes the game so interesting. The Action cards can have a dramatic, and somewhat random, effect on the game. Rotten luck may snatch victory from one player who spent 20 minutes plotting her way home only to drop it into the lap of an unsuspecting Chrononaut. If not taken too seriously, Chrononauts is a fun game and a brush-up history lesson.

-- Brad Weier

Art by Kyle Miller and Phil Foglio

(Author's Note: We apologize for the delay in this product, after having been promised three years ago (New Product Releases: April 1, 1997). The computer that has the current draft has decided that it is entirely too silly and refuses to allow access to the original document. We have managed to obtain this scenario from the current draft (after bribing the computer with back issues of Wired and pictures of a G4 server with its cover off). We hope you enjoy it.)

Introduction

"Good morning Celestials!" Nybbas' voice cut through the homeroom like a burr saw through sandstone over the loudspeaker. "Welcome to another day of fun fun FUN here at Higher Heavens High!"

The irritating voice continued, "First, congratulations to Marc for having the highest sales during the school manna sale -- way to suck up, Marc! The co-ed touch football game is today, and everybody is encouraged to donate blood at some point during the day at the school nurse's office . . . "

* * *

"In Anime" is adapted from characters and settings found in In Nomine (IN), and uses the Toon mechanics. The intent is to have some fun with -- and even play as characters -- the major figures in the IN universe, while encouraging the slapstick of cartoon roleplaying. Those familiar with In Nomine will probably enjoy the characterizations of Archangels and Demon Princes more than someone with no previous knowledge, but Higher Heavens High School (HHHS) could be easily adapted for Teenagers From Outer Space, Big Eyes Small Mouth, or even a charter school under the auspices of (GURPS) Illuminati University . . .

You'll find that the pace of this scenario begins more slowly than a typical Toon game. This is intentional -- the personalities here are less iconic than your standard Toon character, and this will give your players a chance to get comfortable with their characters. However, you'll be thankful for the simplicity of the Toon mechanics later in the game when the PCs are being swarmed by drunken teenage Vikings. But we digress . . .

Cast of Characters

The Animator can include as many characters as they can handle, but remember that Toon moves at a maniacal pace compared to many RPGs. Players can build characters at the suggested 14 Attribute-point level to represent the "average" Celestial student, or they can even take the role of an Archangel or Demon Prince(ss)! (Laurence, who is used during this scenario as an NPC, is built with 18 Attribute points, as are all IN Superior characters.) Note that even Superiors can Fall Down in In Anime -- and a PC can cause it! Toon emphasizes fun, not realism; if it's funny, allow it

and don't worry about the implications for the In Nomine world!

Laurence is IN's Archangel of the Sword and the leader of Heaven's armies; In Anime transforms him into the quarterback of the Higher Heavens Halos football team. Other NPCs include:

- Novalis, In Nomine's Archangel of Flowers, who is transformed into a hippie chick who is slow to violence, but protective of nature,
- Kobal, the Demon Prince of Dark Humor, who is Higher Heaven High School's resident prankster,
- Dominic, the Archangel of Judgment, who will play a role in the final scene of the scenario,
- Any other Angels and Infernals you choose. Marc could run the ticket booth and food concessions, Belial fires off the cannon every time the HHHS football team scores -- let your mind roam . . .

In addition, a brush-up on your Norse mythology might prove helpful. Three specific notables that appear in this scenario:

- The Valkyries, the female warriors who escort fallen warriors to Valhalla, become the Valhalla Valkyries touch football team,
- Loki, the trickster god of the Norse pantheon, who becomes Valhalla High's master of practical jokes,
- Mimir, wisest of the Aesir, who advises Odin despite having his head cut off by the Vanir. He comes into play during the final scene, still wise, knowledgeable and missing a body.

Note that a useful online resource for mythological reference is the Encyclopedia Mythica, at http://www.pantheon.org/mythica/.

Norse by Norse-est

The HHHS Dean of Extracurricular Activities has informed Laurence that Valhalla High wants to arrange a touch football game between the two schools in one week. Valhalla High has a girls' touch football team (the Valhalla Valkyries) that has played together for some time; they have offered to let the Higher Heavens students field a co-ed team for the game to make up for it. The PCs are part of the team that Laurence has put together for the game.

In Anime: The Big Game

Most of the time at HHHS, the Angelic students ("the good kids", "teachers' pets", "those with a Bright future") are at odds with the Infernal students ("the bad kids", "the troublemakers", "those with a permanent record"). However, there's still enough school spirit that both sides can unite for short periods against another school. Consequently, even some of the Infernal Superiors can join the Archangel characters on the touch football team -- just emphasize that there's no love lost between the two factions.

Laurence will schedule a meeting with the PCs (and any other NPCs you want to pepper the team with) to get organized for the game. Laurence, in addition to being the school quarterback, is devastatingly handsome, very focused on succeeding honorably at any task put in front of him and is generally a bit of a stick-in-the-mud. (His standard reply to being asked out on a date is infamous: "How will this date benefit the school?" The date usually goes downhill from there.)

Laurence will open the meeting with his rules for the upcoming game:

- No male is to hit a girl.
- No one is to commit any kind of foul or rule infraction.

- The team is to be absolutely sportsmanlike and polite to all opposing players.
- No spitting.
- No harsh language.
- If their uniforms get dirty, you will go change it. You are a symbol of Higher Heavens High School while on the field, and you will represent them in clean clothing at all times.
- No hitting each other on the behind -- it is unseemly.

Feel free to add more -- *many* more -- items to the list. The PCs should realize that they not only won't be able to get away with anything, but that the entire proceeding will be no fun whatsoever. The other impression they will be left with is that Laurence does *not* expect to lose, and he will *not* be pleased if the Halos even come *close* to losing. (Laurence is honorable to the point of stuffy, and *very* focused on the goal of winning.)

Novalis, on the other hand, is only here to help the other players have fun. Higher Heaven's resident hippie chick, she's all flowing dresses and floral garlands. She is, at least, until Belial sets fire to the school flower bed or something similar, at which she instantly transforms into the Raging Fury of Nature (tm). Violence disturbs her, but she chose to participate in the game because she wants to understand the fun of sports, and "football with touching" sounds -- well, fun.

Laurence will then show a videotape (compliments of Nybbas) that documents a Valkyrie practice. Nybbas' running commentary should detail scenes of such extreme violence and prowess that the PCs should be quaking in their shoes by the end. Laurence will stop the tape, reiterate that they the team has a lot to do in the next two days (!), and then hands out playbooks. (PCs should make a Lift Heavy Object roll to avoid dropping the book when passed to them.)

The first practice should be a disaster. Laurence will work them to the bone, running complicated plays (make up horrendously long play names, and don't tell them what they mean ahead of time) and chewing them out if they don't execute them successfully. Novalis will use her Dodge ability to simply avoid any player coming towards her, and will hand the ball to any player requesting it (on either team).

And, up in the stands, Kobal will heckle the players and occasionally use Cosmic Shift to turn the field to ice, or the ball into an anvil, or whatever other nastiness you can create. Kobol is HHHS's resident prankster, with a bit of a vicious streak and no school loyalty whatsoever. Unbeknownst to the players -- at least at the moment -- Kobal has bet Loki (Valhalla High's equivalent of Kobol) that he can make HHHS LOSE the game. Loki will be working as actively to make the Valkyries lose.

Left Guards, Right Guards -- All We Need Are Asgards

(Play the team meeting and the practice short and sweet, to get you to this scene as fast as possible. This scene should play out very much like a typical ***Toon*** scenario.)

The first play of the game was over -- and first and ten for the Higher Heavens Halos had become second and twenty-two. Laurence walked over to the huddle, a bit wobbly. "Work with me for a moment. They have agreed to play touch football with us, right?" A few pained nods followed. "So, even though we should not hit a girl, we CAN touch them in a respectful and defensive way."

"Respectful? . . . " asked one player, incredulously.

"Yes." Laurence nodded. "Be especially respectful of their offensive line, please, as the alternative seems to be me getting touched in a most painful and discomforting way . . . "

* * *

The stands are full, and the game is ready to go. Unfortunately, so are
the referees -- Dominic (from HHHS) and Mimir (from Valhalla
High). Dominic just likes rules: he's the quartermaster for the HHHS

student council, hall monitor, head of the school Mock Inquisition team and isn't happy unless he's enforcing rules -- *any* rules. He's the one that will call anything possible -- football infractions, local statutes, traffic laws ("Failure to yield right-of-way -- fifteen yards!"), anything he (and the Animator) can think of.

The other referee, Mimir of the Aesir, is much more reasonable -- but, unfortunately, he's also a severed head, and will spend much of the game only looking where Dominic (or anyone else) points his head to look. He also gets set down often, and, oddly enough, is roughly the same size as the football. He's more interested in letting the teams play the game, but will become increasingly frustrated after being set on his face, left floating in the holy water cooler, being kicked through the uprights for three points, etc.

Here is where the PCs can cut loose. Laurence will still insist on honorable play, but is susceptible to Fast-Talk as to why it was appropriate for the PC to create a high-powered fan during the last play to blow the Valkyrie pass out of the stadium for an incompletion. Laurence will be conflicted, but his need to win shouldn't be overlooked in his desire for honorable play.

The Valkyries are incredibly physical and hard to hurt, but they are not the brightest beings in the firmament -- so Smarts and Chutzpah skills should be particularly effective. Their playbook seems to consist of one play (ram opponents into ground, ask if they want to go to Valhalla with them). The HHHS players will also need to avoid their horned helmets and their pigtails containing bricks, anvils and other dangerous objects. (PCs should learn to dread the Valkyrie Spinning Pigtails of Death attack.)

The visitors' side of the field will be filled with drunken Vikings. (Yes, this is high school, but the Viking drinking age is low enough.) Throughout the game, they will yell various insults, unflattering comparisons and random speculation as to the lineage of Halo players. If the Valkyries lose, they will immediately rush the field, looking for a fight.

Kobal and Loki will be running around the stands and field, causing whatever havoc they can against their respective teams. Novalis will continue to sidestep and otherwise non-violently participate in the game. Have a few running gags ready -- Lilith (In Nomine's "I'll help you now, and you'll help me later" Princess) could be on the sidelines in her little cheerleading outfit -- but anytime a PC starts a sentence with "I wish that . . . " or "We need . . . ", Lilith should appear with the requested thing and a dangerous smile on her face. Feel free to transform any of the Norse or In Nomine superiors to their teen archetypes, spice to taste and stir.

Possible Endings

- The game comes down to a last-second field goal. The kick goes up, and suddenly the goal posts take off running, followed in hot pursuit by the football (Loki and Kobal again). It's up to the PCs to get the ball through the uprights.
- Several of the Valkyries sit on one of the Halos players and make that person eat a handful of turf pulled up from the field. Novalis's eyes narrow, she whispers, "For the grass!", and lines up with a very determined look on her face. (Use her Fight skill and her Grow shtick to full effect.)
- The Valkyries win, but at the last moment, Dominic walks over to one of the players and pulls off a mask -- it's Athena, the star touch football player from Olympus High! Dominic declares a forfeit in favor of the Halos, and the obligatory riot ensues.

Innocents Abroad

by James Maliszewski

Art by Dan Smith

At the heart of any occult roleplaying game are secrets. Much of the fun players derive from participating in an occult conspiracy game arises from uncovering secrets and piecing them together so as to uncover even bigger secrets. The less the players -- and their characters -- know about the true nature of the world they inhabit, the more enjoyment they will have in the game.

Consequently, many Game Masters and players will be dissatisfied with the approach taken by games like *Conspiracy X*, *Dark*Matter*, or *Chill*, in which the player characters belong to a knowledgeable and competent organization dedicated to investigating the occult. After all, such organizations already know a great deal about the secret history of the world. In such a campaign, the heroes may not begin with all the answers, but they will have many more of them than would an average person for whom magic or extraterrestrials are sheer fantasy. Similarly, heroes employed by organizations like S.A.V.E. or the Hoffmann Institute have the benefit of significant financial backing for their operations. This provides equipment and intelligence unavailable to more "ordinary" characters.

Thus, the GM may wish to try a different model for his campaign. One such model involves "accidental groups." The members of accidental groups band together not by choice but through circumstances. For the most part, they are ordinary people -- men and women with jobs and lives that do not revolve around investigating the occult. Instead, they stumble upon something Man Was Not Meant To Know and find their lives forever changed. Such groups are common to many of the books, movies, and television shows that inspired the occult roleplaying genre and can be a rewarding campaign option.

Sadly, most games provide only the simplest overview for a GM hoping to start and maintain such a campaign. Given the vast differences between an organization-based campaign and one involving an accidental group, this is unfortunate. This article is intended to fill that void, offering concrete advice and suggestions on a number of areas vital to the success of an accidental group campaign. These suggestions are purposefully generic in their terms, enabling a GM to use them in games as diverse as *Call of Cthulhu*, *Chill*, *Dark*Matter*, *Unknown Armies*, *GURPS Illuminati* or *Horror*, and many others.

Terminal or Open-Ended?

The first thing a Game Master contemplating an accidental group campaign should decide is its basic form. Will it be a terminal game with a distinct beginning, middle, and end or will it be an open-ended game that moves from one story to the next? The answer to this question has consequences for all subsequent decisions the GM makes.

The nature of the accidental group makes terminal games easier to construct. Accidental heroes rarely have the skills and resources necessary to continue their fight against the paranormal indefinitely. Moreover, their involvement stems from a chance moment when the occult world impinged upon their everyday lives. Once the event that drew them into the world of the occult has been resolved, there is often no need -- or desire -- to persist in their quest.

Suppose, for example, the GM builds a campaign around the recovery
of a missing child. One of the heroes is divorced from the child's mother with whom he has joint custody. One day, both the mother and the child mysteriously disappear, leaving the distraught father in need of answers. Such a campaign should logically (and dramatically) continue until the father has learned the true fate of his child and ex-wife: why they disappeared and who (or what) is responsible.

It would be a mistake to assume that terminal campaigns need be short-lived ones. They certainly can be, but they need not be. In the example above, months or even years may pass before the father learns the fate of his daughter. Along the way, he may uncover many other secrets that tie into his primary investigation, yet do not resolve it. In this way, the GM can extend a terminal campaign for a long time without exhausting its potential.

Furthermore, the original goal that started the heroes down their path does not always correspond to the terminal goal of the campaign. In the example above, the child's disappearance propels the father into the secret world of the occult and sustains him there. Yet, in the course of seeking his child, the father may come to see a bigger picture, one that encompasses more than his own personal quest. In such a campaign, the father may then acquire a different goal -- a terminal goal -- that keeps the action going.

At the same time, the GM should never lose sight of the accidental event that began the campaign in the first place. Thus, the search for the missing child should never be far from the surface, even if it ceases to be the main focus of the campaign. Contrariwise, the GM should know when to call it quits and end a terminal campaign. There are few things more grating on players' nerves than reenacting the myth of Sisyphus in their campaign. Eventually, the heroes must achieve their goal -- or die trying. Perpetually frustrating all their efforts is a sure way to kill player interest and trust in the GM. Victory cannot be a mere abstraction; it must be attainable.

Open-ended campaigns, on the other hand, are much more difficult to create for accidental groups. As noted above, accidental heroes rarely have the means to become full-time investigators of the unknown. They generally have mundane concerns like jobs and families that preclude jetting off to Cairo at the drop of a Man in Black's hat. For that matter, they may lack the funds to do so. How then can a GM create an open-ended campaign for accidental heroes?

The truth is the GM can't really -- not without restructuring the campaign. Heroes drawn into an occult conspiracy by accident may not be able to return to their normal lives. In such a case, they could become full-time investigators, but they will require backing by a powerful benefactor like Aegis or S.A.V.E. Of course, their benefactor could remain anonymous, thereby giving them the means to continue their fight while maintaining the mystery essential to the success of the occult genre.

In any event, accidental groups cannot remain so in open-ended games. Over time, former innocents cannot help but be changed by their experiences, both good and bad. If the Game Master and players are willing to accept this fact and work with it, they will find it a rich source of new material for their games. Few things can be as compelling as watching the metamorphosis of a night manager of a video store into a well-honed warrior in the fight against the unknown.

Accidental Heroes

The night manager of a video store? Sure! One of the pleasures of an accidental group is the forging of ordinary people into heroes. Doing so requires a little bit of forethought, but the end result can be quite rewarding.

Admittedly, many players have difficulty creating characters that are not ersatz adventurers. On first glance, a transit cop might seem ordinary enough. After all, he is not a "real" cop, right? A transit cop could well be a great accidental hero. Yet the temptation to play him as a combat machine like any other -- complete with impressive combat skills and weaponry -- is a great one. Most transit cops do know how to handle firearms (at least in the United States), but their everyday duties rarely call for such skills. Instead, they spend much of their time dealing with drunken vagrants, photographing evidence of vandalism, and keeping an eye on rowdy teenagers.

As mundane as these duties may seem, they provide plenty of great story hooks. This is important. Just because accidental heroes are ordinary people doesn't mean they are boring people. Our transit cop probably spends a lot of time riding the bus and patrolling subway stations. Both of these activities are ripe with opportunities for the occult world to reveal its influence. Suppose he witnesses a suicide at a crowded subway station. A woman jumps in front of an oncoming train and no one tries to stop her. As he deals with the aftermath, police and emergency teams arrive, pushing him to the sidelines. When investigates the matter further, he is rebuffed and told not to interfere. Why? Thus is born a campaign.

Plot hooks are what separate any good character concept from a bad one. Hooks are absolutely vital to accidental heroes. Without background elements to draw upon, the GM must rely on feeble contrivances to involve ordinary people in an occult setting. If the night manager at the video store is a divorced father looking to reconnect with his child, the Game Master has something to work with. If the transit cop is an ex-soldier subject to post-traumatic stress disorder, his witnessing of a suicide that no one else noticed is thrown into doubt. These elements are part of what enables ordinary people to become accidental heroes.

Yet, the GM should restrict background elements that mitigate the "ordinariness" of the character too greatly. Otherwise, the character is little different from those in a standard *Conspiracy X* or *Chill* game. For this reason, accidental heroes should not begin the game with any explicitly supernatural abilities. The same holds for unusual skills and talents. Game Masters should also keep a close watch on the advantages and disadvantages of accidental heroes. Many of them are inappropriate for mundane human beings without any knowledge or experience of the occult.

Of course, occult campaigns -- even those involving accidental groups -- are all about secrets. Sometimes it can be quite appropriate for ordinary people to have "secret abilities," whether they be skills, advantages, or disadvantages. These secret abilities are known only to the GM and tie into the campaign background he has designed. For example, an electrical power worker (a fairly ordinary character) might be a UFO abductee, although he does not realize this. The accidental event that triggers his entry into the mysteries of the campaign might be an experience of missing time or waking up in an unfamiliar locale. In any case, the power worker does not begin the game knowing he is an abductee; only the GM knows that. As such, the character has a secret disadvantage with serious consequences.

The opposite situation is also possible. An occult bookstore owner might actually possess the ability to use Hermetic magic. This is a secret ability usable only after he comes to realize the power that lies within him. Once again, the GM knows of this secret ability, but does not reveal it to the player until the appropriate moment in the campaign.

Like all other abilities, secret abilities either cost or net character points. Because the players don't know their characters have them, what is to be done with those extra or lost points? There are several ways a Game Master could handle this. The simplest is pay no heed to the cost of secret abilities. This approach is more story-oriented and less driven by game balance considerations. However, some players may feel cheated if another player's character is granted expensive skills without paying the cost. In such a case, the GM could offset them by selecting an equal amount of secret flaws. Thus, a powerful enemy might hunt a latent telepath seeking to harness his potential for evil ends. Other similar solutions are possible.

Secret flaws without corresponding secret skills or advantages present a minor difficulty. After all, flaws provide extra character points in many games. How then does the player get to use these points unless the Game Master reveals that he has them? Moreover, if the GM does reveal this, doesn't it lessen some of the mystery? In some cases, this will not matter. The GM can simply give the player extra skills points with which to construct his character. In others, he can dispense the points once a previously secret flaw has been revealed through the course of the campaign. A third option allows the GM to assign the extra points to another copy of the character sheet to which only he has access. Thus, a character may actually have a higher skill level than his player realizes. This solution works especially well when the GM regularly makes rolls for the player characters in order to heighten tension. The final decision depends greatly on the sort of campaign the GM has constructed.

Anatomy of an Accident

Accidental groups arise by chance, but that doesn't mean the Game Master can do the same with his campaign. The accidental event or events that kicks it off must be carefully planned, taking into account both the characters involved and the structure of the campaign in question. Like everything else, the GM must give serious thought to the origin of his accidental heroes.

The ideal origin must include several elements if it is to accomplish its intended goals. Most importantly, it must allow for the introduction of all of the campaign's heroes. If it does not, the GM may need more than one trigger event. That is a perfectly reasonable option, especially in a campaign with more than a couple characters. In such a case, the GM must nevertheless find a way for each of the trigger events to relate to the others. Without this, the campaign will lack coherence, becoming a collection of unrelated scenarios involving unrelated characters.

Let's continue with some of previously mentioned examples. The suicide of a woman at a subway station provides a point of commonality between the video store manager and the transit cop. The one witnessed the event. The other is the ex-husband of the deceased. The connection between these two characters is simple enough. Additional characters could have been members of the crowd that also witnessed the suicide, but the GM rules against it because he wants to highlight the transit cop's experience of being the only person to see the entire event.

There are still a couple more characters in this hypothetical campaign: the power worker and the occult bookstore owner. The power worker's job often takes him into sewers while on duty. Perhaps he's working on some underground power lines beneath the occult bookstore. While there, he encounters something undeniably strange: the still-living body of an old man sealed up in a wall that shouldn't be there. Naturally, he contacts the residents of the buildings above the wall, including the bookstore owner, thereby connecting these two characters.

The question for the GM now is to connect both groups through some additional commonality. Perhaps the suicidal woman was recently a regular customer of the occult bookstore, purchasing several volumes on reincarnation and metempsychosis. Eventually, her ex-husband and the transit cop uncover this information, leading them to the bookstore, its owner, and the befuddled power worker. The GM has now successfully found several links between the characters, creating the bonds that will hold together his accidental group.

Of course, these bonds cannot simply be arbitrary ones. They must tie into the plotline of the campaign. Otherwise, the accidental group will not gel. They will drift apart as soon as the contrived nature of their bond is revealed. What the GM -- and the campaign -- needs are trigger events that bind the characters together and propel them toward the secrets of the setting. After all, accidental heroes are ordinary people. They need good reason to stick together in the face of dark forces and their minions. Anything less is a recipe for the campaign's quick disintegration.

Accidental Locales

The locations in which a campaign's scenarios take place are as important as the characters that inhabit them. We've already seen that ordinary people can throw the secret occult world into sharp relief. The same can be true of ordinary locales.

In the case of locales, "ordinary" can mean several things. At its most basic, ordinary simply refers to the commonplace and everyday. Places like a subway station, an office pool, a busy city street, or an elementary school are good examples of ordinary locales. Under most circumstances, few of us would find anything menacing about sitting in a cubicle in an office or visiting a child's classroom. However, if the characters have learned that a shape-shifting alien has infiltrated the office or that one of the schoolchildren is possessed, these ordinary locales take on entirely new casts.

The juxtaposition of the ordinary and the supernatural can be a powerful tool in the Game Master's hands. Occult games should necessarily deal with the strange and the hidden, things of which few have any real experience. Consequently, it can be easy for the bizarre denizens of the setting to become abstractions devoid of any narrative power. Without a context, there's nothing inherently terrifying about a homunculus. Place that little creature into a department store's toy department after closing time and you have the makings of a memorable -- and potentially frightening -- encounter. Always look for ways to integrate the extraordinary into the ordinary world in which the accidental heroes live. It can be a source of great drama.

Another option is to set the campaign in the players' hometown. In this way, everyone is intimately familiar with its locales, adding another layer of storytelling potential. When the GM describes a nearby site, the players can visualize it much better. More importantly, they will have a visceral sense of the incongruity that arises when dark forces exert their baleful influence on their own world. In many ways, a campaign involving accidental heroes is a campaign about heroes who could be someone we know, perhaps even ourselves. Setting the game in familiar surroundings hits this message home in a way that more exotic locales cannot.

A Different Kind of Campaign

In short, accidental hero campaigns offer a unique perspective on the occult worlds of many popular roleplaying games. While they require planning and forethought, they are no more difficult to create than more traditional games. Unlike campaigns centering on a powerful patron organization, however, accidental campaigns give ordinary people a chance to shine, something rare in most roleplaying games. There are many other rewards as well, making them well worth the risks inherent in undertaking them.

A Brief Spell of Madness: A New Twist on GURPS Magic

by Christopher M. Dicely

Art by Dan Smith and Colored by Keith Johnson

Overview

This article lays out a variant system of *GURPS* magic in which the practice of magic poses great risk to the sorcerer. In can be used in a number of settings: for instance, it could be used in a "secret magic" setting, especially one in which magic was typically a dark force (like *GURPS Horror* or *GURPS Cthulhupunk*). It could also be used in a medieval fantasy setting, where it would explain why wizards might be widely feared by common folk and reluctant to share the secrets with any but apprentices carefully chosen both for natural talent and strength of will.

Basic Rules

No special advantage (i.e., Magery) is required to cast spells in this system. The curious student who finds a book with real spells buried in the stacks at her college library might learn to cast some of those spells, but only at great personal risk.

All characters have a level of Magic Stress, which represents the strain on their mind from recent magical activity. Magic Stress starts at zero, increases with spellcasting, and decreases with rest, as explained in these rules.

All characters also have a level of Stress Tolerance, which rates their resistance to the psychological effects of increasing Magical Stress. The base value of Stress Tolerance is two, but this can be modified by the Magic Sensitivity and Magic Resistance advantages.

Advantages

The Magical Aptitude advantage no longer exists. However, two new advantages for spellcasting replace it: Magic Sensitivity and Magic Power. In addition, the Magic Resistance advantage is significantly different than the standard version.

Magic Sensitivity (5 points per level)
Your mind is unusually sensitive to the underlying structure of the universe. This allows you to be more adept than most when using magic, however, it also makes you more sensitive to the shock of spellcasting. Each level of Magic Sensitivity gives you a +1 to all spell skills, but halves your Stress Tolerance. Magic Sensitivity cannot be combined with Magic Resistance or with Magic Power.

Magic Power (5 points per level)
You have a mind that is "wired better" for coping with the exposure to
mystical underpinnings of reality. This gives you the ability to wield a
greater amount of magical power at any given level of personal risk. Each level of Magic Power gives you a +1 to
Stress Tolerance, and a +1 to IQ when determining whether a spell is powerful enough to require a special modifier to
the Fright Check when casting. Magic Power cannot be combined with Magic Sensitivity, but it may be combined with
Magic Resistance.

Magic Resistance (5 points per level)
You are unusually resistant to all of the effects of magic. For each level of this advantage, any spells which have you
as the target give the caster a -1 penalty to skill, any resistance rolls you make against spells have a +1, and you
receive a +1 bonus to your Stress Tolerance. On the downside, however, you are rather inept at manipulating magic,
giving you a -3 penalty to all spellcasting rolls for each level of this disadvantage. Note that this penalty applies only
to spellcasting rolls, not to spell skill levels for other purposes (e.g., prerequisites for other spells). Magic Resistance
cannot be combined with Magic Sensitivity; it can be combined with Magic Power.

Casting Spells

When you attempt to cast a spell, you make the usual roll to cast the spell, with a penalty of -1 per point that the
casting cost exceeds your (Will + Magic Power), and the effects of the spell are resolved normally. Then, the casting
cost of the spell being cast is added to your Magic Stress. Finally, you make a Fright Check, with a penalty equal to
your Magic Stress divided by your Stress Tolerance, rounded down, and, if the spellcasting roll failed, a additional
penalty of one for each point by which it did so.

Maintaining Spells

Whenever you need to pay the maintenance cost for a spell, you follow the same procedure as with spellcasting, except
that there is no roll to cast the spell.

Recovering Energy

For each full night of sleep, a character reduces his Magic Stress by a number of points equal to IQ modified by
Strong/Weak Will and then halved, +1 per level of Magic Power. This number is known as his Recovery Number.

Powerstones

Energy from a powerstone aids in spellcasting. Energy drawn from a powerstone is not assessed against your Magic
Stress, although you still must make a Fright Check based on your current Magic Stress even if all of the energy for
your spell comes from the stone.

Ceremonial Casting and Group Magic

These special types of spellcasting use the rules in the *Basic Set* or *Magic*, with the exceptions noted here.

The only restriction on what casters may join a circle and contribute energy is that every member of the circle must know the spell. There is no minimum skill level, nor is there any limit on the amount of energy each caster may contribute. The caster with the lowest skill always makes the skill roll, and every caster gains Magic Stress and makes a Fright Check based on the amount of energy they contribute. In the event of a spell failure, the margin of failure penalizes every caster's Fright Check, not just the one who makes the roll.

Spectators are allowed (and those who know the spell may opt to be spectators rather than members of the circle). Spectators are treated exactly as members of the circle, except that their skill levels are not included when determining which caster has the lowest skill and they may each contribute only a single point of energy to the casting. The only limit to the number of spectators participating is that the amount of energy from spectators cannot exceed the skill of the least-skilled caster in the circle times the number of casters in the circle.

Each person present (within sight or 10 yards of any member of the circle or participating spectator) during the casting who is neither a member of the circle nor a participating spectator imposes a -1 penalty to the final skill roll. Each person present who is actively opposed to the spell being cast imposes the same penalty and additionally adds 5 points to the casting cost of the spell.

Enchantment

As in the standard *GURPS Magic* system, a caster's effective skill when casting an enchantment is equal to the lower of his skill with the Enchant spell or the spell being enchanted into the item.

Instead of being equal to the skill of the caster, the Power of a magic item has a base value of 10. This is increased by one point for each point by which the skill roll to create the item is made. The effects of a failed skill roll vary by the type of enchantment being used.

The enchantment methods in this system share the names of those in the standard system, but have been significantly altered.

Quick and Dirty Enchantment

This method of enchantment is treated as any other use of ceremonial magic, described above. The casting time in hours is equal to the energy cost of the enchantment divided by 100, rounded up. If the skill roll to cast a Quick and Dirty enchantment fails by less than five points, the item is still enchanted, but has a reduced Power. From the base Power of 10, subtract the number of points by which the roll failed. If the roll fails by more than five points, the enchantment fails entirely.

Any item produced by Quick and Dirty Enchantment may have flaws. To determine if it does, once the item is created, the GM should make a roll against the item's Power. If this roll succeeds, the item has no flaws. If it fails, it should have 1d/2 "warps" -- minor flaws which affect when or how it can be used. The descriptions of minor Powerstone flaws in *GURPS Magic* are a good starting point, although you will want to make sure the flaw makes sense for the item. If it critically fails, it will have 1d-1 warps plus one serious flaw - it either functions as a different spell or has some kind of deleterious side-effect on the user, for instance. Flaws will not be apparent without casting Analyze Magic on the item.

Slow and Sure Enchantment

This method of enchantment is also a form of ceremonial casting. It is much safer than the Quick and Dirty method, at the cost of increased time. An enchantment by this method usually takes multiple days (each day consisting of 8 hours of casting the enchantment, with the remainder available for other activities like sleeping, eating, etc.).

Each day of casting, each caster in the circle may contribute any amount of energy up to his Recovery Number plus any energy drained from a single powerstone during the day. At the end of the day's casting, the caster makes a Fright Check as if that energy had been spent on a completed spellcasting, although the actual skill roll is not made until the casting is complete.

The final spellcasting roll for the enchantment is made at the end of the day on which the energy cost of the enchantment is met, and the final Fright Check for each caster is made after that roll, with the usual modifiers if the roll fails.

Spectators cannot assist with a Slow and Sure enchantment, only skilled casters working as full members of a circle may do so. If the final casting roll for a Slow and Sure enchantment fails, the effort and any materials, including the item being enchanted, are wasted. If the item already had an enchantment on it, the item and the original enchantment may survive: roll against the Power of the pre-existing enchantment to see if it does. If there are multiple pre-existing enchantments, roll against the weakest to see if all of them survive.

Rituals

The Alternate Magic Ritual Rule in the sidebar of p. M7 is used instead of the standard ritual rules which reduce the required ritual with increasing skill. In addition, the caster can halve the casting time for each -5 penalty taken to skill.

New/Modified Spells

All Magery prerequisites are replaced with prerequisites based on the Thaumatology skill. A prerequisite of Magery becomes "Thaumatology 12+", a prerequisite of Magery 2 becomes "Thaumatology 15+", and a prerequisite of Magery 3 becomes "Thaumatology 18+".

Otherwise, most spells written for the standard GURPS magic system can be used in this system without further modification. However, a few spells require special attention. In particular, spells whose effects are designed around the relation between fatigue and magic energy in the standard system need to be re-examined to work well with this system.

Healing Spells

Lend Strength   Regular

Allows the caster to restore the subject's lost fatigue, at the expense of fatiguing himself. For each point of fatigue restored to the subject, the caster takes one point of fatigue.
Cost: 1; allows caster to transfer as many points of fatigue as he desires.
Prerequisite: Thaumatology 12+; or the Empathy advantage.

Recover Strength   Regular

The subject of this spell (which may be the mage himself) recovers fatigue faster while under the influence of this spell. The subject must be resting quietly; he may not, for example, cast spells or even maintain spells that require concentration.
Cost: 2 for the subject to recover one point per 5 minutes of rest, 5 for one point per 2 minutes, 10 for one point per minute; same to maintain.
Time to Cast: 1 minute.

Duration: 10 minutes.
Prerequisite: Lend Strength.

Share Strength

This spell is changed to Share Power. See below.

Meta-Spells

Share Power   Regular

Allows another caster to serve as a conduit of energy for another mage's spellcasting. The subject of this spell is another character that can draw energy from the mage for the purpose of casting a spell. The subject may draw the energy the following turn as long as he is casting a spell; if the spell would not be completed on that turn, he may "hold" the energy to use when the casting is complete. The casting cost, skill roll, and Fright Check for this spell are made once the subject decides how much energy he will draw, up to a limit of the caster's Recovery Number (if he chooses a greater amount, he only gets the maximum and provides the rest himself!). Duration: Energy must be drawn in the turn following casting, cannot be maintained.
Cost: Twice the amount of energy drawn by the subject.
Prerequisite: Thaumatology 12+.

by Sean Punch/TL7

Art by USGS and Keith Johnson

GURPS rules lawyers please take note: we are now officially at tech level 8. Okay -- technically, we are not quite there yet. According to *Basic Set*, TL8 officially starts at the stroke of midnight on January 1, 2001 (see p. B185). However, those of you who are planning to submit manuscripts to SJ Games should note that it is now kosher to include TL8 technologies, characters with TL8 skills, and so on in material set in the present day. (In a few years, only *outdated* technologies and the skills of old fogies like me should be treated as TL7.)

Big, Little

Tech level 8 did not really happen quite the way we thought it would, however. Here is how we called it on p. B185, complete with some context:

> 7. Modern (1951-2000): nuclear energy, computer, laser, rockets
>
> 8. Spacefaring (2001-2050?): slower-than-light space travel, fusion power, implants
>
> 9. Starfaring: faster-than-light star travel, sentient computers, longevity, deteronic frombotzer

Except for the frombotzer, that seemed quite reasonable when it was written. But the TL system was created in 1985, and a lot can change in 15 years. In 1985, the biotech revolution had not shown its true face, "nanotechnology" was just a buzzword, futurists sincerely believed that we would see cheap fusion power "in our lifetime," and the Space Shuttle program still generated enough hype to fuel hopes for manned space travel.

From our vantage in 2000, it is clear that we will see what *GURPS* presently calls "TL9 biotech" within our lifetime. I personally know people who are working on nanotechnology for industrial use. The ETA on that? Sometime before 2025. And the R&D money that might have been spent on manned space travel, fusion power, and other "big science" has gone into "small science" -- the engineering of cells, molecules, and tiny machines.

We can admit when we're wrong, and we strive to fix our mistakes. Authors of *GURPS* material dealing with technology should note that as of the next printing of *Basic Set*, tech levels 7-9 will be defined as follows:

> 7. Modern (1951-2000): computer, laser, miniaturization, mature fission technology
>
> 8. Microscience (2001-2050?): AI, gengineering, longevity, micromachines, early fusion technology
>
> 9. Nanoscience: environmental engineering, nanomachines, sentient AI, mature fusion technology

I will say nothing about TL10 and beyond. That is so far in the future that we really have no reason to doubt (or to trust, especially) the definition on p. B185. After all, if predicting the final decade of TL7 proved a challenge in 1985, then it is likely futile to make authoritative statements about events 100 years from now! What we *can* say is that the

TL definitions on p. B185 focus heavily on space exploration-enabling technologies, but our statistical sample of one -- Earth -- has shown us that high population densities, post-industrial environmental concerns, and widespread access to powerful computers tend to push small-scale, introspective technologies ahead of large-scale space technologies. Those who want to go out on a limb and modify TL10+ are welcome to take this idea and run with it.

I Want My MNT!

The above correction would seem merely to displace the problem, though. Okay, so now we have *different* innovations proposed for tech levels 8 and 9, but it is apparent that the so-called TL8 technologies are not here yet! How is this an improvement? Here is an addition to the TL rules to cover that:

> The technologies assigned to a TL reflect *all* developments which will appear during that TL, from start to finish. Only the subset of TL*x* innovations which were being researched at late TL*x-1* will be available at the debut of TL*x*. The remainder of TL*x* technologies will be conceived of and wholly developed during TL*x*, possibly only at the end of TL*x*! By the same token, the least-advanced items from TL*x+1* will be R&D items late in TL*x*.

The savvy reader will recognize this as an endorsement of the "early TL*x*" and "late TL*x*" designations seen in various *GURPS* volumes on technology, notably *Vehicles*. We are embracing that system because it makes sense. In real life, technological growth is a continuous process, not a series of discrete transitions: radar and jets are TL6 (1901-1950), but appeared in the 1940s, not in 1901, and so are "late TL6." Rockets and nuclear power are TL7 (1951-2000), but they were R&D items in the 1930s and 1940s, and so are "early TL7."

Getting back to the present, the definitive technologies of TL8 include gengineering, micromachines, and early fusion technology. All of these were actual R&D topics in TL7; we have working models of all three as I write. Thus, we are at "early TL8" at the moment. Just hold on to your hats for a few years until the rest shows up! (Except for those darn power cells. Power cells canonically appear at TL8 in *GURPS*, but their energy densities tend to exceed subatomic binding energies, meaning that it would be impossible to build them from matter as we understand it. This puts them in the same category as matter transmission, FTL travel, and force manipulation. Realistic settings probably should not include them. At least not before TL10.)

My PhD in Burger Flipping

Finally, there is the issue of "/TL skills." What happens to *those* as we move from TL7 to TL8?

Tech Level 8 -- Then and Now

People educated at TL7 -- i.e., those possessing skills designated "/TL7" -- will continue to operate largely at TL7. Yes, they will take refresher courses, read journals, and generally try to scratch and claw their way back up the technology curve. This means that they will get the -5 default to use the TL8 versions of their skills, as mentioned on p. B185. Realistically, slackers (such as those with the Laziness disadvantage) will probably end up with the same defaults as the untrained; e.g., the lazy chemist will have Chemistry/TL8 at IQ-6 instead of at Chemistry/TL7-5. GMs should not feel compelled to enforce strict realism, but the fact is that time stops for no man, skills do grow obsolete, and a sudden innovation in a field does not upgrade the skills of those working in that area. Yes, this means that an increasing number of characters will sport "Primitive (-1 TL) [-5 points]" in realistic campaigns. GMs should consider not counting this

toward disadvantage limits.

On the other hand, those who are just starting their eduction here at the dawn of TL8 -- yes, those screaming 5-year-olds starting school this autumn, and even those annoying 12-year-old mall rats -- will have honest-to-goodness "/TL8" skills when they are handed their diplomas in the 2010s and 2020s. The first truly TL8 generation will hit the workforce in 2020 or 2025 . . . by which time many of us will be able to hide our low-tech skills in cushy management positions (Administration is *not* a "/TL skill") or retirement (neither is Golf).

Don't say I didn't warn you.

Kith of the Spider Woman

"If you wish to live and thrive,
Let the spider run alive."
-- Kentish proverb

It's no doubt characteristic of my mind that I read that couplet not as a simple "good luck" verse, but as something along the lines of a threat. Much as we refer to the Faerie as the "good folk" to keep them from behaving like the bad folk they are, the enterprising folklorist (or GM) can find plenty of strands with which to darken the web of mythography around the "lucky" spiders. The ensuing exercise in pseudo-anthropological paranoia can wind up buttressing any secretive spider-cult (from Clark Ashton Smith's Atlach-Nacha to E. Gary Gygax' Lolth) or Hidden Arachnid Race in your game. You say you don't have a secretive spider-cult or Hidden Arachnid Race in your game? Well, now you do.

"There may be in the cup
A spider steep'd, and one may drink, depart,
And yet partake no venom, for his knowledge
Is not infected . . ."
-- William Shakespeare, *The Winter's Tale,* II:i:41-44

Spider goddesses (spiders are nearly always goddesses) sit in the center of a vast web indeed. At their most numinous, they spin out the very stuff of existence; the web of the Hindu virgin spider-goddess Maya can be likened to the Wheel of Fate, of magic, of appearance and illusion (also known as "maya" in Buddhist thought). The Norse Norns, and the Greek Fates, also have the spindle and loom (represented by -- or representing -- the spiderweb) as their symbols and tools of office. Just as the spider creates her web from within her belly, many of the spider goddesses created the world, from the Chaldean Orore, to Areop-Enap on the Pacific island of Nauru, to Hatai Wugti of the Zuni, to Tule of the African Azande. Even those spider goddesses not explicitly given the job of creating the world often supplied it with key ingredients such as fire, as in the Cherokee stories of Grandmother Spider, Kanene Ski Amai Yehi. Most of the rest of the arachnid deities, such as Ix Chebel Yax, a spidery Maya moon-goddess, brought mankind the arts of the loom and spindle.

Perhaps the best known spider myth is that of Arachne, a mortal weaver who boasted that her blasphemous tapestries surpassed those of Athena, goddess of weaving. Athena, unable to find fault with them, angrily turned Arachne into a spider. This story may represent the supplanting by Athena of an earlier spider-goddess of Miletus, where spider-icons have turned up going back to 2000 B.C. or so. (There are odd eight-legged chevron patterns on loom-weights found in Bulgaria as far back as 5000 B.C.) Or it may just reinforce the notion of spiders as equal to even the gods in power, but somehow "wrong" or "different" or dangerous. It's worth noting also that Circe, the great enchantress who ensnared Odysseus, is first seen weaving, and that Odysseus' wife Penelope (whose name means "web over her face") wove a death-shroud by day (and un-wove it by night) to keep her suitors suspended in time (caught in her web?) until Odysseus returned. A particularly unsavory legend implies that Penelope became the mother of Pan, god of fearsome nature, after sleeping with every suitor in turn. These spider-women weave powerful magic, it seems.

"Their webs shall not become garments, neither shall they cover themselves with their works: their works are works of iniquity, and the act of violence is in their hands. Their feet run to evil, and they make haste to shed innocent blood: their thoughts are thoughts of iniquity; wasting and destruction are in their paths. The way of peace they know not; and there is no judgment in their goings: they have made them crooked paths: whosoever goeth therein shall not know peace."
-- Isaiah 59:6-8

In fact, they seem downright spooky when you start adding in the various Trickster spiders. Biluku, an equivocal spider goddess of the Andaman Islands, invented fire but refused to share it with mankind; the trickster Melanesian spider goddess Marawa tricked mankind out of immortality. The Ashanti claim that Anansi, the Spider, is a jovial male trickster-god, but in Haitian vodoun, Anansi became the androgynous and aptly-named Ti-Malice ("little malice"), and

in the Carolina Gullah culture "he" reverted to true goddess-hood as "Aunt Nancy." It can't just be me that hears an echo here of the Greek goddess Ananké, personification of (and weaver of) inevitable fate. Ananké, in fact, is a later form of a Phrygian mountain-goddess Adrasteia ("the inescapable"), the avenger of all wrongs -- wrongs, mayhap, like killing spiders. Where Phrygian mountain-goddesses come up, we shouldn't be too surprised to see traces of the dark goddess Cybele, who messily devours her lover Attis much as the black widow does her own mate. A spider emblematizes, in fact, Cybele's Syrian manifestation Atargatis, and an eight-legged cross represents the Babylonian Great Goddess Ishtar. Speaking of devouring mothers, of course, the Hindu goddess Kali not only destroys the world under cover of night (just as Penelope does her woven universe) but actually has (at least) eight limbs! And Kali's death-cultists, the Thuggee, killed their victims with either a pickaxe (recalling the puncturing mandible of a spider) or a sacred garrotte cord (recapitulating the deadly thread of a spider).

After all of that, it's almost a relief to run across the Egyptian goddess Neith, identified with the spider (and, by the Greeks, with Athena). Neith not only shares the patronage of weaving with her arachnid sisters, she is also a goddess of war (like Kali, or like Adrasteia's Celtic sister Adraste, to whom Boudicca sacrificed captured Roman women), an "opener of the way" for the dead (much like Penelope on the cusp of creation and uncreation), and a goddess of primordial chaos and creation. The inscription on her temple at Sais (where the spider-cultist Milesians had a trading post) reads "I am the Universe, Past, Present and Future; no mortal made the acquaintance of me." Spider-cultists of the Pyramids, anyone?

"One of the names of the Vulture of Neith is Nru. *According to Hor-Apollo the Egyptians symbolized the Mother by a Vulture 'because there is no male in this race of creatures,' which could be interpreted as meaning that the vulture represented a type of conception not wholly human. Nru is numerically 256, which equates it with the Voodou Spider Goddess possessed of 256 kalas."*
-- Kenneth Grant, *Outer Gateways*

In fact, traditional Christian lore has always known just what to think of spiders -- they're evil. The spider was clearly identified as a demon of lust, one which turned into a prostitute. In one celebrated witch-trial, the accused was found guilty of parroting advice from a spider on his shoulder; well before that, the tarantula spider had been identified as the cause of the "tarantella" form of "dancing madness" that swept through southern Italy in the 14th century. (Parallels with voodooistic trance dances for Ti-Malice, or with the ecstasies of Pan's Maenads, imply that the tarantellists may have been cultists, rather than victims, of the spider sorceries.) The medieval kings most closely identified with spiders were fairly unsavory folk; Louis XI "the Spider King" of France created the autocratic regime that led to Revolution, while Robert "the Spider" Bruce only won the throne of Scotland after killing a man who had claimed sanctuary -- and after seeing a spider spin seven webs. (He was also in cahoots with the Templars, whose cross pattee has eight points.) Even the Latin for spider, "aranea," has echoes of Aradia, the Queen of the Night and Air.

Outside Europe, it's much the same; "spider" kabbalistically (OKBYSh) adds to 402, which is the same as "daughter" in Hebrew, or as Set-Aiwaz (the entity who inspired Aleister Crowley), and lies nestled between 401 (the curse) and 403 (the Philosopher's Stone). The spider's web, QWRY OKBYSh, adds to 718, the Abomination of Desolation -- the Kingdom of the Antichrist. None of this would surprise the Malekulans of New Guinea, who must fill in a puzzle-pattern in the sand before Lehevhev, the man-eating spider who guards the mouth of the afterlife; or the Japanese, who learned to fear Tsuchi-Gumo, the spider woman who seduced men and then killed them. Even tribes of Amazon Indians pass warily under the eyes of Ituana, their own arachnid goddess -- and it's an interesting coincidence to note that the warrior-women Amazons, according to Pomponius Mela, also killed men by dragging them in nets.

"Are you aware that the super-brain you refer to is that of the Spider Queen of Space, worshiped on this planet only by renegade cults such as the Obeah branch of Voodoo, and some disciples of Aleister Crowley?"
-- George C. Andrews, "Response to Winston Sarafian," in *Extra-Terrestrial Friends and Foes*

The net-wielding warrior women, the shapeshifting spider seductresses, the eight limbs of Kali and the worldwide connection between websters and sorcery all point to an unseelie race of arachnids living among us in secret. Here's where the legends of [Berchta] -- a weaving goddess symbolized by a net -- living beneath a mountain in Germany come in. To Tannhauser, of course, she was Venus, and the mountain the Venusberg. Venus, not terribly coincidentally, is represented by an eight-pointed star, and should also be triggering our UFO alarm about now. Could

the Spider Women be aliens?

There are an awful lot of arachnid culture heroes, bringing everything from fire to the seeds of the earth to the always-handy art and craft of weaving cloth. (Or, translated, energy, genomes, and nanotechnology.) Spider-goddesses like Athena and Neith were anciently associated with wisdom: Plato says the records of Atlantis are stored in secret halls in the temple of Neith at Sais. In this connection, the Cour d'Alene Indians have an allusive tale of the Spider Women who "live in the sky" helping the son of Coyote to avenge the cuckolding of his wife (shades of Odysseus, a different trickster hero) by teaching him how to "descend to the earth in a box."

So what we have here, for tales ranging from *GURPS Egypt* to *GURPS Illuminati* and beyond, is a shapeshifting race of alien spider-women from, let's say, Zeta Reticulum (A reticulum, of course, is a net, or a web). They crashed on Earth; for whatever reason, be it cultural or biological, they brought only females with them. To stay alive and reproduce, they must devour or vampirize humans, especially human males (hence the legend of the net-wielding Amazons raiding villages for babies). Working in secret, a small group of them have infiltrated selected civilizations, setting up puppet rulers like Robert the Bruce. Some live in underground bases, others in a gossamer interdimensional ship that simultaneously creates and destroys matter. Still others have decayed and become monstrosities, a fitting target for Black Ops teams or jut-jawed *GURPS Atomic Horror* colonels who don't mind risking the Kin of the Spider Woman.

Combat -- Round Two: FIGHT!, and The Last Play Dirty

For those of you looking for the last Play Dirty, scroll down past my incoherent ramblings.

I saw the movie *Blade* (Wesley Snipes, vampires) for the first time this week, and several questions popped to mind.

1. Why am I watching this?!?
2. What's a millennia-old ritual site doing on the outskirts of LA?
3. Do the combats in this movie *work*?

I will leave it to the great philosophers to try to puzzle out the first two questions, but I did work out the answer to the third question.

"Sort of."

Now, Blade is a typical action movie, meaning that you know from the beginning the protagonist may suffer some setbacks, but he'll never be seriously challenged. He's one bad mutha, that Blade.

A lot of adventure game combats/sessions/adventures/campaigns are like that; the PCs may lose some hit points, or be otherwise inconvenienced, but otherwise they'll never be terribly challenged . . . not really. Even if a PC dies, in many games that just doesn't *mean* much. "Drat! Time to come up with Thugneck Strongarm the Third!"

So most action movies follow the trend regarding combat I mentioned last week:

The protagonist wins. Story continues.
The protagonist dies. Short movie.

But one movie (or movie series, if you'd prefer) changed my mind regarding that, and, for the first time, allowed me to concoct combats that were *really* as interesting to me as other aspects of gaming.

That movie was *Raiders of the Lost Ark*.

(Or, if you prefer [though I don't know why you would], *Indiana Jones and the Raiders of the Lost Ark*.)

I saw that movie again with fresh eyes a few years ago, and realized some things.

1. As a watcher, I *knew*, at any given time, that Indy wasn't going to die.
2. Beyond that, I had no clue what was going to happen next.

And it was for a reason that combined with a concept I'd learned in a creative writing class: secondary level of action. Basically, the secondary level of action says that, in a play, movie, or book, you should consider having *something* else going on while characters are interacting.

So consider for a simple lame example:

"Do you have the plans?" asked Agent Uiop.
"Yes; they are in the briefcase," said Agent Qwerty.
"Give me the briefcase," said Agent Uiop.
"No," said Agent Qwerty.
"I have a gun," said Agent Uiop.
"Yes. You do," said Agent Qwerty.

Agent Uiop shot Agent Qwerty twice and ran into the night with the briefcase.

Now combine this with a secondary level of action, you get:

"Do you have the plans?" asked Agent Uiop.
"Yes; they are in the briefcase," said Agent Qwerty, his voice lowering to a whisper as the server approached.
"What can I get you?" she asked. "We have Key Lime Pie on special."
"I don't want anything," said Agent Uiop, drumming his fingers impatiently and looking at the briefcase.
"I'm sorry, sir, but you have to order something to stay here," the server said insistently.
"Coffee, then," he said.
"Regular or Decaf?"
"Regular. Black. Now."
"Oh-kay," she said, pivoting on her heel to the other patron. "And you?" she asked.
"I'll have coffee, too. And a piece of the Key Lime Pie, please," said Agent Qwerty as he cradled the briefcase in his lap under the table.
The waitress wrote the order down and walked away.
"Give me the briefcase," said Agent Uiop, looking nervously at the waitress.
"No," said Agent Qwerty. He unfolded his napkin and placed it in his lap.
"I have a gun," said Agent Uiop, noticing the waitress returning with a coffee.
"Yes. You do," said Agent Qwerty to Uiop. Then, turning his attention to the server, he said, "Can I ask you a few questions?"
"Sure," she said, as Agent Qwerty fumed in anticipation of getting the plans, his hand slowly reaching into his trenchcoat.

Although it's *still* a lame example, at least it's an exciting lame example. What's going to happen next? Is the waitress going to get caught in the crossfire? Is she going to be involved in the fighting? What about the rest of the restaurant?

This was the beauty of the good Indy films; in most scenes, you didn't know *what* was going to happen, because there was usually something else going on that could affect the outcome. And that "something" was usually a secondary goal or objective. Would they make it onto the plane? Would Indy recover the antidote *or* the diamond? Would young Indy get the Cross?

And, in this one realization, I was able to make combats much more interesting (for me, at any rate). Suddenly, by just adding *something* else to the mix, I was able to increase the level of uncertainty.

I personally have a hard time killing PCs, but what about the NPC they've been assigned to guard? What if they need to keep the President from getting kidnapped by zombies? What if the train they need to catch is pulling away at the moment they're attacked by ninjas? What if the building they're in catches fire at the same time Captain Badguy chooses to attack? What if the rampaging monster is really the PCs ally; do they use lethal force?

Now, not every combat needs to be a three-ringed circus. But combats seldom happen in a vacuum; if there's a reason for combat, then that reason doesn't necessarily need to remain passively on the sidelines while the combat occurs. (Of course, multiple levels of action are easier in some systems than others; **GURPS**, for example, with its one-second combat rounds, are challenging for me to work around. "All right; the train moves away in two minutes." "So? That's 120 combat rounds!")

In all, I'm not a fan of "mundane" combats, but I've come to see the value in viewing combats as being potentially as unpredictable and exciting as any other transactions.

?

The Last Play Dirty

Well, this is the time when I have to say goodbye. I've been struggling with a way to do this, and I just can't find the words. But, ours is a relationship built on trust, and like all relationships, this one has run its course.

Over the past month and a half, I've discovered I have nothing new to offer you. Well, that's not exactly true. I've written a couple of things, but none of them are really what I'd call "quality work." See, despite what some may think, I do have a set of standards about my writing. And, frankly, the stuff I've been writing for you just hasn't been able to cut the mustard. I hear some of you asking, "Why?"

Well, the answers aren't as simple as the question. Writing about one subject for over a year - that's a lot of it, I think. It's not that I don't have anything more to say on the subject, it's just that . . . well, a GM has to keep some of his secrets.

I also think a lot of it has to do with the fact I have a new job. Working at Totally Games is a lot more demanding on my creative energies than a foster care agency. Also, deep down inside, I think there's a bit of me that won't let me write for Pyramid because I don't own the columns. They belong to Steve Jackson when the day is done, and I did make a promise to The Wife I wouldn't do any more work I didn't own; even if it is a monthly column of GM advice.

So, this is where we say goodbye. I'm sure Play Dirty will show up again some day. I'll get an itch that only this column can scratch, or Mr. Marsh will find someone else to take over the chore.

Take good care of yourselves, and your players, and don't forget: you always hurt the one you love.

And, as Tyler Durden taught us, the reverse is also true.

--   *John W.*
                 9/14/00

I'm reminded of the (sadly ironic, in retrospect) exchange between Bond and Q in the most recent James Bond film, *The World is Not Enough*:

Bond: You're not retiring any time soon, are you?
Q: Now pay attention, 007. I've always tried to teach you two things. First, never let them see you bleed.
Bond: And the second?

Q: Always have an escape plan!

As a creator, I feel it's definitely better to "escape" before you dip below a level you're happy with . . . a lesson too many novelists, directors, and others fail to realize. Good luck, John!

We're not sure what he means about us "owning" the column, because that's not the way the Pyramid writing deal works -- see our [writers' guidelines](). We buy electronic rights and a limited right of first refusal on paper reprints, and that's all. I got John's column just a few of hours ago, and have replied to John, but hopefully the misunderstanding isn't the real reason he's dropping the column!

At any rate, thanks, John, for giving me lots of ideas and making me think more than most. I *still* can't watch *Star Wars* without thinking, "What's good-hearted, sweet-faced Ben Kenobi trying to do there? He's using the Old Jedi Mindtrick!"

-- Steven Marsh

Pyramid Pick

Demon City Shinjuku: Role-Playing Game and Resource Book

Published by **Guardians of Order**

Written by David L. Pulver (with Mark C. MacKinnon, Jeff Mackintosh, Karen A. McLarney)

150 pages, $19.95

In 1988 the anime feature film *Makai Toshi Shinjuku* was released in Japan. Based on a novel by Hideyuki Kikuchi (a Japanese SF/Horror author), Shinjuku told the story of Kyoya, a young student of the mystic combat art of Nempo.

Ten years before the film begins, Kyoya's father (a Nempo master himself) attempted to prevent Levih Rah (a Nempo master who had turned to evil) from summoning demonic powers to conquer the Earth. He dies in the attempt, but not before he disrupts Levih Rah's spell. Instead of conquering all of humanity in a single blow, Rah is only able to summon his demonic horde to a localized area . . . the Shinjuku district of downtown Tokyo. A massive earthquake wreaks devastation across dozens of city blocks, and Rah begins to prepare for the day when his dreams of conquest will reach true fruition. Now, a decade later, Kyoya must venture into this modern city of the damned, and finish what his father started . . .

Several years after the film's original release, Central Park Media translated it into English as Demon City Shinjuku. In America, as in Japan before it, Shinjuku quickly became a classic of both its medium and genre. And now, twelve years later, Guardians of Order has presented us with the *Demo n City Shinjuku Roleplaying Game and Resource Book*.

Demon City Shinjuku is not the first, nor will it be the last, of GoO's licensed anime games (it was preceded by *Sailor Moon* and *Dominion: Tank Police*, and has been followed by *Tenchi Muyo!*). Like these other games, *Demon City Shinjuku* uses the Tri-Stat System which first appeared in the critically acclaimed *Big Eyes, Small Mouth*.

Action resolution is handled in a fairly standard and straight-forward manner: A roll of 2d6 is modified by a difficulty and compared to the appropriate Stat or Skill. Combat uses the same basic mechanic to determine the relative effectiveness of attack and defense. Damage is determined through the combination of a secondary attribute and the weapon's damage rating. One nice touch throughout the game are two simple flowcharts (one for combat and one for character creation) which clearly and concisely summarize the rules for easy reference during gameplay.

Character creation is based primarily on three things: Three character Stats (Body, Mind, and Soul -- hence the name "Tri-Stat"), Character Attributes, and Skills. Each of these systems is point-based, with fairly broad and open-ended definitions. For example, your character might have a Level 3 in Massive Damage -- allowing you increase your damage in combat by 15 points because you know precisely where to land a blow to cause the maximum possible amount of damage. However, precisely how your character knows how to land such a blow is left open-ended -- they might have trained in the martial arts; or perhaps they receive mystic insight into where to land each blow.

This system is mechanically very precise while, simultaneously, modeling a wide variety of phenomena in the *Demon City Shinjuku* universe in a simple and easy-to-use manner. In addition, a great amount of care has been taken so that the elements of the game system will interact in exactly the manner shown in the movie -- if doing X and Y in the movie allowed a character to achieve Z, then doing X and Y with the game system will also result in Z.

As impressive as the system is, though, the ***Demon City Shinjuku Roleplaying Game*** really begins to shine when we reach the second part of its title: ***Resource Book***.

In addition to simply presenting a roleplaying game for their licensed products, Guardians of Order also present their books as generic resources for fans of the source material. In addition to creating a higher potential for the development of a crossover market of anime fans interested in purchasing the book, this also lends to the book a true depth of source material which is often lacking in licensed products. Instead of simply covering the material found in the movie, GoO has taken the next logical step of supporting the movie with a wide variety of supporting details -- exactly the type of details which a GM craves when running an adventure.

While doing this, however, they have very carefully not imposed a vision of Demon City Shinjuku beyond the confines of the movie. Instead they have presented a wide-open toolbox with which a GM can create their own version of the Demon City Shinjuku universe. By doing so they don't lock the property into their own vision of "how things are supposed to be," instead opening it up to a multitude of visions limited only by the extent of your own imagination and desire. Want a campaign where Shinjuku was only one of many cities struck by Levih Rah's spell? You'll find support for it here. Want a campaign set in the years between Levih Rah's spell and Kyoya's success? You'll find support for it here. Want a campaign where Kyoya failed? You'll find support for it here. And so forth.

Moving beyond this toolbox, they have provided a wealth of real world information on Japan and Tokyo. This is, essentially, the foundation on which the movie is built -- and by stripping away the surface of the movie, and revealing the pylons on which it was constructed, GoO is giving you the same firm base with which to build your own campaign.

By doing this, GoO has proven -- once again -- that they are capable of looking at things with the eye of a master game designer: Finding the basic elements which make up an experience, and laying them bare for you to use in the easiest fashion possible. The result is a high quality product which is, above all else, useful as a gaming resource.

So, at the end of the day, what is ***Demon City Shinjuku***? It's a tried and proven rule system which has been expertly adapted into a near-perfect adaptation of a licensed property. It's a property which is, in turn, rich with gaming opportunities -- demons on the loose in a mystic post-Armageddon setting with gothic horror themes. It's presented in a dynamic and open-ended fashion -- remaining true to the source material, while simultaneously facilitating a diverse set of visions.

It is, in one hundred and fifty pages, a rich and worthy addition to your library of gaming experiences.

-- Justin Bacon

It Came From the Deeps

by Glenn St-Germain

Art by Dan Smith and colored by Alex Fernandez

This *GURPS Space* adventure is for four to six characters of 100 to 125 points. However, as the scenario places an emphasis on investigation and character interaction rather than combat, characters of higher point levels will not unbalance the scenario too badly. The adventure requires the characters to be in an area of space not far outside the fringes of "known space," in an area that is just being explored. The scenario itself takes place on the planet Aqualine, the site of a lost human colony. Aqualine is a water world with a pleasant, temperate climate, with one large island and several small ones; the large island is settled.

One more thing: the scenario requires that one of the ship's crew be "sacrificed," albeit temporarily. This should be a major NPC if possible. (If the scenario is being run during a session where one of the regular players is absent for some reason, that player's character would also be an ideal candidate for the "sacrifice.")

Welcome to Aqualine

The party arrives into the system in their ship. A quick survey of the system reveals that this is a binary star, a spectral class G main star and its class M red dwarf companion orbiting at a distance of just under 30 astronomical units. Orbiting the main star are a handful of planets, the third of which is Earthlike.

Investigating the planet more closely, they discover that the world is almost completely covered with water. There are a few island chains here and there. The largest island, if examined from orbit, shows patters of cultivation. A scan of the radio frequencies will reveal an automated radio beacon signal being broadcast from the southwest corner of the island, where a town is located. The nature of the beacon is similar to a navigational beacon of the type found at class 1 starports, but outdated.

The planetary starport, if it can be called that, is nothing more than a flat area of cleared ground a few kilometers outside the town, with markings in contrasting stone indicating a landing place. The beacon is broadcast from a shack located to one side of the landing area. At the time the players make contact, the shack will be manned by a radio operator by the name of Verd, who will initially believe that one of the other radio operators on the planet is playing a joke on him. He will be sarcastic, but amused, and invite the PC's to land their ship. Once he realizes that the PC's contact is not a joke, he will immediately use his radio to contact the town.

The party will be met by the Mayor of Kreshburg (the town near the starport) and an entourage that includes a brass band, who play celebration music -- off key -- as the party disembarks from their ship. The Mayor, a short, balding man by the name of Bel Torin, will welcome the visitors and call for a celebration, explaining that the party's appearance is the first visit to the planet by a spaceship since Torin was a small boy.

If there are any non-humans in the player characters' party, the residents will initially be apprehensive. None of them have ever seen a non-human sentient; few are aware that they even exist. However, if the non-human reacts in a

friendly manner, the people will quickly become at ease, though some will still keep their distance. On the other hand, children will find the non-human(s) fascinating, and any non-human player character will soon find him/herself surrounded by a group of 10 or 12 kids.

Life on Aqualine

The island is simply known as Big Island. Over 100 years earlier, the colony ship Artemis landed here after experiencing problems with its engines; this system was not the Artemis' intended destination. However, having found an earthlike world suitable for habitation, the Artemis offloaded its cargo of colonists, equipment, and supplies. The original landing spot is located in a park just outside the town of Kreshburg, which has a population of about 5,000 people.

The operational tech level here is equivalent to a late 19th-century Earth, with an agrarian economy. There is little in the way of industry. Most of the machinery dates back to the original colony equipment, and much of it still works, though some repairs have been jury-rigged. The farm combines still work, for example, and are more useful in working the fields than any other method; the machinery is rotated around the island as needed. A geothermal tap built by the original colonists provides the island with electricity.

The planetary population now stands at about 40,000, with the only inhabited islands being Big Island and its nearest neighbor, called Next Island, a few miles north. The land is arable. The seas teem with edible fish and other sea life. Life is peaceful, happy, and a little on the dull side. The Mayor of Kreshburg is the de facto leader of the planet. Bel Torin has run unopposed for three consecutive terms, and the arrival of the visitors is the most exciting thing to happen in a very long time. Aqualine has not had any visitors in about 35 local years -- 52 years, Earth standard. The last visitor was a passing merchant vessel, an event that most of the people on the planet are too young to remember, if they were even alive then.

A group called the "Radio Men" keep the knowledge of technology alive. They act as teachers of science and repair technicians for the machinery, and man the radio network that the population uses to communicate across distances. The small shack next to the landing area, from which the beacon broadcast, is usually manned by one of the Radio Men during the daytime, just in case someone drops by to visit.

Party on the Beach

The player characters have arrived a couple of days before this year's Founder's Day, an annual celebration commemorating the founding of the colony. The visitors will of course be invited. The main celebration takes the form of a party on the beach at Lagoona, a village near the southeast corner of the island, at a large natural lagoon. There will be much feasting and rejoicing as the Mayor and the rest of the inhabitants ply information about human space from them. They will also offer the characters food for their continued trip in exchange for some technical help, as a few of their machines have broken down that no one knows how to do. (Any starship engineer or anyone with a mechanical skill should be able to repair these without trouble.)

The high point of the festivities is the "tribute." Every year, one of the teenaged residents is elected "King" or "Queen" of the festival, alternating between King and Queen from one year to the next. This year, Leeza Teller is the Queen. At a festive ceremony, Leeza is taken to the end of a long, makeshift dock along with crates of seeds and foodstuffs. A short time later, a large sea monster appears, opens its gaping maw, and attempts to take Leeza, the crates, and part of the dock into its mouth. However, one of the members of the spaceship crew (the NPC to be "sacrificed") will be close enough to the dock and react quickly enough to push her away to safety, only to be consumed himself!

The Mayor will be furious with the visitors, and he will demand that they leave immediately. The rest of the population will also be hostile, with a few exceptions. Leeza Teller will be happy that her life has been saved. And the Radio Men will be acting a little strangely, as if they're hiding something. This is because they have a secret: the Artemis itself is still on the planet.

The Artemis

The missing crewman is, in fact, being held in what's left of the Artemis, which is half-buried on a rocky island about 50 miles north of Big Island. When the Artemis first landed near what is now Kreshburg, the colonists and all their supplies were offloaded while the crew tried to restart the ship's engines. They managed to get them restarted, but were unable to move very far; the ship crashed -- again -- this time on one of the other islands. Since then, rockslides have mostly buried the ship; some of these rockslides instigated by its residents, who call themselves the Crew. The Crew number just under 100, and live in the hulk of the Artemis. They eke out a meager existence on their island; the amount of arable land there is small, and the Crew are barely able to grow enough food for themselves. Any seeds from the food they grow wind up sterile. In fact, anyone born on Artemis Island is also sterile; were it not for the fresh seeds and new people for their gene pool every year, the Crew would have died out long ago. This is because of a radiation leak from the ship's engines (which still provides residual power inside the ship). The existence of the leak (and in fact, the understanding of what's wrong) is not known to the Crew.

The Crew have modified the appearance of an Artemis shuttlecraft to resemble a giant sea monster. While this would not fool anyone who saw it up close, to anyone on the beach at Lagoona when it shows up, it appears convincing enough. The shuttlecraft can submerge, and fly short distances, but is no longer capable of reaching orbit.

Even with the annual "tribute" from the main colony, the colony on Artemis Island is dying out. The leader of the Crew, called The Captain, is aware of this problem and has been trying to think of a solution. The biggest obstacle: the Crew think of the colonists on Big Island as "Cargo," and believe it to be beneath them to associate with them. They do grudgingly accept the annual addition to their population, knowing that the alternative would be the end of their own colony. Many of the Artemis Island colonists think that they should move to the main island and merge with the Cargo; however, many are totally opposed to this idea, including the Captain's second-in-command, Number One.

If the players search the other islands, or try to trace the source of the radio signal they received from their shipmate, they should be able to find Artemis Island without much problem. When they arrive, they will find the surface deserted. Once they find the entrance to the Artemis, they will be met by several Crew brandishing energy weapons (none of which work), who will try to bluff and intimidate the PCs. If they are attacked with hand-to-hand combat, they will reply in kind. If the PCs fire a weapon, even a warning shot, they will break and run. If the characters press on further, members of the Crew will attempt to ambush and corner the party -- they know the layout of the ship, after all. However, if anyone in the party announces that they just want to talk, the Captain will be summoned. In this case, the Captain will arrive, accompanied by Number One.

The Crew themselves are dressed in plain black slacks with color-coded tunics, all in poor condition. The Captain's shirt, black, has ratty gold trim on it; Number One's shirt, dark blue, has a large numeral "1" on the front and back, like a football jersey, in white.

The campaign NPC has been very well treated (despite the fact that they expected a female "sacrifice" this year), and has been "forced" to contribute to the local gene pool (though it is likely that not much force was required . . .). He will be glad to see his shipmates, and he can fill in the details about the Artemis and its crew to the rest of the party.

It should be pointed out to the GM that everyone aboard the Artemis by now is descended from Cargo; were that not the case, the Crew would have died out decades ago. This bit of information will be enough to convince the Captain to

abandon ship and try living on the surface. But so far, no one has pointed that out to him, nor has anyone aboard the ship thought of that themselves.

One of the Crew, the Comm Officer, is in regular contact with the Radio Men above. The Radio Men are the only members of the main population who are aware of the Artemis, and they have sworn to keep its existence a secret. If the Crew ultimately decide to relocate, the Radio Men will own up to the deception and offer to assist in any way they can. There are several islands that would make a suitable landhold for the Crew if/when they decide to move to the surface, and Big Island still has plenty of room. With some tact and diplomacy, the PCs should be able to broker a solution to the problem.

Major Characters

Bel Torin, Mayor of Kreshburg

ST 9, **DX** 11, **IQ** 13, **HT** 9

48 years old. Pale skin, gray hair (balding), blue eyes. 5'6" tall, 140 lbs.

Advantages: Charisma, 1 level; Status, +2 (Mayor)
Disadvantages: Sense of duty (planet population)
Skills: Administration-14, Politics-12, Driving (farm equipment)-11, Teamster- 12, Diplomacy-13

40 points

Bel Torin has been the Mayor of Kreshburg for over 13 years now. He is a friendly, outgoing sort who is very popular with the locals. He is a people person, who is always ready to mediate a dispute or offer useful advice. His tenure as Mayor has been uneventful, as nothing exciting has happened on the planet in recent memory, until the arrival of the player characters in their ship. He takes his job as Mayor seriously, and believes his most important role to be keeping the well-being and morale of the populace. In his vocal and physical mannerisms, he would remind some people of a certain alien "morale officer" aboard a lost spaceship in another universe . . . but that's another story.

Zak Darno, head Radio Man

ST 8, **DX** 9, **IQ** 16, **HT** 7

84 years old. Pale skin, white hair, gray eyes. 6'0" tall, 150 lbs.

Advantages: Status, +1 (Radio Man); Mathematical Ability
Disadvantages: Secret (knowledge of the Artemis); Age (-102 points)
Skills: Woodworking-11, Naturalist-15, Astronomy-15 (limited by local tech level), Botany-16, History-16 (Aqualine history only), Mathematics-16, Meteorology-18, Teaching-16, Electronics Operation (Communications)-16

-30 points

As the oldest resident of the planet, Zak is revered by many of the populace, who see him as a teacher, historian, and all-round "wise man." People trust him implicitly. He was a young man in his late 20s when the last ship came by, a merchant vessel, and he will be most interested in finding out the latest gossip about "back home" whence the Artemis originally came. His health is failing, and he is aware of it, but he has kept that knowledge to himself so as to not alarm the others. He believes it to be a sacred duty to keep the secret of the Artemis, so that it is known only to himself and the dozen or so other "Radio Men" on the planet.

Verd Enkar, Radio Man

ST 12, **DX** 14, **IQ** 14, **HT** 10

33 years old. Tanned skin, black hair, brown eyes. 6'1" tall, 180 lbs.

Advantages: Status, +1 (Radio Man); Alertness
Disadvantages: Laziness; Secret (knowledge of the Artemis)
Skills: Electronics Operation (Communications)-14, Teaching-12, Meteorology-12, Astronomy-14, History-14 (Aqualine history only), Blacksmith-12

100 points

Verd is young, single, and enjoys the special status of being a Radio Man, perhaps more so than he should. However, he is competent at his job, and is generally well-liked by the others. He will be eager to hear stories about space and other worlds from the visitors. If there are any non-humans among the visitors, he will be fascinated, and want to know everything about them.

Leeza Teller, Founders Day Queen

ST 9, **DX** 12, **IQ** 10, **HT** 12

18 years old. Peaches-and-cream complexion, auburn hair, green eyes. 5'5," 118 lbs.

Advantages: Beautiful appearance
Disadvantages: Combat Paralysis, Shyness
Skills: Agronomy-8, Sex Appeal-12

30 points

Leeza is the youngest daughter of a local farmer; her parents are very proud that she was chosen to be the Queen this year. However, Leeza herself was less than thrilled. Her boyfriend Karb was the King the previous year, and she still misses him. (He's alive and well aboard the Artemis, and will be very glad to see her when reunited with her.)

The Captain

ST 12, **DX** 13, **IQ** 11, **HT** 7

38 years old, pale complexion, brown hair, brown eyes. 5'8," 140 lbs.

Advantages: Status, +2 (Captain); Common Sense
Disadvantages: Duty, to Artemis crew (-15 pts)
Skills: Administration-12, Leadership-12

60 points

The Captain has been in his current position for about five years, ever since his predecessor passed away. He takes his job very seriously, and is torn between the need to save his charges on the one hand, and the need to preserve traditions on the other. However, he can be reasoned with, and when push comes to shove he will do what is best for his people, even if it means moving to the surface.

Number One

ST 11, **DX** 14, **IQ** 9, **HT** 7

32 years old, pale complexion, blond hair, blue-green eyes. 6'1," 180 lbs.

Advantages: Status, +1 (Number One)
Disadvantages: Stubbornness
Skills: Administration-9

30 points

Number One is marking his time, waiting for his Captain to pass on so that he can take over as Captain. However, he will not deliberately do anything to hasten his Captain's demise. Still, he thinks that the Captain isn't completely loyal to tradition, and believes that a move to the surface would be a serious mistake.

Afterword

- **Variant scenario:** A player character whose player is present can be the "sacrifice," if one of the players thinks of it. In this case, the player should be taken aside and his situation explained in private, with him doing nothing until he sends his message for help a short time later. The player can then role-play his interactions with the Artemis and its Crew.
- *GURPS Traveller***:** This adventure can be used in a GURPS Traveller setting. In this case, the Artemis misjumped into the Aqualine system. Aqualine itself should be placed just beyond known space, in an area that is currently being explored. Two possible locales are rimward of the Solomani Sphere, or spinward of the Spinward Marches.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

by Jon F. Zeigler

Art by Jesse DeGraff

Producing this article was surprisingly difficult. **GURPS Traveller: Rim of Fire** was a breeze to write. I had no trouble meeting deadlines. Not even the last-minute discovery that we were 15,000 words short disturbed me very much (more about that later). The book required relatively little research and allowed me a lot more room than usual to express creativity. In short, there just weren't very many problems to report after the fact. How does one honestly expand "I had fun writing this book" into 1,000 words or more?

Even so, we did make some deliberate design choices in the course of writing and production, and those choices may provide some insight for **Traveller** fans on how to get the most out of the book. In particular, it might be of interest to see how a book which was originally intended to look very much like **GURPS Traveller: Behind the Claw** ended up being a substantially different work.

History Lessons

The first few chapters of the book describe the history and current situation in Solomani Rim sector. I had two distinct goals here. I needed to recapitulate already-published material for the **GURPS Traveller** audience. At the same time, I wanted to "fill in the blanks," producing new details regarding the Solomani Rim.

For example, Archduke Adair was apparently not mentioned at all in **Classic Traveller** material, and appeared only briefly in **Megatraveller** (a few of his responses to the Rebellion were mentioned, but he was never assigned so much as a first name). Those few references hinted at a determined and tenacious Imperial patriot. He must have had a personal relationship with the Imperial family, considering that he was the only Archduke to give his allegiance to the Emperor Lucan. He must also have had a special tie to the Vegans, given that his campaigns in resistance to the Solomani invasion were based within the Vegan district. That was enough to give me a picture of Kieran Langos Adair: a cunning diplomat with surprising talents as a wartime leader, a personal friend of the Emperor Strephon, and a close ally and patron of the Vegan species. The last item also gave me a new piece of background material, the placement of the Domain of Sol capital on the Vegan homeworld.

There were other examples of this kind of extension. Some study of the regnal dates of various Emperors gave me insight into the politics of the Imperial Court in the years immediately after the Civil War. The result was a slightly deeper picture of the origins of the Solomani Movement than we had seen up to this point. A fortuitous conversation with Hans Rancke-Madsen helped me understand the history of the Old Earth Union and the Bootean League, and also allowed me to hint at the surprising origins of the Sword Worlds colony in the Spinward Marches. Marc Miller's question about an uncaptioned illustration in GDW's **Rebellion Sourcebook** inspired me to develop the character of Elias Treleven, and helped me derive a substantial amount of back story regarding SolSec.

Of course, the biggest block of new material here is the detailed history of the Terran Confederation and the

Interstellar Wars. Much of that material is due to Andrew Moffatt-Vallence, whose superb "Prometheus Rising" material formed the backbone for this section of *Rim of Fire*. Not only was Andrew gracious enough to allow heavy borrowing from his work, he even adjusted a number of items from his draft to fit my vision of how the Interstellar Wars must have proceeded. With any luck, "Prometheus Rising" will itself see print someday, providing *Traveller* players with a rich new setting for play. In the meantime, the material in *Rim of Fire* may be enough to inspire an enterprising GM to create his own Interstellar Wars campaign. I would be pleased to discover that this had happened. The Interstellar Wars period is by far my favorite portion of the *Traveller* "history."

It should be obvious by now that I view any body of canon as a creative challenge. How can one break new ground while still remaining faithful to the canon as established? A big detailed setting such as the Third Imperium is best when it provides plenty of opportunity to create new pieces of back story, building the seeds of single adventures and whole campaigns. Thus, we get the best of both worlds: the support of already-published material, and the range to create a private setting large enough for the entertainment of one's friends.

Four Hundred Worlds

With the background chapters finished, I turned to the description of the Solomani Rim's individual worlds. At first, this section was conceived as resembling the similar material in *Behind the Claw*: a block of textual data and a short paragraph of narrative for each world. It took about three days of work for me to discover that this approach was going to be unsatisfying. By that time I had produced writeups for most of the worlds in Ultima subsector. Many worlds were simply not lending me any inspiration, and I found myself struggling to produce any meaningful narrative for them. Others gave me so much inspiration that I had to deliberately cut myself short, lest the book come in at more than 250 pages.

Designer's Notes: GURPS Traveller: Rim of Fire

Meanwhile, I saw a discussion on *Pyramid* regarding the format of *Behind the Claw*. At least one person expressed dissatisfaction with the world writeups in that book, claiming that they were just long enough to get in the way of his own creativity, but not long enough to provide him with a useful pre-packaged setting. This opinion didn't meet with universal approval (and in fact, I didn't entirely agree with it myself) but it gave me an idea. Why not restrict the long narrative writeups to subsector or other capitals, worlds in strategic locations, or worlds which somehow inspired me to write more? For the rest there would be little or no narrative, simply a block of data not much more extensive than what had been published in the original Solomani Rim material. That way referees could either use my material or set their adventures on worlds I had deliberately left sketchy, as needed. Players could read enough to get a flavor for the sector's worlds, but there would be plenty of areas left open for them to discover.

I polled the *Pyramid* audience, and most people seemed to approve (not all, of course). Loren Wiseman and Steve Jackson both gave their cautious approval. I went ahead. The new format helped a great deal. Now I no longer needed to fight to produce useful narrative for worlds that seemed uninteresting to me. When I came to a world that inspired me, I could go on at some length.

The only serious difficulty was an equivalent of the "data entry" problem. I needed to produce a consistent data block for each of four hundred worlds, cross-checking against all published material and triple-checking for errors. This was complicated by a desire to match the rules systems in *GURPS Traveller: First In*, which were not entirely compatible with earlier Traveller editions. I ended by adjusting many star types and planetary orbits.

I also encountered the perennial problem with *Traveller* world generation: tiny planets with breathable, Earthlike

atmospheres. I had glossed over that problem when writing *First In*, suggesting that referees either use a different procedure or live with the implausibility. In *Rim of Fire* I had no such luxury. As a result, astute readers will notice that many of the smaller worlds of Solomani Rim sector have an average density several times that of solid iron. Fortunately only one of the worlds I felt compelled to describe fit this profile (Hamilcar/Gemini). For that world, I borrowed an idea from an acquaintance of mine, the science-fiction writer Ted White. In one of his stories, he placed our own moon in a plastic membrane to hold in a terraformed atmosphere. I did the same with Hamilcar, only about half seriously . . .

In any case, once I had the basic data for each world, I began to write narratives. Some of these were quite short, marking "captive government" situations or summarizing material that had been published as previous canon. The longer narratives all tended to fall into a similar pattern: first a description of the world's physical environment, then its colonization and early history, then some recent history to explain the world's current social situation, then the details of that current situation. This historical approach seemed to work well, and it fit the orientation toward social and cultural issues that I wanted.

The narratives also have the benefit of providing a framework for the evolution of the sector as a whole. If you're a referee about to develop one of the worlds I left undescribed, then there's almost certainly a detailed world nearby to give you ideas. Neighboring worlds were probably settled at about the same time by the Vilani, they were conquered at the same time by the Terrans, they began to suffer the effects of the Long Night together, they joined the Third Imperium together. Even if their local cultures are very different, they will each interact with interstellar civilization from a similar context.

Incidentally, one item that sometimes provided me with a great deal of inspiration was a world's name. World names sometimes suggested ethnic backgrounds. After all, why would the population of a world cling to a name first assigned by a bored survey officer, thousands of years before? Instead, the official name would be meaningful to the present-day population. Thus Darrukesh became a Vilani world, Hiroshi became Japanese, Esperance became Spanish, Suleiman became Turkish, and so on. Other world names suggested unique features of the planet's environment, such as Easter's egg shape and colorful banding, or Caprice's violent storms. Gwynedd suggested settlement by anachronists (Kathryn Kurtz fans, perhaps). Santorini suggested Minoan culture, so I threw in a reference to a crypto-Minoan civilization I've developed for other fiction.

The Final Draft

Finally, I finished and turned in the first draft for editing and playtest. The playtest went very smoothly, but it also provoked the biggest crisis in the production process. Several playtesters suggested turning the data blocks for the various worlds into tables. This took some work on the part of Gene Seabolt and me, but the end result was very attractive.

The conversion to tables also made the Worlds chapter much more compact, with a great deal of text being reduced to the form of half-page or quarter-page tables. How much more compact? Well, Gene put the tables together, I provided a version of the chapter text with the only change being the removal of data blocks, and we counted pages. We were 15,000 words short, with about two weeks to go before the final draft deadline.

Oddly enough, I wasn't worried. (Gene was!) I went back and added bits and pieces. Each subsector got one more world with full narrative, and I also added a few paragraphs here and there to existing descriptions. Gene and I wrote up four Solomani starship designs. I wrote a few pages of text for the last chapter, detailing the situation of each of several non-human races in the Solomani Rim. All of this took just over a week, and it put us at almost exactly the needed word count.

Another item which was added at the last minute was a set of thumbnail sketches for all ten Imperial dukes, along with several lesser nobles. You'll find this material scattered through the Worlds chapter, and despite its late entry into the draft I believe it's one of the more important elements of the book. The Solomani Rim is characterized by its power politics, so that the adventures of PCs will often be affected by the maneuvers of those at the highest levels. The dukes and counts of the Rim may not often be the direct patrons of PC adventurers. Even so, their machinations will often

affect what adventures are available and what the ultimate rationale of such adventures might be.

Once we were up to the target word count, Gene Seabolt began final production. Meanwhile, he had already gone to freelance artists with the first draft. The results were very fine, with the art pieces for the Worlds chapter in particular matching the text quite closely. Jesse DeGraff's stunning cover was almost finished at that point as well. Of all the books I've written thus far for Steve Jackson Games, I think *Rim of Fire* has turned out to be the most visually impressive.

So, to conclude: "I had fun writing this book." I hope you'll find my vision of the Solomani Rim to be a congenial setting for adventure.

I Wanna Kiss You In Paris

The cold drizzle works its way down your upturned collar as you puzzle out the occult symbols painted in wild graffiti on the side of a dirty, forgotten alleyway in Rome, searching feverishly for a killer's motives hidden there before he takes another child. There are clues written somewhere in the random scrawl on the wall, but you haven't put it all together yet. Around you are the sounds of life: the buzz of scooters with a death wish, the loud burp of buses filled with tourists, the clink of forks on plates as people congregate for lunch in sidewalk cafes and huddled under umbrellas, and two priests discussing the Church in liquid Italian. You look up at the pink, whitewashed buildings, and pray for the one clue that will break this case wide open.

Reality provides endless opportunities for involving storytelling to addict even the most adamant non-gamer. But it's a reality that's over . . . there. It's not out the backdoor or the bedroom window. It's not down the street. It's not even at the mall. It's thousands of miles away in an exotic land full of mysterious people and dark pasts.

Want to hook the players? Want to get your girlfriend or wife past the belief that gaming is just playing around with elves? Just a grain, a dash, or even a dab of the living world can breathe life into even the most burned out gamer's life. Kisses in Paris. Death in Rome. Crossing the Himalayas in search of Buddhist monasteries. Travel! Romance! Unusual cultures! New worlds! Bizarre, nearly inedible food! Peril! Strange college classes being put to good use!

Home is passe'. Time to pack bags and go traveling.

I Dream of Paris

While the players may dream idly of love in Paris and the GM imagines the smell of jasmine on the evening air, most GMs and players lack experience with these mysterious lands. This does present a difficulty. It's not easy to construct a realistic living and breathing culture without knowing anything about the place. Sure, the GM can always "make stuff up," but it's a more satisfying experience for everyone if the culture of the exotic land is reflected in the game play. Players can be free of the their day-to-day mundanities, living exciting adventures and eating strange food with tentacles. (That this brave new world is filled with *someone else's* mundanities is a minor, forgettable detail.

Surprisingly, lack of familiarity with a place isn't a huge problem. Any enterprising GM can dig around and find useful information. There are plenty of resources readily available to the GM and players who want to invest some time in building the world. Most of the information is inexpensive or even free. (Most. Not all. Most.) Better yet, most of the steps involved in getting up to speed are blazingly obvious:

- Visit the place in question. There's nothing like first person perspective to get a handle on a strange place. The wealth of culture absorbed in even a short trip cannot be underestimated, especially if it's someplace weird and inexplicable like Texas. Unfortunately, few gamers are independently wealthy and can travel for the background of a game -- and if they are, they should donate some cash to the rest of us.
- Find someone who lives in the land of choice and pick his or her brains. Ask probing questions about the most obscure details to get a feel for the life and culture of the area. The Internet is a big place, e-mail a powerful tool, and any language barrier can be crossed with a liberal application of the word "what?" and some electronic quasi-gesticulations. Pen pals and chat friends can be invaluable resources for getting a strong grip on the intricacies of a different culture. Several of USENET's **alt.culture** groups are extremely helpful. For example, simply reading the chatter on **alt.culture.egyptian** is enlightening on modern Egyptian life in the bigger cities, especially Cairo, useful for many modern horror games.
- Hit the library and dig up a few biographies and autobiographies written by people in the country and time period of the game. The biographies don't need to be the lives of famous people. More often than not, unless the game is a story of deep political intrigue, the commentary by the common man is more insightful and conveys a better sense of the culture. A well-written biography is almost as good as having been there. For example, the book *Rebels and Redcoats*, a travel documentary of the American Revolution, contains letters and diary entries of both the commanders and the common conscripts, opening a window to the direct impact of the battles on

people living through the war. Biographies written on the life of Michelangelo give not only insight into Renaissance Florence and Rome, but also what it was like to pal around with the rich and famous of the time.

- Lay hands on travel books with pictures and maps. Far too many travel books write dry descriptions of hotels or sights without conveying more in the way of useful information. Pictures really are worth a thousand words, and having a book full of them with commentary on the location is incredibly useful. Look carefully for books which contain first person accounts of walking through famous monuments or toss off comments on surviving the culture. For example, Rick Steves' *Europe Through The Back Door* is nearly useless for traveling but full of atmosphere and vivid descriptions of sights and towns -- a cheap book perfect for a GM with tight budget strings. The *Dorling Kindersley* travel guides are filled with pictures of food, people, and architecture, although they're too heavy to carry for real traveling and on the expensive side.
- Find books on costume and fashion. Not only being fun to look at, books overflowing with world costumes crossing various time periods help to populate worlds that would otherwise be filled with Americans wearing black t-shirts and jeans. They bring the panorama of history alive, and allow GMs to point to pictures and say, "This is what you look like." There are several good ones available: *The Art of Costume: Clothes and Society 1500-1914* by Jane Ashelford and *20,000 Years of Fashion: The History of Costume and Personal Adornment* by Francois Leon Louis Boucher are both fine places to start -- and they make attractive coffee table books.
- Watch documentaries on the Travel, Discovery, and History Channels. Ah, basic cable, the television standard for geeks everywhere. These three channels pack more information per square inch for easy consumption than nearly any other source of popcorn research. They provide shows on everything from the Australian Outback to tribal Indians of Indonesia. The problem is that they rarely consult you, the GM, about what you want to watch and what information you need. Furthermore, not everyone has basic cable. For those who are Discovery Channel disabled, they do have a web site with further pointers to books, documentaries, and research at http://www.discovery.com.

Not everything out there is useful. A good GM can save precious time and money on his or her research knowing up front what to avoid:

- *Fodor's* and *Frommer's* guides for traveling far away. While these travel guides are very useful for finding lodging on a trip and are extremely useful for discovering landmarks in an area the GM already is familiar with, they're next to useless for divining the culture of countries with severely different way of being -- nor do they warn you about pigeons in pigeon-intensive zones. The focus of these books is to provide no-nonsense lists of landmarks, lodging, and restaurants. Written in a dry style with nearly nothing about the culture in question, these highly respected travel guides should be avoided by GMs building games in a world far away, but are very useful for filling in a game in a nearby state or county. The trick to making these books useful is to already have some familiarity with the place. For example, *Fodor's Chicago 2000* is highly useful to someone from the Midwest who wants to build a game with 1920's Mafioso and bootlegging, but may not useful to someone from Spain or France who has never been the US.
- Purchasing travel documentaries on video tape. They rarely live up to their advertised production values. The tapes aren't worth the money. Besides, they take up shelf space that can be filled with nearly anything else: gaming dice, gaming books, gaming miniatures, phone numbers of prospective dates, and assorted nick-knacks. The trick to these things is to go into a travel agency, pretend to be booking a trip, and ask to see their videos for free.
- Web pages. The scanty few, poorly snapped photographs placed in disjoint positions on web pages followed by a little text is worse than useless -- and these are the professionally built pages. Woe be to the poor researching GM who stumbles across someone's vacation photos, for their sanity may not escape intact. While these may be good for looking up the occasional fact, they are rarely helpful in building a coherent game world.
- Gaming Sourcebooks. These books need to be taken on their own individual merits. Before spending the money on a sourcebook, which may equate two travel books or a whole mess of maps, it's best to research them up front. There are several very good sourcebooks on the market, notably many of the *GURPS* world books and some of the *Vampire* city books, but a large number of books that cover locations for GMs might be worth passing up in exchange for a good book on period fashion and a handy guide to the place.

A Dark Land Beckons...

The GM prepares her players, both male and female. She's ready to put together a game full of romantic energy, daring travel, and scathing politics all set against rolling green meadows and an exotic landscape -- not an easy task. Culture and language are taken into account. Books are bought. Costumes are designed. Period weapons are obsessed over.

Even with all the arrayed information in once place, what does a GM and players do with it?

- Flashbacks to an earlier incarnation, life, or *Highlander*-style existence. A long-lived character in any number of superheroesque derivative genres can build real world events into her past and offer them as plot hooks to the GM. "In the late fourteenth century, the Inquisition burned me at the stake here in Campo dei Fiori in Rome as a heretic," says an enterprising demon sitting on his own in a small sidewalk cafe. "Now I'm sitting here eating ice cream. Funny little world, isn't it?"
- Period pieces. A well researched game in feudal Japan is worth its weight in a thousand make-believe, pseudo-Asian sourcebooks, and a full-fledged campaign revolving around the backstabbing politics of the Roman Imperial Senate, complete with conspiracy and bloody gladiatorial games, is priceless. Participating in the full sweep of human history instead of trapped, looking on through history books and dull films, is involving and exhilarating for both players and game master.
- Building a war into a campaign. The gritty realities of human war, from the weaponry to the location of battles to the politics to the sheer cost in human life can be emulated in a roleplaying universe to great effect. Even if the game world is set in an entirely fictional land, the GM can construct a war based entirely on real events in real places. For instance, the climax of a campaign can be set against a great battle between humans and orks, based on the Battle of Waterloo -- complete with the ships, small towns to burn to the ground, flintlock pistols, and a green, hulking, tusked Duke of Wellington.
- Gritty realism. The players can chase down serial killers in the dark, twisting streets of Rome, meet with lovers in the neon lights of Amsterdam, and fight duels to the death in revolutionary Paris. The precise realism allows the GM great latitude to weave plots within plots within plots. For example, wrapping black witchcraft around gritty murders in the dark winding streets of Rome may lead to a conspiracy within the Jesuit community . . . right around the corner at their headquarters . . . all the while capitalizing on the players' frustrations at being unable to order something as simple as a delicious ham sandwich.
- The threads of conspiracy. Like *Foucault's Pendulum* or *The Club Dumas*, the threads of a dark conspiracy can lace from one country to another, jumping through time periods, weaving back and forth across cultures and exotic locations to land in the present day. Through the burning embers of the Crusades to the Prague of Dr. John Dee to the modern day secret archives of the Vatican, history itself coughs up dozens of situations and personalities to twine into an endless loop of plot. Building clues into the architecture and position of the buildings is just part of the thrill. The GM can send characters to scrounge through the ashes of history, looking for one clue that gives them endless riches or turns one of them into the Antichrist. (Like most other things, becoming the Antichrist in a conspiracy campaign is often one of those things that "just happens.")

The Author's Exciting Flights of Fancy

On a personal note, if you want to "hook the women," as it were, a combination of the romance of far away and the feel of a world far away yet very real is a winner. After standing in the Doge's Palace in Venice, surrounded by the barely remembered rasps of velvet robes dragging on the floor and faint memories of vast political conspiracies and plays for power, my mind danced with ideas and concepts for campaigns. Coupled with the armory full of Renaissance-era weaponry it was a gold mine! The pulse of what could have been together with being in the center of a powerful city-state started me thinking about running games again. (And thinking about that OGL license . . . but that's another story.)

It's easier to grasp the real world. There's more stuff to play with. While there might be elves out there somewhere, it is more engaging to believe, for instance, that *things* live in dark corners of the tube stations of the London Underground. Underground maps (for what they're worth) are readily available in little "pocket guides to London" for far less than a gaming sourcebook, and they're built to take a beating.

Next time, when trying to hook a new player or trying to get a group of jaded gamers excited again, leave the *Glorantha* on the shelves, next to *Forgotten Realms* and the infinite worlds of *Shadow*. Start flicking through battered travel books on the bookshelves (the ones with the dust on them) and start thinking about the world we live in. It's big and wacky and worth gaming.

Pyramid Review

Core (for Shards of the Stone RPG)

Published by [Obsidian Studios](#)

Written by Sean Patrick Fannon

382 pages; $25.00

With all of the attention this summer on *D&D 3rd Edition* it would be hard to imagine that another game company would have the nerve to release another fantasy game in the same genre at the same time. Yet, this is exactly what Obsidian Studios has done with its new flagship release,*Shards of the Stone*. The game is a bold new take on the traditional fantasy setting, and the timing of its release says a lot about the confidence of its publishers.

The first book to be released is *Core*, which serves as an introduction to the game world and a primary source book for all the major rules and common material of the game. It contains the basic rules, an introduction to Core (the main game world) and how it came to be, character creation rules and material, a bestiary, and general material for the GM.

One of the most interesting aspects of *Shards* that will be most immediately apparent is the unique setting in which the game takes place. The basic premise of the game is as follows: Long ago, all that existed in the world of Core was the Stone. This mythical stone contained all that was life, and everything within it existed in a more or less utopian state. Then along come the Progeny, the god-like manifestations of the twenty-five prime elements, who are given the Stone to do with it what they will.

Before long, they start bickering and fighting, and the Stone is sundered into innumerable fragments. From the shards of this stone sprung countless worlds, each as diverse as could be. Mankind (and its humanoid kin) are thrust into these realms to fend for themselves, and the Progeny fade into the background to become deific manipulators and schemers. Enter into this world infinite magic and countless monsters, and you have a combination for loads and loads of fantasy.

At least as far as *Core* is concerned, *Shards of the Stone* follows along many of the primary lines of traditional fantasy. The playable races include things like elves, dwarves, and orcs, and much of the material presented is standard fantasy fare (swords, sorcery, etc.). This is rather limiting, but *Shards* has taken a fairly unique approach to it. Additionally, it promises to round out and make the game even more unique with the numerous realm books which will be forthcoming.

One of the major themes of the game is the twenty-five elements that make up the world of Core. Twenty-five may seem like a high number, but the elements include a lot more than just earth, air, fire, and water. They also include things like light, darkness, truth, deception, matter, energy, chaos, order, time, and many others. All of these elements have been very closely integrated into the game, something that makes *Shards* rather unique. The elements are the primal energies that make up the world and all that's in it. Different realms will have an abundance of some and a lack of others, a feature that greatly influences just what kind of realm it is. Furthermore, different races even have their own sympathies and antipathies with certain elements. These elements are also very closely tied with magic, making up the primal forces with which magic is cast.

Shards uses the Fuzion rules as its primary die system. Fuzion was developed by the Fuzion Lab Group as a system to

be used with ***Champions: New Millennium***, but that would be open to other publishers that wish to use it. Many of you will notice that Wizards of the Coast has caught onto the effectiveness of this strategy with the open-source gaming that is to be done with its own d20 system. For those of you not familiar with Fuzion, its basics are as such: You roll a 3d6, add your action value (skill level), and compare it to a target number. The difference between what you roll and the target number determines the level of success or failure. Overall, Fuzion is very simple, although it can get somewhat rule-heavy. ***Shards*** pushes this even further, by tweaking it with many of its own rules. The one convenient thing is that Fuzion is very flexible, and if you don't like something, you can often just toss it and everything will be just fine.

As the book is written, it is geared somewhat towards beginners (another factor that implies the publisher's intention of competing with ***D&D***), although experienced gamers will have no trouble making use of it. The hero creation system is pretty detailed, and there's a lot of room for playing characters of all types. The game is skill based, tossing classes out the window, and make the players choose their vocation based entirely on their skills. Even magic-users must buy their spell-casting abilities as skills, although they are rather expensive. There are a wide array of talents, benefits, and complications (i.e. character drawbacks; why exactly they choose to call them complications, I simply don't know), with which players may fully round out their characters.

The combat system is made to be either smooth or complicated, whichever the game master prefers. Players can purchase fighting styles (either as packages or one skill at a time), which allow them to do all kinds of interesting maneuvers and procedures. Furthermore, the combat system has a thorough list of basic and advanced combat maneuvers, listing what they are, how they are played (rule-wise, that is), and what effect they have. This seems clunky at first, but actually makes a pretty handy quick-reference. The rest of the combat rules are for the most part pretty thorough, covering almost every situation the players may expect to find themselves in.

One of the game's highlights is its magic system. The take here is a very different one, which is in some ways simple and in others complicated. All magic in ***Shards*** is tied directly to the twenty-five elements. Any time a spell is cast, a piece of elemental essence is used up. Furthermore, those racial sympathies and antipathies with the different elements come heavily into play when casting spells. So, for example, a race that is sympathetic towards the water element has a true advantage when casting water spells.

The spells don't really have any sort of level in the traditional sense, though they can be cast at different levels of intensity. For the most part, this just means you get more at higher levels of whatever you get at the base level (more damage, more protection, etc.). The spells are all very basic, and they are presented all in more or less identical manners for each of the forms (which are described below). While some gamers may like this simple approach, others may be upset that the spells lose a little bit of their mystic luster when presented on such a basic level.

The spells are broken up into three different types, or forms as they are called, and then into various styles. The different forms are adeptry (magic that is drawn from the inner self), channeling (magic that is drawn from other beings), and practicioning (magic that uses formulas and a somewhat scientific understanding of the elements). These are then broken down into different styles, six of which (two for each form) are given in the main book. They are sorcery, wizardry, druidry, invocation, mindwalking, and psionics.

A system is also provided for creating new spells and styles. It is very detailed and somewhat simple to use; however, its focus seems to be more on tweaking and customizing existing spells and styles than creating entirely new ones. There are a whole bunch of "half-written" spells given that are ready to be customized for use as the player or GM sees fit.

There's a whole chapter devoted to game mastering. It consists mostly of advice for GMs on how to run a game, and much of the material is lifted straight from the ***Fantasy Roleplaying Gamer's Bible 2nd Ed.*** (also published by Obsidian Studios). The advice is all good, but most of it is stuff that experienced GMs will have heard before. Also, a system is given in this chapter for deriving quick stats for NPCs and the like.

And what core rule book would be complete without a chapter on monsters? There are plenty provided here, each with lots of potential not just for gruesome combat, but for plot development as well. There is also a system here for developing one's own monsters and races.

One of the major themes that the writers are pushing in this game is player involvement, not just in game play, but in the writing process as well. If you look closely, you will see that www.shardsofthestone.com appears on virtually every page of the book, including the cover. That's because they want you to go to the site and submit stuff. Obsidian plans on getting players involved in game production as closely as possible through the website. If it all works out well, then this could become a very exciting aspect of the game indeed.

Of course, there are a few snags to be found. The first is that, although *Shards* takes a very original spin on things, it *is* still a traditional fantasy game (at least as far as what's presented in *Core* is concerned), so it doesn't have much to offer those looking for something a little more different. Also, the rules do tend to get a little heavy at times. This is definitely not a quick pick-up game. Players and GMs will need to spend a little bit of time getting all of these rules down before things will move quickly. Of course, if you are already familiar with Fuzion, then this shouldn't take too long.

Lastly, I really hate to pick on games for typographical and layout problems, but this one has a few that are a real pain. There are a lot of little layout mistakes and typos, most of which are simply inane but annoying. The real problem was with some of the section headings within the chapters. They are printed somewhat small and often times not in bold, making it hard to find things fast.

Of course, to be fair we must mention the incredible artwork found throughout the book, which throws the mistakes into check. All of the art is done by Obsidian Studios' own JAE, who is truly very talented. Furthermore, the game is printed on a yellow, parchment-style paper stock, which makes the book stand out a bit from the others and gives it a subtly different visual feel.

Overall, this game is great. There is a lot to chew through, but the high amount of potential this game provides and the original take on a fantasy setting it gives makes it well worth the effort. If all goes well, then *D&D 3E* may truly have met some worthy competition.

Star Crusade 2: Lost Worlds (for Fading Suns RPG)

By Bill Bridges, et al.

Published by [Holistic Design Inc.](#)

120 pages, $20.00

Science fiction roleplaying has always labored under two conflicting desires:
realism and playability. The desire for realism is easy to understand. Science
fiction, as its name suggests, is about science, which in the minds of many is
tantamount to saying "the truth." Consequently, SF fans expect their favorite authors (or game designers) to create rich
and detailed worlds, all of them in accordance with the Laws of [Insert Pertinent Scientific Discipline Here].

Unfortunately, science is a double-edged sword, for it also tells us that faster-than-light travel is, if not impossible,
highly improbable. Not surprisingly, this fact (and others like it) runs afoul of the desire for playability. While many
excellent gaming environments could be constructed without the need for FTL travel, they'll always seem a little pale
in the minds of most science fiction gamers, who dream of star-spanning empires and myriad alien races.

Thus, the designers of science fiction roleplaying games must make a decision: how far will they sacrifice one of these
two desires to accommodate the other? In the case of Holistic Design's *Fading Suns*, it's quite clear the designers
chose rollicking playability over scientific verisimilitude and with good reason. Four years after it's release, *Fading
Suns* remains a game that demands to be played, not just read. This is especially evident in *Star Crusade 2: Lost
Worlds*, a companion volume to the recent *Star Crusade* sourcebook.

Drawing inspiration from the works of Edgar Rice Burroughs, Jack Vance, and sci-fi from the Golden Age, *Lost
Worlds* describes sixteen worlds previously unknown to the inhabitants of the *Fading Suns* setting. With the opening
of the jumpweb to these planets, the careful balance of power between the emperor, noble houses, Church, and
merchants of the Known Worlds could be in jeopardy. Consequently, *Lost Worlds* is, first and foremost, a book of
adventure locales and ideas to add spice to any *Fading Suns* campaign. In that respect, it succeeds admirably.

Each of the book's sixteen worlds is unique, offering a wealth of adventuring opportunities. They range from the water
world of Epiphany to the psychic civilization of Kun Lun to the war torn gangland of Twilight - and many more. Each
world gets a six-page treatment, detailing its history, geography, current conditions, people, and culture. Each world
likewise gets a nice world map in the style of the excellent Imperial Survey volumes, along with a representative NPC.

All in all, the approach taken to these lost worlds is a solid one. Each planet receives a significant enough treatment so
as to be useful to a Game Master without binding his hands overly much with needless details. Indeed, *Lost Worlds*
continues the fine tradition begun in other *Fading Suns* products of presenting a dynamic setting unhampered by
metaplot. Thus a GM will have no difficulty using as much or as little of the information presented in this supplement
without concern about its either upsetting his own campaign or locking him in to future developments he may not
wish. That's a difficult feat to pull off, and the folks at Holistic Design should be congratulated for having done so.

Lost Worlds also include eight pages devoted to four new alien races. These included the hyper-intelligent, genetically
engineered Qabirim, the silicon-based Ming, the fungal Muazi, and the incorporeal Z'go. In general, I was less
impressed with the alien races than I was with the lost worlds themselves. While the Qabirim add another piece to the
puzzle of humanity's tinkering with its own genetics and the Muazi represent an unusual take on sentience, I didn't find
the Ming or the Z'go nearly as compelling. Even given the Introduction's paean to "the stuff of good ol' pulp sci-fi

adventure," I wasn't taken in by the living rock Ming, never mind the sentient energy beings that are the Z'go.

Physically, *Lost Worlds* is as good as any recent *Fading Suns* book. The art throughout is decent, although I missed the *John Bridges* art that usually graces the beginning of each chapter (since *Lost Worlds* has no clear chapter divisions). I especially liked the artwork of Mitch Byrd, who has done a great deal of work on White Wolf's *Hunter: The Reckoning* line. Sadly, the book's cover, by Brian LeBlanc, isn't as good as many recent offerings (or LeBlanc's interior work), but that's a minor quibble. I'm also pleased to note that editing has improved considerably. I noticed no obvious typos in the book, which is quite an accomplishment, given the poor editing in past volumes.

What truly impressed me about *Lost Worlds* is the sheer number of honest-to-goodness usable ideas within its 120 pages. This is a book that's meant to be used. Reading through it, I bemoaned the fact that my *Fading Suns* campaign died several months ago. For me, that's a pretty high recommendation. Any book that can make me regret that I no longer run the game for which it is a supplement is a good one.

This isn't to say the book is flawless; it isn't. Yet, it is a good example of the sorts of supplements of which I'd like to see more: collections of locales, personalities, and situations that eliminate some of a game's drudge work while still leaving the GM firmly in command of his campaign's direction. Other game companies would do well to take note of this and emulate it, since it's a sure way to get my gaming dollar.

Legend of the Five Rings Diskwars --
Imperial Edition

Published by [Alderac Entertainment Group](#)

Designed by Raymond Lau

Boxed set with 8 sheets of disks and one rules sheet;
$9.95

The world of Rokugan depicted in the various incarnations of *Legend of the Five Rings* is an interesting one that takes the tropes of western fantasy and applies them to a medieval Japan-like empire with some Chinese mythology and history thrown in for kicks. Originally a collectable card game, it has spread out into a miniatures game (*Clan War*), a roleplaying game, and now . . . *Diskwars*.

I liked the idea of *Diskwars* -- miniatures wargaming without needing my own weight in lead figures -- but the setting of the original set was too generic for my taste, so I passed on it. The addition of the well-developed setting of the Rokugani Empire made it look much more promising. The time of this game is about the same time as the CCG's *Imperial Edition* on the *L5R* timeline.

For your ten bucks, you get a set of cardboard sheets ("flats") and a rulesheet of unwieldy proportions. There are six different sets, one for each of the original six Great Clans of Rokugan. The two I happened to purchase were Phoenix, who are the masters of the five-element magic practiced in the Empire, and the Dragon, a clan of mystical tattooed warriors. One of the sheets in each box has your clan's Stronghold, which is a large disk used both as a staging area and as a goal in some scenarios, and is equivalent to the land disks in the original game. Another sheet is a components sheet with counters, with the other six being a mixture of fixed clan-specific disks and random sheets of units.

Gameplay is almost exactly like the original *Diskwars*, in that you move your unit-disks by flipping them; when one of your disks overlaps or is overlapped by an enemy disk, they fight it out *Magic: The Gathering*-style. Unlike the original land disks, your stronghold has a special ability relevant to your clan. I've been told later editions of Diskwars include these as well, but for *L5R* it is very appropriate given that the idea of a "stronghold" helped set its CCG version apart from the flood of *Magic*-clones when it was released. Most of the abilities and spells are the same as those found in *Diskwars*, but renamed and reorganized to fit Rokugan. The "Swashbuckler" ability is replaced by "Dai-sho," for example, and the spells are divided into the five elemental rings of Fire, Water, Earth, Air, and Void.

The most important alterations, however, is the addition of Item disks and dueling. Item disks are given to one of your units at the beginning of battle. Every box comes with at least one Item, which is that clan's Ancestral Sword. Items have various effects on the disk that possesses them. Dueling, on the other hand, is a new mechanic that involves challenging an enemy disk through one of several methods, then flipping "duel counters" onto the table. Each duel counter has a "Focus" side and a "Strike" side, that do two and four damage, respectively. By landing the counters on the opponent disk, you deal the damage shown. Mechanically it feels nothing like the card game, but strategically it serves the same purpose of allowing a disk that is spiritually strong but weak in battle to effectively combat a more

powerful disk.

L5R Diskwars makes for an enjoyable game, with more than a few strategic twists. It also seems to be better balanced than either the original *Diskwars* or the *L5R CCG* -- none of the biases present in the *CCG* are exhibited here. The game has a lot of problems, even so. The rulesheet is badly edited, with several annoying omissions and spots where the search-and-replace of *Diskwars* terms for *L5R* ones failed. Several abilities and spells are under the correct heading, but referred to by the *Diskwars* name in the main text. While a [FAQ](#) with corrections is at [www.alderac.com](#), and a revised downloadable rulebook is forthcoming, AEG has had similar editing slips before and it is disappointing to see them yet again.

For a fan of *Legend of the Five Rings* or *Diskwars*, this is certainly worth a look. For devotees of wargames in general, *L5R Diskwars* is just as good as the original and may be more satisfying if you enjoy well-developed worlds and can overlook the rulebook flaws. AEG has plans to release expansions based on the CCG expansions, so combined with the quality of the game itself, *L5R Diskwars* may be around for a while.

Columns

As you can see by this week's Pyramid Poll, the topic of magazine columns has been on my mind recently. Given the conclusion of John Wick's column, I've received many ideas, requests, and offers for new columns . . . as well as many requests *not* to start any new columns. I'm of several minds on the subject, and, in the interests of honesty and communication, I think it's only fair to let you know where I stand.

See, I personally like columns; when they're done well, they're something I look (or looked) forward to each month (or week, or whatever). Penn Jillette's columns [from *PC Computing*](), Peter David's "But I Digress" from *Comic Buyer's Guide*, Harlan Ellison's "Watching" from *The Magazine of Fantasy & Science Fiction*, "Cheers & Jeers" from *TV Guide* . . . I love them all. And I continued reading *PC Computing* long after my 486-33 was an outdated lump of computing sand, simply because I enjoyed Jillette's columns so much.

This continuity is one of the reasons to have columns. Continuity is difficult to achieve in publications (which I've always considered *Pyramid* to be); it's one thing to produce a quality product every month (or week, or whatever), it's another to have a reader come back each month to enjoy that continuity. Although I don't have quite as much pressure to keep you all picking us up off the newsstand each week, I *do* have a pressure of sorts to have you resubscribe at the end of the year. If, at the end of that year, you remember the mag as being a pleasant read, but it doesn't stir any other emotions in you, then you may not resubscribe; you may forget, you may spend that $15 on Hot Wheels, or something similar. But if you remember the mag as the keeper of that one column/feature/comic/whatever that you love each month, the odds seem higher for you to resubscribe.

Columns are also nice because of audience and consistency of product. I've said it before on the newsgroups, but it bears repeating here: As I see it, the purpose of most columns is to appeal to more people and be better received than a random article that would take its place. Thus while not everyone might have a use for an article about how to combine the **Pokémon CCG** with the **Vampire CCG** ("I choose you, Nosferatu!") -- even if it's the best darn **Poképire** article ever -- hopefully more people will be able to use a generically written article about, say, creating a campaign world. Columns are, almost by nature, pretty accessible; they tend not to be game specific, and hopefully provide a lot of readers *something* interesting to read each week even if they don't like the **GURPS** house rules article, the **Settlers of Caitan** variant, or the **Torg** adventure.

A hypothetical recurring campaign-world-creation column (or whatever) is also going to be of a more consistent quality and voice than random campaign-world-creation articles that might take its place. It will also have the advantage of being able to build upon itself and refer to previous installments (like Ken Hite masterfully does in "Suppressed Transmission"), resulting in a richer whole. (These advantages are negated by a couple of the ideas mentioned in the poll, like the historical information column.)

Of course, columns aren't all milk & honey. If you *don't* like a column, then instead of having one piece a month you'll automatically like, you'll have one piece a month you'll automatically *dis*like. And it's possible to have too many columns, resulting in a magazine that feels like nothing *but* columns.

Columns are generic and accessible by nature; this genericness can be a disadvantage, though, if you don't need what the column is offering. This hypothetical recurring campaign-world-creation column is going to be useless if you can create a dozen campaigns before breakfast, but *really* need more specific real-world information or house rules.

Columns also mean fewer slots for other writers or would-be writers to fill; for the aspiring writer this can seem unfair, and can adversely affect the diversity of the magazine . . . fewer voices means fewer choices.

So since I've always been about communication, I invite you folks who wish to have a say in the column decision-making process to join me over in the newly-created **sjgames.pyramid.newcolumn** over in the [discussion groups](). I expect this board to stick around for the next few weeks or so before I make any kind of permanent decision. I hope the lack of 2,500 messages in this new board will encourage folks who might otherwise be intimidated by the "regular" *Pyramid* discussion board. We'll see.

(Of course, I'll always read e-mail you send me, about this or any other topic. But isn't it more fun to be part of a big, wacky gaming community?)

* * *

I confess to suffering a fair amount of technolust, that tendency to "need" the latest gadgets, gizmos, and widgets. Fortunately I'm what we call in the biz "poor," so I can't succumb to it very often. (It's also the reason my computer DVD player is hooked up to my 1984 swivel-based television, which weighs more than Io.)

Nevertheless, I've been sorely tempted by the latest batch of MP3 CD-ROM/CD players. The ability to play a CD-Rom of a couple hundred songs for a gaming session in a compact unit seems *awfully* tempting. If anyone has any personal experience regarding these, I'd love to hear it . . . either via e-mail or mayhaps over in **sjgames.chatter**. Or if you're feeling particularly ambitious, you may want to make an inquiry to write a review about it.

(And if anyone wants to be the guinea pig, feel free to check out http://hardware.mp3.com/hardware/.)

-- Steven Marsh
    (Hoping not to get blown away by a hurricane.)

Last week's answer: **IST Kingston** (for **GURPS Supers**), p. 3.

(four stars) "One thing one has to remember when role-playing a villain is exactly what type of villain is being played. Basically, there are two types of villain: those who say *'Bah!'* and those who don't say *'Bah!'* "

The Influencing Engine

"[T]he said Patient has declared . . . that there had long been and was then an immense Machine under ground near the Hospital under the management of powerful and evil agents . . . by means of which Machine the said Matthews was acted upon . . . and that many other persons were likewise under such malignant influence . . ."
-- deposition of Dr. John Haslam, apothecary of Bedlam, Dec. 1, 1809

It's a mind control conspiracy for the Nineties -- the 1790s, that is. If our modern MK-ULTRA is based on stolen Tesla technology, this misappropriation of Mesmer must have been MK-INFRA. It's not so much [HAARP](#) as it is HAARPsichord. Welcome to the dingy basement of psychiatry and conspiracy theory, to the mysterious apparatus of the Air-Loom, the Influencing Engine.

James Tilly Matthews, a London tea-broker mixed up in radical politics, revealed the Engine's existence to us. An associate of the Quaker David Williams, Matthews went with Williams to France after the outbreak of the Revolution to admire the Cult of Reason and to support the cause of Liberty. Which is why, of course, the Jacobins arrested him as a spy in 1793 when they took over the government; after two years of maltreatment, they released him in early 1796. Matthews returned to England and began demanding recompense for his injuries from Lord Liverpool, the secretary of trade and a privy councilor to King George III. When that worthy declined to meet him, Matthews became threatening and disrupted a session of Parliament, accusing the ministry of "traitorous venality." The Privy Council remanded him to Bethlehem (Bedlam) Hospital as a madman on January 28, 1797, over the protests of his family and parish.

"As boys raise a kite in the air, so these wretches, by means of the air-loom and magnetic impregnations, contrive to lift into the brain some particular idea, which floats and undulates in the intellect for hours together; and how much soever the person assailed may wish to direct his mind to other objects, and banish the idea forced upon him, he finds himself unable; as the idea which they have kited keeps waving in his mind, and fixes his attention to the exclusion of other thoughts."
-- John Haslam, *Illustrations of Madness* (1810)

In Bedlam, Matthews continued to protest against Lord Liverpool's conspiracy, but soon redirected his complaints to a more immediate threat. A "gang of villains profoundly skilled in Pneumatic Chemistry," working from an underground refuge near London's Wall, operated an infernal device -- the deadly Air-Loom -- to drive Matthews insane and torture him into acceding to the Pneumatic Chemists' plans. The Air-Loom (which Matthews illustrated with technical drawings) contains a number of barrels reminiscent of mesmeric "baquet" tubs used by French doctors, a "harmonica" style electrical battery, a windmill or whirligig, and a brass pipe; all controlled by seven Pneumatic Chemists using an array of busbars, pedals, levers, and "piano-forte keys." By electrically activating various gases, the Air-Loom weaves the "magnetic fluid" into "wires" reaching invisibly out to their victims. The Air-Loom can be used to plant or transmit thoughts, read minds, forcibly distort ideology (by "lengthening the brain"), "cut soul from sense," create dreams (by using "puppets of uncouth shape"), and by squeezing the victim in the magnetic fluid, can distend the body with gas, or cause laughter, spontaneous bowel release, bladder stones, lockjaw, apoplexy, and even death. Fortunately its range seems limited to around a thousand feet, but other gangs had other sympathetic Air-Looms planted near "the Houses of Parliament, the Admiralty, Treasury, & c." John Haslam, apothecary of Bedlam, faithfully transcribed all these (and many other) technical details in his pamphlet *Illustrations of Madness,* which he used to defend his judgement that Matthews was, in fact, insane.

"After having by every possible means counteracted me in the effort to save Louis [XVI]; by means of those infamous Men of France, who forming a Corresponding Committee of the Convention; were in connexion with the Secret Cabinet in the Court of St. James's, of which you have been the Prime Mover, you did actually affect the murder of that unfortunate Monarch . . ."
-- letter from James Tilly Matthews to Lord Liverpool, Dec. 6, 1796

One reason Haslam wanted to keep Matthews locked away was because the inhuman conditions at Bedlam, if revealed, could cost the apothecary his position -- as indeed they did in 1816, the year after Matthews' death. Another reason

was the very strong hint by his lordship of Liverpool that Matthews should die in the asylum rather than continue to threaten the government. Matthews, of course, knew that Lord Liverpool was the front man for the Pneumatic Chemists, in their conspiracy to put the Duke of York (the corrupt and incompetent second son of George III) on the throne of France, marry French royalty into the English line, and use the confusion to loot the treasuries of both countries. Matthews accused Liverpool of stealing the French crown jewels (and the diamonds of Marie Antoinette) to further that dastardly goal.

Matthews took such chicanery personally, because by around 1800 he had realized that he was, in fact, the "Omni Imperious Arch-Grand-Arch-Emperor Supreme" of the world, based on his putative descent from King Edward III. (Was an Air-Loom activated near [Joshua Norton](#) for some hidden purpose sixty years later?) Matthews added the college of heralds to those in the conspiracy against him, accusing them of obscuring his bloodline (leading to the inevitable speculation about a Prieuré de Sion power struggle). Matthews does mention that certain of the Pneumatic Chemists told him he was "Buonaparte's talisman," and that somehow his degradation drove the Emperor to further heights. In this context, it's interesting to note that Napoleon's defeat parallels Matthews' eventual removal from Bedlam into a more salubrious asylum at Hackney -- out of range, perhaps, of the Air-Loom. Bedlam itself didn't survive Matthews, as the hospital moved into a new building (now the Imperial War Museum) in 1815. Matthews even submitted a design for the new Bedlam Hospital, which has been annoyingly (if conveniently for Them) lost.

"[T]he miraculous apparitions, ecstasies, and inexplicable visions which are the source of so much error and absurd belief [are] magnetic attacks. One feels how greatly the very obscurity which has shrouded such phenomena, when combined with the ignorance of the multitude, must have fostered the growth of the religious and political prejudices of all peoples."
-- Franz Anton Mesmer, *Memoire Upon The Discovery of Animal Magnetism* (1779)

The Pneumatic Chemists had advanced their plans, meanwhile, to "event-working," a "science formerly supposed to depend on certain positions of the planetary system." And they weren't the only ones. As it turns out in Real History, Franz Anton Mesmer (born, for you Discordian fans, on 5/23 in 1734) was intimately involved in, at the very least, anti-monarchist activities while in Paris between 1778 and 1789. Mesmer's fortunes declined in 1784 after a panel of the French Academy of Sciences (including the chemist Lavoisier, the astronomer Bailly, the surgeon Guillotin -- and Benjamin Franklin, inventor of the harmonica used in the Air-Loom) investigated his student Charles d'Eslon and pronounced mesmerism nothing more than delusion and inappropriate massage. Mesmer, not discouraged, snaked a pension out of the French royal family with an oddly threatening letter and founded a Masonic order along with the radical Brissot and the Marquis de Lafayette. (Matthews feared that an Air-Loom had caused George Washington to resign the Presidency in 1796; Lafayette sailed to America in 1785 to share "Mesmer's secret" with his adored General.) Given that both Mesmer and Franklin were Masons, it almost looks like the whole panel was trying to save everyone's face and avoid an open breach. Mesmer eventually left France after his pupil Brissot (and another doctor experimenting in "animal magnetism," Jean-Paul Marat) launched the Revolution his "Brothers of Light" had hinted that mesmerism made inevitable. Another Brother, Jean-Louis Carra, had explicitly tied mesmerism to revolution, arguing that the poor weather plaguing France was caused by the inherent magnetic imbalances of a monarchy.

"Get acquainted with the science of spiritology. You will get much sense from that."
-- Charles J. Guiteau, assassin of President James A. Garfield (1881)

Which is why, mayhap, Lord Liverpool was so concerned about letting mesmeric maniacs run loose around London. Matthews' testimony accuses the Pneumatic Chemists of orchestrating the attempted assassination of King George III by the deranged soldier James Hadfield in 1800; their Air-Looms may also have been what began to drive poor George mad in 1788, and finished the job in 1811. Another "deranged assassin," John Bellingham, shot and killed Prime Minister Spencer Perceval in 1812, after an unjust imprisonment (in Russia) and baseless accusations (of embezzlement) had ruined Bellingham's life. Somewhat off-beam, any discussion of mind-controlled (or delusional) assassins points us toward not only Sirhan Sirhan and Charles Guiteau, but Ramon Mercader (who killed Trotsky) and Mark David Chapman. The parallels between Bellingham and Matthews bring to mind the alleged "second Oswald," ready to go if the first patsy dropped out; could Matthews have been Bellingham's backup, ready to "escape" if Perceval somehow survived? (In his murky Eco-manque novel *The Influencing Engine,* Richard Hayden gives a wonderfully twisty explanation tying Matthews and Bellingham together with the radical "Cato Street conspiracy,"

which nearly blew up the Cabinet in 1820.)

Taking yet another step into fantasy, Matthews called Liverpool's circle "Vampiring Consequentials" and in one of his "Imperial" decrees, ordered them hung and then beheaded or burned "to assure that they are Dead to be proved." Could Matthews have stumbled upon an actual vampire conspiracy? Could some vampiric Newton or Watt, seeking to mechanically extend his natural domination (perhaps over other vampires, eventually), have developed the Air-Loom to those ends? The Pneumatic Chemists seem an inhuman lot in Matthews' testimony, including a transvestite androgyne ("Sir Archy"), the never-smiling ringleader who eerily resembled dead statesman Sir William Pultney (significantly called "King Bill"), and a mysterious "Glove-Woman" who has "never been known to speak." Possibly some other supernatural explanation is in order; the gases and effluvia used in the Air-Loom include not only the alchemical copper, sulfur, aquafortis, and roses (and the witchly hellebore, nightshade, and "seminal fluid") but "Egyptian snuff" explicitly for "dream wanderings" at the mouth of the Nile. Of course, the Air-Loom might just be a steampunk not-yet-orbital mind-control laser (using gas to focus an energy "wire" sound familiar?), or you could emphasize its farcical elements for an intriguing, tongue-in-cheek *GURPS Goblins* scenario.

Whether its warp runs back to the ropes of the Gordian Knot (enigmatic symbol of imperial rule) or forward to the puppet-strings on John Hinckley, you can weave your campaign's design into the invisible etheric tapestry of the Air Loom. If they listen at the sewer-gratings of history, and place their ears to the madhouse doors of culture, perhaps your players can hear the mutterings of magical conspiracy amid the clacking whir of the Influencing Engine.

by Mike Mayer

There are two kinds of people in the world -- those who win at ***Ricochet Robot*** and those who hate it. If you're one of the winners, good for you, you have mastered a skill that will certainly come in handy when you . . . when you . . . um, well, you have mastered a skill. But if you're one of the people who can't seem to wrap his mind around how the game is supposed to work, that's all right, we can help.

Step 1: Count like a Robot.

Count 1, 2, 3, 4 . . .. Do it again. Not much fun is it? And it takes a lot of time. To save precious seconds when planning your routes, try counting the ricochets in units. Any U-Turn a robot takes needs three movements. Remember this. Drill it into your head. So when taking a robot along U-Turn, instead of counting each movement, simply glance at the board and add three. The same principal works for a zigzag motion. A zigzag takes three movements as well. A route that takes the robot along a square pattern takes four. And an "L" shape takes two. These are the basic movements in the game. If you remember their values and practice this sort of "flash" adding, you'll come out way ahead on the time front.

Step 2: Be as Decisive as a Robot.

As you map out the active robot's movement, if the number of ricochets reaches seven, and the active robot is still nowhere near the target space, switch to another route. Don't waste time with a bum path. The logic is this: if it takes more than seven movements to bring the active robot near the target space, you'll probably lose the round, as that number will most likely be added with an even greater number -- the number of movements it will take to put an obstacle robot into position (see below). And surely your opponents will be able to come up with a lower bid than that.

Step 3: Think Like a Robot.

For the active robot to reach its target space, it will often need to ricochet off at least one other robot acting as an obstacle. Many players find it easiest to figure out exactly where the obstacle robot must be placed before figuring out how to move any other robots.

Imagine that the obstacle robot is already sitting where it needs to be, and then count how many movements are required for the active robot to reach its goal as if the obstacle robot was already in place. In the above example, if the obstacle robot was already in place, it would take the red robot three movements to reach its goal. Keep

Ricochet Robot Examples

this number in mind. When you find a route that puts an obstacle robot where it needs to be, add the number of movements the obstacle robot needs to take with the remembered number. The total is your bid.

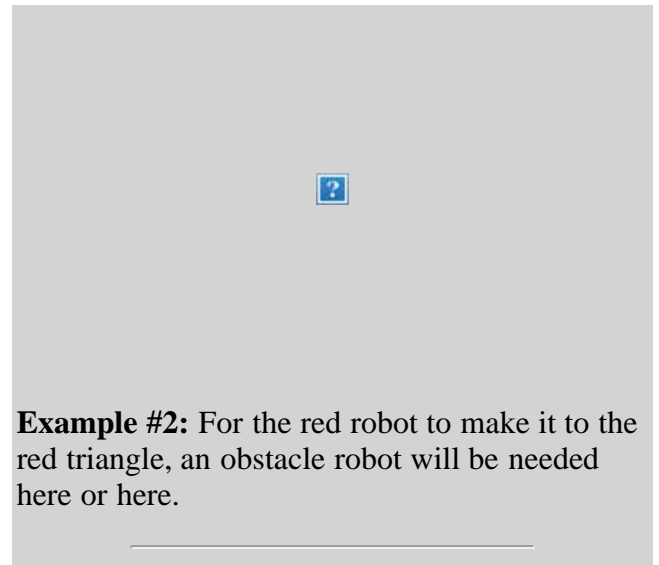
Where do you put the obstacle robot?

If the obstacle robot's placement isn't immediately obvious, follow this rule of thumb: If the target space is located two or three squares from the border of the game board, the obstacle robot will be placed along one of the two borders that are nearest the target space, either wedged in the corner of the game board or wedged between a border and a wall extending perpendicular from the border.

A few of target spaces are exceptions to this rule, such as the one of the green circles and one of the blue triangles. And a few other target spaces will give you trouble depending on how the boards are arranged. In these cases, you'll sometimes have to look elsewhere completely.

Things are often more difficult if the target space is located four or more spaces from a border. In this event, first search the borders across the board from the target space for a place to put the obstacle robot (as long as the target space allows the active robot to enter it from that direction, of course). If an obvious place can't be found, you'll have to do some searching.

But which robot should serve as the obstacle robot? If the choice is not immediately obvious, search for possible obstacle robots in this order:

Example #1: For the red robot to reach the red hexagon, and obstacle robot will be needed here.


Example #2: For the red robot to make it to the red triangle, an obstacle robot will be needed here or here.

- Any robot that can follow the same path the active robot needs to take to make it near the target space. (Since you already spent time figuring out how to move the active robot near the target space, you'll save time and energy if you employ the same path to move the obstacle robot there as well.)
- The robot currently sitting nearest to the active robot. (Though you may not be able to use the exact same path the active robot needs to take, you may find a similar one.)
- The robot currently sitting nearest the target space. (Watch out. If the path of this robot isn't immediately obvious, you may have difficulties finding a route to put this robot into position.)
- Any other robot.

Step 4: Dance Like a Robot.

There are many clever ways to switch robots around back and forth by moving one, the other, and the first one back again. Take some time along and experiment with how the robots move and see what you learn. Some important combination moves are:

The Switch:

Example #3: The red robot moves up. The yellow robot moves right. The red robot moves back down. The yellow robot then moves left and uses the red robot as an obstacle to bounce into the target space.

The Be Where I Was:

Example #4: The green robot moves up. The blue robot moves left. The green robot moves back down, ricochets, and heads to the target space.

Reverse Engineering:

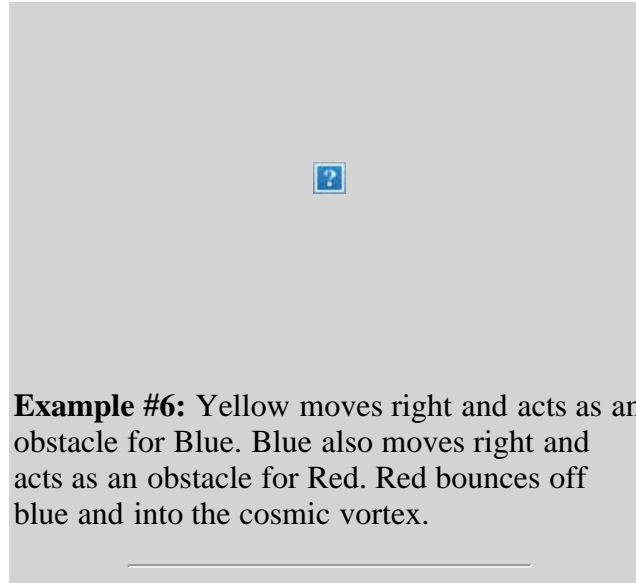
Example #5: An extension of the previous move. The green robot moves past the square where the blue robot will serve as an obstacle. Tis is one of the most important combinations, as it is slightly counter-intuitive and thus often overlooked. In the heat of the moment, players

who first imagine the placement of the obstacle robot sometimes forget that the active robot can still move through that space, as the obstacle robot isn't really there yet. So, green move down, left, and up. Blue moves left. Green moves down and right.

_____

The Double Your Fun:

Example #6: Yellow moves right and acts as an obstacle for Blue. Blue also moves right and acts as an obstacle for Red. Red bounces off blue and into the cosmic vortex.

_____


Step 5: "Be" the Robot.

Ricochet Robot isn't just a game, it's a way of life. All right, it's just a game. But it's a good game and players shouldn't be put off simply because they don't "get it" right away. The first time I played I lost. The second time I played I did even worse. But the third time . . . well! Well, it wasn't great, but then something "clicked." I saw how the game was supposed to work and suddenly the entire world changed. It was as if the software in my brain had been updated and yet, inexplicably, everything worked better than before. Keep at it and you'll get it too, and then you -- yes, even you -- can look like a genius at *Ricochet Robot*.

Quest For Lyre

by Kurt Brown

Art by ArtToday and John Green (courtesy of Dover Publications), colored by Jeremy Zauder

Player Information

The year is 50 AD and the Emperor Claudius sits on the throne of the Roman Empire. One day in early June the characters make their way to pay their respects to their Patron, Gaius Quintillus Martialus, a back-bench Senator of the Conservative party. Martialus greets his clients in their turn, spending a few moments chatting with them to determine what their needs might be. He seems a bit more distant than usual this morning, but deflects any inquiries as to the nature of his distraction. As the characters are leaving, they are intercepted by one of Martialus' servants who tells them that the Senator would like to speak with them privately. He requests that the party return around 11 a.m. for the midday meal.

The Audience

When the characters return they are escorted to the atrium of Martialus' home where the Senator awaits them. There, attentive servants offer them seats on stone benches that surround a small pond and serve them cheese and olives. The characters and the Senator engage in pleasant small talk during the meal that lasts about 30 minutes. After they have finished, servants fill their goblets with wine and retire to the kitchens, leaving the group to discuss more pressing matters.

Martialus addresses the group:

> "As you may know, we have been having some trouble recently with pirates raiding villas along our southern coast, a problem that I have been assured that the Army is handling. Unfortunately, their efforts are too late in one particular instance. I have received word that pirates raided my own villa near Brundisium just over a week ago. They made off with a fair amount of my personal possessions, and unfortunately several of my trusted servants lost their lives while defending the villa.

> "The loss of most of the personal property is not too great an issue. Apparently they managed to take my bust of Cicero, some of my Persian tapestries, and a few other minor items. But they did take one item that I cannot let go so easily. A lyre, valuable enough in its own right for its precious stones and gold leaf work, that means more to my family than ten times its value to other men.

> "This lyre has been handed down for five generations in my family, an heirloom that must not be lost. I fully intend that it should rest in the hands of my son Tullius someday, and not decorate the lair of some common thief. I would ask that you, my trusted associates, set yourselves to the task of recovering this

lyre and returning it safely to me. Your assistance will be greatly rewarded, and you need not worry for your businesses and families. I will make sure that neither suffers on account of my personal misfortune. Will you do this thing for me?"

Once the characters agree to assist their Patron, he will provide each of them with 1,000 sesterces to purchase any equipment or supplies that they may need. He also arranges transport to his villa on the coast near Brundisium and a letter for his headman, a servant named Calamis. Martialus will escort the party to the outskirts of Rome, asking that the party keep him posted as to their progress via regular written dispatches.

The Villa

After an uneventful weeklong trip the adventurers arrive at Martialus' estate on the coast of southeastern Italy. The estate is located in prime wheat growing country, the source of his family fortune. As the wagon comes within site of the main villa, a band of armed servants jog out to meet the party. An older man, darkened from many years of work under the Mediterranean sun, steps forward and introduces himself as Calamis, Martialus' headman. Once the characters introduce themselves and give Calamis the letter from his master he apologizes for the rude greeting, explaining that tensions have been running high since the raid. The servants escort the adventurers to the villa located on a hill overlooking the southern Adriatic Sea.

After more than two weeks of work, the servants have managed to repair most of the damage to Martialus' villa. Once inside the walls, the PCs will notice that there are signs of fire damage to one of the larger warehouses in the main compound but otherwise everything seems to be in order. Calamis orders the stable hands to take care of the horses and cart and escorts the party into the main domus, a whitewashed two-story affair at the crest of the hill.

Once inside, the characters are shown to the main triclinium of the house where a meal of cheese, bread, mutton and olives is served. As the party enjoys their meal, Calamis explains what happened on the night of the raid:

> "It was late, well past midnight, when the raiders struck. I don't know how they managed to get so close without being seen, but I guess that years of peace have made us complacent. The servants who were on guard duty were killed at their posts and the main gate was opened before anyone within the walls knew what had happened.
>
> "We still don't know exactly how many raiders there were, but it must have been around 20 or so judging by how much they managed to get away with. They were very stealthy. Some managed to get inside the main domus before the alarm was raised. We gathered what weapons we could and managed to drive them from the villa and down to the beach where their ship had been drawn up.
>
> "We took heavy losses. Five of our best field hands lost their lives, and several more were seriously wounded. We did manage to wound several of them though, and killed two before they withdrew. Unfortunately, it wasn't enough."

Calamis will provide the characters with a list of items that are missing and presumed to have been stolen from the villa. He shows them the rotting bodies of the raiders, dressed in leather tunics and boots, staked out on the beach as a warning to any other pirates that might happen by. Calamis also presents the party with the weapons they carried which are clearly of a Grecian style. As the characters continue their questioning of Calamis and the other servants, some interesting facts come to light:

- Calamis is fairly certain that he recognized the accents of the raiders. They were speaking Greek with an accent that indicated they were from Epirus, across the Adriatic from Brundisium. Their grammar was very precise, almost academic as opposed to the coarser dialog of common seamen.
- While the raiders managed to steal some very valuable items from the villa, they were oddly selective in their choices. The heavy bust of Cicero, the large Persian tapestries, the lyre, and other items were taken while smaller and more valuable items were left behind.
- The tactics of the raid seems to indicate that the pirates were not disorganized amateurs. Stealth is not a common

tactic of pirates, especially when dealing with an isolated villa such as Martialus'. The raiders were equipped with grappling hooks to scale the walls, and appear to have done so at several locations around the perimeter.

- When the raiders pulled back, it was simultaneously and with a minimum of disorganization. Characters with a military background can tell that it was clearly a withdrawal, not a retreat or a rout.
- The ship appeared to be of a military design, although in this part of the Mediterranean it is not uncommon for civilian vessels to be built in a similar style.

Calamis offers the characters the hospitality of the Villa as they ponder this information and plan their next move.

GM's Information

Senator Gaius Quintillus Martialus is weaving a complex web designed to discredit and eventually replace the governor of Epirus with his own son. The governor of Epirus, Lucius Cornelius Pulcher, is not one of the better examples of Roman sensibility. In addition to heavily taxing his province and pocketing a good deal of that revenue for himself, it is rumored that his agents visited the homes of wealthy locals and "borrowed" their finer pieces of artwork for his own private collection. He has maintained his governorship due to his connections with the family of the Emperor, but it is widely felt that if it were not for that, he would find himself up before the courts on charges of corruption and extortion. Martialus decided several years ago that this situation must be remedied, and who better to assume the post than his own son?

Quest For Lyre

During the last two years, Martialus has had agent provocateurs encouraging the more disillusioned citizens of Epirus to raid Roman settlements along the eastern coast of Italy. While the piracy has raised concerns, especially among the rural farmers of that region, it has yet to attract the full attention of the Senate or the Emperor. Martialus hopes that the raid on his own villa and the loss of a cherished family heirloom will allow him to stir the indignity of his fellow Senators enough to press for the dismissal of Governor Pulcher.

The raiders, mercenaries hired from the ranks of retired marines, were sent against Martialus' estate with the goal of securing the lyre and transporting it back to Epirus. Once there, the mercenaries were to ensure that the lyre found its way into the hands of Governor Pulcher, either as a gift or as payment of tribute. Martialus hopes that the PCs will discover the lyre in the possession of Pulcher thereby "proving" that the raiders originated in his province and leaving him open to an investigation to expose his corruption.

Once the characters reach Epirus and begin their inquiries, they attract the attention of Martialus' agents who steer them towards the governor in Nicopolis. When they reach the governor's palace, they are greeted with a pointed lack of enthusiasm. Pulcher knows that Martialus is not a friend, and views the characters with suspicion. He is not overtly hostile to the characters since he knows that his governorship is drawing unwanted attention and does not want to make matters worse.

Pulcher invites the characters to join him for dinner, a sumptuous affair with extravagant dishes, entertainment, and dozens of guests. The highlight of the evening is a selection of songs . . . performed by the host on his newly acquired lyre.

When confronted about the lyre, Pulcher insists that he received it as a gift from one of his subjects and vehemently denies any knowledge about how it was acquired. Pulcher knows that if word gets back to Rome that he has Martialus' lyre, he will certainly be recalled to stand trial for his other excesses. He will attempt to convince the characters to investigate further in an effort to uncover Martialus' duplicity, and enthusiastically offers his assistance in this effort. If the characters insist on returning to Rome with the lyre, Pulcher may decide to have them eliminated by his own agents

in order to protect his position in Epirus.

If the characters decide that there is enough information to warrant an investigation of Martialus' plot, they become the targets of his local agents and the mercenary sailors who raided the villa. If they survive, Pulcher will offer to accompany them to Rome to present their case before the Senate. Martialus will do whatever he can to prevent this from happening, leading to chases across the Adriatic and through the rolling Italian countryside. He knows that his career, and possibly his life, hang in the balance.

Once the characters arrive and make their case before the Senate, the political fireworks will be memorable. Both Pulcher's and Martialus' careers are in jeopardy, and the promise of exciting and humiliating hearings will draw large crowds of curious plebes and nobles.

Since their testimony is vital to both Martialus and Pulcher, they will be caught in the middle of a struggle to win their loyalty that both parties are unwilling to lose. Martialus will play to the characters sense of loyalty to their patron and their moral indignation regarding Pulcher's governorship of Epirus. Pulcher will appeal to the adventurer's outrage at Martialus' casual disregard for Roman life and his duplicity in sending the characters on a mission to frame an innocent man.

Martialus stands to lose more than Pulcher. While Pulcher's actions are considered distasteful, it is not uncommon behavior throughout the Empire. The attention that is focused on him as a result of the investigation will cost him his governorship, but it is a price that he is willing to pay in order to expose the greater crimes of Martialus.

Martialus, depending on the quality of the evidence presented against him, can expect to be stripped of his land and titles. At best he will be exiled from Rome. His encouragement of pirate raids on Roman territory is treason and could lead to his execution. If it becomes clear that the case has turned irrevocably against him, he will choose suicide over public humiliation.

The characters' actions and testimony during the hearings gains them a certain amount of notoriety in Rome. Depending on which side their testimony favors they could find themselves courted by supporters of the Emperor, conservatives secretly working for a return to the days of the Republic, or other nobles who find people with the adventurers' skills and point of view useful. They could also find themselves the targets of retribution from Martialus' son or supporters of Pulcher or both, depending on the outcome of the trial.

Goals: Achieving (and Leaving) Them

Why do your characters do what they do?

Why do they go into dungeons to cast spells at kobolds, or dress up in Spandex to stop jaywalkers, or prowl the sinister courts of Vladintheplacewhereyoulive the Vampire King?

Or, perhaps put a different way, why *don't* they do something else . . . something safer? Why don't they cast spells for a village shop, or start up a Spandex talk show, or find a small farming community Vladintheplacewhereyoulive's never even *heard* of and enjoy immortality?

In a lot of campaigns it can be important to have an idea of motivation; if you don't, then not only do you not know why you're doing something, you don't know when you'll *stop*.

Consider, for example, the Caped Avenger. The Caped Avenger saw a thief kill his kindly aunt and uncle as a child, and dons pajamas and a cape and prowls the streets of Crime-Ridden City to avenge their deaths. We know why he does it, but when will he give it up? Is he going to keep fighting until he dies? Until he gets too old? Until he can find a replacement? What if he were presented with an opportunity to help more people . . . for example, if he were offered a job as police chief of Crime-Ridden City? Or an opportunity as senator?

What about a religious crusader in the Middle Ages? He may strap on a sword and go off to war, but why? Is it for glory? For wealth? For duty to his nation? For a deeply seated faith? What could cause him to question crusading?

In real life many of us know when we're quitting whatever it is we do; we're working towards a pension, or towards retirement, or towards another career offer or opportunity. In roleplaying games, though, the careers and dynamics of a gaming world are significantly different; the 401K plan for a thief is notoriously unreliable.

A lack of motivation, either for adventuring or *not* adventuring, can make matters difficult on the GM. Creating interesting and logical plot hooks can be more difficult without a motivation. If you're just a hired assassin, with no other goals or motivations than killin' folks and getting' paid, how many times can the phone ring with a job offer before you've got enough money and/or you're bored (as a player *or* character)?

Goals can be short-term and/or specific (find the man who shot your paw, finding the mystery ingredient for Blue Goo Stew, get your name on the front page of *USA Today*, meet the President). They can be medium-term and somewhat nebulous (earn enough money to start a business, concoct a magical formula that helps the world, becoming famous). They can be very general and/or open-ended (help the world, leave a legacy, make your parent proud).

They can be achievable (becoming a competent wizard, running away from home), difficult (be the first cyborg to travel to the moon, learn the truth about aliens), nigh-impossible (defeat the Naughty Cult that threatens the earth, recovering the staff of seventeen parts), or impossible and/or unending (defeat all those who would commit crime, amass as much wealth/power/Legos as possible).

Now, just because you may have a goal for a character, life can do interesting things; you may accomplish that goal, only to realize you didn't really want it or now have another new goal; once you've successfully run away from home, then what? You may realize that the Neverending Battle is just too draining, and seek a replacement to pass the torch on. You may fall madly in love, and your new cuddle bunny may not *approve* of someone who chases after the Naughty Cult full time. You may wake up, naked in an alleyway and surrounded by Legos with no idea how you got there, and realize there's more to life than this . . . like Capsula.

For those of you already considering your characters' (and NPCs') motivations, keep it up! I know I am personally comfortable with coming up with motivations for my characters, but I'm a lot worse at coming up with reasons (good or bad) why they'd *stop*.

And for those of you creating your first mighty warrior, wide-eyed and ready to rid the world of evil, ask yourself, "Okay; what'll they do once *that's* done?"

* * *

Am I the only one who, whenever creating a character with bad eyes, makes them far-sighted and wearing glasses, just in case they need to start a fire and don't any other means of fire creation?

Just curious. I was thinking that today when I got my eyes examined and desperately trying to distract myself with *anything* other than the wide array of torture devices aimed at my squeamish eyes.

-- Steven Marsh

Last week's answer: **Don't Ask!**, an adventure with Ambush Bug for Mayfair's **DC Heroes RPG**.

(Three stars) "Figgerfurbingurbinburbibmurbinmitzermurbin!"

The Wildly Alternate History Campaign

"Less is a bore."
-- Philip Johnson

Slightly over two years ago, I wrote a column extolling the merits of the "Slightly Alternate History" -- the minimalist art of altering only the tiniest data necessary to present the historical conoisseur with the veriest frisson of change. Suitable for historically-minded GMs and strongly simulationist players, the Slightly Alternate History presents a number of unique and piquant opportunities. And obviates or ignores a host of others. This week, a perhaps overdue look at blowing the doors off, tossing history in the blender, messing around with the contrast and the brightness at will and establishing the Wildly Alternate History campaign.

Big changes require largeness of vision on the part of the GM, and largeness of spirit on the part of the players. Halfway measures and halting explanations only spoil the joy, the delight, the old-time Sense Of Wonder at seeing Egyptian pyramids along the Mississippi, or space-stations boasting Alexander the Great's coat of arms, or Apache buffalo-standards fluttering over a radioactive London. The GM has to have a reason to blow it up, in other words, if only so the players can enjoy the earth-shattering (or at least history-shattering) KA-BOOM. The players, meanwhile, have to be the sort who are willing to reinforce their suspended disbelief for the reward of a good story, a rollicking setting, or a world-design exercise. Absent a really gripping campaign, a swell scenario will do; a series of Wildly Alternate Histories works well in dimension-hopping campaigns, where the PCs have already moved on to the Tibeto-Basque Warworld before the Khmer Psiocracy has a chance to show its seams.

Just like astrophysicists watching *Star Wars*, historical pedants (such as myself) need to sharply check their intentions before entering the Wildly Alternate History game. If the GM can maintain unity of theme, realism of character interaction, or just a rip-roaring story that drags players into it willy-nilly, even the most churlish of players should give the game the benefit of the doubt. And come on, people, if you're willing to play in games with dragons, or telepaths, or functioning conspiracies, let the Egyptians build their steamships, okay? It's a game, not a doctoral thesis. If your players aren't historical pedants, or are (even better) blissfully ignorant of the fundamental weaknesses of the Inca empire, then go to town. As long as you show no fear (and provide a rocking game), they'll happily accept the zeppelins of Tupac Amaru raiding the Spanish Main for uranium.

"The destiny of mankind is not decided by material computation. When great causes are on the move in the world . . . we learn that we are spirits, not animals, and that something is going on in space and time, and beyond space and time, which, whether we like it or not, spells duty."
-- Sir Winston Churchill, June 16, 1941

For a Wildly Alternate History that starts with a single change point, making it a big one is crucial. I recommend a world war, at a minimum. Don't lose your grip midway through and actually evaluate German tank performance; stick to your imaginary guns and drive the Wehrmacht on to Reich-5 from *GURPS Alternate Earths*. Here, we went for Wild Alternacy; fascist America, genemod Japanese super-ninjas, Luftwaffe skyhooks, the works. Similarly, Reality Caliph, from *GURPS Alternate Earths 2*, gives another world war (between Islam and Christendom) a reverse, and goes on from there, always in the direction of imagery -- Arabian Nights -- and excess -- nanotechnological superwar!

Or, rather than starting from a Big Cause, aim at a Big Result. Global Empire, or at least global hegemony, works well at establishing scope while unifying theme (and thus minimizing design work for the harried GM). Roma Aeterna (from *GURPS Alternate Earths*) and Ming-3 (from its sequel) both demonstrate what can be accomplished (for the Romans and Chinese, respectively) with sufficient grandiosity of vision and sufficient disregard for puling matters of likelihood or fashionable neo-Spenglerian theories of cultural senescence. A recognizably Pharaonic Egyptian culture lasted almost four millennia; surely it's the act of a petty, carping miser to refuse to allow another two, with a few gratuitous twists here and there as obeisance to Clio. Alexander lives longer, ruling from Alexandria; Mark Antony defeats Octavian and the Eastern Empire becomes a Pharaonic epigone; the Valentinian Gnostics establish a syncretic Egyptiac culture after the fall of Catholic Rome -- see how close we are to those pyramids on the Vicksburg bluffs? It's this kind of special pleading and hindsight I used when building Reality Midgard, in *AE2*, with every juncture

"luckily" going the way of the Norse. Hey, if you're a Marxist (or a Whig), you believe in a teleological history anyway, so why not switch endings on a whim?

"Like all the Second Level, its timelines descend from the probability of one or more shiploads of colonists having come to Terra from Mars about seventy-five to a hundred thousand years ago, and then having been cut off from the home planet and forced to develop a civilization of their own here."
-- Paratime Policeman Verkan Vall, in "Last Enemy," by H. Beam Piper

Of course some worlds require a little something extra to help them along, even with charitably-minded players and well-waved GM hands. Worlds like the Aztec-dominated Ezcalli (from *GURPS Alternate Earths*) or Reality Futura (from this [earlier column](#)) depend crucially on players even more willing than normal to avoid looking at the man behind the curtain. For worlds like these, the GM is wise to stock a suitable range of deii ex machina. Some of them, like the nuclear war we used to establish Centrum (in *AE2*), are blunt but effective instruments: pick the culture you want to win, and decimate all the others. Smacking the Earth (or carefully targeted portions thereof) with a [Tunguska](#), or a [Pole Shift](#), or a megaplague, can accomplish the same effect. Want the Indians and Africans to thrive? Mutate the Black Death and wipe out 99% of Eurasia. A handy religious mania can spread your chosen culture to the far reaches of the world, just as Islam did for Arabic (and Persian) culture in Real History. Give the Balinese a Mohammed and a lot of boats, and watch those Hindu temples rise on the shores of Puget Sound.

With a sufficiently blithe attitude on the part of the GM, even more radical prime movers can set the world starkly akilter. Alien contact at any time in Earth's history can have any result the GM wishes, and is particularly handy for that Global Hittite Empire (blasters + antigrav + immortality treatments = permanent overlordship) or similarly implausible survival. Another good way to add permanence to some otherwise doomed culture is to grant it psionics; if the Tocharian savants of Sinkiang develop workable psi powers, they can build a mighty Nestorian Empire of Prester John with it in time for your "star crusade" campaign. The unlikely present can also result from temporal meddling back in the softly vulnerable past; I once built a self-indulgent Celtic-Khazar parallel for a "time patrol" game and justified it with a fortuitous time-machine crash around 450 A.D. If not time meddlers, perhaps the Conspiracy has some reason for King Ludwig of Bavaria to unite continental Europe in a mad Gingerbread Empire, or for the Kongolese slaves in Brazil to suddenly create a mighty creolized empire in South America with fortuitous aid from Benjamin Franklin and Alexander Hamilton. On yet another level, the gods from the machine can be, quite simply, gods -- the reason that the Maya conquered Spain was that Chac-Mool and Kulkulkan fought on their side in heaven. Present any of the above as a mystery to be solved, and even the more romantic breed of pedant can be drawn into the adventure. ("Aha! Minoan Crete was the heir to Atlantean technology -- that's how they built an empire that lasted until 1952.")

"Thus if the basic statements in their turn are to be inter-subjectively testable, there can be no ultimate statements in science: there can be no statements in science which cannot be tested, and therefore none which cannot in principle be refuted, by falsifying some of the conclusions which can be deduced from them."
-- Karl Popper, *The Logic of Scientific Discovery*

So much for the how and why; let's go back to the when and what. One good way to get a Wildly Alternate History is to discard an assumption about the "natural course of history" or the "laws of history" or any of that bunk. For Shikaku-Mon in *GURPS Alternate Earths*, we removed "Westernization" from the West and created a Japanese hegemony beginning in the 17th century. Abandon some other legacies of our reality: there's nothing particularly inevitable, or permanent, about the nation-state. A suitably broad-based catastrophe (like the Blight in *GURPS Autoduel* or [Reality Rust](#)) could wreck it in the industrial era, and with a few tweaks to human cussedness, Europe's kings might never have brought nationhood out of feudalism in the 15th century. I can easily picture some stuffy political scientist in a world of Icelandic-style anarchies pontificate, with faultless socioeconometrics, that man-portable firearms and the potato make large-scale government simply impossible to maintain.

While we're tweaking human nature around, how about reversing patriarchy? Pick your matriarchal society (the neo-Frazerian one postulated by Marija Gimbutas and Riane Eisler is always a favorite) and have it serve as the template for future civilization, with monotheistic Goddess churches and the "divine right of queens." Re-shuffle the biological cards described by Jared Diamond in *Guns, Germs, and Steel* -- give Kenya triticale, or Mexico the ox, or Europe the

Chinese disaster regime. Swap migration patterns around; send the Aryans across the Pacific like H. Beam Piper did in *Lord Kalvan of Otherwhen*, or point the Celts east instead of west, or send the Athapaskans south instead of over the Bering Straits and have the Sioux wind up running China. Move hominid evolution to South America instead of Africa, and have the primitive tribes of Eurasia die in droves when sophisticated American explorers reach their mud huts in the Thames Valley. Heck, leave the Neanderthals alive, and face humanity with an implacable, equally-intelligent rival for the same ecological niche down through to the atomic age. Keep Peking Man alive, too, for high-quality Orwell-meets-Leakey fun in a three-way struggle between alien races over the same planet.

"Over and above everything else should tower the stark, outrageous monstrousness of the one chosen departure from Nature . . . Even when the wonder is one to which the characters are assumed to be used, the sense of awe, marvel, and strangeness which the reader would feel in the presence of such a thing must somehow be suggested by the author."
-- H.P. Lovecraft, "Some Notes on Interplanetary Fiction"

You can build almost any science fiction world from the stock of human history and culture (heck, that's where most SF authors got them in the first place), and when you add prehistory things just get wilder. Give your dinosaur civilization the handwaving Harry Harrison does in *West of Eden*, or just pop domesticated dinosaurs into a weirdly alternate Babylon, or Renaissance Florence, or Revolutionary America after the example of Brian Aldiss' *Malacia Tapestry*. Or stretch rubber science even further; imagine a Bronze Age mathematical conception that unveils antigravity to Hammurabi, or Euclid, or Leonardo. (Harry Turtledove's "The Road Not Taken" has fun with the notion of space travel at medieval tech levels.) Just pick a doubletalk science from alchemy to mesmerism to Teslatomics, make it real and run from there. Magic, of course, makes things even wilder, and topples us breathlessly over into a (fully topo-mapped) fantasy world, explicable by any of our deii ex machina, or by nothing more detailed than GM fiat. Just tell your players that God said, "Let there be wildness." They'll see that it is good.

Quest For Lyre

A GURPS: Imperial Rome Adventure for 2-6 Players

by Kurt Brown

Player Information

The year is 50 AD and the Emperor Claudius sits on the throne of the Roman Empire. One day in early June the characters make their way to pay their respects to their Patron, Gaius Quintillus Martialus, a back-bench Senator of the Conservative party. Martialus greets his clients in their turn, spending a few moments chatting with them to determine what their needs might be. He seems a bit more distant than usual this morning, but deflects any inquiries as to the nature of his distraction. As the characters are leaving, they are intercepted by one of Martialus' servants who tells them that the Senator would like to speak with them privately. He requests that the party return around 11 a.m. for the midday meal.

The Audience

When the characters return they are escorted to the atrium of Martialus' home where the Senator awaits them. There, attentive servants offer them seats on stone benches that surround a small pond and serve them cheese and olives. The characters and the Senator engage in pleasant small talk during the meal that lasts about 30 minutes. After they have finished, servants fill their goblets with wine and retire to the kitchens, leaving the group to discuss more pressing matters.

Martialus addresses the group:

> "As you may know, we have been having some trouble recently with pirates raiding villas along our southern coast, a problem that I have been assured that the Army is handling. Unfortunately, their efforts are too late in one particular instance. I have received word that pirates raided my own villa near Brundisium just over a week ago. They made off with a fair amount of my personal possessions, and unfortunately several of my trusted servants lost their lives while defending the villa.

> "The loss of most of the personal property is not too great an issue. Apparently they managed to take my bust of Cicero, some of my Persian tapestries, and a few other minor items. But they did take one item that I cannot let go so easily. A lyre, valuable enough in its own right for its precious stones and gold leaf work, that means more to my family than ten times its value to other men.

> "This lyre has been handed down for five generations in my family, an heirloom that must not be lost. I fully intend that it should rest in the hands of my son Tullius someday, and not decorate the lair of some common thief. I would ask that you, my trusted associates, set yourselves to the task of recovering this lyre and returning it safely to me. Your assistance will be greatly rewarded, and you need not worry for your businesses and families. I will make sure that neither suffers on account of my personal misfortune. Will you do this thing for me?"

Once the characters agree to assist their Patron, he will provide each of them with 1,000 sesterces to purchase any equipment or supplies that they may need. He also arranges transport to his villa on the coast near Brundisium and a letter for his headman, a servant named Calamis. Martialus will escort the party to the outskirts of Rome, asking that the party keep him posted as to their progress via regular written dispatches.

The Villa

After an uneventful weeklong trip the adventurers arrive at Martialus' estate on the coast of southeastern Italy. The estate is located in prime wheat growing country, the source of his family fortune. As the wagon comes within site of the main villa, a band of armed servants jog out to meet the party. An older man, darkened from many years of work under the Mediterranean sun, steps forward and introduces himself as Calamis, Martialus' headman. Once the characters introduce themselves and give Calamis the letter from his master he apologizes for the rude greeting, explaining that tensions have been running high since the raid. The servants escort the adventurers to the villa located on a hill overlooking the southern Adriatic Sea.

After more than two weeks of work, the servants have managed to repair most of the damage to Martialus' villa. Once inside the walls, the PCs will notice that there are signs of fire damage to one of the larger warehouses in the main compound but otherwise everything seems to be in order. Calamis orders the stable hands to take care of the horses and cart and escorts the party into the main domus, a whitewashed two-story affair at the crest of the hill.

Once inside, the characters are shown to the main triclinium of the house where a meal of cheese, bread, mutton and olives is served. As the party enjoys their meal, Calamis explains what happened on the night of the raid:

> "It was late, well past midnight, when the raiders struck. I don't know how they managed to get so close without being seen, but I guess that years of peace have made us complacent. The servants who were on guard duty were killed at their posts and the main gate was opened before anyone within the walls knew what had happened.
>
> "We still don't know exactly how many raiders there were, but it must have been around 20 or so judging by how much they managed to get away with. They were very stealthy. Some managed to get inside the main domus before the alarm was raised. We gathered what weapons we could and managed to drive them from the villa and down to the beach where their ship had been drawn up.
>
> "We took heavy losses. Five of our best field hands lost their lives, and several more were seriously wounded. We did manage to wound several of them though, and killed two before they withdrew. Unfortunately, it wasn't enough."

Calamis will provide the characters with a list of items that are missing and presumed to have been stolen from the villa. He shows them the rotting bodies of the raiders, dressed in leather tunics and boots, staked out on the beach as a warning to any other pirates that might happen by. Calamis also presents the party with the weapons they carried which are clearly of a Grecian style. As the characters continue their questioning of Calamis and the other servants, some interesting facts come to light:

- Calamis is fairly certain that he recognized the accents of the raiders. They were speaking Greek with an accent that indicated they were from Epirus, across the Adriatic from Brundisium. Their grammar was very precise, almost academic as opposed to the coarser dialog of common seamen.
- While the raiders managed to steal some very valuable items from the villa, they were oddly selective in their choices. The heavy bust of Cicero, the large Persian tapestries, the lyre, and other items were taken while smaller and more valuable items were left behind.
- The tactics of the raid seems to indicate that the pirates were not disorganized amateurs. Stealth is not a common tactic of pirates, especially when dealing with an isolated villa such as Martialus'. The raiders were equipped with grappling hooks to scale the walls, and appear to have done so at several locations around the perimeter.
- When the raiders pulled back, it was simultaneously and with a minimum of disorganization. Characters with a military background can tell that it was clearly a withdrawal, not a retreat or a rout.
- The ship appeared to be of a military design, although in this part of the Mediterranean it is not uncommon for civilian vessels to be built in a similar style.

Calamis offers the characters the hospitality of the Villa as they ponder this information and plan their next move.

GM's Information

Senator Gaius Quintillus Martialus is weaving a complex web designed to discredit and eventually replace the governor of Epirus with his own son. The governor of Epirus, Lucius Cornelius Pulcher, is not one of the better examples of Roman sensibility. In addition to heavily taxing his province and pocketing a good deal of that revenue for himself, it is rumored that his agents visited the homes of wealthy locals and "borrowed" their finer pieces of artwork for his own private collection. He has maintained his governorship due to his connections with the family of the Emperor, but it is widely felt that if it were not for that, he would find himself up before the courts on charges of corruption and extortion. Martialus decided several years ago that this situation must be remedied, and who better to assume the post than his own son?

During the last two years, Martialus has had agent provocateurs encouraging the more disillusioned citizens of Epirus to raid Roman settlements along the eastern coast of Italy. While the piracy has raised concerns, especially among the rural farmers of that region, it has yet to attract the full attention of the Senate or the Emperor. Martialus hopes that the raid on his own villa and the loss of a cherished family heirloom will allow him to stir the indignity of his fellow Senators enough to press for the dismissal of Governor Pulcher.

The raiders, mercenaries hired from the ranks of retired marines, were sent against Martialus' estate with the goal of securing the lyre and transporting it back to Epirus. Once there, the mercenaries were to ensure that the lyre found its way into the hands of Governor Pulcher, either as a gift or as payment of tribute. Martialus hopes that the PCs will discover the lyre in the possession of Pulcher thereby "proving" that the raiders originated in his province and leaving him open to an investigation to expose his corruption.

Once the characters reach Epirus and begin their inquiries, they attract the attention of Martialus' agents who steer them towards the governor in Nicopolis. When they reach the governor's palace, they are greeted with a pointed lack of enthusiasm. Pulcher knows that Martialus is not a friend, and views the characters with suspicion. He is not overtly hostile to the characters since he knows that his governorship is drawing unwanted attention and does not want to make matters worse.

Pulcher invites the characters to join him for dinner, a sumptuous affair with extravagant dishes, entertainment, and dozens of guests. The highlight of the evening is a selection of songs . . . performed by the host on his newly acquired lyre.

When confronted about the lyre, Pulcher insists that he received it as a gift from one of his subjects and vehemently denies any knowledge about how it was acquired. Pulcher knows that if word gets back to Rome that he has Martialus' lyre, he will certainly be recalled to stand trial for his other excesses. He will attempt to convince the characters to investigate further in an effort to uncover Martialus' duplicity, and enthusiastically offers his assistance in this effort. If the characters insist on returning to Rome with the lyre, Pulcher may decide to have them eliminated by his own agents in order to protect his position in Epirus.

If the characters decide that there is enough information to warrant an investigation of Martialus' plot, they become the targets of his local agents and the mercenary sailors who raided the villa. If they survive, Pulcher will offer to accompany them to Rome to present their case before the Senate. Martialus will do whatever he can to prevent this from happening, leading to chases across the Adriatic and through the rolling Italian countryside. He knows that his career, and possibly his life, hang in the balance.

Once the characters arrive and make their case before the Senate, the political fireworks will be memorable. Both Pulcher's and Martialus' careers are in jeopardy, and the promise of exciting and humiliating hearings will draw large crowds of curious plebes and nobles.

Since their testimony is vital to both Martialus and Pulcher, they will be caught in the middle of a struggle to win their loyalty that both parties are unwilling to lose. Martialus will play to the characters sense of loyalty to their patron and their moral indignation regarding Pulcher's governorship of Epirus. Pulcher will appeal to the adventurer's outrage at Martialus' casual disregard for Roman life and his duplicity in sending the characters on a mission to frame an innocent man.

Martialus stands to lose more than Pulcher. While Pulcher's actions are considered distasteful, it is not uncommon behavior throughout the Empire. The attention that is focused on him as a result of the investigation will cost him his governorship, but it is a price that he is willing to pay in order to expose the greater crimes of Martialus.

Martialus, depending on the quality of the evidence presented against him, can expect to be stripped of his land and titles. At best he will be exiled from Rome. His encouragement of pirate raids on Roman territory is treason and could lead to his execution. If it becomes clear that the case has turned irrevocably against him, he will choose suicide over public humiliation.

The characters' actions and testimony during the hearings gains them a certain amount of notoriety in Rome. Depending on which side their testimony favors they could find themselves courted by supporters of the Emperor, conservatives secretly working for a return to the days of the Republic, or other nobles who find people with the adventurers' skills and point of view useful. They could also find themselves the targets of retribution from Martialus' son or supporters of Pulcher or both, depending on the outcome of the trial.

by Ralph Dula

Art by John Hartwell and colored by Jeremy Zauder

Go through back issues of DC comics, and you're bound to find new character options for West End Games' *DC Universe RPG*. Here are a few new advantages and disadvantages for this game, plus representative characters.

New Advantages

Reputation (-2D): A city, group or race, chosen when this advantage is purchased, is disposed to act favorably to the hero. This might come from deeds the hero has performed, his level of expertise in a skill the chosen group favors, or from outright fear of the character. Whatever the reason the hero gains +1 success to any Presence or related skill rolls involving the chosen group. This Advantage can be chosen multiple times, so the hero may have favorable standing with several different groups.
Representative Characters: John Constantine (mages and demons), Superman (Metropolis)

Weapons Master (-2D to -4D): The character has trained himself to the point of perfection in armed combat, getting +1 success on his attack rolls.

At -2D the character gains a bonus with one selected group of weapons: pistols, knives, clubs, etc. Alternately, the hero may specialize in a unique weapon he possesses.
Representative Characters: Electrocutioner, Tim Trench

At -3D the character may specialize in a class of weapons, such as firearms, bladed weapons, energy weapons, and so on. The +1 success bonus is gained when using any weapon belonging to the class chosen.
Representative Characters: Cannon & Saber, Deadshot

At -4D the character is skilled in every sort of weapon, from knives to field artillery, gaining a +1 bonus with any weapon he uses.
Representative Character: Peacemaker

New Disadvantages

Bad Luck (+6D): The character has been given the dirty end of the stick by fate. The character has a -1 success to every roll he makes, and a roll of a normal failure on the Wild Die counts as a critical failure as well.
Representative Character: J. Wilbur Wolfingham, Predator

Easy Come, Easy Go (+1D): The hero may not be a fool, but he and his money are soon parted (this disadvantage may not be taken by characters with the Poor disadvantage). Whether the hero gambles his money away, spends it on experiments, or gives it to the needy, cash does not stay in his wallet for long. At the start of every game session the hero must make a Moderate Willpower roll, failure of which means the hero has spent all of the money available to him from his job or the Wealth advantage. The Narrator should enforce this problem with role-playing, as the hero must relay on his friends or the kindness of strangers to meet any financial needs during the adventure.
Representative Character: Blue Beetle

Loyalty (+3D): The character possesses total, unwavering faith in an individual, who is present in the character's life almost constantly. Unlike a dependent, the individual a hero is loyal to is just as competent as the hero, if not more so. Whenever the person the character is loyal to makes a request of him the hero must make a Moderate Willpower roll not to do what is asked of him. Additionally, whenever the hero hears the person he is loyal to is in trouble he must do all that he can to aid him or her, no matter the cost to himself.
Representative Character: Robin (to Batman)

Multiple Memories (+6D): The hero has the memories and personalities of multiple individuals in his subconscious.

He may be a psychic vampire who retains the memories of his victims, an individual who has been reincarnated countless times, or a telepath who has read minds for many years and kept residual memories of all the thoughts he scanned. Whatever the case the character has a seething mass of personalities in his mind, waiting to break free.

Whenever a character with Multiple Memories is hit with a Mental Blast he must make a Willpower total as her next action, with a difficulty equal to the number of successes the attacker rolled with his Mental Blast. Failure to do so results in the character being overwhelmed by a rush of his subconscious memories, rendering him incapable of action. This condition lasts for a number of rounds equal to the number of successes the Willpower roll was missed by, so if an attacker has 9 successes with Mental Blast and the individual with Multiple Memories gets 4 successes on his Willpower roll the victim is incapacitated for five rounds.

Alternately, a character aware of a character's Multiple Memories may use Telepathy to activate them. The telepath makes a resisted roll against the target's Willpower, just as when normally using Telepathy against an unwilling subject, with the number of successes the telepath gets the number of rounds the victim is incapacitated.

If a character gets no successes on his Willpower roll to resist his Multiple Memories his mind is overwhelmed by the thoughts for an indefinite time, requiring outside assistance (as determined by the Narrator) before he can act again.
Representative Characters: The Parasite, Kingdom Come's Martian Manhunter

New Form (+1, +2, or +4D): The body the character is currently inhabiting is not his original form. It may not even be of the same gender or race that the character started life as. The level taken in this Disadvantage indicates the difficulty the character has due to his new form.

At +1D there has been little difficulty in the change from the old body to the current one. Either the character lives in a society accepting of such a change or made preparations before the body swap so that he or she could live in the new form with few or no questions being raised. The character still has access to any contacts or resources they possessed in their previous form, though said contacts may be unaware they are dealing with the same person.
Representative Character: Lex Luthor, while posing as his own son.

At +2D the character finds that his new form proves problematic. Those that knew the hero in her previous identity do not accept her now, and are quite troubled by the stranger claiming to be an old friend; the character has a -1 success penalty to any Presence roll made involving such individuals. The character also has no access to any items or wealth they possessed in their previous identity.
Representative Character: Immortal Man

At +4D the character's new body is nothing but trouble. The body he now possesses not only looks nothing like his original form, it is also not of the same race the character started out as. Individuals whose personalities have been transferred into machines, been mutated into monstrosities, or even joined the ranks of the undead would be examples of this level of New Body. The character possesses a -3 successes penalty to any Presence roll made to former friends, along with no access to any resources or contacts possessed in the old body. Also, the character's new form is so distinctive that the character will stick out like a sore thumb no matter how he tries to hide his appearance, illusion and shapeshifting powers notwithstanding; the character suffers a -2 success penalty with the Disguise skill and the Hide skill when trying to blend into large crowds.
Representative Characters: Duke of Oil, Patchwork Man

Weirdness Magnet (+3D): For reasons unknown to the hero fate has decreed he will continually encounter the strangest aspects of reality. Cursed antiques often make their way into the hero's possession, evil cults decide he will be the perfect sacrifice to their god, and long-lost friends turn up as foes. Whenever an odd event is to occur to a randomly-chosen character the hero possessing the Weirdness Magnet disadvantage is always the one affected; if two or more characters are Weirdness Magnets then all of them are somehow affected by the event.
Representative Character: Blue Devil

The Compleat Familiar

by Anthony Jackson

Art by Kent Burles, colored by Jeremy Zauder

The rules for familiars in *GURPS Magic* have some appealing aspects, but they are also somewhat incompatible with a variety of other advantages which do similar things, and, at about a page and a half, they barely scratch the surface of what a familiar can be. This article revises and expands the rules for familiars.

What is a Familiar, and Why Should You Have One?

Traditionally in western mythology, a familiar is a sort of demonic ally for a witch, generally appearing in the form of an imp or small animal; it assists the witch with spellcasting in some unclear way. Note that a black cat or similar animal associated with a witch might or might not be a familiar -- it could also be the witch, shapeshifted into that form.

The tradition of familiars in Fantasy and RPGs is quite a bit broader, to a large degree because magic users in fantasy are not automatically assumed to be evil and have sold their souls to the devil. Still, in general if it's actually called a familiar it will be an animal or minor supernatural entity, with some mystical connection to the mage. In a somewhat broader sense, there are a variety of things which are not called familiars but are functionally the same -- for example, catalyst creatures in *Psionics* could be considered familiars.

While the definition of a familiar is moderately clear, the exact role of the familiar is not. Some literary familiars don't seem to have any role beyond making smartass comments, which makes one wonder why the mage has a familiar in the first place. While the chance to harass the players can be perfectly useful for a GM, players usually want a better reason. A few suggestions:

- Taking a familiar is somehow a rite of passage for a mage. In this case a familiar might actually be a prerequisite for higher levels of magery.
- Familiars aren't required, but they assist in some useful way with spellcasting.
- Familiars aren't required, but they provide other mystical benefits.
- Or, of course, a familiar could just be a ally, likely with exceptional abilities.

Non-mages and Familiars

While it is rare for anyone who isn't considered a witch or wizard to have something actually called a familiar, it's perfectly possible for a non-mage to have an ally who fulfils essentially the same role. This is a very broad category, but in general one of the following should be true: the familiar is a kind of creature who naturally forms such bonds (for example, Pernese dragons), or the character has a special connection with that form of animal (such as a totem animal, a knight's warhorse, a wolf to a werewolf, a cat to a priest of Bast, or just about any animal for someone with

animal empathy). In this case, it is also important to consider whether the familiar is a natural animal, a magical animal, or has a spiritual or divine nature, as this will affect its motivations and likely powers.

Demonic Familiars

A demonic familiar is a very special case of familiar, because unlike other forms of familiar it is fundamentally hostile to the character. As such, a demonic familiar represents a special challenge for both the GM and the player, and the GM would be well within his rights to forbid demonic familiars to PCs. A character generally acquires a demonic familiar in one of two ways: either he makes a bargain, in which case the familiar's goals are to convince the mage and anyone else convenient to damn himself, make life miserable for as many people as possible, and then arrange for the mage to die once he's thoroughly damned, or he places some sort of magical compulsion on the familiar, in which case the familiar's goals are freeing itself, killing the mage, and generally causing as much havoc as possible. The GM should keep a secret character sheet for the familiar, giving it experience as it accomplishes its goals. A character who dies while linked to a demonic familiar is probably damned -- roll a contest of wills, counting good behavior as levels of strong will, evil behavior as weak will. Due to the nature of the familiar link, demonic familiars frequently cannot be banished.

Buying a Familiar

The first part of buying a familiar is convincing the GM to let you have one. During character creation, this is usually just a matter of paying for the familiar; later the GM may require going to some effort to acquire the familiar, as well as paying points. The GM should never actually require buying a familiar, though he may certainly offer opportunities.

Methods for acquiring familiars vary widely, and are left up to the GM -- for magical familiars a roll on Thaumatology or Occultism will reveal a method, for divine familiars it's usually up to the deity's whim, for exotic animals it's generally a matter of training. In all cases there is a fairly substantial amount of luck involved. For animal familiars, it is somewhat traditional to raise them from infants; while most animals mature faster than humans, it will usually be a matter of months before a familiar becomes useful at all, and a year or more for the familiar to reach full growth. This has the advantage that the familiar can be initially fairly cheap, and then cost more points as it grows into adulthood. Once adult, a familiar usually does not age any faster than its master.

Paying for a Familiar

A familiar is bought as a package of other advantages and disadvantages. Most of these advantages are just standard *GURPS* advantages and disadvantages, with a limitation to reflect the fact that they are dependent on the familiar, and do not work without the familiar. In principle essentially any advantage can be granted by the right familiar, but in practice only a few are common.

Advantages Related to Spellcasting

Assist Ritual   10 points

The familiar may join its master in all forms of ritual magic; this includes enchanting. It counts as a second mage, with skill identical to its master. This advantage does not permit the familiar to lead a circle or join any circle the master is not in, though it can still do so if it would normally be able to. The familiar must have magery to have this advantage.

Assist Concentration   5 points

Any time the mage fails a concentration roll, the familiar may make a concentration roll of its own to maintain focus. This does not apply if the mage would not be permitted to make a roll.

Beast Gifts   **variable**

The mage can gradually acquire certain innate traits of the familiar, such as advantages, high attributes, and the like. Occasionally this also result in disadvantages such as bestial or stress atavism.

Borrow Form   **5 points**

The mage can shapeshift into the form of the familiar; treat as the shapeshift spell. Cost is usually 6 to cast, 2 to maintain, though some familiars might be more.

Boost Magery   **variable**

The familiar gives its master a higher level of magery; cost is equal to the difference in cost between normal and boosted magery. You should be careful to note spells which have the higher level of magery as a direct or indirect prerequisite, since they can only be cast with the assistance of the familiar. The GM may wish to require you to learn prerequisite spells at 12 without the assistance of the familiar. In some worlds, this might be the only way to become a mage. The familiar must have as many levels of magery as it grants (but a magery-1 familiar can boost its master from magery 2 to 3).

Boost Psi   **variable**

As per boost magery, but applies to psionic abilities instead.

Innate Spells   **by cost of spell**

Some familiars can grant their masters magical abilities in the form of spells rather than advantages. These spells should generally correspond directly to innate abilities of the familiar.

Share ST   **3 per point of fatigue**

The mage may make use of his ally's fatigue as if it were his own. The familiar may also buy this advantage, allowing it to make use of its master's fatigue. The familiar may choose not to let you use its fatigue. Note that familiars with less than 6 fatigue require 60/fatigue minutes to recover a point of fatigue.

Spell Sustaining   **10 points**

The familiar can maintain spells for the mage; treat as per lend spell. Transferring a spell to the familiar requires a turn of concentration, and requires the familiar to make an IQ+Magery roll at -1 per spell it is already maintaining (-3 per spell requiring concentration). The familiar must have magery.

Advantages Related to Your Link With the Familiar

Most mages have some sort of arcane link to their familiar; the GM may require some minimum level of link. Unless the familiar can talk, some form of link is generally mandatory.

Empathic Link   **5 points**

Allows the mage to sense his familiar's emotional state; this will also allow knowing when the familiar is injured or in pain, but is generally not useful for communication. The familiar should also buy this advantage, for equivalent awareness of the mage. Always active.

Health Link   **3 per hit points**

Allows the mage to transfer wounds to his familiar; cost is per hit point of the familiar. Like Share ST, the familiar can refuse to accept the injury. The familiar may buy this advantage to transfer wounds to its master.

Sense Link   5 points

Allows the mage to perceive through his familiar's senses, per the spell Rider Within. Requires three turns of concentration and two fatigue to activate. +1 point for -1 fatigue cost, +1 point for -1 turn to activate.

Spellcasting Link   5 or 10 points

For 5 points, the mage can cast spells on his familiar as if he were touching his familiar. For 10 points, the mage can cast spells through his familiar, using range for the familiar; note that this is blind casting without a sense link. The familiar can refuse to permit the mage to cast through the link. The familiar may also buy this advantage to cast spells through the mage.

Telepathic Link   5 or 10 points

Allows the mage to communicate telepathically with his familiar, per the spell. For five points, it requires one fatigue and a turn to activate, counts as a spell on, and must be maintained. For 10 points, it is always active and does not count as a spell on.

The Familiar as an Ally

Aside from any advantages a familiar might grant, a familiar normally also counts as an ally or dependent. If you do not want to take the penalties associated with putting a dependent in danger, treat the base ally cost as 1 for negative point value, 2 for 0-24 points, 3 for 25-49 points, 4 for 50-74 points, and normal for higher ally point values. Familiars are usually better than 9- availability as allies; if you want a familiar who is absolutely always available, treat as a x4 frequency multiplier. A familiar not being present does not necessarily prevent use of its powers; take limited availability (below) to reflect that. Demonic allies are considered to be unwilling allies, at half normal cost.

Limitations on Familiar Advantages

The main difference between an advantage granted by a familiar and a natural advantage is that it's connected to the familiar, and may thus not always be present. At the GMs option, these limitations may be bought off, as the increased abilities become innate.

Dependent on Familiar   -10%

This power is lost if your familiar dies. At GMs option, also applies if familiar is in another dimension, time, or solar system. You can't take this limitation on link advantages, they're already automatically limited. Can be combined with any of the below limitations; required for anything other than mana-dependent. At the GMs discretion, up to half the points in abilities bought this way may be spent to obtain a new familiar if the old one dies.

Contingent on Behavior   Variable

Your familiar can, and will, deny you use of its powers if you misbehave. Limitation value is 2% times the value of an equivalent vow, or the actual cost of such a vow, whichever is less. You cannot take this limitation for a vow you already have. Half value if the ally can only refuse permission to use powers by triggering limited range or maintenance requirements. This is most common for divine allies.

Fickle Familiar   Variable

Your familiar must be convinced to help you. Treat identically to the fickle disadvantage; if the fickleness roll fails, the familiar is unhelpful. Bribery may increase the reliability of a fickle familiar. This is not precisely the same as limited availability; your familiar can be present and still not very helpful.

Limited Availability   **Variable**

The power is not always available. -5% if only available 15-, -10% if available 12-, -25% if available 9-, -50% if available 6-. How often this roll is made depends on why the power is limited availability. You may link this limitation to the appearance roll for the familiar, but the rolls need not actually be the same -- even if your tomcat familiar only actually shows up on 9-, its probably within a mile on 15-.

Limited Range   **Variable**

Power only works if familiar is within a certain range. -5% for 1,000 miles, -10% for 100 miles, -15% for 10 miles, -20% for 1 mile, -25% for 100 yards, -30% for 10 yards, -35% for 1 yard, -40% for touch only. Usually not purchased on link advantages.

Mana-Dependent   **-10%**

This advantage does not work in a no mana zone, or if a no mana zone lies between you and your familiar. This value should change in a setting where mana is particularly common or rare. The GM should ban this for advantages which normally do not operate in a no mana zone, such as magery.

Maintenance Required   **Variable**

Your familiar need not be in range to sustain the power, but you need to be regularly in contact with your familiar to maintain your powers. -5% for one month, -10% for one week, -15% for one day, -20% for one hour, -25% for one minute. Cannot be taken as along with limited range; just use the greater limitation. Add an additional -5% if this maintenance causes a wound (1 HT, cannot be healed except by normal daily healing).

Disadvantages Associated with Familiars

There are also a number of traditional disadvantages associated with familiars. Any limitations which apply to familiar advantages may also be applied to familiar disadvantages. The GM may choose not to count familiar-related disadvantages against the normal disad limit.

Infectious Empathic Link   **-5 points**

The mage is aware of the familiar's emotions, per empathic link -- but will also feel those emotions, and may be required to make a will roll to avoid acting on them.

Pain Link   **-10 points**

The mage feels his familiar's injuries, and takes shock and stunning penalties based on wounds to his familiar; high pain threshold does not help against this damage. If the familiar is killed, the mage is automatically stunned, and must make a fright check at -10.

Reversed Spellcasting Link   **-10 points**

Spells can be cast on you through your familiar, based on range to the familiar. Spells which cannot normally be resisted can be resisted when cast in this way, resisting with HT. Missile and jet spells cannot be cast across the link. It is possible to have special vulnerability to spells cast in this way, add -1 point per level of magic susceptibility.

Reciprocal Wounds   -15 points

Like pain link, but worse; damage taken by the familiar is also taken by the mage. If the familiar is killed, the mage must roll vs HT to avoid dying as well. Cannot be taken with health link. This is the same as "the mage suffers his familiar's wounds," from *Magic*.

Witch's Teat   -1 point

Some familiars have a dependency on their master's blood; a witch's teat is the mark left where the familiar feeds. It has a somewhat distinctive appearance, and is immune to pain. If in a particularly obvious position, this might be a 5-point unnatural feature.

Character Sheets for Familiars

Most mundane animals really aren't enough points to cost much as an ally. However, supernatural creatures and other exceptional familiars might be. In addition to any advantages associated with their form, magical familiars should take magery, and most familiars have the same link advantages as their masters. The stats below assume that the process of becoming a familiar boosts IQ to human levels; if this is not true simply buy IQ down to 7, add 3 levels of alertness, bestial, uneducated, and primitive TL0, and usually add at least two levels of short lifespan. This saves 40+ points for a TL 3 setting, and the GM may choose not to count this against disadvantage limits.

New Advantages and Disadvantages for Familiars

Small   10 points/level

This creature is unusually small; size modifier is -1 or less. Each level gives -1 to see or attack the creature, +1 DX for dealing with small objects at touch range, halves life support requirements, halves damage from falls, and generally allows any other actions the GM feels that being small would help with. The creature may still take disadvantages related to being small.

Small Claws   5/10/15 points

The creature has claws which do damage based on the bite table rather than on the thrust table. 5 points for crushing, 10 for cutting, 15 for impaling. This is a slightly modified version of the teeth advantage, with +5 cost for the slightly greater reach and not endangering the head.

Dependency, Master   Variable

Familiars can be dependent on contact with their masters for one reason or another. This is basically a normal dependency; treat contact with the master as a common substance. If it actually needs to drink its master's blood, treat as occasional. Animal familiars may replace the damage with 1 point of IQ loss; once IQ drops to 7 the familiar becomes nonsentient and loses all supernatural abilities.

Typical Mundane Animals

Here are a few typical mundane animals as familiars, with complete character sheets. Many familiars will have attributes at the high end of normal, though it is also moderately common for familiars to be fat and out of shape. Most familiars should also have magery, but that is not included in the template.

Cat
(-5 points)

A typical housecat. A black cat would be likely to have Magery-2 with an innate "curse" spell, the Jinx disadvantage, or both, and a bad reputation.

Attributes: ST 3 DX 14 IQ 10 HT 13/3. (-35 total)
Speed 6.5, Move 13, Dodge 7, PD/DR 0/0, Claw/Bite 1d-4 cut.

Advantages" Alertness +2(10), Catfall (10), Small Cutting Claws (10), Combat Reflexes (15), Four Legs(5), Fur(1), Increased Running x2 (10), Night Vision(10), Perfect Balance (15), Sharp Teeth (5), Skill Bonus: +3 stealth(4), Small (size -3)(30). (115 total)

Disadvantages: No Fine Manipulators(-30), Horizontal (-10), Inconvenient Size (small) (-15), Mute (-25), Sleepy (50%)(-10), Social Stigma: Property (-10). (-100 total)

Skills: Acrobatics(1), Brawling(1), Climbing(1), Jumping(1), Stealth(1)

Spells Granted: balance, night vision, slow fall.

Horse
(103 points)

A good-sized horse; horse allies generally seem to be cavalry horses or warhorses. ST includes -40% for no fine manipulators. This is a fairly expensive template, but note that horses are prone to being basically smart animals.

Attributes: ST 40 DX 9 IQ 10 HT 15. (158 total)
Speed 6, Move 15, Dodge 6, PD/DR 0/0, Bite 2d Cr, Kick 4d+1 Cr.

Advantages: Alertness +2(10), Four Legs (5), Increased Running x2.5 (15) (45 total)

Disadvantages: No Fine Manipulators(-30), Horizontal (-10), Inconvenient Size (large) (-10), Mute (-25), Social Stigma: Property (-10). (-85 total)

Owl
(-25 points)

A large owl, such as a great horned owl. Most small owls will have ST 1. An owl's attack dive is basically an all-out attack for damage, but gains +1 damage due to velocity.

Attributes: ST 2 DX 14 IQ 10 HT 12/5. (-40 total)
Speed 6.5, Move 3/13F, Dodge 7/9F, PD/DR 0/0, Claws/Bite 1d-5

Advantages: Acute Hearing +2(4), Alertness +2(10), Small Cutting Claws (10), Combat Reflexes (15), Feathers (1), Night Vision (10), Sharp Teeth (5), Skill Bonus: +3 stealth (4), Small (size -3) (30), Winged Flight (30) (119 points)

Disadvantages: One Fine Manipulator (-10), Poor Manipulators (-10), Poor Day Vision (-10), Inconvenient Size (small) (-15), Mute (-25), Sleepy (50%)(-10), Social Stigma: Property (-10), Reduced Ground Move -3 (-15) (-105 total)

Skills: Stealth (1)

Spells Granted: night vision, mage-stealth

Typical Supernatural Animals

Minidragon
(35 points)

There's a lot of variation on stats for miniature dragons; this one is in the 20 lb range, with a poisonous bite. In most cases there should be a telepathic or empathic link to the familiar.

Attributes: ST 5 DX 13 IQ 10 HT 13/5 (-30 total)
Speed 6.5, Move 4/13F, Dodge 6/8F, PD/DR 1/0, Claw/Bite 1d-4 Ct.

Advantages: Magery 1 (15), Small -2 (20), Small Cutting Claws (10), Scales PD1/DR0 (25), Sharp Teeth (5), Extra Limb (Tail, No Attack, Extra Flex) (10), Winged Flight (30), Poison (15) (130 total)

Disadvantages: Inconvenient Size (-15), Social Stigma: Pet (-10), Dependency: Mana, Daily (-15), Mute (-25), Reduced Running -2 (-10). (-75 total)

Imp
(55 points)

A small but fairly compact imp, around 15 lb and 18" tall. Note that its vulnerability applies even against nondamaging attacks (holy water does 1d against DR 5) and applies to attacks of magical beings (so imps can hurt one another...barely) but does not apply against spells. The compulsion: evil can be replaced by other 'evil' disadvantages for a particular imp.

Attributes: ST 5 DX 13 IQ 13 HT 13/5 (10 total)
Speed 6.5, Move 6, Dodge 7, PD/DR 1/5, Claw/Bite 1d-4 Ct.

Advantages: Magery 3 (35), Literacy (10), Small-3 (30), Small Cutting Claws (10), PD 1 (25), DR 5 (15), Sharp Teeth (5), Poison (15), Extra Limb (Tail, No Attack, Extra Flexibility) (10), Immunity to Poison (15), Immunity to Disease (10), Strong Will +10, Only vs. Supernatural Abilities that Affect the Mind (-50%; 20), Extra Fatigue-5 (15) (215 total) **Disadvantages:** Vulnerable, Magic/Holy Weapons/Items, 1d (-10), Dependency: Mana, Constant (-25), Dependency: Master's Blood, Weekly (-10), Dread (Holy Items or Holy Ground, -20), Unliving (-50), Inconvenient Size (-15), Bad Reputation -4(-20), Compulsion: Evil (-30). (-180 points) **Innate Spells:** Gift of Tongues-15 (4), Gift of Letters-15 (4), Suggestion-15 (2).

Familiars as Characters

It's certainly possible to play a familiar as a PC, though it would be unusual for a non-demonic familiar to be at the point level of a typical PC, and demonic familiars are generally not advised as characters. A familiar to an NPC mage should take the mage as a patron, and a duty to that mage. A familiar to another PC should handle this through roleplaying, and note that disadvantages such as limited availability, contingent on behavior, and fickle are usually inappropriate. On the plus side, PCs need never pay for other PCs as allies.

Pyramid Pick

Big Eyes, Small Mouth RPG (Second Edition)

Published by [Guardians of Order](#)

Written by David L. Pulver and Mark C. MacKinnon

288 pages (6"x9" full color), $29.95 U.S. ($39.95 Can)

When it was released in 1998, *Big Eyes, Small Mouths* made waves in anime gaming for its simple, streamlined design and versatile mechanics. The Second Edition is better. Much better. In fact, I'd argue it's not just for anime anymore.

To anyone familiar with the First Edition of *BESM*, the Second Edition is a remarkable change. The First Edition was only 96 pages and some 16,000 words, while the Second Edition is over 280 pages and 100,000 words. But fear not, those extra pages are not just filler. Second Edition *BESM* incorporates much of the material previously published in *Big Robots, Cool Starships* along with some concepts from other Guardians of Order titles.

This book is a high-quality product with exceptional production values. The 288 pages are color-printed throughout, and the design uses that color to good effect, showing off the anime-styled artwork one would expect. The art is very good, with only a few real clunkers, and covers a wide variety of anime styles without looking disjointed or busy.

The use of color doesn't stop with the artwork. *BESM* also make good use of color to highlight information tables (green), examples (blue), and notes (red). The notes are especially significant because they highlight changes from First Edition, and usually explain the rationale behind those decisions.

But enough about appearance. What about substance?

BESM sets itself a daunting task; giving players the option of gaming almost any anime genre, from high-powered, mecha-based action to silly (or not-so-silly) teenage romances, with fantasy adventure, pocket monster collectors, and sports teams tossed in for good measure.

Remarkably, it succeeds.

BESM is based on GoO's Tri-Stat system, also used in their licensed game settings. The rules are light, but flexible. They have a strong cinematic bias (the damage rules note that mortally wounded characters "will die within an appropriately dramatic period of time," for example) but leave plenty of room for Game Masters to set the degree of detail required.

As the name implies, Tri-Stat characters have three Statistics (Stats): Body, Mind, and Soul. These range from 1 ("Completely and Utterly Useless") to 12 ("Best in the Universe."); normal humans average 4. These define a character's abilities in the broadest possible terms.

Adding more detail, there are dozens of possible Attributes to represent special abilities. This is where the flexibility of the system really starts to show up. Attributes cover the whole gamut of possibilities from mundane (Appearance) to over the top (Gun Bunny) to downright silly (Flunkies). Each Attribute has six levels and often has several optional special abilities.

Character creation follows the now-familiar pattern of using points to buy Statistics, and Attributes, with the option of getting extra points by taking Defects. In a departure from First Edition, Second Edition *BESM* uses a single pool of points for both Statistics and Attributes and recommends giving each character a fixed number of points depending on expected the power-level of the game. (The First Edition system of separate pools for Statistics and Attributes is included as an option.)

There is an optional, but highly recommended, Skill system as well. Skills are bought from a separate pool of points (certain Attributes or Defects can change the number of skill points). Each skill also has optional specializations if you really need that level of detail. One intriguing feature is a table of suggested costs for the various skills in different settings. Important skills -- Piloting in a Space opera styled game or Cooking in a Teenage Romance game -- are more expensive while less important skills are cheaper. This makes it easy to customize the system for the style of play you want.

As mentioned, *BESM* now incorporates much of the information in David Pulver's earlier GoO work, ***Big Robots, Cool Starships***. That means that you can build mecha using much the same system used to build characters. In this case, mecha is used in its most generic sense; *BESM* will let you design anything from a motorbike to a space-going superbattleship.

The game mechanics are very simple. Almost everything is decided on a single 2d6 roll against one of the three Stats or the character's combat abilities, with modifiers for Skills, Abilities, and difficulty. The amount by which the roll is made determines s the degree of success in a simple linear fashion.

Optional rules cover more detailed movement, fancy combat techniques, mental battles, and so forth. A whole page is devoted to how to blow up building, cities, and (most importantly) planets. What's not to like here?

In addition to the obligatory, but well-done "What is a Role-Playing Game?" section, Chapter 1 contains an introduction to *BESM*, a (very) brief history of anime with comments on a dozen or so of the most popular anime genres, and some notes on changes from First Edition *BESM*.

Chapter 2 focuses on character creation, including "Normal" attributes, defects, and skills (optional, though I would highly recommend them). Somewhat awkwardly, Special Attributes and Defects, mainly paranormal or mecha-related, are separated in Chapter 3, though they are also listed (but not described) in Chapter 2 as well. It might have been better to split out the Skills section as a separate chapter and keep all the attributes together, but it's only minor inconvenience.

Chapter 4 covers basic game mechanics, complete with a simple flow-chart to keep track of combat. (It's not really necessary -- there is a grand total of seven boxes on the chart -- but it is a nice summary.) Chapter 5 includes expanded rules primarily of use for combat situations, including the aforementioned planet-busting rules.

The last chapter, Chapter 6, is the heart of the book, in my opinion. It promises information on "Role-Playing in an anime World" and delivers. There is good guidance for GMs on designing a campaign setting. Time periods, themes, concepts and several campaign "seeds" are given, along with advice on how to flesh out the game. The "fan service section" is especially useful, giving hints on how to give a game a distinctly anime feel, but much of the advice is appropriate for anyone developing a new game setting.

Rounding out this package is an extensive reference section with bibliography, filmography, and other information; several sample characters; and a detailed index.

There are some small glitches: the example space fighter for the "Own a Big Mecha" attribute appears to have been written using ***Big Robots, Cool Starships***, and some of the attributes and options used are not exactly the same as in *BESM*. However, it was a relatively simple matter to discover that "Armour" should be "Heavy Armour" and move on from there. Splitting the Attributes and Defects in separate chapters is slightly awkward, but works fine once you get used to it.

With all this going for it, ***Big Eyes, Small Mouth*** is almost a must-buy for anyone interested in anime gaming. But its

appeal should not be limited to anime. As it stands, **BESM** is also just fine for all sorts of martial arts or action gaming. It would need only minor tweaks to be adaptable to the "Golden Age" Pulp action or Cliffhanger-style game. (For mecha, substitute planes, fast cars, motorcycles, etc.) With some more substantive changes you have a near-perfect "Four-Color" supers game (Add a few special Attributes to cover more superpowers and off you go).

If you are looking for a simple, flexible system for almost any sort of cinematic gaming, you owe it to yourself to give Second Edition **Big Eyes, Small Mouth** a look.

-- Thomas Schoene

Pyramid Review

Gear Krieg

Published by [Dream Pod Nine](#)

Written by David Graham and Richard Meaden

128 pages, $24.95 hardcover

World War II and alternate history have always had a lot in common. Historical wargames are all about exploring different outcomes of WWII battles, and the most compelling and popular alternate history novels have often centered on the question, "What if Hitler had won?" That close association makes Dream Pod Nine's combination of World War II and mecha wargaming seem perfectly logical. It's a natural fit -- the only surprising part is that nobody has ever thought of it before.

In *Gear Krieg*, pulp superscience is alive and well, and living in the 1940s. Armored "Walkers" stomp through the forests of Europe and the jungles of the Pacific, dodging rocket planes and energy cannons as they pour down fire on tanks and infantry squads. The changes in military history are subtle -- panzers and carriers are still crucial weapons in this world -- but the mechs add a new dimension to classic World War II combat situations.

Dream Pod Nine has developed a convincing world for the walkers. The first third of the book is devoted to the background, presenting the first three years of the war in detail and showing the roles that mechs have played in the France, Crete, the Philippines and many other important battlegrounds. They certainly know their history. Most of what they present really happened, and an unwary reader might just wonder if there really were "supertanks" roaming the Ukraine. The changes are subtle and carefully placed, and Dream Pod Nine has even taken time to explore little-known conflicts in the Middle East.

Gear Krieg's background is atmospheric enough that it would probably make a fascinating roleplaying game. *Gear Krieg* is a wargame, though, and the game doesn't quite live up to the setting yet. *Gear Krieg* uses the same Silhouette system as Dream Pod Nine's popular *Heavy Gear* and *Jovian Chronicles* games. It's fast and easy, and works smoothly for battles of 20-40 individual units.

However, there's a problem. *Gear Krieg* apparently uses the same vehicle construction system as the other Silhouette games, but the WWII mechs are built on much smaller point values than the gears of *Heavy Gear* and the *Jovian Chronicles*. They've been scaled back to reflect the much less advanced technology of the 1940s. The walkers of *Gear Krieg* are built on 30 to 50 points, while *Heavy Gear* and *Jovian Chronicles* vehicles are built on hundreds or thousands of points. *Gear Krieg* walkers have less armor, guns with shorter ranges, and smaller damage modifiers.

Size isn't everything, of course. But the Silhouette system becomes grainy at this low end of the scale. The gun ranges are so short and the movement rates so slow that battles between walkers become stop-and-go affairs of trying to get close enough to shoot. There also seems to be no middle ground in damage resolution. In our test battles, hits would do either inconsequential damage or blow the mech to oblivion.

The system works more smoothly with tanks, but the tanks are built on 70-120 points and have significantly better armor, weapon ranges and damage modifiers. The more powerful walkers -- mainly the ones listed as coming into service in 1941 -- also have better weapon ranges, but the walkers of 1939 and 1940 aren't much fun to play.

That may simply be part of Dream Pod Nine's plan. The alternate history of *Gear Krieg* pauses at the end of 1941, commonly considered the height of the Axis power, and it's clear that the story of World War II will continue in later supplements. There are several hints that radically improved technology will appear as the war goes on, which means

the mechs we see in the basic book will be followed by more capable and flexible machines.

Following the progress of tactics and technology through the entire war could be fascinating -- but if playing the walkers of the early war is dull, there may not be many fans looking forward to doing battle in 1942.

Dork Tower!

Pyramid Review

The Sunless Citadel (for D&D)

Published by [Wizards of the Coast](#)

Written by Bruce R. Cordell

32 pages, $9.95

The first adventure for *D&D 3rd Edition*, *The Sunless Citadel* is designed to
challenge four 1st level characters. Unlike some adventures, this one encourages the
GM to award the players experience to advance levels during game play so that
they are powerful enough to handle latter encounters. Briefly touching on preparation, Bruce Cordell advises which
parts of the *DMG* and *Player's Handbook* to look over; this is very useful for new players and GMs. The adventure
background may not be immediately learned by players, but is there for eventual discovery.

More important, though, are the character hooks. While the standard one is there -- e.g. "The Sunless Citadel is a local
legend . . . " -- there are two other options. While being contracted is another standard adventuring motive, the last one,
solving a mystery (in this case the players are looking to discover where goblins get a special type of fruit, and how
they manage, year after year to successfully steal the growing trees of that fruit) is often under-used.

The action takes place in the small town of Oakhurst. Using the same format as found in the *D&D Gazetteer*, the town
is broken down to rows that are easy to read in a glance. You can see the population, authority figures, important
characters, and notes. The introduction of NPC classes is first used here, with warriors and barkeeps making up a good
portion of the classed townspeople. It's important to note that Oakhurst isn't detailed outside of that break down, and
while the map is nice, it's also too small to use Oakhurst as an adventuring local for more than this adventure without
the GM putting in some work.

The maps are well done, and by placing them on the inner side of the cover, Wizards of the Coast manages to save
space. Hopefully all future *d20* products will follow this lead. It's bad enough that they have to suffer the *d20* license
which takes up precious space; they can at least use those covers for something other than binding.

Most encounters are listed by having the word Creature spelled out in bold, with the encounter level, abbreviated *el*,
next to it. At the bottom of this description -- which can include tactics or description -- are listed the names and hit
points of the creature. There is a master stat list in the back of the adventure so space is saved by not repeating
information. Many of the encounters revolve around two classic *D&D* monsters: kobolds and goblins. Those seeking
more than a simple hack-feast can bargain with the kobolds, but the goblins have no interest outside of slaying the
party. The unique creature in this adventure, twig blights, are featured on the cover. A few other monster types sneak
in here: bugbears, a weakened troll, and even a small white dragon. Those GMs looking for traps will find more than a
few here, but nothing too inventive or powerful. One of the interesting things about bargaining with the kobolds is how
experience points are handled. Players earn xp as if they had defeated the kobolds, but if they break the agreements, or
go rogue, they earn the combat xp but lose the negotiation xp.

The maps are numbered clearly, and the encounters follow suit. Most rooms have two parts, one with a general
description and a grayed out area to read to the players. Sidebars feature additional information that may not be
appropriate for players knowledge, like the overview of the Sunless Citadel, while other information, includes types of
doors, light sources, and ventilation found in the Sunless Citadel. There are two levels to this adventure: the Fortress
Level and the more sinister Grove Level.

One of the things I'm glad is that this adventure isn't the "first" in a series. There are no hints as to this adventure being merely a part of a greater book, or it being the first chapter in a novel. When the adventure is finished, there are options for continuing to use the twig blights as a new menace, but the adventure is over.

The interior art is solid and stands up to WotC's standards. For the most part is it limited to one corner, where the art is boxed in to match the column's size. A few illustrations take up two columns worth of space. There are numerous pages without illustration, which allows the adventure more room to breathe.

One of the things that I disagree with WotC is that the back of the Sunless Citadel states you need the ***Monster Manual*** to play. When the adventure first came out that book was not available. The abbreviated statistics at the end of the book will do in a pinch, and eager GMs who've already DMed other adventures for ***D&D***, like ***Three Days to Kill***, ***Death in Freeport***, or numerous on-line adventures, should have no problem with this adventure.

At $9.95, though, the adventure is still too expensive while WotC produces *Dungeon Magazine*. While it's true that the adventurers in *Dungeon Magazine* are shorter, the value per adventure is higher. Still, for ***D&D***'s first adventure for the new edition, it's better than ***Three Days to Kill***, and equal to, if not superior than, ***Death in Freeport***. The follow up adventures will determine the overall impact.

Description

Gabriel is about 45 years old. He is 3 11" tall and weighs 75 pounds. He has faint blue skin and red-brown hair cut very short. He is generally seen wearing clothing suitable for a Priest.

Story

Six years ago, Pastor Jason Alexander McVey was part of a failed survey/religious mission to the planet of Monolith (SAT4/46). On this trip, Monsignor McVey met Scrub, a Truul employed by the ship s cook. He could see that Scrub was being severely mistreated and so by the end of the mission, convinced the old cook to sell him.

When Pastor McVey returned home, the Church was not pleased to see him with a slave. However, after some convincing and explanation, Scrub was made the property of the Church under the guise of being given Sanctuary. It was not long before he was a familiar face. He was given a set of regular duties in addition to acting as a messenger for the Church Officials -- hence his new name, Gabriel.

Two years ago, Pastor McVey was given the opportunity to lead another mission to Monolith. Gabriel went to him with tears in his eyes. Begging him not to leave, Gabriel told him that he would never reach Monolith alive. This was

very unusual talk coming from Gabriel (or any Truul), but Pastor McVey wrote this off as over-attachment and accepted the mission. An accident destroyed his ship and all aboard perished.

Since then, Gabriel has made over twenty predictions with uncanny accuracy. Each time he describes his predictions, his speech becomes very poetic. The Church has so far managed to keep this under wraps. Six Church Officials were assigned to study Gabriel and they have discovered that he receives his information through some sort of Angelic Voices. Skepticism is running high in the official Church channels. Some are even getting a little paranoid around him.

Quotes

- "Message for you, sir."
- "I m sorry to hear about your wife. I m sorry, you didn't know, did you?"

Adventure Seeds

- The PCs are approached by a man who warns them about how something they are about to do is going to go horribly wrong. When questioned, the man explains that he is a Man of the Cloth and that he cannot reveal his sources.
- Word of Gabriel and his abilities has leaked, and he has been kidnapped (possibly by the PCs . . .)
- Gabriel has accepted his "Voices" as his new master and escapes from the Church! The Church wants him back, and so they employ the PCs to track him down and capture him. When the PCs finally catch up to him, he has formed his own Church with a group of fanatical Truul followers.

Variations

- Change "Voices (2) Angelic " to "Voices (3)." In this variation, Gabriel is being given *evil* instructions from his inner voices. The death of Pastor McVey may even have been sabotage that Gabriel was ordered to perform.
- In a campaign where "Very Blessed" does not fit, replace it with ESP (8) [16] (Precognition Only) and Precognition-12 [4].
- The "voices" that Gabriel is hearing are actually the projected thoughts of a powerful Telepath! The "predictions" may or may not be true (they could be staged, or the Telepath could have precognition). Remove Very Blessed. Total point cost becomes 30 points. The GM can decide just what the intentions of the Telepath are . . .

Something Less Than God

by Spike Y Jones

(with thanks to Edmund Shaw and Jon Rowe)

Art by Dan Smith

Ever since I started roleplaying, I've been hearing the truisms "The GM is God" and "The GM's word is law." And since I've spent most of my roleplaying time GMing, it's been easy for me to go along with these sayings, enjoying the power and freedom it entailed . . . until I played in games with other GMs who espoused that same philosophy, which forced a bit of enlightenment on me.

Game Masters are indeed powerful. They control every aspect of the game and the game world . . . except the players and their characters.

The World

It's the privilege and power of the GM to create (or buy) and then run the game world. Every detail is his purview: the movements of the planets, the occurrence of earthquakes, volcanos, locust swarms, plagues, etc.

But the GM's control isn't unlimited. In many cases, he delegates some of his decision-making powers to an unseen agent: the creator of the RPG he's running. Every time he uses a Weather Table or reads out a default description of an average day on the game world, he's deferring to the judgement of someone else.

The players may not like the weather that their characters have to weather, but their griping isn't likely to make it change. Still, if they point-out the inconsistency of rainbows appearing on a rainless day, or the strangeness of a "bright summer monsoon," the GM may be forced to consider a retraction, or to concoct some special circumstances (such as the whim of a storm-god) to justify the strangeness.

Creating an interesting campaign world isn't the purpose of an RPG; running adventures in that world is. So if interesting inanimate bits of the game world threaten to derail adventures, the GM should modify the game world to accommodate these other concerns instead of ruling that the game world, once set to paper, is an unchanging creation. Of course, such changes should take place quietly and out of sight of the PCs in order to prevent problems with consistency ("Hey, wasn't there a mountain range here the last time we passed through?"), but the GM has to remember to be flexible and attentive to the management of his world.

Active vs. Passive

The player characters are the central actors of the campaign. They may not be the most powerful or influential characters around, but they are the focal point of the story as it follows their interactions with the other characters of

the campaign, not those of the movers and shakers. As far as the players are concerned, what their PCs do and what happens to them is far more important than the rest of the campaign world combined.

Which doesn't mean that the PCs have to be destined to triumph in the end; the campaign story can be a comedy in which circumstances always contrive to rob them of their glory, or a tragedy in which they fail in their quest. But whatever the outcome, the narrative follows the lives of the PCs, no matter where the course of outside events goes.

For example, in a *Star Wars* campaign, all the players know who will eventually lead the Rebellion to victory, but that doesn't mean that the GM's adventures should be replays of the movies with the PCs as spectators watching Han, Luke, Leia, and Chewie do all the work. There are lots of other regions of the Empire that need to be cleansed of evil, there can be many more plots that need to be foiled (maybe there were really three Death Stars, or more!) before the movie characters can achieve their victory, and even after Vader is eliminated there will be pockets of Imperial power to clean out. Maybe the PCs can cross trails with the movie characters from time to time, but in their own adventures it must be the players characters who are the stars.

As a result, the characters controlled by the players should seem more active than those run by the GM. For the sake of verisimilitude, NPCs should be run as if they were active characters with lives of their own, but those lives should never become the point about which the action revolves. Even the central villain in the story spends most of his time "off camera," appearing only when the actions of the heroes "bring the camera to him," whether this occurs because they move to where he is or whether they remain stationary and he comes to them.

Well run minor NPCs don't sit around dungeons waiting for the PCs to wander in and "activate" them; they carry out their own lives without reference to the PCs, and if a band of adventurers crosses their paths, they react to the intrusion.

Major NPCs are just as active as the PCs, and since they're motivated to courses of action that are likely to enhance, disrupt or otherwise affect the lives of the PCs, it is their activity which forces the player characters to react. But for all their ability to initiate adventures, a GM should take care to ensure that the NPCs' actions don't pull the PCs through the story like dogs on leashes. The villain provides the impetus and the opposition, other non-player characters provide assistance, plot-twists, or even just local color, but none of these should also tell the story.

The GM should also take care not to identify too much with "his" characters. Even when they're not cannon-fodder, destined to die as nameless obstacles standing between the PCs and their goal, the NPCs are all essentially expendable. If it comes down to a conflict between the enjoyment of the players and the continuation of the actions, plans, or lives of even the most significant or treasured of NPCs, the GM who plays NPCs as his own personal player characters will soon find himself running a solo game.

Consistency

Whether the setting is medieval fantasy, superheroic modern age, or futuristic space opera, the players are going to have to perform a paradoxical task in order to enjoy the game: they're going to have to believe in the normalcy of the setting before they can get excited about its fantastic features. If the setting doesn't provide a certain base reality that the players can feel comfortable with, they won't have any idea what their characters can accomplish, and just won't try.

The campaign world has to be designed with these elements in it. There have to be physical laws in operation that are described to the players before they take actions based on unwarranted assumptions. If gravity isn't going to operate in the normal Newtonian way, this is something the GM should tell the players, as this is something that the PCs would know about through life-experience (unless they've come from some place with different rules). The sun should rise in one quarter of the sky and set in another every day unless there's a reason for it to do otherwise, for example because the campaign takes places in a hollow world with a stationary interior sun (as in the *Providence RPG*).

And the GM should be careful when deciding that he wants his game world to differ significantly from the real world. I set my first *D&D* campaign on a world without a moon just to be different, only to run into problems the first time a

PC was infected with lycanthropy; without a moon, how frequently would he make his uncontrolled changes, and when? And for that matter, without a moon what sort of emblem would a moon goddess such as the Greek Diana have? Would there even *be* a moon goddess on such a world?

The majority of GMs won't even notice this restriction; most campaign worlds are just variations on our world, and the GM has little trouble keeping things straight with such a detailed model to follow. If campaign consistency is to break down, it generally does so in two realms: PC-NPC interactions, and in game sub-systems that differ from the real-world model.

In the hands of some GMs, a character who is a trusted friend of the PCs can turn into a shiftless traitor at a moments' notice, because they needed some way to force the PCs down another plot path and the NPC was convenient. These GMs don't see NPCs as people with defined lives in the campaign, but rather as mouthpieces for whatever they want to communicate to the players, or as handy, all-purpose characters, able to fill whatever momentary roles the needs of the story open up.

NPCs should be treated as if they have working minds, as people who react genuinely to what the PCs say and do to them, and to what the game world presents them with. This allows the players to treat them as individuals, confiding in the character they've come to think of as trustworthy, relying on the courage of the one they think brave, etc. Unfortunately, it can tie the GM's hands if he can't think of an in-character way to make one of his creations perform in a certain uncharacteristic manner, but "deep" characters can be more interesting to GM and players then "shallow" ciphers.

As for breakdowns in the game's rules, these occur when the GM is forced to interpret something for which he doesn't have an obvious real-world analogue. If a player wants his PC to perform some feat with a real-world equivalent, the GM can compare the description of the PC's ability to his own experience to come up with an answer ("No, if your Strength is listed as 'below average,' you can't move a 2-ton boulder."). But where there's nothing in the real world to guide him (could someone with below-average Psychic power telekinetically move that boulder?), he'll be forced to make a decision on the spot.

Deprived of real-world comparisons, the GM has a number of options open to him: he can draw an analogy to another part of the game's rules ("Well, if you had a below-average Strength you wouldn't be able to move the boulder, so I guess a below-average Psychic power score would have the same result"), he can do whatever he thinks would best further the plot (as advocated by the genre of storytelling games including *Everway* and *Amber*), or he can let the dice rule (*Toon* advocates reducing such problems to a yes-or-no question and applying The 50 Percent Rule: 1-3 on a d6 is "yes," and 4-6 is "no").

But whatever conflict-resolution method he chooses, he should remember to use the same result if a similar situation crops up in the future and the same method to solve other problems of the same sort but with different details. The reason for doing this if a near-identical situation occurs is obvious; no-one wants to deal with "but it worked last time" whines. The reason for consistently using the same method is that it allows the players to predict the results of their actions, giving them guidelines as to what actions they should or shouldn't take if they want to get a desired result. If the GM uses an argument based on analogy one day, the players will start to think along those lines when they want to do something not covered in the rules. If the GM then switches to drama-based criteria, the players will find their expectations conflicting with the results the GM announces. And once they've settled into drama-mode and have some confidence that the GM will let the PCs do interesting, if improbable, things as long as they produce a better story, switching to realistic probabilities and dice rolling before announcing the death of the PCs will truly dishearten the players.

Believability

And just as the players have to embrace the reality of an unreal world, they must also suspend their disbelief in its unreality. They must believe in the campaign world and its inhabitants, interacting with the inanimate world as they would with a real world (e.g., bothering to carry umbrellas or wear raincoats in the GM mentions that it's raining) and with NPCs as they would with real, living people.

The GM should be careful not to present things to the players which might shock them out of game reality and back to the mundane world. The classic example is the huge, ancient dragon living comfortably in a 20-foot-wide room with only a 3-foot-wide door; while there are numerous ways in which it could have entered the room (maybe it was hatched there, or knows a shape-changing spell), the players' first reaction will be disbelief. Improbable coincidences, irrational characters, and even simple stilted dialogue can all serve to remind the players that they're just sitting around a table telling a story, crippling their abilities to get into that story.

An NPC more important than just scenery can be patterned on a real person to make him more believable. A shopkeeper whose prices are always the same and who never has anything of interest to say quickly fades into the background. One who raises or lowers his prices based on a Price Fluctuation Table is annoying, but hardly believable. But a merchant who adjusts his prices according to some personal scheme (such as a halfling merchant with a grudge against all taller races, or a perceptive merchant who charges what he thinks his customers can afford) is both memorable and credible.

On the other hand, while all NPCs should be believable, not all have to be memorable; most shopkeepers should fade into the background after use.

The level of believability also serves to set the tone for the campaign, telling the players how they should react to the game. If the campaign is supposed to be in a realistic modern setting but the GM immediately begins describing obvious space-aliens walking the city streets without raising eyebrows, the players become confused about what the campaign is supposed to be about. But if the GM had either announced that the campaign was going to be based on a comic-book-reality, or if he had been subtle about the introduction of the weird elements, then the players' reaction would have been more accepting. Thus, the same strange events and creatures can appear in either an *X-Files*/**GURPS Illuminati** conspiracy-type setting or in a **GURPS I.O.U.** comedy setting, it's just how they're handled that tells the players which setting their PCs are in.

The GM isn't free to just throw story-elements together and call it a campaign. No matter how weird and wonderful he makes the setting, a good GM still keeps a foot stuck in the mud of the real world since that's where his players are coming from, and where they feel most comfortable.

Fairness

Generally, discussions about cheating in RPGs concentrate on preventing the players from doing it, but it's much easier for the GM to cheat in games because so much of what he does is kept secret from the players and because he's the arbiter in any disputes that arise. In fact, the GM can even cheat without realizing that he's doing it.

Something Less than God

There are situations in which cheating on the part of the GM is justifiable. If a player lies about what comes up when he rolls his dice, that's cheating, but if the GM lies about dice-rolls it's his motivation that determines whether it's cheating or beneficial "fudging." If he's doing it to further the plot or to prevent an unnecessary character-death, that's fudging. But if he's doing it to kill-off a PC he doesn't like or to protect the life of one of his prized NPCs (except to further some dramatic-goal, such as having the villain return to fight on another day), then it's cheating.

Similarly, a GM can change the pre-determined events and encounters of an adventure on the fly as a result of changes in the need of the plot or in the direction that the PCs have taken. If his modifications improve the storyline, they're acceptable, but if he's making the changes because he's upset that the players didn't get to see the genius of a death trap he'd set in their path but which they side-stepped, then it's cheating.

But the GM can still be unfair without having to break any of the rules of the game if he's not even-handed in every other aspect of his GMing conduct. If he has the most dangerous monster target one PC while lesser monsters attack others, he has to think about the justification for his monster-assignments. It would be all right for the GM to deliberately face each hero with an opponent that would provide equal challenge, but not to deliberately overmatch a PC unless there's an over-riding reason.

And even a well-meant gesture, such as making encounters easy for a novice player, can go too far. If, for instance, he weakens the opponents who face his girlfriend's PC for fear that she'll get upset with him if her character suffers, the other players might resent such favouritism.

While events in the game world can seem manifestly unfair to the PCs, the GM must remember to be fair to the players, since they're the ones whose presence is essential to the existence of the campaign, not the characters. It's a bitter pill to swallow, but every player in the game (including the GM) must occasionally let his own pleasure take a back seat to that of the rest of the group, and the GM should be mature enough to let his NPCs and game world be snubbed or injured in order to further the plot and ensure the enjoyment of the whole group.

Fun

An RPG adventure should be exciting, engaging, puzzling, satisfying, edifying, and a whole lot of other adjectives that add up to one concept: fun. The GM's ability to manipulate events and characters is limited in that he can't push things out of that realm.

But why would a sane GM design an adventure that wasn't fun? The problem is with differing definitions of "fun."

Some of the pleasures the GM derives from RPGs are world-building, puzzle-crafting, and just the ability to control things. And these pleasures have parallels among the players: world-exploration, puzzle-solving, and the ability to control their own characters. The GM enjoys setting up challenges for the players, and they enjoy overcoming them. But if the GM takes too much pleasure in the challenge and not enough in watching his friends overcome it, he ends up producing unwinnable adventures and then blaming his players for their inability to solve his conundrums and to appreciate his genius. And if he makes his adventures treasure-filled Monty Hauls with no serious challenges in hopes of maximizing the enjoyment of the other players, he runs the risk of boring himself so much that he becomes dissatisfied with his own campaign.

There is some perverse pleasure in creating riddles no-one else can answer, in creating ethical dilemmas which leave the PCs with no "good" choice, or even in killing off the entire party, but it's a solitary pleasure. And getting lots of no-risk treasure and experience points provides momentary thrills to the players, but even they will become jaded eventually.

Memorable RPG experiences come from overcoming obstacles and actually accomplishing things, so while a riddle may be difficult enough that it stumps legions of NPCs (with deadly, Sphinx-inspired, consequences), the PCs' story is a meaningless reiteration of that if they can't be the ones to finally solve the riddle, and there'll be no sense of achievement if, after all its build-up, the riddle is ridiculously easy.

The Ghost In The Machine

So, with the players commanding much of what takes place in the campaign, and with these other considerations hemming the GM in at every turn, what role's left for him to play? The GM is the Demiurge who creates the backdrop for the campaign and then starts the adventure rolling, and he's Fate presenting obstacles to the heroes to keep their quest from being a momentary diversion. He's the Muses, there to inspire the players to action when their emotions flag and their minds wander, and he's Nike who rejoices with them in their victories before he once again becomes the plot-creating Demiurge. Not God, but still gods.

Pyramid Pick

Fudge Expanded Edition RPG

Published by [Grey Ghost Press, Inc.](#)

Written by Steffan O'Sullivan

128 pages, $19.95

I thought I was going to have an easy review; after all, *surely* **Fudge** must have been reviewed at *some* point in *Pyramid*'s past. So when the **Fudge Expanded Edition** came out, I thought, "Hey, I can just run a review saying what's different, take my $50 credit voucher, and spiral into the night with a handful of **GURPS** books." But, alas, no . . . somehow this book escaped *Pyramid*'s all-seeing eye.

So, from the top:

In its basic form, **Fudge** is a worldless roleplaying game system, not unlike **GURPS** or the **Hero System**. But while these latter systems focus on numerical precision and accuracy, **Fudge** encourages you to . . . well, *fudge* it. In **Fudge**, all attributes, skills, and abilities (called traits) are rated on a word-based scale: Superb, Great, Good, Fair, Mediocre, Poor, and Terrible. Thus you might be a Great Doctor, or a Mediocre Gambler. A dice mechanic generates a step on this continuum from +4 to -4; thus your Great Doctor might roll a -2, resulting in a Fair job, while your Mediocre Gambler may have a phenomenal +4 roll, resulting in a Superb job.

These results are compared to the level needed to succeed; this is generally Fair but can be higher or lower if the task is more or less difficult. And contested actions are easy; two Gamblers would each generate a result and compare them.

This is pretty straightforward so far. But the beauty of **Fudge** comes from the fact that almost *nothing* is necessary for the system to work. There are no established attributes, no skill lists, no set advantages or disadvantages. Instead each GM decides what will be necessary for the kind of game they're running. Thus a game may have very broad attributes (Physical, Mental, Social), or very specific (Manual Dexterity, Agility, Instinct, Willpower, etc.). Skills may be painted with broad strokes (Weapons), slightly more specific (Guns), or even more specific (AK-47s), depending on the need of the genre and campaign.

In addition to Attributes and Skills, there are also Gifts (and their counterparts, Faults). These are abilities (or limitations) you either have or you don't. Again, there's no set lists of what's possible, but instead GMs and players are encouraged to come up with their own. Thus you might have Gifts like Absolute Direction Sense, Contacts with the Army, or Immunity to Poisons, while your faults might be things like Unattractive, Disliked by Animals, or Sleepwalking. Keep in mind that these can vary from campaign to campaign; one GM may have a Gift called Eidetic Memory, while another might have a Skill (or Attribute!) called Memory, which you could buy up to Superb.

The beauty of the system comes from its elegance of adding (or removing . . . or changing) elements as needed. For example, I ran a *Star Trek* campaign using **Fudge** about five years ago. Although I liked FASA's skill lists and background material, the underlying system didn't seem terribly fun for me, nor very intuitive for the two *Star Trek* fans I'd recruited that were newbies to roleplaying. For the most part I used FASA's attributes (Strength, Endurance, Intellect, Dexterity, Charisma), but I decided Luck and Psi would be Gifts. So when making the character of the ship's doctor we had attributes that looked like this:

Strength: Fair

Endurance: Good
Intellect: Superb
Dexterity: Fair
Charisma: Great

I showed this to the newbie player, and she immediately had an idea of what her character was like and what her character could do. "But I was wondering," she said, "if there was a way I could make this character more liked by men than by women."

"Sure," I said, and I proceeded to split Charisma: Great into Charisma (Women): Good and Charisma (Men): Superb. If it became important to have a "neutral" Charisma at some point, it would still be Great, but otherwise I was able to give her what she wanted. Another player wanted a finer distinction for her character's Dexterity, so I split it into Manual Dexterity and Agility. Each player thought of skills that their characters would have that weren't covered by the game, so they just made them up; I approved of them. The system still worked.

Attributes that a character doesn't have are assumed to be Fair, while Skills are assumed to be Poor (though easier skills may default to Mediocre while harder ones are Terrible). Character creation can either be Objective, where everyone uses the same attribute/skill lists, or Subjective, where a detailed character concept is created first, then stats are determined by the player and GM based on that concept.

In play the system is a snap; in my game it took all of five minutes to get everyone up to speed, and results were very easy to interpret. The player with a Good Transporter skill understood immediately that he made a Great result, and I, as GM, was able to say what that meant. The system also provides players the ability to alter dice rolls (by spending something called Fudge Points), and the ability to buy skills everyone forgot the character should logically have (called Uncommitted Traits) (The latter neatly eliminates cries of, "What do you mean my Samurai doesn't have Origami? I forgot about it . . . ") I *do* recommend using **Fudge Dice** -- basically a set of four dice with two sides marked with a plus, two sides with nothing, and two sides with a minus (yes, a d3) -- also from Grey Ghost Press, since it reduces overt numbers even further and makes it very easy to glance and determine a result.

Combat is very well thought-out, and includes a plethora of options for making it as cinematic or realistic as you'd like, but I never found the system to be terribly "fun." This is probably mostly due to personal preference against combat, but I found the system was always at its best for my GMing style when used in non-combat actions.

All in all, the main part of the book is filled with options and possibilities to think about: variable dice-rolling methods (resulting in variable probabilities of the -/+4 spread), lots of sample characters (each one using a different spread of attributes/skills), sample attribute/skill lists to consider, etc. Almost anything I could think of is covered, usually well; there's rules for dealing with variable scales (if you wanted to play a mixed group of giants and tiny people, for example), magic systems, psi, animals, cyberware, and others. The book is not indexed, which may be a problem for some, but is so intuitively laid out with a true decimal numbering system (for example, Section 1.35 comes between Section 1.3 and Section 1.4) that I seldom had much problem finding what I needed.

The last part of the book, and the primary portion that I believe makes it "revised," is **Fantasy Fudge**, a complete version of **Fudge** customized for Fantasy games. This is a great example of "putting it all together;" this is, in essence, a complete fantasy game using the **Fudge** rules. There are set attributes and skill lists, gifts/faults, character types, monsters, etc. They *do*, however, go to great lengths to show and explain that this is merely an example of what can be done with the system, rather than a canonical listing of attributes or the like. This section is a very good nuts-and-bolts example of how to make it all work, and is definitely pleasant to read, but didn't inspire much in me personally to make me want to run a **Fantasy Fudge** game.

Although I love **Fudge**, I definitely do believe it is neither flawless, nor ideal for everyone. First, it places extraordinary demands on the GM; practically every aspect of a campaign needs to be considered before commitments to attributes or skill lists can be made. (How *will* having a Luck attribute affect the game?) Once these decisions are made, however, play is generally very smooth.

Second, it is, by definition, very imprecise; if you need a system that says, "A Strength of 81 allows you to carry 4,204

kilograms," this is not the system for you. The GMs and players will need to be of similar minds of what a person with a "Good Strength" can do, or there's going to be problems. The scale systems are also, in my opinion, not terribly intuitive; if you need Superman-style characters to interact with normal humans, this system may not work as well as one that is intrinsically logarithmic (such as ***Masterbook*** or ***DC Heroes***). ***Fudge*** is, most definitely, not for "munchkins" or (again) players who demand precision; since almost everything relies on GM intervention/fiat, players determined to either break the game or make the GM miserable will almost certainly succeed. There are no mechanics for what a successful Tracking skill roll will do, nor detailed systems for Taming Ferrets. Finally, the game may feel grainy to some players; since the range of an action can vary by +/-4, some players and GMs may be bothered by the notion of a Mediocre Writer creating a Superb book (or, conversely, how a Good chef can create a Terrible meal).

But these quibbles aside, ***Fudge*** remains one of my favorite systems of all time. In the hands of an experienced GM, it allows a painless introduction to roleplaying for new players. It allows for making almost *exactly* the character you would like to play, and, provided you like the basic system, can be endlessly modified and tinkered with to create a game system you would like. It remains the only game system where I was able to make NPCs at the rate of one per minute. And the basic system is available for free online at www.fudgerpg.com, so there's little incentive *not* to check it out. (I must confess, though, that having a nicely printed and illustrated book has made me spoiled from the dot-matrix-printed, dog-eared spiral-bound copy of the unexpanded edition I printed five years ago.)

Fudge allowed for an almost immediate transparent roleplaying experience for my players, letting everyone fully enjoy the characters and world we created. And that, in my mind, is well worth a place of honor on my gaming bookshelf.

--Steven Marsh

Play Dirty

"Be fair. . . . Dice are arbitrary, and because of that, you have to be fair. A fair GM always takes things into consideration when he makes decisions. He has to consider the consequences of his decisions and how they will impact the players in his campaign. Of course, this means that sometimes the GM has to break the rules . . ."
-- John Wick, ***7th Sea Game Master's Guide***

Consider this a tribute to a fallen fellow columnist, one who always followed the Secret Columnist Rule: Make Them Care Enough To Bitch. Consider it GM's advice by example, whether positive or negative being a question for the reader, not the writer. Consider it a convenient excuse to tell war stories, some of them, as we say in the columnist biz, "composites" of the kind of stories I'd have to give way too much setup for otherwise. Consider the question of whether, as you vigorously denounce the following cheap shots and scurvy knave's tricks, you have ever Played Dirty. And enjoyed it.

* * *

I'm going to start this off with a dirty trick one of my players accidentally taught me. Ron was a power gamer, and a born psychologist. He was the kind of player who, at the initial character creation session, would ask the seemingly innocuous question that a harried GM always agrees to, because there's six or seven other people wanting to know if they can be members of the Golden Dawn or something.

Ron: "Can my character have a fire opal pinkie ring?" (Or some damn thing.)

Me, busily checking someone else's sheet to make sure that the alleged doctor character has bothered to take any Medicine skills: "Sure, whatever."

Six sessions later, after I've forgotten that his character has a pinkie, much less a fire opal on it, the characters are trapped by a mesmeric rainbow-serpent, the minion of The Bad Guy -- in order, I thought, to convince them to run back down into the mineshaft and find the damn adventure hook I buried there. But Ron's character tosses the fire-opal at the thing, distracting it, and the players beat it down, and chase The Bad Guy into the desert to parch to death or whatever.

Ron's monologues at times like that were always masterpieces of calm rationality, delivered at a steady lope that subconsciously encouraged me to fall into rhythm and keep the game moving: "Well, it's a being with strong ties to the desert here, where you said there were opal mines, and for all I know we're in one here, and gems have magic (or at least that sorceror who summoned this thing used a gem) so I figure it's good for a distraction at least."

Ron, you see, knew ahead of time that I like to use spur-of-the-moment symbology (because he knew I was a Tim Powers fan) and that in any magical-type campaign I ran, there'd likely be magic gems cropping up (because they're cool). If I didn't let him have his magical gem, he'd be sure to keep the bullets the bad guys fired, or the tape-recording of their voices, to use in sympathetic magic -- which he knew I, as an old Frazerian, would allow. So he gamed me every time, using my interests, and my responsibilities as GM to keep the game moving, against me. And I enjoyed it, because I enjoy rewarding player action rather than stifling it.

* * *

So what did Ron teach me?

Two things.

The first, and obvious, lesson is "Know your enemy." I had another player who made the foolish mistake of confiding to me that bugs creeped him out, especially moths. Two months later, guess which player got the West Virginia Mothman scratching at the roof of his character's car? By knowing that Ted is a cryptophile from way back, I can

ensure any number of awful things are unleashed upon the PCs if all that keeps them at bay is a coded data file.

Me: "There's a dead man sitting in the chair, staring at his computer screen with his face twisted into a rictus of horror."

Ted: "A computer screen? What's running on it?"

Me: "You don't know; it seems to be in some kind of code."

Ted: "I shove the corpse out of the chair and start decrypting the file."

The second lesson is more subtle, but potentially more powerful: I never *need* to write the exit to the deathtrap. Like a careful GM, I used to write three exits to anything -- and Ron would always find the fourth. And it would be cleverer than all three of mine. Eventually, Ron began to infect the other players: I playtested Gernsback from **GURPS Alternate Earths** in a massive pulp extravaganza called "Doctor Fang And His Zeppelin Of Doom." I used the suggestion in **GURPS Cliffhangers** of ending every session with a deathtrap. (Yes, this required some hefty GM scripting. Three quick points: It was a pulp serial, so scripting was in genre. It was a *good* script. And for all their whining, most players vastly prefer a trip on the railroad searching for the McGuffin Of Seven Scenario Seeds to screwing around the tavern all night, especially if you let them toot the whistle and ring the bell every so often.) Every session, I never knew how the players would escape: I played every scene as though I *knew* the players were doomed. And every week, the next session would begin with some player saying something like "Well, since I have Tesla's old impedance resonator, I should be able to tune it to the Earth's magnetic field and stop our fall off the Empire State Building's zeppelin mast . . . "

Seven player heads are better than one GM head at tactics, attacking any problem from all angles, brainstorming, and saving their tail.

So use them to do your work. In the time you save, you can be looking up cool stuff about opals.

* * *

That has a reverse, of course, a kind of GM judo using the players' strength against them. One head is far better than seven for seeing things in a unified perspective. A decade or two of trying to get players to spot clues has convinced me that if there's any clue you absolutely don't want them to notice, mention it matter-of-factly in the second half hour of the game. For extra safety, mention it right before the Big Obvious Clue A Mile High. Let's say you're trying to get the players to miss the fact that the Dionysian cults are behind the human sacrifices.

GM: "The old woman reluctantly pulls the thick oaken door back, revealing the stairs. You go down into Lord Vachel's cellar, brushing the thick, clinging cobwebs out of the way. Against the wall is the wine rack, decorated with pseudo-Gothic Green Man carvings. There's torch sconces, tallow drips on the flagstones, the standard wine-cellar deal. Over in the corner of the cellar is a low stone table, with rings at the corners and a groove carved in it."

Players: "A groove? Like a sacrificial altar?"

GM: "Very much like a sacrificial altar. As you approach it, you can see that it's choked with brownish stains."

Players, delighted beyond expression: "Blood! I'll bet it's human blood! Those rings must be manacles! Ooh, are there any pieces of obsidian laying around?" [Mad scramble to play with the altar ensues.]

If your players are basically good sorts, like mine are, during the first half hour (of game play, not necessarily of the evening) they're consciously trying to be good and pay attention. But unless you're running an incredibly taut thriller, after about a half an hour, their attention flags a bit, if only because they've got a half hour of game to digest and figure out. Put in enough stuff (which is a good idea anyway, because details and connections make the world look more like ours, which is not to say "realistic") and they'll float right by it. Then toss in something to wake them up and prevent them from concentrating on it. Once you're sure they've missed it, you're free to hang your villain's plot on it. If

you need it, it can even be a Get Out Of Plot Corners Free card; call attention to it with a second, more obvious clue (like a break-in, or a magical attack). When the players spot it, they'll assign every other plot hole to "that damn Dionysian sect we trusted like idiots." You'll see problems you didn't even know your campaign had solve themselves because seven heads are furiously working to solve them for you.

* * *

Do that to them enough times, and you can get them to take detailed scenario notes.

Which, as GM, you can "borrow" whenever you like, and use to find stuff you just tossed in as scenery that you can later claim you put in on purpose.

It's fun to use the change-up, here, and pretend like you don't want the players to notice:

GM: "The tome describes shrines draped in thick cobwebs *[guilty pause, GM looks around shiftily]* where the cultists performed human sacrifices *[GM punches it, gloating to himself]* to free the Spider Goddess' *[said in a voice of mock-lightness, the GM trying to pretend the tome has it obviously wrong]* spawn from her victims. The victim's blood, full of the Goddess' eggs, was then carefully decanted into sacred wine bottles." *[Oh, now he's given it up! The GM suddenly looks horribly stricken! However could he have made that crucial slip?]*

Players, excited at the GM's accidental revelation: "Spider Goddess? Oh, no, she must be the power behind the cult of Dionysos! Weren't there thick cobwebs in Lord Vachel's cellar? I'll bet that old caretaker woman knows more than she's telling!"

[GM rolls eyes to indicate good-natured acceptance of his thwarting by the So-Clever Players, and shuffles notes to the spider ambush the players have just talked themselves into rushing back into.]

Since combats take a while, and make natural climaxes to a session, you can finish the night on an up note, with lots of yelling and setting webs on fire, and Horrid Spider-Young boiling out of the broken bottles. And you have all next week to hastily write the background on the Spider Goddess cult that has, unbeknownst to everyone involved, including you, been working behind the scenes from the beginning.

Three Days to Kill (for D&D 3rd Edition)

Published by Penumbra (Atlas Games)

Written by John Tynes

32 pages; $8.95

When Wizards of the Coast opened up their new Third Edition d20 system for use
by other publishers, plenty of companies perked up their ears at this opportunity to
freely publish *D&D* related material. Atlas Games was one of the few who were
able provide some of their own d20 material right along with the initial release of
D&D 3rd Ed. in August. All of Atlas' d20 *D&D* supplements are being published under the Penumbra subdivision, and
Three Days To Kill, by John Tynes, is the first to come up to bat.

It's a 32-page adventure that was released as a limited preview edition at GenCon 2000, with a standard edition release
following shortly thereafter. The artwork and graphic design of the module are both very well done, upholding the
standards that TSR and WotC have maintained in the visual design of their own adventure modules throughout the
years. This is not really a big deal coming from Atlas Games (who always manage to do something nice when laying
out their products), but as more and more companies begin releasing d20 supplements on smaller and smaller budgets,
we will begin to appreciate those who can spare the money and the effort to make their supplements look nice.

The adventure itself is also well constructed. It is set in a town called Deeptown, which is located in a valley known as
the Deeps. The setting is just specific enough to host the adventure, but also just generic enough (and self-contained
enough) to be easily dropped into any other campaign world. Deeptown is a big center for commerce, as it lies along a
major trade route that passes through the valley. All this money and merchandise passing through make this an ideal
location for both trouble and opportunity, attracting bandits, merchants, mercenaries, and opportunists of every color.
This, of course, is where the players fit in.

While the law manages to keep things under control within Deeptown, outside the city gates it's another story. The
territory is run by different groups of bandits, with two in particular taking the lead -- Modus and Lucien. The two
have managed to avoid direct conflict with each other . . . at least until now. One of the two leaders (Lucien) has
decided to make an allegiance with a nefarious religious leader from Deeptown. Modus has learned of this and hires
the PCs to pull a hit on Lucien while he is meeting with reps from the religious sect. As you can imagine, things don't
go one hundred percent as planned. The PCs are sorely out-gunned against Lucien to begin with, and when a band of
raiding orcs and a "surprise straight out of hell" show up, things get messy.

The opponents in this adventure are all very tough (at least for low-level adventurers), and the PCs will have to work
to stay alive. Tynes has responded to this by gearing the adventure more for espionage and clever planning, rather than
straight-out combat. The players are encouraged to be imaginative and use the different tools at their disposal to outwit
their opponents and work for the best resolution possible. This provides ample opportunity for players of all classes to
use their many different skills in as many different ways. The end result is a very dynamic and exciting, albeit
dangerous, adventure.

One thing the readers will definitely notice a certain style that Tynes has. He has a particular grasp over the darker side
of human nature, and it definitely comes through in this adventure. The town is run by a bunch of merchants, which
means that money is the bottom line here. These merchants are all, of course, very greedy and have few truly
upstanding morals. Many of the other folks in the town are little better, which gives the place a certain overall feel. It's

not that Tynes stretches reality in any way; everything that goes on is perfectly reasonable, and, some may argue, quite realistic. The real problem that might present itself is that DMs running a group of lawful-goods through this adventure might have a tough time of it, depending on how deeply the PCs look into things.

If this is any indication of the type of material that Penumbra will be putting out in support of *D&D*, then this open licensing thing is looking up already. This adventure is definitely worthwhile. We can only hope that the other publishers preparing to take advantage of the d20 system will be able to provide such quality material as well.

Pyramid Pick

Shiki (for Sengoku RPG)

Published by [Gold Rush Games](#)

Written by Michael Montesa

96 pages, $16.00

Most gamers -- not to mention gaming companies -- have a love/hate relationship with prepackaged adventures. On the one hand, they're incredibly handy, saving the Game Master many hours of painstaking effort needed to produce his own scenarios. Prepackaged adventures come with everything you need: NPC stats, maps, background information, and (if you're lucky) synopses and outlines. On the other hand, the very nature of prepackaged adventures generally preclude their being too specific, for in doing so they diminish their utility to the broadest possible audience of gamers. Thus, game publishers must always walk a fine line between providing so much detail that it prevents the adventure's being usable by many GMs and so little that the GM might as well have designed it himself.

All things considered, *Shiki*, an epic adventure anthology for Gold Rush Games' *Sengoku*, walks that fine line very well indeed. Of course, *Shiki* "cheats" a little in that it's not a run of the mill collection of unrelated scenarios. Instead, it's more of a campaign framework that provides the GM with four adventures, each one tied thematically the one of the four seasons (the eponymous Shiki of the title) and to each other by an overarching plotline.

That plotline concerns the quest of the player characters to protect the heir of a defeated clan until such time as he can rightfully claim his place as daimyo of Suruga province. Each of the four scenarios in the anthology pushes along this plotline, which spans eighteen years of campaign time (from approximately 1550 to 1568). Consequently, *Shiki* necessarily gives the GM a great deal of freedom in using its material. After the initial scenario in which the Tadano clan is overthrown by its rivals, the Ishizaki, the remaining three scenarios can occur whenever the GM desires, within certain limited timeline constraints. Even here, *Shiki* provides plenty of flexibility, thereby increasing its utility greatly.

The first of the four scenarios ("Heavier than a Mountain"), naturally set in the fall, describes the fall of the Tadano and the player character's role in rescuing its heir, the boy Kozo, from the clutches of Lord Ishizaki, who is determined to eliminate him along with the rest of his family. The second scenario ("Shinobi"), taking place in spring, deals with clandestine activities and covert alliances, as Kozo's protector attempts to secure his own position against the Ishizaki. The third scenario ("Kori no Namida") takes place in winter and chronicles the effects of a curse placed on young Kozo by the Ishizaki, a curse that could make all the player characters have worked for come to naught. The final scenario ("Debt of Honor") occurs during the summer, as Kozo reaches maturity prepares to reclaim his birthright from the devious Ishizaki.

All four scenarios are well constructed, providing clear synopses and outlines, as well as advice on staging and further adventures. Because *Shiki*'s four adventures take place over a long period of time, the latter is especially appreciated. Thus the anthology provides the GM everything he needs to give his *Sengoku* campaign an overarching structure, while at the time allowing leeway to add further details and scenarios. It's a very effective compromise between the twin sins of over-scripting and under-detailing that mar many anthologies of this sort.

The book is rounded out by detailed descriptions of all major and minor NPCs, complete with stats for them according to the Fuzion rules. Also included is information on the natural and supernatural creatures that appear in several of the scenarios. There's even a handy conversion chart showing how to use *Shiki* with the anthropomorphic animals of the *Usagi Yojimbo RPG*, also from Gold Rush Games. It's a nice little touch that doesn't take up much space, while once again increasing the utility of *Shiki*.

In fact, *Shiki* is so user friendly that I found it hard not to consider how easily its plotline of restoring a fallen clan to power could be used in other settings. With a minimum of difficulty, one could translate *Shiki* into the feudal world of Green Knight's *Pendragon* or even a world like *Tekumel*, where clan politics and personal honor clash regularly. I suspect astute readers will think of other game settings equally applicable. This makes *Shiki* a valuable resource for players of many games.

If I have a complaint about *Shiki*, it is the book's relatively uninspired layout and graphic design. The cover is black, with an ideogram (presumably for Shiki) and the title of the book. The interior layout is a simple two-column design that's easy enough to read but not especially dynamic. The interior art is made up of mostly good quality black and white illustrations by many of the same artists that graced the pages of *Sengoku*. In fact, *Shiki* has quite a bit of art, much more than you'd expect to find in a small press book like this. It goes a long way toward breaking up the monotony of the layout.

In the end, though, it's a small complaint and one that hardly mars *Shiki*'s otherwise excellent content. While it would be hyperbole to claim *Shiki* sets new standards in adventure anthology design, it would accurate to claim that it does an excellent job of providing the GM with a flexible framework into which he can tell his own stories of feudal Japan. *Shiki* thus succeeds in providing the tools the GM needs to tell a grand story in which the player characters can genuinely make a difference, while at the same time not binding his hands overly much. Given the epic nature of *Shiki*'s plotline, that's quite an accomplishment, one that I'd love to see emulated in other settings.

--James Maliszewski

Pyramid Review

Orkworld RPG

Published by [Wicked Press](#)

Written by John Wick

Art by Thomas Denmark

304 pages; $25.00

To paraphrase his Prelude, Wick's goal in the creation of *Orkworld* was to put (for
lack of a better phrase) a more human face onto the two-dimensional Tolkien orc bad guy. For just about anyone who
bothers to sit and really read *Orkworld*, he's succeeded.

Orkworld is loaded with differences from the standard gaming sourcebook. The first and most telling difference is its
structure. Many sourcebooks begin with a short teaser story, then progress through the basics of character generation,
combat rules, acquisition of gear and weaponry, and eventually meander their way into the real feel of the thing -- the
culture, backgrounds, and "flavor text" of the world and its peoples. Not so with *Orkworld*. The feeling and meaning
of "ork" are front-loaded: the first 175 pages are devoted solely to the kinds of information that many gamers flip past
to find the rules. Everything from ork jokes to the three kinds of gangrene and how to treat them can be found in this
incredible compendium of orkness. It's broken into three sections: "The Caius Journals," "Ork" (called "Culture" in the
page headers -- more on that below), and "Stories." Wick uses the space to pull with ork muscles, talk with an ork
tongue, and help us beat time with an ork heart.

"Culture" is the heart of *Orkworld*, and weighs in at seventy pages long. (I've used here the title of the section that
appears on every page's headers, rather than the title ["Ork"] that appears in the Table of Contents and in the Prelude.
I'm sure Wick would be the first to admit it, but *Orkworld* has some editing and printer problems. More below.) This is
the most interesting section as far as source material goes. It could easily stand by itself in many systems as a
sourcebook. Wick's orks are an odd but memorable mixture of Norse mores, Celtic storytelling, chivalric ideals, steppe
culture lifeways, and Sutton Hoo artistic style. There's a strong Native American Trickster streak in them, too -- less
Coyote, more Brer Rabbit. There's a healthy dollop of Celtic Britain, not to mention Roman era Gaul. Combine this
with some gruesome medieval and Renaissance misconceptions about anatomy and the armature of sickness, and there
are the orks.

Wick's style shows best in the concepts of weight and Trouble. In a migratory culture like the orks', following the
reindeer herds across the face of Ghurtha, an ork can only own as much as he can carry -- and that applies to the most
metaphysical things, as well as household furniture. Trouble is one of those things that must be carried. Every ork is
born with a certain amount of Trouble: the sorrows and sufferings that every living thing must go through before
dying. Trouble may be increased by boasting and/or by attracting the notice of gods and monsters. A particularly
stupid ork might take on more Trouble than he can handle, leaving his loved ones to carry his excess. Devoted Wick
readers will also be pleased by the system he provides for rolling and determining Trouble's effects on gameplay,
which is offered in a later section. The system involves the same nasty dice exchanges and thefts that made his Play
Dirty column a jaw-dropper.

Also covered in "Culture" is a vast array of orkness: their pantheon, magic, tribal and living arrangements, foods,
village life, household politics, crime and punishment, the calendar, music, love, art, hygiene, household gear, diseases,
warfare, the five Fana (Virtues), the laws of war, and anatomy. The only thing missing from the list is just how Wick
got through so much information without either losing his mind or spontaneously goblinizing into an ork himself.

The next section is the core of the ork myth cycle, simply entitled "Stories." These "Brother-Stories" surround the three god-sons of Keethdowmga. The primary actor is Pugg, the smallest of the god-brothers, who is the lamed Trickster god. He serves as a daily amusing reminder that an ork could win every battle, but he's not much of an ork if he doesn't have cunning. He gets results -- at the expense of all sorts of monsters -- that Bashthraka, his brother the war god, can never hope for (or even figure out). Gowthduka, the silent brother, is a sort of Odin figure; he is a living example of the fact that all knowledge comes at a price. The three form a sort of hopeful triad of good qualities from which the orks believe a savior will arise, to lead the orks past their nemesis Gorlam and into their much-deserved afterlife.

The deepest lesson to be learned from Wick's orks is their passion and life. They are a stone and bronze-wielding people in a steel world. They have been denied their own afterlives by the combined efforts of all the world's other races; the giant frog beast Gorlam, created by the spite of humans, elves, and dwarves, eats the souls of the ork dead before they can reach the Otherworld. The lands of the living are being encroached upon as well, and the elves routinely slave among them. They are a people on the edge of desperation. That their stories are filled with cunning mirth is a confirmation, rather than denial, of their dire straits. And yet instead of feeling hopeless, the orks burn with intention. It's the only thing keeping them warm in the eight-month winters.

To remain hopeful in a dire world is not for players who are faint of heart; but for a GM to inspire hope in his players without the easy out of munchkin fun is even tougher. On the system side, beginning with the section entitled "Game," *Orkworld* is amazingly simple. It is elegant in its lack of rules. And that is precisely what makes it a potentially great (but tough) system to play or run. Its elegance and simplicity leaves much up to the imagination -- or to the munchkin who's crass enough to bully his way through it. *Orkworld* places great demands on the maturity of all concerned. GMs suffering with unimaginative (or bullying) players, beware: *Orkworld* will drive you crazy. But if you're very careful and cunning, you can drive them crazy back.

The most intriguing thing about *Orkworld*'s system, especially in what it reveals about ork culture, is that characters are not created individually. Players create their characters from a *pool* of points. If a player hogs enough points to be a combat monster, his PC friends will suffer (and likely die) from his stupidity. In addition, and very amusingly, his tala -- the household bard, the person who is directly responsible for the spreading of fame through his storytelling -- isn't likely to be a very good one if he had no points at character creation. This leaves the ork combat monster without a way to have the story of his exploits told. (In game terms, this shortchanges him on experience points because it's the *tala* that assigns them, rather than the GM. A very cunning and nasty Wick-ism. His fans will be proud.) Even more telling, the dowmga -- the lady ork at the center of each household, its commander in times of peace, its insurance that orks keep on living -- will likely die during the harsh Ghurthan winter because of the player's greediness. And then the ork combat monster is likely to die during the next winter himself because he has no winter home to protect him. *Orkworld* is not a land of individuals. It is an orkum, one vast tribe, with all its parts interconnected and dependent upon one another. What few rules there are enforce this mightily. Even combat becomes easier when the orks fight together -- and this is enforced rules-wise not just in penalties for the besieged, but bonuses for the orks, too.

Another sure sign of maturity (or brokenness, if you come from a rules-lawyer campaign) is the "no-skills-but-the-ones-you-create" policy. Wick puts forward a very small list of skills that he and his players came up with themselves, but the primary policy is for each ork to obey his sense of internal consistency. The GM is expected to enforce this. In fact, the GM is expected to enforce many things. Wick readily admits that "players who feel an obligation to try to break this game system will be successful every time." But true to Wick form, he adds that "*Orkworld* wasn't designed for players who want to make one-sided walking cuisinarts. If that's what you want, go play something else with people who give a hopping hobbit how big your character sheet is."

Even the World Map, appearing in the "Places" section, is left up to the maturity of *Orkworld*'s players. Cities, holy places, mysterious forests and profane places are described and named, but none are actually placed on the map. The intent is for the players and GM to place everything themselves, to locate the tribe's holdings, the monsters, and the other orks into places on the map that will influence their relationships with each other. Given the number of purely evil and haunted places that Wick describes, especially when compared with the numbered of endangered good places, just the structuring of Ghurtha will require some weighty decision-making by the players.

This is not to say that the GM has to come up with everything in *Orkworld*. In the "Places" section just described, each of the places comes with at least one adventure hook -- sometimes several. Another of the many amazing things that appear in the "Game" section is an in-depth look at the ork Winter Home. Being a culture based upon the food source and war-animal reindeer, the orks are migratory. However, Ghurtha's winters are utterly unforgiving for eight months of the year, and thus the orks stay put in a permanent "Winter Home." For the purposes of gaming those eight months of the year, Wick offers an entire set of rolls for the GM to make (and a chart to walk the GM through it) for all of Winter's activities. Most games just assume that the players will make it through the winter sitting on their thumbs (or, like Vampire, largely ignore the fact that it's winter altogether). In *Orkworld*, the players are of necessity involved in the most intimate goings-on of day-to-day survival. There are rolls to determine which dowmgas get pregnant, and whether they survive the births. Rolls to determine the amounts and kinds of game brought home by the thraka (and a point system to determine if it's enough to prevent starvation for the tribe). Rolls to determine the crafts that can be made. Rolls to determine who falls in love and for how long. Rolls to determine which monsters attack -- and in *Orkworld*, dwarves, men, and elves are *all* monsters. But the beautiful part of Wick's Winter Home system (which a GM may take advantage of or not, totally at his discretion) is that it fits into exactly five pages. Five. And also in those same five pages are no fewer than 18 freebie adventure hooks.

Wick's greatest strength is that he never uses dice at the expense of content. Where dice are used, it's to help the GM rather than hurt him. And if the players use dice, it's to save themselves from the GM's lucky streak. It is impossible in *Orkworld* for a player to mistake weapon choice for character development. The success or failure of *Orkworld* rests squarely on the GM and players to use the abundance of information placed before them, and to use it without tripping over themselves because they're expecting the dice to save them.

However, there is a caveat to *Orkworld*. I mention it only because I'm a former English major, and am driven quite insane by this sort of thing. I've already mentioned the titling snafu, the "Culture" section being named "Ork" in the Table of Contents. But the problems don't stop there. Just barely into the "Culture" section, a duplicated page in the content renders every page after it exactly two pages off from the Table of Contents. It also renders them two pages away from the pull-quotes that appear inside the decorative bar in the header space. Looking for the page marked in the header as "Notes"? It appears two pages before the actual Notes content. Thankfully there are large headings and such within the content, or the situation might get desperate. Also appearing at the back of the "Culture" section are endnotes which, true to form, are off. There is a note-marker for number ix, but no note -- hence, all the notes' content is shifted up by one. Close readers will also become annoyed by the frequency with which "above" and "below" problems surface in the text. If the text says that a certain table or definition "appears below," take that with a grain of salt. Quite often it's in the exact opposite direction. There are also a fair number of inconsistencies in name-spelling. In the combat section, for example, an ork named "Taldoona" in one sentence becomes "Tooldana" in the next; a dragon's name goes from having two sets of single o's to two sets of double o's; and so on.

A larger problem is the fluctuation in voice. Wick seems unable to stay within his ork mindset, and at times pops out with 20th century Earth jargon. It's jarring at best to have a fine point of ork culture exemplified by how far human beings stand back from each other at the ATM. And while his scientifically sound explanation of how orks achieve photosynthesis through their skin is interesting, it's destructive to the emotion evoked by those same orks fighting dwarven steel with doomed bronze spearheads. It's all very interesting if you're a Wick column fan, but given that most of the book is pretty well "in voice" rather than out, in retrospect the Wick-isms become disappointing.

All English major sniping aside, *Orkworld* is a very good addition to my shelf of RPGs. There are very few authors whose love for their subjects shine as brightly as Wick's. Obsession might be a closer word in fact; it takes a fanatical sort of lover to see so many of the tiny details that would make his beloved's friends uncomfortable to read about. But it's the discomfort here that reminds us why we're playing this game. We're orks. We've eaten the hearts of our fallen friends. Our tents are sewn with their tendons. There are monsters at the door, and our dowmga urges us against them. Let others tell our story.

-- Kathryn Martens

Memory

As Rod Serling might say, "Picture this:"

- When I asked both my players if they'd read my column last week, they both said yes; they remembered really liking it, but they couldn't remember what it was about. Several long minutes later they were finally able to conjure the topic. (Of course, my secret purpose of writing last week's column was to interrogate my players to determine what the heck their motivations are for my *Aberrant* campaign.)
- A couple of weeks ago our *Fading Suns* GM asked for a summary of what happened the previous adventure, a mere two weeks earlier. It took some prompting to remind me of the big pivotal choice that my character had to make, despite almost being in tears at the time.
- My one time playing a live action game, one of the other players broke the Big Rule and grabbed me by my T-shirt. The adrenaline rush ensured that I remembered that moment, and I know I did something to anger his character, but for the life of me I don't know what, exactly, caused that event.
- A full year into my first Supers campaign I revealed a big plot element that had been dangling from the first session. Fortunately everyone remembered what I was alluding to, and it was a highly memorable "Old Man Peterson!" moment.

Now, this isn't a column about what makes games memorable (I'm not feeling that all-knowing this week). Instead it's a column about how powerful, yet fickle, memory is.

Presuming you're running or playing in a game with any sort of continuity, you're going to have lots of things you need to remember. Some aren't going to have much effect on the game ("Oh, yeah; I have a parrot. Um, I guess I left it on board the ship before we went scuba-diving."), but some are. ("Oh, I just remembered my character has scotophobia. I guess that puts a different spin on this whole spelunking expedition . . . ") Some things you'll conveniently and/or purposefully forget. ("Say, doesn't the President have the Ark of the Covenant?" "Uh . . . maybe.") Some incidents will have the players (or characters) talking about them forever.

If there's anything I've learned, it's how unreliable memory is. As a GM, I've had adventures implode in the first five minutes because the characters remembered an important fact that had dribbled out of my brain. I've also had adventures fizzle completely when I relied on the players remembering something they'd long since forgotten.

Now, in ye olde dungeon-crawling days, memory often wasn't anywhere *near* as important. You entered the Dungeon of Werdna, killed the Monster at the End of the Book, and went on to the next dungeon. But as games got more complex, story-oriented, and farther removed from their wargaming roots, the need for story-telling elements escalated . . . and many of these elements require memory.

Unfortunately, the elements that have plagued gamers forever -- a lack of time, 40+ hour a week jobs, and plenty of real world obligations -- all conspire to take their toll on the memories of gamers. To that end, here's a few tips I try to incorporate into my games to make sure memory is my friend, not my nemesis.

- **Recap.** At the beginning of each adventure, we always summarize what happened the last time (unless it's the first session of a campaign, of course). This gives me, as a GM, a chance to recount important elements from the previous meeting for the players. This is also a good time to bring up any dangling plot threads. ("And Dr. Kasper, your father is still in jail. His parole hearing is coming up next month, though.")
- **Put it in writing.** I love handouts (both as a GM and a player), and I tend to provide them for most important adventures. I've used lots of different types of handouts: fake newspaper articles, lists and descriptions of characters for complex mysteries, timelines of complicated events, copies of prophetic poems, "thank you" cards from folks who turn up dead, and so on. Not every handout is vital to the overall story, and not everything vital to the overall story is represented by a handout, but reminding them the mayor was kidnapped is easier if they have the ransom note.
- **Work in reverse.** Rather than trying to ensure your players remember plot points, why not consider building plot points around things your players remember? If you find your players quoting the throw-away mousy

librarian NPC, who kept offering them coffee on the sly, why not *let* them have a greater role in the grand scheme (for good or ill)? This ploy won't always work, of course, but it can definitely be something to consider if your players remember your flavor text more than the Seven Riddles of Creation.)

- **Repetition.** It works for *Seseme Street*, and it can work here, too. If it's important, and you want your players to remember it, make sure you repeat the information: verbatim, in multiple forms, from different people . . . whatever's necessary. Thus if Monstro the Monstrous's only weakness is gold, then it may not be enough to have it run away from the woman wearing the gold watch. Once he flees, emphasize its weakness by saying, " 'It's a good thing you all showed up,' says the bystander as she adjusts her jewelry." If the bad guy can only be defeated in one-on-one combat, make *sure* he gloats, "All of you together cannot defeat me! Ha ha ha . . . " at least four or five times. If the fact that the butler is left-handed is important, make sure he's picking up objects left and . . . um . . . left.

Memory is a funny thing; some of my adventure notes I look over and can't comprehend what I was thinking at the time. Other times my players reminisce about an adventure I'd meant as a "can't think of anything else this week" throwaway. Still other plot elements I know I can return to at any time, since my players have quoted the relevant information (unknowing to them) years later. Memory is something we all need to compensate for, but the extra effort can definitely be worth it.

* * *

Last week's answer: ***Kithbook: Nockers*** (for ***Changeling***), p. 19

(Two stars) "Tallahassee was almost entirely razed in 2016, and the capital was moved to Los Disneys, now the most important city in Florida."

Murphy's Rules

Murphy's Rules

by Bob Portnell

Art by Dan Smith

Updated April 2004

One of the less-used benefits of a subscription to *Pyramid* or *JTAS* is access to the Pyramid Chat MOO. Apart from being a fun hangout for like-minded gamers and the official venue for company chats, the Pyramid Chat MOO also features several complete and functional "game rooms," allowing you to bring your tabletop game experience online. While the pace of give-and-take is somewhat slower . . . face it, most of us can't type nearly as fast as we talk! . . . the experience is usually at least as good as any conventional in-person game session.

However, many people find the array of commands and locales within the MOO intimidating. Thus, this guide provides clear listing and explanation of the most common commands (or "verbs") a visitor to Pyramid Chat will need, as well as a survey of the game room tools. It is derived from online helps provided by Steve Jackson Games and by the developers of the underlying LambdaMOO software. This is nowhere near a complete listing of actions, but it will do for most casual purposes.

Setting Up

You must be a current subscriber of *Pyramid* or *JTAS* to log in. If you are using a MOO/MUD client software, you'll need to know that the Pyramid chat server is located at pyramid.sjgames.com:2323. If you don't want the extra client software (links can be found at http://www.sjgames.com/pyramid/chat.html), you can use the link to the Java client found on those pages. Naturally, your browser needs to be Java-enabled.

However you choose to connect, the first thing you have to give is the connect command:

```
connect [username] [password]
```

(Note that I'm leaving an implied "return" at the end of these command lines.) This is the same username and password you use to login to the magazine. Once logged in, you will be deposited into the Pyramid Lobby. This is where casual chat is on-going, and there are often interesting people about with whom you might converse.

Self-Identification

The Chat Areas give several options for how you "appear" to others. By default, your "player name" is the same as the username you used to log into *Pyramid*. Your username never changes unless you make special arrangements with the webmasters to change it. However, your player name can be changed any number of ways.

`@rename me to [newname]`

changes your "player name" throughout the entire MOO. It's permanent until changed again, but does not affect the username/password you used to log in.

`@desc me as " . . . ."`

changes the description which others see when they "look" at you.

`look`

lets you see the description of the room you are in, the topic for the room, and who and what are in the room with you.

`look [name]`

lets you see the description of the person named.

`look [object]`

lets you see additional info about some object in the room.

`@doing me is " . . . ."`

lets you customize some information in the 'who' display (below).

`who`

lets you see who is currently logged into the MOO, for how long they've been logged in, how long it's been since they last typed something, which room they are in, and what they're doing.

`@messages`

Several customized verbs have been built into your MOO user identity. You can view your current settings for interacting with these verbs by typing @messages me. You can change an individual message by typing verbname me is "[message]". Notice that the MOO automatically prefixes your player name on the @messages, except for the @connect and @disconnect messages. You have added flexibility for these two messages; you can write your name anywhere in the message. This is all relatively advanced, and many visitors never bother with changing their default @messages.

`plan [username]`

Lets you see any messages that user might have left about his plans, schedule or expected routine. Type help plan for more on this feature and how to set your own plan.

`@quit`

disconnects you. Bye-bye!

Exploring the Pyramid

The Lobby is the heart of informal discussion in the Pyramid Chat; the Auditorium (see below) is the center of formal events; and the third floor game room host online play. Beyond that there are many, rooms within the Pyramid (and even a few sights to be seen outside). Steven Ehrbar is the current keeper of the [Unofficial Map](); while most of the spaces are open for anyone to enter, please exercise discretion and courtesy when entering spaces identified as personal offices. Areas of special interest:

The Pinnacle: The twenty-third level of the Pyramid features an unparalled view of the surrounding Metaverse. It is also restricted to *Pyramid* subscribers only; *JTAS* subscribers cannot enter.

Brubek's: This restaurant is familiar throughout the Third Imperium for its beer, onion rings, and for being familiar throughout the Third Imperium. *Pyramid* subscribers cannot enter here.

Programming: Once nominally the hub for managing the chat area programming, this room is now the de facto retreat for Steve Jackson Games staff. Only staff members have access to this space.

The Dungeon: Once the privacy area for a now-retired Steve Jackson Games e-zine, this foul chamber is now open for all to inspect.

Basic Communication

Face it: For one reason or another, you're here to chat. These are the commands you will use most. They work in any room in the chat MOO.

say [text message]
"[text message]

causes "text message" to be displayed to the room, preceded by "YourName says,"

For example, if I typed

say Hello, Everyone!

the room display would add the new line

BobP says, "Hello, Everyone!"

Notice that it adds a closing quote to the end of every Say message. Also, you would see

You say, "Hello, Everyone!"

Typing a double-quote as the first character means the same thing as writing the say verb.

directed say == ' [player] [text message]

This variation adds direction to the message, but it's still displayed to everyone in the room. If I typed

'James Hello, James

the room display would show

<pre style="color:blue">
BobP [to James]: Hello, James
</pre>

Notice this adds no quotation marks, and that it only works if that player is actually in the same room with you. The single open-quote is in the upper left of the PC keyboard.

<pre style="color:red">
whisper [text message] to [player]
w [text message] to [player]
</pre>

This sends a message to the player you specify, but does not tell the rest of the room about it. Very handy for communicating privately with fellow players or the game master. If James typed

<pre style="color:red">
whisper Hello, Bob to BobP
</pre>

I would see

<pre style="color:blue">
James whispers "Hello, Bob" to you.
</pre>

And no one else in the room would see this. The program will add quotation marks around your message.

<pre style="color:red">
page [player]= [text message]
p [player]=[text message]
</pre>

This does much the same thing as whisper, except your message can be sent from one room to another. The recipient will see a message reporting the sender's name and location, followed by the actual message. The program will add quotation marks around your message.

That covers what you can say and how to say it. How about what you do?

<pre style="color:red">
emote [action]
: [action]
</pre>

This prefixes your "action" with your player name. For example, if I typed

<pre style="color:red">
emote waves to the assembled, then draws a gun and opens fire.
</pre>

the room would see

<pre style="color:blue">
BobP waves to the assembled, then draws a gun and opens fire.
</pre>

Notice the colon is the shorthand symbol for the emote command. Also, this command will always put a space between your name and the action. For other actions, use

<pre style="color:red">
emote: [action]
:: [action]
</pre>

This works just like emote, except it omits the space after the player's name. If I type

<pre style="color:red">
: 's eyes fill with tears of shame at what he's done.
</pre>

the room sees:

<pre style="color:blue">
BobP 's eyes fill with tears of shame at what he's done.
</pre>

But if I type

<pre style="color:red">:: 's eyes fill with tears of shame at what he's done.</pre>

the room sees:

<pre style="color:blue">BobP's eyes fill with tears of shame at what he's done.</pre>

<pre style="color:red">whisper :[message] to [player]
w ::[message] to [player]
p [player]= :[message]
p [player]= ::[message]</pre>

These variations of whisper and page let you send emotes privately within the room (w) or from room to room (p). The recipient sees a whispered emote prefixed with "You sense . . ." followed by the normal output form of the emote; paged emotes are prefixed with "From afar, . . ." Single colons still have the space after your name; double colons omit this, just as with public emotes. Finally, the page shortcut form must be used; "page [player] :[message]" will not work.

* * *

<pre style="color:red">think [text message]</pre>

This is great fun for asides and speculations, in a "you say it, you do it" environment. They can't police what you think, right? So if I type:

<pre style="color:red">think This is stupid.</pre>

the room sees

<pre style="color:blue">BobP . o O (This is stupid.)</pre>

Notice the program adds the thought bubbles and the parentheses. If you wish to keep your thoughts private, don't use this command!

<pre style="color:red">@emit [text message]</pre>

This is the generic display command. It will repeat to the room display exactly the text message. If I type

<pre style="color:red">@emit The dragon eats James.</pre>

The room sees:

<pre style="color:blue">The dragon eats James.</pre>

Since there's no attribution of who made this statement, it can contribute to confusion. For this reason, use the @emit command sparingly and only for very good reason.

Auditorium Manners

Official chats are conducted in the Auditorium on the second floor of the Pyramid. Find your way there from the Pyramid Lobby by typing stairs or up; from anywhere else in the Pyramid, find your way to the Elevator and seek the second floor.

The Auditorium rules and documentation are posted in that room; type rules to see how moderated chats are conducted and how your conversations are affected when you are in the Auditorium.

Game Room Action

On the other hand, if you want to get right at the gaming business at hand, the dedicated game rooms in the Pyramid are on the third floor. From the Pyramid Lobby type

```
elevator
3
```

which will bring you to the third floor Game Rooms Lobby. From here, type the name of the game room you wish to enter. There are two multipurpose game rooms (the Game Commons and the Holodeck) and three *GURPS*-optimized rooms (the Green, Red and Blue rooms.)

The multipurpose game rooms have a fully hierarchical menu system; type help here to see the top level of the menu guide. In the GURPS rooms, help here gives you the entire set of helps for those rooms.

There are several versatile commands to assist gamemaster and players. In general, these only work in game rooms, although "roll" has been switched on for the entire chat area. And some of them only work if you are in a game room and have declared a "localname". Let's take a look at the basics of online play in the Pyramid.

```
@localname me as [newname]
@ln me as [newname]
```

changes your "player name" in the game room only. Your regular player name is still visible on the "who" directory. This is your character's name, basically.

```
@localdesc me as ". . . ."
@ld me as ". . . ."
```

changes the description which others see when they "look" at your localname. Your game character's description, in other words.

```
@localremove
@lrm
```

The local names and descriptions you create stay in the room where they are created . . . forever. Even after you've logged off. Even if you cancel your subscription, perish the thought. So, as a matter of courtesy and tidiness, please use this command to clear your local names and descriptions at the end of your game sessions.

```
@gm
```

tells you who is currently identified as the game master of the game room.

Here are two special commands for gamemasters use in game rooms:

```
@setgm me
@setgm [player]
```

Identifies yourself (or a player) as the GM. This shows when someone looks for the GM. Also, the GM sees every die roll made in the room and who made it. Notice that only someone /in/ the room can be made GM, but if the GM leaves the room . . . he /still/ sees what you're rolling.

Mapping

The SJ Games rooms are set up to accommodate a simple mapping procedure, allowing the gamemaster to create, modify and save maps of a simple square grid. The details of these functions are beyond the scope of this document; interested game masters should refer to the Short GURPS Help Note in the Pyramid Game Lobby.

Dice Rolling

`roll`

The basic command; shows the room you rolled the default dice, and the result. The default dice in the GURPS rooms are 3d6; in the multipurpose rooms, the default is set by the game master using verbs described in the "help setup" screen.

Example: In the Red Room, I type--

`roll`

The Room sees:

`BobP rolls 3d6, and gets a 10.`

You will see something slightly different, as would the game master. There are other permutations for using the roll command; see help roll for full details.

`@iroll`

This command rolls three separate six-sided dice, identifying the last as a "check die." Fans of *In Nomine* will recognize this as the infamous "d666." Note that everyone in the room sees the actions of this command; if you require privacy, you'll need to roll the success dice and the check die separately as private rolls.

The multipurpose game rooms include preprogramed rollers for many popular games and game systems; see the help dice in those rooms for a complete list.

The following commands from the *GURPS* rooms are predesigned to make 3d6 rolls, naturally.

`skill [t]`

Rolls 3d6 and compares to the target value, shows result to room. Identical to "roll t on 3".

`skill [t] [l]`

Rolls 3d6 and compares to the target value. Shows you and the GM the target, the roll, and whether or not you succeeded in your roll against the [l] labeled trait. Shows the room that your rolled against your [l] and whether you succeeded or no.

`qc [t1] [t2]`

A very handy tool for the game master. This does a quick contest on the two trait values listed.

And there you have it! Print this, keep it handy for a while . . . these will all become second nature in short order and you won't need this reference. Enjoy! And say "Hi!" to me when you visit; I'm here a lot more than I should be.

* * *

"Dependent built with 0 or fewer points: Possibly a young child or feeble older person." *GURPS Basic Set, Third Edition*, pg. 38.

GURPS offers a remarkable tool in the Dependents disadvantage. Friends and family especially are areas that most games don't delve far into; it's amazing how many player-characters seem to be orphaned only children whose only touch with the rest of humanity is the other PC's. The *GURPS* Dependents rules make for an excellent opportunity to expand a character's possibilities and add real depth to a campaign, making the fictional world three-dimensional.

While a small child or member of the elderly can certainly be built on zero or fewer points, those are hardly the only options. With a little creative effort and a willingness to compromise, interesting characters who are also productive members of society can be generated.

With a 0-point character, almost all the skills and advantages must come from disadvantage points, so the selection of disadvantages is the single most important step of the process. While his or her advantages and high attributes define a player-character, built on 100 or more points, a dependent must be distinctive on the basis of disadvantages. This isn't to say that 0-point characters must be totally useless; the point of this article is to demonstrate otherwise. It's important to remember, though, that every positive point spent must balance out with negatives.

The following are 0-point characters, suitable for use as dependents. Eleanor Polk and Steven Allen Dertzer violate the 40-point guideline on disadvantage points; they're extreme concepts. Jeanie Leary has 41 points of disadvantages, thanks to the uneven cost of Youth, but is actually a -1-point character. The remainder of the example characters are standard 0-point characters with 40 points of disadvantages. All skills are TL7, where appropriate; the characters have been created as dependents for a modern-day game set in the city of St. Louis. This is merely a default, however. Conversion suggestions (apart from the obvious alterations of Area Knowledge) can be found with each character.

One source of inspiration for this article is "Average Joes (and Janes)" by Brandon Cope, which appeared in Pyramid on October 1, 1999.

(Editor's note: You may also want to check out the sequel, "More Average Joes (and Janes)" from July 28, 2000.)

Eleanor Polk

Appearance: age 31, 5'8", 136 lbs., a slim, dark-haired woman wearing mirrorshades over her blind brown eyes.

Skills: Area Knowledge (St. Louis)-13 [1], Chess**-14 [1], Computer Operation-14 [2], History-12 [2], Literature-14 [6], Knowledge (Classical music)**-16 [4], Meditation*-12 [2], Philosophy (karma yoga)-13 [4], Research-13 [2], Swimming-12 [1], Writing-14 [4] (*realistic version) (**hobby skill)

Languages: Braille-14 [4], English-13 (Native)

Ellie was an editor for a New York publisher, and on the fast track to success; everything was going her way. That all changed the day she was involved in the four-car highway accident that cost two people their lives and Ellie use of her eyes. To this day she can't stand loud noises. For several years Ellie was despondent, but eventually she was exposed to the teachings of Gandhi. His example in the face of adversity gave her a new lease on life, and today she makes a modest living writing with the assistance of specialized software on her computer. Ellie works out of her apartment, which is small and very sparsely furnished, except for her computer and sound system. Speech technology also allows her some access to the Internet.

Quote: "That sounds awful. It reminds me of the Mahatma's time in the South African prisons."

In ancient or medieval times (or a generic fantasy setting), Eleanor is the intellectual eldest daughter of a nobleman, who suffered great tragedy before she found religion. Replace her Philosophy and Meditation skills with Theology-14 [6], and replace Computer Operation, Research, four points to Literature and two points of Writing with Literacy [10]. She likely would wish to join a convent, but she is an only child, and her father demands she marry to secure the line.

In a science-fiction setting Ellie's blindness may be treatable, but her religious convictions and wealth both prevent that. Remove Brontophobia and add Poverty [-15], and change her Philosophy to an appropriate type.

Herman "Jiffy" Ross

Appearance: age 24, 5'9", 148 lbs., dark hair and eyes. Perpetually dressed in black slacks with a white shirt.

ST: 10 [0] **DX:** 11 [10] **IQ:** 11 [10] **HT:** 10 [0]
Damage: *Swing:* 1d *Thrust:* 1d-2
Dodge: 5 **Parry:** n/a **Block:** n/a
Speed: 5.25

Advantages: None

Disadvantages: Clueless [-10], Low Pain Threshold [-10], Obsession (his job) [-15], Workaholic [-5]

Quirks: Afraid of dogs [-1], Can't bear to think ill of a customer [-1], Devoted to waiting tables [-1], Quirk-level cowardice [-1], Uses bizarre words in conversation [-1]

Skills: Area Knowledge (St. Louis)-11 [1], Diplomacy-11 [4], Driving (Automobile)-10 [1], Knowledge: Television*-12 [1], Merchant-11 [2], Savoir-Faire (servant)-18 [16]

Languages: English-11 (Native)

Herman (please, call him Jiffy!) is a waiter at a medium-quality restaurant, and this is the single defining fact of his existence. Ever since "Jiffy" was a small child, he knew what he wanted to do in life, and now he does it. He loves his work, which may make him unique among the waiters of the world. With a song in his heart and a dance in his step he serves his customers, and no one is happier than he.

In his limited free time Jiffy reads widely if not deeply, and has an exceptionally large vocabulary, mainly of adjectives. "Half-as-perfect," "Tickety-boo," "bootless," and "slithey" all receive regular use in his speech.

Quote: "Gloriously, we offer not one, not two, but three different kinds of cheese on our hamburgers. Do you think you would prefer the bitingly-sharp cheddar, the taliaferric Swiss, or the just tickety-boo monterey jack?"

Herman's niche is one which can be found in a wide variety of settings (although sadly not all: *GURPS Dinosaurs*, for example). He is thus essentially the same in all versions, although his Driving and Television skills would need to be replaced with local equivalents (Riding and Knowledge: Folk Music, possibly), as would his unique slang.

Steven Allen Dertzer

Appearance: age 53, 5'9", 283 lbs., balding red hair, blue eyes. An obese man in a Hawaiian shirt, typing at a terminal.

ST: 9 [-10] **DX:** 9 [-10] **IQ:** 13 [30] **HT:** 8 [-15]
Damage *Swing:* 1d-1 *Thrust:* 1d-2
Dodge: 0 **Parry:** n/a **Block:** n/a
Speed: 4.25 (0.25 with Fat encumbrance)

Advantages: Collected [5], Voice [10], Wealth: Comfortable (x2) [10]

Disadvantages: Addiction (tobacco) [-5], Age (53) [-9], Bad Back [-15], Fat [-20], Unfit (Very) [-15]

Quirks: Hates public transportation [-1], Keeps his hair short [-1], Moderately lecherous [-1], Uses the expression "over the hill" whenever he refers to someone even a year older than he is; has done this for years [-1], Wears loud clothing [-1]

Skills: Area Knowledge (St. Louis)-12 [1/2], Astronomy-11 [1], Chemistry-11 [1], Computer Hacking-12 [4], Computer Programming-17 [12], Computer Operation-14 [2], Chess*-14 [1], Electronics Operation (Audio Equipment)-15 [6], History-11 [1], Law-11 [1], Literature-11 [1], Mathematics-13 [4], Performance-16 [4], Philosophy (Aristotelian)-11 [1], Physics-12 [2], Research-12 [1], Speed Reading-12 [1], Swimming-13 [1/2], Teaching-13 [2], Typing-13 [1], Writing-13 [2] (*hobby skill)

Languages: English-13 (Native)

Steven works at a software company, in the programming division. He's well-read, moderately wealthy, and has an encyclopedic store knowledge and a healthy yen to learn. However, that's the only healthy thing about him: he suffers from an unfortunate glandular condition, is extremely out of shape, and has a trick back. He telecommutes because he can't stand public transportation and he can't fit in a car. His hobby is his radio: he runs a low-watt AM station out of his garage, which, despite its intermittent broadcasting schedule, boasts an unusually large following.

Quote: "Hmm . . . now where do I want to go today?"

In ancient/medieval/fantasy times, Steven is a sage widely reknowned. Replace the Voice advanatage with Literacy and the Electronics, Performance, Typing, and various Computer skills with more points in scientific skills. A science-fiction version of Steven could take on a variety of forms, depending on the nature of the setting. One possibility would be to remove his technical skills, using the points to buy Wealthy [10 more points], Reputation (as a media personality, a small bonus from most people most of the time), skills to match, and remove the Age disadvantage (to reflect the longer lifespans of higher-TL cultures), making Steven a media outlet in his own right.

Ted Havershack

Appearance: age 27, 6'1", 157 lbs., dirty blond hair and hazel eyes; a tall guy in cheap clothing reading a comic book.

ST: 10 [0] **DX:** 9 [-10] **IQ:** 12 [20] **HT:** 11 [10]
Damage: *Swing:* 1d *Thrust:* 1d-2
Dodge: 5 **Parry:** n/a **Block:** n/a
Speed: 5

Advantages: None

Disadvantages: Berserk [-15], Bloodlust [-10], Code of Honor (generic "nice guy") [-5], Sense of Duty (friends and family) [-5], Stubbornness [-5]

Quirks: Dislikes people who belittle comic books [-1], Dresses in bland clothing [-1], Likes comic books [-1], Slouches [-1], Has no ethical problem with mooching off relatives [-1]

Skills: Area Knowledge (St. Louis)-15 [6], Carousing-11 [2], Chemistry-12 [4], Comic Books*-13 [1], Driving (Automobile)-10 [4], Mathematics-10 [1], Physics-11 [2], Research-10 [1/2], Role-Playing Games*-14 [2], Streetwise-10 [1/2], Writing-12 [2] (*hobby skill)

Languages: English-12 (Native)

Ted did pretty well in college, majoring in chemistry. After that, though, he revealed he had no interest in finding a job; instead, he lives with his relatives.

He isn't a bad guy, but had a lot of problems growing up; he has very poor anger control. He's taken several rage-management classes, but still finds that the best way to avoid breaking into violence is avoiding contact with the world at large. Thus, his seclusion in his parents' basement.

Quote: "Hey! No way that guy could survive that blast! This movie was made by idiots! Stupid movie! STUPID TAPE! *STUPID VCR!*"

If the game's setting includes feudalism, Ted is a serf who fled his manor. Remove his skills, except for Area Knowledge, Carousing, and Streetwise, and give him Semi-Literacy [5] and skills such as Animal Handling and Agronomy (to reflect his past) and Hiking and Brawling (indicative of his current status as wanderer). A future-Ted is much the same as modern-Ted, although the focus of his attention is likely to be shifted away from comic-books and roleplaying games, toward some other, equally vapid, pursuit.

Susan Roosevelt

Appearance: age 25, 5'6", 112 lbs., thin platinum blonde hair, watery blue eyes: an unkempt, scraggly girl in black and white clothing, playing chess with herself.

ST: 9 [-10] **DX:** 8 [-15] **IQ:** 14 [45] **HT:** 10 [0]
Damage *Swing:* 1d-1 *Thrust:* 1d-2
Dodge: 4 **Parry:** n/a **Block:** n/a

Speed: 4.5

Advantages: None

Disadvantages: Loner [-5], Low Empathy [-15], Odious Personal Habit (drones about chess) [-5], Sense of Duty (Friends) [-5], Shy [-5], Unattractive (nerdy) [-5]

Quirks: Does crossword puzzles [-1], Likes to dress in black and white [-1], Sometimes wears piano glasses [-1], Tries to turn any conversation to chess [-1], Unconcerned with her appearance [-1]

Skills: Accounting-12 [1], Area Knowledge (St. Louis)-14 [1], Chess*-28 [14], Computer Operation-14 [1], Driving (Automobile)-9 [0], Mathematics-15 [6], Merchant-9 [1], Speed Reading-13 [1] (*hobby skill)

Languages: English-14 (Native)

Susan is a shelver in a large used-bookstore, and also handles finances. She was a mathematics major in college, with a scholarship, but after getting a master's degree decided it was a dead-end field. Her real passion is chess: she's a ranked member of the American Chess Federation and reads voraciously every book on the subject she can find.

She doesn't get along very well with other people, however; sales drop considerably whenever she's working the register. When she's not working, Susan is either at a chess club meeting or in her dingy apartment.

Quote: "Uh-huh. Are you going to buy that, or just disfigure it?"

In a setting without chess, Susan isn't likely to appear . . . . An appropriately cinematic Arabian Nights game might feature her as a harem-girl from a faroff land, for nights when the Calpih perfers an intellectual challenge. Remove her Accounting, Computer, Mathematics, Merchant, and Speed Reading skills to replace Unattractive with Attractive (a 10 point shift). Lower her Chess skill to 24 [10], and add Professional Skill: Courtesan-15 [4]. She can be transplanted, as is, into any science-fiction setting with both bookstores and chess.

Ronald Nimble

Appearance: age 23, 5'7", 143 lbs., dark hair and eyes; a good-looking guy behind the wheel of a pizza delivery car, speeding.

ST: 10 [0] **DX:** 11 [10] **IQ:** 10 [0] **HT:** 9 [-10]
Damage: *Swing:* 1d *Thrust:* 1d-2
Dodge: 5 **Parry:** n/a **Block:** n/a
Speed:: 5

Advantages: Absolute Direction [5], Attractive [5]

Disadvantages: Compulsive Lying [-15], Laziness [-10], Poor [-15]

Quirks: Always has a joke ready [-1], Drives unusually fast [-1], Gets offended when people don't believe him (whether he's telling the truth or not!) [-1], Keeps the radio tuned to rap [-1], Light drinker [-1]

Skills: Area Knowledge (St. Louis)-13 [6], Bard-11 [4], Darts-14 [8], Driving (Automobile)-13 [8], Fast-Talk-12 [6], History-7 [1/2], Performance-10 [2], Writing-8 [1/2]

Languages: English-10 (Native)

Ron is a pizza delivery boy in St. Louis. It's about the only job he can hold down: he knows the city as well as he knows the inside of his apartment, and he's an excellent driver. He tried other things: college, the corporate world, etc., but his habitual lying kept getting in the way. So far it hasn't been a problem at the pizzeria, but it may just be a matter

of time. Add to this the way Ron avoids hard work as much as possible, and it's a real recipe for chronic unemployment.

The only thing Ron seems willing to work for is his darts game; he was runner-up for All-City Champion last year, and hopes to win in the next tournament.

Quote: "Well, I was on my way over here, with your pizza, when all of the sudden this van just came out of nowhere . . ."

A low-ranking member of the generic-fantasy Thieves' Guild, Ron can often be found skulking on the streets of Generic Fantasy City. Replace his Darts, Driving, History, and Writing skills with a mix of Thief/Spy skills; a few points in a wide mix of skills is more appropriate than specializing, but Ron could fill virtually any function for the Guild.

Jeanie Leary

Appearance: age 15, 5'2", 108 lbs., brown hair dyed black, brown eyes: a small girl in trendy clothing.

ST: 7 [-20] **DX:** 11 [10] **IQ:** 11 [10] **HT:** 10 [0]
Damage: *Swing:* 1d-3 *Thrust:* 1d-3
Dodge: 5 **Parry:** 6 **Block:** n/a
Speed: 5.25

Advantages: Absolute Timing [5], Lightning Calculator [5], Mathematical Ability [10]

Disadvantages: Epilepsy [-30], Sense of Duty (Family) [-5], Youth (-3) [-6]

Quirks: Considers piercings passe [-1], Defensive about epilepsy [-1], Enthusiastic fan of pop music and MTV [-1], Mocks dorks so people will know she's not one [-1], Tries to look older than she is [-1]

Skills: Area Knowledge (St.Louis)-11 [1], Computer Operation-11 [1], Fast-Talk-12 [4], Judo-10 [2], Knowledge (MTV and pop music)*-16 [5], Knowledge (television)*-15 [4], Mathematics-16 [8], (*Hobby skill)

Languages: English-11 (Native)

Jeanie is a fifteen years old, and fairly normal, except for two things about her. The first is that she's a mathematical prodigy. She qualifies as a "gifted" child, and is involved regularly in math-related afternoon and summer programs at the university. Jeanie doesn't especially like math, but doesn't dislike it either. She does know she is very good at it, and is proud of her talent. Jeanie's second abnormality is her epilepsy. She suffers from a particularly bad form of the disease; she's acutely and irrationally embarrassed by this, as most teenage girls would be. She lives with relatives in St.Louis, where she is a freshman in high school. Jeanie's Judo skill rises from self-defense classes her father insisted she take (until they began to conflict with her differential equations classes).

Quote: "But Daaaad!"

An interesting variation on Jeanie for a fantasy game is a reluctant shaman. Replace Mathematical Ability with World Sight [10], and her Computer Operation, Judo, Knowledges, and Mathematics skills with Occultism-10 [1], Theology-9 [1], Dreaming-8 [1], two points in basic shamanistic magic spells, and Intuition [15]. In a science-fiction setting, the Mathematical Ability and Lightning Calculator advantages might be the result of Bio-Tech genetic engineering, with her Epilepsy an unwanted side effect.

Jack Blumen

Appearance: age 29,5'10", 159 lbs., blond hair, green eyes: a guy in a rumpled suit with a window seat, engrossed in a

spy novel.

ST: 10 [0] **DX:** 10 [0] **IQ:** 11 [10] **HT:** 11 [10]
Damage: *Swing:* 1d *Thrust:* 1d-2
Dodge: 5 **Parry:** n/a **Block:** n/a
Speed: 5.25

Advantages: Claim to Hospitality (various friends) [5], Cool [1]

Disadvantages: Chummy [-5], Code of Honor (professional ethics) [-5], Combat Paralysis [-15], Duty (to company: almost all the time but not usually hazardous) [-8], Sense of Duty (Friends and family) [-5]

Quirks: Loves greasy fast food [-1], Likes the color green [-1], Quirk-level insomniac [-1], Travels light and takes all his baggage carry-on [-1], Wears black socks with everything [-1]

Skills: Area Knowledge (Midwest)-12 [2], Area Knowledge (St. Louis)-11 [1], Carousing-11 [2], Computer Operation-11 [1], Driving (Automobile)-9 [1], Fast-Talk-11 [2], Merchant-14 [8]

Languages: English-11 (Native)

Jack's a commercial traveler, a salesman for a computer company. He's good, but not great. Somewhat surprisingly, he has a high level of job satisfaction: he loves travelling around, loves airports, loves that greasy fast food. He has friends in almost every city in the Midwest, which saves on hotel costs.

His only real hobby is reading thick airport novels; Jack has a weakness for Tom Clancy and John Le Carre. When he's not traveling, which isn't often, Jack has a small apartment in St. Louis and a cat.

Quote: "Hey, that's a nice laptop. Where'd you get it? Because if you're thinking of upgrading . . . "

Jack fits right into the Old West, becoming a salesman of bicycles or something similar, who plies his trade between the Missisippi and the Pecos. Trade Driving for Riding, and Computer Operation for Veterinary (Horse), but the remainder of the charcter can remain as is. He also falls easily into any SF setting with traveling salesmen.

The Words of Self: Demonic Epithets in In Nomine

by Eric Alfred Burns

The following is a suggestion for a non-canon variant to the Word rules for **In Nomine**.

"Hm, I thought as I dropped the kitty corpse into a burlap sack, tied it off and shoved it up into the chimney. I wonder if I could wrangle a promotion out of this mess? 'He Who Disfigures Small Animals?' I shook my head. Too over the top."
-- "Dark Dream," *In Nomine*, p.24.

Most Celestials, whether Angels or Demons, aspire to having Words of their own. They look to have a concept of the Symphony inexorably bound to their being, to embody a Word of their own forevermore, tying their fortunes to that Word's significance to all humanity. However, where Angels can only have Words, Demons have the possibility of promoting themselves as Words. A Demon can earn an Epithet.

Epithets are specialty Words. Even as a Demon reflects on his own personal Symphony to the exclusion of the universe, so can he actually exalt his personal Symphony, forcing the Symphony as a whole to acknowledge him in an act of supreme selfishness. Epithets are not as powerful as true Words -- instead of binding the Demon to a concept of the world, the Demon becomes forever associated with an action or distinguishing feature.

Epithets are declarations to the Symphony, announcing a specific feature of the Demon that the Demon is known for. Epithets are Words in Helltongue, even as other Words are, but they always follow the syntax of "He or She Who Performs A Task," when translated into other languages. So, instead of becoming the Demon of Knife Murders, a Calabite might become "He Who Strikes With Stilettoes" or "She Who Slashes Throats in the Night."

The Mechanics of Epithets

Epithets are far more restricted than true Words. Where a Word embodies a concept that can exist throughout the Symphony, an Epithet is a concept that sticks to the Demon himself. As such, Epithet-Bound Demons need to constantly reinforce their Epithet wherever possible, especially among other Demons. Instead of growing more powerful with the significance of the Concept to humanity and the Symphony, Epithet-Bound Demons become more powerful with greater fame (or infamy) for themselves. The more that He Who Scrambles Light and Fluffy Eggs becomes known in Shal Mari as a breakfast chef, the more powerful he can potentially become.

The problem is the fickleness of fame. Say Jequil, "He Who Strikes Down Malakim Where They Stand," destroys a powerful Malakite of War in a battle he was expected to lose, and the Media broadcasts the fight throughout Hell. Jequil returns to Hell with great pomp and majesty, and as the throngs cheer his name (or at least know of his deed), he feels the Epithet swell in power inside him. Well, the day after his return, Jequil is yesterday's news and no one wants to hear it all again. In order to maintain his strength and position, Jequil needs to get back to Earth and take out some more Malakim. Ofanim won't count

unless they're filler (that boost his legend) in between Malakim.
Jequil's Epithet specifically refers to killing Malakim, and so
he's got to constantly promote his image as a Malakim killer to
effect longer term Epithet growth. Only when his deeds are so
well known that his reputation persists even after a few days can Jequil begin to relax. Even then, he will constantly be looking for Malakim to kill, lest he lose ground in Hell's communal consciousness.

Epithets follow the general rules for Words in the *Game Master's Guide*, pp.21-33. In particular, Epithets gain and lose Word-Forces the same way that regular Words do, by gaining and losing importance in the Symphony. The advantages to Epithets are twofold -- first, a smaller or more discrete population can have a greater than normal effect; a powerful Demon with a well known Epithet in Hell can gain enough Word-Forces to become a Significant or Important Word (in Forces and power, at least) where a full Word-Bound Demon would need to make an impact on the Symphony as a whole. If a Demon's Epithet becomes known in the Corporeal realm (by Humanity), his power can swell quickly indeed. Secondly, an Epithet can be frivolous in nature and still yield significant power. The Demon of Dandruff Chunks In Brushes will have a Trivial Word unless a major miracle occurs. "She Who Leaves Chunks of Dandruff in Peoples' Brushes" can become quite powerful if her exploits become well known. As with Words, an Epithet-Bound Demon may count his Epithet's Word-Forces when figuring out how much Essence the Demon can hold. Further, Demons with five or more Epithet Word-Forces may receive a new rite related to his Epithet. With ten or more Epithet Word-Forces, a demon may receive a second rite and actually give one of his rites to Servitors. (Servitors of an Epithet-Bound Demon are generally called Groupies by their fellows, and have little status in Hell.)

Furthermore, even as the metaphoric meaning and associations of Words can expand their significance (and the Word-Bound's power), Epithet-Bound can use their Epithets metaphorically as well. So, Westa, "She Who Beats A Dead Horse," can keep her Epithet fueled by publicly clubbing fallen stallions, but she can also keep her reputation alive by loudly championing causes long after their issues have closed.

The disadvantages of Epithets over Words are many, however. First off, while it is easy to promote one's Epithet, it is a constant process. If an Epithet-bound Demon fails to reinforce his reputation as it relates to his Epithet among those who know of him, he will lose Word-Forces quickly. Further, even as a Word-Bound Demon can be destroyed if his Word is destroyed, so can an Epithet-Bound Demon be destroyed if his reputation is destroyed. If Alania, "She Who Dominates C.E.O.'s," makes a Balseraph her enemy, that Balseraph can spread rumors and false evidence showing that Alania is actually submissive with C.E.O.s or never met any in the first place. Even if untrue, the damage to Alania's reputation can strip her of Word-Forces as per p.28 of the *Game Master's Guide* -- even to Alania's own destruction. And finally, while Epithets can yield rites, they are not true Words and therefore Epithet-Bound Demons never receive special Attunements or Powers related to their Epithet.

Epithets and Words

Obviously, an Epithet is considered inferior to a Word. While an Epithet is the purest expression of a Demon's own selfish vanity, it can't compare with embodying a true concept in the Symphony. However, an Epithet still represents being set above one's fellows and a significant increase of power and prestige in Hell. Furthermore, Epithets can be expanded into true Words the same way that Words can be expanded into more powerful ones (as per Word-Promotion, *GMG* p.30). Indeed, when two or more candidates for an Infernal Word all prove to be worthy of the Word, Lucifer will often give all the candidates Epithets related to that Word, instead. So when there is a contest for

the Word of Tormenting Small Animals, a Impudite might become "He Who Disfigures Small Animals," and a Djinn might become "She Who Maims Small Animals," while a Habbalite becomes "He Who Tortures Small Animals." Lucifer then generally keeps an eye on the various Epithet-Bound. The one who best promotes his Epithet (if he's lucky) then gets promoted into the Demon of Tormenting Small Animals. His former Epithet is absorbed into the true Word and no longer applies. And those Epithet-Bound who competed with the new Word-Bound Demon all become de facto servitors of that Demon, as their Epithets require them to promote his Word.

Of course, both Lucifer's ire and his fabled sense of humor can fall upon Demons through Epithets as easily (or more easily) than through true Words. Epithets are clearly easier to grant after all, requiring less power. So Lucifer might humiliate a Demon with an Epithet ("She Who Seduces Cattle," "He Who Enjoys Licking Balseraphs' Boots Clean," and the like) or actually use an impossible Epithet to destroy an offensive Demon entirely. One Calabite who offended Lucifer was given the Epithet "He Who Slays Archangel Michael Celestially." The newly Epithet-Bound Demon then had to either try to slay the Archangel of War in Celestial Combat or let his reputation for slaying Michael fall away to nothing, causing his destruction.

Demon Princes and the Epithet-Bound

An Epithet-Bound Servitor is in a unique position for a Prince. It's not enough that they perform actions that fuel their reputations. Their actions have to become known to a sufficient population to fuel their reputations. As a result, Demon Princes have a lot of leverage with the Epithet-Bound. By controlling their access to the throngs who revere (or fear) them, they can control how strong their Servitors' Epithets are.

Of course, a Servitor's Epithet often fuels his Superior's Word anyhow, and that Servitor's fame will also work to strengthen the Prince's Word, so it's often in the Prince's best interests to promote his Servitor's Epithet. And Servitors who aren't promoted by their Prince will start finding ways around their Prince to strengthen their Epithets -- which their Prince's enemies will exploit wherever they can.

Angels and the Epithet-Bound

Angels can't be bound to Epithets. The supreme act of selfishness involved in declaring yourself a concept in the Symphony is alien to the essential selflessness of Heaven, and the Seraphim Council would never even attempt such a thing. (It is thought that the attempt would fail, regardless.) Epithet-Bound are generally Heaven's adversaries, as a result. It is a mixed blessing, since knowledge of a Demon's Epithet usually tips Angels off as to the Demon's intentions. When "He Who Sets Fires To Convents" comes to town, the Angels of the area know to set guards at the area's Nunneries, for example. However, the driving need for Demons to feed their Epithets make them dangerous opponents.

And some Demons have gotten very good at aggravating Angels, specifically to build a reputation in Heaven. After all, if the Heavenly Host makes a concerted effort to prevent the Demon from following through on his Epithet, then his reputation among them grows and so does the power of his Epithet.

Epithets in the Campaign

In an infernal or mixed campaign, Demon PCs may compete for Epithets as stepping stones to true Words. Princes and Princesses can also sponsor a PC for an Epithet as a reward for exceptional service (or to sidetrack a too ambitious PC's quest for more general power.) Epithets become a new level of reward and prestige between a Distinction and a Word, and a well thought out Epithet can enhance a PC's capacity for role playing.

If a PC gains an Epithet, it is up to the Game Master to determine how strong the PC's reputation is among the different populations who know about it, and therefore how many Word-Forces the PC has at any given time. If after several adventures the PC has done little to reinforce his reputation, the Game Master should reduce his Word Forces accordingly.

In an angelic campaign, Epithet-Bound become dangerous adversaries -- powerful demons with very specific agendas they're unlikely to bend on. An entire mission or series of missions can surround foiling an Epithet-Bound from performing the tasks necessary to fuel his Epithet.

Sample Epithet-Bound Character

FORCAS

"He Who Pours Salt into Wounds"
Habbalite Knight of the Black Order

Corporeal Forces -- 4 Strength 10   Agility 6
Ethereal Forces -- 4 Intelligence 8 Precision 8
Celestial Forces -- 5 Will 12   Perception 8

Suggested Word Forces: 9
Vessel: Adult Human Male/4, Adult Human Female/2
Role: "Major Corbin Rathbone," Military History Professor/3 (Status: 3)
Skills: Chemistry/5, Climbing/2, Dodge/2, Emote/3, Fast-Talk/3, Knowledge (Military History/3), Medicine/2, Ranged Weapon (Pistol/4, Rifle/4), Savoir-Faire/1, Small Weapon (Knife/3), Survival/2, Tactics/3, Throwing/3
Songs: Charm (Celestial/3), Dreams (Corporeal/3, Celestial/2), Numinous Corpus (Acid/3, Claws/2, Fangs/2, Horns/2, Tongue/5)
Attunements: Djinn of the War, Habbalah of the War, Art of Combat, Knight of the Black Order
Special Rite: Manage to introduce an actual salt into a corporeal injury without being caught doing it.

Forcas is an old and powerful demon in Baal's service. He has been loyal throughout his career, truly seeing Baal as the Rebel Champion who challenges the soft and weak Heavenly Host in the name of a purer, stronger God. And, over the centuries of service to Baal, Forcas has had many opportunities to test humanity and find it wanting.

While a strong warrior in his own right, Forcas delighted in tormenting soldiers who weren't strong enough to meet the battle. Finding that soldiers too injured to continue the fight failed the acid test of strength in battle, Forcas naturally demeaned them. After breaking the morale of any number of human soldiers following horrible injuries, Baal decided to reward his effective Servitor, sponsoring him for the Epithet of "He Who Pours Salt into Wounds." Lucifer concurred and Forcas gained his Epithet.

Today, Forcas diligently builds his reputation for kicking the weak when they're down. While he doesn't eschew literally salting bloody injuries (which led him to study both first aid and chemistry), he works far more effectively by exploiting embarrassments or mental anguish, adding insult to injury in ways that make a person's suffering intolerable. To that end, his current Role is as a Military History teacher at a Military Academy. "Major Corbin Rathbone" is subject to recall into the Army should it be necessary (and Baal want it), but mostly he works with students at his strict, one might say harsh military school. He is known for being a tyrant in his class, demeaning students who do poorly and questioning any signs of weakness publicly, turning natural concerns and homesickness into excruciating public humiliation. His reputation among the student body keeps his Epithet strong, as does the number of demons Baal sends through his school as part of building their Roles. These demons leave the school and spread Forcas's reputation throughout Baal's organization in Hell and on Earth, keeping "He Who Pours Salt into Wounds" strong.

Deluxe Hero Wars RPG

Published by [Issaries, Inc.](#)

Created by Robin Laws, Greg Stafford, Roderick Robertson, Shannon Appel, and others

Boxed set containing *Roleplaying in Glorantha* (256 pgs), *Narrator's Book* (176 pgs), Gloranthan Visions (112 pgs), Starting Rules Synopsis Booklet (56 pgs), b&w map; $44.95

Last week my wife and I received a visit from someone whom we hadn't seen in a while . . . her multiple sclerosis came back with a vengeance. She's on steroids right now, and the only danger we have to worry about is whether or not she wishes to join the East German olympic team. Last week I received a visitor from someone who I haven't seen in a while: *Glorantha*, *the Hero Wars*.

Sometimes we see a familiar face, and it turns out to be a nightmare. When I saw *Runequest*, as produced by Avalon Hill, the last time it was a nightmare. A somewhat complicated game had become even more complicated, and the meat of what I wanted to read -- Glorantha -- only seemed to come out in fits and starts. To its credit Avalon Hill seemed to be getting more material out about Glorantha, but then they cancelled the game.

I didn't have many expectations for *Hero Wars*. Well, I hated the cover (Orlanth in stretch pants!?!), and I felt that the system was going to be a mess. *Runequest* had always had a certain amount of complexity, and I felt that if this complexity were lost then part of the essential flavor of the world of Glorantha might be lost as well. I was wrong!

Robin Laws, by whatever muse which inspired him, has created a system that expands the story telling opportunities within this extraordinarily rich world of Glorantha. The organization of said rules leaves much to be desired (indices are godsends), but the overall intent and effect is mythical.

The whole system revolves around opposed d20 rolls. Whenever a player wishes to perform a task, both she and the judge will roll dice. The roll will produce critical failure, failure, success, or critical success. These results are then cross referenced to determine the final effects. Needless to say, if you roll a critical success, and the judge rolls a critical failure, someone's going to be singing a song of glory!

This is the basic system, but there are all sorts of neat little fiddly bits that add to this basic system.

One concept is mastery. Now most skills are the things we're all generally good at -- stuff in the teens on a d20. If you're better than average, then rather than having a skill of (say) 23 you get a mastery, which is written as 3M (I don't have the cool rune font for this). Lets say you're even better than that . . . oh, around 53, then its written as 13M2. Well that's the nomenclature, but what does it mean? It means that you can kick some butt. One level of mastery bumps up any roll by one level. A failure becomes a success, and a success becomes a critical success! This means you can put a major hurting on any of those low level critters, but in going against people more powerful than yourself . . . well, that's where the player's brains come in. The rolling is easy, because you only have to remember the number to the left of the mastery rune, while number on the right tells how many bumps up you would get. Masteries will cancel one another out, which evens things up in fights between experienced warriors.

Another wonderful concept is the gambling of action points. These are equivalent to your level in the skill used (5M3

is 65 action points), plus or minus any modifiers. The results of the die rolling then determine how many action points are gained, lost, or given to the opponent. The contest is over when one opponent reaches zero. If you win an exchange you can refuse to take some action points, and instead give your opponent a -1 penalty. This can represent wounding or some other disability. Depending on how the contest turns out these effects can go away, or require some time to heal. There are options for weapons and armor, followers, etc., and all of these things are handled quickly and elegantly . . . though with the disorganization in the rules elegant might take a while. This is a quick and easy system allows players to have characters of some power, while being able to challenge them at the same time. Woof! This is good stuff.

Another wonderful point about this system is the simple variety between the various magic and belief systems in the game. This game handles monotheism, sorcery, God-granted powers, shamanism, Eastern mysticism/kung fu powers, etc. For example, you might be a follower of Issaries, which would give you a chance to develop an affinity like your God's. Issaries is good at communication so you could develop a similar affinity. This would allow you to do a number of things, at a penalty, involving communication . . . but you can develop these affinities into feats such as convince buyer, or talk with hands. (I might be wrong about this, but it is my present understanding.) This allows you to focus the affinity into a specific action at much less of a penalty. If you're a sorceror you can learn grimoires, which give you a wide variety of abilities/spells. For instance, the grimoire *The Book of Betrayal and Murder* has a blessing found in it named Call Teen to Church (I'd like this myself). These are really cool, because there are a lot of different abilites, but they aren't really fleshed out. Now in some ways I would have liked to have these various magical abilities to be better spelled out, but by giving a simple description it leaves an awful lot up to the imagination of the GM and her players.

The books are fairly expensive. The boxed set, which includes the basic rules book, a narrator's guide, a book of short stories, and around 40 pages of additional material, cost $44.95. The ***Glorantha: Introduction to the Hero Wars*** book ran another $19.95. The books are large in page numbers, but small in size. The small size is nice though, because the covers, which I had hated, really look very nice. Its also nice to have these small books because they are much easier to carry around, and I felt a lot less geeky reading them in my wife's doctor's office. They don't scream "Roleplayer!" but quite reasonably state "fantasy book reader."

Overall, this is the finest introduction to Glorantha that I have ever read. The game system now matches the world mythology, and that's a gift. Greg Stafford writes a lot about the power of stories well told (so did Joseph Campbell, as a matter of fact), and on a bad week in my life, these stories helped. Kudos; not many games can serve as inspiration (not distraction) in a time of crisis.

-- Scott Shafer

Pyramid Review

Ghost Dog: The Way of the Samurai RPG

Published by [Guardians of Order](#)

Written by David L. Pulver and John R. Phythyon, Jr.

160 b&w pages; $19.95

Ghost Dog is an attempt by Guardians of Order to fill a special niche in the role playing industry. It's a game that focuses on one player and his game master. Using the easy to understand Tri-Stat System, *Ghost Dog* is simple to start and enjoy.

Part resource book, part role playing product, *Ghost Dog* walks a fine line between usefulness as an RPG, and a movie ad. For those who don't know what *Ghost Dog* is, it's the story of a young "gansta'"-type individual who lives his life through the code of the samurai, working as an assassin for a failing mafia family. A mix up happens that puts Ghost Dog at ends against his former employees, and wham! Conflict is started.

While the Tri-Stat system is a proven system, it's starting to suffer "Palladiumidis." By this I mean that I already have the Tri-Stat 1st and 2nd edition. Do I really need a customized version for this book? Just as Palladium incorporates their core rules into every new game line, it seems Guardians of Order does the same thing. Sure, there are example weapons and stats for the numerous characters of the movie, but since most of these characters are killed or aren't combative in nature, the point is rather moot. One of the confusing things is that while there is some level of customization to account for a real world setting, no super powers or talents,it fails to go far enough. Unlike *GURPS* or *Hero* where there are various point levels set for each genre or specific campaign, *Ghost Dog* leaves it up to the GM to decide what power level his campaign will be. Strangely enough, this only effects the amount of character points (15-25, 30, 35, 40-45, 50-55), but doesn't change the amount of skill points, which is always 20. Just for the record, Ghost Dog is a 35 point character, so perhaps that is the default level. It can be argued that those who play higher powered characters can always spend those character points to gain more skill points, but that's player motivated, not system motivated. A second problem I have with the Tri-Stat system is that there is no limit or standard on the number of disadvantages that a player can take.

The book's focus on the movie is terrific. If you haven't seen the movie and intend to, don't read this book. It is very detailed and has more information that is apparent from one viewing of the movie. You'll spoil many of the movie's finer points by reading the book.

The focus on campaigning in the *Ghost Dog* world is where the book takes a turn for the worse. While mafia-style campaigns are interesting, the book's focus is mainly on using them as the bad guys. While this is based on the movie, it can make for a short term campaign. Again, this is not a problem if that's the goal of the player and GM, but for those who want more information on other organizations like the Triad or the Yakuza, there is little to be found in this book.

A smaller problem is: what type of character is the player going to be? While using Ghost Dog is one option, the other options seem limiting. I was hoping that David Pulver would take the one hint of other street samurai in the game and run with it. While it is an option, there isn't a lot of detail to back up the origin. Player types are basically Ghost Dog, mafia member, connected to the mafia, and other characters based in the street level mode. One of the things that makes *Ghost Dog* such an interesting movie is the numerous conflicts between cultures. Without playing the main character of the movie, you could be playing Dirty Harry, or another gun toting character who's always in trouble with

the wrong people. It's not the same effect. Quotes, both from the book Hagakure and from various characters in the movie, break up the two column layout of the book. The quotes from Hagakure all seem to be drawn from the movie, which is disappointing since if you've seen the movie, you already know those parts of the book. Strangely enough, while there is a lot of detail on this book of the samurai, it doesn't make the recommended reading list.

There are statistics for almost every member of the *Ghost Dog* movie, from the urban samurai himself to the young girl Pearline. In some cases I have to wonder: why do we need stats for some of these characters? Some of these characters have minimal screen time. Take Handsome Frank, killed shortly after the movie opens. Do we realy need stats for him? Perhaps; the background information is sometimes substantial and gives the GM more tools to work with if he chooses to set his campaign in an earlier/alternative world of *Ghost Dog*.

One of the most interesting aspects of **Ghost Dog**, one-on-one playing, is covered too quickly to really showcase the differences between one on one and group play. It's noted that one-on-one play often goes quicker because the action is more focused, but doesn't go into a lot of depth as to insure player and GM are on the same level. The advice is often drawn from other sources like the **[BESM 2nd Edition Book](#)**. It's good advice, but how many times do you need to read it? I would've preferred a whole slew of new advice with a direct focus on how roleplaying with one player is different, how to make it work, what the most common problems are, and how to overcome them.

The book is filled with numerous pictures straight from the movie. In some ways, this is regrettable. The single drawn illustration on page 160, promoting the comic by Scott Morse from Oni Press, has an interesting interpretation of Ghost Dog. Some detail is lost in the photographs, but anyone who has seen the movie will be able to place the scenes easily. More important are the recommended lists. The book list includes numerous mafia books, but not a single RPG book. (I would add to that list anything by Steven Long for the **Dark Champions** setting for the **Hero** system.) The movie list, while including such classics as the *Godfather Trilogy* and other mafia movies, goes a little further with some anime like *Ninja Scroll* sneaking in. Those who complain that game companies never include indexes will be pleased with the two-page one included here. Lastly, there is a character sheet at the back of the book for ease of copying. This game's central theme, that of a solo killer, also works with movies like *The Professional*, and *The Replacement Killers*. Most of the numerous movies listed in the recommended viewing section can be taken almost whole cloth into the **Ghost Dog** setting.

If you enjoyed the *Ghost Dog* movie and want a reference work, or want to recreate some street level themes using the Tri Stat system and don't own (or don't mind owning again) the Tri Stat system, then **Ghost Dog** is for you. If you own **BESM 2nd edition** and the *Ghost Dog* movie, perhaps you'd be better off taking inspiration from the movie, and applying it to your own campaign.

-- Joe G. Kushner

* * *

(*Reviewer's Note:* The *Ghost Dog* DVD boasts a 5.1 Dolby Digitial soundtrack, deleted scenes, music vidio, isolated music score, is 16:9 Widescreen, and has a bonus 30 minute feature, "The Odyssey: The Journey into the life of a Samurai", which could have been renamed, "The Making of Ghost Dog." Definitely a master resource for an assassin style campaign.)

Pyramid Pick

The Big Idea Card Game

Card Game for for 3 to 6 players

Published by [Cheapass Games](#)

Designed by James Ernest

54 Cards; $3.00

So what's the *Big Idea*? It's a card game that takes about an hour where venture capitalists vie to make the most money by investing in companies and taking them public. Sounds dry? Not with products such as "Mentholated Cat -- It's like a cat . . . but it's also invigorating!" and "Unholy Toy -- It's like a fun child's toy . . . but it's also a crime against nature!"

Players start with $10 of their own money, five chips that represent venture capital that they control, and a hand of cleverly designed cards. As with all Cheapass games you must supply some pieces (in this case, the money and chips as well as a six-sided die). The cards are of higher quality than the early Cheapass games such as *Give Me the Brain* and *Kill Dr. Lucky*, with gloss finish fronts on bright white paper.

In the Seed (or Product) phase of each turn, players can form a product from the cards in their hands by combing an Item card and a Description card, then laying them face down. When the cards are revealed side by side, the name of the product (e.g. "Happy Shack") should be oriented so the other players can read it. Players then read the description that is formed on the other side of the cards (e.g. "It's like a house in the woods . . . that makes your troubles melt away!") and must place a chip on their new product. They can then expound upon the virtues of their product to attract further investment in the next phase since there is no game mechanic reason to choose one new product over another. A shy person might have trouble with this part, but the card combinations can be positively inspirational.

In the Venture (or Secret) phase, players secretly decide which new product, other than their own, they will invest in and simultaneously place their chips on that product. We placed a chip in our hand (or not, to skip this phase) and counted to three before placing it on the new product of our choice. This is when you find out how good your product pitch was.

In the Mezzanine (or Open) phase, players invest by placing a chip on one old or new product in turn, but have to pay $1 to each other player with a chip already there. They can also decide to remove a chip from a product in this phase instead. Salesmanship abounds in this phase ("Swiss Sushi will be bigger than Swiss Cheese!").

In the Offering (or IPO) phase, players find out if their companies go public and if so, how successful they were. For each product, a die is rolled and, if the result is less than or equal to the number of shares on the product, it pays off at twice the roll per share. Cheers ("Evil.com pays off big!") and wails ("Gigantic Beer seemed a sure winner . . .") are heard. Products that don't go public and still have investment chips on them stay for the next round.

The card combinations make the game. Some evoke laughter (e.g. "Frozen Pants"), some songs (e.g. "Mexi-Radio"), and some just odd looks (e.g. "Perforated Game"). A warning -- the game can take a turn to PG-13 with a string of products like "Love Pants," "Moistened Chair," and "Erotic Tool," so playing in a mixed age group may be uncomfortable.

The game scales well for different numbers of players since the ratio of investors to products stays the same, but with

only three players the choices can be limiting. With more players there can be more "orphan" products (ones that don't go public) as the hot products attract the investments and go public quickly.

We had a great time and I think it is one of the better Cheapass games, but it is not one that lends itself to replaying immediately. The 54-card deck gets reshuffled once or twice during the ten or twelve rounds you play, and the cards are slightly less entertaining the second time around. I'd love to see a sequel that can be played by itself or combined with the original to provide more variety.

The combination of luck, skill, and humor along with the $3.00 price tag makes this an easy game to recommend as a filler between more serious games or for a get together with your non-gamer friends. What other game lets you rejoice over the successful launch of the Cyber Chicken(TM)?

-- Rich Shipley

Montejon Mutters

Eisen (for 7th Sea RPG)

Published by [Alderac Entertainment Group](#)

Written by Kevin Wilson

128 pages; $19.95

* * *

This is a new feature of Pyramid -- a regular review column. There are a few points
we should over before we actually start.

First, the rating system. I use a scale of 1 to 5. These ratings are based on the perceived value of the work. If I think a
book or game is a waste of time and money, it will get a low rating. If I think a book or game was worth much more
than its price, it gets a high rating. A summary of the ratings is given below.

1 -- Stop the Presses! Please!
2 -- Buyer's Regret
3 -- Worth the Price of Admission
4 -- A Fine Addition to the Library
5 -- Buy Buy Buy!

I will endeavor to give you much more than just the rating to work with.

Secondly, if you have a product you want to see reviewed, send your e-mail request to montejon@mad.scientist.com.
This is the same if you are the publisher of the work, or just someone wanting a second opinion. To ensure your e-mail
doesn't die a horrible death, being thrown against the tender mercies of my SPAM filter, put a tag in the subject line,
like this: [REVIEW].

If you want to comment on a review, you are best off using the [Pyramid Discussion groups](#)

Montejon Mutters will be published on the 2nd and 4th weeks of each month. The first four issues are a trial run. If
you love (or hate) this feature, now is the time to speak up.

* * *

*"The difference between the right word and the almost-right word is really not a small thing -- it is the difference
between the lightning bug and the lightning."*
--Samuel Clemens, Letter to George Bainton [Oct 15, 1888]

7th Sea is the game that almost got it right. It has sword fights, deep passion, religious conflict, more religious conflict,
cannons, pirates, lost treasures, balconies, chandeliers, secret societies, and ancient magic. There are no airships, but
that does the setting no lasting injury. Where *7th Sea* falls apart is in the politics. There are a handful of heavily
stereotyped nations, plus a romanticized edition of the Caribbean buccaneers, duking it out in a bizarre conflation of
famous European conflicts. There are elements of the Christian conversion of Scandinavia, the 30-Years War, the
French Revolution, and the Wars of Napoleon all thrown in a heap.

When framing characters for *7th Sea* I feel as if I were producing the opera Aida with full period costumes against sets

drawn by Charles M. Schulz. The characters are vivid and attractive, but the background they move against is blotchy and abstracted.

To counteract this we have a string of "splatbooks" -- books that focus on one particular setting feature. I am not fond of splatbooks. They are often poorly written, often promote character inflation, and often contradict one another. To make matters worse for the poor game master, they are also the vehicle by which most games advance the so-called "metaplot" -- the underlying narrative of the game setting. While I stand by the theory a metaplot can be a good thing, I have yet to encounter one that added more to the game than it took away.

Against all these prejudices comes the latest national sourcebook from Alderac Entertainment -- *Eisen*. Despite all my expectations, I like it. But, before we get into why I like it, let us talk about what I do not like.

1. **Fiction.** It is standard practice in an Alderac splatbook to start every chapter with a bit of fiction. I dislike game fiction as a matter of principle. However, some of Alderac's fiction, mostly in the ***Legend of the Five Rings*** game line, has been quite good. The fiction in *Eisen* was not so good. It was flat, bland, and boring. It gave me no useful information. It did not expand my understanding of the characters involved. Yeah and verily, it was bad.
2. **Introduction.** One of the weaknesses of *7th Sea* is how often the flow of game information is derailed to promote the authors' moral stance. These petty attempts at moral instruction are often found in the introductions, and *Eisen* is no exception. If I wanted polemic I would go reread Voltaire.
3. **Rules Conflict.** Natives of the province of Sieger must take a Hubris. Someone with the Man of Will advantage may not take a Hubris. Suppose I want to play someone from Sieger with the Man of Will advantage? (In fact, I want to do exactly that.)
4. **Cardinal Sin.** The writer of *Eisen*, Kevin Wilson, committed one of Montejon's Cardinal Sins of English. He wrote "baited breath" instead of "bated breath." This particular error always makes me think bad things about the writer's literary skills.
5. **Presentation.** The Game Master information starts in the middle of a page of player information, and it kicks straight into a list of secrets. I had read the secret of the Imperator Reifenstahl's suicide before I noticed I was reading GM-only information. Granted, I was skimming, rather than reading carefully. When I was reading carefully I noticed the preceding cautionary paragraph, but I doubt I am the only person who will make this mistake.

Now, for why I like it.

1. **Subject matter.** It is about Eisen, which is my favorite nation in the *7th Sea* canon. Eisen encompasses two themes in gaming which I enjoy. It is a land of religious conflict, and it is a land with strong political rivalries. If you ask me, Eisen is the only part of the *7th Sea* setting that does the characters justice.
2. **New toys.** Like every splatbook, *Eisen* includes new mechanics for the game. This is one of the major downsides of splatbooks. However, if you are going to add new toys and thus new GM headaches, they should be good toys. These are. I especially like the new "Man of Will" advantage, the new "Urchin" skill, the "Crisis of Faith" background, the advanced mass combat rules, and the "Drexel" swordsman school.
3. **Politics.** I love politics. A game without politics is not worth playing. As I have said, the cartoonish nature of the setting's politics is *7th Sea*'s greatest flaw. *Eisen* ameliorates this in many ways. Previous nation books for *7th Sea* made the game's nations into bland copies of real nations. Avalon, for example, was a cheap knock-off of the real British Isles. The Eisen book does not fall into this trap. While there are definite echoes of the German Reformation and the 30-Years War, the nation of Eisen manages to stand out as something besides a half-hearted clone of Germany. The provinces have individual character, and strongly individualized viewpoints. Differing viewpoints lead to conflict, conflict leads to politics, politics makes this reviewer happy.
4. **The Nibelungen.** Okay, the name is lame. Still, this secret society of smiths beats out several of *7th Sea*'s more prominent secret societies by a coolness factor of 10.
5. **Religion.** I like themes of religious conflict, and Eisen is all about religious conflict. The section actually about religion is poorly written. The transcripts of the conflict between Mathias Lieber (*7th Sea*'s Martin Luther) and the Church officials fall far short of their intended drama. These are trivial things when stood up next to the fact that religion actually matters in Eisen.

In summary, this book has some very strong flaws but it is still worth its sticker price for those who play *7th Sea*. As a work of art it fails utterly. As a game setting it succeeds admirably. I would go so far as to say that all you need to get the most out of *7th Sea* is the *Eisen* sourcebook, the *Player's Guide*, and the *GM's Guide*. Everything else is trivia.

If you are not a *7th Sea* player, you will get very little from this book. I cannot recommend this book for setting ideas, as there are more cost-effective sources of inspiration.

On the Montejon Scale, the *Eisen* sourcebook gets a 3: Worth the Price of Admission, but only if you already have an interest in *7th Sea*.

--

Kibbles & Bits

Okay; this week I'm going to take it a bit easy and go over some fiddly bits.

* * *

By now most of you should have received an e-mail invitation/confirmation to join the Pyramid subscription list. That's because we've moved our mailing list to [eGroups](#). Hopefully this will give our tireless web wizards fewer headaches and more time to beat their *Welltris* high scores.

If you *haven't* received an e-mail confirmation, you can subscribe by sending an e-mail to [sjgames-pyramid-subscribe@egroups.com](#).

* * *

After far too long without much time to devote to it, I've finally managed to reduce the non-review slushpile from 108 to zero. (For those who don't know, the slushpile is the horde of submitted articles folks send to *Pyramid*.) This took me 52 hours over the course of four days, so I'm still a wee bit out of it currently. But if you *haven't* received a response regarding your non-review submission (not counting snail mail submissions), and you submitted it before October 1st, please [drop me a note](#).

I'm going to try too update the Writer's Guidelines (which haven't been revised since I came on board) some time this weekend, so if you're an aspiring Pyramid writer, you may want to wait for that to go up. Regardless, I'd *strongly* recommend reading over any potential submissions one more time and making sure they're in tip-top shape. And most definitely, I'd *STRONGLY* recommend rereading that first sentence. Of the 108 submissions, eight had a problem in the very first sentence. It *is* possible to recover after that, but as far as first impressions go, it definitely gets my reading of your article off on the wrong foot. (Admit it, how many of you read the first sentence of this paragraph and thought I was a moron for saying, "try too update?")

* * *

This week sees the introduction of a new review columnist: Montejon Smith. His biweekly column, Montejon's Mutters, is one of the experiments to come out of the **sjgames.pyramid.newcolumn** board. You may want to vote on this review (see below on voting), since I'll be looking closely at the ratings for the first few columns to see if this is something you all as readers want.

Likewise I'd invite you all to join us over in the [Discussion Groups](#) (in particular **sjgames.pyramid**) if you have any opinions about this new column you'd like to share in a public forum.

* * *

Speaking of new columns and public forums, the group **sjgames.pyramid.newcolumn** should be going away at the end of this week. I thank everyone who's participated over there; I have a *lot* of good ideas to sift through, and I'm guessing that by November I should (hopefully) have some final decisions. In the meantime, you still have a few days left to make your voice heard on the subject.

* * *

Speaking of voting on reviews, I've been asked, in private and on the message boards, how people should vote on reviews. Should they be voting based on their thoughts on the quality of the review, or their thoughts on the product being reviewed?

Now, you can vote however you like (though you'd need a specially numbered 10-sider for easy gamerly random

generation), but I personally believe that you should vote based on the quality of the review. Did the review help you make an informed decision? Was it interesting? Was it balanced? Voting on the quality of the product doesn't strike me as very fair, since they don't cancel Roger Ebert's TV show just because he was stuck reviewing a stinker like *Zardoz*.

* * *

Thanks to the [chat guide](#) that appeared last week, I saw a lot of new faces in the chat room. Which rakes the cockles of my heart over hot coals. Or something like that. But seriously, it's nice to know that more of you are taking advantage of another aspect of your *Pyramid* subscriptions. Next time we have a chat, why not come and see us?

* * *

And (almost) finally, something else has been brought to my attention as I've sifted through submissions and my e-mail inbox.

Pet peeves: we all have them. I like to think I don't have many, but I *do* have one of note.

Steven: that's my name. It's been my name almost all my life (ever since the day I was born and my dad realized he didn't like the name that *had* been chosen for me, so my tuckered mom needed to come up with something else on the spot). It's what I like to be called.

In particular, my name isn't Stephen, or <shudder> Steve. (As an aside, Steve Marsh was the name of one of the editors on the original ***Dungeons & Dragons*** game. Steve Marsh was also the name of a country singer on the *Alice* TV show.) In a pinch I don't mind (much) being called Stephen; I attribute that more to national/regional differences (not unlike spelling "color" with a *u*). And in person it sounds the same anyway.

But I *really* don't like being called Steve. In my mind it's like a fork on a chalkboard. It's a wet toilet seat in the middle of the night. It's the insane chittering of a thousand howler monkeys yapping on cell phones in the middle a movie.

I know it may be irrational, but I would take it as a personal favor if you all would please call me Steven.

Thank you.

* * *

I just realized that it's the Friday the 13th. In October. In the year 2000. With a full moon.

Um . . . if it's the same to everyone else, I'm going to stay off the streets today.

-- Steven Marsh

* * *

Last week's answer: **The AADA Road Atlas and Survival Guide Volume Three: The South**.

(Three stars) "If it looks like a brithan, smells like a brithan and acts like a brithan -- it may be something entirely different.
   --Cnut One-Arm, legendary adventuring troubadour"

Unriddling the Sphinx

"What has one voice, and is four-footed, two-footed, and three-footed?"
-- riddle of the Sphinx of Thebes, according to Apollodorus

What has one name, three forms, and a hundred explanations? What begins as a man, rules as an angel, and dies as a woman? What is a dungeon at sunrise, a wandering monster at midday, and a puzzle at sunset? What else can it be but the sphinx? I'll unriddle the first one to set our groundwork: although the "traditional" sphinx has the body of a lion with the head and chest of a human, it sometimes possesses, rather than the standard-model human head (forming the androsphinx), the head of a ram (the criosphinx) or a hawk (the hieracosphinx). (Sphinxes also come in male and female, in singles or pairs, and with or without wings.) One name, three forms. The hundred explanations are on their way.

"[F]ierce Echidna who is half a nymph with glancing eyes and fair cheeks, and half again a huge snake, great and awful, with speckled skin, eating raw flesh beneath the secret parts of the holy earth. And there she has a cave deep down under a hollow rock far from the deathless gods and mortal men. There, then, did the gods appoint her a glorious house to dwell in: and she keeps guard in Arima beneath the earth, grim Echidna, a nymph who dies not nor grows old all her days. . . . Echidna was subject in love to Orthus and brought forth the deadly Sphinx which destroyed the Cadmeans, and the Nemean lion, which Hera, the good wife of Zeus, brought up and made to haunt the hills of Nemea, a plague to men."
-- Hesiod, *Theogony*, lines 302-329

By tradition, the sphinx begins in Egypt, with the Sphinx of Giza, carved from a natural outcropping of sandstone near the Pyramids some time in the neighborhood of 2550 B.C. to depict the Pharaoh Khafre, builder of the second pyramid. Virtually every aspect of that statement is, as befits the Sphinx, uncertain. There are, for example, no Old Kingdom records of the Sphinx existing at all, and even Herodotus fails to mention it in his careful 5th century B.C. description of the Pyramid complex. In the other direction, geologist Robert Schoch has studied the pattern of water erosion on the body of the Sphinx and maintains that it must have been carved during a period of frequent rain, placing its origin between 5000 and 7000 B.C. Its face is even more heavily eroded, and has undergone at least three restorations -- the first we know of performed by the Pharaoh Thutmose IV around 1400 B.C. in response to a dream that promised him power if he restored the Sphinx -- and one deliberate desecration, by a 15th century Moslem fanatic. And finally, the Sphinx' primacy in art has been undermined by excavations in Anatolia and Mesopotamia which have uncovered sphinx-decorated seals and ivories, also dating to roughly 2600 B.C.

The third millennium B.C., it turns out, is a good one for sphinxes. They also appear in the *Enuma elish,* the Akkadian creation epic in which the goddess Tiamat gives birth to eleven great monsters to avenge the killing of her husband Apsu. One of them, the *lahmu,* is often translated as a "sphinx" since the later *lamassu* describes human-headed winged lions (or bulls). Sphinx art is definitely coeval with the *Enuma elish* throughout Mesopotamia, and it is interesting that much of it shows sphinxes in groups or in natural settings, almost as if the sphinx is being depicted as a race rather than as an individual monster to overcome. If so, that would make the sphinx the second race on earth, after gods and before men. The Greek sphinxes follow the same literary path, first mentioned in Hesiod (in ca. 750 B.C.) springing from Echidna (like Tiamat a chthonic serpent goddess) along with many other legendary creatures. Greek art also shows a flowering of sphinxes right around the time of Hesiod, although the sphinx had reached Greece via Crete and Anatolia as early as 1800 B.C. Hesiod describes Echidna as "in no wise like either to mortal men or to the undying gods," more evidence for a "third race" concept behind all this. Sphinxes in Greek art, however, are more exclusively monstrous, rather than serving as emblems of royal or divine power as they did in Egypt, Anatolia, and Akkad.

"Science, being the wonder of the ignorant and unskilful, may be not absurdly called a monster. In figure and aspect it is represented as many-shaped, in allusion to the immense variety of matter with which it deals. . . . . [T]he axioms and arguments of science penetrate and hold fast the mind, so that it has no means of evasion or escape . . . and unless they be solved and disposed of, they strangely torment and worry the mind, pulling it first this way and then that, and fairly tearing it to pieces."

-- Sir Francis Bacon, "Sphinx; or, Science"

So if they're not gods and they're not beasts or men, what are sphinxes? The names don't give us much help, although like the statues, they promise more than they can deliver. The Greeks derived "sphinx" from *sphingein,* "binder, constrictor, throttler," which neatly ties in with the serpentine Echidna/Tiamat until you realize that the original Greek form was an entirely different word, *phix,* which doesn't seem to mean anything very clearly at all. The Egyptians may have used the term *shesepankh* ("living image") for sphinx, but that seems suspiciously like another back-formation to explain the anomalous giant of Giza. Appropriately enough, *lahmu* seems to mean "muddy" or "obscure," which is an apt description of the situation.

How the sphinx becomes attached to the riddle of Oedipus at the city of Thebes is yet another unsolved question. Although it's tempting to dismiss the riddle of the sphinx as a metaphor for self-knowledge (as Jung does, at great length), there seems to be more there. It's always possible that the "local hero," Oedipus, and the local mountain, Mt. Phikion, got tangled up with the "phix" of Hesiod (who was also from Thebes). The riddle could be a reflection of the solar cult of the Sphinx in Egypt, where it represented the sun at sunrise (Kheperi), noon (Re), and evening (Atum). Egypt also has a myth of a female monster who rested on a high place above the royal city of Waset (named "Thebes" by Greek travelers, intriguingly enough). This was Hathor-Sekhmet, the mother-goddess (like the Greek Hera, who sent the sphinx to Thebes) who became a devouring lioness (thus establishing our lion-woman sphinx connection) to stop a human rebellion against Re. (The king of Thebes, Laius, had likewise rebelled against morality by raping his guest, the son of Pelops, favorite of the gods.) In order to prevent her eating everyone in Egypt, she (like the sphinx of Oedipus) was defeated with guile, in this case by disguising beer as blood to fool Hathor-Sekhmet into drinking herself into a stupor. In a final coincidence, the name Hathor may mean "House of the Face," a very apt description of the Sphinx temple at Giza.

"He also dedicated for the most secret place, whose breadth was twenty cubits, and length the same, two cherubims of solid gold; the height of each of them was five cubits; they had each of them two wings stretched out as far as five cubits; wherefore Solomon set them up not far from each other, that with one wing they might touch the southern wall of the secret place, and with another the northern: their other wings, which joined to each other, were a covering to the ark, which was set between them; but nobody can tell, or even conjecture, what was the shape of these cherubims."
-- Flavius Josephus, *Antiquities of the Jews*, Book VIII, 3:3

Sphinxes thus emblematize divine rule, and it's in that form that they entered Hebrew religious art as the cherubim. Whether the Hebrews brought their sphinxes out of Egypt (as the Bible would indicate) or obtained them from the Babylonians (whose word *kerub*, meaning "intermediary," they applied to the image of the lamassu/sphinx) they used them in the same fashion, to mark off the divine precincts from mortal gaze. Those who violated the law, the cherubim killed (although the credit always went to Yahweh). Again, note that the cherub/sphinx guards a mystery, the Ark of the Covenant and the Holy of Holies. There's a particularly unsavory Midrashic legend that, when the Greeks (those sphinx-bashers) broke into the Holy of Holies in 168 B.C., they found the cherubim copulating and caged them to parade around Jerusalem in shame. The connection between the sphinx and monstrous (Echidna-like) fertility hinted at by this tale evokes the rebellious Nephilim, the "sons of God" who mated with men and produced monsters.

"The Second Coming! Hardly are those words out
When a vast image out of Spiritus Mundi
Troubles my sight: somewhere in sands of the desert
A shape with lion body and the head of a man
Its gaze as blank and pitiless as the sun,
Is moving its slow thighs . . . ."
-- William Butler Yeats, "The Second Coming"

Recast, then. Born in an unnatural intermediate state between man and god, the sphinx is simultaneously the omnipresent symbol of divine power (especially murderous, unpredictable, and monstrous power) and the unknowable. The sphinx is, in fact, the enemy of memory and clear thought; Sophocles has the Thebans lament that the sphinx compelled them to "forget the past and attend to only immediate needs." Hence, the riddle: the sphinx *is* the riddle, the third element in a world of gods and men, the term that defines itself uselessly, the ineffable face of the Other.

Oedipus, of course, answers the riddle of the sphinx with "mankind," who begins on all fours, walks on two legs as an adult, and hobbles on a cane in senescence; forcing the riddle to reverse. The answer is no longer "sphinx" but "man," the wave form collapses in the other direction, the sphinx must destroy herself in sheer contradiction. Meanwhile, Oedipus' own life recapitulated the greater riddle; his own identity was a mystery to him, he murdered Laius (thus serving as the sphinx' agent of revenge for Laius' crime), and then blinded himself in madness when he learned the truth. To bring rationality to Greece, Oedipus was fated to go mad. The sphinx, therefore, is the "living image," the perceptible facet, of the Things Man Was Not Meant To Know.

"The Great Sphinx! God! -- that idle question I asked myself on the sun-blest morning before . . . what huge and loathsome abnormality was the Sphinx originally carven to represent?"
-- H.P. Lovecraft (as Harry Houdini), "Imprisoned With The Pharaohs"

Which suits them admirably as entities from outside geometry, creatures for a **Call of Cthulhu** campaign of ancient menaces that once ruled the Earth but were expelled or imprisoned by a change in natural law. They still wait, lingering around their old temples and statues, like the vampiric nefilim in Tim Powers' *The Stress of Her Regard*. The lloigor from Colin Wilson's *Return of the Lloigor* fit the sphinx motif almost perfectly, and Cthulhu himself is a monstrous composite representing both divine power and impenetrable insanity, complete with a cavern palace, like Echidna, where he "dies not nor grows old all [his] days." Play it as a game of rebellion against the Outer Ones in **GURPS Egypt** or **GURPS Greece**, or as a **GURPS Places of Mystery** game in which the Sphinx and the Pyramids are the keys to a dimensional prison-vortex of the sphinxes. In a proper **GURPS Cliffhangers** archaeological thriller, the Arabs will have a perfectly good reason for calling the Sphinx "Abu al-Hawl," the "Father of Terror." Perhaps the Sphinx really was carved in primordial times, vanished until Thutmose IV "restored" it after his Cthulhoid, Faustian dream. The sphinxes speak in one voice from many forms, and in the morning, noon, and sunset of mankind's history. What time is it now? Who's asking? And do you really want to know?

Sheaullaugh O'Donough

for *Mage: the Sorcerers Crusade*

by Phil Masters

Art by Dan Smith and Colored by Keith Johnson

Nature: Theorist
Demeanor: Guardian
Essence: Castellum

Attributes: Strength/2, Dexterity/4 (smooth), Stamina/2, Charisma/3, Manipulation/4 (devious), Appearance/3, Perception/2, Intelligence/3, Wits/3

Talents: Alertness/1, Dodge/2, Expression/2, Intrigue/1, Logic/3, Subterfuge/1.
Skills: Etiquette/2, Firearms/2, Research/3, Riding/1, Torture/2.
Knowledges: Academics/2, Culture/1, Investigation/3, Linguistics/2, Medicine/3, Science/2 (anatomy)

Spheres: Entropy/2, Life/3, Mind/3

Backgrounds: Daemon/2, Destiny/1, Influence/1, Resources/2, Spies/2

Arete: 3
Willpower: 6

Appearance and Manner: Sheaullaugh O'Donough (the name is pronounced "Sheelah O-Donnah") is a pale-skinned, red-haired woman who has lost almost all of her original Irish accent; today, she mostly speaks English, and can easily pass as a member of the upper classes. She is reasonably attractive, but makes little effort to exploit the fact, usually wearing dark, plain, but high-quality clothes; un-Enlightened folk often assume that she is the widow of some aristocrat or knight. Her manner is invariably serious and often rather cold, though courteous, usually dominating others in a subtle but effective way.

Away from safe courts and great houses, O'Donough usually travels in the company of an appropriate group of escorts. These may be Daedalean Brethren, or simply mundane hired guards (paid from funds allocated by the Order); in the latter case, she is always able to ensure that they are dependable, and probably a little bit unimaginative (though she knows that it is best that guards be reasonably alert).

Background/Personality: Sheaullaugh O'Donough may be encountered on the road, at some lesser court, or, more likely, in the vicinity of some incident that has caught the attention of the Order of Reason. The un-Enlightened, and non-Daedalean mages, may well take her for a wealthy widow or gentlewoman, perhaps on a pilgrimage. To Daedaleans, she will present herself as a Cosian healer. Indeed, she will quite likely eventually tell them something of her personal history.

The daughter of an Irish barber-surgeon, she acquired a working knowledge of practical medicine in childhood, and

Supporting Cast: Sheaullaugh O'Donough

showed a certain flair therewith -- a flair that brought her to the attention of an Enlightened teacher. Soon, she was traveling among the houses of the Cosians, studying the healing arts and serving as a secret messenger and occasionally as one who can be trusted to resolve problems. In time, she was initiated into the middle ranks of the Order of Reason, and often sent to assist Daedalean groups who have encountered problems. Indeed, she may well appear on the scene shortly after a group of Daedalean PCs have dealt with some kind of dangerous problem. Her healing skills should make her very welcome on such occasions, and her efficiency, contacts with the Order's hierarchy, and reasonable ready wealth should help smooth over minor difficulties in the aftermath of some battle. Even non-Daedaleans may well find her helpful; she is perfectly willing to apply her healing arts to anyone who needs them (though the use of advanced Physic may risk the Scourge if the patient is un-Awakened, making her more cautious in such cases), and she is no sort of direct physical threat even to members of the Nine Traditions; if they recognize her allegiance, she will tell such that her only interest is in healing, and hint that she may well turn a blind eye to their activities if they serve a greater good.

The last is, in fact, the only point where all this typical behavior shades into untruth. O'Donough knows very well that deception is best hidden in a large body of honesty. The story of her life and training given above is completely accurate, but what she will *not* say is that her first teacher was not, himself, a Cosian, but one of the Ksirafai. Having been brought up in a class who were treated as little more than traveling rogues and vagabonds, O'Donough made a promising spy, while her healing skill gave her a useful reason to go where she might be needed. Indeed, her training in Physic was itself combined with observation of the Cosians on behalf of the Ksirafai. Of course, she never had time to venture quite as deep into their Arts as a true member of that Convention, but as a traveler and, in many of the areas to which she is sent, a foreigner, her ignorance of a few deeper Cosian ideas is easy to mask. After all, virtually all of the Daedalean medical scientists have their own diverse theories anyway.

These days, O'Donough is sent to Daedalean groups who have recently had some kind of excitement, primarily to see that there are no undesirable complications ensuing. She will offer real and effective medical aid, and if the group have handled the situation quietly and well, she will be nothing but a help to them, especially if they lack healers of their own; indeed, if they have been especially clever and efficient, her reports may ensure that their talents are noted in the higher levels of the Order. She is, in fact, genuinely compassionate and even kind, when circumstances permit, and may well provide medical aid to anyone who needs it, irrespective of their allegiances. However, she is dedicated and even ruthless in pursuit of her mission, which is to ensure that Daedalean secrets are preserved, and threats to Daedalean ideals are annihilated. She occasionally calls down the full might of the Order, if fire and the sword are truly needed; more often, she applies Mind Arts to ensure that the un-Enlightened forget what they should never have known, or at least that their impression of whatever happened is confused and essentially harmless. She rarely kills, but she is not above such acts. She may use subtle persuasion and Enlightened Rhetoric to achieve such ends, but she may also use drugs and potions, whatever the occasional small risks to the minds or sanity of her "patients."

But beneath all this, O'Donough is a thoughtful individual. She continues in her work, comfortable in herself, because she honestly believes that it is a necessity. She has made serious study of the ideals of the Order and of the Ksirafai, and she is content that what she does is for the best. Indeed, all of her actions are ultimately governed by this rather academic set of ideals and evaluations. Her ideas are subtle and complex, and she mostly keeps them to herself, although they govern her actions -- which sometimes makes her ruthless, despite the fact that her ideals are essentially quite humane.

Abilities: O'Donough is indeed expert in the use of Physic -- exotic and complex medicines, and occasionally surgery and even minor rituals -- to manipulate Life. She can heal others, but she is well aware that the dark side of healing is destruction, and that some medicines influence the Mind as well as the body. Combined with subtle training in Enlightened Rhetoric and courtly manners, this enables her to influence individuals and groups in whatever ways her work requires. She knows how to probe, with blades or words, and sometimes is usefully aware of Entropy, the world's tendency to failure and decay, which she can twist to her own ends. When Enlightened Arts fail her, she usually has a small but well-made wheellock pistol and other weapons concealed somewhere in her heavy traveling cloak or formal dress. She is also trained in various mundane skills, and speaks Gaelic, English, and French (or possibly other languages, as the game setting demands).

Game Uses: Ultimately a typical Ksirafai (if such a thing exists), Sheaullaugh O'Donough represents the hand of the

Order of Reason, and while its touch heals and directs, it can turn in an instant into an iron fist. She will often appear in the aftermath of some dramatic adventure (a demonic incursion, a crashed Skyrigger, the defense of a Cray), offering genuine help -- but also secretly passing judgement. It may take a while for Daedalean characters to guess what they are dealing with here, if they ever do, but her presence means that they have been *noticed* by their superiors, and their errors of judgement will be remembered just as long as their successes. She herself will say little about such lapses, unless they are truly blatant, but she will never assist in concealing or exacerbating them.

To other characters, she is a subtler but more formidable threat. Remember that she is, among other things, a doctor with a Renaissance-era attitude; if the treatments she offers are painful, well, the end often justifies the means. If people learn things that they should not know, they must be induced to forget -- one way or another. She is very careful when she recognizes Disparate or, especially, Traditionalist mages; after all, she is no great fighter, and she will probably be dangerously outnumbered. But that merely makes her inclined and more able to call on any Daedalean warriors in the vicinity.

by Joe Taylor

The Broadside

Be the first in your circuit to own this new dueling sensation. Protected by the thickest armor and armed with 2 compliments of triple shotguns, this beauty will sink all opposition.

The next time you enter the arena, be sure to "cross the T" on your opponents and given 'em the Broadside!

The Broadside -- Luxury, hvy chassis, heavy suspension, large power plant, four heavy-duty tires, driver, gunner, 6 vehicular shotguns; 3 linked left, 3 linked right. Armor: F45, R50, L50, B45, T5, U5. Acceleration 5, Top Speed 92.5, HC 3, 5,760 lbs, $14,900.

The Sniper

Score hits from across the arena with this deadly killer. Its high-resolution targeting system will make you lethal at long range and its extra ammo capacity means you don't have to be stingy with your shots. Sit back and fire away with the Sniper!

The Sniper -- Midsize, hvy chassis, heavy suspension, large power plant, four PR tires, driver, recoilless rifle w/HEAT ammo in turret, one extra HEAT magazine, hi-res single weapon computer. Armor: F44, R44, L44, B44, T33, U5. Acceleration 5, Top Speed 100, HC 3, 5,177 lbs, $13,874.

The Rocket Warrior

With the advanced weapon system of the Rocket Warrior, you will be able to take out even the most heavily-armored opponent with one shot, guaranteed. You can't miss with its five laser-guided heavy rockets and you'll be well-protected behind its tough armor. Each rocket is individually linked so they can be fired in any combination! It makes a deadly partner in team events and a sure winner in solo matches.

Rocket Warrior -- Compact w/carbon-aluminum frame, x-hvy chassis, heavy suspension, medium power plant, four PR tires, driver, 5 laser-guided heavy rockets; 2 front, 1 in right-mounted rocket EWP, 1 in left-mounted rocket EWP, 1 in top-mounted rocket EWP, each linked to front light laser, single weapon computer. Armor: F55, R55, L55, B55,

T5, U10. Four 10 pt. armored wheel hubs. Acceleration 5, Top Speed 90, HC 3, 4,195 lbs, $14,855.

The Incinerator 2050

Fire and explosion: the number one cause of low-division arena deaths. Now they can be at your command with the 2050 model Incinerator. Its unique side-mounted flamethrowers allow a driver-gunner team to BBQ opponents on either side -- a real crowd-pleaser! This year's model features a highly-requested improved fire extinguishing system.

Incinerator 2050 -- Luxury, x-hvy chassis, heavy suspension, super power plant, 4 PR tires, driver, gunner, flamethrower w/HT ammo right, flamethrower w/ HT ammo left, improved fire extinguisher, targeting computer (for gunner). Armor: F40, R50, L50, B40, T5, U10. Acceleration 5, Top Speed 100, HC 3, 6,600 lbs, $15,000.

The Mini-Panzer

Its APFSDS rounds will knock out the opposition while its sloped armor is thick enough to withstand the toughest punishment. It's a good thing the Germans didn't have this baby, but it can be yours today!

Mini-Panzer -- Midsize, x-hvy chassis, heavy suspension, large power plant, four PR tires, driver, anti-tank gun w/APFSDS ammo front, extra APFSDS magazine, single weapon computer. Sloped armor: F60, R50, L50, B50, T9, U10. Four 10 pt. armored wheel hubs. Acceleration 5, Top Speed 92.5, HC 3, 5,757 lbs, $14,280.

To Tear The Scales From Their Eyes

?

by Matthew Rossi

Partial Transcript: Meeting of the Nine, as Recorded by Nathan "Net-Specter" Szilard of the Virtual Adepts, 3/22/98

(Attending the meeting are Chuo-Li Anamaj of the Akashic Brotherhood, Tristan Umbertini of the Celestial Chorus, Curani Apocrypha of the Cult of Ecstacy, Rises Swift as Tears of the Dreamspeakers, Mister Absolute of the Euthanatos, Nialla Du-Chumail of the Order of Hermes, Henri Mazarin of the Sons of Ether, Nharna Govindasama of the Verbena and Nathan "Net-Specter" Szilard of the Virtual Adepts. Also present by invitation is Tizianna Umbrae of the Hollow Ones.)

- **Szilard:** The daimon is active.
- **Umbertini:** Are you certain they can't find us?
- **Mazarin:** Tristan, as I explained to you before, Nathan and I have checked and re-checked the daimon. They can't find us.
- **Absolute:** It hardly matters if they do. We are beaten, Hermean. We . . . are obsolete.
- **Govindasama:** I didn't come all this way to listen to your "return to the primacy of entropy" garbage, Abbie. Nathan and Henri, you two called the meeting, so why not let us in on why?
- **Szilard:** Glad 'ta, G. Apocrypha and I here first twigged to the idea, but it took the Mad Doc to give it form. Doc?
- **Mazarin:** I believe we have discovered a way to win the Ascension War and overthrow the Greyfaces.
- *(Uproar -- several voices muttering or shouting at once. Mazarin waits for calm.)*
- **Mazarin:** As you know, I serve as the Council's mole in the Conventions. It is in that role that I believe we may deal the death-blow to our enemy, in the midst of his power over us.
- **Anamaj:** Explain this!
- **Apocrypha:** Sorry, Chuo-Li. It's a neat plan, really. How do the Greyfaces keep us down?
- **Rises Swift as Tears:** They have poured cement over the well that leads to the Earth. They have frozen the ponds, they have stagnated the rivers, they have poisoned the fields and build mausoleums of metal and flaccid flesh over our world.
- **Apocrypha:** Uhm . . . well, yeah. I was looking for "Paradox" but that's as good as.
- **Du-Chumail:** I have yet to hear an explanation. I warn you, I do not enjoy having my time wasted.

- **Absolute:** Why not let them finish before threatening them? I want to hear them.
- **Szilard:** Wow. Thanks, Abbie. Okay, in a nutshell, here goes: The Conventions hold the knife of Paradox at our throats. Out of six billion or so sleepers, they've made a weight to pins us down and forces us to creep about rather than striding like the colossi we are. So, how do we get out of our chains when we can't count on a Heracles to break us out? Simple. We get the sleepers to do it for us.
- **Mazarin:** It will require sacrifice, but it can be done. We will create such a disturbance that the Greyfaces will be forced to turn to someone to come up with an explanation, and we have already assured that it will be mine to make.
- **Apocrypha:** And then we have 'em. It's like poisoned sugar; they'll be so glad to accept an explanation that they won't even realize that the explanation is the sharp point of the wedge.
- **Mazarin:** It owes a great deal to Quantum Physics . . .
- **Szilard:** And my collection of mint-condition Jack Kirby comics. *(Laughs.)* Paradox will be a whole lot more forgiving of us, if we can pull it off.
- **Umbrae:** So what are we to do? You invited a Hollower, and I came, but I have to be honest and say that I have absolutely *no* idea what you are talking about.
- **Mazarin:** We invited you because this must be more than a few of us. All of us, orphans and Traditions . . . and Marauders.
- *(Deus Carnivore, a Marauder, steps into the room. The buzz of a million wasp's wings follows.)*
- **Carnivore:** Brave new world to make. Especially liked Fourth World books. Kirby was the king.
- **Du-Chumail:** You invited *that*!?
- **Carnivore:** Fear unwarranted. Want what you want.
- **Szilard:** Y'see, there's a Greyface satellite called *Galatea* in orbit. Carnivore's going to hit it for us . . . and in one shot, we will tear the scales from the sleeper's eyes.

March 23, 1998 -- The *Galatea* explodes. All over the world, seemingly normal human beings begin developing powers that seem to defy the laws of nature. The United Nations gives the Aeon Society's Project Utopia the mandate to deal with the "Nova crisis." By December 4th, Dr. Henri Mazarin and his colleague Dr. Farah Rashoud release their discovery of a gland in the brains of those displaying these abilities, and the world comes to accept novas as wondrous yet real people who can do miraculous things.

It was a fraud. The mages of the Traditions used their magick to simulate the eruption of nova powers all over the world, risking enormous Paradox. Of the mages originally behind the effort, six died, chewed up by Paradox Backlash. But the sacrifice was not in vain. All over the world, sleepers became convinced that the impossible had become possible. Mazarin's "node" became real as the realignment of reality happened.

The Technocracy was stunned. In an all-or-nothing roll of the dice, a bedraggled cadre of magi managed to affect a paradigm shift unheard of since their own successful conquest of reality. As the

forces of Paradox realigned, the Traditions staged a series of attacks
on their enemies, who were unsuited to the conflict, having grown
dependent on Paradox to keep their enemies hampered. From 1998
to 2003 the battle raged, across the planes and on Earth.

Null-B and Horizon both fell. Marauders, Nephandi, the Traditions
and the Technocracy tore at each other, desperate to win the war for reality. While they were so occupied, the sleepers
made arrangements of their own.

On September 25th, 2003, the Technocracy got desperate. Under attack from a Marauder cell on the heels of a massive
Nephandi assault they barely repulsed, they used an experimental weapon.

The result was the Sao Paulo blast. Since then, all the factions have been biding their time and observing the new rules
of sleeper reality. There seems to be no doubt that people accept feats that would have slain an aspiring mage; people
fly about, summon lightning, grow to the size of buildings, and even travel via the correspondence point. Yet, although
they don't know it, these "novas" are Awakened. Their nodes allow them power that rivals mages themselves and in
some cases could exceed them.

Following the most recent Tradition/Technocracy war, there are less than two hundred full-fledged mages left of all
stripes . . . and there are more than 8000 novas.

To win the war for reality, the Traditions may have doomed themselves.

The Aeon Society and the Sons of Ether

In many ways, the Sons of Ether are the greatest architects of the nova age. Yet they underestimated the sleepers, and
instead of a world designed to the paradigm experimentation of the Sons, the result of Mazarin's gambit is a place
where the rules are still up in the air. On one side stands the Marauder-Traditions alliance, and on the other the
retrenching Technocracy, fresh from their debilitating war with the Nephandi. Each seeks to manipulate the situation in
order to bring about an ideal future for their own side while once again causing Paradox to come down like a universe-
sized hammer on their enemies.

The Sons of Ether, however, are stymied in much of their attempted manipulations by a group started back in the

1920's, the Aeon Society. Aeon understands the Sons more than anyone else, because both have roots in the wild tumult of the 1920's, of dirigibles and death beams, of daring explorers and evil cults.

Aeon is the child of Maxwell Anderson Mercer. While a sleeper, he was an intelligent, thoughtful man with a great deal more understanding of the reality behind reality than his "friends" among the Sons of Ether and Void Engineers knew. Mercer knew that left to their own devices, the "mages" would continue their conflicts without concern for the human beings who stood in their paths to "Ascension." Working on his understanding, Mercer created Aeon to subtly maneuver around the mages, counting on their disdain for the "sleepers."

Therefore, when the *Galatea* exploded and the first novas began erupting, certain highly-placed members of the Aeon Society recognized the truth, and while the magi squabbled in their shadow war Aeon was busy establishing Project Utopia. In this way Aeon stole the Sons of Ether's thunder and managed to derail the direction originally intended for the new paradigm.

Currently, there are agents of various allegiances within the monolith of Project Utopia. Henri Mazarin, a Son of Ether who betrayed the Technocracy, is highly placed within Utopia's Science and Technology division (as is Farah Rashoud, although she is not a mage). There are several with Technocracy leanings involved in Utopia as well, operating on the theory that getting control of the situation is more important than imposing a now-impossible paradigm.

In general, the Technocracy has been severely attenuated. The Traditions haven't truly been able to capitalize on that situation, mostly glad to just have the playing field level again. However, each of the Traditions has its own "party line" when it comes to novas.

The Akashic Brotherhood

The practicioners of Do have had the occasional conflicts with the Heaven Thunder Triad, the Nakato Gumi and Kuro-Tech (who bear an uncomfortable resemblance to their Technocracy enemies) but make no judgements on novas as a group. Each are individuals, each will be treated as such. Groups such as Bodhisattva Masato's Kamisama Buddhism, however, are disdained as setting artificial lines between novas and baselines. After all, Akashic Brothers do not have nodes. Such elitist views contradict Do.

The Celestial Chorus

The Chorus has been deeply affected by novas; while they are aware of their own part in creating the impression that these beings are powerful, possibly even divine, it frightens them how quickly splinter faiths have sprung up in their wake. In many ways, the novas are doing what the Chorus never could, and it frightens them. At present, with the war between the Technocracy and the Traditions a stalemate, certain members of the Chorus are considering going public with the truth of Ascension and the Pure Ones, as the Chorus sees it, of course.

The Cult of Ecstasy

"Hey, baby . . . we're already public!" Two of the better known novox singers in the world aren't novas at all; they're Ecstatics using magick. The Cult finds the nova phenomenon absolutely delightful; after all, it's all magick, isn't it? Science was really magick, and so is Quantum energy, and Taint is just Paradox under another name. Curani Apocrypha's third album went out over the OpNet and sold in mere minutes. He's very happy with the world he helped make.

Dreamspeakers

Novas like Antaeus and Bounty give the shamanic mages of this tradition a great deal of hope for the future. However, the Dreamspeakers know that this explanation is just as much a crutch as the old paradigm was; it's good that most sleepers accept their magick now, but it's still a crutch and not the truth. Eventually the Dreamspeakers hope to introduce the Metaphysic of Magick to the world at large . . . hopefully before groups like the Teragen can sell their

message of nova seperation.

Euthanatos

When a nova deserves the Good Death, the Euthanatos are more than eager to take the role as executioners. As soon as they finally grind the Technocracy into the dirt, they will demonstrate that having a gland in your brain is no match for an understanding of the truth behind reality's mask. The truth is death.

Order of Hermes

They have mixed feelings; on the one hand, the whole age of novas reminds them greatly of the "Great Experiment" that gave the world the word "Hermean." However, the novas are getting the admiration that really goes to them in the perfect world they seek to make.

Sons of Ether

The Sons tend to view the nova age through rose colored goggles. Mazarin is one of them, and there is a temptation to view the whole event as a throwback to bygone days. However, there are those within their ranks who are deeply disturbed, seeing the novas as another distraction given to the sleepers because the truth is unpalatable. For now, the debate mainly rages through the pages of *Paradigma*, but it could eventually reach out into action. Also, it's been necessary to watch out for the occasional Utopian Science and Technology team who mistake a Sons of Ether lab for something they need to regulate.

Verbena

The Verbena are concerned, to say the least, that the novas will be too easily swayed by their new power. After all, the body is the seat of the mind, and when the body is charged with energies the mind does not have the discipline to control properly . . . the increased aberrancy of some novas only seems to confirm their fears. Verbena mages are preparing for a "first strike" against the novas if it comes to war between baseline society and the Quantum-born.

Virtual Adepts

`"How cool is this!?"`

The Adepts are quite pleased with the results of their little experiment, even if they do have to play tag with Utopia's S&T division. The OpNet is certainly an improvement and can only herald the coming of a new age. Novas are Awakened beings, perhaps even a new breed of mage who doesn't need to study or worry about Paradox, and the end result is the same (the Adepts made sure that Rashoud printed that there was no theoretical limit to a nova's powers in order to ensure that reality would conspire to make it happen) in their eyes. Hell, maybe the Ascension is already *here*.

The Hollow Ones

There is no consensus, no single voice coming from the Hollowers. Uncertain they even *want* to fit in, the Hollow Ones are even less sure about novas, and won't say anything because that's what the others expect of them. They have noticed a disturbing trend, however . . . most of those who might have Awakened lately seem to be erupting as novas instead, as reality seeks to make everyone conform to the new principles. This could lead to the end of magick as the Traditions understand it, and terrifies those Hollowers who have begun to notice it.

The Pogrom becomes the Program

What of the Technocracy? Is this nova age a paradise, with the Greyfaces broken and humbled at the feet of their Tradition counterparts?

Hardly.

The Conventions have suffered a terrible blow, and are not now that reality-shaping power they once were. The machinery they created to control the sleepers is now seemingly in the hands of those same sleepers, and while it does not yet proclaim the Metaphysic of Magick for all to hear and understand, it does serve to convince the mundane herd that there is nothing wrong with seeing the occasional flying woman hurling lightning from her fingertips. Paradox still exists, of course . . . even in the nova age, there are still those who feel that momentary surge of disbelief when they see such marvels . . . but it is no longer the choke chain that serves to hold their enemies at bay.

However, all is far from lost. The Technocracy did not end up in charge of reality for six hundred years by being stupid.

Currently, a three-pronged attack is underway. An agent known only as "Thetis" serves the New World Order by co-ordinating an effort to control and harness novas to the Technocracy's ends. In her role as the head of Project Proteus, Thetis manipulates novas into combating the Marauders and their nova "chosen" (the true role of the Bahrain facility) as well as preparing for future conflicts against the Traditions. (Both Utopia and Proteus teams have seen action against Nephandi in the Kashmir region, and in fact created the nova conflict there as a cover for it.)

The second tier of the trident is already underway. By subtly leaking those actions that are less than savory on the part of Project Utopia and Proteus they hope to create extreme baseline/nova tensions, with an ultimate goal of frightening the baselines into rejecting nova powers (and thus, Vulgar Magick) as other, monstrous and "aberrant."

The third stage is to allow a war to occur between "aberrants" and "humanity." By subtly manipulating the outcome using their agents in various world governments, the Technocracy hopes to show that technology and human ingenuity can overcome the bizarre powers of the "aberrants" and be the salvation of humanity. Once this is accomplished, they will be free to once again dictate the course of human society.

For an idea of how this could come about, see the *Trinity* game. The Earth of 2120 outlined in that game could easily be subtly tweaked to be the result of a Greyface counter-gambit, if so desired. The Doyen become allies of the Conventions, Umbrood who share similar ideas about Magick and reality. The psi orders become the Technocracy's take on the Mazarin Gambit, a more orderly way to ensure that the occasional Vulgar Magick will be excused as "psi powers" by a grateful mundane herd.

As of 2008, the Conventions are still laying plans. For now, it suits them to let the Traditions busy themselves with their nova playthings and their ethical debates. When the time is right, they'll strike the match and plunge the entire world into war, killing millions.

Let the Wild Hunt Commence!

The Marauders are very, very happy.

They are also completely insane, but that's sort of beside the point. Now that the Greyfaces are weakened and Paradox set on its side, Marauders have been coming through in record numbers. After the most recent Technocracy war, however, record numbers for the Marauders would be a handful. It was the Marauders who led the assaults, running screaming into the fray . . . and events like Null-B's annihilation and Sao Paulo were the result.

However, while the nova age certainly has elements that would serve the Marauders very well indeed (some call it the new mythic age) and they *love* the Teragen. *(Yes, abandon humanity, explore your godhood . . . and come to us.)* It's hard to say that the Marauders have any actual *goal* in the nova age. They think they've won.

So far, it looks like they're right.

La Vita Nuova

And as for the novas themselves, they have the ability to escape the manipulations of the Magi. Their Quantum powers are merely unconscious manipulations of Quintessence itself. They suffer not at all from Paradox, as the sleepers have been led to believe that nova powers fit into the laws of "physics" and therefore are acceptable. Even better, novas have the potential to do *anything* thanks in no small part to the manipulations of the Virtual Adepts.

For now, the nova age of 2008 is unaware of the mages working below the surface. However, conflict is assured; the Aeon Society had dealings with "Mad Scientists" in the past who were connected to both the Technocracy and the Sons of Ether, Project Utopia's Science & Technology division has unwittingly busted several mages, and the ongoing war in Kashmir has been used as cover by Technocracy agents to eliminate Nephandi acolytes. None of them want to realize that their puppets are just about ready to cut the strings.

Novas have several advantages in this. First off, their powers come to them a lot more easily than True Magick, and while a newly erupted nova knows nothing of the Metaphysic of Magick, she doesn't need to. Secondly, the number of novas is increasing due to the latent human desire for wonder, while there are only a few mages left (less than two hundred) and their war among themselves has done much to weaken them still further. Finally, for all their magick, mages are human beings with physical frailties and to use their power is an act of will over reality. Nova powers work within reality, and their Quantum-charged bodies require no thought to manifest many superhuman abilities (which are called Mega-Attributes in the *Aberrant* game) that allow them to move faster, think on more levels and in general be superior to frail baseline flesh.

If a conflict comes, it could be anyone's game.

Crossing Over

Campaigning in the *Mage*/*Aberrant* world will certainly have its share of conflict, as the mages seek to understand this new world they've indirectly created and the novas deal with the behind the scenes manipulations of "The Subtle Ones." The Theme of such a campaign could be Revelations, as the lies humanity shelters itself behind are gradually stipped away in favor of the harsh truth; there are no absolutes, and the universe is what we make of it. Possible ideas for such a campaign include:

Mutability

A group of novas working for Project Utopia are assigned to track down and stop a "Teragen rogue" operating in Africa. Upon arrival, however, they discover Deus Carnivore, a Marauder Warlord seeking to bring about a new Mythic Age by breaching the Gauntlet and letting the creatures of the Umbra loose on Earth. Can even nova powers stop a madman with control over the fabric of reality itself? And even if they can stop him, how can they hold him? This could be the beginning of a merged campaign, as the discovery of a "nodeless nova" would no doubt lead to all sorts of complications . . . Project Proteus agents seeking to have him sent to Bahrain, S&T officers desperate to study him, and Teragen allies seeking to rescue him.

Brave New World

Henri Mazarin is respected as one of the discoverers of the M-R Node and a highly-trusted member of Project Utopia's S&T department, although not part of the leadership hierachy. While part of a Utopia mission to the Middle East, the Teragen attack and spirit him away, seeking to use his knowledge to free novas held at the Bahrain facility. Can a group of Tradition mages free Mazarin before he's forced to use his magick, and without giving themselves away as mages? If they fail, the secret behind the "nova age" could become public, leading to possible repercussions in the very nature of perceived reality. And how did the Teragen know to attack Mazarin's mission? Did the Technocracy spill the beans, or is someone else responsible?

The Nova-age Prometheus

A mage from the Progenitors is fascinated by novas; she seeks to come to a complete understanding of the way the laws of physics and genetics have merged and altered in these new beings. Using her powerful Life magick, she seems to offer a cure for "Taint" to a few novas, but really seeks living subjects for vivisection. Can the novas root out her corruption before her new creation, "Cain," can unleash its nova powers upon the world?

The Digital Web

The Virtual Adept online chantry is under attack from a new direction; novas with the ability to manipulate computers have discovered the Adepts pocket Realm in the Omaha, Nebraska area, and have led Utopia"s S&T enforcers there. While some of the mages must arrange for the S&T division to be called off, others must go on-line to prevent the secrets of the Virtual Adepts from being revealed. Can they keep from being discovered . . . and if they *can*, should they?

The Threat From Beyond
(With thanks to Steve Ditko and Stan Lee)

Curani Apocrypha, a popular novox singer, comes to the novas with a problem. A force from the Deep Umbra, an Umbrood Lord of enormous power, is coming back to Earth now that Paradox has been lessened. However, after the recent Traditions/Technocracy war, there aren"t enough magi left to help the Human Mask stop an Umbrood who holds entire Realms in his control. Will the novas help fill the void and step boldy into the Umbra?

by John G. Snyder

Art by Dan Smith and Colored by Keith Johnson

The Awakening is a **GURPS Space** adventure for any number of players, although 3-6 players is suggested. The adventure can also be geared towards a single player and a GM. This would provide a gaming experience quite different than group play. The single character would have to be even more resourceful and careful.

The average point range should be about 100-120 points, with 40 points for Disadvantages. The tech level is roughly TL 8-9 depending on the device(s) in question.

The only book needed to play this adventure is the **GURPS Basic Set 3rd Edition**. Other books that might prove useful in running this adventure or expanding it into a full fledged campaign include, but are not limited to: **GURPS Cyberpunk** and/or **CthulhuPunk**, **GURPS Cyberworld**, **GURPS Ultra Tech I** and **II**, **GURPS Bio-Tech**, **GURPS Reign of Steel**, **GURPS Traveller**, **GURPS Aliens**, **GURPS Time Travel**, **GURPS Black Ops**, and **GURPS Psionics**. Mix and match the above combinations, or don't use anything! This adventure is highly customizable, so tweak it to suite your gaming needs.

[?]

This adventure was inspired by the short story "I Have No Mouth, and I Must Scream," by Harlan Ellison.

Game Master Notes

1. Game Masters should let the players create new PCs for this adventure. Player Characters should top out at about 40 points for Disadvantages, and they should choose a broad range of skills in relation to the tech level (8-9). The disadvantages should reflect the severe conditions of the complex (see the background information).
2. If you are running this game with more than three players, divide the group in half and play the first section with that half of the group. The other half of your group should leave the room; call them back in after their PCs have been rescued from their damaged cryo tanks.
3. This adventure has the possibly of alternate motives, events and endings. They are presented at the end of the adventure; the GM

should decide upon which motive, events and ending(s) will be used
before running the adventure.

Background

Some or all of the background information may vary depending on how this adventure will be used, as either a one-shot adventure or as an introduction to a campaign. Also the background information may differ due to the adjustments with alternate motives, campaign style, different endings, etc.

The characters are part of a secret government operation called Project:Backlash. This project was instituted because, at the time, the human race was attacked by an extraterrestrial force.

This alien force showed no signs of mercy, and they had no known weaknesses. During the war the humans found out that the marauding aliens were very susceptible to a terrible cocktail of terrestrial viruses -- some natural and some man-made. Of course, the use of this new viral weapon wouldn't help the war effort; too many (if not all) of the humans would be killed. The humans were desperately losing the war, and the aliens apparently wanted the Earth for their own reasons. Drastic measures had to be taken. Several human governments wanted to employ a "scorched earth" policy, destroying everything so the aliens had nothing. Then they had a better idea.

Rather than let the aliens kill off the human race and inhabit our planet without any repercussions, Project: Backlash went into effect. A secure mountain site was selected, and the humans began the construction of an underground base. The base would be powered by geothermal and the newly discovered cold fusion process. Dozens of civilians and military personnel were chosen, mostly because of their skills and psychological makeup. The chosen were secretly trained, and after the base was completed, they were put into suspended animation (cryo sleep). The computer systems were designed to run on very little power, and several backup systems were also in place. The operatives were "scheduled" to wake in fifty years. Upon awakening, they could analyze the situation and launch a retributive strike if the humans had failed in their effort against the invading alien menace. If the invading alien force had conquered the Earth, the virus cocktail would be used. No humans would be left to be affected; those that were still alive would probably be slaves or worse.

If the alien force had somehow been driven off the planet, then the men and women of Project: Backlash would observe the situation and decide when to exit the secret complex. It was to be a perfect plan of revenge from a race that died long ago, or so we'd hoped.

About ten years after all the operatives of Project: Backlash had been put into their cryo sleep, there was a terrible earthquake beneath the mountain complex. This disrupted the geothermal power supply and caused massive damage to the complex. Several computer systems were destroyed in the process, and the fifty years came and went. The operatives remained in their cryo sleep for over 185 years.

Then, by some twist of fate, there was another earthquake. This triggered a massive power failure. The resulting backup systems, upon a power failure, would awaken the sleepers. The operatives finally awoke from their cryo sleep, having overslept by 135 years.

Due to an unforeseen after affect of such an extended cryo sleep, some of the operatives are suffering from or have been affected by some mild brain damage, mental illness, permanent long-term memory loss (total amnesia), and other physical disabilities.

The player characters are the last batch of operatives to awake. The first group of recently awakened operatives have already banded together and have begun exploring the base. They are led by a psychotic Lieutenant named David Cashe. Cashe believes that the alien force is still out there, even though surveillance equipment and satellite contacts are gone. He wants to go through with the retributive strike. His dealings with the player characters will be the main

conflict of the adventure.

Cashe wants to be the last human on earth. If all things on Earth are going to die, he wants to be the last human to die -- the last of the human race. Cashe finds some sort of twisted honor with being the last human to walk the Earth.

Eventually a loud banging noise begins in the motor pool area. The vault door that leads to the outside is under attack. No one knows who or what is making the noise. All visual and surveillance equipment is inoperative. Cashe thinks it's the aliens trying to gain access to the base. The reality of it is actually up to the GM. The GM need not determine who is tunneling into the base until they break through . . . which will no doubt happen shortly before or after the Project:Backlash weapons are activated.

Timeline of Events

This is a chronological list of events that will happen during the course of the adventure. The events are not listed with an actual clock time; rather the events are listed in the order in which they will happen. Feel free to adjust or alter as needed.

1.
    - First Player awakens from cryo sleep. Escapes from cryo tank.
    - Lt. Cashe awakens from cryo sleep.
2.
    - First Player may free other players from their tanks.
    - Lt. Cashe frees other operatives from cryo sleep.
3.
    - Exploration of base. Possibly gain access to secondary Command Center.
    - Lt. Cashe gains access to upper level and begins looking for armory and command and control center. He is still confused, but will remember why he's been in cryo sleep (see Project: Backlash notes).
4.
    - Lt. Cashe discovers armory and arms himself and a chosen few (believes others are too mentally unstable for weapons at this time.)
5.
    - A few awakened operatives attack the PCs with bare hands. They're insane and beyond help (a random encounter, and not part of Lt. Cashe's group).
    - When the PCs try to gain access to the level/armory, they will encounter resistance from Cashe's underlings. The underlings are armed with blasters, knives, etc. They might be persuaded or tricked. GMs are encouraged to roleplay this encounter, as it may go in any direction.
6.
    - PCs should run into Cashe soon. He will explain that he plans to launch/activate the weapons.
    - Some of Cashe's underlings want to make their way to the outside world and look around. Cashe won't stand for such insubordination. He'll execute personnel if that is what it takes to keep the people in line.
7.
    - A loud banging noise begins to sound from the upper levels. Someone is trying to get into the base! Cashe sends a few soldiers to investigate.
8.
    - Cashe pushes to activate the weapons. He attempts to take control of the command center. His own people will turn on him to subdue him, in order to stop the launch/activation of the weapons.
    - If Cashe is subdued or killed, one of his turncoat underlings will activate the weapons by surprise.
9.
    - If PCs go along with Cashe, he will activate the weapons, then he will eventually kill the PCs (see Backlash notes).
10.
    - Should PCs survive this long, the banging in the motor pool becomes louder and clearer. The intruders eventually gain entrance. There is no actual time limit here; that is left up to the GM. Pick a very

inconvenient time for the Player Characters to make a split decision, e.g.: Cashe's countdown to weapon launch vs. possible contact/communication with intruders.

Describe the aliens any way you want. Use **GURPS Aliens** for ideas, or go with the standard "Grey" alien: big black eyes, small gray colored body (see **GURPS Black Ops** for more information on the Greys). Use the stats for Lt. Cashe's men as merely quick stats. Beef up the aliens with more weapons and defenses from the **Basic Set** or **GURPS: Ultra Tech I** or **II**. GM must determine if intruders are hostile or friendly depending on the campaign's direction.

If this is being played as a one-shot adventure and not an introduction to a campaign; then the intruders will be hostile aliens bent on eliminating the last human threat (see event #11). They will kill the PCs at first chance. Modify text and adventure as needed.

11.
- If the PCs fail to activate their weapons, let them know that they are, or were, the last humans on the Earth. They have failed in their mission to avenge the death of billions.

Notes

Remember that there is little power to the complex. Lights will be flickering. Doors, computers, cameras, surveillance equipment and monitors do not work very well, and have intermittent problems. There are flashing red lights every twenty feet in the main hallways and in each room. The Player Characters can turn these off with several successful Computer Op/Hacking in one of the command centers.

Also remember that this adventure has a timeline of events. The location descriptions are just that: descriptions of the rooms. The Timeline of Events will detail when and, to some degree, where the events take place. Much is up to the gaming style of the Game Master and the group.

Location Descriptions

A Cold Start

1. Start Room. Pick one individual player and read the boxed text to them. The adventure begins in room 1 on the map; all locations are numbered and correspond with the like numbered description.

> You awake with a gasp. Cold air rushes in to fill your lungs. Everything that you see is covered by a fine layer of frost.
>
> You are in some sort of metal cylinder. There are several blinking lights on a panel directly in front of your face. You are very cold, and you are only clothed in a dark blue jump suit.
>
> Your limbs appear to be held in place. You can move your cramped fingers, and they touch buttons. The panel in front of you changes its display. It shows a series of buttons and controls. Each control lights up when your hand or fingers make contact.

The player can roll an IQ -3 to see if they can figure out the panel and how to free themselves. If the player fails the roll more than three times, the tank will automatically release the restraints and the PC can lift the cryo tank's lid. This will take a ST-2 roll to succeed in lifting the tank's lid far enough to attempt an escape.

All skills and attribute rolls will be modified in some way due to such an extended cryonic sleep. If no modifier is listed assume a -2; some modifiers will be more and some will be less. This will only last about two hours of game time, or until the PCs find the Med Center and the appropriate drug for counteracting the sleep effect.

Upon opening the cylinder, read the following:

> When the metal cylinder opens, you see several other metal cylinders set into the nearby walls. You cannot make out what is in the cylinders due to the frost build-up. Metal girders stab down into the room and wires are dangling from collapsed ceiling panels. Red flashing lights are in every corner of the room. There are five other metal cylinders in an octagonal room. On one side of the room is a door, but it is blocked by a pile of debris.

The player may attempt to open the other cylinders. An IQ -5 or a computer operation skill at a -2 is required to get the computer to open the other cryo tanks. Once the players in this room are free they can attempt to free the other players. To clear the debris a simple ST -2 roll be required from each character.

> The door opens to reveal a small room with another door directly across from you. The door is eventually forced open. Broken ceiling panels, frayed wires, scorch marks on the floor, walls and ceiling tell of a great catastrophe. A five foot wide metal girder stabs through the middle of the hall; crumbled concrete is everywhere. There are large cracks in the ceiling, walls, and floor.

2. Cryo Tank Room. The crevasse in front of the door is about 5 feet across . . . and over 35 feet deep! The sliding door needs to be pried open by two people with a ST roll -2 (cumulative with previous modifiers) for each person.

> This room is totally dark, and it smells like death. The emergency lights from the hallway give witness to a ghastly scene. There are six metal cylinders, much like the room that you left. A large support beam has collapsed and fallen onto two of the cylinders; they are totally crushed. The four other cylinders' control panels do not seem to be working. You can see a rotted corpse in each of the four cylinders.

2a. Collapsed Room. This room is totally collapsed and there is nothing to see in here.

> After opening the door you look into a room where the entire ceiling has collapsed. All cylinders in this room are crushed and any occupants are far beyond help.

3. Cryo Tank Room. The rest of the PCs are in this room. Follow the door opening rules from above.

> Upon opening the door to this well-lit room you see six more metal cylinders. Three are working and you can see people inside; they are shaking their heads, trying to wake up. The sixth cylinder is torn in half due to a large metal girder jutting eight feet out into the room.

If the GM wishes to have NPCs in the other cylinders, that is fine; just adjust the descriptions appropriately.

4. Crevasse Room. Use same door modifiers for this door also.

> You can hear your echo of the door opening in this darkened area.

This entire section of the complex has collapsed due to some catastrophic event. If players insist on having their PCs jump down or climb down, make them regret it. The jump would kill them, and climbing down will be more hassle

than it is worth and will no doubt cause serious injuries.

5. Dead Hall. Use the same door modifiers for this door.

> Upon opening the door an overwhelming stench floods the hall.

Have players make a Will roll with a -2 modifier due to the incredible stench. Failure means that the character will suffer from several minutes of vomiting and weakness. If the player fails their roll by more than 10 than that person will develop a mild (10 point Disadvantage) phobia (necrophobia -- fear of the dead).

If player rolls successfully, they will be immune from all similar rolls in the future.

> When you gather your senses and begin to look into the darkened hall, what you see chills your blood. The hallway is packed with bodies. They are stacked nearly five deep towards the doorway. Bodies piled on top of bodies. Several are sprawled towards the end of the hallway. Rotted corpses leaning against walls in their eternal sleep. It appears as though the door was sealed shut and these people were unable to gain their way to freedom. They are in advanced stages of decomposition, so this must have happened several weeks ago.

6. Cryo Tank Room. All doors to these rooms are open.

> This room has very little structural damage. All cylinders are empty. The control boards have some minor scorching, but seem to be in working order.

7. Cryo Tank Room. Doors to this area are already open, some have been left ajar.

> This room has some cracks in the floor and walls. A few ceiling panels have fallen, burned and frayed wires spill into the room from the holes in the ceiling. Half of all cylinders in this room are empty; the other half are occupied. A grisly and rotted visage stares out from within its once icy casket.

8. Cryo Tank Room. This is area is where Lt. David Cashe and his cohorts were put into their cryo sleep.

> This room has very little structural damage. All cylinders are empty. The control boards have some minor scorching, but seem to be in working order.

9. Body In Hallway. This person died from a broken neck inflicted by Lt. Cashe.

> As you walk down the hall, you see a dead body curled up on the floor. The body is clothed in the exact same type of jumpsuit. The body appears to have died several hours ago.

10. Rubble and a Collapsed Ceiling.

> This room is like many others, with a collapsed ceiling, ruined cryo tanks, and the stench of death is everywhere. It appears as though half of this room's former occupants have survived. Several tanks are empty.

10a. The Collapsed Hallway.

> This hallway has totally collapsed. There is simply no way to get past all the rubble. A rotted hand protrudes from the rubble. Another victim of a forgotten catastrophe.

This section of the base has been left open so that GMs who want may expand the complex for further campaign play. With a little digging this area can be accessed. Remember to adjust the description as needed. Possible areas for exploration might be a science lab, cloning facilities, power armor and heavy weapons area. Maybe a proto-type temporal manipulation device (time travel?). Robots and A.I. could play large part in obstructing/aiding characters and Lt. Cashe.

11. Double doors. Follow the usual door opening rules (see description 2 for door modifiers).

> The hallway ends with a pair of doors. The one on the left says "Med Center." The door to the right says "Secondary Command."

12. Elevator Shafts. Each door requires a ST roll to open. This level is the bottom floor of the base.

> These elevator shafts appear to have literally fallen into disrepair. They are obviously in a non-functioning order.

The characters can climb up through the elevator escape hatch and scale the elevator cables, or use the service ladder to the next level. However the doors still take a ST roll to open. This is hard to do from the ladder without a chance of falling!

13. Stairway.

The stairs are probably the only thing that works in this whole base!

> This appears to be a fully functioning stairwell. There are some cracks and debris littering the stairs, but, since they're made of concrete, they seem safe. They lead up into darkness.

14. Secondary Command Entrance.

> These doors have "Command Personnel Only" written in bright yellow letters.

These doors are locked with interior bolts. They need to be "hot-wired" from the control panel. Electronics: Security Systems, Lockpicking, Computer Hacking are all applicable skills. The modifier for this skill should be between -3 to -5 depending on the character's idea. This area has its own backup power supply, so computers and equipment tend to function a little bit more reliably here.

Alternately, GMs could use a bio-scan device: palm, hand, face, breath, eye, retina, blood, DNA scan. Only military personnel of Captain rank or higher are granted access.

15. Secondary Command Center.

> Inside this room red flashing lights assault your eyes. Monitors flicker and try to maintain a picture. Some screens are cracked and the room smells like burning oil.

Characters may use their computer skills (with a -3 modifier -- see room 16) to tap into the base's project database and gain some very valuable information about Project: Backlash. Several characters will not be found among the records. There has been some computer damage and file corruption with all the seismic activity and damage to the base.

The GM can feed any background information to the players as he sees fit. Information on other base personnel, outside conditions, and information regarding the last 100 years may or may not be available (up to GM -- giving players very little information is recommended). This is because the base had to maintain a low profile in regards to energy consumption, communication and activity. The players will have to make big decisions on their own and without any input from outside sources!

16. Wiring Closet.

> This small room smells like burning oil. There are large scorch marks on the ceiling and walls. The walls are covered with computer equipment, components and thick strands of wiring erupt from one wall only to disappear into another.

This room is where all the components for the secondary command center are located. There is some minor damage to the components due to a small fire. This will produce a -3 modifier to computer rolls due to malfunctioning equipment. Anyone with Electronics: Computers can make an attempt to repair the equipment. There is a small tool kit stored behind the door.

17. Med Bay. The rules for opening these doors are the same as location 14.

> These doors have "Med Bay" written in large yellow letters across the front.

Upon access to the Med Bay read the following:

> The Med Bay has seen some better days. There is a large pile of debris in the center of the room. Several support beams have collapsed and fallen across several beds. There is a set of doors separating the area. The other half of the area is much the same as the first. Although there is a large floor-to-ceiling cabinet that is labeled "Supplies."

The PCs can find basic medical supplies and simple antibiotics. There is also a stimulant drug (pill) that will counteract the cryo sleep fatigue; this drug will remove any cryo sleep modifiers or penalties. If more than two hours of game time have elapsed then the cryo sleep fatigue has already worn off; remove all cryo sleep modifiers.

18. Operation Room/Recovery.

> This room appears to be a small operating room. Most of the equipment has been destroyed due to debris and small fires.

The players might be able to find small knives, scalpels, and other sharp instruments -- about 1D-2 worth of useful "weapon type" tools.

19. Equipment/Uniform Closet. PCs may be attacked at this point by Cashe's underlings. See Timeline.

> This door reads "Equipment and Uniform Storage." The door is slightly ajar.

This area has extra jumpsuits, socks, underwear, boots, pants, T-shirts, light and heavy jackets, and many other garments.

20. Washing Area.

> This area was for the washing and drying of uniforms and linens. Several large washers are in the middle, and dryers line the walls. Piles of debris dot the floor. A large support beam divides the room in half.

21. Security Door/Power Management. This door is locked. A large metal bolt runs through the door. It must be blasted open; one shot will do. A successful Electronics: Security System roll will also open the door.

> Debris clutters the hall which ends with a single door. This door looks like all the rest in the complex. The only difference are the words "Restricted Area-Power Management Systems -- Command Personnel Only" painted upon the door.

22. Power Management Center. This is where the base personnel manage the Cold Fusion Reactor and the Geo-Thermal Reactor. The Cold Fusion reactor is online at about 15-19% capacity. The Geo-Thermal Reactor has shut itself down due to the earthquakes. Neither reactors can be set to overload or self-destruct. They have too many fail-safe mechanisms. The base is *not* rigged with a self-destruct mechanism. The designers didn't feel that the personnel, who are essentially on a suicide mission, needed such an option.

If the power is safely shut down, then any attempts to launch the weapons will fail. There needs to be a minimum amount of power to run the various programs and activate the weapons.

> The door opens to reveal a room that overlooks a larger room that contains large machinery. This room, however, has a large control panel on either side of the room.

23. Reactor Room. This area has no real value for the players. If the Cold Fusion Reactor is severely damaged, it will shut down. This will plunge the entire base into darkness.

> This room is cluttered with debris, fallen support beams, frayed wiring, and one inactive Geo-Thermal Reactor. The machinery is covered with a fine layer of dust.

24. Kitchen/Food Prep. The only food that is left is about two cupboards worth of canned foods. The refrigeration units have lost their power months ago and all the frozen and refrigerated items inside have melted and/or spoiled. Eating this food will make one extremely, life-threateningly ill. There are about 2D knives that are available for use as weapons.

> This room has a strange smell. It is coming from the large silver refrigeration units.
>
> This was once the kitchen. The majority of the major appliances have been destroyed by collapsed walls and ceilings.

25. Mess Hall.

> This Mess Hall is in total disarray. There are dozens of tables and chairs scattered in a

haphazard manner about the room. Large chunks of ceiling and wall have collapsed at various places around the room.

There is nothing of value within this room, although broken chairs and tables can be disassembled so that the steel tubing can be used as a clubs.

26. Showers and Lavatory. The water works, and there is plenty of hot water.

This room is obviously the base's shower room and bathroom. From the layer of dust on everything, no one has been here for quite some time. The room seems to have escaped serious damage.

27. Waste Recycling/Reclamation. The system is working, to some degree. (No, a person cannot be shoved into the unit; it will turn off if something that big is forced into the chute.)

This appears to be the waste recycling/reclamation area. There are large chutes into which various items are deposited. The whole system is automated and needs no human interaction. No one seems to have ever used the system.

28. Armory. Lt. Cashe and his people have already been here. There are two of Lt. Cashe's men on guard here. The two operatives who are guarding the armory are actually in the armory. They are armed with Blaster Pistols (B208) and Large Knives. They have Second Chance Hardcorps System Body Armor (B211). Not knowing what is really going on, they will probably engage in conversation with the Player Characters. Reaction checks may apply, but role-playing the encounter is preferred.

The guards are under orders to not let anyone, unless accompanied by Lt. Cashe and by his order, have access to the equipment. If the guards are pressed they will fall back on their orders. If attacked they will shoot to maim. They don't want to have to kill anyone, but they will if necessary.

29. Bodies. There are two bodies here with burn marks on their chests. They were killed by Lt. Cashe for trying to make a run for weapons. Cashe didn't think they were of sound mind to handle weapons, so he shot them.

Two bodies are sprawled out in the hallway. They have large burn marks on their chests. They appear to be dead.

30. The Armory's Contents. (This is only what is available right now; the rest has been taken by Lt. Cashe.) In the armory the following items can be found (all are found in the **GURPS Basic Set**):

- 3 Blaster Pistols (1 clip each)
- 2 Blaster Rifles (1 clip each)
- 4 Large Knives
- 3 Small Knives
- 3 Second Chance Hardcorps System Body Armor (with Gentex PASGT Helmet)
- 2 Combat Infantry Dress (with CID Helmet)
- 2 Second Chance Standard Vests (with Gentex PASGT helmet)
- Most equipment under the Modern Equipment section in the Basic Set on page 213, several of each, not counting the vehicles. The food would be mostly Concentrated Rations (by the dozen).

This large, well-stocked room has rows and rows of survival equipment. The door to the west has collapsed under some immense weight. Support beams, girders, and debris clutter

the already full room.

31. Primary Command Center. This room has quite an amount of debris and structural damage. Monitors and screens are smashed. There are, however, several terminals in operational order. Follow the general description of room 15 for the use of the computer system and other notes. They apply here as well.

Player Characters will no doubt run into Lt. Cashe here. This may be where the PCs originally hear the strange "banging" noise coming from the level above them. The door, surprisingly, is not difficult to open.

The doors to this room say "Primary Command Center -- Authorized Personnel Only!"

This large room has a 30' foot vaulted ceiling with large display monitors on the south wall. Several of the monitors are cracked and broken. There are two rows of terminals. There are support beams that have fallen across the rows and smashed millions of dollars worth of equipment.

32. Rest Area. This is the base's other bathroom.

This appears to be another rest area. Stalls line the outside of the room with sinks against the far wall. There is very little debris or damage here.

33. Motor Pool. This room is where the vehicles are kept and maintained. The vault door to the south, leads up and out to the concealed entrance at the base of a mountain. The distance from the vault doors to the actual base entrance is about 4,000 feet. This is where the aliens will gain entrance to the base. No vehicles are in immediate working order. It would take a day or two to get them back up and running.

This room has seen massive amounts of damage. There are support beams across two of the ATVs and one of the vehicles has been totally crushed from a collapsed ceiling. Large cracks and crevasses in the floor make walking difficult, if not dangerous.

34. Vehicle Diagnostic Equipment. Almost any vehicle can be repaired here. There are common spare parts, computer equipment, and plenty of tools to keep a mechanic happy for a lifetime. The ceiling (what is left) is 20' high.

Two large vehicle lifters with pits are the main part of this vehicle repair area. Computerized vehicle diagnostic equipment and an assortment of tools, fluids and spare parts complement this area.

35. Fueling Pumps/Battery Recharger. These pumps provide any liquid form fuel such as gasoline or diesel fuel. There are also a battery recharger for almost any type of cell.

There are two archaic fuel pump dispensers and a variety of battery charging stations.

36. Vault Door. This door will come under heavy assault by the invading alien force. It will be up to the GM when the aliens actually breach the barriers. It should be at a totally inconvenient time for the player characters.

This gigantic metal door is over 15' high. The double doors have a small control panel on the right that controls the door's giant locking mechanism. This thing could take quite a bit

of abuse before breaking.

Non-Player Characters

The NPC stats listed below are meant as quick and dirty NPCs. Should the GM require more details, they should flesh out the NPCs to fit adventure. The only real Non-Player Character that is a major plot point is Lt. Cashe. Cashe sees his "soldiers" as just cannon fodder.

Lt. David Cashe

Lt. Cashe is totally insane. He remembers his mission, he just can't see it without rage-colored glasses. Unfortunately, Cashe is doing the right thing. He's following orders. There are still aliens out there, but Cashe does not know this, and he's willing to take that chance. He's certain that the human race was on the losing end of the war.

ST: 13
IQ: 12
DX: 11
HT: 12

Skills: Beam Weapons (blaster)-14, Stealth-14, Knife-13, NBC Training-13, Biology-10, Beam Weapons (laser)-12, Gunner (laser)-12, Gunner (Missile)-11, Guns (grenade launcher)-10, Interrogation-11, Scrounging-11, Electronics Op (Computers)-12, Electronics Op (Security systems)-11, Computer Operation-13, Brawling-14, Intelligence Analysis-11, First Aid-13, Detect Lies-11, Tactics-11, Strategy-10.

Advantages: Military Rank (15), Night Vision (10), Immunity to Disease (10).

Disadvantages: Fanaticism (-15), Sense of Duty(-15) (To avenge the Human Race), Intolerance: Insubordination (-10).

Equipment: 1 Blaster Pistol, 1 Blaster Rifle, 1 Large Knife, Jumpsuit, Boots, Watch, 1 clip in each weapon, Combat Infantry Dress (body armor).

The Soldiers of Lt. Cashe

These men are totally loyal to Lt. Cashe. He did, after all, save them from being trapped within their cryo tanks. They are willing to die for him, and most will. They don't have the same fanaticism for destroying the alien invaders as that of Cashe. These soldiers would like to make an educated guess, rather than just a wild one.

Most of the men suffer from a phobia or some sort of mental disorder. Their cryo sleep and the drug interaction necessary for the cryo sleep had some lasting effects. (The PCs only get bad hangovers from their cryo sleep.) Therefore, Lt. Cashe has decided that only a trusted few will have weapons and armor. Most of these men will also be willing to listen to another, more rational, point of view.

Quick Stats for Soldiers of Lt. Cashe (20)

ST: 12
IQ: 10
DX: 11
HT: 10

Skills: Beam Weapons (blaster)-12, Stealth-11, Knife-12, NBC Training-10,Beam Weapons (laser)-11, Scrounging-10, Electronics Op (Computers)-11, Electronics Op (Security systems)-11, Computer Operation-11, Brawling-13.

Advantages: Military Rank (15).

Disadvantages: Sense of Duty (-15) (To Military and Humanity), Intolerance: Civilians (-10)

Equipment: Most of Lt. Cashe's soldiers will not have weapons, only the most trusted and mentally stable. This is all according to Cashe, and his warped reality. The number of soldiers and what they are armed with is listed below:

- **2 Guards in Armory:** 1 Blaster Pistol, 1 Blaster Rifle, 1 Large Knife, Jumpsuit, Boots, Watch, 1 clip in each weapon. Combat Infantry Dress (body armor).
- **6 Soldiers:** Second Chance Hardcorps System Body Armor (with Gentex PASGT Helmet), 1 Blaster Pistol-1 clip already in weapon, 1 Large Knife, jumpsuit, watch, boots.
- **10 Soldiers:** Jumpsuit, watch, boots (no weapons -- Cashe believes they're too unstable).

Cashe shot the last two soldiers outside the armory.

Alien Invaders (Quick Stats)

GMs should feel free to alter these stats to appropriately reflect their campaign; he may even want to throw in some *Psionics* for added flavor.

Equipment: Blast Rifle, Blaster Pistol. Their armor will be equivalent to the Combat Infantry Dress, except the following: DR 55 areas 9-11 & 17-18.

Alternate Endings and Options

This is a list of story elements that can be changed, literally on the fly, rendering an entirely different adventure altogether. No two sessions need to be the same! Some adventure details may need to be modified regarding an Alternate Ending Option.

1. Aliens never conquered the Earth. They left because it was too polluted and dirty. The humans have unlocked the secrets of the alien technology. The humans have finally put aside all their differences and the Earth has entered a new golden age. The recent earthquake gave away the position of the base. Earth's officials, having never known about this secret base, mount a rescue operation. Will their surprise rescue doom this new paradise? Will the base survivors have triggered an apocalyptic event?
2. Aliens are still on Earth, but the war is over. The humans and aliens have opened a dialogue and found out the whole war was a big misunderstanding! Who knew? The aliens have integrated the humans into the Galactic Community. Will the rescue mission to free the forgotten operatives doom the planet (see #1)?
3. The humans developed super-smart robots to defend the planet. They drove off the invading aliens, but unfortunately, the robots were too smart. There was an A.I. (Artificial Intelligence) uprising (see *GURPS: Reign of Steel* for more ideas). The humans hid their best personnel away for a retributive strike against the A.I.(s) or to repopulate the desolate planet. Do the operatives try to contact the aliens and ask for help?
4. The characters discover a hidden level where there are dozens of cloning tanks. Lt. Cashe wants to make an army of deranged soldiers to wage war upon the surface survivors, whoever that may be!

Adaptations

This adventure can be easily adapted to almost any science fiction roleplaying game; below are some suggestions and ideas. Modifications to the specific details of the adventure will be necessary, but that shouldn't be too difficult.

- *Alternity:* This adventure would work well with a home brew *Alternity* campaign, and GMs should have no trouble dropping it into a *Star*Drive* campaign either.
- *Babylon Project:* The base could be the result of a secret Earth Force and/or Psi Corps operation. The base has been all but forgotten after the Earth/Minbari War. The base was hidden on a world that the Minbari now hold. Will the actions of those inside incite new aggressions?
- *Fading Suns:* This base would be a remnant of the First or Second Republic. The PCs are in a base that has loads of Forbidden Technology, and Inquisitors don't need the players causing that kind of havoc.
- *Rifts/Phase World:* The operatives could be from the time before the Rifts. They awaken into a dark and dangerous world. The Coalition States would quickly gain the operative's trust. In a Phase World setting the PCs could be members of a resistance cell against the Transgalactic Empire. The Kreeghor are knocking at the door and time is running out.
- *Star Wars:* The player characters are Clone Wars leftovers. The Empire/Rebel Alliance has discovered this base and want to stop/help the characters. Is there a Jedi in the house? The player characters are in a secret cloning facility; are they themselves clones?
- *Traveller/GURPS Traveller:* The characters could be agents leftover from the fall of the Second Imperium. Maybe the characters are a sub-project of the Phoenix Project? Did the Terrans have a Scortched Earth plan ready during the Solamni Rim War?
- *Trinity:* The characters are "colonists" awakening from their cryo sleep. They discover their psi powers and realize that they were just bait for a large band of Aberrants. Will they be able to hold off the threat long enough to be rescued? Why were they setup to lure the Aberrants out? Who is pulling the strings? What do they know that they shouldn't? Where are they?
- *Waste World:* The characters are secret commandos put here (exiled?) so that when the Metro Zone (pick one) needs them, they're ready (imprisoned in cryo sleep?). The characters awake before the time is right. Who's at the door? Who did this to them?

Pyramid Review

Warhammer, 6th Edition

Published by [Games Workshop](#)

Designed by Rick Priestley and Tuomas Pirinen

Boxed set; $74.99

Warhammer has been synonymous with miniature gaming for years. It is a game eagerly devoured by young gamers, scorned by old grognards, and envied by those who don't have the time, skill, or wallet for a horde of beautifully-painted miniatures.

After disappearing for a few months, *Warhammer* has been recently re-released in a brand new 6th edition. As with all Games Workshop's releases, the components are gorgeous. It comes with two ready-to-play armies -- the Empire, which is reminiscent of a Renaissance military with handgunners, cannons, and armored knights; and the nasty Orcs, complete with a boar-drawn chariot, archers, warriors, and a general. The game comes with a nice cardstock and plastic building, numerous dice, rulers, and templates, and a gargantuan, beautifully-illustrated 288-page rulebook.

Be prepared to spend several hours assembling the components, even if you don't intend to paint them. Some gamers find this the joy of miniatures gaming; others will pull their hair out cutting the plastic miniatures from their sprues and gluing them to their bases.

The rulebook is very comprehensive, especially when compared to older editions of *Warhammer*. It contains complete rules for battles, war machines, sieges, skirmishes (using the rules from the recently-released Mordheim game), and magic. Furthermore, it contains stats and point values for all units in the *Warhammer* universe, from High Elves and Dwarves to the Vampire Counts and Lizardmen. Of course, those wanting all the history and special abilities of their favorite army will probably want to buy the corresponding army books, also being re-released in the coming months. It is these books, along with special and elite units, that turn *Warhammer* into very expensive hobby.

Those not familiar with the *Warhammer* system will find it well-explained here. While perfectly functional, the system has aged a bit and is not as streamlined as it could be. Moves, maneuvers, and charges are done first, followed by shooting and melee combat. Combat is resolved by rolling handfuls of dice. Basically, each miniature in combat rolls a single die to hit; his target is based on a comparison of weapon skill. "Hits" are rerolled, now with the unit's Strength comparing with the target's Toughness. Lastly, these "wounds" can be nullified by the target's armor.

The end result is that a round of combat takes three dice rolls, two of which involve looking at simple charts. A modern system could probably boil that down to two or less die rolls and no charts at all.

Therein lies the criticism of the system. It is one-step too many for gamers wanting a quick, easily played wargame, and yet not sophisticated enough for the gamer who wants authenticity and a feel for detailed simulation. The *Warhammer* system lands exactly in between those extremes, and thus appeals to neither. To its credit, after playing a few games the die rolls and charts become second-hand, and the game is greatly speeded. But there are quite a few mechanics that could have been streamlined further, though with risk of alienating the previous editions' fans.

Unfortunately, *Warhammer* does not come with a reference card. There is simply no excuse for this in a game that relies on its to-hit and damage charts so much. Also, while it comes with over 70 plastic miniatures, the game becomes markedly more exciting with twice that number. To be fair, this is largely true of every miniatures game out there.

Basic boxed sets are just not enough to get the full experience; more is almost always better in this hobby.

The magic system has been completely overhauled by this new edition. While it used to rely on cards, it has been paired down into a simple dice system. Each army has its own spell list, and each turn its wizards generate dice that are used to cast them. Some spells are more difficult than others, and the player must use more dice to cast them. His opponent gains "Dispel Dice," which are used to counter successful spells. It is solid system, and players will find that wizards are neither overly influential (as in previous editions) nor ineffectual.

Those familiar with previous editions will be pleased to discover that heroes are not the combat gods they once were, and magic items are not all-powerful. The new *Warhammer* is much more about the units, formations, and troops, which is reflected by this edition's dark, brooding art style.

Overall, *Warhammer 6th Edition* is a solid release. As with all Games Workshop's recent games, it is expensive and requires much time. But, in the end, when you have two painted armies facing each other amidst a table of foam terrain, you can't help but enthusiastically reach for the dice.

Pyramid Pick

Creature Collection

Produced by [Sword & Sorcery Studios](#) and [White Wolf Publishing, Inc.](#)

Written by Andrew Bates, Kraig Blackwelder, Carl Bowen, John Chambers, Trevor Chase, Ken Cliffe, Geoff Grabowski, Jess Heinig, Jeff Holt, Mike Lee, Ben Monk, James Stewart, Cynthia Summers, Richard Thomas, Mike Tinney, Jed Walls, Stephan Wieck and Stewart Wieck

224 b&w pages; $24.95

Things have been tight around the Shafer household recently. Money isn't exactly easy to come by, so adjustments have had to be made. One of those adjustments is that I am selling plasma . . . I am selling the contents of my blood for gaming money. So now I judge all of my purchases by one simple rule: Is this worth my blood? God help me if I buy any live action roleplaying stuff for *Vampire*.

So this past week I'm able to pick up two different collections of Creatures and Monsters for the new *D&D 3E/D20* system, and as God is my witness, I really don't know what to think.

The *Monster Manual* is the third and last core rulebook for *D&D Third Edition*. As with the other books in the series it is printed in full color, is extraordinarily well bound, and sells for the bargain price of $19.95.

The 224 page book hits the ground running by skipping a table of contents and instead opens with a huge alphabetical listing of all the creatures in the book. This list includes the various animals, vermin, and templates (which are in separate appendices), and pushes the number of monsters in the book to more than 500.

The next ten pages are spent in delineating and defining the various terms which are used in the *Monster Manual* itself. These entries are concisely written, and defined with a focus upon playability. Every monster is defined by the

same sets of terms: name, size, type, speed, attacks, damage, facing and reach, special abilities, special attacks, special qualities, abilities, skills, feats. There are also listings for secondary stats, which we will look at in a moment.

The type (aberration, plant, undead) is an aid in defining the creature, gives a set of basic saving throws, and hit points, as well as providing a path for the creature's own advancement. In this game you can have your basic run of the mill monster, which is what the *Monster Manual* primarily consists of, but there are also rules for making said monster truly advanced and monstrous. Speed is nicely done in that all types of movement are defined, along with an elegant system for defining just how well a creature flies. Facing and reach help to define just how big a monster is on a grid, and just how far it can reach. This really helps the miniatures gamers.

One of the things that I can remember about *AD&D 1st Edition* is the arguments regarding a creatures special attacks and defenses. Within these first few pages the various special abilities, attacks and qualities are defined. For instance the special abilities are grouped as to whether or not they are extraordinary, spell-like, or supernatural abilities. All of these have effects on play as to whether or not said abilities are vulnerable to anti-magic type spells, and how often they might be used. My description of how they work is inadequate to describe their elegance in play. The fact that monsters are given ability scores is a huge change from earlier versions of *D&D*; in fact, the *DMG* has tables with all kinds of suggested monstrous PC races. This continues the emphasis of *D&D 3E* on giving the players and DMs options, flexibility, and elegance. I especially enjoyed the explanations of the game effects if a monster lacked an ability. For instance, Golems lack constitution, which means they are immune to any effect that requires a fortitude saving throw, unless the effect also works on inanimate objects. Monsters also have some new feats, including the nicely done "Flyby attack." PCs had better be more respectful of flying monsters now.

The secondary stats include climate/terrain, organization, challenge rating, treasure, alignment, and advancement. The usage of a challenge rating is very interesting, and is a godsend for DMs trying to balance encounters for parties. A DM can take the average level of a party, and this group of PCs should be able to defeat an encounter of the same challenge rating . . . after taking some damage, but without casualties. The focus isn't as much upon experience points, as in previous editions, but upon challenging the players.

These monsters are beautiful, and there are 178 pages of them. Most monsters are nicely illustrated, though the statistics can sometimes be scattered from one page to the next. This happens because the book is so jam packed. Most of the monsters are the old favorites (like orcs and trolls), but there are some nice new additions (like shock lizards and howlers). Most of the old standby monsters have been redefined in *3E* terms, and they are very well done. The emphasis upon playability really helps with such argument-generating monsters like the Beholder. It feels luxurious to have all of those classic bones of contention defined.

The book closes with three appendices: animals, vermin, and templates. 12 pages may not seem like a lot of space, but it is absolutely packed with all kinds of animals PCs could encounter in their travels. There are six yucky pages devoted to disgusting vermin like spiders and scorpions. The final appendix is a series of templates, which can be applied to any of the monsters contained in the book. This allows a DM to create goblin ghosts, kobold weretigers, or troll half-dragons (to name a few). Each template tells how it will change the basic creature, and then concludes with an example. These rules give the GM even more flexibility in their creations, even if they do require a bit of thinkwork at times.

The book concludes with another listing of the monsters by challenge ratings, and this, again, is very useful for the harried GM. I've picked up some interesting ideas just by glancing at the list, and it has helped to pull me away from what I typically like to do . . . surprising PCs is always nice.

The *Monster Manual* as a whole really feels like *AD&D 1st Edition*. As in the 1st edition book, not every monster is illustrated, and sometimes the information for a particular creature is scattered over a couple of pages. However, unlike 1st edition, every game effect of a creature's ability is very well defined, and much easier to implement. The 2nd edition of AD&D organized things by placing each creature upon one or two pages, and had a nice illustration for every creature. A large amount of this space was taken up by a larger eyesight saving font size, and a lot of information about a creature's habitat, culture, or ecology. Most of this information is not in the new *3E Monster Manual* . . . it seems that this version concentrates upon the game, while allowing the DM to fill in any missing details.

Perhaps that's why the big lists of encounter tables are in the *DMG*. This is an essential reference book, and it is a bargain at $19.95.

The first book out for *AD&D* was the *Monster Manual*. It was sometime later that TSR released the infamous *Fiend Folio*. It seemed that everyone had an opinion about this book, and that opinion was either love or hate. In *D&D 3E*, ironically enough, the first book of monsters out was not the *Monster Manual*, but Sword & Sorcery Studios' (a cooperative venture uniting White Wolf and Necromancer Games) *Creature Collection*.

The *Creature Collection* is a 224 page book, that is copiously illustrated in black and white. It is hardbound, but nowhere near as sturdy as the *Monster Manual*. It retails for $24.95, and includes over 200 creatures within its covers. This book starts out with a nice table of contents, and continues with a one-page introduction to the Scarred Lands. Unlike the *Monster Manual*, which was intended to be more generic, this book of creatures is tied to a specific campaign setting. There is no listing at the front of the book describing and defining all of the terms used in the creature descriptions; therefore, I assume this book is meant to be used as an adjunct to the *Monster Manual*, and not a replacement for it. All of the special abilities and neat little fiddly bits are held within the individual creature descriptions, which can mean more work for the DM.

Although this book uses the *3E* statistics, including the Challenge Rating, the general layout of the book seems to be following *AD&D 2nd Edition*. Each creature is illustrated, and described upon a single page (or more as needed). This means that the font is larger, and more campaign specific material is included. Much of the geographic information just goes over my head, but the mythical, societal information does seem to be coming together in my mind.

Some of the creatures are variants of monsters in the *Monster Manual*, such as Brewer Gnomes or Steppe Trolls, but many of them are very original creations. These creations aren't just creatures, but some that are specifically built within this world. I don't see most campaigns using Drendari, Demigoddess of Shadow, and fitting in the Carnival of Shadows might be difficult . . . but rewarding. I am particularly enamored of a race of Ratmen, and a nice variant upon zombies, the Morgaunt.

This book concludes with two appendices: three pages describing the Gods of the Scarred Lands, and two pages containing both the Open Gaming License (OGL) and the D20 System License. Unfortunately the book does not conclude with a nice listing of the creatures by challenge level, or any cool templates. For that matter there aren't even any encounter tables, but I presume that these will be in the Scarred Lands book itself.

One of the notable elements of this book is that it was published under the OGL and D20 system License. Whoever heard of a company opening up this much of its system, and allowing another company to create product that could potentially conflict with their own?

As with the *Fiend Folio* I suspect that people are going to either love or hate this book. I have one player that will have fits with the Morgaunt, and he won't like that one bit. Some will want more monsters, others might wonder if the challenge ratings are balanced, and some might quibble with paying $5.00 more and getting around 300 less monsters. Still I feel that this is a very good book, and many if not most of these creatures can be placed into any DM's world with a minimal amount or work.

I am quite satisfied with both books, and feel that they are both worth my blood. One of these books you have to have (the *Monster Manual*), and the other you want to have (the *Creature Collection*). The *Monster Manual* is an essential reference work, that even the *Creature Collection* should be fully useful to a DM. Both are well-organized, with a definite bent toward playability. The *Creature Collection* has some very original creations, and it is fully compatible with *D&D 3E*. but if I had only enough money for one book I'd have to pick up the *Monster Manual*.

-- Scott Shafer

Appropriate Challenges? Hah!

Two weeks ago I tried to kill my players' characters.

This is not to be confused with the time I tried to kill my players with my delicious-but-deadly medium-rare Shake 'n' Bake Chicken.

No, in the last session I ran for *Aberrant*, I had a fairly standard scenario: A major NPC was being held hostage by a Bad Guy, and the Good Guys needed to swoop in, defeat the Bad Guy, rescue the NPC, and fly away to victory. But there was a *slight* snag in this:

I made the Bad Guy about 20 times more powerful than the Good Guys.

This was intentional; this is not like my first time running *GURPS Supers*, where I had an NPC casually toss a fireball and casually kill a PC, because I casually didn't have a freakin' clue about how deadly casual *GURPS* combat could be. No, I made this guy really powerful. And I *knew* there was a very real chance that the PCs would barge in, guns-a-blazin', and in one shot get killed.

Because I was fighting against what is (in my opinion) the Big Lie.

In the past I've joked with my players about *Dungeons & Dragons*:

Fighter: "Does anyone else find it odd that, when we all started out adventuring, we encountered some kobolds and goblins. And they were a challenge equal to us. Then a few months later we encountered those bugbears led by ogres. And they were tough, but we were a bit more experienced. Isn't it odd how we always face challenges of equal merit?"

Magician: "The same thing happened to my father, the Wizard Fizbin. He started out fighting gnolls. Last time he wrote, he was exploring something odd in a dungeon by a sleepy little hamlet; turns out it was a lich. He was pretty hurt."

Fighter: "All I'm saying is, if we'd encountered those beholders just a few months ago, we'd all be dead."

The Big Lie says that encounters will always be balanced for the players; encounters will be challenging for players, but if they're smart (and perhaps a bit lucky) they should prevail.

How unrealistic is *that*?

Admittedly, not all games are like that *per se*; *Shadowrun* is often built around the idea of sneaking into (and out of) a situation much too powerful for them to encounter directly, and *Call of Cthulhu* PCs are seldom in command of the situation.

But in general, it's rather assumed that GMs will develop challenges equal of the abilities of the players. I've never heard of, for example, first level characters being led to a dungeon with an adult red dragon in it. So, I ask myself -- Why?

It's certainly not realistic; In the real world, people often find themselves in situations that they cannot hope to control. People also find themselves in situations they can trivially prevail over.

I think the prevailing wisdom is that it's not fun to either stomp all over the opposition *or* to be trampled on. And there's a certain amount to be said for that; RPGs evolved out of the wargaming tradition, and most wargames and board games (and other games) are built around the idea of a fair challenge on both sides. But as a counterexample I point to the popularity of major league sports. Although the two sides are seldom equally suited, they're arguably often fun to watch *because* of that. It's exciting to watch the undermatched team struggle to hold its own against a powerful team (and occasionally prevail). And it's equally interesting to watch a powerful team you like overwhelm lesser

teams. (I'm a Florida State University alumni; I know of what I speak.)

Now as it turns out, in the adventure two weeks ago the Mega-Perceptive character took a turn to try to figure out who the Bad Guy was, and succeeded phenomenally; as such I was able to tell him the level of threat. As a result, they were able to rescue the NPC and flee, with only one of the two PCs being knocked to near-death (because he dodged).

In fairness, I've also had situations and encounters in the past where my PCs *greatly* outclassed the opposition. (In the **Vampire: The Dark Ages** game I ran, the Bad Guy anarch *knew* the PC was a vampire elder . . . he just didn't know *how* elder she was. It was brief. It wasn't pretty.)

Anyway, my point is, if players *know* everything they encounter will be challenging but surmountable, how exciting is that? On the other hand, if, with every encounter, they can't be sure whether they'll walk away from it alive, that makes each incident more potentially exciting and memorable. (Conversely, for those groups that have compunctions against killing or inappropriate uses of force, if it's made clear that there's a chance they may greatly overpower the opposition, the odds are greater they may avoid using lethal or excessive force until they know the nature of the threat.)

For the most part, I try to make my challenges equal to the characters. But that's by no means a given. And I certainly hope I make my adventures more memorable because of it.

Using Cards

GURPS was designed to be a straightforward, "realistic" roleplaying game, where often the best choice in a combat situation is to avoid combat altogether. Players have a wide range of capabilities, and are encouraged to use ingenuity to stack the odds in their favor; however, when it finally comes down to a simple roll they are ultimately at the mercy of the dice. Having the ability as a player to push the odds in one's favor, especially for those oh-my-gosh-please-roll-a-one moments, can be a lifesaver.

GURPS Dramatic Card Play

Introducing cards to game play can be a simple and effective way to give players that lifesaver. Players draw and collect cards, each with a different effect, and may play these any time they see fit to briefly improve their odds. This can heighten drama and provide players with the sense of control, however tiny, over the cold odds of luck. Dramatic card play can always be useful, and may be especially appropriate for cinematic-style games.

The basic premise is simple: at the beginning of the game, each player draws three cards, which form their hand. Players may also spend one character point to draw three more cards -- either to replenish an empty hand or to increase the size of their own hand past the original three. GMs may (or may not) want to limit the maximum size of the hand, depending on the tone of the campaign and how many options they want the PCs to have. Each suit corresponds to a different character attribute: strength, dexterity, health, and intelligence. Players may only apply the effects of each card to its corresponding attribute (for example, a player with a 5 of cups cannot use that card for a Dexterity skill attempt).

Included are rules for using both standard card decks and exotic Tarot decks. The benefits and drawbacks of each are explained, followed by a breakdown of individual card abilities. It is suggested that Gamemasters allow trading of cards among players, but only in particularly dramatic scenes and when the characters are physically near one another.

Playing with a Standard Deck

While not as colorful and interesting as Tarot cards, the typical card deck, the one used for Poker and other common card games, is certainly more accessible. Many grocery stores sell decks of cards, often in a variety of styles (Bridge, Go Fish, etc.) and sometimes even with cartoon characters. Gamemasters may even already have several decks around

the house. Using a standard deck has more benefits, however, than being easy to find -- there are also fewer cards. The standard deck is derived from the Tarot, but the Minor Arcana (the suits, or all the cards from Ace to King) have changed slightly over the years and the Major Arcana has totally been dropped. That is, with the exception of The Fool, which has become the Joker card.

Playing without the Major Arcana does speed game play. Major Arcana cards have specific, individual effects, and players will need to consult a chart for a while to remember what each card permits. Without these special cards, abilities are limited to straight numeric benefits attributed to one of four suits (see below).

The Deck

As mentioned earlier, every "suit" corresponds to a *GURPS* character attribute: ST, IQ, DX, and HT. They break down as follows.

- **Clubs:** Clubs represents the attribute of Strength. All Clubs cards must be played for ST attribute or skill rolls.
- **Spades:** Spades represents the attribute of Dexterity. All Spades cards must be played for DX attribute or skill rolls.
- **Diamonds:** Diamonds represents the attribute of Intelligence. All Diamonds cards must be played for IQ attribute or skill rolls.
- **Hearts:** Hearts represents the attribute of Health. All Spades cards must be played for HT attribute or skill rolls.

All suits contain a range of numbered and "faced" cards ranging from Ace (representing the number one) to the King. In this case, standard number cards include the Ace card. The value of all number cards is used instead of a regular skill or attribute roll by adding the face value of the card to a roll of 1d. In other words, the number on the card takes the place of two dice out of three in a skill or attribute roll; the third die must still be rolled and added to the card value.

Example: Greg is attempting to roll a skill use for Stealth, with no penalties or bonuses. Ronen has a 10 Stealth skill. Greg possesses a 5 of Spades cards and decides to use it. The five on the card now counts as the sum of two of the three dice. Greg must roll the third and final die to determine the outcome. He does so, and rolls a 4, giving him a Stealth attempt of 9 (5 + roll of 4 = 9). He succeeds! If he had rolled a 6, the result would have been 11, greater than his Stealth, and he would have failed.

Obviously, players holding Ace cards and those of low number have a strong chance of succeeding most actions. The opposite holds true, though, of higher number cards -- a player with a 10 of Diamonds needs a 16 or higher in a mental skill or risk failure!

Face Cards

"Face" cards refer to all suited cards showing a character, which are the Jacks, Queens, and Kings. These cards work by temporarily adding points to the character's skill level. A player spending a face card may apply a bonus, but again, only to the attribute associated with the card's suit.

- **Jack:** All attribute or skill rolls are at +1 for one round.
- **Queen:** All attribute or skill rolls are at +2 for one round.
- **King:** All attribute or skill rolls are at +3 for one round.

The Joker: The Joker is a Wild Card; that is, players may use Joker cards to substitute any card in the deck. A player with a Joker card may use it as a 5 of Hearts, a Jack of Spades, or an Ace of Diamonds, etc. Some decks do not include a Joker; to be safe, Gamemasters wishing to incorporate the Joker should be sure to purchase a Poker deck.

Playing with the Tarot

Gamemasters looking for more atmosphere, and who are not overly superstitious, may find the use of a Tarot deck to be more atmospheric and dramatic than a standard card deck. The Tarot cards are used in a similar fashion -- three form a hand, and may be played for the corresponding attribute -- but bring added benefits with the Major Arcana. The drawback to Tarot use is that decks are much harder to find and can be expensive. A standard Rider-Waite deck, the most common Tarot set, can run anywhere from $10 at a chain bookstore to $40, $50, or more at a magic shop or spiritual bookstore. This added investment may compel Gamemasters to be overly sensitive about the condition of the cards in their deck. Another drawback is that, since the Major Arcana are used, players and gamemasters alike must memorize more effects (or have a chart handy). Tarot decks work especially well, though, with *In Nomine* campaigns and other games based on the supernatural or spiritual.

As with the standard deck, each suit corresponds to a *GURPS* attribute:

- **Wands:** Wands represents the attribute of Dexterity. All Wands cards must be played for DX attribute or skill rolls.
- **Cups:** Cups represents the attribute of Health. All Cups cards must be played for HT attribute or skill rolls.
- **Swords:** Swords represents the attribute of Strength. All Swords cards must be played for ST attribute or skill rolls.
- **Pentacles:** Pentacles represents the attribute of Intelligence. All Pentacles cards must be played for IQ attribute or skill rolls.

The Minor Arcana

The term "Minor Arcana" refers to all numbered cards and face cards of the suits Cups, Swords, Wands, or Pentacles, including Aces and Face cards. Numbered Minor Arcanum have a worth based upon face value of the card, which may be used instead of a regular skill or attribute roll by adding the face value of the card to a roll of 1d. Aces have a face value of 1.

Example: Michelle has the 4 of Wands card in her hand, and is attempting to roll Acrobatics, which she has at skill level 8. She plays the card and rolls 1d, getting a 3. These add to 7 (Wands 4 + roll of 3), providing a successful result. If she rolled a 5, the result would have been above her skill, and she would have failed.

Minor Arcana face cards provide temporary (one round) bonuses as per following:

- **Page:** Attribute or skill is at +1.
- **Knight:** Attribute or skill is at +2.
- **Queen:** Attribute or skill is at +3.
- **King:** Negates the default penalty for one skill which the character does not possess.

The Major Arcana

"Major Arcana" are those cards which do not fall into a suit, and have an individual name (such as Heirophant, Magician, Tower, and Fool). Each of these cards has a special application which may or may not directly affect an attribute or skill roll. There are 22 of these cards, and each has a different effect -- these effects are listed below. The numbers for each card, located on the face of the card itself, are given for ease of reference. Following each title is a one-word description of the card's representation, as one might hear in a fortune reading, and this is followed by the card's application. Major Arcana are unsuited; that is, they have no connection to a specific attribute, and so may be played for any attribute or skill.

0.	**The Fool:** *Folly.*	Provides +1 bonus to any skill that carries the risk of immediate drastic results upon failure.
I.	**The Magician:** *Diplomacy.*	Adds +1 to any skill used to persuade or convince another.
II.	**The High Priestess:**	Provides +1 to skill used to extract information from an intelligent subject.

	Mystery.	
III.	**The Empress:** *Action.*	Adds 1 point to Passive Defense for one round.
IV.	**The Emporer:** *Protection.*	Adds 1 point to Damage Resistance for one round.
V.	**Heirophant:** *Alliance.*	Provides +1 each for two or more characters performing the same action simultaneously.
VI.	**The Lovers:** *Attraction.*	Adds +1 to any Reaction roll.
VII.	**The Chariot:** *Providence.*	Any one action taken to rescue or prevent harm to another character is at +1.
VIII.	**Strength:** *Courage.*	Player may roll one Will roll or Fright check at +1.
IX.	**The Hermit:** *Treason.*	Provides +1 to any skill used to conceal an item or person from discovery.
X.	**Wheel of Fortune:** *Destiny.*	Allows character to take first action in combat round sequence.
XI.	**Justice:** *Equity.*	All players may refill their hands to equal the person with the most cards.
XII.	**The Hanged Man:** *Wisdom.*	Player may ask gamemaster one yes-or-no question and receive a truthful answer.
XIII.	**Death:** *Mortality.*	Allows a critically injured character to void one HT roll for death.
XIV.	**Temperance:** *Frugality.*	Player may retain one card after spending it.
XV.	**The Devil:** *Violence.*	Adds an extra die of damage to an attack roll.
XVI.	**The Tower:** *Calamity.*	Allows character second attempt for failed action at -3.
XVII.	**The Star:** *Privation.*	Adds +1 to any skill used for purposes of theft.
XVIII.	**The Moon:** *Hidden Enemies.*	Provides +1 to skill attempt to discover hidden objects or adversaries.
XIX.	**The Sun:** *Fortune.*	Player may roll four dice and choose best three for one action.
XX.	**Judgement:** *Renewal.*	Player may refill hand (not exceeding beginning maximum).
XXI.	**The World:** *Voyage.*	Character's Move score at +1 for one round.

Note: Some Tarot decks may contain a blank card which gamemasters may wish to incorporate as a wild card.

Conclusion

The use of cards in game play does not need to be confined to the players. Gamemasters may elect to hold a hand of their own, to be used as an "NPC hand" from which any non-player character, good or evil, may play. A system might also be devised by which one card is flipped every round, changing the flow of the action (perhaps using a standard card deck to determine initiative, morale, luck, or other changing fortunes of combat). The most important consideration, though, is whether card use is enhancing the game. It should never be allowed to destroy the flow of an adventure or to add fuel to already over-powerful characters. As with any rule, if it isn't fun, don't allow it!

Pyramid Review

Letters of Marque: Starship Deckplans
Letters of Marque 2: Troopship Deckplans
(for Noble Armada/Fading Suns)

Published by [Holistic Design](#)

Designed by Chris & Tracy Wiese

Ten 17" x 22" maps + Noble Armada Ship Display sheet (Letters of Marque), Nine 17" x 22" maps (Letters of Marque 2); $14.95 each

In my mind, there's no better way to truly understand that you're living in a tin can in space than to have a map of that tin can. When you realize that your living quarters are about a hundred square feet, and you're sharing a room with two other marines, you begin to *really* appreciate the mess hall. It's the room with a luxurious six chairs *and* a table.

Letters of Marque and *Letters of Marque 2* contain ships that are designed for the *Noble Armada* miniatures game, which is set in the *Fading Suns* universe. But they are also "approved for use with *Traveller*" and should be useful for many science fiction games where 25mm-scale maps of ships might come into play. I bought them because of my interest in the *Fading Suns RPG*.

Letters of Marque: Starship Deckplans has five ships. The al-Malik *Odyssey* class explorer is a small ship designed for a small crew . . . about what you would expect a mid-level band of PCs to acquire. The Merchant League *Sentry* class escort is slightly bigger, and would be suitable for 10-12 crew and passengers to travel in comfort (I'm guessing; see below). Two of *Fading Suns*'s competing noble houses, the regal Hawkwoods and the untrustworthy Decados, are represented by two large frigates (each is represented by two 17" x 22" maps). And finally there is a gargantuan Luxury Liner, which is four decks deep and consists of four 17" by 22" maps.

Letters of Marque 2 consists of four ships. There is the torpedo-like Hazat *Stalker* class explorer, again suitable for a standard crew of heroes. The even-longer Hazat *Scorpion* class frigate, which consists of two 17" x 22" maps, immediately evokes images of broadsides and boarding parties (though whether this ship would be the boarder or the boarded is debatable). And, again, the factions of the Decados and Hawkwoods are represented by two galliots, gigantic troop-carrying ships that take up three 17" x 22" maps (two maps for one level and one map for the other).

These maps are exceptionally well done and logical, and they are all very believable; as you wander a miniature down the corridors, it's easy to think this is how they *really* exist. Each faction also has its own style and architecture; from the boxy-but-good Hawkwood vessels to the angular Klingon-like features of the Decados ships to the sweeping curved shapes of the Al-Malik, you really get a sense of the cultural differences. Of course these ships all have bridges, and gunnery stations, and engineering sections, but that's not all. There are bathrooms, and showers, and mess halls, and everything else that makes shipboard life "real." For campaigns where shipboard interactions or daily routines are important, these deckplans can be a real boon. Each ship also contains a more standard "art" drawing, which is useful for understanding what the thing would look like.

These maps are also somewhat useful for generating adventure ideas. What can be in the concealed closet in the noble's chambers? What happens when the back half of the ship explodes and the airlock seals? What if the PCs needed to sneak aboard a galliot?

But these maps do have some problems. First off they are *only* maps; all game-specific information is located in the *Fading Suns* books, including some seemingly universal information (the number of crew and passengers the ship can hold, for example). At least *Letters of Marque 2* offers some details like suggested color schemes of the ships. These maps are also very unwieldy; unless you were planning on having a miniatures battle or specific encounter aboard a ship, most of these are too large for a GM to use in a game without significant troubles or photocopy reduction. (One deck of the Luxury Liner fully laid out is over four feet long!) I'm also not sure how useful some of these ships would be for non-miniatures battles; how often do you *really* need to know where the marines from a frigate are streaming out?

And, finally, there is the issue of cost. No matter how much I enjoyed these maps, my mind was still screaming at me, "It's $14.95 for four (or five) ships!" While this would have been a trivial purchase for me if it were, say, a 32-page book of 16 deckplans (at a reduced size for photocopy enlargement), it's much less so when I'm only getting four ships. If I don't *need* frigates in my campaign, then two of the five ships from the first collection are useless. The reduced number of ships also means that there are some glaring omissions. The Li Halan, for example, are not represented, nor are any of the church ships of the *Fading Suns* universe; of course, this isn't a problem for folks using these plans for non-*Fading Suns* games. Finally I feel I should point out that, for those who would want a complete set of deckplans, you'd need to pick up *Noble Armada*, since it contains other plans, like the Decados Stealth Ship.

All told, I'm afraid that, despite the quality of these deckplans, I can't really recommend these volumes unless someone has a compelling need for them (or they routinely roll around naked in money) . . . in which case they are wonderful. Of the two of them, I would probably recommend the first set more, since it contains two smaller ships that would likely be of interest to PCs, and the Luxury Liner, which immediately evoked many adventure ideas in me.

In the meantime, I'm going to look out the porthole in our tin can . . . *if* I can squeeze by the gunners.

-- Steven Marsh

The Strange Death of Mr. Edgar A. Poe

"In that which I now propose, we will discard the interior points of this tragedy, and concentrate our attention upon its outskirts. Not the least usual error in investigations such as this is the limiting of inquiry to the immediate, with total disregard of the collateral or circumstantial events. It is the malpractice of the courts to confine evidence and discussion to the bounds of apparent relevancy. Yet experience has shown, and a true philosophy will always show, that a vast, perhaps the larger, portion of truth arises from the seemingly irrelevant."
-- C. Auguste Dupin, in "The Mystery of Marie Roget," by Edgar Allan Poe

It's one of the cheap ironies of history that literary history is especially full of cheap ironies. The man who invented the detective story, Edgar Allan Poe, died of unknown causes in the city of his birth after almost completely disappearing from human sight for a week. When you combine the evocative power of Poe with the dangerous romance of antebellum America, stir in fiendish conspiracies and Missing Time, you hardly need laudanum to conjure up horrific visions indeed. Drink deep with me, then, of this heady cocktail, of the mysterious death of Edgar Allan Poe.

"We regret to learn that Edgar A. Poe, the distinguished American poet, scholar and critic, died in this city yesterday morning, after an illness of four or five days. This announcement, coming so sudden and unexpected, will cause poignant regret among all who admire genius, and have sympathies for the frailties too often attending it."
-- death-notice of Edgar Allan Poe, Baltimore *Sun*, Oct. 8, 1849

On September 26, 1849, the forty year old Edgar A. Poe, the most famous literary figure in America, bid farewell to his childhood sweetheart Elmira Shelton in Richmond, Virginia. His plan was to take a steamer to Baltimore, then transfer to the train to Philadelphia. He would spend one or two days in Philadelphia performing a discreetly lucrative ghostwriting assignment, then move on to New York, where he would collect his belongings and his mother-in-law Mrs. Clemm. Poe would then return to Richmond in triumph to marry the wealthy widow Shelton, and relaunch his career and American letters. That, at least, was the intention. Where, exactly, he departed from the plan may never be known; Poe reappears in the world of eyewitness documentation in Baltimore on October 3, apparently sunk deep in inebriated stupor and wearing shabby clothing obviously not his own. One Joseph Walker discovered Poe in Ryan's Tavern, and sent a note to Poe's friend Snodgrass summoning him to the scene. Snodgrass, and a cousin of Poe's named Herring, took him to the hospital. Poe raved in delirium, and when briefly lucid was unable (or unwilling) to say where he had been, or what had become of his clothing and luggage. He died on October 7, 1849, with the medical verdict being exposure compounded by alcoholic posioning. No autopsy was performed, and he was buried the next day in Baltimore.

Poe was not, as it turns out, a consistent alcoholic, being subject only to widely-separated (though devastating) binges. He had, in fact, recently joined the Temperance Society in Richmond, and later testimony (contradicting immediate reports) denied that he smelled of alcohol at all. Partially as a reaction to the jealous slanders of one Rufus Griswold, who painted Poe as a drooling drunkard and drug-fiend, Poe's latter-day defenders attempt to discern other causes for his death. Theorists have postulated a weak heart, epilepsy, diabetic coma, severe hypoglycemia, toxic shock syndrome, cerebral meningitis, and most recently, rabies.

"Poe's condition could easily have been the result of intracerebral trauma, and his lucid interval, if Moran's story can be relied upon, would even lend support to the diagnosis of epidural hematoma."
-- John F. Courtney, "Addiction and Edgar Allan Poe," *Resident and Staff Physician* (Jan, 1971)

At least one physician has determined (well after the fact) that a cerebral hemorrhage could account for Poe's symptoms, assuming for the moment that the contemporary testimony of Poe's "reek of alcohol" is ignored. In 1872, editor R.H. Stoddard combined the two theses, postulating (on rather circumstantial evidence) that Poe had been kidnapped off the street and imprisoned ("cooped") by political-party thugs, who had plied him with whiskey and drugs to commit vote fraud. After squiring him around to "eleven separate" balloting places, they abandoned him at Ryan's Tavern (the fourth-ward polling place) to die. Although this practice was common in nineteenth-century urban America, and although October 3 was the date of a state-house election, further research in the papers indicates that there was almost no "cooping" reported from Baltimore that year. In *Midnight Dreary: The Mysterious Death of Edgar*

Allan Poe, John Evangelist Walsh theorizes (based more soundly on allusive hints and rumors in contemporary letters) that Elmira Shelton's brothers, staunchly opposed to their sister's marriage to the alcoholic, womanizing, generally depraved, and (most importantly) impoverished Edgar Poe, set upon him in Baltimore and either beat him up or forced whiskey upon him, counting on Poe's own debauched behavior to either finish the job or humiliate him so publicly that the engagement would be cancelled.

"He laughed and threw the bottle up-wards with a gesticulation I did not understand. I looked at him in surprise. He repeated the movement -- a grotesque one. 'You do not comprehend?' he said. 'Not I,' I replied. 'Then you are not of the brotherhood.' 'How?' 'You are not of the masons.' 'Yes, yes,' I said, 'yes! yes.' 'You? Impossible! A mason?' 'A mason,' I replied. 'A sign,' he said. 'It is this,' I answered, producing a trowel from beneath the folds of my roquelaire. 'You jest,' he exclaimed, recoiling a few paces. 'But let us proceed to the Amontillado.'"
-- Edgar Allan Poe, "A Cask of Amontillado"

Certain other details give credence to Walsh's theories. Either in July or late September of 1849, Poe burst in upon his friend, the Philadelphia engraver John Sartain, in (as his 1877 biographer William Gill records) "dread of some fearful conspiracy against his life." Poe's first words to Sartain are evocative, and beautifully vague: "Mr. Sartain, I have come to you for protection and a refuge. It will be difficult for you to believe what I have to tell -- that such things could be in this nineteenth century. It is necessary that I remain concealed for a time." According to Sartain's somewhat confused later testimony, while on the train to New York Poe overheard (thanks to his "marvelous powers of hearing"-- shades of Roderick Usher!) a trio of villains plotting to kill him. He eluded them at Bordentown, New Jersey, and with the help of Sartain (and apparently another friend, the author George Lippard) he laid low and left Philadelphia in disguise after clipping off his mustache.

The "three conspirators" combined with the rumored allusions to "brothers" who sought revenge on Poe can be spun in a widening gyre by the properly Illuminated GM. Poe was a dedicated anti-Mason, openly incorporating savage parody of their rituals and secrecies in such stories as "A Cask of Amontillado," "The Devil in the Belfry," and "Never Bet the Devil Your Head." (Satanist Freemasons, one imagines, would be doubly irritated by the latter two of these.) In the latter story, a man is beheaded under a covered bridge, sparking echoes from the Masonic-Templar Baphomet and the bridge-symbolism so prevalent in some Scotch Rite degrees. (Interestingly, a bizarrely runaway train smashed his gravestone while it was still in the stonemason's yard.) Could Poe's other stories, of codes, and robed inquisitors, and bizarre lineages, and fiendish murder have also hidden references to some arch-conspiratorial plot of black magicians in antebellum New York? (Marc Olsen uses this theory to lurid ends in his shocker novel *Poe Must Die*.) What secrets had the investigative journalist and father of detective fiction uncovered that They would kill to protect?

"When I returned I found him in a violent delirium, resisting the efforts of two nurses to keep him in bed. This state continued until Saturday evening (he was admitted on Wednesday) when he commenced calling for one 'Reynolds,' which he did through the night up to three on Sunday morning."
-- letter of Poe's attending physician, Dr. John J. Moran, to Mrs. Clemm, Nov. 15, 1849

In 1885, one George Rollins came forward to identify himself as the train conductor on Poe's final rail voyage from Philadelphia to Baltimore. He describes the figures shadowing Poe (apparently Sartain's help had only temporarily distracted them), saying they looked like "sharks." What if, rather than colorful nineteenth-century metaphor, Rollins' description were the literal truth? Would Poe's literary heir (who, like Poe, received detailed inspiration from dreams) H.P. Lovecraft have recognized them as akin to the Deep Ones of Innsmouth? Would this explain why Joseph Walker, whose peculiarly reticent and tentative note almost saved Poe's life, was found drowned in Baltimore's Spring Gardens, despite being a good swimmer? Would it, somehow, connect to the mysterious figures who appeared to Poe during his July incarceration in Philadelphia's Moyamensing Prison; a radiant woman in white and a "cauldron of boiling liquid"? What Dark Grail did Poe sip from to send him nearly to suicide upon his release?

In this connection, his final call for "Reynolds" takes on added interest: Poe knew, as far as can be told, nobody named Reynolds -- but maintained a compelling interest in the journalism of one Jeremiah Reynolds, whose incessant campaigns on behalf of the Hollow Earth sparked the Wilkes Antarctic Expedition in 1838. In fact, Reynolds' work became a model for "The Narrative of Arthur Gordon Pym," in which an Antarctic Expedition meets an unnamed doom at the hands of a mysterious white figure. During his last week, had Poe managed to communicate with

Reynolds and discover the ultimate truth behind the conspiracy, a truth that led to the deep, dark waters of the Antarctic Ocean? Between Elder technology and GM intervention, Poe's last week could have taken months of extra-temporal experience on the astral plane or in the misty realms of sub-history. After seeing the edge of the gulf for himself, perhaps using opium or some rarer substance, did he revisit the Lady of the Cauldron for guidance? Did he die, perhaps raving "Tekeli-li!" in seeming delirium, to preserve a secret Man Was Not Meant to Ratiocinate? Only the Antarctic Rite Mason Shark-People (and of course the GM) know for sure.

The X Fools

by Doc Cross

Art by Phil Foglio and Colored by Keith Johnson

Greetings, fellow *Toon*sters! In the never-ending quest to find new sources of material to fine *Toon*, we hereby present to you our version of the X Files cast along with a few adventure seeds. Use them in your *Toon* games in any way you see fit and remember . . . The Spoof Is Out There.

Fax Muledeer

Muledeer is a six-foot-tall humanoid deer. He has short antlers and a rather large nose. He usually wears dark suits. Fax is the TBI (Toony Bureau of Investigation) agent in charge of the X Files. X Files cases involve strange, unexplainable and paranormal events. Fax is the perfect person to investigate these cases, because ever since his sister was abducted by aliens he believes in all of that kind of stuff. Aliens, monsters, spontaneous human combustion, worldwide conspiracies, psychic powers, mind-controlling roleplaying games about cartoon characters . . . Fax is sure they all exist. In fact, his superiors at the TBI put him on the X Files just to shut him up. It didn't work very well.

Fax lives in a small apartment and has few friends. In fact, he is a bit of a nerd when he's not actually investigating a case. About the only people he ever hangs around with are the Lone Punmen, and they are so geeky that even other geeks avoid them. Fax does seem to like his partner, Dana Screwy, but it has never ocurred to him to ask her out on a date.

Agent Muledeer always carries a gun, a cell phone that works *anywhere* under *any* circumstances, and a copy of the *Audabomb Guide to Aliens & Monsters* in his back pocket. His Natural Enemies are Worldwide Conspiracies, Aliens, Mutants and Monsters.

Beliefs and Goals: Strange paranormal events *do* happen. (Note: Yes they do, but this is *Toon*, so most characters will hardly notice them.) There *are* monsters and mutants out there. (Note: See previous note.) Aliens *do* visit out planet and they kidnapped my sister, Samantha. (Note: His sister was *not* kidnapped by aliens. She actually just changed her name and went to live with the family down the street to get away from her nutty brother.) A powerful conspiracy that reaches to the uppermost levels of world governments is keeping all of this secret. (Note: The conspiracy *does* exist, but they aren't much of a secret. They are listed in the yellow pages of the phone book under "Worldwide Conspiracies.") I will find out what happened to my sister and expose the conspiracy. (Note: Yeah, right.) Along the way, maybe I can get my partner, Screwy, to believe that these things are real. (Note: Never gonna happen.)

Dana Screwy

Agent Screwy is just about the complete opposite of Agent Muledeer. She refuses to believe in *anything* strange or paranormal, even if she sees it. Dana will always try to find the logical scientific reason why something happens. If she ever *is* present when something totally weird happens, her Incredibly Bad Luck will kick in and she will be knocked unconcious, boggled, blinded or otherwise made unable to witness any proof of what Muledeer has tried to show her. Muledeer, on the other hand, sees strange beings and events all the time.

Dana Screwy is a doctor and a scientist. She was put on the X Files to prove that Muldeer is crazy (What? Crazy *Toon* characters? No way!), but she keeps wanting to believe that he might be onto something. She thinks they might have a logical explanation, although she has no clue what it might be. She DOES believe in the Conspiracy, but she thinks that it is mostly involved in mundane things like making VCRs impossible to program and feeding kids mystery meat in school cafeterias.

Agent Screwy has red hair and dresses in dark suits, like most other TBI agents do. At 5 feet tall, this humanoid squirrel doesn't look tough, but she is. She always carries a gun, a cell phone just like Muledeer has, and an evidence collection kit in her back Pocket. Her Natural Enemies are Worldwide Conspiracies and Male Chauvinists.

Beliefs and Goals: Muledeer *can't* be right, but there are unexplained things going on. All I need to do is find the scientific explanation and everything will be okay. There is a conspiracy out there and I'll help Muledeer expose it. I don't take any guff from macho men. I'm going to try to help Muledeer be less of a dork.

Assistant Director Skinny

Walter Skinny is an Assistant Director of the TBI and Muledeer and Screwy's boss. He knows all about the worldwide conspiracy and doesn't like the fact that they force him to help cover things up. He tries to get Muledeer and Screwy to not investigate things the conspiracy is involved in, but they do it anyway. Skinny actually does believe in some of the weird things Muledeer investigates, but he won't risk his career on things that have no hard proof. Except hair-growing tonics.

Assistant Director Skinny is a 6-foot, 4-inch tall humanoid cat with a bald head and glasses. He usually wears the official TBI dark suit, but without the jacket. Skinny is pretty strong and can kick some butt if he gets mad. His Natural Enemies are Worldwide Conspiracies and people who call him "Baldy." He carries a gun, a TBI rules and regulations book and a bottle of hair growing tonic in his Back Pocket.

Beliefs and Goals: Muledeer and Screwy need to follow the rules, even if they are onto something paranormal. Try to convince them not to oppose the conspiracy. If you can't do that, then at least try to keep the conspiracy from making them Fall Down. Mess up conspiracy plans if you get the chance. Keep trying hair growth tonics. One of them *has* to

work.

The Bubblegum Chewing Man

This guy is the head honcho of the worldwide conspiracy. Called BCM for short, he is responsible for all of the secret projects and alien collaborations that Muledeer and Screwy stumble upon. He always manages to cover things up before the agents can expose things. BCM knows what happened to Muledeer's sister, as well as other big secrets like what really happened at Roswell and why hot dogs come 10 to a pack but hotdog buns come 8 to a pack.

BCM is a 5-foot, 10-inch human with dark hair and a wrinkled face that almost never shows any emotion. He speaks in a very calm, but tired sounding voice. BCM contantly chews bubblegum and blows bubbles in people's faces. This guy is very dangerous and will not hesitate to drop an anvil on the head of anybody that gets in his way. He carries a gun, a stick of dynamite and a five-pound bag of bubblegum in his Back Pocket. His Natural Enemies are Everybody.

Beliefs and Goals: Nothing must stop the conspiracy from achieving its goals, whatever they are. I can never quite remember. Make sure that Muledeer and Screwy never can prove anything. If anyone gets in my way, I'll make them Fall Down. Always carry plenty of bubblegum.

The Lone Punmen

The Lone Punmen are three guys who spend all of their waking hours investigating conspiracies and writing about them in a newsletter and on the internet. They are also pretty interested in anything paranormal, so naturally they are friends of Muledeers. If Muledeer or Screwy have a question about something strange or need a piece of evidence analyzed, they will come to the Lone Punmen.

The Punmen don't seem to do much besides hang around their secret headquarters talking about conspiracy theories and goofing around on the internet. Once in awhile they play roleplaying games like *Dungeons & Toons* or *Mektoon*. They are all terribly geeky and try to flirt with Agent Screwy every time they see her. Their Natural Enemies are Worldwide Conspiracies, Cool People and Monsters Who Eat Nerds. They carry anything the Animator thinks is funny in their Back Pockets.

The Lone Punmen are Shmohicky (a short humanoid frog), Gangly (a tall skinny humanoid dog), and Fryers (a tall

humanoid chicken).

Beliefs and Goals: Conspiracies are everywhere! The truth must be told, even though everyone thinks we are crazy. Help Muledeer and Screwy whenever possible. Dana Screwy is a fab babe! We should try to remember to get lives someday.

X Fools Adventure Seeds

- *Unnatural Selection:* Screwy and Muledeer (and any other PCs) investigate what appears to be the work of a serial boggler, but soon find out that the main suspect might be evolving into a new life form: an Animator!
- *Pie In The Sky:* Muledeer is convinced that a UFO has landed in a small town in Oregon, but none of the inhabitants will admit to seeing anything strange even though aliens are walking all around the town! Naturally, Muledeer is the only one who can see them. Is the Conspiracy connected to this? Will Screwy try to sedate Muledeer so he can get some rest?
- *Squeezed:* In this one, somebody is getting into buildings through some *very* small openings. Once inside, the

crazed maniac (whose name is Eugene Toons) makes people Fall Down and then eats their hair. Can the agents capture him, or will he squeeze through their hands?

- *Where Wolf?:* A hairy howling creature is making people Fall Down (in several pieces) in Hollyweird. Muledeer and Screwy head for Tinseltown to stop it. Is it really a werewolf, or just another ***Toon*** character who has gone to the dogs? Time for Our Heroes to get out the good silver.
- *Alien/Aliout:* This adventure puts Muledeer and Screwy hot on the trail of the BCM and his alien buddies as they try to replace all the hotel doormen in New Pork City with alien clones. Would anyone in New Pork really care? Probably not, but Screwy and Muledeer will try to stop them anyway.
- *Jackalopus Illuminatus:* While helping the Secret Service loot and pillage the offices of a Texas game publisher, Muledeer becomes convinced that the companies president is really a mythical creature called a jackalope. Worse than that, Screwy finds evidence that the company is merely a front for the Worldwide Conspiracy. Featuring guest starring roles for Steve Jackalope, Steven Marshmallow, Duck Cross, David Pulverizer and Sean "Dr. Krime" Punched.
- *Have You Ever Had The Feeling You Were Being Sasquatched?:* During the investigation of mysterious disappearences at a remote forest research project, Screwy discovers some size 47 EEEEEE footpronts. Muledeer thinks it might be Bigfoot and he sets a trap using huge red sneakers. Screwy buys several cases of foot powder.
- *How Kenny Possibly Survive That?:* In a small and very strange town in Colorado, the agents investigate the case of an 8-year-old boy who Falls Down once a week, only to return to life in perfect health the next day. Will the local police officer help Screwy and Muledeer, or will he just call them "looky loos?" Will the local cafeteria cook want to make sweet love to Screwy? And who or what is leaving those smelly brown spots all over?

by Jonathan Souza

Art by andi jones and Colored by Keith Johnson

This *GURPS Black Ops* adventure is for a team of black ops, about four to six. They should have a good range of Science skills. However, *none* of the members can be psi-ops, as this would ruin a good portion of the adventure's plot and feasibility.

Heading To the Bottom of the World

The team is literally taken from whatever they're doing and shoved onto a tilt-rotor transport run by the Company. As they're flown into wherever they're going, the players should note that there is a CD player and CD on the deck. If they play the CD, a message is there for them from the Company.

> Greetings. Sorry about the short notice, but you're the only team we could get for this job and you're up for a big one. A research team in Antarctica has discovered what could be brainsucker worms in the ice. From what we know, the worms they have found so far are dead, but we can't take any chances of them finding live worms or dissecting the dead ones and revealing that they didn't come from this planet. Your job is very simple -- get down there, find out what they found, and deal with it, using extreme measures if necessary. As far as the team knows, you're coming down from UCLA to help analyze the discovery.
>
> There are two major problems. The first is that there is a big storm coming through the area. As of noon tomorrow, local time, nothing can fly in or out. Trying to go overland to any facility would be a slow form of suicide, so you're stuck there for the next few days. The second is that the clock is ticking; if they have found brainsuckers, they have to be Cocktailed and the evidence destroyed in six days; otherwise the only way to keep a lid on this is to kill everyone there. You now have dossiers on the people there, as well as your equipment. Good luck.

The CD destroys itself as it plays (mostly due to an overpowered laser in the CD player), and the team can sort through their equipment. What they have is the following:

- TL8 Cold weather survival gear, enough for every member of the team. It resembles the commercial, TL7 gear but allows for unaffected survival at -90 degrees F (TL7 gear will only protect up to -50 degrees F). The suits are also armored; treat as a full-body suit of heavy monocrys.

- Enough pistols (Glock 17 w/laser sight and barrel mods for silencers), clips of both subsonic and standard ammo to give each player four clips of each, and silencers for the whole team.
- Enough flame-throwers to give the team one flame-thrower per two members, plus one extra.
- Enough HAFLAs to give each team member two packs.
- TL8 biology science equipment; this gives a Science Op a +2 to any medical or biology rolls. As well, it allows for a link-up via Cistron to the Blacknet for access to more information.
- Assorted equipment of the player's preference, up to 50 kg per player.
- Enough survival rations and stored food to last two weeks.
- Enough doses of the Cocktail to handle 30 people.

By the team arrives at site (in six hours, after two mid-air refuelings), they should have a good idea of what their cover identities are and the four person team of scientists and the three-man caretaker staff of the camp are like.

The camp is called (with some odd optimism) Camp Sunny Days. Billed as one of the new "clean Antarctica" facilities, it resembles a cross with domes at each end of the cross's short arms, and a central dome. One of the arms is the living quarters for the camp members; these are set up dormitory-style, with each person having a room and a shower, with access to a central living and eating area. In an emergency, the rooms can be converted into makeshift cells by locking the door with a lock that can't be opened from the inside (needed if one of the people on the staff snaps during the long winter -- it has happened a few times before at other camps).

The central dome is a combination medical facility/research lab/maintenance section. Behind a locked and reinforced door (PD 4, DR 30) is access to an elevator which goes down about 90 feet to the camp's main power plant -- a Russian-designed and French-improved fission power pack. The power pack has more power than the camp will ever need (it's a two megawatt facility, intended to allow for growth of the base), and the package is entirely sealed. For ops that are sufficiently grim about it, there is enough nuclear material here to build two 1-kiloton devices. A backup diesel generator and enough fuel to last three weeks is also stored in a second shaft on the other side of the dome.

The remaining three arms are: a storage facility with supplies to last five months (six with rationing), a vehicle pool with four snowmobiles and two snowcats and the tools to fix them, and a combination refrigerator/cold lab for handling ice core samples. All of the dome walls are heavy cinder block bricks with reinforced concrete cores, covered in a layer of thermal-resistant material both inside and outside (about PD 5, DR 60 per hexside), and each dome has a backup diesel generator that can keep heat and power for a week.

By the time the team arrives, most of the people there are too busy helping the ops to unload and move their gear inside to notice how they got there -- and even if they do ask, the increasingly bad weather can cover just about anything. The three man caretaker staff (Peter Williams, Nboru Musafi, and Tom Kilroy) will help the players to get settled in. They will let them know that the research team was coming back with core samples that they had just acquired. An astute Science op can get to the samples already gathered (especially if the other ops run interference). The sample room is locked, but the lock is old and easily picked (give anybody that tries to pick it a +3 to the roll). Inside are the core ice samples and two of the "worms" they found. If the Science op makes their Biology or Xenology roll, they'll know that the worms are . . . well, kind of like brainsuckers. A critical success will tell the player that the worms have a lot of different structures than a normal brainsucker worm. Mutation or ice damage, the op isn't sure, but this isn't a normal brainsucker.

The Return of the Prize

About three hours after the team arrives, the science team gets back in, beating the early edge of the storm. By the time the science team gets the samples into the cold lab and gets out of their cold-weather clothes, the storm is fully upon them. The storm is worse that predicted, and even radio transmissions are fully jammed up -- for the next week they are literally on their own (even Ops gear like the Cistron can't get through the storm). Dr. Hunt will insist upon doing an examination of the newest core sample they found -- the one with four oddest worms in it -- and to get to them, the core sample has to be slowly heated as to prevent heat damage to the frozen tissue. This is a long and laborious process that will take several hours.

While the ice sample is being thawed, the team should get to know the members of the science team, especially Dr. Hunt. He will *immediately* be suspicious of the team, thinking that they might be here to steal his research after years of skepticism by the scientific community. As the sample is just about thawed, the whole science team and the ops are there to start examining the newly de-thawed worms when the heater explodes.

The explosion of the heater, due to a faulty heating element, should do no more than stun and give everyone ringing ears and a bad headache for the next few hours; unless they have their hands physically on the box, nobody should take any damage. (If they are touching or are near the heater, take 3D in electrical damage.) As people get patched up and things get cleaned up, they notice there's a problem:

The worms are missing. And there isn't a pile of splattered worm goo anywhere to be seen.

A New Kind of Future

Immediately, the ops should assume the first and biggest problem: that there are four brainsuckers loose. Yet nobody has any injuries to that effect or are showing "zombie" signs (information on brainsuckers should be available to the ops via their databases). Assuming the ops don't overreact and pull out guns and start doing crazy things, the hunt for the core samples should proceed slowly with no appearance of the worms. And if the ops go to guns? The three-man support staff regularly watch the scientists at work, and if they see the ops "go nuts," they'll break out their guns (.45 automatics and Kilroy has a 12 gauge Remington), and they'll try to talk the ops down, and if necessary shoot them.

As long as the ops don't go nuts, the hunt for what the players should be convinced are brainsuckers will probably end without results. They won't find anything except ice shards, and with some luck, the worms in storage can be explained away as any sort of primitive lifeform; in short, an easy job for the ops.

If only they had it so easy.

About a day after the explosion (and assuming the ops are looking for signs of brainsucker infestation), the should notice that certain people, perhaps even the ops themselves, are acting a little odd. This is not like a brainsucker infestation, but odd nevertheless. Dr. Hunt might forget his glasses (which he's blind without, as anyone can see just by looking at them) and is reading like he's got perfect 20/20 vision. Or maybe Emily seems a bit more cheerful. And maybe they'll notice that one of Peter's lost fingers is starting to grow back, slowly but surely.

The GM should choose four people (perhaps even one of the ops) and start having them be changed by the brainsymbiote (see description at the end). If the op(s) are being changed, pass paranoia notes the first two days of the change. After the first two days, the change itself is almost impossible *not* to notice. Whole physiques are being altered and people seem to be growing more intelligent and more agile, as if they were being improved from the inside out. Needless to say, the ops have to figure out why.

If the people infested by the brainsymbiote notice the ops attention (especially if one of them *is* an op; a good option is to tell the infested player what's happening after the game, or discuss it over the phone or e-mail), they will do their best to first avoid notice. This can include doing a lot of work alone or spending time by themselves in their own quarters. The second is to try and arrange for the ops to either have "accidents" or to keep the ops busy with other things. A third option is, if one or more ops is female, is to seduce the op and, even if they use birth control, to infest the op with a symbiote. Their goal is simple -- escape to keep themselves and the symbiotes alive, and have them expand and breed. While this goal and what the symbiotes may do is noble, the ops can't let it happen because of what else could result from their talents.

By the time the fourth day rolls around, even the normal people in the base have to notice that those infested aren't acting "right" anymore. While they might put this down to possibly stress, nearing a snapping point from working in such confined quarters, the ops have to realize that something is going horribly wrong and that the infested have to either be contained or destroyed. The moment the ops start to plan a cleanup of the infested (especially if some of the ops are infested), the infested will strike back. The primary efforts will be to stage lethal "accidents" of all sorts (poisonings in the science area, getting stuck outside with minimal protective gear, and such). If that fails, direct

violence becomes the option, made especially more lethal by the nature of the brainsymbiote itself. If one or more ops is a member of the infested, the team will have to face down their own, heavily armed and knowing all sorts of tricks and techniques to pull.

Assuming the players survive, the survivors among the base staff can be Cocktailed; a story about a burst of group paranoia would cover what exactly happened. While the Company would prefer that one of the infested is captured and brought home safe, their destruction would do just as well. The problem is that where the symbiotes were discovered is now covered in a huge landslide, making access to it impossible short of a nuclear strike -- and perhaps safeguarding its secrets for the ages.

Cast of Characters

Dr. Peter Hunt

A heavy-set, balding man in his middle 60's, utterly humorless.

ST: 11 **DX:** 9 **IQ:** 18 **HT:** 9
Advantages: Academic Status 4 (Professor), Status 2, Absolute Timing, Strong Will +2, Ally Group (Grad Students, 100 point allies, Appear fairly often).
Disadvantages: Bad Sight (farsighted), Overweight, Bad Temper, No Sense of Humor, Rivalry (Toshiro Sanjibe).
Quirks: Hates jokes made about his name (especially Mission: Impossible ones), has a dislike for undergraduate students, thinks that everyone in his field is a bunch of idiots, doesn't like computers.
Skills: Survival (Antarctica)11-, Biochemistry 21-, Genetics 21-, Zoology 21-, First Aid 12-, Research 19-, Computer Operation 11-.

To say that Peter Hunt is annoying but good is like saying the sea is a little salty. Utterly irritating to be around, able to annoy anyone without even trying, he is involved in several feuds with fellow biologists on the origins of life. Well known for the horn-rimmed glasses he wears, as well as his hatred of teaching anyone below the graduate student level, the assignment to Antarctica was intended to get him out of the way. He saw it as a change to prove the idiots wrong.

Emily Orr

Nervously thin woman, mid 20's, brown hair and gray eyes, always either too cheerful or too morose.

ST: 8 **DX:** 12 **IQ:** 20 **HT:** 10

Advantages: Alertness, Intuition, Academic Rank 0 (Graduate Student), Disease Resistant.
Disadvantages: Manic-Depressive, Workaholic, Stubbornness.
Quirks: Always wear something red, can't concentrate without something to squeeze, loves gummy bears (has a huge stash of them in her quarters).
Skills: Survival (Antarctica)12-, Biochemistry 14-, Genetics 11-, Zoology 12-, Research 20-, Computer Operation 14-, Karate Art 12-, Karate 14-, Savoir-Faire (Dojo) 11-.
Martial Arts Maneuvers: Back Kick 12-, Elbow Strike 14-, Kicking 15-, Knee Strike 11-.

Emily Orr is one of the few graduate students to survive (and this is an accurate term) her advisor, Dr. Hunt. The years that she has worked with him have most certainly taken their toll on her body, leaving her depressed with bouts of massive energy (Dr. Hunt ignores her depression and only sees her enthusiasm). Her Karate training was at the insistence of her parents, so she could defend herself if she was attacked, and she kept it up because it got her away from Dr. Hunt.

Toshiro Sanjibe

An ethnic Japanese man, early '30s, very pale skin with black hair and gray eyes.

ST: 9 **DX:** 10 **IQ:** 20 **HT:** 11

Advantages: Intuitive Mathematician, Academic Rank 0 (Graduate Student), Attractive appearance, Absolute Timing, One level of Wealth, Gadgeteer (15-point).
Disadvantages: Shy (minor), Skinny, Lecherousness, Rivalry (Dr. Hunt).
Quirks: Tells bad jokes, hates to be around smokers, works his best to try and beat the computer at calculations.
Skills: Survival (Antarctica)11-, Biochemistry 19-, Genetics 19-, Computer Operations 19-, Electronics Operation (Genetic Analyzer) 19-, Research 19-, Engineer (Genetic Testing)21-.

Toshiro Sanjibe is there only because he holds three different patents on genetic testing equipment. Dr. Hunt and he have a rivalry, apparently due to the money he made in creating several pieces of technology. This dislike keeps them cool during work in the lab, and avoiding each other otherwise. He likes Emily, but is nervous about saying it or even thinking it.

Richard Tomalin

Punk man, of late '20s, dyed blonde hair, green eyes, wears leather clothing whenever possible.

ST: 11 **DX:** 15 **IQ:** 14 **HT:** 12

Advantages: Disease Resistant, one level Strong Will, one level Fearlessness, Single-Minded.
Disadvantages: Bloodlust, Major Delusion (you have to wear leather or the dimensional creatures from World 4 will take over your mind), Odious Personal Habit (always hums off-key), Vow (always wear leather), On The Edge.
Quirks: Never eats beans, plays with anything that has a cutting edge on it.
Skills: Sports (Baseball)11-, Knife 14-, Brawling 16-, Language (Spanish) 19-, Survival (Antarctica)11-, Survival (City)14-, Computer Operation/TL7 14-. Zoology 19-, Research 18-, Genetics 18-, Drive Snowmobile 14-.

Richard Tomalin came from probably the worst part of Chicago, and somehow managed to survive the worst public schools to make it to the best in universities studying zoology. Eccentric, he always wears something made of leather near him (due to a bad reaction when younger to LSD) and keeps to himself when not working. With the exception of his dyed blonde hair (it's normally brown), the only real heritage of his punk days is several sharp knives he keeps nearby.

Peter Williams

A balding man in his late '40s, salt-and-pepper hair, with massive forearms covered in scars and tattoos.

ST: 16 **DX:** 11 **IQ:** 15 **HT:** 18

Advantages: Absolute Direction, Ambidexterity, High Pain Threshold, Immunity to Disease, Composed.
Disadvantages: Bully, Gluttony, Stubbornness.
Quirks: Perfectionist, Likes to harass the "new guys," doesn't admit to his sculptures.
Skills: Sculpting 12-, Breath Control 14-, Scuba 11-, Guns/TL7 14-, Judo 14-, Brawling 11-, Computer Operation 11-, Electronics 15-, Physics/TL7 16-, Mechanics (Snowmobiles) 14-, Mathematics 16-, Nuclear Physics TL7 17-, Gambling 11-. Survival (Antarctica)14-.

Formerly a nuclear reactor engineer on an American submarine, Peter Williams is here because he doesn't like the world. This, for him, is the best place for him to be. Any time he's in any other place, he usually tries to either drink people under the table or start a barroom brawl. He's the camp's power technician and main handy man, and is able to

fix just about anything that breaks.

Nboru Musafi

A very dark-skinned man in his '30s, shaved head, with a very long and lanky body.

ST: 10 **DX:** 18 **IQ:** 14 **HT:** 14

Advantages: Combat Reflexes, Composed, Toughness, three levels of Strong Will, Intuition.
Disadvantages: Bad Temper, Impulsiveness, Paranoia, Secret (Major, Committed a Murder and doesn't want to admit to it).
Quirks: Loves old movies, acts very pro-African American.
Skills: A/V Operation 12-, Computer Operation 14-, Brawling 11-, Guns/TL7 14-, Cooking 12-, Electronics/TL7 14-, Mechanic (Cars and Engines) 14-, First Aid/TL7 14-, Diagnosis/TL7 14-, Physician/ TL7 15-, Surgery/TL7 11-, Survival (Antarctica)12-, Driving (Snowmobile) 12-.

"Nboru Musafi" is actually Kevin Cooliage from the Bronx -- but he won't ever admit to it because he killed someone when he was about 16 in a hold-up and has been running ever since. Whenever he's out of Antarctica, his trips are *very* quick, usually to get more video tapes and DVDs for the four-channel "TV" network the camp has, running nearly continuously movies and videos that he picks up on his trips.

Tom Kilroy

A short man in his early '30s, dark hair and blue eyes, very well built.

ST: 18 **DX:** 14 **IQ:** 14 **HT:** 15

Advantages: Absolute Direction, Luck (regular), two levels Strong Will **Disadvantages:** Code of Honor (Pirate's Code), Compulsive Behavior (can't help but read anything he can get his hands on).
Quirks: Plays mumbly-peg with knives, will stop to read just about anything that he can read, will never let a problem lie down.
Skills: Judo Art 14-, Judo 14-, Staff 11-, Computer Operation 11-, Guns/TL7 15-, Cooking 16-, Mechanics (Cars and Engines)/TL7 14-, First Aid 11-, Survival (Antarctica)11-, Driving (Snowmobile) 11-, Staff 11-.
Martial Arts Maneuvers: Arm Lock 11-, Breakfall 14-, Finger Lock 14-, Ground Fighting (Judo) 15-, Push 11-.

A grumbly sort of man, Tom Kilroy is mostly someone whom just like to read and be left along more than anything else -- and Antarctica is the perfect place for that. Anyone trying to get into his quarters would find mountains of books laying all over the place, and just as many burned CD-Rs (he's recently purchased a computer at home with a scanner and an OCR -- he'll dismember a book and scan it in). The Aikido training was to provide him with a good exercise, yet it's made him popular with Emily as a sparring partner.

Brainsymbiote

ST: -- **DX:** 11 **IQ:** -- **HT:** 12/2

Move/Dodge: 2/6
PD/DR: 7/7#
Damage: 1d-2 cutting
Reach: C
Size: <1
Weight: About an ounce
Habitat: Just about anywhere

To anybody familiar with the brainsucker, this brainsymbiote looks an awful lot like a bigger version of the

brainsucker, except that it, well, isn't.

The symbiote will enter the body at any possible point, working to anchor itself along the spine of the person, healing the entry wound instantly. After the first few hours, it can't be removed short of surgery or very powerful poisons (and this will kill the infested person). Once in, it starts to make changes in the person, readjusting their metabolism, fixing damage, and rebuilding the body into something more survivable.

Essentially, the symbiote will "buy off" 40 points of physical disadvantages and *some* mental disadvantages per day; as a rule of thumb, if it can be due to a chemical imbalance such as Manic-Depressive, it can be fixed. At the same time, the symbiote will start to develop in ways that are very much survival oriented. Every day, the infested person will spend ten points plus any extra from the "buy off" pool to develop the following sets of Racial Advantages:

- No Brain
- No Cutting/Impaling Bonus
- No Vitals
- Immunity To Poison
- Immunity To Disease
- Enhanced Time Sense
- Unaging
- Faz Sense
- Fast Regeneration
- Regrowth
- Secret Communications w/other Brainsymbiotes (only general concepts, undetectable).

However, with all of these advantages come a massive host of disadvantages, starting with Extremely Hazardous Duty (Involuntary) to spread the species, Enemy (The Company -- once they discover it), Secret (Brainsymbiote host), Chummy, Obsession (spread brainsymbiotes), Infectious Attack, and one level Vulnerability to Fire. The GM is allowed to add any he or she wants, with the exception of any psi-vulnerabilities or any crippling ones; the purpose of the symbiote is to protect the bearer, not to make them more vulnerable.

Pyramid Pick

The Great Brain Robbery

Published by [Cheapass Games](#)

Designed by James Ernest, illustrated by Brian Snoddy

Boxed board game with eight board sections, 60 cards, and rules; $6.00

The Great Brain Robbery is another game from Cheapass Games, which from the outset has three things going for it. First off it has a title that just grabs the imagination; secondly, it's a Cheapass Game; and thirdly, it's a zombie game. In fact, it's a game about the same zombies from Friedy's Restaurant, who starred in Cheapass' previous titles, *Give Me The Brain* and *Lord of the Fries*. The problem is, as ever, that they're short of brains at Friedy's Restaurant and the only source of zombie fast food is a speeding passenger train full of Government Cheeses. More of the cheeses later.

The game, which is for three to seven players, comes in a sturdy envelope-style cardboard box; hopefully they will use more of these for their games in the future as the normal envelopes are not as sturdy. The box contains the necessary components for the game -- eight double-sided board sections depicting the various carriages of the train, sixty cards representing the brains found aboard the train (plus the Government Cheese) and the four-page rules leaflet. This being a Cheapass Game, you need to raid your other games for the basic bits. In this case they are two six-sided dice, a playing piece for each player, and approximately fifty counters, which mark the location of each brain on the map boards.

The aim of The Great Brain Robbery is to end the game with your zombie having installed in its empty cranial cavity the brain with the highest IQ. Though the map boards are clear and workman-like, artist Brain Snoddy has done an excellent job on the brain cards. These are all individually illustrated, (except the Government Cheeses) often to highly amusing effect, such as a zombie trying to shove a cat into his head!

Play begins in the caboose at the rear of the train, with each zombie moving in turn up to the limit of a 2d6 roll. If they end their turn on a brain square with a counter, they collect the counter as an experience point and draw a brain card. They can discard or keep the brain, but may only carry two brains -- one in each hand. A player can start a fight with one or more zombies if he ends his move in their square. The highest roll of the dice wins the fight, and the winner has the option to steal or rearrange the brains in his opponent's heads!

At the end of their turn they may spend experience to install the brain in their head. The higher the IQ value of brain, the greater the amount of experience that must be spent to install it, ranging from zero for Government Cheeses to twelve for an IQ of 240! Once installed, a brain card is placed face up on the table in front of the player. Brains are the keys to playing and winning the game. Some give movement and combat bonuses, as well as an occasional special move individual to that card, but without a brain installed, a zombie rolls one less die for both movement and combat, for each brain they carry. One option is to install a government cheese, as this acts in place of a brain, but since a cheese has no IQ, the game cannot be won with a cheese installed.

Zombies can also move between carriages and as they move forward, a randomly selected new map board is placed in front of the last and the brain counters filled. Unfortunately, zombies have an irrational attraction to hammering out the pins that connects up the train, and as the rear carriages slow down they may be lost. This is rolled when a zombie moves between carriages. As long as they keep rolling less than the length of the train a carriage will be destroyed and

lost from the rear of the train. Zombies in these lost carriages find themselves running behind the still moving train, forced to discard any brains in their hands (but still with their experience points and their installed brain). While running they cannot fight, and will climb aboard the rear of the train at the beginning of their next turn.

Lost carriages are discarded from the game, except for the caboose, which is reshuffled into the deck of map boards. When it is drawn again, it is turned over. The other side depicts the engine and thus the front of the train. This signals the nearing end of the game, as a zombie can reach the brakes and slow the train. This destroys the rearmost carriage for each turn of braking, and once the engine is the only thing left, the game is over and the zombie with the smartest brain installed is the winner.

Like many other Cheapass designs, ***The Great Brain Robbery*** has deceptively simple rules that anyone can grasp. It also has a given strategy, which is pleasingly outlined by the designer as part of the rules. Further, it would be very easy to create your own rules variations and expansions for anyone who likes to tinker with their games. An obvious aspect that could be tinkered with is giving more brain cards individual special moves. That only a few in the game have these is really my only gripe about the game.

The Great Brain Robbery is another hugely fun slice of silliness from James Ernest, which has all the makings of a parlor classic. (And the title is really, really great.)

Pyramid Review

Hunter Apocrypha (for the Hunter RPG)

Published by White Wolf Game Studio

Written by Tim Dedopulos

128 pages; $14.95

If you're not a fan of "in character" game documents, you'll hate this book. You know what I mean: books and other paraphernalia that exist as physical objects for players to use as their characters would. Although far from the first company to publish such things (after all, most of Chaosium's *Call of Cthulhu* adventures include pages of fake "newspaper clippings" and other such clues), White Wolf has produced quite a number of books in this vein, including the ***Book of Nod*** and ***Revelations of the Dark Mother*** for ***Vampire: The Masquerade***. *Hunter Apocrypha* follows in their footsteps, showing us what purports to be the musings, prophecies, and ramblings of a mysterious hunter known only as "Fyodor."

If you're not a fan of metaplot, you'll hate this book as well. ***Hunter Apocrypha's*** contents are quite obviously tied into the ongoing story of ***Hunter: The Reckoning*** - and quite possibly, White Wolf's forthcoming "Before the ***World of Darkness*** Game" (more on that in a moment). More so than most ***World of Darkness*** games, ***Hunter*** relies very heavily on the fact that hunters (also called "the imbued") are a new phenomenon, one whose sudden and inexplicable appearance may well herald the beginning of the End Times. Consequently, this book is quite useless to anyone uninterested in or otherwise annoyed by this element of the ***Hunter*** game line.

However, if you are put off neither by in character documents nor by metaplot, this book delivers in some remarkable ways. Let me be honest: ***Hunter*** was a big disappointment to me. I expected something wholly different than what I got when I read the book almost a year ago. That I was mistaken about the theme and mood of ***Hunter*** says more about White Wolf's poor marketing of the game than it does about the game itself. Over the last year, the game has grown and developed in entirely unexpected - but not unwelcome - ways. ***Hunter Apocrypha*** is yet another example of this development.

Physically, the book is a digest-sized volume with a pseudo-leatherette black cover embossed with its title in shiny red ink. The title page of the book lists it as having been published by "Anchorite Press." This is followed by a forward written by the hunter known by his Internet handle of "Violin99." Violin explains to the reader that ***Hunter Apocrypha*** is a collection of notes passed on to him by Fyodor "to answer the questions that plague the chosen," which is to say, as an aid to other hunters still grappling with their mysterious calling and the abilities that come with it. Violin then goes on to suggest, "this is the single most important document in the world." While clearly hyperbole, ***Hunter Apocrypha*** is a very valuable book for anyone seeking a very different - and much more sophisticated - take on ***Hunter: The Reckoning***.

The pages of ***Hunter Apocrypha*** mimic a compilation of handwritten notes, complete with black and white illustrations and marginal doodles. Also, included are the obligatory fake newspaper clippings, used to buttress some of the information Fyodor passes on in his notes. Again, I suspect that readers who instinctively dislike the format of books like this will grimace upon seeing the interior of ***Hunter Apocrypha***. I'm somewhat skeptical of the format myself. Nevertheless, I can't deny that I spent some time attempting to fathom the hidden meanings of some of the pages' marginalia (mostly to no avail). I won't go so far as to say the illustration are in any way "authentic," but they do convey well some of the oddity and disjunction you'd expect in the ravings of a mad (but possibly brilliant) visionary.

The meat of the book consists in Fyodor's examination of three questions of immediate import, both to the imbued and to anyone interested in Hunter. These questions are: What are the imbued? What are the monsters they fight? What does the future hold? The answers to these three questions are tied together in a coherent - if not necessarily accurate - explanation that, to my mind, propels *Hunter* into a territory very different than its apparent "Human: The Butt-Kicking" mold. In fact, Fyodor's answers are such that the almost entirely recast *Hunter: The Reckoning* as a game line.

(Editor's Note: Spoiler Alert)

Specifically, Fyodor tells the tale of an ancient Golden Age of Mankind, in which men possessed both great powers and greater goals. One of those goals resulted in a terrible fall, one that clove man's soul in two. The dark half achieved an independent existence, becoming the origin of the various dark beings of the world. Nevertheless, human heroes fought against the darkness but did not defeat it. Instead, the darkness went into hiding and manipulated human society until the time was again ripe for its resurgence. According to Fyodor, that time is now, which is why the imbued - the inheritors of those ancient heroes' power - have again returned. However, Fyodor's vision is not a happy one. He foresees - perhaps even welcomes - a final consummation in which the great mass of humanity will be lost to the darkness, while hunters save only those worthy of the New Golden Age that will be born.

Hunter Apocrypha thus paints a very different picture of the imbued and their role than we have seen before. No longer errant do-gooders seeking only to defeat individual monsters, they are the vanguard of the End Times - from which much of humanity will not escape alive. The book's apocalyptic tone and elitist airs left me with a bad taste in my mouth. I had previously had great sympathy with the hunters' mission as guardians against the darkness. Now, that mission is less clear-cut and tempered with elements that, frankly, make me uncomfortable.

(End Spoiler Alert)

Not surprisingly, I'm also much more certain of how to run a *Hunter* chronicle - and the drama that would inevitably result from that certainty. *Hunter Apocrypha* adds a great deal of nuance and menace to *Hunter: The Reckoning*. I recommend it highly to anyone who didn't think the core rulebook offered anything unique or different. After reading *Hunter Apocrypha*, I think a lot of people will reevaluate this game.

Pyramid Review

Cardstock Cowboys Sets 1, 2, & 3 (for Deadlands)

Produced by [Pinnacle Entertainment Group](#)

Set 1: Sixteen 8-1/2"-11" cardstock sheets; $19.95
Sets 2 and 3: Eight 8-1/2"-11" cardstock sheets; $14.95 each

Miniatures are fun. In a situation where you need to understand the tactical significance of "Who is where?" or "*How* many are there?", miniatures are wonderful for summing up complex situations quickly and easily.

But miniatures are expensive. A full army of the damned (or what have you) would set back most groups a fair chunk of change. And without a full set (or consistency within that set), you run the risk of destroying suspension of disbelief by having fully-detailed PCs battling undead legions of candy corn (or whatever is handy near the table).

Several companies have attempted to solve both of these problems by releasing cardboard miniatures: scads of characters suitable for generic or specific games that groups can cut out and assemble. This review focuses on the *Cardstock Cowboys* series from Pinnacle for the *Deadlands* game (or, as they proclaim, using the free miniatures rules High Noon available from the *Deadlands* website (www.deadlands.com).

The standard miniatures stand 1-1/4" tall when assembled (with figures varying in size depending on their scale). Most figures are made from three panels, with the hole made from this open triangular tube viewable from the top. These three panels consist of two identical images and a black mirrored silhouette on the third face. Differing figures range from the tiny (like the Clockwork Tarantulas) to the mid-sized (like people on horseback, Demons, and Devil Bats), to the huge (like the Maze Dragon and Mojave Rattler, each of which take up an entire sheet of the 8-1/2"-11" cardboard!). Other miniatures are not assembled, but lie flat on the table. These include the bity Prarie Ticks, the large Tarantula Swarm, and the huge Armored Locomotive (which consists of four cars, each of which is about 10" long, and a smaller caboose). The figures are printed in color on sturdy but light coated cardboard; they work much better when they are scored first before folding -- but *only* when scored with, say, the flat of the X-Acto knife The cardboard is much too light to score with all but the gentlest edged cut.

Set one is the "Starter Pack." It consists of a wide variety of basic figures and critters. Many of the human figures are suitable for player characters, though there are also a fair number of bandits, cultists, desperados, and other human opponents. There are also over forty figures depicted on horseback. With the exception of the Maze Dragon and Mojave Rattler, this set doesn't have many truly inspiring or horrifying monsters . . . but a wide variety of fodder is useful for many campaigns. In all there are over 200 figures in this pack.

Set two is called "Horrors of the Weird West." It consists of some of creatures from the first and second *Rascals, Varmints, and Critters* books. These figures are a lot more horrifying and inspiring, but since most of the figures are unique or usually encountered singly, there isn't much duplication. On the other hand, there *is* a lot of white space (which there isn't in the first or third sets). I found myself saying, "Gee, they could have squeezed in a dozen or so more figures on here. The second set consists of 86 figures.

Set three is called "Infernal Devices." It focuses on the gizmos and gadgets of the Weird West, like the train mentioned above, steam wagons, an ornithopter, steam gatling guns, velocipedes, and other armaments. It also has a fair number

of human (more or less) figures, like scrappers and people in jetpacks and rocket boots. There are also some of the mechanical antagonists from **Rascals, Varmints, and Critters 2**, like Automatons and the Clockwork Tarantulas. There are 116 figures in this set.

In all, these sets are somewhat of a mixed bag. The artwork ranges from unclear and muddied to crisp and exciting. Set 1 consists of a lot of artwork I've seen before, like many of the character templates; but what looks good on a full-sized page loses something when shrunk down. The scale of the first set is also problematic in a few places for this reason. For example, the Blessed #1 figure (which uses the Preacher template artwork) has his right arm raised above his head; to fit him in, he needed to be shrunk down, so it looks like a l'il tiny four-and-a-half-foot tall preacher. *(Aww!)* Sets 2 and 3 are better, art-wise, and most (if not all) of the art seems unique to those sets, but these sets are also the most setting specific.

Each figure is labeled, which is very useful for the figures that you can't exactly make out, or for those times where you need to find all the cultists. Unfortunately (for some), each figure generally uses the same art work on two of the three facings; in that way, it's very difficult to determine which way a figure is pointed (you can tell which way he *isn't* facing by the silhouette). This lack of facing is easily fixed, however, by marking one corner of each figure to represent "front" . . . but it would be a pain.

Curiously, some figures *are* mirrored; all the horseback characters, for example, have a definite orientation. I suspect this is because these figures don't have a silhouette, which would make determining where they face difficult. The lack of non-animate figures (like cacti and other oft-repeating **Deadlands** scenery bits) may also prove problematic for some groups, and might have rounded out the emptier second set.

In conclusion, these figures are an inexpensive way to provide useful miniatures at an inexpensive price for **Deadlands**. While I understand that getting any kind of detail at these sizes is very difficult, the muddied coloring and artwork on some of the figures doesn't help much, and keeps me from recommending them without reservation. The cost of the second and third sets -- which have about half as many figures as the first set but only cost five dollars less each -- also gives me pause. But if the figures on the top sheet (visible through the plastic wrapping) seem like something that would be useful to your group, and you can overlook the faults, then it should provide pleasing alternatives to rampaging armies of Pez.

-- Steven Marsh

Montejon's Mutters

Baldur's Gate II: Shadows of Amn

Published by [Interplay Entertainment Corp.](#)

Developed by Bioware Corp.

Required: Windows 95/98 with DirectX 7.0 or higher, Pentium II 233 or faster (although I used an AMD processor with no problems), 32MB RAM, 800MB Hard Drive space for installation, 4X CD-ROM drive, DirectX certified sound card, 4MB DirectX certified video card, 100% Microsoft compatible keyboard, mouse

4 CD's + 264 page manual, $44.99

"Guerre mener n'est que damnation."
-- Eustace Deschamps

1 -- Stop the Presses! Please!
2 -- Buyer's Regret
3 -- Worth the Price of Admission
4 -- A Fine Addition to the Library
5 -- Buy Buy Buy!

Baldur's Gate II: Shadows of Amn is the latest, hottest entrant into the realm of computer-based roleplaying games. It has lavish graphics, stunning audio, and the state-of-the-art in storyline development. If you play through just the core story, you've got about 50 hours of gameplay ahead of you. If you allow yourself to be sidetracked by the optional subplots, you can add another 200 hours of play. It's massive; it's innovative; I rated it a 2.

We'll get into the why's and wherefore's of that rating in a moment. First I'd like to explain why I've reviewed it at all. The 'net is crammed to bursting with computer gaming sites, why invade *Pyramid* with the stuff? I have a couple reasons: **BG2** is specifically a ***Dungeons & Dragons*** computer game. Also, I hope to offer you a perspective uniquely tailored to *Pyramid* subscribers. However, if you would prefer not to see computer roleplaying games in Montejon Mutters, please let me know. I read the [Pyramid Discussion Group](#) regularly.

Set in the epic fantasy world of the ***Forgotten Realms***, often billed as "The Granddaddy of All **D&D** Worlds" for reasons that remain obscure, the plot of BG2 has only a tenuous connection to the original ***Baldur's Gate***. In fact, except for a few brief jaunts into various other Planes, the Underdark, and the sea, your characters never leave the nation of Amn. You certainly never get anywhere near the actual city of Baldur's Gate. The connection between **BG2** and the original ***Baldur's Gate*** is maintained by a handful of recurring characters (including the cheerfully insane ranger Minsc and his pet Miniature Giant Space Hamster) and the fact that the main character is still the son of Bhaal, the late God of Murder. Your main opponent throughout the game is a sneering, sociopathic wizard with a lovely accent, against whom you must ultimately face off in the very bowels of Hell. Along the way you get to do battle with the cream of ***Forgotten Realms*** villainy, including the drow, mind flayers, beholders, and a couple of dragons.

All righty then. Let's start with what I liked about ***Baldur's Gate II***.

1. *Graphics.* They were pretty. They reminded me strongly of other games with pretty graphics, like the latest pair of Final Fantasy offerings, and the Abe line of console games.

2. *Voice acting.* Much of the voice acting in **BG2** is nothing short of brilliant. There are a few ringers in the mix, but for the most part the actors have good lines, and deliver them well. The only thing that really bugged me was the way they pronounced the main villain's name.
3. *Compelling story.* This surprised me. Computer RPG's very rarely have any story worth spitting at, but I found myself quite put out when the villain abducted one of my compatriots. Many of the subplots lacked the same sparkle, but there was more chance to develop a strong characterization than in any other computer role-playing game I've seen. The plot was still quite linear, but it was a lot more fun than the typical "find the McGuffin before the Naughty Necromancer unleashes Doom upon the Universe."
4. *Marketing Tie-ins.* This isn't really part of the game itself, but in the electronics stores where I found **BG2** they were selling ***Dungeons & Dragons 3rd Edition Player's Guides*** and ***Dungeon Master Guides*** as well. It was evident that the **D&D3** books were selling. The hitch in this is that **BG2** uses the ***Advanced Dungeons & Dragons 2nd Edition*** rules. Still, it's nice to see computer games serving as a direct tie-in to PNP (Pen aNd Paper) roleplaying.

Now we'll run down what I didn't like.

1. *Anachronism.* This seems like a silly quibble, since this is a fantasy game set in the ***Forgotten Realms***, a notoriously eclectic milieu. Still, the setting for the opening scene looked like something straight out of a sci-fi thriller. There were steel floors, cables, and lottsa giant glass orbs and tubes. What really made me flinch was finding a porcelain bathtub in the sewers, which connected to hole-in-a-board style commodes. Later, during one of the optional subplots, I wound up wielding a "magic rod" that looked suspiciously like a blast rifle. I found this jarring.
2. *Hack 'n' Slash.* My quote for this column translates as "To wage war is damnation," and it sums up quite nicely my attitude towards games that focus on violence. Unfortunately, computers only have two things to offer the gamer right now. You can have pretty graphics, and fast combats. Because computer roleplaying games have no way to support the common group structure of a small party of Player Characters with a single Game Master, storylines must be linear and character development must be limited. To make up for this you get lots and lots of splashy combats. In **BG2** you get splashy combats out the wazzoo, and there is no way to avoid them. It makes group play very annoying, because you must reload frequently after everyone gets splattered by a sudden vampire ambush, or a bunch of beholders zap you into oblivion with Cause Serious Wounds. Sometimes combat games can be fun, but there are many, many better combat games than **BG2**.
3. *Rules Set.* **BG2** uses the ***2nd Edition AD&D*** rules, as mentioned previously. At the last minute they tacked on three classes from ***3rd Edition*** -- the barbarian, the sorcerer, and the monk. If you've played ***3rd Edition***, **BG2** will drive home for you how inferior the ***2nd Edition*** rules are to ***3rd Edition***. The addition of the three classes does nothing to ameliorate this.
4. *Compatibility.* I use a pretty solid Windows box, so I was able to play **BG2**. If you have anything else, like one of those whiz-bang new Macintoshes, a finely-honed Linux box, or even an out-dated Windows machine, you're out of luck. (However, the developer's next **D&D** release, ***Neverwinter Nights***, is under simultaneous development for Macintosh and Linux operating systems.)

As a computer game, ***Baldur's Gate II*** probably rocks. As a roleplaying game or roleplaying game supplement, it leaves much to be desired. I found nothing in the game that I could use elsewhere. It was expensive, and can only be played if you have the right hardware to play it on. It was only really fun to play if I played alone, killing the social benefits that make roleplaying games worthwhile to me.

So, with all this in mind, I rated it a 2: Buyer's Regret. In a few months, when the price drops appreciably, its rating will increase to 3: Worth the Price of Admission, but only as a solitary entertainment. As a group enterprise, ***Baldur's Gate II: Shadows of Amn*** is a bust.

* * *

Next time on Montejon Mutters we'll dodge back into the realm of the tabletop with my first requested review. If you have a review request of your own, send it on in to montejon@mad.scientist.com and be sure to put [REVIEW] in the subject line. See you in a fortnight.

--Montejon Smith

Lethean Days

"How did you get that mark on your neck?" asked Sir Ross.

Lady Alyse laughed. "You well know how I received this, Sir," she said, winking.

No, I don't, *he thought, looking at her suspiciously.* No, I don't.

* * *

"Lethean Days" is a short *very* generic idea suitable for many campaigns, from Fantasy to **Mage** to *Star Trek*; the only requirement is *some* ephemeral supernatural entity needs to be possible (being of pure energy, demons, spirits . . . whatever). Details will, of course, need to be created, depending on the campaign and situation.

This scenario is perfect as a subplot or secondary story; it requires one PC Victim, and conspiracy between the GM and the other players. Its theme is one of paranoia and fear.

Ingredients

The Downward Spiral

It starts out innocently enough with unrelated events. A friend repeats something witty the Victim said before. The Patron requests a report the Victim promised two weeks ago. The Victim notices a mark on a romantic interest's neck; when questioned, he replies coyly: "You know how that happened."

But the Victim doesn't have any idea what they're talking about. She never said that; she didn't promise any reports; she didn't have any neck-altering amorous affairs.

If questioned, the friends of the Victim may be frightened, suspicious, or understanding. The Victim may well suspect a doppelganger, clone, or imposter (if such exist in the game world).

In fact, the Victim *did* do all those things; she just doesn't remember.

The GM should conspire with the rest of the party beforehand (individually or as a group) to have them "recall" things the Victim did that she is unaware of. (Ideas: Presents given in the past, asking the Victim to enter the security code of the new security system installed, etc.) The GM should *not* tell the other PCs why they are doing this; as the plot unfolds, they will be able to help the Victim, and the story works best if they don't know what's going on. Other NPCs can recall events as necessary, too.

The GM should carefully consider what these clues refer to, and instruct the other players accordingly; more recent memories will point to a doppelganger, older memories will point to memory loss.

Further Down

After a while (perhaps once the Victim starts to think something weird is happening), up the ante: The Duke asks if the message was delivered safely to the Prince. The President inquires what the French ambassador said about Operation: Turnkey in the last adventure. ("He didn't mention it," the Victim says suspiciously.)

Left unchecked, this forgetfulness eventually spreads to memorized spells, knowledge, training, etc. The GM can simulate this by asking the Victim to make certain skills at default levels, or applying ridiculous penalties to trivial knowledge checks.

Eventually the Entity (see below) will leave the Victim a memoryless husk, unable to retain anything for more than a few seconds. She can then work at the DMV.

Cooking Tips

The Entity   Adventure Pizza: Lethean Days

The Victim's problems are being caused by an Entity that feeds off memories. It starts out small, tasting simple recollections and trivial matters; as it grows it consumes more vivid and powerful memories. (This scenario presumes a psychic/energy/mental phenomenon; it *can* be a physical object -- burrowing brain bug or the like -- but the means of dealing with it would be different, probably entailing surgery.)

The GM should determine how it can be discovered: magical spells, psionic powers, Jedi Mind Tricks™, entering the Astral/Ethereal realms, or meditative states are all possibilities.

The GM should also determine how it can be defeated. Some possibilities are:

- **Reasoning.** The Entity doesn't realize that what it's doing is wrong. With good roleplaying it can be convinced to move on . . . if a means of communicating with it can be established.
- **Combat.** The Entity is hostile, and must be attacked on its own terms. This can be direct Astral/psychic combat, or weird dream-realm confrontations with past memories and failings.
- **Overfeeding.** By encountering something *so* vivid and exciting, the Entity may overfeed to bursting and flee or die. This can be a bittersweet resolution of an exciting session; the PCs may witness the birth of a star or the hatching of a Baby Wyrm, and the Victim will be unable to remember it (though she'll be free of the Entity).
- **Poisoning.** By encountering something traumatic, the Victim may "sour the milk" of the Entity. This can be real (a loved one dies horribly) or staged (the Victim starts a vicious argument with an unknowing loved one to get honest hateful reactions). Alternately the Victim may be placed in mortal danger, causing the Entity to flee rather than die with the Victim.

Extra Spice

- As a subplot spread out over several sessions, this scenario's clues are obscured, and the fear and paranoia are more real. As the Entity grows more powerful, a villain may show up that the other heroes recognize, but the Victim doesn't. (The "real" first encounter with this villain can be played as a flashback.)
- This scenario also works well in a Time Travel situation; lapses of events and memory can be explained away as burps in the time stream.
- What if a clone or doppelganger *is* present at the same time as this scenario? It would be farfetched, unless the Entity and clone were the works of a villain, but they would work well together. The Victim *or* other heroes may think they've solved the problem, but the contingency plan remains.

Side Salad

- If the Entity is part of a race of such beings, what would happen if they attacked a group or organization en masse?
- The GM should determine if the memory loss is temporary or permanent. (For fairness' sake, skills and

knowledges, at least, should return.) Reacquiring these memories could be an adventure itself.

- What does the Entity *do* with these memories? Are they being transmitted to some higher (more sinister) being?

Revenge of Clio's Nightmares

"[I]f we had been confronted at the beginning of May with such a prospect, it would have seemed incredible that at the end of a period of horror and disaster, or at this point in a period of horror and disaster, we should stand erect . . . Few would have believed we could survive . . . "
-- Sir Winston Churchill, Aug. 20, 1940

As on [Halloweekends past](#), this year sees the gates of History and Destiny swing wide along with the gates to Death and Hell. Through those dubious portals, then, come three more Alternate-Historical Horrors, this year in a slightly less High Fantastic than Secret-Historical mode, more *GURPS Voodoo* and less *GURPS Undead.* If the sleep of reason (and the sleep of Clio the [last two](#) All Hallows' Eves) bringeth forth monsters, this year the sleep of Clio bringeth forth, well, this.

"[A]we overcame the archons in the presence of the creature because it uttered sounds superior to what its modeling justified, owing to the agent who had invisibly deposited in it a seed of the higher essence . . . And they were stricken with terror, and promptly destroyed it."
-- a fragment of the scripture of Valentinus of Phrebonis

In 141 A.D., the elders of Christianity met in the Roman catacombs to elect the next Pope. The two candidates, Valentinus of Phrebonis and Pius of Aquilea, had been equally matched until Pius' most eloquent spokesman, Justin "the Philosopher," was torn apart by feral pigs in the street. Dismayed at this, the Pian side gave way to the gnostic, mystical Valentinus, whose words wove an eloquent spell around the deacons. They also converted the Emperor Marcus Aurelius' son and heir, Commodus, who turned his father's persecutions against Valentinus' rivals. Eventually, the Emperors openly declared Valentinian Christianity the state religion of Rome, driving trinitarian and demotic heretics like John Chrysostom and Athanasius east into the arms of Persia, where Yezdigerd the Holy made Augustine the Patriarch of Ctesiphon, and accepted baptism himself. Valentinian Christianity, with its Egyptian gnostic priesthood and levels of initiation, married the elitism of the mystery cults to the mass appeal of Christ -- and for those that rejected Iesus-Seth Christos, there were crosses aplenty. The inner fathers of the church knew that Valentinus had taken more than his priests out of his native Egypt -- that Valentinus hid a far older, darker god behind his allegories of Christ as Seth, third son of Adam. Set, third son of Geb, god of the desert wind, of trickery and evil, of war and murder, was the true "hidden god" of the Roman church.

Hints slipped out here and there: when the Emperor Maxentius burned the True Cross, or when churches to St. Simon Magus opened up through Anatolia, or when the Bishop of Alexandria singled out the priests of Horus and Osiris for death by torture. But it wasn't until the Persians briefly captured Egypt in the war of 504 that the extent of Valentinus' secret blasphemy became known. The next war, everyone knows, will be an unholy war to the finish; the Valentinian church must use their every hoarded dark magic to crush Persia utterly or see the Light of Truth prevail. PCs in this *GURPS Imperial Rome-Egypt* crossover can be Persian knights, ecstatic Christian monks with strange martial disciplines learned under Roman persecution, miracle-wielding priests, or Holy Magi puzzling over the papyri brought back from the Egyptian raid. Persia and Christianity's only hope rests on just such a tiny band -- they must cross the entire Roman Empire, dodging not only the Roman army but lamiae, mummies, demons, and Set-beasts conjured up by a desperate dark gnosis. For those papyri tell that the Holy Grail was spirited to Britain by Joseph of Arimathea, and may hold the power to break Set's grasp on Rome -- if the PCs can convince [King Arthur](#) to help them find it.

"At her trial La Voisin confessed that no less than 2,500 babies had been disposed of in this manner, for the Black Mass was continually being celebrated not only by Guibourg but by other priests. The figures are so startling that some incredulity has been expressed by those who do not know the Paris of Louis XIV . . . [W]hen the impostume of filth and crime was ripe to bursting, no less than 319 warrants were issued, whilst there were very many more whose names were suppressed so deeply did they implicate the very highest in the land, nay, the very Throne itself . . . "
-- Montague Summers, *A Popular History of Witchcraft*

Desperate to retain the affections of Louis XIV, his aging mistress, Madame de Montespan, turned to Satanism. At some point in 1679, she succeeded in bringing a succubus to the royal bed, and the depraved monarch's eyes were

opened to the delights of Hell. A black bargain, sealed with a kiss. Louis and Lucifer, it transpired, could do much for each other -- Lucifer guaranteed demonic aid to his new ally, and Louis forsook the divine right of kings for the more lucrative infernal right of kings. Black storms helped his navies drive the Dutch from the sea; sudden earthquakes reduced fortresses besieged by France's armies. Demons discovered buried treasures for Louis' coffers, including the lost treasure of the Templars -- within which were yet more artifacts of blackest sorcery to swell the arsenals of Louis' royal guardsmen. Louis' marshals crushed Holland, humiliated the Empire, and entered Rome to appoint the Satanist Guibourg to the Papacy. La Voisin's troops of whores and defrocked priests desecrated the great cathedrals of France, turning them into fanes of blackest necromancy rivaled only by the orgiastic altars at Versailles.

That, of course, is where Sir Isaac Newton, the greatest theurgickal magician since Dee, comes in. His experiments with angelic forces, and his calculations of their relative gravities, have convinced him that Satan is alive and working actively within the French court. In the confused political atmosphere of Queen Anne's England, Newton can only trust hand-picked men, devout (if scruffy) London footpads, Huguenot refugee swordsmen from the Pit of Paris, scholars of forgotten Biblical lore, Puritan divines and Anglican clerics of spotless sanctity, a few witch-finders recommended by his American correspondent Cotton Mather, and apprentices of his own Newtonian natural-angelic philosophy. They must work against French Satanism, an Invisible College devoted to driving Lucifer back to Hell from his beachhead in Europe. Between J. Gregory Keyes' *Newton's Cannon* and the breathless intrigue of Dennis Wheatley's *Black Magic* series, the GM should have no trouble finding themes and ideas for this **GURPS Swashbucklers-Religion** campaign.

"The Great Race seemed to form a single, loosely knit nation or league, with major institutions in common, although there were four definite divisions. The political and economic system of each unit was a sort of fascistic socialism . . ."
-- H.P. Lovecraft, "The Shadow Out of Time"

Stalin had long known that there was no God. It wasn't, however, until he correlated some of the wilder tales from his Georgian hill-country home with the results of the 1927 Tunguska expedition and the secret diaries of Rasputin that he knew that there were, nonetheless, gods. The NKVD fanned out across the Soviet empire, looting libraries and museums, torturing Siberian shamans and elderly monks, stealing what they could from foreigners, always looking for hints of the elder mythology that now obsessed their steel tsar. In the aftermath of World War II, this trickle of data became a flood, as the Ahnenerbe archives of Nazi occult research fell into Soviet hands along with Berlin. Stalin now knew the Names to call on when the stars were right, the places of power where They scrabbled at the edge of space, the truth that mankind was, just as Marx had promised, the puppet of vast, impersonal forces. And he knew how to bend those forces to his implacable will. Truman might have stopped him, but Alger Hiss painted a certain hexagram in the Oval Office that killed the Cold Warrior. Stalin gladly offended Mao by holding Sinkiang and adding Tibet to his prizes in the confusion of 1949. With the invasion of Afghanistan in 1951, he completed his conquest of the earthly gates to Leng, and to Kadath in the Cold Waste. Egypt fell first to Nasser and then Nasser succumbed to Stalin. Armies of slaves worked gulag mines to supply the Mi-Go with rare Siberian minerals; thousands died in screaming agonies to placate Nyarlathotep; arctic explorers dug up Elder technologies and drove physicists mad trying to utilize them. And then, they succeeded. In 1962, the undying Stalin plans to launch the Third World War -- unless he's stopped.

A young Naval officer named John F. Kennedy became a Delta Green "friendly" after something very unusual attacked PT-109 in the South Pacific. Now, he's just been elected President, and Delta Green has decided that it's worth breaking cover to stop Stalin. PCs in this **GURPS Atomic Horror-Delta Green** crossover campaign must battle Communist subversion at home and inhuman evil abroad or the world will die screaming under Stalinist sorcery, swept clean for the Great Old Ones by atomic fire and the emanations of Yog-Sothoth. Ask not what your country can do for you. Ask rather what you can do for your species.

Murphy's Rules

Murphy's Rules

I Will Show You Fear in a Handful of Dice

This is not a Halloween issue.

Or rather, it is.

But this is not a Halloween issue about horror. This is a Halloween issue about fear, and suspense, and fun.

Horror is blood streaming from the faucets. Fear is the taste of blood on your lips when you awaken . . . when you *know* you haven't been biting your lip in your sleep. Horror is when **It** attacks you from the closet with a knife. Suspense is a knife on the counter you know you didn't put there. Horror is when the Goblin Spectre tries to grab you in his steely clutches. Fun is when the mask is pulled off, and it's Old Man Potter.

I believe it was Stephen King who said that one of the difficulties with horror writing is the six-foot-tall cockroach problem. The protagonist opens the door, and there's . . . a *six-foot-tall cockroach!!!* And the reader is frightened, and screams, but then thinks, "Well, at least it wasn't a *seven*-foot-tall cockroach . . ." and is no longer scared.

In my mind, that's one of the troubles with focussing on horror for Halloween themes; whenever you give something a name and stats, you can kill it. But if it's the Unnamed Thing, the Unknown Threat, the Sinister Secret . . . these things can't be easily overcome.

But Halloween is also about suspense. *The Blair Witch Project* was all about suspense; almost nothing *actually* horrific happens, but the implication of things keeps happening off-screen, almost out of earshot, almost within sight, forever out of reach. Halloween is the time when we look nervously over our shoulders because we didn't hear anything, but the anticipation something might happen looms omnipresent.

Halloween is also a time of fear. Stories told with flashlights under chins, urban legends you *swear* are true, pranks designed to frighten the innocent (and guilty). Horror is generally "satisfied" (you're attacked, you die, you gibber in an asylum for the rest of your days); fear is just as likely to leave you alone, knowing it's won.

And for most folks, Halloween is, frankly, fun. Halloween is one of the few opportunities for most adults to "roleplay" in the real world. If you want to walk down the street as a devil or a superhero or a fairy, you can. Adults in America spend more for Halloween than any other holiday except Christmas. Kids run around at Mach 5 on sugar buzzes their parents will regret for weeks.

So this issue I wanted to keep with a Halloweenie theme, but I wanted to make sure many people would find *something* useful/fun/entertaining. I hope you all enjoy.

To tie these random thoughts into roleplaying, I'd urge folks to realize that genres and traditions are usually about multiple ideas. If you have a Horror campaign, remember that a zombie doesn't *have* to lurk around every corner; consider adding suspense or even fun occasionally. If you're running a Supers campaign, not every adventure needs to revolve around the awesome powers these superbeings have. A *Vampire* game *can* be optimistic and happy, occasionally. This keeps folks from becoming complacent with the status quo; if every adventure feels the same, it's much too easy to become numb. Variety helps keep players on their toes.

Or, for GMs looking for a greater challenge, figure out a way to sometimes make those seemingly-unrelated adventures tie into the overall theme. If the adventurers manage to uncover the mundane cop-bribery conspiracy within the police department in a *Cthulhu* campaign, have it be revealed that some of the money was being filtered to a dark cult. If the coterie in *Vampire* helps the prince do something that seems entirely altruistic and nice, have that be a catalyst for the prince's trial or even death.

Of course, you can't do this every time, or else players will stop believing *anything* a GM does, and always expect the worst. But keeping players on their toes and unexpecting the expected is one of the greatest challenges -- and thrills --

of being a GM.

As ever, feel free to drop me [a note](#) if you're so inclined. And have a happy (and safe) Halloween!

* * *

In other news, it's with heaviness in my heart that I say this month's Women in Gaming will be the last one. The Real World has been providing too many good-but-time-consuming opportunities for Emily Dresner-Thornber, and thus she needs to leave our little family.

I'm sad to see her go; she has been a professional delight to work with. She brought up matters that (in my mind) needed to be discussed, opened some eyes, and made some folks think . . . and did so in a consistently entertaining way, which is no small feat. We at *Pyramid* wish her all the best, and suspect that she'll attack and destroy whatever challenges lie before her . . . or talk to them, or do whatever women do to their challenges . Thanks, Em.

-- Steven Marsh

Last week's answer: **Underground RPG**, p. 3.

(Four stars) "An Alien Kicked Sand In My Face!

"Let's see: unbuttoned Kingston Trio shirt, check; blanket, check; board, check; board wax, check; crew-cut wax, check; sunglasses, check; best girl, yup; bulky radio, check . . . ."

Lost in the Twilight Zone

Halloween. It is undoubtedly *the* gamers' holiday. How can roleplayers not be excited about Halloween? Revelers wear costumes. Strangers hand out tiny chocolate bars. Orange marshmallow ghosts end up in microwaves as the butt of important scientific "experiments." The stars are right and small, red, plushy Cthulhus rampage and eat 1D3 trick-or-treaters per round. Grown men meander through barely-lit alleyways dressed like Sailor Moon.

Best of all, scary stories are told in the darkness of night. Terrifying tales are designed to strike fear to the core of the audience's being. *They* might control the horizontal and *they* might control the vertical, a friend whispers. "Do you want to see something *really* scary?" another friend asks with a hopeful look in his or her eyes.

Sure you do. It's Halloween.

The most frightening story of all, submitted for your approval --

The story of Scott Dicer, age twenty-seven. He lives in Anywhere, USA. His occupation: UNIX System Administrator for the local University and an avid roleplayer. He is presently enjoying a nice, sunny weekend while heading to his friendly local gaming store to pick up the newest *Dungeons and Dragons 3rd Edition* source manual. He has looked forward to the release of this book for weeks, but this trip to the gaming store will be one of terror; his purchases -- fear; his destination -- the Twilight Zone.

Imagine a world subtly different from our own. Games are still games. Dice are still dice. Miniatures are still small. The gaming industry is no bigger than it is today, nor is it smaller: strangely, it's the exact same size. The friendly local gaming store is just as small as it ever was, and just as tightly crammed from floor to ceiling with roleplaying books and paraphernalia. Roleplaying is still a niche entertainment market.

Take the case of Scott Dicer as he walks through the door of the gaming store from our world to a strange one in search of the new *Dungeons and Dragons 3rd Edition Monster Manual*. He does not notice the new posters on the walls. He hardly recognizes the brands of the supplements on the display racks. He is single minded in his pursuit for his long awaited prize.

. . . Ah, there it is. He's been waiting for months. He's obsessively read every advertisement and every pre-review on the net. He picks up the book. He caresses it. He flips through it, looking for the biggest, nastiest creature within its covers. He gives a little squeal of delight when he lays eyes on the statistics for the dragons. He hardly notices the staggering increase in power for the succubus.

It is only then that he notices that the store is filled with women.

He looks up slowly. The cashier giving him a careful look-over is a woman. There are three noisy female gamers at the table at the back of the store. Two female gamers are arguing vehemently over the miniatures table. There is not a single guy in the entire store.

Scott Dicer finds this situation disturbingly odd. Many possibilities cross his mind. Could this be women's day at the gaming store? Could this be an initiative drive to get more women involved in the hobby?

Scott begins to feel nervous, because there are so many eyes on him. Something doesn't feel right. To busy himself and ponder this strange turn of events, he tucks the *Monster Manual* under his arm and picks through the new releases. He looks in the small racks tacked to the wall that are brightly advertised as the "Newest Releases!" The books look very much like the supplements Scott Dicer is familiar with: cyberpunk, pirates, space adventures. He recognizes *Blue Planet* and *SLA Industries*.

The new releases sit above a box labeled "$1 -- Take Several *Please*." The box is filled with marked-down *Girl Crazy* supplement packs from Decipher. Noticing this, Scott peers closer at the books, and subtle differences on the covers

begin to stand out. The artwork on the covers of the supplements displays women, fully clothed in bulky armor or protective vests, wielding well-balanced weapons. Men are shown as either partially naked or heavily armored, standing next to the women in action poses. There are no projectile breasts, no long stretches of legs, no tiny latex uniforms -- on the women. On the men, it's another story. On the men, there's flesh a'plenty.

Scott Dicer picks up the nearest *GURPS* supplement off the just released rack, the translation of Castle Falkenstein, and peers at the eye in the pyramid on the back cover. In bold letters at the bottom of the book are the words **Stephanie Jackson Games**.

Scott knows deep down in his gut that, much like an episode of *Star Trek*, he's stepped into an alternative universe. After reading and watching fantasy and science fiction for most of his life, he considers himself quite an expert on the subject of alternate universes. His entire life has been building to this moment.

Heart racing, he picks up gaming supplement after gaming supplement. The bylines have changed. The d20 supplement *Three Days to Kill* by Jennifer Tynes. Another d20 supplement, *Death in Freeport* by Christine Pramas. *Suppressed Transmission: The Second Broadcast* by Karen Hite. He reaches for the current issue of *Dragon*. It has an interview with Gail Gygax as the headlining article. A multi-page piece in the middle of the magazine deals with the problems of finding the proper costuming materials off the Web for pirate genre live-action games. Near the back of the magazine is a funny comic strip by Joan Kovalic about female gaming enthusiasts having trouble asking out their non-gaming boyfriends.

He dashes to the shelves of the regular roleplaying games, and pulls them down, one after another. He flips frantically through the pages. The names of the games are the same, and the content is similar, but it's skewed. There is more information on setting up complicated plots, character interactions, and political machinations with the occasional mention of a monster chewing on a careless adventurer. Conspiracies bump against costuming tips. Brave maidens in full plate armor fight off acid-dripping monsters in full color illustrations. Fully fleshed versions of live-action roleplaying games for nearly every single system are on the shelf. Games Scott would never have imagined have LARP versions: *Deadlands*, *Legends of the Five Rings*, even *FUDGE*. It is as if the LARPs have sprung up like weeds among the shelves of roleplaying games overnight. It's overkill.

What strikes Scott most of all is the similarity to his own realm of experience. Shelf after shelf, book after book, it all feels familiar. He's trapped in universe with a roleplaying industry for women, about women, written by women with advertising aimed at women. It's still the same roleplaying game industry he is used to with the same basic books, but it's all slanted toward a very specific niche market. The focus in these books is on strong women in perilous situations -- dangerous, edgy women who aren't going to take any garbage from any man, dealing with social problems of global consequence.

He kind of likes it.

This new gaming scene is certainly different, no doubting that. But is it *better* than it was before? Scott isn't sure. From the size of the store, there is clearly the same problem as on his own home world: gaming is a niche hobby. Here, it is slanted toward women. But, do *only* the women come and play? It doesn't matter if there are a million men and a thousand women in gaming or a million women and a thousand men, there's still only one million, one thousand people gaming overall.

Does it matter to be one of the minority when it is still *gaming* and it is still having fun?

The women are watching him. They're smiling in a friendly, "we've never seen your kind here" sort of way. It's almost as if they want to go for the throat.

While thrashing through the shelves of books, Scott Dicer had unconsciously wandered near the girls sitting at the back table. They are sitting around a pile of dice, character sheets, and source books. They're playing *Dungeons & Dragons*. They beam at him. They're friendly. They're open. They gesture toward the copy of the *Monster Manual* he's holding. They *want* him to game. They explain they have such problems meeting men who are interested in their hobby. One mentions that she keeps trying to get her boyfriend to sit down, but he says that he doesn't want to play

such "girly" games. He'd rather watch football and drink beer. Another mentions that it is so hard to meet someone of the opposite sex who is into the same things she is.

One girl leans forward. Her eyes are alight with an idea. She mentions she just read a few suggestions off a USENET group about getting men into gaming. She hastily adds Scott should try the new game *HUGE GUNS SHOOT STUFF*. It's based on the anime series of the same name, so it's not all *guy* oriented. There are some emotional situations involved "depending on the GM," but he might enjoy it, especially given his "Tastes as a Male." She explains this very slowly.

The other girls agree. Clearly *HUGE GUNS SHOOT STUFF* is the right game to get men enthusiastic about gaming. Another girl emphasizes, saying Steven Marsh wrote in his "Men in Gaming" column last week that all guys really want to do is run around in dungeons, kill things, and carry out treasure. It appeals to their nature to drink, hunt big horned things and hang stuffed heads on their walls.

One of the girls chips in and claims she doesn't believe that all men just want to hunt and kill things. She claims to have played with a group where half of the players were men and they like to *roleplay*. She insists that the men got just as much into gaming as the women. The other women don't believe her. They begin to argue.

Scott looks on with horror. He's riveted to the spot, listening to these girls chatter on about him as if he wasn't even there. They're speaking over his head about a gaming hobby that he's been involved in for years, and yet now he can't escape. It's no longer his hobby. It's now theirs.

With mounting terror, Scott makes his apologies and moves away from the table. In a rush, he makes his purchase of his forlorn *Monster Manual*, still clutched in his sweaty hands. His pulse races. His mouth feels dry and dusty. His stomach clenches. He hands his money over to the cashier, who is looking at him with a mixture of curiosity and boredom. He doesn't even bother to check his change.

Scott Dicer flees from the store. He stands on the sidewalk, panting in the sunlight. He has his purchase. He has his sanity. He looks up from the swirl of confusion to see a fellow gamer -- a refreshingly male gamer -- walking down the street at him. As Scott flashes a relieved smile, his friend says:

"Hey, Scott! Cool, you have the new *Monster Manual*! Are you playing in the *HUGE GUNS SHOOT STUFF* LARP this weekend? We're using Nerf this time . . ."

Scott Dicer, a normal gamer trapped in a strange world. This is a minor exercise in the care and feeding of a nightmare, with the hobby run only by women, played only by women, and participated in by only women. But it makes you wonder, in a different universe, what it might be like -- and if it really would be all that different. Scott Dicer knows. He can tell us what it is like to buy gaming supplements . . . in the Twilight Zone.

It's the most celebrated tool of our time. You use it to read *Pyramid*. You use it to process and save your game notes and handouts. You print up character sheets with it, download and run automatic character generation programs, and you conduct your game research on the Web. You may even participate in roleplaying formats designed especially for it -- PbeM, MOOs, and MUSHes, to name a few. Isn't it about time you let your computer in on the fun of your tabletop roleplaying game?

Getting Organized: The Word Processor

Every campaign needs lists of certain types that need to be searchable and require constant additions and changes. Such lists are best kept as word processing documents, kept open throughout the game session.

The word processor makes these documents searchable (every word processor I've ever seen has a simple, decent search function); you can instantly add items with as much or as little detail as you need at the moment. Unlike a physical file, you can organize your lists however you like without losing the ability to search. And unlike an index card file you never crowd an entry by adding detail later.

There are loads of documents you'll want to have handy during your game, and you'll surely have documents unique to your campaign. The following, however, are the most obvious and universal.

- **NPC list:** A no-brainer; the computer multiplies the usefulness of an NPC list when you can search by name, race, class, eye color, pasta preference . . . the list is infinite.
- **Gazetteer:** Village names and roadside shrines in a fantasy game, planets in a space opera campaign, or night clubs and havens in your vampire game; a searchable list of places will always come in handy.
- **Session agenda:** It won't benefit from searchability and expandability the way other documents do, but the constant presence of a session agenda will help keep you on track.

A database might be more specialized than a word processing document for some kinds of lists, but in my opinion it's too cumbersome, and too difficult to establish and modify. In the end, you need searchability and expandability, not massive cross-referencing. So word processing docs, I think, are the way to go.

There and Back Again: Mapping Software

There's some excellent mapping software available, designed specifically for gamers. Several are linked from [Logicrucible's Crystal Ball](), but here are a couple of examples:

- **Campaign Cartographer.** Expensive, but it has several features that make it excellent for use at the tabletop. One of the best is its infinite zoom feature: details can be added at every level, so you can theoretically put building-by-building and even room-by-room maps of cities, dungeons, and castles on the same map as a broad world map. Or, better yet, hyperlink a city icon on the world map to a more detailed map of the city. Or hyperlink a system icon on a galaxy map to a detailed map of the planet orbits . . . and each of those to a detailed map of the lunar orbits. It's only available for Windows, and appears to be untested on Windows emulators under Macintosh and Linux.
- **Hexmap.** Again, only available for Windows, but it's easy to use, customizable with some difficulty, and designed to emulate the ever-popular hex paper. Best of all, this one's free.

Other Gaming Software

There's a lot of nice gaming software available, from customizable automated dice-rolling programs to specialized character generation programs, and an awful lot of it is cheap or free. Unfortunately, availability is somewhat patchy, depending on what game system you're using. Because designing, producing, and marketing software is quite an investment for game companies, a lot of the gaming software available right now is designed and distributed by the fan base. Much of it lacks the professional sheen of commercially released software. But if you search the Internet, you're going to find some real gems, programs being given away that a commercial software company would charge a fortune for.

A few notable gems:

- **Steve Jackson Games' Computer Aids.** Lots of great stuff here for many different games.
- **TableMaster.** Table-rolling software, bundled with lots of useful tables (and more are available). It's also easily customizable for anyone with the barest hint of programming experience (I took a class or two on BASIC in high school, and I can do it; and probably anyone could, with the instructions and examples) and completely compatible with any game. It's not free, but well worth the low price.
- **The Ever-Changing Book of Names**, or **EBON.** Randomly generated names for a variety of cultures. Includes programmability, with good documentation. The fully functional version requires registration, but the unregistered version is completely usable and pretty close to fully functional.
- **Characturge.** An excellent character generator for White Wolf games, and very customizable for house rules and personal taste. There's no price exactly, but the designer asks that you donate blood to the organization of your choice . . . something you ought to be doing anyway.

The Sound of Music: Using a Custom Soundtrack

The ability to select the music you want and organize it into play lists is an incredible feature of the computer at the gaming table. If you haven't discovered the convenience of MP3s, a compact format for saving music as data on your computer, you're in for a pleasant surprise.

You'll need at least a good MP3 player that's capable of creating play lists. [WinAmp]() is a popular choice, with all of the

Campaign Cartographer by Profantasy

Files

Screenshot [345K]

Fractal Terrains by Profantasy

Files

Screenshot [160K]

features you'll need at the gaming table, and equivalents are easy to find for Macintosh and Linux platforms.

You'll likely also want to turn your existing music into MP3s. MP3now has excellent instructions for doing just that, and makes available several CD "rippers," programs that convert music CD tracks into MP3 files.

Napster is a very powerful program for exchanging MP3 files with others on the Internet. However, you should be aware of the legal implications of duplicating music under copyright and storing it as data, and of possessing data thus stored by others.

Once you've established a collection of MP3s, you can sort the files into play lists for various purposes -- brooding music for mysterious moments; exciting, fast-paced music for chase scenes; loud, angry music for combat; and so on. You can also develop a sound track for each campaign, using music as a continuous thread to bind each session to the others. Best of all, you can blend your music in new ways. Campaign soundtracks that mix classical music and instrumental movie scores with postmodern rock or punk become easy. If you're willing to put in a bit of time, you can create custom blends with emotional ebbs and flows . . . with results far superior to the shuffle feature of your multi-disk CD player.

Things That Go Bump in the Night: Using Sound Effects

Requiring a bit more hands-on attention than an MP3 soundtrack, sound effects well selected can really pay off at the gaming table. Portray menacing growls, squeaky hinges, airplane and helicopter takeoffs and landings, gun battles, ominous thunder, and so many more with a click of your mouse. You can buy inexpensive CDs full of sound effects most places you buy music CDs, and you'll probably want to "rip" the tracks into MP3 or wave files as described above. Or download Windows desktop themes (www.themeworld.com is a good place to start) and you'll be loaded up with grouped wave files (*Star Wars* fans will be particularly well armed).

Unlike your soundtrack, sound effects don't fit neatly into play lists. I recommend placing all the sound effects you intend to use during the game clearly labeled in a directory (window) of their own, keeping your music player running, and starting the sound effects as needed. If you use a sound track, you'll want to experiment before the game to see how sound effects interact with the your MP3 player.

Wintertree Games' FXMaster for Windows was designed for the very purpose of managing sound effects at the gaming table. The registered version saves 150 wave file names (far more than I would ever use in one night of gaming). According to my tests, it can also play sounds right over the top of an MP3 player (WinAmp, anyway), which is a handy plus.

Crossing the Fourth Wall: The Computer as a Roleplaying Participant

How about getting the computer involved in the game itself, within the game world?
As a prop it makes an excellent . . . well, an excellent computer terminal. That hacker
NPC can type frantically, slam Ctrl+Alt+Del when things don't go her way,
gracefully type with one hand while sipping a Slushee. Perhaps the monitor can serve
more abstractly as the occasional magic mirror or crystal ball. Or maybe the computer
can even be a central object to your plot: a techno-fetish, the time-travelers' ultimate
reference guide, or repository for the dark contents of Hitler's brain.

Drop the occasional image or text handout onto a floppy disk in a modern or
futuristic campaign, and add that extra bit of physicality and suspense for your
players. The PCs have the MJ files (a disk in the hand is worth so much more than a
note on the character sheet), but they can't actually look at them until they get to a
computer . . . .

Or imagine the computer as a character in itself. This can be used to dark and

dehumanizing effect in many dystopian games, when The Computer orders about human pawns with cold efficiency. Or it can be used for suspenseful and mysterious effect, a la the old movie Whoopi Goldberg movie *Jumping Jack Flash*, as an important NPC speaks only through the computer -- perhaps a human spy, perhaps the avatar of a Virtual Adept, or perhaps a Glass Walker totem at the heart of an urban werewolf caern. Or perhaps its role can be truly horrifying, as Hal in 2001, in perfect amorality. And what better role for the computer than a robot in *Star Wars* or another science fiction setting?

Try using text-to-speech software to enhance the effect with a not-quite-human synthesized voice:

- [Bell Labs' Text-to-Speech Synthesis demo](#) is web-based, easy to use, and reasonably flexible. Voices are created as you enter them. Unless you save individual wave files for later use, it does require an active Internet connection, and takes at least several seconds to reply over a modem connection . . . unless you [buy the software](#).
- [ReadPlease](#) for Windows is free for the taking. It included four voices, two male and two female, which are all easy to understand and fairly expressive. Its type-and-play interface works well. Hit Ctrl+N to clear the screen between lines (it plays everything in its text window, not following the cursor), and keep an open text file handy to copy and paste pre-programmed lines.
- [WillowTALK](#) for Windows produces very distorted output that's difficult to understand (which may be an advantage or a disadvantage, depending on how you plan to use it), and its interface is a bit cluttered. But it does have a lot of voices, including some nifty robot voices with an intentionally tinny edge or lots of reverb ("RoboSoft Two" is perfect for space opera security robots, and "Wendy" is a raspy voice great for damaged robots), and a handy drop-down menu to switch between them.

Perhaps the ultimately ubiquitous computer role can only be fully realized in **Paranoia**, where the computer can play an all-powerful NPC ("The Computer is your friend! All hail The Computer!") and devilish co-gamemaster ("A dozen angry looking blues with wicked looking pistols charge . . . what's that? Of course, Friend Computer . . . I meant to say that several dozen blues pour into the corridor, each one armed with a medical bot . . .").

Remember R2 "speaking" in Aurabesh to Luke in his X-wing in *The Empire Strikes Back*? Many of the computer's roles can be made more effective if you have the resources to set up a local-area network with a clean-looking chat program, one terminal in the hands of the GM, and the other with the players. (Double your score if you recognize the word "Aurabesh;" triple if you have the font on your computer right now.)

(Editor's note: A search for 'Aurabesh' and 'font' from [Altavista](#) should set you up with a truetype version of this font.)

The Devil in the Details

Before your roleplaying session, you'll need to prepare a bit, to adapt your computer to this specialized use.

- Decide what documents and programs you'll want open during the session, and create a directory (a.k.a. window) with shortcuts to each of them.
- Decide what documents you want to keep handy, but won't necessarily need to be open at all times. Create another directory with shortcuts to those, and then put that directory within the first.
- Be sure that you have hard copies of any documents you can't live without, in case of technical difficulties. Chances are that you won't need them . . . but if you don't have them, Murphy's Law will assert itself and trash your hard drive. Consider it hard drive protection.
- Disable any sounds that your operating system plays automatically, error alerts and so on. They can be pretty disruptive (especially if you've set up that *Planet of the Apes* desktop theme).
- Set up the computer where you'll need it before your players arrive.

There are certainly a few pitfalls to using a computer at the tabletop, so watch out for them.

- As the game begins, open every program and document you'll need. You don't want to wait for each one to open during play.
- Position the monitor such that it won't hide you from any of your players, or them from you. Even though it's an exciting tool, you can't let the computer interfere with the real point of the game, having fun with your friends.
- Place the speakers and adjust the volume so that music won't be overwhelming to anyone.

When you've brought your computer to the gaming table, the next step is to judge its usefulness there objectively. You've got to give it a few sessions before you can tell if the newness makes it awkward (be patient, because it will be awkward the first time), or if it's really just not compatible with your style of play. You'll find some functions that work well for you, and some that don't. In the end, remember that the game's more important than the gadget. But you may well find the computer is a powerful tool to make the game run more smoothly, keep it organized, and maybe even make it livelier.

* * *

It's that time again! Election time, when a handful of people will determine who will run the most powerful nation on earth for the next four years. It's almost too bad those people aren't the voters…

That's not to say your vote doesn't make a difference. In fact, voting is your opportunity to suck up to the Secret Masters. Some group of power-crazed madbeings will come out on top. Don't you want to be on their side when that happens?

Of course, it's not easy to decide which candidate is supported by which Illuminati, much less who will win. You can play *INWO* to model battles between the different factions, but, until now, it couldn't help you much with the election problem. Lucky for you, some of Them (for whatever inscrutable reason) have decided to pass along these rules and give you a vague idea of how presidential politics really work. Use the information wisely. But not too wisely. There are some things man was not meant to know.

Election Round INWO

This version of *INWO* uses all rules of standard *INWO* unless otherwise noted. The major difference is the addition of an "election round." During the election round, players nominate and elect a personality to be president, with all the perqs except the interns, until the next election round. They also learn valuable lessons about democracy and how to crush it before it becomes a nuisance.

Preparation

For **Election Round** *INWO*, I recommend that you remove all Groups with the "nation" attribute from play. Sure, arguably China voted in the last election, but let's not quibble. You could also remove non-American or "inappropriate" personalities, though many people would probably get a kick out of electing Count Dracula president. Make sure you include as many of the groups mentioned in these rules as possible, and a bunch of personalities. Media Sensations named after candidates are good, but making regular cards for them is better. There is already an Al Gore card, of course. You can add a George W. Bush card by clipping his picture from a magazine and gluing it onto his daddy's card. You could include their primary opponents, if you're big on simulating the whole election. McCain, Bradley, Forbes, Keyes, Buchanan? Who knows what sinister powers they wield? You could add former presidents as cards, even (supposedly) dead ones. Some have long felt that there should be a Nixon card, and, of course, most of the Founding Fathers were Illuminated.

Use a communal Group deck; if you're unfamiliar with those rules, see
http://www.sjgames.com/inwo/rules/variants/onebigdeck.html.

Finally, for the purposes of this variant, Bill Clinton has a 2 power and his only special ability is that he is Liberal 50% of the time.

The Election Round

At the end of each round of standard play, there is a round whose purpose is to elect a president. The election round consists of three parts -- nomination, naming of vice-presidential choices, and election. Plot cards that may be played at any time may be played normally during any part of the election round unless otherwise noted.

In the nomination segment, each player may nominate a personality in play (which includes those in the uncontrolled area) who will be a legal recipient of support in the election segment. A nominee need not be in the nominating player's power structure, and a single player may control any number of nominees. The players announce their nominations beginning with the controller of the current president and proceeding in standard turn order, until each Illuminati has had the opportunity to nominate once. If no player controls the president, nominate in regular turn order. Ross Perot and Lyndon LaRouche automatically nominate themselves, though they do not count as the nomination for a player controlling them.

Once the nominations are in, the Green Party, Libertarians, and International Communist Conspiracy may spend an action to throw their support behind any nomination, and thereby remove that nominee's opportunity to receive support in the election. All other nominees become "candidates." If no one makes a nomination, all personalities in play or in the uncontrolled area become legal candidates. If the three groups above eliminate all the nominees, any personalities on the table other than those "supported" become candidates. If there are no other personalities in play, the election round is skipped.

After the nominations are sorted out, the candidates must choose running mates. Every candidate must choose a vice-president, as long as there is at least one other personality in play or uncontrolled. The player controlling the candidate, not necessarily the player nominating him, chooses the VP. If the candidate is uncontrolled, the player nominating him chooses his second. (Perot and LaRouche, if they nominate themselves while uncontrolled, pick a VP randomly from among non-Government personalities.) Candidates announce their choice in order that they were nominated. There is no way to get out of a VP nomination. Any available personality may be chosen as VP, even other candidates, or

personalities previously supported out of nominations. The candidate and his running mate are now a "ticket."

When all candidates have VP choices, the election begins. Whichever ticket receives the "support" of the most power wins the election and becomes the president and vice-president. Declarations of support begin with the current president and proceed in standard turn order around the table. A Group, including an Illuminati, normally supports a ticket without using its action, simply adding its power to the total which that candidate has accumulated. A group may only support one ticket, once, and once the controlling player has announced its support, it may not be withdrawn or changed to a different ticket. Each player receives one opportunity to announce the support of his groups. A particular player may choose to divide the support of his groups between different tickets.

There are a few situations where a group may wish to spend its action in support. A media group may support any ticket normally, but if it spends its action, its support is doubled. (For example: Cable TV has a 3/2 power. If it does not spend an action, it may support a ticket with 3 power. If it spends an action, it is worth 6 power of support.) If the Democrats, Triliberal Commission, or Feminists spend an action when supporting a ticket, no Conservative group may thereafter support that ticket. If the Republicans, Fred Birch Society or the Religious Reich spend an action to support candidates, no Liberal group may thereafter support them. In order to gain the benefit of any plot card that temporarily increases power (e.g. Benefit Concert), the group involved must spend its action. A group may always support a ticket normally instead of using its action and attached special consequences. In fact, a group may support normally, and at a later time, use its action to add its additional power or special effects to that support. For example, your Feminists group could support a ticket on your turn, allow the next player to support, and then spend its action to make the candidates it supported ineligible for Conservative support on the third player's turn and beyond. The Eco-Guerrillas could support a hopeful pair on your turn, and at a later time spend their action and the plot card Benefit Concert to add 10 to the value of their support.

After all players have had their opportunity to declare support, the support of any groups in the uncontrolled area must be determined. Any uncontrolled personality who is part of one or more tickets will automatically support whichever of his tickets has the most support to this point. Any player who controls the Trading Card Games automatically decides the support of all other groups in the uncontrolled area, probably by subtle brainwashing in gaming magazine articles. Otherwise, the support of each group goes to the ticket that could mount the best unsupported attack to control on that group. For example, a ticket of Al Gore and Count Dracula could, between them, mount an attack of 13 effective power on the Anti-Nuclear Activists from Al Gore (Gore's 1 Power, +8 for direct control of Green, +4 Liberal in common), or on the Vampires from the Count (his 2 Power and +10 for direct control of the Vampires, Gore's 1 Global Power). No plots or groups outside the ticket may have any impact on this calculation (even with any attempt bonuses), nor is it in any way an actual attack. If two tickets have equal potential attacks, roll off to see which receives the support. Once a ticket is guaranteed victory, you don't really need to figure the rest of the support, unless the victor wants to work on his list of enemies.

If two or more tickets receive equal amounts of supporting power, the presidential candidate with the greatest personal power carries the election. If two or more tickets are still tied, then and only then, the winner shall be determined by a vote (see, I bet you're understanding the electoral process better already) among the players and anyone else who happens to be in the room at the time. Bring your friends! Claim that your dog is a longtime Democrat! And if the vote is a tie too, competitive roll off (which could be modified by appropriate plot or special ability; high roll wins) between the tied tickets will determine the victor. Sometimes it boils down to a crapshoot.

The Executive Branch

The newly-elected president gains the alignment Government and the following special abilities as though they were inherent to the card, until he ceases being president:

- Doubled Power.
- +3 on any attempt to control any Government group that is part of the US.

- +8 for direct control of any Government group.
- An additional control arrow (if the personality loses the presidency while using this extra control arrow, the puppet on the extra arrow is returned to the uncontrolled area).
- He may choose to gain all the special abilities of his vice-president, unless the veep is a Media Sensation. (Ex. if Al Gore is VP, the president receives a +8 to directly control any Green group. If Ross Perot were VP, the president could choose to automatically make his puppets Straight and Conservative.) Note that this is not on a case per case basis. The pres either takes the VP's ability or does not, and then maintains it until he is not president or he changes VPs.
- The real power behind the chief executive, however, is that only the player who controls him may play New World Order cards. In the event that there is no president controlled by a player, anyone may play such cards.

NWO cards may be removed by the use of other plot cards (e.g. Sweeping Reforms) normally.

The vice-president also gains the alignment Government. If the pres or VP were not Government before being elected, they will lose the alignment when they lose their office. If the president is destroyed and not immediately returned to play, or he resigns, or his position is removed for any reason (see below), the VP becomes president and may choose any personality in play or uncontrolled, other than a just-removed president, as his VP. But he may not use his action token for any reason as long as he is VP. The veep is immune to destruction by any means except assassinations. (I mean, he's already the VP.) He can only wish that he could resign. If the vice-president is killed or the position is removed, the president must choose some other personality in play or uncontrolled to become vice-president.

No personality may be elected president more than twice. If there is ever no president, the first personality to be drawn immediately becomes president upon being drawn. (Some possible reasons for this are the destruction of a president with no VP or the failure to conduct an election round due to lack of eligible candidates.) If there are no personalities in play except the president, the first one to be drawn becomes the VP.

The alignment and power gained do count towards any applicable goals while a personality is president, and if he is destroyed while president, he counts as a destroyed Government group, unless he is a Media Sensation. On the other hand, the vice-president may not be counted for any goal, even special goals, so long as he is VP or was destroyed while VP.

The plot Senate Investigating Committee may be used, at the player's option, to remove the president or vice-president from office instead of its normal use; ignore the first paragraph on the card if so used, though all other details of the card remain the same. It may be played at any time except during the election round in this manner. It may only be used in one capacity or the other each time it is used, but may be used in different ways in the same game. The card itself may still be used on any player only once per game, regardless of which way it is used.

Options

Probably because of the limited time until the election, a mysterious man in a black trench coat has handed me an unmarked envelope with some quicker options. But don't blame me if They want to know why you cut corners.

Last One in the White House Wins INWO

This is exactly like Election Round *INWO*, except that the game lasts only a predetermined number of turns (four is recommended), and the only way to win is by controlling the president at the end of the last election round. Whoever controls the VP at that point is definitely the loser. No goal or special goal allows victory. Otherwise, all *INWO* and Election Round rules apply.

The VP Is Eyeing Me Hungrily INWO

This is the same as Last One in the White House Wins *INWO*, except that there is one more round of play after the last election round, starting with the player controlling the president and proceeding in whatever order he desires. In this

way, it may skip around the table, though each player must get one turn. Any player who controls the VP may refuse to take this last turn when called upon, forcing the pres to pick someone else, unless he is the last player available. The vice-president always strikes last . . .

Even More Cynical About Democracy INWO

Don't like the election round at all? Instead, use a plot card that can be linked to a personality to make him president and give him the presidential powers. (Make it with a blank card, or mark a different plot card to represent it.) This "Elected President" plot may be played only during your turn, and requires the action of the current pres or the personality to be "elected," an Illuminati action, and either Media action(s) of 8 or more power or the action of the Democrats or the Republicans. No more than one such plot may be in play at any time. As soon as it is played, any other "Elected" plot in play is discarded, and the powers of the president pass to the personality newly linked. The president must still have a VP as long as at least one other personality is in play or uncontrolled, and that unfortunate suffers the regular restrictions. If the pres stops being president or alive, the link is passed to the VP, not discarded.

In all seriousness, if you can vote, you should vote.

Pyramid Pick

Letter Head

Published by [Atlas Games](#)

Designed by Kristan Lawson and Herbert R. Lawson

124 cards; $19.95 U.S.

"Today's word is ACNE," David said. He spread the cards out in front of them. The "A" and the "C" stared up at the other players, but the last two letters were face-down.

Jody looked at the bright red L-shaped hair of the guy on the backs of the cards. It was the final round, and David hadn't lied once in the forty-five minutes it had taken them to get this far. Something felt fishy, though.

He studied David's eyes. David did his best not to look shifty.

"Challenge," Jody said. Deb followed his lead; Paul didn't. Paul was quiet that way. He was also 50 points behind.

David slowly turned over the hidden cards. He had the N -- but a Z was hiding where the E should have been. He shook his head ruefully. "Thirty points down the drain," he muttered.

Jody said, "It's all in the bluffing." He certainly hoped it was. The best word in his hand was DIVOT, and the only way he could score enough points to win was by convincing the others he was lying . . .

* * *

Letter Head looks like "*Scrabble* with cards." You have a hand of cards and you spell words with them, scoring points depending on how rare each letter is and how long the word is. The cards themselves are well-designed, durable and easy to shuffle, but there's no art or visual surprises.

That's okay. *Letter Head* doesn't need eye candy -- the parts are simple, but the game is great.

Like Scrabble tiles, each card represents a single letter. Vowels are common and worth only one or two points, but the single "Z" card is worth 25 points. You can have between five and ten cards in your hand, and you use these to spell one word in each of the game's five rounds.

So far, there's nothing new. The twist that completely changes the game is that you can lie about what cards you're using.

Don't have an "E" to spell "HOTEL"? Use a "J" instead. Sometimes you will want to use that "J" even if you do have an "E", because you might be able to score more points that way.

Of course, you'll have to sneak this misspelling past the other players. *Letter Head* lets you put any or all of your letters out face-down when you spell your word. You tell them what you're spelling, and they have to decide if your cards are what you say they are.

If your opponents don't challenge you, you can sneak that "J" past them and rake in the points. If they think you're lying and you're not, you score extra points. But if they catch you pulling a fast one, each opponent that challenged you gets points and you lose your turn.

Thanks to the bluffing rules, you can score even if you have a terrible hand -- but you have to be sneaky to do it. In fact, you have to be sneaky all the time. Every play depends on how suspicious your opponents are and how suspicious you can make them be. You want them to believe you when you're lying, and challenge you when you're telling the truth.

The balance is almost perfect. Social skills are slightly more important than vocabulary skills, but you need both to play well. Like poker, you have to be able to put the cards together in useful combinations while figuring out what your opponents are really doing. (In fact, *Letter Head* comes with rules for fourteen other word games, several of which are poker variants.)

Group dynamics are crucial, especially in larger groups. It only takes one person to initiate a challenge, so you have to be much more careful about bluffing when playing with six to eight players. On the other hand, you can score even more points by convincing five or six players to pile onto a challenge when you're telling the truth.

The basic strategies remain the same whether you're playing with the minimum of three people or the maximum of eight, but you have to make adjustments for every combination of players. That's exceptionally good game design.

Game balance isn't the only bit of good design peeking out of this game. Since it only lasts five rounds, even an eight-player game is over in about an hour. Smaller games are shorter, and because you can draw cards at any time -- no waiting your turn here! -- you almost never have to sit around and wait while somebody thinks.

Letter Head has all the earmarks of a classic adult card game. It's fast, it's easy, and its strategies shift with the people you play with. Atlas Games has hit another home run here -- let's hope that *Letter Head* enjoys the same success as *Once Upon a Time* and *Lunch Money*.

--Chris Aylott

Pyramid Review

Blue Planet RPG 2nd Edition Player and Moderator's Guides

Published by [Fantasy Flight Games](#)

Written by various authors / [Biohazard Games](#)

Two 256 page books, hardbound; $27.95 each.

For those who don't know, *Blue Planet* is a hard science fiction roleplaying game released several years ago in softcover by Biohazard Games and supported by two supplements, *Archipelago* and *Access Denied*. After a recent agreement with Fantasy Flight Games, Biohazard has re-released the contents of the core rulebook and *Archipelago* in two nicely hardbound books, split into a *Player's* and a *Moderator's Guide*. The 2nd edition of the game also replaces the rules system of the 1st edition and adds a small amount of new information.

The main draw of *Blue Planet* continues to be its superb setting. The game concentrates on Poseidon, a waterworld very similar to Earth. The planet was colonized by a United Nations effort after a wormhole connecting it to Earth was discovered. However, after a vanguard colony was established, Earth suddenly faced a horrible plague called the Blight, which eventually killed over half the world's population, before being controlled by the concentrated efforts of the new world government, the G.E.O. Further colonizing of Poseidon stopped for over 75 years, and the colonists adopted a low-tech lifestyle to survive. When recontact finally came, a gold rush ensued, as newcomers struggled to escape devastated Earth and maybe make a quick buck, usually at the expense of the now natives. *Blue Planet* is set in the resulting confusion.

The world of Poseidon is ripe with roles and adventures for characters to take on. Countless factions attempt to influence the future of Poseidon: the Incorporate, companies almost as powerful as nations, want to exploit it; the Natives and perhaps the mysterious Aborigines, reclusive aliens that seem sentient, want to protect it; the G.E.O. wants to rule it; and ordinary people just want to survive it. Any of these groups can be used by a GM as enemies, allies, or employers to provide characters with a reason to adventure.

The 2nd edition of *Blue Planet* adds information about the Aborigine and Native groups to the *Moderator's Guide*, as well as a dribble of new technology to the *Player's Guide*. While this information fleshes out those factions, but is by no means crucial to GMs who own the 1st edition. In addition, several pieces from Undercurrents, a newsletter that supports the game, seem to have made their way into the new version. However, the most important change by far in the 2nd edition is the new rules system.

The 2nd edition rules system is a major improvement over the cumbersome and confusing 1st edition rules. Unlike the percentile-based 1st edition, the basic dice mechanic for 2nd edition involves taking the lowest roll from a dice pool of between one and three ten-siders and comparing it against a target number of the total of character's skill and attribute plus modifiers. A roll less than the target number succeeds. This mechanic works well and is used throughout the game.

Other than the new dice mechanic, the best part of the new system is character creation. Using a series of overlaid templates, players progress up a character from childhood through a professional career. Custom points allow the

player to tweak the character to their taste. Following Biohazard's belief that not all people are created equal, the game allows three power levels, Everyday, Exceptional, and Elite, to satisfy a variety of games. The only downfall of character creation is that it is rather slow, although not excessively.

Otherwise, there are a few flaws in the new rules. The combat rules, while quite lethal and realistic, require numerous dice rolls and special cases that other games often manage to streamline. Also, several small details, such as vehicles that lack the range to operate on Poseidon's vast oceans, still haven't been fixed. However, overall the rules system models the setting well, and though it isn't perfect, it definitely is acceptable.

All of this information is contained in the two book format set by *Dungeons & Dragons*: the *Player's Guide* contains the rules and general setting information, while the *Moderator's Guide* contains the descriptions of specific islands found in *Archipelago* along with the GM only information from the core rulebook from 1st edition. The production values for the new books have increased as well, with easier to read type and many new interior illustrations. Unfortunately, Biohazard has abandoned the old photorealistic cover illustrations for drawings that, while pretty, lack the wow-factor of the first edition photos. In general though, the new books are aesthetically comparable to books from the larger roleplaying companies.

Whether or not *Blue Planet* 2nd Edition is worth your gaming dollar depends on your situation. For owners of 1st edition and *Archipelago*, the main attraction of the new edition will be the new rules and production values. If you already use a different system, it may not be worth your money. For owners of only the core rulebook, most of the *Moderator's Guide* will be new, and well-written at that. Gamers with an interest in science fiction should also buy this RPG -- its an excellent hard sci-fi setting and the new version is definitely an improvement. For the general roleplayer, it's still a good game if you can spare the cash, but not a must-buy. All in all, the new edition exhibits all the good qualities of the game and fixes most of its flaws. Go on, take the plunge into *Blue Planet*.

-- Andy Wills

Pyramid Review

The Way of the Wolf (for L5R RPG)

Written by Rich Wulf and Shawn Carman

Published by [AEG](#)

$19.95; 128 pages

The tenth book in "The Way of the Clans" series follows the formula from previous books down to the last detail. Staring off with a short story, then into numerous little tales about Ronin in Chapter One, to history in Chapter Two, character creation in Chapter Three, NPCs in Chapter Four, Character Templates in Five, and an appendix full of useful stuff. Each chapter is separated by a full page illustration, and AEG's use of sidebars continues unabated.

The good news is that while the format may be standard, Ronin, by their very nature are not. The different tales about Ronin in Chapter One give the GM a good idea of the numerous types of origins Ronin can have. Retired Samurai, Samurai out to test themselves, fallen Samurai, children of fallen Samurai, and farmers who want to be Samurai all move about under the broad title of Ronin.

More important than individual Ronin tales, Chapter Two gives the GM and players specific examples that give more information under different headings. For example, under Dishonored Samurai, the reader learns that it is, in the eyes of Rokugan, a harsher punishment to be denied seppuku and cast out then to be allowed to kill oneself. Outside of more general history, there are employment listings, such as advisors, priests, bandits, and player's favorite, mercenaries. Legends recount different tales that show Ronin are not all honorless. The sidebars here are used to good effect, with different NPC backgrounds listed without stats. This is perfect for the GM who doesn't want his players knowing everything about the NPCS.

Another important part of Chapter Two is the Ronin Organizations. Most players will fight Yugoro's Hordes, a group of juzimai (gangs) that follow one bandit, or search out work in the City of the Rich Frog, or mentors in the city of Nanashi, or fight alongside the fallen Toturi, a.k.a. the Black Lion, a.k.a. the Black Ronin. Those seeking information on the Kolat will get a little, but not enough to discourage players from buying the book. Last but not least, Bloodspeakers are given their own section. Unlike many in Rogukan, the servants of Iuchiban always have a place for angry Samurai. Each section includes notes on how the organization reacts to other Ronin organizations, as well as brief history and physical location. At this part of Chapter Two, the idea of Ronin Schools is brought into play.

Other information in Chapter Two includes Ronin Shugenja, The Yotsu Family (a specific example of a Ronin Family becoming Samurai), and ends with Famous Battles. GMs will read about how Ronin have influenced important events like The Battle At White Stag and the Battle of the Cresting Wave, both very established events in Rogukan history.

Players will eagerly devour Chapter Three. Who doesn't want new skills, advantages and disadvantages? Provincial Hero allows the Ronin some clout in a small area, while Personal Mon allows the Ronin to have his own symbol. The Bounty disadvantage gives players a variable number of points depending on how high the bounty is and what crime the character is accused of, while Heimin is a Ronin without Samurai ancestry, a big crime in the eyes of Rogukan.

While Chapter Four includes Ronin of all kinds, the two most famous, Ginawa, and Dairya, only have their backgrounds updated. Why? Why not just a reference to *Unexpected Allies* for more information? Outside of that, there are numerous other Ronin whose backgrounds link them to Toturi, like Mikio, Dairya, Hasame, Toku, and Shotai. There is a high point Ronin army for Clan Wars, but doesn't really help the GM looking for variety in his NPCs. A few others like Seou and Seiki Yotsu, show where the accepted Ronin family is now, one a Samurai, the other a Shugenja.

Chapter Five is useful for new players or GMs needing more quick characters with templates like Retired Vassal, Ashigaru Fraud, Lost Heir, Wandering Duelist (not the same template from Winter Court Kyuden Kakita), Wave-Man Assassin, and Wandering Komuso, or Monk.

The Appendixes cover not only how to survive as a Wave Man, but how the other Clans react to Ronin, how to use Ronin in the campaign, recent developments, information on Scorpion and Akoko Ronin, new spells, magic items, villages and an example village, Nanashi Mura, with map and encounter locations. The book ends with not one, but two character sheets!

The Way of the Wolf, along with the *Minor Clans*, can produce some of the more interesting and memorable characters in a *Legend of the Five Rings* and this book succeeds in making them not only more viable as a character type, but more capable of surviving among their peers.

-- Joe G. Kushner

I Shoot The Body Electric

"In living things, we see the signals of the inner state of the organism reflected in the brightness, dimness, and color of the flares. The inner life activities of the human being are written in these 'light' hieroglyphs. We've created an apparatus to write these hieroglyphs. But to read them, we're going to need help."
-- Semyon and Valentina Kirlian

Take a picture, they say, it'll last longer. That's especially true (using the term with our traditional laxity) of the paranormal; without blurry photographs of everything from Bigfoot to triangular UFOs, we'd barely have a hook to hang a scenario on. What we need, then, is a superior method of pseudoscientific photography, one that combines Tesla, chakras, the KGB, and anything else our little hearts desire. Fortunately, the vasty deeps of Communist claptrap provide just such a mechanism for us all, through the miracle of Kirlian photography. So lure your player characters into high-frequency electrical fields, twiddle those top-line Soviet-vintage Bakelite dials, and say "cheese." Just be sure to pronounce it "Kirlian."

"I studied the picture with pain, excitement, and hope all combined. Did I have a discovery? An invention? It wasn't clear yet."
-- Semyon Kirlian

It all began in 1937 (or, according to other sources, 1939), when Armenian electrician Semyon Davidovitch Kirlian noticed a powerful spark-gap discharge from a medical diathermy machine in a hospital in Krasnodar, Russia. Being a creative sort, he wondered if he could photograph such a discharge, and being a handy sort, he soon whomped up an apparatus to allow him to do just that. By placing anything onto a photographic plate (or on photographic paper) inside a high-frequency, high-voltage current (with a very low amperage to avoid frying the subject), he was able to generate a glowing "airflow" discharge that transferred itself to the photograph. Tinkering with the apparatus, they took "Kirlian photographs" of leaves, fingertips, small animals, and anything else they could find around the lab. The Kirlians became convinced that they'd photographed the "bioplasmic field" or, in occultist terms, the "aura." In 1961, the Kirlians wrote up their results in a scientific paper, with the result that the Soviet (and Czechoslovakian) medical and technical establishments launched a massive investigation of the phenomenon. Scriptwriter turned LSD booster turned UCLA parapsychologist Thelma Moss popularized Kirlian techniques in the U.S. beginning in the early 1970s, and Kirlian "aura diagnosis" became a much-touted buttress of New Age medicine and therapy.

The Kirlians, sad to say, did not actually invent "Kirlian photography," or even discover the phenomenon (or pseudophenomenon) of the Kirlian aura. In 1777, German physicist Georg Christof Lichtenberg discovered that discharging a high voltage current into a resin created a starlike dust pattern -- a "Kirlian sand-painting," if you will. In 1852, Baron Karl von Reichenbach discovered a mysterious glow from many animals and plants, which he considered the visible sign of the "Odic force" within all life, a notion Wilhelm Reich would revive a century later as the "orgone." Nikola Tesla often photographed himself standing within his high-voltage Tesla coil, emitting a nimbus of electricity. It's not at all unlikely that the diathermy machine which initially inpsired Kirlian was one of those invented by Tesla in 1897. Two years later, one Rochas d'Aiglun actually invented the Kirlian process, photographic paper and all. In 1903, French physicist René Blondlot created a ruckus over invisible "N rays" emitted by certain metals; over 100 experiments independently confirmed this cousin of the Kirlian aura before being junked. In 1911, London doctor Walter Kilner developed a technique for viewing the "etheric body" through a dye-filter. Two Czech experimenters also independently developed the Kirlian process in 1939.

"Our special optical apparatus gave us more trouble than anything else we've invented. It would be hard to imagine a more capricious instrument. It had to be tuned in three ways, the optical lenses, the tension, and the high-frequency discharge. The success of the demonstration depended entirely on proficiency and practice. It was impossible not to get nervous with it."
-- Semyon and Valentina Kirlian

Sadly, of course, it's all down to wet fingers. The prime determinant for the type and color of a Kirlian discharge turns out to be how sweaty or greasy your hands are when the picture gets taken. (Some very patient investigators at Drexel

University did the groundwork on this stuff in the 1970s.) Even Kirlian's early experiments detected a notable difference between Kirlian photos of inebriated and sober subjects. (Kirlian might also have become suspicious when inorganic sponges soaked in saline solution also gave full, vibrant "aura photographs" under his process.) Kirlian energies don't manifest in a vaccuum, which also argues against a psychic aura and for an atmospherically-conducted coronal discharge of the same type seen in St. Elmo's Fire. The famous "phantom leaf" photos by Thelma Moss are almost certainly photos of residue left on the plate from previous leaf photographs, and the generally balky and sensitive nature of even a properly-designed Kirlian apparatus means that its "aura photographs" will vary immensely thanks to tiny changes in atmospheric conditions.

"Thanks to the Kirlian discovery, bioplasmic energy can be seen by anyone in photographs and electron microscopes. It can be scientifically observed and studied as it swirls in sparkling flares of color. Twentieth-century scientists, with their tracking and charting devices, lifted the atom of the ancient Greeks out of the realm of philosophy and into the realm of the actual, making it a practical energy. Perhaps the Soviets starting with the Kirlian apparatus will do the same for the vital energy of ancient cultures."
-- Sheila Ostrander and Lynn Schrader, *Psychic Discoveries Behind the Iron Curtain*

Or so says the coverup conspiracy, anyway. It's obvious to even (or especially) the most blinkered researcher that the medical establishment hates and fears Kirlian techniques, which can diagnose diseases both physical and emotional before they appear in any conventional screenings. Kirlian technology helps track the flow of chi for acupuncture, or prana for Tantric magic. Kirlian photography can spot powerful psychics -- Thelma Moss' three sessions with Uri Geller demonstrated just the kinds of results she expected. "Skeptical" Kirlianists say the process photographs a coronal discharge, but one that is sensitive to psychic disturbances and medical states. Proper gung-ho Kirlianists say they photograph the actual astral body, emerging from the corporeal one like the Sun's corona from behind the moon during an eclipse.

Kirlian techniques can have applications far beyond the medical or therapeutic, in the proper hands. If they truly detect an astral body, surely a properly rigged setup would detect ghosts or astrally-projecting magicians in sensitive areas. Kirlian photography could detect lingering psychic traces useful in everything from criminal investigation (in proper *Millennium* style) to psychic archaeology. A Kirlian field could detect ships using Philadelphia Experiment technology, or the invisible unfortunates created by it. Similarly, one could hypothesize a Kirlian "wind tunnel" in which various devices or runes or wards could be tested for magic resistance -- this might even lead to magical (or psionic, or both) Stealth (or hyper-reflective "chaff") designs suitable for tinfoil hats, Reptoid cylinders, UN helicopters, and black suit-coats alike.

But that sounds like a lot of hard work. Simply using off-the-shelf technology, you can easily add the word "Kirlian" to any other kind of sensing for that special flair: for example, "Kirlian earth-penetrating tomography" helps find those hidden temples under the Sphinx or the network of subterranean tunnels connecting El Dorado and Area 51. Does the HAARP projector set up a hyper-energetic diffraction pattern in the troposphere, enabling "Kirlian astronomy" to detect Planet X? Should you feel the need, assume that forty years of top-secret Soviet research (or MJ-12 reverse-engineering of stolen Kirlian systems) have developed "Kirlian" lenses that use other energetic fields rather than electricity: a Kirlian-neutrino camera on the KH-23 satellite could spot powerful psychics (or magical artifacts, or Lost Cities focusing sacred-geometric feng shui) from orbit.

"It seems to be a fact that there are natural flames which at times visibly encircle the human head, and that also from a man's whole person fire may on occasion radiate naturally, not however like a flame which streams upwards, but rather in the form of sparks which are given off all around; further, that some people become resplendent with a blaze of light, though this is not inherent in themselves, but attaches rather to their clothes, or to the staff or to the spear which they are carrying."
-- Pope Benedict XIV, *De beatificatione*

Of course some folks always knew what to call mysterious coronal discharges from the human form -- halos. The hagiologies are full of saints who emitted glows under spiritual impulsion, from St. Lidwinna to St. Francis of Assisi, to St. Philip Neri. The discharge from the Ark that killed the blasphemer, the flash of light that created the "photographic negative" on the Shroud of Turin, and many other miracles no doubt draw on the numinous Kirlian

energies of divine power. Perhaps the Vatican's Kirlian devices date back to the same [ancient astronautic](#) crash that left the Ark of the Covenant and the Holy Grail behind; or perhaps they simply use Czechoslovakian-surplus Kirlian scanners, slaved to the [Ernetti Chronovisor](#), tuning in powerful spiritual emanations from the distant past.

"Within twenty-four hours that machine near the table will generate waves acting on unrecognized sense-organs that exist in us as atrophied or rudimentary vestiges. Those waves will open up to us many vistas unknown to man, and several unknown to anything we consider organic life. We shall see that at which dogs howl in the dark, and at which cats prick up their ears after midnight."
-- Crawford Tillinghast, in "From Beyond," by H.P. Lovecraft

On the other hand, maybe there's a reason that people around the world instinctively know that photographs steal your soul. Perhaps Kirlian photography not only opens our eyes to outside forces, but allows them to look back at us through the pitiless lens. Once you've left your aura's imprint on the photographic plate, the implications for sympathetic (or down right unsympathetic) magic should chill the blood of the cheeriest New Ager. What good is it to develop a Kirlian videocamera that lets you see the egregors, or the poltergeists, or the [Rods](#), if it means that They can now see you? As centuries of pulp novels and late-night Christian broadcasting have taught us, anything we don't understand can be used for the purposes of Evil. No doubt the fiendish Nazi Ahnenerbe dug up Reichenbach's Odic research and tied it in with captured Kirlian technology to release the inherent vril in the [Amber Room](#) and transform it into a gateway between worlds, through the vibratory barriers and into the Mauve Zone inhabited by [green-gloved tulpas](#) and non-Euclidean monstrosities. It's up to your PCs to stop them, or those Kirlian satellites can only document the disintegrating aura of the Earth as ozone depletion, algal blooms, and mass extinctions race each other to a photo finish.

by Sean Robson

Art by Dan Smith

Gulach staggered to the top of the dune and saw nothing but an unending sea of dunes extending to the horizon. He choked out a wheezing laugh -- as much as his parched throat would allow. He had entered the Great Desert on a fool's quest, and he would die here. An ordinary man would have died long ago, but Gulach was not a man, he was a half-breed bastard -- too stupid to quit and too stubborn to die. He stumbled on, each step an effort of sheer will under the relentless hammer and anvil of the blazing sun and desert floor.

He had heard rumors of the Daga-Shai while living as a pit-fighter in Megalos. The Daga-Shai were said to be a secret society of assassins, all of them Half-Orcs like him. It was whispered that they lived in a lost city in the Great Desert, and moreover, that they offered naraghash -- sanctuary -- to any Half-Orc with the will to seek them out. The tales struck a chord in Gulach's soul. Never in his life had he known family or community. His only acceptance was the roar of the crowd for spilling and shedding blood to amuse Megalos's wealthy citizens.

They said he wouldn't last three days in the desert, that he would never find his sanctuary, if it even existed. Gulach didn't care. He would rather die in the desert dreaming of sanctuary than continue to live without hope. He stumbled and fell face first into the sand, and knew he lacked the strength to rise again. As he stared into the face of the late afternoon sun, clawing weakly at the sand, four tan cloaked silhouettes rose up, seemingly out of the desert, before him. One of the figures grabbed Gulach by the hair, bent his head back and placed a gleaming knife blade at his throat. "What do you seek?" whispered the veiled figure.

"Sanctuary," Gulach croaked.

Gulach's head was released and he was lifted to his feet. The leader of the four gestured to a stone walled city in the distance. "Welcome brother," he said, "to the city of Naraghash."

History of the Daga-Shai

In the year 1929 a band of Half-Orc slaves fled from the Spleen-Eater tribe in the Orclands. Knowing they would fair no better in Caithness, they escaped into the wastes of the Great Desert. Led by Goresh Lekh, the strongest and wisest among them, they learned the ways of the desert - how to find water and food. After many months of nomadic existence, they came upon the crumbling ruins of an ancient city. Where most of the band saw ruin and decay, Goresh Lekh saw the future. They settled in those ruins and slowly began to reclaim the city from the desert. As the women began to bear children, and more refugees from the Orclands found their way to them, the community grew and they finally had what they always dreamed of -- a home. They named their home Naraghash, Orcish for sanctuary.

Goresh Lekh knew that, for their society to survive, they must have commerce. In the resource-poor desert all they had to trade was their skill, and the skill they were best at was killing. And so the Daga-Shai -- the "night-shadows" --

were born. Goresh Lekh was born in Sahud and raised for a time by his human uncle who taught him to fight. After his uncle's death, Goresh Lekh was driven from Sahud and into the Orclands, but he never forgot the lessons of his childhood. In training the Daga-Shai, he refined and modified his Sahudese fighting techniques, blending them with the fighting style and weaponry the Half-Orcs were familiar with.

Under Goresh Lekh's tutelage, the Daga-Shai became peerless assassins. Their services were in demand in Megalos, and fetched a high price. As the Daga-Shai's reputation grew so did their ranks, as more and more Half-Orc refugees sought them out.

Politics

The Master of Daga-Shai is the leader of the society, and is known as The Goresh in honor of their founder. Under The Goresh a council of elders govern the city of Naraghash, leaving The Goresh to oversee the business and training of the Daga-Shai. Although the Daga-Shai society is largely secular, The Goresh is the closest thing they have to a holy man. His wisdom and authority are unquestioned.

When the Goresh dies, the most senior and experienced of the Daga-Shai assassins is chosen by the council of elders to replace him. If there is more than one eligible candidate, the issue is settled by sending the contenders to the Master's Alley, a convoluted maze of ruins. There the contenders stalk and ambush one another until all but one are eliminated. The survivor is named Goresh. There can be only one Master of Daga-Shai.

The only other sentient race living in the desert are the Reptile Men. The two races live in relative harmony, each preferring to avoid the other. In the early years of its settlement, Naraghash was occasionally attacked by Reptile Men, who feared the Half-Orcs were encroaching on their territory. Since the city walls were the first structures rebuilt by the settlers, the attacks met with little success, and as soon as the Reptile Men realized that the Daga-Shai wished only to live within the confines of their city and be left alone, the attacks stopped. On occasion the Daga-Shai trade steel to the Lizard Men in exchange for artifacts.

Many Daga-Shai, especially those born outside of Naraghash, harbor a deep resentment toward Orcs or Humans, depending on where they were raised, and many take great satisfaction in avenging themselves upon their former oppressors. The Goresh has strictly forbidden the indiscriminate slaughter of Humans, as it would damage the professional reputation of the Daga-Shai. Orcs, however, are a different story, as they seldom employ the services of the assassins. The Daga-Shai frequently conduct field exercises in the Orclands, as the area provides a limitless supply of training subjects on which to hone their skills.

Culture

The Daga-Shai live in a communal society. All resources are shared equally, and citizens are assigned living quarters with the city. All citizens work for the betterment of the whole, and it is considered the highest honor to serve as an assassin and help provide for the community. Half-Orc refugees are welcome in Naraghash, but are expected to train as Daga-Shai and help provide for the community if they wish to stay. Women are allowed to serve as assassins if they desire, but if they become pregnant they are expected to return to Naraghash to bear their children and nurse them through infancy. Children aged two to ten are raised communally, and are given the run of the city and allowed to enjoy their childhood. All children in Naraghash, boys and girls, begin training as Daga-Shai at the age of ten, and enter service as trained assassins at age seventeen. At present there are approximately three hundred citizens living in Naraghash, and over one hundred and fifty assassins abroad.

At least one Daga-Shai is stationed in every major city on Yrth to take freelance assignments. A small percentage of the Daga-Shai's fee is kicked back to the local

assassin's guild to avoid misunderstandings. Most guilds are happy to accept this
arrangement since the Daga-Shai's contract fee is so high he doesn't really take
much work away from the local talent, and eliminating a Daga-Shai is costly in terms of lost manpower. Freelance
Daga-Shai spend two years at each posting. After being relieved, they return to Naraghash for a period of rest before
being reassigned. Eventually, due to injury or age, an assassin will be forced to leave active service and retire to
Naraghash. There, they continue to serve their people by performing less hazardous duties. Some take up a trade, while
the best become Daga-Shai trainers.

Occasionally, The Goresh will accept a contract putting the Daga-Shai on long term retainer to a powerful individual
or organization to serve as personal assassins and body guards -- who better to protect someone from assassination
than a professional assassin? It is the responsibility of The Goresh to ensure that there are enough assassins available
to meet the Daga-Shai's contractual obligations.

The laws of Naraghash are designed to protect and preserve its citizens and are strictly enforced. The Prime Edict of
the Daga-Shai is to preserve the secrecy of the city. Goresh Lekh realized that if the location of Naraghash were
learned, or even the truth of its existence confirmed by the outside world, the new homeland would be destroyed.
Daga-Shai are expected to take their own lives before revealing the city's location. Anyone who does reveal the
location is hunted down and killed, along with those he told. To prevent accidental discovery, Sentinels patrol the
desert around Naraghash, killing all but Half-Orcs seeking sanctuary.

One of the most striking features of Daga-Shai society is their unshakable solidarity. The citizens of Naraghash are
exceptionally loyal to The Goresh, and to each other. Theft is unheard of in Naraghash, and the incidences of betrayal
have been few. Disputes are settled by a formal duel. For many Half-Orcs, the feeling of brotherhood and acceptance
they find with the Daga-Shai instills fanatical devotion.

Code of the Daga-Shai

The Daga-Shai live by a strict code of personal and professional conduct: once coin is taken, a contract must be
fulfilled, personal disputes are to be settled in a fair duel, die before revealing the location of Naraghash.

Half-Orc Racial Template (from GURPS Fantasy Folk)   Cost: 0 points

Attributes: IQ-1 [-10], HT +1 [10]
Advantages: Extra Hit Points +1 [5], Acute Hearing +2 [4]
Disadvantages: Reputation -2 [-10]
Skills: Brawling (P/E) DX [1]

Daga-Shai Assassin Template   Cost: 100 points

Attributes: ST 11 [10], DX 13 [30], IQ 11 [20]*, HT 12 [10]*
Advantages: 20 points from: Alertness [5/level], Combat Reflexes [15], Fearlessness [2/level], Fit or Very Fit [5 or 10], High Pain Threshold [10], Literacy [10], Magic Resistance [2/level], Patron (The Goresh) [Varies], Toughness [10]
Disadvantages: Duty (12 or less) [-10], and an additional -20 points from: Bloodlust [-10], Callous [-6], Code of Honor (Daga-Shai) [-10], Extremely Hazardous Duty [-20], Fanaticism or Extreme Fanaticism [-15], Intolerance [-5/-10], Loner [-5], Sense of Duty [-10].

Primary Skills: Daga-Shai Hand-Hand [12], 10 points in the following Combat/Weapon skills: Shortsword (P/A), Pistol Crossbow (P/E), Garrote (P/E), Knife (P/E), Knife Throwing (P/E).

Secondary Skills: Armoury/TL 3 (M/A) IQ [2] -- 11, Camouflage (M/E) IQ+1 [2] -- 12, Climbing (P/A) DX [2] -- 13, Holdout (M/A) IQ [2] -- 11, Shadowing (M/A) IQ [2] -- 11, Poisons (M/H) IQ-1 [2] -- 10.

Background Skills: 6 points in any of: Escape (P/A), First Aid (M/E), Language -- Anglish or Orcish (M/A), Survival -- Desert (M/A), Tracking (M/A), Traps (M/A)

* -- Includes racial modifiers

Notes

- **Attributes:** High DX is essential for an assassin. ST and IQ are also important attributes, and the Daga-Shai receive education to overcome their inherently low IQ. Half-Orcs are naturally robust so 12 was chosen to reflect this.
- **Advantages:** Alertness, Combat Reflexes, Fearlessness, Fit, High Pain Threshold, and Toughness reflect the Daga-Shai's training, and in order to function independently they need to be able to read (Literacy). Sometimes The Goresh takes special note of promising students (Patron), and many of the Daga-Shai who were born in the mana-poor Great Desert are resistant to magic (Magic Resistance).
- **Disadvantages:** All Daga-Shai are obligated to accept contracts assigned to them by The Goresh (Duty). Bloodlust, Callous, Intolerance, and Loner reflect the hardships and abuses suffered by Half-Orcs who grew up in either Human or Orcish society. The code of conduct and dangers of life in the Daga-Shai are reflected (Code of Honor, Extremely Hazardous Duty), as is the fervent loyalty towards, and willingness to protect their new home (Fanaticism, Extreme Fanaticism, Sense of Duty).
- **Primary Skills:** The Daga-Shai are killers first and foremost, and their primary skills reflect their ability in combat. All Daga-Shai are extensively trained in the close combat hand-to-hand style developed by Goresh Lekh, as well as in the Shatara -- the Daga-Shai shortsword, pistol crossbow, garrote, and knife.
- **Secondary Skills:** Included here are the skills necessary to get close enough to the target to kill him (Camouflage, Climbing, Holdout, and Shadowing), the ability to keep weapons in good repair (Armory), and knowledge of poisons. The Stealth skill is emphasized as part of the Daga-Shai hand-hand training (see below).
- **Background Skills:** The Daga-Shai live in the Great Desert, and Survival (Desert), Tracking, and Traps help them thrive in an inhospitable environment. First Aid is important in a high risk occupation, and Escape comes in handy in the event of capture.

Daga-Shai Hand-to-Hand

Goresh-Ka   12 points/15 points

This martial art style was developed by Goresh Lekh, the first Master of Daga-Shai, and incorporates elements of

Sahudese martial arts with the fighting techniques familiar to most Half-Orcs. Goresh-Ka stylists use stealth to close to within grappling distance of an unsuspecting target, then kill him with either knife, garrote, or bare hands. When unarmed, the Daga-Shai will always attempt to grapple and take down the opponent, preferably stunning them with a Head Butt, Knee Strike, or Pile Driver. Close Combat and Ground Fighting maneuvers are used to put the opponent at a disadvantage when defending or counter-attacking. The Goresh is considered a master of Goresh-Ka for the purposes of purchasing the Trained by a Master advantage.

Primary Skills: Brawling (P/E), Wrestling (P/A), Stealth (P/A)
Secondary Skills: Body Language (M/H)
Optional Skills: Breath Control (M/VH), Throwing (P/H)

Cinematic Maneuvers: Piledriver (Hard)

Tactics

The Daga-Shai may shadow their targets for days before making their move. They like to familiarize themselves with their victim's routine, movements, and habits, and then set up an ambush, preferably when the target is alone. They prefer attacking at close range with small, easily concealed weapons. If forced to make a hit in public they will arrange a distraction to cover their escape. The Daga-Shai generally work alone on assignment, but will work in pairs or small groups for difficult jobs.

Weapons and Equipment

- **Ka-da (DX, Boxing, Brawling, or Karate)** -- Leather gloves reinforced with metal strips on the back and metal studs on the knuckles. Provides DR 3 to the hands and, like brass knuckles, adds +2 to damage with fists. Unlike brass knuckles there is no penalty to use weapons while wearing the Ka-da; however, skills requiring fine manual dexterity will be at -4 DX.
- **Sarash** -- A mottled, tan colored cloak with hood and veil worn by most Daga-Shai. Provides +2 to the camouflage skill when in a desert or sandstone environment.
- **Shatara (DX-5, Shortsword)** -- This primary melee weapon of the Daga-Shai is a sturdy single-edged shortsword with a sharp point for stabbing. Deep, regularly spaced slots are cut into the non-edged side of the Shatara. The Daga-Shai may attempt to parry at -4 to catch an attacker's weapon in one of the slots. He may then immediately attempt to either disarm the attacker by making a quick contest of weapons skills, or break the attacker's weapon, doing SW crushing damage.

Weapon	Type	Damage	Reach	Cost	Weight	Min ST	Notes
Shatara	imp	thr	1	$500	3	10	Can disarm or break weapon
	cut	sw	1				

Using the Daga-Shai

The Daga-Shai are intended as an NPC group that can be a serious thorn in the side of any PCs who run afoul of them. The template represents a novice, fresh out of training. An experienced assassin should be built on at least 150 points, while a veteran will have 200 or more points in skills and advantages. The Goresh should be at least a 500-point character.

The game master may also wish to allow the Daga-Shai as player characters. Although the template is expensive, it is still suitable for a 100-point campaign. The biggest obstacle to playing a Daga-Shai character is the onerous Duty

disadvantage, which requires the character to take assassination contracts on a frequent basis. Buying off the disadvantage would make the character a renegade, and she would be hunted down as a threat to the security of Naraghash. Alternatively, the character could be placed on retainer with the PC's. This would require that the Daga-Shai's share of income, treasure, etc., less living expenses, would be sent to Naraghash as her contract fee. Unless these payments are at least equal to what the character would earn taking assassination contracts, The Goresh will require that she terminate her partnership with the PC's and accept a new posting.

Daga-Shai Adventure Seed: A Little Too Much Information

The PC's are approached by a very nervous Half-Orc who desperately wishes to hire them to protect him from assassins. He tells the characters of a lost city in the Great Desert that is home to an evil death cult, and that he was kidnapped and brainwashed by the cult but has managed to escape their clutches. Now they want him dead. He offers the characters $4000.00 to get rid of the assassins on his trail.

What the Half-Orc doesn't tell the PC's is that he is a renegade Daga-Shai who grew tired of sending his contract fees to support the citizens of Naraghash and thought he could cut his ties, establish himself as an independent assassin, and keep the profits for himself. He figured the Daga-Shai would never miss him. That was, until a pair of his former brethren showed up in town and made the first attempt on his life. His hope is that the PC's will either eliminate the assassins or at least distract them long enough for him to get out of town and cover his trail.

Regardless of whether they accept the job or not, the characters will now be marked for assassination. If they accept, they will come into direct conflict with the Daga-Shai. If they refuse, the Daga-Shai will catch up with the renegade and make him talk before dispatching him. Because the renegade told the characters about Naraghash, they will be considered a threat that needs to be eliminated. If the characters kill the two assassins in town, more will arrive, and in greater numbers. The characters will be followed wherever they go and will encounter ambushes at the most inconvenient times.

The character's only hope of permanently ending the Daga-Shai threat is to convince The Goresh that they are no threat and swear to keep the secret of the Daga-Shai. To do this they must find Naraghash, brave the dangers of the Great Desert, and get past the sentinels and into the city without being killed. That's the easy part. The difficult part will be to obtain an audience with The Goresh and convince him of their sincerity.

Daga-Shai Character Example

Gulach

Gulach is a former Megalan pit-fighter, now Daga-Shai assassin. His exploitation as a gladiator by the wealthy elite of Megalos has left him contemptuous of humans, and that brutal lifestyle has made it difficult for him to open up to others and make friends. He considers his service in the Daga-Shai to be his salvation and redemption, and feels that it is the first worthwhile cause he has ever fought for.

Though he is a consummate professional, old habits from his past life often resurface and may bring him to a bad end some day. He likes a straight fight man-to-man, and will engage his opponents in a duel unless the mission requires a quick, silent kill. When he fights, the showman in him comes out, and he taunts his opponents, and opts for flashy, crowd pleasing maneuvers.

Gulach is a 150-point character.

ST 12, **DX** 13, **IQ** 12*, **HT** 12/13*
Speed: 6.25 **Move:** 6
Dodge: 7# **Parry:** 9# **Block:** 8#

Advantages: Acute Hearing +2*, Combat Reflexes, Extra Hit Points +1*, Literacy, Strong Will 1.

Disadvantages: Duty 12 or less, Fanaticism, Intolerance (humans), Loner, Reputation -2*, Stubbornness.

Quirks: Likes Duels, Taunts Foes, Showoff, Impatient, Smart Mouth.

Skills: Body Language-12; Brawling-15*; Buckler-14; Camouflage-12; Crossbow-14; Fast Draw (Knife)-14; Fast Draw (Sword)-14; First Aid-12; Garrote-14; Holdout-12; Knife-15; Knife Throwing-14; Performance-11; Poisons-11; Shadowing-13; Shortsword-16; Stealth-14; Survival (Desert)-11; Tracking-13; Wrestling-15.

Maneuvers: Arm Lock-15; Choke Hold-13; Close Combat (Knife)-14; Drop Kick-14; Ground Fighting (Wrestling)-13; Head Butt-11; Head Lock-12; Hit Location (Knife)-14; Knee Strike-14.

-- Includes Combat Reflexes
* -- Includes Half-Orc racial template

Men In Gaming

(I've had this column half-finished for a while, but last week's departure of Emily Dresner-Thornber's "Women in Gaming" column was the spark I needed to finish it.)

* * *

In the *Pyramid* newsgroup many moons ago (back when I was still a 2nd Level Editor), there was a rather heated debate over whether or not the gaming industry was discouraging women from entering the hobby, whether or not we should care, and other facets of gaming gender discussions.

Now, I tend to not talk about most issues like this directly, since it's too easy for them to break down to "Yes it is/No it isn't" dichotomies (either side of which is easy to ignore). Instead, I thought I'd share an incident of mine.

And, perhaps for once, I'm not sure that it has anything to with gaming.

When I was a wee l'il kid -- I'm guessing I was seven or eight, but I'm not sure -- I *really* wanted a Betty Crocker Easy-Bake Oven. I'm not sure why; the vagaries of memory being what they are, it's hard to understand the motivations of Young Me. I suspect it's because the idea seemed so neat; parents who wouldn't let their children within 100 yards of a "real" oven or stove would gleefully allow their children to harness the awesome powers of the light bulb. Maybe it's because I was such a junk food junkie that the notion of being able to concoct my own sugar buzzes was appealing. Sure, I could have settled for the Snoopy Sno-Cone Machine; but any hyperkinetic kid with ice cubes, a Ziplock bag, and a hammer can recreate snowcones. Not so with baked goods.

Regardless, I wanted an Easy Bake Oven. I'm pretty sure I wanted one for several years; for argument's sake, I'll say I longed for one on birthdays and Christmases on my seventh through ninth years.

And I never told anyone.

Not my parents, not my friends, not even Santa Claus. Not a soul.

And I can attribute this to one reason: Because everyone "knew" that boys didn't play with Easy-Bake Ovens. I mean, the commercials had nothing but grinning girls, mixing and baking in domestic abandon. It was in the girl toy aisles, the same domain as the Barbies and My Little Ponies and Monchichis. Heck, the oven itself was peach, and the box was *pink*, for pity's sake . . . and everyone knows what *that* means.

As a sensitive child ("sensitive" meaning "beat up by overgrown younger kids"), I decided to avoid any further headaches and instead stuck with manly (or at least boyly) pursuits: model cars, comics, GI Joes. And I liked them all well enough, but part of me still groused. If only there'd been a Transforming EZ Bake Battle Oven; *then* maybe I'd have been allowed to get it.

When I was eleven, I started cooking for real. After all, women may cook, but men could be chefs, so cooking must be an okay boy-thing to do. And to this day cooking is something I'm fairly good at (though I don't have the time or resources to cook as often as I'd like). But I sure didn't learn that skill from my childhood toys.

When I was twelve, I was introduced to the ***Dungeons & Dragons*** game . . . by Mrs. Dellon, my seventh grade social studies teacher. She was the last (and first) woman I knew who had played roleplaying games until I went to college. Since then, I've had about a 40% female gaming audience, often because I recruited from whatever genre they were interested in. ("Gee, you like *Star Trek*/*Indiana Jones*/*Elfquest*? Then you may like this . . .") By the time I got to college, I was also able to revel in my sensitive nature, and generally told some friends about my childhood Easy Bake Oven desire.

While I worked in the comic and gaming shop, I saw women who would set foot in the store, wince as they realized

they were in the wrong place, and flee. I saw women who consistently spent more than their male friends on Live Action, **Dragonlance**, **Harn**, **Changeling** and others. I saw women who would flip through a game book, frown as they came across particular pieces of artwork, and put the book down. I saw women who painted miniatures with a skill I will never know. I saw mothers shuffle their young daughters out of the gaming section, with an implied understanding that this was something girls weren't supposed to be interested in. I saw mothers buy the **Sailor Moon RPG** for their daughters, worrying as I handed them the receipt whether or not she'd like it. (I never had a copy of that RPG returned.)

My friend Kathryn threatened to buy me an Easy Bake Oven about a year ago; this was, she claimed, after a futile attempt to find me one for the previous Christmas. These ovens were much more gender neutral, looking like stylized microwave ovens. And I rejected her offer; I claimed this was because I didn't have room . . . which was mostly true. But part of me still felt the pressures of . . . something: maybe societal, parental, self-inflicted, or something else.

When these kind of issues are brought up, it's usually done to lay blame: it's the fault of parents/society/shop clerks/game companies/roleplayers/Delta Cepheians that we don't have more women in gaming. But such attempts aren't, in my mind, particularly helpful. Suffice it to say, I can definitely empathize with the barriers that keep many of us from trying what we may be curious about or interested in. And I'd hate to think that some young girl somewhere is being kept from a game she wants to try because it's in a blood-colored box, in the boy's aisle, next to the model cars and action figures.

* * *

Addendum

- Incidentally, I learned that a way many of my female friends got around the gender-issue thing was by having brothers; that way you got to play with their GI Joes, read their comics, etc.. Why it never occurred to me to have a sister, I'm not sure . . .
- Yes, I know that comics are boundless (and models and action figures); but I'm talking about society's perceptions of these hobbies . . . especially in the early 80's (the bulk of my cognitive childhood).
- It has been argued that we've made great strides and are now "good enough;" I'm not going to deny (or affirm) this. But I *will* point out that, even if the entire industry were somehow magically gender-blind as of 1990 (not an argument I'd defend with any vigor), that means we're still about five to ten years away from girls born in 1990 to being able to financially enter into the hobby fully.
- And, as I've [argued in the past](), it only takes one bad experience to undo a lot of good work.

-- Steven Marsh

* * *

Last week's answer: **Blood Brothers 2** (for **Call of Cthulhu**), p. 38.

(One star) "Any number of your Pawns which can legally move may all move one square forward. None of them may make a capture."

Skill-Based Energy Costs For GURPS Magic

?

by Robert Neal Byles

Art by Dan Smith and Colored by Keith Johnson

Energy costs for casting spells in *GURPS Magic* follow a very simple, linear rule: "Each spell has an energy cost. When you cast a spell, it costs you energy—either HT or ST. The better you know a spell, the less energy is required to cast it. If you know it well enough, you can cast it at *no* cost." (*GURPS Magic*, 2nd, Ed., p. 8) This is a well-reasoned explanation; however some have always felt that the implementation of this statement in the rules was somewhat limited. Energy cost drops by 1 point at Skill 15 and by 1 additional point for every 5 Skill Levels after that. This is simple, yes, but not only is it rather static, it tends to result in cookie-cutter mages; how many mages exist with an IQ 14 and Magery 3 so that all of their M/H spells are at 15?

Currently, each player knows how much it is going to cost him before he casts the spell, every time. This lacks the danger and uncertainty (beyond the possibility of a Critical Failure) that fantasy literature often ascribes to mage-craft. Furthermore, a character gets a fair boon at Skill 15 but has little motivation to improve from there, other than to power-spend her points until she reaches Skill 20 and the cost goes down another point. Again, this leads to cookie-cutter mages with skills levels that tend to jump in five point increments.

The following system takes the above statement about the connection between energy cost and skill and adds a third factor: how well the caster concentrates and performs the necessary rituals for the spell. Or, to put it more basely, how well the player rolls the dice. The net result is that, with lucky rolls, a mage's spells can cost him significantly less than they do under the official system. This is balanced by the addition of a further element of risk. A failed roll no longer costs a mere 1 point in energy but will usually cost the mage more than it would have had the spell succeeded.

Energy Cost of the spell, as listed in the spell descriptions, remains as the Base Cost of the spell. This is then modified by the relative success (or failure) of the die roll to the spell caster's skill level, as well as the mana level of the region. The number by which the skill roll succeeds is the Level of Success and is negative in the case of a failed roll. This will yield either a positive modifier to the base cost (more energy), a negative modifier to the same (less energy) or no modifier at all, according to the following table.

Level of Success	Energy Modifier			
	Low Mana	Normal	High	Very High
Crit Failure	+5	+3	+2	+1
-9 to -6	+4	+2	+1	Base Cost
-5 to -2	+3	+1	Base Cost	-1
-1, 0 or 1	+2	Base Cost	-1	-2
2 to 3	+1	-1	-2	-3
4 to 5	Base Cost	-2	-3	-4
6 to 7	-1	-3	-4	-5

8 to 9	-2	-4	-5	-6
Crit Success	-3	-5	-6	-7

This is, of course, in lieu of the deductions to cost as they are now written. (Thus the minus 1 point at skill level 15, 2 at 20, etc, no longer apply.) Assuming normal-mana, both a success by 10 or more and a Critical Success, regardless of the amount by which it succeeds, are always -5. Likewise, Critical Failure and failure by 10 or more are always +3. Adjustments to rituals and casting time due to high (or low) Skill Level remain as described in *Magic*.

If a mage wishes to maintain a spell beyond its normal duration, cost to do this is determined based on one of two choices made by the mage. She can either use the energy cost based on the initial casting roll, or she can roll again hoping for a better result. Whatever the new result, the mage is obligated to pay it. She does not have the option of letting the spell lapse rather than pay a higher cost to maintain. Note that only a critical failure at this stage will negate the spell. A normal failure will result in a higher energy cost to maintain but the spell will continue to function as per the original casting.

Example: Sir Seamus casts a Shield spell on Sir Fenris, a fellow Templar Knight, increasing Fenris' Passive Defense by 4. Due to Fatigue, Seamus' ST is currently 9. Shield costs 2 energy per bonus (half that to maintain) for a base cost of 8/4. Seamus rolls a 9, which is 4 less than his skill level of 13. The Energy Modifier is -2 so his spell costs him 6 points. A minute later the battles rages on. Seamus maintains the spell for another minute but as his remaining ST is only 3 he knows that 3 more points for maintaining the Shield (half the cost of the initial casting) will knock him out (down to 0 ST). He decides to trust in God and try a new roll. Seamus rolls a 15, 2 more than his skill! This results in an Energy Modifier of +1, bringing his base cost to maintain (4—half the original base) up to 5. His last three points of ST are depleted and he takes 2 hits of damage from his HT before passing out cold! Fenris, however, keeps his +4 PD for another minute and manages to win the day. The Lord works in mysterious ways . . .

If a spell is cast using a Powerstone or Manastone and the Stone is depleted in the casting, the overage is drawn from the caster's ST as fatigue. If the caster's ST is depleted in the casting, the mage passes out, and any overage comes directly off of HT as injury! This only flows one way. In other words, energy that exceeds a character's ST cannot be transferred to available Powerstones, nor can overage to HT be diverted to Powerstones or ST. However, the player may announce a split between various sources of power (ST, HT or Powerstone) before the casting. These should be in percentages rather than actual number of points, using quarters, halves, and thirds. Remainders should be split as evenly as possible with any remainders going to the selected source that is highest in the list. That is, Powerstones first, ST second and HT last, but only if such a source was indicated. Thus, if a player chose to split the cost between ST and HT, the remainders would go to ST, and not to any Powerstones he might be carrying.

Example: Ebonan casts a 3-hex Mass Sleep spell (base cost of 9). Prior to casting he decides that three-fourths of the cost will draw from his ST while the remaining quarter will come from the Powerstone in his staff. If he succeeds by 4 then the spell costs him 7 points. 3 points are deducted from his ST (three-fourths of 7, rounded down) and 1 point comes off of his Powerstone (one-fourth, rounded down). What's left is split, with 1 point taken from each and the final point coming off of the Powerstone. The end result then is 4 points from ST and 3 from the Powerstone.

As noted above, this system gives mages the advantage that their spells, if they are good at them, should cost significantly less to cast, while sometimes costing nothing at all. The disadvantage is that they will sometimes cost more, and failures will be terribly expensive. This adds a random element to the game which will make running mages more dangerous and difficult, but also more realistic and fun. If Corenth is down to 3 Fatigue but needs to bring off that last 3-dice Fireball to save the day, does he risk it? If he succeeds by 2 or more, he's golden (if rather exhausted), but if he fails he passes out. If, however, Corenth succeeds by zero or one, the Fireball goes off as expected the instant before he blacks out. Corenth is our hero!

Differing mana levels will shift this table in one way or the other as shown. This system chooses to ignore the low-mana modifier to skill level on the grounds that this system restricts spell casting in low-mana areas enough, but this is entirely up to the GM. Magic items that require a roll and/or an energy cost will cost the listed amount, regardless of the roll or the Power of the item.

Most of the spells in *Magic* and *Grimoire* function under this system with no necessary modifications. A possible exception to this is the Recover Strength spell. While Recover Strength can work as is, this system suggests an intriguing alternative. Rather than treat Recover Strength as a form of Advantage, as it does in the official description, this system treats it more like a Skill, complete with ritual and die roll.

Recover Strength   **Special**

Works on the caster himself; cannot restore ST to others. Allows the caster to recover fatigue by "tapping into" the local ambient mana to "recharge," as it were. The caster must rest quietly for the necessary casting time but may maintain ordinary spells so long as they do not require concentration. Note that Recover Strength is the only spell with a Base Cost of 0 as well as the only spell that can yield a negative Energy Modifier.

With a Base Cost of 0, a success by 5 would yield a net result of -2 energy cost. This means that the caster would regain 2 points of lost Fatigue. Similarly, a failed casting of Recover Strength can result in a loss of ST. Thus, a failure by 4 would yield a +1 modifier and actually cost the poor mage a point of ST. Note that Recover Strength can be cast in a low-mana area (but not a no-mana area, obviously) assuming the caster is willing to risk it.

This spell may only be cast once every ten minutes in the same 10-hex radius location, regardless of who casts it. That is, a mage must either wait for ten minutes or move to a new location before casting this spell again, and two mages may not cast the spell if they are within 10 yards of each other. This is because the spell channels the local mana into the mage, which temporarily depletes the area. In low-mana zones this is thirty minutes and thirty yards, respectively. In high-mana areas this is five minutes and five yards, and in very high-mana areas minutes and yards are both two.

Duration: Permanent.
Base Cost: 0.
Time to Cast: 1 minute.
Prerequisite: Magery; Lend Strength
Item: Jewelry. Recharges the wearer's ST at the rate of 1 per minute assuming she can move around enough to compensate for the 10-hex radius restriction; always on. Automatically interferes with the use of Recover Strength spells, by the wearer or others, within its area of effect. Interferes with Powerstones as well as if it was a Powerstone itself—it is always considered to be the "largest stone" in the area. This item would be exceedingly rare. Energy cost to create: 1500; must be made of alloyed gold and platinum (minimum value of a small ring $500).

by Jody Macgregor

The TV channellers are a power group for use in Atlas Games' *Over the Edge*. They could also be used as a secret group in some of the other current postmodern conspiracy games. Notes on specific game conversions can be found at the end of the article.

TV Channellers

"Ancient cultures did not worship idols. Their god-statues represented ideal states which, when meditated constantly upon, one might aspire to."
-- Alan Moore

"God is in the TV."
-- Marilyn Manson

Type: Secret Society of sorts.
Rep: None.
Brief: Individuals are unwittingly channelling ancient archetypes, invoked by actors on TV, gaining their powers and weaknesses.
Allies and Enemies: Depends on the individual. The Movers are curious about them, and a little fearful. Most of the other power groups in the Edge don't even know they exist, yet.

A recent use of the Cut-Ups Machine (a reality-altering contraption) had some unexpected side effects. The statue of Her Exaltedness in Sunken Plaza changed pose slightly. A prostitute fired from Sad Mary's was miraculously cured of an STD. And the ancient archetypes who were once humanity's gods woke up and demanded homage.

All over the island of Al Amarja, sensitive people started identifying with TV characters more strongly than they previously had. And with that identification came powers, whether the wit of a comedian, the strength of an action hero, or the seductiveness of the classic femme fatale. Unknowingly, several individuals had invoked powerful beings, but there was a down side as well. With these abilities came new goals, and in some cases, weaknesses. The channellers became drawn into the kind of story their archetype was portrayed in. The comedian channeller finds "A funny thing happened to me on the way here," everywhere he goes, terrorists and psychopaths begin attacking the action hero channeller, and the femme fatale channeller begins throwing herself at action heroes. Some of the channellers love it, but others just want their old lives back.

Who is susceptible? Perhaps it's people who watch too much TV, perhaps it's people with untapped fringe powers or

maybe it's people Dr. Nusbaum has treated recently. It's up to you.

New Fringe Power: TV Channelling

TV channelling works slightly like the fringe power Atavism, except that additional dice don't represent extra personae but a stronger connection to the one persona. For each 'shot' characters have in their psychic pool (here called the rerun pool), they may make one die roll on the trait, or negate reality in one way relevant to their archetype's genre. For example, if the action hero takes a bullet, he can use one shot from his pool to reposition the bullet to his shoulder, or make it "just a flesh wound." He can use his next shot to attack back. If that sounds pretty damn powerful, that's because it is -- this isn't a power for your players. Disadvantages include a gradual loss of control to the archetype possessing them, and any flaws the archetype itself possesses. To regain shots in the rerun pool channellers may wait 24 hours in the usual way, but they will recover at twice the normal rate if watching appropriate television.

Who Are The Archetypes?

- Back in the Golden Age men worshipped the gods, and that worship was what kept them alive. Since then, the gods have been forgotten, almost starving to death from lack of belief. Now, humanity has something new to worship: fame. The amount of worship churned out nightly in front of television sets around the world reached a critical level, and the Cut-Ups machine merely tapped into this. It has allowed the gods to come out of their half-death, take new forms that will soak up the most worship and possess a new generation of prophets, high priests and other empty angels.
- Every human being has the potential to be more than they are, if only they can tap the uncharted regions of their own minds. Focussing on near-perfect "god-statues" is one way of doing that, and actors portraying certain easily recognized stereotypical roles are the new god-statues.
- Whoever you want them to be. Fnord.

GMCs

Clydette Ruyters
Plucky Little Girl

"I'll get you next time little girl! And your f---in' dog too!"
-- Hassan Granberry, one of Al Amarja's foremost smugglers, being
led away by the Peace Force after they received information from
Clydette Ruyters

Clydette was watching her favorite cartoon, The Magical Adventures
of Princess Esmerelda (on The Goat in the Coat's Cartoon Hour),
when her archetype took up residence. Since then she has had all the
abilities of a kid's TV show heroine but she hasn't noticed. She thinks
it's normal to have a pet giant robot in your treehouse and a talking dog. See what watching cartoons can do to your brain?

Al Amarjan girl, age six, 115 cm, 23 kg, curly brown hair, disgustingly cute.

Languages: Al Amarjan patois, something that might grow up to be English.
Rerun Pool: 6 shots
Traits
Plucky, 2 dice -- She is able to outsmart almost any adult she meets, completely unafraid of danger, and can only really be harmed by knockout gas, twisted ankles, scraped knees, and boys who pull her pigtails. Any animal that spends too much time around her starts talking, then progresses to singing happy songs.
Disgustingly cute, 3 dice -- She can wrap most parents around her little finger. (Sign: curly hair.)

Talking Animal Sidekick -- Her pet poodle Fifi can talk, which surprised the hell out of Fifi. He doesn't say anything useful, but acts as comic relief and hides whenever danger approaches. He's tried chatting up the Great Dane next door (she's a whole lotta woman), but normal dogs seem immune to cheesy French accents and droopy flowers. (Sign: dog constantly at her heels.)

Little girl, penalty die -- inexperience and small stature works against her. (Sign: young.)

Kill-O-Bot X5000
Reformed Killer Android

The Kill-O-Bot X5000 was created by Dr. Hugh Tinkler (a fringe scientist from D'Aubainne University) for military and general mindless rampaging purposes. It's a miracle of stainless steel and the thin boundary between reality and fantasy on Al Amarja, with spinning blades extending from its hands, a taser that shoots from its waist and laser beam eyes. Actually, the laser beams will only cause damage if you stare directly into them, but they sure look mean. In the tradition of these things, the Kill-O-Bot X5000 escaped from Dr. Tinkler's laboratory and went on a mindless killing spree, until Clydette Ruyters found it hiding from the Loyal Defenders in her treehouse. It leapt at her, blades spinning, taser crackling, lasers threatening cancer in later life -- and then it stopped. The only robots that plucky little heroines meet are friendly ones. The Kill-O-Bot X5000's programming re-wrote itself instantly, much to its own surprise, and ever since then 'Robby the Robot' has been cowering in shame in that treehouse. Clydette sneaks Robby batteries that she steals from her mommy's drawer, and the Kill-O-Bot X5000 plays tea parties.

Android, 185 cm when not stooping, 150 kg. Sleek, curved and metallic.

Languages: Grating English, Basic, C++ and to its eternal shame, COBOL.
Attack: 4 dice, X5 (temporary damage as per rules on p. 23) with Taser, X2 with blades.
Defense: 4 dice
Hit points: 42 (steel)
Traits
Robotic -- Resistant to all poisons, diseases, and other human frailties. (Sign: made of metal.)
Killer, 4 dice -- If Clydette was ever threatened, or taken out of the picture, the Kill-O-Bot would revert to its original programming. (Sign: retractable blades in its hands and a gleam in its eyes.)
Pacifist -- So long as Clydette is around, the Kill-O-Bot can't harm a fly. (Sign: Opens doors when asked.)
Secret: Sexually attracted to C3P0.

Story Ideas

- During the course of the series, the PCs are likely to get up to some strange-looking stuff, meeting with suspicious types in dark alleys, getting into fights, and stocking up on weapons. Every time they do, Clydette Ruyters and her dog are there to see it. Pretty soon they're being followed by the Peace Force who are convinced that they're dangerous smugglers (because the police always listen to little girls in the stories, right?).
- The PCs are given the job of tracking down the rogue Kill-O-Bot, either by Dr. Tinkler, the Gladsteins or some other organization with enough power over them and an interest. Now all they have to do is convince a little girl that they don't want to harm her before the Kill-O-Bot slices and dices them.

Mock Rushkoff
Psycho Killer

Mock's personal history doesn't suggest the kind of deep emotional disturbance common to serial killers; he wasn't abused as a child, he wasn't a chronic bed-wetter, and he never set fire to small animals. He may be twentysomething, white and male, but he's no template post-industrial social outcast. But ever since he saw a serial killer of the month movie on AATV, he's just liked killing people.

Since finishing school, Mock has been working as a waiter at Rugosi's. His targets (two so far) have been young women who ignored him while he served them. He realizes this pattern may lead to his being caught and is planning to move on to prostitutes and homeless people. Deep down, the Jack the Ripper via Norman Bates archetype inside of him hopes to be caught so that he can have a confrontation and philosophical discussion with his pursuers. It may even go so far as to plant clues without Mock noticing.

He also plans to enrol at D'Aubainne University so that he can join the Delta Epsilon Theta fraternity.

Al Amarjan man of Russian descent, age 21, 170 cm, 58 kg. Short sandy brown hair, face that scares small children.

Languages: English, Al Amarjan patois, some Russian.
Attack: 2 dice (Mock strangles his victims)
Defense: 2 dice
Hit Points: 21 (psychopathic determination)
Rerun Pool: 3 shots
Traits
Psycho Killer, 2 dice -- When Mock follows a woman into a dark alley, nobody disturbs him. When he stares at people and talks softly about the sweetness of death they can't help but be afraid. He also has basic, instinctual knowledge of police procedure and a yearning to visit Whitechapel. (Sign: unsettling laugh.)
Fast Runner, bonus die -- He was always good at junior athletics and now it's paying off. Mock receives a bonus die on any test he takes while being chased. (Sign: wears running shoes.)
Waiter, 2 dice -- Carrying drinks without spilling them, being incongruous and smiling as he hands out the soup he just spat in. (Sign: talks about wine.)

Story Ideas

- The obvious idea is to have the PCs solve the murder and catch Mock, but once they do the story has only just begun. Why did he leave such obvious clues, as though he wanted to be caught? Why did a such a well-adjusted young man all of a sudden become a death and religion obsessed psychopath? With a little bit of help, the PCs may notice that all of the killings took place while a murder movie was being shown on television, and with a little help from Brace Kwong (see below) they might discover the other channellers.

Art Prolix
Action Hero

Once upon a time Art Prolix was just a rather mediocre bag-packer at the local supermarket, content with his life, his income, and his stash. But now, Art is something more. Ever since a fateful overdose of zoroaster (a perception-altering drug) taken while watching the Sly and Arnie movie marathon, he's been channelling the eternal action hero. People notice him when he walks into a room, every time he gets in a car a chase scene ensues, he's always thrown clear of the blast, and he always feels lucky, punk. Hostage situations and natural disasters follow him. At first it was a blast, but now Art wants out. Half of his family has been killed by bullets with his name on them, his girlfriend left

him after she was kidnapped three times in the same week, and he's starting to talk in cliches. Unfortunately, the only way he can see out of it is the action hero's way: he has to find the bad guy responsible (preferably a smarmy English guy in a suit, but failing that anyone with a goatee) and kill him in an action-packed extravaganza that would make John Woo weep with envy.

Al Amarjan man, age 25, 180 cm, 70 kg. Shaved head, jutting chin, winning smile.

Languages: Al Amarjan patois, English, swearing in German, Italian and most European languages.
Attack: 3 dice
Defense: 3 dice
Hit Points: 29 (toughness)
Rerun Pool: 5 shots
Traits
Action hero, 3 dice -- May be used in any physical confrontation, test of wits or poker game. He's always wearing a bullet-proof vest after he's been shot in the chest, if he's not shot in the chest it's a flesh wound to the shoulder (he's had twelve of those so far) plus all of the examples given in his description. (Sign: steely blue eyes)
Bag packing, 2 dice -- The world's least useful trait. (Sign: "Paper or plastic?")

Michelle Boulanger
Mover Operative and Femme Fatale

Michelle has been assigned by her cell to keep an eye on Art for obvious reasons; he's accidentally foiled the plots of three drug rings and two terrorist groups that they know of. But since she's started keeping tabs on Art, Michelle's found herself drawn into a new role. Maybe she shouldn't have watched *Octopussy* that night, because ever since then she's been unwittingly channelling femme fatale. It was an easy role to fall into for a French secret agent.

Michelle has only shown herself to Art once: when a nasty was about to pop a cap in him, she came to the rescue as though the script demanded it. She has a vague idea of what's going on, but finds herself drawn to fulfil her expectations anyway -- she's slowly falling in love with Art, and considering betraying her superiors. Whether she winds up the redeemed femme or the betraying femme, she probably won't be back for the sequel.

Attractive French woman, age 28, 162 cm, 53 kg, long dark brown hair, brown eyes, works of art for legs.

Languages: French, English, Al Amarjan patois.
Attack: 3 dice
Defense: 3 dice
Hit Points: 21 (tough)
Rerun Pool: 3 shots
Traits
Moving, 3 dice -- Getting people to do and believe what she wants with subtle psychological cues. (Sign: non-threatening demeanor)
Femme Fatale, 3 dice -- Seduction, and all the fighting moves familiar to Bond girls, mostly karate strikes and cheap crotch kicks. (Sign: flirtatious)
Cello playing, 2 dice -- Hard to carry around, but possibly the sexiest of all the classical instruments. (Sign: complains about Mozart hating cellists)

Story Ideas

- The PCs are sent in by Michelle's Mover superiors (possibly operating through the party's normal contacts) to ascertain why she has gone AWOL, and remove her if she becomes a threat. This will of course set Art after them to gain vengeance and find his nemesis. Any of your PCs have a goatee and an accent?

Brace Kwong

Televisionary

Brace knows all about the ancient archetypes and their ways, because *Wheel of Fortune* told him so. Brace is a televisionary; he uses random channel surfing as a means of divination. Is it any weirder than reading entrails? Normally the television is a fickle mistress, restraining its powers of prophesy when Brace needs them most (like before the lottery numbers are drawn), but this information came through loud and clear. Brace Kwong is now the Edge's foremost expert on TV channellers and willing to help anybody, for the right price.

Asian man, age 30, 170 cm, 77 kg, black hair, glasses.

Languages: Mandarin, English, Al Amarjan Patois
Traits
Televisionary, 2 dice -- When using his powers, Brace either clears his mind for a general reading, or concentrates on a specific question, munches some ceremonial potato chips, and channel surfs. The random snatches of speech and image resolve themselves into a semi-coherent message, most of the time. (Sign: heavily callused right thumb.)
TV expert, 4 dice -- You can learn a lot from documentaries and Brace knows all of it. (Sign: "Did you see that show last night about the rhesus monkeys? It was amazing.")
Couch Potato, penalty die -- A sedentary lifestyle has led to Brace becoming somewhat lacking in the physical fitness department. (Sign: chubby.)

Story Ideas

- Brace tracks down the party after they have an encounter with one of the channellers; he's offering information. The signals he's been receiving are high-definition and crystal-clear reception about their activities. For a constant supply of snack food and a little cash in hand, he's willing to help the PCs keep tabs on the channellers and save the world from being turned into prime-time zombies. How to do it? Kill the babysitter: blow up the TV station.

Conversion Notes

The TV channellers could make interesting opponents or allies in an *Unknown Armies* campaign, just remember to give Alex Abel a reason to want them dead. There's also a possible connection with the Naked Goddess; was she channelling the Porn Star archetype when she ascended to the Invisible Choir?

In a *Mage: The Ascension* saga, the TV Channellers (remember to capitalize names for White Wolf) could be an Orphan clique waiting to be brought together, somewhat like the Hollow Ones. Unless of course the Technocracy (in the form of the New World Order) gets to them first.

Pyramid Review

Hexarcana (for the Deadlands RPG)

By Pinnacle Entertainment Group

Written by John Goff

128 pages; $20.00

Hexarcana, by Pinnacle Entertainment Group's John Goff, both updates and
collects the new Arcane Backgrounds released in three boxed sets (Martial Artist,
Thaumaturgical Diffusionists, and Voodooist) and an expands the spells and
powers available to the standard spell-casting Arcane Backgrounds (Blessed, Huckster, and Shaman). While the book
is specifically targeted to only a portion of Deadlands players and Marshals, Goff's work is up to his usual high
standards and can be used by anyone willing to convert the material into their favorite gaming system.

Players with the standard spell-casting Arcane Backgrounds (Blessed, Hucksters, and Shamans) will find seventeen
new miracles, five gifts, two divine interventions, six tricks, eleven hexes, three guardian spirits, and sixteen favors in
this work. These are all written for the second edition rules and include some notes on updating first edition characters
to second edition system. Each of these are new and do not repeat information found in the supplements designed for
each of these Arcane Backgrounds (*Fire and Brimstone*, *Hucksters and Hexes*, and *Ghost Dancers*, respectively).
Players trying to decide between one of these earlier books or *Hexarcana* should probably go with the original book
first, as there will be more information specific to their background there. Those wishing to expand on this information
will not be disappointed in what they read.

Players wishing to play one of the new Arcane Backgrounds (Martial Artist, Thaumaturgical Diffusionist, and
Voodooist) will be very pleased with *Hexarcana*. The information on each of these Backgrounds, previously only
available in the *Great Maze*, *City of Gloom*, and *River of Blood* boxed sets, has been updated to the second edition
rules. This one-stop shopping will also be of benefit to Marshals, who previously would have to carry and consult
several books to find information about these backgrounds.

If you are trying to decide if these backgrounds have a place in your campaign, here is a brief rundown of each. The
rules for Martial Artists cover not only the basic styles of Chinese Martial Arts (although other Oriental Arts can be
approximated using these rules) but also the more cinematic and mystical powers associated with chi. Thaumaturgical
Diffusionists combine the advances of Mad Science with the magical powers of Hucksters. Includes with this are a list
of four new tricks and thirty-five new hexes specific to this "background" (They may all be used by any Huckster,
should they be discovered by one.). Voodooists use subtle magical spells, rather than the more showy spells available
to Hucksters and Black Magicians. This Arcane Background can be of potential use to Marshals wishing to create
villains working for Bayou Vermillion.

This book has few real defects. Some of the internal art is uneven in quality, and the darkened watermark used on each
chapter introduction page makes reading those pages a little difficult. But these are minor quibbles. The one real
weakness this book may have is the relatively narrow audience: Marshals and players with Arcane Backgrounds. The
game system is not necessarily limiting, as much of the material in this book can be included in other game systems.
With the addition of *GURPS Deadlands* to the Steve Jackson line, this book can be easily moved into a variety of
settings and periods. Also missing is the short adventure found in most of the earlier Deadlands releases. This absence,
however, does allow for more information on the covered Arcane Backgrounds.

Despite this, *Hexarcana* remains a solid piece of quality work. Players may wonder if $20 is worth a relatively small

addition to their character's options -- those on a budget may consider teaming up with a friend who plays one of the other Arcane Backgrounds covered -- but Goff's writing and creations are well worth the price.

Pyramid Review

Battle of the Bands: The Rock and Roll Card Game

Produced by [D.S.I.](#)

Created by Dan Smith

103 cards; $5.00

Dan Smith is well known to gamers as an illustrator of SJ Games products, *Sparks* paper miniatures, and so on. Now he offers a game that he has both illustrated and designed. Priced at $5, it would be hard for *Battle of the Bands* *not* to be worth the money. Every player gets to play out their dream of starting a Rock and Roll band and making a go of it in the music business. Some band members come and go, but the music goes on. At least, it goes on until one of the bands achieves superstardom beyond the ken of all the others.

Game play is simple and easy to learn. Each turn, players draw enough cards so that they have six in their hand and then play or discard one of them. There are several varieties of cards.

Players play Band Member cards to add to their band. Everyone begins with themselves as a member (in the form of a card labelled "Me") and can add up to three members from a varied lot including such rockers as the voluptuous Kym, a grinning Mr. Death, a gorilla named Fella, and Santa.

By playing Instrument and Reputation cards, players can make band members more or less hip. In game terms, this means that the member has more or fewer Hip Points, an attribute abbreviated HP. Of course, HP are just a measure of the band member's coolness, and may not translate into commercial success.

There are also Hit Single and Gig cards, which give a player Superstar Points. Although Superstar Points ultimately decide victory, these cards can not be played unconditionally. Instead, players may only play Hit Singles if they have already played Contract cards. A Gig can be played at any time, but starts a contest between bands. Regardless of who played the Gig card, the band with the most HP's -- the cooler band -- is more likely to win the Superstar Points.

There are also Music Biz cards. This is a catch-all category of cards that allow players to change reputations, steal hit singles, force members to leave rival bands, and so on.

As one would expect, the game is visually impressive. Band members and instruments are drawn with Smith's characteristic flair. Even the fonts are spiffy-looking. Not all the cards have drawings on them, but all are attractively designed and well laid out. The Reputation cards, for instance, list a positive reputation on one end and a negative reputation on the other. If a band member has a positive reputation as a Sex Machine, then the card can be put under the band member with just the bonus showing. If that later changes so that he has a negative reputation for being Diseased, the card can be rotated so that just the penalty is showing.

Battle of the Bands does not involve complicated strategy. If you and your grognard buddies are looking for something to alternate with *Squad Leader*, this is not it. That said, there is enough strategy that players get to make choices during their turns and won't feel straight-jacketed.

No doubt spoiled by Cheapass Games, I was slightly disappointed by the game material itself. The game comes in a zip-lock bag with the cards wrapped in the game rules, unlike the printed paper envelope and cards bound with a strip

of glossy paper that come with many Cheapass games. Moreover, the cards for ***Battle of the Bands*** are printed on flimsier stock. There are a whopping 103 cards, however, making the stack of cards two to three times the size of what you get with comparably priced Cheapass games. In any case, if I learned anything from Cheapass it was that material is not nearly so important as playability.

Ultimately, this is a charming and entertaining game. In my first time playing, my dad and I (the band member cards were "Me" and "Dad") got a record contract and recorded a single that went double platinum, while the opposing band (a talented bunch with double-digit Hip Points) languished in obscurity. Just the image of me and my dad making it big in the music industry was silly enough to make the game worth my while. You don't know either me or my dad, but I daresay that you'll have a good time with ***Battle of the Bands***.

Pyramid Review

Into the Dragon's Lair (for D&D 3rd Ed)

Published by [Wizards of the Coast](#)

Written by Sean K. Reynolds and Steve Miller

96 b&w pages; $17.95

The first post-*3rd Edition Dungeons & Dragons* adventure for the *Forgotten Realms* isn't an introductory adventure, but a scenario for four 10th level characters. This adventure shows how Cormyrm, a country renown for its Purple Dragon soldiers and War Wizards, carries on after the novels *The High Road* and *The Death of A Dragon*. In short, a babe is destined for the throne which throws the country into chaos as nobles and merchants consolidate their power.

The adventure starts with a section detailing the background of the adventure, but the story begins with the characters meeting Lady Kestrel of Arabel. She seeks their aid in recovering the wealth of the dragon that killed the king. A few other suggestions are given for getting the players on the dragon hunt, and a few methods are listed for players who don't have to travel overland (such as by flying), but for the most part it's a standard hunt for treasure.

While sounding simple, during the course of the adventure, the players must deal with not one, but *two* rival groups of adventurers. The Freedom Warriors, a self righteous group lead by Hyraken (a deluded but powerful warrior), and Mahrlee's Raiders, a group lead by a powerful female who has a very special secret. In addition to rivals, the party is pitted against tax collectors (both those working for the crown and for themselves), as well as powerful priests of Talos, and undead soldiers intent on serving the country by turning everyone else into undead.

On their quests, players get to travel to not one, but *two* demiplanes. The first is the home of the goblin city of Grodd, while the second is where the dragon's lair remains. The city of Grodd provides over thirty local areas, not counting temples. DMs should be able to get not only a good game session out of the city, but should also be able to use it in future campaigns. The authors include different options for adventuring in the goblin city. Being high level adventurers, the party always has the option of simply battling the goblins, but ideas for parleying and stealth are also included.

The Hoard Demiplane isn't nearly as interesting, but does pit the players against evil elves that aren't drow . . . not quite a first in the *Forgotten Realms*, but close to it. Players may also match wits against giant wasps, trolls, and a solitary wyvern before finding the hoard.

In comparison to past adventures, the treasure hoard itself is small, especially for a group of 10th level chracters. For example, there are only 7,090 gold pieces . . . a far cry from some of the stashes in adventurers like *The Ruins of Undermountain I* & *II*, or *White Plume Mountain*. To make up for it, there are some choice magic items.

The section on concluding the adventure offers brief ideas on how to handle not only the influx of money to Corymr, but also hints at future events that can involve the elves and goblins.

The Appendix covers Grodd bolins in *Monster Manual* format. It also includes individual listings for different professions such as Adept, General, and Sneak, as well as group encounters. There is one new magic item, six new spells, and some information on converting specialty priests from old campaigns. Trust me, it took three books to get all the information out for 2nd edition; a one page conversion listing isn't going to cut it. The book ends on Shadow Creatures, natives of the Plane of Shadow, and includes a Template that GMs can add to their favorite creatures.

The adventure flows smoothly. Two problems plauge the book, though. First off, unless the DM is very comfortable running NPC antagonists, he's going to have a bit of a problem with the two NPC groups. Lord Hyraken has many feats but few powerful possessions. The other members of the group fall below Lord Hyraken in sheer power, and most parties should be able to plow through them with few difficulties. Lord Hyraken has an Armor Class of 21, and uses a Greatsword +2; using his feats properly, he can be very dangerous, but this requires a lot of work on the DM's part. Mahrlee's Raiders are more powerful, especially with Mahrlee's secret abilities, but once again, an experienced group should be able to handle the Raiders with minimal difficulty.

The second problem is that there are no pregenerated characters. The **Player's Handbook** has been out since Gen Con, which really hasn't given any but the most dedicated groups of players time to advance to 10th level. Then again, this could be a crossover product, where players take their characters from 2nd to 3rd edition; but if that's the case, the differences should have been highlighted. For example, the adventure **The Gates of Firestorm Peak** was designed from the ground up to show the options available to players via the **Players Options** series of books. In addition, there are no conversion notes for 2nd edition campaigns, which would have gone a long way to making this book more useable (though conversion guides are available for free).

At $17.95, it's an expensive adventure, but priced better than the $9.95 adventurers which only run 32 pages. My advice? Keep reading *Dungeon* magazine for adventurers, and wait for the revamped **Forgotten Realms** setting before attempting to leap into a high level adventure in a very detailed campaign world.

-- Joe G. Kushner

Montejon's Mutters

Path of Deception (for Earthdawn RPG)

Published by [Published by Living Room Games]

Created by Joe Chan, Damon Early, Gary McBride, Bert Sanders, and Mike Williams

120 pgs + bonus CD; $14.00

"As you journey through life, take a minute every now and then to give a thought for the other fellow. He could be plotting something."
-- Dik Browne, *Hagar the Horrible*

This time on Montejon Mutters we are taking a look at the rebirth of the *Earthdawn* RPG. Living Room Games has shipped its first release, Path of Deception, bundled with a CD containing the complete *Earthdawn*

1 -- Stop the Presses! Please!
2 -- Buyer's Regret
3 -- Worth the Price of Admission
4 -- A Fine Addition to the Library
5 -- Buy Buy Buy!

rulebook, an introductory adventure with quick-start rules, and tools for playing *Earthdawn* on the web. The Path of Deception book itself describes an adventure set in the Forgotten City of Parlainth.

The cover art for Path of Deception set the tone of my expectations: cheesy, cheap and incomprehensible. Boy, was I wrong. The interior layout is clean and crisp, and the editing is well-done. The writing is clear and forthright. Even better, the actual adventure (more of a mini-campaign, really) looks like dashed good fun. It even has an airship!

Oh, and there's treachery. That is a surefire way to win my blackened heart.

Let's pick it apart, shall we? First off, the things I didn't like.

1. *Meta-plot.* I was saddened to read the following sentence at the very end of ***Path of Deception*** (italics mine): "The fates of Garron Karlson, Master of the Undercity and Gangrene, the Horror twisted by Vestrial, *will be revealed in future products*." Now, as I have said before, I believe a meta-plot can be done well. Furthermore, the writers of ***Path of Deception*** did a very good job of ensuring that this particular bit of plotting can be ignored by referees, or delayed until such a time as a referee feels the need to make use of it. (The master villain's escape plan is quite ingenious.) Still, I resented being told, in effect, that I have to buy more stuff to find out what happens to Garron and Gangrene. It would have been much nicer if the writers had given me at least some vague idea of what to expect.
2. *Blank pages.* There are two completely blank pages at the end of the book. I still feel that ***Path of Deception*** is worth its price even with these blank pages. I just want more stuff. I was, however, glad that Living Room Games didn't follow some other companies' habit of filling up their blank space with advertising. Blank pages are a waste, but advertising is an *annoying* waste.
3. *Art.* The cover art is just bad. I also disliked some of the interior art. Most of the interior art is better than the cover, and none of it seems truly out of place relative to the text. Much of it reminds me of the ***Palladium FRPG***, which is not a positive association in my mind. There are no fewer than twenty-two illustrators credited in the front of the book, which results in a very wide variety of styles. If a unified "look" is your thing, look elsewhere.
4. *Index.* There was no index. In this instance I don't believe an index was absolutely needed, but with two blank pages, why not include one? It would be nice to have some sort of master reference to all the personalities

involved.

Now we'll go over the good stuff.

1. *Scripting.* The scripting of this product is just excellent. The plot is quite linear, something the writers admit in the adventure introduction, but it is not forced. Each step of the way is detailed clearly, with a wide array of possible deviations addressed. The goal of each adventure segment is delineated for the referee, and in most cases a variety of possible solutions is presented. The final battle, for example, offers up a palette of characters from which to select those most suited to challenge the party without automatically wiping the PC's out.
2. *Writing.* There is no brilliant artistry here, but there is no lack of good, solid communication. I never found myself trying to figure out what the heck the writers were driving at.
3. *Characters.* The cast of characters in **Path of Deception** is a delight. The villains are memorable, the bit parts are entertaining. The writers took the time to ensure that I understood what motivated whom. In fact, I sympathised with one of the primary villains quite strongly, and was sad to see him fall.
4. *Bonus Goodies.* Quite apart from the CD (described below), **Path of Deception** includes the new Bodyguard Discipline and a couple of really nifty magic items. The new discipline seems like a real winner, especially given its focus on making sure other people survive. What's especially nifty about the new magic items is that they are completely useless for any sort of combat, and pose little danger to play balance, but are nonetheless interesting. Whether or not I ever use **Path of Deception** for **Earthdawn**, those magic items are as good as swiped.
5. *The CD.* With the CD, which is designed for both Windows and Macintosh, you get everything you need to play **Earthdawn**, except the dice. The CD is mainly a data archive, encoded in HTML, with a character sheet in PDF format (which means those of you with Linux can access all its bounty with a minimum of fuss or bother). It includes a bunch of reference graphics, so you can see what an "Osidiman" looks like, and how the landscape of Parlainth differs from that of, say, Kaer Gardett. There's a search utility, a catalog of **Earthdawn** products, and links to various websites of interest. If you had any doubts as to the value of **Path of Deception**, this CD should blow them away.

So let's sum up, shall we? If you are a fan of **Earthdawn**, you want this product. It has new goodies in it, it is well-written, and it gives you an opportunity to ensure that the game you love will live again. If you have never played **Earthdawn**, but have an interest in a fantasy world unlike the generic feudalism found in most other fantasy worlds, you want this product. It is an inexpensive way to get into the game. Even if you have no interest in the **Earthdawn** line, **Path of Deception** is imminently suited for scavenging. In the final analysis, I rate **Path of Deception** a very solid 4 -- A Fine Addition to the Library. Plus, special thanks to Living Room Games for bringing back one of the best variations on the old theme of high, heroic fantasy. I'd never looked at **Earthdawn** before **Path of Deception** came my way, but you can bet it has got my attention now!

Murphy's Rules

Dork Tower!

Dork Tower!

Random Voting Thoughts

In case you didn't know, I live in Florida.

Tallahassee, the state capital, to be exact.

So, for those of you who keep up with politics, you know that our fair state is currently in the midst of a massive recounting. As I write this, given about 6,000,000 voters in Florida, 229 votes separate the two contenders for the presidency. (To put it in perspective, *three times* that number of people voted in last week's *Pyramid* poll . . . a poll where there was *only* one choice!)

Now, I admit to having been glued to the television for the past few days, so if this column is a bit disheveled, then I apologize in advance. "May you live in interesting times."

* * *

Realizing how few people will probably decide this election made me realize how few people decide the fate of some game lines.

Consider that an average small-to-medium press game may run about 3,000 copies. And how well that supplement sells can often determine whether or not another supplement will be created. And so on, and so on . . .

Now, in my days as a game shop clerk, I would often encounter folks who would not buy a particular RPG, book, or supplement. This happens for a number of reasons: because their friend/GM/player/whatever owned it and they read theirs, because they read a negative review of it, because they don't like the subject matter. While this is certainly understandable (games can be *expensive*!), I do feel the need to point out that each copy of a game *not* purchased possibly increases the chances of that game not surviving. Even if a game is not in danger of being discontinued in the big picture, if a Friendly Local Game Shop doesn't sell enough of a game's supplements, it may eventually scale back or even stop carrying the line, forcing you to special order or shop elsewhere.

Does this mean you need to buy supplements you don't want or that are awful? Of course not! But there *are* things you can do to make a difference to support your favorite line; for example:

- Keep track of items you might buy. If you tell your local game shop what supplements you want (or don't want) ahead of time, they'll be able to adjust their orders accordingly. So if you don't need Careerbook Webmonkey, let them know. (Trust me: trying to figure out how to order is a nigh-impossible job for a FLGS.)
- Write to the game manufacturers. For example, if you are unlikely to buy a supplement, but want to support the line, why not write and let them know (or talk to them at conventions)? A letter that offers concrete reasons why you don't like or want a product -- but what you *would* be interested in buying -- can go a long way with some creators. And, in this day of the information age, getting in touch with many companies is easier than ever.
- Recommend the games you *do* like. If your friends are enjoying a game, but they're bumming all your books, why not encourage them to pick up copies of their own? That should make the game go easier, and may make sure your favorite game line endures. (I calculated one time that our not-terribly-large shop was responsible for promoting and selling 1.5% of the entire run of one game . . . many of which I either bought and gave to friends or convinced my acquaintances to buy.)

I honestly believe that some games survive or die based on a tiny number of players.

* * *

I've really been amazed at the number of little plot points revealed during the week's developments. For example, the person who designed the controversial ballot for hotly-contested Palm Beach county was a Democrat, but may end up costing the Democratic candidate the presidency. And Pat Buchanan -- with whom I seem to agree about as often as a

two-headed calf is born -- admitted that the unprecedented number of votes he received from Palm Beach was probably the result of the poorly-designed ballot . . . causing me to mutter the previously-never-before-said-by-me statement, "Wow; that's really cool of Buchanan."

Which proves to me that, beyond party affiliations and ideologies, these stories are made up and decided by *people*.

It seems logical enough, but it's easy to forget. Not all setbacks are the result of moustache-twirling bad guys; mistakes happen. Happenstance alters nations. Not all bad guys are always bad. People are seldom entirely right or entirely wrong.

This last point is something I always tried to drive home when playing demons in **In Nomine**; they *can* (for the most part) do good, if they're so inclined. For example, if a demon likes a human, then helping that human may be a good thing. Likewise the do-gooder paladin can be a self-righteous pain in the butt.

Darth Vader may like kittens. The seemingly-wise priest could be a misogynist. Cthulhu might just want to be left alone. ("Darn those chanting cultists, always waking me up in the middle of the night . . .")

In the end, it's probably the little ironies, inconsistencies, and situations that provide the most grist for memorable incidents.

* * *

A lot is happening in Tallahassee. It's odd for me to see the national news turned onto buildings and backgrounds I frequently bike past. It's even stranger to see people I recognize from this city -- folks I've met -- talking on that national news, knowing that the entire country (if not world) is hanging on their every word.

So, in terms of gaming ideas, I realized how powerful the media is, and how surreal it can be. So, I wondered, how odd would it be for my PCs to be watching the news or other television, and to see themselves or someone they know . . . especially if it's live media?

"We're standing live outside a warehouse where two dozen runaway diseased monkeys have escaped into . . . "
"Hey; that building looks awfully familiar . . ."

"We have here security camera footage of the suspect who police believe is the Midtown Murderer."
"Um . . . Doc Amazing? You'd better come see this . . ."

* * *

If only one thing can be gleaned from this week, it's this: Anything can happen.

(I wonder if there's any new developments on the news . . .)

-- Steven Marsh

Secret Histories Constructed While You Wait

"[T]here is something that secret histories give you that is very different, because you are trying to uncover the histories of groups and forces that always avoid history. In order to narrate those stories, you must become a little paranoid, though not in the sense that They are out to get you. I mean you must become a little paranoid as a critical method. You must start jumping across vague and shadowy realms of ambiguous data, weaving patterns that won't hold up in court, pointing out strange synchronicities that occur, names that reappear. Suddenly possibilities that exist outside of what we can conventionally narrate start to cohere, many of them bordering on the incorporeal and the imaginal. Patterns resonate in ways that seem to undermine conventional historical thinking itself."
-- Erik Davis, April 1997 interview

To one extent or another, of course, every one of these columns is not just gaming material, but GM advice of the world-building, scenery-painting sort. However, I usually leave the advice in the shadows and present the built world, the result of following said advice, on the outside. This week, since my topic is secret history (and a potentially conspiratorial secret history at that), I thought it might be interesting and instructive to reverse that -- to write this column with the advice in the light and the world in the shadows. Herewith, a Worked Example of secret historianship, a basic two-part primer on How To Suppress A Wild Transmission.

"The events of an interplanetary story -- aside from such tales as involve sheer poetic fantasy -- are best laid in the present, or represented as having occurred secretly or prehistorically in the past."
-- H.P. Lovecraft, "Some Notes on Interplanetary Fiction"

To begin with, you need a high concept, a Central McGuffin to wind everything around. Otherwise, you're just throwing stuff in the air until the players get bored. For this example, I'm taking the Lovecraft quote above, which presents a vastly underutilized topic ideal for our purposes. If this were a conventional Suppressed Transmission, it would have started with that quote, rung four or five changes on it, and concluded with a paragraph Putting It All Together. That's basically what I do when I design a campaign frame, too, as you'll see here.

So our central gimmick is Secret Space Travel, down through history and at least potentially beginning in prehistoric times. Now, SF from James Hogan's *Inherit the Stars* to Jerry Pournelle's *Janissaries* to H. Beam Piper's Paratime sequence have postulated either an extraterrestrial origin for space-travelling humanity or an earlier human history of the solar system, or both. **Traveller** does the same, and perhaps it would be fun to run a **Traveller** game centered on a minor and forgotten Vilani base in ancient Egypt, or Maya Mexico, or on Atlantis. But that starts us out behind the curtain, playing an entirely different kind of secret history game, and I think the concept can support a classic Mismatched Ragtag Team Of Investigators Slowly Piecing Together The Uncanny Truth game. So, our secret space travellers are the conspiracy behind things, and just to keep things simple (and "interplanetary" rather than "interstellar") we'll further restrict ourself to Earth's solar system. (This will also help us avoid the worst of the causality-FTL paradoxes, too.)

There's another two basic questions to answer about our central gimmick, to inform the whole nature of play. Is our solar system basically as we understand it -- inhospitable planets inimical to PC life forms? Here's where gut feelings and aesthetics come in: to me, unless the game is set back when people didn't know what the planets were like (pre-1940, say), it feels like cheating to say "There really are dinosaurs on Venus, and the Soviets and NASA just covered it up." It's extremely implausible and may result in player dissatisfaction when the Big Secret is revealed. And, although a Victorian-era **GURPS Steampunk** game wherein the PCs investigate Her Majesty's Secret Space Service ("Ad Astra Sub Rosa") and its links to the Canal-Builders of Mars would be extremely swell, it would likely soon take on a very different flavor from our "classic" conspiratorial secret history model. So let's assume the solar system is (mostly) like Real Astronomy paints it, with only the necessary Shreds Of Dubious Evidence otherwise such as the Face on Mars or the "Castle" on [the Moon](#).

The second question goes to the nature of the space travel. Again, for purely aesthetic reasons, I want to stick with physical spaceships (if only to tie in UFO legends and run space battle scenarios). However, I don't want a technology with a lot of "spinoff" applications; some kind of bogus "zero-point energy" that's good for flying to Mars and maybe

building the odd pyramid, but unusable for a Babylonian Industrial Revolution, fits the bill. To further restrict it, let's make it depend on some rare unobtainium (Atlantean "orichalcum" will do for a start, methinks), which will also give us plenty of "treasure" to fight over, as well as good hooks for some opening scenarios:

- "Why was everyone in the house killed for a piece of costume jewelry from the 17th century?"
- "Who is kidnapping the great metallurgists of Europe?"
- "What possible reason would a shadowy Japanese consortium have for buying up the mineral rights around Roswell?"

We can restrict it again, keeping our spacefarers to a small conspiracy-sized batch. Perhaps even with orichalcum, you can only fully tap its zero-point potential after lengthy and rigorous training of mind and body. Insisting on a training regimen also gives a central core to all those "initiated" groups from the Templars to the Shaolin monks -- they were practicing space travel techniques. Space travel thus becomes the Secret of the "underground stream" passed down from the pyramid-builders to the Druids to the Illuminati, or however. It's always good when your Secret History can mesh with the secret histories crazy people have already built for you. (We'll pick from our embarrasment of Usual Suspects to focus the campaign further in a couple of paragraphs.) Another advantage of the "trained flier" mode is that we can then say that psionic "tuning" of zero-point energy can keep you alive (or build a "vibratory barrier dome") on inhospitable Mars, which gives us a little more leeway on that score for scenarios set there.

It's a little early to address this issue specifically, but it's always important to think about how to include the player characters. Nothing spoils a secret history faster than inaccessibility: either the PCs can never get traction on it, and wind up spinning their wheels forever; or once they do bust in, they find themselves dependent on NPC mentors, prisoners, or allies for exposition, information, and aid. The party becomes a tour group, rather than a Noble Company Of Adventurers. A GM who likes to live on the edge might ask the players to roll up their characters first ("It's a modern-day game, and everyone should have some tangential connection to espionage or UFO investigation.") and custom-fit the game to suit, but it's less stressful (and better for the campaign's flexibility and realism) to build a bunch of open slots into the background for PC life history hooks. For example, one of the PCs could have a period of "missing time" -- during which, she was trained by a secretive group of rebel conspirators. Or, a PC with a suitable background could find it more useful than he thought: "It turns out your training in the Star Lodge Blessing Way back on the reservation contained the key concepts for psionic orichalcum control. Imagine that." That way, the party can actually use the UFO tech and keep themselves alive in Crater Tycho, rather than depend on GM charity.

"The name of the game is 'Find Your Adversary.' Your adversary's game plan is to convince you that he does not exist."
-- William S. Burroughs

Now that we know "what," "where," and "how," we move on to "who" and "when." Well, we have all time and space. Since our space travel game is still primarily mechanical-physical rather than spiritual-etheric (although that concept can work for [a whole different campaign frame](#) of secret space-travel), we should begin with a technically-advanced civilization. One possibility is our own future selves, who traveled back in time to gain leverage in an interplanetary Time War, and thus wound up spreading primitive humanity hither and yon. Unfortunately, this means adding time travel, at least potentially, at the beginning, and I don't need to tell you, that opens up a whole keg of worms. Since you don't need time travel to start with (and can always introduce it later, with controllable wormhole gates or something), let's go the other direction: [ancient astronauts](#).

It's not immediately necessary to decide anything about the ancient astronauts, or even if they were human themselves. The name of the game is "secret-historical space travel," not "chariot-tracks of the gods." For starters, then, let's say that the ancient astronauts colonized the Tibetan plateau in, oh, 6000 B.C. Why Tibet? Well, Tibetan initiates are reputed to practice the exact kinds of body-control (keeping naked monks comfortable on Himalayan glaciers, that kind of thing) we'll need on Mars, and Tibet is cool. (If you have a lot of knowledge of or interest in some other Place of Mystery, swap it in here.) The ancient astronauts split in two groups; one of which went west to build pyramids and ziggurauts, and one of which went east to rule the natives as "sky dragons." At some point, catastrophe occurred and scattered the fragments of ancient astronautic knowledge hither and yon; the [Pole Shift](#), or interstellar war, or a rebellion of the natives. Possibly all three: maybe the Ur-Tibetan space activity drew the attention of some other power

(we'll call them the Sirians for now), who tilted the poles, bombarded the main ancient astronaut bases, and incited the natives to rebel. This also helps explain why the Initiates have kept space travel a secret; if they explore space too openly, they may bring the Sirians back again!

So we have a basic concept, a few key limitations on it, a Secret Origin, a Fall of the Gods, and at least one semi-plausible reason for secrecy. In a week, we'll finish our Secret History of Space Travel and talk about how to do it all over again in an emergency.

Next Week: Part Two; More Bad Guys, The Plot, Directions, Bisociation, and Novas.

by James Maliszewski

Art by Art Today and Colored by Keith Johnson

The Roaring 20's remain an enduring setting for a variety of roleplaying games; it's not hard to see why. The 1920's are modern enough to be familiar, but alien enough to retain an air of mystery. More importantly, they're rich with adventure possibilities. Everything from Prohibition and Fascism to archaeological discoveries and influenza epidemics make their appearance during this decade. It probably helps that many pulp stories are set in the 20's, making the era an obvious choice for tales of two-fisted action and adventure.

If the potential for adventure is paramount, there can be few places during the 20's that compete with China. In the span of just over a decade, this ancient nation goes from being a monarchy to a republic to a dictatorship to a welter of competing government, each vying for recognition and control. In the midst of this chaos is Shanghai, the so-called "Paris of the East" and home to criminals, Communists, and Westerners of a variety of stripes. It's thus a perfect locale for exciting adventures in the crumbling Middle Kingdom.

The intention of this article is to provide basic information on China during the period for Game Master running games like *Call of Cthulhu*, *Feng Shui*, *GURPS Cliffhangers*, *Wraith: The Great War* and others. In addition, the article offers more detailed information on the city of Shanghai, as it is an excellent setting for 1920's adventure. The information presented here is necessarily short and broad in its outlines. GMs interested in adding further depth should consult the bibliography at the end of the article.

(*Author's Note:* Throughout this article, I have used the Wade-Giles scheme for Romanizing Chinese names. I make no claim that this scheme is better or more accurate than the modern Pinyin. Rather, I have done so for verisimilitude. Pinyin did not exist during the 1920's and thus would not have been used.)

Modern Chinese History

In order to understand China in the 1920's, a brief examination of the turmoil of the previous two decades is necessary.

The Hundred Days Reform and the Boxer Rebellion

From June 11 to September 21, 1898, the emperor, Kuang-hsü (1875-1908), ordered a series of sweeping social and institutional reforms (the "Hundred Days Reforms"). These reforms reflected the thinking of a group of progressive scholars who had impressed the emperor with the urgency of innovation for China's continued survival. Influenced by similar Japanese reforms, the scholars declared China should follow suit. The imperial edicts

covered a broad range of subjects, including stamping out corruption and remaking many hallowed institutions. They also modernized agriculture, medicine, and mining, and promoted practical studies in place of hoary Confucianism. The court planned to send students abroad for firsthand observation and technical studies.

Opposition to reform was strongest among the ruling elite. Supported by traditionalists with the aid of the political opportunist Yüan Shih-kai, Dowager Empress T'zu-hsi engineered a coup d'état on September 21, 1898, forcing the young reform-minded Kuang-hsü into seclusion. T'zu-hsi then took over the government as regent. The reforms ended with the overturning of the new edicts and the execution of six of the reform's chief advocates.

The conservatives gave clandestine backing to an anti-foreign and anti-Christian movement known as I-ho ch'üan ("Righteous and Harmonious Fists"), better known in the West as "the Boxers." In 1900, Boxer bands spread across northern China, burning missions and killing Chinese Christians. In June of that same year, Boxers besieged the Western concessions in Peking and Tientsin, which provoked an allied relief expedition by the offended nations. The imperial government declared war against the Westerners, who easily crushed the Chinese army and occupied northern China. In the following decade, the victors imposed some reform measures. These included the abolition of Confucian-based examinations, educational and military modernization patterned after Japan, and an experiment in constitutional and parliamentary government. The speed and breadth of these reforms actually hindered their success. Ironically, one of their few unqualified successes was the creation of a modern army, which gave rise to the warlords who would seize power for years to come.

The Republican Revolution

The failure of reform convinced many Chinese the only real solution lay in a revolution that would sweep away the old order and erect a new one patterned preferably after the example of Japan. One such person was Sun Yat-sen, a republican activist who was popular among overseas Chinese and Chinese students abroad. In 1905, Sun founded the T'ung-meng hui (United League) in Tokyo. This movement, supported by overseas Chinese funds, also gained support from regional military officers and reformers who had fled China after the Hundred Days Reform. Sun's goals were threefold: "nationalism, democracy, and people's livelihood." Nationalism called for overthrowing the Manchurian Ch'ing dynasty and ending foreign hegemony over China. Democracy described Sun's goal of a popularly elected republican form of government. People's livelihood (or socialism) aimed to help the common people through regulation of the ownership of the means of production and land.

The republican revolution broke out among discontented modernized army units on October 10, 1911, in Wu-ch'ang, the capital of Hupei Province. The revolt quickly spread to neighboring cities, and T'ung-meng hui members throughout China rose in support of the revolutionary forces. By late November, fifteen of the twenty-four provinces had declared independence from the Ch'ing empire. A month later, Sun Yat-sen returned to China from the United States, where he had been raising funds among overseas Chinese and American sympathizers. On January 1, 1912, Sun was inaugurated in Nanking as the provisional president of the new Chinese republic.

Unfortunately, power in Peking had already passed to Yüan Shih-kai, the strongest regional military leader at the time. To prevent civil war and possible foreign intervention, Sun agreed to Yüan's demand that China be united under a Peking government headed by himself. The last Ch'ing emperor, the child P'u-i, abdicated and Yüan Shih-kai was sworn in as provisional president of the new Republic of China.

The Founding of the Kuomintang

The republic evolved slowly. The revolutionaries lacked an army, and the power of Yüan Shih-k'ai was greater than that of parliament. Yüan frequently amended the constitution, ruling as a dictator. In August 1912, Sung Chiao-jen, an associate of Sun, founded a new political party. This party, the Kuomintang (or KMT -- the National People's Party), was an alliance of several smaller parties. In national elections held in 1913 for the new parliament, Sung campaigned against Yüan's regime, and his party won a majority. In retaliation, Yüan had Sung assassinated, along with several generals sympathetic to the revolution. In the summer, seven southern provinces rebelled against Yüan. When Yüan put down the rebellion, Sun and his allies fled to Japan. A cowed parliament then formally elected Yüan president of the Republic of China. Soon thereafter, the Great Powers extended formal recognition to his government.

Soon Yüan Shih-k'ai ordered the Kuomintang disbanded and its members expelled from office. He suspended parliament and all provincial legislatures. He also promulgated a new constitution that made him president for life. However, Yüan's ambitions were still not satisfied. At the end of 1915, he announced he would reestablish the monarchy, with himself as emperor. Rebellions immediately broke out across China, and many provinces declared independence. While facing strong opposition, Yüan Shih-k'ai died of natural causes in June 1916, throwing the country into further turmoil.

Republicanism Reborn

Following Yüan's death, shifting alliances of regional warlords fought for control of the Peking government. The Japanese also threatened the nation. When World War I broke out, Japan sided with the Allies and seized German holdings in Shantung Province. In 1915, the Japanese proclaimed the so-called Twenty-One Demands, which made China a Japanese protectorate. The warlord government in Peking rejected some of these demands but yielded to the Japanese insistence on keeping Shantung. Peking also recognized Tokyo's authority over southern Manchuria and eastern Inner Mongolia.

When the Paris peace conference confirmed the Japanese claim to Shantung, Peking's capitulation became public. There were massive student demonstrations against the Peking government and Japan. The political fervor, student activism, and iconoclastic and reformist intellectual currents set in motion by the student protest developed into a national awakening known as the May Fourth Movement. In reaction, students returned from abroad advocating social and political theories ranging from complete Westernization of China to outright socialism.

The May Fourth Movement rekindles the dying embers of republicanism in China. In 1917, Sun Yat-sen became commander-in-chief of a military government in Canton in collaboration with southern warlords. He then reestablished the Kuomintang to counter the government in Peking. The latter, under a succession of warlords, still maintained its facade of legitimacy and relations with the West. By 1921, Sun had become president of the southern government. He spent his remaining years trying to consolidate his regime and achieve unity with the north. His efforts to obtain aid from the Western democracies were ignored, however, and he turned to the Soviet Union instead. For political expediency, however, the Soviets initiated a policy of support for both Sun and the newly established Chinese Communist Party (CCP).

Nationalists and Communists

In 1922, the Kuomintang-warlord alliance in Canton was ruptured, and Sun fled to Shanghai. Sun thus needed Soviet support even more. In 1923 a joint statement by Sun and a Soviet representative in Shanghai pledged Soviet assistance for China's national unification. Soviet

advisers began to arrive in China to aid in the reorganization and consolidation of the Kuomintang along the lines of the Communist Party of the Soviet Union. The CCP was under instructions to cooperate with the Kuomintang. The CCP was still small at the time, having only 1500 by 1925, while the Kuomintang already had 150,000 members in 1922.

Soviet advisers also helped the Nationalists create a political institute to train propagandists. In 1923, they sent Ch'iang Kai-shek, one of Sun's lieutenants for several months' military and political study in Moscow. After Chiang's return, he participated in the establishment of the Whampoa Military Academy outside Canton, the seat of government under the Kuomintang-CCP alliance. In 1924, Chiang became head of the academy and began the rise to prominence that would make him Sun's successor as leader of the Kuomintang and the unifier of all China under a Nationalist government.

Sun Yat-sen died in March 1925, but the Nationalist movement was gaining momentum. Chiang, as commander-in-chief of the National Revolutionary Army, set out on the long-delayed Northern Expedition against the northern warlords. Within nine months, half of China had been conquered. However, the Kuomintang was now divided into left and right wing factions, and the Communist bloc within it was growing. In response, Chiang abruptly dismissed his Soviet advisers and emerged as Kuomintang leader. The Soviet Union, still hoping to prevent a split between Chiang and the CCP, nevertheless ordered Communist underground activities to facilitate the Northern Expedition.

In early 1927, the Kuomintang-CCP rivalry led to a split in the revolutionary ranks. The CCP and the left wing of the Kuomintang decided to move the seat of the Nationalist government from Canton to Wuhan. However, Ch'iang, whose Northern Expedition proved successful, set his forces to destroying the Shanghai CCP apparatus and established an anti-Communist government at Nanking. There now were three capitals in China: the internationally recognized warlord regime in Peking; the Communist and left wing Kuomintang regime at Wuhan; and the right-wing civilian-military regime at Nanking, which would remain the Nationalist capital for the next decade.

The Soviet cause was bankrupt. A new policy was instituted calling on the CCP to foment armed insurrections in urban and rural areas in preparation for a revolution. Unsuccessful attempts were made by Communists to take cities such as Nan-ch'ang, Ch'ang-sha, Shan-t'ou, and Canton, and peasants in Hunan Province staged an armed rural insurrection, known as the Autumn Harvest Uprising. Mao Tse-tung led the insurrection.

By mid-1927 the CCP was in dire straits. The Communists had been expelled from Wuhan by their left wing Kuomintang allies, who in turn were toppled by a military regime. By 1928, all of China was at least nominally under Chiang's control, and the Nanking government received international recognition as the sole legitimate government of China. The Nationalist government announced that in conformity with Sun Yat-sen's formula for the three stages of revolution -- military unification, political tutelage, and constitutional democracy -- China had reached the end of the first phase and would embark on the second, which would be under Kuomintang direction.

Shanghai

By the end of the 1920's, Shanghai was a bustling cosmopolitan metropolis, the fifth largest city in the world, and China's largest harbor and treaty port. The city was a world apart from the tradition-bound countryside that encompassed most of the country. Beneath its modern surface lurked a seedy and often dangerous world, one that

added the verb "to shanghai" to the English language, meaning "to induce or compel (someone) to do something, especially by fraud or force." Chinese leftists and Communists of the period saw the city as a bastion of evil, of wanton debauchery and rampant foreign imperialism -- in short, a city of shame.

Until 1943, Shanghai was a "treaty port," meaning that foreign powers maintained a legal presence in the city. The Chinese sections in the southern part of the city (a walled city) and in the far north (Chapei district) were cut off by two foreign "concessions," the International Settlement and the French Concession. In these concessions, Chinese and foreigners lived side by side but led separate lives. Nevertheless, the two worlds were bound together by bridges, tram and trolley routes, and other public streets built by Western powers that extended beyond the concession boundaries. The buildings in the concessions clearly proclaimed the Western presence: banks, hotels, churches, cinemas, coffeehouses, restaurants, deluxe apartments, and a racecourse. Many of the modern facilities of Shanghai's urban life were introduced to the concessions starting in the mid-nineteenth century: These included gaslight, electricity, telephones, running water, and automobiles. Thus, Shanghai had the infrastructure of a modern city even by Western standards by the beginning of the twentieth century.

Political Structure of Shanghai

As noted above, Shanghai was divided into three sectors. Each was virtually a sovereign jurisdiction with its own government, armed forces and police. The largest was the Chinese Municipality of Greater Shanghai, part of the Republic of China. However, this constituted only the periphery of the city proper. After the suppression of a Communist revolt in 1927, Ch'iang's Nanking government asserted its authority over all of Shanghai. However, he found that its control did not extend very far. Warlords and gangsters vied with one another -- as well with the central government and Chinese capitalists -- for power. Each regarded the foreign concessions in the center of the city with voracious envy.

The smaller of these, the French Concession, was a residential district near the river. It had a population of half a million in 1936, only a small fraction of whom were foreigners. Of these a mere 2500 were French nationals. There were also 12,000 Russian residents (mainly anti-Bolsheviks who had fled the Russian Civil War) and 2500 British. The French Consul-General ruled the concession with absolute authority, like divine right monarch. A municipal council (which he appointed) nominally assisted him. For security, the Consul-General possessed a force of 4000 gendarmes, most of whom were not French but Chinese or Vietnamese. The gendarmes maintained a very well informed political division as well as corrupt departments supposedly devoted to the suppression of drugs, gambling, and prostitution, but which actually derived considerable profits from these selfsame vices.

The heart of Shanghai, encompassing hundreds of factories, miles of wharfs and warehouses, as well as parks, clubs and hotels was the city's second foreign concession, the so-called International Settlement. This section possessed a population of approximately 1.2 million in 1936, of whom only about 40,000 were foreigners. Nevertheless, this minority had been the concession's rulers since its foundation in the nineteenth century. Unlike the French Concession, the International Settlement did not belong to any one power. In fact, the Settlement's "constitution," the Land Regulations, left several issues unclear, including the question of sovereignty.

Although a foreign colonial enclave, sovereignty in the Settlement remained theoretically Chinese. However, ratepayers limited its ruling body, the Shanghai Municipal Council. The ratepayers were a small group of property-owners, mainly British and Americans (as well as Japanese beginning in the late 1920s), dominated by the heads of the great British merchant houses and banks. The ratepayers met in a yearly public meeting to decide major issues and elect the Municipal Council. The Council's chief civil servant (almost always a British national) was thus one of the most powerful men in Shanghai. High property qualifications restricted voting rights to a small minority of the already small Western population. The Council admitted no political parties but political struggle in the Settlement was nevertheless intense. In the 1920s, it took two main forms: resistance by the foreign communities to the Chinese government's demands and growing conflict between Japan and the Western powers for control of the affairs of the Settlement.

Although "international" in name, the Settlement's Municipal Council was governed primarily by British interests. Until the late 20s, British and American councilors formed the majority. The Germans had possessed one seat until the

outbreak of World War I excluded them and awarded their seat to Japan, whose citizens formed the single largest foreign community in Shanghai. A second Japanese seat was added in 1927, and the Japanese continued to press for even greater representation. With their growing population and investment, they represented the future of Shanghai. Unsurprisingly, the native Chinese population had no say in the government of the Settlement at all until 1928, when three Chinese members were added to the Council's nine foreign members. Two more joined them in 1930. However, in keeping with the council's undemocratic nature, the Chinese members were not directly elected but nominated, in this case by the wealthy Chinese Ratepayers' Association, which represented local business interests.

Physical Structure of Shanghai

Shanghai offered a remarkable contrast between old and new, Eastern and Western. Interestingly, the native Shanghainese did not occupy only the old sections of the city and the Westerners only the new, as one might expect. Indeed, the notorious regulation that barred Chinese and dogs from Western parks was abolished in 1928, opening them to all residents, regardless of nationality.

The central locale of the foreign concessions was the Bund, a strip of embankment facing the Whampoo River at the entrance to the harbor. The imposing European-style banks and merchant houses on the Bund gave an appearance of solidity and permanence. Yet the city was constructed on what were quite literally shaky foundations. Many of its tallest structures were built on concrete rafts that floated on underlying mud flats. The Bund was not only the entrance point from the sea but also a window on British colonial power. The harbor skyline was dotted with edifices of British colonial institutions, prominent among being the British Consulate, the Shanghai Club (featuring "the longest bar in the world"), the Sassoon House (with its Cathay Hotel), the Customs House, and the Hong Kong and Shanghai Bank.

However, by the late 1920's, the era of Victorian glory was over; England was no longer the unchallenged master of world commerce. The United States of America had begun its imperial expansion into the Pacific region, following its conquest of the Philippines in 1898. The merger of the British and U.S. concessions into one International Settlement had occurred earlier, when U.S. power was dwarfed by the might of the British Empire. By the late 20s, Shanghai's International Settlement was the site of competing architectural styles. British neoclassical buildings dominated the skyline on the Bund, but new constructions in a more modern style exemplifying U.S. industrial power also appeared.

Shanghai's Population

Shanghai developed an extraordinary assortment of foreign communities: White and Red Russians, upper-crust 'Shanghailander' Britons, Baghdadi Jewish property tycoons, Korean gangsters, Filipino musicians, low-life cardsharps, pickpockets and assorted con-men. Criminals of various nationalities preyed on tourists at the Park, the Metropole and the Cathay hotels as well as on sailors and soldiers from half a dozen countries.

Even in superficially respectable areas glamor and poverty, beauty and squalor intertwined. At Ciro's Nightclub, the first in the city to have air-conditioning, British businessmen and Chinese mobsters tangoed with their wives or mistresses on most nights of the week. Outside, uniformed Russian doormen -- self-appointed Tsarist "generals" whose fake medals were purchased by the dozen in the Hongkew Market -- defended the club's patrons from hordes of deformed Chinese beggars. In less wholesome dancehalls and bars, lines of Russian "taxi-dancers" and Chinese "sing-song girls" sat waiting for customers. By 1936, it was estimated that one in every thirteen women in Shanghai was a prostitute.

Throughout the city, violence was a constant threat, whether in the form of political assassinations or gang warfare. The stained streets of Blood Alley (rue Chu Pao-san) in the French Concession bore witness to the frequency of brawls among foreign soldiers and sailors. "God owes an apology to Sodom and Gomorrah," according to an American Christian missionary who strove to combat the devil in Shanghai. A Chinese journalist agreed. Shanghai, he wrote, was "a city of forty-eight-story skyscrapers built upon twenty-four layers of hell."

Using this Setting

Shanghai offers many possibilities for Game Masters looking to add some exotic excitement to their 1920's era campaign. The history of China in the early twentieth century is one of contrasts. In about twenty-five years, the country goes from a decrepit monarchy to an unstable republic to a dictatorship to a collection of competing fiefdoms and finally to a nation unified under the Kuomintang. As a large city within China, Shanghai shows the effects of these changes very well, making it an ideal locale for adventure.

Because of its cosmopolitan nature, Shanghai could provide the backdrop for many different types of scenarios. Politics plays a significant role, as Communists plot against their Nationalist enemies, while imperialist Westerners and Japanese look on. Indeed, Shanghai could serve as a prime setting to highlight the rise of the Japanese Empire, ensuring its usefulness well into the 30s and 40s.

Beyond politics, Shanghai is a meeting place between East and West, making it perfect for games involving the occult or esotericism. Secret societies and other cabals would be right at home here. Likewise, the pulp adventure possibilities involving Chinese gangsters are many. Stories involving these mobsters would not be dissimilar to those in, say, Chicago or New York, but they have added appeal, as Asian aesthetics meets Western capitalism.

Here are but a small sampling of the adventures possible in Shanghai:

- A British member of the Municipal Council is murdered. Clues point to native Chinese democracy supporters, but is it that simple? Perhaps local Communists seek to spark an uprising against the "imperialists" or maybe Japanese agents are involved.
- A Chinese gangster possesses information vital to the characters' current mission. They must negotiate with the gangster for the information -- possibly doing him a favor in return for what they seek.
- A Soviet agent arrives in Shanghai to advise the CCP cell in the city, but he is kidnapped before he can make his rendezvous. Who is responsible? Nationalists? Western enemies of the Soviet Union? Or someone more sinister?
- An ancient Chinese vase goes up for auction in Shanghai. The characters must acquire it before Western occultists who believe it possesses magical power obtain it.
- A new secret society appears, one that attacks Westerners throughout the city. Is it the Boxers reborn or something else? And who is behind it?

Many more possibilities exist for the imaginative Game Master. Shanghai is at the center of so many currents of early modern history that it's certain to form the basis of many memorable adventures.

Playing *[Dino Hunt](#)* is fun, but a game for ages 8 and up can always use some alternate rules for adult players. After all, *Dino Hunt* is a collectible card game, and most CCG's involve deck design as a way to win. Here's some down & dirty variants for players who are skilled and want some more strategy in their game.

Variant Deck Design

Dino Hunt is ready to play for 2-4 players out of the box, and is easily expandable to 6 players with a supplement. There are two different ways to do deck design: one-deck play, as done with regular *Dino Hunt*, or each player can design and bring their own decks of Dinos and Specials.

You and your friends can each design your own deck of Dinos and Specials, and each player draws from their personal decks and discards to their own discard piles. If this is the case, cards that mention "the discard pile" now refer to *your* discard pile. Or, if your friends no longer trust you and your evil deck designs, everyone designs their decks, and then gives a list of dinos to the person hosting the game. The host will then pool those cards into a one-deck play design, and everyone draws from the common deck. This solves the problem of each player bringing a deck and shuffling cards into a common deck; *Dino Hunt* cards are an inconvenient size to sleeve, and most players will probably object to marking their cards to make identification simple. Everyone would keep their personal decks of Specials, to maximize their chances of capturing the dinosaurs they designed the deck for.

Since *Dino Hunt* has a point-based goal, there should be equality in deck design. It simply wouldn't be fair for your draw deck of dinos to be twice as large as your opponents'; as the game progressed, only you would have dinos left to hunt. As dino point values vary wildly, I recommend that Dino deck size be limited by point score, not number of dinos. Total points of dinosaurs to keep things at the half-hour to 45-minute game play length should be no more than 200 points. Divide that by the number of players to get the point value for your dino deck . . . or change that to suit your needs.

Dino Hunt doesn't specifically allow or disallow card trading; I always play it that if it isn't mentioned, it isn't allowed. However, if playing against folks with other decks, you might want to allow card trading during the game. This brings

another element of strategy in, and again increases the complexity of the game.

General Dino Hunt Strategy

As the mechanism for getting points is completely die-based, the odds of doing well on your turn depends on the dino you're hunting. A dino you can collect on a roll of 3, 4, 5, or 6 is better than a dino which can only be captured on a 6, even if the easy-to-hunt dinosaur is worth fewer points. And many dinosaurs are dangerous in some way or another; if you roll a 1 or 2, they can make your turn end, or do other unpleasant things. If you haven't already been applying these strategies, then you haven't been playing well. Of course, if you're lucky ("Who needs strategy? I always roll 6's when hunting dinos!") this information is useless to you. You should also focus in on the Specials you need. If your deck has a theme, include those Specials first, then fill out your deck with the range of Specials that are always useful to you or harmful to your opponents (depending on your style of play). And something people often forget: when you clean dinosaurs out of an era by capturing them, you get an extra Special! You'll be using more Specials in this variant-deck play, so don't forget any opportunity to grab one!

Also, to simplify play, rather than rolling a die to see how many dinosaurs you can place on your turn, you could do as the rules say for the first turn on *every* turn: place 4 dinos each turn. If you use a deck against your opponents and it wins, and you bring that deck back against them, don't be surprised if they've changed their deck designs to thwart yours. Don't be afraid to switch things around in between games.

I'll run through some theme deck ideas, and then mention other concepts you can add to those decks to change things from game to game.

Theme Decks

Theme Deck: Big Game Hunting

Take the Dinosaur cards you own. Separate out all the dinos worth 6 points or more, and leave out any Specials that mention low-point dinosaurs, or other cards that wouldn't be appropriate. This has the advantage of giving you high-point critters to hunt and also makes the turns go faster. Normal Dino Hunt play revolves around someone best deciding how to spend their energy each turn. With this variant, there are usually fewer dinos on the board at any given time, and many of the dinos out there are dangerous. You'll want to be strategic in your hunts. As the dinos are dangerous, you'll want to pack a Chronojacker in your Special deck. You might find it easier to kidnap dinos from the other players than to hunt them yourself, especially if you end your turn with lots of spare energy to burn.

Theme Deck: Land, Air, Sea

Ignore the rule about duplicate Experts if using this variant as a deck for all players; put it back in play if using separate decks. Give each player their choice of starting with Sure Shot Sam, the Jet Packs, or the Mini-Sub; or, if building decks, decide ahead of time which player will take which deck theme. Change the text on Sam so that he may only hunt land creatures, not flying or swimming ones. Each time you capture a dino using your Special, you get an extra point for your score. In this variant, you should have both equal numbers as well as equal points (give or take 10%...no need to be completely concerned about this) of dinosaurs who walk, fly & swim. There's no restrictions on what you can hunt...but of course, you'll have better luck if you use your Mini-Sub, Jet Packs, or Sure Shot Sam. If you play this variant and you find Sam to be too weak, you can give the poor boy some antihistamines and let him hunt in the

Cretaceous; if it turns out he's too strong (there tend to be more land than air or sea dinos) substitute the Super Stunner for Sam. Change the Stunner to allow use as often as you like, but it can only hunt land creatures. It has an energy cost, so its use is self-limiting. If the Jet Packs are too weak, then change it so that creatures captured by it have their score increased by one; do the same for the Mini-Sub if that too happens.

Theme Deck: Dangerous Dinos

This deck has a lot in common with the Big Game deck. However, things are even more cutthroat. Every dinosaur chosen must end your turn if you roll low. Also, every player gets a Chronojacker. If playing this as your deck vs. others' decks, you'll want to pack a Solar Collector, Favorable Chronowave, Free Ride, Lucky Shot, Power Cells and Radioactive Deposits. You want to have more energy than your opponents so that you can steal what they hunt. You might also want to kick them around the Time Track, so keep a few Timeslips around. If playing this as a single deck that everyone draws from, you won't be so concerned about beating up your opponent with Specials; you'll just be busy watching out for their attacks against you! Also, if you're doing Dangerous Dinos and your opponents aren't, then capture their dinosaurs and leave them with yours! You're specialized in capturing the dangerous ones and they aren't; you'll have a better success rate than they will.

Theme Deck: Building a Herd

You'll need lots of duplicate dinosaurs for this deck, as well as lots of copies of Mated Pair. You'll also want the specific Specials that give you extra points for owning a certain type of dinosaur. You won't need to pack too many of them, because the text on those cards is going to change. For example, Bonehead Battles normally gives you +5 to your point score if you collect a Pachycephalosaur. This type of card now gives you +1 point for *each* dinosaur of that type you collect in addition to their normal bonus. When doing this deck against other players, you should be sure you're not going up against someone who has built the same herd; the game won't be fun if you're fighting too much over the same dinosaurs with an opponent.

The person who comes up with the Mating Call will have a good time playing for herds of Hadrosaurs, so if you're not that person, don't forget to cause their gadget to Malfunction.

Theme Deck: Trophy Huntin'

No kids in the game, right? You're not using stunners any longer. The value of a deer head is based on the number of points on its horns. The same could go for the Ceratopsians. Score an extra point for each horn it has. (This works best as a one-deck design, so that everyone is going for the same goal.)

Additional ideas to add to any of these decks:

- **Carnivore Attack (derived from the Dino War variant on the back of one of the Energy Tracks):** Each time you capture a Carnivore, you may send it into a player's collection of won dinosaurs. You may have the Carnivore eat any dinosaur in his stack (discarding that card from the score pile into the discard pile), but you must put the Carnivore back in play, and you must end your turn. This will make game play a lot more vicious.
- **Bounty Huntin':** Each player randomly gets a card at the beginning of the game. You can either draw from the specials that mention a specific type of dinosaur, or simply draw randomly from the dino deck (I recommend the former, as the dino cards don't have secret backs). That way you have another way of gaining extra points during the game that doesn't match the theme of your deck, which will become obvious over the course of the game.

- **Uniqueness Counts:** You'll actually have to look at the back of the dino cards to figure out which cards fit the theme. You can choose any of these categories, or make up your own . . . after all, your playgroup has to agree to this alternate rule. Any dinosaur card that is particularly unique (only known from one fossil, the only one in its family of dinosaurs, the only one of its kind in the game [there's only one turtle, for example]) is worth extra points or allows you to draw an extra Special when captured. You could also go for other arbitrary measurements, such as size (large, small, heavy, light, etc.). Use your imagination, because the cards have lots of information.

- **Finding a Family:** the value of a Mated Pair card is doubled if you can also add a Baby dinosaur of the same species to your pair of captured dinosaurs.
- **New Specials or Dinosaurs:** If your play group agrees to it, you could design new cards (use old cards you're not going to miss). Playtest the cards using a one-deck game; that way, everyone gets a chance to try the cards out and see if their play balance is good. If the card is a new Special, and you want to try it out in a multi-deck game, you could give one copy to each player for their hand of Specials at the beginning of the game; you'd discover whether it was play-balanced very quickly.

Okay . . . now go hunt some dinosaurs! And Bring 'Em Back Alive!

Art by Dan Smith

Popular wisdom has it that the gaming habit does not survive adulthood. Many of us who were gamers in high school and college find that, when we get our first 40-hour-a-week job and perhaps a mortgage or a marriage, the gaming habit falls away. It's a sad thing to hear the wistful tones of people who once loved gaming but can't find time for it anymore. Often people will talk about having tried it once or twice, but finding themselves unable to sustain it. They mutter something about "you can't go home again" and sadly close the book on a hobby that once provided a great deal of pleasure.

This doesn't have to happen. But it does far too often. The reason for this, I suspect, is that the conditions under which most of us learn to roleplay -- high school and college -- are ones that afford us more free time than we ever see again. As a result, we tend to develop a roleplaying style that involves hanging out for hours, slowly meeting NPCs in town adventures or making our leisurely way through a room-by-room dungeon or a massively epic adventure, secure in the knowledge that whatever doesn't get finished can be picked up next week. After all, you have the time and no one's going anywhere.

Gaming in this milieu is a form of hanging out that actually seems to invite a time-wasting approach -- one that lends itself to very intricate game worlds modeled on all those bulky fantasy trilogies that have maps at the front, or sci-fi novels that have the answer to every technical question worked out in advance. The GM probably whiles away the idle hours during the week by adding new game-world information for fun, and the players (if they're anything like me and my friends were) make up characters that will never see use, just because they can. Random events (such as wandering monsters and binge shopping spress) occur all the time, sprinkled into the main action like pleasant detours along a scenic path.

This is all well and good for that life-stage, but if you try this as an adult, you're going to spend a few bored hours waiting for the excitement and then going home wondering if it was all worth the time. Usually it isn't.

What you need to do to survive the transition is to rethink your playing style. This is a fairly major shift that encompasses everything from session length to genre to player selection. Through the course of this article, I hope to lead you through a system that has worked for me. It involves a sacrifice or two, but in my experience the payoff is well worth it.

One: Premilinaries

Before you even start, you need to tell people you're starting, and feel out friends who might be interested. You'll also need a time and place. (I've found that Saturday afternoons -- say, 1-5 or 2-6 -- are excellent, even for busy people, since they've had time to get up and run some errands, but they can still go somewhere else for dinner dates and such.) Then, while you're looking at your pool of potentials and selecting candidates, you need to consider the following factors:

1. **Keep the Party Size Small.** In college, when everyone was simply hanging out, seven players was not an unheard-of size for a party. That won't wash anymore. Two to four players is all you should need. I find even in four-player sessions that usually one player doesn't get much to do. A fifth player should be avoided whenever possible, or should be as low-maintenance as possible to justify their inclusion. (Someone who just wants to show up and roll dice would be perfectly fine here; a fifth person who wants to be engaged with the game world will be too much of a time drain, and is bound to be disappointed anyway.) If you don't like turning people away, consider breaking them up. Running two satisfying three-person campaigns is often much easier than running one satisfying six-member one.

2. **Keep Player Expectations Modest.** Let people know you will not be running epic adventures. There will not necessarily be full-color maps, dressing in character, sound effects records in the background, etc. You will probably not lavish time composing paragraphs of evocative description to read aloud at key moments. The point is simple social entertainment, not fictive absorption.

   In a related note, don't expect this to last more than three or four weeks. If it happens, as it often does, then great. But it is hard to accomplish, even with this system, and it's better to keep your hopes modest than make grand plans and feel like a failure. Pretend your campaign is a mid-season replacement show. If it's popular enough to get picked up for an additional season, hooray. But a cancellation shouldn't surprise or upset anyone.

3. **Keep the Logistics Flexible.** You'll want one or two people you can count on to show up every week as your core group. (See point 5. below.) But after that, anything goes. This means that the party itself may not gel like the heroes of old (or, or that matter, like the ensembles on TV, who are at least paid for showing up). If you have four regulars and only two can make it one week, fine. Play with two.

4. **Don't Cancel Unless It's An Absolute Emergency.** I particularly recommend not cancelling for the first three weeks (getting commitments from people ahead of time helps), and *never* cancelling two weeks in a row. Ideally, you should have one or more PCs who are capable of GMing in a pinch, so that even if the GM has to leave town suddenly, the game itself can continue. This way, you establish a habit of meeting and people learn to trust that the game will be there if they just remember to show up.

5. **Have a Core Group.** As mentioned in 3. above, you'll want one or two players you can always count on to show up, and who you will play with even if no one else can make it. Choose people who don't travel for work, don't have family they frequently visit on the weekend, and so on. Homeowners and people with children (no offense if you're reading this and you're one of them) are often a bad risk, since their lives are at the mercy of one or more endless unpredictable sources of emergencies.

A Brief Word on Rules

Once you have your players set up, you'll have to establish the game system. But since the emphasis of the game is on speed and efficiency, the rule here is "Simplify, Simplify!" New players will not have time to read an entire *Players Manual*, and it would be laughable to expect someone to. Also, the game itself cannot be permitted to devolve into a discussion of whether someone firing a gun 15 hexes away gets a -1 for every 5 full hexes of distance or a -2 for every 10. In my ***GURPS*** campaign, optional rules such as Advanced Combat and called shots are only used if all the players know them well enough to agree on most numbers without looking them up. And any rule that slows things down is history, no matter how official it is. (My rule of thumb: when all action stops while at least two players are thumbing for a reference, it's time for a GM snap decision.) I try to limit all introductory information to 3-5 typed, single-spaced pages. Three pages on character creation and combat, and two pages on the actual game world we'll be adventuring in.

I supplement with additional stuff two or so pages at a time every game session, but those five pages should be all anyone actually needs to know in order to play.

Two: The Adventure Proper

Instead of going to books for your inspiration, start paying attention to T.V. shows -- particularly (but not exclusively) the fantasy/sci-fi genre shows like *Star Trek*, *Highlander*, *Buffy the Vampire Slayer*, and the like. What makes them good models is that they do the same thing we try to do as adults playing RPGs: tell an interesting story in a compressed amount of time. The following guidelines are what I use when writing adventures for my fellow adults.

Have An A-Plot And A B-Plot

Most genre shows (in fact, most shows period) tell two stories simultaneously. One of these -- the "A-plot" -- is the main story of the episode; what it's theoretically about. The starship's engineer gets kidnapped by moronic aliens; the agents explore a haunted funhouse; the hero and the bad guy switch bodies for a few hours -- all of these are A-plots. They give the heroes some obvious thing to do, and they either succeed or fail. Either way, when the challenge is ended, you know the episode is over.

The B-plot is a secondary story that is usually more character-driven and is where the actual philosophical or emotional resonance comes in. (Read: roleplaying!) When the hero and the bad guy switch bodies, the hero learns how it feels to be judged on appearances, or sees life as the bad guy sees it, or has to answer questions about what constitutes identity. While exploring the funhouse, one of the agents has to cope with an impending visit from an estranged ex-lover, while the other agents wonder what the ex is going to be like. While the engineer is busy being kidnapped, the rescue party has to face the fact that the kidnappers have a legitimate grievance and find a way to come to terms. All of these deepen the original stories by giving the players challenges that they can't just fight, skill, or advantage their way out of.

I generally make the B-plot an excuse to emphasize a ***GURPS*** character's Disadvantages. This is where someone's Hunted or Dependent NPC come in. This is where a bout with Alcoholism or a Phobia can become a major plot issue. This is also what the best shows do: by making every episode relate in some way to the characters -- challenging their personalities or pasts -- every episode becomes important in some minor way. Your adventures mean more when they're not just "the time we fought the giant," but "the time we fought the giant, and Grundar the Barbarian discovered who his mother was."

If you're going to add a third plot (which some shows do), make it only take up two scenes or so. C-plots tend to resolve quickly, and are only just sizeable enough to feel that something has happened. I don't usually even bother with a third plot. PCs tend to create them on their own when faced with an open-ended situation. Which leads me to my second point . . .

Have A Loose Structure

TV shows do not usually have everything worked out in advance. The first episode presents you with some basic facts (what vampires are like, how space travel is set up, which kingdom is where) and the unanswered questions are left to be filled out as the show progresses. Obvious questions should of course be settled in advance. Less obvious questions (such as when a player asks, "What are the histories of all the rulers of all the baronies in this area?") should be answered with either "you don't know," or "I can't answer that this week, but fortunately it's not relevant at the moment and I'll get back to you." In many cases, TV shows have their details worked out, not by the official writers, but by talented fans (such as Captain Kirk's back story -- like his birth in Iowa and his middle name being Tiberius -- which was fleshed out by fans and eventually became canonized in the movies). So when I find that a player is particularly interested in some detail about the game world, I encourage them to make up whatever they think reasonable and show me what they've done later. A good player's work can save the GM lots of time, and it makes both GM and player more involved in the game.

This "loose structure" idea also affects the individual adventures. On a TV show, although theoreticaly anything can happen, what never changes is that you've got a teaser (that setup before the title sequence), three acts, and a closing sequence (right before the final credits). Similarly, I divide every adventure into 3-5 scenes, each of which is set up as an improvisation. For every scene I try to have one thing that *must* happen (in order to lead into the next scene), and a bunch of variables that I've only vaguely predetermined. So, for example, if the characters meet a woodsman who bears a birthmark revealing that he might be the emperor's long-lost twin, and if that's the core of the story I have planned, then of course there's no point in leaving it to chance: the guy's sleeve drops open as he shakes their hand, someone notices the birthmark, and we're off. It may *look* random, but it isn't: I simply ask everyone to make perception rolls, and whoever makes it most readily is informed of the mark.

But if that's all the players get, you're going to waste some time. Each "must" moment should also contain at least one obvious follow-up action -- in this case, maybe they met an agent earlier who is looking for the emperor's twin, but the players don't know if he wants to kill the twin, embrace the twin, or try to pull some Byzantine switcheroo. In any event, a return to the inn where the imperial agent is staying -- either to talk or to spy -- would be the next obvious course. Although it can be tricky to motivate players, I have found it generally safe to say that most players seek pleasure and avoid pain, and try to do the same thing for NPCs that they like if it's not asking too much. Don't count on pure altruism to motivate uyour players or it'll just break your heart, and don't expect them to leap at a fascinating puzzle if it looks like it'll be hard to solve and doesn't have a sure and magnificent payoff. If your players aren't doing what you want, you either need a bigger stick or a sweeter carrot.

Once they're motivated, don't mess around. Part of the concept of "structure" involves getting players where they need to be with a minimum of distractions. Do it like TV: when they decide to go back to the inn, *Poof!* -- the next scene is at the inn. Don't describe each individual building as the characters wander through town, don't roll for wandering monsters, don't roleplay the part where they stop to buy rope on the way, don't deny information until just the right question is asked and don't randomize a damn thing. You'll just waste time on irrelevancies, which will dilute the impact of your nice story.

That's the "structure" part; the "loose" part is that I never presuppose that the players have to get along with the NPCs, or that some player might not do something disastrous. (Note, by the way, that you can almost always prevent the players from committing a killing by having an innocent eyewitness show up unexpectedly at a safe enough distance to run away and call the cops. Happens in the movies all the time.) To cite my previous example, once the players get to the inn, how they aproach the agent is entirely up to them . . . but one way or another, they're also going to come across a letter from the emperor's wife, whether he has to leave it in his room or keep it on his body. As long as the one "must" element occurs, the adventure can continue and things are happy. If you had a really nice dramatic effect that the players missed, you can always tell them about it afterward instead of shoehorning them into doing what's perfect.

A final note that deserves separate mention: I never put any kind of "must" occurrence in the final climactic scene of an adventure. If someone dies, okay. If a valuable item is broken or lost, that's what happened. If someone manages to reasonably acquire an item of extreme power, I roll with it. That's a concern for next week. For the purposes of the individual adventure, however, I try to never have any preconceived notion of how it's going to end. I just try to make the entire situation as potentially clear to my players as possible and let them decide how to deal with it.

Establish a Pattern and Then Break It

Almost every genre TV show spends its first several episodes establishing the pattern of its default story. An anomaly shows up in Missouri, Mulder and Scully go and get baffled by it up close, then they go home and the episode ends on an uncertain note. A planet sends out a distress call, the Enterprise answers, they correct the culture, beam back to the ship, and end with a joke that provides closure. Whatever your "episodes" are going to be like, you should be trying in your first few sessions to establish a consistent world and a consistent way of interacting with that world.

Then, by episode/adventure four, you can start playing with the players' expectations. The players encounter a member of a "bad" alien race who happens to be good! Someone invents an exception to the laws of magic that affects a PC wizard! The town that is the player's home winds up invaded! One of the players discovers they're really a clone! In a

long, deliberately paced campaign, major changes can have terrible impact on everything the GM has been thinking through. In a short-term campaign where the game world is open-ended anyway, it's much easier to do dramatic things to the entire game world and not face disastrous consequences. So do it, and have fun!

An adventure like this is a good time, by the way, to break another rule: don't worry about doing it all in one session. Think of a major story like this as a "special two-part episode." But remember that it has to *feel* like a two-part episode: that is, the first episode has to build to a climactic, cliffhanger revelation that leaves everyone wondering what the devil is going to happen in the second adventure. Expanding to a second session just because you made the dungeon too large to get through is a crappy thing to do to your players. If you have to interrupt the game because of time problems, you'd better make the halfway point exciting somehow. You want them tuning in next week because of anticipation and wonder, not out of duty and a desire to get it over with.

This guideline applies on the individual PC level as well. Most characters naturally fall into certain high-concept one-sentence patterns: The Strong Guy Who's Emotionless; The Sneak Thief With a Past; The Wacky Dilettante Who Causes Trouble. When players first make their characters, the first few adventures ought to establish exactly the expertise that they designed their characters to exercise. The Brain should be supplied information readily. The Brute should have some wussies to beat up. The Trickster should be able to trick someone pompous and powerful. And all of this should happen fairly publicly so word gets around about our heroes. Then, once these patterns are established, you can start to mess with the different characters' self-conceptions and public reputations. TV shows do this all the time -- establishing character stereotypes, underlining them for a few episodes, and then, once the expectations are established, violating them in some way. But the last step is only entertaining if the character stereotypes are already in place. The sooner you provide opportunities for the players to perform their characters for each other, the sooner you'll be able to have fun messing with them later.

Give Everyone Something To Do

This is why the party size has to remain small. Ensemble TV shows can occasionally afford to let one or more characters take a back seat now and then, giving them only one line and a brief walk-on. That can't happen here. Since everyone has bothered to take the trouble and come, the least you can do is make them all important to the story in some way. Combat-oriented characters are easy to please here -- just throw in some combat and they're bound to shine. (See point 5., below.) But in practice, what this means is that within each adventure I try to have two reactions rolls and at least two skill rolls every time -- featuring at least one Contest of Skills (for all you *GURPS* players) whenever possible.

Note that this doesn't mean that players have to be *good* at something to matter. They can also have their peculiarities and ineptitudes showcased, just as long as they personally affect the adventure in some way. What is important is that the players be challenged and happy. Try to have each of them cry "Oh no!" at least once per game ("How can I pick the lock when my hand's in a cast?"), and then (if appropriate) cheer triumphantly as all the NPCs see how cool they are.

What this also means is that you, the GM, have to have options and back-up plans. If you "must" have someone to pick a lock in order for the characters to continue, and only one player has lockpicking skill, then when this player picks the lock they're going to feel like they're not really acting on their own, but simply serving a plot that's already outlined for them. And if that's the only skill they use all adventure, they're not going to be happy. But if the player's skill is optional somehow (the party has to face the evil cultists anyway, but it'll be easier if they can open a lock and get access to niftier weapons), then the roll actually matters more. I generally try to come up with three plot options for every reaction roll (bad, good, terrific) and two options for every skill roll (success, failure). And I never make these rolls central to the adventure's continuance.

Always Feature Sex Or Violence

Perhaps this should read "desire and conflict," but the point is the same. Although there is a tendency for the authors of articles like this to go on about the importance of roleplaying over combat, what's often overlooked is that talky, peaceful, character-driven adventures almost never work. This is because the episodes we see on TV always feature

the gradual revelation of certain qualities in a character we're trying to get to know. ("Will Amanda ever reconcile herself with her grandmother and yet continue to grow as an artist?") In a gaming situation, all the characters know themselves already, and self-revelations are unlikely to deviate much from a character's initial conception. Another problem is that dialogue is tricky to write, and while it's possible to carefully time a revelation or statement when you're in control of every character, this same power is almost entirely absent when you're simply improvising, and as a result true dramatic impact rarely happens. It's great when it works, but as a former improv comic, I can confidently state that unless you have a terrific team that meshes well together, the occasional payoffs are not worth the time spent on misfires.

This is why I emphasize the importance of examining genre shows as opposed to mainstream family dramas. (Note, by the way, that even non-genre shows like hospital dramas, police dramas, and melodramas all feature love stories set on a framework of life-or-death A plots.) Genre shows tend to have more thinly drawn characters (after all these years, we still know very little about McCoy's family life, voting record, or taste in music) and play instead to the genre's strengths -- visual flashiness, the monstrous and the nefarious, big dangers limned in broad dramatic strokes. An episode of Highlander that doesn't feature swordplay is a true rarity, and Buffy always fights something, even if it's not a major part of the story.

In mimicking this, I try to schedule at least two combats in every adventure: one or two small ones that last no more than two or three rounds, and one climactic one that can end any way the dice see fit. I try to make the small ones avoidable with the appropriate actions (be it clever avoidance, capitulation, high reaction rolls, or bribery). If they take too long -- more than three rounds, or two if it's not a very interesting fight -- then the bad guys either begin to fall easily or run away. (They're usually not out to kill the heroes anyway; they're testing their strength or sending a message or something.)

Since this makes combat a little rarer than in the pre-adult years where you roll dice to beat up kobolds every half an hour, it's worth it to try to make every fight scene different and specific somehow. Have rain obscure everyone's vision! Make a barrel spill slippery stuff on the floor! Turn out the lights and put them near a gas tank! Ruin their ammo and force them to pick up a nearby axe! Anything that affects a character's competency in a battle -- making a sure thing less sure or making a scary opponent more takeable -- is worth choreographing. Figure out the modifiers in advance so you won't have to turn to books in the middle of a fight. Develop an environment that enables the players to select options about how to fight instead of just automatically doing what they always do. They'll thank you for it later.

I also try to make desire part of every scene -- the characters want something, and the NPCs want something else, even if it's something as simple as wanting this conversation to end so the NPC can go to the restroom. Actual sexual situations can be tough to pull off -- especially if you're all straight males and you're uncomfortable adopting cross-gender roles in public view -- but an undercurrent of sexual attraction is often surprisingly motivating. Playing on disadvantages helps here: an ugly sorceress will almost never refuse an invitation for dalliance with a blind man who finds her funny; a greedy gladiator will happily spend the night in a rich woman's room -- and might even countenance an offer of marriage!

Generally speaking, however, violence is an A plot and sex is a B plot. Life and death questions are the most important ones to resolve; after that come considerations about the quality of that life and who you'd prefer to spend parts of it with. In fact, as relationships and sex develop over the life of a campgain, fandom becomes more important and helpful . . .

Encourage Fandom

Thanks to *Star Trek*, every genre show with its head on straight tries to establish a room for fandom -- often a chatroom or e-mail list. This gives the fans a chance to discuss questions about the characters, speculate about upcoming episodes, trade rumors, and in general keep love for the show alive in those 167 hours every week when it's not actually airing. This can have a similar salubrious effect on a campaign as well. I set up an e-mail list for all the players to share, and I try to send out one update every week -- just a paragraph or two -- about what's happening in the campaign. This includes announcements that are both "in character" (Castle Banwyck is reported to be under siege

300 miles to the north) and "out of character" (we're meeting at Steve's this week but his air conditioner's not working so dress accordingly).

This is an opportunity both for the GM and for the players. The GM can fill in game-world information that would be too time-consuming or irrelevant to bring up in an actual session. (The disposition of current politics, who just got promoted, what the weather's been like lately.) And the players can communicate privately to the GM with details about their off-time activities (this is a chance to use *GURPS* job success tables and training rules), and can role-play things like love scenes and secret agendas that are awkard or inappropriate for the larger group. If you have a small enough group, this isn't much of an imposition.

Obviously, though, this is an idea that asks for a little more time commitment than usual, and I've found that some players (often those with boring day jobs that allow them to goof off at their computers) will overuse the system if you give them the merest chance, tying up time you need for other parts of your life. So I try to make it clear that I will accept only one e-mail per week, and that it may describe no more than two relatively simple actions that the player is engaging in -- or one complicated action if it's important enough to work out in a short mini-adventure. (By the way, I never roll dice in a mini-adventure. I just decide on a narratively pleasing result and negotiate later if the player objects to something.)

Final Thoughts

As I mentioned earlier, I plan for three-hour sessions and accept it if it goes for four. I figure the length of my adventure according to the following rough formulas:

- NPC encounter: 15-30 minutes.
- Short combat: 20-40 minutes.
- Big climactic combat: 45-75 minutes.
- Figuring out a plan for what to do next: 30 minutes to 1 hour or more.

The system still isn't perfect, but I have found that the TV-efficiency model I have just described has turned the gaming sessions with my adult friends from sporadically interesting seven-hour marathons that are impossible to maintain from week to week into punchier crowd-pleasing sessions that actually last two to three months before collapsing. I like to imagine that one day I may eventually come up with a gameworld so enticing that it takes on a life of its own, inspiring fan fiction, T-shirts, in-joke bumper stickers and (maybe someday) a convention. For the time being, though, I'm just glad to be able to give my friends an opportunity to wedge in some role-playing entertainment in the midst of all the other demands adult life places on us. I hope it does the same for you, too.

Faces

Published by **InterQuest**

CD-Rom software for Windows '95 and Macintosh; $49.95

Real life often blesses gamers with handy tools for their hobby. The drafting and graphic arts industries have graciously provided us with all sorts of devices and techniques that enrich our gaming experience. Now we get to steal from the police.

InterQuest has created a software package for law enforcement agencies to facilitate the creation and communication of composite pictures. The user interface is an incredibly easy to use point and click configuration. The software, called *Faces*, is available for Macintosh and Windows operating systems, and retails for $49.95 (US). Depending upon your gaming needs, it can be worth every penny.

Faces has a library of almost 4,000 facial features. The combination of features is impressive; faces will have different head shapes, necks, eyes, eyebrows, eye lines, mustaches, beards, forehead lines, sunglasses, hairstyles, hats, lips, and chin lines. That said, when a GM starts churning out pictures of non player characters to wow and amaze his players, some features seem to pop up a lot. In particular, my players and fellow GMs have found that the choices of hair styles could stand to be expanded. There are a number of choices, including various lengths and genders, plus options for balding, afros, and hats, but there are only about a dozen choices for short male hairstyle. Depending on the choice of jaw shape, beard choices may be somewhat limited, but the program separates mustaches and beards into separate features, increasing the variety of combinations.

Skin color is handled pragmatically. The program uses a universal skin color which is the same for all races and complexions. This approach works better than it sounds. In practice, a face crafted with African-American features will look like a light skinned African-American. Further processing via your favorite photoshop software can produce darker and lighter complexions with some success, but it is not necessary to achieve the desired effect.

Pictures must be exported from the program for further modification via photoshop software and for posting the image elsewhere. Unfortunately the program only provides one format for export, but fortunately it is a bitmap format for Windows (PIC for Macintosh), which is highly versatile and should be directly importable into any image processing software. One little annoyance is that the pictures have a little iQ logo stamped on the bottom right of the neck of images that are exported. Users have successfully rid themselves of these stamps with Photoshop software, and my favorite solution is to layer some appropriate image over the stamp, such as a relevant insignia or clan mon.

The problem of sending pictures back and forth has been handled well in *Faces*. For communication between two *Faces* users, InterQuest has created the InterCode system. All pictures created with the program are represented by a string of about forty alphanumeric characters. Any *Faces* program can translate these characters

back into the portrait. This makes for extremely low bandwidth transmission of pictures across the internet.

Obtaining pictures of NPCs and player characters (PCs) through conventional means can be time consuming and expensive. The cheapest way is to look at random pictures or pictures of celebrities and pick one. A generally more expensive route is having an artist create a portrait of a character. Neither one is appealing for a GM that will be introducing ten new NPCs per session. *Faces* is incredibly easy to use. After you have crafted a about a dozen faces, the process is very quick. A new face can be generated within a few minutes. Another option in the software is a random face generator. This usually produces monstrous freaks of nature, but can occasionally generate a good starting point for a new face. The feature is intended for use of the software as an observation game.

Gamers that have never used pictures for characters may dismiss the value of such portraits. The picture has two very clear benefits. The person playing the character, whether a player or GM, has a visible reminder of what the character looks like. More importantly, other people have something to look at instead of the gamer when imagining what the character is saying. This is invaluable when the character is a different gender, race, and/or build. The players and GMs that I know that use it all agree that the pictures are a great aid to role playing, but the price tag makes it more appropriate for a GM purchase.

Faces was written for the modern world, and it is best used for that genre. There are no pointy ears, horns, or other bestial features. Clothing and dress are not shown in the pictures, but the dominant hairstyles and sunglasses are styles of the last half century so the utility decreases for eras with distinctly different period fashions. However, humans pop up in all genres and even in games with a plethora of aliens, at least the faces of human PCs will be easy to make.

The gamers that I know aside from myself that have purchased *Faces* are all GMs and have made scores of faces with the software. We all agree that the software was more than worth what it cost. Players enjoy the faces as a prop and role playing aid for themselves and for the many NPCs that are paraded before them. It especially helps PCs remember when they are talking to a thick-necked bouncer that can eat their head. *Faces* has been a great boon to my gaming and, in spite of its limitations, is a good buy.

Pyramid Review

King Arthur Pendragon: Book of Knights

Published by Green Knight Publishing

Written by Peter Corless

48 b&w pages; $7.95

Quick Start versions of older, large, complex games have become the rage over the last year or so, and this book is Green Knight's entry for their *Pendragon* game. These supplements must be examined with an eye toward both experienced and inexperienced players. The book itself utilizes a small print (10 point), and there are few graphics (about one picture every three pages not counting tables), but the work is original (at least I don't recognize it from other *Pendragon* books) and contributes to the text, so you get a lot of words for your money.

Like other Quick Start supplements, this one includes an introduction to roleplaying, presents the world of the game, concentrates on character generation, and provides the simplest mechanical aspects of the game (combat, action resolution, competitive skill use, and a brief overview of experience). *Book of Knights* restricts introductory material to the first 8 pages (after the table of contents), it covers the world of 6th century Britain and the role of the knight in the world of *Pendragon* succinctly, and even manages to expand on the descriptions given in the 4th edition rulebook. Character generation is covered in the next fourteen pages, presenting an abridged generation sequence but reminds users that far more extensive and complete rules can be found in the cultural sourcebooks (*Pagan Shore* (Irish), *Land of Giants* (Scandinavian), *Beyond the Wall* (Picts) and *Saxons!*). Two sample characters follow, and the final page gives sample minor NPC/monster statistics. The mechanics of the game take eighteen pages and experience is described in two.

Character generation is somewhat different from the system presented in the 4th edition rulebook and as it has been expanded in the sourcebooks. Traditionally there has been a long series of decisions or die rolls to explore where a *Pendragon* character fits into his world, this supplement replaces most of the roll-here-to-see-where-to-go-next tables with a handful of choose-one-from-column-A-and-one-from-column-B tables. This speeds up the generation of characters, but eliminates some of the organic flow and thoroughness of the original system. Furthermore, by unifying some of the tables, the uniqueness of the various cultures that form the world of King Arthur is lost. While not a problem for new players, old players will want to use the complete system. If you are an experienced player looking to replace *Knights Adventurous* as a character generation adjunct-book, then look elsewhere -- this is not it.

One of the great aspects of Pendragon is its devotion to historical heraldry. It receives only two pages at the end of character generation; however, this overview is simple but not simplified. The rules are explained, and include instructions for designing a coat of arms for your character. There is one page showing the components and vocabulary of heraldry that is far more illustrative and instructive than the two pages given in the 4th edition rulebook (experienced players, take note). Cadency (a system for changing or differentiating a coat of arms for the sons of a knight) receives its first exposure in *Pendragon*, and makes for a welcome addition.

Pendragon is a primitive game; there are separate mechanics for each kind of task (skill use, trait checks, combat skill use, etc.). *Book of Knights* explains them all in clear concise terms. It also expands on some of the rules, especially how the Honor Trait is used, and also includes several new options for actions in combat. Experienced players will want to explore these new options including: the "Double Feint," which allows a dagger-user to bypass armor, and

expanded rules for barding and armor. The section explaining skill use is more concise than in the 4th edition rulebook and may prove more helpful to experienced players than the original rulebook itself.

Players new to the game and GMs introducing the game to them will find this introduction enough to explain the game and to get started with a game. Although, as always, an experienced GM improves the experience. I think that the simplifications that were made for this book (especially in the character generation area) will not restrict the players from graduating on to the full game -- although some may feel cheated out of the experience of making a *Pendragon* character using the full system.

Experienced players will also benefit from this supplement, and not much less than a neophyte. The expanded explanation of heraldry, expanded combat options, and tight presentation of game mechanics all combine to make this book a good addition to the library of any *Pendragon* player. It almost looks like the beginnings of a new edition. For the price, GMs may consider requesting that players acquire the book just to save wear and tear on their copies.

Pyramid Pick

Library of Bletherad (for Palladium Fantasy RPG)

Published by **Palladium Books**

Written by Bill Coffin

160 pages; $16.95

Library of Bletherad marks Bill Coffin's latest addition to the slowly growing *Palladium Fantasy RPG* line. Although the books for this series are a bit fewer and further between than those in the *Rifts* series, Coffin has been able to deliver us yet another book that has been well worth the wait.

Library of Bletherad is more or less a compendium of miscellaneous adventure material weaved together through the fabled Library of Bletherad. The library boasts a legendary collection of books, which by far outrivals any other in the *Palladium* world. Coffin presents the different adventure material in this sourcebook by telling of the strange things found in some of these wondrous tomes. As this book demonstrates, the Library of Bletherad is an ideal jumping off point for any adventure.

The first third of the book details the history of the library, the major players connected with it, and the many ways in which the players might become involved. As Coffin explains, the Library of Bletherad (so named for the city in which it resides) is one of the descendants of a grand and mythical library known as The Prime Incunabula. The Incunabula was destroyed centuries ago, and the Library of Bletherad is the only known surviving descendant. The library's history has been rocky and fraught with strife since well before its construction. Those destructive forces, known as the Zealots, who destroyed the Incunabula have also sought to undermine the Library of Bletherad. The peaceful Monastic Order of Bletherad, an order of pacifistic scholarly monks, watches over the library and fights to preserve it for future generations. However, their job is not an easy one. The monks who guard the library are not entirely unified in their efforts to protect the library, nor are the antagonistic Zealots entirely coordinated in their efforts to destroy it.

True to Coffin's style, the library's situation is nowhere near as simple as this basic outline implies. We learn of some of the mysteries involved with the library as well as of the secret societies found there -- the Guardians of Bletherad and the Morphean Fellowship -- both of whom make it their duty to step forth and fight the Zealots and other troublemakers with a vengeance, a vengeance that the peaceful monks are afraid to exude.

This section also explores the library and the area around it. The two major cities of the island are detailed, as well as the many mysteries and potentials for adventure that they contain. And, of course, the library itself is also mapped out. The first thing one will note about the library is that it is absolutely huge. It contains more books than one could read in a dozen lifetimes, and in those books one will find information on just about anything. The library is a large, round structure with grand, yet subtle architecture and about ten total floors, each packed with stuff to explore. The top five floors contain primarily books, all organized by a very simple and meticulous system. The bottom five floors are basements, only the first of which is in use. The other four are locked up, leaving plenty of potential for additional mystery and adventure within the library.

One important section of the sourcebook to note is the one on *The Carbunculum*. This is a tome of mysterious origins that has been making its way into the hands of adventurers all across the realms. It is basically an adventurer's guide to the Library of Bletherad, written by an apparent trickster. Most of its material is false and misleading, making

promises of grand treasure, such as ancient spell books and treasure maps, just lying out in the open for adventurers to discover. For the most part this has done little more than provide a large thorn in the sides of the librarians as they attempt to guide, properly inform, and keep a lid on these wandering (and often disruptive) visitors. However, Coffin makes a note that there might be a few kernels of truth within the tome, making it usable as an ideal plot hook for drawing the players into the library and launching an adventure from there. I don't know if that quite justifies the sixteen pages of text that this book receives, but it is done in quite a bit of detail, with plenty of leads to follow up on.

The second two thirds of the book are a collection of miscellaneous material that can be incorporated into any campaign. GMs will find things such as new spells, new monsters, new items, maps, and many other things that will prove more than useful. The paradigm that these items are presented through is that of books. Coffin provides stats and details for the items found in over a dozen books that may be found within the library. The books themselves are linked together with a common story that ties itself into the history of the library as a whole. They are all survivors from another library that was a descendant of the original Prime Incunabula. It is a descendant that was thought to have ben destroyed centuries ago, a fact that throws a lot of things into question and provides even more potential for adventure. It should be noted that the material presented here need not necessarily be discovered or encountered through the library in any way. These are books about rare things, things that the adventurers might encounter on their own anywhere in the world. This in turn means that GMs don't necessarily have to incorporate the library into their campaigns if they don't want to; the source material can easily be used separately.

The first part details a set of spell books, and Coffin gives us several sets of new spells each from exotic and largely forgotten schools of magic. We are given new ice magic spells, new spirit magic spells, new shadow magic spells, and several others. All of the spells are pretty good, and a few of them are really, really cool. Aside from the main **Palladium Fantasy** game book, there hasn't been too much support in the form of new spells in this game. Finally, spell casters will have something new and exciting to add to their spell retinue.

The next section provides details on a bunch of legendary rune weapons and rune artifacts. Unlike many of the rune weapons in previous source books, no punches are pulled here at all. These are truly powerful weapons, which will add an interesting and dynamic element to any campaign. Aside from just giving stats, Coffin makes sure to give us thorough and interesting histories for each item, making them ideal for incorporation into a campaign.

A summoner will find his or her delight with *The Journals of Sir Garrydyn*. It's a collection of information on thirty-three demons and thirty-three deevils, including their true names. Complete stats are given for three demon and three deevil lords. However, for those with less sinister tastes, there's a catalog of new monsters and strange creatures in *The Brass Menagerie*. Some of them are simple, straight-forward monsters, while others are complex and interesting creatures that provide a lot of potential for GMs. Of particular note are the Yin Lords, a race of strange, yet benevolent snake-like humanoids who are struggling to find their place in a world that is likely to reject them.

The rest of the source book is rounded out with details of some more mundane, but still quite useful, items and topics. Coffin actually manages to make coinage a somewhat interesting topic while giving us the lowdown on the types of money that the different nations in the Palladium world use. There are several tomes presented with many different kinds of maps, from ley line charts to historical maps. The most interesting is *The Heroic Realms*, an account of six different worlds that heroes might be transported to. Finally, Coffin gives us a few other things to play with, like ancient elven air boats and big, nasty siege weapons.

Overall, **Library of Bletherad** book is more than worthwhile. About the only thing you could really criticize about it is Coffin's occasional wordiness as he goes very, very in-depth exploring the different elements of the book. But that's really nitpicking. Palladium Books has strayed from its usual formula of geographically-oriented sourcebooks, and this time with great success. A book of miscellany is a hard thing to do, and the theme of the mystic Library of Bletherad is the perfect tool for weaving all of this diverse material together into one coherent and interesting volume. GMs will find material here useful for just about any type of campaign, which makes this a recommended buy for anyone interested in this game.

-- Jon Thompson

by William H. Stoddard

Art by Alan Gutierrez

The 19th century is an ideal setting for science-fictional adventures: science and technology had achieved amazing things and could be expected to achieve even more, but enough remained unknown so that there were few limits to a writer's invention. Steampunk campaigns look back to that sense of possibility. *GURPS Steampunk* offers a catalog of Victorian marvelous inventions. Unfortunately, there wasn't space to fit in all the ingenious suggestions that came up during the playtest; in fact, several sections of the original text needed to be cut for space. Here then are some of these unexplored possibilities.

Further Looks at TL(5+1)

The age's main power source was coal-fired steam engines. But coal has serious inconveniences, especially in requiring stokers to move it from storage compartments to combustion chambers.

Phil Masters suggested that one solution to this problem, well within the range of Victorian technology, would be grinding coal into a fine powder that could be pumped like a liquid. Fluidized coal power plants require half as many tenders as standard steam engines (divide kW by 500, take the square root of the quotient, and round down). The coal still weighs 50 lbs. per cf, but costs 25% more, $0.10 per cf or $3.30 per ton. However, it cannot be stored in a bunker. Instead, it requires a fuel tank. A cubic foot of coal fills a 6.66-gallon tank, either standard or light (see p. VE89), and has a fire number of 9 in a standard tank or 10 in a light tank (see p. VE90). Under normal circumstances fluidized coal will simply burn, but like flour, it can form an explosive mixture with air in a confined space.

Another plausible variant fuel was noted by Jim MacLean: alcohol. Statistics for this are already provided on p. VE90. Either wood or grain alcohol weighs 5.8 lbs. per gallon, costs $0.025 per gallon, and has a fire number of 11 in a standard tank or 12 in a light tank. Reduce engine power to 85% of normal after conversion from fuel oil to alcohol.

Another playtester, M.A. Lloyd, noted that several 19th-century inventors attempted to develop a coal-gas fuel cell. Such a cell, including the gasification apparatus, might have the following performance statistics: weight 90 lbs. per kW if under 5 kW, or 225 lbs. + 45 lbs. per kW for higher power outputs; volume 1 cf per 50 lbs.; cost $5 per pound,

with a minimum of $50. Fuel consumption per kW would be 0.015 cf of coal and 0.125 gallons of water per hour. For example, an 8-kW fuel cell would weigh 585 lbs., take up 11.7 cf, cost $2,925, and use up 0.12 cf of coal (6 lbs.) and 1 gallon of water (8.5 lbs.) per hour.

The inventive Mr. Masters also suggested that a world with steam-powered mechanical computers might be able to build vehicles with TL(5+1) computerized controls. Such controls could allow one crewman to operate multiple vehicle systems from one station. The interface would be a mechanical analog of a computer terminal, weighing 200 lbs. and occupying 10 cf in addition to the space for the crew station. Cost for the system would be $1,000. Operating a vehicle with such a system would be at -1 to all skills per added function, owing to the complexity of the controls; in addition, anyone not previously experienced with such a control system would face unfamiliarity penalties.

(All statistics for these devices are my own treatments, based when possible on *GURPS Vehicles*. The proposers are not responsible for my versions of their ideas.)

Many steampunk campaigns are going to involve inventors and their novel devices. The operation of such devices will pose certain challenges. Operating a newly invented device requires gaining at least a new familiarity, often a new required specialization (for example, Shiphandling: Submersible), and sometimes a completely new skill (for example, Piloting). The invention of a new device is typically followed by a period of experimentation, when many devices are prototypes or home-built and there is little standardization. In effect, every new device requires a new familiarity. (See p. B43 for the relevant rules.)

If a device invented during play needs a new skill or required specialization, no teacher can be available. The use of the device must be self-taught, taking double the normal time (see p. B83). Once an adventurer has taught himself Pilot: Ethership or Shiphandling: Submersible, of course, he may be able to go into business as an instructor in the new skill.

Zeppelin

Among the vehicles that had to be cut from the published version of *GURPS Steampunk* was the L.3, a zeppelin built for the German navy. This airship has a crew of 15: two watches of pilot, bombardier, mechanic, and gas cell riggers, and a captain, navigator, and top gunner. Seats are available for half a dozen men who are off duty, but the L.3 is not really designed for long occupancy; on flights lasting more than a day the crew will become fatigued. Weekly costs of operation include $2,782.50 for hydrogen and $1,200 for fuel oil. The L.3 has an operational radius of up to 1,200 miles, sufficient to threaten warships, troop transports, or cities even in the British isles. Armaments are high explosive and incendiary bombs on a hardpoint on the undercarriage and a top-mounted 7.62-mm machine gun.

Subassemblies: Body +10, bottom Substructure +4.
Power & Propulsion: 3 x 156-kW high performance Diesel engine with aerial propeller.
Fuel: 2,000-gal., fuel oil (11), light, 95 hours.
Occupancy: See above
Cargo: none
Armor: Bo: 1/1, Su: 2/4
Weaponry: 5 x 110-lb. HE bomb [Su] +2. 20 x 6.5-lb. incendiary bomb [Su] +2. 7.62-mm machine gun (200 Solid)
Equipment: Su: Improved optical bombsight; Precision navigational instruments, +4.
Dim.: 490' x 20' x 20' Payload: 15,700 lbs. Lwt.: 52,700 lbs.
Volume: 796,000 cf. SizeMod: +10 Price: $33,750
HT: 12. HP: Bo: 8,963, Su: 80.
aSpeed: 25 mph. aAccel: 0.4 mph/s. aDecel: 0.5 mph/s. aMR: 0.125 mph/s. aSR: 4.
Lift: 53,700 lbs. Stall Speed 0. Climbing Speed 20 mph.

The L.3's high explosive and incendiary bombs have the statistics given in GURPS Vehicles. For a convenient summary, the high explosive bomb causes 6d x 160 concussion damage and 12d fragmentation damage; the incendiary bomb has a bursting radius of 40 yd. and inflicts fire damage of 3d on anyone caught by the burst. Both types of bomb fail only on a critical failure.

Other Skills

Many characters in Victorian fiction are able to talk to animals. This isn't a magical effect -- neither The Jungle Book nor The Story of Dr. Doolittle is fantasy as it's now understood -- or even a psionic one. In some fictional worlds animals have languages that a few human beings are able to learn. This commonly requires an Unusual Background. The relevant skills are as follows:

Language (Animal) (difficulty varies)   *No default*
Prerequisite: Mimicry (Animal Sounds or Bird Calls)

Animal languages are either Mental/Hard (for languages of land vertebrates) or Mental/Very Hard (for languages of more exotic species). Typically each species has a separate language, but this will depend on the setting; in some settings related species, or all animals, may share a language, while in others a single species may have different dialects or languages. This skill is only available with GM permission. Note that it does not apply to the language of a surviving tribe of primitive hominids, which would be treated as a Mental/Easy human language.

Linguistics (Animal) (Mental/Very Hard)   *No default*
Prerequisite: Language (Animal)

This skill is a required specialization of Linguistics. It confers the same benefits for animal languages that the usual form of Linguistics confers for human languages: +1/10 of skill added to any animal language you know. This skill is only available with GM permission.

This same treatment can work the other way, of course. For example, Dr. John Doolittle started out by teaching his African gray parrot, Polynesia, to understand English; she then returned the favor by teaching him animal languages. In *GURPS* terms the first step would involve the parrot's gaining Mimicry: Human Speech, followed by English as a Mental/Hard skill.

The Lost Princess

Due to space limitations, it was not possible to include example NPCs for all of the campaign worlds in *GURPS Steampunk*. Iron had John Bauer, Qabala had Rebekah Schwartzberg, and Providence had Father Carlos Javier, but none was provided for Etheria. Here is the missing character, specifically designed to get PCs in as much trouble as possible:

Pandhori Viron   **100 points**

Age 17; 5'5"; 130 lbs. A strikingly beautiful young woman with curly dark hair and pouting lips.

ST 8 [-15]; **DX** 11 [10]; **IQ** 12 [20]; **HT** 12 [20]
   Speed 5.75; Move 5.
   Dodge 5.

Advantages: Beautiful [15]; Charisma +1 [5]; Patron (Greek government, 9 or less) [25]; Status 7 [30]; Strong Will +1 [4];

Wealthy [20].
Disadvantages: Charitable [-15]; Curious [-5]; Overconfidence [-10];
Social Stigma (Woman) [-5]; Stubborn [-5].
Quirks: Admires Byron and Swinburne; Adventurous; Susceptible to
handsome or charming men; Tries to write poetry; Wishes to see the
Elgin Marbles returned to Greece. [-5]
Skills: Acting-11 [1]; Appreciate Beauty (The Male Figure)-8/13 [1];
Bard-12 [1]; Dancing-10 [1]; Guns/TL5 (Pistol)-12 [1/2]; Holdout-11
[1]; Literature-10 [1]; Riding (Horse)-10 [1]; Savoir-Faire-14 [0]; Sex
Appeal-11 [1]; Stealth-10 [1].
Languages: English-11 [1]; French-10 [1/2]; Greek (Native)-12 [0].

Named for the mythical heroine Pandora, Lord Byron's granddaughter
inherited not only his physical beauty but his passionate, rebellious
spirit. She discovered his poetry at 13 and was inspired by it to learn English better than she might have otherwise; she
even dreams of writing poetry, though her work so far is amateurish, even in Greek. Her father wants to make a good
dynastic match for her and prays to avoid scandal until then; Princess Pandhori has other plans.

In a campaign based in the British isles, adventurers with an aristocratic background may meet Princess Pandhori at
court, as a guest of the Queen. Adventurers with other backgrounds may run across "Miss Dora Gordon," an educated
young lady with a curious foreign accent always accompanied by a man whose civilian clothing fails to conceal his
military bearing.

As a member of the Greek royal family, Princess Pandhori can act as a Patron for the adventure seed *The Lost City*.
She may even demand to join the expedition!

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

We Don't Communicate Anymore. Over.

On election evening I was clicking "reload" on [CNN's website](#) every thirty seconds, trying to see if they had any new news. And I remembered how recent the advent of instantaneous communications are.

Ten years ago 24-hour cable news was the fastest widely available way to get news, with a general lag of half an hour. Twenty years ago network television was the fastest widely available way to get information, with a general lag of twelve hours or so (for important, but not critical, matters). Fifty years ago the radio was king. A hundred years ago it was the newspaper.

So a hundred years ago I would have needed to wait until the next morning for new information -- information that, if incomplete or incorrect, would need another day to update.

In 1492 the biggest news for most of Europe would probably have been the expulsion of the Moors from Spain; word of Columbus's "discovery" wouldn't have reached them until 1493.

Today, "instantaneous" communications themselves are hampered by the speed of light, over significant distances. The gulf between ol' Terra and Mars, for example, is significant enough that real-time vehicle operation isn't feasible; by the time you realize, "Holy crud! That rock has *fangs!* Turn right! Turn RIGHT!!!", the Martian landscape is already gnawing on your lander.

Anyway, the point of all this is: whether you realize it or not, the availability (or lack thereof) of communications will *significantly* affect your campaign. If folks can talk with others and receive near-instantaneous responses -- especially if those folks can help, like supervisors, police, newsgathering organizations, the Super Friends, etc. These kind of campaigns, left unchecked, can have PCs contacting the Big Guns whenever there's a problem they think they can't handle.

If you can contact these groups, but they aren't able to reply for a certain amount of time (be it hours/days/weeks), that will lead to another kind of campaign. These kind of communications tend to result in campaigns where the PCs report in to the Powers That Be, then go off on their own. This can take a fair amount of pressure off the PCs; it's a lot easier to try to go after the Death Valley Killer if you know that the FBI will be there in three hours. But this can also result in problems similar to instantaneous communications; if the PCs think they can just try to contain the killer, the pressure isn't on them to be decisive.

Finally, there's the possibility of no communications (or communications so sporadic as to be practically nonexistent). Here the PCs are truly on their own; any advice or updates will probably not get back to them until it's too late. The original *Star Trek* universe was like this; the PCs were expected to deal with each problem as they got to it, without knowing whether or not the higher-ups would approve. (It's also one of the problems I had with *Star Trek: The Next Generation*; they would report in for advice or guidance to some admiral or the like just often enough that I began to be bothered when they *didn't*. "Captain, we have devised a means of permanently destroying the Borg . . . are you *sure* Starfleet would want you to ignore this opportunity?" "Um . . . yep.")

GURPS Space has a good section on the implications of the availability of FTL communication, and the kind of decisions it affects on a campaign. But these concerns aren't limited to science fiction; almost *any* campaign will probably need to address the troubles of different types of communication. From modern day cell phones and e-mail to magical communication spells to long-range telepathy to homing pigeons to smoke signals to travelling the astral plane in the wink of an eye, the ability to send word quickly is common in many settings, and will affect the kind of adventures you can run. (Of course, it will also affect the game universe, but I tend to prefer to start thinking of a campaign from the adventurers up.)

Regardless of how limited or available you want communications to be, make sure you remind the players of this fact. In a world with instantaneous communications, not only should the PCs be calling their supervisors for backup and guidance, others should be calling the PCs, wanting them for backup, a news quote, or a project update. (There's

nothing worse than a ringing cell phone while sneaking into the bad guy's lair.)

If the PCs are in the habit of calling La Liga de los Héroes Estupendo Que Ponen Brillante la Ropa in Mexico City and waiting the two hours for them to show up, why not having neighboring cities a few hours away call them, asking for help or information.

And in a world with sketchy and inconsistent communications, you can remind them of this fact by having messages show up much too late. In a *Fading Suns* game I ran, where most non-vital messages are transported by spaceships, I had a letter arrive for a PC inviting her to her family's winter holiday . . . from the previous year. Receiving an addendum assignment for a city you just left, receiving Headquarters' missive delivered two weeks two late ("It says, 'It's vital not to hit the creature with energy weapons.' " "Yeah, we figured that out."), and finding messages that were meant for someone else but never made it (derelict space ships, an important folder in a remote mountain outpost, and half-formed spells of communication trapped in anti-magic areas like flies in amber) are all great ways to reinforce these ideas.

Of course, there's another aspect of communication I'll probably talk about in a couple of weeks: what are the PCs expected to *do*, that they may or may not be tempted to call someone else? But I'll tackle that one another day. In the interim, I need to click "reload" again and see if anything interesting has happened in the past fifteen minutes.

* * *

Well, things have been a bit disheveled for me this week, since on Saturday my sink broke where the water connection meets the wall, dumping about a half-inch of water into my apartment. (For you long-time Steven-watchers, yes, this *is* the same sink I had problems with [when I moved in here](). I am a sad l'il Pooka currently.) Fortunately, the damage wasn't anywhere near as bad as it could have been, since I'd listened to that little voice in my head and cleaned my apartment that day. So the same floor which was stacked with gaming books eight hours before was relatively clear when it happened. (Alas, I did lose a fair number of comics and a couple of *Aberrant* supplements. Apparently the water spirits are diametrically opposed to superheroes.)

Unfortunately, this is the second time in three years that a major plumbing problem has invaded my home . . . which is depressing, since 95% of my belongings are paper products. So let this serve as a lesson to you all (which my parents tried to instill on me . . . but failed): *Clean your home!*

Oh, and I currently don't have a sink again. <sigh>

-- Steven Marsh

* * *

*Last week's answer: **Orks at the Gate** board game, back of the box.*

(Five stars) "**Bench-thumping [Control]** -- Anyone who can get a television set to work by hitting it or persuade a gadget to work by thumping the laboratory bench in exasperation has the Bench-thumping ability."

Secret Histories Completed While You Wait

"The events of an interplanetary story -- aside from such tales as involve sheer poetic fantasy -- are best laid in the present, or represented as having occurred secretly or prehistorically in the past."
-- H.P. Lovecraft, "Some Notes on Interplanetary Fiction"

[Last week,](#) I began an experiment in visibly Suppressing the Transmission, in building a conspiratorial secret history out here in the bright light of reader scrutiny. Our Worked Example takes as its theme the Lovecraft quote above, and having made some key decisions about our Secret Space Travel campaign -- the nature of the Secret, the Space, and the Travel -- we're ready to boldly go where ancient man has gone before.

"Oh man! Look at those cavemen go
It's the freakiest show
Take a look at the Lawman
Beating up the wrong guy
Oh man! Wonder if he'll ever know
It's in the best selling show
Is there life on Mars?"
-- David Bowie, "Life on Mars"

Any story (most emphatically including any roleplaying campaign) needs conflict, and in a story like this one, that means Bad Guys. If you're building a relatively short, or relatively focused, game, you can stick with just the one set. For a properly twisty, longer campaign, I like to use at least the Orwell-prescribed tripolar system. That way, any given set of Bad Guys has a plausible reason to help Our Heroes -- the other two Bad Guys are teaming up on it. For a real headscratching, "maze of intrigue" type game, use as many Bad Guys as you can realistically keep track of. Keep in mind that if you use more than about five factions, you're probably using more than your players can keep track of. So, given that the schtick is Secret Space Travel, whom among our Usual Unusual Suspects can we tap for this campaign frame?

- Well, we began with the Tibetans, back in umpty-thousand B.C. (In the Bayan Kara Shan mountain region of culturally-nearby Mongolia, there's roughly 10,000 year-old cave paintings showing, if you look at them right, the Dropa tribe's extraterrestrial origins.) The original descendants of the Ancient Astronauts could still be there, lurking up on the mountains as the Yeti (or, in the now horribly appropriate Tibetan, "mi-go"). Or, perhaps, their Timeless Wisdom survives in various isolated lamaseries or in the caverns of Agartha.
- The "eastern branch" filters through the traditional Shaolin monasteries, triads, and tongs of China, but it might make for an interesting variant if its current incarnation (or those studying it) are the Japanese [Black Ocean Society](#). In this version of the truth, the "Black Ocean" is, in fact, the "ocean of space," and the Japanese invasions and incursions into continental Asia may have been impelled by a need for orichalcum, ancient wisdom, surviving artifacts, and so forth.
- The "western branch" of the Ur-Tibetan (or Agarthan, or "Uighur" as Col. Churchward of Mu would put it) colonists, of course, built the Sphinx and Pyramids back when Egypt was a wettish grassland. After the Sirian bombardment, they scattered over the ancient Near East, building ziggurats and founding religions and crafting peculiar ancient technology. Their descendants passed the Secret Wisdom of Space Travel down from the Egyptians to the Hebrews (Arks and Temples and miracles, oh my!) and Pythagoras. The Hermetics of Alexandria concealed the Secret behind alchemy: changing lead into gold is a metaphor for training orichalcum-wielding space pilots. Initiatory Mithraism (and all the other quasi-Gnostic religions and traditions of "ascent through the spheres") contain fragments of this wisdom, too. Is there a surviving Middle Eastern tradition, perhaps on Mount Ararat, or in the region of [Irem](#)?
- The Templars, of course, learned the Secret during the Crusades, from Solomon's Temple, and while deep in the Egyptian and Moabite deserts. (Discovering a flying saucer emblazoned with a Templar Cross -- during an archaeological dig in the Golan Heights, or stored deep in the vaults of Chartres Cathedral -- will make a great "sense of secret wonder" moment.) Their descendants, the Illuminati, still carry on the research through their

pawns, the (check all that apply) British royal family, Nazi Party, American military-industrial complex, Communist Party, etc. The Secret can be re-discovered, or passed down continuously, or bitterly fought over by Illuminati sub-factions, at GM whim.

- For our fifth potential group, consider some outlier: the builders of Angkor Wat, or the Anasazi Indians, or a lost tribe deep in the South American jungle, or the descendants of 5th-century Irish travelers to New England (who learned it from Pythagoras' sojourn amongst the Druids). Whichever lucky culture your feel like cribbing out of Erich von Däniken (or W. Raymond Drake's vast panoplies in *Gods and Spacemen of the Ancient East* and *Gods and Spacemen of the Ancient West*) can be dragooned in here at need or will.

"[T]he mere fact of insisting on a secret history calls into question our whole construct of history as a rational object. In that sense, historical thinking becomes more postmodern and imaginative, perhaps hopelessly so -- we are forced to recognize that there are a multitude of stories or histories that provide context, and that each one gives us a fragmented perspective on what is going on."
-- Erik Davis, April 1997 interview

Which Secret Space Travelers you pick, and how many, will likely affect your theme. As noted above, the simpler and more straightforward the campaign, the fewer the Bad Guys. A space-operatic approach lends itself well to one Good But Feeble set of Secret Space Travelers (the remnants of the Victorian-era Lucretius Club, one lone lamasery on the slopes of Mt. Everest; a Navajo pueblo near Roswell retaining the Anasazi secrets) and one Powerful And Evil batch (the Japanese Mitsuru conglomerate descended from the Black Ocean, the CIA-Nazi-NASA combine that whacked Kennedy for uncovering the truth about UFOs, creepy Egyptian magicians made immortal and driven insane by overuse of orichalcum). A more *X-Files* influenced game might combine the Usual Suspects (the Chinese government, the U.S. government, the secret Soviet project now up for grabs) with a wild card (the Vatican, which got it from Leonardo's secret notebooks or from Italian Freemasons) or two (a mysterious billionaire who dug up a spaceship on his estate in New York) for extra confusion.

You can play it with a lighter tone, too. For a classic **GURPS Atomic Horror** game, the Nazis, Egyptians, and Tibetans work with the campy thriller mode; for a redirected martial-arts thriller ("Orichalcum Fists Of Heaven!"), it's all Eastern Wisdom and rival triads (plus the token treacherous Japanese or Westerners) fight over it in 1920s Shanghai. Moving the setting back and forth through history gives natural framing stories: in a WWII game, for example, our OSS/SOE heroes obviously have to uncover ancient Egyptian space travel secrets to defeat the Interplanetary Axis!

"The crucial and delicate matter of getting the characters off the earth must be very carefully managed. Indeed, it probably forms the greatest single problem of the story."
-- H.P. Lovecraft, "Some Notes on Interplanetary Fiction"

So, we've got a backstory, Good Guys (the PCs), NPC Bad Guys (and possibly Medium Guys), and a flavor or theme. So now what? I usually skip this part in conventional Suppressed Transmissions, but I'll dabble in it briefly now: the plot of a Secret History game (or any game of secrets and revelations, whether it's conspiratorial horror or magical quest) is a series of three-act layers of the Big Onion. First act, present the mystery. ("Why did Sir Charles leave me this corroded chunk of brass and his membership in a Florida fishing lodge?") Second act, present the revelation. ("You mean to tell me that a group of British millionaires built a UFO base in the Everglades in 1856?") Third act, resolve the conflict. ("Thanks to our Tibetan contacts, we were able to defeat the fiendish plot of the New Atlantis Society.") To extend the game, either encompass mini-games within it (hints lead to Tibet, PCs discover Tibetan spacecraft, they convince the lamasery to aid them), repeat the story again ("You'll think me mad, but I believe that villain Lord Arthur may have survived that collapsing pyramid shaft."), go sideways (players explore the role of the CIA in Tibet and the UFO phenomenon), or go deeper ("The New Atlantis Society was just a pawn in the greater games of Egyptian Freemasonry!") into the Onion.

"To ignore that level of activity, to deny its energies and events because they do not follow the rules, is to ignore so much of what was going on at the time and all the time. At the same time, the minute you have an idee fixe, you are sucked into a black hole and may never return. This is the tragedy of secret historians. To use a played-out metaphor, the trick is to constantly surf the edges of these various conspiratorial attractors while always staying on edge, and

remembering that there is always another story behind the story you think you are seeing. It becomes a simultaneously paranoid but anarchistic critical method of telling stories that situate us in different kinds of webworks of forces."
-- Erik Davis, April 1997 interview

[Bisociating](#) Secret Space Travel is easy. First, there's the open question of the first Ancient Astronauts: were they humans, human-appearing aliens, or alien geneticists? (Or, did alien geneticists build humans on Sirius, fight a war with them, create an "infiltration race" and then export the whole problem to Earth?) Are the ancient astronauts still Walking Among Us, immortal, or did they all die in the Pole Shift? In a "house of mirrors" style campaign, simply holding off on deciding which side is Good or Bad can give that bisociative frisson we crave, and makes an excellent twist if that third act seems too predictable. Is orichalcum-control pseudoscience or technomagic? Discovering more examples of either could answer the question, or simply cloud the issue. To [nova](#) the campaign, simply reverse a key assumption. If the Nazi Mars colony nukes Tel Aviv (or Miami), or if the Sirians return, it's not a Secret anymore, and the game takes on a new dimension as all the groups the PCs never found out about get flushed into the open. If dinosaurs actually roam the jungles of Venus, it's not Space, even (or especially) if Mars stays its old dead self. The PCs now have to figure out who built Venus, and why, and who covered it up, and why. And if the flying saucers are actually astral-projection chambers (or magical pentacles) after all, it's not Travel. Which should bring up the question: who went to all this trouble to convince us it was? And what exactly are They hiding on Mars?

Dork Tower!

Dork Tower!

?

by Richard Flanagan

Art colored by Keith Johnson

And John calling unto him two of his disciples sent them to Jesus, saying, Art thou he that should come? or look we for another?
-- Luke 7:19

It is a weapon cast in fear and forged in nightmare.

The very few who have heard of its existence do not speak openly of it. If the rumors are true and this blade exists then it not only casts the darkest illumination on the beliefs of both Heaven and Hell, but it also means that a monstrous force of malice stalks the faithful on Earth in its two thousand year old quest for vengeance.

It is the Sword of the Baptizer.

The Facts

The first known record of the Sword of the Baptizer comes from 317 AD, from a scribe of Constantine the Great. After issuing the Edict of Milan four years earlier, which was the foundation of the Roman Empire's embrace of Christianity, Constantine began to amass a collection of every holy relic which could be found. Among those assembled were apparently the Spear of Destiny (the lance which pierced Christ's side), the cloth which would come to be known as the Shroud of Turin, twelve of the thirty pieces of silver paid to Judas for his betrayal of Christ at Gethsemane, and a sword which was believed to have once belonged to John the Baptist. Constantine took the sword as his own, during which time his was described as "quite unlike himself, in virtue and demeanor," and within a fortnight his behavior was "diabolical." The sword was taken from him and he soon returned to normal.

After being taken from Constantine, the whereabouts of the sword were unknown until the early Thirteenth Century. When the Knights Templar raided Constantinople in 1204, a number of relics were taken, among them the Sword of the Baptizer. The sword came into the possession of a Crusader named Iason of Yorkshire, later known as Iason the Black and the Devil Knight of Yorkshire. Iason left the Crusades and returned to England. Once there tales of his being in league with the Devil grew quickly. He was accused of heresy, murder, and other "behaviours most blasphemous," at which point he fled England and returned to the European continent. He was last seen near the Black Forest in Germany. The Sword of the Baptizer was still in his possession.

Centuries passed with no mention of the Sword. Towards the end of the Nineteenth century the Sword began appearing in reports from various sources in Eastern Europe. It was passed from owner to owner until finally falling into the clutches of the Third Reich. Once the war was over the Sword again disappeared, although it is believed to have been brought to the United States.

The Sword

A great deal of the mystery surrounding the Sword of the Baptizer is due to that fact that very few descriptions of the weapon describe it in the same way. Various reports have stated that it is a longsword, a gladius, a broadsword, or a kopesh. This fact splits those who have heard of the sword into two differing schools of opinion; one that the sword can manifest itself into whatever form the owner finds most pleasing, and the other that the sword is merely a rumor, and these inconsistencies are the proof. The tales do agree of a few details, however. First, the metal of the blade has taken on a rusty hue, although no sign of wear can be found. In fact, all the tales agree that the metal of the blade is unmarred, and furthermore than no amount of abuse can even scratch it. Finally, the hilt of the blade is wrapped in a deeply tanned leather which is said to be the skin of John the Baptist.

The Rumors

Central to every tale concerning the Sword is its relationship to John the Baptist. However, that the sword was merely one of his possessions does not seem to explain the malevolent behavior associated with those whom claim the sword as theirs. There are some scholars and mystics who have presented a second, much darker explanation for the sword's origin.

Shortly before his death, as told in the Gospel of Luke, John sent two messengers to ask Jesus if he was, in fact, the Messiah, or if there was one yet to come who would assume that role. According to some, this inquiry shows a direct lack of John's faith in Jesus as Christ. It was a lack of faith which followed John through his imprisonment by Herod and his eventual beheading. It is supposed that John's faithlessness turned to rage at being put to death while a false messiah wandered free. At the moment of his beheading, his shade was neither raised to Heaven nor cast into Perdition, but was anchored directly to the weapon which ended his life. Now, those who own the sword are possessed

by the enraged spirit of John the Baptist, who even in death wages war on the faithful of a callused god who let him perish.

The Curse

While the exact cause of the dementia which grips the owner of the Sword can only be speculated, certain facets of their condition remain consistent. The possessor's nature becomes very grave and surly almost immediately. He will keep the Sword by him, as close as possible at all times, going through great length if need be to do so. An absolute rejection of all religious beliefs will become readily apparent. He will tend to speak in other languages intermittently, chiefly Latin, ancient Greek and ancient Hebrew. The owner's palms will eventually become darkened and callused, and a faint scent of cooked meat will hang in the air about him. Most notably, however, will be changes in the owners dietary habits; he will dine solely on honey and locusts.

The victims of the Sword have also traditionally had many traits in common. Firstly, and most importantly, they are always devout in their religious beliefs, and all follow one of the Abrahamic religions (Judaism, Christianity and Islam). Every known victim of the Sword has been found beheaded, although there is never a loss of blood from the body. This is because the wound inflicted by the weapon cauterizes immediately due to incredible heat.

The Mechanics

The statistics for the Sword of the Baptizer are presented for use with *In Nomine*. What is provided are only suggested abilities, also they are left purposely incomplete so that the Game Master may flesh them out as best suits his whims.

The Sword of the Baptizer

Power +6   Accuracy +3   Reliquary/6

When used against someone of deep religious conviction (as noted above) or exceptional faith (including angels, Soldiers and Saints), the sword will glow white hot. This heat causes an additional +4 to damage (for a total Power of +10). Any wound inflicted by the Sword while in this state will burn closed instantly, leaving a deep and permanent scar.

The Spirit of the Sword

Corporeal -- 4 Strength 10   Agility 7
Ethereal -- 5 Intelligence 10 Precision 10
Celestial -- 5 Will 11   Perception 10

Skills: Dodge/4, Fighting/5, Large Weapon (Sword (any type))/6, Small Weapon (Short sword)/6
Songs: Form (Ethereal/6), Motion (Corporeal/5), Possession/6, Tongues (Corporeal/3)

The Spirit is a Ghost as described in the *Corporeal Player's Guide* (p. 82). The Spirit itself is attuned to the Sword; it uses the Song of Possession to control the owner of the Sword.

The Hooks

There are a number of ways to incorporate the Sword of the Baptizer into a game. These include:

- One of the more militant Archangels (in particular Dominic or Laurence, because of their affinity for Christianity) see the existence of the Sword to be disturbing and potentially dangerous to many widely held beliefs. Their Servitors are assigned to find the Sword (or discover if it indeed exists), and destroy it with

extreme prejudice.

- Many Princes view the potentiality of a weapon with such strong ties to the core of Christian belief problematic. While the sword itself might be a tool for Evil, the foundation of every myth concerning the Sword harkens back to the tales of John the Baptist, and on a larger scale Jesus and the entirety of Christianity, which the propaganda machines of The Game have long sought to crush in Hell. Despite its dark nature, if it exists the Sword needs to be eliminated.
- On the other hand, certain Princes, such as Malphas, would simply adore to obtain the Sword for his own dire purposes . . .
- A series of murders all begin to point to a serial killer targeting openly religious figures in town (noted preachers, reverends, or maybe just older women known to do charity work for the Church). Of course, the victims are always found beheaded, their wounds neatly seared shut. A little investigation reveals a local antiques collector recently acquired a sword dating back to Biblical times.

While the Sword works well as a foil for the characters, it should never be allowed to stay in a character's possession. Besides being extremely powerful and guaranteed to upset game balance, the owner of the weapon would soon succumb to the Spirit and eventually need to be relinquished to the Game Master as an NPC.

Of all the categories of syker powers in Pinnacle's ***Hell on Earth***, Pyrokinesis is the one that has the least creative selection of powers. While other categories allow you to boost natural body functions, rip a man's heart out, or control his mind those specializing in Pyrokinesis are limited to starting fires, blowing things up, and not being hurt by fire. According to page nine of the syker sourcebook ***Brainburners***, Pyrokinesis covers "the mental manipulation and creation of fire, flame, and heat," and the following five powers show you what a creative pyrokinetic can do under those guidelines. It goes without saying that all of the powers listed here fall under the category of Pyrokinesis.

Firebomb

TN: See Chart
Strain: See Chart
Speed: 3
Duration: up to 5 minutes/Blastin' level
Range: Touch

Firebomb was created by sykers to create diversions while on missions. By touching an inanimate object and concentrating a syker can add energy to the object, exciting its molecules and eventually causing the object to catch fire. Unlike similar powers such as Arson, the object does not immediately explode, instead catching fire at a point in time decided upon by the syker, up to five minutes in the future per level of Blastin' the syker possesses; so a character with four levels in Blastin' could cause an object to burst into flames up to twenty minutes after he invoked this power. The TN is based on how flammable the item normally is, with the following chart giving some examples.

Item	TN
3	gasoline, napalm
5	wood, paper
7	damp wood
9	bullets, explosives
11	titanium

Heat Distortion

TN: 7
Strain: 1
Speed: 2
Duration: Concentration or 1/round
Range: 5 yards/Blastin' level

Anybody who's spent any amount of time in a desert has seen heat distortion, the blurring of vision caused by heat radiating off the ground between yourself and the object you are looking at. Sykers have figured out how to create this effect on demand. Heat Distortion allows a syker to create a wall of superheated air anywhere in range, affecting an area 2' x 1" x 6' per level in Blastin'. Anyone looking through the superheated air has their vision blurred, resulting in all ranged attacks through the affected area having a -2 penalty to the appropriate Trait or Attribute roll, with an additional -2 for each raise the syker gets. Those foolish enough to run through the area of superheated air suffer 1d4 Wind +1d4 for every raise the syker had.

Heatstroke

TN: Opposed (Spirit)
Strain: 1
Speed: 1
Duration: Instant
Range: 10 yards/Blastin' level

Pyrokinetic sykers have a bit of a problem when it comes to the subtlety department, as use of Arson, Detonate, or Pyro tends to draw the attention of others. They needed a power that would allow them to quickly take out an opponent without attracting attention or destroying their surroundings. What they came up with was Heatstroke.

Heatstroke allows a syker to generate an extreme amount of heat in a person's body, sending them into shock. If the syker succeeds in his opposed Blastin' roll, his victim suffers 1d6 Wind, +1d6 Wind for every raise.

Hot Zone

TN: 5
Strain: 1
Speed: 1
Duration: Instant
Range: 5 yard radius/ Blastin' Level

Hot Zone was developed by Earth sykers during the Last War who were tired of soldiers and robots using infrared sensors to hunt them down, especially since robots were immune to the syker power Blindside. Hot Zone instantly raises the temperature of the air around the syker to nearly unbearable levels for one second (inflicting 1d4 Wind on all in the area of effect, including the syker), with anyone looking at the area of effect with infrared sensors seeing a flash of light as bright as if a lit magnesium flare was shoved into their face. In game terms this results in a -6 penalty to all rolls done by those using infrared, with an additional -4 to all ranged attacks they make. This lasts for ten minutes, -2 minutes for each success and raise the victim makes on a Hard (9) Vigor roll.

Too Hot to Handle

TN: 5
Strain: 1
Speed: 2
Duration: 1/round
Range: Self

Too Hot to Handle is a pyrokinetic's equalizer when it comes to hand-to-hand combat, allowing a syker to excite the molecules of his body so they heat to the point that anyone touching (or is touched by) the syker is burned. With a successful Blastin' roll a syker using Too Hot to Handle does +2 damage on each successful Fightin: brawlin', wrasslin', or other unarmed form of attack, with an additional +2 damage for each raise on his Blastin' roll. Anyone attacking the syker with a fist, kick or (in the case of abomination) claw takes 1d4 damage from the heat, +1d4 for each raise the syker got on his Blastin' roll. Creatures unaffected by fire and/or heat take no damage from Too Hot to

Handle.

Note that while a syker takes no damage from using his power occasionally his clothing and equipment ends up a bit singed. If a syker goes bust on his Blastin' roll while invoking Too Hot to Handle he sets an item he is carrying on fire. Hope he didn't have any spook juice on him . . .

Pyramid Review

Panzer Grenadier

Published by [Avalanche Press](#)

Wargame boxed set with 495 2/3 inch Counters, four 11x17 inch hard mounted polymorphic maps, Rules Booklet; $59.95

Panzer Grenadier is a platoon level combat game set on the Eastern Front during the Second World War. The box includes 4 geomporphic mounted gameboards (200 meters a hex), 330 playing pieces (2/3 inch), 165 markers, a 16 page rulebook, a 64 page scenario book (51 scenarios), 4 cardstock charts, and an errata insert. The game is designed to be simple, without being simplistic.

West End Games released a series of *Tank Leader* games in the eighties, which were also platoon level simulations set on the Eastern, Western, and the deserts of Africa respectively. This game used an innovative card mechanic for activation of various units, which really served to show how the Germans were able to win versus superior forces, using superior equipment. The Germans had an essential flexibility which the Soviets lacked. *Panzer Grenadier* is also able to showcase this superior flexibility of the Germans, versus the material superiority of the Soviets. *Panzer Grenadier* uses leaders to determine the activation and movement of its units. The Soviets have much fewer leaders than the Germans; therefore they tend to bunch up, and they lack an essential flexibility. When they are able to concentrate their force they can be devastating, but if they are disrupted, then there is hell to be paid.

Squad Leader was one of the first games to really focus upon the morale of units in combat situations. It wasn't necessary for units to be physically destroyed if you could break their morale. *Panzer Grenadier* also uses morale as a factor in combat. This, too, increases the value of leaders, since they give bonuses to units attempting to rally. This can give the game a curious ebb and flow as units are demoralized, and attempt to rally -- does the opponent fire at these units again seeking to eliminate them, or focus attention elsewhere? The sheer breadth of decision-making is enormous within this game, and each decision can have consequences down the road.

This game shares a heritage from other games that have come before, but is there anything especially innovative about this game? Well, *Panzer Grenadier* isn't merely content to steal from the best and brightest, but has a few tricks up its own sleeve. Most notable is how initiative is determined each turn. Each player rolls two dice, with the result being modified by an initiative factor given in the individual scenario . . . the higher result wins initiative. The lower result is then subtracted from the higher result, divided by two, and this is the number of extra action phases the winning player receives before the other player can receive an action phase. The players then take turns going back and forth with their action phase until both pass, then a new turn starts. In each action phase a leader, or a stack of units, may activate units in the same or adjacent hexes may move or fire. These units are then finished acting for the turn. You could launch a huge assault, only to have the other player chip away at it piecemeal, phase by phase, later in the turn. Keeping an operational reserve is a necessity with this game. Just one simple activation mechanic results in Russians bunching up, and being more vulnerable to artillery fire. It also results in German units being able to surprise and disrupt Russian moves more often.

This game strips away a lot of the plaque that has built up around platoon level combat. This is a game where you can have a huge mass of counters, and still have some shot at finishing the scenario. Smaller engagements tend to be a bit more brutal, while there is a magnificent ebb and flow in larger encounters. As a player your objective might have been to secure a town at the start of the scenario, but you may have to take units away from the town to secure your flank, or you might lose initiative and simply have to fight for survival for a turn, while leaving larger objectives alone.

I would have liked having maps that were a bit more interesting. They might be accurate historically, and geographically, for the Eastern Front, but they are boring. There is also a FAQ on the Avalanche Games website,

which helps with some of the questions that arise within the rules. This is not to say that they are badly written, but this game puts things together slightly differently than other games that have gone before, and it takes some time to see how it all works together.

Overall this game gives you a lot of bang for the buck. It hides its complexity well, which makes it easy to teach. New players are not frustrated by the system, but enamored of the possibilities that the battlefield presents. The large number of counters, maps, and rules for design you own scenarios give this game an extended playability that is welcome. In all, ***Panzer Grenadier*** is well worth the money I spent on it.

Sketch! RPG

Published by [Corsair Publishing](#)

Written by Seth Johnson and Brian Schomburg

48 pages; $6.95

Sketch! is a breath of fresh air in the superhero roleplaying game market. Unlike most superhero roleplaying games, which attempt to quantify each aspect of a character's powers, *Sketch!* has a lightweight system which aids in the authors' stated goal of bringing new players into the adventure games hobby.

The world of *Sketch!* bears little resemblance to our own: a cartoonish world in the center "of all explored space," the planet Sketch is a tourist mecca and headquarters for over ninety percent of the universe's media and business conglomerates. In other words, it's a perfect place for a hero (or villain) looking for fame to test their meddle.

Sketch! has a unique character creation system -- players generate characters by drawing them. There are no real restrictions on genre, equipment, or, luckily, drawing ability. (Some of the character art is attributed to "Dan Zigmund and Sherri Johnson's Second Grade Class, South Grove Elementary.") For those who fiercely believe they can't be trusted to draw, *Sketch!* provides an appendix of modular comic book art clips that can be cut and pasted on to a stick figure.

Once you've drawn your character and given it a name, players pass the characters around the table, where everyone votes on your character's statistics on a scale of 1 to 10: Speed, Muscle, Power, Gear, Mind, and Toughness. Take the average of your votes, and you've got a complete character for *Sketch!* (A slightly expanded character creation system later in the game allows for non-combat Skills, Money, and special privileges called Perks.)

The second chapter of *Sketch!* (right after character creation) is a simple game, designed for people who have not played a roleplaying game before, or are just picking up *Sketch!* and want a rude throw-down. The basic game starts in media res with a battle between heroes and villains. (The game provides for players to play both sides, or the GM can take the role of one side.) Combat ensues, with the following basics.

All rolls in *Sketch!* are done on six-sided dice. Characters begin combat by rolling for initiative (modified by Speed). In order, they take movement and actions. All non-combat actions are tested by a roll of 2d6 + the appropriate attribute versus a difficulty number, with the average being 12. In the case of an attack, the attacker rolls 2d6 + an appropriate attribute and the defender does the same. This allows for a range of options. For example, Timmy Lightning might use his Gear attribute to use his Lightning Blasto!, while Mental Mary uses Mind to throw up her Brain Bricks. If the attacker succeeds, the defender takes the difference between the two rolls in damage to her Toughness. A character with 0 or below Toughness drops unconscious for 1d6 rounds, at which point they wake up with only 1 point of Toughness.

This simple combat system allows for comic-book style combat, with low lethality, but lots of over-the-top action. All combats are followed with a press conference, an opportunity for Costumes (as both heroes and villains are called in *Sketch!*) to ham it up, and boost their Popularity Points, the main source of advancement in *Sketch!* The more Popularity Points a Costume earns, the more they can get away with changing their media identify (increasing their

attributes). A unique addition to this system -- as opposed to experience points -- is the ability to lose popularity in a hurry, forcing the character to return "back-to-basics" and lose those changes (bonuses) in a hurry.

The third chapter of *Sketch!* details the Expanded Game, a more traditional roleplaying game that moves past Saturday night brawls to an entire *Sketch!* campaign. This includes the advanced character creation; the only addition is that character can now buy non-combat skills, extra money, and special perks. These skills aren't rated, but give the character bonus dice to roll when performing a feat relevant to the skill. Perks give the character standard (and not-so-standard) superhero bonuses: media agents, a base of operations, connections, independent wealth, and insurance (for those nasty property damage bills that are bound to come in when slugging it out in the streets). The expanded game gives a few notes on gamemastering and how to run a campaign -- nothing the average gamer won't know, but useful information for the neophyte. The chapter is concluded with a lightweight story-based experience system for purchasing more and new skills and perks, and a small bit on character death (it's rare, and completely voluntary).

As a final chapter, *Sketch!* concludes with a travel guide to the planet Sketch, which consists mainly of "create anything you possibly want to," with a short bit about the largest city, Sketchopolis. The chapter concludes with the "Sketch Adventure Generator," a set of random tables full of words to plug into a sentence, much like "Mad Libs." It's actually pretty entertaining, and provides amusing, if not altogether good, ideas for adventures.

On the whole, does *Sketch!* meet its goal of being an introductory roleplaying game for beginners? Certainly; the game is definitely not too complex to be a beginning roleplaying game for someone, and the comic book format it is presented in is inviting enough not to frighten away parents, or carry too much of a "roleplaying stigma." (I actually couldn't find the word "roleplaying" anywhere within the book: it used "storytelling" and "adventure game" instead.) Would I recommend it to experienced players? Definitely; at the least, it's a fun diversionary beer-and-pretzels game, and at the most, it can provide for an interesting campaign for a not-so-serious group of players. My only complaint is that after playing *Sketch!*, beginning players may be turned off by the amount of restrictions and point-counting in more mainstream roleplaying games.

Pyramid Review

Galaxy: The Dark Ages

Published by GMT Games

Created by Don Greenwood and Reiner Knizia

Boxed card game with 120 cards, 25 chips, four combat dice, and a plastic draw/discard tray; $25.00

Galaxy: The Dark Ages from GMT Games is a strategy card game for two to five players that plays in just over an hour. A descendant of *Titan: The Arena*, *Galaxy* depicts a power struggle between the players for influence among the eight worlds. Designed by Reiner Knizia (*Tigris & Euphrates*, *Modern Art*) and developed by Don Greenwood (*Up Front*, *Squad Leader*), *Galaxy* shows both European and Avalon Hill influences and makes an excellent game for hobby gamers and regular folk alike.

The game starts with the eight world cards in a row, heading eight columns. Players do not play individual worlds; they are behind the scenes manipulators -- galactic illuminati, if you will. Players have five bases which they place during the game onto one world or another, representing influence in the different worlds. You can place one base per turn, and bases played earlier in the game give more influence than those placed later. Of course, since one world is eliminated in each of the five rounds, bases placed early in the game may disappear with their world. Bases can be "improved" or "damaged" (moving them up and down the columns and increasing or decreasing their influence and score) during play.

Each player begins with eight cards, nearly all representing ships with strengths of zero through ten belonging to the eight worlds. Each turn you place a ship in the column of its parent planet. When all columns have a ship in the current row the planet defended by the lowest strength defender is removed.

Players may place one secret base, in the first round, which sits on a face down card played in front of them. They get no influence from it during the game, but neither can it be attacked. At the end of the game it scores as the highest level of influence, if its world survives. Players can reveal it during a later turn in place of placing a base, in which case it's placed at the highest influence level.

The weaker ships, strengths 0-5, all have special effects when placed: allowing you to improve one of your bases or damage someone else's, pick up an extra card, see some of another player's hand, or put someone else's cards in their reserve. Each of the eight worlds also has a special power that can be used by the world's governor when they place a card in that column. The governor, of course, is the person with the most visible influence in that world. There are also technology cards, which give you an extra power, such as revealing secret bases, an advantage in combat, or allowing an extra card draw. Technological advantages are fleeting, however: they disappear at the end of the round.

Play takes from an hour to an hour and a half. A couple games' worth of experience speeds things up. When faced with several problems and no good plays, the novice tends to stare at his cards, looking for an answer; but experience quickly teaches you to play a delaying move if you have one, and draw, hoping the next turn will give you better options.

The artwork is spectacular. Each class of ship, each alien race, each technology card is rendered in full color at a very high resolution. You will catch your opponents simply staring at the cards. GMT rules are usually very easy to learn from, but a few sections will have loose wording that can cause interpretation problems during the game. *Galaxy* is the opposite: the rules are very precisely worded, with procedures and options unambiguously laid out, but they are difficult to pick up on the first read through. An index or table of contents would have been a big help. It's fairly easy when explaining the game to new players to forget Spoils of War or some other important detail. Luckily, the somewhat involved turn sequence is spelled out on the back cover.

Play has several intriguing facets: as worlds disappear, the rounds move more quickly. Play is fairly constrained; your eight cards may give you only six plays, half of which are to your disadvantage. You must make the most of what you have. Player interaction is very strong; it's easy to hurt other players, and you often find yourself cooperating with another player to defend a world valuable to both of you, yet trying to smite each other on other worlds.

At ninety minutes, play is relatively short for a strategy game, and it's good and tense throughout. Barring exceptional bad luck, all players should be in the running until the last round. Since secret bases on a surviving world are worth five points, and those on an eliminated world are worth nothing, the final score may surprise everyone. One drawback to play is that as the worlds disappear, more and more cards are unplayable, until in the final round only 44% of the cards can be played. Thus just when the game gets dramatic, players have to discard and draw, each in turn, hoping to be the first to draw a playable card. If you were clever enough to save playable cards for this you can control the endgame; otherwise it can feel anticlimactic. But in all *Galaxy* a solid game.

A few tips: the governor of the Cylor has a large advantage in card flow in the endgame -- either make yourself the governor of the Cylor or shut that world down early. The Myrmidons can force you to use your draw to pick up your reserve; don't make the governor of that world mad at you. The most powerful use of the Divergence power of playing two ships in a turn is probably ending a round early by filling the last two empty places. Saving your bases for play later in the game to improve their chances of surviving to the end may seem attractive, but you end up with bases worth one or two points instead of three or four, so get your bases down early and fight for them!

-- C. Andrew Walters

by Stephen Dedman

Art by **ArtToday**

For this adventure, the GM will need the *GURPS Basic Set*, *GURPS Compendium I* and *II*, and *GURPS Old West 2nd Edition*; *GURPS Voodoo* and *GURPS Undead* may also be useful. The adventure is designed for 100-point Old West characters, but can easily be adapted for a cinematic campaign or for *GURPS Deadlands*.

The adventure is set in the 1870s, when there was a thriving black market in nitroglycerine, and can be part of an episodic or picaresque campaign. PCs may be any combination of character types that can reasonably travel and work together and are motivated by a desire for wealth and/or excitement. It is designed for a campaign where ritual magic works; GMs who prefer a realistic no-magic campaign may ignore the effects of magic or explain them away with natural causes, and a choice of supernatural or realistic endings is provided.

Fair Game

The adventure begins when the PCs encounter a small band of proud but non-hostile Comanches with food and hides to trade. The PCs may be townspeople, cowboys on a drive, hunters, 'rust-eaters,' explorers, settlers en route to farmland or prospectors headed for a boomtown, even soldiers at a fort . . . the important thing is that they should have something the Comanches want, and be hungry for fresh food and/or the money that can be made from furs.

Only one of the Comanches, Bigger Bear, speaks any English, and if none of the PCs speak Comanche, Bigger Bear will act as interpreter. After a little haggling over prices, Bigger Bear will suggest gambling for some items instead.

The competitions proposed by the Comanches are:

1. *A foot race*, for up to four competitors from each side. After some haggling, a distance of 400 yards is agreed upon. (Broken Lance, the fastest runner in the Comanches, has a running speed of 8.25 without a sprint bonus.) The start of the race is a Contest of Running skill (+2 for characters with Combat Reflexes); each point by which the winner wins gives him a 6" lead.
2. *Rifle-shooting*. The target is a piece of paper the size of a playing card, at 100 yards (-17 to hit). Each competitor is permitted one shot after bets are placed; those who hit it can compete in the next round, when the target is moved to 200 yards away (-19), and so on, as the target is moved back 100 yards each time until only one competitor remains.
3. *Horse-racing*. This is as much a test of nerve and skill as of speed. The racers (two at a time) hurtle towards a horizontal bar 100 yards away, high enough for the horse to pass underneath it, but low enough to knock a rider

from his seat. The winner is the first to touch the bar. Competitors must first roll on Will not to stop too soon, then a contest of Riding skill to see who stops nearest the bar; a competitor who fails to make his Riding roll by 3 or more will crash into the bar and be knocked from his mount, taking 2d-8 cr. damage. The Comanches will ride their ponies bareback and naked, to reduce their encumbrance, and will try to persuade the whites to do the same. The Comanches' best rider, Bitten by Cats, has a pony with Move-14. The start of the race is a Contest of Riding skill (+2 for characters with Combat Reflexes); each point by which the winner wins gives him a 1' lead.

4. *Archery*. More a competition of Fast-Draw (Arrow) than of accuracy; archers must fire as many arrows into the air as they can before the first one lands. Each competitor has ST turns to shoot with a short bow; if the first shot 'missed', subtract 1 turn for every point by which they missed. (The Comanches will not be expecting whites to compete at this, but will bet heavily on their own archers if any PC comes forth.)

The PCs are free to suggest other forms of competition, such as contests of ST, knife or tomahawk throwing, or even card games such as poker or monte (games which the Indians took to with enthusiasm, even making their own cards and learning how to cheat. Indians rarely cheated when playing against their own tribesmen -- but whites and unfriendly tribes were fair game.)

Let the contests and gambling continue as long as the players are interested, then . . .

Is this a dagger I see before me?

While the games are happening, one of the PCs or an NPC on their side will notice the Arkansas toothpick tucked into Broken Lance's breechclout. Carved into the hilt is the inscription 'Mark VIII 24.' A moment later, the character will remember why this is familiar; one of the most vicious killers to ever come west from New Orleans, Lucien Xavier Dimascio, had the trademark of inscribing Biblical quotations onto his weapons and some of his victims. (Identifying Biblical quotations requires either a Bible and the Literacy advantage, or a critical success on Theology. Bible quotations are given at the end of the adventure.)

If Broken Lance can be persuaded to tell where he got the knife, he will say that the knife's owner had killed and scalped a Comanche woman while she'd been gathering food and firewood. The woman's daughter had escaped, and the warriors hunted the man down; Broken Lance had killed and scalped him, then kept his weapons. He'd also taken two books the man had been carrying, and used them for making a shield.

A successful roll against Criminology or Literature (Dime Novels) will enable the PCs to remember more of Dimascio's story.

Roll succeeds by 0-4:	Dimascio came west from New Orleans about ten years ago, and is thought to be guilty of at least twelve murders, all done with knives or axes and adorned with his trademark Biblical quotation, plus an unknown number of scalpings of anyone dark-haired and dark-skinned enough to pass as Apache, and a few shootings in self-defense.
Roll succeeds by 5-9:	Dimascio was a former altar boy and a gifted student of music, languages and theology, whose taste for gambling and women led him to New Orleans's vice districts. After he was accused of murdering two gamblers -- one with a knife, the other with an axe -- he hid for a while, then headed west about ten years ago. There were many sightings of him in that time -- working as a logger, a carpenter, a trapper, a buffalo skinner, a butcher, a saddler and bootmaker, a prospector, a gambler and pianist on riverboats and in saloons, a school-teacher, an actor, even an itinerant preacher. He usually worked alone, because even the West's worst badmen were nervous around him, but is suspected of having masterminded some elaborate confidence tricks and robberies, although none of his loot has ever turned up. It's rumored that Dimascio was the first to give the Apache the idea of making playing cards out of white men's hides. The

price on his head is $1,000, dead or alive.

Dimascio's last victim, a con man suspected of stealing a jewel worth thousands, was found two years ago, an unfired derringer in his hand, knife-wounds to his face, and a note pinned to his embroidered vest.

Critical success:	The con man was named 'Doc' George Fletcher, and he was found dead in a town called Rosary. He and Dimascio were suspected of stealing a star sapphire worth $3000, but the stone was never found. If asked, Broken Lance will say, truthfully, that no jewels were found on Dimascio's body, which was stripped then left for the buzzards to eat.

If it doesn't occur to the PCs that the papers in Broken Lance's shield might reveal the secret of Dimascio's hidden loot, an NPC who overhears the story should be inspired to suggest this -- preferably one too lazy, honest or disabled to undertake such a quest himself.

With Your Shield, or On It

The games with the Comanches should finish without bloodshed, unless a PC is caught cheating or accuses one of the Comanches. If the PCs want the knife, Broken Lance considers it worth a good rifle, but any attempts to persuade him to part with his shield will be unsuccessful. The shield, he says, is enchanted, and anyway, he doesn't have it with him. If Broken Lance has a good or better reaction to a PC, he may (if asked the appropriate question) reveal that the shield has to be kept half a mile from camp for fear that menstruating women will contaminate it, but neither he nor his fellow braves will say any more.

If the PCs decide to search the area around the Comanches' camp for the shield, they will need to do so by stealth. The search, though difficult, should be successful . . . but almost as soon as they've taken the shield, Bigger Bear and Bitten by Cats ride past. If the PCs can't hide from them, or fast-talk their way out of the situation, they'll need to fight -- preferably without gunshots alerting the camp.

If the PCs decide against looking for Broken Lance's shield, then they will have a chance to take it a few days later, when cholera breaks out in the Comanches' camp. The band's medicine man convinces them that the whites have cursed them, and the braves attack the PCs' camp (fort, town, wagon train, Hell on Wheels, etc.) in retaliation. Broken Lance will be killed in the raid, and his damaged shield will be discovered by a PC. Other details of the attack and its aftermath, and the course of the epidemic, are left up to the GM.

Books of Blood

The pages used to stuff Broken Lance's shield come from two sources -- a Catholic Bible, and a diary, both written in Latin. If none of the PCs can read Latin, they should be able to find a translator with a visit to any established town, army fort, or wagon train, and a good or better Reaction Roll (most Catholic priests, lawyers, biologists and doctors will have at least half a point in the language, as would most men taught in an English public school).

The Bible should be easy to identify as such; the incomplete diary is essentially a written confession. If the PCs read the fragments (in the original or translation), they'll learn all of Dimascio's story, above, plus a few details no-one else knows.

Dimascio claims to have killed Fletcher in self-defense, throwing his knife as the con man reached for his pistol. He then gloats about hitting him in the eye, killing him instantly; the other mutilations were post-mortem. Unfortunately, Fletcher was the only one who knew how to find a buyer for the gem, so Dimascio writes, "I left it in his care, to enjoy until I return. Thought, too late, that Luke IV 23 would have been as apt a quotation, but alas, I can hardly kill him twice."

Sleeping Rough

Every night after the PCs open Broken Lance's shield, make a Will roll for each PC. Those who fail will suffer brief but intense nightmares of being attacked or tortured by Comanches (alive or dead), or pursued and eaten by wolves. PCs who already have the Nightmares disadvantage will automatically fail their Will rolls. The dreams require a Fright Check at -2, with a further -1 for every consecutive night.

As well as the nightmares, PCs will also be plagued by unseasonably bad weather -- lightning will hit nearby trees, rain will halve their travel speed (see sidebar, p. B187) -- and the faint but unmistakable sound of wolves howling in the distance at night.

After a few nights of this, a raiding party of Comanches will attempt to steal the PCs horses and weapons. At about 2 a.m., the shaman casts a Slumber spell over the PCs' camp and Obscurity over the raiding party. The Comanches will creep towards the camp, on foot, until they are within 100 yards. If any sentries are awake, the Comanches will try to kill him silently with their short bows. If the camp is alerted, they will retreat stealthily rather than attack.

If no-one is awake when the Comanches arrive, the raiders will steal every animal from the camp, every weapon that is not concealed, all food, and anything else that seems worth taking, but leave the sleeping PCs unharmed.

The PCs will then face the prospect of a 50-mile trek across average terrain to Morrow, or attempting to track the Comanches to recover their gear. After the first day, heavy rain (natural or summoned by the shaman) will slow travel and make the Comanches' tracks even harder to find. Whichever way they go, the PCs will encounter the Comanches again at an opportune moment to rescue Brother Lee and Lupita.

Fire Water

The PCs' introduction to Lee will be the sound of gunfire roughly 400 yards away (a Hearing roll will identify the guns and the approximate distance). The Comanches are circling Lee's jump-seat wagon, and have fired their muskets, wounding Lee in the right arm and torso. Lupita has emptied her shotgun without effect, and is trying to reload. Lee is firing his revolver with his left (off) hand; one Comanche lies dead on the ground. Just as things seem hopeless, Lupita throws a bottle from the back of the wagon; the bottle explodes as it hits the ground, and the Comanches flee.

Brother Lee's wagon is loaded with pint bottles of 'Glastonbury Water,' as well as his and Lupita's personal necessities. Most of the bottles have blue labels, and contain only water; 23 of the remaining bottles, however, contain nitroglycerine, which Lee has smuggled into the U.S. from Mexico and is taking to a mining site to sell.

Lee has a crippled arm and has taken 12 points of damage, plus any damage from bleeding, and will pass out before he can speak to the PCs. Lupita will insist on taking him to Morrow to be tended by the doctor there, and asks the PCs to accompany her, to protect her from any other attack. If her Sex-Appeal skill doesn't persuade them, she'll offer them a share of the profits from selling the nitroglycerine.

Transporting the nitroglycerine will require careful driving; the driver should roll on Teamster skill every four hours of travel. On a critical failure, a bottle will be jarred (see p. OW81), potentially setting off the other bottles. As each bottle does 7dx3 damage, PCs should be allowed some sort of saving throw (such as a DX roll to catch a bottle before it falls) if this happens. The trip should be nerve-racking but non-lethal . . . except for Brother Lee, who will hold out until the wagon reaches Morrow, but die a day later; unless one of the PCs rolls a critical success on Physician, he will never regain consciousness.

When Lee dies, Lupita will try to persuade the PCs to buy the wagon and its cargo or, if they can't or won't reach her minimum price of $5 a bottle (about half the legal price), to accompany her on the trip to Santa Dolores where Lee had arranged to sell it . . . and the shortest route from Salvation to Santa Dolores passes through Rosary.

The Road to Salvation

Morrow is a small town near the Mexican border, built to cater to the farmers and ranchers in the area. Though small with only one street (Front Street), it boasts a newspaper, a well-stocked general store, a doctor, a blacksmith, a livery stable, a photographic studio, a telegraph office, a one-cell jail, two churches (one Catholic, one Baptist), three saloons, and a daily stagecoach service to Salvation, the nearest town to Rosary. A day's research at the newspaper office will reveal that there is a $500 reward offered for the return of the gem that Dimascio stole, which has never been recovered. They will also learn the basic facts about Rosary, 210 miles away.

Badlands: An Adventure for GURPS Old West

Rosary was founded after silver was discovered in the surrounding hills five years ago, and the population quickly grew to about 3,000. Because the surrounding land is so rough (bad terrain for 3d+20 miles in any direction, with a few very bad roads) and the town's population has been declining since it failed in its bid to become the county seat, there is no railway or stage route to Rosary; the nearest stagecoach stop is at Salvation, 33 miles south-south-west.

If the PCs travel from Morrow to Salvation by stagecoach (2 days), the coach will overturn on a bad road a few hours out of Salvation. This requires a Fright Check at -2; damage is 1d-2 for anyone inside the coach, but those seated outside will have to jump free to avoid being crushed under the coach. A successful DX roll will reduce damage to 3d-9 (use Hit Location from a Fall, p. B131); a success on Acrobatics (or default) will reduce damage to zero. A failed DX roll means the character takes 9d crushing damage; a critical failure means that the character is also pinned under the coach, and must be freed before he bleeds to death. The coach is too badly damaged to continue; survivors will have to decide whether to wait 24 hours for the next, or to walk 3d miles along a very bad road in the rain, with wolves howling in the distance. If they wait, Lupita's wagon will pass them 2d+2 hours later.

If the PCs ride horses, walk, or accompany Lupita to Rosary, the main problem will be the slow journey and the nightmares (see *Sleeping Rough*, above), but they may also be bothered by minor mishaps -- flash floods, scorpions in their boots and snakes in their bedrolls, beaver traps and leeches when they cross suddenly swollen rivers, etc.

Salvation

If the PCs pass through Salvation, they will be required to hand their guns over to the sheriff while in town. They will also encounter Old Tom, a grizzled cantankerous ex-prospector.

Old Tom isn't the town drunk, but he's a contender. He will offer to carry the PCs' bags from the stage stop or station to a hotel for the price of a whiskey, he will be mucking out the livery stables if they try to rent some horses, and he will be cadging drinks in any saloon they walk into. When he learns that they're going to Rosary, he'll cackle and mutter, "You'll have a long way to go, stranger, less'n you can ride into last year." He won't say anything more on the subject unless plied with whisky, and as he refuses to drink alone, at least one of the PCs will have to match him whisky for whisky (or fake it somehow) until either Tom or the last PC passes out. Each shot has an Alcohol Rating of 24 (see p. CII162). Don't try this at home.

A successful roll on Interrogation with any drink will get twice as much information out of Tom.

Drinks	Information
1	Most of Rosary was burnt down two winters (about eighteen months) ago.
2	Thirteen people died in the fire, the last to be buried in the cemetery on a hill overlooking the town.

3	A few of the more permanent buildings at one end of town survived, but most folks decided to leave anyway. Most of the silver was gone, and winter was coming. Tom himself had almost given up working his claim by this time, and was making a living as the town's gravedigger.
4	Things had been turning bad in the town since Doc Fletcher was murdered. Tom remembers the incident well; shootings were common in town, and most men there died with their boots on, but he'd never seen a man before who'd been killed with a knife while reaching for his gun. Fletcher was the last person killed in town before the fire, a few weeks later.
5	The locals wanted to string up the man who they thought had killed Fletcher, a gambler named Luce, but he'd disappeared by the time they found the body.
6	Luce was an olive-skinned man with black curly hair, a moustache, and dark deep-set eyes. About six feet tall, dressed in black like a preacher, carried a silver-headed cane, didn't drink hardly at all. (This matches most descriptions of Dimascio.)
7	The fire didn't reach the cemetery -- just as well, too, since all the gravestones were just boards, carved and painted.
8	The last burials were buried near the north end of the graveyard.
9	The only undertaker in Rosary was a coffin-maker and cartwright named Rogan. He told Tom that he couldn't disguise the wounds on Fletcher's face, and gave him a closed casket funeral. The man who pronounced him dead was a horse doctor and blacksmith named Boetsch.
10	Rogan and Boetsch came to Salvation after Rosary was burned down; Rogan works as a carpenter, and has a house next to the Boetsch's smithy.

If Tom tells the PCs everything he knows before passing out, begin the obligatory bar brawl. A cowboy playing poker at the next table turns the table over to reveal a holdout device underneath, containing several cards and a stingy pistol. Being unarmed, the cowboy and his friends grab brawling weapons, as do the townspeople. A billiard ball hurled at one cowboy by a soiled dove hits Old Tom instead, instantly knocking him unconscious. PCs may hide, try to sneak out, or join in.

If the PCs speak to Rogan or Boetsch, and they have a Neutral or better reaction to the PCs, they will confirm what Old Tom has said. On a Good or better reaction, they will also add that apart from the clothes he was buried in, Fletcher's belongings were divided between the saloonkeeper, the town marshal, and Rogan and Boetsch. Rogan kept a few dollars; Boetsch kept his watch and surgical tools; neither saw anything else of value, and neither knows where the marshal or the saloonkeeper went after Rosary burnt down. Boetsch will sell the watch for $5, the black bag for $25; neither contains the gem, nor any useful clues.

Rosary

What the PCs find in Rosary will depend on the nature of the campaign. Only four buildings remain standing: two saloons, a general store (also the bank and post office), and a jail (two cells and an office for the marshal). All have been looted of any valuables, but they may provide useful hiding places for the PCs or their opponents. The cells have 6" stone walls, 1/2" iron bars, and a 2" wooden slab roof; other buildings are of 1" wooden slab.

In a *realistic* campaign, the PCs will find Rosary's cemetery occupied by miners, engineers and guards. A mining baron has learned that the hill beneath the cemetery contains enough copper ore to be worth mining. He's hired 40 convict laborers to dig up the graves, dumping headstones and bodies into a nearby abandoned mineshaft. The PCs can wait until the graveyard is cleared and search for Fletcher's body in the dangerously unstable shaft, or try sneaking into the cemetery that night before Fletcher's grave marker is removed. The convicts are too heavily chained to be a menace to the PCs (unless an escape is organized), but there are at least ten guards (use 'Hired Guns', below). To complicate

matters, one of the guards may be an enemy of one of the PCs -- or one of the convicts may be a friend, dependent or a member of an ally group. Alternatively, the convicts may manage to overpower their guard and grab some weapons, forcing the PCs to choose sides. The guards are billeted in the marshal's office and the saloon next door; the convicts sleep at night, in chains and under guard, in the store.

In a *weird* campaign, Rosary is almost literally a ghost town; instead of convict labor, the digging is being done by 40 zombis, and intruders are even less welcome. The houngan controlling the zombis, Pierre Legrand, has taken over the marshal's office, and sleeps on the bare bunk in one of the cells, on which he's performed a makeshift consecration. In a cinematic (high powered) weird campaign, Legrand may be a skin-changer; he may also be Dimascio under another name, returned to collect the sapphire.

If the PCs have come to Rosary without Brother Lee's nitroglycerine and need extra firepower, have Lupita arrive with the wagon and an accomplice (use stats for Hired Gun) in time to rescue them. Of course, her help won't come cheap . . .

Resurrection Men

If the PCs go looking for Fletcher's grave, they will find the marker badly weathered; Vision -5 to read the inscription, "Dr George Fletcher, murdered 18--.". Fletcher is buried 4' down, in a thin wooden coffin, fully dressed, with his boots under his head as a pillow and a red bandana covering his mutilated face. The markers on the graves surrounding him read "Joe Wells, Died With His Boots On 18--", and "Ella Garcia, 18--. Duerme bien." (Sleep well).

A search of Fletcher's clothes, however thorough, will not uncover the sapphire. Dissecting the body won't help, either, but that's no reason to prevent the PCs from trying. The stone is actually hidden in the hollow heel of Fletcher's left boot (the right is also hollow, but empty). If the *players* don't think of searching the boots, it should occur to Lupita or any *character* who makes a roll on Holdout at -5.

Faith to Faith

The PCs should continue to suffer nightmares intermittently until the first to touch Broken Lance's shield has a vision, in which he sees a wolf telling him to destroy the papers taken from the shield. The nightmares will continue until he does this; after that, Broken Lance will appear to the PC in a dream, armed with Dimascio's knife. The PC's hit points will be equivalent to his Will, not HT or ST. If the PC is 'killed' in the dream, he must make a HT roll (+/- Will bonuses) or die; if he survives, the PCs' nightmares will stop. If he defeats Broken Lance in the dream, he will acquire Wolf as a Guardian Spirit, though this will only be apparent to Herbalists, Dreamers or Shamans, who will react to him at +1 after this, and the PCs' nightmares will stop. If he surrenders, he will acquire -10 points of disadvantages that must be bought off (Nightmares and Post-Combat Shakes would be appropriate, as would Unluckiness or Aichomophobia).

Cast

Bigger Bear, Comanche Warrior

Early 20s; bronzed skin, black hair, dark eyes; 5'9", 150 lbs.

ST 11; **DX** 11; **IQ** 11; **HT** 11.
  Move 5.

Advantages: Appearance (Attractive); Charisma +1; Guardian Spirit (Thunder); High Pain Threshold; Language Talent +1; Semi-Literate
Disadvantages: Compulsive Gambling; Curious; Overconfidence
Quirks: Tends to exaggerate.

Skills: Animal Handling (Horse)-11; Axe/Mace-12; Bard-14; Bow-13; Gambling-13; Guns (Rifle)-13; Languages (Comanche)-12, (English)-10, (Spanish)-10; Merchant-11; Riding (Horse)-12; Sign Language (Plains)-10; Stealth-13; Tracking-13; Wrestling-11.
Equipment: Indian Musket; Short Bow and 30 arrows; Coup Stick; Bowie Knife; Shield (PD 3; DR 6; Damage 10/40); Pony.

Bigger Bear is named for a story he tells of a bear he encountered when a young man; when an older warrior dryly commented that the bear grew larger every time the story was told, the young brave became known as Bigger Bear.

Bitten by Cats, Comanche Warrior

Late teens; bronzed skin, scarred face, black hair, dark eyes; 5'8", 100 lbs.

ST 11; **DX** 12; **IQ** 10; **HT** 11.
  Move 5.

Advantages: Animal Empathy; Combat Reflexes; Fit; Guardian Spirit (Thunder); High Pain Threshold.
Disadvantages: Overconfidence; Skinny.
Skills: Animal Handling (Horse)-13; Axe/Mace-12; Bow-13; Fast-Draw (Arrow)-13, (Rifle)-13; Gambling-12; Guns (Rifle)-13; Language (Comanche)-10; Riding (Horse)-16; Running-12; Stealth-12; Tracking-14.
Equipment: Indian Musket; Short Bow and 30 arrows; Coup Stick; Metal Tomahawk; Shield (PD 3; DR 6; Damage 10/40); Pony (Move 14).

Broken Lance, Comanche Warrior

Early 20s; bronzed skin, black hair, dark eyes; 5'11", 160 lbs.

ST 13; **DX** 13; **IQ** 10; **HT** 13.
  Move 6.

Advantages: Combat Reflexes; Fearlessness/3; Guardian Spirit (Wolf); High Pain Threshold; Rapid Healing; Toughness (DR 1); Very Fit.
Disadvantages: Berserk; Great Vows (Never Retreat in Battle, -15; Wolf Dreamer vows, -11); Overconfidence.
Skills: Animal Handling (Horse)-12; Axe/Mace-14; Axe Throwing-13; Bow-14; Fast-Draw (Arrow)-14; Gambling-9; Guns (Rifle)-14; Knife-13; Knife Throwing-12; Lance-14; Riding (Horse)-13; Running-14; Tracking-11; Stealth-13; Wrestling-13.
Equipment: Indian Musket; Compound Short Bow and 30 arrows; Coup Stick; Lance; Arkansas Toothpick; Tomahawk; Shield (PD 4; DR 6; Damage 10/40); Pony.

Broken Lance is named for a battle he had with an Apache warrior; the Apache's lance penetrated his shield before breaking, leaving the head stuck in Broken Lance's arm. Broken Lance grabbed the shaft of the lance and dragged the Apache from his horse, returning to camp with the horse, the broken lance, and the Apache's scalp. Wolf appeared to him that night, giving him a vision of a tougher shield -- including the books that would be needed to construct it.

Brother Lee, Confidence Man and smuggler

Late 40s; 5'9, 160 lbs; tanned skin, blue eyes, mane of silver hair with full beard.

ST 11; **DX** 11; **IQ** 12; **HT** 8.
  Move 4.

Advantages: Charisma +2; Voice.
Disadvantages: Greed; Overconfidence.
Skills: Acting-12; Animal Handling (Mule, Horse)-11; Bard-15; Boxing-12; Disguise-12; Fast-Talk-14; Gambling-

13; Guns/TL5 (Pistol)-14, (Shotgun)-13, (Rifle)-11; Fast-Draw (Pistol)-11; Hold-out-12; Mechanic/TL5 (Wagon)-10; Merchant-13; Musical Instrument (Banjo)-11; Occultism-10; Pickpocket-11; Psychology-11; Riding (Horse)-10; Running-9; Stealth-11; Teamster-11; Theology-10; Whip-10.
Equipment: S&W Model 2; Bullwhip. Wears black suit, Stetson, and cowboy boots.

Comanche Warrior

ST 11; **DX** 11; **IQ** 10; **HT** 10.
  Move 5.

Advantages: Fearlessness/2; Fit; High Pain Threshold.
Disadvantages: Warrior's Code of Honor.
Skills: Animal Handling (Horse)-11; Axe/Mace-12; Bow-13; Fast-Draw (Arrow)-11; Gambling-11; Guns (Rifle)-13; Knife-11; Languages (Comanche)-10; Riding (Horse)-12; Running-10; Stealth-13; Tracking-13.
Equipment: Indian Musket or Spencer Carbine; Short Bow and 30 arrows; Coup Stick; War Club, Tomahawk or Large Knife; Shield (PD 3; DR 6; Damage 10/40); Pony.

Convict Laborer

ST 13; **DX** 10; **IQ** 9; **HT** 10.
  Move 5.

Advantages: High Pain Threshold.
Disadvantages: At least one of the following: Bad Temper; Bully; Greed; Impulsiveness; Outlaw's Code of Honor; Overconfidence.
Skills: Brawling-12; Guns/TL5 (Pistol)-14, (other)-10; Holdout-11; Intimidation-13; Knife-11; Riding (Horse)-10; Stealth-10; other Thief skills-12.
Equipment: Pick or shovel.

Hired Gun

ST 12; **DX** 13; **IQ** 10; **HT** 11.
  Move 6.

Advantages: Alertness +1; Combat Reflexes; Reputation (Fast Gun, +1)
Disadvantages: Bad Temper; Bloodlust; Enemies (Gunslinger's Enemies)
Skills: Animal Handling (Horse)-11; Brawling-13; Carousing-12; Fanning-12; Fast-Draw (Revolver)-14; Gambling-12; Guns/TL5 (Pistol)-16, (Shotgun)-14, (Rifle)-13; Holdout-11; Intimidation-13; Knife-11; Knife Throwing-11; Riding (Horse)-12; Sap-12; Speed-Load (Revolver)-11; Stealth-11; Tactics-11.
Equipment: Colt Peacemaker; Double barrel Shotgun or Magazine Carbine; Arkansas Toothpick; Cartridge belt; Suit, Overcoat, Stetson, Cowboy Boots; Saddle Horse; Bedroll.

Lupita

20 years old; 5'6", 115 lbs; olive skin, waist-length black hair, dark eyes. Quirks: Usually wears black and red.

ST 9; **DX** 11; **IQ** 11; **HT** 12.
  Move 5.

Advantages: Appearance (Attractive); Charisma +1; Language Talent +1.
Disadvantages: Greed; Overconfidence; Post-combat shakes.
Skills: Acting-12; Animal Handling (Mule)-9; Cooking-10; Dancing-13; Disguise-13; Fast-Talk-13; First Aid/TL5-10; Gambling-12; Guns (Pistol)-11, (Shotgun)-11; Holdout-12; Knife-11; Language (Spanish)-12, (Comanche,

English, French)-10; Pickpocket-13; Psychology-10; Sex-Appeal-14; Scrounging-12; Singing-11; Stealth-10; Streetwise-13; Teamster-10; Throwing-11.

Equipment: Double barrel 20g shotgun; small knife concealed in hair. Wears shirt, boots and trousers while traveling, and a dress while in town. Spare clothes, rations, ammo, gun cleaning kit, etc., in travel trunk in wagon.

Pierre Legrand, voodoo houngan

Early 40s; 5'11", 107 lbs; brown skin, bald, dark brown eyes. Wears a Confederate Officer's gray coat, a battered top hat, and cavalry boots.

ST 10; **DX** 11; **IQ** 14; **HT** 10.
  Move 5.

Advantages: Autotrance; Charm (Ghost Shirt); Initiation (Third Level); Mystic Symbol (necklace, +2); Metabolism Control/1; Night Vision.
Disadvantages: Appearance (Unattractive); Bully; Sadist; Skinny; Social Stigma (Mulatto, -2 on all reaction rolls).
Paths and Rituals: Path of the Spirit-14; Raise Zombi-14; Path of Protection-13; Ghost Shirt-13; Obscurity-13; Path of Dreams-10; Path of Health-10; Path of Luck-10.
Skills: Brawling-11; Detect Lies-13; Fast-Talk-14; Fencing-12; Gambling-13; Guns/TL5 (Pistol)-14; Language (Creole)-14, (English, French, Spanish)-12; Occultism-14; Riding (Horse)-10; Ritual Magic-16; Scrounging-13; Stealth-10; Streetwise-13.
Equipment: S&W Model 2 in leather-lined pocket; Saber; pocket knife; bed roll; week's rations; bottle of whiskey; saddle horse; $42 in gold coins.

Old Tom, Prospector

Late 60s; balding, with some gray hair and scraggly gray beard, hazel eyes; 5'6", 130 lbs. Wears ragged buckskins, sombrero, and boots.

ST 10; **DX** 10; **IQ** 10; **HT** 9.
  Move 4.

Advantages: Alcohol Tolerance.
Disadvantages: Age; Alcoholism; Appearance (Unattractive); Miserliness; Odious Personal Habits (Rarely washes, -2 to reaction rolls); Poverty (Struggling).
Skills: Animal Handling (Donkey)-11; Brawling-10; Carousing-11; Gambling-11; Guns/TL5 (Shotgun)-12, (Rifle)-10; Packing-10; Prospecting-12; Scrounging-13; Survival (Mountains)-11.
Equipment: Shotgun, mining tools, and burro at shack.

Smells Water, Comanche Warrior

Late teens; bronzed skin, black hair, dark eyes; 5'8", 140 lbs.

ST 12; **DX** 13; **IQ** 10; **HT** 10.
  Move 5.

Advantages: Alertness +3; Fit; Guardian Spirit (Eagle); High Pain Threshold.
Disadvantages: Bad Temper; Minor Vows (Eagle warrior).
Skills: Animal Handling (Horse)-10; Axe/Mace-13; Bow-14; Gambling-11; Guns (Rifle)-16; Language (Comanche)-10; Riding (Horse)-13; Stealth-13; Tracking-11.
Equipment: Kentucky Rifle; Short Bow and 30 arrows; Coup Stick; War Club; Metal Tomahawk; Shield (PD 3; DR 6; Damage 10/40); Pony.

Zombis

ST 13; **DX** 10; **IQ** 7; **HT** 10/15.
  Move 4.

Advantages: Doesn't Breathe; Doesn't Eat or Drink; Doesn't Sleep; Extra Hit Points +5; High Pain Threshold; Immunity to Disease; Immunity to Poison; Injury Tolerance (No Blood); Invulnerability (Mind Control); Night Vision; Single-Minded; Temperature Tolerance; Unaging; Unfazeable.
Disadvantages: Bad Smell; Cannot Learn; Monstrous Appearance; No Sense of Humor; No Sense of Smell/Taste; Obdurate; Reduced Move; Reprogrammable Duty; Slave Mentality; Social Stigma (Dead); Unhealing; Unliving; Vulnerability (4d from salt).
Skills: Brawling-12; Knife-11.
Equipment: Pick or shovel.

Should a zombi be crippled, or even lose a limb, it will continue to fight. A zombi with a missing foot moves at 4. With a missing leg, it hops along at 2; legless but with at least one arm, it drags itself along at 1.

Only a little salt is needed to kill a zombi, but it must be poured into the zombi's mouth to be effective.

Biblical Quotations

Proverbs XXVII 17 reads "Iron sharpeneth iron; so a man sharpeneth the countenance of his friend."; Luke IV 23 is "Physician, heal thyself."; Mark VIII 24 is "I see men as trees, walking."

Murphy's Rules

Murphy's Rules

Different Engines: Alternate Steampunks

"The real Age of Steam was a specific period in Earth's history, and most steampunk is set in that period. But with more radical divergences, it's possible to imagine similar technologies in other settings . . . ."
-- William H. Stoddard, **GURPS Steampunk**, p. 11

It's not just possible -- it's downright irresistible. As a celebration of the perfected apparatus of brass gears and whirling pistons that is **GURPS Steampunk**, here are three more somewhat less-Worked Examples of vaporous alternate histories. Take a deep whiff of coal-smoke, brush back your whiskers, and let's set the ether crackling.

"The shape of the boiler having been determined at pleasure, in that part of it intended to hold the water a small chamber, perfectly air-tight, is intercepted between two perpendicular partitions. With this chamber a tube, one of those which pass under the coals, communicates near the bottom, one end of the tube being closed that no water may enter it from the boiler: the other tubes lead into the chamber where the water is. Thus when the coals are ignited they will generate steam through that tube which leads into the small chamber. This steam is carried along a tube which pierces the surface of the boiler, and through the mouth of the figure on to the coals, (for the figure must be bent so as to blow downwards;) and as steam is always being generated, the figure is always blowing. The steam is generated from the fire, and, if we pour a very small quantity of water into the small chamber, we shall produce more steam, and the figure, blowing with great violence, will heat the boiler still higher."
-- Hero of Alexandria, *Pneumatica*, LXXIV

Was it the patronage of the priests of Hephaistos, still influential in Egypt in honor of Alexander's lost love Hephaistion? Was it the desperate eagerness of General Vespasian to find something, anything, that would batter down the infernally stubborn walls of Jerusalem? Was it simply a case of academic politics going right for a change? Whatever the reason, Hero received a munificent grant for his own Museum, charged with developing Ktesibos' 200-year old design for compressed-air cannon for the Roman legions. Joining experimental petroleum boilers to machined bronze, and using his own aeolipile as a steam engine to power the device, Hero watched his "Aeolian onager" smash Masada to powder at ranges far beyond what rope and sinew could achieve. Before his death, he had also invented aeolibosae ("Aeolian oxen") to drag the infernal devices across the Rhine and Danube to smash the Germans and Dacians, and "aeolicthyne" ships which could cross the Mediterranean in record time. Trajan conquered the petroleum fields of Mesopotamia and Persia, ensuring the Empire of an unbroken supply of the "Aeolian fluid". During the plagues under Marcus Aurelius, Aeolian engines sowed and reaped the crops, replacing the decimated peasantry.

Now, in 180 A.D., Marcus Aurelius' son Commodus takes the throne of an Empire that stretches from the misty Insulae Hesperes in the west to the borders of India, linked by Aeolian-graded roads, defended by aeolipilum-wielding mechanized legions, and driven by the cthonian petroleum pumps of Babylon. Aeolicar battles in the Colosseum feed the crowd's frenzy, and make millions for patrician owners and their Egyptian engineers. The plebeian "charioteers," however, may want a piece of the action -- and they may not care how they get it. This **GURPS Steampunk-Imperial Rome-Autoduel** campaign can center on rebel Aeolicar fighters battling it out in the arena, dueling on behalf of their patrons on the wide highways of the Empire, or rising up against Commodus' mad attempts to control all Aeolian technology for himself. PCs can be Roman mobile infantry fighting a blitzkrieg in India, street gangs in Rome or Alexandria rumbling over turf, noble conspirators against the mad and decadent Commodus -- or, of course, greasy-haired punks racing and dueling Aeolicars, playing that new-fangled Nubian music, and being hassled by the vigiles. Hey, pater-o! Wanna drag?

"The attraction of a magnet for iron is like that of amber for the smallest grain of mustard seed. It is like a breath of wind which mysteriously penetrates through both, and communicates itself with the speed of an arrow."
-- Kuo Fu (4th century AD)

The Chinese had magnetic compasses as early as the 3rd millennium B.C. They had lightning rods and understood the interrelationship between amber, metals, and electricity in the late Han era of Kuo Fu. By the turn of the first millennium A.D., they had invented the blast furnace, and produced over 35,000 tons of steel annually from coke-burning smelters. All the Song Dynasty needed was a little spark. During the wide-ranging reforms of the minister

Wang Anshi in the 1060s, the mandarinate was in turmoil, and new ideas rose to the fore without obstruction. From a mixture of Taoist alchemy, magnetism, and astronomy came the first electric batteries and dynamos. After Wang Anshi's personal acupuncturist used the new devices to cure the Emperor Zhenxong's near-fatal illness of 1085, no bureaucrat could stop the electrical revolution. Coke-fired electrical motors soon powered weapons factories and shipyards across the Empire, putting guns and rockets into the hands of the entire army. The northern barbarians fell back, then offered tribute -- a brief and pointless rebellion in 1206 by a minor Mongol khan named Temujin was easily crushed by repeater-armed Song troops lifted in by electric gliders.

Shen Yu's improved astronomical techniques, and the insights of Taoist philosophers, led to the discovery of the tian-qi (or, as the newly translated Greek scrolls taken from Central Asia called it, the "ether") that joined all the stars and planets together. The first tian-qi ships reached the Moon in 1247 (after a brief expedition around the world to gather tribute from lesser monarchs), and skimmed the clouds of the inner world Taibaixing two years later. In 1254, Imperial canal-builders arrived on the red planet Yinghuo to study its canal network; they became the nexus of a thriving trade entrepot for rare metals, mysterious herbs, and finely worked silicates and ceramics. PCs in this **GURPS Steampunk-China** campaign can be Western traders (perhaps including a young Marco Polo) trying any angle to break into the Electrical-Celestial Empire's economy, Imperial mandarins keeping watch on the planetary frontiers (the tall, inscrutable people of Yinghuo are rumored to possess subtle mental powers and strange combat techniques), or explorers seeking new adventures under Heaven.

"[T]he old energy of the Norse race arms itself with these magnificent powers; new men prove an over-match for the land-owner, and the mill buys out the castle. Scandinavian Thor, who once forged his bolts in icy Hecla, and built galleys by lonely fiords; in England, has advanced with the times, has shorn his beard, enters Parliament, sits down at a desk in the India House, and lends Miollnir to Birmingham for a steam-hammer."
-- Ralph Waldo Emerson, *English Traits*

It only took forty years of inhumanly patient tinkering, in his forge-hall below Gotland, but Durin Redbeard had done it -- taken the human Roger Bacon's airy theological notions of a steam-driven engine and brought it into the real world of iron and brass and coal. As always, if you want something done right, you're better off asking a dwarf. And, although the new steam engines helped Sweden's mills and shipyards prosper, King Magnus II seemed unable to grasp that basic principle no matter how many times dwarvish silver bailed him out. So, rewrite the constitution in 1359 to give dwarves a majority on the Riskdag. Dwarvish steamships swept the Baltic clear of Danish ships in 1370, and the dwarf-lords got positions in the Hanseatic League in return -- after only two human generations (at compound interest), the dwarves wound up running the German economy. No problem -- lots of coal in Germany. Once the dwarves applied their engineering proclivities to tactics, the Germans even made decent fighters, wheeling and firing the new explosive-powder rifled flintlocks in clockwork fashion. Of course, you had to have dwarven commanders for the units, or the Germans would fall to fighting each other over who was pope or something equally foolish. Not as foolish as starting a whole war over roses, though -- that, you had to leave to the English. All that ruckus interfered with orderly business, had to land some Germans and some cannon off the new ironclads and bombard London, teach them how things work. Put Henry Percy on the throne, from a good Northumberland family, go back a long way with dwarves, they do. Have to put off straightening out this mess in Italy for awhile, though -- word has it there's gold just lying around to be taken in the new lands to the west.

In this Renaissance-era **GURPS Steampunk-Fantasy Folk** campaign, the dwarves have a racial Gadgeteering proclivity, long lives, and a newly-aggressive attitude toward cleaning up an untidy Europe. Renaissance humanity's reaction to being the colonial subjects and economic underlings of saga-spawned surly steam-lords can drive a game of comical neo-Pratchettian misadventure, or one of "rapierpunk" action as "Leonardo the Tall" leads a network of resistance gadgeteers in the name of Humanitas. Introducing human ritual magic, or American elves, or a dwarvish civil war can stir things up even more. Heigh-ho!

Pyramid Review

Star Wars Roleplaying Game

Published by [Wizards of the Coast](#)

Written by Andy Collins, Bill Slavicsek, and JD Wiker

320 pages; $34.95

Following in the footsteps of a phenomenally successful predecessor is never easy.
Not only to do you have to contend with the inevitable comparisons to your illustrious forebear, but there will always be die-hard partisans of "the original" who are not only unwilling to accept your mere existence -- they go out of their way to slander you and work to bring about your failure. You can see this kind of behavior all time, whether it be in entertainment, literature, or politics.

Consequently, I don't envy the position of the designers of WotC's new *Star Wars Roleplaying Game*. Even had their game been perfect in its design and presentation, there still would have been a chorus of naysayers and hardcore West End enthusiasts who wished them ill will. Fortunately, *Star Wars* is a solid enough design that its critics may be drowned out by the din of its supporters -- many of them newcomers -- attracted by the game's high production values and ease of play. Of course, this won't deter the critics, particularly since at least some of their criticisms are dead-on.

As most people know, WotC's *Star Wars Roleplaying Game* is the first non-D&D game to use the much-vaunted "D20 system." At its heart, this system consists of a collection of core characters stats (the familiar Strength, Dexterity, Constitution, Intelligence, Wisdom, and Charisma), a feat and skill system, and a unified mechanic that compares a D20 roll plus modifiers versus a difficulty class. In theory, everything else (character classes, hit points, etc.) is negotiable, subject to change according to the needs of the setting or genre using the system.

For the most part, *Star Wars* avails itself of relatively few of these potential options. The game still has character classes and levels, for example. While the aforementioned critics will undoubtedly scream, "It's *D&D* in space," their comment is both accurate and irrelevant. There can be no question that *Star Wars* bears a lot of similarities to the latest edition of *D&D*; that was clearly intentional. Given the popularity of *D&D*, this is both a logical marketing and design choice. However, *Star Wars* has always been more of a fantasy setting with science fiction trappings than straight SF. If you doubt this, *Episode I* made this fact abundantly clear. Given that, the match between *D&D*-esque rules and the *Star Wars* setting is not as jarring as one might expect.

Moreover, the designers changed just enough from *D&D* to overcome most -- but not all -- of the dissonance between the venerable fantasy game's conventions and those of the *Star Wars* universe. For example, multiclassing carries no experience point penalty for uneven levels, allowing a player to add classes (and their abilities) more freely. Likewise, hit points are now divided between vitality points (which increase with level) and wound points (which are equal to Constitution and rarely increase). Ordinary damage comes off vitality points, while damage dealt by critical hits comes directly off wound points. A character who loses all his vitality points is merely unconscious, while one who loses all his wound points is dead. Ordinary Gamemaster Characters (like stormtroopers) have no vitality points are thus dispatched with relative ease.

In a similar fashion, the game avoids the "kill the monsters" style of experience point awards. Instead, points are awarded on the basis of the length of the adventure compared to the average level of the characters involved. The number of opponents defeated thus has no bearing on the experience points awarded. It's a reasonable system, designed to increase a group of four characters one level for every long adventure, every two medium adventures, or every four

short adventures. It's not a perfect system by any means, but it goes a long way toward excising yet another potentially inappropriate *D&D*-ism from the *D20* system. In fact, I found myself wishing *D&D* included such a system, as it's closer to the way I award experience in my more story-driven campaigns.

Like *D&D*, the heart of *Star Wars* is its skill and feat system. But for the addition of new technological skills and feats, the only significant wrinkle is the addition of Force related feats and skills. To use Force abilities requires one possess the feat "Force Sensitive." With that feat, one can then become trained in the use of the Force (which is to say, become a Jedi or Force Adept), allowing the acquisition of additional feats and skills. Most Force feats have prerequisites of either other Force feats or Force skills, meaning players will need to choose their abilities with care, especially if they wish to acquire some of the more exotic -- and powerful -- Force powers.

The game provides a large number of races to choose from: everything from Rodians to Wookiees to Cereans and (yes) Gungans are available in the core rulebook. Like *D&D*, each race has its own advantages and disadvantages. However, the greater flexibility of the multiclass rules means that humans have only the increased skill points to start and bonus feat to recommend them (not that I mind). The characters classes (fringer, noble, scoundrel, scout, soldier, Force adept, Jedi guardian, and Jedi consular) are reasonably well-balanced against one another. Some (like the scoundrel and soldier) are simply *D&D* classes renamed with mild tweaks here and there. Others (like all the Force users) are more original and are sure to prove popular. All offer something of interest, ensuring that multiclass characters may well be the norm in *Star Wars* campaigns.

The book is a complete game. In addition to character creation and combat rules, it includes chapters on aliens, starships, robots, and an overview of the *Star Wars* universe (including stats for noteworthy characters). There is also a useful appendix containing rough guidelines for converting West End Games vintage characters to the *D20* system. Although the game supports three eras of *Star Wars* play (*Episode I*, *Classic Trilogy*, and the *New Jedi Order* of the novels), there is a subtle emphasis on the *Episode I* period, based solely on various examples (and the sample adventure), as well as the preponderance of stills from that film. Again, this is a valid marketing approach, but it may give critics yet another excuse to avoid the game. (Interestingly, the much-reviled Jar Jar Binks never appears in the book in any form.)

In the end, the *Star Wars Roleplaying Game* is a solid piece of work, but is definitely not for everyone. Enough holdovers from the *D&D* origins of *D20* exist that it may rankle gamers looking for something more "sophisticated." At the same time, this is probably a selling point for newcomers introduced to roleplaying through *D&D*. Of more genuine concern is WotC's upcoming slate of products, most of which seem to recycle plot elements from the films rather than strike out in new directions as West End did so well. Again, this concern may simply reveal my own "inner critic," but I believe it's something of which to take note.

Even so, WotC has clearly given *Star Wars* the care it deserves as a roleplaying property. It'll be interesting to see how it -- and the *D20* system -- develops over the course of the next few years.

-- James Maliszewski

Things to be Thankful For

Well, as foretold by the prophets (despite being a non-prophet organization), here's my Thanksgiving column. (And I'm sorry for all you non-United States-ers out there; these kinds of columns are part of our holiday-type rituals. Maybe I'll try to write a Boxing Day column or something to balance the scales.) This time, I'm going to say how thankful I am for the state of diversity in the industry.

A couple of months ago, I realized what a great time it is to be a gamer. As I look through my collection, I consider that I could run rich and entertaining games in almost any genre, without much effort. I could create an Alternate Earths game, a conspiracy game, a modern game of plotting vampires, a steampunk universe, or a 1920's Cthulhu campaign . . . all with about an evening of planning.

Consider how different this is from a mere twenty years ago. Back then, If I wanted to run, say, a western game, there was really only one option: ***Boot Hill***. But with just a casual glance across my shelf, I see I could run three different western games, and they'd all be a blast. In the early 80's, if I wanted to run a science fiction game, there were two options: ***Star Frontiers*** and ***Traveller***. Today I could run ten . . . including ***Traveller***. I'm hard-pressed to come up with a time when there were more talented creators making games and gaming supplements than now.

Less than a decade ago, TSR successfully stopped Mayfair from producing any more of their ***AD&D***-compatible material from their ***Role Aids*** line. Today, Wizards of the Coast is on the cusp of actively and officially *encouraging* companies to manufacture alternate material. Hopefully this will result in interesting and divergent material for the granddaddy of RPGs (itself having been newly reinvented), since these other companies aren't limited by pre-conceived notions of what has gone before.

Wizards of the Coast has also released over fifty supplements of ***AD&D 2nd Edition*** material for free in PDF format on their website. I've already used many of these items in other campaigns: dungeon plans, overland maps, illustrations, and other goodies are all easily stolen for a variety of uses. These supplements are probably worth almost $1000 in their original paper forms. *And* they've released other out-of-print goodies via electronic downloads for $2.95 each. "The first hit's free," as they say, but the mere availability of these downloads is another thing I'm thankful to WotC for.

The Internet itself is also a true godsend for gamers. Besides delivering the best gaming magazines *<koff> <koff>*, the Internet has made previously nigh-impossible research easily accessible for GMs and players. Just last week, in our ***Fading Suns*** game, our GM downloaded Latin translations of Murphy's Laws of Combat for the Brother Battle church knights. *Si hostes visibilis, etiam tu,* indeed. Likewise fans can create and disseminate material easier than any previous time. There is currently more free gaming material available on-line than I'd ever have time to read, and some of it is brilliant. And the Internet means community; if you need advice or answers or things to think about, there's more options available than any time before. (A sidebar "Thanks!" to the **sjgames.roleplaying** regulars, who've regularly answered my arcane questions . . . usually involving Storyteller probabilities.)

There are more systems in print than ever before. With the plethora of systems out there, I can probably find (or modify/create) a game that's within a hair's breadth of my desires. Complex or simple, elegant or intricate, diceless or diceful . . . there are possibilities beyond imagining. And with a little bit of searching on services like eBay, you can get material that's out of print easier than any time previous!

And I'm thankful for other aspects of gaming goodness, too. A mere decade ago the minigame seemed dead. Cheapass Games proved that wrong, and other companies have followed suit. Perhaps the perfect stocking stuffers, the current crop of minigames are something truly wonderful for my Friday night group gatherings. And, there's more gamerly comics, magazines, columns and other related diversions out there than any time in recent memory, for those times when you *can't* game.

Is the industry perfect? Of course not; things can always get better. And I definitely don't think those who make this hobby possible should stop trying to do even better. But in my mind it's often easy to focus on the bits that annoy or

upset us, while losing sight of how much there is to be thankful for currently.

So, for all the creators, retailers, and fans, thanks for making this a great time to be a gamer.

-- Steven Marsh
  Pyramid Editor Who Ate Way *Too Much Turkey*

* * *

Last week's answer: **Time Lord**, p. 39. (Based on the *Doctor Who* universe, this game is available, along with other loot, *free* [online](#)! This is a great time to be a gamer!)

(Also note that **Time Lord** was written by Ian Marsh [!] and Peter Darvill-Evans.)

(Three stars) "Guideline #1: Temporal Prime is a pseudoreality, not a plane of existence."

"Duke" Samuel Thaddeus Brunswick

by Loki Carbis

Art colord by Keith Johnson

Born: February 17, 1909.

Age 25-35; A youthful man with blonde hair and gray eyes. He is dressed in practical, no-nonsense clothes that are usually in need of cleaning and repair. His face bears a determined expression, and his dominant trait is an unwillingness to suffer fools.

ST 12 [20] **DX** 13 [30] **IQ** 15 [60] **HT** 12 [20]
Speed: 6.25, Move: 4.
Dodge: 4 Parry: 7.

Advantages: Collected (5); Common Sense (10); Gadgeteer (50); Longevity (5); Mathematical Ability (10); Single-Minded (5); Unusual Background: Owner of the Manual for Life (115 points; see below).

Disadvantages: Attentive (-1); Curious (-5); Loner (-5); Low Empathy (-15); Proud (-1); Reduced Move 2 (-10); Secret: Owner of the Manual for Life (Possible Death, -30); Workaholic (-5).

Skills: Brawling-15 (4); Driving (Automobile)-16 (16); Chemistry-16 (6); Engineer (Clockwork)-16 (2); Engineer (Electronics)-18 (6); Engineer (Vehicles)-17 (4) Mathematics-21 (10); Mechanic-(most specializations)-19 (8); Motorcycle-15 (8); Physics-20 (14); Professional Skill: Book-Binding-14 (1); Professional Skill: Librarianship-16 (4); Research-18 (8); Science!-15 (8); Temporal Electronics-18 (10), Temporal Operation-16 (default); Temporal Physics-17 (16); Weird Science-17 (16).

Quirks:
   Cares for humanity, but not particularly for individual humans.   Hates to be called "Sammy"; tolerates being called "Sam."   Irascible   Squeamish   Tries to avoid any romantic contact with the opposite sex.

Total Points: 394

This is the Duke at any time from roughly 1926-1956, on average, his creative peak and his heyday as a two-fisted adventurer. Depending on which incarnation you are using, he could well have different advantages, disadvantage and skills.

The Manual for Life has been classed as an Unusual Background. It has a sliding point value, being assumed to be

worth an average of 5 points times the number of the current edition. Adjust point values according if you're using an earlier incarnation of the Duke.

The inclusion of the Science! And Weird Science skills is a shortcut for describing the Duke's vast knowledge and ability to incorporate new data, no matter how startling. GM's should keep in mind that is does not extend to biology, medicine, psychology or any of their specializations. Each incarnation of the Duke had slightly different skills -- but also had access to simple and easy to follow instructions on any skill any preceding incarnation had possessed, via the Manual for Life.

Life

Samuel Brunswick's early life was unexceptional. Born in 1909, he was raised by his parents in Perfection, Nevada. The defining event of his childhood was the death of his father in the Great War. Due to the poor quality of communications technologies in 1918, George Brunswick was shot and killed an hour after the Armistice was signed.

This effect of this tragic and ironic event on young Samuel was twofold. Firstly, it caused him to withdraw from other people -- his father had been the most important person in his life, and he was determined not to be hurt like that again. And second, he began to study much harder, transforming from an average student to a prodigy over the next year. It seems that he did not wish for anyone else to be hurt like him either.

By the time he was 13, he had begun studies at MIT. The next few years saw his character continue to form along the lines it had already begun to take, while his eclectic interests saw him change institutions a dozen times in the next decade. His personality, which was never terribly sociable, became increasingly distant, even arrogant, and his nickname, given him in 1921, is a reflection of his aristocratic temperament.

First Incarnation

The Duke was a restless and driven man. A polymath and scientific genius, he created many strange and wonderful inventions, many of which he used in a short-lived career as a two-fisted adventurer in the late 1930's. Even the limited fame this brought him was too much for him; although he cared passionately about humanity in the abstract, the Duke had no particular liking for individual specimens of the species. Towards the end of his life, in 1976, he perfected a means of limited time travel, which worked only for inanimate objects. Although briefly stymied by this apparent blind alley, he eventually hit upon the plan of sending back all of his journals, notes, and theories. Everything he'd discovered, and everything he'd theorized but not had the time to investigate fully, he sent back to his younger self.

Second Incarnation

The books he sent arrived on his younger self's bedside table one February morning in 1926. At first, the arrival of the book puzzled the younger Brunswick. But it contained secrets that only he knew, and some predictions of the (to him) near future that soon came to pass, assuring Brunswick of the book's veracity. He set to his work with a will, able to advance upon discoveries he had already made; thus the cycle began.

Third Incarnation

The massive confusion that was experienced by the third incarnation of Duke Brunswick was largely a result of a simple but frustrating error on the part of his predecessor. On February 17, 1926, he received both sets of books -- those of both of his predecessors. It took him over a year to work out what had happened, by which time he had become sufficiently frustrated that he had no intention of going through the same privations as his two predecessors.

In 1956, he was diagnosed with acute liver failure, brought on by several years of wine, women, and song. This diagnosis was a wake-up call to Brunswick. Repenting his dissolute ways, he spent his few remaining weeks building at least the time machine, and sending back the books to his successor. But in order to avoid the problems he had

faced, he was careful to send back his books to the day after the first set, beginning a tradition that all his successors would follow.

Fourth Incarnation

After the warnings of his predecessor, the fourth incarnation of Duke Brunswick was as moral and upright as the day is long. He was the first incarnation (not counting the original) to begin adventuring. He achieved a modest amount of fame as a two-fisted Gadgeteer and crimefighter during the 1930's, but gave it up when age started to catch up with him. This particular activity was frequently pursued by his later incarnations, also. However, as incarnations went by, more and more often his successors would carefully pick and choose only those missions that they believed were essential -- others were either ignored as insufficiently important or carried out by others alerted by the Duke, either directly or by anonymous tip.

Fifth Incarnation

By this time, the collection of journals, notebooks and the like was becoming unmanageable. In his fifth incarnation, the Duke set about organizing them all into one coherent source, editing and removing repetitions. He also took care to create a reasonably easy structure to extend on, so that his successors would have an easier time of adding to his book. This was the first time that the Manual for Life actually took on that form, although the numbering of its editions includes the earlier versions. He also began the practice of constructing the time machine sooner rather than later, so as to guard against narrow squeaks such as that experienced by the third incarnation.

Sixth Incarnation

The sixth incarnation returned to science with a vengeance, and made more advances than any of his other incarnations. He even flirted (briefly) with biology towards the end of his life, but while he made several minor contributions to the Human Genome Project, he made insufficient real progress in the subject in terms of discoveries or inventions to encourage any of his following incarnations to pursue this study.

Seventh Incarnation

The seventh incarnation of Duke Brunswick spent years rehabilitating the work and reputation of Nicholas Tesla, with impressive results. The combined genius of the two of them (and the Duke's independent wealth) was sufficient to develop and build broadcast power for the entire world in 1935, and awesome weapons of destruction that were used by the United States after the Japanese attacks of 1937 to end the Pacific War swiftly and decisively. After the war, the two were joined by Einstein, and together developed the mathematics for faster than light travel, although none of them lived to see its successful testing in 1966.

Eighth Incarnation

The eighth incarnation of the Duke followed up on the work his predecessor had done with Einstein and Tesla, although his focus was more on particle physics than on quantum physics. In 1958 this Duke disappeared when a miniaturization experiment went wrong, and he became lost in sub-atomic worlds.

Ninth Incarnation

After ensuring the safe transmission of the Manual, this incarnation of the Duke experimented with having himself cryogenically frozen upon death, and in this manner, traveled to the very far future. 10,000 years or more in the future, he was revived, and lived for another 200 years, inventing up a storm. But interdictions on time travel prevented him from sending any of these later developments back, and thus his successors have assumed that the cryogenic suspension was unsuccessful, and have not have themselves suspended.

Tenth Incarnation

Reading the journals left by his predecessors left this incarnation with the conviction that his life was empty and meaningless. Although it was full of achievements as an inventor and crime-fighter, the largely solitary nature of the Duke's prior incarnations left a sensation of hollowness in the heart of the tenth. He determined not to fall into the same trap, and sought to know other people better. In 1942, he married Betty Sue Jansen, who had been his lab assistant for the previous decade. The marriage was not a happy one, but the Duke's morals would not permit him to divorce her. Their son, Nathaniel, was born in 1946, and outlived both his parents. He used his own modification of his father's time travel device to explore the future, departing in 1970 for the centuries ahead. Nathaniel never returned.

Eleventh Incarnation

Largely as a result of the warnings of his predecessor, this incarnation of the Duke did not get married, and was, if anything, the most solitary and bookish of all Brunswick's incarnations. He did spend a lot of time pondering might-have-beens, and his work alone constitutes at least half of the Manual for Life's total content regarding temporal physics and related matters.

Twelfth Incarnation

The twelfth incarnation of Duke Brunswick put his immediate predecessor's work to good use. He built himself a time machine that would work for living beings as well as inorganic matter, and spent most of his long career exploring the time-stream -- and the alternate timelines that the Duke's own existence had generated. Most of this activity was motivated by the desire to search for Nathaniel, although Brunswick always claimed that he sought only to expand the frontiers of knowledge. He never succeeded in finding Nathaniel, and eventually concluded that his son's very existence had been erased by some fluke of temporal physics he did not yet understand.

Thirteenth Incarnation

In 1943, the thirteenth incarnation was conscripted to fight in World War Two, and joined the US Air Force. Using the last of his leave to finish his work, he prepared all of his journals and papers, and left instructions in his will to make sure that they would be sent back even if he was not able to send them himself.

Fortunately, his preparations turned out to be unnecessary, although he was shot down on one mission and spent several months in a German prisoner of war camp. After the war, he assisted the State Department in bringing several top German scientists to the United States.

Fourteenth Incarnation

Determined to avoid the errors of his immediately previous incarnation, this incarnation of the Duke joined the Marines instead. Tragically, he was killed at Omaha Beach on D-Day. Fortunately, he had made sure to include the same provisions in his will that his predecessor had, and the progression continued.

Fifteenth Incarnation

Starting with this incarnation, the Duke would release some of his inventions to the public, and thus come into moderate wealth. He used this wealth mostly to further his career as an inventor, but also to buy his way out of military service. (Although he was tangentially involved in the Manhattan Project.) He rationalized that he worth as a scientist was greater than his worth as a soldier, and he seems to have been right about this.

Sixteenth Incarnation

The actions of his previous incarnation worried the Duke a great deal, and although he continued his scientific work,

Brunswick became more and more interested in the search for truth. He studied journalism, and became a reporter in 1932. From this position, he chronicled his age, restlessly searching for the true nature of all things. During World War Two he served as writer and narrator of newsreels when in America -- but he vastly preferred working on the front. His 1944 interview with Erwin Rommel, which led to Rommel's defection to the Allied side, is widely regarded as his greatest achievement. After the war ended later that year, the Duke came home, and started to write as a columnist for several syndicated newspapers. As the years progressed, he continued his quest for truth, but increasingly as a philosopher rather than a reporter.

Seventeenth Incarnation

The seventeenth incarnation of Duke Brunswick is the oddest one of the bunch. He reversed the trend of many of his predecessors. Not only did he fight crime during the pulp era, but he joined the French Foreign Legion in 1938 in order to be able to join the war against Hitler that much sooner. He eventually rose to the rank of Captain, and was decorated as a hero of the French Republic after the war's end.

In the fifties, he returned to science, and worked with the United States Air Force as part of Project Blue Book. Later, he was employed by NASA. His meteoric rise to fame and fortune coincided with the accidental death of Chuck Yeager in 1957. By 1966, Duke Brunswick was the head of NASA, and it was largely thanks to him that the Moon was permanently settled by the USA in 1974. Upon his death in 1980, President Nixon had a statue to him erected at Tycho Centre (on the Moon), and declared that the first Mars base would be named after him.

Eighteenth Incarnation

The eighteenth incarnation of the Duke was invited to speak at a symposium in Berlin in 1934. Ordinarily, he would have refused, but his predecessor's accounts intrigued him, and he wanted to see Nazi Germany for himself. While there, he met Adolf Hitler, and was much impressed with the man. He became a supporter of the Nazi regime, and spend much of the War years working as a saboteur on the homefront. In 1944, he was arrested for his crimes, but escaped custody and fled to Argentina. By the time of his death, in 1978, he was speculated to be responsible, directly or indirectly, for the escape of over a hundred high-ranking Nazis and thousands of deaths. Fortunately, after transmitting the Manual for Life on to his next incarnation, he was executed by his fellows, who suspected him of treachery. His lab was destroyed and his notes thus prevented from falling into Nazi hands.

Nineteenth Incarnation

Upon reading his predecessor's journals, this incarnation of Brunswick was consumed by guilt. He had a mental breakdown and spent five years an institution. When he was released, in 1932, he emigrated to Europe, where he worked tirelessly to oppose the rise of Adolf Hitler. Thanks largely to his efforts, and those of others he had inspired by his work as both activist and propagandist, Britain and France refused to permit the partition of Czechoslovakia in 1938. Hitler's abortive invasion of Denmark in 1939 was cut short by a British counter-attack, combined with a French strike across the Rhine. Hitler himself was shot while trying to flee Berlin. The Duke then turned his efforts to promoting the idea of a Jewish state in Palestine, but was murdered by one of the surviving SS members in 1944. The nation of Israel was founded the following year.

Twentieth Incarnation

Having decided to avoid the extremes of his two immediate predecessors, this incarnation instead devoted himself to practical engineering. His work with R. Buckminster Fuller brought him to national acclaim, particularly after the spectacular success of their dymaxion automobile. In 1952, he married Marilyn Monroe, but the marriage was not a happy one. Despite the frequent rumors of Monroe behaving adulterously, he refused to divorce her. In 1963, a stray shot from the gun of an assassin caused President Kennedy's automobile to explode, killing all within. Brunswick felt responsible (the automobile had been one his designs, and an ordinary internal combustion engine would not have exploded), and Monroe committed suicide out of grief early the following year. Her husband survived to see Aldrin and Miller land on the Moon in 1968, but died from cancer in 1972.

Twenty-First Incarnation

Of all the Duke's incarnations, none were so eager to avoid the limelight as the twenty-first. In 1928, he faked his death and went into hiding on a privately owned island in the Bahamas. From that time, until his actual demise in 1983, he worked on whatever took his fancy. His concern for his security led him to make great advances in robotics and stealth technologies, and by 1947, he was flying in a saucer-shaped craft of his own design that was immune to nearly all forms of detection, including the naked eye, while in stealth mode. Occasional malfunctions led to a few sightings of this craft, but it was never conclusively identified.

Twenty-Second Incarnation

Reacting against the paranoia of his predecessor, the Duke became much more public about his advances in robotics, proving his point dramatically when the wholly automated Enola Gay dropped the bomb on Hiroshima. The Duke was briefly a war hero and celebrity until he was targeted by McCarthy as a "pre-mature anti-fascist" in 1951, and dropped out of the public eye. His work on robotics and cybernetics continued, and by the late seventies, the first cyberware was patented by him. Using his own products, the Duke lived on until 2049, when he was struck by lightning in a freak storm.

Twenty-Third Incarnation

Far and away the oddest incarnation of the Duke, the twenty-third incarnation became fascinated by the shadow play of politics and conspiracy, and devoted his life to rooting it out wherever possible -- utilizing the two-fisted style and marvelous technology of his many antecedents. He had a few early triumphs, most notably the exposure of the corporate conspiracy behind the criminalization of marijuana in 1937. But his true triumph came years later when he exposed several Nazi war criminals who had been given name identities and put to work by a variety of Allied governments. His last well-known exploit was in 1976, when he exposed the CIA's involvement in the fall of the US-allied Australian government the year before. In 1979, he disappeared -- and it was at that time that he sent his Manual back. Rumors surfaced over the years that he had joined some underground Discordian movement, and claims were made that he had been sighted at Live Aid in 1985, and at the fall of the Berlin Wall in 1989. The truth remains unclear.

Twenty-Fourth Incarnation

The current incarnation of the Duke is perhaps the most cunning of all of them. But then, circumstances have forced him to be; the Manual For Life has been stolen from him, and he is marshaling all the resources he has available to him. These include robotic agents that search for the book, as well as a well-funded group of private investigators.

Using Duke Brunswick in the Campaign

The Duke already has several plots associated with him; the search for the missing Manual for Life, 23rd Edition is simply the most obvious. Players could enter that plot in any number of ways, the most obvious being that they could be the investigators hired by Brunswick to retrieve the book. But they could just as easily be the Duke's enemies, or simply his rivals. There's no reason why they couldn't be operatives of the Illuminati, sent to find and either bring back or destroy what has been stolen from Warehouse 23.

In addition, there are several other ways the Duke could turn up; the ninth incarnation could well be revived from his cryogenic suspension in any science fiction game (like a particularly unusual *GURPS Traveller* game, for example), and the eighth could turn up just about anywhere upon his return from the sub-atomic realms. The twelfth incarnation of the Duke could arrive on this timeline at any point, as could his son, Nathaniel. And the twenty-third incarnation could be literally anywhere, doing just about anything, so long as it somehow makes sense to him and his Discordian buddies.

The Duke's reclusive nature and arrogance make him as easy to use as an Enemy for the players as he would be an Ally or Patron -- and it would be child's play to keep them guessing. Even the two-fisted, pulp action style incarnations could be made villainous, depending on how ruthless he was in pursuing his experiments -- or in meting out justice.

Farther out, the Duke could fit easily into any *GURPS Cliffhangers* or *GURPS Atomic Horror* game -- and there's no way for the players to know which incarnation of him you're using until it's too late for the knowledge to help them. And as a man who generates a large number of alternate timelines, he could easily be investigated by either Homeline or Centrum; indeed, Homeline could easily be almost any of his timelines. A *GURPS Alternate Earths* campaign could become very strange indeed if the Duke is around to create new timelines every so often. And the Duke himself would fit right in on Gernsback (*GURPS Alternate Earths*, page 107. The Duke would most likely be a high-ranking member of the World Science Council -- or someone dismissed as a crank even by the open-minded scientists of Gernsback.) And a man knowing as much as the Duke does about things he shouldn't could easily wind up on Coventry (TT105) or in the Village (in a *GURPS Prisoner* game). Keeping him there would be another thing entirely.

At the furthest removes, the Duke could be a mage rather than a scientist -- in which case the Manual itself is more like a grimoire. As such, he would work well in *GURPS Fantasy* or *GURPS Technomancer* -- and even better in *GURPS Mage: The Ascension*. A darker version of him could easily be put into a *GURPS Horror* or *GURPS Voodoo* game -- what if the time travel incantations needed human sacrifices to work?

On the Nature of Time

The many lives of Duke Brunswick are based on the assumption that time is Chaotic on a personal level, but Plastic with High Resistance on a larger scale. That is to say, although individuals' lives can alter easily, larger historical changes are much more difficult -- and take longer to achieve (in terms of elapsed time).

Thus, the Duke's lives vary greatly from incarnation to incarnation -- but only a minority of them have effects that greatly alter the broad shape of history. The history of the most recent incarnation is that of today's world, or of your campaign world. Although the Duke certainly has the knowledge to greatly alter history, he rarely seems to act on it. It is an open question whether the history of the world in his original incarnation is the one we know or not -- the Duke didn't pay much attention to large scale historical events until his thirteenth incarnation was conscripted. It's quite possible that he merely got so engrossed in his studies that he didn't notice World War Two (the Duke was something of a fanatic). But it's equally possible that it simply didn't happen in the histories of any of his previous incarnations.

* * *

(*Author's Note:* Like its companion article, "The Manual for Life: 23rd Edition," this article was inspired by R.A. Lafferty's brilliant short story "Rainbird" (unfortunately *still* out of print), and to a lesser extent by another short story, Robert Heinlein's classic "By His Bootstraps.")

The 30-Seconders: A GURPS Ogre Campaign

by Kurt Brown

"If we win, nobody will care. If we lose, there will BE nobody to care."
Winston Churchill before a secret session of the House of Commons, June 25, 1941

It is 2079, and the Final War has became a war of attrition a meat-grinder that military historians have likened to World War I on a global scale. Paneuropean forces in the Sahara Combat Zone face continuous probes from Combine conventional forces and Ogres based out of Morocco. With the Combine breakout from Spain and into the plains of France, Paneurope Defense Command has shifted their full attention to the European Theater.

Elements of the Second Army based in Egypt have been informed that they can expect little support from home for the foreseeable future. DefComm has decreed that the Second Army should conduct a campaign of harassment and delay against Combine forces in the SCZ until such time as reinforcements can be spared or transport arranged to withdraw the divisions of the Second Army to mainland Europe. It is up to the fast-moving units of the Second Army's Fast Attack Cavalry to seek out and destroy Combine supply depots, command posts, light armored columns, and other support facilities. It is hoped that these raids will distract and delay Combine forces long enough to allow the heavier elements of the army to make preparations to stand and fight in Libya and western Egypt.

The results of this campaign could determine the outcome of the War. If the Combine is allowed to gain control of North Africa along with their current positions in Europe, the Federation will face entrenched enemies on two of her three flanks. The forces of the Second Army must prevent this at all cost.

A Brief History of the 30-Seconders

The Fast Attack Cavalry of the Second Army's North Africa Corps consists almost exclusively of GEV units. The rolling, sandy terrain of the Sahara Combat Zone is the most inviting and accessible terrain short of flat, calm lakes that GEV pilots could hope for. Given the large stretches of open countryside, the speed of the GEVs make them the best suited fighting vehicle for the region since Camels were tamed by Bedouin raiders.

Whereas GEV pilots in other theaters have to maneuver their craft among trees and buildings, FAC pilots routinely maintained 200+ kph speeds for hours at a time while on patrol without having to make more than minor course corrections. The wide open Sahara is a magnet for the speed-demons of the Federation military, and hotshot pilots from other units constantly seek transfer to North Africa. This makes the Second Army FAC one of the best (and most incorrigible) units in the Federation Army.

Before the invasion of Morocco and the Ivory Coast by Combine forces in 2074-2075, the FAC saw few pitched battles. Detractors of the highly individualistic and (to outside observers) pampered unit considered North Africa a cushy assignment for speed freaks and troublemakers. "Drag races" were common, and the officers of the FAC turned a blind eye to most of their men's excesses as they too had been known to "blow dust" on occasion.

As Combine forces began to move out of their beachheads in September 2074, the FAC units were the first to engage the enemy in large-scale fighting. The open terrain that promoted racing and fancy maneuvers also gave exceptional visibility, allowing the heavier Combine forces to score long-range kills against the lightly armored GEVs. The skills of the FAC pilots were put to the test as the speed and maneuverability of their craft were the only thing that prevented them from joining the thousands of others who lost their lives in North Africa, from Roman legionnaires to German tankers.

During the first six months of the ground war in Africa, FAC forces suffered devastating losses. In the battle of Ghadamis on the Algeria-Libyan border, the FAC units involved suffered losses of almost 60%. Fortunately, the heavy armor of the Second Army was successful in stalling the Combine offensive and the FAC units wee pulled back for refit and reorganization. The days of carefree racing were over.

As new equipment and personnel pour in to Egypt, the veterans of the running battles in Algeria have devised new tactics and training routines for the fresh arrivals. The enthusiasm of the pilots disembarking in Cairo is palpable. They are joining the famous Second Army FAC, the best of the best, and are eager to show they have the right stuff. As they settle in to their training rooms, their instructors face them with grim faces and welcome them to the 30-Seconders. Inevitably, one of the new arrivals asks what the term means:

"The average life expectancy of a GEV pilot engaged in combat in the Sahara Combat Zone is 30 seconds. Now, if you turn to page 4 of your briefing manual . . ."

Welcome to North Africa

GURPS Ogre presents the GMs and players with a high-powered setting for roleplaying, and also presents a new set of challenges to the GM. In a world where nuclear weapons are a way of life, typical adventuring styles meet with little success. Ogre is a militaristic world that calls for aggressive, combat-oriented play. The Second Army FAC "30-Seconders" provides the GM and players with a small, cohesive unit that operates independently from the normal channels of military command. This gives them the flexibility needed for individual roleplaying while providing a solid foundation for the GM to build on.

The players should create characters around the GEV-Jockey Template found on pg. 40 of ***GURPS: Ogre***. Additionally, they should take the Non-Com or Officer Lenses detailed on pg. 47. This will yield a "new arrival" character for the FAC of between 80-100 points. If the players wish to be veterans of the Sahara Combat Zone, the GM should allow an additional 25-50 points to create more experienced pilots and gunners for the FAC GEVs.

The 30-Seconders use the Paneuropean "Galahad" GEV detailed on pgs. 69-70 of ***GURPS Ogre***, while the more insane members of the unit fly the one-man "Cossack" Light GEV found on pgs. 70-71. Since the heavier Galahad is a two-man craft (driver/gunner) the PCs can either team up with other PCs, or take one position and leave the other to be filled by an NPC.

FAC units range in size from two-vehicle elements up to 20 or more craft operating together. To date, the hit and run raids punctuated by carefully chosen larger engagements have proven effective at limiting the advance of Combine forces in the SCZ. In addition to these harassing raids, the 30-Seconders scout for the heavier elements of the Second Army, coordinate attacks on fortified enemy positions and force concentrations, transport special forces teams deep behind enemy lines, and other missions that call for speed and stealth.

Mahewy's "Master Ninjas": A sample FAC Unit

Originally part of the 43rd GEV FAC based out of Al-Quatrun in southern Libya, Captain Loraine Mahewy's "Master Ninjas" were established as an independent unit after the 43rd suffered heavy losses to Combine forces in the natural gas fields near Edjeleh, Algeria in late 2074. The Ninjas currently consist of five Galahad GEVs crewed mostly by veterans of the last two years of fighting. The fact that they have survived as long as they have as a cohesive unit is a minor miracle and indicates that they are among the elite, capable of defeating almost any unit from any army in the world.

Since early 2075 the Ninjas have conducted numerous hit and run raids across the Algerian border from their nominal base in Libya, including the spectacularly successful strike against the Combine Forward Rearmament Facility at Mizi, just north of the Tasili mountains. As a result of the raid at Mizi, the Ninjas have earned a price on their head from Combine African Command. The Ninjas take this as a point of pride and are more than happy to remind their fellow FAC units of the fact.

The Ninja's GEVs are in remarkably good shape considering the amount of action they have seen, but obtaining ammunition and replacement parts is becoming more difficult as supplies are diverted to the battlefields of Europe. Captain Mahewy maintains good relations with the commander of the 14th Supply Detachment at Benghazi on the Libyan coast, but the distance to the forward supply depot still poses problems. Unless a more readily accessible supply of parts and ammunition can be located, the Ninja's operational readiness will be severely limited.

The Ninja's GEVs are painted in intricate desert camouflage patterns, and each includes the unit's insignia on the right side beneath the pilot's cockpit: a hamster dressed in ninja garb and wielding nunchaku. Members of the unit wear black bandannas in addition to their standard desert BDU uniforms and carry throwing stars, although few know how to use them to any great effect.

Paneuropean Second Army Fast Attack Cavalry Unit 23: "Master Ninjas"

GEV Alpha: "Tigger"

- Capt. Loraine Mahewy Pilot
- Sgt. Sterum Hitzges Gunner

GEV Beta: "Filcher"

- Sgt. Toby Demming Pilot

Cpl. Novika Stalnykov Gunner

GEV Gamma: "Harpax"

- Sgt. Antonio Mivelli Pilot
- Cpl. Winston Taggart Gunner

GEV Delta: "Silky"

- Sgt. Deandra McDonnegal Pilot
- Cpl. Tanya Bergeron Gunner

GEV Epsilon: "Sapper"

- Sgt. Valislav Wachowski Pilot
- Cpl. Omar Ibn-Jabbar Gunner

Adventure Seeds

Delivering the Groceries

The PCs are assigned to escorting a Napoleon GEV Personnel Carrier and its passengers to a location 30 miles into Combine-controlled territory. Once there, they are to stand guard over the Napoleon as the infantry (nine men in oddly colored heavy battlesuits) conduct their operation. Unknown to the PCs, the battlesuited men are special forces personnel attempting to extract a double agent from a nearby Combine intelligence-gathering outpost. Once the troopers grab the agent it is almost certain that Combine units will scramble to intercept the FAC units.

Unexpected Guests

The PCs FAC is assigned to patrol deep into enemy territory seeking lightly defended supply or command and control targets. Intelligence reports indicate that one of the Combine forward command posts in the PCs area of operation may be receiving a visit from a high-ranking Combine officer. Although such a visit would include a heavy escort, a target like this doesn't come along every day.

The Hunters

Combine forces are conducting a reconnaissance in force in the PCs area of operations. Several heavy tanks, GEVs and other assorted unites are moving into an area of dry streambeds and dunes that will make their passage difficult at best. The PCs are to conduct harassment raids against the heavy tanks while attempting to avoid the GEVs. The Combine is hurting for reinforcements just as badly as the Federation, and any losses that can be inflicted will help the overall situation in the SCZ.

Sitting Ducks

The PCs are the recipients of an almost unbelievable stroke of luck a nearby reconnaissance drone unit reports a lightly defended Combine supply column has been stopped at a recently washed out bridge over a steep canyon approximately 75 km north of the PCs position. A lightning raid should catch the vehicles disorganized and in the process of reversing direction a perfect opportunity to possibly capture some much needed ammunition and other supplies as well as striking a blow against the Combine forces in this area.

Strange Bedfellows

While on a patrol across enemy lines, the PCs are directed to a nearby village where drones report the presence of a Mk I Ogre. According to the imagery received by the Drone, the Ogre is sitting in the middle of the small village and appears to have children playing on it. It seems to be intact and undamaged, and fired on the drones as they approached for a closer look. This highly unusual situation must be investigated as an Ogre in this area (even a Mk I) could prove to be very dangerous to Federation plans. The PCs are advised to try to limit civilian casualties if at all possible.

by Owen S. Kerr

Art by Pat Morrissey

Religion, historically, has been perhaps the single most important aspect of human society. Expressions of faith, from beautiful works of art to declarations of war in God's name, have shaped and shaken the world, and continue to do so. In a roleplaying game, a game that attempts in some way to mimic life (or, at least, some aspects of it), religion and faith should be a dynamic and vital part of game-world life . . . as much if not more so than bigger weapons, tougher armor, and more hit points.

Religion is not always given nearly enough emphasis in many roleplaying games. This is not to say that there aren't any gods. In the High Fantasy genre, the gods are a very real and meaningful presence in the world. Priests of every stripe bop around, curing the sick and the lame or, conversely, carving up virgins in the name of the Dark One, and everyone else just goes about their business. Fantasy religion is certainly run like a business worshipping a god or gods isn't seen as a issue of faith as much as a matter of common sense. When the great God X will heal your sick child upon request, and the terrible God Y can level your village if he gets upset, it's only rational to fervently pray to the one and to energetically appease the other. Faith isn't an issue, since (to paraphrase Terry Pratchett) the gods have a habit of popping by an atheist's house to throw rocks through his windows.

The Gods Above And Below

In stock Fantasy, the commonplace occurrences of miraculous healing, water walking, and transmutation of clean water into a nice dry mead make the First Big Question moot: "Does God (do the gods) exist?" Not only is there proof of the gods' existence, re-affirmations happen every day, in the form of one miracle or another. The spellcasting ability of your average low-level priest would qualify him as a genuine Coming of the Messiah in the real world; not so in High Fantasy. Some fantasy priests also speak with their gods on a regular and informal basis, and can, with your small donation to the cause (read: large donation to the priesthood), pass on any pertinent information to the public at large.

The result of this extended three-way conversation answers Big Question Two: "What does God (do the gods) want Iosef Average to do to make him (them) happy?" Big Question Three -- "What happens after I die?" -- is also wrapped up nicely when your deity hangs out at the local pub, swapping stories about the joys of the afterlife for the odd drink. In a typical gaming world, High Fantasy societies have no need for faith in gods, since they have incontrovertible proof. Believing in the gods would be like believing in the tax collector. The common herd may not know the reasoning behind the wishes of the gods, but they know what the Divine Ones want; that's enough for most folks.

On a related note, in many of the urban horror and urban fantasy games, religion and faith are just different powers that the characters can enjoy. "Your Maltorforatu charms have no effect on me, Von Trapp! I am protected from your diabolical powers by my faith in God! True Faith 1.2™! Now with DarkBlok™, benchmarked at twice the sanctity of the industry standard belief system! And beware of Children's True Faith™, now in chewable tablets! In orange, grape, and new root beer flavor!" The problem here is the characters have more faith in their abilities, powers that (theoretically) come from God, than they do in God Himself. In a modern setting, the omniscient, omnipotent, omni-benevolent Deity rarely makes a personal appearance (even *In Nomine*, a game with angels and demons as PCs, has a God that stays backstage), though He makes His presence known second-hand. There is also the operant conditions of the game world to consider: if witches, ghouls, vampires, werewolves, and Things That Go Rend In The Night are all real and tangible, there's a better than even chance that the Good Guys are real, too. The strong implications of God's existence short-circuit the usual soul-searching and crises of faith that arise in everyday Real Life. Religion is only important to players who gain abilities by abusing the system.

Many of the more mainstream science fiction and science fantasy games, on the other hand, rarely even touch on the topic of religion, at least in a positive manner. (*The Parable of the Sower*, by Octavia Butler, is a notable exception.) Religious plot hooks in sci-fi consistently involve the laughable beliefs of a backward culture that wants to:

a. Sacrifice the Away Team to their primitive god,
b. worship the party's robots as demigods, or
c. subject a main character to the painful rituals of their bizarre faith.

Another standard of the genre is the society that has embraced pacifism as a way of life, and needs the PCs to fight off an otherwise-unstoppable menace. "Religion? Hokey, outdated, and no substitute for a good gauss pistol at your hip. Faith? Only for the weak and superstitious. We're beyond the stage where we need to embrace those irrational convictions, bucko! We have Science, instead!" An area where sci-fi and modern fantasy overlap is found in the *Star Wars Roleplaying Game*: the Force. The Force is there whether you believe in it or not, and if you can train your mind, it is, as they say, a powerful ally. This is another "believe and ye shall receive" game mechanic, but at least it fits the background of the system. What makes the Force different from your typical god is that it doesn't require worship, just a firm belief in oneself. Not that this makes the situation any better for our purposes, but the mood and structure of *Star Wars* would suffer greatly if this mechanic was modified or dropped.

With as bad a rap that religion gets in starship science fiction, the belief systems of the cyberpunk sub-genre are even sketchier. Not only has everyone in post-modern society lost faith in the divine, they don't put a lot of trust in science, either. This worldview is not only dystopian; it's unrealistic. It is disingenuous to think that advancing technology will have a negative effect on the prevailing religious beliefs of the day. In fact, history shows the opposite to be the case. Technological advances before and during the Renaissance and Industrial Age seemed to spark a renewed focus on the spiritual aspects of life. True, an age of high technology, with cultural elements as diverse as cybernetics and starflight, will certainly see some people losing interest in spiritual matters. A percentage the society will feel that science has answered all the Big Questions, and will stop asking. Others, deeply touched by the wonders of the universe, become much more firm and fervent in their devotional beliefs. Any tech advances that increase a society's leisure time will also act to heighten awareness and appreciation of matters of the spirit. In many cases, the new information available to the masses causes a reactionary movement back to more traditional values.

We've looked at the problems that plague religions in RPGs. Game religion doesn't have the massive social impact that it does in the real world. Fantasy societies can shop for gods as if they're buying new rugs for the foyer, and science fiction societies seem to have moved beyond the need for gods. What's left is to talk about methods to change the situation for the better. Ask yourself a few pertinent questions.

First of all, for Game Masters: Will your game benefit from adding a more realistic approach to religion? If you're running a *Paranoia* or *Toon* campaign, chances are good that the answer is no. Be aware that religion adds a great deal of complexity to a campaign, and some games are more than complex enough. Other campaigns demand a good hard look at the beliefs and belief structures of the societies involved. If you're running a campaign based in Renaissance Italy, full of cloaks, daggers, art, intrigue, poison, and court politics, religion had better be a part of the mix. If it isn't, don't throw yourself in the Grand Canal; write out a few lines on the prevailing religious beliefs, their main proponents,

any current variations on the major themes (Protestant vs. Catholic Christianity, Shiite vs. Sunni, Orthodox vs. Reformed, etc.), and any prominent heresies. (In many cases, "variation" equals "heresy," FYI.) Religious intrigue can be just as vicious as any other breed . . . perhaps more so. If you're not playing the type of game that calls for this type of thing, and would like to, take a look at *7th Sea*.

The next questions you must answer are those of location and scope. In the setting of the game, who believes in what, and how many adherents are there for this particular belief? What percentage of the population believes this way? How many major religions are there in the area? How many minor ones? Is there a state religion? How devout is the man on the street? How do the True Believers treat those that believe differently? Are there restrictions placed on the clergy or the general population? What are these restrictions and why do they exist? (Jewish dietary laws make a lot of sense, if you know anything about the cooking practices of the tribes of the Middle East in the BC's. Shellfish, for instance, is prohibited. Seems whimsical, until you learn about the bacteria that exists in Mediterranean shellfish that, if the critter is improperly cooked, can kill you!) Be arbitrary if you wish, but do try to come up with plausible excuses for any wacky "shalts and shalt nots" that you want to spring on the true believers in your game world.

Players: Talk to your GM about the religions in the gaming neighborhood. Odds are your character has been raised within one particular belief system, and will subscribe to one or more of these religions. Choose a religion that's consistent with the way you want to play your PC, and run with it. Think for a moment or two about your character's beliefs. Did his family or family-equivalent have a particular religion? Does the religion discriminate along racial, gender, or social lines? Does the character follow the strictest dogma of the faith? To what tenets of the religion does your character subscribe? Which does he reject or have issue with? Does your character tithe or otherwise financially support the religion? How devout is the character? Why? If your GM hasn't put a great deal of thought into the religious structures of the campaign, help out! Share your thoughts with the other players in your group. Any insight into a character's background and upbringing could be a key in playing that character.

Religious Plot Seeds

The Archpriest

The new High Priest speaks out against the atrocities that the local government has done in order to ferret out a group of rebels or dissidents. The rhetoric of the High Priest galvanizes the other nations in the region, as followers of the same religion demand that something be done. PCs may be assassins hired to kill him in the classic "make it look like an accident" style, devout locals sworn to protect the priest at all costs, or rebel guerrillas trying to ambush government soldiers.

All's Fair in Love and Jihad

The PC's hometown is wracked with civil unrest. The two major religions of the area have come into heated conflict in the city, and revolt and civil war seems immanent. The party may be part of the problem or a means to a solution: the group is either split along religious lines, or is called by moderates from both factions to mediate the dispute. If you're feeling particularly evil, make it both! Make sure to note those townsfolk that won't deal with members of the opposing religion, particularly those that can make life rough on the party: government officials, police, soldiers, doctors, etc.

Jerusalem, Beirut, And Everything After . . .

More a setting than a seed, this city bears the marks of countless years of war. Two (or more) religious factions claim this place as a holy city, and have been attempting to drive all other factions from it. Sporadic street clashes, snipers, terrorist actions, and one broken armistice after another are all too common. PCs may be followers of a particular sect with big plans to win the war, cooler heads trying to find a common ground, or freebooters that take advantage of the high level of conflict in the city to make their fortunes. Holy men, arms dealers, relic merchants, and garden-variety criminals abound.

Sample Fantasy Deity

Morattar
Death God

Symbol: Azure, a sword inverted Sable, on a sunburst Or, bordure Argent. (For the heraldry-challenged: a black two-handed sword point-down in a silver doorway, a gold sunburst behind, with a blue sky.) Priests wear either the Sword (black on gold) or the Doorway (silver on blue), depending on their specialties. High Priests wear both. The Patriarch wears just the Sunburst.

Interests: Death, birth, healing, protection, and peaceful negotiations.

Morattar is the god of timely death. He knows when every mortal in his ken is to die of natural causes, and works through his clergy to ensure that their death comes at the appropriate time. He is the god of the painless and fearless passage to the afterlife. The majority of his priests are called Sentinels, guardians of the passage to the other side. They have sworn to Morattar their service and their lives, and pledge to keep their congregation from harm and want until their natural time of death. The type of death that Morattar smiles upon involves being surrounded by family and friends, at a great age, quietly, in bed. He thinks of disease and injury as agents that unnaturally hasten a mortal's death, and his priests are well trained in the healing arts. He counts many midwives among his followers. No Sentinel may refuse to succor anyone who asks the priest for aid. The Sentinels of Morattar are forbidden to take a mortal's life, unless their time has come. In these cases, they are to make the person's passing as easy and painless as possible (many initiates have a better-than-average knowledge of fast-acting poisons). The feudal lords in an area blessed by Morattar often call upon the Sentinels to mediate disputes that would otherwise lead to armed conflict, as war and its attendant plagues are anathema to the god. Sentinels are known as gifted diplomats and keen bargainers, and well they should be; their auditor is a Lord higher than any mortal monarch.

Morattar's priests are not spineless pacifists -- far from it. They are also charged by their god to protect life unto its natural end. To this point, some priests of Morattar, the Swords, are trained extensively in skill at arms. They use their skills to protect the weak and downtrodden from tyrants and other oppressors. Evil people cause pain and suffering to their fellow mortals, and this can bring a premature end to any number of lives. Swords of Morattar investigate any rumors of harsh governance and bring grievances to the attention of the accused. If an evil or cruel individual mends his ways immediately, nothing more is said or done. If not, Morattar feels that one untimely death, if it will prevent many more from occurring, is a decent bargain to make. Transgressors get only one chance. Swords are sworn to bring wrongdoers to justice, and to act as executioner to the unrepentant wicked.

The afterlife brings mortals to their final reward, and souls of the departed are to remain inviolate. Undead are the foulest abomination in the eyes of Morattar. They are to be destroyed at every opportunity.

In case it needs to be said, there is no resurrection. Ever. Well, hardly ever; the rule has few exceptions, unless the departed soul 1) was killed before its time and 2) can present a compelling argument as to why it should return. Historically, this has only happened on three occasions. Reincarnation is a different story, but is only allowed at the proper time; generally fifty to one hundred years after the death of any given individual.

Galaxy: The Dark Ages

Published by GMT Games

Created by Don Greenwood and Reiner Knizia

Boxed card game with 120 cards, 25 chips, four combat dice, and a plastic draw/discard tray; $25.00

Galaxy: The Dark Ages from GMT Games is a strategy card game for two to five players that plays in just over an hour. A descendant of *Titan: The Arena*, *Galaxy* depicts a power struggle between the players for influence among the eight worlds. Designed by Reiner Knizia (*Tigris & Euphrates*, *Modern Art*) and developed by Don Greenwood (*Up Front*, *Squad Leader*), *Galaxy* shows both European and Avalon Hill influences and makes an excellent game for hobby gamers and regular folk alike.

The game starts with the eight world cards in a row, heading eight columns. Players do not play individual worlds; they are behind the scenes manipulators -- galactic illuminati, if you will. Players have five bases which they place during the game onto one world or another, representing influence in the different worlds. You can place one base per turn, and bases played earlier in the game give more influence than those placed later. Of course, since one world is eliminated in each of the five rounds, bases placed early in the game may disappear with their world. Bases can be "improved" or "damaged" (moving them up and down the columns and increasing or decreasing their influence and score) during play.

Each player begins with eight cards, nearly all representing ships with strengths of zero through ten belonging to the eight worlds. Each turn you place a ship in the column of its parent planet. When all columns have a ship in the current row the planet defended by the lowest strength defender is removed.

Players may place one secret base, in the first round, which sits on a face down card played in front of them. They get no influence from it during the game, but neither can it be attacked. At the end of the game it scores as the highest level of influence, if its world survives. Players can reveal it during a later turn in place of placing a base, in which case it's placed at the highest influence level.

The weaker ships, strengths 0-5, all have special effects when placed: allowing you to improve one of your bases or damage someone else's, pick up an extra card, see some of another player's hand, or put someone else's cards in their reserve. Each of the eight worlds also has a special power that can be used by the world's governor when they place a card in that column. The governor, of course, is the person with the most visible influence in that world. There are also technology cards, which give you an extra power, such as revealing secret bases, an advantage in combat, or allowing an extra card draw. Technological advantages are fleeting, however: they disappear at the end of the round.

Play takes from an hour to an hour and a half. A couple games' worth of experience speeds things up. When faced with several problems and no good plays, the novice tends to stare at his cards, looking for an answer; but experience quickly teaches you to play a delaying move if you have one, and draw, hoping the next turn will give you better options.

The artwork is spectacular. Each class of ship, each alien race, each technology card is rendered in full color at a very high resolution. You will catch your opponents simply staring at the cards. GMT rules are usually very easy to learn from, but a few sections will have loose wording that can cause interpretation problems during the game. *Galaxy* is the opposite: the rules are very precisely worded, with procedures and options unambiguously laid out, but they are difficult to pick up on the first read through. An index or table of contents would have been a big help. It's fairly easy when explaining the game to new players to forget Spoils of War or some other important detail. Luckily, the somewhat involved turn sequence is spelled out on the back cover.

Play has several intriguing facets: as worlds disappear, the rounds move more quickly. Play is fairly constrained; your eight cards may give you only six plays, half of which are to your disadvantage. You must make the most of what you have. Player interaction is very strong; it's easy to hurt other players, and you often find yourself cooperating with another player to defend a world valuable to both of you, yet trying to smite each other on other worlds.

At ninety minutes, play is relatively short for a strategy game, and it's good and tense throughout. Barring exceptional bad luck, all players should be in the running until the last round. Since secret bases on a surviving world are worth five points, and those on an eliminated world are worth nothing, the final score may surprise everyone. One drawback to play is that as the worlds disappear, more and more cards are unplayable, until in the final round only 44% of the cards can be played. Thus just when the game gets dramatic, players have to discard and draw, each in turn, hoping to be the first to draw a playable card. If you were clever enough to save playable cards for this you can control the endgame; otherwise it can feel anticlimactic. But in all *Galaxy* is a solid game.

A few tips: the governor of the Cylor has a large advantage in card flow in the endgame -- either make yourself the governor of the Cylor or shut that world down early. The Myrmidons can force you to use your draw to pick up your reserve; don't make the governor of that world mad at you. The most powerful use of the Divergence power of playing two ships in a turn is probably ending a round early by filling the last two empty places. Saving your bases for play later in the game to improve their chances of surviving to the end may seem attractive, but you end up with bases worth one or two points instead of three or four, so get your bases down early and fight for them!

-- C. Andrew Walters

Pyramid Review

Before the Fall (for Call of Cthulhu RPG)

Published by [Chaosium Inc.](#)

Written by Ralph Dula, Michael Lay, Gary Sumpter, Gary O'Connell & Lucya Szachnowski

Cover by Tom Sullivan; Illustrated by M. Wayne Miller; Maps by Drashi Khendup

64 pages; $11.95

In 1928, the federal government of the United States, with the help of the US Navy, raided the strange town of Innsmouth in northeast Massachusetts. Home to the Human/Deep One hybrids and the supporters of the Deep One city of Y'ha-nthlei, just off the coast, Innsmouth is one of author H. P. Lovecraft's most famous creations as detailed in his story, "Shadows Over Innsmouth." Chaosium has explored both the town and events leading up to, as well as the actual raid itself, in their supplement, "Escape From Innsmouth," part of their Lovecraft Country series.

Prior to *Before The Fall*, the problem remains that Innsmouth is of limited use both before and after the events of the raid. Chaosium have promised us "Children of the Deep," a supplement dealing with the town after that the raid, but this was due to come out in 1999 and has yet to appear. For adventures before the raid, now there is *Before the Fall*, which is part of Chaosium's Fright Night series of adventures that can be played in a single night or session. *Before The Fall* contains four such adventures, all set specifically in the 1920s and in Lovecraft country -- for obvious reasons.

The book is well presented, as people have come to expect from Chaosium. Tom Sullivan's cover is an atmospheric depiction of creatures swimming off the shore from Innsmouth, and M. Wayne Miller's interior illustrations are likewise as good . . . probably better than those in *Beyond The Mountains of Madness*. Although the maps are not drawn by hand, Drashi Khendup has done a better job with these than in more recent releases from Chaosium. In particular, the center spread map of Innsmouth and its environs is very attractive. Within the book can be found eight pages of handouts, a short index (a nice touch for a book as short as this) and a one-page gazetteer of Lovecraft Country. This is very useful, as it describes each of the major locations particular to the Lovecraft Country series, and it notes which supplement in the series is relevant to that town or village.

[POSSIBLE SPOILER ALERTS]

Before The Fall opens with "Mary," by Mike Lay. An attractive woman living in Arkham hires the investigators to help locate her son whom she gave up for adoption at birth. The trail begins in Innsmouth and it quickly becomes apparent that the locals are just as interested in what they can learn and even go to some length to be helpful. Of course there is more to this than meets the eye -- literally! This should be a mystifying adventure for the players as there is no real "bad guy" involved and they should become aware that everyone except them is working to a timetable. Mostly set in Arkham, "Mary" is suitable for solo or relatively inexperienced players.

Plots within Innsmouth lie behind Ralph Dula's "Old Acquantaince," as an old friend, a guilt-ridden, battle-scarred veteran of the First World War, asks for their help. He has literally run into something strange in the nearby town of Innsmouth, and fears for his life. He has every right to do so and although the local doctor cannot save him, he does point to a pair of Innmouth's drunken ne'er-do-well hybrids as possible culprits. Are the two really responsible, or is

there something else going on here? Getting to the truth may bring the investigators to the attention of the town's leaders, possibly leading to their arrest or being run out of town and warned not to return. Their reward may be the saving of the innocent and possibly the acquisition of a Mythos tome or two.

The third adventure, Gary Sumpter's "The Innsmouth Connection," takes the investigators to the edge of Innsmouth as they are asked to check on or possibly inherit a long abandoned mansion on the coast. Reputed by locals to be haunted, there is a more mundane, though no less dangerous, explanation as to what is going on. Whilst the Mythos does appear in this adventure, it is more as an aside, and has to be found to be dealt with. One option is given to beef up the Mythos quotient in this adventure, but this would make it unnecessarily lethal, especially for more inexperienced characters.

The main problem I have with this adventure is not its single typographical error (the only one in the book), but that its plot is very similar to that of a 1981 TSR AD&D adventure, *U1: The Sinister Secret of Saltmarsh*. Even the map of the mansion bears striking resemblance to that of the house in *U1*, which happens to one of my favorite AD&D adventures and thus why I noted the similarity. It is good to see Chaosium throwing a less other-worldly threat at the investigators, but I would have liked this adventure more had I not seen the plot elsewhere.

The final adventure is "The Occulted Light," by Lucya Szachnowski and Gary O'Connell. This has similarities to the first scenario in that it also has a young woman looking for help with investigating her family background. Her attempts to do so in Innsmouth have proved fruitless and she hopes that the investigators will have more luck. She believes that she will learn more by visiting an abandoned lighthouse, where her great-grandfather worked. Getting there is not easy, as the necessary charts have to be found and a boat chartered, but getting back off proves altogether more deadly. Held prisoner by a major Mythos beastie in the waters around the rocky island, upon which the lighthouse stands, the investigators must find a way of getting rid of it. Fortunately, the means to do so, both mundane and magical, can be found on the island, but it may take an alliance with the real reason the young woman came to the island to escape.

These four adventures can stand on their own as written, because Chaosium has included just about the right amount of detail to allow successful play in the towns of Arkham and Innsmouth. But both the *Arkham Unveiled* and *Escape From Innsmouth* supplements would be useful references to the Keeper running these, as would reading Lovecraft's "Shadows Over Innsmouth." Chaosium should be applauded for not making either supplement necessary to run these adventures and I wish that more companies took the same attitude.

Barring the reservations I have about "The Innsmouth Connection," this is a goodly quartet of Cthulhu adventures. They tend towards the slight in terms of encounters with the Mythos and Innsmouth, which is as they should be, hinting at or squirting with the awfulness that lies behind the battered façade of the dreaded town, without giving too much away. Even better is that the conclusions to each of these adventures is far from cut and dried, and there may be consequences, as well as benefits from many of the actions that the players take to solve them.

[END SPOILER ALERTS]

If the Keeper has already run *Escape From Innsmouth*, then another option would be to set these adventures elsewhere where there is a Deep One city nearby, such as Ahu-Y'hloa near Cornwall and G'll-Hoo near the island of Surtesy in the North Sea. Yet *Before The Fall* is really for the Lovecraft Country series, and would be run best as part of that campaign. If the Keeper has already run *Escape From Innsmouth*, then *Before The Fall* will be of little use. But if not, then this is a good way to introduce the players to Innsmouth without exposing to the full horror, and is recommended for that.

The Stealers of Lives

by Michael Wilson

ST: 10-12
DX: 10-12
IQ: 11-13
HT: 10-12
Move/Dodge: 6/7
PD/DR: 0/0
Damage: as human; 1d-3 punch, 1d-1 kick
Reach: C, 1
Size: 1
Weight: 120-220
Habitat: urban

Hidden among the urban throngs dwell a group of creatures who live to destroy the lives of others. Called the Stealers of Lives, they hide in plain view while they methodically go about their twisted business. Each Stealer lives with a single goal in mind: to attack and subvert the network of relationships which makes up its chosen victim's life until there is nothing left. They lie in wait, they make their plans, and then they take everything away.

A Stealer's motives for selecting a target are unfathomable; the most any Stealer has been persuaded to say on the subject is, "He was ripe." Once the target is selected, however, the process follows a standard pattern. First, the Stealer spends months, or even years, watching its designated target, learning his routines, his tastes, his resources. Next, the Stealer sets up its pawns. This may mean insinuating itself into the target's circle of friends, or placing agents into his business. It arranges its considerable resources in such a fashion as to have the maximum influence possible over its target's life. Finally, the Stealer strikes.

Stealer tactics seem to change with age. Young Stealers prefer more violent methods: destruction of property, kidnapping, even outright murder. As they age, however, they seem to gain an appreciation for more subtle strategies. They seduce away husbands or wives, and alienate parents and children. They methodically undermine and destroy careers. They mount whispering campaigns to drive away friends. The most artful Stealers of all manipulate their targets to do the job for them, alienating their own friends and sabotaging themselves in the workplace. A victim's life can collapse before him without his ever laying eyes on the Stealer who destroyed him. One infamous attack placed a first-grade teacher's name on a community-notification database of registered sex offenders, with corroborating documentation placed in various public records. The target was never able to clear his name.

Defending against a Stealer's attacks is nearly impossible. The Stealers of Lives are professional character assassins, and every one of their attacks has been months or years in the planning. Most of them also possess vast resources -- cash and equipment stashed away under dozens of identities. Even tracing the various facets of a Stealer attack back to the source can be a Herculean task; the Stealers of Lives are very particular about covering their tracks through multiple blinds, agents, and false identities. Furthermore, a victim trying to fight back must usually fight alone. It's hard to persuade others that all your troubles are, in fact, due to the actions of a single person; indeed, attempting to do so may get you institutionalized.

Stealers of Lives typically work alone. However, they do seem to keep in loose contact, and will assist one another if

the attack requires more manpower than the attack's initiator can supply. Usually older Stealers call on younger ones; whether this derives from a system of social rank within the Stealers of Lives or simply from the tendency of older Stealers to construct more complicated attacks in not known.

Externally, Stealers of Lives are indistinguishable from humans. Dissection will reveal that a Stealer lacks any sort of heart. Cryptobiologists are still trying to determine how their circulatory system works; they bleed and have arteries and veins, but there is no discernible pump. Stealers may not necessarily be detectable by the absence of a heartbeat; some Stealers have developed the ability to simulate a heartbeat through the control of internal musculature.

Stealers of Lives in the Campaign

The most direct way to introduce the Stealers into a campaign is for one of the PCs to be selected as a Stealer's next target. The nature of the assault depends, of course, on the tone of the game. In a heroic game, the order of the day may be false accusations of crimes, mysterious attacks on friends and dependents, or quests to find the antidote to a strange poison administered to a friend. A psychologically-oriented game may call for a more subtle alienation of a character's relationships: friends, Dependents, Patrons, Allies. The GM may even want to sow suspicion of the target among other PCs (though not every group will find intra-party intrigue fun).

Alternately, the Stealer's target may be someone else in the PCs' life. Friends may suddenly fall prey to a whole host of misfortunes. It can be particularly interesting if the Stealer attacks a character's (or a party's) Patron -- a major source of support is suddenly cut off. The Stealer may even make it seem as if the Patron has betrayed the character. The character will have to decide whether to stand by his Patron or let her fall.

Perhaps most subtly, the GM may introduce the Stealers of Lives into a campaign by having the PCs' current enemy become a Stealer target. Initially, they may celebrate their foe's frustration, but in the long run they will rue their first glimpse of the Stealers of Lives.

Possibilities to Consider

- **Motive:** So why do they do it? Perhaps they feed off the fear and confusion of a person whose life is collapsing. Perhaps their attacks are revenge against humanity for a long-forgotten affront. Perhaps they are the advance force of an alien invasion, carefully undermining Earth society one person at a time. Or perhaps they attack to *reproduce*, waiting until a target is completely without friends or other contacts before taking them to be transformed into the newest Stealer of Lives.
- **This Is No Alien:** What if the Stealers were just thoroughly demented humans? They may be some sort of chaos cult, wreaking havoc on people's lives for the sheer thrill of it or to feed their hungry god. They may be a secret society dedicated to amusing themselves by playing with the "weaker classes." Or they may be just an elite, ultra-mysterious order of character assassins, plying their trade for the highest bidder. If the Stealers are human, what's the story behind the missing heart? Do they really have the power to remove their own hearts and survive, or is it just a clever myth spread to confuse those who seek to understand them?
- **Illuminated Stealers:** One particularly good place to use the Stealers of Lives is an Illuminated campaign. They may be a power in the secret war unto themselves, or they may simply be a valuable tool in the hands of the Secret Masters. Every Illuminatus worth his fnord could make ample use of their finely honed talents against his enemies. A cabal of Stealers can make hash of even the most carefully constructed web of intrigues, turning servants against masters and dissipating years of accumulated leverage. The only question is what you could offer the Stealers that they would want . . . and that you would be willing to give.

Out of the Picture

Okay; this week's column may be a bit abbreviated, because yesterday I hit my finger with a hammer. And it hurt. A lot. So I'm currently typing about 17 words a minute, which is a far cry from my top speed.

First things first. You've probably noticed we don't have a Suppressed Transmission this week. This is because Ken Hite's office flooded over the Thanksgiving weekend due to a burst ceiling pipe, setting his work schedule back considerably. Hopefully Ken will be back up to full writing speed shortly, and in the interim we wish him all the best. As someone who's suffered two plumbing problems in the past few years, one catastrophic and one merely bad, I definitely empathize.

(I swear I'll be talking about roleplaying. I'll tie it all together. Honest.)

Speaking of plumbing problems, I *finally* got my sink fixed on Wednesday. Make a note, renters: The phrase, "How much should I deduct from next month's rent?" can be a *very* effective tool for getting repairs completed in a timely fashion.

Finally, Keith Johnson, Assistant Webmaster and the hombre responsible for our logos, much of our art, and generally making *Pyramid* look good, is a proud father. Congratulations, Keith and Robin! Danica Lynn Johnson, welcome to the outside world.

So . . . hammers, floods, children: what's the connection? Well, they all involve being out of the picture (we have a column title!).

In many of the RPGs I play in, we'll often take turns GMing in the same universe. This makes for some interesting adventures, as differing people's views on the same world help to shake things up periodically. Unfortunately, one of the problems we ran into early on was the need to minimize the role of the GM's character(s) when that GM takes over. Because, if he normally plays suave international spy Stock . . . Jim Stock, why is Stock suddenly so quiet this adventure just because the acting GM doesn't want him hogging the spotlight?

The way I generally get around this problem when I GM is to have my character be busy. After all, these characters are supposed to be somewhat realistic, and that sometimes means occasionally having better things to than sitting around waiting to help out your pals.

Coming up with reasons for characters to be busy is also useful for those groups who like to meet even though a player is going to be absent. Admittedly it's difficult to come up with reasons Thog the Mage isn't there when the entire party is trapped in the Seventh Level of Heck, but it's fairly easy to come up with reasons Thog's not there *before* everyone meets the map-toting old man at the inn.

Finally, coming up with good on-the-spot reasons for characters to be busy is a useful skill for GMs to hone; it helps keep players from short-circuiting adventures by going to see an NPC you forgot about, but they didn't.

GM: Okay; the village is being held hostage by a giant dragon. You are their only hope. What do you do?

Players: We teleport over to Doug Dragonslayer and teleport back with him!

GM: Um . . . he's . . . doing his taxes right now.

So to help get the old creative juices flowing, here are some ideas to consider:

- **Personal.** *Good things happen.* A child is born. A family member gets married. The character goes on a long-deserved trip. The character is requested to make a speech or attend a function in her honor. *Bad things happen.* A dependant gets sick or dies. The character gets sick or injured. Massive home problems (flood, fire, break in)

keep the character from helping. The character struggles with one of his personal disadvantages (alcoholism, hunted, laziness).

- **Professional.** The character gets an assignment that takes him away from the main group. The character gets promoted, requiring that he receive training or other reeducation. The character gets a lead on her Big Personal Goal (the conspiracy, the ancient magical secret, the location of the long lost brother) that requires her to investigate it. The character gets training to increase skills.
- **Other.** The mission presents some direct conflict for the character. The character doesn't *want* to get involved with a particular adventure. The character is assigned to work on some other tangential aspect of the adventure (a personal favorite of mine).

If you want to help your GM, you may want to come up with a list of ideas why your character can't attend a particular mission. Heck, maybe your GM will even use some those ideas to come up with plotlines!

So here's hoping we're not all out of the picture come next time. Maybe I'll be able to type next week!

* * *

By the by, it looks like I'm going to have some free time over the holidays, and the slushpile is actually fairly under control at the moment. So if you want to submit something to us, now might be a good time.

And, as ever, feel free to [write me](#) with any other comments, questions, or observations.

-- Steven Marsh

* * *

Last week's answer: **Chronomancer**, p. 67.

(Four stars) "Zrfff is a freewheeling place, with a constantly changing landscape and architecture altered by the magical whims of its inhabitants, a race of humanoid imps. Anything goes on this Fifth Dimensional planet (as long as it's funny)."

Pyramid Review

Fields of Honor: The American War for Independence

Published by [Pinnacle Entertainment Group](#)

Designed by Shane Lacy Hensley

Boxed Set; $29.95

After several unavoidable delays, Pinnacle Entertainment Group (PEG) has released the first of its new Showcase Game series: *Fields of Honor: The American War for Independence* (*FoH: AWI*). While more limited in scope and complexity than the original *Fields of Honor*, a 19th Century miniatures rule set, *FoH: AWI* allows beginning and experienced players alike with an enjoyable and attractive game that can be easily played within fifteen minutes of opening the box.

The short start time is made possible by the materials included in this boxed set. In addition to the 48-page rulebook and a pair of ten-sided dice, *FoH: AWI* comes with 208 counters representing the units detailed in the rulebook, units for the campaign game, and earthworks. In addition, two double sided, poster-sized sheets provide battlefield maps. One map depicts Brandywine and Monmouth battlefields and the other has Saratoga on one side and Bunker Hill, Guilford Courthouse, and a third small "generic" battlefield on the reverse.

The counters are attractive as well as functional. In the case of the combat units, the circular counters (each roughly the size of a penny) are two-sided with depictions of the units in line and march column formations. Combat and movement attributes are present on both sides. The print is necessarily small but fairly easily read due to smart layout. The smaller counters, used for leaders and for the campaign game, have to carry less information and, as a result, remain readable as well. The campaign counters aid this process by represent the combat strength of a unit pictorially (the reverse side gives no indication as to the force size.

The rule set is simple without being simplistic. The target number for any action is a 5 on a d10 and is modified depending on the unit's morale, location, and armament. This system is simple enough to be picked up within minutes by an inexperienced player who might otherwise be intimidated by a wargame. Indeed, the attractiveness of the presentation may attract new gamers to the hobby.

FoH: AWI also contains rules for miniatures. Players familiar with the 19th Century rule set will find much that is familiar here (as well in the counter game). The rules have been streamlined for a much faster play. In both forms of the game, whether a unit becomes a casualty is determined on whether or not it fails a morale test, reflecting the tendency of units to rout rather than stand and be shot to pieces, as on later battlefields. PEG is supporting these miniatures rules with a line of 15mm miniatures, available both through retail stores and through their online store. Basing for the 15mm figures is three infantry figures per stand and three stands per regiment. Cavalry units have two figures per stand with three stands per regiment. Artillery stands have one gun with four crewmen. 15mm figures are based on 1"x1" stands while 25mm figures are placed on 2"x2" stands.

The campaign game is fought over a simplified and slightly stylized map of the eastern seaboard, running from Savannah to Quebec. While this map does leave off several key locations (Nova Scotia in the north and the western forts so skillfully defeated by George Rogers Clarke), it would not be difficult to work these sites onto the map. Despite these rather minor quibbles, however, the system feels quite sound.

Purchasers of the game with internet access can also look forward to PEG's well-earned reputation of offering errata and game support on their website. Even before the game hit the retail market, the website provided the statistics for a

generic Indian unit -- necessary for those players wishing to re-fight such battles as Oriskany or Bennington.

The game is not without some small defects. There are some minor typographical errors in the text but not so many as to become distracting. The level of protection offered by earthworks is left somewhat vague (Shane Hensley, the author of the rules, has clarified this and confirms that they provide hard cover). In addition, those familiar with the old *Fields of Honor* system of sliding unit size, which allowed you to fight everything from a skirmish at the section level to fielding entire brigades, may be disappointed to find the new system designed for the regimental level (approximately 300 men per unit). It should probably be said, however, that having a fixed size for units in a game is probably the norm rather than the exception in wargames, especially one that can function for both miniatures and counters. In addition, the regiment was seen as the standard unit at this period. It is also true, however, that the reality of the time was that full strength units were not always present on the field. While this can be easily represented in a miniatures game by fielding under-strength units, it is less easily represented in the counters game. Under-strength units may have their fire and/or melee ratings downgraded in the Order of Battle (where troops are assigned before the game) or perhaps by assigning penalties to particular units. Neither of these approaches are specified in the game but this reviewer has used the former in attempting to draw up Orders of Battle for some historical battles.

Despite these minor points, *Fields of Honor: The American War for Independence* remains a welcome addition to the market, is an excellent introduction to wargaming, and well worth the cost. The back of the box indicates that sets for the Napoleonic era, the Civil War, and World War Two may become available in the future. The $30 price tag seems standard for most wargame/miniatures rule sets and is made more attractive by the ability to use the game within minutes instead of having to wait for the painting to be finished makes the game worth the price. The flexibility of the counters, which enable you to refight almost the entire Revolutionary War, makes the price unquestioningly fair.

-- Matthew DeForrest

?

by Elizabeth McCoy

*(This piece, despite being written by the **In Nomine** Line Editor, is not even **remotely** canon, nor likely to become so, as of this writing.)*

In *GURPS Places of Mystery*, there's a section on ley lines. In the expanded description of David, Archangel of Stone (in *Fall of the Malakim*, p. 14, and *Superiors 1*, p. 8), there is a Servitor Attunement, Geomancy, which allows a celestial to position himself appropriately at dawn and gain extra Essence.

And then, in the *Corporeal Player's Guide*, there are sorcerers, who are able to accomplish things that celestials believe no mortal should be *able* to accomplish without the use of Ethereal or Celestial Songs -- or at all!

This can all be put together, of course.

According to *Places of Mystery*, ley lines were (re?) discovered in 1921, by a businessman named Alfred Watkins, in England. In 1922 and 1925, he published books about this, naming them "ley" lines because the ancient sites that stood atop them often had "-ley" in their name.

(Of course, "leigh" and "ley," often pronounced "lee," is a common component of English surnames. It means "meadow." And England is filled with enough ancient sites that you probably could make any number of lines between them. However, let us not debunk. We *know* ley lines of some sort exist in *In Nomine*!)

Ley lines were claimed to be many things, from mere "prehistoric roads" (marked with *medieval* churches and castles), to weak points in space-time where you could see the Loch Ness monster more easily (or get sucked in yourself), to lines of mystic power which UFOs could tap into to travel upon. Some dowsers claimed to be able to detect the ley lines. Groups of ley lines sometimes intersect, and are frequently called "nodes" in various fiction literature.

In the *Liber Servitorum*, we learn that at least two groups of ethereal spirits -- the Benevolent Space Brothers and the Greys -- have taken on the seemings of UFO creatures. (We won't ask if the ideas and forms they borrowed from humanity's beliefs are real or false. That would be another article.) And then there's Ofanim and Elohim, of course, or other sorts of ethereals.

Clearly, ley lines are lines of *energy*, Essence drawn primarily from the Earth, and perhaps even some sort of mutated Tether from the long-ago past when David was experimenting. Or perhaps they're the remains of many, *many* Tethers, ethereal and

celestial, reaching out to each other . . . Individually, they've faded and are no longer Seneschal'ed, no longer funnel Essence to their masters. But if you can stand within the faint, collapsed web of them . . .

So why must a celestial with Geomancy reposition himself every time he wants to tap into this power, instead of being able to just stand at a previously established nexus point? This is simple, and has to do with the nature of celestials, and the fact that they are "out of place" on Earth. They must constantly rebalance themselves within the ever-changing Symphony to take advantage of ley lines and the Word of Stone. And indeed, ley lines on Earth probably change position slowly over time -- some ruins are merely ruins now. Between that, subtle shifts in the Earth's magnetic field, and solar flares, celestials have to make their daily Perception roll to find the currents. But once they are in that delicate, harmonious spot-of-the-day, they can access an extra point of Essence or two.

But humans have no such difficulties. Humans are native to Earth, and are thus naturally "in tune" with the Symphony. Once they find a "sweet spot," they can exploit it with varying degrees of success until it actually *does* move away -- which may take years, at least, if not centuries or millennia. Such a pity, that most of humanity has no way to take advantage of ley lines, except sorcerers . . .

Ley Sorcerers

Start with the ancient traditions, passed down from druids or witches, kept alive by hopeful ethereals and demons of Sorcery. Add a touch of insularity to keep them from getting out into general sorcerous knowledge. This isn't hard; most circles are convinced they've discovered the One True Way of Sorcery, and aren't inclined to risk themselves by experimenting with someone else's tradition. It's never a good idea to get experimental when you're playing with demons, after all.

Then add in a few variant rituals . . .

Tapping Lines for Essence

Ley sorcerers may use a variant of the Siphon Essence ritual (p. 41 of the *Corporeal Player's Guide*) to tap the energy of the ley lines. The sorcerer must be within 6 feet of the line. The ley line does not get a roll to resist having Essence drawn from it, but the variant ritual requires 1 *hour* per point of Essence drawn, up to a maximum of the check digit of the successful performance. (The 2 Essence to fuel the ritual is paid up front, with the initial 1 minute time to begin the tapping process.)

There are rumors of yet another variant, which allows near-instantaneous tapping of Essence -- and can be performed during such things as Will-Wars . . .

Rituals on a Line

At the GM's option, any attempt to summon an ethereal being (or dream-shade) may have a +1 bonus if done on a line, at a node, or while Walking the Road of Worlds (below). Or a bonus for each, at +1/+2/+3, respectively.

Also, nodes may be more effective places for Protective Wards; with a variant performance, even the lowest level Protective Ward may last indefinitely (until it has been broken down), as it can tap the node's Essence to maintain itself. Permanent Ward may also be renewed -- indefinitely, though a sorcerer must still muster up the Essence to refuel it.

Symphonic Awakenings and Sorcerous Initiations may be easier on lines or at nodes (such as Stonehenge, say). Give Awakenings a bonus of +1 to the check digit, and Initiations a bonus of the initiate's Celestial Forces to Will, if the ritual is performed entirely upon a line or node.

Standing stones often mark ley lines -- and may be handy spirit anchors. Normally, they won't be much use against an ethereal spirit -- but if you can use them against an ethereal while Walking the Road of Worlds (below), one could likely be trapped that way, and would remain even after the ritual were ended.

Necromantic rituals are unlikely to gain much benefit from being performed on a ley line, unless the line is being used to tap Essence.

Special Ley Line Rituals

(For the most part, these rituals have been based on, and translated/heavily mutated from, spells in *GURPS Places of Mystery*. One ritual, Walking the Road of Worlds, is not based upon these spells, but is instead inspired by Barbara Hambly's novel, *The Silicon Mage*.)

Each of the following is a ritual based on the sorcerous skill of *Ley Dowsing*, also referred to as "Dowsing." Ley Dowsing requires the dowser to have 6 Forces, as it is a way of listening to the Symphony, but Sorcerous Initiation or Symphonic Awakening is unnecessary for the base skill. At the GM's option, some prophets may also be able to sense the lines, despite having fewer than 6 Forces. The rituals themselves *do* require Sorcerous Initiation.

Dowsing (Perception)

This skill permits the user to sense ley lines. Some use branches or pendulums, others feel the tingling in their bare feet (or a tugging of their entire bodies) as they get closer to the line. An experienced dowser can also make a simple Perception roll without invoking his skill, and see if a place is a likely candidate for ley lines from the way the trees grow, or placement of standing stones or ruins. (This is something the GM could roll privately.)

The Glowing Road (Sense Leys)   (Dowsing/1)

To the performer's eyes, nearby (within his total Forces in yards) ley lines will glow, and even illuminate other objects! Stronger lines will be brighter, and weaker ones dimmer. Corrupted ones (see below) glow with a sickly, diseased purple-green-black. The performer -- and he alone -- may even be able to read by the light of the strongest lines.

To allow others to see the glow, double the time to perform, and add 1 Essence per additional viewer (who must participate in the ritual).

Time to Perform: 1 hour
Duration: check digit minutes
Essence Cost: 1

Purify the Road   (Dowsing/2)

A corrupted ley line (see below) can be purified by hammering angle-irons into the ground at certain points -- with this accompanying ritual, which points out the exact point of grounding required. (A mundane or dowser without this ritual may attempt to do the same by trial and error. Sometimes it works, and could be considered time spent *learning* this ritual, even without a teacher.)

Time to Perform: 15 minutes
Duration: N/A
Essence Cost: 3

Whisper Down the Road (Ley Communication)   (Dowsing/3)

This ritual allows the performer to speak mind-to-mind with someone else upon the same ley line. (Use the mechanics of the Ethereal Song of Tongues, except for the vastly expanded range.) The speaker must know the other being well enough to visualize him or her (and is at a -3 to skill if he can only recall the sound of the target's voice). If the other being is several nodes away, but on a line that is connected to the line or node the performer is on, use the check digit to determine how many nodes the message can traverse before losing coherency.

Needless to say, if either performer or recipient move off the ley line, the communication is instantly broken.

Time to Perform: 10 minutes
Duration: (CD x Essence spent) minutes
Essence Cost: 2 (minimum)

Walk the Road of Air (Ley Flight)   (Dowsing/4)

The performer(s) may fly along the ley line, at up to 50 feet above it or to either side, as if with the Corporeal Song of Motion. Moving too far from the line will cause a crash, as the power runs out. When the duration runs out, the performer(s) will drift quickly to the ground.

Time to Perform: 2 hours
Duration: 10 + CD minutes, plus one minute per additional Essence spent

Essence Cost: 10

Mark the Road (Ley Telekinesis)   *(Dowsing/5)*

This functions like the Ethereal Song of Motion, and ley sorcerers believe this ritual was used to move standing stones to mark nodes and otherwise keep flying sorcerers from meeting a messy ending. The subject may be a giant stone, or a living creature -- if someone will hold still long enough. It's subject to the same restrictions as Walking the Road of Air, and if someone manages to never learn the simpler rituals to perceive the ley lines, he can always just float large boulders to the sides until they fall.

The weight which can be lifted is 100 pounds per Essence spent. (And a performer can ride along on one of the lifted things, if it's twice his own weight, for free.)

Time to Perform: 1 hour
Duration: (CD x Performer's skill) minutes
Essence Cost: 1 per 100 pounds

Walk the Road of Worlds   *(Dowsing/6)*

With enough Essence, one may start from one node -- intersection of 3 or more ley lines -- *or* an endpoint with no other connections . . . and get to any other node or endpoint connected to it, in a single night. Many traditions say that the ritual *must* be started at sundown, or midnight, or it will not work. Others only require that the sun *be* down. The ritual must be performed at a node or endpoint, and leaving the road before reaching another one is *not* advised. (People tend to . . . vanish.)

Also, one must keep moving, and keep awake. Small creatures (like babies) can be carried, but those who stop and take a nap upon the Road of Worlds might never return -- at the least, it will end the trip right there, and "right there" may be anywhere the GM thinks . . . amusing.

If all goes well, the performer and any companions will find themselves on a slightly neglected path of Roman-like paving stones, walking between large standing stones. No matter what they pass through (cities, walls, oceans . . .), they see only fields and forests beyond the stones, lit by whatever moon- or starlight they started with. Nodes appear to be cross-roads. No machines powered by anything but human power can be taken on the Road -- cars and motorcycles just don't work, though bicycles will, as will Walking the Road of Air.

Time spent on the Road of Worlds is . . . odd. Dallying until subjective sunrise is another thing that is ill-advised, but so long as you keep walking, you wind up at the end-node at sunrise, or the amount of time you took to get there -- whichever is less. Essence regenerates at perceived time rates.

You can follow someone on the Road, but unless you leave within sight of them, you won't catch up, though you might see evidence of their passing. (Discarded candy wrappers, etc.) From the outside, the travelers will simply seem to fade from sight in a "natural" way -- a mist obscures them, or the shadows swallow them up.

Some sorcerers speculate that the Road of Worlds runs through the Marches itself, and that the Wild Hunt of legend uses it -- either exclusively, or to get to Earth and back again . . .

Time to Perform: 5 minutes, walking and meditating quietly, to start; 1 round of concentration at each node passed
Duration: 1 night
Essence Cost: 5 to start the journey, +1 per companion. 1 per traveler at each node passed, until the final, destination node. If the performer(s) cannot muster up enough Essence, the journey ends there.

Corrupted Ley Lines

Since ley lines are things of the corporeal realm, they can be affected by the corporeal realm. If too much "negative

energy" is around them, they will become dark and poisonous, dangerous to use. Celestials with the appropriate attunement will simply "route around" such lines, usually unaware of their presence. Sorcerers who don't know better may tap them for Essence, with consequences as unpleasant as the GM wishes. Ley rituals performed upon a corrupted line are also likely to be twisted, again, as amusingly as the GM desires. (Walking the Road of Worlds through a corrupted stretch of line is probably survivable, but there's no telling what might appear.)

Those living near a corrupted line may suffer accidents and sickness, and growing things will become stunted or die; pure lines allegedly aid in plant growth.

It's up to the GM to decide what corrupts a ley line. Too much technology in an area might disrupt the delicate energies, or something that might otherwise cause a demonic Tether could contaminate the existing lines of Essence. Too much *Symphonic disturbance* could also contribute to the poisoning of a ley line! (Which would make it necessary for ley sorcerers to cleanse their lines periodically, after summonings -- if they cared.)

Ghosts

One interesting variation is to have a ghost (see the ***Corporeal Player's Guide*** or the Pyramid [Lost Souls] article) attach itself to a ley line as its focus, perhaps being able to move along any connected line as well. This might only extend its range vastly, or it might actually be easier for a ghost to anchor itself, giving a +2 or higher bonus to the soul's Will roll. Even if the anchoring doesn't get a bonus, the GM might want a ghost anchored to a ley line or node to be able to tap the lines for Essence, much like the Seneschal of a Tether. (The GM will have to assign an Essence flow to the anchoring ley line, probably following the guidelines in the ***Liber Castellorum***, to determine how much Essence the ghost could tap.)

Ley Lines in the Campaign

Ley lines are most commonly associated with foggy English hills, but they are undoubtedly all over the world. If there aren't too many nodes underwater, a ley sorcerer could Walk the Road of Worlds from one continent to another, confounding celestials who are used to humans being stuck with airplanes while they can make use of handy Tethers to move from one country to another quickly.

GMs will (probably) not want to give *unlimited* power to sorcerers who control a line or node. The Essence flow rules for Tethers, from the ***Liber Castellorum***, p. 14, can help determine how much energy is available to any given sorcerers at a given time. If someone attempts to tap a line for Essence it does not have, the ritual will either fail, or work more slowly. (Wards will need large amounts of Essence to stay up.) Since this makes Essence back into a scarce resource, sorcerous circles will not want to share their knowledge too freely -- lest other circles be using *their* nodes when *they* need the energy!

Naturally, this will make ley sorcerers rare, and powerful! With more energy than usual available to them (and without animal or human sacrifice, even!), as well as esoteric rituals, they can exert quite a bit of influence -- ley sorcerers are likely to fit the bill for Illuminati-style secret societies, or perhaps even the Dozen.

Of course, the Dozen are a myth. Any demon knows that.

Ley Lines in In Nomine

Just don't hang around chanting humans in stone circles. Better safe than sorry.

by Kurt Brown

Player's Information

Located two parsecs from the Tischaune, the proto-star known as Vagabond was detected almost by accident by members of the Scout Service Technical Services Branch team based on Tischaune. While testing a new high-sensitivity optical telescope designed to be part of a larger deep-space interferometer, technicians targeted the nearby Salome system, six parsecs away. The lead technician on the project noticed a faint ring around the image of Salome. After spending several long and expletive filled hours, the technician decided that there was nothing wrong with the optics or the focusing motors on the array.

In desperation, he contacted a friend of his who was more knowledgeable about astronomy. His friend, on seeing the image of Salome, informed the technician that one of two things had happened. Either they had both developed a case of myopia, or the array had captured a gravity-lensed image of the star caused by a massive object between Tischaune and Salome.

Deep-space astrophysicists and observational astronomers were called in to investigate further and after several days managed to roughly plot the position of a trans-solar "brown dwarf" that they christened Vagabond. Vagabond has become a top-priority target for the Scout Service, as it is one of only a handful of trans-solar worlds discovered to date. The adventurers have the distinct honor of being the first citizens to visit this wandering world.

Details of Vagabond

Location: Two parsecs anti-spinward from Tischaune
Classification: Trans-Solar Gas Giant/Brown Dwarf
Size: 95,000 miles in diameter
Mass: 0.06 Solar Masses
Composition: Hydrogen/Methane atmosphere, possible liquid hydrogen core
Moons: None
Rotational Period: 17 hours
Axial Tilt: N/A

Vagabond is an enormous gas giant, originally part of a nearby nebula, that was flung into deep space during the early formation of it's parent system by the passage of another star. Had Vagabond not been sent on its interstellar journey, it would probably have gathered enough mass from its stellar "nursery" to become a small star, part of a double system. It has enough mass to emit a significant amount of infrared energy, but does not "shine" in visible wavelengths. Vagabond is currently traveling through interstellar space at 24,000 mph due rimward along the plane of the galaxy.

GM's information

Unlit by any nearby star, Vagabond offers a truly surreal appearance to the newly arrived Scouts. It glows with a dim reddish glare produced deep within the crushing depths of its core. Streaked with rapidly rotating bands of clouds thousands of miles wide, it looks like a reasonable substitute for the countless visions of hell handed down throughout history. Flashes of lightning constantly flare across the tops of the miles-deep cloudbanks. The overall effect is one of foreboding, as this immense proto-star appears to roll through space at almost seven miles per second.

Vagabond is not alone on its journey through interstellar space. At some point in the distant past, another starfaring race used Vagabond as a deep space refueling station. Circling the world in a low orbit is an automated refueling and repair station, still barely functioning after untold millennia. A sensors roll at -5 will locate the station. Should the team fail to find it during their routine scans of the planet, their probing will activate the automated station, drawing it to them.

The station resembles a huge flattened doughnut, almost half a mile across, with eight flexible arms extending out from its edge at regular intervals. The station has three other ships already in its grasp. They are docked to ports located near the base of the flexible arms that are wrapped around them like snakes. None are of familiar design, although one of them does bear the markings of the early Empire. All appear to be in excellent shape.

As the adventurers near the station, they will be hailed in an unfamiliar, mechanical language. Attempts to respond to the hail go unnoticed by the decaying electronics of the station. After several more attempts to contact the Scouts, the primitive artificial intelligence of the station will come to the same conclusion that it has at least three times before: The ship must be too damaged to respond properly. In its mind, such a damaged ship is in danger of falling into the planet, so speed is essential. The station has surprising agility for a structure its size (4-g maneuver drive) and will quickly move to grab the Scout's ship. If they fire on the station, it will not respond but will add "malfunctioning weapons systems" to its damage report.

Once the ship has been captured by one of the flexible arms, it will pull the adventurer's ship down to a docking port where smaller tentacles will extend and wrap around the front of the vessel. Once it is firmly secured, additional tentacles will extend further along the hull looking for fuel ports, maintenance hatches, and other access points along the hull. The ship will not be able to pull away unless it has drives rated for more than 4 g's, and might damage weaker drives if the attempt is made.

Refined fuel will be pumped into the tanks. Exterior damage will be repaired and repainted to match the ship's color scheme. Capacitors will be recharged. Then the trouble begins.

"Let's just pop the hood and have a look. . ."

Once the routine maintenance has been performed, the station will hail the ship and request access to the interior for additional repair work. If the Players have translation computers and the required skills to operate them, they may attempt to translate the language of the station with a -2 to all rolls. Otherwise, the station will assume that communications are still off-line and proceed without permission. If the adventurers insist that their ship is undamaged and they do not need assistance, the station will assume a malfunctioning crew and add them to the list of items that need repairs.

The station extends a docking clamp, latches onto the airlock, and waits for the Scouts to open the hatch. If they do not open it within three minutes, a swarm 3d6 robot "sea urchins" about six inches in diameter will float down the docking

umbilical and begin to burn their way through the outer airlock door. It will take them five minutes to burn through the door. If the adventurers open the hatch before it is cut open, the robots will stop and attempt to enter the ship. Any attacks on the sea urchins will be ignored (treat them as small, moving targets with DR 10 and HT 5), although replacements will quickly arrive to continue the repairs. They will tune the drives, clean the air scrubbers, and attempt to repair the "malfunctioning" communications equipment and ships weapons. Since the station does not stock identical replacements for the ship's equipment, it removes the items and advises the adventurers that they will need to wait for a re-supply ship to arrive with replacements. As they try to decide what to do next, a two-meter tall floating urchin will arrive at the airlock and indicate that it wishes for the Players to follow.

"Looks like you're gonna need a new crew. . ."

If the Scouts go with the large urchin, they will be lead to a circular waiting room with shallow depressions in the floor filled with the remains of ancient cushions. Upon further inspection, several mummified bodies from at least three different species are discovered in the pits. If questioned about this, the large urchin will indicate that they were defective parts of the other vessels that were being held until suitable replacements arrive. If the adventurers point out that the crewmen are dead, the urchin will merely confirm that they are malfunctioning, then leaves via one of eight passages that radiate away from the waiting room.

At this point, the GM is free to lead the players down whatever road they wish. The interior of the station is dark, moody, and should result in at least one fright check per player if handled properly. Within the station there are signs of ancient struggles between the crews of the other ships and the station, more bodies, and several sealed doors that have obviously been the targets of attempts to force them open.

At first, the station will merely ignore the Scouts attempts at communication or escape. Gradually, the deteriorating circuits will drive the station deeper and deeper into madness as the adventurer's efforts to escape grow more intense. It has dozens, maybe hundreds, of robotic minions to deploy against them, but it is not invincible. The station is advanced but old, and as more damage is done it will begin to lose control of its basic functions such as lighting and environmental controls. Eventually the station's higher functions will begin to fail, and its orbit around Vagabond will begin to decay rapidly. A dramatic ending should have the Scouts dashing down a flailing umbilical to their ship as the station begins to plunge into the dense atmosphere below.

The GM should be careful not to let too much advanced technology fall into the player's hands. Several heavy doors seal off the three ships that are tethered to the station. Inside the station, the sea-urchin robots (designed to resemble the race that built them) are portable and might be worthwhile if the adventurers can avoid the micro-fusion torches each robot has and find a way to contain or disable them. The robot urchins are not independently intelligent, relying on information and direction from the station to function properly. However, the advance micro-circuitry would be of great interest to certain individuals or companies. Other than the robots, there should not be too much lying around for them to grab on their way out the door, although this might be a good opportunity to introduce that one "special" device that has been gathering dust in your desk drawer.

Remember that once the Scouts escape from the station, they still have to survey Vagabond. Who knows what else lurks behind the rim of this hellish world?

Pyramid Review

Cry H.A.V.I.C. Miniatures Game

Published by [Talon Games](#)

Written by Jon Walker

128 pages, 4 color inserts, 3 record sheets; $19.95

My first impression of *Cry H.A.V.I.C.* was mixed. Initially I was troubled by the cover, which is an incredibly garish yellow; luckily the interior of the book is simple black type on white paper. My second impression was less superficial; at 128 pages not including card inserts, the book is large, very complete and is supported by a very nice line of miniatures.

The title *Cry H.A.V.I.C.* refers to a Heavy Assault Vessel -- Infantry Carrier, a combination landing craft/starship, which is a little unusual for a game of squad based combat; still it does have a ring to it. As far as the game setting is concerned, *H.A.V.I.C.* has a lot going for it. Beginning with a stratification of state and corporate entities on earth, an expansion into space, planet (and later interstellar) wars, and a subsequent proliferation of empires, *H.A.V.I.C.* has a rich world with plenty of room for expansion. The book focuses on two empires: the Ryuuza Imperium (descended from militant Japanese corporations), and The Terran Confederation (an Australian-based dominion). It provides a lot of in depth information on these rivals. Also mentioned are other governments such as the Hellion Commonwealth and New Avalon, but only as tantalizing hints. Hopefully these other nations will be expanded in later releases, as the tantalizing glimpses of New Avalon power armor would make great minis. I would have liked to have seen more and more detailed world information presented, along with a more chapter breaks or an index to readily find info.

The book is designed for wargamers and suffers a little in presuming that all readers will be familiar with the game world. The rules are complete, and game play proceeds at a typical pace for such games. The rules themselves are similar to *Warzone*, and like that game emphasizes close combat over ranged weapons. Close combat is definitely more effective than any other type of combat (e.g. artillery, psyker powers, or simple guns). The idea that close combat in the future is more deadly than ranged weapons is mainly a setting conceit, and gives the game its own flavor. I found it to be highly reminiscent of the armor knights and less effective missile troops of most medieval era war games. This comparison is intentional, as most of the artwork and the miniatures themselves are evocative of knights, dragons and such.

Combat consists of an attacker's control number compared to a defender's opposing number cross referenced on a success/failure table to determine the base to-hit roll required. Modifiers are added to the required die roll, not to the control or opposing numbers. For close combat each unit's Close Assault Value (CAV) are cross-referenced; ranged combat is similar but compares the attacker's Ranged Assault Value (RAV) verses the range bracket (short, medium, long and extreme) to produce the roll required to hit. To damage a target the weapon's Penetration Value (PV) with modifiers must exceed the target's Armor Value (AV). Any positive number is considered a point of damage and removed from the Target's Damage Factor (DF), which serve as hit points. Large robotic killing machines called M.A.R.S. (Mobile Assault Robotic Soldiers) have target areas that must lose their individual DFs to be destroyed. Each unit has 12 stats of which RAV and CAV are two, which makes each unit distinct but also complicated to remember. The game also uses a number of charts and place markers. Luckily there are record sheets to photocopy, a sheet of colored counters, and two combat chart sheets that summarize all the relevant info you need for combat.

Cry H.A.V.I.C. tries very hard to provide all the information you need to play readily at hand, and there is a lot of information to be absorbed. The game has a lot of terms, and almost every unit or piece of equipment has its own

modifiers, which makes *Cry H.A.V.I.C.* a little difficult to get the hang of. Compared to *Warzone* or the latest incarnation of *Warhammer 40K*, *Cry H.A.V.I.C.* is definitely the more complex of the three, but also seems to be able to accommodate more variety of play. The designers have done a good job creating a strong rule that accommodates almost every aspect of combat as well as providing a framework that could be expanded into an RPG. Examples of actions (most units have three) include move, evade search, aim, or open a window. Units can also have skills such as leadership, tactics, technician, and medical. It wouldn't take much work to expand the skill system into a full blown RPG.

Beginning wargamers might be wise to pick up a less complex game first, but then it's unlikely that *Cry H.A.V.I.C.* would be picked up by beginners. It's not so complex that a beginner couldn't understand it, but it's no cakewalk either. Of course the best reason to pick up *Cry H.A.V.I.C.* is for the miniatures, which are well-designed and well-molded in dynamic poses. The minis are cast in 25mm scale with standard units being one piece and larger units such a M.A.R.S units requiring assembly. The figures are well-crafted and the examples I have seen have little flash and are generally clean. The metal is a little soft and narrow appendages such as swords, spears and some gun barrels bend easily. This isn't really a really a problem but just a bit of a surprise, given that most modern castings are as malleable as adamantium.

Cry H.A.V.I.C. has a lot of potential as a miniatures line, a wargame and perhaps even an RPG. I look forward to seeing what Talon Games has in store for future supplements.

-- Andrew Lucas

Pyramid Review

Siege on Tolkeen: Chapter Two, Coalition Overkill
(for Rifts)

Published by [Palladium Books](#)

Written by Kevin Siembieda and Bill Coffin

112 Pages; $12.95

Bad guys, bad guys, and more bad guys. That's what it's all about as Palladium
gives us installment number two in their six part *Coalition Wars: Siege on Tolkeen*
series, *Coalition Overkill*. The book picks up where book one left off, giving us the current state of the war as well as
a bunch of material for GMs running a campaign to play with.

The main focus of the book, as the title would imply, is the Coalition forces and their nasty reaction to the first wave of
fighting in their siege on Tolkeen. It starts with an exploration of the CS's (Coalition State's) reaction to the initial
wave of combat. For those of you who don't remember, the first round didn't go too well for the CS. Their magic-
wielding foes from Tolkeen proved to be far more than the simple opponents that they had thought them to be, and the
CS lost many of their troops and many of their resources accomplishing nothing in the initial stages of fighting. As
Siembieda explains, this has created a sort of backlash effect. At first the Coalition troops were fairly shaken by these
mysterious forces, but the second wave of troops arrived on the scene more resolute and determined than could have
been imagined.

Siembieda explains at length the effect this war has had on the CS troops and the changes they have undergone.
Unfortunately, many of these have been for the worst. Given that the magical forces the CS is up against are so
mysterious and prone to deception, the Coalition has adopted a bit of a "kill all" strategy. This means that a lot of
innocent bystanders -- harmless villagers and the like -- are being slaughtered in the wake of this rampaging army.
While the Coalition was presented as a dynamic, not *all* bad, force in previous material, this book shows their worst
side, depicting them as the horrible monsters they are capable of being.

Profiles are given for several of the major leaders in the assault, and for the most part, these guys are the worst of the
worst. The most notable of them is their leader, General Micander Drogue. This man is evil through and through, and
it is his diabolical intention to see to it that every last citizen of Tolkeen is slaughtered. He is an absolute genius and a
brilliant commander, one who just might prove capable of the horrors of which he dreams. The other leaders are only
better than Drogue in the respect that they have a little less power in their hands with which to do harm. These bad
guys are all a little bit one-sided and lack a bit in dynamics, which may upset some GMs. However, Siembieda goes
into fair detail with their backgrounds, rounding them out as best as possible.

We also get a profile of a mean and nasty CS special ops team called the Dirty Thirty. They're broken up into A, B,
and C teams, each with their own unique abilities. Most of the team members are pretty interesting characters, and the
Dirty Thirty makes for an excellent group of NPC operatives. Hopefully, we'll see a few more special ops teams
profiled in future books as well. Along the same lines, there are profiles for several notable mercenaries as well. Most
of them are pretty interesting, and a lot of attention is paid to the backgrounds of each one. The only downside is that
all of them are CS agents, even though one team is working incognito.

We also get pregenerated stats for most of your standard CS troops; so the next time you've got a CS commando, a
dog boy, or some other CS bad guy jumping from the bushes, you've got all you need right there for you. We also get
details on the concentration camps being set up by the CS to store all the captured prisoners in. It seems that the CS

may be going the route of the WWII Nazis in their war strategies, something that certainly doesn't bode well.

I must admit a little bit of inconsistency here between the early portion of the book and the later. In the beginning, the CS troops are described as being merciless murderers, set on killing everything in their path. Then, all of the sudden, in the end they are putting the prisoners into camps instead of killing them outright. The camps are termed work camps, and the open agenda isn't to have all of the prisoners systematically killed (like in a true concentration camp); however, Siembieda does note that if things go the way General Drogue plans, then these camps will indeed be used as a tool for all-out genocide.

Some of the strongest aspects of the book are the personal accounts of the war. These are stories written in the first person and told by troops on both sides. We get the picture from these stories that the issues aren't all black and white. The troops on either side don't necessarily fight with the genocidal zeal of their leaders, and they do see faults in the acts which they are being ordered to commit. All too often, this sort of fiction is "fluff" that's unimportant and doesn't really need to be read to catch the gist of the material. Here, however, the accounts lend true value to the story and should not be skipped at all.

There is a portion of the book dedicated to what's going on in Tolkeen. In particular, it focuses on the strategies that Tolkeen has been using as it also advances into the second phase of the war. The strategies are all very smart and inventive, using Tolkeen's magical and dynamic forces to their absolute fullest and demonstrating how Tolkeen is dealing with the massive war machine of the Coalition.

We are also finally given the skinny on the Daemonix. The Daemonix are a race of enormous sub-demons from another dimension that Tolkeen has liberated and added to its forces. The beasts are all enormous, terrible, and utterly alien. What makes them more strange is that Tolkeen has grafted all of them with techno-wizard cybernetic enhancements. Thus, Tolkeen has finally acquired some huge, demonic juggernauts to help them win the war. Of course, with Tolkeen using these "demons" as part of their fighting force bears a lot of implications, the least of which is that the Tolkeenites aren't quite the innocent good guys that they think themselves to be.

The book is rounded out with an adventure called "Asher's Revenge." It is pretty straightforward, but involves some fairly heavy hitters, including a couple of very big and mean dragons, so it should be a welcome addition to an ongoing campaign.

The only real downside to the book is that it is somewhat one-sided, focusing very much on the bad guys and not a whole lot else. Of course, given that this book is only one in a six part series, this is certainly excusable; Siembieda definitely has room to focus a little if he wants to. So long as the remaining books take it in different directions (which they most likely will), then *Coalition Overkill* provides a welcome addition to the *Siege on Tolkeen* series.

-- Jon Thompson

Pyramid Pick

The Keeper's Companion (for Call of Cthulhu)

Published by [Chaosium Inc.](#)

Written by Keith Herber, William Dietze, Brian M. Sammons, Charles P. Zaglanis, Lynn Willis, Sandy Petersen, Kevin Ross, Scott Aniolowski, Sam Johnson, Stacy Clark, Peter Jeffrey, Lucya Szachnowski, John B. Monroe, Bruce Balloon, and Davide Gallorini

Illustrated by Drashi Khendup, Earl Geier, Tom Sullivan, Dreyfuss, Lisa A. Free, Jason Eckhardt and Paul Carrick

Cover by Paul Carrick

208 pages; $23.95

For *Call of Cthulhu* Keepers wanting more information about the game and the Mythos, the first purchase in the last few years (after the main rulebook) has been *The Keeper's Compendium*. Unfortunately this book has been out of print since 1996, but now Chaosium have gone one better with the release of the much expanded *The Keeper's Companion*.

Described as "A Core Book For Keepers, Vol. 1," this is 208 pages long (130 more than the *Compendium*), containing the both the material from the *Compendium* and a lot of new stuff as well. It is a impressive looking book, graced by a full-wraparound Paul Carrick cover, depicting an ominously brooding Cthulhu himself. Some of Carrick's previous artwork for Chaosium has tended to be a little too murky, but this is just right, and Chaosium should allow him to do more in this style.

The internal layout is clear and simple, thus living up to Chaosium's usual standard. While discovering that a book this size does not have an index would normally set me howling (for *The Keeper's Companion* does indeed not have an index), Chaosium have more than made up for it by listing every single entry in the book in the Table of Contents at the front.

The majority of the interior art consists of reprinted pieces from the *Compendium*, but each of the *Companion*'s ten chapters has a new piece in the sidebar of left-hand page, which is reversed on the opposite page. These are all drawn by Drashi Khendup, who has previously drawn most of the maps using a computer in Chaosium's more recent releases. While I have disliked his rather soulless cartographic efforts, Khendup's own art is a revelation, and I urge Chaosium to have him draw more art and less maps.

The reprinted material from the original *Compendium* consists of the chapters on "Alien Races," "Forbidden Books," "Mysterious Places," and "Secret Cults," and each has also been slightly amended. This takes two forms: one is updating the material to take account of information found in more recent *CoC* releases, the second is simply attributing the author of that entry and where it first appeared. This is a nice touch, and Chaosium should be applauded

for it. Also reprinted is "Good Cthulhu Hunting," Sandy Petersen's and John B. Monroe's guide to successful investigating from *The Cthulhu Casebook*. This, along with the final chapter, "Skills Revisited," is probably the only section that the players should have access to, and perhaps should have gone into a book meant for the players instead. As an accompaniment to the useful "Good Cthulhu Hunting," Keepers receive their own advice in "13 Suggestions for Keepers," which is equally as good. Experienced and novice Keepers alike will find this worth the read.

Over all I have no real problem with the reprinting of the contents of the *Compendium*, but Chaosium misses an opportunity in the reprinting of the "Forbidden Books" chapter by including only a partial list of More Mythos Tomes from the original book. I would have liked Chaosium to expand upon the titles given in the *Compendium*, rather than just listing just some of them again.

Augmenting the chapter on "Forbidden Books" is one on "Occult Books." There are seventy entries here, broken down into pre-nineteenth century, 1900-1940 and 1941 to the present day lists. As with "Forbidden Books," each entry gives the book's title, language, author, format, date of publication, whether it is in print, and then a more detailed description. Finally the entry adds the possible SAN loss and Occult skill bonus for reading the book. Occasionally an occult title will grant the reader spells and these are also given, but only with their game names. If these books, which the *Compendium* says are all real-world titles, call their spells by something else (as in many of the Mythos tomes in the "Forbidden Books" chapter), I would have liked to have seen these included.

Similar to the chapters on Forbidden and Occult books is "Arcane Antiquities," which contains twenty-three arcane artifacts taken from both Mythos fiction and many previous *Call of Cthulhu* supplements. Each entry is very full and is accompanied by the original artwork, as well as details of any associated creatures. Fiction sources for the artifacts includes stories Lovecraft, Derleth and Clark Ashton Smith, as well as by more modern authors such as Ramsey Campbell and Brian Lumley. A pleasing touch is Chaosium's acknowledgement of the material published by Pagan by including an artefact that originally appeared in Pagan Publishing's *Unspeakable Oath* magazine.

Version 5.5 of the *Call of Cthulhu* rulebook included an eight-page chapter on forensic pathology, but this was not included in the most recent edition (5.6) of the rulebook. Chaosium has rectified this omission by having a twenty-five-page chapter on Forensic Medicine. This covers most things that a Keeper will want to know about the subject, from Coroners and Medical Examiners and their duties, through the nature of deaths via diverse means, to law enforcement and the actual forensic sciences. In addition, the chapter includes a Law Enforcement Timeline and a list, state by state, of when a death falls under the jurisdiction of the coroner's office. At the back of the *Companion* is a sample "Apparent Natural Death" certificate for in game use. This is another useful chapter, and I can see the information here proving very handy in other modern RPGs.

The final chapter of note is "Skills Revisited," with Chaosium admitting that the game's skills have not been looked at in a while. The aim here is not only to expand on the existing skill list from the rulebook, but also to explain what the skills are and what the ratings really mean in each case. New skills include Academic Lore, Academic Standing, Cryptography, Folklore, Hypnosis, Legerdemain, amongst others; expanded skills include adding use of the Internet to the Library Use skill, for example, as well as changing the basic levels for Mathematics and Climb. Many of these new skills have been looked at before -- particularly by Pagan Publishing, so it is nice to see Chaosium provide an official ruling on them. That said, nothing in this chapter is written in stone and Chaosium offers it as an option.

Alongside the numerous chapters in the *Companion*, there are the occasional short pieces and options. These include alternative rules for Resistance Table, losing Sanity, and brainstorming ideas. Of these, the rules on losing Sanity are of more interest than the other two options, but all tend to complicate slightly *Call of Cthulhu*'s simple mechanics.

Any book described as a core item for a game line should be indispensable to a referee, so is this the case with *The Keeper's Companion*? For the long term *Call of Cthulhu* Keeper, who has the original *Compendium* and the supplements from which many of the artifacts are drawn, the *Companion* is not going to be quite as useful as it is to the Keeper who doesn't. Yet to have all of that information in one place, plus everything new that Chaosium has put into the book, means that *The Keeper's Companion* is very nearly indispensable.

The Keeper's Companion is not without its problems, but these are really niggling little grips upon the reviewer's part. Overall, the breadth and usefulness of the information in this book means that every Keeper should have this book as

their *Companion* when running *Call of Cthulhu*.

Only 17 Shopping Days 'Til Lux Splendor!

To paraphrase South Park, the holidays are about something very important: *presents*.

Strangely enough, one of my favorite parts of many RPG campaigns isn't the creation of characters, or the discovery of hidden plot, or the inevitable combat with the oily-moustached villain. No, I like the holiday time of gaming worlds.

The gift-giving time of year, be it wintry Judeo-Christian holiday, Lux Splendor, or ancient fae festivals like Boxing Day, usually means downtime (which, as I've said before, I like). It's a quiet moment that's generally consistent from year to year, and (at least in my gaming groups) tends to be memorable. Unlike, say, birthdays, which vary from character to character and tend to get forgotten (in a way unlike most real people), it's a lot easier to look at the big master calendar and say, "Whoops! Holiday time! What's everyone up to?"

These holidays allow characters to give presents to other PCs and NPCs, and allow a unique opportunity for a different kind of characterization, where both the giver and givee can shed new light on their characters, and can introduce (or reintroduce) subplots, character aspects, or even plots.

Consider *Star Trek II: The Wrath of Khan*. In that movie, Dr. McCoy gives Captain Kirk two gifts for his birthday: a bottle of Romulan Ale, and a pair of antiquated Ben Franklin-style glasses. Both gifts reveal much about Dr. McCoy (who is willing to supply highly illegal alcohol to his friend, himself a military lawman, *and* provide a more practical, thoughtful gift)[1], and set up the thematic tensions of growing older, career choices, etc.

So why not give presents to characters in the gaming world, and have presents given to them? They can shed light on NPCs; the narcissistic character can give a mirror (or worse, a picture of himself), the gregarious character can throw a party in the character's honor, the mysterious ally can give the quiet character a tiny bird in a cage.

The holidays are also great for characterization. It says one thing to give a fellow PC a book you think she might like; it's another to give her a copy of *your* character's favorite book. And how your character reacts to those gifts can give new insights. How does your character react when presented with a previously lost shield that belonged to your deceased brother? What does your character do when kissed beneath the mistletoe by a possible romantic interest? Why does your character refuse to give presents?

The gift-giving season can provide plot hooks. Let's face it . . . there aren't many instances where receiving a treasure map *wouldn't* be suspicious. But being given a map by a not-so-close acquaintance who believes it to be worthless is completely believable. An NPC Patron could give the PCs a piece of information or lore that could provide adventure possibilities. An NPC enemy could show up on the holiday eve with a banner of truce; is it a trick?

Finally, depending on the genre, the holidays are a time when *much* less believable incidents (a.k.a. miracles) can occur, and be completely acceptable. As a GM, were you looking for an excuse to bring back a long-lost parent? Did you have a disease subplot that was dragging down the campaign that could be miraculously healed? If the good character has been having a rough year, the holidays are a fine time to balance the scales with a karmic reward.

In many ways I believe the real world and gaming worlds can mirror each other, and the giving and receiving of holiday presents are one of the nicer occurrences. By making your characters thoughtful (or thoughtless), and introducing new curious (and possibly rewards) to think about. you can greatly enrich their characterization in an organic fashion. And, really, isn't that what gaming is all about?

Besides presents?

-- Steven Marsh

* * *

[1] As a completely random aside, I love a piece of creative fixing of a seeming mistake a fan has proposed about *Star Trek II*. In the gift-giving scene mentioned above, Kirk reads the bottle. "2283," he says, squinting to read the bottle. McCoy replies, "Yeah, well, it takes this stuff a while to ferment."

Now, according to the *Star Trek Chronology*, this movie occurs in 2285 . . . so it's not a very fine vintage at all. It has been proposed that the date of the bottle is, in fact, correct; Bones was being ironic about his comment, and really gave his friend galactic hooch, the Romulan equivalent of Thunderbird.

Which, in my mind, sheds even *more* light on McCoy's character.

* * *

Oh, I've also got a note here from K. David Ladage, ringleader behind the *GURPS: Pyramidian Project*:

> The deadline is quickly approaching for submissions into the *GURPS: Pyramidians Project*. The *Pyramidians Project* is a collection of the various members of the *Pyramid* Online community written up as **GURPS** characters.
>
> K. David Ladage will accept submissions for this e-book until the end of December. The book will be edited, formatted and published electronically sometime in early-to-mid Januarys.
>
> More information about the project is available on-line at http://pages.prodigy.net/kdladage/jegame/gpp.html.

I feel I should point out that this project is unofficial, and in no way sponsored by Steve Jackson Games.

But I'll have my writeup in there (once I squirrel a few minutes away to finish it), so you may want to check it out regardless.

* * *

Last week's answer: **The Atlas of the DC Universe**, p. 203.

(Two stars) "Imperial overconfidence remains the Rebellion's biggest advantage in the galactic civil war, and nowhere was this overconfidence personified better than in the Death Star battle station."

High Weirdness Indeed: The Empire State Building

"The reports themselves argue strongly against this. For the reports do not range over a broad spectrum. There are virtually no reports of unidentified sailing objects, or of UFOs with wings or wheels, and there are no reports of flying pink elephants (FPEs!) or of the Empire State Building being seen upside down in Pittsburgh."
-- J. Allen Hynek, "The UFO Mystery," *FBI Law Enforcement Bulletin* (Feb. 1975)

But you know, if people did see a tower "upside down in air" (as T.S. Eliot would, and in fact did, put it), it would probably be the Empire State Building. Much as it galls my skyscraping Chicago soul to admit it, when it comes to capital-T The, capital-T Tower, there can be only one. And what a one it is -- possibly the last truly great building in America, built when Art Deco had aged to mellow perfection, but before the bitter Teutonic winds of the International Style could sweep all ornament and humanity away. Is it any wonder that the Reptoids and the Rosicrucians, Doc Savage and Felix the Cat, King Kong and the C.H.U.D.s, that everybody who isn't anybody fights their secret battles over it through time, space, and dimension? Well, it is a wonder -- and a story. 102 of them, in fact.

"A new and convenient house, barn, and several out-buildings, together with 20 acres of land, situated in the heart of New York Island, along the Middle Road, near the 3-mile stone, about 1/2 mile north from Chelsea Village. . . . . It is confidently expected by those whose opinions are conceded to be found, that the rapid growth of the City and the villages of Greenwich and Chelsea will soon cause the value of the Aforesaid Land to be greatly enhanced."
-- notice for sale by "Jno. Thompson" of the future site of the Empire State Building (1825)

All 102 stories begin in the middle of Manhattan Island, on a swampy site known in colonial times as Sunfish Creek. The lot where Sunfish Creek and another, lesser, stream intersected, was common town property until 1799, when one John Thompson purchased it for $2,400 and built a farmstead there. (The western slice of the future Empire State block had been granted in 1686 to a black man named Francisco Bastian, who sold out to a silversmith thirty years later.) In 1825, Thompson in turn sold the lot to a married couple, the Lawrences, who turned right around and sold it to a man named Charles Lawton for $10,000. Lawton doubled his money in two years, selling the property to William Backhouse Astor for $20,500. The Astor clan, headed by German fur-trader John Jacob Astor, was busily buying up all of New York City that was for sale. In 1849 a slum riot on Astor Place led the Astors north, to the old Thompson farm, where they built a sumptuous mansion at 350 Fifth Avenue. After feuding with his aunt Caroline Astor, William Waldorf Astor tore down his neighboring mansion and replaced it with a "common tavern," the Waldorf Hotel. John Jacob Astor IV responded by tearing down his mother's mansion and building an even grander hotel, the Astoria; cooler family heads prevailed, and the Waldorf-Astoria became a linked "twin" hotel and the center of New York's "tenderloin" district of Mauve Age decadence. Eventually, the Waldorf-Astoria became a victim of its address; midtown property was too valuable to waste on a mere hotel, Waldorf-Astoria or not. The Astors sold the hotel and two acres of the lot to vice-president of General Motors John Jacob Raskob, the duPont brothers, and a pair of silent partners for $16 million -- a tidy profit indeed. And there, Raskob and his architect William Lamb decided to build the world's tallest building.

"The directors of the Empire State, Inc., believe that in a comparatively short time the Zeppelin airships will establish trans-Atlantic, transcontinental and trans-Pacific lines, and possibly a route to South America from the port of New York. Building with an eye to the future, it has been determined to erect this tower to land people directly on Thirty-fourth Street and Fifth Avenue after their ocean trip, seven minutes after the airship connects with the mast."
-- Alfred E. Smith, press release (1929)

They were in competition with Walter Chrysler, who was equally determined that his Chrysler Building should be the world's tallest skyscraper. (The Crash of 1929 knocked a third competitor out of the race before he could break ground.) But, in the game of construction chicken, Chrysler finished first, allowing the Chrysler Building to claim the coveted slot for only a year. Raskob sealed its fate by planning the famed zeppelin mast for the Empire State, raising its height from 86 floors to 102, firmly trumping the Chrysler Building by 204 feet. Sadly, eventual experiments with the Navy airship *Columbia* proved that the powerful updrafts deflected by the building's walls made horizontal docking impossible.

In our world, that is. Surely somewhere or somewhen Yankee ingenuity (or German discipline) keeps zeppelins on an even keel as they debark passengers into the "World's Highest Bar." Fritz Leiber, in "Catch That Zeppelin!" presented an Empire State Building where those worlds overlapped; the Gernsbackian future and the dire present. Norse tradition speaks of Yggdrasil, the tree at the center of the cosmos, the Axis Mundi around which all the worlds revolve; Siberian Tatar shamanism presents the "tree to heaven" as the axle of the world. Which may be why our demigod and protector, Doc Savage, dwelt on the 86th floor of that "gleaming spike of steel and brick" during his crime-fighting career. Perhaps, if one knows the right code to press, you can still emerge in Doc's eyrie. (An irresistible opening for a Cliffhanging Secret Urban [Fantastic] History game presents itself: the PCs discover Doc's dusty and sheet-covered eyrie for themselves when they accidentally activate the hidden relays, and must take up the Man of Bronze's mantle for the 21st century -- get Philip José Farmer's *Doc Savage: His Apocalyptic Life* and Lester Dent's novels, and get started.) There's more adventure in the building directory yet: does the Horatio Club rent out a suite on the 66th floor, or the Pyramid Warehousing Corporation on the 23rd? Why stop with Doc's world, or even our Gernsbackian zeppelin paradise: what if each of the 73 elevators of our Technopolitan Yggdrasil leads to another world, when its buttons depress in kabbalistic sequence?

"[T]he TV tower of the Empire State Building. And tell me to what empire this creation of American initiates refers if not the empire of Rudolf of Prague!"
-- Belbo, in *Foucault's Pendulum,* by Umberto Eco

Of course, if the doors lead to all worlds, some of them might not be pleasant at all. Yggdrasil, after all, had its roots in Hel; persistent urban legend describes secret sub-basements beneath the Empire State Building, headquartering Men In Black or hiding UFOs. (One particularly inventive sort argues that the "Manhattan Project" was so named because the real work, on Tesla-based [Philadelphia Experiment] technology, took place in the chambers beneath the ESB.) These chambers connect to the [secret world of underground] Manhattan (as seen in ***Underworld***, for example) through "triangle-shaped tunnels" reminiscent of the trapezoidal halls [beneath Peru]. Another rumor calls the chambers ritual magical spaces for Satanists preying on the homeless and "missing persons" -- the reliable David Icke not only identifies the Astors (who tunneled under the bog there for a century) as Reptoids, but derives their family name from the dark goddess Ashtoreth. Perhaps the Empire State's parallels should expand to include the voudun "middle post" or poteau-mitan, the doorway for spirits to enter our world. The Empire State has more than its share of spectral tenants: the building killed 14 people during its construction, another 14 died when a B-25 bomber crashed into the 79th floor in 1945, and another 16 leaped from its observation deck in the first 16 years of the building's existence. Our skyscraper also scrapes the bowels of the Pit: here dwell the Mole People, the Masonic Morlocks, the ghouls and the necromancers.

"The logic of the plan is very simple. A certain amount of space in the center, arranged as compactly as possible, contains the vertical circulation, toilets, shafts, and corridors. Surrounding this is a perimeter of office space 28 feet deep. The sizes of the floors diminish as the elevators decrease in number. In essence, there is a pyramid of non-rentable space surrounded by [a greater pyramid] of rentable space."
-- William Lamb, architect of the Empire State Building

Which makes the fact that the Empire State was dedicated on May 1, 1931, all the more disturbing; the Astors are apparently Illuminati, too. Saturn, killer of children, was in the American Eagle, Aquila, on the dedication day, for extra necromantic oomph. It took 410 days to construct; 410 being the kabbalistic value for "Kadosh," the vengeful Templar order of German Masonry. The Waldorf-Astoria was demolished on Black Tuesday, 1929, the destruction of the old financial order; excavation began on January 22, 1930, at the cusp between Capricorn and Aquarius; the building's final official height, with the TV tower, is 1,454 feet -- one less than 1455: "Adam Kadmon," the alchemical Perfect Man. Man, the measure of all things. The building is at Fifth ("gab", or "top"; the sphere of Mars) and Thirty-Fourth ("Babel," as in Tower of); 5x34 is 170, both "staff" and "cup," as well as "Kesilim," or Orion -- the Giant.

"On the lofty minarets of Manhattan there stands day and night an invisible muezzin who calls the faithful to the worship of Mammon and Speed. For our religion is practical pantheism, with energy as the Eternal Substance.
We are the super-city. We are the Nibelungen of the West. We possess the magic Rhine-gold, which is the Holy Grail of man's desire.
We are Gargantua and Siegfried. The old gods across the sea are graying. Already their Goetterdaemmerung has

begun.
Come we, the newer Titans: and we are not yet pubescent."
-- Benjamin Casseres, "New York: Matter Triumphalis"

The Empire State, then, is a powerfully [bisociative](#) symbol: Tree of Worlds and the Technological Man, bringer of the new order and destroyer of the old (just as primitive King Kong falls from the Building's pinnacle, slain by technology and love joined). It is also, of course, the Tower, Struck By Lightning (on average, 23 times in any given storm). Not only is it on the street of Babel, but in Illuminati-designed meters it rises to 443: the number of "Bethel," the "House of God" -- the name of the Tower trump in some French Tarot decks. The Tower, of course, is the card of destruction and doom -- but also the kabbalistic path between Netzach and Hod, between the spheres of victory and splendor. Both cup and staff, perfect man and Satanic monster, the building rises at the axis of a symbolic Empire indeed. Perhaps its enigma only be truly captured in the blank smile of Felix the Cat -- the first image broadcast on NBC television, from the top of the Empire State Building, on Yule of 1931. Reach into his bag of tricks, why don't you? It's a magic bag, and it goes all the way down.

Floating on Air

by David Morgan-Mar

Lighter-than-air craft seem to hold a special place in the hearts of gamers. Zeppelins have conjured up grand images of stately travel through the skies, and exciting encounters with Nazis, for many of us. But how many have actually used these vehicles in their games? Zeppelins and their forebears are unfamiliar contraptions to most of us, and few people have any idea where to start adapting such a vehicle for detailed use in a game.

In order to fully appreciate the grand majesty of zeppelins -- and to gain enough understanding to utilize them in games -- it pays to take an historical journey through the events that led to their development and eventual demise. Along the way we shall stop to consider the substantial gaming possibilities present in each stage of the development of lighter-than-air flight.

Balloons

Joseph and Etienne Montgolfier flew the first hot air balloon in Avignon, France, on June 5, 1783. The first manned flight in history took place in Paris on November 21 of the same year. Within a year, balloon ascents had become a popular pastime for the French nobility.

The hydrogen-filled balloon was also demonstrated successfully in 1783, by Professor Jacques Charles of the French Academy of Sciences. The first aerial crossing of the English Channel was performed in a hydrogen balloon in 1785. It had only recently been discovered that hydrogen was lighter than air. The gas was generated by dissolving iron in sulfuric acid, in vast quantities -- 500 pounds of acid and 1000 pounds of iron to produce enough hydrogen to fill a 12-foot diameter balloon. Hydrogen also leaked easily through cloth and the balloon had to be sealed with a thin rubber coating. Later "goldbeater's skin" -- the intestines of oxen -- would be used as a gastight material and after 1800 hydrogen was generated more easily by electrolysis of water.

The inventive mind of man naturally soon put the balloon to use in warfare. The French Revolution (1789-99) saw many opportunities for the use of a Balloon Corps. After some reluctance by commanders to use aerial reconnaissance information (as "unsporting"), tethered observation balloons made helpful contributions to a number of battles. Napoleon was unimpressed however, disbanding the French Balloon Corps in 1802.

The first balloon flight in the USA occurred in 1793, witnessed by President George Washington. Both sides in the US Civil War (1861-65) made use of tethered observation balloons. The Union had a formal balloon corps, enthusiastically supported by Lincoln. The world's first aerial artillery fire occurred in July 1861, with guns mounted in balloons helping defend the besieged suburbs of Washington, D.C. (The first aerial bombing had occurred in 1849, with the Austrian army launching unmanned balloons carrying bombs over Venice. A wind change saw half the bombs land on the Austrians.)

An interesting use of free-flying balloons occurred during the siege of Paris by the Prussians in 1870-71. Cut off from the countryside, the Parisians used hot air balloons to run the blockade, carrying letters and orders to the provinces and

pigeons to fly back to Paris with return correspondence, encoded on microfilm. (Balloon flights back into Paris could not be made due to the unpredictability of the winds.) Sixty-six balloons made the flight during the four month siege, carrying 2.5 million letters and 102 passengers. Two balloons were lost at sea and four were captured by the enemy, but all the rest made it safely, including one which did not land until it reached Norway!

Campaign Use

Although difficult to turn into a campaign because of the one-way nature of the travel, a balloon trip out of besieged Paris in 1870 would make an interesting episode in a campaign set in this turbulent time. A French Revolution or US Civil War campaign could make further use of balloons, with Balloon Corps troops assigned observation or communication missions, with plenty of chances to land behind enemy lines.

For a Cliffhangers-style ballooning campaign, the essential reference is Jules Verne's 1862 novel "Five Weeks in a Balloon." This describes the adventures of an English scientist and two companions in an aerial trip across Africa. The workings of the balloon and the hazards encountered are presented in enough detail to supply a GM with many sessions of adventuring.

For those interested in gaming alternate histories, it is interesting to note that the ingredients used by the Montgolfiers to attain human flight -- namely fire, paper, and cloth -- had been available to civilization for at least 5000 years. Imagine a Nile delta campaign, with observation balloons hovering above the Pyramids spotting the approach of Assyrian war chariots, or the Roman Empire spanned by balloon couriers.

Dirigibles

The biggest problem with balloons is that they are at the mercy of the wind. A free-flying balloon can only travel with the wind, and at the same speed as the wind. Some control can be exercised by manipulating ballast and lifting gas to change altitude and pick up different winds, but this is hardly convenient or reliable.

Floating on Air

Following failed attempts at rowing through the air, or using birds as beasts of burden to pull balloons, it became clear that an engine would be needed to overcome the wind and make a dirigible (or steerable) craft. In 1852 Henri Giffard mounted a special "lightweight" steam engine on a cigar-shaped balloon. The engine weighed 350 pounds (without coal and water) but it produced only 3 horsepower and was insufficient to propel the craft against even the lightest headwind.

In 1897 an interesting attempt at practical dirigibility was made by Salomon Andree. He led an expedition to fly a balloon over the North Pole, twelve years before Peary would succeed in reaching it by foot. Andree's balloon used a dragged rope to slow the balloon below the speed of the wind, and a system of sails could then alter its course by up to thirty degrees. Unfortunately the journey was a failure, with all three men freezing to death after their balloon iced up and could not stay aloft.

The internal combustion engine was invented in 1872 and immediately tried on balloons, but like steam engines it was too heavy to propel an airship. In 1886 Gottlieb Daimler built an engine weighing only 88 pounds per horsepower, initiating a flurry of experimentation. A cash prize was offered to the first person who could fly a round-trip from St. Cloud in Paris to the Eiffel Tower and back, a distance of 7 miles, in 30 minutes. On September 19, 1901, the Brazilian Alberto Santos-Dumont finally claimed the prize after several attempts.

Campaign Use

Aviation from Giffard to Santos-Dumont fits within the Victorian era, a rich background for roleplaying. Victorian horror games or Sherlock Holmes-style investigations might benefit from the occasional adventure involving balloonists. Balloons and dirigibles are a natural feature in Steampunk campaigns. In a Steampunk world where technology has not progressed too far beyond our own Victorian era, scientists, entrepreneurs, and crazed adventurers will naturally seek to experiment with flying machines.

Zeppelins

In Wurttemburg (soon to become part of a united Germany) in 1900, Count Ferdinand von Zeppelin demonstrated his first airship, the *LZ-1*. This ship reached 17 miles per hour in powered flight. Zeppelin's airship design was different to anything flown previously, having a rigid frame with the gasbags held inside. In modern terminology, airships with inflatable gasbags are called blimps, while those with rigid structures are called rigid airships or zeppelins. In between is a semi-rigid airship, with an external gasbag strengthened by a rigid keel. (In *GURPS Vehicles* terms, blimps and semi-rigids are vehicles with external gasbags; zeppelins are vehicles with lifting gas stored in the body.)

Count Zeppelin had become interested in air transport while observing the balloon corps in the US Civil War. Once back in Wurttemburg, Zeppelin had set out to build airships, financed out of his own pocket with help from the Union of German Engineers. Despite the success of the *LZ-1*, his investors were discouraged and Zeppelin was left broke.

Zeppelin began raising money by appealing to the public, and in 1905 the *LZ-2* took to the air. Interest developed and the German army bought *LZ-3* and *LZ-5*. With no other buyers Zeppelin ran into a finance problem. He solved this by starting two companies: Luftschiffbau Zeppelin GmbH in 1908 to build zeppelins; and the Deutsche Luftschiffarhts-Aktien-Gesellschaft (known as DELAG) in 1909 to fly them. DELAG was the world's first commercial airline. By 1914, DELAG had carried 34,028 passengers without injury and flown over 100,000 miles with a fleet of four zeppelins.

Campaign Use

The opening years of the 20th century can provide a "magnificent men and their flying machines" background for adventurers. The film of this title can provide background and ideas. The race to become the first to cross the English Channel from France to England (against the wind) could offer a prize large enough to tempt any player characters. Dirigibles could compete on a level footing with early heavier-than-air machines in this era (the Wright Brothers flew at *Kitty Hawk* in 1903), making exciting possibilities for races or competitions between rival groups.

Airships at War

In 1914, Europe suddenly found itself embroiled in war. For some years newspapers and journals had predicted that dirigible airpower would be extremely useful, if not decisive, in a war. Military commanders disagreed; for several months the full potential of both airships and airplanes was left unused.

With fighting on the ground in France, England dispatched all of her fledgling airplane division across the Channel in support. Air defence was utterly non-existent. When it became clear to the German commanders that the war would not be won before winter set in, they urged Kaiser Wilhelm II to authorize zeppelin bombing raids on Paris and London. Wilhelm resisted, clinging to the 19th century idea of "civilized" warfare and believing aerial bombing of cities to be unchivalrous.

With the war going badly against Germany, Wilhelm finally agreed in January 1915 to allow bombing of military targets. The army and navy ordered new airships and Luftschiffbau Zeppelin began turning them out at a rate of two per month.

Early raids on English ports were hampered by navigational difficulty. The zeppelins flew at night, with no moon, for surprise and concealment, and were guided more by the instinct of the navigator than anything else. By May, Kaiser Wilhelm allowed bombing of London, but maintained a strict proscription against targeting historic buildings and especially Buckingham Palace. Cities were easier targets, since a policy of darkening lights had not been enacted.

By the end of 1915, 208 British had been killed by zeppelin bombers, with no German losses. In 1916, the Germans intended to do much more damage and break the will of the English. The bombings hardened the resolve of the defenders, however, and improved airplanes with incendiary ammunition flew to intercept the zeppelins.

Despite being filled with flammable hydrogen, zeppelins were difficult to shoot down, even with incendiary bullets. Pure hydrogen does not burn -- it must be mixed with air first. The normal result of shooting at a zeppelin was a slowly leaking gasbag, which would not hinder its mission in the slightest. Sustained incendiary fire at a single hull location was necessary to ignite the gas. By the end of 1916 the British pilots had the technique, and zeppelins played no further significant part in the war.

Attempts were made in 1917 by zeppelin squadrons to fly as high as 20,000 feet, well above the ceiling of the British airplanes. The thin air, cold, and unpredictable high winds at this altitude made these operations untenable, and none were successful.

Campaign Use

With all this activity, it is easy to work airships into a World War I campaign. The Germans were not the only ones using lighter-than-air craft in the war. The British built over 200 blimps, using them with great success in naval convoys to detect submarines and as coastal patrols. The Italian army used blimps for reconnaissance and bombing support of ground troops. Almost any action of the war could be the stage for adventure involving airships.

After the War

The 1920s and '30s were the golden age of lighter-than-air travel. Many military rigid airships were flown, including: The British R-series, numbered intermittently from *R.28* up to *R.80*; the US Navy's *Shenandoah*, *Los Angeles*, *Akron*, and *Macon*; and a handful of ex-German zeppelins given to France and Italy as war reparations. Germany was prohibited from building new zeppelins of its own until 1925 by the Treaty of Versailles.

By 1920, there had been a few accidents involving the burning of the hydrogen lifting gas of an airship. The USA had recently begun producing helium, at a cost nearly ten times that of hydrogen. Public outcries after the loss of the *R.38* and Italy's *Roma* resulted in the US Navy thereafter only using helium as its lifting gas. Helium was treated as a military commodity and not exported from the USA; all other countries had to make do with hydrogen.

This was the age in which airships made epic journeys. In 1926 the Norwegian semi-rigid *Norge* made a flight over the North Pole. The *Graf Zeppelin* topped even this, flying around the world in 1929. This trip took just 12 days and carried paying passengers, years before the first torturously slow intercontinental commercial airplane flights. It followed a successful regular passenger service between Germany and the USA and Brazil. The new director of Luftschiffbau Zeppelin, Dr Hugo Eckener, held high hopes for financing a huge commercial zeppelin fleet.

The stock market crash of 1929 and the Depression killed any hope of Eckener's dreams being realized. The British Government, however, had recently completed two passenger airships, the *R.100* and *R.101*. Each could carry 100 passengers, but it soon became clear the *R.101* was flawed and did not have enough lift. While it was cut in half and lengthened to add another gasbag, the *R.100* made a return flight to Canada. The newly lengthened *R.101* began a trip to India in *1930*, but crashed disastrously in France, ending British airship development. The *R.100* was dismantled

without flying again.

The next German zeppelin was not built until 1936, funded by the Nazi Government. It was named the Hindenburg. To Dr Eckener's disgust, the Nazis used the new ship for propaganda purposes. She dropped leaflets during the 1936 referendum and made a fly-past at the Berlin Olympic Games with swastikas adorning her tailfins.

After the referendum approved the German annexation of the Rhineland, the Hindenburg made several passenger flights from Frankfurt to Rio de Janeiro and Lakehurst, New Jersey, in 1936-37. Her most infamous flight ended in fiery destruction at Lakehurst on May 6, 1937. The disaster, in which 36 died but 62 on board survived, was the beginning of the end for the airship era.

The *Graf Zeppelin II*, under construction when the *Hindenburg* burned, was quickly modified to use helium instead of hydrogen. Eckener appeared before a Senate Committee in Washington to plead the case for the USA to export helium. Convinced, Congress and President F.D. Roosevelt agreed to let Eckener have the helium. Hitler had plans of his own, however. With the *Anschluss* in Austria in 1938, the USA froze exports to Germany. Eckener again pleaded with the US Government, but this time could not convince them that helium would not be used for war.

By 1939, the *Graf Zeppelin II*, filled with hydrogen, was indeed being used for military purposes. She flew spy missions outside Germany and even flew over Scotland once. When World War II began, Hermann Goering put all his faith in the Luftwaffe and ordered both *Graf Zeppelin*s dismantled and used to build airplanes. Thus ended the era of the zeppelin.

Campaign Use

The years between the World Wars are the usual setting for Cliffhangers adventuring in the best *Indiana Jones* spirit. With plenty of exotic locations around the world being opened up for travel, and modes of travel as glamorous as zeppelins and ocean liners, the possibilities are limitless.

South America makes a perfect setting for Cliffhanging adventure, with impenetrable jungles and mysterious mountains inhabited by fierce natives and creatures. Lost cities full of treasure or isolated plateaus populated by dinosaurs are obvious goals, and what better expedition vehicle than the *Graf Zeppelin* or *Hindenburg*, berthed at Rio de Janeiro and only awaiting an encounter with Nazis to arrange a "loan."

Horror games can also use this time period effectively. Hitler's fascination with the occult is well-known. What if a Nazi expedition to America is returning to Germany with a collection of dusty tomes and grimoires found in old university libraries and, halfway across the Atlantic in the Hindenburg, crew and passengers on the PCs' flight start disappearing? A zeppelin makes a good setting for action, being large enough to hide all manner of menaces, but fragile and claustrophobic enough to cause panic at the slightest whiff of brimstone . . .

Following this line of thought, a passenger zeppelin flight can be treated as an ultimate "locked room" for murder mysteries in Agatha Christie "Ten Little Indians" and "Murder on the Orient Express" style.

In Alternate Earths games, zeppelins can come into their own. We can all imagine a world in which the Hindenburg never crashed, but what if *Wall Street* never crashed in 1929? By 1938 there could have been scores of large passenger zeppelins plying the skies -- and giving passenger ocean liners a run for their money. The Depression was also a factor in bringing the Nazis to power, so the American reluctance to part with helium may never have developed, and safe helium airships would have ushered in a golden age of technology through a war-free 1940s.

Time Travel campaigns also have plenty of uses for zeppelins. These range from the almost cliched "save the *Hindenburg*/make sure the *Hindenburg* burns" missions to subtle interventions with the Nazis or even the British or US Navies. On a different tack, a suitably equipped airship makes a good time vehicle, capable of travelling over Jurassic plains or of observing the Battle of Agincourt from a discrete altitude.

Technical Details

Provided with this article are PDF format files containing deck plans of the passenger areas of the *Graf Zeppelin* and *Hindenburg*. These are the most likely airships to appear as passenger carriers in games, so this section will concentrate on pertinent statistics of these two ships. Similar fictional ships can of course be based on these two.

The frame of each ship was built of duralumin, a strong but light aluminum and copper alloy. The spidery network of duralumin girders was covered with an outer skin of doped cotton cloth. The bulk of the hull was filled with large bags to hold gas, made of goldbeater's skin in the *Graf Zeppelin*, and of cloth coated with an impermeable gelatin solution in the *Hindenburg*.

The *Graf Zeppelin* used Blaugas as fuel -- this is a gaseous fuel with the same density as air. It filled nearly a quarter of the hull, but had the advantage that the ship's buoyancy did not change as it used fuel. The Hindenburg used diesel fuel, and had to deal with increased buoyancy as it burned it. Electrical power for lighting, radio, and cooking was produced by a small wind turbine on the *Graf Zeppelin*, and by diesel generators on the *Hindenburg*.

The passenger areas of the *Graf Zeppelin* were all inside the large gondola, attached below the main hull of the ship. The front of the gondola was the bridge and command areas. In the *Hindenburg*, the gondola was much smaller and contained only the bridge and controls. The passenger areas were inside the hull itself, where more room was available. The crew had small cabins in the main hull in both ships.

Although the hull was mostly full of gas, there was a system of catwalks and ladders around and between the gasbags, allowing the crew to reach most parts of the ship. The engines on each zeppelin (5 on the *Graf*, 4 on the *Hindenburg*) were housed in pods outside the hull, and crew could climb out of the hull and into the pods in flight to work on them.

During flight, the crew were kept busy performing engine maintenance and checking gasbags and the hull for damage caused by turbulence. They wore felt covered shoes to avoid striking sparks on the metal catwalks. Tears in the cloth of the hull or tailfins often had to be repaired in flight, with crew climbing about over the surface of the ship tethered by ropes.

As could be imagined, smoking on board the hydrogen-filled *Graf Zeppelin* was strictly forbidden. Surprisingly though, both the *R.101* and the *Hindenburg* had smoking rooms for the convenience of passengers. The *Hindenburg*'s was lined with asbestos and accessible only through an airlock arrangement of doors designed to stop embers.

Indiana Jones notwithstanding, German zeppelins never carried airplanes. The *USS Akron* and *USS Macon*, however, carried squadrons of three *F9C-2 Sparrowhawk* biplanes, which could be both launched and captured in flight using a specially designed trapeze-hook apparatus. It was a delicate operation requiring experienced pilots, but never caused any problems.

Over the 1936 flying season, the *Hindenburg* averaged 65 hours from Friedrichshafen, Germany, to Lakehurst, New Jersey, and 50 hours on the return journey. The difference is due to the easterly prevailing winds. A return ticket from Lakehurst to Friedrichshafen cost $720 for a single berth in a twin-share cabin, or $1,350 for a whole cabin. A one-way ticket cost $400.

Controlling an Airship

The primary consideration for RPG characters who might need to control an airship is lift. In order to climb, the ship must drop ballast; in order to drop it must vent lifting gas. The amount of water carried as ballast was plenty for routine operations, but could be stretched on long voyages with bad weather.

Elevators on the tailfins could be used to attain a small degree of dynamic lift or dive. A rudder provided steering control. These were important for navigation of course, but gas and ballast control were crucial in keeping the ship in the air.

As an airship rises, it moves into lower pressure air and the gas in its bags expands. This provides more lift and gas

must be vented once the desired cruising altitude is attained. If gas is not vented, the gasbags may distend and rupture. To initiate another climb, ballast is dropped.

The reverse holds for dropping in altitude. A drop is initiated by venting gas. As the ship drops into denser air, its lifting gas contracts and provides less lift, so ballast must be dropped to slow or halt the fall.

Beyond these intricacies, zeppelin controllers must also deal with weather. Hot air is less dense and provides less lift than cold air, so less of a load can be carried over hot terrain than in colder regions. Air is generally warmer over land than oceans too, because of solar heating. Crossing a weather front into colder or warmer air can start rapid climbs or falls, respectively. And gusts of wind can buffet an airship as much as any modern airliner suffers from turbulence.

Perhaps surprisingly, hydrogen-filled airships also routinely flew through thunderstorms, and were struck by lightning. Only three airships ever burned in mid-air. Two of those had been venting gas when struck by lightning and Hugo Eckener strongly suspected the third had also ignited under the same conditions. His crews flew with a strict order never to vent gas in a thunderstorm, and none of his ships ever had a problem with lightning.

Experienced airshipmen could deal with all these events routinely, though serious weather could certainly cause some anxious moments. Despite the Hindenburg disaster, airship travel remains to this day the safest long-range transport in terms of fatalities per passenger-mile. The *Graf Zeppelin* flew over a million miles without a single injury. Recreating this sort of travel in a roleplaying game should be both an interesting and exciting adventure.

Ship	*Graf Zeppelin*	*Hindenburg*	R.100	R.101**
Year built	1928	1936	1929	1930
Length	775 feet	804 feet	709 feet	777 feet
Diameter	100 feet	135 feet	130 feet	131 feet
Cruising speed	73 mph	78 mph	64 mph	48 mph
Top speed	80 mph	84 mph	81 mph	71 mph
Range	8400 miles	8420 miles	3500 miles	3500 miles
Weight	61 tons	130 tons	102 tons	113 tons
Aerostatic lift	94 tons	240 tons	156 tons	166 tons
Fuel	0 tons*	64 tons	34 tons	25 tons
Water ballast	10 tons	16 tons	10 tons	8 tons
Passengers	20	50	100	100
Crew	43	62	48	42
Cost (US$)	$1 million	$2.2 million	$1.75 million	$2.5 million

* Effectively -- Blaugas fuel with same density as air.
** After modification.

Having miniature heroes be the little fish in a big, **big** pond is nothing new; literature and movies have shown us hundreds of ways to go about it. Odds are, however, that you've never tried it in your roleplaying. Here are a collection of tips and notes on how to run an adventure or a campaign that lets your players face problems of an entirely new scale. Any stats given reference *GURPS*, but the concepts can be applied to most any game or genre.

An ultra-small PC game can turn ordinary tasks into extraordinary ones, and create adventure out of the mundane. It can be used to lower the power tone of the campaign (Bjorn the demigod, Terror of the Kaldath Plains and Conqueror of the Byanta Peaks, now must make his way across the village) or to introduce epic tasks into an otherwise commonplace situation (the room Nelson once knew as the Kitchen has become a vast realm with sheer cliffs, rats that could bite him in half, invincible cockroaches, and at times, a feline of inconceivable size.)

Ultra-small games are, for the purposes of this article, defined as having PC's with an average height of no more than 6 inches, and no less than 1/2 inch (any larger and the focus of the campaign will be different, and any smaller and interaction with non-microscopic portions of the real world is too difficult.

Sizing Them Up

A GM should carefully consider the effects of the selected scale before deciding. For example, a 3-inch tall character can wield a sewing needle as a sword, have a walking stride of around 1/2 inch, and can ride a mouse (assuming you can find a willing mouse), while a 1-inch tall character can use a needle as a spear, runs to keep up with a 3-inch character, and is a good-sized cat treat. Selecting the scale of your campaign will decide how your players view the real world and how it interacts with them. Whether a wasp is the relative size of a cat or a house makes a very big difference. Points to consider when setting the scale:

- *Relative size of creatures:* rats, mice, spiders, insects, cats, dogs, etc.
- *Interactions with humans:* A 6-incher is unmistakable, while a 1/2-incher is easily overlooked.
- *Interactions with terrain:* A 6-incher faces long distances and obstacles, but for a 1/2-incher seams, cables, and twigs become the terrain itself.

Once the GM has decided what scale to play at, (s)he needs to decide how the players will become this scale. There are numerous scientific difficulties with being small (see **GURPS Biotech** [BIO33, sidebar] for details), so it is best to ignore science for the most part. Ways to do this include:

- **It's Just The Way Life Is.** Just like Mary Norton's Borrowers, or Swift's Lilliputians, the characters' race is just naturally this size. Naturally this is usually only appropriate for an ultra-small campaign, rather than just an adventure. A variation on this is to be playing a very small race, such as the Ellyllon of **GURPS Fantasy Folk** (FF54), or the Cidi of **GURPS Aliens** (A40).
- **Abracadabra.** The Shrink and Shrink Other spells (G18-19) can perform exactly what is needed, and can be done on a temporary or permanent basis. These spells require a large amount of mana, however, so the GM will have to have an explanation ready. A **GURPS Technomancer** campaign can use this as an opportunity to combine magic, technology, *and* the ultra-small.
- **Whoops.** Alternatively, the shrinking can be the result of a critical magical failure, and be of whatever duration the GM prefers. The GM should be careful not to ruin the flow of an adventure by suddenly shrinking the party without a clear concept of how to keep it interesting rather than frustrating.
- **Things Man Was Not Meant To Know.** The characters could be suffering from a powerful curse. This can lead to attempting a quest to restore themselves, but quests are a bit more involved when you can't wrap your arms around a sword handle, much less your hands.
- **It's not *me*.** The characters could be visiting somewhere (dimension, plane, beanstalk, planet, whatever) where everything else is much larger. Most of the rule options presented in here won't apply (or will apply in reverse to the large creatures).
- **The Incredible Shrinking Man.** The characters could simply be slowly, inexplicably shrinking, in defiance of science. This allows you to sidestep many of the science problems (after all, the scientists are baffled), and allows for some preparation by the characters while they are still large. It also means that the GM has to arrange for surprises because the characters are prepared, and are unlikely to be venturing into mouseholes without a good reason.
- **Igor, I've Done It!** Weird Science can explain anything, and a shrinking machine is par for the course in the lab of any self-respecting mad scientist. The characters can be shrunk as part of a mission ("Retrieve my lost microchip from the bee hive in the walls before my reactor hits meltdown!"), as punishment ("So Agent Steele, you thought you could outsmart me, did you? Now we'll see if your even smart enough to survive a rat maze . . . along with a few hungry rats!") or by accident ("Igor, did you leave the Shrinko-Dinko Ray on? For Shame! Where are those assistants anyways?").
- **Please Report Any Unusual Side Effects.** A variant on the Weird Science theme, this explanation has the shrinking as a result of some critical failure. Philadelphia Experiment, Hyperspace Jump failure, or whatever, it has left the characters with a small problem.
- **I'm Just Visiting.** The characters aren't really shrunk, they are simply inhabiting small bodies (Animals? Aliens? Gene-crafted hosts? Miniature androids?) via magic, psionics, or science. Usually such characters will have a specific goal that they need to accomplish, since this method usually involves some preparation and conscious choice.
- **Welcome to Nimh.** The characters aren't human, but small anthropomorphic animals. This can be combined with **GURPS Bunnies and Burrows**, or simply run on your own. Usually something has to threaten the characters home to drive them into the realm of full size people, but not necessarily.

The Natives Are Getting Restless

All characters have motivations, and adventures normally draw on those to ensure that the players have a good time. Players can be frustrated if their characters are too small to do much, so the GM should make sure that the adventure isn't just a delay in the normal adventure for the players. For campaigns that are ultra-small, this is less of a problem, as the GM can simply design normal games around the goals and obstacles of the smaller world. For adventures in a campaign that find the characters suddenly reduced, the characters are likely to have a different set of goals and difficulties. Here are some common themes throughout the ultra-small genre:

- **I Won't Grow Up.** The characters want to be restored to full size, and are either seeking to learn how to do so,

or to implement their knowledge. The GM should be sure to keep hope alive with the players, by offering the characters some clue that restoration is possible, and some idea of how to discover it.

- **I Have Plans For You.** The characters need to avoid a full-size person who seeks them for some reason (be it a scientist trying to study them or a giant trying to eat them.) The GM usually has to make sure that the enemy reveals his strategies and plans before confronting the characters, because a full-size NPC can usually ignore the struggles and escape attempts of ultra-small characters. The characters will need to use their ability to be overlooked to their advantage. A variant of this theme is to avoid discovery (not only capture) while accomplishing some other goal.
- **No Fluffy, No!** Friendly animals and minor pests can become useful allies or terrifying monsters. Entire societies that most people are normally ignorant of become significant. Interesting critters include ants, spiders, caterpillars, cockroaches, bees, flies, butterflys, mice, rats, bats, birds, cats and dogs. This can also lead to some humorous activities once the characters are restored (igniting an ant colony or adopting the mutt).
- **What A Long Strange Trip It's Been.** The characters often have to cross a vast distance that was once an easy and familiar route. This allows the GM to entertain the players with new exciting descriptions of routine areas. A sandbox becomes a desert, a puddle a sea, and a lawn a jungle.
- **Capture The Flag.** The characters have to find something or someone, usually something appropriate to their size. The GM needs to be careful to make the object findable, and to keep the characters aware that it is. A directional indicator is great for such a task (keeping distance unknown only adds to mystery).
- **The Clock Is Ticking.** A final common theme in ultra-small settings is a time limit. The characters have to accomplish their goal in a certain amount of time or something dire will happen (the world will blow up, the change becomes permanent, or little Timmy dies). The GM should make sure the characters do not lose hope too early as a result of serious mistakes, and should keep the time limit long enough to allow adventures and side-tracking, but short enough to keep the sense of urgency.

Cinematic Effects

One interesting effect of being ultra-small is that relatively large falls do not produce large amounts of damage. Your falling velocity (ignoring air resistance) does not change based on your mass, but the energy involved in impact does. For simplicity, the GM can simply assign normal falling damage, *ignoring scale*. Thus a 1-inch character falling 3 yards would suffer the normal 3d-9 damage that a full-size character would. GMs that find this too generous can give the damage a multiplier, or modify the scale of the damage chart (feet instead of yards, for example). Regardless, falling shouldn't hurt as much when you are ultra-small. Of course, characters don't have to know this is how it works. This rule doesn't apply to characters who are normal size in a very large world; however, dire things happen to full-size creatures that fall in that world.

Ants and related insects can lift many times their own weight. While people (big or small) aren't built like ants, it can be a fun cinematic rule to ignore science and say that ultra-small characters have relative super-strength. Because of their size, this means they aren't throwing cars around, but that they can throw things the relative size of cars. Likewise, the characters can be gifted with extreme jumping abilities, such as those possessed by many species of spiders and small animals.

Of course, even if a character is smaller, that doesn't mean everything works smaller. Take fire, for example. Matches make inappropriate torches because they'll burn out just as quickly regardless of the size of the user. (Note, however, that glowing embers are much more useful to an ultra-small character than to a full-size character. Note also that small embers can go out very easily.) The GM can use such differences as mental challenges to the players, or can ignore them in favor of game flow.

When dealing with full size opponents, the players should be threatened with defeat rather than death. Creatures the size of insects rarely pose much of a threat to the average person, and anything that started trouble would be quickly squashed. Rather than being killed as realism would dictate, the character should be bowled over, captured, swallowed alive (and remain alive), and/or moved somewhere other than where they wanted to be. If the players start to take unfair advantage of this, however, they become fair game.

For full size creatures, use the stats of similarly large creatures from *GURPS Basic*, *Bestiary*, *Fantasy Bestiary*, *Space Bestiary*, or *Dinosaurs*. Note that *GURPS Bunnies and Burrows* has an extensive listing of "normal" creatures with their stats adjusted relative to a rabbit-sized creature. Humans can be treated as strong but slow, as giants are treated in *GURPS Fantasy Folk* (FF82).

Just a Litle Magic

Any campaign that includes psionics or magic will have to decide how to resolve their effects against full-size opponents. They can work as normal, which will lead to very powerful (as far as the full-size creatures are concerned) players, or they can they can work only on creatures near the characters' size. This can be an absolute rule, or the GM can rule that larger targets require more energy, as if the spell were an area effect spell that must affect the entire size of the creature (remember that a hex is a smaller unit when one is a smaller character). An interesting variation is to allow powers to affect mental conditions regardless of scale, but cause physical effects relative to the characters' scale. Another interesting variation is to introduce magic into a campaign where it is normally *not* present. After all, the world as a whole might by a low mana area, but who knew the inside of trees/animal burrows/whatever was a high mana area?

Micro Machines

Ultra-small characters in need of equipment obviously can't just drop by the local corner store for supplies. Even if they can get there, it's unlikely such a shop will have a 1/2 inch (long) wrench. That's why ultra-small characters have two friends: The toy store, and the Gadgeteer.

Your basic toys lack functionality, but more and more modern toys include all sorts of interesting features. Radio control, motorized moving parts, and those spring-loaded missile launchers that may actually seem threatening to creatures the size of a paper-clip. Construction toys such as Erector sets, Legos, or others offer nearly unlimited opportunities.

A Gadgeteer loves a toy store, but can produce a miniature equivalent of just about any full-size equipment given enough trash to scrounge. Vehicles can be constructed of bottles, pencils, and string. Weapons are made from paper-clips and rubber bands. The various bits and discards of full-size life become much more useful when you are on their scale. Ultra-small Gadgeteers love finding the various odds and ends that have ended up under furniture, beneath the floors, or trapped in other small areas.

Gear and Equipment by the Lowest Bidder

Much of a ultra-small campaign will revolve around the acquisition of the gear necessary to accomplish goals. The GM should have some idea of what level of gear to allow before beginning the game. If the characters are converted to a smaller size, does their gear transform with them? If it does, most players will have their characters gather equipment before hand, and even if they can't, they are often prepared for most eventualities (who has need of a needle-sword when their trusty magical flaming sword shrank with them?). If their gear does not transform, the characters will have to be concerned with not only the tools to accomplish their goals, but also very basic needs of shelter and protection (imagine the chagrin of mighty adventurers that have to raid a Barbie dollhouse for clothes!).

Here is a short list of suggestions for some improvisational weapons and gear. In extended campaigns, players should be encouraged to construct working versions of the gear their characters will wield. (Disclaimer: If a player pokes someones eye out while demonstrating a paperclip/rubber band bow-and-arrow, neither the author nor *Pyramid* is responsible!) The suggestions below should be used as appropriate for the characters' height.

> **String/Cord** (for lassos, bolas, nets, etc)
> **Pencils** (as spears, quarterstaff)
> **CD's** (as shields)

Pin Buttons (as shields)
Shirt Buttons (shields, guard on a weapon, sewn to cloth for armor)
Thimble (helmet)
Paperclip (mancatcher, straightened for javelin)
Staple (straightened for dagger)
Needle (spearhead, arrow, sword, dagger)
Toothpicks (arrows, javelins)
Twist-ties (can be shaped into armor)
Matches (flaming arrows)
Rubber Band (sling, used with paperclip to make bow, several in combination with some pencils can make a good catapult)
Marbles (as ammo, or as mace head)
Never underestimate the usefulness of **superglue**

These are just a few suggestions. Try opening a desk drawer and seeing what imaginative ideas are summoned. Give your players freedom to experiment and create.

How To Have Fun On Only Two Inches A Day

A creative GM can use the material above to come up with endless adventures and plots, but here are a few adventure seeds to get started with. These seeds can be modified in many ways to create a wide variety of campaigns.

- **Stopping Dr. Badd.** The Agents break into Dr. Badd's secret lab to investigate rumors of his dastardly deeds. Not only do they discover that the rumors are true, but he plans to unleash his revenge on the world very soon! Before the Agents can grab him and foil his scheme, they get shrunk down by one of his traps. Now they have to traverse his lab and stop his plans while only a few inches tall. Even if they're successful, they are still shrunk, and Dr. Badd never figured out how to reverse the process. If they get in touch with their agency, they'll be told to continue to monitor the Doctor's actions in secret.
- **One Ring to Rule Them.** Legend says that the long lost Ring of Aldarus can identify the true heir to the throne. Now that the king is on his deathbed, and the barons are gathering armies, it is essential to find it. It is said that it was stolen by the shadow lizards that live in tunnels beneath the castle . . . very small tunnels.
- **Alien Nation.** The recent Xyrgrn-Dylar alliance has the Terran Alliance concerned. The Defense AI wants to have a fly on the wall of their next conference. Security is too tight to slip an agent in, and droids lack the adaptive intelligences. No alien race has even been able to prevent rats (or the equivalent), so the players are going to be uploaded into a set of robotic miniatures, and led to where they can hop on board a shuttle headed to the appropriate space station. The players will have to dodge security, automated defenses, and of course, space rats, and still listen in on the meetings.
- **Pardon Me Your Highness.** It has been known since 1817 that bees produce royal jelly, which can turn a bee larvae into a queen larvae. It wasn't until now that it was realized that royal jelly is a powerful anti-agathic. It can't be synthesized, and must be used almost immediately to work, so the rich and powerful hire teams to accompany them into the hive where they can get their dose direct. The bees normally ignore human intruders, unless provoked, so it's reasonably safe. Of course, the rich are terribly vulnerable while wandering about a hive, and their foes aren't above sending in their own miniature teams in to assassinate the target and anyone who gets in the way, introducing more aggressive species of bees, or arranging for lab accidents.
- **Heart of Darkness.** The characters have gotten themselves shrunk in the wilderness, with nothing to do about it except survive six months until help arrives (or the process "wears off"). The characters have little equipment, and will have to adapt their skills towards a wilderness outlook. It's Swiss Family Robinson meets Tom Thumb.
- **Foreign Bodies.** The characters are shrunk and inserted into a full-size entity's body. This usually requires a scale smaller than most ultra-small games, as it deals with things on the microscopic level, but not necessarily: They could be inserted into something larger. This can be as simple in concept as traveling into the Space Whale's stomach to retrieve the beacon, or as complicated as navigating your sub through blood vessels, fleeing the representatives of the immune system. Read Asimov's *Fantastic Voyage* and *Fantastic Voyage II* (which was more under his control) for inspiration.

- **Little Endians.** The characters are part of a race of small people, who live by stealing from Bigguns. Unfortunately, not everyone of this race agrees on different philosophical viewpoints, and several factions are constantly warring. The characters will have to survive the normal dangers of being a hidden Littleun, as well defend themselves from others like them. This campaign can combine elements of politics, trade, piracy, adventure, and theft.

Obligatory Puns

An ultra-small campaign can give your players a whole new outlook on matters, and can provoke them to new heights (hah!) of creativity and ingenuity. The GM can discover that adventures and epic tales flow easily when something as simple as a large tree becomes a vast realm full of different lifeforms and peril. A game of small characters need not be a minor matter.

by C. A. Johnson

Art by Dan Smith

A group of people takes their seats around the desk of the mission coordinator at Whitehall. Looking briefly at each of them, the grim-faced man behind the desk reaches into a drawer, pulls out a set of colored, unmarked file folders, and hands them out to each person. "I don't need to tell you that this information doesn't leave this facility," he says matter-of-factly. "You'll check those folders at the door before you leave." The acknowledgment is universal and automatic as the group opens the files and scans the summary page.

"We may have a problem with an ongoing mission," the nameless coordinator states. "A number of bodies have turned up in an Ohio suburb. There is no known link between the victims. Cause of death has been murder, but the method has varied in each case. You have summaries of the police reports in your files. There are two things that really concern us here. First, there's the frequency of the attacks. Statistically, the murder rate in that area has trebled in the last month. Secondly, in each case, the attack has been quick, brutal, professional, and had a near total absence of evidence left behind. Remind you of something?"

One of the listeners speaks. "Sounds like a clean-up."

"Exactly. However, in no case can the Company trace any leaks to these individuals, even in our most paranoid projections." That raises a few eyebrows in the room. The personnel at Whitehall make paranoia their stock and trade. They, as are all departments of the Company, are obscenely good at their jobs. "Ordinarily, we'd chalk this up to a fluke, or some clever serial killer, and leave it to the authorities to handle . . ."

"Except for that ongoing mission you mentioned," the same listener fills in.

"Correct. The Company has a long-term surveillance in progress in that area. You have the mission briefing, all relevant reports, and the squad portfolios in your mission packets. Department specific information has been provided where appropriate. Our worst case scenario is that one of our operatives has cracked. Best case is that serial killer I mentioned earlier.

"I'm not going to lie to you, people. This is the most dangerous type of Security mission there is. You're going undercover against our own. If there is a secret here to be found, there is no one on this planet better trained to keep it and eliminate the individuals trying to ferret it out. If our worst fears are realized, your orders are to neutralize the threat without jeopardizing the existing mission or the conspiracy. You have the authority to abort that mission should you see a need. Speaking as the man who set it up, you better have a damned good reason if you do abort. The reports were just starting to show progress. If we had to back out now, it would take months to get back into the position we're in now. Given our position in this war, it may be months we can't spare.

"I want a mission synopsis on my desk in seventy-two hours. You have ninety-six hours after that to requisition your equipment. From that point on, I expect nothing other then results. Is that clear?"

Everyone else in the room nods silently.

"Are there any questions?"

"Sir?" the only other person to speak so far says, "Why the codename? Why Ravenheart?"

The mission coordinator locks eyes with the speaker. "Because one way or another, there's a black-hearted bastard behind this. Your job is to find out if he's ours or not. Anything else?"

Silence answers.

"Excellent. Dismissed."

Briefing File

Operation: Ravenheart

Mission Synopsis: Imagitech Surveillance.

Mission statement: Investigate the possibility of Grey involvement with the technical aspects of Imagitech Inc. Determine the extent of any such involvement. Report back to the Company on any findings.

Corporate Profile: Imagitech Engineering

Imagitech Engineering is a relatively new company entering the lucrative video game market. Herman Gander incorporated it a mere four years ago. They specialize in easily portable personal entertainment units, similar to the popular "Gamebuddy" line in size. Company growth started slowly, as they attempted to get product recognition. Two years ago, the main product of the company took a radical upswing in quality and presentation, utilizing graphics of near photographic quality in a unit the size of a sophisticated market available graphic calculator.

Less than a year after that, Imagitech began to enter bids on government contracts; specifically, contracts for training simulators utilizing VR technology. This is what earned them the scrutiny of the Company.

Imagitech's financial footing is relatively firm for a company of its age. Sales of their

flagship product have secured a solid base in the marketplace, and show no signs of slowing down. With the additional revenues from the contracts mentioned above, Imagitech stands to turn a thirty million dollar profit next quarter. Projections for the following quarter almost double.

Analysis of Imagitech's PlayPal yielded some unexpected results. The central processing chip is extremely complex, capable of running hundreds of thousands, perhaps even millions more operations per second than required by the games themselves. Considering the quality of the graphics, this is a very impressive number indeed. The chip seems to have a self-limiting structure, in that it appears to be hardwired to run much slower than it is capable of.

Most impressive of all, even the Tech department has so far been unable to replicate or reprogram these chips.

Personnel Briefs:

- **Bill:** Intelligence department.
  Specific expertise: Covert entry and surveillance techniques. First mission.
  Pre-Academy history: Art thief involved in several high profile thefts.
  Academy history: Swimmer, excelled in chess, drafted early by his department of choice. Excelled in intrusion and social training. Struggled with combat.
  Profile: Early thirties, 5'7" tall, Caucasian. Hair usually blonde, eyes naturally green. Suave and smooth, even for a spook. Prefers hands-on work, but highly expert in long range surveillance techniques.
- **Larry:** Intelligence department.
  Specific expertise: Corporate espionage techniques. Veteran of nine missions. Designated mission commander.
  Pre-Academy history: Freelance corporate espionage operative.
  Academy history: Rugby player, moderately good at chess. Placed about a third of the way through the draft by second choice. First was Security. Displayed general competence, but excelled in corporate infiltration. Weak in the science fields, from a Company viewpoint.
  Profile: Mid thirties, 6'1" tall, Caucasian. Prefers brown or auburn hair, eyes are naturally brown. Quietly competent and self-assured, he volunteers nothing, ever.
  Mission summaries: Two Cover-ups, both successful. Three Discovery missions, with one aborted by Secop, and one partial failure. One Bug Hunt, successful. Three Recon missions against corporate targets, all successful.
- **John:** Security department.
  Specific expertise: None. Veteran of seven missions.
  Pre-Academy history: Graduated MIT with Electronic Engineering and History degrees. Leftist politics led him to life as political activist, then low profile terrorist. Contacted after first international job.
  Academy history: Struggled a bit with some of the academic work. Excelled in survival and weeding drills. Rugby player, not an exceptional chess player. Good at Go. Drafted late by third choice. First two were Tech and Combat. John is known to have exceptional sensory abilities, notably scent and hearing.
  Profile: Amerindian, 5' 11" tall. Dark hair. Eyes naturally black.
  Mission Summaries: Two Recon missions, one successful, one aborted. Two Clean-ups, both successful. One Containment mission, aborted. Two Cover-ups, both successful.
- **Gina:** Tech department.
  Specific expertise: Entertainment systems. Veteran of three missions.
  Pre-Academy history: Self educated hacker and gamer. An Op squad caught her

when she found and attempted to enter a Blacknet node. Seeing her potential, they let her go with a cover story and kept her under surveillance. She was recruited two years later.

Academy History: Swimmer, with a keen mind for academic work. She was widely skilled as a side effect of her gaming days. Excelled in chess. Drafted at once by her department of choice.

Profile: Caucasian, 5'4", naturally blonde, eyes naturally blue.

Mission summaries: One Containment mission, successful. One Cover-up mission, successful. One Discovery mission, failed.

- **Sarah:** Tech department.

Specific expertise: Electronics engineering and manufacturing techniques. Veteran of five missions.

Pre-Academy history: A brilliant engineering student out of Cal-Tech with looks to match her mind, Sarah was contacted indirectly almost at once after her graduation. Her job at Dynatronics convinced the Company she was worth having.

Academy history: Brilliant academic work, but struggled a bit in the field as her expectations caught up with her natural talent. Swimmer, top of her class at chess. Top pick of her class for her department of choice.

Profile: African American, 5'6", prefers golden or lightened hair, eyes naturally dark brown.

Mission summaries: One Discovery, successful. One Containment, successful. Two cover-ups, successful. One Clean-up, successful.

Preliminary scenario: After due consideration of personnel and the situation, the consensus of the squad is to insert Gina as a testing engineer. Offering one of the existing Imagitech personnel a position at Dynatronics can easily create the necessary opening. Once in, Gina can plant evidence of corporate espionage on one of the senior engineers. Larry will provide the necessary evidence and coordinate placement of it. This will allow placement of Sarah in the upper echelon of the engineering staff. John will insure that other applicants do not take or are not eligible for the position. Bill will maintain active surveillance on squad members and on any other people deemed necessary by the situation and the squad. From this point in the operation on, Gina is superfluous in her cover, and can pursue a more aggressive intelligence gathering agenda with minimal risk. Reports indicate that Gina meets the profile of women the president of Imagitech tends to be attracted to. This may create a window for advanced surveillance.

Summary to date: It has been four months since this scenario was implemented. Reports to date indicate that it has played out well. Gina was able to work Sarah into place. No notable hitches were reported. The opportunity for advanced surveillance the squad hoped for has not yet materialized, but has not been discounted. We have no reason to believe that the mission's security has been compromised at this time.

The first murder took place two months into the mission. Since that time, a new murder has occurred at a frequency of not less than one per week, with five reported in the third week. The precise whereabouts of every squad member cannot be ascertained during the times of the killings.

Argus Eyes Only

The Company has sent the squad out because something about these murders has raised the suspicions of the retired Ops that interpret mission data. While the Committee does its best to weed out potential problems before they are even approached by the Company, extreme situations can have extreme results. In this case, the Company's instincts are correct. One of the members of the squad is performing these killings. It is the Secop, John. The problem is his motive.

Imagitech Engineering has indeed made contact with the Greys. In fact, the Greys have been in on the company since its inception. This connection has been extremely hard to track because not even the CEO and founder of the firm is truly aware of it. The Greys have worked almost entirely through his dreams. While specific communication between our races is difficult, the transmission of images is much simpler. Ever since he first conceived the company, Herman Gander has been fed images of his manufacturing process. His highly analytical mind was able to seize these images, break them down, and turn them into practical applications.

As the surveillance progressed, John began to realize what was happening. With his remarkable sensory abilities, he was able to find a pheromone trace left by the Grey responsible. When he attempted to track the offender that night, he was taken . . . but only for a few minutes. The Greys had prepared for the possibility of Company interference, and had a strategic experiment prepared to implement on a moment's notice. John was captured, injected with a more sophisticated and selective version of the Cocktail, and turned loose, but with one minor addition. He now has a chip similar to the Imagitech CPU in his head. It monitors him as do the standard Grey chips, but it also absolutely destroys his ability to keep a secret. Not only can he no longer lie, he feels compelled now and then to blurt out awkward truths and damning statements. Each individual murder has been a cover-up. The only link between them is John.

The Secop knows what the problem is, and has connected the missing several minutes of his life with the embarrassing slips. However, two things keep him from coming forward. First, his survival instincts have been reset at "Extraordinarily Paranoid." He is convinced the squad will kill him on the spot and call it a clean up.

Second, John is completely dedicated to the Company. This dedication keeps him on the job because he knows he has abilities that others don't. He is convinced he can control, and eventually beat this problem on his own. He believes it is a matter of concentration and focus, rather than surgery and recovery. So far, his slips have been minor, and his skill in conversation and half-truths has allowed him to indulge his compulsion without revealing enough to be a real threat. On those occasions when he has slipped something truly important, he has taken his own steps. He refuses to resort to the Cocktail. That would cause the Company to ask dangerous questions that he can't cover for. He has actually had to kill several more people then the Company knows about, but has been able to do it by means of convenient accidents. The more people he kills, the more he strains his creativity. He knows that any sort of pattern will set off Company alarms. So far, he believes he has avoided detection.

The Ointment Coated Fly

Every cover-up has a hole in it. John has been trained specifically to find and eliminate such holes, and has put all of his skills to good use in the past weeks. Nonetheless, there are still some details that will tip the players off if they pay attention.

While Bill is responsible for maintaining surveillance on those members of his squad actively engaged in intelligence gathering, John is the one responsible for keeping track of the movements of the squad as a whole. The reason the precise locations of each squad member cannot be accounted for is because John is fudging his data. At no point is he actually lying (remember, he can't do that). Rather, he is exaggerating uncertainties, and planning his clean-ups accordingly. If two members usually go offline at similar, predictable times, John extends those intervals so that they overlap, and makes whatever move he needs to at that time.

If his moves are scrutinized, there is enough data in his reports to place him in the vicinity of each killing. However, he has used his exaggerations to good effect here, too. If there is the slightest room for uncertainty, John made sure to give himself the greatest benefit of each doubt. The problem here for the investigating squad is the sheer amount of data gathered. John has been tracking everyone's moves for four months! The files are in Blacknet.

John will avoid answering questions about these discrepancies if at all possible, going so far as to change the subject. As long as they are merely questions, he will take no overt action. Erasing the data would be too suspicious, and modifying it would be lying.

Another piece of evidence is John's increasing independence from the group. The Secop has deduced that the Grays are

responsible for his predicament. While he has no illusions about getting them to reverse the procedure, he does hope to catch one of them. He figures this will buy his life from the Company for his indiscretions and let him do his important work. John's absences are during low priority mission times, and are carefully placed nowhere near any of the killings. They are getting longer as John devotes more time to his growing obsession. He is working on a near-Academy level schedule, sleeping perhaps two to three hours a night, performing his regular duties, then engaging in his hunt during his down times. With the stresses of both the mission and his predicament weighing on him, this workload could very easily cause the psychotic break the Company feels may have already happened.

Catching the Fly

The Ops have several choices as to how to proceed. They can try to place the target squad under long term surveillance. This has advantages and disadvantages. The heroes have all the data they need to find their targets at almost any time. They know where and when to look, and who to look for. They also have a pretty good idea how their opposite numbers will react under given circumstances. (What Academy graduate hasn't taken Advanced Avoidance 706 with the dreaded Dr. Hildebrandt?)

The problem is that the on-site team will be looking for surveillance as part of their standard mission protocols. While they won't be at the top of their form, they won't be easy to tail either. If the pursuers are discovered, they could very easily find themselves on the wrong end of the hunt.

Alternately, the characters could simply insert themselves into the mission. They have the authority to do so from Whitehall. This would get them right up close to the team, but would heighten their alert status. Whitehall doesn't send reserves on a whim. Unless a very good cover story is provided, the on-site team will become suspicious that something is up . . . John in particular.

The characters could simply become active near the team, hoping to draw out whatever is happening. This is similar to the surveillance option. The main difference is the field of engagement. Active surveillance engages them as Ops. If the characters meet them socially, they will instead be dealing with the cover identities. This has the chance of getting John to make one of his embarrassing "confessions" to the characters. It wouldn't be long before the Secop was forced to make his move.

Revealing their identity as an Op would not save the characters. Rather, it would send John into a near berserk panic as he tried to escape. Should he get away, not only would he become a threat to the Conspiracy, he would probably remain active in his own way. Cut loose from Company policies and restrictions, John could become a deadly adversary as he stalks the globe hunting his redemption.

Into the Web

Whatever the team decides to do, at some point John will become aware of their nature and activities. After all, he's a Secop. It's his job to be aware of things like that, and he's very, very good at his job. If the character forces his hand early, he will do his best to make a quick getaway and pursue his revenge. Given his dedication to the Company, John will only do this if his cover is well and truly blown, and his problem is exposed. If there is any doubt in his mind at all, he will try to bluff it out a little while longer.

If John has enough time, though, a desperate plan will take shape in his mind. He knows his squad's orders. He knows what his people will and won't do, and has planned all his contingencies around these facts. Another squad, though, offers him a new way out. Shortly after John realizes what is going on, clues will begin to appear near the investigating squad. Snatches of Grey clothing, acid burns near their homes, lingering traces of cinnamon scent in the air. The squad's response to these clues will tell John a lot about what they are doing there. If they aggressively pursue these leads, then he will use the squad to help him on his hunt. In doing this, John is not lying. He *knows* there are Greys around. He just doesn't know where they are. He is reasonably sure they are dealing with Gander, but can't discover how. Therefore, he will aim the investigating squad at Gander.

If the squad does not follow up, then John will assume the worst. He knows the Company will catch up with him

eventually. He is desperate, not stupid. If the team doesn't follow up on the Grey evidence, he will assume they are after him, and his time is up. He will abandon his cover and move on Gander himself.

In either case, things will start moving very rapidly at this point. The on site team will not take kindly to interference in their mission objectives. If the characters move on Gander, the team will move on the characters, if for no other reason then to find out exactly what is going on. If John moves on Gander alone, the on site team will move on John. When this happens, the characters will also have to move also.

During that fracas, the Greys will strike.

Imagitech is considerably more important to the Greys than the Company imagined. The chip in the PlayPal is not hardwired to operate at slower speeds, as the Company first thought. It is working at capacity already. Using science not even vaguely understood by the boys in Tech, the PlayPal is slowly attuning the minds of countless teenagers and children to the telepathic wavelength of the Greys. It's a slow project, but then, the Greys still have well over a decade left before the next ship arrives. If they can successfully implement this plan, they will have thousands, perhaps even millions of humans susceptible to their powerful telepathic abilities. With an asset like that at their disposal, humanity will be theirs to do with as they pleased. Even the Company would be unable to stop them.

So far, only Gander has been able to translate the psionic projections of the aliens into practical applications. He is, therefore, a vital cog in the plan, and cannot be easily sacrificed. The present form of the chip is only the first stage of the process. He has been under close but cautious surveillance since the Greys first established contact. When the Company moves on him, the Greys will counterattack with everything they have available. When this happens, John will have fulfilled the ultimate purpose of the chip in his head. The Greys knew they couldn't break Ravenheart quickly enough to avoid alerting his squad. They also couldn't get enough out of him to ID the squad. The installed the chip to force the Company's hand. If John were caught, the Company would have to back out to avoid suspicion. If he weren't, eventually his paranoia would have forced him to take out his own team, and set him loose. If the Company took any other action, John would lead them directly to Gander. In doing so, he would play them right into the Greys hand.

You see, Gander's house is a gauntlet.

Gander's security system is much more advanced then he realizes. When John was captured, it was by a squad of Greys making modifications to that network. Until the Greys activate it, it acts exactly like Gander intended it to. It alerts the authorities and the household to attack or intrusion. Once activated fully, however, it becomes much more deadly, and tells no one but the Greys anything. The system will do its best to kill the characters, but will most likely only slow the Ops down. The Greys, who have a small ship nearby for just such an emergency, will handle mop up. The GM may tailor the Grey's numbers and equipment to the players. Gander's estate is large and private, so they will be able to fight freely so long as the Greys operate the system. The on site squad will have the layout down, but the intensity of the security will surprise them.

In the battle, John's chip will appear to burn out, as it was programmed to. If he survives, he will be free of its effects. The Greys know this, and will try very hard to make sure he does not survive. Whether the "burnout" is permanent or not is up to the GM.

The Greys will also try to preserve Gander. If they can get him out, the experience he remembers (totally different from what actually happened) will cause him to go underground and submit designs to his company by proxy and courier. He has already prepared for this eventuality, convinced by his own chip. What the Company chooses to do about that is another story.

Pyramid Review

The Horror Beneath (for D20)

Published by [Nightshift Games](#)

Written by Eric Metcalf

32 b & w pages; $8.95

> *(Editor's Alert: Like many adventure reviews, this one has spoilers. If you plan on playing this adventure, it's strongly recommended you* not *read it. You have been warned. We now return you to your regularly scheduled review.)*

The Horror Beneath is an adventure for four to five *D20* characters between the levels of 3rd and 5th. This is important for a few reasons. First, it's the first *D20* adventure for that range of characters. Second, it's the first adventure by a company other than [Wizards of the Coast](#) that challenges characters higher than first level.

The characters can become involved with the adventure in several ways. This includes the standard being hired to investigate, missing relatives, and being asked. The first and third methods are pretty similar save that the players get hired for the first scenario.

There are several NPCs in the adventure that lend the background some strength. One of the problems with the *D20* adventures is that every company uses their own setting, which makes connecting adventures troublesome. With strong characters to back it up, *The Horror Beneath* has the potential of being used for background in future games.

The main problem involves the small town of Scarborough, where people have been disappearing and iron has stopped flowing to the nearby lords. It's up to the players to discover why this is happening and stop it.

During the course of the adventure, the players can interact with the people of Ravendale. The town has some personality with two different inns, a number of dwarves offering their services, and three different temples. Most memorable, however, has to be The Order of Scarlet, a monk organization led by Logash, a gnome monk. Characters that do a little snooping around can discover some rumors and truths about the area. Unfortunately,there are no examples of using skills to gain said information, and no DC checks that have to be made.

On the way to Scarborough, the players encounter zombies. This encounter is a red herring though. The village of Scarborough has more areas for the players to investigate. The village square is made up of four buildings: a church, a blacksmith, a trading post, and the magistrate's home. All are empty, as is most of the town. A chance encounter with one of the few survivors leads the players to a home where they meet the Tendermores, the only survivors.

When night falls, the party is attacked by what appear to be zombies, but these undead cannot be turned. There are two problems with this encounter. The first is that there isn't a specific number of creatures. The second is that the encounter only ends when the creatures captures one of the party members, or failing that, two of the Tendermore women.

The players apparently cannot stop the zombies from retreating, as there is no option to ever regain the captured

people. The players have to follow the trail to Mine Twelve, an abandoned mine that is now the staging area for these zombie invasions which plague the land. Once there, the players have to overcome several traps and a new breed of monsters. The whole scene plays out very much like the movie *Aliens*. It turns out that these zombies that attacked the Tendermore house aren't undead at all (despite using Undead statistics such as d12 hit dice), but are parasites that turn their hosts into monstrous creatures. Further *Alien* references include a Brooder Queen, and Brooder Warriors aplenty for the characters to battle.

One of the problems with the conclusion is that there is no option for failure. There are no notes on what happens if the players all die, or if they retreat. What happens, for example, if the Brooder Queen is able to infect a 5th level warrior with her parasites? Does it become a 5th level Brooder Warrior, or become a 2nd level Brooder Warrior? Creatures like this might have made for a good template style monster.

Past the adventure, there is a section entitled the Whole Story, which gives the GM more information about the background of the adventure. Why not put this first? I've been in games where the GM simply picks up a adventure and runs with it. This isn't the correct way to do things, but nonetheless, it happens. After the Whole Story comes statistics for the Brooder Warrior, Grub Host, Brooder Queen,and Berullius, a necromancer whose practice in Mine Twelve reintroduced the Brooder menace to the world.

My main question about these creatures is: Why are their statistics repeated again? When they are first encountered, their stats are listed. With only 32 pages to tell a story, every advantage must be used to overcome the limits of the small package.

There are several maps to help the GM and players visualize the new area. The County of Leona, which is shown twice, is a bit dark, but readable. Ravendale and Scarborough both suffer from too much murkiness. Ironically enough, Mine 12, where the majority of the action takes place, uses standard grid mapping and is probably the easiest one to read.

The Horror Beneath suffers in a few areas. First, the adventure is only 27 pages long. The interior covers are not used. One page has to go to the *D20* license, while another two pages go to advertising *Black Powder Gods*, a new setting coming from Nightshift Games, and another page on credits (which should be covered with the credits on the first page), and an ad for *The Foundation*, another game from Nightshift games. Three and a half pages of advertising and one on the standard *D20* license does not make me a happy reader. Save the ads for the web site.

The adventure is useful if you're willing to convert the setting to your own and makes a good night or three of adventure for characters who have graduated beyond the 1st-3rd level adventures. If this book had been a little meatier, free of advertising, and used the interior covers, it would have been a much sounder buy.

Art colored by Keith Johnson

As far as I know, there haven't been any "Revisor's Notes" published in *Pyramid*. There have been plenty of Designer's Notes, but nothing for subsequent editions. So I'll have to be first.

The bulk of the book, the animal entries, didn't get revamped too much. They got shuffled around and split up a bit -- the mythological creatures and the speculative creatures each got their own section, like the dinosaurs and domesticated animals had before. A handful of new animals from the *Pyramid* readership were included as well.

The real change is in the back of the book, in chapter 5. Almost all of this chapter is new, and it was the most fun to work on. The Characters chapter is always the first thing I turn to in a new *GURPS* book. Even though I GM much more than I play, I like to take a look at any new setting through the characters' eyes first. In the earlier editions of **GURPS Bestiary**, however, there was no Characters chapter. Now there are rules for creating animal templates, sample templates for a wide variety of animals from Alligator to Yeti, and a sample character for almost every sample template. The chapter grew from my initial outline, at the expense of the folklore chapter (which is also mostly new).

Here are some additional templates that were not included in the final draft, for your enjoyment:

Diatryma   *(157 points)*

Attributes: Enhanced ST +20 (No Fine Manipulators) [105]; DX +4 [45]; IQ -7 [-60]; HT +6 [80]; Extra Hit Points +8 [40].

Advantages: Acute Hearing +5 [10]; Alertness +5 [30]; Claws (Talons) [40]; Damage Resistance 1 [3]; Enhanced Move x1 [10]; Passive Defense 1 [25]; Penetrating Call [5]; Peripheral Vision [15].
Disadvantages: Attentive [-1]; Bestial [-10]; Color Blindness [-10]; Edgy [-5]; Hidebound [-5]; Increased Life Support [-10]; Incurious [-5]; Innumerate [-5]; Loner [-5]; Mute [-25]; Obdurate [-10]; No Fine Manipulators [-30]; Povery (Dead Broke) [-25]; Presentient [-20]; Short Lifespan x2 [-20]; Social Stigma (Barbarian) [-15].

Skill: Survival (Plains or Woodlands, specialized)-IQ+3/IQ+9 [10]

Notes: The horse was the only mount to get a template in the published book. Here's a more esoteric possibility for *Time Travel* or *New Sun* campaigns. As with the Deinonychus (p. BE108), some of this information is guesswork.

Eagle   *(-130 points)*

Attributes: ST -5 [-40]; DX +2 [20]; IQ -6 [-50]; HT +3 [30]; Reduced Hit Points -8 [-40].
Advantages: Acute Vision +4 [8]; Alertness +4 [20]; Enhanced Dodge x3 (Accessibility: Only while Flying) [32]; Enhanced Move (Flying) x2 [20]; Flight (Winged; Cannot Hover) [24]; Penetrating Call [5]; Peripheral Vision [15]; Sharp Claws [25]; Telescopic Vision 3 [18].
Disadvantages: Bestial [-10]; Edgy [-5]; Fragile [-20]; Hidebound [-5]; Incurious [-5]; Innumerate [-5]; Loner [-5]; Mute [-25]; Poor Grip [-5]; Poverty (Dead Broke) [-25]; Presentient [-20]; Reduced Move (Running) -5 [-25]; Restricted Manipulators [-15]; Short Arms [-10]; Short Lifespan x3 [-30]; Social Stigma (Barbarian) [-15].
Skill: Survival (Mountain or Woodlands, specialized)-IQ+2/IQ+8 [8]

Ferret   *(-174 points)*

Attributes: ST -9 [-80]; DX +5 [60]; IQ -5 [-40]; HT +2 [20]; Reduced Hit Points -8 [-40].
Advantages: Acute Taste/Smell +4 [8]; Alertness +5 [25]; Combat Reflexes [15]; Decreased Life Support [10]; Early Maturation x1 [5]; Enhanced Move x1/2 [5]; Faz Sense (3-hex range, -20%) [8]; Four Legs [5]; Night Vision [10]; Sharp Teeth [5].
Disadvantages: Attentive [-1]; Bestial [-10]; Color Blindness [-10]; Dull [-1]; Horizontal [-10]; Inconvenient Size [-15]; Innumerate [-10]; Mute [-25]; No Fine Manipulators [-30]; Poverty (Dead Broke) [-25]; Presentient [-20]; Short Arms [-10]; Short Lifespan x6 [-60]; Sleepy (75%) [-25]; Social Stigma (Barbarian) [-15]; Staid [-1].
Skill: Survival (Plains or Woodlands, specialized)-IQ+1/IQ+7 [6]

Notes: Pet-store ferrets will rarely have any Survival skill at all. This is true for many quasi-domesticated animal species.

Gibbon   *(-84 points)*

Attributes: ST -7 [-60]; DX +5 [60]; IQ -4 [-30]; HT +3 [30]; Reduced Hit Points -10 [-50].
Advantages: Alertness +4 [20]; Ambidexterity [10]; Brachiator [5]; Enhanced Move (Brachiating) x1/2 [5]; Extra Arms x2 (Short Arms; temporary disadvantage: "legless" while in use; -35%) [6]; Fur [4]; Increased Speed x1 [25]; Penetrating Call [5]; Perfect Balance [15]; Super Climbing x3 [9]; Super Jump x4 [40].
Disadvantages: Bestial [-10]; Cannot Swim [0]; Dull [-1]; Edgy [-5]; Intolerance (other gibbons of the same sex) [-5]; Mute [-25]; Odious Racial Habit (noisy) [-5]; Poverty (Dead Broke) [-25]; Presentient [-20]; Reduced Move (Running) -1 [-5]; Short Arms [-10]; Short Livespan x4 [-40]; Social Stigma (Barbarian) [-15].
Skill: Survival (Jungle or Mountain, specialized)-IQ/IQ+6 [4]
Quirks: Highly territorial [-1].

Notes: Siamangs share the same template with the following changes: ST -5 [-40]; Super Jump x3 [30]; Reduced Hit Points -8 [-40]. Template cost for siamangs is -49 points.

Orangutan   *(40 points)*

Attributes: ST +5 [60]; DX +3 [30]; IQ -4 [-30]; HT +4 [45]; Extra Hit Points +1 [5].
Advantages: Alertness +4 [20]; Brachiator [5]; DR 1 [3]; Enhanced Move (Brachiating) x1 [10]; Extra Arms x2 (Short Arms; temporary disadvantage: "legless" while in use; -35%) [6]; Long Arms [20]; Super Climbing x3 [9].
Disadvantages: Bestial [-10]; Cannot Swim [0]; Careful [-1]; Dull [-1]; Laziness [-10]; Loner [-5]; Mute [-25]; Poor Grip [-5]; Poverty (Dead Broke) [-25]; Reduced Move (Running) [-5]; Semi-Upright [-5]; Short Lifespan x3 [-30]; Sleepy (50%) [-10]; Social Stigma (Barbarian) [-15].
Skill: Survival (Jungle or Mountain, specialized)-IQ/IQ+6 [4]

Raccoon   *(-90 points)*

Attributes: ST -6 [-50]; DX +4 [45]; IQ -4 [-30]; HT +4 [45]; Reduced Hit Points -7 [-35].
Advantages: Acute Hearing +2 [4]; Acute Vision +1 [2]; Alertness +6 [30]; Cast Iron Stomach [15]; Claws [15]; Decreased Life Support [10]; Early Maturation x1 [5]; Faz Sense (Eye Contact Only; -20%) [8]; Metabolism Control x4 (Hibernation; -50%) [10]; Night Vision [10]; Reproductive Control [2]; Sharp Teeth [5]; Super Climbing x2 [6]; Thick Fur [29].
Disadvantages: Attentive [-1]; Bestial [10]; Color Blindness [-10]; Curious [-5]; Horizontal [-10]; Inconvenient Size [-15]; Innumerate [-5]; Mute [-25]; Poor Grip [-5]; Poverty (Dead Broke) [-25]; Presentient [-20]; Reduced Move (Running) x1 [-5]; Short Arms [-10]; Short Lifespan x5 [-50]; Sleepy (50%) [-10]; Social Stigma (Barbarian) [-15].
Skills: Swimming-DX [1], Survival (Swampland, Urban, or Woodlands, specialized)-IQ/IQ+6 [4].

Notes: Brian Smithson created this one after the *Bestiary* playtest, and agreed to let me include it here. Along with the ferret, very useful for running Grey Ghost Games' new adventure *Another Fine Mess* with *GURPS*.

Velociraptor   *(13 points)*

Attributes: ST -2 [-15]; DX +5 [60]; IQ -6 [-50]; HT +2 [20]; and Reduced Hit Points -6 [-30].
Advantages: Acute Hearing +2 [4]; Acute Taste and Smell +2 [4]; Alertness +6 [30]; Claws (Long Talons) [55]; Combat Reflexes [15]; Early Maturation [5]; Enhanced Dodge [15]; Enhanced Move x2 [20]; Peripheral Vision [15]; Scales [3]; Sharp Teeth [5].
Disadvantages: Attentive [-1]; Bestial [-10]; Color Blindness [-10]; Edgy [-5]; Hidebound [-5]; Incurious [-5]; Innumerate [-5]; Mute [-25]; No Depth Perception [-10]; Poverty (Dead Broke) [-25]; Poor Grip [-5]; Presentient [-20]; Social Stigma (Barbarian) [-15]; Sleepy (50%) [-10].
Skills: Survival (Plains or Woodlands, specialized)-IQ+2/IQ+8 [8].

Notes: I created the Velociraptor template and was trying to wedge Johnny Dino (p. BE101) into its small package when I decided to switch to the Deinonychus instead. But this will certainly fit into 100-point campaigns better!

Wild Boar   *(47 points)*

Attributes: Enhanced ST +10 (No Fine Manipulators) [66]; DX +4 [45]; IQ -4 [-30]; HT +5 [60]; Extra Hit Points 5 [25].
Advantages: Acute Taste and Smell +4 [8]; Alertness +4 [20]; Damage Resistance +1 [3]; Early Maturation x1 [5]; Enhanced Move x1/10 [1]; Faz Sense (3-hex range, -20%) [8]; Four Legs [5]; Fur [4]; Passive Defense 1 [25]; Sharp Teeth [5].
Disadvantages: Bestial [-10]; Color Blindness [-10]; Dull [-1]; Horizontal [-10]; Innumerate [-10]; Mute [-25]; No Fine Manipulators [-30]; Poverty (Dead Broke) [-25]; Presentient [-20]; Short Lifespan x4 [-40]; Sleepy (50%) [-10]; Social Stigma (Barbarian) [-15]; Staid [-1].
Skill: Survival (Woodlands, specialized)-IQ/IQ+6 [4].

Research

Determining the levels of Extended or Short Lifespan, Early or Late Maturation, and Less Sleep or Sleepy can be tricky, since the normal Bestiary entries do not include any data. General encyclopedias are often useful for this, and here are some websites which have some of this information for multiple animal species:

http://library.thinkquest.org/25553/english/animals/when/index.shtml
http://www.sleephomepages.org/sleepsyllabus/fr-b.html
http://www.geocities.com/longevityrpt/lr57.htm
http://www.ris.net/~yarberry/Brett1697/animals.htm

by John Kovalic

Murphy's Rules

Murphy's Rules

Let's Get Organized! . . . Or Maybe Not

One of my biggest quirks as a GM is my continued insistence on almost no preparatory notes before running an adventure.

For example, let's look at some notes from my second *Aberrant* adventure:

> West Lake & N Dearborn St / East Randolph & State Street
>
> November 23rd, 2007: George Ottman (Mayor of Chicago) offers the PCs
>
> DosPrompt
>
> - Hard sell from Corbin

Those are my entire pre-typed notes.

Either shortly before, or during the adventure, I hand-scribbled:

> Puerto Rico/Guam
>
> Ann Kolinsky
>
> Circus 901 W. Weed St. (near North and Clyburn aves.)
>
> Captain Earl Hawkins -- Information Officer, Fort Sheridan
>
> Underworld bar -- Matchsticks

Those are the entire notes. Just over 50 words for an adventure that ran for six hours.

Of course, I had lots of *internal* preparation, and I'm sure that, at the time, those notes made perfect sense to me. But currently they don't (though parts, of course, mean something).

Now, my style of taking notes differs from several of my GM friends' styles. Dennis, for example, has a beautiful knack for creating nearly *every* aspect of a game world, with 3-ring binders filled with notes. A typical transcript might thus look like this:

Dennis: "Okay; you are in Southampton. The Vampire Prince of the city has asked you to investigate a mystery in London. You also have a lead about some odd rituals being performed in York."

Us: "Let's go to Las Vegas!"

Dennis (flipping pages): "Okay; the Vampire Prince of Las Vegas is named Carl Desota. He is currently locked in political machinations with his second-in-command about who should control the local tabloid."

Us: "Bah! Let's go to Antarctica!"

Dennis (flipping pages): "The South Pole has one very cold vampire, ostensibly the Prince, named Flores Gilder. She's in charge of security for half the year at the research station Amundsen-Scott. You're in luck! It's the six months

of the she's awake!"

And so on.

He also uses a checklist system of adventures, where he has certain events that might happen, and when they do, he checks them off. Thus he might have an adventure outline that looks like:

- PCs are invited to a party at the museum
- After party, PCs confronted by mysterious stranger (contact of Mercenary's Guild) at the lake
- The head of the Mercenary's Guild offers PCs a job to investigate the disappearance of an associate in the mines
- PCs offered 10,000 credits to *not* take the job by someone else on the subway ride there . . .

etc.

This isn't terribly different from my method, except his lists tend to be more detailed, and he *does* check off events when they happen. Thus if the PCs don't go on the subway, the subway event doesn't happen. All told, it's fairly easy weeks or months later to reconstruct what happened by going down the list.

There are other methods, too. Some GMs like to concoct elaborate histories and character backgrounds, so that they understand what all their NPCs are feeling, and can thus construct the plots and machinations of all the major players on the fly.

Some GMs like to construct timelines of events that *will* happen, regardless of player interaction. ("10:12 pm -- The Duchess meets with Cap'n Munch.") Others like to create their adventures around the players' involvement. ("The PCs witness the Duchess interacting with Cap'n Munch.") Others wing it even further, hoping that a situation will present itself where the relevant information can be presented to the PCs. ("The PCs learn of the Duchess's scheme with Cap'n Munch.") And I'm sure there's even more methods.

All of these methods have their advantages and disadvantages. Some methods (like the set timeline) feel much more rich and realistic, with events that happen around the players whether they get involved or not. These methods can, if not used carefully, make the PCs feel like they don't know where to start; where are they supposed to *be* at 10:12 pm, and if they aren't there, will the Evil Scheme reach fruition without them?

Other methods feel much more cinematic, with the PCs always being at *just* the right place and time. But that can make the PCs feel like they don't have free will; can they spend two weeks wasting time at the casino, and just *happen* to stumble across the jewel thief on their way out? If so, does it matter *what* the PCs do?

Anyway, the point of this column is this: I definitely don't believe GMing is a science, but feel instead that it's an art that is very personal. Finding out what's right for you is the crucial thing. My style evolved because, no matter how much I tried to prepare, my players always wandered off in random directions. Why bother making up every possible NPC in the city when the players might decide to start calling people in the next city over? Plus, no matter what kind of solutions I devised to a problem, they'd always come up with something different.

Nowadays I've started campaigns with the vaguest of notes and a list of unassigned names: for example, Suzan Singer, Franklin Spelling, Roberta Del Toro, and Dan Postlethwaite were among the starting names of one of my campaigns. The PCs want to visit a television reporter for information? That's Suzan Singer. They want to go to City Hall? No problem; Franklin Spelling is there to answer any questions. And so on. I'd jot notes after the names about who these people "really" were now, and moved on.

Is this technique good for everyone? Of course not! But it works for me, and it might work for some other folks. Other methods might work much better for them. While I hope this seems obvious, I've meet too many folks in print, on the net, and in person who seem to view their way of GMing as the One True Way, which is nonsense.

Experiment. Try new things. Find out what works for you. If you're having fun, and the players are having fun, then that's all that really matters.

And don't ever let anyone convince you otherwise.

* * *

By the by, I'd like to make a public announcement about our new blazing-fast web discussion boards. The result of tireless hours of revamping, the new program is literally leaps and bounds above what has gone before, able to handle huge lists like never before. If you haven't checked our discussions out in the past, now is a great time to do so. A lot of cool people are over there, including yours truly in the General Discussion About Pyramid section.

(Oh, and of course our Discussion Groups are still usable with your favorite NNTP newsreader. Who loves ya, baby?)

-- Steven Marsh

* * *

Last week's answer: **Death Star Technical Companion** (West End Games), p. 84

(Three stars) "In fact, it adds to the not-quite-rightness of the campaign if, for example, one day the waiter serves only whiskey (non-alcoholic) and the next day 'only beer is available here, sir,' or if one day phones have dials and the next day all calls must be placed through an operator."

Melts In Your Mind, Not On Your Hands

"I want the world
I want the whole world
I want to lock it all up in my pocket
It's my bar of chocolate
Give it to me now."
-- Veruca Salt (Julie Dawn Cole), *Willy Wonka & the Chocolate Factory*

We still don't know why we want it -- pharmaceutical chemistry makes a few good guesses, but can't reliably explain anything. We aren't sure where we got it -- archaeologists push its origins further back every year. We don't know who makes it -- half the American market is controlled by the most paranoid and secretive establishment outside the CIA. But every American soldier carries it with them; it's distributed to children on the night when the dead walk the earth, and without it, love (we have somehow come to understand) is meaningless. It's chocolate, and there has to be something more there, behind that silver foil wrapper.

Americans eat eleven pounds of it a year -- more, in a good year. Globally, cocoa production is around 2.9 million tons; the American chocolate retail market alone is worth $14 billion a year. Facts are available, if you look for them -- but meaning, well, that has to be left to the imagination; which is to say, gaming. I've based much of what follows, then, on the reliably sound facts in Sophie and Michael Coe's *The True History of Chocolate*. But this column is something far sweeter -- the Secret History of Chocolate. How many licks does it take to get to the center of the Conspiracy? The world may never know.

"This saying was said of cacao . . . nowhere did it appear in times past. The common folk, the needy did not drink it. Hence it was said, 'The heart, the blood, are to be feared.' And also it was said of it that it was like Datura; it was considered to be like the mushroom, for it . . . intoxicated one . . . it was not drunk unthinkingly."
-- Fr. Bernardino de Sahagún, *General History of the Things of New Spain*

Chocolate comes (after any number of different processes not restricted to roasting, fanning, dutching, alkalizing, pressing, and conching) from the cacao bean. The word "cocoa" comes from an English misspelling of the Spanish version, *cacao*, of the Mayan *kakaw*, which itself seems to derive from the Olmec *kakawa*. (The word "chocolate" either comes from Aztec *xocoatl*, "bitter water," or a Spanish mixture of the Maya *chocol*, "hot," with the Aztec *atl*, "water," in all cases referring to the original cacao-and-peppers beverage of the natives.) Carolus Linnaeus, apparently irked at the confusion, gave the original name second place when he named the cacao tree *Theobroma cacao*. Theobroma; "food of the gods." (Let us remember, however, what H.G. Wells decided was the Food of the Gods, and in our speculations wonder precisely how They will use human fat to make up for the projected global chocolate shortage in 2020.) The Aztecs, Mayas, and other Mesoamerican nations had a peculiar relationship with cacao -- to them, also, it was the "food of the gods," given to them by our old ancient astronaut buddy Quetzalcoatl. As Father Sahagún reports, they used it (under the peculiar kenning "the heart, the blood") in hallucinogenic beverages, and sacred communion with astral entities. The Aztecs seem to have transformed it from a sacred beverage to a luxury; Montezuma reportedly wept when a sorcerer warned him the Aztecs were doomed for debasing cacao.

Chemically, modern pharmacists can't explain it. Cacao does contain caffeine, the mild dopamine-trigger phenylethylamine (which is apparently molecularly very similar to Ecstasy), and the alkaloid theobromine. (Theobromine is also found in yerba buena and kola nuts, both also used in shamanic trance practices.) Most commercial chocolate has far less theobromine than the pure stuff that apparently kept Balboa's men wired for three straight days of crossing Panama, but even at its top levels chemistry can't find any reason for cacao to trigger hallucinations. Of course, there are well over 300 trace chemicals in cacao, and at least five major varieties of the plant -- perhaps the heirs of the Mayan priesthood still know the recipe for True Chocolate, and they're waiting for the end of the world in 2012 to share it.

"Ellegua likes the following foods: chicken (if you're vegetarian, get a box of frozen chicken nuggets and defrost one whenever you need an offering), rum (small nip bottles are great for this) and CHOCOLATE. Three M&M's are great.

Find a small offering dish to give him things in -- we have a little black cup."
-- Raven Kaldera, "Orisha Altar-Building"

Or maybe they're protecting us from it. Cacao, although credited to Quetzalcoatl, seems to have been a major offering to the far less pleasant god Huitzilopochtli. Now we start thinking about that icky Aztec poetic metaphor "the heart, the blood," and the whole Food of the Gods thing and wondering exactly what we've gotten our sticky fingers into. (And just what secret Huitzilopochtli worshipper first started packing Valentine's chocolates into a heart-shaped box, anyway?) Chocolate is also a favored offering to voodoo loa such as Legba (the master of the crossroads and the mirror; the Key and the Gate), Oya (a Santería orisha associated with wind and spirits), and Le Baron Cemetaire -- the graveyard loa of the dead. And we're back on Halloween, tossing Hershey bars to ghosts. Is there some deeper reason that a richly chocolate cake is called Devil's Food?

"[T]he murder of the Pope has been proven by the clearest evidence. A slow poison was given him by his own innocent [confectioner] in a dish of chocolate last Holy Thursday at the Vatican, where he assisted at the ceremonies of the day. It is surprising that he who from the beginning of his pontificate had taken every precaution to avoid what he always feared, should persist in drinking the chocolate . . ."
-- Sir Horace Mann, letter to Horace Walpole, Oct. 8, 1774

And just why did the Jesuits (in popular legend at least) adopt it as their favored method of murdering people? Pope Clement XIV, who suppressed the Jesuits in 1773, died of a remarkably unpleasant wasting disease in September of 1774. Frederick the Great was saved from poisoned chocolate by the fortunate accident of a spider falling into the cup; when he called for a refill, the chocolatier, fearing that he had been found out, shot himself. (That, they say, is why there's a spider painted on the ceiling of Frederick's anteroom in his palace at Sans Souci. There may be another reason.) The Jesuits did, in fact, control virtually all the trade in South American chocolate, and their international network of houses and missions may have been responsible for spreading cacao, and chocolate-drinking, worldwide. (The Jesuits, not to change the subject or anything, have also long been particularly intent on meditations to visualize the Sacred Heart; no connection with "the heart, the blood," and hallucinogenic theobroma, I'm sure.)

Chocolate-drinking was, in fact, also connected with conspiracy by the royal houses of France and England, where it was monopolized or banned outright. Cardinal Alphonse de Richelieu introduced it to his more famous brother, who passed it on to Mazarin, who obtained the royal monopoly on chocolate for his creature Sieur David Chaliou. (The later Medici were also big chocolate fans, as was the Marquis de Sade.) Charles II attempted to close "any Public . . . House" selling "Coffee, Chocolate, Sherbet, or Tea" in 1675 as dens of license and political subversion. Interestingly enough, after the Stuarts were dethroned, such establishments as the Cocoa-Tree in St. James' Street or White's Chocolate House became dens of Jacobitism and Freemasonry. White's, intriguingly, had a back room called "Hell." Just thought you should know.

" "What made Forrest [Mars]'s blood rush was the thrill of mastering new opportunities and taming uncharted worlds. Like Milton Hershey, he was driven by his visions; but where Milton Hershey saw utopia, Forrest Mars saw conquest."
-- Joël Glenn Brenner, *The Emperors of Chocolate*

As the industrial era came of age, methods of processing, refining, and smoothing the bitter taste of natural cacao turned chocolate from a political stimulant into a global confection -- suitable for global conspiracies. (The Secret Chocolate Wars no doubt parallel the wars of wines in Tim Powers' *Earthquake Weather*.) James Baker and John Hannon began the first chocolate-mill in America in 1765; "Hannon's Chocolate" became "Baker's Chocolate" in 1799 after Hannon was mysteriously lost at sea in the (voodoo loa-controlled) Caribbean. The Gnomes of Zurich began their involvement in the global chocolate conspiracy in 1819, when Francois-Louis Cailler opened his factory on Lake Geneva; Philippe Suchard began the Suchard-Toblerone empire in 1826; Henri Nestlé birthed the largest food company in the world in 1879 after inventing milk chocolate. In 1854, John Cadbury received a Royal Warrant as chocolatier to Queen Victoria, and the Round Table Group entered the scene. (Why, precisely, did Italian chocolatier Domingo Ghirardelli travel to San Francisco via theobromine-rich Peru -- was it to get an Imperial Warrant from the Emperor Norton?) Milton Hershey tried to build a Utopian chocolate-town in Pennsylvania (just as Henry Cadbury did in Bournville); his bitter rival Forrest Mars (inventor of M&Ms, born in future UFO nexus Tacoma, Washington) became a billionaire recluse, living over a massive chocolate factory in Las Vegas. (Masking himself from

Huitzilopochtli's vision? Or prolonging his unlife by inhaling the sacred fumes?) The Mars Company, however, remained headquartered in McLean, Virginia, and worked closely with their neighbors, the CIA. The true story of the Chocoluminati may never be told -- except in your game. But keep one thing in mind -- revenge is sweet.

Pyramid Pick

The Knuckleduster Firearms Shop

Published by Knuckleduster Publications

Written by Forrest Harris

122 pages; $19.95

One of the great difficulties I personally have with many Western RPGs is that I have a hard time, as a player, coming up with different and unique characters. The solitary gunman wandering the prairie, looking for vengeance? Seen it. Especially in realistic campaigns, where you don't have magic or other abilities to differentiate yourself, how do you keep everyone from melding together?

One way is to choose trademark gear. Jesse James' Schofield, J.E.B. Stuart's LeMat, The Lone Ranger with his silver bullets. The problem is, most of us don't have the knowledge necessary to know what that *means*. Many games provide stats for a dizzying array of guns, but what do they look like? What makes them different and special?

Knuckleduster Publications has come to the rescue with the ***Knuckleduster Firearms Shop***, chock full of real-world Western information that will do wonders for many campaigns in making it all feel real.

The book opens with an explanation of its rating system. Since this is a generic book, it uses a seven-word rating system (Superb, Great, Good, Fair, Mediocre, Poor, Terrible) that should look immediately familiar to users of ***Fudge***. It also includes worthwhile notes for converting to most systems by aligning those seven words with similar items that should be common for most systems; for example, "Terrible" damage is the equivalent of a fist punch; Severe is the same as a Colt Army .45 Peacemaker or a Winchester 1873. In this way you should be able to align your system with this books'. The last page of the book also includes a ***Deadlands*** conversion key.

Next is a ten page chapter called "Cops on Gunfighting." This chapter consists of interviews with three officers who give their insights into what gunfights are *really* like. Although it felt a little out of place, it can be argued that policemen are the closest equivalents of the sheriffs of yore, so their inclusion *does* make a fair amount of sense. For the purposes of realistic gaming, so, too, does their advice. For example: "The vast majority of our homicide by firearm deaths are simply a 'I've had enough of your s---' and BLAM! Once or twice at point-blank range." (That quote alone gave me an idea for how my PCs might be introduced to a campaign's tone . . .)

The book is then broken down into five chapters on the guns of various eras: 1849-1859, 1860-1865, 1866-1872, 1873-1885, and 1886-1900. This is the meat of the book. Each chapter opens with a brief overview of the era, its history, and what demands were placed on its weaponry. After this intro come the guns.

Generally one gun is presented per page. Each gun has its history presented, the year it was invented, and the Caliber and Action. In the seven word game terms, it presents Damage, Drawing Speed, Rate of Fire, Concealment, and Reliability. The cost of the weapon at the time it was available is given, as are ranges for Close, Medium, Long, and Maximum Effective. For the realistically minded, the reload procedure for each is presented. Finally, any specific quirks of the weapon, like flash burn, accidental discharge, and jammed lock, are described.

Guns detailed are from the common (like most of the Colt weapons) to the rare (like the LeFaucheaux's 20-Shot Pinfire Revolver) to the bizarre (like the Frankenau's Purse Revolver: a gun hidden in a purse . . . a weapon perfectly suited for the1877 female spy who has everything). Each gun is presented with a photo, catalog clipping, or illustration. Some guns have multiple illustrations.

Given how boring I generally find talk of guns, the writing in **Knuckleduster Firearms Shop** is surprisingly crisp and entertaining, full of straight information as well as trivia and flavor. For example, the history of the Colt Model 1862 says:

> "Colt had always made a short-barreled weapon for the purpose for those who wanted greater concealment without sacrificing performance. The names often implied a noble purpose: Shopkeeper's pistol, Trapper's pistol, Police revolver. Of course, foot-pads, gamblers, and other ne'er-do-wells found these compact weapons the ideal tool to get their jobs done."

Or the Colt Third Model Deringer: "There's not much to dislike about this slick little pistol. Except for the fact that you can't hit anything with it, it's a truly excellent choice." And I'm not even going to *mention* what the Remington Double-Derringer, often hidden in garters and bras, was called in some quarters.

The quirks and reloading procedures are great, making Critical Failures and in-combat reloads that much more flavorful and exciting. And the number of just plain *odd* guns means you can have characters wielding all manner of odd weapons. It's going to be a sore temptation, for example, to create a Western character who uses the LeFaucheux Knife Revolver.

The book closes with a useful (if short) chapter of accessories, like holsters (including fast-draw holsters and swivel holsters), sights, and other gear. It also has an index.

About the only fault I can really find with it is that there *is* a fair amount of white space; since each gun gets its own page, much of the time half a page is left more-or-less blank. But I didn't personally mind; it kept the book from feeling too cluttered, and made it much more reader-friendly. But for those who are accustomed to **GURPS**-levels of information, this book may disappoint somewhat.

In all, **Knuckleduster Firearms Shop** does exactly what it sets out to do: describe the wide range of innovation, variety, and ideas (good and bad) in the Old West for gamers in a generic fashion. And, in so doing, it made me excited to add some of the variety to any Western I would run. Forget bad guys with generic .45's . . . watch out for the leader with the Jarre Harmonica Gun, with its weird horizontal sliding clip of ammo.

-- Steven Marsh

Generally one gun is presented per page. Each gun has its history presented, the year it was invented, and the Caliber and Action. In the seven word game terms, it presents Damage, Drawing Speed, Rate of Fire, Concealment, and Reliability. The cost of the weapon at the time it was available is given, as are ranges for Close, Medium, Long, and Maximum Effective. For the realistically minded, the reload procedure for each is presented. Finally, any specific quirks of the weapon, like flash burn, accidental discharge, and jammed lock, are described.

Guns detailed are from the common (like most of the Colt weapons) to the rare (like the LeFaucheaux's 20-Shot Pinfire Revolver) to the bizarre (like the Frankenau's Purse Revolver: a gun hidden in a purse . . . a weapon perfectly

suited for the1877 female spy who has everything). Each gun is presented with a photo, catalog clipping, or illustration. Some guns have multiple illustrations.

Given how boring I generally find talk of guns, the writing in ***Knuckleduster Firearms Shop*** is surprisingly crisp and entertaining, full of straight information as well as trivia and flavor. For example, the history of the Colt Model 1862 says:

> "Colt had always made a short-barreled weapon for the purpose for those who wanted greater concealment without sacrificing performance. The names often implied a noble purpose: Shopkeeper's pistol, Trapper's pistol, Police revolver. Of course, foot-pads, gamblers, and other ne'er-do-wells found these compact weapons the ideal tool to get their jobs done."

Or the Colt Third Model Deringer: "There's not much to dislike about this slick little pistol. Except for the fact that you can't hit anything with it, it's a truly excellent choice." And I'm not even going to *mention* what the Remington Double-Derringer, often hidden in garters and bras, was called in some quarters.

The quirks and reloading procedures are great, making Critical Failures and in-combat reloads that much more flavorful and exciting. And the number of just plain *odd* guns means you can have characters wielding all manner of odd weapons. It's going to be a sore temptation, for example, to create a Western character who uses the LeFaucheux Knife Revolver.

The book closes with a useful (if short) chapter of accessories, like holsters (including fast-draw holsters and swivel holsters), sights, and other gear. It also has an index.

About the only fault I can really find with it is that there *is* a fair amount of white space; since each gun gets its own page, much of the time half a page is left more-or-less blank. But I didn't personally mind; it kept the book from feeling too cluttered, and made it much more reader-friendly. But for those who are accustomed to ***GURPS***-levels of information, this book may disappoint somewhat.

In all, ***Knuckleduster Firearms Shop*** does exactly what it sets out to do: describe the wide range of innovation, variety, and ideas (good and bad) in the Old West for gamers in a generic fashion. And, in so doing, it made me excited to add some of the variety to any Western I would run. Forget bad guys with generic .45's . . . watch out for the leader with the Jarre Harmonica Gun, with its weird horizontal sliding clip of ammo.

Pyramid Review

Siege on Tolkeen Three: Sorcerers' Revenge (for Rifts)

Published by **Palladium Books**

Written by Kevin Siembieda

112 pages; $12.95

The battle continues in the third chapter of Kevin Siemieda's *Rifts* war saga, with *Siege on Tolkeen Three: Sorcerers' Revenge*. The heat is turned up even further in this book, and gamers are provided with even more material for adventuring in the ongoing war campaign.

The stage was set by the first *Siege on Tolkeen* book, and the story further explored in the second. Here, Siembieda turns the attention back around to the nation of Tolkeen and focuses primarily on them and their response to the Coalition's rally to their initial defense (as explored in *Book Two*). *Sorcerers' Revenge* is primarily devoted to readily usable game material rather than plot or setting development, making it a pretty useful book for most.

The first two thirds of the book are devoted to Tolkeen's heroes, and it is in turn broken down into three sections. The first is the introduction of some new races. As you would guess, they are all races of D-Bees who are loyal fighters for the nation of Tolkeen. Palladium seems to avoid falling into its trap of simply presenting new power-gamer fodder with these races, as each is pretty interesting and well-rounded. The real bad news is that there are only three of them: the Auto-G, the D'Norr Devilmen, and the Larmac.

The Auto-G's, a race of very adept shape-shifters (perfect spies and assassins), are a bit heavy-handed and might have been under-balanced, had Siembieda not made the Coalition the world's leading expert on detecting them. This sets the stage for some serious cat-and-mouse espionage games, with Tolkeen trying to infiltrate the Coalition, and their adversary watching their every move with a trained eye. The other races provide plenty of room for plot development too, with the beastly but gentle D'norr and the ever-lazy Larmacs.

Just as *Siege on Tolkeen Two* gave us a bunch of NPC mercs and military operatives (mostly for the CS), so too does this book. But this time, most of the material is for Tolkeen. The NPCs presented are all very well-rounded, much better in fact than the ones presented in the last book, and this time there are more of them. The different characters draw primarily upon races and classes established in some of the related books (*Rifts: Canada*, *Rifts: Coalition War Campaign*, etc.) and are put to good effect. We get just and noble fighters, such as Sir Bokobo the Noli Cyber-Knight, selfish fighters, like the Lord Murgesh lead Simvan Raiders, and truly evil ones, such as Lord Ultim and the Dark Cabal. All have their own reasons for fighting in the war, and they just go to demonstrate the diversity of the fighting force on the Tolkeen side.

I will stop here a moment to nitpick about one aspect of this section. One of the NPC groups, Kado & Co., lead by respected Tolkeen patriot Jara Kado, are on a mission to find a communications bunker in the area that might be linked to a "killer satellite" still orbiting Earth -- one that might be used by Tolkeen to change the tide of the war. Her band of followers is one of the most diverse and interesting present, and much time is spent (nine pages) developing this little plot strand involving the company's race against the Coalition to find this satellite control. And then Siembieda comes straight out and says, no we're not allowed to put this in our campaigns. This is a bit of a break in form from Siembieda's usual style of simply setting the stage and providing whatever necessary caution, and it's just kind of annoying. Why waste nine pages and a bunch of good NPCs on a red herring? Sure, you can make the (plenty legitimate) argument that red herrings happen in war all the time, but it's just a tad frustrating to have something so juicy with a "No, No" sign on it. I guess you could always ignore the warning, but like I said I wanted to nitpick for a

second.

This section also includes material on the Vanguard. They are a super mysterious organization of wizards who are secretly and anonymously allied with the Coalition. This group was hinted at in previous material, and it is quite interesting indeed. The Coalition is a nation bent on the eradication of all magic and all non-humans, who would persecute the Vanguard just as it would any other illegal organization. Yet, they continue to fight for the Coalition, casting a helping hand from the shadows whenever they can. This group is mysterious beyond mysterious (Siembieda doesn't even give us stats for the leaders) and is something that most GMs will probably use in their campaigns eagerly. In fact, it's something that's easily worth checking out even if you aren't planning on running a *Siege on Tolkeen* campaign.

And then we bring out the guns -- er, more guns anyway. In the first book, Siembieda revealed Tolkeen's new line of super weapons, the Iron Juggernauts. Well, he follows it up here with a more dynamic line up that rounds out the bunch. These machines are made for flying through the air and swimming through the sea, giving GMs more toys to play with. And, yes, they are quite beefy.

The only section truly devoted to both sides is that on adventure generation tables. Here were are provided with tables for rolling up quick adventures (as the name would imply). It opens up, telling us that we will be provided with tables for all kinds of adventures, from rescue a friend, to search and destroy, to protect the town. However, tables are only provided for missing person adventures and random encounters. These are quite extensive and rounded out evenly for all kinds of parties, but it would have been nice to get a better diversity. However, the tables are quite good for coming up with adventures on the fly, or at least for generating good adventure ideas (for those who don't like the risk of rolling those dice).

A very small amount of the book is spent furthering the war's plot line. In response to the Coalition's increased efforts, Tolkeen has planned a massive rally, in which they will make an all-out blitz against the Coalition's main lines. Full details are provided for Tolkeen's plan of attack, but unfortunately the fate of the battle is already decided. I won't tell you what it is, but I will say that it's kind of frustrating to have things made up for you. Then again, one must remember that this is a six book series, and that some advancements in the story are going to have to be made and be predetermined. Fortunately, enough is left to the imagination so that GMs will be able to flesh out the details as they see fit.

The big fat cherry at the end of the book, and that which you've all been waiting for, is the specs on the mysterious shadow dragons. These beasts were hinted at in (and even pictured on the cover of) earlier books, and no doubt a lot of gamers are eager to see them. I won't go and spoil it, but I will say that they're not what one would expect. They are pretty good however. Siembieda hasn't just provided us with just another power-gaming beast, but has instead created a plot thread that is quite dynamic and bears a lot of consequences on the fate of the war.

The cover art on this book is another excellent piece by Dave Dorman (who did the first book as well), and the interior art is for the most part pretty good. It should be noted that there are more reprints here than in other books, but they aren't that overwhelming. The layout is, of course, as per the Palladium Books standard.

This book provides a pretty solid follow-up to the previous two. It builds upon the material established in the first two books, and it adds plenty of new material ready to be used. Its lack of setting material, while a hindrance, also makes it of use to gamers not planning to run a *Siege on Tolkeen* campaign. These first three books have set the stage and gotten the war off to a firm start. Now, hopefully, Palladium will follow it up with some good twists and turns in the final three.

Arizona Smith was hacking his way through the jungle towards the hidden temple. No way Doktor Müller would get there first in his truck. Suddenly he heard a strange noise. A bulldozer? Here? Then he saw the tank breaking through the saplings . . .

Heavy Metal: Four 20th Century Tanks for GURPS

* * *

Sgt. Young sneaked through the night. In a few hours thousands of paratroopers would jump out of their planes all over Normandy, and before that happened his resistance team had a mission to do. But something looked wrong as he approached the bridge. Could that be tanks? . . .

* * *

The way in would be simple, Agent 700 thought. Just glide down the telephone line. But that was no way out. Steal a truck and crash through the gate? No very good plan, with machineguns in the guard towers. Of course they could try to get one of the tanks. "Tanya, have you ever driven a T-55?" . . .

* * *

Ramirez peered through his binoculars. The Greys had selected a good position for their camp. Did the aliens expect an attack? Whatever the reason, they'd need something heavier than their Hammer railguns. Perhaps the Spook on the squad could "borrow" a MBT from the locals. Their SecOp would have screaming fits, of course, but something had to be done before they dug in even more . . .

* * *

Heavy armor can be useful in many "action" adventures, not just in vehicle centric wargame campaigns. Here is a selection of historical vehicles that covers most of the 20th century, from early TL6 to late TL7. For each of the four tanks, there is a historical introduction to help the GM place it in a campaign, a detailed description, and finally a reasonably realistic representation using ***GURPS Vehicles***.

Foster Heavy Tank Mk I (Male), UK, 1916   (TL6)

History: The Foster Heavy Tank Mk I (Male) was the first fully tracked, armored, and armed combat vehicle. It was developed by a team at Foster & Co in England during the first years of WWI in response to trench warfare, initially under sponsorship of the Royal Naval Air Service. The "Landships Committee" had experimented with several patterns until concentrating on the now familiar box with all-around tracks. The first "tanks" (a cover name to foil the Germans) were delivered to the British Army's "Heavy Section, Machine Gun Corps" (another cover) in June 1916. They were first deployed to France in August 1916. Tanks were used in combat for the very first time on September 15th, 1916 at Flers-Courcelette in the Battle on the Somme. During the early days they were used in very small numbers, usually three at a time. At least once they even a single tank, a tactic which failed to deliver the impact they might have had otherwise. Really successful use would only be made of later versions.

Only 75 of the "Male" version described here were built, plus 75 "Female" tanks armed with 7.7x 56mmR Vickers Mk I machine guns instead of the main guns. Most of these tanks were gradually rebuilt as unarmed supply or radio tanks as the improved successors of the Mk I entered service.

Description: The Foster Tank Mk I (Male) looked like a box with lozenge-shaped all-round tracks and two box-like sponsons on either side. It was typically painted with a 4-color brown/green/black camouflage pattern, but also with olive drab overall. The vehicle was made from face-hardened armor plates which were riveted together like a boiler, partly sloped on the front. The crew entered through doors in the rear of the side sponsons. There was no compartmentalization, everything including the engine and fuel tank being included in the fighting compartment. The driver sat on the right side of the front. He could not steer the vehicle by himself, needing the assistance of both the brakeman to his left and the two gearsmen in the rear of the tank. The brakeman was also the commander.

Between the driver and the commander was a forward-firing 7.7x56mmR (.303 SAA) Hotchkiss No 2 Mk I machine gun (p. HT118), which was usually operated by the commander, but could also be fired by the driver, if necessary. The machine gun fed from 14-round strips. Behind them, in the middle of the vehicle, was the hand-started, unsilenced Daimler gasoline engine and the munition for the onboard guns. Each sponson mounted a manually-operated 57x305mmR (6-pounder) Hotchkiss QF Mk I naval gun with L40 barrel, which could be traversed through 90 degrees, which allowed firing to the front or side. It was manned by a single gunner, who loaded and fired it by himself. The standard ammunition was of the LE type. Some canister rounds were carried against troops. Also in each sponson was a ballmount for a side-firing Hotchkiss No 2 Mk I machine gun. When not firing the machine guns, the machine gunners assisted with loading the main guns. Revolvers, usually the 11.5x20mmR (.455 SAA) Webley No 1 Mk VI (p. HT110), and No 5 Mk I *Mills Bomb* hand grenades (p. HT117) were stowed in a compartment near the commander's position.

The fuel tank was located in the rear of the vehicle under the roof. Its gravity-feed was a distinct disadvantage, since the engine would starve when the vehicle was reared at certain angles. Also in the rear of the hull was the transmission and the stations of the two gearsmen. Each was responsible for the secondary gears of one track, and had to change it when signaled by the driver. The engine, the transmission, and the guns all resulted in quick heat and fume built-up in the confines of the machine. The only crew comfort carried by the vehicle was a water tank near the commander's position. For communications, the vehicle carried signal flags and two pigeons in a basket.

One of the major shortcomings of both the Mk I and all its successors was the armor, which was riveted to steel girders and braces. This meant that even non-armor-piercing rifle projectiles could enter at the seams and either penetrate or cause spall. The armor-piercing bullets fired by the German 7.92x 57mm DWM-Maxim MG08 machine gun (pp. HT117-118) and 20x70mmRB Becker TAK16 autocannon could often penetrate the plating from most angles anyway. It was common for the crew members to wear face armor (DR 2) to protect the face and eyes from spall. Under concentrated machine gun fire, the crew would often fling themselves to the floor, so little was the protective value. The vehicles were also very vulnerable to their own guns and most field guns of the era.

Subassemblies and Body Features: Tracks (Tr, two tracks). Two superstructures (Su1 on BoR and Su2 on BoL). 30 degree slope on BoF.
Propulsion: 77 kW tracked drivetrain (Bo, HP 30).
Armament: Two 57mm QF Mk I Guns (Su1R, Su2L, HP 40 each). 302 x TL5 57mm LE rounds (Bo, HP 50). 30 x

TL5 57mm canister rounds (Bo, HP 11). Casemate mounts for QF Guns (Su1, Su2, HP 27 each). Three 7.7mm No 2 Mk I Machine Guns (BoF, Su1R, Su2L, HP 4 each). 6,272 x 7.7mm rounds (Bo, HP 11). Casemate mounts for Machine Guns (Bo, Su1, Su2, HP 2 each).

Instruments: Signal hoists. Two pigeon cages (Bo, HP 10 each). Two telescopes (Su1R, Su2L, x 1.5, vision bonus +1, HP 1 each).

Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls, "Commander" operates brakes and forward-mounted Machine Gun, two "Gearsmen" operate secondary gears, two "Gunners" operate QF Guns and telescopes, two "Machine Gunners" operate side-mounted Machine Guns and load QF Guns, all from roomy crew stations (Bo, HP 75 each). *Crew:* "Driver," "Commander," two "Gearsmen," two "Gunners," two "Machine Gunners". *Occupancy:* Short. *Provisions:* 24 gallon light tank (Bo, fire +2, HP 15). 24 gallons water.

Power and Fuel: 77 kW standard gasoline engine (Bo, uses 3.465 gph G, HP 30) powers drivetrain. 46 gallon tank (Bo, fire +1, HP 22). 46 gallons gasoline (fire on 12) last for 13 hours 17 minutes.

Access and Empty Space: 21.48 cf access space (Bo), 192.87936 cf empty space (Bo), 2.775 cf each empty space (Su1, Su2).

Volume: Bo 660 cf, Tr 396 cf, Su1, Su2 30 cf each.

Area: Bo 500 sf, Tr 400 sf, Su1, Su2 60 sf each, total area 1,020 sf.

Structure: Extra-heavy, very cheap frame.

Hit Points: Bo 3,000, Tr 1,200 each, Su1, Su2 360 each.

Body Armor: BoF PD 5, DR 50 expensive metal armor, BoR, BoL, BoB PD 4, DR 30 expensive metal armor, BoT, BoU PD 4, DR 20 expensive metal armor.

Track Armor: Tr PD 4, DR 30 expensive metal armor.

Superstructure Armor: Su1F, Su2F PD 4, DR 35 expensive metal armor, Su1R, Su1B, Su2L, Su2B PD 4, DR 30 expensive metal armor, Su1T, Su1U, Su2T, Su2U PD 4, DR 20 expensive metal armor.

Vision: Poor.

Details: Doors in both superstructures, no headlights, no keys.

Statistics: Cheaply made. Empty weight 51,334.5 lbs. Fuel 276 lbs. Ammo 3,007.232 lbs. Crew and water 1,804 lbs. Loaded weight 56,421.732 lbs. (28.21 tons). Volume 1,116 cf, size modifier +5. Price $59,168.5. HT 10.

Ground Performance: Speed 17 mph. gAccel 1 mph/s. gDecel 20 mph/s. gMR 0.25. gSR 6. Very low GP, off-road speed 4/5.

Note: The calculated top speed is far too high. 3.7 mph forwards and 1 mph backwards are more realistic.

MAN PzKpfw V Panther Ausf G (SdKfz 171), Germany, 1944-1945   (TL6)

History: Many authorities believe that the German *Panzer-Kampfwagen V Panther* was the best tank of WWII. It had neither the thickest armor nor the most powerful gun, but it was rated the best overall vehicle, with a good gun, effective armor (whose front facing was impenetrable for most Allied tank guns from all but the closest distances) and good mobility. Built in response to the advanced design of the Soviet T-34, it was a marked improvement over earlier German tanks. The Allies expected to lose five M4 *Sherman* or nine T-34 tanks for each *Panther* destroyed. Three main versions were made by a number of companies under leadership of MAN beginning in 1943, the Ausf A, D, and G. The Ausf G entered production in February 1944 and was made until the end of the war.

Five *Panthers* were sold to Hungary, and quite a few captured specimens were used by American, British, French, and Soviet units. Very small numbers (two or three at a time) were even used in several instances by the French and Polish resistance. After WWII, *Panthers* served in the Czechoslovakian, French, Hungarian, Romanian, and Yugoslavian armies for some time, but these were scrapped in the early 1950s.

The basic chassis was used for several other vehicles, including the *Befehlspanther* command tank, *Bergepanther* armored recovery vehicle and *Jagdpanther* tank destroyer. Before the Battle of the Ardennes, elements of the *Panzer-Brigade 150* camouflaged a number of their tanks with sheet metal and paint to look like American M10 tank destroyers.

Some 3,740 G-models were built for the German Army (for a total of about 6,000 of all variants), almost three times as many as for example the *Tiger I* Ausf E. It was deployed in platoons of five.

Description: The *Panther* was a very modern-looking tank, with sloped armor facings and a long gun. It was typically painted with various camouflage patterns, including a 3-color sand/brown/green pattern and white overall. The driver sat in the front of the hull on the left side. The hull machine gunner to his right fired the 7.92x57mm Rheinmetall PzMG34 tank machine gun (p. HT119), which fed from 150-round belts carried in special belt pouches. He also operated the radio located between the driver and himself. Both had hatches in the hull roof, as well as escape hatches in the hull belly behind their seats.

To their rear was the main fighting compartment with the turret. The gunner sat on the left side of the turret, the commander behind him and slightly elevated. The loader had his station on the right side. The commander had a hatch above him. There was also a small escape hatch in the turret rear. The 75x639mmR Rheinmetall KwK42 rifled gun had a L70 barrel. Two types of ammo were available, APCBCHE and HE. An improved APCR round had been issued in 1943, but by the time the Ausf G reached the troops, it had already been removed from service for lack of tungsten. The ammunition was stowed throughout the hull, mostly in the sides above the tracks, but also behind the driver and hull gunner. The turret had an open basket so that the ammo could be easily reached.

To the right of the main gun was the PzMG34 coaxial machine gun, also fed by a 150-round belt. Another PzMG34 was installed on a rotating skate mount at the commander's hatch for anti-aircraft fire. Any one of the machine guns could be removed from the vehicle and, when fitted with the bipod and buttstock carried onboard, used in the infantry role if necessary.

In the rear turret roof was a 92mm *Nahverteidigungswaffe* reloadable discharger, which fired smoke bombs. It could be rotated through 360 degrees, but was fixed in elevation, to give a smoke screen at about 75 yards from the tank. It was loaded from the inside. With its breech open it could also be used as a gun port for the 26.5x150mmR Walther KP42 flare pistol, which fired star shells, orange marker smoke and a special HE grenade (Exp.* 1d-1[2d]). The HE grenade was for close defense of the dead angles and detonated at a distance of about 10 yards (20 of these were carried).

All crew members were armed with pistols, usually the 9x19mm Walther P38 with two magazines each. A single 9x19mm ERMA MP40 submachine gun (p. HT116) with six magazines was stowed in the turret, and six *Stielhandgranaten* (p. HT117) were also carried. The Maybach gasoline engine, the fuel tanks and batteries were in the rear, separated from the crew by a fireproof bulkhead.

    Subassemblies and Body Features: Tracks (Tr, two tracks). Two open mounts (Om1 and Om2, full rotation, on TuT). Turret (Tu, full rotation, on BoT). 60 degree slope on BoF. 30 degree slopes on BoB, TuF, TuB, TuR, TuL.
    Propulsion: 515 kW tracked drivetrain (Bo, HP 100).
    Armaments: 75mm KwK42 Tank Gun (TuF, HP 100). 41 x 75mm APCBCHE rounds (Bo, HP 27). 41 x 75mm HE rounds (Bo, HP 27). Two 7.92mm PzMG34 Machine Guns (BoF and TuF, concealed, HP 7 each). 7.92mm PzMG34 Machine Gun (Om1F, HP 4). 4,650 x 7.92mm solid rounds (Bo, HP 9). 150 x 7.92mm solid rounds (Tu, HP 1). Casemate mount for PzMG34 (BoF, HP 5). Universal mount for PzMG34 (Om1, HP 2). 92mm *Nahverteidigungswaffe* (Om2, concealed, HP 8). 12 x 92mm Smoke rounds (Tu, HP 5).
    Instruments and Electronics: Medium communicator (Bo, 10 miles, HP 2, 0.1 kW). Telescope (TuF, x5, vision bonus +2/+4, HP 2). Telescope (BoF, x1.5, vision bonus +1, HP 1).
    Miscellaneous Equipment: Fire extinguisher system (Bo, HP 13).
    Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls, "Hull Machine Gunner" operates body-mounted Machine Gun, communicator and telescope, both from normal crew stations (Bo, HP 60 each), "Commander" operates open-mounted Machine Gun, "Gunner" operates Tank Gun, turret-mounted Machine Gun and telescope, "Loader" operates *Nahverteidigungswaffe* and loads Tank Gun, all from normal crew stations (Tu, HP 60 each). *Crew:* "Driver," "Hull Machine Gunner," "Commander," "Gunner," "Loader". *Occupancy:* Short. *Environmental Systems:* Environmental control for five persons (Bo, HP 6, 1.25 kW).
    Power and Fuel: 515 kW standard gasoline engine (Bo, uses 23.175 gph G, HP 100) powers drivetrain. Two 5,184 kWs lead-acid batteries (Bo, HP 5 each) power other systems for 128 minutes, recharged by engine. Two 55 gallon tanks (Bo, fire +1, HP 25 each), 35 gallon tank (Bo, fire +1, HP 19), 30 gallon tank (Bo, fire +1, HP 17), 18 gallon

tank (Bo, fire +1, HP 12). 193 gallons of gasoline (fire on 12) last for 8 hours 20 minutes.

Access, Cargo and Empty Space: 126.6 cf access space (Bo), 20 cf cargo space (Bo), 63.4755 cf empty space (Bo), 0.105 cf empty space (Om1), 9.8835 cf empty space (Tu).

Volume: Bo 700 cf, Tr 420 cf, Om1 1 cf, Om2 1.8 cf, Tu 240 cf.

Area: Bo 500 sf, Tr 400 sf, Om1 6 sf, Om2 9 sf, Tu 250 sf, structural area 1,150 sf, total area 1,165 sf.

Structure: Heavy, very cheap frame.

Hit Points: Bo 1,500, Tr 600 each, Om1 12, Om2 18, Tu 750.

Special Structural Option: Heavy compartmentalization in Bo.

Body Armor: BoF PD 6, DR 385 expensive metal armor, BoB PD 5, DR 160 standard metal armor, BoR, BoL PD 4, DR 140 expensive metal armor, BoT PD 4, DR 45 standard metal armor, BoU PD 4, DR 60 standard metal armor.

Track Armor: Tr PD 4, DR 30 standard metal armor with PD 3, DR 10 cheap metal track skirts.

Turret Armor: TuF PD 5, DR 325 standard metal armor, TuB, TuR, TuL PD 5, DR 140 standard metal armor, TuT PD 4, DR 45 standard metal armor.

Surface Feature: Camouflage paint job.

Vision: Poor.

Details: Two hatches on body top, two hatches on body underside, hatch on turret top, hatch on turret rear, intercoms, headlights and running lights, no keys.

Statistics: Empty weight 93,806.95 lbs. Fuel 1,158 lbs. Ammo 2,542.7 lbs. Crew and cargo 1,400 lbs. Loaded weight 98,907.65 lbs. (49.45 tons). Volume 1,362.5 cf, size modifier +5. Price $248,276.1. HT 8.

Ground Performance: Speed 30 mph. gAccel 2 mph/s. gDecel 20 mph/s. gMR 0.25. gSR 6. Low GP, off-road speed 2/3.

Uralvagonzavod T-55A obrazets 1970g, USSR,   (TL6- 1970-1979   7)

History: The T-55A (1970) was the main production version of the ubiquitous T-55 family. The basic T-55 entered production in 1958, and was based on the earlier and quite similar T-54-series. It was followed by the improved T-55A in 1961. In 1970, production switched to the T-55A (1970), and many vehicles of earlier manufacture were upgraded to this standard. License-produced vehicles were also made in Czechoslovakia and Poland, while China and Romania build similar vehicles.

The T-55 was a good design when introduced, heavily armored and with an effective gun. It was also cheap and made in large numbers. Today, it is usually considered as the "Warlord's Special," that is as a budget vehicle with questionable performance, often used by irregular troops in backwater countries. Second-hand vehicles have been sold for $10,000 apiece! It stands no chance against modern designs, but is extremely widespread, with the number of users exceeding 40 countries, most of them in East Europe, Africa, and Asia. Variant models and derivatives are too numerous to mention, but despite continuous upgrading programs, there are still many T-55s in this or a similar configuration around. One of the simpler and more common upgrades was the T-55A (1974), which had a laser rangefinder added over the gun mantlet.

Production in the USSR ceased in 1979, after about 20,000 T-55s of all variants had been made (plus some 9,000 in Czechoslovakia and Poland).

T-55s were widely used in combat, including during fightings in Afghanistan, Egypt, Iraq, Somalia, Syria, Uganda and Yugoslavia. In the Soviet Army, it was deployed in platoons of three.

Description: The T-55A (1970) was of conventional layout, with the engine at the rear. It was typically painted olive drab. The driver was seated on the left side of the hull front, with a hatch above him. To his right was some of the main gun ammunition stowage. To his rear was the fighting compartment with the turret. The gunner sat on the left side, with the commander behind him. The loader was on the right side.

The main armament was the 100x707mmR Degtyarev D-10T2S rifled gun with L56 barrel. Originally, it fired HE,

APCBCHE, APDS and HEAT rounds. In the 1990s, the 3,000 or so T-55s remaining in Russian service had HE, APFSDS and HEAT available. All ammunition was stowed below the hull roofline. To the right of the main gun was the 7.62x54mmR Kalashnikov PKT machine gun (p. HT120). The weapon fed from a 250-round belt. Early models of the T-55 did not mount an anti-aircraft machine gun. However, the T-55A (1970) did again receive such a weapon. The 12.7x108mm Degtyarev DShKM heavy machine gun (p. HT120 under "NSV") at the loader's hatch fed from a 50-round belt.

Driver, gunner and commander had IR-lights and IR-sights for night combat. Driver, gunner, and commander were armed with 9x18mm Makarov PM pistols (p. SO98) with two magazines each, while the loader had a 7.62x39mm Kalashnikov AKMS assault rifle (a folding stock variant of the AK-47, pp. HT114-115) with four magazines. A 26.5x103mmR SPSh-2 flare pistol and ten F-1 hand grenades were provided for distribution among the crew.

The engine was a turbocharged diesel which could also burn other fuels. By injecting diesel into the exhaust, the tank could generate a smoke screen to hide behind. The Soviets pioneered the external fuel tank concept. Only 180 gallons of fuel were carried inside the vehicle; 75 gallons were carried in three unarmored fuel tanks on the right fender above the track. As an option, another 110 gallons could be carried in two fuel drums on the hull rear. The T-55 could ford rivers and other water bodies up to 5 yards deep by installing a snorkel over the loader's periscope. The snorkel was usually carried on the turret rear and took about 15 minutes to install.

Subassemblies and Body Features: Tracks (Tr, two tracks). Open mount (Om, full rotation, on TuT). Nine pods (Po1-Po7 on BoT, Po8, Po9 on BoB). Turret (Tu, full rotation, on BoT). 30 degree slope on BoF.
Propulsion: 425 kW tracked drivetrain (Bo, HP 75).
Armaments: TL6 100mm D-10T2S Tank Gun (TuF, HP 125). 15 x 100mm APDS rounds (Bo, HP 21). 22 x TL6 100mm HE rounds (Bo, HP 27). 6 x 100mm HEAT rounds (Bo, HP 11). Full stabilization for D-10T2S (Tu, HP 27). 7.62mm PKT Machine Gun (TuF, concealed, HP 6). 1,250 x 7.62mm AP rounds (Tu, HP 4). 750 x 7.62mm AP rounds (Bo, HP 2). TL6 12.7mm DShKM Heavy Machine Gun (OmF, HP 8). 300 x TL6 12.7mm AP rounds (Bo, HP 4). 200 x TL6 12.7mm AP rounds (Tu, HP 3). Universal mount for DShKM (Om, HP 5).
Instruments and Electronics: Medium communicator (Tu, 30 miles, HP 1). IR searchlight (TuF, 0.5 miles, HP 2, 0.5 kW). IR searchlight (TuF, 0.25 miles, HP 1, 0.25 kW). IR searchlight (BoF, 0.05 miles, HP 1, 0.05 kW). Telescope (TuF, x7, vision bonus +3/+5, HP 2). Telescope (TuF, x5.5, vision bonus +2/+4, HP 1). Telescope (TuF, x3, vision bonus +2/+3, HP 1). Navigation instruments (Bo, HP 4).
Miscellaneous Equipment: Full fire suppression system (Bo, HP 16). Smokescreen (Bo, HP 8).
Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls and 0.05 mile IR searchlight from cramped crew station (Bo, HP 50), "Commander" operates radio, 0.25 mile IR searchlight, x5.5 telescope (daysight) and x3 telescope (nightsight), "Gunner" operates Tank Gun, Machine Gun, 0.5 mile IR searchlight and x7 telescope, "Loader" operates Heavy Machine Gun and loads Tank Gun, all from cramped crew stations (Tu, HP 50 each). *Crew:* "Driver," "Commander," "Gunner," "Loader". *Occupancy:* Short. *Environmental Systems:* NBC kit for four persons (Bo, HP 10, 1 kW).
Power and Fuel: TL6 425 kW HP diesel engine (Bo, uses 19.125 gph D, HP 100) powers drivetrain. Snorkel (Tu, 2.5 yards, HP 4). Four 3,024 kWs lead-acid batteries (Bo, HP 3 each) power other systems for 112 minutes, recharged by engine. 84 gallon tank (Bo, HP 40), two 40 gallon tanks (Bo, HP 20 each), 16 gallon tank (Bo, HP 11), three 25 gallon tanks (Po5-Po7, HP 15 each), two 55 gallon tanks (Po8, Po9, HP 25 each). 180 gallons of diesel (Bo, fire on 9) last for 9 hours 25 minutes, 75 gallons of diesel (Po5-Po7, fire on 9) last for 3 hours 55 minutes, 110 gallons of diesel (Po8, Po9, fire on 9) last for 5 hours 45 minutes.
Access, Cargo and Empty Space: 87 cf access space (Bo), 5 cf cargo space (Bo), 3.5 cf each cargo space (Po1, Po2), 3 cf cargo space (Po3), 1.5 cf cargo space (Po4), 13.5529 cf empty space (Bo), 0.55 cf empty space (Om), 2.8735 cf empty space (Tu).
Volume: Bo 330 cf, Tr 198 cf, Om 3 cf, Po1, Po2 3.5 cf each, Po3 3 cf, Po4 1.5 cf, Po5-Po7 3.75 cf each, Po8, Po9 8.25 cf each, Tu 160 cf.
Area: Bo 300 sf, Tr 250 sf, Om 13 sf, Po1, Po2 14 sf each, Po3 13 sf, Po4 8 sf, Po5-Po7 15 sf each, Po8, Po9 25 sf each, Tu 200 sf, structural area 894 sf, total area 907 sf.
Structure: Bo, Tr and Tu extra-heavy, cheap frame, Po1-Po9 light, standard frame.
Hit Points: Bo 1,800, Tr 750 each, Om 26, Po1, Po2 11 each, Po3 10, Po4 6, Po5-Po7 11 each, Po8, Po9 19 each, Tu 1,200.

Special Structural Option: Heavy compartmentalization in Bo.

Body Armor: BoF PD 5, DR 490 expensive metal armor, BoB PD 4, DR 125 expensive metal armor, BoR, BoL PD 4, DR 220 expensive metal armor, BoT PD 4, DR 90 expensive metal armor, BoU PD 4, DR 55 expensive metal armor.

Track Armor: Tr PD 4, DR 30 expensive metal armor.

Pod Armor: Po1-Po9 PD 2, DR 3 expensive metal armor.

Turret Armor: TuF PD 4, DR 560 expensive metal armor, TuB PD 4, DR 175 expensive metal armor, TuR, TuL PD 4, DR 415 expensive metal armor, TuT PD 4, DR 105 expensive metal armor.

Surface Features: Sealed. Camouflage paint job.

Vision: Poor.

Details: Hatch on body top, hatch in floor, two hatches on turret top, intercoms, headlights and running lights, no keys.

Statistics: Empty weight 75,493.32 lbs. Fuel 2,190 lbs. Ammo 2,314.5 lbs. Crew and cargo 1,130 lbs. Loaded weight 81,127.82 lbs. (40.56 tons). Volume 730.25 cf, size modifier +4. Price $585,853.8. HT 9.

Ground Performance: Speed 40 mph. gAccel 3 mph/s. gDecel 20 mph/s. gMR 0.25. gSR 6. Low GP, off-road speed 2/3.

Note: The engine of the T-55A (1970) is multifuel-capable, something impossible at TL6 under *Vehicles* rules.

Krauss-Maffei *Kampfpanzer Leopard 2A5,* Germany, 1995-2000   **(TL7)**

History: The German *Leopard 2* was the first of the current Western main battle tanks, superseding the *Leopard 1-* series in front-line service with the German *Bundeswehr* beginning in 1979. It introduced the 120mm smoothbore gun now customary on Western tanks and featured the British-designed Chobham armor. The *Leopard 2* was built in a number of minor production variants, older vehicles gradually being upgraded to the final production standard, the *Leopard 2A4* of 1987. In 1995, the *Leopard 2A5* was introduced by upgrading older vehicles. It had markedly improved protection over the frontal turret area, as well as many other modifications. Slightly customized versions of the *Leopard 2A1* were adopted by the Netherlands and Switzerland. During the 1990s, surplus vehicles of A1-A3 standard from the German and Dutch armies were sold to Austria, Denmark, Spain and Sweden. In addition, Sweden purchased the Strv122, a further improved variant also known as the *Leopard 2A5S*. So far, almost 3,000 vehicles have been built in Germany, Sweden and Switzerland, but only 350 of those in the 2A5 configuration detailed here. The Netherlands use a very similar model known as the *Leopard 2A5NL* (from 1995). Beginning in 2001, all German A5s will be upgraded to the *Leopard 2A6* configuration, which will be armed with a longer gun. Denmark, the Netherlands, Spain and Switzerland will upgrade their vehicles to at least this standard as well.

The basic chassis was also used for the *Büffel* armored recovery vehicle.

The *Leopard 2* has not yet seen combat, but both Dutch and German 2A5s were deployed to the former Yugoslavia in 1999. A German platoon consisted of four vehicles.

Description: The *Leopard 2A5* was painted in the NATO-standard 3-color green/brown/black camouflage pattern. It was of conventional outlay. The driver sat in the hull front on the right side. To his left was a stowage rack for 27 rounds of main gun ammunition, accessible to the loader through the open turret basket. In the floor behind his seat was an escape hatch. Behind the driver was the turret with the rest of the crew. The gunner sat on the right side, with the commander behind him, slightly elevated. The commander had a hatch above him in the roof. The loader had his station on the left side, also with a hatch above him. The main armament was a 120x560mmR Rheinmetall BK120-1 smoothbore gun with L44 barrel. It fired HEDP and APFSDS rounds with semi-combustible casing.

The APFSDS has continuously been improved, the latest type penetrating much more armor than the earlier rounds. The ballistic computer could be programmed to handle a third type of round. Foreign rounds such as American APFSDSDU, Israeli Canister or Swedish HE could then be fired, but were not used by the German Army. 15 ready

rounds were stowed in an anti-blast magazine in the turret bustle. The computer supported shots to a range of 4,400 yards. The commander could override his gunner and fire the main gun himself. To the left of the cannon was the 7.62x51mm Rheinmetall MG3A1 machine gun, the latest incarnation of the WWII-vintage MG42 (see p. HT119 under "MG34"). It fed from a 500-round belt, and another 500-round belt was positioned nearby for quick change-over. A second MG3A1 was installed in a rotating open mount at the loader's hatch. This fed from a 100-round belt in a small can. When fitted with a bipod, it could also be used dismounted.

In German service, the driver and gunner were issued a 9x19mm H&K P8 pistol (a variant of the USP, p. HT109) with two magazines each, while the commander and loader had a 9x19mm IMI MP2A1 submachine gun (*Uzi*, p. HT116) with seven magazines each. A 26.5x103mmR H&K P2A1 flare pistol (**High-Tech** 1st ed., p. 124) and four DM51 hand grenades were also carried. The powerful MTU turbocharged engine in the rear was designed to also be able to run on other fuel grades, including gasoline and jet fuel (at slightly lower performance). The engine, drivetrain and batteries were separated from the fighting compartment by bulkheads, as were the explosion-proof fuel tanks located in the sponsons above the tracks.

Subassemblies and Body Features: Tracks (Tr, two tracks). Open mount (Om1, full rotation, on Tu1T). Four open mounts (Om2-Om5, two each on Tu1R, Tu1L). Turret (Tu1, full rotation, on BoT). Turret (Tu2, full rotation, on Tu1T). 30 degree slope on BoF. 60 degree slope on Tu1F.

Propulsion: 1,100 kW tracked drivetrain (Bo, HP 125).

Armaments: 120mm BK120-1 Tank Gun (Tu1F, HP 125). 10 x 120mm Late APFSDS rounds (Tu1, HP 18). 5 x 120mm HEDP rounds (Tu1, HP 11). 18 x 120mm Late APFSDS rounds (Bo, HP 27). 9 x 120mm HEDP rounds (Bo, HP 17). Full stabilization for BK120-1 (Tu1, HP 25). Anti-blast magazine for 15 x 120mm rounds (Tu1). 7.62mm MG3A1 Machine Gun (Tu1F, concealed, HP 6). 2,000 x 7.62mm solid rounds (Tu1, HP 5). 2,750 x 7.62mm solid rounds (Bo, HP 6). Full stabilization for MG3A1 (Tu1, HP 1). 7.62mm MG3A1 Machine Gun (Om1F, HP 3). Universal mount for MG3A1 (Om1, HP 2). 16 76mm *Nebelwurfkörper* Decoy Dischargers (four each Om2-Om5, HP 3 each). 16 x 76mm CHEM (Hot Smoke) rounds (four each Om2-Om5, HP 1 each).

Instruments and Electronics: Two medium communicators with scramblers (Tu1, 30 miles, HP 1 each). Telescope (Tu1F, x8, vision bonus +3/+5, HP 2). Telescope (Tu1F, x12, vision bonus +3/+6, HP 2). Telescope (Tu2F, x24, vision bonus +4/+8, HP 4). Light amplification (BoF, HP 1). Two thermographs (Tu1F, Tu2F, 3.2 miles, scan rating 14, HP 3 each). Digital vehicle camera (BoB, HP 1). Navigation instruments (Tu1, HP 4). Inertial navigation system (Tu1, HP 6). Military GPS (Tu1, HP 1). Two laser rangefinders (Tu1F, Tu2F, 6 miles, HP 2 each). Dedicated, hardened minicomputer (Tu1, C2, HP 7) with targeting (C2, +3 to hit).

Miscellaneous Equipment: Full fire suppression system (Bo, HP 16). Bilge pump (Bo, HP 30, 1 kW).

Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls, light amplifier and digital vehicle camera from normal crew station (Bo, HP 60), "Commander" operates Decoy Dischargers, radios, x24 telescope, thermograph, laser rangefinder, navigation instruments, inertial navigation system and GPS, "Gunner" operates Tank Gun, turret-mounted Machine Gun, x12 telescope, backup x8 telescope, thermograph, laser rangefinder and computer, "Loader" operates open-mounted Machine Gun and loads Tank Gun, all from roomy crew stations (Tu, HP 75 each). *Crew:* "Driver," "Commander," "Gunner," "Loader". *Occupancy:* Short. *Environmental Systems:* NBC kit for four persons (Bo, HP 10, 1 kW).

Power and Fuel: 1,100 kW turbocharged standard diesel engine (Bo, uses 38.5 gph D, HP 175) powers drivetrain. Eight 5,400 kWs lead-acid batteries (HP 4 each) power other systems for 360 minutes, recharged by engine. 92 gallon self-sealing tank (Bo, fire -1, HP 40). 74 gallon self-sealing tank (Bo, fire -1, HP 30). 66 gallon self-sealing tank (Bo, fire -1, HP 30). 61 gallon self-sealing tank (Bo, fire -1, HP 27). 13 gallon self-sealing tank (Bo, fire -1, HP 10). 306 gallons of diesel (fire on 8) last for 7 hours 57 minutes.

Access, Cargo and Empty Space: 222.2 cf access space (Bo), 12 cf cargo space (Bo), 13 cf open cargo space (Tu1B), 23.0475 cf empty space (Bo), 0.035 cf empty space (Om1), 8.475 cf empty space (Tu1).

Volume: Bo 715 cf, Tr 429 cf, Om1 0.726 cf, Om2-Om5 1.252 cf each, Tu1 300 cf, Tu2 1.08 cf.

Area: Bo 500 sf, Tr 400 sf, Om1 5 sf, Om2-Om5 7 each, Tu1 300 sf, Tu2 6 sf, structural area 1,206 sf, total area 1,239 sf.

Structure: Extra-heavy, very cheap frame.

Hit Points: Bo 3,000, Tr 1,200 each, Om1 10, Om2-Om5 14 each, Tu1 1,800, Tu2 36.

Special Structural Options: Heavy compartmentalization in Bo and Tu1. Improved suspension.

Body Armor: BoF PD 5, DR 1,100 advanced laminate armor, BoB PD 4, DR 140 standard metal armor, BoR, BoL

PD 4, DR 305 advanced laminate armor, BoT PD 4, DR 90 standard metal armor, BoU PD 4, DR 55 standard metal armor.

Track Armor: Tr PD 4, DR 40 standard metal armor with PD 4, DR 135 expensive composite skirts.

Turret Armor: Tu1F PD 6, DR 2,400 advanced laminate armor backed with DR 15 non-rigid armor, Tu1B PD 4, DR 110 advanced laminate armor backed with DR 15 non-rigid armor, Tu1R, Tu1L PD 4, DR 740 advanced laminate armor backed with DR 15 non-rigid armor, Tu1T PD 4, DR 90 standard metal armor backed with DR 15 non-rigid armor, Tu2 PD 3, DR 10 standard metal armor.

Surface Features: Sealed. Camouflage paint job. Hitch.

Vision: Poor.

Details: Hatch on body top, hatch in floor, two hatches on turret top, intercoms, headlights and running lights, no keys.

Statistics: Empty weight 121,442.25 lbs. Fuel 1,836 lbs. Ammo 2,317.2 lbs. Crew and cargo 1,300 lbs. Loaded weight 126,895.45 lbs. (63.45 tons). Volume 1,450.814 cf, size modifier +5. Price $5,021,044. HT 10.

Ground Performance: Speed 45 mph. gAccel 3 mph/s. gDecel 20 mph/s. gMR 0.5. gSR 7. Low GP, off-road speed 2/3.

Notes: The commander can override the tank gun control, which can't be properly represented in *Vehicles* rules. The engine of the *Leopard 2A5* is multifuel-capable, again something impossible at TL7 under *Vehicles* rules. The armor details are still classified, but even an educated guess creates problems. The thickness of side armor increases considerably towards the front, which we had to average. The speed came out too high, but was corrected using the "Making Lemons" sidebar.

Tank Weaponry

It would be surprising if eleven real-world weapons exactly matched the formulae from *Vehicles*, but fortunately the rules allow for some adjustments. This wasn't always enough -- we had to introduce a new ammo type (APCBCHE) and adapt the rules for plastic-cased ammunition to cover semi-combustible cases, the newer machine guns are a little too light, the decoy dischargers get too much range, and the modern HEDP rounds get too little punch.

New KE-Class Ammunition:

APCBCHE, Armor Piercing Capped, Ballistic Capped, High Explosive (TL6): An anti-armor round with a small amount of explosive. Available only for cannon.

CHEM (Smoke)	Crit.	Spcl.	22yards		3	100	1,100				2.6	0.033	$16	
CHEM (Hot Smk)	Crit.	Spcl.	22yards		3	100	1,100				4	0.033	$48	

Notes: The calculated accuracy and ranges of the *Nebelwurfkörper* are too high. Use it like a mortar with Acc 0 and Max 75 (50 for HE). The calculated HE concussion damage is too high. Use 5dx2[6d] instead.

Selected Reading

Apart from the relevant **GURPS** books (**High-Tech** and **Vehicles**), we can recommend from the wealth of books on the topic several English-language books for further reference: Chant's *World Encyclopedia of the Tank* (1994) provides a very good overview on the history of tanks, and also many details on individual models. The standard reference on modern combat vehicles, Jane's *Armour and Artillery 1999-2000* (1999), is invaluable for research into any TL7 tank. Information on early tanks is harder to come by, but one commonly available, good book is *AFVs of*

World War One, originally published in 1970, but recently reprinted. The inexpensive *New Vanguard* booklets published by Osprey's are lavishly illustrated and offer much detail, including cut-away drawings. NVG 22 is about the *Panther* family, NVG 24 about the *Leopard 2*. Spielberger wrote the massive *The **Panther** and Its Variants* (1993), which includes everything you could ever want to know about that tank. Culver/Feist's ***Panther** in Detail* (1998) is not quite as completist, but very well illustrated. *Soviet/Russian Armor and Artillery Design Practices 1945 to Present* (1999) by Hull/Markov/Zaloga is currently the standard reference work on Russian tanks. Böhm's *Leopard 2/2A5* (1998) is a cheap and neat full-color booklet with good pictures. Those who want to read more about armored vehicle design and construction should consult Ogorkiewicz's excellent *Technology of Tanks* (1991) and Jane's *AFV Upgrades 1999-2000* (1999).

If you can read German, you will want to acquire Spielberger's "*Waffensysteme **Leopard 1** und **Leopard 2***" (1995).

Interesting web sites include:

Battle Line Card Game

Designed by Reiner Knizia

Published by GMT Games

6"x9" box with nine wooden bottle-pawns for flags, 70 cards, and a plastic draw/discard tray; $20.00

Battle Line from GMT Games is a strategy card game by Reiner Knizia for two players that plays in about half an hour. A descendant of the German game *Schotten-Totten*, *Battle Line* is an abstract game of playing cards into sets by color, number, or sequence. With no way to discard and rapidly disappearing positions to play into, *Battle Line* rewards thinking ahead and the Tactics cards keep things lively, making for an interesting game start to finish.

The deck itself is very nice; these are quality cards that shuffle well, and the backs feature classical artwork and border. The faces use artwork apparently borrowed from GMT's *Great Battles Of History* series, featuring clean, accurate drawings of ancient soldiers. There are sixty Troop cards, six colors each numbered one to ten, and ten additional Tactics cards with a different colored back which are drawn from a separate deck.

Players start with a hand of seven Troop cards and alternate placing a single card on their side of one of the nine flags. Each turn after you play a card, you can claim any one flag if you have played three cards on that flag and it can be seen from the visible cards on the table that your opponent cannot complete a better formation. Lastly, you draw a new card, your choice of a Troop card or a Tactics card.

The formations each player tries to form on his side of each flag in order of rank are Wedge (same color, consecutive numbers), Phalanx (same number), Battalion Order (same color), Skirmish Line (consecutive values in any colors), and Host (anything else). Ties are won by the higher total value. The first player to win three adjacent flags (a Breakthrough) or five flags total (an Envelopment) wins.

The Tactics cards introduce that random element that makes war continually surprising. They can remove a key Troop card from a powerful formation or render formation meaningless. Some act as wild cards to complete uncompleteable formations, or allow you to choose your next card. Despite these awesome powers, however, they don't unbalance the game; each effects the outcome of just one flag (or possibly two with Deserter), and only then if played correctly. Additionally, though you can draw as many Tactics cards as you like (in place of Troop card draws), you can play a maximum of one more than your opponent. I have played Tactics cards only to lose the flag in question when my opponent showed flexibility and resource, and I have struggled through the endgame with very few playable cards in my hand after drawing Tactics cards I cannot play since I've already played more than my opponent. As it should be, clever generalship is required to make advantage out of random happenings.

Mid-game finds your opportunities evaporating: there are flags that have already been decided, flags for which you are waiting for the right card, flags where you have played three cards, and flags you will lose with your next card. You find yourself selecting the lesser evil as flags start falling to one side or the other. The player who prepared best in the early part of the game will see things turn out in his favor. The decreasing options and acceleration of flag claims gives a nice climax.

The rules are very nicely written and attractive, filling both sides of one folded sheet. I could find no overlooked game

situation, and diagrams and examples present things clearly. An quick reference on the back or on a separate card showing the ranking of the formations would be the only improvement.

Historical wargamers may be irked that each troop type has only a crude numeric rating, and none of its historical characteristics; Archers have no advantage over horses, chariots have no problem with formed heavy infantry, and elephants don't scare horses, but if this expectation can be set aside the ancient military flavor works very nicely over the color-and-number-based mechanics.

Battle Line's short playing time allows you two or three games instead of one, and can neatly fill that half hour while waiting for the whole group to gather. Simple rules and a quick game make it attractive for non-gamers, and they will enjoy it. *Battle Line* is easy enough for a twelve-year-old to play, and deep enough to keep an experienced gamer wrestling with dilemmas through the final play.

Tips

Don't try to "draw to an inside straight": if you have two cards in sequence you can try to wait for the one that follows or precedes them, but if you have two cards with a gap between them the odds are much lower of filling it. While it's difficult for your opponent to claim a flag where you have played only one card, its actually quite likely when you have two cards down, so think twice before playing that second card. Tactics cards can instantly swing a flag in your favor, so its tempting to draw several; since you may not be able to play them, however, they can take up valuable space in your hand. Conversely, the card backs allow you to see when your opponent has over-drawn Tactics cards in search of a quick fix; consider not playing any yourself to constrict his hand. If you are aiming for a Wedge on one flag and your opponent starts playing junk into that position on the assumption you will win, you can seize it with any color-matched card, opting to beat a Host or Skirmish Line with a Battalion order, relieving you of the need to find the right card and denying him a chance to play a third card, effectively a discard which gives him another draw.

Solitaire

You can build your planning skills with a simple solitaire variant. Shuffle and deal two seven card hands; take one for yourself and put the other on the bottom of the deck. Start playing onto the nine flags normally, drawing after each play. If you fill a second position next to any flag with a card that rules out any formation other than Host you are assumed to have lost that flag and cannot play a third card there. When you have filled all three positions in front of a flag draw one card for the opponent's side of each flag, evaluating them as follows: 10 is a 7-8-9 Wedge, 9 is a 4-5-6 Wedge, 8 is a 1-2-3 Wedge, 7 is a Phalanx of 10s, 6 is a Phalanx of 7s, 5 is a Phalanx of 4s, 4 is a Phalanx of 1s, 3 is Battalion Line totaling 28, 2 is a Battalion Line Totaling 10, and 1 is a Host totaling 21. The imaginary opponent wins ties for a flag, and victory is determined the usual way. You should win half the games.

The Forge Of Fury (for D&D)

Written By Richard Baker

Published by [Wizards Of The Coast](#)

32 pages; $9.95

The second adventure in a series of core adventures, *The Forge Of Fury* does not
directly follow *The Sunless Citadel*. Instead, *The Forge Of Fury* embarks players
with characters of 3rd level on a new mission, with new twists to get them involved.

The Forge Of Fury is an old dwarven stronghold, Khundrukar, that was overrun by orcs years ago. The players have
various methods of hearing about the stronghold, ranging from being hired to retrieve dwarvenworks to finding a map
in a previous adventure. The first few pages are very good at walking new Dungeon Masters through the steps needed
to properly prepare for the adventure. I guess my main question would be, "Why?" This isn't an introductory
adventure, nor is it an adventure for 1st level characters. Like the *Sunless Citadel*, the main focus is on the adventure.
While there is a town nearby the ruins of Khundrukar, there are no maps for it, and the details are minimal. Still, this
doesn't impact the adventure at all.

The ruins of Khundrukar are vast. In a mere 32 pages, Richard Baker manages to throw in four levels of different
monsters. Even more impressive is that these levels aren't small ten-room layouts. Each level is named, and has its own
personality.

The first level, where the players will start off, is The Mountain Door. Here the players will pit their strength against
orcs and their ogre leader. More impressive than the orc threat however, is the personality types that are given to the
NPCs. Dungeon Masters get to play a wide range of characters ranging from lazy orc sentries to an enraged orc
shaman. The second level, The Glitterhame, engages the players with troglodytes, stirges, and giant lizards. One of the
more interesting tricks that the troglodytes have is a trained brown bear. More sinister foes include yellow mold, a very
dangerous encounter for characters of any level. If the players survive the threat of the Grick, a monster with damage
reduction (15/+1), they can descend into the Sinkhole.

With a waterfall and a river, the Sinkhole place might be the perfect area to get away from it all . . . save for the
intelligent roper here. A powerful creature with a Challenge Rating of 10, the roper is perhaps too powerful for the
party to fight. Ironically, the author can't seem to make up his mind. On one hand, he advises that the characters should
seek to avoid the encounter and if they don't, they deserve what they get. In the same section, he advises Dungeon
Masters who know that their group will attack the roper anyway, to omit the encounter. In my opinion, you can't use
the left hand to say that the party deserves what they get and then use the right to take the whole threat away.

Characters who endure the roper can meet the other inhabitants of the Sinkhole, the duergar. I have to tip my hat to the
author, in that there are several named duergar with a few hints on roleplaying them. This makes a new Dungeon
Master's job much easier. Even better though, is that it saves the DM the time of making up names for monsters that
might want to talk to the party. How often have you had to pause the game and think of a name for the monster?

For those who prefer more roleplaying opportunities still, there is the succubus Idalla. Trapped and bound by a wizard
to a single room, she must have a good-aligned character grant her permission to leave, or have a good-aligned
character attack her. This is another case where perhaps the encounter could go very wrong for players. More
important than Idalla's abilities however, are the tales she has for characters. One of the sidebars includes different

rumors that Idalla knows. While most of them are false, there are some interesting things that a DM could run with.

Those party members that insist on moving further into the ruins must seek out the Black Lake. Here they'll encounter one of the classic staples of the **Dungeons & Dragons** game, a dragon. The black dragon, Nightscale, has many advantages in the watery environment and players will have to stay on their toes to defeat her. Still, if they do, they can get their hands on quite a bit of treasure.

The adventure ends with suggestions that deal with the method of how the characters started the adventure. If it was through the map, for example, there is little to do save have the characters go to town and gain fame and fortune. Of course they could find another map . . . If they were hired to find dwarven weapons, they can gain a lot of wealth, but lose some very potentially useful items.

One of the nice things about the adventure is that there is very little wasted space. Following the lead of **The Sunless Citadel**, the adventure packs all the statistics at the end of the book. This saves a ton of space. The book uses two columns and separates the read aloud text from other text by enclosing it in gray space. The font sizes that introduce new sections are moderately sized; there are no massive words to waste space here.

The art is some of the best I've seen in the **d20/D&D** adventures. In addition, Wizards makes use of almost every inch of the paper. The interior covers, for example, have the maps on them. The interior work has important notes boxed off to the side, cutting into the one-inch margins instead of directly into the text. The format is simple and easy to read. Monsters are denoted with a dragon's head, and important information, like doors that don't follow the standard, are marked by a shield.

The encounters start off like *Diablo*. For the most part, the party should walk through the orcs and perhaps have a little difficulty with the ogre, but by the time they get to the dragon, they'll know they've been in a fight. The treasure is also fairly balanced. There are no overwhelming magical items here, but there are a few. There aren't tens of thousands of gold pieces, but adventurers will find some very interesting treasures. Game balance is a fine thing, and having appropriate treasures is a great help to new Dungeon Masters. "What, you mean that +4 sword shouldn't be in this orc's hoard?"

Still, there are some problems. The adventure is directed at new players and new Dungeon Masters. The problem here is that, currently, the market is crowded with such **d20** products, including those by Wizards Of The Coast. There are many references to game rules, but few references to good roleplaying. The worst instance is with the roper. If the party agrees to feed it, say, a captive orc, the monster will let them go. What type of act would that be, to feed an orc captive to an aberration like that? I think that would definitely call for some alignment checks, depending on the characters' beliefs. In addition, there are times when it pits the characters at such a disadvantage that one wonders if they'll be able to survive. The black dragon uses all the tricks in a dragon's repertoire and -- with the environment on her side -- a few more!

The adventure is one of the best value-wise but still not as good a deal as *Dungeon Magazine*. Those who'll get the most out of it are not only new Dungeon Masters, but gamers like myself who are pressed for time and prefer to work with prewritten materials that are easily adaptable to an individual campaign.

Pyramid Reviews

The Agency: Men in Black Dusters (for Deadlands)

Written by John Goff

128 pages; $20.00

* * *

Ghost Busters (for Deadlands)

Written by Lucien Soulban

$15.00

Both Published by [Pinnacle Entertainment Group](#)

The Agency: Men in Black Dusters, by Pinnacle Entertainment Group's John Goff, details the history, workings, and equipment available to members the Agency, *Deadlands'* secret United States government organization directed to contain and cover up supernatural occurrences. *Ghost Busters*, by Lucien Soulban, is an adventure that begins following the near-destruction of Gomorra. The Ghost, the head of the Agency's western bureau, has disappeared and the players are charged or hired to find him. While neither of these books requires the reader to own the other, the two do form a coherent piece when used together. Both books are of high quality and of great potential use for many (but not all) *Deadlands* players and for some players of other horror or conspiracy-based games.

The Agency provides players and gamemasters with a close look at the successor organization to the Pinkerton Detective Agency and how it operates. The book provides an interesting mix of history, operational procedure, and 24 pages of new equipment for Agency operatives. There is information on training and advancement for operatives and guidelines for work in the field. This provides not only roleplaying opportunities for players but gives gamemasters a greater sense of how to create adventures for Agency players or produce more complete Agency NPCs and adventures centering on Agency operations.

This book is not, however, perfect. The Agency is given the Vigenère Code to encode their messages -- a code used by the Confederacy in the actual Civil War and broken by the Union. This seems an odd choice for the US' most secret organization. In fairness to Goff, however, it is a simple enough code to be used effectively in a role playing game. Likewise, the generality of the book, which covers the operations of the Agency throughout the United States, Confederate States, and Disputed Territories, prevents Goff from going into great depth on any one point or location. Although this is not a flaw, readers should also be prepared for some dense material, especially that material provided to organize the bureaucratic information necessary to put together a believable government organization.

Ghost Busters provides such an adventure for players. Soulban has created a suspenseful, dark, and complex challenge. The flow of events will take posse across the Weird West to a number of locations, introducing them to a series of major and minor players in the *Deadlands* world. The challenges presented in the adventure are serious enough to test the skills and abilities of any posse and are well balanced between "thinking" puzzles and combats.

While the adventure will require some tailoring to create a perfect fit for any given posse, the adventure is well written and allows an individual posse to make a real impact on the events of the Weird West by determining if the Ghost will remain a part of their campaign world or not. Pinnacle Entertainment Group will be determining the official events via the results of players. By the time this review appears, however, this decision will already have been made. The results, however, will not force gamemasters to substantially tinker with later material in order to bring it in line with later publications.

Included in this adventure are two sheets of Cardstock Cowboys. Although this reviewer had initial reservations about the usefulness of such an inclusion, they are a helpful and useful addition to the game. Best yet, it is an addition that does not appear to have increased the price of the adventure.

Both publications are worth their price but players and gamemasters should weigh their appropriateness to their own campaign. A campaign based in New Orleans will find **Ghost Busters** of limited usefulness. If one of the posse members is an Agency operative operating under cover in the Big Easy, however, then you will find **The Agency** a useful book.

Those who do not play **Deadlands** will probably not find **Ghost Busters** useful. The alterations required to move this game into another genre or setting would be extensive. **The Agency**, however, may be worth considering. Any game that is based in a horror or conspiracy setting will find some of the information useful for either creating secret organizations or helping expand on such organizations. Earlier publications by Pinnacle Entertainment Group offer conversion rules for the **Call of Cthulhu** and the **World of Darkness** systems. In addition, the upcoming **d20** and **GURPS Deadlands** books will allow Pinnacle's work to be easily moved into other game systems.

-- Matthew DeForrest

Clever Odysseus

by Scott 'Blade' Hamilton

Art by Dan Smith and colored by Keith Johnson

"Tell me, O muse, of that ingenious hero who travelled far and wide after he had sacked the famous town of Troy."
-- The Odyssey, Book I

Odysseus, was one of the greatest heroes of Ancient Greece and of Western Literature. A favorite of Athena, general in the Trojan War and subject of one of the greatest epics of all time, Odysseus was a "master in all ways of contending." And he still is.

History

Odysseus was the son of Laertes and king of Ithaca. An unparalleled tactician and cunning warrior, Odysseus was one of those rare mortals that were born with six Forces. His legendary shrewdness made him a favorite to the goddess Athena, who often came to his aid.

Supporting Cast: Clever Odysseus

The central event in Odysseus' life was the Trojan War and, from what the stories say, Odysseus was wrapped up in almost every facet of it. He was originally one of the suitors for the beautiful Helen and it was he who suggested that Menelaus get the oath of the unsuccessful suitors to protect the marriage, thus requiring they do nothing to obtain Helen for themselves.

It was also to Odysseus that the goddesses Athena, Hera, and Aphrodite came to with the Golden Apple of Discord so that he could choose which of them was the prettiest. Odysseus, being the clever Athenian lad that he was, realized the amount of trouble he could get himself into with this little contest. So he claimed that he could not be objective, being that Athena was his patron goddess. Thus the trio went on to find another judge.

They found a Trojan named Paris and he choose Aphrodite, since Aphrodite promised him the most beautiful woman in the world if he choose her. Thus, Paris absconded with the aforementioned Helen back to Troy and sparking the Trojan War as Menelaus and his oathbound compatriots pursued. Odysseus himself was not in favor of going to Troy. When messengers came to inform Odysseus that Menelaus was calling on his oath, Odysseus pretends to be insane. Only when the messengers put Odysseus' son in danger did he drop the ruse so he could save the life of his son.

At Troy, Odysseus continued to distinguish himself among his comrades, eventually devising the famous Trojan Horse so that the Athenians could sneak into Troy. (For a full history of the Trojan War, see *The Illiad*, by Homer) However, Odysseus was the only of the surviving Athenian heroes not to return after the Trojan War. It took him ten years to return to Ithaca, due to the fact that Odysseus had angered the Greek god Poseidon. The story of what exactly he had to endure is Homer's *Odyssey*, one of the greatest works of ancient Western Literature. For exactly what happened there, you should read the *Odyssy.* Mythweb has both excellent summaries and detailed information (http://www.mythweb.com/odyssey/index.html). Some in Heaven believe his story is actually a chronicle of his travels through the Deep Marches.

Afterlife

After dying, Odysseus found that Poseidon's ill will continued -- he could not pass on to his final reward. He was so fixated on Poseidon's anger that he could not allow himself to ascend to Heaven, nor would Poseidon allow him to serve Athena in the Marches. He became a dream shade and wandered through the Far Marches for millennia, trying to find some way to be allowed into Mount Olympus or to pass onto the Heavens.

His wanderings among the Ethereal plane became just as legendary, and convoluted, as his Corporeal Odyssey had become. Some stories talk of a duel with Laurence in which Odysseus survived by fighting dishonorably. Others describe Odysseus sneaking into Hell to see if he could find Achilles among the souls in Gehenna. Several former Malakim of Purity report seeing Odysseus fighting along the side of the Greek gods during Uriel's Purity Crusade.

What is definite is that the first confirmed report of Odysseus in the Corporeal plane was in the 19th century, when a group of angels conflicted with him as he was attempting to incite a conflict between celestials in Constantinople. Since that time, celestials on both sides have run into Odysseus, usually on the losing end of one of his many schemes.

ODYSSEUS
Dream-shade

Corporeal Forces - 2	Strength 3	Agility 5
Ethereal Forces - 4	Intelligence 9	Precision 7
Celestial Forces - 3	Will 7	Perception 5

   Skills: Language (Ancient Greek)/6, Language (Latin)/2, Language (English)/2, Knowledge (Ancient Greece)/5, Savoir-Faire/5, Fast- Talk/6, Lying/6, Detect Lies/4, Large Weapon/4, Throwing/2, Tactics/4, Drive/3, Dodge/5, Emote/6, Fighting/4, Move Silently/4, Swimming/4, Running/4
   Songs: Tongues (Corporeal/4), Spirit Speech (Corporeal/3), Spirit Speech (Ethereal/2), Motion (Corporeal/1)
   Advantages: Soul Link (to Athena)
   Vessel: Mediterranean Male, Level/2, Charisma/2

Odysseus is, essentially, a dream-shade that has developed himself to 9 Forces the hard way. And he has managed to acquire a vessel somewhere. The list of skills and songs above is merely a starting point -- the GM should feel to change that list as needed and to make Odysseus more appropriate for the setting of the campaign. The general idea is that Odysseus has been around for a long time and has picked up a lot. He should be proficient in all of the little details of life (like driving, using guns, etc.) as well as familiar with the local languages. Only in specialized areas should he be completely out of his element. He is a "master in all ways of contending," after all.

Personality

The most defining characteristic of Odysseus is his cunning. He's not a scholar or philosopher, but rather a clever tactician and an engaging orator. No matter what is going on, Odysseus is trying to find the angle and figure out how to come out on top. He was good enough to impress Athena when he was alive and he's even better now. Almost as pervasive as his cunning is his confidence. Odysseus has been through Hell (some say literally) and come out of all of them (eventually) in one piece. He is adaptable, learns quickly, charismatic, determined and he knows it.

But like most Hellenic heroes, he does have several flaws. His confidence very often inflates into overconfidence. Despite his caution and wit, Odysseus will often gloat or taunt his opponents, leaving himself vulnerable in someway or giving out a critical piece of information. Sometimes he does this intentionally, either to further one of his plots or to just to make sure the game continues -- Odysseus respects worthy opponents and loves a challenge. However, if his continued existence is at stake, he will pull out every stop to get out.

Additionally, Odysseus has some of the worst luck in history. Unfortunate events happen to him frequently, leaving

him stranded, in the clutches of some monster or demon or such. Odysseus is a master of escaping these situations, but his companions usually are not as competent. Thus, Odysseus is usually found working by himself.

Odysseus is still a product of Ancient Greek society. Honor is important (as long as he is still alive to enjoy being honorable). He reacts better to good-looking people and still believes in some ways that truth equals beauty. He also views himself as better than almost all mortals. The fact that he is still legendary is something he is quite proud of.

Running Odysseus

Odysseus can be an NPC in almost any capacity. He works well as a continuing opponent for a group on either side of the War. Or as an ally. Or both at the same time. PCs could get caught up in one of his misadventures, or become pawns in one of his schemes. In any of these cases, you can play him as a dangerous rebel, a misguided hero, or a dashing anti-hero.

As a dangerous rebel, Odysseus is on his own side above all else. Rejected by his gods as well as Heaven and Hell, he only concern is to stay alive and make trouble for those who have wronged him. Odysseus will side with whomever is winning and maximize what he gets out of whatever situation he is in. He will hold a grudge until his Forces are disbanded.

As the misguided hero, Odysseus is just trying to survive and find a way to pass on to his ultimate reward. He is convinced that he must have the permission of Poseidon to pass on, and he is tired of this existence. He values honor and will help those he finds worthy when he can, but will still do what he can to save himself. He will avoid dealing with the Infernal elements unless he knows he can get the upper hand, but will be generally sympathetic to angels unless they antagonize him.

As the dashing anti-hero, Odysseus is a sort of swashbuckler and wandering man-at-arms. His main goal will be to help his patron, Athena, and to convince Poseidon to lift his curse. He a gentleman villain, fighting both sides, but occasionally helping out honorable and competent opponents and pausing to sweep a woman off her feet.

But no matter what happens (unless it is a major plot point), Odysseus should get away to fight another day.

Adventure Seeds

- Odysseus has made a lot of enemies, on all sides of the War. At any point, he may annoy someone enough that they decide that he has to be taken care of. Diabolicals could be sent by any Prince to destroy Odysseus, though Baal and Asmodeus would like to capture him and force him to fight for Lucifer. Angels could be dispatched for similar reasons, but are more likely to be ordered to capture him or at least get him to go away.
- A big Hollywood film company has started filming on a film based off of Homer's *Odyssey*. Not only are several Celestials battling over it, but Odysseus is determined that it go through since a big hit about him would give him a huge boost of essence. Agents of Nybbas may be producing the movie and call in for help with some Ethereal who is trying to steer the plot or affect the production (a la *Phantom of the Opera*). Or other Diabolicals could be sent to sabotage the movie and face Odysseus, who insists that the show must go on.
- A group of angels has been given the task by Michael to find Odysseus and convince him to join the War on the side of Heaven as a sort of special forces irregular. PCs could be the angels in question, or could be angels sent by another Archangel to make sure that their agenda gets taken care of. Dominic would like to see Odysseus destroyed, for instance, while Janus likes having him on the loose -- it keeps everyone on their toes. Whatever happens, Odysseus will lead the angels through a very complex game of cat and mouse. If they are good enough and manage to impress him with their honor and character, he might even consider Michael's offer.
- How Odysseus managed to get a vessel is still a mystery. He claims to have "won" it in a game of skill with a powerful Ethereal spirit. Given Odysseus' track record, it's very likely that the loser didn't take it too well and may be plotting revenge. Odysseus may want to draw the PCs into whatever he is doing in order to confuse the situation.
- Odysseus, in his many wanderings in the Far Marches, found the dream-shade of Iamblicus, an ancient

Pythagorean philosopher and mathematician. Iamblicus had designed a way to focus Essence in an area using the geometric mysteries of Pythagoras, thus creating a sort of artificial Tether. Odysseus sees that as his ticket home if he can get the Tether built and dedicated to Athena or Poseidon. This activity would, of course, attract the interest of other celestials.

The Shadow Over Britain: *King Lear*

"I' the last night's storm I such a fellow saw;
Which made me think a man a worm . . .
As flies to wanton boys, are we to the gods.
They kill us for their sport."
-- William Shakespeare, *King Lear,* IV:i:35-39

In our previous examinations of the magickal and mysterious side of Shakespeare's plays, we sought meaning: who opened the "wide gap of Time" in *A Winter's Tale,* and why? Who wore the masks, and held up the mirrors, in *Twelfth Night,* and what did they conceal? How do Shakespeare's connections to the worlds of occultism and sorcery (real or surreal) undergird his plays; how does the Great Storyteller shape his stories to twist history itself into a new mold? In *King Lear,* we may find out the answer -- there is no meaning. The gods kill us for sport, love ends in death, and madness stalks the ruined Earth. Shakespeare's cosmic horror: is it warning -- or blueprint?

"I promise you, the effects he writes of succeed unhappily; as of unnaturalness between the child and the parent; death, dearth, dissolutions of ancient amities; divisions in state, menaces and maledictions against king and nobles; needless diffidences, banishment of friends, dissipation of cohorts, nuptial breaches, and I know not what."
-- William Shakespeare, *King Lear,* I:ii:155-161

As with *Twelfth Night,* there are two plots in *King Lear.* At play's opening, the 80-year-old Lear prepares to resign his powers and divide his kingdom between his three daughters; Goneril (wife of the Duke of Albany), Regan (wife of the Duke of Cornwall), and Cordelia (unmarried, but soon betrothed to the King of France). When Cordelia refuses to flatter Lear outrageously, he divides her share between Goneril and Regan; she leaves for France with her husband-to-be. Unfortunately, without his powers or lands, Lear has no hold over Goneril and Regan, who ungratefully abuse his servants, strip him of his remaining knights, and finally drive him out of doors onto the heath with only his Fool for company.

Meanwhile, Cornwall's vassal, the Earl of Gloucester, himself has two sons, the legitimate firstborn Edgar, and the handsome bastard Edmund. Edmund convinces his father that Edgar is plotting parricide; Edgar flees as Gloucester orders his death and creates Edmund his heir. Edgar disguises himself as a madman, and meets the now-raving Lear on the heath in the middle of a ferocious tempest. Gloucester defies Regan and Cornwall by rescuing Lear from the storm and then sending him to Dover; for that, the two blind him and taunt him with the fact of Edmund's treachery. The blinded Gloucester must now himself wander the heath, but encounters Edgar, and then Lear, in the camp of Cordelia's French army. She, of course, has returned to rescue her father; the two reconcile.

Regan and Goneril have both now fallen for Edmund; Cornwall was fatally wounded by a servant during his blinding of Gloucester, and Albany has come to hate his wife. However, Albany must oppose the French invasion, and with his aid, Edmund captures Lear and Cordelia in battle and secretly orders their execution. The disguised Edgar now supplies Albany with proof of Edmund's treacherous and adulterous conspiracy with Goneril; after Edmund demands a trial by combat, Edgar slays him. Although Edmund repents while dying, it's too late to save Cordelia; she's been hung, and although Lear has killed the executioner, he dies raving in denial. (Gloucester has also expired, albeit of a heart that "burst smilingly" upon his reunion with Edgar.) Goneril, having poisoned her rival Regan, now kills herself; only Albany and Edgar are left in the wreckage of the "gored state" of Britain.

"Edg. I am no less in blood than thou art, Edmund;
If more, the more thou hast wrong'd me.
My name is Edgar, and thy father's son . . .
The dark and vicious place where thee he got
Cost him his eyes.
Edm. *Thou hast spoken right, 'tis true;*
The wheel is come full circle: I am here."
-- William Shakespeare, *King Lear,* V:iii:167-175

Shakespeare took the Gloucester-Edmund-Edgar "echo plot" from an episode in Sidney's Rosicrucian poem *Arcadia,* "The Tale of the Blind King of Paphlagonia." The main plot came from an anonymously printed 1594 play, *The True Chronicle History of King Leir,* which borrowed it in turn from Holinshed's *Chronicles,* which took it from Geoffrey of Monmouth's 12th-century *History of the Kings of Britain.* (Geoffrey placed Lear's reign in the 9th century B.C.) Interestingly, all of these sources end their stories happily; Lear and his daughters (and the King of Paphlagonia and his sons) are reconciled and live happily ever after. Shakespeare, as though impelled by ancient forces, returns to the earliest versions of the tale, in which Lyr is the sea-god, and his daughter's marriage to a foreign king ends in death, betrayal, and war.

This earliest version also has two brothers (in this version, half-brothers of Branwen/Cordelia), the twins Nisien and Evnisien. This twin theme (as Shakespeare again invokes his [mirroring](#) effects to heighten unreality and warn us of sorcery) echoes down into the Edmund-Edgar rivalry in *King Lear.* Edmund is evil disguised as good; Edgar is legitimacy disguised as madness. When they fight, it is in a ritual context, and neither gives a name to the herald until one dies. As Edmund betrayed Edgar with a forged letter, so a letter proves his own undoing, and the "wheel is come full circle." It's interesting to note that Goneril's letter to Edmund reaches Edgar after Edgar kills the murderous patsy, *Oswald* -- the prophetic mirror reflects not only the distant British past, it seems.

"For, by the sacred radiance of the sun,
The mysteries of Hecate, and the night;
By all the operation of the orbs
From whom we do exist, and cease to be;
Here I disclaim all my paternal care,
Propinquity and property of blood . . ."
-- William Shakespeare, *King Lear,* I:i:111-116

But that whiff of sacred king killing is but the appetizer for the orgy of magickal imagery roiling through the play. Lear begins with a ritual division of the land into three parts; when Cordelia breaks the ritual he barks "Come not between the dragon and his wrath." Lear is the Pendragon, the ley-king, but when he unnaturally attempts to put aside his crown, his sacred status as king, from that moment the land is doomed. When he then cuts off his heir, he breaks his own connections to the land's renewal; he curses his other two daughters with sterility, compounding his hubris. He invokes Hecate, but perhaps her sympathies are with the three women, the triple Fates? (Edmund, meanwhile, is affirming his allegiance to the goddess Nature, to the wild Cybele who delights in blood and death and holds no law but that of the pack.) Never mind, he threatens revenges against the "unnatural hags" that "shall be the terrors of the earth" even as he rages against his own "corrupted blood." As he goes mad, a storm of unprecedented fury howls across the skies. Lear attempts to command the thunder and wind, but having put aside or "corrupted" his powers, he cannot stop the forces of chaos and destruction. He decks himself with garlands of flowers; a desperate bid for the goddess' affections, and is rewarded with the death of his daughter and renewed insanity.

"'Tis the times' plague, when madmen lead the blind."
-- William Shakespeare, *King Lear,* IV:i:49

Blindness and madness now rule Britain and the world of the play. Edgar, posing as Tom o' Bedlam, discourses on the powers of devils and demons, identifying his own father as "the foul fiend Flibbertigibbet" and telling tales of cannibal giants and the "dark tower." The [Fool](#) prophesies the later prophecies of Merlin, and laments that Lear mistakes his head for his codpiece and his toe for his heart; the spiritual body of the King, like the land of Britain, is disjoint. When Lear and the Fool join Edgar in a hovel on the heath, they create a new triplicity of madmen opposing the three women. The Fool departs when Gloucester joins them, announcing that he'll "go to bed at noon," in a stark admission that the time has come unhinged. (The Fool is then never seen again in the play; perhaps his invocation of Merlin has flung him through the wide gap of time.) Thanks to Lear's madness, Britain has fallen into chaos and magickal space; again, anything can happen; a bastard can rise to nobility or a madman lead the blind.

"These late eclipses in the sun and moon portend no good to us: though the wisdom of nature can reason it thus and thus, yet nature finds itself scourged by the sequent effects: love cools, friendship falls off, brothers divide: in cities,

mutinies; in countries, discord; in palaces, treason; and the bond cracked 'twixt son and father."
-- William Shakespeare, *King Lear,* I:ii:112-118

These inversions of the natural order were, as it appears, forecast by the "late eclipses in the sun and moon" -- a dangerous omen for a nation ruled by a king who swears "by the sacred radiance of the sun." (As yet more evidence of Edmund's unnatural corruption, he rejects the orderly influence of the planets and the stars.) These eclipses also, intriguingly, give an indication of the play's composition date: in 1605, there was an eclipse of the moon in September, and an eclipse of the sun in October. In November of 1605, of course, came "in palaces, treason;" the Gunpowder Plot against King James I. Interestingly, it's entirely possible that *King Lear* had its debut in May -- before the eclipses. Again we see the warp and weft of history twisting under the dramaturgickal pressure applied by Shakespeare (or the circle of occultists behind him). Why, exactly, then, did James order a command performance of *King Lear* on St. Stephen's Day, 1606 -- the traditional day of Misrule, when the natural order was at its weakest?

"Alas, sir, are you here? things that love night
Love not such nights as these; the wrathful skies
Gallow the very wanderers of the dark,
And make them keep their caves: since I was man,
Such sheets of fire, such bursts of horrid thunder,
Such groans of roaring wind and rain, I never
Remember to have heard: man's nature cannot carry
The affliction nor the fear."
-- William Shakespeare, *King Lear,* III:ii:42-49

Was it in intentional echo of Lear's invitation, or invocation, (after banishing Cordelia) of Saturn, "he that makes his generation messes," in other words, the devourer of his children and destroyer of gods? Saturn, the evil planet -- that governed time. In his rage, Lear demands that the gods "drench our steeples" -- drown the cities in a new Flood. He orders fire and wind, and then cries for "all-shaking thunder" (in parallel with Poseidon, the Earthshaker, and Greek counterpart of -- Lyr) to "strike flat the thick rotundity o' the world" and "crack nature's moulds" -- to destroy the Earth and all life. The play becomes a dramaturgickal recipe for destroying, at the very least, a kingdom -- and potentially, the planet. Some scholars have argued that the intemperate heat and bitter nihilism of the play indicates that Shakespeare was, himself, suffering from syphilitic derangement while composing it. But perhaps a deeper wellspring lies yet untapped.

John Dee (a Welshman) claimed descent from the ancient British kings -- such as Lear, and indeed, Lyr. He had created the British Empire and, like Edmund, had spent time overseas (seven years for Dee, "nine years" for Edmund) and returned to find himself scorned and deprived of his rightful place. Did Shakespeare overhear the almost 80-year-old John Dee deep in converse with the "atheist" School of Night over the translated *Necronomicon*? Did he craft this play as the warning of what an embittered old man, rejected by society, could do -- were he capable of summoning the ancient gods? Or did Shakespeare retell the story of Lyr and the Blind King in service to those gods? Did simply writing down the words eclipse the sun, and set gunpowder treason in motion? Why are the final words of *King Lear* a desperate plea to depart from the script, to "speak what we feel, not what we have to say"? Was the performance, on the day of Misrule, an invocation of another King in tatters and rags -- a King in Yellow? Encore -- and goodnight. Exeunt with a dead march.

Holiday Adventure Clichés

Greetings, all!

Yes, we've listened to the demands of our faithful audience, and decided to stick around for the holidays. We love you all!

If you happen to be online on Christmas Day, feel free to stop by the *Pyramid* Chat; there's a fair shot I'll be there.

And now, without further ado, our special holiday column.

* * *

I like clichés. I think there's a reason why some themes and stories become "classics." Knowing that your players know the story can give you all freedom to explore -- and break -- standard story elements.

In particular the holidays seem to bring certain stories to the fore time and again. And many of these stories could be plain *fun* to run as adventures. Maybe. I've never done any of these, but what the heck. They seem like good ideas now. (Then again, so did the *Torg* adventure . . .

Here, then, are five holiday mass-media clichés that I might someday inflict on my poor players.

1. It's a Wonderful Life. Taking the cue from the seminal Jimmy Stewart holiday classic (which is odd, since so little of it takes place on Christmas), I've wanted to do an adventure where the characters learn what the world would be like had they never been born. This basic premise is such a classic bit that there are a million permutations to it: What would have happened if . . . the PCs had failed to save the city? The hero decided not to undergo the cybernetic experiment? The young apprentice opted not to pursue his training? (It's also one of the reasons I was interested in the Alternates article from a few months ago.)

But the basic premise -- what would the world be like if a hero (or heroes) hadn't been born? -- seems to have the possibility to be a great adventure. Unfortunately, I've never had the opportunity to fulfil the basic pre-premise of the movie; namely, I've never had anyone play a character that *faced* those sorts of doubts. Likewise I'd need to figure out a way to make it interactive; having the omnipotent narrator merely explain why things went differently isn't much fun. I'd probably have the PCs appear, dazed and disoriented, in the alternate timeline, without a guide; letting them figure out what happened could be most of the fun. (An interesting twist on this idea would be, after this adventure, to have one of the semi-major NPC villains come to the heroes and claim to reform, since he'd been visited by three spirits who showed him the error of his ways.)

Of course, I've also wanted to base an RPG session on one of my *other* Jimmy Stewart favorite classics . . . *The Man Who Shot Liberty Valance.* But I'd need a player who was playing a John Wayne-type character.

2. Gift of the Magi. This one would be difficult to initiate as a GM, since most PCs tend not to be that poor. But it would be easy to pull off; all a player would need to say is, "I'm selling X to afford gift Y," and I'd be ready to go.

3. I Believe in Santa. I've always wanted to play a character who, honest-to-goodness, believes in something most of society considers to be foolish. Santa is a classic; the Great Pumpkin is also promising. Ideally it would be some annual event, so those campaigns that span multiple years (of game time) would be able to have some event of annual disappointment . . . and perhaps the merest glimmer of hope. Maybe it could even be an otherwise intelligent, thoughtful man. ("Are you telling me, Dr. Scroggen, that you *honestly* believe the ghost of Thomas Edison visits hard-working scientists every February 11th?")

Besides, if The Tick, Linus, and Cecil Adams can't discount the possibility of some benevolent force, why can't we?

4. The Substitute. Whether it's someone substituting for Santa, a reindeer, top elf, of equal holiday import, it could be an interesting "holiday" adventure to have the characters pinch-hit. It could make an *especially* appropriate *Changeling* or *In Nomine* adventure. (Seraph of Marc in the roll of Santa: "Tell me what you want, little boy." "Um . . . a train set?" "Liar! You want me to find your long-lost mother!")

5. The Inappropriate Christmas Special. Following the examples of classics like *Xena, Star Wars,* and *The Flintstones,* I've wanted to have a "Christmas" special set in an inappropriate setting. Perhaps a ***Ravenloft*** special, or a ***GURPS Conan*** Christmas special. Or mayhaps ***Call of Cthristmas.*** Regardless, I'd like to play it totally straight, ideally even getting the players into the spirit of things. Then, when they go home after having had a good time, they realize, "Hey! Why the heck were the Alpha Centaurians celebrating *Christmas*?!?"

And make sure you don't miss "Spirit in the Sky!", the second issue from the first *Star Trek: The Next Generation* comic mini-series (reprinted in *Star Trek: The Next Generation: Beginnings*). Er . . . no, wait. You probably want to miss it.

All told, the holidays are meant for spending time with loved ones, being good to each other, and having fun.

Not, in many ways, unlike gaming.

-- Steven Marsh

Reviews of Gameable ~~Fiction~~ Fact

The Howdunit Series

Published by [Writer's Digest Books](#)

Reviewed by Alexander Johnston

Although previous Primary Sources reviews have focused on fiction, I have found this series of jauntily written reference manuals to be excellent gaming resources; rather than gameable fiction, call it gameable fact.

Writer's Digest Books publishes the Howdunit series as a reference library for mystery writers who want to write authentically about the culture of crime, justice and law enforcement in contemporary America. However, they are also excellent resources for all kinds of contemporary roleplaying -- from gritty, realistic "cops and robbers" campaigns to wild flights of cerebral urban horror. Some of the books also have some application to fantasy or science fiction settings.

The following titles are currently in print (available at Amazon or www.writersdigest.com):

- *Amateur Detectives*
- *Armed and Dangerous*
- *Body Trauma*
- *Cause of Death*
- *Deadly Doses*
- *Just the Facts, Ma'am*
- *Malicious Intent*
- *Missing Persons*
- *Modus Operandi*
- *Murder One*
- *Police Procedural*
- *Private Eyes*
- *Rip-Off*
- *Scene of the Crime*

Each one is written by a professional (or two) in the field (authors include P.I.s, trauma surgeons, and District Attorneys) and serves as an introduction to the topic discussed. Their styles are light and conversational, and assume readers are broadly familiar with the justice system. They are however, below the level of professional reference material.

As well as chapters covering different aspects of the topic, each book includes sidebars and sub-headings with examples and commentaries. Many also have appendices with either case histories or lists of resources. Because they are written for authors, they are very conscious of the demands of plot and frequently offer suggestions on integrating real world ideas or occurrences into story structures. My favorite examples of this are the droll suggestions in *Body Trauma,* relating injuries to the downtime your plot requires: "A stiletto stab wound in the right upper abdomen may hit the liver, causing trivial bleeding, which your villain survives in his room on the fifth floor of an abandoned building in the barrio. Or it might slice through a hepatic artery and throw the fellow into hemorrhagic shock."

By now most of you should be finding this format awfully familiar . . . and you are right to be suspicious. With the exception of game mechanics, these books are structured almost *exactly* like gaming sourcebooks, right down to sidebars and story seeds. In fact, the main criticism I have of these books is that, while they provide a broad introduction to their subject matter, they are sparse on exactly the kind of details that a determined reader might pick up on in a novel -- which is a weakness when writing for reality obsessed mystery fans, but the perfect level of detail for busy GMs.

Certainly there are some differences between these books and gaming sourcebooks. The biggest difference being that the authors are *uniformly* professionals in the fields they are addressing; when they editorialize, their experience certainly qualifies them for it. Interestingly, one of the most common themes of their editorializing is the debunking of common myths propagated by screenwriters and authors, and the best of the Howdunit authors will provide more realistic alternatives that drive the plot in the same way as the prevailing myth.

However, the books do have their share of problems. Again and again one is aware of the shallow scope of the books. Although the overviews and insights are valuable, they often give a bare minimum of details. They offer more than most GMs would need to know about broad areas of law enforcement, but I periodically found myself just getting interested in the details of a forensic technique or legal process when the book abruptly changed subject.

Having commented on the series in general, allow me to consider select titles in greater depth. I should say here that I have not read every book in the series, but these comments concern ones I have read and I feel are a representative sample. To help you decide which of them to check out, I have chosen two I thought were excellent gaming resources and one I felt was not, and tried to explain why.

Rip-Off: A Writer's Guide to Crimes of Deception; by Fay Faron. I place this at the top of the list because, for individual bang for the buck, I believe this is one of the most useful. Precisely because con-artistry is not often discussed in gaming supplements, this eminently gameable treatment of it is valuable. The book is organized into chapters which each address one particular genre of scams. Examples include "Classic Street Cons," "Investment Opportunists," and "Biz-Op Scams." The author illustrates a selection of favorite cons in that genre by presenting them in a style very similar to RPG encounters -- first Faron describes what the victim/mark would see and then what is going on behind the scenes, with notes on why it works and what kind of variants exist. This book also includes an intriguing discussion of the various cons traditionally associated with the Gypsies. While, to be frank, Faron borders on sharing the prejudice which she warns us the law enforcement community harbors towards Gypsies, the cool and (as far as is possible) factual treatment is an excellent balance to the awestruck cultural-appropriation of White Wolf's *Gypsies*. Finally, although Faron has chapters dealing with cons that are specific to high-tech settings, many of the

cons she describes are traditional ones along the lines of bait-and-switch and shell-games which can just as easily part a fool from his gold pieces and +1 Sword as his wads of cash . . .

Although Faron is somewhat more tangential than the average Howdunit author and her sense of humor sometimes gets in the way, her writing is jovial, incisive and knowledgeable. Her other Howdunit book, *Missing Persons,* is also excellent and covers another topic that often comes up in contemporary campaigns.

Just the Facts, Ma'am: A Writer's Guide to Investigators and Investigative Techniques; by Greg Fallis. This is an example of a Howdunit title that might make itself indispensable for a particular kind of campaign, but would not have quite the broad uses of *Rip-Off* (which could simply be flipped open for a random urban encounter, even in a fantasy game). Concerned with a broad range of detective techniques ("Crime Scene Investigation," "Surveillance," and "Undercover Work" are sample chapter titles), this book is similar to the notes in **Call of Cthulhu** or the old **Millenium's End** investigation supplement. On the downside, the book is a little thin in some of its sections; most determined gamers could probably get all the techno-gizmo information in the "Wired Investigators" chapter from a few evenings of web-surfing. However, the author, a private investigator, more than makes up for it with tidbits, like his sidebar on the right way to bribe public officials and his discussions of the Zen of surveillance. Not only is Fallis an easy and engaging writer, he offers great insight into the character of detectives. (Fallis, I should point out, is at pains to explain the experiences of *both* police and private investigators.) Furthermore, his meditations on how valuable it is to be courteous and listen to people (even when you want to trick them into selling their brother down the river for twenty-five to life) is such a welcome change of pace from many gamers who may attempt to imitate the misanthropic smarminess of the duller action heroes.

The Howdunit titles by Corvasce and Paglino (*Modus Operandi: A Writer's Guide to How Criminals Work* and *Murder One: A Writer's Guide to Homicide*) also leaven a great deal of practical information with lively tidbits of personal experience -- although they do not have quite the charm or sense of what writers (and GMs) are looking for that Fallis does.

Body Trauma: A Writer's Guide to Wounds and Injuries; by David W. Page, M.D. This is an example of a Howdunit title less likely to interest gamers, since almost every RPG has extensive rules on wounds and injuries. It does have some potential gaming uses, though. One might use the excellent discussion of the narrative elements of injuries to fill out the experiences of characters facing long healing times (e.g. after a nasty fight with no access to hi-tech medicine/healing potions). Furthermore, GMs looking to create a more narrative, less rules-based injury system, as a supplement or replacement for a more conventional one (a la "The Interactive Toolkit" in the *Inphobia* magazine), would do very well to check this title out. A smoothly written and interesting book certainly, but only gameable if you're particularly interested in the topic.

There are several Howdunit titles that, like *Body Trauma,* would only be of interest for GMs with very specific games in mind. These concern subjects already covered in depth in roleplaying games (e.g. *Armed and Dangerous* about contemporary guns) or topics specifically related to the conventions of the mystery novel genre (*Amateur Detectives* and *Private Eyes*).

However, when considering any of the Howdunit series, I urge gamers to consider the lesson of the *X-Files:* many of the trappings of murder-mystery/true-crime fiction can form "elements of the onion skin," so to speak, of larger or more fantastic stories.

Page, M.D. This is an example of a Howdunit title less likely to interest gamers, since almost every RPG has extensive rules on wounds and injuries. It does have some potential gaming uses, though. One might use the excellent discussion of the narrative elements of injuries to fill out the experiences of characters facing long healing times (e.g. after a nasty fight with no access to hi-tech medicine/healing potions). Furthermore, GMs looking to create a more narrative, less rules-based injury system, as a supplement or replacement for a more conventional one (a la "The Interactive Toolkit" in the *Inphobia* magazine), would do very well to check this title out. A smoothly written and interesting book certainly, but only gameable if you're particularly interested in the topic.

There are several Howdunit titles that, like *Body Trauma,* would only be of interest for GMs with very specific games in mind. These concern subjects already covered in depth in roleplaying games (e.g. *Armed and Dangerous* about contemporary guns) or topics specifically related to the conventions of the mystery novel genre (*Amateur Detectives* and *Private Eyes*).

However, when considering any of the Howdunit series, I urge gamers to consider the lesson of the *X-Files:* many of the trappings of murder-mystery/true-crime fiction can form "elements of the onion skin," so to speak, of larger or more fantastic stories.

by Dmitri Scull

Art by Christopher Shy

The standard Venom Advantage for *GURPS* works beautifully, up to a point. While it admirably covers many toxins and corrosive attacks, it does have some weaknesses, and does not manage to describe many real-world venoms very well; especially toxins normally found only in invertebrates, plants, or fungi. In addition, many creatures have, instead of an actual venom, a virulent symbiotic disease; for which the Venom Advantage is inappropriate.

The following Advantages are racial Advantages specifically for such races; also included is the Strong Jaws Advantage, as the Disease Carrier Advantage is especially appropriate for scavenger races, who while not specifically needing Sharp Teeth, should have a better bite attack than normal.

Note that much of the new material is an addition to the Venom Advantage; for clarity's sake, the original Venom rules are included as part of the revision. Note that there are a couple of new Enhancements as well, especially ones that can be used to create combined venoms (such as a poisonous toxin that acts as an anaesthetic as well).

Anti-Coagulant Venom   *30 points*

The venom the character possesses is a particularly nasty one; any wounds from the envenomed attacks are treated as if the victim had the Hemophilia Disadvantage. Once the wound has been bandaged, it will heal normally, but until it is bandaged, it will continue to bleed.

Disease Carrier   *5/10 points*

The character is a carrier for some virulent disease. The character will not infect himself, but can contract other diseases (unless he or she has the Immune to Disease Advantage). If the character is assumed to be suffering from the disease, he should take an appropriate Disadvantage. For 5 points, the disease will only be transmitted by some form of close contact, usually from a natural attack such as a bite or claw attack. A victim of the attack must make a HT roll (for each wound) or suffer the effects of a serious, but not lethal illness (GM's choice). For 10 points, transmission is airborne; anyone around the character must make a HT roll once per day or contract the disease; the character's natural attacks still carry the infection. Individuals with Immune to Disease are (naturally) immune.

- *Special Enhancement:* The disease is especially virulent; HT rolls are at -5; +5 points.
- *Special Enhancement:* The disease is fatal; +10 points.
- *Special Enhancement:* The disease is magical in nature, and can infect even those who are immune to disease, depending on the special effect of that advantage; +10 points.

Strong Jaws   *3 points*

The character gains an effective bite attack. Damage is still crushing, but is now calculated using the character's full ST score.

Venom   *15 points/level*

You secrete a venom that can be delivered by various means. Types of venom include:

Venoms With Bite

- *Anesthetic:* Rather than causing direct damage, the venom numbs the target; each level of the venom costs the victim 1d points of DX; at 0 DX, the victim is too numb to move. Anesthetic victims must enter the blood to work; else they must be bought as Contact Agents. If the character succeeds in a HT roll, no DX is lost, but the HT roll is at a penalty equal to the number of levels of venom, and a cumulative -2 for each injection after the first.
- *Corrosive:* Such as acids and digestive enzymes; these venoms do damage quickly, and on contact (there is no need to buy the Contact Agent enhancement for Corrosive venoms). They do 1d of damage per level on the first turn of contact; on each subsequent turn the venom does 1d less damage until no damage is done. Armor protects at full DR on the first round, but loses 1 DR each round. Objects, including armor, are similarly damaged. There is no HT roll to avoid damage from a corrosive venom.
- *Hallucinogenic:* These venoms, rather than harming the target directly, cause wild hallucinations. Needless to say, this can be potentially more dangerous than other types of venom, but it still must enter the bloodstream. The target must make a HT roll to avoid the effects (at a penalty equal to the number of levels of venom, and at a cumulative -2 for each injection after the first). If the HT roll is failed, the victim will hallucinate for 1d minutes per level of the venom.
- *Irritant:* The venom does not kill or knock the target out, but drives the target away or incapacitates him; if inhaled, delivered to the eyes, or injected, the victim must make a HT roll (at a penalty equal to the level of the venom) or take 1d-4 damage and be incapacitated for 1 turn per level of the venom. Each turn of incapacitation, the victim may make a Will roll (at a penalty equal to the level of the venom) in order to recover.
- *Lethal Paralytic:* These venoms kill by paralyzing the diaphragm and heart; they are rather deadly. Even if they do not kill you, you will become paralyzed by the attack. The venom must be injected into the blood, but once it is, the victim must make a HT roll (at a penalty equal to the number of levels) or take 1d damage per level of the venom. If the victim survives, he is paralyzed for 1d hours per level of the venom. If the HT roll is made, a second HT roll must be made (at the same penalty) or the victim is still paralyzed for 1d minutes per level of the venom. Lethal Paralytic venoms are considered a +50% Enhancement.
- *Lethal Poisonous:* These venoms are similar to ordinary Poisonous venoms, except that there is no immediate damage. However; the damage if the HT roll is failed is 3d per level of the venom, and even if the HT roll is made, the victim still takes 1d damage.
- *Necrotic:* This venom works almost identically to the poisonous venom; however, HT rolls are made by the day rather than the hour, and all damage is applied to the location where the poison was introduced until the location is destroyed; then the next location adjacent begins to take damage (moving inwards). Limbs crippled (or worse) by Necrotic venoms generally must be removed; however, this will stop the poison if done before the damage

"migrates."

- *Paralytic:* These venoms paralyze rather than kill; they must be introduced into the blood, then the victim must make a HT roll (at a penalty equal to the number of levels of venom) or be paralyzed for 1d hours; if the roll succeeds, a second HT roll (at the same penalty) is required, or the victim has a penalty of -1 per level of venom on all rolls (this is not cumulative, but it does apply to HT rolls to avoid paralysis).
- *Poisonous:* These venoms must be introduced into the bloodstream; once poisoned, and every hour thereafter, the victim must make a HT roll (at a penalty equal to the number of levels of the Venom advantage) or take 1d damage per level of the venom. Once the victim succeeds in a HT roll, no further rolls are needed.
- *Soporific:* These venoms knock the victim out, rather than causing any real harm. They must be introduced into the bloodstream; once injected, the victim must make a HT roll (at a penalty equal to the number of levels of venom) or take 1d Fatigue damage per level of the venom; when ST reaches zero, the victim is rendered unconscious. Soporific venoms are considered a -33% Limitation.

Venom Enhancements and Limitations

- *Special Enhancement:* Any venom (other than Corrosive venoms, which are already such) can be defined as a contact agent, which absorbs through the skin; contact agents cannot be washed off. +70%.
- *Special Enhancement:* The venom may be delivered at range (spit, squirted, etc.). This is a ranged attack, based on DX, with SS 12, Acc +12, ½D n/a, and Max 5. Corrosive venoms work normally; other venoms must strike open wounds or mucous membranes (or be defined as contact agents) in order to work. +35%.
- *Special Enhancement:* The venom may be sprayed as a cloud of mist. The cloud covers 3 hexes (they must be adjacent to each other and at least one must be adjacent to you) and lasts 1d turns. +100%.
- *Special Enhancement:* The venom (which cannot be a Soporific) has an additional soporific effect in addition to its normal effects. This is normally bought for Anesthetic, Hallucinogenic, Paralytic, or Poisonous venoms. +50%.
- *Special Enhancement:* The venom has an additional effect (other than Soporific or Lethal Paralytic; Soporific venoms cannot take this Enhancement, although Lethal Paralytic venoms can) in addition to its normal effects. Venoms combined with Corrosive venoms enter the bloodstream if they do damage. This is commonly used to create Poisonous Corrosive effects or venoms with Anesthetic effects to mask their true nature. +100%.
- *Special Limitation:* You sweat your venom; it cannot be delivered actively except by grappling or being bitten. -70%.
- *Special Limitation:* Your flesh delivers the venom; it is only delivered if you are bitten. -100% (keep in mind the 20% minimum cost, though).

Pyramid Review

Gemini RPG

Published by Cell Entertainment

Written by Johan Sjoberg and Stefan Ljungqvist

240 pages; $30.00

Most American gamers have probably never heard of *Gemini*. This is because most of the games that we play over here are American ones. Many gamers probably never stop to think about the fact that there is an entire continent of gamers across the ocean, all gaming away just the way we do (we're talking about Europe here). Most of them just go about their business playing their American stuff and assuming that the term "foreign game" means a non-English translation of an American one.

Well, the truth is that there are plenty of other games out there, and *Gemini* is a great example of one that is ever-so-slowly creeping its way onto American gaming tables. It hails from Sweden and brings with it a style similar to our own, yet at the same time unique unto itself.

The main theme of *Gemini* is a great religious war. It is set in a world called Gemini, which is very similar to medieval Europe. The major player in this world is The Church of the One, a religious organization based very strongly upon the Roman Catholic Church of medieval Europe. The Church exists to provide order for men's lives and to fight back the forces of the Darkness. Unfortunately, things aren't going so well.

Until recently, the Darkness had been kept imprisoned behind the mystical forces of the Iron Gate. Well, the gate has been opened, and the Darkness is now setting out upon the land to corrupt mankind and overthrow the Church. Even worse, the leading sovereigns of a bunch of Gemini's kingdoms decided that they'd had enough of the Church and rebelled against it a little while ago. So the Church isn't exactly standing in a firm position of power right now. Add to this mix the nations of the elves and the dwarves, both of which are in their own state of disorder, and you have quite a lot of room for adventure.

Overall, the game world is very rich with detail and full of dramatic and well fleshed-out characters. The author has really managed to give the game a certain flavor, which usually isn't quite as distinct in its American counterparts. Instead of giving the game a heavy fantastic tone, the author has given it a heavy mythic tone. The world itself is very much like real medieval Europe. Most folks are just normal people who will never witness a wizard casting a spell, a demon taking shape before them, or anything else of the like. They just go about their lives and confide in the protection and wisdom of the church. Although elves, dwarves, and demons are incorporated into the game, it shies away from any other fantastic races or creatures (no dragons, etc.). The central conflict is that of evil versus good, and how mankind is caught in the middle of it.

The characters of the game capture that mythic tone, but with a true epic feel. These are not ordinary people; they are the shapers of nations. We meet corrupted men such as the Dark Martyr Cyrus, the evil messiah appointed to lead the apocalypse for the Darkness; we also meet his henchmen, the forsaken Marquis Lazarus and the dark elf Malachdrim. The characters have dramatic backgrounds that are drawn out very well. There are good guys too, although they are quite the underdogs. One of the primary plots of the game is a quest by both the Church and the Darkness to find a boy who is the living incarnation of the One, the person who will eventually save them from the Darkness. The child is a mystery, but the man seeking him out is well described. Unfortunately, he's not the sword-swinging knight that you would expect. In fact, he's an old, blind monk who wanders the world alone in his quest. The good guys indeed have it

cut out for them in this game.

Being that *Gemini* is labeled a dark fantasy game, it takes a very gothic approach to things. And we're not talking gothic here in the ***Vampire: The Masquerade*** sense. No, we're talking gothic in the *gothic* sense, meaning the old-school traditional sense (picture cathedrals and tales of Faust). Most games that attempt this fall short at least just a bit, but our Swedish creators here have really managed to hit it on the head. This makes the game a great alternative for those interested in a dark fantasy game with a slightly different feel.

The prime method for developing this atmosphere is through the heavily developed plot, the rich characters, and the author's overall tone; the artwork itself also adds a great deal to the game. The layout has been done in a manner that reflects the game material well; the pages are surrounded by a lattice work pattern that one would easily expect to find on the side of a cathedral or similar Gothic structure. (It should be noted that the designers used uneven columns in the layout, which many won't mind, but is bound to displease a few readers.) The artwork is simply magnificent. All of it is very dark and captures the gothic feel of the game expertly. The haunting portraits of some of the major characters bring them to life more chillingly than any of the author's words possibly could have. The one drawback is that the paintings are spread unevenly throughout the book, leaving large expanses of text in between with very little illustration.

We must take a quick second here to make note of the translation. For the most part, the translation into English is very good. The English is smooth and reads better than even a lot of American texts do . . . but there are exceptions. The most notable is the introduction, which is translated very poorly. Don't let this opening section deter you from the rest of the book. The only other problems are an occasional word misuse here and there, but I doubt if most readers will notice any of them (they are subtle).

The game's die system, unfortunately, isn't quite up to the quality of its story line and setting. The basic system uses a d20 and has one use it to roll under a chance of success (CS), which is determined by adding several stats and other factors ogether. While it involves a bit of adding, this basic system is okay; it is, in fact, pretty smooth. But it gets complicated from there. First, players must keep careful track of the exact number by which they beat their CS, as it is oftentimes used later when determining effect. This isn't too bad, but then we get to combat.

The author has come up with an interesting system for combat, whereby the combatants choose a combat strategy: defensive, offensive, or feint. Then everyone rolls their initiative and checks this handy chart and compares the attacker's style versus the defender's style to see what happens. It looks neat at first, but it's really a pain in the butt. The system is very static, meaning that combat is forced into a kind of attack-parry, attack-parry rhythm. The strategy system also isn't highly compatible with the base die system. It's almost as if they just laid one system on top of another. What's worse is that the author tells us that not all combatants get to use the strategy system, but gives us no way of handling the two types together. So, if someone uses a combat strategy against an opponent who doesn't, we aren't really told how to handle it.

On the other hand, the combat system does have a few perks. Damage is not determined randomly. Weapons have a fixed damage modifier, and the amount of damage done is determined based on the success level of the attack. The game also uses a wound system (meaning that it uses wound levels instead of hit points) that takes physical stamina into account a little bit better than some systems.

The magic system is kind of a mixed bag. It uses a very open-ended system, where the players are given the basic aspects (e.g. forms) of magic and are able to combine these freely to create their own spells. Open systems like this are interesting and a lot of fun to use because they get the players involved on a whole new level. They're not easy to do, however, and this one falls far short of being balanced. Within the confines of the story, magic is balanced very well. It is powerful, but very rare. It is only mastered by those black of heart and favored by the forces of the Darkness, so most people don't ever see it. System-wise, however, there is almost nothing to throw it into check. There is very little to keep one from learning magic, and, aside from their die roll difficulty, there's nothing to keep a magician from casting extremely high level spells. While some GMs might be able to handle this without a problem, others could have quite a bit of trouble.

Another lacking area is the powers of the clergy. As the story is set up, the power of The Church of the One is

described as the only thing capable of fighting the forces of the Darkness. Unfortunately, when it comes to the game system, the Church is given relatively little to play with. Sure, they are able to heal, perform exorcisms, and wield powerful relics, but most of the bonuses are small and simple. When compared to the fantastic might of the magic wielded by the forces of Darkness, the Church's powers seem weak indeed. It would be nice if the good guys had been given a little more to play with.

One minor aspect of the game system that's pretty interesting is alignment. Alignment, while rated solely on a scale of good or evil, is a fluid thing, capable of change -- an aspect that seems rather realistic, because people themselves change. It can be changed by major events, players' actions, or even through experience points (at the narrator's option).

Despite the major kinks in the game system, *Gemini* still remains a pretty good game. Players and GMs who have too much trouble reworking clunky systems might want to avoid it, but it is a great alternative for those looking for something a little different in a gothic vein. The game's distinctive setting and strong development make it too interesting to simply pass up. The only real problem is going to be in finding a copy of it, as not too many American distributors have picked it up yet.

Apocrypha 2: Chart of Darkness

A Companion Volume for Warhammer Fantasy Role-Play

Published by [Hogshead Publishing](#)

Written by Graeme Davis, Anthony Ragan, Mike Brunton, Ken Rolston, Marcin Segit, Iain Smedley, Paul Murphy, Philip Wells and Lewis Page

Cover by John Blanche

Illustrated by Ralph Horsley, John Keane, Rik Martin, Bunny Smedley, Annelise Johnsen, Tony Ackland, John Blanche, John Bolton, Paul Bonner, Kev Walker, Russ Nicholson, Gallagher and H

128 pages; $14.95

Since acquiring the license from Games Workshop in 1994, Hogshead Publishing have been slowly but steadily reprinting old material and publishing a little new for what must be the most popular of British RPGs, *Warhammer Fantasy Role-Play*. *Apocrypha 2: Chart of Darkness* is a sequel to 1995's *Apocrypha Now*, Hogshead's first companion volume for *Warhammer Fantasy Role-Play* (WFRP). Unlike *Apocrypha Now*, which contained only reprint material (though no less useful), *Apocrypha 2* contains new stuff as well as old. This, of course, makes it of interest to *WFRP* fans who already have the reprints, as well as those who don't.

Both the title of *Apocrypha 2* and its cover by John Blanche are an amusing reference to *Apocrypha Now*. Inside, the contents are well laid out and illustrated by a range of new artists for the new material, with mostly the original artwork for the reprints. Of the new art, that by Ralph Horsley, John Keane, and Rik Martin all stand out. The quite diverse contents are spread over twenty-one chapters, collated into five roughly themed sections. At the beginning of each section, a flyer, done in mock Shakespearean-style (like *Shakespeare in Love* but without the bit with a dog -- that's been promised for the forthcoming *Empire in Chaos,* the fifth and final part of the *Enemy Within* campaign), announces that section's contents.

Section one is called "Crime and Punishment," focusing upon the former more than the latter. Graeme Davis expands the rules for that mainstay of every thief - the art of picking pockets, as well as giving new rules and careers for Beggars. Ralph Horsley's art really makes these two chapters come alive. The *WFRP* rulebook lists only two spells specific to the Cult of Ranald, the god of thieves, so the six here by Marcin Segit are most welcome. Finally, Anthony Ragan, who created the infamous prison of Rijker's Island in *Marienburg: Sold Down The River,* explores the history of prisons in The Empire and details four examples -- though one does lie outside The Empire far to the South. The author also makes suggestions on how prisons can be used within the game and provides three detailed adventure ideas for the GM to run. If you consider the nefarious nature of an adventurer's life, then they going to fall foul of the law sooner or later and so this section contains some useful material before and after their life of crime!

Death is the subject of Section Two (all penned by *WFRP* co-creator, Graeme Davis) and in particular how society in the Old World deals with it. Primarily, death is the concern of the Cult of Mórr. To the average citizen, Mórr is represented by the Mourner's Guild, which oversees all funerals. This section examines the guild, but also the cult's more militant arm, The Knights Raven, which actively prosecutes practitioners of the necromantic arts. Discussed from both the GM's and player's side, the Cult is presented as an interesting choice of career for those players not wishing to follow either Sigmar or Ulric. Besides this, we have a description of new spells for use with the Cult; how the law deals with death; a description of a funeral home in Marienburg and five graveyard encounters that need just a little fleshing out.

Section Three is about people and places, the majority of which have been reprinted from *White Dwarf* magazine. Otto's Printworks describes a Marienburg printer and is accompanied with a short encounter with some non-Chaos cultists. Of more use to players is the magical item identification service offered by The Vermillion Pawn. Magical items can also be purchased from the shop, which does cheapen magic a little in *WFRP,* but the items on sale are all pleasingly expensive and quite specific in their use. For rural encounters there is Morbog's Marauders, a mixed band of Orc and Goblin mercenaries. These should just about test the mettle of any player party and they are well written up. Completely new is The Pandemonium Carnival, a travelling circus that can be encountered anywhere. This is described in depth, coming with several ideas for inserting it into a game, and is nicely illustrated by Rik Martin The section is rounded out with the game details for Gotrek and Felix, the Dwarven slayer and his human scholarly companion from several of the Warhammer novels.

The fourth section is comprised of four diverse entries, two major and two minor. The latter are pieces on "Archery And Enchantment," and "Puddlefoot's Common Herbal," which adds more herbs to the game. Of particular use to the players is "What a Character" reprinted from the *WFRP Character Pack*. This presents a series of tables for adding more depth to character during creation -- not just the usual eye and hair colour, but names, place of birth particular to the Old World and family background. Although geared towards human characters, it also covers the Dwarf, Elf and Halfling races. Just as useful, but more for the GM is "Lifting The Veil," an examination of the art of divination in the Old World. Although careers are given for the various types of diviners, I don't recommend that the players take them up, as the arts are potentially rather dangerous -- particularly if you really succeed or really fail! Various means of divining are discussed (cards, dice, palmistry and astrology, amongst others) and given rules for, providing the GM with an excellent tool for use in their campaigns.

The fifth and final section contains four adventures, two of which can be slotted into *The Enemy Within* campaign, but are not specific tied into it. "The Ritual" calls upon the players to investigate a murder that lands literally at their feet after a night out on the town, and thus least well-equipped to do so! "The Affair Of The Hidden Jewel" is a tale of double crosses and daring do, influenced perhaps by Robin Hood. The other two adventures can be slotted with relative ease into the *Doomstones* campaign (the third and final part of which is due for release shortly). "Ironstone Pass" is a tough ambush encounter that can be run at anytime, whereas "Deep Trouble in Karak-Zulvor" is best run between the actual *Doomstones* adventures. Deep Trouble is probably the weakest of the four adventures here, leaning towards the dungeon bash end of the *WFRP* game, but that said it is well written and gives the players some interesting challenges to overcome.

Unlike some companions, which can be somewhat hit or miss, *Apocrypha 2: Chart of Darkness* is definitely more hit than miss. The misses are really the adventures, as they have little usefulness once played, though that is the curse of all such beasts. The hits are the section of death -- the articles on the Cult of Mórr should be most useful, as will the articles on thievery, begging and divining. Alongside these articles are lots of suggestions for adventures, but any good *WFRP* GM should be thinking up his own, just by reading the hits I've described. That is, of course, testament to Hogshead's high standards.

All-in-all, *Apocrypha 2: Chart of Darkness* is an excellent addition to *Warhammer Fantasy Role-Play* and every *WFRP* GM should have this on their shelf.

by Matt Riggsby

Art colored by Keith Johnson

One of the first questions many adventurers will ask when they start dealing with a new country or group of people is "Who's in charge?" The correct answer might be "In charge of what?" Even if player characters aren't directly involved in politics, their society's political scene can be the source of constant adventures. This article provides a sort of checklist of ideas for GMs to use in order to construct realistic power blocks in a society and use them in adventures.

Power and Where It Comes From

Briefly put, political power is the ability to get people to do something whether they want to or not; politics is the process of getting them to do it. Power can come from a variety of sources, each with its own advantages and limitations. A government is only part of a political picture.

Religious groups, companies, private organizations, political parties, social classes, and the general public may have power as well. Even groups whose individual members appear powerless may form powerful coalitions. For example, farmers and factory workers are individually weak. However, if they can organize, they can use their vital role as producers of food, manufactured goods, and tax revenues as an extremely powerful weapon.

When defining powerful groups and institutions in a society, the GM should determine what means they can use to exercise their power. Major sources of power include:

- **Religious authority:** A perceived or actual connection to powerful supernatural entities. This may include divinely transmitted authority over other mortals or hidden esoteric or "higher" knowledge.
- **Military power:** The ability to use brute force, particularly against large groups of people.
- **Legislative and bureaucratic authority:** The ability to set rules for society and direct the machinery of the state against offenders through such devices as tax collectors and law courts. Although bureaucracy has become synonymous with inefficiency, remember that bureaucracy is one of the hallmarks of civilization. No government can be effective without a body of officials making sure that laws are enforced and taxes are paid.
- **Status:** Connection to a group generally acknowledged as the natural and legitimate leaders of society (e.g.: Roman patricians or the Brahmin caste).
- **Wealth:** Direct control over production and/or distribution of material goods or services. This can also include control over specialized information or proprietary technology.

Exceptional abilities, such as magic, psi, or super powers, are likely to function as either military power or wealth.

Any powerful group is likely to partake of each in some way. Historically, members of ruling classes have usually been rich, members of traditionally powerful families, and leaders of armies, and they are often intimately connected to their society's religious hierarchy and bureaucratic apparatus. However, most powerful groups have their power

ultimately rooted in one particular area. A powerful church may have vast wealth and the ability to call out troops, but its primary source of power is its religious authority. If its religious authority were to decline, so would its wealth and its overall power.

On the other hand, several different groups within a society can simultaneously hold power in different ways. The powerful groups of the late Middle Ages are a good example. Many parts of Western Europe saw four powerful groups: the Catholic church (whose power was based on religious authority), a largely rural nobility (who formed the bulk of the military, and were members of a high-status class to boot), kings (who were, at the time, increasingly powerful due to their role as legislators at the head of growing bureaucracies), and a growing class of urban merchants (who derived their influence from nothing except their enormous wealth).

Not all of the factors need be in play at once. For example, the late Roman Republic saw several different powerful groups: a patrician Senate, powerful warlords from all social classes, and wealthy "new men" risen from the lower social classes. But while each group had its own religious ties, there was no overtly religious faction, nor did any of them seek overtly religious goals. Likewise, many cyberpunk societies have no effective legislators or courts, only economically and militarily powerful corporations, crime syndicates, and other private organizations.

Factions

Having decided where power is coming from, the GM should go on to identify sources of conflict between and within powerful groups, as well as tensions between those in power and those out of it. People with similar backgrounds will, naturally, have common interests, which will inevitably run contrary to the interests of others. People with common interests will join together for protection and advancement, forming factions. Conflicts between and within factions are, arguably, responsible for most political activity and social change in a society. Factions can arise for any number of reasons, but here are some social tensions that have caused factional problems:

- **Religion vs. religion.** Not all religions will give rise to factional conflict. The permissive brands of paganism in many ancient societies gave little reason for explicitly religious dissension. However, over the past two thousand years, religion has become a major motivation or at least a plausible pretext for violent disagreement (Christianity vs. Islam vs. Judaism in Europe and the Near East, conflicts between Muslims and Hindus in India). Doctrinal disagreements within a religion are responsible for at least as much conflict as differences between religions (Protestants vs. Catholics in Western Europe, Iconoclasts vs. Iconophiles in the Byzantine Empire). A subset of religious conflict is conflict between secular and religious interests. Modern religiously motivated groups worldwide have taken governments and cultural trends to task for championing what they see as immorality, and have even taken on secular governments and won, as in Iran in the 70s. Religious groups already have objections to cloning and genetic engineering, and artificial intelligence is likely to cause controversy as well.
- **Rural vs. urban.** Farmers and country landlords may feel threatened by urban economic development and distrust arrogant city-dwelling merchants and industrialists, regarding them as city slickers of questionable honesty. City dwellers may in turn consider their rural cousins as bumpkins, only a half-step above their livestock.
- **Class vs. class.** This is conflict between social classes, not economic classes, although it can have an economic dimension. Peasants and the lower urban classes always chafe under the yoke of their lords and rulers, but nouveau riche merchants and tradesmen may also resent the ancestral (and therefore, to their mind, unearned) privileges enjoyed by the traditional upper classes. The upper classes, of course, are terribly concerned with the rise of the lower classes, regarding the status quo as a clearly superior and proven arrangement.
- **Racial and ethnic conflict.** Conflicts between ethnic groups were relatively rare in antiquity, if only because travel and emigration on a large scale did not yet exist and identification with a particular ethnic group was rarely as strong as it often is today (without a visible Them, there's little reason to be strongly attached to Us). The modern world, however, sees communities of racial or ethnic minorities in every major city. Since the minority looks, speaks, or acts differently from the majority, it follows that there will be tension between the two groups. Alternatively, a society might occasionally see attacks on foreigners of all kinds, regardless of their homeland (as during China's Boxer Rebellion). Alien species, of course, qualify as ethnic groups, as do fantasy

races like elves and dwarves, and while the possibility is often overlooked by science fiction authors, aliens may themselves have ethnic subdivisions.

- **Regional rivalry.** A relative of ethnic conflict. Residents of a particular area might think of themselves as superior to or at least different from residents of another region, even if they appear fairly similar to outsiders (e.g.: northern and southern Italians, northern and southern Californians). This rivalry may be the expression of economic or political interests common to the residents of each region. There may even be subtle rivalries between neighborhoods of a city, usually expressed as constant attempts to outdo the rival in civic sporting events, public celebrations, conspicuous acts of charity, and the like. Centuries-old neighborhood rivalries are still carried on in Sienna's famous horse race, the Palio.
- **Exceptional Powers and Technological Enhancement.** Magicians, psis, superheroes, and the genetically or cybernetically enhanced may end up in new quasi-ethnic groupings. Those whose abilities are naturally superior or have been enhanced by technological means may divide into factions along lines related to the source of their abilities (for example, cyborgs vs. psis), or arbitrary factions for other reasons. While those with superior abilities may be powerful enough to form a dominant political faction, they're just as likely to form their own factions or join existing ones. For example, most Marvel comic books address the activities of super-powered mutants in a world where mutants are a despised minority. The mutants are divided among a number of factions ranging from separatists to mutant supremacists to those who want to assimilate into "normal" human society.
- **Wealthy vs. poor.** Conflicts between the haves and the have-nots are at least as old as civilization. This conflict is particularly heightened during times of economic hardship.
- **Ancestry.** In most societies, the strongest loyalties are familial. Two or more families might find themselves in conflict over issues of family honor stemming from offenses (possibly imagined or exaggerated) that occurred generations earlier. Feuds can continue for generations until one side or the other is defeated or, rarely, a later generation makes peace.
- **Professional rivalry.** Members of different trades or unions may fight with one another for control over various enterprises. For example, the carpenters' guild may fight with the sailors' guild to determine who controls shipbuilding, or the Teamsters and UAW might battle over which union absorbs which trades. In an ultra-tech setting, jump-gate manufacturers may carry on a rivalry with warp drive shipyards.
- **Fandom.** Popular artistic or sporting figures (or, indeed, charismatic religious figures) may acquire large followings. In low-tech societies, such factions are likely to be specific to particular cities, where enough fans can gather in one place to make a difference, or to members of a particular class, ethnicity, or other small group. However, as travel and communication become easier, fan organizations can span the world. Most of the time, these factions will do no more than cause minor periodic violence, such as riots caused by soccer hooligans. However, fans can have political leanings and make a remarkable impact on their society. In 532 AD, chariot-racing fans in Constantinople started a riot that ended with a third of the city in flames and imperial troops forcibly suppressing street fighting. More often, there is low-level tension between groups of fans, expressed as contempt on both sides (mods vs. rockers, fans of *Deep Space Nine* vs. fans of *Babylon 5*). Such conflicts may appear utterly incomprehensible to outsiders. Indeed, they may be unable to tell the sides apart.
- **Political and philosophical differences.** While political differences may often be ascribed to more-or-less veiled self-interest, they can also be the result of genuinely different ideas. Factions may find themselves in conflict over such issues as peace with neighbors versus conquest, persecution of foreigners versus tolerance, the bounds of allowable behavior in public, or even something as trivial as traffic regulation or conspicuous consumption versus dull, sober dress and conduct.

Building Social Conflicts

Factional conflicts can be incredibly complex and can take players a long time to unravel, but they're not actually all that difficult to build. Really, all you need to do is pick a few sources of faction from the list and assign some relative importances. Those internal divisions may be well hidden, particularly if one faction is particularly powerful, but they will never be completely absent.

For example, take that fixture of fantasy and science
fiction gaming, the Evil Empire. We're all familiar with
the idea of a large, acquisitive empire run by an inevitably
dark lord, served by largely anonymous but very
dangerous soldiers. But what forces might be at work
within the empire?

Let's start by identifying where the dark lord gets his power. He's probably either a military dictator, deriving the bulk of his power from the fanatical loyalty of the troops, or an overwhelmingly powerful legislator and administrator. That may not sound like much, but if nobody is willing to go against the will of the courts or resist the tax collectors, the emperor can do pretty much what he wants, parlaying iron control into tremendous tax revenues and a large, loyal army. He may very well have magical powers in a fantasy campaign, but unless he's powerful enough to control everybody in his realm, people are afraid of him because he's a personification of the power of his troops or his authority.

So what potential factions might there be in the Evil Empire? Any large empire is likely to have some sort of regional or ethnic divisions unless generations of intense indoctrination have wiped such things out (extremely unlikely unless the evil emperors have access to cheap mind control). Perhaps different divisions of the iron-shod black legions are raised in different parts of the empire. Soldiers of IV Corps might think that solders of IX Corps are mincing cowards, while IX Corps will think that VI Corps are clumsy, stupid barbarians. Perhaps troops are from all over but only members of an aristocracy or residents of core provinces are made officers, leading to class as well as ethnic problems between troops and officers. Government officials may be assigned to posts far away from their homes to prevent conflicts of loyalty which might occur if they were called on to judge their own friends and families. Many historical governments experimented with this technique as a preemptive strike against kinship conflict, but it might lead to the region's residents becoming resentful of "foreign oppression" and ensures that the governor doesn't know the people and region he rules as well as the natives do.

Another point of contention might be a more ideological one. The typical evil empire is full of people who hate foreigners, but how do they express that dislike? Some may be in favor of a policy of expansion, crushing and dominating inferior foreigners. Others would champion isolationism, closing the borders and not polluting the empire with the blood of foreign scum, even as slaves.

The Power of Ambiguity

It's easy to built two or more "sides" for a society's political scene (say, secular military vs. religious government or urban merchants vs. rural noblemen). However, there are always more positions than there are apparent power blocks. This is where things get really interesting both in real politics and for PCs. Even in a society where all power is nominally in the hands of a single government or other organization, there's room for factions. This is because every organization, no matter how powerful, consists of individuals, and individuals don't always agree or get along together. This leads to two important rules to follow whenever you construct a society.

Rule Number One: In any group, there will always be divisions.

While people may be devoted to a common cause, they still have their own private ambitions, beliefs, alternate interpretations of doctrine, and other petty differences. These differences may be carefully concealed in an

authoritarian setting, but even the most apparently similar people will have disagreements: "Yes, we're all identical bowling-enthusiast space Nazi clones, but Klaus always struck me as being a bit too identical..."

Rule Number Two: Between any two groups, there will always be individuals with interests in common.

The king's chief minister, ostensibly a loyal cog in the bureaucratic machine, might have well-hidden sympathies with the rural lords among whom he grew up or well-hidden rural land holdings which might be hurt by the king's new taxes, putting him in league with his master's opponents. A legislator representing a suffering industrial world might have deeply seated religious convictions against the experimental arms facility which tax dollars might build there, leading him to make secret agreements contrary to the wishes of his voters back home. Such conflicts of interest may lead to a faction splintering or joining with other factions.

These personal and potentially faction-wide differences are a two-edged sword for PCs. On one hand, clever characters can take advantage of the divisions that exist in any power block, no matter how monolithic it may appear. Even if people are fanatically loyal to their rulers, those close to the centers of power will disagree with each other about how best to carry out their ruler's policy, while those farther away may not really know what those policies are. On the other hand, if PCs themselves become powerful and prominent, their underlings will be subject to the same divisions as any other group of people.

Conducting Factional Conflicts

When considering conflicts between factions, the GM may be tempted to think in terms of open warfare between organized groups. However, social conflicts almost always play out in far less violent and systematic ways. For all of their antagonism, opposing groups rarely regard their differences as serious enough to allow indiscriminate killing (or, at least, to risk their own lives in attempts to kill others). Rather, they're resigned to the fact that they have to live together regardless of their distaste for one another.

For example, armed peasant revolts have historically been extremely unsuccessful. A band of peasants might successfully ambush an unwary soldier or tax collector, but as soon as those in power can organize, the rebellions are crushed bloodily. However, peasants and rulers alike knew it was in their best interests not to let things come to that point. If a ruler kills his peasants, he will find himself without crops or tax income for years to come and the peasants will find themselves dead. As a result, open peasant-aristocrat fighting happened occasionally, but not often. Likewise, a secular ruler unhappy with the position of an important religious leader won't necessarily have him and his priests killed even if he has the troops to do so, since he might alienate everyone left alive. The policies of powerful leaders and groups must be a careful balance between exerting the power they have to get what they want and not galvanizing resistance, starting an expensive and difficult direct confrontation that they have no certainty of winning and much to lose even if they do emerge victorious.

Ongoing tension between ethnic, religious, or social groups will likewise play out as social "cutting" rather than fighting in the streets. They will charge each other inflated prices if they do business, go to different churches if they belong to the same religion, drink at different taverns, make up derogatory names for one another, and forbid their children to marry one another (adventure possibility: the PCs are Montague and Capulet servants, acting as go-betweens for Romeo and Juliet while still acting like enemies). However, less powerful groups are more likely to come out on the wrong end of riots and civil unrest. Groups suffering repression will call strikes (a popular weapon of disgruntled workers and peasants through history) and shirk the duties their oppressors heap on them. Only when a group is provoked or talked into it by a leader with more enthusiasm than good sense will open violence break out.

From time to time, factions can form political parties specifically to further their interests. Even in non-democratic societies, people may organize to support a particular political position, although their actions will be geared towards influencing rulers rather than gaining popular support. More often, however, existing organizations are used as rallying points. Members of an ethnic minority might use their church as a forum to discuss problems and organize actions. Most if not all members of the congregation are likely to belong to the same ethnic group, so the church, being a place

they all meet anyway, becomes a natural center for political activity. Members of a faction might instead join the same fraternity, go to the same bar, support the same sports team, attend lectures by a particular scholar or holy man, or otherwise use regular social venues as a means to communicate with one another and coordinate their actions.

In most cases, the older and more intense the rivalry, the harder it is to get beyond it. It is one of the exasperating facts of history that rivalries of long standing often take precedence over more immediate threats. Factions will often continue fighting one another in the face of invasions, plagues and natural disasters. Empires dealing with less sophisticated tribes and colonial powers expanding into new territories are usually smart enough to take advantage of this fact and play local groups off against one another. They may support one group or leader for a while, then another to keep any one group from gaining a decisive advantage, or they may support just one group with imported manufactured goods (for example, guns or rum) to the point where the supported group may have defeated all of its local enemies but has become completely dependent on outside aid. These tactics are depressingly effective and natives rarely see it coming until it's too late. After all, a distant empire is an unknown quantity. So far as the natives know, it might be made a friend or ally, persuaded to go away, or end up not being as powerful as it first appears. The blood-enemies next door, however, are a clear and present danger. They aren't going away, they can't be trusted, and they will attack at the first sign of weakness.

Kitsune

by Jared Smith, Mark Arsenault, & Jason Prince

The following material didn't make it into *__Usagi Yojimbo: Monsters__*, the new supplement for the *Origins Award*-nominated *__Usagi Yojimbo Roleplaying Game__*, published by Gold Rush Games. But Gold Rush has graciously provided this material exclusively for *Pyramid*!

In this *Pyramid* exclusive article, we present the crafty and mischievous fox-spirit for the ***Usagi Yojimbo Roleplaying Game*** (and all other *Fuzion*-powered games) . . . the kitsune!

Usagi Yojimbo RPG (Instant Fuzion) Stats

Physical 3, **Mental** 6, **Combat** 4, **Movement** 7, **Hits** 15, **Defense** 6
Skills: Bite 4 (1d6 damage), Evade 8, Perception 4 (6 with smell), Persuasion 4, Stealth 8, Tracking 5
Special Abilities: Enchant Creature, Illusions, Possession, Shape-shift

(Note: Stats for the kitsune for use with *FUDGE* and the new *D20 System* are included in the *Usagi Yojimbo: Monsters* supplement.)

Kitsune, or mystical foxes, are found throughout Japan. They differ from normal foxes in their shape-shifting ability and other magical powers, and their malicious and crafty nature. They appear as normal foxes, about three feet in length with a large bushy tail. Most kitsune have reddish fur with white highlights, though 1,000-year-old kitsune are thought to be pure white, with nine tails.

Kitsune live in the wild, in underground burrows, thick brush, or under logs. Kitsune who live near human communities sometimes build their dens in the spaces under houses. Female kitsune give birth once a year to a littler of anywhere from two to twelve kitsune pups.

Kitsune livers are believed to have powerful medicinal properties, and kitsune fur is valued by trappers and tanners. Inari, the Rice God and patron of rice fields, swordsmiths and merchants, is sometimes represented as a kitsune. Kitsune serve as messengers for Inari. Shinto shrines dedicated to Inari often have small statues of kitsune outside and around the shrine. Inari sometimes sends kitsune on missions for him, and may reward people who are kind to kitsune. Because of their association with Inari, kitsune are said to watch over rice crops, and are considered lucky by farmers. In general, however, kitsune are regarded with suspicion.

Kitsune have a large variety of magical powers. Kitsune can **Shape-shift,** sometimes posing as normal people to perform mischief. Female kitsune commonly transform into beautiful women to lure men, but other forms are possible. Some men have even unknowingly married kitsune, believing them to be beautiful young women. Children from this union are only born one at a time, unlike kitsune litters. Children from a union between a human and a transformed

kitsune sometimes gain some of the magical powers of the kitsune.

According to legend, a kitsune will sometimes place a leaf or other object on its coat as part of its transformation; when they change shape, the leaf (or other item) will turn into a child.

Kitsune also have the power to cast **Illusions**. Sample uses of this power include making a kitsune's den appear as a fabulous mansion, or day appear like darkest night.

Kitsune can also **Enchant** people, causing them to do the kitsune's bidding.

Younger kitsune are most often the ones most responsible for trickery and mischief. Older kitsune are more cautious when dealing with humans. Elder kitsune will make efforts to rein the younger kitsune, especially if threatened with attack by the humans. For example, if a hunt is organized by local samurai to rid an area of kitsune, an elder kitsune may approach the hunters and promise to make the younger kitsune behave themselves.

As kitsune age, they gain even more powers. When a kitsune reaches 100 years old, it gains the ability of **Possession,** controlling their actions or speaking with the victim's voice. This condition is known as kitsune-tsuki. Possession can be ended by a Priest or Monk exorcising the kitsune (see Exorcism earlier in this book). The experience often leaves the victim suffering from insanity for a time; sometimes permanently.

When kitsune reach 1,000 years of age, it gains great wisdom, its coat turns a golden color, and it grows eight new tails (for a total of nine). Such creatures are incredibly powerful and very crafty (+2 **MENTAL**).

Kitsune will attempt to have a general gathering of their kind once a year, presided over by an ancient kitsune (one 1,000 years old or older). These meetings are sometimes witnessed by humans (usually from a distance), with the kitsune appearing as dancing flames or wisp-like lights, which people call "fox fire."

Enchant

To enchant a person, the kitsune rolls a number of dice equal to his **MENTAL** stat. If the total meets or exceeds the victim's **MENTAL** stat x5, then the victim is enchanted. The enchanted person must obey the kitsune and believes whatever the kitsune tells them.

For example, a kitsune attempts to Enchant Taro, a strong but not-too-bright samurai retainer (he has a **MENTAL** stat of 3). The kitsune has a **MENTAL** stat of 6, so the GM rolls 6d6, totaling 25. Because 25 is more than Taro's **MENTAL** stat x5 (15), Taro is enchanted by the kitsune and under its control.

A new roll is made each hour, until the kitsune fails its roll and the victim escapes the enchantment, or the kitsune voluntarily releases the person. Kitsune often use this ability in conjunction with their illusions, and typically to cause mischief among humans.

Illusions

Kitsune can create realistic illusions of whatever they desire. This ability is often used to embarrass people (e.g., a merchant believes that a customer has paid him 100 gold coins when in fact they are really copper coins). The illusion appears quite real, and affects all of the applicable sense groups; for instance, an illusory bowl of soup would feel warm and smell like soup.

When casting an illusion, the kitsune rolls a number of dice equal to his **MENTAL** stat, recording the total. A character may spot an inconsistency in an illusion, however, on a successful **MENTAL** + **Perception** + **3d6** roll, using the kitsune's die roll total as the observer's TN. If the observer's **Perception** roll is successful, he is alerted to the fact that the image before him is not real, even though it still looks real.

Possession

When attempting to possess someone, the kitsune rolls a number of dice equal to its **MENTAL** stat. If the total of the roll is equal to or higher than the victim's **MENTAL** stat x5, then the kitsune has possessed them.

Once possessed, the victim is controlled by the kitsune like a puppet, even using the victim's voice to speak to others. The kitsune maintains its own **MENTAL** stat and memory, but uses the victim's **PHYSICAL**, **COMBAT** and **MOVE** stats, as well as any of the victim's Skills that are based on these stats, for as long as it possesses the victim. The kitsune does not gain the victim's **MENTAL**-based Skills, however.

While they are possessed, the victim's mind goes into a sleep-like state; when the possession ends, the victim will not remember anything that happened while they were possessed. A successful **Exorcism** performed by a Monk or Priest will force a kitsune out of a body they have possessed. (See *Usagi Yojimbo: Monsters*, page 12, for rules on **Exorcism**.)

Only kitsune 100-years-old or older have this Special Ability.

Shape-shift

Kitsune can change into the form of a person and back again. Each change takes one complete Phase, during which time the kitsune can do nothing else (except try to avoid attacks), and is at -3 to its COMBAT score.

Appearances

Fox Fire (UYCS #3). Usagi and Tomoe are walking through Geishu province when it begins to rain. They seek shelter in a nearby hut, which is also the home of a kitsune, disguised as a normal person.
The Inn on Moon Shadow Hill, (UY3 #31). Usagi seeks out an inn only to find that all sorts of other monsters are plaguing it.

Kitsune

Outfoxed (Adventure)

One evening, after a long day of walking or riding, the heroes come upon a large inn set back a short distance from the main road. The inn looks fairly new and inviting. With no other accommodations nearby, the characters decide to lodge there for the night.

If the PCs are reluctant to stay there, the GM may decide that rain begins to fall, the heroes hear howling wolves in the distance, that bandits are known to roam the area, or anything else that will help convince them to want to stay at the inn. The characters will be greeted by the servant girl, Umiko, a friendly Cat Servant, and her father, Goromasu, a Cat Innkeeper. The pair show them to their room (or rooms, depending on how many characters are present) and offer a hot bath to the weary travelers. Meals will be prepared, sake brought out . . . anything the characters desire, within reason. Overall, it is a very comfortable stay.

Suspicious heroes should make a **MENTAL + Perception + 3d6** roll, with a TN of 20. Those heroes who succeed sense that "things just don't look right" -- as if things are just a little too perfect. Any characters who roll 24 or greater will notice a bushy, reddish-brown foxtail underneath the kimono of the servant girl.

If the characters confront the innkeeper and his daughter, they will try their best to fast-talk their way out of trouble. Failing that, they will flee into the woods. If the heroes follow them, they will lose the pair after a short but merry chase, as the pair will turn back into their kitsune forms and hide in the underbrush (**MENTAL** + **Perception** + **3d6**, TN 24, to spot the hiding kitsune).

If the characters do not detect anything wrong, then they will go to sleep that night on comfortable bedrolls, under a warm comforter, with content bellies full of supper and sake. If any characters stay awake for "guard duty," one of the kitsune will attempt to enchant or possess them, in order to make them go to sleep also.

The next morning, however, they will awaken to a rude surprise! The characters wake up in the woods, on the ground. They will realize that they are laying in the exact spot that the inn was, near the road, but the entire inn and the staff are gone.

Those thinking to check their supplies will also notice that any money or valuables they had with them are also gone, as the kitsune made off with them in the night and sold or traded them off to a traveling merchant.

If the characters are set on recovering their items, the GM can have the characters encounter the traveling merchant on the road. Imagine the merchant's surprise when the heroes see their stolen goods in his wagon and demand them back!

The merchant could easily mistake the heroes for bandits or abusive ronin, or he may be completely understanding and give the items back to the heroes, saying, "It seems that everyone has been tricked by the pesky kitsune known to live in the area . . ."

Pyramid Pick

Hush Hush, the Sleeper's Sourcebook (for Unknown Armies RPG)

Published by Atlas Games

Written by Zach Bush, Andrew Byers, Michael Daisey, Gustavo Diaz, Tim Dedopulos, Kenneth Hite, Daniel Ksenych, Gareth-Michael Skarka, Rick Neal, James Palmer, Carlos Serra, Greg Stolze, Tim Toner, John Tynes, Chad Underkoffler

Illustrated by Toren Atkinson, Drew Baker, Moises Donoso, Matt Harpold, Richard Pace

Cover by Hive

126 pages; $19.95

Hush Hush is the latest supplement for the *Unknown Armies* game. It details the Sleepers, a watchdog group that works to keep the Occult Underground in line. For those unfamiliar with *Unknown Armies,* it's a modern horror game that takes a refreshing new approach to the genre specifically as well as roleplaying in general. Adepts practice a form of mysticism known as Post-Modern Magick which is based on the power of paradox (for example, an Entropomancer gains control over the universe by surrendering control of himself). Avatars can channel the abilities of powerful Archetypes like the Mother or the True King. Powerful groups like the New Inquisition and the Sect of the Naked Goddess struggle for dominance. The game background reads like Clive Barker channeling William S. Burroughs during a bad mescaline trip, but in a good way.

With all these powerful occult movers and shakers running around behind the scenes, you would think that the ordinary mundane world would be powerless before such people. You would be wrong. The only reason that the Occult Underground gets away with most of the things it does is because the mundane world is not aware that it exists. The metaphor given in the game is that of a Sleeping Tiger. All the adepts and avatars and secret societies are locked in a room with a big hungry sleeping tiger. They can attack each other all they want, as long as that tiger stays asleep. Once it wakes up, all the adepts and avatars and secret groups are just so much Asian Jungle Cat Chow. Wielding magical abilities is not going to protect you from a rioting mob of hundreds of panicked mere mortals. Kenneth Hite even provides a handy sidebar of events through history that illustrate the power of an angry mob.

The Sleepers exist to make sure that Tiger never wakes up.

Hush Hush follows the same format that other *Unknown Armies* supplements have. It opens with a creepy little story about an animated dog corpse that was written by John Tynes. The story is pretty good for game fiction, though I was spoiled by the vignette used to open an earlier *Unknown Armies* book, *Lawyers Guns and Money.* That set a standard that this doesn't quite match. Still, it is a lot better than most of the game fiction out there.

The first chapter gives an overview of the Sleepers and their history, with a bit of a surprise twist in their origins. The

chapter also lists each of the major players in the Occult Underground and whether or not the Sleepers see them as a threat. The one new interesting rule provided in this chapter is a section on determining the size and severity of a riot. It is an interesting method of determining the effects of a rioting mob when faced with high weirdness. Considering the way most Player Characters act, it would probably useful to adapt to other game systems as well.

The second chapter details the four major locations used by the Sleepers as well as their standard equipment. There are some interesting ideas provided, like the half-formed golem with the glass shards covering its body. Also scattered through this and the preceding chapter are eyewitness testimonials of how different people see the Sleepers. These sidebars are very well done and give an excellent idea of how creepy and threatening the Sleepers can be in a campaign.

The third chapter gives character descriptions for some members of the Sleepers. There is a sidebar on Authentic Thamaturgy (A school of magick that uses only ritual spells, not the book by Isaac Bonewits). The Cabinet members who rule the sleepers are all pretty interesting, I thought that Gerlinda Unger (who keeps taking over other bodies through the use of the Ritual of Union) and Sebastao dos Prazeres (who has been living in first his son's, and then his grandson's, body) were the creepiest. The rest of the characters were all relatively interesting, and any one of them could provide the spark for a game plot.

The last chapter provides several scenarios to use for a Sleepers campaign. I felt that this was the weakest part of the book. I would have liked to see some of the scenarios developed a little more. Some of the ideas were not especially interesting to me, but there were others that I loved. I found Showdown and Eat It All to be especially amusing.

All of the *Unknown Army* books have been worthwhile purchases, and this one is no exception. The system contains some of the best writing in the business, and the art has improved greatly since the core book came out. The Black and White illustrations serve to enhance the mood of the supplement. Since this is an *Unknown Armies* book, you also get treated to the photography of John Tynes, which manages to capture the feeling of the game as well.

Hush Hush is a great addition to an ongoing *Unknown Armies* game. It is also a good source of ideas for any high weirdness campaign, even if you are not using the *Unknown Armies* system. Either way, it is well worth the price.

-- Thom Marrion

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

'. . . and a Happy New Year.'

Well, with the new year approaching (and the new millenium, if you believe in that sort of thing) come thoughts of the previous year. And I'd like to take a moment to address a couple of trends I've noticed in 2000 that I hope continue.

Affordable Electronic Gaming Material

From affordable miniatures options like [Microtactix's](#) excellent ***[Cardstock Buildings](#)*** line of printable miniature scenery and S. John Ross's line of [Sparks](#) TrueType Font miniatures, to free "quick start" downloads for games like ***[GURPS](#)*** and ***[Dying Earth](#)***, to actual supplements and adventures like [Wizards of the Coast](#)'s PDF conversions, there is more available, affordable, *good* material out there now than any time previously. And I hope the trend continues. It seems to be an excellent way to release new products that would be impossible to release in an affordable format on RPG shelves. It's also a great way to release product that would otherwise have been lost due to a line's cancellation (like *Alternity*), or due to the product falling out of print (like most of *AD&D's* 2nd Edition material). And, of course, the quick starts, rules excerpts, and extras are all great ways to introduce players to new games.

Personally, I'm *delighted* that I finally have another copy of ***Throne of Bloodstone,*** the only official TSR adventure ever designed for 100th level characters. Yes, it's cheesy, but it's also (in my opinion) delightful, goofy fun, and well worth the $2.95 for the download. And I'm fighting the urge to start buying the rest of my incomplete 2nd Edition collection through this means.

(As a random aside, I'm also pleased with how much better many companies have been about releasing errata for their games in the information age. My gaming has gone much smoother now that more timely attempts to fix and explain rules have been made.)

Quality Art And Layout

The year 2000 saw the bar raised for art, layout, and presentation of roleplaying products. Yes, I definitely prefer substance over style, but I won't deny that how a product looks influences how I experience it. There have been great accomplishments in the gaming biz this year, including: ***D&D 3rd Edition's*** art style, recent *GURPS* books presentation and art direction (*Ogre* and ***Bestiary 3rd Edition*** spring to mind), the art and layout of ***Big Eyes, Small Mouth 2nd Edition***, among many others.

Even smaller press items, like ***Orkworld*** and ***FUDGE Expanded Edition***, have seen remarkable leaps in their art and presentation. Most of today's RPG products wouldn't have been possible in an affordable hobby market format even five years ago.

I'd also like to offer a special side kudos to most of the makers of ***D20*** products. Most of the new material I've seen from companies like [Atlas Games](#) and [Alderac](#) has been really creative and innovative. (I love the affordable format of AEG's recent batch of small "narrow" adventures; anything that evokes a response of "Why didn't *I* think of that?" is okay in my book.)

In all, I've been happy with how 2000 has shaped up; lets hope the next year is even better.

And please, everyone, have a happy and safe New Year.

* * *

Speaking of holidays, you'll note that Dork Tower is taking a break this week. Given how John's the Hardest Working Cartoonist in Game Business (Where *does* he get 30 hours in a day?), we hope he gets a few moments to himself over the holiday. Happy New Year, John! And thanks for everything this year!

* * *

For all would-be writers out there: make sure you read our Writer's Guidelines.

Now, I'm sure this seems obvious. (Or, at least I hope so.) And for the most part our writers do okay. But a surprising number of our writers -- people from whom I've accepted and published pieces -- don't include sufficient information for us to pay them.

To summarize our guidelines on this matter:

Our default payment method is via check. If you don't tell us what you want, we presume you want a check.

In order to issue you a check, we need a Social Security number (if you're a United States citizen; if you're not, you need to let us know that, and we have some other paperwork you may need to fill out).

Now, we have lots of people who will send us an article with their address, without a payment method detailed, and without a SS#. This leads to a classic programming lockup, which means your article goes into the "Payment Problem" folder.

The "Payment Problem" folder (or, let's be honest and call it a "dungeon") is the folder I weed through and resolve whenever I have spare time.

I never have any spare time.

As a result, anything that ends up there isn't exactly resolved in a sprightly manner.

So, please, don't delay the untold riches you so richly deserve; make sure you include full payment info on each article you submit . . . .even if you've published a jillion articles with us (that way I don't need to track down your info). It will save us all potential trouble and heartache.

Last week's answer: Errata for ***The Autumn People*** for ***Changeling*** (as seen in ***Changeling Player's Guide,*** p. 188)

(Four stars) "St. Sollars the Twice=Martyred is standing in from of Castle Al-Amo, welcoming the PCs to the Seven Heavens."

A Noble Company of Conspirators

"His characters live in the worst possible moral universe: you're punished if you do wrong, and you suffer if you're innocent."
-- Lloyd Rose, on Stephen King's fiction

By default and design, this column traditionally takes a worldbuilder's viewpoint. It's about neat worlds, neat things to put in your world, neat theories to operate your world with, design guidelines both occult (kabbalah, sacred geometry) and theoretical (histories secret and alternate), scenery and Bad Guys and Cool Freaky Stuff. Occasionally we'll even go so wild as to dabble in plots and plot devices, especially plot devices designed by Nikola Tesla from the ancient Druidic blueprints beamcast into his mind by the orbiting Venusian saucers. But without characters to wreck, misuse, slaughter, and stumble blindly into it all, even the most cunningly-suppressed transmission is, at best, like a tree falling in the forest -- a cheap excuse to trivialize ancient wisdom. So this week, a look at those inconveniences, those meddling kids, those plucky gangs of misfits, those skunks in the woodpile of Antarctic Space Nazi global dominion -- the characters.

"We few, we happy few, we band of brothers;
For he to-day that sheds his blood with me
Shall be my brother; be he ne'er so vile,
This day shall gentle his condition."
-- William Shakespeare, *King Henry the Fifth,* IV:iii:60-63

Before we start totting up modifiers and skills and Advantage points ("Hey, since this is a ***Suppressed Transmission*** game, is being Aleister Crowley's bastard daughter technically an *Unusual* Background?"), though, it might repay the GM to decide exactly what the characters are doing in this beautifully-crafted world in the first place. (Besides "messing it up.") What brought them to this pretty pass, and why? This question will set not only the opening scene of the game, but much of the tone of the first few sessions, and potentially the narrative structure of the whole story arc. In a conspiracy game, it's not necessary to decide on the Real Answer right away, but you should at least decide the one the players (or at least the PCs) believe, ideally before they ever touch those so-tempting dice. The basic possibilities (and keep in mind that these are far from mutually exclusive in Actual Truth) are:

- **UFO Attack at San Luis Rey:** The PCs just happen to be present where the world tears open. They're all randomly abducted by the Reptoids; they all happen to be at the K-Mart when the dimensional rift opens; they were all Confederate P.O.W.s when the Airship attacked the camp; they were the five people who followed the mirage into the desert during the Paris-Dakar road rally. This has the advantage of justifying any group of roughly contemporaneous characters as a player group -- why wouldn't a Navy SEAL, a 33rd degree Arch Mason, a tabloid reporter, and the world's leading genetic experimenter all be in the 7-11 the night the werewolves attacked? (And depending on how cute you get with that dimensional rift stuff, you can justify any character grouping from all of space and time yanked together by the Blue Bolt Of Lemuria.) The key here is likely to keep whacking the characters with stuff, now that they're "off the sidewalk" and part of the Secret Struggle. Even if the PCs know there's no connection between them, their Too-Subtle-By-Half Opponents won't believe it for an instant.
- **The Fiendish Backstory of Fu Manchu:** Because, nine times out of ten, it isn't true at all. These characters were patiently maneuvered together by the Conspiracy for its own ends -- housing loans approved, unit transfers authorized, the last can of Diet Sprite stolen from the lab -- all to get them together at the 7-11 at precisely 1:14 a.m. on that Tuesday of blood. A variant on this is the "reading of the will" or "mysterious patron" version -- they're all gathered by a Good Conspiracy to fight the Evil one and their own connection becomes the first secret for the PCs to unravel. (For extra fun, the "mysterious patron" can die before the PCs ever learn what his plan was.) The GM can put off figuring out exactly why the Conspiracy gathered the PCs together for a surprisingly long time; my favorite way is to keep creating links and weird synchronicities, and once the players come up with a really cool-sounding explanation, make it true retroactively. As a hybrid version, the Fiendish Backstory can work out by pure chance; each character happened to touch the Amulet of Leng at some point in its

existence, or some version of six degrees of separation can ensure that the PCs all know Aleister Crowley's bastard daughter (she dated a guy in the Navy, she runs a Masonic website, she's good tabloid copy, and she went to school with the geneticist).

- **Having Met At The Tavern, We:** Often, to get some handle on the game, the GM will ask the players to create their own linkages. Sometimes you get that "six degrees" thing, which again depends on the GM for the spark of unity. Other times, you can get a party with pre-existing cohesion: the crew of a tramp steamer, the members of a second-story gang, the family of an eccentric millionaire, the night shift at a K-Mart. Then, it's back to the first two setups: do these people stumble into Madness -- or were they pushed?
- **We're Ghostbusters, Ma'am:** The easiest way to do things, of course, is to have the PCs all be members of some group with an explicit mandate to go wading in High Weirdness. The Horatio Club, or PROJECT: BANQUO, or the Black Ops all get into plenty of occult messes; the one that leads to the bigger plot is the one you begin with.

"'What was the worst thing you've ever done?'
'I won't tell you that. But I'll tell you the worst thing that ever happened to me.'"
-- Peter Straub, *Ghost Story*

Building a PC for this kind of game is a kind of dance between the player and the GM. The GM needs a character who can tie into the plot and other characters, and who can respond usefully to the world. The first part is up to the player -- no moody loners who keep to themselves, no cowards whose reaction to threatening Blue Book officers is to move to Vermont and raise sheep. The second part is up to the GM: if a player desperately wants to build a character who is the world's leading Hungarian chef, there should be elements of Hungary or cuisine or (ideally) both in the big story box of the world. Thus both the players and the GM must work on hooking the PCs into the world and into each other; "player hooks" can link PC to PC or PC to world/NPC or (ideally) both. If the GM wants to conceal some element of a Fiendish Backstory, making the player write his character's resume (educational background, previous employment, job skills, hobbies and interests) can be a great way to do it. Remember, the Illuminati are everywhere: any military character can have a covert deployment to the Atlantean ruins (even if she just flew helicopters into Belize City), any scientist character can be secretly employed by the Network, any character with money can be in hock to the Gnomes of Zurich.

"In the end, of course, we remain puppets and our smiles are still painted ones. But now at least we have moistened them with our own blood."
-- Thomas Ligotti, "Professor Nobody's Little Lectures"

A conspiratorial, ***Suppressed Transmission,*** High Weirdness game makes an ideal "plot driven" game; there's a cunning plot that the PCs must expose. "Ghostbuster" characters can simply get a series of missions from higher ups until they're battling a Boskone sized conspiracy and saving the world by working up the food chain. For players who don't mind a little scripting, any of the other setups can produce the same thing, the old reliable story arc of investigation, discovery, reaction and climax. This much is pretty obvious. But this kind of game is also great for "character-driven" storytelling. Since (in theory) the whole world is weird, or conspiracy-powered, or whatever, no matter where the PCs go, they're bound to get into trouble. Either a compulsive world-builder or a compulsive on-the-fly GM can work this to her advantage -- the world-builder always has detailed writeups of what the Bad Guys are up to wherever the PCs are going ("Okay, the doorway blinks and you're in 16th-century Pusan, Korea. The hot-bun seller gestures frantically and says 'Thank Buddha you're here -- the mechanical men have almost completed their magno-gun!'") and the on-the-fly GM can just make something up that sounds cool (see previous example).

The key to making a character-driven game work is a clear character agenda. Either the GM, the lead character, or that old man in the tavern has to point the players in a direction and shove hard. A simple iterative game of "last tags" can escalate the PCs-vs.-Bad Guys fight and write its own script, with the PCs choosing how hard and where to hit each time. A GM with a yen for road movies can let the players meander around getting into trouble for the rest of the campaign. ("Well, that old guy sent us to the abandoned Air Force base where we met the surviving Martians from the 1938 invasion who told us about the Nazi cell in Disney World and when we busted them up we saved the Rhine maiden they held captive and she told us where the One Ring was and now there's Nazgûl everywhere and I'm sick of sticky rice.") Meanwhile, the GM with an ear for cultural-political particle physics can ring the changes on cause and

effect to create more drama that will, sooner or later, impact the PCs. The Martians have given the PCs up to the AFOSI interrogators, the surviving Nazis have fallen to the Templars who have become drunk with power, and the party of Discordians who were going to save the Rhine maiden are following the PCs for no good reason.

"We were the elite, do you see? There was no one like us in the world. Our minds and experiences were far beyond the streets and towns we found ourselves locked into. We were equipped like no one else to educate and direct this place, our home."
-- Sherlock Holmes, in *Planetary #13* by Warren Ellis

Once you've let the players drive things a little bit, let them co-create. It can begin small; one of your players, excited at the heady air of improvisational storytelling you created with that bit about the Rhine maiden, says: "Yes, the wounds on the body remind me of the murders of the Jakarta Ripper back in 1927. Fortunately, I know a man in Singapore who has the soul of the Jakarta Ripper's last victim preserved in a bottle of arrack." You, the GM, have never heard of the Jakarta Ripper, or that man in Singapore, or (if pressed) arrack. But here's why it works: the player is giving a hint ("I want to be a mysterious guy with connections just like all those cool NPCs") or two ("and I know a lot about Southeast Asia") that the GM can pick up and run with. Note that the player leaves areas of mystery for the GM to fill in; note that the good GM should always listen to her players. Especially if her players know cool things like that -- have the mysterious mentor ask that player's PC for his "expert input on the situation in Java as he sees it" and let the player build your world for you! Maybe he's "wrong" -- big deal. Even if you don't want to bisociate your way into what is likely a pretty neat setup, you can mine it for the Real Plan. "Yes, Commander Swift, you were close -- but you forgot about the Lemurian heritage of the orang-utang! Seize them, my orange minions!" Why should the players be the only ones who get surprises? Make their characters truly part of the game, and discover the Highest Weirdness allowable by law.
