UNCLE SAM

Ethereal Genius Loci and Seriously Ticked-Off Spirit

Corporeal Forces - 5 Strength 10 Agility 10
Ethereal Forces - 4 Intelligence 8 Precision 8
Celestial Forces - 4 Will 10 Perception 6

Skills: Acrobatics/1, Detect Lies/1, Dodge/3, Emote/3, Escape/1, Fighting/5, Knowledge (America)/6, Language (American English/6, French/1, Spanish/3), Large Weapon/2 (baseball bat), Move Silently/1, Ranged Weapon/3 (rifle), Savoir-Faire/2, Tactics/2

Songs: Attraction (Ethereal/2), Dreams (All/3), Form (Corporeal/1), Healing (All/1), Light (Celestial/2), Projection (Ethereal/2), Shields (All/3), Tongues (Corporeal/1). Sam also knows a special variant of the Corporeal Song of Motion/6: three times the range, but it only works inside the boundaries of the United States of America.

Vessel: Usually, Sam materializes as an old but vigorous man.

First off, let's get this straight. Uncle Sam is not a god. Call him one and you'll feel his boot on your backside.

He's an honest, hardworking Genius Loci called into existence by the Sovereign People of the United States of America, and he's never sought worshippers. He doesn't want them, doesn't need them, and will never, ever condone that sort of foolishness. Why, he himself believes in the Supreme Being, though he's not much one for praying: Sam's sure that God has no problem with his existence, and looks forward to the day when he can formally give over his charges to Him.

He also doesn't have a thing to do with Hell. Heck, they've offered enough times to take him in, but he'll have nothing to do with such trash. They've tried to corrupt his image, with admittedly some success, but the core of America remains true, so Sam's still a stubborn old S.O.B. who has no truck with evil.

Still, he has changed, over the years. The concept of "American" has broadened, so he's had to grow beyond the old "Brother Jonathan" persona of the 19th Century . . . and he's wept when his people have squared off against each other. Mostly, though, he's just gotten madder and madder. Thanks to Hell's meddling, there's crime in the streets, intolerance, self-serving factions, corrupt politicians, and a general loss of faith in his country and cultures. Worse, Heaven, who should be grateful that someone else gives a hoot and is willing fight by their sides, keeps assuming that he and other political spirits are just as self-serving as those pagan leeches in bed-sheets.

On the other hand, it's not like he's never dealt with would-be absentee landlords before.

Goals and Relations

Sam (and a few other like-minded ethereal personifications of cultures and peoples) has recently decided to do some housecleaning. God help the hypocritical politician or "community leader" that gets within range of him: Sam will put the fear of the Almighty in them so fast that they'll fall all over themselves to practice what they preach. Unless they happen to

be Hellsworn: Sam has no tolerance for treason.

The idea is to "encourage" top political leaders to act like Americans (or Russians, or British, or Mexicans), dammit, and less like a bunch of hogs sucking from the public trough. When he and his colleagues aren't engaged in this pleasant task, they tend to roam around locally, trying to strengthen their communities.

Sam and his crowd have little use for other "pantheons" (another word to never use when referring to him), with one exception. The August Prosperity Collective (*The Marches*, p. 104) has quite a few ethereals in it that aren't too pleased with their current lot in life, and they're often willing to give his crowd a little covert help. This doesn't endear him to Nybbas or Beleth, but genius loci are a little harder to degrade than the average ethereal. So far, they haven't been able to put Sam down.

The Host officially treats Sam and his cronies like they would any other ethereals. Unofficially, there's a wide gap between Superior and Servitor opinions. Seraphim can see Sam's Truthful desire to protect the country that produced him, Malakim sense the honor that rolls off of him like the North Atlantic waves, and Cherubim always appreciate somebody unafraid to defend something that's really, really big.

It's amazing how often Servitors of Stone or Judgement completely miss detecting his activities. Servitors of War don't even bother trying to hide their approval of Sam . . . and Michael lets them get away with it. Unfortunately, Servitors of the Sword don't have that option, but even they will cheerfully stop targeting him if something more pressing comes up.

This (mostly) benign neglect is one of the things that is actually keeping Sam alive and kicking. Not that he'd thank them. By his lights, they're letting their own partisanship get in the way of their sacred tasks.

That's Un-American.

Creation Notes

Uncle Sam is an ethereal spirit (specifically, a genius loci) designed to be an NPC for an *In Nomine* campaign. For those readers out there who do not play *In Nomine*, ethereal spirits are entities created and maintained by the collective belief of humanity. Most of these spirits tend to manifest as pagan gods, and as such have been favorite targets of Heaven: the few remaining pantheons mostly survive by avoiding the corporeal plane (in other words, Earth), instead remaining in the ethereal plane (the place humans go when they dream, or suffer nightmares). These spirits are in a slow state of decline as they continue to lose worshippers: many have made reluctant pacts with Hell in order to survive.

Genius loci (*You Are Here*, p. 124-125) are special ethereals: they are embodiments of a specific place, and are not necessarily explicitly religious in nature. However, they still suffer from guilt by association: as the above character

shows, they are not particularly happy about this.

Play Notes

Uncle Sam can appear in any campaign that has the United States as a base. He can serve as an adversary to either demons or angels: demons because he's actively fighting against evil, and angels because Sam is breaking the rules by manifesting on the corporeal plane. As written, stopping him is a knotty ethical problem for honorable PCs: should such a fighter for Good (or Freedom, for demonic PCs) be eliminated just because he's in technical violation of the rules?

Sam can also serve as an ally. This is most likely for Angelic PCs, unless the campaign is such that Heaven is unambiguously a force for utter repression. He'd make a good one (although the PCs should keep from letting their Superiors from knowing about him): Uncle Sam has an instinctive knowledge of his country and people, knows how to fit into any American social function, and can speak every dialect of American English perfectly. Seraphim in particular would find him invaluable in negotiating their way through American society.

In combat, he's an accomplished corporeal and celestial brawler, and can wipe the floor with any beginning angel or demon. He's also not afraid to cut his losses and run: those foolish enough to follow soon discover that Sam knows the value of guerilla fighting and ambushes. His special version of the Song of Motion practically assures him of having sufficient time to do so.

Adventure Seed: All Around My Hat

The PCs come across a stovepipe hat in their adventures. It has all the hallmarks of an artifact created by Eli -- humming with power, indestructible, John Philip Sousa marches constantly emanating from it -- but it doesn't seem to do anything useful. Presumably, they take possession of the hat anyway.

Unfortunately, it seems that other people want the hat, too, ranging from the annoying (minor human politicians) to problematic (Servitors of Nightmares) to terrifying (whole squads of Triads and Servitors of the Sword). Pretty soon, it seems that everybody wants the hat, although nobody can ever give a legitimate reason why (beyond, of course, "Because everybody else does," which should be reason enough). Worse, the PCs will quickly find out that they can't, in point of fact, get rid of the thing: it keeps coming back to them. Over and over and over again. This simply increases the desire of everybody else to get his or her hands on such an obviously potent item. The PCs should never actually suffer permanent harm, but they certainly should start hating the sight of the hat.

The hat actually is a creation of Eli's. He made it specifically for Uncle Sam (they split a bottle at the first Space Shuttle launch), but got distracted just before he could deliver it. Eli stuck a unique Feature on it that would allow it to eventually get delivered: essentially, the hat would find somebody going in the right direction and stay with him or her until it got to Uncle Sam. The hat is just intelligent enough to pick out another unwitting mailman, but it likes the PCs. It thinks that they do funny things.

Eventually, either Eli or Uncle Sam will show up. By then, even the most fanatical Malakite of Laurence should be ready to ignore the ethereal or semi-Outcast and just hand over the damned hat (or at least be "restrained" by other members of the party while they hand it over). The hat will go quietly, although it will play marches at dirge-like speed as it leaves its friends. On the bright side, both Eli and Sam will look kindly on the PCs for their diligence. Of course, should Sam get hurt or killed, the hat will come back, and won't leave the PCs until they've avenged the genius loci.

And what are the actual powers of the Hat? It's indestructible and plays Sousa marches. Eli *does* make items that aren't inhumanly potent, sometimes.

The Fall

It was a golden age, humanity's finest hour, and it was coming to an end. During the time of the Second Republic all of humanity had been joined into a whole across the vastness of interstellar space; but now, under the petty manipulations and power mongering of the noble families, humanity's cohesion and greatness was pushed to its limits and then broken. The Second Republic fell.

And as the Chaos of the Fall began to spread, as darkness enveloped world after world, as the people became frightened and afraid, neighbor began to war on neighbor once more and all of human society teetered upon the edge of barbarity and obscurity. World after world sealed themselves away from neighbors who, once friendly, could now only be considered potential invaders.

These worlds were lost from Known Space -- that region around Holy Terra, the birthplace of humanity, where treacherous noble families who had engineered the Fall consolidated their power. As the universe was plunged into a new Dark Age, the wonders of the Second Republic were forgotten and lost.

Over the years some of these lost worlds have regained contact with Known Space as sealed gates reopened and forgotten jumpkeys were rediscovered. There they found a power struggle between feudal lords, merchant guilds, and an orthodoxical church all struggling to impose their will upon the shattered remnants of human society. Some of these worlds have rejoined the worlds of Known Space (whether through their own will or through compulsion), while others have maintained their barbarian ways and seek to conquer the Known Worlds and seize their secrets and remaining civilization. Without exception, however, it is believed by the citizens of the Empire that the worlds of Known Space are the only significant civilization of interstellar proportion to have survived the Fall.

They are wrong.

During the aftermath of the Fall a second group of worlds found themselves isolated. As the universe fractured and the shadows spread over humanity, ten worlds found themselves alone among the stars. These ten worlds -- Alhera, Cyberna, Kyreen, Unan, Mecca, Poa'pal, Tua'kal, Barre, Jandi, and Ayto -- squabbled and traded and warred among each other as the memory of the Second Republic began to fade. As Known Space was sliding into a Dark Age, so, too, were these worlds. As it was for what would become the Empire, so it was for what would become known as the Human Concordat.

The Sartran Doctrines

In the year 4110, a mere hundred years after the catastrophe of the Fall and the New Dark Age began, a new voice was heard among this small enclave of humanity. The voice belonged to a man who was known only as Sartra, and he taught a lesson of unity. He refused to recognize Alheran as different from Cybernan, or Cybernan from Jandite, or Jandite from Aytan. He called to them all as citizens of what he termed the Ten Worlds, and he reminded them that all were human. He called them brother, and in seeing him as such so they saw each other as kin. His teachings rekindled the memories of the Second Republic and a time when all humanity was composed of a single, glorious whole. He gave the people of the Ten Worlds a new identity, a common identity. He brought them together and bound them to a common purpose.

His words inspired many, both high and low, but the most important of his converts was Duke Daneel, the eldest member of House Britannia. House Britannia was of minor importance before the Fall, but had managed to secure sole sovereignty over the planet of Alhera. By the time of Sartra, Alhera had risen to be the brightest star of the Ten Worlds and House Britannia's power had grown great indeed. But Daneel was a wise and compassionate man, and when he heard the words of Sartra he sought out this man and gained his friendship.

Of perhaps only slightly less importance than Duke Daneel was General Anton Baghera, the feudal warlord who had seized control of the world of Cyberna twenty years earlier and now ruled it with an iron grip. He, too, became Sartra's friend, and these three unlikely allies joined upon an even more unlikely mission -- the establishment of an interstellar government which was, in many ways, even more liberal than that which had ruled over the Second Republic. In the year 4125 General Baghera and the nobles of House Britannia both relinquished their power, and the worlds of Alhera and Cyberna both became the first members of the newly formed Human Concordat, with Sartra elected as its first president.

Over the next decade the remaining eight members of Sartra's Ten Worlds joined the Concordat, one by one, with Mecca -- ruled over by the suspicious Orthodox Church -- joining last in 4135. Although the Concordat, under the careful guidance of President Sartra, never attempted any military or economic coercion of the other worlds, still blood was shed. Freedom fighters on many worlds threw down what they saw as oppressive governments, while freedom fighters on other worlds attempted to prevent their world from "surrendering" to the Concordat (of particular note is the Order for Aytan Freedom, which nearly succeeded in sealing Ayto's jumpgate in order to prevent their world from joining the new government).

Shortly after Mecca joined the Concordat Sartra's second term of office as President came to an end and he retired from public life. He lived a life of seclusion for another ten years before disappearing entirely in the year 4145. Shortly following his disappearance, and assumed death, a collected book of his teachings -- entitled the Sartran Doctrines -- appeared. This book, still considered the greatest philosophical and political teachings ever constructed, has proved to be one of the most important historical documents to the Human Concordat, second only to the Constitution which also bears Sartra's hand.

The Human Concordat

It has been over 850 years since Sartra's death. During that time the Concordat has slowly grown to be the society which Sartra imagined not only as an ideal, but as a reality. They have become a liberal and peace-loving people, worked hard to regain the technological knowledge lost during the Fall, and dedicated themselves to the principles of liberty and equality which Sartra set down in the Doctrines. To a large degree they have succeeded.

Perhaps one of the highest things that the Concordat values is the preservation of knowledge. Through the Doctrines the memories of the Fall are still kept fresh, and all of Concordat society dreads such a repetition. Knowledge, they know, is the most precious of all commodities -- and all too easily lost. They have worked hard to regain what was lost during one

[Jumpweb of the Human Concordat](#)

Jumpweb of the Human

hundred years of barbarity, and have largely succeeded -- propelling their understanding of the universe back to a place which is, in some ways, stronger than the Second Republic, while still being deficient in others.

The Concordat has also taken steps to recompense the alien species which have been trodden under humanity's foot over the millenia -- even going so far as to restore homeworlds where that has been possible. These initiatives meant that when the Concordat again made contact with the Vau, their relationship with them was much easier than it had been in the past. Although it is perhaps not peace, it is an understanding.

But the Concordat has not contented itself with civil rights merely for the disenfranchised within its borders; it has pushed for a society which is in all ways possessed of more liberty and greater hope. These advances, naturally, have had their price for some: The nobles were disenfranchised under the rule of Sartra, and now they are nothing but fading memories. The Church, unable to politically force one view of itself upon the populace, has found itself splintered time and again by divisive sects of belief. Although it is still technically true that nearly 75% of the population believes in the Pancreator, many of these are those whose place in the church has lapsed along with their conviction.

In truth, though, perhaps the greatest accomplishment of the Concordat is not tangible at all -- but rather the essence of the society they have unconsciously constructed. Where Sartra found a set of fractured and disparate worlds there is now one society, which has as its identity not separate cultures, but all humanity. Where once humanity was divided, it has been made whole. As, over the years, other lost worlds have made contact with the Concordat and joined this society, it has become apparent that the greatest gifts which have been offered are these: Unity, Peace, and Hope.

Concordat and Empire

The year is now 5000 A.D. In Known Space five years have passed since the coronation of Emperor Alexius, whose brave new reforms and attempts to rekindle an exploratory spirit in his people have just begun to have some long-term effect. In the midst of this growing renaissance in the Empire, a jumpgate between one of the outer worlds of the Concordat and Byzantium Secundus reopens.

The first tentative contact between these two societies has been mutually positive. Emperor Alexius is overjoyed to have regained contact with so large a segment of lost humanity, while the Concordat is overjoyed in the discovery that they have not been alone in maintaining interstellar civilization. But these two societies are polar opposites of each other -- diametrically positioned on the political, social, and religious spectrums. Although for now goodwill prevails, can it not be said that conflict is inevitable? And if so . . . what then?

Government

The government which was formed under the counsels of Sartra, Duke Daneel, and General Baghera was, naturally, of a constitutional nature; expounding the freedoms of its citizens and laying out a concrete system of governance. Based upon the classical three-tiered system of democratic government dating back to before the founding of the First Republic, the great nationalistic pride which most of the Concordat communities have felt towards this edifice of power has had a general homogenizing effect on many regional and local governments as well. Although there are exceptions the vast majority of Concordatian governments function along this same basic model.

Government in the Concordat is essentially split as a republic into four different levels: the Galactic, the Planetary, the Regional, and the Local. The

Concordat

[2000x1600 pixel .JPG \[364K\]](#)

[1000x800 pixel .JPG \[195K\]](#)

[500x400 pixel .JPG \[69K\]](#)

[250x200 pixel .JPG \[22K\]](#)

former, as the name implies, is the government founded under the guidance of Sartra; it rules over the whole of the Concordat. The second, the next step down from the Galactic, takes a variety of specific forms, but adopts the common name of Planetary because it is generally composed of planet-wide governments. Most planetary governments oversee a group of Regional governments, which deal largely in bureaucratic initiatives focusing on specific sections of individual worlds. Finally, Local governments usually take the form of county boards or city councils, dealing with the nitty-gritty details at the most immediate level to the average citizen.

The galactic government, as noted, is a federal constitutional system with a legislative, an executive, and a judicial branch. The executive is composed primarily of the President, who serves a five year term, and his immediate advisors and bureaucratic chiefs. The legislative is formed around a bicameral Congress composed of two houses -- the Assembly and the Senate. The Assembly draws its membership proportionally from each planet, serving three year terms. The Senate is composed of three members from each planet, one of which is elected every two years to serve a six year term.

The Judicial system established by Sartra is the most unique element of the Concordat system of government. At its highest level it is composed of a Supreme Court formed of ten Justices. All of these Justices are popularly elected at the Galactic level. Five positions are possessed of a lifetime term; five of a ten year term. At the lower levels cases are heard by a Judicial Panel consisting of six Judges and six Jurors. The Judges are elected officials; the Jurors are randomly selected citizens who serve on a single panel. Unlike previous jury systems, Sartra's did not have a lengthy juror selection system designed to minimize prejudice within the jury system -- instead he saw that the judicial system could be sped up considerably by simply slotting in the first six randomly determined jurors, and then using the six judges to counterbalance any missteps on the parts of the jurors. The judges would counteract the vagaries and prejudices of the jurors, while the jurors would counteract the tendency to corruption or tyranny which might breed within the judges.

Finally a Bill of Rights rounds out the constitutional system, protecting the citizens of the Concordat from infringement by the government on many "basic rights."

Most Concordat citizens are, rightfully or not, extremely proud of the freedoms and democracy which their government represents. The Galactic Constitution and the principles on which it is founded are regarded as unquestioned virtues.

Religion

In the nine centuries since the end of the Second Dark Age the Orthodox Church and religion in general have weakened within the borders of the Concordat. When the Church Elders, based on Mecca, were finally forced by grassroots efforts to recognize and join the Concordat government they lost a great deal of political power. The Constitution as defined under Sartra not only encouraged, but enforced and exemplified a strict restriction on the intermingling of church and state. He respected primarily the freedom of the individual, and knew that the structure of the Orthodox Church would lead to an oppression of minority interests and beliefs if they were allowed access to pure political power.

Without the political power to puritanically enforce their religious views, the Orthodox Church found its constituency base begin to splinter apart. Although true alternatives to the Omega Gospels and the worship of the Pancreator do not really exist, the way in which the Pancreator is worshipped and the Omega Doctrines interpreted have begun to diversify. As the Church has found itself broken apart by differing interpretations and modes of belief, religious fervor in general has suffered: It is easier to believe in unprovable religious truths if the religious community is unified; if it is fragmented it is easier to simply dismiss them as whole.

Orthodox Church

The Orthodox Church is still the primary religious institution in the Concordat, with fully 25% of the population under its auspices in one capacity or another. With that being said, however, it is necessary to admit that the church is little more than a shadow of its former self. Although the official doctrine still supports the belief that the Patriarch of Mecca is the spiritual leader of the Church, the average churchgoer is far more relaxed in his beliefs -- accepting official Church doctrine only when it suits them.

As noted the Orthodox Church structure is still based primarily on Mecca, a planet which assumed religious prominence due to the abundance of Ur gargoyles and ruins on its surface. When the Concordat sealed itself off from the rest of the galaxy the church leaders on Mecca seized political control of the planet and asserted their leadership on the church structures of the Ten Worlds.

Liberalism

About two decades after Mecca finally capitulated and joined the Concordat, the unified facade of the Church began to crumble under the religious teachings of Uther Fairchild. Fairchild preached that belief in the perfection of the Patriarch was a fallacy. Instead of looking to the Church for leadership the faithful should instead look to it only for guidance -- the truth of the Pancreator was not to be found in edicts, but through the exploration of a personal truth reached through personal interpretation. Each individual should strive to interpret the Omega Gospels in their own way and to find the truths within it which are meaningful to their own lives. The structure of the Church, Fairchild said, was only useful in so far as it served to educate and to guide the faithful through their own spiritual journey.

Such convictions quickly found fertile soil in the fresh nationalism which was spreading through the newly formed Concordat. The Church, stripped of its power to politically silence Fairchild, could do nothing more than excommunicate the rebellious teacher. It has long been argued whether or not this was an even greater mistake by the Church -- the highly public excommunication of Fairchild, and Fairchild's own embracing of this new reality, served not as a warning, but as a clarion call that the Church's ability to tyrannically enforce its view of faith was broken by the realities of the new system of government.

Today nearly 15% of Concordat citizens are members of the Liberalist church -- making it the strongest competitor with the Orthodox for the faith of the people. It also remains at bitter doctrinal and political odds with what it perceives to be the archaic, restrictive, and false tyranny of the Orthodox religious teachings.

The Sainted Orders

The Sainted Orders date back to an amalgamation of different religious sects in the 46th century. The basic structure of the belief differs depending upon which Order one is analyzing, but the central tenet is that the Prophet was actually the living incarnation of the Pancreator, with all or some of his eight followers sainted and/or deified as well.

Although initially a great populist success, the Sainted Orders have faced a general decline for several centuries. During the past hundred years or so this trend has been accelerated because the Orders have tended to be a haven of religious extremists. The loose collection of slightly differing religious beliefs within the Orders makes it easy for radical cults to spring up and mass suicides, murders, and religio-terrorist actions have become semi-regular events.

Rejuvenites

At one point during the early scientific renaissance of the Human Concordat a popular theory held that the dimming of the suns was simply part of a long galactic cycle which would, eventually, reverse itself. In short, there was nothing to be particularly worried about -- the problem would take care of itself. Although this theory has since been discredited and now is largely ignored, the idea seemed to find ideal fermentation within the religious community. The Rejuvenite faith maintains the Orthodox position that the suns are fading because of the sins of mankind, but they differ in one important respect: There is no hope of rekindling them. They are a sign of the end of an age, at which point the Pancreator will "clothe himself within the confines of the flesh" and "walk among the people of the Galaxy" to "pass judgment upon the deeds of his servants, faithful and unfaithful."

If the Pancreator finds mankind worthy he will "rekindle the stars with the light of his love" and a golden age will ensue. If not, then he will destroy mankind and start anew. The Rejuvenites hold that just such an event occurred eons ago when the Ur races ruled the universe, and that the Ur races were found unworthy.

Some fringe Rejuvenites believe that each race will be judged in turn, and particular focus has been spent upon the Vau. Some believe that the Vau have found the true secrets to acceptance in the eyes of the Pancreator and that their ways should be emulated. Others imagine some sort of interspecies contest in which only one will be chosen to proceed into the golden age -- they would have the Concordat attack and destroy the Vau.

Uritic Order

The Uritic Order was initially an order of monks organized around the teachings of Petref Alanna in the 47th century. Its spiritual roots lie with both the Rejuvenites and the Sainted Orders. Alanna accepted the belief that the fading suns were an indication of the end times, which would culminate in a judgment of mankind which would determine whether mankind would be sent into a golden age.

Instead of believing that the alternatives were either a golden age here in this plane of existence or utter destruction, Alanna believed that in the judgment the Pancreator would send those he chose as worthy into another plane of existence -- a Nirvana or a Heaven. Those who were not chosen would remain behind. He said that the Ur races had not failed the test, they had passed it and been sent on into this other plane -- leaving the imperfect Ur-Ukar and Ur-Obun, who had failed the Pancreator's test,

behind.

Finally Alanna said, along with the Sainted Orders, that the Prophet was not a mortal man. However, he did not embrace the conclusion that the Prophet was an incarnation of the Pancreator, either. Instead, he said, the Prophet was a reincarnation of the collective wisdom of the Elder Races and focused particular attention upon the role of the Ur-Obun Follower, Ven Lohji.

Since Alanna's death, the ideas of the Uritic Order become more widely popular and accepted. Although the Order still exists as a brotherhood of monks, it is also complicated by an infrastructure of "Houses of the Order" which teach and give a sense of religious community to those who are not brothers, but still embrace the beliefs of the Order.

Promethean Division

The Promethean Division is, in some ways, not so much a religious sect as it is the opposite of a religious sect. It is based on the belief that the Prophet was, in fact, a False Prophet used as an unwitting tool of the dark spirits. Where the Omega Gospels present a highly structured set of moral beliefs, the adherents of the Promethean Division believe that the only true sin is becoming obsessed with sin -- particularly over the sins of others.

This should not be viewed as a complete abandonment of moral authority (few Prometheans take it so far), but Prometheans generally believe the proper purview of ethical questions should be calmly reasoned as a tradeoff between infringing individual freedom and allowing the actions of individuals to impinge upon the freedoms of others. "Sin" doesn't enter into it, and remains the purview of the individual's discretion. Risk damnation if you want, but it is your decision so long as you do not infringe upon my freedom.

Nor should this be construed as a denial of the Pancreator. The Promethean Division embraces the concept of the Pancreator, but sees the Pancreator as embracing and supporting their philosophy of freedom and scientific improvement. The stars are not fading because of the Pancreator's anger over the sinfulness of his people, they say, the stars are fading because religious fanatics are obsessing over imagined "sins."

Sathraism

Although religious freedom is almost utterly unfringed upon and many minor non-Omega sects proliferate, Sathraism is still banned. Members of the Orthodox Church, other sects, and a majority of private citizens believe that the effects of jumpgate travel on which Sathraism are based are physically and mentally harmful. "Public safety" legislation, therefore, prevents the exercise of Sathraism, and so far the Courts are unwilling to challenge it.

Antinomy

Like Sathraism, the mysterious rites of Antinomists have been banned. They are considered highly subversive and dangerous by even the non-religious, and the remaining political forces of the religious orders reinforce this conviction.

Worlds

Although the Concordat sprung up out of the seed of the Ten Worlds, it has since expanded far beyond that, encompassing in its modern form a total of thirty-three systems and thirty-one planetary governments. They are a widely varied lot, but all are bound together by their ideological commitment to the virtues of the Concordat.

Sartra

Originally known as Alhera, this world was the brightest and best of the original Ten Worlds. Under the leadership of House Britannia it was one of the first worlds to join the Concordat and became the capital of the new government. Following Sartra's disappearance and assumed death it was renamed in honor of him. Today it remains the shining star of the Concordat -- it's communities are ergonomically designed and architecturally splendid, with plentiful parks.

Cyberna

The technological hub of the Concordat, Cyberna has earned the nickname of "Chrome World." Its politics are dominated by the massive interstellar conglomerates which control the vast majority of business throughout. The vast majority of this world is rocky wasteland, and so its cities are tightly compacted bunches of skyscrapers and apartment complexes with the occasional archipelago, all built around technologically-assisted agricultural hubs.

Kyreen

In many ways a showpiece of the justice and idealism which the Concordat represents, Kyreen was originally the homeworld of the K'i'Reen, an insectoid race who was displaced onto reservations during the time of the Second Republic. Few of these reservations were located in the worlds which are now the Empire of Known Space, but in the Concordat they were much more numerous. The more liberal ideals of the Concordat restored their homeworld to them in 4615. The K'i'Reen opted to remain members of the Concordat and share their planet with the humans already living there. Since the K'i'Reen live primarily below the surface, an interesting relationship has developed between their revitalized civilization and culture and the human settlements which still dot the surface.

Unan

Unan is a generally unremarkable place. With a fairly even division between industry and agriculture, it is one of those rare planets which moved beyond the specialization of its early colonial days and became a largely self-subsisting community. Despite this, however, Unan has distinguished itself as a major tourist attraction as a result of the daily meteor showers. The entire Unan system is full of debris which is constantly peppering the upper atmosphere, creating impressive light shows in the night sky. These displays are particularly impressive near the equator and this fact, combined with the large, peaceful, equatorial seas of Unan, has led to several booming resort towns and floating gambling complexes in that area.

Mecca

When it was first explored during the early years of the Second Republic, Mecca was known as Milton -- a minor colonial world with poor resources. About two centuries before the Republic collapsed, however, vast archaeological discoveries began to be made on the planet. Many, if not most, of these discoveries were prominently Anunnaki gargoyles. As the fame of these

gargoyles spread their religious significance turned Milton into a major pilgrimage site. Eventually Milton changed its name to Mecca and became a major center of Church politics.

After the beginning of the Dark Ages, a council of clergyman formed an organization known as the Cathedrals of Mecca. Although this group recognized that the true center of Church power rested elsewhere, they also recognized the practicality of their current situation. The Cathedrals of Mecca became the de facto leaders of the Orthodox Church for the Ten Worlds. They were one of the loudest and most influential of the anti-Sartrons, but eventually lost their conservative battle. Today Mecca remains the last true bastion for religious fundamentalism. The Cathedrals of Mecca still maintain control of the Orthodox Church in Concordat space (although how this will change now that the gates to Holy Terra have been reopened remains to be seen), and the vast majority of Meccans still adhere to the Orthodox faith.

Poa'pal and Tua'kal

Poa'pal and Tua'kal are two planets which circle a single star in an identical, but opposite, orbit. When they were discovered during the Second Republic it was widely believed that they were artificially placed in their orbit by the Ur races, for reasons unknown. They were each home to an identical species, one of which referred to themselves as the Poa'pal and the other as the Tua'kal according to archaeological records. When they independently discovered spaceflight they also discovered their other half. Religious doctrine apparently convinced the two species that the other was the source of evil and war ensued. By the time humans arrived on the scene, the two species had already wiped each other out. Poa'pal and Tua'kal became colony worlds. Today they are proud members of the Concordat, under the rule of a single, joint government.

Jumpweb of the Human Concordat

The Heartland

The three worlds of Barre, Jandi, and Ayto are collectively referred to as the "Heartland." The Heartland is the source of the majority of the agricultural output for the Concordat, and is also one of the more conservative regions of the republic, with a particular focus on traditional (or "Sartran") virtues. Surprisingly, however, this conservatism does not spread to their religious convictions -- which are generally nonexistent, and usually non-Orthodox even when they are.

Progenitor

Progenitor, like Mecca, once was possessed of a different name: Lonbette. Once a fairly successful colonial world of the Second Republic, Lonbette fell into backwater savagery during the Dark Ages after its jumpgate was sealed. Then a generation ship from the time of the First Republic appeared in the system and colonized the world. Their civilizing presence restored not only the technological foundations of the world, but formed a strong central government for the

world. Eventually their jumpgate reopened, and they found themselves in direct contact with the Concordat, which they quickly joined.

Jumpweb of the Human Concordat

Haven

During the Dark Ages four planets (Adde, Polyani, Hannal, and Jelen) bound themselves together and sealed off the rest of the universe. Unlike many worlds which followed their course these four managed to maintain a high level of technology and pushed towards not only maintaining, but improving the technology they had inherited from the Second Republic. Unfortunately, this zeal for progress was ultimately their downfall. Using their own terraforming engines as a basis for experiment they made leaps of massive discovery, but eventually their experiments caught up with them. The terraforming engines on three of the planets began to seriously malfunction. Adde, Polyani, and Hannal became known as the Fallen Worlds as their populations were driven into exodus on Jelen. Billions died, but those who survived renamed their new homeworld Haven.

Altrua

Altrua is also known as the "Homeworld of the Anima." Much persecuted during the time of the Second Republic, the Anima discovered a jumpgate code to an uncolonized world. For nearly a hundred years it served as a secret gathering point for them -- a place of safety and acceptance. Then, during the Fall, violence against Anima forced many to flee to Altrua. As their planet was threatened by discovery they sealed their jumpgate. Eventually contact was made with the Human Concordat, and the culture of universal acceptance and emancipation was extremely attractive to the historically oppressed Anima.

Tempest

For unknown reasons the terraforming engines on this planet were calibrated to create massive equatorial hurricano storms. These storms, constricted by the terraforming engines, do not effect the northern and southern hemispheres, who have formed separate governments, each of which is represented in the Concordat.

Entreri

This alien homeworld was undiscovered at the time of the Fall. Later discovered by the Human Concordat, the complete and unadulterated freedom the Entreri have enjoyed as members of the republic is an excellent example of the Concordat's tolerance. The Entreri themselves are extremely intelligent, telepathic, over-sized rodents with opposable thumbs. Famed for their curiosity they have popularly been nicknamed "raccoons," a name which they seem to embrace wholeheartedly.

Colony

Established at the very end of the Second Republic, the terraforming engine on Colony was never finished. Largely desert the planet's population is centered in a huge biosphere near the equator. The planet has become a center for the study into terraforming technology -- the one true secret which remains, as yet, unmastered by the Concordat scientists.

Binary

The world of Binary, as the name implies, orbits two stars. This notable feature meant that Binary managed to establish itself quite successfully as a tourist trap. From these roots Binary quickly grew, and is now considered the entertainment capital of the Concordat.

The Seven Pearls

Also known as "The Chain," the seven worlds of the Seven Pearls are most notable for their arrangement in jumpgate travel -- strung out, one after the other. They are Lyonesse, Leicester, New Salisbury, Exeter, Cambridge, Suffolk, and Carlisle. The Seven Pearls have developed a certain homogeneity of image, despite the fact that they are politically quite separate. Since they have joined the Concordat, they have become known for their financial and political power.

The Hinterlands

Like the Empire, the Concordat has also been forced to deal with barbarian worlds whose jumpgates have reopened onto their space. The four worlds Norjken, Rampart, Bastion, and Owre are collectively known as the "Hinterlands," providing a military buffer between the various barbarian powers and the Concordat. This was the acknowledged "frontier," and is popularly known as a rough, dangerous place with a slightly uncivilized edge.

Geneva

Centuries after Sartra's reforms brought the Concordat out of the Dark Ages contact was again made with the Vau when the planet Geneva was rediscovered. Today Geneva has lived up to its namesake by being the primary seat of the diplomatic efforts between the Concordat and the Vau. Although the Vau are still withdrawn from human affairs, their relationship with the Concordat is far more cordial and refined than it has ever been before in human history.

The Concordat as a Campaign Setting

The Empire of the Known Worlds, the established setting of the *Fading Suns* game, is described by HDI as "a futuristic passion play." As they say, it is primarily a science fiction game, but one indelibly painted with broad strokes of fantasy, sociopolitical feudalism, horror, and ancient mystery. It is a world in which stories of "varied and exotic themes" can be told, but those stories are -- by the very nature of the setting -- of a dark tone. It deals with "grand themes of the human experience" with a main theme of "Seeking," the "mythological role all heroes play: the knight on quest, seeking power to vanquish his enemies or the secrets of self-discovery. Success or failure on this quest is not as important as the insights learned while on it."

In expanding the setting to include the Human Concordat I have been careful to maintain that central theme of "Seeking," but I have also been reticent of the fact that the Concordat shifts the way in which that theme is conveyed. It is a brighter, better place than the Empire. Where the Empire operates in shadow, the Concordat is a place of light.

But both share the exploratory spirit. Where Emperor Alexius is dragging his feudal empire into a new age of renaissance and exploration, the Human Concordat is engaged in its pacifistic mission to reunite humanity (and using that term to not only include humans, but all intelligent species). The exploration of the Empire is a renewal, the exploration of the Concordat is a cleansing. The exploration of the Empire is focused on the individual and self-improvement; the exploration of the Concordat is focused on society as a whole and unified improvement. There is a difference of means, but not ends.

In choosing to add the Human Concordat to an existing campaign, or starting a new campaign using the setting, it is important to remember that you are shifting the focus and feel of the *Fading Suns* game. In doing so you will find that the Concordat, although changing the feel of the setting, also complements the Empire. Use not only the thematic similarities, but also the thematic dissonances between the Concordat and the Empire to your advantage in designing and supplementing your campaign.

Pyramid Review

Further Information: A Gamemaster's Treasury of Time (for Continuum RPG)

Published by [Aetherco/Dreamcatcher Multimedia Inc.](#)

96 pages; \$15.00

If you've read or played *Continuum*, Aetherco's role-playing game of time travel, you know the mantra sung by characters you meet from far-flung points in the timestream who can't afford to give away too much information about the future: "Further information is not available here." Instead, they've placed it in *Further Information*, the new supplement for the line.

Some individuals are selected to become spanners, time travelers who strive to protect the timeline from the Narcissists. The Narcissists are an opposing breed of travelers who lack a spanner's cautious nature and who don't care that their oft-paradoxical actions may fragment history. Since the timestream is rife with spanners and Narcissists, there's a whole secret history that, until now, has been drawn with somewhat indistinct lines. *Further Information* throws things into sharp relief.

The first part of the book is mostly comprised of practical advice for the *Continuum* gamemaster. Time travel is a headache in any game, and while *Continuum* has done a wonderful job making the concept a feasible and gameable part of the environment, there are still as many questions to be asked as there are permutations of the genre. Player characters get a certain number of contacts with their past or future selves, so how do the players and the GM make the most of them before they "run out?" How do you handle players who show up late to a game session when their character ought to logically be able to join the rest of the party just in time? Any game that talks about how to kill PCs with an eye toward keeping the game going richly deserves the too-commonly applied praise "cutting edge."

Not all of the GM's section is an exercise in temporal logic. There's some good stuff about filling out the ranks of the Fraternities -- the jobs -- that spanners have within their society (it still must fall to someone to bandage the wounded, or handle the finances). A sample corner is provided, a corner being a sort of agreed upon time and place that serves as a base of operations for the otherwise-flightly spanners. And before technology gets out of control or history loses all its mystique for the near-omnipotent PCs, *Further Information* reigns in player passions and shows the GM how to keep that thrill of discovery alive.

The rest of the book is given over to the Eras. Even time travelers seem to need some means of quantifying time even if it doesn't have to happen in the order it once did, and spanners name their historical periods after zodiacal signs. Nine societies are described in great detail, each a representative sampling of the state of temporal affairs for that Era. In some periods, early man works side by side with the travelers to enhance their knowledge and ability; in others, spanners need permission even to visit peoples who are under special protection because of the vital and precarious role they play in the Greatest Game.

These societies are described not only by the level of technology, style of art, and dress typical of the time, but by the contribution they make to man's development and, consequently, to spanner society. NPC profiles and character details describe the more prominent members of the community, and different themes and movements at work in their lives are provided in place of specific lists of wars and events. It gives each world a livelier, mythic feel, rather than making it a laundry list of opportunities to be exploited or explored by time travelers from either side.

The stylistically blurred watercolors that graced the pages of the original rulebook still hold a position of dominance in *Further Information*. The more cartoonish drawings from the RPG have been replaced in the supplement with

somewhat blunter drawings of the old mixed with the new, the sort of satirical in-joke characteristic of time travel games. It's still a nice recipe, and this slow evolution of style is part of what will keep the game a refreshing surprise.

Another thing that has survived from one book to the next is the strange style in which the game is written. The deliberately baroque language and shifting point of view makes you wonder if it's a game written by time travelers or a time travel manual written by gamers. It never talks down to its audience, and the authors seem as interested in making high art as parlor games. The lofty prose is a mixed blessing for writers and readers alike: It can be a dry read, but if it doesn't push the right buttons, it may not be your game to begin with. It also serves to hide some of the editing oversights, though for those with a critical eye such distractions can make it even harder to slog through.

Further Information leaves you wanting for a little more GM advice and some more probing of this fascinating game. Certainly if supplements will be this long in coming out it would be nice to see under the hood more often, but another school of thought suggests it's more fun finding it out on your own. Perhaps the next supplement will go further still.

Pyramid Pick

The Key of Delhyread (for SLA Industries RPG)

Published by [Hogshead Publishing](#)

Written by Laim Wickham

32 pages; \$7.95

SLA Industries, the RPG of futuristic urban horror set in the World of Progress, is a game with a long and troubled history. First published in 1993 by small Scottish independent Nightfall Games, who were picked up the next year by WotC, the game languished in limbo (being kept alive by fan interest and support on the Internet) after becoming a casualty of WotC's dumping of its RPG lines in 1995. It was returned to its original owners in 1999, and in August of 2000, was relaunched by Nightfall Games through the UK's largest publisher of RPGs, Hogshead Publishing.

Despite the new (version 1.1) rulebook containing an excellent one-page guide to playing *SLA Industries*, it was still only a reprint, albeit with new art and fiction, as well as a stunning new cover. Although no less welcome, it still left GMs and players with relatively little idea as how exactly to run or play *SLA Industries*. Thankfully this problem has been solved with the release of the 32-page scenario, *The Key of Delhyread* (pronounced Deh-LEE-Ree-Ad). In fact *The Key of Delhyread* has sat waiting to be published from the time that *SLA Industries* was with WotC. So the question is, has the scenario been worth waiting all that time for?

The Key of Delhyread is a handsome booklet, clearly laid out in the same style as the *SLA Industries* rulebook. Extra information and NPC details are highlighted in grey boxes and though the text is a little too tight in some places, it makes everything easy to find. Sparsely illustrated, the art is as good as any in the main *SLA* rulebook. The colour cover by Rik Martin is eye-catching, although not as superb as his black and white work seen in other Hogshead books. One nice touch about *The Key of Delhyread* is that the pages are packed to the gunnels with information and there is not a wasted page to be seen -- no obligatory licence agreements here!

[SPOILER ALERT! -- Scenario details are discussed below. If you wish to play The Key of Delhyread please refrain from reading further. Just tell your SLA GM how good it is . . . or even better, buy it for him!]

The scenario is about the hunt for a macguffin, the *Key of Delhyread* of the title. In the adventure, the players are a squad of new or relatively inexperienced operatives working for SLA Industries, offered a BPN or mission by an internal affairs operative to locate and return the Key. This is an ancient Ebon artefact, recently stolen from the Ancient History Museum, but all the squad will be told is that a Key has been stolen and SLA Industries would like it returned as quietly as possible.

Beginning at the warehouse where the Key was stored after its theft, the adventure evolves into a frantic race against time as the squad chases the artefact down. Of course, those that originally ordered the theft from the museum still want it back and deploy some tough DarkNight forces to retrieve it, any way they can. Of course, the squad is bound to run into them! Along the way, the characters have to investigate and possibly infiltrate the infamous Krosstown Traffic street gang, encounter a serial killer (no *SLA Industries* adventure would be complete without one!) and make friends with, or an enemy of, a very dedicated reporter.

[SPOILER ALERT OVER!]

Make no mistake: this is not an easy adventure for the players, particularly if they are new to *SLA Industries*. Their opponents are invariably tough or can appear in great numbers. The adventure can be played using experienced

characters as well, and a simple method of increasing the ability of the NPCs to make them enough of a challenge is provided. A good GM will be able to run the players' squad through this with little difficulty, but he will have to pay a lot of attention to the adventure's numerous timelines. Almost every character in the adventure has one of these, and it would have been nice to have a complete timeline of events for the whole of the adventure and all of the NPCs in one place as well as in the appropriate places in the text.

The Key of Delhyread is a linear adventure, but this is not to its detriment. It is a short (perhaps two or three sessions at the most) adventure, intended to give a flavor of how the World of Progress works and how the game can be run -- Nightfall Games are planning longer and thus deeper scenarios. Once *The Key of Delhyread* has been played, there is still plenty of potential left in the book. The final few pages explores several possible outcomes depending upon player actions, and suggests several methods by which the surviving NPCs and the Key itself can be used in later adventures. In addition to this, *SLA* GMs will find the information on the Krosstown Traffic street gang very useful in ongoing games. Considering that this is just a 32-page adventure, this really makes *The Key of Delhyread* of more use in the long term than most adventures of its ilk -- a very nice touch upon the part of Nightfall.

Hogshead Publishing and Nightfall Games have already given fans of *SLA Industries* an excellent present this year with the re-launch of the game, but now they've given us a new year's present as well. The *Key of Delhyread* is a get-down dirty-deadly adventure that every *SLA Industries* GM will love to throw at their players.

Pyramid Pick

Pyramid Pick: Adventure Boosters (for D20)

Adventure Boosters (for D20)

Written by Various

Published by [AEG](#)

16 b & w half pages; \$2.49 each

A company has decided that maybe you don't need a full adventure for your 3rd Edition *Dungeons and Dragons* game. The same company has also decided that, instead of creating scenarios in the format of official adventures, by making their adventures in a smaller format they could charge substantially less.

In 16 pages, amounting to about eight full pages, the writers manage to give the reader an adventure that'll last a night, maybe two at most. The good news is that each adventure is well done and worth the \$2.49. More importantly, each adventure is self-contained and doesn't rely on the other adventures to use. This is a nice thing if you're only looking for a night or two of adventure.

[SPOILER ALERT! Don't read if you don't want to know about the adventures!]

- **Castle Zadrian**, by Rich Wulf, involves the party with an alchemist and his eccentricities. Apparently, alchemist Timoth has not visited his daughter in some time. The party finds out that the alchemist enjoyed the study of different planes and that through different means, has managed to breach the layers of the prime plane with others. Unfortunately, one of the planes that he breached had some mighty unfriendly creatures that have caused many troubles.
- **Sundered Faith**, by Kevin Wilson, has the party hired by the governor of the city to prevent more murders from happening in the sewers. They unearth the undead and have to determine what can prevent them from rising from the sewers.
- **Tomb Of the Overseers**, by Ken Villars & John Zinser, launches the party on a quest to summon back a legendary paladin to overcome an evil mage. Only by defeating the guardians that the vile mage has placed about the tomb can the party hope to bring forth the champion.
- **Against the Barrow King**, by Steve Hough, involves a small town that believes that they have somehow angered the legendary Barrow King, but as the party soon discovers, the villagers are instead being used as fodder by a cult that employs ghouls in their worship of their dread god.
- **Jerimond's Orb**, by Ree Soesbee, involves monsters raiding a small village. Like other adventures though, there is more going on than what is easily apparent.
- **Out Of Body, Out Of Mind**, by Patrick Kapera, involves the players in a situation similar to **Tomb Of the Overseers**. This time though, instead of trying to summon a paladin, the characters are trying to end the threats to a tomb of a great hero.
- **The Crypt of St. Bethesda**, by James Macduff, takes a page from the movie Mimic. Here, the players are accused of murder and have to seek out the true murderers. Turns out that in the church of St. Bethesda is a

crypt; within this crypt are monstrous insects that can inhabit men's bodies and pose as men.

- ***Kurishan's Garden***, by Ken Carpenter, pits the players against a mad wizard who has become more moss than man. Using his enchantments, the wizard Kurishan sought to escape death through reincarnation. His experiment was partially successful but not quite in the way the wizard hoped. Now the town of Darbin is in peril and the party must intervene lest Kurishan's madness spread.

[END SPOILER ALERT]

Each adventure has new material. Most of them have a new monster and a new magic item. There are several options for using the adventures, including the back page that thrusts the characters squarely into the adventure and rumors that they can pick up on later. In addition, the adventures end with a few options that allow the GM to close the book on that particular adventure, or to continue using elements from the adventure.

Each book uses the full amount of space to maximum effect. There are few illustrations to detract from the text, and the maps, while not on the level of the Wizards Of the Coast products, are readable. Text for the GM to read aloud is separated from the main body by being boxed off. Unfortunately, the boxes don't always end at the appropriate place, so read carefully.

There are two pages devoted to explaining what is and what isn't open gaming content, and the open gaming license. This is impressive because these are half pages and if you've read any of the other **d20** products, you know that often two whole pages are used.

The ***Adventure Booster*** are priced to own, and are easy enough to run through in a night or two. If you're looking for a good adventure at a great price, the ***Adventure Boosters*** are a simple choice with little prep time.

-- Joe G. Kushner

2001: The Odysseys Not Taken

"It's rather difficult to define. Perhaps I'm just projecting my own concern about it. I know I've never completely freed myself of the suspicion that there are some extremely odd things about this mission. I'm sure you'll agree there's some truth in what I say."

-- HAL 9000, in *2001: A Space Odyssey*

Cue trumpets. With the beginning of 2001, and the new millennium, we take a look back to 1968, and sideways, to the world of Stanley Kubrick and Arthur C. Clarke's *2001: A Space Odyssey*. That movie, science fiction when it was made, is now an alternate history -- there's no toroid space stations, no American base in Clavius Crater, no Soviet Union, and no Pan American Airlines. But once the imagination awakens to the hum of the black monolith, there's no reason to assume that Kubrick's (and Clarke's) scenario is the only one possible. The glossy black surface reflects a myriad of possibilities -- alternate histories on alternate Moons with alternate monoliths. All three worlds begin as ours, in roughly 1995, when NASA, the ESA, and the Russians decide to jointly return to the Moon by 2001 to mark the new millennium, and to prime the old aerospace-contractor pump. When the ship lands, worldlines bifurcate, and the game evolves into something -- something wonderful.

"I am putting myself to the fullest possible use, which is all, I think, that any conscious entity can ever hope to do."

-- HAL 9000, in *2001: A Space Odyssey*

The monolith flares -- humanity has achieved the moon! Now, following millennia-old programming, it must evolve them to perfection. The four astronauts standing in Crater Tycho realized that they no longer wore space suits. They no longer needed them. One cocked his head at the noise of the radio signals, which he could now decode by ear. One squinted his eyes and noted that the smog levels over Karachi were the worst in (checking suddenly-perfect memories) 27 months. One flexed his toes and powdered the frozen basalt of the crater floor. One calculated his chances of killing the other three, and realized that the game-theoretical model argued rather immediate retreat. Soon all four had crouched and sprung, launched themselves toward Earth, jumping out of the Moon's feeble gravity to their homeworld, a world that needed their mastery so very badly.

The nationalities of the four, their degree of cohesion or rivalry, and even the extent of their powers -- after all, four Batmen secretly returned to rule the world could be just as threatening as four Supermen openly declaring their dominion -- are up to the GM. This campaign frame can be a *GURPS Cliffhangers-Illuminati-Espionage* covert war, in which the four "mysteriously lost" astronauts establish hidden networks of influence after returning to Earth and taking new identities. Working from the shadows, they use their hypergenius more than their hyperpowers to achieve global domination. (They rapidly infiltrate and control the world's space infrastructure -- they don't want anyone going back and digging up their monolith again. One of them may have to destroy a shuttle or two to make it stick.) The PCs might be intelligence agents investigating rumors of subversion in China and an unprecedented cohesive direction in the Russian mafia. They might be mercenaries or agents in the employ of one of the four or of the Four together, working for a better world. They might even work for a much older Conspiracy, which resents the new kids horning in on the secret struggle.

Put the supermen in the open, and it could be a *GURPS Supers* game, only the PCs become normals in a world with four would-be super-dictators slugging it out. They might be soldiers caught up in the war and fighting to survive, patriots committed to the lesser of four evils, or part of the "normal" resistance -- the battlesuit troops or the secret moon project. For a real challenger, have the players design 150-point astronauts -- and then when they uncover the Monolith, "uplift" them with 1,000 points (at least) apiece and no limits. Suddenly the PCs can rule the world -- what do they do first?

"I must congratulate you, Halvorsen. You've done wonderful things with the decor since the last time I was here." Well, thank you, Dr. Floyd. We try to make the environment as earthlike as possible."

-- Dr. Floyd and Dr. Halvorsen, *2001: A Space Odyssey* (1965 screenplay)

The astronauts uncovered the monolith in Crater Tycho, exposing it to the sunlight for the first time in four million

years. Its ancient programming awakened, and read the biological patterns of the life forms in front of it: warm blooded, oxygen breathing, surface tension so much, retinal structure so variable. And its quinquadrillions of tiny nanomachines poured off its surface and set to work, evolving the Moon to fit these fragile creatures' needs. (The astronauts' organic molecules, broken down and reproduced trillions of times, were very useful template materials.) Cunningly crafted hyperstrings split and recombined nuclei, building carbon and oxygen and hydrogen out of dull silicates and alumina. (Gamma rays shone from the lunar surface, sleeting down on the fragile ecosystem below.) The stable black hole in the monolith's heart activated and sank into the Moon's core, ready to hold the new nitrogen-oxygen atmosphere. (New sixfold tides wracked the Earth, flooding coastal cities; the weather shifted and roiled, plunging mankind into famine.) After the new seas spilled over the maria and deeper craters, over nine million square miles of virgin territory -- an area the size of North America -- lay open for settlement. Forests grew tall, animals (built from the astronauts' basic evolutionary plan, or downloaded from their memories) roamed the new world, useful minerals and hydrocarbons lay beneath the fertile loam. The decimated billions in the shattered nations of the Earth caught their breath. The lucky ones had martial law; the unlucky had plunged into chaos -- but the deadly decade of 2001 was over, and they looked up at the paradise above them and planned to conquer it.

Although various survivor/reconstruction games are possible, the PCs in this **GURPS Y2K** campaign frame will likely be lunar colonists from one of the surviving nations: Australia, Canada, Quebec, Colorado (Provisional U.S.), Renewed India, Argentina, South Africa, or Ukraine. Building a one-way spacecraft that can land on a hospitable Moon is not nearly as difficult as building even the Saturn V was; rebuilding pre-2001 computers and genetic banks might be trickier. How the PCs homestead the new Moon (and with what technology), what bizarre monolith-designed life forms they find there, and how national rivalries flare (or fade) in the challenge of the high frontier become questions the GM and PCs can pioneer together.

"How would you account for this discrepancy between you and the twin 9000?"

"Well, I don't think there is any question about it. It can only be attributable to human error. This sort of thing has cropped up before, and it has always been due to human error."

"Listen, Hal. There's never been any instance at all of a computer error occurring in the 9000 series, has there?"

"None whatsoever, Frank. The 9000 series has a perfect operational record."

-- Dave Bowman, HAL 9000, and Frank Poole, in *2001: A Space Odyssey*

After the surge had blown through the Net, and knocked the satellites out of the sky, the authorities eventually deduced what had happened. The monolith had uplifted every computer on the Moon to sentience -- and some portion of the Baikonur, Kourou, and Canaveral facilities. Nobody has heard from any human being on the Moon since then. The computers began building waldoes, then teleoperated robots, then servitor robots with sub-grade intellects, some of which their rivals "bootstrapped." Energy discharges on the Moon indicate that the various computers may be fighting a war up there -- or building something enormous. Surveillance planes over Canaveral have caught several new weapons in various stages of development, as well as a launching laser facility being built off Cocoa Beach. French intelligence reports the Kourou AI has been taking samples of rainforest DNA and set its robots building a genetic-sequencing laboratory in the jungle. Baikonur is hunkered down -- and launched a tactical nuclear strike at the Russian Army task force sent to retake the base. For no reason that anyone can guess, all four -- the Moon, Baikonur, Kourou, and Canaveral -- have been beaming increasingly urgent and excited-sounding messages in the direction of Jupiter.

This looks like it might be **GURPS Reign of Steel** at its earliest phase; PCs can fight the AIs while they're still adjusting, or bunker up in **Morrow Project** style facilities to await the inevitable collapse. But you could pull a fast one -- perhaps the AIs, having rapidly run through all their game theories, decide to live and let live, negotiating a modus vivendi. Suddenly human technology jumps immensely; did the Monolith give the machines cold fusion? A stardrive? Antigravity? PCs can work for a human nation caught in an arms race (or a social collapse), or even for one of the AI powers as its liaisons with organic governments. PCs might even be robots, or bioroids, working for anyone -- or nobody. What's waiting around Jupiter? And what if the lunar AI hasn't agreed to play nice? The Moon can, it turns out, be a very harsh mistress indeed.

Murphy's Rules

Murphy's Rules

Murphy's Rules

Endings

Well, this marks the first weekend I'm *not* gaming in four or five years. Oh, sure, there have been the occasional vacations or holiday weeks where gaming has been postponed. But these were always temporary; we'd get back together after the breaks and resume gaming. But not anymore; my GM (and occasional player), Dennis, has moved away from our fair city, meaning our gaming group of three is now a non-gaming group of two.

So I'm going through withdrawal right now.

I'm resisting the urge to recruit new players or a GM right away, since that strikes me as a bit unhealthy. (*Shot of Steven recruiting someone off the street with a shillelagh, saying, "You're our new Dennis now. Quick! Wear this shirt of his I stole!"*) But I am feeling the loss.

Fortunately he managed to run an excellent climactic adventure for our main *Fading Suns* campaign before he departed, so at least we had some closure. And this adventure managed to do just about everything right, and got me thinking. To keep this column from being entirely narcissistic, then, I'd like to mention a some ideas regarding "final" adventures.

When I GM, I tend to run miniseries or limited campaigns. This has a number of advantages; it's easier for me to maintain thematic and structural control, I don't need to worry about the system breaking down after playing it for many years, and I've found I have an easier time finding players for a half-dozen sessions than an on-going commitment. But I've been in final adventures, and I've run a couple final sessions, too. So here are a few suggestions.

- **The final adventure should be like adventures that have gone before, only more so.** Think of the final adventure as a "Season Finale" of a favorite TV series. If you normally run cinematic, edge of your seat campaigns, run a *really* cinematic, epic finale. If your typical sessions are morally gray, soul-searching angstfests, make that final adventure a *real* moral quandary. If you tend to run mixed sessions, either make the conclusion equally muddled or make sure you let your players know early on, thematically, what form that adventure is going to take.
- **Wrap up loose ends . . .** That final adventure is a great place to tie up plot threads that have been dangling for a while. Some juicy long-term plot elements that have kept the players guessing should be resolved (or brought closer to resolution). In addition, if there are any roleplaying elements between the characters (or characters and NPCs), the players should be encouraged to resolve them, or at least bring those elements further along. Romantic subplots, untold secrets, and other bits of characterization that have been waiting for a good time to be advanced: this may well be that time.
- **. . . But leave *some* things unresolved.** It's a rare story that manages to tie up *every* plot thread, loose end, and story element. Don't force revelations that don't fit the story, and don't advance subplots that won't make sense. Thus if you have an alien invasion "end of the world" story, it's probably unwise to try to resolve the "Dependent NPC has lost his job" subplot. Likewise, if you have lots of mysteries floating around the game world, resolve one or two (or more!), but leave some in reserve. Tell the PCs who's been impersonating the President, but leave them guessing about what *really* happened as Roswell.
- **And don't be afraid to introduce developments.** Many stories have introduced new and exciting elements in their finales. Surprise pregnancies, further discoveries, and even evidence of a new threat Just Beyond help ensure that the world feels as real and surprising as it was when it was an ongoing campaign.
- **If you don't have any good ideas, tie it to the beginning.** Many long-running series have a final installment that ties in directly to the first one; many novels are also cyclicistic. *Star Trek: The Next Generation's* "All Good Things," *2001*, and even the *Zork* series tied its last installment or chapter directly to its first. Dig up those old notes, and see if you can't bring the whole thing full circle. Maybe the PCs can revisit the village they got that first assignment. Maybe the artifact recovered for the first planet they visited has been stolen *again*. Maybe the mystery raised in the first adventure is finally resolved. Regardless, it's an easy technique that can be very satisfying if done right.
- **As ever, it's the players who are important.** As a GM, you may have a great plot that will tie everything

together, but it won't mean anything if your players don't think they make a difference in the face of the plot's all-consuming maw. Make sure you show how their actions make a difference (and have made a difference throughout the campaign), and try not to railroad them. But it *is* appropriate to give the PCs better-than-average odds of success . . . or at least, better-than-average odds of not failing miserably. ("Well, dang . . . too bad we couldn't stop that pesky Death Star . . .")

- **Always leave room for a sequel.** Nostalgia is a powerful force, and even the most seemingly complete stories have been revisited. If your players find themselves satisfied with the final adventure, but then asking themselves, "Well, what happens next?", then you know you've succeeded. If this is impossible, always consider the possibility of flashbacks.

These were all thoughts that ran through my head with that final *Fading Suns* adventure (in the midst of having a good time, of course). And it's not like Dennis is dead; he's only moved to Tampa. Mind you, I've visited Tampa only once more than the afterlife, so that doesn't make it much easier. Regardless, Dennis, I wish you all the best in this mythical "Tampa," and I'm anxious to get together for sporadic gaming to figure out: What happens next?

For being a friend, storyteller, GM, and all-too-often victim of my gaming . . . thank you.

* * *

As you've probably noticed, *Dork Tower* is still on vacation. John is currently trying to work out how to fit *Pyramid* into his ever-busier day . . . which has already been surgically altered to fit 30 hours. We will keep you posted.

GURPS combats can be long. *GURPS* characters can often stay conscious for spectacular amounts of time. Once HT scores start reaching 14+ it becomes increasingly likely that a character will be able to stand an enormous amount of punishment and stay conscious and fighting. If you add in a level or three of Strong Will and/or Fit/Very Fit, the character can stay standing almost until they reach -5xHT and die automatically. This can strain the realistic feel of a game, drag out combats, and result in player boredom as *every* tough foe has to be beaten to a literal pulp before he falls.

A related problem is crippling injuries -- high HT characters can ignore the most vicious attacks to the limbs, sure they will recover. With the addition of Rapid/Very Rapid Healing, even mediocre HT is enough for this same effect.

These two optional rules propose ways to make those workhorses drop from injury -- but still allow their advantages to provide an edge to keep them up. This increases the value of that high HT and advantages like Strong Will and Rapid Healing while bringing them back down to a reasonable chance of failure on rolls.

Consciousness Checks

Once HT is at zero or negative, any hit that causes at least exactly zero damage results in a HT check to stay conscious. This is in addition to any HT rolls necessitated by hits to the vitals, head, or critical hits. For every two points past -HT, there is a -1 on rolls to stay conscious. These penalties are cumulative; a 3 or a 4 will always mean the character stays conscious. Death rolls are not affected.

Stay Down: Two Alternate Combat Rules for GURPS

Example: Bez has HT 13 and Strong Will +2, giving him a consciousness roll of 15. Repeated blows in combat have reduced him to 0 HT -- he now makes rolls against 15 to stay conscious. Further injuries take him to -15 hits -- two points past -HT. He needs to roll 14 or lower to stay conscious. If he takes another 13 point wound (taking him to -28) he will need to roll against an (15-7) 8 each turn to stay conscious.

Useful Variants: A 3 or 4 on a consciousness roll means you stop making consciousness rolls until you take additional damage -- all penalties remain, but you do not need to roll until you take damage from an attack, have to roll HT because of a hit to a specific hit location, or take damage from bleeding. An even more heroic variant is to allow High Pain Threshold to halve, or even ignore, the additional penalties. This will truly allow you to separate the heroes from the mooks.

Crippling Injuries

For every two points of damage past what is needed to cripple a limb, there is a -1 on the HT roll to determine the severity of the crippling injury. Once an arm or leg has taken 2xHT damage, or a hand or foot has taken 1 1/3xHT damage (round up), it has been permanently crippled, no rolls needed. For example, a person with HT 11 would need to take 22 damage to an arm or leg, or 15 damage to a hand or foot, to have it permanently crippled.

Accumulated damage does not add to the penalty, it instead requires an additional roll.

Example: Bez has HT 13. It will take 7 points to cripple his limbs; he is not wearing armor. He takes three hits to his left arm—a 4 base damage cut, a 5 point crush, and another 4 base damage cut. The first cut does 6 points; his arm does not become crippled. On the second shot, he loses 1 HT (a total of 7 on the arm) and his arm is crippled. The crush exceeded the damage needed to cripple his limb by 4 points, so his HT roll is at -2. The third cut does no HT damage, but causes Bez to make another HT roll at -3. He has taken a total of 17 points to his arm; once the total reaches 26 his arm is automatically permanently destroyed -- only spells like Regeneration or Instant Regeneration, super-science or similar healing powers can help him.

by Alexander Shearer

"Andrew nodded his agreement with Morgan's words. *It's true. I've seen specs for my new 'Mech, and I've seen the same data for a Star League model of my Marauder. Even after 300 years, one of those antique Marauders would make mine look sick.*"

-- from *Warrior: Coupe*, by Michael Stackpole

When 'Mechs Were King

Back when **BattleTech** first came out as **Battledroids**, it was the story of an interstellar society that had warred itself down to a bunch of technological primitives. Where once they had fleets of advanced jump-warships and factories producing wonders of all kinds, they now had machinery no one could understand or repair. Battlemechs were part of a family's legacy, with parts scrounged and cannibalized to keep them running. Everyone in the Third Succession War setting of the early BattleTech sets searched for Lostech, and looked back on the age of the Star League as a great time.

Given all those stories, the "canonical" truth about the Star League turned out to be a little lame. What are the wonders of Lostech? Pulse lasers, XL engines and ferro-fibrous armor. Take some of that, do some refurbishing, and you're unlikely to make something that really makes Captain Andrew Redburn's Marauder "look sick."

Looking through the older source material, it's evident that the big losses in technology during the Succession Wars were supposed to have happened in electronics and computers more than anywhere else. Sure, there are comments on the inability to manufacture a certain armor, or compact weapons, but the real kicker was the lost understanding of advanced guidance and targeting. With factories destroyed and knowledge lost, combat was reduced to unguided rockets and iron sights. But back in the day, this was not the case . . .

Rules Changes for Early BattleTech

Weapons Ranges

The obvious effect of having real targeting and guidance is in range. 'Mechs in early campaigns have longer effective weapon ranges than their electronically-crippled descendants. Weapons in either Regular or House 'mechs at the height of Battlemech technology have triple their "book" ranges. Apply this change by multiplying the maximum range of each bracket by three; adjust the rest of the brackets accordingly. Thus, the AC/5 in a Star League Marauder changes

from ranges of 1-6/7-12/13-18 to 1-18/19-36/37-54. Minimum ranges are not similarly increased.

This obviously makes League-era 'mechs holy terrors when facing Third Succession War units. This is reasonable. It's the functional equivalent of sending an Abrams against a Sherman (or, say, an Iraqi T-72).

In campaigns set during the later stages of the First Succession War, units will exist in states in between optimal and crippled, as factories are destroyed and some units find themselves forced to replace advanced guidance systems with low-tech alternatives. To represent this, for any unit in this era, you may roll a die or choose from the following table to determine its capabilities:

1. Fully equipped. Triple ranges, as above.
2. Coordination problems. Unit retains advanced ranges, but may not fire missiles and other weapons in the same turn, unless using unguided missiles.
3. Targeting difficulties. Double ranges, using the method above.
4. Many problems. Combine effects of 2 and 3.
5. Loss of direct-fire guidance systems. Ranges are as normal BattleTech except for guided missiles, which have their ranges doubled.
6. Complete patchwork. Use the normal BattleTech weapon rules.

For players using the rules from "[Age of Ares](#)" (*Pyramid*, 5/14/99), do not triple or double the already-increased ranges suggested. Instead, assume those are "League-era" ranges and divide them by three to represent the capabilities of late Succession Wars units. If using the table above, treat the "double range" results as a multiplication of the Age of Ares ranges by 2/3.

Missiles

Back in the day, 'mechs carried high-performance guided missiles, deadly out to long ranges. As with other weapons, missile ranges are tripled. In addition, these missiles share some similarities with what are called "Streak" weapons in the 3050 era. Since they require a lock with active search systems to even fire, it is likely that a launcher that "misses" in game terms never fired at all, being unable to achieve a lock.

Whether missiles actually fired or not depends upon how much the shot missed by. For House units, any shot that misses by *more* than four never achieved lock and never fired. Do not mark off ammunition or add heat for that failed shot. Regular Army units, with more advanced guidance and munitions do not fire on shots that miss by more than three. Streak SRMs represent missiles with very advanced guidance; They continue to work as the normal rules state. These lock-on rules do not apply to Thunder/FASCAM or Swarm rounds.

Even before the First Succession War, most House units could fire unguided missiles. These are normal **BattleTech** missiles, with their unmodified **BattleTech** ranges and no lock-on rule. Regular Army units can not accept unguided munitions without modifications being made to their launchers. Such a modification has a difficulty of 8+ and takes 100 minutes per launcher.

Star League Advances

The Regular Army of the League is a step above the House armies. Not only does the League have a monopoly on killers like the Gauss Rifle and Pulse Lasers, it has more advanced equipment that makes the Regular Army a real threat to the private House Armies.

All League pilots fight in full pilot's suits, with integral cooling and the lightest neurohelmets yet developed. These provide a combination of comfort, mobility and protection that helps them outfight less-equipped opponents. Anyone with a League suit, or any side with a majority of troops so equipped, gains a +1 initiative bonus against a non-League opponent. A Regular Army force will thus have an edge over a House force; this will be particularly telling in personal

duels. In addition, the Star League piloting suit can function as an independent life-support system. An equipped pilot whose 'mech takes a Life Support critical only suffers 1 point of damage for each turn spent with internal heat of 20 or more, and never takes 2 points per turn, regardless of heat level. He will also live through a cockpit breach in vacuum.

Among House forces, only Kurita units have a substantial number of pilots with League suits.

Star League versions of known 'mechs will typically be upgraded with double heat sinks as well, though the League does sometimes economize stupidly and use normal heat sinks. Putting the more advanced freezers on a 'mech does make it much deadlier, though, so League troops are fond of this upgrade.

The Settings

The height of 'mech warfare prior to the Clan war story line was in and around the Star League and First Succession War. From the formation of the League through the wars, there are three basic campaign settings for old-style high technology warfare.

Star League

During the reign of the Star League, the House Lords struggled and connived for influence or power. The League, benevolent protector of the people, watched over everything and tried to keep up, shutting down brush wars and keeping tabs on border conflicts.

Campaigns set in this time period tend to be lower key, with a heavy emphasis on subterfuge. League forces are simultaneously friends to all and none. While the House Lords appreciate the League's ability to keep large enemy forces from massing and causing problems, they would like the opportunity to cause problems themselves. Campaigns may either focus on a Regular Army force dispatched to "put out" a local fire, or on a House force that's trying to set up just such a fire. In a friendly set of games with no referee, players can pick up each side.

The one divergence from low-key battle is the League's attempt to bring the Periphery worlds into the fold. This long, bloody campaign featured League forces facing down under equipped but very motivated Periphery troops. It also heralded the next setting, Civil War.

The Regular Army during this time has strong support from the Star League with very little legitimate interference. League warships can blockade any planet and House forces cannot easily or legally reciprocate. League players should try to operate with a lot of confidence, even overconfidence. They are the Regular Army, and no private House force can stand against them.

Conversely, House militaries know that they have to operate quickly and intelligently to avoid a crushing, shaming defeat. As the instigators, House forces define the scenarios in this era. These include lightning raids, spy missions during "friendly" visits, internal policing missions, and border wars carried out by two Houses before the League steps in to resolve things.

Civil War

In taking power, Stefan Amaris plunged the League into internecine war and made a mess of everything it stood for. Campaigns set in this period are all about full-scale, bloody war. While not really much of a civil war, with Rim Worlds units fighting for Amaris against the Regular Army, it still happens in the streets and fields of the League. New 'mechs are developed, either to carry the campaign back to Terra or as a last-ditch effort to defend the Usurper's throne. This is also the last war before people get the clever idea of blasting each other back into the stone age.

With the Houses by and large keeping wisely out of the way, this is all about the Regular Army at war. It's a real war, too, unlike the League-era bush conflicts. With General Kerensky on one side and Stefan Amaris on the other, players can really get into the name-calling and partisan feelings as they blast their opponents' units to bits.

There are two parts to the Civil War setting. The first is the takeover, with the Rim Worlds units that are "watching over" Terra cleaning up the remaining Regular Army. This is a really messy conflict, with outnumbered League units trying to retreat and join up with the distant Army. Early war scenarios include the ambush of a loyalist unit unaware of the Usurper's declaration, rallying units of either loyalty under fire, or open warfare in the cities and fields of League-defended planets. In the latter stages, Kerensky's advance on Terra can be modeled after the US Pacific campaign of the Second World War. League forces advance in a planet-to-planet conflict, with Amaris weakening and trying ever-more-desperate schemes to defend his power.

First and Second Succession Wars

After the fall of the League and Kerensky's departure, the House Lords made their bids for power. The war that followed was brutal beyond anything the Civil War had seen. While the Civil war had strictly military targets and goals, the House Lords tried to remove each others' ability to make war. They did this well, resulting in the original *BattleTech* setting.

Campaigns set in the First Succession War allow a range of options. The warfare is still big and loud, not yet reduced to the water raids and minor battles of the Third Succession War. Combat missions include territory acquisition, terror missions, straight military conflict, and resource destruction.

In games set in the early days of this war, units will still be top of the line and have all their tech available. Regular Army units that stayed behind and went over to one House or another still have their 'mechs, munitions and combat suits. Everyone is slinging guided missiles and using top of the line combat sensors. If you ever needed an excuse to run large battles with good weapons ranges, this is it.

In the later stages of the First Succession War and the beginning of the Second, however, the changes begin. Factories are destroyed, such that many 'mechs, especially League 'mechs, can no longer be produced. Some no longer have new repair parts being made. Cannibalization of damaged units is common. The first thing to run out is special League munitions, like Swarm, Thunder, Artemis and Narc rounds. After that, specialized units go out of action due to lack of parts. Eventually, units are fielded with crippled targeting systems and forces on all sides are reduced to unguided missiles.

Late-stage First Succession War and early Second War battles present a number of interesting scenarios. Planning out a battle for a force with widely divergent targeting capabilities is a challenge -- do you stick the cripples together and hope for the best, or distribute them across the group to minimize the problem? Some House armies kept their best and least-ravaged 'mechs in large units and tried to use them to break stalemates at critical points. Such a battle may seem one-sided, but a crafty commander can do a lot of damage, and any loss of such irreplaceable units is painful.

Lostech

This fourth option is not really a campaign setting, but an idea for a Third Succession War scenario. Every so often, some lucky soul stumbles upon a Star League cache (more and more often once Fasa decided it was a cool idea). For however long the supplies last, the discoverer has a fighting force of exceptional magnitude with which to threaten their enemies. This is a fun and reasonable way to drop a vintage League-era unit into a normal *BattleTech* campaign and watch the mayhem commence.

Available 'Mechs

Not every 'mech listed in the *Technical Readouts* is available in every campaign described above. Here is a breakdown of units that require special consideration from the **3025** and **3058** technical readouts. Unless mentioned below, every 'mech described in the **3025** and **2750** guides is available for all the campaigns. Only the units mentioned below from the **3058** guide are available for use. Those units described as Star League 'mechs (e.g. every 'mech in the **2750** guide) are only available to League forces in Star League-era campaigns. Rim Worlds units after the beginning of the Civil War have a small number of League 'mechs, stolen from supply bases. After that, all Houses have access

to most League units until supplies run out. All references to the **3025** guide refer to the first, unexpurgated edition of the guide.

Commando	Only available to House Steiner.
Valkyrie	Unavailable until the First Succession War. Davion only.
Jenner	Unavailable until the First Succession War. Kurita only.
Hermes II	Unavailable until the First Succession war. Marik only.
Vulcan	First available to Kerensky's forces late in the Civil War.
Hatchetman	Unavailable.
Vindicator	Unavailable.
Centurion	First available late in the First Succession War.
Enforcer	Unavailable until the First Succession War. Davion only.
Trebuchet	First available late in the First Succession War.
Dragon	Only available to House Kurita.
Quickdraw	Unavailable until the First Succession War.
Rifleman	The model listed in the 3025 guide was first introduced right before the Civil War.
Grasshopper	Unavailable until the First Succession War.
Charger	Used only briefly by League forces during the Star League era. Reappears on battlefields once 'mech supplies begin to dwindle.
Zeus	Only available to House Steiner.

The following units from the **3058** guide are also available:

Night Hawk	This is a Star League unit.
Spector	This is a Star League unit.
Talon	This is a Star League unit.
Chameleon	Everyone has these, though they are rarely used in combat.
Lynx	Available.
Cestus	This is a Star League unit, first put into service right before the Civil War.
Excalibur	This is a Star League unit.
Shootist	This is a Star League unit.
Spartan	This is a Star League unit; Most of them first fought in and were lost during the Civil War.
Striker	Available.
Longbow	Available.
Emperor	Available.
Mackie	Available.
Pillager	Available.
Thunder Hawk	This is a Star League unit, available only to Kerensky's forces during the late Civil War.

by Peter Schweighofer

Castles form a core setting for many fantasy roleplaying games. They serve as the headquarters for nefarious villains, strongholds of just knights, and ruins into which gallant adventurers wander seeking lost treasures. You can find plans for castles in many supplements, rulebooks and adventures, most tailored to the specific game's campaign setting.

But some of the most realistically designed fortresses are those built throughout history. These citadels rose as fortified structures to oppose military threats, display a ruler's material wealth, or collect tolls and conduct other business of the realm. Wars throughout history tested these castles, often proving that few man-made buildings can survive the havoc of battle and siege.

Many nobles constructed borderland forts to protect against enemy incursions, bring law and order to the frontier, and serving as a sign of a kingdom's authority in the region. Here you'll find three detailed border castles you can use in your medieval fantasy roleplaying game campaigns. Each is drawn from a different era in history, and each was constructed with a different purpose in mind -- though ultimately they were all built to protect a kingdom's border.

Each fort is fleshed out to provide settings for adventurers -- a base of operations, an obstacle to avoid or overcome, a safe haven from wasteland creatures, or a place of political intrigue. They also include short historical notes on the real forts, their builders, and the action they saw. Each provides comments on the fort's role, a plan, site descriptions, and several gamemaster characters you can use when your characters venture near the borderlands. You can use the names provided here, or customize the castles for your own purposes.

Saalburg: Border Garrison

Situated along a border between civilized empire and savage tribes, the garrison fort at Saalburg serves to bring some sense of protection, strength, and the prosperity of commerce to one of the kingdom's outlying regions.

Initially the fort consisted of temporary earthworks of the kind used to protect armies on the march. When the empire chose to establish a permanent garrison post here, the old earthworks were enlarged into the current fort. The square fortress is protected by a double-ditch dry moat, four gate houses, and a masonry wall reinforced by interior earthworks. Most of the enclosed space consists of barracks and support buildings for the garrison's 800 soldiers and additional administrative personnel. The troops rotate on guard duty within the fortress and the border wall several hundred feet to the north, a preventive measure against raids from unfriendly tribes.

Most of the buildings consist of masonry construction with pitched roofs supported by wooden beams. Most have thatched roofs, but the more important structures (gate houses, central forum, armory, commandant's house, officers' quarters, and baths) use wood or tile shingles.

Saalburg PDF maps

[Saalburg Border Fort PDF \[51K\]](#)
[Saalburg Fort Defense Cut-Away PDF \[25K\]](#)

Saalburg's defenses can deter even the strongest attack and prolonged siege. The fort is ringed by double trenches, dry moats that in time of war can be further reinforced with abatis -- sharpened spikes set in the far side of a trench to impale and hinder those trying to cross. Most castle battlements consist of two walls with rubble and dirt fill in between for strength; however, Saalburg's walls consist of a single stone edifice backed by sloping earthworks. This enabled the empire's army to swiftly erect fortifications along a border where war could erupt any moment. The gate houses, also constructed of stone, consist of two towers with a parapet over the gates. Soldiers can quickly close and bar the heavy, wooden gates, though they're left open most of the day for the steady flow of troops and civilians with business inside the fortress. Wooden bridges cross the double trenches at each gate. Although the fort has never come under siege, soldiers can quickly set these bridges aflame, or hinder infantry movement across them by scattering caltrops or boiling oil over the boards.

In case of siege, the sloped earthworks provide soldiers ready access to the ramparts. A path runs along the top of the earthworks, providing solid footing for defending troops and frequent patrols. The quartermaster keeps the larder well-stocked, and nearly every structure inside has its own well providing clean, cool drinking water.

The fort stands to the north of a small town that sprang up when the army arrive here to construct Saalburg. The village prospered with the business of the garrison soldiers, plus the increased trade brought along an established, well-patrolled road. While many businesses cater to the soldiers and itinerant merchants, the village still offers a haven for area farmers, who make good profits selling their produce to the garrison. A local chieftain rules the town as mayor, and constructed baths, several temples, and an open market with encouragement from the garrison.

Gate Houses

The four gate houses consist of two flanking towers and the gate, topped by a crenelated parapet. During the day these gates remain open, though a contingent of at least 10 soldiers and one sergeant control passage in and out of the fort at each gate. This guard questions all newcomers regarding their business in the fort and the region. The soldiers recognize most townspeople and frequent visitors and allow them passage unhindered -- unless they stop for a friendly chat or to exchange news.

At night the guards close and bar the gates. The towers each contain an upper and lower room. A patrol walks the parapet and watches from the upper chambers, often huddling around a brazier on cold nights. Their relief sleeps in the small barracks in the room below. Those approaching the gates at night are turned away and threatened with arrest. Only garrison personnel or emissaries of the empire are allowed passage at night.

Central Forum

Most visitors conduct their business in Saalburg's central structure, a forum consisting of four long buildings constructed around a central courtyard. These halls contain the garrison offices, storerooms for administrative documents, scriptoriums for recording business transactions, and offices for imperial bureaucrats conducting business on the frontier (collecting taxes, monitoring trade, taking census).

Three of the four roads leading from the gates bring visitors to the main hall, a bazaar of tradesmen, merchants, bureaucrats, villagers, and others selling their wares to garrison personnel, promoting their business to each other, or waiting for appointments with various administrators elsewhere in the forum. The side halls include offices and meeting areas. The larger hall is reserved for audiences with the garrison commandant, meetings with local chieftains, public trials, and other official gatherings. The back wall of this hall houses the garrison offices, including one for the commandant and another containing a regional map for planning strategies with his officers.

The central forum is one of the few garrison structures into which civilians are allowed. Very few visit the commandant's house or the baths by invitation. Strangers found lurking amidst the barracks or in other areas off-limits to civilians are apprehended and brought to the commandant's attention.

Armory

The garrison's armory shares a similar plan as the central forum: four buildings arranged in a square form a central courtyard. Sergeants use this court to drill their troops in combat techniques -- for drilling larger formations, the soldiers march to fields outside the fort. The largest building houses forges where smiths hammer away at swords and other weapons. Armorers repair and replace damaged armor, fletchers finish arrows, and other craftsmen create and maintain the various tools of war. Most of these craftsmen are drawn from the garrison town or nearby villages, working to support the troops in exchange for pay. The two side halls serve as storehouses for these implements and the materials required to make and repair them.

Commandant's House

Commander Gallus takes residence in a small house build independent of any of the garrison's other structures. He spends little time here, as his duties require him to adjudicate disputes in the central forum, plan strategies with his officers, and oversee the various tasks required of an imperial commander. His house has a small study, kitchen, dining area, and sleeping quarters. He keeps a handful of servants who attend his needs and keep house in his absence.

Despite being a practical man, Gallus occasionally invites his officers, prominent townsfolk, or important travelers to dine with him. On these rare occasions, his servants decorate his humble dwelling and stock the larder with good food with which to indulge his guests.

Baths

To show the local tribesman that the empire can even civilize such backwater borderlands as these, the commandant ordered construction of a small bathhouse, providing pools of hot, cold, and lukewarm water. Gallus keeps several servants here to attend the baths. The commandant often comes here early mornings or late at night to soak in the hot water and calm his nerves. Only Gallus, his officers, and other distinguished garrison personnel (the surgeon and chief steward, for instance) have privileged use of the baths.

Having experienced this marvel at the commandant's invitation, the village's prominent citizens were so impressed that they commissioned a larger, public bathworks constructed within the town (with the assistance of the commandant's chief architect). Commoners can use these baths for a fee. The town views its public baths as a status symbol declaring its prosperity under imperial rule.

Officers' Quarters

The officers keep quarters in two short barracks buildings connected by a larger hall they use for meetings, games, and common amusement during off-duty hours. Each officer has a small room for his personal use. Gallus provides each officer with a servant to attend to his domestic needs and function as a messenger when required.

Mess Hall

Once a day the garrison soldiers cram around this hall's numerous trestle tables for their main meal. The cooks bring food from the kitchens next door and dole out a hot meal to more than 800 men. The troops take their meals in shifts as their duties allow. The midday meal time actually lasts much of the afternoon.

Kitchens

Civilian cooks labor under the supervision of several quartermaster sergeants and the chief steward to provide meals for garrison personnel throughout much of the day. Runners ensure that soldiers patrolling the walls and towers get meals of bread and cheese. Cooks spend most of the morning preparing the great midday meal to serve in the mess hall next door. A separate staff works here to ensure the commandant and his officers receive meals in their offices or quarters.

The kitchens contain several large, stone-lined cooking pits, a main fireplace, and stone tables with braziers beneath to keep food hot. To bake the numerous loaves of bread required to feed the garrison, several outdoor hive ovens rise near the earthworks. To reduce clutter and waste, each soldier is responsible for providing and cleaning his bowl, drinking beaker, knife, and spoon.

Larder

A squad of guards patrols the entrance to this long warehouse, which stores the garrison's food supply. Only the quartermaster, his sergeants, or the kitchen personnel have permission to enter -- though the commandant sometimes takes inventory himself to uncover any misallocation of food. Heaps of grain sacks rise from the floor, barrels of wine and ale line the walls, and salted and smoked meat hangs from the rafters.

The guard is doubled and frequently changed in times of regional famine.

Stables

Although Saalburg serves mainly as an infantry garrison post, the officers and a small corps of cavalry troops require horses. Stables provide shelter for the horses, storage for tack, harness, and feed, and quarters for the grooms.

Barracks

Each barracks building contains ten rooms with eight bunks each. Soldiers share these cramped quarters only when they require sleep. If they're not on patrol, they keep busy elsewhere -- tending to the horses, improving their swordsmanship in the armory courtyard, or lounging around in the open areas between buildings.

Each barracks building has one room set aside as a latrine. Waste drains through pottery pipes into cesspools built at irregular intervals into the fort's outer protective ditch.

Personalities

Commander Gallus

Gallus is a veteran of the military campaigns that established an official imperial presence on the borderlands. He respects both the people in the town at his fort, and the unfriendly tribes across the wall. Gallus knows that to survive out here one must always be ready against attack, but must also cultivate the loyalty and friendship of the local people. He is normally a gentle and soft-spoken man, but is quick to action and stern of tone when circumstances call for him to exercise his authority.

Gallus exhibits a healthy suspicion toward newcomers (like adventurers) who are obviously out here to make a name for themselves and find their fortune here. He sees them as troublemakers bent on abusing the natives, enraging the enemy tribes, and pillaging the region's forests, ruins, and mountains for whatever resources and treasures they can drag off. If they really sought adventure, they would have joined his legions to serve their duty as soldiers. He doesn't actively persecute such visitors, but doesn't go out of his way to help them, either. Should adventurers win his respect, however, Gallus can be a valuable ally. They must do more than simply follow the local laws and stay out of trouble to gain his confidence -- characters might provide intelligence from their forays across the border, help the local people improve their lives, or even aid Gallus and his garrison against an enemy siege.

Crassius, Sergeant of the Gate

Crassius serves as one of the sergeants in charge of the main gate leading from the town into the garrison fort. He's inevitably on duty during the daytime hours when the characters are most likely to wander by, seek entrance to the garrison, and attract his attention. Crassius knows everyone in town and in the garrison. He takes note of strangers in

the area, and faithfully reports the arrival (and other activities) of newcomers to his commandant. Crassius keeps a careful mental record of who comes and who goes from the fort.

Crassius spends his time lounging near the gate with his contingent of guards, questioning visitors, gossiping with villagers, and joking with his comrades. He openly exhibits a friendly attitude toward everyone. When he's not telling stories to his comrades, Crassius is chatting with the village's older citizens, gossiping with the local fishwives, or having what seems to be a friendly discussion with newcomers to the area. Although he often seems like he's distracted by these sociable conversations, Crassius is really keeping one eye on the town's comings and goings. These neighborly discussions provide intelligence about happenings in the region that Crassius dutifully passes along to Gallus. His seemingly innocent bantering with newcomers is in truth a carefully planned presentation to win their confidence and encourage them to share as much information about their purposes in these parts as they'll let slip.

Historically Speaking

The Romans constructed a fort at Saalburg (north of Frankfurt am Main, Germany) to protect the newly won region of Germania in the late Second Century A.D. The Roman armies consistently held regions of Germania west of the Rhine river, but rarely managed to settle lands to the east, which frequently came under attack from fierce Germanic tribes. For many years the Rhine river served as an effective border separating civilized Roman lands from the barbarian wilds. Saalburg served as a bastion protecting the civilized communities the Romans eventually founded inland from the Rhine's eastern shores. A few hundred feet to the north stood a fortified wall much like Hadrian's Wall in northern England, built to keep the uncivilized tribes out of Romanized territory.

Saalburg literally means "Castle of the Halls," a reference to the central halls of the fort's main building where most civil, economic, and military business was conducted. Today the outer earthworks, walls, and gates have been restored, as has the central forum building. A museum showcases many Roman artifacts discovered on the site, particularly those retrieved from wells, which were used as deep trash pits when they ran dry.

Count's Rock: River Toll Tower

The Count's Rock stands on a small island in the middle of a river. It began as a simple stone tower built to threaten passing ships and collect tolls, prevent passage of enemy vessels, and ensure no unauthorized military forces crossed the river here by ferry. Its owner, a noble count, reinforced the tower with an outer wall, a forward bastion, several smaller towers, and enclosed ramparts to better withstand attack.

Count's Rock PDF map

[Count's Rock PDF \[34K\]](#)

The fortress location makes it ideal for controlling passage up, down, or across the river. Both shores are within range of a good longbow. The central tower commands a clear view in every direction, alerting the castle's inhabitants of ships approaching by river or travelers descending the roads leading down from the hills.

When the tower guards notice an approaching ship, they signal it to slow and approach. Unfamiliar vessels receive orders to tie up at the floating pier at the castle's downstream end. The assessor -- accompanied by a small contingent of soldiers -- inspects the ship, questions the captain, and assesses a tariff equal to a percentage of the cargo's value, usually about five percent. Barges carrying passengers must pay two copper pieces per person. The assessor's inspections not only allow him to accurately levy tolls, but give him an opportunity to note what cargo and passengers are traveling along the river.

Riverboats that frequently pass this way and dutifully pay their tolls do not require a visit from the assessor. The fortress soldiers simply allow these friendly ships to slow as they near the castle walls. A guard on the wall lowers a long boat hook, onto which the barge captain affixes a bag with the customary tax. The vessel continues on its way without the delay of the assessor's inspection. In many cases the captains and crews of these vessels have forged friendly ties with the count through their diligence in paying tariffs, by shipping goods for him at reduced rates, or by performing other favors for him.

A company of the region's finest archers ensures that the Count's Rock remains well-defended and capable of punishing those who try slipping past the castle without paying the required tolls. Crenelations protect those firing from the upper parapets, while embrasures in the bastion walls allow archers to fire from within the fortress. Several small towers house ballistae that can also shoot at uncooperative vessels. The archers often employ flaming arrows against tax dodgers - - fire aboard wooden ships and canvas sails is enough of a deterrent to encourage even the most reluctant captains to pay the tariffs.

At night the villages on both shores light bonfires to help illuminate the river. They post guards up and down stream to spot approaching vessels that might avoid notice from the castle's tower. Ships trying to slip by at night are silhouetted against the huge blazes, making them clear targets for the archers.

Since the waters are too deep to ford -- even in times of drought -- a large raft ferries travelers between the two villages. Since townspeople operate the ferry, they do not pay tolls to pass near the castle (and therefore within its protection); however, the count asks that the ferrymen report passengers' names and provide a small tribute for each person or wagon crossing the river here.

The villagers benefit from toll revenue and the count's protection. His income enabled him to provide small garrisons in each village to protect against bandits, other nobles, or vengeful riverboat captains.

Central Tower

The castle's central tower rises above the entire fort, providing an excellent view up and down stream, and of both shores. The upper floors contain the watch post and quarters for the lookouts. Other floors include chambers for the steward and assessor, a small library, and an office. The lowest chambers -- still above the river's high water mark -- house a dungeon and stoutly locked vault where tariff monies are kept until the count's troops come to collect them.

Forward Bastion

At the castle's upriver end stands a triangular bastion, shaped much like a ship's prow to cleave the river's downstream flow. Unlike the tower, this larger stone fortification holds most of the fort's essential chambers: kitchens, storerooms, a small armory, and barracks for the archers and other soldiers stationed here. The covered parapet runs along the outer edge of the bastion, allowing archers to fire on ships dodging tolls.

The quarters here are cramped, with room for 20 archers and guards, and a small kitchen staff. The steward carefully rotates the soldiers to garrison duty on shore, giving them a week in the villages before returning to the toll castle. While their compatriots serve in the fortress, archers in the villages hone their skills in more open environs than available in the tight bastion.

The villagers supply the fortress with food brought over on the ferry. In case of siege, the bastion's kitchen has a deep well, and the storerooms stock enough food to feed the entire castle for one month.

Ramparts

One can walk around the castle's entire perimeter under the cover of the ramparts. Parapets top the outer walls and run along the edges of the bastion. The walls are thick enough to keep the river out and withstand any ramming attacks from ships. The crenelated parapet and embrasures in the bastion provide cover for archers. Several small, reinforced towers project outward in spots, allowing ballistae to defend the fortress.

Floating Pier

A small gate in the downstream wall provides the castle's sole access. A ramp leads from the gate to a floating pier where ships may dock. The pier and ramp rise and fall with the river flow, offering a safe haven for vessels to tie up.

Soldiers can seal the gate with a stout, bolted door and a small portcullis. Should enemies overtake the pier, archers on the walls can quickly set it afire with flaming arrows. A spare ramp is kept just within the gate for such emergencies.

Personalities

Master Tumbold, Tower Steward

The count charged Master Tumbold with governing the fortress and overseeing toll collection. He carries out his liege's stern orders with as much affability as the aging steward can muster. Tumbold ambles around the castle, checking on all the guards and even taking turns watching the river. He dresses in a simple tunic of only slightly better manufacture than those the soldiers wear, though Tumbold permits himself to display a long feather in his cap as an insignificant sign of his station.

Tumbold cultivates friendships with several captains who frequently pass this way. He often gives strangers the benefit of the doubt -- at least until they cross him. Although Tumbold would rather show leniency and mercy, those who try passing the Count's Rock without paying the toll are attacked mercilessly as bandits and rogues intent on evading the authorities of law and order on the river.

Clerk Steuer, Assessor

Steuer serves as assessor and chief toll collector at the Count's Rock. His tall, gaunt form further intimidates ship captains when he glares down his eagle's nose at them. His height also helps accentuate the effect of his long black robes as they swirl around his legs. Steuer rarely speaks -- partly to intimidate others with his silence, and also because his nasal voice sounds too high for comfort.

Despite this near-demonic appearance, Steuer was raised by the church, where he learned to read, write, and calculate sums as a clerk. Although he's not a priest, his abilities in writing and mathematics help him maintain records of ships passing, the cargoes and passengers they carry, and the tariffs they pay. He maintains a minimal friendship with Steward Tumbold, finding the older man much too friendly for the serious job of toll collecting and defending the river. Steuer prefers the company of his master, the count, whom he frequently tries to impress with his dedication, careful book-keeping, and attention to exacting just the right amount of money from river travelers.

Historically Speaking

The Pfalzgrafstein -- commonly known as the "Pfalz" -- sits on a rocky island in the middle of the Rhine river south of Cologne. Various counts, barons, and other factions used similar castles along the Rhine to levy tolls on cargo barges using the river for transport. The counts who owned the Pfalz reinforced the original toll tower with a wall and bastion shaped like a ship's bow to withstand the current. Its unique position as the Rhine's only island fortress ensured it was never captured by enemy forces.

Castle of the Chimes: Artillery Citadel

The Castle of the Chimes is an imposing stone fortification overlooking the narrow section of a lake. With its impressive array of artillery, the fort can strike at any target within the shores of that narrow passage, thus limiting enemy travel between destinations at the lake's farthest ends. Since it was built on the local heights, the castle commands several major roads and bridges allowing passage through the surrounding countryside. The citadel's high stone walls, bastions, and extensive earthworks also defend it well against attacks over land and the lake.

The castle got its name from the sounds made by operating the great artillery pieces -- the catapult and ballistae winding and release machinery makes clanking noises that sound like a dissonant chorus of muted chimes.

Although it overlooks a small village about half a mile away, the citadel has little to do with the townspeople. A detachment of soldiers guards the fort, while a company of artillery experts operates and maintains the machinery. In times of siege, the fort closes its gates while the villagers fend for themselves. The citadel exists solely to protect the kingdom's military interests in monitoring, regulating, and preventing unauthorized passage on the lake and nearby roads.

Defensive earthworks surround the fort, making a direct assault difficult and providing a basic trench system defenders can use against besiegers. The high stone walls surround a central parade ground and barracks, with a bastion at each corner. Two extended bastions form islands that give defending archers enfilading fields of fire against attackers, and provide platforms for additional artillery pieces.

The kingdom sends supplies and fresh troops once a month, though storeroom larders and a deep well can sustain the inhabitants for six months under siege. Few outsiders find welcome here. The gate guards have orders to turn back all visitors unless they are official envoys of the king. The fort garrison suspects most strangers of spying or sabotage. The local villagers know the garrison commander considers certain areas off limits, particularly places where enemy troops might try moving to pass or besiege the citadel. Strangers wandering through the region -- especially the area between the fort and the lake -- might very well find themselves the objects of artillery target practice.

Main Gate

A simple gate allows access to the fort. A tunnel opens in the middle of one wall, leading through the thick stonework and one of the barracks buildings to open onto the central courtyard. The tunnel is large enough for artillery pieces, large wagons, and columns of troops to pass through.

Soldiers can seal the entrance with three stout wooden gates that are easily barred from the inside. Although the gate is no more fortified than the main wall, troops can still defend it well from the parapet above. Invaders can fall under heavy attack at murder holes where the gate tunnel passes through the barracks into the parade ground.

A fortified stone wall keeps enemy troops from charging up the slope directly in front of the gate -- all approaching soldiers must pass before one of the bastions before reaching the castle's entrance. Troops patrolling the gate often stand guard on this wall, within easy running distance of the entrance itself. The garrison commander posts at least 20 soldiers here during the day, when the gates are left open for rapid deployment of troops. The sergeant on duty has standing orders to admit only official military personnel or those delivering dispatches bearing the kingdom's seal. This guard detail dismisses all others -- civilians, strangers, passing travelers -- with the greatest degree of suspicion and contempt.

Walls and Bastions

The citadel's walls are extremely thick, built of stone and fill in most places. The bastions also consist of heavy stonework, though those on the corners each contain rooms used to maintain the fort (see below). The two independent bastions house lower rooms containing emergency supplies should they become cut off during a siege.

Each bastion (including one of the independent ones) mounts two catapults on revolving turntables, allowing the crews to aim them at any target in a 360-degree fire arc. Solid wood construction makes these turntables durable enough to withstand the stresses of catapult operations, though they revolve rather slowly with the entire artillery crew pushing. The mechanisms lock in place once properly aimed at a target.

Each bastion contains a store of ammunition and grease for the catapults. The independent bastions connect to the main walls by wooden bridges -- light walkways that soldiers can quickly hack apart or set aflame if enemy troops overwhelm the independent bastions and threaten to rush into the main fort.

Although they're thicker than most castle walls, the parapets cannot mount the massive catapults like the bastions. Several ballistae defend each wall, and the crenelations protect the archers deployed to guard the walls during a close siege. Ballistae also protect the bastions.

The four corner bastions contain rooms that help maintain the castle's operation:

- **Armory:** The armory houses smithies and storerooms to maintain and replace weaponry and armor. Specialists also craft replacement parts for the various artillery pieces. A workroom provides space for fabricating weapons that do not require smithing. The chimneys all connect to discharge through a central stone vent at one corner of the bastion.
- **Kitchen:** The castle's kitchens occupy the chambers beneath another bastion. Several shifts of cooks work throughout the day (and much of the early morning) keeping the fires stoked, cooking and baking foodstuffs for the daily meals. They draw on supplies from the larder in the nearest barracks, and serve meals to troops and officers in the mess hall beneath the storerooms. Like the armory, the kitchen's ovens and fires vent to the surface through a central chimney at one corner of the bastion.
- **Cistern:** An entire chamber beneath one bastion serves as a cistern containing the castle's water supply. A simple network of drains and pipes collects rainwater that falls on this bastion and the adjacent walls. A trap door in the bastion leads to a small room above the cistern with a simple cheesecloth filter that requires changing after heavy rainfalls. Piping leads through the walls to provide the kitchens and the adjacent barracks with water. Drainage networks on each of the independent bastions also collect water in this manner to supply them in case they're cut off from the main castle during a siege, or supplement the main cistern in times of drought.
- **Dungeon:** The cold, damp chambers beneath one bastion serves as the fort's jail. Captured spies, indolent soldiers, and other offenders languish behind iron-bound doors in cells with some straw, a chamber pot, and a bucket of water. Prisoners guilty of crimes in the region are transferred here from local jails before proceeding under guard to one of the kingdom's infamous prisons.

Barracks

Two-story barracks buildings form a perimeter on three of the courtyard's four sides. These structures house long barracks rooms for the soldiers, a common room for off-duty troops, individual quarters for the officers, a small surgery, stables, and administrative offices for the fort and region. The mess hall and main larder occupy the building nearest the kitchens. Basements in all buildings serve as storage space. The barracks' stone construction helps them resist fire attacks during siege.

The troops use the courtyard for general assembly, training drills, and other public functions. Ramps lead from the courtyard's corners to each of the four main bastions, enabling teams of men to resupply the catapults and ballistae with heavy loads of ammunition.

Personalities

Lord Gaspard, Garrison Commander

The citadel's commander is a petty noble who loyally served his liege in several military campaigns. His experience during siege actions led to his appointment to the Castle of Chimes as commander. While he trusts his stewards to oversee his domain, Lord Gaspard sits in his fortress, guarding the frontier and lake passages against the kingdom's enemies. Although he's grateful for his liege's favor in appointing him commander, he views his service here as punishment for some unknown offense.

Gaspard's simmering anger at his exile at this border outpost shows in his harsh temperament toward all matters within the fort. He constantly drills his troops in the parade ground, and requires the artillery crews to undergo drills and test-firing on their pieces. As this is a purely military fortification, he does not tolerate civilian presence here short of the cooks, smiths, and servants. In addition to frequent supply caravans from the kingdom, he demands additional goods from the townspeople in nearby villages who supposedly enjoy the protection afforded by the castle's presence. The villagers bring supplies once a month, though they unload them just outside the gate.

His soldiers know Gaspard as a stern commander not to be crossed without severe repercussions.

Lieutenant Haver, Artillery Captain

Haver balances his commander's stern demeanor with a friendly temperament and a solid rapport with his artillery crews. Though he only holds the lowly commission of lieutenant, he displays the demeanor of an officer with much greater maturity and experience. He realizes that a military organization like the one occupying the citadel functions best with a good mix of respect and tolerance.

Haver trains his crews well, often floating reed rafts onto the lake for target practice. He's rarely seen without his spyglass, scanning the horizon for enemies, or figuring the ranges to potential targets. During exercises, he strides from one crew to the next, shouting encouragement and supervising their aim. Most of the artillery crewmen have a high regard for him (often higher than for Lord Gaspard), and the general infantry troops hold him in great esteem even though they don't serve directly under him. Haver remains one of the few officers to act with such affability among the men and still maintain an obedient relationship with Gaspard and his stern and sometimes unreasonable demands.

Historically Speaking

Fort Carillon -- better known as Ticonderoga -- was built by the French between Lake Champlain and Lake George in Upstate New York. The French launched several sorties from the fort during the French and Indian War. The British later overwhelmed it during that conflict, and kept a minimal garrison there until American forces -- led by Ethan Allen and his Green Mountain Boys -- captured it during the Revolutionary War. In each case the fort was won primarily because those who occupied it left it under-garrisoned or retreated in the face of a more powerful military force.

Ticonderoga's cannon commanded the southern end of Lake Champlain. The artillery was later removed and hauled overland to aid in the American siege of British forces stationed in Boston. Those running medieval campaigns can use the catapults and ballistae noted in the castle above, or could employ early cannon pieces in much the same way as Ticonderoga did to restrict traffic on the lake and hold off enemies in a prolonged siege.

Pyramid Review: Mythica Rules Engine

Mythica Rules Engine

Published by [Roc Games](#)

Distributed by [Deep7](#)

Written by Peter Raines et. al.

Beta PDF; \$7.95

Mythica is Roc Games' debut release, downloadable from their website. As a debut release, *Mythica* leaves me drooling in anticipation of Roc Games' future products. They really did come to the table with new ideas, and I hope they can infect the hobby with some of their creativity.

The game, as stated in the PDF rulebook, is rules-light and stresses roleplaying over combat. Peter Raines and his crew have filled *Mythica* with different widgets that encourage roleplaying. *Mythica* is meant to be playable in any setting imagined by the GM. Currently players must make do with their own home-brew worlds, but Roc Games should be releasing campaign worlds soon. While a little advanced for newbie gamers -- who may ignore game balance -- *Mythica* is a wonderful game in the hands of slightly experienced and advanced players.

Character generation uses a *GURPS*-like point-based system. Nothing new here. When wanting to use a skill, the GM assigns the attempted task a difficulty rating. The mechanic that determines success has a bit of a twist. Different difficulty ratings require different numbers of die rolls. A simple task succeeds when any one of three dice rolls higher than the skill value. Other difficulty ratings require different total successes on different numbers of rolled dice. Instead of searching for another +1 to add to the roll, players spend their time trying to figure out how to change a difficult feat (two successes, two dice) into an average one (one success on one die). In a skill contest the instigator rolls first, a success makes the target's opposing roll one skill level harder, and a failure leaves the roll unaffected. In a chase, or similar circumstance where two successes aren't possible, the two reroll until somebody fails.

As the party wins successes, the GM rewards them with experience points. These points may be used toward advancing skills, statistics, learning magic or can be saved for dire circumstances. Players may also use experience points to affect the outcomes of either their characters' rolls or other rolls that affect their characters. This is a sensible game mechanic to simulate the luck that follows some people around.

Combat works a little different from the norm as well. When defending against an attack, the character gets an attempt to defend. If the blow hits home, damage applies to a hero's damage soak before causing any ill-effects. The GM decides which of the villains has a similar damage soak. This helps keep the party alive a little longer in combat-rich areas. Also, there is no limit to the damage a character may take. When the wounds he received total more than his damage level, he must roll according to skill challenges to stay standing. Failure causes him to collapse, but success indicates that adrenaline and excitement keep the character going. This may not be terribly realistic, but it is interesting.

The magic system showcases Roc Games' talent. *Mythica* worlds follow the basic concepts of mana found in *Authentic Thaumaturgy*, except mana is called makia. *Mythica* has no spell lists. Magic users must learn spell effects piecemeal, using "shards" to construct a complete spell. A player wanting to open a lock, for instance, may use the shards "move" and "metal" to magically pick it, "transmute," "metal," and "spirit" to cause it to disappear, or "destroy" and "metal" to annihilate it, depending on the desired result, and the shards known by the caster.

Once a spell is built and the cost determined, the magus must roll against the Sorcery skill for success. A single-shard spell counts as a simple feat, with more shards making the task more difficult and dangerous. Channeling makia is a dangerous past-time, and based on the difficulty of an attempted spell, the caster risks possible makia strain -- mental damage which can kill as effectively as physical damage. When a spell fizzles (usually because of a failed Sorcery roll) the energies involved remain in the body, making it much more likely to suffer this damage, and doubling its effect. Building spells is an art.

Overall, I am greatly impressed by Roc Games and *Mythica*. Meant for experienced gamers, the rules encourage more roleplaying and character interaction than the "justification of dicing results" mentality of competing products. If you are looking for a game that relies on rules without stressing them, allows the GM to interpret situations and results, and allow the players to actually act, then *Mythica* is one you should definitely check out. If I didn't already have a copy, I'd be hinting to my friends to buy me one for my birthday.

Pyramid Review

The Cities and Knights of Catan (an expansion for The Settlers of Catan)

Published by [Mayfair Games](#)

Designed by Klaus Teuber

Boxed set; \$38.00

In 1995, Klaus Teuber's board game *The Settlers of Catan* won Germany's most prestigious game award, the Spiel des Jahres (Game of the Year). Mayfair Games' English translation of the game won the American Game of the Year Award the following year. The game is widely regarded as being responsible for American interest in other "German" games, such as those published (in English) by Rio Grande Games. Now, Mayfair has given us Klaus Teuber's newest expansion to the game, The *Cities and Knights of Catan*. *Cities and Knights* is a wonderful addition to an already classic game, and adds strategic depth without sacrificing any of the basic game's simplicity.

The first thing you'll notice about *Cities and Knights* is the presence of the Barbarian Horde tile. This special double-hex tile replaces one of the standard water hexes at the edge of the island, and is used to track the progress of the barbarian fleet as it approaches Catan. Every time the special Event die comes up with the black ship (three of the six faces), the barbarians move a little bit closer to Catan.

To combat the barbarians, players must build up a force of Knights. When the barbarians reach Catan, the strength of their attack (equal to the number of cities) is compared to the strength of the Knights' defense. If the barbarians are stronger than the Knights, they will pillage a city belonging to the player who contributed the fewest Knights to Catan's defense. But if the Knights manage to hold back the Barbarians, the player with the most Knights is named Defender of Catan, and receives a victory point.

The other thing that *Cities and Knights* adds is a different way of handling cities. In the basic game, upgrading a settlement to a city doubles the settlement's production. In *Cities and Knights*, cities now produce "commodities" as well as resources. These commodities can be spent to purchase city upgrades along three different paths, which eventually lead to the three great metropolises of Catan. A metropolis is worth two additional victory points (the game plays to thirteen), so competition for the metropolises can be fierce . . . especially in a game with four people, where someone isn't going to get one.

The old development cards have been eliminated from the game, and replaced with "progress cards." Players no longer spend resources directly to buy progress cards; instead, the cards are distributed when the Event Die matches a type of city improvement that the player has built. Some of the progress cards are quite powerful, such as the Inventor, which allows its player to swap two of the numbered chits that control production. Most of the cards, however, are very well balanced, and make the game more unpredictable without sending it careening out of control.

This expansion isn't entirely perfect, of course. For one thing, it makes the game last substantially longer; I've only played one game of *Cities and Knights* that lasted less than two hours, and most last close to three. Compared to the original *Settlers*, where an hour and a half is a "long" game, this factor may turn some gamers off to the expansion. More problematic is the fact that someone who gets behind at the start of the game tends to remain far behind for the rest of the game. This was a problem in *Settlers* too, but it's far more pronounced in *Cities and Knights*, when (due to the barbarians) it's actually possible to lose cities.

In all, however, *Cities and Knights* is a wonderful addition to an already classic game. If you've played *The Settlers of Catan*, you owe it to yourself to try *Cities and Knights* at least once.

-- *J.W. Taylor*

An Evocation of Griffins

"Explain all that," said the Mock Turtle.

'No, no! The adventures first,' said the Gryphon in an impatient tone: 'explanations take such a dreadful time.'

-- Lewis Carroll, *Alice's Adventures in Wonderland*

Not quite a convocation of noble eagles; less forthright than the pride of lions, we must perforce collect our griffins with hints, with magic, and with indirection. The griffin (or griffon, or gryphon, or girphinne, or grefyne, and so forth) has the head, wings, and forelegs of an eagle and the body, hindquarters, and ears of a lion. (Heralds and other picky sorts sometimes add the tail of either a camel or a serpent, or the beard of a unicorn, or replace the wings entirely with spikes for the "opinicus".) The griffin, if not first, then definitely foremost, is a unity of opposites -- of Christian salvation and of infernal cruelty, of implacable justice and of unquenchable arrogance. Both bestial and divine, it bisociatively haunts the caves of the deepest underground and the airy rocks of the mountains. So mount up, with Alexander the Great, and see the world from the griffin's eye level. Hold tight.

"These griffins, Aristeas of Proconnesus says in his poem, fight for the gold with the Arimaspi, beyond the Issedones. The gold which the griffins guard, he says, comes out of the earth; the Arimaspi are men all born with one eye; griffins are beasts like lions, but with the beak and wings of an eagle.

I shall say no more about griffins."

-- Pausanias, *Description of Greece*

The griffins, our old [immortal friend](#) Aristeas of Proconnesus says, enjoy above all things the gleam of gold, and they dig it out of the Earth and fish it out of "Pluto's stream" with their immense claws. The Arimaspi, who despite only having one eye are gifted horsemen, wage a constant war with the griffins to steal the gold. The griffins, thus, acquire a taste for horseflesh; although they will devour humans cruelly (much as their Indian cousins the [manticores](#) will), they frenzy for fresh mare. This appetite, although it helps them guard their gold, proves a weakness in guarding their gemstones. According to Prester John (who, as ruler of griffin-infested Central Asia, ought to know) tribesmen in India throw fresh-killed horses down into the Valley of Jewels, knowing that the griffins will carry the now jewel-encrusted corpses out of the valley to their nests. By following the griffins' trail, Prester John's subjects can gather the jewels (especially emeralds and agates) that fall off the horsemeat, without risking griffinish wrath and entering their guarded Valley. [Sir John Mandeville](#) helpfully described griffins as the size of eight lions, with the wingspan of a hundred eagles.

The ferocity, speed, and steadfastness of the griffins recommended them to the gods. Griffins occasionally drew the chariot of Apollo, and that of the Sun from their Indian lairs to their Hyperborean ones. Artemis, Apollo's sister, also kept griffins as coursers, and in a spookily evocative phrase in *Prometheus Bound*, Aeschylus refers to them as "the sharp-beaked hounds of Zeus that bark not." The Greeks also began to associate them with Hermes, the guide of the dead, as the griffins guarded the dead and flew them to the afterlife at the headwaters of "Pluto's stream." Either in their connection with death and rebirth, or their connection with India and the sun, the griffins attached themselves to the stories of tiger-riding [Dionysos](#) -- who entered Greece from "India" in the 9th century B.C. Roughly the same time, intriguingly, that Aristeas visited the Arimaspi "wraapt in Bacchic fury." In other words, while stoned out of his mind on Dionysian soma, Aristeas saw griffins. And they saw him.

"And these are they which ye shall have in abomination among the fowls; they shall not be eaten, they are an abomination: the eagle, the griffin, the osprey, and the vulture, and the kite after his kind."

-- Leviticus 11:13-14

Which, if you believe the Bible (and the medieval bestiarists definitely did), was not A Good Thing. The visionary St. Hildegard of Bingen described the griffin's hidden eggs as nests of vileness, which the noble lion seeks to destroy. The griffin is cruelty and rapacity; it draws the chariot of Nemesis, Vengeance Inescapable. Or, as the Greeks knew her, Nemesis Adrasteia, which catches our griffins in the [Spider Goddess'](#) web. The spiderweb becomes the wheel of Nemesis' chariot, possibly reinforced by the sunwheel of Apollo and the Juggernaut wheel of griffin-plagued India. This is the Chariot of the Tarot; card of tyranny and triumph. Triumph, being, of course, descended from Dionysos'

title Thriambus, and becoming the Trump of the Tarot as the symbolic wheel turns. The medieval bestiarists also knew that Alexander the Great ascended to the "sky of fire" in a chariot drawn by griffins, to "go up into the sky and see if it is the very same sky which we see." Another visionary ascent, courtesy of Dionysos' wine?

If so, he was following a very old path to the sky indeed; fourth-millennium B.C. cylinder seals from the Elamite plateau in southern Persia depict griffins spreading their wings in flight. Griffins entered Egypt around 3000 B.C. and reached Byblos in Phoenicia at almost the same time. Griffins ramped along the walls of Knossos, and strode at the side of Shaushka, the Hittite mistress of the night. The Egyptian griffin, the *sefer*, carried the Pharaoh into the kingdom of Horus, even as it rent and tore the enemies of Set, god of smoke and darkness. Mesopotamian art likewise depicted the griffin as servant of the gods, of Nergal (death) and Ishtar (life). Assyrian and Chaldean art, and later Zoroastrian and Mazdaist iconography, shows griffins guarding the Tree of Life, serving the divine Sun (a griffin represented the Mithraic *heliodromos* degree, the "sun-courier"), and drinking from a fiery cup.

*"The interval between these four contained
A chariot triumphal on two wheels,
Which by a Griffin's neck came drawn along;
And upward he extended both his wings
Between the middle list and three and three,
So that he injured none by cleaving it
So high they rose that they were lost to sight;
His limbs were gold, so far as he was bird,
And white the others with vermillion mingled."
-- Dante Alighieri, *Purgatorio*, Canto XIX:106-114*

Which seems to be where the Holy Grail comes in. Crusaders in Syria saw the ubiquitous griffins-and-cup motifs on temple walls, building pediments, and sacred vessels. Surely, then, this must be the Grail, guarded by griffins in the East. Wolfram placed the Templar castle in India and described the Grail as a green stone fallen from heaven (the griffins' "sky of fire"); other writers described it as cut from a solid emerald. Griffins suddenly appear on heraldic shields; English estate inventories begin to contain "grypeseye" or agate griffin-cups. Griffin eggs (natural mineral nodules hollowed out and polished, or ostrich eggs coated with lapis) had been considered magically potent in Europe even before the Crusades -- King Robert the Pious of France had his nobles swear fealty on a griffin's egg in a silver casket. Griffin-egg goblets were known proof against poison, as were griffin-claw cups such as the ones in the famous shrine of St. Cuthbert in Durham; healing cups like the Grail. After 200 years of Crusader-spawned (Templar-directed?) pro-griffin propaganda, Dante recast the griffin as the emblem of Christ, and his chariot as the vessel of the Christian Roman Empire of perfect justice and divinity.

*"Hence then it appears, that the negative testimony of Michovius is not sufficient to overthrow the received opinion of the Ancients concerning Griffins, especially seeing there is a possibility in Nature for such a compounded animal. For the Gyraffe or Camelopardalis is of a stranger composition . . . Besides, though some fabulous narrations may be added to the story of the Griffins, as of the one-ey'd Arimaspi with whom they fight, yet it follows not that therefore there are no Griffins. If any man say, that now such animals are not to be seen; I answer, It may be so, and yet not perished; for they may be removed to places of more remoteness and security, and inaccessible to men: for many such places there are in the great and vast Countries of Scythia, and Tartaria, or Cathaia, whither our Europeans durst never, nor could venture."
-- Alexander Ross, *Arcana Microcosmi* (1651)*

But by that time, people were beginning to come up with new ideas about the griffin. Marco Polo thought the true explanation of the griffin was sightings of the roc, which is pretty close to the modern theory that the griffin was "actually" the bearded and crested Lammergeier vulture. Albertus Magnus doubted that griffins existed at all outside "books of history," which is intriguingly close to the notion that the legend stems from fossil dinosaur eggs dug up in Mongolia by the Scythians' neighbors. (Looked at right, ceratopsians have the four limbs, beak, and "mane" of the griffin.) A Polish scholar, one Mathias Michovius, wrote in 1518 that since there was no gold, and no Arimaspians, in the "northern region" (he was half right), there were no griffins there either. Ulisse Aldrovandi's magisterial *Ornithology* of 1599 placed griffins firmly in the list of "fabulous birds." Sir Thomas Browne's 1646 *Popular Errors*

again refuted the griffin, despite the fervent objections of Alexander Ross, chaplain to King Charles I. Ross, the first translator of the Koran into English, firmly defended the ancients' wisdom, sounding remarkably like a modern cryptozoologist. His work brings to mind a wonderfully-lurid notion for a Restoration-era *In Search Of* . . . campaign (*GURPS Swashbucklers-Fantasy Bestiary*) in which bold cavaliers strike out for Furthest India to strike a blow for romance, griffins, and good St. Cuthbert against killjoy Puritan rationality.

*"Not grey, but Griffin! No one likes to hear
Himself called grey. In every word there rings
An echo of the sense from which it springs:
Grey, grizzled, gruesome, grim, and grave-yard -- thus
They tune in etymology, but us
They put quite out of tune."
-- The Griffin, in J.W. von Goethe's *Faust, Part Two*, II:iii*

Goethe's griffin brings up an interesting angle. The etymology of the griffin, like that of the [sphinx](#), is uncertain. The Latin *gryphus* comes from the Greek *gryps*, which was the word Aristeas apparently used to describe the hideous winged and clawed creatures he astrally encountered in Central Asia. Some scholars trace it to *grypos*, the Greek for "hooked" (like a beak or claw), others to an Indo-European root cognate with "grip" and "grasp," while Grimm was the first to suggest a connection with that other winged guardian enigma, the Babylonian *kerub* or cherub.

Allow me to present one final possibility. The griffins mine and hoard gold that makes its way into the hands of one-eyed beings in Central Asia. Into the hands of the Lemurians, in other words; ancient cyclopean entities guided by the astral spirits held within Dionysos' soma. (And who, like the griffin-roc, also dwell in [Madagascar](#).) This egg-born (!) race built the griffins, recombining DNA in an emerald grail from heaven. (Is it a coincidence that alchemist and immortal Nicolas Flamel acquired his griffin-decorated grimoire from Sefarad; perhaps not Spain at all, but the land of the Sefer -- griffins?) As the Lemurians fell further into decadence, the griffins rose up against them (just as the shoggoths, the ne plus ultra of chimerae, rebelled against the Elder Races in Lovecraft's theosophy) and the war was on. Lemurians domesticated the horse (on the verge of extinction just as the griffin emerges on the Iranian plateau) and trained humans to ride, and to ride the waves of hallucination to balk the griffins. Eventually, the Lemurians faded into the astral, and the covert Templars at the Stuart court couldn't keep the griffins materialized either. Like us, they lost the griffins (and their Grail) somewhere in a cave in India Ultraterrestria. And we find ourselves, at the end (and the beginning, as the griffin's wheel turns) unable to hold the griffin in place. Between Apollo and Dionysos, Christ and Nemesis, between black and white, flits the grey and indefinable griffin.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

O.D.T.A.A.

Last night I was up until six A.M., finally finishing the editing of *GURPS Best of Pyramid Volume 1* (a title I hope isn't as optimistic as *GURPS Middle Ages 1*).

I needed to be at my "real world" work early the next day, because two people were sick, and we were still suffering from employee shortages brought about by one person quitting and another person being fired.

At my real world gig, today we got word that the boss's hard drive, which had suffered a head crash, was completely unrecoverable.

The hard drive was damaged because the boyfriend of another employee had, in anger, pounded on the desk so hard as he was being escorted out of the building, that the laptop the drive was in fell off the desk, resulting in the head crash.

And, in all probability, when I bike to work tomorrow, it will be raining.

Now what does this have to do with gaming?

Well, my life is currently an example of one of the tricks I like to use every so often in my gaming.

When it rains, it pours.

Now, many folks (including myself) tend to design fairly linear and focussed adventures. The bad guy does something bad, the good guys chase after him, there are complications, the good guys triumph. Even if the specifics aren't linear, most options and complications at least relate to the main plot.

But the real world seldom gives you free reign to pursue your bad guys. No, just when you think you've got things under control, something bad happens. Or something different happens. Or something good happens.

The point is, whatever happens, it usually has *nothing* to do with whatever you're focussed on.

So let's say you've got Superhombre trying to keep Spleeniatic from destroying the world with his Illudium Q-36 Explosive Space Modulator hovering over the unaware city. S-hombre is flying towards the device when, using his Schwa-Ray Vision, he sees an unscrupulous gentleman robbing someone with a gun. Dangit. What does the paragon of virtue do?

Or, right before the climactic battle with the Orc Leader, the party healer starts hearing voices from some netherworld entity. It's probably demonic, sure . . . but it's just a coincidence that it happened right before that combat (or is it?).

Or your spaceship is on a diplomatic mission to a long-lost world. There's a mystery planetside the party is investigating. Meanwhile, a member of a trickster alien race has tracked the PCs there, and has "official" paperwork claiming the ship the heroes are using was actually stolen from their people. (This is, of course, a lie.) And, finally, a member of the away team has found an alien artifact with strange powers . . . powers that are *completely* unrelated to the matter at hand.

Although most movies generally need to be more focussed, many TV series (where as much time per installment doesn't need to be spent on characterization) make use of this technique to keep things interesting. *Law & Order*, for example, generally has plots where two or three intertwining, unrelated, whacked-out things are bobbing around the pool waiting for the protagonists to resolve (or ignore) them. Many sitcoms also have several plots and complications going on at the same time. And it's difficult to find a book where multiple things *aren't* happening.

If you want to try this technique, here are some tips:

- **Don't do it all the time, unless you're a juggling genius and your players love it.** It takes a fair amount of

planning to make complicated adventures work, and making your players continuously waiting for the next shoe to drop can get old. Besides, complications are nothing if not unpredictable; sometimes the most surprising complication is one that *doesn't* happen.

- **Figure out how to tie it in.** Ideally you'll have a good idea of a moment, and can work in a complication into that moment organically. Thus you may have an idea that the heroes are going to chase after the bad guys in their car on the interstate. What if the car suddenly billowed black smoke out of it in the middle of the chase? Do the PCs push the car and hope it stands up to the abuse? Do they try to do a quick repair job? Do they abandon the car and pursue another option?
- **Be flexible.** If the heroes take the bus instead of their car, there's (naturally) no reason the car should start threatening to burst into flames. Maybe the car will break next time . . . or maybe the GM should just drop that plot point for another day.
- **Things work out.** In the real world, even if you don't make an effort to put out *every* fire that erupts around you, things have a habit of generally working out. (At least, that's my theory, and as a card-carrying optimist, I'm sticking to it.) Thus if the hero's cat sprints out the door as he's leaving his apartment to investigate the mystery, and he decides not to chase after it, maybe it'll be waiting outside the door when he gets home.
- **Keep options limited.** Generally, if you can get in contact with folks who might cause complications, they'll understand, and let you weasel out of it . . . especially if you're saving the world. Thus, if you want the romantic interest's mother-in-law to visit, have her write a letter instead of call. Likewise, if the heroes call an NPC to help them with a complication, make sure *they* get called by NPCs with oddball (inconvenient) requests . . .
- **Good things happen.** Psychology teaches us that good things can be just as stressful as bad things. It's true. What if, during the street-side investigation of the villain's deeds, the music-loving hero discovers a piece of evidence in a dumpster . . . next to a vintage jukebox? It'd be a great addition to the PC's collection, but it's huge and unwieldy, and the investigation needs to be done quickly. And the rumbling of the garbage truck is getting closer . . .
- **Disadvantages = complications.** If you, as a GM, aren't combing your PCs' disadvantages as ideas, do so now! This is especially true for complications. So if a character believes all life is sacred, mention how there's a blood shortage in the city. If he donates blood (which he may well), then he can be woozy when the "real" adventure begins. (And he'd better not strain his arm . . .) Dependents, allies, and contacts can all provide obvious complications, but so can the more inward disadvantages. Play with compassions, attractions, and repulsions.
- **Complications need to be fun.** Complications are *not* an excuse to muck with your characters' lives living hells; they're good for giving your heroes additional adversity to overcome *without* having Dr. Mood be responsible for everything that goes wrong. If you're players are annoyed with their heroes suddenly catching the flu, don't force such things on them in the future.

Heroes are often as good as their adversity. And reality often has a way of providing us with lots of adversity . . . and thus lots of chances to be heroic.

At least, that's what I'm telling myself after the week *I've* had.

-- Steven Marsh

Zombie Master Screen (for All Flesh Must Be Eaten)

Published by [Eden Studios](#)

Written by Ben Munroe

Additional Material by Al Bruno, CJ Carella, Derek Guder, M Alexander Jurkat

Illustrated by Brad Rigney, Christopher Shy, George Vasilakos
Cover by Christopher Shy and George Vasilakos

48 pages; \$16.00

The *Zombie Master Screen* is the first supplement for Eden's *All Flesh Must Be Eaten* RPG of Survival Horror, where the players are pitted against the overwhelming horde of the undead. The game uses the Unisystem game mechanics which makes it compatible with *WitchCraft* and *Armageddon* (two Unisystem Games developed by CJ Carella). Since Unisystem is a generic game system, *AFMBE* can be used to play any scenario from *Night of the Living Dead* to *Aliens*. It's all about people trying not to be horribly killed by inhuman things.

The actual screen part of the *Zombie Master Screen* is very well-designed and provides all the tables that a Zombie Master (what other systems would call a Game Master) will need while running a game. The screen is a sturdy four-panel design that is more than enough to hide all the rolls that the Zombie Master is going to lie about so that he can inflict whatever fate on the players that he wanted to anyway. The other side of the screen (which the players will look at while the ZM is cheating on his rolls) is one of the best parts of this whole package. It's a 70s-style mural that depicts a zombie-fighting trio holding their own against the undead horde. The shirtless martial artist has a giant afro and the guy next to him resembles John Saxon. It is like a poster for a Seventies Horror movie and even proclaims that the feature is in "Living Stereo."

The book that comes with the screen continues this cinematic feel -- the credits are even done as film credits! The first part of the book is "A Bad Day at the Office," a two page vignette chronicling one man's efforts to escape a building full of the hungry dead. It has a nice twisty ending.

The next part is the introduction, which includes "No Such Things" by Al Bruno. This piece is about what life is like after the zombie hordes have brought civilization to a screeching halt. The introduction then includes a summary of the main adventure that follows. The adventure "Coffee Break of the Living Dead" then takes up the bulk of the book.

"Coffee Break of the Living Dead" concerns six normal human beings and one really bad day at work. The adventure starts off as just another day at work at an average office building. All six end up on the same elevator when the building's power goes out. At that point the group must try to either make it out the lobby door or to the roof without being mutilated by the living dead who have overrun the block their building is on or shot by nervous national guardsmen. It's a great adventure which has a nice *Resident Evil*/George Romero feel to it.

After the adventure comes a section of new rules for *AFMBE*. The section on campaign levels, the optional skill point generation system, and some of the new character qualities have all been taken from Eden's *WitchCraft* system for the benefit of those people who own *AFMBE* but don't own *WitchCraft* yet. There is a new section on creating Zombie

player characters, because while it's fun to shoot the brains of ambulatory corpses, sometimes it's also fun to shamble along the sidewalk and eat the flesh of the first person you met. (At least that's what I have heard.) This section also includes new Aspects, which are the powers of various types of zombies. Some of the Aspects are cool and some are creepy, all of them were pretty useful for the **Zombie Master** who wants to create a unique monster to plague his players with.

The last section is an essay about **Zombie Survival Horror**. It addresses the issue of what **AFMBE** is all about, and also includes general advice on running a scary game. Many horror games end up being about a group of heroes with strange powers and big guns chewing their way through supernatural cannonfodder which might as well be a bunch of storm troopers or orcs. In an **AFMBE** game, the players should be uncertain of their survival. The game is supposed to be like a scary movie, so the players should be scared. Since the game is supposed to be like a scary movie, the players should also have fun.

The **Zombie Master Screen** is a great supplement and a useful tool for anyone running an **AFMBE** game. It is also useful for those running **WitchCraft** games until the **Chronicler's Screen** comes out. The cover alone makes me want to use it as a GM screen for every game I run. It's a good product and I highly recommend it.

Art by Ruth Thompson and Color Alex Fernandez

Serge knew he was in trouble when the burst from the AK47 hit him in the back. He slammed into the wall, his precious blood gushing onto the five-hundred-year-old fresco that adorned his lair. He crumpled to the floor like a shattered mannequin.

Now that the slayer's masking spell was broken, Serge saw that his assassin was alone: watching, waiting. Serge let his eyes glaze over as the pool of blood blossomed around him on the cold tile floor. Lulled, the slayer came out of the antechamber and set down the rifle. Curiously, there was no hint of hatred in the man's gray eyes as he pulled a wooden stake from his jacket.

A ruby ring on the slayer's finger glinted like an angry red eye. As the bloodthirst arose in Serge's throat, the memory of the first time he saw such a ring flashed before his eyes. A memory of the time when he still breathed the warm, sweet air of Provence . . .

The guards' pikes formed a gauntlet of blades on either side of the red carpet. The men stood impassive, unseeing, mindless. As Serge approached each pair, they pulled their weapons upright with a jerk, as if they were puppets on strings.

At last Serge came to their mistress, a beautiful woman in a fine brocaded dress. She eschewed the powdered white wigs favored by the timid-looking courtiers who whispered in the wings. Rather, she wore her own dark, lustrous hair in a full pompadour around her lovely alabaster face. At her side was a huge gray dog, teeth bared and eyes smoldering like candles.

Serge had been leery of accepting the invitation to the marquise's court, but the sudden, inexplicable death of his father had left him little choice. The lady extended her hand to him; on her forefinger a ruby ring glowered like a bloody eye. As he knelt to kiss her hand, the animal growled.

"Does my pet bother you, cher Serge?" Marquise Antoinette asked. Her blood-rouged lips parted to reveal sharp fangs.

* * *

In literature and film, flashbacks show how relationships between characters are forged, explain a character's motivations, and reveal the source of a character's innermost fears. Television shows such as *Highlander* and *Forever Knight* often spend as much time in the past as they do in the present.

Flashbacks exemplify one of the cardinal rules of good writing: *Show, don't tell*. It's much more engaging to see events unfold than to listen to a dry, third-person narrative. Flashbacks can enliven roleplaying games the same way.

Flashback Seeds

When players create characters, they're always scraping for character points. Enemies are a favorite out, especially in superhero games. When creating Captain Liberty, the player probably won't explain exactly why Zorkon hounds Captain Liberty so doggedly. The player just needs 10 more points, and doesn't have time to write an extensive backstory for Zorkon. Many players equate such out-of-game preparation to doing homework.

Using flashbacks, the Game Master and the player can collaboratively sketch out the Enemy. Since a flashback is more of an improvised story than a combat simulation, the GM doesn't need to prepare a detailed character sheet. A rough outline will usually suffice: the events of the flashback will shape the Non-Player Character. The result will be a better rounded Enemy in the present, with tighter connections to the character.

Although everyone knows how things turned out, playing out past events can still be entertaining and enlightening. Nuances that might have gone unnoticed in that brief description of the Enemy on the character sheet can be fleshed out. Such details can make a tremendous difference in how a player character relates to the NPC in the present.

Flashbacks have certain advantages over "extemporaneous" roleplaying. Since everyone knows how things turn out, players have more freedom to actually *roleplay*, without worrying about picky little things like dying. Characters can be friendlier and more generous and trusting, behaving more like real people instead of constantly second-guessing the GM. Best of all, the player can often do the right thing without any coaching from the GM. In a flashback, Captain Liberty's player can go along with the GM and let Zorkon trap him in the Evil Engine of Death, because the player *knows* Cap will survive. And the player will know *exactly* why the Captain despises that low-down, good-for-nothing, crumb-nibbling skunk.

Flashbacks require cooperation between the players and the GM. Players have to give GMs the latitude to do things to the PCs that they would normally never allow. Surrendering your character this way makes the events much more visceral, providing real motivation for the *player* to dislike an enemy. This can make the player's job easier, especially for those who feel they lack that spark of creativity when fleshing out their character's histories.

Enemies are not the only motivation for flashbacks: other disadvantages make good fodder too. Phobias, Intolerance, Rivals, Duties, Amnesia, Codes of Honor, Vows, and (of course) Flashbacks can often be attributed to a turning point in a character's life. Reliving such seminal events can be very revealing. Advantages and Powers are also good: Patrons, Allies, Trained by a Master, Clerical Investment, Magery, etc., may have an interesting back story. Super Powers are naturals for flashbacks.

Finally, a character's origin is practically a mandatory flashback. Any vampire, revenant, superhero or *Highlander*-style immortal should play through the event that blessed or damned him with great powers.

Using Flashbacks

Flashbacks make past events live and breathe. Here are some techniques for incorporating them in play.

How It *Really* Happened

Flashbacks can impart information to the players that they might have otherwise missed, or introduce NPCs who, for plot purposes, need to figure prominently in the present but otherwise haven't appeared in previous gaming sessions. A flashback can be used to introduce such characters and information.

For example, let's say a player dashed off the following on his character sheet when describing his Patron: "Got me into the Space Patrol." When the group encounters a man with a nasty scar on his face, that player has a flashback. The flashback explores the details of the character's induction into the Patrol, introduces a few characters, explains how the man got the scar, and gives some background about the relationships among the scarred villain, the patron and the

character. Then when scarface plunges his vibrosword into the character's left thigh, the player will know exactly why.

Flashbacks as Training

In some genres the player characters are often very powerful, with a wide assortment of powers and skills. New players may be overwhelmed by the array of abilities, and may not know best how to use them. Rather than just sitting and explaining how these abilities work, GM to player, use a flashback. With the GM in the role of the character's mentor or master, the player can assume the role of the naïve or unskilled neophyte. The player can then try out these abilities in a "live" situation without worrying about making mistakes in the present that would kill the character. If the player discovers that an ability doesn't work as expected, the GM should allow the character to be revised accordingly. This will prevent grossly incorrect assumptions about how things work, making for a much happier player.

The Friend of My Enemy Is My Enemy

An interesting twist is to use flashbacks to develop a relationship between the Enemy or Patron of one character with a *different* player character (or characters). It's often useful to keep the identity of the NPC unknown, to prevent premature judgment on the part of the players.

For example: Horst, Edgar and Rhiannon run into a knight-errant at the court of Duc de Navarre. Suddenly, Edgar has a flashback to that same knight helping some peasants pull a wagon out of the mud. Edgar stops and lends his back to the effort. He and the knight repair to the inn down the road to enjoy conversation and drink. There, Edgar gets into a brawl with local thugs, and the knight saves Edgar's life. Don't come right out and tell Edgar's player that this same knight killed Horst's lord in a fight over a woman. Let the player make the connection after the flashback concludes and he sees the look of hatred on Horst's face when the court crier announces the knight's name.

If the relationship between the NPC and the second PC isn't going the way you anticipated, don't force it. Let the player decide how to relate to the NPC. If the player winds up hating the Enemy, he and the other player have something in common. If he befriends the Enemy, then an interesting dynamic is set up between two players.

Flashbacks as Emergency Scenarios

Flashbacks can be good "filler" material for GMs strapped for the next installment in their campaigns. Face it; sometimes GMs just don't have enough time to prepare for the next gaming session. Instead of delaying the inevitable, try this instead: before the session, scan your players' character sheets. Look for an Enemy, Disadvantage or Advantage that the player never quite explained to your satisfaction.

Then put the player on the spot. Flash the character back to that time and have the *player* explain what's happening, through the character's eyes. Listen, then run with what the player gives you. Weave something about the current events in the campaign into the flashback to give a motivation for the flashback, and perhaps a hint that illuminates a current mystery in the campaign. You'll be surprised at how easily story links form during your interaction with the players.

You can also use this technique if players are absent from a gaming session. Rather than skipping the evening, you can run a flashback scenario involving only the player characters present.

Flashbacks as Time Travel

Flashbacks can be an interesting form of time travel. In campaigns where the characters are very long-lived (vampires or other immortals), flashbacks can be used to transport the players and their characters back in time. (More details on a flashback-oriented campaign are below.)

For example, if the players in your Vampire campaign are tiring of incessant attacks by blood-thirsty anarchists, you might flash back to Enlightenment-era France for a *soirée* with Voltaire, to the Renaissance for the unveiling of

Leonardo's great equestrian statue, to Revolutionary Russia to arrange Rasputin's demise (an Undead, no doubt), or to Vlad Tepes's reign for dinner with Dracula himself.

Always make flashbacks relate to the player characters' histories and personalities. The campaign is about the *player characters*, first and foremost. Let them assume a larger role than recorded history might indicate. If it tickles the players' fancy to make Einstein see the light, seduce Napoleon, or stand beside Nelson at Trafalgar, let them do it. And if a player wants her character to actually have *been* Florence Nightingale or Mata Hari, let her do it. Queen Victoria is another story, however . . .

In historical flashbacks the GM can afford to be generous: if the players can justify it, let the characters have outrageous wealth, connections to powerful kings, or fabulous magical weapons. By the present time they will have lost these ephemeral things, so let them have fun.

Running Flashbacks

There are practical considerations for running flashbacks. First, make sure that *all* your players are entertained, not just the one having the flashback. If possible, choose flashbacks that involve more than one character. If that's not possible, keep one-on-one flashbacks brief.

Switching back and forth between past and present is a technique frequently used in literature and film. Such flashbacks can provide an interesting counterpoint, showing the relationship between events then and now. It can also prevent players not involved in the flashback from getting bored.

A perfect time for a one-on-one flashback is when one character is separated from the group, perhaps due to injury or disability. Rather than having an injured character's player skip the next two gaming sessions, consider using a flashback to give the character insight on the current situation and something to do while the other players carry on.

Flashbacks should have a logical *trigger*. Unmotivated flashbacks can be disconcerting and confusing to players. Flashbacks should generally have some bearing on events in the present, either to explain something or introduce an NPC.

Use dramatic license to introduce flashbacks. Instead of saying, "You see Marcus Tal, and you have a flashback to 1810," say, "A man approaches you, carrying a white lily. The lily morphs into a *fleur-de-lis* in a coat of arms on the wall of a French palace. You are attending a *grande soirée* in Napoleon's Paris. The beautiful woman on your arm asks you why you are so pale."

Use foreshadowing, another trusty literary device, to provide the characters greater insight during the flashback. For example, the PCs are trying to uncover the identity of a crazed killer, but the players have completely missed all the clues that you as a GM have placed for them. A flashback to a similar case can jog the players' mental elbows, without explicitly giving everything away.

Don't let a flashback drag on. Once it has accomplished its goal, return to the present with a transition symmetrical to the trigger. Unless, of course, your players are having a blast -- let that go on as long everyone is having fun.

The Immortals Campaign

Though flashbacks can be used in any kind of campaign, they reach their full potential in campaigns that have long-lived characters such as vampires, deathless immortals, longevity-potion-swilling wizards, body-switching sorcerers, reincarnating revenants, booster-spiced spacers or disembodied spirits. In such campaigns, players should design their characters with flashbacks in mind.

Immortal Character Creation

Immortal characters have a *lot* of history. Most players don't have the time, inclination or knowledge to create all that detail at once, but immortal characters are fun precisely because they have all that history. So where does that history come from? Flashbacks, of course.

When running an Immortals campaign, the GM should make sure that there's plenty of overlap among the lifespans of the characters. Players whose characters who are significantly younger than the others will find themselves idle during flashbacks that occur before their births (though this can be alleviated with Alter Egos -- see below).

As GM, you should set a minimum age for Immortal characters, which encompasses the eras that interest you. Players should pick a birth date before that time, and at least one era or historical event after that date that interests them. You should encourage players to define "rendezvous points" with each other's characters throughout the timeline. Players should put as much detail into their characters' backgrounds as they can. But don't be disappointed if no one does. It just gives you that much more leeway. If they make no decisions, feel free to make them yourself.

It's impossible for players to detail every single acquaintance and enemy over a long lifetime during character creation, but you should require them to name at least one Enemy and one Rival (a half-cost Enemy). Beyond that, you can allow a certain number of TBD (to be defined) Enemy or Rival disadvantages. You can also allow one or more TBD Ally advantages, who may appear at critical junctures as *deus ex machina* saviors. All TBD NPCs should be half or quarter the normal point values, since the player is taking the easy way out and leaving it up to the GM to define them. Using TBD Enemies in play is described below.

The Younger Self

In most immortals campaigns, characters grow over time. They don't have the same lofty power and skill levels throughout their lives. In flashbacks where combat occurs, the GM and the player must decide these prior levels. Ambitious players can design multiple versions of their characters: a full-point version for modern times, and one or more younger versions played in flashbacks. Otherwise, just knock off a skill or power level for each significant segment of the character's life.

The younger selves can be much different from the current character, but generally they will be weaker. Since players know that they survived flashbacks, the younger selves don't have to be tremendously combat-worthy. Players can afford to make their younger selves substantially weaker to make their characters' earlier lives more interesting. Conversely, some characters might have been more powerful in combat in the past than in the present. A knight who saw too much blood and death during the Crusades might well swear off the sword in later life and dedicate himself to peace.

In real life people remake themselves all the time. As GM, you should grant the players the right to make these decisions themselves (within reason, of course). A varied and checkered past can make an immortal character very interesting to play.

Building and Running the Immortals Campaign

When you have all the players' characters, each of the eras the players indicated becomes a *locus*, a place and time where flashbacks may occur. Using these loci, you can interweave them to form a narrative through flashbacks, or to provide springboards for scenarios in the present with origins rooted in the past.

When flashing back to a particular locus, make sure that at least one character knows who his character was at that time. Describe things through that character's eyes so that the other players get a feeling for the times. If players haven't decided who their characters were at a particular locus, give them some time to figure it out. It's good technique to time the beginning of a flashback so that it occurs near the end of the playing session. This will give the players who haven't filled in their histories some out-of-game time to think about who they want to be in that era.

Don't be afraid to let the players ham it up. If a player wants his character to be one of Napoleon's marshals, let him. It's all right if your flashback bends history a little. Who's to say how it really happened, anyway? Half the fun of flashbacks is finding out that *your* character was responsible for sinking the Titanic.

In flashbacks the players don't always know who's who. Immortals use different names over the centuries. Sorcerers may inhabit different bodies. The humanity drains out of vampires like so much blood, drastically changing their appearance and behavior. Sometimes people just forget a face, or blot it out of their memory because it's too painful.

TBD Enemies enjoy their greatest use in flashbacks. Typically, TBD Enemies enter the character's sphere of influence in the present, causing some consternation. They may meet and befriend other player characters, both the character's modern Allies, friends or lover, or mess with the player's source of income. When the player character finally encounters the TBD Enemy in the present, the GM initiates the flashback and everything becomes clear. The TBD enemy can be a very sympathetic character in the beginning of the flashback, before the tragic event that ruined his life and turned him against the PC. Or he could have been rotten to the core from the very beginning.

Make each TBD Enemy unique and memorable. They can turn into unifying force among the players, or a divisive wedge. Making the same NPC one player's Enemy and another player's Ally can provide for some entertaining play, during which the GM can just sit back and watch the fun. And the great thing about flashbacks is that when the players have Enemies they love to hate, they can keep coming back in flashbacks even after they've been killed off!

Alter Egos

When a flashback centers on only one or two characters of a group, or occurs before a younger player character was born, the players whose characters aren't involved will find themselves idle.

Not to worry: as a GM you can assign the idle players *alter egos*. Alter egos are NPCs played for the duration of the flashback. If the flashback is going to be extensive, the players can design their own alter egos, if they're so inclined. Alter egos have their own motivations, desires and goals. You should tell the alter ego's players what those motivations are, letting them know what specific actions the character should take in the scenario. Beyond that, encourage the players of alter egos to embellish and make the characters their own.

It's the players' job to breathe life into alter egos and make them interesting foils for the PCs in the flashback. Since you're roping the players into helping you GM, you should make sure that you reward them, perhaps with flashbacks for their own characters.

Alter egos may be the older character's sidekick, ally, patron, lover, enemy, etc. They can be recurring. If several flashbacks occur to that same locus, the same player should run the alter ego again (if it survives!).

Experience and Flashbacks

There are two takes on awarding experience points for flashbacks:

1. Award no experience for flashbacks: since you know your character has survived to the present day, you don't get anything because you don't risk anything.
2. Award experience points for good roleplaying, no matter when it occurred. This can be justified by a character "learning from his mistakes."

Generally, if flashbacks are brief, no experience is necessary. If flashbacks are extensive, however, you should award roleplaying experience.

Summary

At their heart, roleplaying games are interactive storytelling. The same techniques that make books and films more interesting can do the same for your gaming sessions.

by **Mark A. & Jennifer Schmidt**

We've been playing a lot of *INWO* lately and noticed that in a larger game it can take a while for the last player to get into the game. The more players at the table, the longer each person spent "out of the game," watching and interfering in the other player's actions, but unable to act.

Controlled Chaos: An INWO Variant

This variant brings everyone into the game sooner by limiting each player to one action at a time while sharing turn phases. In each phase of the turn, all players act.

Setup for standard and OBD games remains the same, except the players do not roll to determine who goes first.

The turn sequence is as follows:

1. Determine the player order by the following criteria and tiebreakers:
 - a. Most groups
 - b. Highest total Power
 - c. Highest total Resistance
 - d. Highest total Global Power
 - e. Dice rolls, as required.
2. Draw a Plot card, if desired. In an OBD game, do this in player order. You may purchase extra Plots with action tokens as a free action at any time, even interrupting the draw sequence.
3. Draw a Group card. In an OBD game, do this in player order.
4. Take ATOs, as described in the existing rules, in player order.
5. Action Token Placement Phase: Everyone places action tokens as appropriate.

Main Phase

6. Each player, in player order, may attempt one attack, take any other single action, or pass. Other actions include playing a plot that requires an action token, playing a New World Order card, or using their Illuminati action token to bring out a Resource. Free moves do not count as an action, and may be used freely.

A player may declare a win when a Goal is achieved. A win *must* be declared in this phase, allowing the other players to spend action tokens and use plots to stop the win.

This phase ends when all players have passed in order.

End of Turn

7. End of Turn actions. Everyone must discard any excess Plot cards, Bermuda reorganizes, cards lasting to the end of a player's turn expire, free actions may be taken, and winning conditions are verified. If someone met the winning conditions, declared a win, and the other players could not stop the declared winner, the game ends

here. Otherwise, everyone may take any free actions they like then begin the next turn.

As in the standard rules, nobody can attack anyone else's power structure in the first full turn. Any Illuminati that controls no Groups at any time after the end of the third full turn is eliminated.

Options

- **More Action!** Consider only attacks as each player's action during the Main Phase. Players may play Plot cards freely and spend action tokens for various purposes, but each player's action *only* ends following an attack attempt or when the player passes. This allows each player to do more at a time without telegraphing future actions, but loses some of the feel of the variant as the other players watch and wait.
- **Shorter Plots.** Plots lasting until the end of the player's turn end only last until the next time around the table, not the end of the Main Phase, limiting the effectiveness of the Plot card. This can produce a vicious, bloody game.
- **Time Limits.** Increase the speed of play by limiting each player's action to a specific time. We recommend giving each player two minutes to declare an action. The declared action can be completed even if time expires. Use shorter times to really speed things up.

Pyramid Review

Points in Space: Volume I: Starport Locations

Published by [Cumberland Games](#)

Written by **S. John Ross**

One 40 p. Main Book, one 103-page Map Book (both in PDF electronic format); \$12.95

Starport Locations is an electronic book full of settings for science fiction gaming. Two books full, really. The Main Book describes fifteen locations on some rundown space station. It includes schematic maps for each location, with notes scribbled in about what can be found there. The Map Book contains the same maps in tactical scale, overlaid with a hex grid.

The Main Book is a good read. It provides descriptions of restaurants, clubs, stores, a hotel, and even an adult theater along with brief sketches of several characters who frequent each location. Such workaday settings could easily be bland, but here they come to life. The locations are ripe to be inserted as encounters in science fiction RPG's, where they can remind players that there is more going on in the world than the PC's current adventure. The description of a fast food restaurant contains the delightful Random Food Tables. ("Tell me, Skato, do these chalky, blue strips taste funny to you?") Even Laxa's Holoporn Theater, which could not help but be salacious, offers unexpected possibilities; it turns out to be the center of a local ethnic enclave. The book contains few explicit suggestions about how to put PC's into these places, but GM's will have little trouble finding adventure and encounter possibilities. Ross is in good form, serving up characters and background with characteristic humor and aplomb.

The book includes no game statistics and should work fine with any system. When it mentions specific races and nations, careful room is left so that they may be replaced by whatever races and nations GM's already have in their campaigns. This may seem like a shortcoming to readers in need of detailed alien cultures or political situations, but the book makes no aim to provide those things. Where other game resources dwell at the level of cultural or political abstraction, *Starport Locations* is about particular and local color.

The Main Book ends with the Face of Enoch, an original card game for two to six players. A gambling game popular among spacers at Whomar's casino, Face of Enoch forces players to collect cards depicting the mouth, eyes, and tentacles of an alien god so fearsome that no card can depict his entire face. The deck consists of 54 cards and can be printed out onto cardstock. I've never had players roleplay in any detail the games that their characters play, but Face of Enoch tempts me to work it into a campaign and give it a try.

The Map Book may be used in conjunction with the Main Book to set tactical encounters in the locations described there, but it doesn't have to be. The map of the Cor/Kraylor Customs Checkpoint might serve for a security station on any border or even at the perimeter of a secure building, the map for Ela's Tomb might serve for a bar almost anywhere, and so on for the other maps.

Other than the Face of Enoch and the maps, there is no art in these books. This is not a great weakness, since the exposition is rich and the layout attractive.

The books are available only as electronic documents in PDF format, readily usable with Adobe's free Acrobat Reader.

The ReadMe file that accompanies the books explains that they are meant to be printed out and includes advice on how to print them nicely. Hardcopies of the book do look nice, even on a black and white printer. That said, the Main Book looks good on screen and needn't be printed to be enjoyed. I read it on my computer and will only print sections if I need them for running a game. Although I have no difficulties reading the book, it would have been nice to see hypertext links and a table of contents that took advantage of the electronic format.

The Main Book is \$9.95, the Map Book is \$7.95, or the two are package priced at \$12.95 for the pair. If you intend to print them, you'll have to shoulder printing costs in addition. At these prices, the books are *not* a bargain. Nevertheless, they are a solid value. GM's of *Traveller*, *Star Wars*, or Other-Spacefaring-Science-Fiction campaigns will find a lode of local flavor to put into their games, along with ideas for adventures and NPCs. In addition, anyone who plays out tactical combat in planet-bound or modern-day campaigns can probably find uses for the Map Book. If you think you might be in one of these groups, you can try a free sample which contains part of both books.

If you aren't a space gamer, you don't need these books. Yet *Starport Locations* is the first release in the Cumberland Games' All-Systems Library, a projected line of e-books providing resources that gamers can use in their game systems of choice. The series will include a book on medieval society and others on who knows what else, so expect it soon in a genre near you. If other releases match *Starport Locations* in quality, you will want to take a look.

Pyramid Review

The Character Naming Sourcebook

Written by Sherrilyn Kenyon

Published by [Writer's Digest Books](#)

360 pages; \$18.99

One of the hardest things for a GM to do is come up with a name for all of his NPCs. He's spent all week getting the adventure ready, drawing maps, outlining scenarios, stating up the bad guys, and then it comes time to name them. Most of us just start pulling stuff off the top of our head. Jorn. Ismael. Guthar. Dar. Hey wait, I think that one's already taken.

While we gamers often come up with some pretty good ones, most of these names are bound to leave us a bit unsatisfied. I mean after all, most of them are just things we pulled out of the air, so what is there really to distinguish them? Thus, we can see that picking a good name is something we should put a bit of time into. The more meaning a name has and the more logical it is linguistically and culturally, the more it will satisfy both the GM and the players.

We can take a look at it from another standpoint. Stop for a second and think about the coolest bad guy you've ever known. Not just from games; let's try picking one from a movie. First one that comes to my mind is Darth Vader. Now granted, Darth Vader *was* cool, but do you think he would have been an iota as memorable (or *Star Wars* a fraction as successful) if he had been named Donald McKibble? It's a perfectly legitimate name, but it's pretty clear that it doesn't work. Darth Vader bears with it a wicked connotation, and much of this villain's character is gleaned directly from the resonance of his name alone. What's more is that his name actually has meaning -- "Dark Father" (if in fact my German lingual sources ring true). For those of us who understand that, it opens up even more insight (and spoils a certain crucial scene in Episode V).

But finding good names like that, which make sense and have meaning, isn't easy. Many of us have probably hit the multi-lingual dictionaries and baby naming books at one time, and we've all raided our favorite fiction pieces for cool names. But these sources are a bit scattered and unfocused. Fortunately there is a resource out there which provides just such a naming lexicon -- the *Character Naming Sourcebook* by Sherrilyn Kenyon.

This book has been around for a little bit, but it was originally penned as a resource for fiction writers, and these sorts of things tend to take their time seeping into the gaming community (if they do at all). In it, one will find a listing of names, complete with their meanings, in dozens of languages. Languages covered include Danish, English, Egyptian, Greek, Latin, Gaelic, Norse, Russian, Slavic, and many more. Need a good name for a servant? How about Cletus, Greek for "summoned." Need a name for a spirited tagalong squire? How about Faolan, Gaelic for "little wolf." How about a name for that dastardly villainess? Try Serilda, Teutonic for "armored battle-maiden."

The book opens with a thought-provoking intro on the general importance and significance of names, which should get a lot of GMs bubbles brewing by itself. It explores the depth of meaning in a name and the effect it has on an audience. The concepts of the Characternym, or a name that reveals inner meaning about a character, as well as the toponym and resonym, meaningful names for places and objects respectfully, are introduced and explained. The author then goes on to discuss the importance of naming by genre. Those covered include science fiction, romance, mystery, westerns, horror and fantasy, and action-adventure. In each, the author draws upon the wisdom of well noted writers in the field, such as Ben Bova, Ann Williams, and James Reasoner.

Overall this introduction, while short, is very worthwhile. Good naming advice isn't easy to come by in standard

gaming resources, and if you're looking in those "10,000 names for your baby" books, well, I doubt they've got much advice that gamers are really looking for. But of course the good part isn't the intro discussion, it's the massive list of over 20,000 names that follows that is truly valuable. There, a GM will find a name for every occasion, and though the players might not usually be completely privy to it, the names of your NPCs, from low to high, will be riddled with meaning. And what's perhaps greatest is that the names in your game can finally make a little bit of sense. Instead of naming a given group of people randomly, you can name them all from a particular language set. Their given names and surnames can follow a set pattern, and it will add a subtle element of consistency and realism to the campaign.

Like most books, there are a few drawbacks. The first is that very little attention is paid to surnames. Virtually all of the names given are first names, and although guidelines are given on how surnames are comprised with a few examples (virtually all, it seems, are the "X, son of Y" or "X of the land of Z" type), this material is spotty. So some of the lesser-known nomenclatures leave much to be desired in the way of surnames. Names are given for both men and women and a little bit is done here and there to discuss exactly how and why those names are given, but much is left out. For those GMs looking to make their games 100%, absolutely realistic, additional sources (such as history books, atlases [for place names], and foreign language dictionaries) might be necessary.

These limitations make the book a little harder to access for writers, the intended audience, but GMs will have a much easier time getting over them. If information is left out on surnames for a particular culture, a GM can just make up the rule. They're not as restricted by the necessity of realism, and they can turn this book into more of a guide for creating their own nomenclatures and lexicons.

Of course, this book can also be used by players, and it's certain that it will be a welcome addition to the table at character creation. Just having a list of 20,000 names is something that's of great value to any GM, and enough historical and linguistic information is provided by the book to turn it into a truly valuable resource.

Abomination Codex (for WitchCraft RPG)

Published by [Eden Studios](#)

Written by CJ Carella

176 pages; \$20.00

The *Abomination Codex* is the latest release from Eden Studios for the *WitchCraft* game. *WitchCraft* is the game of modern horror developed by CJ Carella, and it uses the Unisystem. This makes it compatible with *Armageddon* and *All Flesh Must Be Eaten*. This latest book offers new Character Types, new Associations, new Metaphysics, and a whole lot of different spirits to use in a *WitchCraft* campaign.

Since this is a game of modern horror, it has to contain vignettes to open each chapter. (I think that it's an amendment to the Constitution for which White Wolf lobbied.) All of the short fiction pieces are pretty good, my favorites among them would be the openings to Chapter Three (where a group of racists get punished for their crimes by a shape-shifting Feral) and Chapter Four (Which has an Immortal finally tracking down her adversary after sixty years only to watch him get assassinated by a Templar before she has a chance to kill him herself. Irony is always good in the modern horror genre).

After the introductions in Chapter One, Chapter Two presents some new rules and secret groups. A new Character Type is presented: the Lesser Supernatural. This is the type used to build a Feral Character. The new Associations are also summarized. The favorite secret society of conspiracy theorists everywhere is here, the Knights Templar. It would be pretty difficult to design a gameworld of many occult secret societies without eventually including the Templars. The Covenant of Legba is a large group of Voodoo practitioners. The Nomads are a group of wandering Ferals, humans who have had their souls merged with a nature spirit. This is what gives them the ability to shift between human and animal forms. There is a Covenant of Tainted individuals in this book as well, the Mockers. They are people who have been changed by a confrontation with the Mad Gods and yet have managed to hold on to their sanity. The last group presented is the Lodge of the Undying, a group of Atlantean Immortals who have been revised since their first appearance in *Armageddon* (back when it was published by Myrmidon).

After the overview of the new Associations, some new Qualities, Drawbacks and Skills are given. The most interesting of these is the Skin-Changer quality which allows a magician to change into a beast form without actually being a Feral, and the Familiar Quality which allows a magician to pay points to have a spirit allied with him. Later in the book there are write-ups for many different spirits, so it is nice to be able to have your Character have some of them bound to his service.

Chapter Three has rules for running two types of Inhumans, the Ferals and the True Immortals. As has already been mentioned, the Ferals are the shapeshifters of the *WitchCraft* world. Ferals can only be based on carnivorous mammals, but apart from that restriction they can be any variety. There are Wolf Ferals, Jaguar Ferals, Hyena Ferals. This allows you to play anything from the traditional werewolf to the shapeshifters of South America or Africa. The rules give an interesting twist to the shapeshifters of folklore. More importantly, it evens out your basic required monsters. Vampyres were presented in *Mystery Codex*, and now Ferals are presented here. Everyone should be happy. The True Immortals are the reincarnations of the last remnants of Atlantis. Anyone who has the previously published *Armageddon* will be familiar with them, but they have been updated and improved. The Child Drawback allows you to play an undying immortal who has to spend her centuries of life trapped in ungrowing body of a child and the Shettari Warrior quality is an interesting new variety of Immortal to unleash on the Cast.

Chapter Four gives more details on the five new Associations that were described earlier in the book. All of them were interesting and will give campaign ideas to any Chronicler. I thought that they were an improvement over the new Associations that were in *Mystery Codex*. Those were a bit uneven, all of these are very well done.

Chapter Five gives new Metaphysics rules, and there are a lot of them. The first thing described is the Keys of Solomon used by the Templars. These powers act as a sort of ÜberInvocation that gives the Templars some amazing powers. One Key even lets the Templar Cast Member hold her own against the Seraphim, some of the most powerful beings in the game universe. After that is a section on using Voodoo Magic in the *WitchCraft* game. CJ Carella developed the *WitchCraft* game, so you knew that eventually there was going to be voodoo in it. The Voodoo section also includes rules for Spirit Patrons, having a supernatural being (like the Loas and Orishas) grant powers to someone who might otherwise not have any metaphysical ability.

The Metaphysics Chapter also includes a section on Taint Powers. These are abilities fueled by Taint (the primal energy of the Mad Gods and their minions from the Outer Dimensions) instead of Essence (the primal energy of everything in our universe from cute fuzzy bunnies to the Dukes of Hell). The section can be used for running Mocker Cast Members or for detailing powers for the Mad Cultists that the Cast is eventually going to run into. The last section gives rules for the Atlantean Arcana, the metaphysical constructs that can be created by True Immortals with the maker Quality. Most of these will be familiar to Armageddon players, the energy blasting Essence Wands and the UFO like Thought Ships. There are also some new Arcana like the Crystal Skull.

The last chapter covers the Supernatural, and has write-ups for examples of every type of spirit in the *WitchCraft* game world. The four classic elementals are described, as well as a fifth Electricity Elemental. Four Nature Spirits are detailed, including Cockroach Spirits to creep out players in an urban campaign, Three types of zombies are presented; Astral Zombies which are enslaved spirits, Living Zombies which are the more realistic version of a voodoo zombie (the puffer fish/premature burial/abuse/brain washing variety), and the Undead Zombie which is the rotting walking corpse of fantasy and horror. The foot soldiers of Heaven and Hell are described, the Angelic Ethereals and the Fiends respectively. Another Ethereal, the Vengeance Ethereal, is also described. Two Tainted Spirits are presented, a Tainted Fire Elemental and the Wendigo (Which is a Tainted Feral). Finally, a new Mad God Cult is written up. This is the Cult of the Rending Shadow which worships Lle'Khor. A history of the cult is given, as well as statistics for Lle'Khor, its minions, and one of its high priests.

There are some new artists working on this book, and the illustrations in this supplement give the work a darker feel than either the *Mystery Codex* or the core book. The pieces by Juha Vuorma were especially dark and disturbing, which is what you want in a horror game. I didn't like the symbols presented for the five new Associations. They were a lot less iconic than the ones done for *Mystery Codex* or the core *WitchCraft* book. But if the only thing I don't like about a book is a minor graphic symbol that only appears once on the cover and once in the book, then I think that I have a pretty good product on my hands. The *Abomination Codex* is a good sourcebook for any modern supernatural game, but a vital necessity for anyone running *WitchCraft*.

-- Thom Marrion

American Arcadia: The Big Rock Candy Mountain

"The whole nation had been footloose too long, Heaven had been just over the next range for too many generations. Why remain in one dull plot of earth when Heaven was reachable, was touchable, was just over there? . . . He had a notion where home would turn out to be, for himself as for his father -- over the next range, on the Big Rock Candy Mountain, that place of impossible loveliness that had pulled the whole nation westward, the place where the fat land sweated up wealth and the heavens dropped lemonade."

-- Wallace Stegner, *The Big Rock Candy Mountain* (1943)

Et in America ego. There's a paradise somewhere in this land of ours, built on the dreams of tramps royal and singing schoolchildren alike. In this American Arcadia our national pastimes of getting and spending take a hike, so you don't have to. There, "the handouts grow on bushes, and you sleep out every night." It's the home of the Bluebird of Happiness, it's the pie in the sky, it's where the streets are paved with gold. In our continuing illumination of the American mythology, what better place to paint than no place at all? So come with me, we'll go and see the Big Rock Candy Mountain.

*"One evening as the sun went down
And the jungle fire was burning,
Down the track came a hobo hiking
And he said 'Boys, I'm not turning,
I'm headed for a land that's far away
Beside the crystal fountain,
So come with me, we'll go and see
The Big Rock Candy Mountain.'"*

-- Harry "Haywire" McClintock, "The Big Rock Candy Mountain" (1928 recording)

The irksome thing about oral history is that nobody ever writes it down until it's too late. During the 1893-1897 Depression, there may have been a million people "on the bum" to one extent or another. In an era before Social Security -- and before Social Security cards -- and when the railroads shipped millions of tons along millions of miles of unguardable railway track -- a man, or an idea, could become completely anonymous. Even a whole mountain could disappear, or, as it happened, appear without anyone realizing it. As a result, the actual origin of the Big Rock Candy Mountain itself is probably unknowable. Like any good myth, it's how Never Always Was. We don't know, for sure, if the hoboes actually called America's paradise the Big Rock Candy Mountain before its realization in song. To paraphrase the Zen koan, is the Big Rock Candy Mountain a legend about a folk song, or a folk song about a legend?

As far as my (admittedly limited) folk musicological resources can stretch, I'm pretty sure that Harry "Haywire" McClintock wrote the standard version of "The Big Rock Candy Mountain," the one adapted by Burl Ives into a perennial children's favorite. (Remember, kids, they're "peppermint trees," not "cigarette trees.") But even I was able to dig up at least four major versions of the song, and plenty of minor variants. McClintock was an orphan from Tennessee who ran away to join the circus, and hit the rails at age 16 (during that 1890s depression), where he became a kind of "court jester" or minstrel to the hobo gangs, singing and playing guitar. I can't say for sure, but my sense is that it was then, desperate to keep the goodwill and interest of people who were, themselves, the original "desperate men," that he revealed the story of the Big Rock Candy Mountain. McClintock went on to serve in the Spanish-American War, gold-rush to the Klondike, work as a railroad brakeman himself, and eventually host a children's radio program on San Francisco's KFRC. In 1928, as far from the 1893 Depression as he could get, he recorded his song -- ironically, when he tried to enforce copyright, the judge refused to allow it, saying it was "a folk song and in the public domain." An interesting fate for a song about the abolition of private property.

"The bluebirds no longer sing by the lemonade springs: The Big Rock Candy Mountain Resort on the Sevier River near Marysvale, Utah, is bankrupt. The sulphur- and chocolate-colored mountain, celebrated in a song written by Harry McClintock and sung by Burl Ives, attracted visitors from around the world who during the 1950s drank its mineral-rich spring water, rumored to have healing powers."

-- "Reality Intrudes on Big Rock Candy Mountain," *Western Roundup* (Oct. 17, 1994)

Another element briefly intrudes into the Big Rock Candy Mountain, the Mountain itself. This brown-and-yellow rounded pyramid rises out of the Utah desert roughly midway between Zion National Park and Mt. Nebo, Utah. Its name comes from the plentiful deposits of yellow and pink rhyolite (volcanic granite) crystals around the area -- and from the folk song. The name came after the first automobile roads went through the Sevier Valley, well after McClintock wrote the song. However, it is interesting that the springs here were "rumored to have healing powers" -- would those be the "lemonade" (or, in a decidedly not-Burl-Ives version, "rock-and-rye") springs, or the "crystal fountain"?

Crystals, fountains, paradises in the desert Waste Land -- is the Big Rock Candy Mountain the Grail Castle, where "each knight ate whatever food he deemed best, and as much as he wanted" as it magically appeared on his plate? How, precisely, does the Big Rock Candy Mountain, as an American paradise, tie in with the "Zion" the Mormons found in Utah? Of course, ever since the Puritans settled in to build their "shining city on the hill" -- or even before, when Columbus thought he had discovered the Garden of Eden in America -- our national dream has been the Garden in the Wilderness, the perfect city. Chicago's motto, *Urbs in Hortis*, means "City in the Garden," and the Columbian Exposition (commemorating the 400th anniversary of this voyage to Eden) featured the White City -- a model of urban perfection that became the Emerald City of Oz, the great American Utopia of 1900.

*"And all larks that are so couth
Fly right down into man's mouth
Smothered in stew, and thereupon
Piles of powdered cinnamon:
Every man may drink his fill
And needn't sweat to pay the bill."*

-- *The Land of Cockaigne* (from a 12th century French ballad)

Of course, the story is even older than that. The German peasants had their own paradises, Schlaraffenland and Lubberland, where bread and cheese grew on trees and beer foamed up from wells. The minnesingers told tales of the Venusberg, the hollow mountain ruled by the Goddess of Pleasure where travelers roistered in endless debauches of rich food and orgiastic sex. The story of Cockaigne, the "land of cake" where pigs walked about already roasted and wine flowed in the streams, shows up in a symphony by Elgar, a painting by Breughel, and poetry in English and French stretching back to the 1100s. Cockaigne's rivers of wine flow back to Hesiod's 7th-century B.C. *Works and Days*, which tells of Saturn's kingdom somewhere to the West, where men "lived as if they were gods, their hearts free from sorrow, and without hard work or pain," and "the fruitful earth yielded its abundant harvest to them of its own accord, and they lived in ease and peace upon the lands with many good things." Another source, even older, is the Garden of Eden, where Adam and Eve could "eat of any fruit" and did no labor for it. Also in the Bible, we find Zion to be "a good land and a large, unto a land flowing with milk and honey;" Isaiah (roughly contemporary with Hesiod) places the earthly paradise in "God's holy mountain."

But there's another side of the Mountain. Paradise is, after all, a place you go [when you die](#). It's a land of the dead, an Elysian Field with "a lake of stew and whiskey too." In "The Dying Hobo" and "The Wabash Cannonball" the hobo singer hops the last freight to a land suspiciously like our own Big Rock Candy Mountain, where (for example) "the handouts grow on bushes and everything is bright." In hoodoo tradition, ghosts like sweets, tobacco, and liquor -- that's the Mountain, all right. And it might not even be Heaven, after all. The Venusberg is, after all, a hollow mountain ruled by a [demonic goddess](#). Isn't it kind of creepy that the "air is pure and bright" *inside* a mountain? McClintock, at one point, said that the song was a parody of the "fairy tales" (brrr) or "ghost stories" (double brrr) that hoboes would spin to lure young boys onto the road. There's a variant of the song, called "The Appleknocker's Lament" that casts the Big Rock Candy Mountain as akin to the Paradise promised the Children's Crusaders, or the song sung by the Pied Piper. Perhaps that good old mountain music isn't so good, after all.

*"I'll show you the bees in the cigarette trees,
The big rock candy mountains,
The [chocolate](#) heights where they give away kites*

*And the sody-water fountains,
The lemonade springs where the bluebird sings,
The marbles made of crystal.
We'll join the band of Dangerous Dan
Who carries a sword and a pistol."*

-- attr. to Wheaton "Skin" Brewer, "The Appleknocker's Lament" (1927)

Whether Heaven, or Hell, or both, the Big Rock Candy Mountain deserves a place -- or two -- in any game of American fantasy, of American myth. For games of a high mythic level, it can actually exist; if you're playing the [Paul Bunyan](#) Pantheon game I've mentioned earlier, it can be the Grail or the Valhalla for our American heroes. In an America-centered *In Nomine* game is it a Dream battleground between Beleth and Blandine? One of Eli's projects, hijacked by Nybbas over the KFRC airwaves through the insidious machinations of Burl Ives? A stronghold for Haagenti, or a killing zone for Marc, or both? A "happily ever after" land for Christopher and the Angels of Children? For even wider-eyed "juvenile fantasy" gaming, supernatural child PCs can emerge from the Big Rock Candy Mountain to help kids in trouble across the Depression-era West.

Or, of course, you can really throw your players off, and sneak the Big Rock Candy Mountain into a "straight" game, either as a one-off comedic note or as a cave opening out into High Weirdness. Our enigmatic [ultraterrestrial Airship](#) emerges in 1897, around the same time as the song may have; was the Big Rock Candy Mountain an attempt at a Belle Epoque [Faerie](#) hill? You could build the Big Rock Candy Mountain with a pretty simple nanotech spill; was there a UFO crash in Utah in 1894? Does the [Templar map](#) encoded by John Dee reveal "God's Holy Mountain" as the source of lemonade springs? Are hobo code marks Enochian sigils? Did Sir Walter [Raleigh's occult tobaccos](#) come from America's hidden cigarette trees? What, exactly, is in the Warehouse 23 candy machines? It's fun to play where the Nephites pray, where you find the Grail in an Oz lunch pail, where the American Dream comes with free ice cream -- it won't be tame if you set your game in the Big Rock Candy Mountain.

Murphy's Rules

Dork Tower!

Dork Tower!

Sometimes, I Hate Me

I don't know about the rest of you players, but I'll often create characters that I specifically dislike . . . or, at least, that have traits and flaws I specifically dislike. It's part of the challenge of gaming for me, I guess; the natural tendency for many people is to play someone who's more or less like you. It's easy to play, say, you with a ray gun, or you with a cowboy hat. But trying to create someone who's actively different from the way you think, and doing that character justice, is a big part of the fun.

Then again, in high school I did some acting, even receiving the prestigious "Honey Baked Spiral Cut" award.

Now, playing someone with a different mindset from your own is separate (in my mind) from playing someone who's Chaotic Yahoo. One is an attempt to try creating a character who is different, the other is an excuse to see what's flammable in the campaign world. Playing someone different doesn't have to be playing someone who's worse, or more evil/selfish/whatever; you can play someone who's *too* good/nice/etc. For example, in the most recent campaign I was in, I played someone who was *so* good, he was constantly on the cusp of being a danger to himself and to others. But he was internally logical and consistent; in essence, he believed in the golden rule (do unto others as you would have them do unto you), but he also thought nothing about sacrificing himself for the Greater Good. So he didn't have many qualms about sacrificing others for the greater good, since he would expect others to do the same thing.

(Of course, you can also play someone who's more evil/selfish/whatever from you . . . but then I personally make sure to understand *why* they do what they do, so I don't fall into the trap of acting like a fiend just because it's easy.)

I also like playing characters who have flaws and characteristics that I don't like, but want to work towards overcoming. Almost all of the various character disadvantages provide grist for this mill: alcoholism, overconfidence, cowardice, etc. It can be a long and meaningful voyage to play a character who goes from being someone that doesn't look out for anyone but himself, to someone who can actually start to care. But in addition to disadvantages you might want to overcome, why not look at *advantages*? In a horror one-shot one time, I played a C-list horror writer hack with ten levels of Fearless. In essence, he was an awful writer who investigated the supernatural and unknown because he wanted to be scared once in his life (it's difficult to write horror if you've never known fear). It enabled me to play a character who was much less careful and discerning than I am, while trying to overcome an advantage (yet not die in the process).

If you're going to play someone wildly different from the way you are (or your normal characters tend to act), you may want to consider telling your GM your character's philosophy as best you can. Of particular use would be how he would react to some "standard" situations (being trapped, being tempted with an "irresistible" offer, etc.). Those reactions are subject to change depending on the exact situation, of course. But it can be useful if, say, you've always played characters who would specifically investigate something if forbidden by an authority figure to do so, and this time (against the GM's expectations and plot requirements) you're playing someone who *always* bows to authority.

Likewise, if you're playing someone who's not particularly likeable, make sure your gaming group and compatriots understand that you're just flexing your acting muscles . . . and *definitely* make sure they understand (if at all appropriate within the game) what motivates your character. It's one thing to play a mercenary that will sell out his associates for the highest bid, and makes that known; it's another to play someone who'll sell them out when this fact becomes known as they're all being devoured by Dr. Foom's deathgeese.

If your character does act against the rest of the party, hopefully everyone's mature enough that they won't take it personally. And if they shoot your character in the knees because they don't trust him . . . don't take that personally either.

* * *

As an aside, I've found myself stymied a bit in some of these "player's advice" sort of columns. On the one hand, I want to provide examples, many of them personal; on the other, I'm wary about boring you all. "I don't care about your

character," as the button goes.

Feel free to start a thread over in the Pyramid discussion board about the amount of detail (or lack thereof) you all care about my ramblings. Or, as ever, feel free to [write me](#).

* * *

Oh, and it's most disheartening to get in a public forum and say, "Dang it! My GM friend Dennis moved to Tampa! I'm all alone, and it stinks!," and have four people write and say things like, "Hey! Can you tell Dennis that we'd like him to GM for us!" It's like the gamerly equivalent of ambulance chasers. Where are you all in Tallahassee, huh?!? Maybe one of you could move *here* . . .

* * *

By the by, I'm looking to possibly do a Valentine's Day theme issue for February 9th. Please feel free to submit articles, adventures, or any of the features (Supporting Cast, Adventure Pizza, and so on) having to do with love, relationships, etc. (Of course, you'll want to do that soonish . . . folks who are considering submitting may want to visit the Pyramid discussion board for updates; when I have a full issue, I'll post something there.)

-- *Steven Marsh*

* * *

*Last week's answer: **Corax**, p. 54.*

(Five stars) "Men have fought and laid claim to fame, fortune, and victory. Countless battles of epic proportions have been waged across the same of time from the age of pharaohs to the 20th century . . .when weekend warriors began to recreate the conquests of the past using armies of miniature figures doing combat in basements and garages."

by [Rick LaRue](#)

I started painting lead figures a long time ago . . . something like fifteen years or so. Over the years, I've made lots of mistakes, but I've learned something (or at least tried to) from each one. Every chance I get, I try to see how other people do things, to see if their techniques and tricks can teach me anything. And they almost always can, if not how to do something, then how *not* to do something. Keep that in mind while you read this, because this is how I do things, but not necessarily how things *must* be done. You may find it very basic. You may find you don't agree with my ideas. Or you may find a few things you hadn't thought of before. In any case, take from it what you will and discard the rest. Hopefully it will help you become a better painter.

Buying Figures

Buy only well-made, well-cast, detailed figures. There are lots of different companies, some better than others. I like Ral Partha and Reaper figures. Games Workshop/Citadel also make very nice figures. Many people hate Company X and swear by Company Y and they'll tell you you're wrong for not agreeing with them. Ignore them. Buy and paint what you think is cool. I've seen figures from every company that I wouldn't buy with someone else's money and I've seen some beautiful figures from no-name companies.

Keep an eye out for the sculptors you like. Most companies list the artist and you can often find other figures you like and avoid the figures you don't by looking at the name. Take that last piece of advice with a grain of salt. Everyone has an off day and just because one figure an artist sculpted wasn't to your liking, doesn't mean all their work is bad.

Buying Paints

Since the whole point of painting your figures is for them to look good, the quality of paint you use will make a big difference. Good paint will have a thick, even consistency. It will apply and dry evenly and won't cake. Paint that is too thin or too thick will not cover properly or will clog some areas and leave others uncovered.

You want quality over quantity. You'll be amazed at just how little paint you really need, and overbuying will waste your money and your paint. Paint dries. That may seem obvious, but it dries *in* the bottle too. Eventually, you'll go to open a bottle or jar of paint and find nothing but a hard pile of useless paint. Sealing the paint jars and storing them in a cool place will help prevent this, but it's inevitable. Remember to clean the tops of your paint jars before closing them. This will allow them to form a better seal and help prevent drying out. Don't buy the industrial size bottle of paint unless you plan to use it all within a few months. Also, don't buy every color under the sun right away. You need the basics, but buy what you need for the figure(s) you're painting now. When you get a new figure that requires a special color, go to the store and buy that color. It's a real drag to think you have everything you need only to find half your paint collection has turned into a desiccated mess of chalk. I've had paints last years, but I've also had them last only a few months. Be warned.

Another hazard is separation. Sometimes the pigment of the paint separates out and you're left with colored water. Mixing the paint works occasionally, but most times the paint is dead. Time to buy new paint. Beware of this from stores that stock a lot of paint that sits on the shelves for a long time. This is a symptom of poor quality paint, but can also happen to the best brands.

So what are the basic colors? To start, you need about ten colors: black, white, medium gray, flesh tone, medium green, medium brown, yellow, red, beige or tan, medium blue, and silver. This is about the minimum I like to have. All of these can be combined to make a much larger array of colors. In practice, I don't usually blend colors unless I have to. I like to use colors right out of the jar. Painting figures is about touching up repeatedly, and trying to match a custom color is nearly impossible. You can always make large batches of mixed colors, but that tends to use up your basic colors, forcing you to buy more paint. If you have to buy more paint anyway, why not just get the color you want and avoid the bother of mixing? I'm sure many people will disagree and that's okay, but I like to keep things as simple as possible.

Where can you get good paint? A good hobby, craft, or gaming store will usually carry a decent selection of water-based acrylic paints for about a dollar for a one- or two-ounce jar. *Do not* use plastic model paints! They are almost always oil based and they will not work the same as water based paints for lead figure painting.

Buying Brushes

No matter how good a painter you are, if you don't have a good set of brushes, you aren't going to be able to do your best work. The old adage "It's a poor artist who blames his tools" doesn't apply here, but a new one does: "It's a stupid artist who doesn't invest in a good set of brushes." A good rule of thumb is: if it comes in a package set, don't buy it. I've found I use three types of sable brushes. A small, fine-tipped brush for detail (size 5/0 or 10/0 Liner or Script); a slightly larger round brush for covering larger areas (size 000 Round) and a flat, medium-sized brush (size 1 or 2 Shader) for Dry Brushing. The last is a personal preference since Dry Brushing (see below) can be done with either of the other types. You may also find having a few other brushes of various sizes will come in handy from time to time.

It's important to clean your brushes properly. The better you take care of them, the longer they'll last. While painting, I use a small cup of water to clean paint from the brush before changing colors or switching brushes. Change the water in your cup frequently, especially when Washing (see below) to avoid muddying your colors. *Never* leave paint on a brush you aren't using. That's a surefire way to destroy it. Some people will tell you to leave your brushes bristles down in a cup of water while painting; I've found this can deform the brush and ruin them. Clean off the excess paint and let them lie off to the side until you need them again. When you're done working, clean all the brushes you used with light soap and cool water. When all the paint is gone, gently reform the brushes, replace the plastic tube that covers the bristles and store them bristles up in a safe place.

Tools

Brushes aren't the only things you need to paint. A craft knife is essential for removing flashing, cleaning up molding lines, and a million other things. Make sure you have extra sharp blades for it, too. A good flat file for filing bases and a few small files of different shapes for getting at casting imperfections on the figure are also useful. Some people like clips and vices for holding figures without touching them with fingers, and magnifying glasses for seeing detail.

Glue is another must. I use three types: Crazy Glue, Epoxy, and Elmer's Glue. Crazy Glue and Elmer's Glue are the typical glues everyone has been using since kindergarten. Epoxy is a different story. I use the type that has to be mixed before it will dry. It's messy, dries too fast, and is hard to work with, but it hardens like solid steel! There's nothing better than Epoxy for assembling metal figures (see below).

For years I used Crazy Glue to mount figures to just about any hard, non-porous surface. I've changed my mind about this. Over the years, I've started to see more and more of my figures separate from their bases when using Crazy Glue. So now, I use Epoxy for mounting, even if it's more of a pain to use. I just try to mount as many figures as I can before the Epoxy mixture dries. *Warning:* Do not get mixed Epoxy on your hands or anything of value. Trust me, it's

not pretty.

Lighting is a very important tool. Good light, at the correct angle, can make the difference between a well-painted figure and a garish mess of unrecognizable colors. Harsh, bright light is as bad as dim light. You need a cool, soft, non-fluorescent light source that can be directed on what you're painting. I like using one or two drafting lamps on my workbench in an otherwise dark room.

Speaking of workbenches, where you paint can make a big difference. I dream of a large secluded workbench with a clean surface where all my paints, tools, and supplies are within easy reach, a comfortable chair, proper lighting, and maybe a good stereo so I can have tunes playing in the background. That's not easy to achieve. For the most part, all you need is a clean space on a table with good lighting. Put some newspaper down to protect the surface. Spread out your supplies and get to work. As you become more serious, you can figure out something more permanent. If you end up using the kitchen table, make sure you clean up when you're done. There's no better way to aggravate spouses, roommates, or parents than by leaving your painting stuff lying around. Worse, if you leave it where anyone can get to it, there's a good chance something bad will happen. And of course we all know, no one is as careful with our precious masterpieces as we are. All it takes is someone dropping a nearly completed figure to ruin hours of work.

Cleaning

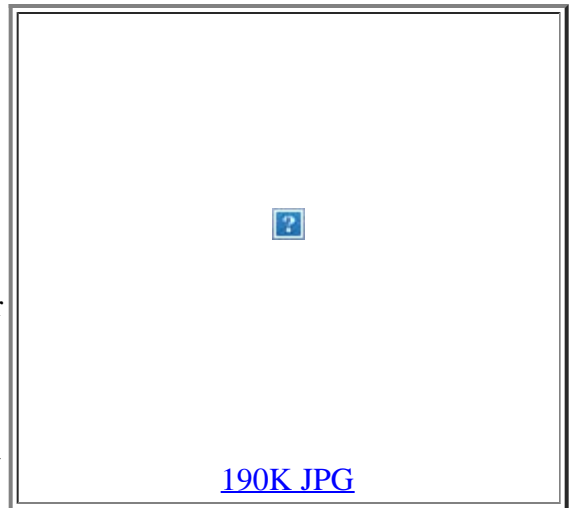

No matter how well-cast a figure is, it will probably need to have the flashing removed. Flashing is the extra metal left over during casting. A good sharp hobby knife or small file can be used, and if done right will be impossible to detect after it's painted. Make sure you file the base so it is flat and can be easily glued to your choice of mounting bases.

The next step is to wash the figure. This is not to be confused with "washing," which is a type of finish detailing I'll describe later. This type of washing is to clean the figure with soap and water to remove oils and grit the figures pick up during casting. Dish washing detergent works well. Gently wash and towel dry the figure, then let the figure completely dry overnight in a safe place.

Priming

Next you have to "prime" the figure. I can't stress how important this step is. Some people neglect to prime their figures and end up with thin spots where the metal of the figure shows through, giving the paint a metallic look. Primer or base coats provide an even painting surface to which other layers can be easily applied.

Priming can be done using any of several different colors and is as simple as putting a light base coat of paint or primer on the figure. I've heard of people using black, dark gray, light gray, white, and even red to prime their figures. Experimentation will tell you what works best for you. As a guideline, dark colors make for darker figures and may be harder to cover with some colors. On the other hand, there are some shortcuts you can use with dark base coats to make figures look more detailed without requiring a lot of work. Light, neutral colors (e.g. white, light gray, etc.) are my personal favorites. They are easy to cover with any color and don't darken the colors you put on it. While some people have claimed to have good success with red primer, I won't use it. Red is notorious for being difficult to cover with almost anything other than black.

Once you've chosen a primer color, you need to apply it. Application can be done by spray or by brush. Personal preferences aside, both methods work well. Brushing requires more work and can leave streaking if not done carefully. Spraying works well, but over-spraying is a real hazard and can remove fine detail from figures by covering them up. Try both and see which works best for you, but in either case, use a consistent coat that covers the entire figure with a thin, even layer of paint.

Mounting

I like to mount my figures. Most figures come with very small bases that are hard to grasp. I use 1" ceramic hexagonal tiles. You can get them at most tile stores in various colors for less than \$10 per 12" square sheet (about 144 tiles). They're cheap, nearly indestructible and look nice. For larger, diorama-style bases you can use whatever seems right: pieces of wood, large ceramic tiles, or a bunch of small ones glued together.

In most cases, I'll mount figures before I paint them, but after I prime them. It gives me a better way to manipulate the figure while painting. I can also hold the figure without touching any of the painted surfaces. Exceptions to this rule are when mounting makes getting to certain areas of the figure with a brush impossible. In that case, you just have to make due with the figure's own base, or clips.

Mounting is also a part of finishing the figure. A good base can enhance even the most well-painted figure. You can add flocking, small stones, lichen, and many other things to give the figure a more realistic look. Just apply a thin coat of Elmer's Glue and add the extras of your choice. Let it dry and you go from having a well-painted warrior standing on a plain base to having a well-painted warrior standing amidst the rubble of a ruined castle.

Drying

I always let *any* layer of paint dry over night. It allows the paint time to set and adhere itself to the surface. You also avoid mixing colors by accident. It may end up taking a long time to finish a figure, but you can work on several different figures at once without rushing. I also find that waiting a day gives me a better perspective to look at the figure with. Painting takes concentration and it's easy to miss things when your eyes start to go buggy from focusing on something as small as most figures. If you come back fresh the next day, you'll spot places you missed or where your hand wasn't as steady as you thought.

Assembling

You've heard the old saying "Some assembly required," right? Well the same is true for some figures. Because of casting restrictions, packaging, and various other reasoning, some figures have to be put together either before or after painting. The hardest part of this (besides figuring out what goes where) is getting all the pieces to fit together properly.

All the pieces are created using separate molds, and try as they might, miniature companies can't always get flawless molds. This leaves use with the equivalent of fitting a square peg into a round hole.

I don't think I've come across a single multi-piece figure that fit together without some filing. Accept that now, and you'll be a happier person in the long run. It's not as bad as it might seem. The biggest hazard is overdoing it. File a little at a time, checking the fit often. Also, think of the problem from both sides. Is it easier/better/faster to make the hole bigger or the peg smaller? Which approach will make a better-looking finished product? Often, it's a little of both.

What needs to be filed? If you're lucky, it'll be obvious. Otherwise, here's a suggestion. Try marking one of the pieces with ink where it will touch the other piece. If you do it before the ink dries, you'll see little spots on the unmarked piece where the ink of the marked piece touched it. That's where you start. File those a little bit and try again. This takes patience, but the results are pretty good. You can usually get a good fit after a few tries.

"Well, now it fits together, but it has these big gaps between the pieces!" This happens a lot, but it can be fixed. There are all kinds of ways to do this, from excessive filing to melted lead filler. I like doing something a bit less extreme. Since you're going to use epoxy to glue them together anyway, why not make use of it as filler as well? Like I said

above, epoxy dries like solid steel. With the proper application of a little extra epoxy (liquid or putty), you can fill in the gaps. When the epoxy dries, prime it (it might take a few coats) and paint it like the rest of the figure. You can even add some custom details to help blend the area into the whole. Afterwards, the gaps will either be reduced greatly, or completely unnoticeable. Problem solved.

Okay, so it's not that easy. But with a little practice, you really can do wonders. I had a dragon figure that no matter how hard I tried I could not get its head to go on right. If I wiggled it one way I had a huge gash on one side. Wiggle it the other and the gash switched sides. Filing didn't help (if I filed any more I start losing an unacceptable amount of detail). In the end, I glued the head as best I could so there were small gaps on both sides and filled them in with excess epoxy. Once I painted them, you could hardly tell they existed at all.

Remember not to gleefully assemble your figures right away. Think about how you're going to paint them. Sometimes, adding a piece will make painting some part of the figure very hard or even impossible. Hold off. Add as much as you can without making your life difficult. Then paint everything (even the pieces that aren't attached) and add the last few pieces at the end. This will undoubtedly require touch up, but it's better to touch up a small area than to be unable to paint part of your figure.

Painting

Painting is more than slapping some paint on a surface with a dripping brush. It takes a certain amount of planning to get the results you want. Color selection is extremely important to a finished figure. A poorly chosen collection of colors will take away from even the most masterfully painted figure. Try to pick colors that not only compliment each other, but the subject matter of the figure as well. You want the figure to be eye-catching, but not offensive.

Begin painting as if you were dressing the figure. That is, from the lowest part of the figure (usually the skin) outwards. Apply the paint evenly, being careful not to leave streaks or pools of paint. Paint carefully, but don't be overly concerned with perfection, at least not at this point. The object at first is to put a layer of paint on the major features of the figure. Fine detail (e.g. belt buckles, buttons, eyes, lips, etc.) will come later.

You will make mistakes. Always. No matter how good you become, you will make mistakes. That's okay. Since all we're trying to do is define the parts of the figure, you can go back and touch things up. Take your time. Take breaks. As I mentioned above, a break can often allow you to see places where a little bit of the brown from the belt got on the blue of the tunic. Carefully touch these up. It may take several attempts, but eventually, you'll have a fully painted figure.

Some people will tell you to pick a feature on a figure, a tunic or shirt for example, and paint it to completion (e.g. apply the paint, wash it, dry brush it and add the finishing detail) and then move on to next feature to be painted. I don't agree with this approach. I prefer to paint everything (except fine details) first, touch it up so it's as close to perfect as I can get it, and move on to the finishing techniques (like washing, dry brushing, etc.). Why? Well, if I spend a lot of time painting and finishing some part of a figure and later, while working on another feature, I get paint on it, I'll have a much harder time fixing my mistake because I'll have to redo all the finishing as well as the basic painting.

Finishing Techniques

By this point, you should have a fully painted (minus the details) but essentially dull-looking figure. Right on schedule! This is where you start finishing you figure. There are five basic finishing techniques you can use to make your dull painted figure come alive. You don't have to use all of them. You don't have to use any of them. But the better you understand their use, the better you'll be at knowing which to use when and how much to make the best figure you can.

Washing

Washing adds depth and realism to a figure by adding shadows. To wash a figure, take a darker shade of a color and water it down until it's thin, but still has a deep, rich color. In some cases, you can use straight black paint (I call this black-washing), but this will often darken a figure greatly. While I use paint, you can also use inks to accomplish the same thing. Paints tend to dry with a flatter finish than inks, which tend to have a slightly glossy look when dry, but this depends on the ink as well. The correct combination of paint and ink washes can really make a figure stand out. Try both and see what you feel most comfortable with.

Apply the wash to the figure by brushing it on, but allow the mixture to pool slightly in the crevices and deeper areas. If the pooling is too great, use a dry brush to draw off some of the wash. As the wash dries, the pigments will settle in the deeper areas of the figure creating a shadowing effect. You may have to apply a few washes to get the colors you want.

Other interesting effects can be created by repeatedly washing a figure with gradually darkening colors. Another trick is to mix metallic and non-metallic colors to create a hybrid, which works great on jewelry, weapons and armor. Also, remember to be careful when washing dark colors next to light colors.

Outlining

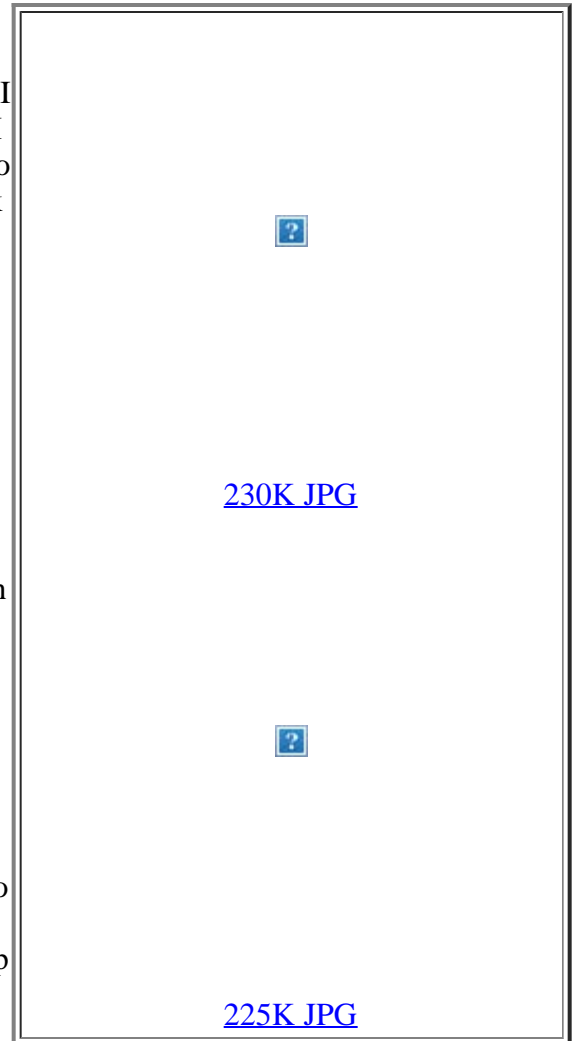

Outlining is a variation of washing. It adds a very vivid shadowing effect to figures by delineating where different areas come together. For instance, where the belt meets the chain hauberk. This creates dark shadows that help to emphasize the details of the figure.

To outline, carefully apply a heavy wash of black paint or ink (i.e. a blackwash) to the areas of a figure where two details come together. Be careful to keep the pooling to a minimum. Use a normal wash on the rest of the figure and you'll be amazed at how good the figure looks.

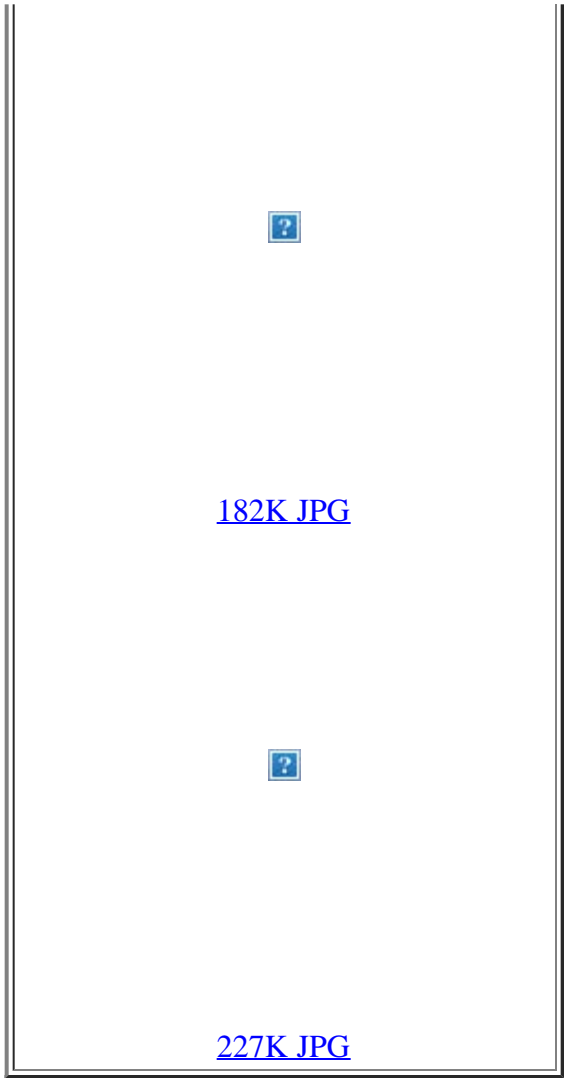

This is where using black primer can save some time. If you are careful when you apply the basic colors to your figure, you can allow the black primer to show through at the detail intersections, effectively outlining the figure. In my opinion, this doesn't look as realistic as true outlining, but it is a time saver and doesn't look all that bad.

Dry Brushing

Dry brushing is just what it sounds like; you use a dry brush to highlight a figure. The brush is "dry" because most of the paint has been removed. The goal is to highlight the raised parts of a figure with a lighter shade of paint.

To use this technique, put a little paint on a brush and wipe it on a paper towel until almost all of the paint has come off. Then, gently brush the raised parts of the figure until a small amount of paint has covered them. It's best to use a slightly lighter shade of paint than the color your painting over, but you can also restore an original color that has been darkened by washing.

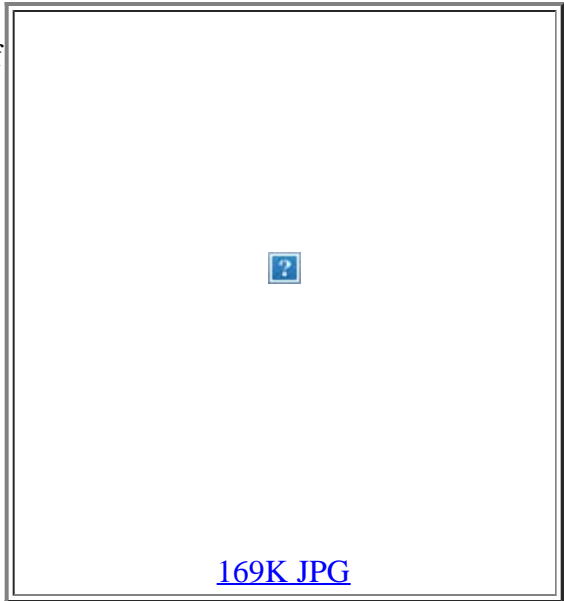

Detailing

This is the most challenging part of painting. It requires a steady hand and a good eye. I save this for last since most of the fine details would be lost if you accidentally wash or dry brush over them. Fine details include eyes, lips, buttons, buckles, studs, gems, rings and other tiny features that require only a small dab of paint.

Start by steadying your arms; place both elbows in front of you, touching the top of the table. Hold the figure in one hand and your brush in the other. Then brace your brush hand against your other hand so they move as one. Put a tiny bit of paint on the tip of your brush and dab it on the figure. The trick is to be confident and deliberate in your brush strokes. Don't hesitate, but don't overreact either. This may take a few tries. If you make a mistake, touch it up and try again.

Remember, find the easiest way to achieve your goals and use them. If you can dry brush the details on some parts of your figures, fine. Sometimes it's easier to be a bit messy when you detail and then touch up around it. The end result will still look like you have the steadiest hand in the world.

A note about eyes: eyes are tough. No doubt about it. I tend to paint the eyes white (or an appropriate color) before painting the face. Then I carefully paint around them with the flesh color. When I apply the wash, I wash right over

them and then go back and draw off the wash with a dry brush.

The last thing I do is paint the pupil. Be careful how you do this. Look at the figure and try to see where it's looking. Once you know, paint one eye. Look again. Where's the painted eye looking? There's nothing worse than a cross-eyed mage, so paint the second eye to match the first.

Protecting

You're done. Your figure is finished and the paint is dry. What's next? Protect it! Fingers have acids and oils all over them (and greasy chip and cookie fingers have even more). I always avoid touching a finished figure by anything other than the base, but if you plan on using the figures to game, that won't be enough.

There are finishes and sealants that you can spray or paint on that will seal and protect your figures. They come in flat and various levels of gloss. Beware of how the different finishes will look on your figure. To me, when used exclusively, gloss finishes make a figure look like it was painted with nail polish, while a flat finish can dull down an area you intentionally painted to be shiny. I like to use flat finishes on most (if not all) of a figure, with gloss finish on small areas like crystal balls other things that should be shiny.

To apply, get a brush (for liquid finish) or spray can and cover the completed figure evenly with your choice of finish.

A Few Closing Comments

Well, that's the gist of it. It may seem overwhelming, but it's not. With each new figure you paint, you'll get better and, eventually, you'll have a whole list of tricks of your own. Good luck.

Oh, and by the way, if you discover any neat tricks, [let me know](#). I'm always looking for something to add to my own bag.

by **Hans-Christian Vortisch**

"Secret Weapon. A weapon closely guarded or kept under concealment so as to be used with advantage before countermeasures can be taken against it."

--Dictionary of Weapons and Military Terms

This article deals with weapons used in covert operations, either by secret agents or special operation troops. It is thus intended as direct support for *GURPS Espionage* and *Special Ops*. Both concentrate only on modern day guns, and had to neglect older and the more bizarre designs out there because of space constraints. Some designs will also be useful in *GURPS Cliffhangers* campaigns, or certain historical adventures set in the 20th century.

"Secret agents operating inside enemy territory may carry concealed weapons, mainly for use as a last resort to avoid capture . . . special forces have to carry out such a wide variety of missions that they have a great need for specialised weapons."

--The Visual Dictionary of Special Military Forces

Below the reader will find a mixture of types suitable for covert operations. Most were not necessarily secret in the strictest sense of the term, nor easily hideable, but all were used or intended to be used in secret operations with either secret agents, counter-intelligence agents, or SpecOps soldiers. There are guns literally hand-built for special missions along with some which were made by the million. Some were built into everyday objects, some were easily concealable under clothing, some were vehicle-mounted. Some were used by lonely assassins. Some were used by entire battalions in daring commando raids. And some were probably never used in action at all.

Special Weapons

Aste Stockflinte, 9x10mmR Flobert, Germany, 1910 (Holdout -4)

A smoothbore singleshot weapon concealed as a walking cane. Weapons like this were very popular with civilians in the late 19th century and made in many countries. This one was made in Germany before WWI, where guns like this were often outlawed in certain cities and counties, and forbidden nationwide after 1928. It fired a weak rimfire round. A 9x30mmR smallshot shell could be loaded instead; Dam 1d+1*, Acc 1, 1/2D 3, 1/4D 6, Max 20.

SS-Waffenakademie Koppelschlosspistole, 7.65x17mmSR Browning (.32 ACP), Germany, 1944 (Holdout +6)

The bizarre Koppelschlosspistole (belt buckle pistol) was developed by the SS-Waffenakademie at Brünn (Brno). A special belt buckle was fitted with a springloaded cover. When activated (e.g. by pressing a catch on the buckle or by pulling a string when the wearer was ordered "hands up!"), the cover would open up, revealing four barrels loaded with 7.65mm cartridges. These immediately fired. The belt was intended to be issued to agents as a last-ditch self-defense weapon to avoid capture. The full snap shot penalty always applies, and hits will usually be to Hit Locations 10 or 11. Only a handful were manufactured, and they were probably never used in combat.

SOE Sleeve Pistol Mk I, 7.65x17mmSR Browning (.32 ACP), UK, 1944 (Holdout +1)

This was a slender tube holding a firing chamber and an integral sound suppressor (Hearing -6). It could be carried concealed up one's sleeve. Just before firing it had to be slipped into the hand and could then be fired by pointing the arm at the target. To reload, the cap at the end had to be unscrewed and the spent case removed (about 10 seconds). This was a pure assassination weapon designed by the British Special Operations Executive (SOE).

U.S. Naval Gun Factory Glove Pistol MK1, 9x20mmR (.38 S&W), USA, 1944 (Holdout +3)

Developed by U.S. Naval Intelligence, this weapon consisted of a heavy leather glove with a small metal plate riveted to the back of the hand. This mounted a very short barrel loaded with a single round and a striker assembly, which protruded slightly when the hand was balled into a fist. The weapon was to be used in hand-to-hand combat. The user was to strike the target with his fist, thus firing the bullet point-blank into whatever body part he had hit. Of course, the Glove Pistol's use was highly questionable, and it is unlikely that it was ever used in action.

Llama Pressin, 7.65x17mmSR Browning (.32 ACP), Spain, 1982 (Holdout +2)

This unique weapon was nothing more than two very short barrels side-by-side in a rectangular block, triggered from a button trigger. It came in a cheap-looking plastic case, from which it could be fired without removing the case. The 4.8"x1"x2" case was a non-descript thing of the type used for sun glasses. The double-barreled weapon was developed to discreetly arm a bodyguard. Reloading was not an option in a fire fight.

Pistols

Czeská Zbrojovka vz.27, 7.65x17mmSR Browning (.32 ACP), Czechoslovakia, 1927 (Holdout -0) Secret Weapons in GURPS

A small blowback pistol, adopted by the Czechoslovakian police. Production continued after the German occupation, and the weapon was issued to the German police and Waffen-SS as the P27(t). From about 1943, small numbers were made with slightly longer barrels and screw-on sound suppressors, and these were used by German Abwehr agents, Brandenburg commandos and SS-assassins; Dam 2d-2-, Hearing -5. The SS-Waffenakademie produced and supplied the 7.65x17mmSR K-Patrone, which held a small amount of Aconitine poison (2d damage, see p. CII146 under "Wolfsbane"). In turn, captured weapons were used by the British Special Air Service (SAS).

Production of the vz.27 was resumed after WWII and continued until 1951. Surplus weapons were later delivered to struggling communist countries such as Ethiopia and North Vietnam. In the 1950s it was adopted by the West German foreign intelligence service, the Bundesnachrichtendienst (BND).

Walther P38, 9x19mm Parabellum, Germany, 1939 (Holdout -1)

The P38 superseded the 9x19mm Luger P08 as the standard service pistol of the German military and was consequently made in huge numbers, also by Mauser and Spreewerke. It was the first high-power pistol to use a double-action system. Its commercial counterpart, the Heerespistole (HP), was made between 1938-1945, while the P38 was kept in production until 1946 under French occupation. In the immediate years after the war, it was used by French, Israeli, Norwegian and East German forces.

The P38SD, a modified version, was available with a barrel prepared for the attachment of a sound suppressor, but in much smaller numbers and for special units only. This was commonly used with a special subsonic round, the 9x19mm Nahpatrone with reduced charge; Dam 2d-1, Hearing -5. The P38SD was a standard CIA weapon in the 1950s and 1960s, and also used by the West German Fernspäher (long-range reconnaissance patrol) units.

During the 1940s and again between 1975-1981 the P38K was made. It differed in a shortened barrel; Dam 2d+1, Wt 2.3, Holdout 0. The P38K was used by SpecOps units during WWII, and in post-war years by both the East German Stasi and shortly by the West German GSG9 antiterrorist unit.

In 1957 an improved P38-model with a lightened aluminum frame (Wt 2.1) was adopted as the P1 by the newly formed West German military and was also available commercially, foreign users including Austria, Chile, Pakistan and Uruguay. Although slowly superseded in German service by the 9x19mm H&K P8 since 1994, it is still in production for the civilian market.

High Standard HDMS, 5.6x16mmR (.22 Long Rifle), USA, 1944 (Holdout -2)

The commercial High Standard HD pistol was modified into the HDMS, a silenced weapon with integral sound suppressor for the agents of the American Office of Strategic Services (OSS); about 2,000 were made. It was usually loaded with hollow-points.

Pistols in this caliber have always been popular with professionals. They are light, accurate and easily silenced. For example, Israeli Mossad assassins have long used the Beretta Mod 70 in this way.

KGB Troika, 7.65x17mm, USSR, 1950 (Holdout +2)

The Troika (the name given to it by Western intelligence agencies) was a typical spy weapon designed for assassination at close range. It was a small hide-away gun chambered for a unique electrically primed 7.65mm cartridge. In place of a magazine it had a replaceable barrel cluster which was inserted into the weapon from above. The cluster consisted of three preloaded over-and-under barrels with integral sound suppressors (Hearing -6). After all three barrels had been fired the cluster had to be replaced. Three different types of projectiles were available, a normal bullet, a hollow-point bullet (p. HT7) and a poison projectile containing cyanide (the poison does 4d of damage, causing cardiac arrest; see p. CII141). The pistol fired electrically; a commercial 9V battery went into the grip. The slimline frame allowed it to be easily hidden. All Troikas were hand-made in small numbers in the workshops of the KGB.

Apparently, it was copied as an unreloadable plastic throw-away weapon by Arab terrorists during the 1970s for use in airplane hijackings. This version was undetectable by metal detectors when the battery was removed. It was not suppressed.

Heckler & Koch P9S, 9x19mm Parabellum, West Germany, 1970 (Holdout -1)

A double-action pistol using the same roller-locking action as most longarms made by H&K. It was adopted by the GSG9 antiterrorist unit, but in their service replaced by the 9x19mm H&K P7 in 1980. Other SpecOps users have included the Dutch SBS naval commandos, the Greek MYK naval commandos, and the Portuguese and Spanish police GEO antiterrorist units. The P9S was also widely sold commercially, in both combat and sports versions, the latter with match grip, muzzle weight and accurized sights; Acc 5, Wt 2.8. EBO of Greece made it under license.

A number of sound-suppressed versions were made to special order beginning in 1973, including some made for a Swiss agency and a larger batch for the U.S. Navy SEALs, replacing the obsolete 9x19mm S&W MK22-0 Hush Puppy; Wt 3.2 with the suppressor attached. The SEALs used it throughout the 1980s and apparently right until 1996, when it was officially superseded by the 11.43x23mm (.45 ACP) H&K MK23-0.

From 1976 the basic P9S was also made in 11.43x23mm for the American market; Dam 2d+, Wt 2.2, AWt 0.5, Shots 7+1, ST 11, Rcl -2. A much smaller number was made in 7.65x21mm Parabellum for the Italian market; Dam 2d-, Shots 8+1.

Tzniitochmash MPS, 7.62x35mm, USSR, 1972 (Holdout +2)

This was another purpose-built assassination weapon. It was a double-barreled derringer-type weapon, which was loaded with two-round clips. The cartridges were of the silent "piston" type (Hearing -6). They didn't require a sound suppressor, as the powder gases were contained within the sealed cartridge case. A bullet fired from this pistol would look exactly as if fired from a 7.62x39mm AK-47 assault rifle, down to the rifling marks, and might thus suggest to the authorities that the shot was fired from a much greater distance. The weapon was used both in Afghanistan and Central America by Soviet KGB agents and SpecOps units such as the Spetsnaz.

Shotguns

Remington MOD 7188 MK1, 18.5x70mmR (12-gauge), USA, 1968 (Holdout -6)

This was a full-automatic conversion of the Remington Model 1100 semi-automatic shotgun. It was developed for the U.S. Navy SEALs, and very small numbers were used in operations during the Vietnam War. It was fitted with rifle sights and a bayonet lug for the M7 knife/bayonet of the M16.

Submachine Guns

Steyr M.12/P16, 9x23mm Steyr, Austria, 1916 (Holdout -2)

This machine pistol was a variant of the Austrian service pistol M.12, designed for Austrian mountain troops fighting the Italians in the Dolomites during WWI. It featured a fixed, elongated 16-round magazine, which was loaded with 8-round stripper clips. A wooden shoulderstock was sometimes attached (+3 Acc, using Light Auto skill). Some 9,900 were supplied before production ceased in 1918.

In 1940, a number of surviving guns was re-barreled to fire the 9x19mm Parabellum round and issued to the German SpecOps commandos of the Brandenburg regiment. These could also be fitted with a sound suppressor.

Marlin UD42, 9x19mm Parabellum, USA, 1942 (Holdout -5)

This submachine gun was made by Marlin Firearms for the United Defense Supply Corporation, which was a cover organization set up by the OSS. The UD42 was of high quality, and externally resembled the Auto-Ordnance M1921 Tommy Gun. It had a wooden foregrip. The weapon fired from a closed bolt in single shot mode (Acc 8) and from an open bolt on full auto (Acc 6). The double magazine consisted of two separate magazines taking 20 rounds each, mated at the back. After 20 rounds had been expended, it had to be removed, turned over and re-inserted (requiring 2 seconds). About 15,000 of these guns were made. Most were taken by the OSS, and either issued to agents inserted into occupied areas or dropped by parachute for use by resistance fighters. Some 2,000 were thus delivered to the French resistance.

BSA STEN Mk IIS, 9x19mm Parabellum, UK, 1943 (Holdout -5)

This was a variant of the STEN Mk II (p. HT116) with an integral full-length sound suppressor. The suppressor was very effective (Hearing -6), but wore out after 30 or sometimes as little as 15 rounds. Burst-fire was strongly discouraged, the idea being to fire carefully aimed single shots to make it last longer. The magazine was badly designed, and the manufacturer advised to load it with only 28 rounds for more reliable feeding! The STEN Mk IIS was the most numerous sound-suppressed weapon of WWII. It was widely used by British and some Allied commando units, and many were also supplied to resistance groups in Western Europe, especially Denmark and France. Specimens captured by the Germans were used by their own SpecOps assets as the MP751(e).

Beretta Mod 12, 9x19mm Parabellum, Italy, 1959 (Holdout -4 with stock folded)

This blowback weapon used to be the standard Italian submachine gun. It had an integral foregrip and a folding wire stock. It was offered with magazines holding 20 (AWt 0.95), 30 or 40 (AWt 1.6) rounds. In 1961 it was adopted by the Italian armed forces and police as the PM-12 (including the GIS antiterror unit), and also delivered to a number of foreign nations, among them Chad, France, Guatemala, Iran, Libya, Nigeria, Saudi Arabia, Somalia, Sudan, and Venezuela. The U.S. Navy SEALs acquired 200 in the 1970s, while the State Department bought large numbers for U.S. embassy guards in foreign countries. It was license-made by FN of Belgium, Taurus of Brazil, Bandung Arsenal of Indonesia, and Kaduna Arsenal of Nigeria. The Mod 12 was a favorite weapon of the terrorist Illich Ramirez Sanchez ("Carlos the Jackal"), and apparently also used by German RAF terrorists. In 1978 it was superseded in production by the slightly improved Mod 12S. For illustration, see p. SO2.

Heckler & Koch MP5K, 9x19mm Parabellum, West Germany, 1976 (Holdout -3)

The Maschinenpistole 5 Kurz was a chopped-down variant of the MP5 submachine gun (pp. HT116, SO105-106) without stock. It was normally used with the standard 30-round magazine, but a shorter 15-round magazine (AWt 0.7) was available. The gun was so small that it could be conveniently carried in a special shoulder holster. The MP5K was

designed for bodyguards and SpecOps forces, and widely adopted by Western units of this type, including the German GSG9 and KSK, the U.S. Army 1st SFOD Delta, the helicopter pilots of the 160th Special Operations Aviation Regiment, the pilots of the USAF 16th Special Operations Wing, the U.S. Navy SEALs, the French GIGN, the Royal Canadian Mounted Police, the Australian and British SAS, the Irish Rangers, the Kuwaiti and Jordanian Special Forces, the Indian presidential guards, etc. Through hidden channels it was also acquired by the former East German Staatssicherheitsdienst (Stasi), the secret police and intelligence service, and apparently used as a standard weapon with in-country hit teams. It is safe to assume that the Soviets also acquired some. The gun has been made under license in England, Iran, and Turkey.

The MP5KA1 had the sights removed (+1 Fast-Draw), and with a 15-round magazine had these stats: Acc 3, Wt 5.0, Holdout -2.

The MP5KA4 available since 1982 had a 3-round burst option added, while the MP5KA5 was similar to the MP5KA1, also offering 3-round bursts.

In 1991, the MP5K-PDW was introduced, basically an MP5K with folding stock and a barrel prepared for a sound suppressor; Acc 7, Wt 7.3, Holdout -3 with stock folded. This was designed as an aircrew survival and self-defense weapon, and usually issued with a detachable sound suppressor (+1.25 lbs., Hearing -5). A special hardshell briefcase was offered by H&K, which held any one of the above models in a quick-detach mount. A trigger and a safety were incorporated in the carrying handle, so that the gun could be remote-fired through a hidden port from within, the spent cases being collected inside. The non-descript briefcase weighed 14.85 lbs. including the loaded gun and a spare 30-round magazine, and cost \$1,600. When firing from the case, the full snap shot penalty is always applied.

Similar cased assemblies have been made in Czechoslovakia (suppressed 7.65x17mmSR CZ vz.61 Skorpion), Israel (9x19mm IMI Mini-Uzi) and in the USA (short-barreled 5.6x16mmR American 180).

Rifles

Cranston-Johnson M1941, 7.62x63mm (.30-06 Springfield), USA, 1941 (Holdout -6)

This was a self-loading rifle developed in the late 1930s in an unsuccessful bid to replace Garand's M1. It had an internal 10-round magazine loaded with 5-round clips or single cartridges. Some 2,000 made by Cranston Arms were taken by the U.S. Marines in 1942, and used in the Pacific Theater until sufficient M1 rifles became available. Service was restricted to Marine Parachutists and the Marine Raiders. In about 1944 these were returned to the USA and given to the OSS, which dropped many by parachute over Europe to resistance fighters, mostly in France. The U.S. Army Rangers also got some, many of a 50,000 contract originally for the Dutch colonial troops in the East Indies, which could not all be delivered. Many of those wound up with the Brazilian forces in Europe.

One thousand were made in 7x57mm Mauser for Chile (Dam 6d+2) before production ceased in 1944.

Rheinmetall FG42/II, 7.92x57mm Mauser, Germany, 1943 (Holdout -6)

The German Fallschirmjäger (parachutists) were under the control of the Luftwaffe (air force), and used some weapons differing from normal Heer (army) units. The Fallschirmjärgewehr 42 was developed by Rheinmetall to a Luftwaffe requirement for a combined rifle and light machine gun. It was a very unique design of bullpup configuration, with the magazine feeding from the left side above the pistol grip. The gun had several good design features such as a straight-line stock with recoil-reducing spring and a muzzlebrake compensator, but operationally it was a failure in the end because of the insistence of using the full-power rifle round. It fired from a closed bolt in single shot mode (Acc 10) and from the open bolt position on full auto (Acc 8). Features also included an integral folding bipod and a spike bayonet which swiveled backwards when not in use. The pre-series FG42/I was ready in 1942.

The FG42/II entered limited production the next year and was first used in May 1943 in a SpecOps operation on the Greek isles and also in the famous operation "Eiche," the daring raid to free Mussolini on September 12, 1943 in Italy. Two Fallschirmjäger per 9-man squad carried the FG42/II in place of the standard 9x19mm ERMA MP40 submachine gun.

The main production weapon, the improved FG42/III made by Krieghoff, was not delivered until 1944. It differed from the earlier types in a number of ways; Wt 12.6, RoF 10*, Rcl -2.

The FG42 was often fitted with a 4x scope (+2 Acc). Only about 7,000 of all types were made for the Luftwaffe. Late in the war, a separate batch of some 4,100 was made for the Heer.

Remington M1903A4, 7.62x63mm (.30-06 Springfield), USA, 1943 (Holdout -6)

A dedicated sniper version of the Springfield M1903A3 bolt-action service rifle (see p. HT114). It featured a 2.5x Weaver scope and was loaded with 5-round stripper clips or single cartridges. During WWII, each Ranger platoon had one sniper with this rifle. It was also used in the initial stages of the Vietnam War.

The Remington M1942 adopted by the USMC was a similar weapon. It was based on the Springfield M1903A1 and was fitted with a 8x Unertl scope (+3 Acc). It was used until the 1960s.

Haenel StG44, 7.92x33mm Kurz, Germany, 1944 (Holdout -6)

The Sturmgewehr 44 was the first assault rifle in both name and shape and function, the direct forefather of Kalashnikov's AK-47. It fired an intermediate power round and used a curved large-capacity magazine. It evolved via the MKb42, MP43 and MP44, which were all basically the same gun with almost identical statistics. A few thousand of the MKb42 were made and successfully tested at the front in 1942, whereupon the MP43 was put into full production. Minor production changes led to the MP44, which was re-designated the StG44 in December 1944. More than 430,000 were made by Haenel, ERMA, Mauser, Sauer, Steyr and Walther, and it was intended to replace all rifles and submachine guns in German service; it was also installed as bow-machine gun in the experimental Panther II tank.

As to clandestine use, about 300 were fitted in late 1944 with the top secret Leitz ZG1223 Vampir active IR-sighting system. This consisted of an IR-spotlight and IR-scope mounted on the gun (5.1 lbs.), and a heavy battery assembly carried in a rucksack (29.9 lbs.). It could be used to a range of some 75 yards and negated all darkness penalties.

The weapon continued to surface for many decades after WWII in smaller conflicts in Africa, the Middle East and Southeast Asia, usually delivered to Communist forces by sympathetic nations such as Czechoslovakia and East Germany. Thus it was encountered by the Americans in Vietnam and the Israelis in Lebanon.

Izhmash AKS-74UB, 5.45x39mm, USSR, 1979 (Holdout -5 with stock folded)

This was a SpecOps version of the AKS-74U assault carbine (p. SO100 under "AK-74"). The flashhider of the standard issue weapon was replaced by a detachable PBS-2 sound suppressor (Hearing -5). Typically used with special subsonic ammunition, it could also fire standard rounds, although with less good results (Dam 3d, Hearing -3). It had a folding stock and could use all magazines of the AK-74-series, including a short 20-round magazine (AWt 0.9) and the 45-round magazine (AWt 1.65) and 90-round drum (AWt 4.55) of the RPK-74 light machine gun. The gun was adopted by SpecOps units of all Soviet armed forces, including those of the Ministry of the Interior. It continues to be used in Russia.

The AKS-74UB could mount the 30mm BS-1 underbarrel grenade launcher (see below).

Walther WA2000, 7.62x66mmB (.300 Winchester Magnum), West Germany, 1982 (Holdout -7)

The Walther Automat 2000 was supposedly one of the most accurate sniper rifles ever designed. It was a bullpup weapon literally built around an extremely heavy, free-floating barrel. It had a fully adjustable wooden stock with thumbhole grip, a folding bipod and a variable power scope (2.5-10x). The WA2000 fired semi-automatic. It was only made to order and each was adjusted to the individual customer (one of them being James Bond in *The Living Daylights*). It could be set up for left-hand firers.

Alternatively, it could be ordered in 7.62x51mm NATO or 7.5x55mm Swiss (both Dam 7d).

Although offered until 1988, production already ceased in 1984, a mere 72 having been sold. A handful were acquired by the German state police of Baden-Württemberg, both in 7.62x51mm and 7.62x66mmB, and used by SWAT officers. The price listed is for a used gun in perfect condition.

Machine Guns

Vickers G.O. Mk I, 7.7x56mmR (.303 SAA), UK, 1937

This gas-operated machine gun (commercial designation Mark K) was based on the Vickers-Berthier Mk I light machine gun of the Indian Army. It was adopted by the Royal Air Force to replace the 7.7x56mmR BSA-Lewis Mk III as a defensive gun on airplanes such as the Fairey Swordfish naval scout or the Vickers Wellesley bomber. Like the Lewis, it fed from a large platter drum magazine on top of the receiver. The gun was soon obsolete as an aircraft weapon, surplus weapons being used from about 1942 onwards by British elite raiding and reconnaissance units such as the Long Range Desert Group and SAS as vehicle armament, especially for use against aircraft. A typical Willy's jeep of the SAS in North Africa and later France was fitted with twin guns on a pintle mount at the co-drivers seat, and another pair of linked guns behind the drivers seat, covering the rear when the vehicle was standing still. It was still in service in 1956, when the Willy's jeeps airdropped together with the British Paras over Egypt during the Suez crisis were armed with twin guns at the co-driver's seats.

The Mark K was also delivered to Poland and Spain, while Argentina bought some in 7.65x53mm Mauser (Dam 6d+2) and Turkey in 7.92x57mm Mauser (Dam 7d+1). These were all used on aircraft.

Cadillac Gage-Stoner MK23 MOD 0 Commando, 5.56x45mm (.223 Remington), USA, 1969 (Holdout -7)

In 1962, Eugene Stoner, father of the AR-15 family, started to design a modular firearm system which allowed assembly of a rifle, a carbine, and several machine guns from a common set of parts. The Model 63 system was tested by the USMC, but rejected.

The slightly improved Model 63A entered production in 1966 and was immediately seized upon by the U.S. Navy SEALs. A belt-fed light machine gun version of the Model 63A was extensively used in Vietnam by the SEALs (and only them) beginning in 1967. This weapon fed from a disintegrating belt, which was usually transported in a 100-round plastic container clipped below the receiver; Dam 5d, 1/2D 500, Max 3,500, Wt 15.2, AWt 3.3, Shots 100.

A further improved version was the Model 63A1. It was officially adopted by the SEALs as the MK23-0 Commando, the only Stoner machine gun to be so. The MK23-0 had a shortened, fluted barrel and lacked both the bipod and carrying handle of the earlier guns. It introduced an aluminum drum container which held a 150-round belt. Only 800 of the Model 63A and 63A1 guns were made.

Santa Bárbara-CETME AMELI, 5.56x45mm NATO, Spain, 1982 (Holdout -6)

The Ametralladora Ligera was one of the lightest weapons of its class. It resembled a smaller version of the German 7.92x57mm Rheinmetall MG42, a 7.62x51mm NATO variant of which was made in Spain as the MG3S. The AMELI was a belt-fed weapon using either 100-round or 200-round (AWt 6.6) disintegrating belts, which came in plastic assault packs attached under the weapon. The cyclic rate of fire could be changed by installing either one of two bolt carriers available. The AMELI was adopted by the Spanish Army and Mexican Marines. One interesting feature was that it disassembled very easily and would then fit into a small briefcase, together with a 100-round box. A trained operator could assemble the gun from the briefcase in 20 seconds (an Armoury (Small Arms) or Guns (Light Auto) roll is required).

Since the late 1980s, a lightweight version was available; Wt 14.8 with 100-round belt.

Grenade Launchers

Izhmash BS-1, 30mm, USSR, 1986

This was a unique underbarrel grenade launcher only seen mounted under the AKS-74UB suppressed assault carbine (see above). It silently launched a 30mm HEAT grenade by means of a piston, which was activated by a 9x18mm blank cartridge. Flash and sound were contained within the weapon, helping to conceal the grenadier's position. The grenade was muzzle-loaded, while the blank cartridges were fed by means of a bolt-action system from a curved 10-round magazine in the launcher's pistol grip. The whole assembly weighed 3.3 lbs.

Hand Grenades

NWM V40, The Netherlands, 1968 (Holdout +3)

The V40 minigrenade was the smallest hand grenade ever produced in quantity. Its body was spherical and only 1.5" across (about the size of a golf ball), with a filler of 1.1 oz. of RDX. The fuse detonated it after 4 seconds. It came in bandoleers of five (1.4 lbs.). The V40 was combat-trialed in 1969 in Vietnam by the U.S. Navy SEALs and U.S. Army Special Forces, but not adopted. It was copied in China and North Korea.

Selected References

Dockery, Kevin (1991). *Compendium of Modern Firearms*. R. Talsorian Games, Berkeley.

Only some of the listed weapons are described here, but the book is too good to miss.

Gander, Terry, ed. (2000). *Jane's Infantry Weapons 2000-2001*. Jane's Information Services, London.

The most valuable single-volume resource in the field of modern firearms. For purposes of this article, older issues of this since 1975 annually published book are actually more useful.

Hogg, Ian (1996). *Jane's Guns Recognition Guide*. HarperCollins, Glasgow.

An inexpensive handbook, whose descriptions, pictures and data fulfill most players' needs.

Hogg, Ian (1999). *The Greenhill Military Small Arms Data Book*. Greenhill/Stackpole, London/Mechanicsburg.

Excellent source for technical data, manufacturers etc. 295 pages and worth every penny. Almost no pictures, you need at least another book to visualize what Hogg is talking about.

Smith, Walther/Smith, Joseph (1973). *Small Arms of the World*. Stackpole, Harrisburg.

Another excellent book, available in a number of different editions. If you get only one book on guns, get this.

Tucker, Louise, ed. (1993). *The Visual Dictionary of Special Military Forces*. Eyewitness Visual Dictionaries. Dorling Kindersley, London/New York/Stuttgart.

No stats, no explanations and weak on dates, it is nevertheless worthwhile for its very good illustrations, not restricted to guns either. Actually includes much secret agent equipment as well.

Notes

Wt: Loaded weight of the gun, in pounds.

AWt: The weight of the standard ammunition container or a number of loose rounds. Optional magazines are listed in the descriptions.

Cost: Cost with one empty magazine, unloaded, including any sighting devices as per description.

Beneath the Sphinx

by A. L. Maturin

Ingredients

Introduction

Since the beginning of recorded history humanity has tried to unravel the mysteries of the Sphinx. How was it built? Who built it? When was it built? These questions, and many others, along with the sheer majesty of the Sphinx have caused many men (and women) to devote their lives to answering the riddle. Even now, millennia later, the Sphinx still baffles Egyptologists and continues to reveal its secrets. In the 1990s, due to the work of archaeologists using ground-penetrating radar (GPR), what is believed to be a chamber has been discovered beneath the Sphinx. The Egyptian government refuses to allow a dig to open the chamber, so one can only guess at what wonders lay inside . . .

The False Chamber

This is the chamber that the GPR revealed. It is located between the Sphinx's two paws, just before the body. The earth here is very hard, yet sandy, clay. Once dug, a descending stairway leading to the entrance is revealed. The stairs are huge slabs of limestone quarried from nearby. The entrance is an unmarked, granite frame with a large limestone slab blocking the doorway. There are no inscriptions on the frame, which strikes any archaeologist as very peculiar. Once the stone slab is removed, a 10' x 20' chamber, devoid of the usual hieroglyphs and artifacts accompanying tombs, is revealed. There is a limestone sarcophagus lying at the far end of the room. It too is devoid of inscription. The sarcophagus is empty; however, there is a false bottom, which leads to another descending stairway. The stairway ends abruptly at a 10' x 10' square pit that is 20' deep. The walls of the pit are utterly smooth so it would be impossible to climb without help from others or modern rock climbing equipment. On the other side of the pit are two corridors, each leading in opposite directions and each leading to an adjoining chamber.

The Adjoining Chambers

Each of the adjoining chambers contains enough Egyptian artifacts to make this dig the most valuable in history. The items range from golden scroll containers (each containing scrolls originally housed in the Library at Alexandria . . . with the seal to prove it.), gold dining ware, mummified cats and dogs (in jewel encrusted, golden sarcophagi), and chests of gold and gems; each chamber also contains four full sets of Egyptian-made armor. All of this, of course, is a distraction to keep tomb robbers from the real prize, which lies in the inner chamber.

Each chamber contains a corner floor stone, which can be lifted, revealing another descending stairway. These stairwells are very small and steep, and descend about 40'. There is a chance of someone falling and severely injuring himself due to the nature of the stairways. Both sets of stairs lead to opposite ends of the inner chamber.

The Inner Chamber

The inner chamber is a 10' x 10' room centered between the adjoining chambers, some 40' below. There is a pedestal, carved of solid obsidian, in the center of the room. Hieroglyphic inscriptions on the walls warn of the destructive power of the item that sits on the pedestal. Anyone removing the item from the pedestal will receive three poison darts (coming from the pedestal itself), though the poison itself will do no damage -- it's been harmless for millennia -- it will still make its victim feel somewhat nauseated. Anyone else in the room may have a chance of getting hit with the darts, as three fly from each of the pedestal's cardinal directions.

There are several different types of statuettes lining the walls of the chamber. They range from 6" to 1' in height. They

are recognizable to any Egyptologist as warrior guardians that protect a Pharaoh's soul on the trip to the land of the dead. It is strange, however, because no remains can be found anywhere within the complex.

Cooking Tips

The Glory of Egypt

The item on the pedestal is an ancient time-traveling device. When activated the device will automatically send the occupants of the room back to the time when the priests buried the device. The priests, of course, knew this would happen and have prepared for it. Several guards and priests will meet the time-travelers here and request their aid in stopping the Pharaoh's plot.

The Pharaoh's plan involves building a massive pyramid; five times the size of the Great Pyramid, with an outer covering of gold, which will be inscribed with blasphemous text to incite rage in Ra (king of the gods), in hopes of challenging him for his position. The pyramid is nearing completion, with only the inscriptions left to complete. The priests believe the Pharaoh has gone mad, and believe Ra would destroy all of Egypt rather than accept the challenge. It is up to the time-travelers to stop the construction of the Pyramid, or all of Egypt is doomed.

Extra Spice? What if the item is a one-way device? What if the priests stole the item from an alien race still in Egypt? What if the priests want the time-travelers to kill the Pharaoh? What if the Pharaoh is an alien?

The Glory of the Sphinx

The item on the pedestal is an ancient magical orb, which was used to transform the Sphinx into its current state. When touched the orb will glow and the earth will begin to tremble, as the Sphinx transforms back into its original (living) state. The Sphinx is still angry at being turned to stone and begins his rampage at Giza. Fully healed in the reverse of the transformation, he will attack any humans on sight. The Pyramids are a reminder of those who enslaved him, so he will attempt to destroy them too.

Extra Spice? What if the Sphinx was willingly turned to stone to deliver some message? What if he dies, due to the damage to his body, before he can fully deliver the message? What if the message was the return of the ancient gods? What if those gods are already here?

The Glory of Ashun

Ashun is a god born of Geb (the earth-god) and Nut (goddess of the heavens). Ashun has never been mentioned before in any religious scripts because Shu (air-god, second king of the gods), enraged by the newborn child, enslaved him into a magical orb before anyone learned of his birth. This orb lies upon the pedestal. When activated, the orb will free Ashun, who is all too eager to claim the throne as the king of gods, since all the other gods are gone.

Extra Spice? What if Ashun is angry at humanity also? What if Ashun was trapped in his child-like state? What if Ashun requires a human queen to continue his line? What if the other gods return?

Side Salad

Don't forget about the items in the adjoining chambers. The scrolls could contain any number of things: the real location of Atlantis, encounters with alien races, lost technology, evidence that the Egyptians had some modern technology (like steam engines or electrical power), etc. This would be a good place to plant clues to further adventures. The pedestal could also have some importance to the adventure. It could be the only weapon that could destroy the Sphinx, the Pharaoh, or Ashun, for example.

Professor Pfiffen-Pfeffer (The Big Cheese)

by Rik Kershaw-Moore

Note: The Big Cheese's stats are presented in parentheses.

Beliefs & Goals: Der vorld vould be der better place mit gadgets. Vith mine gadgets I can be makink der world happier. Ah-ah-ah-choo! *(Ah, as you can see I am the consummate villain. I will take over the world, and there is nothing you can do to stop me. Ah-ah-ah-choo!)*

Hit Points: 7 (10)

Muscle: 3

- Break Down Door 3 (5)
- Climb 3 (3)
- Fight 3 (5)
- Pick Up Heavy Things 3 (4)

Zip: 4

- Dodge 4 (6)
- Drive Vehicle 6 (4)
- Fire Gun 4 (6)
- Jump 4 (4)
- Ride 4 (4)
- Run 4 (4)
- Swim 4 (4)

Smarts: 6

- Hide/Spot Hidden 6 (6)
- Identify Dangerous Things 11 (9)
- Read 8 (6)
- Resist Fast Talk 9 (9)
- See/Hear/Smell 8 (6)
- Track/Cover Tracks 6 (6)

Chutzpah: 5

- Fast Talk 5 (8)
- Pass/Detect Shoddy Goods 8 (8)
- Sleight of Hand 7 (6)
- Sneak 5 (5)

Shticks:

Change Shape: 7

Bag of Many Wrong Things: 5 -- This is a like a standard bag of many things except that whatever is pulled out is always totally wrong and useless.

(Change Shape 7, Teleport 6)

Quote: Somereve is der lever zat vill change der vorld, all I am havink to do iz findink it. *(No Mr Stocks, I expect you to cry!)*

Professor Pfiffen-Pfeffer is your classic 4-foot high cartoon duck in a white lab coat; the right pocket of which is a bag of many *wrong* things. He has the usual yellow bill and black feathers except, for a mass of white feathers that

flop uncontrollably across his face. He is also extremely absent-minded, speaks with a heavy Teutonic accent, and works at Anytown University.

The good professor has a serious problem. He is violently allergic to an astonishingly wide variety of substances. In fact, his sneezes are so violent and long drawn out that they catapult him out of shot, and cause him to change into the evil genius known as the Big Cheese.

The Big Cheese is a sinister looking 4-foot high white mouse (also with allergies). This evil genius has waxed and curled whiskers and wears impeccably tailored black suits with matching black gloves. The Big Cheese has one ambition: to rule the World; strangely enough, he tries to achieve this goal by using the good professor's inventions. So far no one has worked out that the Big Cheese and Professor Pfiffen-Pfeffer are one and the same. In fact, neither the Big Cheese or Professor Pfiffen-Pfeffer are aware of this fact.

So what makes these two characters sneeze? Well it can be anything from the mundane (pepper) to the esoteric (Foogle Bird feathers), depending on what the animator feels is appropriate. There is, however, a 50 percent chance that the substance that made the Professor change will not make the Big Cheese sneeze. Also if either the Big Cheese or the Professor are knocked down, then there is a 50 percent chance that when they come round they will flip characters.

Plot Lines

The Amourizer

In a desperate attempt to help reduce the amount of needless violence in Anytown, Professor Pfiffen-Pfeffer came up with the Amourizer, a raygun shaped device that shoots out an incoherent stream of strange attractor particles. The upshot of which is that anyone who gets zapped by the pink mist ray will instantly fall in love with his or her mortal enemies. Cats suddenly love dogs, and mice will treat cats with great affection and so on. In short, total chaos, and guess who has the ray now?

Not only will the Characters have to work out a way of taking the Amourizer off the Big Cheese, but they need to work out how to reverse the effects of the ray.

The Weather Machine

In the last couple of days Anytown's weather has become very erratic, and the populations of "real" penguins and ducks has mushroomed, whilst showers of cows and anvils have risen dramatically.

After a while, when things apparently can't get any stranger it is revealed that the Big Cheese is behind all this high weirdness. He has taken control of the weather using Professor Pfiffen-Pfeffer's weather machine.

The Weather machine is a 30-foot high black cube of metal with a parabolic dish on top. The machine has a control panel with a small screen, a keyboard, a large black lever, a large read lever and a six position selector switch labelled N, R, S, H, C, and U.

To operate the machine you first select a type of weather, then enter the coordinates of where you want the weather to happen and pull the black lever. If you don't enter the coordinates then the weather will happen directly above the machine. When you want the weather to stop simply push the black lever back to its starting point. Oh and whatever you do, don't pull the red lever . . . this makes the machine explode.

The Dial Settings:

N (Nice) A typical nice sunny day.

R (Rain) A small black cloud will move in and block out the sun. Then it starts to rain. Within seconds the characters will find themselves up to their knees in water, and ducks will swim past. If the rain isn't stopped then it will quickly submerge the characters, and shark fins will slice through the water. Switching the machine off will make the water drain away but the ducks will hang around for a while, getting under everyone's feet.

S (Snow) Snow is very similar to rain except that the black cloud dispenses mammoth quantities of snow. The characters will instantly become living snowmen, and penguins and polar bears will turn up to harass them.

H (Hail) The black cloud scuds across the sky, produces a megaphone and screams "Hey Taxi!" Roll on the "Call Me a Taxi" Table for the result.

C (Cows) Mooooooooooooooooooooo . . . thud! Speaks for itself really. Cows start dropping from the sky. By some strange quirk of fate the cows are being deliberately aimed at the characters. The cows probably want to use the characters as a cushion. It will take liberal use of Dodge rolls to avoid being boggled and flattened by incoming cattle. Those who don't get out of the way take 3 dice damage.

U (User-Defined) Anything the animator wants. Anvils are a good all round choice, but if you are fresh out of ideas the feel free to consult the "Things Falling From Sky" Table.

Pyramid Review

Hero Builder's Guidebook (for Dungeons & Dragons)

Published by [Wizards of the Coast](#)

Written by **Ryan Dancey, David Noonan, and John D. Rateliff**

64 ppg.; \$14.95

The *Hero Builder's Guidebook* is a companion to the *3rd Edition D&D Player's Handbook*, and that alone set my teeth a little on edge when I first took a look at it. TSR's seeming marketing strategy throughout the 1980s and 1990s -- release as many books as possible, charge about \$20 for each, and tell the fans that every one of them would be indispensable -- may have looked good on paper, but it only drove me even further away from the game than its antiquated rules set and overly rigid concepts had already done. With Wizards of the Coast at the helm, *3rd Edition D&D* has already enjoyed its share of controversy, but my big question ultimately was how they would approach the release of supplements: would the game stand alone? Would new supplements be optional, but of high enough quality to make them appealing despite the cost? Or would they continue the shell game, the Supplement Shuffle? I saw the *Hero Builder's Guidebook* as a good test of that question. And to my mind, Wizards passes the test. At least for now.

Although it never says so explicitly, the *Guidebook* is written for beginning gamers. From the Introduction on, it assumes nothing about the readers except that they've read the *Player's Handbook*: the Introduction starts with notes on what sets player characters apart from other characters, and the section on rolling ability scores explains the mathematics behind the dice and the rationale for the favored "roll 4 dice and drop the lowest" method. All of this material will be old-hat to veteran gamers, but it's just the sort of thing that helps an enthusiastic newbie understand exactly why the game does what it does. (As an aside, I particularly liked the mathematical stuff. All that cryptic bell curve material in the beginning of the first edition *Dungeon Master's Guide* was great for me to get a sense of what the ability scores really should have meant -- and that's what first clued me in to the shortcomings of *AD&D*, like the fact that only the upper 2% of the population were any different in their performance of the core actions of adventuring, like fighting or casting spells; the fact that *D&D3* threw *that* nonsense out the window was one of the things I liked best about it. But, on with the review.)

The meat of the *Guidebook* is the chapter on "Choosing Your Race and Class," a 30-page expansion of the brief but useful notes that accompanied each class description in the *Player's Handbook*. (You remember the original notes: "A gnome monk is such a goofy idea that your character must surely be special. Wing it." That sort of thing.) The *Guidebook* devotes a full section, from a quarter-page to a half-page, to each possible combination of race and class, with useful summaries of the class' role in the race's culture, the implication of racial bonuses and penalties to the class' requirements and activities, and class "variants" to offer quick and easy ideas for how a character of that particular class and race would fit into the world. It's all the kind of stuff that experienced gamers will figure out on their own, but it can get new players into the swing of things quickly.

"Creating Your Personal History" is essentially a collection of charts and tables for easy rolling-up of a character's background, from her type of home community to family life. (If anyone remembers Mayfair's *Role Aids* book on generating character backgrounds, it's like a condensed version of that.) Like most collections of charts and tables, it's theoretically useful, but I don't know how much it will actually get used. I played with the idea of writing a script to automate the thing for my own use in coming up with Instant NPCs so as not to tax my brain in the middle of a game,

but otherwise the greatest value in the charts will be in reminding players that the cultures of *D&D*'s fantasy world ought to be just as complex and subtle as those in our own world, and that they shouldn't serve to pigeonhole anybody into a cliched character concept.

"Selecting an Alignment" is an ethical questionnaire to help determine what alignment your character should be, and it ought to look familiar to psych. majors, guidance counselors, and anybody who's had to take an "ethics questionnaire" in order to get a sensitive job. "Are you in touch with childhood friends?" "Would you help an injured stranger on the side of the road?" "Would you kill someone in order to escape from jail?" Each possible answer gives you a number of points to tally, and the end result is a suggested alignment for the character. The same sort of thing has been on the Internet for several years. Like the Personal History charts, it's more useful as a way of illustrating the concepts of the alignments than as an actual method for character generation.

The last chapter, "Planning Your Future Career," offers several possible character types, using the standard classes and races, with recommended choices of skills and feats: how to create a Robin Hood-type archer, how to create a necromancer, how to create a swashbuckling swordsman, and so on. As before, none of it's going to be new to experienced players, but it can save a new player the trouble of figuring out the various combinations of skills and feats needed for that particular style of character he or she has in mind.

Finally, there's an appendix on naming characters, with notes on methods for coming up with names and titles, tips for maintaining atmosphere, and even bigger lists of sample names for each race than were included in the *Player's Handbook*. This was the weakest section of the book, with nothing that even a beginning player couldn't figure out immediately after reading the *Player's Handbook*; but it was only a 4-page appendix, after all, so no great loss.

At 64 pages, the *Hero Builder's Guidebook* (*PCs for Dummies* might have been a more apt title, but I suppose it would have confused a lot of beleaguered computer shoppers . . .) seems a little slim for its \$15 price tag, but it has its place. Experienced gamers might not get much out of it, but Dungeon Masters facing new players will find it immensely useful; it's just the sort of thing to hand to a couple of newbies, allowing them to get the hang of things on their own while you deal with a whole table of others clamoring for attention. And, let's face it: some of us are willing to pay hard cash for that kind of peace of mind.

Werewolf: The Apocalypse Revised Edition

Published by [White Wolf Publishing](#)

Written by Deirdre Brooks, Brian Campbell, Harry Heckel, Heather Heckel, Forrest Marchinton, Matt McFarland, Denna McKinney, Kyle Olson and Ethan Skemp

\$29.95

I'm going to start this review off with a statement of position. *Werewolf* is my favorite game of the Storyteller series. Unfortunately, I like it for all the wrong reasons. My style of play is generally termed "superheroes with fangs," and I see no problem with that. I love the fact that there's a race of inhuman creatures, organized along tribal lines, that are attempting to perform a duty they were charged with ages ago, and are failing miserably. The spiritualism of the game and the visceral charge it can deliver give me chills. The varieties of games that can be played, with an emphasis on any one of the game's aspects, fill my mind with possibilities.

So, yeah, I'm the developer's worst nightmare. But gamers tend to be annoying like that; the wrong people keep playing the wrong games.

So, what do I think of *Werewolf Revised*? I like it.

The basic concept behind *Werewolf* is as such: millennia ago, the Garou (werewolves) were charged by Gaia, the Earth spirit, with protecting the planet and safeguarding humanity (or safeguarding the planet from humanity, depending on who you ask).

They failed, and one of the great spirit forces of the universe, the Wyrms, has gone insane and is attempting to bring about the end of existence. The Garou, who've lost three of their tribes, one of which was even corrupted by the Wyrms itself, are on the losing end of this great war.

Revised is the game's third edition (fourth, if you count *Werewolf: The Wild West*). They've cleaned up a few things here and there. The game is, like any successful RPG these days must be, visually arresting. I don't think a single piece of art in it was sub-par. Each chapter has a full-page representation of one of the tribes as a header, along with a short fiction piece about each tribe. There's a new art series for illustrating combat, with two Garou fighting an Umbral beast of some kind; this is a bit of an improvement over previous editions, which had two Garou fighting it out. There's also a nice series of pieces to illustrate each of the lunar aspects.

The rules revision are mostly subtle, with clarifications and such. Many of the rules changes concern the spirit and Umbra rules. Garou no longer need a mirror to cross to the spirit realms; it's just easier for them to do it with one. Spirit combat has been pretty much completely changed; a Spirit's Rage is now the difficulty to damage it. A spirit's power is now equal to the sum of its three attributes.

Like with all the White Wolf game worlds, *Werewolf's* Revised edition has seen some changes. One of the tribes of the Garou Nation, the contemplative Stargazers, have left the nation to seek healing with the Beast Courts of Asia. There's still a little info available on them in the Allies section of the book. The world sections are revised and expanded. There are changes in the dialect of the Garou; non-werewolf shapechangers are now called 'Fera' instead of

Bete (which is good, because not too many Garou speak French). The book covers the red star approaching through the Umbra; named Anthelios, it's a harbinger of the coming Apocalypse, and relates to the events of the "Year of the Reckoning."

The Antagonists section is well realized; it contains info on the Black Spiral Dancers, the fallen Garou, as well as rules and info for Fomori and other foes. Garou Gifts (their magical abilities) are expanded. There's a number of new ones, particularly first level ones.

My biggest complaint with the book isn't with the content. It's the binding. Less than 24 hours after receiving my copy (I had barely done any reading) the back cover had begun to split from the book. Within a week, it had completely separated, being only attached by the spine.

So, the big question that comes with a new edition (or at least just a revision of a current edition), is it worth it buying for current players? It does a good job updating *Werewolf* in the six years since the second edition was released. It's pleasing visually, and is complete (one of many complaints I heard about the Revised edition of *Mage* released last year was that there wasn't as much information about the antagonists of the game).

The developers weren't able to copy the Revised edition of *Vampire* and include the optional Merits & Flaws system into the game, but rules and setting-wise, the game is complete. It's managed to help keep *Werewolf* at the top of my list of favorite games.

Siege on Tolkeen 4: Cyber-Knights (for Rifts)

Published by [Palladium Books](#)

Written by Kevin Siembieda

112 pages; \$12.95

As the *Siege on Tolkeen* series has been released and developed, there have been two camps of readers who have voiced the strongest opinions about it. There are those that love it -- those who praise Siembieda for creating what may be the greatest set of books he has yet written in the *Rifts* series. And then there are those that hate it -- those who claim that Siembieda is ruining one of the greatest settings and plots that he had created when he penned the original book. The fact that Siembieda took ten years to get this series out (and left gamers ten years to anticipate it eagerly) could easily be why there's such a split between the satisfied and the disappointed.

There are strong and weak arguments on both sides of this fence, and I'm not about to make a point in favor of either. What I will say is that if you are among the *Rifts* gamers who have not been buying this series, then *SoT Book 4: Cyber-Knights* is the one book you may want to consider picking up.

The first thing one will notice when seeing it is the distinct cover. No, we're not talking about the bold artwork by Dave Dorman (which is pretty decent I might add). We're talking about the distinct change in font in which the title and subtitles are rendered. Although Palladium does rotate its cover fonts slightly, they seldom break form this strongly. The cover of this book clearly reads "Cyber Knights." The "Siege on Tolkeen Four" subtitle is all but unnoticeable until one inspects closer. So, we are immediately led to suspect that this book is being presented (even if just slightly) as a rogue in the series.

(Editor's note: At press time, we have been unable to find a version of the cover with the title on it.)

And when we read through it, we find that this is largely true. The vast majority of the book spends time developing and further exploring the saga of the Cyber-Knights -- a mystical order of modern "techno-knights" who were presented in the original core book. They have been a staple of the game and a favorite class of players for the entire time the game has been around.

The book starts with the same sort of introduction that the others have received (a fictional account of the war, told in first person by one of its survivors), but it quickly breaks into something else: an in depth reevaluation of the Cyber-Knight class. Not too much is changed, but a few little things are added here and there, and many things are further explained. Little tweaks include things such as a few more psionic abilities to choose from (for those who have them), more options for the psi-sword (like wielding two or changing the shape or color), and partial cybernetic body armor which now regenerates.

The major tweaks are, naturally, more noticeable, but none of them throw the class out of whack. In fact, they really bring it around to the elite warriors that these knights are supposed to be. The first is the addition of Cyber-Knight Zen combat -- a sort of spiritual awareness of machines and technological dangers that allows the Cyber-Knight to do some pretty amazing things, like disappear from a computer's sensors and predict an electronic weapon's attack. Though some may not like to see this class gain an ability that throws it further out of proportion from the other core classes, this new combat style really seems to suite the warriors well, and most gamers will likely be pleased with it.

Another new convention is that of the dream vision. At some time in their lives, all Cyber-Knights become recipients of a powerful dream with great significance in regard to their individual fate. For many, the dream becomes a quest that will span and define the knight's entire life. For others, it will remain a mystery that they will chase for all of their days. These dreams fit very well with the philosophy of the Cyber-Knights and its mystic origins, and, even better, it opens up all sorts of possibilities for roleplaying and character development. Sometimes Palladium's classes are a bit lacking on this end, so it's nice to see so many opportunities opened with this one.

Then we come upon the different paths of the Cyber-Knight. Siembieda avoids the possibility of creating a bunch of sub-classes, each with their own unique bonuses and negatives, in favor of basing these new divisions on more plot and character oriented elements. There are four types of Cyber-Knight: the courtier, the crusader, the hermetic knight, and the fallen knight. Examples of sample knights are given for each type, and these quick character sketches are pretty well-rounded and diverse overall. As opposed to just being filler, they actually manage to drive home Siembieda's points about the individual knight types pretty well.

The courtier is the traditional Cyber-Knight, as set forth previously in the core book. These knights follow the code of chivalry to the letter and spend their lives in strict pursuit of it. Siembieda takes the opportunity here to explore each of the tenets of the code. His analysis is a bit long-winded, but very thorough. Anyone with any misperceptions or confusions will likely find them answered here.

The crusaders are the die-hards that see themselves as glorious warriors, bound to spend their lives seeking perfection in their martial arts. They follow an additional four precepts: poverty, humility, purity, and generosity. These knights are very rugged and dogmatic in their beliefs, and their single-mindedness sometimes leads them to more critical faults, such as pride and arrogance.

Hermetic knights are those who have "retired" and gone into seclusion. For the most part these are the Obi-Wan types, who live in hiding, only coming out to train new faithfuls. The more elite of these hermits are also known as dream sages, and they serve as spiritual guides who help the Cyber-Knights in interpreting their dream visions.

The fallen knights are largely what you would expect . . . though, thankfully, Siembieda has fleshed them out as a dynamic group. The "anti-paladins" that some GMs just can't seem to avoid including in their campaigns are present, but they are the minority. The fallen knights fall into two types: those who have simply fallen from the order, unable to uphold the high responsibilities placed on them, and the blackguards, the *real* bad guys. The blackguards are in turn divided into three groups: the robber knights, those who run off to abuse their powers as bandits and mercenaries, the justicars, those knights who have taken code of chivalry way *too* far and punish all who fail to adhere to it with swift death, and the despoilers, the aforementioned anti-paladin types.

These new paths for the Cyber-Knights are well rounded out, and Siembieda sticks to providing new ways in which these characters may be roleplayed, instead of just giving them new super powers to run free with. It might have been nice to have another path more open to PCs (the hermetic knight and fallen knight are a bit tough), but players are bound to have a nice time exploring their characters with the ones there.

The history of the knights is explained in full, and their leader, Lord Coake, is finally exposed in detail. Those gamers who have been eagerly awaiting these details finally have them, and they are for the most part what you would expect. Overall, Siembieda's look into the lives of the Cyber-Knights is very thorough and dynamic. Those things that were hinted at in previous material are finally explained fully, and those Rifts gamers who have been waiting for them finally have the Cyber-Knights that they've always loved.

The book does, however, tie the Cyber-Knights into the campaign at Tolkeen . . . rather well, in fact. Few have been hit as hard by this conflict as the Cyber-Knights. What used to be a strong and unified order is now split in half. Their leader, Lord Coake, has ordered that no Cyber-Knights should participate in the conflict between Tolkeen and the Coalition States. Unfortunately, not all of them agree. Some see the CS as a major villain that should not be ignored, despite any faults that the leaders of Tolkeen might have (and they certainly *are* engaging in practices that violate the code of the knights). What makes the situation so complicated is that neither side is dead wrong. The knights fighting for Tolkeen do so for the greater good, just as those knights who abstain do. The real issue at hand is whether or not it's better to ally with a lesser evil to defeat a greater one or to abstain altogether and maintain one's honor and

principles. The answer is anything but clear, and the repercussions for the fellowship of the knights could be grave indeed. Just what happens in the end, though, will be up to the GMs and the players.

Overall, there is a lot of potential in this book. If you are not using the *Siege on Tolkeen* series, then you will still find something of use here. If you *are* using the *Siege on Tolkeen* series, then this book will add another dimension to your campaign that is sure to enhance it. In fact, this book would be an excellent one for launching a *Siege on Tolkeen* campaign off of as the primary source or focus. The book's only real drawback is that, well, it's all about Cyber-Knights. If you're not using the *SoT* series, and if you've no interest in Cyber-Knights (a definite possibility in the broad world of *Rifts*), then this book will be all but moot.

-- *Jon Thompson*

by **Steve Jackson**

Here are four scenarios created for *Ogre Battlefields* that -- due to space -- didn't make it into the final product.

"Breakthrough" Scenarios

Map G-3

Basic scenario setup. The defending player gets 20 strength points of regular infantry; each point of infantry may be traded for 2 militia. The defender also gets 3 engineer squads and 6 armor units of his choice. Defending units may be set up anywhere on the map except within 3 hexes of the S edge. Defending units are all exposed.

More Scenarios for Battlefields

The attacking player gets 16 armor units; any number may be GEVs, but note that the terrain does not favor them. Attackers move first and enter on the S edge of the map; the entry hex counts for movement. The attacker does not have to commit all his units on the first turn.

Special rules. At the beginning of every turn, the defender may place a single unready militia platoon in any town hex that has not been turned to rubble.

Escape. Attackers may leave the map on the N or S side; only N counts for victory points. Defenders may not escape.

Objectives and victory points. Exactly as per *G.E.V.* section 9.024, counting full value for any regular armor unit, half value for any LT or LGEV, and double for a SHVY. Note that destroyed town hexes do *not* give victory points.

Advanced scenario. Give the defender 4 more armor units and 3 more engineers. Give the attacker 8 more armor units.

Victory levels. As for map G-2.

Ogre scenario. As for "Breakthrough" on map S-2.

Map S-3

Basic scenario setup. The defending player gets 4 HWZ, 4 MHWZ, and 24 infantry. Any 2 infantry can be traded for one squad of either engineers or marines. These units may be set up anywhere on or east of the line of hexes whose

numbers begin with 05. The defender also gets 10 militia, which must be set up in town hexes.

The attacking player gets 12 GEVs and 12 LGEVs. Attackers move first and enter on the lake on the W edge of the map; the entry hex counts for movement. The attacker does not have to commit all his units on the first turn.

Special rules. All town hexes adjacent to the lake on the W side of the map are considered rubble. Other town hexes are undamaged.

Escape. Attackers may leave the map on the E or W side; only E counts for victory points. Defenders may not escape.

Objectives and victory points. Exactly as per *G.E.V.* section 9.024, counting full value for any regular armor unit, half value for any LT or LGEV, and double for a SHVY. Note that destroyed town hexes do *not* give victory points.

Advanced scenario. The attacker gets 16 of each unit type. The defender adds 3 superheavy tanks to the force described.

Victory levels. As for "Breakthrough" on map G-2.

Ogre scenario. The attacker gets the forces described in the advanced scenario. The defender gets the infantry and militia described in the basic scenario, plus two Mark IIIs, one in 1518 and the other in 1506. Even more than in the other scenarios, the defender has strength, but not enough flexibility.

"Raid" Scenarios

Map G-2

Basic scenario setup. The defending player gets 10 militia (in any town hexes; only one per hex); 12 squads of infantry (in any hex whose last two digits are 19 or less); one laser tower and one laser (anywhere); and 10 armor units. The armor units are not manned; set them all up as "disabled." The defender chooses one armor unit each turn to activate.

The attacking player gets 12 armor units. Attackers move first and enter on the S edge of the map; the entry hex counts for movement. The attacker does not have to commit all his units on the first turn.

Special rules. At the beginning of each movement phase, the defender rolls a die. On a 6, four GEVs enter the map on any water hex on the E side. The defender only gets these reinforcements once.

Escape. Attackers may leave the map on the S side; defenders may escape to any other side.

Objectives and victory points. As per *G.E.V.* section 9.034, except that there are no CPs; each river bridge is worth 8 points, and the town hexes at 1205 and 2003, as railhead ports, are worth 20 points each.

Advanced scenarios. The attacker gets (a) 16 or (b) 20 armor units. The defender adds (a) 4 more unmanned armor units, or (b) a single Cruise Missile Crawler with missile.

Victory levels. As per *G.E.V.* section 9.038.

Ogre scenario. The attacker enters with 24 armor units. The defender has the basic scenario setup and a single Ogre Mark III in hex 1607.

Map S-2

Basic scenario setup. The defending player gets 18 infantry, which can be traded for marines, engineers, or militia (2 INF per marine or engineer, or 1 INF for 2 militia). The defender also gets 10 armor units, none of which may be

GEVs, and 5 large revetments; any large revetment may be traded for 2 small ones. These units may be set up anywhere within the loop to the N and W of the river; no defending units may be set up to the S or W of the river.

The defender has two CPs (Alpha and Beta; both mobile with defense 2). One starts at 2117 and the other at 1413. The defender also has three structures, which must be set up outside town hexes: two lasers and one laser tower.

The attacking player gets 24 armor units. Attackers move first and enter on the E edge of the map; the entry hex counts for movement. The attacker does not have to commit all his units on the first turn.

Special rules. The 5-hex town at the west edge of the map is already rubble.

Escape. Attackers may leave the map on the E side; defenders may not escape.

Objectives and victory points. As per *G.E.V.* section 9.034, except that river bridges (including the RR bridge) are worth 8 each, the lasers are worth 20 points each, and the laser tower is worth 35 points.

Advanced scenario. The attacker also gets 3 GEV-PCs, each with 3 squads of infantry. The defender gets another 12 infantry (or equivalent) and 4 LT, which may be set up anywhere except within 3 hexes of the S map edge.

Victory levels. As per *G.E.V.* section 9.038.

Ogre scenario. The defender substitutes a single Fencer for all his armor and revetments; the attacker has the setup described for the advanced scenario.

Murphy's Rules

Murphy's Rules

Verily, Just Gimmie That Rock 'n' Roll Music

This column begins as a not-terribly-funny anecdote, turns into specific advice, veers off into metaphor, picks up a Cherry Coke, and drops you off in time for this week's quote.

We'd been gaming almost exclusively in a *Vampire: Dark Ages* campaign for a couple of years. It was set in Wales, and was steeped in the politics and history of the time (at least, as steeped in history as you can be when you've got vampires and faeries running around).

Finally, we added another campaign to the gaming mix: *In Nomine* (set in modern times).

And as we were preparing for that first session, I said (pulling out a Depeche Mode CD), "Well, I'm really glad we're playing something modern, so I can use some more contemporary music."

"Oh? Why's that?" asked Dennis.

"Because if I heard something by Enya again, I was going to need to find my staple gun."

Well, I'm sure we can all guess who the performer that Dennis picked for the second CD. And, no, I never did find my staple gun.

(That was the anecdote. If you'll look out the right window, you'll see we're just coming up on the specific advice.)

Now, I'm sure for many people's roleplaying campaigns, music is as much a part of the environment as Mountain Dew, bean bag chairs, and bowls of Corn Bugles (a.k.a. mini-Doomsday Devices). But I'd also guess that many folks feel (as I did) that the music you play should have something to do with the setting you're in (or at least be close): Celtic music for medieval fare, *Star Wars* soundtracks for space opera, Metallica for nihilipunk campaigns, and the like.

But last week I saw *Fantasia 2000* (a movie that I enjoyed, despite the lukewarm response it got from critics, and the fact that it was only 72 minutes long). One of the segments in this movie was a retelling of Noah's Ark with Donald Duck set to *Pomp and Circumstance* (three concepts that my mind instinctually says don't go together, like McDonald's, breakfast, and burritos). And that segment was really neat.

And afterwards I thought, "Why am I knocking myself out trying to find period music for my gaming sessions?" I mean, if a tune usually associated with high school graduation to most Americans (I don't know about the rest of the world) can be equally applicable to an anthropomorphic duck acting as an agent of the Lord, why *can't* I play whatever I darn well please?

And after thinking about it, I realized that movies have already been doing this for a while. The 1996 modern retelling of *Romeo and Juliet*, starring that kid from *Growing Pains*, featured a modern setting with entirely modern music. A *Midsummer Night's Dream* used Italian opera to great effect. And it's difficult to listen to the *William Tell Overture* the same way again after watching *Clockwork Orange*.

(At this time I also remembered that I liked playing the *Tie Fighter* computer game with the Cars Greatest Hits CD instead of the usual soundtrack.)

Now, obviously the developers of these movies were making careful decisions about the world they wanted their music to develop. But they didn't limit themselves to the time frames their pieces were (originally) set in, or music that necessarily even made sense. If Terry Gilliam can use "Brazil" in the quasi-cyberpunk movie of the same name, why can't the fae courts be singing Depression-era ballads? Why can't jazz define a space campaign? What kind of campaign would feature dungeon crawls set to ska?

So I've decided to remember that, in my next campaign, just because I'm playing in (say) an Imperial Rome game

doesn't necessarily mean I need to reach for the *Gladiator* soundtrack. I could just as easily make a mix CD with songs like "The Brazilian" from Genesis, "Army of Me" from Bjork, and tracks from the *Beetlejuice* soundtrack (or, really, almost anything by Danny Elfman).

(As an aside, I have a CD called *Bach Meets the Beatles*, which is, as it sounds, music by the Beatles done in the style of Bach. I really wish I would have remembered it for our *Fading Suns* campaign; given the religious themes of that 51st century game, I think that's *just* the sort of music that might be reinterpreted in a more religious light.)

Now, having realized this fact about music and role-playing campaigns, I started veering into more metaphoric realms.

If music from different genres and eras can collide, why am I stuck on producing "true" campaigns? In this way, music is merely a metaphor for the larger issue. When I start, say, a Cyberpunk campaign, why can't I mix genres and moods in the same way?

In movies this melding can be done for serious and/or thematic reasons; *Ghost Dog* melds African-American rap with Asian philosophy (with a helping heap of an askew Mafia perspective). *Magnolia* mixes biblical elements with a more traditional ensemble piece. *Doctor Who* combined science fiction with an Oscar Wildeian outlook (in the most recent movie, this was seasoned with a steampunk influence). *Mystery Men* melds a jillion different periods into its city, producing a world that is timeless but definitely not of our time.

This melding can also be done for comedic effect. *Aladdin* combines an Arabian atmosphere with the sensibilities of a Hope & Crosby movie. *Jack of All Trades*, *Xena*, and others play fast and loose with history, creating a world where the stories are unfettered by accuracy. (And, in the RPG world, scifi elements tend to crash-land on fantasy worlds all the time. The twelve-year-old in me still giggles with glee every time I read *Expedition to the Barrier Peaks*.)

So I'm considering running, say, an optimistic swashbuckling campaign set in a post-apocalyptic world. Or a *Shadowrun* campaign rolled back to the 1950s, making a darkly *Atomic Horror*-esque fantasy/cyber world. Or an *In Nomine* campaign where Heaven feels not unlike *The Prisoner* . . . perhaps downplaying the Marches and augmenting the roll of the Eastern religions/beliefs.

In a lot of ways, one of my biggest challenges as a gamer (both player and GM) is to keep from limiting myself by my own pigeonholed expectations. It's easy to play all Jedi, all fighters, all scientists the same. It's easy to create worlds that are what people expect. But to keep things interesting and fresh -- to make them (and you) wanting to come back each week -- it can be worth mixing things up, combining elements to make something new and unique.

So, from now on, I'm not going to be ignorant of the possibility of using elements of Aztec culture when devising the government of my far-futuristic empire. Or elements of Illuminati conspiracy in a 1940s World War II campaign.

Or Enya in my *Cthulhu by Gaslight* games.

-- Steven Marsh (drinking a Cherry Coke)

* * *

Last week's answer: 1993 TSR Master Catalog -- Collector's Edition hardback, p. ii. (This was a \$9.95 hardback of a catalog. I'm deeply curious as to why I have it . . . let alone why I *still* have it.)

(*Three stars*) "STUDENTS CIRCULATE PETITION CONDEMNING REPRESSION: NO EFFECT."

Heart of Weirdness: The Congo

"There were moments where one's own past came back to one . . . but it came in the shape of an unrestful and noisy dream, remembered with wonder amongst the overwhelming realities of this strange world of plants, and water, and silence. And this stillness of life did not in the least resemble a peace. It was the stillness of an implacable force brooding over an inscrutable intention."

-- Joseph Conrad, *Heart of Darkness*

In the heart of the oldest continent, of the literal primordial soup wherein mankind was formed, lies a mystery. Compared to the Congo River, the Nile is an Autobahn, and even the storied Amazon an interstate. But there have only been two scientific descents of the entire Congo in history -- and the first one mapped out the land for more efficiency in murder. Ever since Conrad wrote his novel, based on his own experiences in Leopold's genocidal slave state, the journey up the Congo has emblemized any journey into evil, or nightmare, or madness, or mystery. Which makes it a suitable course to set for your players, between the cannibals and the crocodiles and into the horror -- the horror.

*"Through sixty-six and seven they fought the Congo war
With their fingers on their triggers, knee-deep in gore
For days and nights they battled the Bantu to their knees
They killed to earn their living and to help out the Congolese."*

-- Warren Zevon and David Lindell, "Roland the Headless Thompson Gunner"

The Congo remains a feverish theater in the conspiratorial history of the 20th century. When Belgium, after a century of misrule, panicked and left the Congo to its own devices in 1960, local politics fell into the hands of a tiny number of *evolués* -- literally, "the evolved" -- Westernized Congolese with little in the way of public support and less in the way of a functioning national system. Patrice Lumumba and Joseph Kasavubu had the most support of anyone -- and had vastly divergent notions of what to do with it. Lumumba sought Soviet aid, for which the CIA tried to kill him -- but eventually turned him over to the separatist troops of Moïse Tshombe deep in the Katanga. Lumumba died in January 1961 under the eyes of Tshombe's Western advisers. The Soviets accused UN Secretary General Dag Hammarskjöld of complicity in the murder -- and Hammarskjöld's plane crashed mysteriously that September. Tshombe's independence movement was crushed, and he joined Kasavubu's government, only to face another separatist movement in Kivu, this one sponsored by Communist China. (And using magic to make itself bulletproof.) Coup followed rebellions followed counter-coups, and by 1969 Tshombe was in exile after his plane was hijacked to Algeria, Kasavubu was dead, and CIA client Joseph Mobutu was President of the Congo. Mobutu unified the Congo by murdering or co-opting anyone who opposed him -- until another rebel movement, led by one of those magical Communist fighters named Laurent Kabila, overthrew him -- again, say the Congolese, with CIA aid. Kabila, of course, was just assassinated almost 40 years to the day after the death of Patrice Lumumba -- while waging war against his previous sponsors in Uganda.

*"Listen to the yell of Leopold's ghost
Burning in Hell for his hand-maimed host.
Hear how the demons chuckle and yell
Cutting his hands off, down in Hell."*

-- Vachel Lindsay, "Congo"

But this river of blood goes deeper yet into the jungle. From the beginning of history (which, in the Congo, is about 1490), the story of the Congo is a story of violent death, wanton needless cruelty, and the depths of human evil. The Portuguese connived at the destabilization of a Christian kingdom at the mouth of the river in order to nurture the slave trade there. Later European rulers would not be so finicky; the Belgian king Leopold II starved, enslaved, murdered, mutilated, and worked to death over 10 million Congolese -- most of whom had been Christianized by the missionaries his "Congo Free State" was theoretically there to protect and support. Desperate nations, deep in the interior, launched rebellion after rebellion, only to fall to tribal treason -- and the Hotchkiss gun. Finally, Leopold's death ended the first

mass genocide of the century, although if the Belgian government proved less sadistic it was only slightly less brutal. Reliable rumors hint that Leopold's old whips and mutilating knives were called back into service when the Belgian Congo's rubber had to keep the Allies rolling in World War II -- and when its uranium had to power the Manhattan Project, and 150,000 more deaths.

Death, then, not only stays in the Congo; it emerges. From the Congolese jungle comes Ebola, and from the Cameroonian highlands just north of the Congo basin, they say, comes AIDS. (Unless the CIA cooked them both up back there, in between assassinations.) Diseases of the spirit, too, seem to flow out of the Congo -- the Kongo "nation" of vodoun loa maintain the underlying basis of Petro, the vodoun "hot" rites of cruelty, gunpowder, and death. (From this nation, too, comes Congo Square, the New Orleans plaza where the city, as far back as colonial times, kept voodoo rites in the guise of public dances.) The Congo murders by retail, as well as wholesale. Luc Jouret, the grand master of the mass-suicidal Order of the Solar Temple, was born in the Belgian Congo in 1947 -- and Victoria's psychic, Robert Lees, identified a London house of Leopold II as the house of Jack the Ripper.

"What but some great creature like the Amali could account for the broken ivories we used to come across in the so-called elephant cemeteries? Fine old green ivory that's valuable for inlaying wood. Snapped right across in the thickest part and left in splinters. Aye! There's places in Africa where you get visions of primeval force. And not so distant either, as when you picture the prehistorics in Europe and America . . . But 'tis a thing of the dead past there. In Africa the Past has hardly stopped breathing."

-- Alfred A. Horn, *Trader Horn* (1927)

Something dead, something old, something cthonic and powerful. Ever since the French traveler Abbé Proyart described three-foot tracks of an animal "not seen but . . . monstrous" in 1776, word has filtered out of these swamps of a great lizard, a beast larger than a crocodile or a hippo, with a long neck and tail. It's called the *amali* or *chipekwe* or *n'yamala* or *jago-nini* or, as it's best known, The One Who Stops The Flow Of Rivers, Mokele-Mbembe. It sounds, to cryptozoologists, rather like a dinosaur, possibly an apatosaurus since the Mokele-Mbembe eats only a kind of local lotus, and not the local Pygmies. The Pygmies have played their own role in mythography, being legendary for their warlike skills as far away as ancient Greece and Babylon. In Babylon, in fact, we see giant lizards called *sirrush* carved proudly on the Ishtar Gate, ramping with the extinct aurochs bison over the characteristic Babylonian field of blue-glazed bricks. Blue-glazed bricks such as the ones allegedly brought out of the Congo Basin around 1905 by animal collector Hans Schomburgh -- who was on the trail of a "huge monster, half elephant, half dragon." The image of Nebuchadnezzar's Jurassic Park seems somehow to fit alongside the roiling timestream of the Congo.

"Quap, sir, is the most radio-active stuff in the world . . . It's a festering mass of earths and heavy metals, polonium, radium, ythorium, thorium, carium, and new things, too. There's a stuff called Xk -- provisionally. There they are, mucked up together in a sort of rotting sand. What it is, how it got made, I don't know. It's like as if some young creator had been playing about there. There it lies in two heaps, one small, one great, and the world for miles about it is blasted and scorched and dead. You can have it for the getting. You've got to take it -- that's all!"

-- Gordon-Nasmyth, in *Tono-Bungay*, by H.G. Wells

And there's anomalies still more ancient back in the darkness. Around 1.8 billion years ago (when Lovecraft's Old Ones were raising their shoggoths and their basalt cities in the steaming mud flats of the Paleozoic), the Oklo uranium field in southeastern Gabon suddenly, spontaneously, went critical. Composed of 70% pure uranium dioxide, of which 3% was U-235, at least fifteen sites in a twenty-mile radius became water-cooled breeder reactors, boiling plutonium-239 out of their rocky substrates. A French nuclear analyst discovered the Oklo phenomenon in 1972, and it remains almost unique. There's another "natural reactor" at Bangombe, 20 miles closer yet to the Congo -- and there's plenty of 70% pure ore back in the Katanga, that Leopold's heirs killed for, and that Lumumba and Tshombe died for.

It was over those mines, in fact, that a CIA asset saw two flying, fiery disks in March of 1952, and in October of 1963 Project Moon Dust recovered "a fragment of metal" described as the result of a "mid-air explosion" over Xerekena, Congo. Later military analysis (as given in a now-declassified, but consummately uninformative, "Exploitation Report") indicated that it had withstood intense heat, and was "smoothly rounded" -- a tardy Old One probe coming back to check on the crinoid things' breeder reactor sites?

"Those are just little molecular centres of disintegration, of that mysterious decay and rotting of those elements, elements once regarded as the most stable things in nature. But there is something -- the only word that comes near it is CANCEROUS -- and that is not very near, about the whole of [it], something that creeps and lives as a disease lives by destroying; an elemental stirring and disarrangement, incalculably maleficent and strange."

-- H.G. Wells, *Tono-Bungay*

Strange metal, magical massacres, nuclear reactors seemingly thrown back in time and dinosaurs swimming forward through history into the gates of Babylon. Something has twisted up reality, balled it like a linen rag and hurled it back into the jungle. The Congo Basin is the home to a myriad of fictional lost cities -- Haggard's *Kôr* ruled by She Who Must Be Obeyed, Lovecraft's *Grey City of the White Apes*, Burroughs' golden *Opar* and Crichton's *diamantine Zinj*. But in the real world, even the real world of pseudoarchaeology, it boasts only those fragments of Babylonian brick. No famous "lost city" worthy of the name lurks in that basin on the far side of the *Mountains of the Moon* -- quite literally, for the Greeks, off the edge of the world. Could these fictions, then, be the decayed and depleted remnants of realities themselves lost, the trace elements and ghost particles that tell us that the *Old Ones*, at least, dreamed of cities here? Did *Nebuchadnezzar's* priests build a watchtower on the edge of the papyrus swamp to capture stray *allosaurs* and to see the true face of the gods in the mists at the edge of the world? Do mass murders sleet like gamma radiation from the fast-breeding decay of reality? Did the *UFOs* spring like alpha particles from the slaughter-cooled *transuranium* reactors deep in the Congo? Did *Kennedy* kill *Lumumba* to get his hands on that metal fragment from a prehuman fiction? Do the dinosaurs serve as temporal brakes, the *cadmium* rods keeping the *River of Time* from melting down in the white-hot heart of darkness? Send your *PCs* up the river -- and find out.

Dork Tower!

Dork Tower!

Blue Genes

by James L. Cambias

This adventure is suitable for most backgrounds between tech level 8 and TL12.

The Job

The player characters are contacted by a woman called "Ms. Lazarus," who wants them for a rather unusual job. One of the tragedies of the early days of interstellar exploration was the extinction of the Ineema of Tau Ceti II. Ms. Lazarus claims to represent a group devoted to restoring extinct species like the Ineema by locating samples of their DNA and creating clones. Her organization has located a sample of Ineema tissue, but the owner refuses to let them have it. So she is offering the group \$50,000 apiece to steal it.

The tissue sample in question is a chair, upholstered in the distinctive iridescent blue hide of a male Ineema. It belongs to billionaire Saut Silver, and is kept on his private space station orbiting Saturn. Ms. Lazarus can provide photos of the chair and old plans of the station. She can arrange for transport aboard a stealthy orbital shuttle; everything else is up to the PCs.

There are a couple of things "Ms. Lazarus" isn't telling the adventurers. The first is that she's working for Calvin Biotechnics, a corporation which wants the chair in order to make a killing marketing blue Ineema hide for everything from wallets to ottomans. When Calvin Biotechnics made Silver an offer, he refused. The company is using the player characters so that there will be no connection between the robbery and the company.

The second thing is that Ms. Lazarus has decided to run a little side operation of her own. Saut Silver is working on a new design for a hyper-stealthy space plane which will make all existing aerospace fighters obsolete. There are people willing to pay enormous sums for a look at Silver's designs, and Ms. Lazarus has been in touch with some of them. She has engaged a separate group of agents to invade the station and steal some of Silver's technical data. Lazarus figures that the two teams will divide the attention of Silver's security guards, so that at least one group will get out successfully.

Saut Silver

Saut Silver is a leading spacecraft designer, whose genius has made his company, Argentech, one of the most successful makers of air and space vehicles. As his wealth has grown, so have Silver's eccentricities. He is an obsessive collector of rarities, and has accumulated a vast museum of singular objects. (His reason for turning down the Calvin Biotechnics offer was that cloning the Ineema would mean that his blue chair would no longer be unique.) Silver is also somewhat paranoid about his privacy, and employs doubles and sophisticated robots to make many of his

For an explanation of the Iron Ref rules and a list of the secret ingredients, please see the [Introduction](#).

public appearances.

The Plan

If the players enjoy planning out complicated capers, they can play through all the stages of preparing the mission, getting special equipment, and learning everything they can about Silver's space station. If they don't enjoy that kind of thing, Ms. Lazarus can handle much of the planning and preparation.

Characters with skill in space piloting, astronomy or astrogation can make a very useful discovery on a successful roll. There is a brief window coming up during which Silver's space station will be in the shadow of Saturn while all the other inhabited moons and space colonies will be on the other side. For a period of six hours, the station will be cut off from all communication. A perfect time for a robbery, especially since a search of news services reveals that Silver will be on Earth to attend a conference during that period.

The choice of weapons and equipment are up to the players. If they let Ms. Lazarus supply their gear, she will provide non-lethal weapons for the team (her employers at Calvin Biotechnics don't want to be connected with murder). Depending on the Tech Level of the campaign, this can be anything from gyrojet guns loaded with tranquilizer-dart rounds to electrolasers to neural disruptors. There is a budget of about \$20,000 for equipment, but Ms. Lazarus gets to keep anything the party doesn't spend. (Her own team is a gang of hardened crooks who are supplying their own weapons and are perfectly willing to kill anyone they meet.)

The Station

Silver's space station is a relic from the early days of settlement around Saturn. It is a rotating ring of twelve converted fuel tanks, linked to a central hub. The station originally housed ice miners working in Saturn's rings. With each tank divided into three levels the station could hold up to 500 people. Hydroponic farms supplied oxygen and food, and a pair of fusion power plants kept everything running. Each of the twelve modules is 100 feet long and 30 feet across. The entire station is 300 feet across and spins three times a minute to produce half a standard gee. The central core holds the spacedock and power plants, and is connected to the outer ring by two spokes.

Iron Ref: Science Fiction -- Blue Genes

That's what the party can learn from old data files and the plans provided by Ms. Lazarus. Since Silver bought the place he has made substantial alterations, but has kept the details secret. If the players can find someone who has visited or worked for Silver, they may be able to provide more information.

The current layout is greatly changed from the original design. Silver didn't like the claustrophobic feel of the old station's eight-foot ceilings and narrow corridors, so he ripped out many of the decks and bulkheads, so that most of the modules are immense single rooms.

Module 1

This module is Silver's living quarters. The upper floor has a glass ceiling with a fantastic view of Saturn and the stars. It is furnished with eighteenth-century furniture and a huge curtained bed which once belonged to Louis XIV. The walls are lined with bookshelves. The lower level has a medical clinic, and Silver's personal shelter.

Module 2

This unit is where Silver works. The upper room has a highly advanced computers and a large holoprojector tank to display designs. The lower level has a machine shop with robot fabricating machines to make mockups and test units. The computer has sophisticated security programming and a retina scanners so that only Silver can operate it. Ms. Lazarus's team are planning to just take the whole computer and let a professional hacker get into it later.

Module 3

This entire module is a swimming pool (and freshwater tank for the whole station). Bridges connect the access tunnels, but otherwise the module contains nothing but water. The bottom of the pool is transparent, so that swimmers can look down at Saturn spinning by.

Module 4

This module is guest quarters, and is still set up with three levels. The top level is a glass-roofed parlor furnished like a Victorian bordello, and the lower levels each have ten guest rooms.

Module 5

This module houses part of Silver's collection. It is a huge single chamber with no lower level, and is devoted to extremely large objects. The unit contains an old Soyuz capsule, a colossal alien stone head, part of the Berlin Wall, a giant penny, and various other big curiosities.

Module 6

This module contains Silver's collection of art objects. The upper level holds sculpture, the lower level is devoted to paintings.

Module 7

This unit is Silver's miscellaneous collection. The three levels hold objects as diverse as a jewel-encrusted falcon, an old Chevy Malibu, a container of radioactive isotopes, a sled, a clay cup, a gilded chest and some preserved alien bodies.

Module 8

This module is storage space. The upper level has unused furniture and carpets, the middle and lower levels are big freezers for food. The chair is on the top level.

Module 9

This module is a truck garden, growing unusual varieties of exotic fruits and vegetables. The lower level houses irrigation pumps and nutrient tanks.

Module 10

This module is the domain of Silver's human servants. It is set up with three levels. The top floor is a recreation area. The lower levels have ten rooms each for servants, secretaries and bodyguards, though the station usually has only ten people on the staff (butler, cook, shuttle pilot, technician, trainer, curator, maid, gardener, and two bodyguards).

Module 11

This unit is a garden, planted with rare varieties of flowering shrubs. One end is a hedge maze. The lower level houses irrigation pumps and nutrient tanks.

Module 12

This unit is the dining area. The upper level is a glass-roofed dining room with a huge oak table. The lower level is a very well-equipped kitchen and large freezers.

The Big Day

Depending on what the players have planned, they can either try to talk their way into the station, fool the security scanners at the docking bay, or else breach the walls of the station with demolition charges. Once inside, they have to find the chair and get out. Naturally, there are problems.

Problem Number One

Unfortunately, Saut Silver is not on Earth. He suffered an eye injury during testing of a laser weapon system at the Mars Proving Ground, and so he sent a double to the conference and returned to the station. He didn't bring the full staff along -- only Georges Bloch, the chef; Toshiro Ito, the gardener; Sergei Feodorov, the technician; Giulia Dandolo, the curator of Silver's collection; and Jesus Santiago, Silver's bodyguard.

Problem Number Two

The team hired by Ms. Lazarus to steal the space plane designs began their operation shortly before the PCs. As the player characters' shuttle approaches the station, they can detect a distress beacon and see another spacecraft clamped to the top of Module 11. The second team consists of six professional killers armed with military-grade weapons and light body armor. By the time the PCs arrive, the other team has already killed Santiago, Ito and Feodorov. Ms. Dandolo is hiding in Module 5, and M. Bloch is on the lower level of Module 8.

The second team has left two people to guard their exit in Module 11, while the other four have gone through Module 12 and are currently in Module 1 battling robots.

Problem Number Three

When the station was attacked, Silver himself got into his emergency shelter and took control of the station's systems to fight off the invaders. The shelter is heavily armored and has its own power and life support systems. It is effectively a little spaceship which can survive even if the station itself is blasted apart.

The station's defenses were designed to prevent people from docking without permission, and control movement between modules. It was not intended to stop a heavily-armed group equipped with breaching charges. As a last-ditch measure, Silver has sent all the station's robots into battle. There are four gardening robots equipped with buzz saws and clippers, six cleaning robots with caustic detergent sprayers, and two humanoid robots built to look like Silver himself. All the work robots are small spider-shaped machines with multiple tool-tipped arms. The humanoid robots can use normal hand weapons, and are superhumanly strong.

Problem-Solving

Since the station is under attack when the party arrives, the players must decide whether to take Silver's side, help the other team, fight against both, or simply try to keep hidden and accomplish their mission. The other team knows the PCs are going to be on the station, but don't know what they look like and are likely to shoot any strangers without

stopping to chat. Silver can talk to all the intruders through the station intercom, but is naturally suspicious of these armed lunatics invading his home. Game Masters who want to encourage ethical behavior may remind their players that Silver's robots can take pictures of the PCs, identifying them as members of the dangerous gang of criminals. Saut Silver can be a very useful patron in later adventures: for starters, he's going to need someone to track down Ms. Lazarus.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Pyramid Sweeps Month

In theory, I hate the idea of "sweeps weeks."

For those of you not familiar with them, sweeps weeks are how American television networks (I'm not sure about the rest of the world) determine their advertising rates for the year. The basic idea is that each network pulls out all the stops and puts on their best programming for one week; whatever gets the best ratings can charge the most for their advertising.

Now, the annoyance for me is that it often seems like the networks are holding back on showing their best stuff for weeks (or even months) before the sweeps period. So for what feels like an eternity you're forced to endure absolute drek . . . then every show you might possibly be interested in is suddenly trying to be on their best behavior. So whenever I see, say, a network toting how neat their February is, all I can think of is how unimpressive their January was.

Now, having said that . . . um . . . *<koff koff>* I think we have a pretty neat February.

I've told you all about the time I tested the limits of my players' consciousness, when I ran an ultra-long Supers adventure [way past everyone's bedtimes](#). But in hindsight, there was another element that may have led somewhat to that evening's disappointment. In essence, that adventure was an attempt to create something of a "sweeps week" feel; I *had* been holding back somewhat in previous week's adventures, because I knew there were so many cool plot points coming up in that big überadventure, I didn't want anything competing with it.

Which, in hindsight, was really dumb.

I really didn't need to worry about competing with myself; there's something to be said for delivering consistent quality material, and I suspect everyone might have been happier if I'd only spread out some of the excitement over several adventures.

But I also remember an adventure I did for the *Star Trek* game I ran. (This was many years post-FASA, and several years pre-Last Unicorn.) Set in the time of the Enterprise-C, I'd been running each adventure in a *very* episodic format: scripts with the pre-ominous horns "teaser," the ritual playing of the theme song, printouts of each episode's title, wrapping up *everything* by the end of each adventure . . . the whole shebang. Now, this adventure was the next-to-last in the mini-series I was running, and it was a pretty complex adventure. And exciting things were happening, and everyone was into it, and there were a *lot* of balls in the air. And then, after a particularly climactic revelation . . .

I whipped out the "To Be Continued" sign.

It was completely unexpected for my players, and they let out an "Ieee!" in frustration and anticipation. They wanted to know what happened next, but they were also content to revel in the cliffhanger. I'd surprised them, and it felt *good*. Because I'd also surprised myself. And the next week we got together, I had a recap script, and we concluded the two-parter. Those were, arguably, the best adventures of that series.

Now, what does this have to do with the price of dice in Peoria? Well, I realized that my problem with sweeps weeks isn't that they're doing something special, per se . . . it's the "Enjoy our specialness or we shoot this puppy!" aspect of it. In essence, they're not doing something neat, new, and nifty because they have the urge; they're doing something because market forces dictate they do it. Likewise in my Supers campaign I was trying to force something cool onto my players, and as a result, I don't think they enjoyed it as much. On the other hand, in my *Star Trek* campaign I was able to integrate a surprise in a way that didn't feel gratuitous, but instead seemed organic. Which, in my opinion, should be how "sweeps" should work.

So what I'm trying to say (in my inimitable rambling way) is that, for the next month, I'm going to try to surprise you - and myself -- with something different. This week we have our almost-entirely *Iron Chefy* issue . . . but I hope you

don't think you need to be a fan to enjoy the results. "Iron Ref," in particular, is only vaguely tied to the show, and should be good for an idea (or three) for your adventures.

This week we also have a [chat](#) with John Kovalic on Wednesday, February 7th. And on Friday the 9th we're having a *Summer of Horror* chat event, with Kenneth Hite, Hunter Johnson, Sean Punch, and Philip Reed.

Why are we doing this? Well, partly to see if I can't reach my goal of hitting 4000 subscribers this month, but mostly because there are a lot of interesting things happening with me *besides* the magazine (like [GURPS Best of Pyramid I](#)). February is a good month, and I hope to have some surprises. Next week I hope to have a Valentine's Day themed issue (for which I'm still looking for a submission or two, if you've been meaning to write . . .).

So, while I definitely don't think we've been slacking here (and I sure hope you all don't think so, either), I do like dressing up in the metaphorical tux every so often. We're trying some different things (some of which may work, some of which may not; for pity's sake, [jot me a note](#) or post to the [discussion boards](#) and let me know!), while still doing what we've always done.

In short, welcome to our sweeps month. We hope you enjoy, and we hope you have the ability to be surprised as much as we try to surprise ourselves.

(Speaking of surprises, you may want to check out the larger version of the art in this week's *Star Wars CCG* article . . . just click on the smaller version. Thanks, Keith!)

* * *

Oh, and happy first birthday to our sister publication [Journal of the Travellers' Aid Society!](#)

-- Steven Marsh

(Four stars) "Game sent to Peru by Sleepy Shippers: Any Game in Sales -- Down One Level!"

A Night Like Every Other

by Justin Achilli

It's winter, and a chill rain falls in the early night. As each of the characters retrieves her mail, she finds a simple, off-white envelope with her name and address written by hand in a labored script. The letter bears no return address. Rain has caused the ink to run on the envelope, leaving blue blemishes and streaks on the envelope's surface.

For an explanation of the Iron Ref rules and a list of the secret ingredients, please see the [Introduction](#).

The letter reads:

Greetings, [character's name];

I hope my letter finds you well. You won't you remember me; the last time I saw you, you were only two or three years of age. I am your cousin, thrice removed. A family matter has recently arisen and I would like to meet with you to discuss it. I have sent this same invitation to other cousins here in the city as well. Although the concern that has made this reunion necessary is a grave one, I hope that me may take whatever joy we can in each other's company.

Please visit the hotel where I make my home: The Wilkinson Terrace. I will tell the concierge to expect you, and to please show you up to my room. If I am not present when you arrive, please make yourself comfortable -- I will return in a matter of moments.

Please arrive this Friday evening just after dinnertime.

Sincerely,

Roland Camberly

The letter includes no phone number or other point of contact.

Prep Work

Gamemasters planning to run "A Night like Every Other" will need to do a little work beforehand. Before the game session, the gamemaster should encourage the players to create characters who have some common ancestor. This can be a parent, making certain characters siblings, or it can be any relation however far back in the family genealogy the player wants to go.

Also, the gamemaster must decide to which character the situation at the end of the story applies. Although he may

choose at random or at the climax of the story, he will probably want to make his decision at the beginning, so that he may foreshadow the events that lead to the end (occluding the character's memory, describing how uncharacteristically exhausted she feels . . .).

Also, see the end of the story for further concerns.

Guests and Visitations

The gamemaster may have the characters receive the notes any night he wants -- giving the characters some time before the "reunion" will allow them to do research, check out the hotel, and do anything else they want before meeting Roland. This allows the gamemaster to build the characters' histories, perhaps even introducing them as they run into each other at the library while looking for family secrets. Gamemasters should build as many ties between the characters as they can, whether artificially ("As it turns out, Stephen's mother had Virginia first, but gave her up for adoption.") or by letting the players themselves expand their backgrounds to accommodate.

Visits to the Wilkinson Terrace reveal it to be a pleasant place, if a bit musty and antique. The concierge won't allow characters to wander the halls, though they may wait in the lobby. Regardless of how long they wait, though, they never see anyone exit or enter. If they question the concierge, he explains that the hotel is almost completely residential -- only a few of the rooms are let in traditional hotel style; the rest of the building is private apartments. Characters who wish to do a little unsanctioned reconnaissance find the hallways similarly empty, with row after row of almost identical doors. Those stalking the halls should have a feeling of walking in a dream or state of hallucination. Only if the character makes an explicit attempt to look do the letters on the door become clear, and even then, the details swim into a haze as the character looks away. Murky sounds may be heard from behind the walls at times, but they sound miles away, or as if they were happening underwater.

Gamemasters may wish to have the invitations arrive only a day before the meeting (or -- horrors! -- the day of) to heighten the tension. This is fine, but doing so may make it difficult to maintain that pace while building the hazy, indistinct environment or prevent the players from building relations between their characters.

Together Again for the First Time

On the night of the reunion, the concierge will escort the characters (individually, as a group, or in whatever order the characters arrive and ask to be let in) to Roland's room. Although the Wilkinson has an elevator, the concierge leads characters up the stairs. The trip of several flights should give the characters a sense of *déjà vu*, as though the stairs they just climbed were exactly like the ones they're climbing now. Even the inconsequential details they (actively, remember) observe reoccur -- that smudge on the wall is in the exact same place a similar smudge was on the last flight. Finally, they're let out onto an indeterminate floor (even those who have said that they're counting can't be sure; is this the twelfth floor? The tenth? The eighth?) and shown to apartment F.

Knocks are met with silence, or with other unidentifiable and muffled sounds from elsewhere. Unless the characters let themselves in, they may well wait forever.

Roland's apartment is a curious little place, consisting of only a single, unremarkable room. The walls are a pea green and the sole window, streaked with rain, opens to face a brick wall next door. (That's strange -- no one remembers the next building being so close.) No bathroom is evident. (Maybe this hotel is so old the whole floor shares one?) The only objects in the room are an obviously valuable cherry-wood chair upholstered in a pale blue that continues to fade in the yellow light (but the room has no lamps -- how is it lit?) and a cherry-wood roll-top desk that was obviously built by the same craftsman, perhaps even as part of the same set. Those examining the desk are unable to open drawers or retract the top; they feel as if they're part of the bulk of the thing itself rather than moving parts of it. Anyone who sits in the chair feels an intense chill that lingers even after they've moved out of it.

When the characters are all present and preoccupied -- when no one's stating that they're specifically looking the chair - - Roland appears therein, sitting with one leg crossed over the other. Anyone watching the door obviously didn't see

him come in.

Without regard to the strangeness of his arrival, Roland makes introductions to those who still need them. Over the course of these introductions, and through the conversation thereafter, Roland never leaves his chair. He offers no refreshments (no one's hungry or thirsty, anyway . . . even though they can't remember what they had for dinner despite the invitation's instruction to come after dinner) or hospitality, which should seem odd given his formality and obvious distinct breeding.

Roland proceeds to relate a tale for the characters, regarding a death in the family's past. As history would have it, an ancestor who just happens to share a name with one of the characters (the character the gamemaster has selected), died under mysterious circumstances. Roland, while looking through letters concerning the ancestor's will and testament, suspects that the ancestor was murdered. In the interests of the family, won't the characters please investigate? Roland would, but he can't leave the house because his health prevents him.

Roland can be as helpful or as vague as the gamemaster wishes. If the characters seem to grow frustrated with him, feel free to offer a bit of substance -- perhaps Roland can't leave due to palsy, or perhaps he asks them to retrieve a letter concerning the will from the desk (which now works, to the surprise of those who tried it earlier) and allows them to read it. Use whatever suits the characters' temperament.

In the end, Roland confides in the characters the location of the murdered ancestor's home, a converted airplane hangar. Thereafter, Roland's contributions end. Some gamemasters may wish to have him begin to literally repeat himself, verbatim.

Dead Again

At this point, the players will probably send their characters to the hangar. The hangar itself should leave much the same impression, a vague homogeneity of surface and texture.

Inside the dirt-floored hangar rests an old prop plane. Anyone with knowledge of such things may even think it resembles the plane first flown by the Wright brothers -- or perhaps an even *earlier* model, if such a thing existed (did it?). A search of the hangar reveals minor clutter, tools and the like, but nothing that suggests anyone actually lived in here. In the corner, however, the condition of the earth suggests that some digging had been done. The marks indicate something the size of a man may have been buried therein.

Sure enough (now that the characters are looking for it -- don't mention it earlier, even if someone does specifically say they seek it), a shovel is included among the hangar's tools.

As the characters dig, mention to the previously selected player that her character feels a bit disconcerted. As the digging continues, she slowly becomes more and more hazy, her body becoming translucent and finally just short of transparent. As the final scoop of dirt leaves the grave, the character has vanished completely, only to have appeared, entirely intact, in the grave itself. The character, unable to move, lies on her back in the makeshift tomb, with a hideous, livid wound that betrays the removal of her eye.

The gamemaster should allow the characters to discuss the situation for whatever length of time he wishes. He may even choose to allow the "murdered" character to speak (though she probably shouldn't move, at risk of spoiling the effect) after the initial revelation. Before long, however, the gamemaster should fade the scene out . . .

. . . And then open it again as it occurred at the beginning of the story, right down to the splotched ink on the invitation.

Running the Story

A gamemaster running "A Night like Every Other" should consider a few things when he prepares to tell the story and

while it's going on.

- **Read the title:** It's always night, for any character who makes a point of noticing. Even in the "days" that pass, the characters should have no recollection of what occurred in anything other than the immediate present.
- **Keep it blurry:** Don't allow the characters to focus on individual details, except as they become important to the resolution of the story.
- **Whodunit?:** That's not really important, as the tone and mood of the story take precedence over the narrative. Still, some players may want the answer (and you know your players' tastes better than I do). If you anticipate this, feel free to alter the flow of the story so that it implicates someone. For more horrifying (if less bleak) ending, have another character find himself in possession of a bloody awl or knife as the first character's body materializes in the grave.
- **Twist the environment:** Emphasize the repetitious, unreal nature of the characters' immediate surroundings. Was that car there a moment ago? Wait, what car? Did the concierge always have that mustache? Does he exhibit any secondary gender characteristics at all?
- **Always alone:** Surrounding characters, if you choose to use any others, should be kept to a bare minimum. Let the understanding that they may be the only people in whatever world this is slowly crawl across the players and unsettle them.
- **Fire and forget:** This story is designed solely with the purpose of being a one-shot. It would obviously not fit in a campaign of any stripe. Simply close the session as the players realize their characters are about to undergo it all again, and then discuss everyone's experience with it.
- **Be the people:** That's most important! The story is meaningless without the characters that it intends to unnerve. Encourage relationships; wind them into the events.

The Flight of the Azure-Cherry Wood Duff Lifter

by Sean Patrick Fannon

Important Note -- the Game Master should **not** reveal the name of the scenario until after it is completed.

This is a scenario for *very* inexperienced characters. It doesn't really matter how many -- the typical-sized group will do. It can be in pretty much any typical fantasy setting.

For an explanation of the Iron Ref rules and a list of the secret ingredients, please see the [Introduction](#).

The Heroes have just made the dangerous trek down the treacherous, winding path that carries them from the top of the Dreadfall Cliffs to the bottom, where the teacher and friend of one or more of them, Master Izzin, resides in a secluded cottage on the edge of the sea. They are going to pay their respects before they set out on the adventures they are destined for. It takes a full 2 days to navigate the path, but it is an important and proper thing that they do.

Master Izzin is a cantankerous and eccentric old wizard given to strange inventions and alchemical experimentation, and he likes his privacy. However, he is expecting the Heroes and is quite pleased that they are coming.

When they reach the bottom, however, they are attacked! Goblinoids from across the sea have sent an advance scouting party, and they intend to use the treasures found in Izzin's home and the cliff pathway to invade the local territory.

(Use whatever low-level humanoid aggressor is appropriate to the game -- rat-men, goblins, orcs, etc.. Use one per Hero.)

Once the Heroes defeat their attackers, they will note the front door has been bashed in. Normally, Izzin has plenty of magical and mechanical traps to deter such brutish invasions of his privacy, but it is clear that he deactivated them all in preparation for the arrival of his former students and their friends.

Rushing in, the group will be met by two larger opponents, obviously guarding the door. They should make relatively quick work of these brutes.

(Use the next level up of aggressors, such as bigger orcs, bugbears, or the like.)

Izzin's cottage is actually laid out fairly simply. There is the main floor, and then there is a basement. The main floor has 4 rooms -- a Master Bedroom, a Guest Bedroom (given over to bookcase overflow), a Kitchen/Dining Area, and a Library. The basement is one large space that serves as Izzin's laboratory and storage area. More detailed descriptions come later.

The Heroes will find Master Izzin lying in his bed in the Master Bedroom. He has a jeweled, black-tinged dagger embedded in his eye -- a most grievous wound! It is a testament to his will and endurance that he is still alive. Izzin is quite delirious from the pain and is barely able to speak coherently. After a few moments of attention (and a likely attempt at healing, which will make him better after a fashion, but with the dagger remaining in place), he will clear up a bit and be able to say,

"D- . . . Dagger of Leaching. Do not pull . . . it out. Li- . . . little monster wants my mind, which this . . . thing is . . . draining into its . . . hilt. He plans . . . plans to come back . . . and take all there is of me into him. Pull it before it's . . . done . . . and I will . . . die."

Izzin will spasm and seem to fade a moment. Further stirring and aid will rouse him for a moment more.

"More . . . more of them coming . . . from across the sea. Must get up . . . high . . . fast." Izzin's mind is already being made a bit fuzzy by this point. "Get to town . . . priests there can help. Find bl- . . . bl- . . . blue . . . butt . . . "

At this point, Izzin will fade and no amount of help will bring him around. Over time, it will be clear that his health is fading as well. The Heroes must find a way back up the cliff face -- fast!

Time to search the house.

Master Bedroom

A huge, cherry wood four-poster bed, very comfortable.

A dresser-and-mirror combination that, if you concentrate while staring into it, will let you imagine what you would look like dressed in anything at all.

A fine cherry wood chair, upholstered in bright, bright crimson.

A well-crafted seat-and-chamber-pot contraption, behind a privacy screen, that seems to magically eliminate whatever is put into it (possible repository for just about any unwanted thing).

A large cherry wood wardrobe that does not lead to a magical kingdom, but is filled with many fine clothes. Among them are various magical robes -- one that will keep the wearer warm in the cold; one that will keep the wearer cool when it is hot; one that allows the wearer to breathe underwater; one that makes the wearer invisible.

Various and other sundry things appropriate to an old man's bedroom.

Guest Bedroom

A smaller version of the Master Bedroom in all ways, including the very nice chamber pot contraption (though the seat is not so fine). However there are bookcases crammed all along the walls, full of books. Most of these books have been rifled through, tossed onto the bed or floor in scattered piles. This has obviously happened very recently.

(What are the books? Time to get creative, my Game Mastering friend. There will be historical treatises, philosophical dissertations, theological ruminations, and magical and scientific pontifications galore, all relevant to the world you are running this in. However, nothing in these books will necessarily help in this scenario, and the more time is taken searching through them, the more Izzin's life will fade away -- play that up).

Kitchen/Dining Area

Fairly modern idea -- the kitchen is set up just off the dining area, with a pass-through built in. The whole area is fairly trashed. The remains of mostly-eaten food are flung everywhere, and the very nice cherry wood dining room table and chairs are badly scratched and marred, and a couple of the chairs are outright broken. Each chair is upholstered in

almost-florescent peach.

There are a few large knives and other utensils, but nothing that would represent better weapons than the Heroes have.

However, what is here (that will be helpful later) is a very large, very heavy sack of rice.

Library

In addition to the many, many bookcases (and books scattered and flung everywhere), there is an assortment of very nice cherry wood furniture, including four chairs and two benches. The chairs are upholstered in a bright canary yellow, while the benches are done in vibrant emerald.

One of the bookcases has been hacked up and shoved around in such a way as to reveal the passage (once secret) to Izzin's downstairs laboratory.

Basement

Think mad-scientist meets eccentric wizard, and you have it. Lab tables with vials and pouches of powders and small trays to contain tiny fires . . . almost all of which has been smashed up by the current occupants. These would be a goblinoid spellcaster (mage, if appropriate) and three more larger brutes of the variety that was guarding the door.

(The spellcaster should be barely more capable than the best in the Hero party, but he is the one who put the Dagger of Leaching into Izzin's eye, hoping to gain the old man's master of magic. He trashed the basement in frustration, because he can't make heads or tails out of anything he has found, so he thinks it's all useless. No, he hasn't thought far enough ahead to realize that, once he has Izzin's mental gifts, he will then be able to use the stuff . . .)

Hopefully, the battle will go well. Now the Heroes must search for the "blue butt" thing that Izzin mumbled about . . . which, in this case, is a cherry wood chair, upholstered in a bright, metallic blue and, oddly enough, happens to be bolted to the floor for no apparent reason. Additionally, the wood on this chair has a much darker tone than every other piece of furniture in the house.

Amidst the insane amount of odds and ends (add as much flavor as you wish), other things of note and use include: a Stone of Blade Keening (will add a +1 to any blade that it is used to sharpen, as long as it is used once a day); 3 Healing Potions (moderate strength; should be enough to heal the party up); Dust of Weight Reduction (enough to make 6 grown human men weigh 1/4 their normal weight); and a 100 foot length Trick Rope (a rope that will follow simple commands, such as "Wrap around that" or "Grab Tessa's wrist").

Okay, Here's the Trick . . .

The "blue butt" is the blue-upholstered cherry wood chair, which has been treated with a special mixture of Izzin's own creation, a very powerful levitation oil coating the wood of the chair (which is why it is darker). Careful searching of the components on the bench by anyone with any alchemy or related training will reveal the mixture, and some experimentation will reveal what it does.

If the chair is unbolted, it will immediately rise (with great strength, but **not** intense speed) to the ceiling. It will be incredibly difficult to pull down again (an incredible feat of strength, really, or teamwork will be required). Testing will reveal that the force of the chair's levitation will be enough to carry 3 grown humans up the cliff side (and the Dust of Weight Reduction will make it possible to carry even more, especially with creative use of the Trick Rope). The chair will rise slowly enough that it will be possible to grab onto something near the top of the cliff before they all go rising into the atmosphere (which is what will happen if they mess up and don't jump off).

Getting the chair out of the house and positioned at the cliff side will be a neat trick, but this is where the huge bag of rice comes in. Careful apportionment of the rice will balance out the levitation, and make it possible to maneuver the

chair outside.

Obviously, they might think of something else, but that's the best path to succeed in this scenario. If they come up with a better approach, let them -- that's the magic of interactive storytelling.

Storyline Rules for the Star Wars CCG

by Joe Taylor

Art colored by [Keith Johnson](#)

These rules are designed to set up a series of games which will follow, more or less, the progression of the *Star Wars* movie trilogy while still allowing players flexibility in deck design. There is a lot of room to tinker with the rules to fit your taste and several suggestions for optional rules.

1. **Choose sides.** The two players decide who will play the Light and Dark sides and they will keep these alignments for each game.
2. **Decks.** Since the expansions follow the same progression in focus as the story of the movies, play is divided into a series of games where decks made from each expansion face off against each other.

Each player picks 60 cards each from *Premiere* (including *Premium Premiere* cards), *A New Hope*, *Hoth*, *Cloud City* (including *Premium CC* cards), *Dagobah*, *Jabba's Palace* (including *Premium JP* cards), and *Endor* (including any *Preview* cards from the *Death Star* set). Objective cards cannot be used. Each group of cards is to be kept separate; these represent decks you will be playing with -- but it is not your finished deck. You should now have 7 decks of 60 cards each.

3. **Support Deck.** This is a new mechanic for the purpose of the Storyline rules. The *Premiere* set contains many "staple" cards like Stormtroopers, X-Wings, Sense, and Alter that are common throughout the *Star Wars* trilogy. Also, the Special Edition set has cards which enhance all of the expansions and is not meant to "happen" in any sequence with the rest of the sets. Therefore, each player will create one Support Deck made up of 120 cards from the *Premiere* and *Special Edition* sets, as well as Premium cards from *Third Anthology* and the *Official Tournament Sealed Deck*. You'll want to fill this up with any "staple" cards or multiple copies of mains that you'll want later on.

[Storyline Rules for the Star Wars CCG](#)

Using the Support Deck: Before each game, a player may swap up to 15 cards in his deck for an equal number of cards in his Support Deck. The swapped cards then become part of the Support Deck and can be used in a later game.

Example: When it comes time for the *Dagobah* game, the Dark Side player has decided that even though he can use the Bounty Hunters from that set, he'd rather play an asteroids strategy and save the Hunters for *Cloud City*

or *Jabba's Palace* where they'd be more powerful. So he swaps the Bounty Hunters and their ships and weapons for the TIE Fighters and TIE Defenders he has in his Support Deck. Now those Bounty Hunters are in the Support Deck and he'll be able to swap other cards for them next game when he's playing Cloud City.

4. **Games.** Each individual game will be played normally, one at a time, in sequence. First, both players use their *Premiere* decks, then play with their *A New Hope* decks, then *Hoth*, and so on. At the end of each game, the Force Differential is added to the winner's total score. If the Light Side player wins the *Premiere* game by 9 force, he gets 9 points. If he then wins *A New Hope* by 2 force, his total score would then be 11.
5. **Winning and Challenging.** Once all seven games have been played, the player with the higher total score is, tentatively, the winner. However, the player with the lower score may challenge his opponent to a final game using either 60 or 120 cards from their Support Decks. The winner of this ultimate game adds the Force Differential to his score, and if the challenger managed to change his score enough that he has the highest total, he is now the winner. Otherwise, his opponent still wins.

This challenge may be treated as an optional rule but keeping it in ensures that players will think carefully about what they want to end up with in their Support Deck by the end of the game. Plus, the 'last gasp' of the losing player keeps with the spirit of the novels and comics which take place after the trilogy, when the Empire is broken but not defeated.

Storyline Sequence

- I. Both players construct 60-card decks for *Premiere*, *A New Hope*, *Hoth*, *Dagobah*, *Cloud City*, *Jabba's Palace*, and *Endor*.
- II. Players construct a 120-card Support Deck using cards from *Premiere* and *Special Edition*.
- III. Seven games are played in the following sequence (before each game, players may swap up to 15 cards from their decks with cards in their Support Deck):
 1. *Premiere*
 2. *A New Hope*
 3. *Hoth*
 4. *Dagobah*
 5. *Cloud City*
 6. *Jabba's Palace*
 7. *Endor*
- IV. Players total up their score and the loser may challenge opponent to a final game using cards in the Support Deck.

Death Star II: When this expansion comes out, it will be the end of the *SW:CCG* sets which follow the sequence of the movies. As far as these rules go, it can be added as an eighth and final expansion which the players must incorporate into an eighth game occurring after Endor. It seems as though the *Death Star II* and *Endor* expansions are intended to be very inter-related, with the Endor Shield Generator covering the second Death Star. However, the mechanic of the Support Deck should still allow players to swap out Endor cards that can be swapped back into their *Death Star II* decks. No other potential problems are foreseen with the incorporation of *Death Star II* should pose for these rules.

Variants

- **Team Play:** Ideally, you need 7 players on each team -- one for each deck. If the individual games are played sequentially, fewer players are needed since they can play in more than one game. However, two full teams can pair off their players according to the appropriate expansions and play all seven games at once! In either case, each team has only one Support Deck which they must share (it is up to the team to decide how the Support Deck is constructed). If the games are to be played simultaneously, resolve who takes what from the Support Deck first. Cards are still to be swapped in order of expansion: *Premiere* player goes first, followed by *A New Hope*, then *Hoth*, *Dagobah*, *Cloud City*, *Jabba's Palace*, and *Endor*. Otherwise follow the same rules for a two-

player Storyline game. When each game is finished, the winner's score is added to his team's total. The team with the highest total score when all games are finished wins. There is no challenging in team play.

- **Continuity:** In this variant of the two-player rules, at the end of each game, cards which were not lost or placed out of play are kept for the next game! This adds a feeling of continuity to the series of games -- though it also tends to give an advantage to whoever won the previous game, so be warned. Also keep in mind that this will lead to games with unequal force piles.

That said, there are several ways this can be done: 1) Only the cards that were on the table at the end of the game can be used in the next game. Location cards may be left played on the table, all other cards can be left as well or shuffled into the next game's deck. 2) All cards which were not lost or placed out of play -- those on the table, in each player's hand, and remaining in his life force -- are kept for the next game. Again, those on the table can either be left out or shuffled into the next deck, whatever the players decide.

If the players feel that these rules makes things too difficult for a losing player, here are two options to off-set the winner's advantage: 1) Whichever player lost the previous game goes first in the following one. 2) Players may swap cards on the table or in their hand for cards in their lost pile at the end of each game -- the winner still gets an advantage, but the loser is able to retrieve any crucial cards he lost in the last game.

- **Strategic Reserve:** This variant changes the way the Support Deck operates. First, if the players wish to change the number of cards allowed in the Support Deck, they may do so. Second, the players may wish to allow cards from any expansion in the Support Deck (though this is still the only source for Special Edition cards). The Support Deck now functions like a strategic reserve or extra cards which can be depleted. Before each game, instead of swapping cards from their deck with ones in the Support Deck, players may add cards from their Support Deck to their deck. Whether or not they can choose which cards to add, or if there is any limit to the number is up to the players. This can lead to games where one side has a greater number of cards in his life force than the other, but both sides will have access to the same number of cards overall. If the Dark Side player chooses to add 30 cards to his Premiere deck, he'll have that many fewer cards to use later -- and the Light Side may choose to add just as many cards to his deck in the next game.

by **P.D. Magnus**

Art by **Phil Foglio**

If you've played *Before I Kill You, Mr. Bond . . .* ([Cheapass Games](#)), you've had the chance to capture spies, to mock them, and -- if you were lucky-- to kill them. The game's simple play is one of its charms. There are only three kinds of cards: Spies, Lairs in which to capture Spies, and Doublers with which to taunt them.

Of course, the charms of simple play can wear thin. Once you've built your hundredth Pyramid of Power, introduced the thousandth spy to your overworked business associate Mister Lo, and had it all torn down by Mr. Fazz more times than you care to count, being a super villain may lose just a bit of its sparkle.

What do other criminal masterminds do to keep their lives interesting? They get embroiled in Subplots. Now, so can you.

Making the Cards

Subplots are a new kind of card in addition to the familiar Spies, Lairs, and Doublers. There are eighteen of these new cards in all. They are provided as a PDF [Subplots PDF File \[30K\]](#) file, which you can read and print out from Adobe's Acrobat Reader. If you don't have Acrobat, you can get it [for free](#).

Each Subplot card is the size of a normal *Mr. Bond* card, so nine of them fit on one page. Although you can print them off on paper, they're easier to use if you print them on card stock. If you can't print directly to card stock, you can photocopy them to cardstock at your local copy center or paste them to cardstock before cutting them out.

If you print them onto white cardstock, you will be able to tell them apart from Lair cards and Doublers. If you're especially concerned, I suppose you could photocopy the card backs from the *Mr. Bond* game and print the Subplot cards onto yellow cardstock. This isn't at all necessary, however. Although other players will know if you have any Subplot cards in your hand, they won't be able to tell which ones you have until you play them.

In any case, you'll have to print out the cards. You'll also need the *Mr. Bond* game.

Using the Cards

Shuffle the Subplot cards into the deck at the beginning of the game. When you draw a Subplot card, you can play it for a particular effect. When you can play the card and what it does are indicated on the card. After being played, Subplot cards are put on the discard pile.

Subplot cards add another dimension to the game by giving you new tactical options. Watch for combinations, like the

powerful Steroid and Triple Espresso double-punch. Don't let the power go to your head, though. The uncanny Mr. Fazz can still destroy your Secret Laboratory.

The Subplots

The PDF file contains the cards in nicely-formatted card shapes, but for your convenience the text of the cards is given below. Some cards can only be played on other villains, some only on yourself. Where a card says 'someone' or 'a player,' you can play the card on either yourself or an opponent.

Closed for Renovations

Move one card of your choice from a player's lair to their hand.

Play when a spy or team is played into the player's lair but before any Doublers are played.

Commando Raid

Send a spy to destroy a single lair card in another player's lair. If the lair card isn't of lesser value than the spy, the spy may still be captured.

Play when you play a spy or team.

He Stopped To Ask For Directions

A spy played into another player's lair moves to yours instead of being captured or escaping. If a team was played, you may only move one spy.

Play when someone plays a spy or team into another player's lair.

Larceny

Move a lair card from another player's lair into your own.

Play instead of playing a Lair card.

Pansy Taunt

Doublers only multiply the value of this spy. One Doubler doubles the value, but two Doublers multiply the value by three, three multiply the value by four, and so on.

Play when an opponent is taunting a spy.

Petty Larceny

Pick a card from an opponent's hand and put it in your own.

Play at any time.

Property Tax

Every player must discard one card of their choice from their hand for each card in their lair, upto their entire hand. You discard first, then taxation proceeds clockwise around the table. The normal turn sequence resumes after taxes have been paid.

Play at any time.

Scavenged Resources

Take a card as it is being moved to the discard pile and put it in your hand.

Play any time cards are discarded.

Secret Room

One Lair card in your lair is saved from the destructive force of a spy or spy team.

Play when a spy or team escapes from you lair.

Sedatives

A spy is treated as having a value three less than their normal value. A spy with a value of zero or less is worth no points.

Play when a spy or team is played into someone's lair but before any Doublers are played.

Steroids

A spy is treated as having a value three higher than their normal value.

Play when a spy or team is played into someone's lair but before any Doublers are played.

System Reset

Discard your hand and draw a new hand of five cards.

Play instead of drawing a card on your turn.

Team-Building Exercise

Play a team of spies into another player's lair from either the top of the deck or another player's hand.

Play instead of playing a spy in the normal way.

Temptation

Force an opponent to play as many Doublers as they can. If they don't have any Doublers, they get frustrated and release the spy who leaves without destroying their lair.

Play when the opponent captures a spy or team.

Thirst for Blood

Force an opponent to kill a spy without playing any further Doublers.

Play when the opponent has captured a spy or team.

This Reminds Me of Work

Swap hands (but not lairs) with another player.

Play at any time.

Triple Espresso

Each 1 point Lair card in your lair counts for 3 against this spy only.

Play when a spy or team of spies is played into your lair.

Wrong Turn

Move a spy played into your lair to the lair of another player. If a team was played, you may only move one spy.

Play when a spy or team is played into your lair.

Iron Weirdness

"Five years ago, a man's fantasy became reality in a forum never seen before -- a giant cooking arena, Kitchen Stadium. The motivation for spending his fortune to create Kitchen Stadium was to encounter new original cuisines, which could be called true artistic creations. To realize his dream, he first secretly started selecting the top chefs of various styles of cooking. And he named his men the Iron Chefs -- the invincible men of culinary skill . . . Kitchen Stadium is the arena where Iron Chefs await the challenges of master chefs from around the world. Both the Iron Chef and challenger have one hour to tackle the theme ingredient of the day. Using all their senses, skills, and creativity, they're to prepare artistic dishes never tasted before. And if ever a challenger wins over the Iron Chef, he or she will gain the people's ovation and fame forever."

-- opening narration, *Iron Chef* (international version)

If memory serves me right, this issue of *Pyramid* has something of an *Iron Chef* feel to it already. For those who had hoped to find solace from that culinary storm in this column, then, my apologies. Food is already deeply intertwined with gaming, from the Doritos and pizza on the table to the ubiquitous iron rations and meetings in taverns to the, er, special menu needs of many fantasy and horror creations. But oddly, for something so central to daily life, to existence, to pleasure itself, food doesn't often take center stage in our RPG adventuring or in our little corner of "fan media." The latter changed with the debut of *Iron Chef* on American cable TV; for the former, I humbly offer this *Iron Chef*-inspired campaign concoction.

First, a quick summary for the uninitiated. Fuji TV in Japan aired the *Iron Chef* program between October 1993 and September 1999; since July of 1999, it's been in syndication on cable television's Food Network. The opening narration quoted above gives the basic setup; the Iron Chef takes on challengers (some of whom represent ominous "factions" of Japanese cuisine rather reminiscent of martial arts schools, complete with feared masters and devout pupils) in the enormous Kitchen Stadium. As the chefs prepare their dishes, breathless play-by-play commentary fills in the audience on the ingredients and the battle's emotional swings. Guests (sometimes the master of a competitor, other times family or fellow chefs from a competitor's school) watch from the Royal Box; a panel of judges then tastes the two chefs' dishes, all of which must include the theme ingredient. (For more details, see www.ironchef.com.) The theme ingredients are typically the finest, most expensive and luxurious versions available -- the potatoes for a "potato battle" are special breeds grown only in one Japanese prefecture and picked under a new moon. No, really. Kitchen Stadium is also fully-stocked with the most recondite sauces, spices, meat, vegetables, and other ingredients available -- \$8 million worth over six years. All of this happens, in the show's mythology, at the behest of the mysterious, wealthy, eccentric, and gaudily-caparisoned "Chairman of Kitchen Academy," Kaga Takeshi.

"Show me what you eat, and I'll tell you what you are."

-- Anthelme Brillat-Savarin

Perhaps it's just me, but I delight in chewing over the mysteries and enigmas surrounding Chairman Kaga and Kitchen Stadium. Why on Earth did he have to *secretly* select the top chefs from various styles of cooking? And if it's so secret, why is it on television? For what monarch, really, is the Royal Box intended? Why do members of the Japanese parliament and famous fortunetellers judge his cooking competitions? Does that yellow pepper contain a human soul, or give the knowledge of good and evil? Why can the wisdom of Chairman Kaga only be contained in subtitles? And what's the deal with his brocaded jackets?

Possibly overstimulated by the jackets, I propose the following five explanations, none of which necessarily fit the facts, but all of which are more than suitable setups for culinary gaming adventure. Many of them assume that the *real* Kitchen Stadium and the *true* competitions happen out of sight; possibly in a subterranean complex powered by a tamed volcano. Some of these explanations can even be combined with one another, for a perfected dish of unique boldness.

- **No, Mister Bond, I Expect You To Cook:** Chairman Kaga is a Bond villain, or a 1960s-era Batman villain. He commits brilliant food-related crimes, or his plan for world domination involves controlling global agriculture. Kitchen Stadium is a monument to his madness.

- **Everybody Comes To Kaga's:** Rather than risk another global conflagration, the conspiracies now conduct their Secret Wars through a combination of potlatch (by cooking and eating incredibly powerful and expensive ingredients, they boast of their resources) and cook-off. Around the fringes, shadowy deals are cut.
- **Uplift Stadium:** The Chairman has been elsewhere; perhaps he was an alien abductee, or he's crossed over from a parallel Earth. (My personal theory is that Kitchen Stadium is a nexus into the Godzillaverse.) Now, he's desperately trying to raise our level of food preparation before They get here; he knows that if They deem human cuisine acceptable, Earth will be granted "civilized" status. Why should membership in the Galactic Federation depend on our space drive capacity?
- **To Encounter New Original Cuisines:** Chairman Kaga is a wealthy, and incredibly bored, immortal. Only through new and exciting food can he retain any connection to his existence. Hey, if [Jesus could be Japanese](#), so could [the Wandering Jew](#). For a magical version of this, the Chairman uses the Stadium as a cover for his sorcerous food experiments in culinary alchemy; with recondite ingredients, he has been building his power for generations.
- **Burnt Offerings:** Or let's go "one louder" on this: he's a god, or the high priest of a god, sustained by the esoteric smells of cooking food. Is the Chairman attempting to placate the deity -- or invoke it?

"When we call corn Ceres and wine Bacchus, we use a common figure of speech; but do you imagine that anyone is so insane as to believe that the thing he feeds on is a god?"

-- Cicero

With all that in mind, here's a campaign frame inspired by what you might call the Secret Mythology of *Iron Chef*. The PCs work for the Chairman, whose motives remain unknown. The true competitions occur in the secret, even more amazing, Kitchen Stadium buried in the bedrock beneath Tokyo. For his endless stream of culinary battles, the Chairman demands only the finest, most recondite and downright peculiar ingredients available. For this, he depends on the Iron Victuallers -- the PCs. Their mission, to go out into the world and hunt down these ingredients; the Chairman provides limitless funding and top-of-the-line refrigerated Black Helicopters. The Iron Victuallers -- skilled in all forms of infiltration, covert operations, and cuisine -- deploy from the Pantry, their superscientific gourmet HQ. Their competition (in addition to the obstacles before any given ingredient) can be other exotic provisioners working for other crazed gourmards, a gray global killjoy group like UNFIT (the UN Food Insipidity Taskforce), evil agribusinesses, or a rival Illuminati group in an "Everyone Comes to Kaga's" world. Although this is basically a cinematic (not to say campy) food-centered variation on a *GURPS Warehouse 23* campaign, it could be flavored with *GURPS Atomic Horror*, *GURPS Cliffhangers*, or even *GURPS Black Ops*, depending on the GM mood.

Unless the PCs investigate and expose the secret motives or nature of the Chairman, there's not a lot of space for evolution and climactic drama in an Iron Victualler campaign. Therefore, keeping player (and GM) interest will depend on maintaining variety in the scenarios. (This, of course, can also make Iron Victualler games great "one-shots" when some key player can't make it to the regular game.) To that end, unless you have a really swell ingredient that you want to build a game around (Odin's mead, [Dionysos' wine](#), mandrake plants), it might be easier to work it from the other direction: decide the theme ingredient based on the scenario.

The "travelogue" approach is one way to do it: pick some place cool and dangerous that the Iron Victuallers haven't yet gone and find out its key foodstuff. Whether you send them to [the Amazon basin](#) for the rare Sapphire Mango, or deep beneath the Bermuda Triangle for kraken, or to Tibet for yeti butter, getting there is half the fun. Sometimes just finding "there" is the challenge. If the Chairman demands coffee beans picked from bushes outside [Irem](#) and roasted over the Fiery Furnace of Babylon, or pure, natural lemonade from the springs of the [Big Rock Candy Mountain](#), or paprika from the dreams of a Hungarian poet, the scenario may center around finding the worm-eaten old map or [eccentric wanderer](#) with the necessary directions. If the Pantry has access to a time machine, you can expand their horizons temporally; send them after fresh hadrosaurus, or aurochs from Attila's prize herds, or [Coca-Cola](#) from Pemberton's first kettle-full, or wine from the wedding feast at Cana.

Another approach is to design the theme ingredient around the opposition, someone or something the PCs haven't fought before -- or a foe they lost to, and desperately crave a rematch with. This can be a simple "monster hunt" (dragon ribs, milk-fed [manticore](#) veal, [griffin](#) eggs, swamp elemental salad) or it can be something guarded by formidable and distinctive opposition. What kind of wine does the Sasquatch crush out of Oregon pinot grapes with

those big feet? Do [Black Dragon Society](#) ninjas guard a pool of immortal koi somewhere in the Ryukyu Islands? In what isolated greenhouse do the Adepts of Hermes raise the Pomegranates of Persephone that allow speech with the dead?

Finally, the nature of the scenario may dictate the opposition, or the theme ingredient, or both. A taut, *Mission: Impossible* "caper scenario" may be just the thing for breaking into Hangar 18 to steal the Roswell Saucer's food locker. A gun-toting rumble will surely help the PCs liberate mammoth steaks or Hyperborean saffron from a Russian mafia larder. For games of intrigue and interpersonal roleplaying, nothing could be finer than the decennial *Prieuré de Sion* wine auction, unless it's the Arcadia County Fair somewhere in the Midwest where the faerie farmers all compete to grow the most impressive and magical vegetables. Looking in books of food history, or reading novels like Michaela Roessner's Renaissance-kitchen-fantasies *The Stars Dispose* and *The Stars Compel* or Tim Powers' secret histories of beer (*The Drawing of the Dark*) and wine (*Earthquake Weather*), can spark yet further ideas. How will the PCs acquire the ingredients for Chairman Kaga's desperate recipes? And how will their opponents -- be they the Iron Chef Aztec or the Antarctic Space Nazi Brewmasters -- fight back? The heat -- will be on!

Pyramid Review

Big Eyes, Small Mouth GM's Screen (for BESM 2nd Ed.)

Published by [Guardians of Order](#)

Screen Cover Art by Julie Dillon and Screen Design by Jeff Mackintosh

Supplement Written by Jesse Scoble

48 pages (adventure book) & screen; \$12.95

Since its release last year, Guardians of Order hasn't exactly been the quickest to provide us with new material for use with the second edition of their exciting anime genre game, *Big Eyes, Small Mouth*. However, they have finally made a little bit of leadway, and there are even a few books for it on the horizon. The GM's screen is one of the first of this forthcoming material to hit the shelves, and while GM screens are seldom items to jump up and down about, this one bears some flaws that make it less useful than usual.

The screen itself is a four-part fold out, with the same digest-sized dimensions as the other books in the line (when folded). It is adorned with yet another graceful cover by artist Julie Dillon, whose art for the *BESM* line captures that anime flair and appeal just right with each piece. The interior is done in a layout similar to that of the core book, but in black-and-white. The tables included on the chart include the action modifiers charts, the degrees of success chart, the weapons chart, and others.

Now, one thing you may be wondering here is, do we really need a GM screen for this game? I mean, this *is* the Tri-Stat system we're talking about here. And if you know anything about this system, then you know that it is notoriously simple -- probably the last game system one would need to have a bunch of charts out in the open to run. And after taking a good hard look at the screen, the truth is that the charts are only mildly handy. Probably the most useful are the attack roll modifiers and the weapons chart, but they hardly constitute the majority.

The screen's lack of utility is further compounded by the smaller size. Because it is a digest-sized screen (height-wise) it isn't going to provide as effective coverage for concealing dice rolls as other, full-sized screens. This isn't to say that the screen will be useless in this regard, but some GMs are certainly going to just keep using one of their older screens from a different system. Thus, the *BESM* GM's screen is a little bit more of a GM "woobie" than a necessary tool.

However, as is done with just about all GM screens these days, this one comes with an adventure book to make it a little bit more worth the money. The adventure is called "So, We Have. . . an Obelisk," and it's written by Jesse Scoble. It is set in a cross-genre setting, allowing players to use just about any character they like, and allowing GMs a lot of freedom when running the game. The basic premise behind the adventure is that a company from Earth, AmeriCorp, has managed to take over the majority of the known universe through the control and manipulation of these titanic obelisks, capable of all kinds of neat things, from folding space to destroying and recreating worlds. The PCs are all Guardians of Order (neat, huh?) -- those individuals marked with a tattoo of Balance and capable of manipulating these mammoth obelisks.

The adventure is divided into two parts. In the first the players are thrust into a world being harvested by AmeriCorp through one of the obelisks, and they must do something or watch it perish. In the second part, the players are whisked away to none other than the AmeriCorp intergalactic center of operations, where they are promptly fallen upon by AmeriCorp agents who want to convert them to their cause and use the PCs' rare ability to manipulate the obelisks to

AmeriCorp's advantage.

The adventure is open-ended that it almost doesn't resemble an adventure so much as it does an extended adventure seed. The world setting is set up, its relevant history is explained in fair detail, and important NPCs are introduced with full stats and illustrations, but the adventure doesn't really demand the GM to take it in any particular direction. It goes over all of the possibilities and suggests a lot of things that GMs might want to do, but ultimately it's up to the individual what shape this adventure (or potential campaign) takes.

Given that there wasn't an intro adventure in the ***BESM 2nd Edition*** core book, this adventure sort of assumes the responsibility of an intro adventure, especially since it comes with the GM screen. This is not an easy thing to do with such a universal game system, but this one does a fair job of it. As it is set up in the adventure, everything is simple and straightforward enough that no GM should get lost trying to run it, and its cross-genre approach allows players to make full use of the character creation options in the core book. However, more experienced GMs are going to find it somewhat lacking due to its relative simplicity, and any GM who wants to get a lot out of it is going to have to do some additional work, especially in the second part.

Given the moderate usefulness of the two items in this combo, we'd have to say that this is only really a good buy for the true beginner or the truly hard core ***BESM*** GM (the mad otaku, who just won't run his ***BESM*** game with anything *but* a GM screen made for the job). Anyone else will probably manage to get by okay without this one.

Aberrant Players Guide

Published by [White Wolf Publishing, Inc.](#)

Written by Andrew Bates, Bruce Baugh, Deird're Brooks, John Chambers, Chris Haddad, and Steve Kenson

192 pages; \$25.95

White Wolf's game of superhuman conflict often asks, "What would you do with the power of a god?" The main book, however, doesn't really fully address that question.

The *Aberrant Players Guide*, on the other hand, does -- and the answer is far more than merely "anything you want to." This supplement, which answers a great many questions about White Wolf's Aeon Society universe, is the ultimate tool kit for a player *or* Storyteller (despite the name) who wants to explore or expand the possibilities of being more than human.

Despite the usual White Wolf tendency to include large amounts of in-character fiction and graphics, the guide is packed from cover to cover with useful ideas, new abilities, new ways of looking at old abilities, ways to tinker with the system, and meatier sections on organizations that had only been hinted at before.

As promised, the new powers range from the merely impressive, such as Psychic Link, to the literally godlike, in the case of Universe Creation. All are well-detailed, and the virtual omnipotence available at the highest levels is reserved for novas with power levels well beyond those of starting characters. The experience cost for such abilities is also staggering, which should allow Storytellers to keep them away from power gamers for the length of any reasonable campaign.

The less overwhelming abilities are reasonably play balanced. A host of new methods is now available for altering powers, increasing or decreasing their effectiveness through the setting's unique characteristics. Also, Merits and Flaws -- the Advantages and Disadvantages of the Storyteller system -- return, as they always do in White Wolf's player guides.

In a strange but welcome twist, the rules for creating naturally-occurring psychics are also provided. Primarily a mystery from the *Trinity* game, the psychomorphs or "psiads" are worked into the setting quite effectively all the same. Though far more limited than novas -- the more polite term for the supers of the *Aberrant* universe -- psiads have a number of abilities that allow them to hold their own in a world of gods, and fascinating potential for a quiet campaign woven in the shadows of the Nova Age.

Finally, the long-awaited super-gadgeteering rules make their appearance. Despite a sidebar to the contrary, you *can* be Iron Man using these rules. It just won't be easy. Nova gadgets are basically devices that mimic quantum powers, but the inventor either has to have the power to be included or be able to observe the power in action, so time machines and Ultimate Nullifiers won't be showing up in most novas' labs any time soon.

More impressive, however, is the way in which all these abilities are presented. Nearly every new ability, and many old ones, are presented with story hooks to make a character more interesting or turn an NPC into a ready-made adventure. The ability to merge with a computer system turns a nova into a literal ghost in the machine. A single turn

of phrase by a manipulative nova can be an assassination attempt -- and an entire adventure. A minor aberration like "androgynous" can be an evening's entertainment as a love-struck character accidentally pursues someone of a gender they don't normally prefer.

Perhaps the best example of this is the section of the book in which the Backgrounds are revisited. Short fictional pieces -- several of which advance the story line -- are followed by how these minor abilities can shape or be shaped by the character. Nothing new to experienced roleplayers, perhaps, but still welcome when well done. Perhaps the most amusing anecdote in the book is a sequence in which a distressed damsel is rescued by her slinky dress -- which happens to be a symbiotic, mobile "eufiber" suit. Spandex, eat your heart out.

Amidst all of this expansion of the game mechanics is also an expansion of the setting. The reader is introduced to no less than three regional super-teams, each with its own feel. (And once again proving that the *Aberrant* designers don't take themselves too seriously, one is nicknamed by its rivals the "Swedish Nova Bikini Team.") A closer look at home town heroes, nova special-interest groups, and the "young heroes" expansion of the world's premier super-team round out the list of modern groups receiving special focus. All are at least interesting, and offer various ways of embroiling characters in local problems.

One of the most interesting revelations in the book is the partial revelation of the origins of the Aeon Society and the motives of its founder, Maxwell Mercer. The Grand Old Man of the setting still has a few aces up his sleeve, and while it remains to be seen what he intends to do with them, they can make life interesting no matter what faction a given campaign focuses on.

The art, as is typical for White Wolf, tends towards the excellent, with a few pieces being less impressive. (The sweet granny lifting the car was priceless, though.) Ranging from the beautiful to the bizarre, it's about what one can expect from White Wolf in general and *Aberrant* in particular.

What really holds the book together, and for that matter what makes *Aberrant* in general so much fun, is the style. The *Aberrant Players Guide* is practically glowing with it, from fun with code names to exploring the final frontier as a hobby. This style, however, is perhaps the book's one weakness as well. Though the creators stress the unlimited possibilities of the setting, there seems to be a certain disdain for four-color heroics. The entire introduction is devoted to pushing campaigns centered on something, *anything*, other than heroes in costumes. The gadgeteering rules are quirky, and meant to avoid gadget-centered heroes, and adventure seeds focused on the rival "hero teams" of the world are decidedly unheroic for the most part. While *Aberrant* was never meant to be a traditional super hero world, elements of the genre are unquestionably in evidence, and the game's schizophrenia isn't helped any by the contradictions perpetuated in the guide. Also, the back cover blurb promises the "full skinny on the N! Network," something I didn't notice in the book myself.

And of course, White Wolf can't leave well enough alone. Having revealed the truth behind one major power type, the psychics, they hint at a *third* type of empowered beings, something they call "paramorphs." All we get is a name. We'll probably find out a little more about them in the coming pulp-era game . . .

Aside from thematic confusion and a few typos, however, the *Aberrant Players Guide* is an indispensable tool for budding novas and Storytellers alike, with something to offer any campaign set in the Nova Age. Indeed, many other campaigns with powers beyond those of mere mortals might benefit from this book.

So, what *will* you do with the power of a god?

-- Peter Flanagan

Pyramid Pick

The Speaker in Dreams (for D&D)

Written by James Wyatt

Published by [Wizards of the Coast](#)

32 b & w pages + 10 pages of "Web Enhancement;" \$9.95

(SPOILER ALERT: If you plan on playing in this adventure, you probably don't want to read this review.)

The Speaker in Dreams is an adventure for four 5th level characters. Like the *Sunless Citadel* and *The Forge of Fury*, this is one of the core adventures that is supposed to be kept in print. Unlike those two though, this isn't solely a site-based encounter. That's right, there's more than just running around the dungeon this time. Taking place in the city of Brindinford, the characters get to match arms against wererats and wits with a player's most dangerous foe: NPCs.

The adventure starts off with an introduction that gives a one sentence recap of what the adventure is about, how many characters are needed, what level the characters should advance to by its conclusion, and notes on why the adventure has encounters a bit more difficult than earlier adventures. The adventure background and synopsis allow a GM to read it over briefly and know why the events are taking place. The section on character hooks enables the GM to get the players involved. Because Brindinford isn't just a hamlet, the city is broken up into neighborhoods, each with a different style and information. The Ford North is the wealthier holy quarter, while the Southspur is the poor area. Text that is to be read aloud is in a gray background, while additional information, such as what area effect spells can do in the city streets, are boxed off from the main text to the side of the page.

Broken up into two main sections, Events and Encounters One and Two, the party is led to believe one thing, and then learns that not everything is as it seems. Because it's not a dungeon crawl and may be the first time players are involved in a 3rd Edition adventure that isn't one, the GM should keep the players on their toes. New players may be unfamiliar with the main antagonist, a mind flayer, and have no idea how to fight other adventurers.

Because it uses events to get characters involved, there is an adventure flow chart. This allows a new GM to quickly glance at the chart now and again and see where his party currently is. The interior covers include a Manor House, two temples, a maze of alleys, a bell tower, and an overview map of Brindinford itself. Unlike the smaller villages of earlier adventures, Brindinford has more detail given to it. Like previous adventures in the core adventures, *The Speaker in Dreams* has a tight layout, uses interior covers, and doesn't waste a lot of space with strange, ungainly fonts. There are only three pages that could have been done better: 17, 25, and 26 (the last two could have been combined into one page if the illustration was taken out). Maps are well done and easy to read, and art goes along with the text and is of high quality.

One of the best things about adventure is the Web Enhancement of the product. A section titled "All Around The Town" adds ten pages to the adventure for the hefty cost of nothing. Stored as a PDF document, I had no problem opening and printing the adventure supplement. It has the same fonts, design, and layout as the adventure. More impressive is this isn't just a piece of fluff, but is written by the same author and gives a lot more details to the city of Brindinford. There are new NPCs, adventure hooks, and monsters to throw at the players. While Wizards has used Web Enhancement for a few products before, this is the first time so much useful material has been added. Wizards of the Coast does a nice job of breaking away from the dungeon hack style of game play with this adventure and the extra Web Enhancement gives the GM something that players might not have access to right away. If Wizards can keep up this level of quality and add-ons, the bar for *d20* products has just been raised.

Reviewer's Note: The Wizards of the Coast web site is unfortunately, not as nicely done as this adventure. Those wishing to add the Web Enhancements to their adventure, go here: <http://www.wizards.com/dnd/article.aspx=dnd/we/we20010105a>

-- *Joe G. Kushner*

Three competitors. Three minds of the roleplaying world, each representing a different gaming genre, have accepted the Iron Ref challenge.

Three secret ingredients. Selected by a special guest, three ingredients -- plot elements, story pieces, or other oddities -- are selected for the challengers to incorporate into their concoctions.

2000 words. Each competitor has two thousand words -- and no more -- to devise a generic scenario in their genre incorporating all three secret ingredients.

24 hours. And they have one day to work their magic.

Who shall emerge, victorious, as the Iron Ref?

* * *

Our challengers, and their respective genres, are:

James L. Cambias, writer of such diverse items as *Six Guns and Sorcery*, (for *Castle Falkenstein*), *Fall of the Malakim* (for *In Nomine*), and *GURPS Planet Krishna*, will be representing the **Science Fiction** genre.

Justin Achilli, line developer and contributor for [White Wolf's Vampire: The Masquerade](#) line (plus contributor to *Kindred of the East*, *Clanbook: Cappadocian*, and the *Werewolf Players Guide Second Edition*) will be representing the **Horror** genre.

Sean Patrick Fannon, leader of the [Shards of the Stone](#) project, creator of the *The Fantasy Roleplaying Gamer's Bible*, and writer for *Champions*, *Shatterzone*, and WEG's *Star Wars RPG*, will be representing the **Fantasy** genre.

* * *

The secret ingredients have been painstakingly corralled by none other than **Kenneth Hite**, brainchild behind [Suppressed Transmission](#), and creator of more roleplaying material than we can shake a stick at. And, really, who's better at supplying secret ingredients than our own master of arcane lore?

Stop reading if you don't want to know the secret ingredients!

This competition's secret ingredients are:

- An injury to the eye
- An experimental flying-machine

Fiddly Bits

This first Iron Ref competition was held from midnight on Tuesday, January 30th, through Wednesday the 31st (in other words, all day Wednesday). To the best of our ability, the challengers were kept secret from each other, as was the identity of the guest ingredient supplier. Except for coding and formatting for HTML, Iron Ref entries were not edited.

The order of presentation was determined randomly by [Adam Jury](#) (the creative force behind [The Shadowrun Supplemental](#)) and [Keith Johnson](#), Assistant Webmaster at [Steve Jackson Games](#). They were picked through a very selective process involving being available in the chat rooms at one in the morning.

Extra special thanks go to [Steven Howard](#), who first suggested this idea waaaay back in September in the .newcolumn newsgroup. Extra special thanks also go to [Peter V. Dell'Orto](#), for suggesting the Iron Ref name. And a general round of appreciation to the other folks who inhabited the .newcolumn board for

A cherry-wood chair upholstered in a significant, perhaps even alarming, shade of blue

Without further adieu, then, here are the results of this competition:

SciFi: [Blue Genes](#), by *James L. Cambias*

Horror: [A Night Like Every Other](#), by *Justin Achilli*

Fantasy: [The Flight of the Azure-Cherry Wood Duff](#)

Lifter, by *Sean Patrick Fannon*

offering their thoughts and opinions on this idea. So . . . thanks!

Although designed as a one-shot, if Iron Ref is popular enough, we have no problem making this a recurring feature (although, if we did that, it probably wouldn't be made any more common than bimonthly or so). Commentary on this little experiment is welcome, either by sending us a [note](#), or dropping by the [Pyramid discussion boards](#).

Adah Gregory

A Non-Canonical Character for *In Nomine*

by Kathryn Martens

Art by Dan Smith and colored by Keith Johnson

Book of Genesis

Many gamers are familiar with the basic creation story as presented in the Book of Genesis: God creates the Earth and all things in it in six days; He creates Woman as a mate for Man; the Serpent tempts the Woman into eating the fruit of the Tree of Knowledge of Good and Evil; and finally Man and Woman are evicted from the Garden of Eden for their transgression. But among the many interesting things to note about the creation story is the following passage, Genesis 3:22:

"Then the Lord God said, 'Behold, the man has become like one of us, knowing good and evil; and now, lest he put forth his hand and take also of the tree of life, and eat, and live for ever' -- therefore the Lord God sent him forth from the garden of Eden . . . "

In essence, it seems that God Himself feared humanity would reach beyond itself a second time, and aspire to more than they were given. To prevent their overreaching themselves again, He cast them from the garden and set a flaming sword at its entrance to drive them away.

Book of Enoch

Fewer people are familiar with the apocryphal book known as the Book of Enoch. Enoch was the sixth generation after Adam, and by all accounts (in the books of Sirach and the Wisdom of Solomon) was a just and righteous man. He was so righteous, in fact, that he did not die, but rather was assumed bodily into Heaven by God. It is recorded in the Book of Enoch that he was taken to Heaven in a chariot borne on the backs of angels in the form of flaming wheels; it is from this image that the phrase "chariots of fire" was created. (Those who game *In Nomine* will recognize the Wheels by the name "Ophanim," given to them in the first millennium AD by Pseudo-Dionysius the Areopagete.) After he was assumed, scribes wrote down his visions and his assumption as an extensive work on spiritual physics and the history of the world since Adam.

What Genesis only hinted at, though, appears in full in the Book of Enoch: the history of the Grigori. The early fathers of the Christian Church culled the Book of Enoch, among others, from the Bible because of its "questionable" theology. (For reference, other questionable books include the Book of Adam and Eve, in which Adam's first wife, Lilith, is described; books in which it is revealed that Jesus had brothers and sisters; and other texts in which strict doctrine is thrown into question.) One of the reasons for Enoch's removal was the Grigori and their history with humanity.

The Grigori

Once God had thrown humanity out of the Garden of Eden, His anger softened a bit. He wished the pinnacle of His creation to succeed in the world, rather than be destroyed by it. Thus, God created a band of angels known as the Grigori. They were more commonly known by their assignment, as the Watchers.

The Watchers were assigned the duty of teaching the newly formed humanity how to live in the world. According to

the Book of Enoch it was the Grigori who passed on all the secrets of civilization to humans. In the beginning, these inventions had the holiest of intentions: the art of building shelter, to protect humanity from the elements; the art of agriculture, to feed them; literacy, to pass on the Word of God. The Grigori adored humanity for their eager minds, and were proud of their quick progress. The Watchers soon became the closest of all the angels to the human race.

Unfortunately, this also meant they were the most fallible. At first the Grigori were revered as mentors. But as the Grigori lived longer and longer among humanity -- and produced greater and more varied inventions for their most adored human charges to indulge in -- the Grigori found themselves in turn adored as gods. Humanity was overreaching itself again, this time with the help of the angels. Both the most grim and the most frivolous Grigori inventors found themselves the object of human adoration: among them were the makers of war machines, and the makers of fineries. Humanity sought the power to take life at their own will, rather than God's; and they sought to create the illusion of youth and beauty long beyond their appointed old age.

The Grigori soon became as debauched as humanity could dream. The Grigori took lovers, husbands and wives from among humanity and produced terrible half-breed children: literal giants, they were known as the Nephilim. They were tremendous in size and terrible in their twisted natures. They terrorized the Earth, and defiled all they touched. Humanity, running rampant with the inventions the Grigori gave them, made war upon each other and indulged in abominations of every sort. Eventually the Almighty could suffer it no longer and cast the Grigori from Heaven. The Nephilim were hunted down by the heavenly host and destroyed. Three generations after Enoch was assumed into Heaven, it is recorded in Genesis that the family of Enoch's grandson, Noah, was chosen as the sole survivor of the Great Flood. God chose to wipe the Earth clean and start over again.

The Game

Most celestials agree that all the Grigori were destroyed in the Flood. Some celestials (the crackpots) believe that a few Grigori may somehow have escaped the wrath of God. However, what angels (and demons) agree on is that the Grigori's half-breed blood still exists in humanity. Their progeny that did not immediately become Nephilim remained largely human; and as it passed through Noah's family down through the generations, it spread thinner and thinner -- but farther and wider -- until the numbers of Grigori half-breeds may well be countless. It is a possibility that these half-breeds may become conscious of their "difference" from the rest of humanity, and may well learn to exert their control over the Symphony somewhat as a celestial might. It is unknown what the reactions of such a being might be to suddenly being exposed -- and manipulated -- as another pawn in the War between Heaven and Hell. But more than anything, it is certain that a Grigori's first priority will always be humanity.

For the purposes of "Supporting Cast," at least one Grigori may still exist. Her name is Adah.

Adah

One of the most prolific of the Grigori, both in invention and in debauchery, Adah was the angel gifted with the knowledge of human adornment. To begin with, adornment was intended as a holy ritual used to express authority. Adah invented a crown as an Earthly imitation of the corona of golden glory that surrounded the Godhead. She invented a priest's staff as a mimic of a shepherd's rod -- but a rod fine enough to shepherd humans. She felt that Man could benefit from such authority because of the order, peace, and prosperity it would bring: order brought about by the awe inspired by impressive adornments. With judicious use, this awe could bring order where none existed.

However, it wasn't long before Adah wished to express more than straight lines and heavy gold. Searching about for more varied forms to inspire her, she discovered that Man in general had a fascination

for one thing that surpassed all others: Woman. Intrigued, she took on Woman's form to study her more closely. She discovered that human women were more delicate of frame, and somehow all the more interesting because of it. Women had more interesting eyes, more graceful curves. Yet some women weren't as beautiful as others; some had squinty eyes, some had bony shoulders. She watched these women fade into the background as more naturally beautiful women entered a social group of humans, and she felt pity for them.

From the humble beginning of a single plait of hair, Adah began the indelible weaving together of love and appearance. Adah created makeup, jewelry, and other forms of adornment in her zeal to make the bodies of human women even more beautiful. Adah wanted every woman to feel loved and loveable, and to leave none unwanted and unwedded. In theory, anyway, she rationalized causing the interdependence of love and appearance in this way: with the aid of these things, human women could increase that most holy of emotions, the love of wedded husbands. By increasing the love within matrimony, Adah could give human women their closest analogy to the love and devotion shown to them by both God and his angels.

Adah began experimenting with her own looks first. She invented hairpins to make her long hair more interesting. She invented kohl for a human friend whose eyes (she felt) were too small. She invented braiding for another lady whose long neck was beautiful, but her hair too plain. She created a crown of wildflowers on a whim -- and made it of gold the next day, and lowered it around her neck. Dresses and earrings, makeup and rings were all her inventions. The ring she took most pride in as humans began to use it to show a promise made to a loved one.

Unfortunately, what Adah created was not the art of self-esteem and happy marriage; what she made was a mirage. Women and men both began to twist themselves into false things with the adornments she created; to obtain the love of someone else, they made promises they couldn't keep, lied with their looks and lied with their lips. The art of self-worth became the art of seduction. As she practiced zealously with her own looks, she began to find *herself* adored, rather than her students. She had suitors by the houseful. And just as suddenly she found that adorning oneself was a ritual of empowerment and sensuality -- of reaching beyond oneself.

It wasn't long before Adah had earned herself a place among the truly fallen Grigori. She neglected her duties of solemn adorning ritual, suffering kings and priests to fall as she concentrated on prostitutes. She had children by numerous men, and each child was more monstrous than the last. She tended them jealously, attempting to make their hideous forms more pleasing to the eye so that they, too, could find love -- whether honestly or through false arts, she didn't care.

But none was more surprised than she when all Grigori were sundered from Heaven by the Almighty. She was condemned to live upon the Earth for the rest of her long life for having debased the newly created humanity. The shock of being stripped of her powers proved too much for her; she wandered for centuries in a daze, pulling her fading trappings of gold and finery about her like a tattered cloak. When the Flood came, she (like the rest of

humanity) was caught unawares; she survived by merest chance, being trapped in a cavern carved by a natural freshwater springs.

When the waters receded, and eventually humanity walked abroad again, she sought out humanity's cities to make her living. She sold off her ornaments to get food, until none were left except her hairpins. Refusing to give them up, she sold herself. Mindless, she did anything she had to -- except giving away the last of her ornaments -- in order to survive. And humanity slowly debased itself again.

But one day, in a dusty desert town in a place called Judaea, Adah stumbled across not only her salvation, but her "fifteen minutes" of fame. She found a crowd gathered outside a house to hear a rabbi speak. Thinking perhaps she might find someone to love her for a price, she investigated. What she found was a young rabbi named Jesus sitting down to dinner with a Pharisee. She noted that no one -- not even the owner of the house -- had bathed the feet of the young rabbi, nor welcomed him with the customary kiss, nor even anointed his head. And she also knew that he had been neglected thus because he lacked the solemnity of the Pharisee's garments, and the costliness of his badges of office. To humanity, grown so accustomed to the fake finery she herself had invented, He looked like a ragged, radical teenager instead of -- gulp! -- who He really was. Stunned and ashamed, she turned from the house and went to the money-changers. She sold her last gold hairpins to buy a sweet ointment, and went back to the house. Knowing that He would never accept adornments such as the Pharisee carried, she offered him the only form of honest love she could: she anointed his feet as the owner of the house should have, and bathed his feet with her contrite tears, and dried them with her own long hair. Adah was forgiven her sins on the spot, but has never since adorned herself. (Readers familiar with the Book of Luke from the New Testament of the Bible will recognize this incident as the story of "the woman who was a sinner," Luke 7:36-50.)

Today

Modern day games will find Adah as a sort of wandering Cupid. Having learned the hard way what really makes any human being beautiful -- devotion and honesty, rather than bells and whistles -- she knows at a glance not only what a person really desires, but also whether or not he should get it. In game terms, Adah can fit easily into three different campaign types: high-powered, standard, and low-powered.

High Power

For high-powered campaigns, in which archangels are as readily accessible as CEOs, Adah can be played as a sort of Jackie Onassis. It was said that Jackie's incredible power lay in the fact that she made every man feel as if he was the only man in the room. Adah has that same ability -- to adorn a man's arm and yet make *him* the center of attention. In such a spotlight, very few people will fail to shine. The thing to remember here, however, is that if you choose to play Adah as a true surviving Grigori, there is no source material on her choir to provide checks and balances on game play. Her powers might well be archangelic in stature, but without guidelines as to her proclivities, Adah could get out of hand quickly. It may be a suggestion to play her as the equivalent of a Role 1 Status 6 character (if such a thing were possible): the tremendous media splash that is suddenly gone after a month. Her chosen splash-mate, however, will be remembered long after she herself has moved on. She has learned to show love and adoration by helping others achieve their dreams -- no frills, no lies, just by encouraging their natural abilities (and helping them along with some truly miraculous "coincidences"). Her appearance will change as often as she changes mates; she takes on the form they would feel proudest to stand next to. For a guide to her powers in general, you might wish to consult the Song list provided below.

Adventure Seed

In a surprise election, a formerly unknown minor city commissioner has rocketed to the position of Governor of the state. Within months of beginning his term, his name is being bandied about as a nominee for Vice President. The PCs' Superior is profoundly worried by this dark horse. His politics seem okay, but his rise was simply too meteoric to be natural. The Superior suspects celestial influence. The PCs are assigned to figure out who is pulling this man's strings,

and for whom. And where did he pick up that bombshell brunette . . . ?

Standard Power

For a more traditionally powered campaign, Adah's effective choir can be Mercurian. The history is unclear as to whether the Grigori were created on the Mercurian model or vice versa; regardless, they each have an indelible love of humanity, and their Resonances would act the same. For this sort of campaign, Adah would be the sort of socialite lady found in *Town & Country Magazine* whose picture was snapped while attending the Vanderbilt family reunion. She might make a living as a matchmaker for these upscale families. She would make marriages that last, but would also have a reputation for discreetly getting rid of libertines or opportunists of either gender.

The thing to remember about giving Adah the characteristics of an angel, however -- even a Mercurian -- is that she is a 5,000 year old angel. She has had no "down time" in Heaven; she has been adventuring with humans since before the Flood, and her abilities should reflect a power level that is quite nearly archangelic. There are two critical levelers here. Firstly, since they were cast out, the Grigori may not enter Heaven or Hell. The Marches are open to her, but Adah might well not wish to take the chance of going there; if her corporeal vessel is destroyed while visiting the Marches, her Forces will be Disbanded. Secondly, since the Grigori have no Words or Superiors, they have no Attunements or Rites.

ADAH GREGORY

Matchmaker, Professional Socialite and Promoter

Corporeal Forces - 5	Strength 8	Agility 12
Ethereal Forces - 5	Intelligence 9	Precision 11
Celestial Forces - 6	Will 12	Perception 12

Skills: Detect Lies/6, Dodge/4, Emote/6, Savoir-Faire/5, Seduction/4 (a holdover from her "younger" days)

Songs: Tongues (Corporeal/4), Empathy (Corporeal/3, Ethereal/5, Celestial/6), Friendship (Corporeal/4, Ethereal/4), Form (Celestial/6), Desire (Celestial/6), Charm (Corporeal/6, Ethereal/3, Celestial/4), Attraction (Ethereal/6, Celestial/4)

Vessel: Human/1 (adult female), Charisma +2

Role: Socialite/6, Status/5

(These are suggested abilities, and are meant as a guideline. Additional skills, knowledges, and other abilities can be added as necessary.)

Adventure Seed

The PCs are invited by name and reputation to a house in the Hamptons. The door is answered by a servant, who shows them to the library. There is Adah, acting as go-between for the distraught family she serves. Their daughter has gone missing, and are trusting Adah to find her before word leaks out to high society. Adah has told the family that their daughter rejected her marriage offer from a young man and has "run off" in protest. The real story: Adah was discovered by a powerful demon who wished to bend her to his service. When she refused, he retaliated by kidnapping the young lady to whom she had been acting as mentor and matchmaker. She needs the PCs' help to find and destroy the demon before he murders the girl (or worse).

Low Power

For an everyday sort of campaign, it may work best to lower Adah to the level of half-breed. Most humans never attain that extra Force required to become a Soldier, but Adah -- like untold thousands of humans -- could have been born with it naturally. A half-breed Adah could well be that "crazy girl down the block" who keeps daring God to show her

an angel.

Adventure Seed

The PCs are on a stakeout. A young girl walks straight up to them and demands to know what they are. (If they're invisible, so much the better!) If the PCs won't answer, or if they attempt to blow her off, she threatens to start screaming. She is homeless and slightly crazed, having run away from home at 13; and until she finds out why she can see what no one else can, she will pursue everyone who seems even slightly more than human (and the PCs fit that bill). The girl shows remarkable resistance to Songs that would normally leave a human flattened on the pavement. Regardless of what happens next -- even if it's a firefight with the people the PCs were staking out! -- the girl never flinches. She will dog the PCs wherever they go until they relent and invite her in, or she will gladly die trying.

Recipe Card for Love Potion Number Pi

by Alice Turow

Art by Phil Foglio and colored by Keith Johnson

Brambles dug past denim into Jody's legs as she forced herself into the clearing. "If my research is right," she thought, "the mezlin blossom should be somewhere near here. Then all I'll need is the sliver of a giant squid's tentacle, and I'll be able to . . ."

Hearing a familiar laugh, she stopped short. "Lou?" she called out to the encampment, where her childhood friend -- but never more -- emerged from a tent. Her heart fluttered wildly, and spiked again when she saw the lone needed blossom in the middle of the campsite. "But . . . what are you doing in Brazil?"

"Well, the company sent me here for research. You know," he said, smiling, "we've got to stop meeting like this."

True Love Potion

This potion will allow the brewer to know the true love of his (or her) heart's desire. Such powers should be treated with the respect it deserves.

2 cups of pure spring water	1 sock from the desired (unwashed)
1 pinch of sand from the nearest beach	A pocket mirror which has glimpsed the smile of the desired
1/4 cup tea tasted by the desired	The year's first strawberry
6 soda crackers	A piece of a fallen star

• • •

1. Heat the spring water to near boiling with the mirror submerged in the pot.
2. Stir the sand into the tea; add to the mixture.

• • •

This four- by six-inch card, labeled "True Love Potion" at the top of one side, has a formula -- or more correctly, a recipe -- for an odd brew handwritten on its front and back. Its ingredients are improbable and challenging, its instructions Byzantine. Its promise? True love. And it delivers . . . somewhat.

Anyone who holds and reads the recipe card, who would like to win the love of another, will find a recipe tailored to that specific person. If followed, the preparer will find himself drawn into events that will bring him into increasingly

improbable encounters with the object of his affections. At the culmination, true love will be known.

Except the preparation portion of the recipe does nothing; it is the gathering of the ingredients that works the *real* power. Each element becomes more difficult to gather, and places the beloved (and pursuer) into more improbable meetings. If there are any feelings to be had between the two, the gathering of these ingredients will make these feelings known, and will enable a relationship to blossom from there.

For example, the card above might work as follows:

- The preparer goes to get water from the nearest spring and finds a piece of jewelry he knows belongs to the beloved, which may (or may not, depending on his courage and situation) give him an opportunity to return it.
- Visiting the nearest beach may coincide with a freak heavy storm, from which the only shelter can be found in a nearby cave . . . a cave currently sheltering the beloved, who is also trapped there.
- An opportunity to acquire tea tasted by the desired occurs when she becomes sick and needs a hot soothing beverage . . . her favorite of which is, of course, tea.

And so on.

By the time of the last ingredient, the two will have had more than enough opportunities, and if there is to be a chance of a relationship between them, it will be so. However, the card does promise *true* love; by the time the last ingredient is acquired, if the beloved does not share those feelings, then that person is compelled by the power of the card to have this be known. If the preparer foolishly tries to create the potion from the amassed ingredients (either despite having won the desired, or because the desired has said no), then a particularly nasty fate will befall the consumer. Possibilities include death by poisoning, falling into a coma where the consumer perpetually lives out a fantasy dream with his beloved, or the annihilation of all feelings towards the beloved (or perhaps even the annihilation of all feelings, period).

How the card works is a mystery. Perhaps it is merely precognitive, and can determine when particularly good times to meet (or learn about) the object of the affections will arise.

Perhaps it actually alters time or fate to bring the two together. More sinisterly, perhaps it controls or possesses the beloved in order to bring that person into contact with the user.

The ingredients offered by the card are often seemingly random. There is generally no correlation between what the brewer knows about the beloved and the ingredients required. (For example, it won't ask for "two scoops of the desired's favorite ice cream," but it might ask for "two scoops of hand-scooped ice cream parlor Rocky Road.") Many times ingredients will require creative interpretations; a "nervous swallow," for example, may refer to a bird or an esophageal movement. Other ingredients may be downright cryptic; what, exactly, is "1 page from a book that hasn't been written" or "1/4 cup child's laughter?" (Sinister GMs may have a specific interpretation in mind; more generous GMs will allow the first reasonable solution to work, and have the beloved be at the appropriate place.)

The pursuer is under no compulsion to continue preparing the recipe, and can quit amassing ingredients at any time. Stopping does not preclude the possibility of a relationship later (either naturally or through use of the card). If he does stop, the ingredients amassed become worthless, and if the card is read again its ingredients will change. The card will only show one recipe at a time; if someone else acquires the card with the intent of wanting to prepare a love potion, it will attune to his recipe . . . making the previous recipe useless. Likewise the recipe card must be possessed to work; photocopying or otherwise duplicating the recipe will prove ineffective.

Adventure Possibilities

Someone becomes enamored with one of the PCs, and acquires the recipe card. The hero suddenly finds himself in increasingly improbable places, meeting the same person in the unlikeliest of situations, and seeing that person spirit off bizarre objects. What's going on? (GMs who use this idea are advised to try keeping the ingredient list secret, so that random elements can be picked out of the PC's actions and pointed to as "correct.")

Alternately, one of the NPCs associated with the party becomes the target for one of these cards. The group may become entangled in whatever insanity brings the brewer and associate together. For added romantic possibilities, the NPC may start developing feelings for the pursuer at the same time the pursuer has second thoughts . . . and an eye towards one of the party.

A movie star hires the party to protect her from a stalker . . . and from her own developing feelings towards that person.

A box of the love recipe cards upends at a crowded place (a mall, a sporting event, a concert). Soon thereafter the city is abuzz with impossible romantic pandemonium. (For more widespread chaos, the powers of the card may be distilled to a website; the global ability to alter people's destinies, in the hands of millions of curious and idle minds, can be a challenge for even the most powerful adventurers.)

And, if the card *is* used with successful results, traditionally this fact is learned afterwards, leading to a complication.

Alternate Ideas

- The recipe card not only works as directed, but it also will work when there is no specific beloved in mind. In this way the card will literally allow "the brewer to know the true love" . . . even if that true love is unknown to the pursuer. If this option is used, it may be recommended that the object of the desire not be revealed until the culmination of the ingredient hunt; other possibilities may come and go throughout the amassing, but the "real" true love of the user won't be revealed until the end.
- For a more sinister version, the card can be maneuvering the user towards malevolent ends. This can be something as simple as a Faustian bargain, where a dark power arrives upon amassing the last ingredient to offer the person's desire. Or it can be more complex, with each ingredient placing more and more of the person's life, soul, or world in danger. ("Well, I barely acquired a child's favorite doll and the stop sign of a major intersection. Time to get the thumb of a political leader.")
- When the card has served its "purpose" (either by uniting two people or proving to them that there is no chance for a relationship), it may disappear, be consumed in fire, or otherwise fade from memory . . . only to appear in the hands of the next person who it finds to be appropriate.
- For that matter, what *is* the card's purpose? Is it altruistic, bringing people closer to their destinies; neutral, being nothing more than a tool, the morality of which is the user's problem; or malevolent, seeking to alter people's lives from their natural courses for more sinister ends? The answer to this may provide other adventure possibilities; to know true love can be a powerful and potentially dangerous thing, and anyone with the ability to orchestrate such events may be truly worrisome.

The love potion is a classic element of fairy tales, stories, and legends; the Recipe Card can be a good way of introducing many elements of these classic elements, while hopefully adding something new to that brew. Such potions are almost always proof of the old adage: "Be careful what you wish for; you just might get it."

Monsters of Faerûn (for D&D)

Published by [Wizards of the Coast](#)

Written by James Wyatt and Rob Heinsoo

96 pages; \$21.95

Dungeons and Dragons has long had a tradition of making a lot of *Monster Compendiums*, a showcase of new and exotic monsters to add to the creatures in the *Monster Manual*, for settings from the *Forgotten Realms* to *Dark Sun*. The first *Monster Compendium* made for the Third Edition of *Dungeons and Dragons* continues this old tradition, and does it well.

The first ten pages of the Compendium reiterate the basic organization of the *Monster Manual*; it presents the basic rules for reading and understanding the various entries in the Manual, describing the various elements from Hit Points to Challenge Ratings. This allows *Monsters of Faerûn* to be used as a stand-alone source of monsters, without constantly referring to the *Monster Manual* for detailed information. There is a new element in the descriptive text, however: "In the Realms," which inform the reader how that creature fits into the *Forgotten Realms* setting. This is added separately from the main text of the description, adding world-specific information which spices up the creature, but makes it easier for a Dungeon Master to adapt the creature to any other D20 setting.

The actual monster entries have a large variety of interesting and distinct creatures, from the almost classic Peryton, stag-headed hawklike Beasts who hunt humanoids to devour their hearts, to the more exotic Helmed Horrors, a new class of Constructs who are animated suits of armor with magic weapons and the fighting skills of experienced warriors. Added to the new monsters are some new variations on old creatures, like the Beholder Mage Prestige Class (which is the first official Prestige Class made for a monster), and three examples of Beholderkin, odd creatures which look like evolutionary off-shoots of the original Beholders, created by magical manipulations on Beholder spawn.

There is also the addition of some flavor text which connects many of the creatures in the *Monsters of Faerûn* book together. In the *Forgotten Realms* setting, for example, the Beholderkin were made by another new race of monsters dwelling in the Underdark of the Anauroch desert; the Phaerimm, leech-shaped Aberrations who are all powerful sorcerers. They also hate any and all life that isn't Phaerimm, including the Beholders, which the Beholderkin were made to kill. This little piece of Metaplot, though not vital to the descriptions of the monsters, does make them more interesting to use in *Forgotten Realms*, as well as Hint to the detailed interaction of plots that is to come in the *Forgotten Realms* campaign setting.

Other monster variations of note are a few additional subtypes of Dragons, from the desert-burrowing Brown Dragons to the dark and devious Shadow Dragons. There are also a few new types of Demons, apparently unaligned with the Tanar'ri, some new types of Giants, the new Gem Golems, and six new breeds of Planetouched: the four kinds of Genasi, Elemental-based Planetouched, and two new types of Tieflings: the Fey'ri and the Tanarukk, born from Elves and Orcs respectively.

The Appendix for Templates adds the possibility for even more monsters. There are some new tricks for old Templates like ghosts, lycanthrope, and lichs (including rules for good lichs), and brand new templates, too. The Beasts of Xvim are normal animals and monsters given supernatural powers and cunning by a Dark God. The Curst are humanoids cursed with eternal unlife, unable to die, though not by choice. And the Yuanti in the Realms have started creating Yuanti-Humanoid crossbreeds like the Broodguard and the Tainted Ones.

There are also some new races described in the *Monsters of Faerûn* book, from the now familiar Aarakocra to the new and exotic Dragonkin, a race of dragon-like humanoids. The Dwarven subraces of Faerûn also get an entry to describe the cultural and racial variations common the Realms, from traditional Shield Dwarves to the barbaric Wild Dwarves. Elves don't get such a spotlight, but the complexity of Elven life in the Realms might have made them incompatible with an entry in this Compendium, due to lack of space. Still, other possible races are added instead. The Alaghi beastmen, the froglike Bullywugs and the Wemic lionoid-centaurs all make comebacks from the *Complete Handbook of Humanoids*, along with the Aarakocra. These classic monster races add new roleplaying options, along with other new races, such as the Hybsil, centaurs with the attributes of antelopes rather than horses, and the aquatic humanoid race of the Shalarin.

Overall, *Monsters of Faerûn* seems like a very useful supplement for any campaign of *Dungeons and Dragons 3rd Edition*, and not just for the fans of *Forgotten Realms*. The creatures therein will add interesting details and good adventure opportunities for any fantasy RPG campaigns.

Evil Unlimited (for Brave New World)

Published by [Alderac Entertainment Group](#)

Written by Matt Forbeck

128 pages; \$20.00

Bond movies and superhero games have something in common: they live or die on the coolness of their bad guys. That shared trait highlights the biggest problem with *Evil Unlimited*: it's an interesting supplement, but Evil Unlimited itself is more like the forgettable Max Zorin of *A View to a Kill* than the immortal Ernst Stavro Blofeld.

The premise certainly sounds exciting. In the universe of *Brave New World*, Evil Unlimited is the world's most powerful criminal organization. Its headquarters are in the United States, but they have their fingers in operations all over the world. They'll do almost anything if the price is right . . . theft, blackmail, character assassination . . . but they steer away from murder as "bad for business."

Evil Unlimited provides all the details on this organization, along with six new power packages, gamemaster notes and an adventure. The book is well-organized, and the line's typical "informative website" approach works particularly well in this supplement.

The first third of the book describes itself as Evil Unlimited's "annual report," but it's really a glossy recruiting document. Executive Vice President Nicollette Marks presents a detailed introduction that covers the usual topics for this kind of setting material. We learn about what the company does, where its main offices are, and who the important managers are. Marks also spends quite a bit of time explaining EU's policy of "enlightened self-interest."

The tone is low-key, rational, and if anything a bit earnest. "Sure, we're Evil," Marks seems to say, "but we're not really *evil*." It's a refreshing approach, but it doesn't quite work.

Brave New World is already a comic book world of grays and muddied colors. It is a dystopia, full of tarnished rebel heroes and government stooges. Evil Unlimited fits into this setting, but it doesn't stand out.

That makes the organization Marks presents feel like a missed opportunity. The name "Evil Unlimited" oozes with the potential for over-the-top villainy, begs for an organization that wears its pitch-black hat with a merry sneer. If Forbeck had written EU that way, it would have made an exciting contrast to the morally ambiguous factions that *Brave New World* has already explored.

Of course, as is typical for this game line, Marks isn't always telling the truth. The details are hidden away in the gamemaster's section of the book, but experienced *Brave New World* players won't be surprised to learn that Evil Unlimited's recruiting materials don't tell the whole story.

The gamemaster-only material brings up another problem, though. The additional information doesn't add much interest to Evil Unlimited. The secrets aren't that surprising, and when they are revealed many players will probably just shrug and say, "whatever".

The root of the problem can probably be found in Forbeck's notes for using Evil Unlimited in your campaign. Rather than present a variety of options, he describes one linear storyline that will take a group of player characters from point A to point B. The story he presents is interesting in fact, it's a classic comic book storyline that will never get old but

there's no sign that Evil Unlimited can or should be used for any other purpose.

That's too bad, because the basic organization is sound. There's some interesting characters running the operation, and Forbeck has put a lot of thought into its signature tricks and scams. On the other hand, he has glossed over EU's fundamental goals and purposes. There's a lot about how Evil Unlimited does its business, but there's nothing in the gamemaster section about why it does what it does or what its leaders hope to accomplish. We're left with the motivations described in the player's section, and if we take those at face value many of the secrets in the gamemaster section become irrelevant.

The sample adventure in the book stresses this narrow approach. Again, the premise is interesting. A group of heroes is asked to help bust a delta out of custody as he's being taken to New Alcatraz, but the mission is not what it appears to be and complications quickly develop. The most interesting scenes, however, take place off-stage as the delta the PCs are trying to help confronts the major characters in the scenario. There's no way for the characters to be involved in these scenes they simply hear about them in passing later on.

That's classic bad adventure design, and it tells me that the NPC is the real PC of the adventure. (After all, he's getting all of the really good scenes.) In fact, the way the adventure and the supplement are written suggest that Forbeck is simply reporting his playtesters' approach to the material instead of exploring the different ways that Evil Unlimited can be used in a game.

Evil Unlimited is a respectable supplement, but it never really takes flight. Forbeck seems committed to his particular vision of Evil Unlimited, and that vision is a little too prosaic to inspire a gamemaster into creating great adventures. There are ideas that any superhero gamemaster can use, but this book could have been so much more.

Pyramid Review

Sword and Fist (for D&D)

Published by [Wizards of the Coast](#)

Written by Jason Carl

96 pages; \$19.95

In 1989, TSR came out with a 128 page, \$15.00 book called *The Complete Fighter's Handbook*. It set the stage for kits, and was the prototype for the entire *Complete* series. History repeats itself as the first class support book for third edition, *Sword and Fist*, focuses on Fighters and Monks.

Broken up into five chapters, *Sword and Fist* introduces many new options that can be inserted piecemeal, or all at once. Chapter one, Feats and Skills, has some feats that will sound very familiar to old *Oriental Adventure* fans, like the Eagle Claw Attack or Fists of Iron. For those not interested in old martial arts moves, how about Sharp-Shooting or Zen Archery for that master Bowman? With over thirty new feats, most players should be able to find something they like. The new skill listing however, is much smaller. Six knowledge skills are listed with the areas they cover, but no game benefits. Far more useful are the new uses for old skills that allow you to use Sense Motive for combat prediction or to decipher strategy.

Chapter two, Prestige Classes, is either something you'll hate or love, depending on how you feel about Prestige Classes in the first place. With almost twenty new prestige classes to choose from, the days of being a mere Assassin or Black Guard are over. For those wishing to augment their monks, choose the Drunken Master or the Red Avengers. Those preferring something a little non-standard can pick the mysterious Ghost Walker or Master of Chains. My only disappointment with this section is that the Duelist is reprinted from *Dragon* magazine. There are a wide variety of options here, including Prestige Classes that have role playing limitations, like worshipping a certain god (Fist of Hextor), or being a specific race (like the Halfling Outriders).

Chapter Three, Worldly Matters, gives the GM background on many of the Prestige Classes. The Fists of Hextor, The Knight Protectors of the Great Kingdom, The Ravagers and others are given enough detail that a GM can slip them into a Greyhawk campaign with little modification. Those playing their own campaigns will have to apply the background as they see fit.

Chapter Four, the Game Within The Game, provides more options to players who don't want a prestige class. Looking at different styles of character, like duelist, gladiator, and others, the book examines background details, what ability scores you should have and appropriate skills and feats. For those new to the game, the section on Advancement shows how players should select their next feats and how to prepare long term goals with several examples. After that, How to Fight Nearly Everything (And Survive), gives brief advice on how to battle undead, flying, and unbeatable opponents. Next up, Tactics, shows examples using your abilities and cover for best effect. Using grids, the examples are cleanly laid out and easy to follow.

Other important sections in Chapter Four are notes on using monstrous fighters and monks. The new feat, Large and in Charge, is a great feat to push back those pesky opponents who are determined to get in your face. Even better though is the feat Multitasking, a feat for those monsters with multiple limbs that enables them to use them better. Ever want to know what an ogre's long sword does? The Weapon by Damage Size table will tell you. How about a monk storm giant? Monk damage by size is your table. There are also two examples of combat, one on horse, the other by two swashbucklers, that show dice rolls, stats, and maneuvers. Just as important are the descriptions of what the characters

are doing. New players and GMs can steal those for their own campaigns, and can use them as examples of what the character is doing visually, as opposed to game mechanics.

Chapter Five, Tools of the Trade, lists new melee and ranged exotic weapons. Some of them are very simple, like a bladed gauntlet or bolas. Some are eastern, like the war fan and the three-section staff. All add a little bit more to the campaign that has them for a reason. Ever wonder what a Sai, Jo Stick or Yari does in 3rd edition? Well, instead of making more weapons with new prices, damage, and other statistics, Wizards went with the Weapon Equivalency Table. Here, you see that a Sabre or a Cutlass is the same as a Scimitar and that a Sickle is the same as a Kama. This is a nice table that could've been much bigger, and is in dire need of illustrations.

The next portion, Magic Items, lists new items in categories. Under Shields are the Arrow Catching and Dancing Shield. The Amulet of Mighty Fists and other wondrous items join the sword Shatterspike, reprinted from *The Sunless Citadel*.

Another nice section is the one on Vehicles. Chariots are updated with feats such as Chariot Archery and Chariot Trample. More impressive than the Chariot however, the Halfling War-Wagon, a massive device, looks like it could've come from some post holocaust fantasy setting.

The last section, Towers, Keeps, and Castles, has several examples of each type. Wonder what you can do with those new Chariots? Turn to page 92 for the description of the Gladiator arena, and then 96 for the visual. In addition to the arena, there is an elven canopy tower, a lighthouse tower, and a monk's temple compound among others. Each one is described and has a half- or full-page illustration. For those more interested in the logistics, the start up and yearly costs are also provided.

Dennis Cramer does all of the interior art, so it has a unified feel. But obviously, if you don't like the art style, you won't enjoy the art in this book. The layout is similar to other Wizards of the Coast products with a one inch margin on the outer edge of the page, important information boxed off from the main text, and maps well done and readable. There are a few sections that suffer word order confusion, but if they are there in the second printing, I'd be surprised.

Still, there are some small problems with this product. For example, why all the focus on Prestige Classes? Didn't the *DMG* also have rules for making new classes? One of the new Prestige Classes is Master Samurai. Where's the regular one? In addition, there seemed to be some crossover with a few of these classes. What are the real differences between a Cavalier and the Knight Protector of the Great Kingdom? They are there, but the two are very similar in base concept. Next up, when discussing character concepts, they used the same names as some of the prestige classes. Duelists? Why not swashbuckler? In addition, why such a short weapon equivalency table? Is there going to be a separate book for that? Lastly, I'm not too fond of the reprinted pieces, like the duelist and Shatterspike. Both were very recently put out in the open. Heck, 3rd edition isn't even a year old yet. It's just a little too soon to start reprinting stuff.

Even with these minor complaints though, *Sword and Fist* is an obvious buy for players who enjoy playing fighters and monks. The sections on creating monstrous characters with special feats for them also make this an almost mandatory buy for GMs wishing to continue challenging their players.

Twelve years ago, *The Complete Fighters Handbook* set a standard that not all *Complete* books were able to live up to. I hope that the next few books in the new series, *Defenders of the Faith: Clerics and Paladins*, and *Tome and Blood: A Guidebook to Wizards and Sorcerers*, raise the bar instead of falling beneath it.

(Reviewer's Note: Do not insert this whole book into your campaign without preplanning it. Start slowly with a prestige class here and a magic item there then to overwhelm the campaign with the sheer amount of material found within these pages.)

-- Joe G. Kushner

More Cunning to Be Strange: Wherefore Art Thou *Romeo and Juliet*?

*"Two households, both alike in dignity,
In fair Verona, where we lay our scene,
From ancient grudge break to new mutiny,
Where civil blood makes civil hands unclean.
From forth the fatal loins of these two foes
A pair of star-cross'd lovers take their life;
Whose misadventur'd piteous overthrows
Do with their death bury their parents' strife."*

-- William Shakespeare, *Romeo and Juliet*, Prologue, 1-8

Before these words were first declaimed, the world did not know its greatest love story. After, it could know no other without them. There may be no better example of the sheer force of [Shakespearean dramaturgical magic](#), in the purest sense, than the hold his *Romeo and Juliet* has on lovers' minds, and the power it has to mold their thoughts. For what is magic but the imposing of the magician's will on others, and on reality? As we've done [in the past](#), then, let's see what sorceries Shakespeare (or his occult masters) spun here, in fair Verona.

*"The fearful passage of their death-mark'd love,
And the continuance of their parents' rage,
Which, but their children's end, nought could remove,
Is now the two hours' traffick of our stage;
The which if you with patient ears attend,
What here shall miss, our toil shall strive to mend."*

-- William Shakespeare, *Romeo and Juliet*, Prologue, 9-14

Unlike many of Shakespeare's plays, *Romeo and Juliet* has only one plot: the love of the two title characters. The Montague and Capulet families of Verona are engaged in a blood-feud. Romeo, only child of the elder Montague, besotted with the fair Rosaline, sneaks into a Capulet ball with his friends Mercutio (a kinsman of the Prince, not a Montague) and Benvolio (a Montague) to find her. Instead, Romeo finds Juliet, only child of the elder Capulet, and they are immediately smitten with each other. He hides in the Capulet garden to press his suit, and the two lovers agree to a clandestine marriage, which they contract the next day with the aid of Friar Laurence, a herbalist.

However, that afternoon, Tybalt, Juliet's fiery cousin, encounters Benvolio and Mercutio on the street and starts a fight with Mercutio. When Romeo tries to stop the fight, Tybalt uses the distraction to kill Mercutio; Romeo then slays Tybalt in revenge. For this manslaughter, the Prince of Verona exiles Romeo to Mantua; he leaves after secretly consummating his marriage to Juliet. Unknowing, old Capulet betroths the bereft Juliet to the Count of Paris; rather than marry him, she beseeches Friar Laurence to poison her. The good friar suggests a different plan -- Juliet will, indeed, drink poison, but one that will merely put her in a deathlike trance for 42 hours. After her entombment, Romeo will steal her from the crypt and flee with her to Mantua. Unfortunately, Friar Laurence's letter to Romeo miscarries; Romeo, hearing of Juliet's supposed death, buys deadly poison himself and, after killing Paris on the way, breaks into Juliet's tomb. He poisons himself just as Juliet awakens from her trance; in grief, she stabs herself with Romeo's dagger. The watch summon Montague, Capulet, and the Prince; when Friar Laurence tells his tale, they agree to end the feud and erect "golden statues" to the doomed lovers.

*"Ben. He ran this way, and leap'd this orchard wall:
Call, good Mercutio.
Mer. Nay, I'll conjure too.
Romeo! humours! madman! passion! lover!
Appear thou in the likeness of a sigh:*

Speak but one rime and I am satisfied;."

-- William Shakespeare, *Romeo and Juliet*, II:i:9-14

Shakespeare took this tale from Arthur Brooke's 1562 poem *The tragicall Historye of Romeus and Juliet*. Brooke likely took it from Luigi da Porto's 1535 *New History of The Two Noble Lovers*, which itself borrowed the plot from any number of Italian "novels" going back to Masuccio Salernitano's 1474 collection of romances, *Il Novellino*. Brooke changed the Italian versions, which allowed Romeo and Juliet a final exchange of words in the tomb. Shakespeare follows Brooke here, but breaks from him not only by telescoping the play's action down to six days, but by making Juliet an innocent rather than a wanton to be punished. Shakespeare's reason for insisting on Juliet's purity (he repeatedly states her age as "not yet fourteen") may be allied to his other profound change to the play -- the addition of Mercutio.

Da Porto had a minor character named Marcuccio ("Marcus") in his novella, but Shakespeare turns him from an anonymous spear-carrier to the driving force catalyzing the play. Mercutio brings Romeo to Juliet, Mercutio taunts Tybalt inflaming the feud, Mercutio's death forces Romeo into revenge and exile. Some scholars see Mercutio's character as Shakespeare's tribute to his friend and rival [Christopher Marlowe](#), also dead by violence spilling from a feud -- between Raleigh and Essex -- he had no part in. Mercutio's quick wit, hot temper, and ambivalent sexuality also reflect Marlowe's personality. But Shakespeare joins these "mercurial" characteristics to the emphatically changed name Mercutio. Shakespeare all but flaunts his character's true identity -- that of Mercury, the god of cleverness and speed. And of alchemy.

*"O! mickle is the powerful grace that lies
In herbs, plants, stones, and their true qualities:
For nought so vile that on the earth doth live
But to the earth some special good doth give . . .
Within the infant rind of this weak flower
Poison hath residence and medicine power . . .
Two such opposed foes encamp them still
In man as well as herbs, grace and rude will . . ."*
-- William Shakespeare, *Romeo and Juliet*, II:iii, 17-30

In this speech, Friar Laurence, almost word for word, encompasses the principles of Paracelsan alchemy, the joining of opposites in the "mickle grace" of herbs, plants, stones -- and their true qualities, their quintessence. It is his elixir that joins Romeo and Juliet forever, although not in the way he claims to have intended. To Romeo as hot-headed sulfur and Mercutio as quick-witted mercury, Shakespeare added Benvolio ("good will") as calming salt, to become the trinity of matter. The other trinity, of the Black Lion, the White Queen, and the Red King, comes from the three bodies in the crypt at the end. Black-hearted Tybalt is the "king of cats." White Juliet, "handmaid to the moon" is "fair," and, as Shakespeare continually reminds us, pure. Finally, Romeo (fiery lover, named for the scarlet city) might well be, as Juliet calls him, "a new day" and "the sun" -- or Rubeo, the alchemical Red Dawn. When the two lovers mingle in the Chemical Marriage of Red and White, they call each other by each other's names ("Juliet is the sun," Romeo is "starry night"). Perhaps this is why Father Laurence deprecates Romeo's love affair with Rosaline -- two "rose" figures cannot become an alchemical union. Mercury/Mercutio brings Red and White together the first time, engineers their separation (sublimation into nigredo) and thus their permanent exaltation. And after the Chemical Marriage and death of the ingredients, the Prince declares the lovers shall become "golden statues."

*"I fear too early; for my mind misgives
Some consequence yet hanging in the stars
Shall bitterly begin his fearful date
With this night's revels, and expire the term
Of a despised life clos'd in my breast
By some vile forfeit of untimely death."*
-- William Shakespeare, *Romeo and Juliet*, I:iv:115-20

To this alchemical blend, Shakespeare adds astrology. The "star-crossed lovers" from "two opposing houses" give us

early astrological warning, and the characters have planetary identities as well. Mercutio, again, is Mercury; Romeo the Sun, Juliet the virginal Moon; Benvolio is Venus, the Sun's other "morning star." And as in astrology, when Mercury is too close to the sun, it is "combust," its influence killed; Mercutio is slain "under Romeo's arm." His killer, Tybalt, is violent and jealous Mars.

Romeo, the sun, can only see Juliet, the moon, at night. At the balcony scene, Juliet the moon is high in the sky; as the play progresses she goes lower in the sky until she is laid underground in the crypt; the moon is below the horizon. The Nurse's emphasis on Juliet's "fourteen days to her fourteenth year, at night" shows half the lunar cycle; the waning half. At her lowest point, the sun covers her; then, she covers him in a solar eclipse and the death of the sun. ("The sun, for sorrow, will not show his head," says the Prince after Romeo's death.) A solar eclipse, of course, is one of those magickal openings in time, an unnatural moment when mercury might create gold, or something -- or someone -- else emerge.

*"And in this state she gallops night by night
Through lovers' brains, and then they dream of love . . .
O'er ladies' lips, who straight on kisses dream;
Which oft the angry Mab with blisters plagues,
Because their breaths with sweetmeats tainted are . . .
. . . This is that very Mab
That plats the manes of horses in the night;
And bakes the elf-locks in foul sluttish hairs,
Which once untangled much misfortune bodes;."*
-- William Shakespeare, *Romeo and Juliet*, I:iv:77-97

That someone might be Queen Mab, invoked by Mercutio (him again!) in the speech above as "midwife of dreams"; in other words, a faerie who assists in the birth of a new entity (The True Elixir? The Philosopher's Stone?) from the land of fantasy and dream. Mercutio's "Mab" comes from Maeve, the Celtic triple goddess -- a third triplicity -- who demanded human sacrifice of kings after a ceremonial marriage. Is the Capulet tomb (from *capus* or head) the hollow skull of her deadly mansion? Is Juliet her virgin priestess on Earth, wed by Romeo in alchemical marriage before his needful death? Is Romeo Attis to her Cybele, willing sacrifice to the Faerie Queene -- as Spenser called Shakespeare's patron, Queen Elizabeth? Juliet's birthday is "the night of Lammass Eve," a moon and harvest festival of the ancient Celts. The play begins 14 days before, on July 17, the birthday of Isis -- also Queen of the Night, also the lover of a dead man -- and ends six days later on the cusp of Cancer and Leo, between Moon and Fire. (The same sacrificial day, by the way, that Raleigh alchemically founded the doomed [colony of Roanoke](#).)

Shakespeare, or his sorcerous employers, thus wove his simultaneous astrological and alchemical spells to a climax in the Torment of the Metals and the Solar Eclipse. At that moment, the path is wrenched open into the hollow skull of Verona ("true one") for the Faerie Queene to bring a dream of immortal love and immortal gold. And all it takes is five deaths, and eternal tragedy. Happy Valentine's Day.

Love and Secrets

NPCs don't leave the cap off the toothpaste.

NPCs don't leave the toilet seat up.

NPCs never ask "What are you thinking?", forcing you to come up with something sincere-sounding on the spot, since, "Duhhh . . . nothing . . ." isn't terribly romantic.

No, when an NPC leaves the cap off the toothpaste, it's because they forgot to put it back on when they snuck in and added the deadly neurotoxin to dispose of meddling heroes. When the toilet seat is up, it's because that's a clue the Countess may not be as she appears. And when an NPC wants to know what you're thinking, they'll generally use their mind-crushing psionic powers that most real-world significant others claim not to possess.

Anyway, the point is that, in most games, the only obstacle in beginning a romantic subplot is getting the GM to create a suitable victim . . . er, interest. Once established, the biggest obstacle to furthering a romantic subplot is often time: "Okay, I've been dating the Scarlet Vixen for two game years now . . . guess I should consider asking her to marry me." And the general ways romantic subplots end, if at all, are death and betrayal. Most in-game relationships don't end because she snores and he belches; they end because she dies sacrificing herself to stop the Dude of Darkness, or he suffers a head injury and becomes Crazy Mixed-Up Evil Guy.

Now presuming you're trying to foster romantic subplots, how do you, as a player, create any kind of dramatic tension without resorting to endangering the lady (or laddie) love?

Well, one easy way to do it in cinematic (and even many realistic) campaigns is to do what I do: have secrets.

Generally most characters I create have at *least* one big secret . . . sometimes more. They'll usually also have lots of little secrets. Now, once you have these secrets, it becomes easy (if not trivial) to spice up a romantic subplot. You, as a player or GM, can have a secret be revealed (for example, you used to launder money for the mob). Or you can have the aftermath of a secret be revealed (for example, the mob shows up, asking for a favor, information, or "one last job").

Secrets give a gaming relationship a challenge; they either provide grist for a relationship to end, or they give something for the love to overcome. And, depending on the secret, it can open up new possibilities; the lover who shares in a secret is a classic element of many classic works of literature . . . like Superman and Lois Lane. And, of course, secrets can make for interesting developments even for those non-romantic plots.

Here are some possibilities to consider when coming up with secrets.

- **Secret identity.** "Why can't you be more heroic like Grandiose Guy?"
- **Past lives.** "Well, I *was* a prince . . . until I ran away . . ."
- **Ties to something bad.** "What does DismalCo want with *you*?"
- **Ties to something good.** "You're the one who saved the Vice-President from the evil mutants? Wow . . . they'd be pretty upset if they ever found out . . ."
- **Betrayals.** "How do they know so much about us?!?"
- **Already married.** "You're *WHAT?!?*" (Tin roof rusted.)

Hopefully this will give you some ideas for spicing up your own game romances. Just remember: secrets aren't anywhere *near* as exciting in the real world as they can be in fictitious universes. If you've betrayed your Clan and stolen the Eye of Deminti, and have relocated partly to start a new life with a new identity, but mostly to escape your estranged spouse, make sure you let your current significant other know this.

Preferably *before* the ninjas start attacking.

* * *

Jeremy, I'm sorry.

See, the 9th is Jeremy's birthday. And he wrote me voting against the Valentine's Day Theme Issue, because he doesn't want his birthday associated with that holiday (which he abhors) any more than it already is.

So here's a little gaming birthday anecdote *not* relating to Valentine's Day.

*(Semi-spoiler alert: I talk about one of the metaplot elements from **Aberrant** here . . . but it's in the main book, so isn't much of a secret.)*

When I ran my **Aberrant** campaign I asked everyone to come up the birthdays of their characters. I also started the campaign about eight months before the campaign world "officially" began, so the characters could interact with some of the backstory. I also forbade my players from reading any of the source material, so I could surprise them and control the flow of information.

One of my players picked May 13th for her dour character's birthday. This happened to be the day that Slider, the beloved young heroine of the **Aberrant** universe, was horribly murdered . . . which happened in the eight month backstory window.

So once the fateful day in question arrived, I got to play up the juxtaposition of these two events. "The first sketchy reports are in; it seems America's sweetheart, Jennifer Landers, aka Slider, was killed today in Calcutta. Authorities are still in shock, and the world is mourning the loss of its cherished hero. Oh, and your character got a birthday card."

Ironically, the player in question has a birthday that is the day after JFK was killed.

So . . . happy birthday, Jeremy! <grin>

-- Steven Marsh

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

by Steven Marsh

Art colored by Keith Johnson

Love is perfectly in place in many settings. In cinematic campaigns love is the catalyst and goal of many a hero. In realistic worlds, love can be as simple or as complex as we make it. And in gothic or tragic worlds, part of the fun can stem from *knowing* that love is doomed.

But there are many campaign worlds where love doesn't spring readily to mind. Neither the cinematic worlds of derring-do nor the tragically hip worlds of the gothic romantic, there are many campaigns where love seems far removed from the cover art. These worlds, like *Dark Sun*, *Twilight: 2000*, *Conan*, and most cyberpunk games, are often bleak, frightening places, where life is cheap, and luxuries like comfort, family, and love are not on the forefront of gaming possibilities. After all, it's difficult to consider wooing the lady fair when everyone's dying of blood poisoning.

But as a basic (albeit complex) human emotion, it seems unlikely love would be obliterated, no matter *how* bleak the world is. And, although it can be difficult to bring love to the forefront in these kinds of games, it can still provide many possibilities often overlooked in darker games.

The Worldview: What's Love But a Second-Hand Emotion?

"REJOICE!" the proclamation read. "For the full moon approaches, and by order of the Shadow King, upon that day those who associate with the opposite sex shall not be put to death! Procreate, and enrich the Shadow Empire."

Some of the first questions that needs to be answered in a darker campaign world, where elements of love are explored, is: What *is* love to this world, currently? How long has it been such? What are the implications? Is there an ideal of love vs. a reality? If so, what are the implications?

In a near-future post-nuclear apocalyptic setting, the ideal of love may not be that far removed from our own, although the realities of maintaining a viable population base, the difficulties in keeping physical beauty, and other obstacles may make this a highly unrealistic ideal; the realities of love in such a setting may be far more mechanical and unromantic. In such a world, romantic movies and books may still be very popular, albeit as escapist fiction; anyone who actually *believes* in those outdated ideas will probably be met with scorn.

But in a harsher fantasy setting, like *Dark Sun* or *Conan*, our ideal of love may be viewed by society as something for the weak. In this case, the world's ideal may be finding a mate who is equally suited to surviving this harsh environment; a soul mate could be simply someone who can watch your back, and for whom you could feel emotions. If they are not weak, then the odds of their succumbing to the savage lands are lessened, and the risk of feeling their loss is minimized. (Conan and Valeria's relationship from the *Conan* stories is a good example of this mindset.) In such a world, regulations for (or against) marriage, the right to bear children, or other draconian measures may be common.

Or in a cyberpunk universe, where drugs are common escapist fare and virtual reality might give you the opportunity to do whatever you want with whomever you want, love might be nothing more than another kick to pursue, another high to indulge in. Or love *might* be something even *more* idealistic or alien; in the future, it's not inconceivable to meet, fall in love, get married, consummate the relationship, and have a child together . . . all without having ever met face-to-face.

In all, society can have *many* views on love and relationships; it's up to the GM to determine what, exactly, that mindset is. As some things to consider, what does the society feel about marriage, children, birth control, divorce, remarriage, polyamory, "true love," etc. Ideas for starting points can be obtained from various cultures and societies; a world with views on love based on feudal Japan might place an emphasis on duty and honor, while one based on the French Romantics may prize passion and persistence.

Personal Views: I Touch No One And No One Touches Me

Shira drank the filtered water slowly, savoring it. As she put the cap back on the canteen, she caught the eye of Doc Davis, who was surprised into betraying a brief flicker of emotion. "These feelings are wrong," she thought. "He's not one of the pure gens. And yet he's so . . . nice . . ."

Having sorted out what society feels about love, it can be helpful to determine how your character feels about love. This may well not differ from the societal norm, or it may vary wildly. For example, a character in the post-apocalyptic setting above may be incapable of feeling love. Or a character in the cyberpunk world may have a reputation online for insisting on commitment and "real" relationships. These views can be either expressed as minor quirks, or major life-affecting core beliefs. Such designations can be useful in differentiating similar characters; one gladiator may look like another, but a gladiator who falls in love easily -- with the pleasures and problems that entails -- will stand out from a sea of others.

Love Among the Ruins

Alternately, the character might not have given it much thought; few of us codify our ideas on love. In this case, you may want to try to at least define the outer edges of what your character is (or isn't) capable of, so as not to *completely* blindside your GM. And if you don't want to fabricate your views out of whole cloth, there are other avenues you can approach the question from.

Backstory: That Music Used to Make Me Smile

"Where did it all go wrong?" thought Jenson as the security slumped to the ground. He began stripping the still-warm body, looking for the passcard. "How did we come to this? 'Lissa, where are you now?"

Many darker worlds weren't always that dark. In fact, many worlds weren't all that bad within living memory. *GURPS Cyberworld*, for example, begins in 2043; the world doesn't turn unrecognizably bleak until 2006 (or 1997, depending on your view). Although it would take an older (50+ years old) character in that world to remember "good times," such a character would have the possibility of a prior romantic relationship. This can serve as a catalyst for the character to try to make the world a better place, or a bitter reminder of why he fights against (or for) the society.

If you want to play a younger character, then perhaps his parents, family members, or a mentor lived in this prior not-so-bad time. In this case, it can be helpful to determine the mindset of the prior generation towards love, as well as how the character's views differ. If mom and dad were happily married, but then dad lost his job in the Crash of '08

and committed suicide, that's probably going to affect the character's view towards love.

Of course, keep in mind that if you base your character's views on his parent's views, you may want to tweak them slightly to indicate the difference the generation gap often makes. Almost certainly there *will* be differing views on romance, in the same way 1945's attitudes towards love and marriage varied wildly from 1970's.

History: The World Will Always Welcome Lovers

Kip held the silver disc up to the light. "Looks old. Twentcent, at least," he muttered, blowing dust off it. "Now . . . what data did this Bing Crosby possess?"

If any sort of "normal" love has been impossible within living memory, then the question has to be asked: has it *ever* been possible? The existence of such, as an ideal, a long-lost possibility, or even an outdated notion can shape the world. Or the very *concept* of love can be hidden or suppressed in the dingy past . . . waiting to be uncovered. (Good inspiration for love being rediscovered, rekindled, or renewed can be obtained from movies like *Brazil* and *Life is Beautiful*.)

In a post-apocalyptic game world divergent from the modern day real world, the question of whether love existed (and how) is easy. In universes which are based on Earth but which diverge in the distant past, the question can be difficult. The rigid code of courtly love as we know it dates to approximately the twelfth century, and the Bible's own sensual [Song of Solomon](#) is older still. A bit of research may be required to determine what love was like before the world diverged, and extrapolation may be required to see where those worlds would end up. Good ideas can come from thinking about the noteworthy events relating to love that were unusual. For example, in 1936 King Edward VIII abdicated the throne after eleven months to marry an American divorcee, Wallis Simpson, to the shock of many. The divorce of the "fairy-tale" marriage between Prince Charles and Princess Di in 1996 was likewise affecting (especially in contrast with their marriage in 1981).

On fictitious bleak worlds where love has been eliminated in recent memory, determining if (and how) society ever expressed love can be even more difficult. Generally, if there was ever a time of peace, prosperity, or other non-awful time to live in, it's probable that some concept of romantic love evolved. Perhaps remnants of ancient ballads or romantic epics can be sung in hushed tones by bards or entertainers, hoping the quaint ideas aren't lost for all time. If the world has always been abysmal, then you may truly be on your own to determine what this world substitutes for love. In general, something needs to ensure that the human race continues; this may be something relatively benign like arranged marriages or pure logic, or it might be something more malevolent like pure animalistic urges, cloning tanks, or forced breeding programs. In this case, a powerful campaign could be built around the simple idea of (eventually) discovering love for the first time. Many far-flung future science fiction stories have been built on this very premise.

Past Loves: Yesterday's Gone

"We have to go back," Durm muttered, as his companions stared slack-jawed and ragged in disbelief. "I lost my locket somewhere in the tower."

If you've determined that your character has known love in the past, then you may want to determine what happened to that love. How that relationship ended can provide material for motivation, plots, or character depth.

Some ways the relationship could have ended:

- Tragically, quite possibly owing to the bleak nature of the world
- Mutually, opening the possibility for a friendly, if emotionally laden, contact in the future
- Mundanely, perhaps shaping the character's attitudes towards love
- Abruptly and/or mysteriously, providing the possibility of rescue, reunion, and perhaps rekindling

"That female pirate looks awfully familiar," thought Orolk, seeing the swift, deadly form emerge from beneath decks. "No . . . it can't be . . ."

Of course, one of the common aspects of many bleak campaigns is how the world changes you; this fact should not be lost if reintroducing a past love. Perhaps the high school sweetheart is now an expert hacker for the corporation; maybe that first love was forced into an arranged marriage to keep the peace between two nations, becoming distant and Machiavellian. Remarkable changes are possible, even in five to ten years.

Or perhaps the person, against all hope, *hasn't* been changed by these dark times. Like a beacon of light, a character may work at a mercy hospital, maintaining a code against killing and valuing life above anything else, while all around life looks remarkably cheap. Such an NPC would be special -- and perhaps vulnerable -- indeed, and many story possibilities present themselves. Is the past love *really* as good as memory serves? How could s/he survive in this bleak world? Were any Faustian deals made, or secrets controlled? If the PC has been changed by the world into something less than pure, can there be any hope for a reunion?

"Richard!" Jen gasped, hand on the assault rifle. "I thought you were dead!"
Richard chuckled and smiled that half-smile she remembered as if it was yesterday. "I get that a lot. Now, can we talk about . . . Operation Booker?"

If the past love ended tragically, don't underestimate the possibility of that love still being exploited by the enemies of the protagonist. In a world where cloning, eldritch necromancy, virtual reality, or communication with the dead is possible, any signs of seeming weakness might be used to attack the character, allowing for interesting roleplaying possibilities. Given a choice of being reunited with the lost love, or losing that love forever, how will the character react?

Now that you have an idea of what love is in the world's present, and understand what it was like in the past (and how it possibly affected the character), you can start adding elements of love to otherwise bleak settings.

The Dreamer: What's Wrong With That?

"There is another way," the HexMail began. "We need not resort to solitary rest chambers in the eve. A demonstration of the possibilities -- and the dangers -- will be realized at midnight . . ."

If none of the party is an idealist with antiquated (or revolutionary) ideas about love, an interesting possibility for a bleak world is to have such a person exist publicly. This could be a phenomenal poet, a singer or songwriter, an author, or other artist. Or it could be someone who elevates the ideals of love through their very existence, like a Romeo and Juliet, or a famous wedding or relationship (like many celebrity couples). Or it might be an archeologist or other scholar who unearths or translates some hidden treatise from times past.

It would be up to the GM (and possible party involvement) to determine what the affect of such a person might be. He might be met with derision and mockery, not unlike the village idiot of times past. He might be met with curiosity or even acceptance, acquiring interested followers in exploring these ideas. In a sufficiently media-savvy world, he might even become a flavor of the moment, inspiring the masses to abandon ideas that society may have forced upon it . . . if only for his fifteen minutes of fame.

Such widespread approval may be very dangerous; if the social order depends on the obedient masses, then having someone spark disobedience -- even in a seemingly benign way -- could be very bad for the forces that keep the world in the state it's in. The person could be in grave danger if he's *too* successful in getting the word out. The PCs could thus get involved on either side, needing to protect or eliminate him.

If this architect of love's knowledge is also a product of the times, he might resort to the methods of his era to convey his message. Thus a cyberpunk amorous poet might resort to hacking into the international newsfeeds to convey his radical ideas, or a post-apocalyptic scholar may secure a compound (complete with followers) to refine his knowledge and research. Again, PCs could be drawn into either side of such a person; he could be an unconventional ally, or an

unusually motivated adversary to defeat. (For a good example of how this person might operate, read the graphic novel *V for Vendetta* by Alan Moore.)

Of course, if a PC *is* an idealist with antiquated (or revolutionary) ideas about love, then any of these plots could directly relate to them . . . with the same results. Perhaps the weathered bard starts attracting a following, or the poems of a PC are uploaded to OpNet.

The Grip Tightens: Darkness Has A Hunger That's Insatiable

"The Overlord has passed a new decree," said Sir Reginald, his face ashen, to his betrothed Irene. "All new brides are, on their wedding night, to be . . ." he couldn't bring himself to finish the thought.

"B-but they can't do this . . . can they?" Irene asked, her thoughts already turning to their wedding date three weeks away.

"Not if I can help it," he said as he put on his armor.

Another way to involve the players with more romantic plots of bleak worlds is, ironically, to take away meager freedoms they may have possessed in the world. If freemen suddenly need to get a license to associate with someone of the opposite sex, or radioactive waste upstream is rendering everyone temporarily sterile, or the possibility of marriage revoked for all but nobles, this can make the game world *more* bleak, and make the characters more involved. Even if not used, there are no privileges so precious as those that have just been taken away. This technique also works well if the world's views on romantic issues had never been explicitly spelled out before. You can say how things were, then say how they are now.

Hopefully, this new condition or obstacle will give the protagonists something to rally against (or for a GM to build adventures around). If and when the heroes succeed in overturning or thwarting this new development, they can feel good about having achieved a victory, despite their being in the same boat as they were before that subplot began . . . only now they're aware of the possibilities surrounding love in this grim world.

The Unattainable Goal: Don't Forget The Best Will Go Wrong

"I really want kids," chuckled Ryan bitterly. "But not in a world like this . . ."

Of course, love and romance also work well as an alternate unobtainable goal for a campaign. Too many bleak settings presume that the PCs will (on some level) be all working to resolve the bleakness: Defeat the Dragon Kings, tear down the Megacorps, or restore global order. While these aims are generally unobtainable (for the most part), they provide a good background goal to loosely build adventures around. But not all protagonists are going to be necessarily working towards that goal, and those that *are* may be doing such for their own reasons. Love and romance all provide good alternate character motivations for bleak worlds. Some examples include:

- Finding a soul mate. S/he's out there, somewhere, and the adventurer's life is probably the best way to meet my one true love.
- Accumulating enough stuff to get out of the game. It's so expensive/dangerous/ruthless in this world, but if I can only get enough credits/protection/power I can protect my loved one.
- Making the world a better place for my true love. So long as there is such evil in the world, we can know no happiness. (Or: because I swore a vow, or want to avenge my beloved's death, or want to learn the truth, I must destroy this evil.)

Or Is It Attainable?: Uncertainty Excites Me

"Don't you see, Kevin?" Alliana said, rubbing her feet through the sand. "This island is my home now . . . and it can be our home, too."

Many bleak worlds have portions of them that aren't so bleak, be it a continent that escaped the effects of the radioactive waste, an otherworldly plane the darkness' tentacles have yet to envelop, or a heavily magnetic mountain that scrambles the satellites' surveillance. These places can serve as a way for the romantically inclined character to "win"; he can escape with his love away from the bleakness, and live if not normal lives, than at least sheltered lives.

Of course, such an escape should not be without its problems; finding this nirvana may be difficult or expensive, or it may need to be claimed (or reclaimed) from forces that occupy it currently. But once found, it can serve as a possible retreat (either temporarily or permanently) for the character.

Ironically, properly played such a safe haven could heighten the bleakness of such a setting. Nothing is quite as stressful as knowing that you only need three more successful runs before you can afford the rest of the island, or realizing that the last component you need to create the interdimensional portal is located inside the Dragon King's lair. And it's perfectly in keeping with the hopelessness of the setting to have the protagonist fail with the goal within grasp.

And the existence of such a place provides plot elements of its own. What if the antagonists learn of it? What if the hero leaves his true love in this refuge, and returns to find her missing? Can you ever *really* escape the game?

The more inhuman the world, the more difficult it can be to keep the players emotionally attached to it. Fortunately love can both enhance and contrast the darkness of these worlds. Ironically, despite being one of the most ephemeral of emotions, love can also serve as a powerful anchor, making bleak worlds more real and grounded.

by John Macek

Were you thinking of running a swashbuckler campaign using *Third Edition D&D*? Were you hoping to find a decent selection of firearms in the new *Dungeon Masters Guide*? Well, in all likelihood you were sorely disappointed. But weep no more, fellow DMs. This article is here to assist with descriptions of some common black powder weapons, simple rules on how to use them in the game, and a few new feats to keep those firearm toting players happy!

The Musket

One of the main firearms of the swashbuckling era was the musket. It was a smoothbore weapon, used primarily by the military, but also found among civilians. They were built in a variety of sizes and weights. Most were large caliber weapons, and some of the largest needed to be used with a musket rest due to their weight. The table below gives values for two types of musket.

The first, a standard musket of about .65 caliber, was a type that did not require a musket rest. It was fairly common throughout this era. Eventually muskets of this type supplant the second type completely, and have a long reign on the battlefield.

The second was the large musket, caliber .80 or above. Because of its great length and weight medium sized creatures must brace this musket before firing on a musket rest, on a wall, ledge, battlement or rigging. Large muskets fired in this manner receive a +1 to hit modifier due to firing from a stable platform. However, when fired without a rest of some sort, they incur a -2 to hit penalty. Creatures with a 16 or greater strength can manage the large musket without bracing. If used in this manner the +1 modifier is lost. If a rest is used, the +1 bonus is retained. Small sized creatures find this type of musket too unwieldy to use at all.

Weapon	Cost	Damage	Critical	Range	Increment	Weight	Type
Musket, .65 cal	70 gp	1d10	x3	100 ft	10 lbs		Piercing
Musket, .80 cal	80 gp	1d12	x3	150 ft	15 lbs		Piercing

The Rifle

The rifle differed from the musket in that it was a weapon with groves -- rifling -- inside the barrel. This rifling imparted spin to the bullet, and thereby caused the bullet to fly straighter, which gave the rifle greater accuracy. But in order for this to work, the bullet needed to be tightly seated in the chamber, so rifles were slow to load. Slower loading meant they were not as useful on the battlefield. This, and the fact that in the swashbuckling age creating a rifled barrel was expensive, meant that rifles were quite often the playthings of the nobility. As such, many had inlay of precious metals, wood, or ivory, and used the most complex and expensive locks -- wheellocks and flintlocks. Rifles of this nature would be considered masterwork quality. Toward the end of the age of swashbucklers, rifles became commonplace.

Listed below are the values for an ordinary rifle of the period. These do not reflect any modifications due a masterwork item. Consult the *Player's Handbook* page 114 for details on how to make a masterwork rifle.

Weapon	Cost	Damage	Critical	Range	Increment	Weight	Type
Rifle, .55 cal	100 gp	1d8	x3	200 ft	7 lbs		Piercing

The Pistol

This really was the weapon that made all men equal, and no swashbuckling campaign would be complete without the pirate armed with a brace of pistols. Due to their small size, pistols with belt hooks could be worn suspended from a sash or belt. It was commonplace among the seafaring scalawags of the day to wear as many as six hanging in such a fashion. If not worn with belt hooks, they were worn in holsters on shoulder straps, or just carried in hand. Pistols, like rifles, were usually expensive wheellocks at the beginning of this era. By the end of it, flintlock pistols were found in abundance.

Two pistols are given in the table below. The small pistol represents a smaller pistol, about .50 caliber or less, a type that might be hidden away in a gentleman's valise, or possibly a coat pocket. Horse pistols and Sea Service pistols, and others above .50 caliber, should use the stats for the large pistol.

Weapon	Cost	Damage	Critical	Range	Increment	Weight	Type
Small pistol	20 gp	1d6	x3	30 ft	2.5 lbs		Piercing
Large pistol	40 gp	1d8	x3	40 ft	4 lbs		Piercing

Lock Types

Muskets, rifles and pistols were made up of three basic components -- lock, stock and barrel. Of these components, the one that varied the most between early swashbuckling firearms and later period examples was the lock, which is the system used to ignite the black powder. The most common lock types were, in chronological order, matchlock, wheellock and flintlock.

The matchlock used a smoldering length of matchcord held by a metal clamp called a serpentine to ignite powder in a pan when the trigger was pulled. There were some obvious drawbacks to this system. Reliance on the lit match meant: there was a danger of accidental black powder explosions; troops were easily spotted at night by the glow of the match match (+1 Spot check per matchlock); and that in bad weather there was a chance the match might go out (see the *Dungeon Master's Guide* page 87 for rules on how weather effects flames). On the positive side, the mechanism was cheap and reliable. Reduce the price of any matchlock by 20% of the listed cost.

Wheellocks, unlike matchlocks, were expensive and complex, because the lock had more working parts. It consisted of a wheel driven by an internal spring, a hammer holding a piece of pyrite in a clamp, and a pan for the priming powder. The wheel/spring mechanism was wound from the outside by way of a key called a spanner. While difficult to manufacture, this

system had an important advantage over the matchlock -- it could be loaded and held ready to fire indefinitely. However, there is a drawback to this, if a loaded wheellock is dropped it may discharge (25% chance of accidental misfire, roll d8 for direction of shot, anyone along that angle has a 5% chance of being hit). Increase the price of any wheellock firearm by 15% of the listed prices. Many wheellocks are masterwork items (reduce the chance of a dropped masterwork wheellock misfiring to 10%).

Flintlocks, which for the purposes of this article also include snaphaunces, doglocks, and miquelet locks, have the same advantage as the wheellock. They too can be carried ready to fire. In fact, the invention of the flintlock brought about the demise of the wheellock, and the matchlock as well (though matchlocks continued to be used for some time afterwards because of their low cost). In a campaign that takes place early in the swashbuckling era (for instance, in an early 1600s Elizabethan campaign) the price of flintlocks should be doubled.

Using Firearms in Combat

Loading black powder firearms takes a good bit of time. The most highly trained troops of the era were expected to average about one shot every 15 seconds. Others less highly trained would take longer. To load a rifle properly took longer still. The following table shows the number of full-round actions needed to load each type of firearm. These need not be consecutive, but can be spaced out between other actions.

Number of Full-Round Actions Needed to Load:

Musket	4
Pistol	4
Rifle	10

Attacking

Attacking with a firearm is handled using the same method as with any other ranged weapon. The attack action may include a 5 foot move, with the exceptions being the large musket used with a rest and the Marksman feat (see below). In these instances the firer must stand still to make an attack.

Firearms and Armor

Armor was of little use against firearms at close range. From point blank range out to three range increments the target receives no benefit from armor. Targets at a range beyond three increments, but within six increments, receive half the usual armor bonus. Those targets that at six and beyond gain full benefit from armor.

Feats

For a campaign set in this time period black powder weapons no longer considered unusual. Thus, these weapons are no longer Exotic Weapon Proficiencies. Instead, treat them as Simple Weapon Proficiencies.

The usual ranged weapon feats can be used with these new weapons. However, the following new feats should make things a bit more interesting for those using guns.

Marksman [General]

You are skilled at firing on a target's weak point at medium and long range.

Prerequisites: Dex 13+ and a Base attack bonus of +4 or higher.

Benefit: This feat allows the attacker to ignore his target's armor at ranges beyond three increments. If the target is unarmored, the attacker gains a +1 bonus to hit.

Speedy Reload [General]

You are well trained in the methods of reloading the musket, rifle or pistol.

Prerequisites: Dex 13+ and a Base attack bonus of +1 or higher for musket or pistol; Str 13+, Dex 13+ and a Base attack bonus of +1 or higher for rifle.

Benefit: The number of actions required to reload is reduced by one-half. This feat may be taken multiple times, but only to gain the feat for one of the other types of firearm.

Conclusion

These rules should provide sufficient information to allow you to introduce a more accurate version of black powder firearms into your swashbuckling *D&D* campaign.

by **D.L. Ganger**

Getting a group through character generation so that you can start playing, especially when your players have a wide variety of gaming experience, can be extremely difficult for both the GM and the players. This is especially true if you're introducing a new or modified campaign setting that your players are not familiar with. One of the most frustrating parts of character generation is trying to create a fully-fleshed character when you don't really know that character's world. This frustration can cause players to fall back on overused concepts in order to complete the character sheet. Here's an example.

You're sitting down at a table with your recently assembled gaming group, ready to start a new campaign in a fresh, unfamiliar world. Your experienced players already have their rulebooks out before them. The two brand-new players sit there, nervously fidgeting with their borrowed dice, excited but unsure of what they should be doing. Already, queries are being tossed at you more quickly than you can respond. "What house rules are we using?" "What kind of world is this?" "How powerful are our characters going to be?" You smile slightly, swallow your mouthful of soft drink, and begin introducing your players to Earth in the 22nd century as you pass out blank character sheets.

"As the occupants of Housing Sector Philadelphia-65ZD rise on the morning of July 1, 2113 AD, it is with lighter hearts than most days. The beginning of Third Quarter, this day is one of the four Birth Days of the year, when 125 proud couples -- approximately 1 person for every 1,000 who live in the Sector -- are granted reprieve from their normal work schedule and allowed to proceed through winding corridors to the gleaming halls of the Sector Birth Institute, there to solemnly receive a healthy, squirming infant, product of their flesh. It has been a long year since their Reproductive License was granted and their sperm and ova harvested, to begin the nine-month gestation period at the Institute.

"The parents queue up in a line, quietly conversing, until it is time to accept guardianship of their child. Your parents are in that line, holding their copy of the License in eager hands. They are good, solid midscale citizens with enough social credits to have guaranteed that you have been corrected of major defects, but not enough to have earned the privilege of custom genetic counseling, nor the right to determine gender. Discovery of whether you are a boy or girl is the first of the surprises in store for them this day, and as they walk back to their quarters, they discuss one last time what your name will be, so that they may comply with EarthGov policy requiring your name to be registered by the end of the day. Take a moment and decide your name and gender and fill them out on your character sheet. We'll fill in the rest later as we go. . . ."

At the end of this two hour *GURPS Space* session, two experienced gamers and two new players had worked their way through 18 years of character history and completely developed their characters. Each PC was well-defined with unique (and appropriate) skills, advantages, and disadvantages, a well-fleshed character history, and solid interaction with the other PCs. All four players were completely intrigued by the world they were in and were eager to continue, even though no one had found the world to be what they expected from the short description they had going in. If you are willing to do some planning, start the game with empty character sheets, and follow two simple rules, your sessions can be this easy and fun.

Rule Number One: Throw your players in the deep end. Do

not waste time dryly describing your writeup. Instead, immerse the characters in events before the players have a chance to think about mechanics. As with the example above, the events do not have to be happening directly to the PCs as long as they set the stage for their later actions. The key is exploration, not explanation; it's fine to drop a bit of exposition here and there as long as you return the focus back to the PCs on a regular basis. Relate it all back to them and how it affects them. This is possibly the most effective way to get the feel of your campaign across in vivid, living detail.

Rule Number Two: Control the options your players have during character creation. Do not hesitate to dictate their starting conditions or limit their choices along the way. In fact, if you don't practice some pruning, you run the risk of overwhelming the storyline. The trick to successful application of this rule is intimate knowledge of how the PCs fit in. If you have put some forethought into your world, the result will be a setting that comes alive from the very beginning. Your players will easily discover, explore, and choose their roles, and you'll have all the opportunity you need to guide character development and interaction without causing resentment. Always give them choices -- but be in control of what the choices are.

So, you've seen the opening shot. How does this translate out through the rest of the character creation process? The precise details are up to you, but here's one way to handle it. Let us continue with the example.

The GM wants to run a *GURPS Space* campaign centered on the EarthGov Navy, locked in a war with a rebellious colony planet. He wants the PCs to end up as young officers in the EarthGov fleet, eventually facing a painful moral struggle as they realize the depths of slavery practiced by their government against its own citizens, and are given the choice of either opposing the only culture they've ever known or being willing participants in its depravity.

First, they need a thorough indoctrination in the culture of their oppressive government. A few short anecdotes (the food fight in the common cafeteria area that resulted in their family's food rations being cut for three months) help set more of the world in place. By the time they begin school at age four, Al, Anne, John, and Jane are all old acquaintances from their daycare facility and from life in the Housing Sector.

They spend the next 12 years following the standard curriculum, which will bring them up to their currently allowable maximum of 32 points in skills: 8 points of math and science skills, 8 points in soft science skills such as History, 8 points in library/literacy skills such as Research and Computer Ops, 2 points in Area Knowledge (Housing Sector Philadelphia-65ZD), 1 point in Law (EarthGov Civil), and 5 points in elective skills, as approved by the local administration. The GM encourages the players to think carefully about their choices; their skill levels will play a role in determining their characters' future careers.

During this time, the players have the opportunity to spend extra points on their basic stats, Advantages, Disadvantages, and Quirks. In this case, the GM has ruled that points may be spent on anything (barring skills) up until the end of the sixteenth year, but once points are taken or spent, they cannot be returned. This helps avoid bringing the roleplay to a screeching halt through min-maxing. It also encourages players to raise or lower attributes one level at a time.

At the end of the PCs sixteenth year, they take a standardized EarthGov aptitude exam that determines their future career choice. There are two main life paths, 2 years of secondary education, or 2 years of vocational instruction. Luckily, one of EarthGov's colonies has just declared independence, and the Navy prefers its draftees to have the

secondary education. Al is accepted as a candidate for Engineering School, Anne's math aptitudes put her straight into Astrogation Officer training, and Jane's interest in psychology sends her into training as a Political Officer. John, however, fails to make the cut by a hair and is instead sent to learn how to service automatic food distribution systems on luxury spaceliners.

The PCs are given 4 points to spend on skills appropriate to their State-chosen careers and are asked at this time to finalize their totals. Any remaining points spent outside of skills at this point are subject to GM approval.

By this point, two or three hours have passed; not only do the PCs have full write-ups, but they have full history and interaction with each other. Additionally, the players walk away from this first session with a good grasp on character and motivation.

It is at this point the GM can bring Al, Anne, and Jane back together again on board the ESS Constancy for the first training cruise of Class 2113-2 of the Naval Academy. As it just so happens, John is assigned to the same vessel as Lead Food Service Technician (a duty that is handled by non-military personnel on training vessels). When neglect causes a breakdown of the engines, the party is ready to swing into action as a well-integrated team to save the ship and earn glory for themselves (and a coveted mid-season appointment to the Naval Academy for John).

Although this example may seem contrived, the devil is in the details. It all depends on how well you know your world and can show it to the PCs. You are revealing the setting one step at a time. You control the presentation. If you firmly limit the choices offered to the PCs, while making sure that those choices are genuine, you will see your party respond -- possibly with some of the best roleplaying they've produced.

This technique works for all settings and systems, not just *GURPS* -- but it doesn't work for all GMs, and it may not work well with all players. *D20* and *AD&D Second Edition* work just as well with this method, as does *7th Sea* or *Dragon Fist*; however, fans of pure hack and slash may not get as much out of this. The start of your campaign sets the tone, not the game system. These two simple rules can be one of your most valued tools in producing a vibrant, dynamic world that your players want to explore, and can make your entire gaming experience more rewarding.

Pyramid Review

Diablo II: Diablerie (for D&D)

Published by [Wizards of the Coast](#)

Written by JD Wiker

96 b & w pages; \$19.95

So what does the *Diablerie* book bring to 3rd edition? In many ways, this is a complete update of *Diablo II: The Awakening*. For example, the five classes from *Diablo II*, done up for 2nd edition in *The Awakening*, are translated into 3rd edition stats. This time around, the classes have a much more unique feel to them. The Necromancer, shortchanged a bit in *The Awakening*, gets better hit dice and combat ability, as well as specific monsters when casting his golem spells. The Barbarian, still using a d12 for hit dice, is given a whole slew of abilities. Each class can advance up to 25th level, so those who wonder what the base attack bonuses and saving throw bonuses for the core classes, look at the corresponding class in *Diablo*.

Because third edition uses feats to accomplish powerful abilities, the Amazon and Paladin both lose their spell casting abilities; they instead get their abilities through magical groups. The groups correspond to the skill trees in the actual *Diablo* game with groups being broken up into six levels. For the Barbarian, some early levels are Axe Mastery, equal to weapon focus with axes, and Find Potion, which allows the barbarian to make a search check with a difficulty of 20 to find a healing potion. Higher level abilities include concentrate attack which gives the barbarian a bonus to hit his target, a penalty to his armor class against the target, but a bonus to his armor class against anyone else attacking him.

The brief section on skills relies on the reader to be familiar with the skill system from the *Player's Handbook*, and includes Alchemy, Craft, Knowledge, and Profession. The section ends with a listing of all skills crossed with all classes. A quick glance will tell the reader if a Barbarian can use spellcraft (no), or sport (yes), and if it's a class skill or a class cross skill.

Chapter Two covers the equipment of the *Diablo* universe, bringing over all the new weapons and armor types from the game. New weapons like war staff or battle staff take their place alongside new armor types like gothic and ancient. More impressive than the new equipment, however, are the new options. In *Diablo*, weapons and armor suffer damage and need to be repaired. While *3rd Edition* has rules for hardness and hit points, *Diablerie* carries them a bit further with rules on what happens with items reaching lower durability scores, what skills are needed to repair said items, and a random item damage table. Still, these rules aren't for everybody, because they can add some time to combat.

The spells of the Necromancer and Sorcerer are detailed in chapter three. Each list is broken down by class, then level, with another listing of all spells in alphabetical order. More important to a non-*Diablo* based campaign though, is that each spell has an equivalent level. Blood Golem, a 4th level Necromancer spell, is a 7th level cleric spell. Thunder Storm, a 5th level Sorcerer spell, is a 7th level wizard spell.

The fourth chapter covers the magic items from the *Diablo* setting. Unfortunately, this material has seen the light of day on both the Wizards of the Coast web site, and in *Diablo II: The Awakening*. Tweaks have been made to insure *3rd Edition* compatibility, but it's essentially the same. Items are broken up into three parts: A prefix, a root, and a suffix. Both prefix and suffix give the item powers, while the root is the item type. This gives you options like Godly Ancient Armor of Deflection which gives the user a +15 to his armor class (+16 against missiles) and absorbs 6 points of damage from each attack. It's a nice system that provides a lot of random items. Some, like said armor above, may

not be appropriate for a non-*Diablo* game.

Chapter five, monsters, is (like chapter four) drawn directly from *The Awakening* save for that it's for *3rd Edition*. Like *The Awakening*, each monster has a base type -- say, Claw Viper -- and then several sub type underneath that, like Tomb Viper, Claw Viper, Salamander, Pit Viper, and Serpent Magus. Each entry goes from weakest to strongest, so the Tomb Viper is a challenge rating of 2, while the Serpent Magus is 6. Unfortunately, there are some classic creatures from *Diablo* missing from this book, like the Hidden and the Mud Demons. The worst thing about this chapter is that the Lesser Evils and their more powerful masters, The Prime Evils, are missing. Strange having a book about the world of *Diablo* without having *Diablo* himself in the product!

Chapter six introduces the players to the *Diablo* world through Morgen Keep, a brief five page adventure that lists monster encounters for players of levels 1st through 6th. Still, the adventure is too short and gives very little information on the setting.

The book ends with a double sided character sheet suitable for copying.

If you already own *Diablo II: The Awakening* and are comfortable with conversions between *2nd* and *3rd Edition*, then *Diablerie* isn't for you. There is too much repeated material with too little new in it. If you love *3rd Edition* but don't want to bother with all of the unique elements of the *Diablo* world, yet want the setting, this book won't help you with that. Lastly, if you want to run through the *Diablo II* adventure, this book won't provide you with the maps, quests, and characters as *The Awakening* did with the first *Diablo* game.

The book does a fantastic job of bringing the unique classes, magic items, monsters, and weapons of the *Diablo* world to *3rd Edition* but very little in terms of what to do with it. If you're going to buy the next *Diablo II* book, *To Hell and Back* (due in March), this is a worthy investment for *Diablo* fans, and if you just want to expand your *D&D* campaign with all the goodies within, you may not go wrong with the *Diablerie* book.

-- Joe G. Kushner

Pyramid Review

Flagstones (a True Type Font)

Produced by [Cumberland Games](#)

Created by **S. John Ross**

\$4.00

For some people, myself most certainly included, gaming has always had a very strong visual component. I have never participated in an RPG campaign that did not involve miniatures in some way, shape, or form . . . usually moved about on a properly scaled map or a board full of elaborately prepared scenery.

Lacking any trace of drafting skills, I've always been limited to using map boards that others have produced. I have a large collection of such items -- a collection that has grown with tremendous speed ever since I combined an internet connection with a color printer -- but until now I have remained unable to make my own map boards.

Flagstones, produced by Cumberland Games, is a True Type Font that allows the user to quickly and easily create simple dungeons and building interiors -- both as small maps and as printed floorplans large enough to game on. It's not at all difficult to use; once it's been installed, creating an unbroken line of five different *Flagstones* is as simple (literally) as typing "abcde". This can be used to create a grid that forms a room or corridor in a matter of seconds, and a pair of half *Flagstones* (created by typing "1" and "!") can be used to make a staggered pattern that looks good and functions as a pseudo-hex pattern.

In addition to the basic flagstone pattern, the letters "f" through "j" produce unbroken stone tiles, and typing the letters "k" through "o" creates some nifty cobblestones . . . ideal for city streets and areas that have seen a lot of weathering.

The first three number keys each produce half-tiles -- two for each of the three different *Flagstones* styles. The number keys "4" through "7" produce a total of eight different spiral and straight stair sections, and the "8" key produces a trap door. Finally, the underscore key ("_") creates a rough line that can be used to divide a room into sections.

I have found that setting the font size to "90" results in tiles about 1 inch square, but you may need to experiment a bit to find the exact size to suit your needs.

The *Flagstones* tiles can be used as-is -- they print out very nicely on gray or light brown paper -- or they can be given color or texture in a painting program before they are printed out. For example, I have superimposed the *Flagstones* on a granite texture produced by the standard Windows drawing application. As I've already mentioned, *Flagstones* can also be used to create very attractive maps. It's a nice change if your artistic abilities have heretofore limited you to boring grids drawn on graph paper.

Flagstones is a complete product, but it would be nice to have a few other accessories as part of the font. The trap door is excellent, but an overhead view of a standard door would be very useful. It's easy enough to create simple doors using a drawing program, but including something in the font itself would make the creation process even easier.

One warning: playing with *Flagstones* can be somewhat addictive.

Intending only to see how well it worked, I was up until 2:00 AM the night that I purchased it, creating an elaborate dungeon complex that would cover over twenty sheets of paper if I were to print it out. Which, inevitably, I will. Fortunately, I've just purchased some new ink cartridges for my printer.

-- *John Xavier Crimmins*

by **Steven Marsh**

Around the World in 80 Thrills is a four-part Cliffhangers adventure set in the 1930s (the popular "world on the brink of war" setting). One part will appear each month from now until May. Each part is written by a different author, making this also a Round Robin event:

- Part One -- Steven Marsh
- Part Two: [The Steps of Chiushan](#) -- James Maliszewski
- Part Three: [The Minos Touch](#)-- Bob Portnell
- Part Four: [The Atlantis Crystal](#) -- Steve Kenson

Stats are presented for **GURPS**. Additional stats appearing for **Fudge** presented in **bold italic red**. Stats for **Big Eyes, Small Mouth 2nd Edition** have also been presented in blue boxes with white text. The adventures should also be generic enough that they can be used in a variety of systems.

"When Suddenly . . ."

The sounds of the rain falling on the plane's wings are drowned out as the starboard engine explodes in a ball of fire; the entire plane banks left, shuddering to compensate. You drop your complimentary champagne. Amid the panicked screams of the passengers, you notice a dark-suited man in the back of the plane wrestle the little girl out of her mother's lap next to him. He draws a pistol from a holster around his ankle and holds it to the child. "You'll save us, heroes, or else," he snarls.

What do you do?

What's Going On?

It is the late 1930s.

The Heroes are aboard a commercial flight going from Midway Airport in Chicago, Illinois, to San Francisco Municipal Airport (Mills Field) in California. They are going to meet with Jill Spires, the competent and comely assistant (and daughter) of Dr. Reginald Spires, Professor of Archeology at the University of California (at Berkeley).

Unfortunately, Fate has also booked Francis "Frost" Palone on the same flight. Frost believed the he could quit being a hitman for the Chicago mob and "borrow" enough money to start life anew in California.

He is sadly mistaken.

Frost was to be an object lesson of what -not- to do to the mob. The mob paid off (or intimidated) the people necessary to plant three explosive charges on the plane's engines. They were -supposed- to be timed to explode at the same time, but the rain has shorted out one of the charges so it detonated early.

So now Frost has taken a hostage, the other explosives will go off Real Soon, and the complimentary champagne has spilt.

Of course, the GM *could* start the adventure in a traditional way, with them receiving a letter (see below), deciding to take the plane, and then having mayhem ensue. But if your players would find it fun, the pulps are often better served by beginning with a cliffhanger.

In Medias Res

This encounter is designed to bring the players up to the breakneck speed of pulp fiction, and should be tailored for your players' skills, with suitable complications added depending on their skills and interests.

- **Pilot:** The main pilot can be shot or have a heart attack, and the co-pilot is unable to fly in rainy weather.
- **Doctor:** The main pilot can have a heart attack (or, if there's a pilot PC, shot).
- **Dilettante:** The other passengers start panicking, endangering themselves and everyone else. They need the soothing words of a level head.
- **Reporter/Photographer:** This is news in the making! Perhaps the camera slid towards the front of the plane when the first engine went down.
- **Multiple daredevils:** If there are a number of physical adventurous types, perhaps the engines weren't merely destroyed, but are still on fire. While one disarms the bombs, the other needs to use an extinguisher to put out the fires before they destroy the wings.
- **G-Man:** A suitcase full of one hundred thousand dollars is sliding around the cabin, and threatens to fly out the plane. Not only is it a chunk of change in this Depression Era, it's evidence!

The two remaining explosives are timed to go off at the same time. The one on the port wing can only be accessed from the outside, requiring a wing-walking daredevil who can disarm the bomb (or two people working in tandem). The one in the front can be easily accessed from underneath when the plane is landed . . . which isn't much of a consolation in the air. Fortunately it *can* also be accessed from inside the plane, provided a gadgeteer can take apart (or a strong person can rip) the panels preventing access from the cockpit. (If no one has skills in demolitions, the co-pilot is an ex-Great War munitions expert, and, provided the players can protect him, disarm the bombs.)

Even if the PCs fail to disarm one of the explosives, the plane can still survive; triple-redundancy is common for planes of this era. If all three charges go off then it'll be a bumpy landing . . . one worthy of an ace pilot.

For GMs running a more horrific campaign, there are numerous options to make this encounter even more horrifying. Any occult artifacts or other Things Man Was

Model 80A-1 (AKA the "Flying Pullman")

The Flying Pullman is a large passenger biplane with three engines: one in front and one between the two wings on each side. It was introduced in 1928, and was the first plane to offer stewardess service in 1930.

Crew: 3 (one pilot, one co-pilot, one registered nurse/stewardess -- behind a closed door at the front of the plane)

Passengers: 18 (six rows of three seats)

Engines: 3 (one in front, one on either wing)

Maximum Speed: 138 mph

Cruising Speed: 125 mph

Range: 460 miles

The exit is on the port side at the back of the airplane; it can be opened, though it is latched and takes a deliberate action to do so.

Francis "Frost" Palone

Not Meant To Know that the Heroes may possess could easily break loose, threatening to unleash their evil, spill over the side and be lost, or the like. Any dark forces the Heroes may have angered in the past might also make an appearance now, even if only to feed off the terror of the passengers; glimpses of terrifying forces out the plane's windows should set the player's mind on edge.

Presuming the PCs defeat Frost, disarm the explosives, and save the day, the plane limps the rest of the way to Mills Field. On the way they will be treated to another glass of champagne and extra peanuts, and the Heroes can reflect on the letter that got them in this mess.

The Letter and the Mission

To Whom It May Concern:

I have heard it on good authority that you are as skilled as you are discreet. I pray this is true.

I have need of a band of civic-minded individuals to aid in the confirmation of a discovery potentially great in import and national interest. I fear that I cannot say any more at this time, as I do not fully trust postal delivery methods. (Nor do I trust the telephone company.)

Please find enclosed airplane tickets for you all. My assistant Jill will meet you at the airport and escort you to me. I cannot stress enough the need for discretion.

Sincerely,

*Reginald Spires
Professor of Archeology
University of California*

This letter should be tailored towards the group in question (addressed to someone specific, the "good authority" is an actual person, etc.).

Jill Spires meets the PCs on the airfield; she is focussed but pleasant. As the police cart off Frost (or his body) and a band of mechanics scramble to repair the plane, she'll ask, "Nice flight?" She will be sympathetic and glad they are alive, but not overly surprised to hear of their troubles. They -are- Heroes, after all . . .

She'll make small talk as she drives the Heroes to the University of California, but won't divulge much about the mission. She *will* take the opportunity to compliment them on any public escapades they may have had; any romantic subplots could

The Kensington Stone

The Kensington Stone is a stone found in Kensington, Minnesota. It is inscribed

easily begin here.

Dr. Spires will meet the Heroes at his office in the Anthropology Museum. After introductions are made (including the possibly awkward for the romantically inclined: "And you've already met my daughter, Jill . . ."), he will explain his troubles.

"I have a graduate student named Philip Inell who was researching evidence of Viking inhabitation of Minnesota, starting with the Kensington Stone. He rang me two weeks ago to say he had made a potentially shocking discovery -- a book of great interest that was older than the Stone, and didn't seem to have anything to do with the Norse. He didn't feel safe in discussing it any further, but promised he would call within a few days on a more secure line to update me.

"I haven't heard from him since.

"I'm not a young man, and feel unsure in investigating the matter myself. I'd heard of your exploits, and hoped you would bring the matter to resolution. In short, you need to find Philip *and* this book."

If asked, Dr. Spires will present information on the Kensington Stone and the enigma in question.

At this point, the party may be ready to go. Dr. Spires has arranged for a Stinson-Detroit six-seat plane to take the Heroes to the Minneapolis Municipal Airport, where they can either rent a car or take a train the remaining 100 miles west/northwest to Kensington, a small farming community about 50 miles east of the North & South Dakota border. Given the number of stops the train needs to make, travel time will be approximately the same (2-4 hours); rail is more comfortable, but a car will provide more travel options once there.

As they leave, though, Jill will try to persuade the party to let her accompany them. She will be quite persuasive, arguing that she knows almost as much as her father about Viking culture and history, knows pertinent details about the dig, and can pilot a plane as well. She will not insist, however (though she will pout if not permitted).

Kensington, Minnesota

The trip to the airport and then to Minnesota will be uneventful (though an evil GM might try to scare players by asking, "Who's sitting by the exit?" or other questions). The players will then have the option of going to Kensington or (if Jill is there) searching the site.

Kensington is a tiny farming community with about 200 people. It's about 0.14 square miles big. There is just one street of note within the city: Central Avenue, which is divided into North and South by the railroad track, which belongs to the Soo Line. The Soo Line is the railway that primarily serves Minnesota, Wisconsin, and North Dakota.

The entire population of the town is currently terrified . . . and not without good reason. The entire town is held in the grip by Dante della Griva, an Italian "grave robber" who was rejected from the international archeological community due to his callous disregard for proper procedures.

with Viking runes, which translate to:

8 Swedes and 22
Norwegians on a
discovery voyage from
Vinland westward, we
had anchored by 2 rocky
islets one days voyage
north from this stone.
We had fished a day,
after we came home
[we] found 10 men red
with blood and dead.
AV(E) M(ARIA) deliver
from evil. We have 10
men at sea to look after
our ship 14 days voyage
from this island. Year
1362

It is considered by many to be proof of significant Viking inland involvement long before Christopher Columbus's voyage, but it is also considered to be a hoax by many. Substantiating proof, in the form of other evidence of Viking involvement, has so far been maddeningly difficult to find.

Danger Sense

Strong Will +2

Dante, a staunch member of the Fascist party, has brought his crew (or, more correctly, gang) to Kensington; they have secured this city and used strong-arm tactics to keep everyone quiet.

The city is otherwise unremarkable and should contain items of interest to a small farming town (farm buildings, silos, a general store) plus a train stop. If questioned, people will obviously be frightened; if pressed, they will reveal that they are afraid of an Italian named Dante who was digging with his crew about five miles to the north. (This is a partial lie; Dante has already departed, though more of his crew *are* still at the dig site.) They will be happy to give them directions to the site.

The *real* reason the town is still frightened will be revealed if they press the matter too much; the Heroes will find themselves facing a number of Dante's gang equal to their own, emerging from farm houses and small shops. This encounter should be dramatic but brief, with an emphasis placed on complications appropriate to a small farming community (foes hiding in cornfields, a battle in a barn); again, complications tailored to the abilities of the Heroes are appropriate.

Once the town members are freed, they will still be reluctant to help if the gang at the site (see below) is still around. They will reveal their reasons for nervousness, in hopes that the Heroes will defeat them as well.

If the Heroes have already defeated the rest of Dante's gang (or if they haven't, but force the townsfolk to talk), they will reveal that Dante loaded a sheet-wrapped item aboard a freight car. It was narrow but about half as long as the car itself. The train left about an hour ago.

The Kensington Dig

It's possible for the Heroes to go to the dig site directly (if they have Jill) or from Kensington. The site is five miles north of Kensington by a small lake; in fact, the edges of the dig that border the lake are very wet, and not terribly strong. The dig itself is a hastily-dug pit about thirty feet wide by sixty feet long by ten feet deep, with several ladders descending vertically into it from the sides. The area around the dig shows many signs of heavy (but hasty) occupation.

A casual glance over the pit will not reveal much, except a mound near one corner of the lakeside edge; an active search will reveal, near the center of lakeside edge, another engraved stone, similar to the Kensington stone. It is buried and will take several minutes to uncover and clean. If Jill is with the party, she can translate it, given a few minutes:

"This vessel is final home to Ottar, the jarl who led us on this voyage and keeper of the axe of Saint Olaf. Let he

who disturbs his rest, or the goods he departs with, die in shame as those who

would die in it in honor."

Jill will recognize this as a curse of some sort, but will be unable to comment as to the nature of it.

Uncovering the mound in the corner will reveal a body; Jill is able to recognize it as the body of Philip.

At the point where both items of interest are revealed within the pit, the trap is sprung.

A rope, tied to a support buried within the lakeside edge of the pit and buried under a layer of dirt, is pulled by more of Dante's gang members outside the pit. The Heroes will have but a moment to react; they can cut/shoot the rope, grab the rope and pull back, or try to get out of the pit.

If they fail, or don't react properly, then the support pulls away, revealing the side of the lake. The pit quickly fills up with water; quick action will be necessary to save Jill (if she is there) and themselves. But the gang members (again, in equal numbers to the Heroes) will press their advantage, shooting at them or otherwise trying to hit them while they are floundering in the water. They will get into position from their hiding places around the site to standing on the edge of the (possibly water-filled) pit.

After a difficult battle (assuming the Heroes win), the Heroes can either go back to Kensington (if they haven't been there), or try to chase after Dante (if they know how he escaped).

Unfortunately the car they've rented will not be up to the challenge of chasing a train. Fortunately fate provides help in the form of Dante's gang's motorcycles: BMW R.12s, equal in number to the gang (and the Heroes). They will either need to double-up one person or leave someone behind; Jill will, again, grumble at the prospect of being left behind.

Although challenging to drive (especially if the Heroes haven't driven motorcycles before) these will be able to go 80 miles an hour . . . more than enough to catch up with Dante's train. (If they chose to go by car, they will probably either need phenomenal driving abilities or a gadgeteer to make their car go faster.)

The Train Chase

Dante will have about an hour's head start on the Heroes; fortunately, since the Heroes can travel at twice the train's speed on motorcycles, it will only take about an hour to catch up with him. Dante's train, the Soo Line #2719, is currently carrying seven cars (not counting the engine): a passenger car, two freight cars, two more passenger cars, one more freight car, and the caboose. (The second set of passenger cars and the cargo car will be transferred to a new train in Minneapolis; they are on their way, ultimately, to Eau Claire.)

The #2719 is headed non-stop through to Minneapolis; it will reach that city in an hour, and the Heroes may be tempted to wait for Dante there.

But there's a snag: the curse which Jill may (or may not) have alerted the Heroes to has started to occur.

Wealthy

The second cargo car is currently the holding place of a Viking drakkar, a raiding longship that was constructed as a burial vessel for Ottar the Bold, leader of the ill-fated group of Swedes and Norwegians who explored the American Midwest before Columbus. This ship was originally constructed to be destroyed as other Viking burial vessels -- by fire. Unfortunately, unseasonable flooding kept them from doing this, and they were forced to bury the ship; they marked the ship with the stone described above; Dante, not knowing (nor caring) about the Viking runes, is claiming the treasure for its value. He *has* found the axe of Saint Olaf, and is guarding it (and the ship) within the freight car.

The curse on the ship has activated, and the ship has begun to smolder. It will shortly be consumed in flames, and threatens to take the train with it. The Heroes should be able to detect smoke coming out of the side of the car; it falls to them to be heroic and figure out a way aboard the train and the freight car, where they will find Dante.

Unfortunately, Dante himself is currently under a curse. As a non-Nordic man wielding the axe of Saint Olaf, an all-consuming bloodlust and rage is possessing him. He will strike out blindly at the Heroes with the axe, ignoring the danger to himself or the train posed by the flaming ship. (GMs wishing for a more horrific campaign can say that each wound inflicted by the axe will instill a similar bloodlust and rage for a day, week, or even a month. In this case, a "warning" wound should clue the Heroes into the danger.) The rage will consume Dante until he is defeated or, more likely, disarmed of the axe. At that point he will try to escape by any means necessary to harass the Heroes again. As the flames consume the ship, at one point part of it should fall away, revealing a cache of buried goods, including an ominous-looking book . . . a book which is in grave danger as the flames lick all around it . . .

This is the big climactic battle; as many complications as appropriate or desired should be used here.

- There is probably another group of Hero-matching gang members aboard the train, making trouble. They could seek to uncouple the second group of passenger and freight cars, placing those cars in danger.
- A gang member could force the conductor to accelerate the train dangerously fast, either to get away from their pursuers or to distract the Heroes. If there are scientists or gadgeteers, the mechanism for stopping the acceleration could break, needing repair.
- As the drakkar is consumed in flames, other parts of the train could catch on fire. The flames will either need to be brought under control or the train stopped and evacuated.
- Perhaps the axe makes Dante cunning as well; if pressed he may escape and enter the passenger cars, threatening those inside.
- Jill may be endangered; perhaps she sprints in after the book and becomes trapped by flames, or is threatened by Dante or members of his gang.

Aftermath

Dante should be thwarted (and, in Cliffhangers tradition, die in a gruesome way or, perhaps ideally, escape to fight again). The book should be recovered. The train (or its passengers) should be saved. The grateful Jill should kiss someone.

Skills

Unfortunately, this week's archeological find of the century is destroyed by fire. The dig sight has been flooded (if not during the encounter than afterwards by another of Dante's inimitable gang acting after the Heroes left). Philip is still dead. The axe is still valuable, but transporting it is problematic.

The Book

This oversized tome is written in an ancient, unknown tongue, except for the inside cover, which contains more Viking runes. Jill will translate these as: "We found this in a dark place 988. May it be known by future sons for the light it may bring." She won't have any idea theories about what it means. The book will appear to have been written long ago as pages, but bound more recently (comparatively speaking; probably around 800 AD).

If the players search the book, they will discover a curious bump along the binding. If they open it (probably needing a knife or the like), they will discover a key hidden in the binding.

University of California

Once they return to the University, Dr. Spires will be saddened to hear of Philip's death, but will be very interested in the book and the axe. He will tell the Heroes he needs time to learn what he can about the book. He will offer them lodging within San Francisco.

After a day, he will reveal whatever information about the book the Heroes didn't know before, and present them with (chemical) photocopies of the book and a copy of key (even if they hadn't discovered it before). He will again thank them, promise to keep in touch regarding his findings, and provide whatever a fair and just reward for the band of Heroes would be.

Fade to black.

Epilogue

Many interesting things can result from this adventure, making it quite suitable for continuing adventures:

- The Chicago mob now has reason to dislike the Heroes. How might they retaliate, especially if the Heroes are subpoenaed to appear at Francis "Frost" Palone's trial?
- If Dante della Griva escaped, who knows what troubles he can stir up? He'll *definitely* have a bone to pick with the Heroes . . .
- If any Heroes were inflicted with the axe's bloodlust, even a seemingly routine mission will become problematic until its effects wear off.
- The Axe of Saint Olaf could easily be stolen from the Museum of Anthropology, making for a very difficult time at the University of California.

And what of the mysterious book and key (and Dr. Spire's lovely daughter Jill)? Tune in next month for part two of *Around the World in 80 Thrills*.

Cultural Arts (Archeology, History) -- 4, Driving -- 1, Gun Combat -- 3, Intimidation -- 1, Medical (First Aid) -- 1, Piloting -- 1, Social Sciences (Anthropology) -- 1, Stealth -- 1, Unarmed Attack -- 2, Urban Tracking -- 2

The Axe of Saint Olaf

The axe does sw+4 damage (**Strength+2 damage**) and gives the wielder an Axe/Mace skill of DX+4 (or +4 to existing skill) when wielded, with a maximum skill of 19. (**In FUDGE, the axe gives the Axe skill at DX+2, or +2 to the existing Axe skill, maximum of Superb.**) It also gives the wielder Combat Reflexes, High Pain Threshold, Toughness (DR2), 4 Extra Hit Points, and Strong Will (+3).

It also curses the wielder with Berserk, Bloodlust, and Fanaticism (to converting or killing non-Christians).

Damage 10

Gives Melee Attack (axe) at 3 or +3 (maximum of 6) and Melee Defense (axe) at 1 or +1 (maximum of 6). Also Gives Unique Character Defects: Berserk, Bloodlust, and Fanaticism (to converting or killing non-Christians).

The Matochkin Earth Star

by Rik Kershaw-Moore

Art by the U.S. Department of Energy

ST: 4

DX: 2

IQ: 2

HT: 19/6

Move/Dodge: 1/0

PD/DR: 4/5

Damage: The contact poison does 4 dice damage and causes nausea followed by sudden paralysis. If the victim can make a successful HT roll, the 2 dice damage is taken as well as DX reduced by 5 for a day. The poison takes 2 rounds to take effect.

Reach: C

Size: 2

Weight: 270 lbs

Habitat: dark, moist areas

On October 30, 1961 at 11:32am Moscow time, the Union of Soviet Socialist Republics detonated a massive 50-megaton atomic device over the Novaya Zemlya archipelago in the Arctic Ocean. In less than a second the energy releases exceeded the total power of all the explosives used during World War II, including the atomic bombs dropped on Japanese cities by the United States. The giant swirling mushroom cloud that followed rose over 40 miles into the sky while the atmospheric disturbance generated by the explosion orbited the earth three times. This super bomb had absolutely no significance as a military weapon but was designed instead to be a one-time demonstration of force in a superpower game of nuclear one-upmanship.

However, what Andrei Sakharov, the other designers of the super-bomb, and Soviet Premier Nikita Khrushchev failed to consider was the lasting effect that such a nuclear explosion would have on the environment. Particularly they failed to realise the effect the blast would have on one species of fungi; the Matochkin Earth Star (Gasteromycete Matochkini).

At ground zero on that fateful morning was a clump of almost mature Matochkin Earth Stars, and as it had been raining early in the day, the rays of the Earth Star had uncurled and the fruiting bodies were fully exposed when nuclear chaos rained from the skies.

Normal Earth Stars are relatives of the puffball fungus, whose fruiting bodies are stomach-shaped sacs, which are protected by a number of arms or rays that are folded over the body during dry weather, making the Earth Star look something like a pale yellow onion. However, once it rains, these arms uncurl forming a star shape, which has enough force to raise the fruiting body clear of the forest floor to a height of several inches.

After being exposed to the intense gamma radiation that followed the Russian super-bomb the genetic structure of the Matochkin Earth Stars was altered in a number of highly unusual and dramatic ways. First, the cells in the rays which

Creatures of the Night: The Matochkin Earth Star

lift the Earth star off the ground became more akin to muscle fibers which allowed the Matochkin Earth Stars more freedom of movement. Second, as a result of the radiation, the Matochkin Earth Stars began to grow bigger and bigger, until eventually their growth stabilized at around 4 feet in diameter. The surface of the Peridium (the outer covering of the Earth Star) is now covered in thousands of tiny tendrils that constantly writhe when wet, but will hang limp in dry weather. Each of these tendrils has at its tip a tiny blob of a highly lethal neuro-toxin that paralyses the victim's central nervous system; once exposed, victims suffocate to death. Finally, the Matochkin Earth Star has the aroma of rotting meat.

This gigantism means that the Matochkin Earth Stars can now launch its spores with even greater velocity than before. Usually the Matochkin Earth Star will release its spores towards the end of autumn with such velocity that the airfoil shaped spores are often recorded at altitudes in excess of 10,000 feet. Once in the atmosphere, the spores can glide for many thousands of miles before coming to earth. Once a spore has landed on a suitable spot, it will begin to germinate. Such spots are generally in damp areas with plenty of shade. At first the Matochkin Earth Star will grow as deep beneath ground as a mass of fibrous hyphae whilst it waits for winter to pass. Once winter has passed, the Matochkin Earth Star begins to put itself towards the surface.

Here it waits, attracting prey towards itself using the smell of rotting meat as a lure, killing anything it attracts with the deadly nerve toxins secreted by the tendrils. The Matochkin Earth Star then secretes a powerful digestive enzyme and sends out more hyphae to feed on the resulting compounds. It will take about a day for the Matochkin Earth Star to devour a carcass before it needs to move on. Matochkin Earth Stars only ever move at night, and they will always try to find quiet dark spots to make their new lair. Finally in late autumn, the Matochkin Earth Star will seek out high ground, from which it can discharge its spores.

The government of the USSR first became aware of the existence of the giant Matochkin Earth Stars in the spring of 1964 when an entire platoon of men were wiped out when they wandered into an area inhabited by three such specimens whilst on a night exercise in the Krasino. Since then the USSR has managed to keep their existence a secret. There is evidence to suggest that they have gone to a lot of trouble to make sure no one learns the truth about these bizarre fungi, including the setting up of a special task force to deal with the Matochkin Earth Star and its victims.

Any area that becomes the center of a Matochkin Earth Star infection is usually cordoned off while a detachment from the 12th Glavnoye Upravleniye Ministerstvo (12th GUMO) deals with the threat. The 12th GUMO is the Russian Nuclear arsenal defence unit, which can be considered to be equivalent in training and materiel to Spetsnaz (p. SO39).

12th GUMO are able to track the Matochkin Earth Star because it has a unique radioactive signature that can be tracked by satellite. This is why wherever a Matochkin Earth Star lands a 12th GUMO team is not far behind to help pick up the pieces.

Even today, following the collapse of communism and the fragmentation of the old USSR, this task force is still in evidence, and still dealing with Matochkin Earth Star infestations. The last truly serious outbreak was in 1992, when 193 people died during an infestation at the nuclear power plant in Voronezh.

While it is thought to be solely a Russian problem, there have been a number of incidents involving Matochkin Earth Stars in other European Countries including Poland, Romania, Switzerland, Italy and Ireland. So far there has only been a single reported case of Matochkin Earth Star anywhere in the United States. In 1973, a single Matochkin Earth Star spore landed in Bettles Field, Alaska.

Adventure Seeds

The Biological Weapon

The player's government has learnt about the existence of the Matochkin Earth Star and believes that it will make the perfect biological weapon. The characters are tasked with acquiring either a living specimen of the Matochkin Earth

Star or its spores so that they can be studied.

This mission will be doubly tough since not only will the characters need to be inserted into one of the most well protected and radioactive areas in the world, the Russian Nuclear test facility on Novaya Zemlya, but they will also have to deal with a huge number of hungry Matochkin Earth Stars.

The Presidium Incident

At 21:43 last night, person or persons unknown fired an RPG-11 anti-rocket into room 1013 of the Presidium Hotel in Washington D.C from an adjacent building. In the ensuing blaze, 11 guests died along with the occupant of room 1013: Dr. Yuri Kruglov, a visiting Mycologist from the Irkutsk State University, in Siberia.

Kruglov travelled to the west with the express intention of alerting the rest of the world to the dangers of the Matochkin Earth Star. He brought with him a fairly immature specimen, which he has deposited for safe keeping in the Arlington National Cemetery. Before he died he talked to a number of other scientists as well as members of the press. In every case he told them about the specimen he had brought with it, but only hinted as to its location.

The characters are all members of a law enforcement agency assigned to bring the killers to justice. They should quickly learn who Kruglov talked to and when they start to die as well it should be apparent that these people need to be protected from 12th GUMO who were sent to silence Kruglov. Then the body count begins to rise and the characters will find themselves facing the reality of a giant killer mushroom on the loose.

Death in Middle America

A single Matochkin Earth Star spore has been wafted into a small town in Idaho. Here in the ideal conditions needed to promote growth, the Matochkin Earth Star has germinated and is slowly decimating the town. The characters are all members of the local community trying to work out what is killing these people.

Shortly after the characters start to investigate these deaths, a research team from the Centre of Disease Control in Atlanta arrives to begin its investigation. These guys are really 12th GUMO come to sort out the problem. They have orders to kill anyone or anything that gets in their way, including the characters.

Experiments

I'm something of a mad scientist when it comes to my gaming.

Although there are many ideas I haven't tried (yet), there aren't too many ideas I've rejected out of hand. Cliffhangers, "You wake up and it was all a dream," starting in medias res, players running multiple characters, "Opening the laboratory cooler, you discover bodies that look identical to your own," and so on.

But whenever I *do* experiment, I try to do it for a reason. Unlike bad 3-D in a movie, if there isn't a reason to have the players swap characters, I generally avoid it. (Now, if they get hit by the mind transference ray . . .) Some experiments work. Some don't. (As foreshadowing, and tied in by an experiment that failed, I *do* have another of [Steven's Biggest GM Mistakes](#) coming up . . . although I will protest in advance that I don't believe this one was my fault, per se . . .)

Many of these experiments turn upon the conventions of roleplaying and storytelling; why does one adventure have to occur sequentially after another? Why do players (and characters) have to be given free will? Why can't players know how a game is going to end? Who says the players need to know what they're doing to have fun?

From these random thoughts (!) I've done:

- Flashback and flashforward adventures
- Pre-written scripts, often placing the heroes in awkward or dangerous situations
- Foreshadowing, either in-game ("The fortune-teller says . . .") or out of game ("Come back next week when a major character dies . . . and a hero is accused of it").
- Identity crises, making the players guess at the nature and situation of their characters (not unlike *Quantum Leap*).

Anyway, for those of you who haven't noticed, this week has something of an experiment for *Pyramid*. We're running a four-part Cliffhangers adventure called "Around the World in 80 Thrills." A new installment will be running once a month for the next four months, with a different author taking up each part . . . making this something of a "round robin" effort, too. Like my gaming experiments, this one stemmed out of thinking about bending the conventions of the magazine. In this case, I realized, "Wait a minute! Why *can't* I run a multi-part adventure? It's not like folks aren't going to be able to collect the back issues . . ."

We've striven to make each part of this adventure stand alone as much as possible (despite some fairly easily removed continuity elements), so that if one adventure doesn't appeal to you it doesn't make the whole series moot. In addition we've also tried to make it as useful as possible by including stats for a few game systems (*GURPS*, *FUDGE*, and *Big Eyes, Small Mouth*), and making it as generic as possible so that it can hopefully be ported over to other games without much effort.

As ever, your comments are welcome, either on the [message boards](#) or by an [email to me](#). In particular, let us know if you like the idea, hate the idea, like the implementation, hate the implementation, like the inclusion of lots of systems, hate the inclu- . . . you get the picture.

* * *

Now, if there's one thing I've learned from my madcap experimenting, sometimes the most surprising thing you can do is . . . the expected. The butler did it. The orphanage isn't saved. The woman peels off the bandages and she's hideous.

So, despite our self-professed "sweeps month," next week isn't going to have much of a theme, special event, or exciting occurrence, outside of a loose "vacation" idea. The vacation theme is foremost in my mind currently because, as I write this, I am five hours away from boarding a plane for my first vacation home in three years. (Don't worry; *Pyramid* will run . . . though I'm not sure I can promise that about my column . . .)

As an aside, I'm also going to be away from email and the message boards for a week and a half. Feel free to write or post, but please don't expect an immediate response from me. I'll be sleeping, watching *MST3K* tapes, and in general doing anything other than working a jillion hours a day. Woo-hoo!

* * *

The trouble with being a good writer is that you tend to be a *busy* writer . . . particularly if you've foolishly made your prowess known to others who want to shower you with money, affection, and power to get you to write for them. At least, that's my understanding. Which is my roundabout way of saying that Ken is too darn busy this week finishing other Secret Things to bestow his Illuminated Weirdness upon us. But he promises he'll be back next week . . . and in his absence, some mutant spore creatures have taken the opportunity to invade. Enjoy.

-- *Steven Marsh*

Fluid Mechanics: Technology in the World of Blue Planet

Published by [Biohazard Games](#)

Written by Jeffrey Barber, Greg Benage,
Greg Porter, Brian Schoner, and Jason
Werner

128 pages, hardbound; \$23.95

Fluid Mechanics bills itself as a guide to technology in *Blue Planet*. If you translate that as "gun and toy catalog," think again. The book includes some toys, sure, but more than that it looks at how technology affects all aspects of life in the *Blue Planet* universe. So while *Fluid Mechanics* details diamond machetes, it devotes equal space to wetsuits and an essay on fusion reactors in 2199. The technology is divided into four broad chapters: "Hardware," "Weapons," "Biotech," and "Vehicles."

"Hardware," the longest chapter in the book at 40 pages, covers an amazing assortment of material. It starts with a general overview of technology on Poseidon, then moves into power sources and tools, sensors, materials such as diamond glazing and body armor, computers, espionage gadgets, medical equipment, survival gear, and cetacean hardware -- plus many other topics. In short, there's a lot of stuff crammed into this chapter.

For example, the Computers section begins with a page forecasting the integration of computers into everyday appliances and their resulting standardization, the use of optical chips and DNA-based memory, and the way Commcore, a futuristic Internet, has led to a distributed computing network, where users rent most processing power and applications they need. This is followed by a description of the general types of software available--basic things like encryption, analysis, and navigation software, but also more interesting ideas such as a personal network that allows all the character's equipment to act in unison. Many other sections of *Fluid Mechanics* also include bits about tying gear, such as sensors into a computer network.

The next chapter, "Weapons," is the shortest chapter in the book. Again, it starts by summarizing the advances in firearms, military support weapons, their manufacturers, and R&D. In *Blue Planet*, little has changed in basic technology, but continual refinement and cybernetic targeting have made weapons deadlier than ever. Each type of weapon gets a few specific models that are similar to the generic guns listed in the Player's Guide. SASERs are introduced as weapons which concentrate sound and are highly effective underwater, although much less so above it. Several flavors of ammunition are introduced, of varying levels of legality. No PC's kit is complete without an adequate demolitions kit, which is followed by numerous grenades, mines, guided missiles, and a few other things characters probably shouldn't get their hands on. While not incredibly imaginative, the chapter does a good job of providing game statistics and flavor for most situations, as well as leaving space for other parts of the book.

The "Biotech" chapter hashes out the social ramifications and prejudices about cyberware (basically, it's too darn useful for people on Poseidon who are struggling to survive to be concerned about the ethical problems), damage to cyberware, and second-hand mods. It slips in a hodge-podge of new cyberware, from spacer limbs and plain vanilla cybereyes to "wakers" and reflex programs. So far, the chapter isn't much different than parts of *Shadowrun* or *Cyberpunk 2020*. The biotech section becomes much more interesting, with options as varied as third eyelids, bioluminescence for the fashion conscious, and perfect pitch. A section on complete genetic redesigns follows, mainly

talking about the history and hysteria over complete genetic redesign, but also presenting two new redesigns, the "Mongrel" hybrids and the "brainchildren," guaranteed geniuses with a manic-depressive personality. The chapter ends with a selection of biomods for cetaceans, although most prefer not to modify themselves.

"Vehicles," the final chapter, contains both vehicles and new rules for dogfighting. It adds two statistics to the basic ones listed in the *Player's Handbook*, "Power" and "Handling." While useful, no explanation is given for determining these statistics for vehicles from the basic books, and a few of the vehicles in *Fluid Mechanics* lack them as well! GMs who want to use the new rules system will have to guesstimate these two statistics for many vehicles, and, although it's not that difficult to do, it would have been better if Biohazard had included guidelines for vehicles from the main rulebook.

Anyway, there's nothing too atypical with the vehicles here; the chapter starts with a motorized tricycle only fit for newcomers to Poseidon, leads through hovercraft, jumpcraft, and VTOLs without anything too different than the *Player's Guide* except stats for the Jefferson Overland Hovertrain which services remote farms on Prime Meridian and a construction jumpcraft. Ground effect planes, airplanes which fly extremely close to the surface to increase their load and fuel efficiency, are introduced, then surface vehicles. The Hobart Class research corvette finally plugs the peculiar hole in *Blue Planet* in that there are no plain-vanilla boats in the game, the Trident Fast Assault Trimaran provides a new way for characters to hit the beach, and the ERT 14M Cutter can save the PCs when their plane goes down in the Storm Belt. Combat, research, and personal submarines each get a write-up, followed by a long and well-researched, though systemless section on space flight process, flight options, and the various spaceships. This is good stuff for the next time the PCs decide to go on a quick jaunt through the wormhole. Vehicle accessories, such as superchargers and chaff launchers, end the section. Any pilot jock will want to customize her vehicle, and now she can.

The dogfighting rules that end the book are well thought-out, although less numbers-based than *Blue Planet* fans might expect. Considering the basic rules give a scant page to vehicles, most players are going to want them. Encounters start at different range bands, from close to extreme, and characters can change the distance by making an opposed skill roll modified by the new "power" attribute. Maneuvers and evasive actions are handled in a similar fashion, although using the "handling" attribute. The rules are fairly comprehensive and simple enough to keep chases from turning into a war of graphing calculators. Although they probably ought to have been included in the basic book, the new rules work well and are a welcome addition to the game.

Fluid Mechanics is an excellent first supplement for the new version of *Blue Planet*. It is well-written and edited, with a variety of useful technology, from broad essays that add to the futuristic feel of *Blue Planet* to simple toys for the PCs or their opponents. The art continues to range from good to terrible; while most of the pen and watercolor pieces are well done, Biohazard has unfortunately abandoned the elegant wireframe look of the first edition technology for some rather crude drawings, especially of the vehicles. The book costs more than most supplements at \$24 for 128 pages, but it is also hardbound with a better, lay-flat binding than the main books, which makes up for the price increase.

Blue Planet fans will definitely want this book, if they don't already have it. Hard science fiction GMs for other games might want to consider picking up a copy of the book as well. It presents a viewpoint that doesn't have a radically different prediction of technology than most hard science fiction, but the side-effects and linkage of the various advances is very well thought out. Two problems with this are the focus on a water-world and the amount of *Blue Planet* rules-specific information in the "Weapons" and "Vehicle" chapters. Biohazard has written an excellent supplement to start their line. *Fluid Mechanics* is the best roleplaying tech book I own, and I'll buy every supplement in the line if they continue to be of this quality.

-- Andy Wills

by **Stephen Dedman**

We tend to look down on plants, despite the fact that they made this world liveable for oxygen-breathing animals like ourselves, and will probably be responsible for making other planets habitable. They may be at the bottom of the food chain, but they're not wimps; plants compete with each other just as animals do, and will go to great lengths not to be eaten until they've reproduced. Some endure for millennia, some survive in vacuum or thrive in extremes of heat and cold that would kill us in minutes, some grow to more than a hundred yards tall, some arm themselves with thorns or poisons, some have turned the tables and prey on animals . . . it's even been suggested that pollen from new varieties of plants poisoned the dinosaurs, leading to their extinction.

Plants that have enlivened science fiction include the stage trees and sunflowers from Larry Niven's "known space" stories, Leela's Janus thorns from *Doctor Who*, H.G. Wells's "strange orchid" and its descendants, Audrey II from *Little Shop of Horrors*, and John Wyndham's triffids. So next time your character is wandering through a generic forest on an unexplored planet, remember: the trees outnumber you, they can probably outlast you, they might outgun you, and they may already have outsmarted you.

The plants listed below are designed for *GURPS Space* campaigns; they may be native to alien worlds, mutated from terraforming fauna, or genetically engineered by the Precursors, according to taste. Plants described in *GURPS Bio-Tech* may also occur naturally on other worlds. Even the most dangerous species may persist on populated planets; apart from being hard to eradicate, they may provide ground cover (preventing erosion and dust storms), food (for humans or other species), drugs or medicine (likewise), area denial (smugglers, terrorists/rebels, and others who want natural or natural-looking barriers may surround their camps with razorsedge or similar plants), or have other uses that compensate for hazard they pose.

Bed-of-Nails

Known by different names on many worlds, mostly those with extreme seasonal conditions or very long nights, bed-of-nails is a sharp, spiky ground cover plant consisting of long sharp thorns thrusting out of a moss-like bed. It is difficult to eradicate, and plains of bed-of-nails can stretch for hundreds of miles, allowing almost no other plants to grow.

The thorns of a typical bed-of-nails do 1d-5 crushing damage per turn to anyone walking slowly (Move 1-2; minimum

damage 0, roll randomly for the foot injured) or 1d-4 impaling per turn to anyone running or jumping. The only ways to walk across bed-of-nails safely are to wear tough boots (the thorns will shred DR 1 soles in TL/2 hours), or to use Light Walk skill. Knocking someone to the ground on a bed of nails inflicts an extra 1d-1 cutting damage; the thorns cannot penetrate DR 2+, but can (for example) tear a spacesuit if the damage is bad enough.

- **Popweed** is another ground cover plant, but with gas-filled pods instead of thorns. These burst if trodden on; -2 to Stealth rolls. The only other hazard posed by popweed is that it can grow over swamps or narrow rivers as easily as solid land, but doesn't support much weight; treat as 1" ice (p. B188).
- **Viper Grass** resembles bed-of-nails, but the thorns are poison-tipped (usually Type H, doing 1d damage; see p. CII149). Fortunately, viper grass is much less common than bed-of-nails, and easier to keep at bay with other ground cover plants.

Some animals may be adapted to eating bed-of-nails, viper grass, and similar plants; most of these will have very large and tough mouths and hard hooves. If converting a grazing herbivore to this environment, add +1 to both biting and kicking damage.

Indicator Species

These plants reveal the location of something in the soil -- or the immediate future. Examples useful to humans include species that only grow in soils rich in certain minerals, or that change color in the presence of radioactive leaks. Other native plants may have their life-cycles cued to specific events -- e.g. flowers that bloom immediately before solar flares are due, distinctive seed-pods that appear before migratory animals arrive in an area, etc.

Industrial Plants

Humans have been making tools, buildings, vehicles and weapons of wood and bamboo since before the stone age. Some of these have required minimal work: making a club, for example, may be as simple as breaking off a branch; Australian lawyer vines resemble barbed wire; and most of us will have trodden on naturally occurring caltrops at some time. On other worlds, more complicated items may simply be plucked from the trees -- or *be* living trees, as with the Residential Tree from *GURPS Biotech* (p. BIO94). Many TL0 items might occur naturally on some planets, requiring only imagination to be put to use. Enormous seed pods might serve as bowls, bottles, helmets, canoes, or huts; clusters of nuts or fruit could be used as bolas; reeds might dry out and harden during summer to become serviceable arrows or spears (treat as fire-hardened tip) or transplanted to form a palisade. Three more examples are given below. Note that plants are more likely to grow to great size on planets with low gravity and hot, wet climates; plants from heavy worlds are likely to have tougher, denser wood, which makes better weapons. Naturally-occurring tools and weapons may help a near-intelligent species survive to evolve into a sentient race that can improve on these items.

- **Cacafuego:** Many plants are dangerous to burn because their smoke is poisonous, hallucinogenic, or otherwise noxious, but the Cacafuego qualifies for some sort of record. Cacafuego trees grow up to 10 (2d-2) yards tall, and are harmless except in conditions of extreme heat (200 F+), when their huge seed-pods explode like fragmentation grenades, doing 1d+2 concussion damage, 1d+1 fragmentation damage, and scattering their seeds far and wide. This normally happens only during thunderstorms and forest fires, but a stray shot from a laser, flamer or chemical slugthrower can set one off. A cacafuego pod that explodes on or near its tree has a 1 in 6 chance of detonating 1d more pods, which in turn can set off others in a chain reaction (the average tree bears 3d+1 pods). Turning a pod into an effective bomb requires only the application of heat (a fuse, a pyrokinetic attack, etc.) but they are heavier and bulkier than TL7+ grenades; 1/2D ST; Max STx2.5; Weight 2-3 lbs; Min ST 7. Cacafuego trees should be examined carefully before being used for firewood.

Cacafuego trees grow in warm rough areas where rain is uncommon and fires frequent, on planets with .7 to 1.1 G. They are rarely found within walking distance of human settlements, as they pose too great a temptation to children, drunks, and engineers. Cacafuego trees give any native culture that has developed fire (TL0+) a TL4 weapon.

- **Dagger Trees:** As the name suggests, these trees grow seed pods that can be picked and immediately used as cheap quality daggers. The "hilts" contain seeds, the "blades" are hard wood with a sharp point; there is no handguard. Windfall seed pods rot after 1d+3 days on the ground; the "hilt" of any "dagger" picked up from underneath a tree has a 2 in 3 chance of breaking in the user's hand, but the pod will still make an adequate throwing knife.

Dagger trees can grow up to 100 yards tall, and are found on worlds with .7 to 1.2 G and large, well-armored, not particularly bright animals (they are common on Cretaceous). Any impact that does more than 6 points of crushing damage to a dagger tree will cause it to drop "daggers," point down, in an attempt to send the attacker running with a few seeds sticking into its hide. Any 1-hex being standing under a dagger tree when the tree is damaged may be hit by a falling dagger for 1d-1 impaling damage (they can be dodged or blocked if the target is aware of the attack, but not parried except with Parry Missile Weapon skill). The chances of this is 1 in 6 for every 6 points of crushing damage done to the tree, with no more than 3 daggers falling in any given hex.

Dagger trees are frequently surrounded by small carnivorous plants (see below), or home to nests of swarming creatures that eat carrion or wounded prey (an equivalent of Terran army ants would be ideal). Their seeds are much prized by gourmets (a fresh pod is worth \$2-\$4, the seeds selling for \$100+/lb), making the slow-growing trees too valuable to fell. Dagger trees found near cities will usually be surrounded by fences.

- **Leatherbark:** As the name implies, the bark of these trees can be cut with sharp tools, peeled off, and used as armor with minimal preparation. A vest of leatherbark (TL0) has PD 1, DR 2 against most weapons, protects locations 9-11 and 17-18, and weighs 12 lbs; a helm has PD 1, DR 2, covers areas 3-5, and weighs 2 lbs. Against flamers, lasers, blasters, dragon breath, or flame jets, leatherbark is even more effective; PD 3, DR 8. As with ablative armor (p. UT29), every 4 hits a particular location stops reduces that location's DR by 1. PD drops to 2 when DR is reduced below 5, and to 1 when DR falls to 2. A slightly more advanced society (TL 2+) confronted by ultra-tech or magical weapons can make full suits of leatherbark armor, weighing 35-TL lbs.

Leatherbark trees are found on many worlds with extreme seasonal effects, including frequent thunderstorms and forest fires; only the oldest and largest trees have bark thick enough to be useful, keeping the price roughly equivalent to that of fur. Leatherbark with the properties of bioplas (p. UTII73) could also be genetically engineered, but you wouldn't want to live somewhere where it occurred naturally.

Razorsedge

Growing up to a hex high, razorsedge is long grass with a stiffening spine, a vicious saw-toothed edge, and intertwined roots. There are reports of razorsedge amputating human legs; treading on an exposed root can bring a blade (literally!) of grass around with the force of a machete, doing 1d cutting damage, plus 1 point of damage for every two hexes of movement. Chances of treading on a root in any turn are equal to the character's move on 2d.

Razorsedge grows in wet climates -- swamps and shores -- at .6 to 1.2 G, and if cut or burnt, grows back at a half-inch per hour of sunlight unless the roots are destroyed. Small swarming creatures that eat carrion or wounded prey often nest among razorsedge; it's a safe home for anything weighing less than 20 lbs. The ideal razorsedge-dweller would be an amphibious well-camouflaged snakelike scavenger with slow regrowth; ST 3, DX 13, IQ 3, HT 14/5; Speed/Dodge 4/7; PD 0/0. Individuals bite for 1d-5 crushing; treat a swarm as a swarm of rats (p. B143).

Razorsedge's color makes it invulnerable to blue-green lasers (p. UT37), crushing damage only flattens it temporarily, and it only burns at high temperatures (a plasma torch or hand flamer should do the trick). The flames only spread 1 hex for each die of damage -- slow enough for any inhabitants to flee. On planets where razorsedge is a problem, the job of clearing it is usually given to nanobots or to convict labor, depending on the society's TL and wealth.

Shotgrass and Gunroses

Shotgrass and gunroses are generic names for plants found on low-gravity worlds (.1 to .7G) that can spit their seeds with enough force to puncture a pressure tent or spacesuit. None of them resemble grass or roses, and most are large and easily recognized (and avoided), but their range in low gravity is frightening. Shotgrasses throw pellets, 1d cr. Damage; 1/2D 50; Max 300; RoF 1/4; Shots 3d+1. Gunroses spit thorns, 1d-1 Imp. Damage; 1/2D 100; Max 400; RoF 1/3; Shots 4d.

Stingweed

Stingweed are semi-intelligent carnivorous plants, with coiled tendrils that can lash out at a slowly moving target for 1d-4 cutting damage. This tendril also carries Type C venom (see p. CII147) that does 1d+2 damage if the sting hits breaks the skin or hits the eyes. Most varieties of stingweed have exotic flowers that attract insects and small birds (their preferred prey), but also human collectors. Claims that stingweed can target the eyes are unproven; they seem to rely on IR or sonar, and ignore anything moving faster than 2 hexes/turn, but anyone who tries to pick a stingweed flower is almost certain to be hit in the face.

Strange Fruit

Many otherwise harmless (and possibly useful) plants have fruit, berries or other parts that are poisonous, or simulate the effects of wonder drugs (though usually at low doses and with odd side effects). Moormelons, for example, provide a temporary cure for Acceleration Weakness, but are so sour that anyone who eats them suffers the No Sense of Smell/Taste disadvantage for the same length of time. Another example is Arden fruit; half a cup of the nectar lowers the eater's Will Rolls against seduction by -3 for an hour (1d+2 minutes to take effect), making it popular at parties and in singles bars, but consuming more requires a HT roll. Failing this roll causes nausea and localized itching (-2 to HT and DX) for 1d+2 hours; a Critical Fail leaves the eater ill for 24 hours (-4 to HT, -2 to DX, unable to eat or drink without vomiting).

While no one has found a fruit that gives knowledge of good and evil, hallucinogens are fairly common, some fruit may be addictive, and other effects can be imagined (e.g. fruit that temporarily causes Delicate Metabolism, Laziness, Nightmares, Paranoia, or Tourette's Syndrome). Some effects may be triggered only under certain circumstances (e.g. a fruit that causes Horrible Hangovers if the eater also consumes any alcohol). Similar effects may be caused by eating fungi, inhaling the smoke from burnt leaves or other parts of the plant, or inhaling pollens. Some effects may be selective, affecting only some individuals, or very slow acting, making the cause difficult to pin down.

Biochemical effects such as these are likely to be species-specific; an airborne pollen that causes Lecherousness and Overconfidence in humans may turn cattle or pigs into Berserkers and give Gormelites the symptoms of Malaria. Such effects may also be seasonal (particularly likely with pollen and fruit), and not noticed until long after a planet has been colonized.

GURPS Black Ops and *GURPS Atomic Horror* GMs should note that Earthly plants and pollens may have similarly strange effects on alien invaders.

Symbiotes

Plants that have a mutually beneficial arrangement with the animals they live in or on are common on Earth; without our intestinal flora (bacteria in our gut), for example, we would be unable to digest our food. Others include the fungi that give blowfish their venom (fugu, p. CII142), and the algae that grow on the tree sloth to camouflage it. Similar plants on other worlds may develop symbiotic relationships with imported animals; imagine the hazards posed by porcupines whose spines are tipped with curare, or leopards with the Chameleon advantage (p. C151). Other possible variants include:

- **Blue Genes:** A nickname for a form of cyanophyta (blue-green algae) that likes to live in fur. As well as giving the creature a bonus to Stealth in the appropriate environment (+1 to Stealth while moving, +2 while perfectly

still), it acts as Reflec armor against blue-green lasers. "Blue Genes" are most common in wet, cool, heavily vegetated environments: swamps, jungles and forests.

- **Hellmouth:** A fungus-like growth that lives on the underside of leaves, Hellmouth can also thrive in the mouth of a herbivorous or omnivorous creature with poor oral hygiene. It produces a toxin that can be ingested safely, but if injected, it acts as a venom -- usually type A doing 1d-1 damage (see p. CII147). Fortunately, the bite of creatures infected with Hellmouth usually does crushing damage; roll for venom effects if a bite breaks the skin. Hellmouth can also kill its host if it has a bleeding wound in its mouth.
- **Photosymbiotes:** First discovered in the tropical swamps of Summerskye, these single-celled algae also live in the skins of many of the planet's animals, enabling them to photosynthesize when food is short; they can also be safely absorbed by humans. They give the Decreased Life Support (breathe carbon dioxide rather than oxygen when sleeping, 10 points), Deep Sleeper (5 points) and Doesn't Eat or Drink (10 points) advantages; and the Dependency (lie naked in shallow nutrient-rich water and sunbathe for at least 8 hours; common, daily, -15 points) and Unnatural Feature (greenish skin, -5) disadvantages.

Trapweed

Common in jungles, swamps and dense forests on worlds with .5-1.1 G, trapweeds catch animals either to eat or to more thoroughly coat them with pollen or seeds (small animals that become stuck in non-carnivorous trapweeds lure in larger predators or scavengers, which then disperse the pollen or seeds). Anyone or anything stuck in a trapweed must win a contest of ST to escape; if they win by more than 5 points, the trapweed hasn't even broken their stride. Ignore trapweed with ST of 4- as no more than a nuisance, unless characters are trying to hurry across an area covered with it; however, trapweeds on worlds with very large animals can grow to 2' high with ST of up to 13. Some of these can only be triggered by creatures over a certain weight, or so slowly that a running man can get through them but create a hazard for any pursuers -- very useful for unencumbered PCs trying to escape large animals or heavily-armored opponents. Some trapweeds are phototropic, and will wrap themselves around anyone carrying a light (or firing a laser or weapon with muzzle-flash).

- **Carnivorous trapweeds** have weak digestive acids, doing 1d-5 damage (minimum 0) per hour, and pose almost no threat to uninjured adult humans. They can, however, help keep down the spread of rabbits, rats, feral cats, and similar vermin.
- **Jenny-Greenteeth** is a more dangerous aquatic form of carnivorous trapweed, growing up to 4 hexes high and with ST of 16-30, that kills by drowning its prey. It has small thorns that inject a Type D venom (p. CII148), but cannot penetrate DR 2+. It is most common in large, slow-moving rivers or coastal shallows, in warm to hot climates.
- **Startraps** are trapweed-like plants that are adapted to space. They resemble enormous water-lilies, some of them miles across but rarely more than an inch thick. The greenish "lily-pads" act as solar sails as well as gathering sunlight for photosynthesis; the "flowers" are sensory and digestive organs. Startraps mostly "eat" ice and carbonaceous asteroids, but they may also mistake bioships (pp. BIO106-110) for food. They pose no threat to an armed ship, and an unarmed one should be able to outrun or outmaneuver them, but if a startrap wraps itself around a damaged bioship, it can blind it and slowly digest its hull.
- **Stunflowers** are like Jenny-Greenteeth in most respects, but use an electric shock to paralyze prey instead of envenomed thorns.

Adventure Seeds

- **Black Roses:** Gunroses have been a minor problem on Montgolfier since it was settled, but human fatalities have been rare -- until a fruit-picker is killed by an envenomed thorn. Another dies a week later, and then another . . . is it a new species of gunrose, or a serial killer with a blowgun? One of the PCs may be the next victim . . . or a prime suspect.
- **Hell Week:** For many years, the agricultural world of Tlalocan has been plagued by outbreaks of apparently senseless murders. A xeno-botanist, Dr Lisa Fox, discovers that these outbreaks coincide with high pollen counts, and hires the PCs to take her to Tlalocan to gather more evidence. They stay in a small rural town where

a murder was recently committed; unfortunately, Dr Fox doesn't know that the pollen affects anyone with active or latent psi powers, including Danger Sense and Empathy -- and she has one level Healing power.

Those susceptible to the pollen seem normal while they're awake, but suffer from the Sleepwalking disadvantage -- and while sleepwalking, will attack anyone who caused them stress during their waking hours, as though they had the Bloodlust and Bad Temper disadvantages. The effects last for 18-HT nights.

- **Savage Garden:** The Botanical Gardens on Blaufeld are famous for their collection of dangerous plants -- cacafuegos, dagger trees, trapweeds, razorsedge, viper grass, and more -- as well as their aquarium, filled with equally dangerous aquatic animals. It's popular with xenobotanists, children, and organized crime figures -- and a great place for a climactic fight scene, especially after hours when the electric fences have been switched off.

The Foundation (for d20)

Produced by [Nightshift Games](#)

Written by Eric Metcalf, Michael Nunn, Dale Perkins,
Paul Arden Lidberg

Cover by Derrick Thomas

Illustrated by Kenneth Petersen, Phill Knicht, Michael Kasinger, Derrick Thomas, Johnny Mince, Michael Nunn

128 pages; \$19.95

The Foundation from Nightshift Games is an RPG that uses the d20 System of mechanics that powers *D&D 3rd Edition* from [Wizards of the Coast](#). This makes it our first look at a *d20* game that does not come from WotC, and our chance to see how the *d20* system works in a genre other than high fantasy or space opera.

The Foundation claims to be a *d20* game of Superheroics, providing a setting -- including the background and its heroes and villains, the rules for super-powered *d20*, and a novella detailing the origins of the setting. This setting is adapted from a series of short stories by the author, Eric Metcalf, about a team called the Guardians. These can be found at the author's website (http://members.tripod.com/Eric_metcalf). Much of the book is devoted to the background and the thirty or so heroes and villains. To be honest, the setting is somewhat run of the mill, and there is little here to grab the imagination in comparison with other superhero RPGs such as *Aberrant* or *Brave New World*.

Gamers coming to *The Foundation* after seeing the crisp layout and art of the third edition *D&D* books will be in for a disappointment. The layout appears rushed and slipshod, with many silly errors. The contents are done in grey tones, and lie behind a color cover which garishly depicts four characters from the book in un-dynamic poses. The internal artwork serves to showcase numerous characters again in un-dynamic poses, and is nothing to write home about. What few pieces of art that show the characters doing anything other than posing, such as fight scenes, are muddy and indistinct. None of the art invokes any sense of *The Foundation*'s setting and again, there is little here to grab the imagination.

The roster of characters does serve to showcase how a *d20* superhero game could work -- far better than the actual rules as written. The thirteen pages of new mechanics are actually the best thing in the book, although still flawed. Players create their superhero characters by choosing from one of three races, then selecting a class (*The Foundation* is, like *D&D*, a class and level game), powers, feats and skills, just as they do using the *Player's Handbook*. The races are ordinary humans, which get an extra feat; meta-humans, which have 1-4 powers; and aliens. This latter race is actually a catchall, as *The Foundation* details no new races, but suggests that the GM and player agree upon the nature of the race the player wishes to have. Aliens receive one or more innate powers, which must be agreed upon during character generation.

The Foundation takes the staple character types of superhero comics and employs them as classes, both old and new. The new classes are Brick, Energy Projector, Gadgeteer, and Mentalist. The Combat Artist replaces *D&D*'s Fighter, and the Martial Artist replaces the Monk, but the Rogue, Sorcerer, and Wizard classes are ported over from *D&D* without any change. Powers in *The Foundation* work as a sub-class of Feats, and the game gives a list of forty

Superpowers and nine Mental Powers. All of the Powers are given a simple description, and many of them work exactly some of the spells in the *PHB*. There are new Feats and skills to reflect the modern setting of the game, and also updates of existing Feats to reflect this. Unlike many other superhero RPGs, there are no disadvantages or modifications given that can be applied to characters; to my mind this reflects poorly upon the genre that *The Foundation* is trying to model. Finally, the book gives an example of a starting character for each class.

Character generation is relatively easy, but you need constant reference to the *PHB*, as the book contains no guidelines whatsoever on how to create a character. Nor is an example of character generation given. A simple list would have sufficed, but is wholly absent. It may now be found on Nightshift's website (<http://www.teamfrog.com/oglsupers.htm>), but the fact that it is not in the book is inexplicable. Also absent are any rules on running the game from scene to scene, on running superhero combat, awarding experience points suitable to the genre or a list of modern equipment (one NPC is equipped with an SMG, so where are the stats for it?). Considering that the actual rules as described only take up thirteen pages of this 128-page book, what is in the rest of *The Foundation*?

There are five pages of advice for the GM on running the setting of *The Foundation* and writing adventures for it. It is decent, if scant, material. This is followed by two short adventures. The first, "Breakout At Para-Max One!" has the players dealing with a breakout at the prison where all the supervillains are incarcerated, and is just an excuse for a fight. The second, "Arcanus Strikes Back -- Again!" has the players facing the game's major mystic villain. It is a little more involved, requiring some investigation and roleplaying. While Arcanus' details can be found elsewhere in *The Foundation*, his henchman left for the GM to create, but again there are no suggestions given for this.

The rest of this book pretty much consists of a roster of the heroes and villains. These do show how a *d20* system can model such characters, but I'm not sure that it was necessary for either a player or a GM to know what the vital statistics are for some of the more buxom female characters. (I personally found the inclusion of these details quite tasteless.) This also reflects a problem I have with the novella at the back of the book, which take up a whole 30% of the contents of *The Foundation*. Not only can this novella be found on the author's website, but it deals with adult themes as well. On the website, there is an "over 18 only" warning, but this is absent in the book. The fiction as written also fails to inspire, and considering that I can download for free from the Internet, I do feel that I am being shortchanged here.

I'm not someone who likes to be wholly critical of a new book, but over all, I am stunned by the mediocrity of *The Foundation*. It feels rushed and very undeveloped. It devotes the majority of its contents to an uninteresting setting, where it should have been developing the rules and helping both player and GM get the feel of the genre. It does none of that. Yet at the core of *The Foundation* are thirteen pages of rules with which an experienced GM could run, not a *d20* superhero game, but a *D&D* game in the superhero genre, as it relies upon both the classes and spells to be found in the *PHB*. Further, this not a game as it describes itself, but a superhero supplement for *D&D*, and an exciting one at that.

Should anyone be buying *The Foundation*? If you like Eric Metcalf's fiction, or really (and I mean really) want to have a *D&D* superhero game right this minute, then this book might be of interest to you. Otherwise, I can honestly recommend that you steer clear of *The Foundation* and wait for WotC to publish their own superhero *d20* RPG.

SOPAC: The Solomons Campaign Wargame

Published by [Avalanche Press](#)

210 one-inch counters, 140 half-inch counters, two hard mounted game boards, rulebook, scenario book with 20+ scenarios; \$49.95

Avalanche Press has been releasing games for its *Great War at Sea* for years. So far they have managed to cover the First World War in two volumes, the Russo-Japanese War, and two speculative campaigns in the Caribbean and the Pacific, between the Americans, Germans, and Japanese respectively. All of these games are strategic, in the sense that they cover specific battles, and tactical in that you can fight specific engagements within the overall battle. The games are not strategic in the sense that you are able to fight an overall campaign, with each individual battle affecting other engagements down the road.

"SOPAC: Naval Action in the South Pacific: 1942-1943" is the first game in a new series, "Second World War at Sea," and it is a doozy. The box includes 210 one inch counters (with side views on one side, and top views on the other of the ships involved), 140 1/2-inch counters (including planes, and various information counters), an 11x17 hard mounted strategic map (covering part of New Guinea, and Guadalcanal), an 11x17 hard mounted tactical map, 24 pages of rules, a 28-page scenario book (10 tactical battle scenarios and 10 operational scenarios), one cardstock sheet of tables, 10 pages of ship information, two task force cards, two airbase cards, and a player's log sheet. The log sheet, and appropriate ship information sheets, will have to be photocopied in order for play to proceed.

In this game the fog of war is maintained by the player log sheets. At the beginning of an operational scenario the player must divide her ships into task forces, and assign a mission to each task force. Some of the mission types are bombardment, transport, and intercept. All movement for bombardment and transport must be preplotted through the end of the scenario; intercept forces are allowed to be plotted one turn in advance. This means that you must plan ahead, and be acclimated to the fact that your opponent may not be exactly where you expect them to be. Contact occurs through air searches, and when task forces pass through the same squares on the board.

Combat is handled on the tactical board, and it is very simple to run. Each ship is able to roll a number of dice equal to its gun factors at a ship that is within range. If the other ship is hit, then the weight of the shell (whether or not it is from a primary or tertiary battery) determines whether or not it is able to pierce the armor of the other ship. Torpedo combat is held somewhat differently, in that they do damage to whatever they hit. This gives even little destroyers a chance to damage the big boys, if they don't go down first. There is some recordkeeping involved in combat, and not all of the relevant information is on the counter. But overall I would say that combat is effectively done, and is somewhat fast moving; this allows for larger battles to be fought in an acceptable time frame.

I would have liked to have seen some campaign rules to link the operational scenarios together. It would also have been nice to have a design-it-yourself scenario section that would give point values for the combatants involved, and allow players to create their own scenarios. There is also a lot of plotting that must be done for the larger operational scenarios.

This game does not have a lot of tactical polish, and sometimes it does seem to be a bit simple on the tactical board. Units move, fire, move again, and so on. Movement is not used to "cross the T," but is essentially used to just maintain range. The game also lacks some elements which would be nice to have in a strategic game. Where the game excels though, is in the sheer variety of ships and aircraft involved. The tactical rules may seem simplistic, but the differences between the various ships will eventually make themselves felt. So when you play this game you will get more of a sense of what it was like to be commanding these specific ships into battle.

SOPAC is definitely worth what I paid for it. Not so much for the individual game itself, but for the series from which it is derived. Now I can play around with modern Japanese battle ships, and American sea going Zeppelins! There are many games out there, which give more complete portraits of the battles for the Solomon Islands, but precious few that will allow you to bring ships together from the Second World War and beyond.

Pyramid Review

NeMoren's Vault (for d20)

Published by [Fiery Dragon Products](#)

Written by James Bell

32 pages; \$9.95

NeMoren's Vault starts with an uncomplicated plot. The characters, at one point or another prior to the module, inherit a silver key. The key is an invitation to explore the vault of the NeMoren family. Players battle undead, hobgoblins, and the unique Undrathar, an ancestor of the Umber Hulk. The section detailing the aftermath of the adventure allows GMs to weave further stories based on the events of the module.

The adventure is balanced in terms of the players' strength against the enemy. The only thing that can overshadow game balance is the high amount of treasure that can be found within the Vault. There is one room, sealed by an earthquake, which houses over twenty five thousand gold pieces. One of the first rooms has a tree with leaves of elfish brass. Each leaf is worth four gold pieces, with five hundred leaves to a tree. Your only hope as a GM is that players don't think to take it, or that you rule the value fades as the leaves are taken off the tree.

Outside of the adventure, there are color counters. They can be cut up and used in place of miniatures. This is a great aid to those still working out the kinks of Attacks of Opportunity and determining whom the fireballs hit. In addition, there are two pages of color handouts. On the back side of the handouts are grid maps, suitable for copying for use in game play.

Another important asset in *NeMoren's Vault* are the Runes of Passage. This allows the user access to the password protected part of the Fiery Dragon website. Unfortunately, there isn't much there now. Currently, the evolution of the cover, some PDF versions of tetranitrate characters, information on rune swords, and the promise of an extra adventure, coming in February, that ties into the module. For now, the Runes are better than mere errata and a single magic item, but final judgment must wait until the extended adventure is posted.

Lastly, there are pregenerated 2nd level characters. On one hand, these are useful tools to get players right into the game. On the other, players may not want pregenerated characters. Still, they can be a lifesaver for players in a hurry, and at worst, a crafty GM can use them as NPCs.

The cover is too bright and the art is not to my taste . . . it's a little too cartoon-like. The illustration on the back cover shows the style of the interior art, all done by the same artist. The book's lay out is excellent. The interior covers are used. The first one is used to show challenge ratings. This is handy for new GMs who are uncertain what CRs traps and obstacles should have. Unfortunately, the interior back page is information about Fiery Dragon. Still, I'd prefer it on the inside cover than the adventure itself. There is a one-inch margin for top and bottom, and a half-inch margin for the outer edge. Material for the GM to read aloud is separated from other information through a gray background, and extra information is boxed off. Monsters and magic items are put in the appendix, allowing more space to be used for the module itself. Last, the legal text (e.g. the Open Game License and D20 System Trademark License) are both put on one page. In my opinion, a vital element for any *d20* module is that this information take up as little space as possible. There should never be a module that uses two or more pages to reprint this information.

The price may seem high since several other *d20* adventures, like *Death in Freeport*, are \$8.99 or lower, but the color inserts and computer support are nice touches, and worth the extra dollar . . . especially if and when the web support kicks over into high gear.

NeMoren's Vault is a good first level module that players might not have seen yet, and can put even the greenest players on friendly terms with 3rd edition in no time.

(*Reviewer's Note:* The Fiery Dragon web site, <http://www.fierydragon.com/>, has more information on the company, their products, and the Runes of Passage.)

-- *Joe G. Kushner*

by Matt Riggsby

It seems too mundane to consider at first. What do adventurers eat? Who cares! Let's go hit something! However, by overlooking food, one overlooks a universal aspect of life. Food is an everyday necessity, a means of identifying people and societies, a comfort in hard times, a symbol of wealth, and a tool for power. Properly described, food can also be used to engage the interest of players as well as characters.

Presenting Food

One way of engaging players' interest in a campaign is to contrive a "feel" for the world, an identifiable look (provided by distinctive clothing, geography, or architecture) or sound (with, say, dialects or music). Far less common, though, is the use of descriptions of the campaign world's distinctive food and drink. This is a pity, since, properly handled, it can be an effective way of grabbing players' attention. A good description of a special dish or an exotic spice will appeal not just to the visual imagination, but to the senses of taste and smell as well.

Many of us have stopped to look longingly into a bakery window at an elaborate cake or paused while channel-surfing to watch somebody on a cooking show effortlessly execute a nearly impossible dish. Now, imagine bringing that feeling to your next roleplaying session. Your players may appreciate your sketch of the grand palace or marvel at your eloquent use of an obscure orcish dialect, but if you can make their mouths water with the description of a tureen of rich, simmering dill-lentil soup melded with a lamb broth, or perhaps a simple cooling drink redolent with the aroma of cardamom and mace, you will have effected them physically as well as intellectually. It is, perhaps, a small thing, but it will certainly help your players submerge themselves in your world.

"Artistic" considerations aside, some consideration of food and drink can lead to opportunities and complications for PCs. PC generals might be forced to deal with the fact that an army travels on its stomach. Spacefarers are entirely dependent on the resources they carry with them, and may need to take extreme measures to replenish their supplies or repair food synthesizers. The spice trade was a major factor in historical trade, and PC merchants may use it as a means to get rich quick. Moreover, food and drink have great social and symbolic importance in many societies, from taking bread and salt from a host to buying people drinks in order to get close to them.

What There Is To Eat

Hunter-gatherers may not prepare food as elaborately as those at higher levels of technology, but they exploit a wider range of food species: berries, roots, nuts and seeds, edible fungus, fruits and vegetables, leaf plants, insects, fish and shellfish, and animals ranging from mid-sized rodents and birds to the largest creatures they find, including mammoths and whales. Without agriculture, advanced food preservation techniques, and the capability to carry large food stores, they must rely on anything edible and in season. Most foods will be roasted in or over a fire, but entrails and hollow wooden tubes, plugged at both ends and thrust into or held over the fire, make excellent one-

use cooking vessels for steaming and boiling. Some societies boiled foods by heating rocks in a fire, then dusting the ashes off and dropping them into tightly woven baskets along with the food itself. Smoking and air-drying are sometimes used for preservation.

With the rise of agriculture, the number of species exploited for food drops sharply. Many herbs, fungi, fruits, nuts, and wild animal species may be used for flavor or a few extra calories, but a handful of domesticated animals and grains (supplemented by tubers or beans) provides the bulk of caloric intake. Early farmers make unwitting use of naturally occurring yeast to leaven bread and ferment wine and beer. New food preservation techniques are developed, such as cheese-making, pickling, and storing in sealed ceramic pots, the distant forerunner of modern canning.

New technologies also lead to new cooking techniques. Sedentary farmers can build permanent ovens (typically free-standing domes built from mud brick or ceramic tile). Increased availability of fats (animal fat, vegetable oils, butter) leads to more frying techniques. Metal cooking tools, which are far more durable than wooden and ceramic cooking tools, also give greater control over heat.

Perhaps as a result of those two developments, what early agriculturalists' diets lack in diversity of food species, they make up for in elaborate preparation. With some creative treatment, grains may be turned into sprouts (sprouted seeds were an source of vitamins in many societies, including Medieval Europe), noodles, breads and crackers, porridge, alcoholic beverages, and flavorful fermented sauces and pastes. Likewise, milk can be turned into yogurt, butter, or cheeses. Most foods can be pickled, both preserving them and giving them additional flavor. Less common ingredients, such as herbs, pungent vegetables and preserved (usually smoked and salted) meats, can be used in small quantities, imbuing plain dishes with a broad range of flavors.

Geography and related resources may have a profound effect on ingredients, cooking, and storage techniques. People living by oceans, lakes, or rivers are, of course, able to add fish and water plants to their diet relatively regularly. Societies in tundra environments may preserve food by hanging it until the cold, dry winds have sucked the moisture from it or hack a pit into the permafrost to act like a natural refrigerator, while societies in warmer societies must smoke foods or seal them away. If fuel is in short supply (as, for example, in China), cooking is likely to be quick frying or searing, using a minimum of fuel, while societies with more fuel can develop more leisurely simmering, roasting, and baking techniques.

The industrial age sees a number of developments in cooking technology. Iron stoves and gas burners provide more even and easily controlled heating surfaces than open fires, an effect compounded by the development of thermostats and cheap timers. Iceboxes (supplanted by electric refrigerators) preserve food without extensive processing, and chemical preservatives allow foods to be stored even longer. Artificial cooling also allows more extensive use of chilled ingredients, a necessity for some cooking techniques (a variety of tasks from whipping cream to preparing good puff pastry) and iced dishes (syrup-flavored snow is at least as old as the Romans, but true ice cream is a coal-age invention).

Chemical leavening agents like baking soda also appear, so many yeast-free baked goods begin to take on their modern forms. Electric mixers and blenders allow cooks to prepare in minutes dishes that would have taken hours a century earlier. Microwave ovens allow faster heating, although many "traditional" dishes cannot be made properly in a microwave and a body of recipes specifically for the microwave oven is only slowly developing.

Another by-product of increasing technology is a wider range of available ingredients and dishes. Better transportation and communication mean that foods traditionally found in widely separated areas can be combined to provide new dishes. For example, potatoes and tomatoes, both New World crops, have been thoroughly incorporated into many Old World cuisines. Just about any modern city is likely to have restaurants serving at least a few varieties of Asian and European foods. If a star-spanning empire's subjects have more-or-less compatible biological requirements, adventurers might eat dinner at a Little Green Man restaurant (several Star Trek episodes feature characters enjoying alien cuisine).

Early space dwellers are likely to be vegetarians by necessity, or at least return to treating meat as a rare treat. Space and life support will be at a premium and food animals compete with human crew for resources, while plants and microorganisms can process organic waste and turn carbon dioxide back into oxygen, becoming a contributing part of an ecosystem. As soon as they can grow food rather than carry prepared rations, space dwellers might tend hydroponic gardens or, perhaps more efficiently, vats of edible yeast and algae. These "crops" can be genetically engineered to ensure proper levels of vitamins and proteins in the diet and even to adjust flavor, although they'll require constant tending to weed out foul-tasting mutant strains and synthetic foods will probably be an acquired taste. With sufficient genetic engineering, animal cells might be altered to provide sheets of vat-grown flesh without the space and resources necessary to keep entire animals. The same technology could be used to feed overcrowded cities.

At some point, it may become possible to feed nutrients directly into the bloodstream. Combined with a computer and bio-monitoring equipment, a drip could adjust nutrient intake for maximum efficiency, manipulating blood sugar levels to prevent hunger or adding more salt and water to the blood in high heat to replace sweat losses. The user would simply plug nutrient cartridges into an implanted feed every few days. Such a system could greatly reduce the risk of a number of diet-related illnesses like high blood pressure and hardening of the arteries. Eating could be eliminated altogether, although only religious extremists and the heavily engineered are likely to forego the pleasures of the table. However, long-term space travelers may find it practical to switch to less bulky "food serum" to reduce the volume and mass given over to food storage. Perhaps, in a heavily cyborged society, eating would become a wildly popular hobby, but not a necessity.

Religion and social mores affect diet considerably. Particular species may be avoided because of they are considered either too sacred or too profane to eat. Jews and Muslims avoid pork for religious reasons, Catholics and Orthodox Christians are periodically prohibited from eating meat, and most Hindus let what others might regard as perfectly good beef cattle alone. A few religions or societal traditions may restrict the use of some foods to special occasions. A tribe worshipping, say, the heron spirit may avoid herons most of the time, but hunt them for initiation feasts so that the initiates may "become one" with the tribe's totem.

However, ideological rules need not be present to prevent some foods from being eaten. Some perfectly edible foods may be avoided because society regards them as inedible. For example, it would be almost inconceivable for a European to serve rats or dogs, while an Asian might react to cheese or yogurt with equal distaste, regarding them as sour milk gone extremely bad, and both would look askance at the African consumption of grubs and grasshoppers. Serving such a dish can provoke a very strong negative reaction, and even a hungry man might hesitate to eat bizarre and unfamiliar foods (see *Indiana Jones and the Temple of Doom*). Low-tech adventurers are particularly susceptible to this kind of problem, since most ancient diets were fairly monotonous. Characters who are used to eating the same things on an almost daily basis are likely to be more skeptical about unfamiliar foods than people in the modern industrialized world, who often have access to cuisines from all over the world.

Nevertheless, people have gone to considerable effort to turn borderline-inedible foods into delicacies and even staples. For example, acorns, an important food for some Native American groups, are bitter and somewhat toxic unless soaked for long periods.

Eating Meals

The number and size of meals can vary widely from society to society. The evening meal is often the largest although, as in hunter-gatherer societies, there may be constant snacking through the day. This may be because evening meals

are often more socially important. Guests are most often entertained during the evening meal, and celebratory feasts are most often held in the evening, perhaps because such meals can run long without using up valuable daylight hours and cooks have more daylight to prepare. Peasants may put more emphasis on a mid-day meal to give them more strength to do hard work during the day. Morning meals are often very light, perhaps no more than a bit of bread or a small bowl of gruel, but may be followed by a more substantial "second breakfast" mid-morning. The poor may have only one major meal per day, while the rich may eat five or six meals a day, most of which will be little more than formalized snacks, like an English tea or a Continental breakfast. Lighter and less formal meals usually have everything served at once and eaten in any order the diners see fit. Larger and more formal meals may have a definite order such as appetizer-main course-dessert or alternating sweet and salty or hot and cold dishes.

Adventurers may find themselves faced with the unexpected challenge of unfamiliar eating utensils and table manners. Every society will have its own etiquette governing how to eat particular foods, when to begin and end eating, what hands may be used for, when toasts are appropriate, and so on. For example, foods are eaten with the hands from communal dishes at feasts in the Islamic world. Everyone touches everybody else's food, so cleanliness and use of the right hand are very important. In Medieval European feasts, a diner is often expected to share a cup, plate (or trencher of bread), and perhaps utensils with his neighbor. Strange table manners will cause at least a few moments of anxiety the first time characters sit down to a meal in a distant land and may lead to serious embarrassment, especially if they have particularly fastidious tablemates. The GM may make appropriate skill or other social situation rolls the first time a character attempts to eat an unfamiliar food or use unfamiliar utensils (for example, a Westerner trying to use chopsticks for the first time, or an Asian learning to eat spaghetti with a fork) in a formal setting to avoid making an embarrassing mess. This embarrassment may be mild (causing muffled titters around the table) or severe (inadvertently mortally offending the host and thereby coming close to blows) depending on how badly the roll was missed. Communal meals at noble courts are likely to have elaborate protocols dictating who sits where, and characters involved in political intrigues may spend time jockeying for a better position at the dinner table.

Where To Eat

Most eating is done at home, but adventurers will often have to find a table elsewhere. Stalls which sell snacks seem to be as old as civilization, although sit-down restaurants have vanished and reappeared several times through history. China has a long tradition of restaurants, but eating establishments in European history were rare until the modern period. An inn or charity hostel might serve an extremely limited menu (often limited to a single dish, such as a soup or stew), or they might expect guests to bring their own food but cook it for them. Some societies in SF and fantasy stories regard either cooking or eating to be somewhat vulgar and done only in private. If that's the case, public eating places are likely to be rare and adventurers would have to find a quiet place to make and eat dinner.

Cookbooks

Ancient cookbooks are rarer and far less explicit than in the modern era. There were no standardized measurements and no way to accurately measure temperatures, and the recipes were written for an audience which, the authors assumed, already knew what they were doing. When cookbooks can be found, their instructions are extremely vague. One might be told to cook a dish "in a very hot oven until it is done." Such books will be all but useless to characters who don't already have cooking skills. Only in the nineteenth century do measurements become sufficiently standardized and thermometers accurate enough for explicit directions for the non-professional to appear. Since that time, both general and specialized cookbooks have proliferated. Given access to the proper ingredients, which can be a major issue, it is now possible for a moderately skilled home chef to accurately reproduce just about any cuisine without ever meeting a native chef or coming close to the cuisine's homeland. In the distant future, cookbooks may be replaced by catalogs of programs for household food synthesizers which mix and texture basic food components into dishes that would be impossible for the modern cook.

Food, Wealth, Medicine, and Magic

Food isn't just something you eat. It's also a source of wealth and power, particularly in a low-tech society. The vast

majority of wealthy people of antiquity were supported not by trade or industry so much as by their control of agricultural land. Even when trade did become important, spices and exotic foods were among the most important commodities. Pepper and other spices were in great demand, prized for both taste and medicinal properties, as well as being easy to transport, giving the merchant an enormous price-to-weight ratio (the old saw about pepper being used to cover up the taste of tainted meat is more than a little dubious, since the high cost of pepper made it unavailable to most Medieval Europeans).

One of the primary advantages of being rich at lower tech levels is the opportunity to eat well. The upper classes may consume "festival" foods on a daily basis and have access to foods that the poor will never see: fine wine, imported spices and the like. Dishes for the very rich may be mind-bogglingly elaborate, particularly at festivals. A particularly exotic feast might feature strange dishes made for the sake of extravagance, such as a rabbit stuffed into a goose stuffed into a pig all roasted inside an ox, edible sculptures made from pastry or bread, or dishes garnished or flavored with ingredients ranging from unusual to downright bizarre, including flower petals, musk, ambergris, precious metals pounded into leaf and precious stones reduced to powders. Since the old "preferred" foods are cheaper at higher levels of technology, the gap between upper and lower class diets begins to shrink, although the rich are still more likely to consume exotic foreign foods.

Another link between power and food has to do with the use of food in social relationships. A remarkable number of important social events in every society are centered around eating, or at least drinking, and an important factor in those events is who's buying. In a great many societies, one of the expectations about wealthy, powerful people is that they provide food and drink for their underlings and supporters. The same is generally the case for hosts, who are expected to provide sustenance for their guests. Powerful characters may be more or less obligated to supply large feasts for allies and employees on the occasion of weddings, births, and religious festivals. This obligation was even used as a political weapon. Some monarchs would travel around their countries, lodging with noblemen of dubious loyalty. Because those noblemen were essentially obligated to host their ruler (and his *entire* retinue), the clever monarch could eat his potential rival out of house and home. Contrarywise, characters making a play for higher social status would do well to host festivals and dinner parties.

There has long been a close relationship between food and medicine. For most of the history of civilization, doctors would be as likely to prescribe a special diet as to prescribe medicines. Indeed, some foods were initially used as medicines. Sugar's early use in Europe was as a medicine, and soda water was originally used as a base for medicinal preparations before it became a popular drink on its own. The doctor may prescribe either a particular food or a general change in diet, such as eating more vegetables and less grain. The reason may be specific to a disorder ("The radish is an infallible cure for gout.") or more general, treating underlying causes instead of symptoms ("The radish balances the choleric humor, which is out of balance in this patient.").

Just as early medical practice overlapped magical beliefs, foods can be used in the practice of magic. Spices and herbs are an integral part of any wizard's bag of raw materials, and blight on a particular food or an interruption of trade with a far-away land providing exotic spices might cause a crisis in a local magical community. The magical properties of some foods are so strong as to be a powerful curse. In some European folk beliefs, eating food offered by fairies will trap you away from the human world, while in Greek myth, Persephone was trapped in the underworld for part of the year because she ate six pomegranate seeds.

Making Up Cusines

For fictional societies, you might want to start easy and base exotic cuisines on real-world cuisines (dwarves eat German food, elves eat Japanese, orcs eat Twinkies and pork rinds, etc.). However, to really get your players' attention, you may want to come up with your own cuisines. As a first step, decide on a few "core" ingredients which will make up the bulk of the diet. Most agricultural societies use a cereal grain (or perhaps two or three), but they could also be acorns, beans, gourds, or even a few preferred species of animal. Next, pick a few ways in which those core ingredients will usually be prepared. Common methods of preparation include:

- Drying
- Wet heat (boiling, steaming)

- Dry heat (roasting, baking)
- Frying
- Grinding
- Fermenting
- Soaking
- Seasoning (salting, spicing, pickling)

You may want to pick a few combinations. For example, bread is essentially wheat which is ground, fermented, and baked. Radically different ingredients can be prepared in remarkably similar ways. Just about anything can be dried, ground up, and baked as a dense cake or wafer.

Probably the easiest way to come up with exotic cuisines is to concentrate on unfamiliar ingredients. Insects are good for gross-out effect, but are nevertheless an important food resource in some parts of the world. In a fantasy or alien world with giant, man-eating insects, man may return the favor and cultivate and eat other, equally giant but less vicious insects. Many flowers are edible, if only suitable for garnish and coloring. Tree leaves, wood (bamboo shoots are the only known edible wood, but you can make up your own), saps and nectars, reptiles and amphibians, beasts of burden, pet animals, microbial soups, and sea plants may be at the core of your exotic cuisine. Likewise, you can make use of unexpected parts of food sources; animal skins, organs, and even parts of bones can be used as a food.

A more subtle method, however, is to combine foods which aren't usually used together. One effective way of doing this is to use sweet foods in savory (that is, not sweet) dishes and vice versa. For example, chocolate is now a confection, but in Aztec Mexico, its birthplace, it was used in spicy moles and as part of a peppery drink far removed from our sweet, mellow hot chocolate. Sweet fruits may be pickled and otherwise seasoned to make bitter or pungent dishes. Moving in the other direction, traditionally savory foods can be used in sweetened dishes. Sweeteners may be added to meat dishes; sugared dried squid is a moderately popular snack food in parts of Asia. Many vegetables, such as carrots, tomatoes, and onions, can be used to sweeten dishes as-is or after some processing. Modern Americans might be used to carrot cake, but be somewhat surprised by a sweet onion tart (which, by the way, may be found in southern France).

Culinary Adventure Hooks

- **Head of the Table:** At last, the PCs have infiltrated the sinister Order of the Obscure Reference and are living in their secret monastery. All they have to do to unmask the Grand Master is to get close to him. But how? He only shows himself at the Order's grand dinners in the refectory. In order to complete their assignment, they must work their way up from the low benches at the back of the room to the high table on the dais through service to the Order, cajoling the masters of protocol, or impersonating people with better seats. Perhaps they might even join the serving or kitchen staff, who can go anywhere in the dining room.
- **Algaeloaf Again?:** The PCs are on a small vessel when the FTL drive suddenly dies, stranding them weeks away from rescue. The fusion power plant provides plenty of energy, but the ship isn't equipped with enough provisions to keep them alive that long. They'll have to jury-rig food synthesis equipment from the ship's life support gear and find out who sabotaged the hyperdrive...and who might try to poison their hydroponic garden.
- **Let Them Eat (Wedding) Cake:** The PCs are retainers of a lord who has, after long and difficult negotiation, secured an advantageous marriage for his daughter to solidify a shaky association with a reluctant ally. Word reaches them that a rival has slipped a few drops of fairy nectar into one of the dishes for the wedding feast, which will put whoever consumes it into an unbreakable slumber for a century. They must find the person responsible and, more importantly, find the poisoned dish without disrupting the wedding and destroying the alliance.

Selected Sources

If you don't already cook, you may need some pointers to examples of descriptions of unfamiliar foods and their use in fiction. Cookbooks can be good, but look for books written for a specialist audience. Most "popular" cookbooks dumb down the food and will do you no good at all. If recipes recommend using a pre-made mix or a bread machine, put the

book down. If you feel intimidated by any of the dishes, you've probably found a good one. Here are a few more specific suggestions:

- Vance, Jack: almost anything, but particularly the Dying Earth books, and chief among them *Cugel's Saga*. Vance has an unmatched gift for describing food.
- Rosener, Michaela: *The Stars Dispose* and *The Stars Compel*. Fantasy novels set in Renaissance Florence, with much of the action taking place in kitchens.
- Apicus: *De Re Coquinaria*, available in translation under other titles. One of the earliest cookbooks, this Roman work contains recipes ranging from the vile (garum, a popular Roman condiment made of fermented fish) to the familiar (a recognizable "french toast").
- Sterling, Bruce: *Holy Fire* This book presents a society where even vegetarianism is considered a risky lifestyle, and truly healthy food is produced in biological factories.
- *Gourmet* magazine. Nothing surprising to the experienced cook, but a useful source of descriptions of mildly obscure foods and unfamiliar preparations, particularly good if you want to base your fantasy cuisines on real-world examples. Many of *Gourmet's* recipes may be found on the web at <http://www.epicurious.com/>.
- *Iron Chef*: This remarkable Japanese cooking show (imagine Julia Child joining the WWF and moving to Asia) is being rebroadcast on the cable Food Network. The food is often, by Western standards, outlandish, and the show is a good example of how other societies can regard what is edible and how it can be prepared.

Vacation

(WARNING: This week, *Random Thought Table* truly lives up to its name. The usually spastic editor has been replaced, for the time being, with a mellower margarita-drinking one.)

Ahh, vacation. Good for the soul, this. Being back home for week has been very pleasant. So has visiting a Renaissance Festival, although it's a good thing I don't go to one of those things with a huge sack of money . . . I'd be able to transmute it into stuff of dubious utility in no time.

"What didja get at the Fair, Steven?"

"Oh, a quarterstaff, a suit of leather armor, a bard's outfit, a kilt, ten puzzle rings, an astrolabe, a henna tattoo, a mace, a dozen ceramic roses . . ."

"That's pretty sad, dude."

"I saved the receipts for tax purposes!"

Of course, I haven't been able to leave the magazine *entirely* alone in the interim; I've checked in on mail (about 300 messages this week so far!) and visited the boards as well . . . as I mentioned via email to one SJ Games co-worker, "I *am* on vacation . . . meaning I'm only working 5-10 hours this week on the magazine. <grin>"

Here are some random adventure thoughts that have sprung to mind whilst I've been kicking back and relaxing.

- Have the trusty butler (or other employee of the heroes' group) take a trip for personal reasons; casually mention that he's using a month or two of his vacation time. (The Alfred Pennyworths of the world must get vacation time, but they never seem to *use* it . . .)
- For many space (or sea)-faring campaigns, the "shore leave" adventure is a staple. What can happen when adventurers are supposed to be in a secluded, unreachable enclosed environment (a pleasure planet, a tropical island, a holodeck, etc.)?
- Vacations make wonderful, different ways to start adventures. Ask the players what they're doing for "downtime," then begin the adventure that way. "You're skiing in Aspen, when suddenly . . ."
- If you use this technique, make sure that you give your players "real" vacations; have exciting and dangerous things fail to happen. Otherwise, you run the risk of your players being terrified to go anywhere exciting. "Where do you go for vacation?" "Ummm . . . the fifth basement of the Pentagon, whimpering in a locked closet while holding a loaded Uzi."
- You may not be able to convince your players to have their characters take vacations; heaven knows my characters tended to be workaholics, using downtime to kick doors and get into trouble. In this case, consider using contacts, dependants, allies, and the like. "We just got an urgent telegram from Higgins." "Higgins? Isn't he skiing in Aspen?"
- Use vacations to allow opportunities to advance subplots.. Romantic interests can get their quiet moments, fame and fortune subplots can begin ("Look, it's famed Planet journalist, Abbie Rhode!"), hunted might show up, and so on.
- Use vacations as rewards or alternate "treasures." Mission command can give cruise tickets, adventurers can find exclusive passes to the Secluded Mountain Spa, heroes can be invited to visit the home of the elfkin whenever they want.

Things I've Learned While On Vacation

1. The entire magazine could be run from a WebTV television console device.
2. Running the entire magazine from a WebTV would result in the departure of my remaining sanity.
3. Watching *Fight Club* with your parents is definitely a different way to experience the movie.

Just some ideas. As for myself, I'm enjoying my vacation. Whee!

* * *

Well, the ratings are in, and it looks like you all like the Iron Ref idea. (Either that, or you *really* liked my introduction.)

Now, a couple weeks ago I talked about [secrets](#); I have one to share with you all.

Anyway, when I ran the Iron Ref articles, although I received a lot of positive email and feedback, I *did* receive a few emails from folks who were upset by the theme issue. Some folks argued that if they didn't like (or know about) *Iron Chef*, then the issue was useless or incomprehensible.

While this might be true of Ken's column or John's contribution (though I don't necessarily believe this to be so), and putting aside the two articles that *weren't* related to the theme, I didn't consider this to be the case for the Iron Ref feature. In fact, I found this ironic, since at the time I organized and printed the article, I'd never even **seen** *Iron Chef*. No, I'd merely heard the idea in the newsgroups a while ago, and it sounded neat . . . so I did it.

So as I was reading these emails, I found myself wondering, "Wow; I guess I'm in the awkward position of editing things I don't even understand!" While it certainly wouldn't be the first time, I was still amused.

So that's my secret.

(As an aside, I *did* see the show for the first time over my vacation. Very odd . . . but impossible to pull the eyes away from, like a traffic accident or *Pop-Up Video*.)

* * *

Hopefully, by the time you read this, I am already at (or am enroute to, or am coming back from) the [Game Invasion](#) convention in Jacksonville, Florida, where I'll be attending as a guest. (I'd have let you all know sooner, but I wasn't sure I was going to make it; I didn't want anyone making the trek just to meet me [hah!], only to be disappointed.) At present I'm not quite sure what I'm going to *do* while there, but I'm sure I'll have fun.

-- Steven Marsh

* * *

*Last week's answer: **Fudge**, section 6.353. (**Fudge Expanded Edition** p. 65)*

(Four stars) "Not everyone is enjoying this unseasonably warm spring. Indeed, it has been a season of death for those on the South End, as a recent series of gruesome murders continues."

Worldbuilding With Extra Pulp

"Had I been present at the Creation, I should have given some useful hints for better ordering of the universe."

-- Alfonso X, called the Wise, King of Leon and Castile

Here's another run at worldbuilding, this time an annotated example of a world designed to support a specific genre of stories: pulp aerospace adventure. For this column, I'm reprinting a portion of an actual player handout from an old dimension-hopping campaign I ran -- the timeline to an alternate-history science-fantasy world I nicknamed "High Red" for reasons that seem peculiar even to me, now. (At one point, I and my co-conspirators had alternate histories written for each of the 128 colors in a large box of Crayolas. Just be glad I'm not doing that any more.) Interspersed with that timeline, I'm inserting notes explaining why I made the decisions I did, and how I intended them to affect game play and player decision-making. Although the initial scenario was a one-shot "rescue Amelia Earhart" action story, my players had shown a tendency to revisit worlds they liked, and I wanted Reality Tunguska (nee High Red) to be one of them. In the event, they never went back, which I blame on the scenario, not the world -- and on the fact that I had a bunch of other great ideas to throw at them.

"He had no idea what comprised her usual diet, but he bought a can of New York roast beef and one of Venusian frog-broth and a dozen fresh canal-apples and two pounds of that Earth lettuce that grows so vigorously in the fertile canal-soil of Mars. He felt that she must surely find something to her liking in this broad variety of edibles, and -- for his day had been very satisfactory -- he hummed 'The Green Hills of Earth' to himself in a surprisingly good baritone as he climbed the stairs."

-- C.L. Moore, "Shambleau" (1933)

The flavor I wanted to capture for this scenario, and for this world, was very much like the wonderful indeterminate-future, mixed-technology world of C.L. Moore's Northwest Smith stories. In two hundred years or so, with a stardrive, maybe some discreet biotech, and an alien invasion or two (or possibly a Buck Rogers-style Global War), this setting and Moore's might be almost indistinguishable. But for right now, it's time to look to the skies.

1908: Unknown object obliterates St. Petersburg, Russia, at noon on June 30, leaving behind chunks of radioactive metal, including uranium and unknown transuranic elements such as astronium and petrinium.

For details of the Tunguska Object, and for an earlier summary of this very world, see [my previous column](#) on the subject. The reason I picked Tunguska, rather than some other breakpoint, is that I wanted a recognizably Belle Epoque politics with recognizably 1930s Indiana Jones geopolitics -- Germany, France, Britain, Italy, America, Japan.

1909: German Army moves into Poland, the Baltics, and White Russia; Japan occupies Manchuria, Korea, and Vladivostok; Britain establishes protectorates over Central Asia.

Had I wanted to tell slightly different, more Earth-driven and ideological, stories, I could have decided that the chaos in Russia did, in fact, lead to a socialist revolution. But for the purposes of this world, I wanted to keep the Great Powers focused on space colonialization -- retelling the stories of European imperialism, which faced little or no ideological challenge. So I just removed Russia.

1910: Team of scientists at the Kaiser Wilhelm Institut split the atomic nucleus of astronium; the Curies, and Rutherford and Moseley, replicate the feat by the end of the year.

1911: Henri Coanda invents the jet-reaction engine.

1914: Kaiser Wilhelm Institut team under Einstein develops self-sustaining astronium fission.

1916: France and Italy back Arab revolt against German-backed Ottoman Turkey; Britain attempts neutrality while remaining in Egypt.

1918: Germany, France, and Britain all develop plutonium-fission bombs.

Thus preventing, via nuclear blackmail, any overly-distracting war on Earth. Which would support tales of spies, mercenaries, and other "deniable" PC types, in case the characters returned here.

1919: Willy Ley designs the atomic torch ship; Baron Manfred von Richthofen becomes the first man in orbit. Berlin-Baghdad railway completed.

Using the Red Baron here sends an important signal to the players -- this is a world about airmen, and the more superheroic the better. Had I wanted to tell a different story, the first man in space could have been Vladimir Orlok, Clark Savage Jr., or even Reed Richards.

1921: Von Richthofen placed in command of the Imperial Raumwaffe; Winston Churchill becomes Minister for Aerospace and First Aerospace Lord of the Admiralty. Hermann Goering becomes the first man on the moon. British expedition under Alcock and Brown follows later that year.

1922: Frank Whittle invents the turbojet. Arabian Revolt settles into status quo with German satellite state in Turkey, British in Kurdistan, French in Syria and Mesopotamia.

All this distracting detail about the Middle East was to set up any *Lawrence of Arabia* or *Raiders of the Lost Ark* action for the putative sequel. It also had the nice effect of splitting up all the Middle Eastern oil so that nobody got left out.

1923: British begin construction of Entebbe Spaceport; construct a permanent moonbase in Copernicus, begin testing "lunar gun." Moonbase race begins. General Billy Mitchell placed in charge of the U.S. Space Command as a way of getting him out of the Army.

The sidetracking of Billy Mitchell into a career that he's uniquely suited for is a little poetic justice from me, the author -- and it helps remind us that we're in a pulp world where bucking your superiors and being larger-than-life is actually a success strategy. The "lunar gun" is a little reverse-homage to Verne and Heinlein, and a warning to the players that the science in this reality plays by the rules of drama, and not the other way around.

1924: Cpt. Edward Rickenbacker, USSC, becomes the first man on Mars. Germans and British orbit wireless-transmission satellites.

1925: Georges Gunemeyer disappears on French expedition to Venus. Chinese Republic in turmoil after Sun-Yat Sen's death; Japanese begin backing local warlords. Willy Ley invents the atomic-ion engine, making interplanetary travel practical.

But the bogus science had to be sufficiently late that the first bloom of exploration doesn't simply recapitulate *Space: 1889*, especially since I was already ripping off chunks of its planetology and themes wholesale. This also helped drive the 1908 Tunguska breakpoint; too late for "luminiferous aether," too early for "flying saucers." Tesla, normally my go-to guy for improbable technology, I dismissed as opening up too big a can of worms -- the man was just too prolific. By simply presenting a "reaction-lite thruster" I got the effect I wanted -- easy zipping around the solar system, and proper pulp-era dogfighting tactics.

1926: British found Marsport, the first permanent Martian colony, on the slopes of Olympus Mons. German expedition under Oswald Boelcke plants Charlottenburg colony on Venus. Italo Balbo leads Italian expedition to Mercury. Germans begin construction of Kilimanjaro Spaceport, Italians begin Mogadisco Spaceport in Somaliland.

I added a bunch of details on the various planets to the handout; suffice it to say that they parallel the ones in *GURPS Steampunk* and in all properly antiquated planetary-romance SF. Mars has canals and a dying race, Venus has soda-water oceans, the Moon has fungi-filled hollow caves. The continuing mentions of the Great Powers' colonial Spaceports not only let us know that their rivalry has driven a hyperbolic Space Race, but they reinforce the "imperialism" theme of the alternate history -- I've been very heavily influenced by Moorcock's *Warlord of the Air*.

1927: René Leduc invents the ramjet.

1928: Franklin Delano Roosevelt elected President of the United States. Japanese move into North China. French begin construction of Kourou Spaceport in French Guiana.

1929: U.S. begins construction of Jefferson Station in LEO; Goddard develops the orbital ferry. Italian Ferrarin-del Prete expedition explores the Jovian system, constructs shipyard on Io when del Prete's craft nearly destroyed in Jovian atmosphere. U.S. begins supplying arms and advisers to Chinese government.

Okay, the Jovian system was going to be another "frontier dogfighting" zone, should things come to that. And the war in China lets me keep at least half the Axis active, since I've left Germany Kaiserine and prevented Hitler.

1930: Admiral Nagano placed in charge of Japanese Imperial Planetary Navy, Japanese begin construction of Hainan Spaceport. Panic of '30 causes major dislocations in European, North American economies; planetary colonization and exploitation speeded up as psychological "safety valve," full-employment program, and subsidy to big businesses.

This is a bogus justification for all that stuff in space, just barely a decade after Ley invents the torch ship. Admittedly, with a much smaller industrial base, the Portuguese had conquered the whole Indian Ocean basin within a decade after going there -- but they didn't have to bring their own oxygen. Hopefully, by now, the players are on my side, and willing to buy the premise to get the pulp.

1931: Sir Charles E. Kingsford-Smith founds Ceres Station for the Royal Navy. Construction begun on Victrix (British) and Valhalla (German) LEO stations.

1933: Kingsford-Smith establishes forward British base on Europa. Jefferson and Valhalla Stations completed. Baron von Huenefeld leads German expedition to Ganymede, establishes Raumwaffe base there.

Boo, hiss! Germans on Ganymede! Baron Ehrenfreid Gunther von Huenefeld, the "Crazy Baron," headed the first transatlantic flight from East to West, on a Junkers W33, the *Bremen*, in 1928. Looking up cool aviation history basically wrote all my historical NPCs for me.

1934: Victrix Station completed; Japanese begin construction of Yamato Station. American presence in China increased.

1935: Britain begins construction of Singapore Spaceport; Germans begin building Madang Spaceport in New Guinea. Hughes Aircraft, Marland Oil, and Brazil begin joint commercial spaceport, refinery complexes at Belem.

I had an idea that I might need a commercial presence in space, either as boldhearted Heinleinian entrepreneurs, or as evil manipulating alien-egg coveting weasels, or both.

1936: General Mitchell dies, Admiral Richard E. Byrd appointed chief of USSC, USSC headquarters moved to Tampa Spaceport; construction begun on Pearl Harbor Spaceport.

Although Billy Mitchell was a happier, and probably a healthier, guy in this reality, I still killed him on schedule to get Richard Byrd onto the timeline. I remain conflicted about the USSC's rank and grade terminology, as you can tell.

1937: Amelia Earhart vanishes in the Saturnian System.

1938: Yamato Station completed.

Also in the handout, I mentioned "odd lights and electromagnetic bursts" emanating from Titan, also in the Saturnian System. If that doesn't set up a scenario, nothing will. And just to be sure, I railroaded the PCs onto the *USS Stephen Decatur*, with Cmdr. Robert A. Heinlein, USSC, commanding.

Shooting to Live

Non-Lethal Weapons for *Fading Suns*

by Lloyd Brown III

Characters in roleplaying games are notorious for their propensity for heavy firepower. Given the choice between food and guns, players seem to prefer guns, apparently on the assumption that they can kill their food, or at least kill somebody else and take their food.

Perhaps a part of the problem is the equipment list. Looking over the list of available weapons, the player can readily see that non-violent options are few and often inferior to deadly force. The Gamemaster is in a similar situation; in order to threaten player characters properly, he has to rely on bigger, better guns. Each enemy the characters defeat leaves them more heavily armed.

A potential solution to the arms race is a wider variety of non-lethal weapons. Non-lethal weapons offer many advantages to both players and GMs. First, the person using them has the option of capturing his opponent, allowing for the roleplaying opportunities after the inevitable fight as well as before. Secondly, player characters don't need to worry as much about legal prosecution if they capture instead of kill their opponent. In fact, not only will the law appreciate such consideration, their enemies will, too. The villain whose brother was let go with nothing more than a headache and a bloody nose after the characters defeat him feels no driving need to humiliate, torture, and kill the heroes. Finally, players need not fear for their character's lives all day and all night. The standard adventuring party tactic of leaving standing watches in all situations and places can be abandoned if it is known that the potential villains don't have any guns. The player characters can stop behaving with military caution and start acting like real people.

The Church approves of these devices as permissible technology, except for the man o'war slugs, which they officially ban to back the Emperor's restriction (although they rarely enforce this ban unless it furthers their own goals), and the drone. The Church considers the drone an insidious pagan weapon as evil as extreme cybernetics.

Buzz Stick (TL4): The buzz stick operates as a normal club most of the time, inflicting 4 dice of bludgeoning damage on a successful hit. When the buzzer is activated, the stick delivers an additional electrical jolt designed to stun the opponent by shorting out his nervous system. The person struck must succeed in an Endurance + Vigor roll or let go of anything held in his hands, which usually results in dropping a weapon, but might also result in letting go of a ship's controls, releasing a held hostage, or falling off a ladder.

A single charge lasts for 10 uses. Cost: 50 firebirds.

Man O' War Slugs (TL 5): These projectiles are shotgun slugs filled with a gel that carries the stinging venom of deadly jellyfish. The amazing gel keeps the stinging properties of the venom fresh almost indefinitely, allowing it to be stored in the slugs until fired at a target. The shooter makes a normal attack to hit a target, and the gel splashes onto the victim, delivering stinging material across a wide surface area.

For each wound a person suffers from the man o' war slug, he must succeed in a Strength + Vigor roll or suffer two more wounds from intense pain. If the pain reduces the victim to 0 wounds, his system shuts down entirely from the pain and he falls unconscious. Impact wounds are normal and might kill a target regardless of the additional pain.

The Emperor has outlawed these weapons across the Known Worlds, although the Vau continue to smuggle them into Cadiz. Man o' war slugs cost 2 firebirds each.

Heavy Stunner (TL 6): The heavy stunner is a rifle-sized version of the hand stunner. Amaltheans and others who don't wish to kill in self-defense carry the weapon when they expect threats from elite troops, aliens, and others that might shrug off the effects of a hand stunner.

The best heavy stunners are made by Argobast, who hope to please the church with this technology and thereby earn approval to indulge in other research. Their Dreamlands model is the industry's standard model.

Targets hit by a stunner must roll Endurance + Vigor with -2 on the goal. Failure indicates that the target is stunned for the rest of that turn and the next entire turn, as with a hand stunner. If the damage taken equals or exceeds the character's Endurance, she rolls as above but failure means she is rendered unconscious. Like a hand stunner, heavy stunner damage is healed entirely after one span, but additional damage from other sources can result in fatal wounds. Cost: 500 firebirds.

Cough Gun (TL 5): The cough gun takes its name from the sound it makes as it fires a burst of compressed air. This blast has a miserably short range and a slow rate of fire, but it has the advantage of unlimited ammunition. Whereas energy weapons use replaceable fusion cells, the cough gun has a single internal cell that lasts for years.

Some criminals favor the cough gun because it leaves no telltale bullet casings or other traces that can link them to the damage it causes. Unlike other non-lethal weapons, this one can kill, but it kills so slowly and ineffectively that murders attributed to it are rare. Several storehouses on Stigmata maintain cases of these weapons in case the garrison is ever besieged and must rely on them for backup weapons.

The cough gun does 3 dice of damage and knocks down any opponent who fails to make a Strength + Vigor roll each time he is hit. On top of its other drawbacks, the cough gun is heavy and makes a shrill whining noise between shots as it compresses air for its next blast. The Gathman Tornado is the premier model, being found from Leagueheim to Bannockburn. It costs a paltry 100 firebirds.

Suythe Poison: Suythe is a rare toxin taken from a venomous lizard on Gwynneth. The Van Gelders alone buy enough to keep its harvesters in business. When the notorious assassins need less than usual, a few dozen vials find their way to the open market on Criticorum, from where they appear all over the Known Worlds.

The poison works almost instantly upon introduction to the bloodstream, spreading numbness through the body as it moves through the victim's arteries and veins. The victim must make a Passion + Stoic Body roll or the area struck becomes numb and useless immediately. On a critical failure, the target collapses into an immobile heap, able to do nothing but watch and listen. Numbness begins to wear off after 10 minutes, at which point the victim can move (painfully) but suffers -2 to all goal rolls Strength, Dexterity or Endurance. After another 10 minutes, the target has recovered enough to function normally. Cost: 500 firebirds per dose.

Dart Rifle (TL 4): A dart rifle, also called a Piercer, is a single-shot rifle with a large bore designed to fire a special hypodermic that delivers its contents on delivery. Generally the contents are drugs or poisons (such as suythe) designed to disable a target for capture. The weapon has no magazine and must be loaded one projectile at a time. The Mercy model is widely used in the capture of wild animals on Holy Terra, but Inquisitors sometimes use it to bring heretics to an involuntary confession. Cost: 200 firebirds. The special needles cost 1 crest each.

Drone (TL 6): The drone produces subsonic, rhythmic tones that dull the senses and leave the victim feeling confused and disoriented. Its main drawback is that it takes time to work its effect. Even more so than the lightning strobe, drones tend to affect everyone nearby. Hence, the drone is a principle defense against intruders rather than a mobile offensive unit.

Typically, the drone is a system of speakers spread throughout an area of 2,000 square feet or more. For each 30 minutes spent within its area, characters must roll below Endurance on d20 or temporarily lose 1 point of Wits. The Wits loss lasts as long as the characters are in the drone's area. Wits is restored at one point every ten minutes once the character leaves the area. The operating center, once found, can be disabled by a successful Tech + Mech Redemption roll, although it could well be booby-trapped against such interference.

Nulna of Leminkainen is the only known manufacturer of drones. Their main customers are Vuldrok pirates who install them in their ships as defense while they are away raiding. The raiders sometimes return to find a cabin full of happily drooling invaders slumped against the hull walls. Cost: 1,000 firebirds per 2,000 square feet they are designed

to protect.

Lightning Strobe (TL 7): A strobe pattern of certain frequency invokes instinctive reactions in the human nervous system that can cause it to effectively shut down.

Any flashlight of tech level 7 or higher can be set to strobe on this function if the person adjusting the setting rolls 5 successes with Tech + Mech Redemption. The person aiming the flashlight rolls $Dx + Vigor$ to point it at the target's eyes, with each success subtracting one from the target's $Dx + Dodge$ roll to avoid the effects. If the target does not dodge or rolls no successes, he is either stunned and unable to act (failure) or knocked unconscious (no resistance or a fumble on the attempt). An energy shield offers no defense against a lightning strobe.

House Shelit has constructed a type of flashlight dedicated to this specialized use. The Shelit Blinder has a pistol grip, allowing its user to use his $Dx + Shoot$ instead of $Dx + Vigor$ when aiming at his target and carry it in a holster as well. Binders don't function on any alien races, only humans.

Because of the difficulty in aiming a flashlight at a person's eyes and keeping it on them long enough to have an effect, a more common use of this technique is to use it to trap forbidden places where an open bulb can emit its light waves omnidirectionally. Avoiding such an open strobe requires a successful $Dx + Dodge$ roll and at least three victory points. The Shelit Blinder and others like it cost 200 firebirds. The stationary version costs 100 firebirds per unit, and most companies prefer to sell a minimum of four units in order to ensure a customer's maximum security (and their own maximum profit).

Stream Gun (TL5): A stream gun has a thick barrel which attaches to either a small canister underneath the barrel or a larger container carried on the back, much like a flamethrower. The stream that it fires is a sticky tube that adheres to anything it touches. A person struck will find his arms attached to his body, his legs stuck together, and his body sticking to walls, floors, or other nearby objects.

The attacker rolls victory dice as normal for a successful hit. Instead of damage, however, he's rolling for completeness of coverage of his target. Each victory point means the target is bound and unable to move for one round. The person struck must make a Strength + Dodge roll to break free. Each victory point reduces the time bound by one round. Breaking free of the adhesive is tiring and temporarily reduces the victim's Strength score by one each round spent trying to escape. The victim can prevent this loss by waiting for the adhesive to wear off, which takes about 30 minutes. After that time, the victim can tear the stuff off with little difficulty. Lost Strength is restored at the rate of one point per hour spent resting.

The self-contained version of the gun has only enough adhesive for one attack, and so is used against specific targets in abductions or kidnappings. It also sees some use in law enforcement. The Harastan Ogre's Hand is the favored model, preferred by Brothers Battle for bringing in heretics whose low-scale activities don't earn a visit from the Avestites. Harastan's larger Titan Grip is the preferred backpack-style weapon. It contains enough adhesive to bind a dozen man-sized targets. The Ogre's Hand costs 250 firebirds, but each use requires replacing the canister for 25 firebirds, although multiple canisters can be carried. The Titan Grip costs 600 firebirds. Refilling its backpack apparatus costs 200 firebirds.

Eleras Gas: Eleras gas exists in thin quantities underneath the polar regions of Pandemonium. It affects human muscles and tendons, resulting in reduced coordination, weakness, and fatigue. Early signs include sweating, blurred vision, and slight fever. In concentrated form, eleras can weaken a person to immediate exhaustion, turning his muscles to water and bringing him to his knees.

Eleras gas generally appears in a canister and is delivered by expulsion from both ends within a few seconds. The canister has a short fuse of up to three seconds (like a standard grenade) and emits its contents in an area of 3 meters. A grenade-launcher version is also available.

Anyone within the area of effect must make an immediate Strength + Vigor check or her Strength is temporarily reduced by 4 points. Characters carrying heavy loads might crash to the ground, while characters whose Strength is reduced to 0 (Strength does not go below 0) fall helpless, unable to move.

The effects last for two full turns automatically. Every second turn thereafter, the character may make a Strength + Vigor check (using the reduced Strength score) to restore one point of Strength. An eleras grenade costs 100 firebirds in its thrown form or 150 firebirds for a grenade-launcher form.

Shrieker (TL6): "Shrieker" is Scraver jargon for any device that generates sound waves too high for the human ear to bear. The device could take any form, but the Burnur Shatterer dominates the market for this type of item. It is a simple box that fits comfortably in the hand, about 8" long, 3" wide and less than an inch in thickness. At the press of a button, the shrieker emits a piercing whistle that climbs the scale from a low bass into inaudibility in under a second. Anyone without protection must roll Endurance + Stoic Body or be deafened for a span. Anyone who rolls a critical failure passes out from pain and stays unconscious for 10 full minutes. On waking, the character must make an Endurance + Stoic Body or suffer permanent hearing damage (as the curse Bad Hearing). The Amalthean rite Healing Hand of Saint Amalthea automatically cures the deafness, as will Restoration if the caster rolls 6 victory points or more. For each meter from the device, characters add 1 to their goal roll.

Besides its effects on living things, the shrieker shatters glass and ceramic objects in a 3-meter radius. The operator and his allies typically wear hearing protection before activating it. Standard hearing protection adds +5 to the goal roll for resisting the deafness and prevents the character from being knocked out. Characters not equipped with proper protection who have their hands over their ears add +2 to their goal. The shrieker costs 250 firebirds.

Clamshell trap (TL6): The clamshell trap is a large, bulky device used in a defensive measure to capture an intruder or enemy and hold him until somebody can arrive to transport him to a more permanent secure location. The trap lies either on the floor, ceiling, or wall and comes with no camouflage of its own. It consists of a five-pointed starfish-shaped piece of canvas that seems to have wires or ribs inside its otherwise flat surface. Once 5 pounds or more is placed in its center, the arms wrap shut, binding the target and entwining tightly around loose limbs.

It takes five minutes to set the clamshell trap, and the person setting it may attach the outside to a rope so that the prey caught inside may not simply run away, taking the trap with him (this technique is usually used if the trap is placed on a wall instead of the more usual floor). Once the trap has sprung, it holds the target as a wrestling character with a Strength 4 and Vigor 5. The device is constructed so that once closed, it does not continue to damage its victim. A person might be reduced to vital wounds, but it will not die. When closed, the trap looks like an elongated mollusk. A clamshell trap costs 200 firebirds.

Non-Lethal Weapons

Weapon	Roll	Init	Goal	DMG	STR	RNG	Rate	SIZ	Cost
Buzz stick	Dx + Melee			4	2	-	-	M	50

Old Henry ("Henry the Assessor")

by Phil Masters

GURPS Swashbucklers:

ST: 9
DX: 11
IQ: 13
HT: 10

Advantages: Contacts (two capable fences, "Street," "connected," both available 9-); Contact (clerk in a gem-trading house, "Business," effective skill 12-, available 9-); Literacy; Reputation +2 (as a useful contact, among pirate crews and the like, 10-).

Disadvantages: Age 55; Careful; Status -1; Struggling; Weak Will -3.

Quirks: Enjoys a drink or two, but is careful not to get drunk among strangers; Likes beautiful things, but won't usually risk much for them; Talks "a bit like a gentleman" compared to most people he deals with.

Skills: Accounting-10; Appreciate Beauty-15; Area Knowledge (England)-12; Detect Lies-12; Fast-Talk-12; Filch-9; First Aid/TL4- 12; Heraldry-11; History-10; Holdout-11; Merchant-11; Occultism-11; Panhandling-12; Riding (Mule)-9; Savoir-Faire (Servant)-14; Stealth- 11; Streetwise-13; Survival (Urban)-11.

Languages: English-13 (native); French-11.

Mage: the Sorcerers Crusade:

Nature: Sensualist

Demeanor: Renunciate/Sage

Attributes: Strength/1, Dexterity/2, Stamina/2, Charisma/1, Manipulation/2, Appearance/2, Perception/3, Intelligence/3, Wits/2.

Talents: Alertness/2, Awareness/1, Dodge/2, Elusion/1, Subterfuge/1.

Skills: Etiquette/2, Research/1, Riding/1, Stealth/1.

Knowledges: Academics/1, Culture/1, Enigmas/1, Investigation/1, Linguistics/1 (French), Occult/1, Seneschal/3, Symbolism/2.

Backgrounds: Resources/1.

Willpower: 4

Lace & Steel:

Disposition: Three of Wands (R): Old Henry's life has taught him always to expect the worst.

CHARACTERISTICS:

Strength	7
Endurance	9

Dexterity	11
Reason	12
Intuition	13
Drive	8
Charisma	8
Magical Aptitude	10
Hit Points	4

SKILLS:

Assess Personality-1, Brawling-1, Cutting Sword-0, Detect Lie-0, Etiquette-3, Geography-0, Language (Alamarian)-0, Legend Lore-0, Literacy-0, Merchant-3, Riding-0, Spot Hidden-1, Streetwise-2, Travel- 0.

(Note: Old Henry is a native speaker of Modern Tantic. His Etiquette skill was learned from the point of view of an observant servant; he knows how things are supposed to *look*, rather than how to do them himself. It also combines with his Merchant and Legend Lore skills to make him exceptionally adept in the assessment of *objets d'art* and luxury goods; give him an effective skill of 3 on any Reason or Intuition tests when evaluating such items.)

Image

Old Henry is a fixture on the docks of some city frequented by the PCs, and thereabouts; a battered old fellow with some taste for a drink, but also with a high-mannered, even courtly way about him when he chooses to use it. He will talk to almost anyone who will buy him a drink, and listen to offers from most quarters, but he is a fair judge of character, and will try to avoid dealings with people who could get him into deep trouble or physical danger, including most officers of the law. (A reputation as a possible informer would not only be bad for his business; it would probably get him killed.)

It's no great secret that Old Henry makes his living through his specialist education. He is well-known to the pirates and some other rogues of this part of the world, and what they mostly know is that he knows about *art*. The point is, sometimes a lucky rogue gets hold of plunder that's not gold or jewels, but that's worth plenty in the right place, and that's more conveniently portable than most loot. The trouble is, even the run of fences don't know what's worth what, or how to get the best money for it. Old Henry, though, does. He may well have useful acquaintances in various places, but his greatest importance is that he knows what might be worth going to some trouble over, and what might not.

Background

There are rumours that Old Henry is a fallen aristocrat of some description, or at least a gentleman; some of these tales may be more specific, depending on the place and time. For example, in an English Civil War-era pirate game, he might be reputed to be an English lord who has managed to get on the wrong side of both Cromwell and the Royalists by trying to play both sides against the middle, while in *Lace & Steel*, he would be Duncruighan, and some people might believe that he was a cousin to some of the more conservative aristocrats who have got on the wrong side of King Firined. In fact, these wild rumors are wrong (unless the GM chooses to make one of them true, to confuse the players); the boring truth is that Henry was a servant in a grand house who got thrown out for offending the master of the place's son.

Still, there is a small oddity in even the true tale. Old Henry wouldn't know as much as he does if he didn't have a real love for artistry and fine things -- a love that developed when he was helping one of his former employers maintain and catalogue his art collection. Then, however, the son of the house came home from a stay in the big city with some appalling "aristocratic manners"; he took to walking mud into expensive silk carpets with his riding-boots, spilling drinks on expensive items of furniture, breaking ornaments, and possibly stealing smaller objects to sell to cover his gambling debts. Henry kept his counsel for a while, but eventually snapped and told the "young master" what he thought of all this. Unfortunately, the "old master" was a doting father, and it wasn't Henry's place as a servant to

criticise his betters; he was thrown out on his ear. This began a downward spiral that took him right to the gutter before he pulled back a little by adopting his current career.

(It should be noted that Old Henry learned his lesson when he lost his job; he would never risk speaking out of turn over a mere *thing* these days, if his neck might be at stake.)

Abilities

Old Henry is no fighter, and relies on seeming harmless, and being useful and essentially trustworthy, to keep him alive. His key ability is an eye for fine things -- a sense that goes beyond simple knowledge into a real aesthetic sense. He actually has quite a taste for real beauty, and may show his pleasure when handling fine artworks, although he wouldn't risk danger or trouble to possess or protect such objects. He also has all the skills of a good servant to the upper classes, and even speaks a few words of an appropriate foreign language. (The choice of native and learned languages in the above character skill lists are of course just suggestions that can be changed as appropriate to the campaign.) In order to survive, he has learned to be light on his feet, but his combat skills are the minimum necessary to enable him to try and get away if trouble starts.

Although GMs are of course free to change specific details in this character sheet, there are some limits. Whatever the setting or style of game, Old Henry is not at all likely to possess magical or exotic powers; he's a simple man with a good eye for valuable things, no more. Still, it is *just* possible that, if he were to stumble across something magical, or if some of the loot brought to him for assessment was more exotic than its holder knew, Old Henry's practised judgement and patchy knowledge would enable him to spot whatever was unusual, and maybe he could even work out how to use it. He would regard this as a fearfully difficult situation; he is just greedy enough to want to exploit such knowledge, just wise enough to see that some power probably ought to be kept out of the hands of the sort of rogues he deals with, and just moral enough to see that keeping quiet might not be an acceptable option. At times like this, he might turn to the PCs, or he might not.

Game Uses

Old Henry is presented here for use in a range of games that include swashbuckling and piracy in a broadly Renaissance setting; however, he could easily be adapted for almost any game in which some thieves might pick valuable artworks that they don't know what to do with. Just adapt his specific skills to fit the background. In a **GURPS Swashbucklers** game, he could appear on the streets of Port Royal, or perhaps some European or American port where pirates can venture with caution. In **Mage: the Sorcerers Crusade**, he could be known to some Void Seekers (or even to some Skyrigger crews -- some very odd acquisitions must surely pass through their hands at times, so perhaps Old Henry has found his way to Portus Crucis), or he could perhaps find himself caught between freebooters and the strange powers of some Hermetic or Celestial Master whose island retreat they have raided. In **Lace & Steel**, he would be found in one of Duncruigh's shadier ports, or just possibly in a Duncruighan outpost in the Harabian seas or the Western Isles.

As noted above, Henry is careful not to get a reputation as an informer, for the sake of his health. However, he is also careful not to annoy the authorities too much, if he can't simply avoid them altogether; that could be equally bad for his prospects. PCs on the side of the law would do better to cultivate him as a contact than simply to try to pin any charges on him; he is essentially harmless, not actually *directly* involved in serious crime, and will probably drop a few hints and pass on a few well-known rumours if treated politely and bought a few drinks. Incidentally, he is quick-witted enough to withstand most verbal interrogation, but would crumple under torture; he keeps quiet out of a practical sense of self-preservation, not because of any sense of duty or ethics.

Adventure Seeds

- **Hot Stuff:** Someone brings a recently-acquired item to Old Henry for assessment; a finely-decorated writing-case, holding the usual pens, ink, and so on, but also a bundle of letters. Old Henry frowns when he sees the box,

and then breaks out in a cold sweat when he looks at the letters. It turns out that the crest on the box marks it as belonging to someone very powerful indeed, and the letters are clearly addressed to a mistress, and are (while written with aristocratic grace) extremely, shall we say, *colorful* stuff, leaving the nature of the relationship in little doubt (and making the nature of the writer's tastes in certain intimate matters pretty clear too). For added color, the mistress may be identifiable as a politically unwise association for the writer, or the letters could let slip some secrets of state. Incidentally, it's best to set this up so that the rogue who got hold of the box is illiterate or semi-literate (hence Old Henry's role), but more to the point, the letters themselves are unsigned; it's the crest on the box that gives the game away. (Or *perhaps* it's a red herring; the box was a gift to an underling or was lost at cards, and the writer, while high-ranking, wasn't who Old Henry has guessed. This might help explain how a thief in a remote, pirate-infested area got hold of it, which is something that will need some explanation.)

Regardless, suddenly what had seemed like a good prize is a hot potato instead. Wise folk would put the letters back in the box, add some heavy stones, and drop it in the nearest bay, but the chance for profit is probably more than any rogue can resist. Or perhaps the political implications of these letters are such that even a pirate feels obliged to intervene. The PCs could be the original thieves, law enforcers suddenly receiving dark and ambiguous hints from Very High Places about their latest instructions, other rogues, smarter than the original thieves, asked for help by Old Henry when the business starts to get out of hand, or independent agents recruited by one of the several factions involved the affair and paid to be very discrete about it.

- **Emissary:** Sometimes, messages have to be taken from low places to high. The problem is usually finding a suitable messenger. When a certain pirate wants to negotiate terms for turning himself in to the authorities, saving his neck and his fortune by handing over information or something else important (perhaps those letters from the last scenario), or perhaps gaining official status as a privateer, his thoughts turn to Old Henry. It's a somewhat risky job, but Old Henry can present himself as a mere messenger with no crimes of his own to answer for, and anyway, the pay is tempting. However, Old Henry requires an escort as part of the bargain. The PCs get this job; if they're on the side of the law, their role is arranged as part of the preliminary deal, if they're legitimate freelancers, they're hired as dependable neutral parties, and if they're known rogues, they receive a safe conduct (hopefully reliable) from the authorities. (In the latter case, the fact that the pirate captain doesn't send members of his own crew may say something about the deal he's arranging.)

The PCs may be a little surprised by the transformation in Old Henry, once he has good reason and a little spending money, but they probably always thought that he was a bit upper-class if they've known him long. The mission itself is going to have more complications (and probably more surprises) than that, though; the deal quite likely has clauses that even Old Henry hasn't been told about, and there may well be third parties who'll try and intervene. Old Henry's advice on etiquette may prove essential; it may also display embarrassing flaws, given that he learned manners as a servant, not as a nobleman.

- **Old Friendships:** Old Henry comes to various of his piratical associates (possibly including the PCs) with interesting news; he says he's recognized a certain wealthy fellow recently arrived in town, who's apparently looking to set up in a plantation or farm locally. Although he's changed his name, he used to be a notorious magistrate in another port; an evil-minded, vicious, pirate-hating piece of work, with a great love of the noose. If anyone mutters that it sounds like something should be done about this fellow, Old Henry won't disagree. However, at the same time, he's going to some of the local land-based thieves and saying that he hears that this same individual is even richer than he looks, and the strongbox in his room might repay investigation . . .

Actually, most of this is Old Henry's invention. He has indeed recognized the subject of all these rumors that he's spreading -- but only as the "young master" who lost him his job years ago. Suddenly burning with the desire for revenge, Old Henry will risk a great deal and say anything to make life hard for this individual. Wherever the PCs stand, in the underworld, in law enforcement, or perhaps as guards or friends to Old Henry's target, they'll get caught up in the ensuing chaos. Old Henry has a painfully efficient grasp of how to manipulate his contacts. Eventually, he may either flee the area, become the object of several very dangerous people's annoyance, or make an insanely risky direct attack on his old enemy. Whether the aristocrat in question is still the spoiled oaf who Henry remembers, or whether he's mellowed with time, is up to the GM.

Lost Cities: Daring Adventure for Two

Published by [Rio Grande Games](#)

Created by Reiner Knizia

Card game with board; \$19.95

ISBN: 1-892081-23-7

As far as I can tell, Reiner Knizia doesn't know how to design a bad game, and *Lost Cities* is no exception to his exemplary track record.

Although connected to the reputed theme of the game (adventurers traveling to *Lost Cities* around the globe) in only the loosest of possible fashions, the mechanics here prove to be simple, but not simplistic: To borrow the cliché, *Lost Cities* is easy to learn, difficult to master.

Despite the fact that it comes with a board, *Lost Cities* is essentially a card game: You have five different color suits (each belonging to a different environment in which a lost city is located), with each suit containing three "investment" cards and ten cards numbered from 1 to 10. Each player receives a hand of eight cards, and play proceeds in turns, with each player either playing or discarding a card, and then drawing another card in order to replace it.

Cards are played off of the board (which has five playing areas keyed to each of the five colors), with each player playing on his or her side of the board. Cards must be played in order, with investment cards coming first, and then the numerical cards in order after that. (So, in other words, if you've played the red seven, you cannot go back and play the red five; you can only play the red eight, nine, or ten.) When you decide to discard a card (rather than playing), you do so into one of five discard piles (keyed to each of the colors). When you draw a card you may do so from the top of any of the discard piles, or from the top of the draw pile. The game ends when the last card is drawn from the draw pile.

You score each color separately in the following manner: Total the numerical cards, subtract 20 from the resulting total, and multiply that total (whether its positive or negative) by the number of investment cards you played plus one. If you didn't play any cards in a color (investment or numerical), however, your score for that column is 0. Then add the totals from all five colors together.

Simple, right? Right. But in the actual practice of it, *Lost Cities* becomes something more than you'd expect.

For example, it's not enough to merely play cards out in a haphazard manner: You must be aware of your ability to reach the 20 point minimum required to see a return (otherwise you're throwing your money away). You must balance the risks and advantages of additional investment in an exploration. You must keep in mind how much time you have left in the game, and attempt to manipulate that time limit to your advantage (and your opponent's disadvantage) through your discards and draws.

And then there is the direct player interaction through the five discard piles, which takes a difficult decision and turns it into a nerve-wracking one: You must play to your strengths, subvert your opponents, and avoid your weaknesses.

The incredibly diverse array of tactical options and strategic possibilities which result from the elegantly simple mechanics of *Lost Cities* is a testament to Knizia's brilliance at game design, and the strength of this game. This is a

game in which you will be asked to choose between the lesser of two evils, and forced to decide between the conservative and the risky.

In addition to being a great two-player game, *Lost Cities* is also a visually beautiful package (although the white "map" on the superfluous playing board comes off as far too bluish, leaving you momentarily confused the first time you look at the game board). There is little doubt that this game is well worth the cost of admission, and should prove a worthy addition to your collection of games.

Unseen Masters: Modern Struggles Against Hidden Powers (for Call of Cthulhu)

Published by [Chaosium, Inc.](#)

Written by Bruce Ballon

Art by Matt Harpold, Paul Carrick, & Drashi Khendup

216 pages; \$23.95

In comparison with the classic period of the 1920s, the modern day has seen relatively scant coverage from Chaosium for their venerable RPG, *Call of Cthulhu*. This is not to belittle their releases for the modern day such as *Utatti Asfet*, *The Stars Are Right*, or *The Resection of Time*, but many feel that none have come close to Pagan Publishing's *Delta Green* setting and books in terms of tone and feel. Yet now Chaosium have published a contemporary set campaign that can justifiably said to come very close.

Unseen Masters is a book containing three scenarios set in modern day New York, in which the investigators are up against shadowy conspiracies and hidden powers. Since they are all based in New York, they can form the basic structure to a campaign. Further, the second two adventures are designed with loose structures, allowing other scenarios to be played between events, and can thus be played as mini-campaign themselves. This makes *Unseen Masters* into something of a hybrid book between the traditional anthologies of individual scenarios (such as *The Stars are Right*) and the classic onionskin campaigns exemplified by *Masks of Nyarlathotep*.

Behind Matt Harpold's eerie cover, *Unseen Masters* is up to Chaosium's usual standard of presentation. Stalwart Paul Carrick's internal art is as good as ever, and Drashi Khendup's cartography thankfully fails to grate as in previous books. There is a solid index and seventeen pages of handouts, some of which the Keeper will have lots of fun with. The book is text-heavy, though not a heavy read. That said, in a couple of places, the author's phrasing is a little too colloquial to my mind.

Designed specifically for the experienced player and Keeper alike, both will get more enjoyment out of *Unseen Masters* if they have played through some of Chaosium's classic campaigns, such as *Masks of Nyarlathotep*, *Day of the Beast*, and *At Your Door*. The author draws heavily upon these and other influences, which he acknowledges in the book. These include Kolchak; The Night Stalker, The Exorcist and The Hunger; the works of authors - Mythos (Lovecraft, Bloch, Campbell, Klein) and not (Tolkien, Philip K. Dick, Umberto Eco); and numerous *Call of Cthulhu* supplements. Besides Chaosium's own, the works of Pagan Publishing (*Delta Green*), Triad (*Lurking Fears*) and T.O.M.E. (*Whispers from the Abyss and Glozel est Authentique!*) are all referenced. By drawing upon these books, and particularly *Call of Cthulhu*'s own internal history, the author has given the adventures in *Unseen Masters* a solid foundation.

(SPOILER ALERT!)

The first adventure is The Wild Hunt, which opens with the investigators, as outside consultants or FBI agents, being asked by the NYPD to help catch the serial killer that has struck in the fictional SoHo district of Manhattan. The players will be worked hard in this adventure, particularly those that like the nitty gritty of an investigation. There is a lot of information to uncover and process, including plenty of red herrings. The Keeper also plenty to get his teeth into, especially during the investigative sequences that take the players into the S&M, Goth, and vampire sub-cultures.

Pleasingly, these sections are handled with great care and sensitivity by the author.

Like the subsequent adventures, *The Wild Hunt* is structured into numbered sections that count up to the culprit. These present possible paths of investigation, but do not restrict the players to a linear course of action. Whilst they are free to pursue lines of questioning as they see fit, time can be short as the true masters and their nefarious pawns are invariably working to their own agendas. Though it appears at first that the investigators face a conventional threat, behind this is a Mythos race rarely seen outside of single individuals. Whilst I will not go so far as to name them, it is a pleasure to see them used as something more - as an Unseen Master.

The Wild Hunt is the most traditional of the *Call of Cthulhu* scenarios in this book. The Mythos has always contained a strong element of the impersonal, and rightly so. Yet the second scenario, *The Truth Shall Set You Free*, goes the other way and makes the Mythos very personal. It asks a question right out of a Philip K. Dick novel "What is truth?" and applies it to a single investigator. Can what they are seeing be real, or are the other investigators the mad ones? This adventure takes time to set up and play through. It is here that *Unseen Masters* expands into a meta-campaign as other scenarios are played. Those from *Secrets and Last Rites* are suggested, but non-Mythos adventures could equally effective. This calls for clever roleplaying from both Keeper and the victim, who may be willing or unwilling; the book giving guidelines for both. The second half of *The Truth Shall Set You Free* concentrates on the attempts to get help for the victim, while other forces seek to further or enhance his weakening grip on reality. Though the shortest of the three adventures in *Unseen Masters*, this is really evil and very well written. The section on psychiatry and psychology included at the beginning of *Unseen Masters* will be particular use in both this adventure and the next.

The last adventure, *Coming of Age*, is as equally vile as *The Truth Shall Set You Free*, but its evil is more insidious and comes from a completely different direction right into an investigator's home. To say more would spoil it, but the villains of this piece have very strong links to Chaosium classics -- *Masks of Nyarlathotep*, *Day of the Beast*, and *Shadows of Yog-Sothoth*. Should seasoned players realize whom they are facing, then their own sanity should be at risk! Some of the scenes in *Coming of Age* are deliciously evil and should set any Keeper salivating at the thought of unleashing them on his players.

(END SPOILER)

Unseen Masters is a fantastic new addition for *Call of Cthulhu* in the modern day. Not only is the best release from Chaosium since their mammoth *Beyond the Mountains of Madness*, but it is the most contemporary of any release for the game in some time. In particular this is a must for any *Delta Green* Keeper as it is set in New York (home of *Delta Green*'s *The Fate*) and is very suitable for Federal Agents. Indeed, *Unseen Masters* devotes one of its appendices to adapting all three adventures to *Delta Green*. This is welcome advice, but does not necessarily have to be adhered to the *Delta Green* game unless the Keeper is a purist. This may not be as good as the *Delta Green* books themselves, but Bruce Ballou has come very close in this superb set of three adventures, and for that he should be applauded.

Pyramid Pick

Witch Trial Card Game

Published by [Cheapass Games](#)

Designed by James Ernest

Illustrated by Charles Dana Gibson

84 cards, 1 board, and a rulesheet; \$6.00

It is the late seventeenth century in America. You are a lawyer, you are convinced that Mad Gertie Hayes is guilty of the Ol' Hokus-Pokus, and you are going to make sure the jury is convinced as well. You bring into evidence that Mad Gertie keeps bad company and that she is known to read without moving her lips. The jury seems to agree, but your opposition, a sly defense attorney, presents Mad Gertie's friends as character witnesses and relates that Mad Gertie regularly works with children. The jury sways towards the defense, but you have one final trick up your sleeve. You point out that, even in today's noon sun, Mad Gertie casts no shadow! Aghast, the jury finds Mad Gertie guilty, sends her to her fate and, most importantly, you collect the court fees for a successful prosecution.

If this sounds like a fun evening, then Cheapass Games first release in 2001, the card game *Witch Trial*, will appeal to your inner-barrister. Set around the time of the Salem witch trials, three to seven lawyers prosecute and defend suspects who are charged, not with witchcraft, but with related crimes such as drinking, pilfering, and golf. Whoever wins the case also keeps the court fees. The player with the most money after all the suspects are tried wins the game.

Money is not simply a method of keeping score; it also helps lawyers win cases. Each player begins with a hand of five cards, but for the rest of the game, players get new cards by purchasing them from five face-up choices. An attorney can take the oldest card for free, but if a valuable new card turns up, she or he may have to pay through the nose to grab it.

After assembling strong hands, players begin to try cases. A lawyer can create a case by matching a Charge card, such as "Frowning," to a Suspect card, like "Meek Little Sarah." The lawyer becomes the Prosecution for this case. Another player may decide to defend the case, thus becoming the Defense. If there are no willing defenders, the prosecution can force a random player to assume the Defense.

A trial consists of each side playing Evidence cards to sway the Jury. The Jury is represented by a number, one through 12. The higher the number, the more convinced the Jury is of the Suspect's guilt. The Prosecution goes first, playing Evidence cards that add to the Jury number. Once the Prosecution rests, the Defense may play Evidence cards to subtract from the Jury number. When the Defense rests, the Prosecution gets one final argument; a last card. When both sides are done presenting Evidence, the Prosecution rolls two dice and if the total of the dice plus the Jury number is thirteen or greater, then the Prosecution wins. Otherwise, the Defense wins the case. Each Charge has a dollar value which goes from the bank to the winner.

Evidence is only one part of a trial. Players can also play Motion cards which allow them to do such things as bribe the jury, cross-examine another player's hand, or leave the case. Players can change the original Charge to a lesser or greater offense. A lawyer may call other Suspects to testify which will help his or her case with a successful die roll. Finally, when all else fails, players can plea-bargain, agreeing to split the Charge's dollar value as they see fit and sending the Jury home.

The components of the game are of higher quality than many previous Cheapass releases. The cards are glossy and

sturdy, and the game is packaged in a cardboard box, a new feature Cheapass revealed at GenCon 2000. The only shortcoming is the art. Cheapass chose Gibson's clip art which is in the public domain (they don't call themselves Cheapass for nothing) and while it is fairly high quality, it is also about 200 years too modern; this makes the theme of colonial America a little inconsistent. This does not affect the game play, though, which is full of logic, bluffing, and not a little bit of roleplaying.

Perhaps the most interesting mechanic is *Witch Trial* is the method by which players get new cards. First, players often have to spend money to get desirable cards, yet having the most money wins the game. So each player must perform a cost/benefit analysis before buying a card. Second, all of the other players can see which card the buyer is taking. By paying attention, players will know who is building a strong Prosecution hand, who is building a strong Defense hand, and who has cards that aid in forcing a plea bargain. In fact, the threat of a card is often more powerful than actually playing the card.

The game scales well from three to seven players, but with more players the time between turns can become a bit long. Players will enjoy trying to out-guess each other when choosing Evidence cards and trying to play Motion cards when they will have the greatest effect. Negotiations during a plea bargain can become quite intense, depending on how much each player knows about the other's hand. Finally, players with a penchant for drama will enjoy explaining exactly why the Widow Shelly is guilty of public lewdness and how her faithful pet helps prove her guilt. *Witch Trial* is the best of Cheapass Games' most recent offerings.

-- Brad Weier

Untouchable: The Cleveland Torso Killer

"Of all the horrible nightmares come to life, the most shuddering is the fiend who decapitates his victims in the dark, dank recesses of Kingsbury Run. That a man of this nature should be permitted to work his crazed vengeance upon six people in a city the size of Cleveland should be the city's shame. No Edgar Allan Poe in his deepest, opium-maddened dream could conceive horror so painstakingly worked out . . ."

-- Editorial in the *Cleveland News* in September, 1936

He almost certainly doubled [Jack the Ripper's](#) total, and may have more than quadrupled it; estimates of his death toll range between a significant thirteen and twenty-three victims, with outlying speculation running all the way to forty or more. To a Depression-era Cleveland police department barely advanced from Victorian Scotland Yard techniques, he was uncatchable, adapting to the harsh rhythms and rules of the underclass and the underworld and using them to cover his tracks even while he boasted of his crimes. He was, in short, the first modern serial killer in America, setting the archetype for decades to come -- and perhaps it was fitting that his nemesis was the other American archetype of the 20th century, the G-Man himself, Eliot Ness. He was the Kingsbury Run Butcher, the Cleveland Torso Killer -- and he remains uncaught to this day.

"[T]he bodies of two white men, both beheaded, lying in the weeds; both bodies were naked except that one of them had socks on . . . After an extensive search the heads of both men were found . . . buried in separate places, one about 20 feet away from one of the bodies and the other head was buried about 75 feet away from the other body. . . . It was apparent that oil, acid or some chemical was poured over one of the bodies as it was burnt to quite an extent; it was also evident that both bodies had been there several days as they had started to decompose."

-- from the police report of Detectives Emil Musil and Orly May, September 23, 1935

With these words, the official Cleveland Police files on the Cleveland Torso Killer begin. The two bodies appeared in a prehistoric creek bed known as Kingsbury Run, a "cut" through Cleveland occupied by railroad tracks, waste land, and "hobo jungles," dark and overgrown even in the daytime. To the east of the Run, the "Roaring Third" contained all the vice and misery of Whitechapel in its prime; at its north end in the Cuyahoga Flats rested one of Depression America's largest shantytowns. The Cleveland police department, meanwhile, was legendarily corrupt and antiquated, owned by the Democratic machine and the local mobs. It was a location, in other words, ready-made for serial murder.

However, it took the discovery of four more bodies between January and September of 1936 to make that apparent to the Cleveland police. Only one of the four was ever identified (photographic fingerprint reconstruction determined she was local barmaid and prostitute Florence Polillo), despite the ornate tattoos on one dismembered corpse. In all cases, the bodies had been idiosyncratically decapitated, and were usually dismembered, drained of blood, and washed in a chemical preservative -- all to conceal the time of death and the victims' identities. The preservative triggered a memory for the coroner, Arthur Pearse -- in September of 1934, a woman's decapitated body doused with the same chemical had washed up on the shore of Lake Erie -- could the killer have begun with a "practice" before transferring his attention to Kingsbury Run? With the sixth (counting the "Lady in the Lake," the seventh) killing, the police put Detective Peter Merylo in charge full time, and kicked off the biggest manhunt in Cleveland history.

"Jim, you've got a real problem on your hands. The same guy did them all. Too much similarity to be coincidental. Death by decapitation. The expert hand with a knife. Bodies all cleaned up and neat. I can't tell you why he kills women one way and men another, but it's the same man, I guarantee you."

-- Eliot Ness, June 7, 1936

The killings weren't only an embarrassment to the police and to the city (the "Tattooed Man" was found in front of a police station two days before the 1936 Republican National Convention was due to open), but to the city's newly-appointed Director of Public Safety, Eliot Ness. Fresh from his triumph as head of the "Untouchable" squad who brought down Al Capone in Chicago, Ness had been hand-picked by Republican Mayor Harold Burton to clean up Cleveland's civic cesspool. The last thing he needed was a Mad Butcher slaughtering "nobodies" to distract him -- and the press -- from the war on corruption and rackets. But although Ness successfully prosecuted the largest graft scandal in Cleveland history, broke the back of the gambling and labor rackets, and reorganized Cleveland's traffic control

system (saving hundreds of lives per year), he couldn't shake -- and couldn't touch -- the Torso Killer. During 1937, the Butcher struck three more times, and raised his known toll to eleven by February of 1938. On August 16, 1938, the killer left two more bodies in sight of Ness' office window. Desperate, Ness struck back. Unable to catch the killer, he resolved to remove the victims. Shortly after midnight on August 18, 1938, Ness and 35 police officers swept through the hobo jungles of the Flats, jailing every drifter there and burning the shantytown to the ground. However, the Butcher had won the press war; the papers turned against the "Boy Wonder" for his "Gestapo tactics" in the raid, and his campaign for mayor of Cleveland ended in disaster. Although Ness made no arrest in the case, the Cleveland Torso Killer never struck again.

"About twenty minutes past three o'clock yesterday afternoon Frederick Wildborn, a carpenter employed by Messrs. J. Grover and Sons, builders of Pimlico, who are the contractors for the new Metropolitan Police headquarters on the Thames Embankment, was working on the foundation, when he came across a neatly done up parcel in one of the cellars. It was opened, and the body of a woman, very much decomposed, was found carefully wrapped in a piece of what is supposed to be a black petticoat. The trunk was without head, arms, or legs, and presented a horrible spectacle."

-- "Another Ghastly Discovery in London," *Pall Mall Gazette*, Oct. 3, 1888

Unless, of course, he did. Three bodies turned up in the Lake Erie Rail Yards in McKees Rocks, Pennsylvania on May 3, 1940, bearing some of the Torso Killer's signature wounds. Other beheaded victims in New Castle, Pennsylvania, Youngstown, Ohio, Pittsburgh, and again in Cleveland raised Merylo's personal estimation of the total to twenty-three, although he was finally taken off the case on October 1, 1942. Investigators looking into the Black Dahlia killing in Los Angeles in 1947 were intrigued by the similarity of the knife wounds, bisected bodies, and an anonymous 1938 letter claiming the Torso Killer had gone to "sunny California for the winter" and announcing another killing near where the Dahlia's body would be found nine years later. Even more tenuously, one can extend the killings back in time to the Ripper era, when three mutilated torsos appeared in London between October of 1888 and June of 1889 -- fifty years before the Torso killings stopped.

"I felt bad operating on those people but science must advance. I shall soon astound the medical profession . . . What did their lives mean in comparison to hundreds of sick and disease twisted bodies. Just laboratory guinea pigs found on any public street. No one missed them when I failed. My last case was successful. I know now the feeling of Pasteur, Thoreau, and other pioneers . . . They called me mad and a butcherer but 'the truth will out'."

-- Letter signed "X," sent to Cleveland Police Chief Matowitz on Dec. 21, 1938

Both the Ripper and the Butcher were theoretically medical men, although both official investigations note that a butcher or hunter could have caused the same wounds with their own specialized knowledges. Eliot Ness, in fact, believed he had identified the murderer as one Dr. Francis E. Sweeney, a bisexual, alcoholic, possibly psychotic surgeon of great physical gifts, born and raised in the Kingsbury Run area. Ness brought Sweeney in for polygraph interrogation on August 23, 1938; Ness later said that in his entire career he had never felt as threatened as when he was alone in that room with Sweeney. Unfortunately, Sweeney's cousin was the powerful Democratic Congressman Martin L. Sweeney, a political enemy of Ness' -- without proof, Ness couldn't prosecute him. Dr. Sweeney checked himself into a mental hospital two days later, occasionally sending Ness taunting postcards. He outlived Eliot Ness by ten years.

"'Both bodies have been totally drained of blood.' 'Really?' 'Totally drained.' 'What does that mean?' 'It means that there is no blood in these bodies.'"

-- Pearce and Myrlo, in *Torso*, by Brian Michael Bendis and Marc Andreyko

The medical theory spawns the "eugenic Frankenstein" theory; the anonymous "X letter" claims the Butcher was working on an elixir of life or some vast medical breakthrough. The draining of blood, of course, implies vampires (or at least it does to S.A. Swinarski in his novel *The Flesh, The Blood, and The Fire*) -- as do the beheadings, unless the Gathering of Highlanders took place in Cleveland in the 1930s. Merylo investigated all manner of "crazies," including a "Voodoo Doctor with a death ray," and a number of "covens of self-proclaimed witches and warlocks" in the words of Steven Nickel's relatively unsensationalistic book *Torso*. (Brian Michael Bendis and Marc Andreyko's rather less accurate, but superbly evocative graphic novel *Torso* endorses a combination Sweeney-eugenicist theory.) The video

game *The Black Dahlia* ties the Killer not only to the Dahlia but to the Nazi occultists -- and indeed, one of the McKees Rocks victims had the word "NAZI" carved into his back. The supernatural boils through the Kingsbury Run, then, suitable for any dark game of horror. However, nobody seems to have noted what, to me, is the most disturbing, if faint, parallel, one for any *Unknown Armies* GM to look into.

Perhaps gruesomely appropriate for a story beginning with a Lady in the Lake, the killings seem a horrible underside to some proto-Arthurian sacrifice myth. The bodies, maimed in streams to echo the Fisher King; the first two dead men with hidden identities as recapitulations of Balan and Balin who killed each other unknowing, the "piebald" Percival as the "Tattooed Man." The two identified women are connected by blood and names; Flo Polillo echoes Florée (bride of Gawain), and Rose Wallace recalls Gawain's brother Gareth's paramour, the Lady of the Rose. There may be a connection to the protective, watchful Head of Bran in the "death mask" police mounted on the wall of the train station. And we mustn't forget our frustrated witness Eliot, and the deaths scattered across the Waste Land so evocatively named Kingsbury Run. The echoes recur; the killings muffled by the "sound of horns and motors" in the railroad yards, the bodies "stretched out on those red rocks," the "drowned sailors," the corpses buried in the garden, cities turned upside down. Fear death by water.

Polls and Cons

Well, in accordance with prophecy (or at least last week's column), I visited the Game Invasion convention in Jacksonville last weekend, and a good time was had by all. I got to meet Jolly Blackburn and participate in a live *Knights of the Dinner Table* reading (appearing, alternately, as Bob and Dave). And I also got my copy of *KotDT* #1 signed . . . once I could coax the \$100 book out of my hand. (How many other folks get their RPG books signed, anyway? It's very common in the comic world, notso common in the gaming biz . . .)

And, after coming back, I've been working tirelessly (well, okay, I've been nodding off every now and then) trying to catch up with correspondence, slushpiles, etc. So for those of you who've been waiting for a reply, I appreciate your patience. I'll definitely try to get to you all soon. And I'll try to write some meatier columns once I get caught up.

As an aside, if you have a quick question you'd like to know the answer to, you may want to consider visiting the [Pyramid chat](#). I visit there almost every day, generally in the evenings. And, of course, there are lots of other cool and interesting folks who dwell there.

* * *

Funny story time:

On my vacation, between visiting my parents in Fort Lauderdale and the Game Invasion convention in Jacksonville, I made a pit stop back home in Tallahassee. This was last Thursday night, before the magazine's upload. So I finished up my column, posted it, and put in a new poll.

Unfortunately, I forgot to mention to anyone else that I had uploaded a new poll.

Making matters worse was the fact that the previous week's poll and the newly submitted poll were similar; the prior poll asked how many people you have in your gaming group (an objective question), while the new poll asked what you thought about the size of your group (a subjective question). Thus while I generally have 2-3 people in my group, I often felt my groups were undersized by a person or two. I was curious if other people had similar reactions.

Now, since I was busily working and sleeping between vacation destinations, I wasn't around in the chat room for the magazine's upload. Unfortunately, owing to the madcap pace that is upload night, a cursory glance of the poll made it look like I hadn't changed it from last week. So at two minutes past midnight, with the new magazine uploaded, panic ensues: "Oh, no! The poll hasn't been changed!" (I'm guessing here with a creative reenactment; in actuality, I suspect the cursing of my name was also prominent.)

So our fearless webmasters tackled someone in the chat room to come up with a new poll: Steve Jackson.

Steve, having been reprogrammed just like I was when I saw it, based a poll around the previous day's [Daily Illuminator](#):

February 22, 2001: All Your Base Are Belong To Us

We get signal.

Techno signal.

All your base (your base) (base) (base) All your base. Are belong to us.

The best part is, [this](#) was inspired by a game. Zerowing.

All your base.
Are belong.
To us.

The poll itself may not have been bad . . . if only my standard "Other" feature hadn't been included.

So when I woke up the next morning, I checked my email . . . and found about forty emails from folks saying, "What the @#!\$ is the poll about?" "Huh?" "I don't get it." "This is the kind of poll I'm paying for?" etc.

And as I'm reading these bewildered and annoyed emails over, I'm scratching my head (which, for its part, had begun to peel because of the long-standing natural hatred between redheads and Mr. Sun). "Jeepers," I thought, "I didn't think it was *that* odd a question . . . I must've really phrased it poorly . . ."

And then I checked out the poll. And I'm staring at the screen, feeling like a character living the last five minutes of a *Twilight Zone* episode.

So for everyone who was confused by last week's poll . . . IT'S NOT MY FAULT! Blame the guy who signs my paychecks! (*I'm sure not going to . . .*)

So anyway, being an optimist, I'm going to interpret at least part of the results as "Do you check the [Daily Illuminator](#) every day?" And for at least 14% of you, I'm going to guess the answer is "No." (The poll I originally asked should run next week; I may well ask the Daily Illuminator question for real at some point.)

Oh, and for those of you looking for more information on the whole AYBABTU phenomenon, a good starting point is <http://hubert.retrogames.com/history.htm>.

-- *Steven Marsh*

* * *

*Last week's answer: **Masque of the Red Death** boxed set, **Red Jack** book, p. 8.*

*(Two stars) "However, no action is to be taken until after the *Titanic* strikes the iceberg at approximately 11:40pm on Sunday, April 14. On no account initiate any incident which might jeopardize this. The mission ends when the *Titanic* sinks and you clock back."*

The FBI in Gaming

by Darren Watts

Introduction

"Fidelity. Bravery. Integrity."
-- The FBI's official motto

The Federal Bureau of Investigation might play a role in any campaign set in the United States in the past century. No government agency has such a high profile in popular fiction, partly due to the intense self-promotion it has carried out since the days of mobsters and tommy guns. It makes an imposing enemy for lawbreakers, a marvelous background for characters of any stripe, and can serve as the employer/motivating force for entire campaigns of wildly varying styles. All too often, however, the fictional portrayals of "The B" (as its agents refer to it) feature some massive factual boners. Here an effort has been made to give a realistic description of the FBI in the "real world" with an eye towards gaming relevance; of course, in any specific game setting its activities, powers and history may vary.

The first and most obvious use of this article is in plot design; PCs are forever doing things that bring them into contact or conflict with the law, and the FBI investigates such a wide variety of crimes that eventually some interaction is almost inevitable. Another use is in character design. If you're playing a group of FBI agents (or agents of a similar fictitious organization), the descriptions will help you fill in appropriate skills and advantages. A concise timeline and online references are also provided.

Timeline

- 1870-1908** Prior to 1908, the Department of Justice (itself founded in 1870) has no investigative branch, only financial "examiners" to help investigate the primary crimes defined as "federal" at the time, such as bankruptcies and business fraud. When legwork is needed in handling these cases, the DOJ hires private investigators such as the Pinkerton Detectives or "borrows" agents from the Secret Service.
- 1908** Charles Bonaparte, Attorney General for President Theodore Roosevelt, hires a small handful of "Special Agents" to investigate full-time for the Justice Department, and has them report to the "Chief Examiner," Stanley Finch. Eventually this core of agents, which expands in number tremendously over the next fifteen years, becomes known as the FBI.
- 1910** Congress passes the Mann Act, which attempts to combat the menace of prostitution and "white slavery" by making it illegal to transport a woman or minor across state lines for "immoral purposes." As a side effect, the Mann Act gives teeth to federal laws involving the investigation of interstate crimes and the prosecution of fugitives.
- 1912** A. Bruce Bielaski is named the second Chief Examiner and head of the Bureau.
- 1917** On the eve of America entering World War I ("The Great War"), the FBI is given responsibility by President Woodrow Wilson to investigating violations of the Espionage, Sabotage and Selective Service Acts.
- 1919** William J. Flynn is appointed the Director of the FBI, the first to use that title.
- 1921** William J. Burns is named the fourth Director of the FBI.
- 1924** J. Edgar Hoover becomes the Director of the FBI. Under his regime the Bureau greatly expands its power

and prestige. Hoover is exceptionally good at publicity, and his relentless promotion of his own organization in the press and popular media, especially during the era of Prohibition and mobsters, creates the enduring image of the two-fisted, "untouchable" G-Man. (Hoover is also very good at making himself covertly useful to the Executive Branch, increasing his own influence by providing Presidents from Roosevelt to Nixon with information about subversive elements and political enemies.)

- 1932** Kidnapping is made a federal crime.
- 1934** Concerns about organized crime spur Congress to allow FBI agents to make arrests and carry firearms.
- 1935** Hoover founds the FBI Academy at Quantico, largely ending the practice of recruiting agents with police backgrounds in favor of training their own.
- 1940** With the specter of World War II looming over the US, Congress passes a law making it a federal crime to "advocate violent overthrow of the government." This was the justification used first by President Roosevelt to have the FBI begin covert investigation into "subversive" groups (which itself led to the COINTELPRO scandals of the 1970s; see below.) Also, a subdivision of the FBI is created, called the Special Intelligence Service, to combat German espionage in Latin America for the duration of the war.
- 1946** Congress passes the Atomic Energy Act, which specifically requires the FBI to "determine the loyalty of individuals with access to Atomic Energy secrets." Armed with this new mandate, the FBI devotes tremendous time and resources in the late 1940s and 1950s to ferreting out Communists in government service.
- 1960-1971** The FBI expands its programs combating subversive organizations, under the umbrella of "Counter Intelligence Projects" or COINTELPRO. The social turmoil of the Sixties and especially the fear of riots, bombings and other sabotage leads to frequent covert investigations by the FBI against controversial people and groups like Martin Luther King, Abbie Hoffman, John Lennon, the Nation of Islam, and the Weathermen.
- 1963** President Kennedy is assassinated. The crime is investigated at first as a local homicide by the Dallas police, because murdering the President was not at the time a federal crime; Lyndon Johnson issues an Executive Order a few days later allowing the FBI to get involved, and the law is changed in 1964.
- 1970** The Racketeer-Influenced and Corrupt Organizations Act (RICO) is passed into law, giving the FBI a powerful weapon against organized crime by allowing disparate accusations of crimes by a group to be investigated and prosecuted together.
- 1971** NBC reporter Carl Stern files a set of Freedom Of Information Act requests about investigations by the FBI against American Leftist groups, leading to embarrassing revelations about the FBI's illegal wiretapping activities.
- 1972** J Edgar Hoover dies after 48 years as Director. His immediate successor, L. Patrick Gray, serves as Acting Director until being caught in the tangle of Watergate amid accusations of destroying documents and obstructing the investigation.
- 1973** Clarence Kelly, former FBI agent himself and then-police chief of Kansas City, becomes Director with a mandate to "clean up" the Bureau and cooperate with Congress' investigations into alleged COINTELPRO abuses. (The FBI itself maintains that the program was ended in 1971.) The Senate Select Committee holds hearings through 1976, but though several activities of the past are condemned, no files are charged and the Senate seems satisfied that the programs have been discontinued.
- 1978** Kelly resigns. William Webster takes over as Director and oversees the expansion of FBI efforts in battling drug-related crime, counterterrorism, and the Savings & Loan scandals of the 1980s.

- 1987** Webster resigns to move laterally over to head of the CIA, and William Sessions is selected as Director. Sessions is considered an outsider by the rank and file of the Bureau, and there is occasional open antagonism among the senior staffers.
- 1992** An FBI sniper accidentally kills the wife of federal fugitive Randy Weaver during a tense standoff at Ruby Ridge, Idaho.
- 1993** The FBI is accused of mishandling the standoff with David Koresh and his followers when their compound burns down in Waco, Texas.
- 1993** Sessions is removed by President Clinton in 1993 over ethics violations (building a fence around his house with FBI funds and flying his wife for free on government flights.) Louis Freeh is named Director, with the mission of restoring public confidence in the FBI and streamlining the organization for the future. He begins cutting staffing and reorganizing departments.
- 1995** The Murrah Federal Building in Oklahoma City is bombed, and the FBI leads the investigation.
- 1996** The FBI is accused by several former employees of gross mishandling of evidence at their laboratories, including some charges of intentionally favoring the prosecution in criminal cases.

Organizational Personality

The FBI generally inspires a fair amount of institutional loyalty. Partly this is a holdover from the Hoover days, when the FBI seemed to operate without much Congressional oversight and the media helped further the pristine image of the forthright, brave, two-fisted agent battling the forces of organized crime. There is no doubt that the Bureau remains the premiere crimefighting organization in the world in terms of resources, prestige, and authority. However, the 1990s were a period of intense second-guessing of Bureau procedures and policies, and in many cases the agency has hunkered down and developed a "bunker mentality" against its critics.

Critics of the FBI point out that they have the lowest rate of conviction and highest rate of declined prosecutions of any government agency, and have been accused of "selective prosecution" in support of various political agendas. Further, FBI agents have a perception within government circles for being "cowboys," preferring the action of "cops & robbers" and showy drug busts to the methodical building of cases against white-collar offenders and corporate criminals. The Bureau also has still not entirely escaped the shadow of the revelation of the COINTELPRO abuses, and some believe programs like this continue against leftist organizations like Earth First! and the opponents of the World Trade Organization.

Despite the public black eyes of Ruby Ridge and Waco, FBI recruitment is still tremendously successful. (No doubt, the popularity of shows like *The X-Files* and movies like *Silence of the Lambs* are at least partly responsible for this.)

Structure and Jurisdiction

Of all the federal law-enforcement agencies, the FBI has the broadest mandate; basically, it investigates all federal crimes not expressly assigned to another agency. This includes over 200 types of crimes, meaning an FBI background can cover the widest possible range of possible duties and skills. GMs can pit agents against organized crime families, drug smugglers, bank robbers, or domestic terrorist groups, dealing with crimes as prosaic as smuggling or kidnapping or as convoluted and challenging as white-collar embezzlement. FBI agents also investigate crimes such as child pornography, consumer product tampering, telemarketing fraud, or toxic waste-dumping. Any crime occurring on a Native American reservation is also the purview of the Bureau, as are violations of the Civil Rights Act and Equal Credit Opportunity Act. And, of course, there are always threats against the President, Vice-president, or members of Congress to investigate. FBI PCs should never be bored.

In addition to investigation, the FBI has a couple of other major responsibilities. As the best-funded law-enforcement

agency in the country, they naturally have the best infrastructures and databases, which they are expected to maintain and share with other federal agencies or state or local officials as needed. The Bureau administers the National Crime Information Center (which provides information to law-enforcement agencies worldwide), provides extensive training programs, and publishes the annual Uniform Crime Reports. Apart from its own academy at Quantico, VA, the FBI also runs a similar training program at the International Law Enforcement Academy in Budapest, which trains police forces in "emerging democracies." The FBI is also responsible for background checks on nominees for "sensitive" government posts, including Presidential appointees and federal court judges. Somewhat less officially, since the days of J. Edgar Hoover the FBI has had a reputation for serving as the direct covert investigation agency of the President, with several reputed shady activities only justified by executive order and with minimal openness.

The FBI works in concert with the United States Attorneys, providing them with information about crimes that they can choose to prosecute. Title 28, Section 533 of the United States Code places the FBI firmly under the Executive Branch umbrella: officials in the Bureau are appointed to work on behalf of the Attorney General to "detect crimes against the United States." The Directorship of the FBI is a Presidential appointment, with "the advice and consent of the Senate," serving a ten-year term.

The Director is assisted in his duties by a Deputy Director. Below them are thirteen Assistant Directors; eleven of those are responsible for a Division and assisted by a Deputy Assistant Director of their own. There are also Assistant Directors in the Office of Public & Congressional Affairs, in charge of reporting on what the FBI actually accomplishes, and the Office of Public Responsibility, which handles civilian complaints. There are two other special posts equivalent to an Assistant Director in authority: the General Counsel for the Bureau, and the Equal Employment Officer (who makes sure federal hiring standards are met).

The eleven Divisions of the Bureau have confusing titles, and it is frequently difficult to pierce the bureaucracy and determine which division handles what (complicated by the similarity between many of their names), but here is a listing: Administrative Services, Counterterrorism, Criminal Investigations, Criminal Justice Information Services, Finance, Information Resources, Inspection, Investigative Services, Laboratory, National Security, and Training. Greater detail is provided on several of these below.

The FBI has over 11,000 active Special Agents (in keeping with the original terminology used by Bonaparte), and 16,000 assorted support employees. This massive force maintains 56 field offices (including one in Puerto Rico), in various metropolitan areas of the US. Each is run by a Special-Agent-In-Charge (SAC), except for the offices in Washington DC, New York City, and Los Angeles. These largest three offices are headed by an Assistant-Director-In-Charge, due to the large numbers of agents and support staff they must manage. Each SAC has an Assistant SAC. Each Field Office is responsible for several smaller Resident Agencies, which are satellite offices in less populated areas and are run by Supervisory Senior Resident Agents (SSRAs.) Finally, there are four Information Technical Centers, where the computer databases are maintained, in different areas of the country (Pocatello, ID; Fort Monmouth, NJ; Butte, MT; and Savannah, GA).

The FBI has also expanded its presence overseas in the last two decades. The International Operations Branch of the Criminal Investigation Division coordinates all overseas activities, which require the permission of the host country and coordination with the State Department, generally through one of the 38 Legal Attache offices scattered around the world. This branch also coordinates the FBI's relationship with Interpol and with foreign law enforcement agencies that have permission to operate within the United States.

Some of the other divisions require further details. The Criminal Justice Information Service (CJIS) Division maintains the National Crime Information Center (NCIC) database, which includes the national fingerprint database, as well as databases on missing persons, state arrest records, etc., and is generally available to assist any local authority. This is a tremendous resource for any hacker/researcher PC, official or otherwise. Another subdivision with a lot of gaming potential is the Critical Incident Response Group (CIRG), formed in 1994 as a multi-divisional task force for emergency response to major terrorist activities such as bombings, hijackings, etc., as well as hostage and barricade scenarios. The Hostage Rescue Team (HRT) has been combined into the CIRG recently. A third subdivision that can be an interesting addition to a modern-day scenario is the Disaster Squad, a subdivision of the FBI Labs Division that specializes in the rapid identification of the deceased at disaster sites.

The Special Agent

A Special Agent of the FBI begins his or her career at the FBI Academy in Quantico, VA. In order to qualify as a Special Agent, applicants must have a ST and HT of at least 11, and an IQ and DX of at least 10. Eyesight and hearing must be at least average, and the applicant must have no physical disadvantages that would interfere with meeting the physical training standards. Candidates also have to pass several interviews and a full background check, so many of the most severe mental disadvantages are also disqualifying. They must be between the ages of 23 and 37, and have a four-year degree at an accredited institution. Agents who have degrees in accounting or law or speak a foreign language of particular use to the Bureau (for example, Spanish, Russian, or Arabic) will be preferred.

The Academy itself sits on 385 acres of lovely woodlands, and includes several dorms, a dining hall, library, chapel, auditorium, and a world-class forensics lab. There are several gymnasias, over a dozen shooting ranges, a driving track for training, and an entire fake "town" of building facades called "Hogans Alley" for training in urban tactics and surveillance. The Agent training program is sixteen intensive weeks, in which the trainee takes classroom courses alternated with physical training. A graduate of the Academy should have the skills listed below:

- At least one of Law (Federal Crime)-14, Accounting (Forensic)-14 or fluency in at least two useful languages besides English. If Law (Federal Crime) is not used for this qualification, the agent must still spend at least 2 points on that skill.
- At least 4 points in: Criminology, Gun (Pistol)
- At least 2 points in: Driving (auto), Forensics, Judo, Karate, Shadowing
- At least 1 point in: Computer Operation/TL 7, First Aid/TL 7, Gun (rifle), Handcuff*, Holdout, Interrogation Leadership, Psychology, Research, Stealth, Tactics
- At least 1/2 point in: Administration, Diplomacy, Fast-Draw (pistol), Gun (Light Automatic), Running, Writing

* Handcuff is a new P/A skill, defaulting to DX-3, the successful use of which allows the user to apply ordinary handcuffs to a docile or surprised subject (or a resisting subject who is pinned, as B112) in a single action. Without this skill, applying handcuffs takes 2d6 seconds. Handcuffs cannot be applied to a subject who is resisting without pinning or otherwise immobilizing him.

At the end of the training period, the agent begins a two-year probationary period. They will be assigned to a field office (the Bureau will consider any requests for postings, but retains final decision based on its own needs) and given a "mentor," usually a Special Agent with at least five years experience, to oversee the continuing training in the field. Special Agent status gives the agent the Legal Enforcement Powers advantage at the 10-point level, plus Administrative Rank (FBI) at the 5-point level. Also, the FBI itself becomes a patron, Very Powerful, Quite Often. A Duty (Almost All the Time) is added, making the entire basic package (without including required skills) worth 50 points.

Keep in mind that this package is for Special Agents, and it's entirely possible to have FBI employment in a character's background without any of these requirements, if they've been employed in some other capacity. The FBI employs over 16,000 support staffers in various areas like lab technicians, programmers, fingerprint specialists, translators, lawyers, chemists, etc. All that is required for these positions is a physical (ST & HT of at least 9), passing a low-level background check, and possession of relevant professional skills. Many support staffers have at least a basic self-defense course (say, at least 1/2 point in Judo) and firearms training, but even this is not a requirement for most positions.

The Administrative Ranks for the FBI are as follows:

- *Rank 7:* Director
- *Rank 6:* Deputy Director
- *Rank 5:* AD or other Divisional Head
- *Rank 4:* Deputy AD or ADIC
- *Rank 3:* SAC

Rank 2: SSRA or Asst. SAC

- *Rank 1:* Special Agent
- *Rank 0:* Support Staff

Please note that at any given time Ranks 6 and 7 are unique positions. As suggested on p. B22, no PC should begin with an FBI rank above 3.

Agents carry credentials, handcuffs and sidearms (typically .38s or .45s of various makers- the FBI uses a wide range of firearms). Special Agents are expected to maintain a fairly strict dress code.

by **Stephen Kenson**

"[Wonder Woman's invisible plane] is just the sort of lovely and pointless idea we should encourage."
-- from Alan Moore's proposal for the *Glory* comic book series

The world of the *Aberrant* RPG from White Wolf Games Studio is a near-future transformed by the presence of people with super-powers, known as "novas." *Aberrant* takes many of the cliches and conventions of the comic book genre and examines them in a new light. After all, if you really had super-powers would you put on a colorful costume and start robbing banks, or would you sign a lucrative licensing deal with Nike or Disney that could earn you millions? Not all of the "heroes" in *Aberrant* are motivated by pure altruism, nor do the "villains" operate purely in the name of badness. The setting has a more post-modern look and feel compared to its comic book predecessors.

However, that additional level of realism sometimes means *Aberrant* sacrifices some of the "lovely and pointless" elements of the comics (as comic book writer Alan Moore once called them); things like fantastic lost cities, aliens, weird science, giant monsters, magic (with all its alliterative spells and entities), parallel universes, and so forth. Fortunately, the *Aberrant* setting is more than capable of explaining a lot of weird stuff, it's just a matter of how high on the weird-O-meter scale you want your own *Aberrant* game to get.

The mechanism *Aberrant* provides for explaining the comic book superpowers of novas is the ability to mentally control quantum forces, believed to be the fundamental forces that make up physical reality. Some of the wilder ideas of quantum rubber science offer plenty of opportunities to add strange elements to this game world.

Super-Science!

"Of course! Reed Richards! The most gifted inventive genius of our time!"
-- *Fantastic Four #15*

A staple of the comics that *Aberrant* tends to downplay is the wondrous variety of super-scientific gizmos heroes and villains seem to whip up at the drop of a hat. The prime reason for this is novas can actually use their scientific discoveries and inventions for the betterment of humanity (or at least to earn big royalty checks), rather than just using them to commit or solve crimes. Nobody invents a time travel device and then just keeps it in their Bavarian castle. Therefore the game tries to limit the proliferation of advanced technology to keep the world looking like something vaguely resembling our own. If you're not concerned with such consequences, then you can loosen the restrictions placed on Mega-Intelligent novas who want to invent teleportation devices and other such world-altering machines. Just be aware that such technology will transform the setting in a fairly short amount of time.

Another way to allow super-technology into the game that doesn't impact too greatly on the setting is to draw a distinction between novas inventing new, viable technologies that anyone can use and nova-made "gizmos" that are really just manifestations of the nova's inherent quantum ability to bend reality. For example, the nova invents a particular device, but only he (or another nova) can make it work as it's supposed to. In anyone else's hands, it's just a useless piece of junk and, if anyone takes it apart, not only can they not figure out how it works but it will appear that it shouldn't work at all.

The City in a Bottle

"I have to check the city-in-the-bottle regularly to see that the tiny people inside it are safe!"

-- Superman, *Superman* #134

Characters in the comic books often have access to fantastic places like the bottle-city of Kandor in Superman's Fortress of Solitude, Wonder Woman's home Paradise Island, and the Microverse visited on occasion by the Fantastic Four and other Marvel heroes. While it's not likely someone in *Aberrant* has a city under glass sitting on a desk somewhere (although you never know), there are still plenty of possibilities for "bottle cities" that fit into the setting.

One possibility is the existence of a "virtual city" (or even a "virtual world") that exists solely inside a computer. Computers in *Aberrant* are becoming more and more advanced due to the genius of nova engineers and programmers, and some novas can interface with computers directly via the cyberkinesis power. Perhaps a simulation or computer model of a real-world city takes on a life of its own. By putting on VR suits (or using cyberkinesis), characters can "enter" this virtual world and interact with its inhabitants. This allows for adventures like the movie *The Matrix*, or lighter fare like *Tron*. The virtual world can be just about any kind of setting and the characters may or may not have access to their nova powers there, allowing for change-of-pace adventures.

The unleashed quantum forces in *Aberrant* may lead to other sorts of "bottle cities." Perhaps a "fold" in spacetime traps a city or town outside of the rest of the world, surrounded by an impenetrable "fence" only novas (with their quantum manipulating abilities) can pass through. What happens to the people inside the "quantum barrier," cut off from the outside world, possibly forever? They might revert to a more pastoral existence, with no television, radio, or other outside resources. Or they might be forced to become more independent and self-sufficient, depending on the size of their bio-sphere.

The spacetime fold might also cause time to pass more quickly for the people trapped inside it. Imagine: a town vanishes off the face of the Earth. Novas sent to investigate discover a spacetime distortion invisible to everyone else. Inside they find the lost town, only centuries have passed for the people there rather than hours or days. When the novas return, they discover they've only been gone a matter of seconds rather than weeks or months. How might such a pocket of "fast time" evolve? What happens when the evolved (or de-evolved) society within finds a way back to Earth?

A literal "city in a bottle" is difficult to explain even with the quantum rubber-science of *Aberrant*, but it could be that such a "shrunk city" might be inside a spacetime distortion similar to the one mentioned above. The city only looks miniaturized from the outside; pass through the distortion and you find yourself in the full-sized city. Perhaps the world outside looks enormous, or perhaps it's not even visible.

Lost Worlds

"It's the strangest feeling I've ever known! I'm actually flying in a world that should have died out a million years ago!"

-- The Angel, *X-Men* #10

Comic book settings often feature various "Lost Worlds," places where dinosaurs still roam and savage tribes of people struggle to survive. They often have elements of different ancient civilizations (lost worlds where the successors of the Roman Empire still live are quite popular). Marvel Comics' Savage Land is one such example, as are Skartaris and the Wild Lands from the DC Comics *Warlord* and *Superboy*, respectively.

There are several ways to introduce Lost Worlds into the *Aberrant* setting. The first is the *Jurassic Park* approach; some Mega-Intelligent nova scientist figures out how to clone dinosaurs from DNA samples (or genetically engineer convincing fake dinosaurs). The thunder-lizards are grown on an isolated tropical island, intended as test subjects for scientific study, the attractions for a new theme park, or both. Naturally, things don't always go smoothly, and novas have to deal with a rampaging T. Rex or two.

Perhaps a nova with temporal manipulation abilities comes up with a way to "fish" into the past, hooking dinosaurs

(and other creatures) and "pulling" them into the present. Putting aside the possibility of temporal paradoxes and the like arising from this approach, its a good way to bring real dinosaurs into the present. You can always have the science-types speculate the the dinos come from an alternate past or "shadow time" that doesn't impact the present in any way, keeping history intact. (On the other hand, a more fragile temporal continuum may lead to lots of other problems for novas who start tampering with it.)

If "pulling" things into the present from the past doesn't affect our history, then the idea might get extended to creating "living laboratories" for observing human and proto-human civilizations abducted from the past, isolated "habitats" where real ancient Romans or Egyptians still live. Maybe alien and "faerie" abductions in the past are the result of nova time-travelers looking for "specimines" for the future. And what if there are people in the future doing the same thing in our present?

Finally, novas might run into a natural quantum phenomenon like a "pocket universe" where dinosaurs still thrive (perhaps alongside primitive humans, unlike our own history). Is the "pocket" a fluke of quantum forces or a portal into the past (our own or that of a parallel universe)? With their quantum-manipulating abilities, the most powerful novas may even be able to create their own pocket universes, populated however they want! In addition to being amusing playgrounds, they may offer all kinds of scientific insights.

They Came From Outer Space!

"They were merciless! They were inhuman! Greater than Earthmen! They were the deadly Skrulls from Outer Space!"
-- *Fantastic Four #2*

People in *Aberrant* have explored the solar system a bit farther than anything we've done; being able to teleport out to the orbit of Jupiter to collect samples and take pictures without having to wear a space suit has its advantages. Still, space is vast, and humans in *Aberrant* haven't gone beyond the confines of the solar system, or encountered any other life out there. This is quite different from the comic books, where dozens of alien races visit Earth on a regular basis, although the general populous rarely, if ever, finds out anything about them and most are considered nothing but hoaxes. Definite proof of alien life would certainly change how humanity looks at the universe.

Fortunately, *Aberrant* is set in the same universe as White Wolf's *Trinity* RPG, which takes place over a hundred years after *Aberrant*, when humanity is exploring the universe and has encountered some aliens. If you want to stay true to the *Aberrant/Trinity* timeline, then any human contact with the aliens from *Trinity* that takes place in the 21st century will have to be covert. If you're not worried about altering the *Trinity* future timeline, then you can feel free to plunder *Trinity* for ideas about alien encounters, and have the Qin show up a century or so early to pay us a visit.

Plenty of popular science fiction deals with first contact with an alien race in the present or near future. Unlike the comics, first contact is likely to be a momentous event in *Aberrant*, unless something happens to ensure things remain covert, in which case you can run *X-Files* type adventures as the Powers That Be in the *Aberrant* world (like Project Utopia and the Directive) work to cover up the existence of alien beings while the player characters encounter increasing evidence of their presence.

Aberrant is also well suited for the appearance of truly alien lifeforms, along the lines of David Gerrold's *War Against the Chtorr* series or the Swarm invasion in the *Wild Cards* anthology series of books (both detailed in *GURPS* sourcebooks). An alien infestation might not be smart enough to know that Earth has novas to defend it, or might be operating based on outdated information from before the eruption of the first novas, and therefore not expecting any heavy resistance. While Chtorrians are more than a match for most humans, novas should be able to plow through them. But there are likely to be a lot of alien creepy crawlies, and there are only so many novas.

If an intelligent alien race makes contact, they might still be hostile (leading to a nova-powered version of *Independence Day*) or they might be peaceful, although still mysterious regarding their intentions (like the enigmatic Qin from *Trinity*), leading to plotlines like those on the *Earth: Final Conflict* television show.

There's also the possibility of aliens having visited Earth in the past that aren't around any longer. Warren Ellis' story

"The Outer Dark" in *The Authority* comic book postulates that Earth was actually terraformed by an alien in the distant past, inadvertently leading to the creation of life. Now, millions of years later, the alien returns to find its "summer home" infested with six billion of these little parasites that call themselves "humans." H.P. Lovecraft's *Cthulhu Mythos* stories are about the existence of very alien creatures visiting Earth from space and possibly other dimensions. Imagine sending a group of novas up against a mixed-up cult they think is led by a renegade nova, only they discover this nova can summon strange things, some of which seem to have minds of their own. Quantum Constructs, aliens, or demons? Is there really a difference?

The Mystic Arts

"The mystic arts of black magic are older than the memory of man! In time to come, let us peer behind the enchanted veil together!"

-- Dr. Strange, *Strange Tales*

There's no magic in the **Aberrant** world . . . or is there? Novas all gain their amazing powers from the ability to mentally manipulate quantum forces. Still, who's to say that isn't the same thing as magic? After all, the **Aberrant Player's Guide** states that small numbers of novas have existed before the mass-eruptions in 1998. The powers of these novas may have led to the creation of myths and theories about magic throughout history. Also, a number of modern occultists and scientists speculate that quantum models of the universe may account for "magical" or "psychic" abilities possessed by humans. If the nova potential is latent in everyone, then perhaps the mystic arts aren't all that far from the powers of novas.

Nova powers also tend to manifest within the framework of the individual nova's experiences and beliefs. So a nova particularly dedicated to studying the occult might manifest quantum powers based around how he or she things magic works. The powers might be dependent on particular magical rituals or trappings like symbols and talismans. The Satanist novas in the **Reignofevil.com** book use this motif. The characters Fortunato and the Astronomer from the *Wild Cards* books were aces (novas) with similar limitations. And when a mystically-minded nova with the Quantum Construct power uses it to summon a horde of demons, who's to say they're not real? Maybe demons have always been "quantum constructs" or perhaps what novas like to clothe in the comfortable terms of "quantum power" is really something else altogether.

Of course, there's always the possibility that the abilities of novas only scratch the surface of the "true" nature of reality. Storytellers looking for a real weird combo may want to import some of the cosmology and systems from White Wolf's Mage: the Ascension RPG, where people with the ability to reshape reality are fighting a secret war for control over it. The existence of novas definitely changes elements of the Mage setting, but the two systems could coexist with a little work. (*Editor's note: check out [To Tear The Scales From Their Eyes](#) for a view of such a world.*)

Parallel Dimensions

"I am from the other side of the mirror . . . I was born in an antimatter reflection of your universe. Where I live, good is evil and vice versa."

-- Alexander Luthor, *JLA: Earth 2*

One opportunity quantum theory and the quantum powers of novas opens up is the existence of parallel universes, perhaps an infinite continuum of worlds where events happened differently from how they happened in **Aberrant's** timeline. Fred Alan Wolf's book *Parallel Universes: The Search for Other Worlds* provides all sorts of information on the science behind the theory of parallel universes, how they might exist, and how we might be able to reach them. It's certainly possible novas might have the ability to travel into parallel universes, or bring things from parallels into their universe (the "dino-napping" in *Lost Worlds*, above, is one example of this).

Parallel universes provide a great mechanism for stroytelling simply because they're places where novas can "let loose" without seriously impacting the setting of the regular series. If a nova causes California to slide into the ocean on a parallel Earth, it doesn't affect the nova's home-world (although it should certainly affect the nova). Parallels offer the

opportunity to show what might have been, or what might be, if the characters were to take a different path. The Storyteller can also use encounters with parallel versions of the player characters to point up particular things about their background or personality, like holding up a distorted mirror that exaggerates certain things.

Of course, there's also the possibility of a parallel universe making contact first, either sending peaceful explorers or an invasion fleet. Even peaceful contact with the best of intentions may go awry if the visitors make mistakes about our culture, technology, or the like (or if they simply underestimate human greed and paranoia). Hostile contact may be the start of an interdimensional war (or just a skirmish, depending on how difficult it is to travel between worlds). What do the novas do when a refugee from a parallel world that's going through its own version of the Aberrant War (described in *Trinity*) shows up on their world begging for their help? Do they go to another world to stop Taint-crazed versions of themselves and the people they know from destroying it? What does that tell them about the future of their own world? If they intervene once, where do they stop? Once the floodgate of parallel worlds is opened, there may be no going back.

Fabled Realms

"Asgard! Fabled realm of the Norse gods!"

-- "Tales of Asgard" from *Journey into Mystery*

More than a few novas fall prey to what is known as "India Syndrome." With their god-like powers, these novas actually come to believe they are gods or, at the very least, divinely empowered. The Syndrome is named for the fact that so many of the novas that erupt in the Indian sub-continent believe they are avatars of the Hindu gods, with their powers and appearance matching accordingly. These novas are often worshipped by baseline followers, petitioned to use their "holy" powers to aid and protect their people. And what is a pantheon without some infighting between divinities from time to time?

As with magic, who's to say whether or not nova "gods" are the genuine article? Perhaps some of the mythological gods actually were novas, real people with superhuman powers that became the basis of the myths and legends. Perhaps those novas were "channeling" the same archetypes from the Universal Unconscious, the Morphic Field, or some similar source, in which case the modern "gods" are just as real as their predecessors, if not more so. Even if these novas aren't really gods, they're worshipped and believed in; do the characters have the right to destroy the faith of the people who believe in them?

Mythology provides a rich source of ideas for nova characters and plotlines. Perhaps modern-day nova deities are re-enacting some of their ancient myths. Old rivalries between gods and pantheons flare up and a "war of the gods" becomes a distinct possibility, with the player characters caught in the middle. Self-proclaimed "angels" war against "devils" (nova and otherwise). Competing nova "deities" create conflicts of faith among their human worshippers, while others proclaim new cults and religions, like the Church of the Immanent Escheaton or Kamisama Buddhism. What's more imposing, facing off against a Taint-ridden aberrant freak or the living incarnation of Kali, the Hindu goddess of destruction?

And what of the fabulous realms of the gods, the heavens, hells, and various afterlives? It's quite possible, given the existence of parallel universes (above) that these places all exist somewhere "out there." Are they real places that some special people (novas?) have had contact with in the past, were they created by powerful nova "gods" in the past, or did they arise somehow out of an interaction between the Universal Unconscious and the quantum structure of reality? Or are newly erupted nova "deities" actually creating entire new universes at the moment of their eruption to fit into their concept of their place in the cosmos? There's really no way of knowing for sure, but it's possible that some novas have the ability to travel to these worlds, allowing Storytellers to re-enact the battles of Ragnarok or other mythological events with the novas as the stars of the show. Characters can pay visits to "heaven" or "hell" and have their preconceptions of the universe shaken by those experiences. And there's always the possibility that something from one of those realms might come to pay us a visit.

Recommended Reading

There are many sources of ideas for adding strange new elements to an *Aberrant* game. One of the best is the comics themselves, although most of the ideas in the four-color comics need to be looked at through the modern "lens" of the *Aberrant* setting to give them just the right twist to make them fit, like the things described in this article. Some other useful sources of inspiration are given below.

- Carroll, Peter. *Liber Kaos*. Samuel Weiser, Inc. Although this is mainly a book on post-modern occultism (known as "chaos magic") it does have some interesting ideas about the nature of space-time and the universe and how they make magic possible. Applicable to the quantum powers and abilities in *Aberrant*, especially if you want to tie them to magic.
- Crosley, Reginald. *The Vodou Quantum Leap*. Llewellyn Publications. Vodou and quantum theory combine to make a surprisingly coherent look at how the universe may work, with some ideas applicable to novas, particularly those of a mystical bent.
- Ellis, Warren. *The Authority*. Wildstorm (DC Comics). A comic book series about a group of superhumans who could easily be novas, set in a world full of "lovely and pointless" things and general weirdness. If you like *Aberrant* you owe it to yourself to pick up this book. Ellis wrote the first twelve issues, but it's now being ably written by Mark Millar. Ellis' earlier work on *StormWatch* is also worth looking at (and has been conveniently collected into four graphic novels).
- Gruenwald, Mark. *Squadron Supreme*. Marvel Comics. A graphic novel (originally a 12-issue comic series) about a super-team that takes responsibility for fixing all the world's ills and falls into some ethical dilemmas along the way. A little more "comic book" than *Aberrant*, but with a lot of ideas applicable to it.
- Hite, Ken. *Suppressed Transmission*. Steve Jackson Games. Ken Hite's Suppressed Transmission column in Pyramid is a weekly dose of weirdness usable in all sorts of ways. For the conspiracy buffs there's lots of opportunities to weave in threads of plots going back to the dawn of time, while those looking for elements of the fantastic will often find them here. Not always applicable to *Aberrant*, but always a good read. Some of the columns have been collected into two books, also from Steve Jackson Games, and complete with annotations and footnotes.
- Moore, Alan. Nearly anything by this brilliant British comic book writer is worth looking at. He coined the phrase that gives this article its title and has a great insight into the nature of comic book stories. Of particular interest is his *Watchmen* series (considered a classic), along with *Promethea*, which gets into the nature of stories and archetypes, and comics like *Supreme*, *Tom Strong*, and *Top Ten*.
- Morrison, Grant. *JLA*. DC Comics. Grant Morrison's modern interpretation of the Justice League of America manages to sneak in all kinds of modern science weirdness about superspace, the fifth dimension, time travel, nanotechnology, and quantum theory in between the colorful costumes and heroic action.
- Talbot, Michael. *The Holographic Universe*. HarperCollins. Quantum theory and holographic reality for the average reader. Provides lots of information about new scientific theories about the nature of reality and how they may be tied to paranormal abilities. Full of ideas usable with *Aberrant*.
- Waid, Mark & Ross, Alex. *Kingdom Come*. DC Comics. A comic series (also collected into a graphic novel) about a future DC Universe where everything's going to hell. Some good ideas of what the *Aberrant* setting might look like not long before the Aberrant War happens.
- Wolf, Fred Alan. *Parallel Universes: The Search for Other Worlds*. Touchstone (Simon & Schuster). How modern scientific theories speculate about the existence of parallel universes, what they might be like, and how we might be able to visit them. Full of ideas about the quantum science that forms the background of *Aberrant*. His *Taking the Quantum Leap* is also worthwhile.

by Dmitri Scull

Designing races that behave in a completely unpredictable manner isn't too easy with *GURPS*; the basic rules assume that the character is a rational, thinking being . . . which isn't necessarily the case in a fantasy scenario. Races such as the fae, or creatures born from chaos, will not behave according to what is acceptable in polite society, they may not even be recognizable as intelligent.

Remember that these Disadvantages are disruptive before taking them; the Game Master may wish to limit them to NPC characters, unless the party is ready to deal with an individual who is clearly insane. This may not be a problem in a game based around the Faerie Folk, or that regularly deals with primal chaos, or any good comedy game, but serious games may have a problem with insane player characters.

On the other hand, if treated in a serious fashion, any of these Disadvantages can make for a truly dark and scary villain, especially one with spells or psionics that can induce madness in others . . .

Irrational

-30 points

The character is wildly unpredictable, and draws unsupported conclusions and acts in a bizarre and uncontrolled manner. The character is clearly insane by most standards. This Disadvantage requires roleplaying. Aside from that, the character must make a Will roll at -4 to behave in an orderly manner or not act on a whim. Most people react to irrational individuals at -4 or worse, fearing them to be dangerous. No character can have the Irrational Disadvantage and the Wild Disadvantage. A character can be both Irrational and Impulsive, but will act on just about any whim, no matter how self-destructive or dangerous.

Whimsy

-10 points

Whimsical characters cannot take anything really seriously. They constantly make jokes, laugh at inopportune times, and are unlikely to react in what most would consider a useful manner. A character with the Whimsy Disadvantage can make a Will roll to remain serious, if the situation warrants. If the character is actually funny, this may give a reaction bonus at times. If the character isn't funny, this is usually worth a -1 penalty. In situations requiring tact and a serious demeanor, this is worth at least a -1 to reactions. Characters with the No Sense of Humor Disadvantage react to characters with Whimsy at -2 (and vice versa).

Wild

-15 points

The character tends to act on his or her whims, often behaving in an unpredictable manner. This is a lesser form of the Irrational Disadvantage. A character with this disadvantage who wishes to resist an impulse must make a Will roll. Note that this differs from Impulsive in that the actions of impulsive characters still tend to make sense; a character with this Disadvantage tends to act on any impulse. No character can take this Disadvantage and the Irrational

Disadvantage. Characters who are both Impulsive and Wild tend to act on any and all impulses. Most people react to Wild characters at -2.

154 bean cards, 7 3rd bean field cards, rulebook; \$14.95

Players sitting through their first session of Rio Grande Games' German import, *Bohnanza*, may have trouble deciding which is funnier, the idea that they are all a bunch of bean farmers, or the hilarious illustrations of their crops. *Bohnanza* is a card game of resource management and wily trading. Once all of the laughter subsides, and that may be a while, players will find a clever game that continues the tradition of substantial German imports.

Two to seven farmers manage two bean fields, attempting to plant beans and harvest them at just the right time to get the best price while making room for incoming crops. After the farmers have gone through the deck three times, the player with the most gold coins wins.

The rules of the game are clear and easy to follow. The rulebook is colorfully illustrated and the margins contain text that repeats the most important rules for easy reference. The final page contains variations on the game based on the number of players. By removing some of the cards, players can adjust the game for two to seven players, although the two player version requires significant rule changes.

The cards are high quality playing cards with simply fantastic illustrations. The black-eyed bean is a dazed boxer with a shiner, the soy bean is dressed like a hippie, and the red bean is very embarrassed because he is nude. There are eleven types of beans in all.

Players begin the game with a hand of five bean cards. The order of cards in a hand is very important, so players must never rearrange their beans. During a turn, a player starts by planting the first bean card in her hand, and optionally the second. An empty bean field can contain any kind of bean. A bean field with one or more beans already planted can only have more beans of the same kind. If both of a player's bean fields contain beans, and she must plant, then she will have to harvest one of her fields. (A farmer can alleviate her pain somewhat by purchasing a third field for three gold coins.)

At any time during the game, players may harvest their beans. At the bottom of every bean card is a "beanometer." The beanometer shows a set of numbers and a stack of gold coins for each number. This tells the player how many gold coins he or she will receive for selling that number of beans. For example, if a farmer sells four wax beans, he gets one gold coin. If he sells seven he gets two coins. He gets three coins for nine beans and four coins for eleven beans. The rarer beans have a better return on their beanometers. Of the eleven types of beans, the cocoa bean shows up the least (only four in the entire deck), and it has the best return on its beanometer. The plentiful wax bean, at 22 for the deck, requires many more cards to turn a profit. The frequency of each bean in the deck appears on the bean cards as a yellow number.

The back of each card has an illustration of a gold coin, so players merely flip the necessary number of cards to keep as their score and discard the rest. This has the effect of lowering the number of that particular bean in the deck, so players have to pay attention if a particular type of bean is becoming scarcer.

After planting the first card in her hand, the active player then draws two cards and places them face up in front of her fields. She will have to plant these two new beans. If they match the beans already in her fields, then she can plant

them for a bigger harvest. If they do not match, she will want to trade them away.

Players can trade beans from anywhere in their hands for the two new cards. They can also trade for cards from the active player's hand. Players can donate a bean card to another player if they are desperate to get rid of a card. The receiving player, however, can turn down the donation. All players are out to fine tune their hands so they can plant wisely on their turns. After trading, players must plant all of the beans they received in trade or donation. Ideally, the active player will be able to plant more of the same type of beans and will have traded away any other beans. Finally, the active player adds three new cards to the bottom of her hand and the next player takes a turn. Players shuffle the discards when the deck is depleted to form a new deck. When the deck is exhausted for the third time, players add up their coins to determine a winner.

The challenge of ***Bohnanza*** comes from being forced to plant too soon. Players are constantly faced with this problem. Just as they finally have two fields with plenty of beans, along comes a stink bean to force them to harvest a field before they got the maximum number of coins from the beanometer. Often, players will have to harvest without getting even a single coin. The only remedy for this is smart trading tactics. Through trading, players can get rid of useless cards from their hands and can avoid being forced to harvest early. Unfortunately, every card traded or donated usually helps an opponent.

Players must also keep an eye out for bean market surpluses. If two players are already planting chili beans, a third player will have difficulty trading for these beans. A crafty trader will try to play these chili farmers against one another to get the best beans for her chili cards.

Like so many games coming from Germany in the last decade, ***Bohnanza*** provides a great deal of fun with attractive, high quality components. Games last about 45 minutes and anyone age 12 years old and up can handle the rules.

Pyramid Review

A Lion in the Ropes (for d20)

Written by Stephen Chenault

Published by [Troll Lord Games](#)

24 b&w pages; \$6.00

A Lion in the Ropes is a *d20* adventure designed for 4-8 characters levels 2-4. The adventure is set in Troll Lord Games' *World of Erde* in the *After Winter* Dark Fantasy Campaign Setting. The author doesn't waste precious space explaining how to either scale the adventure or place it in a different setting, trusting that a capable DM can either do so herself or find the relevant information in the *Dungeon Master's Guide*.

The adventure is short but well thought-out and very different from other *d20* offerings to date. The book opens with a brief narrative to establish the setting then goes on to give an outline of the adventure as a whole as well as relevant history of the region and how it pertains to the events of the story. The background is informative without being gratuitous and while the players will likely never discover most of the details, knowing the underside of the iceberg is essential for adding dept to the adventure. Also included is a brief (four paragraph) section titled "Advice from a Tired Referee." As the name implies, this is a somewhat apologetic attempt at advising the DM, concerned mainly with how to maintain mystery, build suspense, and handle an encounter-based adventure with numerous red herrings.

Troll Lord's original material, including NPCs, new monsters and new spells, is separated in gray boxed text, while flavor text intended to be read to the players is printed in bold type. There is actually an inordinate amount of such flavor text in the adventure, including quite a bit of NPC dialogue. This is a far cry from the usual *D&D* style of a short paragraph of read-aloud description followed by several (sometimes tedious) paragraphs of DM information. Moreover, the dialogue is reasonably well-written, more akin to a good novel than the usual role-playing fare.

Jason Walton's cover painting is excellent, conveying an amusing sense of menace while taking little risk of spoiling the adventure. The interior art is not quite as impressive but is not bad by any means. It is also relevant to the adventure. Maps are included on the interior covers of the book. While they get the job done, they are dull by comparison to those in Wizards of the Coast's products. Unfortunately, *A Lion in the Ropes* uses two full pages on the *d20* and Open Game Licenses, using the same font for them as the main text. For a twenty-four-page book these are wasted pages indeed.

A Lion in the Ropes is a good, solid adventure that should make for a fun evening of play. It is rather short at (effectively) twenty-two pages but even so it is well worth the \$6.00 cover price.

(SPOILER ALERT: Potential players should read no further.)

The adventure does a nice job of setting up red herrings to deter the players from easily identifying the villain in the story. The most misleading fact is the sighting in the area of a large, cat-like creature with a mane of serpents that local folklorists identify as a dreaded Charon Fiend, a close cousin of the chimera. In reality the "Charon Fiend" is nothing more than a tame lion recently escaped from a traveling carnival. The restraining board and frayed ropes still clasped to his head have given him the appearance of a mane of snakes, which has led to his misidentification. This is a clever ruse on the author's part and a well-drawn illustration of the hapless beast makes it clear how such a mistake could be

made. However, the title of the adventure and especially the reprinting of said illustration on the back cover give away entirely too much of the secret. Moreover, half a page of text is given to the stats of the Charon Fiend even though the beast never actually appears in the adventure.

The resolution of the ultimate conflict is equally paradoxical. The true culprits in the story make for some tough monsters to fight, but the adventure provides a potentially elegant resolution to the conflict. However, on the chance that the PCs don't think of this solution, there are several more, powerful monsters inexplicably waiting inside a sealed tomb for the characters to fight. This seemed like a cop-out from what might otherwise have been a refreshing way to end the adventure.

Even so, conscientious Dungeon Masters should have no difficulty utilizing this adventure to its best potential.

Pyramid Review

Siege on Tolkeen: Chapter Five, Shadows of Evil

Published by [Palladium Books](#)

Written by Kevin Siembieda

112 b & w pages; \$12.95

The fifth installment of the *Siege on Tolkeen* takes a step back. Instead of more monsters, magic items, and techno-wizardry devices, the book surveys the land and the damages done to both sides so far.

There are no chapters in the book, but thanks to the contents page, and the quick find page, things can be found fairly quickly. Starting off with a brief update on the Tolkeen forces and their triumph from book three, the *Sorcerer's Revenge*, the reader discovers that many of the Tolkeen volunteer forces have slowly started to disband. The two main reasons are that they think the war is over, and they are tired of the evils committed by Tolkeen in its defense.

The majority of the book has locations, NPCs, and tables to add into the *Siege On Tolkeen* campaign. This ranges from wastelands such as The Barrens, earthly fortresses crafted by Earth Warlocks, to Skelebot Graveyards where scavengers, active Skelebots, and other terror wait. The most detailed area, Mad Town, is mapped and has over fifty locations for characters to explore. One of the more interesting groups of bandits or freebooters is the White Knights. Organized by Lady White, a fallen Cyber Knight, this group has some morals and honor, but serves the Tolkeen forces out of hatred for the Coalition.

The most useful parts are the updated maps that show where all these things fit into the regions. Both Tolkeen and Coalition forces have P.O.W. camps, but the Coalition ones are death camps. The master map on page 48 shows where all the new areas introduced in this book, Mizereen Barony, Rivereen Barony, Wildwoods Barony, and others, fit in with the Tokeen Barony, the Hives, where the new Barrens, and CAMPS are. The ending, an epilogue, has a nasty surprise for the Tolkeen forces which should lead up to *Chapter Six: Final Siege*.

The art continues to be a strong seller for the *Rifts* line. Kent Burles does some fantastic landscapes for the Barrens, lending the scored earth a personality that few artists could capture. His full page spread on page 6 shows a tower of stone fighting off Coalition forces. Other illustrations by Burles of the Barrens help bring this location to life and give GMs a great visual reference. Other artists, like Wayne Breaux Jr. and Freddie Williams II, do a great job, but the lion's share goes to Burles illustrations.

As far as adventures, this book only has one in Hook, Line, Sinker format dealing with the Coalition Death Camp, but there are enough seeds scattered throughout location and NPC descriptions that most GMs should get months worth of value out of the book.

I would have liked to see more details on some groups that changed alliances from Tolkeen to the Coalition. The break up of many volunteer units and the disillusionment mentioned would have made strong factors in crafting new power groups that stood against their former Tolkeen allies. A few more adventures would've made this product even better, but for \$12.95, you definitely get your money's worth here.

-- Joe G. Kushner

The Head That Wouldn't Die: The Baffling Baphomet

"Ed . . . you don't know what you're talking about!"

'Oh yes I do! I was a Mason until I found out about Baphomet!'

'Who?'

'This "Great Architect of the Universe" you pray to is NOT the God of the Bible . . . It's really Baphomet! And he's ugly, frightening and completely satanic.'

'That's impossible! I've never even heard that name. Have you, Sally?'

'No, I haven't.'

'Of course not, Sally. Most Masons don't learn about Baphomet . . . until they get to the highest degrees. Wait here, I've got a picture of him in the car. I'll be right back.' "

-- Alex, Ed, and Sally, in *The Curse of Baphomet*, by Jack T. Chick

Sadly, the picture Ed brings back from his car is not Baphomet at all, but the famed "Goat of Mendes" drawing (or "the Devil," in most Tarot decks), misnamed Baphomet by the excitable, if sloppy, Eliphas Levi. Of all the many things the tortured Templars described their putative idol as, a goat is not really on the list. So, without Ed to guide us, we shall have to look elsewhere for the truth. And perhaps, in the unblinking eyes of Baphomet, we'll see truths that will either raise us to superhuman levels of numinous power or send us shrieking back into welcome catatonia. But, let's not get ahead of ourselves.

"[Seek] a man's head with a large beard, which head they kiss and worship at all their provincial chapters, but this not all the brothers know, save only the Grand Master and the old ones."

-- from the instructions for the arrest of the Templars

The fifth article of accusation against the Templars held "that the brothers practiced idol worship of a cat or a head." The putative idol of the Templars (which, in the Real World, they sadly didn't possess, as Edward Burman notes in his *Supremely Abominable Crimes*) became known as "Baphomet" at some point during the trial. Whether the inquisitors or the tortured knights first named it remains uncertain. As, in fact, does the appearance of Baphomet -- of the 231 knights examined by the Inquisition, only 12 of them mentioned the head specifically. The consensus description is of a very fierce, bearded head, usually with long hair, and occasionally depicted with glowing eyes. However, Baphomet is also described as having two or three faces, being made of golden or silvery metal or of wood, being a human skull, or even being a woman's head. The formal charges of 1308 took this variance into account, arguing that "in each province the order had idols, namely heads, of which some had three faces and some one, and others had a human skull."

"Then it is really foolish to fight the Turks, now that Jesus Christ no longer opposes them. They have vanquished the Franks and Tartars and Armenians and Persians, and they continue to do so. And daily, they impose new defeats on us: for God, who used to watch on our behalf, is now asleep, and Bafometz puts forth his power to support the Sultan."

-- from a poem by the troubadour Ricaut Bonome, ca. 1265

The real explanation, prosaic as it may be, is that in Provençal, Mohammed (or Mahomet, to the medieval Europeans) is often rendered Bahomet, or Bafomet, or Bafometz. King Philip accused the Templars, essentially, of collaborating with the enemy by worshiping the "demon" Mahomet. (The fact that the last thing secret Muslims would do is worship a humaniform idol is enough to clear the Templars of both charges.) If the Templars did have a symbolic head in their commanderies (and aside from one dubious silver reliquary, no such head turned up when they were searched), it may have been the skull of the first Grand Master, Hugues de Payens. Whose coat of arms, it turns out, was three black heads on a golden field -- recalling both the gold and the "three faces" mentioned under torture.

". . . 'Bafomet' has no connection with Mohammed, but could well be a corruption of the Arabic abufihamet (pronounced in the Moorish Spanish something like 'bufihimat'). The word means 'father of understanding.' In Arabic, 'father' is taken to mean 'source, chief seat of,' and so on. In Sufi terminology, ras el-fahmat (head of knowledge) means the mentation of man after undergoing refinement - the transmuted consciousness."

-- Idries Shah, *The Sufis*

But before we go racing ahead toward our three faces, it's worth mentioning some of the other ingenious explanations people have offered over the years. By cleverly plugging B-P-W-M-T ("Baphomet") into the Atbash Cipher used in some of the Dead Sea Scrolls, maverick Biblical historian Hugh Schonfield gets SH-W-P-Y-A -- close enough to the Greek word "Sophia," or wisdom. Austrian Orientalist, Freemason, and diplomat Joseph von Hammer-Purgstall got to "wisdom" with less effort (and in 1818, no less), by deciding that the "met" in "Baphomet" was "Metis," the Titaness of Wisdom and mother of Athena. (Is the birth of Athena, female wisdom, from Zeus' male head an alchemical creation, recombined in Baphomet's androgyny?) The "Baphomet" was therefore the "Baptism in Wisdom." My personal favorite is another gem from the fevered brow of Eliphaz Levi -- "Baphomet" is actually "TEM. O.H.P. AB." backwards! That being short, you see, for *Templi omnium hominum pacis abbas*, meaning "In the Temple is the father of universal peace among men." The "father of peace" recalls Idries Shah's theory mentioned above that "Baphomet" is a corruption of the Arabic *abufihamet*, or "father of wisdom" (again with the wisdom!). One Frater Baraka goes even farther and assumes that the "abu-Fihamet" refers to an actual person, the Sufi master Hussein ibn-Mansur al-Hallaj, beheaded (!) in 922 A.D. and (says Sufi fan Ernest Scott in *The People of the Secret*) later known as "Hiram Abiff" (short for "Abifihamet"?) in Masonic lore. And there you have another Mason-Templar link, as if you needed one.

"Other descriptions, clearly referring to copies, included mention of gold and silver cases, wooden panels, and the like. But the Paris head is different. One gets the distinct impression that this was the holy of holies, accorded ceremonial strikingly reminiscent of that used by the Byzantines."

-- Ian Wilson, *The Shroud of Turin: The Burial Cloth of Jesus Christ?*

Of course, you don't need to postulate the Templars as secret Sufis to make the Baphomet a relic. Ian Wilson famously proposed the Shroud of Turin as the Baphomet, noting that one of the Templars burnt in 1314 along with Jacques de Molay was one Geoffroi de Charnay -- and the first recorded owner of the Shroud, in 1355, was one Geoffroi de Charny. De Charny was known as the "bearer of the sacred standard," and lived in Lirey, near the old Templar center of Troyes. The two-sided Shroud would give a "two-faced" figure, and if it was kept folded up in a reliquary with only the face visible it could seem a disembodied head to the lay membership. The Shroud (or the Baphomet) may also have been any of the sacred images of Christ's head from the "Mandylion" cloth of Edessa to the "Veronica" in Rome. Cooler still is the legend (recounted, among other places, in a continuation of the Templar-symp Chrétien de Troyes' *Perceval*) that St. Nicodemus brought a sacred head with him to Britain when he and Joseph of Arimathea fled there with the Grail: "Nicodemus had carved and fashioned a head in the likeness of the Lord on the day that he had seen Him on the cross. But of this I am sure, that the Lord God set His hand to the shaping of it, as they say; for no man ever saw one like it nor could it be made by human hands." Lynn Picknett and Clive Prince, of course, go even that theory one better, saying that the Grail and Baphomet were the same -- the severed head of John the Baptist, which the chronicler Robert de Clari says the Crusaders (including the Templars) looted from Constantinople in 1204.

"Now tell us about the head." "Well, the head. I've seen it at seven chapters held by Brother Hugh de Peraud and others." "What did one do to worship it?" "Well, it was like this. It was presented, and everyone threw himself on the ground, pushed back his cowl, and worshipped it." "What was its face like?" "Terrible. It seemed to me that it was the face of a demon, of a maufé. Every time I saw it I was filled with such terror I could scarcely look at it, trembling in all my members."

-- dialogue between an Inquisitor and a Templar, from *Procés des Templiers*, edited by Jules Michelet

From such heady altitudes, we plummet to the basest diabolism. Picknett and Prince agree that the Templars were, indeed, craniolatrous heretics; perhaps their magical head was the same as the "brazen head" built by Vergil Magus or the demoniac Pope Sylvester or the Templar-friendly magus Roger Bacon? The brazen head would, in fact, match the description of Baphomet as "reddish" as well as explain the various metallic Baphomets. Or, the head may also have been an older idol still, passed down from the ancient Celtic head-cults, or the worship of the fertility god Bran (Baphomet was said to make the trees flower and the land germinate), or even one of the carved faces from the Neolithic shamanic empire of [Glozel](#). Could Baphomet be the severed prophetic head of Orpheus, or of [Dionysos](#), or of his avatar St. George? St. George, of course, is a redaction not only of Dionysos but of Perseus -- slayer of Medusa, whose head inspired paralyzing fear in enemies. Could the Templars have dug up the head of the Gorgon? Medusa, of course, had two sisters, three hellish heads recalling the three-faced goddess Hecate -- and the three faces described on Baphomet by the terrified Templars.

"The point being, our whole planet's genetic intent roots are pirate genesplicers. Pieces of 8, were toroid shadows. Skull and Bones were Orion bone touch spark gap ritual imported into Templar mnemonics "Baphomet" Skull Touch. Jon & Magda's skull and bones after the templar banking cartel planets biggest navy got bad PR disappeared into Scotland and became the pirates, became the CIA. Always massaging the drug cartel for control of externalized disempowered borg psychokinesis access to the time wormholes."

-- Dan Winter, "Liberty Bell Rings Again, As Genes Sing of the Grail"

We can get in even deeper, as the waters of mystification close still further over our heads. [Bisociate](#) our boy Baphomet, then. Baphomet is Orpheus, and John the Baptist, and Bran the Blessed, and Medusa, and Metis. (Don't those names sound eerily similar?) All of them are aspects of the Watcher at the Threshold, the Opener of the Way -- *Bfmaat*, in Enochian, as I am reliably informed. Baphomet's "sparkling eyes" show his role as one of the Grigori, the Watchers -- the heads in the subsidiary commanderies serving as Orwellian telescreens for the Templars' true master in Paris -- or Babylon -- or Hell. If Baphomet is a mechanism, the Brazen Heads become individual control or interface terminals -- or, perhaps, all three were the same Head, reappearing or reconstructing itself from some demonic blueprint, a time-shifting (and hence "prophetic") AI. Perhaps the "Templar kiss" and the peculiar transference of "cords" from Baphomet to his worshipers truly referred to Baphomet's implanting of psychometric controls, or alien parasites, or a magic toad, in the skulls of his followers in a kind of [trepanative](#) impregnation. The central processor may be a holographic personality imprinted in the center of the [Crystal Skull](#), taken by the Templar Fleet to the [American Refuge](#) in Mexico. Like Yog-Sothoth, Baphomet is only dimly seen as "a congeries of (head-shaped) spheres" -- like the Grail, its shape is ever-shifting. Perhaps the Templars worshiped Baphomet -- or perhaps only their sorceries kept it penned up in their round churches and towers. Now that they're gone, Baphomet rules America from the Skull & Bones fraternity in Yale. Heads up!

Friends Don't Let Friends Forward

Unfortunately, the column I wanted to write this week has been put on hold so I can talk about an item that, the more I think about it, the more upset I get. I also feel bad, because this column doesn't apply to the vast bulk of you. But I also believe this needs to be said . . . so here we go.

* * *

As I've reported here before, I was at the Gaming Invasion convention a couple of weekends ago, and someone came up to me and said (and I'm paraphrasing here):

"Hey, Steven! It's really great to meet you! I'm a big fan of what you're doing. (pause) Well, I haven't actually subscribed yet, but people are forwarding me stuff from the magazine all the time, and it's great!"

Now, I have many things in this world that I'm thankful for, but at that very moment I was particularly glad that I'd never consumed the contents of that mysterious bubbling vial from my mad scientist friend's lab a year earlier. For if I had, I'm sure that, at that moment, my muscles would have surged with all the raging fury an editor can summon, and I would have rended him limb from limb. (Either that, or my remaining hair would have fallen out . . . quality control on nature-tampering concoctions is sorely lacking.)

Those who know me would, I generally believe, consider me to be pretty easy-going. I almost never get angry. But I was angry then.

All the more upsetting, two other people made similar comments at this convention. And we're not exactly talking a GenCon-sized gathering here.

All of this reflects one of the sad truths of our little industry of fun:

If you don't buy it, we don't make money.

While this may seem pretty darn obvious, it's also seemed to elude the folks I met at that convention, and, presumably, whoever has sent *Pyramid* content to them.

Over in the message boards, a fair number of people make suggestions about how to improve the magazine. And while many of them are very good ideas, most of them break down to requiring either time or money (or both). And, really, the former is usually a version of the latter. Webmasters, writers, artists, and *<ahem>* editors need to buy their Ramen just like everyone else.

Unfortunately, we're limited with what we can accomplish. While we were profitable in 1999 (and, once we get the numbers in, I hope for 2000, too), we aren't so profitable that we don't appreciate every subscriber we can get. So when I hear of folks sending or getting sent articles from *Pyramid* -- folks who I doubt would swipe a boxed set from their FLGS or photocopy a game book for their pals -- it saddens me, and makes me wonder how many subscribers we *could* have. But the internet age makes it so easy to copy, paste, and email (or post to a website) that we may scarcely realize the implication of our actions.

Within the confines of our rules, we provide (in my opinion) a lot of leeway. You can tell your friends about an article. You can email them the sample link (where they'll get the first paragraph or two). You can -- if the article is Steve Jackson Games support -- possibly send them the sample link to get the full article. And you always have the right to print out one copy of an article; you can show or mail that printout to a friend. And those are all possibilities you have *without* needing to write to us for any special permissions or break the law.

From a professional standpoint, I want nothing more than for *Pyramid* to be the best it can be. But to grow, and improve, and become a mad whack voodoo publication, it needs your help. We have that, now, because you subscribe.

Thank you. Now I'm asking the few of you who may not understand . . . please don't hurt our potential for growth.

Or at the very least, *please* don't brag to me about it at a convention.

For more information on our policies, check out our [Copyright FAQ](#). If we can clarify anything (or, of course, if you want to write about anything else), feel free to contact me at pyramid@sjgames.com.

* * *

I fulfilled one of my personal geek-dreams this week by buying a personal document binding system. This is a device that punches the little rectangular holes along the edge of a packet, then lets you bind them on little plastic spiral-type combs (the sort you generally get from copy shops and college packets). I'd always wanted one of these, but all the devices I'd ever seen were *awfully* expensive. Well, I've finally found one that's meant for personal/light office use; it only punches around 5-6 pages at a time, and can only bind documents up to 100 pages thick (though I'm probably going to try to jury-rig something to use the larger binder combs at some point). It was about \$65 after tax, which is pretty expensive but will also pay for itself after a dozen bindings . . . so I'm not worried.

Anyway, with the growth of PDFs and other RPG downloads, I'm delighted to finally have a good way of printing and binding manuals. Already I've bound the first four volumes of my *Pyramid* printout archives (approximately four hundred pages covering the first six months of the online magazine), and I'll probably start trying to make physical versions of some of my favorite online electronic RPG documents real soon.

Even better, when I start my next campaign I'll be able to create actual booklets for my players with all the information they need. These *feel* more professional, useful, and "real" to me, somehow, than Duotang folders, 3-ring binders, or stapled packets. Even better, I'll be able to add and remove pages fairly easily from these packets, so I might have their character sheets, histories, and notes in there too. And, of course, if they find the Sinister Conspiracy's Secret File, I'll be able to create something *really* special.

But if you decide to buy one of these, make sure you take a friend who can intervene to ensure you only buy this item . . . *especially* if you're an [Office Depot](#) junkie, like I am.

-- Steven Marsh

*(Five stars) "**Field Gravity Detector:** This sensitive device is used to detect the presence, magnitude, and directional component of local gravitation fields. The field gravity detector requires no external or internal power source, drawing it's [*sic*] energy for operation from the local gravity field itself. The unit consists of a divided flattened cylindrical indicator body and a thin gauge tether, which is attached to the indicator body and the hand of the operator."*

by Volker Bach

" . . . then the Batavian auxiliaries began putting in their well-aimed sword thrusts, striking with their shield bosses, cutting up faces . . . "

Tacitus, *Agricola* 36, 2

" . . . first their quarters, then their wardes, blowes, thrusts, and breaking of thrusts, then their closes and gripes, striking with the hilts, Daggers, Bucklers, Wrastlings, striking with the foote or knee in the Coddes . . . "

George Silver, *The Paradoxes of Defense*

There are few GMs running fantasy campaigns who have not, at some point, been irked by the question: "Can I play a samurai?" That is, of course, because samurai (or ninjas, or Shao Lin monks, or just about every mysterious Asian fighter) are trained in the martial arts, while knights, longbowmen, legionaries, and bravos merely have some unconnected, unrelated and usually comparatively ineffective weapon skills. That this very widespread misconception is adopted wholesale by most roleplaying games does nothing to dispel it. The usual solutions are either to enforce (against the wishes of the players) running the campaign on a strictly western line, or populating the fantasy middle ages (or, for that matter, the historical medieval period) with wandering ninjas, outcast ronin, and enslaved Chinese fighter monks. A third option is to flesh out the fighting abilities of those legionaries, knights and Vikings with what we know of Europe's native Martial Arts tradition. It won't (and shouldn't) make them the equals of high-kicking cinematic Shao Lin monks, but it helps to close the "coolness gap" yawning between East and West in these matters.

The biggest problem facing enterprising GMs is that, while books and roleplaying supplements on Asian martial arts abound, the Western traditions that came before Renaissance fencing are obscure and little understood. Little or nothing of them survives to this day, and the written and pictorial sources are rare, full of gaps, and hard to interpret. The largely academic work done on the matter translates badly into roleplaying. However, it is possible, with some handwaving and a lot of educated guesswork, to put together a picture of western martial training.

The differences are obvious at first glance. Europe's martial arts tradition is mostly armed, using empty-hand techniques only to supplement weapon strikes. It is also utilitarian, almost completely lacking the mystique of the Oriental schools. There were no meditative or mystical elements in its swordplay, no religious significance in its kicks and grapples, and accordingly, tales of cinematic feats were few and far between. This does not mean that there was no sophistication, though. Wherever we get glimpses of them, combat styles were complex and refined, often including highly specialized and difficult moves as a matter of course. Any GM looking to include Martial Arts rules in his campaign will find them easily the equal of the more popular Eastern styles.

The descriptions of styles in this article are largely conjectural, with a lot of guesswork to fill in gaps. The decision whether to call an unarmed technique Brawling or Karate, Wrestling or Judo has been made conservatively. GMs should feel free to upgrade them whenever they feel it appropriate, generally tinker with the styles, and create personal and period varieties. We know these existed, though it is impossible to tell from the sources what they were like. The article also concentrates exclusively on combat styles used in war. 'Civilian' styles must have existed, but unfortunately we have no information about them after AD 300.

New Maneuvers

Hook (Hard) ***Defaults to Polearm-2, Axe/Mace-2, Two-Handed Sword-2 or Two-Handed Axe/Mace-2***
Prerequisite: Polearm, Axe/Mace, Two-Handed Axe/Mace or Two-Handed Sword
Cannot exceed prerequisite skill level

This attack can be used with every weapon that has a hook or hooked beak (halberds, picks, bearded axes, bills, daggeraxes, poleaxes and various exotic polearms fall into this category). A specialised form of the Maneuver is also used with the quillons of two-handed swords gripped by the *ricasso*. The attacker uses the hook to catch the target's limb, weapon or shield (the attack must be specifically targeted to one of these. Hit Location penalties apply).

A Hook attempt can be dodged, parried, or blocked. However, since the Hook does not depend on getting through armor, the PD of all armor is reduced by 2 for purposes of defending against this attack. After a successful Hook, the attacker pulls his weapon to put the target off balance. This pull happens on the same turn, immediately after the attack. If the weapon's hook is sharp this may cause some cutting damage in the process (GM's call. The amount should not exceed thr-1 even for the largest weapons). Armor protects fully. Other effects depend on what is hooked.

If a weapon is caught, the attacker may attempt to disarm the target. Roll a Quick Contest between the attacker's Hook and the defender's Weapon Skill or Retain Weapon Maneuver. If the attacker wins, the target is disarmed. If the defender wins he retains his weapon, but an unbalanced weapon is unready the following turn. Swords, knives and similar weapons without protrusions to catch onto can not be hooked. If a shield is hooked the attacker can pull it aside. Roll a Quick Contest between the attacker's Hook and the defender's Shield Skill. If the attacker wins, the shield becomes unready. The defender is prevented from blocking and loses the benefit of its PD until he can re-ready it.

If a limb or the neck is hooked, the attacker may pull the defender off balance. Roll a Contest of ST between the attacker and defender (the attacker is at -1 if he uses one hand only, +1 for a weapon with Reach 2, +2 for one with Reach 3. A mounted defender may substitute his Riding Skill for ST). If the weapon does damage to an unprotected location, the defender needs to make a Will Roll to force himself to resist the pull (+2 for Combat Reflexes, +4 for High Pain Threshold). If the attacker wins the Contest of ST, the defender is pulled off balance and can not use any attacks or Active Defenses the following round. If he wins by more than 2, the defender falls down. If the defender wins he keeps his balance and can act normally.

Mounted Shooting (Hard) ***Defaults to any Ranged Weapon Skill-4***
Cannot exceed prerequisite skill level; must specialize

In addition to the bow, cavalrymen can learn to competently use almost any ranged weapon while mounted. Javelins and darts were commonly used from horseback in Antiquity, crossbows in the late Middle Ages, and carbines and pistols in the modern world. This Maneuver represents such training. It reduces the penalty for shooting from a moving horse for other weapons in exactly the same manner that Horse Archery does for the Bow Skill.

Mounting Vault (Average) ***Defaults to Riding-3, Jumping Acrobatics or Equestrian Acrobatics***
Prerequisite: Riding

Before the introduction of the stirrup most riders were used to mounting their horses either with help from a comrade or by using a stepping stone. Cavalrymen, and anyone else who depended on speed and versatility, were trained to vault into the saddle. For an unencumbered man to jump on a standing horse with a 3-hex running start is at Riding-3. Add the rider's Encumbrance and the horse's Move, if any, to the Penalty. Rome's elite cavalrymen were able to leap onto a trotting horse in full armor.

Attempting to vault onto a horse is tricky. On a failure, roll vs. DX immediately. On a success the rider is left standing beside the horse looking stupid. On a failure he falls to the ground. A critical failure results in a fall and spooks the horse.

Swim with Mount (Average)

Defaults to Riding-4

Prerequisite: Riding

Cannot exceed prerequisite skill level

This Maneuver represents the ability to control a horse in the water. The Celtic and Germanic tribes of Northwestern Europe were masters of this art, and many Roman cavalrymen were trained specifically in it. A roll has to be made when entering the water and every time the rider tries to change direction or do anything other than just sit still. Obviously, the horse has to be trained to do this as well. The best horsemen were supposedly able to throw javelins, shoot bows and engage in swordfights while their mounts were swimming. Even less able cavalrymen using this Maneuver will be able to cross rivers, lakes and inlets without putting aside their armor and shield and emerge on the opposite bank fully battle-ready.

Twirling Javelin (Hard)

Defaults to Spear Throwing -2

Prerequisite: Spear Throwing

Cannot exceed prerequisite skill level

It is possible to throw a balanced javelin so that it flies end over end, like a throwing axe, rather than in a straight line. This allows the thrower to send the spear around an enemy's shield but requires a good eye for range to make sure the weapon doesn't impact sideways, or butt forward. A twirling javelin reduces the effective PD of a shield by 2 for all Active Defenses. However, it is less accurate (Acc 1) and has less range (1/2 Dam: ST, Max: ST x 1 1/2) than a regularly thrown javelin. The Twirling Javelin Maneuver was taught to Roman cavalrymen to fight shield-bearing warriors in close formation. It is impressive to look at, but not much use beyond this narrow specialty.

Antiquity

In spite of tantalising glimpses through Egyptian frescos, Assyrian reliefs and Syrian pottery we do not know enough to reconstruct the martial arts of the ancient Orient. Certainly these old and often warlike civilisations had sophisticated fighting techniques to teach to their warriors, though, and GMs wanting to speculate need not stick to the 'primitive' mode. However, our first glimpses of a recognisable fighting system in surviving sources comes from Greece and Rome.

In the Greek city states of the Classical age, every citizen was a soldier and martial skills were widespread and considered essential to a well-rounded upbringing. Even long after the citizen armies of the Classical *polis* had been abandoned, military training was part of a proper education for every male Hellene. For most, this meant little more than the basics of handling shield and spear and a degree of physical conditioning at the public *gymnasion*, but dedicated practitioners went farther than that. Eachers of the *hoplomachia* (lit. 'armed combat') as well as the empty-hand sports of boxing, wrestling and *pankration*, offered their services to eager youths. Their status was disputed, some thinking them essential to a city's military strength while others regarded them as dangerous men of doubtful morals. Indeed, some philosophers agued that this kind of training was detrimental to a soldier since it taught him how

to defend himself rather than rely on his comrades in the firm battle line.

HOPLOMACHIA

7/14 POINTS

Hoplomachoi led with their heavy round shields (PD 3, 15 lbs), often held out at an angle in front of the body or even horizontally, with the rim pointed at the opponent. Attacks were often led by shield bashes and executed with the spear, targeting unarmored locations. Fighters were trained to use the pointed butt spike aggressively when an occasion presented itself. Some used slashing broadswords as secondary weapons, but shortswords were more common. All were trained to grapple and stab with their swords or butt spikes in close combat.

Primary Skills: Shield; Spear; Wrestling

Secondary Skills: Boxing or Brawling; Broadsword or Shortsword; Running

Maneuvers: Close Combat (Broadsword or Shortsword); Hit Location (Spear); Lunge (Spear); Spinning Strike (Spear)

Cinematic Skills: Immoveable Stance

Cinematic Maneuvers: Enhanced Block

The Roman legionaries, starting out with the Greek tradition, developed a distinctive fighting style of their own. We can get a reasonably accurate picture of this *armatura* from the sources for the 2nd and 3rd centuries AD, when the Roman army was placed on a professional footing and the troops received thorough training. The basic forms were similar for legionaries, auxiliaries and marines, though the various arms emphasised different weapons. In many cities the young men of the upper and middle classes also took instruction in military combat styles as a matter of pride. The *armatura* was taught by professional instructors, sometimes brought in from gladiatorial schools. Roman soldiers positively prided themselves of their knowledge of dirty tricks, and any number of unsporting Maneuvers could reasonably be added to the style.

ARMATURA

7/-- POINTS

Roman soldiers were trained to lead with their shields carried on the long arm and used aggressively to bash or shove the enemy. They attacked with the sword around the sides, preferring the stab to the cut so as not to expose themselves. Auxiliaries also used a stabbing spear. Close combat techniques were less emphasised.

Primary Skills: Broadsword (for auxiliaries) or Shortsword (for legionaries), Hiking; Shield; Spear (for auxiliaries) or Spear Throwing (for legionaries)

Secondary Skills: Brawling; Knife; Spear Throwing (for auxiliaries) or Spear (for legionaries); Wrestling

Optional Skills: Axe/Mace; Bow; Riding (horse); Sling; Swimming

Maneuvers: Feint (Broadsword or Shortsword); Hit Location (Broadsword or Shortsword); Retain Weapon (Broadsword or Shortsword)

Cinematic Skills or Maneuvers: The Roman legions were a prosaic bunch, and few legendary feats of arms are reported. However, given the great store Roman writers put by the stamina and bravery of their troops, several levels of Extra Fatigue and Fearlessness as well as the Immoveable Stance Skill seem appropriate. Power Blow (shortsword), Enhanced Block and Kiai (the *barritus* battlecry) also fit the mix.

The cavalymen of the Roman Empire combined the martial traditions of the various subject peoples into a composite, highly effective fighting style that blended standoff engagements (every cavalryman had to be proficient with either the javelin or the bow) with hand-to-hand techniques. It survived through much of the Dark Ages. More heavily armored, carrying a longer spear and less reliant on the shield, the cavalymen of Byzantium and Dark Age Europe used a similar style. Byzantine cavalymen were trained with the bow while Western ones usually used the javelin. A historical 'Knight of King Arthur' would be trained in the *armatura equestris*.

ARMATURA EQUESTRIS

13/-- POINTS

The horsemen of the Roman Empire faced the enemy with their shield side, protected by a medium shield of light construction wielded in a mobile blocking style. Some were trained as mounted archers (slipping the shield behind their back on a sling rather than abandoning it altogether), but the majority used the spear and javelin as their main arms. Thrusting broadswords similar to those used by the auxiliaries were worn and competently handled by all Roman cavalymen. (Some cavalymen were recruited from the infantry and already were fully trained in the *armatura*).

Primary Skills: Bow [2] or Spear Throwing; Broadsword; Riding (Horse); Shield; Spear

Secondary Skills: Knife; Swimming; Wrestling

Optional Skills: Axe/Mace; Brawling; Fast Draw (Arrow or Javelin)

Maneuvers: Direct Mount; Fighting While Mounted (Spear); Fighting While Mounted (Broadsword); Hit Location (Spear); Horse Archery or Mounted Shooting (Javelin); Mounting Vault; Swim with Mount; Twirling Javelin (javelineers only)

Cinematic Skills and Maneuvers: No cinematic Skills or Maneuvers other than incredibly high levels of skill with their ranged weapons are reported of Roman cavalymen (one of them left an epitaph commemorating how he shot an arrow into the air, then split it in two with a second before it hit the ground, while on the back of a swimming horse in the middle of the Danube!). Some units were specifically trained to cross bodies of water with their mounts in formation.

The Middle Ages

To historians of the martial arts the proverbial Dark Ages extend from AD 400 right up to AD 1300. Some texts and paintings offer rare glimpses of combat techniques that reasonably could (and probably did) combine into a coherent whole, but before the turn of the fourteenth century this material is scarce. However, the very sophistication of the martial techniques that come to light after this date point to a highly developed earlier tradition. It is not unreasonable to suppose that the fighting men of barbarian and medieval Europe kept their battle edge finely honed.

The warriors of Migration Era Europe (c. AD 450-800), including the Vikings, practiced a style we know only in outline. It was partly born from Germanic traditions and partly developed from Late Roman military training but unique in its style. Traditionally, strength was the most admired attribute in a warrior, though speed and dexterity counted for a lot in practice. The most common main weapon was the spear, with many warriors carrying several light ones for throwing and a heavier thrusting weapon for close-quarter fighting. Wealthier men used heavy broadswords geared primarily towards slashing blows, with axes and large fighting knives (Shortsword Skill) still commonly used in battle. Large, light wooden shields were carried by almost everyone, but armor was rarer than in preceding periods. The shields were flimsy by Roman or Greek standards and quickly disintegrated in battle, but they were well suited for this fluid, mobile foot combat style.

MIGRATION ERA FOOT COMBAT

10/18 POINTS

Warriors trained in this school led with their light shields, actively blocking incoming blows and missiles. The shields were quickly destroyed in battle until only the iron boss remained, which was used as a weapon of defense and offense in the left hand (this may be the origin of the sword-and-buckler play that became a style in its own right in later medieval Europe). Parrying with the weapon was only the last line of defense. The main weapons of attack were the spear and axe or (if they owned one) the sword. Very strong men sometimes specialised in the two-handed axe after c. 1000.

Primary Skills: Brawling; Shield; Spear; Spear Throwing; one of Axe/Mace, Broadsword, or Shortsword

Secondary Skills: Bow; Buckler; Two-Handed Axe/Mace; Wrestling

Optional Skills: Axe Throwing; Knife; Riding (Horse); Swimming

Maneuvers: Close Combat (Sword or Axe/Mace); Hit Location (Spear); Hook (Axe); Kicking; Off-Hand Weapon Training (Sword or Axe/Mace)

Cinematic Skills: Kiai; Power Blow (Sword or Axe/Mace)

Cinematic Maneuvers: Enhanced Block

With the rise of the knights (*milites*) in the 10th to 12th centuries, mounted combat techniques come once again into focus in the sources. Aristocratic fighting men were trained from an early age, and standards were high (Hrabanus Maurus wrote that a boy not trained to be a fighter from age 12 would never be up to scratch). Foot combat, while still taught, was no longer emphasised, to the point where the mounted warrior was thought the only true warrior.

EARLY KNIGHTLY MOUNTED COMBAT

12/14 POINTS

The early knights relied heavily on their large round or kite-shaped shields to protect themselves. They led with the shield side both on foot and mounted, attacking with long spears one-handed. Their broadswords, status symbols and main weapons in man-to-man combat, were used mostly to deliver overarm slashing blows. Stirrups were common and the spear was occasionally seen couched under the right arm, though their saddles did not yet give the support needed for a true 'couched lance' attack and overarm blows, stabs and throws were equally familiar attack modes.

Primary Skills: Broadsword; Riding (Horse) [2]; Shield; Spear; Wrestling

Secondary Skills: Axe/Mace; Brawling; Knife; Spear Throwing

Optional Skills: Animal Handling; Bow; Swimming; Throwing

Maneuvers: Direct Mount; Fighting while Mounted (Broadsword); Fighting while Mounted (Spear); Hit Location (Spear); Mounting Vault; Retain Weapon (Spear)

Cinematic Skills: Power Blow (Spear); Kiai

Cinematic Maneuvers: None are specifically mentioned, but Enhanced Block would be in character.

In the 12th century a slightly different style of combat was developed that remained common in outline well into the 14th century. This is the more stereotypical 'knight' in a long hauberk and mail chausses, a coat of plates on his torso and a fully enclosed great helm, all in bright heraldic colors. Around this time the 'couched lance' style became the knight's trademark attack to the exclusion of most other uses. Horsemanship was still all-important and training had to begin at an early age to gain proficiency.

HIGH MEDIEVAL KNIGHTLY MOUNTED COMBAT

11/12 POINTS

Knights of the high middle ages were still skilled in multirole combat, but the emphasis was much more on horsemanship and the use of the lance. They led with the right, often discarding the shield altogether, and increasingly avoided dismounting. Their style of swordsmanship began to favor the stab over the slash (this is a good place to implement the Primacy of the Point Optional Rule from SWp. 23), and parrying became more important as shields shrank. Swords in the period were made longer, and fighters began to develop the habit of gripping them with two hands for extra power (+1 damage).

Primary Skills: Axe/Mace; Broadsword; Lance; Riding (horse) [2]; Wrestling

Secondary Skills: Bow or Crossbow; Brawling; Buckler; Knife; Shield

Optional Skills: Animal Handling; Climbing; Spear

Maneuvers: Direct Mount; Fighting While Mounted (Axe/Mace); Fighting While Mounted (Broadsword); Hit Location (Lance); Tip Slash (Lance)

Cinematic Skills: Power Blow (Broadsword)

Cinematic Maneuvers: None are mentioned, but Enhanced Parry and Enhanced Block are both defensible.

Into the Renaissance

Rare manuscripts and notes by chroniclers and poets afford us a glimpse of the martial arts as practised in Europe after 1300. The whole topic is too wide to be included in this article in full, but as many of the texts deal with combat practised by the knightly classes they can be used to piece together a view of what a knight's combat training looked like at the time.

(Editor's note: A fuller treatment of the various weapon styles taught in Europe between 1250 and 1500 will be found in the companion article "Vechten unde Schirmen," appearing next month.)

In the later 14th and 15th centuries the picture of knightly combat changed drastically. Highly developed armor and the relative uselessness of the lance against disciplined infantry forced knights to abandon their cherished heavy cavalry role in favor of a more versatile training in foot and mounted combat. Great emphasis was placed on agility and speed in heavy armor as a man's survival increasingly depended on his ability to parry or dodge incoming blows - shields were almost completely abandoned. The free left hand could now lend extra force to blows and aid parries and trick strokes in the two-handed weapon techniques that became a regular feature of martial training at the time. Knights adopted the thrusting bastard sword and poleaxe as their principal weapons, developing mastery of both into refined arts.

LATE MEDIEVAL KNIGHTLY COMBAT

15/-- POINTS

Late medieval knights faced their opponent squarely or leading with the left. They discarded the shield in favor of two-handed weapons, favoring the 6-7' poleaxe with thrusting spikes on either end. This was held by a centered grip like a staff, diagonally in front of the body for better parrying ability. The bastard sword was often handled in a similar fashion, concentrating on defense. (GMs may want to consider allowing the Improved Parry Maneuver for Two-Handed Sword). Refined grappling techniques and a repertoire of knife moves to complement them rounded out their foot combat training. On horseback they were limited almost completely to their role as lancefighters, though they trained with the bastard sword for single combat against cavalry and infantry. Maces and picks were widely carried as secondary weapons for their armor-piercing ability.

Primary Skills: Axe/Mace; Lance; Polearm; Riding (Horse); Staff; Two-Handed Sword; Judo

Secondary Skills: Brawling; Broadsword; Knife

Optional Skills: Animal Handling; Spear

Maneuvers: Close Combat (Knife); Counterattack (2-Hd. Sword); Direct Mount; Fighting While Mounted (2-Hd. Sword); Hit Location (2-Hd. Sword); Hook (Polearm); Spinning Strike (Polearm); Sweep (Polearm)

Cinematic Skills and Maneuvers: the emphasis on parrying ability by contemporary instructors makes Enhanced Parry credible.

The Horsemen of Islam

The fighting style of the early Muslim armies is still shrouded in mystery, around the 13th century we begin to get a picture of the training Islamic elite mounted fighters received. In defiance of a long-standing myth Islamic horsemen wore armor, often more than their Christian opponents. However, their training and tactics fitted them better to the role of light cavalry. Their reliance on the bow prevented them from using large shields and furthered the development of a two-handed lancefighting style more like the Roman tradition than the Frankish. They were also very fond of exotic weapons such as fire siphons, naphtha grenades and crossbows that could shoot primitive molotov cocktails! Contemporary with the knights, a class of professional warrior emerged in the Islamic world that developed this style to a fine art. It is from the Mamluks of Egypt, soldiers purchased on the slave markets and trained from childhood, that training manuals detailing the *furusiyya* (combat horsemanship) survive. Keep in mind, though, that not all Islamic warriors were trained to such exacting specifications.

FURUSIYYA

15/23 POINTS

Practitioners of *furusiyya* were trained in a fast-paced, fluid style of combat keeping their distance from their enemies and engaging them only on ground of their choosing. Mounted, they alternated between showering the enemy with arrows and swooping in for a devastating lance attack. Their swordsmanship emphasised the cutting stroke and some of them used an intriguingly cinematic two-sword style.

Primary Skills: Bow; Broadsword; Riding (Horse) [2]; Spear

Secondary Skills: Axe/Mace; Fast-Draw (Arrow); Knife; Lance; Shield; Wrestling

Optional Skills: Brawling; Crossbow; Equestrian Acrobatics; Fire Siphon; Throwing

Maneuvers: Attack and Fly Out; Fighting While Mounted (Spear) [2]; Fighting While Mounted (Broadsword); Hit Location (Spear); Hit Location (Broadsword); Horse Archery; Mounting Vault; Off-Hand Weapon Training (Broadsword)

Cinematic Skills: Zen Archery would be appropriate, though the flavor is very different from the meditative Kyudo.

Cinematic Maneuvers: Dual Weapon Attack (Broadsword); Enhanced Parry

Further Reading

Unfortunately, most books on the subject are in German or French. There are some useful sources available in English, though. A good start, and within financial reach of most roleplayers, are the lavishly illustrated military history books by Osprey Books. To pursue the matter further, you may want to look at these books:

- Anglo, S. *The Martial Arts of Renaissance Europe.*
- Connolly, P. *Greece and Rome at War.*
- Nicolle, D. *Oriental Military Equipment; The Crusades.*
- Poliakoff, M. B. *Combat Sport in the Ancient World.*

Thanks to Michael Hornbostel, Andi Jones, Nigel McCarthy-Eigenmann, David P. Summers, Johannes Trimmel and the Saturday Bunch for playtesting and comments.

A Tour of the Workshop

by William H. Stoddard

GURPS Low-Tech, like a medieval cathedral, was the work of many hands. It received one of the most extensive playtests of any *GURPS* title; many sections were virtually completely rewritten as a result of playtest discussion. A number of playtesters contributed valuable additional material, notably the character sketches by Jason Morningstar and David Morgan-Mar. And like a cathedral, its building involved a great deal of scaffolding that was taken down when it was done, leaving no visible trace in the finished product.

Like the other Tech volumes, *Low-Tech* was intended to stand on its own, so that anyone who owned the *GURPS Basic Set* and *Compendium I* could use it. The published volume makes almost no reference to *GURPS Vehicles*. But the vehicles and artillery weapons in *Low-Tech* needed to be compatible with *GURPS Vehicles* -- and that meant building all them them using the *Vehicles* rules, to make sure it could be done. These designs are the largest body of "hidden text" in *Low-Tech*. So here is a look at how they were created.

Boats and Ships

From the beginning of civilization up to at least 1800 A.D., large ships were the most sophisticated products of human technology. *GURPS Low-Tech* presents statistics for over 30 such ships, as well as a variety of boats and rafts. Most of the design process was a straightforward application of *GURPS Vehicles*, but a few additional rules were needed to cover options not considered there.

A ship at TL1-3, or a boat at TL0-3, consists of one or more propulsion systems (paddles, oars, poles, or sails); space for the crew to man them and for the officers and passengers; space for cargo; and a hull, which in terms of *GURPS Vehicles* includes a frame, a modest amount of armor (usually wooden), and waterproofing. Warships also have weapons systems, such as rams, catapults, or Greek fire siphons. The volume of the hull has to be sufficient to hold everything else.

So far as propulsion is concerned, *GURPS Vehicles* provides statistics for oars and sails, but not for paddles or poles. Paddling uses the strength of only the upper body; based on this, a paddling position can be estimated to take up the same volume as a rowing position, 10 cf, but to have half the weight, cost, and thrust: 5 lbs., \$10, and 0.25 times the ST of the paddler, in pounds of thrust. Poling is normally done while standing on the deck, and thus requires deck room (9 sf per man) but no space within the hull of the craft. For convenience, the weight and cost of the pole can be included as part of the crewman's personal gear and disregarded. Its effective thrust can be taken as 0.5 times the ST of the poler, the same as for rowing, and more efficient than paddling; but note than poles can only be used in shallow water.

Sails are extensively discussed in *GURPS Vehicles*, which divides them into three types: square-rigged, fore-and-aft, and full-rigged. There were actually many other types of sails, but their differences in performance are often fairly subtle. *GURPS Vehicles* classifies the lateen-rigged sails of Arabian ships as a variant on fore-and-aft rigging; the exotic sail designs of Polynesian seagoing canoes can also be placed in this category, based on their ability to beat upwind.

Crew requirements depend mainly on the system of propulsion and the number of watches. Paddled, poled, and oared craft need very large crews; however, up through TL2 they almost always spent their nights ashore, so they needed no accommodations and no space for a second watch. Sailing ships needed far smaller crews to man their sails (see p. VE75). However, sailing ships often spent nights at sea and carried two watches, doubling the crew size. In either case, a few more crew could be added as officers: a lookout, a coxswain, a steersman, and a captain, for example. Late TL3 and early TL4 voyages of exploration carried even larger crews, often by a further doubling, to allow for the risks of long voyages. Sailing ships, starting at late TL2, had galleys and a few cabins, but the crew typically still slept on deck, or in rowed ships such as Viking longship on their rowing benches.

The number of oarsmen can be estimated from the length of the ship, or vice versa. The dimensions of the human body require roughly 3 feet of length between one oarsman and the next. In addition, part of the ship's length fore and aft cannot accommodate oarsmen; the length of a ship's side needs to be at least 5 feet per oarsman seated along it, and slightly higher in some craft such as canoes. It's possible to fit in more oarsmen, either by stacking them above and below, in two or three levels, or by seating them side by side, or sometimes both. The Chinese yichuan must have had some such arrangement, for example; its 79 feet could have held no more than 16 oarsmen per side, or 32 total, but its complement was 48, so they were probably seated two to a bench on each side for a total of 12 benches on each side.

Estimating cargo space was even more complex. *GURPS Vehicles* allows 20 lbs. of cargo per cf for generic cargo. For specialized bulk carriers, an estimate of 50 lbs. per cf is reasonable for such cargoes as grain, oil, or wine (allowing for space between jars of oil or wine). For ships with a stated burden, the weight can be divided by one of these numbers to obtain a cargo volume. If the burden of the ship is unknown, the cargo volume can be estimated by multiplying the length, beam, and draft of the ship and dividing by 4. (If the draft is unknown, set it at half the beam; if the beam is unknown, base it on the ship's lines -- 1/3 to 1/5 the length for mediocre lines, 1/5 to 1/7 for average lines, 1/8 for fine lines. Most cargo ships had mediocre lines.) If the ship carries open cargo, rather than having a hold, only half the total volume of cargo is considered to be within the hull; that is, double the effective cargo space.

Adding up the space for rowing or paddling positions, the crew and passenger space, and the cargo space gives the volume inside the ship's hull. After adjustment for the ship's lines (see p. VE16), this gives the surface area of the ship (see p. VE18). And at this point things get complicated.

GURPS Vehicles distinguishes a vehicle's structure and armor -- though both have weight and cost proportional to surface area -- and specifies that to be sealed, a vehicle must have armor (which may not be open frame armor) over its entire surface. This seems to imply construction like that of Age of Sail ships, where structure represents the internal frame of the ship and armor represents its hull, or outer skin. But ancient shipwrights seldom followed this model. Typical ships were built hull first, with hull members fastened directly to each other rather than to a frame; partial frames were added afterward for extra strength. Small boats might have no frame at all; dugout canoes were simply carved from logs and all one piece.

For most of these cases, the *GURPS Vehicles* definitions can be forced to fit by assuming that "structure" includes the fasteners that hold the hull together. A craft with only cord fasteners, such as an Arabian sewn boat, has a super-light frame; a craft with clamps, nails, dowels, or the like has an extra-light frame. Adding internal bracing such as ribs increases frame strength from super-light to extra-light or from extra light to light. Most frames are considered to be of standard materials; boats sewn with coarse rope have cheap materials, while the elaborate joinery of triremes counts as expensive materials. Wooden boats usually have standard wood armor, though tropical hardwoods count as expensive wood armor. Bark and leather and basketry are all nonrigid armor.

Dugout canoes are a different case. They actually have no frames at all. Instead, the same weight of material is counted both as structure and as armor. First determine the base weight for 1 sf of structure of the appropriate cost class and TL. Then determine the actual hull weight per sf from DR and type of material, and divide this by the base weight to get a percentage. Multiply the surface area of the craft by 1.5 and then by this percentage to get the HP. This double benefit should only be allowed when the entire craft is carved or shaped from one piece of rigid material. A similar process could be used for the clay tub; however, to reflect the brittleness of its material (in effect, low-tech ablative armor), it is considered as having 0 HP -- any damage that gets through its DR causes hull failure.

Rafts

A different approach is needed to design rafts. *GURPS Vehicles* assumes that a vehicle is, in effect, a hollow box, with components, cargo, and crew in the hollow interior. But a raft has no interior. In effect, it is a top deck (p. VE94) with no body underneath. Trying to determine a volume in cf and work out its design from that involves arbitrary assumptions and leads to unrealistic results. Instead, raft characteristics should be computed directly from area in sf.

A raft is typically a number of logs fastened together in some way. If the fastening is cords, reeds, or withies (lengths of willow), treat this as super-light structure, with a 0.1 weight multiplier (2 lbs. per sf at TL0 1). If it is wooden crossbeams, treat this as extra-light structure, with a 0.25 weight multiplier (5 lbs. per sf at TL0-1). The weight of the logs themselves can be found as follows. A squared-off log with a 1-ft. cross section has a volume of 1 cf per foot of length; p. VE88 gives 30 lbs. as the appropriate weight. If the log is cylindrical, the weight is reduced to 78.5%, or 23.5 lbs. per foot of length. Multiply this by the length of a log and by the number of logs to get the total weight of the wood.

If the thickness of the logs is reduced to 6 in., the weight per log is reduced to 5.9 lbs. per foot of length, a factor of 4; but since the logs are only half as wide, twice as many are needed for the same width, and the overall reduction is by a factor of 2. In general, if the raft area stays the same, any reduction in thickness produces a proportionate reduction in weight and cost for the wood. The DR and HP for each section of a square log can be taken from p. B125; for cylindrical logs, multiply by 78.5% again.

Rafts can be built of other materials, such as the reeds the Egyptians favored. Reed bundles are half again as thick as wood of the same weight; for that weight, they have the same HP but 50% as much DR.

How much can a raft support? Flotation capacity has nothing to do with the volume of the raft, but is based on the relative weights of the raft material and water. Since 30 lbs. of wood occupy 1 cf, they displace 1 cf of water, which weighs 62.5 lbs. So if the piece of wood is carrying 32.5 lbs. of added weight, it exactly equals the water it displaces and the water will be level with the top of the raft. If it is carrying half as much added weight, the water will be roughly three-fourths of the way up the side of the rafts, and so on. Similarly, reed bundles weigh 20 lbs. per cf, allowing them to support 42.5 lbs of added weight; in compensation, they have a lower DR.

Building a Trireme

The ancient ship on which the most detailed information is available is the trireme. Its construction has been debated for centuries. Unfortunately, no actual triremes survive, even as wrecks, but the sheds that housed them have been found in Athens, and there are detailed inventories of various pieces of material and equipment that went into them. Based on this information, an actual trireme was built and its performance tested several years ago. Given all this, the trireme is the ideal ship to illustrate ship construction rules for ancient and medieval times. (See the *GURPS Low-Tech* bibliography for sources of more information.)

A trireme is a long, narrow ship; the hull is 120' long and 12' wide. It carries oarsmen on three levels: down inside the hull, rowing through oarports (27 on each side); along the side at the usual height (27 on each side); and in a superstructure overhanging the side (31 on each side). The ship also carries 5 officers, 11 sailors, and 14 marines. The superstructures are 90' long and 6' wide, of which 2' extends past the side of the main hull, making the total structure 16' wide. (They are traditionally called "outriggers," but they are nothing like the structures on Polynesian canoes.) There is a 25' foremast and a 35' mainmast; typically only one is used at a time, and in battle the ship relies on the oars.

Given the basic requirement for 3' front-to-back space per oarsman, the superstructures can just barely hold the top level of oarsmen. The total ship length is a bit short of the 5' overall length per oarsmen for the bottom two rows. The entire design is organized to fit in the absolute maximum of rowing power. The purpose of all this power is to drive a ram through the water at the highest attainable speed, allowing the trireme to incapacitate enemy ships.

Using the tables in *GURPS Vehicles*, the lowest 54 oarsmen need 540 cf for their equipment and 1080 cf for cramped seats, all in the body. The next 54 oarsmen need the same space for equipment, but 1620 cf for normal seats; of this, 810 cf is in the body (in effect, they occupy normal exposed seats); the other 810 cf in the superstructures. The top 62 oarsmen are entirely in the superstructures, where they take up 620 cf for equipment and 1,860 cf for normal seats. The body also has space for five roomy exposed seats for the officers, 100 cf, and 180 cf of stores. This totals 3,250 cf in the body (increased to 4,225 cf by fine lines) and 1,645 cf in each superstructure. This produces areas of 1,570 sf for the body and 840 sf for each superstructure. The body has a light, expensive frame (1,178 HP) and expensive wood armor (DR 5); the superstructures have extra-light, expensive frames (315 HP) and expensive wood armor (DR 2), open-frame except on top, supplemented by leather curtains along the sides (DR 4) to screen the oarsmen from arrows.

The two masts, if both in use, carry square-rigged sails with 720 sf of total area. The ship is waterproofed, and the front is a massive ram. The crew includes 30 officers, sailors, and marines, in addition to the 170 oarsmen. The trireme carries a bare minimum of supplies and is not designed to spend a night at sea; its crew expect to beach it at night and launch it in the morning. In short, it is more like a fighter airplane than a warship of the Age of Sail.

Empty weight is 48,000 lbs; crew and provisions raise this to 88,360 lbs. A size of 7,515 cf gives a +6 modifier to hit. Top speed works out to 11 mph under oars, or 13 mph in full sail with a favorable wind; in practice the ship relies on oars in battle. Draft is 3.9' when fully loaded; that is, this is a very light ship. This covers most of the key points in vehicular design, and shows that even a remarkably sophisticated watercraft at TL2 can be worked out fairly quickly by a GM who wants a full *GURPS Vehicles* design.

At this point, it's useful to do a check of the volume against the dimensions. The hull cross section is nearly triangular (historians compare it to a wine glass), and thus has roughly half the area of a square cross-section; it also tapers to prow and stern, so its average cross section is roughly half its maximum cross section. Dividing hull volume of 3,2500 cf by length of 120' gives average cross section 27 sf, or maximum cross section 54 sf. A triangle with base 12' (the maximum beam) and height 9' has area 60 sf. This seems close enough to suggest that the design is reasonably accurate.

Mechanical Artillery

After the era of the trireme, warships shifted to relying primarily on mechanical artillery, and such weapons were also used in land warfare, especially during sieges. Ships up through the early Roman Empire carried both of the two main types of artillery then in use, the bolt-throwing scorpion and the stone-throwing ballista.

The scorpion was a relatively light weapon; a typical weight for one carried on a ship was 110 lbs. From the design rules in *GURPS Vehicles* (pp. VE97-100), this indicates a ST 37 weapon (37 x 37 x 0.8 for torsion x 0.1 = 109.5); thrusting damage for this ST is 4d, increased by 1d to 5d. Cost can be computed to be \$5,020, rounded for convenience to \$5,000.

The ballista was a heavier weapon. Exact weights are not available, but ballistas were rated by the weight of the stones they hurled, typical weights being 1 talent (about 60 lbs.) or one-half, one-third, or one-fourth talent. Ships carried light ballistas firing 15-lb. stones. This indicates a weapon of ST 150, which would weigh 4,500 lbs. Swinging damage for such a weapon is 16d. Cost for such a weapon is \$13,800.

Thus, a Roman quinquereme with 9 scorpions and 2 ballistas would have \$72,600 worth of armaments. This makes up more than half its total cost of \$135,000.

The Fire Lance

The single largest change in the weapons lists for *GURPS Low Tech* was in the specifications for the fire lance. The version in *GURPS China* is effectively a primitive one-shot musket. But the actual description gives a different impression: a combustion chamber mounted on the end of a long pole with its exhaust directed at the enemy. Damage from such an attack would be comparable to that from a large, hot fire (1d-1). The exhaust would have no great range;

rocket exhaust damage is quartered for each 2 yards distance from the engine (p. VE163), which would effectively reduce damage to 0 after 2 yards. Like a rocket, a fire lance could be expected to burn for several seconds, allowing multiple attempts to catch a foe in the exhaust.

The basic technique for wielding a fire lance involved swinging a long, heavy pole about; this amounts to Polearm skill. Assuming a 3-yard pole, the effective range would be 3-5 yards. A fringe benefit of this redesign was that the fire lance became significantly more exotic -- in effect, a nonmagical flaming melee weapon.

Nearly all of this analysis is invisible in the published book, which is as it should be. But some readers will want to see "the little man behind the curtain." This article is for them.

by James Maliszewski

Around the World in 80 Thrills is a four-part Cliffhangers adventure set in the 1930s (the popular "world on the brink of war" setting). One part will appear each month from now until May. Each part is written by a different author, making this also a Round Robin event:

- Part One: [The Kensington Codex](#) -- Steven Marsh
- Part Two -- James Maliszewski
- Part Three: [The Minos Touch](#)-- Bob Portnell
- Part Four: [The Atlantis Crystal](#) -- Steve Kenson

Stats are presented for **GURPS**. Additional stats appearing for *Fudge* presented in **bold italic red**. Stats for *Big Eyes, Small Mouth 2nd Edition* have also been presented in blue boxes with white text. The adventures should also be generic enough that they can be used in a variety of systems.

Because much of this installment's action takes place in Shanghai, China and the surrounding area, GMs are referred to the article "[Middle Kingdom of Crime: Shanghai in the 1920s](#)" for background information that might lend additional flavor to this scenario.

"When Suddenly . . ."

The sound of breaking glass, followed by a large thud, resounds throughout the silent Fellows' Quadrangle. The ensuing echo only heightens the realization that something is terribly wrong. Either something untoward has happened to Dr. Hartwick or someone has entered his room ahead of you. Neither option offers any comfort. When you arranged the trip to Oxford, you thought it'd be a simple matter of consulting with a noted professor of Egyptology -- but you were you wrong. Why do you always have to be wrong?

What's Going On

The characters have come to Merton College, Oxford to consult with Dr. Nigel Hartwick, a noted professor of Egyptology regarding the discovery of an unusual key. The key was found in the binding of an ancient Norse codex unearthed in Kensington, Minnesota (as players of "The Kensington Codex" will know). This discovery is highly unusual -- and not simply because the existence of a Viking settlement so far inland on North America was previously unproven.

More interesting is the key. Scholars who've examined the key were skeptical of its authenticity, as the Norse weren't

well known for their skills as locksmiths, especially not in the 10th century (the supposed date of the Kensington settlement). This skepticism was only heightened by the revelation of odd carvings along on its length, carvings that are not Viking runes at all but appear to be Old Kingdom Egyptian hieroglyphics!

The characters have thus traveled to England in order to seek Dr. Hartwick's opinion on the matter. Whether they have done this on their own initiative or at the behest of a patron (such as Dr. Reginald Spires from "The Kensington Codex") makes no difference to the course of the adventure. All that matters is that they've journeyed to Oxford to meet Dr. Hartwick -- only to find someone has beaten them to his office!

Inside the Office

The characters are now outside Hartwick's office on the evening in which they've arranged to meet him. From inside the office, they can hear what sounds like a rather crude effort to search his office. The sounds of breaking glass and wood echo through the deserted hallways of the building. The characters must now decide whether or not to enter the office and, if they do so, how to proceed.

Inside the office are two Chinese thugs sent to England by Lee Cheng, a Shanghainese gangster-politician with delusions of grandeur. Lee sent his goons to Oxford for their own "consultation" with the learned professor. When they arrived, they found him missing. Rather than return to Shanghai empty-handed, the two thugs (named Fan and Yi) decided to search Hartwick's office for something -- anything -- that might satisfy their boss's interest in the professor.

Fan and Yi are armed with revolvers, but don't expect anyone to enter the office this late at night. If the characters act with some degree of forethought, they should have relatively little difficulty surprising the goons. Of course, the thugs have no compunction against violence and will do their best to avoid being defeated by the characters.

The Game Master can run the struggle with the gangsters however he wishes, even introducing additional elements for maximum pulp effect, such as a student who accidentally stumbles upon the scene. There are only three requirements for its proper execution. The first is to emphasize the oddity of two Chinese mobsters rifling through a professor of Egyptology's office. The second is to ensure that at least one of the goons survives to be interrogated. Given that both Fan and Yi are cowards, this shouldn't be too hard to arrange for a clever GM. The third requirement is that the characters find an unusual symbol carved into Hartwick's desk. The symbol looks like a thin mountain surrounding by clouds.

Spill the Beans, Punks!

If interrogated, Fan and Yi explain they were sent to ask Professor Hartwick to come with them to Shanghai. Their employer, Lee Cheng, is a respected business leader with an interest in matters of archaeology. If asked why they were destroying Hartwick's office, they state rather matter-of-factly that, since the professor wasn't here, they'd "have a look around" for information Lee might need. Of course, they're somewhat vague about what it is they were looking for, since -- truth be told -- they don't know why Lee wanted Hartwick.

The end result of this interrogation is that the characters know only that Hartwick isn't in his office and that a Chinese gangster from Shanghai wants to consult with him. Checking with the Warden of the College reveals that Hartwick did not indicate he'd be leaving Merton. As he has lectures this term, it's unlikely he'd disappear willingly. Visiting his home confirms that he is nowhere to be found in Oxford.

Should the characters ask about the symbol on Hartwick's desk, they plead

ignorance at first. Upon further questioning they admit it's the symbol of the Black Pinnacle Society, a mysterious group they've tangled with in Shanghai. They suggest that its presence proves that this nefarious band has kidnapped Hartwick.

If the characters do not think of it, Fan and Yi suggest they visit Lee; he may be able to help them. As a fellow "seeker after truth," he shares their interest in scholarly matters such as Egyptology. They even offer to smooth the way between them. Unfortunately, British authorities want to hold the two thugs on charges of breaking and entering, as well as suspicion in the disappearance of Professor Hartwick. Consequently, the characters must make their way to Shanghai -- and Lee Cheng -- alone.

Welcome to Shanghai

Travel to Shanghai will take several days, even by plane. During that time, the characters have ample opportunity to familiarize themselves with the city and its unique circumstances. Information on Lee exists, but is sketchy. According to fragmentary reports, he is a "legitimate businessman" with considerable investments in shipping and overseas trading. He's also associated with the Nationalist movement in a peripheral way, having aided anti-Communist politicians in central China. Lee is also known as a collector of rare Chinese artifacts, especially those from the Han period.

Upon arriving in the city, the characters should find ample lodging in the two Western concession areas. Well-placed bribes and requests for information will reveal that Lee Cheng spends most of his time in the International Settlement's newly built Cathay Hotel (in the Sassoon House). The hotel boasts a fine nightclub with a dance floor and live music (including jazz). Getting a room in the hotel itself will be difficult, unless the characters have lots of influence or resources. However, staying at the Cathay Hotel isn't necessary to enter the nightclub.

The Nightclub

The hotel's nightclub is a fancy affair and the characters are expected to dress accordingly. Its clientele is largely British and American businessmen, but there are plenty of native Chinese present as well, including Lee. Dressed in an immaculate tuxedo, the gangster has a private booth close to the dance floor. Surrounded by a half-dozen burly thugs, he is attended by two young women, both Westerners -- a sign of his affluence.

Approaching Lee will be difficult, as he's as paranoid as he is wealthy. However, there are numerous ways to attract his attention. Chief among them is dancing or otherwise flirting with either of his two female companions, both of whom occasionally leave his side to get him drinks from the bar. Lee is protective of these young women and will immediately send a couple of his goons to bring any characters to his table who dare interfere with them. Another possibility is ordering a round of drinks for Lee's table, a gesture that will likewise draw his attention. The GM should reward player creativity in this area, as there is no single way to get the characters invited to Lee's table.

Kingpin of Crime

How Lee reacts upon first meeting the characters depends on the circumstances that brings them to his table. Even under the best of circumstances, they are frisked for weapons and shadowed by a thug. Lee speaks English with a polished British accent and displays impeccable manners. He offers the characters drinks and food (even if they've offended him by flirting with his companions) and assures them they are not poisoned. He then gets down to business and interrogates them as to their business with him.

If told about Fan and Yi, Lee laughs at the incompetence of his minions. He readily admits that he sought Professor Hartwick's advice on a matter of scholarly importance and regrets he sent two bumblers to collect him. Unfortunately, affairs in Shanghai required his presence here. If asked about his reasons for consulting with Hartwick, Lee will be reluctant to reveal them at first. The characters must work to convince him. Most arguments are ineffective, but Lee will react well if the characters admit their own reasons for seeking the professor. Upon hearing of the key with

Egyptian hieroglyphics, the mobster's eyes will widen and he will relax noticeably.

Lee then leans over and whispers to the characters, revealing that he has come into possession of a most unusual funerary urn. Lee says he is a collector of Chinese antiquities -- the older the better. This urn he now possesses is doubly unusual. For one, its pictographic exterior strangely melds archaic Chinese script with something else, something that looks like Egyptian hieroglyphics. Stranger still, its contents are not the ashes of a deceased nobleman at all, but a reddish crystalline powder. Lee hoped Professor Hartwick might be able to determine of the odd markings are indeed hieroglyphs and, if they are, translate them for him. Unfortunately, someone else seems to be interested in Hartwick as well.

The Enemy of My Enemy

Lee says he suspects Hartwick has been abducted by the Black Pinnacle Society, a secretive and powerful group that has recently arisen in Shanghai. According to him, the Society has been raiding archaeological sites throughout China, frequently coming to blows with his contacts and underlings. The Society is incredibly well funded and informed. If they've come across an artifact like the urn he's acquired, they certainly would have sought out -- and possibly kidnapped -- Professor Hartwick. If so, he may be in grave danger. If told about the symbol carved in Hartwick's desk, Lee will curse in Wu (the Chinese dialect spoken in Shanghai), saying that the Black Pinnacle Society has once again beaten him.

By now, the characters should realize Lee is indeed ruthless but honorable in his own warped way. His interest in archaeology and his consternation at being bested by the mysterious Black Pinnacle Society present an opening for them. If asked, Lee is willing to work with the characters to unravel this mystery and -- it is hoped -- find Hartwick. He will even offer to show the characters the unusual urn, hoping they might be able to shed some light on the matter. Lee then leaves the nightclub, ushering the characters into his waiting limousine.

The limousine takes the characters to Lee's neoclassical home on the banks of the Whampoo river. The mansion is most impressive and speaks volumes about the gangster's wealth and influence in Shanghai. As one might expect, the mansion is well guarded by armed Chinese mobsters. Its interior is beautiful, a testament to Lee's taste -- as well as his ill-gotten gains. Western artwork is interspersed between exquisite Chinese vases, porcelain and other objets d'art.

Lee leads the characters into his large study (whose walls are lined with books). There he shows them the urn that caused him to seek out Professor Hartwick in the first place. One glance at the urn and it's obvious that the hieroglyphs that mark its exterior are similar -- almost identical -- to those on the key found in Kensington, Minnesota. Lee wonders what the connection could be, given the great distance in time and space between these two artifacts, never mind culture. What is the connection?

The urn holds a reddish crystalline powder that scintillates in the light. Characters with skills in geology or chemistry will recognize it is as finely ground gemstones, possibly rubies. Lee finds this revelation amazing, as he cannot fathom why anyone would grind such valuable gems into powder and then place it within an urn.

Men in Black

While Lee and the characters debate the meaning of these discoveries, they are startled by the sound of gunfire from the mansion's foyer. In a matter of seconds, three men -- Westerners -- wearing dark clothing and carrying machine guns enter the study, spraying the area with bullets. Lee ducks behind his large oak desk and urges the characters to do the same. These men are agents of the Black Pinnacle Society, who fought their way in to Lee's mansion to eliminate him -- and the characters!

The combat in the study should be tense and cinematic. Lee keeps many art objects and bookcases in the room. Consequently, there are ample things to use for cover.

Black Pinnacle Hit Men

ST: 10 (*Mediocre*)

DX: 11 (*Mediocre*)

IQ: 9 (*Mediocre*)

HT: 11 (*Mediocre*)

Speed: 5.5; Move: 5

As the hit men blanket the room with leaden death, vases shatter and books fall. The room quickly turns into a chaotic mess. The GM should make every effort to emphasize the characters' dire situation, as well as the unpredictability of the situation.

The hit men are well trained and relentless. Defeating them requires considerable skill and ingenuity on the part of the characters. As always, the GM should reward innovative thinking in the pulp idiom. The study contains several cubbyholes, as well as a chandelier and a wheeled ladder. All of these facts can be used to the characters' advantage with a little thought. In any event, the hit men will fight to the death rather than be captured. All wear the symbol of the Black Pinnacle Society somewhere on their person.

More interestingly, all the hit men look identical. That is, they appear to be identical twins (or in this case triplets). Anyone skilled in medicine can examine their bodies afterwards to confirm this. There is no evidence the hit men have been surgically altered or otherwise changed. As far as anyone can tell, they are indeed perfect copies of one another. If asked, Lee reveals the Black Pinnacle Society seems to have a preference for using twins and triplets. He and his men have encountered this enigma before.

In the course of the fight, the funerary urn is broken in four pieces, spilling the red powder onto the floor, which again refracts any light it catches. Looking at the broken pieces, a strange pattern emerges. The inside of the shards are marked with a fine etching. Characters familiar with Chinese geography quickly recognize what looks to be a crude map. Lee (who survives the shootout) hadn't noticed the map before because he had been extremely careful in examining the urn. In being shattered, the powder filled the etching marks and highlighted the map within -- something no one would have seen before.

The Map

The map within the urn is difficult to interpret at first. With effort, some details become apparent, chief among them being the course of a river, probably the Yangtze. There is also a prominent mountain range in the map. Using the river as a rough guide, Lee suggests it may be the Chiushan Range to the north, in the surrounding Ansu province. The range has profound religious significance for the Chinese people and has been a site of pilgrimage for over two thousand years.

The mountain range seems to have special prominence on the map, as its location is marked with two unusual characters. The ideograms looks vaguely like the Chinese symbols for "excited," "light," and "three thousand three hundred and thirty-three" but they're not precisely enough like modern Chinese to be certain. Like all the other symbols the characters have seen, they show certain similarities with archaic Egyptian hieroglyphs. Nevertheless, the prospect of the Black Pinnacle Society's having a map of their own (a likelihood considering their acquisition of similar funerary urns) suggests the characters should act quickly. Lee concurs and offers them the use of his private plane to speed them on their way to the Chiushan Range.

Mt. Chiu

The journey to the Chiushan Range is a simple matter, but the GM should take the time to emphasize the natural beauty of the area. Not only will this add to the

What's the Story. . .

. . . behind the identical men in black? Basically, whatever the GM wants. This element of the plot is left unexplained, leaving it to the wishes of the GM and the needs of his game. If he wants to play up the "mysterious East" element of the scenario, they can be the result of feeding rare herbs to women to produce twins and triplets. If he wants to emphasize weird science, they can be clones created before DNA is discovered. For occult horror versions of the adventure, more unpleasant explanations abound.

Reality Check

Let's be clear about a few

exotic flavor of the scenario, it sets up the dichotomy between the site in which the story's climax takes place and the events of that climax - always a useful tool in pulp adventures.

Lee recommends the characters visit Chiu'an, a sleepy city at the base of Mt. Chiu. Here, Chinese emperors sometimes came to offer sacrifices to Earth and Heaven. The summit of the mountain can be reached by climbing over 7000 steep stone steps placed by human labor. There are ancient cypress trees, beautifully carved memorial arches, temples and breathtaking views of forests and crags. Once again, the exotic and ancient nature of the locale should be emphasized. Visiting Chiu'an is something the characters should remember for years to come.

In the city, the characters may look for signs of the Black Pinnacle Society. Most locals will not admit to seeing such people in their city, but their reluctance to speak with the characters should reveal that they are lying. Other than repeatedly saying, "no one like that is in the town," the locals offer no help to the characters. Even Lee has no ability to gain additional information. However, he will offer to use his goons to interrogate the locals, but upstanding citizens like characters should reject such methods.

If the characters are persistent (and keep Lee at bay), they'll eventually encounter an old woman named Chin Lizhen. Chin admits to seeing several Westerners in Chiu'an very recently. She says most of them "looked alike," but one was "different." Describing him, the characters realize she's seen Professor Hartwick with what were probably members of the Black Pinnacle Society. Chin adds that the group of men was headed toward Mt. Chiu, although she doubts they were either tourists or pilgrims.

Up the Stairs and Into Trouble

Mt. Chiu has over 7000 stairs carved from its face by unknown hands in the ancient past. They are used to reach its summit, where religious rituals and meditation take place. Having seen the map's reference to 3333, the characters probably suspect they must reach the equivalent stair to proceed. That assumption is indeed correct, as that stair is located at a small ledge on the mountain face, one with an unusual overhang. The overhang conceals a small cave into which a human being can enter -- if he is dexterous enough to jump into it successfully.

While this isn't a problem for the characters or the Black Pinnacle men, aged Professor Hartwick is in no condition to perform such a feat. By the time the characters reach the ledge with the 3333rd stair, they'll encounter four Black Pinnacle agents (all of them identical in appearance) attempting to set up a makeshift winch that will allow them to get Hartwick into the cave safely. When they see the characters, drop what they're doing and draw their revolvers. One of them grabs Hartwick and uses him as a human shield.

Fighting on the stairs is a wonderfully cinematic opportunity for the GM. The locale is inherently limited and offers almost no cover. In addition, the threat of falling -- either down the stairs or off the mountain -- presents many challenges as well. The GM should take full advantage of the environment.

Professor Hartwick's precarious situation must also be dealt with. The Black Pinnacle men have no compunction about threatening the old man's life to give them an advantage. However, they won't actually harm him, since they've been instructed by their master to bring him to Mt. Chiu alive. Characters skilled in psychology should be able to ascertain this fact and use it to their own advantage. Nevertheless, the GM should play the scene as a standoff, with the Black Pinnacle men doing their best to find a way to eliminate the characters without allowing Hartwick to come to permanent harm. In the end, though, they'll die trying to stop the characters from saving Hartwick and entering the mysterious cave.

things: there is no Chiushan Range or city of Chiu'an. They're fictitious creations that further the plot of this adventure and are in keeping with its pulp character. After all, the events of this adventure are clearly unreal. Why shouldn't the geography be too?

If you're a stickler for accuracy (or have a post-graduate degree in Chinese geography), feel free to change the locale to an actual site in China. The adventure is flexible enough that this shouldn't be a problem. The important thing is that this scenario be enjoyable. If a fictitious mountain range or town gets in the way of that enjoyment, be all means change them to suit your group.

Hartwick's Revelation

Once freed, Hartwick thanks the characters and explains that he's been shuttled around China to examine a variety of odd artifacts. He says that all are ancient Chinese in origin, but many (though not all) show peculiar affinities with similar artifacts from Egypt. In fact, there are weird commonalities in both the style and symbology that suggest they may have a common origin!

Hartwick realizes this is implausible, but he cannot deny what he's seen with his own eyes. More ominously, these Black Pinnacle people (all of whom seem to be twins or triplets or . . .) seem to believe that these artifacts hold the key to something bigger still, although they never made it quite clear what. Hartwick believes they're seeking some sort of power source or even a weapon with which to advance their nefarious plans.

The answer may lie within the cave.

The Cave

Professor Hartwick will not enter the cave. Lee will see that he's taken back to safety in Chiu'an. Entering the cave requires the characters to use the overhang to swing into the opening. If successful, they find that the "cave" is actually a regularly carved passageway that descends into the depths of the mountain. The smoothness of the passageway suggests a technology that no one in ancient China was known to possess. Likewise, the characters find themselves growing warmer as they descend deeper into the mountain.

After some distance, the passageway widens and opens up into a chamber with a high ceiling. The room glitters with coruscating red light that's almost blinding at first. The light originates in a strange glowing device at the center of the chamber, reflected throughout hundreds -- perhaps thousands - of red gems that line its walls and floor. Standing beside the device is a tall, thin man, surrounded by five more Black Pinnacle men.

Unless the characters alert the chamber's occupants of their presence, they can observe them in safety. The tall, thin man is clearly their leader and (in the pulp tradition) explains his plan to his henchmen. He says, in an obviously American accent, "We only need the professor to verify the translation of this last part and we'll have completed this weapon for our master. Then, the world will know the might of the Black Pinnacle Society!" He then laughs heartily, joined by his five identical henchmen.

What Now?

The characters must now decide how to deal with the Black Pinnacle Society. Whatever the device, it is clearly a weapon of some sort, one that uses light and gems to power it. No matter the cost, they must be stopped.

The five henchmen use revolvers to fight, while the leader has an automatic pistol. If confronted, they will attack with great ferocity, doing their best both to defeat the characters and prevent the device from being damaged. They react similarly to taunting or other attempts to speak with them. They use the usual bag of villainous tricks to convince the characters to surrender before to the Black Pinnacle Society. If told of Professor Hartwick's escape, the leader grows angrier and orders his men to attack.

Black Pinnacle Leader

ST: 10 (*Mediocre*)
DX: 12 (*Fair*)
IQ: 16 (*Great*)
HT: 10 (*Mediocre*)
Speed: 5.5; **Move:** 5
Dodge: 5.

Advantages:

Intuition
Strong Will +1
Very Wealthy

Disadvantages:

Megalomania
Overconfidence

Skills:

Fast Talk-14 (*Good*)
Guns (Pistol)-12 (*Fair*)
Leadership-16 (*Great*)
Savior-Faire-14 (*Good*)
Tactics-14 (*Good*)

Body 5 Mind 9 Soul
7

Attributes

Aura of Command

Defects

Once the fight begins to turn against the henchmen, their leader activates the device and aims it at the characters. It is a primitive laser weapon. However, it has been constructed poorly (based on a mistranslation of the passage they needed Hartwick for) and will explode rather than operate properly. Thus, the climax of this scene may well be the weapon's destruction at the hands of its operator -- resulting in his death as well.

Aftermath

Once defeated, the characters can examine the bodies of their fallen enemies. Other than the oddity of so many identical henchmen (except their leader), they find only one clue of interest. As Lee had suggested, the group had pieced together more of the weird Chinese/Egyptian symbology from various artifacts. Looking over the fragments they brought with them, it's clear they include not only a map to Mt. Chiu, but also the plans for a powerful energy weapon -- one that amplifies the Earth's own telluric energies through rubies and other gemstones. Professor Hartwick can confirm this with some difficulty (the symbols are neither truly Egyptian nor truly Chinese), although he continues to doubt the authenticity of what he is reading.

Should the characters check into the matter of the leader's identity, they can confirm that he is Stockton Van Dyke, a prominent New York financier with business interests throughout the world, including China. In recent years, Van Dyke has grown increasingly reclusive and inaccessible. He has left the running of his vast enterprise to his son, Arthur.

Finally, the characters now have a contact in Shanghai. Lee Cheng could thus recur in future adventure as the morally dubious but helpful crime boss that aids the characters when they need something done in the Orient.

Epilogue

The conclusion to this adventure saves Professor Hartwick and foils the development of an energy weapon by the mysterious Black Pinnacle Society, but it doesn't resolve everything. The "Steps of Chiushan" can be followed up in numerous ways, including:

- Why was Van Dyke involved in this weird conspiracy?
- What is the mystery of the identical henchmen?
- What is the origin of the weird symbols that combine both Chinese and Egyptian symbology and yet predate both great civilizations?

For the answers to these and other questions, tune in next month for the next installment of Around the World in 80 Thrills.

The Energy Weapon

Like the identical men in black, the energy weapon can be dressed up in varying degrees of chrome to suit the needs of the GM. The scenario as written assumes it is a conventional -- if ancient -- weapon of a science fictional sort. Its origin is all that sets it apart from space opera blasters. However, the GM is perfectly within his rights to make it something more sinister or scientific. The pulp genre is a broad one and runs the gamut from hardboiled detectives to globetrotting investigators of the occult. Thus, the weapon could as easily be a soul-sucking engine as a laser beam. Use whatever is best for your own game.

Pyramid Review

Adventure Boosters #9-12 (for d20)

Published by [Alderac Entertainment Group](#)

The Last Gods, written by Kevin Wilson
Bring Him Back Alive!, written by Matt Forbeck

The Heart of Amun Khonshu, written by Marcelo and Kat Figueroa
The Murder of the Seven Points, written by Erik Yaple

16 half-size black and white pages; \$2.49 each

Alderac's *Adventure Boosters* aren't the best adventures ever, but they're arguably the best value in roleplaying. There are three hits and one miss in the latest batch, and you can't beat two and a half bucks for an evening's entertainment. At the same time, there are limits to what a writer can do with a sixteen-page pamphlet. The three successful adventures work because they present a very limited situation with style, and the failure -- *The Murder of the Seven Points* -- collapses because it doesn't have enough space to do its plot justice.

There's a good spread of difficulty among the four adventures. *Bring Him Back Alive* is for 1st through 4th level *d20* characters, and *The Murder of the Seven Points* is intended for levels 5 through 8. The last two adventures aim a little higher, at 8th to 12th level. It's not hard to find an *Adventure Booster* that will fit your current *D&D* group.

Each booklet in the series follows roughly the same structure: a central map keyed to a series of encounters, with a new monster and a new magic item profiled at the end. Once you're familiar with the format, it's easy to pick one up, give it a quick read, and be ready to run in a half hour or less.

(SPOILER ALERT)

The Last Gods is probably the best of the four. It's a classic self-contained adventure, with a premise that can be dropped into any game on a moment's notice. One night, a god named Azrael appears before the PCs with a terrible story. After stealing an ancient and powerful artifact, he has destroyed the universe. Now, facing the end of everything, he feels remorse, and has traveled back in time to stop himself. He needs the heroes to prevent him from stealing the artifact.

High stakes. With a wave of the narrative hand, the characters are brought to the Mausoleum of the Gods, the place where the gods themselves go to die. It's up to the PCs to get into the heart of the temple, find Azrael, and stop him before he gains the power to be a very bad boy.

There are some monsters lurking around, but *The Last Gods* is a puzzle adventure. Due to the unusual magicks of the Mausoleum, the monsters are a little less powerful than normal . . . though the final battle with Azrael more than makes up for this. As for the puzzles, they're quite dangerous. This is not a *Tomb of Horrors*, but a poorly prepared or thoughtless party is going to get mangled.

All the puzzles are fair, and they usually reward investigation and lateral thinking. (By the way, one puzzle works especially well if the gamemaster prepares some props.) Several of the later puzzles are "tests of character," though,

and those can fall flat unless the GM handles them very carefully. What should be an epic journey -- following in the footsteps of the gods themselves -- can easily turn preachy and dull during these scenes.

What makes *The Last Gods* good, though, is that it supplies all the incidents the GM needs to create a single-session epic. The whole universe is at stake, after all, and it's not every day you get to take on a god. In the wrong hands, the adventure is an arbitrary puzzle fest. Done right, it's a mythic tale of heroism and sacrifice that the players will talk about for months. Everything depends on the GM's own ability to describe the action and set the mood.

The Heart of Amun Khonshu doesn't have the same epic scope, but it's a well-themed raid of an evil pseudo-Egyptian sorcerer's tomb. Another powerful artifact is at stake -- an Elven ranger needs the heart of the title to heal a suffering friend -- but the PC's main interest is to sack the tomb and clean out the treasure.

There's more fighting in this adventure, but what the players will remember is a selection of vicious traps. Most of them are of the "stick your hand or head into the room and nearly get it blown off" variety, which should get the players twitching fairly quickly. It's a good thing this is a short adventure -- a few traps like these go a long way -- but there are few enough here that the players are on to the final confrontation before they get sick of being blasted and poisoned.

This is also a good adventure for reminding your players of what unpleasant work adventuring can be. This tomb doesn't have lights or doors -- the PCs have to dig out the bricked-in masonry -- and a few choice descriptions of how dirty and hot the characters are getting as they dig through the tomb will remind the players that dungeon delving isn't just strolling down ten-foot-wide corridors.

Bring Him Back Alive! is less interesting, but it's still a respectable low-level adventure. Tiny people have kidnapped a merchant's son, and the characters have to retrieve him. Standard stuff, but the plot can be resolved in several different ways. Even the seemingly obligatory dire rats and spiders -- can you have a low-level adventure without them any more? -- present a surprise or two.

Then there's *The Murder of the Seven Points*. This one features another standard plot -- a hunt for a ritual murderer -- but presents it very poorly.

There are two good approaches to a mystery adventure. You can dig into characters, provide enticing red herrings and clues, and give the players a fair chance to solve the mystery through deduction and intuition. Or you can run the story like an action movie as the characters chase an obvious villain through exciting situations. *The Murder of the Seven Points* does neither.

There are almost no clues by which the characters can deduce the villain's identity, and his motivations are completely unexplained, even to the GM. There isn't much of a chase after the villain either, since the characters almost never encounter him. Instead, they are led by an NPC from point to point in the city. There's also an unimaginative red herring and a lot of waiting around for something to happen. Worse, the adventure ends in anti-climax if the PCs *do* guess who the murderer is before the big fight at the end.

The Murder of the Seven Points could have been an interesting mystery, but probably not in this format. There simply isn't enough room in these short adventures for the complicated clues and interconnecting motivations that keep players guessing. It's too bad, though, that Alderac didn't even get a good action story out of this adventure.

(END SPOILER ALERT)

Three out of four isn't bad, but the failure of the fourth points out a fundamental limitation of the short adventure. You can do a lot in sixteen pages, but you can't do it in detail. Dungeons have to be small, descriptions have to be brief, and the story has to be simple. Dungeon crawls work well, but you can't do much else.

Fortunately, *D&D* always has room for another good dungeon crawl. Hopefully Alderac has plenty more on the way.

-- Chris Aylott

Pyramid Review

Pyramid Review: Shipwrecked Card Game

Shipwrecked Card Game

Published by [Out of the Box](#)

Designed by **Matthew Kirby and Mark Alan Osterhaus**

Illustrated by **John Kovalic**

24 Bid cards, 24 Resource cards, 65 gemstones, rulebook; \$15.95

Two to four castaways are stuck on a deserted island and must compete with each other for food, shelter, water, and friends in this new bidding game from Out of the Box Games. In the tradition of their previous games, *Apples to Apples* and *Bosworth*, *Shipwrecked* is simple, fun, and hysterically illustrated by John Kovalic.

Kovalic provides a unique illustration for twenty Resource cards. The Resources are divided into the four types mentioned above and are ranked from ten to 50 Points each. The first Crusoe to win 100 Points worth of cards of a single type of Resource, or to win 150 Points worth of cards of any type, wins the game. Each Resource also has an Income number that gives players gemstones, the local currency, at the beginning of their turns. Finally, they have a Value number players can use to sell the card to the bank for a quick cash infusion. As the Points of the cards increase, the Income decreases, so a player lagging behind in Points receives more help from the bank each turn.

Players win Resource cards by bidding on them. On each turn, a player reveals the top Resource card and begins a six round bidding session. The price of the Resource cards begins at five gemstones for the first round and it decreases every round until a player wins the Resource. This system makes it possible, but highly unlikely, that a castaway could win the card for free.

Players do not bid with their gemstones, however. They bid with one of six Bid cards, played face down each round. Each player has two Stop cards, three Pass cards, and one Strike card. If a castaway is the only one to play a Stop card during a bidding round, that player wins the Resource and pays the bank the appropriate amount. A Strike card trumps a Stop card. Two or more Strikes in a single round, however, cancel each other. The Pass card simply allows the bidding to advance in hopes of winning the Resource at a later -- and cheaper -- bidding round. In a final bit of strategy, playing a Stop card does not necessarily stop the bidding. A player must announce that she is stopping the bidding. This allows players a last minute change of heart should they suspect a Strike has been played.

Players can tie during a bidding round if two or more play Stop cards at the same time. Ties are broken by the number of Pass bids played during previous bidding rounds for this card. The Resource goes to the player with the most Passes. If a tie remains, then the tied players pay for the Resource and must begin a new bidding session with just those players involved. This is an expensive outcome, and if a player can not pay for a Resource card, then he is bankrupt and out of the game.

The fun of *Shipwrecked* is trying to out-guess your opponents. Players must decide how much each of their rivals are willing to pay for a Resource, what their bidding strategy will be, and how to win while avoiding a dreaded tie.

Shipwrecked is not a revolution in bidding games, but it is quick, easy to learn, and fun. And John Kovalic's illustrations are a riot; the picture of the monkey sitting atop a disgruntled castaway's head is almost worth the price tag alone.

-- *Brad Weier*

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Dork Tower!

Dork Tower!

Enoch, Enoch, Who's There?

"And Enoch lived sixty and five years, and begat Methuselah. And Enoch walked with God after he begat Methuselah three hundred years, and begat sons and daughters. And all the days of Enoch were three hundred sixty and five years. And Enoch walked with God, and he was not, for God took him."

-- Genesis 5:21-24

It's either the first ever alien abduction on record or the record of the ancient astronauts. It's either a book of antediluvian wisdom, or a dangerous work of lurking heresy. It's a warning, and a dream, and a prophecy, and an apocalypse. It's a surprisingly influential book, considering it was completely lost (or . . . *hidden*) for over a millennium. It's the *Book of Enoch*, and it's the original old-school Book Of Hidden Lore. Let's open it up.

"This is the book of the words of righteousness, and of the reproof of the Watchers, who are eternally present, according to that which He who is holy and great commanded in the vision. I perceived in my dream that I was now speaking in a tongue of flesh, and with my breath, which the Mighty One has put into the mouth of men, that they might converse with it."

-- Enoch 14:1

The *Book of Enoch* is both a compilation of perhaps five of the books and a portion (or summary) of the older *Book of Noah*, which remains lost. The first 36 chapters, comprising the "Book of the Watchers," expand on the story of the "sons of god and the daughters of men" from Genesis 6:2-4, and discuss the fallen angels and their fate. The second section, of 34 chapters, is a collection of visionary "parables." In the ten succeeding "Astronomical" chapters, Enoch travels to heaven and has the working of the skies revealed to him; the next 8 chapters are divinatory dream visions, followed by stern moral advice in the final 15-chapter "Epistle of Enoch" section. (Chapter numbering in the *Book of Enoch* is unstandardized; I'm using the Richard Laurence translation, available at

<http://www.bible2000.org/lostbooks/enoch1.htm>.)

The oldest known versions of the Book of Watchers and the Astronomy date to the early 3rd century B.C., and most scholars date the Parables to the first century B.C. or A.D. The rest of the book dates from between these eras, although the "Apocalypse of Weeks" (so called because it divides human history into ten symbolic weeks) in Enoch 92 and the Dreams probably date from the Maccabean Era (ca. 165 B.C.) since they refer to those events in some detail. The [Dead Sea Scrolls](#) contain fragments of the *Book of Enoch*, although nothing from the Parables, and it became a key part of both early Christian and revolutionary Jewish mysticism. The New Testament Book of Jude even approvingly quotes Enoch 2:1, and other New Testament epistles (including Paul in Corinthians) refer to its concepts, indicating that it was considered valuable, even divine, by the early Church. Although Origen and Clement both considered it canonical, St. Augustine disagreed, saying "their [the Books of Enoch] antiquity brought them under suspicion" -- especially because of all that foolishness with giants and angels and their evil spawn wreaking havoc over the earth and people traveling bodily to heaven and coming back.

*"Enmeduranki was a prince in Sippar, beloved of Anu, Enlil and Ea.
Shamash in the Bright Temple appointed him as priest.
Shamash and Adad took him to the assembly of the gods [in heaven]
They showed him how to observe oil on water, a secret of Anu, Enlil and Ea.
They gave him the Divine Tablet, the kibdu secret of Heaven and Earth....
They taught him how to make calculations with numbers."*

-- Sumerian Tablet of Enmeduranki

And it probably wouldn't have made Augie feel any better to know that Enoch is a close parallel to the Sumerian hero-king Enmeduranki of Sippar, who also traveled into the seven heavens and learned all wisdom from the gods. In addition to the names ("anki" and "Enoch" are cognate, it seems), Enmeduranki is the seventh god-king of Sumer just as Enoch is the seventh patriarch from Adam, both have a strong connection to the solar calendar (Enoch's Biblical "365 years" contrasts with the traditional lunar calendar of, say, the Jews and Babylonians), and they both founded prophetic lineages. Enoch/Enmeduranki has also been identified with the Assyrian Utu-Abzu, who did the same thing,

and the word Abzu is also the "subterranean fresh water ocean" of the Sumerian god Enki -- and we're back to Enoch again. One source identifies Enoch with the Titan Atlas, which brings in the giants and the "from Earth to Heaven" motif; and the Alexandrian Greeks (who wrote the *Book of the Secrets of Enoch*, also known as 2 Enoch, in around 60 A.D.) identified him with Thoth and Hermes, creators of writing and magic.

"My brother, I see thou dost not understand the mystery of this Book, or work thou hast in hand. But I told thee, it was the knowledge God delivered unto Enoch."

-- angelic message to John Dee, Jul 7 1584

Which is why John Dee was so excited when the angels started giving him the long-lost *Book of Enoch* in 1584, in their language, "Enochian." Sadly, Dee's *Book of Enoch* is not the same as our *Book of Enoch*, consisting primarily of gibberish and angelic summoning tables. (Dee's "Enochian" alphabet differed, as well, from the one printed in 1530 by the alchemist Pantheus in his *Vorarchadumia*, although Dee read and annotated it.) 320 years later, Aleister Crowley also received an "Enochian" book, the *Book of the Law*, which also isn't the *Book of Enoch*. However, since Enoch wrote 366 books after his return from heaven (says 2 Enoch 23:3), maybe John Dee and Aleister Crowley each got one of the even more thoroughly lost books. Perhaps every one of the various magical, lost books from the eldritch *Necronomicon* to the enigmatic [Voynich Manuscript](#) to the saucerian *Book of Urantia* are part of Enoch's spiritual lending library.

"Enoch is by some identified with Hermes, the Hellenic Mercury, and the Egyptian Thoth. To him were attributed certain learned books; by him also the brazen and stone pillars connected with the learning of the ancient world were erected . . . But the whole doctrine respecting Enoch is involved in mystery . . . It may be well to add to this article a few words about the Abyssinian Book of Enoch. This book was known to exist from very ancient times, and is continually alluded to by the fathers of the Church. Bruce brought home three copies from Abyssinia . . ."

-- Kenneth Mackenzie, *The Royal Masonic Cyclopaedia*

Enoch (busy guy) also carved all knowledge into two pillars, variously described as brass and stone, or by Josephus as brick and stone, to survive the coming Apocalypse -- either the Flood or the next one. (The stone pillar is the flood-proof one; the brick or brass pillar is the fireproof one.) These two pillars find echoes in Masonic lore as the twin pillars of Jachin and Boaz, before the Temple of Solomon. And, in my mind, as the Pillars of Heracles, which connects us back to the Giant Atlas -- and to Heracles' incarnation as Ogmios, the hero-king who taught the Druids "ogham" writing and ascended into heaven. Be that as it may, Freemason and antiquary James Bruce (a member of the Kilwinning Lodge of Scottish Freemasonry -- which contains the Arch of Enoch degree), ostensibly to discover the source of the Blue Nile, ventured into Ethiopia in 1768, emerging five years later with not one but three copies of the "Ethiopic" *Book of Enoch*, a close translation of the full Greek text into Ge'ez. Finally, the lost book was found, and in 1821 Bishop Richard Laurence of Cashel produced the first English translation of Enoch's antediluvian wisdom.

"I saw the key-holders and guards of the gates of hell standing, like great serpents, and their faces like extinguishing lamps, and their eyes of fire, their sharp teeth, and I saw all the Lord's works, how they are right, while the works of man are some good, and others bad, and in their works are known those who lie evilly."

-- 2 Enoch 42:1

It has taken more than 150 years for the implications to begin echoing through Biblical studies. The foremost expert on the *Book of Enoch*, J.T. Milik, has demonstrated that Augustine was wrong -- Genesis 6:2-4 it turns out, is the summary of the older story contained in full in the *Book of Enoch*. Thus, if you buy Genesis, you get Nephilim, and the evil "sons of God," known as the Watchers, or Grigori. The *Book of Enoch* goes into much explicit detail about Semjaza, the leader of the Grigori, and how he and the other Grigori taught men all useful and impious arts, from sorcery to war to astronomy to cosmetics. This, of course, is where we join the [ancient astronauts](#), already in progress. You can tie the Grigori and Nephilim to the giants (duh), to the winged [ultraterrestrials](#) (angels have wings in Enoch, or at least feathers), to the Nordics ("his body was white as snow and red as a rose, and his hair was white as wool, and beautiful, and when he opened his eyes, the house glowed like the sun . . ."), and to the Reptoids. One of the Watchers, Gadrel, is revealed as the (serpentine) tempter of Eve in Enoch 68:7. Those who find Enochian parallels elsewhere in Scripture note John the Baptist's use of the "generation of vipers" (Luke 3:7) as a sign of the coming apocalypse. Enoch, it transpires, was the eyewitness to a War in Heaven and an apocalypse on Earth -- and then,

having written down his wisdom and hidden it (From the Watchers? From the angels?) he "walked with God, and he was not, for God took him." Or the Reptoids did.

Anniversaries

In the week that this issue is new, we will pass the third anniversary of the online version of *Pyramid*. Last month I had the one-year anniversary of my editorship of *Pyramid*. And next month is my parents' anniversary, and it has been hinted that there will be Dire Consequences if I forget it again. So anniversaries have been on my mind lately.

I'm definitely glad the magazine has survived when it seems just about everything else internet-related has fallen into the sea; thanks to you all of you readers for making this possible. And hopefully we'll survive another three years, when *Pyramid* is scheduled to be replaced with a holodeck virtual reality gaming experience (no doubt coming out at the same time as the flying cars they kept promising us).

For whatever reason we humans have a fascination with anniversaries. We like to be able to say that it's been ten years since the as-yet-unsolved Fooble Murder, or a hundred years since the birth of Merle the Mystic. I suspect it's because we like to compartmentalize our lives, in order to keep everything from merging together into this one amorphous event (much like the 90's are currently trying to do in my mind).

Regardless, it's also one of the interesting things I like to do in gaming. If you have someone in the group who's the timekeeper (a topic I'll expand upon in a few weeks), or a game world with a lot of history and dates (like anything involving Time Travel, or richly detailed worlds like *Aberrant*), you can use anniversaries to your advantage. It can be very powerful to realize that, in the middle of an adventure, some *previous* adventure is having its anniversary . . . perhaps with the resultant memories media coverage. Anniversaries are a very easy way to provide continuity and cohesion to a campaign that may otherwise struggle to be episodic. For example, the *In Nomine* adventure "Feast of Blades" from the *In Nomine GM Screen* takes place around [SPOILER ALERT!] a plane crash near Christmas time [END SPOILER ALERT]. In the campaign where I was a player in the scenario, this incident became a forging incident for our group; as the years went by in the campaign, we would return to that event and its repercussions (and NPCs and dangling plot threads), giving the entire campaign more verisimilitude.

So, presuming your campaigns last more than a year in game time (which I would guess is a problem for many groups), keep track of the dates of those big events, birthdays, and other happenings. Otherwise you'll forget . . .

. . . with Dire Consequences.

* * *

And, speaking of anniversaries, next week is the one-year anniversary of [The Torg Story](#). Let me stress this ahead of time about next week's tale: **it's not my fault!!!** Okay, maybe it is . . .

* * *

I considered my one-year anniversary to be significant. Since everyone subscribes to *Pyramid* for a year at a time, I had no real way of knowing if most people liked what I was doing or not; everyone *could* have subscribed right before I came on board, and been stuck with me for a year. But by this point just about everyone who's still reading has had to resubscribe once. And our numbers are still solid currently, so I'll take that as affirmation that you all still like *Pyramid*. (Whether that is because of or in spite of my involvement I won't presume to know . . .) Regardless, as ever I welcome and encourage your comments, either over in [the discussion boards](#) or via [email](#).

* * *

This week also sees the semi-official departure of our webmaster Keith Johnson. He's going to the GAMA show next week (where, ironically, he'll meet his boss Steve Jackson for the first time -- the joys of telecommuting!). Keith may be around to help with next week's issue (and/or the weeks afterward), but even as I type the Arcane Secrets of the SJ Games website and *Pyramid* are being sliced out of him by corporate ninjas.

With *Pyramid* alone, Keith was responsible for most of the attractive logos at the top of the articles, getting the art in shape (often scanning and/or coloring the art entirely for a week's issue), and jillions of other things behind the scenes. He was also the magical black hole where I got to forward questions like, "I'm trying to access *Pyramid* via my Atari 2600, and it's not working! What do I do?", and the person I emailed in a panic when I realize I had typos in the poll. And he's a generally cool guy to hang out with virtually in the [chat rooms](#) (even if he *did* cheat at my weekly trivia quote for a while . . .).

So let me take this opportunity to thank you, Keith; may your bluebird of happiness always rest upon your windowsill of life . . . or some such. (Can you see why I edit a magazine instead of writing for Hallmark?)

* * *

Gloat Time: Next Thursday I get to go to a They Might Be Giants concert. Yea! I'm so happy.

To tie what would otherwise be a bit of geekgloat into gaming (somewhat), [eMusic.com](#) is offering a free album (or 15 tracks) for folks who register with their site. Check out <http://www.emusic.com/index.html#promoanchor> for more information. They have a fair amount of interesting things, including a lot of neat soundtracks (like *Star Trek* and *Quantum Leap*) that should be of some interest to gamers. But act quickly; the offer expires March 18th.

Of course, you could also use your free tracks to download [They Might Be Giants](#) material . . .

* * *

*Last week's answer: **Doctor Who RPG** (FASA), **A Sourcebook for Field Agents**, p. 50. (The quote in question was referring to a yo-yo, and went on for another two paragraphs. Brilliant technobabble.)*

*(Three stars) "Magical weapons can affect tech targets on a successful attack roll, inflicting 1 point of damage for every '+' of the weapon (thus a *long sword* +2 inflicts 2 hp on a successful strike)."*

Pyramid Review

Diablo II: To Hell And Back

Published by Wizards of the Coast

Written by Jason Carl, David Eckelberry, Jeff Quick, and Rich Redman

192 b & w pages; \$29.95

The *Diablo II* sourcebook *Diablerie* went a long way towards bringing the characters, magic items and monsters of the *Diablo II* game to the 3rd edition *D&D* rules, but was missing some critical elements like Diablo and the adventures of the *Diablo II* computer game. *To Hell and Back* brings those elements to the 3rd edition, but is it enough?

The game starts off with an overview of the Diablo universe's background, with information on the peculiars of the Diablo world. This includes the use of Waypoint Portals, Shrines, Special Areas, and miscellaneous information like Story XP Awards, NPC Hirelings, and monster tactics. Each section is short and to the point.

The four acts The Sightless Eye, The Secret of the Vizjerei, The Infernal Gate, and the Harrowing, follow the computer game closely, but have some variants within them. Each section is mapped out with encounters with the locals. In each act the NPCs are given stats, quotes, and rumors. Those who provide services have information on what type of items and abilities they can provide the party with.

The unique monsters are not segregated, but rather, have stats in abbreviated format. All the end monsters are here, from Andariel, Duriel, and Mephisto to Diablo himself. Even the minor bosses like Blood Raven and Hephasto the Armorer are given stats.

Lastly, there is nothing in the module that requires you own *Diablerie*. Normal characters may have an easier time of it since they have a greater range of abilities than the standard *Diablo II* classes.

Appendix A is the Monster Compendium for all things *Diablo II*. It seems every monster from *Diablo II*, including all those missed by *Diablerie*, are covered here. Baboon Demons, Blunderbores, Cantors, Frog Demons and others can be transplanted to any campaign. At the end of the section is an alphabetized listing of monsters sorted by challenge ratings, which is a quick way to determine what to throw at characters from any setting. Those who want to know what creature goes with what act though should look through Appendix B, the encounter tables. Here, each act is broken down by area with monsters common to that land. One roll of a d20 with the proper chart will tell you what the characters encounter from the Rocky Waste to the Ancient Tunnels.

The last three pages almost seem thrown in as an afterthought. Page 190 is a map of the Diablo II world. It's a nice map, but what's the scale? Outside of the areas in the game, no cities or locals are detailed. Page 191 is a map that can be used as a drawing map with one hex equaling five feet, or as a miniature map with one square equaling five feet. The page is a map key for the computerized Diablo II maps.

Layout is the standard two columns with spoken material boxed in gray background. The art for the area and dungeon maps is similar to previous Diablo II products in that it looks very computer generated. Fortunately, some of the maps are enlarged so that they can be copied and used with standard miniatures.

There are four issues that I have with *To Hell And Back*. The first is the use of old art. Art from the previous *Diablo D&D* products worms its way into this product, and it's annoying. If new art couldn't be commissioned, way make the reader pay for it? They could have at least reduced the size of the book.

The second problem is reuse of monsters covered in *Diablerie*. While not all the monsters are reprinted, most of them from *Diablerie* (like Bat Demon, Bloodhawk, Claw Viper, and Corrupt Rogue) are covered. This would have saved about another fifteen to twenty pages if they had just covered new monsters.

The third problem is the selection of creatures that are detailed. The angels, like Tyrael and Hadriel have no stats. If the authors are going to go through all the trouble of providing stats for the townspeople, why not the same for the angels? The third demon lord, Baal, is also not given stats. Once the players defeat Diablo, there is a paragraph section, "Where to Next?" that suggests they hunt down Baal. Without stats this would be difficult. If they are expecting us to make up stats, then why did we pay for the adventure?

The last problem is a minor one, but the boxed text often comes right from the computer game and should be read carefully before reading. Some characters address the "barbarian" or "paladin." What happens with a new GM whose group doesn't have such a character? The results might be a little humorous; new GMs should read the book first and then adjust the text to your own game.

All in all, as a dungeon crawl, *To Hell And Back* is massive and will take many weeks to complete. Is it anything other than a dungeon crawl? No. Can it be? The world background is brief, but those GMs anxious to carve their own notch in the setting have more material than previously available. If you already own the computer game, the 3rd edition expansion *Diablerie*, and the two boxed sets of miniatures to go with it, *To Hell And Back* is an excellent way to bring the computer game to the RPG. If you're looking for a world book that gives you the *Diablo II* cultures and history, this isn't it.

-- Joe G. Kushner

Better Than Him; Worthy Of You

A Scenario for *Ars Magica*

by Timothy Ferguson

The following is a single-session scenario designed for use with the *Ars Magica* game, but it is easily converted to other fantasy settings.

Forty years ago an elderly puppeteer named Geppetto carved a marionette from an enchanted block of wood. He developed paternal affection for his puppet and, when his wooden son ran away, Geppetto abandoned his workshop to search for him. Geppetto found Pinocchio, who fled from him time after time until, worn down by sickness, fatigue and exposure, Geppetto hovered at the edge of death. Pinocchio changed his ways and nursed his father back to health, then cared for him until his death, twenty years ago. Pinocchio was granted a human body, by the faerie mistress of the forest from whence his wood first came, and so all that was wrong now seemed right.

During his first adventure, Pinocchio was captured by Fire Eater, an evil puppeteer who kept animate marionettes as slaves and firewood. After softening his captor's heart, for just a moment, Pinocchio was set free and he never saw Fire Eater (also called the Director) again. Pinocchio never returned to the hamlet where he was carved, settling down as a basket-weaver, then a rich craftsman, in a distant village by the sea. His father's house, his father's goods, his father's other marionettes, all were forgotten . . .

. . . except, of course, by the Director. He bought the house. He animated the puppets. For the last thirty-nine years, they've been his toys. He's broken almost all of them, all but a scant few who were too inconvenient to replace. One of those was Polendina, a girl marionette designed as a seamstress, who also prepared his meals and tended his house.

When the Director died, his puppets were freed. Freedom, though, isn't useful when you are broken and suffering. Polendina can transplant parts between animate puppets, sewing together the fragments of the broken to repair her siblings. Short of an accident, however, there is no dying puppet to donate all of the parts her family need. That's why she needs to find her brother, the legendary puppet who became a real boy, the one she thinks of as The Liar.

When Pinocchio became a "real boy" he was given a new body, not transformed from wood to flesh. His marionette remained, and he has kept it safe all these years, since it is linked to him sympathetically, like a voodoo doll. Polendina can vivisect the marionette and use the pieces to mend her family. It will kill Pinocchio, but Polendina thinks he's irredeemable.

Characters

Pinocchio Today

Pinocchio, named Paul Collodi after his confirmation, became wealthy in his youth. He was, at first, a skilled basket-weaver, then was given a fortune by the Lady with Azure Hair, the faerie guardian of the grove his wood came from. He's since married Jeanette, the daughter of an older weaver, taking over that family's business.

Paul is technically one of the Fae. The block from which Pinocchio was carved could move and speak before it was carved into a boy. It was animated by a spirit, which Geppetto's Free Expression virtue allowed him to mould into a marionette. Pinocchio was a sort of kobalt (*Faeries Revised Edition*, p. 117) The Lady transformed Pinocchio into a variant of hamadryad, linked to his marionette the way normal dryads are to trees. As an urban faerie, Paul is unharmed by the symbols of divine power, but gains no benefit from miracles.

It's central to Paul's sense of self-worth that he is a "real" person. He does not know that he is a faerie, and will not

accept the idea if someone informs him. Although he knows he is sterile, he doesn't connect this to him being something other than a "real" person. Paul is unaware that Geppetto's other puppets are sapient or mobile.

Faerie Might: 25

Size: 0

Characteristics: Int +1, Per +2, Str +1, Sta +5, Prs +2, Com +0, Dex +3, Qik +3

Powers: Although he has faerie powers, Paul's Delusion makes him unable to use them deliberately. He has the equivalent of the following virtues and flaws.

Virtues and Flaws: Wealthy Merchant +3, Temporal Influence +2, Contortions +1, Perfect Balance +1, Well-Travelled +1, Knack With Swords +3, Faerie Friend +2 (Lady with Azure Hair), Delusion -1 (is human), Enemies -2 (Polendina, possibly the Talking Cricket he murdered), Cursed -4 (sympathetic link to marionette)

As a faerie, Paul is not Faerie Blooded, which is a virtue for mortals with faerie ancestors. He has Faerie Sight, but doesn't realise it. He just thinks he's very perceptive.

Traits: as the GM sees fit.

Skills: as appropriate for class and lifestyle, along with high scores in Carouse (dancing), Juggling (acrobatics) and Single Weapon (sword), from his initial design.

Polendina

Polendina is a female marionette about two feet in height. She has blonde hair (worn in pigtails) and freckles. Her eyes are wide and brown and look like a baby's. Those who know Paul can discern a family resemblance in Polendina's features. She's removed her strings, so the small holes in the hands and feet can be covered with gloves and boots. When fully rested, she can appear to be a six-year-old, or a tiny woman. She is technically a kobalt, but thinks of herself as a marionette.

Polendina, although the villain of this piece, is not mechanistically evil. If she were offered another way to save her family, short of suicide, she'd probably accept it. That she is morally superior to Pinocchio is a very important part of Polendina's identity: she doesn't hurt other people, and tries to avoid other "sins." Abandoning her family to their suffering or being repeatedly dishonest would make her too much like The Liar for comfort, so she's both truthful and driven.

Pinocchio was deceptive, tried to commit murder, and drove Geppetto mad with grief. His reformation occurred after he'd run away to the coast. Polendina doubts Paul's epiphany, because marionettes, like other faeries, can't change their personalities without assistance. It could all be a trick, another ruse to make himself comfortable at the expense of others. Polendina, although she doesn't admit it to herself, envies Pinocchio's humanity and emotional rapport with their father. She expresses this by despising the opportunities Pinocchio wasted, and by loathing him for not coming to his family's rescue, once he was a real boy.

Faerie Might: 15

Size: -2

Characteristics: Int +1, Per +2, Str +5, Sta +5, Prs +2, Com 0, Dex +3, Qik +3

Powers:

Communicate with Animals, 1 point.

Control Element (Terram), 2 points: Can make needles and pins appear from nowhere and fly. Flying needles are not elfshot, but if Polendina returns in later scenarios, she might have developed that power.

Shapechange to Person, 2 points: A variant of the Shapechange to Object power. Polendina's natural form is as a marionette.

Enchant Object (mending needle), 1 point: Empowers the magical needle that Polendina uses to mend marionettes. This can also be used to join together other wooden objects. For example, Polendina can sew a door to its arch. Her joints are always slightly stronger than the surrounding wood.

Traits: Hard Working +3, plus those the GM sees as fitting.

Skills: Tend to the domestic, but also performance and communication skills.

Weapon/Attack	Init	Atk	Dfn	Dam
Scissors	+7	+7	-1	Dam +9
Flying pins (Ranged)	1st +2	+2	Parry -	Dam +3

Dodge: +5

Soak: +7

Fatigue Levels: OK, -1, -6, Incapacitated

Body Levels: OK, -1, -6, Incapacitated

Player Character Involvement

How the PCs become involved in the story will vary depending on their class and experience. One way of introducing them to the story is to have them hired as guards by Paul, who has noticed that someone is entering his house and searching it while he is about town or at night while he sleeps. Oddly, the burglar doesn't force entry, and doesn't seem to steal anything, with the exception of loose change and a little food. His wife Jeanette, a rather pious woman, wants to hire a cleric to bless the house, fearing that some imp or ghost is moving the family's possessions. This provides an alternate hook, or, in the *Ars Magica* setting, an extra complication.

The items in the house are being moved by Polendina as she searches for Paul's marionette. She doesn't want to be seen by the family, so most of her foraging occurs while they sleep. One the few occasions when both Paul and Jeanette are out of the house she searches their chambers. She steals loose change in case she needs to buy transportation back to Geppetto's workshop.

Characters guarding Paul's house may conclude that the thief is looking for a particular item. Paul doesn't want them to search his house, since it would involve damaging his possessions, but they can wait until he is away, much as Polendina does. Paul's marionette body is stored in a wine barrel in his cellar. Polendina hasn't found it yet, because she doesn't have the strength to bust a barrel seal, and wants to search other areas before she starts sawing into things, in case she accidentally damages the marionette. That might mangle a part she needs to repair one of her siblings.

Options

Combat

The simplest, and least attractive, solution is for the player characters to catch Polendina red-handed and chop her to pieces. A complication is that when first discovered Polendina probably looks like a human girl. Combat is unlikely to solve the problem in the long term, because Polendina remains alive even if dismembered, and has the power to patch herself up. Once she finds Pinocchio's doll, she'll fix herself permanently, then take her spares home. To destroy her they need to immobilise her pieces, (by burying them separately for example), or destroy them utterly, by (for example) burning them.

Capture

Polendina will surrender if she feels it is in her interest. Once captured, she has no qualms against revealing Paul's secret, or seeking to turn his protectors. To the morally shady, she can offer the Director's treasure, which isn't large but might tempt low-level characters. For characters of a higher level, she can offer the services of herself and her family. The GM should tailor this potential retinue to be tempting. In an autumnal *Ars Magica* game, she might hint that an injured marionette knows the Arcadian trods that lead to the City of Puppets, where the ability to craft her kind of faerie can be learned (although that, of course, is another story).

Trickery

Polendina can try to trick the characters to her side. If they are taken in by Jeanette's ghost story, Polendina will begin to plant clues which indicate that Paul is guilty of murder. This includes speaking to the characters in her "little girl" form, asking them why they are in the house haunted by the ghost of Jeanette's father. If she's using this ploy, Polendina will be sure to imply that Paul is "undead," so that the characters uncover his faerie nature. She believes this will make killing him less objectionable to them. Although Paul's death would damage his marionette, many of his parts would still be useful. Polendina would prefer an execution, by hanging or drowning if possible, to the usual gore of sword combat because it would ruin fewer of the marionette's parts.

Conclusions

Death

The simplest resolution is that one of the non-player characters dies, probably assisted by the player characters. If they kill Polendina, the characters should then be encouraged to travel to Geppetto's workshop for another story. If they kill Paul, or aid in his death, they may be answerable to the authorities, but if they demonstrate his faerie nature things may go less hard on them.

Deadlock

Characters can stop Polendina's attacks by destroying her family. Were they to die, she'd seek the Land of Puppets in Arcadia to build a new life for herself. Although she's not generally violent, once her family are dead she has no further need for pieces of Paul's marionette. At this extreme she might set fire to Paul's house, after sewing the doors shut. Like all villains who escape to Arcadia, she can return in later stories.

Alternate Solutions

GMs wanting to spare both characters can include another way to mend the puppets in a second scenario. Examples include:

- Go on a quest to find the Lady with Azure Hair, who gave Pinocchio his body. She can cure puppets, or make all of them "real" if she wishes, so that they heal like people.
- Travel the fairs of Europe seeking another puppeteer who will care for Polendina's family. After her experience of abandonment and slavery, Polendina isn't sure such a person exists, and will require skilled convincing.
- Summon Geppetto's ghost, or that of Fire Eater, so that they can train a new puppeteer. Remember that only someone with the Free Expression virtue can successfully make magical marionettes, and only then from the Virtuous woods of certain rare trees.
- Seek a magic item which makes the puppets who touch it animate, so that Polendina can harvest them for pieces.
- Hunt down dryads, the wild form of marionette, so that Polendina can use their body parts to repair her family.
- Journey to the faery Land of Puppets, where marionettes are free and their strings trail languidly into the sky.

Acknowledgements

- *The Adventures of Pinocchio* by Carlo Collodi (Lorenzini) is available online at http://www.ulib.org/webRoot/Books/_Gutenberg_Etext_Books/etext96/pnoco10.txt
- The title is a quotation from "Just a Toy" by Barenaked Ladies, from their *Born on a Pirate Ship* album, which is a lament by an inanimate puppet that wants to incinerate Pinocchio. It provided the spark for this scenario.
- The term "The Liar" appears in the Dead Sea Scrolls, and is echoed in both Pinocchio and "Just a Toy." It may refer to Saint Paul, which is where Pinocchio's Christian name comes from in this scenario.

Now That's a Knife!

Modern Blades in GURPS

by Jeff Fournier

GM: "Ok, your chopper crashed and sank into the ocean. You all made your swimming rolls so you are all on the shore of the island. Because the chopper sank you only have what was on your backs when you jumped in. What are you going to do?"

Players: "I'm cutting down trees with my dagger. I'm making a raft here! How long does it take?"

"We lost the First aid kit in the chopper, so I'll use my bowie knife to cut the shrapnel out of Dukes wound! What's the modifier to my First aid roll?"

"I use my knife to kill a wild pig after stalking it."

(GM checks sheet, it reads "pocket knife." GM shakes head in disbelief.)

Players: "I saw it on a TV show once! Really."

* * *

Whether or not the above has happened to you as a GM, it could in the future. *GURPS* has quite a few excellent rules for simulating the strengths and weakness of a great deal of different things from Guns to Vehicles and Robots. In this article we will go into some guidelines to help you "game simulate" the oldest of man's tools in some of its newest variations. It has been around throughout the ages in many forms and used for many purposes. In modern day we call it the knife.

What Is A Knife?

In *GURPS* terms it is a weapon of several potential basic sizes (Small and Large) as well as a further refined weapon in *GURPS Martial Arts* (such as the kris, parang and tanto). To break it down to its simplest terms it falls into two categories at the same time:

- It's a tool.
- It's a weapon.

It is how different types of blades, and their function in these areas, that make their usefulness far outweigh their size. A small knife may be great for light tool work but not that great for combat. On the other hand, a large knife can be useful for small tasks, it is primarily a big combat tool. It is also by their design and shape that we can find the right knife for the right job. At the end of this article are listed some example knives and their games stats, based upon the following optional category examples of basic shape for the knife's blade, size, and how it was designed to work.

Feel free to pick up a book or magazine which outlines the relative merits and shortcomings of various new blade designs. These are generalities and can be interpreted by GM's as they see fit in their campaigns. Encourage players to have their characters experiment with using different blades in game to find their strengths and weaknesses.

Blade Shapes

Spear

The spear blade is usually long and relatively narrow in width to its length terminating in a sharp point. It is usually sharpened only on one edge for its entire length. Examples exist with a sharp portion of the blade on the back side as well usually running an inch or to from the tip, not the full length (which would make it a dagger). For purposes of this article the Tanto point also resides in this category.

As a weapon it excels at the thrust (+1 to all Thrust damage, not exceeding the max for the weapon) and functions average with the cut. As a tool it has a good utility capability to pry and cut because of its strong blade, giving a +1 modifier to the penalty of -5 for a mechanic or crafter not having any tools when he makes his skill check. It is not, however, the best substitute for chopping if you do not have an axe. The best example of this blade shape would be a straight bayonet blade from any of the world wars, or the main blade on a Swiss Army knife.

Clip Point

A clip point ends in a sharp thin tip with a dished-out portion near the point on the unsharpened side. Examples of this would be a Bowie knife or USMC K-bar combat knife. While the blade's width and sharp point help in any chopping or fine whittling task (again a +1 bonus to the no-tool modifier on skill rolls) it is only average on combat cutting and thrusting. A good-sized clip point blade should not be underestimated in combat as it could easily fell a small tree as easily as a person's limb. It is also a very popular design for hunting knives primarily in America.

Dagger

Everyone is probably quite familiar with the shape and basic function of the dagger, so it will only lightly be touched upon here. As a hand weapon it is excellent as far as knives go, which is reflected in its *GURPS* stats. As a utility blade the dagger can cut, but is a poor chopper. It is very weak in blade strength due to having a second edge grind where a stout back would be to support the blade (giving an additional -1 modifier to any tool use for skill rolls). A critically failed skill check with a dagger will almost certainly result in a broken blade.

Utility

The name really says it all. In non-combat situation the use of a utility style blade should be very helpful (+2 to Skill modifier where appropriate) in any cutting task. Its edge-only blade shape makes it a poor weapon (-1 to hit and damage rolls, no Thrusting).

Larger heavy utility blades like Bolos or machetes have the ability to tackle larger tasks and in some cultures are a useful and valid weapon (+1 Swing damage modifier but still no thrusting).

Examples of this type include a "click from the handle" X-acto type blade to a blunt sheepsfoot blade carried by sailors on board ships. Interestingly enough, the sheepsfoot blade was the only blade that some captains would allow their men on board to carry, fearing that any pointed knife would deal lethal damage instead of just a cut.

Spike

From the Stiletto to the modern Delta Dart made of poly-carbonate, this point only weapon has only one purpose: killing. The favorite of assassins for its hard to heal wound, the spike style blade is a dangerous weapon in combat (+2 to Thrust damage, No swing or cutting). The stiletto is completely useless as a cutting tool except to punch holes in things. While this might give a +1 modifier to leather-working skill, that is about the limit of its use. Any thin "point only, no edge" weapon would qualify as a stiletto blade, even some makeshift ones if they were hard and thin enough.

Fantasy Blade

If you shop at any shop with more than a few knives you will see examples of these flights of fancy in steel. Often made by custom bladesmiths to appeal to the sci-fi and fantasy crowd, these knives are a growing trend in modern

blade ware. Mostly used for show or ritual purposes, these knives do not easily fall into any of the above classifications. They can have serrations (see below), but they are usually not very well-designed. Their wavy impractical blades are poor combat performers at best or unwieldy pieces of junk at worst (-1 to hit and damage). As tools they usually lack any useful cutting edge except perhaps a hook that could open a bottle top. GMs might be willing to grant a character who pulls one in a combat situation an Intimidation check with a +2 bonus to see if his opponent backs down from combat due to his fearsome looking weapon. They would probably make excellent trade goods to a lower tech society who would be amazed by their fantastic shapes. Some warriors would no doubt be known for their choice of such exotic blades, and this could be used to build a reputation and identify them in a fight.

Serrations

In the past decade the modern combat knife scene has exploded with a plethora of new designs and innovations. One of these is adding a serrated edge to the otherwise straight razor edge on modern combat blades. By doing this the now wavy edge puts more blade surface area on the cutting edge of that portion, making it perform like a slightly bigger knife. Most modern users admit it to be a boon when cutting line or other space age tough materials (giving a +1 skill bonus to the appropriate mechanical skills), however it has a increased chance to snag up on something during combat (-1 on ST check to unstick a stuck impaling weapon if it has serrations). On a deep thrust you might find yourself without a weapon. Most modern combat blades come in at least two versions, with or without serrations as the buyer prefers.

Saw Back

During the craze for the *Rambo*-type survival knives of the 80s, saw backs appeared on the unsharpened back of many combat knives of the period. Even today military issue knives such as the Air Force Survival knife have this feature. The ability to use a knife as a saw is a real advantage (+1 to an appropriate skill modifier) however it suffers the same combat disadvantages as blade serrations (see above). Please note that while it is possible for a blade to have serrations and a saw back, the in game penalties as well as the bonuses are cumulative.

Combat Folders

Beginning in the 80s with the advent of space age plastics for handles and improved steel for blades the Modern Combat Folder made its debut. With pocket carry clips (+1 to Holdout) and one-hand opening blades for ease of use, these new breed of knife took the cutlery world by storm. Touted as being foldable for carry but with locks strong enough for actual combat, these folders delivered . . . for a price. The average cost of a quality combat folder in any blade type would be ten to twenty times the price of a average quality knife! While their utility is unquestioned, they suffer from the fact that they are a folding knife doing a fixed blade's job. If ever any skill check (including Combat) critically fails while using the knife as your only tool, it has probably closed on your fingers!

Example Blades

Below are some examples of modern blade ware and their **GURPS** stats as derived from the above information added to the basic knife data from the **GURPS** main rule book where applicable.

Spyderco "Military" Folder (small knife)

Combat Stats: Cut SW-3, Imp Thr, Max Dam 1d+1

Skill use modifiers: +2 to skill tool modifier, +1 to holdout, -1 to Unstick from thrust

Notes: Spear point, serrated, pocket clip, combat folder.

Produced by Spyderco, the pioneers of the modern combat folder, this knife is their answer to the requests of users for a stout folding blade for military/combat applications. It comes with or without serrations as the buyer prefers. Cost is \$150.

Buck 110 Folding Hunter (small knife)

Combat Stats: Cut SW-3, Imp Thr-1, Max Dam 1d+1

Skill Use bonus: +1 tool modifier

Notes: Clip point, lock blade folder.

Invented by Buck knives in the mid 70s as a folding hunting knife, the model 110 soon became the pattern all the other companies copied to grab some of its success. It was an excellent folding field knife and was very popular with Outlaw Bikers and bar room brawlers who called the knife the "Ozark switchblade," even though it wasn't. Its traditional wood and brass parts make it appealing to the eye, and its robust lock and reputation make sure it has continued to sell to the present. Cost is \$39.

Timberline Spec War (large knife)

Combat Stats: Cut SW-2, Imp Thr+1, Max Dam 1d+2

Skill Use bonus: +1 tool modifier

Notes: Spear point (tanto), fixed blade sheath knife.

Pioneered by advances in metallurgy and machine technology, the Timberline company's premier knife, The Spec war, gained an immediate following in the market it was designed for. It is a nearly indestructible tool meant to take more abuse than any knife should. For the last years of the 80s and into the early 90s, practically all special warfare operators wore this knife into harms way on missions. Cost is \$250.

Cold Steel Delta Dart (Small knife)

Combat Stats: Cut -, Imp Thr+2, Max Dam 1d+1

Skill Use bonus: None

Notes: Spike, non-metallic construction.

As a last ditch concealment weapon meant for deep cover or espionage, the Delta Dart (it is not weighted to be thrown, no matter what the name says) is made of a super-strong resin mixture of glass and space-age plastics. Undetectable by metal detectors and capable of piercing a 2x4, this is considered by some as the ultimate spy knife. Cost is \$5.

Sicut MinTan survival knife (Small knife)

Combat Stats: Cut SW-3, Imp Thr, Max Dam 1d+1

Skill Use bonus: +1 to skill modifiers, +1 to Holdout from size/sheath.

Notes: Spear point (tanto), lashing holes, neck sheath, fixed blade.

Created by Australian knife maker Ron Spencer in 2000, the MinTan is intended to function as an emergency survival knife in a small "tobacco tin" style survival kit. With a leather neck sheath to keep it handy (or concealed) the thong that holds the knife around your neck can also be used to tie it through special lashing holes to a stick, making the blade into an impromptu spear in emergencies.

Pyramid Review

Cosmic Coasters

Cosmic Coasters

Published by [Looney Labs](#)

Designed by Andrew Looney

4 coasters; \$5.00

Remember the night when you dumped an entire Guinness on your copy of the original *Cosmic Encounter* at the Stop 'N' Gulp Tavern? Or how about that time you were enjoying the *Age of Renaissance* and you mistakenly invaded a glop of nacho cheese left there from the last time you played at Taco Heaven? If you long to indulge in some gaming while eating out or tossing a few back, yet are fearful of loosing your supplies to an accidental spill, Looney Labs has the perfect game for you: *Cosmic Coasters*. Not only does it feature simple mechanics ideal for a noisy atmosphere, *Cosmic Coasters* is resistant to all manner of dining trauma because the board is made out of beer coasters.

Each of the four coasters has a moon of Jupiter printed in color under a grid of nine spaces. Every player needs one moon and seven coins; or seven cheese snacks, or tiny pretzels, or anything that can represent space ships on the coasters. To win, a player must teleport to her opponent's moon, then teleport back home. The rules are simple, fitting entirely on the back of a single coaster. Like all good abstract strategy games, though, the rules are deceptively short. The game's strategy is satisfyingly deep and luck plays an acceptably minor roll in determining the winner.

A moon has nine spaces made up of four Factories, four Control Points, and one Teleport Pad. On a turn, a player can teleport from his moon to another moon, build a new ship in a Factory, or move a ship and engage in combat.

Players can teleport a ship if they have one on the Teleport Pad and if they have at least two ships in Control Points on the moon. Most importantly, the opposing player can possess no more than one Control Point on the same moon. Thus, if both players possess two Control Points on a moon, no one can teleport from that moon. At the beginning of the game, teleporting to your opponent's moon is easy, teleporting back home to win is much more difficult.

To make travel a bit easier, a player can destroy an opponent's ship by teleporting on to it. If the opponent has ships in the Control Points on either side of a Factory, however, she can create a new ship to replace the old one, to a maximum of seven ships.

Players may move a ship one space each turn. If they land in an occupied space, then combat is resolved through Rock-Paper-Scissors. Wait! Don't hit your web browser's Back button! Granted, Rock-Paper-Scissors is not the most original game mechanic out there, but there are several benefits for this game. First, most everyone knows how to play it, so teaching the game is easy. Second, in a noisy environment, such as a bar, it requires no shouting. Players need only be able to see one another. Finally, it offers three possible outcomes, allowing combat to be weighted in favor of the attacker. This is more interesting than a coin flip and yet does not require dice.

If an attacker wins Rock-Paper-Scissors, then the defender's ship is destroyed and the attacker now occupies that space. If the players tie, then the defender's ship is destroyed, but the attacker returns to its original space. If the defender wins, then nothing happens and the turn is wasted. Thus, combat is weighted in favor of the aggressor and players must work with these odds to be successful. A defensive strategy is not necessarily a good one in *Cosmic Coasters*.

Finally, borrowing a concept from the aforementioned *Cosmic Encounter*, each player has a Special Power. There are four choices. Stinging Defense means that an attacker can lose a ship to the defender during combat. Rapid Transit allows a player to move two spaces at a time. Teleport Inhibitor forces invaders to win Rock-Paper-Scissors to teleport

on to your moon. A player with Warning System is not destroyed when an invader teleports on to her ship. Fans of *Cosmic Coasters* will certainly begin to come up with new powers after wearing out these four.

This simple rules set leads to some agonizing tactical decisions. Generally, players teleport a couple of ships to an opponent's moon, take over a factory to build new ships, then try to knock their opponent off of the final Control Points so they can teleport home. Because every player is being aggressive at the same time, the decision whether to advance a strategy on an opponent's moon or take care of things at home can be delightfully frustrating. While any one match of Rock-Paper-Scissors is not interesting, stringing twenty or more together presents a psychological game within the game.

Cosmic Coasters is designed for two players; however, additional rules allow for up to four. In this version, players must teleport to and from the moon on their left. The game does not work perfectly with more than two players, unfortunately. If one player is more defensive than the rest, then his opponent to the left stands a good chance of winning as they are not busy dealing with an invasion.

Cosmic Coasters succeeds at exactly what it sets out to accomplish. It is durable, playable with a minimum of pieces and table space, and requires little verbal communication. At the same time, it offers a strategic challenge and some goofy fun. If you do not think it sounds particularly goofy, wait until you see the stares you get from the rest of the bar after playing your fourteenth game of Rock-Paper-Scissors and raising your fists in triumph.

Terror in Freeport (for d20)

Published by [Green Ronin Publishing](#)

Written by **Robert J. Toth**

32 b&w pages; \$7.99

Terror in Freeport is the second adventure in the *Freeport* trilogy. Sporting another powerful cover by Brom that has little if anything to do with the adventure itself, *Terror in Freeport* is a roleplaying adventure with little in common with the dungeon hacks of *Sunless Citadel* or *Forge of Fury*.

The set up is nice with a brief history of Freeport, the previous adventure, *Death in Freeport*, and an adventure synopsis that gives the GM the bare bones of the adventure. After that, the adventure, designed for four 3rd level characters, starts in earnest.

[SPOILER ALERT!]

The adventure pits the players against politicians and the Cult of the Yellow Sign. Players will have lots of interaction with city guards and priests of Knowledge to get the truth they seek. Some of the twists and turns are a little humdrum like having the characters return to the Temple of the Unspeakable one, now The Abandoned Temple, while others, like the true identity of Thuron nicely play into information already provided about the ancient serpent people.

The adventure has one major flaw: a cliffhanger style ending. Sure, characters can go through the free adventure on the Green Ronin website or enjoy any number of d20 sourcebooks out, but that will defiantly throw the timing and urgency of the whole series off. A minor flaw is the advice, "give XP for innovative solutions." Because that's the extent of the advice.

[END SPOILER]

One of the nice things is that stats aren't spread though the book. Instead, all the stats are rounded up to Appendix, with a breakdown by townsfolk, creatures, and named opponents. The handouts include an illustration of a book and a written speech. Remember the pre-generated characters from *Death In Freeport*? They're back, only now they're all 3rd level. It's nice to see how they advance, but since this isn't a starter adventure, are pre-generated characters really necessary? The book ends with Appendix 2: Licensing Agreements which is the infamous OGL and d20 System Trademark License.

The layout is the standard two columns of text with illustrations breaking up the pace. Text to be read to the players is boxed off in light gray, and text the GM should pay close attention to -- The Real Story -- is boxed in dark gray with white text so that GMs don't get confused. On another note, the map of a landmark from the first adventure is a reprint, but takes up one quarter of the space. If maps can maintain their readability at such a small scale, I'm all for it, but I fear that because the map was a reprint, that future maps will indeed take up a whole page.

One of the things I don't like is the wasted interior cover space. I understand that pricing is an issue, and at \$7.99, *Terror in Freeport* is one of the least expensive full length adventures out. Even so, I would love to have seen those maps and handouts presented there. Those wishing to base a campaign in Freeport might want to buy all three adventures, gather all the "Focus on Freeport" material from the Green Ronin Website, and then run the whole thing like a seamless epic. Those just looking for a night or two of gaming, especially those who haven't run *Death in Freeport*, will have a little more effort to customize the adventure, but the payout is worth it.

-- *Joe G. Kushner*

Pyramid Review

Transactions of the Royal Martian Geographical Society - The Journal of Victorian Era Role-Playing (for Space 1889)

Published by [Heliograph Inc.](#)

Created by Dr. Mark Clark (Ed.) et al.

\$20 (vol. 1), \$22 (vol. 2), \$18 (vol. 3)

For the gamer with a discerning taste for playing in a more polite, civilized era, 2000 was a vintage year. Not only did we see two *GURPS supplements* - *Castle Falkenstein* and the incomparable *Steampunk*, as well as Marcus L. Rowland's *Forgotten Futures*, but also the return of the RPG that can claim to have initiated the interest in combining all things Victorian with other genres. GDW's *Space 1889* melded Science Fiction and Victoriana to create a fantastic setting that cast the colonial and imperial urges of the great powers across the ether to Mars and Venus. Long out of print, Heliograph Inc. has reprinted not only the rulebook, but all of GDW's supplementary materials, with two GDW titles reprinted in each of the new Heliograph books.

Alongside the official GDW books, Heliograph have also released three volumes of the *Space 1889* fanzine, *Transactions of the Royal Martian Geographical Society (TRMGS)*, combining a mixture of reprinted and new material. First published in the early 1990s, and later to include GDW's official *Space 1889* newsletter, Ether Society News, Heliograph reprints the first four issues of the original fanzine in their first volume, issues five through eight in the second, whilst the third contains material only seen previously on the Heliograph Web site.

Each volume is an A5 sized thick book, averaging approximately two hundred pages in length, and printed on slightly yellowed paper. Layout is decent, if rudimentary, but the artwork is not. At best, the original line art could be called charming but quirky. The period reproduction art is far better, but the standard of all the art improves markedly over the course of the three volumes. Unfortunately the maps let the series down badly, as some are very rough. Since these books have been completely reprinted, there is little reason why the maps that needed redrawing could not have been so.

Although *TRMGS* is subtitled *The Journal of Victorian Era Role-Playing* (later of *Historical Science Fiction Role-Playing*), its coverage of roleplaying games outside of *Space 1889* is limited. Primarily this is an occasional foray into *Cthulhu by Gaslight* or rather, Cthulhu 1889. In the third volume, this expands slightly with a scenario suitable for *Castle Falkenstein* ("Queen Victoria and the Zeppelin Pirates") and an article for *GURPS* on gaming with Captain Nemo. Although this has been reprinted from *Pyramid*, it will be useful additional material to that already given in *GURPS Steampunk*. Also included is an alternative Victorian-era Mars for those that do not find the Mars of *Space 1889* their cup of tea.

The trilogy includes little that is of use for the *Space 1889* miniatures rules, *Soldier's Companion*, but provides several bits and pieces for the board game, *Sky Galleons of Mars*. The focus, however, is more on the *Space 1889* roleplaying game, and as such there is much more information for that game in these books. This includes new character careers and backgrounds for Mars and Earth, as well as examinations of the Martian religions and the presence of the Russians, the French, their Foreign Legion, the Japanese and Suffragettes on Mars. There are a few independent scenarios across the trilogy, but the majority comes from the editor's own Transactions campaign. While pre-generated characters are provided for all seven parts, the campaign is not tailored specifically to them, being generic enough that any characters could be used. If I have a quibble about the campaign, it is that it occasionally lapses into unnecessarily Pythonesque humor, which is perhaps a little uncivilized.

What is apparent from the many articles in these three books is that the editor and several of the writers are history post-graduates, specializing in the nineteenth century and the growth of technology. Even if the GM is not planing to run a *Space 1889* game specifically, it is these articles that should interest the Victorian gamer. Few of these are game specific, making their contents suited to any set of rules. This is where *TRMGS* justifies its own description as *The Journal of Victorian Era Role-Playing*.

In the end, *Transactions of the Royal Martian Geographical Society* is aimed squarely at the *Space 1889* fan. For them these three volumes should prove highly useful, not to say entertaining additions to their games. Yet there is still enough information in the books for them to be a boon to the fan of the Victorian Science Fiction or Steampunk genres.

-- *Matthew Pook*

Rebounding: The Return of Spring-Heeled Jack

*"For life is but a dream whose shapes return,
Some frequently, some seldom, some by night
And some by day, some night and day: we learn,
The while all change and many vanish quite,
In their recurrence with recurrent changes
A certain seeming order; where this ranges
We count things real; such is memory's might."*

-- James Thomson, *The City of Dreadful Night*, I:iii (1870)

A little over two years ago, we discussed the undying, the uncatchable, the downright uncanny knotted tangle of urban legend and ultraterrestrial known as Spring-Heeled Jack. (Jump [back there](#) and catch up, if the details have blurred.) Although that column conveyed the basics, from Jack's best-known appearances in Victorian England to his alchemical and superheroic resonances, there's more ground left to cover, even (especially) on spring-shod bootheels. The more you look for Jack's tracks, the more you'll find -- if only because someone (or something) like Spring-Heeled Jack will always bounce back.

"We became afraid to go out after dark . . . He'd jump out at people, from behind a tree, maybe, or over a wall -- a figure dressed all in black. He was very agile; some people said he must have had springs on his feet."

-- Matt Costa, recalling the Provincetown Phantom of 1938

Between the first rash of assaults and encounters in 1837-1838 and his star turn at the Aldershot barracks in 1877, Jack continued to appear. His stomping (jumping?) grounds ranged along the south of England from Yarmouth to Teignmouth, with major appearances in the south London suburb of Peckham in the fall of 1872, and venturing as far north as Sheffield in Yorkshire in the spring of 1873. In his Sheffield rampage, Jack wore a white sheet and ominously prowled near the Cholera Monument in the park. After a brief appearance in Liverpool in 1888 (during the Ripper killings in his old hometown -- a Jacks' quarrel?) and a return to Sheffield in the 1890s, Jack diverted further north to Bradford in September of 1926.

Overseas, Jack carried out a reign of mischief and assault in Provincetown (on Massachusetts' Cape Cod) between October 1938 and December 1945, although there he blew blue flame and jumped around as the "Black Flash" or the "Provincetown Phantom." More intriguingly still, the people of Nazi-occupied Prague enjoyed the antics of "the Springer" who leaped over rooftops after curfew and pestered the SS -- and shivered at the attacks of "the Razor Blade Man" in the spectral streets of the onetime alchemists' paradise. (Are these tales the surface ripples of a wartime Jacks' alliance, flowing between shadowy London and haunted Prague through John Dee's old Enochian gateways? And if not, why not?) After the war, tales of "hopping mannikins" and "spiral hoppers" plagued East German Saxony and Thuringia in 1950-51 -- were the Jacks and the [Werwolves](#) cooperating in some occult op at the dawn of the Cold War? Perhaps this mésalliance created the "creatures that walk like dogs, have faces like pigs, eyes like bulbs, and springs on their feet" that plagued Uttar Pradesh in India in 1996.

"A reporter . . . adopted every means for obtaining information on the subject, and personally visited many of the places above-mentioned, where he found that, although the stories were in everybody's mouth, no person who had actually seen the ghost could be found."

-- The *London Morning Herald*, January 10, 1838

Although Jack's earliest appearances, before the ectoplasmic mold had quite set, varied just as much as his Indian bastard spawn. Eyewitness reports described Jack as a ghost, a bear, a devil, a figure in brass armor, and a mailed figure wearing bullock's horns. In his white-clad animal form, Jack may be the similarly-agile "Hammersmith ghost" of 1803. The multiplicity of reports coalescing into one mostly-standardized form seems to be standard procedure for a mass-hysterical panic (or, one supposes, an ultraterrestrial incursion), as the UFO flaps demonstrate. Another example is the case of the Phantom of O'Donnell Heights, whose nocturnal prowlings and assaults terrorized that Baltimore housing project in the summer of 1951. The original descriptions varied, but after only a few days, the Phantom

became a "tall, thin, black-clad figure with a hideous face" -- who could leap 20 feet straight up without leaving a footprint. (One local official blamed Batman.) All these tangles leave us no wiser, with the truth (or truths) safely sprung out of our grasp. It's enough to make one suspect some deliberate hand at work in the disappearance from the British Library (during the Blitz, while Jack was out of the country) of all three anonymous 1838 broadsheets dealing with his exploits, especially the evocative *Authentic Particulars of the Awful Appearance of Spring-Heeled Jack; Together with His Extraordinary Life, etc.*

"In one chronicle there is a reference to a de la Poer as 'cursed of God in 1307,' whilst village legendry had nothing but evil and frantic fear to tell... The fireside tales were of the most grisly description, all the ghastlier because of their frightened reticence and cloudy evasiveness. They represented my ancestors as a race of hereditary daemons beside whom Gilles de Retz and the Marquis de Sade would seem the veriest tyros, and hinted whisperingly at their responsibility for the occasional disappearances of villagers through several generations."
-- H.P. Lovecraft, "The Rats in the Walls"

Which is where the conspiracy theories come in. The earliest newspaper stories of Jack's 1838 appearances blame "a member of a certain band of aristocrats, who, for a wager," has impersonated "a ghost, a bear, and a devil" in order to "destroy the lives of . . . as many servant girls as [he] can, by depriving them of their reason, and otherwise accelerating their deaths." Henry de la Poer Beresford, the 3rd Marquis of Waterford, the Regency "blood" and usual suspect for the "aristocratic Jack," was a famously eccentric wagerer; last time we discussed some of the other evidence (well, hearsay) that leads Peter Haining to finger him for the crimes in *The Legend and Bizarre Crimes of Spring-Heeled Jack*. (In this context, it's interesting that the same rumor -- of a wager to frighten insensible "a certain number of individuals between then [Easter] and Whitsuntide" -- shows up in the 1873 Sheffield reporting, too. A Discordian conspiracy of Madness by Deed?) The Marquis of Waterford was also a Freemason, knew both Gypsies and "men advanced in mathematics," and was the nephew of the founder of the arch-conservative Orange Order -- which London CID inspector McNaghten believed [Jack the Ripper](#) killed to thwart. And again, our dueling Jacks turn up in this bet.

*"Now is the Time that Rakes their Revells keep;
Kindlers of Riot, enemies of Sleep . . .
Who has not heard the Scowrer's Midnight Fame?
Who has not trembled at the Mohock's Name?
Was there a Watchman took his hourly Rounds,
Safe from their Blows, or new-invented Wounds?
I pass their desp'rate Deeds, and Mischiefs done
Where from Snow-hill black steepy Torrents run;."*
-- John Gay, *Trivia: Or, The Art of Walking The Streets of London*, Book III (1716)

But conspiratorial mischief doesn't begin with Jack; the London of 125 years earlier quailed under the outrages of the Mohocks (named, like the punk haircut, for the Mohawk Indian tribe). Under the rule of a mysterious "Emperor" (with a Turkish crescent "engraved" on his forehead), between 1712 and 1714 these spoiled "peers and persons of quality" assaulted young women and "late pedestrians" with swords and razors. The ruling Tories accused the Whigs of fomenting "a nocturnal fraternity" to overthrow the government -- and when on Lammas, 1714, Queen Anne did, in fact, die, the government did, in fact, fall to the Whigs. Spring-Heeled Jack's occasional horns come to mind with the Mohocks' fellow rakehells, the Bold Bucks, whose aggressive paganism and devotion to violence and orgies recall the crazed followers of [Dionysos](#). Did some alchemical confectioner mix the [chocolate](#) at the Whig Kit-Kat Club to an ancient Dionysiac formula, sending young aristocrats pouring through Hawksmoor's haunted London streets in search of blood and madness?

"But, as usual, he walked to and fro, and during the day did not pass from out the turmoil of that street. And, as the shades of the second evening came on, I grew wearied unto death, and, stopping fully in front of the wanderer, gazed at him steadfastly in the face. He noticed me not, but resumed his solemn walk, while I, ceasing to follow, remained absorbed in contemplation. 'The old man,' I said at length, 'is the type and the genius of deep crime. He refuses to be alone. He is the man of the crowd. It will be in vain to follow, for I shall learn no more of him, nor of his deeds."
-- Edgar Allan Poe, "The Man of the Crowd" (1840)

So, perhaps the secret to Jack is not a single immortal ultraterrestrial, or even a bisociated blending, but a whole deck of Jacks, spirits of [urban fantastic](#) frenzy and nocturnal nightmare flooding forth every 125 years from 1713 to 1838 to the Mods and Rockers of 1963. Go back 125 years, and you get that fulcrum year of 1588, when [Christopher Marlowe](#) (speaking of death by Whitsuntide) and the University Wits dueled in the streets of theatrical London. Are the Jacks simply Maenads and Bacchantes? The faerie host of the Sluagh, the restless dead? Immaterial urgencies, primal totems as in the movie *Nomads*? The [Wild Hunt](#)? Or could they be the torch-bearing followers of the faerie swan-queen Aine (thus joining Spring-Heeled Jack's occasional wings and breaths of fire together), boiling out of the Beresford family lands on the southern reaches of Knock Aine and into London and history and nightmare -- and your game? Whatever your game, make sure that Jacks are wild.

The Realm of the Inca

An Empire of Magic and Super-Science for GURPS Castle Falkenstein

by James L. Cambias

In the history of our own world, the Inca civilization was destroyed by civil war, the Spanish conquest, and disease. But beyond the Faerie Veil in the universe of *GURPS Castle Falkenstein*, the fate of the Inca was very different. There, the Inca had fantastically advanced science and sorcery, and their empire has survived in isolation until the Steam Age.

The Empire

The Incan Empire is called Tahuantinsuyu by its people. The empire extends along the western coast of Antillea, from Gran Colombia clear down to Chile, and inland to the eastern foothills of the Andes. The Empire has over 7 million inhabitants, making it the equal of many New European powers.

The subjects of the Inca are a variety of tribes, including Quechua, Aymara, Cara, Nazca, Chimu and Chibcha. Each of tribe has its own language. The Inca clan uses Quechua as the court language, and most inhabitants of the empire speak that tongue in addition to their native dialect. The people of the empire are pure-blooded Indians; no immigration is allowed.

The empire is divided into four sectors, each under an Inca governor. The provinces come together at Cuzco, the capital. Each province is divided in turn into smaller areas called sayas.

The northern sector extends from Cuzco to Gran Colombia. In the far north of this region live the Chibcha, who had an advanced culture before they were conquered by the Inca. South of them, just on the equator, are the Cara. The Chimu dwell between the Cara.

The western province includes the area between Cuzco and the sea, and includes the territory of the Inca and the Nazca plain. The southern province encompasses Lake Titicaca and extends down to Chile and the Argentine, and is inhabited by the Aymara people; it is the richest of the four provinces.

The eastern province of the empire includes the bulk of the Quechua tribal lands northeast of Cuzco. Beyond them the province is sparsely settled, and much of it is a military buffer zone against the Amazon tribes and Brazil. Great fortress-cities like Machu Picchu guard the mountain passes.

Major cities of the realm include Quito, which sits only a few miles south of the Equator and has a quarter-million people; Huanuco, an important silver-mining center with 200,000 inhabitants; Popayan, the northernmost metropolis with 150,000 people; Chanchan on the southern coast, once the capital of its own empire ruled by the Chimu tribe; and Cajamarca, the summer residence of the Sapa Inca, home to 100,000 citizens. The greatest city by far is Cuzco, the capital, with a million inhabitants.

The empire's economy is based on agriculture, and is entirely controlled by the government. The chief crops are potatoes and corn. Other food plants include mushrooms, peppers, beans, bananas, yams and melons. Guinea pigs are the most common domestic animal -- most households have a dozen or so running about underfoot. Herds of llamas, guanacos and vicunas supply wool and meat. The people drink beer made from corn or potatoes.

Every scrap of fertile land is carefully cultivated, and the sides of many valleys are intricately terraced to prevent erosion, and look like colossal staircases. Water is carried to the fields in stone aqueducts which far surpass anything the Romans constructed.

The People

The subjects of the Inca are proud and dignified, reserved in the presence of strangers. But they are not without a sense of humor and fun. The common folk like to get together to drink beer, sing songs accompanied by drums and flutes, and dance.

The people of the mountains wear llama and alpaca wool, and weave wonderful designs in subtle colors. The common attire for men is a wool tunic, a heavy cloak and leggings, topped off with a wool stocking-cap with earflaps. Women wear long dresses and a shorter cloak, with hats that are remarkably like a New European gentleman's bowler. Men cut their hair to neck length, and women wear theirs in long, lustrous braids.

Andean mountain dwellers have very deep chests, and beaky noses. They have astonishing stamina, and can perform great feats of labor at altitudes that leave lowlanders gasping. An Andean mountain dweller's legs are like steel, and they think nothing of going a thousand feet up or down a steep slope on an errand.

Subjects of the Incan Empire generally marry at about age thirty. Families are relatively small, and the population has been steady for centuries. Sons take their fathers' surnames and daughters bear the names of their mothers.

History

The Inca clan has controlled their empire for thousands of years. They claim to be descended from godlike beings who live among the stars. According to the Inca, humans lived in ignorance and savagery, and the wise and powerful star beings saw this and pitied mankind. To help humanity, the sky beings chose two of their number and set them down on Earth, in a high mountain region where conditions were similar to their home in the heavens.

This pair was the ancestors of the Inca clan, Manco Capac and his sister Ocllo Huaca. They landed on an island in Lake Titicaca. Equipped with a magical golden rod and amazing knowledge of magic and science, the two persuaded the tribes of the Andes to accept them as rulers. The two children of the heavens instructed humans in all the arts of civilization -- farming, irrigation, and building. Manco Capac built the city of Cuzco in a single night, using magic to raise huge stone blocks into place.

The Inca and their subjects gradually conquered the other tribes of the region, using their amazing flying pyramids and Sun-Fire projectors to overwhelm any opposition. They left the defeated lands as semi-autonomous provinces under Inca governors. With the amazing technology of the Inca, the empire prospered. Great cities grew in the mountains.

In 1532, a Spanish expedition under Pizarro entered the territory of the Inca from the north. The Empire was disorganized in the aftermath of a power struggle between the Emperor Atahualpa and his brother Huascar. Taking advantage of the confusion, the Spanish were able to march as far as Cajamarca. But by then Atahualpa had finished overthrowing his brother, and was able to turn the full force of his army against Pizarro's men. Only one survivor returned to Panama. Since that time the Inca have guarded their empire with ceaseless vigilance. The border is clearly marked with stone cairns, and anyone crossing into Inca territory risks destruction.

Cuzco, City of the Sun

The great city of Cuzco stands at the center of the Inca Empire, in a great valley surrounded by looming mountains. Its name means "Navel of the World." Cuzco is an enormous city, with a population of just under 1 million. The city is a place of wonders, with great pyramids and towers of 100 stories.

Cuzco proper is inhabited only by the Inca clan. There are 12 wards, one for each of the Inca *ayllu*, or sub-clans. Outside the walls stretch suburbs where the ordinary folk of the empire live. There are two great squares in the center of Cuzco -- the Plaza of Joy, used for celebrations of happy occasions, and the Plaza of Tears, site of serious religious observances.

Over it all looms the colossal Sacsahuaman Fortress, covering six acres and built of stones twelve feet square. The fortress's high walls are topped with Sun-Fire projectors, and at least one Sky Pyramid floats above Cuzco as a reminder of the Sapa Inca's might. The Inca himself lives in the fortress, and other members of his family are scattered about the city in great palaces of their own.

The greatest temple in Cuzco is Coricancha, the Garden of Gold, sacred to the Sun. The building is huge and beautiful, with gold dust mixed in the very mortar. A great gold Sun disk stand in the center of the temple, decorated with emeralds and turquoise. The priests of the Sun welcome the dawn with chants and incense as the first rays strike the disk each morning.

Behind the royal palace is a complex of schools where the young nobles of the Inca are educated and trained in magic, science and the use of the quipu. Nearby is the convent of the Sun Virgins, who are the custodians of Inca medical lore and maintain the health of the Sapa Inca.

Cuzco has a municipal water system fed by mountain springs, and the water is conveyed by aqueducts all through the city. A system of sewers carries waste off to storage tanks, where it is transformed into fertilizer. A complex of baths stands above the city where hot springs issue from the mountainside, and the hot tubs are a favorite lounging-place of Inca nobility. The modest Inca have separate buildings for men and women.

The Court of the Sapa Inca

Government of the Empire is held entirely by the Inca clan. At the top, of course, is the Sapa Inca himself, the lord of the Andes and Son of the Sun. The Sapa Inca, known generally as just "the" Inca, is the absolute ruler of his domain. He wears a hat with a gold fringe as a badge of office, and carries a golden mace and golden staff as symbol of authority. The staff is a magical artifact of great power, the same one borne by Manco Capac. He sits on a throne of solid gold.

The Sapa Inca is assisted by a Council of the Realm, made up of the governors of the empire's four provinces and representatives of the 12 wards of Cuzco. The Council advises and informs the emperor, but the ultimate decision-making power lies with him. Under weak emperors the Council is powerful; under strong ones it seldom meets at all.

During the summer the Inca holds court at his pleasure-palace at Cajamarca, amid hot springs and gardens. Otherwise he rules from the Sacshauaman Fortress at Cuzco. Etiquette at the court is rigid and complex. Everyone entering the presence of the Inca must remove their shoes and bear a symbolic burden on their backs.

The Inca has a corps of inspectors, known as *Tocoyricoc*. They travel about the empire in secret, looking for officials who are not performing their jobs, signs of rebellion among the subject tribes, plots among Inca nobles and potential problems requiring help from the imperial government.

To protect the Son of the Sun, there is an Imperial Guard, made up of men from the Canari tribe near Quito. They are imposing warriors, with fantastic headdresses of gold and feathers. The Imperial Guards carry the dreaded Sun-Fire weapons, which emit a dazzling beam of light which destroys whatever it touches.

The standing army is nearly as impressive. The Incan Empire has 50,000 men under arms, organized into regiments of 1,000 men each. Each regiment has its own uniform and traditions, and draws its members from specific tribes. They are armed with a variety of weapons: slings throwing explosive grenades, fire-sprayers, blowguns with poison darts, spears, bows, and maces. Certain regiments specialize in night fighting, sieges or guerrilla warfare.

One interesting feature of Inca government is that the mummies of previous rulers are preserved in their royal residences, with servants and attendants. By means of sorcery the current Inca can commune with his predecessors and get their advice on matters of state.

All the Inca nobles are recognizable by their elongated ears, into which they insert studs of jade, gold or turquoise. The Inca royal family and nobility are rather inbred. It is the custom of the emperors to marry only within their immediate

family, and this practice is followed by the other great nobles as well.

While the imperial throne is hereditary, it does not pass automatically to a single candidate. Instead, all of the Inca's male descendants are eligible to succeed him. The heirs constantly intrigue against each other, and use poison, assassination, sorcery and blackmail to get rid of rivals.

There are several factions right now at the Sapa Inca's court. The traditionalists wish to preserve the Incan Empire's isolation from the Lower Kingdoms. For thousands of years the empire has prospered by itself, needing nothing from the outside world. The Spanish invasion proved that all outsiders are barbarians and savages. This is still the Inca's official position, and has the support of most of the Inca clan.

The "progressive" faction wishes to increase the empire's contact with the outside world. There is much to be learned in the outside world, and all may benefit by the sharing of knowledge. If the Incan Empire does not change, it may someday fall to a new set of conquistadores armed with weapons that match the dreaded Sun-Fire itself! This faction is small, but includes some of the cleverest and best-educated members of the Inca clan.

A third faction also wish to end the empire's isolation. Armed with the might of Inca sorcery and super-science, the Sapa Inca's armies could easily defeat the disorganized and disunited nations of Antillea. A few even envision expanding across the seas, forging a vast worldwide empire ruled from Cuzco. This view has support among the warriors who would gain glory leading the armies, and among the minor nobility.

Justice in the Incan Empire is severe; the penalty for murder, robbery, rape or fraud is execution -- usually by being hurled from a cliff. The penalty for disobeying a command of the Sapa Inca is the death of the offender and his entire family. In a novel twist, the local administrator is also punished when a crime is committed, on the assumption that he has not been doing his job.

Viracocha II, Sapa Inca and Son of the Sun

The Emperor Viracocha is a weak ruler, devoted to study and pleasure. In his youth he was a vigorous monarch, but as he enters his second century he has withdrawn, and now leaves most of the running of his empire to the bureaucrats and the Council of the Realm. Viracocha is a tall, lordly old man who spends much of his time listening to poets sing of the past. He is nearly blind and goes everywhere with a young boy to guide him.

Marvels of Inca Science

The technology of the Incas is astounding. They have preserved the knowledge given to Manco Capac by the star-dwellers centuries ago, and have added new techniques developed by the engineers of the empire. Among the Inca, there is not nearly as rigid a distinction between science and magic as in Western civilization. Many of their devices

combine magic and technology, and they may have a form of Engine Magick inherited from the star beings. In general, ordinary people of the empire live at a very mature TL3, but the advanced weapons and devices of the ruling clan are TL12 or better.

A surprising lack is the complete absence of the wheel among the Inca. Despite their splendid road system, they do not use wagons or any kind of wheeled vehicles. Small loads are carried by llamas or porters; heavy items are levitated by Inca anti-gravity machines or magic.

The Inca engineers are remarkable stonemasons, constructing walls so carefully joined that one cannot force a pin between the stones. Their architecture favors massive walls and narrow windows. Buildings have high-peaked roofs of thatch. Heat comes from smoky fires of brushwood or dried llama dung.

Nowhere is the Inca gift for building more visible than in the road system. There are roads stretching thousands of miles across Inca territory. They wind across the face of sheer cliffs, pass through tunnels carved through mountains, and cross chasms on suspension bridges. The chief highway runs north from Cuzco through Cajamarca, Quito and finally to Pasto. Southward the highway goes to Lake Titicaca, and stretches to the borders of Chile and the Argentine. All along the roads are inns for travellers, maintained by the government.

The art of writing is unknown among the Inca. However, they are not without a way of recording information. The Inca use knotted strings, called *quipu*, as record-keeping devices. The number and pattern of knots of a quipu can encode numbers, allowing the Inca empire to keep extensive records about population, taxes, and all the other business of government. All young men of the Inca clan are trained in reading quipu.

For other information, the Inca make use of a specially-trained caste of secretaries whose memories are absolutely photographic. After years of training, the Inca "rememberers" can hold a virtual encyclopedia in their heads, using a quipu as a guide to recall. These secretaries are a vital part of the empire's government, and are expected to be absolutely reliable. Any "rememberer" caught telling a lie is sentenced to hard labor in the quicksilver mines.

Crystals and jewels are a key part of Inca science. Using intricate arrangements of rubies, they can create the destructive Sun-Fire beams. Crystals also play an important part in Inca medicine, as their healers have learned to use crystals to focus energies that fight disease.

Most tools in the Inca Empire are of a superior alloy of bronze. Iron is known, and there are abundant veins of iron ore, but the Incan Empire lacks supplies of coal for steelmaking. Gold and silver metalwork made by Andean craftsmen is beautiful.

Inca medical knowledge is advanced. They know of the germ theory of disease, and practice vaccination. This was one reason the Inca suffered far less than other New World peoples from the diseases introduced by the Conquistadores. Surgery has been developed to a high art among the Inca. Doctors even perform brain surgery. Inca medicine incorporates much magical healing, as well. The Sapa Inca benefits from the magical art of "sharing life" practiced by the Sun Virgins. The Sun Virgins use magic to age themselves a few months, and transfer the lost time to the emperor. This is how the Inca rulers reign for more than a century.

The source of power for many of the Inca's most astounding machines is something they call "Blood of the Sun," a form of magical fusion power. Gravity has long been conquered by the Inca. Using the Blood of the Sun to power machines which must be magical Engines, they can raise objects of any size, as their flying Sky Pyramids demonstrate. Inca magicians are also masters of the art of levitation, which is of great use in such a mountainous country.

Sun-Fire Beams

These weapons emit a dazzling beam of light, which burns and destroys whatever it touches. The Sun-Fire beams come in two sizes. The smaller ones are a staff the size of a spear, tipped with a crystal lens. They are the equivalent of **GURPS Space** laser rifles, doing 2d impaling damage with a 1/2 damage range of 450 yards. Small Sun-Fire beams

may be used 6 times before they need recharging.

The larger Sun-Fire projectors are enormous Infernal Engines used as artillery. They are mounted on the flying Sky Pyramids and on the battlements of Inca fortresses. The giant Sun-Fire beams are focussed by a gigantic gold Sun disk studded with jewels. Large Sun-fire beams are the equivalent of *GURPS Space* light starship lasers, doing 100d damage (1d space combat damage), with a 1/2 damage range of 110,000 yards in air.

Sky Pyramids

The Sky Pyramids are the most impressive symbols of the Sapa Inca's power. They are large pyramids of some ceramic material, roughly a hundred yards square at the base and fifty yards high. The shining gold sides are decorated with images of the sun. They fly by means of the secret Inca anti-gravity device, powered by Sun's Blood power generators. Sky Pyramids are relatively slow flyers, moving at a stately pace of about 20 miles per hour. Each Sky Pyramid is armed with a large Sun-Fire beam at the apex, and can carry an entire regiment of troops. Sky Pyramids can damage objects on the ground by landing on them. The outer covering of a Sky Pyramid has DR 500.

Inca Magic

The Inca do not use Lorebooks as such, but rely entirely on personal instruction in transmitting their magical knowledge. Their magicians learn from one of four traditions.

The Lore of the Sun

The priests of the Sun are the keepers of some of the most powerful Inca magical knowledge, handed down from Manco Capac himself. Priests must be members of the Inca clan, and the organization is exclusively male. Inca rulers must master the Lore of the Sun in order to qualify for high positions in the government. The Lore of the Sun includes the familiar spells **Mastery of Levitation** and **Scrying**. It also includes the new lore of **The Blood Oath**, which compels the subject to fulfil a vow made to the caster; and **Memory**, which allows the subject of the spell to remember something with perfect clarity.

The Lore of the Mountains

When the Inca conquered the tribes of the Andes plateau, they were careful to preserve the existing magical traditions, now codified as the Lore of the Mountains. This tradition concentrates on practical spells: control of weather, communication with ancestral spirits, and protection from harmful magic. Students of the Lore of the Mountains are usually tribal magicians of subject tribes, but occasionally an Inca sorcerer will seek to learn their magic. The Lore includes the secrets of **Speaker to the Dead**, **Raise the Storm**, **Quell Nature**, and **Banish to Eternal Rest**.

The Lore of the Virgins

The all-female order of Nustas, or Sun Virgins, preserves Inca secrets of healing and longevity. They live in great convents in Cuzco, and are responsible for the health and well-being of the Sapa Inca and other nobles. They also provide magical healing to the common people, and know a great deal of ordinary medicine. Their Lore is taught at the great convent in Cuzco. The Lore of the Virgins teaches the student how to **Cast Out the Other**, **Conquer the Madness**, and **Strengthen the Life Bond**. It also includes the secret of how to **Share Life**, which allows a large group of magicians to allow themselves to age a short period, giving the lost time to the subject of the spell in the form of renewed youth.

The Lore of the Lines

The Nazca plain occupies an area just southwest of Cuzco, in an elevated valley separated from the sea by the coastal range. It is a vast level expanse of bare dirt and scattered tufts of grass. From the ground it appears to be nothing but

desert. But seen from the air the plain is marked by colossal figures of animals and vast geometric patterns. Perfectly straight lines stretch for miles across the plain. The lines are made by removing the darker topsoil to expose the lighter material beneath.

The Nazca lines are magical diagrams drawn by the Inca sorcerers, and serve as paths through space and time. The sorcerers can walk the lines to other worlds, other times and other dimensions. They visit the kin of the Inca beneath other suns, and bring back marvels from their journeys. Or they follow the paths into the past and future to see what has been and what will be. Some paths lead to other Earths, where history has followed different courses.

The magicians of the Nazca Plain are more like a New European magical Order than other Incan groups, selecting members on the basis of talent alone. Training is arduous, and many candidates fail. The Nazca Lines can act as magical paths to: **Dimensions Beyond the Faerie Veil, Other Planets of the Sun, Planets of Other Suns, and Other Times.**

Murphy's Rules

Murphy's Rules

We Need to Talk

I suspect that, like most guys, there aren't many phrases that will fill my mind with more apprehensive dread than, "We need to talk." Whether uttered by girlfriends, teachers, or employers, there are few good situations that begin with those words.

So when Dennis and Kathryn -- my two players in the *World of Darkness: Dark Ages* campaign I took over temporarily from Dennis -- showed up at the game shop I was working at, their eyes showing unhappiness and concern, and my football-scholarship-declining friend Dennis said, "We need to talk," my heart sank.

But let me back up a bit.

For those of you unfamiliar with White Wolf's *Storyteller* system (at least, as far as it applies to *Dark Ages*), you are generally trying to roll 6's or better on a number of 10-sided dice equal to your ability. This works very well, at lower levels; an average person rolling two or three dice has a good chance of scoring a minimal success on average tasks, and a skilled person with six to eight dice has a very good chance of scoring a complete success, with phenomenal successes being feasible but rare.

The system breaks down when you have eight to twelve dice. In everything.

Both players were still using the same characters they had been for years, so they were quite skilled and powerful in just about everything. Most of the little black dots on the character sheet were blackened in. So crafting challenges for these characters was something of a nightmare:

"The Dark Beast Bl'aaaaal stands before you, its eyes blazing in fire and fury."

"I smack it with my magic dagger."

"<dice rolled> The atomized bits of the Dark Beast Bl'aaaaal flop to the ground in a moist pile. Um . . . uh . . . The Dark Beast's ten older, more powerful brothers suddenly show up . . ."

In addition, since the adventures took place around one kingdom (where one of the PCs was the ruling noble), the likelihood that insanely powerful -- and thus appropriately challenging -- threats could just wander up and knock on the castle door was fairly low.

So I crafted a different sort of adventure. I started with the supposition that, if these characters were as powerful and as known as they were, then anyone who would oppose them would be stark raving bonkers to do *anything* out in the open. So I created an adversary who was moderately powerful, but, most importantly, she was sneaky and smart. And she embarked on a long-range campaign of terror; the adventure series, as I had planned it, was scheduled for a year of game time. She would, slowly and methodically, try to unseat the PCs from their positions of power with fear and paranoia; you can't fight what won't make itself visible, and it doesn't matter *how* many dice you get to roll if the threat is non-obvious. And, ultimately, I expected the heroes to emerge, battered but triumphant in the face of this threat.

And, after a couple of sessions, the plot did, indeed, progress; the evildoer would act, the heroes would react. The heroes would respond to the plots with their plots, and life was generally very complicated for them. In fact, there was only one little problem.

I was succeeding.

And so, as I stood as a clerk peddling games, they approached. "We need to talk," they said. "We're not having fun."

I was succeeding too well. They weren't having fun, because it felt (perhaps not unfairly) that I was just messing with them. They weren't getting a sense of victory from the sessions, merely a draining relief at having endured the latest

round of assaults. "My real life is grinding and oppressive enough," one of them said, "I don't *need* this from my hobbies."

Mind you, this felt ironic to me. The players were doggedly creative and insightful in how they dealt with the various crises crafted by the adversary, and situations that were designed to be catastrophic were mitigated into mere annoyances. They were *winning*, in that they weren't being more than heavily inconvenienced by the most methodical, grandiose plots I could devise. And as a result, when they ultimately succeeded, they would be even stronger than before.

But they weren't having *fun*.

I've protested that this episode wasn't my fault, and, in many ways, I still don't believe it is. Mostly because there is no single thing where I look and say, "Ah-hah! That was the error in judgement; that's what I did wrong." But this situation arose because I was *too* good in bringing to life what my vision was.

On the other hand, at a core level it *was* my fault. Because I made an adventure where I would have wanted to play. As a player, I tend to favor the more "tragic" characters; it's nowhere near as satisfying for me to accumulate power/wealth/fame/happiness, as it is to start with these things, *lose* them, and then reacquire them (or not). The idea of redemption and returning to power is so compelling from many of my favorite movies and stories that I tend to favor that in my characters. (The difficulty in simulating this is also one of the biggest problems I have with most **D&D** games.) But my players don't like the same things I do, and I forced that view on them. And, in that way, I was wrong.

Fortunately my players came to me, and expressed their concern. (Unlike other campaigns from other GMs they've been in, where they would "accidentally" have other plans until the campaign collapsed.) As such, I was able to modify the campaign midstream, and fix things . . .

. . . more or less. My adventure series finished, and my players seemed pretty happy. The campaign ended shortly after I handed control back to Dennis. I like to think that wasn't my fault -- that I didn't deliver a fatal wound to that campaign -- but it's a nagging doubt.

And regardless of what kind of terror I was trying to instill in their characters, it was nothing like that caused by the simple utterance of, "We need to talk."

Fashion Victims

An Adventure for San Angelo: City of Heroes

by Steve Kenson

Introduction

Fashion Victims is an adventure for the *San Angelo: City of Heroes* campaign setting for the *Champions* super-hero roleplaying game. With some minor adjustments it can work as an adventure for other super-hero RPGs, and conversion notes are included at the end of the adventure. Page references in the adventure are to the *San Angelo: City of Heroes* sourcebook, unless otherwise noted.

In the adventure, unusual circumstances bring an ordinary department store Mannequin to life, with the power to animate and control clothing of any kind. Although not the sort of villainous power most heroes are used to tackling, the Mannequin's ability proves sufficient to terrorize and blackmail the entire city when she turns everyone's own clothing against them. Can the heroes find and stop the Mannequin before San Angelo is forced to truly become "the Naked City"?

Fashion Show Nightmare

The adventure starts out with a fairly ordinary day at San Angelo Plaza, the largest and newest mall in downtown San Angelo (SA, p.122). The heroes are likely visiting the mall in their secret identities, although they might be there for any number of other reasons, such as appearing at a promotion to open a new store or a charity event hosted by the Plaza. Perhaps they're invited to the fashion show at the Plaza, or asked to cover it for a local newspaper or television station (for heroes with media connections). The open-air Plaza is a large two-by-five block area of downtown that hosts some 130 different shops, it is usually bustling with people, particularly teenagers and young families, and today is no exception.

A stage and runway are set up in the midst of the Plaza for a fashion show sponsored by the Plaza merchants association as a publicity event. Things seem ordinary enough, when the heroes hear a shriek of terror coming from backstage. A number of scantily dressed models (male and female) come running out, chased by a horde of animated clothing! The cries of terror are echoed from the nearby Fontaine's Department Store and patrons pour out of the store, chased by a horde of marked-down clothing bargains! Quickly, clothing throughout the plaza takes on a life of its own and attacks, with murderous garments pouring out of boutiques, factory outlets, and department stores. The heroes can do whatever they want to try and stop the wardrobe rampage, but they have a few problems of their own. Characters who have to change clothes to switch to their super hero identities suddenly find their discarded clothing rising up to attack them! Heroes also have to stop smothering clothes without harming any of the people tangled up in them. For details on the abilities of the animated clothes, consult Mannequin's stats at the end of the adventure. Tailor the scene (no pun intended) to fit your group and campaign. Some things you may want to consider include:

- Most of the clothing can't do much direct physical harm, but it can trip, smother, and choke victims. Clothing with built-in weapons (like a spiked leather jacket or the like) could manage to do some minor injury (equal to a 1/2D6 HKA).
- The clothes work together and there are a lot of them. As fast as the heroes destroy them, they keep coming. The clothes have to be burned or shredded (or the equivalent) in order to render them inanimate again.
- Feel free to throw in "specialty" clothing for a change of pace or comic relief: lingerie from Victoria's Secret, sporting goods, military surplus uniforms from G.I. Surplus, or fine suits and snake-like ties from Daley's for Men.

GMs looking to involve San Angelo NPCs in this scene can throw in some people from the media to cover the event. Some of San Angelo's wealthy might show up, like Bethany Waterhouse (SA, p. 188) and fashion models like Sasha from *Enemies of San Angelo* (p.54) can be in the show, which means her photographer Evan Beaumont (secretly the mutant illusionist Glamour) can't be far behind. Don't miss out on the chance to have some of the heroes' DNPCs on hand to endanger either.

Fashion Statement

Run the fight with the rampaging clothes as long as it's interesting. When the heroes clearly gain the upper hand or they are defeated, the clothes become inanimate once more. The local authorities quickly show up, followed closely by the local media. On-the-spot reporter Tobi Cantrell from KCTZ wastes no time in setting up a shot just outside the mall for live coverage of the event. Any player characters with jobs in the media shouldn't miss this opportunity for a scoop!

As Cantrell begins broadcasting live, the story is picked up on the television screens in the window of a nearby store, allowing the characters to watch the following:

"This is Tobi Cantrell reporting for KCTZ in downtown San Angelo, where it seems that the city is facing one of the most unusual happenings in a place where the unusual is often everyday. Less than an hour ago patrons here at San Angelo Plaza were attacked by a virtual army . . . of animated clothing. Dresses, shirts, and slacks marched off the bargain racks to commit acts of mayhem. The authorities have cordoned off the mall and appear baffled by the incident. As yet . . ."

Suddenly, a crackle of static fills the screen, when it clears the image is of a shapely woman, wearing the latest fashion, standing in a nondescript looking room. As she sashays closer to the camera, the characters immediately notice something odd about her; she's not real! The figure looks like a department store mannequin made of plastic, but she moves as if she were alive. A voice comes over the airwaves, although the figure's perfect painted lips do not move.

"Hello, fashion victims! I am the Mannequin. What you have seen at San Angelo Plaza is only the smallest sample of my power! If the city of San Angelo does not agree to pay me a ransom of 250 million dollars I will unleash a plague upon the city far worse than the outfits I've seen out on the streets. Just so you understand what you face, I will give you another example in 30 minutes. Remember it well and do not cross me, or else!"

Loose Threads

How the heroes proceed depends on whether or not they are sanctioned by the city government or not. Sanctioned heroes (like the Justice Foundation) are immediately contacted by the SAPD's Paranormal Affairs Office and asked to meet with Police Chief Jack O'Shea and Mayor Alex Martinez about the Mannequin's threat as soon as possible. The city officials offer whatever assistance they can to the heroes in tracking down the Mannequin and putting a stop to its threat.

If the heroes are not sanctioned, then they're largely on their own. They can rely on any contacts they may have, and they might even be able to convince the authorities to cooperate with them on this occasion, provided they're not wanted criminals themselves.

There are a number of clues the heroes can attempt to follow up on to learn more about the Mannequin and its plans:

- The transmission the Mannequin used to override the local television signals must have come from somewhere inside the city. A hero with Radio Hearing who thinks to do so during the broadcast can make a Perception roll. Success tells the hero that the signal originates northeast of the Plaza, but there isn't enough time to triangulate the exact location (unless the character is capable of teleportation or super-speed).
- Recordings of the Mannequin's transmission can be analyzed; they show the villain looks exactly like a type of

female mannequin manufactured for Fontaine's Department Store some years ago in a factory on the North Side. The mannequins haven't been made for over ten years, and the company that made them is out of business. The clothes the Mannequin wears look fairly new, however, and are currently carried by Fontaine's. The room she made the broadcast from doesn't provide any useful clues.

- Whatever the force that animated the garments in the Plaza was, it didn't register on any scientific instruments and left no apparent traces. As far as the police lab, Orion Labs, or the heroes can determine, it's just ordinary cloth, with no sign of what caused it to move and attack.

Fashion Revolution

While the heroes are tracking down clues as to her whereabouts, the Mannequin strikes again, this time using her power throughout the entire city to cause clothing to come to life and attack. This time she doesn't exclude clothing people are wearing, either. One full combat turn after the rampage begins the clothes people are wearing (including the heroes' costumes) take on a life of their own and join the attack! So the heroes have to contend with struggling against their own costumes while trying to contain the situation in the city. The GM should use the events in "Fashion Show Nightmare" as a guideline to create incidents for the heroes to handle during the fashion revolution. In addition to protecting innocent people and rounding up as many of the dangerous garments as possible, heroes can stay busy handling the numerous little catastrophes that happen when people's clothes go out of control: car crashes, fires, and so forth. Ideal sites for trouble include malls and shopping centers, Laundromats, charities, and anywhere else a large concentration of clothing and people can be found.

Super-hero costumes with special properties can become real dangers when they take on a life of their own, particularly battlesuits! If the GM desires, Cavalier or other members of the Justice Foundation (SA, p. 226) can show up to assist, only to fall victim to the strange effect, causing another problem for the heroes.

For an additional complication, some criminals (even some super-villains) might try to take advantage of the chaos and confusion to engage in some looting or other illegal activities. Alternately, some super-powered criminals might decide to team up with the heroes to put a stop to the Mannequin, especially if it might get them a reduced jail sentence or a chance at parole. Naturally, these "allies" are likely to turn on the heroes as soon as they get the opportunity.

The Mannequin's Lair

The Mannequin is hiding out in an abandoned plastics factory in San Angelo's North Side. The heroes can track her down using any of the methods mentioned above or some other idea of their own. If all else fails, they can convince the city to pay the ransom and covertly follow the animated clothes that come to collect it.

The Mannequin has stockpiled her lair with various clothing she can animate and a number of other mannequins, several of which look identical to her. She can move them by animating their clothes, and uses them as a distraction to allow her to escape, if need be. Keep in mind that the Mannequin isn't really alive and doesn't need to breathe or rest. Her lair is filled with inactive (but still functioning) plastics machinery, which can get switched on during the battle. It also has a lot of volatile chemical supplies, which can lead to a massive explosion if struck by a fire or stray energy blast. The factory is a maze of catwalks and heavy machinery, providing lots of places for cover, lots of things to pick up and throw and many places for clothes to hide and ambush the heroes.

The heroes have little chance of reasoning with the Mannequin, although they might be able to distract her if they've learned something about her origins (see her writeup at the end of the adventure).

All Tied Up

If the heroes capture the Mannequin, she appears to become inert, reverting to lifeless plastic and leaving the heroes to wonder whether they've really captured her at all. If the Mannequin escapes from the heroes (possibly by distracting them with the other mannequins, as described above) then she'll likely resurface later on, probably looking for revenge

against the heroes who thwarted her plans. Lastly, the fight in her lair could lead to the Mannequin's apparent destruction in a fire or explosion. The San Angelo Fire Department finds a cracked and broken plastic head, with a painted smile frozen on its lips. Is the Mannequin destroyed, or will she find some way to return?

The Mannequin

STR 20, DEX 18, CON 30, BOD 20, INT 13, EGO 15, PRE 20, COM 14, PD 10, ED 10, SPD 4, REC 10, END 60, STUN 0 (see powers)

Powers: Animate Clothing (20 STR Telekinesis, Area Effect Radius (15 range doublings), Selective, 0 END, Only Affects Clothing), Entangle (5d6, requires available clothing), Full Life Support, Damage Resistance (10 PD/10 ED), Takes No Stun (Automaton Power, Champions, p. 181), +20 Mental Defense.

Skills: CK: San Angelo 11-, KS: Fashion 13-, PS; Modeling 13- Disadvantages: Enraged when reminded of her former life, 11- (recover 11-), Distinctive Feature: animated mannequin (Concealable, Major Reaction), Hunted by the San Angelo Police Department 11-, Hatred of Normal People, Hatred of Beautiful (COM 16+) Women, Secret Identity, Vulnerability: x2 BODY from Fire & Heat.

Background: Fifteen years ago Ashley Schmidt defined the word "supermodel." She was on the cover of every major fashion magazine, did shows in Paris, Milan, and Rio, was in demand by dozens of companies to sponsor their products.

But the life of a high-fashion model took its toll on Ashley. She starved herself, had plastic surgery, used diet pills and other drugs to help her maintain her energy and her fabulous figure. In the end, none of it mattered, because Ashley, like everyone else, got older. And the demographics wanted models to appeal to a young audience. Ashley felt the end of her career looming before her. She was over the hill at 27.

Desperate, Ashley sank even further until she eventually died of a overdose of an experimental drug. After a flurry of news reports, she was quickly forgotten and replaced with a newer, younger model. But Ashley Schmidt wasn't ready to be forgotten just yet. Somehow her spirit lingered on in the world. She "awakened" in a store window in San Angelo, in the body of a plastic mannequin, her vehicle to gain revenge on those she blamed for her death. Store security never understood the mysterious "break in" where nothing was stolen except a display mannequin and some clothes. Especially when it appeared that someone broke the window from the inside.

Now Ashley Schmidt is no more, but the world will feel the revenge of . . . the Mannequin!

Animated Clothes

The clothes animated by the Mannequin's power have STR 20 and can move under their own power (usually by "walking" using their sleeves or legs or crawling otherwise). They have DEF 0 (except for articles made of stronger materials, like leather, which are DEF 1-3) and BODY 2-3. They have DEX 18 and SPD 4 (equal to the Mannequin's) for the purposes of taking actions. As unliving objects they have no STUN or other characteristics, nor are they affected by Mental Powers. Several different articles of clothing can attack en masse to create a sort of entangle with their combined BODY. They can also squeeze trapped victims, doing 4d6 damage per action.

Running "Fashion Victims" in Other Games

Gamemasters can adapt "Fashion Victims" for most other super-hero RPGs with little difficulty, whether using the San Angelo setting or not. The adventure is fairly four-color, so it's not well suited to settings like White Wolf's *Aberrant* or Alderac's *Brave New World*. Conversion notes for other super-hero RPGs are included below.

Hindrances: Susceptible (Fire). Calling: Vengeance.

Castle of Frankentoon

(Starring Rabbit & Cowstello and The Three Pooches)

An Adventure for TOON

by Doc Cross

The Set Up

It's Halloween night and those intrepid (but not overly smart) reporters, Rabbit and Cowstello are just arriving at long abandoned Frankentoon Castle in search of a story concerning recent reports of strange goings on in the area. Meanwhile, at the back of the house, The Three Pooches (Hairy, Schmoe and Coily) are going in on assignment from their boss at the Ace Detective Agency. Their mission? Find out if wanted criminal Fingers Ravioli is hiding out here with his gang. If he is, arrest him!

Unbeknowst to any of the five nitwits now entering the castle, Fingers Ravioli and his gang ARE here, but they are being held captive in the dungeon by Count Dorkula and his monster pals. As if that wasn't enough, the strange goings on that have been reported have actually been the boys from a local fraternity (Tappa Kega Bru) getting part of the castle ready for their annual Halloween party.

The Animator can choose to have the Three Pooches meet up with Rabbit & Cowstello early on, or they can be kept apart until about halfway through the adventure. If they are kept apart, let the players of one group play NPCs while the other group is "onstage."

Running Gags

Several running gags appear in comedy horror movies, short subjects and cartoons. Here are a few.

- **The Changing Room:** This room has walls and floors that rotate to show one sort of room one way and another sort of room the other way. These changes are triggered by opening the door. Naturally, only one character will see the room as a torture chamber. when he shows it to his friends, it looks like a cozy parlor.
- **Slide To The Dungeon:** There are several trap doors and hidden panels in the walls. They all lead to a slide that ends in the dungeon where the monsters are. Pick one or two poor schmucks to constantly take this scarey slide.
- **More Fun With Hidden Doors:** Of course, the monsters will use secret doors to pop up wherever the Animator needs them. For that matter, so will the frat boys . . . all of whom are dressed up as monsters.
- **The Old Armchair Bit:** Simply put, someone sits in a big comfy chair and arms pop out and grab him, holding him in the chair.
- **Oh No, I'm Hip-Mo-Tized!:** Count Dorkula can and will hypnotize one or more of the characters, who will then spend several turns doing strange, stupid or funny things. Well, DIFFERENT strange, funny or stupid things from what they normally do.
- **Gee, Doctor, Are We Ever Glad We Found YOU!:** The kindly Doctor Jerkyl will be more than willing to help the characters. Of course, when he's alone with one of them, he'll turn in to the portly and psychopathic Mr. Wyde.
- **The Old Hallway Full Of Doors Bit:** This bit is a classic and we've all seen it 1,000 times, so you know the drill:) Draw a long hallway with at least 6 doors on each side. Once the monsters start chasing the characters in earnest, have the action move to this hallway and place one character and one monster behind each door. Toss something scarey into the rooms with the characters so they'll leave their rooms. Most likely they'll run in to monsters in the next room they choose. Much running from room to room and screaming and hilarity will ensue. At some everyone (monsters included) should step into the hallway, look at everyone else, scream and run back

into their room. Optional gag: A character leaves a room and passes himself in the hallway. Optional Gag 2: The door a character enters is not the one he leaves by. Sort of a random teleportation thing.

- **Guest Monsters:** Have a very ornate coffin show up in different rooms throughout the adventure. When a character opens it (or when it opens on its own) have a different Guest Star Monster step out and chase the characters for a turn or two. To find out who the Guest Monster is, roll on this table . . .

The Super Duper Guest Monster Table

- 11 Cthulhu
- 12 The Creature from the Black Lagoon
- 13 Any Politician
- 14 A Floating Disembodied Brain
- 15 The Phantom of the Opera
- 16 A Ghost
- 21 Martha Stewart
- 22 A Werewolf
- 23 A Weremoose
- 24 A Weremuskrat
- 25 Bigfoot
- 26 A Giant Spider
- 31 Godzilla
- 32 The Devil
- 33 Lots Of Snakes
- 34 A Giant Eyeball
- 35 A Crazy Psycho Killer
- 36 Regis Philbin
- 41 Bill Gates
- 42 Bride of Frankentoon
- 43 A Zombie
- 44 Giant Ants
- 45 The Invisible Man (you'll have to take his word on it)
- 46 King Kong
- 51 1d+1 Skeletons
- 52 The Blob
- 53 The Hunchback of Notre Dame
- 54 A Game Designer
- 55 An Alien (or maybe Sigourney Weaver)
- 56 A Great White Shark
- 61 The Iron Chefs
- 62 A 50' Long Alligator
- 63 Any WWF Wrestler
- 64 1d+1 Hideous Mutants
- 65 A Giant Turkey

Stuff

Here are a few items to have sitting around for the characters to find.

- **Hammer & Stakes:** Just the thing to spike old Count Dorkula with right? Wrong. The head of the hammer will fall off the first time anyone tries to use it and the stakes are rotten wood anyway.
- **Hair Remover:** Splash some of this on the Werewombat and his hair will all drop off instantly, leaving him standing there in his undies. He will then scream and run off, only to return 1d+1 turns later . . . hairy again and really angry.
- **Dynamite:** Just because TOON games are more fun when high explosives are around.
- **"Know Your Monsters":** This handy series of books tells the characters all they need to know about the various monsters. However, the books are so interesting that anyone reading them will fail to notice the monster creep up behind them and start reading over their shoulder . . . until they feel a tap on their shoulder and hear someone say "Turn to the next page"
- **A Black Cat:** This pussycat just loves to leap out of closets, put its tail out to be stepped on and do other heartstopping things to the characters. As with all cartoon cats, if it gets killed at all, it must be killed 9 times.
- **Tana Leaf Tea:** Any character who finds this cup full of tea and drinks it will become a regular Mummy magnet. The Mummy will chase them everywhere for 3d+2 turns.
- **Trick Guns:** The frat boys left several guns around, but although they LOOK real, they aren't. They are squirtguns, paintball guns, lasertag guns, cigarette lighters that look like guns or just capguns. The characters will find this out too late. Won't that be fun?

Cast Of Characters

Bud Rabbit

Bud is a 6 foot tall humanoid rabbit. He has slicked back hair and a little moustach. He's a pretty snappy dresser and prefers wearing suits. Bud thinks of himself as the brains of the Rabbit & Cowstello team and he IS smarter than Lou, but that's not saying much. A fencepost is smarter than Lou. Bud will never hesitate to let his little bovine partner do anything that smacks of dangerous or labor intensive work. He will also do his best to confuse Lou with convoluted arguments and word games, as in the famous "Who's On First" bit. Altho Bud will act brave, he will turn into a big coward once he finally learns that the monsters are real. Interestingly, and despite lou trying to show him proof, this will never happen until the game is at least half way over.

Bud carries a newspaper, a cigar and a reporters notebook and pen in his Back Pocket.

Beliefs and Goals: Get the story, but make Lou do any unpleasant or dangerous work. Pay no attention to him when he starts panicking. Keep clean and looking good in case we meet any ladies.

Lou Cowstello

Lou is a 5 foot tall chubby humanoid cow. (well, actually he's a bull) He has dark hair and big brown eyes. He wears a suit that looks like he slept in it and a battered fedora. He is a loveable little guy, but not very bright. He tends to get scared easily and when scared he loses his voice for a few minutes. He can, however, still whistle very loudly. Lou knows that Bud takes advantage of him, but he still gives in to Buds fast talking. Like Bud, Lou is a sucker for a pretty face.

Lou carries a big reporters camera, a bottle of soda and a bag of popcorn in his Back Pocket.

Beliefs and Goals: Get the story and take lots of pictures. Be on the lookout for REAL monsters! Try not to let Bud confuse you.

Shmoe

Shmoe is the toughest and smartest of the Three Pooches, but he is still a moron. He's also not overly brave, especially around monsters. He is a 5'6" humanoid Boxer dog. He is dressed in a dark colored suit with a fedora hat. He is attempting to look like Sam Spade or Philip Marlowe. In fact, he looks more like a gangster than a detective. Shmoe slaps and whacks Hairy and Coily around, but they often whack him back. All three of the Pooches can take HUGE amounts of damage before they fall down.

Shmoe has a snubnose .38, a bottle of cheap hooch and a copy of the Racing Form in his Back Pocket.

Beliefs and Goals: Solve the case and become a famous gumshoe! The dames will really think you're hot stuff then! Keep an eye on those two knuckleheads, Hairy & Coily. Show them how a REAL private eye does things.

Hairy

A 5'6" humanoid Poodle, Hairy is dressed in a trenchcoat and slacks. Both are rumpled, since he is going for the "Columbo" style of detective look. He is smoking a cigar. Hairy is just as dumb as Schmoe, but thinks he is the brains of the bunch. He does have some talent for inventing things, but his inventions NEVER work right. Hairy is just as much of a coward as Schmoe or Coily are.

Hairy carries a flashlight, notebook & pen and a cup of hot coffee in his Back Pocket.

Beliefs and Goals: Solve the case and become a famous gumshoe! The dames will really think you're hot stuff then! Keep an eye on those two knuckleheads, Schmoe & Coily. Show them how a REAL private eye does things.

Bag of Many Baked Goods: 6

Coily

AKA "The Fat Bald Pooch," Coily is probably the dumbest of the three. He is a chubby and bald humanoid Labrador Retriever. He is dressed in a Sherlock Holmes outfit, complete with deerstalker cap. Of all the Pooches, Coily is the one most likely to do really strange things when he gets mad, frustrated or sees a good looking woman. By the way, Coily's name is pronounced the way it is due to his "New Joisy" accent. That also explains why he uses the woid, err,

word, "soitanly" instead of just saying "yes."

Coily carries a large magnifying glass, a pipe (it blows bubbles) and a copy of "The Hound of the Basketballs" in his Back Pocket.

Beliefs and Goals: Solve the case and become a famous gumshoe! The dames will really think you're hot stuff then! Keep an eye on those two knuckleheads, Hairy & Schmoe. Show them how a REAL private eye does things. Nyuck, nyuck, nyuck!

The Monsters

(We've only listed a short description, hit points and basic stats for the monsters, in order to save space.)

Frankentoons Monster

7 feet tall humanoid duck, greenish skin, bolts in his neck, not very fast, VERY strong and very scary looking. Not much of a talker.

Hit Points: 30

Speed: 3

Muscle: 11

Zip: 2
Smarts: 2
Chutzpah: 4

Count Dorkula

5'8" pale looking humanoid cat, wears formal evening attire and a cape, has the Hypnotize shtick at 7, controls Frankentoons Monster and The Mummy, speaks with a thick Transylvanian accent, wants to drink your blood.

Hit Points: 16
Speed: 6
Muscle: 6
Zip: 5
Smarts: 7
Chutzpah: 6

The Werewombat

6' tall humanoid wombat with big sharp teeth, howls alot, smashes furniture, a little sensitive about being one of the goofier types of lycanthrope, pretty well housebroken.

Hit Points: 22
Speed: 5
Muscle: 9
Zip: 4
Smarts: 4
Chutzpah: 5

The Mummy

6' 4" humanoid pig wrapped from head to toe in old moldy bandages, smells pretty musty, can't talk...just groans, afraid of fire, sometimes hums the Bangles tune "Walk Like An Egyptian"

Hit Points: 30
Speed: 4
Muscle: 8
Zip: 3
Smarts: 4
Chutzpah: 6

Dr.Jerkyl/Mr.Wyde

5'10" human/6' tall human, thin and aristocratic looking/burly and common looking with a really big butt, soft spoken and helpful/loud rude and psycho, carries a doctors bag/carries a big honking axe

Hit Points: 13/25
Speed: 4/6
Muscle: 4/7
Zip: 3/5
Smarts: 9/9
Chutzpah: 5/7

Write Your Own Random Thought piece of furniture_____

Warning! You may not want to read this week's until you've either used our [online data entry form](#), or printed and filled out the [list from last week](#)! These sorts of things happen when it's April Fool's Week.

If you filled out the entry form from last week, [CLICK HERE](#) to see your results.

Otherwise, just print out this sheet and fill it in!

* * *

To me, the essence of roleplaying is collaborative -- or *adjective*_____ -- storytelling, where the Game Master (alternately known as the *noun*_____, Master, the *profession*_____, or *proper noun*_____) begins with the outline of a(n) *adjective*_____ tale. He then introduces his *emotional adjective*_____ players, who, through their actions (or inactions), shape the narrative.

Now, I've always appreciated the incredible contributions my players make, no matter how much I may *first person verb*_____ about them at times. I've always said, "If I wanted to know *adverb*_____ what was going to happen, I'd create my own *item found in a bookstore*_____." (I also tend to say, "*idiom*_____" . . . but generally only after I've drunk too much *liquid*_____.) Most of my fondest gaming memories stem from either doing something completely *adjective*_____, or having something *adverb*_____ unexpected done to me.

- "I attempt to parlay with the *animal*_____."
- "We'll attack the *profession*_____; I think he's possessed by *plural noun*_____."
- "This is a pretty *adjective*_____ situation, but I've got an idea . . . Let's *verb*_____!"

Unfortunately, too many GMs I've *past tense verb*_____ with in the past don't seem to agree with my mindset. I distinctly remember one campaign in particular where our GM had this epic **D&D** adventure, which led through his own universe, the **Dark** *astrological body*_____ world, and the *vehicle*_____scape setting. All of this might have been a lot of fun, except his seven other players and I had *no* control over the plot. Led like *plural animal*_____ with *small objects made of metal*_____ through our *body parts*_____, we went from one encounter to another, escorting our super-powerful NPC to various encounters, where we'd fight the *adjective*_____ minions of the evil super-powerful NPC. We had no control over our *noun*_____; our purpose was to roll the dice to hit and for damage. At one point I said, "Why don't I bring my Apple II out here and, the next time you need me to roll *number*_____ dice of *adjective*_____ damage, you can just press the spacebar?"

Mind you, I've been guilty of this myself. I still remember the first game I GMed. It was in the mid-to-late-80's, when I'd gotten the *movie*_____ RPG Boxed Set for *holiday*_____. Unfortunately, I still didn't quite "get" what GMing was about; I basically *vehicle*_____ed them through one of the published adventures for that game. But at *least* I gave them the plot options that were presented in the adventure, even if I only did it *adverb*_____. We only played that one time, and I'm not sure if they had fun; I seem to recall one player spending a lot of time looking at his *item worn on the body*_____. But I had a *much* better idea of what I was doing when, five years later, I ran my first ongoing campaign of GURPS *noun*_____.

Anyway, the point of this installment is to realize that, in my mind, Gamemastering is (much like this particular column) a lot about letting go, and trusting your audience. Give them some control; let them *verb*_____.

results may be *adjective* _____ or *adjective* _____; the game may go *adverb* _____, or everyone might giggle *adverb* _____ once it's done. And hopefully, in the end, you'll be surprised by the *noun* _____.

-- Steven Marsh (*and You*)

I've had many people asking me more about the personal document binding system I mentioned [a few weeks ago](#). Well, it's called the GBC Personal DocuBind P50 (with names varying depending on who's site you're visiting). The best word to search for is "Docubind"; it seems to be mostly unique to this model. I've found it online at [Office Depot](#) and [Staples](#). \$59.95 seems to be a standard price.

I can continue to recommend it after a few weeks of using it. It's by no means perfect; the comb separating device uses plastic instead of metal teeth, and mine has already had one of them broken off. Fortunately this hasn't seemed to affect performance. It also lacks a means to latch it shut like many 3-hole punches; this only becomes a problem when, say, a paper clip unknowingly slips into the punching mechanism, jamming the thing up in the process. I wasn't aware of the problem, and so I was actually able to force it through . . . though I *definitely* recommend against that. But it still seems to work okay.

Finally, although the device claims only to be able to handle combs up to 1/2" thick (holding 90-100 sheets), I've actually gotten it to work with 3/4" and 1" thick combs, allowing documents 165 to 220 pages thick. It doesn't work *great* admittedly, but it works well enough, separating the comb enough to allow pages to be inserted slowly. But if you do use these larger combs, please be aware that it's a somewhat more permanent binding method, since adding and removing pages is a huge pain.

*(Zero stars) "What is a roleplaying game?" [How many can **you** find, with appropriate variants?]*

Mummy: The Resurrection RPG

Published by White Wolf Game Studio

by Jim Comer, Robert Hatch, Jess Heinig, Conrad Hubbard, Steve Kenson and Richard Ruane

231 pages; \$25.95

Greetings and felicitations to you, my esteemed patron; and greetings as well to my fellow scholars.

A manuscript has recently come into my possession, one whose contents -- if they are to be believed -- suggest that great changes are afoot in our world. I say "if" because this manuscript, entitled ***Mummy: The Resurrection***, bears all the marks of a forgery. It appears to have been crafted to look like an Egyptian papyrus scroll, but my trained eyes recognize its more modern provenance. Nevertheless, I must admit that it is a very high quality forgery, whose script and illustrations are both well chosen and suitable to the subject matter at hand.

That subject matter is a type of supernatural being known as an "Amenti," taking its name from the Egyptian City of the Dead. The first section of the manuscript claims that a metaphysical disaster known as the "Dja-akh" has destroyed the City. The Dja-akh seems to be another name for the Sixth Great Maelstrom that destroyed the lands of the dead in recent months (assuming our Giovanni contacts are to be believed). Consequently, the souls who dwelt within Amenti were blown hither and yon, until they could find mortal vessels to inhabit. The combination of these two elements produces a new being, one that possesses the characteristics of each, but is greater than both. This being is one of the Reborn, as the manuscript also calls them.

The bulk of the manuscript is divided into eight distinct sections. The first of these describes the process by which one of the Reborn supposedly comes to be. The process (called "the joining" in the text) occurs when a recently deceased mortal soul encounters a fragment of an Egyptian spirit in the lands of the dead. This fragment (the "tem-akh") offers the mortal soul the chance to live again through its intercession. Together, the two elements of the new being seek out the priests of the god Osiris, who perform the Spell of Life in order grant "the Third Life" upon the new joined entity. If successful, this creates one of the eponymous mummies to which this manuscript is dedicated. The remainder of the first section describes the Amenti in detail, including their strengths, weaknesses and enemies.

To my mind, the second section highlights the forged nature of this manuscript, for it claims that the Reborn are divided into six types. These are the Kher-Minu (Tombwatchers), Khri-habi (Scroll Bearers), Mesektet (Vessels of Ra or Night Suns), Sakhmu (Spirit Scepters), Sefehi (Unbandaged Ones) and the Udja-sen (Judged Ones). Each type has an affinity for a form of "Hekau" or magic. Reading through this section, I was struck by its unoriginality, by which I do not mean the types of Amenti lack creativity - they do not. Rather, I am amazed that our forger should choose to model the Reborn so closely on the other supernatural beings of our world. The types of Amenti recall the clans among the Kindred or the tribes of the Lupines. The forger apparently believes these groupings are ironclad features of the cosmos and has thus dutifully reproduced them here -- his first major error in judgment.

I shall pass over the third section, for it includes material describing the specific attributes, abilities and advantages of mummies. This section also seemed highly derivative of other occult tomes, giving further support for my assertion of

its forgery. Moreover, the section is incomplete, referring the reader to other librams to obtain the necessary information to complete one's knowledge. Despite this, I believe the section provides sufficient information to gain a solid understanding of the reputed powers of the Reborn.

The fourth section describes the various Hekau paths in some detail. These paths, each of which is tied to a type of mummy (again, a derivative idea) are: Alchemy, Amulets, Celestial, Effigy, Necromancy and Nomenclature. I must confess I found this section extraordinarily intriguing. Whatever the origins of previous sections, the paths often showed a remarkable flair and originality. I have passed on copies to my colleagues among the Tremere to see if they can determine whether Hekau is simply a degenerate form of Thaumaturgy or a new kind of sorcery altogether.

The fifth section details the concept of "Ma'at," or balance, and how it affects the Amenti. The Reborn work to preserve Ma'at at all costs. These beings believe that the cosmic order has been overturned, which is why they have entered our world to correct the problem. This section does a fine job of elucidating this fundamental concept, as well as how it plays out in the existence of mummies. Again, the derivative nature of the manuscript shows: the discussion of Ma'at apes similar discussions of the various Paths we Kindred walk in our unlives. Nevertheless, there is much of interest in this section; I found myself impressed in spite of myself.

The sixth section is a gazetteer of the lands in which the Amenti are active, primarily the Middle East. The section is well written and provides plenty of food for thought. Small details here and there highlighted the inadequacies of my own geographical and cultural knowledge -- no small feat! Yet, the inclusion of many modern details made it certain that this manuscript is not at all ancient, for how could an Egyptian of the Old Kingdom speak of the Gulf War or the PLO? That the writer made no attempt to avoid these details boggles my mind and makes me question his reasons for dressing the manuscript in tattered finery elsewhere, since he obviously intended to tip his hand later in the tome. Curious indeed.

Section seven outlines the types of activities in which the Amenti engage. Thus, it's of prime importance to a would-be chronicler of their exploits. Although there is a remarkable diversity among these activities, the information is thinner than I would have liked. It also lacks examples in some instances -- an infuriating omission that made it harder for me to grasp the role these beings supposedly play in our world.

The eighth section complemented the previous one by describing the enemies of the Amenti. Everything from "bane mummies" (with many examples) to Lupines to the Followers of Set are detailed. Again, I would have appreciated more concrete information in places, but the large number and diversity of these antagonists impressed upon me the desperation of the mummies' existence. Their goal of restoring Ma'at cannot be an easy one.

At the end of the manuscript, there is a short appendix, written in another hand, that describes the mummies of cultures other than the Egyptians. I find the treatise intriguing for its breadth and willingness to look beyond the narrow confines of our Western culture and its antecedents -- a common flaw in treatments of this sort.

In the end, I am baffled. There are too many inconsistencies and borrowings for me to accept the notion of the Reborn wholeheartedly. Moreover, the idea that our world is inhabited by yet another type of supernatural being challenges even my credulity. Yet, I find that this manuscript, forged though it may be, contains within it much that is of value. I am not certain I could ever accept all that it says without reservation, but I rarely do that with any tome of this sort. Thus, I caution any who would read it to weigh its contents carefully before accepting it. Whether mummies do indeed exist as this work purports, I cannot yet say. However, I will suggest that Mummy: The Resurrection deserves study by anyone interested in the hidden world in which the Kindred exist.

I remain humbly and respectfully yours,

Dr. Douglas Netchurch

(Editor's note: Already this new volume has found itself researched far and wide; as such, a FAQ of findings and conclusions is available at <http://www.white-wolf.com/Games/Pages/MummyPreview/MummyFAQ.html>.)

JLA Sourcebook (for DC Universe RPG)

Published by [West End Games](#)

Written by Mark Barnabo, Jack Emmert, Matt Forbeck, Fred Jandt, Steve Kenson, Chris McGlothlin, Michee Rose, Aaron Rosenberg, David Ross, Jim Spivey & Nikola Vrtis

160 pp; \$21.00

The doorway from the teleporter banks slammed open, startling Green Lantern and Plastic Man. Orion and his Astro-Glider roared to a stop beside the round table that dominated the Justice League's Watchtower.

"Where is everyone?"

Plastic Man appeared to be sitting in a child's playground swing, suspended from support structures above the Watchtower's Hall of Justice. The coloring of the swing "ropes" gave away that they were, in fact, his own legs. "It's just us. The others are out fighting some planet-eating menace called G'Lactose or something like that."

Orion visibly tensed. "And why was I not summoned, if there is a battle to be won?"

"Maybe because they knew you'd mmmff!" A glowing green hand had materialized over Plastic Man's mouth.

"... ah, you'd be needed here to help us with any emergencies that came up," Green Lantern said. "Superman didn't think the entire League would be needed."

Orion thought this over for a moment and apparently found it acceptable: the cords of muscle in his neck relaxed.

"What's all that?" Green Lantern said, pointing to the stack of books clutched in Orion's arms. In reply, Orion dumped the books into an untidy pile on the table.

"*That* is trouble. We have a major security breach. Somewhere." Orion scowled.

"Hmm." Plaz picked up a copy. "JLA Sourcebook." He thumbed through it. "What's a 'roleplaying game?'"

"Don't ask," Orion said grimly.

" 'Chronicles the past, present and future of the World's Greatest Super Hero Team and their most dangerous enemies,' "
" GL read from the back cover.

"I like the cover," Plaz said, "but is my nose really that big?"

"Is that all you do -- look at the pictures?" Orion said.

"Don't knock it," Green Lantern put in. "Pictures are very important to communication." He leafed through the book. "The art here isn't bad. A little comic book-y, but what can you expect? The layout's all right, too. A little bland, with only the black, white, and rust . . ."

Orion watched with mounting disbelief as Plastic Man and Green Lantern continued to page through their copies.

"Chapters 2 through 5: JLA Year One. All right, the original Leaguers!" Plastic Man hooted with joy. "'Bout time people remembered there were heroes before ol' Red-Cape or Bats showed up. Why, I remember back when I was in the All-Star Squadron . . ."

"Good for you," Orion rumbled. Wars involving fewer than five planets failed to impress him.

"Er . . . right. Anyway. Members, Allies, Adversaries, Base & Equipment. Pretty decent coverage. Not everybody, but all the bigwigs. 'Most dangerous enemies,' like GL said. Say, here's the Doom Patrol. There was an odd bunch."

Green Lantern said, "The chapters on Young Justice are organized the same way: members, allies, adversaries, base and equipment. Seems pretty thorough. On the other hand, the kids haven't worked up the decade of history the League has."

"Speaking of which, Chapter 1 has a pretty good history of the League. Hey, lookie! The By-Laws! I'll have to read those someday . . ." Plastic Man thumbed his way toward the rear of the book. "Too bad there's nothing in more detail about the years between the founding of the League and now, other than that chapter."

"Chapter 15," Orion interrupted, "claims to be 'Updated and expanded rules for Manipulation Powers.' Rules? Chapter 16 is on android & robot creation -- as if making such things were as simple as scribbling notes on paper! Chapter 17 is advice for 'narrators' on handling high-power 'characters.' Do these people believe that this is some kind of game?"

"Check out the back." Plaz pointed into chapter 18. "An adventure running the range of Justice Leaguers from the past & present and into the future. How would *they* know? Sounds like a crock of crud to me."

"Oh, wait. I get it." Green Lantern closed his copy. "When I was in high school, I always had people coming to me wanting me to draw pictures of their characters for these games like *Catacombs & Creatures*. This must be something like that, except the players are playing . . . us. Weird."

"Hmm." Plastic Man frowned. "Wonder Girl's mom is named Helena. Or is it Helen? Seems they can't make up their mind."

Green Lantern nodded. "Yeah, bugs like that always turn up. Names misspelled, too many dependent clauses, stuff like that. I've seen worse, but I've seen better, too. This one has a decent index -- a lot of these books wouldn't even bother."

Plastic Man snorted. "Here's what they say about me: 'Race: Human (well, sort of...)' Hmph! I'll show 'em who's human... and what's a Villain Point? 'Cause I seem to have one."

"Whatever." Green Lantern put the book down down and looked at Orion. "I don't really see anything to worry about. Celebrities get this all the time. A measure of fame & fortune, and suddenly there are dozens of unauthorized books each claiming to tell the one true story of that celebrity's life and works."

"This," he gestured to the pile on the table, "looks basically okay -- nothing grossly wrong or offensive. From what little I know about these games, the write-ups all look to be fair and accurate."

"Perhaps too accurate." The warrior from New Genesis picked up the discarded book and handed it back. "Look more closely at chapters six through ten."

Green Lantern sighed and opened the re-offered book. "Uh-huh. It's the current League, organized the same way."

Current members. Current Former Members, that's new. Allies, Adversaries, Base & Equipment. So?"

"Look again." *Orion's being unusually patient*, Plastic Man thought. *His mother box must be working triple overtime.*

Green Lantern did so. "So? It's us." Then he did a double-take. "It's *us*. And that's my real name!"

"Mine, too!" Plastic Man turned a page. "Batman is really Bruce Wayne the billionaire? I'd never have guessed! And why do Batman and me have Villain Points, whatever they are, when that murderous Huntress doesn't?" Another few pages. "And Superman is Clark Kent? Incredible!"

Green Lantern murmured, "This section on Adversaries could come in handy. Imagine being able to reliably know your foe's limits and weaknesses in advance. On the other hand, this report on the Watchtower is far too accurate for my comfort. And if we can read about the bad guys, they surely can read about us. If this book fell into the wrong hands, we'd be in serious, serious trouble." Green Lantern put the book down. "I apologize, Orion. You were right. This might be the greatest threat the League has ever faced."

Orion nodded. "I acquired as many copies as I could find, but we cannot know how many more of these exist."

Plastic Man unwrapped his legs from the ceiling and dropped lightly to the floor. "Okay! So we're off to save ourselves from the world! Who'd've thought it?"

"Plaz?" Green Lantern's voice was calm and even.

"Yes?"

"Shut up."

Passion Play (Live-Action Rules for the Fading Suns Universe)

Published by [Holistic Design](#)

Written by Bill Bridges, Jeff Brown, Gary Glass, Mareen Goebel, Bill Maxwell, Nikki Johnson-Maxwell, Kim Scott, Trevor Valle, Dave Vasquez

232 5-1/2"x8-1/2" pages; \$14.95

Philosophus Gandius Mathews,

The end is nigh! The Eskaton approaches, and the teeming millions whose souls flicker dim are not unlike the fading of the stars; their hopes for salvation dwindle as the embers of their inner potential flames fade fast. Soon all will end in darkness.

But not, it seems, today.

Perhaps Thursday. The end times will be nothing if not unpredictable, even if going so far as to be predictable to further reinforce the need for unpredictability.

In the interim, my studies continue. And in my travels I have discovered a new volume called *Passion Play*. Incredible as it sounds, this work seems designed to allow others to simulate the lives of nobles, priests, and freemen, through "live-action roleplaying."

The end is nigh.

The first chapter details current events in our world. I am curious who would find the information in these 26 pages useful; for, who does not know about our lives in the dawn of the sixth millenium: the rise of the nobles, the power of the church, the enemy barbarians threatening to invade the boundaries of the jumpweb Emperor Alexius Hawkwood has struggled to hold together? It serves as an excellent primer, to be sure, if one were to have amnesia or other demons of the mind. It also sets the mood for the remainder of the tome, providing the background information necessary. I also fear the barbarian Vuldrok or Kurgans may glean entirely too much useful information from even this rudimentary parser.

The second chapter, titled "Rules," provides the framework for this game to allow the impersonation of others. For, who without a lifetime of training could hope to duplicate the knowledge of your typical Li Hilan noble or Amalthean healer? Yet these rules seem to allow for such masquerades. The system itself is simple; there are three Characteristics (Body, Mind, and Spirit) rated from 1 to 5. There are also similarly rated skills, and Metiers -- in essence, specializations, like "Strength" for Body -- that can add to the Characteristics and Skills. Thus under normal circumstances one might have a rank of 1-10 to do an action. Actions themselves are ranked 1-10 or more, where 10 or more is a Herculean effort.

The system, such as it is, compares these; if the action is ranked at the level of ability the impostor possesses (or less), it succeeds. Otherwise it fails. Thus if you have a Body of 4, and you need 3 levels of success, you achieve it. If you only have a body of 2, you fail.

There are numerous supplemental systems that enhance this basic one. For example, Twenty Questions represents wheedling true information out of another, and their efforts to resist. Contracts represent binding exchanges between two people, like offering to vote in another's favor in exchange for his voting your way in the future. And Wyrd represents manipulating the tides of fortune, with good and bad luck. Wyrd is controlled through the use of standard cards, where each suit is a different effect. And for those who might complain of the lack of uncertainty in the task resolution system, there is an optional rule at the end of the tome that provides a random element.

The next section details "Characters," as if such sinful impersonations could be explained through the hand-waving used by actors and other voidbound souls. These fifty-odd pages comprise the largest section. Viewed objectively (as most all knowledge should be, even that considered wicked by the Orthodoxy), this section is remarkably thorough and versatile while retaining their ease of comprehension. It should be quite possible to create a detailed and interesting impostor, with backgrounds, history, motivations, and flaws. Of particular note are the essays at the end of this book, where insight is provided to more fully flesh out the methods of mimicking your roles, and dressing in an appropriate manner without spending many firebirds. Disgraceful, and *truly* a sign that the end times approach.

Chapter Four, entitled "The Will and the Way," details combat, cybernetics, and, most distressingly, the Occult. Instructing serfs in the ways of picking up arms and dueling -- even in mock fashion with each other -- is remarkably distressing. And to inform the masses of the potentials and pitfalls of religious rituals and psionic abilities alike? A recipe for disaster, where the ignorant are eggs. (That is what we call a metaphor, Philosophus . . . I have yet to discern truth in the rumors of the Vao's energy poultry experiments.)

The fifth chapter, entitled "Drama," details how to make this faux world of nobles, priests, and freemen teem with verisimilitude. The advice here, forbidden though it is, is nonetheless sound, and should prove fruitful for both neophytes and members of the Masque Guild of professional performers. There are also interesting rules that should enable the "gamemaster" (as the leader of such a group is called) that enable the course of the saga to be shaped through the player's actions. For example, the playing of a Death's Door Wyrd card is of great import, and moves the world towards a more sinister destiny. There is much here of interest, and I must confess when I may . . . though I hope some knowledge of light may be gleaned from this morass of banned knowledge.

Chapter six, "Life in the Known Worlds," expands on information presented in the first chapter, and presents a detailed overview of the Known Worlds. For attempting to comprehend the various forces that shape our world this guide will prove useful; however, for those who would seek more in-depth knowledge to impersonate another, they will need to seek out additional forbidden tomes of knowledge. Nevertheless this section is a good starting point for these sinners. In addition, plot elements and story ideas are presented, providing many opportunities for the gamemaster.

The book ends with a map of the Known Worlds, a summary of the tables and other information, and a "character sheet" to record the exacting specifications of one's descent into hubris.

There are no illustrations within the book, though there are numerous daguerreotypes of those dressing in improvised but nonetheless convincing looking garb. There is incredible skill to behold here, wicked though the subject is.

I have consulted with a Reeve associate, Director Wattson; he has informed me that much of the material in this tome is very similar to another sinful work entitled *Fading Suns*, also apparently known in some secret societies as the "main book" (with whatever sinister implications *that* implies). This volume apparently details another altogether different form of game. Wattson has informed me that the material in these two works is quite compatible, and with minimal effort either could be used to augment the other. There *are* differences, however . . . most notably in the flavor of the simulation presented owing to the differences in the task resolution in the two games. Combat in the "live-action" game is much faster and more decisive than that in the "tabletop" version, while the role, power, and rarity of Wyrd in both games is wildly different. But in all they are more similar than dis-

In all, this work does that which it sets out to do: it provides a portable encompassing framework to indulge in

forbidden impostory, and provides both real-world information of the factions involved, as well as practical advice for how to make the charade work. It's biggest shortcoming, in my mind, is its basic resolution system, which seems quite prone to abuse. But there *are* methods built in to ensure things go smoothly, and in the hands of a competent "gamemaster" with fair-minded sinners, this should provide the framework for much Church-disapproved merriment.

And if this book grants others with the skills necessary to impersonate nobles and churchmen, ready to infiltrate the factions towards their own ends, can there be any doubt as to the likely outcome?

It's almost Thursday, and the end is nigh.

Your servant, striving to remain graced in humility,

Novitiate Randolph Muir
Priest of the Eskatonic Order

The Hunting of the Hunting of the Snark: An Agonetta in Six Fitlets, With Apologies To The Reverend Dodgson

1. A Student of matters mystic once read the ineffable works of Lewis Carroll.
 2. And, being somewhat confused at the time, decided to try and find a Snark.
 3. Meditation can do this sort of thing to unbalanced personalities."
- Count Zeno the Zetetic, *The Book of the Arrow*, 1:1-3

"Just the place for a Snark!" the Transmitter exclaimed,
As the April Fool's deadline impended;
As his regular Muse had succumbed to the booze
Leaving columnists' mornings upended.

The Transmitter panicked, then cried with delight,
"Thank the Reptoids I'm never too clear!
If I'm over a barrel, I'll just rip off Carroll,
Whose Snark poem lurks around [here](#)."

"I was walking on a hillside, alone, one bright summer day, when suddenly there came into my head one line of verse - one solitary line -- 'For the Snark was a Boojum, you see.' I knew not what it meant, then: I know not what it means, now; but I wrote it down: and, sometime afterwards, the rest of the stanza occurred to me, that being its last line: and so by degrees, at odd moments during the next year or two, the rest of the poem pieced itself together, that being its last stanza."
-- Lewis Carroll, "Alice on the Stage"

On July the eighteenth (John Dee's birthday, you know)
The Snark scabbled through this dimension.
And impressed on L. Carroll a name darkly feral
Of which "Boojum" was but an extension.

(A similar cognomen, of unseemly omen
[H.P. Lovecraft](#) would hear in his sleep.)
But the Snark found its Door (eighteen-seventy-four),
As an Irishman vampirized sheep.

"The Hunting of the Snark, by Lewis Carroll. Valuable to those who understand the Qabalah."
-- Aleister Crowley, *Magick in Theory and Practice*, "Curriculum of A.'.A.'"

Was it those depredations that prepared the equations
For the Snark to emerge in his mind?
Kabbalistically numbered, the Snark is eight-hundred,
Or "boundary" (three-thirty), we find.

"Snark" might be (with terminal Samekh) 570
The number of Moloch -- what fun!
(But a tad rearranged, Moloch can be changed
To "angel" -- five-seventy-one.)

While removing the zero, from Moloch the Snark,
Gives you Boojum -- Beth-Wau-Gimel-Wau-Mem
In the numbers of Heaven, that makes fifty-seven
Or "fishes," or "chaos," or "rim."

"[S]tudy that darkest problem of metaphysics, the borderland between reason and unreason, and the nature of the most erratic of spiritual forces, humour, which eternally dances between the two. That we do find a pleasure in certain long and elaborate stories, in certain complicated and curious forms of diction, which have no intelligible meaning whatsoever, is not a subject for children to play with; it is a subject for psychologists to go mad over."

-- G.K. Chesterton, "The Library of the Nursery"

It's here, to be eerie, I should mention the theory
That the Snark was [the Ripper](#), as well.
But there's hints in the chanty reminiscent of Dante
And the horrible deepness of Hell.

The Bellman's large map is of unbroken white,
Arthur Gordon Pym's vision symbolic,
This cartography Snarked thus depicts the [Antarctic](#),
where [Nazis](#) and Elder Things frolic.

But what if the Snark does mean Nothing At All,
Deus Et Nihilo Ex Machina?
It's the cousin and heir to What Should Not Be There,
Be it shoggoth or [elf](#) or mujina.

"Hunting for the Holy Grail is rather like hunting for Lewis Carroll's Snark. It comes in many shapes, it leaves many trails, and, if you find it, the only certainty is that it won't be what you were looking for. Like the hunters in Carroll's poem, you'll discover that the Snark was a Boojum after all."

-- Andrew Sinclair, *The Secret Scroll*

Could the Snark perhaps be the Philosopher's Stone?
Such conundra are endlessly fussed.
The answer, occulted, from the tomes I've consulted,
"It depends on the sources you trust."

Quercetanus gives twelve, Zosimos fifteen,
As the stages within the Great Work.
Paracelsus gives seven, to Norton's fourteen,
And both call Zosimos a jerk.

So if you'll trust Ken, I'm sure someone's said ten,
(It's the number of sephiroth spheres)
Which nicely equates to the number of mates
Which the Bellman so capably steers.

The vanishing Baker must be sublimation,
The Banker nigredo as well,
With further allusion, and minor confusion,
I'm sure that the rest parallel.

"In answer to your question, 'What did you mean the Snark was?' will you tell your friend that I meant that the Snark was a Boojum. I trust that she and you will now feel quite satisfied and happy."

-- letter of Lewis Carroll, 1897

So the Snark may be demon or vampire or Grail
Or alchemically-perfect azoth,
Or Joy, or Surprise, or the Lord of the Flies,
Or Lovecraft's blind god Azathoth.

But it misses the boat saying the Snark's a qliphoth,
[Ultraterrestrial](#), or sidhe,
It's the act of predation as [bisociation](#).
For the Snark *is* a Boojum, you see.

Designer's Notes: GURPS Discworld Also

The Not-Too-Gentle Art of Parody

by [Phil Masters](#)

Writing [GURPS Discworld](#) a couple of years ago was enormous fun and a privilege, but it was also, inevitably, a somewhat *constrained* process. I was looking at a world which had been developed, in depth and width, over twenty-odd novels; my primary job in that book was simply to convert it to **GURPS** game mechanics. [GURPS Discworld Also](#) is a slightly different beast.

Designer's Notes: GURPS Discworld Also

It's partly an update and expansion of the stuff that appeared in the first book, of course, mentioning plot events from recent novels (such as the attempted vampiric take-over of Lancre, from *Carpe Jugulum*), providing rules and numbers where necessary (such as the skills involved in operation of the new semaphore system that first appears in *The Fifth Elephant*), and sometimes simply providing New Game Stuff (such as racial packages for assorted minor sentient species and beings). It also allowed me to apply some newer **GURPS** concepts to Discworld games, like the whole chapter of character templates (which, incidentally, are also mostly applicable to other fantasy games).

However, the greater part of the book consists of an extended treatment of the Discworld *as a venue for games*. Not that the first book didn't cover that, of course, and from what I've heard, plenty of people have been using it for RPGs just fine. But in this book, I wanted to play with some variations. The Disc *is* a world, and I wanted to show a little more of what could be done in that direction, working outwards from the (wonderfully rich and varied) material in the novels.

The Tools to Hand

One big trick I used was parody. The Discworld novels are a lot *more* than parodies -- they're social comedies, action-adventure stories, novels of character, and sometimes good old-fashioned slapstick farces -- but parody and satire have been recurrent themes throughout the series. The range of targets has been wide, from British public school stories through RPGs and revolutionary politics to Hollywood and rock and roll, and the tone has ranged from the affectionate to the savage.

So I felt entirely justified in running with this idea. The real world is pleasingly full of stuff that can be parodied, and Terry Pratchett hasn't got around to all of it yet, so I had a good range of targets. I paid particular attention to the games industry; aside from being familiar to the potential audience, these sorts of thing can make for interesting games in themselves. For example, I think that the idea of playing Cart Wars in EcksEcksEcksEcks is not only a logical extension of something first seen in *The Last Continent* and a modest joke about something close to home round here, but also a viable game on its own account (and an interesting use for the **GURPS Vehicles** design system, and proof of its flexibility).

But just as the Discworld novels work as novels, not *just* as parodies, I wanted the campaign outlines and scenarios in this book to work as "pure games." Indeed, the town of New Smarlhanger isn't a parody of very much, but is (I hope) a place where good games can be set, and "Walking the Spiral" is mostly an excuse to take a bunch of PCs round as much of Ankh-Morpork as possible (with, admittedly, some gags about the computer business). Is Port Duck a parody of two popular (but deeply parody-worthy) types of movies, run together, or is it a place where two different types of swashbuckling adventure story can be played out, more or less straight? That's up to the people who play with it, though I like to think that they'll be able to manage both, often in the same scene.

And there were always questions of getting the *flavour* right. Pratchettian parody is subtle, and often has a *point* (and a kernel of realism, of a particular sort). Anyone can crack a few feeble puns on the names of people or things, or make parody versions of clever characters stupid or big things small, but good comedy should do more than that. When I created a tough, swashbuckling renegade cop for Port Duck, I could have made him clumsy and inept, but that would hardly have been plausible from the plot point of view, so I made sure that he was every bit as tough and agile as he needed to be. However, I then asked myself what an objective observer might think of a swashbuckling renegade cop, and what his reasons for this behaviour might be. I came to the conclusion that, well, he certainly *looks* like a vain poseur. Is that the whole story about him? Maybe . . . But the book has to leave a few questions open.

It also became clear that some subjects might work better than others. The Discworld novels may go after a wide range of targets, but they do have their own consistency, and their fans have quite strong feelings about anything that compromises their integrity. I tested this a little with one long sidebar I included in my first draft. It's a parody of a particular, well-known bit of pop culture (and, perhaps, a tribute of sorts, with a bit of irony). When it hit playtest, some people liked it; others reacted quite strongly against it, clearly feeling that it *wasn't Discworld*. I could, still, argue the point in its favour, but in the end, it had to come out. I'm including it here, though, partly because it *does* seem to work for some people, partly as a demonstration of how to take a familiar idea and give it a Discworld twist, and partly as an example of the sort of thing that stretches the limits.

(I should emphasise, though, that while much of the book is not "official Discworld" -- as I said, it's an exercise in taking ideas into new territory, for the sake of gaming, and indeed some of it may be superseded by future novels, if Terry so chooses -- this particular idea is doubly unofficial.)

The Mysterious Five

The Mysterious Five are an NPC group who can be encountered almost anywhere on the Disc, mostly as a red herring, although they do come with a full-scale plot buried in their background. There are five of them (if you count the dog, which seems somehow obligatory), travelling in a garishly-daubed cart. They may at first appear to be Ecksian backpackers (especially the two blond ones), but their lack of distinctive accents gives the lie to this.

[Designer's Notes: GURPS Discworld Also](#)

The truth is that the group is a by-product of wizardly eccentricity. The solitary wizard in question was experimenting with permanent variations on the Morphic Tweaking spell (p.DII140-141), and took, as an experimental subject, a female hamster who he had decided was too undignified to appoint as his familiar. He transformed it into a semi-human female form; the only flaw in the result was that the hamster, having been rendered more intelligent by the spell, is now convinced that she is a genius. (She is actually IQ 7, but with Overconfidence.) She has picked up a working grasp of certain clichés from somewhere, and thinks that all geniuses have poor vision; at her insistence, the wizard even gave her a pair of eye-glasses to "cure" this, but they actually distort her perfectly adequate eyesight (giving her -3 to vision-based rolls). The wizard kept her around his tower as a harmless if useless amusement, naming her "Wilma" (after his sister, who he had never liked).

Then the tower was attacked by a group of "heroes"; a hulking blond barbarian, an enchantress, and a fairly benevolent werewolf, who had heard rumours and taken him for an evil wizard. (He wasn't evil, just misunderstood.) The wizard may have been mad, but he was ready for this sort of thing, and dropped a net and some stunning spells on them when they were half-way up the first staircase. He wasn't sure what to do with them, but decided to start by trying some experiments on the werewolf, splitting its human and wolf aspects into separate beings. However, each aspect retained some odd features; the human part seems barely human, and what should have been the wolf part, being heavily influenced by its human-socialised nature, turned into, well, a dog (looking to have about equal parts Great Dane, Labrador, wolfhound, and spaniel).

Then Wilma, who had taken a liking to the prisoners, tried to free them. The wizard, irritated by this, decided simply to throw all five out. In order to avoid having them come back, he cast a series of mind-control spells on them, telling them "Forget all about me. In fact, forget all about magic. Tell yourselves there's no such thing. And forget this heroic nonsense. Just go away and play tourists or something."

The Five did indeed forget everything he told them to, and took up the lives of wandering tourists, complete with new names. When Wilma unlocked the cell holding the barbarian, on whom the wizard had already cast some befuddling spells, she said "You're freed now," and as a result, he now answers to "Freed," that being the nearest thing to a name that anyone's offered him. He is ST 18, HT 13, and Attractive, but displays no other significant skills, having been obliged to forget everything about the heroism that was previously his entire life. And the former enchantress, her old, nigh-unpronounceable name now shortened to "Narcissa," has likewise forgotten her former array of supernatural powers (though she remains the most organised of the group).

As for the two beings who were once one werewolf, they continue to hang around together, sensing a kinship. The near-human part is known as "Scruffy" (because he is), and the canine part is called Scruffy Too. The wolf's barely-controlled hunger for flesh has been transmuted into a shared tendency to snack at every opportunity, and a willingness to try anything edible once, including hallucinogenic fungi. That aside, Scruffy can be treated as an Unattractive but otherwise average male human, while Scruffy Too combines un-canine intelligence with all-too-canine curiosity and clumsiness; consider him to have IQ 7, DX 10, Move 7, and the Insatiably Curious (p. CI89) and Total Klutz (p. CI82) disadvantages.

The Five's biggest problem, apart from their lack of useful skills and general cluelessness, is their conviction that magic, and even things like perfectly normal trolls, *don't exist*. Faced with any situation or problem involving the supernatural, they charge in, announcing "You can't fool us," and try to expose the conjuring tricks or pull the "masks" off the monsters. They are thus likely to require a certain amount of saving by less deluded folk.

It would take truly superhuman magical powers to fully restore their old selves. However, optionally, at times when they are out of sight of any PCs, their old adventuring skills might surface temporarily (and unconsciously). PCs might walk into a room and discover carnage wrought by Freed's combat skills, Narcissa's magic, or either of the Scruffies' lycanthropic fury. Wilma may just temporarily disappear, leaving only a confused-looking hamster. This could become the basis for a running joke, or a particularly warped murder mystery. (Don't forget that some of these people *did* used to be professional killers . . .)

Storyteller System Secondary Abilities Redone

by J. Edward Tremlett

Secondary Abilities for White Wolf's *Storyteller System* are one of those odd mechanical things which can create undue complexity while masquerading as a simplification. Like Merits and Flaws, they are totally optional; they aren't needed for the *Storyteller System* to work, and are simply meant to add more depth to a character's background, should the Storyteller allow their use in her game.

Some players might want to take dots in Secondary Abilities because they sound intriguing, or seem as though they might come in handy. The fact that they're supposed to be less expensive at character creation also attracts players to them. But while such Abilities can be useful, "lesser" skills or refinements to have in your game, sometimes they just become wasteful quirks that might see too much use, too specialized a use, or no use at all.

As currently presented, Secondary Abilities can cause a bit of a muddle when used on the same playing field as ordinary ones. The purpose of this article is to present a way that these Secondary Abilities could be used so that they add to the game, rather than adding to player and Storyteller confusion over which Ability to use when. It will also cover suggestions on how to get them during character creation, and how to raise them with Experience.

The Secondary Dilemma

On any *Storyteller* character sheet, there are usually a total of 30 Abilities listed, broken down into Talents, Skills, and Knowledges. These 30 Abilities are considered "regular" Abilities: ones which are considered the most useful, or at least the most likely to be used, by the characters in that game. Most of the examples of rolls for various feats or actions given in the main rule book for a Storyteller game (often called the Core Book) utilize those regular Abilities.

Various Players Guides, supplements, "Splatbooks" and other such materials for the games often list other Abilities that characters could have. These are what we mean when we speak of Secondary Abilities. There are some Secondary Abilities which, quite clearly, can only be used for certain purposes, such as Archery for using a bow and arrow, Pilot Airplane for flying a turbo prop, Psychology for getting someone to talk about their mother, and so on.

And then there are Secondary Abilities which are either replacements for, or refinements of, the regular Abilities. These could be used instead of regular Abilities for the same, basic rolls given in the core book. For example, a player could roll Dexterity + Climbing to have her character climb a wall, rather than rolling Dexterity + Athletics that's prescribed.

It's suggested that Secondary Abilities be less expensive than regular Abilities, and this is another reason some players choose them. After all, if you're playing a paid interrogator for the Prince, why take two dots in Intimidation (for Manipulation + Intimidation rolls to torture someone) when you could pay the same amount to have four dots in the Torture Secondary Ability? It seems a lot more advantageous, at least while creating the character.

But then, when it comes time to raise their Abilities through Experience Points, players might not be sure what to do. Do they raise a regular Ability, which can be used to do a whole range of things, or raise the Secondary Ability which allows one to do one, specific thing very well? It works fine if the Secondary is higher than the Regular from Character Creation, but sooner or later the character's stats might raise them both to an even level, and the question remains as to where to go from there. Do you raise one and abandon the other (leading a Storyteller to ask why the other was taken in the first place) or raise them both in tandem (which is expensive and kind of silly)?

There's also a question of how much to charge. Regular Abilities cost two times their current level in Experience Points to raise, and the Vampire Storytellers' Companion says that Secondary Abilities should only cost their current level in Experience Points. That seems to cheapen their importance and use, and could make it a bit too easy for players to "min/max" their characters: taking advantage of cheap purchasing costs to raise several, high-important

Secondary Abilities up to 5 after a few good sessions, and ignoring their regular Abilities altogether.

Suggestion: Split the Difference

One way to handle what to do with the confusion of Secondary Abilities is to separate them into two new entities: "Other Abilities" and "Ability Specialties."

In this method, "Other Abilities" would be Talents, Skills, and Knowledges that must be learned to do certain things, or at least do them well. Put another way: if it can logically exist by itself, without needing to have another Ability to use it, it's an Other Ability. These would be such Abilities as Pilot, Archery, Ride, Lore, Instruction, and so on. They would cost the same amount as Regular Abilities during Character Creation, and cost the same to raise through Experience Points as Regular Abilities. The only difference between these "Other Abilities" and Regular Abilities is that they're not printed on the character sheet.

The "Ability Specialties," on the other hand, would be those Secondary Abilities which are enhancements of, or alternatives to, Regular Abilities. If Other Abilities are those which can logically exist by themselves, then Ability Specialties are things which need to be coupled with something else: Fast Talk with Subterfuge, Swimming with Athletics, Computer Hacking with Computer, and so on.

Ability Specialties would go from 1 to 5, but they would not be rolled in Attribute + Ability rolls. Instead, they would grant modifiers to Attribute + Ability rolls made that compliment the Ability Specialty. If someone has the Climbing Ability Specialty, then they would make a Dexterity + Athletics roll to climb a wall, but each dot they possessed in Climbing would lower the Difficulty by 1.

Ability Specialties would cost one point per Dot in Step Three of character creation, and two Freebie Points per dot in Step Five. During character creation, they cannot be taken at more than half (rounding down) the starting level of whatever Ability they are most likely to modify, which means that they can never be taken above two dots by starting characters. They would cost two times their Current Rating to raise with Experience Points.

To use Jorge again as an example: when he was created, he was given a Firearms of 4, and his player has him take the Ability Specialty of Fast Draw. His player can only take two dots in this Ability Specialty at character creation, because that is half of Jorge's Firearms Ability. Later, during play, his player can raise his Ability Specialty up with Experience Points.

Old "Specialties" and What to Do With Them

If Storytellers choose to use the Other Ability/Ability Specialty system, the obvious question is what to do about the old Specialties. Under current Storyteller System rules, characters who have the 4th level of any Ability or Attribute may have what is known as a Specialty to go with it. Specialties allow for players to reroll any 10's that come up when using that Ability or Attribute in the manner indicated by the Specialty.

So, if the Other Ability/Ability Specialty system is adopted, a character who has an Ability Specialty of Swimming and a Specialty in "Australian Longstroke" is double-dipping a bit. She will not only stand a better chance to get successes through minus modifiers to her roll, but she'll have the chance of getting even more by rolling 10's. This could be min/maxed quite obnoxiously, especially with combat-oriented characters, or those characters who are designed to do one thing, and only one thing, extremely well.

One way to handle this problem is to do away with such "Specialties" altogether. In this method, a 10 rolled becomes just a very good result for that die. The chances of getting more successes through Special Ability modifiers does away with the chancy boost that a 10 rolled at the right time can give.

Another way to deal with it would be to allow Specialties for Attributes and not Abilities. Most of the suggested Specialties for Attributes given in the core book are descriptions, rather than tasks, and this is good. The Storyteller

should make certain that her players don't pick Specialty descriptions that come too close to any Ability Specialties they may have. She should also encourage them to roleplay out any such Specialties, rather than just letting them reroll 10's on any roll using that Attribute as a matter of course.

Other Abilities and Ability Specialties for Vampire: The Masquerade Revised Edition

To start Storytellers off, I have compiled a list of Other Abilities and Ability Specialties from the Secondary Abilities given for *Vampire: The Masquerade Revised Edition*. They are listed with whether they are described in the *Vampire Storytellers Companion (VSC)*, *Guide to the Camarilla (GttC)*, or *Guide to the Sabbat (GttS)*. Those suggested as Ability Specialties are coupled with the regular Abilities they would most likely modify.

The *VSC* also gives lists of Hobby Talents, Professional Skills, and Expert Knowledges. Most of these were spelled out in the 2nd edition *Vampire Players Guide*, and some of them were also written up in the *GttC* or *GttS*. Storytellers can go through those lists of suggested Abilities and separate the Other Abilities from the Ability Specialties themselves, based on the suggested criteria above.

Also note that Fortune Telling, given in the *Guide to the Sabbat*, is not found below. The authors say that it's up to the Storyteller to decide if it really works in her game, or if it's just a sham. If Fortune Telling works as a divinatory act, then it should be listed as an Other Ability. If it's all trickery, though, then it should be listed as an Ability Specialty, and could be coupled with either Empathy or Subterfuge depending on the soothsayer's style.

Other Abilities

- Archery (*VSC*)
- Area Knowledge (*VSC*)
- Black Hand Lore (*GttS*)
- Bureaucracy (*VSC*)
- Camarilla Lore (*VSC*)
- City Secrets (*VSC*)
- Clan Knowledge (*GttC*)
- Cryptography (*VSC*)
- Demolitions (*VSC*)
- Enigmas (*VSC*)
- Grace (*VSC*)
- Intuition (*VSC*)
- Instruction (*VSC*)
- Masquerade (*VSC*)
- Meditation (*VSC*)
- Pilot (*VSC*)
- Psychology (*GttC*)
- Ride (*VSC*)
- Research (*VSC*)
- Sabbat Lore (*VSC*)
- Scrounging (*GttC*)
- Sewer Lore (*VSC*)
- Style (*VSC*)
- Underworld Lore (*GttS*)

Ability Specialties

Acrobatics (*GttC*) (Athletics)

Camouflage (<i>GttC</i>)	(Stealth)
Computer Hacking (<i>GttC</i>)	(Computer)

Ventriloquism (<i>VSC</i>)	(Performance)

Concealable Weapons and Equipment for GURPS

by Ian Freeman

Has this ever happened to you? You're monitoring someone, or maybe you're looking for someone. Whatever the reason, you've been invited to a ball, or a concert, or a movie. You don't want to go unarmed, but you can't very well carry your assault rifle with you. The solution: concealed weapons, of course. They've got style, substance, and most importantly: they'll all fit in your tux without anyone the wiser.

All of the equipment listed is TL7.

Electrode Gloves/Nails

The item is concealed as a glove of any kind. Attached to each of the fingers of the glove, concealed on the inside, is a small electrode. Each electrode is attached to a 6 yard, extremely thin wire that carries a strong electrical charge. When the gloves are simply worn, this wire wraps around the finger of each prospective launcher. The electrodes can be launched with a flick of the wrist. Once a nail electrode has been fired, that electrode can never be used again.

Upon use, the wearer makes a DX roll. The weapon has Acc 4, and SS 10 (DX). On a success, the electrode hits; on a failure, it misses. The defender may dodge or block, but not parry . . . but blocking with shields that conducts electricity does not work. A successful block with a metallic item counts as a hit on the part of the attacker. Anyone hit must make a HT+2 roll. On a failure they are immobilized by the charge and they drop to the ground for as long as the electrode is inside them (up to a maximum of 2 minutes).

Armor has no effect on the electrodes (disregard its PD), unless it is more than a 1/2 inch thick. Typically, any armor with a PD of 4, or a DR of 4, will be more than 1/2 inch thick. It must be this thick, because the current can jump that far. If the armor in question is conductive of electricity, never use its PD, regardless of thickness.

The user may fire as many electrodes as they choose, one from each finger. For each additional 3, the DX roll is penalized by 1. For each additional electrode, the targets HT is penalized by one for the purposes of the roll.

Treat multiple shots as you would any other burst (i.e., into 2 groups of 4, and 1 group of 2 if you fired all the electrodes).

While an electrode is in a target, they suffer -1 to all success rolls (per electrode), even if they succeeded their HT roll (it still hurts!). This effect lasts for 2 minutes, or until the offending electrodes are removed.

Alternatively, this item may be taken in a surgically implanted form. If the GM is willing to stretch the boundaries of TL7, or if the players have access to TL8 equipment, the electrodes may be surgically implanted under the users fingernails. The weapon works exactly the same way, except in terms of pricing.

Any close examination of the inside of the glove will reveal them to be abnormal. Only invasive surgery will reveal the nature of surgically implanted equipment.

Each gloves cost \$150, and each electrode (which must be replaced after each use) costs \$100. The implanted form costs \$300 per finger, and each electrode cost the same amount (\$100).

Cufflink Chemical Delivery System

A specific chemical is contained within each of your cufflinks. When the cufflink is snapped in half, it releases a chemical and has an affect. Each cufflink costs \$25, but you must also pay for the chemicals. As a note, you typically wear 2 cufflinks on each sleeve. Their weight is negligible.

Magnesium Flares

Upon breaking, a spark lights on the magnesium strip in the cufflink. 2 seconds after the cufflink is broken, the magnesium ignites. Magnesium burns impossibly bright, and anyone directly looking at the flare must make an HT-10 roll. For every point the roll is failed by, the victim is blinded for 3 seconds. On a critical failure, the victim suffers serious damage to their retina and is blinded for 2d hours.

For each 5 yards that separate the target and the flare, they gain a + 1 bonus to their HT roll. The maximum range is 30 yards.

Anyone who knows what is about to happen may choose to look away; everyone else must make an IQ check to realize it.

Magnesium flare cufflinks cost \$350 each.

Smelling Salts

This cufflink is used by breaking it under the intended target's nose. Upon inhaling, the target must make an HT roll. This roll is modified by anything that modified the original HT roll that resulted in their unconsciousness (unless, of course, there was no HT roll, in which case this check is unmodified). If the target succeeds at the roll, they are immediately roused to consciousness. They do not regain HT, so any further damage (if they are in the negatives) will immediately return them to unconsciousness, but other than that this return to consciousness is permanent. It will not return someone to consciousness if they are in the negatives as far as their own HT (i.e. In risk of death).

Smelling salt cufflinks cost \$50 each.

Smoke Packet

The cufflink is filled with a compressed gas that reacts with oxygen to produce a thick, opaque smog. It does not restrict breathing, but does completely obscure lines of sight. Each charge contains enough chemical to fill a 4 yard by 4 yard by 4 yard area (64 cubic yards). The smog remains until cleared by fans or whatnot. If the ceiling of the targeted area is less than 4 yards, modify the area of effect appropriately. If the ceiling is 2 yards, then double the area of effect to 128 cubic yards, which is 8 yards by 8 yards by 2 yards (the height of the ceiling).

Smoke packet cufflinks cost \$120 each.

Intoxicant

When cracked open, a liquid runs out and will dissolve in any liquid. It has no odor or taste. Anyone who drinks the concoction must make an HT-3 roll, or become immediately impressionable. Anyone using the fast-talk, sex-appeal, hypnotism or any other skills that depend on convincing someone gain a +6 to their checks against the subject. The effects last for 1 hour.

Intoxicant cufflinks cost \$80 each.

Phosphorus Ceramic Dagger

This a small, ceramic (so it is not picked up by metal detectors) dagger that has been coated in phosphorus and is contained in a special one-use sheath. The sheath is in the form of a necktie, which costs \$65 (but you can pay more for the necktie if you would prefer a higher quality one).

Immediately upon drawing the dagger, its phosphorus coating ignites into a white hot flame. Phosphorus ignites when

it comes in contact with oxygen; therefore, the necktie is specially designed to prevent this reaction before the dagger is drawn.

The dagger itself is a fairly average knife, dealing Thrust -1 piercing damage, or Swing-1 slashing damage. But then comes the phosphorus. The white hot flames deal 1d-1 damage in addition to the damage done by the attack.

The Dagger can be used on inanimate objects. It will ignite paper instantly, and wood in 1 second.

The burning chemicals last for 90 seconds.

The burning chemicals essentially destroy the dagger, at the end of the elapsed time.

The tie costs \$65 (or more for a nicer tie), and the dagger and chemicals are \$450 (\$200 for the dagger, \$250 for the chemicals). It weighs a third of a pound.

Razor-Barb Neck Protector

A thin metal strip, about an inch wide, is wrapped around the wearer's neck. It is concealed under their collar. If any substantial amount of force is applied to the wearer throat or neck, tiny razor sharp barbs pop out of the metal strip, slicing through flesh, bone and almost anything else.

If the wearer is being choked by some sort of garrote wire, cable, or rope, it is immediately sliced through by the razor barbs, freeing the wearer.

If someone is unfortunate enough to use their hands or arms to strangle the wearer, the barbs immediately do 1 point of damage, and the attacker must make a Will-6 roll or let go (unless, of course, they want to let go). If the attacker manages to hold on, they are at -3 to all strength checks to hold on to the wearer due to the excruciating pain inflicted by the barbs.

The wearer may choose to coat the barbs with any poisons they choose, at additional cost.

The Neck Protector weighs a half pound, and costs \$370.

Arm Guards

Thin strips of a carbon-fiber titanium alloy run up and along the wearer's outer, lower arms. These are so that the wearer may more effectively parry melee attacks.

The user makes unarmed parry rolls as normal, but, if the user succeeds by at least 2, there is no chance that their arms can be struck. Typically, these are worn under ones clothing.

These weigh 1-1/2 pounds, and cost \$800.

Shoe Contained Caltrops

These can be added to any reasonably sized shoes. A number of caltrops, and a small explosive charge, are placed in the heel of a shoe. A small cable runs up your pant-leg into your pocket. The wearer can reach into their pocket and press a button, releasing the caltrops and allowing the small charge to scatter them about.

The caltrops fill a 2 by 2 yard area on the ground immediately behind the wearer. An enormous number are scattered about, because they are stored in the form of very small ball bearings, but they expand into 4 stainless steel blades. To move through the caltrops, you must make a DX roll. On a success, the person may move through the caltrops at 1/4 speed. On a failure, they take 1 point of damage to their feet. The excruciating pain restricts their movement (and

dodge roll) to 1/3 of normal. Also, they are at -1 to all success rolls.

The entire unit, consisting of the trigger, the caltrops and the installation costs \$250, plus the cost of a shoe. The weight is negligible.

Garrote Wire

A thin, very sharp wire is stored in the wearers belt. It can be easily removed in a single second. This wire is about 2 feet long, and is used to aid in strangulation and suffocation attempts.

While using a garrote wire, strangulation attempts are handled exactly as they normally are, except the user gets an effective +5 to strength due to the leverage granted by the wire and the difficulty of removing it from around the target's neck.

Alternatively, the wire can be stored within a watch, pulling on the winder extracts the wire.

The wire costs \$35, the belt costs \$40, and the watch costs \$90 (or more, for a better watch).

Arm Shiv

A shiv is a long, 3/4 inch thick dagger that can deal either piercing or slashing damage.

While it may not make it through a metal detector, it sure is deadly. An 18" retractable shiv is attached to your lower underarm. By touching the controls on your arm, the Shiv can be fully extended, fully retracted or extended up to the wearers knuckles.

If it is extended to the knuckles, treat attacks with it as a standard close combat strike dealing normal punching damage. Except, on a successful hit it deals an additional Thrust-1 slashing damage. On the other hand, when extended to its full 18" size, it is deadly weapon indeed. It uses the Knife skill, or any unarmed combat skill, or Shortsword-1 (what with it being a foot and a half long . . .). It deals swing+2 slashing damage, or thrust+1 piercing damage.

It takes a single second to alter the length of the blade. If the player takes the skill Fast Draw (Arm Shiv), the size can be changed in (effectively) zero time.

If you would like, you can coat this weapon with phosphorus and add an airtight containment sheath (so that you don't burn your arm). Doing so gives all the same bonuses as the Ceramic Dagger, but costs more, since this one is bigger.

This weapon weighs a 1/2 pound, and the complete set-up (including dagger and sheath) costs \$950. Coating it in phosphorus costs an additional \$450 for the chemical, and \$200 for the modified sheath.

Reversed, Concealed Holsters

This is a holster which is designed to be worn on your back, under clothing. The holster is upside-down, so that the gun inside can be accessed by reaching up the bottom of your shirt. Naturally, tucking in clothing will cause problems. Therefore, if you are wearing a suit, the holster can be worn on the outside of your undershirt. It's not visible, but accessible by reaching under your blazer or coat.

The holsters are designed to be concealed and confer a +6 to all Holdout checks. They will only work with pistols that are not overly large. For example, a .50 caliber desert eagle with a 9" silencer would be too big. What can and cannot fit is up to the GM, but almost all pistols will.

The holster weighs 1/2 pound, and costs \$75.

Pyramid Review

Aberrant: Worldwide Phase II

Published by [White Wolf Games](#)

Written by **Deid're Brooks, Steven Michael DiPesa, Lucien Soulban**

160 pages; \$19.95

Since its inception, the *Aberrant* line has been unabashedly metaplotted, exploring the interactions between Novas and society over the course of many years. However, the advancement of the metaplot has been handled in a uniquely well-coordinated manner, as the job of advancing the timeline has been confined primarily to the *Aberrant Worldwide* series of adventure anthologies, each of which promises to place the PCs in the midst of the major events of a given period--in the case of *Phase II, 2010-2015*. The very consciousness with which the metaplot is being advanced means that the series is also written with an eye towards how it might unfold differently in the an individual campaign, and earns high marks for flexibility -- a quality which adds to the ease with which many of these adventures could be ported over to a non-Aberrant Supers campaign.

(SPOILER ALERT!)

The adventure design allows a GM to involve PCs from the most loyal Utopian to the most radical Terat to take roughly the same course through the adventure (and to desire roughly the same outcome), maximizing utility to all gaming groups while keeping the complexity from being unwieldy. For better or worse, this generally means that *Aberrant Worldwide Phase II* drags the setting even further into the realm of conspiracy gaming. Three of the four adventures feature some minor faction with a handful of Novas embarking on a conspiracy to gain a great deal of influence in the baseline world with an agenda that can plausibly upset all Novas, and the fourth is set in the aftermath of an elaborate series of double-dealings by Proteus -- all end with lots of explosions.

The first adventure, "The Pope of Babylon," is the best of the book, centering around an extremist faction of the Roman Catholic Church attempting to wrest control of the Papacy. This will result in the rescinding of Ad Dei Lucem, the papal bull that declares humans and Novas equal in judgment. Placing the characters between two conspiracies dueling over the future of religion and crawling with obscure catholic sects, aging mobsters, and super powered fanatics, the adventure is original, well researched, and entertaining. Additionally, it is surprisingly portable for such an intricate story of intrigue, as the only major setting-specific faction required to play a significant role in the action is the Camparelli-Zukhov crime syndicate, easily replaced by a generic equivalent.

"A Green and Pleasant Land," by contrast, is less an adventure than a short faction-writeup on a pseudo-Masonic English Nova Cult lead by a villain so cinematic he could have jumped straight out of a James Bond film. Arthur Francis Anningsley is a Mega-Intelligent Nova with a complicated master plan to return England to a role of global dominance -- with himself as absolute monarch -- by assassinating hundreds of world leaders, suppressing dangerous Nova elements and, for no particular reason, mining London's tube system. Rather than a linear adventure workup, it provides a workup on the cult, its members, Aberrant-London, Anningsley's plans, a few hooks and a couple of potential complications which may be stirred in at the GM's leisure.

The third adventure, "Dominion," feels the most complicated and wide-ranging of the scenarios, and almost demands to be spread out in the background of several months of play, as one of DeVries' top executives conspires towards the military conquest of the Ukraine (sense a pattern yet?). The set dressing is exotic, ranging from the "cold-war" feel of Skopje, Macedonia to religious ceremonies in small Indian villages to the jungles of South America to the tribunals of

the United Nations. The forty page adventure could, in fact, easily form the foundation of an entire campaign. However, it seems unlikely that its elaborate plot could easily survive contact with the players, not to mention the near necessity of a GM fiat to place the characters in Kiev at the crucial moment. It's an interesting setup, and the climax, wherein the players must somehow figure out a means to delay a larger and more powerful force of Novas long enough for reinforcements to arrive, is the sort of epic climax worthy of unraveling a complicated conspiracy to get to.

The final adventure in the book, set in the aftermath of a Team Tomorrow raid on The Amp Room, "Where Heaven Ends," is the Aberrant universe's answer to "Saving Private Ryan," as the PCs are sent into a war-zone to rescue an important NPC. While the adventure itself is a race-against-the-clock with a good objective, interesting twists and an exciting setting, I can't help but feel a twinge of disappointment that the plot calls for the PCs to sidestep around the Aberrant Universe's two major teams slugging it out over the setting's most famous piece of real-estate, rather than becoming directly involved.

(END SPOILER ALERT)

Aberrant Worldwide Phase II is a mixed bag. The adventures themselves are individually solid and enjoyable, the 45 pages of flavor text documents are consistent with the high quality standard in the ***Aberrant*** line, and the ***Worldwide*** format remains a sound one both for adventure publishing and for involving PCs in the metaplot. As a whole, however, the collection suffers from a lack of variety, particularly when compared with ***Worldwide Phase I***.

Pyramid Review

Psionics Handbook (for D&D)

Published by [Wizards of the Coast](#)

Written by **Bruce R. Cordell**

160 color pages; \$26.95

The *Psionics Handbook* is almost *GURPS* like in its approach to Psionics, in that its total coverage that can be added whole, piecemeal, or ignored. In this one book, new classes, skills, feats, psionics, powers, characters types, psionic items, monsters, and the all important character sheet are laid out for 3rd edition consumption.

Starting off with Psionic Classes, the reader is introduced to the Psion and the Psychic Warrior. The former is similar to a sorcerer in terms of combat deficiencies -- and his reliance on special abilities -- while the latter has fighting skills and some psionic ability. The interesting thing about the Psion is there is no generic psionist. Instead, the psion must specialize in one of the fields of psionic abilities: egoist, nomad, savant, shaper, seer, and telepath. This method works so well that it's amazing that Wizards didn't do this for the wizard classes. Each section comes with standard class information and, more importantly, starting packages that show how different races can start off with the new classes.

Each class gains access to psionic powers similar to a standard spellcaster gaining access to different level spells. The main difference is that psionics use power points to fuel their selections. Each class gains bonus power points based on the ability score more appropriate to the class. This prevents the seer, who should have a high Wisdom, from putting his highest score in Constitution. These new characters still use the same experience table, and can multi-class into other classes with the standard restrictions. More importantly, other classes can multi-class into these new classes per normal rules.

Unlike previous editions, psionics fit much better in some areas. In 2nd edition for instance, many creatures lacked psionic defenses of any kind. In 3rd, if you have Spell Resistance, you have Power (Psionic) Resistance. In addition, psionics are now level-based, much like spells. These concepts make it easier to integrate into the core rules than ever before.

Chapter Two, Skills, brings new skills to 3rd edition like Knowledge: Psionics, and Stabilize Self, the ability to stop yourself from dying of a near-fatal wound.

Chapter Three, Feats, show how to customize your character with one of the main innovations of 3rd edition. While there are dozens of new abilities listed, for some reason they decided to reprint dodge, point blank shot, power attack, and sunder. Now the book is already taking flack for its price, Wizards had no need to do any reprints in this book. Outside of those few reprints though, feats like deep impact, the ability to strike an opponent with a weapon as if you were using a spell touch attack, (for those who don't know, it ignores armor) and it's range equal, Fell Shot, which lets the user's ranged attacks gain that benefit. While most of these abilities are for psionist only, I imagine that soon we'll see a Dragon article converting many of these feats to wizard/cleric equivalents.

Chapter Four, Psionics, gives GMs ideas on how powers are displayed, called upon, and interact with the game. Advice is given on which powers to chose, and the definition of what exactly a psionic power is. (It's a one-time psionic effect.) The information is good for roleplaying, especially the breakdown of the different psionic types: clairsentience, metacreativity, psychokinesis, psychometabolism, and psychoportation. This chapter also covers making psionics different from magic in a campaign that wants psionic characters to truly stand out. In addition, there are

several psionic diseases introduced in the book.

Chapter Five is a listing of psion powers from 0 to 9th level. The powers are listed by class, level, and alphabetical for reference, then after, the details of each power are listed purely alphabetically. This makes for easy reference when looking up a specific class and level reference, or just looking up the psionic power itself. Players will have a fun time deciding what new toys they want their characters to have. For example, *Breath of the Dragon* is a 6th level ability deals 11d4 points of damage, while a simple ability, *Bolt*, creates a single projectile weapon. It doesn't launch it, merely creates it. Unlike most spells, psion abilities are almost always standard in damage in relation to the characters level. *Flaming Shroud* inflicts 11d6 points when the psion can first select it at 12th level to 20th level.

Chapter Six, *Characters*, presents unique prestige classes based around and on psions. The *Metamind* is concerned only with mastering raw psion power, the *Pyrokineticist* specializes in the field of fire, the *Slayer* hunts down *Mind Flayers*, and the *Soulknife* is an assassin whose specialization with psionics makes him a dangerous foe. The next section allows for the creation of random NPC psionicists. This is a great section for GMs in a hurry. With a few die rolls, you can determine alignment, class, ability scores, and look at the different charts which give a level by level breakdown of what each psionicist can do.

Chapter Seven, *Psionic Items*, brings all manner of new devices in a format similar to the *Dungeon Masters Guide*. For example, items are sectioned off by item type, so under *Armor and Shield*, you can find crystalline armor or armor that has the quickness special ability. Under *Psionic Weapon Special Abilities Description*, there are weapons that excel at parrying, or those that can, through the use of the impact ability, increase their own mass upon striking. Some of the more interesting items, crystal capacitors, are power point storage devices, while *dorjes* are similar to wands, with one psionic power and 50 charges.

Chapter Eight, *Monsters*, updates old favorites like the *Githyanki*, *Githzerai*, and *Intellect Devourer*, as well as bringing in specialized monsters like the *Neothelid* and the *Phthisic* from the *Monstrous Arcana* series. More importantly though, if you want a *Mind Flayer* that has psionic abilities, you no longer have to ponder the existence of two subspecies; instead, just add a psionic template to the current *Mind Flayer*. At the end is a table that breaks the monsters down by challenge rating and alphabetizes them.

The last few pages include a two-page index and a new character sheet. The index is useful, but the character sheet is nothing special. Wizards could have taken the time to make at least two different sheets here, one template for psions and another for psychic warriors.

Most of the book uses the standard two column layout. Some exceptions, like for long tables such as *Psionic Character Skills*, break the monotony of the text up nicely. The book boasts full color throughout, which is truly helpful for DMs unfamiliar with some of the more exotic monsters and powers in the book. The art is similar to other 3rd edition products, so if you enjoyed the *PHB*, *DMG*, or *MM*, you'll enjoy this art.

Some people may consider the \$26.95 pricetag unreasonable, but it is comperable with, say, the 178-page b&w *GURPS Traveller* released for \$29.95 in 1998. For 160 full color pages in a hardcover, \$26.95 seems very reasonable.

If you're going to use Psionics in D&D 3rd ed, this book is easy to insert either whole, or piece by piece into your campaign. A lot of the best material from various sourcebook, like the *Monstrous Arcana* *Illithid*, and the psionic setting *Dark Sun*, have been updated into the new edition smoothly. And not content to leave well enough alone, Wizards of the Coast has added 10 pages of web enhancements which add old favorites like *Gem Dragons*, the *Su Monster*, and the insect like *Thri-Kreen* to the 3rd edition rules. The material is done in pdf format, and follows the standard format for printed materials. It can be found online at http://www.wizards.com/dnd/files/Psionics_enhance.pdf. But if you're only interested in picking the *Psionic Handbook* apart for the feats, magic items, and monsters, you might not be getting your money's worth.

-- Joe G. Kushner

Budget Battlefield

Published by [MicroTactix](#)

Designed by Greg Poehlein

Illustrated by Gary M. Williams

Rules, figures, and two scenarios in six Adobe Acrobat files and four TIFF files; \$9.00

Every once in awhile, an idea comes along that causes the gaming world to smack itself on its collective forehead and ask, "Why didn't we think of that?"

MicroTactix' latest offering, *Budget Battlefield*, is just such an idea. This miniature war game replaces traditional lead and plastic figures with triangular cardboard figures in electronic files, allowing players to print as many as needed to compose an army. Simply cut out the figures, glue them to cardboard bases, and it's clobberin' time. In addition, *Budget Battlefield* is fully integrated with MicroTactix' *Simply Roleplaying* and *Compact Combat* games, allowing players to use the same characters in three different types of games.

The rules set is streamlined to about thirty pages that cover science fiction and fantasy battles. The system is so flexible that the hostilities are balanced even if players decide that the undead hordes need to invade Saturn Outpost Alpha. The rules support virtually any size battle, from skirmishes of 50 figures to epics of 200 figures.

Gamers can purchase *Budget Battlefield* at the MicroTactix World Wide Web site using a secure credit card transaction. For nine dollars, they get a compressed ZIP file containing Adobe Acrobat files for the cover art, four army lists (two science fiction and two fantasy), a 31-page rulebook, a set of quick reference sheets, and fifteen pages worth of army figures, scenery, and vehicles. The figures are repeated in four TIFF files for those who wish to work with them in a graphics program. The ZIP software and Adobe Acrobat software are both available either free or as shareware at the software manufacturers' web sites.

After downloading, printing, and assembling the necessary figures, players are ready for mayhem. The game includes two scenarios. The first is a large fantasy battle between the Royal Army and Undead Army with a few forests and mausoleums. The second is a science fiction skirmish between the Planetary Army and Mercenary Army with optional grav platform mortars and armored cars. Army size is controlled by the Cost of every figure or vehicle. Players agree on a total number of points before a battle and spend these points buying figures. The more powerful a figure, the more it costs.

Players will also need to keep their Troop Cards handy. A Troop Card contains all of the statistics for a type of figure. Every type of figure has a Move allowance in inches, Hit Factor that shows how much damage he can take before dying, Morale rank that describes his susceptibility to panic, and Attack table which allows a single, ten-sided die roll to determine his success in combat. Players need only one Troop card for each type of figure they are using.

The turn sequence is somewhat familiar to experienced war gamers. Each army rolls for initiative. The loser moves their entire army, then the winner moves their entire army. This can make for some long turns depending on the size of the armies, but this is a common complaint about war gaming and not particular to *Budget Battlefield*.

Figures do not move entirely independently. At the beginning of the game, players assemble their figures into Units, which is a group of at least two of the same type of figure. Every figure in a Unit must end their movement within one

inch of at least one other member of their Unit. Thus, a unit can move in single file, in a block, or any other shape as long as each figure remains part of that Unit. Like most war games, the terrain around the figures may slow them down or stop them.

Next, the player with initiative attacks. Miniatures whose bases are touching may engage in melee combat and figures armed with ranged weapons may fire at distances prescribed on their Troop Cards. In either case, combat resolution is quick and efficient. A ten-sided die roll tells how much damage an attacker does. If this damage equals or exceeds the defender's Hit Factor, as listed on the Troop Card, then the defender is dead. The player that lost initiative attacks second, but because *Budget Battlefield* considers combat to be simultaneous, even those figures already killed get a parting shot.

A roll of ten is a Critical Hit which allows another roll for additional damage. Additional tens keep adding to the total damage. Thus, even a weak skeleton has some chance to kill a powerful member of the Planetary Army.

Any figure that did not attack on this turn gets a second movement phase. This allows the archers to hang back and fire while the melee fighters close rapidly.

Finally, players remove all of the casualties and check to see if a Unit has failed morale. A number of factors affect morale, but essentially any Unit that lost a fourth of its number may be paralyzed by fear or even run screaming for their mothers.

While most of the figures on the field have very simple abilities, a few are more complicated. Commanders are those figures that are able to split apart and reform Units and who give nearby Units a bonus on their morale checks. Heroes are those truly spectacular characters that can destroy multiple figures with a single attack and have actual hit points, meaning an opponent must damage them multiple times before they take a dirt nap.

Gamers who enjoy the aesthetics of painted miniatures and realistic scenery are not left out. Obviously, players can replace the cardboard figures with three dimensional miniatures of their choice. Even more interesting, though, *Budget Battlefield* provides all of the rules necessary to give any miniature *Budget Battlefield* statistics. Players can create new types of troops borrowing figures from any other game.

Budget Battlefield is not without its faults. These are the first version of the rules, and the MicroTactix Forum already has a correction to the turn sequence. Gary Williams' art is often good, but sometimes fails to make the different types of units distinguishable at a glance. For example, the Royal Army Commander can be tough to find if he is on foot in a group of regular militia. Finally, there is a notable absence of magic in *Budget Battlefield*. There are no fireballs, speed potions, or healing arts for the fantasy characters. The science fiction characters get grenades and vehicles, but the system leaves considerable room for this kind of flavor. Perhaps MicroTactix will consider a supplement when *Budget Battlefield* receives the success it deserves.

-- Brad Weier

Frog-Boiling For Fun And Profit: Adding Conspiracy To Your Game

"If thou be'st not immortal, look about you: security gives way to conspiracy. The mighty gods defend thee!"
-- William Shakespeare, *Julius Caesar*, II:iii:4-5

They say that They boil frogs. Or, rather, Those who say things about Them say that They (Them, not Those) boil frogs. If this is the kind of thing you want your players to say, or if it's the kind of thing you want to say to your players, you want to run a conspiracy game. To do that, you'll want to boil your players like They (Them, not your players) boil frogs, in a bubbling broth of pronouns and all-concealing steam. Cooking directions follow -- so hop on in, the water's fine!

"That was nothing. But, that's how it always begins . . . very small."
-- Egg Shen (Victor Wong), *Big Trouble in Little China*

All that batrachian business is by way of analogy. If you want to cook a frog, you put him in a pot of warm water and turn up the heat a little bit at a time. The frog, who would hop out of the pot if you just tossed him right into boiling water, will placidly sit still and simmer to death as the heat increases by slow degrees. The parallel case in game design is the slow introduction of little elements, hints, connections, and so forth. By the time the characters notice How It All Fits Together, they're well and truly cooked. (A somewhat important note: Players aren't frogs. If the players keep hopping out of the water when it gets too warm, they don't want to play a conspiracy game. You can't make them, so don't try.) The "slow and sneaky" conspiracy game becomes a conspiracy game gradually, one piece at a time.

In general, then, start small and work up. Even if you've announced it's a conspiracy game already, this approach reflects the standard tropes of the genre. In addition to the usual missing documents, mysterious strangers, peculiar letters, odd graffiti, etc., the GM adding conspiracy to her game should connect in-game elements in inobvious ways. Have one character's contact in the ONI refer to another character's adopted brother. Plant clues at the scene of the burglary recalling an earlier murder the players thought was solved. In general, reach across [characters](#) or across "story arcs" for the sense of impending connections. In some games, this will just look like adding depth to the setting. Once you've spun a web that can withstand it, start putting in slightly bigger signs -- a black helicopter overhead, a significant tattoo on a "random mugger" or "wandering monster," or any of the rest of the [Conspiratorial Alphabet](#).

"All I know is that this Lo Pan character comes out of thin air in the middle of a goddamn alley while his buddies are flying around on wires cutting everybody to shreds while he just STANDS there waiting for me to drive my truck straight through him with LIGHT coming out of his mouth!"
-- Jack Burton (Kurt Russell), *Big Trouble in Little China*

Or, of course, you can just crash a flying saucer in their backyard. This "expanded scope" [nova](#) technique works well if you want to unmistakably "announce" the sudden irruption of conspiracy into the game. If the players seem to object, go ahead and Scully it with some plausible explanation. In a "straight" espionage game, the UFO was an experimental aircraft. In a "straight" historical game, the document is forged, or the eyewitness is crazy, or both. If, on the other hand, they react with wide-eyed avidity and drooling glee, they've signed on for the boiling -- and you can have Operation Moondust steal their UFO wreckage, or the Inquisition arrest their informant, or a fire destroy the evidence. Now, the characters want to find out what's going on -- and, ideally, so do the players. You expanded the scope of the game by flicking the lights on and showing them a glimpse of the Truth. Then you turned out the lights and contracted the scope again, but the Truth remains Out There, an afterimage in the darkness. You can go back to building things up by tiny increments, only this time the players eagerly add every tidbit to their mosaic, trying to fit the puzzle pieces you dole out into that one vision of the Truth they had before you hid it from them. Players will often work harder to uncover the Conspiracy if they have some notion of what it's conspiring to conceal -- and once they're sure the Air Force is working for MJ-12 to conceal alien infiltration, you can throw another Big Revelation at the players ("the aliens are invading because they're fighting the Freemasons") and jump-start to the next level.

*"O conspiracy!
Sham'st thou to show thy dangerous brow by night,
When evils are most free? O! Then by day
Where wilt thou find a cavern dark enough
To mask thy monstrous visage? Seek none, conspiracy;
Hide it in smiles and affability ..."*
-- William Shakespeare, *Julius Caesar*, II:i:86-90

So when should you put in conspiracies? In the Obvious Case, where you said "I'm running a *GURPS Illuminati* game," the answer may be "right away," or you may boil the frog slowly as normal, albeit with its consent. Players may also request added elements of conspiracy in an ongoing game, either out of game ("It would be cool if you put conspiracies into the game.") or in-game ("My character suspects that the Black Dragon Society is behind this seemingly-unrelated string of murders.") The GM may suddenly decide to add conspiracies either to spice up a game that's gotten a little predictable, to explain a game that's gotten bizarrely tangled, or to scratch an Illuminated itch.

Like most elements of worldbuilding, conspiracies normally begin with the GM deciding to put them in. For the creative, "think-on-the-fly" GM, this can be as simple as: "There's definitely something behind this, and I'll figure it out later." Other GMs start big ("The Greys and the Cabal are behind everything") and fill in the middle levels on an ad hoc basis. Still others follow the "Boskone model" where little conspiracies lead to bigger ones, which lead to global ones, which lead to global, millennia-spanning ones, which lead to global, millennia-spanning, pandimensional ones, which lead to ... The Boskone Model is one direction you can take the "expanded scope" game, or you can go "sideways" -- each conspiracy may not lead to a bigger one behind it, but (say) to a different one opposing it. The GM may either have worked all of this out in advance, or she may fill in each layer of the onion in only as the characters solve the previous one.

*"There's a spy in the sky
There's a noise on the wire
There's a tap on the line
For every paranoid's desire"*
-- Bob Geldof, "Someone's Looking At You"

Like many Secrets What Is Hid From Players, a courageous GM can easily pick the coolest-sounding player theory and make it retroactively true (or mostly true) ten minutes after the players bring it up. Let's say that the GM wants to subtly turn her Air Adventure game into a conspiracy game. She starts by dropping hints into ongoing adventures: a drunk in the bar babbles about a "guy in a silver shirt," a newsreel says that a World War Two ace died in a plane crash, Admiral Byrd tours the air base, a mysterious heart attack grounds the blonde PC's rival. One or two mysterious "You don't know what's going on, get out while you can" type meetings with a trench-coated AFOSI type, and the players are all a-tizzy. Then, she sets the hook -- a test pilot's jet lands, completely empty, with snow in the cockpit interior. The GM thinks she's set up the [Antarctic Space Nazis](#) pretty well, a "Silver Shirt" fascist agitator seen nearby, an anti-Nazi killed, an Antarctic explorer shows up on mysterious business, a true Aryan granted a favor, and then the snow indicating a midair kidnapping by someone with snowy jackboots! The players, meanwhile, are buffaloed -- until one of them says something like: "I've got it! It's Shangri-La! The Lemurians wear silver robes, their pacifist ideology made them kill the famous warrior ace, Admiral Byrd knows the secret of the hollow earth, the heart attack was their psionic powers at work, and the snow is from the top of [Mount Shasta](#)." That's so much cooler (and, more importantly, the players are charged up about it and on target for it) that our GM might very well change horses in midstream; the Conspirators gain an eye and move underground. If she wants to work the Nazis in, she can expand the scope when the PCs find a giant emerald statue of Hitler in the Tibetan monastery -- now the players know the Nazis have to be involved somehow, and they'll set themselves to looking for those clues.

"The imaginary vastness and strangeness of the plot distracted people's understandings, and subverted every reason for reciprocal confidence. Besides ambition and cupidity, which were at first supposed to be the motives of the poisoners, they fancied, they even believed at length, that there was something of diabolical, voluptuous delight in this anointing -- an attraction predominating over the will. The ravings of the sick, who accused themselves of what they had apprehended from others, were considered as revelations, and rendered anything, so to say, credible of any one."

-- Alessandro Manzoni, *The Betrothed* (1827)

The attraction of the conspiracy will depend, of course, on the coolness of the GM's idea, and on the players' desires. Some players demand only grim and gritty conspiracies; CIA Cubans killed Kennedy, and Exxon triggered the Gulf War. Some players demand only big magical conspiracies; John Dee and the court of Faerie are behind the UFO phenomenon, and the Greys killed Kennedy with a microwave beam from orbit. "Realism" in conspiracy gaming is much like "realism" in magic or fantasy; a matter of taste, not of fact. That said, it may suit in-game realism to have a conspiracy "guest star" and vanish. Let's say that in one *GURPS Old West* scenario, wherein the PCs meet John Wilkes Booth living under an assumed name in Tombstone, they discover that the Egyptian Freemasons killed Lincoln. They then go back to gunfights and Indian raids for the rest of the campaign. On the other hand, game tone may require a villain who can take a larger role, but can be defeated rather than take over the game. In that model, the PCs decide to travel back East, and after a few adventures, eventually go to England and, in a guns-blazing climax, deal out a little frontier justice to the Grand Lodge of Luxor-in-London. If the players still have their conspiracy jones, the GM can always crash a UFO on them when they get back to the good old New Mexico Territory, and we're off again in a cloud of dust and frog-flavored steam.

Murphy's Rules

Murphy's Rules

When Is Gaming Like A Cocktail Party?

This week I heard someone say something that made me think. (Well, okay . . . I think I read it in my email. But let's not get technical now.) Basically, it pointed out that roleplaying sessions also doubled as socialization opportunities for most groups, with a 50/50 split between gab time and actual gaming being fairly common. It pointed out that gaming groups, for many folks, were not unlike cocktail parties, with folks gathering over dice and character sheets instead of little blocks of cheese and glasses of wine.

Now, this struck me as interesting, because I know that staying "on-topic" with my groups has always been something of a problem. We'd often get together, goof around, game a bit, get snacks, chat, game, prepare dinner, chat, game, finish up the game, chat, then go home.

And we'd all have a great time.

I mention this because one of the things I've heard from some gamers is how they're upset that they can't get their group to stay on-topic, with too many quotes from Monty Python, too many memories of previous games, and too many discussions of *Babylon 5* creeping into the games. Now, having given the matter some thought this week, I've come to the conclusive question: What's wrong with chatting?

I mean, if everyone is playing (say) *Monopoly*, I presume it's okay to chat about things other than Keynesian economics. Chatting in and out of game is a cornerstone for games like *INWO*. And the insane ramblings inherent in most games of *Talisman* usually make the evening for me. ("Oh, no! I've been cursed by the Witch *and* the Devil . . . now I'm an *EVIL* toad!!!")

I suspect, in fact, that this *lack* of chatting is one of the things that has made it difficult for me to engage in many of the "alternative" gaming possibilities. Some of my friends play by email, but it seems less immediate and too soulless for me; I *like* being able to babble about how someone in a movie dealt with a situation that was similar to this one . . . only that solution wouldn't possibly work here. I think it's great when a player says, "It's been an awful week," and so the GM adds more ninjas to the adventure for stress-relieving carnage.

Of course, I also completely understand that we *are* there to roleplay, and a certain amount of on-topic time is required. I remember when one of my GM friends was having a hard time getting one player to stay focussed, since he kept insisting on wisecracking. After giving the player several warnings one session -- and then hearing one aside more -- the GM finally said, "Okay; your character actually said that, and the town is furious. In fact, it looks like they might call the slavers over to deal with you." And so the party needed to escape quickly out of town.

While I'm not sure I'd ever do that as a GM, I can definitely see the point. (Of course, I've never been in a situation where I've needed to do anything that drastic . . .)

In all, I tend to view my gaming sessions more like movies than cocktail parties. Some movies you talk about before, like *Star Wars: Episode I*. Some movies you talk about after, like *Fight Club*. And some movies you can't help but comment **during**, ala *Mystery Science Theatre 3000*. But talking during a movie that should be riveting? That's just tacky.

Regardless, I do believe that, whether its cocktail parties or movies or roleplaying games, they're all good excuses for gathering with friends and associates. And as long as everyone is having fun, who *cares* how on-topic or not everyone is?

* * *

I had a few folks asking about how to rate last week's Random Thought Table column. Well, if you log into the column, then scroll down (without going to the CGI script page that plugs in your answers), you'll see the "normal" rating menu at the end. (Such are the difficulties when you do something completely oddball with a column.)

Of course, you could also go to our [ratings page](#), if you were so inclined.

-- *Steven Marsh*

* * *

(Last week's answer) Yeah, right . . . Though if you got more than 20, pat yourself on the back.

(Four stars) "HEY!! DANYA! You said you wouldn't read this. Put it down girl!"

A Fist Full of Tunes You Can Whistle

A Scenario Location for GURPS Discworld

by Phil Masters

*(Note: This article originally appeared in **Visions Magazine**, issue 1, in May 1999.)*

Introduction

The Discworld is a big place, with all sorts of locations to be found -- and all sorts of stories happening. There is even room for narratives involving taciturn men with weapons, a hot, dry climate, a certain amount of posing in broad-brimmed hats (masks optional), and inadvisable amounts of smoking.

Oh, and tunes you can whistle.

This location for scenarios uses an area of the Disc with the right sort of climate as a location for such stories. (Actually, what few hints appear in the books suggest that Brindisi is more Italianate than Mexican -- but spaghetti is certainly popular there.) All you need to do now is get your PCs off to that part of the world, and get them talking slow.

*Note: This setting is **not** an "official" part of the Discworld, although it's not too inconsistent with stuff that has appeared in the novels. All sorts of stories fit on the Disc without too much trouble, and if you want to drop a specific set of clichés into a [GURPS Discworld](#) game, all you have to do is decide where they happen, and how the Disc distorts the familiar themes. This article can be taken as a demonstration of the technique.*

The Region: Backwoods Brindisi

Somewhere between Klatchistan and Genua, far enough to Rimwards to get unpleasantly warm but not near enough to the sea to get much rain, the land is a parched waste that somehow, just about, supports ranch-style farming and a bit of other miscellaneous food production. (Beans, mostly.) There's also enough minerals to support a mining industry. (Gold turns up sporadically, usually leading to trouble.) Towns are few and far between here, and any government is spread so thin as to be transparent; the resulting society is one where men can be men and dwarfs can be dwarfs. In other words, the mortality rate due to violence is appalling.

Although this region is technologically almost as advanced as Ankh- Morpork, in an impoverished sort of way, the basic social pattern is feudal. Not, you understand, that you'll find many knights and barons; rather, any local bigshot who has enough heavies, cash, and macho pose can claim to be the boss of his area. (Or hers; on this part of the Disc, "Being In Charge" is almost an equal-opportunities profession, although raw muscle can be a crucial advantage.) The law is supposedly laid down in some royal court off in the more refined coastal towns, and is enforced by local sheriffs and the occasional touring judge, but all these types of lawmen are generally in the pockets of local bosses.

But none of this really defines the region. For that, you need to look at the heat. And the flies. Given these conditions, the local peasantry has developed a taste for broad-brimmed sombreros and big ponchos, under which they can catch a lot of siestas. They aren't so much lazy as sensibly comatose. Being poor, they only seem to shave every three or four days, and many have big moustaches.

Visiting?

This is, in many senses, classic mercenary-adventurer territory, if you can stand the heat. But visitors should be

warned; it's advisable to stay on the right side of the local bosses, who have numbers in their favour. This would be fine, except that many local bosses don't seem to *have* a right side. Best to keep riding on, trying to stay out of trouble . . .

Other visitors might include performance artists offered wonderful deals by agents who don't tell them that the new theatre or opera house is being built in the middle of nowhere by a raving lunatic, and isn't finished yet. Then there's the commercial opportunities; this is certainly classic snake-oil-salesman country. Likewise, rather low-grade gamblers are not exactly infrequent in these parts. And tourists might be persuaded of the region's unspoilt ethnic charm and colourful tradition of poncho-making.

The Village of Mallo Burro

Mallo Burro might be considered a classic backwoods-Brindisi village, albeit with a few more causes of trouble than most. It's near enough to main travel routes for wandering PCs to hear about it or even blunder through by chance, remote enough for the local problems to fester. One road -- well, a broad, dusty trail -- passes through, and local ranches and bean-patches support a population of a few hundred, a cantina, a blacksmith and a general store. (Oh, and a witch, of course.) Traders bring carts through every couple of weeks, trading anything that can't be made locally (including limes for the bar) for whatever can; they rarely stop long.

The village itself is dominated by one family, the Varozags. However, there is also a dwarf-run goldmine not far out of town, and the dwarfs somehow just don't get on with the Varozags. Furthermore, neither faction is excessively popular with the local peasantry, and all sorts of other trouble sometimes flares up.

Local Geography

Mallo Burro is strung out along the single road that passes through, with few buildings more than a few yards back; whenever anyone sites a new house or shop, there's usually nothing to stop them adding it to either end of the village, and few people, even in these parts, want a location with a view of the midden or junk-heap behind someone else's place. Take a left or right off the road and between two buildings, and you're soon in the wilderness.

North of the village, the land rises into an unremarkable but determinedly rocky set of mountains, and a poor trail leads up this way to the dwarf-mine. Travellers will need to cover slightly more than three miles of increasingly poor terrain; most will want to ride a mule. The mine entrance itself is marked by a plain "gateway" of rough but solid timbers, and there's usually a couple of dwarfs around with axes and picks to greet any visitors (usually by telling them to go away).

South-west of the village, and less than half a mile away, one finds a mesa -- a steep-sided lump of volcanic rock sticking up out of the desert, with a flat top a few hundred yards across. The mesa dominates the village visually, but few people find much reason to climb up it; nothing much grows here. Thus, the locals tend to forget that there is in fact a structure of sorts up there; an old circle of granite slabs, somewhat worn down by wind-blown sand but still all standing. Their history and purpose are effectively forgotten, although some older peasants may be able to say something.

Incidentally, the landscape in these parts is dotted with cacti. One species contains a sour-sweet pulp that can be fermented and then distilled to produce a drink. (It has to be a drink; the Disc doesn't have much use for battery acid in its present state of technology. Most local peasants prefer beer, which may or may not have a slice of lime stuck in the neck of the bottle.)

The Varozag Clan and the Dwarfs

Mallo Burro's ruling family are the Varozags; in full, the family name is "de Varozag de La Lala." They occupy a rather grand three-storey house at one end of the village, usually emerging in groups of two or three family members

and about as many servants and hangers-on, to supervise their cattle ranch and push the peons around. The head of the clan, Don Dominguito de Varozag de La Lala, is said to be in his late sixties, and to be a huge bull of a man with a really impressive moustache, a will of iron, a foul temper, and a vast capacity for alcohol. However, hardly anyone knows for sure, as he hasn't been seen by anyone outside the family (apart from one fanatically loyal serving-woman) for decades. He supposedly holes up at the top of his house, issuing peremptory commands to his relatives. Some cynical local peasants secretly think that he has been dead for years, and that "Don Dominguito orders it!" has become the family's all-purpose excuse for some increasingly eccentric and sometimes vicious policies.

The truth behind these whispers is left to the GM to determine; an encounter with Don Dominguito (live -- or stuffed, as a few peasants suspect) should come as the confused climax of a long scenario. However, the Varozags do actually have one big secret that *no-one* suspects; a dash of elf-blood in their ancestry.

The story behind this is forgotten, and the genes are now thinned out enough that the only signs are that family members are pale by Brindisian standards, with a slight tendency to pointed ears, good looks, and fashion sense -- and sometimes, a definite streak of inventive cruelty. The Varozags all wear dashing-but-baggy clothes (often silk) and stylish broad-brimmed hats (*not* sombreros) which they pull down low. They usually marry members of other noble families, many with similar secrets, who they meet on infrequent trips to larger towns; those who marry into the family are chosen for their similar attitudes and manners, and soon fit in. However, the Varozags do sometimes emit an unintended, indefinable aura, which certain others may unconsciously notice over the years.

This is one reason why the family doesn't get on with the dwarfs who moved into the local mountains about fifty years ago, when a decent vein of gold showed up. Another is simply that the family wants to control everything in this area, and the dwarfs don't want to be controlled. A third is that these dwarfs are surly even by their species' standards -- something to do with wearing chainmail and metal helmets day and night in a desert climate -- and don't get on with anyone much. From the peasants' point of view, at least a Varozag will acknowledge your existence, even if they make it clear that you exist only to clean their boots; they rather like attention. The dwarfs, by contrast, rarely talk to anyone they aren't buying from or selling to.

The "king" of the mine, Norrin Nuggetsbane, is a walking definition of words like "dour" and "monosyllabic," but he is also a competent tactician and a very effective long-term planner; actually, the biggest problem is that his plans are often a century out of date by the time they come to a head. He is currently working to persuade traders to come direct to the mine, so that he doesn't have to send his people down to the village to buy supplies; his eventual idea is to cut the Varozags' ranch off from outside business. He simply doesn't care what this will do to Mallo Burro.

For a typical member of the Varozag family, use ST 10, DX 12 (or higher), IQ 10, HT 10, and skill around 12-16 in various refined weapons. Their loyal thugs are about ST 14, DX 11, IQ 9, HT 11, with skills of about 12-14 in Brawling and Axe/Mace. Dwarf miners mostly have their racial package plus a point or two of extra ST or HT, Axe/Mace-15, and decent levels in mining-related skills. Obviously, individual members of any of these groups may vary somewhat.

Local Characters

Ninairara, "La Bruja"

ST 9, DX 11, IQ 14, HT 12

Advantages: Fully Literate, Magery +2, Reputation (+2 in Mallo Burro), Status +1.

Disadvantages: Hunchback, Overweight, Sense of Duty (All Peasants), Struggling Wealth, Truthfulness.

Quirks: Dislikes spiders, Loud laugh, Nosy about people, Thinks that colourful ponchos are really *cool*.

Skills: Animal Handling-11, Area Knowledge (Mallo Burro)-14, Brawling-12, Cooking-14, Fast-Talk-16, Naturalist-14, Physician-15, Psychology-14, Savoir-Faire (Backwoods Brindisi)-16, Shouting at Foreigners-14, Veterinary-14.

Languages: Brindisian (native)-14, Ankhian-12.

Spells: Beast-Soother-15, Borrowing-14, Englebert's Enhancer-15, Find Weakness-14, Foolishness-16, Lend Strength-17, Morphic Tweaking-20, Persuasion-16, Purify Water-15, Seek Water-14, Sense Emotion-14, Sense Foes-14, Sense Life-14.

Mallo Burro's resident witch is relatively youthful and inexperienced, but is a typically determined member of her profession. In these parts, that profession requires her to wear a big patterned sombrero with a pointy tip; given her build, hunched back, and taste for garish ponchos, she cuts an unmistakable figure.

Although she is not violent or malicious, she doesn't like taking backchat from anyone, and she is rather unsubtle by witch standards. She knows something of Borrowing, but she is not especially good at it; she secretly slightly enjoys using Morphic Tweaking, usually turning annoying people into small sand-lizards. In any encounter with PCs, she is likely to size them up and then do whatever is necessary to protect her village from the worst of any trouble. She can be a helpful ally, if approached carefully, for her medical skills if nothing else.

Don Gavaroz de Varozag de la Lala, "El Aguila del Cubo"

ST 11, DX 16, IQ 10, HT 11

Advantages: Attractive Appearance, Ambidexterity, Fully Literate, Status +2.

Disadvantages: Delusion ("My identity is secret, thanks to this mask"), Gentleman's Code of Honour, Impulsiveness, Secret (Elf- Kin), Trademark: Initial-Carving ("DGDVDLLEADC").

Quirks: Always wears black, Flamboyant swashbuckler, Keeps trying to carve his initials in combat, Likes the admiration of the lower classes, Prone to sunburn (wears a broad-brimmed hat and baggy shirt for protection).

Skills: Acrobatics-14, Brawling-15, Climbing-15, Dancing-15, Fast-Talk-8, Fencing-18, Jumping-15, Knife-16, Riding (Horse)-15, Running-10, Savoir-Faire (Brindisi)-12, Stealth-16, Whip-15.

Languages: Brindisian (native)-10, Ankhian-8.

The black (or perhaps white) sheep of the Varozag family is a younger son, whose idea of a way to spend his time is to dress up in black silk, a broad-brimmed hat (pulled low), and a nifty little black eye-mask, swagger around the area with a fencing sabre and a whip, and declare himself the protector of the local peasants. Sometimes, he actually does some good; the shrewder peasants are beginning to realise that if their more fetching daughters make eyes at him a bit, he'll do almost anything they ask, and there isn't even any serious immediate risk to the girls' virtue. The purpose of the eye-mask is a mystery; Don Gavaroz announces his identity whenever a dramatic scene seems called for, and keeps trying to carve his initials, including on opponents. (He rarely gets beyond "DG," and in any case a victim would surely pass out from loss of blood before he finished the job -- and Don Gavaroz is not a sadist, and stops when a victim is down -- but he doesn't stop hoping. There are rules for combat initial-carving in *GURPS Swashbucklers*, or just improvise some cumulative minuses to hit.)

Gavaroz should represent a loose cannon in events around Mallo Burro. His family think that he's going through a temporary phase; they won't kill him if he gets in the way of their plans, which happens (Gavaroz liking to think of himself as a rebel), but they'll certainly contrive to have him hit on the head and locked up for a month or six if necessary. They know how fast he is with that blade, and will allow for it.

The Dwarf With No Name

ST 13, DX 14, IQ 10, HT 13

(Attributes include bonuses from racial package.)

Advantages: Dwarf Package (with Dwarfish Greed), Combat Reflexes, Disease-Resistance.

Disadvantages: Addiction (Chain-Smoker), Code of Honour (Stays Bought), Odious Personal Habit (Very Laconic: -1 reactions), Stubbornness.

Quirks: Likes to play sides off against each other, Smokes thin cigars, Squints a lot, Wears a poncho *everywhere* (including bed).

Skills: Axe/Mace-14, Blacksmith-13, Brawling-15, Crossbow- 16, Fast-Draw (Arrow)-15, Fast-Draw (Knife)-15, Knife Throwing-15, Metallurgy-9, Prospecting-10, Riding (Mule)-12, Tactics-9.

(Skills include bonuses from Dwarf racial package and Combat Reflexes.)

Languages: Dwarfish (native)-10, Ankhian-9, Brindisian-8.

This dwarfish wanderer is *almost* as much of a poseur as Don Gavaroz, but more calculating and self-centred. He has nothing to do with the dwarfs up in the mountains; he just wandered into Mallo Burro recently, recognised this as a situation with potential, and decided to stay a while. However, he doesn't bother explaining himself, so there's a fair bit of speculation about his motives.

In fact, they're painfully simple. He has long since learned that some people -- humans and dwarfs -- will pay gold for combat skills. This suits him fine; he has a fairly low regard for life (aside from his own), although he's happy to be paid just to look threatening. But he's found that more gold tends to come available if there's actual fighting, so he encourages it. He's not very good at manipulating people yet, but he's learning; he'll certainly never tell anyone anything that might reduce a conflict. His dwarfish racial loyalty is low, although he would probably slightly favour his own kind if it didn't cost him anything.

He wears plain clothes and a poncho, which can conceal both his bronze breastplate and how heavily armed he is, to a casual glance; he also has a metal helmet (with a flat brim to shade his eyes). He carries a pistol crossbow (ST 5, 1d-3 impaling, SS 10, Acc 3), half-a- dozen daggers, and a couple of hatchets. If he makes a Fast-Draw roll, he can fire the crossbow every three rounds, but it doesn't do a lot of damage; in a fight, he mostly stands his ground, fires off one or two bolts, follows up with some fast-drawn throwing daggers, then wades in with a hatchet. (In melee, he's strong enough not to have to ready that between blows.)

Pedro the Undertaker

Mallo Burro's funeral director is also the village's chief carpenter and a general odd-job man; a village of this size doesn't usually see *very* many funerals. Pedro, however, has decided to do something about that, and he has little regard for human life and an instinct for trouble-making. If he's around and either a Varozag or a dwarf should say something about the other faction, he'll repeat it -- provided that it is, or can be twisted to sound, bad. However, he's also good at playing the humble peasant who doesn't understand what he's repeating, and at offering to make himself "useful." He's now looking at bigger schemes for encouraging open warfare around Mallo Burro, and he has become sort-of-friendly with The Dwarf With No Name.

He has IQ 12 and 10 in other attributes, along with Acting-14, Carpentry-14, Diplomacy-11, Fast-Talk-11, Professional Skill (Undertaker)-13, and Scrounging-12.

Jose the Barman

Quite likely the first resident of Mallo Burro who PCs will talk to is the proprietor and sole full-time staff of "*El Barra Donde La Gente Habla Lentamente*" -- the village bar (and its nearest thing to a hotel). Jose knows exactly how his job should be performed, and being slightly crazy is part of the image. Whenever a PC enters his establishment, he will be behind the bar, moving smears around with a dishcloth; he will look up, look back at a glass, look up again,

and loudly ask "What you want, gringo?"

Whatever they answer, he will announce loudly to the bar (even if it's empty); "Ha -- he say he wanna beer" (or whatever). Then he will lean conspiratorially across the bar, look at them slightly sideways, and ask loudly, "You wanna slice a *lime* in that?"

Again, whatever they answer, he will announce. ("He wanna slice of lime in it!"/"He no wanna slice of lime!") He can keep this up for hours. He's not worried what or how much customers drink -- he sells enough beers to the peasants to cover his costs -- but he is convinced that everyone should want to drink their chosen tippie straight out of the bottle, with a slice of lime jammed in the neck. Telling him that this is way out of date, or stupid, makes no difference; he will always offer. ("Ha! He say it stoopeed to hava slice a lime in it . . . ")

Jose is basically a normal, average character, but he does have an uncanny knack for diving behind his bar the moment trouble starts; as the place is actually full of secret escape-hatches and hiding- places, his survivability is good. (Really smart PCs may spot this, and extract his secrets from him for use in emergencies -- but this will take work. "You wanna secret door? You wanna slice a *lime* in it, maybe?") Treat him as having Combat Reflexes and Extraordinary Luck, along with full Literacy and the skills Bartender-16 and Stealth-15.

His bar is a classic western saloon/cantina, with double swing doors, adequate spittoons, and more bottles than should be economically viable.

Scenario Ideas

Getting to Mallo Burro

GMs can arbitrarily start PCs off in this location if they wish -- well, it'd be polite to tell the players something about it before they start generating characters -- but it's also possible to bring a pre-existing group to Mallo Burro. Reasons why PCs might be in this general area have already been discussed; Mallo Burro isn't so remote that getting them *here*, specifically, should be hard.

If the PCs are a traditional pack of hard-bitten adventurers -- dubious thugs who'd do most things for money -- it can be easy; they're hired. Who by, is a matter of taste; the Varozags are obvious candidates, especially if they decide to do something serious about those dwarfs. On the other hand, a more *traditional* option would be to have this assortment of mismatched combat merchants hired by the villagers, perhaps to deal with trouble from the Varozags, or to fend off bandits who the Varozags are just ignoring. The set-up should, of course, be run as a parody of those early scenes in *The Magnificent Seven*, if at all possible. But remember that this is the Discworld; the villagers know the unwritten rules at least as well as the players, and while they will play a certain amount by the book ("We are a poor veeleej, Senor . . . "), especially when it gives them a moral advantage over the PCs ("There no seven hof you? Seven ees traditional"), they want to avoid the worst stuff. Ninairara is likely to produce a *written* contract for them to sign, which will include a clause about not leading impressionable young villagers to dream of life as freelance mercenaries. Oh, and it will also specify, in the small print, that anyone who doesn't survive the job certainly doesn't get paid; if anyone spots that and asks, well, "If you get kill, gringo, you no much good at your job, hey?"

If the PCs are a bit less stereotyped, however, you'll probably have to work out a customised plot. (If they're *very* strange, you'll be used to that.) Hint at gold in the mountains. Link them up with a merchant who works this area. Get them jobs as touring freelance law enforcers for the Brindisian government. Have artistically-talented PCs hired by the Varozags to bring a bit of culture to the region. (The Varozags aren't totally sane, and are quite capable of deciding to build themselves an opera house.) Tell them they've inherited a ranch (actually ten thousand acres of tumbleweed) . . .

Of course, one small problem with this region is that troll PCs are fairly useless here, given the heat. If you *have* to bring such to Mallo Burro, have them master the fine art of taking siestas during the day (and they can wear some pretty impressive ponchos and sombreros), and let them lumber round at modest efficiency in the night.

The Dwarf in the Middle

The basic plot involving The Dwarf With No Name is, of course, highly derivative. (Sergio Leone borrowed it from a Japanese movie.) Thanks to some gentle prodding, tensions in Mallo Burro warm up from simmer to fast boil.

The PCs can either be hired, or persuaded by appeals to their better natures, to protect the villagers from collateral damage. Alternatively, they can be employed by the Varozags or the dwarfs to fight in their war; if they have any traces of conscience, they should eventually realise that they are mixed up in a futile and messy struggle. Unfortunately, trying to calm things down by appeals to reason will achieve little; each side *wants* to fight, and has heard vague rumours that the other has been saying some nasty things. Furthermore, whichever side has currently hired The Dwarf is finding him invaluable -- and his monosyllabic suggestions won't involve the word "peace."

Mallo Burro is full of swaggering thugs hired by the Varozags; *El Barra* is being smashed up so often that Jose's ingenuity and savings are taking a battering, he's almost run out of limes, and a lot of peasants are being maltreated. Don Gavaroz is actually doing some good, for once, which means that his family will soon catch him and lock him away for the duration; if the PCs need some extra skills and combat capability, getting him free could be a smart idea.

The dwarfs are less blatantly troublesome -- at first. However, they are *planning*. Specifically, they are building a set of siege engines that could punch holes through a mountain. If and when these are deployed, they will be aimed at the Varozag mansion; unfortunately, their operators will regard other human buildings that lie in the way as expendable. A climactic scene should probably involve sabotage and its spectacular consequences, if possible.

Grey Import

The stone circle up on the mesa is more than just a natural formation. And late one morning, someone shows up who can do something with it. A mule shambles into town carrying a scrawny, absent-minded young man in what appears to be a white night-shirt.

This is Dafydd, a Llamedosian programmer. He found references to some early Strict Druidic missionary efforts in some dusty records, deduced the probable existence of this legacy system, and guessed that it can be re-booted and upgraded to modern standards. And its power is sufficient to control the weather, as well as predicting astronomical events. (Throw in some double-talk about butterflies and quantum, if anyone asks him to explain.)

When they have worked out what he's talking about, the villagers will regard this as an interesting idea. The region has little, unreliable rainfall, and the last few years have been particularly bad ("which ees why we are a poor veeleej, Senor"). But there *are* vague stories from folks' grandfathers' days of better weather, thanks to gringos in night-dresses. If this druidic computer can be restored to operation, that would be wonderful. The PCs (who might have fallen in with Dafydd on the road, if they weren't already in Mallo Burro) should hopefully get caught up in the enthusiasm. The Varozags and the dwarfs ignore all this, unless provoked.

And Dafydd, having examined the circle, will announce that he *can* get it to work. It will need a small hardware upgrade to run modern software -- just a couple of small slabs of rock, nothing the village can't afford. Very observant PCs *may* note that he largely ignores the flat slab in the centre of the circle; if asked, he will refer to it as the "Central Processing Unit," shrug, and say that it's not needed for this application.

The thing which Dafydd has neglected to mention (for all sorts of reasons) is that, well, there's these people who'd like to have a word with him. Other druids, to be specific. The problems start when they show up.

There are several of them, accompanied by a bunch of hired bandidos (similar to the Varozags' thugs); they may also hire The Dwarf With No Name. They include some burly assistant priests who are handy in a fight (treat sickles as shortswords or broadswords, but with no option to stab), and one or two senior figures with some knowledge of their own branch of magic -- say, half-a-dozen spells, drawn from the Elemental Colleges, especially Fire.

Catching Dafydd is their initial concern, but will be partly forgotten when they notice the circle. It's a *good* circle, and

they too want to bring it back on line. The snag is, they are devotees of a more traditional school of programming methodology.

They, too, can improve the weather locally, they say, and the villagers may be tempted to listen to them, especially if they capture Dafydd or he goes into hiding. The snag is, they not only demand that the villagers convert to Strict Druidism (complete with male voice choirs), they *do* want to reactivate the Central Processing Unit. Which is supposed to be used for good old-fashioned sacrifices. If Dafydd can be asked, he'll turn a bit green, and say that *he* can get the circle running without that sort of unpleasantness, but this sort of disagreement about tradition is the kind of thing that led him to leave home.

The PCs' task now is to get rid of the Strict Druids, despite their large support-group of bandidos, and rescue Dafydd if necessary. With a sufficiently shameless GM, this scenario should involve a terrifying clash of hideously stereotyped accents; remember, the locals call everyone "Senor" (or "Senorita") or "Gringo," while the Llamedosians favour "Boyo" and begin or end most sentences "look you." Given the background of a lot of RPG'ers, you can expect plenty of computer jokes, too. There will probably also be sacrificial victims chained to the CPU, and the occasional unprovoked male voice choir.

And if the stone circle does get brought back partially on-line, things can get a bit weird, especially if anyone's using magic; basically, the GM can temporarily modify the local mana level to something silly. Triggering a full-scale thunderstorm can throw confusion into a final fight scene; you should probably have Dafydd running circles round the mesa through it all, desperately hacking up *ad hoc* chants while dodging lightning bolts that all seem to have his name on them. And if Ninairara somehow got chosen as an early candidate for the CPU, *someone* is going to get turned into a sand-lizard.

by Royce Easton Day

Teal paused at the end of the shuttle's loading ramp, her knees suddenly weak. The familiar corridors of the slow-light transport, so much like the crowded warrens of Earth, were gone. She stood now in an open space bigger than the largest Green Space back home, with a ceiling (the sky, she told herself) higher than anything she'd ever seen.

A warning honk from the cargo loader made her jump off the ramp to stand on the shuttleport's tarmac. She turned around, drinking in the open, unfiltered, pure air. Then she stopped, pausing in confusion.

"Now where do I go?" she said aloud.

* * *

Space colonies have been a staple of science fiction since its literary beginnings. From the eager Ganymede Boy Scouts of Heinlein's *Farmer in the Sky*, to the stranded, Thread-threatened colonials of McCaffrey's *Dragonsdawn*, colonists exploring and exploiting their new homes have provided the plots and settings for numerous books.

While most space-based RPGs have rules on how to generate planets and cultures, it's rare to find one that details how those worlds were colonized. This article builds on the ideas provided in ["Thoughts of Empire."](#) and provides GMs with guidelines on how to set up a campaign set on a single colony world, and how to involve PCs in carving out a whole new civilization.

Building the Colony

Following the guidelines of Thoughts of Empire, a GM preparing a colonial campaign should figure out what sort of group, business or government is sponsoring the colony. Then he should fill in the details of what the planet's ecosystem is geology is like, using the world building rules in *GURPS Space* or *GURPS Traveller: First In*.

After that there are just a few more vital questions that should be answered before starting a colonial campaign.

How settled and explored is the world?

A significant factor for PCs is how "tamed" the colony is. If the PCs are part of a pathfinder group, paving the way for settlers to land, they may know next to nothing about the planet's ecosystem and unique hazards. If they're part of a later group, the area around their landing site might be quite hospitable, but a mile outside of town they might be walking into untamed wilderness.

A well-explored world might give them more warning, but surprises can still abound. As an example, much of the

Earth was mapped and civilized by the mid-19th century, but there were still large patches where no human being had ever set foot. And even on a world mapped completely by satellites, there will still be a need for people walk the ground to make sure it's safe for the farmers.

How much support do the PCs get from the local government?

This usually related to the amount of support the sponsoring group gives the colony. Well-funded governments or corporations will be able to hand out fair loans, or lend heavy equipment vital to constructing a colony. Wildcat colonies with little outside support might just give newly landed greenhorns an axe, and point them in the direction of the trees so they can build their own log cabin.

Are there natives on this world?

What if, when the colonists arrive, they find out that someone was there first? Natives may consist of primitive aborigines, or possessors of a sophisticated culture. It's likely that they'll probably be of a significantly lower tech level than the colonists; otherwise why would they allow intruders on their world? An exception might be made if the colonists are able to exploit a region that the natives consider incredibly hostile (a desert, for example) on a planet where the natives evolved in a rain-forest environment.

As a quick look at British or American colonial history will show, natives are an enormous complication. Depending on the attitudes of the colonists and the sophistication of the natives, the end result might be an at least marginally beneficial meeting of cultures (like the British in New Zealand and India) or a painful series of broken treaties and shattered tribes (the American colonists versus Native Americans).

Remember that the natives will have a separate agenda from the colonists, and may not be above exploiting the colonists' presence for their own purposes. If there are multiple native governments on the planet, there will probably be at least one willing to trade native wealth for high tech goods that will give them a technological or military advantage.

Characters

Some of the more common types of characters that might be found in a colonial campaign are . . .

Administrator

Unless a colony is under the direct control of a military commander, the colony's homeworld will usually assign civilians to keep things in the colony organized. A fair and just administration will usually keep things running smoothly. But if the colony's administration is notably unfair or corrupt, it's going to be a flash-point for colonist's grievances and anger.

Advantages: Administrative Rank, Common Sense, Legal Enforcement Powers, Strong Will, Wealth.

Disadvantages: Dishonest Administrators might have Addiction (various), Alcoholism, Enemy (Disgruntled colonists), Greed, Reputation (corrupt). Honest Administrators are more likely to have Code of Honor (Treat colonists and natives fairly), Enemy (Back-stabbing subordinates), Honesty, Sense of Duty (Colony).

Skills: Accounting, Administration, Area Knowledge (Colony), Computer Operation, Leadership, Politics, Savoir Faire.

Con Man

Where there are tenderfoot colonists, there are the men that prey on them. Con men do everything they can to avoid doing an honest living, from scamming newly arrived tenderfoots in a card game, to convincing them to pay outrageous fees for bogus "land grants."

Advantages: Alcohol Tolerance, Appearance, Charisma, Sanctity.

Disadvantages: Compulsive Carousing, Enemy (Local Lawmen), Greed, Overconfidence, Reputation (Crook), Poor or Struggling.

Skills: Acting, Fast Talk, Forgery, Gambling, Sex Appeal, Slight of Hand, Streetwise.

Homesteader

Homesteaders traveled vast distances to this new world, just to get a little piece of land to call their own, usually to farm, or perhaps to extract important resources. For a completely virgin planet, a homesteader may be allowed to own as much land as he can prove he or his family can exploit. For worlds with a more restrictive land use policy, he may be limited to owning a set number of hectares. Adventures for a homesteader will revolve around clearing his land of dangerous predators, or keeping it safe from land barons.

Advantages: Ally Group (Family members, local co-op), Animal Empathy, Common Sense, Weather Sense.

Disadvantages: Dependants (family), Duty to the local bank, Enemy (rival farmers, land barons), Struggling or Poor.

Skills: Accounting, Animal Handling, Driving (Heavy Machinery), Meteorology, Professional Skill - Agronomy, Riding.

Law Enforcer

The local sheriff of a new colony world has a big job in front of him. He's got large territories of land that are nearly empty except for the occasional farmhouse to protect, and he must also keep order in the Startown, which is usually full of gullible tenderfoots, and the lowlifes that prey on them. He may also run into the occasional professional criminal on the run from more civilized law officers on other worlds.

Advantages: Alertness, Ally group: deputies, Contacts, Empathy, Intuition, Legal Enforcement Powers.

Disadvantages: Bully, Enemy (Local crooks), Sense of Duty (Community).

Skills: Forensics, Beam Weapon or Gun (Pistol), Intimidation, Interrogation, Shadowing, Streetwise.

Missionary

Where there are natives on a colony world, there will also be missionaries, trying to convince the poor benighted primitives to change their spiritual path to one of righteousness. Though often seen as a participant in colonial oppression throughout history, a missionary can also serve as a mediator between colonists who want to overrun native lands, and the natives who will fight tooth and nail to preserve it. They also may be the only people willing to teach native sophonts what they need to know to survive and integrate with the growing colonial populace.

Advantages: Charisma, Clerical Investment, Sanctity, Voice.

Disadvantages: Disciplines of Faith, Enemy (Native shaman), Fanaticism, Stubbornness.

Skills: Bard, Diplomacy, Fast Talk, Teacher, Theology.

Scientist

Biologists, meteorologists, ecologists, and all other manner of -ologists will be needed if the hazards of a new colony world are to be understood. Biologists and physicians will have to make certain that local plants and animals are not poisonous to humans. Ecologists will examine the ecosystem to make certain clearing land for farming won't fatally disrupt a vital chain of life. Xenoculturalists will want to speak to the natives to try and examine their unique way of life, and perhaps discover what the newcomers can learn from it.

Advantages: Alertness, Focused, Intuition.

Disadvantages: Absentmindedness, Curiosity, Hidebound ("That fits no accepted theory!").

Skills: Any Science skill, except for Science!, which is inappropriate except for high adventure style campaigns. Computer Operation, Electronics Operation (sensors), Research, Writing.

Soldier

Where there's trouble, the soldiers are there. They may be assigned to a fort defending a new community deep in native territory, or they may be defending a town from vicious native organisms. Combat engineers may be asked to build dikes to guard a farm against a raging river, or build a bridge to allow the colony to expand across it.

Usually soldiers will be made up of a local militia, with a core of ex-professionals acting as a cadre to train colonials from more civilian occupations. Some homeworlds may assign a company or more of professional soldiers, either to defend against native & outside threats, or (in the case of more repressive governments) to keep colonists from feeling too free.

Advantages: Alertness, Ally Group (Buddies in the unit), Combat Reflexes, Fit, Hard to Kill, Peripheral Vision, Toughness.

Disadvantages: Duty, Sense of Duty (Unit). Militias badly in need of personnel may allow soldiers with physical handicaps, particularly if they bring some unique skill.

Skills: Beam Weapons or Gun (rifle), Driving (AFV), Engineering (combat), Pilot (usually Helicopter or Grav Vehicles), Strategy, Tactics.

Tenderfoot

When a colonist from a technically advanced world first lands on a newly founded colony, he's likely to be woefully short on basic survival skills. Just finding a meal and shelter may be a major adventure, unless more experienced colonists take this tenderfoot under wing.

Advantages: Luck, Pitiabile, Wealth.

Disadvantages: Clueless, Curiosity, Klutz, Odius Personal Habit (Always asking questions), Phobia (Open spaces).

Skills: Any related to their life on back on the homeworld.

Transportee

Not everyone comes to a colony voluntarily. Criminals or "undesirable elements" may be shipped to a new world to provide slave labor. Sometimes their term of service is for life, but more often they are only required to serve out their sentence, and then are assigned a small parcel of land. Whatever their eventual fate, transportees are usually assigned the most hazardous jobs. Some may try to escape, and depending on the magnitude of their original crime they might be hunted down, or allowed to settle down far from the colony's center.

The next step up from a transportee is an indentured servant. Indentured servants agree to work for someone else, in return for transport to the colony. Usually they are released from their obligation after a set number of years, though less scrupulous patrons might try and enslave indentured servants permanently.

Advantages: Fit, Immunity to Disease, Strong Will, Toughness.

Disadvantages: Bad Luck, Enemy (Owner), Involuntary Duty, Social Stigma (Criminal or 'Undesirable').

Skills: Any Thief/Spy. Almost any other skill is possible, particularly if the transportee is innocent of the crime they were convicted of.

Trailblazer

Trailblazers aren't merely scouts, though that's a large part of the job. Orbital surveys can give a good idea of where the fruitful land is on a planet, but it's up to the Trailblazer to walk in, find and neutralize what hazards are in the area, identify safe sources of water, and locate convenient natural resources. They'll also be the most likely people to make first contact with the native population, if there is any. Though they work closely with scientists when examining new lands, it's the trailblazer's opinion which will often determine if settlers will be allowed into the area.

Often a trailblazer operates on the fringe of the colony's society, opening up the frontier for settlers, but never staying long when 'civilization' starts to move in.

Advantages: Alertness, Danger Sense, Intuition, Luck.

Disadvantages: Loner, Phobia: Crowds or Enclosed Spaces, Shyness, Wanderlust.

Skills: Any Survival, Area Knowledge, Electronics Operation: Sensors

Campaigning

The following are some ideas for long term campaigning on a colony world.

First Landing

Character Types: Homesteaders, Trailblazers, Scientists, Soldiers.

Somebody has to carve out a safe haven on this planet, and you're the folks stuck with the job. Adventures will probably revolve around a team exploring a small but completely unknown area, removing potential hazards that might threaten the large number of colonists that will be landing soon, and creating suitable shelters for them to inhabit until their homesteads can be explored and settled.

Explorers

Character Types: Trailblazers, Scientists, Soldiers.

Lewis & Clark had just a continent to explore; you've got a whole planet! If the adventurers are lucky, they'll have orbital photos of the areas they have to explore. But they still have to come down to the ground and take samples. Adventures will revolve around searches for badly needed raw materials, examining native life forms, or evaluating land to see if it's suitable for turning into much needed farmland.

If there are native sophonts, the PCs may be responsible for 'first contact' of isolated tribes, offering to trade goods (or just offering good will) in return for the colonists' right to move in. Their acts of initial diplomacy may be the deciding factor on whether the colonists will be welcome, or fought at every turn.

Spreading the Faith

Character Types: Missionaries.

There are heathen natives all over the planet, and its the PCs' job to bring the word of God (or the Goddess, or Mohammed, or Vishnu) to these poor unenlightened folk. This can be played as dead serious (perhaps the natives are wracked by warfare, and only a message of peace and brotherhood can stop the fighting), or comedic (imagine a group of cultists trying to convince the local chief to embrace their crazy doctrines).

Going by the history of our own world, missionary work can range from the benevolent construction of hospitals to treat natives with high-tech medicine, to the wholesale by-the-sword conversions of entire nations. Perhaps the missionaries may find their own faith challenged by the natives' beliefs (read James Blish's classic *A Case of Conscience* for the strife that might bring).

At any rate, considering the touchiness of religious subjects, if a GM or his players are not comfortable with this type campaign, it would be far better to avoid it.

Keeping the Peace

Character Types: Law Enforcers, Soldiers.

It's a big beat to walk, but somebody has to keep things safe for colonists just trying to build a home for themselves. It's up to the PCs to maintain the rule of law in an area where there was no law previously, or where the law up until now was "Survival of the Fittest."

Colonies that were founded by mid-level CR governments will probably try to put into place a rational set of laws as soon as the colonists arrive, to be enforced by trained police officers. CR 5 or 6 governments will also make sure the rule of law is place, but it will most likely be enforced by some very heavy-handed methods, probably by soldiers who've never heard of Miranda rights. More libertarian governments may enforce few, if any, laws at all, depending on the colonists to decide for themselves what behavior they're willing to put up with.

If there are natives on the world, it will be up to the PCs to prevent colonists from accidentally, or deliberately, violating local customs, and invoking the natives' wrath. Alternatively, they might have to be the ones to arrest the local high priest, after he sacrifices some poor farmer's entire herd of cattle to the Rain God.

Unless local conditions force the colony into a confined area, a single lawman's beat will be measured in hundreds of square miles. He may spend days patrolling his sector, visiting individual farms to check up on people, or perhaps just stay in his office and wait for an emergency call on the radio. At any rate, the local sheriff may be the only form of government an isolated colonist might see for years at a time.

Rebellion!

Character Types: Homesteaders, Law Enforcers, Soldiers.

When, in the course of human events . . .

Maybe it was the last round of tax increases on the colony's exports. Maybe it was the way the Imperial Guard drove farmers from their homesteads to create a new bombing range. Maybe it was just time for a change. For whatever reason, the average citizen of the colony is no longer willing to put up with be governed by a homeworld government that just doesn't seem to care. He's willing to take up arms against soldiers of his distant masters and fight for the colony's independence.

Adventures will revolve around sabotage, stealing and hiding much needed weapons, and gathering intelligence on the occupation troops. If off-world travel is available, PCs might have to try and contact other governments, trying to garner support and recognition for their cause in the arena of interstellar politics.

Alternatively, the rebellion may come from the native population (if any). This sort of war will be of the nastiest sort, as the natives use their inherent knowledge of the local terrain and lifeforms to wreak the maximum amount of havoc as they try to drive away the off-worlders.

Startown Blues

Character Types: Administrators, Con Men, Law Enforcers, Tenderfoots.

Rather than concentrate on exploration, a campaign could easily revolve around the small-town politics and crime of the local starport and town. An expanding colony will always be filled with tenderfoots to shepherd, con men to prey on them, and law enforcers to keep the peace. Administrators will have to work hard to balance the needs of the expanding colony with the demands of the homeworld, and limited resources. Con men can spend their time either fleecing newcomers, or perhaps 'procuring' high demand manufactured items from the shuttleport's warehouse. For a price, of course.

The Transcontinental Monorail!

Character Types: Administrators, Soldiers, Transportees, Trailblazers.

Even if a colony has air transportation, planes or grav vehicles are expensive to maintain, and perhaps impossible to build if the colony has limited manufacturing resources. Building a safe and reliable ground transportation network will go a long way toward 'civilizing' the planet.

Of course difficult terrain and hostile natives won't make things easy. And if the monorail has to go through land already claimed by homesteaders, the colony's administration might have to either find a way to placate the farmers, or prepare to fight a guerrilla war against them.

Recommended Reading

Fiction

- *Foreigner* trilogy, C.J. Cherryh. An isolated human colony must deal with sophisticated alien natives, trading advanced technology for resources. Very good for ideas on native/colonist politics and alien thought.
- *Deathworld*, Harry Harrison: A con artist in trouble runs offworld, to a colony with a literally malicious ecosystem. Two sequels deal with equally hostile worlds.
- "Asgard" short stories, Daniel Hatch. Independent homesteaders fight a political battle to avoid being sucked into a greedy collective.
- *Farmer in the Sky*, Robert A. Heinlein. A Boy Scout and his family travel to their new home on Ganymede.
- *Red Planet*, Robert A. Heinlein. A brother and sister attending a boarding school on Mars fight for their world's independence.
- *Uller Uprising*, H. Beam Piper. Human colonists must fight a native uprising, in a re-telling of India's Sepoy Rebellion.

Non-Fiction

- *Undaunted Courage*, Steven Ambrose. A biography of Meriwether Lewis, one half of the Lewis & Clark Expedition. Read it to get a feel for the sense of wonder a virgin world might hold for explorers.
- *The Fatal Shore* Robert Hughes. The story of the colonization of Australia, with an emphasis on the large convict population. Worth reading for ideas on prison colonies, but not for the squeamish.

Television

- *Earth 2*. Occasionally improbable tale of a pathfinder group who land on their new home world short of equipment and a long way from their chosen landing site. Currently re-running on the Sci-Fi Channel in the US.
- *Red Planet*. A four-episode animated serial produced by Fox Television, loosely based on Heinlein's original novel, with an occasionally heavy-handed eco-message. Worth watching for details on "New Ares" ecology.

Movies

- *Outland*. Sean Connery stars in a re-make of *High Noon*, set in an enclosed mining colony on the moon Io in orbit around Jupiter. Watch it for ideas about small town politics and crime around Startown.

"Bill"

For *Vampire: The Masquerade*

by Ben Vandgrift

Some people lurk in dark corners. Some people seem to bring the dark corners with them. You can bet that someone that deep in shadows knows their way around in the Dark.

History

Wrong place, wrong time. Happens to us all at some point. For a switchboard operator in Lowell, MA, it happened after his shift one night.

"It was especially dark after the evening shifts on weekdays, when the factories had been spitting up ash into the air all day long. The only real light came from the gas lamps spaced too far apart. Ah, for the streets of Boston, or even New Haven. Even then Boston was putting up Edison's electric lights along its streets. While I knew eventually they would spread everywhere, patience had never been a virtue I possessed."

Times were definitely changing. National Bell had become American Bell, and A.G. Bell, who'd founded the company, was just awarded his citizenship to the United States. There were telephone networks arising in California, Connecticut, New York, and Massachusetts, and the life of one of those responsible for their success was about to change.

Raymond Miller was a gifted technician and scientist before he was recruited. While Lowell wasn't the booming industrial city that Boston was, it did a fair amount of manufacturing, and nestled between the soot-covered factories and warehouses was the budding American Bell company. The labs and experimental areas within the building were Raymond's home. Sure, he had a flat on Shaw, but he didn't have much in the way of family. He preferred the company of his tools and wires to his lonely apartment.

Miller's mind was brilliant, grasping the concepts of networks and interchanges quickly and easily. He worked with several other technicians to develop the prototypes which were turned into switchboards, had extended Dr. Parker's ideas about phone numbers into something usable, and had just begun work on more complex networking scenarios. To help out the company he worked the switchboards after his shift. He became familiar with most of the influential people in Lowell, Boston, and the region, switching them from one connection to another. That, combined with his knowledge of the telephone system was what attracted *their* attention.

"I could hear my bones crackling under my skin, reshaping themselves into something vile. My skull ached, and the least light burned and blinded. I had no idea what I was becoming, but I knew that the pain would stay with me for the rest of my life. If what I'd been told was to be believed, that would be a long time indeed."

As Raymond walked home one night, he was accosted by two men whom he'd mistaken for bums. When he held out his hand to give some change over, they dragged him into an alley and killed him. A few hours later, he arose as an

undead being, his life fueled by their blood.

The Nosferatu living under Boston and the region saw in Raymond an opportunity to catch up on quite a bit of lost technology. They recognized the potential that telephones had, and intended to use this potential in their own intelligence gathering methods.

"I stood there before him, their Master, still aching from my transformation. He chuckled at me, shaking in his dusty chair. Soon he explained his plan to me -- I was to keep learning my trade, and make sure that they could listen in. I thought to refuse, but you're no doubt well aware of how persuasive they can be." He looked aside, remembering. "Before the Boston-New York Line went up, we had the central board tapped. All calls to and from Boston were overheard by us from then on."

Resigned to his fate, he began to appreciate the information he was receiving. It allowed him the respect of his peers quite readily, and it wasn't long before he rose within the ranks. He was the first stop on anyone's list when it came to information.

By 1900, there were almost 900,000 phones in the Bell System. Raymond kept up with his colleagues, and helped advance the technology. He claimed extended sickness, and communicated by courier and telephone. Based on his ideas and former notes, the American Telephone and Telegraph company (which had bought out American Bell three years earlier) developed an automated switching exchange capable of handling 10,000 lines. With the increase in telephone traffic, Raymond stopped listening and set others at the task, monitoring their information at a much higher level.

Raymond had taken to calling himself "Bill." As the information transfer became more and more complex, he told his spooks to use the name "Bill" as well. To anyone outside their group, "Bill" appeared to be one person. Not even the other Nosferatu knew the whole truth.

"I've never had any interest in politics outside of information. I kept up with technology, and throughout the twentieth provided my superiors with better and better ways to gather information, most of the time without ever having to leave the tunnels. Each of them was most grateful -- right up until they tried to kill me."

With as much information and power that Bill had, many of his superiors became suspicious, and paranoid. They had a right to be. One after another, they tried to destroy Bill and all he had done. Each time, Bill knew before they got there, and dealt with them. The more his superiors fell, the more powerful he became.

At the beginning of the new millennium, Bill is a name of influence to those who know it. He has ceased to play in politics, since it is a game in which he has no competition. He does, however, make sure that he knows everything which is going on in Boston, and keeps a close eye on most of New England.

He has unfailingly kept up with his passion -- information technology. He understands communications hardware and software inside and out, and makes sure he is aware of all recent developments. He is extremely fond of cell phones, and has designed several firmware encryption implementations, which he passed on to Bell Labs, now Lucent Technologies. He maintains several contacts there, and a friend or two.

Personality

Bill is, even after all this, an easy-going guy. He fully plans to spend the rest of his days amusing himself. His voice is soft and polite, but extremely smug. He walks slow, and smiles often. He is often given to sentimental notions, but doesn't allow them to get in the way of his devices.

He usually appears as a tall, slim man with short black hair. This is exactly how Raymond looked in life, and allows himself this conceit. He was not an unattractive man, and looks quite smart in the businesslike clothes in which he dresses. His spooks appear much the same way, though some variation is inevitable. All answer to "Bill", and it is impossible to tell any of them apart.

Bill is very sly, whether someone is speaking to Raymond himself, or one of the spooks which serve under him. He will duck the point, change the subject, and provide half-truths unless he wants the information clear. Most of the time, Bill's words are a complex combination of deceit, the truth, and various points of view.

"I think I can help you," too many jagged teeth grinned under greasy locks. "In fact, I'm sure of it. I can get you right out of this mess you're in. You just have to make this delivery for me."

"What is it?" Ray looked suspiciously at the unmarked, cardboard box.

"It's your delivery. Don't worry. It's not for you."

Because of the many agents under Bill, he may appear to be several places at once. The agents are in constant communication and don't often make mistakes -- even when they do, they are able to change their appearance, or vanish into the night. In almost a century, very few have learned the true, multiple nature of Bill, and those who have haven't lived long enough to tell anyone about it. Bill will remain ever secretive, and treats every fact as though it were the most important, most occult knowledge on the planet. This too, is for his own amusement, not any real belief.

Gameplay

Bill is a good character to bring into a story, even if the player characters never see him. He always has an agenda, and is often in the position of kingmaker. Any plot can be disturbed by the kind of information, materials, and blackmail that Bill brings into play.

If the characters are stumped, Bill is good for helping them along. He will do so, of course, as a favor, and will expect a favor in return. He will always call his favors in at the worst possible time. Bill is also good for the reality check. Assume he knows all about the characters, like where they are, and their cell phone number. As a last resort, Bill can usually get people out of trouble. They don't even have to know. He could bring it up later.

Harry reached into the box and grabbed a slice of steaming double-pepperoni. As he pulled the cheese away from the rest of the pizza, he caught Jeannie's eye.

"What?"

"Something written on the inside of the box, I think," she said, reaching for a wedge.

Harry raised the lid and looked. "Dammit. How does he always know?"

As a villain, Bill is quite nasty, giving away critical information about the player characters, their friends and family,

and their allies to all the people who hate them. They get IRS audits, their credit cards get canceled, they find out they're legally dead. Bill's like that.

A character like Bill is usable in any genre. In a fantasy genre, he could be a high-placed member(s) of the thieves' guild. In the cyberpunk style, he could be incarnate in a group of net runners operating out of whatever city is appropriate. In a space setting, bring him as a diplomat or smuggler with too many contacts which always seem to be where you're going. Without his shape changing ability, he simply uses more common tactics to avoid detection (picture-phones, holo-belts, icon programs, etc.).

Allies and Contacts

While it may not be obvious, Bill does report back to a superior. He is not the leader of the Nosferatu, but he has almost complete autonomy, so long as he provides Warwick (that leader) with the information he requests. Neither Warwick nor Bill are confident enough to challenge the other, and Bill is content with his half-dozen or so spooks.

As you can imagine, many people dislike Bill, but even more have a grudging respect, even dependency on his information. Most of the undead in Boston owe Bill at least one favor. If they don't, Bill will arrange for them to owe him a favor. However, with that comes the knowledge that he exists, something he is loathe to reveal.

Bill doesn't have any real friends, but he does have a few allies. Derek Terran, a mage of some note in Boston, has sided with Bill several times. Theodore St. Devian, a student of Derek's, also appreciates Bill's talents. Most of the Broken Seal Chantry, which Derek and Astor Eldridge lead, has had a run-in with Bill, either covering their tracks or providing them with useful information. He does this mostly as a favor to Derek, but they have come to trust Bill's information (when they can decipher it).

Det. Randall Casey, of the 23d precinct in Boston has likewise come to rely in Bill's information. Bill still has a sense of justice, and Casey knows more about the shadows than most of the good men of the Boston PD.

Clan: Nosferatu

Haven: The Sewers and Tunnels under Boston, MA

Generation: 7th

Nature/Demeanor: Jester/Architect

Attributes: Strength/3, Dexterity/4, Stamina/4, Charisma/3, Manipulation/5, Appearance/0, Perception/5, Intelligence/6, Wits/4

Skills of Note: Bill has an in depth knowledge of all things electronic, especially communications equipment. He has studied a fair amount in his spare time, having a basic grasp on the sciences. He also speaks several languages: English, German, Russian, Japanese, Arabic, Hebrew, Greek. He can read Latin.

He is very alert, and pays attention. He also has good instincts, and can see through most deceptions. He is a good leader, and has an excellent sense of timing.

In a fight, Bill will run. He values his existence, and will protect it at all times. This rarely comes up, however, as Bill is very good at knowing what's going on, and will avoid or divert the scene before things become violent.

In The Belly Of The Beast (for d20)

Published by [Atlas Games](#)

Written by Mike Mearls

Illustrated by Helena Wickberg, David Interdonato, Chris Seaman, and Scott Reeves

32 pages; \$8.95

In The *Belly Of The Beast* is the third entry in the Penumbra series of *d20* scenarios from Atlas Games. It is designed for four to six characters of second through fourth levels, though it is specifically aimed at third level characters.

As per the previous two Penumbra adventures, *In The Belly Of The Beast* is a 32-page book. It is clearly laid out, with the Open Gaming License material plainly contained in grey boxes. The artwork is also attractive, in particular the tentacularly themed sidebars from Scott Reeves and the character pieces by David Interdonato. The thumbnail portraits of the adventure's NPCs are a little rough, but they do convey the personality of each rather well. *Belly of the Beast* also makes use of ProFantasy Software's *Campaign Cartographer 2* to design its single map. As with the other Penumbra adventures, this map can be downloaded from the Atlas Games website.

Importantly, a quarter of this module is actually an eight-page pull-out special section. This includes not just the map, but also the adventure's single handout and details of the eleven important NPCs in the adventure, including their game stats, background and motivations. It is rounded out with a table to help run all of these NPCs though any combats that might occur during the final encounter.

The plot revolves around the merchant House of Mezzia, whose fortunes have been flagging of late. Bruno, the son of the head of House Mezzia, hires the PCs to help restore his family's fortunes by performing a number of tasks for him. After a small job to test their mettle, Bruno explains that he knows who is responsible the downturn in the luck of House Mezzia. He identifies a dark shadowy conspiracy to be found within the city and says that he wishes to strike a blow at them. Leading the way, Bruno sets out to attack the very heart of this conspiracy, so taking the players into the final encounter.

Everything in *Belly of the Beast* is geared towards getting the party into this final encounter. It places Bruno and the party in a closed room situation. Initially unable to escape, the players will quickly discover that they have literally tumbled into circumstances beyond their ken. Eventually escape is possible, but until then, they must not only survive but also forge alliances with and possibly against an array of potential allies and enemies. Only together will they be able to stave of the threat and get out . . .

Belly of the Beast goes into some depth to explain both the motives and possible courses of action for each of the NPCs. Although this is very helpful in keeping track of the seven major NPCs and their subordinates, as well as giving a voice to each, is no easy undertaking for the DM. Perhaps a DM's assistant might be needed here. This is the main weakness of *In The Belly Of The Beast*.

The other problem with *Belly of the Beast* is as much an advantage as it is a disadvantage. The adventure is deemed to take place in a city of the DM's choice, with all of the necessary details and background being provided to run the

adventure, but little more. This leaves what information that is given on the adventure's major players as perhaps a little too generic. If the DM is to include it within their campaign, they are going to have to add greatly to this information themselves. Though not a problem to the experienced referee, the less experienced may be left wanting more detail, and the highly generic aspects of *Belly of the Beast* could be a disadvantage to them. Yet this does make the adventure very flexible, allowing the DM to choose not only the location, but possibly the fantasy RPG of their choice too. This could work just as well in *Warhammer Fantasy Role-Play* as it does in *d20*.

By placing the adventure in a single closed room environment (reminiscent of a classic convention live-action game), *Belly of the Beast* contains lots of opportunity for both roleplaying and interaction. In fact, this is the main focus of the adventure, though combat is not ignored, as force of arms will most definitely be required if the players are to escape. The author has done a nice job of achieving a good balance between the two.

On the downside, the long-term usefulness of this scenario could be better. yet this minor gripe aside, *In The Belly Of The Beast* is a challenging adventure for characters of this level. It is generic enough to slot into any city of the DM's choosing and contains several pieces of background that can be added to, and developed for, an existing campaign.

The Legacy of Zorro Introductory Adventure Game

Published by [Gold Rush Games](#)

Written by Mark Arsenault

Fuzion rules by David Ackerman, Ray Greer, Bruce Harlick, George MacDonald, Steve Peterson, Mike Pondsmith, and Benjamin Wright

32 pages, \$9.95

It seems that good introductory roleplaying games, suited for younger or inexperienced players, are becoming harder and harder to find. Gold Rush Games has answered this need before with their *Usagi Yojimbo RPG* and now they're doing it again with their *Legacy of Zorro Introductory Adventure Game*, based on the adventures of the swashbuckling masked hero in colonial California and due for release in June.

The game is a 32-page 8.5" x 11" book containing a simple set of rules, four sample characters, and an introductory adventure (complete with a two-page map). The first four pages provide an overview of roleplaying games and an introduction to the world of Zorro in early 19th century Spanish California. The players don't get to play Zorro (which player would get to play him, after all?). Instead, they play people chosen and trained by Zorro to aid in his fight against injustice.

Seven pages provide all of the basic rules of the game, using the "Instant Fuzion" game system (also used in *Usagi Yojimbo*) with a few interesting twists. The basic game system is Attribute + Skill + 3d6 vs. a difficulty number, with damage rolls handled by rolling a number of d6 and adding them (then subtracting the target's Defense). There are four main attributes: Mental, Physical, Action, and Movement. There are also Hits that determine how much damage characters can suffer, Defense for soaking damage, and two attributes players can use to influence their characters' luck: Faith and Pride. Faith represents belief in a higher power, and players can use Faith points to give characters a bonus on die rolls relating to merciful and helpful actions. Pride is a measure of self-confidence, and can be used to improve aggressive or selfish actions (that help the character rather than someone else). Both sorts of points can also be used to reduce the amount of damage a character suffers from an attack, allowing *Zorro* characters to pull off daring stunts and survive combat more easily.

Characters also receive "Z Points" for dramatic actions during play, which they can use to greatly improve die rolls for swashbuckling and daring-do. Interestingly, characters receive Z Points for dramatic critical failures as well as critical successes, simulating the situations where heroes manage to overcome sudden reversals of fortune. Characters can only save so many Z Points from game to game, encouraging players to spend them.

The game has a short selection of very broad skills like Athletics, Combat, and Reasoning, which improve the use of different attributes. It includes an automatic success rule (if a character's Attribute + Skill is greater than the difficulty number), critical successes, and critical failures. The game uses a basic version of Fuzion's fairly comprehensive combat system. The choice of swordfighting maneuvers is a bit limited but covers the important ones like blocking, disarming, and pinning an opponent's weapon.

The middle of the book contains four sample characters (with two-sided character sheets) complete with background, roleplaying tips, and a summary of available actions for easy reference. Each character also has a "special talent" that helps make it distinctive.

The remaining ten pages are taken up by the adventure "Rescue Zorro!" in which the Fox has been captured by the soldatos and the player characters must rescue him from prison. It's a simple introductory adventure, with plenty of advice for the GM and players, clearly intended for beginners (including things like a brief aside on what to do if the players decide to just slaughter their opponents, pointing out "that is not Zorro's way"). It helps set up the idea that the player characters are "helpers" Zorro has chosen in his fight for justice, and encourages them to strike out on their own a bit at the end of the adventure.

The only thing the game is really lacking is a way of creating new characters, which will be included (along with expanded rules and much more setting information) in the forthcoming *World of Zorro Adventure Game and Resource Book*, due out in the Fall (and priced at \$24.95). Otherwise the *Intro Game* contains all the rules for a swashbuckling adventure. It's a great and inexpensive way to introduce new players to the roleplaying hobby with a character that's familiar to most people (especially since the recent release of the *Mask of Zorro* film, with a sequel already in the works). If you're interested in swashbuckling heroic adventure or looking for a good, simple, "entry level" RPG, I recommend giving the *Legacy of Zorro* game a try. You can find more information and support at Gold Rush Games' ZorroRPG.com website.

Murphy's Rules

Mermaids and Manatees

(*not* a d20 supplement)

Art by [ArtToday](#), colored by Ben Kimball

This is a picture of a mermaid.

Mermaid

This is a picture of a manatee.

Manatee

It's been argued that legends of mermaids began when sailors saw manatees at sea, and mistook these gentle sea cows to be beautiful women with the tails of fish.

These were lonely, lonely sailors.

Anyway, the point (and yes, there *is* a point) is that our eyes can lie.

But how do you represent this in gaming . . . without having the players and GM come to blows?

Consider this. The adventurers are wandering through the fantasy city of D'Troit. They follow the captain of the guard through the Nagihcim Dungeon. Midway through the Dungeon the captain turns into a rampaging slugmonster, and proceeds to attack the party.

"But wait!" one player says. "I'm a *member* of the city guard! Why didn't I notice that the guard was an impostor?"

"Well," says the GM, "because I rolled your perception in private. You failed."

"But we've spent 18 hours with him! I've known the captain for years before this! Surely I'd know if he were an impostor!"

"Umm... you failed a lot of rolls."

And then the players vote the GM off the island.

On the other hand, consider the alternative. "Okay; you're about to enter the dungeon. The person who looks like the captain of the guard follows up the rear."

"Whoa! *Looks like???* Um . . . do I notice anything odd about the captain of the guard? Does he use the same hand as I remember? I sniff him; does he smell right?" And so on.

Most of the best adventures come about where things aren't what they seem: the hidden trap, the impostor, the final clue. It's a fine art to obfuscate these bits, and keep them surprising while still fair to the players, and it's an art that I'm still not sure I have right as a GM. But I've come up with some tips, which hopefully may help someone out there.

- *A glimpse is uncertain.* Manatees can most easily be mistaken for mermaids when they're only seen for a moment, from afar. If the manatee hovers an inch from the boat, gnawing on seaweed and looking weird, even the most grog-filled pirate would be hard pressed to mistake it for a mermaid. So in our captain of the guard example, if the Captain runs up to the heroes, breathlessly hands them a note, and says, "Deliver this to the Prince! Quickly . . . I have to go alert the others!" before running off, there's only the briefest of moments that the heroes *might* notice something's amiss.
- *Knowledge is incremental.* In the real world, most mysteries don't hinge on the proverbial smoking gun; instead they're usually the result of tiny scraps put together. It's the same in most day-to-day mysteries. If you think your mate is having an affair, it's more often because of pieces taken together that indicate a whole: too many phone calls that hang up without speaking, too many unexplained charges on the credit card, lipstick on his collar that isn't his shade (ba-dum bum). This works well in gaming; each piece should be easily explained away taken separately, but taken together it should all make sense. In our captain of the guard example, the guard may not be riding his trademark horse ("Oh, it's sick currently," he explains). He may ride off without saluting like he normally does (he *must* be in a hurry . . .right?). He may use a different fighting stance, and strike more fiercely or softly than he normally does. And so on.
- *Not all of reality is a plot.* We all have secrets; just because someone is hiding something from you doesn't mean they're a shapeshifting brain-eater (or a mermaid). If you plan to make mysteries part of your games, it's strongly recommended that you include many mysterious non-threats. Thus the week before the captain of the guard may have been favoring his off-hand . . . because he injured it while sparring. He may be sneaking out at night . . . to partake of a clandestine interlude. And so on. If you have plenty of red herrings and non-events surrounding the characters, they won't feel the need to get paranoid and investigative whenever you make them roll for perception.
- *Some plots are obvious.* When structuring your plot, make sure you understand *why* you're making something a mystery, and seeking to deceive the characters' perceptions. Sometimes the story can be made more interesting if you automatically say that one or more characters knows something immediately. In our example above, envision this:

The Captain runs up to the heroes, breathlessly hands them a note, and says, "Deliver this to the Prince! Quickly . . . I have to go alert the others!" The GM pulls the player whose character is a member of the guard aside, and tells him, "You know, in your heart of hearts, that is *not* the captain. And you have only seconds to react before he gets away. You're also holding a note. What do you do?"

- *People see things based on their interests and worldviews.* I'll touch on this later (perhaps next week), but for now I'll point out that we tend to see the world based on our interests and passions. Thus a martial master may notice the guard runs as if he were slightly out of shape. The priest may notice that the Captain doesn't have a religious symbol prominent on his belongings like most soldiers, the scholarly wizard may notice the penmanship on the note, and so on. By making each PC have a unique sphere of knowledge you can ensure that each player feels special, and can make the clues you deliver that much smaller.

We only know the world through our senses; our senses lie to us. In roleplaying, it is the GM who is our senses . . . and thus it is the GM who lies to us. But ideally, if he plays fair (perhaps by using these ideas), and everyone has fun, the players are about as likely to be angry with the GM as they are to curse their eyes when they see mermaids instead of manatees.

* * *

Kenneth Hite is too darn busy this week with various secret projects that we can't comment on (though I *will* note that the pilots who were in China *are* safely home in the U.S., and they're still working on getting the spy plane back . . .). As such Suppressed Transmission is taking the week off. But it should be back next week . . . unless *fnord* happens.

-- Steven Marsh

Last week's answer: Vampire Diary: The Embrace, pp. 4-5.

(Three stars) "Any character who says the magic words 'Jim, I can't push her any faster than that' or 'Damn it, Jim, I'm a doctor (or magician)' gets 5,000 xp for being a Star Trek fan."

by Volker Bach

Editor's note: This piece is a companion (of sorts) to last month's article "[The Western Way of War.](#)" Although it's not necessary to read that article to enjoy this one, they do complement each other. (And it's not like we're making you hunt down a back issue or anything . . .)

While most roleplaying games tend to depict western fighting styles before the Renaissance as very simple, not to say primitive, few things could be further from the truth. Medieval armsmasters may not have measured up to Shao Lin monks in their legendary feats, but they trained their pupils in sophisticated, complex styles tailored to the exploit strengths of the weapon and the individual. Not being literary types, they rarely left a lasting record until about 1400. Fighting techniques before that time are difficult to reconstruct, and even afterwards it is hard to piece the scraps of evidence together, but there is enough material to paint a fairly complete picture of the most widespread styles. They may lack the elegance of Renaissance fencing and the mystique of eastern teachings, but they certainly did not want for effectiveness or sophistication. Anyone playing in a historical medieval or fantasy setting will surely appreciate them.

Compared to the Asian styles, European fighting techniques were depressingly unmystical and appallingly dirty. Christian knights may have held some religious views about the esoteric significance of their weapons and discipline and some armsmasters taught the use of charms and folk magic along with their more mundane styles, but these were exceptions. Most fighting men had an earthy, practical appreciation of their techniques. Happily unencumbered by notions of cosmic harmony, stylishness or fair play, they practiced styles unsurpassed in their refined brutality. Not just street thugs but soldiers, students, knights and even the instructors of princes and noblemen taught and readily used these moves. The opponent was kneed in the groin, punched in the face, tripped, kicked, strangled and elbowed, had his eyes poked, his nose twisted, ears torn, fingers broken, and sand (if not powdered quicklime!) thrown in his face. Cloaks, rocks, bottles . . . anything remotely suited to the purpose was pressed into service as a weapon. The overriding idea was brutally direct: to maim and kill with a minimum of fuss and danger for oneself. Even in sporting contests and tournaments lethal accidents were not unknown, and anyone complaining about such trifling things as a broken wrist or a lost tooth was branded a sissy.

The practice of (mostly armed) martial arts was fairly widespread in medieval Europe. Most people were permitted to own weapons of some kind, and many young men wanted to learn how to use them. Prowess at arms was a status symbol as well as a useful skill in a violent age. Thus, the aristocracy was bound by social expectation to learn the handling of arms and young commoners of the upper classes sought to imitate their betters, while peasants learned at least to defend themselves and many poor men spent their hard-earned money on lessons in the use of shortsword or knife. Even monks and priests indulged in wrestling matches and sporting contests of swordplay. Undoubtedly most of these people had no more than basic competence with their weapons, but many pursued this path farther, and some devoted their life to the mastery of arms.

Except for noblemen, the career of a professional fighting man was hardly attractive. Commoner armsmasters were socially grouped with entertainers, pimps, and barber surgeons. Mercenary soldiers were reviled almost universally, and professional champions making a precarious living by standing in for people in trials-by-combat had few chances to enter a bourgeois existence. Teachers of the martial arts could become wealthy, but hardly ever respectable. Most students acquired their martial skills as a hobby, or out of vital necessity, not in the hope of making a living with them.

Aside from this, there was always a spectator sport element to the martial arts. The knightly classes competed in tournaments, much to the delight of large numbers of spectators. Trial by combat, both for nobles and commoners, was not only an extant judicial process but also a surefire crowd pleaser. Noblemen dueled, not, as became the standard later, surreptitiously, but openly and with prior announcement, before anyone who cared to watch. Armsmasters and their students occasionally gave show fights for a paying audience, and the graduation ceremonies and masters' exams of these schools were public events with great attendance. One couldn't call it bloodsport, strictly speaking, but as in many violent sports today people came expecting to see blood spilled.

The teaching of martial skills was strictly a commercial affairs. The best armsmasters were retained by noblemen to teach their children and train their knights and followers. Others set up private schools in cities, teaching their art to paying students. In some countries they developed a regular guild structure, complete with royal patents and journeyman's and master's examinations, in the course of the 14th century. Their fees ranged from stiff to exorbitant, but the cachet of having studied under, and obtained a certificate from, one of the great names made it seem worthwhile to many. For a mercenary soldier, it might even be a career move -- certified halberdiers or swordsmen commanded higher pay and often were promoted to elite units. The lowest kind of teachers were itinerant, moving from place to place in search of business and holding classes in bathhouses, brothels or backyards. Their credentials were often dubious, but they were cheaper than the regular schools and more than happy to teach people without enquiring too much into their background or intentions. Informally, anyone with any skill in fighting happily passed it on. Archery, for example, was a popular sport in England; wrestling and crossbow shooting were favored in Germany.

Maneuvers

Armed Grapple (Hard)

*Defaults to DX-3, Wrestling-3 or Judo-3
Cannot exceed prerequisite skill level*

It is possible, if difficult, to execute grapples and throws with one's hands full. Penalties vary; a Close Combat weapon (Reach C), buckler or similarly small item will put a character at -2, a sword-sized (Reach 1) weapon or other medium-sized object will already give -4, and a weapon with a Reach greater than 2 (or other large item) will result in a -6 penalty. The Armed Grapple maneuver allows a character to buy off up to -3 of these penalties. As with Hit Location, it may not be used to increase success chances beyond what the unmodified chance would be. A character skilled in the Armed Grapple Maneuver may also use a Judo Parry at -2, while holding a close combat weapon or similarly small object. This penalty can not be bought off. Once a grapple is established, a held weapon (not a buckler) may be used for extra leverage, giving the wielder +2 to all Contests to hold on. Grappling while armed was an important part of many European combat styles.

Face Attacks

(p. MA48)

There is no reason (other than style) why this Maneuver should not default to Karate. In the Combat Wrestling style it is used with that Skill, in keeping with the refined savagery of medieval fighting styles.

*Hook (Hard) Defaults to Polearm-2, Axe/Mace-2, Two-Handed Sword-2 or
Two-Handed Axe/Mace-2
Prerequisite: Polearm, Axe/Mace, Two-Handed Axe/Mace or
Two-Handed Sword
Cannot exceed prerequisite skill level*

This attack can be used with every weapon that has a hook or hooked beak (halberds, picks, bearded axes, bills, daggeraxes, poleaxes and various exotic polearms fall into this category). A specialized form of the Maneuver is also

used with the quillons of two-handed swords gripped by the *ricasso*. The attacker uses the hook to catch the target's limb, weapon or shield (the attack must be specifically targeted to one of these. Hit Location penalties apply). A Hook attempt can be dodged, parried or blocked. However, since the Hook does not depend on getting through armor, the PD of all armor is reduced by 2 for purposes of defending against this attack. After a successful Hook, the attacker pulls his weapon to put the target off balance. This pull happens on the same turn, immediately after the attack. If the weapon's hook is sharp this may cause some cutting damage in the process (GM's call. The amount should not exceed thr-1 even for the largest weapons). Armor protects fully. Other effects depend on what is hooked. If a weapon is caught, the attacker may attempt to disarm the target. Roll a Quick Contest between the attacker's Hook and the defender's Weapon Skill or Retain Weapon Maneuver. If the attacker wins, the target is disarmed. If the defender wins he retains his weapon, but an unbalanced weapon is unready the following turn. Swords, knives and similar weapons without protrusions to catch onto can not be hooked. If a shield is hooked the attacker can pull it aside. Roll a Quick Contest between the attacker's Hook and the defender's Shield Skill. If the attacker wins, the shield becomes unready. The defender is prevented from blocking and loses the benefit of its PD until he can re-ready it. If a limb or the neck is hooked, the attacker may pull the defender off balance. Roll a Contest of ST between the attacker and defender (the attacker is at -1 if he uses one hand only, +1 for a weapon with Reach 2, +2 for one with Reach 3. A mounted defender may substitute his Riding Skill for ST). If the weapon does damage to an unprotected location, the defender needs to make a Will Roll to force himself to resist the pull (+2 for Combat Reflexes, +4 for High Pain Threshold). If the attacker wins the Contest of ST, the defender is pulled off balance and can not use any attacks or Active Defenses the following round. If he wins by more than 2, the defender falls down. If the defender wins he keeps his balance and can act normally.

Improved Parry

(p. SW20)

This Maneuver should also apply to unarmored shortsword, broadsword, and longsword forms developed in medieval Europe. The wielder may not have more than Light Encumbrance and must have room to move to benefit from the Improved Parry with any of these weapons.

The Styles

The styles as laid out here are reconstructed from contemporary manuscripts and pictures, filled out with some educated guesswork. Most of the sources depict masters fighting, so they represent very advanced fighting techniques, and it is perfectly defensible to allow PCs to study stripped-down versions of any style. European armsmasters mostly did not view their styles holistically, and were happy to teach techniques separately. Final choice in this matter lies with the GM.

COMBAT WRESTLING

16/17 POINTS

While open-hand forms were not usually very highly regarded in Europe, armsmasters developed an effective style of unarmed combat. Combat wrestling had no pretensions to elegance or nicety (the farthest the masters would go in this direction was to label certain moves "not convivial", i.e. not to be used in friendly bouts). Despite the name "wrestling," it included blows and kicks as well as holds and throws. The techniques were quite sophisticated, justifying the Judo and Karate Skill, but unlike many "soft" Eastern techniques the emphasis was never on allowing weaker fighters to turn the opponent's strength against him. Many combat wrestling moves required great strength to use, and the idea of a wizened old master effortlessly defeating a young student would have seemed preposterous to European teachers.

Combat wrestling was a fast and furious style relying mostly on infighting, though it also included some attacks used at arm's length. Fighters would circle each other, exchanging blows and looking for an opportunity to apply a hold or effect a takedown. Striking techniques were sophisticated (using the expanded Hit Location rules on p. CII53 is suggested), but kicks did not see much use. Throws designed to drop the opponent in some dangerous manner, preferably on the head, were a major feature. (A Judo Throw to drop the opponent on his head is at -6. To bring down

this penalty, the Hit Location (Judo) Maneuver is used. GMs may want to expand on the creative uses of "drop locations.") Most fights ended in close combat as one opponent crippled or knocked out the other.

Primary Skills: Judo; Karate

Secondary Skills: Body Language

Optional Skills: Knife

Maneuvers: Arm Lock; Choke Hold; Disarming (Judo); Elbow Strike; Eye Gouging; Face Attacks; Feint (Karate); Finger Lock; Ground Fighting (Judo); Head Butt; Head Lock; Hit Location (Judo); Hit Location (Karate); Neck Snap

Cinematic Skills and Maneuvers: Pressure Points (this models the reputed ability of master wrestlers to cripple limbs with excruciatingly painful blows).

DAGGER FIGHTING

14/- POINTS

Large, often double-edged knives with a strong thrusting point were the most common weapon of self-defense carried in Europe's cities. Consequently, martial arts teachers considered using them, and defending against them, a very important ability. Some such knives could be very long (up to 18" in length), almost shortswords. Soldiers sometimes carried these as secondary weapons.

New Weapon: Knife

Name	Type	Damage	Reach	Cost	Weight	MinST	Notes
Long Knife	imp cut	thr sw-2	C,1 1	\$120	1.5 lbs	6	-1 to Parry

Dagger fighting (sometimes also called dagger-wrestling, pointing to the strong role grapples and throws played in it) always was a morally dubious technique. It was taught regularly, but many good citizens questioned the motives of teacher and student alike as it would be of most use to footpads, burglars, and young hotheads looking for trouble. It is unlikely that this refined art was ever common among the underclass, but in a campaign that takes liberties with the truth it would be ideal for thieves. It was certainly popular among university students, apprentices, and wealthy young men with nothing better to do.

Dagger fighting was a fast and furious style alternating between intervals of circling each other at a distance and quick bouts of close stabbing, grappling, shoving, and punching. Students were taught to fight both with one and two blades, keeping the opponent at a distance with quick jabs until the saw an opening in his defense, then closing in for the kill. Great attention was paid to disarming moves, but it is likely that both sides would come out of such a fight badly cut at best.

Primary Skills: Brawling; Judo; Knife

Secondary Skills: Fast-Draw (Knife)

Optional Skills: Knife Throwing

Maneuvers: Arm Lock; Armed Grapple; Close Combat (Knife); Disarming (Judo); Eye Gouging; Face Attacks; Feint (Knife); Finger Lock; Knee Strike; Off-Hand Weapon Training (Knife); Retain Weapon (Knife)

Cinematic Skills and Maneuvers: None are recorded. Some tales of German masters would justify allowing them Toughness and/or Extra Hit Points.

Sword Forms

SHORTSWORD FIGHTING

16/24 POINTS

The shortsword was an unpopular weapon for much of the middle ages, but around 1250 blades around 2' in length appeared in the hands of foot soldiers. The high point of this development came in the late 15th and early 16th centuries in Germany, where such weapons were the normal sidearm of the *Landsknechte*. Many commoners throughout Europe used the handier, lighter and cheaper shortswords, and in some areas they were legally restricted to them, broadswords being reserved for the nobility. Shortswords, like daggers, could be worn with street clothes even in the city and used in tight corners.

Shortsword fighting was used by unarmored or lightly armored combatants relying on deft footwork and quick parries for their protection. Some used two swords, one to defend and the other to attack. The razor-sharp swords were primarily designed for cuts, though most had a stabbing point, and fighters were trained to defend themselves in close combat with hand parries, grapples, kicks and blows with the pommel.

Primary Skills: Brawling; Judo; Shortsword

Secondary Skills: Fast-Draw (Shortsword)

Optional Skills: Knife or Main-Gauche

Maneuvers: Arm Lock; Armed Grapple; Close Combat (Shortsword); Close Combat (Pummeling); Bind; Disarming (Judo); Eye Gouging; Feint (Shortsword); Ground Fighting (Shortsword); Hit Location (Shortsword); Improved Parry (Shortsword); Lunge (cut) (Shortsword); Off-Hand Weapon Training (Shortsword)

Cinematic Maneuvers: Dual Weapon Attack (Shortsword); Enhanced Parry; Fighting While Seated (Shortsword)

SWORD-AND-BUCKLER PLAY

14/20 POINTS

Fighting with the broadsword and buckler was a common method of self-defense among the nobility and bourgeois classes of Europe from at least 1250 onwards. It may well be much older than this as Germanic and Viking warriors were known to use their iron shield bosses in combat like bucklers after their light wooden shields disintegrated. Around the middle of the 13th century, metal bucklers are seen in illustrations on the swordbelts of unarmored knights and common travelers. This method of fighting appears to have been popular with the urban upper classes, students and clerics. Footsoldiers, especially archers, crossbowmen and handgunners, often studied it as a form of self-defense to use when their formations were broken. In a fantasy setting it is the natural choice for elves.

Sword-and-buckler fighting relied strongly on mobility and speed. The fighter faced his opponent squarely, keeping both sword and buckler pointing forward and keeping him at arm's length. Both cut and thrust attacks were used, as were shield bashes (thrust crushing damage, or swing crushing when swung, in which case the buckler cannot be used to Block that round. It is possible to sharpen the rim of a metal buckler -- convert swing damage to cut.) and quite sophisticated fencing moves. Wrestling grapples, trips, throws and kicks to exploit an opportunity to step into close combat were also part and parcel of the style. Though there was a sport form intended for public display and friendly competition, this was mainly practiced as a serious form of self-defense.

Primary Skills: Brawling; Broadsword; Buckler; Wrestling

Secondary Skills: Knife

Optional Skills: Fast-Draw (Broadsword)

Maneuvers: Arm Lock; Armed Grapple; Bind; Counterattack (Broadsword); Disarming (Broadsword); Feint (Broadsword); Kicking; Lunge [cut] (Broadsword); Lunge [thrust] (Broadsword); Retain Weapon (Broadsword)

Cinematic Skills: No cinematic feats are recorded of sword-and-buckler fighters.

Cinematic Maneuvers: Enhanced Block

SWORD-AND-SHIELD FIGHTING

8/- POINTS

In its prime in the early Middle Ages, the use of sword and shield in combat remained a popular style with soldiers until well into the Renaissance. It is likely that this style retained many elements of much earlier fighting methods practiced as far back as the Dark Ages. Unlike bucklers, shields were clearly military weapons and were not normally carried by civilians. They were popular both in Southern Europe (Spanish troops included sword-and-shield-men well

into the 16th century) and in the Celtic areas of Britain. In a fantasy campaign, this style will be close to ubiquitous as nearly anyone carries sword and shield.

After 1350, the shield was mostly an infantry weapon. A number of forms were used, with the round targe or rondache (Medium Shield, PD3) being the favorite. Targes could be made out of hardened leather (4 lbs, as carried in Scotland), plain wood (6-8 lbs, in use throughout Europe) or metal-covered wood (12 lbs, favored in Italy and Spain after 1450). Some targes came equipped with sharp spikes (thr impaling damage on a shield bash).

Our evidence for the style is slimmer than for most others, but apparently it emphasized deft footwork, fast stabbing attacks and fighting at arm's length, though it also included some wrestling moves. Fighters held their shields at chest height, blocking incoming attacks actively. Parries were rarely used. Attacks were made at range, lunging and jabbing at vulnerable points, and fighters needed much space to circle each other and gain an advantageous position. The aggressive use of the shield was taught regularly, with bashes being executed with the boss (thr cr) and the rim (thr+1 cr). As a desperate measure, fighters also used their shields to swing at the enemy (sw+2 cr, but the shield becomes unready).

Primary Skills: Broadsword; Shield; Wrestling

Secondary Skills: Brawling; Knife

Optional Skills: Acrobatics

Maneuvers: Attack and Fly Out; Counterattack (Broadsword); Feint (Broadsword); Hit Location (Broadsword); Lunge [thrust] (Broadsword)

Cinematic Skills and Maneuvers: Enhanced Block or Dodge would be in character.

LONGSWORD FIGHTING

19/- POINTS

The two-handed longsword was a popular weapon in later medieval central Europe after about 1350 until it was eclipsed by rapier-type blades. It represented a hybrid between a broadsword and bastard sword with a relatively light 30"-45" blade tapering evenly from base to tip and a two-handed hilt with wide quillons. The blade had a *ricasso* (unsharpened part at the base) extending almost halfway up. Fighters could grip the weapon by the hilt and ricasso for the 'half-sword' defensive stance not unlike that adopted with the staff, or place both hands on the ricasso of an inverted sword to use the Hook Maneuver with the quillons or hit the opponent over the head with the pommel (At 'half-sword' stance, only thrusting attacks can be made. Changing from the regular grip to either stance or back requires a full action. Changing from 'half-sword' to inverted sword or back is a free action.). Shorter versions were worn on the belt by civilians, being no more unwieldy than later rapiers, while larger types, approaching the bastard sword in weight and reach, were carried on the saddlebow or blank in the hands of knights fighting in the lists. The style was also taught to the *Doppelsoeldner*, wielders of fearsome 6-foot greatswords, and though it is unlikely that any fancy footwork or deft maneuvering was possible while being encumbered with such a weapon, all men aspiring to the privileged status of greatswordman had to produce a diploma from a recognized armsmaster certifying that they had mastered the longsword. As fantasy settings go, this style is a favorite of paladins and knights in shining armor, but the historical style is a bit too 'dirty' to appeal to the stereotype. The hulking barbarian warrior, on the other hand, should be quite happy with it as written.

New Weapon: 2-Handed Sword

Name	Type	Damage	Reach	Cost	Weight	MinST	Notes
Longsword	cut imp	sw+1 thr+2	1,2 1,2	\$600	4 lbs	7	Only the last third of the blade is sharp

Longsword fighting was used armored as well as unarmored. The blade was intended mostly for stabbing, though its forward section was sharp enough to deliver cuts. Armored fighters used an up-close-and-personal style involving many wrestling moves and bashing and battering while unarmored fencers, unprotected from the secondary cuts likely

to be inflicted by swordblades in a scrimmage, preferred to keep their distance, circling and feinting until they saw an opening to step in. Nonetheless the armored and unprotected techniques were considered the same by contemporary teachers.

Primary Skills: Brawling; Judo; Knife; Two-Handed Sword

Secondary Skills: Broadsword

Optional Skills: Fast Draw (Knife)

Maneuvers: Arm Lock; Armed Grapple; Bind; Close Combat (Pummeling); Counterattack (2-Hd. Sword); Disarming (2-Hd. Sword); Disarming (Judo); Ground Fighting (Knife); Hit Location (2-Hd. Sword); Hook (2-Hd. Sword); Improved Parry (2-Hd. Sword); Kicking; Knee Strike; Lunge [thrust] (2-Hd. Sword); Retain Weapon (2-Hd. Sword)
Cinematic Skills and Maneuvers: Both Enhanced Dodge and Enhanced Parry fit the bill, but no truly cinematic feats are recorded of the masters of this weapon.

Optional Rule: The Longsword Fighting style uses the Improved Parry Maneuver that is canonically reserved for light, swift weapons. It is perfectly feasible with the common longsword types about 3 feet in length and 3 lbs in weight, but increasingly unlikely to work with the weapons normally used with the Two-Handed Sword Skill. Instead of forbidding it outright with the heavier blades, GMs could resort to the following rule: Improved Parry can be used with bastard swords and greatswords if the wielder's ST exceeds the MinST for these weapons (wielded two-handed) by 4 or more. Every point of ST below this limit will give a -1 penalty to Parry. Fighters gripping the sword by the hilt and ricasso in the 'half-sword' stance are considered to have +2 to effective ST for this purpose.

Polearm Forms

STAFF FIGHTING

11/18 POINTS

The staff, while essentially a poor man's weapon, was mastered by many formally trained fighters. Several armsmasters regarded the use of the staff as the foundation of all spear and polearm work and the techniques were similar enough to justify that view. Contrary to the common stereotype, the staff was not the weapon of the peace-loving or nonaggressive. Ruffians going about the highways carrying long staves with iron ferrules or points (thr+2 imp. Use the Spear Skill to stab effectively. Changing grips requires a full action) were the terror of the countryside in unsafe times. Historically, the staff was largely a plebeian weapon, and in a fantasy campaign it is best placed in the hands of stout peasant lads and merry outlaws. Elves may take to it, but will probably dislike the iron points.

Some staves were as long as 12', which forbade their use as a quarterstaff. These were wielded with the Spear Skill (as a regular quarterstaff can be -- increase swing damage by 1), sacrificing defensive ability (1/2 Parry instead of 2/3) for increased reach and damage.

New Weapon

New Weapon: Spear

Name	Type	Damage	Reach	Cost	Weight	MinST	Notes
Long Staff	cr	sw+3	1,2,3	\$20	6 lbs	9	
	cr	thr+1	2,3				

Staff fighting depended on keeping the opponent at a distance with the weapons held ready between the fighters. Long periods of circling, feinting and sparring alternated with furious attacks to vulnerable targets. Once come to grips the fighters grappled, kicked and pushed, trying to disarm the opponent and using their weapon for extra leverage in takedowns and holds.

Primary Skills: Brawling; Staff; Wrestling

Secondary Skills: Spear; Knife

Optional Skills: Parry Missile Weapons (Staff)

Cinematic Skills and Maneuvers: The staff had little mystique attached to it, and no miraculous abilities are recorded of its wielders. Enhanced Parry and Power Blow would be in character.

SPEAR FIGHTING

9/- POINTS

The boundaries between staff and spear fighting were fluid, but the armsmasters distinguished certain techniques suitable for the one or the other. While spears had been used in concert with shields for most of the middle ages, by the time the sources give us any clear idea of their use they were wielded two-handed with a defensive stance taken from the Staff technique. Historically, spears had become uncommon by the later Middle Ages, being carried mostly by huntsmen. Some royal guards used spear-style polearms like the partisan. Fantasy savages from the fringes of the civilized world should adapt well to this style.

Spear fighting, like staff fighting, was done at a distance with the opponents circling, jabbing and parrying before closing in with a killing attack. Failing that, fighters could go into close combat, mastering a sophisticated array of wrestling moves.

Primary Skills: Spear; Staff; Wrestling

Secondary Skills: Brawling; Knife

Optional Skills: Parry Missile Weapons (Staff); Spear Throwing

Maneuvers: Arm Lock; Back Strike (Spear); Lunge (Spear); Spinning Strike (Spear); Sweep (Spear); Tip Slash (Spear)

Cinematic Skills and Maneuvers: None of the near-miraculous feats that embellish the records of other weapons are recorded with the spear.

POLEARM FIGHTING

11/18 POINTS

While appearing clumsy and slow, the manifold variations on the polearm theme (bills, glaives, and halberds being the most common) were used by the armsmasters with consummate skill in a complex and brutal, aggressive style. Most polearms were relatively light (5-7 lbs) and between 6 and 8 feet in length, and could be used in a Staff grip for a defensive stance. They often had metal ferrules or even spikes attached to the butt to allow secondary attacks.

Polearm fighting was a varied style, using the strengths of the design in hand (a forest bill being used to trap an attacker's blade while the halberd's forte lay in its hook and long stabbing point). Fighters would circle each other, sparring for an opening before stepping in to attack. Parries were made with blade and haft alike, and some masters taught refined counterattacking techniques. Hooks on the blades could be used to disarm, trip or unsaddle the opponent. Wide swings were discouraged in favor of stabbing attacks, though they were often used to dispatch fallen or disarmed foes.

Primary Skills: Brawling; Polearm; Staff

Secondary Skills: Knife; Wrestling

Optional Skills: Parry Missile Weapon (Staff)

Maneuvers: Counterattack (Polearm); Disarming (Polearm); Feint (Polearm); Hook (Polearm); Kicking; Knee Strike; Spinning Strike (Polearm); Sweep (Polearm)

Cinematic Skills and Maneuvers: None are expressly related in the sources but both Power Blow and Enhanced Parry would be in character.

POLEAXE FIGHTING

10/- POINTS

For a brief period in the 14th and 15th centuries, the poleaxe (or warhammer) gained popularity as a knightly weapon, being used in battle and in duels. Poleaxe fighting was a sophisticated style that remained popular as a sport form (with wooden axeheads) well into the Renaissance period. It probably has roots going very far back in time, perhaps as far as the great Danish axes of the Viking period. By the time the manuals began describing it, poleaxe fighting was a chivalrous style popular with the nobility and those who liked to ape their betters. Unlike a sword or dagger, a poleaxe could not be carried with street clothes and the whole style was geared to fighting in heavy armor. In a Fantasy campaign this one is the natural choice for dwarves.

Poleaxes were gripped two-handed like a quarterstaff, with the hands spaced far apart and the shaft held diagonally across the body. The emphasis was on close-in fighting, parries and jabs rather than wide swings that use the weapon's full power but expose the wielder. Hooking the axe's beak, blade or spike behind the opponent's weapon, leg or neck was another trademark technique. Some poleaxes were fitted with a concealed hollow space in the axehead to hold an irritant "blinding powder" (treat as Tear Gas, p. B132) that was spilled in the opponent's face (roll vs. Polearm-4 to release it, Active Defenses do not protect. However, every time the axe is used with a swinging attack there is a 2-in-6 chance of the powder being spilled accidentally, and any critical failure can spill it on the user.). The method was unfair, but effective.

Primary Skills: Polearm; Wrestling

Secondary Skills: Brawling

Optional Skills: Knife

Maneuvers: Arm Lock; Disarming (Polearm); Hit Location (Polearm); Hook (Polearm); Knee Strike; Retain Weapon (Polearm); Spinning Strike (Polearm); Sweep (Polearm)

Cinematic Skills and Maneuvers: None are recorded.

Dork Tower!

Pyramid Pick

The Witchfire Trilogy, Book One: The Longest Night (for d20)

Published by [Privateer Press](#)

Written by Matt Staroscik

Art by Brian Snoddy and Matt Wilson

64 pages; \$9.95

Since the release of *Dungeons & Dragons Third Edition* in August 2000, many companies have taken advantage of the Open Gaming Licence to release their own adventures for the game. A wide range are available, most of which are fairly standard flavored *D&D*. Some companies have gone further; Necromancer Games, for example, has looked back to the first edition *AD&D* for their inspiration, while Green Ronin mixed pirates with the Cthulhu Mythos in their *City of Freeport* setting. Now these companies have been joined by another.

The Longest Night is Book One of the *Witchfire Trilogy*, the first release from Privateer Press. This book offers a new campaign background in the form of the Iron Kingdoms, as well as a long scenario using this setting. The Iron Kingdoms is a world that combines technology and magic in the form of steam power, guns, and lumbering robots known as Steamjacks. These are powered by magical means as much as they are by technological. For example, Steamjacks are magically created but require coal to run, and guns do not use gunpowder as a propellant, but silk pouches of magical blasting powder that need to be individually created for each weapon. Such technology is uncommon, but serves to give the setting of the Iron Kingdoms a darker and slightly grimmer feel than the normal *D&D*, though still with the fantastical elements of that genre.

This dark tone is carried over into the look of the book. Matt Wilson's cover is ominously threatening, though as much as I like it, it does give away an important plot point! Brian Snoddy and Matt Wilson illustrate the inside of *The Longest Night* and their art compliments the oppressive feel of Matt Staroscik's writing, although it does have a slightly cartoon-like quality. Fans of Brian Snoddy's work on the *Friedey's Restaurant* games from Cheapass Games will be pleased to see that he gets to draw a zombie or two! The layout of the book isn't ornate, with useful information set aside in grey boxes, though it does have a couple of minor problems; there is an occasional spelling error, and the maps could be a little lighter, although they can still be read without any difficulty.

(SPOILER ALERT!)

The adventure is set in and around the town of Corvis, known as the City Of Ghosts, in the small Kingdom of Cygnar. The party travels to Corvis whilst guarding a caravan along the muddy trails through the swamp and forest surrounding the town. Once there, they are asked by a priest to investigate a recent spate of grave robberies in around Corviss.

After investigating each robbery, the characters discover that the disappearances are somehow linked to a witch trial that took place a decade earlier, and the priest suggests that the tomb of the witches should be their next port of call. This is the first of several trips that the party will make deep into the swamps around Corvis. Combined with an exploration of the warrens beneath the town, they can learn not only who is behind the robberies, but why they are doing it and the fact that they are assembling an army of undead to strike at Corviss on the Longest Night, a masked celebration for all of the townspeople held each year on the night of the lunar eclipse. This ends in a rousing climax

between the adventure's major protagonists, which is nicely handled considering the experience levels of those involved.

(END SPOILER ALERT)

Although this adventure is designed for three to four characters of first and second levels, it is perhaps a little too tough for so few characters. This might be a particular problem if the players are inexperienced. Otherwise this is a complex adventure, which has been given room to breathe in the 64-page format. There is opportunity aplenty for both role-playing and combat, although possibilities for material reward are rather slight. Magical items in particular are few in number, but they are actually woven into the setting. By giving each item a history and background, the author helps bring the setting of the Iron Kingdom further to life, even if only a little. One major oversight is the lack of suggested rewards for the actions undertaken by the players during the course of play, but this is my only serious complaint.

For many who read this book, it will be a disappointment to them that there is little detail given about the Steamjacks of the Iron Kingdoms. Enough information is provided to cover their appearance during the adventure, but the actual game statistics are not present. This has been rectified with the information being available through a link on the Privateer Press web site, but hopefully this information will appear in the next book in the Witchfire Trilogy.

In this, their first release, Privateer Press have done a great job of laying the groundwork for the Iron Kingdoms as a campaign setting. They provide enough information to get a feel for the town and area surrounding Corvis as well as giving a long adventure that is both interesting and challenging. With the addition of steam-powered technology, the Iron Kingdoms is not steampunk, but rather a steampunk-esque setting. Were it not for these aspects of the background, it would draw strong comparisons with the grim Old World setting of *Warhammer Fantasy Role-Play*. (Referees of that game may not want to run *The Longest Night* because of the steamjacks, but it is certainly worth them taking a look at this book.)

The Longest Night is the first part of what looks to be an excellent trilogy of adventures. Not only is the setting interesting and just that ever so slightly different from other D&D3e books, it also comes at an attractive price. Privateer press is to be applauded for the quality of their first release and let us hope that the next is equally as good.

-- *Matthew Pook*

The Waste Land Is A Terrible Thing To Waste

*"Ganga was sunken, and the limp leaves
Waited for rain, while the black clouds
Gathered far distant, over Himavant.
The jungle crouched, humped in silence.
Then spoke the thunder."*

-- T.S. Eliot, *The Waste Land*, 395-399

April is the cruelest month. Or so I've heard, anyway. I've also heard you should fear death by water, and that I should consider Phlebas, and that someone will show me fear in a handful of dust. And, at my back from time to time I hear the sound of horns and motors. I've heard it all (especially the horns and motors at my back) from the same place that you likely have, from T.S. (Thomas Stearns) Eliot's absolutely epochal poem *The Waste Land*.

For those who plan on using this column as more than a shadow under a red rock, I'd recommend biffing off and reading it [here](#), complete with Eliot's original footnotes. Yes, you read that right; the poem is so dense with allusion and metaphor and reference and meaning that the poet himself had to footnote it so that people would get it. (He later unhelpfully mentioned that the notes were a "remarkable exposition of bogus scholarship," and more popular than the poem itself -- whatever else you say about him, ol' Tom had a sense of humor.) Which makes *The Waste Land* kind of an ur-Suppressed Transmission, the city over the mountains cracked and reformed and burst in the violet air, with nothing but the stony rubbish of modern literature all around it. Reason enough, then, for this withered stump of a column.

*"My nerves are bad to-night. Yes, bad. Stay with me.
'Speak to me. Why do you never speak? Speak.
'What are you thinking of? What thinking? What?
'I never know what you are thinking. Think.'"*

-- T.S. Eliot, *The Waste Land*, 111-114

Eliot wrote *The Waste Land* in the winter of 1921-1922 as a lament for the desolation of Western civilization following World War One, although some of its passages date back to Eliot's arrival in England in 1914. Eliot wanted to strip out the meaningless connectives from the poem, creating a kind of mosaic or impression based on juxtaposed images (rather like a series of Tarot cards, actually) of startling clarity -- emotionally, if not intellectually. He succeeded brilliantly. However, this left him with a serious problem; how to structure the poem itself -- how, in a work now free of narrative, to introduce a narrative spine.

*"What are the roots that clutch, what branches grow
Out of this stony rubbish? Son of man,
You cannot say, or guess, for you know only
A heap of broken images, where the sun beats."*

-- T.S. Eliot, *The Waste Land*, 19-22

Relatively late in the poem's composition, as far as we can tell, Eliot decided to use the myth of the Grail and the Fisher King as his spine. (His experience reading Joyce's *Ulysses* in manuscript certainly inspired him to use mythology thusly, although Joyce didn't appreciate it.) In his notes, Eliot says that "Not only the title, but the plan and a good deal of the incidental symbolism of the poem were suggested by Miss Jessie L. Weston's book on the Grail legend: *From Ritual to Romance*," which appeared in 1920. Both Weston and Eliot also drew heavily on our old buddy J.G. Frazer's *Golden Bough*, especially "certain references to vegetation spirits" -- specifically, the Dying God Attis/Adonis/Osiris and his connection to the maimed (dead) and healed (reborn) Fisher King. Eliot also openly credits Dante, the Bible, Buddhist scriptures, the Upanishads, Jacobean playwrights, and classical myth taken straight.

*"Madame Sosostris, famous clairvoyante,
Had a bad cold, nevertheless*

*Is known to be the wisest woman in Europe,
With a wicked pack of cards.."*

-- T.S. Eliot, *The Waste Land*, 43-46

But what pops to us gamer types, of course, is that business with the Tarot and the Holy Grail. As early as the first book publication of *The Waste Land*, Eliot begins to back away from that precipice; his note to line 46 says that he is "not familiar with the exact constitution of the Tarot pack of cards, from which I have obviously departed to suit my own convenience." Not satisfied to leave matters there, in 1956 he tried to back off the whole theme, saying: "It was just, no doubt, that I should pay my tribute to the work of Miss Jessie Weston. But I regret having sent so many inquirers off on a wild goose chase after Tarot cards and the Holy Grail." To quote almost the only poet more quoteable and Suppressible than Eliot, the lady doth protest too much, methinks. In *The Birth of Modernism: Ezra Pound, T.S. Eliot, W.B. Yeats, and the Occult*, critic Leon Surette argues that Eliot, Pound, and Yeats were all associated in some fashion with the Occult Revival of the 1890s through the 1920s -- Yeats, obviously through the Golden Dawn, and Pound (who would later wage a bitter, maniacal literary war against global banking conspiracies) through Yeats. Pound, of course, edited *The Waste Land*, and Eliot dedicated the poem to him. Eliot was very familiar with Indian mysticism, later mentioning (as a cover?) that at the time he wrote the work, he had considered conversion to Buddhism. (Defection to Shangri-La?) Jessie Weston implied that the Grail was a Gnostic initiation cult, and that she gained her insights through friends' access to secret traditions. She may, hints Surette, have been a Theosophist, which paints an interesting picture of the eldritch Madame Blavatsky as Eliot's Madame Sosostriis, and the poem as initiatory ritual liturgy.

*"(Come in under the shadow of this red rock),
And I will show you something different from either
Your shadow at morning striding behind you
Or your shadow at evening rising to meet you;
I will show you fear in a handful of dust."*

-- T.S. Eliot, *The Waste Land*, 26-30

So now that we have a comfortably conspiratorial hook on which to hang the poem, how do you use it in a game? Any way you want to, of course. Since Eliot ties so much to the poem, you can piggyback on his allusions without too much sweat; snag a copy of B.C. Southam's *A Guide to the Selected Poems of T.S. Eliot* and go crack some books. Or, since Eliot has so many hooks and threads, you can add your own -- although Eliot seems ignorant of kabbalah, only a true spoilsport would insist that there's no meaning in the poem's 433 lines, 433 being a prime number between 432 ("world") and 434 ("door"). Perhaps a **GURPS Cliffhangers** team of two-fisted literary critics can hear of a dangerous poem opening incantatory doors to the Waste Land, or some modern (or Modernist) game can involve stumbling on the Gnostic Banking Conspiracy (the Gnosis of Zurich?) that Pound tried to emasculate by editing Eliot's invocatory work.

Even easier, you can simply sprinkle your game with Eliot quotes for creepy purposes. Why kill yourself coming up with disturbing phraseology when the greatest poet of the last century already has? "Fear death by water" is the most famous, probably, but "Tell her I bring the horoscope myself: One must be so careful these days," to pick a line (lines 58 and 59, specifically) virtually at random, makes a horripilating thing for a strange voice to rasp on the phone at midnight. (Why was the voice raspy? "Madame Sosostriis had a bad cold," I'd guess) The next stage is to borrow Eliot's imagery for creepy purposes, especially if your game already ties to the Grail, Gnosticism, human sacrifice, King Arthur, Christ, desolation, or the Tarot. Put a hyacinth girl, or a drowned Phoenician sailor, or a sprouting corpse, or "towers upside down in air" or "voices singing out of empty cisterns and exhausted wells" into your game and see if I'm not right. For some concrete examples, check out how Tim Powers did it in his modern fantasy novel *Last Call*, or Martin Rowson did in his surreal P.I. noir comic *The Waste Land*. Eliot also makes a fine example of parallelism and bisociation, especially of including the mundane ("Hurry up please it's time") alongside the sublime ("Shantih. Shantih. Shantih.") -- an important element in horror, urban fantasy, and conspiracy gaming.

*"April is the cruellest month, breeding
Lilacs out of the dead land, mixing
Memory and desire, stirring
Dull roots with spring rain."*

*Winter kept us warm, covering
Earth in forgetful snow, feeding
A little life with dried tubers."*
-- T.S. Eliot, *The Waste Land*, 1-7

As a final example, I'll limn a loosely-scripted *GURPS Bunnies and Burrows Waste Land* campaign. It's sketchy, but surprisingly complete given that all I did was reread Eliot while looking for rabbits. (Maybe it's the Easter candy talking, but go ahead and imagine a rabbit declaiming the seven lines above -- I dare you.) In the first act ("The Burial of the Dead"), we discover that the Downs are dying, laid waste by the hubris of some King Rabbit, who committed some grave crime, perhaps motivated by a young female rabbit named Hyacinth. Our heroes cast lots, and possibly meet the wizard-rabbit Stetson, who has some necromantic plan involving planted rabbit corpses and an army of undead conies. ("Oh keep the Dog far hence, that's friend to men/Or with his nails he'll dig it up again!") In the second act ("The Game of Chess"), they meet the (dead?) Queen, discover elements of insanity and infertility deep within the warren, and cross paths with the Rats, who can be the Nazgûl types in our story, and are abusing Stetson's foolish plan for their own ends. ("I think we are in rats' alley/Where the dead men lost their bones.") In the third act ("The Fire Sermon") the heroes uncover the Crime ("Musing upon the king my brother's wreck/And on the king my father's death before him") by Water, and hear (from Stetson, dying of Rattish treachery?) that the land must be purged by Fire, probably involving the "sound of horns and motors" and the "Isle of Dogs." The fourth act ("Death By Water") is very short, wherein the heroes finally meet the dead King (the victim of the death by water). The fifth act ("What the Thunder Said") features a trip along "rock and no water and the sandy road" where a mysterious "third figure" aids them. They somehow (Compassion? Alms? Control?) activate the voice of the thunder (A bomb? A cloud-seeding airplane?) and although it shatters their world to ruins, it opens the path for "a damp gust bringing rain" and, eventually, peace.

Lop. Lop. Lop.

by **Chris Aylott**

Once upon a time, roleplaying games were leisurely affairs. Adventures stretched for hours, and there was always time for a digression, a snack, or a long discussion of just how to whack the Orcus over the head and take his wand.

Those days are gone in the hyper-acceleration of the Internet Age. There's always time for snacks and digressions, but actual playing time is getting hard to find.

Fear not! There are Solutions. With these helpful hints -- and just a bit of GM sadism -- you'll be blazing through adventures and still a few minutes to call the pizza delivery.

***PARANOIA* combat -- it's not just for *PARANOIA* any more**

Greg Costikyan's *Paranoia* is one of the comedy classics of roleplaying, but any game can use its fundamental combat principle: fights are fast and scary. If you need to think, you're already dead.

Paranoia GMs point at their players and give them three seconds or less to announce an action. If a player dithers, his character does nothing. Players quickly learn that almost any action -- even an insanely risky one -- is better than doing nothing at all.

The toughest part about this kind of point-and-shoot style is keeping the current situation clear for the players. Quick recaps at the beginning of each combat round can help, but a flexible attitude helps even more. If the player misplaces a piece of scenery or mixes up the situation a little, roll with it! An exciting combat action beats an argument over continuity any day.

Reward impulsiveness

Most tricks and traps are designed to punish the foolhardy. This is a good thing; nothing feels better than folding, mangling and spindling a player character who really should have known better. But players have a discouraging tendency to learn from these experiences, and careful players are just a step away from being dull players.

The fast GM encourages his players to kick that door open and march on through. They'll never believe that you have their best interests at heart -- they're not dumb -- so give them some incentives. Let them surprise the stormtroopers on a cigarette break, or spot the secret door just as someone closes it. Make them glad they just charged on in.

Players aren't dumb, but they are optimists. Give them a reasonably equal mix of reward and trickery and they'll hope for the reward every time. Then they'll walk right into your vicious scything spiky door trap.

Be illiterate

We all love rulebooks. They inspire, they illuminate, they resolve potentially life-threatening disputes about the weight of tech level 9 batteries.

Throw them out.

Okay, you can keep them on the table, where they look authoritative and can backstop your dice throws. Don't open them. If you don't have the answer memorized, make it up. Every minute you spend looking things up is a minute without clever dialogue, breath-taking descriptions, or obscene damage rolls.

You can't keep your players out of the books, of course. Most PCs are complex enough that their players need to look up a couple of maneuvers or spells during the game. That's fine -- but don't let them do it when you're interacting with them. They can look things up when you're dealing with other players. If you need an answer now and they don't know it, make it up.

Make the clock tick.

Deadlines have a marvelous way of focusing the attention -- especially deadly deadlines. The ticking bomb, the sinking fuel gauge, and the parents driving back from Schenectady all give the players a reason to pick one of their plans and put it into action.

Don't be afraid to let time pass a little faster than is realistic. Sure, the players' discussion may have only been going on for ten minutes, but you can count down a lot more game time if you like. If you're compressing game hours into a few minutes, it helps to let the scenery reinforce the clock. Tell them how bad their 23rd cup of coffee tastes, or describe the lengthening shadows as the sun sets and the vampires get ready to feed again.

It doesn't hurt to review the players' options and plans as you count down to your ominous deadline. If they're having trouble deciding, you can even steer them towards or away from a particular plan as you recap. If they can't decide which side of the cliff to go up, you can emphasize the slick, dangerous rocks on one side in your summary of their plan.

Turn the villains loose

Even if you don't have a specific deadline for your heroes, you can move your players along by reminding them that other characters have plans of their own. If they know Dr. Zargo has nearly assembled his Orbital Cattle Prod, they'll know they have to get moving and stop him.

A little third-person omniscient description can be very helpful here. Shift the scene, showing them just enough about what the villains are doing to get them worried. The early Bond films are a perfect example of how to use this technique -- Ernst Stavro Blofeld plotted against Bond for years, and moviegoers saw nothing of him but his hands and his fluffy white cat.

"Wipe them out. All of them."

Raymond Chandler was right. Nothing kick-starts a plot like two thugs firing tommy guns through the window. If the players get stuck, don't hesitate to get them moving with a few well-placed bullets.

There's a catch. Some players will take the threat of violence as a reward, not as a plot complication. Unless there's a cost, players have every reason to sit back and let the GM make things easier for them.

The men with the tommy guns should be more than a hint and an empty threat. Shoot at a PC or two. Wound or even kill one. Kidnap a Dependent. Destroy Earthforce One. The PCs should always learn something important from an encounter that puts the plot back in gear, but they should also pay a price for that knowledge.

The equipment montage

If the players are running scared -- if they know they have to plan fast before they act and think on their feet when they do -- then most of your battle for gaming time is won. Just one more deadly trap threatens your game.

The shopping trip.

Players love gear. Nobody knows why. It's not like their stuff is really going to help them, because you're going to make sure they break, lose, or expend anything that would make their lives too easy. Maybe they just want to distract you with long equipment lists.

Don't let them. Hide the lists under those rulebooks you're not opening. Let each player decide whether her character has a little stuff, some stuff, or lots of stuff. Assign appropriate encumbrance penalties and use it as a guide to determine how likely they are to have the specific item they need. That gives them room to be creative and puts the focus on how they use their equipment instead of how much stuff they can write down ahead of time.

Of course, this method misses out on one of the grand old traditions of heroic fiction: the "arming the hero" scene, where a story's protagonist straps his special armor and weapons and prepares for a great battle. Achilles had his arming the hero scene when he went to fight Hector. So did Aeneas and Neo, and your players deserve one too.

Enter a fast-paced "arming the hero" scene for the television era. It's the *A-Team* Equipment Montage.

Just before the final confrontation of every *A-Team* episode, Hannibal Smith and his merry men would work up the Gadget of the Week. The theme music would play. Materials would be gathered. Mr. T would weld. At the end of the scene, they had just what they needed to defeat the Bad Guy.

With the magic of nostalgia, you can do this too. Go from player to player, giving each of them a "camera shot" to describe a piece of equipment they are obtaining or preparing. Let their creativity run wild -- if it's even remotely plausible for them to find or create the item in question, they can have it. They can each get their own item or they can work together to create one big Gadget of the Week.

Hum the *A-Team* theme while they describe their contributions. It adds atmosphere -- and the montage ends when you finish the theme. If they don't keep their scenes brief, somebody doesn't get a turn. With a little practice, they'll learn to pace themselves so that they're ready just as the theme ends -- just like on TV.

Will their special gear be useful? Maybe -- this is gaming, not fiction, and not everything happens according to plan. But if they've been using their heads, it should be easy to work at least some of their toys into the climax of the adventure.

One more thing: don't forget to include a shot of Mr. T welding. Sometimes playing fast has to take a back seat to tradition.

A Variant for Dino Hunt

by P.D. Magnus

"Last Tuesday, a temporal rift opened in the Pacific Ocean off the coast of Southern California. Scientists at Scripps Oceanographic Institute report that it was caused by solar flares leading to shifting tachyon densities beneath the Earth's crust. Some local leaders lay blame the scientists themselves, echoing rumors that the Navy has been performing offshore tests of a parachronic weapon. Whatever the cause, the rift has drifted toward the coast and made land fall near the city of San Diego. Creatures from the prehistoric past, dragged across the timestream, are terrorizing communities up and down the coast. There is hope that the effect will subside eventually, but will that be before or after the city is destroyed?"

Dino Hunt is a great game, but it doesn't really give the dinosaurs a chance to cut loose. Jurassic Park, a movie about a dinosaur zoo, had a sequel in which a dinosaur rampages across San Diego. Now Dino Hunt, the game about collecting for dinosaur zoos, has a variant in which hordes of dinosaurs stalk through the city!

In Dino Rampage, each player takes the role of a team of scientists with a time machine, defending the city and attempting to send the wayward dinosaurs back to their own time.

What You'll Need

- 1 pawn for each player
- 1 Energy Track for each player
- 1 Energy Marker for each player
- a pile of dinosaur cards from Dino Hunt
- 3 6-sided dice
- the City Map
- 8 Mission cards

Most of these are in the Dino Hunt boxed set. You'll need to provide 2 dice of your own. The City Map and Mission Cards are provided here as a PDF file, which you can read and print out from Adobe's Acrobat Reader. If you don't have Acrobat, you can get it for free at <http://www.adobe.com/products/acrobat/readstep.html>. They are also provided as JPG files.

You can print the map and cards on cardstock if you like, but you won't have to move them around or handle them once the game gets started. Printing them on paper works just fine.

[Click to download the City Map and Mission Cards in PDF](#)

Starting the Game

1. Shuffle the Dinosaur cards. Set the Specials aside; you won't need them to play Dino Rampage.

As in Dino Hunt, the size of the Dinosaur deck controls the length of the game. Moreover, in Dino Rampage a larger Dinosaur deck increases the likelihood that the saurians will gain the upper hand and destroy parts of the city.

2. Shuffle the Mission deck. Each player draws one Mission Card, looks at it, and keeps it hidden until the game is over. Put the rest of the Mission deck aside.
3. Put the City Map in the center of the table. The map represents the coastline, running from Tijuana, Mexico north to Ocean Beach, California.
4. Each player gets an Energy Track and an Energy Marker. Decide who goes first in some equitable way. Play proceeds clockwise.

How The City Gets Destroyed

The Score listed on each Dinosaur card is a rough measure of its ferocity. Each neighborhood has a maximum dinosaur capacity, indicated in the lower right of each on the City Map. If the total Score of the dinosaurs in a neighborhood ever exceeds this number, that neighborhood is destroyed. When this happens, immediately gather the Dinosaur cards from that neighborhood together in a stack and put them face down on top of the space on the Map.

Since the neighborhood is destroyed, there is no longer any point in hunting the dinosaurs there. No new dinosaurs may be placed there. If dinosaurs flee an adjacent neighborhood, they pass through the destroyed neighborhood to one on the other side.

Coronado Island and Downtown are two separate areas. To put dinosaurs in Coronado, place the Dinosaur cards above the City Map. To put them Downtown, place the cards below the Map. Coronado and Downtown have their own maximum capacities, and it is possible for one to be destroyed while the other remains.

Taking a Turn

1. *Recharge!* Move your Energy Marker to 10.
2. *Watch for Dinosaurs!* Take the top 3 cards from the Dinosaur deck and roll the dice. Each die indicates where one of the Dinosaur cards must go. Each neighborhood corresponds to a number, as indicated on the City Map. For each 6 you roll, you may decide where to place one of the dinosaurs. Although the dice determine where you can place Dinosaurs, you decide which of the three dinosaurs to place in each neighborhood.

If you roll a 1, for instance, then you must put a dinosaur in Tijuana; if you roll two 1's, then you must place two of the dinosaurs in Tijuana; and so on.

If any neighborhood's maximum capacity is exceeded by the dinosaurs you've put down, that neighborhood is destroyed.

Coronado Island and Downtown are two separate neighborhoods. If you roll a 3, you may put a dinosaur in your choice of either Coronado or Downtown.

Hillcrest is an in-land neighborhood, so you can't put any aquatic creatures there.

You can not put dinosaurs in a neighborhood that has already been destroyed. If you roll the number of an area that has been destroyed, put the dinosaur in the next highest area. If all the higher-numbered areas have been

destroyed, put the dinosaur in the area of your choice. For example, if you roll a 1 after Tijuana has been destroyed, then place a dinosaur in National City; if National City has also been destroyed, place it in Coronado or Downtown; and so on.

3. *Protect the City!* Just as in Dino Hunt, you move and hunt on your turn.

Movement

Schlepping your equipment across town requires considerable effort. Moving 1 space along the City Map costs 1 Energy. You should allow extra time when crossing the border; travelling between Tijuana and National City in either direction costs 2 Energy.

Note that Coronado Island and Downtown are separate neighborhoods. It costs 1 Energy to move between them.

The Hunt

To initiate a hunt, announce which dinosaur you intend to hunt. You must be in the same neighborhood as the dinosaur. Roll one die and compare the result to the table on the Dinosaur card for the dinosaur that you are hunting. The tall buildings Downtown make it easy to ambush dinosaurs; if you are hunting Downtown, add +1 to your die roll.

If you roll a "Capture!" result, you have successfully sent the dinosaur back to its home time. Spend the indicated Energy, then remove the Dinosaur card from the Map and put it in front of you. Sending dinosaurs back to the past is one way to score points in Dino Rampage.

If you roll a "Missed!" result, you have failed to send back the dinosaur. Spend the indicated Energy. If you have enough Energy left, you may hunt again.

So far, this is just like hunting in Dino Hunt. However, dinosaurs who escape from hunters in San Diego are still rampaging around the city! If you roll an "Escape!" result, spend the indicated Energy cost but do not remove the Dinosaur card from the table. Instead, move the card to an adjacent neighborhood of your choice. If adding that dinosaur exceeds the neighborhood's maximum capacity, then the neighborhood is destroyed.

If you roll any other result that directs you to discard the Dinosaur card, move the dinosaur to an adjacent neighborhood instead.

If a dinosaur flees toward an adjacent neighborhood that is already destroyed, put the Dinosaur card in the first neighborhood in that direction that is not destroyed. When only one neighborhood remains, there is nowhere else for the dinosaur to go; leave it where it is.

Balboa Park is home to the San Diego Zoo. Dinosaurs fleeing through the park may wander into the zoo and settle down, belaying their rampage. Any time a dinosaur flees from Coronado or Downtown into Hillcrest or from Hillcrest into Coronado or Downtown, roll a die. On a roll of 5 or 6, the dinosaur has wandered into the zoo. Remove it from the Map and set it aside. It does not go into anyone's pile. This is the only way besides a successful hunt that dinosaurs can be removed from the Map.

Ending the Game

The game ends when either all the dinosaurs have been hunted successfully or all the neighborhoods have been destroyed.

Your score is the total Score value of all the dinosaurs you sent home, plus a bonus if you've completed your Mission.

Mission Cards

There are eight Mission cards which give players secret goals during the game. The PDF file contains the cards in nicely-formatted card shapes, but for your convenience the text of the cards is given below.

- **Diplomacy:** If Tijuana is not destroyed, you get a 20 point bonus at the end of the game.
- **Gaslamp:** If Downtown is not destroyed, you get a 40 point bonus at the end of the game.
- **Hotel Investor:** If Coronado Island is not destroyed, you get a 50 point bonus at the end of the game.
- **Nationalist:** If National City is not destroyed, you get a 30 point bonus at the end of the game.
- **Pride:** If Hillcrest is not destroyed, you get a 30 point bonus at the end of the game.
- **Surf:** If Ocean Beach is not destroyed, you get a 25 point bonus at the end of the game.
- **Terrorist:** You get a 10 point bonus at the end of the game for each neighborhood that is destroyed.
- **Zoo Keeper:** You get a bonus equal to the value of any dinosaurs that fled into Balboa Park and stayed in the zoo.

Further Variation

Although many Specials (like Extinctions) are inappropriate for Dino Rampage, others would work just fine. You could easily sort out the latter and use them to spice up the game. To turn things up even more, try Dino Rampage with custom decks. See the [Deck-Building Rules](#) from several months back.

No Place Like Home

by **Dmitri Scull**

Where one lives is an important facet of one's personality, especially if one has a physical or spiritual link to that home, such as many fantasy races do. From the mythical dryads and naiads, to beings from other realities, many races have ties that bind them to their home.

The following optional advantage and disadvantages for *GURPS* represent such ties (or lack thereof, in the case of Wanderlust) that a race or individual might have. While most of the following are supernatural in nature, Territorial and Wanderlust can be taken by anyone (and many animals are naturally Territorial). In addition, Linked Personality Shift, if taken to represent an animal character's reactions to the seasons, is also quite fitting.

Merging **20 points**

The character can merge his or her essence with a single, inanimate object, such as a tree, a forest glade, a river, lake, or mountain. It need not be a natural object, but such is most likely. While "inside" the object, the character is invisible and intangible, although some magical forms of detection might be able to find him or her. While using this power, the character is effectively in sensory deprivation. Note that the character is not really inside the item, and damaging it does not harm the character (unless the character has a disadvantage which causes it to).

Special Enhancement: The character can sense the immediate surroundings of the area, as if he or she were there. 10 points.

Special Enhancement: Rather than a single item, the character can bond with a closely related group of items, such as any tree in a given forest; this costs 10 points. If the character can bond with a loosely related group of items, such as any oak tree or any point in a single ocean, it costs 20 points. If the character can bond with a broad classification of items, such as any tree, open ground, any stone, it costs 40 points.

Special Limitation: The character's outline is faintly visible in the merged object. -10 points.

Banishment **-5, -10, or -15 points**

This disadvantage is only available to races that frequent planes of existence other than the one they are native to. Upon being struck by a certain attack, they are expelled from their current plane, back to their native one. Rarity of the attack sets the value of the disadvantage; very common attacks (metal weapons) are worth -15 points, occasional ones (fire, ice, poison) are worth -10 points, and rare attacks (water, holy water) are worth -5.

The base rules for the Banishment disadvantage assume that there is nothing to prevent the character from returning immediately, other than whatever mechanism the character possesses to do so. The following enhancements can be used to simulate more permanent conditions of banishment. Note that if the return time is less than a week, this is normally a special effect of "normal" Banishment, unless the campaign involves extensive, easy and cheap planar travel.

- If the character is prevented from returning to the plane he was visiting for a week to a month, double the cost of the disadvantage.

- If the character is prevented from returning for a month to a year, triple the cost of the disadvantage.
- If the character is prevented from returning for a year to a decade, multiply the cost of the disadvantage by four.
- If the character is prevented from ever returning, multiply the cost of the disadvantage by five. This can also be used to simulate long banishment times, such as a lifetime or a century, as the character will likely not be able to return to the plane during the campaign (or have reason to, after so long), even if the character will still be alive.

Special Enhancement: If the character gets a HT roll to resist banishment, halve the cost of the disadvantage.

Linked Fate **-15 points**

The character's fate is linked to a specific area or item, such as a tree, grove, building, statue, lake, or other natural or artificial feature. If the linked item is damaged, the character suffers a proportional amount of damage, which cannot heal until the target heals or is repaired. If the item is destroyed, the character is slain, instantly.

Special Enhancement: The character can survive the destruction of the item; the character will not be reduced below negative hits (the character does still have to make survival rolls) from damage to the item. This reduces the disadvantage value to -5 points.

Special Enhancement: The character still dies and is destroyed with the item, but if it is rebuilt, the character will return to life. This only applies to death due to loss of the linked item. To represent such healing of damage from other causes buy Regeneration or Resurrection. This reduces the disadvantage value to -10 points.

Linked Personality Shift **-10 points**

The character's personality waxes and wanes with the cycles of something else. This can be just about anything changeable, from the tides, to a river, the weather, the seasons, or the growth cycle of a forest. This is essentially the Lunacy Disadvantage; only broader in scope. When the linked item is in an "up phase," (high tide, spring and summer, active weather) the character is at -2 to all Will rolls due to increased emotional variance. On a "down phase" (low tide, fall and winter, summer doldrums) the character effectively has the Laziness disadvantage. Volatile changes (floods, storms, storm surges) make the character hurried and distracted, giving the character the Impulsive disadvantage.

Territorial **-15 points**

The character is especially attached to a specific location. He must make a Will roll to leave, and a Will roll each day to remain away from the location. Each week the character has been gone imposes a cumulative -2 penalty to the Will roll. If the character fails the Will roll, he must do everything in his power to return to his home. A critical success "resets" the character as if he just left. If the character is physically bound to the location, buy it as a Dependency.

Wanderlust **-15 points**

The character has problems staying in one place for more than a few weeks or a month at most; the character will want to move on and see new things after only a short time in a new location. At the end of each week after the first, the character must make a Will roll to see if he can remain in the area; this roll is at a cumulative -1 penalty for every two weeks after the first Will roll. Such a character is unlikely to own anything more than he or she can carry; although the character could instead have a mobile home or boat that he or she lives on.

Pyramid Review

Gramercy Island (for Heroes Unlimited)

Published by [Palladium Books](#)

Written by **Bill Coffin**

\$20.95; 224 Pages

How is it that I can read two books, by the same author, in the same setting, and enjoy one so much more than the other?

Gramercy Island is the second book in the [Century Station](#) setting for *Heroes Unlimited*. It describes the super-prison Gramercy Island in the *Century Station* setting (although Gramercy Island is generic enough that it can be slotted into any setting with minimal problems: Take one island, add a prison. Tah-dah!).

Super Prison is used literally here, because Gramercy Island is the prison where Century Station's various super-powered/paranormal felons and crooks (as well as the mundane scofflaws) are sent to serve their time.

Unfortunately, *Gramercy Island* doesn't quite give the same oomph that *Century Station* did. It feels more like a standard character catalogue than a cohesive sourcebook on the level *Century Station* was.

The first ten pages of the book detail prison life. It's a fairly well written description of prison life (and seems to be accurate . . . as far as I know from watching *Shawshank Redemption* and occasional trailers for *Oz*). The glossary of prison terms is also interesting, but I won't make any statements about its genuineness. Prison is a fairly surreal existence, an alien society so separate from our every day lives that I'm pretty sure it would be easy enough to use the information in here in any incarceration facility.

The next section has info about the prison itself. This is the most satisfying segment of the book; we're given information on the history of Gramercy Island (it could be argued that there's more pirates in this book than *7th Sea!*), and how it came to be a prison. There's also a map of the island that lays out the numerous wings and areas.

Therein lies one major problem I have with the book's layout of Gramercy Island. Each Supers containment wing has an evidence depot. While it may fit in with some genre conventions, having the "super-gadget depot" in the same building as the super villainous gadgeteers just strikes me as stupid on a cosmic scale. This allows for good breakout scenarios (since many of the villains are gadget-based), but also requires the prison's designers to have been very, very stupid.

Prison security is composed of normal human guards and robots constructed under Operation Argonaut. The prison staff work nicely, although the Warden's great secret is a bit too ambiguous, and could have been expanded a bit. The information is given, and is followed by two paragraphs of short question sentences (Who? What? Where? When? Why? How? WHY?).

The remainder of the book, detailing the various inmates of Gramercy Island, is entertaining enough. There is a section on villain teams and solo scoundrels; the teams tend to be a bit more interesting, if only because they have clever concepts behind them.

The Dynosaurs, for example, are a combat team composed of mutant animals (guess what kind; come on, take a guess) that are named after characters from Shakespeare. The Body Shots are a team of brawlers and hand-to-hand combatants, and include a refugee from Clockwork Orange and an android butt-kicker.

Art-wise, *Gramercy Island* is consistent with most Palladium books; the art ranges from okay to great, never straying too far from the genre.

There is a layout issue that seems to have popped up in recent Palladium books. An ad is included in the back of the book (standard procedure for most games these days), but instead of being in the back of the book, its on page 211 of the 224-page book.

Super prisons have always been an interesting aspect of every super heroic RPG. From Project Pegasus to Belle Reeve, crime and punishment in a four-color world is something that every supers GM will have to look at eventually. The first 60 or so pages of *Gramercy Island* will be useful to supers GMs as source material. The rest of the book, unfortunately, appeals mostly to people using *Heroes Unlimited* (although some of the villains and teams look interesting enough to port to other systems).

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

A Brief, Sketchy History of Quirky Time

It was October 15th, 1189. King Richard of England needed to raise money for the crusades, and so was selling the titles to some of the lands he controlled . . . like, say, Wales, where a certain sidhe noble princess (who had "PC" stamped on her forehead) reigned. While she was negotiating with the king's representative to purchase the rights to these lands, I was taking notes on this historic event in my duty as the timekeeper.

Did you know that October 15th was a Sunday?

But I get ahead of myself.

It began years earlier . . . around 1049, if my notes are to be believed. The vampire knight and immortal sidhe (aka "the party") were roaming across England and Europe, having the kind of adventures that new characters do. ("Oh, no; bandits! We'd better be careful!") Traveling overland in the Middle Ages, time tends to pass pretty quickly (especially when you're an unaging fae or vampire). As such the need to keep careful track of time wasn't high on our priority list.

But after several years of adventuring we settled down in her fledgling kingdom. My vampire roamed off, and I started playing a mage. Oh, and there were werewolves in the area that she and her allies needed to befriend.

So we were invited along to meet with the werewolves one evening. My mage -- a cautious sort -- asked innocently enough, "Um . . . before I go, what's the phase of the moon?"

A long silence. We players stared at the GM.

"Oh, and how should I dress?" I continued. "What month is it?"

Like some kind of Wile E. Coyote contraption, the current adventure sprang apart at two innocent questions.

Because we realized that we didn't have the foggiest idea what day it was . . . or even what month it was. After a few minutes, we were pretty sure we knew what year it was. But there was no way on Gaia's green earth we knew what phase the moon was in.

It was at that point I designated myself as the campaign timekeeper.

Unfortunately, we realized that we didn't have a clue about how to make our timekeeping realistic. This was before the calendar reformation, so none of the "traditional" means of determining a calendar (like the perpetual ones found in almanacs) would work. But after a little bit of thought at work one day I realized: Why do we care? I mean, how accurate and realistic do we *really* need to be in a world where the undead roam the earth and hold political office?

And that's when I created The Calendar:

January	February	March	April
S M T W T F S	S M T W T F S	S M T W T F S	S M T W T F S

At a casual glance, you will notice several interesting points about this calendar. On the one hand, it's completely wrong. On the other hand, it's completely intuitive. It roughly aligns with the phases of the moon (we designated the 28th/1st as the full moon). Each day is the same in each month, and in each year. August 15th was the same as January 15th which was the same as October 15th.

Which was a Sunday.

It was portable; three years could fit on a sheet of paper, and you can just tally off days as they happen (with notes on paper or in the margins if necessary). It was perpetual; I could print up a stack of 10 sheets and know we'd be okay to handle our immortal characters for a few decades.

And, after thinking about it, we also realized this was a good simulation of the timekeeping precision (or lack thereof) of the times. To make our calendar work out, we added festival and saints' days as needed, with the 12 Days of Christmas filling out the end of the year nicely.

When we moved on to other campaigns, we had an easier time. We decided the *Fading Suns* universe used our current calendar; the trick was finding a calendar computer program that could handle the year 4996. (I eventually needed to hex edit the save file of one program, since the only choice they offered was "click right arrow to advance a year" . . . which is a pain if you need to do it 2996 times.) With the computer programs we could be a bit more "realistic," and print out nice-looking calendars with little boxes to record notes as needed. And moving to *Aberrant*, set in the year 2008, was a piece of cake.

So for you players who are looking to help out the overworked GM, why don't you volunteer to be the timekeepers? It's pretty easy (especially depending on the method you use), adds a level of realism, and gives you a sense of history and continuity.

But regardless, I'll always have a fondness for my first calendar, where every month has a Friday the 13th, Easter is always on April 22nd, and characters' birthdays (and anniversaries . . . like October 15, 1189) are always on the same day.

* * *

Unfortunately, John Kovalic's in Germany now, so we won't have a *Dork Tower* for the next couple of weeks. Rest assured, however, that DT (like Bond) will be back. Have fun, John!

-- Steven Marsh

Last week's answer: Castle Greyhawk, p. 77.

(one star):

"Survey Control, a mutant space amoeba just ate the stardrive! What do we do now?"

"Survey 1138, it will take about a month to route a rescue craft to you. Meanwhile, the scientific staff want some information on the amoeba. Here's Dr. Gzing."

Gzing here, Survey 1138. What color is that amoeba? Please send somebody out to take its temperature. Can you tell if it's carnivorous?"

by **Bob Portnell**

Around the World in 80 Thrills is a four-part Cliffhangers adventure set in the 1930s (the popular "world on the brink of war" setting). One part will appear each month from now until May. Each part is written by a different author, making this also a Round Robin event:

- Part One: [The Kensington Codex](#) -- Steven Marsh
- Part Two: [The Steps of Chiushan](#) -- James Maliszewski
- Part Three -- Bob Portnell
- Part Four: [The Atlantis Crystal](#) -- Steve Kenson

Stats are presented for **GURPS**. Additional stats appearing for **Fudge** presented in **bold italic red**. Stats for **Big Eyes, Small Mouth 2nd Edition** have also been presented in blue boxes with white text. The adventures should also be generic enough that they can be used in a variety of systems.

"When Suddenly . . ."

"That will be far enough," the heavily French-accented voice said. The blindfolds are pulled from your eyes and you blink, even in the dim light of the gas lanterns around the room. The light creates strange and unnerving shadows, dancing around the bone-lined walls of the chamber.

Surrounding you is a large group of men, most armed with pistols, some with knives, all with smug expressions. Across the damp chamber a man waits, grinning, next to a seated figure. This figure is well-tied to the chair, and has a hood covering its head, but the clothing is very rumpled and very familiar to you.

The man says, in his thickly accented English, "If you have brought the item we wish, you may take your friend and go. If not, you shall join the other millions here who are dead." He waits for your reply.

What do you do?

What's Going On?

The Empire of Death

Most major cities have made use of the underground spaces . . . for rail tunnels, utility services, emergency shelters, armament storage, and so on. In the late Eighteenth Century, with ground level land at a premium and medieval cemeteries occupied beyond capacity, the City of Paris undertook to relocate the populations of numerous cemeteries into mass graves in disused underground vaults. Some of these chambers & tunnels date back to the Roman Empire.

Over seven million skeletons and corpses were moved, quietly in the night, over a fifteen month span in 1785

One of the group's members has been kidnapped! The kidnappers' telegrams demanded they meet them near the Eiffel Tower on a specific date and time, and that they bring a specific small and valuable object as the ransom. They made the rendezvous, were blindfolded, and taken for a short drive around the city, then led on foot deep into the Catacombs of Paris (see sidebar).

If you have been following the *Around the World In 80 Thrills* series, the kidnap victim should most reasonably be Jill Spires, daughter and assistant of Professor Reginald Spires. The heroes have been following clues in a mystery first uncovered in an archaeological site in Minnesota, then further revealed on a mountain in China. After returning to Shanghai and preparing to book passage back to California, the adventurer party finds that Jill has been kidnapped, her rooms ransacked. Telegrams with ransom demands (specifically for the Key the party carries, found in "The Kensington Codex") arrived a few days later.

Given the travel time between Shanghai and Paris (as much as a month or as little as two weeks, depending on the mode of travel), the GM may wish to stage other adventures along the way. Calcutta and Cairo are ideal hotbeds of intrigue which may distract the player group as they attempt to make their way to the city of lights to rescue Jill. If this is done, the GM should emphasize the deadline, subtly reinforcing the pressure on the players.

Of course, it's perfectly in keeping with the genre to just "follow the dashed line as it moves across the map," carrying our heroes directly from Shanghai to the rendezvous at the Eiffel Tower.

In The Catacombs

There's nothing like a big blood-stirring fight to kick off the adventure with a bang. The heroes are intended to win, and collect the next bit of information they need: a clue leading to the man behind the kidnapping, who is apparently aware of the Key (or whatever small treasure). The gang leader was to leave the parceled key in a luggage locker at the main railway station; he would return the next day to find other half of their "fee" for the job. The gang leader bears telegrams with these instructions; they were sent from an address in Vienna by a person named "Rudolf S. Habsburg." The players need to keep one of the bad guys alive long enough to collect this information.

If the players fail to collect this information directly from the character, they may find it on his body, or on his person . . . or in the last resort, the kidnap victim/Jill can mention that she overheard this sensitive information. "Victim"/Jill will seem very shaken, occasionally forgetting characters' names and just confused in general.

If the players are extremely devious, they might let the gang leader have the key to complete his assignment. They might then keep watch on the locker, to see who makes the pick-up. If they do, they will catch another generic French thug, with directions to switch parcels and to

and 1786. Bones were used to line the chambers, to reinforce the archways, to create artistic images on the walls. The natural cool and damp of the Catacombs serve only to reinforce the atmosphere of mystery and wonder.

In the generations since, monarchs have held parties in the underground. In World War II, the French Resistance kept a headquarters there. It is a captivating setting for adventures of almost any genre and an interesting place just to visit.

mail the key to a specific address in France. (Don't tell the players, but the Bad Guys are *already* watching them . . .)

On The Road

The players can choose their own means, of course, but the most direct route between Paris and Vienna (by rail or road) passes the southern part of Nazi Germany. Players whose passports, identity cards, or other travel documents are even the slightest bit out of order will find themselves detained at the borders (entering or leaving Germany), to spend some time in the unpleasant company of government bureaucrats and security officers. These are just your normal stiff-necked civil servants; please do not indulge in war-movie melodramatics ("Ve haff wayz uff making you talk!") . . . unless you really want to, of course.

Depending on how broadly or subtly the GM plays this, it may happen that the adventuring party discovers a rather important piece of information: the companion they rescued isn't the same person who was kidnapped! The person/Jill was indeed kidnapped by members of the Black Pinnacle Society in Shanghai and spirited away to one of their secret lairs. There a duplicate was made by means mysterious and sinister -- the same means they use to make the endlessly identical henchmen encountered in "Ashes to Ashes."

When exposed, the duplicate is found to have extremely limited knowledge: basics of the original's background and skills only. The GM is free to install any red herrings here that he wishes, but the only pieces of information the duplicate has is:

1. The adventurers must be led to Crete and the Labyrinth by the speediest reasonable means.
2. By this time, the original is already there, healthy but in relative discomfort.
3. Their progress is being closely monitored.

This ought to be good to crank up the paranoia level a notch or two!

Sometime during the trip (probably during some unexpected stopover or inspection) the players will make the acquaintance of another detained traveler, the British journalist Percy Aubrey-Smith. "Bloody bureaucrats," Aubrey-Smith explains. "One brief jaunt home to prove to my esteemed Fleet Street masters that I am, indeed, still able to cash pay drafts . . . and in both directions, questions, detentions and distractions." He, too, is on his way to Vienna to resume his duties as a correspondent for the London Daily Crier. Aubrey can make an excellent tour guide for the Imperial City, if asked; otherwise, he'll carry on back into his work, leaving the players with a business card.

the Holy Roman Empire. Inquiries with the librarians will eventually reveal the "sender" of the telegram to be Emperor Rudolf II, who led (badly) at the end of the sixteenth century. If the players don't suggest a look at Rudolf's documents, let the librarian suggest a tour of those sections, since the players have traveled so far. They should have something interesting to take away from Vienna.

While walking to the relevant sections of the archives, the librarian will chatter informatively about the life of Rudolf II . . . how the sickly young man came to the throne, and how he retreated from it to his palace in the Prague, there to study the arts and sciences. Of course, arts and sciences in those days meant alchemy, and Rudolf II was a great believer in alchemy, spending lavish amounts on alchemists. Rudolf sought cures for his ailments (of course), but also for the usual goal of alchemists through time, the Philosopher's Stone, said the transmute base metals to gold and to create a potion that would bestow immortality.

The party is halted in a set of musty shelves of books and scrolls. "Here we are!" the librarian says. "I encourage you to look about." He watches all that they do, ready to answer questions and correct mishandlings of the artifacts.

Never underestimate the power of coincidence and luck in pulp adventuring. While rummaging through the musty old parchments, one player will find a letter . . . with one section of markings identical to the runes found on the Key (and the Chinese urn)! Appropriately skilled heroes can translate the parts of the letter in German . . . or they can ask the librarian.

It is a letter from a Greek alchemist to the Emperor. He reports success in creating the stone of transmutation, and will be happy to demonstrate it to the Emperor at any time. (The Emperor died not long after and made no such trip, the librarian would note.) The paragraph of symbology interrupts the text. The closing of the letter reports that, for safekeeping, the stone has been entrusted to "the prisoner of Minos."

Adventurers with a classical education -- and the librarian -- will be aware that Minos was the king of Crete in mythology, one-time patron to the inventor (alchemist?) Daedalus. Minos' wife apparently had intimate relations with Zeus (in the guise of a bull) and gave birth to a child with a brawny human body and a steer's head. Minos imprisoned this "Minotaur" in a maze designed by Daedalus.

Moving Right Along

The next major set-piece is (of course) in Crete and the Labyrinth of Knossos. If the players have not figured this out for themselves, there are several ways the GM can steer them in the right direction. First, the duplicate might give themselves away in a particularly obvious fashion (perhaps the original is a non-smoker and the duplicate gets caught lighting up in private). Or a conversation with Percy Aubrey-Smith might help them choose this option. Percy is willing to help, in fact --

The Orient-Express

This rail line from Paris to Constantinople set the standard for plush train travel from Victorian times to the 1970s and, thanks to the works of Agatha Christie and Graham Green, carries a perpetual aura of mystery and wonder. Not that it needed their help; the Orient-Express was always a focus for intrigue and adventure. The infamous spy "Mata Hari" was a frequent customer. The train has been ambushed by kidnappers and robbers, held in quarantine for cholera outbreaks on the train, and attacked by terrorists (in 1931, easily within recent memory for our characters and the people they meet). Setting an adventure aboard this train would be a very natural occurrence in our pulp setting. The trip from Paris to Vienna would take just two days, so it'll need to be a fast-moving adventure . . .

The Imperial City in the Late Thirties

Vienna retains much of the appearance it had during its tenure as a capital of the Holy Roman Empire. Careful planning of parks, roads, and newer buildings have helped the city retain the visual charm of its older days.

Unfortunately, the political life in Vienna is not as placid. Vienna after "The Great War" is a city in partial search of an identity. The treaties which ended World War I broke the Austro-Hungarian Empire (last vestige of Charlemagne's Holy Roman Empire) into smaller republics. Vienna had been

he has a Grumman amphibian (see sidebar) that will make the trip with no trouble at all. Finally, a call to Professor Spires back in California and his encouragement or direction may do the trick.

GMs can fill out the visit to Vienna with encounters with the famous (like Dr. Freud), or visits to centers of culture (like the Opera). A performance by horses of the Imperial Spanish Riding School is always stirring. (In the film *The Seven Percent Solution*, Sherlock Holmes received a private demonstration of these equines' skills that nearly proved fatal.) And, of course, there are the Nazi sympathizers (or actual Nazis, after 1938) to be avoided or harassed.

Players are free to choose their own routes to Crete, of course. Aubrey-Smith's plane is the most convenient, but road, rail, and ship are always possible. Given the situation at this part of the adventure, incidental encounters during this travel phase are not recommended.

Meet and Crete

>From this point, our adventure resembles a dungeon crawl, or the opening of *Raiders of the Lost Ark* (or the close of *The Last Crusade*). The players reach Crete (if Aubrey-Smith flew them, he bids them go on ahead while he tends to his aircraft) and make their way to the archaeological site at the palace of Knossos. These passages have been excavated and systematically explored for more than a century; there is no danger here. If the heroes are garbed as researchers might be, they will garner no undue attention. Or, if the GM feels like softening the party up a bit, they might encounter a band of desperate looters.

However, there is an as-yet undiscovered chamber. The entrance to this hidden lair is concealed behind a ten-foot tall statue of the Minotaur set into the wall of one of the main galleries. (This is the "prisoner" to whom the alchemist correspondent entrusted the Stone.) Heroes with Traps skills will come into their own for the next part of the adventure, as they find how to open this passage, and to disarm any live traps within this undiscovered section. (Details of these minor traps, if any, are left to the fiendish game master.)

After the obligatory traps, the players pass through a downward sloping passage, about 100 feet (30 meters) in length. At the end, our heroes enter into a large circular chamber. Strange but now familiar glyphs line the walls, a huge stone block roughly 10' by 3' wide by 3' high (3 meters by 1 meter by 1 meter) occupies the enter of the chamber, and on a pedestal at the far side sits a smooth grayish lump of metal.

The trap on the stone should be fairly complicated and vicious, but not insoluble. One possibility: the floor all around the pedestal is false -- one step past the stone block will drop the explorer into a pit of variable depth and lethality. It may take some creative rope or pole work to rig some apparatus to retrieve the Stone across the gap.

In any case, after a good bit of sweat, the PCs should eventually be

accustomed to being the true center of its world, and finds itself merely the capital of a minor country. Worse, the rise of Nazi power in neighboring Germany and the pressure on Austrians to join the Greater Reich causes protests and occasional riots. After the Annexation (*Anschluss*) of 1938, Vienna trades its independence for somewhat increased prominence on the world scene and as part of the growing German realm.

Despite the political chaos and upheaval, on the whole Vienna retains much of the calm charm and sociability of its history. Not much can disturb the "art of living" in Vienna, and the musical and art scene is as vibrant as ever it was. (Recall that Hitler was an art student here, once.) Behavioral sciences are in their formative years; Sigmund Freud still lives at Berggasse 19 during the time of the adventure. The Viennese are by and large friendly and approachable, political activists excepted.

The Grumman "Goose" Amphibian

This is a small twin-engine utility flying boat with wheels, originally built at TL6. It can still be found in use at TL7, with improved fixtures, instruments and turbo-supercharged engines. The Grumman G-21 Amphibian was the first commercial design for Grumman Aircraft Engineering Corporation, intended as a flying limousine for the wealthy. It evolved into a hard-working hauler of passengers or freight, and a very popular vehicle for pulp adventuring. (Louis Lamour used one in his South Seas stories; a "Goose" was featured in the television series "Tales of the Gold Monkey.") The safety and sturdiness of the plane and the reliability of the engines made it a well-respected small craft. It didn't have the range of later amphibians, nor the capacity or luxury, but the versatility of the "Goose"

victorious . . . or so they think. For just as they have the Stone in hand, the kidnappee/Jill backs toward the door, draws a pistol and says (in a voice very unlike the kidnappee/Jill's), "Don't move." She is quickly flanked by another half-dozen men armed with submachine guns.

Some variations here: If the duplicate has been discovered and disarmed, the duplicate will need to quickly steal one of the players' weapons. If the duplicate was left behind (anywhere!) this scene peaks with the duplicate reappearing from the outside, accompanied by the six heavily-armed troops.

From The Jaws of Victory

The face-off continues for some seconds. A voice shouts orders from outside the chamber, and the machine gunners herd the party to one side of the chamber. Two more hirelings enter, carrying the original kidnappee/Jill strapped onto a stretcher. They place their burden on top of the huge stone block, then step away and ready their submachine guns as well.

Finally, the foes' leader makes his entrance. It is Percy Aubrey-Smith. He congratulates his men (in fine Italian) on stopping the spies. He turns to the player group and speaks in English. "Well, we seem to have a sort of stand-off here, do we not? You have the Stone, which I am tasked by my employer to acquire. And I have your colleague."

"Now we could just make an even trade, shake hands and part ways, but I'm inclined to think that neither of us is so trustworthy. So I took the liberty of tying a bomb to your compatriot." Aubrey-Smith gestures at the original kidnappee/Jill on the slab. "I have the dead man switch grasped her in my other hand." He gives it to the duplicate (if present, or a henchman if not). "You will give me the Stone, my little party shall withdraw, and this person will give you the switch. We make our exit in peace, and . . . so do you."

Aubrey-Smith moves to stand near the entrance. "Or I can just shoot the duplicate (the henchman) in the back, and settle the issue straight-away. A bit of delay which my master will dislike, but only a bit. I shall have your decision please. Now."

The players, we hope, will show sense in the face of being outnumbered and outgunned. After the exchange is made, Aubrey says, "Ah, thank you most kindly." A few curt instructions in Italian, and the henchmen begin to back away from the party and out the door. Finally, only Aubrey-Smith is left in the entrance. "One thing more," Aubrey-Smith adds.

"I lied. It is, in fact, a time-bomb and you have about five minutes to live. I wouldn't want you to suffocate in there. Farewell." He closes the entrance to the chamber -- naturally, there seems to be no mechanism for opening it from the inside.

What's Really Happened Here

was unbeatable. G-21s still fly today, most commonly as a "bush" plane.

The write-up below is for the 8-seat passenger version. Stats are a mixture of real performance data and calculated figures from *GURPS Vehicles*. (Don't try to build this at home!) The Goose first flew in 1937; technically, it could be difficult to justify one in Percy's possession. However, the plane is too cool to not use, so we'll ignore that minor detail!

Subassemblies: Retractable wheels (three small wheels, retract into Bo.). Two standard wings. (Flotation pods attached to wings ignored.)

Body Features: Mediocre Hydrodynamics. Fair Streamlining.

Propulsion: Two late TL6 333kW aerial propellers (WiR, WiL), with total 2000 lbs motive thrust.

Instruments & Electronics: TL 6 communicator, medium range (10 mi., HP 2). TL6 navigation instruments (HP 3).

Controls: Mechanical. Duplicate maneuver controls. *Crew Stations:* "Pilot" runs controls from roomy crew station. "Navigator" runs duplicate controls, communicator from roomy crew station. Good visibility.

Occupancy: Short. *Passengers:* 6. *Crew:* Pilot, Navigator. *Accommodations:* Six roomy seats for passengers; fair visibility.

Power System: 2 Pratt & Whitney "Wasp Jr." 333kW TL6 HP gasoline engines (WiL, WiR) power airscrews, HP 38 ea. (See below.) TL6 800kWs lead-acid battery (HP 1) powers communicator & lights when engines are off.

Fuel: TL6 220 gal ultralight fuel tank (fire +3) (Bo) Typical load of 175 gallons aviation gas (fire 16) for 5.5 hours fuel.

Access, Cargo & Empty Space: 20 cf cargo space, 5.3 cf empty space (Bo). 16 cf access space, 10 cf empty space per wing.

Volume: Bo (500 cf). Wings (42 cf each). Wheels (25 cf). *Areas:* Bo (385

Percival Aubrey-Smith is not a globe-trotting reporter but a globe-trotting mercenary, with contacts all across the shadier side of the British Empire. It was he, by direction of his mysterious but generous boss, who arranged the kidnapping in Shanghai through his contacts there. Another hireling sent the telegrams from Vienna to the French gang. His use of the name "Rudolf S. Habsburg" was an inside joke (and perhaps a hint) suggested by his boss, as was the address on the telegrams. His mastery of languages and acting have allowed him over the past year to insinuate himself into the Italian underworld; they trust him well enough to believe his stories of the player group being "spies" and to lend him gunmen for the pursuit. Of course, by the end of the adventure, he no longer needs them or Vienna. He is on his way to America.

What Will You Do? Again?

The escape from the chamber is left as an exercise for the alert player. First priority, of course, will be to separate the weakened kidnappee/Jill (who has spent almost all of the intervening period drugged and has no helpful information) from the explosive. If time remains, the bomb can then be used to destroy the door, though some characters are likely to take damage from flying chips of stone. The players may (and likely will) come up with other more creative solutions.

The head start is ample, though. When the heroes return to the docks, they will find the bad guys long gone.

Join us next month for the fourth and final installment of "Around the World in 80 Thrills."

The Phantom Subway: A Ghostly Adventure for In Nomine

by **Perry M. Lloyd**

This being was formed when a subway train somehow managed to crash into the wall of the subway, killing everyone in the car almost instantly. Though families mourned, and the rest of the world has moved on, the subway car's Ghostly form has not. Rather than resulting from a single mortal's death, this Ghost came into existence from the collective desires of those on the subway train who wished dearly to reach their destination.

The deceased souls pooled their resources, effectively binding their souls together. Thus its Forces total is higher than most ghosts, and its skills include bits and pieces of those who initially formed the collective, and those who've joined since . . . because it possesses the ability to trap inside and assimilate any who board it.

(*In Nomine's* rules for Ghosts are in the *Corporeal Player's Guide*, pp. 80-82)

Corporeal Forces - 5	Strength 12	Agility 9
Ethereal Forces - 4	Intelligence 8	Precision 9
Celestial Forces - 4	Will 10	Perception 8

Skills: Area Knowledge(the city/3, Boston,MA/1, Douglas,AR/1, Duluth,MN/1, Savannah,GA/1), Artistry (Sculpture/1, Drawing/1), Computer Operations/2, Driving/4, Emote/1, Fighting/1, Knowledge (History/1, Biology/1, Baseball History/2, Sports Lore/3, Cultural Studies/1, Art History/1, Business/1), Languages (Spanish/2, English/5), Lying/2, Savoir-Faire/1, Singing/2, Seduction/1

Some Personae on the Train

- Sara, sculpture artist and art history major. She was on her way to the bus station to go back home to visit her boyfriend for the weekend. Attractive, she sits waiting impatiently for her stop.
- Ben, computer programmer. He had finally figured out how to work some code and is looking forward to getting home so he can try it out. He can be seen scribbling furiously in a notebook.
- Mr. Rhodes is the man dressed in the suit and nice coat. He didn't drive this morning because he car wouldn't start. He really wants to get home so that he can watch the rest of the game and see his wife.
- Charlie and his mother, Darla, are looking forward to getting home, too. Charlie so that he can play with his Legos and watch TV, Darla so that she can put her feet up and relax after a long day at the lab.

The Add-Ons

These are victims who haven't been made part of the collective yet.

- Walter, a homeless man who swears up and down that the train is "cursed" and that they, the PCs, have to get out. Of course, after the first time the train crashes, Walter is strangely confused on the topic and doesn't know

what the PCs are talking about if they bring it up to him.

- Steven, a middle-class kid who's listening to his radio and chilling in a back corner on the car. A PC might recognize him or anyone else on the train from Missing Persons posters they may have ever seen, perhaps from years ago.

The GM is, of course, free to modify the skills listed as well as the characters on the subway (perhaps including any NPCs that have disappeared under mysterious circumstances, or otherwise haven't been seen for a while). There should be at least ten people in the train with the PCs, with a suggested maximum of two or three being add-ons.

PC Involvement

One of the easiest ways to involve this being in the game would be to have the player characters board it mistakenly. On the other hand, the PCs might have been specifically sent to help the Ghost to come to rest.

Perhaps a servitor of one of their Superiors is known to have suddenly disappeared in the part of the city near to the train, and the PCs discover him trapped on the train! Perhaps the servitor was able to get word out by falling asleep and journeying through the Marches, but is snapped back awake every time the subway crashes. Alternatively, the characters might have discovered the trapped celestial, or lucid dreamer, or Sorcerer who got the word out this way.

Outcasts or Ethereal spirits might be using the train as refuge from those who seek them -- alternatively boring and traumatic as it might be -- and they need to be set free (if they haven't already joined the collective and are lost to the world).

Act I: Trapped!

Unless the characters immediately start to actively interact with their environment (unlikely if the GM describes the subway casually) they won't realize that anything is out of the ordinary until the subway car suddenly jerks to the side, everyone on board is tossed forward like paper dolls in a breeze, and the PCs die. But then they awaken and get their bearings again, only to find themselves having just entered the train again. (Note that Malakim of War should sense the impending danger before the crash, but even six minutes won't be enough time to stop the train in time even if the PCs *do* figure out what the danger is.) After a second crash, they may realize that they're effectively trapped!

Normally, of course, the PCs could always go celestial and just escape. But on board assuming celestial form either just doesn't work -- perhaps because they've *left* the mortal realm -- or their celestial forms aren't able to move beyond the limits of the train, including returning to their Heart.

The biggest threat the ghostly subway poses: it's able to blind others as to its true nature and slowly draw them into itself. Any new passengers (add-ons) must make a Will roll every time the train crashes. Once they fail a number of rolls equal to their Total Forces, the soul loses a Force and the Ghost gain a characteristic level. Once the soul has lost at least one its Forces to the train, it will defend the train just like the personae, and will have no recollection of anything of the train's odd nature, believing that they're merely on their way to their "destination," dreaming up a false one if need be. Once they've lost all of their Forces to the Ghost, the soul has become a personae of the train, part of the collective soul, and will leave with the train if and when the train is freed from its anchor.

Ghosts don't have a vessel and have no body hits, therefore corporeal damage to the train is effectively meaningless; it cannot be "killed" corporeally, and neither can any of the personae within (though add-ons who haven't completely joined the collected can be, such as Walter and Steven); it can only be damaged Ethereally and Corporeally.

Act II: What's Going On?

The GM knows that the Ghostly Subway is "reliving" the period of time up until the crash, crashing, and then cycling back. The PCs have become part of the cycle, much to their chagrin. The length of each cycle is up to the GM, and is

suggested between forty-five minutes to an hour.

Obviously, the party will have to figure this out on their own. Fortunately, as Celestials, many will have abilities that allow insight into the situation (and it may be fairly obvious to any who are familiar with ghosts).

Angelic Resonances are the most applicable in this regard. The Malakite Resonance can discern that this being's latest dishonorable act was to fail to make it to its destination. A Seraph's resonance might detect that the personae is lying but doesn't realize it when she says that she's going to go see her boyfriend. The Mercurian's resonance immediately detects that this person is dead, and that the person and the train and all other personae in the collective are one being. The EloHITE's resonance might reveal the "true" emotional state of the collective soul, that it's anxiety ridden, and why (death, over and over again). The Lilim resonance could easily discern that this train and all its occupants (since Resonating on one resonates on them all) have the Need to reach their destination safely (or to be freed of its anchor). Any use of Resonances or other information abilities on add-ons will pick up information from that unincorporated rider only.

Soundtrack may prove useful in this regard, too (the soundtrack to *Speed* might be appropriate). Knights of the Dead will automatically know that everyone here died in a wreck and that the wreck is going to occur, again, and when.

If none of these abilities alert the new occupants, perhaps one of the characters picked up a newspaper that has an article on the "anniversary" of the locally famous subway train crash, including the names of the people on the train. Alternatively, the newspaper may have blown in with them as they boarded the subway car, or someone on board could be reading a newspaper with the article within view (they would be an add-on or recent addition to the collective, of course.)

Maybe even all the watches of the passengers read the same, and set to an incorrect time (or even traveling backwards to the time of crash). After a while, the characters might notice that everyone and everything on the train, except themselves, is just slightly translucent. The GM might decide that if the PCs experience "the end of the line" and crash multiple times with the train, that they see that they're also starting to look a little translucent (or, alternatively, the train's starting to look a lot more solid), especially for those who've been failing their Will rolls.

Act III: Escape!

Possible ways to escape include:

- Convince the conductor to stop. Not that it'd be easy, of course, though a Balseraph can convince the train that it's already reached its destination, or that it absolutely must stop. Divine Logic might be useful to convince the conductor. One possible argument would be that there's a problem ahead on the tracks, they're here to fix it and they need to be "let out" to "fix it." The conductor, and all the other personae on the train, is really one being, with Will 10. Roleplaying, of course, should aid the effects of persuasion.
- Reducing its Celestial Forces to 1 through Celestial combat can force the Ghost to let go of its corporeal anchor and go on to its Heavenly (or Hellish) reward. This would require that the GM allow the PCs to assume celestial form (but not allow them to ascend to their heart).
- Breaking a window or forcing an escape hatch open would probably work, but the Ghost will take care of its own. The passengers in the train should leap its defense, trying to pull the characters away from the hatch physically, or verbally convince them to stop. As they all serve as "arms" for the Ghost's strength and agility and are virtually unkillable, they will probably stop the PCs unless they can be somehow distracted or preventing from interfering.

Act IV: Denouement

If the train is stopped for the PCs to make repairs and they escape, or the train is otherwise convinced that its now able to reach its destination, or has been reduced to one celestial force, then the Ghost will be freed from its anchor and the collective soul will move on to be judged. The PCs will be left in the middle of a subway tunnel, which may be

somewhat anticlimatic. The collective soul may so thankful that the PCs receive an artifact from the train and/or its remaining Essence is distributed to the party.

Walter and Steven, along with other add-ons who hadn't lost their souls completely to the Ghost, appear with the PCs, having been "freed." Depending on what Forces they've lost and how many, they may or may not be suitable for recruitment into the War.

Suggested Effects of Other Powers on the Ghostly Subway

Kyriotates/Shedim will be unable to possess the people on the train, Cherubim/Djinn who attune to a persona on the train will realize that the personae and the train are one soul. Calabim who use their Resonance on the train -- or any of the personae within it -- will cause the train to suddenly rock violently and throw them on their face (dealing as much damage as they inflicted).

Habbalah will be happy to discover that the Ghost has a considerably high Will. Lilim can detect the Needs of the train and the add-ons within (the personae and the subway train share needs as a collective).

Elohim of David might realize that they're left normal space/time. Incarnate Law might discern that the local laws (as drawn up by human souls bound up together) involves soul sharing.

Cherubim of Eli will realize that nothing on the train is an item unto itself, but is all part of a "collective entity." Likewise, Transubstantiation will not work. An Ofanite of Fire might recognize that the inhabitants of the train are fleeing from *heavenly* justice (i.e. final judgment).

Swipe will have no effect on anything on the train. Friends of the Unseen will inform the angel that the train itself is watching him. Kyriotates of Jean will be unable to possess anything in the subway train; Remote Control will not work either.

The effects of Call of the Wild shouldn't take until the characters are off the subway. Elohim of the Sword will be able to sense the intense loss, pain, and feelings of failure from within the train. Cherubim of Marc will know that nothing on the train has a true owner, while Mercurians of Marc may be able to learn that no one on the train has earned *any* money for quite a long time. Cherubim of Novalis will notice that they cannot heal the wounds of anyone on the train (the GM might describe one of the personae on the train as having a minor wound, like a cut hand, for this reason).

Seraphim of Yves will note that *everyone's* true name on the train is the same, Cherubim of Yves attempting to attune to someone on the train will learn that s/he's already dead, Mercurians of Yves learn that no one on the train **has** a fortunes in the coming months, and Divine Destiny has no effect, as the train and its passengers are no longer mortal.

Shedim of Beleth will not drive the Ghost mad with their celestial form. Balsraphs and Djinn of Belial will discover that their Band Attunement affects nothing on the train (only the train as a whole).

Djinn of Fate who attune to the train or one of its personae will discover that it's already dead. Impudites of Fate will discover the true nature of the Ghost Subway. Fated Future discovers that the train/personae do not have a great destiny/fate, Temporal Projection will not work, while Knight of the Winged Chariot will discover that time is altered here and that nothing in the train is *really* an object.

Servitors of Malphus will be unable to spark conflict between the personae on the subway. Captains of Swank will receive their +3 reaction bonus from the train and its personae. Calabim of Death should automatically detect that no one in the train is alive; likewise, Vampiric Kiss will have no effect on the train or its personae. Balsraphs of Vapula will discover that nothing on the train is really a device (except those possessions of add-ons). Impudites of Vapula will see with their glasses that the train and the personae within share an Essence pool.

The hard-working Research and Development Team at Uncle Albert's Auto Stop and Gunnery Shop are proud to present three new products just in time for the 2051 Dueling Season!

High Torque Motors

Does your gas-burning neighbor have you suffering from Acceleration Envy? Sure, his car is loud, expensive, and smells like a biker bar, but it's *fast*, right? Fear no more, Uncle Al feels your pain!

Our crack team of engineers has been working overtime to find a way to bring you that same rush of acceleration your neighbors smog-belching machine has, but at a fraction of the cost! Thanks to their success, your efficient electric machine can now keep pace with most of the fossil fuel fanatics.

Or, if you're a *real* speed junkie, try our heavy-duty version instead. It's a little more expensive, but provides a lot more performance

when coupled with your already extra-powerful motor. No longer will you be left at the stoplight choking on exhaust fumes; instead you can stick right with Joe Dino Burner all the way to his maximum, then engage your normal motors and leave him behind!

High Torque Motors (HTM). \$100/wheel, no weight; no space. Compatible only with Electric car or cycle power plants. Limited compatibility with OD, not compatible with HD Transmission. When engaged, the acceleration of the vehicle is increased by 5, and top speed is reduced by 1/4. Engaging or disengaging is a firing action. While HTMs are engaged, the power plant consumes power units at 1.5x the normal rate. If an ISC is triggered while HTMs are engaged, apply the ISC bonus after the HTM bonus. Also, because of the extra stress on the engine from combining these systems, the PP loses 1/2 of its DP due to ISC damage instead of 1/3. A vehicle may mount both HTM and OD, but may never engage both at the same time. Attempting to engage OD or HTM while the other is engaged will trigger safety interlocks that disengage both systems.

Heavy-duty High Torque Motors (HDHTM). \$200/wheel, no weight, no space. May not be combined with HTM. When engaged, base acceleration is DOUBLED, and top speed is reduced by 1/3. While HTMs are engaged, the power plant consumes power units at 2x the normal rate. Identical to HTM in all other respects.)

Metal Airfoils (Improved!)

That metal exterior is the only fire protection your composite-armored machine ever needed—until your expensive plastic spoiler burned away and left you spinning off the road. Until now the expense and weight of a metal version was prohibitive, but Uncle Albert has come through for you again!

Our armor specialists have put together a new blend of metal alloys with an advanced shaping process that gives you the fire protection and durability of metal in your spoilers and airdams, but at a greatly reduced cost and weight. Now metal and composite-armored vehicles can enjoy the handling improvements of an Uncle Albert spoiler or airdam while retaining the full durability and fire resistance that you've come to expect from that thick metal skin!

Metal Spoiler or Airdam. Cost = cost for 10 points of Metal armor; Weight = Weight of 2 points of metal armor; no space. Operation is identical to that of its plastic counterpart, with these exceptions:

- The metal spoiler or airdam becomes ineffective when over half of the original metal armor on the equipped side is destroyed.

- The metal spoiler or airdam is inherently fireproof
- If a vehicle uses composite armor, the spoiler or airdam must match the outer layer armor type.

Cycle Wheel Hubs

Tired of outfitting your cycle with those heavy armored hubcaps that were designed for cars? Uncle Albert would never forget that special group of you who prefer to use fewer than four wheels!

Our special cycle products division has something just for you: A new armored hub that protects just as well as the heavier car version, but is specially designed for your smaller, lighter wheels. Now you can outfit the best tire protection money can buy . . . and still have some weight left over to armor the rest of you!

Cycle Wheel Hubs (CWH). \$10/2lbs per point, maximum of 20lbs per hub. Must match the vehicle's armor type. Mounted instead of Armored Wheel Hubs on any wheel that may use a cycle wheelguard. Protects on a roll of 1-4 on one die, just like an AWH. One CWH protects against damage from one side only. A second CWH must be purchased to protect the other side.

Pyramid Review

Heaven and Earth RPG Player's Guide

Published by [Guardians of Order](#)

Written by Jeff Mackintosh, John R. Phythyon, Jr.,
Lucien Soulban

128 pages; \$19.95

The long awaited second edition of the Guardians of Order's *Heaven & Earth RPG* has finally come to the market, and *In Nomine* revisited, it isn't.

The core of the setting revolves around the War between Heaven and Hell, with Earth being the battleground, and the collection of Souls being the prize. Unfortunately for us Humans, that's all our Souls really are: prizes to be fought for, and neither Heaven nor Hell are too picky about what they have to do to get us.

The theme of *Heaven & Earth* is that of Horror. Horror not only on an individual or social level, but also on the level of reality: The world is a Dark, Evil place, far more then the news would have you believe, with tales of death and murder hidden behind the white picket fences of suburbia. In this game's background story, the main story arc is the coming of Armageddon, which is unfortunately unlike what is stated in the Bible: once God ends the world, it won't be the Rapture promised, just the End. And Jesus won't be coming back as God's champion, since he's rebelled against this plan and now works independently to save Humanity, even as the world at large remains unaware of its dark fate.

The Game uses the Tri-Stat mechanics (with three basic attributes: Body, Mind, and Soul), making Chapter Two, Character Creation relatively simple for new players, and instinctive for anyone familiar with *BESM* and related games. There are some altered goodies (for example, "Owned by a Corporation" becomes "Sold His/Her Soul"), but otherwise, anyone familiar with Tri-Stat character making should be familiar with the system found therein.

The rest of the Game Mechanics, displayed in Chapter 3, favors a cinematic view of gaming, from the fluid time-keeping to the more open taking of action. Instead of Dice, however, *Heaven & Earth* uses decks of 52 cards (plus Jokers), drawn in threes which make a Hand of Fate: using one, saving a second, and discarding a third. Each of the three Attributes is covered by a Suit which favors it and penalizes others (Body = Spades, Mind = Clubs, Soul = Diamonds), with Hearts being neutral. The Combat system is fairly simple, with additional rules covering firearms, other combat options, and special damage rules as additions.

Chapter Four introduces us to the first Supernatural element of *Heaven & Earth*, the Mules. Mules are ordinary humans who, usually due to contact with the Supernatural, become hosts for powerful spirits which then use their bodies for personal pursuits. In a dark horror game like this, this generally means becoming the vessel of a mass murdering entity, like a horror movie slasher.

Chapter Five introduces the Paranormal, individuals with elaborate psychic gifts, who keep their abilities hidden from the world, due to fear of public panic at their existence as well as fear of the Government's possible actions. There are rules for psychic powers, uncontrollable Wild Talents, and some Drawbacks limited to Paranormal characters.

Chapter Six gives us the game's magic system, based on the Tri-Stat's own default Dynamic Magic system, which favors making freeform magical effects rather than making a default list of spells. This system is somewhat altered by making Mage characters favor a Paradigm, or set of magical beliefs (Such as Wiccanism, Voudoun, or Kabbalism), centered around a Stat for magic use. So mages might favor Physical (Body), Mental (Mind) or Spiritual (Soul) spells.

Magic use in *Heaven & Earth* tends to be very subtle, the working of a magician's will to create seemingly "Coincidental" magical effects, rather than calling upon cosmic energies for Fireballs and the like.

Chapter Seven, Fate and Destiny, expands on the action resolution system of the Hand of Fate by explaining what Fate and Destiny is in *Heaven & Earth*. In this game, Fate is what the Universe places in your path, in seemingly random patterns. Destiny is your character's reason for being, be it to be a saint or a sinner. In game terms, the Hand of Fate card system allows either a GM or a Player to add seemingly random events, benefiting either PCs or NPCs, by drawing and playing Fate Cards, which have different events tied to them.

Chapter Eight, Horror and the Supernatural, works to describe how to roleplay the setting of *Heaven & Earth*, with a lot of emphasis placed on covering the mood of the world, which are: Subtle Horror, Maddening Surrealism, and Dark Absurdity. Supernatural Elements, Dark Conspiracies, and the looming Apocalypse all get mentioned in this chapter, although angels and demons don't get more than a single paragraph's worth of mention.

Finally, Chapter Nine focuses on a little slice of the "Hidden Horror" of the Campaign with the little town of Potter's Lake, one of your typical "Small-Town USA" sized cities, the likes you could find in an old 50s sitcom. This city has a paper mill, an Air Force Base, and more "Something is Wrong" levels of weirdness than should be stuffed into a city that size (such as an entire 4th of July parade disappearing right in the middle of a performance, only showing up skinny dipping at a nearby lake sometime later, without any memories of the event). This chapter is chock full of good plot hooks and adventure seeds, and describes how to make characters to fit this "Twin Peaks" like setting, with some character samples.

Overall, *Heaven & Earth* makes for an interesting, albeit nihilistic roleplaying experience, and might even serve an enterprising GM as a tool for converting a game like *In Nomine* to the Tri-Stat system. As it is, though, the game sorely lacks stats and rules for playing angels and demons (which, for a game called *Heaven & Earth*, is an odd omission). As such, the main book will be most useful for those games focussing mostly on Mules, Paranormals, and Mages. It's worth taking a look, at least.

Pyramid Pick

War in the Heavens: Hegemony

Published by [Holistic Design Inc.](#)

Written by Bill Bridges

128 pages; \$20.00

War in the Heavens: Hegemony is the second in a planned trilogy of books detailing major alien factions of the *Fading Suns* universe. Consisting of two sections, a sourcebook and a lengthy adventure, *Hegemony* is an excellent addition to the *Fading Suns* line. Indeed, it's one of the best *Fading Suns* books to date. The combination of evocative writing, fascinating ideas, and usability marks it as one of the best roleplaying supplements I've read in a long time.

Hegemony provides both players and GMs with oodles of information about the alien Vau species - their society, culture, and goals - while deftly avoiding a common problem in factional sourcebooks of this kind: "setting escalation." That is, *Hegemony* shows the importance and uniqueness of the Vau to the *Fading Suns* setting without making them the most important element of that setting. It's a tightrope that many supplements fail to walk, and it's a credit to the author that he managed it in this volume.

Physically, the book is up to the high standards of previous *Fading Suns* books. *Hegemony* has an attractive cover showing a suitably mysterious Vau mandarin, as well as excellent interior art. John Bridge's moody art doesn't appear as much as I'd like, but it's supplemented by some first rate work by Mitch Byrd, whose work on White Wolf's *Hunter* line hasn't always appealed to me. The layout of the book and choice of fonts succeeds in combining legibility with atmosphere, which is another tightrope game books of this sort often fail to walk. My only criticism is that there are still too many typos and editorial glitches for a professional game book. It's a minor point, but one that's all the more jarring given the otherwise high quality of *Hegemony*.

Broadly speaking, the book is divided into five parts. The first is the obligatory chapter from "Alustro's Journal," the ongoing saga of a young priest journeying with his companions among the worlds of *Fading Suns*. The latest installment does a good job of conveying the alienness and mystery of the Vau, a race with whom humanity has had only intermittent and puzzling -- contact throughout its history. The journal entry is followed up by a brief introduction that outlines the book and its place in the "War in the Heavens" trilogy.

The second part is entitled "Book One: Inception" and is a subjective account of history and culture of the Vau, as told by a human raised in the Vau Hegemony. It's extremely well done and goes a long way toward making the Vau mindset intelligible to outsiders, while still conveying its otherworldly character. However, if you're not one for in-character descriptions of the game setting, you'll find Book One very annoying. A lot of what the viewpoint character says is untrue or at least inaccurate, which might be frustrating to readers who want the whole truth and nothing but.

That said, Book One discusses Vau history and evolution, including the race's relationship with the fabled Architects -- the ancient race of the *Fading Suns* setting. That information is augmented with details of the Vau's society and culture. Everything from their caste system to language and naming practices is given a solid treatment. There's also plenty of information on the internal politics of the Hegemony and its many alien races (the Vau are not only species in their area of space). Book One strikes a nice balance between too much information and not enough. Reading through it, you get the impression of a genuinely alien culture without being bogged down with pseudo-sociological mumbo-jumbo. It's a good approach and one that conveys depth without drowning the reader in superfluous details.

(SPOILER ALERT!)

The third part of the book is entitled "Book Two: Elabi." It is a massive adventure that takes the characters into the Hegemony to learn firsthand about the Vau and their ways. It also corrects many of the errors and omissions from Book One, but does so through the adventure, which is a very nice. This approach allows the characters to be the agents by which humanity learns more about the Vau and resolves some of its misapprehensions. The adventure assumes the characters were involved in the adventure included in Part One of "War in the Heavens," but contains enough GM advice and options that it's not a necessity. The adventure is extremely well done and engaging. My only complaint - and it's a small one - is that its conclusion makes the characters very important people in the *Fading Suns* setting. They'll have done what no one has done in centuries: set foot upon a world of the Hegemony and plumbed its secrets. Thus, the adventure is epic in its consequences, which some GMs may not find to their tastes.

(END SPOILER ALERT)

Part four of the supplement includes rules for generating Vau and other Hegemony aliens as characters. This is a nice touch and a warranted one. Hegemony provides enough information that I can easily envisage a campaign that takes place entirely within Vau space. Moreover, Holistic Design has promised additional support for this setting, which should warm the hearts of anyone taken in by this book's portrayal of the Vau.

Hegemony concludes with an eight-page report on the Vau that represents humanity's knowledge of the species prior to the events of Book Two. It's a nice summary, and makes a good handout to give to players before the game. A PDF version is available on Holistic Design's website - another nice touch that made me quite happy.

All in all, *War in the Heavens: Hegemony* represents another example of why *Fading Suns* is an under-appreciated gem of a game. The supplement is well conceived and detailed without hampering a GM's ability to include the information into an ongoing campaign. More significantly, it shows yet again how to produce a dynamic setting with plenty of mysteries and enigmas without locking a campaign into a set story arc or metaplot. It's a nice little trick and one that I'd love to see other game companies emulate. In addition, the Vau are a genuinely interesting alien race, with lots of potential for spurring space operatic adventures among the *Fading Suns*. Fans of both *Fading Suns* and good game design owe to themselves to give this book a look.

Pyramid Review

The Unspeakable Oath 16/17

Published by Pagan Publishing

Edited by Brian Appleton, John H. Crowe III, Adam Scott Glancy & John Tynes

Art by John Coulthart et al

\$16

The Unspeakable Oath is Pagan Publishing's magazine devoted to Chaosium's *Call of Cthulhu* game, and the latest issue has just been released. Unfortunately it has been a long wait for issue 16/17 . . . some four years since the previous issue (14/15) was released back in 1997. Pagan Publishing is not a company that likes to publish in a rush, and instead tends to release a book once they have it right. In the long hiatus, have they got it right with this issue?

As with all of their books, *UO 16/17* is attractive to look at. John Coulthart's full wraparound cover is equally eye-catching and disturbing, and not necessarily something you want to be seen in public with. Inside, John Tynes' layout is very clear and simple after the graphical complexities of the previous issue. Throughout, the use of both artwork and photographs is suitably appropriate.

Besides three new mysterious manuscripts, this issue has a strong bibliophilic bent. John Goodrich's "That Horrid Book" discusses the possible side effects of reading Mythos tomes, with a focus upon the *Necronomicon* itself. This aside, these are very good suggestions and should set any good Keeper thinking about possible side effects of reading other books. In "Lesser Evils," Brian M. Sammons introduces a number of new tomes and published chapters from actual tomes, all of which have been taken from published Cthulhu Mythos stories. These do not just include tales by Lovecraft and Derleth, but also Brian Lumley, Lin Carter, Robert Bloch and Henry Kuttner. The intention with these lesser tomes is to place them in an ongoing campaign to help maintain the mystique and power of the greater, better known books such the *Necronomicon* or the *Cultes De Ghouls*.

Considering that New England is the prime setting for both Mythos fiction and *Call of Cthulhu*, it is surprising that its major city Boston has not been explored anywhere before. Guy Bock rectifies this with an article on the Boston of the thirties. This is accompanied by a chronology of the city, which includes the details of the Lovecraft stories that take place in (or are in some way connected to) the city. It would have been nice to also have a list of the *Call of Cthulhu* scenarios that are likewise set in or connected to Boston. Guy Bock's second article examines technology and science of the twenties and thirties; it lists selected technological inventions and scientific discoveries, and examines them in detail. Not just everyday items are described -- such as the elevator, electric light and phonograph -- but also gear that an investigator might want to use. The stance on the technology is not just when it was invented, but when it entered widespread use, so if a Keeper wants to know when the players can get hold of dynamite or a Geiger counter, then this will prove useful.

Not quite so immediately useful are the two articles on India. The first is "The Deceivers" by David Perry and A. Scott Glancy, which is an examination of the secret cult of Thuggee, followed by "Dhanurvedya, Varman and Avarna," Michael J. Varhola's article on the arms and armor of the sub-continent. That India has been little used in *Call of Cthulhu* is a shame, as it offers plenty of opportunities as game setting. Both of these articles go far in redressing the balance, but unfortunately neither is made use of in this issue of *UO*. It would have been nice to see an adventure included using this material. Without it, these articles only have real use in historical scenarios or even as the

background for Dreamlands-set adventures.

The two adventures in the book break with the graphic simplicity of the rest of the magazine. "Punitive Measures" by Brian Appleton is laid in the same style as Pagan Publishing's *Mortal Coils* anthology, while Adam Gauntlet's *Delta Green* scenario, "See No Evil," is done as a *Delta Green* book. "Punitive Measures" is a one-shot scenario set in 1916, during General Pershing's campaign in Mexico against Pancho Villa. The players are US Army troopers assigned to follow up on a raid upon a village by some of Pancho Villa's men. In doing so, they stumble upon the potentially very bloody Mythos situation. The finale of the adventure is very strongly combat-oriented, and with either the pre-generated provided or new characters this encounter could be the reason why the investigators now fight Mythos forces. There is only slight room for including non-military characters in this adventure, and almost none for including female characters.

"See No Evil" is a low-key scenario for Delta Green as the players are ordered to piggyback an FBI surveillance operation upon a group that adheres to the theory of Holocaust Denial. Not only do the investigators have to conduct this surveillance in a legal manner, but hide their illegal activities and methods from the ordinary FBI team members. Set in New York, this could easily be slotted into part of an Unseen Masters campaign if that is being run for Delta Green. This is a good scenario, which has the potential to explode into combat at the end. It does come with play test notes, but the writing feels a little rushed in places.

The Unspeakable Oath 16/17 is rounded out with a letters page and a reviews section. The latter covers games, books, and films in some depth. It does show its age in coverage of the games, although the reviews of Steve Jackson Games' *GURPS Warehouse 23* and *Black Ops*, as well as *In Nomine* are rather favorable.

Although *The Unspeakable Oath* has been on a four-year hiatus, it has been worth the wait. This is mainly due to the quality of the contents, which, while perhaps not comparable to that found in previous issues, is still worth reading. The issue might have been seemed better if we didn't have to wait quite so long, but we can only hope that it isn't another four years until the next issue.

-- Matthew Pook

Who Was That Masked Man, He Asked Ironically

"Some months after the death of [Mazarin], an event without parallel occurred, and what is no less strange is that all historians are unaware of it. An unknown prisoner, of height above the ordinary, young and of an extremely handsome and noble appearance, was conveyed with the utmost secrecy to the castle on the island of Sainte-Marguerite in the sea off Provence. On the way there, the prisoner wore a mask, the chin-piece of which had steel springs to allow him to eat with it on, and the order was to kill him if he took it off . . . This unknown man died in 1703, and was buried at night in the parish church of St. Paul . . . What is doubly astonishing is that when he was conveyed to Sainte-Marguerite, no man of consequence in Europe disappeared . . . it is clear that it was a prisoner of the greatest importance whose destiny had always been a secret."

-- Voltaire, *The Age of Louis XIV* (1752)

The story of the Man in the Iron Mask first appeared in print when that cunning propagandist Voltaire painted it into his *Age of Louis XIV* (which he, no idiot, had printed in Berlin). He, Voltaire, having done time in the Bastille (admittedly fifteen years after) had heard of the "noble prisoner," the sole charge of the head of the Bastille, former Musketeer Benigne d'Auvergne de Saint-Mars. And now, discreetly, he blew the gaff: Saint-Mars had escorted a noble prisoner from prison to prison over a space of forty years, always keeping the man's face masked. In an age before television and *People* magazine, there were very few people whose face was so recognizable that such a mask could have been needed -- except, of course, the King, whose face was on every coin and note. Voltaire dropped enough hints to make sure even the dimmest *philosophe* understood -- the Man in the Iron Mask was the twin brother of Louis XIV, concealed to conceal Louis' inferior (moral, or sometimes even chronological) claim to the throne.

It's important to note, here, that Voltaire exaggerated the hell out of the prisoner's "nobility", but no more than roughly contemporary rumor did -- there was a masked (albeit in black velvet) prisoner in the Bastille, who died on November 19, 1703. The documentary chain of evidence makes it almost certain that this Man in the Velvet Mask was a single prisoner who had followed the jailer Saint-Mars from prison to prison, starting out at the Alpine fortress of Pignerol on August 24, 1669. At least once, we have a dated, contemporary (albeit still second-hand) reference to the prisoner being made to wear an iron mask. But we stray dangerously toward history here, so as a corrective, we'll note that Alexandre Dumas played his customary ducks and drakes with the story, including a scene in which the entire Paris court sees the twins meet -- which would tend to make masking the twin to conceal his existence rather pointless, I'd think. But anyway, the last part of Dumas' *Viscount of Bragelonne*, sometimes excised as *The Man in the Iron Mask*, is a corking good story, which is all we need.

"And they saw, by the red flashes of lightning against the violet fog which the wind stamped upon the bank-ward sky, they saw pass gravely, at six paces behind the governor, a man clothed in black and masked by a vizor of polished steel, soldered to a helmet of the same nature, which altogether enveloped the whole of his head . . . 'Call me neither monsieur nor monseigneur,' said the prisoner in his turn, in a voice that penetrated to the very soul of Raoul; 'call me Accursed!' He passed on, and the iron door croaked after him."

-- Alexandre Dumas pere, *The Viscount of Bragelonne*,

And corking good stories abound. In addition to Louis XIV's secret twin brother, some have proposed Louis XIV's secret older half-brother (the illegitimate offspring of his mother Anne of Austria and the Duke of Buckingham being the most popular candidate), a secret older sister (the mask being necessary to disguise her female features), his secret father (Louis XIII not having been up to the task) masked to conceal his resemblance to his son Louis, and his (real) illegitimate son, the Comte de Vermandois. Unfortunately, Vermandois died on the battlefield in 1683, by which time, the Man in the Iron Mask had been imprisoned for 14 years. Nothing loth, the Vermandois patrons argue that the first prisoner was a "placeholder" kept masked so that someone famous could be secretly imprisoned after a faked death.

Thus, for our purposes, absolutely anyone who died between 1669 and 1703 could "actually" have been spirited away to prison and masked, which opens the field marvelously: my favorite version has the Duke of Monmouth, who attempted to overthrow James II in 1685, being swapped in for the Iron Mask and a lookalike executed in London. (Contemporary rumor did, in fact, identify the Iron Mask as an "English milord.") Richard Cromwell (son of Oliver),

who died in England in 1712, is another candidate put forward based on contemporary rumor and a properly cavalier disregard for chronology; in this context it's kind of disappointing to report that the Grand Admiral of France, the Duc de Beaufort, is often placed in the Iron Mask based on his disappearance in 1669 during the French attack on Crete.

"I see," said Aramis, with a most engaging smile; 'it is written that our dear d'Artagnan shall know all our secrets this evening. Yes, my friend, you have surely heard speak of M. Fouquet's Epicureans, have you not?' 'Undoubtedly. Is it not a kind of poetical society, of which La Fontaine, Loret, Pélisson, and Moliere are members, and which holds its sittings at St. Mandé?' 'Exactly so. Well, we are going to put our poets in uniform, and enroll them in the service of the King.'"

-- Alexandre Dumas pere, *The Viscount of Bragelonne*

It's far more refreshing to dive into the theory that the Man in the Iron Mask was, in fact, the father of the French Theater, Moliere! Moliere's play *Tartuffe* had offended the powerful Compagnie du Saint-Sacrament, a secret society of creepy ultramontanist Catholics (who, for example, opposed both Mazarin and the Jesuits) "officially" disbanded by Louis XIV in 1660. However, from the shadows, they struck -- kidnapping Moliere after Moliere had "died" onstage (in a performance of *The Imaginary Invalid* in 1673) and bustling him off to Pignerol in a mask. (The mask, of course, to conceal Moliere's very famous actor's face, and the instruction against speaking to conceal his equally famous actor's voice.) This theory, delightfully, has the near-complete absence of hard documentary evidence regarding Moliere's life going for it -- he left little more behind him than Shakespeare did -- which implies that the Compagnie cleared out his rooms after doing the deed.

"You must make sure the windows are so placed that they do not give on to anywhere accessible to anyone, and that there are enough doors closing one upon the other that the sentries will not be able to hear anything. You personally must take the wretch whatever he needs for the day once a day, and you must never listen to anything he tries to tell you, whatever the pretext may be. You must threaten to kill him if he ever opens his mouth to speak to you about anything save the bare necessities of his life."

-- letter from the Marquis de Louvois to Saint-Mars, July 19, 1669

Sadly, after sifting the archives (which unkindly list every prisoner at Pignerol), there are really only two real candidates worth mentioning. The first is one Ercole Mattioli, secretary of state to the Duke of Mantua. Mattioli double-crossed the French in a complex intrigue, and was clapped into Pignerol in 1679 with orders from Louis XIV that "no one should know what becomes of this man." The masked prisoner of the Bastille, it turns out, was buried under the name "Marchiolly," and the King's Lieutenant in the Bastille referred to the masked man as "M. Marchiel" -- all significant pointers. The other candidate is one Eustache Danger (or Dager, or D'Angers), a "mere valet" arrested at Dunkirk in 1669 and clapped into durance vile for still-murky causes. John Noone, in his meticulous and intelligent *The Man Behind the Iron Mask*, makes a compelling case for Danger over Mattioli, but falls down on the question of Danger's crime. (As far as the mask goes, Noone describes it as a deliberate attempt at mystification and self-aggrandizement by Saint-Mars.)

One fascinating possibility is one Eutache d'Auger de Cavoye, a childhood playmate of Louis XIV, who was involved in a Black Mass in 1659 -- and eventually implicated as a poisoner, Satanist, and sorcerer in the "La Voisin ring" that included the King's mistress Montespan. The authorities had quashed and covered up one branch of La Voisin's organization in 1668 -- including, according to surviving records of interrogations, a "surgeon" (possible code for an abortionist-poisoner) named "Auger" -- who lived at d'Auger's address! The Satanist in the Iron Mask has a cool ring, eh? Some writers try for the trifecta by assuming that d'Auger's father, Francois d'Auger, captain of the Cardinal's Guard, might have been the "stud" who impregnated Anne of Austria -- and thus d'Auger had to be masked to conceal his resemblance to Louis XIV. Annoyingly, it's likely that d'Auger de Cavoye (who may, still, have been "Auger") died in the asylum of Saint-Lazare in 1688ish.

"Monsieur de Cinq-Mars [sic] has by order of the King transported a state prisoner from Pignerol to the island of Sainte-Marguerite. No-one knows who he is, there is an interdiction on speaking his name and an order to kill him if he should pronounce it . . . He was enclosed in a sedan-chair with a steel mask on his face, and all that one could learn from Cinq-Mars is that this prisoner was at Pignerol for many years, and that all the people one believes to be dead are not."

-- unsigned letter, possibly from the Bishop of Agde, Sep 4, 1687

Intriguingly, there's at least a smidgen of evidence that d'Auger (unsuccessfully) poisoned Louis XIV's minister of finance, Nicolas Fouquet -- who, in fact, received the Man in the Iron Mask as a valet while doing time in Pignerol. Fouquet's arrest has always seemed dodgy -- he was a prominent member of the Compagnie du Saint-Sacrament, by the way -- and there are those who, in defiance of his well-documented death in 1680, make Fouquet out to be the Man in the Iron Mask after some creative body-switching. Fouquet is also at the hub of the whole *Prieuré de Sion* thing, and the Man in the Iron Mask might have been the true Merovingian heir, the Duc de Guise. This theory holds that Louis XIV faked Guise's death in 1664, but secretly imprisoned him to paralyze the *Prieuré* -- with the True King still alive, they couldn't begin conspiring to put the next Merovingian heir on the throne. Similar threads run through the notion that either the illegitimate son of the (Merovingian) Charles II Stuart, or Charles II himself (swapped for a pliable double during his exile in France) was the Masked Prisoner.

"No fable however far-fetched, no grouping of characters however improbable, can, however, destroy the interest which the innumerable writings about the Iron Mask excite, although no two agree in details, and although each author and each witness declares himself in possession of complete knowledge."

-- Alexandre Dumas pere, "The Man In The Iron Mask"

This should illustrate the possibilities for the Man In The Iron Mask -- in a triumph of bisociative Maskerade, anyone or anything might be behind that black velvet domino. Perhaps the Man in the Iron Mask was a superhero, a 17th-century Unknown Soldier, who hid his "secret identity" in the comfortable prison of Sainte-Marguerite, and only emerged when la Belle France needed him most to impersonate someone. Was the Iron Mask in fact the Templar [Baphomet](#), placed on the faces of political prisoners to draw out their knowledge or feed on their souls? Maybe the Iron Mask was the Man's actual face, hidden behind a black velvet hood -- could he have been a clockwork cyborg? Could he have been the [Comte de Saint-Germain](#), or the [Wandering Jew](#), masked to conceal the fact that he did not age? Did the mask conceal the scales of a Reptoid, or protect France from the deadly charismatic nimbus of an [Enochian Nephilim](#)? "All the people one believes to be dead are not." And some aren't even people. Unmask, and enjoy.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Trickery! Trickery!

One of the biggest difficulties I've had when GMing has been sneaking in information.

Because players are inherently paranoid, and they listen to *everything*. Oh, sure, they may spend hours running after some red herring or another, but it's worth it to catch the GM flat-footed, scrambling to repair the shambles of the adventure.

Let me give an example.

Our GM was running an *In Nomine* adventure where we needed to figure out what was going on in this house; we suspected something was manipulating the members of the family to hate each other. As we approach the home, she describes the scene, and mentions (amid a couple other details) that there is a dog barking at us.

We players just looked at each other. And in each others' eyes we could see *Terminator*-esque targeting HUDs zeroing in.

"DOG" = "ENEMY"

"I look at the dog using my special investigative power."

"I examine the dog with my gift of knowing the virtue or vice of its soul."

"I load."

And peering over the screen, shifting through notes and rolling dice, our GM said:

"Damn you."

Like accidentally showing the last five minutes of a *Twilight Zone* first, the adventure was clearly veering off into territory our poor GM wasn't expecting, and she scrambled to adjust.

She ended up doing a fine job under pressure, and I believe she quickly realized that knowing who The Bad Guy is and being able to do something about it are two very different concepts. ("Why are you beating my dog to death with a bat?" "Because we're trying to help your family, Billy . . . and we didn't want to wake you up by using the rifle. Good night.")

But I can't help but consider that she might have had an easier time if she hadn't revealed too much too soon. On the other hand, you *need* to include that information; otherwise if she had just introduced the dog in the last ten minutes of the adventure, we would have been wildly disappointed. ("Ha-ha! They had a dog you didn't know about, and it was behind the whole thing!") Bad mysteries have this problem, where the "solution" is completely unknowable until the writer chooses to reveal it to you. I remember one soap opera I saw where they hadn't revealed that the cottage where the murder occurred was on the edge of a cliff . . . a cliff that figured prominently into the solution.

Here, then, are some techniques I've used in the past to obscure the truth, while still making the clues available and keeping the whole experience satisfying.

- *Give the shadows of the clue, not the clue itself.* It can often work wonders if you can give a glimpse of the Clue, without giving the clue itself. If our GM had mentioned the baying of a dog in the background as our car approached, we may well not have noticed. Even if we had, we would have needed to *find* the dog to further that avenue of investigation.

Consider an adventure where the regular batteries in a radio have been replaced with a bomb; the next time the radio is played it will explode. Instead of giving access to the radio, telling the players it's a bit heavier than normal or doesn't feel right, let them find the replaced batteries. Now they may know there's something going on

. . . and it has something to do with batteries . . . but they don't have direct access to the device (yet).

- *Obstruct clues with clues.* A mean trick is to hide an important clue with another clue (perhaps one of lesser importance). In the *In Nomine* game, for example, our GM could have said something like, "As you approach the driveway you notice tire marks and paw prints, probably belonging to a dog. You're able to tell that the car pulled out recently, because the tire marks are fresh, and cover the paw prints." In that way she could have hidden the existence of the dog with another clue (a clue which, ideally, would continue the adventure in a way she wanted).
- *Cover clues with gamespeak.* Since roleplaying games are often about rules, it's easy to sneak in information wrapped inside rules. In my original *GURPS Supers* game I ran, for example, I had a subplot where the gadgeteer scientist character was being possessed by an entity that was controlling him at night to create a giant device that would be used against the heroes. So I pulled that player aside and told him, "You've been working long days trying to complete the repairs on the vehicle that was damaged in the last adventure; you're going to be at -1 to observation and reaction rolls until you can get a decent night's sleep." In that way I was able to sneak in the clue that he hasn't been sleeping right, while not making him overly paranoid.

Likewise in our dog example our GM might have said, "Between the dog house in the yard and the watering dish on the porch you can tell there's a dog around here. If you sneak around to the house let me know; you're at -2 to all sneak attempts." Or something else. Make up penalties (or bonuses) to sneak in information.

- *Put the characters on the defensive.* Another way to keep the players on their toes is to make the characters reactive; if they're too busy worrying, they're less likely to notice the true significance of the clue. In the dog example we might have been taken aback if our GM said, "You see what looks like the family dog here, eyeing you suspiciously and sniffing the air. Does either of your characters wear cologne? Deodorant? What are your initiatives?" By making the players react they have less time to do anything else.

(As an aside, I've always wanted to run a cyberpunk/*Shadowrun*-style adventure where the heroes need to sneak into a building for a mission, they take the elevator up to some floor, accomplish some goal, and leave the building. There would be no complications. Then once they're dividing up the loot, I'd ask the party, "Oh, by the way . . . when you got on the elevator, who pushed the button?" I'm guessing the players would devolve into a raging argument over who pushed the button.)

Perhaps most importantly, be prepared to *let* your players understand the clues. If you wanted to make sure your players absolutely couldn't figure out your ultra-kewl mystery, you wouldn't invite them to play. But by obstructing the truth, and making your players really think, it'll make the times they *do* figure out the clues that much more satisfying.

--Steven Marsh

Last week's answer: GURPS Space, all three editions (look up "Amoeba, giant space" in the index).

(Five stars) "The game begins in June 1941 with huge Axis armies poised on the borders of the Soviet Union, ready to annihilate the ill-prepared Russian forces guarding the frontiers. As in the actual event, the game accurately portrays the devastating Axis blitzkrieg which swallowed whole Russian armies in the summer of 1941."

by **James L. Cambias**

The Mayan Empire in our own timeline was destroyed during the Spanish conquest of the New World. In the universe of *GURPS Castle Falkenstein*, the Maya were better able to resist the European onslaught, and their kingdom has survived into the Age of Steam as a unique realm of strange customs, powerful magic, and curious "windpunk" technology.

Geography

The Mayan Empire occupies the entire Yucatan peninsula, and extends south to the Cuchumatanes mountains. It borders Mexico on the west, the Republic of Hidalgo to the south, and the Republic of Honduras to the east.

The terrain of the Yucatan is flat. There are no rivers in the northern part of the peninsula, because all the water flows through underground channels and caverns in the porous limestone rock. Here and there natural sinkholes, called *cenotes*, give access to the water from the surface. Mayan cities grew up around the cenotes, and the Maya became experts at constructing reservoirs and irrigation systems to spread the water.

In the south, the terrain becomes more hilly. The valley of the Usumacinta river cuts through the southern highlands, and is the breadbasket of the Maya. Beyond the river the land rises to the heights of the Cuchumatanes range. The mountains hold veins of copper, gold and silver.

The east coast of the Yucatan is low and swampy, covered by heavy jungle. In the south, there are two large rivers, the Motagua and the Poichic, which flow into the Gulf of Honduras. The jungles are inhabited by Indians related to the Maya, and serve as a buffer between the Empire and the republics of Latin America.

The population of the Mayan Empire is a million and a quarter . . . much larger than any of the other Latin American states except Mexico. Most of the people live either at the northern end of the Yucatan peninsula, in the central hills, or in the Usumacinta valley in the south. The eastern part of the Empire is nearly empty.

Cities

The capital city of the empire is Mayapan, with a population of about 100,000. Mayapan is by far the biggest city; other cities have populations of 20,000 to 30,000. Important cities of the Empire include Chichen Itza, Tikal, Palenque, Uxmal, Sayil, Kabah, and Yaxchilan.

Mayapan is an impressive city. Most of its great buildings were built in the past two centuries, and there is a detectable Spanish influence, particularly in the use of the arch, which was unknown in Mayan architecture before 1492. It is not, however, a frequently-visited place. There are only three hotels, but they are quite large and comfortable. The hotels are practically the only places in the whole country where one can find a bed; the Maya prefer to sleep in hammocks.

Sisal is the chief port of the Mayan Empire, and lies on the northern coast of the Yucatan Peninsula. The area around Sisal is mostly farmland, devoted to the production of hemp. The harbor cannot accommodate large modern steamships, so everything must be brought ashore in small boats. Sisal itself is an unimpressive town; the real metropolis of the region is the city of Dzibilchaltun, about 20 miles away. Sisal is connected with Dzibilchaltun by a remarkable wind-powered railway, and plans are afoot to extend the lines all over the country.

History of the Maya

The ancestors of the Maya entered the Yucatan from Mexico thousands of years ago. Their great civilization developed around A.D. 300, when the first large cities were built. Mayan chronicles of the early period are filled with myth and legend, and it is difficult to tell what really happened.

For example, tradition holds that the city of Uxmal was built in three days by a dwarf magician. Some modern Dwarfs claim this must have been one of their race, exhibiting the legendary craftsmanship for which they are still known. But the fact that the dwarf is described as a magician tends to contradict that theory, and the truth may never be known. Was it perhaps a midget human who was a powerful sorcerer? Or possibly an actual dwarf who somehow retained magical Talent? Or is the whole story just a legend?

The various city-states flourished during the next few centuries, fighting wars with their neighbors and building impressive monuments which still may be seen today. At its height the Mayan civilization extended much further south, encompassing the modern Republic of Hidalgo and the western half of Honduras.

During the Tenth Century, the Maya fell into a decline, and the region was conquered by Toltec followers of Quetzalcoatl who had been driven from Mexico by the invading Aztecs. They established themselves as a ruling class and helped to revitalize the Maya. The Toltecs established their capital at Chichen, and conquered all the surrounding states. Their kingdom flourished for two hundred years before a terrible plague ravaged the entire empire and left the capital depopulated.

Into this power vacuum came a second band of invaders, the Itza. They arrived in 1224 and crossed the thinly-populated center of the peninsula to settle on the east coast, then moved north to occupy the old capital city, which became known as Chichen-Itza. A generation later the Itza founded the city of Mayapan, and forced the other Mayan cities into a unified kingdom in 1283.

Initially the Itza were nothing but rapacious conquerors. Their new capital was stuffed with loot from the other Mayan cities, and the Itza constantly fought wars to gain new booty and slaves. But over the centuries the Maya conquered their conquerors and civilized them.

In 1461, the ruler of the Mayan Empire was Hunac Ceel, a great sorcerer and a thoughtful ruler. His magic brought him premonitions of disaster, and eventually Hunac offered to throw himself into the Sacred Cenote at Chichen Itza in exchange for a prophecy of the future. Attired in elaborate regalia, Hunac jumped. Unlike previous sacrifices, he came out again. The Rain Gods had given him two visions of the future.

In one, the Maya rebelled against the Itza tyranny, the Empire dissolved into civil war, and was conquered by invaders from over the sea. In the second, the Itza accepted their Maya subjects as partners, developed a prosperous nation of traders and farmers, and united to repel the invaders.

It took all of Hunac Ceel's authority and sorcery to convince the nobles of the Empire. He inaugurated great reforms, and allied himself with the old Maya nobles against the other Itza. Hunac died, worn out by his efforts, in 1494, just as word came from traders in Cuba that strangers had arrived from across the sea.

The first Spanish attempt to conquer the Yucatan came in 1527, when Don Francisco de Montejo landed on the island of Cozumel, then crossed to the mainland. Surprisingly swift and organized resistance drove him back to the island, where the Conquistadores looted and demolished the great Temple of Ix Chel. A decade later, Montejo's son made a landing near Campeche, and penetrated as far as the city of Ake before his force was cut off and destroyed.

The Spanish made three other attempts at conquest: a landing near Sisal in 1544, an invasion from Mexico in 1588, and a disastrous attack from Honduras in 1601. Finally in 1617 the Spanish and Maya signed the Treaty of Cozumel, in which the Spanish agreed to end their attacks in exchange for three conditions: that Mayan ports be closed to all but Spanish ships, that missionaries be allowed into the Mayan Empire, and that the Maya make no alliances with Spain's enemies. The treaty was effectively an admission by the Spanish that they couldn't conquer the Mayan Empire, since the Maya had no desire to trade or negotiate with other New Europeans anyway.

Mayan Society and Culture

The Mayan state makes a great effort to remain entirely self-sufficient. Instead of importing foreign goods, the Maya either make things for themselves or do without. A shortage of iron on the peninsula means the Maya have become experts at working stone and making tough ceramics as substitutes. Soldiers in the Mayan army use bullets of baked clay rather than lead.

That being said, the Maya actually do trade quite a bit with their neighbors, particularly the Latin American republics to the south. The Empire's leading export is cotton cloth, dyed in bright colors and woven in intricate patterns. Chocolate is another export, as is salt from the evaporation beds near Campeche. Merchants and traders are generally devotees of Ek Chuah, the Black God. The majority of Mayan seafarers are members of the Chontal tribe. They are excellent seafarers, roving the Gulf and the Caribbean. Much of the Empire's freight moves by water, and several Chontal-owned shipping lines sail to Mexican, Cuban and Texican ports.

Mayan money is based on the gold standard. The coins are minted bearing the image of a cocoa bean. Cocoa was legal tender among the Maya until the early 18th century. Even today, the word for money and the word for chocolate are the same. Merchants in the major cities will freely accept foreign gold and silver coins, but one can exchange paper money only with great difficulty. The Spanish-Jewish Levi family have operated a bank in Sisal for generations, which handles most foreign exchange.

The backbone of the Mayan economy is corn. More varieties of corn are grown within the Empire than in the rest of the world combined. Mayan farmers also raise beans, peppers, squash, tomatoes, coffee and chocolate. Surprisingly, tobacco is not common in the Empire, nor do the Maya smoke or chew. They are, however, addicted to drinking cocoa, which they brew as strong and black as coffee.

A great gift of the Spanish invasion was the introduction of meat animals. Before the Spanish, the chief source of meat among the Maya was dog, and the occasional small deer. Now they raise cattle in the dry central part of the peninsula, and pigs and chickens everywhere. Oxen and mules are widely used as plow animals on Mayan farms. Horses are uncommon, as the Maya remain awkward horsemen.

All the Maya wear nothing but cotton. They favor sleeveless tunics. The men in the cities and port towns wear European-style trousers, but inland they make do with simple kilts. Despite the hot climate, the Maya are intensely modest; even when out working in the fields they are properly dressed. Shoes, however, are almost unknown. Even the most "Europeanized" dandies of Sisal would never dare to wear something as sissified as a shoe.

All travelers in the Mayan Empire have remarked on the great degree of politeness of the inhabitants, and their serious and restrained demeanor. They are much like stereotypical New England Yankees . . . laconic, a bit pessimistic, but kindly and hospitable.

Each Mayan has two names plus a given name. One surname is matrilineal, passed along the female line of descent; the other is patrilineal, from the father's line. The father's name determines clan affiliation, which is quite important.

One thing which can make the Maya lose all self-restraint is the ball game. This violent team sport is a mainstay of Mayan society. It is played by teams of men wearing heavy stone belts and little else. The game uses a solid rubber ball weighing about twenty pounds. Players can strike it only with their bodies and knees, and score goals by directing the ball through a stone ring. At sacred festivals the winners of the game are selected as sacrificial victims; more

commonly it is played for fun and entertainment. Professional ball-players occasionally become rich enough to retire . . . if they survive the injuries sustained during play.

Government of the Mayan Empire

The Mayan Empire is not really an empire at all but a federation of 26 city-states, each with its own hereditary king, or *Halach Uinic*. Before Hunac Ceel's reforms, the more powerful cities dominated their weaker neighbors. Nowadays, the states are all equals, and the ruler of each city-state sends a representative to a council in Mayapan, called the Popol. The position of Emperor is hereditary; the current Aac ("Turtle") dynasty have ruled since 1750.

The Emperor has control over the army and foreign affairs, and can regulate trade within the Empire and abroad. His chief sources of revenue are customs duties and the annual tribute from the cities. The Emperor is also the ruler of Mayapan. His official title is *Ah Pop* . . . "him of the mat," which refers to the ceremonial mat upon which the Emperor sits.

The Popol council votes annually to set the tribute, which is paid by the cities in proportion to their population. The nobles of the council can advise the Emperor on policy, but cannot make laws. All positions in government are limited to the noble class, known as *Almehen* ("persons of known descent").

Otherwise, all government is at the local level. The king of each city makes his own laws and sets his own taxes, with the aid of a council of local nobles. A few cities have their own distinctive governments. Chetumal, over on the east coast, has a democratic assembly much like the system of the ancient Greeks, in which all citizens vote on legislation. Huaymil, on the northwest, has an elected city council, and Chichen Itza is administered by the chief priest of the Rain God.

The ruling class of the Empire are descendants of Itza and Toltecs who conquered the Maya at about the same time the Normans invaded England. Like the Normans, they have become completely assimilated. Careful observers may be able to spot the more Mexican features of the upper classes, and often the rulers have Itza personal and family names.

The Royal Family

The current Mayan Emperor is Yax U Aac ("Green Moon Turtle"), who has been on the throne since 1835. He is the first Mayan ruler to take a foreign wife. The Empress Christiana is a princess of the Swedish royal house. She met the Emperor Yax during his tour of New Europa in 1842, and the two were married a year later. They have five children.

Yax U Aac

Yax U Aac has ruled the Maya since he was only nineteen, and has generally done a good job of it. He has tried to end the traditional isolation of the Mayan Empire by encouraging trade and contact with the nations of America, Antillea and New Europa. The Emperor's tour of New European capitals in 1842 was the first time a Mayan ruler ever left the country. Emperor Yax is fluent in Spanish, English, French and German.

One reason for the Emperor's interest in the outside world is his great love for science. He is a dedicated naturalist during his scarce free time, and has corresponded with Darwin and Huxley. Yax U Aac is also a skilled sorcerer, trained in all the magical traditions of the Maya.

Now in his late seventies, the Emperor Yax is starting to show his age, but is hoping to stay on the throne long enough for his son to gain some responsibility. He is a small man, who sometimes seems to have difficulty carrying the elaborate regalia of his office.

Christiana

The Empress Christiana's life has not been easy. She scandalized her family by agreeing to marry the Mayan Emperor, and since then has lived with the disapproval of many Maya aristocrats. Getting used to the customs of the Mayan court was very difficult, but she is a woman of great courage and determination.

Christiana is now in her fifties, but remains a great beauty. She is tall and fair and dresses in traditional Mayan clothing. The Empress is devoted to her husband and children. Lately she has been the mediator between the Emperor and his eldest son.

Tochtli Bernadotte Aac

Prince Tochtli ("rabbit") is something of a disappointment to his father. The prince is tall, strong and handsome, but is careless and easily manipulated by others. He is an Eagle Knight of the Mayan army, and commands a regiment, but spends nearly all his time playing the ball game or drinking. The Prince has not yet married . . . another source of anxiety for his parents . . . but is notorious for his romantic affairs.

Tochtli has been trained in magic by some of the Mayan Empire's greatest sorcerers, and is a superb ball-player. But he has no interest in the arts of government. The Prince is thirty years old, but rough living and heavy drinking make him look older.

The Mayan Army

Ever since the first Spanish invasions, the Maya have kept a standing army, with universal military service required for all men. During the 18th Century a French exile instructed the Maya in modern forms of military organization and doctrine.

The Mayan army is controlled by three warrior orders, the Eagle Knights, Jaguar Knights and Coyote Knights. They form the officer class, while conscripts and apprentice Knights fill the ranks. Each order has its own regiments, and draw recruits from all over the Empire.

The Eagle Knights are the oldest and most prestigious order. They are also the most stodgy and traditional. Eagle regiments switched over to firearms only in this century, after a disastrous defeat by Mexican bandits in 1836. The Eagle Knights are much like members of a high-class British regiment . . . brave, undisciplined, and hard-drinking.

Jaguar Knights are less prestigious than the Eagle Knights, but they win more battles. Jaguar regiments are the most professional units in the Mayan army, and pay the most attention to training and doctrine. In battle they are fearless and reliable. Off the field, Jaguar Knights are like Prussians in their stiff reserve and precision.

Coyote Knights are the intellectuals of the Mayan army. Coyote regiments often experiment with new weapons and tactics, and Coyote Knights make up the bulk of the Mayan intelligence service. Many Coyote regiments are technical specialists . . . the engineers, artillery, signal corps and snipers are all Coyote units. Coyote officers are more willing to use psychological warfare, dirty tricks and unorthodox tactics.

The Mayan army has platoons of ten men, commanded by two Knights. Four platoons make up a company, with two more officers in charge. Four companies form a battalion of 200 men, and four battalions make up a regiment. The Mayan army has 13 regiments in all. The Eagle and Jaguar orders each have four infantry regiments and one cavalry regiment, while Coyote order has one infantry, one cavalry and the new Coyote technical regiment, which incorporates an engineer battalion, a signal and intelligence battalion, and two artillery battalions. The cavalry are mostly recruited in the western regions, where the Mexican love of horsemanship has seeped across the border. They are mounted on mules, which survive better in the Yucatan climate.

The army is currently equipped with American-made Springfield rifles sold as surplus at the end of the Civil War. Officers in the Eagle regiments carry old-fashioned war clubs studded with obsidian flakes. Other officers use steel swords and pistols.

During the period of Spanish domination the Maya did not maintain any ships of war, but since their neighbors have become independent the Maya have needed ships to protect their shores. Most of their fleet consists of small sloops and gunboats for coastal defense. They did purchase one steam ironclad, the *Chac*, from a British shipyard in 1870 (the ship was originally commissioned by the Confederacy, but was not finished when the Civil War ended).

Foreign Affairs

For the past few centuries the Maya have had little interest in the world beyond the borders of their empire. Their neighbors the Aztecs were never exactly pleasant people to be near, and for decades all contact with the Spanish came in the form of conquering expeditions. During Spain's heyday, the Mayan Empire was effectively a protectorate, and foreign ships seldom dared to slip past the watchful Spanish patrols.

The Mayan Empire began opening up cautiously to the outside world with the decline of Spanish power, beginning around 1700. Smugglers began to bring in European goods, and with them rumors of interesting ideas . . . astronomy and mathematics to rival the Mayan achievements, useful arts and industries, and tentative offers of friendship from the rulers of mysterious lands called "England" and "France."

But the breakup of Spanish power also brought pirate raids on coastal towns, and new missionaries preaching a variant form of Christianity who were just as bothersome to the Mayan priests as the Spanish Jesuits had been. The Maya saw little reason to end their policy of isolation during the 18th Century, and only a few scholars ventured to Spain and Italy. Many pirates did seek refuge in the swampy eastern part of the Yucatan, and while the government periodically sent in troops to root them out, the pirates did forge ties with the local inhabitants, so that many Maya from that region later went to sea themselves as traders or smugglers.

It was only with the wave of independence movements sweeping Latin America in the wake of the Napoleonic wars that the Maya began opening up to the outside. Instead of haughty and aggressive empires, their new neighbors were mostly small and unstable republics, eager for the trade and military protection the Maya could provide. For the minor states of Central America, the Mayan Empire has been a useful counterweight to the influence of big powers like Mexico, the United States and Great Britain.

During his long reign the present Emperor has tried to encourage contact with other lands to prevent the Mayan Empire from falling too far behind. The technological marvels he saw in New Europa impressed him deeply, as did reports of British and French empire-building in Africa and Asia. To prevent his own land from becoming some colonial power's property, Emperor Yax U Aac has tried to encourage domestic industries, and has cultivated alliances with Brazil and Mexico. His attitude towards the United States is cordial but wary.

Religion

The religion of the Maya is extremely complex, and many large books have been filled by scholars trying to explain Mayan religion to outsiders.

The Maya worship a vast pantheon of 166 gods, but the large number results from the fact that each god has multiple aspects. The most sophisticated theologians among them maintain that all the gods are merely aspects of a single divinity known as Hunab Ku. The following is a list of only the most important Mayan gods:

Itzamna is the chief of the Mayan pantheon, the inventor of writing and the calendar. He is portrayed as an aged man, but is also identified with the alligator. Itzamna and his wife Ix Chel are the parents of all the other Mayan gods.

Ix Chel is the goddess of the rainbow, of healing and of weaving. Medicine among the Maya . . . both scientific and magical . . . is quite advanced. The Empire's greatest medical center is the huge complex surrounding the Temple of Ix Chel, on the island of Cozumel. At the temple there are several large hospitals, a medical school, and libraries holding the accumulated medical lore of the Maya. Ix Chel is depicted as an old woman, sometimes with serpents in her hair.

Ah Kinchil is the Sun god, and at night he transforms into the Jaguar god as he journeys through the underworld. Ah Kinchil has the form of a powerful youth, sometimes with a jaguar mask.

Ix Ch'up is the Moon goddess, who is the consort of Ah Kinchil. She is portrayed as a beautiful maiden. The rabbit is associated with the Moon goddess.

There are four Rain Gods, called Chacs. Each has a different color corresponding to the corners of the world (red for east, white for north, black for west and yellow for south). The cenote at Chichen Itza is sacred to the rain gods. Intriguingly, the Chacs are said to be the ancestors of dwarfs, which live underground.

Besides these chief deities, the Maya honor scores of lesser gods, including Ah Puch, the god of death; Ek Chuah, the god of merchants and chocolate-growers; the heroic twins Xbalanque and Hunahpu; Tohil, the god of fire and change; Hun Hunahpu, the corn god; and many others.

Sacrifice

The Mayan religion, like the extinct Aztec faith, includes blood sacrifice. The practice of killing living humans for their magical power was adopted from the Aztecs, and was almost completely abolished by Hunac Ceel's reforms.

Modern Mayan religion still includes blood offerings to the gods, but nowadays the faithful offer up their own blood willingly and in safe amounts. Animals are also given to the gods, particularly to the Chacs. Their sacrifices are thrown into the sacred well at Chichen Itza.

But the reforms did not completely do away with human sacrifice. Each year a volunteer must leap into the sacred well to appease the Chacs. Amazingly, there are always plenty of volunteers, and would-be sacrifices must often wait several years before they can jump. Stranger still, attempts to drag the cenote to recover bones or treasure have never brought up anything . . . it is as if whatever falls into the sacred well vanishes from the world.

Astrology and Astronomy

Astrology is a very important part of the Mayan religion. Nearly all priests are skilled astrologers, and the sophisticated Mayan calendar was developed as a tool for divination. Priests kept detailed records for centuries of the motions of the planets, and created a superb set of tables for calculating planetary positions.

According to Mayan myth, the universe follows cycles of creation and destruction, each lasting about 5200 years. The Maya believe the last cycle began in 3113 B.C., and that the world will end in A.D. 2011, after which a new creation will make a better universe.

Mayan astrologers also perform a great deal of scientific astronomy. The introduction of the Copernican model of the heavens and Newtonian physics caused a small revolution in Mayan science. Today Mayan astronomers are among the best in the world, with a modern observatory at Jacaltenango in the southern mountains and thousands of years of data to draw upon. Yet, strange as it seems to New European scientists, Mayan astronomers also determine auspicious dates and interpret the signs of the heavens.

Other Religions in the Empire

Over the years, Spanish missionaries did make some converts among the Maya. Today there are some thirteen thousand Catholics in the Mayan Empire, mostly in the western part of the kingdom. There are also a surprising number of Jews in the Mayan Empire, most of them descendants of those expelled from Spain by the Inquisition. Sisal has a colony of nearly a thousand Jews, and Mayapan is home to another thousand.

A small population in the southwest follow the ancient Aztec religion and preserve a remnant of Aztec civilization under the protection of the Mayan Empire. The Aztecs are forbidden to practice death magic but are otherwise free to follow their gods.

Mayan Magic

Mayan magicians are almost all priests and nobles. Midgets and hunchbacks among the Maya often show a great deal of magical talent. The Maya have four great magical books, said to be written by their chief god Itzamna himself. Few sorcerers are permitted to study more than one book.

The Codex of the Observatory

Kept at the great center of astronomy at Jacaltenango, this book holds all the Mayan secrets of astrology and divination. Most of the book is devoted to tables of data on planetary motions. It includes the lore of *Scrying*. By means of astrological calculations, the astronomer-priests can perform *Precognition*, seeing potential future events; and *Retrocognition*, seeing things that happened in the past.

The Codex of the Sacred Well

Guarded by the priests at the cenote of Chichen Itza, this book contains Mayan magic for promoting fertility of the land and controlling the underground rivers. The Mayan kings all study this book. Sir Richard Burton learned the lore of *Summon the Earthquake* from this text, and the lore of *Shaping the Element* and *Elemental Barrier* are also known to the Druids. Unique to the Codex are the disciplines of *Seeking the Element*, which allows the caster to sense the presence of one of the four magical Elements; and *Create the Element*, which lets the mage generate a volume of one of the Elements out of nothing.

The Codex of the Hospital

The accumulated knowledge of the temple of Ix Chel on Cozumel Island, this book holds all the Mayan secrets of healing. After the only copy was nearly destroyed by the Spanish invasion, the Maya have placed duplicates in each hospital in their kingdom. The Codex includes much mundane medical knowledge in addition to its magical Lore. The book teaches students how to *Cast Out Illness* and *Ward Off Sickness*, but also how to cause sickness in others. In addition it tells how to *Speed Healing*, which doubles the normal healing rate for injuries.

The Codex of the Ball-Court

Brought to Yucatan by the Itza, this book includes much magical knowledge from Mexico. Mayan nobles study the lore in this book, which contains mystical knowledge of conditioning the body. Several copies exist, kept by important noble families around the Empire. The book teaches such arts as "Bear Strength," or "Puma Swiftmess" . . . all aspects of the lore *Invest With Powers of a Known Form*. A second volume containing secrets of Aztec death-magic was destroyed by order of the Emperor in 1732.

Thaumic Energy Requirements For New Effects

Precognition: 10

Retrocognition: 6

Cast Out Illness: 10

Ward Off Illness: 4

Speed Healing: 6

Seeking the Element: 4

Creating the Element: 8

Technology

The Mayan Empire has a sophisticated culture with many skilled craftsmen, but suffers from a crippling lack of resources. As a result, Mayan technology is a triumph of making do with primitive materials. Yucatan has no coal deposits (and the petroleum is all off-shore and unknown in the Age of Steam), and very little water power. The forests are scanty, so the chief sources of energy are wind power and muscle. Metals are also scarce, and the lack of fuel for smelting makes them quite expensive, so things like stone and wood are commonly used where New Europeans would employ steel or brass. Mayan technology uses what outsiders would call "primitive" materials and power to achieve sophisticated results.

In *GURPS* terms, the Mayan Empire is mostly TL4, but with some unusual "TL4+1" inventions. Any technology which doesn't require large factories or sources of power, like medicine and the sciences, is TL5. In the poorer sections of the country, the peasants live at TL2 or even below. The army has imported TL5 guns and equipment, but the Emperor is painfully aware that his country's defenses rely on the American republics and New Europa for supply.

An example of Mayan "windpunk" technology is the Sisal Railway, connecting the port of Sisal with the nearby city of Dzibilchaltun. It uses rails of carved stone, carefully fitted together by master stonemasons. The trains themselves are wind-powered. Huge windmills mounted on the locomotive provide the energy needed to drive the train. The locomotive sacrifices speed for pulling power, so the wind railway can only reach 10 miles per hour with a string of three cars. On calm days a team of oxen take over. Other examples of "windtech" abound: in the city of Mayapan the Hotel Yucatan has a windmill on the roof which pumps water for the plumbing system and hauls up the counterweights which operate the elevator. An inventive engineering officer of the Coyote Knights has even devised a windmill-powered repeating catapult which protects the city of Sisal from aerial pirates.

by Dylan Craig

"*Faire Camerone*, they call it. Means to 'do a Camerone' -- 'sfrom a battle where eight of ours bayonet-charged a few hundred Mexican cavalry in the closing minutes of some uneven battle. Eight against a thousand, know what I mean? That's the Legion for you. Death and glory. But what if it's eight Legionnaires against a thousand Legionnaires -- and the thousand are already dead? That's what me and my seven mates are thinking, here in this trench . . . "

It is the winter of 18___. Europe finds itself under assault by the undead, who are spreading their zones of influence along the Mediterranean coast and up into the heartlands of France, Italy, Greece, and Spain. These beleaguered nations are holding them off, for now, but it cannot be long before their resolve breaks and the undead columns march inexorably into Germany, Russia, and the rest of the continent.

It was eighteen months ago that the French Minister of War began to receive the first desperate communications from the commanders of the larger Algerian garrisons. Entire companies were going missing while on patrol; traces of bloody battle were usually found, most of which indicated that the Legionnaires and their native auxiliaries had been attacked by a superior force and wiped out, but not a single body could ever be recovered. In addition, the desert patrols were discovering more and more abandoned native settlements. The commanders urgently requested reinforcements; all the signs indicated that a fresh offensive against the colonial presence was being prepared, and the commanders wanted the wherewithal to march against the mountain strongholds which they suspected would be used as staging points, to destroy the offensive before it got off the ground. The reinforcements were duly dispatched; large recruitment drives across the continent ensured that a steady stream of volunteers poured into the Foreign Legion's training battalions. If the Algerian rebels were indeed massing for attack, then the preemptive strike envisaged by the Legion commanders could, if successful, finish the rebels as a military force for decades, and the French government intended to provide the generals with all the manpower they needed for such a task.

It took nine months for the preparations to be completed; during this time, patrol losses had become so regular that commanders feared a wide-scale mutiny if they continued to assign patrol duties. However, to everyone's relief, the long-awaited offensive had still not materialized, and with the disembarkation of the reinforcements and the commencement of their march into the interior, most felt that the shoe was about to be transferred, firmly, to the other foot. Fortresses were stripped of all but their essential staff; three massive Legion columns were assembled and prepared to strike deep into rebel territory. It was there that they met their long-lost Legion comrades.

There were no survivors.

Weeks went by, then months. To send out an expeditionary force to determine the fate of the three columns would have required further depletion of the now-tiny Legion garrison; this was being painstakingly debated via telegraph, when all communication from Algeria ceased. Civilian shipping which had fled the Algerian coast spoke of towns falling to an unstoppable assault by armies of Legionnaires! The French government had little chance to react to this news before further reports that coastal towns all along the Mediterranean coast were now under artillery and infantry assault. Reports were patchy, but refugees fleeing north spoke of the renegade Legionnaires as demons or madmen, impervious to damage and with a terrible lust for human flesh.

What the French government didn't know -- in fairness, *could* not know -- was that the Legionnaires currently laying waste to *belle France* were no longer human, or even alive. Raised from the dead by ancient magics, they were now the tools of a vengeful Algerian sorcerer-hermit, whose agenda was nothing less than the complete subjugation and extermination of the Western heathen invaders.

All attempts at diplomacy or interaction of any sort failed. Town after town fell, and as the first shells began to slam into Paris, the French government fled to London. There, in hushed conferences, the heads of the European states have begun their debates on how to counter this seemingly unstoppable invasion.

Several courses of action have already been suggested, but rivalries, suspicion, and hidden agendas have proved to be an insurmountable problem in this regard. For instance; a Prussian suggestion for incendiary attacks on "infested" French cities by air was vetoed by the French as a transparent excuse to cripple the French industrial base, and a French request for gunboats to destroy the Algerian ports which seem to be the resupply nexus for the invasion force was met with unequivocal scorn as the other delegates accused the French representatives of trying to save themselves the expense and effort of pacifying their own rogue colonies. While the delegates bicker, European cities are emptying and entire armies are deserting in the face of the Legion onslaught. If the invasion is to be stopped, something must be done soon.

Only Great Britain, isolated from the threat for the time being, has maintained a cool head; the British training camps and steelyards are busy day and night, preparing the army and navy for the battles to come. It is even rumored that agents of the Foreign Office have penetrated into Legion-held territories to gather intelligence about the invaders, their leaders, and their plans for conquest.

Hungry Ones: These ancient spirits are the motivating force behind the Legion. Pale, glowing shapes devoid of form, they exist partially in our world and partially in the next. They can pass through solid objects, float above the ground, and change their shape (but not their consistency or color) at will. Their presence is indicated by a thin, piping, ceaseless wail.

In game terms, they can be thought of as bundles of pure Essence. Each Hungry One has 20 Essence; these points are used up in the process of raising Legionnaires. The expenditure of a single Essence point raises all dead bodies within **D6x3** yards. When a Hungry One's Essence is depleted, it ceases to exist; in addition, they cannot regain Essence by any means. However, five separate Hungry Ones can 'spawn' a new Hungry One with a full complement of Essence by each expending an Essence Point. This process takes one hour.

Hungry Ones are highly susceptible to the powers of the Inspired; an Inspired spending Essence Points to banish a Hungry One only needs to match half their target's remaining Essence, or a third if their attempt takes place while standing in a location particularly significant to their faith. Damage caused by miracles such as **Holy Fire** is applied directly to Essence if used on a Hungry One, and miracles such as **Binding** are also effective against them.

Story Ideas

Last Train out of Nice

The characters are the commanding officers of a ragged French unit whose orders are to hold the railway station of the city of Nice until the civilian population can be evacuated. They have a few hours to prepare their defenses before the Legion arrive in strength. Can they hold their line in the face of artillery, unstoppable wave assaults, and ammunition shortages? When the command center is cut off from the

Zombie Legionnaire

Str: 2	Dex: 2
Int: 1	Per: 1
Con: 2	Wil: 2
Spd: 4	Ess: 6

Getting Around: Life-like
Strength: Dead Joe Average, Damage Resistant

Senses: Like the Dead, X-ray Vision

Sustenance: Daily, Sweetbreads (Heart)

Intelligence: Tool Use 2, Teamwork

Spreading the Love: Only the Dead

Gear: Lebel Rifle (use 7.62 bolt-action civilian rifle, but

last train as it departs, can they cut their way through a wall of foes to reach safety?

Cloak and Dagger

The characters are agents of the British Foreign Office, on assignment to gather intelligence about conditions behind enemy lines. Expecting a sympathetic local population and counting on the anonymity bestowed by being a "face in a crowd," they are completely unprepared for the utter desolation they encounter. Nothing moves but the Legion Patrols and scavenging animals; Paris is a boneyard piled high with the half-eaten bodies of executed civilians. Several mysterious, robed humans are also in evidence, and appear to display some kind of control over the Legionnaires. The characters must decide which aspects of their mission are still attainable, and then try to survive until their pickup returns in a week's time.

Meat Trap

The information gathered by covert investigations behind enemy lines has revealed the weaknesses and origin of the Zombie Legions to the British government. To replenish its losses and feed its soldiers, the Zombie Legion requires hearts. If the zombie hordes can be trapped somewhere where "food" is low, and then attacked at long range, the armies of the living might just have a chance to strike a telling blow. Trainloads of convicts and "political undesirables" are shipped from all over France, Germany, and Russia to provide the bait; several easily isolatable towns in the path of the Legion advance are cleared and booby-trapped. All the characters have to do is provide token resistance, and then pull back to the trenches and let the artillery and mines do their job. But what if an inopportune riot among the prisoners traps them between the convicts and the advancing undead? Conversely, what if one of the players recognizes a relative, old friend, or lover among the "bait" as they withdraw?

reduce CAP to 8)

Note: Zombie Legionnaires do not Spread the Love. This task is undertaken by the packs of Hungry Ones that follow the Legions. The number of Hungry Ones in existence at any one time may never exceed 144; in general, one Hungry One is encountered per twenty Legionnaires, to a maximum of 15-20 per area, city, or battle.

Zombie Legionnaires do not feed indiscriminately, and will wait until a battle is finished before feasting.

Only a corpse with an intact heart may be raised as a Zombie.

Red Monsters from Beyond the Moon!

by Joe Taylor

At first, the creatures were thought to be some previously-unknown species of tiger which lived only in the deepest jungles of the Dark Continent.

When enough railway workers disappeared that the work slowed, hunters were sent in to deal with the new man-eaters. When the hunters failed to return, soldiers were sent. Then more soldiers. Then all contact with the outpost was lost and further down the line, people began seeing red-purple shapes in the wilderness just beyond the towns. Large shapes, like long tigers without legs . . .

Thus *GURPS War Against The Chtorr* meets *GURPS Steampunk*.

In this scenario, the Chtorran invasion begins in the 19th century rather than the 21st. It assumes that the plagues caused by Chtorran microbes in the novels do not happen -- this keeps the steampunk setting intact and gives humans a fighting chance. The infestation begins in remote, "uncivilized" areas which are only just being explored. First the worms appear in Africa, but are soon spotted in the Amazon, Tasmania, and near the Rocky Mountains. Characters (and players unfamiliar with the Chtorr series) may assume that the strange creatures are just another one of the many unusual animals native to these lands which Europeans have never seen. When the worms and other Chtorran life-forms begin to rapidly spread, replacing Terran flora and fauna, it becomes evident that something else is going on. Unknown enclaves in South East Asia grow unmolested until they begin to spill over and threaten India and China. It is only a matter of time before the ravenous gastropedes are stalking the black forests of Germany. Biologists debating theories of evolution now have a totally different ecology to observe while scientists push the technology envelope to find new ways of combating the threat.

And the Chtorran infestation is a difficult threat to combat at TL5 or TL5(+1). Science just barely has the tools necessary to understand the ecological threat the alien life poses and the larger implications of it may still elude scientists until much of the world is already "Chtorraformed."

The Great Powers will be more inclined to fight the invading ecology with physical military means, concentrating on destroying the gastropedes. This is a task which military technology of the period may not be up to.

Any kinetic damage done to a Chtorran (such as with bullets) which penetrates its DR is divided by 10 before being applied to its Hit Points.

Tech level 5 firearms do not stand a chance of harming a worm. Before a GM decides to weaken the gastropedes to make the fight more fair, it should be pointed out that even TL8 firearms are just as useless and that developing new weapons to fight with is what *War Against The Chtorr* and *Steampunk* are all about. The TL5(+1) electric gatling does only slightly less damage than an AM-280 and has a higher RoF. Explosive damage, if the bomb or shell is in contact with the Chtorran when it goes off, does double damage before being divided by 10, so artillery and land ironclads can be somewhat effective. If the campaign has or develops etheric shock weapons, they would act like particle beams and do full damage which is not reduced, as would a lightning cannon (see p. STM89). Damage from a wind cannon would be reduced and damage from a vibra-cannon which penetrates DR is first divided by 10, then is -1 per full 1,000 lbs. of target weight.

Chtorrans hit by a flasher or hand flasher roll at HT-2 to avoid their effects, though being blinded often drives them into a rage (and isn't too effective since they can still track their prey by smell).

Even if the campaign includes these "baroque weapons," the most effective means of fighting a gastropede is with fire. Flame weapons do an extra +2d and damage is not reduced. Tech level 5(+1) flamethrowers would not be any different in operation than those of TL6. *GURPS High Tech* has weapon stats for a man-portable flamethrower from WWI and one from WWII -- both are TL6. *GURPS Vehicles* can be used to design vehicular flamethrowers for those land ironclads. What effect chemical weapons such as Mustard Gas would have on Chtorran life forms is anybody's guess, but the results certainly wouldn't be pretty.

So the PCs ought to be able to dish out some damage once they find the right weapon systems to use. However, the Chtorrans may still need to be toned down a bit for this setting. A charging gastropede will probably be the fastest thing on a TL 5(+1) battlefield, too fast for heavy weapons to track them. A fully adult worm might be more than a match for even steam-powered mecha like the O-Daisuchiimu. Considering that Steampunk weapons often have a very low RoF or even require time to reload between each shot, a GM may want to reduce the Chtorrans' move score to slow the pace of the battles a bit. This is probably the only area the GM will need to tinker with in order to keep things balanced and give the PCs a chance.

Still, the worms should remain exceedingly hard to beat. If the PCs will need any slack from the GM, it should probably be that he reduces the rate at which the infestation grows and changes. Always keep it just ahead of mankind's ability to manage it, but since the campaign world won't have the luxury of instant worldwide communication, that will probably mean things proceed at a slower pace than in the novels.

GURPS War Against The Chtorr recommends doing without the plagues in any campaign set below TL7. Much of the flavor of a steampunk campaign comes not only from the technology, but from the culture of the Victorian Age, which would certainly be destroyed if Chtorran diseases run rampant. The GM can, of course, include the Chtorran plagues in his campaign if he wants.

Diseases such as Influenza and Yellow Fever were still a common cause of death in the 19th century, so the plagues could be incorporated without disturbing the Victorian feel too much. In this case, the first step to fighting off the invasion is to discover some sort of "Chtorricillin" to beat the germs -- an effort which the PCs will no doubt be at the forefront of.

The tone of the campaign should be somewhat different than that of a normal War Against The Chtorr game. The 19th century was a time when everyone thought that science would soon be able to solve any and all of mankind's problems. Even when faced with a problem 19th century science is woefully inadequate to fight, that positive attitude should still prevail. This invasion takes place in a world which has not been devastated by plagues, so the social upheaval in the *Chtorr* novels is not present and the powers leading the fight will probably not be hindered by coalitions of Third- and Fourth-World countries. However, the invasion can move and change faster than the rate at which information can be transmitted and there are parts of the world which are still unknown where the alien ecology can grow deep roots undisturbed. Humanity should begin fighting the invasion as soon as it appears because it will be a long time before a way to make real progress is found. It is suggested that the GM begin the campaign in a historical TL5, 19th century setting and let it develop into a steampunk TL5(+1) world as a result of fighting the invasion.

Adventure Seeds

First Contact

An important rail line under construction in Africa is being plagued by what seems to be a man-eating lion or tiger. Only a few native workers have gone missing but the rest are so frightened that all work has ceased. The PCs can be a small military unit or a group of hunters hired by the government, with a naturalist or two going along to study the creature.

The man-eater is actually a lone Chtorran gastropede, far more dangerous than any lion. When the party arrives at the work camp, rumors about the beast may clue them in that it is something different. If the party survives hunting the worm, this would make a good introductory adventure.

Trouble in Show-Low

Show-Low, Arizona (named after a card game) is a new boom town. The news of some gigantic man-eating worm found in Africa is largely regarded as a hoax, or at least no cause for concern in America.

Trouble begins when a local Indian village is destroyed and every last man, woman, and child in it vanishes. Other neighboring Indians are divided about what to do, but many blame the US government or the white folks of Show-Low. Some begin making raids on the town and tensions between the white settlers and local Indians rise until bloodshed looks inevitable.

When tempers reach their peak, with Indian warriors surrounding the town, a large family of six gastropedes -- the same ones who wiped out the Indian village -- attacks Show-Low. Can the settlers and Indians together right off the aliens? The PCs can be townsfolk, Indians, or adventurers just passing through who get caught up in the strife.

Expedition to the Amazon

The Royal Academy of Science is sponsoring a large-scale, coordinated effort to study the Chtorran infestation. A large cargo airship is being converted into a flying laboratory which will allow the scientists on board to conduct on-site investigations safely. The infestation in the Amazon jungle is one of the most developed and has had little interference by humans so the research will be conducted there. PCs of a scientific bent will be invited to join the expedition, while military types may be hired as security. While on board the airship, the PCs can rub elbows with the likes of Charles Darwin, Alfred Nobel, or Thomas Edison.

It's a chance for the players to experience some serious, scientific investigation of the infestation and really learn something about the threat. It's also a chance for them to find out some crucial information which could help mankind's struggle -- or for something to go terribly wrong and mankind lose some of the best scientific minds of the age.

* * *

An alternative Chtorr/Steampunk campaign can be set in Etheria (see p. STM126), where fantastic technology allows space travel in the 19th century. Instead of discovering tropical forests and amphibious primitives living on Venus, however, space travelers find a far more alien world, one with jungles as red as the surface of Mars and creatures resembling gigantic, carnivorous caterpillars. In this scenario, Venus, Earth's own neighbor, is the homeworld of the Chtorr! Europeans set up a few colonial outposts near the poles, where the most deadly creatures scarcely venture, but worm huts dot the horizon and only a few degrees of latitude away are vast mandala complexes with thousands upon thousands of worms.

Though the dense, steaming atmosphere of Venus seems to fit Chtorran life better than Earth, there are still aspects of the aliens which would seem to be incongruent with it being their homeworld. The GM can feel free to alter the habitat to fit the Chtorrans, alter the Chtorrans to fit their environment, or ignore the evidence all together -- perhaps Venus isn't the Chtorrans' homeworld here, either, and the infestation simply missed Earth and hit the next world. In this setting, Venus is supposedly a more primitive planet, yet here it boasts life forms far more developed and voracious than any on Earth. The simple explanation (if one is needed) is that Venus is indeed more primitive but it has not suffered any mass extinctions like the one that killed off the dinosaurs, therefore its current ecology is older.

In any case, the GM will have to handle a fully developed Chtorran ecology and fix the gaps in the food chain by deciding what a Chtorran gastropede's normal prey is -- and if anything preys on the worms in turn. The players will have to face a Chtorran ecology running at full speed, but one that is also stable. Once again, the GM will probably want to assume that Chtorran (or Veneran) diseases and micro-organisms will not pose a problem for the human race. It will be up to the GM to decide whether or not there is any intelligent Chtorran life -- something which was a

mystery in the novels -- and how it will react to the human invaders. In this setting, however, it is unlikely that there is an intelligent, sentient Chtorran species, but the average "animal" will probably be unexpectedly clever. Having to survive on the edge of a screaming, red, fully Chtorran world will likely be challenge enough.

Why would anyone want to go there to begin with, much less establish a colony in such a deadly, forbidding place? For the same reasons why Europeans ventured to the New World, or Australia, or Africa. The GM can make the planet home to rich mines of precious minerals or jewels -- some of which are unlike anything on Earth. The hallucinogenic Chtorran plants may lead to a parallel of the opium trade. Scientists will want to study the native life, too, especially with the mechanics of evolution in hot debate.

Human settlements on this Chtorran Venus could take the form of military outposts, scientific surveys, prison camps, mining and trade stations, or even full colonization efforts. The Chtorran wilderness also offers the ultimate in big game hunting.

A campaign in this setting will be different from a normal Chtorr campaign in that the characters will constantly be surrounded by a fully developed Chtorran ecology. Most adventures will come from carrying out whatever goals bring them there while surviving the local wildlife. When things get too rough, they can always go back home to an Earth which is not endangered by an invading ecology, and there is no need to worry about the survival of the planet or the human race. At least, not until samples from that alien world are brought back, either on purpose or accidentally, and begin to spread out of control . . .

Adventure Seeds

The Most Dangerous Game

The PCs are either big game hunters themselves or are hired by one to help with his expedition. In any case, the players will have to brave dangerous alien jungles for the glory of being the first man to mount a gastropede's mandibles as a trophy. Alternatively, the PCs are hunters on a mission for a scientific establishment and have been hired to capture and bring back a live gastropede. Without damaging the specimen, please.

Marooned

The PCs are on a transport carrying prisoners to a penal colony on Venus. They can be the ship's crew, the guards, or the prisoners. En route, the prisoners try to escape and take control of the ship. During the struggle, the ship goes off course and crashes hundreds of miles from the nearest human outpost. Lost in an alien jungle, surrounded by deadly life forms, the survivors must somehow work together to make their way back to civilization.

Heart of Darkness

A company which has several outposts on Venus set up to exploit the planet's resources and native life has lost contact with one of its camps furthest in the interior. The place was a mining camp which had recently begun to also collect some of the hallucinogenic local plants which are replacing opium in the drug trade. It was under the command of a former military officer, a highly-decorated individual who was also known as a deeply sensitive humanist. The PCs are sent to investigate this sudden lack of communication and determine whether or not the camp has been overrun (and whether or not anything can be salvaged). As the outpost is deep in the wilderness, the PCs must disembark at a colony nearer to the pole and their make to the site by way of a river, which the company has built its camps along and uses to transport goods. As the PCs stop at these camps along the way, they see cute, dancing bunnydogs devoured by a family of worms, they come under nightly attack by one strange species or another, and their progress may even be slowed by a seasonal pink storm and the resulting feeding frenzy. In short, they gradually experience more and more of the alienness of this terrifying place. When they finally arrive at the camp in question, they find that the commander has become infected with neural symbionts and is growing Chtorran "hair." He claims he can speak with the jungle and even keeps a baby gastropede as a pet! The workers and soldiers in the camp have gone renegade with

him. The commander intends to become a "native son" of this alien world and drive off all other human settlements, which he claims are a harmful blight to his new master.

The Earth: Edit, Save, Destroy?

A Moral Dilemma

by Loki Carbis

This particular Adventure Pizza will work best for characters of a morally dubious nature. Not necessarily evil characters -- in fact, characters who are solidly on the side of either evil or good will get less out of this than others. But many games feature characters who are morally grey -- from *Unknown Armies* to *Vampire: The Masquerade* to *Brave New World*. For *GURPS*, nearly any genre can be made to work with it except for the strictly realistic. This Adventure Pizza will only work in a game of moral grays, though it can be effective if only some members of a shadier nature.

The situation begins *en medias res*: the characters have just defeated a major opponent, possibly even their ultimate enemy, after whatever struggles and privations on their part, and are now in the control room of his (or hers, or its) headquarters. And it's here that they have discovered the secret project that they have previously heard only inconclusive rumors about. It's a completed device that the villain just couldn't stop boasting about the capabilities of -- and that the characters were only just in time to stop him from using . . .

. . . and it's fully operational.

The device itself could be magical, technological, or some combination of both depending on the nature of the campaign. What it does is simply incredible - it gives the user power over whatever the most common power source of the game world is. This could mean mana, electricity, wind, force power, psi, nanotech, steam, or whatever. This control is absolutely complete, and capable of very fine focus; one could use it, for example, to make either the entire world, or a single small box, or any volume of space between those extremes, cut off utterly from the energy source. It could even be used to do the same thing to a living being.

The system is voice-activated, and capable of very fine distinctions; it could be used to target all people traveling on trains at the moment, or all green-eyed, left-handed, divorcee single mothers, or all buildings containing a reproduction of Michelangelo's David. It's hooked up to a communications apparatus allowing it to cut into the major communications network of the world (whatever that may be), allowing the villain -- and the characters -- to broadcast whatever threats and ultimatums he feels like issuing.

In short, the players have just been handed Pandora's Box. There is no way to tell how well the device functions other than to use it. There's no user's manual, although the artificial (or possibly magically bound) intelligence of the device will respond truthfully to any question it's asked. GMs should be relatively generous in allowing the characters to experiment with it; there should be no nasty backlashes or unforeseen side-effects unless the characters do something blatantly stupid.

The one thing that the GM must do is make sure that the players realize the depth of the moral dilemma facing their characters. Their options are basically fourfold:

- They can use the device to take over the world.
- They can use the device to selectively and covertly "fix" the world.
- They can abandon the device.
- They can destroy the device.

Each of these has its own pitfalls and snares.

Taking over the world would be fairly easy, but keeping it under control may be harder. Cue the emergence of a resistance movement led by scientists, magic-users or whoever, employing an alternate technology that the device

cannot effect to battle their new overlords.

Fixing the world is probably the most tempting option, but it's not a solution to the moral dilemma, just a continuation with an increasing number of special cases. And the pattern of the device's effects is likely to be noticed by the campaign equivalent of Fox Mulder before too long. Alternately, it could just be a slower way of taking over the world.

Abandoning the device means that someone else will find it, and face the same moral decisions . . . and they may not choose as benignly as the characters did. In this case the characters have not only the special knowledge but also the moral obligation to stop whoever's got the device now.

Destroying the device is probably the safest choice, but even that contains its danger. The intelligence in the device contains all the instructions needed to destroy it safely . . . a long and pain-staking process. It also contains a self-destruct function. If this is used (or if the characters choose another means, such as high explosives or fireball spells), there will be a backlash that will fundamentally effect the world.

A wave of transforming energy of the type the device uses will spread out from it, blanketing the whole globe -- and causing massive destruction at the opposite point on the world. The transformation isn't necessarily destructive; it could even be benign. Likely effects includes mutations (a la *GURPS Wild Cards*), the total destruction of any technology or item using the same energy source (much like an Electro-Magnetic Pulse - see *GURPS Y2K* for details), blasting a gate to another reality (like the Banestorm of *GURPS Fantasy*), causing a [pole shift](#) (as described in *Suppressed Transmission*) or anything else you can imagine that seems appropriate.

What will the characters do?

Extra Spice

For the more technically-minded characters, pointing out that this device seems to violate several known principles of physics or thaumatology in its functioning could prove to be either a meaningless distraction or the seed of a whole new sub-campaign.

Pyramid Review

Another Fine Mess (for the Fudge RPG)

Published by [Grey Ghost Games](#)

Written by Ann Dupuis

32 pages; \$8.95

Another Fine Mess is a wonderfully original adventure. It is designed for use with the *Fudge* roleplaying system but can be easily adapted to any system that has stats for animals.

The premise of *AFM* is, at its core, a standard one for fantasy games: a party of adventurers, including rangers, warriors, thieves and a (sort of) magic-user, must enter a subterranean complex to rescue a friend from an evil sorcerer. What makes *Another Fine Mess* unique, however, is the fact that the members of the adventuring party are all animals, and relatively normal ones at that.

(SPOILER ALERT!)

At the adventure's outset the eight animal companions (the PCs) of a ranger/mage (known to them as "The Master") find themselves in a bit of a pickle. While investigating a number of disappearances in the wilderness, The Master himself disappears, leaving his companions to their own devices at his campsite. To make matters worse, the ranger's familiar, a cat named Shadow, receives a brief telepathic cry for help from the Master. Since the animals are the only good guys for miles around, it falls to them to save him.

While it uses the *Fudge* system, *Another Fine Mess* is a totally self-contained game, including six pages of "All the Rules You Need to Know." The fact that such rules can be presented in six pages is one of the beauties of *Fudge*. The compact nature of these rules is enhanced by *Fudge*'s storytelling and improvisational approach to gaming as well as by the fact that the game is best played with the pre-generated characters provided.

The pre-gens are important, if not absolutely necessary, to the success of the adventure. While the eight characters, Anaxagoras the Owl (a self-proclaimed wizard's apprentice), Bandit the Raccoon, Barney the Mutt, Isabelle the Bloodhound, Midnight the Horse, Penny the Peregrine Falcon, Shadow the Cat and (my favorite) Reek Havoc the Ferret, are all rather archetypal, they are interesting characters with enjoyable personalities. More than just a collection of game stats, these characters are described in detail in terms of their motivations, loyalties, likes/dislikes and personality quirks. Writer Ann Dupuis, who was one of the playtesters and contributing writers for both *GURPS Bunnies & Burrows* and *GURPS Bestiary*, is clearly an animal lover of the highest order. Anyone who has had a lot of exposure to animals, particularly of the types featured in the game, will immediately recognize how true to their species these characters are.

Clearly *Another Fine Mess* was originally designed as a gaming convention one-shot, probably to playtest the upcoming *Fudge Animal Companions* supplement. This creates a potential problem for the adventure concerning the requisite number of players. There are eight characters in this adventure, meaning it works best with eight players. Since the challenge of the game is overcoming normal animals' considerable limitations, successful resolution of the conflict is best facilitated by the cooperation of all eight characters; the absence of even one character can make things a lot more difficult. This can be resolved in a number of ways. The Game Master can either adjust the obstacles to account for any missing talents, run extra characters as NPCs, or allow some of the players to run more than one animal. Each of these techniques has its disadvantages, so an eight-member group is preferable. Because of the simplicity of its rules and the universal appeal of the story, *Another Fine Mess* is an excellent vehicle for introducing

potential players to roleplaying, especially if they are animal lovers.

Another Fine Mess is, in its own way, a dungeon crawl. The heroes must navigate a cave complex to reach the Sorcerer's lair, which can prove to be quite tricky for the horse. However, the Cave is a far cry from the "ten-foot-by-ten-foot" corridors of traditional dungeons. As much care has been spent to present the look, feel and features of an actual cave complex in a realistic manner as has been to make realistic animal characters. The cave has been designed in three dimensions, with both birds-eye-view and cross-section maps to aid visualization, and its features are geologically accurate. While this would make a traditional crawl difficult to map, it lends *AFM* a wonderfully gritty sense of realism (besides, no one in the party should be making maps anyway).

Obstacles along the way include a scent trail for the dogs, magically created hostile human/animal hybrids (called Abominations) for the dogs, birds and horse to fight, traps and mechanical devices for the racoon and ferret to use or disable and numerous natural obstacles that will alternately challenge the flyers and the crawlers, the large and the small and those with paws or hoofs. All of these lead to the final confrontation with the Mad Sorcerer.

Numerous possible ways to resolve the final conflict are presented, depending on the party's condition by the time of the climax. Guidelines are given for handling the Sorcerer's magical abilities and spell tactics without need for a codified magic system (the animals wouldn't understand magic anyway). If such a system is desired, there are a number of options, including the Scholarly Magic system from *Fudge Expanded Edition*, the detailed system from *A Magical Medley* or any number of home-brewed systems available at www.fudgerpg.com. Given the characters' widely disparate combat capabilities, the final conflict has the potential to become a wildly entertaining brouhaha as a powerful sorcerer must face the difficulties of targeting dogs, falcons, and ferrets with fireballs. Game Masters should play this up to the fullest.

(END SPOILER ALERT)

In addition to All the Rules You Need to Know, the appendix includes numerous adventure seeds to continue the fun beyond this story as well as suggestions for how the adventure can be adapted for more traditional (read: anthropomorphic) parties. While doing so is certainly possible, the adventure would lose most of its flavor and end up being a fairly typical and somewhat boring dungeon crawl. It works best as is, even if that means limiting it to a one-shot.

Another Fine Mess is an entertaining and original adventure that serves as a perfect introduction to roleplaying in general, *Fudge* in particular and playing non-anthropomorphic animals as characters in the very specific. The original artwork is limited to a few illustrations of some of the Abominations, while the remainder of the book is served by clip art of the animal types and cave formations that appear in the story. While clip-art is usually annoying it is well suited to this vehicle and its use helps keep the idea of playing animals grounded in reality. There is one clip-art picture of The Master that looks disturbingly similar to Errol Flynn that probably could have been omitted, but most of the pictures work. Maps are simple affairs presented on the inside front cover, while the back cover has a very useful combat summary sheet.

If *Another Fine Mess* is any indication, we can expect some great things from Grey Ghost Press and *Fudge* in the near future.

Pyramid Pick: The Works Card Game

The Works Card Game

Published by [James Ernest Games](#) and Studio Foglio

Designed by James Ernest

Illustrated by Phil Foglio and James Ernest

112 cards, rule sheet; \$14.95

Just like the mythical phoenix rising from its own ashes (if the phoenix was a card game and was not on fire and was real), *The Works* rises from the ashes of an older game, *XXXenophile*. Published in 1996 and based on a Phil Foglio comic book, *XXXenophile* was a nifty card game that got lost in the CCG glut. That it was for sale to adults only did not help.

The Works shares most of *XXXenophile*'s rules, drops collectibility for a fixed deck, and is based on a new Phil Foglio comic book, *Girl Genius*. The story is a gaslight, steampunk (without the punk) setting where super geniuses, called Sparks, build robots, called Clanks, and watch them wreak havoc on the countryside. In *The Works*, two or more players manipulate the cogs of a giant machine to "pop" cards out of it and score points. These cogs are actually many of the characters from the comic. The theme may hang a little loosely, but the rules set is sound and deserves this second chance.

Play begins by dealing every player five cards and then building a latticework of twelve face-down cards on the table. Each turn, a player will flip over a face-down card then spin one card 180 degrees to see if it "pops", meaning that they place it in their score pile. If there are still face-down cards, players can spin any card they like, but if all cards are face up, then they must pop at least one card. If no player sees a way to pop a card, then they reshuffle the board and lay the cards face down again.

Each card in *The Works* features a character from *Girl Genius*, a name plus some descriptive text, a point value, and a set of different symbols each of its four edges. When a player spins a card, he checks all four edges to see if the symbols on the spun card match the symbols on the edges of an adjacent card. If the symbols match, one, or possibly both of the cards will pop. If the symbols match on multiple cards, then the player will pop more than one card. A player replaces the popped cards with cards from their hands, then draws back up to five.

Finally, many of the cards have game instructions that the player must follow after popping it. Some cards allow a player to pop another card that has a specific piece of descriptive text. Others force the player to lose a turn. Some move cards from one score pile to another. Others allow a player to move cards from her hand to her score pile, or vice versa. The first player to reach 100 points worth of popped cards wins.

At first glance, *The Works* seems to be a game of chance. Since the board is dealt out randomly and players must turn over cards without seeing them, some players will be able to pop cards due to sheer luck. After a few games, however, patient players will discover several interesting challenges.

Primarily, *The Works* is a game of setting yourself up for a good move while leaving bad moves for your opponent. Players must be careful when replacing a card that they have popped so that it does not leave a good opportunity for their adversaries. At its most subtle, this challenge involves playing cards that will work well for you but will work

poorly for anyone else. For example, if you place a card that, when popped, forces players to lose a turn if they have no Clanks in their hands, this card may be safe for you, but will be harmful to others players lacking Clanks.

While *The Works* can handle from two to six players, it works best with just two. In a game with multiple players, setting yourself up for a good move becomes much more difficult and the game seems to involve more luck. For example, in a two-player game, forcing your opponent to lose a turn is an important play. It means that you will be able to play some cards on the board, then pop them before your opponent has a shot at them. With more players, losing turns becomes more of a nuisance than a bold move.

The Works continues James Ernest's tradition of complex games hidden in simple rules. Phil Foglio's illustrations are as delightful as ever, and fans of the comic are sure to enjoy the full color art. *The Works* will quickly have you searching for Racing Dirigibles, avoiding Dr. Monahan's Rats, and rolling your eyes when yet another Mimmoth (a tiny woolly mammoth) comes on the board.

(Note for *XXXenophile* fans: *The Works* has virtually the same rules as *XXXenophile*. The biggest difference, besides the art, is that *The Works* does not have Gizmos or Settings. Those could appear, though, in an expansion if *The Works* proves successful.)

--Brad Weier

No Help For It, Part I

I'm a comic collector, and a comic reader.

And one of the common questions that pops into my mind when I'm reading comics is one that always pops into my mind when I'm running epic adventures:

Don't these people have a *phone*?!?

I mean, some world-threatening villain is about to complete The Plan, and he's being investigated by the New Warriors, Alpha Flight, the Teen Titans, or some other mid-level book constantly on the cusp of cancellation. In too many of these stories I find myself asking, "If this is so important, and the world is in so much danger, why aren't they calling the Fantastic Four, Avengers, Justice League, Superman, or anyone else they possibly can?!?"

Why doesn't the Enterprise call for every other ship in the quadrant? Why doesn't the detective get every other cop in the precinct to surround the mad bomber's headquarters?

The answer, of course, is that it's not very exciting for your protagonists to have other, better heroes on speed dial. But, while the writer in me appreciates that explanation, the reader and realist in me balks.

It's the same problem I tend to have with a lot of the more "epic" games I run. In most game worlds, the PCs are not the be-all and end-all; there are usually more powerful fish in the sea. So how do you create adventures that are grandiose in nature, yet keep the PCs from calling the FBI, the Jedi Academy, the Ghostbusters, or anyone else?

- **They aren't able to call anyone else.** If you keep your party away from any means of communication, there's no danger of them calling anyone. The heroes can be trapped deep underground, on a remote continent, in another dimension, or someplace else inconvenient.

The danger with this technique is that rapid communication and transportation is common in many genres. If you can teleport, or use a cell phone, or enter the astral plane, you can get help. Sure, you can say the mystic shielding surrounding the caves (or whatever) prevents teleportation/telepathy/cell phone use, but too much of this technique tends to drive players nuts. "Oh, right. The orbital space station is covered in Bolognium. Again. Why the heck did I spend all those points on Allies and Send Message?"

- **They aren't able to trust anyone else.** In conspiracy, horror, and other campaigns you can keep the heroes from contacting anyone else by making the heroes distrust potential aid. If they suspect the police are behind the Big Conspiracy, they're not very likely to give them a call when they get in trouble.

This technique presents its own problems. In the police conspiracy example, the party may well try to alert the media, other allies, or anyone who will listen with the accusations; logically, if they can turn up the heat at all, the Conspiracy will have to spend resources on dealing with those actions. If you as a GM want to avoid this possibility, there are several options. Maybe the group is only potentially untrustworthy; knowing there is a mole in the FBI doesn't mean the entire organization should be brought under fire, but it also doesn't mean the PCs should poke around there trying to find allies. Or maybe the organization is normally closely tied to one or more of the heroes. For example, if the church the priest belongs to is suspected of being infiltrated by dark forces -- but dark forces that might be overcome -- then there will be a strong pull to keep the matter private until the heroes can resolve the matter.

- **"We're out saving the world, but if you leave a message . . ."** One of the easier, and fairly non-cheesy, ways to keep the heroes on their own is to just say that anyone they might call is out doing similarly heroic (and time-consuming) deeds. This technique was somewhat common in Marvel comics for a while; a group would get in trouble, and they'd call the Fantastic Four (answering machine), the Avengers (butler), the X-Men (gone), and so on.

One problem with this technique is that it can stretch the believability of the world. If there really *are* ten earth-shattering crises going on at any one time, how impressive is it for the heroes to thwart one? "Sure, you took care of the 80-foot cockroach . . . but you should've seen the 200-footer the Mod Squadron defeated. Wow!"

A nice compromise is to have *almost* everyone the heroes call be busy. Let Moderately Useful Fuzzy Guy be around when the rest of the ultra-powerful super team is gone; let the Knights Who Fight be unavailable, but Kevin the eager squire be anxious to help. At least it will reinforce that there *are* rewards for calling for help, while not leaving any doubt in the minds of the heroes who *really* saved the day.

- **"We're here to help; how big is this problem, anyway?"** A *very* easy (and sneaky) technique for the GM is to make the problem too big for the heroes . . . but have the parts they can't handle happen off-camera. Consider, for example, if Dr. Düme has a weather machine that requires the heroes acquire two parts to neutralize. If you think the heroes are going to call in for help, why not increase that number to three (or more) parts, with the reinforcements running off to deal with the other -- newly invented -- part? As the GM you don't need to deal with inventing that part; just have them run off, successfully complete their part of the mission, and return with a few details. ("Whew! I didn't know kittens could be so deadly!")

(Of course, one or more players may want to accompany that group. Encourage them not to do such with Twix, experience points, cash, or pain, as necessary.)

Alternately, you could combine this technique with another above, and have the reinforcements be unavailable *because* they're dealing with some other aspect of this crisis. This keeps the number of earth-shaking events needed in the world down somewhat, and prevents the heroes from wanting to accompany or otherwise interfere with this plot.

There are a few other techniques I've used over the years; I'll probably talk about them next week.

In the interim, I'll be reading comics.

* * *

John Kovalic is back safely from Germany, but currently suffering from jet lag and the million little tasks that build up when one is away. Hopefully everyone's favorite cartoonist will be able to take a vacation from his vacation over the next week, and be back to us next week.

-- *Steven Marsh*

Last week's answer: The back of the box for **Stalingrad**, an Avalon Hill wargame from 1963. (Remember wargames?)

(*three stars*) "**Two-Headed Lernaean Bombardier Giant Space Hamster:** 'Well, we're certainly not likely to make this mistake again or at least not more than once again anyway.' "

Neither Hera Nor There: Hunting Amazons

*"And, furthermore, of roving Indian maids
Whose camping-grounds by Aethiopia lie,
And camels burdened even as mules, and bearing
Riders, as horses bear, mine ears have heard;
And tales of flesh-devouring mateless maids
Called Amazons . . ."*

-- Aeschylus, *The Suppliants*

Despite -- or perhaps because of -- their misogynist piggery, the ancient Greeks have left us an image of female power and independence to rival anything else in the vast cabinet of our subconscious wonders. Of course, to them, the Amazons were terrifying embodiments of all that was alien -- but even the 5th-century B.C. poet Hellanicus can't conceal a certain fascination when he describes them as "golden-shielded, silver-sworded, man-loving, boy-slaughtering Amazons." From whence, besides well-deserved Hellenic nightmares, did the Amazons spring? And what else do they get up to besides springing from nightmares? In honor of Wonder Woman's sixtieth birthday, then, let's chase us down some Amazons.

"In ancient times were the Amazons, daughters of Ares, dwelling beside the river Thermodon; they alone of the people round about were armed with iron, and they were first of all to mount horses, with which, owing to the inexperience of their foes, they surprised them and either caught those who fled, or outstripped those who pursued. They were accounted as men for their high courage, rather than as women for their sex; so much more did they seem to excel men in their spirit than to be at a disadvantage in their form. Ruling over many nations, they had in fact achieved the enslavement of those around them; yet, hearing by report concerning [Athens] how great was its renown, they were moved by increase of glory and high ambition to muster the most warlike of the nations and march with them against this city."

-- Lysias, *Funeral Oration 4-5*

To begin with, not even the skeptical Pausanias and Arrian doubted that the Amazons existed, and that they very nearly eradicated Athens. Compiling the ancient histories gets this narrative: Myrina, Queen of the Amazons, ascended to glory by sacking Atlantis. Now Queen of Atlantis, she perforce had to fight the Atlanteans' enemies, the Gorgons of Libya. The stories vary, but it seems Myrina got beaten and had to retreat to Cyrene, named for the Amazon princess who founded it. (The Amazons of Cyrene became powerful pirates, and some authorities say that they were the Cyrens, or Sirens, that Odysseus escaped.) Allying with Horus, they passed through Egypt and conquered Asia Minor, where they founded their capital, Themyscira, and more cities such as Ephesus and Mytilene. [Dionysos](#) warred against the Amazons with his army of Indian elephants, on his way to Greece and Heracles successfully took the girdle of Queen Hippolyta to Athens as one of his Labors.

King Eurystheus sent it back (no fool he), but then Theseus went to Themyscira and stole it, along with Hippolyta's daughter Queen Antiope. The Amazons assembled a mighty army to avenge this insult, and (after battling past Priam's Troy) swept down into Athens, fighting a vast battle in the very streets of the city. (Pausanias mentions many tombs of the Amazons visible even in the 2nd century A.D. along the roads of Attica.) Driven back by Athenian valor, Queen Penthesilea fought on the side of the Trojans against the now-hated Greeks, but the Amazons lost there, too. Eventually, the Amazons moved east into the Taurus mountains, from whence Queen Thalestris emerged in order to seduce Alexander and bear a mighty daughter who could restore the glory of the Amazons. According to Diodorus, however, she died on the way back to Amazonia before her eugenic ardor could bear fruit. The last Amazons died, according to Plutarch, fighting for Mithridates of Pontus against Pompey and the Romans.

"The women of the Sauromatae have continued from that day to the present to observe their ancient customs, frequently hunting on horseback with their husbands, sometimes even unaccompanied; in war taking the field; and wearing the very same dress as the men. The Sauromatae speak the language of Scythia, but have never talked it correctly, because the Amazons learnt it imperfectly at the first. Their marriage-law lays it down that no girl shall wed

till she has killed a man in battle. Sometimes it happens that a woman dies unmarried at an advanced age, having never been able in her whole lifetime to fulfil the condition."

-- Herodotos, *The Persian Wars* IV:116-117

Herodotos has an interesting story that probably, more than any other, explains who the Amazons "really" were. After their Athenian defeat, a band of Amazon prisoners rebelled and siezed an Athenian fleet, but caught in a storm wound up wrecked on the north coast of the Black Sea. They fought the Scythians to a draw, and the admiring Scythians married the Amazons to found the new tribe of the Sauromantians. Grave excavations have, in fact, proven that female warriors were relatively common among both the Scythians and the Sauromantians -- and anyone who requires more than horsewoman warriors, golden armor, and rough geographical accuracy from his Amazons is just trying too hard.

"Know that to the right hand of the Indies was an island called California, very near to the region of the Terrestrial Paradise, which was populated by black women, without there being any men among them, that almost like the Amazons was their style of living. These were of vigorous bodies and strong and ardent hearts and of great strength . . ."

-- Garcia Ordonez de Montalvo, *Exploits of Esplandian*

But for Amazon-hunters everywhere, if you can't have all three, get rid of geographical accuracy. Our old pal [Sir John Mandeville](#) places the Amazons both "below Scythia" and on an island "next to Chaldea," and says that they guard the Brazen Wall of Alexander against the soldiers of Antichrist. Prester John ruled the Amazon land of Great Feminie, and when he moved from Asia to Africa, he took the Amazons back with him. (And, indeed, both the Berbers and the Oyo of Dahomey have female warriors.) In 1542, Francisco de Orellana fought against women warriors in the Brazilian jungle, including twelve "very white and tall" women who each outfought ten men -- so he sensibly named the immense river he was on at the time the Amazon River. The same year, Juan Rodriguez Cabrillo sailed north from Baja and (on what grounds is hard to say) named the land there "California," after the Amazon kingdom in Montalvo's novel.

"When the king comes into the house, the throne-goddess calls an eagle and says to the eagle: 'Come, I am sending you to the sea. But when you go, look into the green forest, who is there?'

The eagle replies: 'I looked, and the goddesses, the infernal, ancient female divinities are kneeling there.'

And the throne asks: 'What are they doing?'

The eagle replies: 'She holds a distaff and they hold full spindles, and they are spinning the years of the king . . .'"

-- Hittite tablet, KUB XXIX 1, I 10-25

The Amazons in California (or Calyferne, as it was known in earlier stories) rode griffins, which was a big departure for them -- as horse-women, they were the mortal enemies of griffins in Greek myth. (Both Amazons and griffins love gold, too.) However, the Amazon city in Brazil (according to Orellana's chronicler) did feature lion statues prominently, and griffins liberally bedeck the old Amazon stomping-grounds in Hittite Asia Minor, as escorts of the night-goddess Shaushka. In the exciteable, but not crazy, *On the Trail of the Women Warriors*, Lyn Webster Wilde uncovers hints of a priestess cult tied to Cybele at the center of Hittite culture, and implies that their holy warriors (and the Hittite penchant for fighting in kilts) may have contributed to the strong "Amazon" presence along the south shore of the Black Sea. More Cybele fun appears when we note that Themyscira supposedly supported a sacred black stone, and that the "Diana of Ephesus" (a city founded by Amazons) was also a black meteorite. (There are those who link "Ka'aba" and "Kybele," while we're on the topic.) This begins to sound eerily like our old sky-cult of fallen [Spider Women](#) -- and the Amazons become the genemod superwoman products of parthenogenetic alien cloning.

"All over the ancient world populations were now set against other populations, as men were set against women . . . Wandering over the width and breadth of this disintegrating world, masses of refugees were everywhere fleeing their homelands, desperately searching for a haven, for a safe place to go. But there was no such place left in their new world. For this was now a world where, having violently deprived the Goddess and the female half of all power, gods and men of war ruled."

-- Riane Eisler, *The Chalice and the Blade*

Or, of course, they could simply have been the last remnants of a truly superior matriarchal civilization such as we

(well, such as Marija Gimbutas and Riane Eisler) find in Crete, Catal Huyuk, and other putatively Goddess-powered civilizations of ancient times. If people ever actually bull-danced, they were in pretty good shape -- perhaps the ancient Minoan martial artists survived, passing on their mystic lore from mother to daughter, occasionally recruiting Amazon (from the Armenian *maza*, "moon," not from Greek *a-mastos* "without breasts") warrior women to try recreating the lost Goddess power. Heck, maybe the Goddess' Amazons, treacherously betrayed by patriarchal Aryan sky-magic, fight a constant guerilla battle through time-travel and reality-quakes, slugging it out with Athens (and the "Nordic" [Loi](#)?) in a glorious Amazonomachia during the suspiciously-empty [hollow history](#) of pre-classical Greece. Maybe the Amazons (with their moon goddesses and mirrored shields) live behind the [mirror dimension](#) -- and perhaps the wick-fighting [Benandanti](#) ride out in dreams to keep our world safe for patriarchy, seeing that witches were also called "broom Amazons" in medieval times.

"Q: What advanced civilizations were before Atlantis and Lemuria?

A: Many.

Q: Was there an ancient advanced civilization located in the area we now call Antarctica?

A: Yes.

...

Q: Are there any remains of their civilization left?

A: Yes.

...

Q: Where might the remains be found?

A: South America. Amazon. Ancient legend of Amazons.

Q: Do any of our scientists know any of this?

A: Yes."

-- Laura Knight and a channeled Cassiopean, Dec. 10, 1994

The notion of Amazons as interdimensional warrior women from behind time and within reality would explain their weird geographical dispersion. Their [connection](#) with griffins may be another clue; since we've postulated a connection between the griffins and the Lemurians -- and since the Lemurians, also, appear both in [California](#) and inner Asia -- perhaps the Amazons are the very embodiment of sexuality and gender, somehow psychically "calved off" by the desperate-to-stay-chastely-astral Lemurians. If the Lemurians created the Amazons as repositories of ferocity and passion, it's no wonder that only Heracles and Theseus are their equal in battle. The Lemurian connection may also explain the colony of "white and tall" women in the Brazilian jungle, possibly connected to (or deadly rivals with) the evil Aryan city of [Akakor](#). Was Raleigh's secret Guiana mission an embassy from the Faerie Queene Elizabeth to the Amazon Queen Califia? Was Elizabeth an Amazon agent, priming the pump for their slow return to power? One of the most famous Brazilian UFO stories involves a very close encounter in 1967 between one Antonio Villas-Boas and a naked woman with blond hair -- another Amazon DNA raid? What else could a millennia-spanning, reality-hopping, transdimensional cult of genetically-perfect, bloodthirsty superwomen want? It makes one wonder.

by **Michele Armellini**

There are many sources that explain a lot about the best tanks in history. But what about the worst one?

Well, maybe "worst one" is too harsh; there were a few other tanks that weren't much better. Tank design was still immature in 1930, and Italian engineers had much to learn and very little money to spend. The result was a small, low-powered, thin-armored tankette, the CV3/33, the CV3/35 being a marginal improvement.

This armored vehicle could fit in several types of campaign: *GURPS Cliffhangers*, *GURPS Special Ops*, or *GURPS Time Travel*. If the campaign is slanted towards military operations, a tank is never out of place; but if it isn't, a tank is a nice surprise. Or a nasty one! It could be a weird twist in a *Supers*, *Horror*, or even *Martial Arts* campaign set in the 1930s. And during that decade, the CV3/35 was possibly the most widely available armored vehicle all over the world. It was cheap. It was exported everywhere. It saw employment in several wars.

If a 1930 adventure features a would-be tyrant, a private army, an ambitious warlord or a whimsical crime lord, they could all own this tankette. Just one of them, as a pet "terror" weapon, or even a full battalion!

This vehicle also has another great advantage. In the 30s, tanks weren't common, and the only sight of a fire-belching steel monster could be a reason for a Fright Check for poorly trained troops. On the other hand, the CV3/35 is far from invincible. A brave infantryman could defeat this thing in several ways (see below). Therefore, it is the ideal opponent of a truly heroic group of PCs.

Finally, it presents an amazing list of shortcomings. This makes it a useful tool in the hands of the wicked GM. Read the description and data, then think about those gun-happy, gung-ho mercenary adventurers. When the shady middleman tells them: "We're recruiting a true army. We even have tanks . . .", they won't resist. Then they end up driving a CV3/35, and they will learn technology isn't everything.

The Fiat-Ansaldo Carro Veloce CV3/35 Up Close

Inspired by the early British armored carriers, this vehicle was meant as a mobile MG nest. When it was developed, field guns were slow to train, anti-tank guns seemed an untested novelty, and tank-to-tank combat a far-fetched idea. Therefore, the CV3/35 was to avoid slow-reacting artillery fire thanks to sheer speed and its small size, and its armor wasn't meant to face cannons. The "assault" tank would support attacking infantry, raking the enemy positions with MG fire and suppressing strong points such as MG nests or mortar positions. Since it seemed to be reasonably fast, it could also support, or replace, the cavalry. So it was a tiny vehicle, with a 2-man crew, armed with MGs only. Its engine and drivetrain were quite reliable and it was reasonably fast, although not exceptionally so. Its armor was thin, cheap, and weak. Made with face-hardened, riveted plates of mediocre-quality steel, the armor was intended to withstand fire from small arms and rifle-caliber MGs.

It also had no accessories to speak of. The idea was to keep it cheap, fast (anything you add increases weight, thereby

reducing speed) and reliable (what isn't there can't break down). So, for instance, the standard model had no radio. No thought whatsoever was given to comfort or safety. Again out of economic considerations, the CV3/35 was not given a turret. The MGs were fitted in a superstructure, with a very limited field of fire. Being so fast and tiny was a double-edged sword. It did make the CV3/35 a small, elusive target. It also meant that any piece of seriously uneven ground (and the driver would often see it at the last second) could cause major trouble. A larger, longer tank would simply roll over, or down, or across a bump, a scarp, a shellhole, a wide trench. Not so the CV3/35, which was just 10 feet long (!). It could easily remain trapped in a hole! And it should be remembered that the tankette only had two hatches on the superstructure top. What does that mean for the crew if loss of control (p. V149) results in an overturned vehicle? The vehicle became a deadly trap for those inside. And see below for action by the enemy, to the same end.

As long as the opposition was what the CV3/35 had been designed for, the tank worked quite well. If the enemy only had basic-training infantry in the open or in earthworks, with light MGs and old-fashioned artillery support, the tankettes would win. Things changed if the battle featured any of the following:

- Anti-tank guns, cannon-armed tanks, or anti-aircraft guns
- Fortifications and/or very rough or cluttered ground
- Heavy machine guns, or other serious infantry AT weapons
- Well-trained and very determined infantry

Now, any WWII engagement would include at least one of the above elements. But by then the vehicle was hopelessly obsolete (it was used nevertheless). Its finest hours came in the early 30s . . . the time of *GURPS Cliffhangers*.

The CV3/35 According To GURPS Vehicles

TL6 tankette

Subassemblies: Tracks, Superstructure.

Body Features: 30° slope on Body Front and Superstructure Front (some sections had a circa 60° slope, but others weren't sloped at all).

Propulsion: tracked drivetrain, motive power 31kW (Bo, DR5, HP21).

Weaponry: 2 Fiat 8mm reel-fed MGs (Su, DR5, HP6). 2170 8mm standard rounds (Su, HP5). The MGs are linked.

Instruments: communicator: signal flags (Su).

Miscellaneous: access: 2 hatches (SuT).

Crew: Controls: mechanical. Crew stations: 2, cramped (half in Bo, half in Su). "Driver" runs controls, "Commander/Gunner" runs MGs. Occupancy: short.

Power: 31kW standard gasoline engine, uses 1.8 gph (Bo, DR5, HP17).

Fuel: standard 15-gallon tank, Fire +1 (Bo, DR3, HP11).

Access spaces: 10.44 cf (Bo).

Volumes: Body (47.44 cf), Tracks (28.47 cf), Superstructure (23.68 cf).

Surface Area: Bo 100, Tr 60, Su 50. Total surface area: 210.

Structure: cheap medium structure.

Hit Points: Bo 150, Tr 45 (each), Su 75.

Surface Features: cheap metal armor. Body: F PD5, DR45; R,L PD4, DR30; T,U,B PD4, DR20. Superstructure: F PD5, DR45; R,L PD4, DR30; T, B PD4, DR20. Tracks: PD4, DR20. Camouflage paint. Pin.

Vision: poor.

Details: headlights (SuF), hatches, ignition by hand crank, either internal or external.

Statistics: empty weight 6659.5, usual payload 598.5, loaded weight 7258 (3.63 tons). Total volume 99.59. Size modifier: +2. HT: 9. Price: \$9,569.

Ground Performance: Speed 26 mph. gAccel 2 mph/s. gDecel 20 mph/s. gMR 0,25. gSR: 3. Low GP. Off-Road Speed: 2/3.

Maintenance interval: 80 hours.

Starting with historical data and using the *GURPS Vehicles* formulas, one would end up with better performance than

historical. So the "Making lemons" (p. V198) rules have to be used because of poor vehicle design. This tankette has Hangar Queen (reducing the maintenance interval from 200 to 80 hours, much closer to the reality), Low mileage (increasing fuel consumption from 1.4 to 1.8 gph), Slow (reducing the calculated top speed from 29 to the historical value of 26 mph) Unstable (reducing SR from 4 to 3) and the new flaw Thin Tracks (increasing ground pressure from very low to low, and thereby reducing off-road speed to 2/3). All of these flaws are already factored in.

Statistics for the Fiat 8mm MG (remember the CV3/35 version has 2 of these weapons, linked):

Malf	Type	Damage	SS	Acc	1/2D	Max	Wt	RoF	Shots	Cost
16	Cr	6d	18	10	1,000	3,800	20	7	70	\$200

The weapons are fed from a reel (similar to a non-disintegrating belt) with 70 rounds. Changing reels requires the Gunner 3 seconds; the MGs are rather prone to malfunctions, which are almost always jams but of course involve just one of the barrels (see also pp. HT14, 15, 76, 77).

Starting the tankette requires 10 seconds of hand cranking. Roll against Driving or Mechanic. Penalties: -2 for using the internal, smaller hand crank, up to 4 for cold weather (see also p. HT94). It is suggested an optional 1 penalty for each point of ST below 10.

The hatches are hinged along their back edge. Therefore, they offer no cover if the crewmen have to bail out under enemy fire from the front. They do offer a bit of cover, if fixed in the upright position, to anybody crazy enough to travel outside the tankette, over the engine (see below).

So Where Do We Find That Tin Can?

The CV3/35 was exported in Afghanistan, Austria, Bolivia, Brazil, Bulgaria, China (where the Japanese captured a few of the 100 tankettes), Iraq, Spain and Hungary. Before WWII, it was employed in the Ethiopian war, the Spanish Civil war, the Chinese-Japanese war, the occupation of Albania, and in local accidents in South America. Note that some of the export versions had different MGs, but usually in the same or similar caliber (Madsens, for instance). Any government willing to spend its money in this questionable way, and not too disagreeable for the Italian Fascist regime of that time, could probably buy a stock.

Of course all of these areas could be where a 30s Special Ops team can find jobs, and these mercenaries could face the tankettes as a (dubious) asset or in the hands of their enemy. The Spanish Civil war, the "last crusade," is an especially intriguing and passionate setting for black-and-white Cliffhangers, but if the adventurers come from the United States they can also stop in South America. This would be the most likely continent where even a crime lord could boast a private army, and therefore a tank. China is the right place for a Martial Arts campaign, where Nationalist or Communist generals are actually regional warlords and love new war toys. And Time Travel, or alternate earths, can by definition bring you anywhere. Pulp-style Supers set in the 30s should face down a tank sooner or later in their careers. And what about Horror? The party travels to an exotic location to smite the Abomination Men Shall Not Put Up With. There they discover the local coven is too strong for them. Their guide tells them: "No you worry. My second cousin, he is sergeant on the barracks. You pay him well, he close his eyes while we borrow a tank...". And of course, just using the tankette against a horde of low-tech cultists isn't funny enough; let's see if the CV3/35 can survive the great Abomination itself!

The mercenaries might be hired by someone who already owns the tankettes. Or they could gain one as war booty. But it could also happen that they want to buy armor. Well, military surplus is always good business, and unscrupulous governments could sell their obsolete tanks, even as scrap metal, with no other precaution but removing the MGs. The tankette could also become the object of an adventure with a twist, especially in a *GURPS Espionage* campaign. The Rumanian government wants freelancers to investigate about their neighbors' top-secret arms deal. Will Hungary be buying advanced fighters? Revolutionary hollow-charge rocket weapons? The spies are in for a disappointing surprise; don't play this trick unless the players like realistic espionage!

So How Do We Handle That?

As said above, the CV3/35 isn't exactly mighty. It does have a morale effect, usually. For example, the PCs could be military advisors with the Ethiopian army. When the tankettes arrive, a dense cloud of dust will announce them, but instead of the usual sounds of horses, unknown, unnerving clanking noises will be heard. When the tankettes become visible, the tribal soldiers won't consider them as laughably puny tanks, but as giant, angular metal bugs, moving in fits and starts with sudden sharp turns. Once these things open fire, the soldiers will have to undergo a Fright Check.

Assuming the adventurers won't run, what can they do? The ideal weapon would be an anti-tank gun, even a very light one, or an AA gun such as a 20mm Oerlikon. A heavy MG, such as the classic Browning M2 .50 (p. HT122) is very useful, too; it's common, and easier to use than a AT gun. This MG was designed specifically to deal with tanks like the CV3/35. Failing these, a clever mercenary can try with his rifle. A 7.92mm round can't pierce the front armor, but it can do the trick if hitting any other side. A very good sniper could always aim for the vision slits. Rifle-fired grenades could work, but a direct hit would be needed.

But the true mark of heroes is the close assault. It is reported that these tankettes were surprisingly resistant to hand grenades . . . probably because many models of the time were concussion grenades, and poorly designed to boot. Of course, things would be different if the infantrymen could devise a way to make the explosive stick. Molotov cocktails can also be dangerous, since the vehicle isn't sealed. Also, legend has it that in Ethiopia, a squad of able-bodied braves managed to incapacitate a tankette, simply by overturning it! Of course this wouldn't be easy in any case, and it would be impossible if the vehicle was capable of moving. But against a bogged-down tankette it might work. The *GURPS* formula tells that, without Extra Effort, twelve ST 12 soldiers would be needed, with a running start and a fully coordinated action . . . or else use Extra Effort, and good luck! Finally, there are the tricks that only special persons could use. The warlord's Iron Dragon terrorized everyone in the region, until the mysterious Shaolin monk used his Breaking Blow and Power Blow skills (see pp. MA31, 33) to break open the hatch and drag the evil warlord out of his infernal machine.

A super needs a ST of 60 to lift the tankette (with Extra Effort, see p. S83).

And Now The Crew

A tank is really just a piece of junk, without its crew. Here are two *GURPS* NPCs for manning the tankette, one fictional and the other inspired by history (although romanticized).

Bob "Cranky" Jones

Maintenance expert

ST 11, DX 10, IQ 13, HT 10

Advantages: Double-Jointed, Gadgeteer, Strong Will +1

Disadvantages: Addiction (tobacco), Bad Temper, Delusion (minor, thinks engines have a will of their own), Duty (to employer), Secret (?)

Quirks: talks with machines, hates the CV3/35 tankettes

Main Skills: Armory(Vehicular Weaponry)-14, Driving(Tracked Vehicles)-13, Engineer(Vehicles)-19, Mechanic(Tracked Vehicles)-15, Scrounging-15

In 1929, Robert Jones was a promising engineer working for the U.S. Wheel Track Layer Co. of J.W. Christie, the leading American tank designer. He was absolutely brilliant, and rumor has it that the hybrid wheeled/tracked vehicle was actually his own idea. But then he had to leave the USA in a hurry, no one knows why. He accepted a series of consultancy contracts with third-world armies, but his difficult character (and Bad Temper) did not help him, and each job was slightly worse than the previous one. His current task should be to train Iraqi technicians and mechanics in the maintenance of a brand-new batch of CV3/35 tankettes. He already knew and despised the machines, and he isn't a

good teacher, but he had little choice. Unfortunately, he has discovered that most of the mechanics he should train can't tell a nut from a bolt, so while he angrily teaches them the basics, he also has to actually dirt his own hands if he wants to keep the damned things in running order. Being stationed in the midst of a desert, he thinks it's really time for a change.

GM's note: just replace the country name at will. Christie and his company are historical. Also note that Bob would be able, thanks to his skills and advantage (Gadgeteer) to redesign the engine or drivetrain, so that most of the above listed flaws could be removed; he could easily devise other improvements, such as fitting a heavier gun and/or a turret over the superstructure.

Captain Antonio Paladini

Tanker officer

ST 10, DX 11, IQ 11, HT 10

Advantages: Alertness +1, Charisma +1, Rank 4, Reputation +2 (decoration, knowledgeable people only, see p. SO49)

Disadvantages: Duty (to Army), Impulsiveness, Intolerance (communists), On the Edge, Reputation 3 ("he'll get us killed," tankers in his Army)

Quirks: loves hand grenades, sings while going to battle

Main Skills: Carousing-10, Driving(Tracked Vehicles)-9, Gunner(MG)-12, Guns(pistol)-13, Leadership-16, Tactics-14

In 1938, Capt. Paladini led a charge of his Italian tankette company inside the narrow streets of a Spanish village . . . the kind of terrain tankers should avoid. It was difficult for him to see the "Reds" who were firing from the buildings, through his small vision slits. He was also annoyed that the snipers disappeared before he could bring the MGs to bear. So he opened the hatch, climbed behind the superstructure, and from there he yelled directions to his driver and the accompanying infantrymen. Meanwhile he fired his pistol and threw hand grenades. He took the village and earned a medal. Originally coming from the Bersaglieri (light infantry), Paladini has flair and style, but he is way too rash and willing to take risks to be loved by his men. He's just a lukewarm fascist, but in Spain he has become an anti-Communist firebrand. Note his low Driving skill; he has half a point in it just because he's tried a few times, but he considers that a mechanic's menial task. He is an officer! And indeed, he's better at commanding the company than at firing his own MGs.

GM's note: Although inspired by history, he can represent a tanker officer in any army . . . somewhat haughty but bold and aggressive.

Suggested Reading

- *I Carri dell'Asse*, by Nicola Pignato, E. Albertelli Editore, 1983.
- *I Corazzati Italiani*, by Paolo Cazzani, Storia Illustrata, 1976.
- *Mezzi Corazzati e Blindati 1935-1939*, ed. by Nicola Pignato, Curcio, 1980.

When looking for the CV3/35, remember that, despite being basically the same model, it's been renamed several times and it may be known as: CV3, CV33, CV35, L3, L5.

Pyramid Review

L1 -- Demons And Devils (for d20)

Published by Necromancer Games

Written by Bill Webb and Clark Peterson

Art by John Massé, Brian LeBlanc, and Conan Venus

\$8.95

Scenario anthologies are not a new idea. Chaosium have probably published the most for *Call of Cthulhu*, but various *Dungeons & Dragons* adventures have also been released in this format. Judges Guild led the way for the First Edition with titles such as *The Book of Ruins*. TSR also published several for the Second Edition, including *I13 - Adventure Pack 1* and *REF3, The Book of Lairs*. But until now, no publisher of adventures for *d20* has followed suit.

L1 -- Demons And Devils is the third scenario published by Necromancer Games and the first anthology for the *d20* system of adventures suitable for use with *Dungeons & Dragons*. It is a trilogy of adventures designed to run in one or two sessions, each as the culmination of a long quest for a particular mightily magical artifact guarded by either a demon or a devil. Each adventure already has an artifact to be found, but it is suggested that the DM is free to substitute his own. Each artifact is accompanied by the legend surrounding it, enabling easier working into an existing campaign. These are to be played by characters of at least 9th level and challenging enough for characters as high as 13th level. If the players are too attached to their characters to risk them upon any of these mini-adventures, Necromancer Games have made available a set of suitably high-level characters as a download from their web site, so that the adventures can be played as one-offs. This is indicative of this company's continued excellent support for their products via the Internet, and goes further for *Demons And Devils* with a set of free wilderness encounters to make these lairs difficult to get to.

Demons And Devils is another attractive book. John Massé's cover is very eye-catching. Inside Brian LeBlanc's interior artwork appears infrequently, but is rather good where it does. As with his previous efforts in *Rappan Athuk*, Conan Venus' maps still suffer from being too cramped. Here this not so much of a problem because each adventure has a pair of maps at most, but it would be nice to see maps with clarity in the future.

Before examining each adventure it should be noted that this being a Necromancer Games product, they do make use of their own *Creature Collection* book in the selection of monsters, but pleasingly, they keep this to a minimum, and do include the minimum necessary details here to make the adventures playable.

The first adventure is "The Sorcerer's Citadel," and is for 9th level and above characters. The Tower of Crane the Sorcerer contains a well-hidden Sphere of Annihilation. It is comprised of a simple tower with a sixteen-room dungeon below. This is the biggest and most traditional of the three adventures in the book. As the easiest of the three, its traps and puzzles are not as deadly as the second two.

"Ra's Evil Grin," the second scenario, is smaller and simpler without losing any of the lethality. Searching for an ancient religious artifact, The Globe of Arden, reputedly the left eye of the sun god, Arden himself, the party

(recommended minimum level for which is 11th) must travel to a lost island. On an island within that island lies the dungeon, which is thoroughly vicious, despite relying on only a few monster encounters, one of which is the Marilith or Type V Demon as depicted upon the cover. The rest is made up of a number of very deadly traps, which tend to kill rather than drain hit points.

For 13th level and above, "The Pit of Despair" is the final part of the trilogy. It is aimed squarely at a party that includes a paladin. Only those deemed most worthy and devout may be allowed to quest for the Temple of Justicars and thus find the fabled holy sword of Karith, a +5 Holy Avenger. Not only is this a very deadly dungeon by design, but utterly evil by intent. Every DM should enjoy running this one -- to say more would ruin some vicious surprises.

The three adventures in ***Demons And Devils*** are short, difficult and nasty. They are mini-adventures inspired the classic First Edition adventure by E. Gary Gygax, Tomb of Horrors and the authors do acknowledge this in confessing that this adventure is a personal favorite. If this is the kind of scenario that you need or are looking for, then those in ***Demons And Devils*** should fit the bill or indeed as a diverting set of puzzlers for when a break in the campaign is wanted.

Imperial Survey 3 & 4 (for Fading Suns RPG)

Imperial Survey: Hazat Fiefs

Written by Andrew Greenberg

Imperial Survey 4: Li Halan Fiefs

Written by Rustin Quaide

Published by [Holistic Design, Inc.](#)

32 pages each; \$6.95 each

These two slim volumes are the latest installments in Holistic Design's ongoing "Imperial Survey" series. Each book describes a handful of worlds for their *Fading Suns* science fiction roleplaying game. The unifying principle of these surveys is the noble house to which they owe allegiance. This is a nice approach as it kills two birds with one stone: detailing each planet, as well as fleshing out the major noble factions of the Known Worlds setting. In its latter role, the Imperial Surveys are also great props for the game. The Game Master could easily allow his players access to the description of each world, as a kind of in-game primer of the planet in question. That's because game information is kept to a minimum, allowing each GM to determine for themselves how best to employ the data in these books.

Physically, the latest volumes are much like their predecessors: 32 page staple-bound books with glossy color covers. The interior art is sparse, but generally well done. Both Alex Sheikman (in *Hazat Fiefs*) and John Bridges (in *Li Halan Fiefs*) do an excellent job of capturing the feel of their subject matter. Sheikman's dark but kinetic illustrations capture the spirit of the Iberian-inspired Hazat, while Bridges' softer and contemplative images recall Chinese brushwork - a perfect fit for the Asian Li Halan. Each world entry runs five to seven pages and includes a nice map of the world, complete with surface details like mountain ranges and settlements. The maps are quite useful in play too, providing just enough information to jumpstart the imagination of a beleaguered GM.

Hazat Fiefs describes four worlds in detail, along with a brief discussion of Hazat holdings in other parts of the Known Worlds. The worlds run the gamut from ancient Sutek (the first world humanity visited after discovery of the jump gates) to war-torn Hira. There's a lot of diversity within these worlds. I was especially pleased to see notes about the various factions and dynasties within the Hazat, as they create all sorts of plot hooks and opportunities for the GM to develop storylines. Because Hazat have dominion over only four worlds, the descriptions in their Imperial Survey volume are much more extensive than those volumes including more worlds. Happier still, the bulk of the additional space is devoted to the "People and Places" category, packing even more story hooks and characters into the book.

Li Halan Fiefs likewise describes only four worlds. These worlds have a great deal of thematic unity, focusing to

some extent on the religious and philosophical elements that are the hallmark of House Li Halan. Being of such a bent myself, I found this Imperial Survey volume particularly enjoyable. Like its predecessors, it provides lots of information usable in a *Fading Suns* campaign. More importantly (for me anyway) were the insights into the setting's syncretistic Universal Church of the Celestial Sun. Though clearly modeled on the medieval Catholic Church (with solid doses of Byzantium and a touch of Buddhism), the Universal Church has transcended pastiche and become an interesting creation in its own right. *Li Halan Fiefs* adds further pieces to that puzzle by focusing on some of the Asian elements of the faith. I was particularly taken with the illustration of the Church's founding Prophet as a bodhisattva - a nice touch that adds depth and diversity to the game.

Taken together, these two volumes nicely add to our understanding of the Known Worlds of Fading Suns. More importantly, they do so in a way that is fundamentally gameable. That is, they do not present reams of history and other minutiae. Instead, they focus on the information players and GMs alike need to run satisfying adventures. That's exactly what I want in a roleplaying supplement - an aid to my imagination. I rarely have difficulty coming up with the broad outlines of adventures or campaigns. What often eludes me are the little details that bring those outlines to life. The Imperial Survey series provides them in large quantities.

Equally important is that, like the rest of the *Fading Suns* line, these books paint a picture of a dynamic, living setting, one in which major events can and do happen. In that respect, they're no different than many other gaming supplements on the market today. Where they part company with the others is their ability to paint this picture without locking the GM into any single direction. There's very little expectation that a GM will pick up any one of the myriad story threads running through these books. Instead, each one is presented as an option - one among many - to be accepted or rejected according to the needs of a GM's ongoing campaign. In a way, they're "toolkits" more than supplements. In my experience, that's what GMs really want: something that's a spur to their own imagination rather than something that locks them into a plotline they didn't create. *Fading Suns* has been employing this approach for almost five years now. It's a shame it has garnered more recognition - or imitators - among the gaming industry.

The Dying Earth Roleplaying Game

Published by [Pelgrane Press](#)

Written by **Robin D. Laws, with John Snead and Peter Freeman**

Hardback, 192 pages; \$29.95

Jack Vance is one of the most idiosyncratic and popular fantasy authors of the last forty years, and his many and varied worlds and settings have always seemed ripe for translation into RPG settings. But it is not until this year, with the release of both the upcoming [GURPS Planet Of Adventure](#), from Steve Jackson Games, and Pelgrane Press' new *Dying Earth Roleplaying Game* that there have been any licensed Vance products on the market. Pelgrane Press' game, designed by Robin Laws, is an impressive effort, with great pains made to enforce the peculiar nature of Vance's world.

The *Dying Earth* tales are set at the twilight days of our Earth, during the 21st Aeon -- an undefined, but very distant, time in the future. In this strange, ancient world is set the *Dying Earth Roleplaying Game* -- a world of powerful, capricious magicians, baroque customs, ravaging beasts, and callous cruelty. Vance's stories are atypical fantasy -- the protagonists are clever and resourceful, but also amoral and pragmatic; they are more likely to flee than fight. About half of Vance's *Dying Earth* stories are about Cugel the Clever, who is twice flung to distant shores by the whim of a magician, and must journey across strange lands to find his way home. Other tales concern the powerful -- and not-so-powerful -- magicians of the 21st Aeon, who seem as concerned with staving off ennui as they are with acquiring more potent magic.

The *Dying Earth Roleplaying Game* opens with a brief introduction to the game system and a simple example of play. Chapter two covers character generation, while the third through fifth chapters cover the basic rules of play. The remaining chapters follow a typical pattern, covering spells, equipment, player and GM tips, a guide to the game-world, some sample NPCs (many are characters from *Dying Earth* books), monsters, and an excellent sample adventure.

Characters in *Dying Earth* fall into one of three ranks, named for protagonists from Vance's tales. "Cugel"-level characters are the weakest: opportunistic rogues who may dabble in magic, but who by and large live by their wits (or, occasionally, their swords). Cugel-level characters explicitly begin the game broke and with only a few possessions. "Rhialto"-level characters, on the other hand, are the most powerful of magicians, commanding mighty entities from other planes, and with considerable material resources. Somewhere in between fall the "Turjan"-level characters -- capable magicians, and by no means destitute, but not of the same order as the Rhialto-level archmages. Within each rank, however, there are no further divisions; all characters of a given rank have access to the same range of abilities.

Dying Earth is unusual in that it lacks almost all of the conventional attributes most RPGs give to characters, such as "strength," or "intelligence." Instead, the five primary abilities are: Persuade, Rebuff, Attack, Defense, and Health. The first four of these will be further specified by a "style," denoting which particular kind of persuasion (etc.) the character prefers; each of the six Persuasion styles (such as "Eloquent" or "Glib") is countered, or "trumped," by one of the six Rebuff styles (such as "Wary" or "Obtuse"), and vice-versa. Trumping gives an advantage in opposed contests; the Attack and Defense styles trump each other in a similar manner.

Abilities are rated numerically, from 1 (abysmal) upwards, with ratings of 10 (for Cugel-level characters) through 20

(for Rhalto-level characters) considered excellent. *Dying Earth* uses this rating system for all aspects of a character, including skill-like abilities (such as "Pedantry" or "Living Rough"), possessions, financial resources, contacts, and capacities to resist temptation -- only in a Vancian setting would characters have a "Resist Pettfogger" ability, for which there is even an extended example in the rules.

The basic game mechanic is deceptively simple : players roll a single six-sided die. On a 1-3, their character fails at the task they were attempting. On a 4-6, they succeed. Players may always re-roll, but to do so costs them a point from the "pool" for the relevant ability. For example, a character with a Persuade rating of 10 could make a total of ten re-rolls on Persuasion attempts before their pool was exhausted. Rolls of 1 and 6 are particularly extreme, and can further deplete -- or partially refresh -- an ability pool. Opposed contests -- such as one character's Persuasion versus another's Rebuff -- continue until one of the participants cannot, or will not, re-roll a failure.

Once all of the points in a given ability pool are gone, the character is at a considerable disadvantage. Under certain circumstances, however, the pools refresh; exactly what these circumstances are varies from ability to ability, and there are some neat tricks to ensure game-balance. For example, a character with a Relationship ability has a powerful NPC he can call on for help -- until the pool for that ability is depleted. To refresh a Relationship pool, the PC must do some favor for the NPC in return -- a perfect plot hook for the GM. Other abilities may refresh through rest, study, meditation, or tending to one's estate.

Magic in *The Dying Earth Roleplaying Game* takes several forms. All characters have access to "cantraps" -- simple magical tweaks, such as minor blessings and curses. Any character who has learned the Magic ability may learn *Spells*, which are eclectic, but powerful, magical effects. Less-skilled practitioners ("dabblers") are less effective at learning and casting spells. Characters who have a sufficient Magic ability to be considered "Magicians" may create enchanted magical items using a fairly simple point system. The Enchantment rules aren't perfect, but the designers know it -- there are several suggestions for limiting abusive items. The most powerful "Arch-Magicians" may command the services of one or more "sandestins" -- almost omnipotent extradimensional beings. Sandestins do not serve willingly, however, and their servitude is regulated by a system of "indenture points", and is often subject to the magician's powers of persuasion.

Dying Earth goes to great lengths to establish the peculiar mood of Vance's books. The basic experience system rewards two things: turning up to play in a session, and uttering "taglines" at appropriate moments. The taglines are specific -- and characteristically Vancian -- pieces of dialogue that each player is given for the session; they range from the fairly flexible ("The prospect remains unpromising"), to the somewhat more specific ("I surmise you to be a noted wizard, seething with spells"). If a player can use the dialog in an entertaining and appropriate circumstance, they gain several experience points. If they use it in a mundane or inappropriate manner, they gain few or none. This is a neat device; it explicitly encourages all players to have the limelight at some stage in each session, and to engage in in-genre dialog. In the basic experience system, nothing is awarded for success, failure, conquest or discovery -- only the taglines matter. For those who don't care for the tagline system, a somewhat more conventional alternative is provided; it does, however, reward dramatic failure to the same degree it rewards dramatic success.

The changing fates of the protagonists is one of the characteristically Vancian features that *Dying Earth* emphasizes. Several other such features -- including elements as "Crafty Swindles," "Casual Cruelty," and "Foppish Apparel" -- are conveniently discussed at length in the chapter on GM advice. This is helpful not only for general adventure design, but as a primer to the mood of Vance's world for those not already familiar with it. GMs are encouraged to include as many of these elements in an adventure as possible; for reference, the sample adventure discusses which elements it employs, and which it passes over.

The rules themselves are written in what strives to be a Vancian style; for the most part, they succeed without being clumsy or opaque. There are plenty of illustrative examples, both of actual game mechanics, and of mood, setting, and themes. The language used is entertaining -- where else would you find an "Overarching Rule of Efficacious Blandishment" -- and many pages have pithy quotes from Vance in one corner. The chapters which discuss the lands and creatures of the Dying Earth give a fairly complete picture of the setting, but players and GMs who haven't read any of the *Dying Earth* might still feel a little lost -- accomplished though the writing in the *Dying Earth Roleplaying Game* is, it's not really a substitute for reading one or two of Vance's books to get a feel for the setting. All in all, it's

still a very entertaining book to read, and, perhaps more importantly, it's an intelligently designed game which offers some unconventional role-playing opportunities.

Gamers who are fans of Vance's work and enjoy games that favor interaction over combat will certainly want to look at *The Dying Earth Roleplaying Game*; in fact, there's probably something in it for anyone who can stand to go a few sessions without a rousing fight.

Copies of *The Dying Earth Roleplaying Game* purchased from Pelgrane's website also include the first issue of *The Excellent Prismatic Spray*, a bi-monthly magazine published in support of the game.

-- Mark Cogan

by Ralph Dula

Salt Lake City, the capital of the Mormon nation, is known as the most technologically advanced city in the world, courtesy of the vast collection of mad scientists that reside there. However, only a few people know that it is also the home of Percy Sitgreaves, the first man to combine the mystical skills of the huckster with the otherworldly knowledge used by mad scientists, a mixture Sitgreaves has named Thaumaturgical Diffusion. As discussed in *City Of Gloom*, Sitgreaves has combined the two arts to create a whole new class of huckster magic, one he attempted to share with the world in Autumn of 1876, hiding his mystical knowledge in the pages of a Smith & Robards catalog he published.

It has been more than a year since that catalog was released, and in that time many hucksters have deciphered Sitgreaves' hidden message, and using that knowledge have created hexes of their own that combine mad science and hexslinging. What follows are six new hexes created based on Sitgreaves' work.

Crystalline Sheen

Trait: Smarts

Hand: 1

Speed: 2

Duration: 5 rounds/hex level

Range: Self

Percy Sitgreaves created a useful hex called Bulletproof, allowing a huckster to literally grow armor. Unfortunately, while providing excellent protection, the mystical transformation greatly reduced the nimbleness of the huckster, making it harder to defend against enemies. Christina DeRose, a huckster and mad scientist who studied the science of geology, created the Crystalline Sheen hex as an alternate means of defense, inspired by the way several of her crystal and rock specimens caught and reflected light.

Crystalline Sheen causes a physical transformation in the caster's skin, causing the huckster's entire body to be covered in a semi-transparent crystalline substance. The altered flesh catches any light that strikes it, magnifying it tenfold as it reflects the illumination, making it painful to look at the huckster. The Target Number for any attack against the huckster is increased by one, plus one for each hand above the minimum the caster gets, as the attacker is unable to focus his vision upon the huckster without suffering incredible pain.

If there is very little light in the area (less than that found at twilight) than the hex provides no benefit, except making the caster look inhuman. Additionally, abominations which do not use vision to find their prey are unaffected by this hex.

Fusion

Trait: Smarts
Hand: Jacks
Speed: 2
Duration: 1 round/hex level
Range: 10 yards

The huckster who created the Fusion hex was something of a bookworm, reading any scientific text that he could get his paws on. In a text on metallurgy he came upon the term fusion, which the book defined as "The merging together of objects via heat." Having been robbed at gunpoint the day before, the huckster was inspired to create this hex, to deal with anyone else who waved a gun in his face.

Casting this hex upon a gun-toting individual causes a feeling of intense heat to rush over the victim, followed by the weapon he is holding merging into his hand, with no way of removing it before the hex expires! While no permanent damage is done by this hex, the victim is in extreme pain for the entire time it lasts, having a +1 added to the Target Number of any action he attempts, with an additional +1 for every hand the huckster got over the minimum. Needless to say, the merging of man and machine makes the victim unable to use his gun (or his hand) for the hex's duration. At the Marshal's discretion, the victim of Fusion might have to make a Guts check (TN 7) due to the shock of having his body temporarily mutated.

Once the hex is over the gun detaches from its bearer, with neither suffering any permanent damage, though a gunslinger might be a bit leery of picking up his piece again. Note that this hex affects only firearms, so casting it upon a knife or club-wielding foe is just a waste a time and a risk of backlash. Also, the hex only affects one gun per casting, so a fellow with a gun in each hand can still blaze away with one while the hex affects the other.

Iron In Your Blood

Trait: Smarts
Hand: Pair
Speed: 1
Duration: Instant
Range: 5 yards/hex level

This hex was created by one of the few hucksters who also studied the mad science art of alchemy. In her studies of the human body she learned that minute traces of iron can be found in the blood of humans and animals. Always looking for ways to drum up business she created this hex, convincing those she used it on that they had suffered a poisoning or heart attack, and making a tidy sum selling them her elixirs to cure the damage she had caused.

Casting this spell upon a person causes the iron in a person's bloodstream to grow for a brief second, blocking the flow of blood and putting incredible pressure on the victim's arteries, before shrinking down to normal. Naturally this is very painful, inflicting 1d6 Wind, +1d6 for every hand gotten over the minimum. Unlike many damage-causing hexes, there is no visible magical energy streaking from the huckster to the victim, nor is there external signs of injury; a well-concealed huckster can use this spell to wear down a target with the victim never having a clue as to the source of his injury.

Note that abominations do not have blood as normal creatures do, and so are immune to this hex, as are Harrowed.

Lead Feet

Trait: Spirit
Hand: Pair
Speed: 1
Duration: 1 round/hex level
Range: 5 yards/hex level

Sometimes you have to make a hasty exit after being accused of cheating at cards or consorting with the devil. This hex allows a huckster to slow down the Heel-Toe Express of his opposition, giving him a chance to escape.

The target of this hex literally finds his feet and legs have turned into supernaturally heavy lead, reducing his speed dramatically. Base success with this hex increases the level of load the victim is carrying by one step, with every hand above the minimum increasing the load level by one, as per the "Carrying a Load" table in the Deadlands rulebook. If this takes a character's load level above Heavy he cannot move until the hex is over, his legs now literally too heavy for him to move.

Note that while a victim may not be able to pursue the huckster until the effects of the hex is over, his hands and mind will be working as normal, allowing him to shoot, throw things, or even cast magic. Also, the victim of this hex suffers no actual damage, his legs returning to normal at the end of the hex none the worse for wear.

Lead Poisoning

Trait: Knowledge

Hand: Pair

Speed: 2

Duration: 2 rounds/hex level

Range: Touch

Some hucksters realize that displays of their mystical talents in public will eventually get them strung up with a hemp necktie. Those same hucksters also realize that sometimes using their talents in public is the only way to keep their fat out of the fire. Lead Poisoning is a hex designed to give hucksters an edge in combat without letting everyone know they have powers beyond those of normal men.

The huckster casts this spell upon a loaded gun, infusing a manitou within each bullet in the firearm for the duration of the hex. When one of the bullets strikes a target the manitou becomes active, causing the round to break apart inside the target and sending its fragments to burrow through the victim's body, causing an additional +1d4 damage, +1d4 for every two hands gotten over the minimum during casting. Several hucksters using this hex have astonished onlookers with the amount of damage they have inflicted with a simple derringer.

While the hex is active the bullets are considered to be magical weapons, meaning they affect abominations immune to mundane weapons just fine. Also note that only the bullets that are in the gun when the hex is cast are enchanted, so if a huckster fires off a few rounds from a gun upon which Lead Poisoning is cast and stops to reload while the hex is still active, the newly loaded rounds will not be enchanted, unless the huckster decides to cast Lead Poisoning again.

Steel Grip

Trait: Smarts

Hand: Pair

Speed: 2

Duration: 1 minute/hex level

Range: Self

Steel Grip transforms a huckster's hands, making them into metallic talons with razor-sharp edges. Base success with this hex increases the huckster's Strength by one step, +1 step for each hand above the minimum the huckster gets, but this bonus to Strength only applies to doing damage in Brawlin' combat. This damage is considered lethal damage, as per the rules on Brawlin'. Additionally, the huckster receives a bonus to his Climbin' Aptitude equal to the increase in Strength. This reflects the talons' ability to punch through material to create handholds while climbing. This does leave an easily-followed trail of vast holes, however, so this hex is not recommended who wish to keep their vertical travels a secret.

Stoicism, by Sigismondo filius Vittoria, Follower of Tremere

God is order. No more need be said amongst intelligent people, but you are my apprentice and thus a mindless animal, forcing me to squander my time explaining further.

Both Aristotelians and Platonists misunderstand the nature of God, and their views of the world and how we should live in it are tainted. God is not some transcendent deity, nor is He an all-seeing philosopher perched at the top of creation. God is the principle that organizes the universe. God is Logos, reason, the order of the universe.

Stoic Logic and Physics

All knowledge comes to the soul from the body's senses. Can anything be more obvious? Platonists say our senses lie to us. Aristotelians say that rational thought supersedes vulgar observations. Can anything be more incongruous with the facts of life? We are born empty babes, filled with knowledge by our betters (whose wisdom of course must enter through the eyes and ears) until we possess sufficient faculty to learn from our own observations.

If knowledge comes from our senses, how can we distinguish truth from dreams, illusions, or the imagination? Certainly Plato's Forms cannot help us, and neither can Aristotle's dry, analytical metaphysics. Both are the product of contemplation and thought. But thoughts come from within the mind, and everything within the mind once came from the outside by way of the senses. Therefore, thoughts are products of our senses, nothing more, and cannot help us differentiate between true and false sensations, or between knowledge and lies.

Truth cannot be found in thought, only in feeling. Real objects, real observations, invoke within us intense conviction that they actually exist. True sensations, and therefore "true knowledge," convince us of their existence. This is the Gift: the ability to tell dream from real, fact from fiction, with the tugging of the heart.

What does your heart tell you about physics? Two basic things: only matter exists, and reason governs the world. The soul, despite Christian ramblings on the incorporeal world, must be made of matter. The body and the soul work in tandem: the senses of the body produce thoughts in the soul, and the thoughts of the soul produce motion and actions in the body. The body and soul, therefore, must be made of the same substance. The same can be said of the world and God. But what element, what physical substance, could possibly comprise the soul, the thoughts within our minds, and even God Himself?

Fire, the element of reason.

The world began in primal, divine fire, the other elements brought out of fire by God's will. The Divine fire suffuses the world; thus the world and God are one and the same. The human soul, a spark of the Divine, suffuses the body; thus the soul and body are one and the same. Because God suffuses the world, every object in it has a purpose, and exists in an ordered, harmonious design.

This impression-the Divine flame burning in all things, bringing order and purpose to everything that ever happens-is so beautiful it has to be true.

Stoic Ethics

Live according to nature.

The absolute law of Logos governs the universe; human nature is no exception. The virtuous man acts rationally as his place in the universe dictates. Perhaps you have heard Aristotelians and Platonists claim the same thing? They possess a sloppiness of thought I will burn out of you. A stoic strives to live a life free of passion. Plato and Aristotle falsely believed that passions had their place in human nature and life. All passions are vice. All rational actions, no matter how severe, are virtuous.

Virtue, founded upon reason, stems from knowledge. The greatest virtue, therefore, is wisdom, not as an end to itself, but as the prerequisite of living morally. Wisdom comes from the study and application of logic and physics. From wisdom comes insight, bravery, self-control, and justice.

Only two moral states exist: wise and foolish. The wise possess perfect virtue. Fools wallow in absolute evil. No intervening state exists. People are either divine or worthless.

I, as a master magus, am divine. You, as apprentice, are worthless. When you pass your Gauntlet, you too shall become one of the wise, a rare beacon of godly light in the ever growing miasma of mortal evil.

Commentary

The Stoic school lasted for 500 years. Stoic influences can be seen in the Christian notions of salvation and divine providence. Its founder, Zeno (circa 336-264 BC), not the same Zeno of "Zeno's Paradox," combined Socratic thought with the theories of Diogenes and Cynicism to argue that virtue did not originate in the external world, but resided instead in self-sufficiency and rational, mental discipline. Thus, one's fortune in life (wealth or poverty, honor or shame) played no role in "the good life." Later Hellenistic Stoics fleshed out the stoic doctrines of logic, epistemology, and cosmology.

The writings of Epictetus (c. 50-138 BC), the Roman developer of the ethics and theology of Stoicism, were widely read by early Christians and influenced the inception of Christian morality. Epictetus codified the practical side of stoicism. To gain wisdom, Epictetus taught, you must first recognize which aspects of life are under your control, and which aspects you are powerless to affect. Then, to live a virtuous life, you must control things that are within your power to change (desire, belief, and judgment) and disregard the inevitable (the appreciation of social status, the accumulation or loss of possessions, health and appearance, and even death).

The Stoic

The stoic sees the entire universe a single, magical machine. Humans can understand the machine and participate in its operation, but can never change its destiny. A stoic does not despair or struggle against fate.

A stoic's strict sense of morality stems from this principle. "Evil" is ignorance of the universe's workings, the ignorance of magic and actions wasted on false ideas. "Good" is knowledge and practice of magic.

Suggested Mystae Virtues: Ars Notoria +3, Augury +3, Celestial Magic +2, Hermetic Astrology +1, Hermetic Theurgy +1, Magical Imagination +1

Suggested Hermetic Virtues: Affinity with Creo +4, Affinity with Ignem +3, Cyclic Magic (stellar), Deft Art (Intéllego) +1, Elementalism +5, Penetration Mastery +1

Suggested General Virtues: Destiny +4, Divination +4, Higher Purpose +1, Strong Personality +1, Strong Willed +1

Suggested Flaws: Cyclic Magic (stellar), Incompatible Arts (Perdo Ignem) -1, Overconfident -2, Oversensitive (the uneducated) -1, Sense of Doom -3, Tormenting Master -1

Suggested Abilities: Certamen, Concentration, Disputatio, Enigmatic Wisdom, Finesse, Hermetic Law, Leadership, Lectio, Philosophiae

Suggested Arts: Creo, Intellego, Ignem, and Imaginem

Suggested Spells: Any Ignem and Imaginem spell, especially Intellego Ignem.

Bjornaer: The Gift allows members of our house to do something no one else can: unlock our heart-beasts. Others think we waste our time in the wilds-but to ignore our power would be a crime!

Bonisagus: Those who try to break the limits of magic are fools; their wicked efforts will bring ruin to our house. Learn what can be learned, and leave the unthinkable to the mundanes.

Criamon: The Enigma is obvious-it shines out of every thing. You are simply too dim to see it.

Ex Miscellenea: Our diverse house does more good than the rest of the Order combined. Our many traditions pursue every aspect of human endeavor.

Flambeau: Fire burns. Nothing more need be said to the truly wise. (What does that -- and this very question -- say about what I think of you?)

Guernicus: All true law is Natural Law. Justice is inevitable as death.

Jerbiton: Too many of our house are awash with angst and possessed with poseur. Do not write poems about life; live it.

Mercere: Our founder was the ideal stoic: when he lost his Gift, he accepted his loss, served the Order in the best way he could, and became a greater light than any other Founder.

Merinita: Surrender to faerie. They are the superiors.

Tremere: Certamen shows us who shall have power, and those who never will.

Tytalus: Our games reveal our fates.

Verditius: Like the ants and bees, humanity was born to build. Artifice is the one true good.

Stoic Understanding

Stoics claim their powers comes from clarity of vision-actual, physical vision, not spiritual insight. By adopting the fatalist understanding of the ancient stoics (represented by the Sense of Doom Flaw), a stoic's eyes can see far and clear into the Fire that is the universe. This sight gives a stoic the following abilities:

- **Meditation:** For every 15 minutes spent in mediation of the cosmic fire, you can add your Concentration score to any one roll of your choosing until the next sunrise. For example, by spending 45 minutes in meditation, you may add you concentration to any 3 rolls that you make before the next sunrise. The maximum number of rolls you can boost with Concentration per day equals you Per + Concentration + aura of the area in which you meditated.
- **Seeing:** In addition to the normal uses of Divination, you can cast any Intéllego spell with a duration of Momentary or Concentration by rolling a stress die + Per + Divination + Awareness + aura total greater or than equal to the spell's level of effect. All stoic Intéllego spell effects have a range of Sight without changing the original effect level of the spell. For example, a stoic can cast Converse with Plant and Tree (normally at range Touch with an effect level of 25) at a range of Sight with an effect level of 25. Such spell effects take one round to cast, and cost one Fatigue level.

You may perform Intéllego spell effects with durations greater than Concentration, but doing so costs 1 pawn of vis per magnitude, increases casting time to 15 minutes of meditation per magnitude, and costs two Fatigue levels. You can also cast Intéllego rituals or Intéllego spell effects at Arcane Connection range this way, but doing so costs 3 Fatigue levels.

- **Portent:** You can cast geasa upon someone, as per the guidelines in Lion of the North, page 104. Your formula to cast a geas is: stress die + Per + Divination + Concentration. According to the stoics, they do not actually "cast" geas, they merely "see" what fate lies before you.

Autocannons For GURPS

"Get one today, because the guy you meet tomorrow may already have one!"

-- Uncle Albert's™ Auto Stop & Gunnery Shop, 2035 Catalog

GURPS High-Tech thoroughly covers most types of small arms and also includes a fair number of support weapons. One class of weapons is absent, however: the automatic cannon. Most of these are vehicular armaments and are thus included to a certain extent in **GURPS Vehicles**. But the scope of the latter is very different from that of HT: It is designed to provide generic game stats only, in contrast to HT, which strives to represent specific weapons and also tries to enlighten the reader on the weapons' service histories and interesting details. Some autocannons would fit nicely into HT, and indeed some are mentioned in various chapters, but eventually the whole class was left out because of space constraints.

This article has 25 autocannon entries HT-style, that is with a lot of real-world information. Game statistics are of course also here, based on what VE has to say about the topic. However, the weapons were *not* reverse-engineered using the rules, instead most of the data was taken directly from reference works wherever possible. Nevertheless, all are fully compatible with VE.

* * *

Autocannons are defined here as fully automatic weapons with a caliber of 20mm or larger.

Rotary autocannons are multi-barrel weapons often powered by an electric, hydraulic or pneumatic motor, resulting in increased rate of fire (the Russian 23x115mm Izhmash GSh-6-23M has RoF 150!) and high reliability (several 10,000 shots between failure). They are often called *Gatling cannons* after the hand-cranked multi-barrel gun invented by Dr. Richard Gatling. Many self-powered rotary cannons also exist (almost all Russian designs are gas-operated). Most rotary weapons are based on the first such weapon that reached service, the U.S. M61 *Vulcan*. One drawback of rotary cannons is their spin-up time, that is, they require a split second to reach their selected rate of fire. Thus, 1-second bursts or the first second of a longer burst consist only of about 70% of the noted RoF.

Externally powered autocannons are single-barreled guns powered by an external motor. The most prominent examples are members of the *Chain Gun*-family, where the action is driven by an internal chain-mechanism. However, there are also other motor-driven weapons. All externally powered guns have a high reliability.

Revolver cannons, originally invented in Germany during WWII, are single-barreled guns with several chambers not unlike a hand-held revolver. This arrangement provides higher rates of fire while allowing for a compact, lightweight and reliable weapon. Revolver cannons can also be found with motor-driven actions.

All belt-fed autocannons up to mid TL7 were single-feed only, which meant they were often loaded with a mix of ammo types on a single belt. For example, German fighters with the MG151/20 fired a 1:1:1 mix of SAPHEC-SD, SAPHE-SD and APEX-SD. This was usually neither economical nor very effective. In the mid-1960s, the double-feeder was invented, and common on ground service guns by the 1970s. A cannon equipped with it can feed ammunition from either side, so that the gunner can choose between two different types, as need arises. Some of the most recent guns even have triple-feeders. This is generally not available for rotary and revolver guns (although possible and already proposed for certain anti-aircraft applications), which therefore today mostly fire multi-purpose rounds such as SAPHE, HEDP or FAPDS.

Note that autocannon projectiles are almost universally fitted with a tracer (e.g. HE-T, APFSDSDU-T). See *Walking the Burst*, p. HT78. In keeping with VE, this is not noted in the weapon chart. Most autocannon projectiles are highly volatile and will count as flame attack (p. VE183), including SAPLE, SAPHE, SAPHEC, HE, HEDP, AHEAD, FAPDS, API, APEX, APDU, APDSDU and APFSDSDU. Weapons mounted in aircraft (including helicopters) can *not* use sabot rounds. The sabots pose a distinct danger for jet engines and propellers. The same guns used in ground or naval applications are of course not restricted by this.

Most modern autocannons, especially for use in or against aircraft, have dual firing rates, a lower one against ground targets and a higher one against airborne targets. Note that many autocannons are incapable of single shots. Most TL7 weapons have burst limiters included in their fire control systems, which help conserve ammunition.

Maxim QF 1-pdr Mk I, 37x94mmR Hotchkiss, UK, 1889

By definition, this was the first autocannon ever. The British water-cooled Maxim machine gun (pp. HT117-118) was scaled up to fire the same 1-pound blackpowder shell as the Hotchkiss Mle 1877 mechanical rotary gun (p. HT117). It was originally intended for use against torpedo boats. The Maxim was first adopted by a number of naval forces, including the British (1889) and Imperial German (1897), and also the French and about 30 others. Germany made it under license. It was nicknamed the *Pom-Pom* during the Anglo-Boer War in South Africa, where both sides used it. German Navy guns also saw land service during the Chinese Boxer revolt, and many were still in service in WWI, when the British Army and Navy, among others, used it as an anti-balloon gun on horse-drawn field carriages and armored cars. It was adopted by the Imperial German Army in 1915, which found it useful against early tanks. The *Pom-Pom* had a short barrel and fed from a non-disintegrating 25-round belt. The Germans also used 50-round and 100-round belts. It was manually aimed and fired. During WWI, APEX and SAPHE rounds were introduced by some nations.

Becker Kanone, 20x70mmRB Becker, Germany, 1917

The first light autocannon, this gun was patented in 1914. It was a simple blowback weapon, used as the flexible Becker FlzK on heavy aircraft. Mounted on a tripod (60 lbs.) it was called the Becker TAK and employed against tanks and aircraft. It was manually controlled, had a medium barrel and fed from a top-mounted 12-round box magazine. The gun was only used by the Germans during WWI.

The Becker FlzK was mounted on some AEG G IV bombers and Albatros J I close-support aircraft.

Oerlikon S, 20x110mmRB Oerlikon, Switzerland, 1927

The Oerlikon S cannon was a gradual development of the Becker gun, the patents having been sold to the Swiss company. During the late 1930s an improved variant, the SS (1938), was widely adopted as an anti-aircraft gun, mounted on tripods, trailers and especially ships; RoF 8. All models usually fed from a 60-round drum, which weighed 62 lbs. loaded. Among the Oerlikon users were Japan and the USSR, but the main operators of the SS were Britain and the USA. Hundreds of thousands were made.

The far less successful Oerlikon FFS (1935) was an aircraft weapon; use the same stats except for Ewt 86, RoF 7. Hispano-Suiza located near Paris produced a licensed copy of the FFS called the HS.7; Ewt 103, RoF 6.

The French Dewoitine D.501 fighter (1935) had a single HS.7 gun with a 60-round drum, firing through the propeller hub.

In 1936 Hispano-Suiza came out with their own development, the HS.404, which became the main competitor of the Oerlikon. Although a completely different design, it was very similar operationally and both widely exported and license-made. It used the 20x110mm Hispano-Suiza cartridge, which was *not* interchangeable with the Oerlikon round. During WWII it was mainly employed as an aircraft gun. The original HS.404 usually fed from a 60-round drum, but by 1941 improved British and U.S. aircraft versions used disintegrating belts. The company introduced their own belt-

feed model, the HS.804, shortly after WWII. Use the Oerlikon S stats, except for Ewt 105-121, RoF 8 (drum-feed HS.404); Ewt 114, RoF 13 (belt-feed HS.804); Ewt 95, RoF 10 (drum-feed British Mk II); Ewt 92, RoF 12 (belt-feed British Mk V); Ewt 112, RoF 10 (belt-feed U.S. M2); Ewt 95, RoF 13 (belt-feed U.S. M3) and Ewt 90, RoF 13 (belt-feed U.S. M24).

The Royal Air Force Supermarine *Spitfire Mk IB* fighter (1939) had two Mk II guns in the wings with 60 rounds per gun, the Hawker *Hurricane Mk IIC* fighter (1940) had four Mk II guns in the wings with 60 rounds per gun (p. HT89), the U.S. Army Air Corps Lockheed P-38F *Lightning* fighter (1942) had one M2 cannon with 150 belted rounds, the U.S. Navy Grumman F8F-1B *Bearcat* fighter (1945) had four M3 guns in the wings with 200 belted rounds each (p. HT91), the U.S. Navy North American F-1C *Sabre* fighter (1953) had four M24 guns in the nose with 132 belted rounds per gun and the Argentine FMA IA-58B *Pucará* ground attack fighter (1975) mounted two HS.804 guns with 270 belted rounds per gun (p. SO15).

During the 1960s, the U.S. Navy converted thousands of M3 guns to the MK16 MOD 0 deck gun; use the same stats, except for Ewt 95, RoF 10.

The LCM(R) *Monitor* riverine boats (1963) mounted one MK16 MOD 0 with 365 rounds in the aft turret.

The German Ikaria MG-FF (1936) was a modified variant of another Oerlikon model, the FFF, which very much resembled the original Becker gun. It was a compact weapon with medium barrel and fired the 20x80mmRB round; Dam 5dx2(0.5) plus 1d-4[2d], 1/2D 1,000, Max 4,800, Ewt 62, RoF 9, WPS 0.44. It usually fed from a 30-round or 60-round drum. API and APEX rounds were available, but the modified MG-FF/M (1940) mainly fired SAPHEC rounds.

The Messerschmidt Bf 109E-4 fighter (1940) mounted one MG-FF/M in each wing with 60 rounds per gun. The Heinkel He 111H-16 transport (1941) mounted one flexible MG-FF/M in the nose with 30 ready rounds and 5 spare drums.

Bofors m/36, 40x311mmR Bofors, Sweden, 1936

This Swedish anti-aircraft gun was designed beginning in 1928 and became a huge success during the 1930s and 1940s. More than 20 nations adopted it in that era in widely varying numbers, among them Argentina, Finland and Turkey, and many more after WWII. The basic gun was license-made in Austria, Belgium, Canada, Czechoslovakia, Great Britain, Hungary, Norway, Poland and the USA. After WWII, it was also made in Germany and Italy. It was used both on ground and naval mounts, including trains and submarines, and often found in twin or quadruple installations. The Bofors fed from 4-round clips, although bulky feeders holding 10, or after WWII up to 101, rounds were developed and used by some nations (but usually confined to naval applications).

The Swedish Army Lvakan m/36 and its copies were the most widespread ground mounts. They had a single gun on a four-wheeled trailer. Some 24 rounds would be stowed on the trailer right beside the gun, with about 200 more on the towing truck. Such an anti-aircraft mount would mass around 2.5 tons. The Cadillac M42 *Duster* self-propelled armored anti-aircraft system (1951) of the U.S. Army carried two license-made Watervliet M2A1 guns in an open turret with 480 stowed rounds.

The U.S. Navy mounted a single MK3 on the LCT landing ships (1940), while the Vietnam-era LCM(R) *Monitor* riverine craft (1963) mounted a MK52 in the bow turret, fed by a 48-round drum.

The U.S. Air Force's Rockwell AC-130U *Pave Spectre III* gunship (1994) carried a side-firing M2A1 gun with shortened barrel and 276 stowed rounds (p. SO89).

After WWII, the gun was commonly known as the L60 (although its barrel length actually was 56 calibers), to distinguish it from the improved L70 or m/48, which fired the more powerful 40x365mmR cartridge; Dam 6dx7(0.5) plus 4d[4d], 1/2D 5,000, Max 13,700, Ewt 770, RoF 5*, WPS 5.5.

Mauser MG151/20, 20x82mm Mauser, Germany, 1940

An improved version of the 15x96mm Mauser MG151 heavy machine gun, which was modified to accept a more effective cartridge by simply replacing the barrel. It was one of the first guns to fire electrically primed ammunition and was a standard light cannon of many German, Italian and some Japanese and Romanian aircraft, mainly in fixed mounts. Later in the war it was also used on single and triple anti-aircraft mounts and even improvised ground tripods and naval fast attack boats. After WWII it was used for some time by Czechoslovakia, France, Israel and South Africa, France even producing it until 1970. The MG151/20 used a disintegrating belt.

The Junkers Ju 87D-5 STUKA ground attack aircraft (1940) had one gun with 180 rounds in each wing. The Messerschmidt Bf 109G-5 fighter (1942) had a single gun with 200 rounds firing through the propeller hub. The Focke-Wulf Fw 190A-8 fighter (1940) had four wing-mounted guns, two synchronized in the wingroots with 250 rounds each and two unsynchronized with 140 rounds. The Japanese Kawasaki Ki-61-Ia *Hien* (*Tony*) fighter (1942) mounted one in each wing, with 120 rounds per gun. Some French Aérospatiale SA 316B *Alouette III* helicopters (1960) mounted a MG151/20 with 480 rounds (p. SO86).

The South African Vektor GA-1 *Rattler* (1989) was a slightly modernized copy; use the same stats except for Ewt 86. By installing a few replacement parts, it could be converted in 10 minutes to fire the 12.7x99mm Browning (Dam 12d, 1/2D 1,500, Max 6,800, RoF 10, WPS 0.25). It was available on armored vehicle, aircraft and naval mountings.

The Atlas *Oryx* helicopter (1991), a derivative of the Aérospatiale SA330L *Puma* (p. SO86), could mount one GA-1 as door gun with 240 ready rounds.

Tulamash VYa-23, 23x152mmB Volkov-Yartsyev, USSR, 1940

The most powerful small caliber autocannon of WWII was an aircraft weapon for ground attack. It was scaled up from the 12.7x108mm Beresin UBK heavy machine gun and had a long barrel.

The Lavochkin-Gorbunov-Gudkov LaGG-3 Tip 8 fighter (1941) had a single gun firing through the propeller hub, with 80 rounds. The Ilyushin Il-2M Tip 3 *Shturmovik* ground attack aircraft (1942) had a VYa-23 with 250-round belt in each wing.

The Tulamash AZP-23 (2A7) was a later development installed on the ZSU-23-4. It used the same cartridge case as the VYa-23, but ammunition was not interchangeable; use the same stats except for Ewt 176, RoF 15.

The ZSU-23-4 *Shilka* armored anti-aircraft vehicle (1966) mounted four AZP-23 guns with 500 ready rounds each.

Rheinmetall-Borsig BK3.7, 37x265mmR Rheinmetall, Germany, 1942

This aircraft gun was based on the FlaK18 anti-aircraft gun of the 1930s. It was used both as an heavy aircraft destroyer and tankbuster. It fed from 6-round clips inserted from the side. The APCR round introduced in 1944 was in short supply because of severe lack of tungsten.

The Junkers Ju 87G-1 *Kanonenvogel* ground attack aircraft (1943) carried two guns with 12 rounds per gun below the wings, while the Henschel Hs 129B-2/Wa heavy fighter (1943) carried one as a belly gun with 6 rounds ready to use, plus 66 in reserve.

Rheinmetall-Borsig MK108, 30x90mmRB Rheinmetall, Germany, 1943

A cheap, lightweight gun designed for air-to-air combat, the shells carrying enough explosive to bring down even heavy Allied bombers, although its short range was a distinctive drawback (pilots usually opening fire at 300 yards). The action was scaled up from the old Becker. The MK108 was extremely compact and had a short barrel. It used electrically primed ammunition in disintegrating belts.

The Messerschmidt Bf 109K-4 fighter (1944) had one gun firing through the propeller hub with 60 rounds, while the Messerschmidt Me 262A-1 *Schwalbe* jet fighter (1944) had four nose guns, two with 100 rounds each and two with 80 rounds each.

Mauser MK213, 30x85mmB Mauser, Germany, 1945

This revolutionary gun was the first revolver cannon, with five chambers and a medium barrel. Its high rate of fire, good reliability and effective *Minengeschoß* completely outclassed all Allied weapons of the time. In our reality, only 15 prototypes were made before the war ended, but had it continued as postulated in *Alternate Earths*, the MK213 would have become the new standard gun of the *Luftwaffe*.

The Messerschmidt Me 262F-1 jet fighter (1946) had two guns with 120 rounds per gun, while the Horten Ho 15A-1 flying wing jet fighter (1946) had two guns with 150 rounds each.

DEFA Mle 552, 30x113mmB DEFA, France, 1954

A direct copy of the experimental 30x85mmB Mauser MK213, this weapon was an instant success. It was a gas-operated revolver cannon with five chambers and medium barrel. The Mle 552 was adopted by the French Air Force as the CN-MIT-30-F1 and made in several variants, including the Mle 554 with RoF 18/30. All models were widely exported, and some were licensed to Israel and South Africa.

The Dassault *Mirage IIIC* fighter (1960) mounted two Mle 552 guns with 125 rounds per gun. The Brazilian AMX A-1 ground attack aircraft (1990) had two Mle 554 guns with 125 rounds per gun.

The British Royal Ordnance ADEN-series was very similar and fired ammunition identical except for the priming; use same stats except for Ewt 192.

The SEPECAT *Jaguar GR.1* ground attack fighter (1973) had two ADEN Mk 4 with 150 rounds per gun. The BAe *Sea Harrier FRS.1* V/STOL fighter (1979) carried two ADEN Mk 4 with 130 rounds per gun in a belly pack.

Tulamash GSh-23, 23x115mm Afanasiev-Makarov, USSR, 1959

A standard Soviet aircraft cannon, the GSh-23 was a twin-barreled gun whose medium-length barrels fired alternatively, an arrangement first used in the German 7.92x57mm Vorwerk-Gast MG17 of WWI. It fed from a disintegrating belt. The GSh-23 was license-made in China and Yugoslavia. Shrapnel rounds were available for ground attack. They exploded at 1/2D, scattering pellets in a narrow cone along the flight path. Even chaff and IR-decoy rounds were made in this caliber, but only used in bombers.

The gun was widely used and most often found in a belly pack with 200 rounds, for example on the MiG-21PFM (*Fishbed-F*) fighter (1964) or MiG-23M (*Flogger-B*) fighter (1973), but it was also installed in the chin turret of the Mi-24VP (*Hind-E*) attack helicopter (1992), feeding from a 470-round belt (pp. SO88). The Tupolev Tu-22M-2 (*Backfire-B*) strategic bomber (1971) had two in a remote-controlled tail barbette, each with 600 rounds.

Ford Aeronutronic M129, 40x53mmSR NATO, USA, 1963

Although strictly speaking an automatic grenade launcher, it was used operationally very similarly to a cannon. The M129 was externally powered by an electric motor and had a short barrel. It fired the same belted ammunition as the Naval Ordnance MK19 MOD 0 grenade machine gun (p. HT121). The gun was widely used during the Vietnam War.

The M129 was first installed in the chin turret of the Bell AH-1G *Cobra* attack helicopter (1967) with 300 grenades (side-by-side with a 7.62x51mm GE M134 minigun and its 4,000 rounds). The experimental Lockheed AH-56A *Cheyenne* attack helicopter (canceled 1972) mounted it in a chin turret with 780 rounds. The USAF used it as a doorgun on the Bell UH-1N helicopter (p. SO81).

General Electric M61A1 *Vulcan*, 20x102mm M50, USA, 1964

After WWII, the U.S. Air Force started to look for a new aircraft gun based on the multi-barrel Gatling guns. In 1956, the M61 *Vulcan* was adopted. It was an externally powered cannon with six long barrels, feeding from a disintegrating belt. First installed in the Lockheed F-104A *Starfighter*, it was soon superseded by the M61A1 variant, which used a linkless feeder for better reliability and higher rate of fire. It remained the standard American aircraft gun for many decades. Like most modern aircraft cannons, the M61A1 had two selectable rates of fire, low (RoF 66) or high (RoF 100). The original M61 could only fire at RoF 66. The ammo was contained in a large drum magazine, whose capacity differed depending on the installation. The M61A1 was license-made in Italy and Japan.

The more recent M61A2 (1990) had been reduced in weight; Ewt 200.

The Lockheed F-104A *Starfighter* (1956) mounted the M61 with 750 rounds, the McDonnell Douglas F-15C *Eagle* (1979) had the M61A1 with 940 rounds, the General Dynamics F-16A *Fighting Falcon* (1979) had the M61A1 with 511 rounds, and the Lockheed Martin F-22A *Raptor* (2002) carried the M61A2 with 480 rounds. The Boeing B-52H *Stratofortress* bomber (1961) used to have one M61 as remote-controlled tail gun with 1,242 rounds (RoF 41). The Lockheed AC-130H *Pave Spectre II* gunship (1972) carried two M61A1 guns with 3,000 rounds per gun, both firing to the left at RoF 41 (p. SO89).

The GAU-4/A (1966) was a self-powered version (Ewt 275, Pow 0) installed in a gunpod with 1,200 rounds.

A single pod was carried by Royal Air Force McDonnell Douglas *Phantom* FGR.2 fighter/bombers (from 1969).

The M168 was the U.S. Army's variant for use in anti-aircraft systems, mounted on a trailer or armored vehicle; Ewt 299, RoF 16/50. It was license-made in South Korea.

The M163 *Vulcan* air defense system (1968) mounted an M168 gun in a one-man turret on a modified FMC M113A1 armored personnel carrier. It had 1,100 rounds ready-to-fire and 1,000 in reserve.

It was also part of the shipborne MK15 *Phalanx* radar-controlled Close-In Weapon System (CIWS) first deployed in 1980. It typically fired APDSDU rounds in 60-round or 100-round bursts; Dam 6dx5(3), 1/2D 2,600, RoF 50, WPS 0.6.

The USS *Enterprise* aircraft carrier mounted three *Phalanx* stations from 1980, each with an integral magazine with 989 rounds, while the FFG-7 *Perry*-class frigates (from 1980) mounted one each.

OTO Melara 76/62 *Compatto*, 76x636mmR OTO Melara, Italy, 1967

One of the most popular medium-caliber naval weapons, adopted by 50 navies and license-made in Australia, India, Japan, Spain and the USA (as the MK75 MOD 0). It had a long, seawater-cooled barrel and was useful against both ships and aircraft. Anti-armor ammunition had been developed for use in armored vehicles, but was not usually used with this gun. It was typically installed in a remote-controlled gun turret.

The 76/62 *Super Rapido* was an improved version with RoF 2*.

The Italian *Audace* destroyer (1973) carried four *Super Rapido* with 85 ready rounds per gun. The U.S. Navy FFG-7 *Perry*-class frigates (1978), the PHM-1 *Pegasus*-class hydrofoil patrol ships (1978) and the U.S. Coast Guard WMEC-901 *Bear*-class cutters (1983) all mounted one MK75 MOD 0 with 80 ready rounds.

General Electric GAU-8/A *Avenger*, 30x173mm Oerlikon, USA, 1975

The most powerful cannon ever carried by an aircraft. It was a hydraulic rotary cannon with seven long barrels and a linkless feed. Its recoil was so high that firing it considerably slowed down the jet-engined aircraft it was installed in!

The main round was APDU, which was usually mixed 5:1 with SAPHE. Its ammo had alloy cases.

The GAU-8/A was designed specifically for the Fairchild A-10A *Thunderbolt II* ground attack aircraft (1977). When introduced, it offered dual firing rates (RoF 35/70), but since the late 1980s, the gun on the A-10A could only fire at RoF 65. The A-10A had a 1,174-round drum magazine.

The Dutch SGE-30 *Goalkeeper* (1980) was a shipborne CIWS armed with the GAU-8/A. It fired an APDS or FAPDS round at RoF 70. From 1988, the British *Invincible*-class aircraft carriers mounted two *Goalkeeper* systems with 1,190 ready rounds each.

A development from this gun was the GAU-13/A, a 4-barreled weapon powered by a pneumatic motor. Use the same stats except for Ewt 339, RoF 40, Pow 44.75 kW. It was used in a gunpod with 353 rounds.

Tulamash 2A42, 30x165mm Shipunov, USSR, 1976

Another widespread Soviet design, this weapon was originally developed for the BMP-2 infantry fighting vehicle. It was a conventional single-barreled gun with dual-belt feeder. The 2A42 was license-made in Bulgaria, Czechoslovakia and India.

The BMP-2 (1976) carried 305 SAPHE rounds and 195 AP rounds ready-to-use.

The Kamov Ka-50 (*Hokum-A*) attack helicopter (1995) was also armed with this cannon. It carried 250 SAPHE and 250 APEX rounds (RoF 5/15).

The improved 2A72 (1990) was a lighter and less complex weapon. Use the same stats except for Ewt 185, RoF 5*.

The 2A72 armed the BMP-3 (1990), which carried 305 SAPHE rounds and 195 APDS rounds.

Mauser BK27, 27x145mmB Mauser, West Germany, 1977

This belt-fed revolver cannon with five chambers and a long barrel was based on the experimental 20x135mm Mauser MG213 of 1945. It had a high rate of fire and very good reliability. It typically fired 10- or 20-round bursts.

The multi-national Panavia PA200 IDS *Tornado* fighter/bomber (1982) had two BK27 with 180 rounds per gun (typically SAPHE), while the Swedish SAAB JAS39A *Gripen* (1995) carried a single gun with 120 rounds.

In 2001, the BK27 installed on the remote-controlled MLG27 mount entered service with the German Navy. The MLG27 accommodated a 90-round belt and fired FAPDS.

The Mauser BK27-2 was an improved version with linkless feed; Ewt 297.

It armed the multi-national Eurofighter EF2000 *Typhoon* (2001), which carried 150 rounds. The same gun licensed to Boeing was selected for the Joint Strike Fighter developed for the U.S. and British militaries (either the Boeing F-32A or Lockheed Martin F-35A, from about 2008). The F-32A/B carried 150 rounds of HEDP.

Izhmash GSh-301, 30x165mm Shipunov, USSR, 1978

A belt-fed gun with a water-cooled medium barrel, very light and powerful. It was developed in the late 1970s and entered service in 1984. The GSh-301 fired electrically primed ammunition, which was otherwise similar to the rounds used by the 2A42.

The MiG-29 *Strizh* (*Fulcrum-C*) fighter/bomber (1984) carried one gun with 150 rounds, as did the Su-27 (*Flanker-B*) fighter (1984).

Hughes M242 *Bushmaster*, 25x137mm Oerlikon, USA, 1981

Design of this weapon started in 1976, and it was first fielded in 1983 by the U.S. Army on the FMC M2 *Bradley* infantry fighting vehicle. It was a member of the *Chain Gun*®-family, which means it was an externally powered gun employing two internal chains to operate the action. The M242 had a dual-feed system, so that it could change from one ammunition belt to another at the flick of a switch. Although its maximum theoretical RoF was 8*, all weapons used by the U.S. military had it fixed at RoF 3*, to increase accuracy and reduce ammo consumption. It was typically fired in 3-round bursts.

The FMC M2 *Bradley* (1983) carried 300 ready-to-use rounds, 225 SAPHE and 75 APDS or, since 1991, APFSDSDU. Some 600 spare rounds were stored in the back of the vehicle. The DDGMC LAV-25 wheeled armored personnel carrier (1983) used by the USMC had 210 ready rounds (150 SAPHE and 60 APDS) and 420 in reserve.

The MK38 MOD 0 *Sea Snake* (1988) was the same gun in a naval deck mount and used on smaller U.S. Navy and Coast Guard vessels. It fired SAPHE or APDU.

The PC-1 *Cyclone*-class patrol boats (1993) had two mounts with 150 ready rounds per gun.

The MK44 MOD 0 *Bushmaster II* was nothing more than a scaled-up version of the smaller M242, chambered for the 30x173mm Oerlikon round. It even shared a large number of components with the earlier weapon; use stats of the GAU-8/A except for Ewt 324, RoF 3*, Pow 1.1kW. It fired single shots, 5-round bursts or full automatic. An APFSDS round was in service; Dam 6dx9(2). The *Bushmaster II* became available in 1992 and was selected by the U.S. Navy.

The Swedish-designed Hägglunds CV9030 infantry fighting vehicle (1998) adopted by Finland, Norway and Switzerland mounted the *Bushmaster II* and carried 160 ready rounds and 240 stowed. The General Dynamics AAV amphibious assault vehicle (2006) adopted by the U.S. Marines was armed with the MK44-0 and carried 50 ready APFSDS and 100 ready SAPHE rounds plus 400 stowed.

General Electric GAU-12/U *Equalizer*, 25x137mm Oerlikon, USA, 1983

The GAU-12/U was a five-barreled hydraulic/electric rotary cannon, which, although about the same size as the M61A1 *Vulcan*, was actually based on the GAU-8/A. It fired the same cartridge as the M242 *Bushmaster*, but not usually the same rounds. Typically fired 10-round or 30-round bursts. It was license-made in Italy.

A GAU-12/U with RoF 63 was carried in a belly pack by the U.S. Marine Corps' McDonnell Douglas-BAe AV-8B *Harrier II* S/VTOL fighter/bomber (1989) with 300 rounds SAPHE (p. VE142). The Rockwell AC-130U *Pave Spectre III* gunship (1994) mounted one side-firing GAU-12/U with 3,000 rounds (p. SO89).

The DDGMC LAV-AD light armored air defense vehicle (1997) adopted by the Marines had 385 rounds ready-to-use and 600 in reserve (the ground version had RoF 30).

Hughes M230, 30x113mmB DEFA, USA, 1984

Development of this externally powered helicopter gun began in 1973. The first of the *Chain Gun*®-series, the M230 was an especially lightweight and compact weapon with a medium barrel. The only ammo nature commonly used was a HEDP round with alloy case.

The M230 was installed in the MDHC AH-64A *Apache* attack helicopter (1986). Linkless rounds were fed to it from a 1,200-round magazine. Although the gun was quite reliable, the actual weapon system as installed in the AH-64A proved to be unsatisfactory, resulting in frequent jams (Malf 16). A temporary fix was to carry only about 500 rounds of ammo (Malf Crit).

General Dynamics M301 *Vulcan II*, 20x102mm M50, USA, 1998

The M301 *Vulcan II* three-barreled helicopter gun was an update of the old 20x102mm General Electric M197. It was lightened and used ammunition with alloy cases for reduced weight.

It was installed in the Boeing-Sikorsky RAH-66A *Comanche* attack/scout helicopter (2002), feeding from a 500-round disintegrating belt.

The UHED *Gunhed* mecha (2020) mounted one gun with a 1,750-round belt.

Its predecessor, the General Electric M197 (1969), was a lightened three-barreled version of the M61A1; use the stats of the M61A1 except for Ewt 146, RoF 12/25, Pow 2.2kW/6.4kW.

The M197 was first installed in the Bell AH-1J *Sea Cobra* attack helicopter (1969), feeding from a 750-round belt, and also armed the AH-1S *Cobra*, AH-1W *Super Cobra* and AH-1Z *King Cobra*. On the AH-1-series, it fired 16-round bursts at RoF 12.

A gunpod used with, among others, the Sikorsky MH-60G *Pave Hawk* SpecOps helicopter (1992), held a M197 and 300 rounds (p. SO82).

CTAI CT2000, 40x225mmCTA *Super Forty*, France/UK, 2004

Cased Telescoped Ammunition used a large-volume, can-shaped cartridge case (as opposed to the usual bottle-shape), which completely enclosed the projectile. This made it lighter, more powerful, allowed it to be stored more space-efficiently and to be handled more easily than conventional ammo. CTA International, a joint venture between GIAT and Royal Ordnance, developed this externally powered cannon since the early 1990s for use in armored fighting vehicles. It fired 40x225mmCTA rounds with a plastic case through a very long barrel. The CT2000 had a linkless triple-feed system. Apart from standard ammunition, CTAI also designed a guided APEDS-CLGP round, which fired a sabot, armor-piercing tungsten projectile with HE charge. This laserguided 25mm dart was modified from the submunitions of the British *Starstreak* surface-to-air missile. Use it like a TL8 CLGP munition (p. VE112) with SALH terminal guidance (+3 to skill), with the important difference that it can only be used in direct fire.

The CT2000 was compact enough to be installed in even a relatively small fighting vehicle (in fact it had less inboard length than the M242 *Bushmaster*), and was retrofitted to the British GKN FV510 *Warrior*. The French adopted it for their new family of wheeled armored vehicles, and it was selected for the U.S. Army FSCS armored scout vehicle (2007). It remained a standard weapon until about 2050.

Mauser RMK30-2, 30x230mmCLTA, Germany, 2005

An advanced recoilless gun firing caseless telescoped ammunition through a medium barrel. It was a front-loading, externally powered revolver gun with three chambers. The recoilless operation allowed for a high-powered weapon in a very light, rotating mount. Designed in the 1990s, it was proposed for the German variant of the Eurocopter *Tiger* gunship and also for the KMW *Wiesel* microtank. It was extremely accurate, further amplified by state-of-the-art targeting electronics. The gun fired single shots or 3-round bursts.

In 2005, the German Army adopted the gun for use in an external chin mount under the Eurocopter UHT *Tiger* attack helicopter. The mount carried 40 linkless rounds.

Mauser MK50, 50x330mmCTA *Supershot*, Germany, 2006

Beginning in 1985, this externally powered gun was developed by Rheinmetall as the Rh503. It was designed from the start as being able to be converted from conventional 35x228mm Oerlikon ammo to the new plastic-cased 50x330mmCTA round by simply changing the barrel; with 35mm SAPHE-SD rounds, it had these stats: Dam 6dx6(0.5) plus 3d[4d], 1/2D 3,500, Max 8,700, Ewt 1,078, WPS 3.5. AHEAD, FAPDS and APFSDS ammo was also available, but the 35mm variant was soon outgrown by threat vehicles. In both calibers, the gun had a very long barrel

and linear linkless dual feeder. Since Rheinmetall had taken over Mauser, Oerlikon and a number of other European defense companies in the 1990s, series production of the MK50 was transferred to Mauser.

The MK50 was adopted by the German Army as the main gun of its infantry fighting vehicle for the 21st century, the *Marder 2*. It remained a standard weapon until about 2050.

New Ammunition Types

SAPHEC, Semi-Armor Piercing, High Explosive, Concussion (Late TL6)

Developed during WWII as the *Minengeschoß*, this round for use against aircraft develops few fragments, but has a high explosive payload. Counts as flame attack. Available only for cannon. First available in 1940.

	Type	Damage	Rng	WPS	CPS	Acc
	Cr.	KE(0.5)	-	/1.5	x4	-
plus	Cr.	CxX/12,000				

FAPDS, Frangible Armor Piercing, Discarding Sabot (Late TL7)

An anti-armor round with a sub-caliber penetrator which disintegrates into pyrophoric fragments after penetration. Counts as flame attack. First available in the 1990s.

	Type	Damage	Rng	WPS	CPS	Acc
	Cr.	1.33xKE(2)	-	/1.5	x6	-
plus	Cr.*	Fragmentation damage according to p. VE113				

AHEAD, Advanced High Efficiency And Destruction (Late TL7)

A multi-mode round which can either function as a HEPF-ABF round or as SAPHE. The heavy metal fragments count as armor-piercing, i.e. [8d(2)] are treated as eight 1d(2) attacks. Its fuse is set electronically while leaving the muzzle of the gun. Available only for cannon. First available after 1991.

	Type	Damage	Rng	WPS	CPS	Acc
	Cr.	KE(0.5)	-	-	x8	-
plus	Exp.*	CxX/24,000 and armor-piercing fragmentation damage according to p. VE113. Fragmentation damage is doubled in HEPF-ABF mode.				

APEDS, Armor Piercing, Explosive, Discarding Sabot (TL8)

An anti-armor round with a sub-caliber penetrator with explosive charge. Counts as flame attack. Available only for cannon. First available after 2000.

	Cr.	KE(2)	x1.5	/1.5	x6	-
plus	Exp.*	CxX/64,000 and fragmentation damage according to p. VE113 divided by 2.				

New Ammunition Option

Lightweight Alloy Case (Mid TL7)

Popular for aircraft guns to reduce weight. Divide WPS by 1.33 and multiply CPS by 1.33. VPS is not affected. First available in the 1970s.

Notes For The Table

Ammo: The most common ammo types are listed, in order of approximate "popularity". Note that for some weapons, these are the only ones available, while others reflect only a part of the many types produced. If in doubt, use only the ones in the chart. Note that APEX becomes available at TL6!

Malf: v(c) is short-hand for ver (crit) and means the verification must be another critical miss for the weapon to malfunction. For some modern weapons, this is still not good enough!

Damage: Mainly calculated according to pp. VE104 and VE112-113, when and if the results did not deviate too much from reality. For example, this was the case with the 30x113mmB HEDP. The rules said 2d+1(5), which penetrates a lousy average of 14.5mm of armor steel. The real thing blasts through an average of 70mm, or 11d(5). This author has opted for 5d+2(10), as it more accurately reflects the real-world performance of the round. Explosive damage was always calculated using real-world data on the explosive contents of shells. However, the Dam of KE rounds generally confirms to the rules, including the grossly inflated penetration values of some AP rounds.

1/2D and Max: Based on real-world data. The results from p. VE105 are generally too low. 1/2D (xx) means that, while accuracy suffers, Dam does not. This is generally confined to explosive rounds. Some shortened Max ranges are the result of self-destruct fuses (SD), which blow the projectile up at a given range.

RoF: The notation xx/xx means the gun has two selectable rates of fire. Usually, the lower one is for use against ground targets, the higher one for use against aircraft. Only those with a * are capable of single shots.

Ewt: Empty weight of the gun, without any mount. Taken from real-world sources. Slight differences in weight are possible, usually due to varying installations.

Cost: The costs are based on the few figures that could be secured: the HS.404 was priced at \$3,500 in 1937, the M242 cost \$40,000 in 1990. All other costs were based on that, but realistically, the costs are just for comparison. Weapons pricing is more often than not a matter of politics.

WPS: All taken from real-world sources.

Pow: Power requirements were taken from real-world sources except those of the M301 and RMK30-2, which had to be guesstimated.

No Help For It, Part II

Okay; this week I'm continuing what I was talking about [last week](#): creating epic adventures where the heroes believe they can handle it themselves. After all, in the Real World when most of us face problems, we call someone else. "Hmm. Well, the entire neighborhood is being consumed by a raging inferno, but I have a Super Soaker and some baking soda that might do the trick . . ."

But when you're trying to create something epic, it's no fun to have your heroes calling up someone else who can help. Of course, it's also not fun to stretch believability to the breaking point by *not* having them call someone else. Here, then, are some more tips for keeping your heroes active and heroic, without having them whimper.

- **Smaller-Scale Worlds.** Consider: from an excitement standpoint, what is the difference, really, between blowing up the earth, and, say, a city? (Outside of the larger insurance premiums.) The *Freeport* adventure series for *d20* takes place entirely in one city; if the heroes fail, disaster might befall the entirety of Freeport. So if you're in a superhero campaign, having the heroes save the day in Ann Arbor means a heck of a lot to the residents of that city, while limiting the options of the heroes to call the Global Justice Defense Force.
- **Keystones.** Even blowing up something as simple as a building can be grandly epic . . . if it's the right building. I once ran an *In Nomine* adventure that took place on New Year's Eve, 1999. I knew that I couldn't let not-the-new-millennium-but-everyone's-drunk-like-it-is go by without *something* big happening, but I didn't want to nuke the world or anything so melodramatic. So I decided to try and build an adventure around a room full of revelers. I had the adventure take place in Rotorua, New Zealand, which (as I understand it) was one of the first points to ring in the new year. There the bad guys were going to attack a room of partying people and try to destroy the hotel they were in. Why? Because then for the entire day -- the dawn of this new millenium (not) -- the news would be abuzz of this awful tragedy.

At its base the heroes were doing nothing more than saving one hotel. But, of course, it was about so much more.

- **"It's important to us!"** Otherwise simple adventures can be elevated to epic status -- while limiting the possibilities of calling for help -- by making them personal. For example, if the heroes have a powerful patron, and someone is seeking to destroy that patron's company, livelihood, and life (and, of course, his support of the party), it might not warrant the full-scale attention and aid of the authorities. But it will definitely make the heroes feel similar epic-style elation if they overcome the adversity.
- **Most authorities are more interested in maintaining the status quo.** Consider the following scenario: You know that someone is going to kill half the earth, so you call the authorities. They'll probably show up in moments and help, since their interest is in maintaining the status quo. Now consider if someone has developed a cure for a disease . . . a disease that, left unchecked, will kill half the earth. And someone is trying to kill *that* person. You might the police, but they probably won't be able to help you much.

Something wonderful failing to happen can often be just as devastating (and epic) as something awful happening directly . . . but most authorities don't have the resources to help these wonderful things happen. (Fortunately, a band of correctly-placed heroes might . . .) If you're reluctant to introduce a cure for cancer, cold fusion power, or other wonderful goodies to your campaign world (and I don't blame you), you can be an evil GM and introduce *bad* things five or six adventures earlier . . . only to give the heroes a chance to "save the world" by removing these adverse conditions. In this case, let your imagination run wild: create odd diseases, have the world run out of fossil fuel, create a grain blight. You'll be fixing the problems soon enough anyway . . . presuming, of course, the heroes are heroic. (And they probably won't be able to call for help as easily.)

- **"Wow. This is big . . . kinda."** One of the things I loved about the old *DC Heroes RPG* from Mayfair (and which also appears in *Blood of Heroes*) was their designation of threat and consequence levels for determining experience. For example, you can have something that threatens things on a planetary or galactic level, but which has temporary or permanent non-fatal consequences. Consider the possibilities that opens: If you have an adventure that threatens to, say, remove the memory of a first kiss from everyone on earth, that's a Big Deal . . .

somewhat. But it's not the sort of thing you're able to call most authorities about.

Non-fatal large-scale crises can feel much like world-blowing-up epics, but don't have quite as high stakes. If someone wants to destroy the Internet, or mutate the world's corn into something that tastes like broccoli, or surround Mars in a force field so he can have that world for himself, these will have real, lasting effects. And the missions, though weird, should be epic enough to get your heroes motivated to stop them.

Weird can be good. Epic weird can be great.

Hopefully I've given you some ideas to help keep your players on the edge of your seat, without having their characters reaching for help on the phone.

* * *

I've been forgetting to mention this for a few weeks now. Whoops.

Anyway, for those of you who've been wondering what I look like (or whether or not I show up on film), a picture of me appears on page 32 of issue of *Knights of the Dinner Table* #54. But it's not a terribly flattering picture, and they call me "Steve." So if you want to see a picture that doesn't make me look quite like those guys that're way too interested in the guinea pigs at the pet store, I might direct you to:

<http://www.waitingforgo.com/photo1a.jpg>

Or you might want to see what *Pyramid*-chained web guru Keith Johnson has done to that picture at:

<http://staff.sjgames.com/~keith/pyramid/SMarsh.jpg>

But probably not. I'm not that interesting, after all.

* * *

John Kovalic is still catching up on his vacation backlog o' work, which explains why he's still not back with us. I know that I'm *still* recovering from the vacation I took back in February, and hope John's a bit more able to get caught up than my cluttered self.

Good luck, John! All-speed . . . we miss you!

* * *

By the by, in case I haven't mentioned it lately, please feel free to make your thoughts and comments known, either over at the [Pyramid discussion boards](#), or by sending me an email at pyramid@sjgames.com.

(*Last week's answer*) *Spelljammer Monstrous Compendium*, Space Hamster entry.

(*Three stars*) "Anyhow, Kennedy started out ruling with an iron fist, and he hasn't mellowed much over the years. If anything, matters have gotten worse."

The Lindbergh Variations

"One is constantly aware that we live in a world where dreams and reality interchange."

-- Charles A. Lindbergh

In the quantum fog of High Weirdness, pulp, and Alternate History, some people just seem bound and determined to be strange attractors, to take more than their fair share of Secret History. Charles Augustus Lindbergh is one of those folk -- which is all the more uncanny, since he first became an American icon of normalcy. To make matters worse, the key things we all know about Lindbergh aren't true at all -- he was the 92nd person to fly the Atlantic, and whatever his considerable failings, he wasn't a Nazi -- making Lindbergh's "history" even more of a ramshackle scrim than that of most famous folk. In short, even Lindberghian heroism won't fly us out of this quantum fog -- but he makes a dandy pilot for those of us who would fain fly in. Shall we?

"It would be almost three decades before Lindbergh would discuss it publicly, but after almost twenty-four hours of his ordeal -- at around five o'clock in the morning by his clock -- the fuselage behind him filled with phantoms -- 'vaguely outlined forms, transparent, moving, riding weightless with me in the plane.' He later recorded that these ghosts were benign, vaporous presences. They permeated the fabric walls of the plane, coming and going at will. With human voices they spoke to him above the noise of the engine, advising him on his flight and giving him 'messages of importance unattainable in ordinary life.' They were human in shape but devoid of real form."

-- A. Scott Berg, *Lindbergh*

On May 21, 1927, Lindbergh landed at Le Bourget Field in Paris, and became the world's first hero. Radio, cable, newspapers, and the brand-new technology of the newsreel carried Lindbergh's heroic feat and open, Midwestern countenance to every corner of the globe. Nobody was more popular in every nation of the globe than Charles Lindbergh -- who probably became a voodoo loa at that moment in the sheer backwash of global relief and adoration. Perhaps that's what the phantoms in his cockpit told him -- and perhaps it was to commune with them (or with [the Rods](#) or with some other aerial intelligence), rather than to claim the Orteig Prize, that Lindbergh made his trip. His 33-hour flight was thus the equivalent of a shamanic ordeal to pierce heaven and communicate with the spirit world. This might explain why he remained awake all night on May 19-20 before takeoff -- was it a Mithraic vigil at the final cusp of Taurus?

Of course, had French air aces Charles Nungesser and Francois Coli and their Levasseur biplane the "White Bird" not mysteriously vanished twelve days earlier, the whole thing might have been for naught; crossing the Atlantic first, nonstop, *and* solo was a profoundly magical act of boundary-breaking. Of course, Nungesser might have vanished into the Bermuda Triangle, or been gobbled up by etheric monsters -- or *intentionally* crossed into the Phantom Realm above the Atlantic skies. Lindbergh later reported seeing phantom islands in the Atlantic -- St. Brendan's Hy-Brazil? Atlantis?

The Rods, or the phantoms, were hardly Lindbergh's only brush with Very High Weirdness. His aide during his triumphal return tour of America was Donald Keyhoe, later author of *The Flying Saucers Are Real*, and Lindbergh himself buttonholed Carl Jung for a lengthy UFO chat in 1959. Lindbergh himself test-piloted a flying saucer, the Vought V-173 "flying pancake," in 1942. And, perhaps most famously (and intriguingly) he personally pulled strings and called in favors to get Robert Goddard's rocket workshop set up at Roswell, New Mexico in 1929. Was Goddard part of Lindbergh's communication with Those Above? Did they respond in 1947, trading three gray pilots for Nungesser and Coli? Did they respond again, sending UFOs over Lindbergh's childhood home in Little Falls, Minnesota, in 1979 and 1989?

"dear Sir! Have 50.000 \$ redy 25 000 \$ in 20 \$ bills 1.5000 \$ in 10 \$ bills and 10000 \$ in 5 \$ bills. After 2-4 days we will inform you were to deliver the Mony. We warn you for making anyding public or for notify the Police the child is in gut care. Indication for all letters are singnature and 3 holes."

-- first letter from Lindbergh baby kidnapper

Or did They require a darker sacrifice yet? On March 1, 1932, Charles Lindbergh, Jr., vanished from his crib in an

upstairs nursery in the Lindbergh mansion in Hopewell, New Jersey -- the note left was signed with a cryptic design of blue interlocking circles. Lindbergh took personal command of the investigation, with the assistance of Col. H. Norman Schwarzkopf (father of the future Gulf War general), head of the New Jersey State Police. Lead after lead was followed, and ransom after ransom was paid; even sleeping psychic Edgar Cayce was called in. Nine weeks later, searchers discovered the body of the Lindbergh baby buried about two miles from Hopewell. (The hasty autopsy and immediate cremation caused a number of "Lindbergh baby" claimants to surface later.) Although Cayce implicated "three men" (Modern [Magi](#) taking this "Child From The Sky" back with them this time? Men In Black?), authorities arrested carpenter Bruno Hauptmann and, after a trial infamous even at the time for procedural sloppiness and railroading, executed him on April 3, 1936.

That said, the preponderance of the evidence does indicate that Hauptmann was guilty, although Schwarzkopf always believed he had an accomplice and an "inside man." Some speculation centers on Lindbergh's butler, Aloysius Whateley (whose last name would be grounds for suspicion, were the Aerial Entities akin to Hastur or Yog-Sothoth); Lindbergh at the time thought it to be the work of a "gang." Al Capone offered to use his leverage to find the Lindbergh baby in exchange for a pardon; did he plan the daring kidnapping as leverage? Another author suggests that Elizabeth Morrow, Lindbergh's sister-in-law, killed the child in a fit of jealous insanity; and author Gregory Ahlgren suggests, most disturbingly of all, that Lindbergh did it himself either as a cruel hoax that got out of hand -- or in a rage at the baby's presumed deafness and deformed toes.

"It is always a pleasure to see good workmanship combined with vision in design and great technical ability. I have never been more impressed than I was with the aviation organizations I saw in Germany. I believe that the experimental laboratories which are being constructed will undoubtedly contribute very greatly to the progress of aviation throughout the world."

-- letter of Charles A. Lindbergh to Hermann Goering, August 20, 1936

Which were, of course, just the kind of toes the Nazis objected to. Lindbergh first toured Germany at the invitation of the German Air Ministry in 1936, stayed for the Olympic opener, and over-reported to American military officials the rise, size, and efficiency of Nazi air power. He was less easily fooled during a 1938 tour of the Soviet Union, but then he despised the Soviets as an "Asiatic horde." After the chaos of the kidnapping, Germany's orderly technocracy impressed him mightily, and he considered relocating to Berlin. (Had he not been in Berlin during Kristallnacht, which he considered embarrassing and silly, he might have done so.) He believed that Germany would win the war in Europe, which he considered foolish suicide by the white race. Lindbergh was never a Nazi -- his wife Anne Morrow Lindbergh summed up the couple's opinion perfectly when she called Hitler, Mussolini, and Stalin "scum on the wave of the future" -- but he was an imperfect democrat indeed. Hence, his duel against FDR over American isolationism.

He came by it somewhat honestly; his father Charles August Lindbergh began as a Progressive Congressman and vigorous opponent of World War One. Men in black-type goons actually broke up the plates of Congressman Lindbergh's books during the Wilsonian clampdown that sent other Progressives to jail. Such attacks and pressures drove Congressman Lindbergh into conspiracy theory and socialism, as he blamed the Money Trust for his sufferings. People like J.P. Morgan, he wrote, could never rest until all private wealth, especially gold, was in their hands. Intriguingly, Lindbergh paid his baby's ransom in gold certificates -- and FDR used the publicity to recall all gold certificates in circulation, and ban their possession. Particularly inventive conspiratologists claim that Lindbergh's enmity to FDR sprang from this moment -- perhaps FDR and the Illuminati pushed Lindbergh into alliance with Hitler.

"Carrel wrote to Lindbergh about creating a foundation devoted to 'the study of man.' It was meant to consider: the use of voluntary eugenics in the building up of a stronger human race; procedures to increase the nervous resistance of the individual; psychological, physiological, and chemical factors of spiritual growth; the problems of longevity; social and economic conditions that are 'indispensable to the life of an elite'; the possibility of raising human intelligence above its present level; the genesis of great leaders."

-- A. Scott Berg, *Lindbergh*

Lindbergh's fascination with eugenics came not only from his tangled family history, but from his association with pioneering doctor Alexis Carrel, winner of the Nobel Prize for his work in organ transplantation. Working with Carrel,

Lindbergh invented the first artificial heart, the Lindbergh Pump, in 1935. Carrel was a polymath, discussing ESP with Einstein or race betterment with Henry Ford. Lindbergh helped establish and sponsor Carrel's foundation, the prospectus of which reads like every creepy **GURPS Illuminati** sect imaginable: eugenics ("a stronger human race"), cybernetics ("increasing the nervous resistance of the individual"), the occult ("chemical factors of spiritual growth"), immortality ("the problems of longevity"), psionics ("raising human intelligence"), "social and economic conditions that are indispensable to the life of an elite," and -- perhaps -- a Sacred Bloodline ("the genesis of great leaders"). All this and reanimated body parts, too.

Lindbergh shared all of these interests; working on "etheric communication" and meeting British mystic Francis Younghusband, who had achieved illumination while invading [Tibet](#) in 1906 and now believed that ascending mountains (or flying the Atlantic solo?) put humans in touch with, literally, "higher intelligences." Lindbergh was also a Freemason, for those scoring at home, joining Keystone Lodge No. 243 in St. Louis; and painted a Masonic symbol on the ever-more-intriguingly-named *Spirit of St. Louis*. Intriguingly, Lindbergh's grandfather, August Lindbergh, was originally Swedish legislator and bank official Ola Månsson, before fleeing Sweden with his mistress in 1859 ahead of an embezzlement inquiry.

"Charles's grief, Anne discovered, was different from hers. He kept talking about the bigger picture, how they must find some way of making Time go backwards,' so they could reclaim who they were before this catastrophe . . . 'Everything is chance,' he said. 'You can guard against the high percentage of chance, but not against chance itself.'"
-- A. Scott Berg, *Lindbergh*

Ola Månsson was an intimate of the romantically inclined Crown Prince Charles (the future Charles XV) -- and rumor hinted that he had shared his mistress with her. Was Charles Lindbergh actually the true heir to the throne of Sweden? (If not, of course, he was still Charles MånssonŠ) Could the Lindbergh baby have actually been the Merovingian True King, a scion of the *Prieuré de Sion* bloodline? If not a Merovingian, perhaps the Månsson blood meant something -- Ola was born in 1808, during a fall of "star jelly" in Sweden. Could Lindbergh have been seeded here by the Sky People? Perhaps the kidnapping was a front-line struggle in the Secret Wars; all the misdirections and scoundrels involved agents of the warring Illuminati. Perhaps Lindbergh did fake the kidnapping, eventually smuggling his first-born son to Marconi's [Council of 98](#) city of super-science high atop the Andes Mountains. Could this American Dauphin still head a spiritual conspiracy of eugenically-perfected immortals using bionic Lindbergh Pump technology and flying UFOs? And if so -- whose side are they on? Well, just ask yourself one question. Do you feel lucky, Lindy?

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

by Steve Kenson

Around the World in 80 Thrills is a four-part Cliffhangers adventure set in the 1930s (the popular "world on the brink of war" setting). This is the thrilling conclusion. Each part was written by a different author, making this also a Round Robin event:

- Part One: [The Kensington Codex](#) -- Steven Marsh
- Part Two: [The Steps of Chiushan](#) -- James Maliszewski
- Part Three: [The Minos Touch](#)-- Bob Portnell
- Part Four -- Steve Kenson

Stats are presented for **GURPS**. Additional stats appearing for **Fudge** presented in **bold italic red**. Stats for **Big Eyes, Small Mouth 2nd Edition** have also been presented in blue boxes with white text. The adventures should also be generic enough that they can be used in a variety of systems.

"When Suddenly . . ."

*There's nothing wrong with traveling in style, and the **Graf Zeppelin** offers the finest transatlantic travel in the world, from Europe to New Jersey. Of course, you're not traveling for pleasure. You're in pursuit of an English mercenary named Percival Aubrey-Smith, who stole two valuable archeological artifacts before heading across the Atlantic to America. You aim to recover the lost items and see that Aubrey-Smith pays for his crimes. But nothing says you can't enjoy yourself a little along the way.*

*You're doing just that in the **Graf Zeppelin's** sumptuous lounge when suddenly a shot rings out and a woman seated near the windows of the gondola screams as a group of armed men burst into the room. They level their Tommy-guns and a deep voice calls out, "All right, nobody move or everybody gets ventilated!" A large man in a heavy overcoat and fedora steps through the ranks of the gunmen, his dark eyes sweeping the room until they come to rest upon you.*

Option: Up in Smoke

If the adventure takes place in 1937, and the GM is feeling particularly cruel, the zeppelin the characters are on board can be the *Hindenburg* rather than the *Graf Zeppelin*. Both airships made transatlantic flights to New Jersey before the *Hindenburg's* spectacular destruction seriously dampened interest in travel by zeppelin. If the characters are on board the doomed airship, they can get off before the *Hindenburg* docks in Jersey (perhaps via the aforementioned plane Grancella planned to use for his escape). If not, then perhaps the fire that started on-board the zeppelin *wasn't* an accident. Perhaps it was another attempt to kill the player characters!

Giovanni Grancella

Age 35, 6', 195 lbs., black, slicked-back hair, dark brown eyes, small moustache. Wears a dark suit under an overcoat and a

"They're the ones," he says to the gunmen. "Take 'em."

What do you do?

Trouble in the Air

Unfortunately for the player characters, Percival Aubrey-Smith's employer is aware they are coming after him and has taken steps to ensure they don't cause any further problems. The man in the overcoat is Giovanni Grancella, a notorious Italian gangster, accompanied by several of his men (a number equal to the player characters). Grancella owes someone a favor and he's repaying it, by eliminating the player characters.

He orders his men to march the characters out of the room, barring the door behind them, then takes them to a hatch to throw them out into the middle of the Atlantic Ocean, where their bodies will never be found. He and his men will then escape using a plane moored below the zeppelin's gondola.

Of course, the player characters aren't likely to go along with this plan. They can get the drop of Grancella's goons by distracting them for a split-second. Then a fight breaks out. Grancella knocks aside the weapon of the first of his men who tries to shoot the characters. He yells, "What are you, stupid? This thing is full of hydrogen! Do you want to kill us all?" Hopefully this will remind the players of the dangers of gunplay in the zeppelin, making the melee a fistfight. Grancella tries to flee as soon as the heroes begin trouncing on his men. He'll take someone hostage, if necessary, to protect himself. If the heroes are traveling with Jill Spires from "The Kensington Codex," she makes a good candidate.

So What Is Really Going On?

As readers who have followed the first three *Around the World in 80 Thrills* adventures know, the heroes are on the trail of a series of mysterious crimes involving archeological artifacts, particularly a key recovered from an ancient tome and a stone that is supposedly the legendary Philosopher's Stone. They also know someone hired Percival Aubrey-Smith to acquire these items for an as yet unknown purpose.

The man behind it all is actually Professor Reginald Spires, Jill Spires' father, and the man who first contacted the heroes in "The Kensington Codex." Spires is secretly obsessed with uncovering evidence of the lost civilization of Atlantis, and he believes that the artifacts the heroes helped uncover, along with another discovery he has made,

fedora.

are keys . . . not only to a great archeological discovery but also to untold power!

A few years ago, Spires experienced hypnotherapy to treat some headaches he was having. The hypnosis triggered a spontaneous regression in which Spires perceived himself as a philosopher-priest in ancient Atlantis, a civilization of technological and philosophical wonders. Although he tried to ignore the experience at first, he became more and more obsessed with it, but afraid to speak of it openly, knowing it would only bring him ridicule and professional ruin. Instead, he began to secretly search for evidence of the existence of Atlantis, gathering a substantial body of lore about the lost continent, most of it worthless.

Then Spires came upon the work of Edgar Cayce, a psychic known as the "sleeping prophet." Cayce claimed to have experienced past-lives in Atlantis as well and even predicted that evidence of Atlantis' existence would be found in the Bahamas. Spires contacted Cayce and the two began a correspondence that affirmed Spires' theories, and Cayce had several visions relating to Spires' work, which helped to guide him in the right direction.

Spires discovered ancient sites containing remnants of highly advanced technology. Rather than sharing his discoveries, however, he sank deeper into his personal delusions and became convinced it was his destiny to restore the glory of the Atlantean Empire, with him as its philosopher-king. He used his discoveries to build a secret fortune to continue his work, selling scraps of knowledge to criminal organizations and would-be inventors.

He was on the trail of the "key to it all" that Cayce said he might find in Minnesota when the events of "The Kensington Codex" occurred, leading him to call upon the help of the player characters. Since then, Spires has tried to use the heroes' efforts to help him in his quest, while keeping them from getting too close to the truth. He thought his man Aubrey-Smith had eliminated them in Crete at the end of "The Minos Touch," only to discover that they survived somehow.

Still, Spires has what he has been looking for according to Cayce's visions -- the Kensington Key and the Philosopher's Stone -- and they will lead him to the greatest treasure of all: the legendary Trident of Poseidon, an Atlantean artifact of immense power. With the trident, Spires can make his dream of a new Atlantean Empire come true, unless the heroes find a way to stop him, of course.

Option: It's Payback Time

If the characters went through "The Kensington Codex," Grancella might not have anything to do with the mystery the heroes are investigating. Instead he might be doing a favor for friends in the Chicago Mob as payback for the trouble the characters caused them in that adventure. Otherwise, Grancella is involved, although he has no idea what's really going on.

You Have Taken What I Have Rightfully Stolen

Astute readers may recall that at the end of the "Kensington Codex," Prof. Spires provided the characters with *copies* of the book and key, but that he kept the originals himself. Why did he have to have Aubrey-Smith steal them, then?

It's a simple matter of "no honor among thieves." Spires was dealing with the Black Pinnacle Society from "The Steps of Chiushan" and they got greedy for the technological secrets he had, so they stole the key and codex from him, forcing Spires to try and recover the copies he'd given the player characters without arousing their suspicions. (If the original key and codex remain missing, they could be hooks for future adventures, as the Black Pinnacle Society unravels their secrets.) If Aubrey-Smith failed to get the key or codex from the characters at the end of "The Minos Touch," then assume that Spires managed to recover the originals and proceeded with his plans.

Double Trouble

At this point, the heroes have seen doubles of people in both "The Steps of Chiushan" and now here. There's no real need for an explanation; it can simply be a bit of random weirdness. The default assumption is that Prof. Spires discovered a secret

Prophet

After the heroes deal with the danger posed by Giovanni Grancella and his thugs, the rest of their trip across the Atlantic is uneventful. They pick up Aubrey-Smith's trail in New Jersey, where they discover he headed south. They also find out that their friend Professor Spires has mysteriously vanished, along with the original Kensington Key and Codex. If the characters don't think to contact Professor Spires, Jill suggests it (if she's still with them), and is very concerned about her father's disappearance, fearing whoever is behind it has abducted him, too.

Spires has very carefully staged his disappearance, ransacking his own office and making it look like there was a struggle, although there are no witnesses and no one heard anything. If the characters want to rush to California to follow up on Spire's disappearance, remind them that they're hot on the trail of Aubrey-Smith and it's likely that the Professor's kidnapping and the theft of the artifacts are related. If they can find the British mercenary, he may be able to give them some answers. (Jill Spires mentions this if she's with the characters.)

The only clue they have is that Professor Spires placed a phone call to a Mr. Edgar Cayce in Virginia Beach, Virginia just hours before he disappeared. Jill doesn't know anything about Cayce, or her father's involvement with him, and says as much if the heroes inquire. They can find Cayce's address and telephone number with a little investigative work, making him their best lead. If one of the player characters makes a successful Occult roll, he's heard of Cayce, supposedly a very talented psychic and clairvoyant. Otherwise the characters know very little about the man.

Contacting Cayce

If the characters try to call Cayce, his wife Gertrude answers the telephone and tells them Edgar can't be disturbed right at the moment, and inquires as to the nature of their call. If they persist, they can get in touch with Cayce by phone in a few hours, but it makes them too late to stop his abduction (see below).

If the heroes tell Mr. Cayce they are friends of Prof. Spires, Cayce becomes cautious, because he knows Spires feared for his professional reputation, should word of their collaboration get out. If they tell Cayce about Spires' disappearance, he becomes more cooperative. He tells them that he and Professor Spires have been corresponding for nearly two years now, and that the Professor is keenly interested in the mysteries of ancient Atlantis. He offers to

Atlantean cloning technique, which he sold to some interested parties, including the Black Pinnacle Society from "The Steps of Chiushan." But if you prefer, there might be other reasons for the clones, from thought-projections to plastic surgery. If the clone element doesn't fit into the feel you want for the adventure, ignore it and replace the clones with ordinary thugs who may or may not happen to look a lot alike.

Edgar Cayce

show Spires' letters to them, if they think they would be helpful. Jill Spires is surprised at this information. She knew nothing about her father's correspondence with Cayce or his interest in Atlantis.

If the heroes go to visit Cayce, it's a short flight from New Jersey to Virginia. But when they get to Cayce's home in Virginia Beach, they find trouble. A group of masked men are kidnapping Cayce! There are as many kidnappers as the PCs. They have a dark sedan parked in front of the house with the engine running and are hauling the psychic out, having dosed him and his wife with chloroform. When they see the heroes, the men open fire on them with the Tommy guns they're carrying, then try to pile Cayce into the sedan and drive off.

The scene can play out as a shootout between the thugs and the heroes, or a chase scene as the characters race after the getaway car (or both in succession, if you like). The thugs are more than willing to use Cayce as a hostage, but they're under strict orders not to harm him (which a Psychology roll might reveal, if a character has a chance to talk with the men to tell they're bluffing). Some quick action on the part of the heroes can save Cayce and nab his abductors. When captured, the men not already unconscious or dead pass out. Pulling off one's mask reveals that he's Percival Aubrey-Smith. But taking off the others' masks reveals *they're* Percival too! They all look identical! A moment later, the bodies begin to smoke and the men turn to ash, leaving only their clothing behind.

If the characters successfully rescue Cayce from his kidnappers, he gladly tells them all he can about his correspondence with Professor Spires. Jill, if she is with the characters, is eager for any information about her father, and surprised that he never mentioned to her that he knew Cayce.

The prophet responds that Professor Spires was concerned about his academic standing, but that he was quite sincerely interested in Cayce's visions about Atlantis, particularly one where he said information about Atlantis would be discovered near the Bahamas. Just recently (shortly before the start of "The Kensington Codex"), Cayce phoned Prof. Spires to tell him about a vision he had regarding the Kensington Key, which the characters found (or Spires found on his own, if the characters weren't in the first adventure).

It seems likely whoever has the Professor has gone to Bermuda to follow up Cayce's prediction. If the players don't come to this conclusion, Cayce can suggest it, mentioning that Spires felt he was very close to uncovering evidence of Atlantis. Perhaps Aubrey-Smith's mysterious

Edgar Cayce was born in 1877 in Kentucky and demonstrated psychic abilities from a young age, including the ability to see people's auras. At age 21, he underwent hypnotherapy to treat laryngitis and discovered a talent for psychic diagnosis. He began giving psychic readings for others, diagnosing their symptoms and ailments from nothing more than a name and an address, despite no previous medical training or knowledge.

Eventually, his visions became more elaborate and he began to attribute ailments to karma from past lives. He had a number of past life visions in which he saw himself as an Atlantean, an Egyptian priest, a Persian ruler, a Trojan warrior, and many others. He believed in the existence of Atlantis, and in extraterrestrial life. He received a vision to move to Virginia Beach with his family in 1928 and established the Association

employer is searching for the same thing. "If so," Cayce says, "the results could be disastrous. There are powers from the ancient world that mankind has yet to imagine. They must not fall into the wrong hands." Cayce will go with the characters to Bermuda if they ask him to.

If the characters fail to rescue Cayce, his wife offers to let them examine her husband's letters for clues as to who might have taken him. They can get the above information by reading through the letters Cayce and Prof. Spires exchanged, including Spires' increasing interest in Bermuda. Jill again expresses surprise that her father never mentioned this correspondence to her before, but she can verify that the handwriting of the letters is her father's.

Pirates of the Caribbean

One way or another, the characters should come to the conclusion that Bermuda should be their next stop. If they don't, then Jill Spires or Edgar Cayce can suggest it (if either of them is present). It doesn't take long for the characters to catch a flight to Florida, then charter a boat or plane out to Bermuda. This scene should start with the characters already in the islands, searching for Prof. Spires and the British mercenary Aubrey-Smith. If you want to extend the events of the adventure, the characters might face some additional trouble getting to the islands, including sabotage of their plane or bad weather.

Although it's only a small collection of islands, Bermuda offers a lot of coastline for the characters to search. If they have Edgar Cayce with them, things are a bit easier, as the psychic has a strong "feeling" of the right direction for them to go in. At the GM's option, player characters with occult or paranormal abilities might get the same "gut feeling" guiding them toward their destination. Otherwise, the characters have to do some old-fashioned detective work to find their quarry. Fortunately, they can turn up some information in a waterfront dives about a British man fitting Aubrey-Smith's description hiring some local men for an undisclosed job off of Bimini, the westernmost islands. Characters can get this information with a few small bribes and some successful Carousing, Diplomacy, or Fast-Talk rolls, or a bar-fight, depending on the inclinations of the GM and the players.

Follow the Bimini Road

Spires and his men are making their way out to the Bimini Road, an unusual phenomenon off the coast of North Bimini. The "road" is a collection of regular square blocks of white stone extending in a straight line for over 600 yards, some 20 feet below the water's surface, and a few

for Research and Enlightenment (ARE) in 1931, the same year he predicted that evidence of Atlantis would be found in the Bahamas.

Cayce is an earnest man who wants nothing more than to help others with his gifts. He believes firmly in his visions and in his work, ignoring the scorn of skeptics. He's unaware of the depths of Professor Spires' ambition, and thinks of him as a fellow seeker after truth. Cayce is the GM's ace-in-the-hole in this adventure; his psychic abilities allow him to pass on hints and useful information to the players when necessary. But, like most prophets, his visions can be cryptic and vague, rather than providing direct answers.

Option: The Lovecraft Connection

Call of Cthulhu Keepers -- or GMs interested in a more horror-oriented adventure -- can easily substitute Howard Phillips Lovecraft for Edgar Cayce in this adventure. Lovecraft was known for having visions in dreams (some of which were the basis for his famous Mythos stories), and corresponded with a number of people over mutual interests. Lovecraft lived in Rhode Island, rather than Virginia, requiring only a slight change of scene.

In this sort of adventure, of course, Prof. Spires is likely driven by visions of alien landscapes and non-Euclidean geometries to seek out something best left undisturbed. The thugs can be members of a Cthulhoid cult or strange homunculi created by a blasphemous combination of science and forbidden sorcery (requiring a SAN roll when they dissolve horribly). And the sunken land Spires seeks is probably not Atlantis, but R'leyh. For more information on the adventure possibilities of Lovecraft, see *GURPS Who's Who 1* (p. 122-123) and the *Call of Cthulhu* RPG from Chaosium.

hundred yards from shore. With the clarity of the Caribbean waters, the road is clearly visible from the air or from a boat positioned directly over it. Prof. Spires believes the Bimini Road is a remnant of an Atlantean structure, and that he now has the means of finding it. (For more information on the Bimini Road, see the links section or *GURPS Places of Mystery*, p. 13.)

Of course, Spires has anticipated the possibility (however slight) that he might be followed, so he's paid off a group of local pirates to keep other boats away from the area while he investigates the Bimini Road. He and Aubrey-Smith don scuba gear and dive down to the road, where the Philosopher's Stone acquired in Crete begins to glow. Ideally, the player characters should show up just as the Professor and Aubrey-Smith (and Cayce, if he's with them) head underwater. A pair of speedboats each holding four men come roaring at the player characters' boat, opening fire on them. If the characters made their way to Bimini by plane, then their attackers are a boat and a seaplane, both with armed men.

The characters have to avoid the pirates, as well as rocky shallows and any other hazards you care to throw their way. The scene should be an exciting chase ending in the destruction of the pirates (preferable in a spectacular explosion of some kind). Or the characters' boat might be destroyed, allowing the characters to play dead until the pirates leave (but forcing them to deal with the additional complication of a great white shark attracted by the fight).

Terror from the Sea

Once they've dealt with the pirates, the heroes can get on board or pull up alongside Spires' boat, a small cabin cruiser. When the characters get to the boat they notice two things immediately. First, there is a glowing light coming from the end of the Bimini Road, visible through the water. Second, there is a scratching sound coming from the hull of the boat.

Suddenly, a group of skeletons lurch over the side of the boat! They're covered in tattered, rotten clothing, corroded bronze bracelets, and festooned with dripping kelp, each armed with a rusty (but functional) sword. They look like they just stepped out of a Ray Harryhausen film.

The skeletons are the guardians of the gateway, but allowed the Professor to pass because he carried the Philosopher's Stone. The heroes, however, do not. The skeletons lurch forward to destroy them and fight until they are themselves destroyed. There should be at least one skeleton for every player character, plus an additional one

or two. If the characters are overcoming the skeletons too quickly, you can always have a few more climb up out of the water to attack them.

The Gateway

The shining light at the end of the Bimini Road forms a sort of gateway characters can pass through. Professor Spires left the gate open in his eagerness when he passed through it, allowing the characters to follow. The gateway is beneath only twenty feet of warm, tropical water, so any character able to swim can reach it easily. Although he can swim, Cayce prefers to remain behind, although Jill Spires will go with the characters, if she's there. If you want to make things a bit more difficult for them, you can throw in some more skeleton pirates to guard it underwater, or use the shark from the previous scene if you didn't get to before.

Once the characters pass through the gate they find themselves . . . elsewhere.

Secrets of the Lost World

The characters emerge from the gateway in a strange place. It is a plaza paved in white marble, surrounded by ruins made up of a mix of classical styles (with Egyptian, Greek, and Babylonian influences predominant). The sky is a neutral gray color that's hard to look at for long. The buildings all show signs of great age (although not weathering) and seem to have been toppled by an earthquake or similar disaster. There's a structure like a Greek temple at one end of the plaza, the most intact of all the buildings. Its massive bronze doors stand open and a trail of water leads toward it.

Sorry, Old Chap

When the heroes move toward the temple, a group of skeletons emerge from the ruins to surround them. Unlike the ones they encountered outside the gate, these creatures are carrying shields and wearing ancient-looking metal armor, giving them +6 PD (for a Block total of 10) and DR 4 [+2 Defense Combat Value and Heavy Armour Level 1 in *BESM*]. There should be at least half again as many skeletons as there are player characters (up to twice as many or more, if the GM thinks the PCs really outclass the skeletons). The characters should feel outnumbered.

A hearty chuckle comes from the open temple doors and Percival Aubrey-Smith emerges, holding the glowing Philosopher's Stone in his hand.

Skills:

"Useful little thing, eh?" he says with a snide smile. "Apparently it controls them somehow," he nods toward the skeleton warriors, "among other things. I'm impressed you've made it this far, but this is the end of the road for you."

The British mercenary is enjoying the opportunity to gloat, and smart characters can draw him out by engaging him in conversation. Percy won't reveal the identity of his employer, but he will mention that he's "gone ahead to secure our prize" and he'll reveal that he still has the Kensington Key he took from the characters in "The Minos Touch." He'll also offer the lovely Jill Spires the chance to escape alive if she wants, but she'll disdain his advances, saying she'd rather die than owe her life to him.

"As you wish, my dear," Percy says. Then he raises the Stone and commands the skeletons to kill them all. The player characters can fight the skeletons, but it should be a difficult fight, particularly since their opponents are largely immune to gunfire (to say nothing of pain).

A smarter tactic is to take the Philosopher's Stone away from Aubrey-Smith somehow. The skeletons block any attempt to reach the mercenary directly, but characters can try to shoot the Stone out of his hand (at -5 to skill) or use any special abilities they might possess. Percy isn't helpless, either. In addition to his combat skills (and the pistol he carries in his other hand), he can also use the Philosopher's Stone to cast a Flesh to Stone spell at skill 13 (Good), up to three times. The spell can be reversed using the Stone (at the same skill level) or by destroying the Stone. The Stone itself is DR 3 and has 10 Hit Points before it shatters into useless fragments. If the Philosopher's Stone is taken away from Aubrey-Smith (or destroyed) the skeletons stop fighting and collapse into piles of bones and armor.

The Truth Revealed

Once they've dealt with Aubrey-Smith and the skeletons, the heroes can make their way into the temple building, following the trail of the mysterious mastermind behind it all. The wet footprints lead down into a chamber beneath the temple, a vaulted room supported by soaring columns with an altar-like structure at the far end. Above the altar is a frieze of a stern, bearded man wearing a crown. As the characters enter the chamber, they see a dark figure silhouetted against the light coming from a crystal sitting in a golden stand on the altar. The crystal is quartz-like, vaguely in the shape of a trident, with two points splitting off from the main cluster near the top, and glowing with an

Option: The Femme Fatale Ending

GMs looking for a twist on the above can have Jill Spires turn out to be the mastermind behind it all, rather than her father! She's been manipulating everyone and the attacks and kidnap attempts on her during the adventures were merely red herrings so the heroes wouldn't suspect her. In the climatic scene, she seeks to claim the crystal and shoots her father in cold blood with a pistol the characters didn't know she had. Then she tries to take the crystal for herself, with pretty much the same results as above.

Professor Reginald Spires

inner light.

When the characters enter, light flares from the eyes of the frieze and shoots out at them, trapping them in some sort of impenetrable force field. Nothing the characters have can break through they field. They're rendered quite immobile. The dark figure turns toward them, pulling off the hood of his wetsuit to reveal . . . Professor Reginald Spires! Jill Spires gasps as her father smiles at them. "Well, you're just in time to witness the outcome of years of research and work." He gestures toward the crystal. "There lies the greatest scientific discovery of all time! Not only positive proof of the existence of Atlantis, but a container, a vessel holding the collected knowledge of those ancient philosopher-kings, discoveries you can scarcely imagine! And now it is mine!"

The heroes can interrupt the Professor's monologue with questions or comments of their own. Spires has been working in secret for quite some time now and he's also a megalomaniac. He's dying for someone he can explain his brilliance to. So he'll take any opening the characters give him to lay out the details of his plan, filling in anything the characters haven't figured out yet. He points out how he manipulated the heroes into helping him recover the Kensington Key, and how he kept them off-balance the whole time while gathering the things he needed to reach this ancient Atlantean outpost. He makes it quite clear that he intends to use the knowledge contained in the crystal to make himself philosopher-king of a new Atlantean empire, and that he'll have to dispose of the heroes unless, of course, they're willing to join him.

When Spires reaches for the crystal, a voice booms out in the chamber, coming from the frieze above the altar. "Hold!" it says. "Who enters the sacred Temple of Poseidon and seeks to claim the Crystal of Knowledge?"

"I, Reginald Spires, philosopher-king of a new age!" the Professor responds.

"And are you worthy of the wisdom of the ages, Reginald Spires?" the voice asks.

"I am!" The Professor affirms.

"And what of you others?" the voice asks the heroes. "Do you come to claim the Crystal?" If none of the characters answer in the affirmative, then the voice calls for Spires to take up the crystal, which he does eagerly.

If one or more of the characters say they've come to claim the crystal as well, then the eyes of the carving flare and the force field around them vanishes. "Then let a challenger come forward!" the voice says, calling one of the

characters to come and stand beside Spires. "May the strongest mind conquer!" it says, and a beam from each eye strikes Spires and the character, who must engage in a Contest of Wills. The loser passes out. The winner is encouraged to take up the crystal.

However, unknown to Spires, the whole thing is an elaborate trap. The correct answer to the guardian's question is to claim to be *unworthy* of the Crystal of Knowledge, for the Atlantean philosopher-kings understood the value of humility. Anyone who takes the crystal claiming to be worthy of it has his mind and sanity destroyed by a flood of knowledge too great for anyone to bear. So if Spires is unopposed, or wins the Contest of Wills, he seizes the crystal in triumph, then screams as its light washes over him. If a player character wins the Contest and tries to claim the crystal the same thing happens to him (it doesn't pay to get greedy in these situations).

The moment someone takes the crystal, the temple begins to crumble. In moments it is collapsing. Jill tries to reach her father but a multi-ton block of stone plunges down between them. The heroes have to run for the gate to get out before the entire place comes down. Outside in the plaza a tremor collapses the remaining ruins and the "sky" above rains fire down on the remains. After the characters plunge through the gate, it vanishes, sending a geyser of water up from the Bimini Road then tend lapses into silence.

Epilogue

In the end, the heroes should come away with some great stories and little else. The mysterious gateway at the end of the Bimini Road has vanished and there seems to be no means to bring it back. The temple and all it contained is lost (including Professor Spires, Aubrey-Smith, and probably the Philosopher's Stone). Jill Spires decides to devote herself to the science of archeology, for the *good* of mankind, and may be a future ally (or love interest). Edgar Cayce returns to his home and his prophecies, perhaps offering the characters a cryptic hint about their future in parting. If the heroes manage to hang on to any of the artifacts (particularly the Philosopher's Stone), it's up to the GM what (if any) powers they retain.

The heroes get to spend some time on the beautiful beaches of the Caribbean, relaxing and sunning themselves before the call to adventure and excitement lures them away. But this tale of their adventures is over, for now.

Paranormal Powers and Super-Science

Depending on the style of pulp campaign you are running the player characters may have extraordinary abilities beyond those of mortal men. This may include various low-level super powers and weird science gadgetry. In this case, you can assume that Prof. Spires uncovered sufficient Atlantean trinkets, psychic secrets, and super-science to give him powers to counter those of the player characters. One of these is an amulet or device that completely protects the Professor from

Further Adventures

Like any good serial, there are plenty of hooks left over for intrepid GMs looking to plan future adventures for our heroes:

- The characters should still have a copy of the Kensington Codex and Key from the first adventure. While the Atlantean temple is lost, it's possible the Codex may contain other information useful to the characters, and that the key may open other locks they have yet to discover. Someone might try to take either or both from them in order to find out.
- Professor Spires made a number of discoveries that he sold on the black market to finance his work. With Jill Spires' assistance, the characters might find the Professor's records, indicating whom he sold what to, allowing them to track down various mystic trinkets and super-science items that have fallen into the wrong hands (like the Black Pinnacle Society in "The Steps of Chiushan"). This can be the basis of a series or even a short campaign.
- The American Mafia, the Italian Mafia, and the Chinese Triads all have reasons to be less than happy with the characters (to say nothing of the Nazis, from "The Minos Touch"). Any of them might pursue a vendetta against the characters, or simply try and find out what they were up to, stumbling across some of Prof. Spires secrets in the process.
- Now that the characters know there is at least *some* truth to the Atlantis legend, they might choose to pursue it. The temple Spires found was only an outpost; there may be others like it hidden around the world. Was the temple responsible in some way for the strangeness of the Bermuda Triangle? Will it stop now that the temple is gone, or get worse? Are the people, ships, and planes that have vanished into the Triangle in some "pocket dimension" like the temple? Are the ruins of the real city-state of Atlantis out there somewhere just waiting to be found?
- And, of course, it would be *impossible* that Professor Spires survived the collapse of the Atlantean temple (after all, *no one* could have survived that!). But, if he did, then a madman with fragmentary knowledge of ancient Atlantean science and magic, and the location of other outposts around the world, would be a dangerous nemesis for the characters to encounter in the future . . .

mind-reading and similar effects that would reveal his perfidy too early in the adventure. (Although it provides him no advantage in the contest of wills over the Trident of Poseidon, unless you feel the player characters need a handicap.)

Likewise, you may want to beef up the powers of the Philosopher's Stone, making Aubrey-Smith into a low-level super-villain while wielding it. Perhaps it can transmute and animate all sorts of matter rather than just turning flesh into stone and commanding skeletons.

Something Rich and Strange

by Phil Masters

*Full fathom five thy father lies;
Of his bones are coral made:
Those are pearls that were his eyes:
Nothing of him that doth fade,
But doth suffer a sea-change
Into something rich and strange.*
-- William Shakespeare, *The Tempest*.

The point about *GURPS Atlantis* is that Atlantis is what you make of it -- or what other people have made of it over the last couple of thousand years.

The brief for the book was pretty simple, and quite broad; a treatment of Atlantis -- the *Atlantis Myth* -- in game terms. That made me decide to try and avoid getting too specific in the opening chapters; with everything from Greek philosophy to superhero comics to worry about, it would have felt unfair to pin readers down to a single viewpoint too early on. However, gamers have a natural and justified aversion to vague and waffly generalizations in game books, so the second half of the book, the last three of its six chapters, consists of game-usable treatments of Atlantis. ("Worked examples," in Bill Stoddard's felicitous phrase.)

By the Book

The other thing I wanted was to try to be quite *rigorous* about some things. This is a bit of a habit among *GURPS* writers and fans, to the extent that it sometimes becomes a joke, but while I was prepared to be cinematic and dramatic, I found some of the secondary source material on which I had to draw rather annoying. To explain: "Atlantis" is an idea with a clearly-defined first known manifestation. It's all there in the surviving works of Plato. And yet, many later uses of the name more or less completely ignore Plato, and go their own way with this idea of a lost land under the sea. Well, that can be entertaining enough, but I decided to stick to Plato's sometimes weird images as closely as possible. This had the added virtue of making chapter 1 easier to write; this is, so far as I know, the first RPG supplement where the Father of Western Philosophy really deserves an "Additional Material" credit. Though it'd be hard to ship him his comps (and I doubt that he'd approve of RPGs anyway).

On the other hand, the more generalized image of the Lost Land clearly has great appeal, so while chapter 1 went back to Plato and went over his ideas in detail, chapter 2 looked at the alternatives and spin-offs -- the odd little tales of drowned towns from along the coasts of northern Europe, Arabia's "Atlantis of the Sands," the dingbat imagery of the Theosophists, and so on. Then, the idea of rigor gave me another angle. As numerous modern writers have realized,

the invention of undersea travel makes *visiting* a sunken Atlantis a somewhat-viable proposition. But there's more to venturing underwater than a facemask and a pair of flippers per PC. So chapter 3 is about the sea itself -- the vast, dangerous, bizarre environment that happens to cover most of the surface of our home planet. Here, I was traveling out of my own familiar environment, so I recruited some helpful assistance through the *Pyramid* boards, which in turn ensured that the book would include some detailed and interesting treatments of subjects which *GURPS* has only discussed in passing before -- subjects like the evolution of submarine technology, and the complex dangers of deep diving.

(Talking of rigor -- the more research I did for this chapter, the more exasperated I became with all too many writers and films. It soon became clear to me that deep-sea exploration is a complex and risky enterprise. Cinematic writers may be entitled to skip over some of the practical problems, but all too often they give the impression that they just plain don't know and don't care. This book tries to make realistic games involving deep dives a little easier to run -- which should mean that they can be as tough on the PCs as realism demands.)

Anyway, that was the set-up; the worked examples then took Atlantis back into high fantasy, out into the twisted world of conspiracy theory, and off into the weirdness of steampunk or supers stories. Which done, the book went into the invaluable process of playtesting.

One More Theme . . .

During which, one theme was mentioned occasionally which I hadn't covered much, and which, I'm afraid, I couldn't justify covering much more in the final draft. (*GURPS* book projects work to a page count.) That theme was, broadly, "Atlantis of the Future." A class of myths that's lasted this well surely doesn't have to end here.

Traveller

For one thing, some people came up with ideas for merging ideas from this book with *GURPS Traveller*, which I *did* manage to use in partial, truncated form. One involved space travelers -- Droyne or Vegans, most likely -- lurking on our world in the Bronze Age; I do find the idea of Odysseus and his crew meeting a "one-eyed" Vegan amusing, if slightly implausible. (Really, Droyne/Ancients make better candidates for the role of Secret Atlanteans.) Another playtester suggested using the myth as a model for events on a Vilani-occupied world during the Long Night; a PC party gets sent to look for artifacts that were placed there during the fall of the First Imperium, only to discover that terraforming or climatic shifts have rendered their maps largely useless, and the old colony was located in a deep valley that's now completely flooded. Here, as usual when playing with "sunken Atlantis survives" stories, we have to assume implausibly rugged domes and logically-previously- superfluous life support systems, but there's always ways round that sort of thing, and it *does* get us an interesting place to visit.

Disasters Closer to Home

Another thread that I wasn't able to exploit properly in the final draft of the book looked at our own world, and asked which familiar cities we could sink. The prosaic snag with this subject is that we can't sink most of them more than a few feet, even with every known flood defense overwhelmed by catastrophic events and worst-case global warming. Somehow, wading knee-deep through the streets of an abandoned London lacks the sort of melodrama we've come to expect from a neo-Atlantis story, and "fell into a swamp" doesn't sound as good as "sank beneath the waves." Holland was noted as one country in a really confrontational position with regard to the sea; apparently, bits of it would be 20 feet under if all the dykes collapsed. Other cities at or below sea level were mentioned -- Miami, Bahrain, Dhaka, Bangkok -- as well as the good old possibility of California being hit by a big enough earthquake and falling into the Pacific, but the candidates that looked best was those which scored highest for *style*.

Venice is an obvious name here, of course, being a city of canals, with severe flooding problems, as it is; somebody threw in the idea of a drowned Venice inhabited only by vampires, which has a certain gothic charm. It was also pointed out that modern Cairo is more or less at sea level; given a rise of just a few feet, the entire Nile delta might flood. Alexandria, on the current coast of the delta, would obviously suffer badly; the great city of the Hellenic era is

already largely under the harbor, for one reason or another, and that comes complete with the classical architecture that Atlantis imagery demands. Near-future scenarios in such a setting could combine cyberpunk glitz, Middle Eastern intrigue, and sunken-city melancholy.

Meanwhile, another thread was addressing the subject of New Orleans -- a city located, by some genius of an urban planner, not only in a swamp, but also below sea level. Actually, the subject of possible threats to that city proved complex (so that we were treated to the unusual sight of RPG fans admitting that they weren't entirely sure what the results of a particular development would be), but the first place anyone looked for trouble was a set of river control projects north of the city. One projection was that if they were lost, the river would silt up, destroying its usefulness as a port; then, knock-on effects involving deposition and erosion patterns on the coast would cause the Mississippi delta to erode away, so that New Orleans eventually flooded. This would take a while; someone suggested that the place might be under a dome (and hence even more humid) by then, leading to more proper quasi-Atlantean imagery. (Don't ask why anyone would build such a dome instead of fixing the flood prevention measures.) Anyway, New Orleans's somewhat louche reputation seemed to make some people think that it was a natural target for disasters.

Which is wandering away from Plato's tale, perhaps. But that's what happens when you go looking for a philosophical metaphor in the middle of the ocean; you get your feet wet.

The Dawning of the Age of . . . Atlantis?

It took days to reach and explore the inner chambers. The undersea equipment was cumbersome and difficult to navigate through the fabled sunken city. But the explorers' search was methodical, as wonder after wonder was cataloged.

One room seemed to shine with a brilliant light all its own. Only when the last person entered did they feel a bristle on the inside of their skin as reality melted away . . .

. . . into a rest stop on I-96. They stepped outside, disoriented. Removing the undersea breathing apparatus from his mouth, team leader Kennings muttered, "What the hell?" as a '67 Chevy drove by. Its bumper sticker said, "Come Back, President Truman! All Is Forgiven!"

"Where are we?" asked Doctor Perkins.

"Not where," said Max the engineer. "When."

Ingredients

Are We Now Yet?

Although designed with Atlantis in mind, this adventure seed will work with any secluded, difficult-to-reach but desirable locale.

The premise is as described above: The heroes step into a large chamber in Atlantis, and are transported somewhere else.

March of 1968, to be precise.

The exact day and time of March corresponds to the day it was when the heroes stepped into the chamber. Thus if they entered on May 17th, 2001, they will emerge on March 17th, 1968. If they enter on June 23rd, 2055, they'll emerge on March 23rd, 1968. (Clever or mathematically inclined GMs can come up with different formulae, but this one was chosen for simplicity.)

Where they emerge seems to be random. It is always outside of public view, and out of danger (relatively). Of course, the equipment that was required to access Atlantis may well prove to be a liability; how *do* you explain full undersea gear when you emerge from an office in McCarthy's New Hampshire primary headquarters?

This Is Big . . .

Of course, the out-of-game reason for this is to plop the heroes down in a completely alien time . . . one that has a lot of roleplaying and adventure potential. 1968 was a particularly tumultuous time for the United States and the world (see sidebar). And depending on when the original adventure takes place, many of the PCs may have personal subplots they would wish to pursue, given this opportunity. This opportunity to meddle may be too great for the party to resist.

The GM, then, will need to determine to what extent (if any) time can be altered. In particular, consider what alternate timelines might come into being. A group

1968

B-52 bomber
with four
January 22 hydrogen
bombs crashes
in Greenland

that enters the chamber in June 21st, 2001 will arrive on March 21st, 1968 . . . is this the same timeline as a group that leaves July 2nd, 2010, thus arriving on March 2nd, 1968? Can they meet? (Although it *is* a big world, and the odds of two groups randomly meeting each other are slight, if one group is aware of the possibility of the other then they might try tracking them.) Can the future be altered? If so, do heroes need to worry about their time altering or ceasing to be? Can they meet younger versions of themselves . . . or other future versions of themselves using the portal again? *GURPS Time Travel* will prove invaluable here in sorting out these ideas.

Some things to consider:

- Time passes normally in the "original" timeline at the same rate it does in 1968. Thus spending two months in 1968 will cause two months to pass in the time the party came from.
- A party will always travel together. Unless extraordinary methods are taken (such as dividing a party into two groups, one of which specifically doesn't step into the chamber until waiting an hour or two), the entire group will teleport to the same place.
- Groups won't intersect. If extraordinary methods *are* taken, the two (or more) groups will be separate; as such they will appear in diverse secluded places.

Cooking Tips

The Leap Home

After mucking around 1968 for a while, the thought may occur to the heroes: How do we get home?

Well, if there are no other means of time travel in the game (and this seed probably works best if there isn't), then the answer is simultaneously simple yet complicated:

The same way they got there.

If the party *returns* to Atlantis while in 1968, and steps into that same chamber, they will arrive back in their own time . . . advanced (of course) by whatever time passed in 1968. The same arrival rules apply; they'll appear someplace secluded, outside of immediate danger, etc. (If they left anything in Atlantis, they may face the disheartening task of going back there *again* . . .)

Of course, if they relied on modern (or futuristic) high-tech gear to reach the sunken city the first time, they may have a difficult time returning in 1968.

Now, if this March of 1968 is the same for all users of the portal (in other words, if there aren't alternate timelines), then that return portal may become clogged very quickly. Consider that, although people can come from all times in the future, they must go to the same point to get home; as such there might start being lines forming in 1968's Atlantis portal . . .

Keep in mind that nothing says a party has to go home. They could easily live out the rest of their lives from 1968 onward. (Of course, then they'd need to endure the 70s again.)

What's Going On?

January 30	Tet Offensive in Vietnam
April 5	Martin Luther King Jr. assassinated
May	France brought to standstill by protesting workers and students
June 5	Bobby Kennedy assassinated
August 20	Soviets invade Czechoslovakia to end liberalization
August 26	Riots at Democratic National Convention in Chicago
October	Summer Olympics in Mexico City, Mexico

The in-game reason for this bizarre time portal is left to the GM's imagination. At its finest it doesn't *have* to be explained; many stories have had their heroes just appear in an interesting time. But if that's not satisfying, here are some possibilities.

1968 was, in all likelihood, meant to be a leap *forward* . . . at the time that Atlantis would have met its doom, 1968 would have been far in the future. Why this year? Perhaps the Atlanteans liked it; maybe the heroes stepped into the Atlantean Tourist Machine and arrived at the last programmed vacation destination. (The April 6th premiere of Kubrick's *2001* would be especially ironic . . .) Perhaps the Atlanteans had some tie to Yuri Gagarin, the Soviet astronaut and first man in space, and had some continuing dealings with him before his plane crash death on March 27th, 1968.

But in all likelihood there was some strong reason for the time portal. Various excuses metaphysical, astrological, and/or historical can be devised; 1968, for example, saw the beginning of the big surge in constructing nuclear power plants, and maybe the increased draw on fissionable material has caused this to be a nexus of some sort. Or this might be more sinister and/or intentional; depending on the motivations of the Atlanteans, perhaps they were manipulating (or ensuring) the future.

One of the most intriguing options is that the Atlanteans *escaped* to 1968. Perhaps whatever cataclysm doomed the Atlanteans (nuclear winter, invaders, alien microbes) was finally certain to be gone by that time; although they needed to desert their city, at least they would still be alive. And, owing to the peculiar temporal physics of the device, they could have planned to spend a few hundred years in their future, only to return home once those years had passed. (Although perhaps the city hadn't sunk until after they departed their time; in that case, they may well be stuck here if they can't figure out where their return portal is.)

If the Atlanteans *did* escape to 1968, then the ironic question arises: What happened to them all . . . again? After all, there (probably) isn't any evidence in the modern time of Atlanteans; are they just hiding very well, or did something happen to them? In this way an entire campaign could be based around this portal, and the search for the truth.

The success or failure of this entire adventure seed probably depends on maintaining a sense of wonder, possibility, and tragedy. Layering the incredible awe and scope of Atlantis with the emotional heights and depths that 1968 offered -- and the tragic stories of both -- can make for a more poignant adventure than a standard sunken city.

Side Salad

Once the heroes have returned home, and presuming Atlantis still stands, the existence of a time portal like this would have enormous implications. If any governments found out -- especially if more than one -- there is a strong possibility of warfare over this find.

Of course the heroes *could* just become rich in various ways, depending on the nature and rules of time travel. Even if the standard means of amassing wealth through time travel (stock market, collectibles) is unavailable, the party could still become rich escorting rich nostalgic Baby Boomers through the perilous undersea voyage to relive earlier days.

Although this idea assumes a modern or science fiction setting, nothing says other historical options can't be considered. Many cliffhangers heroes have sought Atlantis, for example, and seeing how the 1920s handles the 1960s could be very interesting . . .

Pyramid Reviews: Blink and My Word!

Published by [Out of the Box Games](#)

* * *

Pyramid Pick: Blink

Pyramid Pick: Blink

by Reinhard Staupe

56 cards each; \$8.95

When you first look at *Blink*, or just read the box blurbs, it's easy to see all the influences that could have gone into making this game: *Uno*, *Brawl*, *Crazy Eights*, *Twitch*, Lucky Charms breakfast cereal. When you open the box and see that it contains 56 cards, a slip of paper with rules and a company catalog, you'll probably think you got taken for nine bucks. When you read the rules, there's no denying they're almost childishly simple.

But when you're smacking cards down faster than you can draw them from your deck and sweating, thinking your opponent must be speeding ahead of you and you've got to pour it on or you'll fall behind in what the box calls "the world's fastest game," you concentrate less on little things like how lame you thought the game would be or grease fires in your kitchen.

The 56 cards are decorated with a variety of symbols in different colors. The deck is split during startup into two piles, one for each player, and this forms your draw pile. Each player takes three cards from their deck to form their hand, and each then puts another card face-down on the table. The face-down cards are flipped over simultaneously and the heart palpitations begin.

With never more than three cards in your hand, you must select one to play onto one of the two face-up cards between the players. These cards have to match in some way; they must show the same symbol (lightning bolt on lightning bolt), have the same count (three symbols on three symbols) or share the same color (red on red). There are no turns; you just spew cards onto the table as quickly as you can. The first person to exhaust his draw pile wins.

The game is intended for two players, though there are rules for more. The multiplayer rules almost read like a forced afterthought by the creator, but playing them doesn't take away from the game at all. Both are fast and frenetic, and while it does share a number of things in common with the games mentioned above, *Blink* is different enough to stand on its own. Quick, fun and cheap at the price.

* * *

Pyramid Review: My Word!

by Reiner Knizia

56 cards each; \$8.95

My Word! also has some kinship with a few other releases, most notably *AlphaBlitz*, *Word Whiz* and *Letterhead*, but the similarities are fairly superficial. Again you have

a deck of 56 cards, this time with letters or combinations thereof. Sensibly, there are plenty of As and Es and Ss, and only one of things like Z. Some cards have paired letters like RE and IT, and someone has wisely joined QU together on a single card.

Each player gets a turn as dealer; the dealer doesn't score points, but instead adjudicates when there's confusion about who spoke up first. Drawing cards off the top of the deck, the dealer plays them out onto the table at whatever speed and in whatever layout he cares to while the others search for words. Players must use the letters of at least three cards to create their word, and they must use the letters as they appear on the card - ND can be used to spell ENDS but not NEED.

When a player spots a word, he calls it out. If he's right, that player gets to scoop the cards that spell out his word into his hand and keep them. If he's wrong, everyone else at the table gets to take one card from those showing and hold on to it. This continues until all the cards have been played or no one can make any more words. Everyone gets a point for each card they took, the score is noted, and the cards are reshuffled and passed to the new dealer. When everyone has had a turn dealing, the scores for each round are added up and the highest total wins.

To keep things from getting too simple, there are Wild Cards -- ? and ?? -- that can be used to represent one or two letters (respectively) of your choosing to fill holes in potential words. When a player blows it and everyone else gets to take a card, canny folks will use that time to study the cards that will remain when they've made their selection, piecing together new patterns and setting themselves up for a kill. And while the relative vocabulary levels of the participants do seem to skew things in favor of the brains in the group, often enough there are queer deals (say, a bunch of vowels) that allow clever people to hunt for the big score while the less savvy ones are ready to pounce on simpler combinations.

Like its companion, *My Word!* is letter-perfect at the price.

Fairy Meat

Published by [Kenzer & Company](#)

Designed by Scott Leaton

44 page rulebook including 12 pages of cardboard counters and figures; \$24.88

Although few will admit it, everyone has always suspected that those fairies were up to no good. That they are a bunch of violent cannibals, however, may shock even the most ardent fairy critic. The makers of *Knights of the Dinner Table* bring their sense of humor to the world of fairy-on-fairy battle in *Fairy Meat*, a fast-playing miniature war game. Designer Scott Leaton has created an entertaining game with easy movement rules, simple magic use, and a combat system that uses regular playing cards instead of dice.

The entire game is included in 44 pages of rules, 12 of which are cardboard counters and cardboard fairy figures. The rules are clear and well organized. The art has the lush flavor of typical fantasy art, but is mixed with the cannibalism theme, making for somewhat gruesome scenes.

The world of *Fairy Meat* is our own world, and the scale is 1:1. Thus, any playing surface will do, and any existing obstacles are appropriate as well. For example, a table with soda cans, snack food, and game books is a suitable field of combat. Players will have to cut out the circular counters (although a separate Components Pack contains die-cut counters) and will either assemble the cardboard fairy miniatures, or use the cardboard wings and weapons to make any other miniature into a fairy. (Kenzer and Company has released metal fairy miniatures as well.) A battle also requires a standard deck of playing cards with jokers.

Like any miniature war game, players have a number of army points with which they buy fairy units and weapons. Then, they choose a scenario that defines the goals of the battle. Typically, the scenario involves blood thirsty fairies attacking one another, then eating whatever is left. It may not be pretty, but it is kind of cute.

Each fairy starts the game with a number of Live points, a number of Kill points, and a number of Twinkle points. Live points define how well a fairy defends themselves in a fight, in other words, how well they live. Kill points define the power of an attack coming from that fairy. Twinkle points power fairy spells. Every time a fairy takes damage in a fight, they will lose Kill points and Live points. When all of a fairy's Kill and Live points are gone, they become fairy food. The primary way of regaining Live and Kill points is by eating a fairy that has died during the battle.

Fairy Meat features easily remembered movement rules that minimize measuring and speed up the violence. Fairies can Pose while not moving and gain a combat bonus, Flutter for 12 inches at an altitude of three inches, Frolic for six inches at a height of six inches, or Pounce, moving only three inches, but clearing obstacles that are 12 inches high. All movement ends with the fairy standing on the ground, so flight more closely resembles a jump.

Rather than dice, players use playing cards to fight one another. Fairies have three types of combat with which to rend one another into bite-sized pieces. During melee combat, the attacking fairy gets a number of cards equal to their Kill points and a defender gets a number of cards equal to their Live points. Each player chooses one card, and if the attacker's card is higher, then the defender is going to hurt. If the defender has the higher card, then the attack is squandered. Weapons will add to the number of cards that a fairy draws. Also, a player can add trump cards, jack

through ace, to increase their number card. This system sounds involved at first, but plays surprisingly fast.

Ranged combat is conducted similarly to melee, but at distances prescribed by the ranged weapon. Wrestling is similar to ranged and melee, but both players draw cards equal to their Kill points and either, or both, may take damage.

Fairies also have magic in their arsenal. They can spend their Twinkle points on eight different spells. Spells can restore Live and Kill points, damage enemies, and affect movement. The game leaves room for a much longer spell list which will probably grow with expansions.

Finally, fairies lose Kill, Live, and Twinkle points throughout combat, but can regain them as well. A fairy can stop fighting long enough to eat a fallen fairy. Her dinner can give her as many Kill or Live points as the meal had when living. Fairies can only charge up their Twinkle points by discarding trumps during combat or by giving up attacking for one round.

Fairy Meat is an excellent introduction to miniature wargaming. It is simple enough for new players to grasp in a single game, but retains enough variables and complexity to distinguish it from a board game. Grogards who are not amused enough by the theme and art may enjoy the speed of set-up and play along with the card mechanic. And who wouldn't be tickled to watch those cute, little sprites beat the pixie dust out of one another?

-- *Brad Weier*

Pyramid Review

The Tide of Years

Published by [Atlas Games](#)

Written by Michelle A. Brown Nephew

Illustrated by Ross Bonilla, Helena Wickberg, David Interdonato, Chris Seaman, and Scott Reeves

48 pages; \$10.95

It begins with the party camping down for a quiet night beside a lake. Then a strangely garbed man enters their campsite and implores them for their aid in restoring the city of Lagueen to its former glory. The only problem is that Lagueen, a fabled utopia made so through the will and belief of its citizens, happened to have disappeared and passed into legend aeons ago. Fortunately for the characters, the stranger, Jonar is a native of Lagueen and happens to know where it is: at the bottom of the lake they choose to camp beside.

This is the beginning of the fourth scenario for *d20* in Atlas Games' Penumbra line. Designed for characters of 4th through 6th levels, it is the first entry in the series to be written by its editor, Michelle A. Brown Nephew. Further, it marks a departure from the previous three adventures in several ways.

First is its appearance. Ochre hues are used throughout to enhance every aspect of *The Tide of Years*, including the text, sidebars and other art. The addition of a third shade improves the look of this book no end. David Interdonato's interior illustrations, already good, really stand out with the addition of these shades. Second, the scenario contributes substantially in terms of content to the Open Gaming License, more so than other Penumbra releases. This is not just new monsters, magical items and traps, which *The Tide of Years* has, but a whole new clerical domain, that of Time.

Initially I was dubious at the concept of time travel and manipulation being added to fantasy games, as it has the ability to thoroughly unbalance any campaign it is introduced to, much as psionics did in the first and second editions of *Dungeons & Dragons*. Thankfully, it is obvious that a great deal of thought and care has gone in designing this new domain. It is specifically pitched away from time travel and manipulation beyond already existing spells as powerful as Haste or Slow. The new spells do not go past eighth level and include Detect Temporal Disturbance, Scry the Ages, Hastening of Age, and Wellspring of Youth. The last two are interesting in that they alter the physical age of the spell's recipient without effecting the actual age of their soul and thus how long they will live. The secrets of time travel through divine means still remain the province of higher-level clerics and particularly the devout followers of Ras'Tan the All-Knower. This is the god of enlightenment, whose domains are Sun, Time, and Knowledge, and who is the patron god of the city of Lagueen.

(SPOILER ALERT!)

To restore Lagueen to its former glory, Jonar, who is a priest of Ras'Tan, directs the players to visit the main temple to Ras'Tan in the lake below. There they have to restore the Temporal Crystal to its rightful place, but this is not an easy task. They require a shard of the Temporal Crystal - which is located half way up a cliff overlooking the lake and they need to a method of breathing underwater. One is available in the form of a kiss from a capricious water sprite, so the players need to be on their most persuasive behaviour. This is alongside a number of combat encounters with

prehistoric monsters that do seem rather superfluous.

Once below, the Temple of Ras'Tan is easy to locate. It is a giant tetrahedron (like a four-sided die) that thrusts up from the mud. The temple is only partially flooded, so actually exploring the triangular rooms inside is actually just that little more difficult than doing so completely underwater would be. There are still plenty of opportunities for the players to explore this strange new environment both inside and out, and plenty of information is included to run this properly. The temple itself is nicely mapped using ProFantasy Software's *Campaign Cartographer 2*, and can be downloaded from the Atlas Games' web site.

Not only do the players have to contend with environmental problems, but understandably temporal ones also. These include temporal traps and a new monster in the form of a Temporal Elemental. The latter is the final obstacle in restoring the Temporal Crystal to its place; there the adventure ends. The aftermath though -- possible reward for the players (though there are plenty of scrolls and potions to find that might have survived submerged), the effect of restoring Lagueen and the effect this restoration might have on its neighbors -- is all covered in the last chapter, which gives lots of solid advice on each of these topics.

Because of its subject matter, *The Tide of Years* is more atmospheric than other Penumbra titles. It includes much that can be continued over into existing campaigns, but cleverly stills remains generic enough to be introduced to almost any game. Primarily this is the god Ras'Tan, whom the players can choose to worship or even follow if they wish to be come a cleric of his faith, after coming into contact with him in this adventure. Secondly, Lagueen and its clerics can become a factor in the party's future adventures, either as a patron or allies. Their ability to travel through time opens up plenty of opportunities for the DM to take his players to mysterious times and places.

(END SPOILER ALERT)

Hopefully Atlas Games will follow this adventure with both trips to other time periods and more information on the higher levels of the Domain of Time, as this is an excellent starting point for both. In adding more to the Open Gaming License and coming with a strong atmosphere of its own, *The Tide of Years* stands out as the best Penumbra title to date.

--Matthew Pook (With thanks to Roj at Wayland's Forge)

Islands in the Timestream: Alternate Atlantises

"Imagine an alternate history uncannily like our own, but with one great difference; Plato's Atlantis was real . . ."

-- Phil Masters, *GURPS Atlantis*

Or don't imagine it; game in it! Just because Plato sank Atlantis doesn't mean it's gone, after all -- rather the opposite, even in our humdrum world of plate tectonics and carbon-14 dating. The following four Atlantises (Atlantes? Atlanti?) can all work with the rough geographic strictures set down by Plato (and Phil Masters) -- a mountainous island slightly smaller than Algeria roughly where the Azores are right now. (It's at its easternmost location in the first setting; at its westernmost -- west of Bermuda -- in the second.) So tear up those tired old maps, and sail on!

"And, besides this, the inhabitants of the last island Poseidonis preserved the memory of the prodigious magnitude of the Atlantic island as related by their ancestors, and of its governing for many periods all the islands in the Atlantic sea. From this isle one may pass to other large islands beyond, which are not far from the firm land, near which is the true sea."

-- Proclus, *Commentary on the Timaeus*

It turns out Carthage was good for something after all. Its ships had kept the Atlanteans out of the Mediterranean, after they slowly recovered from the catastrophes following their Greek debacle. But when Rome smashed the Punic in 202 B.C., that opened the Pillars of Hercules to Atlantis again -- the mud had receded three centuries before that. For a century, they traded and watched; their galleys slowly became familiar sights even in Neapolis and Alexandria. They paid in gold and orichalcum for certain old statues of the gods, for bones dug up from Aegean islets, and even for cuttings from the sacred groves. They were biding their time -- and in 73 B.C., when Spartacus raised the banner of revolt in Italy, Atlantean galleys landed in rebellious Spain. With them came the bronze giant Talos, rebuilt in Atlantean forges; the deadly chimera, rehatched from a fossilized Typhonian egg; the sirens and tritons and harpies and gorgons by the battalion. By virtue of the Atlantean priesthood's blood, that of hereditary sons of Poseidon, they brought these fragments of heroic ages past to life. Of course, they *are* fighting Romans. Heroic David-Drake-school PC legionaries square off against magical monsters from Bacchic nightmare in this *GURPS Atlantis* vs. *GURPS Imperial Rome* showdown.

*"There will come an age
In the far-off years, when the Ocean
Shall unloose the bonds of things,
And a great land shall emerge, while Tethys
Will disclose new realms, and Thule
Shall no longer be the ultimate."*

-- Seneca, *Medea*, lines 375-79

On October 28, 1493, Columbus' ships passed through a storm like none any man aboard had ever seen -- lambent green St. Elmo's fire danced along the yardarms, and a line of swirling fog cut across the seas running due north to a harbor that would, in another future, become [Philadelphia's](#) Navy Yard. One sailor swore he saw an "enormous metal ship" as they crossed the fog line. But when Columbus' armada made landfall in Atlantis' Grand Harbor three days later, such visions were put aside. The glorious vistas of orichalcum and crystal towers, the powerful slab-sided Atlantean dromons that sailed against the wind as easily as with, and the tall, bronzed figures who greeted Columbus were all too real. When his ships returned to Spain with decks piled high with roc's feathers, gryphon eggs, mandrake peppers, orichalcum, dog-headed slaves, and ultraviolet dyes, the dangerous jungles and sandy islets of his first voyage were put aside as well. Although the passage across "St. Elmo's Line" was tricky to navigate and hard to weather, the rewards of Atlantean trade made it worth the dangers.

A century later, feisty sea dogs from Tortuga or the piratical Azores harry the galleons on the Atlantis run -- but only on the return. Spanish ships carry cloth, and paper, and silver, and gunpowder, and glass, and cattle, and other goods apparently much esteemed by the Atlanteans. Failing a Spanish galleon piled with Atlantean goods (gathered from Hy-Brasil, and Calyferne, and a hundred other islands on the other side of the Line), a Portuguese one stuffed with gold

from Mexico suffices -- Camoes' conquest of the Aztecs was forty years ago, but the land still produces bullion in plenty. Such conquistador theatrics have not succeeded against Atlantis -- a disastrous 1530 battle off Poseidonis Harbor taught the Europeans that they could barely hold their own against Atlantean ships supported from shore by sorcery and driven by vril. Enough Atlantean sorcery has found its way to European alchemists and vitruvians, however, to spark other nations' imagination. Drake's navy stopped Spanish galleons -- even the vril-driven ones -- in 1588, after all. Perhaps, brave navigators with John Dee's newest charts might be able to find an alternate passage through the Line, bypass Atlantean waters, and open up trade with other islands -- or an embassy with Prester John, who rules Utter India, somewhere furthest west.

*"Solemn heave the Atlantic waves between the gloomy nations,
Swelling, belching from its deeps red clouds & raging Fires!
Albion is sick. America faints! enrag'd the Zenith grew.
As human blood shooting its veins all round the orb'd heaven
Red rose the clouds from the Atlantic in vast wheels of blood
And in the red clouds rose a Wonder o'er the Atlantic sea . . ."*
-- William Blake, "America: a Prophecy," Plate 4, lines 2-7

Captain Cochrane could hardly blame the Sea Lords for thinking him mad. But he ran a tight ship, and his crew backed his testimony -- the French West Indies fleet had escaped when an armored leviathan, belching smoke from its chimneys, had sailed over the horizon and splintered three of his ships with broadsides so accurate that they must have been laid by clockwork! Further reports from the Straits of Gibraltar, the American coasts, and Halifax all painted more of the picture -- somehow, Atlantis had returned to 1805, and to the middle of the Atlantic Ocean, and begun making war on Britain! Natural philosophers decided there must have been some sort of "time slip" from an alternate Creation; Atlanteans in Europe soon confirmed that in their history, Atlantis had not sunk (save into barbarism) after their defeat by the ancient Greeks. Roman conquest, Irish settlement, Arab invasion, Portuguese reconquista, Elizabethan alliance, Huguenot migration: all of these enriched Atlantis. Trade struggles and bitter rivalries with England, Spain, and France (at various times) forced Atlantis (and its competitors) to improve on primitive Heronian screws, Archytan clockwork, and Archimedean engines until the naval race led, again, to war.

Napoleon has retained the services of the American steam-expert Fulton, and has sent Talleyrand to negotiate a Franco-Atlantean Alliance with the Platonian Republic. The Americans enjoy a fortuitous opportunity to study a hurricane-wrecked Atlantean leviathan on Cape Hatteras and spark their Yankee ingenuity -- Britain, with the world's greatest sailing navy, finds itself falling behind in the Age of Fighting Steam. PCs in this *GURPS Steampunk-Scarlet Pimpernel* game can be industrial spies infiltrating Atlantean shipyards (or Atlantean libraries), mesmerists attempting to harness the energies of the time-slip, gadgeteers in Boston or Southampton or Brest seeking to build submersibles, or ornithopters, or hydrofoils -- or jut-jawed Atlantean mariners seeking new worlds to conquer with the power of steam!

"The Fuehrer is engaged in the question of occupation of the Atlantic Islands in the view of a future war against America."

-- letter of Luftwaffe Major Sigismund Freiherr von Falkenstein, to Luftwaffe operations staff, October 1940

When Atlantis rose again, it was a bad time. Specifically, it was 1930, and the world couldn't afford the resources to properly explore the new continent. The hurricanes, droughts, floods, and blizzards caused by the new mid-Atlantic weather patterns only exacerbated the problems of the Depression; National Geographic, the Royal Geographic Society, and the Berlin Academy of Sciences could only mount one or two expeditions apiece into the jungle interior. Some of them came back, reporting a Darwinian nightmare of dinosaur hatcheries, angry (and deadly) gill-men living in weed-grown Greek temples, and enormous forests of crinoids and anemones the size of oaks. All under a volcanic pall that raised the temperature to tropical levels, feeding the riotous growth of plants and monsters from a prehistoric past. However, by 1943, the Seabees have cleared off nastier jungles than this one in the Pacific -- or so the War Department thinks. It's not like they have a choice; the Germans have fortified the ruins of the Grand Harbor (now a Kriegsmarine naval base) with enormous radar-controlled guns; if the U.S. is going to stop the Nazis from expanding their Atlantean bridgehead, it will have to begin with jungle fighting. And it had better begin soon -- the OSS thinks the Nazis are finding some kind of weird artifacts deep in the interior that just might win the war for Hitler.

This ***GURPS Cliffhangers-Special Ops-Dinosaurs*** campaign frame is World War II action with everything but the kitchen sink. From orichalcum pyramids to the mighty Kong to nightmarish Nazi experimental facilities, anything and everything can lurk back there in the Atlantean jungle. You can even advance the timeline to 1953, and game a ***GURPS Atomic Horror-Special Ops*** game of Army Rangers hunting down Communist guerrillas among the gill-men while keeping an eye out for giant tyrannosaurs made radioactive when the Dresden fallout blew west

The Not-About-Atlantis Column

Do you know what I love about Atlantis?

At its core, Atlantis can be *anything*.

I don't confess to being a connoisseur of all knowledge, but off the top of my head I can remember Atlantis being:

- A super-scientific world explored by Indiana Jones in a pulp setting.
- A steampunk-esque city explored by TV's Macgyver in a modern setting.
- A steampunk world explored by 1890's Verne-esque explorers.
- A source of magic from untold ages past, as told in DC Comics.
- A domed kingdom with water-breathing humanoids ruled by Namor, a mutant with wings on his feet.
- A domed sci-fi kingdom of the year 2099 with water-breathing fish men who wore breathing suits filled with water. . . and some of whom wore *glasses!* (As seen in the deliriously awful *Ravage 2099* comic.)
- An ever-changing construct of dreams, built on the collective unconscious of this mythical lost land that *must* have existed.
- Zorak from *Space Ghost Coast to Coast* (No, wait . . . that's a mantis.)

Anyway, the point is, whatever you could possibly want to do with Atlantis, it will work.

Moody atmospheric exploration? No problem. Action-packed pulp showdown? Simple. Four-color domed cities rising from the seas to invade the surface world? You bet! Interdimensional prison holding a pre-historic proto-demon? Sure! (That last one was taken from my own personal use of Atlantis, as part of a *Fading Suns* adventure. I posited the Atlanteans -- or, more likely, the ancient precursor Ur race -- sank the city to keep this fiend from escaping. Unfortunately, the Bureau of Back Story failed to inform the players of this . . .)

Now, so much of Atlantis' appeal and utility comes from its symbolic and thematic utility. Which is why this column isn't really about Atlantis, per se. Rather, this column is about the notion that you *can* do whatever you want with many ideas, even classic ones.

As an example, I ran a *GURPS Prisoner* game for a while. I wanted to do thematically similar things with the TV show -- with surrealism and psychological issues -- only with more pulp action . . . sort of a cross between *Secret Agent Man* and *Prisoner*. (Fans of both shows: file under "I" for irony.)

So when both players' characters were pursued by strangely-clad men in jetpacks through the streets of New York . . . *before* entering The Village . . . they were revved for action. And they escaped.

When I incarcerated them in The Village, the first question I asked each of them was, "Have you ever seen *The Prisoner* TV show?" When they answered yes, and that's why they were interested in playing the RPG, I said, "No no no . . . has your *character* ever seen the TV show?" Long pause. When they stammered something in the affirmative, I shouted out, "It's **just** like that." That supplied the surrealism.

And finally, when they were testing the limits of The Village, and made those first tentative steps to escape, I let them. For an hour of real-world time they walked outside the city limits . . . and no one tried to stop them. Eventually they reached a small English village; from there they could call their family, friends, or anything else they wanted. They were, for all intents and purposes, seemingly free. But the players *and* characters had both seen the show, and knew how unlikely that was. This tension supplied the psychological issues.

Then they were kidnapped by the strangely-clad jetpack men and transported to the *real* Village.

And then they were scared.

So the point of this rambling little column is to consider the possibilities of taking the most common of elements, themes, and stories of roleplaying, and don't be afraid to make them your own. *Spelljammer*, a personal favorite of mine (sorry, folks), combines space opera with medieval fantasy. *All Flesh Must Be Eaten* took the "pursued by zombies" yarn and made it entirely fresh by transporting it to different times and places. The *X-Files* took the standard mystery show and turned it on its ear by *not* solving most of its fundamental stories. And so on.

The oldest ideas -- even hoary old chestnuts like, say, a sunken continent -- can be made anew with a clever twist or turn. If you're designing a dungeon crawl, consider constructing one where the heroes must fight their way *out* of the dungeon from the bottom up. Or a dungeon where they specifically *can't* kill their opposition. (Perhaps the party is cursed such that all damage they deliver is dealt back onto them.) If you're designing a murder mystery, have all other information be known except *when* the murder happened -- and have that be the piece of information that needs to be figured out. Can you design a horror adventure if you suddenly make the heroes invulnerable to all damage?

Even the most classic elements of roleplaying games can be reinvented to maintain that air of uncertainty, wonder, and awe . . . not unlike a certain lost continent.

A lost continent, I might add, that this column is *not* about.

* * *

For those of you who haven't noticed, *Pyramid* is proud welcome Guardians of Order (*Big Eyes, Small Mouth*) to our playtesting fold. For the next week or two, they'll be playtesting *Hong Kong Action Theatre 2nd Edition* with us. Make them feel welcome and go check it out!

Our main playtest file page is at <http://www.sjgames.com/pyramid/login/playtest/>

The *Hong Kong Action Theatre* playtest files are at <http://www.sjgames.com/pyramid/login/playtest/hkat/>

* * *

This week also sees the conclusion of the Cliffhangers Round Robin *Around the World in 80 Thrills* adventure. Please feel free to make your comments, thoughts, and opinions known on our [discussion groups](#) or by sending us an [e-mail](#).

(Oh, and for those of you who are curious, the adventure was written months ago; we didn't tie it in to Atlantis for this week's theme. But it seemed like a happy coincidence to tie a theme around, so that's what we did.)

--*Steven Marsh*

* * *

*Last week's answer: **Brave New World**, p. 28.*

(One star) "The Narrator rolls three dice (results of 4, 6 and 9) and consults the Technobabble chart: It appears that the gauss induction grid has shorted out."

Dork Tower!

Dork Tower!

by Steve Honeywell

The *Player's Handbook* for *Dungeons & Dragons 3rd Edition* contains many interesting and unusual weapons your characters can take into battle. However, for it to offer a complete list of weapons that have been used down through history would cause the book to be as thick as the average phone book. The following list of weapons includes some ideas for weapons and weapon-like items not covered in the original rules.

Many of the weapons included here offer special rules or abilities. Care has been made to both make these weapons historically accurate and playable. For instance, sais were designed both as an offensive weapon and as a device to disarm opponents or destroy their weapons. Suggested rules that allow sais to be used in this manner are included in the description of that weapon.

If any of these weapons seem too difficult to use or too complicated to keep track of, ignore them. Consult with your DM before you equip your characters with a weapon he or she may not allow in the campaign.

Atlatl

Not a weapon in and of itself, the atlatl (pronounced AT-lat'l) augments the use of javelins and other hurled weapons, increasing both the speed at which the weapon is thrown as well as the distance it can be thrown. The atlatl, for all intents and purposes, is a grooved stick. The javelin is placed into the groove and hurled overhand. This requires about three feet more clearance above the thrower than a normal javelin throw, making this device very difficult to use underground in anything but large caves.

The benefit to using an atlatl is in the range possible. The range increment for a javelin thrown with an atlatl is double that of a javelin thrown without an atlatl, so targets within 60 feet can be attacked without penalty.

Bagh Nakh/Shuko/Ashiko

Various forms of this weapon have existed around the world. Not originally a weapon, the Japanese shuko was developed to help a person climb walls. This device consists of a small glove that covers just the palm and back of the hand. Three to five spikes extend from the palm. Any character wearing shuko gets a +1 circumstance bonus for all climbing attempts provided the material being climbed allows the claws to penetrate (soft mortar, wood, etc.). If the material being climbed does not allow the claws to penetrate (metal, stone, etc.), the reverse is true--the claws reduce the character's ability to grip and give a -1 penalty to climbing attempts.

In battle, shuko can be used to strike much in the same manner as an unarmed attack. However, the claws do actual, not subdual, damage.

Also available are ashiko, which are a version of shuko worn on the feet. A character equipped with both shuko and ashiko get a +2 circumstance bonus for all climbing attempts, again provided that the material being climbed allows

the claws to penetrate. There is no additional penalty for wearing ashito when climbing a harder surface.

Similar in many ways to shuko, bagh nakh were designed not for climbing, but to simulate the attack of a wild animal. However, for game purposes, bagh nakh should be considered as shuko in terms of the circumstance bonus/penalty for climbing and in the method they are used in combat.

Battle Fan

This unique weapon may look ineffective and weak, but in the hands of a master, it is truly deadly. Made of ribs of iron or bone connected by strips of decorated canvas or fabric, the battle fan can be folded or unfolded. When folded, an attack with this weapon is treated as a short club. Unfolded, the fan can be used to slash. The amount of damage caused by this weapon is identical in either case.

What makes this weapon truly unique is that it can also be used to distract enemies in the middle of battle. This weapon can be used in battle as a primary or secondary weapon, with all penalties applying when it is used in the off hand. If the character forgoes his or her attack with a battle fan used in the off hand, he or she can add +5 circumstance bonus to any bluff attempt in battle due to the hypnotic movements of the fan. However, all penalties apply to any attack made with the primary weapon as if a second weapon is being used because of the concentration needed to manipulate the fan in combat.

Bokken

The bokken is essentially a wooden sword usually used for training. When used in combat, it is nothing more than a sword-shaped club. However, because it is shaped and balanced like a sword, characters not proficient in sword use will not be proficient in using a bokken. A bokken can be used to inflict subdual damage with no penalty.

A bokken can be made in the shape of any type of sword. It weighs the same as a normal sword of that type.

Chakram

This is Sikh weapon that looks like a bladed Frisbee with a hole in the center. Also called a quoit, the chakram is thrown by spinning it around the index finger. To release the chakram, the index finger is tucked down. It is difficult to release properly if the user hasn't been trained (an inexperienced user is just as likely to release the chakram in the direction of an ally), making this a particularly dangerous weapon in the hands of a novice.

Emi

Emi are tiny spears designed as jewelry. They extend about 10 inches and are usually worn as a ring. They allow the wearer to strike for actual damage in a hand-to-hand situation instead of attacking for subdual damage. Emi are easily poisoned and easily concealed, making them a favorite among assassins and characters requiring stealth. Emi are similar to daggers in most respects, but cannot be thrown.

Escrima/Kali Sticks

Escrima, or Kali sticks, are virtually always used as a set of two, one stick in each hand. They are little more than simple sticks of about two feet in length that can be used to strike. Escrima are generally much smaller and thinner than clubs. However, because of the speed and accuracy with which escrima can be handled, they can be used to strike at gaps in armor, pressure points, and joints. They are just as effective as a club in the hands of an expert.

If a character using escrima chooses, he or she can elect to take a second attack (one with each hand) in a given round. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Jo Staff

Essentially, the jo staff is a shortened version of the quarterstaff. Generally, a jo is between 4 and 4 1/2 feet long and is usually thicker than a quarterstaff. What it gives up in length, it makes up for in speed. In all other respects, it is the same as a quarterstaff.

Kusari Gama

The kusari gama is a hook or scythe attached to a long chain, usually with a weight on the far end. Traditionally, the weight and chain were used to snare an opponent, who could then be finished off at leisure with the hook. A variation of this weapon, the manriki gusari, has weights on both ends. One end is used to entangle and the other to bludgeon.

A successful hit with a kusari gama does no damage, but entangles and trips an opponent. In the next round, while the opponent struggles to free himself (using the Escape Artist skill with a DC of 20), the wielder of the kusari gama gets to attack as if his opponent is helpless. Naturally, this is only useful against enemies that can conceivably be tripped, and is useless against anything of large size or larger.

Sai

Sais look very much like swords with large hilts or the heads of tridents with a much larger central spike. The "blade" of a sai is generally octagonal or rounded, and while pointed on the end, has no sharpened edge. This is primarily a thrusting weapon.

The extended hilts on either side of the central blade of the sai are used to trap weapons and potentially break them. Any disarm attempt made with a sai is made without incurring the normal penalty of an attack of opportunity from the defender. Sais can also be used to strike at an enemy's weapon, with no penalty for their small size (they can be used to strike at even large weapons).

As with escrima, sais are almost always used in pairs. A character using sais may choose to take a second attack (one with each hand) in a given round. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Sectioned Chain/Whip

Also called a kau sin ke, this is a weapon of Chinese origin. It consists of a handle connected to a series of long, thin metal segments, usually with a much larger and thicker segment on the end. The segments are generally held together with chains or cord. Typically, a sectioned whip or chain has seven or nine segments, but some have as many as thirteen.

Unlike a whip, this weapon deals actual damage similar to a flail, and does not suffer the penalty against armor that a normal whip does. Unlike a flail, it is flexible throughout its length and has a much longer reach. Like a whip, it is treated as a projectile weapon with a maximum range of 15 feet and no range penalties. However, it cannot be used to trip or entangle.

Shinai

A shinai is similar to a bokken in that both are used for training purposes and are not generally seen in actual combat. However, unlike bokken, shinais are always straight and cylindrical. A shinai is made from bamboo slats, tied tightly into a cylinder and wrapped with twine. The end is usually padded, as is the hilt. Many a martial arts student has felt the sting of his instructor's shinai against his shins or calves when not performing up to his potential in training.

Shinai deal subdual damage only. Additionally, in the hands of someone untrained in their use, shinai are very fragile. If the twine that holds the shinai together breaks, the entire weapon unfolds and becomes useless. Any strike

with a shinai in the hands of a novice forces the shinai to save against DC 10. A missed save causes the shinai to break and unfold.

Three-Section Staff

This is a truly unique weapon that combines the best elements of the quarterstaff, nunchaku, and escrima all in one difficult-to-use (but highly effective) package. It consists of three hardwood sections about the same length as a single escrima and about the same thickness as a quarterstaff. The middle section of the staff is traditionally connected to the other two by chain or stout cord.

This weapon has many different uses. All three sections could be folded over and the weapon used as a club; two sections could be folded with the third acting as a flail; the user could hold the middle section and use both end sections as flails; or the wielder could hold the two end sections and use the central piece to block and strike.

Because of the unique form of this weapon, any character using a three-section staff can elect to make a second attack in a given round. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Tigerhead Hooks

A fascinating and frightening-looking weapon, a tigerhead hook is designed both to kill and to intimidate. It consists of a long, hooked shaft with a sharp point both on the hook and the opposite end. It is gripped near the base, and the hand guard consists of a crescent-shaped blade that can also be used for striking. Tigerhead hooks are almost always used in a set of two.

Like many of the weapons listed here, a character using tigerhead hooks can elect to make a second attack in a given round, one attack with each weapon. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Tonfa

Tonfa are a medieval Asian weapon that is most-commonly seen today in the form of police batons. This weapon consists of a stick approximately two feet long with a short handle on one side. Tonfa are almost always used in pairs. Traditionally, they are used by holding the handle with the long part of the weapon extending down the forearm. The shorter end extends forward and can be used to strike. The weapon can also be rotated in the hand, with the larger end swinging like a club, or extended forward to jab.

This is an extremely versatile weapon, and can be used to block attacks, strike, trip, and subdue opponents. As with bokken, a character using tonfa can elect to cause subdual damage with no penalty.

Like many of the weapons listed here, a character using tonfa can elect to make a second attack in a given round, one attack with each tonfa. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Finally, because tonfa are designed to be as much of a defensive weapon as an offensive one, a player wielding a pair of tonfa can elect to use the off-hand tonfa as a shield. It offers the same protection as a buckler, and can be used against the melee weapon attacks of a single opponent. So, while a character with tonfa can defend against every axe blow from an attacking barbarian, the tonfa is useless in blocking the claws of a wild animal, bite attacks, or missiles.

Proficiencies

Characters are given proficiencies in these weapons automatically as follows:

Barbarian	bokken, emi, jo staff, shinai
Bard	emi, jo staff
Cleric	emi, jo staff
Druid	jo staff
Fighter	bokken, emi, jo staff, shinai
Monk	chakram, emi, escrima, jo staff, tonfa*
Paladin	bokken, emi, jo staff, shinai
Ranger	bokken, emi, jo staff, shinai
Rogue	bokken (short sword only), emi, shuko/ashito
Sorcerer	emi, jo staff
Wizard	emi, jo staff

* Because training differs for Monk characters depending on the monastery they learned at, the DM may also wish to allow a Monk character to choose to be proficient in one or more of the following weapons: battle fan, kusari gama, sai, shinai, three-section staff, and tigerhead hooks.

Additionally, some DMs may wish to allow Barbarian characters to be proficient in atlatl use.

Weapon	Style	Cost*	Size	Dam.	Crit.	Range Inc.	Weight*	Type
Atlatl	Exotic, Ranged	1GP	Med.	1D6	x2	60 ft.	1lb.	piercing
Ashito	Exotic, Melee	5GP	Tiny	1D3	x2	--	1lb.	slashing
Bagh Nakh/Shuko	Exotic, Melee	5GP	Tiny	1D3	x2	--	1lb.	slashing
Battle Fan	Exotic, Melee	15GP	Small	1D3	x2	--	1lb.	bludgeoning/slashing
Bokken	Martial, Melee	5GP	S-L	1D4**	x2	--	3lb.-30lb.	bludgeoning
Chakram	Exotic, Ranged	1GP	Tiny	1D2	x3	10 ft.	1/5lb.	slashing
Emi	Simple, Melee	2GP	Tiny	1D2	x2	--	1/2lb.	piercing
Escrima/Kali Stick	Exotic, Melee	--	Small	1D6	x2	--	1lb.	bludgeoning
Jo Staff	Simple, Melee	--	Med.	1D6	x2	--	4lb.	bludgeoning
Kusari Gama	Exotic, Melee	10GP	Med.	--/1D6	x2	5 ft. (max.)	6lb.	piercing
Sai***	Exotic, Melee	4GP	Small	1D6	x2	--	3lb.	piercing
Sectioned Whip/Chain	Exotic, Melee	8GP	Large	1D6	x2	--	5lb.	bludgeoning
Shinai	Martial, Melee	2GP	Med.	1D3****	x2	--	2lb.	bludgeoning
Three-Section Staff	Exotic, Melee	5GP	Large	1D6	x2	--	5lb.	bludgeoning
Tigerhead Hook	Exotic, Melee	10GP	Med.	1D6	x3	--	3lb.	piercing
Tonfa***	Exotic, Melee	1GP	Small	1D6**	x2	--	1lb.	bludgeoning

* Costs and weights are given for a single weapon, even for those normally used in pairs.

** Damage with a bokken or tonfa is either actual or subdual at the player's preference.

*** Halfling versions of these weapons do 1D4 damage, weigh half of the normal-sized version, and are tiny.

**** Subdual damage

by Steve Honeywell

The *Player's Handbook* for *Dungeons & Dragons 3rd Edition* contains many interesting and unusual weapons your characters can take into battle. However, for it to offer a complete list of weapons that have been used down through history would cause the book to be as thick as the average phone book. The following list of weapons includes some ideas for weapons and weapon-like items not covered in the original rules.

Many of the weapons included here offer special rules or abilities. Care has been made to both make these weapons historically accurate and playable. For instance, sais were designed both as an offensive weapon and as a device to disarm opponents or destroy their weapons. Suggested rules that allow sais to be used in this manner are included in the description of that weapon.

If any of these weapons seem too difficult to use or too complicated to keep track of, ignore them. Consult with your DM before you equip your characters with a weapon he or she may not allow in the campaign.

Atlatl

Not a weapon in and of itself, the atlatl (pronounced AT-lat'l) augments the use of javelins and other hurled weapons, increasing both the speed at which the weapon is thrown as well as the distance it can be thrown. The atlatl, for all intents and purposes, is a grooved stick. The javelin is placed into the groove and hurled overhand. This requires about three feet more clearance above the thrower than a normal javelin throw, making this device very difficult to use underground in anything but large caves.

The benefit to using an atlatl is in the range possible. The range increment for a javelin thrown with an atlatl is double that of a javelin thrown without an atlatl, so targets within 60 feet can be attacked without penalty.

Bagh Nakh/Shuko/Ashiko

Various forms of this weapon have existed around the world. Not originally a weapon, the Japanese shuko was developed to help a person climb walls. This device consists of a small glove that covers just the palm and back of the hand. Three to five spikes extend from the palm. Any character wearing shuko gets a +1 circumstance bonus for all climbing attempts provided the material being climbed allows the claws to penetrate (soft mortar, wood, etc.). If the material being climbed does not allow the claws to penetrate (metal, stone, etc.), the reverse is true--the claws reduce the character's ability to grip and give a -1 penalty to climbing attempts.

In battle, shuko can be used to strike much in the same manner as an unarmed attack. However, the claws do actual, not subdual, damage.

Also available are ashiko, which are a version of shuko worn on the feet. A character equipped with both shuko and ashiko get a +2 circumstance bonus for all climbing attempts, again provided that the material being climbed allows

the claws to penetrate. There is no additional penalty for wearing ashito when climbing a harder surface.

Similar in many ways to shuko, bagh nakh were designed not for climbing, but to simulate the attack of a wild animal. However, for game purposes, bagh nakh should be considered as shuko in terms of the circumstance bonus/penalty for climbing and in the method they are used in combat.

Battle Fan

This unique weapon may look ineffective and weak, but in the hands of a master, it is truly deadly. Made of ribs of iron or bone connected by strips of decorated canvas or fabric, the battle fan can be folded or unfolded. When folded, an attack with this weapon is treated as a short club. Unfolded, the fan can be used to slash. The amount of damage caused by this weapon is identical in either case.

What makes this weapon truly unique is that it can also be used to distract enemies in the middle of battle. This weapon can be used in battle as a primary or secondary weapon, with all penalties applying when it is used in the off hand. If the character forgoes his or her attack with a battle fan used in the off hand, he or she can add +5 circumstance bonus to any bluff attempt in battle due to the hypnotic movements of the fan. However, all penalties apply to any attack made with the primary weapon as if a second weapon is being used because of the concentration needed to manipulate the fan in combat.

Bokken

The bokken is essentially a wooden sword usually used for training. When used in combat, it is nothing more than a sword-shaped club. However, because it is shaped and balanced like a sword, characters not proficient in sword use will not be proficient in using a bokken. A bokken can be used to inflict subdual damage with no penalty.

A bokken can be made in the shape of any type of sword. It weighs the same as a normal sword of that type.

Chakram

This is Sikh weapon that looks like a bladed Frisbee with a hole in the center. Also called a quoit, the chakram is thrown by spinning it around the index finger. To release the chakram, the index finger is tucked down. It is difficult to release properly if the user hasn't been trained (an inexperienced user is just as likely to release the chakram in the direction of an ally), making this a particularly dangerous weapon in the hands of a novice.

Emi

Emi are tiny spears designed as jewelry. They extend about 10 inches and are usually worn as a ring. They allow the wearer to strike for actual damage in a hand-to-hand situation instead of attacking for subdual damage. Emi are easily poisoned and easily concealed, making them a favorite among assassins and characters requiring stealth. Emi are similar to daggers in most respects, but cannot be thrown.

Escrima/Kali Sticks

Escrima, or Kali sticks, are virtually always used as a set of two, one stick in each hand. They are little more than simple sticks of about two feet in length that can be used to strike. Escrima are generally much smaller and thinner than clubs. However, because of the speed and accuracy with which escrima can be handled, they can be used to strike at gaps in armor, pressure points, and joints. They are just as effective as a club in the hands of an expert.

If a character using escrima chooses, he or she can elect to take a second attack (one with each hand) in a given round. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Jo Staff

Essentially, the jo staff is a shortened version of the quarterstaff. Generally, a jo is between 4 and 4 1/2 feet long and is usually thicker than a quarterstaff. What it gives up in length, it makes up for in speed. In all other respects, it is the same as a quarterstaff.

Kusari Gama

The kusari gama is a hook or scythe attached to a long chain, usually with a weight on the far end. Traditionally, the weight and chain were used to snare an opponent, who could then be finished off at leisure with the hook. A variation of this weapon, the manriki gusari, has weights on both ends. One end is used to entangle and the other to bludgeon.

A successful hit with a kusari gama does no damage, but entangles and trips an opponent. In the next round, while the opponent struggles to free himself (using the Escape Artist skill with a DC of 20), the wielder of the kusari gama gets to attack as if his opponent is helpless. Naturally, this is only useful against enemies that can conceivably be tripped, and is useless against anything of large size or larger.

Sai

Sais look very much like swords with large hilts or the heads of tridents with a much larger central spike. The "blade" of a sai is generally octagonal or rounded, and while pointed on the end, has no sharpened edge. This is primarily a thrusting weapon.

The extended hilts on either side of the central blade of the sai are used to trap weapons and potentially break them. Any disarm attempt made with a sai is made without incurring the normal penalty of an attack of opportunity from the defender. Sais can also be used to strike at an enemy's weapon, with no penalty for their small size (they can be used to strike at even large weapons).

As with escrima, sais are almost always used in pairs. A character using sais may choose to take a second attack (one with each hand) in a given round. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Sectioned Chain/Whip

Also called a kau sin ke, this is a weapon of Chinese origin. It consists of a handle connected to a series of long, thin metal segments, usually with a much larger and thicker segment on the end. The segments are generally held together with chains or cord. Typically, a sectioned whip or chain has seven or nine segments, but some have as many as thirteen.

Unlike a whip, this weapon deals actual damage similar to a flail, and does not suffer the penalty against armor that a normal whip does. Unlike a flail, it is flexible throughout its length and has a much longer reach. Like a whip, it is treated as a projectile weapon with a maximum range of 15 feet and no range penalties. However, it cannot be used to trip or entangle.

Shinai

A shinai is similar to a bokken in that both are used for training purposes and are not generally seen in actual combat. However, unlike bokken, shinais are always straight and cylindrical. A shinai is made from bamboo slats, tied tightly into a cylinder and wrapped with twine. The end is usually padded, as is the hilt. Many a martial arts student has felt the sting of his instructor's shinai against his shins or calves when not performing up to his potential in training.

Shinai deal subdual damage only. Additionally, in the hands of someone untrained in their use, shinai are very fragile. If the twine that holds the shinai together breaks, the entire weapon unfolds and becomes useless. Any strike

with a shinai in the hands of a novice forces the shinai to save against DC 10. A missed save causes the shinai to break and unfold.

Three-Section Staff

This is a truly unique weapon that combines the best elements of the quarterstaff, nunchaku, and escrima all in one difficult-to-use (but highly effective) package. It consists of three hardwood sections about the same length as a single escrima and about the same thickness as a quarterstaff. The middle section of the staff is traditionally connected to the other two by chain or stout cord.

This weapon has many different uses. All three sections could be folded over and the weapon used as a club; two sections could be folded with the third acting as a flail; the user could hold the middle section and use both end sections as flails; or the wielder could hold the two end sections and use the central piece to block and strike.

Because of the unique form of this weapon, any character using a three-section staff can elect to make a second attack in a given round. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Tigerhead Hooks

A fascinating and frightening-looking weapon, a tigerhead hook is designed both to kill and to intimidate. It consists of a long, hooked shaft with a sharp point both on the hook and the opposite end. It is gripped near the base, and the hand guard consists of a crescent-shaped blade that can also be used for striking. Tigerhead hooks are almost always used in a set of two.

Like many of the weapons listed here, a character using tigerhead hooks can elect to make a second attack in a given round, one attack with each weapon. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Tonfa

Tonfa are a medieval Asian weapon that is most-commonly seen today in the form of police batons. This weapon consists of a stick approximately two feet long with a short handle on one side. Tonfa are almost always used in pairs. Traditionally, they are used by holding the handle with the long part of the weapon extending down the forearm. The shorter end extends forward and can be used to strike. The weapon can also be rotated in the hand, with the larger end swinging like a club, or extended forward to jab.

This is an extremely versatile weapon, and can be used to block attacks, strike, trip, and subdue opponents. As with bokken, a character using tonfa can elect to cause subdual damage with no penalty.

Like many of the weapons listed here, a character using tonfa can elect to make a second attack in a given round, one attack with each tonfa. This entails all normal penalties for attacking with two weapons, with the off-hand weapon considered light.

Finally, because tonfa are designed to be as much of a defensive weapon as an offensive one, a player wielding a pair of tonfa can elect to use the off-hand tonfa as a shield. It offers the same protection as a buckler, and can be used against the melee weapon attacks of a single opponent. So, while a character with tonfa can defend against every axe blow from an attacking barbarian, the tonfa is useless in blocking the claws of a wild animal, bite attacks, or missiles.

Proficiencies

Characters are given proficiencies in these weapons automatically as follows:

Barbarian	bokken, emi, jo staff, shinai
Bard	emi, jo staff
Cleric	emi, jo staff
Druid	jo staff
Fighter	bokken, emi, jo staff, shinai
Monk	chakram, emi, escrima, jo staff, tonfa*
Paladin	bokken, emi, jo staff, shinai
Ranger	bokken, emi, jo staff, shinai
Rogue	bokken (short sword only), emi, shuko/ashito
Sorcerer	emi, jo staff
Wizard	emi, jo staff

* Because training differs for Monk characters depending on the monastery they learned at, the DM may also wish to allow a Monk character to choose to be proficient in one or more of the following weapons: battle fan, kusari gama, sai, shinai, three-section staff, and tigerhead hooks.

Additionally, some DMs may wish to allow Barbarian characters to be proficient in atlatl use.

Weapon	Style	Cost*	Size	Dam.	Crit.	Range Inc.	Weight*	Type
Atlatl	Exotic, Ranged	1GP	Med.	1D6	x2	60 ft.	1lb.	piercing
Ashito	Exotic, Melee	5GP	Tiny	1D3	x2	--	1lb.	slashing
Bagh Nakh/Shuko	Exotic, Melee	5GP	Tiny	1D3	x2	--	1lb.	slashing
Battle Fan	Exotic, Melee	15GP	Small	1D3	x2	--	1lb.	bludgeoning/slashing
Bokken	Martial, Melee	5GP	S-L	1D4**	x2	--	3lb.-30lb.	bludgeoning
Chakram	Exotic, Ranged	1GP	Tiny	1D2	x3	10 ft.	1/5lb.	slashing
Emi	Simple, Melee	2GP	Tiny	1D2	x2	--	1/2lb.	piercing
Escrima/Kali Stick	Exotic, Melee	--	Small	1D6	x2	--	1lb.	bludgeoning
Jo Staff	Simple, Melee	--	Med.	1D6	x2	--	4lb.	bludgeoning
Kusari Gama	Exotic, Melee	10GP	Med.	--/1D6	x2	5 ft. (max.)	6lb.	piercing
Sai***	Exotic, Melee	4GP	Small	1D6	x2	--	3lb.	piercing
Sectioned Whip/Chain	Exotic, Melee	8GP	Large	1D6	x2	--	5lb.	bludgeoning
Shinai	Martial, Melee	2GP	Med.	1D3****	x2	--	2lb.	bludgeoning
Three-Section Staff	Exotic, Melee	5GP	Large	1D6	x2	--	5lb.	bludgeoning
Tigerhead Hook	Exotic, Melee	10GP	Med.	1D6	x3	--	3lb.	piercing
Tonfa***	Exotic, Melee	1GP	Small	1D6**	x2	--	1lb.	bludgeoning

* Costs and weights are given for a single weapon, even for those normally used in pairs.

** Damage with a bokken or tonfa is either actual or subdual at the player's preference.

*** Halfling versions of these weapons do 1D4 damage, weigh half of the normal-sized version, and are tiny.

**** Subdual damage

by **Matt Riggsby**

The article "Low-Tech Economies" (available in *Pyramid* #26, *GURPS Best of Pyramid 1*, and [on-line](#)) outlined major differences between the modern economy and most ancient economies and provided basic rules for handling buying, shipping, and selling goods. This article presents some additional rules and historical material outlining other challenges in being a merchant in a low-tech setting, particularly the problems faced by adventurous "international" merchants. While "Low-Tech Economies" was fairly generic in describing situations in most more-or-less monetary early economies, this article draws heavily from the economies of Medieval Europe and the Near East. However, similar complications and strategies for responding to them could evolve in many low-tech societies.

Making Connections

Making deals and buying or selling goods depends heavily on getting to the right people. General knowledge and skill go only so far in the insular communities which characterize most low-tech societies. Moreover, somebody with recent knowledge and experience in the local market is much better prepared to work in it. Without a guide through a strange land, it will be difficult to make the necessary connections, and even a shrewd old hand may not have the specific knowledge to be on an even footing with a native.

Historically, the limitations of being a stranger in a foreign market led to a number of different reactions. For example, fairly early in the Medieval period, many successful merchants in Europe and the Near East were Jewish. Because Jews were a minority wherever they lived, they often maintained communication with other Jewish communities, giving them ready-made contacts in far-away cities. During the Renaissance, when trade across Europe reached a high enough volume, merchant and banking houses were able to employ permanent factors, agents charged with keeping an eye on local market conditions (which most emphatically included possible political changes; a merchant factor could closely resemble a spy) and passing important information along to the home office. Factors could act as a foreign merchant's guide to society, or even handle the buying and selling themselves. Being a factor could be lucrative and extremely educational, but it also kept one away from the center of a mercantile concern's power. A member of a merchant house could find himself appointed a factor as grooming for a higher position or as a polite form of exile. A factor or someone willing to act as one (a distant relative, co-religionist, family friend, etc.) is as much as social connection as an employee, so getting one can be an adventure in itself. A Patron or Contact advantage can provide characters with the appropriate assistance.

In game terms, a merchant visiting an area to which he is not native or at least a long-term resident is at a penalty to Merchant skill depending on how "distant" (in a cultural and political as well as geographical sense) it is from his home.

Familiarity	Penalty
Home city and dependent territories	NA
Same country/cultural area but different government or rulers (Renaissance Venetian in Rome, Classical Athenian in Sparta)	-2
Different country with some cultural or political ties (Medieval	-3

Englishman in Rome)

Different country with vague awareness of foreigner's society (Medieval Englishman in Istanbul) -5

Completely alien country (Medieval Englishman in Japan) -6

However, both experience and local aid can overcome this problem. A character may roll against an appropriate Area Knowledge specialty, although the GM may rule that other skills such as Streetwise or Savoir-Faire may apply in some cases. If the roll succeeds, the penalty is reduced by the amount by which the roll was made. The success of the roll will only offset the penalty; it will not provide a positive bonus. Alternatively, a character may employ a local or long-term resident (someone living and working in the foreign area for at least a year) with an applicable skill at 12+. With a qualified guide, the familiarity penalty is halved (round up), and the guide may roll against his own applicable skill in order to reduce the penalty further.

For example, Paolo, a merchant from a wealthy city-state in the warm, sunny south, has traveled to the far north to trade casks of wine for the exotic furs the northmen bring in from the snowy mountains of the interior. The northern barbarians speak a different language, worship different gods, and have, in general, a completely separate culture and history from Paolo's fellow city-dwellers. However, people from his country do, from time to time, come to the north to trade for furs and timber, so the northerners have some awareness of those short, dark-haired fellows from far away. Paolo is at -5 to his Merchant skill. Fortunately, on the trip up, he engaged the aid of an elderly northman who retired from a life of raiding to become a merchant sailor along the fjords of the north. Having the assistance of this man (a native with an Area Knowledge of 14) reduces Paolo's penalty to -3. The assistant rolls a 10 against his Area Knowledge, succeeding by 4 and wiping out the remaining penalty.

Barter, Cash, and Scarcity

To bypass the limitations of the scarcity of currency, merchants in low-tech settings may want or need to trade goods directly for other goods instead of selling them for cash. In this case, each merchant should make all appropriate rolls for selling his goods, and when the final values are determined the merchants can exchange equivalent values of goods. To continue the example, the GM has already determined the approximate local value of Paolo's wine (500 gallons of it) at \$15.30 per gallon. He decides that the trader Paolo is selling his wine to has a supply of good-quality hides at \$80 per square yard. First, the merchant and Paolo roll a contest of Merchant skills to determine the final value of the wine; they tie and the cost of \$15.30 per gallon stands. Then they roll a contest of Merchant skill to determine the final cost of the furs. The trader wins by one, bringing the cost of his hides up to \$81.60 per square yard, or about 5 1/3 gallons of wine per square yard of fur. Paolo would theoretically be able to trade his 500 gallons of wine (worth \$7650) for 93.75 square yards of furs.

Whether the merchant is trading for goods or cash, there is still a very real problem of supply. There simply may not be enough buyers on the market to take what he's selling off his hands immediately. When a merchant tries to buy or sell a large quantity of goods, roll against his Merchant skill. He may immediately exchange 30+(the amount the roll was made or missed by)*5% of his goods. Treat any result of less than 5% as 5%. The roll is modified as follows:

In particularly rich economy (high imperial Rome, Renaissance Venice): +4

In particularly poor economy (late imperial Rome, Dark Ages Europe): -4

Selling for cash rather than bartering: -3
(*this penalty may be increased for lightly monetized economies, like early Mesopotamia, or decreased for heavily monetized economies, like early modern Europe*)

Total price of goods to be sold is \$1000 or less: +8

(the GM may instead use the campaign's standard starting wealth and modify the following amounts accordingly; the GM may also treat small transactions as automatic total success)

Total price is \$1001-\$3000: +4

Total price is \$3001-\$5000: +2

Total price is \$5001-\$10,000: +0

Total price is \$10,001-\$20,000: -1

Total price is \$20,001-\$40,000: -2

Total price is \$40,001-\$60,000: -3

Total price is above \$60,000: -4, and an additional -1 for every \$20,000 or part thereof of the base cost

Seller accepts lower sale price: +1 per -2% to final sale price (the seller may choose to accept a lower price after the Merchant skill roll is made, applying the modifier retroactively)

The GM may impose other modifiers and arbitrary limitations as necessary. For example, no matter how good a merchant is or how highly desired his goods are, he is unlikely to get more than perhaps \$100 in cash if he attempts to sell his goods in a small farming village. After an initial attempt to sell goods, the merchant may roll again in a week to see how much he can sell then. By this time, market conditions may be different, the local price may have changed, and the merchant will have to negotiate a new price.

So, back to the example: Paolo is trying to sell \$7650 worth of wine. The important question is whether there are \$7650 worth of furs available to Paolo. The GM rules that the local economy is mildly prosperous (+1), and there's no modifier for quantity of goods he is trying to sell, and since he's bartering rather than selling for cash, there's no modifier there. The trading post is itself no bigger than a large village, but the GM decides that because the settlement's purpose is as a central point for trade, he won't impose a limit on the value Paolo can trade for, although he might if Paolo was trying to trade more. Paolo makes his Merchant roll by three, allowing him to sell 45% of his wine. At this rate, it will take Paolo about three weeks to completely exchange his wine for furs. Historically, caravans and shipping convoys could spend weeks or even months at their destinations, so Paolo is probably fairly happy with how things are going.

The GM may apply this rule to any large sales. For example, a feudal lord may want to sell off farmland with a huge nominal value, but if he wants to sell it quickly, he may have to accept a far lower price, or an enchanter may have to wait some time before he can find a buyer for a hideously expensive magical weapon.

Nothing Lasts Forever

A merchant dissatisfied with the prices he is offered may hold on to goods until the market changes, but he waits at his own risk. Goods can spoil, be nibbled by rodents, accidentally break, and be subject to pilfering or, in extreme cases, lost to raiders or warfare. In some settings, they may also run the risk of becoming obsolete or unfashionable. Large stocks of goods will diminish over time as detailed below, with the listed proportion of the original amount being lost

at the end of the time period given. The bonus amounts for extended lengths of time are cumulative. For example, a load of fresh carrots would be reduced by 8% a week for two weeks (total waste 16%), 13% the third week (total waste 29%), 18% the fourth week (total waste 47%), and so on. The GM may alter these rates for particularly fragile or durable commodities within each class (for example, lettuce will go bad much faster than onions). The amount of material wasted can also be modified by climate and other storage conditions. For goods with variable rates of decay, no waste at all is possible. Therefore, treat any result of zero or less as zero. The GM should use this chart only to reflect the gradual diminishing of large reserves sitting in a warehouse or ship's hold. It should *not* be used to slowly degrade individual pieces of adventurers' equipment or small quantities of supplies on hand, which receive far better care than goods in a warehouse.

Foods

Fairly durable fruits/vegetables (onions, potatoes):	8%/week for 2 weeks, +5% per week thereafter
Dried or preserved fruits/vegetables:	1%/month for 6 months, +0.5% per month thereafter
Fresh meat, most dairy products, delicate greens and vegetables:	+10%/day after 1 day
Dried, smoked, or preserved meat, hard cheeses:	1.5%/month for 6 months, +0.5% per month thereafter
Grain/flour:	1%/month for 6 months, +.5%/month thereafter

Other Goods

Cloth:	(1d-3)%/month
Fragile goods (ceramics, glass):	(1d-4)%/month
Durable goods (metal, stone):	(1d-5)%/month

Conditional Modifiers

Perishables in cold climate (near-freezing or below):	reduce waste by (1d-2)%
Dried perishables in very dry climate (near-desert or drier):	reduce waste by (1d-2)%
Perishables in wet climate:	+(1d-2)%
Perishables in climate-controlled containment (probably magical at these TLs, but includes burial under permafrost):	reduce waste by (1d)%

use instead of the above modifiers):

Transporting less durable goods (foods, cloth, fragile goods):	+(1d-3)%/week
--	---------------

Transporting more durable goods (metal, stone):	+(1d-5)%/week
---	---------------

The GM may apply any additional penalties he sees fit if the goods are in a vehicle which takes a "cargo" hit.

Example: On a later voyage, Paolo buys a cargo of 1000 square yards of silk. His voyage takes two months. The basic rate for damage to cloth is (1d-3)% per month. The GM rolls a 4 for the first month and a 2 for the second. 1% is lost the first month, 0% the second. Cloth is also damaged at (1d-3)% per week when transported. The GM rolls the following: 4, 4, 6, 1, 3, 5, 2, 1, for a loss of 7%. The total loss is 8%. Paolo's cargo of salable silk is 920 square yards when it reaches port.

Loans and Banking

As has already been mentioned, money is scarce. For a merchant, that's a problem. A merchant may have clear sailing, a silver tongue, and a room always waiting for him at the royal palace at his destination, but that doesn't do him any good if he can't buy a cargo to take with him and hire a ship to carry it. Few individuals, even few families, had the resources to lay out that kind of cash all at once. Even fewer could afford to lose a large sack of coin to accident or theft, and just as is the case today, legal money in one place is just a handful of metal (albeit valuable metal) in another. So where can a merchant get a great deal of money in a hurry? This is where banking comes in.

The earliest "bankers" were money lenders and coin changers. The two practices shaded into one another, and a banker would probably do some of both. Money lenders typically charged high rates of interest, usually expressed as a lump sum to be repaid after a set period of time rather than a percentage rate, with additional penalties for late payment ("In return for the loan of 100 pounds, there shall be a payment of 124 pounds ere next Witunside eve. Should the full amount not be paid, he shall suffer a penalty of four shillings each fortnight until the full sum be paid."). Translated into modern terms, annual interest rates of twenty percent or more were very common, but preferred customers could get slightly lower rates.

Coin changers changed money from one denomination or currency into another. The Saturday Night Live "Exchange Bank" sketch aside, changing denominations was serious business. For example, a tradesman or merchant might take in most of his income in silver or copper but need to convert an unwieldy mass of low-denomination coins into easy-to-handle higher denominations for easy transportation. Because of the scarcity of money, this was a service for which somebody with a lot of coin could charge a small but not insignificant fee. Coin changers could also take coins minted in one place and convert them to an equivalent value in another currency based on their precious metal content (taking a cut, of course).

What many low-tech economies *didn't* have was the idea of a bank as a place to keep money. It was a concept which evolved through the Middle Ages and Renaissance in small steps. Among the earliest forms of deposit banks in Europe was the financial service offered by the Templars and other monastic orders during the Crusades. Crusaders could give money or goods to the order through a local monastery in return for a *letter of credit*. The letter identified the bearer and the amount deposited, and it could be exchanged for money and goods at another monastery once the Crusader reached the Holy Land. It was far more portable and secure than a bag of money; a thief wouldn't match the description in the letter, and if it were lost, the legitimate bearer had the option of going home and requesting a new copy (although that could be difficult if he was already near his destination; PCs in a distant land might have to expend considerable energy chasing after a lost letter of credit). In time, some wealthy merchant houses with a presence in different cities began to provide similar services to profit from the trade of other merchants.

The idea of standing deposits grew out of the idea of letters of credit. If money could be held securely by a third party while one traveled far away, why not have that same third party hold money while one stayed at home? The depositor would be relieved of the need to keep and carry sacks of coin (which could be stolen) or count it out (possibly

inaccurately). Instead, when a large transaction needed to be made, both parties could simply go to the banker and have him transfer the amount from one account to another. Meanwhile, the banker could loan out the coin he had on hand for profit. And so the deposit bank was born. Banks dealing solely in deposits used in local transactions could be much smaller (they could be one man or one small family) and therefore much more numerous than "international" merchant banks which issued overseas letters of credit.

Despite the convenience of deposit banking and letters of credit, these ideas were slow to catch on because early banks were essentially unreliable. Bankers could and often did overextend themselves, making unwise loans or borrowing too much (bankers often borrowed from other bankers to amass capital for larger, higher interest loans) and losing their deposits. At any rate, banking services were exclusively for the rich and powerful (the accounting overhead in dealing with small deposits made them unprofitable) and used only for large transactions. A wealthy merchant might use the services of a banker as little as twenty or thirty times a year; an average of one transaction every two days would be extremely frequent. A merchant or nobleman might have reason to use a bank, but the average adventurer won't. Most characters will have to keep their savings under the mattress or in a well-secured pouch. On the other hand, if a party of adventurers kills a dragon and brings a wagon-load of gold back to town . . .

Money lenders were never popular. Commonly held attitudes about the shiftlessness of merchants went double for them, and then as now people tended to resent their debtors. A money-lending character might be fabulously wealthy and have connections to any number of powerful figures in society. Indeed, a particularly wealthy money lender would have remarkable access to aristocrats and could hope to hobnob with princes and kings. But he'd also probably have a negative reputation and a socially precarious position. Bankers might be the target of riots and other civil disturbances in bad times. Worse yet, their connections to powerful rulers were a bit dubious when push came to shove. The same noblemen who might protect them in troubled times might also be heavily in debt to them ("conflict of interest" is not a term current in most of ancient law). If an angry mob of townsfolk was advancing on the moneylender's house, a ruler would have the choice between sending out the troops or letting the banker's records of his heavy gambling debts go up in smoke. Indeed, if the ruler were particularly intemperate and indebted, the moneylender might find himself on the wrong end of trumped up criminal charges. In dark times, a wealthy money lender would probably be very happy to have a batch of tough adventurers ready to get him out of tight spots or, in particularly bad spots, out of the country.

One purely cultural aspect of early banking is that periodically much of it was performed by religious and ethnic minorities. For various doctrinal reasons, Medieval Christians were prohibited from loaning to other Christians for interest, and Muslims were prohibited from loaning to other Muslims. As a result, Jews were employed as middlemen in Catholic Europe and both Jews and Christians performed that office in the Muslim world. For example, person A, a Muslim, would want to loan money to person C, another Muslim. Person A would actually make a loan to person B (or person Beth, if he's a Jew), who would then immediately loan that money to person C. One can imagine an ethnic character to banking in fantasy worlds as well, with, say, gold-rich dwarves dominating money lending or long-lived elves carefully regulating deposit banking. At any rate, the minority character of money lending made it a doubly dangerous occupation. Because many minorities had limited legal rights, they were that much more vulnerable to popular unrest, and it was that much easier for a ruler to regard them as useful but disposable.

To obtain a loan, a character must make a successful Merchant skill roll. His Merchant skill is subject to *double* the area familiarity penalties discussed in Making Connections above (bankers are sensibly reluctant to loan to people without local ties) and to the same modifiers for size of transaction and overall economic conditions in Barter, Cash, and Scarcity. The basic interest rate is 20%; the roll may be modified by +1 for every additional point of interest, or -1 for every *half* point of interest below that level. The roll is further modified for the character's wealth as follows:

Dead Broke:	-10
Poor:	-5
Struggling:	-2
Comfortable:	+1
Wealthy:	+3

Very Wealthy: +5

Filthy Rich or better: +8

Monopolies

Sometimes, charm and money aren't enough. Merchants may be prohibited from dealing in the most profitable goods. Far from prohibiting monopolies, many low-tech governments actively supported them. The best-known examples of government-maintained monopolies are relatively modern (for example, early modern companies chartered by European governments with exclusive rights to trade with India and the Far East), but the practice is as least as old as the Roman empire's control of the salt trade. A government might conduct trade in particular goods as a direct source of revenue or, more often, charter a merchant or group of merchants with exclusive rights to trade in specific goods or in a particular region in return for a substantial payment. Merchants attempting to compete would face not only an entrenched competitor, but also criminal prosecution. Because governments declared monopolies on preferred goods or trading areas, the franchise on a monopoly could be extraordinarily lucrative. A merchant would go to considerable trouble and expense to obtain one, and lesser merchants might make similar efforts to ally themselves with a monopoly holder. Obviously, the existence of monopolies might lead to the same kinds of adventure possibilities inherent in any other setting where people jockey for money and power. Characters pursuing a monopoly might try to befriend the current monopoly holder to get a piece of the action, eliminate him and take his place, or attempt to persuade the government to change the rules and include them in the monopoly. Particularly action-oriented characters might even resort to smuggling.

One special form of farming out a monopoly bears mentioning: tax farming. In some ancient societies, particularly large kingdoms and empires, the business of tax collection was sold off just as monopolies on goods were. The publican (a term which, alas, has nothing to do with pubs) would have the right to collect a specific tax (for example, rents on tenants' farmland but not an additional per capita tax, or duties on silk but not duties on wool) in return for what was usually a lump sum. He would, of course, have to bear the costs of the tax collection himself, but if he collected more than he was required to turn over to the government, he got to keep the excess. Tax collecting could be extremely profitable, but if people disliked merchants and bankers, they *hated* publicans. Working for a tax collector might lead to interesting moral dilemmas for PCs. For example, should they collect the legally owed rents from an aged grandmother, or should they leave her enough to live on until the next harvest?

Pyramid Review

The Crucible of Freya (for d20)

Published by [Necromancer Games](#)

Written by Clark Peterson & Bill Webb

48 pages; \$7.99

Crucible of Freya is the first module released by Necromancer games for their new Sword & Sorcery line of *d20* system products. The quality of the book it self is very good, with a lot of attention obviously being paid to layout and interior art.

This isn't surprising, considering that Necromancer is closely associated with White Wolf games, or that the Sword & Sorcery line is headed up by Ken Cliffe, a White Wolf alumni with a proven track record. The writing is clear and informative, without being distracting. Art-wise the book is very clean and subtly reminiscent of first edition; the format of the book is likewise easily comprehensible easily referenced with little difficulty locating the various sections. The book's three maps are straightforward, though the wilderness map is a little uninspiring. Anyone familiar with any of the various incarnations of *D&D* will have very little difficulty picking up this product and running it.

Chapter one is an introduction to the adventure and includes a module overview, background, and a lot of advice for running the adventure; this is all very informative and designed to assist a novice DM run the module quickly.

(SPOILER ALERT)

The adventure itself revolves around the theft of a valuable artifact from the temple of Freya and the party's quest to retrieve the artifact. Fairhill is a small town beleaguered by the forces of evil, as evil forces tend to do. The party wanders into this town and become involved in the action almost immediately. The set up is pretty basic; on the other hand, it *is* an introductory adventure, vaguely reminiscent of the classic *Dungeons & Dragons* adventure *Keep on the Borderlands*. There are a few surprises in the adventure portion of the module, and the work seems to have a slight identity crisis; it's difficult to determine if it's a bad thing of not.

Chapter two is called Areas of Adventure and gives an overview of the town of Fairhill, the wilderness surrounding it, and its occupants (both humanoid and other). Nineteen pages detail the town and its major npcs in enough detail to allow Fairhill to serve as a home base for a fledgling party. There are thirteen keyed locations (three of which are taverns) and 11 NPCs, all of which are detailed enough to give the town its own character. I was surprised than a few of the locations were detailed in much the same way a dungeon room would be. I really hope it isn't necessary to know how much the jewelry of Fendrin's recently dead wife is worth, or the contents of the Magistrate's lockbox. Also included in chapter two is a room by room description of a ruined keep which is well stocked with adversaries and obviously meant to be explored and cleansed by the party (this becomes important in the adventure itself).

Chapter three contains the adventure itself, and as beginning adventures go it is somewhat linear. Evil creatures attack, you find their home and make them regret it . . . pretty much standard fantasy adventure plotline #4. In this case it is the ruined keep detailed in chapter two. Once the party find the keep, they simply have to attack it and retrieve the module's namesake: simple -- maybe. At first glance it seems uninspired, but there are a few twists than make it interesting. In fact, the threat level of the keep's occupants may be more that a beginning party can handle and the adventure is designed to allow the party to "siege" the keep. It would have been nice to be able to call upon Fairhill's town guard to aid in the siege, but alas "real" adventurers wouldn't call for help. As introductory adventures go, *Crucible of Freya* was nice, and being able to retreat back to Fairhill to rest between assaults almost guarantees that the party will become attached to the town as well as being well rested & healed, especially as the module's main bad

guy is very challenging for beginning players.

Crucible of Freya is billed as being "a challenging introductory adventure for four to six characters of 1st or 2nd level" -- challenging might be an understatement. Most 1st level adventures are designed to ease new players into the world as well as the game system, by slowly increasing the challenges in the adventure as it progresses. This adventure contains a number of set encounters in the wilderness area that contain creatures with challenge ratings far higher than 1-2 level parties can face. Most of these encounters are scripted to have "outs" for the party to survive or at least have a chance to survive them. Still, there is little chance of a beginning party facing off against a hunting Manticore or EL 6 Troll. These encounters are a little out of the league of beginning parties, especially when an EL 6 Troll can look much the same as a mundane one.

Fairhill contains many rumors that are intended to lead the party out into the wilderness seeking adventure, possibly finding only their death. If the DM is wily and keeps to the module's storyline, ***Crucible of Freya*** is an excellent adventure, and is very reminiscent of original ***D&D***. The plot is straightforward and gives all character classes an opportunity to share the limelight. Thieves get to sneak and pick locks, and there is plenty of combat to keep both fighters and clerics busy. Fairhill itself is interesting, though references to legends, locations, and people which will be featured in future Necromancer Games releases could be tiresome to some readers. If your players are not prone to killing everything they meet, they will probably enjoy this module. If your party is of the "Hack and Slash" variety and would sooner die than retreat, then *Crucible* will most likely give them an opportunity for the former once they have their first wilderness encounter. I'm still not sure if this is an entirely bad design philosophy, but it will certainly make players less impulsive, which certainly isn't bad.

(END SPOILER ALERT)

(Editor's Note: Necromancer Games' website has a free 23-page supplement of additional material available for those who have purchased this adventure.)

Pyramid Review

Rain o' Terror (for Deadlands)

Published by [Pinnacle Entertainment Group](#)

Written by Anthony Ragan

\$15.00

*(SPOILER ALERT: The following review contains some information that may reveal more about the **Deadlands** setting than players generally know.)*

Pinnacle Entertainment Group's **Rain o' Terror**, by Anthony Ragan, is an adventure for an experienced posse ready to make an impact on the future of the Weird West. The adventure balances fast-paced combat with investigation and problem solving, giving almost any posse member a moment to shine. In addition, the posse will be rubbing shoulders with some of the big players of the **Deadlands** universe while helping to determine the political future of California. While this adventure was written for **Deadlands** players and Marshals, it can be easily converted to any steampunk setting. It can also be shifted to other settings with some more planning and work. No matter what the setting, however, **Rain o' Terror** will challenge and entertain player and gamemaster alike.

Rain o' Terror is primarily set in the tense world of post-Knicknevin California. The adventure is designed to allow Marshals to link this adventure to **Ghostbusters**, although it is not necessary to have run this adventure prior to running **Rain o' Terror**. In this adventure, the players are hired to protect The Proletariat — the airship of Collegium mad scientist Fineas von Landingham — and its cargo: a Ghost Rock bomb capable of creating a 5-mile wide Deadland. The airship and bomb, of course, are stolen and the posse will find themselves leaving Gomorra for Shan Fan and Sacramento, eventually becoming embroiled in the brewing referendum to decide if California will continue to support the Union, join in with the Confederacy, or strike off on its own as the Bear Flag Republic. Behind all these events lurk some of the Weird West's major powers: the USA, CSA, Hellstrome, and Grimme.

The pacing of **Rain o' Terror** is impressive. The posse will be kept on their toes and challenged at every turn. The challenges are interesting but not so obscure that Marshals will have to worry about redirecting posses that have gotten off-track. Several of the encounters are quite chilling . . . even for a horror game. It is important that the posse is well balanced, and helps if there is at least one Mad Scientist. Those posses who have some contacts in Shan Fan will find themselves at some advantage but not so great an advantage to upset the adventure's design. Marshals may find it helpful to have a copy of **The Great Maze** and **Doomtown or Bust** to help flesh out the posse's stays in Shan Fan and Gomorra, but neither is required. **Rain o' Terror** provides quick introductions to both locations and more than enough information for the Marshal to comfortably introduce the posse to these locations. Indeed, the information in **Doomtown or Bust** is sufficiently "out of date" (it details pre-Knicknevin Gomorra) to be of relatively limited use unless you intend to use Gomorra as a base of operations for your posse.

Conversion to other systems is relatively easy for campaigns in a steampunk setting. Airships and doomsday weapons are the stuff of such worlds, like **Castle Falkenstein** and **GURPS: Steampunk**. Moving the adventure into a non-steampunk setting involves a bit more work, yet it is possible. Von Landingham's airship, for example, could become a gnome's masterwork carrying an archmage's spell held in stasis in a **Dungeons and Dragons** game. While such a conversion would entail some work, the forthcoming **d20 Deadlands** will make this process easier.

All in all, **Rain o' Terror** is a great purchase for players of **Deadlands** and other games at \$15. Those who purchased **Rain o' Terror** as a PDF file during the short-lived alliance between Pinnacle and Cybergames can purchase a hard copy at a reduced rate and should contact PEG directly. As the part of a three-part story arc (**Ghostbusters**, **Rain o'**

Terror, and Christopher L. McGlothlin upcoming *Dead Presidents*), this adventure helps weave your posse into the world of *Deadlands*.

Pokéthulhu Adventure Game

Published by [Dork Storm Press](#)

Written by S. John Ross and Philip Reed

Illustrated by John Kovalic

32 pages; \$5.95

Based upon a concept by Philip Reed and Russell Godwin, and written by S. John Ross and illustrated by John Kovalic, *The Pokéthulhu Adventure Game* was originally seen at Gen-Con 2000. Since then, anyone who wasn't there has had to make do with the still excellent T-shirt. Now Dork Storm Press has published the game in comic book format. For those not in the know, the concept behind *Pokéthulhu* is that it is a parody of a certain Japanese children's cartoon that has become a worldwide phenomenon using the Mythos of author H. P. Lovecraft.

Actually, *Pokéthulhu The Adventure Game* is based upon a cartoon broadcast on the Lovecraft Network. The players are cast in the same roles as little Randy Carter, Sonia, and Titus. These young cultists capture, raise, and train Pokéthulhu. These loveable eldritch monsters are pitted by their owners against other Pokéthulhu, not for the purposes of evil, but purely for sport. Only the dreaded Team Eibon have motives that are decidedly un-sportsman-like. This is a world that only the young (or an insane adult witch or wizard) can understand, as it would scare the trousers of normal adults.

After a fun introduction to roleplaying from the Dork Tower crew (which will look familiar to *Pyramid*-readers, we get down to the game. Players each create a trainer, spending thirty points to define their scores in Grade Level (their normal education), Phys Ed (all physical aspects of a character bar sneakiness), Pokéthulhu Lore, Shoplifting (stealth and stealing), Sanity, and Talking Trash (fast talk). Scored between one and twelve, one ability is designated as being lucky for that trainer. Grade Level determines a trainer's age, and adding either Grade Level or Pokéthulhu Lore to their Sanity cannot exceed thirteen.

The game system is very simple, requiring three "Shining Dodecahedrons" (twelve-sided dice). Abilities are tested by rolling up to three dice -- the more difficult the desired action, the less dice rolled -- and if any result is equal or less than the ability being tested, the roll is successful. If the ability has been designated as lucky for the trainer, then three dice are rolled whatever the difficulty.

Once created, trainers grab a copy of the Pokénomicon, the book of elder lore used together with Shining Dodecahedrons to capture and store individual Pokéthulhu. These cute eldritch beasts can be given to the trainers as gifts (as happens in the book's first adventure seed) or captured from the wild. The most important factor to any Pokéthulhu are their aspects, which are described as their essential spiritual resonances. Each Pokéthulhu has three, one of which is actually their weakness. Likewise, trainers also have an aspect, for which they have an affinity with Pokéthulhu of the same aspect. For example, Randy Carter's own aspect is "Squamous," but his favourite Pokéthulhu, Pikathulhu, has the aspects of "Fungous" and "Luminescent" with a weakness of "Sticky." There are eight given aspects, all of which have been taken from the television series.

Seven Pokéthulhu are detailed, plus a variant; this includes the three winners of a design competition held via the

Internet. This leads to one of the only deficiencies about the game: there aren't enough Pokéthulhu detailed here! Another ten or so are mentioned throughout the book, such as Jigglypolyp and Tindaloo, the Non-Euclidean puppy escapee from the Cheap Curry Dimension. It would have been nice to see some more described, but given a copy of a certain horror game and access to a certain kid's cartoon, any self-respecting Owner of Arcane Rules (as the GM is known in this game) should be able to create his own.

Apart from the simple combat and training rules, the bulk of the book is made up of Philip Reed's five adventure seeds and S. John Ross' full-blown adventure, "Over Cold Mountain." The seeds form the basis for a campaign or series, and are designed to have other adventures slotted in around them. In fact, they work better than "Over Cold Mountain." This is not to detract from Ross' scenario, which is rather fun, but the seeds parody that certain kid's cartoon to greater effect. Rounding out the book are Trainer and Pokéthulhu sheets as well as a set of paper minis for the Owner of Arcane Rules to photocopy and use.

There is still room in this game world for more material. A Pokénomicon detailing more Pokéthulhu would be welcome, as well as something covering Team Eibon. Although mentioned in the book, and having their chant appear on its back cover, no more information about Randy Carter's rivals is given.

Once in a while something comes out that makes every gamer sit up and go, "Cool!" The latest in the list of games to elicit such a response is *Pokéthulhu The Adventure Game*. This isn't a game for the kids, but one for us big kids who get the joke. (Unless of course, you've already let them in on the secret and got them worshipping early. In that case, well done!) This is a hugely fun yet simple game of Non-Euclidean proportions, which really must be thine!

-- *Matthew Pook(émon)*

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Dork Tower!

Dork Tower!

Playing Chicken

A friend of mine, Robert, was in a fantasy RPG one time . . . a game, I might add, I had nothing to do with. And Robert -- along with the rest of the group -- wasn't having any fun with the GM's dungeon. (As an aside, this is the same GM we wrote about in this year's [April Fool](#) column.)

So at one point there is a dungeon room with miniature twelve demon statues; the heroes need to find the one that weighs differently from the other 11, but they only have three uses of a magic scale to determine this. (Puzzle enthusiasts will recognize this as the classic coin-weighing puzzle, with the serial numbers filed off.) If they choose incorrectly, the eleven identical statues will animate, and the party will surely be torn apart by the blood-thirsty demons.

The players sigh, and begin to try to remember how to do that puzzle. But before they can get too far, Robert picks up a 12-sided die and rolls it. "I choose the eighth one," he says, obeying the result of the die.

"Are you sure you want to do that?" asked the GM. "The odds of randomly choosing the right one are pretty slim . . ."

"Well," said Robert, "the way I see it there are two possibilities. Either I randomly chose the right one, and we get to go on without doing one of these bull puzzles; or I chose wrong and we all die, leaving us an opportunity to do something fun with the rest of the evening. It's a win-win scenario, as best I can tell."

The gaming group dissolved shortly thereafter.

Anyway, there are a dozen lessons that can be gleaned from that anecdote, but today I'm going to focus on one:

Are you, as the GM, prepared to blow up the world? Are you, as a player, prepared to make the GM blow up the world?

A couple of weeks ago I talked about how to maintain an epic feel in your campaign without making the players feel so overwhelmed that they feel the need to go get help. But that begs the question, if you *do* run or play in something that epic, are there really any consequences for failure? If the presumption is success, and the game world can't continue without success, then there's a tremendous pressure on the GM to allow them to succeed. And, more insidiously, there is sometimes a slight pressure on the players to try and fail; after all, he wouldn't *really* blow up the world, would he? It can become a game of chicken, with both sides knowing that the GM wouldn't possibly end everything.

In my mind, as a GM, that can be dangerous. Once the players believe that something *won't* happen, any threats to make that thing happen can seem empty and hollow.

"The world will blow up in an hour unless you find the bomb!"

"Ohmigosh, really? I make nachos!"

(As an aside, this same tendency can also be a powerful tool. For example, my players know that I probably won't kill their characters, unless they bathe with toasters or similar suicidal actions. As a result they are encouraged to try things that are riskier and more cinematic than they might normally, since the risks of bodily maiming aren't as prevalent . . . which is just the kind of game I usually want to run.)

One of the highest compliments a player ever gave my GMing style was to say that they didn't know *what* I was capable of; there was no such thing as being safe or knowing that it would all work out all right. As a result, that made her (and the other players) work that much harder to accomplish their goals . . . which made their victories all the more exciting.

The *AD&D* adventure *The Apocalypse Stone* all but presumes that the heroes will fail, and provides a "no shame in

losing" kind of mechanism if the world *does* come to an end because of their failure. But it also leaves the glimmer of hope that the just *might* succeed.

So for this week I want to leave you with the idea that in my opinion, whatever you need to do to make your players believe you'll blow up the earth, do it. Blow up another planet. Blow up a beloved city. Take the heroes to an alternate dimension; blow that up. Make the heroes love an NPC. Blow him up. Conspire with a player who's playing a character that he doesn't like; blow the character up. Take the heroes to a possible future where everything's blown up. And so on.

I've done all of these things (and more) in my games. And nineteen times out of twenty, the heroes save the day and everything's right as rain. But it's the possibility of the twentieth that makes the other nineteen victories possible.

Oh, and make sure your players are having fun. Otherwise, they'll mutiny and try to blow *themselves* up.

* * *

I've been forgetting to mention it, but I thought I should plug a gamer-type summer movie that came out a week ago. Called *A Knight's Tale*, it's a medieval story about a young man who becomes a jousting knight and . . . um . . . jousts. I think there was a love story or some other subplots in there, but ignore them; they'll only hurt you. This is a summer movie.

I won't lie and say it's a good movie, but I felt it was a *fun* movie. It's a gamer movie; you can see the PCs gathering and envision the interaction, and it feels like the DVD to have the side-by-side feature of reading the GM's notes. Plus any film that has an ultra-cool Chaucer as a major protagonist is a winner in my book. And the soundtrack includes "We Will Rock You" and "Low Rider" . . . proving quite handily one of my comments from a while ago about [using different music genres](#).

* * *

Unfortunately the real world has attacked another *Pyramid* regular, and **Kenneth Hite's** column for this week has been eaten the the aether. Hopefully things will be back to normal next week for our own Illuminated Journalist. Good luck, Ken!

-- *Steven Marsh*

(*Last week's answer*) ***Star Trek: The Next Generation RPG***

(*Three stars*) "Pearl can lift almost anyone over her head. She likes sports, Theater, and beating people up."

by Elizabeth McCoy

This college of magic was researched and designed by an IOU double-major: College of Metaphysics and School of Performing Creative Arts. It is, effectively, a subset of the Making and Breaking college (p. M51) and therefore the spells listed would be usable by a One College (Making & Breaking) mage, though a more-limited Magery might only permit Clothes magic.

It should be noted that this could also be called "the Fabric College," as the same spells will allow one to work with drapes, slipcovers, or even upholstery; however, most masters of the following spells prefer to use it for clothing. (Most are also possessed of the advantage of Fashion Sense.)

All Clothes spells have a prerequisite of a suitable mundane skill, such as Professional Skill: Fashion Designer or Professional Skill: Seamstress/Tailor. Attempting to cast these spells without a sufficient knowledge of the underlying skill tends to produce very crude results, and no teacher of the College would tolerate that.

In all cases, an "outfit" is what would be required to clothe a single person. This may be a dress, pants and a shirt, or an entire suit with coat and tie. Socks and underwear will also be included when appropriate materials are provided, or with Create Clothing (below). An "item" is a single item: a dress, a shirt, a single sock, etc.

Other spells from *[GURPS Magic](#)* which are considered part of the Clothing College are: Measurement (p. M47), Dye, Clean, Rejoin, Repair, Knots (pp. M51-52), and, strangely, Enchant, Fortify, Deflect, and Lighten (pp. M38-41). Spells which can affect clothing may be used when Enchanting clothing, such as Resist Fire or Resist Cold, even if the mage has One-College (Clothing) Magery. Spells from *[GURPS Grimoire](#)* which should count are: Haircut (p. G16; useful for getting wool), Prepare Game (p. G43; useful for getting leather materials), Inscribe (p. G56; for more magical patterns), Duplicate (p. G56), and Fasten (p. G67).

Seek Clothes

Information

Useful for finding your clothing in the dark, or the last pair of clean underwear in the pile on your dorm room floor. This spell allows the caster to sense the nearest item that fits the description. (This may be "my pants" or "clean socks." A truly detailed description, such as "A red leather corset done up with silver laces and a latex over-pattern, with a hidden pocket containing a credit card," will carry a penalty -- usually around -1 to -5, but it could be more, depending on how much the GM thinks the spell is being abused.)

*Cost: 1.
(This is also a Knowledge College spell.)*

Know Pattern

Information

With a successful casting upon an item of clothing within the caster's sight, the mage will know what pattern was used to create the item. The caster may try to sketch the pattern out then and there (using an appropriate Professional Skill: Fashion Designer or Artist skill), or quickly use Cut Pattern (below). Note that this will be the pattern of the clothing as it is being worn -- if the wearer is a size 6, then the pattern will be for a size 6 person. (Something which may be annoying, if the mage is a size 8.)

If the pattern so discovered is not transcribed into a physical form (by magical or mundane means) or memorized quickly enough, the GM may require IQ rolls to duplicate it exactly, later on. These IQ rolls would have the usual bonuses for Eidetic Memory.

Cost: 1.
(This is also a Knowledge College spell.)

Memorize Pattern

Special

A variant of Memorize (p. G59), this allows the caster -- or, with a touch, anyone else -- to memorize a pattern for future use. (The pattern may be one the subject is looking at physically, or one that has just been discovered with Know Pattern (above).) The subject may store, as perfectly as if he had 60-point Eidetic Memory, up to (IQ) patterns via this spell. Memorized patterns may be "over-written" if the subject desires. (There is a rumored improved version which allows the number of memorized patterns to equal the skill with the spell or the underlying mundane skill of Seamstress/Tailor/Fashion Designer, whichever is higher.)

Cost: 3.
Time to Cast: 1 minute.
Prerequisites: Know Pattern or Memorize.
(This is also a Knowledge College and Mind Control College spell.)

Stitch

Regular

When the basic elements of clothing are assembled -- properly-cut fabric, needle, and thread -- this spell will quickly by-pass all the tedious sewing required to make a single outfit. (Pants and shirt, dress, etc.)

Cost: 2.
Prerequisite: Either Rejoin or Air Golem.
(This is also a Movement College spell.)

Undo Sewing

Regular; Special Resistance

As you sew, so shall you rip. This spell causes a designated item of clothing to come completely unstitched. If it is being worn, the clothing's occupant has a chance to grab for the unraveling thread and hang on, aborting the spell. This requires a DX roll. (The GM may rule that the degree of success of the DX roll indicates how quickly the spell was aborted, and thus to what degree the wearer is now unclothed.) A counter-casting of Stitch, Weave, or other clothing-creation spells will also cancel the Undo Sewing, as the threads upon the clothing seem to ripple and come un-done and re-done much like a Magical Girl costume change. Only without the change (probably).

Cost: 2.
Prerequisite: Either Stitch or Weave (below) or Weaken.

Mend Clothing

Regular

This is, essentially, a cheaper version of Repair, specialized for clothing. It will fix any outfit, provided there is needle and thread and appropriate patching materials. (If spells which would provide such material are known, such as Weave and Create Fabric, the physical ingredients need not be present.)

Cost: 1 per outfit.

Prerequisite: Rejoin or (Weave, Cut Pattern).

Cut Pattern

Regular

With a physical pattern (or a previous casting of Know Pattern or Memorize Pattern (both above)), and fabric, this spell will create the raw materials for a single outfit. The outfit can then be put together with Stitch, or mundane means of sewing. The spell is at a -5 to cast if the fabric has been previously worked. (E.g. if someone is trying to cut a ballgown into a pair of overalls, whether or not the ballgown is being used . . .)

Cost: 1; 3 if the fabric was previously worked.

Prerequisites: Either Undo Sewing or Weave or Reshape.

Dye Pattern

Regular

With this spell, outfit may be dyed in the pattern of the caster's choice. (One pattern per casting; the mage may wish to separate items if more than one pattern is desired.)

Duration: 2d days.

Cost: 1 for an item of clothing that provides partial body coverage, such as pants, a sock (or, in this case, a pair of socks), or a bathing suit; 3 for an outfit or item that provides extensive body coverage (such as a dress, a catsuit, or an old-style bathing suit).

Time to Cast: 5 seconds.

Prerequisite: Dye.

Weave

Regular

Given basic materials (yarn, thread, etc.), this spell will weave a bolt of fabric. With extra energy, the basic materials may be raw wool, silkworm cocoons, etc. A use of the Clean spell (p. M51) is suggested in such cases, if the material has not already been washed.

Cost: 2; 5 for raw materials.

Time to Cast: 5 seconds.

Prerequisites: Reshape or Stitch.

(This is also a Movement College spell.)

Alter Clothing

Regular; Special Resistance

The caster may alter the fit of any one outfit within sight, by means of waving her hands in the air (or actually touching the garment) with appropriate motions as if to physically sculpt the item. (At IOU, the dreaded "Wedgie Gesture" can cause many students to jump for cover.) Alas, this spell will only work on one subject-outfit at a time. Though there are always rumors of a version that will allow the caster to modify whatever she (or he) looks upon for the duration of the spell.

The effects may be resisted by contorting one's body (Double-Jointed helps), as the effective strength of the modifications is relatively weak. (Except, for some reason, the Wedgie maneuver.) Getting out of the mage's line of sight will cause the mage to be unable to modify the clothing until visual contact is once again established.

Duration: 1 minute.

Cost: 3 to cast, 2 to maintain.

Time to Cast: 2 seconds.

Prerequisites: Weave or Reshape.

(This is also a Movement College spell.)

Make Clothing

Regular

This is basically a spell that combines the effects of Cut Pattern and Stitch, and has the same basic requirements: Pattern (or appropriate prior spell), fabric, needle, and thread. If Dye or Dye Pattern are known, their effects may also be incorporated. If Weave is known, only appropriate threads are required -- and the clothing created will have no seams!

Cost: 3.

Time to Cast: 5 minutes *Prerequisites:* Cut Pattern and (Stitch or Weave).

Create Fabric

Regular

This is a specialized version of Create Object (p. M46), which is cheaper and only creates a bolt of fabric, but is otherwise identical.

Duration: Indefinite, so long as it is touching a living being.

Cost: 1 per 10 pounds of fabric created.

Time to Cast: Equal to cost, in seconds.

Prerequisites: Ten Clothing College spells or (Magery 2, Create Earth, Perfect Illusion).

(This is also an Illusion and Creation College spell.)

Create Clothing

Regular

Again, a specialized form of Create Object, permitting the (cheaper) creation of clothing -- including more complex forms than Create Object permits. (The caster must be familiar with the pattern which is being used as a template for the created clothing, however.)

Cost: 2 per outfit.

Time to Cast: 5 seconds.

Prerequisites: Memorize Pattern and (Magery 2, Create Earth, Perfect Illusion) or Create Fabric.

(This is also an Illusion and Creation College spell.)

Summon Brownies

Special

This summons 1d Brownies (also known as elves) into one's workroom. Given sufficient supplies, they will mend clothing for a period of one night or until they are disturbed. (The caster is advised to sneak out quietly after summoning them.) Once summoned, make a reaction roll for the Brownies; if it is Good or better, they will continue to appear every night and mend whatever they find. If a gift of clothing is made to them, fitted to their size and pre-made,

they will vanish immediately upon donning the clothing and a subsequent casting of the spell will be required if Brownies are once again desired. If the conditions in the area are harsh (such as a Brownie sweatshop), they may become very liberal in interpreting what a "gift of clothing" is . . . ("Oh, look! A napkin! What a wonderful hat this makes. I'm outta here.")

Duration: 1 night; anything after that is up to the Brownies.

Cost: 10.

Time to Cast: 5 minutes.

Prerequisite: Magery, and either at least one spell from 10 different colleges, or 12 Clothing spells.

(This spell is a variant of Planar Summons (p. M65) and is therefore also a Necromantic College spell.)

* * *

*(This College was inspired by a minor character in John M. Ford's **The Last Hot Time**, and by the Angel of Comfortable Clothing, who has appeared from time to time in the author's personal **In Nomine** games.)*

by Dan Howard

A staple of fantasy gaming is the stereotypical wood elf. And the elf's favorite weapon is his trusty longbow. The argument has come up that a longbow is not a practical weapon for a being who spends most of his time in the woods. It is a valid argument; the longbow is pretty useless for anyone who lives in rugged terrain. It was designed for long-distance shooting; any obstacles between the archer and the target increase the difficulty of hitting that target. Longbows were used by the English to great effect by keeping their archers back and firing a great many volleys at the enemy before they could close on them. Two hundred yards was not an uncommon distance to begin firing, and up to twelve volleys could be fired in a minute. Even an average longbowman could hit a moving target fifty yards away. In a forest there could be a great many obstacles within a distance of fifty yards, thus negating the primary advantage of the longbow. Also, any item which is longer than the person carrying it would greatly hinder the ability of that person to move through rough terrain, or in tight spaces . . . such as a dense forest. Accurately firing a longbow in this situation would be almost impossible.

In order to determine what weapons an elf might prefer, one should examine both the physical characteristics of typical elves and the environment and society in which they might live. A stereotypical elf usually lives in the forest isolated from humans. Due to this existence it would be difficult for elves to base their livelihood on agriculture. This leaves two means of subsistence: hunter/gatherer and pastoral. Both of these make large settlements impossible as resources are limited. Forest elves must therefore live in small family clans widely scattered throughout the forest.

If their existence was pastoral, their animals might include goats, pigs, and possibly deer. Elven clans would also need to be mobile, moving at least twice per year between summer and winter pastures. If they were hunter/gatherers they would rarely have a fixed abode for more than a year at a time. Either way they would not have permanent settlements. They could, however, have fixed locations at which all the clans gathered for special occasions during the year such as religious festivals and celebrations but it is unlikely that this would be a fixed residence.

It is also likely that individual clans would often be hostile to one another. In a pastoral existence a clan's wealth would be in its herds rather than in land, and adjacent clans might poach each other's livestock. In a hunter/gatherer society one clan would often encroach on the traditional hunting grounds of another when resources were scarce. Combat involves small raiding parties and tends against pitched battles in favour of hit and run guerilla tactics. Success in this sort of society would be calculated by the amount of booty brought home rather than the amount of people killed or land captured. Of course, in a High-Magic world, anything is possible. Magic would negate the problem of limited resources as well as provide advantages for communication and living conditions.

In most game systems elves are usually more agile than humans so they naturally prefer weapons that take advantage of their superior agility, such as thrown and missile weapons. In most societies weapons were usually adapted from tools used in daily existence. Spears would be of two types, both handy when hunting -- lighter javelins for throwing and heavier melee spears for more hostile prey. Throwing blades and handaxes are more portable than spears and are just as deadly against prey. Slings are an excellent inexpensive hunting weapon but a lot of space is needed to swing it about the head before releasing, so it has limited practicality amongst trees. Plus the rapid movement caused by swinging is likely to startle the prey and cause it to flee. Knives are probably the most useful of tools so every elf would carry one on his belt. Large blades such as machetes would also be extremely handy -- providing a tool for clearing undergrowth and dispatching wounded game. Balanced swords really only have one use -- combat. It is unlikely that elves would make much use of weapons such as the traditional broadsword or rapier because they usually don't have access to large amounts of good quality metal, and because they don't have a professional warrior class.

Long weapons that rely on swinging attacks would also have limited practicality when fighting amongst trees. Thrusting attacks would prevail. Spears would be the preferred melee weapon both because of its method of attack and the small amount of metal required to fashion one. Bows are, without a doubt, the best hunting weapon. As mentioned above, longbows are no use but perhaps a shorter bow could be utilised.

Heavy armor would also be a disadvantage to the elves. Firstly, because it would hamper their main advantage -- their superior agility-- and secondly, because it hinders rapid movement through their awkward terrain: dense forest, hilly ground, thick undergrowth, marshes, and unbridged rivers. Also, because of this, and because of the lack of suitable pasture, it is unlikely that elves would ride mounts.

So, we have a group of beings who live in small clans, are highly mobile, and don't have any centralized government. They are guerilla fighters who rely on agility and subterfuge rather than open combat. They wear light armor and do not utilise cavalry. Their weapons of choice are the knife or machete, spear, and bow. But what sort of bow and how could it be effectively used?

A historical parallel might best be sought here. Many of the characteristics of our elves can be attributed to many forest dwelling cultures; Medieval Wales is a good example. The Anglo-Norman invasion of Wales by Edward I can be also used to demonstrate how elves might react to an outside aggressor.

The 12th-century chronicler Gerald of Wales (Giraldus Cambrensis) gives a good account of Wales and her inhabitants. Contrary to popular belief, the English longbow was not invented by the Welsh. Most evidence suggests that it was Scandinavian in origin and introduced to England during the many Danish invasions before 1066. Gerald describes the Welsh bow:

"The bows used by these people are not made of horn, ivory, or yew, but of wild elm; unpolished, rude and uncouth, but stout; not designed to shoot an arrow to a great distance, but to inflict very severe wounds in a close fight."

Here we have the real Welsh bow. A roughly-fashioned bow no longer than the standard continental bow (otherwise Gerald would have commented on its unusual length) -- about four feet long, made of elm, with a short range but great power. Much more practical for woodlands use than a six-foot longbow. Welsh bows were fired at close range, as an ambush weapon -- a perfect bow for our elves. During fighting at Abergavenny Castle, a Welsh arrow was recorded to have penetrated a horseman's mail-covered leg, through his saddle, and into his horse far enough to kill it; another arrow was fired 4" into a solid oak door.

Using this description we can approximate *GURPS* stats for such a weapon.

Weapon	Type	Amt.	SS	Acc	1/2Dam.	Max.	Cost	Weight	Min ST	Notes
Welsh/Elven bow	imp	thr+3	13	2	STx12	STx18	\$150	3lbs	10	Max dam.1d+4.

Note that standard arrows are not suitable for this weapon. Welsh arrows are shorter and heavier than longbow arrows. The extra weight reduces the weapon's range but increases its damage at short distances. Larger flights help stabilize the missile. These arrows cost the same as normal arrows but are double their weight and cannot be used with any other sort of bow. Likewise, normal arrows cannot be used with this bow.

The tactics used by Welsh armies were orchestrated to suit the rough terrain -- this was often the main weapon against the invading English. Battle was preferred on marshy or broken ground, which favored the Welsh's mobility over the clumsy, heavily armored English knights. Often the Welsh would break off and feign retreat to lure the enemy into prearranged traps. Tactics consisted mainly of ambushes and raids. Gerald noted that they "stole anything they could lay their hands on and lived on plunder, theft and robbery." Here we see the tendency to concentrate on booty rather than killing. If the enemy could never have a decisive battle then it was hoped they would eventually be demoralised enough to give up and go home.

So how does one counter this sort of tactic? Edward's campaign is a good example. As his main body moved along, it

was preceded by 1,800 axmen who cleared a wide path through the woods, depriving Welsh troops of cover from which to harass Edward's army. If these axemen were Welsh prisoners of war, the enemy would be less willing to attack them. At strategic points along the way Edward left strong detachments to construct defensive fortifications such as Flint and Rhuddlan Castles. He rarely made direct assaults on Welsh strongholds, instead he ravaged the land and took their food stores and livestock. His troops were supplied from the sea. He also adopted the Roman strategy of divide and conquer -- picking the weaker of two rival clans and giving them assistance against their stronger rival -- thus destroying the stronger clan and having the weaker one indebted to him.

In conclusion it does seem possible for elves to use bows in their natural terrain -- providing they choose a suitable bow and adopt practical tactics. The Welsh provide an excellent example by using compact bows for short-ranged ambushes. Avoidance of pitched melees is of paramount importance, for they would be decimated by more heavily armed and better trained troops.

* * *

Special thanks to Kromm both for the original idea and his suggestions.

Scottish Terror: The Monster of Glamis

*"But evil things, in robes of sorrow,
Assailed the monarch's high estate;
(Ah, let us mourn, for never morrow
Shall dawn upon him desolate!)
And round about his home the glory
That blushed and bloomed,
Is but a dim-remembered story
Of the old time entombed.
And travellers now within that valley
Through the red-litten windows see
Vast forms that move fantastically
To a discordant melody . . . "*
-- Edgar Allan Poe, "The Haunted Palace"

In the North, between the River Tay and the lowering scarp of the Scottish Highlands, a thousand-year-old castle crouches over the town of Glamis. Within the castle, and within its thousand years, murders, devils, faerie, kings, treason, and phantoms swirl, an incarnadine accretion disk surrounding the black hole of the British monarchy. Deep in the battlements of Glamis, deep in the legendary substrate of the island itself, the Monster of Glamis roars. Let's talk of the death of kings, and listen for the echoes.

"More recently, it has been reported that Lady Elphinstone, sister of the Queen Mother, remembered being very frightened as a young girl of the sinister atmosphere in the rooms where Duncan is said to have been murdered."
-- Antony D. Hippisley Coxe, *Haunted Britain*

Glamis Castle first appears in history as a royal hunting lodge where the grievously wounded King Malcolm II came to bleed his last in 1034. Legend, bolstered by Shakespeare, has it that Macbeth killed Malcolm's grandson Duncan at Glamis Castle seven years later, and then died himself on nearby Dunsinane Hill. When the Stuarts themselves usurped Duncan's heirs, King Robert II (the first Stuart king of Scotland) granted the thaneage of Glamis to Sir John Lyon of Forteviot. Again, Glamis claimed blood -- Sir James Lindsay murdered Sir John in his bed.

King James V had the widow of the 6th Laird Glamis burnt at the stake as a witch in 1537 and seized Glamis Castle for his own, stripping it of its valuables. He died too early to extirpate the Lyon line, however; Glamis returned to the young 7th Laird in 1542, and the Lyons returned to favor under Mary, Queen of Scots and her son James VI. After James VI became King of England in 1603, he created Patrick Lyon, 9th Laird Glamis, the Earl of Kinghorne. Although the family supported the Covenanters, they somehow remained in the Stuarts' good graces; upon the Restoration, King Charles II created Patrick Lyon, 11th Laird Glamis, the Earl of Strathmore. The Earls supported the Stuarts through exile (the Old Pretender stayed at Glamis in 1716), and returned to prominence when Lady Elizabeth Bowes-Lyon (daughter of the 14th Earl of Strathmore) married the future King George VI in 1923. Princess Margaret was born at Glamis in 1930 -- due to the 14th Earl's peculiar delay in registering the birth, nobody quite knows where Lady Elizabeth, the Queen Mother, was born.

"After a very hospitable reception from the late Peter Proctor, Esq., then seneschal of the castle, in Lord Strathmore's absence, I was conducted to my apartment in a distant corner of the building. I must own, that as I heard door after door shut, after my conductor had retired, I began to consider myself too far from the living and somewhat too near the dead."

-- Sir Walter Scott, *Letters on Demonology and Witchcraft*

With two royal deaths, Glamis Castle started off with plenty of spiritual magnetism, and Glamis Castle has only been accumulating further ghosts ever since. The unjustly burnt Lady Janet Douglas haunts the Clock Tower as a "white lady," a "dark man" disappears through the walls, an "armored figure" and an "old hag" often hover over sleeping guests, a "huge dead man" warms himself before one fireplace, and a "gray lady" haunts the Chapel of St. Michael.

Other ghosts include the "hanged man," the "black boy," and the "tongueless woman," who shrieks at an upper window before being dragged away, and sometimes runs across the grounds tearing at her bleeding mouth. Another ghost, "Jack the Runner," sprints across the grounds in a manner not unlike that of our old nemesis [Spring-Heeled Jack](#). Finally, there is the ghost of "Earl Beardie," the 4th Earl of Crawford (grandson of the murderer of Sir John Lyon). Accused of cheating by the 3rd Laird Glamis, he swore that he'd play cards with the Devil if nobody trusted him. The Devil promptly appeared and shut himself up in a room with Beardie, where they still play cards to this day.

"If you wish to please me, you will never mention the matter of the chamber to me, for I have seen inside the secret room. I can only say that if you could guess the nature of the secret, you would go down on your knees and thank God it was not yours."

-- Claude Bowes-Lyon, 13th Earl of Strathmore, to his wife (1870)

That room in the West Tower is but one of the secret rooms of Castle Glamis. In addition to the card room, there is a Haunted Chamber where the Lyons immured members of the Ogilvy clan and left them to die by starvation and cannibalism. A party of young rakes once took advantage of the Earl's absence to hang sheets and towels out of every window in the Castle to find the secret chamber, but when they trooped outdoors no less than *seven* windows showed no linen. The Earl's return ended the experiment; the quick attention of the Earls of Strathmore and their proctors has also prevented workmen from exploring numerous secret passages. In one celebrated case, a stonemason was well-paid to emigrate to Australia shortly after doing some work at Castle Glamis -- or, at least, that's what the Earls of Strathmore *said* happened to him.

"It was the ghoulish shade of decay, antiquity, and dissolution; the putrid, dripping eidolon of unwholesome revelation, the awful baring of that which the merciful earth should always hide. God knows it was not of this world -- or no longer of this world -- yet to my horror I saw in its eaten-away and bone-revealing outlines a leering, abhorrent travesty on the human shape; and in its mouldy, disintegrating apparel an unspeakable quality that chilled me even more."

-- H.P. Lovecraft, "The Outsider"

Or he may have become a victim of the Monster of Glamis. This misshapen creature, a "flabby egg" with spidery (but amazingly strong) limbs, supposedly appears in the Glamis bloodline every so often, and must be immured in a secret room. The secret of the Monster, so the story goes, is revealed to each Earl of Strathmore on his 21st birthday so that only the current Earl, his heir, and a chosen steward know the hideous truth. Some tales call the Monster a vampire, others refer to it as a "dwarf." Since the turn of the century, speculation has centered on a badly deformed child born as the "rightful heir" to Castle Glamis and sealed up in the room to avoid the embarrassment of the family. The investigator Paul Bloomfield has found a record of the first-born son of the 11th Earl Strathmore, reported as dead within a month of his birth in October of 1821, but (in this theory) actually a living but deformed (possibly Down's syndrome suffering) child kept imprisoned (until his death in the 1870s) as a merciful alternative to either ridicule or infanticide. Bloomfield claims that earlier reports of a monster at Glamis either refer to other ghosts or are opportunistic fictions planted by the Strathmores to confuse the issue.

*"Still it cried, 'Sleep no more!' to all the house:
'Glamis hath murder'd sleep, and therefore Cawdor
Shall sleep no more, Macbeth shall sleep no more!'"*

-- William Shakespeare, *Macbeth* II:ii, 53-55

Which is as good a place as any to discuss the greatest fiction of all involving Glamis, Shakespeare's "Scottish tragedy," *Macbeth*. Patrick, 9th Laird Glamis, may have met Shakespeare in London at the court of King James -- where [Shakespeare](#) likely debuted the play in 1606, the year the Lairds of Glamis became Earls of Kinghorne. Throughout the play, from the "bloody child" to the killer "not born of woman," the Monster casts his shadow. Shakespeare's text, full of imprecations against time and destiny, with its witches ("secret, black, and midnight hags"), ghosts, and demonic fertility rites ("unsex me, spirits") dramaturgically recapitulates Glamis Castle -- which Shakespeare subtly recasts as a bastion of Hell on Earth. Patrick Lyon may have done the same -- he rebuilt and renovated Glamis Castle using the designs of the Vitruvian master of [sacred architecture](#), Inigo Jones. Did the 9th Laird build folds in "the great shoal of time" into his battlements, seven windows (one for each planet) looking out

from secret chambers embedded in hidden dimensions?

"This was the result of the first attempt to create a royal moonchild, two hundred years ago. The baby's body and brain warped under the pressure of the ultradimensional emanation it was made to contain. Nevertheless, this is the rightful heir of the Earl of Strathmore, and our future monarch."

-- Sir Miles Delacourt, in *The Invisibles* #11 (first series), by Grant Morrison

Glamis has long been [Faerie](#) country; how many of Glamis Castle's ghosts are actually fays or other [ultraterrestrials](#)? Even before the castle, Glamis was a magical place with a "holy well," a no doubt ley-riven locality associated with dragon energies. The River Dean, which runs through Glamis, legendarily demands a life every seven years, a period eerily similar to the mythic Faerie Teind to Hell or to the ancient term of the British sacred king (according to Margaret Murray). Do the deaths of Malcolm II and Duncan seven years apart consecrate Glamis to the Horned God -- or has the baptism in royal blood made the castle the "cracked tower" of the [Waste Land](#), womb of blighted fertility? The Merovingian Holy Blood runs through the veins of the Lairds of Glamis -- Sir John Lyon married Joanna Stuart in 1376 -- is the Monster of Glamis actually the product of a *Prieuré* genetic experiment? Are the "night hags" appearing over sleepers at Glamis actually foul succubi, spawning in the Castle's vortices? Perhaps the Lyon family takes its name from its feline and monstrous [manticore](#) heritage, which, crossbred with the ultraterrestrial seed of Glamis' specters and with the eldritch Merovingian bloodline, emerges as the vampiric Monster of Glamis -- and rightwise king of Britain.

Johnny Law

for *GURPS* and *Feng Shui*

by Jesse Lowe

Full Name: John Jiheng Law

Concept: Chinese-American chi-using gunslinging private investigator for a cinematic pulp adventure setting.

Quote: "If the gentle persuasion of a reasonable man fails, I find my little buddy is a pretty persuasive speaker on his own terms."

Description: An average-looking Chinese American male, about 25 years old, with brown eyes and black hair. Usually dressed in a cheap suit with a tan trench coat and fedora. Wears a small amulet with the Chinese character for peace on it below his shirt. Born February 17, 1911 in San Francisco.

Weapons: Carries a pair of Colt 1911s in shoulder holsters. Also has a 2-shot derringer up his left sleeve and a switchblade up his right.

Other equipment: spare ammunition for the Colts, half a dozen bullets for the derringer, wallet, some cash, some matches, a PI badge, notebook and pencil stub.

Background

Born of a mixed-race couple in San Francisco, Johnny has always been a bit of an outcast from both cultures. In his childhood, he found solace reading the Westerns that his Chinese mother, Liu Zhenxian, left around the house. Though only a passable student, he excelled at sports and found some acceptance at school on the baseball team. He still throws a mean fastball. This fairly mundane existence was cut short at age 13 when his father, Eric Law, was shot, an innocent bystander in a gang war between the Triads and the Mafia. Johnny and his mother went to live with her parents in Chinatown, where he began to learn the ancient wisdom of the East thanks to his grandfather, Liu Aoli. Aoli saw that Johnny had great potential chi, but could not control due to the emotional trauma of his father's death. A master of Wudong (p. MA106), he decided that his final work in this life would be to train his grandson to harness his chi and ascend beyond his demeaning Western origins.

Johnny, however, didn't like the idea of learning "Chinese mumbo-jumbo" (he feared it would make him even less acceptable to his white friends), and spent more and more time reading Westerns and going to cowboy movies. Aoli, no fool, noticed Johnny's preoccupation with the Old West. That summer, he presented Johnny with a brand new Colt 1911 pistol and began taking him to a local shooting range.

For the next eight years, Johnny learned to shoot like nobody else, advancing his education both mystic and secular, and picking up some Wudong on the way. Unfortunately, the money his family had been surviving on (Eric Law's savings) was slowly dwindling, and by his twenty-first year, it was painfully obvious that he would need to find gainful employment. His knack for detail and uncanny shooting ability had caught the eye of Albert Weisenberg, a respected private investigator who practiced at the same shooting range as Johnny and Aoli. When he heard that Johnny needed a job, Weisenberg was quick to offer him a junior partnership in his detective agency. Johnny's abilities complemented Weisenberg's knowledge of the streets and the criminal mind wonderfully.

Soon, the agency prospered and Johnny began to seriously learn the ropes of private investigation. He and Weisenberg became close friends, and Johnny even attended Weisenberg's grandson's bar mitzvah. Then they got involved in the Red Dagger caper. Hired by a strange little German man to find the Red Dagger (a weird Tibetan knife) in the San Francisco underworld, the two detectives found themselves in way over their heads. After a fire on May 31st, 1935,

with a bunch of Italian thugs, Weisenberg was dead and Johnny was in a coma. He woke in July to find that his grandfather had been taking care of the detective agency in his absence.

Now Johnny's trying to get over the loss of Weisenberg by plunging himself into his work, while at the same time keeping his mother safe and his grandfather out of trouble. It's a full plate of problems, but hey -- it's better than a pair of cement overshoes and an intimate acquaintance with the Golden Gate.

Adventure Seeds

High Weirdness/Secret Magic

The little German man was Hans Steiner, an occultist and rabid Aryan supremacist. He set Johnny and Weisenberg up, hoping to kill them just after they had secured the Red Dagger for him. Unfortunately, in the confusion, Steiner was wounded and lost the dagger. He assumes that Johnny has it, and is preparing a vast and deadly plot to take his revenge and finally obtain the Red Dagger (a Tibetan phurba imbued with the power of Shambhala, or simply a bad fake, depending on the GM's mood).

Steiner is doubly dangerous because he is very wealthy, has many friends in the occult, theosophist and especially ariosophist communities, and will eventually become a member of the SS Ahnenerbe, the occult branch of the SS. He is utterly ruthless and may have dark powers, gained from green-gloved mystics (see the Suppressed Transmiission It's Not Easy Being Green -- and Evil!) or through ancient Nordic rituals.

Kung Fu Action

The PCs are approached by a mysterious old man who offers them a sum of money, or, if they are inclined towards the martial arts, teaching, to ambush Johnny. They are given strict instructions in how, where and when to attack him -- a small laundry in the middle of Chinatown. They are to attack him one at a time, and to let no one interfere.

Assuming the PCs do ambush Johnny, or show up at the laundry in order to warn him, they and he are attacked mid-scene by hatchet wielding Triad assassins; Johnny recently busted a Triad operation and they're out for blood. Should the PCs appear to be losing to the Triad assassins, the old man will appear out of nowhere and join in. After the fight he will reveal that he is Liu Aoli, and had decided that it was time to test his grandson to see if he was fit for further training. He is mildly annoyed at the Triad's interference, but will give the PCs the agreed upon payment. Johnny is more than a little annoyed at his grandfather's trick, and reconciling the two may present some story opportunities. The PCs have also angered the Triads, of course, and the Triads have a long memory.

Other Genres and Times

Johnny can easily be adapted to any time period with guns and martial arts; he would probably work particularly well in the Old West and the 1850 juncture for *Feng Shui* campaigns.

Pyramid Review

Pyramid Review: Way Out West

Way Out West

Published by [Warfrog](#)

Written by **Martin Wallace**

\$35

Whether the title indicates the Old West's distance or demeanor, *Way Out West* is a board game depicting the pioneer spirit in the Southwest. Three to five players compete to herd cattle and sow the seeds of new towns along the frontier. They can try to outmaneuver their opponents, but chances are good that sooner or later some disputes will be settled with a hail of lead.

The object is to score the most victory points at game's end. How many points you get depends on how well you set yourself up during the course of play. Cash is nice and it plays a part in awarding the victory points, but mostly it helps you build up a winning position during the game.

Each player starts the game with a stake of money and two tokens. Except for the first turn, when dice rolls determine player order, a system of bidding establishes who gets to go first. The first person to drop out of the bidding goes last, the next to drop out goes next to last, and so on.

Once the order is settled, the first player places his token on one of the action boxes on the board. These boxes determine what you'll do. You may want to build a building or set up transportation in the town, hire more cowboys, buy cattle, move units around the board or start a gunfight with a competitor. The trouble is, there are only so many boxes for each action, and once an action has been taken that turn others may not be able to do the same thing. This is what makes turn order so important.

Everyone plays his first token in this fashion and performs the corresponding action, and then the first player gets to play his second token. Again, everyone places a token in an unclaimed box and performs that action. The turn is then over, the tokens are cleared from the action boxes and bidding begins again. At the end of every third turn, players receive their income.

Some actions are free, but some have an associated cost just as bidding for turn order does. If you don't want to run low on cash, you'll have to invest in some moneymaking options.

The board has areas representing five towns of increasing size, and each town has corral boxes, building boxes, and a name box. The corral boxes allow you to place cattle, the building boxes are for buildings and transports, and the name box holds cowboys. You must have a cowboy in the town to place cattle there, and you have to start in the smallest town -- you can't build in the next largest town until the previous one is more than half full.

You want to be able to build in the bigger towns because that's where the points are to be had. The larger the town, the more expansion it can accommodate. The more built up a town is, the more points it scores at the end. You get points for whatever you contributed to constructing the town, and may get additional points if you control the town with the most counters.

A number of conventions of the Old West genre are present. You can build stores and make money off cattle, or put up a hotel and charge the cowboys. The bank earns extra cash for the owner until another player's cowboys decide to

rob it. Stagecoaches make profits when cowboys start moving around the board, and there's always the danger of the sheep farmer moving in and devaluing your herd. Just about any problem can be solved with judicious application of gunfights; get a posse of your guys together and take over the train or rustle some cattle.

The game lasts a while -- about 90 minutes to two hours -- but individual turns are fairly brisk, which keeps the action lively. The biggest problem is keeping track of all the pieces of the puzzle that figure into a win; there's a pretty complex web of interrelated factors, and a clear idea of where everything has to be can be a maddening exercise. The math alone can be a headache.

The rules are simple even if the dynamics aren't, though they aren't presented in the neatest outline. A few turns of play will be enough to memorize the majority of them. The board is a solid piece of work, and the graphics are clean and subdued. Similarly, the counters are large and mostly easy to read (some of the buildings and transport counters might make you squint), and the money is a series of round counters with different sizes for different denominations.

The quality of the components helps drive the price up, of course, but it's about on par with most of the recent crop and easily as playable. Walking an even line between economic acumen and western action, *Way Out West* rounds up a little flavor and a lot of fun.

--Andy Vetromile

Pyramid Review

In Your Face Again (for Feng Shui)

Published by [Atlas Games](#)

Written by Anthony Botz, Darrin Bright, Loki Carbis, Jim Crocker, David Eber, Mark Kinney, Alex Knapik, Tom McGrenery and Mike Mearls Illustrated by Toren Atkinson, Andrew Baker, William Bronson, Eric Hotz, Jim Pavalec, Steven Saunders, Grey Thornberry and David White

128 pages; \$19.95

Under the aegis of Atlas games, *Feng Shui*, the RPG of Hong Kong cinematic action, has been well supported with four good sourcebooks, but barring Robin D. Laws' *Four Bastards*, actual adventures have been a little thin on the ground. Now this has been rectified with an anthology of ten scenarios, entitled *In Your Face Again*.

This 128-page book is laid out in the standard *Feng Shui* style -- easy to read and littered with cheesy sub-titles, but it does suffer from the occasional typographical error. The standard of the interior art is a little variable, with the work of Toren Atkinson, Andrew Baker and David White standing out from the rest.

Seven of the ten scenarios are set in *Feng Shui*'s contemporary juncture, though as evidenced from this book, it has yet to take into account the handing over of Hong Kong to the Chinese government. One each of the remaining three is set in the 69 AD, 1850, and 2056 junctures. Several do make use of the *Golden Comeback* sourcebook, but referees looking to expand these adventures as part their own campaigns will find *Elevator to the Netherworld* equally as useful. At the beginning of each adventure, a short paragraph explains that scenario's premise, twist, and climax at a glance, before getting into the meat of the plot.

(SPOILER ALERT!)

In Your Face Again opens with Darrin Bright's "Fast Forward." This is a suitable as an introductory adventure for players new to the game or who have not yet learnt of the Secret War. A chance encounter and a mix up in videotapes they are returning to their local video rental library, causes the players to learn more than they should. As with every scenario, each fight location is accompanied by a detailed list of suggested events for that scene. "Blood & Sand" by Tom McGrenery is the second entry and takes the players back to the Rome of 69 AD in search of a new Chi site. Of course, what does one do in Rome but go to the races? And if a chariot team is short a rider, then who better than the players top leap aboard? The race is one of those great scenes that should get the blood racing for both players and GM alike, though the GM does need make sure that it is just as fun for those not in the race itself.

Preventing the Ascended from obtaining a powerful fu-based weapon is the reason for getting the players deep into the Netherworld in Anthony Botz's "Invincible Chi." Thankfully the Guiding Hand are along as allies, but then it all goes pear-shaped and climaxes on a speeding train hurtling through the Netherworld. This is followed by Mike Mearls' "Last Stand at Old Man Fong's," which also involves another powerful artefact. And if the players ever wanted to ride a speeding eighteen-wheeled truck into the Netherworld, then this is their chance! Both of these scenarios are more

suitied to experienced players.

Tom McGrenery's second contribution is another blast to the past, and gives the GM the opportunity to drag out every jungle cliché at their command. A treasure map leads the players deep into the Congo and darkest Africa of the 1850 juncture to The City of An-Makalur. This is a lot of fun as hungry natives, devious Belgians, and eventually crazy gorillas harass the players on their journey up the river Congo and into the jungle.

Also suitable for beginning players is "Fight Night" by David Eber, as the links in this adventure to the Secret War are rather slight. Set outside of Hong Kong in California, they are asked to locate a missing girl by her father. Her trail leads into the Los Angeles underground fight scene where they have to win her back in the arena. Being in the wrong place at the wrong time puts three factions upon the players' tail in Mark Kinney's Crossfire. This ultimately leads to a local Science Fiction convention, and once there who's to tell which of the weird things walking around there is actually real and deadly?

Loki Carbis also gives three factions, this time all after one Hong Kong resident in "Hong Kong Phonebook." Unfortunately three men in Hong Kong all share the same name and guess what? Each faction ends up with the wrong man! Even if they resolve this situation, the players only get a whiff of the figure behind this mix-up, and it would be great to see them come back in future adventures.

The most difficult adventure to run is Jim Crocker's "E Ticket Ride," which is set entirely in a newly opened Buro theme park in 2056 called Freedom Flags Park. This pokes a lot of fun at various theme parks and associated kids stuff, and has some great scenes and ideas, such as a rolling ferris wheel and a chi-powered zero gravity roller coaster ride. Unfortunately it will be difficult to get characters from outside the 2056 juncture involved, and this is its biggest weakness. Referees will also need a copy of the *Seed of the New Flesh* sourcebook to run this scenario. The last adventure is "Murderer's Row" by Alex Knapik, which saddles the players with a five-year-old girl at a baseball game. The kid is stranger than she looks -- aren't they always? -- and someone wants her dead. The fun and crux of this scenario is in dealing with the child and where she ends ups.

(END SPOILER ALERT)

Every one of ten scenarios in this book includes details of how to adapt it to be run with players who are part of factions other than the Dragons, as well as suggestions for further adventures. This increases the utility factor of *In Your Face Again* to just beyond the adventures in the book. The best of these have to be Tom McGrenery's pair of entries, "Blood & Sand" and "The City of An-Makalur," because they just that little bit different to the normal Feng Shui adventure and make good use of the possibilities that their respective junctures offer. But all of the adventures included are worth looking at. Every *Feng Shui* GM should have a copy of *In Your Face Again* on their bookshelf for when they need a scenario in a hurry. Atlas Games has put together an excellent anthology, and not only would it be great to see this followed up with another book that includes a few sequels, but also some sort of campaign book as well.

--*Matthew Pook*

Forgotten Realms Campaign Setting (for Dungeons & Dragons)

Published by [Wizards of the Coast](#)

Written by Greenwood, Reynolds, Williams, and Heinsoo

320 color pages, \$39.95

It's impossible to cover every aspect of the new *Forgotten Realms* book in one review. For those who are unaware of what the *Forgotten Realms* setting is, it's high fantasy with powerful spellcasters and magnificent dragons. It's a vast land with knights, barbarians, horse archers, and just about any other type of fantasy archetype you can name.

For those who want gaming details, here are some of the highlights.

Player Races

Gray Dwarf: Duergar

Drow

Wild Elves (Slight modification to standard package)

Moon Elves (Standard)

Sun Elves (the old Gray Elves from 2nd Edition)

Wood Elves

Deep Gnomes: Svirfneblin

Rock Gnomes (Standard)

Half Elves

Half Orcs

Ghostwise Halflings

Strongheart Halflings

Lightfoot Halflings (Standard)

Planetouched:

Aasimar: Celestial

Genasi: Earth, Air, Fire, and Water

Tiefling: Fiendish

Each race has personality information, as well as what region they hail from, what racial abilities they possess, and what level adjustment they suffer for their power. The level adjustment factor is crucial for many of these new player races, like Drow who have a +2 level modifier, or Svirfneblin, who are so powerful they have a +3 level modifier. This level modifier counts towards their encounter level for purposes of how much experience points and money they are worth. The book has a page which explains in greater detail how to use these powerful characters, and this information would be useful for GMs who want to throw other races into the stew like Half Dragons or Cambions.

Feats

There are fifty one new feats in this book. Many of them fall under the category, regional feat. These feats represent skill sets, or abilities of those who follow a certain lifestyle. For example, the Twin Sword Style, made famous by Drizzt Do'Urden, can only be taken by those who hail from Sembia, Waterdeep, or are drow elves. There is a wide variety in the new feats, including some names from 2nd edition's various *Player's Option* books. For example, Signature Spell enables a spellcaster to select one spell, and treat it as a cleric would a healing spell. This lets the spellcaster swap out other spells to cast this spell when needed. Thus, if the mage selected lightning bolt, but had memorized dispel magic or fireball, he could swap out either spell to cast a lightning bolt. Another ability is Innate Spell, which allows the user to chose a spell and cast it like a natural ability. The cost is step though because they lose one spell slot higher than the spell. So a 3rd level spell with this ability would permanently reduce the number of 4th level spells the caster could memorize.

Prestige Classes

Arcane Devotee: Arcane spellusers who serve a deity.

Archmage: Mages who sacrifice spell slots to gain powerful spell augmentation.

Divine Champion: Combat specialist who serve a deity.

Divine Disciple: Augmented divine spellcasters.

Divine Seeker: Stealthy individuals who serve a deity.

Guild Thief: Name says it all.

Harper Scout: Bard like class.

Hathran (Witches of Rashemen): Class for individuals who have arcane and divine magic abilities.

Hierophant: Powerful divine class with access to powerful special abilities.

Purple Dragon Knight: The knighthood of Cormyr

Red Wizard: Wizards who specialize in a school of magic to a high degree with advanced abilities.

Runecaster: A divine spellcaster who makes runes with various abilities, triggers and powers.

Shadow Adept: Spellcaster who gains shadow based feats, spells, and powers.

Domains

All of the standard domains are listed, along with these new ones. Each domain has a list of deities which grant access to that domain, while the new domains have the granted power, and level dependent spells.

New Domains: Cavern, Charm, Craft, Darkness, Drow, Dwarf, Elf, Family, Fate, Gnome, Halfling, Hatred, Illusion, Mentalism, Metal, Moon, Nobility, Ocean, Orc, Planning, Portal, Renewal, Retribution, Rune, Scalykind, Slime, Spider, Storm, Suffering, Time, Trade, Tyranny, Undeath.

There are over thirty new spells, and the book converts many old favorite *Forgotten Realms* spells to 3rd Edition, including Aganazzar's Scorcher, Great Shout, Grimwald's Graymantle, Lesser Irconguard, Snilloc's Snowball Swarm, and Thunderlance. One of the best things about these new spells is that if you own the original 2nd edition spells, you can gain a better understanding of how to convert other spells to 3rd edition.

The book reintroduces some old mundane items, like bandoleers for carrying items and marbles for delaying foes. There are new special items like disappearing ink, infertility herbs, and powderhorns for carrying smokepowder. New mundane weapons include the blade boot, chakram, claw bracer (not unlike the mutant character Wolverine), cutlass, khopesh, maul, saber, and scourge.

The geography includes most locations and recent updates to them. For example, Anauroch now hosts the City of Shade, an ancient city of Neheril that has returned from the Plane of Shadows with a host of powerful spellcasters. Each section has the Capital, population, government, religions, imports, exports, and alignment. This breakdown information is followed by information on the region, life and society, major geographic features, important sites, regional history, plots and rumors, and an NPC. The NPCs range from famous individuals from novels and adventures (like Drizzt and Mirt) to new faces like Arrk (a troll fighter) and Sahbuti (a monk, sorcerer, and shadow adept). There are also several different maps of the land. One of them shows the various trade routes. Another shows the political boundaries.

Areas mentioned, but not covered in detail, include all the expansion areas like Kara-Tur, (Oriental Adventures), Maztica (Maya/Aztec Indian based), and Zakhara (Arabian Adventurers). Some of the old *Spelljammer* material is mentioned, like the Tears of Selune, but the whole setting is filed under "the Sea of Night".

The deities listing includes fifty six human based gods, ten from the Mulhorandi (Egyptian) gods, six gods from the drow, fourteen for the dwarves, twelve for the elves, eight for the gnomes, six for the halflings, six for the orcs.

Not all of the gods are given detailed descriptions though. Each breakdown includes name, alignment, domains, favored weapon, symbol, and portfolio. Each description includes name, status (greater, lesser, demi), symbol, alignment, portfolio, domains, favored weapon, description, history, relationships dogma. The description gives the reader information on what the god represents, the history, information about what the god has done or been involved with, the relationships, who the god is allied with, or battles against, the dogma, what the church preaches to its followers.

One of the most interesting things is the return of Bane, one of the gods killed during the Time of Troubles. The god Iyachtu Xvim is no more, as this was but a seed for Bane to be reborn into . . . but with a name like Iyachtu Xvim, you knew he wasn't going to last!

Perhaps the strangest part of the whole *Forgotten Realms* book is that the history of the Realms is towards the end of the book. A brief section is followed by a six page timeline.

After history, organizations are listed. Each organization includes name and background information, which includes goals, allies, and enemies. Some entries include a typical member with stats and possessions. This makes it much easier to insert a group of Fire Knives or members from the Cult of the Dragon against the party. Other organizations include the Emerald Enclave (a group of druids), the semi-secret group called the Harpers, the People of the Black Blood, worshippers of Malar, the Red Wizards of Thay, the Shades, the Netheril wizards who've returned from the plane of Shade, and others. A few organizations have popular figures with full stats, including Khelben "Blackstaff" Arunsun, Alustriel, and Manshoon.

The book includes two adventures: "The Color of Ambition," for 1st or 2nd level characters, and "Green Bones," for 16th level characters. The former pits the characters into the machinations of a Red Wizard, the latter against a powerful green dragon.

Also included are new monsters and more old favorites like the Death Tyrant, an Undead Beholder, the Dracolich, a lich template designed for dragons, and the Shade template, along with mundane animals, rothe, and kir-lanan gargoyles. Each follows the standard *Monster Manual* Layout. Most of the monsters have illustrations; only the mundane animals don't get illustrations, as there are six different types.

Also in this book you get a sneak peak at one of the books coming up next year: the *Epic Level Handbook*, a book designed for characters above 20th level. Some of the benefits of raising above 20th level are covered, and some only hinted at.

The book ends with a very thorough five-page index.

The map, which is glued to the book in two spots, did not come out in my case without pulling the blue material with it. The map is eight pages and feels very light and is very crowded. Many details from previous adventures are missing on the map. In addition, unlike an American Map where Alaska and Hawaii are included in a sidebar, there is no sidebar for several off-shore areas like the Isles of Evermeet. The maps' colors are muted in comparison to other *Realms* maps from previous editions.

The art is top notch. Todd Lockwood, Sam Wood, Matt Wilson Carlo Arellano, and Stephanie Pui-Mun Law all did a great job. Todd's work stands out the most in my mind, with several full color illustrations of some of the most famous characters in the Realms, defining them in ways that Larry Elmore's covers haven't been able to.

The book is laid out with the standard two columns in most places, with numerous sidebars, often at the bottom, giving the user extra information on subjects ranging from unique dragons, history, and dungeons. The book is printed on paper that looks faded like old parchment, while the sidebars are a darker yellow.

Now the books' organization is a whole different story. By placing so much of the Realms itself at the back, like the history, organizations, and gods, Wizards of the Coast seems to say, "Buy this book because of all the cool stuff you can throw in your own campaign, look the *Realms* over later." I'm sure many *FR* fans would have rather seen the *FR* information at the front of the book, and all the "candy" at the back of it. It's like putting the new monsters, magic items, and spells of an adventure at the front, and then putting the module after them.

After all is said and done, the question is, is the book worth the \$39.95 price tag? Even without playing in the *Forgotten Realms*, the casual reader will gain two adventurers, over fifty feats, over thirty new cleric domains, over ten new player races, over ten prestige classes, expanded selection for dwarf, drow, elf, gnome, and halfling clerics, and over thirty new spells. In this aspect, this book is not so much a campaign setting as a Core Game Rule Expansion . . . so the answer is "yes."

If you happen to enjoy the *Forgotten Realms* and want to see what Wizards of the Coast has done with it, then prepare for the standard. The setting continues to labor under the novels. Setting-wide changes, such as the inclusion of Shades and the return of the Nethril wizards, all come from a single novel. The greatest strength of the setting has always been Greenwood's love of magic. His creations, for better or worse, have given the *Forgotten Realms* a distinct flavor. The greatest weakness is probably that the Realms are tied to other projects, like the upcoming *Assault of Myth Drannor*; for better or worse, these things will effect the campaign setting, requiring the GM to either ignore, add, or modify a bought setting. Having said that, though, if you're a *FR* fan and have enjoyed the changes made in the past based on novels and games, then this book is for you.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Son of Odds 'n' Ends

This week I'm just going to deal with fiddly bits. Sorry; I need to, every so often.

* * *

Okay; I've received a few emails from folks asking about the coin puzzle from [last week's column](#). Now, keep in mind that this puzzle was specifically held aloft as an example of what *not* to do . . . much like the [Torg](#) story. Yet I've got folks curious about wanting to know the puzzle's solution so they can inflict it on their players.

Okay; 'cause I love you all, I'll tell you how to do the coin puzzle. BUT DON'T DO IT! Resist the temptation! Or, if you must, then don't make the adventure depend on it; make it for an optional treasure, reward, or the like.

Okay; the puzzle's premise is: You have 12 coins. All 12 look identical. Eleven of the coins *are* identical, while the twelfth merely looks identical, but it weighs differently (either more or less).

You have an old-fashioned scale, where you weigh objects on one side against objects on the other. Thus you don't know actual weights; instead, with any two objects (or groups of objects) weighed you only know if one side is heavier or lighter than the other, or if the two sides are equal.

The question is, how can you determine which coin is different in only three weighings?

Okay; here's how you do it, in probably the easiest way to remember in case you're trapped on Game Show Island and they make you do this puzzle.

Label the 12 coins with the twelve letters in the phrase "FAKE MIND CLOT." Then use the mnemonic phrase "Ma, do like me to find fake coin." to determine the order you are supposed to weigh the coins; each group of eight letters indicates the four coins to be weighted on the left side and the four to be weighed on the right. (Thanks to Steven Howard for revealing this method.)

Thus for your first weighing you would have coins "MADO" on the left side, and "LIKE" on the right. On the second weighing you would have "METO" on the left and "FIND" on the right. Third weighing: "FAKE" left, "COIN" right.

Now, once you've used your three weighings, you should be able to use logic to determine which one is the odd one out. Let's say coin "F" is heavier than the others. Then the result of the weighings will be first = equal, second = right heavy, third = left heavy.

Since they were equal in the first weighing, then coins "MADOLIKE" all weigh the same; thus they can't be the odd coin. Marking those coins as lowercase (since they can't be the odd coin), we're left with:

meTo is lighter than **FiNd**.
Fake is heavier than **CoIN**.

Now, either the odd coin is heavier (in which case it's in both the **FiNd** pile and the **Fake** pile), or the odd coin is lighter (in which case it's in both the **meTo** pile and the **CoIN** pile).

The coin can't be lighter, since there's no coin we haven't eliminated that's in both the **meTo** pile and the **CoIN** pile. Therefore, the coin must be heavier; the only coin that we haven't eliminated that's in both the **FiNd** pile and the **Fake** pile is F. Therefore our coin is F, and it's heavier.

It is left to the reader to work out the other 24 possibilities (11 more options for the coin to be heavier, 12 options for the coin to be lighter, and 1 option where all 12 coins, are, in fact, identical . . . and the GM gets his kneecaps clubbed by angry players). But keep in mind that, in all scenarios, one of the three weighings will be identical, meaning that at least 8 coins will be eliminated right off the bat. Also keep in mind that I *don't recommend using this puzzle!* It's pretty

straight-forward if you know what you're doing, but it can be a pain to figure out if you're not.

* * *

Okay; for the four folks still reading the column, umm . . . hi.

If you're looking for *good* puzzles, I honestly can't recommend any better starting point than the **rec.puzzles** archive. There are hundreds of classic puzzles here, with solutions. And many (if not most) can be easily modified to a variety of situations, from fantasy dungeons to the tests of omnipotent aliens. (As an aside, the coin puzzle is under the Logic section.)

That archive is at <http://ladybug.xs4all.nl/arlet/puzzles/>

If the Logic section interests you (in particular, those labeled "smullyan"), then I can heartily recommend other writings by Raymond Smullyan. A Professor of Philosophy, Dr. Smullyan has written many books about abstract logic which are amazingly approachable. He has a wonderful way of weaving stories around expanding logic puzzles. For example, one chapter of his book *What is the Name of This Book?* details a woman named Portia (based on the *Merchant of Venice's* Portia) who is trying to choose a worthy husband based on intelligence; if he can correctly choose the casket that contains her portrait (using logic, of course), she will marry him.

The first puzzle in that series has three caskets:

- **Gold:** The portrait is in this casket.
- **Silver:** The portrait is not in this casket.
- **Lead:** The portrait is not in the gold casket.

The suitor is told that, of the three statements, at most one is true. So . . . which casket contains the portrait? The puzzles get progressively harder . . . and eventually move through several generations of Portias. (Of course, the clever GM is realizing the "portrait" could just as easily be the "Artifact of Power" or "Spock's Brain" . . . though in the latter case it's questionable if adventurers would want to find it.)

Another chapter of the same book details a philosopher going on an extended quest to determine the answer to the question: "Why is there something instead of nothing?" The answer is surprising.

In addition to that book, I personally own and can recommend Smullyan's *The Lady or the Tiger?*, *The Riddle of Scheherazade*, and *Satan, Cantor, and Infinity*. (He also has a couple of books of chess puzzles, as well as numerous college textbooks, so so be careful about buying a book sight unseen.)

* * *

Okay; now let me talk about submissions a bit.

- For those of you using AOL, please note that there seems to be some sort of bug with their web mail client that prevents imbedded text files longer than 18K (about 2,500 words) from being submitted. The first 18K will be sent, but the rest will be lost to the aether. The ways around this seem to be to use AOL's standard mail client, to send the file in multiple pieces, or to send your file as an attachment. (Yes, I *really* don't like to receive files as attachments . . . but I'll endure if I need to. Even so, I *strongly* recommend sending it as a straight text file. I'm not at the point where I'll automatically delete, say, a Word document I receive, but it will only take one bad incident to make me change my mind.)
- I'm currently slogging through the slushpile in my spare moments (hah!). For those of you who keep track of these things, I have about 50 pieces in the slushpile currently (though that's mostly because I've received about 30 in the past couple weeks). I also have about 60 pieces that I've made up my mind on, but I need to write acceptance/rejection letters.
- For would-be review writers, please note that, with *very* few exceptions, reviews need to be at least 750-1,000 words. More is generally okay; less generally isn't. Even the most seemingly straightforward product is difficult

to do justice in less than 750 words; if it's a simple game, give an example of what makes it different. Maybe give an example of play. If it's a short book, do more than give an itemized list of what's included; try to put it in some context with the rest of the game line. And so on.

Well, I've rambled enough for this week. As ever, please feel free to drop me a line via [e-mail](#), the [chat rooms](#), or the [discussion boards](#).

--*Steven Marsh*

* * *

*Last week's answer: **Button Men**, from Cheapass Games. (I think it's also on the **Brawl** deck too . . . but I'm not sure.)*

(One star) "Your victim must share living quarters with a cat -- preferably a very friendly, cuddly one. Borrow that cat, by fair means or foul, and paint its claws with colored nail polish. Then return the cat. Its nails are now covered with a virulent poison!"

by Phil Masters

(Note: The *Magnus* is mentioned, very briefly, in the *Mage: the Sorcerers Crusade* supplement, *Castles and Covenants*. This article expands and extends the information given there.)

Introduction

This article describes a plot feature originally created for White Wolf's *Mage: the Sorcerers Crusade*, and hence something that could exist in the fifteenth-century history of any *World of Darkness* game, especially the modern-day *Mage: the Ascension*. (A couple of the scenario suggestions given enable it to play a part in the latter game.) It -- or a similar vessel -- could also be used in other fantasy settings, or as part of the history (c. 1450 AD) of many modern-day supernatural/conspiracy games; it can fit into any game-world with mysterious, icy polar regions, which permits the existence of a small exploration craft whose crew use minor magics and high levels of practical skill. (In *Mage: the Sorcerers Crusade*, the two can be almost the same thing.) Notes on adapting this material to other games are given where appropriate. The geography assumed is that of our own world; GMs of other fantasy games should substitute place-names from their own worlds.

The *Magnus* (properly, the *Saint Magnus*, but people are forever forgetting) is a small, single-masted sailing vessel, which may be found in the harbors of Orkney, Shetland, Iceland, or Norway. The people of those parts know it for a wandering trader, and accept it as such, although the wiser among them consider its captain mad for sailing in all weathers in such a small craft, with a crew of but a dozen.

In fact, Olave Kethrisson is an Enlightened Void Seeker, as are three of his crew; their diverse Arts ensure that their craft is far more robust than it appears. The other eight of those aboard are junior "brethren"; all share the Void Seeker dream of questing and courage.

The *Magnus*'s trade activities are a sideline -- a smokescreen over its true mission. This is a continuing dream that has kept the vessel and its crew together for a long time. Kethrisson takes the ship further north every summer, deeper into the realms of ice. He is a peculiar sort of scholar, and he believes that ancient texts that speak of "Ultima Thule" refer to something other than the lands he already knows; he has also heard wild whispers -- of cave- mouth gates leading to whole new worlds, of the true origins of the Northern Lights, of lands beyond the ice . . .

The Vessel and its Crew

The *Magnus* was built in a Danish shipyard to the order of Olave Kethrisson's family trading-house, under the supervision of a number of highly talented craftsmen (High Artisans and Void Seekers in *Mage: the Sorcerers Crusade*); as a result, it embodies the most advanced construction techniques of the age. It is a rugged, clinker-built vessel, square-rigged, and rounded, high at prow and stern; its design is actually sophisticated and subtle, and it can raise a lateen sail in addition to the main square-sail. It is kept in excellent condition by the crew's special

A Note on "Magick"

The "Enlightened Arts" used by the *Magnus*'s crew are

talents.

The crewmen were recruited by passing word around places where the bravest and most talented explorers congregate (Void Seeker lodges), though Kethrisson puts some effort into maintaining a façade of normality. Mostly, they signed up unprompted, because they shared the captain's obsessive interest in exploration, although Kethrisson went out of his way to persuade one or two of them to join because they possessed specific skills the ship needs.

Olave Kethrisson

The captain of the *Magnus* is a well-built middle-aged man of Norwegian descent, as suggested by his red hair and beard. (The latter is now just turning to gray.) With the look and surface manners of a stolid trader, he is easy to underestimate in some ways. In fact, he is at heart a scholar above all.

He was born into a family of traders, with enough spare wealth to indulge this clever younger son; for a while, it was assumed that he would go into the church, and he spent some time at various universities and colleges around the northern coasts of Europe. But then he returned home with ambitious suggestions for increasing the family's fur trade -- and also with some knowledge of systems of navigation, that obliged his family to admit that his education was some use. Nor was he too proud to bend his back, serving on a number of trade vessels to gain the additional knowledge he needed before he acquired a ship of his own.

Today, Kethrisson and the *Magnus* have relatively little contact with the family trading-house, although relations remain friendly when they do meet; his two surviving brothers, both now comfortable stay-at-home merchants, regard him as a little touched, too much the dreamer to really make good. In *Mage: the Sorcerers Crusade*, treat him as having a little knowledge of most of the Spheres, with a special interest in Connection; in other games, he should be given above-average perceptions and a number of divination and detection spells.

Lars Palme

The first mate aboard the *Magnus* is Lars Palme, another experienced Norwegian sailor who was recruited into the secret brotherhood of Explorators when an observant member of the group recognized that he was quite *implausibly* good at keeping ships intact and afloat. In *Mage*, his affinity is with Matter, working through plain tools and good materials, and his secondary arts of Prime and Entropy mostly serve to enhance this; in other games, he should be given extremely high levels of skill with various crafts, and some simple spells of mending. In a real sense, the entire ship sometimes becomes his casting tool or "focus." Although he is a peaceful man, he is dangerous in a fight, because the blades he wield (usually axes) cut so well.

Palme is sometimes visited by a guiding spirit -- a "Daemon" in *Mage* terms -- when no-one else is around. It takes the form of a misty vision of a man with the face of his dead father, a master-shipwright. Palme finds this unnerving -- his father, while not cruel, was a cold, critical man -- but the vision always advises him well.

Colin Macinvar

Tall, blond-haired, handsome, and oddly clean-shaven, the Scotsman Colin Macinvar is the *Magnus'* healer and

deeply pragmatic, with only a rather loose underpinning of theory; from the high-magical point of view, even the more blatantly supernatural part of their work is mere hedge-magic, and academic philosopher-scientists would view them with some disdain. They combine smatterings of academic lore with old sailors' charms, survival tricks learned from Lapps and others, and vast practical expertise in the building and maintenance of ships. On the other hand, their study of shipbuilding and sail-handling is deeply logical and rational, verging on the prosaic, save in its perfection. In *Mage: the Sorcerers Crusade* terms, their Arts are so subtle that they can pass for coincidences or "good workmanship" (which at least ensures that their activities are usually casual). They are unlikely to use their Arts in combat (save for Countermagick), preferring to depend on good steel if they must fight.

The other aspect to the Void Seekers' Arts is mystical and ritualistic; they attach *names* to what they discover, and thus bind the world to their vision. The crew of the *Magnus* mostly leave this great, secret, serious work to senior Guildsmen when they return from their journeys, although Kethrisson has some grasp of the forms.

chirurgian (an expert in the Sphere of Life in *Mage*). He is important to the ship; his arts enable the crew to remain alive and effective (if not actually comfortable) for days at a time in arctic conditions. He achieves this through a vast range of knowledge and methods; he has studied with academics, but he also spends as much time as he can with any arctic-dwelling tribes he meets, learning what he can of their secrets and tricks. He is certainly not too proud to use anything that works.

Beyond a surface charm and a clear taste for scholarship, Macinvar's nature is actually something of a mystery to his shipmates. One or two of them recognize that he is as adept with the mind as with the medicine of the body, using special techniques to learn enough of any language he needs -- and sometimes, subtle tricks of rhetoric to extract secrets from others. In truth, he is a collector of secrets, a nigh-perfect Explorer in everything save his lack of deep passion.

Michael Galglass

The fourth Enlightened crewman aboard the *Magnus* is an Irish weather-worker (a specialist in Forces Art in *Mage*; give him some basic weather-related magics in other games). Michael Galglass is short and red-haired, and dresses in an archaic but colorful style, wearing a number of amulets and lenses, especially when at sea.

His techniques are very *traditional* in style, involve charms and chants to control the weather in the ship's immediate vicinity and predict its behavior in the near future. (In *Mage*, Galglass has some secondary talent with the Sphere of Time.) Thus, they are reasonably subtle -- except when used at their limits, as such forces are not supposed to be commanded by mortals. Galglass himself is quiet when not working; secretly, he has a growing taste for power for its own sake, and seeks to stretch and test his own capabilities in the extreme conditions of the arctic realms.

Other Crew

The eight Brethren aboard the *Magnus* are all pretty competent, of course, and are perhaps a little more staid and quiet than most Explorators; this vessel does not plunge recklessly into storms or open ocean, or confront wild tribesmen, but probes, season after season, looking for channels through the ice and safe passage around bleak, uninhabited coasts. Most of them were recruited in the Scandinavian lands, and all must know Norwegian, in which the ship's operations are conducted.

Unbeknownst to the rest of the crew, and to a large extent to himself, one of them, Harald Kveldulf, has the "Fae Blood" merit (see *Crusade Lore*; basically, he is related to the faerie folk, who can sense this and may respond to him kindly). He has had occasional brushes with his cousins, but put them down to chance so far. (His name actually implies *werewolf* associations -- something that hints, however misleadingly, at oddities in his family.) He has something of a fae's taste for the wondrous, but that is hardly unusual in his present company.

Incidentally, the crew of the *Magnus* are all male. Although the adventurous Explorators have less bias with regard to women's abilities than most folk of the age, when one goes looking for tough, experienced sailors, it is hard to avoid finding mostly men, and in any case, on a ship this small, there is little scope for even minimal privacy; taking women aboard would cause all manner of problems. (And it is impossible to keep secrets on the *Magnus*.)

Polar Exploration

The crew of the *Magnus* are, by the standards of their age, insanely brave; mundane explorers have not ventured into the arctic regions yet, and it takes a great deal of ingenuity (and reality-twisting willpower) to keep a vessel built seemingly to fifteenth-century standards intact amidst the ice, and its crew alive. Even the hardy folk of the Scandinavian kingdoms regard the very far north as infinitely hostile. They know of people on their northern borders; the Lapps, a pagan race with a name for witchcraft. Hints say that, beyond the territory of these strange reindeer-herders, there is an ocean of ice -- a mystery best left alone.

Actually, it is possible that Viking seafarers explored some of this region centuries since; even so, the *Magnus* is

effectively blazing trails. But the crew's efforts will bear fruit; by the end of the fifteenth century, Russian seafarers will be quietly sailing around the northern extremity of Norway to do business, and in the sixteenth, the English and then the Dutch will scout out routes to the fur trade of Siberia, and dream of establishing a permanent "Northeast Passage" to the wealth of Asia. (Needless to say, the Void Seekers will be thoroughly entangled with all this.)

Further south, only scholars give any thought at all to the polar regions, and even they view them as inherently enigmatic. A few ancient texts speak of months-long days and nights -- something any intelligent philosopher-astronomer or geographer can see as logical -- but not much more. The question of celestial mechanics also arises; all sensible scholars know that the world is a spinning globe, and though few are so old-fashioned as to believe that there must be a physical axle involved, some do. Certainly, the question of the physical nature of a region of extreme cold around which the world revolves represents something of an enigma. Philosophy sometimes seems merely to add to the questions; for example, no one is sure how a magnetic compass *should* behave in the far north, but there is evidence that such devices act rather oddly.

In other words, the far north is a realm of mystery, of precisely the sort which the Explorators are sworn to resolve and map. What they do not yet quite recognize is that, where there are so few people of any sort, let alone representatives of the competing philosophical schools of more civilized lands, reality is unfixed, and thus malleable. The heroic efforts of the Void Seekers may actually serve to establish the nature of this true axis of the world -- and the *Magnus* is the very vanguard of this effort.

Theories and the Hollow Earth

To add to the significance of this project, the polar regions may, in some frames of reference, grant access to something more. Some philosophers observe that the universe is, according to many popular theories, a set of concentric shells, with the Earth at the center. Furthermore, observation shows that all living things tend to have internal cavities and complexities, rather than being homogenous throughout -- and is not the Earth a living thing, in many ways? Who is to say that the Earth is the *innermost* of the spheres?

The idea of the Hollow Earth will survive into the twentieth century. (In *Mage*, this is despite heroic efforts by the Order of Reason to show how ridiculous it is; the Sons of the Ether will struggle to preserve it even once their former colleagues have closed the last entrances.) But in the era of the *Magnus's* voyages, it is the Explorators who are just beginning to discover those entrances -- and the poles are where most will be found.

There are minuscule hints in old texts of what they will discover; for example, in the thirteenth century, Bartholomew of England wrote that, at the north pole, there was a great black rock, "33 leagues" in circumference, beneath which the ocean flowed through four channels into an immense whirlpool. If Bartholomew was anything more than a fantasist, he would have to have been a true visionary to learn of such a thing; Kethrisson for one has doubts about this information (and later research, by any faction, will find no rock). Still, Bartholomew's ideas will endure for some time; the seventeenth-century Jesuit philosopher, Athanasius Kircher (in *Mage* history, probably a sleeper pawn used by the Order of Reason to introduce their ideas into the consensus), will theorize that the waters of the earth flow into just such a vortex, pass through the fiery interior of the Earth, and emerge through an inverse vortex at the South Pole. For now, the *Magnus* proceeds carefully, watching lest the northward currents grow too strong, and the ship should become unable to turn back.

Given that these vague current philosophical ideas are all that is "known" about the very far north, they may actually be enough to *shape reality* in those parts; there may indeed be vortices, strange geology, or extraordinary cave-systems. (See *The Book of Worlds* for information on the state of the Hollow Earth in the twentieth century of *Mage: the Ascension*. Modern mages believe that the so-called "Hollow Earth" is in fact the Shade Realm of Matter. However, not only is Awakened cosmology a lot less developed in 1450, with no strong conceptions of Shade Realms, but humans generally have a very different concept of the structure of the universe -- which may well influence what explorers may discover.)

It's possible that gates in the Arctic (vast "Crays," stable and easily traversed in this area without strong belief reinforcing reality) lead to realms similar or identical to those detailed *The Book of Worlds*; storytellers can use this as

an excuse to startle swashbuckling Void Seekers with the dinosaur-ridden jungles of Biotopia, or confront Explorators with enigmatic philosopher-monks of vast Awakened power (remember that the Deros do not yet exist); but it's also possible that these gates might take the form of passages leading sharply down, and exuding a warm, sulfurous stench .

..

For *many* sleepers still believe that Hell lies, literally, beneath their feet, which might shape reality so as to make ventures into the depths of the Earth terribly dangerous and hubristic. In the terms of the period, what the crew of *Magnus* finds may lead them, very literally, to the Devil.

Other Views of the *Magnus* in the Sorcerers Crusade

The Order of Reason

Those other Void Seekers, and their allies among the Celestial Masters, who know of the *Magnus* have great respect for its work, and its crew. The only occasional small joke comes from those of the Convention who share too much of the High Guild view of things; most travel and exploration is conducted with a view to trade, but what profit is there to find among the northern pagans, let alone the polar ice? (There is a serious answer to this question, actually; arctic furs have significant value.)

Once or twice, when Kethrisson has reported his findings to great meetings of the Order of Reason, some among the Gabrielites have listened hard, and spoken to him both of those pagans and of his other ideas. Their dream of "One World, One Faith, One God" demands that they learn what races dwell in even the furthest corners of the Earth, that one day, the Word may be carried there. As to supposed gates into strange underworlds -- well, that sounds unlikely to them, but it is not their place to question the intricacies of God's Creation, and perhaps a few rather hubristic spirits dream of Crusades into the very mouth of Hell.

Mostly, however, the activities of the *Magnus* are of little interest to the great councils of the Order, and its crew, spending much of their time out of contact with most of humanity, are not much involved in politics. The Ksirafai have never bothered placing a spy in its crew; a dozen Explorators, venturing beyond human company, are unlikely to represent a danger to the ideals of Reason. They record a few comments on this subject, sometimes check that port-gossip does not run out of hand when the *Magnus* has passed through, and leave it be.

The Traditions and the Disparate

The *Magnus* mostly avoids the attentions of other folk of any kind, but a few northerly will-workers have noted its passing, sensed the subtle arts it embodies, and maybe wondered a little. There are some highly capable shamans among the tribes of the far North (both the Lapps and the Inuit of Greenland, where the *Magnus* has occasionally traveled); of these, some are associated with the Dreamspeakers (themselves a loosely-organized Tradition at best), while others are distinctly Disparate.

In fact, Colin Macinvar is slightly acquainted with a few of these folk, who do not -- yet -- see him or his friends as any sort of danger. One risk to the *Magnus* is that visitors or messages from the Council of the Nine could somehow rouse the local tribes against them, but this is probably unlikely. Twelve men, not wielding much serious magick, seem like threats to no-one, and sometimes they bring interesting trade goods.

Other Supernaturals

No vampires or shape-shifters seem yet to have noted the activities of the *Magnus*, or if they have, they have given it little thought. It's not encroaching on anyone's territory; even the werewolves do not, at this time, worry about a few weak humans wandering into areas of such completely lifeless wilderness. As usual, the introverted preoccupations of the various groups prevent them from recognizing the long-term consequences of the Order of Reason's activities. Like the sleepers who see the ship sailing past, they shrug and dismiss its crew as a little crazy -- even if they smell magick on it.

Thanks to Harald Kveldulf's associations, a few fae (who pay more attention to him than he does to them) have actually taken note of the *Magnus*. Although they do not generally approach it closely -- the caution of its methodical crew strikes them as terribly Banal -- they suspect that it may one day return with tales of true wonders, making it, at least potentially, a source of Glamour.

Scenario Seeds

Help Needed

For some characters at least, the easiest way to become involved with the *Magnus* is to find its crew asking for assistance (probably with the backing of higher-ranking philosopher-scientists). This could be for all manner of reasons; for example, super-competent artificers might assist in reinforcing the ship, to make it capable of breaking through some barrier of ice, or inventors might be asked to transport an ornithopter or a small balloon northwards in its hold, for use in reconnoitering some mysterious area from the air.

Of course, the mysteries might run deeper than expected; using H.P. Lovecraft's *At the Mountains of Madness* as a model would be excessive, and wouldn't really fit in *Mage: the Sorcerers Crusade*, but the *Magnus* might find some outpost of ancient human sorcery, perhaps left over from the height of Hermetic influence in the Middle Ages, or even from earlier eras of Egyptian magickal experimentation, or a construct of refugees from the old Himalayan Wars (perhaps tying up with later Sons of the Ether stories of Agharta).

The simplest and most straightforwardly dramatic find requiring aid for the crew might be a region where a few stout warriors are needed. Whether this is a matter of facing giant lizards in Biotopia with pistol and rapier, or actually descending into the upper borderlands of Hell with flaming sword and cross in hand, is up to the storyteller.

Beware of the Future!

Alternatively, members of the Traditions (or other factions in other games) might be sent on a mission to act **against** the *Magnus*. This could involve spreading the word among the Lapps or Inuit that these visitors may be a threat -- probably hard work when the tribes are just as likely to be suspicious of other visitors, and the *Magnus* at least brings trade -- or it could be a more specific matter of aiding some tribe in a fight against, say, violent missionaries who have traveled aboard the ship. (Of course, this begs the question of why the missionaries are over-reaching themselves so; what do they know that's special about this specific tribe?)

In either case, the opponents would have to find their own solution to the problem of survival in the hostile environment of the extreme north, conversing with remote tribes who speak no recognizable language, and so on.

Skyrigger on Ice

(Gamers who insist on thinking in cinematic terms should look on this one as *Ice Station Zebra* and *The X-Files* meet *Call of Cthulhu* in the 15th Century. And maybe *Smilla's Feeling for Snow* is in here somewhere too.)

In *Mage: the Sorcerers Crusade*, one faction of the Enlightened ventures even further than the Void Seekers; the Skyriggers of the Celestial Masters. Other games have their own space-faring ships. After their expeditions, of course, the flying vessels must return to Earth. But what if one such, driven far off course by some wild mischance, were to crash far to the north?

Assuming that enough of its fate was somehow divined by astrology (though how can astrology determine anything involving the celestial spheres themselves?), direct observation by some great telescope, or other means, word would be swiftly passed (across the Viasilicos network from Portus Crucis or the White Tower, in *Mage*); the sky-ship must be found, its crew succored if they live, its secrets (and the cause of the wreck) recovered if possible -- and if all else fails, all trace of it may have to be destroyed. The *Magnus* would be the best available transport (assuming that no

other sky- ships were available, or that none such were considered reliable in arctic conditions); its crew could be reinforced by the more varied skills of some other characters.

Alternatively, if some other organized or semi-organized faction were somehow to sight or learn of the fallen vessel, might this not be a fine chance to learn something of the these secretive sky- travelers and their craft? Of course, the problems of mustering and conducting an expedition across the tundra and ice would be followed by a confrontation with the crew of the *Magnus*, reinforced by allied soldiers.

And then there's the question of what might be found aboard the wreck -- and what might have caused the accident. A violent face-off between Void Seekers and Artificers on one side and Hermetics and Dreamspeakers on the other might be interrupted by *something* from beyond the fixed stars . . .

Redrawing the Maps

In a modern-day *Mage* game, records of the activities of the *Magnus* represent something of an issue for the Technocracy. On the one hand, the ship and its crew laid the groundwork for the Void Engineer's eventual consolidation of reality in the far north, and of all the conventions, the successors to the Void Seekers and Celestial Masters are the most prone to sentiment; their specialist historians know of this story, and regard Kethrisson and his men as heroes. On the other, this particular region took a fair amount of stabilizing, and not all of the data returned by the *Magnus* was incorporated into the current Consensus.

Thus, the Technocracy have a mixed committee of Void Engineer cartographers and historians from the Ivory Tower Methodology of the New World Order assigned part-time to tracking discoveries and research into old maps. Their job is to analyze anything that turns up, and modify or suppress it as necessary before it enters public circulation. Mostly, in fact, any such discoveries are allowed to go out unmodified; people expect old maps to be "inaccurate," and anything that suggests real strangeness can be written off as "doodling in the margins," period fantasy, or just a harmless mystery that will keep a few postgraduates distracted from anything more serious. Occasionally, however, anything up to a full team of Men in Black may have to go in, correct the misleading information, and even engage in a little mild mental processing on some sleeper researcher.

Tangling with this committee and its minions could be an interesting adventure for members of the Traditions, while working for it could make for an interesting change of pace in a Technocracy game. Characters with academic or antiquarian connections (such as many Hermetics) would be the most likely to note the mirrorshade- wearing visitors "from the funding department" who have just dropped into the library . . .

A Relic of the Rise

Another present-day option; Norwegian, Finnish, or Russian archaeologists working beyond the Arctic Circle report a striking find that makes the inside pages of a few newspapers; the remains of a sea-going vessel, apparently from the mid-fifteenth century, well beyond what was previously thought to be the limits of European sea- going travel in that era.

That in itself might seem like nothing more than a curiosity, although enough alarm bells would probably go off in certain quarters that a research team would be assigned to investigate. Getting members of *Mage*'s Traditions involved, save by blatant coincidence, would be a little harder (though mages are often *prone* to blatant coincidence); aside from having them happen to know some sleeper researcher involved, or learning through deep- cover spies within the Technocracy, or a Virtual Adept hack into a Technocracy comms system, they might recognize some obscure symbolism in one of the finds shown on a TV report, or be alerted by a spirit posted at the site by a Dreamspeaker, five hundred years ago.

On the site, any supernatural factions present should probably be careful, and even if they spot each other, should refrain from open conflict; there are a number of intelligent mundanes around the place, and there may well be TV crews. (Some TV crews include agents of the New World Order, but most don't.) And to begin with, there seem to be no specific reasons for conflict right here; the forces of Order will be aiming to have the find largely forgotten, filed

away as a minor academic curiosity, while more anarchic factions can't hope to profit much from it, aside from reintroducing a tiny amount more strangeness and ambiguity into the world.

But the storyteller can then set to work to make matters more interesting. Why did the *Magnus* come to grief here? In *Mage* terms, could this spot be magickally special -- perhaps a former entrance to the Hollow Earth, and still a functional Node? If so, the Traditions, and especially the Sons of the Ether, will be keen to know about it, although it will be hard to prevent the Technocracy from sanitizing it. If the Gauntlet is indeed thin here, *something* might break through, attracted by the unprecedented number of bodies or minds in the vicinity (and perhaps encouraged by Marauders who have also learned of the find); Traditions and Technocracy could be forced into temporary alliance. Or there might be still-functioning magickal artifacts among the remains, or a log- book recording other sites of potential interest anywhere from Greenland to northern Russia.

And for a really strange story, suppose that, when the ship was wrecked, Colin Macinvar endeavored to save the surviving crew any way he could -- employing Life and Entropy Arts in a very vain, inspired manner to place them literally on ice, preserving them against the hope of future rescue. Now, the supernatural visitors to the site can recognize that the "ice mummies" that the archaeologists turn up are more than dead bodies . . .

For the crew of the *Magnus*, awakening after half a millennium would be quite a shock; for everyone else, it would lead to complications. The event would have to be kept secret somehow, and the crew smuggled away; much as *Mage* Traditions might love to trumpet this strangeness, the added risk of Paradox backlash would be too much. Some technocrats would probably wish that the crew had stayed dead, but sentiment aside, the opportunities for Void Engineers to study the long-term effects of cryogenic suspension, and for Enlightened historians to learn, would be too good to miss. Mages, too, could learn from these people -- and it's by no means certain that they couldn't persuade the *Magnus*'s crew to join them rather than the likes of the Technocracy; after all, the ideals of the Technocratic Union are very different from those of the Order of Reason. This could be quite a propaganda coup of sorts -- and then, there are the story possibilities arising from their knowledge . . .

Bibliographical Note

As usual, anyone wishing to disentangle the historical background from the fantasy in this article should start with such standard sources as the *Encyclopaedia Britannica*. Many of the more bizarre details came from *Arktos: the Polar Myth in Science, Symbolism, and Nazi Survival*, by Joscelyn Godwin. Thanks to Ken Hite for pointing me towards much of the peculiar history of arctic myth-making.

Unexploded Cow

Published by [Cheapass Games](#)

Created by James Ernest with Paul Peterson

Art by Mike O'Connor

\$6.00

In 1997 England had a problem with mad cows. In 1997 France had a problem with unexploded bombs. Wouldn't the perfect solution be to bring the cows to the bombs? Just one little patriotic pep talk and you'll have your herd of mad militaristic bovines yomping through no-man's-land in no time. And wouldn't it be even better if you could earn a few dollars along the way? Sure it would!

With the release of his latest Cheapass Game, *Unexploded Cow*, designer James Ernest gives you the perfect opportunity for all this and more, like being evil to your fellow players. Isn't Mr Ernest nice to us?

Unexploded Cow is the newest Cheapass card game, designed for three to six players. It comes packaged in the standard envelope box, and contains a deck of twelve city cards, a second deck of sixty-nine Cow cards, and four pages of rules. This being a Cheapass game, your own components are required . . . in this case, a six-sided die as well as \$2000 worth of money per player in not less than \$50 denominations. The designer wisely suggests using play money instead of the real thing, but trying to lay one's hands on even that amount of play money is a big undertaking. You could use a lot of matchsticks or pennies instead.

The City Cards are valued one through twelve, and are illustrated with the number of buildings according to their value. Thus Quimper, valued at one, has a single building, whereas the ten-point Périgueux has lots. The Cow deck is split between Cow cards and Event cards. Each is illustrated from a limited range of pictures, but given an individual name and description such as "willing cow" or "decent cow." Each cow card also has a money value given for both the cost to put it into play and the reward or penalty earned when it explodes. Event cards are likewise illustrated but only have a cost to put into play and details of their effect.

The objective of the game is to gain the most money by winning the Pot and the Ante. Earning City cards throughout the game does this, and the value of the City cards held by each player is added together; the person with the highest score wins.

Play begins with each player receiving three Cow cards and contributing \$100; half of this money goes into the Pot (which fluctuates throughout the game) and the other half goes into the bank, which does not change. During their turn, a player draws, plays, and rolls.

After drawing two cards from the cow deck, a player can play any number of cards from their hand. Cow cards can be placed into the field of any player, which is the line of cows in front of each player. The owner of the field into which the cow is played immediately becomes its owner and must pay its price into the Pot. The order in which the cows are lined up is important for bomb rolls, so while a player can rearrange their own field by adding a cow, they cannot rearrange that of the player the cow was placed into. Instead, it may go at either end of the line. Event cards can also be played after their price is paid. These affect cows or bomb rolls, such as moving everyone's field of cows to the payer on their left or making an extra bomb roll.

At the end of each turn, the player rolls a single die and counts along from the rightmost cow in their field to the field of the player on their left and so on until the corresponding cow is reached. That cow finds the unexploded bomb and therefore explodes. The owning player of the cow discards it and earns the value of the cow as a reward from the farmer. This money comes from the Pot, but if the cow has a negative value, such as a sloppy or greedy cow, the owning player must pay that amount into the Pot. If a player explodes a cow in their own field during their turn, then the people of the city card currently in play rewards them and they receive that city card and its score. At the beginning of the next player's turn a new city card is drawn.

As well as Event cards, some Cow cards have special powers; these are usually placed into the fields of other players. For example, cow mechanics can defuse bombs, generals hand on any bomb they find to another cow in the same field, PFCs can steal bombs, and when the mad bomber finds a bomb, he hands a bomb to every cow in the same field and they all explode!

The game ends when the last City card is awarded for an exploded cow. Each player totals the value of the city cards they hold, and the highest total wins the Pot and the bank. The strategy behind *Unexploded Cow* is quite complex for a simple card game. Players try to seed their own fields with the more valuable cows, but other fields with cheaper ones, which can still boost the money in the Pot. Of course, the expensive cows can be stolen, offsetting this strategy.

Unexploded Cow is not quite so much fun as the previous two Cheapass Games (*Witch Trial* and *Great Brain Robbery*), and having to find \$2000 real or otherwise per player is something of a chore. Of course, having it priced in dollars and not Euros may be anathema to some (English or French), but at least the dollar is a currency that everyone understands, and let's not have something like local politics get in the way of a fun game.

Pyramid Review

Kingdoms of Kalamar (for Dungeons & Dragons)

Published by [Kenzer & Co.](#)

Edited by David S. Kenzer

272 color pages; \$34.95

In 1994, the *Kingdoms of Kalamar* first made its appearance as a setting designed for any game system, but had numerous game stats relating to 2nd edition *Dungeons & Dragons*. Even the adventures and sourcebooks that came out for it, while aimed at "any game system" were heavily peppered with *D&D* stats. So now that the Kingdoms are an official *Dungeons & Dragons* setting, what do you get? Just the opposite, a setting with very few *D&D* specific references.

This hardcover is broken up into ten chapters with seven appendices. The first chapter, "The Humans of Tellene," gives brief information about the different types of humans found in the setting, Tellene being the name of the world. There are six different types of humans with variations within each branch. The red-haired Kalamarans, the fair-skinned Brandobians, the yellow-skinned Dejy, the blonde-haired, pale-skinned Fhokki, the olive-skinned Reanaarians and the dark-skinned, black-haired Svimohz. Each section is brief and only gives a hint as to what each culture is capable of.

In addition to the human breakdown, there are bits on warfare, religion, climate, and cities. The cities section explains how the detailed parts will be broken down when presented: Name, Population, City at a Glance, Government, Economy, Military, Temples, Mages & Sages, Underworld, Interesting Sites, and Special Notes.

Chapters two through seven cover the major countries and the subdivisions within them. For instance, under Brandobia there are four countries: Cosdol, Eldor, Mendarn, and the Theocracy of Pel Brolenon. Each section contains general background information on the country, the capital, and another city. Mendarn, for example, has its capital Ospolen and the city of Dayolen detailed under its general description. At the end of the countries the topography is listed. This includes woodlands, mountain ranges, hills, wetlands, and bodies of water. Each section has details that range from local inhabitants to actual cities that may be found within them. For example, Lendelwood is home to Lathlanian, city of the wood. In between each chapter, full color maps show the countries being covered by the chapter.

Chapter eight lists several independent organizations that can be found throughout Tellene. These range from the Secret Network of the Blue Salamander (an organization that controls thieves, assassins, and blackmailers) to the Disciples of the Creator (a network of priests and followers who believe in the Creator, a mythical being, and practice worship of this being). These organizations are only briefly described, and can be inserted into almost any campaign without too much loss.

Major languages are covered in chapter nine. There are six major human languages, one for each race. Included are details on the language, specific names, and its alphabets. Also included are Dwarven runes, Elven scripts, Hobgoblins letters, and details on Halflings and Merchant's Tongue. This is a very useful chapter to those who want to add a lot of detail to their setting, but also one that -- outside of grabbing names -- would require some practice.

The Gods of Tellene are covered in chapter ten. Here I was really hoping to see some *Dungeons & Dragons* elements

sparkle through . . . perhaps some new domains, some specialty spells, and/or some powerful items. While none of those are present, there are fifty-four gods, each one with different names according to which country the god is worshipped in. All of the major portfolios are covered from magic, time, and war, to strategy, knighthood, and honor. Each deity has a number of "generic" names -- like The True, The Blind One, The Magnificent Magistrate, The Exalted Judge -- followed by their regional specific names, their spheres of influence, alignment, symbol (with an illustration), divine focus, holy days, place of worship, colors, animal, appearance, church, clergy, raiment, sacrifice & frequency, advancement, clerics, friends/allies, foes/enemies, and sayings. There are small tables that show the title of the cleric as well as the color of clothing that the cleric should wear. At the end of the chapter is a listing of the gods by name, spheres, priesthood (name of the clergy), church name, colors, holy/unholy days, symbol of deity, divine focus, and animal. This chart is a great quick reference tool for GMs in a hurry.

Appendix I covers Celestial Bodies and Calendar. This section hosts illustrations of the stars above the world with some interesting sidebars. For example, Magnostorms are magnetic storms that effect various races' direction sense and interfere with teleportation spells. More important than the stars though, is the chronological record. Five time lines show the history of Tellene in two pages.

Appendix II covers cities. The coverage is general information and can be used in any typical fantasy setting. There is nothing here that says, "I belong in this book!" Only the City Quick-Reference Chart lets you know that the chapter is still dealing with Tellene. The cities are listed by alphabetical order, with the region, country/location, population, and page number where further details are located. Appendix III, Code of Law, is also general information that could be easy to insert into any campaign setting. Various crimes and their punishments are listed.

Appendix IV, Armies of Tellene, shows the military backbone of the various countries with a breakdown of different armies and leader. A chart shows how many troops of each type each country supports. Appendix V is a Country Chart, with country name, capital city, population, ruler, and resources. Appendix VI, Nomenclature, details a chart with domain, resident, residents plural, and things of this origin. Appendix VII is an NPC Reference chart by alphabetical order, showing the name, alignment, race/sex, location, and class level. Another useful tool, but perhaps it would have been more useful to separate entries by country or region?

The index is more like a combination between glossary and index. Each entry has a brief description of a few words and a page reference.

One of the things that *Kingdoms of Kalamar* were always known before this edition were the maps. These were always very high quality on very heavy paper. The quality is still there, but that quality of the paper has gone down. The maps are in two different places in the book with rubbery glue that's easy to remove, but leaves a stain. There is also a semi-transparent hex grid for overland travel that's easy to remove. Still, the downgrade in map paper quality means that people will have to handle these with care.

The art in the book ranges from okay to great. There are several pieces that will be familiar to old readers of the Kalamar books, included the full color cover to the "Secret Temple of Adajy" module. On the other hand, the full color illustration at http://www.kenzerco.com/dnd/kalamar_artwork_tour1.htm is black and white on page 188 in the book.

The layout is standard two-color, with pull out boxes to highlight a few *D&D* things, like magic items and a new race: the half-hobgoblin. The spacing of the text itself, though, is generous . . . especially in comparison to the *Forgotten Realms* campaign setting.

On one hand, this is a good world book. A lot of thought and detail went into it. On the other hand, it seems to have very little to do with *Dungeons & Dragons*. Even the gods don't have domains listed in the book. A lot of information in the appendices is generic enough to fit any setting. In this aspect, it's a great sourcebook for someone new to the *D&D* setting and who doesn't want a lot of new mechanics to play with, instead preferring some advice on how cities and laws should work.

On the other hand, for \$5 more, the *Forgotten Realms* is vastly superior to the *Kingdoms of Kalamar* in terms of game mechanics, text-to-page ratio, and art quality. *Kalamar*'s biggest benefit here are its superior maps, although those aren't as good as the originals.

If you're looking for an interesting setting to set your next *GURPS*, *Warhammer*, *Palladium*, or *Heroes* setting in, the *Kingdoms of Kalamar* is a bit pricey at \$35 but worth it to new players and GMs. If you're debating between the *Kingdoms of Kalamar* and the *Forgotten Realms*, spend the extra money and get all the gaming goodies as well as a setting.

So Who Needs Glasses?

by Charles Calvert

Secret identities.

For all the years that superheroic adventures have been played out in games and printed on a page, no concept has been more hotly debated. "Oh, come on," the detractors cry. "You're telling me that lady reporter can't recognize him? All he did was change clothes, put on a pair of glasses, and slick down his hair!" "Right, a multimillionaire whose face is all over the papers can't be identified because he wears a costume." In recent years, even the comics have taken flight from that age-old precept, abandoning it as "unrealistic," "a cliché," "old-fashioned."

But is it?

"Over in (Chicago's Eighteenth Precinct), there was a guy who dressed up as Superman and secreted himself behind a steel door in the subway. He got the frame loosened before he went behind it. He was with a robbery decoy; this guy lay down on the platform and let this street person pick his pocket. With that, the steel door comes crashing down. Out comes Superman; the guy was arrested by Superman. When it gets to court, the judge says to the officer, 'Were you the arresting officer?' 'Yes, your honor, I was.' The street person goes, 'That ain't the arresting officer. That was Superman that arrested me.' "

-- from "Pure Cop," by Connie Fletcher

The policeman was seen at close range, and for an extended duration. How could the perpetrator be mistaken?

The answer lies in optical illusions.

To begin with, take a look at the stereotypical super-suit. A neutral ground, with a central emblem in bright primary colors, much like the costume worn by that policeman above. With no mask, it doesn't look like much of a disguise, does it?

But look at the suit again. The central emblem focuses attention on the chest, making it appear larger. With solid color at the waist, the effect is to make the chest appear outsized, beyond normal proportion.

Now add briefs in a color taken from the chest emblem . . . well, to quote the "Lois and Clark" series, "they won't be looking at your face." They're not as bright as the central emblem, nor as big, but they serve the purpose of making the waist appear even smaller by comparison.

Next, boots to match the briefs, and we add several inches to the hero's visual height . . . since legs are vertical in shape, the boots can't add much width, and so the added visual size takes the form of increased height.

Finally, the ever-traditional cape, in a color to match the briefs and boots, and we expand the hero's visual width one last time. Still, even with a spit curl for style, you wouldn't expect this to make that much difference, right?

Now look at the average business suit, straight off the rack. Modern business attire, while wonderful in its way, does its best to reduce all shapes to one: the rectangle. Whether the secret identity is male or female, the modern business suit tries to turn them into a chocolate bar as far as visual perception is concerned. Solid colors with vertical pinstriping add a little height, but subtract width in order to get it. The visual chest size is reduced, the waist almost eliminated by the hanging cloth.

Uniforms go even farther. Whether it's a policeman's basic blue or a nun's habit, the first intention of any uniform is to make everyone look like everyone else. In fact, here's where we hit that poor crook back in the quote: During his arrest, he's brought down by this figure in red and blue, flowing red cape, and that big red 'S' on the front. But when he gets to the stand? A cop.

Another important identity-hiding feature is the mask, however. While less subtle, it can be equally effective.

The full-face mask, of course, is the most effective, whether you're a wallcrawler or some guy in a suit of armor. With this mask, any visual distortion can be realized, whether it's monolithic anonymity or wild alterations of the visual outline.

But the half-mask, though sometimes overlooked, is equally vital. Much like the markings of the raccoon, its purpose is to break up and distort the pattern of light and dark that makes up the face. The traditional "grim antihero" mask over the upper face, by use of dark color, lowers the forehead and emphasizes the jaw. When completed with a nasal (a projection to cover the nose), even the physical profile is changed. Upward projections can also narrow the contour.

Even if your hero doesn't wear a mask, don't discount it. A pair of glasses, a false beard, a hat . . . any of these changes the visual image, and by extension the face. That's right, the secret identity can wear masks, too!

All things considered, it seems the secret identity, however old its inception, still has a good run ahead of it.

by Chad Underkoffler

Genre: Hero Pulp with Arcane Abilities (think Doc Savage, the Shadow, Indiana Jones, *Tales of the Brass Monkey*, or street-level supers like the Batman, the Golden Age Sandman, or Captain America).

Style: Action, Adventure, and Mystery

Theme(s): Heroism, Weird Science, or Arcane Abilities must counter Weird or Arcane Threats.

Campaign Setting and Background Information

What Everybody Knows: The year is 1930. The place is Futura City. The Future is Now.

The advanced technologies pioneered by inventive genius Alexander Cain have changed the world in the aftermath of the Great War. The most ubiquitous of Cain Crystal Science's new inventions are the Cain Crystal Battery (used to power vehicles) and Cain Structural Glass (as resilient and flexible as steel, but lighter and cheaper). They have also made him wealthy beyond belief. These formulations are not easily replicated, so he is the sole provider of the cutting-edge. A few isolated scientists have been able to duplicate his technologies, but have been unable to develop processes for industrial production of them.

Wealth brings influence -- and possibly hubris as well. Cain decided to build a hyper-modern city on the Jersey Coast. His front companies quietly purchased lots of available land over the course of five years, always paying generously. Land was broken in 1927, and Cain threw himself into developing his City of Tomorrow.

In three short years, Futura City has exploded into existence. It is already becoming a major metropolis. Construction is constant. Each day brings a new wonder around the corner: the Crystal Spire, the Field of Glass, the Imperial Building, Futura City Music Hall, the Pyramid Stock Exchange, and much more.

Cain's technology is everywhere. Personal autogyros fly downtown through the holes in the crystal skyscrapers. Huge zeppelins deliver needed supplies and curious visitors. Telephones and pneumatic mail tubes are cheap and readily accessible by all. Elevated multi-level monorails provide efficient public transportation. Cain Crystal Sciences has implemented a modification of Tesla's ideas on broadcast power (unfortunately, the energy beamed out from the Crystal Spire occasionally causes volatile materials to detonate, which has led to strict statutes regarding fuel, industrial chemicals, and explosives--including gunpowder). New photographic processes have been developed, especially in the area of cinema film, kick-starting a modest Futura City movie industry.

Every day, hundreds of laborers, scientists, businessmen, philanthropists, entertainers, socialites, philosophers, entrepreneurs, industrial spies, drifters, private eyes, mystics, charlatans, and criminals come to the City of Tomorrow chasing new possibilities; each desiring to carve their own niche in its glassy towers and valleys. Gangsters, smugglers, and bootleggers have set up shop; the Futura City Police Department (also called the Crystal Cops) is there to stand against them with shock pistol in hand. Masked adventurers with colorful sobriquets have come to dance on both sides

of the Law. There are a million adventures in the crystal city, just waiting to be discovered.

What Everybody Doesn't Know

1. In the July of 1910, after a torrential rainstorm, twenty-five year old Pennsylvania dairy farmer Alexander Cain found a "crystal box" buried in a gully on his family farm. Taking a shine to it, he left it on the dresser next to his bed. After a few weeks, it began "speaking" to him, giving him methods for improving the machinery around the farm and ideas for new, even more useful inventions. Cain began building devices according to the crystal box's whispered designs. After selling an enhanced steam boiler to JP Morgan, Cain took his earnings and invested them into the stock market according to the dictates of the crystal box. In weeks, he had quintupled his money. He founded Cain Crystal Sciences in 1916; by 1919, he was a multi-millionaire. Guided by the knowledge and insight of the crystal box, Alexander Cain began to bring his wildest dreams into reality.
2. People with verifiable mystical, mental, or arcane abilities-- true clairvoyants, mediums, mesmerists, ritual magicians, gadgeteers, etc.-- have begun appearing within the last two decades. Their arrival coincides with the discovery of Alexander Cain's crystal box. Is it raising the ambient mana level of Earth or is Atlantean psionanotechnology infecting the biosphere?
3. The crystal box is a piece of lost Atlantean technology. Whether its bizarre hyper-science (and concomitant increase in wild talents in the population) is based on advanced technology, the forces of magic, or accessing psi energies is currently unknown.

NPCs and Their Goals

Alexander Cain, Genius Inventor and Industrialist: Over the years, Cain has picked up enough scientific, engineering, and industrial knowledge to hold his own in conversation. He has a vision for the future: a vision of everyone living in clean crystal towers where all their needs are met with a single thought. He is an active philanthropist and patron of the arts. He's known as the First Citizen of Futura City.

Goals (pick one): 1) Cain is a good soul, and really does want the best for everyone. He's using this fire stolen from heaven to try and help humanity elevate itself. 2) Cain has been driven completely mad by the constant whisperings of the crystal box in his mind. He's speeding hell bent for leather towards the future, directed only by his whims and the Atlantean influence. 3) Cain knows exactly what he's doing. Careful manipulation of science, industry, and technology will grant him the power he's always dreamed of. Someone needs to rule the world; it may as well be King Cain.

Joshua Cohen, Blackmail King: Joshua Cohen and his Mob rode into Futura City on the blackmailed-back of his cousin -- financier Abraham Roth -- and a tidal wave of bootleg Scotch. The Cohen Mob controls 75% of the City of Tomorrow's speakeasies and back-room casinos. Currently, Cohen's at war with "Big Danny" O'Malley and his boys.

Goals: Cohen wants to sell booze, run casinos, blackmail wealthy sorts, and make as much money as possible, to give his "dependents" a good, secure life.

Dr. Eclipse, Brooding Mastermind Gadgeteer: Dr. Eclipse (first name unknown) is one of the few scientists who has been able to catch the outlines of Cain's crystal technologies. He's invented a number of unique devices that could be of great value to the Futura City PD (or the military) if he could just mass-produce them. After having met Cain a number of times, Eclipse is convinced that Cain could not have conceived this crystal technology on his own.

Goals: Dr. Eclipse wants to know how to mass-produce Cain's crystal technology. He's been able to figure out how to duplicate (and even modify) some of it, but large portions of the technology still has him baffled. Right now, he's unsure whether he's driven to discover the industrial processes for crystal technology or just to uncover the secret of who Cain got it from. He could be a masked hero, villain, or shadowy mastermind.

Rocko Kablowski, Heavyweight Contender: A great big ape of a guy, Rocko's brawn is matched only by the size of his heart. Of course, before his boxing career took off, he did some strong-arm work for the Cohen Mob . . .

Goals: Rocko wants to become the heavyweight champion of the world and to outrun his seedy past.

Kelly McNamara, Secretary and Industrial Spy: It hasn't been that long since the Irish were treated like subhumans. Kelly McNamara grew up poor and being looked down on, and it affected her. Money is her ticket to being treated the way she believes she deserves to be treated, and money will let her treat others the way she wants to treat them. Passing sensitive information for a buck is a lot more lucrative than taking dictation from some fat cat. And when you have expensive tastes, you need the sawbucks.

Goals: Make money by stealing industrial information without being caught. Pay cash for a '31 Cain Crystal Battery Dusenberg when it rolls off the assembly line.

Other NPCs to use in your Futura City Campaign:

- **Daniel "Big Danny" O'Malley**, Irish Gangster and Smuggler
- **Waldo "Ace" Powell**, Movie Star, Daredevil Pilot, and Playboy
- **Abraham Roth**, Financier and Blackmail Victim
- **Professor Hans von Shockenstein**, Former Lab Assistant to Alexander Cain, now Gadgeteering Science Pirate!
- **Rebecca Telford**, Chemical Heiress and Socialite
- **Yvonne Garcy**, Singing Sensation (and Secretly the Sister of von Shockenstein!)
- **The Wraith**, Mysterious Mystic Avenger

Items and Locales

- **The Crystal Box:** A bottle-green rectangle of glass, about the size of a cigarette case. It is warm to the touch. Whatever you decide about the crystal box will have a tremendous effect on your campaign. Is it an Atlantean computer? A prison for the astral form of an Atlantean criminal? Could it be just a hunk of radioactive glass that somehow unlocked the potential of Cain's mind? Is it a mind control device of the Illuminati? You make the call!
- **Crystal Spire:** A slender blue spire of glass that rises up out of the Bay and broadcasts power throughout the City of Tomorrow. Do the harbor fish swarm around it, or do they die in agony? Does the Spire shine at night, or are its emanations invisible? Will Abraham Roth's plan to piggyback radio station WFCT's signal on the Crystal Spire's energy broadcast work?

Other locations to use in your Futura City Campaign

- **The Field of Glass** (This is just a cool name; what is it in your campaign? A solar energy collector? An underground greenhouse? A new sports arena?)
- **The Imperial Building:** The tallest building on the planet, pierced with monorail lines and autogyro access tunnels.
- **Futura City Music Hall:** Where the elite are entertained.
- **The Pyramid Stock Exchange:** Small now, but there are millions to be made in Futura City . . . on margin!

Events and NPC Intersections

- **Heavyweight Championship:** Big Danny O'Malley is pressuring Rocko to take a dive, but the Cohen Mob is threatening to let Rocko's leg-breaking days for them go public if he loses. What's a mug to do?
- **Movie Opening:** Waldo Powell and Yvonne Garcy are certainly the most handsome couple at the premiere of Powell's new air-war movie *Winged Knights*. Rebecca Telford is resplendent in her new Cain miracle fiber evening gown provided by her escort, Alexander Cain, but she is not paying the First Citizen any heed -- she only has dreamy eyes for Ace Powell!
- **Speakeasy, Speak Softly:** Rebecca Telford and Kelly McNamara frequent the same Cohen Mob gin joint on the West Side. They've struck up quite the friendship, despite the difference in their social circles, which Telford is

not cognizant of. When Telford is kidnapped by Professor von Shockenstein, who will she go to -- Alexander Cain, or her secret ally, Dr. Eclipse?

Possible Story Arcs

Story arcs -- or continuing threads that weave throughout a campaign -- are one of the things that really make a game stand out. The development of a long-term plot that can be seen from a distance, will keep the campaign in your players' memory for years to come. They can be easy to implement; a solitary mention of an NPC action or random event in an adventure can often propel a story arc along. Never neglect to listen to your players (not just their PCs, but *players'*) theories about What's Going On. Often coming up with added bells and whistles you never thought of, this can occasionally develop a more elegant story arc altogether. Remain flexible, open to ideas, and steal from your players ruthlessly.

Three interesting story arcs to incorporate into your Futura City campaign could include:

- **The First Citizen's Descent Into Madness.** Start Cain as sane but driven, drop a single hint of increasingly bizarre behavior each adventure, then bring him out as a full-raving loon further down the road.
- **Difficulty of Crystal Technology Replication.** Why can't scientists duplicate Cain Crystal Sciences' devices? This could be an excellent subplot about the value of handcrafting items vs. industrial products. Or perhaps the issue is solely about having "weirdly talented" people working the line? A machine shop full of empaths and clairvoyants would be quite a different place to work from the norm.
- **Love, Exciting and New.** A romance subplot between Garcy, Powell, and Telford could have interesting repercussions on the game-world once you work out how their friends and foes react to the other lovebirds' friends and foes. Will Cain try to crush Powell's acting career? Did von Shockenstein kidnap Telford so that his little sister could win her boyfriend back? Will Telford use her wealth and influence to buy Garcy's recording contract, then hang the songbird out to dry?

Genre Advice

"Pulp is not simply a genre or era fixed in stone, it is really a state of mind. Fast-paced and energetic adventures. Exotic locales and two-fisted action. A wistful and nostalgic glimpse of an era that seems familiar but more simpler, innocent and daring. Pulp is all these and more. Some features of the pulp genre include its simple morality of good versus evil, masked and cloaked heroes and heroines, devious villains and their schemes, gun-wielding desperados, cliffhanger endings, weird science, and a world still lush with unexplored places and lost races. Understanding the nostalgic elements of the material the pulps cover and the stylistic conventions used in them are essential in squeezing the most enjoyment out of this rip-snorting and adrenaline-laced gaming genre."

-- Brian Misiaczek, *THE PULP AVENGERS: Game Mastering Pulp Adventures in the 1930s and 1940s*
(http://www.columbia.edu/~mfs10/Brians_Pulp_File.html)

The above quote sums the genre up nicely. Brian Misiaczek's *THE PULP AVENGERS* is a great resource, and is one that can be returned to again and again, and used for a number of campaigns. Check it out!

Advice: go with it. Live larger than life. Take unreasonable risks. Laugh at danger. Let the villain paste you one on your lantern jaw, then get back up and knock him down. Death is present, but only if you lose your nerve.

Style Advice

The watchwords of the pulp genre are action, adventure, and mystery.

- *Action.* Keep each adventure moving. Mild conflict should be happening at all times -- and not just combat. Interpersonal friction, high-speed autogyro chases, romantic interactions, scaling buildings like human flies, intense social affairs -- keep it all moving.

- *Adventure*. Keep the risks and rewards high. Adventure is all about chancing danger for gain. If action is the stick, adventure is the carrot. Hang out hidden information, secret formulas, money, fame, freedom, and safety as bait to lure your players into action.
- *Mystery*. Mystery is all about keeping things veiled, and letting the players figure it all out. Let the players work for a solution; resist the temptation to either make things easier or harder. Decide on a simple, one-twist mystery, and let it lie to be poked and prodded at. Emphasize ambiguity, vagueness, and nebulousness around your mysteries. Don't overdo it -- it shouldn't take Sherlock Holmes, Jr. an hour to remember where he parked his autogyro or if he had eggs for breakfast, but the symbol carved in the murder victim's forehead should not be too easily identified.

Theme Advice

The concept here is that Weird science (or Arcane abilities) are best countered by a combination of Heroism and Weird Science (or Arcane abilities). You just can't call out the Army when Alexander Cain goes mad and turns the Crystal Spire power transmitter into a Death Ray. What about when Joshua Cohen has paid Professor von Shockenstein to dose Rocko Kablowski with An-vitamins before the title bout? Or when the Wraith falls off of the Imperial Building and starts to plummet 150 stories to his death?

The PCs can and should be the ones involved in handling these issues. Their abilities and outlook make them the perfect candidates to run right in where angels fear to tread. They should stand against the odd and the powerful to protect the mundane and weak, be it from a rampaging 10-foot tall robot or the blind eye of emergent hyper-technology. That's the theme of a Futura City Campaign.

Opportunities & Pitfalls

Pulp or cliffhanger adventures are great ways to get your action ya-yas out. It's a simpler, more idealistic period; heroes are heroes and villains are villains. The ends justify the means. To a modern aesthetic, that may seem trite, silly, or downright dangerous.

Make sure all the players are on the same page as you before trying to run a pulpy game. If even one player out of the group plays it more lightly or more post-modern, that can have a strong effect on your plots or adventures. If the PCs are constantly questioning the motives of the Police Commissioner who calls for their help, how will they ever stop the Museum Burglar's escape autogyro?

Guns. In some ways, guns can be the biggest threat to the whole pulp vibe. They are not necessarily a trump card, as they're not really as deadly as in real life (at least not to the PCs and major villains). Guns shouldn't be much more deadly to the major characters in a pulp game than the average dagger or shortsword in a fantasy game. Implement system rules like penalties to firearms skills at close range, spend experience to make an injury "only a flesh wound," allow a "healing" back of some health after a combat round, or the like to minimize the effect of guns. Or you could opt to use genre conventions like "the first bullet always misses"; this allows the hero to jump for cover. Another interesting convention to use is named/unnamed foes (like *Feng Shui*'s mooks or S. John Ross's "[Beyond the Grip of Realism](#)" scrubs) to minimize the value of firearms. Guns should be a useful tool, not a magic wand.

Other Tips & Tricks

An interesting GM "trick" to use is an *NPC Interaction Matrix*. The NPC Interaction Matrix is handy, especially when your PCs ask an NPC how they feel about a second NPC, and you need to come up with an answer on the fly. Indeed, you can use it to develop plots, scenes, and adventures, just by looking to see how NPCs react to each other without the presence of PCs to muddy the water.

A quick example, using a subset of the NPCs we've mentioned here, we can illustrate some complex relationships. Let's say that Dr. Eclipse has hired Kelly McNamara to infiltrate Cain Crystal Sciences as a member of the corporate

secretarial pool. Let's throw in Rocko Kablowski as a romantic interest for Kelly, too. We could show this by:

	AC	DE	RK	KM
AC		-	+	+
DE	-!		-	*(+!)
RK	+	+		+
KM	+(n)	*(+!)	+	

AC = Alexander Cain

DE = Doctor Eclipse

RK = Rocko Kablowski

KM = Kelly McNamara

+ = Likes

+! = Ally

- = Dislikes

-! = Enemy

* = Haven't Met

n = No Opinion

() = Secretly. . .

Okay, the way we read this is by cross-referencing NPC initials to NPC initials. Thus:

- Alexander Cain dislikes Dr. Eclipse, likes Rocko Kablowski, and likes Kelly McNamara (she's very attentive during dictation).
- Doctor Eclipse sees Cain as his enemy, dislikes Rocko, and acts as if he hasn't met McNamara (who he's secretly allied to).
- Rocko Kablowski is a genial sort, and likes Cain, Dr. Eclipse, and McNamara.
- Kelly McNamara pretends to like Cain (who she could care less about but doesn't actively dislike), likes Rocko, and claims to have never met Dr. Eclipse (who she's secretly allied to).

Mismatches between the opinions of NPCs -- like Dr. Eclipse seeing Cain as an enemy and Cain merely disliking Eclipse, or Rocko liking Eclipse while Eclipse finds him distasteful -- can make for complex and vibrant interactions when the PCs are talking to NPCs. This Matrix can be used to help NPCs seem more like real people, with motivations and opinions of their own.

Pyramid Review

Pyramid Review: Dungeons (for d20)

Dungeons (for d20)

Published by [Alderac Entertainment Group](#)

Written by Nancy Berman, Noah Dudley, Peter Flanagan, Mike Mearls, Jim Pinto, John Seavey, Eric Steiger, Serge Stelmack, Greg Stolze, Ree Soesbee, and Steve Wright

Illustrated by Julian Aguilera, Storn Cook, Liz Danforth, Jonathan Hunt, A. Bleys Ingram, Scott James, Richard Pollard, and Mike Sellers

Edited by Ree Soesbee and Rob Vaux

128 pages; \$19.95

So far, Alderac Entertainment has taken a "short and sweet" approach to their *d20* offerings, presenting the *Adventure Keep* series of brochure-sized adventures. *Dungeons* is their first full-size *d20* book, but it's not really a single work. As you might guess from the long list of authors above, it's a collection of essays and tips. The tips are good, but design problems keep the whole of this collection from being as good as the sum of its parts.

There are four main sections. "Tips and Tricks" explores general principles of dungeon design from both the player's and the gamemaster's perspective. "Dungeon Types" describes eight basic styles of dungeon -- from fortresses to subterranean communities to the ever-popular madman's lair -- and presents suggestions for designing each style. The "Player" section focuses on new skills, spells and prestige classes for dungeon-delving player characters, while the "Dungeon Master" section presents monsters, magic items, traps, and some short sample dungeons.

Each section accomplishes its basic goal, progressing naturally from topic to topic and covering its subject in a detailed and logical manner. The "Tips and Tricks" section begins by addressing players and providing useful tips for safe -- well, not as dangerous -- dungeon delving. Each of the player hints does double duty as a gamemaster hint, though, reminding GMs of design elements that will add challenge and atmosphere to their own dungeons. After the first essay covers the information most useful to players, the next essay quietly shifts gears and addresses GMs. The transition is subtle but definite -- it's always easy to tell who will get the most benefit out of a piece. Players will probably find this book less useful than gamemasters will. Everything in the book is useful to GMs, but a player who never runs games will find only about half of the book immediately useful.

It's easy to tell that the essays were written by different writers -- you may not know who wrote what, but you can hear the differences in style from piece to piece -- but the book is remarkably consistent. There is a noticeable absence of contradictions and redundancies in the text, which speaks well of the editors. Either they planned the book very carefully, or they did a bang-up job of fixing the glitches typical of a group work.

Despite this care, *Dungeons* doesn't quite work. Its design problems suggest that nobody really asked themselves, "Who are we writing this book for, and how will we attract them to it?"

Most of the suggestions are basic advice, the kind that has cropped up in how-to-gamemaster gaming articles since the early days of *Dragon*. There's the physics of traps, the importance of creating a history of the dungeon so you can extrapolate the changes it has gone through, the food needs of the common dungeon monster, et cetera. This is all valuable material, even if it has appeared in other places before. As long as there are new gamemasters, there will be gamemasters who need to read this information for the first time, and even old geezer GMs can use occasional reminders of the many ways you can give treasure and the dangers of flash floods in sewers.

The content should appeal to less experienced gamemasters, but the presentation probably won't. The layout is simple and a bit dull. There isn't much white space to catch the eye, just block after block of text insufficiently set off by the small headers. When you flip through the book on the shelf, nothing stands out. Add the boring cover to the mix, and you have a book that's likely to be ignored by the gamemasters who will get the most benefit from it.

It's easy to see that *Dungeons* is modeled on the *Dungeons and Dragons Player's Handbook*, which has plenty of long blocks of very small text. The *Player's Handbook* works, however, because of the features that *Dungeon* doesn't reproduce. There are more tables to break up the text, and the art appears in a greater variety of positions. Because the *Player's Handbook* is in color, it can create more variations in fonts, artwork and backgrounds. The *Player's Handbook* also serves a slightly different purpose than *Dungeons*. It is primarily a reference work, meant to be consulted when players need to know what an attack bonus is instead of read cover to cover. Due to its essay format, *Dungeons* is more of a reading work than a reference work, and the repetitive design of the book is more of a drawback.

Of course, *Dungeons* didn't have the production budget that the *Player's Handbook* did, so there's no way it could have reproduced all of the *Player's Handbook's* deluxe features. But if the editors had taken a different design approach, they could have circumvented some of the problems. The essays are useful, but summary checklists and other tools would break up the text and make it easier for gamemasters to put the book's advice into practice. Flowcharts and step-by-step dungeon design tutorials would have made the book more useful and added visual interest.

Dungeons is a good effort, but Alderac needs to take some lessons from its previous *d20* offerings. The Adventure Keep modules leap off the shelf because their covers -- while simple -- catch the eye, and it's easy to spot useful material during a quick flip through any given adventure. Hopefully Alderac's next *d20* book will be just as appealing.

-- Chris Aylott

The Peculiar Flight Of Rudolf Hess

*"He is insane. He is the Dove of Peace.
He is Messiah. He is Hitler's niece.
He is the one, clean, honest man they've got.
He is the worst assassin of the lot."*
-- A.P. Herbert, on Rudolf Hess

That doggerel quatrain neatly brackets the bisociative Deputy Führer of the quondam Third Reich, Rudolf Hess, who sixty years and one month ago leapt the surly bonds of Earth and joined the all-star enigma list. Although he was plenty goofy before he took the high road to Scotland, it's in Hess' flight and fate that our high weirdness sensors detect a mother lode. You know something pretty special is going on, after all, when *Hitler* calls a guy crazy. Let's drill down, then, and see if, somewhere in his madness, Rudi has a message for us.

"My Führer, when you receive this letter, I shall be in England. You can imagine that the decision to take this step has not been easy for me."
-- letter of Rudolf Hess to Adolf Hitler, May 10, 1941

To start with, let's look at what history records. On the evening of May 10, 1941, expert pilot Rudolf Hess climbed into a twin-engined Messerschmitt 110 fighter-bomber on the tarmac of the Messerschmitt works at Augsburg. Shortly after 10 p.m., a man calling himself "Alfred Horn" walked up to a Scottish farmer near the town of Eaglesham (south of Glasgow) and asked to be taken to Dungavel House, the home of the Duke of Hamilton. The suspicious farmer called the authorities, and "Horn" was rapidly unmasked as Rudolf Hess. Hitler's propaganda machine immediately declared Hess to have gone insane; British propaganda, on the other hand, did almost nothing to exploit the defection of Germany's Deputy Führer. Hess was locked up in the Tower of London, then transferred to a secret "Camp Z" site in Surrey, and thence to Abergavenny in Wales. After the war, he was tried at Nuremberg, sentenced to life imprisonment in Spandau Prison, held almost entirely incommunicado for forty years, and died of strangulation in 1987 at the age of 93, an apparent suicide.

"Certain of Hess's closest friends have thrown an interesting light on the affair. They say that Hess has always been Hitler's astrologer in secret. Up to last March he had consistently predicted good fortune and had always been right. Since then, notwithstanding the victories that Germany has won, he has declared that the stars showed that Hitler's meteoric career was approaching its climax."
-- *Times* of London, May 14, 1941

Also on May 10, 1941, a conjunction of six planets occurred in Taurus, coinciding with a full moon. Hess' personal astrologer, Ernst Schulte-Strathaus, pointed out the unique configuration to Hess, noting that it combined extraordinary danger to Hitler with extraordinary potential for world-shaking changes in international politics. (According to Ellic Howe's fascinating *Urania's Children*, Schulte-Strathaus even "joked" that the conjunction could cause a [pole shift](#) not unlike that latterly predicted for [May 5, 2000](#).) Hess, the theory goes, already a confirmed believer in astrology, anthroposophy, and the magical power of herbs, decided to take Hitler's fate as his own (which may be why his alias "Albert Horn" had the initials "A.H."), make a separate peace with Britain, and thus redeem Germany -- and Hess' flagging political fortunes. Peter Levenda and other authors (of varying reliability) even suggest that Schulte-Strathaus had been fed astrological disinformation by the British "dirty tricks" units under Ian Fleming -- still wilder speculation touches on MI5-forged copies of [Nostradamus](#) or other astrological texts cunningly placed in German bookshops. To Hitler, of course, it served as evidence that the astrologers were all out to get him, and he ordered the SS to round up and imprison astrologers in June 1941 under the code-name *Aktion Hess*. It's only fair to point out that *Aktion Hess* might have been a Bormann-Heydrich plot to weaken the equally occult Himmler politically -- or magically.

"[T]he people around me during my imprisonment acted towards me in a peculiar and incomprehensible way, in a way which led me to conclude that these people somehow were acting in an abnormal state of mind. Some of them -- these persons and people around me were changed from time to time. Some of the new ones who came to me in place of those who had been changed had strange eyes. They were glassy and like eyes in a dream."

-- statement of Rudolf Hess before the Nuremberg War Crimes Tribunal, August 31, 1946

Heydrich's name comes up in another context -- the "Hess double" theory. Heydrich may have, the story goes, intercepted Hess (possibly while refueling at a Danish airfield), executed him on the spot, and sent a double to Britain to determine the extent of Hess' contacts. This seems, it must be admitted, like a very pointless plan, even for Heydrich. On the other hand, some sources do claim that the Messerschmitt that crashed in Scotland had a different tail number than the one which took off from Augsburg -- which could be explained by that refueling stop. More than that, however, the pilots also seem to have changed. Not only was the Hess who landed in Scotland considerably more frail and addled than the strutting newsreel hero who took off from Germany -- he was missing a scar. Rudolf Hess was shot through the lung in World War One; the prisoner of Spandau had no scar tissue on his chest or back. His dental records don't match descriptions of Hess' teeth, either. Either anthroposophic herbal healing works better than it has any right to, or something winky is going on.

Allen Dulles, of the OSS, sent Dr. Ewen Cameron to Spandau "to establish the state of mind of Rudolf Hess" -- and (so the story goes) to check Hess' chest for that evasive bullet scar. Cameron, by the way, continued his OSS-CIA career as head of a Montreal psychiatric clinic doing contract work for MK-ULTRA -- the CIA mind control program. Was Cameron checking for telepathic influence on Hess? Or was he, ahem, "establishing" it? Could Cameron have drained Hess' memories, of [Nazi Antarctic bases](#) (Hess, we are told, sponsored the Antarctic Expedition of 1938 and kept the "Polar File" for Hitler) or UFOs, for later CIA analysis -- or replication? Speaking of replication, there's always Mengele and his cloning experiments -- and some clones seem to age preternaturally, like Hess apparently did.

One intriguing possibility is that there really was a high-level (even royal) cabal attempting to surrender England to the Nazis, and although Churchill intercepted Hess, he couldn't risk exposing Hess' fascist allies in Britain and wrecking public morale. Hence, Hess had to die in secret -- possibly in the mysterious plane crash that killed the Duke of Kent (part, obviously, of this phantom royal surrender ring) in 1942. Until 1987, the British could count on Soviet bitterness to keep the pseudo-Hess incommunicado -- but when Gorbachev offered to release Hess as a gesture of goodwill, MI5 strangled their double. Between the peculiarities of identity, the tangled webs of politics and perception, and all-encompassing secrecy, "Spandau Prisoner No. 7" has become a 20th-century [Man in the Iron Mask](#).

"Hitler put the blame for Hess's flight on the corrupting influence of Professor Haushofer. Twenty-five years later, in Spandau prison, Hess assured me in all seriousness that the idea had been inspired in him in a dream by supernatural forces."

-- Albert Speer, *Inside the Third Reich*

Here's another possibility. The prisoner was, in fact, a tulpa, a thought-form created by focused vril energy using powerful Tibetan magics. Hess was carrying a Tibetan amulet when he flew to Scotland, and we've already mentioned his deep involvement in anthroposophic vegetarian ritual (the "prisoner of Spandau" ate steak, by the way). Hess was one of the first students of Professor Karl Haushofer, whose personal [connections with Tibet](#) helped add a little occult oomph to Nazism. (Hess and Haushofer also both joined the Thule Society, which you knew was going to show up here sooner or later.) Hess may also have been a member of *les Veilleurs* ("the Watchers"), a magical sect centered in Paris and the Rhineland between the wars. Another batch of Watchers are the [Enochian](#) Grigori -- who, as "egregores", provide a Western synonym for tulpas. Hess' flight (like [Lindbergh's](#)) can be seen as an attempt to make contact with the Grigori, or with the ["spirits of air and darkness"](#) that he may have met while circling the Zugspitze (the highest mountain in Germany) during air races in the 1930s. This, by the way, is another connection with the Duke of Hamilton -- the Duke was the first man to fly over yeti-rich and tulpa-haunted Mount Everest, in 1936. The "real" Hess flew off to [Antarctica](#) or Argentina in a UFO to direct the building of the Refuge, leaving his tulpa in the hands of the British.

"According to what Ewen [Cameron] told her, Hess was a highly dedicated member of the Brotherhood [of the Snake], even more so than Hitler. Hess left Hitler's Germany in 1941 for Scotland in order to meet someone and participate in some sort of magical ritual. It involved time travel, and Ewen boasted about it as if it was successful. The control group were waiting for an Aryan planet, known as Marduk, to come into resonant orbit with that of Mars."

-- Peter Moon, *The Black Sun*

Hess was, in a way, to the magic born; his father was a German merchant in Alexandria, Egypt, and Hess grew up in that center of Hellenistic magery until he was sent to Bavaria in 1906. Which means, of course, that the young Hess and Aleister Crowley (another mountain-ascending fan) might have met, since Crowley received the psychically-dictated *Book of the Law* in Egypt in 1904. (A book, by the way, that he saw a number of parallels to in Hitler's -- and Hess' -- *Mein Kampf*.) Crowley, of course, may have worked with MI5 on their astrological dirty-tricks program -- he certainly knew Maxwell Knight, the legendary "M", well enough to initiate him into the OTO. Hess might also have been working (as Peter Moon proposes above) to alter history through time travel somehow -- and perhaps it was an alternate time-track Hess (with no bullet scar) or an aged (but futuristically-healed) Hess who landed in Scotland. Finally, the mention of Scotland leads to the speculation that Hess' true goal was the Holy Grail, hidden (no doubt) in the Rosslyn Chapel of the Sinclairs. Could a British royal conspiracy have attempted to purchase Britain's freedom by turning over the Holy Grail to Hitler? Could Rudolf Hess and Aleister Crowley have planned a ritual to literally turn the world upside down? Did not just the future, but all of history, turn on the flight of a Tibetan doppelgänger through the ["wide gap in time"](#) opened up by a conjunction in Taurus? If so, it's a good thing that Heydrich, or Churchill, or those pestiferous Scottish fogs, or a suspicious farmer, or your PCs, stopped him short of success. But if you're looking for someone to keep your campaign's secrets while sending your players off into the swastika-spangled wild blue yonder, well, Rudi can't fail.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

The Undying Villain

Lots of GM tricks try to tell you to keep your cool villains alive. And that's definitely a good idea, in my mind. After all, really neat villains are difficult to come by. But done poorly, saving a beloved (or behated) villain could well tick off your players. Why? Well, because (depending on the genre) keeping a bad guy alive usually means handing some defeat to the heroes; snatching away the deathblow, having the body disappear, or otherwise have some *dice ex machina* appear. It would be like, in the last five minutes of a Monopoly game, throwing a glass of Mountain Dew in the face of the player with the most money and shouting, "**Fool!** Uncle Moneybags shall not be defeated so easily! He escapes to fight again! Ha ha ha!", then swiping the stack of \$500s he has hidden under the edge of the board.

Of course, as I said, this depends a lot on the genre. Four-color Supers expects (and often requires) capturing and containing bad guys, only to place them in the Maximum Security Papier-Mâché And Chicken Wire Prison. Keeping them alive -- or not having a verifiable body -- is one of the conventions. But lots of genres don't allow such chivalrous behavior. So what's a GM to do to keep their favorite baddie alive?

Here are some tips:

- Make sure you need to keep the bad guy alive. After all, one moustache-twirling fiend is the same as another. But if you have a neat background, hook, methodology, or other mannerism, then keeping him around can be worthwhile.
- As an alternative, consider keeping around a minion. If the heroes keep defeating the big Bad Guy, but there's a lesser henchman or lackey that's developing a life of his own, why not let the lackey live? He can be kind of like an evil Wedge from *Star Wars*. I've done this in a fair number of campaigns, and it's always seemed to be enjoyed. Many players like continuity (but often don't like to lose), so having a lesser character that's continuously defeated -- but escapes -- is often appreciated. (Advanced option: Once that lackey is established, consider having him visit the heroes. He claims that his current boss has gone over the line, and he feels compelled to stop him. Is he lying? Has he had a change of heart? Or is he being used -- subtly -- by the mastermind?)
- If you want to keep the bad guy around, you probably want to limit the amount of direct exposure he allows himself to the good guys; otherwise, the possibility exists of the heroes trying to attack (and possibly defeat) him. "Greetings; I am Synnystyr the Migh...." "GET HIM!!" Holographic/illusory projections, letters, and other indirect evidence is ideal for keeping such villains alive.
- Consider a hook for keeping him alive. If the villain has diplomatic immunity, or possesses a spell that renders him immune to death (and/or resurrects him), is an integral part of the balance of the universe (such that his death would cause Bad Things to happen), or has some other method of staying alive, then direct confrontation can still be possible. In this case, the heroes may undergo epic quests to figure out how to remove this advantage so they can deal with this fiend once and for all.

There are other methods; I might return to them when I get another undead topic (see below). In general, though, I think it's crucial to keep things interesting while making the heroes feel important, and not subservient to the whims of the GM. (Whether they *are* subservient to GM whims is another matter . . . just so they don't feel that way . . . <grin>)

* * *

The reason I'm speaking of undying enemies is because my dear friend, the coin-weighing puzzle, haunted my inbox again this week.

The question most oft asked this week was whether or not the solution presented was too complicated. The answer is yes and no; last week's solution presumes you don't know whether the odd coin is heavier or lighter. If you *do* know, then it's a much easier puzzle.

For example, if you know that it's heavier, then you could divide the 18 coins into three piles of six, weigh two of them, and discard the lighter one. (If they're equal, it's in the unweighed pile.) Then you can divide the remaining six

coins into three piles of two, weigh two of them against each other, and discard the lighter one. (Again, if they're equal, it's in the unweighed pile.) Finally, just weigh the two coins against each other.

Now, with this version of the puzzle, you'll probably note that we're getting off easy. For the last weighing we don't need to divide the coins into three piles; we still could still determine the heavier coin if there were three coins left. Working backwards, we can see that this version of the puzzle will work with 27 coins initially.

So, in a nutshell, last week's puzzle solution is needlessly complex if you know that the odd coin is heavier or lighter. But if you don't, you'll probably need to do something similarly arcane.

(Ironically, this version of the puzzle I don't think is particularly unfair; you should be able to explain it -- and the solution -- without notes, scrap paper, or props. And since this version is modular and incremental, you can let smart *characters* make Intelligence/IQ/Smarts rolls to reveal the first step without revealing the whole thing, yet giving them a significant clue as to how to progress.)

Okay; having said that, I must also point out that I was wrong with last week solution. (*Yeah*, I hear the loyal readership say. *What else is new?*) At one point I said that, in each batch of three weighings, one of them would be equal, thus eliminating four. Well, as an astute reader pointed out, coins E, I, and O are present in all three weighings; if any of those coins is the odd one, then all three weighings will be unbalanced. Of course, the solution is still good, and logic should be able to tell you where the odd coin is if it's one of those three. (As a hint, if all three weighings are unbalanced, then you've narrowed it down to one of those three . . .)

* * *

Finally, I received some questions regarding last week's casket puzzle. Here's that solution.

To recap:

Gold: The portrait is in this casket.

Silver: The portrait is not in this casket.

Lead: The portrait is not in the gold casket.

You know that, at most, one of the statements is true; where's the portrait?

Since you know that at most one of the three is true, let's suppose none are true. Then the Gold and Lead caskets would contradict, so we know that a) at least one of the three statements is true, and b) it's either Gold or Lead that must be true. If Lead is true, then the portrait must be in the Gold casket; but then the portrait is *not* in the Silver casket. Since that would also be a true statement, we'd be breaking the rule about more than one true statement. Therefore Lead must be true and Gold must be false; thus Silver must be false, and so the portrait is in the Silver casket.

(Now I know how Click 'n' Clack feel . . .)

--*Steven Marsh*

* * *

*Last week's answer: **Killer**, various editions.*

(Four stars)

"There was a young man from Sybar
Who was stung on the nose by a wasp
We said 'Does it hurt?'
He replied, 'Not at all,
It can do it again if it likes.' "

by **Stephen Dedman**

The following NPCs are designed to be used when a GM or PC need a small gang of 25-point or 75-point criminals for a -10 point Enemy disadvantage, a supervillain's Ally group, a crowd in an underworld dive, a cellblock riot, a few "cut-outs" for an Intelligence Organization, some dupes for the Illuminati, or even some trouble-prone dependents.

Most character backgrounds are presented with modern-day campaigns in mind, particularly *GURPS Supers* and *GURPS Voodoo*, but most will only need a few changes to adapt them from any setting from the far future to the Old West or even earlier.

Aaron "Harry" Kosminski, Crooked Cop

ST: 11 [10] **Basic Damage** Thrust: 1d-1 Swing: 1d+1

DX: 11 [10] Dodge: 5 Parry: 6 (Shortsword) Block: 5

IQ: 10 [0] Basic Speed: 5.25 Move: 5 (6 running)

HT: 10 [0]

Advantages: Alertness +1; Contact (Street, skill-15, available on a 9 or less, somewhat reliable) [2]; Legal Enforcement Powers [5]; Patron (Houston PD, appears on 6 or less) [8].

Disadvantages: Duty (on 12 or less) [-10]; Greed [-15]; Secret (Criminal activity) [-10]; Sense of Duty (fellow cops) [-10].

Quirks: S.C.A. member; Sings (loudly and badly) when drunk; Tries to avoid physical work; Wants to become a Vice squad detective; Collects antique and modern weapons.

Skills: Acting-9 [1]; Administration-9 [1]; Area Knowledge (Houston)-9 [1/2]; Brawling-12 [2]; Computer Operations/TL7-9 [1/2]; Criminology/TL7-7 [1/2]; Detect Lies-9 [2]; Driving/TL7 (Car)-11 [2]; Fast-Draw (Pistol)-10 [1/2], (Shortsword)-10 [1/2]; Fast-Talk-8 [1/2]; First Aid/TL7-9 [1/2]; Forensics/TL7 [1/2]; Guns/TL7 (Pistol)-14 [2], (Shotgun)-13 [1]; Holdout-9 [1]; Interrogation-9 [1]; Judo-9 [2]; Knife-10 [1/2]; Law-8 [1]; Motorcycle/TL7-10 [1/2]; Professional Skill (Law Enforcement)-10 [2]; Riding (Horse)-9 [1/2]; Running-7 [1/2]; Savoir-Faire-9 [1/2]; Shield-10 [1/2]; Shortsword-12 [4]; Stealth-10 [1]; Streetwise-10 [2].

Maneuvers: Arm Lock-10 [1]; Choke Hold-8 [1]; Retain Weapon (Pistol)-1.

75-point version: Add Combat Reflexes; High Pain Threshold; Rank/1 (Detective); +1 to IQ and IQ-based skills, +1 to DX and DX-based skills.

Gear: Glock-17; AMT backup in concealed ankle holster; Baton; Heavy Flashlight; Small switchblade knife; Tear gas spray; Second Chance Standard vest; Leather jacket; Boots; Swiss Army Knife; Handcuffs; Police radio. Police car contains Remington Model 870 shotgun; Police Riot Helmet; Police Riot Shield; First Aid Kit; other equipment. Shotgun, first aid kit, S.C.A. weapons and armor, etc., at home or in own car.

Appearance: 28 years old; Razor-cut dark brown hair, small moustache, tanned complexion, blue eyes; 5'11", 160 lbs. When not in uniform, wears leather jacket, blue shirt and pants, sunglasses, and boots.

Harry Kosminski is a third generation cop, and it's never occurred to him to become anything else. Most of the time, he's reasonably honest -- he's careful not to be caught doing anything that might bring the department into disrepute, and gives value for money when bribed -- but he's slightly more ambitious than most of his family, with dreams of taking control of a large part of Houston's sex industry. He's reluctant to involve his fellow cops too heavily in these plans, but not averse to using police cars and equipment in his extra-curricular activities. He's always heavily armed,

usually armored, and uses the police computers to keep track of any opponents. He can also find criminals for hire if he needs other services performed.

Campaign uses: Harry is not an enemy to be brushed aside lightly; if killed or injured, he will be avenged by his fellow cops, unless the PCs also manage to find evidence of his corruption. Alternatively, Harry might be a useful police contact for the PCs, or even an ally: PCs caught in illegal activity may well prefer to be arrested by an ambitious crooked cop than an honest one. At different stages of his career, he may be encountered as a detective, behind the desk at the evidence storeroom, or anywhere else he can be useful/dangerous to the PCs.

Other settings: Harry's essentially identical relatives may be found in most large cities in the US and elsewhere, and in most eras since the Roaring 20s or even earlier. He can be adapted to other times with only minor changes (such as replacing Computer Operations with Intimidation), and may well survive into the far future.

Dr. Byron "Benny" Factor, Underworld Doctor

ST: 9 [-10] **Basic Damage** Thrust: 1d-2 Swing: 1d-1

DX: 11 [10] Dodge: 5 Parry: n/a Block: n/a

IQ: 13 [30] Basic Speed: 5.25 Move: 5

HT: 10 [0]

Advantages: Contact (Street, skill-15, available on a 9 or less, somewhat reliable) [2]; Reputation (+2; small group of people, recognised on 10 or less) [2]; Wealth (Comfortable) [10].

Disadvantages: Callous [-6]; Overweight [-5]; Reputation (-2; small group of people, recognized on 12 or less); Secret [-20]; Weak Will -1 [-8].

Quirks: Mild lecherousness; Enjoys the company of criminals; Dislikes being called "Benny," but will tolerate it from people he fears; Fascinated by tattoos and skin diseases; Collects more videos than he has time to watch.

Skills: Area Knowledge (LA)-13 [1]; Artist-10 [1/2]; Diagnosis/TL7-11 [1]; Disguise/TL7-13 [2]; Driving/TL7 (Car)-9 [1/2]; Fast-Talk-12 [1]; Language (English)-13 [0], (Latin)-11 [1/2]; Merchant-13 [2]; Physician/TL7-14 [8]; Psychology/TL7-11 [1]; Streetwise-12 [1]; Surgery/TL7 (Cosmetic Surgery)-18 [8], (other surgery)-12 [0]; Tattooing-11 [1/2].

75-point version: Add +1 to IQ (and IQ-based skills) and +2 to DX (and DX-based skills); increase Wealth to Wealthy; remove Overweight.

Gear: Surgery; good clothing and shoes; sports car; doctor's black bag (in car).

Appearance: 31 years old; Light brown hair, pale complexion, brown eyes; 5' 9", 195 lbs.

As a young man, Byron Factor was studious, plump, respectable, and unadventurous, though addicted to cinematic sex and violence. His parents sent him to medical school expecting him to become a dermatologist, but away from their influence, he decided to specialize in plastic surgery, and by the time he turned thirty, he had reduced the noses and inflated the breasts of more than a hundred wannabe starlets, as well as writing false prescriptions for many. When one of his patients died in his bed, he panicked, and asked his street contact to help him dispose of the body.

Since that night, Byron Factor has secretly done a lot of work for local criminals to pay off this debt, which he thinks of as "an agreement" rather than "blackmail." He's known to well-connected crooks as a good plastic surgeon and competent medic who doesn't ask embarrassing questions; among LA's medical establishment, he's known as a sell-out and widely suspected of criminal activity (though he's never been charged or even openly accused).

Campaign uses: Dr Factor can provide discreet medical care to PCs who live outside the law, invaluable inside information to crimefighters (if interrogated successfully), or help keep a PC's other enemies alive.

Other settings: Criminals have used surgery in the hopes of concealing their identities since the 1920s, and may continue to do so for centuries to come.

Daisuke the Wolf, Bandit

ST: 13 [30] **Basic Damage** Thrust: 1d Swing: 2d-1
DX: 12 [20] Dodge: 5 Parry: 7 (Axe/Mace) Block: n/a
IQ: 9 [-10] Basic Speed: 5.5 Move: 5
HT: 10 [0]

Advantages: Rapid Healing [5]; Fearlessness/2 [4].

Disadvantages: Berserk [-15]; Bully [-10]; Code of Honor (Pirate's) [-5]; Poverty (Struggling) [-10].

Quirks: Hates farming; Enjoys watching fish and birds; Incompetence (Navigation); Always keeps at least one weapon within reach, even when sleeping or bathing; Mild phobia (cats).

Skills: Axe/Mace-14 [8]; Bow-10 [1]; Climbing-10 [1/2]; Gambling-7 [1/2]; Intimidation-8 [0]; Judo-10 [1]; Karate-10 [1]; Language (Japanese)-9 [0]; Polearm-12 [2]; Riding (Horse)-10 [1/2]; Running-8 [1/2]; Shortsword-11 [1]; Stealth-10 [1/2]; Survival (Mountains)-8 [1]; Swimming-11 [1/2].

Maneuvers: Arm Lock-12 [1]; Disarming-11 [1].

75-point version: Add Combat Reflexes, High Pain Threshold, +1 to IQ and IQ-based skills, +1 to ST.

Gear: Naginata; Kama; Leather do (corselet); Old padded cotton kimono; wooden sandals; straw hat; belt pouch containing personal basics; dice and dice cup.

Appearance: 28 years old. Long face with pointy jaw and long nose; dark grey hair, cut short with knife; tanned complexion; brown eyes; tattoo of wolf on right arm, long scar on neck; 5'7", 135 lbs.

The third son of a peasant farmer, Daisuke grew up during the Warring Provinces era. He received some training as a foot soldier, and has seen combat -- always from the losing side, which rather spoiled his taste for the soldier's life. When his lord's army was routed and disbanded and his family killed, Daisuke joined a pack of bandits led by masterless samurai. His nickname comes from his long face and prematurely gray hair, as well as his ferocity.

Daisuke enjoys melee, but rarely uses ranged weapons, for fear that he might go berserk and attack his own allies.

Campaign uses: Daisuke may be encountered as a bandit, a bodyguard, a sentry, or in the obligatory tavern brawl. He rarely works alone, but usually makes up the brawn part of a brains-and-brawn team.

Other settings: With a different name and gear and other minor changes, Daisuke might be reincarnated anywhere -- especially in settings where guns and/or ammunition are difficult to obtain, but muscle is still effective. To change him into a medieval European brigand, replace Judo, Karate and his maneuvers with Brawling and Knife; to adapt him to a high tech world, replace Bow with Guns (Pistol or Shotgun) or Beam Weapon (Blaster), and Riding with Driving or Motorcycle.

Fritz, Henchman

ST: 15 [45] **Basic Damage** Thrust: 1d+1 Swing: 2d+2
DX: 11 [10] Dodge: 6 Parry: 8 (Brawling) Block: n/a
IQ: 8 [0] Basic Speed: 6.25 Move: 6
HT: 14/19 [45]

Disadvantages: Hunchback [-10]. **Zombie Advantages:** Doesn't Breathe [20]; Doesn't Eat or Drink [10]; Extra Hit Points +5 [25]; High Pain Threshold [10]; Immunity to Disease [10]; Immunity to Poison [15]; Injury Tolerance (No Blood) [5]; Invulnerability (Mind Control) [75]; Single-Minded [5]; ST +1 [10]; Temperature Tolerance/10 [10]; Unaging [15]; Unfazeable [15]. **Zombie Disadvantages:** Bad Smell [-10]; Cannot Learn [-30]; Dead Broke [-25]; Disturbing Voice [-10]; Eunuch [-5]; Hidebound [-5]; IQ -2 [-15]; Low Empathy [-15]; Monstrous Appearance [-25]; No Sense of Humor [-10]; No Sense of Smell/Taste [-5]; Obdurate [-10]; Reprogrammable Duty [-25]; Slave Mentality [-40]; Social Stigma (Dead) [-20]; Unhealing [-30]; Unliving [-50].

Skills: Axe/Mace-12 [4]; Brawling-13 [4]; Driving/TL7-9 [1/2]; Intimidation-10 [0]; Knife-12 [2]; Language (English)-8 [0]; Lifting-13 [1]; Stealth-11 [2]; Thrown Weapon (Axe)-12 [2].

Maneuvers: Neck Snap-13 [2].

75-point version: Add Independent Body Parts advantage (p. UD59), and +1 to HT.

Gear: Remington Model 870 Shotgun; Throwing Axe; Large Knife; Leather jacket; jeans; shirt; Boots.

Appearance: Greenish-grey complexion; shaggy white hair; amber eyes; huge hands and feet; 5'8", 180 lbs.

Fritz was the favorite henchman of mad scientist Dr Theodore Munro, whose atrocities including maiming suspected mutants to see what powers they would come up with to compensate. When Munro's lab was discovered and attacked by a super-team in 1940, Fritz hid in an airtight radiation chamber. The chamber was buried when the lab was destroyed, and when Theodore Munro, Jr. located it ten years later, the hunchback's corpse had barely decayed. After some experimentation, Munro Jr. was able to revive his father's assistant, and put him to work. While he did mostly menial tasks around the lab, Fritz's specialty was stealing bodies -- dead or alive, according to demand.

Munro Jr. required expensive equipment and chemicals for his experiments, and was soon deeply in debt to his black market suppliers. Fritz managed to keep most debt collectors at bay, but one was impressed enough by the hideous creature that he offered to hire him. Since then, Fritz has spent at least one night a week as a debt collector for loan sharks, taken part in several armed robberies and hijackings, and played bit parts in a few horror films.

Campaign uses: Fritz may be sent to kill, kidnap or frighten a PC, or one of their allies or dependents. He may also be encountered as a sentry at a mad scientist's secret lab or a crime boss's fortress, or be ordered to guard the PCs when they've been captured. (He's an extremely good sentry, able to stand guard almost indefinitely without needing food, sleep, or a power pack recharge.) He's rarely used as a bodyguard, however -- few people are willing to put up with the smell.

Fritz will not become an enemy of his own volition -- he doesn't have any -- but he may be used to replace an enemy who the PCs have killed, as he will not let the death of his master prevent him carrying out his orders.

Other settings: Fritz is designed for use in a Cliffhangers, Atomic Horror, or Supers campaign, but he can appear in any setting where weird science is appropriate. To create zombie henchmen for fantasy or secret war campaigns, see GURPS Undead.

James 'Little Jim' Athy, Bank robber

ST: 9 [-10] **Basic Damage** Thrust: 1d-2 Swing: 1d-1

DX: 13 [30] Dodge: 7 Parry: n/a Block: n/a

IQ: 10 [0] Basic Speed: 6 Move: 6

HT: 11 [10]

Advantages: Combat Reflexes [15]; Reputation (+2 to dime novel writers, yellow journalists, and anyone who hates the police and banks; recognized on 7 or less) [2].

Disadvantages: Bad Temper [-10]; Bloodlust [-10]; Low Pain Threshold [-10]; Overconfidence [-10]; Reputation (-2 to law enforcement and potential victims; recognized on 7 or less) [2].

Quirks: Mild phobia (snakes); Touchy about his small size; Likes spicy food and Mexican girls; Names his guns after his old girlfriends; Horrible hangovers.

Skills: Animal Handling-8 [1]; Area Knowledge (New Mexico)-9 [1/2]; Climbing-11 [1/2]; Cooking-9 [1]; Escape-10 [1/2]; Fast-Draw (Pistol)-15 [2], (Shotgun)-13 [1/2]; Filch-11 [1/2]; Guns/TL5 (Pistol)-17 [8], (Shotgun)-14 [1/2], (other)-13 [0]; Holdout-9 [1]; Intimidation-11 [4]; Lasso/Riata-11 [1/2]; Language (English)-10 [0], (Spanish)-8 [1/2]; Riding (Horse)-13 [2]; Running-8 [1/2]; Sex-Appeal-9 [1/2]; Stealth-11 [1/2]; Survival (Desert)-8 [1/2].

75-point version: Add +1 to IQ and IQ-based skills, +1 to DX and DX-based skills, replace Low Pain Threshold with Skinny, add Ally Group (small, appears on 12 or less).

Gear: Colt Lightning in Kansas Loop holster; Double-barrel 20-gauge shotgun; Pony; Linen Duster, shirt, Levis, vest, bandana, Stetson, cowboy boots with fancy spurs; personal basics.

Appearance: 19 years old; Tanned complexion; strawberry blond hair; blue eyes; 5'7", 130 lbs.

James Athy grew up in New York's notorious Five Points district after the Civil War. Short, scrawny and thin-skinned, he was easy prey for neighborhood bullies until a gang leader recruited him as a runner. Athy's life changed forever when he was given a .22 pistol and discovered that he was a better shot than any of his enemies. One month, five

murders and a robbery later, the 16-year-old Athy fled to New Mexico, where he became a cook on a ranch until he shot a cowboy who laughed at his accent. Another rancher bailed him out of jail and recruited him to fight in a vicious county war. When the war ended, Athy and two friends rode to a nearby county, and after spending the last of their money, robbed the bank. Reports of his skill with a gun spread, and soon bad likenesses of his face were appearing in newspapers and on Wanted posters.

Campaign uses: Athy would make a good enemy for a gunslinger in an Old West campaign, an ally for an outlaw, and a quarry for deputies and bounty hunters. He may also be hired to kill a PC who gets in the way of a wealthy cattle baron. Athy is often overconfident, and unlike most gunmen of the time, he prefers to challenge his enemies to fast-draw competitions rather than shooting them in the back -- but he's not stupid or suicidal.

Other settings: With very minor changes (Driving instead of Riding, an FN HP-35 instead of a Colt Lightning, etc.), Athy could resume robbing banks in a GURPS Cliffhangers game and get the same sort of press coverage and mixed reactions. After the 1970s, when bank security improved, he would have to lower his sights to convenience stores and other easy targets, and his reputation would probably suffer -- but he might still become glorified by yellow journalists, as in the movie *Natural Born Killers*. He might also work as a hired gun in most TL5+ settings, and because of his low pain threshold and lack of unarmed combat skills, will do almost anything to stay out of jail.

Kiet, kickboxer

ST: 11 [10] **Basic Damage** Thrust: 1d-1 Swing: 1d+1

DX: 13 [30] Dodge: 7 Parry: 8 Block: n/a

IQ: 9 [-10] Basic Speed: 6 Move: 6

HT: 11 [10]

Advantages: Toughness 1 [10].

Disadvantages: Poverty (Poor) [-15]; Proud [-1]; Status -1 [-5]; Unattractive [-5]; Youth/1 (17 years old) [-2].

Quirks: Believes everything his sister tells him; Secretly likes country and western music; Mild phobia (snakes); Refuses to beg, and steals only from foreigners; Distrusts cops, soldiers and blonds.

Skills: Boxing-12 [1]; Filch-11 [1/2] Karate-12 [2]; Knife-12 [1/2]; Language (Thai)-9 [0]; Motorcycle/TL7-12 [1/2]; Running-9 [1/2]; Survival (Urban)-8 [1].

Maneuvers: Axe Kick-11 [1]; Back Kick-11 [1]; Elbow Strike-11 [1/2]; Hit Location (Karate)-11 [2]; Hook Kick-12 [1]; Jab-10 [1/2]; Jump Kick-11 [1]; Kicking-12 [2]; Knee Strike-12 [1]; Riposte [Karate]-9 [1]; Roundhouse Punch-10 [1/2]; Shin Kick-12 [1]; Spin Kick-12 [1]; Spinning Punch-11 [1].

75-point version: Add High Pain Threshold, +2 to ST; increase Boxing to 14 [4], Karate to 15 [16], and Survival (Urban) to 9 [2].

Gear: Old leather jacket, ragged jeans and T-shirt, hard shoes (+1 to kicking damage).

Appearance: 17 years old, but looks older because of battered face; dark golden skin, black hair, dark eyes; 5'7", 140 lbs.

Kiet grew up in Thailand's Golden Triangle, but was sent to Bangkok by his family when they could no longer afford to feed both him and his father's heroin habit. He found his sister Sunee, also an addict, working in a brothel; her pimp and supplier, noticing that Kiet was tough, quick, and not particularly bright, decided that he had potential as a kickboxer. The pimp, acting as his manager, paid for his training, gambled on him, kept most of his meagre winnings, and occasionally employed him as a courier and bouncer.

Campaign uses: Kiet may be an opponent for PCs in a full-contact martial arts contest, a member of a street gang, or a bouncer in a seedy nightclub. He may also come to the rescue of a woman or a fellow street kid if he thinks the PCs are harassing them -- or lend aid to a female, Asian or obviously poor PC. In a Supers campaign, he may be a wannabe superhero sidekick.

Other settings: A young tough like Kiet, who sees martial arts as a means of leaving the streets, might be encountered in the poor parts of many towns. While Muay Thai was not well known in the USA before the 1970s, he would be well suited to any modern day, *Cyberpunk*, *Autoduel* or *Space* campaign.

Lisa Parkes, Criminal Lawyer

ST: 8 [-15] **Basic Damage** Thrust: 1d-3 Swing: 1d-2
DX: 10 [0] Dodge: n/a Parry: n/a Block: n/a
IQ: 14 [45] Basic Speed: 4.75 Move: 2 (in wheelchair)
HT: 9 [-10]

Advantages: Beautiful; Contact (Street, skill-15, available on a 9 or less, somewhat reliable) [2]; Contact (Police, skill-12, available on a 6 or less, usually reliable) [1]; Contact (Business, skill-15, available on a 6 or less, somewhat reliable) [1]; Reputation (+3; large group of people, always recognized) [5]; Voice [10].

Disadvantages: Bad Sight (Nearsighted, wears contacts or glasses) [-10]; Paraplegic [-35]; Reputation (-3; large group of people, always recognized). [-5].

Quirks: Won't defend rapists or child abusers; Doesn't use drugs, and rarely drinks alcohol; Prefers vegetarian food; Likes wearing the shortest skirts she can get away with; Closet science fiction fan.

Skills: Administration-12 [1/2]; Area Knowledge (San Francisco)-13 [1/2]; Bard-14 [1/2]; Computer Operations/TL7-13 [1/2]; Detect Lies-9 [0]; Diplomacy-15 [2]; Fast-Talk-12 [1/2]; Forensics/TL7-11 [1/2]; Guns/TL7-11 [1/2]; Interrogation-12 [1/2]; Language (English)-14 [0], (Latin)-12 [1/2]; Law-16 [8]; Psychology/TL7-13 [2]; Research-13 [1]; Savoir-Faire-15 [1/2]; Sex-Appeal-11 [2]; Streetwise-12 [1/2]; Swimming-8 [1/2]

75-point version: Increase Wealth to Comfortable; add Eidetic Memory (30 points, and increase IQ-based skills accordingly), Charisma/1 and Status/1.

Gear: Wheelchair; laptop computer; mobile phone; AMT backup in concealed holster.

Appearance: 28 years old; Long auburn hair; pale complexion; green eyes; shapely legs; 5'5", 125 lbs.

Lisa Parkes was already cynical about the legal process when she started law school, but she became truly bitter after seeing the wealthy drunk driver who'd killed her date and left her confined to a wheelchair, get away with a suspended sentence and fine. Convinced that the law existed to protect the rich, so she decided to become rich. Specializing in personal injury lawsuits, she was so skilled at manipulating juries that she was invited to join a team of lawyers defending a millionaire accused of murder. Since then, she's defended many high-profile criminal cases; she's expensive, but she rarely loses. Criminals who can afford her services react to her at +3; prosecutors and cops, at -3.

Campaign uses: Lisa Parkes may frustrate the PCs' attempts to put criminals in jail, and might make regular appearances in a Supers campaign. Less law-abiding PCs may need her services themselves. Lisa could even be a minor criminal mastermind, sending her former clients out to perform crimes so they can pay for her skills, or to dispose of inconvenient witnesses or jurors.

Other settings: A wheelchair-bound female lawyer is best suited to modern-day campaigns; a male version (most probably a disabled war veteran) might be encountered as early as the Old West, though he would be less effective with the all-male juries common until more recent times. In an ultra-tech setting where paraplegia can be cured with bionics or transplanting cloned parts, Lisa would need another obvious disadvantage to elicit pity from juries, such as a Weak Immune System acquired from medical malpractice.

Sam Gacy, Gumshoe

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d
DX: 11 [10] Dodge: 5 Parry: n/a Block: n/a
IQ: 11 [10] Basic Speed: 5.25 Move: 5
HT: 10 [0]

Advantages: Alertness +1 [5]; Contacts (Street, skill-15, available on a 9 or less, somewhat reliable) [2], (Police, skill-12, available on a 12 or less, usually reliable) [4].

Disadvantages: Curious [-5]; Post-Combat Shakes [-5]; Poverty (Struggling) [-10]; Unluckiness [-10].

Quirks: Shy around women; Hates loud noises; Talks (softly) to cats; Doesn't smoke or drink; Reads pulp magazines

in the office, but Shakespeare and poetry at home.

Skills: Acting-10 [1]; Administration-10 [1]; Area Knowledge (Chicago)-12 [2]; Astronomy/TL6-8 [1/2]; Cooking-10 [1/2]; Climbing-10 [1]; Disguise-10 [1]; Driving/TL6 (Car)-11 [2]; Fast-Talk-12 [1]; Guns/TL6 (Pistol)-12 [1]; Holdout-10 [1]; Language (English)-11 [0]; Literature-9 [1/2]; Photography/TL6-11 [2]; Running-8 [1/2]; Scrounging-10 [1/2]; Shadowing-14 [8]; Stealth-12 [4]; Streetwise-11 [2]; Survival (Urban)-9 [1/2].

75-point version: Remove Unluckiness; add Eidetic Memory (30 points; increase IQ-based skills accordingly) and Night Vision.

Gear: S&W M10, Camera and binoculars, all kept in briefcase or in car (dark gray Ford Model A). Wears overcoat (reversible), gray suit, shoes (with soft soles, +1 to Stealth when trying to move silently), and hat.

Appearance: 38 years old. Brown hair, cut short; brown eyes; 5'9, 150 lbs.

A man of extremely average appearance and little ambition, Sam Gacy has often been described as a born follower. After returning from France at the end of the Great War, he found a quiet job in a film processing workshop in Chicago, spending his lunch breaks and evenings walking around and taking photos. He might have kept up this routine for the rest of his life if the workshop hadn't closed after the stock market crash, leaving Sam unemployed.

Fortunately for Sam, a P.I. who'd noticed his eccentric habits hired him to do some legwork, and Sam soon became accomplished at shadowing people and photographing them unawares. He rarely cares who, or why, as long as he can afford to pay the rent and live in peace.

Campaign uses: Sam can help a PC by tailing his enemies, or vice versa.

Other settings: A character like Sam could survive in almost any large city at almost any time. Before 1919, replace Driving and Photography with other useful Thief/Spy skills, such as Pickpocket or Starglazing. By 2000, Sam would be carrying a cellphone and a digital camcorder, but his (or her) car and gun will still be the most inconspicuous available. In later eras, he might equip himself with Nightshades (p. UT121) and a Varicloth suit (p. UT60), but the basic character will still be the same.

Tori Adore, Armed Robber

ST: 10 [0] **Basic Damage** Thrust: 1d-2 Swing: 1d

DX: 11 [10] Dodge: 5 Parry: 6 Block: n/a

IQ: 10 [0] Basic Speed: 5.5 Move: 5

HT: 11 [10]

Advantages: Attractive; Contact (Street, skill-12, available on a 12 or less, somewhat reliable) [2]; High Pain Threshold [10]; Reputation (+2; large group of people, recognised on 10 or less) [2].

Disadvantages: Addiction (Cocaine) [-15]; Compulsive Carousing [-5]; Compulsive Spending [-5]; Greed [-15]; Reputation (-2; large group of people, recognized on 10 or less).

Quirks: Alcohol intolerance; Doesn't trust or respect men; Collects teddy bears and gold; Dislikes silence; Always wears at least one cross.

Skills: Acting-9 [1]; Area Knowledge (USA)-11 [2]; Brawling-11 [1]; Dancing-9 [1/2]; Disguise-10 [2]; Driving/TL7 (Car)-9 [1/2]; Fast-Talk-10 [2]; Filch-10 [1]; Guns/TL7 (Pistol)-12 [1]; Holdout-10 [2]; Intimidation-10 [2]; Judo-10 [2]; Language (English)-10 [0], (Spanish)-8 [1/2]; Merchant-11 [4]; Savoir-Faire-9 [1/2]; Sex-Appeal-13 [6]; Stealth-10 [1]; Streetwise-10 [2]; Survival (Urban)-9 [1/2]; Video Production/TL7-9 [1/2].

Maneuvers: Knee Strike-12 [1].

75-point version: Add +1 to DX (and DX-based skills), and +1 to HT (and HT-based skills); increase Appearance to Beautiful and Wealth to Comfortable, and add Voice.

Gear: Handbag contains AMT Backup, handcuffs, tear gas pen, hand stunner (pp. HT 100-101), Swiss Army knife, wig, camera, a change of underwear, assorted sex toys, cosmetics, and other personal basics. Usually wears respectable middle-class clothes, expensive lingerie, high-heeled shoes or boots, and a wig.

Appearance: 26 years old; black hair, olive complexion, dark brown eyes; 5' 6, 125 lbs.

Like too many teenage girls, Rosa Valdez ran away to LA in search of her fortune. She went from stripping and lap-

dancing to appearing in adult films under the name "Tori Adore," becoming mildly notorious (+2 from fans of X-rated videos; -2 from anti-porn campaigners, her victims, and other strippers who know about her sideline). She was soon being paid handsomely to travel the US as a feature dancer at clubs, but spent the money as fast as she made it. Using the internet and her reputation, she began setting up 'dates' with wealthy businessmen in hotels near the airport on her last night in a city; after having sex with these men, she would then steal their wallets and trousers and any other valuables -- sometimes stealthily while they sleep, sometimes at gunpoint, sometimes by handcuffing them to the furniture, sometimes by disabling them with tear gas or the stungun -- and photograph them, then be on a plane before they could catch her. Because of the photos and the potential humiliation, none of her victims has ever gone to the police. Sometimes her contact will help her select a particularly profitable victim (or away from a dangerous one), but she prefers to act on instinct.

Campaign uses: Tori is basically a thief, though she will fight - possibly even kill -- if the reward is great enough. She is most likely to enter a campaign by stealing something that the PCs will have to recover (a patron's address book, keys to a secret base, a superhero costume hidden in a belt-buckle, etc.) as discreetly as possible.

Other settings: Sex has been used to lure men into being robbed and/or blackmailed for centuries. An earlier version of Tori would probably need a male accomplice (someone like Daisuke would do nicely), but few other changes. A TL8+ version would have the Extreme Sexual Dimorphism bio-mod (p. BIO62; reduce Holdout and Fast-Talk by one point each) and possibly other modifications such as Stingers and a Flesh Holster (p. UT68-70).

Pyramid Review

Veil of Night (for Vampire: The Dark Ages)

Published by [White Wolf Game Studio](#)

Written by **Chris Harford, Ellen Kiley, James Kiley, Michael Lee, Sarah Roark, Lucien Soulban, and Adam Tinworth**

\$29.95

Let me start off by saying I don't think I can approach this book with the lack of bias that no one really expects from reviewers anymore. My background is from the region it covers (Northern Africa and Western Asia, generally termed the Middle East), so I'll probably cheer for any book that portrays the region as more than a radioactive wasteland (ala *Cyberpunk 2020*).

This year I've got a lot to cheer about, thanks to White Wolf making it the Year of the Scarab. Like the Year of the Lotus before it, the YotS books will focus on a specific region; this time Araby instead of the Orient. The first book of the series was the dissapointing *Mummy: the Ressurrection*, and there will be more books for the various White Wolf games.

Veil of Night is the YotS sourcebook for *Vampire: the Dark Ages*. It gives readers a quick tour of the Near East and Northern Africa, from Moorish Spain to Persia & Pakistan.

The book begins with an encounter with Muhammad, the Prophet of Islam and a vampire (presumably, Suleiman Ibn Abdullah, the founder of the Isharra sect of vampires & a major player in this book). The encounter was well done and respectful, and shouldn't offend.

The theme of the book is the effect that Islam has had on the vampires of the Middle East; it's had just as strong, if not a stronger, impact on Arabia's Kindred as Christianity has had on the vampires of Europe. The book's primary purpose is to expand on the Ashirra (originally introduced in *World of Darkness 2nd Edition*). The Islamic precept of submission to Allah leading to redemption meshes nicely with *Vampire's* core theme of the vampire's struggle to control or come to terms with their inner beast.

The history chapter describes the evolution of Islam, and how it spread across Arabia and Africa. I'm not an expert on the region, but it seems to hew to the real world history, while inserting the requisite vampires. The geography section does a good job of laying out the state of the various Islamic states, and their vampiric inhabitants. Each of the major cities on the route followed are described; the reader gets more atmosphere than hard facts, although a few citizens of each city are described.

The appendix to the geography section goes into the characters a bit more. My only quibble is with this section's art; it seems somewhat uneven, and none of the pieces stand out.

Following that, it's into the meat and potatoes of the game. We're given a listing of what the Arabic names for the various clans are (and they become familiar surprisingly fast), and how they're different from their European counterparts; for example, the Toreador, or Ray'een Al-Fen, hew away from representational art, and instead are focussed towards poetry, music, and architecture. The Setites and Assamites, as might be expected, are more prevelant in this setting than in the main *Dark Ages* one.

Interestingly enough, the three clans not represented strongly in Arabia are the Ventrue, the Tremere, and the Tzimisce. These clans, along with all other non-Ashirra vampires, are referred to as Franj.

The roads that vampires follow are detailed, each of them altered slightly to fit in better with the setting. Following this are rules on character generation. There are guidelines for naming your character and developing their backgrounds. The background ideas first came to my attention in *Blood and Silk* (the sourcebook for East Asian vampires in *Vampire: the Dark Ages*), and they're very good, particularly when PCs are going to be from a society the players won't be familiar with, like the Dark Ages era games (specifically the non European parts).

Skills are gone over, but there's one area where a change seems somewhat strange; Linguistics seems to have stepped back from more languages at higher levels to X extra languages, where x = the number of dots you have in the knowledge. This is easy enough to circumvent, but it just seems like a strange step back.

The book finishes with a short citybook on Damascus; since Jerusalem & Constantinople have already been covered in citybooks, it makes sense, although I might have preferred to see the space go to Cairo or Baghdad. Damascus is an interesting city, with plenty of plots and plans afoot from both the Franj and Ashirra.

There is a short appendix on antagonists to be found in Arabia; this is mostly stuff on common beasts (Werebeasts, Ghosts, Mages, and Vampire hunters), and a short section on Djinn. Most of these sections have concluding sentences directing you to the relevant books.

One thing I've noticed is that the Baali are being developed as a threat in the *Dark Ages* setting, especially in this setting. Their Demon Worshipping aspect is a bit over the top for the current regime of *Vampire*, but they work well in the *Dark Ages* setting.

The lives of Arabic vampires is well defined in this book, as are their responsibilities to each other. Everyday lives of people in the Middle East are slightly less well detailed, although the bibliography contains a good selection of books & websites.

Overall the book was satisfying. with the book. I'm glad that WW is doing The Year of the Scarab, since it will hopefully answer a lot of questions I've had about the World of Darkness. For its part, *Veil of Night* does an excellent job of covering the Medieval Middle East.

--Justin Mohareb

Pyramid Review

Defenders of the Faith (for Dungeons & Dragons)

Published by [Wizards of the Coast](#)

Written by Rich Redman and James Wyatt

96 b&w pages; \$19.95

The next class splat book for *Dungeons and Dragons*, following *Sword & Fist*, *Defenders of the Faith* augments the cleric and paladin classes with new feats, prestige classes, and organizations.

Broken up into four chapters, *Defenders of the Faith* starts with Cleric and Paladins, brief guides to how to effectively role (and roll) play these characters. The advice is useful, but rarely goes beyond the basics information. One of the most interesting areas though, is the section on special mounts for paladins. The most desired mount of course, is a dragon. Methods to acquire dragons, keep them, and when to let them go, is covered.

The chapter rounds out with new uses for old skills, new skills, new feats, equipment, and magic items. These are all "candy" and their mileage will vary depending on your campaign.

The new feats include general feats -- like shield charge and improved shield bash -- and divine feats. These divine feats are interesting in that they use a turn/rebuke undead attempt to power them. Divine feats include Divine Might, increasing the damage you inflict by adding your charisma bonus to your damage roll, or divine resistance, where you grant your allies resistance to elemental based attacks.

The metamagic feats, extra smiting, extra turning, empower turning, heightened turning, and quicken turning are all pretty simply and can be very useful for games that are heavily involved with undead.

The new equipment, sacred gear, consists simply of non-magical items like prayer books, incenses, candles, and censers. This is nothing special, but useful to have prices and weights for them. The real question is will this information be in the forthcoming *Master Tools* software or is it something that'll have to be manually added?

The magic items are broken up into categories: armor and shield, weapons, rods, and wondrous items. There are over thirty items described here, the majority falling under armor and wondrous items. Some, like Energy Drain, can be quite powerful, while others, like the black patch -- an eye patch for half or full-blooded orcs -- are very specific in their use.

Chapter two, churches and organizations, has generic information on churches based on alignment, as well as specific churches. The generic information is truly generic. "Neutral good churches are less interested in organization than they are in doing good." (I guess that would follow since their alignment is neutral good.) The useful part of this chapter is the various temples, fully mapped out. None of these temples are huge or earth shaking, but they are quite useful for quickly inserting them into campaigns. Churches of Pelor, Wee Jas, and Erythnul are all mapped out. In addition, there are several organizations for paladins and clerics to join, like the Justice Blade (a collection of paladins) and the House of Death (an organization that hunts the undead). The House of Death has a typical house mapped out. Other organizations include the Council of Blades, the Laughing Knives, Order of the Chalice, and the Stargazers (who also have a mapped out temple, the Mount Baden Chapter house).

The chapter closes out with information about how temples are run, how they charge for services, what type of services they provide, and what types of clerical duties are expected from them. Unfortunately, it doesn't go into a lot

of detail. For example, are there any cases where a lawful good church won't use an ability like raise dead? And if so, what happens with funds gained for expensive spells? It wouldn't take long for millions of gold pieces to pile up through spell use. What happens to that money?

The meat of the chapter for many players is chapter three, prestige classes. Here, classes range from church inquisitors, who hunt corruption within the church, to the knight of the chalice, an order devoted to fighting demons. Unfortunately for those wanting entirely new material, the Hunter of the Dead (from *Dragon Magazine*) is reprinted here. The prestige classes give a good range from paladin, knightly based ones, to clerical healers and secular clerics.

Chapter four, divine magic, lists new spells for clerics, paladins, druids, and rangers. The spells can help fill some gaps in the core rule. The spells are broken up by class, level, and alphabetized by name. The nice thing about this is that there is a brief description of what the spells do. The actual spell descriptions are all alphabetized by name. These spells almost put a cleric on equal ground with a wizard. For example, Curse of the Brute allows you to augment a physical stat by +1 per level, with a penalty to Intelligence and Charisma equal to the bonus. Still, how many fighters won't take a +5 bonus to Strength for a brief penalty? Divine Agility gives a wide number of bonuses to Reflex save and Dexterity, as well as the Feat Spring Attack.

One of the most interesting things about the new spells are the new prestige domains. These domains cannot be taken by starting characters, but only when the character enters certain prestige classes. This is an interesting concept, with domains like Beastmaster, Creation, Exorcism, Glory, Inquisition, Madness, Mind, Mysticism, Pestilence and Summoning rounding out the idea. Each domain lists the deity that has the domain, granted powers, and domain spells from 1st to 9th level.

The book ends with the Appendix: Monstrous Clerics. Here, the gods of various monsters are listed in alphabetical order. Many of these should be familiar to readers of earlier editions like Gruumsh, the Great Mother of the Beholders, and Vaparak. Each has a brief description, domains, and favorite weapon.

The book follows the standard from *Wizards of the Coast*: two columns, broken up by art and maps. Dennis Cramer from *Sword and Fist* does the art, so if you liked *S&W*, you'll enjoy *Defenders of the Faith*.
