

Designer's Notes: GURPS Cops

The Job Isn't What You Think It Is

by Lisa J. Steele

We see police every day, but we don't really know what they do. There's almost no gaming material about cops as player characters, or for that matter about cops as adversaries. What we see in movies and TV is more fantasy than fact -- but, in the absence of better information, it's what we tend to fall back on.

I, however, work on criminal appeals. I read about a dozen trial transcripts every year, mostly in homicide cases, and I see actual police reports and testimony. I've seen the crime-scene photos, talked to clients on death row, talked to the detectives, the prosecutors, and the experts. Often, as I read, I play detective -- looking at how the investigation was done, and trying to decide in my own mind whether I think it was done right. I've had to learn a fair amount about forensic evidence, autopsies, and crime-scene handling. Hollywood, even the based-on-reality movies and shows, cuts lots of corners for dramatic purposes.

Such thoughts led me to what I think of as the heart of the book: the "How to Solve a Crime" chapter. Solving, stopping, or escaping being framed for a crime is one of the all-time classic plots -- but it's surprisingly hard to pull off in a game. You probably know to look for means, motive, and opportunity. You probably know about fingerprints, blood types, and ballistics. You probably know, thanks to Hollywood, how to play "good cop/bad cop." But to really solve a crime -- or even to do so in a cinematic yet satisfying manner -- takes a lot more than that. How do you question a witness? How do you interrogate a suspect? What should you look for at the crime scene? What should you listen for from the Game Master? And, if you are the GM, what should you give your players?

"The Station House" is about pacing, locations, plots, and police departments. There are fundamental rules for setting up a mystery that aren't intuitively obvious. There are also differences between the classic puzzle-box plot (where the PCs get the clues and red herrings mixed together in no particular order) and the ball-of-twine plot (where the PCs get led from scene to scene through the investigation). Certain locations in a police station are typical sites for classic scenes -- the interrogation, the evidence room, the crime lab. The locations, and ideas for how to use them, are also in this chapter.

Cops need robbers. "Criminals" is about crooks from a cop's view. It's about the essence of criminal defense law. And it is about problem solving. Being a cop isn't just about being a crack shot and an ace driver. It's about people -- often, good people seen at their very worst. It's about everything from barking dog calls to serial murders, from drug addicts to white-collar criminals.

"Putting Them Away" was a hard chapter to write. It deals with trials and prisons. It is hard to simplify the nuances of my job. But what a player and a GM need to know to handle a hearing, a trial, or a prison campaign isn't what I do for a living. You might need to know about bail and about bounty hunters. You might need to know about how plea agreements work and how illegal evidence gets suppressed. You might need to know the seven most important concepts about evidence. You might need to know about prisons, probation, and parole.

What else is in the book? There is character creation -- advantages, disadvantages, skills discussed as they apply to police work. There are lists of standard equipment from the uniform to the police cruiser. There's a discussion of the history of policing and profiles of some famous or typical officers. There's a quick discussion of some typical law-enforcement agencies from the LAPD and the NYPD to the FBI, to police departments in England, France, Japan, and the former East Germany.

What's The Book About?

Cops is about being lied to. Cops say there's something about the color blue that makes everyone from a nun caught speeding to an eyewitness that doesn't want to be involved tell boldfaced lies to an officer's face. It's about being yelled at, thrown up on, hit, bit, and kicked -- and still expected to act professionally. It's about "street justice" and about excessive force. It's about the "Thin Blue Line," the "Blue Wall of Silence," and the "World's Biggest Boy's Club."

Cops is about legal use of lethal force. I have a license to carry a firearm in my home state. I represent people who have done foolish, impulsive, or wicked things with firearms. I've seen the autopsy pictures, the crime scene photos, and held bullets recovered from corpses. Cinematic cops, and characters in cinematic games, get to blaze away with firearms with abandon. You can do that with **Cops**. You can also deal with a dramatic reality where Internal Affairs and prosecutors will investigate every questionable gunshot. Where there are consequences when player characters fire away at the bad guy on a crowded city street.

Cops is about alternatives to deadly force -- pepper spray, tear gas, bean-bag rounds, rubber bullets, and tasers. It gives characters options for self-defense that doesn't mean the characters risk facing murder charges, or kill the NPC the GM needs to keep alive until he gives them an important clue.

Cops is about jail. Getting yourself or an NPC into or out of jail is another classic plot. Not surprisingly, prisons are very reluctant to talk about their layout and security measures. But there are some ideas for realistic weak spots for players trying to brainstorm a jailbreak and or for a GM looking for a caper the PCs can thwart. I visit prisons about once a month. The sound of a heavy steel door rolling shut makes the same sound you hear on television, but it feels very different when you are inside that door about to sit down for the first time with a guy facing lethal injection or doing 100 years for a gang killing. And it's very different for that guy as he's arrested, strip searched, cavity searched, issued his prison clothes, and sent to his cell for his first night behind bars.

And, of course, **Cops** is about cops. The police are everywhere. Almost every game world has someone powerful who wants to keep order. (And the players trying to undermine it, as often as not.) That makes the question of who enforces that order, what they do, and why they do it nearly universal. The players may want to play the enforcers -- or the GM may want to bring the enforcers down on them. Whether they're called the Space Patrol or the Anointed Guardians of the True Faith, they're still going to look out for each other, close ranks against outsiders, and bust the perps.

The Cult of Asklepios

By Dan Howard

*"I start to sing of Asklepios, healer of ills,
Apollo's son, the one divine Koronis bore
in the Dotian field, King Phlegyas' girl,
a great delight to people, soothing evil pangs.*

"So hail to Thee, Lord; I beseech Thee with my song."
-- Homeric Hymn

Introduction

What do PCs do when they are struck down with illness or injury? In a fantasy world they simply make a trip to the nearest temple, offer the priest a handful of coins, and they are healed. In a medieval setting they would take their chances with the local barber or wisewoman. Either way this process is usually a very minor part of the campaign. This article is an attempt to expand upon the healing aspect of roleplaying campaigns.

There are countless examples of healing cults throughout history and the tapestry of the GM's game world becomes more richly embroidered with the inclusion of some of these. Historically the cult of Asklepios was the largest of these cults in the ancient world. The Cult of Asklepios can be slotted into any campaign. It has been kept as general as possible to allow use with any game system. Any low-tech setting from high fantasy to ancient Rome or Greece would be appropriate. In a pantheistic world (such as ancient Greece), Asklepios would be openly and widely worshipped. In a culture that doesn't tolerate other religions (such as Christian Europe), the cult of Asklepios would either be a secretive and small organisation, or else the pagan god would be replaced with a respectable patron saint, and rituals and medical practice would continue with minimal interruption.

Asklepios

From the time of Homer down to the reign of Constantine, the prominent figure associated with healing in the ancient world was Asklepios, or Aesculapius as he was known to the Romans. He was revered as a divinely inspired physician and the founder of the medical profession. Mortal, like Herakles (Hercules), Asklepios became a god because of his services to mankind.

In Greek mythology he was the son of the god Apollo and the nymph Koronis, a princess of Thessaly. Angry because Koronis was unfaithful to him, Apollo killed her and took his infant son to the centaur Chiron to be raised. Asklepios learned all that Chiron knew about the art of healing and soon became a great physician. As an adult he became so skilled in surgery and the use of medicinal plants that he could even restore the dead to life. Hades, ruler of the dead, became alarmed at this and complained to Zeus, who, fearing that Asklepios might render all men immortal, killed him. Among his children the best known are his daughters Hygeia ("health") and Panacea ("all-healing") who are also associated with medicine.

Priests, called Asklepiads or Asclepiadae, were supposedly descended from Asklepios himself, hence the term. It seems likely that Asklepiads were initially a clan group with blood links to Asklepios and their skills were passed down from one generation to the next within the family group. Over time the term was expanded upon to designate all medical practitioners in general.

Sanctuaries

Beginning in the sixth century BC, health resorts, or sanctuaries, known as Asklepia sprang up all over the Mediterranean. These sanctuaries, such as those at Epidauros, Tricca, Kos and Pergamon, were built outside the towns on particularly healthy sites, where the sick and injured would come to worship and seek cures for their ills. Harmless serpents were kept in these temples of healing, supposedly tended by Hygeia. Snakes were held sacred by Asklepios and he was thought to sometimes appear in the form of a snake. Patients who saw snakes in their dreams believed that the god of healing himself had come to their aid.

There were two main types of sanctuary, depending upon which type of medicine was being practised. The original kind was completely mystical in orientation. It involved the patient offering a sacrifice to Asklepios and then going to sleep in the temple. During this sleep Asklepios would either intervene directly and heal the suppliant, or appear in a dream and give instructions on how to be healed. The second, and later type of Asklepia, was founded upon Hippocratic principles and more closely resembled modern surgical hospitals.

Depending upon the game world, either of these types could be employed. In a world where the gods take a physical role, the former mystical type would be prominent. While the patient slept Asklepios or one of his daughters would appear in their material form, or through his agents, the serpents, and perform some act to heal the patient.

There are many examples of divine intervention in Greek incursions found at Asklepia ruins. A sacred snake licking a patient's eyes thus curing him of blindness. A warrior with a serious arrow wound dreams of Asklepios operating on him. He wakes up to find his injury healed and the arrowhead in his hand. A woman's disease was cured when she dreamt of Hygeia covering her affliction with a poultice.

Alternatively, Asklepios would appear to the patient in a dream and give advice. In the morning the priests would interpret the dream and explain the god's precepts.

A simple Asklepia of the mystical type would include three buildings: the Thymele or Tholos, where the purification ritual would take place; nearby would be the Temple of Asklepios, which would include a statue of the god and an altar for offering sacrifices; attached to this would be the Enkoimeterion or Abaton, a dormitory where people would lay down on pallets to sleep and await the cure of the god. These were all located within a sacred grove marked out by boundary stones. In order to maintain the purity of the grove, no birth or death could take place within the perimeter. Larger Asklepia would have many other buildings including separate structures for the temple and altar; temples to other gods, like Apollo; staff quarters; a gymnasium; public baths; and a guesthouse for people who came to worship the god but did not require healing. Instead of boundary markers, the sanctuary may have been surrounded by a wall. An excellent example of a mystical type of sanctuary was found at a city called Epidauros.

Alternatively, in a world where the gods are benign, the surgical Asklepia would be more prominent and priests would also be physicians who took an active part in healing the patient. In this case other buildings were also required, and located just outside the sacred boundary markers. These included surgical theatres, sickrooms, birthing chambers and apothecaries. An excellent example of this type has been found on the isle of Kos where Hippocrates, himself, was commonly believed to have practiced.

Ritual

"Do dreams cause a concern for man to be attributed to the gods or does the god's care for man cause him to be saved through dreams?"

-- Aelius Aristides

Arrival

A suppliant to either type of Asklepia would undergo similar rituals prior to being healed. Sometimes they were required to camp outside and fast for a certain period of time before being permitted entry. If this sanctuary was located just outside a city, then this time could be spent in comfort in a local inn. Larger Asklepia had specially built guesthouses to accommodate large numbers of visitors.

Purification

Upon entering, the suppliant must purify himself (or herself) through ritual bathing in the sacred waters. This would either be a natural spring or a specifically constructed well around which the tholos was erected. After bathing a white garment was donned. There were simple prayers and choral hymns, which were accompanied by musical instruments, and often composed by the suppliants themselves.

Worship

Once purified, the suppliant proceeded to the temple to beseech the god for assistance. Asklepios was usually depicted in one of two ways. Either as a bearded man, standing, dressed in a long cloak, with bare breast, and holding his symbol -- a knotted wooden staff around which a mystical snake was coiled. Otherwise he was depicted sitting on a throne grasping his staff in one hand and his other hand above the head of a serpent. A dog was occasionally lying at his feet.

The staff of Asklepios became the traditional symbol of medicine. Note that the caduceus, with its winged staff and intertwined serpents, frequently used today as a medical emblem, has no medical relevance. It represents the wand of Hermes, or Mercury, the messenger of the gods and the patron of merchants and thieves.

The snake wrapped around the Asklepiian staff may also have had more than merely symbolic value. Snakes tied to a stick may have been a way of inoculating patients with nonlethal doses of snake venom -- a primitive hypodermic injection device. There is little evidence to support this theory however.

Sacrifice

The altar is sometimes located within the temple and sometimes outside in the open. Contrary to most Greek gods, Asklepios seems to have been satisfied by bloodless sacrifices. Bread, cakes, eggs, wine, fruit, or gold and silver crowns, etc. were either placed on the altar or ritually burnt. Votive offerings were also common, many of which were representations of the diseased part of the body. The more wealthy the suppliant, the more valuable the offering that was expected. How effective a PC's offering is should be determined by the GM. Two things need to be taken into account: the wealth of the PC, and the severity of the injury or illness. The god would be far more receptive to a poor farmer who offered half of his entire harvest than to a wealthy adventurer who offered a similar amount in gold. Try and encourage the PCs to determine their own offering rather than providing a fixed "price." Imaginative offerings should be rewarded, even if their monetary value is lower. If the PC put a lot of effort into composing his hymn then this should also contribute towards a favourable result.

Incubation

After offering sacrifices and prayers the suppliant goes to sleep. This process of "sleeping in" is called enkoimesis, or incubatio. The patient goes to the abaton and lies down on a pallet. The temple warden extinguishes the lights and tells the incubants to go to sleep and keep quiet. In smaller Asklepia there would be no abaton and the patients would sleep in the temple itself. Imagine the patient lying there in total darkness listening to the soft padding of the warden's feet, the trickle of the sacred spring nearby, and the almost imperceptible slither and rustling of the sacred snakes. If Asklepios was favourable the patient would either be healed during the night or the god would appear to him in a dream, sometimes both.

Morning

In the morning, if the patient wasn't healed directly, a priest would interpret the suppliants' dreams. Dreams are used both as a means of diagnosis and a mechanism for determining a cure. If the suppliant was in a mystical Asklepia, he would now be required to thank the god and leave. This thanks usually involved either tossing coins into the sacred well or by hanging ex-votos on the walls of the temple. The cure prescribed to him could include bathing in the sea or

river during winter, taking medicinal herbs, fasting, or strenuous exercise (sometimes during the heat of summer). Sometimes a specific task needed to be performed.

If the suppliant was in a surgical type of Asklepia, he would be required to stay so that the priests could attempt to cure him. This could involve anything from surgical operations, to setting a broken bone and applying a poultice, to medicinal cures concocted in the local apothecary. Beds were available for the patient to recover.

If the god was not favourable the suppliant may be given a penance to complete before being considered worthy to present himself to Asklepios a second time. This is a good opportunity for the GM to insert quests and adventures that may be relevant to his overall campaign.

Conclusion

Hopefully this has widened the scope of possible avenues of healing in a GM's game world. No longer can the players rock up to the local temple, toss a few coins at the feet of the nearest priest, get some quick laying on hands, and be back at the taven in time for the next round of ale. If treated with the proper reverence, the Cult of Asklepios can be a powerful ally. Making an enemy out of Asklepios is unwise (a couple of failed disease resistance rolls will teach the proper respect). The search for the legendary healing cult may become the central focus of the campaign itself. A PC inclined towards healing may be a priest of Asklepios. His skills would range from theology to surgery and he would be respected throughout the ancient world -- until an influential patient died that is. Healers often had to flee for their lives from vengeful relatives. Whether good or ill, the world becomes more interesting if Asklepios is a part of it.

Pyramid Review

At Your Service (for Over the Edge)

Published by [Atlas Games](#)

Written by **Keith Baker, Robert "Doc" Cross, Brian Joughin, Neil Laughlin, Lee Moyer, John Nephew, Michelle A. Nephew Brown & John Spey**

Illustrated by **Lee Moyer & C. Brent Ferguson**

112 pages; \$19.95

It has been a while since the last release for *Over The Edge*, Atlas Games' modern day RPG of secrets and conspiracies, magic and science fiction, all blended into a surreal whole. So the publication of *At Your Service*, a new supplement describing some three-dozen businesses and locations across the tiny Mediterranean island state of Al-Amarja -- the setting for *Over The Edge* -- should be a welcome sight for fans of the game.

There are exactly thirty-six entries in *At Your Service*, some no more than a page long, others as long as ten or even eighteen pages, with most running to two or three pages in length. The book is light on art, but what there is -- all by Lee Moyer and C. Brent Ferguson -- is both good and captures the feel of the location or person each illustrates. Lee Moyer, in addition to the cover, also provides a logo or business card for each of the entries, and while many lose a little in resolution, it would be nice if Atlas Games were to make them all available as a download from their website. One final complaint is the fragility of the cover -- after only a few days use, the laminate giving the book's cover its glossy finish is beginning to peel. (Unfortunately, my copy of *At Your Service* is not my only Atlas Games book that this has happened to . . .)

Each entry opens with a one-line description of the business or location, its reputation (if any), and a short description encapsulating the site, including whatever secrets it may hold. Each establishment's address is also given. The main body of the text builds upon the short opening description and is followed by details of any GMC (Game Master Character) pertinent to the location. The entry is rounded out with story ideas to get the players involved in the site and anyone to be found there.

[SPOILER ALERT]

The largest entry in the book is The Rose Hotel by Keith Baker and Lee Moyer, which describes a weird time-locked hotel located inside the head of an old bag lady. Street ladies with strange powers are far from original, but the authors have given it an Al-Amarjan twist. The hotel is part of her subconscious, and while getting in is easy, getting out is something of a challenge. A range of people from the last eighty years populates the hotel, with the most active eager for news of the present and even for the books the newcomer might have been carrying when they were entrapped. Then there is the strangely polite Midwich family of children to be found on the fifth floor. Rumour has it, that they know a way out of The Rose Hotel, but why is it that all of the adults avoid them? This location easily provides a mini-adventure in itself, as plenty of individuals and plots are given for the players to interact with and the GM is free to add their own.

Pride of place in *At Your Service* goes to The Cali Dump, a small and relatively peaceful neighborhood in the rundown Great Men Barrio. It is not easy to get to, as cabs tend to avoid going into the area. Drivers will relate how objects and even people have been ripped from their cab to be left behind in The Cali Dump. For those in the know, the whole

area is home to large number of spirits, none of whom can actually leave. Dominating these spirits and thus the streets of The Cali Dump is a quartet of spirits or sticks, "The Cali Loa." They are very protective of their small domain and even aid the local gang, The Drogues, against incursions by the Great Lords, a satanic gang from the surrounding Great Men Barrio. The Loa have their own agenda and may even employ the Players, who in return can learn to call upon their aid.

Besides the actual description of The Cali Dump itself, there are another thirteen entries in *At Your Service*, which can actually be found within the three streets of the neighborhood. In fact, there are no other establishments described in the book taken from the Great Men Barrio. These can include services like Johnson's Divinations, where any question can be asked for a price; Pike's Diner in which the hostess and her guests discourage the purchase of meals; components for both black and white magic are available at Hell in a Handbasket and Beautiful Day, respectively, whilst Veve can supply any Vodou or Santeria items the players might need.

After learning of his secret activities as a "Cut-Ups" operative in the previous *Over The Edge* supplement, *Weather The Cuckoo Likes*, "Doc" Cross describes his latest recruits at the amusingly named "You'll Rot Your Mind Reading That!" This is the island's best-known comics and games shop, which brings in a range of customers, many of whom are movers and shakers in the various Al-Amarjan conspiracies.

If the players ever feel guilty about their activities, they can get it all of their chests at Deadly Confessions, where counsellor will ensure that they feel so much better after they leave. Player characters that like to roleplay as their hobby can enjoy a LARP session at The Haunted House, Al-Amarja's hottest new re-enactment venue, where the blood is fake, but the horror is not. And if your no-doubt oddball players wonder how the other half live, then they can view the living museum, Norms, a nightclub hosted by a real American couple leading an ultra-normal day-to-day existence!

The only entry that has been reprinted is John Nephew's Fleur de Lys Investments, Ltd., originally seen *Pyramid* #6. For fans of all things Harry Potter, this is an interesting take on the Philosopher's Stone, which of course, reveals the truth about a pair of financial consultants.

[END SPOILERS]

At Your Service is rounded out with a pair of indices. The first lists each of the GMCs in alphabetical order. The second breaks the list of establishments down by barrio or neighborhood in which they are each located. Perhaps a third could have been added listing the various businesses by type, but the two here are more than serviceable.

Further, Atlas Games suggests that the book is not just useful for *Over The Edge*, but a "gold mine of ideas for any modern game setting involving the unusual and supernatural." Pleasingly, this is a fair claim, as many of the entries in *At Your Service* could be used in many other modern set RPGs. The most obvious of these is *Unknown Armies*, Atlas Games' own RPG of modern day pulp action magic, and *Feng Shui*, their game of Hong Kong action, as well as Eden Studio's *Witchcraft*. Of course, you would have to tone down or excise the science fiction elements as necessary, but likewise, it would be necessary to play down the more outré elements if you were using some of these locations for Pagan Publishing's *Delta Green* or Hogshead's *SLA Industries*.

At Your Service should provide a welcome shot in the arm to any *Over The Edge* game, and there is bound to be more than just something that the GM can add to their campaign in this book. Yet referees for other games looking for a selection of interesting locations, businesses and NPCs should at least take a browse through *At Your Service*.

-- Matthew Pook

Pyramid Review

Mystic Warriors (for d20)

Written by **Doug Herring, Andrew Thompson, Kenny Lewis, John Kubisz**

Published by [Mystic Eye Games](#)

128 b&w pages; \$14.95

Mystic Warriors not only brings over twenty new prestige classes, each with their own background and special abilities, but also introduces vitus and techniques to the **d20** system. Vitus is similar to chi or the Force in that it's an energy that everyone has, but few are able to channel. The Mystic Warriors of the book, different prestige classes, are all trained in the use and handling of vitus to augment their abilities.

Vitus is a point-based score that varies depending on the characters class, his level and some key statistics, which vary according to class. Vitus is used to fuel special powers. One of the nice things about *Mystic Warriors* is that it acknowledges that vitus might be easier handled by using subdual damage on hit points instead of vitus points, or for those who don't like the idea of vitus at all, ignore it and the techniques it fuels. One of these options should fit almost any type of campaign.

The prestige classes suffer numerous roleplaying drawbacks and some minor game ones. If the GM isn't at the top of her game, the players may quickly flock to these character classes in hopes of easy power without restrictions.

Each school starts with the name, and the country of origin, which includes the location for the campaign the "Rise of Evil," and a generic location. The requirements often include alignment, base attack bonus, a certain number of ranks in harness vitus, and other skills, as well as feats, ability scores, and any special restrictions. These are followed by the class skills, skill points at each level, the formula for determining how many vitus points the character gains per level, and the hit die.

After that block of information is passed, the description of the class is given along with strictures. These strictures often take roleplaying into effect as in many portions of the The Hunt setting. The weapons and armor proficiency block shows what skills the character gains, as well as details the powers that the character gains per level. Each class comes with two tables, a standard table with the level, attack bonus, saving throws and powers by level, as well as a technique table that shows how many techniques the character has mastered. Each section concludes with a short story illustrating how the characters interact with their environment.

There is a wide variety of classes to choose from, and most who are looking to augment their warriors should easily be able to find at least one prestige class to add to their warriors. Some of the classes have a slight edge to them in another direction from warrior, like the Guild of the Dancing Knife. These knife fighters are more like thieves that are highly specialized with knives. On the other hand, the Brotherhood of the Sparrow Hawk is the perfect thief-catcher.

Some of these classes would probably be better off as antagonists for the players. Members of the Cult of Madness are insane warriors, while Shiva's Chosen are non-good warriors who seek out powerful individuals to kill in order to gain the attention of their god.

Now the techniques are special abilities that the character can select. There are some techniques that only certain classes can take, and the technique lists goes from 1st to 5th level. Some of the first level techniques include ability boost, which augments physical abilities in exchange for vitus, to doom strike, which charges a weapon with killing

power unless the struck victim makes a fortitude save.

In addition to vitus, techniques, and new prestige classes, there are also new items and new feats. The feats include general, mystic warrior only, item creation, and fighting stance. The fighting stances give the character different bonuses depending on the feat.

The book wraps up with an appendix that details more specifics about several of the prestige classes and an NPC write up. Other information included is the official academy name, other names, leadership/organization, current leader and level of secrecy. The level of secrecy is an important aspect since the dominating religion of The Hunt campaign setting looks down upon the Mystic Warriors.

Most of the art is considerably better than in previous books. Jason Smith brings a true level of professionalism to Mystic Eye Games that many found were lacking in previous products. Still, there are some cases where a prestige class has two illustrations: a powerful one, and an okay one. If the okay art was removed and the tables minimized, the book could've come in at 112 pages and still been a bargain at \$14.95. The sharper art would have given the book a better overall feel instead of a beefier feel.

GMs looking to expand their knowledge of The Hunt Campaign world, or those interested in expanding their home campaigns with vitus and techniques, will find this book useful. Players looking for warrior-based prestige classes should be able to find at least one or two in the pages of this book. At \$14.95, the book is a bargain.

Random Thoughts On Lord of the Rings

Greetings, Pyramidkateers! Welcome to the new year, and the last palindromatic year for 110 years.

But first, a caveat. I'm sicker than a dawg currently, so if this week's installment doesn't make any sense . . . well, I'm content to blame the tiny beings that have invaded my bloodstream (despite previous nonsensical installments crafted while entirely healthy).

Having seen *Lord of the Rings* on Sunday, I thought I'd take a column to share my random thoughts on the film. (Various spoiler warnings; if you haven't read the books, seen the movie, or eaten the Fruit Roll-Ups, you may want to give this column a skip.)

* * *

As a caveat, I feel I should point out that I have not, in fact, read the trilogy. Invariably whenever I say this I get gasps of disbelief, and an occasional stone or two hucked at me. But whenever I say that I've started to read it -- only to get caught up in dozens of pages of troop movements, Welch-y Elvish, or incomprehensible historical material -- many of these same folks have also said, "Yeah; those are pretty boring bits. You should skip those the first time." This makes the *Lord of the Rings* trilogy perhaps the most beloved series where its fans think you should specifically avoid reading certain points.

(As an aside, I should point out that I have read *The Hobbit*, and -- although it has been many years -- I recall enjoying it.)

* * *

One of the interesting things I walked away from the movie with is the realization that our heroes spent an inordinate amount of time running away (complete with all the *Monty Python & The Holy Grail* references that sparked within me). I kept expecting the heroes to kick butt and take names during most combat scenes, but for the most part they were so outnumbered or outgunned that their only rational option was to flee.

Now, in the past I've discussed the folly of [providing appropriate challenges](#), but this phenomenon sparked a new idea. Namely, how did the heroes *know* when they should run, or when they should stay and fight?

And so in my next campaign I've decided to try an idea I've dabbled in before, but never fully manifested. I'll allow those with sufficient martial ability to "size up" the battlefield situation, and roll to determine their chances. This would be in general terms like, "Piece of cake," or "Even up," or "No shot in heck." A failed roll would give no or false information, and the result would be modified based on appropriate advantages or disadvantages, like Overconfidence or Combat Reflexes. (One of my favorite continuing jokes in the *Vampire: The Dark Ages* campaign was -- no matter what kind of opposition our party faced -- having my overconfident character say, "Hmm . . . I think we can take them.")

Some games make this easier than others; *Dungeons & Dragons 3rd Edition*, for example, specifically has a Challenge Rating that should make it easy to give an idea of relative opposition level. And point-based systems would enable me to compare relative point totals as a ballpark figure. (Of course, I'd need to make sure that I only counted things the heroes could reasonably see; a dozen orcs in the same room as an invisible dragon would lead to a different conclusion than if the dragon were in plain sight . . .)

But in this way I could throw wildly challenging obstacles at the heroes, without fear that they'll necessarily rush lemming-like to their deaths.

(As an aside, it *was* satisfying to see the wizened and scholarly mage assess the situation and then proclaim loudly, "RUN!!!!")

* * *

When watching a 3-hour movie with 217 movie trailers beforehand, it is generally *not* a good idea to get a football helmet-sized caffeinated Cherry Coke, nor is it wise to drink said Cherry Coke before the movie even begins. This is an especially a bad idea in a movie that's part one of a trilogy, where you *know* it's not going to broadcast its ending, nor, really, even have an ending per se.

Er, not that I'm speaking from experience or anything . . .

* * *

Okay; this is my doctoral thesis material right here.

I'd like to point out that, as best I can tell by watching the movie, there are *no* human women in the entire world. I'd also point out that it's humans who generally go bug-nuts over the One True Ring. Hobbits, who seem to have plenty of women in their village, can handle the ring with relative ease. Elves, who again have dating possibilities, seem to do okay with the ring. Humans who are dating elves seem all right being near the ring. But the rest of the men seem to grab for the first yonic symbol they can. And the dwarf -- for whom we also have no evidence of females of the race -- also goes a bit nuts, too . . . albeit manifested in an axe-wielding rage.

In other words, there seems to be a direct relation between interpersonal frustration and the desire to get the ring.

(Now, I have it on good authority that there will, in fact, be a human woman in the second movie. Hopefully I'll get my doctoral degree before then . . .)

* * *

According to my research, all three movies were filmed at the same time for a total cost of \$180 million (which, after the favorable exchange rate in New Zealand is taken into account, was worth approximately \$350 million). Between this movie and *Harry Potter And The Sorcerer's Stone* earlier this year, I've been definitely pleased to see movies for the first time where I thought, "Wow! This is a movie that cost a \$100+ million to make that actually *looks* like it cost \$100+ million to make!" I hope this trend continues.

* * *

And hopefully I'll be better -- and more coherent -- next week.

--*Steven Marsh*

* * *

*Last week's answer: **Book of the Wyrms 2nd Edition**, p. 50.*

(Three stars) "The Viking women of real history played a powerful role in their societies, often dictating the length and nature of the feuds and imposing their considerable strength of will on local politics. However, they egged their men into battle instead of picking up sword and shield themselves."

A Firmament of Rocs

*"All feathered things yet ever knowne to men,
From the huge Rucke, unto the little Wren;
From Forrest, Fields, from Rivers and from Pons,
All that have webs, or cloven-footed ones;
To the Grand Arke, together friendly came,
Whose severall species were too long to name."
-- Michael Drayton, "Noah's Flood" (1630)*

So begins the roc, in this column at least, at the head of the birds and surrounded by water. The roc, in his widening gyre, will return to those positions, and his outstretched pinions will brush many others, even to the ends of the universe. Which, as it turns out, the roc has seen for itself. So look up, into the all-sheltering sky, into the eye of the roc, and listen for the thunder of mighty wings.

*"I saw that the cloud was none other than an enormous bird, of gigantic girth and inordinately wide of wing, which as it flew through the air veiled the sun and hid it from the island. At this sight my wonder redoubled and I remembered a story I had heard aforetime of pilgrims and travelers, how in a certain island dwelleth a huge bird, called the rukh, which feedeth its young on elephants."
-- Richard Burton (trans.), *The Thousand Nights And A Night*, "The Tale of the Second Voyage of Sindbad the Seaman"*

The roc, or rukh, or at least his name, comes to us first in the *Arabian Nights*, which is to say about a thousand years ago give or take a century. (His name comes to us from the Persian *rukḥ*, which oddly enough is also where the [chess](#) "rook" originates, but from there, we hit a blank wall.) In the *Nights*, the roc is an enormous bird who lives on a mysterious island somewhere in the China Seas (which may, or may not, be what we now call the Indian Ocean). The roc eats elephants, and the occasional rhinoceros, pouncing on them as a hawk does a field mouse. Rocs can carry men without even noticing the weight, as one did when Sinbad lashed himself to the roc's claw to escape the island upon which he had been shipwrecked. The roc's egg is so large that, half-buried in the sand, it can be mistaken for an alabaster or ivory domed building. Both Sinbad the Sailor and one Abd-el-Rahman "the Moor" (also, confusingly, nicknamed "the Chinaman") encounter the Island of the Roc; both incur the roc's wrath when their men break into the egg, kill the chick inside and eat its flesh. The parent roc then follows the ship out to sea and drops rocks on it until the ship is sunk, usually leaving only the canonical sole survivor to tell the tale.

*"For persons who had been there and had seen it told Messer Marco Polo that it was for all the world like an eagle, but one indeed of enormous size; so big in fact that its wings covered an extent of 30 paces, and its quills were 12 paces long, and thick in proportion. And it is so strong that it will seize an elephant in its talons and carry it high into the air, and drop him so that he is smashed to pieces . . . The people of those isles [Madeigascar and Zanghibar] call the bird Ruc, and it has no other name. . . . They brought (as I heard) to the Great Khan a feather of the said Ruc, which was stated to measure 90 spans, whilst the quill part was two palms in circumference, a marvellous object!"
-- Marco Polo, *Travels**

Marco Polo unhesitatingly places the roc, or ruc, on [Madagascar](#), where he promptly confuses it with our other aerial enigma, the [griffin](#). Madagascar does possess two of the most likely explanations for the roc; the raphia palm (whose dried fronds do rather resemble enormous feathers) and (or at least it did in Polo's day) the Aepyornis, also evocatively called the "elephant bird," a kind of giant ten-foot ostrich with eggs two feet around. (One can imagine an Arab sailor seeing those "chicks" and wondering how big the parent bird must be.) More tenuously, fossil ceratopsians (whose beaks, hips, and ribs might have seemed like the remains of an enormous bird), an extinct giant vulture of Malta (which sadly would still be unable to lift even the dwarf Maltese elephant), and an amazingly lost condor have all been tagged as the "real" roc.

Another great traveler, Ibn Battuta, saw the Island of the Roc in the Indian Ocean, or rather, he saw a mountain in the middle of the air which the sailors assured him was actually the roc itself. This has spawned a kind of desperate

speculation that the roc originated with the sight of a mirage-mountain at first explained as the roost of the roc and then as the roc itself, a bird as big as a mountain in mid-air. Explaining the roc as a mirage, however, seems even less satisfactory than explaining it as a fossil or an ostrich, or even a fossil ostrich.

*"In Kâf the simorg hath its dwelling-place,
The all-knowing bird of ages, who hath seen
The world with all its children thrice destroyed."*

-- Robert Southey, *Thalaba the Destroyer*, viii:19 (1797)

Evidently the roc's wingspan can't be contained within the boundaries of history, then. It outsizes even one whole mythology; the shadow of the roc falls almost everywhere on Earth. The first line of descent runs from the roc to the legendary Arab anka, which lived for 1700 years before dying (significantly like the phoenix) in flames. Originally the Bird of Perfection, the anka's predations began depopulating whole regions until Allah banished it to an island on the edge of the world. On the other wing, we have the Persian simurgh, or simorg, which was the bird that nested in the original Tree of Knowledge at the center of the world; it lived forever (or for 2000 years) and also ate elephants. The simurgh may have come, like the [manticore](#), out of India, where the enormous Garuda bird appears in the Vedic hymns flying between earth and heaven as the mount of Vishnu. Similar Indian influence might be the source of the roc, especially their shared connection with the Indian Ocean, and with the mountain between earth and heaven (Qaf to the Moslems, Meru to the Indians). Both the Garuda and the roc convey immortality; the Garuda brings it as nectar from the moon, while the sailors who survive eating roc flesh never age. Other giant birds include the thunderbird and piasa of Indian tribes all across the Americas, the norka of Russia, the Turkish kerkes, and the bar yuchre and ziz of Jewish legend; the vision of an enormous bird, blotting out the sun, and carrying men, horses, or elephants off as prey seems universal.

"Moreover, the valley swarmed with snakes and vipers, each big as a palm tree, that would have made but one gulp of an elephant. And they came out by night, hiding during the day lest the rocs and eagles pounce on them and tear them to pieces, as was their wont, why I wot not."

-- Richard Burton (trans.), *The Thousand Nights And A Night*, "The Tale of the Second Voyage of Sindbad the Seaman",

And another odd twist follows the legend more often than not; the roc is the mortal enemy of the serpent. Where he kills the elephant for food, the serpent he kills as his duty. The eagle and snake emblem on the Mexican flag, descended from the vision in Aztec legend that founded Tenochtitlan, eerily parallels the war between the Garuda and the serpentine Naga. If the simurgh nests in the Tree of Knowledge, the dragon at its base might be seen as its reflection, or opposite, and to the extent that Qaf is Eden -- a paradise at the center of the world -- we have another sighting of the serpent Enemy. Perhaps we begin to get a hint of the roc's true mythological purpose here; to watch and war upon the Leviathan, Tiamat, and the other creatures of the deep that roil and lurk just out of sight at the edges of the map.

"And he took me and led me where the sun goes forth . . . and I beheld a bird circling before the sun, about nine cubits away. And I said to the angel, What is this bird? And he said to me, This is the guardian of the earth . . . And the bird expanded his wings, and I saw on his right wing very large letters, as large as the space of a threshing-floor, the size of about four thousand modii; and the letters were of gold. And the angel said to me, Read them. And I read and they ran thus: Neither earth nor heaven bring me forth, but wings of fire bring me forth."

-- 3 Baruch 6:1-9

Thus the roc becomes a guardian of reality, encompassing and observing the world. The roc embodies all four elements: as the king of birds it rules the air, its island in the Ocean or its tree at the source of all rivers rules the water, its egg recapitulates the earth as does its floating mountain, and it rules fire as the sun-bird. The roc in 3 Baruch also dies in the fire, like the phoenix (and sometimes the simurgh and anka). Perhaps the four guardians of the watchtowers at the corners of the world, the Aethyrs or Angels of Dee's Enochian tradition, are actually rocs. The roc is the rook, and the rook is a castle (or watchtower), after all. The rook, interestingly, began as an elephant, much as the eight elephants at the corners of the world also hatched from the egg of the Garuda. Perhaps the roc dines on the very concept of elephants, rather than the physical pachyderm itself, leaving mastodon skeletons scattered across the wilds

of the north. The simurgh has seen and remembered all of history (and an elephant never forgets), witnessing the end of every age before this one. (This, by the way, is why the Queen of Sheba kept one around.) Is the roc, then, the observer who makes sure that when the earth falls, it makes a sound?

The fallen egg of the bar juchne supposedly destroyed sixty villages; if the ziz folds its wings, the unshaded Earth burns to a cinder. Without the roc, does [reality itself quake](#) and tremble? Is that the true meaning of the hail of stones from heaven that follows the death of a roc, fallen fragments of the once-solid past? Did such a death destroy the "egg-born" Lemurians, also sprung from Madagascar, foolishly allied with the "Serpents and Dragons of Light," leaving the griffins as the broken echo of both races? Do the [sphinxes](#), dark shadows of the simurgh, wait on the other side of the [mirror](#) for the next roc to fall and for their hour to come round at last? Keep watching the skies -- if the roc isn't, then someone has to.

Circle Of Fear -- Part II

A GURPS Atomic Horror Adventure

by Stephen Dedman

In [Part I](#) of "Circle of Fear," the PCs investigated a series of UFO sightings, crop circles, and rains of fish and other creatures. If they followed these clues, it should have led to their being abducted by an alien scoutship. Part I ends with the PCs escaping from the saucer into Lake Baikal, Siberia, unaware that they are all little more than an inch tall . . .

Them!

After being jettisoned from the cylinders, the PCs will find themselves in the cold (but not frozen) water of Lake Baikal, surrounded by apparently gigantic fish.

Reaching the surface will require 10 successful rolls on Swimming skill; normal failures will merely cost them fatigue, but a critical failure will mean that they have attracted the attention of a hungry monster -- a pike or sturgeon which looks as large as a whale. If attacked, the PC will either have to make a successful Dodge roll, or an attack doing a minimum of 3 points damage to deter the fish (see "Combat in and under water," p. B91), or be swallowed whole -- though apart from possible after-effects of a failed Fright Check (roll at -4), this is merely a temporary inconvenience (see below).

PCs who aren't swallowed by fish should make it to the surface uninjured, if exhausted; if any are in danger of drowning, bubbles of gas escaping from the sinking ship should boost them to the surface, or female PCs may be rescued by the amphibious Tuskers. There will also be enough unidentifiable pieces of flotsam from the saucer for the PCs to use as life-preservers, rafts, etc. -- though they may still have to defend themselves from "giant" fish or water tigers before reaching the shore.

The Tuskers will part company with the PCs before they reach the shore (though they may re-appear later; see "The Creature Walks Among Us," below), leaving the PCs to try to establish where they are. The muddy soil is littered with long woody stakes, while nearby vast trees, apparently miles high, tower above them like mountains. Above them, they can see a dark sky, with clouds obscuring too many of the stars for them to identify constellations. A roll on Naturalist or Botany will reveal that they are in a normal conifer forest, but shrunk to a very small fraction of their original size. A few seconds later, a loud whining noise (+4 to hearing rolls) will herald the approach of a swarm of "giant" midges. Use the stats for striges (p. B145). 1d+1 midges will attack each PC. If the PCs lack weapons, pine needles may be found that are the right size for crude but adequate batons, clubs, staffs or spears (thr-1 imp., +1 if used 2-handed). If the midges are killed, they will spurt blood and ichor over whoever swats them.

After each PC has killed at least one midge, it will start raining, with drops hitting like water bombs: roll ST or DX (whichever is better), or fall over. The rain will scatter the midges. If the PCs don't start running for cover, the first hail-stone will smash a few hexes away from them, and the next one will be much closer (3d+3 crushing damage if it hits). The nearest shelter is a 40-hex run away, a shallow depression underneath a tree root. Each PC should make a vision roll at -4 to see the spider web spanning the gap. PCs who fail this roll will have to make a DX roll to avoid running into the web; a critical failure on vision means no DX roll. Anyone running into the web will be grappled, suffering an immediate -2 to DX. A contest of ST is needed to break free, and the web has ST of 13. A failed roll results in the victim becoming further entangled, costing 1 point of fatigue. For purposes of cutting, each strand of web has DR 3 and HT 6, and each strand cut reduces the web's ST by 2. The spider will arrive 1d+1 turns after something touches its web; if someone is still entangled when it gets there, it will begin adding one strand every other turn to the web to strengthen it. Unless attacked, it will not bite someone who is not thoroughly entangled (e.g. whose effective ST is at least 6 less than the web's).

Giant Fish

ST 50-70; **DX** 10; **IQ** 2; **HT** 12/50-70.

Move/Dodge 9/7; Size (30-40+); PD/DR 1/1#; Weight (10-20 tons); Damage (swallows whole); Reach C.

Water Tiger (Dragonfly Larva)

ST 12-16; **DX** 16; **IQ** 2; **HT** 10-14.

Move/Dodge 6/8; Size 2; PD/DR 1/2; Weight 60-125 lbs; Damage 1d imp; Reach C, 1.

Giant Spider

ST 20; **DX** 15; **IQ** 2; **HT** 14/20.

Move/Dodge 6/7; Size 4; PD/DR 2/2; Weight 400 lbs; Damage 1d imp*; Reach C.

* Bite injects Type C venom, 1d-1 damage.

If the PCs are underground, under the root, or inside a fish when they return to normal size, they will take 1 point of damage (minor abrasions), and be left looking wet, disheveled, and (particularly if they're trying to wield normal-sized pine needles as weapons) foolish. Any damage inflicted by the bugs will have to heal or be healed normally, but if anyone is suffering the effects of the "giant" spider's venom, their DX will return to normal in 20-HT minutes. The PCs will then have approximately nine hours to perform first aid (if needed), find dry wood and start a fire, and try to get their bearings, before the Russians arrive, a few minutes after sunrise. The air temperature will drop to freezing (20-30 degrees) for 1d+1 hours overnight; see p. B130.

The easiest ways to establish their location are with Naturalist, Botany, or Ecology (-3, in Siberia; -10, on the shores of Lake Baikal). Successful rolls on Astronomy or Navigation will tell them that they're still in the Northern Hemisphere, and (-5 to roll), somewhere between the 50th and 60th Parallels, but nothing more. This becomes academic a few minutes after sunrise when a helicopter, marked with a red star, lands nearby, and four men with Simonov SKS carbines, fur hats and military uniforms come running out.

The four Russian soldiers have been sent to search for the plane which the saucer (inadvertently) brought down; if they see the PCs, they will try to arrest them on the suspicion of being spies or saboteurs, and take them to Dr. Zupanov's research center (see The Brain that Would Not Die, below). The PCs may attempt to:

- **Hide.** Contest of Stealth or Camouflage against IQ -- with a +5 modifier for the soldiers if the PCs have lit a fire or left other obvious clues to their presence. If they evade the soldiers (and the soldiers will return the next day and every 1d days after that, searching for any debris from the saucer), they will have to survive the oncoming winter (and possibly encounters with local animals, including brown bears and the world's largest tigers) until they can get to friendly or neutral territory by other means. This will be extremely difficult, especially if they don't speak Russian or have any appropriate Area Knowledge, Savoir-Faire, or Streetwise skills. They will be in constant danger of being reported to the authorities and taken to the Research Center for interrogation . . . but they shouldn't be prohibited from trying to (for example) hike to the nearest town (Nizhneangarsk, population 10,000, with a railway station, airstrip, and fish processing plant), catch the Trans-Siberian railway to Moscow, and try to convince the staff at the US Embassy that they're not spies, haven't been brainwashed, etc., and should be permitted to return home.
- **Fight.** The Russian soldiers are almost certainly better armed than the PCs, and probably in better condition, but they may still be outnumbered and outmaneuvered, and they will try to bring as many witnesses as possible back to Dr. Zupanov alive, while the PCs might not be so delicate. Like hiding, attacking the soldiers will accomplish little unless the PCs also manage to steal or hijack the helicopter and fly it out of Russia, or use the stolen weapons and uniforms to try to bluff their way to some other form of transportation. If the soldiers do not return, another party (or two) will be sent out in 1d+1 hours.
- **Hijack the helicopter.** Stealthy PCs may be able to evade the Russian soldiers and sneak into the helicopter and

either overpower or intimidate the pilot. The soldiers will come running if they hear any shots or shouting. If the pilot is unwilling or rendered unable to fly the helicopter, the PCs may have to fly it themselves (-2 for unfamiliar model, and defaults to IQ at -9, not -5, unless the PC can also read Russian). If they succeed at flying back to friendly or neutral territory (the helicopter has a range of 405 miles -- enough to take them to Ulan Bator -- and top speed of 135 mph), the adventure is over; go to "The Creature Walks Among Us."

- **Surrender.** The soldiers will then take them directly to the Research Center.

The Brain That Would Not Die

The soldiers who take the PCs to the Research Center will report immediately to Natalya, who will perform a medical examination, do her best to heal any wounds the PCs may be suffering, and then order Ivan and the soldiers to strip the PCs of all clothing but their underwear (-5 to Holdout and Arctic Survival) and then confine them to the cell beneath the lab. When this is done, the soldiers will then retire to their barracks.

The lab is cluttered with scientific equipment and textbooks, half-finished experiments and disemboweled gadgets, rats in cages, and biological specimens in jars. Amid this mess, the PCs will need to make vision or Science! rolls at -10 to notice that one of the brains in jars is connected by tubes and wires to a number of tanks and instrument panels, or that the faintly glowing camera eyes of the clumsy-looking robot standing near this brain move slightly to keep Natalya in view. The robot will only move if the PCs attempt any sort of attack or resistance, and then it will fight to defend Natalya and the brain.

If the PCs do not resist, they will be kept in the cell for 24 hours while Zupanov readies his mind probe. The cell floor and ceiling are of 6'-thick concrete (DR 4; see p. B125), and the walls of 3" brick (DR 3), set in frozen soil (DR 2). The door is of 1" iron bars (DR 3), which also cover the small window (6" by 1' -- large enough to let in cold air and rain, but too small for even a skinny character to squeeze through). The lock on the door is -2 to Lockpicking attempts. The cell is lit by a single low-watt bulb. The air temperature will drop to freezing (20-30 degrees) for 1d+1 hours each night. Any PC who gets a Good or Better reaction from Natalya or Ivan will be given a rough blanket (treat as normal winter clothing) to protect them from the cold.

The PCs' weapons, clothes and gear should be divided more-or-less evenly among Natalya, Ivan and the soldiers, with Natalya getting first pick. Ivan will take a pair of boots or shoes, while the soldiers will be more interested in weapons and American clothes. If/when the PCs seek to recover these items, they will be found on the NPC who took them, or in their quarters.

While in the cell, the PCs will have two meals delivered -- one by Natalya (who will also check up on anyone injured; treat as Physician's care, at -2 for unhealthy surroundings), and one by Ivan. While the food (kasha, buckwheat porridge) is awful, this visit will give the PCs a chance to try to use Fast-Talk, Sex-Appeal, or similar tactics to persuade either Natalya or Ivan to help them escape. Neither will open the cell door unless tricked into doing so (sliding the bowls through a gap between two bars instead), but will come within 1 hex of the bars. If either Natalya or Ivan assist the PCs in escaping, they should be able to reach the hangar without difficulty, and may even have some of their gear returned.

If the PCs have not escaped by the time the 24 hours are over, Ivan and one of the soldiers will return to the cell and escort one PC (Dr. Zupanov will have chosen the apparent leader or most intelligent of the party) upstairs to the lab. The PC will be ordered to sit in a chair (bolted to the floor near a work bench) and manacles and leg-irons will snap shut around his wrists and feet (-5 to Escape rolls); if he resists, the robot and Ivan will force him into the chair (contest of ST). Natalya will then fit the mind probe to his head, and Dr. Zupanov will activate it and run it for 90 minutes, or until he gets a "Scan Ends" result. Go to "The Tingler."

Research center

- **Lab.** Use the "indoor" side of the map from the Basic set for the lab interior (see p.B226). Exterior walls are 6" stone (DR 6), interior walls 3" brick (DR 6), doors and window shutters are 1" wooden slab (DR 2), floor and

ceiling are 6" concrete (DR 4).

- **Stairs.** Leads down to cell.
- **Natalya's bedroom (Kitchen).** Contains small bed, a trunk of clothes (including a radiation suit, spare lab coats, the rest of the PCs' clothes and gear, and 25 Tokarev rounds), and a bookshelf (medical texts and scientific journals in Russian, US movie and fashion magazines in English, novels in both languages). Loaded Tokarev under bed.
- **Kitchen (Pantry).** Contains basic pre-WWII kitchen appliances, a wood stove, a more modern refrigerator and freezer, a samovar of tea, 20 lbs of food (36 man-days), Ivan's bed (near stove), and a stack of firewood. When not on Ivan's belt, a ring of keys (including a key for the cell door) hangs near the door to the stairway.
- **Laboratory (Great Hall).** Contains Dr. Zupanov, Robot, Mind Probe chair and hardware, Biology and Chemistry labs, surgical equipment (treat as a Doctor's black bag), library (all in Russian; +1 for research into Electronics (Computers), Engineering (Robot), Physiology (Brain), and Surgery (Brain)).
- **Bathroom/Storeroom (Max's Bedroom).** Contains bathtub, washing machine, stove, sink, toilet, parts of prototypes of the Tingler and Robot (which a Quick Gadgeteer can use as components), and assorted tools.

Immediately across from the Lab's door to the outside is the Barracks, a simple square building contains 6 bunks, 1 small bathroom, 1 stove, 2 pints of vodka, 5 footlockers, and (usually) the 4 soldiers, the pilot, their weapons, and 400 rounds extra ammunition. Most of the PCs clothes, gear and weapons will also be in here. Walls, doors, and window shutters are 1/2" plywood (DR 3); roof is 1/8" steel (DR 4); floor is 6" concrete (DR 4).

50 yards west of these buildings is a hangar, which contains the helicopter, jeep, generator, 6 5-gallon jerry-cans of petrol, 6 empty jerry-cans, a 400-gallon tank of avgas, and a tool kit. Walls, roof and doors are 1/8" steel (DR 4); floor is 6" concrete (DR 4).

The Tingler

Dr. Zupanov's Mind Probe maps the brain by stimulating different areas -- pleasure, pain, fear, memory, vision, etc. Every 10 minutes that the subject spends being probed, roll 2d and consult the table below.

2 Memory center affected. Subject develops total amnesia for 20-IQ hours. Scan ends.

3 Vision center affected. Subject becomes blind for 20-HT hours.

4 Subject becomes Lecherous for 1d+1 hours.

5 Fear centre stimulated. Make a Fright Check at -4.

6-7 Scan succeeds, giving Zupanov enough data to study for 1 day. Scan ends.

8 Pleasure centre stimulated.

9 Pain centre stimulated: subject suffers Migraine for 1d+1 hours.

10 Random memory retrieved: subject suffers Flashbacks for 1d+1 hours.

11 Random memory retrieved: subject gains 1/2 point in a not-very-useful Mental skill he'd forgotten learning (possibilities include Language or Scientific skills studied in college, Area Knowledge from somewhere he lived many years ago, etc.)

12 Psionic center stimulated. Roll on table below.

1 Subject autoteleports, appearing (still in underwear) in Hangar. Scan ends.

- 2- Subject develops Pyrokinesis (10), inadvertently setting fire to
- 4 Natalya's lab coat. Further attacks made at IQ -3. Power lasts for (IQ +/- Strong/Weak will) minutes.

Subject temporarily "mindswapped" with someone else in lab:

- 5- Zupanov (controls Robot), Natalya, or Ivan, leaving their mind
- 6 imprisoned in his body. Mindswap lasts for (IQ +/- Strong/Weak will) minutes.

If the first probe ends without the subject escaping, Ivan will carry him back to the cell to recover, then tell the PCs that Zupanov and Natalya plan to transplant his (Ivan's) brain into one of their bodies and, if this is successful, to transplant Zupanov's brain into another. 24 hours later, Ivan and two of the soldiers will return to take another subject upstairs for a mind probe. Repeat the procedure.

24 hours after the second probe, if the PCs still haven't found a way to escape, go to Deus Ex Machina.

Deus Ex Machina

Shortly before a third PC (one with good stealth or combat skills) is taken upstairs for interrogation, a team of Russian investigators who have discovered the sunken saucer will try cutting through the hull. In doing so, they will cause the anti-matter power plant in the saucer to explode.

Just as the PC is ordered (or forced) to sit, the explosion will cause a massive electro-magnetic pulse. All the lights in the lab will go out (-8 to Vision for anyone without Night Vision), the Robot will be paralyzed, and Zupanov will be plunged into sensory deprivation. Natalya will realize that her father's life support system has also stopped, and assume that something has gone wrong with the generator. She will send Ilya out to tend the generator, order Ivan to hand-crank the emergency pumps for Zupanov's life support, and order the Robot to prevent the prisoner escaping. If the PC makes a Vision roll, he will notice that the Robot has stopped moving and its eyes are dark and do not track. The PC is not cuffed to the chair, and can leave any time.

The sound of the blast, and the shock wave, will hit 95 seconds after the electro-magnetic pulse. Anyone in the Research Center will have to make a roll vs HT or be deafened (treat as a crippling injury) by the blast -- at +3 for anyone in the cell, at +1 for anyone inside a building at ground level, and at -1 for anyone outside. The main building and the hangar are solid enough to withstand the blast, but the flimsily constructed barracks will collapse, doing 4d crushing damage to everyone inside and pinning them under 2dx10 lbs of debris, and many objects will fall from the shelves in the lab, doing 1d-2 to Natalya and Ivan. Everyone in the research center, including the PCs, will also be exposed to 100 rads from the blast, and a further 2 rads/hour for every hour they spend in the area. Multiply this x4 for anyone not protected by stone or metal walls.

If the PC tries to sneak out, Natalya is at -10 in her contest of IQ vs Stealth, Ivan at -5, and Ilya will not be returning any time soon. The PC can try sneaking outside, or downstairs to try to free his friends. The keys hang from Ivan's belt; use Pickpocket skill to get them without him noticing, or Stealth and a DX roll to grab them and run, or combat.

If the PC decides to attack while he has the advantage of surprise, there are several objects in the room that make good improvised weapons. These include: a tray of surgical implements (treat as 1d+1 small knives), two hexes from the chair; bottles of acid (do damage; roll on Russian language skill to read labels) on the shelves; electric flexes that can be used as garrottes; various instruments and containers that can serve as saps, batons or small maces (pestle, slide rule, heavy bottle, etc.); and the Robot (precariously balanced; roll vs ST to push it over, doing crushing damage to anybody standing behind it).

If the PC is able to threaten Zupanov convincingly, Natalya will order Ivan to hand over his keys and weapons -- and will then try to trap the PCs under the house by bolting the door at the top of the stairs, blocking it with the refrigerator, etc.

When the PCs get outside, they will find Ilya standing in the space between the lab and the hangar -- dazed, dazzled by the fireball, and (if the shock wave has hit) temporarily deafened. His carbine is slung over his shoulder; he will fight to retain it, but at -10 to all DX-based skills. The other soldiers and the pilot are trapped in the ruins of the barracks. If the PCs rescue them, they will react to them at +4 for at least 24 hours after that, and maybe even help them to escape.

The helicopter and jeep have not been damaged by the blast. The PCs can take whichever they are best able to use: the jeep is slower, has a shorter range, and can be stopped more easily, but it's also easier to re-fuel; the helicopter can make it to Ulan Bator, in Mongolia without refueling, but only if the PCs can pilot it and navigate (Navigation -3). The helicopter has a radio that can be used to contact US forces in Korea and Japan; the jeep doesn't.

The Creature Walks Among Us

Once the PCs have escaped from Russia, the adventure is over -- but there are plenty of chances for a sequel. The Tuskers might not only survive, but breed. While they may remain in Siberia during the winter, they will find it unpleasantly warm and humid come summer and migrate south to the Himalayas, possibly inspiring a rash of Yeti sightings. Alternatively, Russian scientists may decide that the Tuskers might make good amphibious troops, and start trying to breed and train them.

While most of the scoutship was vaporized when the power plant exploded, a few fragments may have survived, and the TSF or the Pentagon could decide that these have to be recovered. The mothership may remain in a geostationary orbit above the south pole for years: as it is packed with creatures from dozens of planets (some of them intelligent), as well as advanced alien technology, and much closer even than the moon, it would be an excellent setting for an early TL7 Space adventure. Of course, even if the TSF or another patron can build a rocket that will take the PCs there, they will have to find a way inside, and the saucer will certainly be able to defend itself. Alternatively, once the PCs are inside, the saucer may continue on its course across the galaxy in search of its creators . . .

The Cast

Ivan Igorievich Frykowski

Early 30s; lopsided features, leathery complexion, shaggy dark hair, dark brown eyes; 5'7", 170 lbs.

ST 15; DX 10; IQ 10; HT 14. Move 6

Advantages: Double-jointed; High Pain Threshold.

Disadvantages: Berserk; Duty (to USSR, all the time); Hideous; Hunchback; Jealousy; Poverty (Poor).

Skills: Area Knowledge (USSR)-10; Axe/Mace-12; Brawling-12; Cooking-11; Driving (Truck)-11; Electronics Operation/TL7 (Radio)-11; Engineer/TL7 (Combat Engineering)-10; First Aid/TL7-9; Guns/TL7 (Rifle)-13, (Pistol)-12, (Shotgun)-11; Knife-12; Mechanic/TL7 (Car, Helicopter, Robot)-11; Savoir-Faire (Military)-9; Stealth-9; Thrown Weapon (Axe)-11.

Maneuvers: Neck Snap-13.

Gear: Tokarev; Hatchet; Large Knife; Heavy clothing (sheepskin, leather, and heavy canvas; PD 1, DR 2, +5 to Arctic Survival); gloves; boots; fur cap.

Born in Stalingrad, Ivan Igorievich Frykowski was rejected by the Red Army and was working as a gravedigger when the Nazis invaded the USSR. His professional services were soon greatly in demand, and soon he was working for army engineers. When the war ended, a Kremlin bureaucrat with a quirky sense of humor assigned him to Dr. Zupanov, one of the USSR's more innovative weapons designers, as an assistant.

Robot

Neckless metal cylinder with arms, legs, and dimly glowing red eyes; 7'6"; 360 lbs.

ST 30; DX 8; IQ (4); HT 12/20. Move 6

Advantages: Metal armor, sealed (DR 8, PD 1); Peripheral Vision.

Disadvantages: Bad Grip; Color Blindness; Disturbing Voice; No Sense of Smell/Taste.

Skills: Brawling-8; Guns/TL7 (Machine pistol)-11; Intimidation-15; Shortsword-8.

Zupanov's homemade robot is usually remotely controlled by Zupanov, when it has an effective IQ of 16; when contact is lost with Zupanov, its IQ drops to 4, and it continues to obey the last order it received. It is designed to be the disembodied Zupanov's eyes, hands, and sometimes voice, but doesn't do any of these jobs particularly well, and Zupanov spends much of his time trying to design something more sophisticated to transfer his brain into.

The robot's right arm includes a Tokarev modified for a 71-round drum and autofire (RoF 16*), and can punch for 3d cr.; the left includes a flashlight, cutting torch, and retractable machete blade (6d-1 cut). The head has full rotation and two cameras that give peripheral vision. The body features a short-wave radio and bullhorn, as well as the brain, battery, and gas tank for the torch.

Russian Pilot (Yuri)

ST 10; DX 12; IQ 11; HT 10. Move 5

Advantages: Combat Reflexes; High Pain Threshold.

Disadvantages: Duty (all the time); Lecherousness; Overconfidence; Poverty (Struggling).

Skills: Administration-10; Area Knowledge (Siberia)-9; Brawling-12; Climbing-10; Detect Lies-10; Driving (Car)-12; Fast-Draw (Pistol)-12; First Aid/TL7-11; Guns (Pistol)-14, (Light Automatic)-13; Knife-12; Language (Russian)-11, (English)-9; Mechanic/TL7 (Car, Helicopter)-11; Pilot (Large Helicopter)-14; Running-10; Scrounging-11; Spear-10; Stealth-10; Streetwise-10; Survival (Arctic)-11.

Gear: Tokarev; Small knife; Leather jacket, coveralls, leather helmet, boots.

Russian Soldiers

ST 11; DX 10; IQ 10; HT 11. Move 5

Advantages: Combat Reflexes; High Pain Threshold.

Disadvantages: Duty (all the time); Poverty (Struggling).

Skills: Administration-10; Area Knowledge (Siberia)-9; Brawling-12; Climbing-10; Detect Lies-10; Driving (Car)-11; First Aid/TL7-10; Gambling-10; Guns (Light Automatic, Rifle)-14; Knife-12; Language (Russian)-10; Mechanic/TL7 (Car)-10; Running-10; Scrounging-11; Spear-10; Stealth-10; Streetwise-10; Survival (Arctic)-11.

Gear: Simonov SKS; Large knife; Overcoat, coveralls, fur hat, boots, gloves.

The pilot and soldiers assigned to guard Zupanov's research center were given a job as punishment for minor infractions, but they're generally competent (if unenthusiastic) henchmen who would rather be there than prisoners in a gulag. Each has a weakness and they're open to bribes, but they're not cheap, stupid, or suicidal.

Dmitri has the Military Rank/1 (Sergeant) advantage, and the Bully disadvantage. Pyotr has the Greed disadvantage and Pickpocket-9. Sergei has the Alcoholism disadvantage; Ilya has Unluckiness.

Tusker

See [Part I](#) for the Tuskers' stats.

Natalya Zupanov

Mid 20s; pale complexion, black hair, green eyes; 5'9", 130 lbs.

ST 11; DX 11; IQ 14; HT 13. Move 6

Advantages: Beautiful; Fashion Sense; Voice.

Disadvantages: Curiosity (-5); Dependent (Father, all the time); Self-Centred.

Quirks: Secretly likes American music and clothes; Attracted to intelligent men (+1 to IQ 14, +2 to IQ 15+); Wants to become a doctor.

Skills: Area Knowledge (USSR)-10; Brawling-11; Cooking-10; Driving (Truck)-10; Electronics/TL7 (Computers)-13; Guns/TL7 (Pistol, Rifle)-12; Judo-10; Languages (Russian)-14, (English, French, Mandarin)-12; Mechanic/TL7 (Car, Helicopter, Robot)-10; Physician/TL7-12; Psychology/TL7-13; Research-13; Science!-12; Sex-Appeal-15; Stealth-10; Surgery/TL7-14.

Maneuvers: Knee Strike-13.

Gear: usually wears white lab coat over heavy coverall (PD 0, DR 1, and slightly too tight), boots, and fur cap. Rarely armed.

Natalya is the beautiful (and usually dutiful) daughter of Dr. Vladimir Ilyich Zupanov, but is beginning to become discontented with a life where she is little more than his nurse and his hands. Though it may be possible to win her over with an offer of a more comfortable life, she won't co-operate with her father's killer(s). Natalya has little loyalty to the USSR or to communism; if taken to the USA, she is likely to become a double agent, selling secrets to the highest bidder.

Dr. Vladimir Zupanov

Brain in bulletproof glass case, with assorted gadgets attached. 2000 lbs.

ST -; DX 11; IQ 16; HT 10/6.

Advantages: Gadgeteer, Realistic; Mathematical Ability; Versatile.

Disadvantages: Bad Temper; Callous; Disturbing Voice; No Physical Body; Obsession (acquire or create new body); Stubbornness.

Skills: Area Knowledge (USSR)-15; Armoury/TL7 (Body Armor)-14; Astronomy/TL7-15; Computer Programming/TL7-14; Computer Operation/TL7-16; Detect Lies-14; Electronics/TL7 (Computers)-17; Engineer/TL7 (Robotics)-17; Interrogation-14; Intimidation-15; Languages (Russian)-16, (English)-14, (Latin)-14; Mathematics/TL7-14; Physician/TL7-16; Physics/TL7-16; Psychology/TL7-13; Research-16; Science!-14; Strategy (Land)-13.

Dr. Vladimir Ilyich Zupanov was one of the Soviet Union's most brilliant robotic engineers. He spent the Great Patriotic War working on guidance systems for missiles while dreaming of more ambitious projects -- including better prosthetic arms and legs for maimed soldiers, mine-clearing robots, and space probes. After the war, he was put in charge of a project to develop a robot tank, but the tank's brain malfunctioned and it went on a rampage, nearly killing Zupanov as it went. When the robotank was finally destroyed, Stalin banished most of the scientists and engineers to Siberia, and had Zupanov's brain kept alive to work off his debt to the USSR.

Zupanov is still laboring to build himself a body that will enable him to escape from Siberia and endear himself to the Kruschev administration, but his personality becomes less human and more machinelike every year his brain spends in a glass case.

Murphy's Rules

Murphy's Rules

Murphy's Rules

The Lost Tribe of the Library

by **Loki Carbis**

Somewhere, way back among the dim and dusty shelves of the library, there exists a restless tribe of comprised of the misfits, the outcasts and the merely lost. This motley assemblage is the fabled Lost Tribe. Living deep in the shadows, surviving on a diet of old paper and rat meat, the Lost Tribe is a rumour to the other patrons. Still, someone must be drawing those weird cabinet paintings -- or is it just student hi-jinks?

Unknown to almost all, deep in the bookshelves of the night, the Lost Tribe is real. Overwhelmingly male and poorly washed, mostly composed of nerds and geeks, and, as a group, prone to Absent-Mindedness. Deep in the stacks, they have constructed a primitive but (mostly) functional society, away from prying eyes. More gatherer than hunter, but not afraid to play up to the role, the Lost Tribe may not be very advanced -- but they are very deadly.

The weaponry of the Lost Tribe ranges from TL0 to TL3, although usually lacking in bows or catapults (and never featuring any other sort of siege weapon), due to the rarity of the necessary fibres to string such weapons. However, rather than stone, it is usually constructed of wood or metal (taken from shelves or other fittings) or glass (scavenged from bins and unattended tables). Their other technology can be anywhere from TL0 up to the base level of the campaign (assumed to be TL7 in this article). It will mostly consist of stolen or improvised equipment, and some things we take for granted will be very rare. Ropes, for example, are not often found in libraries, and so must be made from woven together threads scavenged from clothes and carpets -- a time-consuming process and one that leads to very oddly coloured ropes.

The social organisation of the Lost Tribe is similar to that described for bands in *GURPS Low-Tech*, although what "families" exist are purely invented, since only second or later generation members of the tribe are actually related to each other. Food is gathered mostly by trapping rats and stealing it from unwary library patrons. Depending upon the actual library, the range of food may vary somewhat: a library with a conspicuous rat problem may have cats as well, which will also be preyed upon by the Tribe. (Less fastidious Tribe members might also steal the food and milk left for these cats.) In the basement levels of a library, weird farms of fungi and lichen may grow, but overall, the diet of the Lost Tribe will be lacking in fruits and vegetables -- which doesn't lead to a very healthy diet for the Tribe. (Mental or Physical Disadvantages based on missing dietary requirements are certainly appropriate to more realistic versions of the Tribe.)

The Illuminated Tribe

Depending on how exactly your game world works, the Lost Tribe could change its nature profoundly. This is how the Lost Tribe might appear through each of the four "lenses" from *GURPS Warehouse 23*.

The Mundane

The Lost Tribe, if it isn't just an urban myth of some sort, is probably very small indeed -- maybe only one person, most likely an eccentric researcher, and probably a reclusive nut rather than actually lost. Alternately, maybe it's just a student prank designed to freak out the freshmen -- it certainly makes a great excuse for a party.

The Occult

The Lost Tribe has discovered forgotten magicks unknown to most of humanity -- either through finding them in the books of the library, or through achieving a better understanding of reality in returning to primitivism. In this case, their magic is likely to be either improvised (see *GURPS Magic*) or shamanic (as in *GURPS Spirits*).

The Fortean

Pretty much anything goes -- maybe the reason the Lost Tribe never emerges is that they're too weird and mutated for the world to cope with them anymore (or vice versa). Or maybe they've mastered the mysteries of L-Space and have other fish to fry.

The Illuminated

The Lost Tribe is a warning. Every last member of the Tribe is there because the Conspiracy has messed with their heads, and they can no longer find the way out of the Library. But the Conspiracy never wastes anything potentially useful -- killing them outright would be a much less effective warning, and run the unnecessary risk of creating martyrs. And some Tribe members may well have knowledge that the Conspiracy still wants (a la GURPS *The Prisoner*).

Campaign Role

The Lost Tribe can be a small piece of minor weirdness, or a major antagonist, or pretty much anything in between. Probably the best use for them is as guardians of whatever is hidden. Their location in the library means that they may well have in their position nearly any book (or disc, or magazine, or whatever) that the characters may need for any purpose. Whether to protect the book or to protect others from it -- or to use it themselves -- is entirely dependent on their role in the game.

The question of how big a secret the Lost Tribe is must also be answered. Maybe all the library staff and patrons know about them and think nothing of it, or maybe they're just a legend. The most practical way to keep the secret is to use some variation of the Mundanity advantage (*GURPS IOU*, p. 19) or some similar workaround.

The Lost Tribe could easily be the rescuers of the characters if for some reason they're attacked in the library -- and they may not feel inclined to let the characters return to the outer world and tell others of their existence. This is even more likely if some members of the Lost Tribe are people who believed to have disappeared -- but have in fact joined the Lost Tribe -- some of them may well be believed dead by the mundane world.

If the theories of L-Space (See the sidebar on page 115 of GURPS *Discworld*) are correct, then the Lost Tribe may well be able to travel from library to library at will -- although they may not actually be aware that they can do this.

Other Tribes

As written, the Lost Tribe could be dropped into either *GURPS IOU* or *GURPS Discworld* without any changes needed. And it would only take a small amount of re-writing to fit them into a *GURPS Warehouse 23* game. Likewise, the libraries, archives or warehouses of various umbral realms in either *GURPS Werewolf: The Apocalypse* or *GURPS Mage: The Ascension* could easily be homes to Lost Tribes of their own.

Liberating the idea of the Lost Tribe from the library setting, there could be such a tribe just about anywhere. In *GURPS Vampire: The Masquerade* and *GURPS Werewolf: The Apocalypse*, the Nosferatu clan and Bone Gnawer tribe both fall into this sort of category, dwelling in the sewers beneath the city. Another logical place for Lost Tribes is in a modern shopping mall -- obviously, the larger the better. (Combining this article with "Space-Time for the Advanced Mallwalker" could make the Lost Tribe stranger still. The Lost Tribe would be a fourth faction in that setting, not allied with the Locksmiths or the Couriers, although they may have some sort of understanding or alliance with the Mall hivemind.) Further out, how about a Lost Tribe deep in the forgotten underburrows of a *GURPS Bunnies and Burrows* game? A Lost Tribe of disembodied cyberpunks lost somewhere in the un-used portions of the Net? Or a Lost Tribe composed of escaped prisoners of an underground labyrinth? (This idea could easily be adapted to *GURPS Greece*, *GURPS Special Ops*, or *GURPS Swashbucklers*.)

Adventure Seeds:

Secret? What Secret?

The library is invaded by an event that brings a lot of media attention. Maybe a crime is committed in the building, or maybe someone famous is dedicating the new wing in a ceremony this Friday. However it comes to pass, the Lost Tribe finds its foraging area greatly cut down and its privacy rapidly evaporating. Will they be forced out into the open? Will they kill to protect their secret? Or can the characters find a third way?

. . . So Goes My Nation

When it's decided that the library has to move to a new location, there's one small hitch: the Lost Tribe don't want to go. And they know things about guerilla warfare that make the North Vietnamese Army look like beginners. The characters might be a team of enforcers hired to "clear" the premises -- or they might be ordinary library patrons caught in the middle. (The latter could make an unusual starting point for a conspiracy or weirdness based campaign.)

One Of Us, One Of Us

The Lost Tribe, for reasons unclear, has decided to recruit one or more members of the character party into its ranks. As a result, each time the characters return to the library, they find themselves subject to an escalating series of trials, tests and ordeals -- all part of the Tribe's initiation ritual.

The World in a Bottle

by David Morgan-Mar

Herge, the author of the *Adventures of Tintin* comic books, once had a plan to set the entire plot of a book within an airport departure lounge. He said that an airport contains "the whole world on a reduced scale . . . tragedies, jokes, exoticism, and adventure." These four elements are also basic ingredients for interesting and exciting roleplaying adventures. So let's examine what such a restricted microcosm as a setting can offer.

The basic concept we are exploring is the idea of setting an adventure in a single, physically small location. The meaning of "small" may vary by circumstance, as we shall see. The player characters will be restricted from leaving this small location, either by physical isolation, regulations, happenstance, or even simply because there is no need for them to leave.

Total Isolation

In the simplest case -- physical isolation -- NPCs will also probably be prevented from leaving, or arriving at, the adventure location. An example would be on board a ship at sea. The valiant heroes are stuck on the ship, just as is every member of the crew and any passengers. A small underground settlement on a new colony world with a hostile atmosphere and no supply ship expected for another week provides a more literally claustrophobic setting.

This sort of set-up provides a very controlled environment in which the GM can structure the adventure. The number of NPCs is fixed and, if there are not too many, they can all be enumerated and described to whatever level of detail is required. This eliminates the possibility that the adventurers will travel to an unexpected location and encounter people for whom no background or statistics can have been prepared.

Of course, many GMs are comfortable with running partially improvised adventures, rattling off a convincing string of personal details for every shop assistant in any department store the heroes may decide to enter on a whim, but not all of us are so blessed. Restricting the environment and the number of possible encounters means the GM can maintain a greater level of pre-prepared detail. This is especially important in genres which benefit from atmosphere and easy suspension of disbelief, such as horror or anything which deeply explores character motivations and emotions.

Isolated Adventure Themes

There are several adventure themes which are particularly suited to the isolated location setting. Murder mysteries are a classic example. Suspense is easily built when a group of people are trapped in close proximity with no escape and the murder victims start piling up. The old country mansion cut off from civilization by a raging storm comes to mind, as does the Orient Express.

Avoiding a disaster is another suitable theme. The disaster can either be caused by chance, such as a fire or an attack by wildlife, or by a human agency, such as a terrorist bomb which needs to be found and neutralized. The villains hijacking the vehicle in which the heroes are travelling is probably the most familiar example of this theme, with the vehicle itself serving as the restricted location. This is a high action theme, especially compared to the more cerebral murder mystery.

Escaping from the location provides a third possible theme. In this case the location is either a prison of some sort or a place which is about to become dangerous in some way. The prison need not be literal -- a group of shipwreck survivors on a deserted island naturally wish to escape from their isolation. Escaping can overlap with avoiding disaster: Perhaps a way to overcome the hijackers is to land the plane and get off -- though this will certainly be a task requiring skill and daring.

A theme less often explored by roleplayers, but which is useful for the restricted location, is romance. Romance worthy of a roleplaying adventure often instigates strong personal conflicts, and such conflicts are naturally magnified when they occur in the pressure-cooker environment of enforced proximity. Imagine *Romeo and Juliet* playing out in a tiny mountain village, or a snowbound apartment building, rather than the vastness of Verona. The film *Titanic*, although perhaps not to everyone's cinematic tastes, is a powerful example of how romance and interpersonal conflicts provide drama in an isolated setting. (It also segues neatly into avoiding disaster and escaping the doomed location.)

Isolated on a Vehicle

As can be seen from the sample themes, a common isolated location is the confines of a vehicle. Commercial passenger vehicles are ideal, since they provide a number of NPCs to use as allies and enemies, including some measure of "law" (the vehicle crew) which may either be subverted, eliminated, or appealed to for help. If the characters own a vehicle of their own, it can be used for disaster plots with mechanical malfunctions, stowaways, or environmental damage.

Airplanes and passenger ships come to mind immediately as vehicles in which adventures can take place. Science fiction adds spaceships. The film **Alien** is an archetypal example of how a fairly simple plot is made to feel intensely claustrophobic and suspenseful by the isolation of the characters and their restricted mobility.

More exotic vehicles present interesting adventuring environments by virtue of being unfamiliar to most people. Airships are popular, but also consider vessels not usually associated with carrying passengers, such as merchant ships (low-tech or modern), cargo planes, or hot air balloons. Military vessels provide another source of ready-made adventure locations, particularly if the heroes aren't supposed to be on board. Submarines are especially useful.

Isolation by Circumstance

A different way to constrain characters is to place them in a situation in which only they cannot move freely. NPCs may be able to come and go at will, but something inhibits this same freedom for the heroes. Sometimes this doesn't make much difference to them, but often the fact that they are restricted while other folks are not is a source of frustration. Overcoming this frustration can be a motivation which drives the adventure naturally.

Isolated by Regulations

The law can be a bummer for anyone who manages to get entangled in it, even on the right side. The cops might not be able to chase the crooks over state or national borders. The sheriff might order the group of wandering gunslingers not to leave town while he tries to sort out whatever shooting mess has occurred.

If the characters might be able to deliver a greater justice by breaking some regulations, should they do it? This is one of the classic sources of conflict in fiction, both internal and external. The moral dilemmas are often obvious, but the solutions far from it, and whatever course of action the heroes take they may get chewed out by their boss, fired, arrested, killed, or destroyed along with the rest of the world.

Not all regulations are imposed by law. In many games characters get hurt. Yet not many GMs use the opportunity to advance the plot by playing out time spent in hospital. Our hero is sleeping off a dose of morphine when he wakes to see the evil Dr Claw standing in the room. "That was just a warning. Nobody crosses Dr Claw!" Claw exits calmly, leaving the hero struggling to his feet and trying to convince the nurse in the corridor he's not hysterical and to block all hospital exits and no, he doesn't want to go back to his bed, damnit!

The other great source of regulations is parents, but games in which the players take the roles of minors are rare. Besides, these are the sort of regulations which are bound to be broken anyway -- would you rather play Ferris Bueller or Richie Cunningham? Creative GMs may however find some use for parental restrictions, probably in humorous games. One possibility is a *Toon* game using the Toony Tyke Adventures setting from the *Tooniversal Tour Guide*.

Academic institutions also have regulations. University students are viable characters in games ranging from *GURPS IOU* to *Call of Cthulhu*. The *Harry Potter* novels by J. K. Rowling provide plenty of inspiration for a fantasy campaign based on boarding school students, who must continually battle against school rules in order to go where they shouldn't and solve mysteries under the noses of the adults.

Isolated by Chance

This is really a catch-all category covering any other method of keeping characters in one location. The airport lounge mentioned in the opening sentence of this article is an example. The heroes could leave the airport if they really wanted to, but they need to catch their flight so can't go far without things becoming inconvenient. With an adventure in an airport, say a terrorist attack or runway hostage drama, there probably isn't much reason to leave anyway (assuming they want to do something about it and not just go home where it's nice and safe, like normal people).

Sometimes characters just get unlucky. (Okay, all the time . . .) Their car breaks down in the storm and they seek shelter at the creepy looking house on the hill. Night falls before they make it out of the Daunting Forest. The elevators stop working and someone accidentally dumped a load of concrete behind the fire door. These are really methods of creating an isolated situation. Once the situation is established it becomes like any other, except the adventurers can shake their heads and say, "If only such and such had never happened . . ."

A chance isolation can be a good way to increase tension suddenly in a game. Things were going well for Chekov, draining gamma rays from the nuclear power plant on a US aircraft carrier in *Star Trek IV*, until Scotty's transporter failed. Mechanical failures and vehicle crashes are typical methods of unexpectedly isolating characters. Low tech traps work just as well: The heavy portcullis blocking the only known dungeon exit dramatically heightens the need to explore.

Using Isolated Locations

The isolated adventure location can serve in several capacities, from an entire campaign setting, to a short scene within a longer adventure. The general rule is: The more plot time expected, the larger the location needs to be.

The Isolated Campaign

As a campaign, the isolated location becomes one of the main features of the game world. An example would be a campaign set on board a spaceship, making a long journey between worlds, or on a small island without sea travel capability.

In this extreme, the location usually needs to be large to provide realism and enough opportunity for adventure, with many NPCs, although this is not always necessary. The BBC TV show *Red Dwarf* provides an example in which the heroes are the only characters on an immense spaceship, and many adventures take place within its confines. (Some of the episodes involve external excursions, but a good number rely only on internal character interaction.)

Entire campaigns can be built either within the bounds of a restricted setting, such as West End Games' *Paranoia*, set in the computer-controlled confinement of Alpha Complex, or with the goal of escaping the setting, such as in the TV show *The Prisoner*. Further examples of such prison-like campaigns and how to use them can be found in the *Pyramid* article "[Weird Prisons](#)".

The Isolated Adventure

In the middle ground, a restricted location makes a good adventure episode within a longer campaign. Normally the adventurers are mobile and can travel as freely as anyone else, but for some reason they are confined for a period of time. They might be thrown into the microcosm of a prison, where they must make friends, accumulate equipment, and plan and execute their escape.

In ultra-tech campaigns the heroes may be confined by a trip up or down a "beanstalk" -- a long cable connecting a planet to an orbital station. The distance involved is great enough that such a trip usually take a few days, during which the protagonists are stuck in a vehicle hurtling along a thick cable with their fellow passengers, stewards, and whatever operations crew are required.

The classic fantasy dungeon adventure is a good example of both the advantages and problems inherent in isolated adventures. Dungeons can be mapped and cataloged, room by room, so there are few surprises for the prepared GM. The characters can explore at will within the confines of the dungeon, giving them a sense of free choice, and the GM always knows what is around the next corner. Many of the early published dungeon adventures were however unrealistic in that rooms full of monsters existed in a stasis without regard to food (or hygiene) until the heroes blundered into them. Things have thankfully improved and any dungeon-building GM should take heed of such things.

The isolated adventure episode can be used in almost any campaign. If the players are used to being able to travel anywhere they like it can make an interesting change of style. Their characters will have to deal with the restrictions of their location by thinking in different ways and perhaps applying little-used skills. Any game in which the heroes travel long distances can use an adventure within the confines of their vehicle, or in the isolation of the wilderness, to break up a journey or to provide some detail when the travel itself might otherwise be glossed over. Any building, from a castle to an office block, might provide a setting for an entire evening's roleplaying.

The Isolated Scene

At the smallest scale, a confined location can be used to add drama and immediacy to an otherwise mundane scene. When James Bond fought Peter Franks in the movie version of *Diamonds are Forever*, what might have been just another fight scene was made into the most memorable sequence of the film by the fact that they were stuck in a cramped elevator at the time.

Confining your characters to a small space makes them edgy about being attacked or trapped, by cutting off any obvious escape routes. Most individual scenes in an adventure already take place in a finite location, so an even tighter restriction is required to enforce this feeling of confinement. Think of the trash compactor scene from *Star Wars*, or Indiana Jones racing to beat yet another inexorably closing stone door.

Many scenes can be placed in tight settings to increase drama. Imagine a group of characters in a jeep trying to outrun a pack of velociraptors in some anachronistic theme park. Now imagine this happening in the park's underground service tunnels. A plethora of claustrophobic locations can be utilized to spice up scenes in this way: Sewers, bank vaults, elevators, caves, corridors, cable-car cars, crowded shopping malls, castle towers.

Be careful not to use this device too much however. If every scene is played out in the confines of a Ferris wheel cabin or 747 cockpit, things can get cramped and tiring. Some especially dramatic types may enjoy it though!

Using Isolation

A recipe for building an adventure might start with the idea of using an isolated location, either for a change of pace in a free-wheeling campaign, or as a dramatic scene within a greater story. The type of campaign will dictate which locations are suitable. Once an interesting location is chosen, the reason for being confined in it must be decided. This, and plot considerations will determine what NPCs are required. The location might be mapped out and the NPCs detailed, complete with their motivations and actions. This step can take some time, depending on how big the location is and how detailed you like to make your GM's notes. All that is then required is getting everyone to show up on gaming night!

Herge never followed through with his plan for that airport lounge adventure -- unfortunately, he did not finish another book before he died. Perhaps if we take his idea of a microcosm which contains all the essential elements of a good story and develop it in various directions, we can gain inspirations for adventure locations, themes, and plots.

Ragnarok! Tales of the Norse Gods (for d20)

Published by [Avalanche Press LTD](#)

Written by William Sariego

Illustrated by Lorenzo Sperlonga & Peggy Gordon

48 pages; \$12.95

The Vikings or the Norsemen have proved a rich vein from which to tap as a source for various RPGs and supplements. These include sourcebooks for systems as diverse as *GURPS*, *AD&D*, *RoleMaster* and third edition *RuneQuest*, plus games such as Atlas Games' recent "smash-tastic" *Rune RPG*. The all-new, all-modern *d20* phenomenon has not ignored the Vikings either, with them being the subject for Avalanche Press' second release, *Greenland Saga - The Lost Norse Colony*. This, like their first release, *The Last Days of Constantinople*, was a historically based adventure, but while they return to the subject of Vikings for their third book, Avalanche Press have written something a little different.

Ragnarok! Tales of the Norse Gods is not just historically based, but rather a campaign sourcebook upon the historical myths of the Vikings. What it offers is not a game in which our players take on the roles of Viking warriors -- though they can -- but instead provides a framework in which the players become Norse gods themselves.

The first thing that strikes you about *Ragnarok!* is its cover. Indeed, this cover recently won a "Buzzie," or a 2001 RPGnet Award for the most gratuitous cover. Take another look; that cover *is* gratuitous . . . there were hopes that the days of the chainmail bikini and cheesecake had died with 1st Edition, if not 2nd Edition *AD&D*. Not so, because here Avalanche Press revives the tradition, but with strips of leather instead of chainmail.

Like the previous releases from Avalanche Press, this book is light on art and heavy on text. The layout is organized in a perfunctory manner, with just a single box of text that has wandered into the adjacent column. There is a lot of boxed text, with any falling under the Open Gaming License being marked with different pattern on the box's border.

As the title suggests, *Ragnarok! Tales of the Norse God* has as its subject matter, the "Doom of the Gods" foreseen by Odin in a vision. Though he does not fully understand what he saw, he knows that it spells the end of both the Aesir and the Vanir. Eventually Loki's jealousy of his nephew, Balder, will drive him to murder the brightest of all the gods, and this will allow order to slip away as the forces of chaos strike at Midgard. Yet Odin counsels that these events have yet to pass and may not yet do so at all! All that the gods can do is prevent the onset of Ragnarok . . . and this is where the players come in.

In *Ragnarok! Tales of the Norse Gods* the players take on the roles of Lesser Gods, whose worship has passed out of legend and been lost . . . actually immortal high-level D&D characters that each serve one of the Greater Gods in the Norse pantheon. In addition, they can also play ordinary mortal Viking warriors, and on occasion, the Greater Gods as well. Adventures take the form of quests, which if successfully completed can help forestall Ragnarok.

A player's choice of Greater God determines much about a Lesser God -- particularly their class and starting levels, as well as their favored attribute. Thus if Uller was chosen as a Greater God, a Lesser God could be a ranger of not more than 14th level as Uller is himself 15th level. Likewise, a Lesser God of Frey could not be more than an 11th level fighter and a 6th level sorcerer. The only Greater God that cannot be chosen is Odin, who remains the province of the "High Skald" as the GM is termed here. Lesser Gods gain attributes of not less than twenty, enhanced hit points,

damage reduction, spell resistance, the ability to travel between the Nine Worlds and cast Runes (a new form of magic particular to Norse myth), limited immortality and Divinity Points (the equivalent of luck or hero points in **Ragnarok!**) In addition, each Lesser God possesses a single magical item particular to them, in what is a low-level magical setting. Lesser Gods are invariably male and of the human -- or rather "divine" -- race, nor can they be of evil alignment. [*Editor's note: actually, the rules state that no party may be composed of more females than males.*] This combines with all of the feats and skills granted from creating a normal character up to the agreed level, to make each Lesser God very tough indeed. Perhaps a munchkin's dream? . . .

Should ordinary, mere mortal heroes be required from among the Lesser Gods, all **D&D** races are available, except the Half-Orc, which are renamed the Trollborn, and the gnome and halfling, which are unavailable. Any class can be selected, except for the martial artist monk, which would be anachronistic, and the paladin, as this class is restricted to the god Balder only. Together with the choice of Greater God and their Lesser God, a player's mortal hero slips into what is known as their Divine Portfolio.

There are several new feats and skills in **Ragnarok! Tales of the Norse God**. These include the feats of Weapon Catching (upon the edge of the shield, no less) and Weapon Expertise: Hurl Spear. The new skills are Charioteering, Hurl Axe, and the all important skill of Runecraft. This allows Lesser Gods to use Norse Rune magic, the knowledge of which was originally won by Odin and is used by all of the gods to shape the universe. Lesser Gods begin the campaign with knowledge of one of the runes known by their Greater counterpart per character level, out of the twenty-four available. Each Rune has both a beneficial and a baneful effect. For example, the "Elloh" or defense rune can increase a target's Armor Class by two or reduce it by two.

A **Ragnarok** campaign takes place across the Nine Worlds, but mainly on Midgard itself. This is made up of five kingdoms roughly analogous to the Viking view of Europe. The Northern Kingdom equates to Scandinavia, the Western Kingdom to France, the Eastern to Russia, and so on. In addition there are several islands to the west that are dominated by the druids. Each kingdom, as well as the other eight worlds, is given a good description, with a focus upon the major inhabitants and military forces. Religion plays an important role in a **Ragnarok!** campaign as the Southern Kingdom is very forthright in proselytizing its own monotheistic faith that holds Odin to be the All-Father and does not accept any other gods except his junior partner, Frigga and their son Balder.

A default campaign, "Wolf Time," is provided to get the High Skald started. A variety of adventure types are discussed, with the advice that the dungeon-type is highly inappropriate to the setting. Four Quest Seeds are outlined, with one suitable each for mortal heroes and Greater Gods, the other two designed for use with Lesser Gods. The players begin the game with three Fate Points, which indicate how close the Nine Worlds are to the onset of Ragnarok. Should this score reach zero, then the end time has come . . . The players are thus attempting to raise the number of Fate Points through the completion of quests, but can also lose them through failure to complete them or even through the death of a god. There are rewards to be as the number of points rise, but Ragnarok! Tales of the Norse God is a fatalistic game and the Doom of the Gods cannot be forestalled forever.

Written by a noted authority upon the Norse sagas and religion, **Ragnarok! Tales of the Norse God** is an interesting approach to running a **d20** campaign. It approaches the style of troupe play, and an interesting option might be to have players control characters in different Divine Portfolios, rather than have characters all from the same one. Except for Odin, no Greater God is given full **d20** statistics, and it is suggested that both the referee and players decided upon the particulars for each one. Of course, long time gamers might like to consult their copies of the **Deities & Demigods** or **Legends & Lore** supplements for their statistics under previous editions of **AD&D**. Likewise any of the Viking supplements listed above should prove useful to the referee.

Ragnarok! Tales of the Norse God is perhaps the most interesting and useable sourcebook to be released by Avalanche Press to date. It should provide the referee looking to get something more out of the **d20** System with somewhere to start a campaign, whereas their previous scenarios were rather limited in the long term. Likewise, there is no reason -- except for the mechanics and statistics -- that a GM of the **Rune RPG** could not also use this book as a campaign framework.

Target: Awakened Lands (for Shadowrun)

Published by FanPro

Written by Rob Boyle, Martin Gotthard, Eleanor Holmes, Steve Kenson and Shane Winzar

128 pages; \$18

God, those FanPro guys are sneaky. Sneaky, sneaky, sneaky.

Picture this terrifying, yet real-life, scenario. FanPro tells you "we're gonna release a sourcebook for *Shadowrun* with all these cool magically active places!" And you go "woot!" Why, I don't know. It's a strange sound, to be honest, but there you go. "Woot!"

So, you stroll down to your Friendly Local Game Store and pick up *Target: Awakened Lands*.

You go home, uncork some Dew De Montagne '01, and begin to peruse.

But wait! This isn't a sourcebook on magically awaked places! Okay, it kind of is, but Not All of It! No, this is a sourcebook on that most strange and exotic of locations: Australia!

Okay, so it isn't bad that they've finally done a sourcebook for Australia in *Shadowrun*. It's a nice place (when it isn't on fire, mind you). They've contributed so much to international culture (Midnight Oil, Nicole Kidman, Russell Crowe, and at least three *Crocodile Dundee* films) and they have a great wilderness that's almost as lethal as Canada's ("almost" by dint of it's mostly warmer).

And they have gotten a lot of short-sticking by many game companies. Since I'm not from there, I can't say there's anything wrong with an Australia sourcebook. But I would hare preferred they say that on the cover. (Okay, so they have an illustration of an Aboriginal and a Koala on the cover, and the back says "Welcome to Australia." So technically it *is* on the cover. It's just not in the title. Ah, heck. I just like to kvetch.)

In fact, after reading the book, my only real complaint is it tries to do a tetch too much, and ends up doing not enough.

The Australia info is done in standard *Shadowrun* format. There's IC info, with IC debate on it. It gives us the SOTU on Australia and New Zealand in 2061 (the two states merged in 2022, forming ANZAC). Of course, there's shockingly little info on NZ in the SB, as it seems to focus mostly on mainland Australia.

The book opens with a short section on the Manascape of the *Shadowrun* universe, with descriptions of Mana storms, Mana Ebbs and Flares, and a variety of astral phenomena.

Australia in the *Shadowrun* universe is being wracked with Mana storms, huge expressions of magical energy that wreak havoc across the terrain. I don't know how much of this was covered in the main *Shadowrun* rules (What's it say in my copy? That's a good question. If I could get it back, I'd tell you), but I'm going to assume this was mentioned as a fact of life for the Aussies. Mostly, they rumble across the outback, wreaking havoc in the inner part of the country, leaving the coastal cities alone. Except, of course, Sydney, which has a huge Mana Storm parked over it.

The info on Australia is pretty good, although fairly brief. You get a sense of each city (I like Brisbane, a town that

sounds a lot like *Cheers*, with Everyone Knowing your Name), but I think more info could have been had on the various job opportunities for Shadow runners to be found in each metropolis. It seems as if the assumption is that most of the work will be in the interior, which is where a lot of words are spent.

[SPOILER ALERT]

Sydney is given a decent going over. The Sydney Harbour Bridge was shattered, and has been squatted on, much like San Francisco in Gibson's *All Tomorrow's Parties*. I loved that fictional setting, and it's great that we can now play somewhere very similar in *Shadowrun*.

The various crime concerns that make Australia their home (gotta love a country where the Ethnic mob is Greek, eh?) are described. There's the standard Mafia, Yakuza, Triads and Tongs. There are also outback crawling biker gangs, if you're getting nostalgic for the time when Mel Gibson didn't want to be taken so dang seriously.

There's stuff aplenty on the outback. The Aborigines and their magical traditions are discussed in a pair of articles. I don't know how authentic it is, but it certainly reads well. The magical traditions of the Aborigines are described in *Shadowrun* terminology; since they use Totems quite strongly, naturally they follow a shamanic tradition.

The aboriginal shamanic tradition is discussed. There are discussions of the songlines they use to travel the outback, the use of blood and animal bits in their craft, the dreamtime, and their totems.

The magicscape of the outback is looked at, discussing the temper of the local spirits. The various magical phenomena of the outback are also discussed, from the seeming constant mana storms to the Alchera, which seem to be magical oases that drift in and out of existence.

Another good section is the various paranimals that inhabit the outback. My favorite? Well, since they don't include the ghost of a naturalist, ripped apart by crocodiles, I'll have to go for a Drop Bear, which is a carnivorous Koala infected with Human Metahuman Vampiric Virus. A vampire Koala. Funny, yet terrifying, although for some reason it still requires eucalyptus. There are also magically active Dingoes, who won't attack adults, but will come into inhabited places and steal unattended children. If you're not careful, dingoes will Eat Your Baby. So you gotta be careful.

The various magical places, including the Great Barrier Reef (which has the world's largest Merrow civilization inhabiting it), Ayers Rock, and Kakadu rainforest, among others. There's also info on the magical threats in Australia, including secret societies, toxic shamans, and bug hives.

Bug hives are shelters from the mana storms, so one can only imagine the dramatic possibilities inherent in seeking safe haven from a storm in a hive; to mix metaphors, any harbor in a storm may be leaping from the frying pan into the fire.

The book also contains a short tour of other magically active places in the world of Shadowrun. You get a quick rundown on Mt. Kilimanjaro, Egypt (finally), Chicago (post Bug City), the Nazca lines in Peru, and Dunvegan Castle (the home of Clan Mcleod, and the resting place of its fabled Clan Banner) in the Sixth World. Each of these places has a certain amount of interesting stuff going on. They get a certain amount of short shrift by being appended to the main body of the book.

Following that, all the neat stuff talked about in the previous section of the book is given stats; it's fairly thorough, although we don't get game explanations for everything.

[END SPOILER ALERT]

The only quibble I have with the book (since I'm not a psychic Australian, and hence cannot say "that's not what Australia will be like in 61 years if magic returns!") is that it seems as if two good ideas ("Australia" and "Awakened Places") were jammed into one. The book could have easily added another 64 pages or so to its length, or have been cleft in twain, with an Australia book and a proper *Target: Awakened Lands*.

The information given is good, mind you. If you want to run a game set in Australia, this is a great place to start (provided you don't mind jumping to Fodors shortly afterwards). If you just want info on strange magic happenings and the assorted magical places, it won't be quite as sparkling a buy for you.

De Profundis

Published by [Hogshead Publishing](#)

Written by Michal Oracz

Translated from Polish by Maja Apollonia Pica

Cover Artwork by Dennis Detwiler

32 pages; \$6.95

De Profundis, subtitled "Letters from the Abyss," is part of Hogshead Publishing's "New Style" line of roleplaying and storytelling games. Like its companions in the series, *De Profundis* proposes a unique new way to explore the boundaries of the roleplaying hobby and to create fascinating stories. Unlike a few of its forebears of the New Style, it also makes for truly fun gaming.

The goal of *De Profundis* is to replicate the horror stories of H.P. Lovecraft through a style of roleplaying the author calls "psychodrama." Psychodrama, in this context, is a fancy word for storytelling without rules and without a gamemaster. While the book gives rules for plain psychodrama (simply -- taking turns in a dark room cooperatively narrating a story in which you play yourself), the heart of *De Profundis* employs "correspondence psychodrama" as its primary format. Translation: *De Profundis* is played out in letters -- hand-written and in-character -- shared between two participants and posted through the regular mail.

Correspondence psychodrama is rules-free and GM-less, but this doesn't mean it is entirely without strictures or focus. What *De Profundis* does is exchange rules for the epistolary format, which brings with it some significant restrictions and qualifiers. Coupled with the requirements of the Lovecraftian genre, letter-writing in *De Profundis* has as sturdy of a framework as any comparable game. The by-product of this framework is a series of evocative, deeply introspective compositions telling a story whose path and conclusion -- like the tales of Lovecraft's narrators -- could never be foreseen by the storytellers themselves.

It is an ingenious concept for roleplaying that's probably been done before, but never turned into a full game in itself. It is also uniquely suited to the horror genre and the Lovecraftian setting specifically. Those who thoughtfully enjoy both Lovecraft's stories and the *Call of Cthulhu RPG* will recognize that the action-oriented play of *Call of Cthulhu* often feels dissimilar to the atmospheric, internally focused monologues of Lovecraft's prose. Such monologues, as *De Profundis* astutely points out, are particularly capable of expressing the metaphysical and psychological horror of the Mythos as well as the gradual disintegration of the psyche that encounters it. Compared with the summary of a *Call of Cthulhu* campaign, a *De Profundis* plotline would probably more resemble in tone, scope, and pacing an actual Lovecraft story. Even more compelling is the fact that playing *De Profundis* leaves you with all the contents of the game in concrete form (you save all the letters, of course), so that you basically have a Lovecraftian short story, in toto, when you're done.

The book's text *is*, itself, a Lovecraftian short story . . . though it's perhaps more precise to call it the result of a fictional session of *De Profundis*. The entire contents are written as letters from the game's author to an unknown addressee. The letters detail the discovery of *De Profundis* -- the game itself -- in the authorial narrator's dreamscape and go on to expound upon the mechanics as a way of bringing the game out of its ethereal trappings and into the world for people to play. The effects on the narrator of grappling with the game and its Mythos-touched source are

mixed in with a more straightforward explanation of exactly how to play. It's similar to the color fiction presented in many recent RPGs except, that it is somehow both interspersed liberally among the game material and also surprisingly unobtrusive. If nothing else, it is competently written in an atmospheric style more-than-reminiscent of Lovecraft's. And considering that *De Profundis* was originally written in Polish and then translated to English by Hogshead, I'm tempted to call it the best game fiction I've had the pleasure of reading.

There's an even more pleasant surprise to be found in *De Profundis*, however, and that is how remarkably practical and helpful it is in terms of actually running a De Profundis campaign. Considering that it is a 32-page, rules-free, non-conventional roleplaying game translated from Polish and written entirely in-character as real-life correspondence, it is stupendously playable. And it's not playable despite these factors; it's arguably more playable because of them. The text is not only interesting fiction coupled with an explanation of game mechanics, it is also an example of play!

Far more than that, the topics covered in the text are full of eminently practical advice for playing De Profundis. They address how to write in a Lovecraftian style; how to keep correspondence between two players from turning into two disassociated plotlines; how to integrate *De Profundis* into a *Call of Cthulhu* campaign; how to maintain a suspension of disbelief for all players; and even how to use expressive handwriting for emotive effect. *De Profundis* outlines the fundamental differences in engaging in a letter-writing campaign set in the 1920s and one set in 2002. It gives tips for playing yourself, a *Call of Cthulhu*-style investigator, or a protagonist - even antagonist -- straight from one of Lovecraft's works.

What this all boils down to is that *De Profundis* is a New Style game that wants to be played, not just read. Like another New Style game, *The Adventures of Baron Munchausen*, all De Profundis requires is an open mind about what constitutes roleplaying and a willingness to immerse yourself in the game's requisite style.

There is another way *De Profundis* compares to the other New Style games that deserves mention. Warnings sprinkled on the game's cover and title page declare that *De Profundis* is only for "mentally stable adults." Arguably, this is true of any RPG, but when *De Profundis* stands next to New Style games like *Power Kill and Violence*, one starts to see a trend in Hogshead's direction with the series. Still, the disclaimer seems more like marketing (and maybe a touch of liability avoidance) than a true warning. For one thing, unlike *Power Kill and Violence*, De Profundis is meant to be played and played safely.

Still, there may be good reason for the warning, since *De Profundis* does spend the last eighth of its pages taking the basic concept a step or two further than it necessarily needed to. The last two chapters, entitled "Phantasmagoria" and "The Hermitage," go from logical extension of basic play to mechanically nonsensical, albeit fictionally interesting, near-psychosis. Since a little more than half of the game's rules for correspondence psychodrama involve playing yourself -- today, and in real time -- and also call for a tone of internal struggle and self-transformation, "Phantasmagoria" postulates a reasonable corollary to this style of play. It is called "field psychodrama." Really what it constitutes is a practice that a modern day *De Profundis* campaign requires: looking at the world around you with an eye towards what horrible Lovecraftian things might be seething beneath the surface and letting your imagination extrapolate your observations into fodder for letter-writing. Sure, calling this a "state of controlled paranoia, or schizophrenia" is a bit inflammatory while maybe even being accurate. But what is really being described is something roleplayers do as a matter of course (and Kenneth Hite does with obsessive zeal), not something dangerous to a normal mind.

In keeping with the fictional concept behind the book, field psychodrama is explained in parallel to the author/narrator's own mental decline. But it really doesn't go too far -- at least, not far enough to warrant Hogshead's melodramatic disclaimers. Arguably, "The Hermitage" does cross a line by showing a player of the game (the narrator) who has failed to maintain a distinction between fiction and reality. Still, it's mainly attributable to the premise of the book's story, not to any probable extension of the game's mechanics in real life, no matter how much they push toward meta-game considerations. In the earlier chapters of *De Profundis*, the narrator talks about how to approach the critical denouement of a campaign: "a clever reader should be able to detect a change in the correspondent, detect that something is wrong, from their handwriting, choice of words, various nuances." In keeping with the idea that the game's text is also an example of play, "The Hermitage" is really just an illustration of this segment of gameplay. As such, it is really harmless fiction with no conceivable lessons to the player, regardless of Hogshead's implications,

about how to possibly use roleplaying games to achieve psychosis.

More than any Hogshead release since *Baron Munchausen, De Profundis* succeeds in what the publisher declares is the purpose of the New Style line: to be "innovative, genre-defying narrative games." While *Power Kill and Violence* are more cynical (though perhaps educational) thought-experiments, *De Profundis* -- with its impressively clear and practical content -- manages to be what Hogshead purports it to be: a game. Yes, it's a game that plays unlike any other. Yes, it's a game with a theoretically interesting lack of boundaries. But in the end, what's important is that it's a game, both playable and fun. It evokes the spirit and style of H.P. Lovecraft with unrivaled ingenuity and gives gamers a new format in which to explore their hobby. Not bad for 32 pages.

--*Christopher Patrick Floyd*

The Unexplored of the Rings

"IN ORBIT WITHIN THE RINGS OF SATURN, WE SEE A BLACK, MILE LONG, GEOMETRICALLY PERFECT RECTANGLE, THE SAME PROPORTIONS AS THE BLACK ARTIFACT EXCAVATED ON THE MOON.

For two million years, it had circled Saturn, awaiting a moment of destiny that might never come. In its making, the moon had been shattered and around the central world, the debris of its creation orbited yet -- the glory and the enigma of the solar system."

-- Effects note and closing narration, *2001: A Space Odyssey* (1965 screenplay)

In a scientific universe, wonder must have a scientific gloss, if not necessarily a scientific content. The dragons and gods of the ancients must reshape themselves, as spaceships and wavefronts and energy fields. And, like the dragons of the old age, who were confidently placed only in the blank corners of the map, our pseudo-scientific monsters also live far away from us -- hundreds of millions of miles away, ideally. If we travel far enough, and the data are murky enough, we can still see the Beast Leviathan, churning up an electromagnetic wake in the rings of Saturn.

"A second close-up of Saturn containing suprisingly important information . . . reveals salient features of an operational electromagnetic vehicle. A component is identifiable readily as the nose orifice. Extending from below the orifice is a long, tightly twisted tongue. The top longitudinal-profile body element is perceptible for a short distance aft of the nose. Location of the bottom longitudinal-profile body element is obscured inasmuch as a solid band of under-body emissions, exhausts where this element otherwise would appear. The distance between these two locations establishes an approximate body diameter, and permits estimation of trailing-end location. When a 13 to 1 fineness ratio is used for length estimation, the trailing-end lies just beyond the furthest aft body-attached streamer. Back at the nose a bi-lateral projection can be identified extending on each side. Branch streamers rise from this projection and flow centrally to form a large-overhead annulus. Secondary streamers flow into this annulus from in- and out-board of the body. . . . The electromagnetic character of these phenomena is affirmed by presence of nodules, on streamers just aft of the annulus. These nodules, being visual properties of pinched plasmas, are indicative of electromagnetic interactions."

-- Norman Bergrun, *The Ringmakers of Saturn* (1996)

Well, maybe *we* can't. But NACA and later Lockheed aerodynamicist Norman Bergrun sure can. Starting in 1980, with the Voyager 1 photographs of Saturn's rings, Bergrun began examining NASA imagery with what can only be described as fanatical attention. He was struck (as many NASA scientists were) by the incredible intricacy and detail of the rings, and believed that he saw major changes and bodies appear and disappear in shots taken five minutes apart. He began using microscopes to enlarge the photographs to (or even beyond) the limits of the imaging optics, and then combing through, and refining, the resulting shots with computer software and other optical tools. He spotted anomalous blobs of light, often on the edges of the ring photos, and detected other ellipses and spindles in the rings where conventional wisdom saw nothing. Bergrun even began to determine that some of the rings were "unfinished," not completing a full orbit of the planet yet, or were too narrow to be accounted for by standard orbital dynamics. Finally, in 1996, he announced his discoveries to the world in the book *Ringmakers of Saturn*. Enormous EMV (electromagnetic vehicle) alien spacecraft -- some of them longer than three Earth diameters -- were producing Saturn's rings, most likely as "exhaust" from their mining or monitoring orbits around that planet. Others ("only" fifteen or so miles long) were flitting around Saturn's moons; still others had landed on our own Moon, where they made all manner of new, exciting [shadow anomalies](#) of their own.

"The specialist did try to talk me down. He said that on plate five, the picture had been 'cut off', and that's why I couldn't trace the ring."

-- Norman Bergrun, *Fortean Times* interview (2000)

In actual likelihood, sadly, Bergrun's EMVs are a combination of light smear at the edges of the photos, optical shadows and other tricks of the camera and eye, or artifacts of his almost comically intense and arcane magnification and enhancement processes. In matters like this, you can also always count on good old pareidolia, the same neurological quirk that finds faces on Mars or Jesus in a tortilla. His spotting efforts aren't made any easier by the

EMVs' "tendency to hide," as he puts it, although in one interview he has seemed optimistic about the possibility of reshooting the rings with [Kirlian photography](#). Enthusiasts have been strangely loath to embrace Bergrun's Ringmaker EMVs, possibly because Saturn is a little too far, and possibly because pyramids on Mars are just sexier. One does occasionally get mysterious government sources like "Sherman" admitting to U.S. government knowledge of a "massive alien relay station" around Saturn, and British remote viewer Angela Thompson has spied on the "mining operations" of the Ringmaker EMVs for the Defense Intelligence Agency, but largely even the Men In Black seem to leave Saturn to its own devices.

"Even more amazing, in my opinion, is that Galileo, while he was able to resolve the slight phase of Mars, was unable to resolve the major ring around Saturn. Mars is a difficult object in a small telescope, while Saturn is easily resolved as a ringed planet in even a 40-mm spotting scope at 30X. Why did the rings of Saturn elude Galileo, while the more difficult Martian phases did not? Perhaps at the time of Galileo the rings of Saturn were much more difficult to observe than they are today."

-- Geophysicist Karl Fabian, September 9, 1988

This is kind of a shame, because Saturn (considered correctly) is quite the happening place for High Weirdness. In 1789, William Herschel tracked any number of anomalous lights around Saturn while discovering Mimas and Enceladus (two inner moons of the planet), and finally decided they must be intense fires, since they could be nothing else. Astronomers have tracked Saturn's Great White Spot for centuries, generally assuming it to be a large atmospheric storm like Jupiter's Great Red Spot -- but there have been a disturbing number of White Spot sightings in the rings rather than on the planet, and even more of the White Spot moving against the planet's rotation! Saturn emits one and three quarters the energy that the Sun radiates to it; physicists assume there is some kind of spontaneous gravitic helium fusion in the planet's atmosphere accounting for the effect -- but it might be EMV power grids. (Those power grids may work through [sacred geometry](#) based on Saturn's anomalous hexagonal cloud "hole" at the planet's north pole.) Over and above the increasingly tangled and convoluted rings, Saturn's moons are a real handful as well. Titan's elliptical orbit should be impossible, given its surface heat and tides from Saturn's gravity -- unless Titan was "built" within the last few million years. Many of Saturn's moons show only one "umbilical" crater, looking for all the world like the neck of a balloon; did Someone "blow up" a bunch of hollow moons for Saturn, perhaps as EMV hangars? The moon Dione has even shown clouds, of all things, despite being far too small and cold for such hijinks.

"I have a note upon a determined luminosity that was bent upon Saturn, as its objective. . . . [A] correspondent writes that, upon July 13, 1896, he saw, through his telescope, from 10 until after 11:15 p.m., after which the planet was too near to the horizon for good seeing, a luminous object moving near Saturn. He saw it pass several stars. 'It was certainly going toward Saturn at a good rate.' There may be swifts of the sky that can board planets."

-- Charles Fort, *New Lands*

Searching the relevant documents, one also sees a few significant conjunctions with Saturn in the UFOlogical sphere. Fort cites a luminous UFO sighting near Saturn in 1896 (the year of the [Great Airship Mystery](#), I'll point out). In 1975, Soviet astronomer Sergei Bozhich announced that, based on Soviet space tracking data, most UFOs leaving Earth (or leaving Russia, at least) headed for Saturn, where they likely therefore had a base. Oddly fascist-inflected contactee George Adamski was taken to Saturn by his "Nordic" alien friends (to meet with President Kennedy, as it turned out), which resonates eerily with the two humanoid aliens from Saturn who telepathically spoke in "High German" to contactee Reinhold Schmidt in 1957. Have the [Antarctic Space Nazis](#) branched out into the icy Saturnian system? Beginning and ending with Fort for proper circularity, the gigantic EMVs recall Fort's beloved [Monstrator](#), a "super-Zeppelin" (shades of the Great Airship!) 100,000 miles long seen crossing the sun by two independent observers in 1762.

*"But when good Saturn, banish'd from above,
Was driv'n to Hell, the world was under Jove
Then summer, autumn, winter did appear:
And spring was but a season of the year.
The sun his annual course obliquely made,
Good days contracted, and enlarg'd the bad.
Then air with sultry heats began to glow;*

*The wings of winds were clogg'd with ice and snow;
And shivering mortals, into houses driv'n,
Sought shelter from th' inclemency of Heav'n.."*
-- Ovid, *Metamorphoses* (Dryden translation)

And so we remain, looking dreamily upward at these planet-sized forms cruising between Saturn and Earth, recalling the monolith that Arthur C. Clarke placed in the rings before special-effects considerations dethroned Saturn in favor of Jupiter. Do these monoliths, also, hold our species' heritage, perhaps left over from the days when, as modern catastrophism maintains, the Earth orbited Saturn itself? This would explain, albeit not without some cost to Occam's Razor, why primitive man worldwide identified the otherwise faint and uninteresting planet Saturn with the first king of heaven. It could explain why, both in the Kabbalah and in Babylonian astrology, the Sun and Saturn can be interchanged. It might also explain why, in the mythological "Age of Saturn," the Earth's climate was permanently stable and springlike; evidence of either tidal and axial locking, or of Dione-style terraforming to keep Earth pleasant until Monstrator could clean out our world's new orbital home around the Sun. Or was Monstrator hurried along, perhaps by some unthinkable war around Saturn between titanic EMV leviathans? Did our [ancient astronaut](#) ancestors retreat with the Earth from some cosmic Dunkirk, rescued from an enormous, inhuman prowling evil held back only by Monstrator -- and the Defense Intelligence Agency? Have the Antarctic Space Nazis sold our planet out to its ancient oppressors; has the time come again for Saturn to devour his children? A billion miles away, Saturn watches and waits, building its rings with unthinkable power -- to bring us all back, and in the darkness bind us to him again forever.

My Campaign is Not a Number!

(Okay; Maybe It Is. . .)

Well, this marks both the 200th electronic issue of *Pyramid* and my 100th issue. Of course, that's somewhat less spectacular when you're a weekly type of publication (as we have been for over three years), but as an avid comic collector I still get giddy at nice evenly divisible numbers. And by my math we should be overtaking *Dragon Magazine's* number system in 28 months (19 months if you count the 30 paper issues of *Pyramid*). Set your calendar now!

To tie this into gaming, I've wondered what affect it has to "number" or otherwise codify a roleplaying session. For example, in most comic book universes, they like to call big evenly divisible numbers (like 100, 50, or even 25), "milestone" or "anniversary" issues, and the publishing houses generally like to save Big Things -- like big storylines, new creative teams, or big team shakeups -- for those issues. And lately even television shows have gotten into the act by making big deals and events of 100th, 200th, or other big evenly divisible numbers. (I've always waited for a show to make its "Big 100th Syndication-Ensuring Easy Cash Celebration" Episode . . .)

So why can't games do the same -- or similar -- things?

First off, it means codifying what an "issue" or "episode" of a game is. In some game worlds this is pretty easy; my *Star Trek* miniseries, for example, was very episodic . . . to the extent that I printed up sheets with each week's title on them to show my players after the episode's pre-credits "teaser." Likewise my friend Matt used to plot his Supers campaigns around issue names and numbers. In other games this may mean specifically rethinking your campaign's focus or conventions. For example, a World War II game that wants a comic-book or episodic feel will probably require restructuring so that it's more like *Black Sheep Squadron* instead of *Saving Private Ryan*. For campaign groups that don't meet that often, it might mean saying that each meeting is really two or more "issues."

Second off, you need to let your players know what you're up to. This can be as simple as telling them you're numbering "issues" or "episodes," or as complex as you want it. You might tell your players the installment's name, either before or after the adventure; you might even make the players come up with the name for the issue once they're done. (I've done that before in a Supers game; it's a lot of fun to see the players try to distill the essence of the adventure down to one title. The one that springs most readily to mind ended up being called, "Caught Between Iraq and a Hard Point" . . .) If you have any players with artistic talent, get them to do cover sketches for each adventure; *that* will be a campaign memento for everyone to drool over.

You might start organizing adventures based on the numbering system ("Captain Dan was last seen alive in #27 . . ."). If the players get into the convention, they may even start offering their own ideas into how to further advance the idea. (For example, one might say, "Well, we've got episode 50 coming up soon; I'd like my character to propose during that one.")

Now, the biggest question is probably *why* you'd want to go to this trouble. Well, the biggest reason is that it's an easy way to give the campaign an extra structure, and, perhaps more importantly, a different flavor. It can be challenging to try to differentiate, say, one fantasy campaign from another. But as soon as you make your new campaign episodic or following some "comic book" conventions, you open up new possibilities. Your players would know that something fairly big will happen in adventure #50 . . . but what? The anticipation can make them interested. Following a numbering convention can also make you shake up your notions. Rather than just letting adventures happen haphazardly yet organically, what if you knew that every 25 adventures or so you'd be expected to "shake things up" . . . even if those shake-ups are only temporary?

I've dug up some of my old notes for a Supers campaign I never ended up running fully; here are some transcribed bits that may be of interest.

- #1: Introduce heroes, nemesis
- #12: "One year" mark; public challenge of group's "reason for being"?
- #25: Moon disappears; heroes must discover what's going on, "recover" it
- #50: Nemesis dies; government investigates death (?)
- #51-55: Nemesis failsafe plan from beyond the grave
- #75: New pretender to Nemesis identity?
- #100: Team disbands (is forced to disband?) . . . possible new series, or paving way to 101.

Yes, I had a rough plan for how I wanted the campaign to go 100 adventures into the future (even before I had a name for the nemesis . . .). Of course, I was prepared to change that "timeline" if the heroes did anything wildly different . . . but since the players liked being passive for the most part, I knew I had a reasonable shot at using this material. Now, with that much planning in advance, I suddenly had a number of realizations. First, foreshadowing was much easier now, since I had something to foreshadow *to*; if the government is going to be problematic in #50, then I can start having them be problematic from the beginning, knowing when it will culminate. Perhaps more importantly, but structuring such that I knew what the "big" issue numbers were, I also knew I wouldn't upstage myself; if saving the moon was going to be the biggest event of the first 25 adventures, then I couldn't have them save the galaxy in #17.

Probably the biggest hazard of this method is that the heroes may well feel (not incorrectly) that they are being railroaded . . . or at least have the possibility of being railroaded. After all, if the heroes know that, no matter what, something spectacular will happen in seven adventures, that may dampen their enthusiasm somewhat. Again, it depends on the players and their preferences; talk to them ahead of time and see if they'd have a problem with a more structured campaign.

But if not, then maybe you'll find a new lens through which to view a favorite genre or campaign setting.

* * *

Well, alas my illness has *not* gone away, despite my best efforts. So now I've bitten the bullet and gone to a health care facility, where I am on antibiotics, cough syrup, and an inhaler. I also have incentive to get better; if I don't when my antibiotics run out (seven days left, currently), then I have pneumonia or bubonic plague or something, and need to go to the E.R. where they will shoot me. To paraphrase *MST3K*, that's what I get for combing my hair with rat bones.

The upshot of this is that I'm still woefully behind on lots of stuff; I'm trying to catch up, but given how little usable coherent consciousness I've had lately, it's going to take a while. For those of you who have been waiting on email responses, slushpile info, or other stuff, I thank you for your patience. If you need a more immediate response, I recommend trying to track me down in the *Pyramid* [chat room](#); when I'm home and conscious, I can usually be tracked down there.

--*Steven Marsh*

*Last week's answer: **Rune RPG**, p. 15.*

(Four stars) "A Basilisk moves one square at a time, either ahead diagonally or vertically or backward vertically. It captures by forward movement only. A Basilisk also has the unique ability of "freezing" an opposing piece -- but not a friendly piece -- located directly above it on the middle board, such that the opposing piece cannot move until the Basilisk is moved or captured."

Scale and Lamellar Armor

by Dan Howard

Continues our in-depth examination and discussion of low-tech armor. This week concentrates on scale and lamellar armors. This is intended to clarify and expand upon the brief mention of these armors in *GURPS Basic* and *Low-Tech*, and designed to be used in conjunction with the article "[Armor Damage in GURPS](#)" published on September 7th 2001, and the article "[Chainmail -- Why Bother?](#)" published on September 14th 2001. Those sections discussing armor maintenance, rust-proofing, and armor quality may also be applied here.

Scale Armor (TL1)

Introduction

Scale armor, sometimes called *jazeraint*, is the oldest known type of metal body armor. The initial concept may have been inspired by observing animals such as fish and reptiles. Scale has had a long history of use in Egypt, Asia and the Mediterranean. The earliest records depict Mesopotamian and Sumerian troops in 2500 BC wearing bronze helmets, studded cloaks (see p. LT50) and kilts of scale. Many Assyrian sculptures, show warriors fighting in chariots wearing scale armor. The asiatic Hyksos are believed to have introduced scale into Egypt during the second millennium BC -- Ramses II was depicted wearing it in battle. In the biblical story of David and Goliath, Goliath is described wearing "a helmet of bronze upon his head, and clothed in scale armor, the weight of which was five thousand shekels of bronze." Many Roman sculptures portray officers in fine scale armor. The Bayeux Tapestry depicts figures like Guy, Count of Ponthieu, in a sleeveless scale hauberk.

Scale armor is made of small, thin plates of iron, bronze, or brass usually laced to each other in horizontal rows with leather or wire. Each row is then laced, sewn, or riveted onto a cloth or thin leather backing. Scales are staggered from one row to the next to increase the strength of the armor. Scale can also be fashioned from non-metallic materials such as leather, wood, horn, bone, or even horse's hoof. The Chinese used lacquer for hardening leather scales and laced them together with silk (p. LT49). Treat this type of scale as *Reinforced leather* (PD 2; DR 3; \$120; 12 lbs. see p. LT115).

Well-made scale armor is extremely attractive. The Romans called it *lorica squamata* and it was widely used, especially by cavalrymen and officers, because of its comfort and superior looks. Scale is also lighter, more flexible, and it 'breathes' well compared to more rigid armors, so it is more suitable for warmer climates. Scale is difficult to maintain however. It rusts or tarnishes quickly, is difficult to clean, and can shed scales.

Construction

Low-Tech states that it takes 1 1/2 hours per pound to create standard scale armor (sidebar p. LT44). This figure is for heavy scale. Light scale requires a greater number of scales and takes twice as long (3 hrs/pound). This assumes that two people (possibly an armorer and his apprentice) are working together to fashion the scales, wire or lace them together, and attach the rows to the backing. The smaller the scales, the more that need to be fashioned and the greater the manufacture time. If an armorer is working by himself then manufacturing time is *doubled*.

Types

There are two main types of scale armor, which are dependent upon the size and gauge (thickness) of individual scales. Light scale is more attractive and comfortable, but heavy scale offers better protection. All scale armor is susceptible to impaling attacks from below, however, and thrusting attacks angled upwards reduce the PD (imp.) and DR (imp.) by -1. If the defender is at least three feet higher than the attacker (such as a horseman vs a footsoldier), then any thrusting

attack with a Reach 2 or greater impaling weapon gets this advantage. If both combatants are on the same level, then this sort of attack can only be attempted from within Close Combat. It must be an underhand thrusting attack using a Close Combat impaling weapon (Reach C) such as a dagger.

As mentioned above, scale can shed scales, especially in combat where a sword cut can slice off scales by hitting the rivets or lacing. If the optional [armor damage rules](#) are being used, then any critical hit on scale armor inflicts *one extra* penetration point.

Light scale (p. LT115): Individual scales are fairly small (1/2 to 1 inch wide) and very thin. Their strength comes from the staggered, overlapping rows, and the backing behind them. Light scale is very flexible and can be fashioned into sleeves and leggings enabling all over bodily protection. Manufacture time is 3 hrs/pound. This will be used as the basic armor and modifications can be added when applicable. A corselet protects areas 9-11, 17-18.

Light scale corselet: PD 3 (cut), PD 2 (cr./imp.); DR 4 (cut), DR 2 (cr./imp.); Weight 15 lbs; Cost \$260.

Manufacture time is 3 x 15 = 45 hours.

Other body locations:

Light scale sleeves (areas 6, 8): weight 6 lbs.; cost \$120; manufacture time 18 hrs.

Light scale leggings (areas 12-14): weight 9 lbs.; cost \$180; manufacture time 27 hrs.

Heavy scale (p. B120; p. LT41): This is the metal scale armor as described in **Basic Set** (p. B210) and **Low-Tech** (p. LT41). The scales are larger (up to 3 inches wide) and a heavier gauge than light scale. Heavy scale is also cumbersome and less flexible, so it is difficult to fashion into sleeves or leggings. Because of this, the entries for arm and leg scale armor in **Basic Set** (p. B210) and **Low-Tech** (p. LT116) should be disregarded (use the *Light scale* entries above instead). The shoulders, however, can be extended to protect part of the upper arms. It protects areas 6, 8 (roll 5-6 only). Cost, weight, and manufacture time is +20%. The corselet can also be extended down in the form of a skirt to protect the legs (see *Hauberks*, below). Heavy scale provides PD 3 (cut/cr.), PD 2 (imp.); DR 4 (cut), DR 3 (cr./imp.); Cost is 120%; Weight is 150%; Manufacture time is *half* that of light scale (1 1/2 hours per pound).

Note the weight of heavy scale is much less than that shown in **Basic Set** (p. B210). The scales used by recreationists today are usually heavier than historical examples. All types of scale armor are fairly flexible and because of this, the wearer is susceptible to *Blunt Trauma* (see below).

Augmentations

Several innovations were developed to improve the effectiveness of scale armor.

Medial ridge (TL2): To increase resistance to strong blows each individual scale was embossed along its back with a ridge or crease. The ridge provided extra reinforcing without increasing overall weight. This sort of scale armor was very attractive. It gave the impression of feathers so the Romans called it *lorica plumata*. +1 DR (cr.); +50% to cost and manufacture time; weight is unchanged.

Vertical lacing (TL2): In the 2nd century A.D., the Romans began lacing each scale to its vertical, as well as horizontal, neighbors. Flexibility was compromised slightly for the benefit of increased protection against impaling attacks. +1 DR (imp.); weight is increased a little (+1 lb); cost and manufacture time is +50%. Can only be applied to torso armor.

Scale mail (TL3): Another method of increasing damage resistance is to use *fine-mesh mail* (see the [chainmail](#) article for more on fine-mesh) as a backing instead of cloth or leather. Scale mail combines the best features of both fine-mesh mail and light scale. Its manufacture is extremely labor intensive, however, and without slave labor the cost of production would have been ridiculous. Scale mail offers PD 3 (cut/imp.), PD 2 (cr.); DR 5 (cut/imp.), DR 4 (cr.); cost is 12x; weight is the same as heavy scale; manufacture time is 40 hours per pound. The 'vertical lacing' augmentation mentioned above cannot be performed on this, but 'medial ridge' reinforcement often was. The difficulty and expense

of acquiring scale mail meant that was a kind of status symbol among the upper class. Treat this type of armor as if it had *fine* decoration (see *Decoration*, below).

Below is a breakdown of the described scale types.

Torso (Areas 9-11, 17-18) Description	PD (cut/cr/imp)	DR (cut/cr/imp)	Weight (lbs.)	Cost	Production time
Light scale corselet	3/2/2	4/2/2	15	\$260	45 hrs
medial ridge	3/2/2	4/3/2	15	\$390	68 hrs
vertical lacing	3/2/2	4/2/3	16	\$390	68 hrs
both augmentations	3/2/2	4/3/3	16	\$520	90 hrs
Heavy scale corselet	3/3/2	4/3/3	23	\$310	34 hrs
medial ridge	3/3/2	4/4/3	23	\$465	51 hrs
vertical lacing	3/3/2	4/3/4	24	\$465	51 hrs
Both augmentations	3/3/2	4/4/4	24	\$620	68 hrs
Scale mail corselet	3/2/3	5/4/5	23	\$3120	900 hrs
medial ridge	3/2/3	5/5/5	23	\$4680	1350 hrs

Lamellar (TL2)

Introduction

Lamellar is a form of semi-rigid body armor most often associated with Japanese samurai, but also used by the Byzantines, Romans, Russ and other Dark Age warriors. The Assyrians (900-600 B.C.) are thought to have first developed lamellar armor. It was widely used in the [Byzantine Empire](#) and proved to be very effective. An anecdote recounted by Anna Comnena describes when Alexios took two simultaneous charges from Frankish heavy cavalry and was merely pushed partly off, then back onto his horse without sustaining any injury. The Vikings may also have used lamellar -- archaeological examples have been found at Birka and Gotland (Wisby). It is also possible that some Norman nobility may have worn lamellar at Hastings.

Lamellar consists of small rectangular plates called lames or lamellae, attached to each other with lacing. A more advanced type of scale armor, lamellar differs from scale in four main ways. Firstly the scales are a heavier gauge and overlap each other more. This provides better protection, but the extra metal increases its weight. Secondly, it is assembled in an inverse manner to scale, so it is no longer vulnerable to upward thrusts. Thirdly, the construction is stronger and there is no need to attach it to backing material. Finally, the rows are not staggered, individual lamellae line up vertically as well as horizontally.

Japan

Low-Tech calls Japanese armor *laminated steel* (see p. LT115) to distinguish it from European lamellar armor. This is misleading as Japanese and European lamellar were very similar in both the size of the lamellae and the method of construction. The differences were mainly cosmetic: the shape of the lamellae differed slightly; braided silk lacing was often used instead of leather; and the Japanese almost always lacquered their steel.

As in Europe, Japanese lamellar was usually made from leather or steel. Steel lamellae, called *sane*, were lacquered

both for decoration and to rust-proof them. This was a complicated process involving many layers of different types of lacquer. Because of this, the cost and production time is *triple* that of unlacquered lamellar (treat as *fine* decoration; see the [Chainmail](#) article for more on rustproofing). Sane were then laced into horizontal rows with either leather thong or a flat silk braid -- usually brightly colored -- so that each sane overlapped the one on its right. The horizontal rows were then laced to each other with more leather or silk.

Construction

While producing scale armor is a fairly simple, repetitive operation, manufacturing lamellar is more complicated. The metal must be forged, the plates trimmed to shape, and at least seven holes must be punched or drilled. Individual plates must then be assembled into horizontal rows and those rows linked vertically to make the cuirass. Since lamellar plates are longer than scales, and the finished item is less flexible, the neck and arm openings of the cuirass must be made with specially shaped lames in order to provide the best possible protection while allowing freedom of movement. Lamellar construction takes 2 hours per pound.

As with scale, low-tech armorers could create lamellar from a variety of readily available materials. Archaeological samples of lamellae vary from metals such as steel and bronze, to rawhide, waxed leather, horn, ivory, and whalebone. Lacing materials can range from metal wire, to rawhide or leather thongs, to braided silk or linen cord. Non-metallic lamellar armor should be treated as *Reinforced leather* (PD 2; DR 3; \$120; 12 lbs. see p. LT115).

Types

There were many types of lamellar armor. The shape of the lamellae may have differed but they were all of a similar size. The main difference was the amount of overlap. The greater the overlap, the more lamellae that were required, the heavier the final product, and the better the protection. Lamellar can be split into three general categories -- 'light', 'medium', and 'heavy' -- based on the amount of overlap and the overall weight of the armor.

Light lamellar will be used as the basic armor and modifications can be added when applicable. It was designed to avoid significant overlap and thus greatly reduce the armor's weight, and the number of lamellae required for construction. The Japanese called it *iyozane*. Lamellae only overlap by a small amount -- up to one quarter. Because of its reduced weight and increased flexibility, troops requiring speed and mobility preferred it, although it was susceptible to *blunt trauma* (see below).

Light lamellar cuirass: PD 3 (cut/cr.), PD 2 (imp.); DR 5 (cut/cr.), DR 3 (imp.); Weight 20 lbs; Cost \$560. Protects areas 9-10, 17-18.

Manufacture time is $2 \times 20 = 40$ hours.

Medium lamellar: The most common type of lamellar, the Japanese called it *kozane*. It overlaps by about half the width of the lame -- effectively doubling the thickness of the metal. A special half-lame is added to the end to maintain a constant thickness. +1 PD, +1 DR (imp.). The extra mass of medium lamellar means that the wearer is not susceptible to *blunt trauma* (see below). Cost and weight is 1 1/2 x.

Heavy lamellar: A rare type of lame that is wider than medium lamellar and punched with three rows of vertical holes instead of two. The Japanese called it *shikime zane*. It is assembled in a double overlap, each lame overlaps its neighbor by three-quarters, which effectively triples the thickness of the metal. +1 PD, +1 DR (cut/cr.), +2 DR (imp.). Many more lamellae are required for this than for the construction of light lamellar. It is also very cumbersome -- usually only worn by cavalry. The mass of heavy lamellar means that the wearer is not susceptible to *blunt trauma* (see below). Cost and weight is 2 x.

Note that lamellar armor does not normally cover the lower torso (area 11). This is because most lamellar is not flexible enough to allow enough movement in the waist. In most cases lower torso protection was added separately, usually in the form of some sort of kilt or apron (see *Other Locations*, below). Only light lamellar may be extended down to cover area 11. Add +25% to the weight, cost, and manufacture time.

Modifications

Rigid Lamellar: Sections of lamellar sometimes had extra leather thongs concealed under the lacing to lock the rows together, thus improving their resistance to impaling damage. This was used most often on upper torso armor (areas 9-10, 17-18) because other sections of armor needed more flexibility. +1 PD (imp.); +1 DR (imp.); +25% to cost and manufacture time; weight was slightly increased (+1 lb.). This cannot be applied to light lamellar as the lamellae do not overlap enough.

Below is a table showing the characteristics of various lamellar constructions. A cuirass encases the upper torso, protecting areas 9-10, 17-18.

Upper Torso (Areas 9-10, 17-18) Description	PD (cut/cr/imp)	DR (cut/cr/imp)	Weight (lbs.)	Cost	Production time
Lamellar cuirass, light	3/3/2	5/5/3	20	\$560	40 hrs
Lamellar cuirass, medium	4/4/3	5/5/4	30	\$840	60 hrs
Rigid lamellar cuirass, medium	4/4/4	5/5/5	31	\$1050	75 hrs
Lamellar cuirass, heavy	4/4/3	6/6/5	40	\$1120	80 hrs
Rigid lamellar cuirass, heavy	4/4/4	6/6/6	41	\$1400	100 hrs

Layering Armor

Most warriors, both Japanese and European, wore lamellar layered over a lighter type of armor. Leather and padded cloth were common under-armors. Those who could afford it wore [mail](#) (this would have been the case with Alexios in the anecdote described by Anna Comnena, above). *Low-Tech* states that any armor can be worn over any other, subject to GM approval (see p. LT114). The catch is that massive amounts of armor are bulky and hamper movement:

For every point by which the DR of the inner layers (every layer but the outermost layer) exceeds 3, reduce the wearer's effective DX by -1. (see p. LT114).

In the case of some types of armor the DR varies. To solve this simply average the three DRs.

Light lamellar: $(5 + 5 + 3)/3 = 13/3 = 4.33$.

Because it exceeds 3 but is less than 6, there is a DX reduction of -1 if it is worn under another type of armor.

Other Locations

Lower Abdomen Protection (area 11): The semi-rigidity of lamellar severely limited the amount of movement in the waist. For this reason body armor often stopped here (only covering areas 9-10), and a separate section of armor was worn on the lower abdomen (area 11). European and Asian warriors usually adopted a different type of armor to protect the waist such as a scale or mail skirt, or some sort of leather kilt. *Hauberks* could also be worn (see below). The Japanese developed an apron of large lamellar panels called *kusazuri*.

Upper Leg Protection (areas 12-14; roll 1-3 only): Mounted samurai sometimes wore underneath the *kusazuri* two larger panels called *haidate*, designed to protect the thighs (areas 12-14; roll 1-3 only). The upper section, which was layered under the *kusazuri*, was padded giving +1 DR to area 11. They were extremely awkward to walk in, however, and wearing *haidate* reduces one's Move by -2. The more typical method of protecting the thighs was the *Hauberk* (see below).

Upper Arm protection (areas 6, 8; roll 5-6 only): The nature of lamellar prevented it from being used to create joints. Shoulder and upper arm protection was attached separately, and the underarm was always vulnerable (see *Special Attack -- armpit*, below). Separate lamellar guards could be added to protect the shoulder and upper arm. The Japanese called these *sode* ('sleeve'). Note that lamellar was never worn on the lower arm. Forearm and wrist protection usually took the form of plate or splint armor. The same armor was likewise used for shin greaves.

A device unique to early Japanese samurai was called the *o-sode* ('large sleeve'). A mounted archer could not use a shield so this was developed as a replacement. Each shoulder was protected by a large rectangular panel of rigid lamellar. They were laced to the cuirass and hung down to just above the elbows. O-sode functioned like small shields, sliding off the arms when they were raised to shoot, hanging behind to protect the shoulders and the entire upper back (areas 9-10; rear only). Add +2 PD to any attack striking this area whenever the defender is firing a bow (but it no longer protects the upper arms). The entire weight of o-sode was born by the shoulders making them a little restrictive (-1 to all melee and thrown attacks). However, given that early samurai were mainly mounted bowmen, this wasn't much of a problem.

Description	PD (cut/cr/imp)	DR (cut/cr/imp)	Weight (lbs.)	Cost	Production time
Heavy Scale kilt (area 11)	3/2/2	4/3/3	6	\$80	9 hrs
Kusazuri (area 11)	4/4/3	5/5/4	7	\$210	14 hrs
Haidate (areas 12-14; roll 1-3)	4/4/4	5/5/5	8	\$280	20 hrs
Sode (areas 6, 8; roll 5-6)	4/3/4	5/4/5	6	\$200	12 hrs
O-sode (areas 6, 8; roll 5-6)	4/4/4	5/5/5	8	\$300	20 hrs

Decoration

A neat method of decoration was to alternate steel scales with other metals such as bronze or brass so that a checkerboard effect was produced. Weight and cost is unchanged. This, however, would reduce the defense capability of the armor (-1 DR), so plating was more common. Plating or gilding was used both for decoration and to improve rust resistance. See the [Chainmail](#) article for more on decoration and rustproofing. Gold plate could be gilded onto the scales. White metal plating of scale was frequently either silvered or tinned. The Japanese usually lacquered individual plates in various colors, including gold (gold dust was ground into the lacquer). Plating and lacquering increases cost and manufacture time by 3x (treat as *fine* decoration). If gold is used then the cost is 5x (*very fine* decoration).

Armor and Stealth

Armor is noisy, and easily noticed, making sneaking around difficult. In addition to any encumbrance penalty (see p. B67), armor imposes an *extra* penalty to Stealth, equal to PD-1 (maximum penalty of -3). If different armor types are worn on different body locations, then use the armor with the *highest penalty*. *Special preparation can reduce the chances of being detected by the enemy. Spending 10 mins to pad or tie down rattling buckles and rubbing armor segments can reduce the enemy's Hearing roll by -1.*

Lacquering (see Decoration, above) also reduces the amount of noise made by armor. Another method is to wrap each individual segment in silk cloth or fine leather. Treat as fine decoration and triple the costs accordingly. Both of these methods reduce the enemy's Hearing roll by an additional -1. If appropriate camouflage colours are used (see p. B65) then the enemy also gets a -2 to his Vision roll.

Blackening armor (see [Chainmail](#) article -- Rustproofing) cuts down on glare but does little to reduce noise. If blackened armor covers all the main body locations (head, torso, arms, legs) and is worn at night time or in deep shadow, then reduce the enemy's Vision roll by -2 (in addition to any darkness penalties).

Optional Extras

Special Attack -- armpit: As stated above, lamellar could not be used to effectively cover joints. The armpit was especially vulnerable. A thrusting attack to this area only needs to contend with the lighter layer of protection worn underneath. An impaling wound in the armpit is no laughing matter. It could sever the brachial artery and the nerves controlling the arm, before puncturing the lungs and heart. Treat as a thrusting attack to the vitals but at -6 to hit. If the attack roll is missed by 1 then the torso is hit instead. This attack damages the torso but can also disable the arm. On a critical hit, instead of rolling on the Critical Hit Table, the arm is automatically crippled (see p. B127). This is in addition to any damage done to the torso.

Blunt trauma: Often when a defender wearing non-rigid armor was struck with an impaling or cutting weapon, even though the armor prevented the attack from piercing the skin, the impact of the blow often left severe bruising or cracked bones. **GURPS** already has blunt trauma damage for Kevlar vests (see p. B211) and the same rule can be applied here with a small modification:

When all of the damage in a cutting or impaling attack is absorbed by the armor, any rolls of 6 on any damage dice result in one point of crushing damage per 6 rolled being applied to the wearer.

For example, a warrior wearing light lamellar is stabbed with a dagger doing 1d-3 damage. The attacker rolls a 6, which results in 3 points of damage. This is totally absorbed by the armor but, because a 6 was rolled, the defender takes 1 point of crushing damage.

Brigandine (p. LT98): Can only be made from light scale or light lamellar. Brigandine was designed for concealment. Sometimes mistakenly called a coat-of-plates, the name 'brigandine' came from the tendency of robbers and brigands to wear it. **Low-Tech** describes this armor in detail, including rules for Holdout (p. LT98). The best brigandine was made in Milan, Italy. It was the fashion of upper class gentlemen who frequented brothels and other disreputable parts of town, providing good protection from a knife or rapier blade. Brigandine was also worn as a regular part of the fashion of the day. The rows of studs fastening the plates to the fabric were often deliberately left visible on the outside of the garment. Visible studs obviously negate any Holdout bonus.

Hauberks: Flexible armor can be extended into a long skirt that falls down to the knees (protecting areas 9-11, 12-14, 17-18). It is split either up the sides for infantry, or front and back for cavalry. Manufacturing a hauberk adds +50% to the cost, weight, and production time. This type of protection leaves the shins exposed, however, and any attack that hits the legs will strike the exposed part on a roll of 5-6. A hauberk can be made from medium and heavy lamellar but, like the haidate mentioned above, the wearer suffers a -2 Move penalty because of its awkwardness.

Other Materials

Bronze & Brass: During the Bronze Age (TL1), copper alloys were used extensively in the manufacture of body armor. They are +20% heavier than an equivalent item made from steel. Cost is 80% and manufacture time remains unchanged. Alternatively, if the weight is kept the same as a steel item, the inferior material results in a DR reduction of -1.

Superior steel: Add +1 DR, weight is unchanged. Cost is doubled. This could be equivalent to steels originating from regions like Damascus or Solingen (see p. LT86). Local ores from these areas contained impurities that happened to improve the quality of steel.

(Many thanks to Thomas Barnes, Peter Dell'Orto, Shawn Fisher, and Bob Huss.)

Dork Tower!

Dork Tower!

Unusual Suspects

by Stephen Dedman

This is a collection of 25-point criminally-inclined *GURPS* NPCs designed for use as enemies, allies, dependents, Illuminati dupes, hirelings, or random encounters. They may also owe the PCs a favor, which they can repay in interesting ways . . .

Most character backgrounds are presented with modern-day campaigns in mind, particularly *GURPS Supers* and *GURPS Voodoo*, but most will only need a few changes to adapt them from any setting from the far future to the Old West or even earlier.

Crystal Carver, Hacker

Attributes: ST 9 [-10], DX 11 [10], IQ 13 [30], HT 9 [-10].

Basic Damage Thrust: 1d-2 Swing: 1d-1

Basic Speed: 5 Move: 5

Dodge: 5 Parry: n/a Block: n/a

Advantages: Mathematical Ability [10]; Versatile [5].

Disadvantages: Curious [-5]; Manic-Depressive [-20]; Phobia (Open Spaces) [-10]; Sense of Duty (Close Friends).

Quirks: Attentive; Imaginative (during manic phase); Prankster (during manic phase); Nosy; Distrusts multi-national companies.

Skills: Computer Hacking/TL7-16 [8]; Computer Operation/TL7-15 [4]; Computer Programming/TL7-14 [2]; Cryptanalysis/TL7-16 [4]; Cryptography-10 [0]; Cryptology-9 [0]; Electronics/TL7 (Computers)-13 [1]; Electronics Operation/TL7 (Security Systems)-12 [1]; Fast-Talk-12 [1]; Forgery/TL7-13 [2]; Mathematics/TL7-17 [8]; Merchant-12 [1]; Research-13 [2]; Streetwise-11 [1/2].

Gear: Lives in basement apartment with state-of-the-art mainframe computer, security system, and survival equipment. When outside, carries tear gas spray and Swiss army knife, wears leather jacket.

Appearance: 19 years old, but looks barely 15; round-faced, brown skin, curly black hair, brown eyes; 5'5", 135 lbs.

75-point version: Add Eidetic Memory [30] and +1 to IQ (gives +2 to IQ-based skills); replace Manic-Depressive with Trickster.

A mathematical prodigy fond of solving puzzles and cracking codes, Crystal Carver was orphaned a few days after her sixteenth birthday. She and her mother were walking across campus when a sheet of window glass fell from a building site, narrowly missing Crystal and killing her mother. After receiving a compensation payout, Crystal retreated into a basement apartment (a converted fallout shelter), went into business as an internet service provider, and finished her university training by e-mail.

Crystal only ever leaves her apartment during her manic phase, and even then her fear of open spaces won't let her cross the street. What she can't get that way, she orders over the internet and has delivered, or has her friends -- mostly fellow hackers -- bring her. During her manic phase, she also likes to try hacking onto heavily secured websites: she's neither malicious nor particularly greedy, but she's not above using the numbers of corporate credit cards or phone cards to buy what she wants, or diverting the links on conservative websites (she draws the line at viruses, though). She also provides computer support for left-wing protest groups, and enjoys forging false IDs for her underage overachieving friends and "discount vouchers" for multi-national fast food outlets.

Campaign uses: Crystal occasionally hires out as a hacker and codebreaker (using the hacker name Hope Diamond), but only if the cause is good or the challenge sufficiently tempting (McMurdo, for example, might be able to recruit her by using a combination of fast-talk and bribery). Crystal may agree to help the PCs (especially if she owes them a favor), or may become an enemy if she thinks the PCs are a threat to her friends. She's unlikely to be encountered at

random, except in cyberspace -- she rarely goes outside, or lets strangers into her shelter.

Other settings: Crystal can exist in any TL7+ setting; the only changes will be the gadgets with which she surrounds herself (and/or has implanted).

Gene Rogan, Survivalist

Attributes: ST 10 [0], DX 11 [10], IQ 11 [10], HT 10 [0].

Basic Damage Thrust: 1d-2 Swing: 1d

Basic Speed: 5.25 Move: 5

Dodge: 5 Parry: 7 (Brawling) Block: n/a

Disadvantages: Bloodlust [-10]; Intolerance (other races) [-10]; Overconfidence [-10]; Paranoia [-10].

Quirks: X-files fan; Mild phobia of helicopters; Thinks cats are spying on him; Doesn't eat pork or shellfish; Packrat - hates throwing anything away.

Skills: Armoury/TL7 (Handguns and rifles)-14 [8]; Brawling-11 [1]; Camouflage-9 [0]; Chemistry/TL7-9 [1]; Computer Operations/TL7-10 [1/2]; Conspiracy Theory-8 [1]; Demolitions/TL7-13 [4]; Driving/TL7 (Car)-10 [1]; First-Aid/TL7-10 [1/2]; Forgery/TL7-14 [8]; Guns/TL7 (Rifle)-16 [8], (Shotgun)-14 [0]; (other)-12 [0]; Holdout-9 [1/2]; Intimidation-10 [1]; Knife-11 [1]; Language (English)-11 [0]; Merchant-11 [2]; Orienteering-9 [1/2]; Photography/TL7-10 [1]; Scrounging-12 [2]; Streetwise-10 [1]; Survival (Forest)-11 [2], (Radioactive)-9 [1/2], (other)-8 [0]; Tactics-8 [1/2]; Traps/TL7-11 [2].

Gear: Away from his bunker, Rogan wears a brown leather jacket over a Second Chance Standard vest, jeans, cowboy boots, and an old Stetson over a steel skullcap; his pockets contain at least three double-derringers in different calibers and a small folding knife, while his 4WD van contains at least one rifle, shotgun, and pistol. At home, he wears forest camo over the Kevlar vest, and carries a survival knife and a Beretta 92 modified for burst fire (RoF 18, ST 12, Rcl - 5), with 1d-1 other guns within 4 hexes at any time.

Appearance: 44 years old; Razor-cut rusty brown hair, long moustache, weathered complexion, blue eyes; 5'10", 150 lbs.

75-point version: Add Danger Sense; High Pain Threshold; Resistance to Disease; +1 to IQ and IQ-based skills, +1 to DX and DX-based skills.

Gene Rogan grew up in the suburbs of Denver during the Cold War, with a fallout shelter in his back yard, and most of his childhood fantasies centered around how he would survive and flourish in a post-holocaust environment. After failing the psych tests to enroll in the army, he apprenticed to a gunsmith and later bought his own shop, but soon became convinced that the government was conspiring to put him out of business at any cost. He took to carrying more and more concealed weapons, and came into contact with other conspiracy theorists. When one of these was arrested, the ATF began investigating Rogan, and he was soon imprisoned for several weapons offences.

After his release, the bankrupt Rogan tried unsuccessfully to find another job, and when a former cellmate asked him to make a few silencers, he went into business as an armourer for the black market. He discovered that he also had a knack for forging licenses and ID papers, and after a few years, he had enough money and false references to buy himself some land and start building a small house with a well-equipped underground shelter. Silencers and weapons modified for autofire are his stock-in-trade, but he also makes bombs of all sizes, as well as false documents.

Campaign uses: Rogan is mostly a source of illegal weapons and weak alternate identities (he can fabricate 15-point Alternate Identities in 1d+2 days, but his services won't come cheaply) for the PCs and/or their enemies. In a Supers, Espionage, Cops or Special Ops campaign, he may have built the weapons used in a crime that the PCs are trying to solve, and might need to be taken alive to lead the PCs to the other conspirators. If he becomes convinced that PCs or their dependents are trying to harm him, he may decide to attack them, using bombs and traps or (as a last resort) sniping at them with a high-powered rifle.

Other settings: Though Rogan is designed for a 1980s-1990s setting, he can fit into an *Atomic Horror* setting with almost no changes, and would be perfectly at home (and probably feeling slightly smug) in *Y2K*, *Autoduel*, or *Reign*

of *Steel* campaigns.

Master Sergeant Joe Lord

Attributes: ST 10 [0], DX 10 [0], IQ 12 [20], HT 10 [0].

Basic Damage Thrust: 1d-2 Swing: 1d

Basic Speed: 5 Move: 3

Dodge: 5 Parry: 6 (Judo) Block: n/a

Advantages: Contact (Street, skill-15, available on a 9 or less, somewhat reliable) [2]; Military Rank/2 (Master Sergeant) [10].

Disadvantages: Duty (on 12 or less, rarely required to risk life) [-5]; Greed [-15]; Migraine (common, appears on 10 or less) [-10]; Overweight [-5, 45 lbs Encumbrance]; Stubbornness [-5].

Quirks: Loves beer and pizza; Considers pistols necessary evils; Dislikes exercise; Incompetence (Cooking); Follows stock market avidly, but never invests.

Skills: Administration-12 [2]; Brawling-10 [1]; Computer Operations/TL7-12 [1]; Detect Lies-12 [4]; Driving/TL7 (Car)-8 [1/2]; Fast-Talk-12 [2]; First-Aid/TL7-11 [1/2]; Guns/TL7 (Light Automatic)-13 [2], (Pistol)-11 [1/2]; Holdout-10 [1/2]; Judo-9 [2]; Knife-10 [1]; Merchant-13 [4]; Savoir-Faire (Military)-11 [1/2]; Scrounging-11 [1/2]; Spear-10 [2]; Stealth-9 [1]; Streetwise-12 [2]; Tactics-12 [4]; Thrown Weapon (Grenade)-10 [1].

Gear: Normally unarmed except for small folding knife. When expecting trouble, Glock-17 in concealed holster and another in car, and wears Second Chance Standard vest under leather jacket. M16 for home defense.

Appearance: 38 years old; Freckled complexion; strawberry blond hair, cut short; blue eyes; 5'10", 195 lbs.

75-point version: Add Ally Group (appears on 6 or less) [5], Danger Sense [15] and Wealth (Comfortable) [10]; add +1 to, DX and DX-based skills; remove Migraines.

Joe Lord grew up in a rough neighborhood in New Jersey, the youngest of three sons. After one of his brothers died while stealing a car, and his father and oldest brother were arrested for planning an armed robbery, Joe's mother persuaded him to enlist in the Marines in the hope of keeping him out of trouble. To her surprise, and his, Joe found that military discipline suited him well, and he rose through the ranks to become a supply sergeant. Unfortunately, Joe's greed got the better of him after he realized that his superiors rarely bothered checking the inventory to see what was missing. While reluctant to sell too much military equipment, because of the dangers of eventually being caught, he found he could supplement his income by hiring some of it out to criminals. Soon Joe's relatives and their friends were hijacking trucks and robbing banks while armed with military weapons and wearing government-issue body armor.

Joe, who has grown plump from years behind a desk, prefers to avoid the violent end of either military or criminal operations, but he is able to protect himself if necessary.

Campaign uses: Joe is mostly a source of military equipment for the PCs and/or their enemies. He sells weapons, ammunition, etc., at normal black-market prices and in limited quantities, but treats this payment as a deposit against 10% of the take from a robbery, and "buys back" the items after the job is over (effectively charging 10% of the black market price per day for hire, paying a minimum of 30% for items returned after a week). While he rarely smuggles more out of the store in one day than he can carry in the trunk of his old Cadillac, he can easily provide a small team of PCs with weapons, armor, SCUBA gear, etc. He can't provide them with vehicles, but he can supply uniforms and help smuggle them onto a base where they can attempt to steal whatever they need.

Other settings: Quartermasters who sell their government's equipment may be found in any era or nation. Replace Computer Operations with Forgery to put Joe into a pre-1970s setting, and change other TL7 skills and equipment as necessary.

Raji Sahir, Gambler

Attributes: ST 9 [-10], DX 9 [-10], IQ 12 [20], HT 9 [-10].

Basic Damage Thrust: 1d-2 Swing: 1d-1

Basic Speed: 4 Move: 4

Dodge: 5 Parry: 5 Block: n/a

Advantages: Danger Sense [15]; Language Talent +1 [2]; Night Vision [10]. Psionics: Clairvoyance (9)-12; Limitations, Roll to Activate (Activation number 11). Range 6' 9". [10]

Disadvantages: Combat Paralysis [-15]; Low Pain Threshold [-10]; Overconfidence [-10]; Skinny [-5].

Quirks: Collects comics; Dreams of being a superhero sidekick; Incompetence (Motorcycle); Loves very spicy food; Mild weakness for redheads.

Skills: Archaeology-12 [4]; Artist-9 [1/2]; Cooking-11 [1/2]; Criminology/TL7-10 [1/2]; Driving (Car)-8 [1]; Fast-Talk-10 [1/2]; First Aid/TL7-11 [1/2]; Forensics/TL7-9 [1/2]; Gambling-13 [4]; History-10 [1]; Judo-8 [2]; Languages (Arabic)-12 [1/2], (English)-13 [1], (French)-12 [1/2], (Hindi)-14 [0], (Latin)-12 [1/2], (Mandarin)-12 [1/2], (Russian)-12 [1/2], (Spanish)-12 [1/2]; Linguistics-10 [1]; Lockpicking/TL7-10 [1/2]; Research-12; Scrounging-11 [1/2].

Gear: Usually wears leather jacket, jeans, sneakers, and mirrorshades. As Schrodinger, add leather hood (DR 1), Second Chance Standard vest, leather gloves, smoke grenade, lockpicks, and handcuffs.

Appearance: 22 years old; dark brown skin, straight black hair, dark brown eyes; 5'9", 100 lbs.

75-point version: Add +1 to IQ and IQ-based skills, +2 to, DX and DX-based skills, Fit, and Luck [15]; replace Combat Paralysis with Pacifism (Cannot Kill or Self-Defense Only).

Raji Sahir had long had a knack for "guessing" what was inside parcels, "seeing" other people's cards, and "divining" where things were hidden or buried, but it wasn't until he volunteered for an ESP experiment at his college that he realized that he had an unreliable clairvoyance talent. While this made him more useful when he went on digs with other archaeology students (compensating for his natural clumsiness), and enabled him to supplement his income by playing poker and blackjack, his real dream is to use his powers to become a spy or fight crime.

Campaign uses: In a Supers campaign, Sahir will moonlight as the minor-league crimefighter Schrodinger, hoping that an experienced superhero (e.g. one of the PCs) will take him on as a sidekick. Alternatively, the GM may choose to make him a criminal, but he can probably wreak more havoc as a wannabe hero. For one thing, he's very good at seeing inside helmets and behind masks . . .

In "real world" campaigns, abilities such as Sahir's are rare enough to be very useful; he may be able to tell spies, cops or conspiracy theorists what lies inside closed buildings, safes, suspicious looking parcels, flesh holsters, etc. The PCs may be able to enlist his services -- but so may their enemies.

Other settings: Sahir's abilities are ideal for counter-espionage or treasure-hunting in any setting past or future, enabling him to foil the PCs' plans or those of their enemies at any time. He could help protect a daimyo from ninja, or detect armed cyborgs in a spaceport bar; hunt for booze with Prohibition-era gangbusters or narcotics with the DEA; single-handedly save the city of Troy; etc. He could also make a living as a gambler at any time since the invention of playing cards.

Senator Richard McMurdo

Attributes: ST 9 [-10], DX 10 [0], IQ 12 [20], HT 9 [-10].

Basic Damage Thrust: 1d-2 Swing: 1d-1

Basic Speed: 4.75 Move: 4

Dodge: 4 Parry: 5 (Boxing) Block: n/a

Advantages: Contact (Business, skill-18, available on a 9 or less, somewhat reliable) [3]; Contact (Military, skill-21, available on a 6 or less, somewhat reliable) [2]; Contact (Police, skill-15, available on a 9 or less, somewhat reliable) [2]; Contact (Street, skill-15, available on a 9 or less, Unreliable) [1]; Favor (Medium sized Ally Group, appears on 6 or less) [2]; Favor (Political Party; Patron, very powerful organization, appears on 9 or less) [5]; Reputation (+2 to

political allies, large group of people, recognized on 10 or less) [3]; Status +2 [5; 1 level free with Wealth]; Voice [10]; Wealthy [20].

Disadvantages: Alcoholism [-15]; Dependent (wife, 51-75 point character) [0]; Greed [-15]; Post-Combat Shakes [-5]; Reputation (-2 to political opponents, large group of people, recognized on 10 or less) [-3]; Unfit [-5].

Skills: Administration-12 [2]; Area Knowledge (Constituency)-13 [2]; Area Knowledge (World)-12 [1]; Bard-12 [1/2]; Boxing-8 [1/2]; Conspiracy Theory-7 [1/2]; Detect Lies-11 [2]; Diplomacy-13 [2]; Economics/TL7-9 [1/2]; Fast-Talk-12 [2]; Guns/TL7 (Pistol)-11 [1/2], (Rifle)-12 [1]; Law-10 [1]; Politics-15 [4]; Savoir-Faire-16 [0]; Savoir-Faire (Military)-14 [0]; Streetwise-10 [1/2].

Quirks: Incompetence (Mechanic); Always buys American-made gear if possible; Loves Westerns and war movies; Talkative when drunk; Dislikes children.

Gear: Good suit; Second Chance Standard Vest; mobile phone; large amount of cash; shoes or cowboy boots. Keeps a few guns in his home and office, but rarely carries a weapon.

Appearance: 49 years old; tanned complexion; wavy iron-grey hair; brown eyes; 5'10", 150 lbs.

75-point version: Add +1 to IQ and IQ-based skills; add Light Hangovers advantage; change Favors to Ally Group and Patron; change Wealth level to Very Wealthy.

Richard McMurdo had greatness thrust upon him at the age of twenty-three, when his father, a successful lawyer and businessman turned politician, suffered a minor heart attack while on the campaign trail. When doctors told McMurdo Senior that he was unlikely to survive another election, he began grooming his son to replace him. Thanks to his father's influence and investments, Richard rose through the ranks of the party, and became his small state's junior senator a few weeks after his thirty-fifth birthday. McMurdo Senior died the next year, leaving his son to cope as best he could.

McMurdo's tactic for gaining power is to single out a group with little political power and publicly attack them: depending on the campaign and setting, this may be a government body (such as NASA, the CIA, or a city police department), a private company or club (TSF, Supertemps, the AADA), or a type of person (science fiction fans, hackers, bounty hunters, martial artists, magicians, etc.). Occasionally he will single out an individual as a target -- an administrator, a scientist, a superhero, a publisher of girlie magazines or RPGs -- and become that person's Enemy.

While neither charismatic nor academically gifted, McMurdo has a knack for guessing who can be bought, and with what currency, and for how long they'll stay bought. Fortunately for him, he can afford to keep giving the voters, his allies in the party, and the special interests who pay for his campaigns, what they want. People he can't buy make him nervous, and he will do his best to destroy any who cross him -- though usually he prefers to ruin their reputations and/or livelihood, and will only have them physically attacked as a last resort.

Campaign uses: A PC who has McMurdo as an enemy should expect lots of low-level harassment -- smear campaigns in the senate and the press, problems caused by unusually diligent police and inefficient bureaucracies (license checks, lost paperwork), etc. This may escalate to them having their bank accounts frozen, being temporarily declared dead, being framed for crimes, etc. If the PCs try fighting back, McMurdo will hire a bodyguard and ask his police contacts to beef up surveillance on the group. While he can afford to hire professional criminals for really dirty work -- burglary, hacking, assault or assassination -- he prefers to rely on corrupt cops and spies.

If McMurdo is an ally of the PCs or owes them a favor, he can lend them money or try to arrange government funding (research grants, etc.), halt a police investigation, have their enemies arrested, or put them in touch with the expert they need for a particular job. He may even be able to arrange temporary legal enforcement powers (by having them deputised or hired as "consultants"), legal alternate identities, diplomatic immunity, etc. -- but PCs will have to pay for favors like these with character points.

Other settings: McMurdo is designed for a modern-day Supers or Illuminati campaign, but might be found in any setting where political power can be bought and/or inherited. Only his equipment need be changed: he will always wear the best concealable armor available for the era, but will only carry weapons when it is socially acceptable. In low-tech settings, he will need a larger staff (secretaries and messengers as well as bodyguards); at higher tech levels, these may be replaced by computers, expensive security systems, and robots.

Yoshi and O-kazu, Assassins

Attributes: ST 10 [0], DX 13 [30], IQ 10 [0], HT 11 [0].

Basic Damage Thrust: 1d-2 Swing: 1d

Basic Speed: 6 Move: 6

Dodge: 6 Parry: 6 (Judo) Block: n/a

Advantages: Attractive; Musical Ability +2; Voice.

Disadvantages: Dependent (other twin; loved one, appears on 15 or less) [-48]; Secret (ninja) [-10].

Yoshi

Skills: Acrobatics-10 [1/2]; Acting-10 [2]; Bard-10 [1/2]; Blowpipe-10 [2]; Disguise-9 [1]; Escape-10 [1/2]; Garrote-14 [2]; Judo-10 [1/2]; Karate-10 [1/2]; Knife-14 [2]; Musical Instrument (Flute)-10 [1]; Pickpocket-12 [2]; Poisons-8 [1]; Running-8 [1/2]; Savoir-Faire-11 [1/2]; Sex-Appeal-13 [1]; Scrounging-10 [1]; Singing-14 [1/2]; Stealth-13 [2].

Quirks: Bisexual; Overconfidence, only when drunk; Collects dirty jokes; Mild jealousy; Enjoys lying to the gullible.

Gear: Rope garrote; Tanto (large knife); Blowpipe (disguised as flute); 4 bamboo slivers dipped in fugu poison; 4 doses masuizaki powder; padded cotton kimono (DR 1); medium pouch; traveler's straw hat; sandals.

Appearance: 20 years old; light golden complexion; black hair; brown eyes; 5'4", 120 lbs.

O-kazu

Skills: Acrobatics-10 [1/2]; Acting-10 [2]; Bard-10 [1/2]; Cooking-9 [1/2]; Dancing-11 [1/2]; Disguise-10 [2]; Escape-10 [1/2]; Garrote-12 [1/2]; Judo-10 [1/2]; Karate-10 [1/2]; Knife-13 [1]; Musical Instrument (Biwa)-10 [1]; Pickpocket-12 [2]; Poisons-9 [2]; Running-8 [1/2]; Savoir-Faire-12 [1]; Scrounging-9 [1/2]; Sex-Appeal-13 [2]; Singing-15 [1]; Stealth-13 [2].

Quirks: Bisexual; No alcohol or drugs (but does a great lecherous drunk act); Mild laziness; Dislikes dogs; Loves new costumes.

Gear: Kozuka (small knife), disguised as hair ornament; Combat fan; 4 doses fugu poison; 4 doses masuizaki powder; 4 doses lacquer; Silk kimono; traveler's straw hat; umbrella; fan; sandals.

Appearance: 20 years old; light golden complexion; black hair; brown eyes; 5'3", 110 lbs.

75-point version: Add Combat Reflexes [15] and High Pain Threshold [10]; add +1 to IQ and IQ-based skills; add Bloodlust; raise Judo and Karate skills to 11 [1/2 point each] and add Arm Lock-12 [1/2] and Knee Strike-11 [1/2] maneuvers. Value of Dependent disadvantage reduced to 0.

In 1571, entire ninja clans were wiped out in the battle of Mt Hiei. Yoshi and O-kazu were only babies at the time, but would also have been slaughtered had their mother O-yuri not escaped with them before the battle began. Too paranoid and impulsive to stay in one place for long, O-yuri took the twins with her as she travelled through Japan -- cutting purses in Izumo, working in a brothel in Edo and a slaughterhouse in Osaka, and wandering with a troupe of entertainers before settling down in an inn on the Tokaido Road. She taught the twins to hate samurai, and what ninja skills she could, until she died the day after their thirteenth birthday.

The twins soon found themselves another teacher and protector, a wealthy and unscrupulous merchant named Takeshi. When O-kazu heard her employer wish the local daimyo dead, she volunteered to kill him. He became the first of the twins' many victims. Takeshi himself was poisoned a few years later by his wife and her lover, who tried to blame O-kazu; the twins fled, leaving Takeshi's wife hanging from the rafters surrounded by poems her lover had written her.

Yoshi and O-kazu became wandering entertainers, hiring out as prostitutes or assassins as required. Occasionally one will murder a client if they think they've been underpaid, or a samurai who boasts of being at Mt Hiei, but mostly they're careful not to draw suspicion on themselves. Yoshi likes to garrote his victims, while O-kazu prefers poisoning their food or drinks, but though they usually carry knives and other concealable weapons, both will run or hide rather than fight.

Campaign uses: Able separately or jointly to appeal to most sexual preferences, Yoshi and O-kazu pose a danger to anyone with the Lecherousness disadvantage, and murder most of their victims in bed (though when short on money, they may settle for luring people into dark alleys). Either may be hired to kill a PC, or hired by the PCs to kill an enemy, and anyone harming one of the pair will almost certainly be killed by the other. The twins will occasionally join larger groups of criminals, though rarely for long.

Other settings: Yoshi and O-kazu are best suited to settings where handguns and swords are rare, but with different names and gear, they might appear as wandering bards in a fantasy campaign, as an act in a Roaring 20s speakeasy, or as the pets of a minor crime boss in any era.

Adventure Seeds

Who Was that Masked Man? (for Cliffhangers or Modern Day)

The PCs need to find who has supplied a branch of the Ku Klux Klan with automatic weapons used in a murder. Raji Sahir is able to see the faces inside the hoods, if he can get close enough, but taking him to a Klan meeting (even in disguise) is hazardous.

Hacker Crackdown (for Modern Day or Cyberpunk)

After his website is sabotaged to show a spreadsheet listing donations to his campaign, Senator McMurdo starts making life tough for hackers in general, and tells his criminal contacts to spread the word that he's offering a reward to shut down "Hope Diamond." The PCs may be trying to protect Crystal, or bounty-hunters competing with other thugs for the reward.

Creatures of the Night -- and Afternoon, Evening, or Too Darn Early in the Morning

aka "IOU Bestiary Out-Takes"

by Elizabeth McCoy and Walter Milliken

When composing the Illuminati University "bestiary," space forced us to leave several things out of the final version. One of the most notable lacuna was left by the *Anims*, our attempt to allow *Toon/GURPS* crossovers. (Other nascent plans included actual conversion guidelines for *Toon* characters into *GURPS*. That was clearly meant to rest on some other intrepid author's shoulders.)

Anims

ST: 1-12 **Move/Dodge:** var. **Size:** any
DX: 1-12 **PD/DR:** 0/0 **Weight:** any
IQ: 1-12 **Damage:** embarrass **Origin:** Weird Science
HT: 1-12/# **Reach:** C **Habitats:** Anywhere They're Not Wanted

Note: Anim attributes *never* exceed 12, except that multi-hex Anims have roughly 10 hit points per hex of size.

Advantages: Instant Regeneration, Indestructible (see below).

Disadvantages: at least one Odious Personal Habit (often Practical Joker); most also have the Compulsive Behavior: Be Silly.

Skills: varied, but no Anim ever has a skill level above 12, even with modifiers.

Short for "Animates," anims are sentient creatures made of doesn't-matter (see p. IOU82) by an especially unsuccessful WUSE experiment. These cartoon-like creatures sometimes spontaneously appear on campus, harassing students, staff, and faculty. A few have been admitted as students, or employed as staff or even faculty. Most vaguely resemble normal people, animals, plants, or inanimate objects. All are self-aware (though many are incredibly stupid) and capable of speech, though holding a conversation with one is usually a frustrating experience.

All anims have the advantage Instant Regeneration (see p. CI64), regaining one point of HT every second. They also have the special advantage "Indestructible" -- like demons, destruction of an anim's physical body merely relegates it to some Limbo, and it will eventually return, usually at the most inconvenient time.

Despite the rapid -- and enthusiastic -- destruction of the original anim generator (which was *supposed* to be the ultimate kitchen appliance), new anims appear on campus from time to time. Theories on this phenomenon are varied: some hold that the original anim generator merely opened a gate to an especially strange demonic plane that the other demons sealed away as too dangerous, and mercifully forgot.

Other professors, led by Professor Cootie of the English Department, advocate the "Cootie Theory" -- that like vampires and werewolves, the anim "life force" is contagious, and prolonged contact between anims and normal matter causes otherwise normal animals and objects to become animates themselves. Campus Security favors this theory, as it justifies their efforts to purge the campus of anims (since it *is* theoretically possible to get rid of them, unlike in the "demonic gate" explanation). More importantly, the inevitable massive collateral damage becomes "purification of contaminated objects."

The Team has developed a simpler theory -- that anims are created by art students ("they're all wimps, anyway"), which leads to frequent lynchings in front of the Fine Arts building. Fortunately for the victimized artists, the Team

has yet to figure out how to tie reliable knots.

Variations: Anims will not exist except on a Silly campus. Honest.

Cash Cows

ST: 40-70 **Move/Dodge:** 8/4 **Size:** 3
DX: 8-9 **PD/DR:** 0/0 **Weight:** 1/2-1 ton
IQ: 4 **Damage:** 1d+1 **Origin:** Weird Science
HT: 14-17 **Reach:** C **Habitats:** Plains, Campus Grounds

A project in the Department of Animal Spousery, calves are born a metallic gold color, which turns to green and black as they get older. When fed *precisely* the right diet, they will produce milk with a high concentration of gold flakes (worth at least as much as the special diet, and often a little more). Unfortunately, getting the diet right can be a bit tricky. Mostly, the Department of Animal Spousery just sells them to greedy farmers or ranchers for high prices.

Cash cows will only produce more cash cows when bred to a cash bull (these keep their golden color, and are often referred to, jokingly, as "papal" bulls); bred to a normal animal, their offspring is normal. They produce a respectable quantity of normal milk when not on their special diet, and are fairly typical dairy cows, except for the color.

The bulls are also typical in personality, though slightly smaller than their normal counterparts. Short-tempered, they are likely to react to trespassing students with a charge -- a slam and a trample. The slam (*head butt*) does a base damage of 1d crushing (1d+1 impaling if the bull's horns are long). After knocking the foe down, the bull tramples with its hooves for 1d+1 crushing, halved for running through the hex. It will then turn around and gore the prone victim (or chase a running one), this time doing only half head butt damage because the speed of the charge is missing. If there is anything left, the bull will toss the remains: treat this as falling damage from 5 yards (p. B130).

Variations: In a Weird or Dark setting, cash cows have more normal coloration (though still with hints of oddness), but are otherwise unchanged. Well, the genetic engineer(s) responsible for Dark cash cows may have signed some contracts in blood, but that surely wouldn't affect the cows, right?

Cat-alog

ST: 10+ **Move/Dodge:** 15/7 **Size:** <1 hex-1 hex
DX: 14+ **PD/DR:** 2/4 **Weight:** 15-50 lbs.
IQ: 10+ **Damage:** 3d cut **Origin:** Weird Science
HT: 15+ **Reach:** C **Habitats:** Campus Grounds

Skills: Fast-Talk-15, Merchant-15.

These felinoid sales-creatures are easily distinguished from the ArchDean's cats by their extensive cybernetic enhancements -- think "RoboCat." However, they use their formidable cyborging for one purpose only: to sell things.

Every Cat-alog carries a means of displaying its items (a slide- or holo-projector are most common), and the larger ones will have sample merchandise tucked away in special compartments inside their chromed bodies -- students are advised against attempts to steal samples, since Cat-alog *are* cyborged. They are all capable of reading credit cards by licking the mag-stripe, or they deal in cash by swallowing money and spitting out the change.

The Cat-alog's most innocuous tactic is to position themselves near a group of students -- outside the cafeteria, next to the Adds & Drops building, in front of dorm doors, et cetera -- and start into their selling spiel, repeating as necessary until they've sold something, been driven away, or just decided that nobody around has enough money to buy what they're offering. (Cat-alog *will* make deals, lowering their prices from incredibly over-priced to merely exorbitant.) However, as if their incessant sales pitches weren't enough, they may also corner individual students and, after using

their cybernetic enhancements to good effect, recite their commercials to a literally captive audience.

Variations: Cat-logs are unlikely to appear on any campus but Silly, though a Cyberpunk campaign might have some. A Dark Cyberpunk setting would probably build *human* brains into the animal-esque robot bodies.

Dogs, Stray

ST: 1-12# **Move/Dodge:** 4-12/6# **Size:** 1 hex
DX: 11-12 **PD/DR:** 0/0 **Weight:** 5-150+ lbs.
IQ: 5 **Damage:** * **Origin:** Real
HT: 12-15/4-12 **Reach:** C **Habitats:** Campus Grounds, Real World

Occasionally, stray dogs from the town will wander onto campus -- some of these are pampered pets who have slipped away for a moment (or at least until a reward is offered for their return), some are perpetual strays who stop off at a particular house for a daily handout and some few are feral canines who are attracted by the various fauna -- squirrels, pigeons, rabbits, meeps, and for the desperately hungry, arctic furred turtles.

For the most part, stray dogs are ignored until they get into enough mischief (digging in the gardens, tearing up trashbags, or leaving "doggy deposits" outside the School for Social Anti-Sciences) that somebody will catch the offending beast and call the local pound. However, those canines who try chasing the ArchDean's cats will soon discover what the phrase "Evolution in Action" means as they are abruptly yanked out of the gene pool. Mostly, such foolish dogs just . . . disappear. Rumors of flashes of lightning are surely exaggerated.

Therefore, most strays on campus will be very well-behaved, and restrict themselves to lurching on meeps or begging for handouts from students.

ST, HT, Weight and Move vary greatly, depending on breed. A small lap dog has Move 4, while some greyhounds reach Move 20, with selected individuals hitting Mach speeds and low orbit . . .

Taxi Drivers

ST: 9-14 **Move/Dodge:** 6/6 **Size:** 1 hex
DX: 14-18 **PD/DR:** 0/0 **Weight:** 160-220 lbs.
IQ: 8-10 **Damage:** by car **Origin:** Real
HT: 10-13 **Reach:** C **Habitats:** Roads, Real World

Advantages: Absolute Direction, Absolute Timing.

Disadvantages: Greedy, Illiterate, Bad Temper, On The Edge.

Skills: Area Knowledge-20, Driving-20, English-7.

The ultimate in "wandering monsters," taxi drivers are commonly found on streets (and sidewalks), usually in a cab moving at about 50 mph through a traffic light that just turned red. Naturally, the PCs are trying to cross the street at the same time . . .

Sometimes taxi drivers can be useful for transportation, or to find a particular place or type of place. ("Sure-I-know-just-de-spot-ver-e-ya-kin-find-a-pizza-wid-pickled-newts. Ten dolla.") Just remember, "Taxi drivers don't speak English, and they don't take Illuminati Express cards."

Waterbed Elementals

ST: 9-15 **Move/Dodge:** 4/4 **Size:** 1 hex
DX: 10-12 **PD/DR:** 0/0 **Weight:** 120-160 lbs.
IQ: 8-12 **Damage:** thrust/cr. **Origin:** Weird Magic

HT: 12-20 **Reach:** C

Habitats: Dorms

Presumably these creatures were once free undines (see p. M114), but were captured and bound into waterbeds by sybaritic Metaphysics majors. Or perhaps they are the result of a Body of Water spell gone wrong (or right . . .) and a Bimbira.

However they were created, it *is* certain that waterbed elementals appear as curvaceous humanoid females, and they give the *best* backrubs that bribery can acquire. Their curiously mattress-less homes are standard furnishings in the most luxurious dorm rooms, but it is harder to acquire one for an off-campus dwelling -- possibly they can't survive in low mana areas.

Male versions of waterbed elementals are not yet known, though elementals really are neuters, and ought to be able to take whatever form they wish.

Variations: On a Weird campus, a waterbed elemental will only manifest as a peculiarly sapient waterbed, responsive to commands such as "massage" or "rocking boat mode." In a Dark one, they're probably not actually elementals, but instead are *demons* . . .

Pyramid Review

The Book of Eldritch Might (for d20)

Published by [Sword & Sorcery Studios](#)

Written by Monte Cook

48 b&w pages; \$10.95

The Book of Eldritch Might is full of crunchy stuff that can easily be added to most campaigns with a minimum amount of set up time. There are new feats, prestige classes, spells, magic items, and a new template.

Among the new feats, a new type of feat is introduced, the Eldritch Feat. These feats grant magical abilities or mystical powers. Despite the potential for abuse, they have high requirements so low level games shouldn't suffer, and by the time the character can use them, the abilities of the feats, while powerful, aren't unbalancing at that point. For example, Conjure Mastery grants all creatures summoned a +2 bonus to Strength, Constitution, and Dexterity, while Lace Spell has three sub feats like Elemental Energies, Enemy Bane, and Holy/Unholy. Each one adds an extra amount of damage with a special kick to it. Enemy Bane inflicts +20% damage against that type of creature.

For those more interested in general feats, the manufacture magic poison feat allows the user to invent poisons, a great feat for any assassin with a very high requirement of spellcaster level 1+ and Cha 19+. Other feats include Dreamspeaking, a useful tool for roleplaying out dreams and dream scenes, and magic talent, which gives +2 bonus to Knowledge (arcane) and Spellcraft. At this point, I think it's time that the official feat Skill Focus either go up to +3 for a single skill, or just change the wording so that it's a +2 bonus to any two related skills.

There are three new prestige classes: the embermage (a fire wizard to the Nth degree), the graven one (a tattoo covered spellcaster), and the mirror master (an arcane spell user whose mastery over mirror magic gives him access to new abilities). The focus of each class prohibits them from getting spells every level, so their spells per day are only increased every other level. The Embermage gains special abilities related to fire, such as Burning Touch, which flames burst forth from the tips of his fingers, to Internal Explosion, an ability that allows the Embermage to cast the spell Implosion on another with the special effect of fire. The Graven One gains different tattoos with different abilities. These tattoos have variable times to scribe and duration, but each gives the user different bonuses. For example, some of the basic ones, like Endurance, Strength, or Dexterity, give the user a special bonus to that stat, while Fortification has a 25% chance to negate critical hits. Each has several new spells and abilities that are all covered in this book. Mirror Masters gain special abilities with a focus towards . . . yes, mirrors. Some of their early abilities include Mirror Thoughts, where the spellcaster uses a mirror to read other people's thoughts, and Mirrored Eyes, an ability that gives the arcane spell user another saving throw against gaze attacks. There is a nice selection of Mirror Master bonus spells, including several that are introduced in this book.

Chapter Three covers spells, and that's where the bulk of the book resides. Starting the chapter off is a listing by class of all the spells. The spell list is nice because it includes in it a breakdown for assassins, bards, clerics, druids, sorcerers, and wizards. Usually the non-arcane spell users, especial the prestige class assassin, get left off such lists. While there are a lot of spells meant to do damage and knock out the enemy as quickly as possible, they do things a little different here. Some of them combine different types of damage, so some damage might come from sound, another part from fire. These types of spells are great to shake up things. How can you go wrong with spells like Coldscream, -- half cold, half sonic -- or Acidic Curse which fills a victims eyes with acid? The majority of the spells here of course, fall within Evocation, with a smattering of Transmutation, Necromantic, and Universal.

The new magic items include all categories: weapons, rings, rods, wondrous items, magical vehicles, poisons, and

minor and major artifacts. Some of my favorite items from this section include the magical vehicles. While the Bulette Walker isn't anything great, being a magical vehicle hollowed out former living bulette, the War Throne and War Altar are both impressive pieces. These could finally give a GM a chance to use some of his *Games Workshop* pawns that never quite fit into the setting before. The major artifacts weren't anything special or innovative, being a powerful Staff of Eldritch Might, and Tears of the Gods. Both powerful but not without equal or superior items in other books.

The magical poisons add a nice touch to the mix. Included are almost twenty different magical poisons that range from darkmind, which puts the victim into a coma, to fireheart, which burns the victim with fire damage. One of no-brainer sections includes a new listing of potions that follows the formula from the DMG of spells being potions.

One of the nice things about this book is that the requirements to craft the items is listed. I hate it when a cool general magic item is introduced without the requirements to make it. Want to know how to make a Rod of Branding? You have to be 14th level with Craft Rod with the following spells, silence, and limited wish with a market price of 55,000 gold pieces. Of course the major artifacts don't have such a listing as these are items without peer and can't be recreated.

Chapter five covers magical constructs. This template can be added to many types of creatures and includes two examples, a stone (dire) tiger, and an eleven headed brass hydra.

Appendix I is a random rune description tables. Three tables that allow a GM to quickly come up with different runes. For example, a roll of 54, 60, and 18 provides a spear thrust through a tree inscribed within a red circle. A neat tool for the time pressed. Appendix II is the good old Open Game Content and License, and the book ends with an ad for the printed version of the *Demon God's Fane*.

The book follows the standard two columns of text per page with black and white illustrations breaking up the text. The interior covers aren't used, which is too bad since the open game content and ad could've been placed there and some more spells then been added.

Since this supplement was originally offered as a \$5.00 36-page downloadable PDF, what are the differences between this and the PDF version outside of the price? The PDF version had no spell lists in its original incarnation, but since it was created for the printed version, that's now available. In addition, the PDF version boasted full color art, but not as much as the paper version; in general, the paper version has art that is cleaner and easier on the eyes. The PDF version was also missing some minor parts, like the potions and some of the general feats, but the latter were available for free download prior so that's not a big deal. In other words, if you have the PDF version, you aren't missing too much.

For those who don't have the PDF version and are looking for more spells, prestige classes, and magic items, *The Book of Eldritch Might* is a no-brainer for purchase. Many of the items, like the magic poisons, aren't covered in other products, and the feats can add another layer of power to spellcasters who are already jaded with the vast amount of material out there.

For those wishing to see a sample of the product, check http://www.montecook.com/arch_stuff4.html , a preview of the monster template, for more info.

Dime Heroes RPG and Jungle Adventures Supplement

Published by [Deep7](#)

Written by James Stubbs

Dime Heroes: 11 pages (2.59 MB pdf file); \$3.95

Jungle Adventures: 15 pages (2.79 MB pdf file); \$1.00 when bought with Dime Heroes

Pulp-era gaming is becoming popular again, as more companies release or re-release pulp games. *Dime Heroes* is the newest 1PG RPG from Deep7, and *Jungle Adventures* is the first *Dime Heroes* supplement. Both are e-book releases only. You will need Internet access to download them, and an unzipping program and Adobe Acrobat Reader to use.

Dime Heroes is inspired by pulp stories, radio dramas and movie serials. The main influence in the game appears to be movie serials. It assumes the players and GM are already familiar with role-playing games and the pulps. A GM willing to provide explanations or references could use it to introduce new players to role playing, or his current group to the pulp era.

Character generation in *Dime Heroes* is mostly done with random roll, with skill points distributed by the player, and could be completed in a few minutes. The system uses four attributes (Moxie, Glitz, Cunning, and Gray Matter), rated from 1 to 3, each of which has at least four skills associated with it. To use a skill, add the skill rating to the appropriate attribute, and then try to roll that number or lower on one d6. There are also four other character statistics; Blood, Guts, Wits, and Notoriety. Blood is the amount of damage a character can take, the other three are for special situations.

[SPOILER ALERT]

Dime Heroes comes with a 5-episode adventure entitled, "The Crimson Tiger Strikes!" The adventure is undated, though between the atomic ray that is the MacGuffin and the use of TV cameras to watch the entrance to the Crimson Tiger's lair I would judge the game year to be in the mid to late 1940's. The basic outline of "find the criminal mastermind" would be typical of most of the pulp era. The GM will need to camouflage the railroad tracks in this adventure unless he has very tolerant players. Phrases such as "regardless of the players' actions . . ." are not a good sign.

Proofreading is generally good. The Crimson Tiger's ransom demand drops from 100 million dollars to 1 million dollars in the course of the adventure, and there are a few minor typos that made it through as well, but nothing that should make it hard to understand the rules.

[END SPOILER ALERT]

There are some gaps in the rule system. *Dime Heroes* needs a non-lethal form of combat; currently anything from a fist to a fragmentation grenade subtracts from the victim's Blood, and a character who loses all his Blood is dying. Two of the adventure episodes depend on the heroes taking a prisoner alive and intact enough to rat out his boss, and it would be nice to be able to do that without getting into house rules. Related to this, there are no rules on healing damage in the game. If you're copying the serials, this wouldn't matter -- any heroes not dead at the end of the last episode will be fully recovered shortly into the current episode. If you want to run a game that's more like the pulp

magazines, well, the Shadow needed medical attention during the story on several occasions. The guidelines for using Notoriety are alluded to in the Rules of Play section but not present. The character sheet includes a hit location grid and space for vehicle statistics, but neither is covered in the rules. Guts and Wits need a better description; as it is Wits appear to be *Call of Cthulhu* SAN points that can only be recovered by spending character experience. However, since Wits don't come into play in either of the adventures currently published for *Dime Heroes*, this is a minor point.

Jungle Adventures is meant to expand Dime Heroes into the realm of lost civilizations and Tarzan-esque adventure. The core rules are not included. It provides a new character type (Jungle Lord/Lady), suggestions on modifying the Explorer and Hunter types from *Dime Heroes* to fit better in a Jungle Adventures game, and notes on developing new character types. There is a four-page section on jungle adventuring, from the different types of tribes one can encounter to surviving after the party's bearers run away in fear with the supplies.

[SPOILER ALERT]

Jungle Adventures also comes with a 5-episode adventure, "The Blood God." As with "The Crimson Tiger Strikes!" there is no game year given. Also as with the earlier adventure, it locks players into a given course of action, though this one may be more heavily railroaded than the first. I know several players who would object strongly to the entire party contracting malaria by GM fiat, even if the biologically impossible method from the adventure was replaced with something that could actually work. Player character caution could eliminate the malaria and two other events that the adventure depends on, but the adventure doesn't allow for that. While the "poetic justice" ending written into the adventure is appropriate to the genre, allowing the PCs to eliminate the villain themselves is also appropriate, not a sign that "these people need therapy." (Especially since the author had no trouble with the PCs blowing away all the villain's followers . . .) As a final note, players who know anything about the ancient Maya may need to be reminded that historical accuracy was never a strong point of the pulps.

[END SPOILER ALERT]

Should you buy *Dime Heroes*? If you know nothing about pulp gaming, you would be better off buying a game that includes background information on the pulps and the pulp era. If you want something you can download and run as-is, it will depend on your gaming group. I wouldn't run either adventure without rewriting, but your players may vary. On the other hand, if you want something quick and easy for an impromptu gaming session, *Dime Heroes* certainly qualifies. Ease of play (and the basic game rules printed on the character sheet) would also make this a good game for a convention or game store demo. As long as you're downloading *Dime Heroes*, the extra dollar for *Jungle Adventures* is probably worth it. The adventuring section will never replace my copy of *Lands of Mystery*, but makes some good points. The page on designing your own character types would be useful in any pulp genre.

--Leah Watts

Wanna Bête? The Beast of Gévaudan

"For I was now upon the limit of Velay, and all that I beheld lay in another county -- wild Gévaudan, mountainous, uncultivated, and but recently disforested from terror of the wolves. Wolves, alas, like bandits, seem to flee the traveller's advance; and you may trudge through all our comfortable Europe, and not meet with an adventure worth the name. But here, if anywhere, a man was on the frontiers of hope. For this was the land of the ever-memorable BEAST, the Napoleon Bonaparte of wolves."

-- Robert Louis Stevenson, *Travels With A Donkey in the Cevennes*

It seems that winter is our season for wolves. As the cold settles into the land's every crevice, and the light begins to go, we hear them howling on the frigid boundaries of our subconscious. And sometimes, they don't stay out there. Sometimes, they're not entirely wolves. Something lupine (or some things lupine) came in, and went out, in midsummer two centuries ago, rending and tearing at the vulnerable throat of France's ancien regime. *La Bête Anthropophage du Gévaudan*, the Man-Eating Beast of Gévaudan, left behind almost a hundred deaths in an overture to the Reign of Terror, and made an uncanny exit with a bisociative silver bullet. Hunker down, then, and listen for the crack; of muskets, of twigs, of bones

"[A] wild animal, unknown in our climes, appears within them as suddenly as by miracle, without it being known from where it can come. Wherever it appears, it leaves bloody traces of its cruelty: fright and consternation are spread, the fields become deserted; the most intrepid men are paralyzed at the sight of this horrible animal, destructor of their species, and do not dare any more to leave without being armed; it is all the more difficult to be defended against its force, cunning, and surprises. It stalks its prey with an incredible speed, and in a very short space; as you know, it travels to various places extremely distant from each other; it prefers to attack the most tender age and the weakest sex, and even old men in whom it finds less resistance."

-- from the denunciation of the Beast, to be read from the pulpits of Gévaudan, by order of the Bishop of Mende

In June (around midsummer) of 1764, a young cowherd girl from Langogne, in the province of Gévaudan, in south-central France, became the first person to see the Beast. Her bulls frightened off the creature, which she described as a wolf the size of a cow. Later peasant girls, and children out of doors on errands or at play, would not be so lucky; the Beast killed a small girl that July by ripping the heart from her body. Over the next three months, the Beast struck again and again, savaging victims all across the countryside. When the Beast left corpses, their throats were ripped out, and often their livers were gone, presumably eaten. Sometimes the Beast left only scraps or single limbs; sometimes victims simply vanished. Occasionally, the Beast left survivors, whose consensus description revealed an enormous wolf, with a wide chest, long snout, enormous fangs, and a thin tufted tail. Its long hind legs could apparently propel it in leaps of thirty feet or more, and some witnesses saw a black spine of stiff fur running the length of the creature.

King Louis XV sent first a troop of cavalry, under the imperious Captain Duhamel, in October 1764. When Duhamel's tactics failed to capture the Beast (and succeeded in driving the province to near-rebellion), the King then sent the famous wolf-hunter Denneval to the region. Between February and June of 1765, Denneval killed 74 wolves in Gévaudan, but the Beast killed twenty or thirty more peasants in the same period. Denneval followed Duhamel into failure, and the King's personal gun-bearer, Antoine de Beauterne, arrived to take charge in July 1765. For three months, he studied maps of the area, plotted the reports of the killings, and then organized a final battue. On September 21, de Beauterne flushed the Beast, cornered it with nets, and shot it dead. He ordered the corpse stuffed, mounted, and shipped to Versailles -- the Beast of Gévaudan was no more.

"At the other extreme, we could accept that she was something unique in recorded human experience -- an alien, mutant, or surviving prehistoric monster. Only such explanations fully satisfy the records of her speed, elusiveness, and cunning. You can, of course, choose to dismiss La Bête as merely a large wolf but you will find those two very uncomfortable words 'and yet' keep coming to mind."

-- Derek Brockis, "The Beast of Gévaudan"

Except that it kept killing. The King, however, forbade the new ravages to be mentioned in French newspapers or broadsheets; the situation in Gévaudan had apparently become a critical lever for anti-royal propagandists both in

France and elsewhere. Gévaudan suffered alone through the winter, and into 1766. After the Beast's 96th kill (of an unidentified girl on June 18, 1767), the Marquis d'Apcher, the local nobleman, organized his own hunt -- and on Midsummer's Eve, 1767, a local poacher named Jean Chastel shot and killed the Beast with a bullet variously reputed to be blessed by an unknown priest, made of silver, or both. This corpse, too, after being exhibited around the province, made its way to Versailles, where the King ordered it hastily buried, local taxidermy not being up to de Beauterne's exacting standards.

We can dismiss the claims that the Beast was "just a wolf" with ease; Denneval, who knew wolves, and saw the spoor of the Beast, proclaimed it something different. Wolves, even two centuries ago, seldom attack men unless rabid, and rabid wolves do not make the clean marks of the Beast. The local peasants, of course, knew what it was -- the loup-garou, the werewolf. Cryptozoologist Andrew Gable goes the other direction, suggesting that the Beast was an unknown (possibly atavistic or prehistoric) species of pine marten. In his discussion, however, he unwittingly makes a pretty good case for a big wolverine, which jumps out of trees, attacks heads and throats, and is generally ferocious as all hell.

"If these things that may not be dogs be, their disappearances are as mysterious as their appearances."
-- Charles Fort, *Lo!*

But even wolverines don't have the ability to switch bodies, revive after being apparently fatally shot, dematerialize out of apparently solid traps, and leap thirty feet on level ground. For that, you need a fortean creature like the "vampire wolves" that plagued such locations as Limerick, Ireland in 1874, Edale, Derbyshire in 1925 -- and Orel, Russia in 1893, where that leaping creature (like the Beast) attacked only women and children, killed during the summer (unlike man-killing wolves), and was described as having a long muzzle and smooth tail. The Limerick and Edale cases, meanwhile, sound very much like the Chupacabra, the goatsucking vampire of mid-1990s Puerto Rico. Meanwhile, eyewitness evidence of the Chupacabra has the same long hind legs, extended snout, and black spine of fur as the Beast of Gévaudan! Another creature, again described in almost identical terms (which also strikes its human victims' head and throat), is the chemosit, or "Nandi bear," of Kenya. Over three centuries and three continents, the Beast leaps just ahead of its hunters.

"[I]t appears that he is neither a Wolf, Tiger, nor Hyaena, but probably a Mongrel, generated between the two last, and forming, as it were, a new Species."
-- from the *St. James' Chronicle* (June 6, 1765)

The African connection of the chemosit is intriguing, in light of the fact that de Beauterne's specimen (or its skin) actually turned up in the Paris National Museum of Natural History -- and has been conclusively identified as an African spotted hyena. Which, it turns out, may have been the one apparently owned by Jean Chastel's son Antoine, in a kind of local menagerie. Curiouser and curiouser -- because Chastel shot the Beast two years after de Beauterne turned over that skin to the museum. And because before that so-convenient skin reappeared (after almost 170 years in obscurity), forensic scientists, examining drawings of the wounds on the Beast's kills, definitively identified the Beast as -- a large wolf. Which is the one thing we know it cannot have been.

*"Paul will die at noon three leagues from the Rhône
Two flee the oppressed district of the Tarrasque:
As Mars makes horror his throne
The Cock and Eagle of France, Three Brothers."*
-- Nostradamus, *Centuries VIII:46*

While the Beast has its hunters chasing their tails, we can slide back out of the sunlit meadows of fact into the dark woods of mystery. The Catholic Church officially proclaimed the Beast to be a deformed wolf granted supernatural powers by God to scourge the sins of Gévaudan. Others have accused the Beast of being a propaganda tool (or demonic servant) of the Jesuits seeking to crush Huguenot remnants in the region while embarrassing the anti-Jesuit crown of France. The Chastels have been accused of serial murder (using their hyena as cover), and much is made of the reports of the Beast following a shadowy figure into the woods, and of the sightings of strange "fur-covered" men near recent Beast killings.

[Nostradamus](#), who lived just nearby, albeit two centuries earlier, gives us two interesting clues in his traditionally murky way. The Tarrasque, a fearsome monster (sometimes described, like the Beast, as a wolf the size of an ox), arose out of the Rhône River and laid waste to the land around (including Gévaudan) until he was stopped by St. Martha with a blessed chalice. Nostradamus seems to be predicting the Beast's coming; the "two [who] flee" may be Duhamel and Denneval, while the "Paul" who dies at noon may refer to the Beast's daylight decimation of the town of Paulhac (which is, sadly, rather more than three leagues from the Rhône) in January of 1767. Intriguingly, in this context he disturbingly places Trois Frères (Three Brothers) behind the national and royal symbols of France. Trois Frères, as it turns out, is a prehistoric cave in the Pyrenees (the Beast was often seen in similar caves near Sarlat), famously decorated with the image of a man clad in the skins of a wolf and wearing the horns of a hunter.

"What a career was his! He lived ten months at free quarters in Gévaudan and Vivarais; he ate women and children and 'shepherdesses celebrated for their beauty'; he pursued armed horsemen; he has been seen at broad noonday chasing a post-chaise and outrider along the king's high-road, and chaise and outrider fleeing before him at the gallop. He was placarded like a political offender, and ten thousand francs were offered for his head. And yet, when he was shot and sent to Versailles, behold! a common wolf, and even small for that . . . [yet] if all wolves had been as this wolf, they would have changed the history of man."

-- Robert Louis Stevenson, *Travels With A Donkey in the Cevennes*

Could Nostradamus have been hinting that an ancient [cult of werewolves](#) (possibly including the ghouls of [Glozel](#)) lay behind the royal lineage of France? Could the Beast of Gévaudan have been sent by the shadowy ultramontanist [Compagnie du Saint-Sacrament](#) to warn Louis XV that the true Merovingian dynasty (founded in part by St. Martha, and descended from a triune god) would soon reclaim its own? Was Jean Chastel an agent of the werewolves, or was he rather one of the [Red-Capped Jaegers](#), killing wolves for Liberté, Egalité, and Illuminisme? Does the Beast still lurk in the bisociative darkness between dimensions, like the Hounds of Tindalos, ready to strike when History is about to swing around again? What Revolution do the black ops hunting the Chupacabra through Puerto Rico seek to derail? It's up to you to choose which tracks to follow, and where to aim. But whatever you decide, keep quiet about it. Just hide it in the brush by the side of the path through your campaign's darkest, deepest forest. Like they say in the Gévaudan, when the twigs crack, don't whistle.

Romantics Vs. Simulationists, With the World in the Balance

Well, given how I'm back from the Valley of Death and all I got was a lousy T-shirt, it's time to get back to *coherent* random babblings.

For the next couple of weeks, I think I'll be looking at some of the presumptions of gaming, and try to figure out what they actually *mean* . . . and what it says about our hobby. (Or maybe in a week I'll realize these goals are too dang lofty and start babbling about Pringles . . .)

Anyway, there's an underlying struggle -- a basic presumption as to how games are played -- that seems so fundamental we don't even really talk about it (at least, it's never come up in any of the midnight ramblings with my gaming friends).

Namely, the choice between a Simulationist gaming experience and a Romantic one.

The Simulationist view holds that the goal of roleplaying games is to provide as objective and impartial an experience as possible, and that out of this objective view will come dramatic stories. The Romantic view holds that the goal of roleplaying games is to create dramatic stories directly.

(I suppose now I should explain my terminology a bit. Originally I'd used "Dramatic" in lieu of "Romantic," but I realized that 1) I would receive 870 emails from people complaining that Simulationist games can be dramatic, and 2) I get to use a bit of my English degree. In literature, the Romantic movement tended to create stories that were optimistic, with facts and realism getting little in the way of telling a good story; in general, the Good Guys won. By comparison, the Realistic movement tried to be as neutral as possible, creating stories that tried to be as realistic as possible. Sometimes the heroes won; sometimes they didn't. The Naturalistic movement was generally pessimistic, believing the world is a cruel and hostile place where only the strong survive. Generally the heroes didn't win; in fact, generally there *were* no heroes. For our purposes, I'm swiping Romantic for one label, and lumping the Naturalistic and Realistic movements together and calling it Simulationist. Sometimes the world is a staid dungeon of orcs and treasure; sometimes it's a Shoggothian horror.)

The Simulationist view tends to believe that Rules are Good; if it's heavily codified, it can be done correctly. Is the hero dangling off the edge of a ledge over a boiling cauldron of molten lead? Then the Simulationist would like to know precisely the chances of falling off the ledge, the rules for possible actions the hero can take to escape that situation, and the exact damage caused by the Vat-O-Pain. In this case rules, not the GM, are often meant as an adversary. If a hero gets poisoned and survives, it's either because he got lucky, or he took the correct actions necessary to survive; it's *not* because it's dramatically appropriate for the hero to survive.

The Simulationist view usually has plots that will unfold in a precise way. The nuclear bomb will go off at 5:35, even if the heroes are stuck in traffic. If the heroes are presented with a blind fork in the road, the left one will lead to the Time Critical Castle of Death and the right one will lead to the Dead End Chicken Shack . . . let's hope the heroes flip their coin well.

Point balance often isn't as important to Simulationist games. After all, people in the real world don't all have equal levels of advantages, disadvantages, and skills. Simulationist gamers may even prefer random character generation.

The Simulationist view usually tries to simulate reality as accurately as possible. If the heroes are stuck on a tough criminal investigation, and they're sitting around their office twiddling their thumbs wondering what to do, a well-timed matchbook will fail to find its way into the heroes' hands, the phone won't ring with a traceable call from the criminal mastermind, and a blonde bombshell almost certainly won't wander in with the treacherous twist necessary to get the heroes back on track. But the heroes' thumbs *will* be well-twiddled.

The standard dungeon crawl probably stands as one of the most perfect expressions of the Simulationist ideal. It's a closed environment, it's almost feasible to codify every possible action, and individual encounters can usually be discrete (since each dungeon room can be treated as a separate scene).

The Romantic side, on the other hand, tends to view rules as a necessary evil. After all, it's difficult to create dramatic situations without *some* guide work; the players will probably start to disbelieve if you start too many scenes with, "You find yourself locked in epic battle with Dr. Floon atop the bomb-carrying dirigible hovering over Copper City. And you're on fire." But the dice are meant to be a guide, not a binding contract; if the rules say the hero dies, but it's not dramatically appropriate for that to happen, then somehow the hero will live. (He may not be happy about it, but still . . .)

Plots in Romantic games tend to be more fluid; the nuclear bomb may be set for 5:35, but if the heroes are a bit late it will probably wait for them. (In fact, the nuclear bomb is probably set for a more nebulous time . . . like "as soon as my goon arrives with the plutonium.") If the heroes are presented with a fork in the road, then they probably won't make the wrong choice if it's crucial to the story.

Point balance tends to be a little more important in Romantic games; after all, when so much is left to the GM's discretion, point balance is nice to make sure those arbitrary decisions have some temperance to them. Yes, one hero might be a great swordsman, but another might have an equal level of dance skill. And the Romantic campaign will generally assure that, if a sword fight saves the world this time, then next week the fate of nations will rest on Disco A-Go-Go.

The Romantic game tends to strive to resemble other media . . . whether it's books, movies, TV shows, comics, or the epic anthems of Meatloaf. Reality isn't meant to be simulated, so much as the reality of the other media that is being emulated. Thus while the Bad Guy may get away in the real world, he'll generally be caught in the Romantic world (if that's the convention of the kind of stories being told).

The standard linear plot-point adventure is probably one of the most "pure" representations of the Romantic game view. In these kinds of adventures there are usually several pivotal scenes around which the rest of the game is woven; the heroes may get to control the order of those scenes (depending on how linear the adventure is), but unless they do something wildly unexpected ("The mayor may be evil! Better shoot him to be safe!"), they should get to play most of the adventure in a dramatic fashion.

Now, I don't think one game style is better than the other, and I suspect that many gamers tend to either combine the two worldviews, or use a Simulationist view for some campaigns and a Romantic view for others. (For that matter, there may well be an entire class of play style that I've overlooked.) But they *do* seem ideologically incompatible, and can be the cause of friction between gaming fans who favor -- and argue about -- one form over another. Next week we'll continue to explore these ideas, and see what kind of conclusions we can come up with.

In the interim, if you have any thoughts or comments, or just want to send me haikus extolling your preferred gaming style, feel free to drop an email to pyramid@sjgames.com, or stop by the [discussion boards](#) and join in the conversational bliss.

--*Steven Marsh*

* * *

Last week's answer: Dragon Magazine #100, "Dragonchess" article (p. 38).

(Two stars) "Foul Air of Argument Technique . . . The character can cause a request, project or initiative to become the kiss of death for a bureaucracy. Meetings produce nothing, initiatives fall into pointless squabbling, and departmental infighting hampers even the slightest matters."

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

The Taking of the Twin Chalice

An Adventure Interlude for *Call of Cthulhu: Cthulhu Now!* or *Delta Green*

by Dylan Craig

Overview

The characters have stopped for supper at a roadside gas station and diner. As they dine, an abduction takes place in the parking lot outside. In the company of the manager of the diner, they give chase, and stumble into a nightmarish ritual -- hopefully in time to save the lives of the abductees.

Setup

The characters are approximately twenty miles out of town, headed overland by road toward their intended destination. The skies are clear and the night is warm and still. It is 8p.m., approximately two hours after sunset, and they are halfway through their dinner. The diner is otherwise deserted except for the manager/chef and waitress/cashier. Outside, cars pull into and out of the self-service station at irregular intervals. The surrounding area is uninhabited and uniformly pitch-black.

The Diner

Ray's is a steakhouse owned and operated by Ray Micklewhite and his wife Margaret, who also manage the gas station after hours. The diner offers both eat-in and take-out food, catering to drivers who prefer to pull off the road and stretch their legs as well as those who just want a foam cup of brew and a roast beef sandwich to consume as they drive. Taped classical music emanates from a portable stereo mounted above the cash register, the grill sizzles, the register dings. A screen of plastic ferns screens the diners from the sight of the driveway and their waiting cars.

A Shot, a Scream

The party's meal is interrupted by a single echoing boom from the driveway (Spot Hidden or Pistol skill roll to identify the sound as a pistol shot). A second or two later, there is the roar of a powerful engine and the screech of tires. By the time the characters can get to a position where they can see out of the diner, Ray is vaulting over the counter and Margaret and a man who was standing at the till are charging through the door in the direction of the shot. The taillights of a single vehicle are visible in the distance as it pulls onto the road and speeds off into the night.

The Victims

A woman is lying on the tarmac outside, shot in the head. She is being cradled by the man who was at the till, who is howling in anguish. Margaret is running towards the road, while Ray is dropping to his knees beside the woman to see if he can help. Unfortunately, she is beyond help; a single wound in her temple has blown a channel through her head. Automobile window glass is scattered everywhere, especially in her hair (Spot Hidden or Forensics skill roll will suggest that she was shot at short range, through a car window). There are two packets of takeout food lying on the ground beside the screaming man. The only other car in the lot (apart from the characters' own vehicle(s), and Ray and Margaret's ancient station wagon) is a battered pickup truck parked alongside the woman's body, with its passenger door open. The windows of this vehicle are intact.

A Call to Action

Ray yells at Margaret to come back. She does, screaming that "some old guy got out of that pickup, shot that poor woman, and drove off in her car." The man on the ground moans that his kids were in the car. Ray tells Margaret to phone the cops, and runs back inside for his shotgun and cell phone. As he does so, he yells at the characters to get their car started -- he intends to give chase and hopefully stop the fleeing car or at least call the cops on his cellphone and report on the direction it goes.

Hasty Preparations

The characters may wish to investigate the scene or ask Margaret or the wailing man exactly what happened. Each character has the time to perform two actions or ask either of the witnesses two questions before Ray arrives.

- **The children:** Marisa (female) and Jamie (male) are eight years old, twins, with blonde hair
- **The old man:** Arrived in the truck. Margaret says she has seen him before -- possibly, he lives in the area, or passes through it regularly.
- **The truck:** Is covered in dents and mud, and is at least fifteen years old. It smells strongly of rotten leather and burnt oil. It requires a Drive Automobile roll to get started due to a defective ignition. The glovebox contains a roadmap, a filthy rag, a half-empty packet of loose tobacco, and a shell from a .44 Magnum revolver.
- **The woman:** Her head wound (Forensics roll) is consistent with a large-caliber pistol wound at close range. She is dead. SAN loss for viewing her body (unless accustomed to violence and gore): 0/1.

Ray needs the characters -- or at least their vehicles -- as his own station wagon is not in the soundest condition. He will not accept "It's a job for the police" as an excuse; if that creep gets on the highway, or onto the back roads, the cops will never find him. He is not above ordering the party to help him, using his shotgun as leverage; he was a State Trooper before he retired and would far rather go to court on a Threatening Behavior charge than let innocent children get abducted. The more vehicles and sets of eyes the better, but if only a few of the characters are willing to assist him, he will go with what he has.

A Chase

By the time the characters (and Ray) get onto the road, the headlights are no longer in sight up ahead. Some reckless driving is required (Drive Automobile skill roll; failure indicates that the driver must slow down or crash). At least one vehicle must make 3 driving rolls out of 5 to be in a position to see a pair of headlights turn sharply off the tarred road onto a dirt road several miles up ahead. Ray swears, "He's on the back roads. Now we really have to chase the son-of-a-bitch; those roads are like a spider's web . . . thousands of places to hide." If the party's vehicles do not make at least 3 out of 5 driving rolls, they have lost sight of their quarry. They might still notice the dust trail left by his car, but this will require a Spot Hidden roll at 1/5 skill. Remember that Ray also gets a roll.

A Search

The characters are driving down a moonlit dirt road. A plume of bone-white dust marks the passage of each car; accordingly, the occupants of the lead car will note that the dust raised by the stolen car's passage is still thick and hangs over the road like a cloud even though they cannot see the car's tail-lights yet.

Suddenly, however, the dust trail stops as if cut off, and they are driving in clear conditions again. There is no sign of the car they were chasing. If the lead vehicle slams on brakes without warning at this point, Drive Automobile rolls are required from the drivers of the vehicles behind them to avoid a collision; inhabitants of both cars take 1 point of damage per full 10 points that this roll is failed by if a collision does occur, halved for those characters wearing seat belts (Luck roll if not specifically stated).

A careful analysis of the road confirms that the dust trail of the quarry vehicle stops suddenly, as if the car itself had

stopped in the road. Nevertheless, the car is nowhere to be seen. The level fields stretch off in all directions. There is nowhere alongside the road where the car could have been hidden. A successful Track roll shows a set of tire tracks swerving off the road at the point where the dust trail stopped, but they disappear -- literally, end in thin air -- at the point where they leave the road. Examination of a local road map (such as the one from the truck) will indicate that the road should branch here. But it does not, and there is no indication that it ever has.

A Path Revealed

The characters may stomp around in the fields as long as they like, but the solution to the mystery will only become apparent if a vehicle is driven off the road in approximately the same position as the tracks would indicate. In this case, there is a brief sensation of unreality followed by a horrendous visual effect where the roadside scene parts like overheated taffy, stretching and distorting until it settles into the same scene, except with the addition of a dust-trail-bearing dirt road corresponding to the one on the map. [SAN loss: 1/1d6].

The Hidden Road

The height of the dust trail indicates that the quarry is still several minutes ahead. The characters may continue along the road (unless any of their cars have been rendered unusable by collisions) uneventfully for several minutes, following the dust trail, until they hit a gravel stretch where the dust fades. Up ahead, a bridge over a creek is visible. Characters watching the road alongside the bridge may make Spot Hidden rolls; this will reveal that a set of muddy tire tracks lead from the creek up the opposite side of the bank; it appears that the abductor's car went offroad, crossed the stream, and drove up the opposite bank rather than drive over the bridge itself. Any characters making this observation may warn the driver before he or she reaches the bridge.

The bridge is unstable; any vehicle heavier than a motorbike will cause it to collapse, sending the vehicle smashing into the support span on the far wall of the creek bed. This will cause 1d6 points of damage to all the car's inhabitants, plus 1 point for each full 15 mph that the vehicle was travelling at -- once again, halved for those wearing seatbelts.

Up ahead, a darkened shape against the stars seems to be a farmhouse and barn.

A Sharp Welcome

A mud-spattered luxury car with a warm engine is parked outside the farmhouse. Three Glossolalians are lurking in the darkness between and around the farm buildings. Their stats, and description, can be found at the end of this document. One will attack almost as soon as the characters begin searching the homestead; the other two will circle around and wait until the party are distracted (possibly while examining the body of their cohort) before launching their attack.

A sharp grinding sound can be heard from the barn. Upon investigation, it becomes clear that the winch mechanism designed to drop the fourth Glossolalian onto the ground has jammed, stranding the thrashing creature a few feet above the ground. The barn is otherwise empty.

The Farmhouse

A single-story L-shaped building with a single entrance into a dining room/lounge. The building's windows are small, shuttered, and barred from the inside. No details of the contents of the rooms within can be made out unless the windows are smashed in.

Doors on either side of the bare dining room lead to a kitchen (to the left) and a study (to the right). A single door in the study completes the angle of the L, opening into a single bedroom and bathroom. Hannes Potgieter (see below) and Jamie are currently in the bedroom; Marisa is locked in a secret crawlspace concealed under the bed.

Hannes' Story and Motivations

Hannes' stats can be found at the end of this document.

Hannes was an anthropological researcher for the University of Amsterdam during the Second World War, studying the afterlife-belief structures of several isolated fishing communities along the coast of the Waddenzee. His assistant and companion in his work was his twin sister Janneke. During one of his resupply visits to Amsterdam, he was contacted by a fellow academic who occasionally acted as a spy for the Americans, who asked him to keep an eye on Nazi fleet movements. As a true Dutch patriot, Hannes agreed without hesitation, and for several months he sent back vital information on Nazi fleet strengths along with his research data. However, Hannes was discovered by the Nazis; while he was able to escape into the sheltering arms of the Waddenzee fishers, Janneke was captured and executed as a spy.

Repatriated to America after the war, Hannes refused to let the memory of his sister go. Drawing on whispered legends told to him by the fisherfolk, and combining them with his own research, Hannes grew determined to cheat death and return his sister to life. A half-complete necromantic spell referred to in occult texts as the "Ritual of the Twin Chalice" seemed to be his best bet; this spell would allow him to invest Janneke's soul into the body of another. However, for the ritual to become permanent, the caster's soul also had to be moved immediately afterwards, and its recipient had to be the twin brother or sister of the victim used to hold the Janneke's soul. Initially, Hannes tried to adopt a pair of twin children, but his unkempt appearance and shaky finances kept success from him. Finally, in 1958, he became desperate enough to kidnap two children from a playground and use them as the "Twin Chalice."

But something went wrong; instead of drawing Janneke's soul into the body of the little girl he had kidnapped, the poor victim became a screaming monster, babbling simultaneously in several voices and irredeemably insane. Hannes restrained the babbling thing in the cellar, but only after it had strangled its brother. He attempted the ritual again in 1971 and 1985; each time, the first casting of the spell created a gibbering, slavering creature bent on murder. On these two occasions, however, the creatures didn't kill their brothers; Hannes did, fearful of discovery. Details of these abductions and of Hannes' ghastly quest are recorded in various scrapbooks and journals in the study; photographs stuck between the pages also tell the story of a once-happy academic who was as surely killed by Nazi bullets as his sister.

Hannes knew that he would not be able to perform the ritual more than once or twice more before he lacked the power to fuel it. Since the last failure he has studied constantly, re-translated the ritual countless times, and memorized every last inclination and enunciation. Tonight, when he pulled into Ray's for a cup of coffee and a donut and saw the smiling blonde children in the car alongside, he knew that the time had finally come.

However, his hasty abduction has drawn attention to him, and he knows that he no longer has enough time to complete the full version of the ritual. As the characters arrive, he is hastily casting the lesser Incantation of the Twin Chalice spell, which allows him to switch his soul with another for a few minutes only. Accordingly, he has concealed Marisa under the bed, and clasped the struggling Jamie in an iron embrace as he mutters his spell. As soon as the spell is finished and he hears the sound of the characters moving around the house, he plans to run out of the room (in Jamie's body, leaving the disoriented Jamie staggering around in the room behind him) and head, screaming in mock terror, straight into the arms of the characters.

Once in this position, with the characters distracted by "Hannes" appearing, mumbling and naked, at the door, he plans to either grab a weapon from one of his pursuers or retrieve one of the pistols he has hidden around the house, and make use of the distraction to kill every last one of them before he runs out of time in Jamie's body. After he has dealt with his pursuers, he intends to retrieve Marisa and complete the greater Incantation of the Chalice ritual, binding himself into Jamie and Janneke into Marisa permanently.

If Hannes' body has been killed when his time in Jamie's body is up, his consciousness blinks out like an extinguished candle, and Jamie's spirit returns to its rightful body.

Marisa, once retrieved from the crawlspace, is unharmed.

NPC Stats

Ray Micklewhite

A fat, muscular man in his middle 50s, wearing an apron, jeans, and white T-shirt

STR 15 CON 13 SIZ 10 INT 11 POW 10

DEX 8 APP 9 EDU 9 SAN 45 HP 13

Skills: Grill Chef 60%, Shotgun 40%, Spot Hidden 35%, Track 15%, Dodge 20%, Drive Automobile 30%

Glossolalian

A mumbling female human wearing dungarees, a tight leather hood and harness, with scythes strapped into her hands

STR 11 CON 7 SIZ 10 INT 4 POW 19

DEX 15 APP Varies EDU -- SAN 0 HP 9

Skills: Scythe Attack 50% (does 1d6 damage; 2 attacks per round), Sneak 15%

Notes:

1. If a conscious Glossolalian's facemask and leather gag are removed, the ensuing babble of several obviously unearthly voices immediately causes a SAN loss of 1d4/1d10, plus 0/1 per day of continued exposure.
2. Glossolalians do not need to eat, drink, or breathe, as they are sustained by an immensely powerful flow of magical energy. This energy also augments their normal physical functions; they take one-third damage from non-slashing weapons (including bullets and shotgun attacks). They cannot be stunned or drugged.
3. When they are not roaming his property, Hannes uses a winch system connected to four meathook-bearing chains to winch and suspend these creatures off the ground by their harnesses (which have a built-in ring to accommodate the hook).
4. Hypothetically, if the spell affecting the Glossolalians could ever be reversed, they would revert to normal, although their SANs would still be 0. In this case, their POWs would also drop by 3d6.

Hannes Potgieter

A stooped and wracked old man with eyes lost in pits of shadow and a distracted manner

STR 6 CON 7 SIZ 10 INT 4 POW 7 MP 7

DEX 9 APP 6 EDU 17 SAN 15 HP 9

(in his own body)

STR 5 CON 7 SIZ 7 INT 17 POW 7 MP 7

DEX 15 APP 6 EDU 17 SAN 15 HP 9

Skills: Handgun 65%, Dodge 35%, Struggle Loose 40%, Cthulhu Mythos 13%, Pick Pocket 23%, Sneak 44%

Spells: Ritual of the Twin Chalice (greater and lesser versions)

Notes:

1. Hannes has several heavy revolvers concealed around the house, mostly .44 and .357 Magnums, but he will use an automatic if it is all he can lay his hands on.
2. Hannes' notes are treated as a tome, should anyone carry them away to read:

Notes towards a Dissertation on Resurrective Beliefs among the Fishermen of the Waddenzee (Dutch), +5%, x1, -2d6. Contains Twin Chalice spell -- greater and lesser Incantations. Effects as described above, require physical contact between the caster and the vessels. Greater Incantation is a two-part ritual costing 3 POW and 2d6 SAN, and requiring thirty minutes to cast; lesser Incantation costs 3 MP and 1d6 SAN, and can be cast in a single round, but only lasts 1d100+10 minutes. Greater Incantation requires a Luck roll for success; in the event of failure, victim becomes a Glossolalian as described above.

Designer's Notes: In Nomine Anime

by Genevieve Cogman

In *In Nomine* campaigns, there are some themes which keep on turning up again and again. Concepts such as the Archangel of Judgment going over the edge and Falling, the Archangel of Creation having a secret mission which will ultimately save Heaven, the Demon Princess of Freedom secretly wanting to be redeemed, the return of the Archangel of Purity, the triumph of Hell, and so on.

So, how exactly might these play out in *In Nomine Anime*, you ask me? An excellent question. Let's consider a few alternatives . . .

The Fall of the Archangel of Judgment

Some GMs like to follow a plotline where excessive strictness on Dominic's part, or collaboration with the Demon Prince of the Game (for the highest motives, at the time) have led him down a slippery path towards a Fall. This can unfold in different ways.

Decline And Bitter Fall

(Tragic Romantic)

Dominic's long hunt for heresy and treason has led him down the slope of cynicism into the belief that anything is justifiable as long as it protects Heaven -- and, of course, his is the only judgment that counts. Other Archangels support him without realizing the truth, or are too weak to oppose him. The angels must face the stern, cold-blooded servitors of the Inquisition, who honestly believe that they act for the good of Heaven, and who are prepared to torture or kill them for their own good. Handsome but naïve Laurencians, honest but mistaken Davidians, and others in Heaven stand shoulder to shoulder with the angels of Judgment. Can the angels find allies to shelter or support them while they endeavor to convince Dominic of his error, and to prove that Heaven *cannot* be saved by these methods? Will the innocence and compassion of the angels of Flowers heal the weary Archangel of Judgment, or must he perish by the wrath of Gabriel and Michael? Will it be war in Heaven?

Corruption In The City

(Noir)

The characters have jobs in a gritty down-and-dirty city, as police, private detectives, investigators, criminals, or similar dangerous occupations. If angels, they have to deal with demons on a regular basis, either as enemies or as occasional neutrals, and may even find some demons more congenial than their fellow angels. Slowly, their investigations and their demonic contacts reveal widespread collaboration between angels of Judgment and demons of the Game, with links on the highest levels, which can eventually be traced back to the Archangel and Prince. As their knowledge becomes evident, they will be pursued by agents of both sides, (falsely) accused of heresy by the Inquisition, and must gamble their lives and their hopes of salvation to get help from another Superior -- whether in Heaven or Hell. Gunfights, betrayals, trenchcoats, and at least one doomed relationship with an agent of the Other Side are mandatory.

The Redemption Of Lilith

Another popular theme is that Lilith is one of the more approachable Demon Princes, and may even have the potential for redemption. If so, who will she approach, and what will the result be?

Girls Just Wanna Be Green

(High School)

Characters are pupils or teachers at a high school with an extraordinarily high Lilim population; this is where Lilith sends her innocent young Daughters for basic education before they take up full-time jobs as Tempters. The heroes may be angels infiltrating the place, Lilim being educated, or a mixture of both: other angels and demons are doubtless present. Life is a mixture of crushes, adolescent angst, schoolwork not being done in time, cheating in class, martial arts or sports competitions (probably between angels and demons), everyone pretending to be normal humans most of the time, and inspections by agents of the Game trying to find grounds to close the school down. Occasional visits by Lilith herself prove her to be disgustingly cute, perky, and cheerful, just like her Daughters. Can the heroes persuade her to join up with Heaven? Or would they rather stay at school for a few years longer?

Techno-Apocalyptic-Tempter

(Weird Science Futuristic)

An unusual Lilim has been born from the parthenogenetic clone vats where Lilith creates her Daughters -- one with a conscience, who seems to be able to provoke moral behavior in her Sisters. She's on the run now, hiding in the mass of humanity, looking for angelic help. Will the heroes be able to gain her confidence, and navigate among uncertain Lilim and insane scientists to find out how she was created? How many twisted, misshapen, mutant Lilim are living in the slums and sewers? Is this innocent some sort of ultimate conscience for the whole race of Lilim, their free will given form and choosing to seek the path to Heaven? Is there anybody out there who *doesn't* want to vivisect her and examine her genetic structure? And if they bring her into contact with Lilith, can she redeem her Mother, or will the two of them both be doomed? Alternatively, players may be the unusual Lilim(s), trying to find out who or what they really are and to achieve their destiny, lost and alone in a world of mad science and untrustworthy strangers.

Eli's Wanderings

Many people -- including most of the Archangels -- would like to know why the Archangel of Creation has left Heaven and is wandering across the face of the Earth. He appears from time to time to his own Servitors, but gives no definite answers . . .

Eternity's Children

(Weirdness Hunters)

The characters believed that they're ordinary humans -- until they began to demonstrate strange powers. Now scientists are hunting them for their DNA, criminal conspiracies want to use their abilities, mysterious strangers are muttering about Heaven and Hell, and a street punk artist seems to be the only one who's willing to tell them what's going on . . . The heroes are descendants of the Grigori, angels outcast for the crime of breeding with humans (or maybe children of other celestials.) They must work together to discover their powers and their true nature -- and, maybe, to find their celestial parents. But what plan does the Archangel Eli have for them? Why is he encouraging them to develop their skills, and helping them to avoid pursuing angels and demons? Can they find out the truth before the Apocalypse?

Opening The Gates

(Fantastic Alternate Reality)

Strange gates are opening across the world, as Tethers to the Marches stabilize, and creatures from the Marches start to enter the world of humans. Elves, dragons, superheroes, giant mecha -- it's Eli's work, and most of the Seraphic Council wants his head on a silver platter. (So do most of Hell; this wasn't on their schedule for world domination at all.) Heroes have to try to sort out the fantastic creatures invading the modern world. Should they make exceptions for ethical or noble beings? Can they cope with the vampires and werewolves invading the sewers and forests? Why is Jordi collecting unicorns? How does one cope with a consortium of dragons allying with Marc to buy into the stock

market? Virtuous Martial Artists, Angstful Experts, and Innocent Power-Wielders are needed to fight the forces of evil, whether from Hell or from the Marches, and to rescue those young innocents who are wandering through the Tethers and into the Marches. And why has Eli disappeared now, at the moment of his triumph?

Oh My God! They Got Johnny!

Optional Rules for Snipers for *GEV* and *Ogre Miniatures*

by Eamon Honan

Francois breathed, slowly, steadily. "I am calm," he told his beating heart and trembling fingers. "I am calm," he told his shivering legs. Sweat ran down his back and pooled in his skivvies. His trembling stopped. He breathed again and let his hatred warm his belly.

He snuggled down in his sniper hole and reviewed his guns. He could see the troopers scurrying through the rubble. He flicked from camera to camera, watching the patrol as they made their way closer to the heart of the town. They had not taken the town yet and probably did not want to risk armor units in the warren of ruined buildings. He studied them intently, were they Americans, Brazilians, or British turncoats?

They were past half of his guns now, moving up into the killing ground. He couldn't pick out the officer. He frowned and activated his eavesdropping gear. The patrol stopped dead, conscious of the presence on their radio net. One stopped and tapped the side of his head, others moved forward in a wedge formation, scanning the surrounding area. He watched them, they were good, spread out at fifteen meter intervals. He would probably only get two or three. Probably American; their equipment looked good.

Fancois grinned and triggered the recording he'd made of the Argentinean two weeks before. "Madre dios, madre dios . . . help me momma, help me . . . holy Mary mother of God, pray for . . ." The soldier had cried for help in English, Portuguese and Spanish before he died. It was one of the more useful recordings in his library.

The patrol reacted quickly, fanning out, moving farther apart, using their suit sensors to search the area. Francois picked up curt orders over the net, sounded American all right. The guttural tones of English grated on his ears. He waited until the trooper second from the rear moved up, he flicked to his rear gun and drew a bead. He breathed in and slowly exhaled. It didn't matter with the remote controlled guns, but it was how he had been trained. He squuuuuueezed.

The gun sixty meters away barked once. The trooper took the 20mm round in the back and went down. Shouts and numbers and codewords rattled across the net. Two troopers rushed the gun, the second kicking his jets and lifting twenty meters into the air over the weapon's position firing his rifle as he went. Francois switched guns and tracked. He squeezed the trigger slowly.

The depleted uranium shell scythed off the troopers leg and the man corkscrewed downwards. There was panic in the air, frantic yelps of pain, screaming a prayer he thought. The squad hit the ground and hugged cover. Francois thought of his home, the lasers that had lit up the sky over Marseilles, fighting a losing battle against Combine cruise missiles, their beams searching the night sky, the bright light that left spots before his eyes. He could hear the sobs of pain from the wounded soldier over the radio net. Hatred warmed his belly again.

* * *

There were those who thought the sniper was as dead as the dodo at the beginning of the Last War. Proponents of massed armored formations slugging it out with nuclear weapons saw infantry as a necessary evil at best, a complete

irrelevance at worst. It was primarily through political pressure brought to bear on the Combine High Command by one of its elite infantry formations, the Marine Corps, that sniper survived on the Combine order of battle. The Marine Corps sniper was a specialist, armed with a large caliber accurized gauss rifle and an IR cloak that masked his heat signature and electronic countermeasures that spoofed the enemy's electronic detection gear.

Unfortunately, the Marine Corps sniper was as much an anachronism as his critics feared. A single man with a high powered rifle was simply too easy a target to find and kill. One round, maybe two, was the most he could expect to fire and survive the mission and even then he only had a fifty-fifty chance. Man-portable spoofing electronics were simply not good enough to mask his location for more than a minute of intensive scanning by even a squad of powered armor infantry. Drones made better and more cost effective scouts, depriving the sniper of one more of his roles. Marine corps snipers were reduced to forward observers, lasing targets for the artillery, a job they were overqualified for. Occasionally when intelligence got information that a senior officer was visiting the front lines, they would dispatch a sniper as an assassin. Otherwise the highly trained men who expected to be the terror of the battlefield sat in the rear areas teaching marksmanship to recruits and acting as errand boys for the artillery. Smart asses compared them to the cavalry of the First World War, highly trained, well equipped and completely useless.

It was left to the Paneuropeans to reinvent the sniper after their own elite marksmen were proved to be a bad investment of time, money and training. It was not a happy birth, but an innovation forced upon them by their own strategic reverses. The Europeans were outgunned, out-numbered and almost always on the defensive. In the aftermath of the invasion of France, lack of resources forced the Paneuropeans to consider more cost-effective ways of defense. It was a Belgian Infantry Chef de Battalion, James Ensor, whose unit had been taken heavy casualties in the battles around Brussels that was the father of the new system. Ensor's battalion had been asked to fight a series of holding actions to buy time for retreating troops to be evacuated. After his men had butchered the armor units sent to blast them out of their positions, the Combine sent in assault troops armed with flame-throwers and satchel nukes. The fighting was close and bloody and while the battalion accomplished their mission, they took grievous casualties in doing so. When battalion was sent to France for a period of rest and re-organization, Ensor had some time on his hands and began to experiment with better ways of fighting delaying actions, a function previously served by sniper teams. He took his ideas to the sub-committee on defense and had his ideas ignored. It took two long painful years and a unauthorized "field test" during a Combine probe into Alsace-Lorraine for Ensor to gain the attention of military men of influence. The central committee on procurement reviewed his ideas and prototypes (several of which had seen extensive action) and after one or two revisions, adopted them.

Ensors system was quite simple, a snipers role was still to sow confusion and to shake the confidence and morale of enemy soldiers. Advanced targeting and detection system made this impossible using standard sniping tactics. Ensors essential leap was the move the sniper away from his weapon and to multiply the number he commanded. Each sniper controlled an area approximately a mile in diameter, controlling between six to eight remote controlled 20mm rifles. Throughout this area were scattered cameras, motion sensors and other communications and detection equipment.

The sniper's job was to tie enemy infantry up for as long as possible by harassing them, sapping their morale and restricting their ability to move. A sniper must prevent enemy infantry bypassing his position by using long range fire to attract their attention and lure them into his area. Against enemy armor, the sniper has the choice of either combining fire from all his guns to destroy the vehicle (typically only possible with a light tank or GEV) or strip the vehicle of any supporting infantry leaving it open to an assault from friendly infantry. The more foolhardy try to play possum, allow their position to be over run and then attack the rear echelon units as they move in.

Game Notes

Prior to the game, the player (typically the defender) using snipers will place them in specific hex or on the board. A single infantry squad counter or miniature represents a sniper. The single squad does not have to be identified as a sniper until troops have moved into overrun combat with it. Snipers are static and once placed may not move for the rest of the game. A sniper may "fade away" and be taken off the board, the unit is not counted as destroyed and the opposing player does not gain victory points for it. A sniper may not "fade away" when there are infantry in overrun combat with him. When infantry move into overrun combat with a sniper, they may choose to either to try and flush

him out or move on.

Flushing out a sniper requires the unit to roll under its strength points on a die (d6). Should it do so, the sniper is either killed or frightened away. If the roll is equal to or above the units strength points, the unit is occupied and may not move or fire for a number of turns equal to the number of pips it failed by. The unit may then either move on or attempt to flush out the sniper again. The unit may still defend itself in overrun combat.

Example: A three-strength infantry platoon moves into overrun with what it believes to be an infantry squad. However, the squad is in fact a sniper. The platoon's player decides to flush out the sniper and rolls a d6. He rolls a three and fails to flush the sniper. His unit must spend one turn without moving or shooting, he may then try again.

Moving through the sniper fire is both difficult and potentially suicidal. The sniper may make a 1-1 attack against the unit, which may not fire back. On an X result, the unit loses one squad. On a D result, the unit is pinned down for one turn during which it may not move or fire. Pinned units may defend themselves in overrun combat.

Snipers may in a very limited manner engage armored units, by combining the fire from as many of their guns as possible and expending most of their ammunition, they may make a single Strength 1 attack on an armored unit. This may only be done once per game, after which they must "fade away."

Snipers can be attacked by long-range fire, however, they benefit from all the terrain benefits enjoyed by infantry (double defense in woodland, triple in city). The attacking units are simply pumping ordinance into the general area and hoping for the best, because it is very difficult to target a sniper who is well concealed. Consequently, the sniper is only killed on an XX result. On an X result, enough of the sniper's guns have been destroyed that he is rendered ineffective. The sniper is removed from the board, but no victory points are gained for killing him.

*(Editor's Note: For those without **Ogre Miniatures**, an XX result is any X in a column on the Combat Results Table after the first, i.e. for an attack of 1-1 odds, a "5" is an X result, and a "6" is an XX.)*

Unit Table

Sniper Attack 1 (special) Defense 1 Move N/A Mode N/A Size N/A
Points Cost 3

Notes on the Care and Feeding of Snipers

Snipers are specialist infantry much, like marines and engineers. Well-deployed, they can be devastating; badly deployed, they are a waste of points. Their immobility makes it impossible to re-deploy them if their initial placement is bad, so they should be placed where they can do the most good, in build up areas, forests, and revetments. They are strictly speaking an anti-infantry weapon, so they should be placed where you believe the enemy infantry is going to go. Snipers can be used in conjunction with normal infantry to create an anti-armor team. A sniper occupies the armor unit's infantry screen, while the infantry unit over-runs the armor. Secondly, holding a single infantry unit in reserve in a build up area defended by several snipers can be very useful. While the sniper occupies or pins the attacking infantry, the defending infantry sits back and pours fire into them from a distance.

Garnath Minarsson

A Virtuous Traitor For *Hero Wars*

by Jamie Revell

Background

Garnath Minarsson didn't always like the Lunars. He was born shortly before the Conquest, into a clan that vehemently opposed the invaders. (*Narrator's note: This should ideally be the same clan as the player characters hail from, but if that is a Peace Clan or similarly inappropriate, a close ally or neighbor may be used instead.*) He was a difficult child, and something of a loner, but not so much as to be remarkable.

When Garnath was nine years old, the adults of his Bloodline took part in a cattle raid against a neighboring clan, which went disastrously wrong. Garnath's uncle slew a priestess of the cow-goddess Uralda, and her clansfolk struck back with righteous anger, maiming many and leaving Garnath's own father, Minar, dead in the fields. Naturally, wergild was demanded from both sides, but as Minar was only a lowly cottar, by far the greater fine lay upon his clan. Of such things are feuds often made, but in this case, Garnath's chieftain was so shamed by the death of a priestess, and so afraid that the gods might be angered if restitution was not made forthwith, that he ordered the wergild be paid in full. Most of the final fine of ninety cattle was paid for by Garnath's Bloodline, which was economically crippled as a result. The young boy, already bereaved of his father, could only watch his relatives suffer still further for the actions of one man.

Never able to accept the justice of the decision, Garnath found himself further separated from his kinsfolk and his clan. Once he became an adult, he became a hunter, so as to spend as much time as he could away from the tula, and away from those whom he believed had betrayed him. It was there, out in the wilds, that the final break would come, two years before the campaign starts. He encountered a Lunar merchant caravan that had been set upon by a horde of Uz, who had killed and eaten as many of the humans as they could. Searching through the wreckage, Garnath discovered one survivor, a merchant named Tarala, who, although badly injured by sling stones and spells, had managed to escape from the carnage and hide in the underbrush. Seeing an innocent young woman with no combat skills, badly in need of healing and succor, the hunter resolved to carry her to safety and do what he could to help her recover from her terrible ordeal.

His clan, of course, was outraged. Not only were the Lunars invaders who had stolen their lands, but they consorted with the evil deities of the Predark, who could bring nothing but ruin upon the whole world. They demanded that Tarala be thrown back into the wilds, where she would surely die, thus ridding the clan of an evil enemy without any blame being traceable to them. Garnath refused, unable to see any evil in the frightened and helpless merchant. At first he faced down the clan weaponthanes, and demanded that a healer be brought. When none would come, he stood vigil over his charge, hoping that his kinsfolk would finally see sense. But it soon became clear, even to his stubborn mind, that the clan would not loosen their resolve, and were willing to use violence against him if necessary. He stole a horse from the chieftain's corral, and escaped into the night, never to return.

Garnath now lives in Jonstown (or other suitable city, at the Narrator's option), where he works as a native scout for the Lunars. None the less, he has not taken to the worship of Lunar deities, although he willingly cooperates with those who do. He still holds to the Heortling maxim "nobody can make you do anything" -- it's just that he no longer feels any affinity for his former kin.

Stats

Keywords: Hunter, Varanorlanth

Skills: Butcher 18, Close Combat (Spear) 8W, Close Combat (Unarmed) 6W, Craft Tools 20, Dragon Pass Geography 7W, Endurance 3W, Heortling Customs 13, Heortling Myths 10, Hide in Cover 4W, Know Local Area 5W, Know Prey Animals 18, Listen 19, Mimic Animal Sounds 20, Pelorian Customs 10, Ranged Combat (Archery) 4W, Ranged Combat (Javelin) 20, Ride 14, Running 12, Set Traps 17, Stalk 2W, Track 4W, Wilderness Survival 12W

Magic: Initiate of Varanorlanth 17, Combat 17, Movement 17, Wilderness Survival 5W

Adventure Seeds

Garnath is intended as a minor recurring villain in a Dragon Pass campaign centered on the Sartarite rebellion. He is basically a decent person who has been forced (as he sees it) to break the bonds of kinship that most Heortlings hold dear. Extremist rebel heroes will undoubtedly see him as a traitor, and want to deal with him accordingly. More moderate Heortling heroes might try to understand the causes of his betrayal, and should be given opportunities to return him to the fold. They may come to understand that the issues behind the rebellion are not so black and white as many would suppose.

For all that he has rejected his kinfolk, Garnath is still a Heortling at heart. If he were to discover a Lunar plot that struck at the core of his society's beliefs -- such as desecrating an Ernaldan temple -- he might well try and contact a rebel hero band and the leak the information to them. Will the rebels trust the Lunar sympathizer? And if they do, will they find themselves being lead into a trap after all?

Lunar heroes may find Garnath to be a useful ally, with detailed knowledge of their foe, and skilled in traveling the windswept hills of Sartar. But they should never completely trust him -- at least not unless they can convince him to join the Lunar Way wholeheartedly. If they ever did convert him, of course, he'd lose his special magic, although he might be convinced to join similar cults such as Doburdun or Kenstrata, and remain working as a scout, but this time working in further corners of the Empire.

Using Other Systems Or Settings

Garnath should need little conversion to work in Gloranthan campaigns using systems other than *Hero Wars*. If the GM only uses published *RuneQuest* cults, then Orlanth Adventurous would be the best fit. In other settings, such as Yrth, Garnath could be a former member of any close-knit tribal community, who has abandoned his heritage and taken to civilization -- a nearby civilization hostile to his barbarian kin would be especially appropriate. GMs should emphasize his survival skills, especially in campaigns where a typical warrior or hunter would not be expected to have access to magic to the same degree as they would in Glorantha.

Pyramid Pick

Dragonstar: Starfarer's Handbook (for d20)

Published by [Fantasy Flight Games](#)

Written by Greg Benage & Matt Forbeck

Illustrated by Andy Brase, Darren Calvert, Mitch Cotie, Jesper Ejsing, David Griffith, Dave Lynch, Klaus Scherwinski, Brian Schomburg, Simone Bianchi, Jean-Pierre Targete, Kieran Yanner

178-page b&w/color hardback book; \$27.95

Over the years there have been several attempts to combine the rather vanilla flavored fantasy of *D&D* with other genres. *Ravenloft* added gothic horror, and wooden space going ships were added for a "Space 1492" feel in *Spelljammer*, but there has been no direct combination of classic fantasy and classic science fiction in an *D&D* setting. This situation changes with the *d20* system and *Dragonstar*, which is the first big science fiction and fantasy setting that is not merely an adaptation of an already existing game.

Dragonstar: The Starfarer's Handbook is the launch title for FFG's new setting and the pattern of releases is modeled on the core *d20* books. Thus *Dragonstar: The Starfarer's Handbook* is the setting's equivalent of the *Dungeons & Dragons Players Handbook*, with everything you need to get started -- characters, races, feats, skills, combat and equipment -- but which is otherwise light on background. It does open with a sixteen-page color chapter giving basic information on the *Dragonstar* galaxy, but the DM will still need to buy FFG's equivalent of the *Dungeon Master's Guide*, the *Galaxy Guide*, before a gaming group can get the most out of this setting.

Millennia ago, the normally solitary dragons found safety in numbers as they traveled to the stars. They founded the kingdom, Quesemet, ruled by the gold dragon Khelorn. But a civil war ensued when the chromatic dragons founded their own kingdom, Asamet. After the war escalated to the point where an entire planet was destroyed, dragon kind took stock of the situation. Although it took another thousand years, a settlement unified the two kingdoms into the Dragon Empire to be governed by the ten royal draconic houses. Every thousand years a new dragon from the next house in the line of succession takes the throne; so far, this system has lasted six thousand years. The current emperor is Mezenbone, a red dragon, making this the Red Age, which has another nine hundred years to run. Under Mezenbone, the Dragon Empire has expanded aggressively; sending legions into the outlands to bring numerous worlds into the empire, often under the command of the Drow dominated Imperial Special Police Directorate.

While magic is highly prevalent, not everyone can command the arcane forces, and even those that must study to do so, such as wizards, are not as highly regarded as those to which it comes naturally, such as sorcerers. On the other hand, science and technology can be easily understood, easily mass-produced and wielded by everyone from the lowest of commoners up. However, science does have its limits and the ability to travel faster than light is one. This is when magic comes into its own, because through arcane methods, one can break, or at least circumvent the laws of science. Each starship is fitted with an artefact called a "Starcaster" and its Astronav computer, used to plot teleport jumps. Both are constructed and linked together -- destroy one and the other cannot be linked to a replacement.

Wherever ships go in the Dragon Empire, there is one striking fact about the galaxy -- its uniformity across races and tongues. Orcs, Dwarves, Humans, Elves, Halflings, Gnomes and so on are essentially the same everywhere. The reason for this is simple. The gods wish it so, just as they allow magic to operate in a world of science and technology.

After the first chapter, which explains the basic background, *Dragonstar: The Starfarer's Handbook* provides everything required to play in this setting bar the full background. The next eight chapters cover races, classes, skills, feats, equipment, combat magic, and vehicles. The grayscale layout is very clean and despite using several artists, they each get across a feel for the Dragon Empire and the flavor of the outlands. There is an occasional error in the order of entries, so that (for example) the Hacker and Implant Spellware feats come before Etiquette, but this is a minor quibble. If I have a complaint about the art, it is that none of the equipment illustrated is actually named. This is particularly annoying for the weapons as every player surely wants to know what that cool gun in their character's hand actually looks like. Oh well, this is sure to be rectified with an equipment guide.

In the Dragon Empire you play any one of the races and classes to be found in the *Dungeons & Dragons Third Edition* rules. This could be your Dwarven fighter from the fantasy campaign, where the DM has decided to integrate the world into the Dragon Empire, but *Dragonstar: The Starfarer's Handbook* is really about characters that already live under the banner of Mezzenbone. The races chapter looks at each of the basic races in turn, explaining their place in the empire and their relationships with other species. Except for humans, all races receive new racial traits. Dwarves have gravity sense, Elves receive bonuses to their Freefall and Biology skills, and Half-Orcs receive bonuses to their Demolitions skill due to their violent nature. Interestingly, Halflings receive bonuses to the Piloting and Use Device skills because their size makes them excellent spacers, but the tinkering nature of Gnomes is played up as they have inclinations toward the hard sciences and technology.

Indeed, Gnomes feel that it is the highest achievement to each create a Soulmech, one of the new races in *Dragonstar: The Starfarer's Handbook*. These are robotic constructs that have been given animation and free will by binding a soul directly into them, through the Soul Bind spell. An expensive process, these new beings with old souls, often find themselves beholden to their creators. The other new races available are the Drow, Orcs and Half-Dragons. These latter have a dragon as one of their parents and gain social status for this. But few live for anything other than riches and a pampered existence. The fact that you can play a member of an evil race, such as the Drow or Orc, is covered by the suggestion that not all members of the race are actually evil. Further it is imperial law that an individual be judged by their deeds rather than what is in their blood. Outside of the races given in the *Dragonstar: The Starfarer's Handbook*, any monster race can be used as the basis for a character, subject to DM approval, as they can all be found somewhere in the galaxy.

As with the races, the classes have been reworked slightly to fit the setting. The monk hardly changes at all receiving the new class skill of Freefall, whereas the paladin becomes the sacred warriors of the unification church. They lose the right to a special mount at eighth level, can face prosecution for the wrongful use of Smite Evil, and may have to associate with Drow officers of Mezzenbone's Imperial Special Police Directorate. New classes include the pilot and mechanist (which is the preferred class for Soulmechs), and after discussing the prestige classes found in the core books, provides yet more: the Gundancer -- Monks who have embraced the use of firearms -- *Feng Shui*-style, the Negotiator, and the Technomancer, who try to combine mastery of both magic and technology. A nice touch is that *Dragonstar: The Starfarer's Handbook* also revisits the basic NPC classes and gives us the Thug, the rogue's equivalent of the fighter's warrior class.

The examination of the original and presentation of the new continues with skills and feats as they work in the Dragon Empire. The most important new feat is Technical Proficiency, which allows characters to use most common technological devices and learn to use others. It is a pre-requisite for several other feats, including Starship Piloting, Armored Proficiency (Powered), and Autofire. In general, the Technical Proficiency is a free feat gained by all citizens of the Dragon Empire, but those from the Outlands can also take it as a new one later in their careers, after they have spent some time in the empire. Other interesting new feats include: Dragonblood -- the blood of dragons runs through your veins, giving a natural affinity for arcane magic and make the sorcerer the favored class in addition to your race's; and Implant Spellware, which seems to allow devices to be powered by spells like Darkvision and Enhanced Strength and for them to be implanted into a recipients body. This would appear to be the *Dragonstar: The Starfarer's Handbook*'s equivalent to cyberware, but we need to wait for the *Galaxy Guide* before we will know more.

From guns to robots, the equipment guide covers everything an adventurer might need to carry. There is nothing particularly radical about this section and these are pretty standard science fiction RPG gewgaws. Vehicles and space ships, including their operation are covered in a separate chapter, which includes the deck plans for the small two man

explorer class star ships.

The combat section works to integrate firearms into the standard *d20* game, but points out that firearms are going to dominate most battlefields. The new rules cover firearms used in melee, friendly fire, attacking through cover -- some weapons are rather deadly, suppressive fire, and the ever-popular auto fire. Along the way the chapter discusses the various types of guns and dispenses a little tactical advice for those used to pure swordplay.

Magic does not work all that differently in *Dragonstar: The Starfarer's Handbook*, but how its casters use it is different. Although sorcerers gain the status granted as instinctive spell casters, Wizards can actually make use of the technology. Spells are stored on datapads, which means the need for more space can be covered by the purchase of an upgrade package and the transcribing of new spells needs nothing more than an electronic stylus. Spells can be downloaded from the InfoNet or another data pad and with the right software, spell books can be used to create the digital equivalent of scrolls.

As before the chapter on magic looks at how *d20* magic works in the *Dragonstar* universe, first with general principles and then spells on a case-by-case basis. The spell Flaming Arrow (and any other that affects projectiles) works on bullets as well as arrows! Leomund's Tiny Hut, everyone's favorite nightly refuge even works in outer space! There are over thirty new spells which range from the mundane Refuel; Repair and Inflict Light to Critical Damage on any object or item; and Endure Radiation; to the fun Power Down, which shuts down electrically powered devices . . . even Soulmechs; and its immediate answer, Instant Reboot. The Irradiate spell, which is similar to the spell Sunburn but which fires off beams of high intensity radiation, causing damage and radiation poisoning, is rather vicious. Unfortunately, we will need the *Galaxy Guide* to learn the mechanics and effects of radiation poisoning.

In making use of the *d20* system to power their game systems, many publishers have still forced gamers to radically rethink how their characters are placed in the new world and how they operate. There is nothing intrinsically wrong in this as gamers do this every time they pick up a new RPG. But *Dragonstar: The Starfarer's Handbook* does not do this and I would argue that it is less and more than a *d20* system game. Rather this is *Dungeons & Dragons Third Edition in Space*.

What this means is that a die-hard *D&D* player can very quickly go from the *World of Greyhawk* or the *Forgotten Realms* with little more to learn. Indeed both of these planets, plus any *D&D* world could be incorporated into the Dragon Empire or be placed along the Outlands ready for integration into the Empire. I cannot even think of a *D&D* setting that could not be so integrated, including *Spelljammer!* In this way, the setting lives up to FFG's tagline, "Take Your Adventure To The Stars!" There are shades of both Holistic Design's *Fading Suns RPG* and Games Workshop's *Warhammer 40K* universe in *Dragonstar: The Starfarer's Handbook*. (Indeed, were you to add psionics by using WotC's *Psionics Handbook*, you could use *The Starfarer's Handbook* rules for the *Warhammer 40K RPG* that Games Workshop promised but never released . . .)

A *Dragonstar* campaign can be played from both ends, as citizens of the Empire working along the Outlands encountering strange new worlds or as inhabitants of those worlds being invaded by the Empire. Inspiration for the latter could come from Poul Anderson's *The High Crusade* -- I'll be raiding my Dragon Archive CDs for the appropriate article, or *AD&D's S3, Expedition to the Barrier Peaks* and *Night of the Comet*. For the former, the prospective *Dragonstar* referee should be raiding their gaming collection for suitable adventures.

One problem with *Dragonstar: The Starfarer's Handbook* is the lack of background material . . . but there was not much in the *Dungeons & Dragon's Player's Handbook* either. What little there is, both in the first all-color chapter and scattered throughout the book, is at least intriguing and inspiring for the reader. It is almost enough that you do not need the *Galaxy Guide* to get started with a *Dragonstar* campaign and in some ways, I would like to see more adventures than source material . . . perhaps in the Adventure Booster format.

If you are a DM looking for a *d20* science fiction game then either the *Dinosaur Planet: Broncosaurus Rex, Star Wars*, or *Fading Suns* RPGs are your first choice. If you instead want *D&D3e in Space*, then *Dragonstar: The Starfarer's Handbook* is exactly what you need.

--Matthew Pook

Pyramid Review

Song and Silence (for Dungeons & Dragons)

Published by [Wizards of the Coast](#)

Written by David Noonan and John D. Rateliff

96 pages; \$19.95

The latest installment in the guidebook series for *Dungeons and Dragons* features the two most urban character classes: bards and rogues. While these two classes are quite possibly the most versatile of classes, this book primarily focuses on the two most popular aspects of these classes: music and thievery. There's also a few goodies tossed in for the assassin prestige class.

So, let's break out the old formula and go through the chapters.

Chapter one is the goody that seems obligatory for any *D&D* supplement: prestige classes. And they offer some jim-dandies in this one. For those pining for the days of *Unearthed Arcana*, there is the return of the thief-acrobat, now reworked as a prestige class. Also, there is the Fang of Lolth, which starts with the assumption that a PC tries to access an artifact not meant for humanoids with a Use Magic Device roll. Hijinks ensue.

The rest of the prestige classes, while they are interesting and fulfill crucial roles, do not make stretch the genre my motor run and the way that the Fang of Lolth does. Yes, the crime-fighting Vigilante, the Robin Hood-ish Outlaw of the Crimson Road, and the swashbuckly Dread Pirate do exactly what a prestige class is meant to do: help to define a setting. Got a port city with ships going in and out of it? Sure, Dread Pirate is a possible branch for a character there. It'd be pretty cool to play, in fact. But on the down side they just aren't breaking new ground with some of these.

Also, as can be expected when you have a diverse assembly of prestige classes, not all of them are particularly useful. For example, the Dread Pirate is a cool prestige class. Reading through it, they got some pretty slick abilities that could be fun to play. So, I think to myself, "Could my character go into this prestige class?" Well, the first problem is that not everyone in your party is necessarily a sailor. Which means that either the Dread Pirate will be pirating alone, the rest of the party gets dragged unwillingly onto the ship, or the Pirate is a Pirate without the ability to use the ship he had to own to gain the prestige class . . . it just doesn't fit down dungeon corridors. The second problem is that *Dungeons and Dragons* is a little geared towards . . . dungeons. The information provided for ships explain how long it takes to get from Point A to Point B, not how to use them in combat. It's not really designed for a career of sailing the high seas, getting scurvy and attacking ships loaded with ducats. This might fit neatly in a sourcebook about adventures on the high seas, but seems a little awkward here.

And, as a final quibble (I promise this is the last before I move on to the next chapter), only one of the ten prestige classes has an obvious link to bards: The virtuoso. All the others have more of a roguish slant to them.

Chapter Two is called "Skills and Feats," though most of the chapter is really about how player characters can build their own traps using the Craft (trapmaking) skill. One might opine that this should be in its own chapter, but it's probably placed into this chapter because the volume of other material is significantly smaller in comparison. Besides, I think they're trying to follow a similar formula as the other books in the series. For those not interested in having your player character make traps of his very own, there is a handy section on how you too can make poisons. There's a section on how to use Hide, Bluff and Spot while following someone, a section on concealing weapons, a section on making tumbling more difficult, and then there's the feats.

The feats are all really cool, though I was of mixed feelings regarding the inclusion of a few feats that were originally

printed in the *d20 Star Wars RPG*. While they are all cool feats, and I'd have stolen them from *Star Wars* anyway, it was something of a disappointment to see reused material.

Chapter Three is "Bard and Rogue Equipment." A big chunk of the beginning of the chapter is all about musical instruments a bard can use. They do a few interesting things here. First is the fact that they've given up on *AD&D 2nd Ed*'s tendency to give historical perspective on an item, and instead have created their own histories for the instruments in question. So alpenhorns are now an invention of giants. Goblins have a long tradition of using bongo drums. And apparently dragons have pioneered the conversion of a hookah into a musical instrument. (Personally, I never imagined dragons being that mellow.)

The second interesting thing is that they have applied bonuses to different bardic abilities when using a particular instrument. Drums are good at inspiring courage, but bad at helping people resist charm effects. The lap-harp allows you to have multi-task with your bardic music, creating new effects while sustaining old ones. The whistle-pipe is good for use in countersongs. And so forth. While it may seem like some strange number-crunching exercise designed for min-maxers, it does have the effect of having players suddenly care what kind of musical instrument they have, rather than just wanting something cheap.

Also in this chapter are some new weapons, the most notable being the garrote and the musical instrument bayonet, though there are other nifty items as well. The garrote in particular smacks of "something kinda new" that helps to think outside the box of, "I hit the monster with my sword," particularly when combined with the rules for using a garrote provided later in the book. There's also a section on thief gear, with items that are useful but not exceedingly so, as well as magical items. The magical items are particularly neat, providing some items that just seem intriguing and pretty useful. My personal favorite is the Thief Catcher, a book that eats people who try to read it without permission.

Chapter Four is "Organizations for Bards and Rogues." This chapter provides ten generic types of thieves' guilds, with occasional specific examples, as well as a half-dozen bardic colleges that your PCs can aspire to join. One of the great parts of this chapter is that it actually provides ways to include these organizations into your games without having players be members in them. Which means there are lots of plot hooks to nab your players with when they're tooling around your favorite *D&D* city.

The organizations presented in this chapter are well thought out. The types of thieves' guilds presented provide a pretty decent representation of what you can find in a given city. The bardic colleges are diverse, and range from groups of knowledge hording scholars to an ill-reputed groups of bards obsessed with the study of death to the point that some will speed the process along. The latter group, called "The Lamenters' Order," is the first thing to get me excited about bards in a long time.

Chapter Five is called "You and the World Around You." The first part of the chapter, which comprises the bulk of the section, is all about bards and rogues from a roleplaying perspective. It has great commentary on the scope that is possible with these classes. Rogues aren't just thieves. They can be tricksters, explorers, and even leaders. Bards aren't just musicians, but jack-of-all-trades who blend in the strong points of multiple classes. They also discuss how they may relate to other classes, possible motivations they may have for adventuring, and general strategies for how to play their strengths.

The end of the chapter, however, is combat rules. Not much, mind you. . . just help in clarifying how flanking works, as well as detailed rules for how to garrote someone with the weapon they describe back in Chapter Three. But, still, it's a bit of a jolt after the frothingly good pages about roleplaying.

Last, but not least, Chapter Six is simply "Spells." It primarily focuses on music and sound oriented spells for bards, though there's a few new assassin spells for those who just love that prestige class.

As for the overall presentation of the book, there isn't much to say. The art is decent. The layout is clean and crisp. I haven't noticed any typos. Some of the chapters are prefaced with quotes from the wacky stock characters they introduce in the *Player's Handbook*, like Redgar and Lidda. "How do you do that?" asks Redgar at the beginning of Chapter One. "It's all in the wrist, just . . . like . . . this!" Lidda replies. Those crazy kids.

End verdict? It's a good book. It's not mind-blowing. It isn't going to win any awards. But, it fulfills its purpose. If you play **D&D** and you've bought the other four books in the series, no harm would come of picking this one up. It has useful rules for the game, and some kernels of coolness nestled within its pages that you could possibly even apply to other games.

Dork Tower!

Dork Tower!

Part of a Simulation Nation

This week we continue the topic started [last week](#): Pringles. Er, no . . . varying views of gaming. This week I take a gander at the Simulationist view, and what (in my mind) it has to offer.

With few exceptions, almost every sport movie has a universal annoyance for me. Namely, that the climactic moment of the film is usually The Big Game, where The Fritterstone Underdogs are facing the Snotschool Jackasses, and it's the fourth quarter/ninth inning/third period/eighteenth hole, and the score is Dramatically Close . . . you know what I mean. It all comes down to the bases-loaded grand slam, the fourth-and-inches touchdown, the last-second three-pointer, the final putt . . . whatever.

(An exception to this in recent memory was *Harry Potter and the Sorcerer's Stone*, where the rules of Quidditch are such that everyone else on the field putters around, moot, 'til the Seekers get their act together and decide the game. Of course, the climactic game occurs halfway into the book/movie, and is merely one of eighty-seven million climactic moments to spring out of J.K. Rowling's skull . . . so I guess I can forgive her.)

Now, that Dramatically Close ending immediately causes two problems.

The first problem is, once you get to the Dramatically Close ending, you can only generally go in one of two directions: You either win, or you lose. There are few exceptions to this; most of them involving Zeus being lowered by a rope from a giant apparatus suspended over the stadium. Again my old Creative Writing courses rear their judgmental heads. As soon as you know you've narrowed it down to a Boolean outcome, you've taken away a lot of the dramatic tension out of that scene; no longer is the story a place where anything can happen . . . now it's a place where two things can happen. Oh, and as a hint . . . generally the Bad News Bears win. (For Random Thinkers, I'd point out that I discussed this problem with regards to combat [many moons ago](#), then discussed how I solved the problem [the next week](#).)

The second problem is, as anyone who has watched sports more than once knows, those last-second type of dramatic victories just generally don't happen. You can watch your favorite team all season long and never see that last-second Dramatically Close ending. My own alma mater of Florida State University, for example, traditionally turns opposing teams into tapioca pudding (although last season was the worst I'd yet seen, even losing a game to the Nova High swim team). Most games are fairly boring on paper; 5 to 2 for baseball, 21 to 3 for football, and so on. Most Super Bowls, the most-hyped sports event in America, traditionally have blow-out scores that makes one wonder if the opposing team, in fact, remembered to show up.

(At this point I also feel obliged to note that basketball, for whatever reason, seems to be designed for more exciting endings than just about any other sport. Although I don't think of myself as a sportshead by *any* definition, if I'm channel-flipping and encounter the ending of a basketball game, almost invariably I'll stare slack-jawed at the screen for those last two minutes. Of course, I'll frequently do the same thing for a cat food commercial I find amusing, so I wouldn't read *too* much into this . . .)

Now the interesting thing, in my mind, is that despite the lack of these exciting climactic moments, sports are still wildly popular the world over . . . certainly more popular than most sports-based movies. Why is that?

Well, I have a few theories . . . and they tie into what I feel the biggest appeals of Simulationist RPGs are. The biggest is that the excitement of both of these stems from within, not without.

In other words, there's a basic situation (two teams facing each other, a score set to zero, and so on). And anything exciting happens because of the actions of those two teams. If one team pulls a brilliant sneak play and outwits the opposition's defenses, then that's exciting . . . and dramatic. And those dramatic moments can happen at any time, not just because the referee/director/GM decides this is the best opportunity to craft an exciting moment.

Likewise, any defeats the heroes suffer are their own; if they manage to barely escape with their lives from the

rampaging hordes, that escape becomes its own reward.

(As an aside, over on the [discussion boards](#) one player talked about how the GM killed her character even though he should have lived, because it was dramatically appropriate for that character to die then. That is a naughty, naughty GM, and he gets no biscuit.)

To continue the sports analysis, within the confines of a game, *anything* can happen. One side might score a hundred points and the other side score none. A player might run the wrong way, scoring for the other team. A player might, sadly, get injured or even *die*. Using a rigid framework, ironically, may well provide more freedom for dramatic possibilities; provided you stay true to the game, It can be the difference between riding a roller coaster and driving a car; although the former seems to be more frightening and exciting, those on the ride know that, in all likelihood, the danger is all illusory. (No matter how fast you spin the teacup, it won't break loose.) Not so with driving a car; you have the freedom, while driving in a parking lot, to floor it suddenly and smash into the side of the mall. You almost certainly *won't*, but the limitless freedom you're allowed in a car can be both exiting and liberating. So, too, can a Simulationist game; knowing there aren't any tracks to keep you safe and pointing in the right direction, and being given the freedom to do (or not do) what you want can allow for much more exciting sessions.

To escape from sports and go to another example (which may or may not be related to gaming), take a traditional "mystery." This could either be a *How to Host a Murder* game, one of the old *Crime and Puzzlement* illustrated mysteries, or any of the more "interactive" mysteries (like the old Infocom detective adventures). Or it could be a mystery in a roleplaying game. Anyway, presumably the heroes are given the clues, suspects, and avenues in some fashion to pursue. In all the mystery examples I named, the Simulationist pursuit of the game would be (in my mind) the most satisfying. In this way the player(s) need to sit down with the clues, investigate, and come to a conclusion. It's most satisfying to realize that you figured out what happened on your own, without a fate-provided clue or last-minute hint to save the day.

Of course, the corollary to this satisfaction is that it's entirely possible the heroes *won't* figure out the mystery . . . the bad guys get away, the mystery goes unsolved. And if the purpose of roleplaying is for everyone to have fun, then it's entirely possible that the players *won't* have fun in this situation Just like watching an action movie where the bad guys win, or a mystery that's never solved, many people don't consider games that aren't exciting or inherently dramatic to be a waste of time. (As an aside, foreign movies tend to be a *lot* more liberated in breaking these views than American films; it's entirely possible for a foreign film to have a less-than-optimum ending, where the good guys die and the bad guys win [if good and bad can even be determined]. I think this is great, personally, but the traditional movie-going audiences here tend to disagree . . . if they hire a babysitter, they want to feel good.)

Next week we'll continue our discussion. I'm not sure if I'll keep talking about the Simulationist ideal, or move on to the Romantic view. Let's play it by ear, eh?

* * *

Ken Hite needs to take the week off so he can work on Top Secret projects . . . absolutely *none* of which involve an eel, electrical tape, and an Etch-a-Sketch. Hopefully he'll be back next week.

--*Steven Marsh*

* * *

Last week's answer: Exalted RPG, p. 205.

(*Four stars*) "As bumbling as this comic duo are, it should always be remembered that they can be dangerously effective. . . . If only one of them is present, it will be Skeeve. The odds of baiting Aahz into an adventure away from his apprentice are so low they can't be considered seriously."

Charles A. Lindbergh

by Joe Taylor

Total Points: 444

Born 1902; died 1974

Age 28; 6'2"; 160lbs.

Attributes: ST 13 [30], DX 12 [20], IQ 12 [20], HT 14 [45].

Basic Speed: 6.5 Move: 6

Dodge: 6 Parry: 8 Block: 4

Advantages: Acute Vision +2 [4], Combat Reflexes [15], Courtesy Rank 6 [6], Filthy Rich with Multimillionaire [75], Imperturbable [10], Literacy [0], Reputation +4 (first person to fly nonstop across the Atlantic) [20], Single-minded [5], Status 7* [25], Strong Will +2 [8], 3-D Spatial Sense [10], Very Fit [15].

* Includes +2 for Wealth.

Disadvantages: Chauvinistic [-1], Intolerance (reporters) [-5], Sense of Duty (to America) [-10], Stubbornness [-5].

Languages: English (native)-12 [0]

Equipment: While traveling, Lindbergh packs as light as possible, but often carries one or more firearms.

This represents Lindbergh from 1927 to 1932, during the period between his flight to Paris and the kidnapping of his son. His wife, Anne, would probably be worth 76-100 points and might count as an ally; their children would rate as dependents. Before his famous flight, remove Status, Reputation, and Courtesy Rank. After 1939, give him a Reputation -4 as a Nazi sympathizer and lower his Status to 6. In 1954, his Courtesy Rank becomes that of General. During his lifetime he pursued a wide variety of interests, and the GM could justify giving him 1/2 point in just about any skill.

Biography

What If?

Though it may seem like a trivial event historically, Lindbergh's flight had far-reaching effects, mostly because of what he accomplished after achieving international fame. Turning down over five million dollars' worth of movie deals and endorsement offers, Lindbergh used his fame to greatly assist the aviation industry. Had he died before making his flight to Paris, or if someone else made the flight first, history would certainly be affected. Aviation at the time was a risky business; Lindbergh could have easily been killed at any point before his flight to Paris. Alternately, someone could simply beat him to it; a French team making the attempt was declared missing only just before Lindbergh took off, and an American team was ready to go at the same time. Whoever crosses the Atlantic in Lindbergh's place would be in a position of great influence, which might prove

Charles Augustus Lindbergh was the son of a Minnesota congressman, and grew up with a love of the outdoors and a fascination with airplanes. At the age of 18, he tried to study engineering at the University of Wisconsin, but other than showing an aptitude at mechanics and placing first on the nationally-ranked pistol and rifle team, he found college difficult. After two years, he dropped out to become a barnstormer, performing daredevil aerobatics. In 1924, he enlisted in the Army Air Service Reserve, proving to be the best pilot in the class and earning a commission as a Lieutenant. He then became an airmail pilot, flying routes and training others.

In 1919, hotel owner Raymond Orteig had offered a \$25,000 prize to the first aviator to fly solo nonstop from New York to Paris. By 1927 it remained unclaimed, though there had been several failed (and fatal) attempts. Lindbergh was convinced that it could be done and he set about gaining financial backers and planning his attempt. On May 20, he left from New York City in the Spirit of St. Louis and when Lindbergh landed in Paris 33 1/2 hours later, he became the most celebrated man in the world. Stunned by his sudden fame, Lindbergh was honored with countless awards and celebrations in America and Europe. He was awarded the Congressional Medal of Honor and the first Distinguished Flying Cross in American history. He was promoted to a Colonel in the Army Air Service, and Time magazine created its Man of the Year feature to honor him. The modest, shy young man now found that everywhere he went, he was swamped with admirers and reporters.

Lindbergh used his newfound status to promote aviation and be a goodwill ambassador for the United States. In 1929, he married Anne Morrow, daughter of an American diplomat. Teaching her how to fly, she accompanied him on journeys across the globe as his navigator. Together, they charted routes for airlines -- trips which took them to remote and unusual places. The Lindberghs made headlines daily and were constantly under siege by the press.

On March 1, 1932, the Lindberghs' 20-month-old baby was kidnapped. The media sensation surrounding the slightest clue or rumor made investigation difficult but eventually contact was made with the kidnapers and the Lindberghs delivered the \$50,000 ransom. The child was not returned and its body was soon found within a few miles of the Lindbergh estate, apparently having been killed accidentally during the kidnapping attempt.

Feeling more pressure from the media and fearing for the life of their second child, the Lindberghs moved to Europe. They visited Nazi Germany, where Hermann Goring presented Charles with a medal of honor and showed off Germany's advances in airplane design. Lindbergh delivered crucial information about Nazi air power to the US embassy, but his acceptance of the medal -- and his fascination with German technical prowess -- made many Americans uneasy. Returning to America in 1939, he warned the government of Germany's military power. His visits to England and France had convinced him that those powers would not be ready for a war with Germany, and neither would America. He joined America First, an isolationist movement, and spoke out against American involvement in the growing crisis in Europe. Many mistook his anti-war attitude as actual sympathy for the Nazi cause and he suddenly went from being a national hero to a villain.

When America was brought into the war on December 7, 1941, Lindbergh stopped his protests, determined to help his country in any way he could. That proved difficult when President Roosevelt prevented him from enlisting and kept aircraft manufacturers from hiring him. Finally, Ford Motor Company hired him as an advisor and in 1944 sent him to the Pacific to inspect their planes there. He developed techniques that extended the

crucial in the years before WWII.

Alternatively, if something else were to have gotten his interest as a young man besides aviation, his career could have been very different -- though perhaps just as successful. In our history, Lindbergh dabbled in just about everything and usually proved capable in whatever he attempted. Working with Dr. Alexis Carrel, he invented the first artificial heart in 1935, and his book *The Spirit of St. Louis* won the Pulitzer Prize in 1953. An alternate history could easily see Lindbergh becoming a famous writer, politician, or explorer.

Lucky Lindy and Flying Saucers

Lindbergh had a wide range of interests besides aviation, and liked to push the edge of science. He dabbled in mysticism to test its power, explored archeological sites in South America, and was an early supporter of rocketry. However, despite his interest in UFO phenomena, he claimed that he did not believe they were alien visitors. If there

range of fighters an extra 200 miles, and unofficially flew 50 combat missions.

After the war, he was able to withdraw from public life, being commissioned as a brigadier general and serving as a consultant for the Strategic Air Command. During the 1960s, he became a tireless promoter of the conservation movement. He also took an interest in primitive cultures and briefly lived with tribes in Africa and the Philippines. He died of cancer in 1974 and was buried on the Hawaiian island of Maui, where he had recently moved.

Encountered

Despite his fame, Lindbergh remains modest and approachable, even friendly. However, he rarely lets his feelings show other than giving a slight smile. At social functions, he will be polite but secretly uncomfortable and he tries to avoid the press whenever possible. He is straightforward and unapologetic. He will pursue anything that catches his interest, and heartily support what he feels is important.

Whether searching for previously-undiscovered Mayan ruins from the air, spending a few months living with Eskimos or islanders, or just touring around Europe, the globe-spanning Lucky Lindy could pop up literally anywhere.

Further Reading

- **Lindbergh** (Berkley Publishing Group, 1999). Bergh, A. Scott.
- **The Spirit of St. Louis**. Lindbergh, Charles.

was any hard evidence to the contrary, he once said, he would have been aware of it. An interesting statement, considering that he had personally arranged funding for scientist Robert Goddard to set up a research facility in Roswell, New Mexico.

Crime of the Century

Two years after the Lindbergh kidnapping, Bruno Hauptmann was arrested for the crime. The trial was highly sensationalized; there was a mountain of evidence against Hauptmann but it was mostly circumstantial and he never confessed, even after being found guilty. Many have since speculated that Hauptmann was innocent, or at least one member of a gang of kidnapers.

Though the motive for the crime seems to have been the ransom money, perhaps there was more behind it. The first-born child often has significance in mysticism and myth. Perhaps cultists (or, say, the Cabal) were actually behind the crime, believing the child of the world's most famous

aviator would be a powerful sacrifice. Even darker, in some myths, the first-born child is taken as payment for demonic favors. Perhaps Lindbergh's Paris flight and subsequent fame came with a dreadful price.

The Kobb Group

by Alice Turow

Edward was an early adopter of technology; he had insisted his wedding photographs be taken with Kodachrome. Color pictures -- true color, not the painted daguerreotypes that were so popular earlier -- were a rarity in 1937. Jessica loved those pictures. Unfortunately, the process was unstable prior to 1939.

Edward looked at the picture frame. It didn't contain a photo anymore, except by the most generous of definitions . . . just a white sheet with a hint of green in some places that was almost visible if you squinted and imagined. And remembered. Jessica died shortly after man walked on the moon. The frame sat to the left of his typewriter, in his windowed office.

Kelly entered his office, startling Edward out of his past. "Hate to disturb," she said, her face beaming with youthful energy, "but I just wanted to remind you that we'll need the Hamilton file closed before 5 tomorrow. Mr. Kobb has assured us all there would be dire consequences if it wasn't done."

*"Ah. Yes, I know, I know. Thanks, Kelly. I'll have it done soon." Kelly smiled, did a body-bobbing nod, and left. Edward looked at the Hamilton papers on his desk. What they referenced, what they represented, what they **meant** -- if anything -- completely eluded him. He knew what needed to be done, just not why. He ran his hand through his hair, still naturally brown after all this time, and sighed quietly.*

"You're lucky, Jessica," he said, addressing the frame in a quavering whisper. "You only faded away . . ."

* * *

The Kobb Group seems, by all outside appearances, to be a normal business. Its three-story building houses 87 employees (or possibly less, if there are recent departures), and it has been a part of the city landscape for as long as anyone can remember. Before 1937 it was known as the Kobb Foundation, the century before that as the Kobb-Westman Conglomerate, and the century before that as the Kobb & Westman Atlantic Trading House. The business has been wholly owned by the Kobb family for over a century at least, presumably when Westman was bought out.

The Kobb Group offers standard -- if uninspiring -- compensation. Its employees tend to be paid a modest salary . . . enough to ensure a middle class life. Health benefits are provided for the employees and their families, there is a "retirement" plan, and from their first day all workers get one week of vacation and one week of sick leave a year. But these benefits are flat; salaries keep up with inflation, but nothing more. No employees get more than their one week of vacation and one week of sick leave. And while those in higher levels of the company -- the managers and department heads -- *are* paid more for their efforts, it's not so much more that there is significant aspiration within the company for advancement. And they still aren't given any more vacation or sick leave.

The Kobb Group also has a peculiar secret. Its employees will remain at the age they were when they became employed by the company, for as long as they continue working there. Thus, its employees are effectively unaging -- for the small cost of eight hours a day, five days a week, fifty weeks a year. Forever.

This secret is not common knowledge; in fact, it isn't even spoken of by long-time employees. The job is monotonous enough that most employees leave within a few years, unaware of what has happened. For those who have been there long enough, it's simply presumed they will understand what is happening. Lunchtime conversations are generally veiled in phrases like, "We've been working together a long time," or "This job doesn't pay much, but there *are* other

benefits."

The Mechanics of Immortality

"Adam announced his retirement today; he's leaving in a week. He said he's been with the company too long. He says he's tired. On Tuesday we'll eat cake, solemnly. By Friday he will be dead."

--Journal entry from Kelly Gale from Tuesday May 4th, 1937.

Those who work for the Kobb Group are not truly immortal; they simply do not age while employed there. The moment they lose their job -- whether they quit or are fired -- whatever time they have had thwarted by working at the Kobb Group returns, aging them the full amount over the course of a week. Thus an employee who leaves after seventy years would age ten years a day for a full week. Of course, employees who worked there an exceptionally long time -- or those that were already older when they started -- may find the results fatal before the week is up. There are no other adverse physical effects of leaving the job. If, for some reason, the person goes back to work for the company, the lost years do not return.

There are also no other benefits of working at the Kobb Group. The job does not bestow health, nor grant any other powers or boons . . . although every once in a while someone brings in doughnuts on Mondays.

The Company

"Those without an eye to the past cannot hope to thrive in the future. To that end, the Kobb Group is dedicated to bringing its clients up-to-date and accurate information, analysis, and extrapolation. We carry out these goals with efficiency, confidentiality, and integrity. Yesterday, today, and tomorrow, the Kobb Group will be there for your needs."

--Excerpt from the Company Statement section of *Kobb Group Employee Handbook*

On the inside, the Kobb Group is an uninspiring company, to say the least. At a glance, it doesn't seem like its 87 employees actually *do* anything, beyond filling out and filing papers, sending faxes around the world, issuing memos to each other, and other bits of tedious office work. An in-depth investigation, however, reveals that the first glance is entirely accurate. The Kobb Group has more than enough clients to keep everyone busy, despite the fact that no one actually *recruits* new clients (unless Mr. Kobb does such himself directly, as some on the inside theorize). And what -- if anything -- the Kobb Group actually does for those clients is anyone's guess.

The entire organization seems to revolve around pointless paperwork; those who ask too many questions are given "evaluations," are saddled with even *worse* drudgery until they learn, or -- in extreme cases -- are fired.

The Kobb Group is divided into five sub-organizations: Information Analysis, Customer Relations, Data Processing, Financing, and Internal Affairs/Human Resources. Each of these subgroups has 16 employees plus one manager. Although it's difficult to say what (if anything) each group *does*, it's generally presumed that the "information, analysis, and extrapolation" of the Company Statement loosely correspond to Customer Relations, Information Analysis, and Data Processing. Customer Relations, contrary to its name, almost never deals with actual people; instead it's responsible for processing paperwork and data directly submitted by the clients (presumably). Financing seems to deal with both clients' and the Kobb Group's monetary matters . . . although both are equally inscrutable. Internal Affairs/Human Resources is perhaps the most lucid of the departments; they deal exclusively with the employees, internal correspondence and supplies, and bureaucracy of the business itself. Although many new to the company believe that IA/HR is the best section to work for -- since it's the only section that makes any *sense* -- longtime workers realize that this is not without its price; new employees often engage in politics to try to get those jobs, and Mr. Kobb seems to pay special attention to that department. And IA/HR usually has the unenviable task of firing employees . . . generally knowing full well the consequences.

The five managers of this department report directly to Mr. Kobb. Mr. Kobb (no first name known; if pressed for a "full name" he signs documents "Kobb VI") can override or modify any decisions of the department heads; he does

this often enough to make the managers nervous. He can also take an interest in the progress of specific projects, or the performance of specific employees. Mr. Kobb looks to be in his late 40s, and is generally affable . . . although his demeanor can change at a moment's notice. At those times he can be coldly cruel yet detached, and a shudder runs down everyone's back whenever he firmly tells someone to "clean out [his] desk. Now."

There is one other employee at the Kobb Group: Mr. Kobb's personal secretary Judith Iecur. (Heaven help anyone who mistakenly calls her Judy . . .) She has been here longer than *any* of the other 85 employees can remember; she can answer any question about the company without hesitation, and is aware of minutia regarding clients that no one else is. Young-looking -- in her late 20s, at most -- Ms. Iecur is constantly moderated and cool; she serves as the gateway to Mr. Kobb (who generally has time for all employees . . . provided it is important), and no piece of paper leaves Kobb's office without also having her initials. There are those who suspect -- very quietly and privately -- that she may be the *real* power behind the company. Or maybe she's something completely different . . .

Thus the company employs 85 people, plus Kobb and Iecur; there may be fewer employees if there have been recent departures, but there are never more. In fact, for as far back as IA/HR has records (and is willing to share them) the company has *always* had 87 total employees. Whether or not this is significant is a matter of debate.

The Kobb Group always seems to be behind the times technologically. In a modern setting they don't have *any* computers (although they have several fax machines); some desks have electric typewriters, but most have old manual ones. Those who have worked there a while remember how long it took to even get *those* in . . .

Employees are discouraged -- but not forbidden -- from bringing in their own technology. However, it *is* generally forbidden to store any company information on personally owned items (although some still do such); thus an employee could use a palm-held computer to store appointments or personal company data, but couldn't store client information therein. Some people bring in radios, a few people bring in tape players, and one new employee has brought in a CD player . . . which many others view with suspicion. There *is* a water cooler.

There is no security system in the building (which itself looks ancient), beyond old reliable deadbolts. If the building has ever been burglarized, no one has ever noticed or reported it.

Company Policies

The Kobb Group has a very strict stance regarding its time off. All vacation days must be scheduled ahead of time (although only a week's notice is required to use vacation time). "Sick leave" can be used for any purpose at all, without notice . . . but taking any more time off than the allotted week will result in immediate termination. This can make those unlucky enough to contract any serious illness *extremely* nervous. The company is willing to give an extended leave of absence for women expecting children, but the unaging properties of the Kobb Group treats this departure as unemployment; the results on both mother and child can be tragic. As a result, long-term female employees of the company tend to be *very* careful with their private relations; some have even forgone sex entirely, just to be safe.

There are no company-wide vacation days given; if an employee wants Christmas off, he can use one of his five days. There are no exceptions. And Mr. Kobb and Ms. Iecur *never* take a day off. Employees must all work 8:00 AM through 5:00 PM, with an hour-long lunch to be taken when they desire (although that time cannot be used to arrive late or leave early). Tardiness will count towards the employee's sick leave. Neither vacation or sick leave may be accrued from year to year; any time not used is lost (although the employee *does* get monetary compensation for those days). Beyond these rules, and presuming the company doesn't break any laws or do anything egregious, the company is surprisingly tolerant. Employees may talk or associate with each other on company time, assuming they get their (not insignificant) work done. To that end, employees will often celebrate each others' birthdays (itself an ironic ritual for those who work there) on company time, tell jokes, and do any of the myriad of little defiancees that compromise an office. Provided the employee does his job, he's assured a job for life . . . with all that entails.

Given the oddities of working at the Kobb Group, they have surprisingly few problems with the government. Laws that their policies would seem to break elsewhere -- most having to do with vacation and sick leave -- are not prosecuted.

In fact, in-depth investigation will show that there are loopholes, provisions, and exceptions, seemingly tailored *just* for this one company. Likewise the employees will never be hassled by any government agency for being of an unnatural age; the Department of Motor Vehicles will blindly nod and give the license to the person whose birthyear is listed as 1911.

The Hidden Rules

Although the company doesn't have many rules, the *employees* have adopted fairly intricate rules of conduct.

As previously mentioned, the unaging effects of the company are not mentioned. If an employee *does* inquire too much into the phenomenon, he will be quietly told by another worker that no one talks about such things.

Intercompany romances are not forbidden, but they are strongly discouraged by the employees; knowing that you may need to work in the same office with an ex-relation for the rest of time will do much to discourage such affairs.

The company is not discussed outside the company. Secretly the employees fear that -- should the outside world learn of the Kobb Group's unaging properties -- there would either be a rush of prospective employees, an in-depth investigation into *why* the company has this effect, or something worse. The longest-lived of the workers fear that anything which upsets the balance may cause the company to close down, or keep them away from work for more than a week . . . either of which could be fatal.

In fact, anything that draws undue attention to the company is greatly discouraged. This includes the obvious, like talking to a reporter about the company, but also the not-so-obvious, like maintaining relations too long. Those who work for the Kobb Group for many years find themselves needing to sever ties with family and long-time friends, lest they become too suspicious. The only exception to this rule goes towards spouses, provided they can be sworn to secrecy. Of course, such marriages often have other strains put on them . . .

Nepotism is forbidden. In fact, relatives and friends are strongly discouraged from even applying for work at the office; the potential for problems is considerable if the only thing keeping a loved one from getting a job is getting someone else fired.

If an employee breaks any of these rules, the other employees generally do their best to make the offending person's life miserable. Files will take forever to get found or copied, parking spaces will be filled with nails, The person then usually has three options: reform (at which point the torment normally stops), endure the misery (which, as far as anyone knows, could last for all eternity), or quit (with the resultant consequences).

As a rule, no one tends to break these rules *after* they leave the company either. Those who would, say, threaten to report what they know to the press tend to be persuaded not to. In extreme cases they may disappear entirely.

The Psychology of Working at the Kobb Group

The mindset of those who work at the Kobb Group is varied, and employees' reactions can depend on their own mindsets, how long they've been working, and what their life outside the company is.

Some employees can't deal with the monotony of the job, and the relative scarcity of perks. Those workers tend to leave quickly, before they even learn the *real* benefit of working there.

Some people at the company see the incredible advantages the employment offers. After all, millions of people spend their lives working at places they hate; at least this company gives the possibility of longevity. One employee wrote a Pulitzer Prize-winning book pseudonymously over the course of forty years. Another has devoted his time to recording as much lore as possible about European history. And one employee has been working for over a century, taking meticulous notes, analyzing scraps of information, and doing research, trying to discern what's *really* going on at the Kobb offices . . .

And some people at the office -- perhaps the majority -- view their employment entirely neutrally; they don't even think about it, really; they put their time in, go home, watch television until they fall asleep, and go to work the next day. These people may find it hard to even realize how long they've been working there. Those with more lucid (or paranoid) minds at the company wonder if their zombie-like state is entirely their own fault.

After a while, many employees find themselves in a quandary. They realize they hate working for the company and want to leave, but are afraid. After all, going from 26 to 66 in a week is too much for most people. Unfortunately, that decision doesn't get any easier; eventually, it becomes a choice of living in a situation they hate, or certain death.

Using the Kobb Group in a Campaign

The Kobb Group is open-ended enough that a GM has many options for using it.

Here are some possibilities.

- **Weird Immortality.** Vampires are lucky; drinking blood only takes a few minutes a day, not 2000 hours a year. But vampires also don't tend to hire new recruits via want ads. If a GM or player is looking for an alternative for any of the "classic" immortality hooks, working for the Kobb Group provides such a means. And, given the restrictions of working there, in many systems the disadvantages of working there will partially or entirely offset the advantage of being unaging.
- **The Secret.** What is happening at the Kobb Group could be the focus of an adventure, a series, or an entire campaign. It may be part of an evil plot, an unusual coincidence, or something entirely alien. In *In Nomine*, for example, it may be a Demon Prince's means of extracting Essence out of humans, or some more grandiose plot. (Malphas or Kronos would be logical choices.) In *Call of Cthulhu* the company may be part of an *incredibly* slow ritual, whose participants are unknowing, and the final outcome of which would be suitably . . . interesting.
- **An Onion's Layer.** Given the nature of the company, it should be easy to include as an element for many kinds of plots. The Kobb Group might make a mysterious red herring for another plot (if, say, an employee happens to be involved with some *other* mysterious force). Or maybe the plot is tied mysteriously to Westman, whose name used to adorn the company . . .
- **An Alternate Prison.** If all the heroes of a group start as employees of the company, the campaign can begin with them trying to either determine the secret, using their agelessness for their own benefit, or working up the nerve to quit. In this case, the "actual" age of the heroes should be determined as advantages or disadvantages; it's not as much a risk for an employee who has been working there for two years, versus one who's been there a century. (On the other hand, one who's only been there two years may not know what he threatens to lose if he quits . . .)
- **McGuffin of Lore.** The Kobb Group can hold any kind of plot device for a campaign. It may employ someone who has accumulated information over a long period of time, or it may contain an item that has been lost (or hidden) for centuries. And once they interact and investigate, they may well be drawn into the company's own plots.

Alternatives

The Kobb Group can be moved into many other genres or eras without much difficulty; the basic premise is fairly straightforward. Perhaps the only thing to remember is that the more common unaging is, the less special the company is. If a cyberpunk setting has eugenics drugs, for example, then the Kobb Group's secret isn't as interesting (although it might be a curious alternative for those who are unable to afford it).

Lighter Options

If you want the Kobb Group to be lighter in tone, all you need to do is change the nature of the company. Perhaps the company's employees are really helping to sort out Marc's finances in an *In Nomine* campaign. Perhaps they are responsible for keeping the paperwork of Project Utopia's altruistic deeds in order in an *Aberrant* game. Perhaps

they're helping to compile Santa's Naughty/Nice list. Regardless, actually completing a goal that has some worth does a lot to shave the sinister edge off the company.

Likewise, reducing the side effects of quitting also lightens the tone. Perhaps any years gained by being employed there *don't* come back to haunt the worker. Perhaps they can get more vacation time, or more flexible hours. (The latter can be important for crafting adventuring possibilities if the heroes are employees of the company.) Perhaps working there makes the employee truly *immortal*; that would open up all sorts of possibilities (as well as new dilemmas).

Darker Options

Making the Kobb Group darker in tone is challenging; if the company is *too* demonic, then it's difficult to justify why people work there. Some possibilities include:

- Those who work there are unaging. Those who leave, die. (Whether death appears natural or gruesome is the GM's discretion.)
- The longer employees work there, the more they realize they are working for some demonic, alien, or otherwise sinister force. Employees are then faced with the horror of knowing they work for evil, yet knowing that they cannot leave.
- Employees *can* advance in the company. There are additional benefits for higher-level workers, and managers wield new advantages and powers (perhaps some mundane, some wondrous). This would probably cause cutthroat intercompany fighting; if employees have reason to work harder, backstab, or scheme, they very well might. And if they *don't*, someone may be planning to backstab or scheme against them . . .

* * *

"Mr. Kobb?"

"Yes, Edward? Er, it's all right, Judith . . . I can handle this."

Ms. Iecur left the room as Edward approached the desk. "Today I have written my one millionth zero, since I started counting 50 years ago. I didn't count before then, but 50 years ago the president was shot. 50 years ago my life began losing meaning; six years later killed the meaning that was left."

"What are you trying to say?" asked Mr. Kobb; there almost seemed to be a pang of emotion in his voice. Anticipation? Nervousness? Excitement? Edward couldn't tell.

"What I'm trying to say, sir, is that I quit. I've given you a million zeroes, and I quit."

"I see." Mr. Kobb offered him a cigar -- which he refused -- then lit up one himself. "You do realize what that means, then . . . don't you, Edward?"

"Yes, sir, I do; that's why I'm quitting."

Mr. Kobb nodded and shook Edward's hand firmly. Edward then turned around and walked out the office. He didn't look back.

Pyramid Review

Mage Knight Dungeons

Published by [WizKids](#)

Written by Michael Mulvihill, Kevin Barrett, Ian Reddit, Matt Robinson, and Jordan Weisman

Starter Set: \$19.95

Booster Set: \$6.95

Dungeons Builder Kit: \$14.95

Miniature Wargames figures and the term "collectible" would appear to be quite incompatible, but the publisher, WizKids have certainly proved that this is not the case. Their collectible miniatures wargame, *Mage Knight: Rebellion*, has been something of a hit, with both clever design and marketing. The marketing in that the game was sold like a collectible card game -- you bought an \$18 starter set and then added as many \$6.50 booster sets as you wished. Once you got the boxes open you found the rules and everything you needed to play, but most especially the miniatures. These were done in tough plastic and came pre-painted, so that there was none of the time-consuming preparation of painting and assembly required with more traditional metal miniatures. True, the paint jobs were rather rough in quality, but it still meant that when you got your small army on the table, you had an instantly attractive and durable product before you. Of course, there was nothing to stop you repainting your *Mage Knight* miniatures.

Mage Knight: Rebellion also cut down on the record keeping and paperwork of traditional wargaming through innovative design. The base of each figure contained a combat dial, which combined with the rest of the information upon the base, kept track of a miniature's status as a battle progressed. Simply, as each figure or warrior took damage, this dial was turned clockwise to reflect its reduced status and effectiveness.

Mage Knight: Rebellion concentrated upon war between eight different factions, and following in the pattern set by collectible card games, WizKids brought out two expansion sets, *Lancers* and *Whirlwind*. Now they are taking the *Mage Knight* concept in a slightly different direction . . . underground, with *Mage Knight Dungeons*. As the title suggests, this is a game of delving into and raiding below ground facilities in the well trodden mould of classic games such as TSR's *Dungeon!*, Games Workshop's *DungeonQuest*, plus their *Hero Quest* and *Warhammer Quest*, as well as Ariel's ancient *Sorcerer's Cave* and SPI's *Deathmaze*.

Inside a Starter Set are eight figures in roughly 30mm scale -- two *Hero Warriors* and six "enemy" Mage Spawn, two Treasure Chests that can open and close, a thirty by twenty-inch double-sided paper Dungeon Map (marked in one-and-a-half inch squares), a fold out Special Abilities card, a 24-page full-color rulebook, a handful of tokens and markers, plus a pair of ordinary six-sided dice. If I have a complaint about the contents of both the Starter and Booster Sets, it is that the little individual plastic trays that the figures come in are just too flimsy for long-term use. Even normal handling caused splitting and really, all of these components could have been packaged into a single, sturdier tray. Plus it would make getting the game out for a session (and putting it away afterwards) much, much easier.

The selection in my *Starter Set* included the six *Mage Spawn*: one Gnoll Hunter, a Gnoll Fletcher, two Skeleton Archers, one Armored Skeleton, one Potbellied Gremlin, and the two Hero Warriors, Lord Oren and Mage-King Alment Lan, plus the two treasure chests. As with other *Mage Knight* figures, the base of each is marked with the warrior's name, their point value for when you want to include it in an army, a symbol indicating the faction they belong to, their front and rear arcs, and their collector's number. For those that do like to collect, there are some

Pyramid Review: Mage Knight Dungeons

hundred figures in the *Mage Knight Dungeon* basic series, including some thirty-two Hero Warriors, plus thirty-two treasure chests. WizKids claim that the painting on these figures is much improved, and this is certainly the case with the Mage Spawn figures, which are far better painted than the Hero Warriors.

The combat dial on the base indicates a figure's values for speed, attack, defense, range and number of any distance attacks. If any of these are marked with a colored spot or square, it indicates a special ability associated with that value. For example, Lord Oren has two special abilities at first level -- a Sweep Special Attack Ability that allows him all opponents in his front arc and the Battle Armour Defence Special Ability, which provides extra defence against ranged attacks. At higher levels, Lord Oren gains more abilities such as Command and Forced March, but can lose his standard abilities if damaged in combat. Abilities can be supplanted by those taken from Treasure Chests, but in general, Hero Warriors have more special abilities than figures in Mage Knight Rebellion. The other difference is level. Yes, "level," as the Hero Warriors in *Mage Knight Dungeons* can earn experience and gain levels. They start at first and can rise as high as fifth level, and on the underside of a Hero Warrior's base is a sticker showing their point value for each level. The treasure chests consist of two parts: a trap in the lid and the treasure located in the base. There is a small dial in both the lid and the base, so that treasure and trap can be randomly determined for each game.

Upon pulling everything out of the *Starter Set*, the game is designed so that it can be played almost immediately in a two-player basic version called a "Lone Wolf Dungeon Crawl." I say "almost immediately" because the rules, while simple enough, are not quite written in a step-by-step manner, so that you can play as you learn. That said, reading them takes only a matter of ten minutes or so.

The objective in both the basic and advanced games is for a Hero Warrior to enter and leave the dungeon by their designated entrance and exit, having opened and taken the contents of a Treasure Chest. Along the way, they will face Mage Spawn and possibly their opposing player's Hero Warrior, but if successful will gain experience and possibly new special abilities.

Set up is quick and simple -- laying down the dungeon map, designating entrances and exits, and placing both the Treasure Chests and the wandering monster tokens that represent the Mage Spawn until they are encountered. The Mage Spawn figures are kept aside in their own pool until needed. During a game, players can activate two figures per turn; one of these should be their Hero Warrior and the other a wandering monster counter, or a Mage Spawn figure in play. Even after a Hero Warrior has died or left the dungeon, its player continues to move whatever monsters are still in play until the opposing Hero Warrior either leaves or dies. Once a wandering monster counter meets a Hero Warrior, it is flipped over and the table on the back is rolled on to determine the point value of the monsters pulled into play from the Mage Spawn pool. Roll high enough and this can bring several Mage Spawn into play! Combat invariably ensues and damage from both ranged and melee attacks is inflicted upon each figure by clicking their combat dial down.

Getting to a Treasure Chest is half the fun, as a Hero Warrior has to deal with the trap in its lid before they can open the contents, which itself can also be a trap! A trap can be disarmed either quickly or slowly, which gives a bonus to the disarm roll. If failed, a trap can inflict damage upon just the Hero Warrior trying to disarm it or upon all of those around the chest or the whole room . . . and that includes any Mage Spawn that springing the trap might have summoned! The treasures are items that give temporary bonuses to a Hero or even a special ability. Heroes can carry no more than two treasures. Chests also contain gold and the player who carries the most gold out of the dungeon will be the winner.

For every action -- springing or disarming a trap, killing Mage Spawn or a Hero -- experience points are earned. For each fifty so gained, a Hero goes up a level. This automatically improves their abilities and also fully heals them! This can be a godsend when facing a lot of Mage Spawn. Players need to keep a running score of their experience, as level gains take place immediately upon earning enough points from completing an action. This is the only record keeping within the game.

Play is quick and involving, and a Lone Wolf Dungeon Crawl should take no more than an hour the first time round. With practise, such a game should be a lot quicker. Although only a two-player game, more can be accommodated through the purchase of a *Booster Kit* for each new player. These contain one random Hero Warrior, one "rare" Mage

Spawn, two common Mage Spawn, and one random Treasure chest. Beyond this there are the Advanced Rules, which come into their own with the *Dungeons Builder Kit*. This contains four seven-and-a-half inch square double-sided dungeon tiles, two five by seven-and-a-half inch square double-sided dungeon tiles, six double-sided terrain markers, ten markers, and four plastic painted doors that actually open and close! There are three types of the *Dungeons Builder Kit*.

There is relatively little difference between the Basic and Advanced Rules, but instead of using the *Starter Set*'s Dungeon Map, players take turns to lay down the dungeon tiles and modify them with the terrain markers, which include stairs, which enable dungeons to be built with multiple levels and teleport pads. The Advanced Rules discuss using multi-hero teams and how to use *Mage Knight: Rebellion* figures in *Mage Knight Dungeons*. Essentially, *Rebellion* figures can be added to the *Mage Spawn* pool, and those used as Heroes can only be fully healed rather than gain levels as they acquire enough experience points. Also the only multi-dial figures that can be used in *Mage Knight Dungeons* are, naturally enough, dragons! Finally, where unit formation and movement is important in *Rebellion*, it is not here.

Like any collectible game, *Mage Knight Dungeons* can get expensive quite quickly, but only if you want to add all of the options of the *Dungeons Builder Kits* to your games. For a two-player game, the *Starter Set* is relatively inexpensive and if a group shares the costs, adding more players is not costly either. If you are prepared to do so, a lot of fun can be had from *Mage Knight Dungeons*, and with a few Booster Kits, simple scenarios can be created and a little roleplaying thrown into this underground skirmish game. Further, with these rules, you could use other floor plans of a similar scale, such as the *Cardboard Heroes Dungeon Floors* or other titles in the *Floor Plan* series from Steve Jackson Games -- *Floor Plan 1: Haunted House* springs to mind here.

Mage Knight Dungeons has the advantage of simple rules and great visual appeal, and with a little added roleplaying, could be used to introduce new players to the hobby. The internal packing is a little flimsy, but otherwise, this is a fun game that is easy to get out and play, to which you can add as much or as little as you want.

Pyramid Review

Beyond the Veil (for d20)

Published by [Atlas Games](#) (Penumbra)

Written by Monte Cook

48 b & w pages; \$9.95

[SPOILER ALERT]

Beyond The Veil is something that not enough d20 publishers are making: A quality upper range module suitable for 9th level characters and higher. Within these pages, the party will pit their wits against an undead dragon whose powers were never tested when at their peak. Instead, slain by treacherous monks, the dragon's ghost is awakened years later and its original boast, that it could never be defeated in its lair, is the only way to lay it to rest.

The module starts off with a bit of background, an adventure synopsis, and three ideas on how to get the characters started in the module. Starting off in the village of Iversham, the party will see evidence of the black dragon Storamere's power. There are several bits of information that the party can gather through the villages as well as some minor magics like potions and scrolls. Once the party begins looking through the swamp, they get to encounter the dragon first-hand. At this point, even if the players beat the undead beast, it matters little since its ghostly nature prevents it from resting in peace . . . the party may learn this lesson the hard way if the GM wishes to pound them a bit with a rejuvenated undead dragon!

Once the party realizes that they cannot simply kill the beast, they have to seek out the monks who originally killed it to find out how to lay the beast to rest permanently. The monks are two interesting characters that the players may not have long to learn about as one of Storamere's children, a half-dragon half-stone giant attacks. One of the nice things here is that even if the party fails to save the monks, they can still gain the information they need to progress in the adventure without being railroaded. It just takes longer.

The party finds a broken arch bridge . . . but this is only an illusion. The other half of the bridge isn't in this world but rather, "beyond the veil." A clever play on words the references the title just as much as the dragon's undead state does. Another nice thing about this adventure is that it has some red herrings that anxious players may stumble upon and provide the GM with even more hours of amusement as they keep wondering how to put the dragon to rest.

Assuming that the players finally discover the veil, the party has to battle Storamere in his palace, a place where all of the walls are acid. Since the dragon is immune to such damage, this makes the battle an extremely dangerous one that stupid players will quickly perish in. Worse still, the party must do battle not only with the dragon, but more of his children in the forms of skilled half-dragon half-drow fighters, a half-dragon half-manticore, a half-dragon half-giant-constrictor-snake, and several other interesting combinations of dragon and monster until they confront the monstrous undead dragon at the heart of his acidic lair for a climactic battle.

Like most Atlas *d20* products, *Beyond the Veil* one has a fair number of crunchy bits. All of the half-dragons showcase how to add a template to a standard creature to create some truly unique encounters. In addition to the half-dragon template use, there is a new feat, Sundering (which adds a bonus to strength when using the Sunder feat), a new magic item (the Amulet of Dragon Will), a new weapon (the Dragon Dagger), several new potions, and a new spell (Wall of Will -- a high level arcane spell that prevents passage). To cap it all off, there is a new template, the Dragon Bloodspawn, which is a quarter-dragon.

One of the only obvious failings of this module is there isn't enough information on how to scale it for higher or lower

level characters. Still, one of the best things about the module is the potential for other adventures. While not more than a paragraph, Monte suggests adding further "half-bridges" or other veils that can allow the GM to finally put that new *Manual of the Planes* to use. Of course, the GM could always have Storamere's father Leashadram return, quoting the *Godfather*, "Look how they butchered my boy."

[END SPOILER ALERT]

Appendix A is an experience chart for 9th level characters. One of the nice things is that it shows how experience values can be modified or awarded. Unfortunately, it's only for 9th level characters. Appendix B is the map of Storamere's Palace. An index with a quick listing for monsters, NPCs, spells, and other goodies makes finding most things a snap.

While the spacing is a little generous for me, the fact that this module is the same price as a 32 page Wizards of the Coast adventure more than make up for it. The only thing that would've made it better would be using the interior cover pages for stuff like the table of contents and the OGL. The art is a little darker in the module than in most Atlas ones, perhaps a change of the ink tone color, but is still high quality. Statistical text, such as monster and NPC stats, are placed when the creature is first encountered, unlike some other modules where all such stats are collected in an appendix.

The book follows the standard two columns of text. Open Game Content is identified by being boxed in gray. For There isn't really a lot of read-aloud text (for those who like that), and when there is, it isn't really boxed or separated so the GM must read the adventure all the way through at least once to insure that the traps and other hidden goodies aren't given away by reading everything aloud. Advertising, another pet peeve of mine, is also kept to a minimum with less than half a page going to the *En Route* sourcebook.

Beyond the Veil is a challenging module for 9th level characters that will add a lot to the campaign months after the adventure is finished.

Pyramid Review

Adrift in the River of Dream (for Tribe 8)

Published by [Dream Pod 9](#)

Written by **Bradley Robins, Lisa A. Nichols, & Joshua Bishop-Roby**

\$22.95; 144 pages

For me, the first time I read *Tribe 8* was like the first time I fell in love. I got this goofy look on my face, we spent all our time together, and we stayed up real late learning about each other. The main difference is Tribe 8 didn't leave me to get married to a sailor.

My greatest reaction to *Tribe 8* was a desire for more knowledge. "I want to know more," I said, "about the Fatimas" . . . and then they gave me the Word books. "I want to know more," I said, "about the Z'Bri" . . . and *Horrors of the Z'Bri* soon found its way to publication. "I want to know more about Synthesis and Dreaming," I said.

So now, they've given me *Adrift on the River of Dream*. Very, very cool.

The River of Dream, for those of you who don't play *Tribe 8*, is fairly similar to that Billy Joel song (since, of course, we can only assume that everyone who doesn't play *Tribe 8* is a Billy Joel fan). It is where the lands of spirit and matter meet, where Dreamers travel when they sleep. It's the source of Synthesis (the "powers" of *Tribe 8* characters). It's where metaphor and prophecy become real.

And it's very ambiguous. If you think *Mage* has a tendency to be vague and open to deliberation by players & GMs, you've never seen Synthesis. The problem is that there are very few rules for it. Synthesis is covered in about fifteen pages or so. It's very straightforward and easy to handle. "I don't need straightforward and simple!" I say. "I like *Champions*, for the love of Elvis! I enjoy reading the *Dungeons & Dragons 3rd Edition* rulebook!

The shockingly low page count for Synthesis rules both confused and frightened me. It was always the one thing that kept me from playing or running *Tribe 8*. I never felt as if I could really grasp the Synthesis system properly. *Adrift on the River of Dream* doesn't totally remove the apprehension, but it helps dampen it a lot . . . enough that I think I've got the hang of this thing now.

The book follows the current literary method of game supplement design; it opens with game fiction, and concludes with crunchy bits. One difference is that the game fiction is a single unified story that takes up the first half of the book. The intro is the account of a circle (*Tribe 8* talk for a party) that is seeking to understand how the River of Dream flows. They start out as a trio of young tribals until their investigations begin to scare those in power. Instead of being executed, they're maimed and exiled.

This is the start of pretty much all *Tribe 8* games (well, the exile part, anyway). They begin to lose themselves in the sea of human detritus that is Hom (the island the 8th tribe call home). They regain their drive to complete their quest, and gain a fourth member of their circle. From there, the story gains momentum, taking them across Vimary to the land of the keepers, out to the outlands, where they encounter a tribe of Squats, and eventually taking them physically into the River. The characters are statted out in sidebars as they progress along their quest.

The story was thankfully engaging. The only other sourcebook that took a gamble such as this and used half its space for a fiction piece was the first edition *Shadowrun Virtual Realities* book. Of course, the similarities go deeper than

that; both of them are set in strange realms open only to those who are properly trained, and in both of them I liked the fiction more than the rules.

River's rule bits are by no means bad. But they come across as too dry in the aftermath of the preceding story. Some bits read poorly, and some bits are jarringly anachronistic. For example, there's a Synthesis Aspect called Habeas Corpus, used by a secret society to dig up evidence. It jars that in a post-apocalyptic society where mispronounced and half understood terms are clumsily integrated into the common vernacular there would be a complete Latin phrase being used.

Aside from a few small quibbles, the book does serve to expand on the use of the River of Dreams and Synthesis in *Tribe 8*. The legend described in the opening sequence expands the place of the River in *Tribe 8*'s cosmology; the stakes in the game have suddenly risen significantly. The framing legend would work wonderfully to help launch PCs on quests of their own, and would be a good springboard for quests that can be both personal and epic in scope.

I can see some quibbles from the *Tribe 8* fanbase (they're gamers, after all) at the game shifting from a high style Spirit-Punk game to something like what it will likely become in the wake of *River*. And, of course, anyone who hates Metaplots will find it a personal affront. But it's good to see them taking such a dramatically different tack with *Tribe 8*. And the book's ideas would be fairly easy to port to any low fantasy game or occult conspiracy game. It's a good value, being a good read and a good sourcebook.

--Justin Mohareb

Black Box Down

"Hey, what's that?"

'Arc light. B-52 strike.'

'Every time I hear that, something terrible happens.'"

-- Chef and Willard, *Apocalypse Now*

World War Two is officially gaming material now. It was the Good War, with moral clarity on all sides, and plenty of Spielbergian footage of scrappy heroes giving it up with gusto. Which leaves Vietnam as the Suppressed War, a war seemingly designed for Secret History, for Conspiracy, and for the Horror . . . the Horror. With clarity the first casualty of the murk of Indochina, we begin, then, with a single scene -- a B-52 resting, seemingly unharmed, in the middle of the jungle. Inside it, of course, we'll find all the murk, and horror, we need to go in country.

"When we got there, what we found was pretty bizarre. First of all the aircraft was fully intact. It had not crashed. It looked like a great big hand had grabbed it and just set it down in the jungle. There was no crash trail or anything."

-- testimony of William S. English (1992)

The central core of Bill English's story is so perfect that, like a soap bubble, one hesitates to touch it for fear that it will disintegrate. English, he claims, was attached to a specialized unit of American Green Berets in Vietnam. "In April or May of 1970," he and his team went to recover the survivors from a B-52 Stratofortress bomber that had crashed somewhere in Laos. The bomber, however, had not crashed, but had somehow been landed intact in the jungle. The hatches were still intact, and English's crew had to blow them open. Even stranger, the crew were still strapped in, but had been horribly mutilated -- although the interior of the bomber was remarkably unbloodied. English and his men took pictures of the mutilations, grabbed the dog tags, maps, and "everything else we needed to" (gun camera films, most likely), blew up the plane, and returned to Saigon.

Later, as a civilian analyst working for the DIA (or, possibly, the NSA) at RAF Chicksands air base in England, he saw his own photographs in a packet labeled "Grudge/Blue Book 13." This legendary report remains the only one never released to the public by the Air Force -- the Air Force claims it doesn't exist, having skipped "unlucky" 13 in the series. When, based on his knowledge of the photos' authenticity, he approved the packet as genuine, he was summarily fired, deported, and then hounded into hiding by the authorities. Attempting to clear his name, he tried to dig up a crashed UFO on the grounds of White Sands AFB, but his associates were killed by security helicopters. The whereabouts of Grudge 13, the nature of the unknown force that grounded a B-52, and the role of the NSA in evaluating UFO reports remain enigmatic shadows around the stark image of a close encounter in the Vietnam War.

"Before we go any further, let me tell you, I have over the years publicly acknowledged that the material that I viewed could very well have been misinformation. I've never denied that possibility."

-- testimony of William S. English (1992)

Well-respected UFOlogist Peter Brookesmith investigated English's story and discovered any number of problems with it. First, every B-52 ever made can be easily traced by serial number and tail number; no B-52 crashed under any circumstances between July 1969 and July 1972. Second, the Green Berets were not tasked for air crew recovery; the Air Force either used its own 3rd Aerospace Rescue and Recovery Group or, in inaccessible locations, tasked MACV/SOG's SOG-80 "Recovery Studies Division." (A division, in any event, that English doesn't claim to have belonged to.) English does claim to have been part of Operation Phoenix, but their job was infiltration and assassination, not UFO crash investigations. And, needless to say, none of his story about White Sands checks out at all. On the other hand, he seems credibly informed about Chicksands, and Brookesmith concludes that he got fired from the American intelligence services there for mistaking a disinformation op for a real dispatch, and confabulated the rest to delight the days of people like Peter Brookesmith, and me, and you.

"As a specialized aspect of its overall materiel exploitation program, Headquarters USAF has established Project Moon Dust to locate, recover, and deliver descended foreign space vehicles."

-- Col. Betz, U.S.A.F. memo, Nov 13 1961

Of course, jurisdictional issues may not be the insuperable obstacle that Brookesmith believes they are. Project Moon Dust began in 1953 (or 1957, depending on which Air Force official you believe) as part of the Air Force's crash recovery teams, based out of Fort Belvoir, Virginia. Its job, officially, was to identify, track, and recover space crash debris, specifically foreign space debris. (Operation Blue Fly was the specific group within Moon Dust tasked with recovery missions.) A later Department of State communique clarified Moon Dust's mission: "the examination of non-US space objects or objects of unknown origin." At least two Moon Dust missions are public knowledge: a recovery in Nepal in 1968, and one in the Sudan in 1967. (Rumor also puts Moon Dust operations in Chad, Botswana, Bolivia, and several domestic crash sites.) At some point, at least according to indefatigable UFO Freedom-of-Information gadfly Clifford Stone, Project Moon Dust has been put under the Department of State rather than military command per se. Moon Dust may now have its own teams of paramilitary commandos, much as the CIA does for use in tumultuous ground situations. And it may have "borrowed" Green Berets for its own use in 1970, especially if its primary team was off somewhere else at the time.

"It was while there that I discovered that there was a tremendous amount of UFO and alien activity in Vietnam. It was always reported in official messages as 'enemy helicopters.' Now any of you who know anything about the Vietnam war know that the North Vietnamese did not have any helicopters, especially after our first couple of air raids into North Vietnam. Even if they had they would not have been so foolish as to bring them over the DMZ because that would have insured their demise. Our troops were fired on occasionally by these 'enemy helicopters,' enemy troops were fired on occasionally by these 'enemy helicopters,' and occasionally people would disappear. And on one instance that I know for sure at least one entire village disappeared one night due to alien activity." -- William Cooper, "UFO Cover-Up: Alien Nation or Conspiracy Theory?"

Certainly there were plenty of UFO incidents in Vietnam for Blue Book, or Moon Dust, or anyone, to investigate. In June 1966, a UFO blacked out the power at the army base at Nha Trang; a bat-winged "bird woman" (perhaps a [Spring-Heeled Jill](#)?) appeared to U.S. Marine Earl Morrison near Da Nang in the summer of 1969. Two separate reports exist of a spherical UFO piloted by Greys landing near Tonle Sap, Cambodia; at least once (in September, 1971), U.S. forces reportedly engaged them in combat. The region is even more famous for its USOs, Unidentified Submarine Objects. As early as June of 1909, a cigar-shaped USO flew over Dong Hoi and submerged off the coast. Two underwater "wheels of light" appeared in the South China Sea in 1891 and 1910; another two appeared in the Gulf of Siam in 1962 (to the *S.S. Telemachus*) and 1970 (to the U.S. Coast Guard cutter *Mellon*). Did the massive U.S. deployment to Southeast Asia serve to screen (or even to cover up, or better yet to justify) a reconnaissance-in-force against Sub-Oceanic Aliens, or against the remnants of the Lost Continent of Mu?

"You came up my river -- in that small boat. So simple. I always thought the final justice would come from the sky, like we did."

-- Col. Kurtz, *Apocalypse Now* (early draft screenplay)

Around the central core of "UFO operations in Vietnam" much can be spun. Whether the player characters are Moon Dust special ops, black ops fighting a long-term battle against the denizens of Vietnam's "lost world" of dinosaurs and Reptoids, VC guerrillas battling any number of indistinguishable "aliens from the sky", or even Zeta Reticulan grunts stuck "in country", the potential is there for darkness, confusion, and terror. **GURPS Atlantis** GMs can pit their gill-men and sentient octopoids against Navy SEALs; **GURPS Atomic Horror** GMs can send their MJ-12 agents to salvage the intergalactic inertial trackers from Angkor Wat before the war spreads to Cambodia. Any number of mysteries, from the aerial predators like the [Rods](#) to the vegetable hallucinocthones from [Mandrake](#) Country, can lurk underneath the canopy and behind the scrim of official prevarication. The struggle is there, the jungle is dark, and the aliens are waiting. Move in.

The Romantic View . . . By The Book

I have a confession to make, and it's one that may well alienate me from a bunch of our readers . . . but frankly that's never stopped me in the past, so what the heck.

I don't really read many books.

Now, by books I mean "novels." I tend to constantly be reading factoid books, logic and puzzle books, graphic novels, and even the occasional short story collection . . . not to mention the moon-sized mass of roleplaying books circulating around my apartment.

But I tend to read very few novels.

I generally justified this by saying I didn't have time, and to a certain extent that's true; I've almost always had at least one job since I was 15 (and frequently two), not to mention school and whatever else would drain my time. But I've come to realize that this is an excuse more than a reason.

(There's also another reason . . . but I think that's another column idea at some point.)

No, in reality the reason I don't read many novels is because, at their core, I don't trust them.

By this I mean that the potential for disappointment versus the time invested is too great for me. I can read a comic or a short story in 15 minutes. I can watch a television drama in an hour. I can watch a movie or read most graphic novels in two to three hours. And if any of these are truly lousy . . . well, then I've only lost at most three hours of my life.

But a novel? A novel represents a serious investment of time . . . generally a week or so at least (depending on how much free time I have to invest each day). And if at the end of that week I'm not satisfied with the experience, I tend to be *really* ticked off. Too often I've started a book, enjoyed the beginning, hit a stumbling block of some sort slogging through the middle, and limped to the end, hoping that the ending would either have a payoff or at least resolve the problems and issues introduced earlier. Or else I've just been profoundly disappointed by the ending itself. And I find myself thinking, "What the heck did I waste my time with that for?!? I want that week of my life back!"

(The problem has been even worse in the past couple of decades, with the increase in both the size and magnitude of recent offerings . . . especially in the Fantasy/Science Fiction realm. I've often had a book recommended to me and I've gone to check it out, only to learn that it's the first book in a 40-book series, each one the size of the Greater Atlanta Telephone Directory. Maybe it was a mistake growing up as an Asimov fan, whose skinny books didn't let things like characterization or description get in his way of his plot. "Bob, the ship's captain, entered the Engineering Room," would be a typical Asimovian sentence that gave both characterization [Bob's a captain] *and* background description [there is a ship with an Engineering Room, and presumably interesting things will happen there]. But I digress.)

Which, 542 words later, leads me to tie this to my belief about Romantic games. Because roleplaying games, at their core, generally represent an even *bigger* investment of time than novels. First you need to read at least one rule or background book . . . generally taking at least as much time as reading a novel. Then as a player you need to create a character and a background; as a GM you need to create scads of NPCs and a plot. Both of these take time. Finally everyone needs to get together and play; now the player needs to make sure his character isn't killed in the first five minutes (bringing total time invested to 12 hours, five minutes).

(This reminds me of the old Genesis *Spider-Man* video game. In it you got access to all of Spidey's cool powers . . . but the game was difficult to control. Making matters worse is the fact that the game's designers padded gameplay by having lots of mundane enemies -- like dogs and rats -- nickel and dime you for damage. So a rat would skitter up, you'd fail to work the controls, it would bite you and run off. Take enough damage and you die. After a while of having piddling vermin deliver the coup de grace, I took to intoning gravely in a dramatic narrative voice, "The Day

Rats Killed Spider-Man." [As in, "Tune in next week for part four of our exciting story: 'The Day Rats Killed Spider-Man.'"] This amused my friends.)

Anyway, a roleplaying game session may last two to ten hours. A single story may take several sessions, spread out over the course of weeks or even months. I suspect that that many gamers -- the Romantics -- having invested so much time, effort, and often money into the game, want to at *least* make sure they get a good story out of it. If this is by "any means necessary" (fudging die rolls, having opportune clues pop up, stretching the plot, last-minute saves, or whatever), then so mote it be. And, of course, the group's need for a good story can directly affect the means needed; a group may be entirely Simulationist, except in situations where the story threatens to get stuck . . . then a matchbook-type clue or a witness may turn up. Ironically, it's possible to be entirely Simulationist in the way one approaches the Romantic; for example, you may have a strict Simulationist world, except for a [no-death policy](#), or "Hero Points" (or the like) you can use to modify the rules in-game.

Of course, beyond the desire to ensure an exciting story, there are many other possible appeals of the Romantic style of gaming: a chance to emulate a favorite genre . . . no matter how unrealistic, a desire to "do the right thing" without being necessarily punished for it, or even not *knowing* what the "realistic" thing is. (Movie/television law enforcement, for example, is almost always cooler and more exciting than the real deal.) But, ultimately, I suspect that the fear of a wasted and unsatisfying Saturday night is the biggest appeal of a Romantic convention.

It's no fun trying to be a hero, only to be eaten by rats.

* * *

Next week I'll be taking a break from my theory-type stuff here, but it should be back the week after. Unless, of course, the pitchfork-wielding villagers catch up with me before then.

--*Steven Marsh*

* * *

*Last week's answer: **Wizards**, p. 67.*

*(I received a couple of questions regarding this one. This book was published in 1983 as part of the Role Aids line of semi-compatible **AD&D** books from Mayfair. It contained information on various mythic and literary wizards, with introductions [in the literary cases] by the authors who created the character. Thus we have Roger Zelazny's *Shadowjack*, Gordon R. Dickson's *S. Carolinus*, Marion Zimmer Bradley's *Lythande*, and Robert Lynn Asprin's *Aahz and Skeeve*. The latter is where the quote came from . . . apparently **Pyramid** has a number of **Myth-series** fans.)*

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Out of Body, Out of Mind

by Steven Marsh

Introduction

"Out of Body, Out of Mind" is an Adventure Pizza designed for a science fiction/space opera campaign. Depending on the game world, its premise may demand a fair amount of lead-in (see sidebar); science fiction games are notorious for their lack of a "common" background. It is, at its core, a morality challenge, with no easy answers.

Background

The GM must choose a "victim" for an incident. This person should be fairly important, and ideally have a code of honor but also be morally questionable; *Star Trek's* Captain Kirk or or *Star Wars'* Han Solo would be fine examples.

Anyway, after the Incident, life seems to return to normal . . . until one day (probably within a few days) the victim becomes aware of a severe (but not crippling) pain. Investigation by doctors reveals that he has Space Cancer. (No, it's not *called* Space Cancer; it's whatever dread disease exists in the future that's roughly analogous to cancer . . . slow-spreading but deadly, non-contagious, and generally incurable.) Furthermore, this case is fairly advanced; it's progressed through at least half of its spread rate; thus if Space Cancer would normally kill someone within a year, then testing shows the victim has had it for at least six months.

Curiouser and Curiouser

Presuming the victim normally has physical examinations, this should strike him -- and his doctor -- as impossible. (Of course, if the victim is the rugged "doctors be damned" sort, he may well have put off his last physical examination or four . . .)

Further investigation will lead to other clues; perhaps a childhood scar doesn't exist, perhaps an earlier medical transplant isn't present. Regardless, the victim should come to a conclusion: although the DNA is the same, this is *not* his body.

Turning Up The Heat

Depending on circumstances, the victim should eventually figure out that he has been in a bizarre accident; his body has been replaced with a parallel universe version, while his mind stayed here. The parallel version of the victim apparently had Space Cancer, and has had it for some time.

Letter To Myself

At this point the campaign's scientists should be working around the clock to figure out what's going on; through Scientific Gobbledygook (vibrational patterns, tachyon decay, the Force) they will be able to confirm what the victim should suspect.

The Incident

The lead-in to this adventure is problematic, since it requires an incident. This will require whatever McGuffin is plausible for the world.

Some examples:

- This adventure would probably be easiest to use in *Star Trek*, where transporter accidents are as common as mosquitoes. Of course, that universe has other possibilities, including omnipotent beings (this seems like a perfect Q test), alternate timelines, alien interference, and the like.
- It would be more difficult to work this into a *Star Wars* campaign, but it might be possible. The best bet would probably be some kind of alien Force artifact designed to tap into alternate and possible futures . . . but with a weird

Using this information, the scientists should be able to begin working to find a solution. Although it will take them some time to effect a solution (if that's even possible), using the Scientific Gobbledygook they *will* be able to come up with a means of communicating with his alternate self, by using the anchor of existing SG patterns and tweaking to allow messages to transfer along the connection between the alternate-version SG patterns with blah blah blah technobabble variance possibilities. The upshot of this is, through the use of a device, the victim will be able to communicate with his alternate self through "thinking" a word-based message. It's a slow process (akin to early 20th century telegraph), but exact.

(If the victim chooses not to communicate with himself, he will probably become startled to experience his alternate self start communicating with *him!* Clearly alternate world scientists work just as hard as their PC-counterparts . . .)

The Decision

Eventually, scientists will resolve how to reverse the process; this will be *much* easier if these scientists can communicate with their alternate universe counterparts through the victim.

At this point (or before, if the victim is contemplative) the victim will face a dilemma: is he willing to, in essence, kill his alternate self to save his own life?

Several elements can make this choice easier or more difficult:

- If either universe's self is in the midst of a crisis that demands a living hero, then they may decide the Space Cancer is best served in the *other* universe. Of course, both worlds may well be in such a crisis . . .
- If either universe has access to medicines, science, or magic unavailable in the other world, the victim(s) may well decide to send (or keep) the Space Cancer there. Of course, it's presumed that, if the other universe had a means of dealing with it, they would already have done so.
- If the alternate self is "evil," the decision is pretty simple for all but the most altruistic heroes. (Naturally, discerning that he *is* evil may be a challenge, with only a telegraph-rate exchange of information and ideas . . .)

Resolution

It's basically up to the victim(s) to decide what they want to do. The ultimate resolution will probably depend on what the GM chooses is necessary to reverse the process. If both sides need to make a decision and/or act at the same time, it will probably be fairly elaborate; both universe's victims will need to arrive at the same decision and work towards the same goal.

If, on the other hand, only one side needs to reverse the process (forcing the other side home), then the PC victim has more of a quandary. On the one hand it's easier to do since you don't need to convince your alternate-self to go along. On the other hand, it's a *lot* more difficult to look at yourself in the mirror knowing that you've sentenced an unwilling man to die . . .

For the O. Henry/deus ex machina ending, if the PC victim decides against transferring or doesn't make up his mind, the alternate victim may go through with the process instead . . . allowing a cross-dimensional heroic sacrifice.

effect on beings not of the originator's species.

- In a *Fading Suns* game, this would seem to be the result of an Ur artifact, or perhaps a jumpgate accident. This setting would have a particular challenge, given the religious aspect of the universe. Since Ur artifacts are usually considered to be holy, does that mean it's the Pancreator's will that you now have the disease?
- In a game set in a comic universe, this adventure should be fairly easy to incorporate. The DC Universe would probably involve a cosmic incident that has affected Hypertime; the Marvel Universe would probably involve an alternate timeline.
- In a *Torg* game, it's easy to blame it on the Infiniverse . . . especially if you assume a Reality Storm or some other big Cosmic Event.
- Aliens are always a good excuse . . . especially the big energy-cloud type. If, in a previous adventure, any of the heroes had their minds probed, controlled, or otherwise touched by an alien presence, it's possible that the alien presence has its

If the bodies are returned to their original places, the victim will no longer be able to communicate with his alternate self. His destiny, like the victim's, now lies in his own hands.

Side Salad

Scientists will be unable to bridge the dimensional gap directly before the Space Cancer kills either victim. But (presuming the Space Cancer is transferred back) some time *after* the disease would have presumably consumed the victim's alternate self, the scientists may be able to go to this other world. If the victim feels guilty or responsible enough, he may have the desire to go to this other world to either investigate or "set things right."

Extra Spice

"Out of Body, Out of Mind" is designed to be as straightforward or as convoluted as the GM (and players) would enjoy. At its core the dilemma is quite simple . . . but all manner of complications can be added.

- Presuming that the Space Cancer will leave the victim with six months left to live, this could well be a subplot that can last months. Woven among other adventures, this story can cause all kinds of angst . . . confusion, mystery, and thoughts of mortality. It can be difficult to fight the Moonworm of Trabos IV when the doctor warned you not to overexert yourself.
- Likewise during this time the victim may well have a "guardian angel," of sorts. This will depend on how fast, exactly, the GM decides communication with the other-victim is, and how portable (or non-) the device required to make contact is. The victim may be able to tap his alternate-self for information, advice, or guidance (especially if the alternate world has resolved problems still troubling the "real" world, or has access to information or resources unavailable to the victim). And the victim may well find himself being probed for information regarding *his* world . . .
- Given the possible length of the adventure, the GM may well want to allow the heroes to try to investigate solutions or possible cures to Space Cancer. How successful these adventures are is up to the GM.
- For a twist within a twist, what if the doctors determine that this Space Cancer sample, owing to its trans-dimensional trip, is special? The doctors may determine that it may be possible to devise a *cure* for Space Cancer, utilizing postmortem cells taken from the brain (or some other equally invasive surgery that cannot be performed while the victim is alive). Depending on the player and character, this may either make them sacrifice themselves for the greater good, or keep the Space Cancer with him for an extended period while the scientists try to see if they can get the possible cure without the death of the victim.

Much of the power of this adventure depends on what's happening in the alternate dimension. Some possibilities:

- **The same, but different.** Basically the alternate universe is the same as this one, only with minor differences (the victim did *not* cut his knee as a child). And, of course, the alternate victim has Space Cancer.
- **Alternate (?) timeline.** Any alternate history you would want to introduce (that still includes the victim, of course) can be used here. In fact, the timeline doesn't even need to be at the same time as the original; it's unlikely that someone would notice a year or two (or more!) difference in their own age . . . especially once they get to a professional age. If the alternate timeline is close enough to the original, the GM has two intriguing options; the alternate timeline may be in the future, meaning the victim has the possibility to get information about a (possible) future to help them. Or the alternate timeline may be in the past, which may give tinkering heroes the desire to warn the alternate universe of dangers in the future, or otherwise try to steer the

vibrational existence spread out over multiple timelines and dimensions (insert appropriate technobabble).

Regardless, blame the aliens.

- Likewise, if your game world has any kind of hyperspace or similar inter-dimensional region, it's entirely plausible to concoct a computer accident or other mishap to allow contact with an alternate reality.

In any of the alien artifact scenarios, it's presumed that the body-switching is a one-time occurrence, affecting the victim only. Of course, this doesn't need to be the case; how likely are you to notice if your body were replaced with an exact duplicate?

development of the other reality.

- **Mirror, mirror.** The alternate universe may be wildly different . . . even evil! This one would be a difficult one to GM, but could be intriguing. Of course, the more "alien" the alternate version of the victim is, the less likely the player may be to feel the compassion and attachment to their alternate self that this adventure would require.

In all, you have a possibility of running any stereotypical alternate universe adventure, while having it be unique; the heroes are communicating with another world and its problems without even being able to *see* that world . . . at five words a minute.

Finally, truly devious GMs may want to run a scenario well in advance of "Out of Body, Out of Mind" for the heroes . . . one involving radiation exposure for the victim (or whatever causes Space Cancer). The hero should escape unharmed, and he should have a full bill of health afterwards. In that way, not only is there an in-game reason for the alternate person to have the disease -- he wasn't as lucky as the victim -- but there's the possibility of future worry and adventure:

What if he has only delayed the deadly disease?

Rotgut Rumble in the Rockies

An Adventure Scenario for the *Deadlands* RPG

by Dylan Craig

Overview

The Posse sweats blood to get twenty barrels of booze into a frontier railroad town for the grand opening of a saloon there. What they don't know is that each of the barrels contains an undead critter, ready to leap out at the right moment to sow mayhem and devastation -- a Bayou Vermilion plot to disrupt Iron Dragon operations in the area. The heroes have to deal with Nosferatu, booze-soaked zombies, flocks of undead bats, and the Bayou Vermilion agents themselves if they hope to see the dawn.

Setup

The Posse find themselves in Jackson, Wyoming, at about the time that the wagon shipment has to go through. Jackson is a respectably sized frontier city, with a steady flow of fortune-seekers passing through it in both directions. The Rockies thrust up majestically to the West, and to the East lie the plains and hills of settled America. Junction Gap, their destination, is a tiny trading post which lies along the path of a new spur which is being built to bring together two divergent Iron Dragon lines, shortening the Deadwood line considerably and providing a secondary line in case of sabotage against the original track.

There are several ways in which Hans Grupp, the owner of Grupp & Sons Haulage, might approach them:

- **As an employer:** Grupp will pay the group \$250 in gold for the four days' work it will require to haul the booze to Junction Gap, plus a \$50 danger pay bonus per hero if there is any trouble along the route, payable on their return to Jackson.
- **As an old friend:** Grupp might be an old war buddy of one of the heroes, or a retired lawman who one of the characters studied under. He would certainly consider himself deeply in debt to anyone who helped him make this delivery.
- **As someone who can help them:** Access to Junction Gap is highly restricted -- only railroad employees and contractors are allowed in. If the Posse needs to get in to speak to a contact, track down a criminal who is suspected to be hiding out among the laborers, or find a missing person, taking Grupp's contract is the best way to do so.

The Posse may very well ask Grupp why he can't use his regular hauliers. He will sigh, frown, and grumpily explain that several local prospectors and trappers have gone missing in the mountains over the last fortnight, and his drivers, suspecting that the local Crow Indians are responsible for the disappearances, are refusing to make the trip unless armed guards are hired to accompany them. With Iron Dragon having hired up most of the local regulators and driven off all the others, there isn't a single affordable gunslinger left in the county; Grupp has spoken to some out-of-town contacts about importing shootists from the Maze, but it would be difficult and extremely expensive to get them to Wyoming in time. As things stand, the amount he is offering the Posse amounts to almost half his profit on the shipment; paying any more would be ruinatious.

A further complication may result if none of the characters have the Teamster skill. Hans Grupp is willing to spend an afternoon training two characters to drive and perform basic repairs on the wagons. These characters can gain 1 point in Teamster as a result of his excellent instruction. The regular passage of wagons to Junction Gap has left a well-worn track through the passes and forested slopes of the Eastern Rockies, and Grupp is confident that this rudimentary level of skill will allow the characters to make the journey with minimal effort.

Scene One: Leaving Jackson

The Posse may very well wish to investigate the disappearances before accepting Grupp's offer. An afternoon in Jackson's taverns and sheriff's office will, unfortunately, accomplish little in this regard except a list of the suspected victims.

Those missing include three prospectors (the Chappleton brothers: Isaac, Jacob, and Ezekiel), an itinerant preacher (Reverend Paul Mathee), a Texan trophy hunter (Col. Samuel Goode) and two locals he had hired as trackers (Mack Ferguson and John Two Trees), and a local madwoman (Jennifer Colqhoun), whose disappearance three days ago was the most recent.

Characters investigating the cases further (this will require a *Cognition* roll against a TN of 9) will realize that most of the disappearances are likely to have taken place on the very route they are about to travel, and that their frequency seems to be increasing.

No official search has yet taken place, although a letter has been dispatched to the territorial governor asking for help. General consensus among the townsfolk is that the disappearances are the work of the local Indian tribes, who have possibly been disturbed by the growing amount of rail traffic through their territory, and the locals whose livings take them into the mountains have begun to travel in larger and more well-armed groups. None of these groups have, as yet, reported any trouble with Crow warbands, so while the townsfolk are cautious, they are not in a state of complete panic yet.

Wagon Contents

The lead wagon's load is: two rolls of high-grade felt, two faro machines, a set of beer taps, a bottle rack, a crate of poker chips, cards and accessories, two crates of delicacies (salted cashews, pickles, capers, and oysters), a box of silver shot-glasses, and the provisions, trail gear and wagon tools. The rear wagon is loaded with: nine large kegs of beer stout, six casks of red bourbon whisky, a cask of Cuban white rum, and two cases of French wine and Champagne.

The merchants in Jackson have also thrown in an etched bar mirror, a cask of French cognac, and an ebony roulette wheel as freebies. These items are distributed evenly across both loads. The loads themselves are roped together tightly, with sacking and sawdust between the casks to stop them jarring. This means that the heroes will find it impossible to access the contents of any but the rear three casks of whiskey, a fact which become significant later if the heroes begin to suspect that their cargo is not all that it seems. The wagons are drawn by four oxen each.

Jackson's general stores and outfitters have more than enough stock to cater for any last-minute requests or provisions the heroes may have before they set off, although the wagons are fully outfitted in this regard. Grupp will also hand the heroes the papers they need to get into Junction Gap, which list the recipient of the delivery as a Mr. Vincent Green, the proprietor of the Rail Baron's Rest.

Scene Two: Get Them Dogies Rolling

The first two days of the journey are as uneventful as Grupp could have wished. The roads are relatively full of fellow-travellers; most, as indicated above, are traveling in well-armed groups. The terrain abruptly gives way to forested mountains on the second day, however, which makes the going a little harder and a little slower, and heralds the end of the regular road traffic seen up to this point.

A random encounter suited to your Posse might serve to provide atmosphere along the way. Chance meetings with a camp of traveling vagabonds, a random Army patrol, or a well-armed Pony Express rider returning from Junction Gap would all serve this purpose well. The Pony Express rider, in particular, will be able to clue the Posse in about the

condition of the track ahead (good), the state of the inhabitants of Junction Gap (thirsty), and the potential danger level of the journey (low, in her opinion). With regard to the latter inquiry, the rider will confide to the party that while she did imagine that she was being observed as she rode through the woods, she didn't actually see anything out of place, and attributes the feeling to the rumors of the disappearances having put her on edge.

By sunset on the second day, however, when civilization is well out of sight and the party have been surrounded by the gloomy mountain forests for several hours, a strange event will occur. As the track passes through a narrow cleft of rock, the oxen of the rear wagon (the one containing the casks of booze) begin to snort and jostle in their harnesses, slowing to a halt and exhibiting all the signs of being about to panic. At the same time, each character who is within 2 yards of the rear wagon should make a *Cognition* roll:

- 7+** The contents of the wagon are suddenly giving off waves of heat, and bubbles of boiling booze are visible at several cracks and joints. It is as if each barrel has been instantly brought to a boil by some strange influence. The barrels are holding together under the pressure for now, but they cannot be expected to do so for much longer.
- 9+** Several nooks and projections in the cleft hold unusual contents: bundles of burnt herbs, the melted stubs of candles, and clumps of strange dense ash. The placement of the items has a certain ritual look to it, centered on the ground which the rear wagon is now passing over.
- 11+** Two figures are crouching in the trees some six hundred yards away, on the opposite slope of the valley.

Anyone hoping to discern the specific features of the figures will require a spyglass or other means of visual enhancement, but will be able to make them out as Crow Indians, one of whom is carrying an ornate staff. At the first sign of trouble from the Posse, the two figures will step back into the trees and out of sight.

It will require a *Teamster* roll against a TN of 7 to shift the oxen out of the affected area. If this roll is failed, subsequent attempts may be made, but the TN increases by 2 for each failure. Needless to say, there is no possibility of moving the wagon without the oxens' cooperation.

If the characters have not moved the wagon five turns after the strange phenomena begin, the casks will begin to pop open, one by one, in steaming geysers of boiling booze. Skip to "Scene Four: Troublesome Spirits," below. If the wagons are moved a mere ten yards down the path, the bubbling stops and the barrels, while warm to the touch and slightly scorched, are undamaged.

Examining the Pass

Characters examining the ritual leftovers in the pass will need to make an *Academia: Occult* roll against a TN of 9. Those with the *Blessed* or *Shaman Arcane* Backgrounds may add 2 to this roll. Success indicates that the trappings are a mixture of traditional Indian spirit-magic fetishes and Christian religious supplies (votive candles and incense). The blend is reminiscent of that seen in Voodoo rituals, but it is impossible to tell what ritual occurred here from what still remains visible.

Magical lines of inquiry will not fare much better than mundane ones; the mystical energies that persist here are too confused to permit analysis. Such inquiries, however, confirm that the energies seem to be a mix of Judeo-Christian and shamanistic techniques. Inventive experimentation by the Posse is the only thing that might reveal the nature of the enchantment -- the area has been Sanctified (as per the Miracle), and has the usual effect on malevolent or diabolical entities. This is the cause of the strange agitation within the casks. Should the Posse discover this and decide to open or destroy the barrels, skip to "Scene Four: Troublesome Spirits," below.

A *Tracking* roll against a TN of 9 indicates that three adults seem to have performed this ritual the night before; one wore boots, and the other two wore moccasins.

Scene Three: Bushwhackers!

At noon on the third day, when the wagons have been following a contour path through a densely forested patch of slope for several hours, an obstruction on the track become visible approximately a hundred yards ahead and across a curve in the track. A tree has fallen across the path; characters with the *Eagle Eyes* edge or a spyglass will be able to see that the tree has been uprooted -- literally knocked out of the soil. The bush on around the track around the tree is particularly dense and foreboding, and includes several shadowy granite boulders taller than a man.

The Posse is faced with a difficult decision at this point. There is not enough space to turn the wagon around, but everything about the situation yells "ambush." However, what they might not realize is that the ambush is behind them, not up ahead. Two Crow are hiding behind a carefully constructed camouflage screen thirty yards up the slope and behind the rear wagon; observing the party. If the party abandon the wagons to investigate the tree, or leave them lightly guarded, they will begin to creep forward as quietly as possible. Their only handicap in this regard are the hissing fuses of the lit dynamite sticks one of them is carrying!

The Crow holding the dynamite will try to approach to within five yards of the wagon before tossing her sticks among the barrels; her partner will stay ten yards away, ready to give covering fire with a pair of flintlock muskets he has over his shoulder, and close in with his tomahawk if necessary. The dynamite thrower is his wife; he will not hesitate to take risks to save her or draw attention from her. Their stats can be found in "Boot Hill," below.

Each character who has remained with the wagons must make a *Cognition* roll. Subtract 2 for each person engaged in conversation within earshot of the wagon. To reach the wagons, the Crow will each need to make three rolls against the highest Cognition total among these rolls.

- **If any of the rolls fails by less than five**, those in the wagon will hear the snap of a twig somewhere in the area, but will be unable to pinpoint its source;
- **if the roll is between 5 and 9 points lower than the required total**, the characters will not only hear the noise but also be able to discern that it came from behind them and up the slope, and
- **if the roll fails by more than 9** one of the Crow has been spotted, and the characters may fire on them or take whatever actions they wish from that point onwards.

Each successful roll will bring the Crow ten yards closer to the wagons. The dynamite thrower's last 5-yard dash will not benefit from the concealment of the bushy slope. If any dynamite lands in the wagon, draw a card; the dynamite will explode on that card in the next combat round. Grabbing a stick of dynamite from the floor of the cluttered wagon requires a *Deftness* roll against a TN of 11, but a character may add 2 to their roll for each of the the following skills that they possess; *Fast Draw*, *Speed-Load*, *Sleight of Hand*, *Trade: Mining*, and *Demolition*.

If the dynamite goes off, skip to "Scene Four: Troublesome Spirits," below. The barrels provide one level of armor to everyone in the wagon, including the critters themselves.

If captured, the Crow refuse to talk to the Posse and will escape at the first opportunity. If placed in fear of their lives, they will close their eyes and recite a strange hybrid prayer made up of the same religious jumble as was apparent in the religious trappings at the pass. As these things turn out, however, these two saboteurs are the aunt and uncle of John Two Trees, the local scout who is one of the missing persons. If the barrels are opened in their presence, they will do their utmost to kill the undead being he has become, even if it means sacrificing their own lives to do so.

Posse members examining the fallen tree which started this whole mess will find a deeply embedded human-size handprint smashed into the bark. It appears that whoever knocked this tree over was strong enough to do it with a single openhanded slap . . .

Scene Four: Troublesome Spirits

Through suspiciousness, accidental rough handling, or pure lust for liquor, the Posse may find themselves face-to-face with the contents of the barrels. Before doing so, they will have to overcome certain difficulties.

For one thing, the barrels are tightly tied together. This means that only the rear three barrels can be accessed via the tail flap of the wagon -- the rest are protected by the sides of the wagon and the other barrels. Of course, it would be easy to breach one of them through its upper lid, but that would be hard to explain to the tavern owner in Junction Gap. If they are forced to pay for a broken barrel, they will more than likely make almost no money for this job. More surreptitious access is possible, of course, if the party are happy to simply bore a tiny hole in the side and let the booze trickle out -- say, into their waiting cups. Such a trickle is easily patched with the tar that is part of the wagon supplies, and would confirm that the barrels do indeed contain whiskey, stout, or whatever, and high-grade hooch at that. Encourage the Posse to sample the cargo -- this might come in handy (and amusing) later on.

A hole of the size mentioned will be too small to admit much in the way of skewers or other tools, should the characters wish to probe the barrels for hidden goods; in any case, the last three barrels -- the only ones they can comfortably reach -- don't contain anything suspicious; the undead beasts are all packed into the hindmost barrels, tucked up tight and floating in booze, waiting for the right signal to strike. Only if the party somehow manages to disturb any of their "passengers," or the barrels are broken open, will they come to life and attempt to kill everyone in sight.

The barrels contain ten Pickled Dead, three Nosferatu, and around a hundred Undead Bats (split up between the casks, around eight or ten to a cask). All relevant stats can be found in "Boot Hill." The Pickled Dead are the poor unfortunates that have gone missing in the area over the last fortnight -- the preacher, Texan hunter, guides, madwoman, prospectors, and so on, as well as a few the townsfolk haven't missed yet). They are still attired in their normal clothes and, due to the preserving effects of the booze, are not immediately recognizable as zombies.

As mentioned previously, the undead are supposed to wait for the commands of the houngan who is waiting for them in Junction Gap, but if they are prematurely discovered they will be more than happy to improvise, starting with the Posse. If, however, the Posse are content to sip at the booze and then continue on their way, then nothing will seem out of place until they reach Junction Gap.

Interlude: In Vino Veritas

Here's the story so far, Marshall, just in case you're scratching your head. Junction Gap is Iron Dragon's latest successful project, which should give them a definite edge in their race towards the Pacific. Construction is split up between several railheads in the area; these railheads are less than a fortnight from completion, Once the line is linked to Iron Dragon's existing tracks, Kang will have made a hundred-mile leapfrog ahead of his opposition, and will finally be able to shift some of his stretched private armies off the exposed southern tracks and back into more critical spots.

The town itself has grown up around a trading post which was established here to trade with the Crow; when Kang was allowed to build through this land by the Sioux Council, he decided to enlarge the settlement to serve as a resupply nexus for his multitudes of work crews -- and, to contain potentially troublesome regulators and locals in one place where he could keep an eye on them between assignments.

Unfortunately for Iron Dragon, Junction Gap's newest barkeep is a secret agent for Bayou Vermilion, and it was he who came up with the idea of smuggling some undead muscle into the town via a booze shipment. The disappearances have most of Kang's available regulators prowling the woods and protecting the rail crews, leaving the town well defended but still vulnerable to a surprise attack from within. 'Vincent Green' (real name: Vincenzo Verdi, a native of New Orleans) has been sent detailed instructions on how to command his deathless troops, and plans to use them the very night they are delivered in the hopes of catching a visiting party of Iron Dragon dignitaries who are currently in Junction Gap. Well, that's the plan, anyway. But like so many villainous plans, it doesn't take the presence of your

heroes into account! In addition, a powerful local Priest/Shaman by the name of Father Red Hair (yes, he has both Arcane Backgrounds, and a suitably unusual style of supernatural effect) has had a foreboding that some evil cargo will be transported to Junction Gap and be the cause of much death and misery; the Crow saboteurs were under orders from him, and it was he who sanctified the mountain pass. However, he has bigger fish to fry, and considers his part in stopping the wagon to be done -- if the saboteurs failed, it's Iron Dragon's problem now.

Scene Five: One Hell of a Party

The Iron Dragon pickets are strung well out from the town, and consist of five to ten Iron Dragon regulators (mostly local, but bulked up with conscripts from the Maze and led by one of Kang's hand-picked henchmen). The Posse will be stopped and asked for their papers several times before reaching Junction Gap itself. When they do reach the town's well-constructed wooden palisade wall (one of Kang's first investments), they will be forced to wait behind a two-wheel cart bearing fireworks (for the opening ceremony in a few weeks' time) for almost fifteen minutes while the driver is questioned about an irregularity on his manifest. Eventually, they will be ushered through the gate and pointed to the trading post which forms the center of the settlement. The guards will also perform a brief eyeball inspection of the characters' armament; pistols, rifles and so on are acceptable, but any Gatling pistols, dynamite, or flame-throwers will have to be locked away in the guard shed for the duration of their stay. By this time, it will be late afternoon. 'Vincent Green' will be on hand to receive the shipment, and will come across as warm and friendly, asking with great concern about any troubles the Posse may have had on the way. He will explain to them that the town hasn't had any potable liquor for over a month now, and that he is looking forward to a big opening party tonight -- to which the characters are invited, of course. He will also hand them \$15 each in Iron Dragon scrip (redeemable only within the town), and recommend that they try the Exquisite House of Vapors bath house to help them soak off the trail dust before sunset.

If the characters take the time to wander around the town a little (perhaps on their way to the bath house), they may be disappointed to find that it is as good an example of a boring company town as they come. Grim, double-story barracks dominate the town plan; most of the inhabitants live in tents or lean-tos. Most of the people on the street are Westerners; it appears that Junction Gap is equal parts shipping depot and round-eye quarantine camp, with none of the accouterment the Posse may have come to expect from the booming West. At least the bathhouse is worth the trip -- after the efficient ministrations of its gray-haired proprietress and her legions of assistants, the heroes are likely to be cleaner and more fragrant than they have been in weeks -- or, perhaps, ever. A bath costs 25c for gentlemen, or 50c for ladies (who get private tubs rather than communal ones). As far as overnight lodgings go, the only available rooms are in the Baron's Rest; the characters may sleep elsewhere for free (such as in a tent), but if they want a room they will have to pay standard rates, although breakfast is thrown in.

Junction Gap also has a large general store which sells everything except firearms. Ammunition, supplies, food, and items usually only found within the Maze (such as martial arts weapons), are all available.

The town will begin to fill up around six, as the various drovers, foremen and lumberjacks who call Junction Gap home begin to return from their days' labors; sunset and the opening of the Rail Baron's Rest come simultaneously at around seven. By eight, the place is packed; apart from a few very squashed card games taking place on hay-bales and empty gunpowder crates in the corners, everyone is on their feet and drinking like there was no tomorrow -- which, for most of these unfortunate revelers, is more likely than they might suspect . . .

"Green" has pitched the prices high, but not so high that everyone can't afford at least one drink; and, as the characters may well know, the hootch in the barrels is nothing if not potent. Soon, every one of the Rest's fifty or sixty customers is more than a little "likkered," packed shoulder-to-shoulder, singing along with the piano, dancing on the stage, and firing the occasional pistol shot into the ceiling. When the party is well under way -- introduce a random fist fight or beer-spilling to distract the Posse -- Green will duck momentarily behind the bar, complete the Voodoo incantation required to activate the Zombie Hootch in the barrels (see below for details, but these aren't important until someone with a gutful of the tainted liquor dies) and, laying his hand briefly on each of the barrels, give the critters within their long-awaited signal. At the same time, his two confederates outside the bar wedge the main doors closed with a horse trough. A few seconds later, the rack of barrels begins to shake alarmingly, and then one by one the barrels smash

open in a cloud of bats to reveal a dozen ghastly figures bent on slaughter!

Predictably, the saloon turns into a welter of fleeing, screaming, panicked, pistol-packing drunkards, and no one is safe. While the majority of the bats stream out the back door (which is the only viable exit from the saloon), followed by two of the Nosferatu and a few Pickled Dead, enough remain to stop the hysterical crowd of regulators from fleeing.

The combat in the bar should be resolved as follows:

- In advance, draw ten cards from a shuffled deck. Note these down on a piece of paper and use the character generation rules to convert them into dice combinations (2d4, 4d6, etc.)
- Now, note that each Club result (d4s) represents a pistol shot, each Diamond result (d6s) is a knife attack, and all other results are Brawlin' attacks. Pistol and Knife attacks do 3d6 lethal damage; Brawlin' attacks do 2d6 non-lethal damage.
- These combinations represent the attacks faced by each character stuck in the crowd, per round. Assign each set of dice a number from 1 to 10; every round in which a character remains in the saloon, roll a ten-sided dice and assign an attack of that type and number of dice to them -- someone has shot at them, stabbed them with a knife, or simply tried to batter them unconscious. Characters who are up against one of the walls, out of the general press of bodies, may make a Dodge roll against a TN of 7 to avoid the attack, and are never attacked on a Club (by a pistol); others must dodge or retaliate normally.
- Characters who are trying to get through the crowd (to attack the undead, perhaps, or reach the back door) can only do so if the action card they play is of the same suit as the attack they are facing that round; if the suit does not match, they may retaliate against their attacker or dodge, but they cannot get any closer to their objective. Conversely, if the suits match, they can get where they want to be even if the attack directed against them hits. The rules above are for heroes who are trying to get through the crowd with a minimum of bloodshed. Anyone who is intent on fighting their way through the crowd simply enters combat with the barfly who is attacking them this round; this combat continues until one party is knocked out or killed, at which point the winner may move to any point in the bar he or she likes. For each fighter put down in this manner, drop one card from the pool of attacks faced by the characters; if this number is rolled on the ten-sided dice, that character suffers no attack that round and may move as he or she pleases. Hence, if ten fighters are put down by the PCs, the crowd will have thinned to the point where no-one is attacking anyone but the undead critters and the heroes can join in or flee as they like.
- The effectiveness of various inventive means of crossing the bar or parting the crowd are left to your discretion; certainly, a swing on the wagon-wheel chandelier would be an option, as would starting a fire or using supernatural powers such as the *Harrowed Ghost* ability.

Anyone hoping to get out the back door will need to fight one of the Pickled Dead or, possibly, the last Nosferatu remaining in the bar, depending on how dangerous they seem to the undead.

Anyone trying to break the jammed doors down will need to deal 50 points of damage to the doors. Up to two characters may take turns to kick or shoulder-charge a door in every round, doing damage equal to a *Strength* roll. Note that the first person out of the main doors is likely to get hit with both barrels of a shotgun from a Bayou Vermilion agent lying in wait across the road. Outside, the sky is teeming with bats and the ground is strewn with the dead and half-dead. Horribly enough, some of the recently-killed are starting to rise back to their feet as Hootch Cadavers! This is the effect of the *Zombie Hootch*; effectively, anyone killed by the bite or claws of a creature soaked in this stuff rises as a zombie for 2d6 minutes before falling to the ground for good; this means that most of the town are now busy fighting not only the Bayou Vermilion infiltrators, but also the animated corpses of their own comrades. The same goes for the party members, of course; anyone who has consumed the *Voodoo Hootch* will rise as described, and any *Harrowed* must make an immediate *Dominion* check once the fighting starts to resist losing control to their *Manitou* for 1d6 rounds.

At this point, start keeping track of how many Pickled Dead and Nosferatu are left. Roll a single six-sided dice to see how many Pickled Dead the bar patrons managed to put down; add to this the number the party have personally accounted for, including the Nosferatu if necessary. Because of their short lifespan, the Hootch Cadavers are considered more of an environmental hazard than specific foes; the same goes for the bats on account of their numbers.

Eliminating the Bayou Vermilion agents and remaining undead should be on top of the characters' priorities.

No doubt, the characters will have several plans for accomplishing this goal. The most immediate plan that comes to mind for clearing the sky of bats is the massive load of fireworks the characters saw being brought in ahead of them. If the characters don't think of this on their own, you can always steer the fight over to the storage sheds and have a stray round ignite a lone firework, blasting a dozen bats from the sky, to give them a hint. As far as the other hazards the town offers, these can be handled wargame-style, or as random events using the guidelines below, based on each action card tossed in by your Posse as they move around their surroundings:

On a Deuce: a Hootch Cadaver lurches from the shadows to attack the character.

On a Three: an Undead Bat flits down to attack the character.

On a Queen: a panicked Iron Dragon regulator, dug in behind cover, opens fire on a random Posse member and will keep firing until killed or disarmed.

On a King: one of the Bayou Vermilion spies, concealed in the shadows alongside a building, opens fire on the most exposed Posse member. There are only three such agents; mark them off one by one as the party deal with them, saving "Green" for last.

On a Ace: a Pickled Dead (or Nosferatu if there are none left) attacks the character.

There are effectively limitless numbers of regulators and Cadavers. The same goes for the bats, unless your Posse can come up with some appropriately wide-effect attack to deal with them. Using the fireworks will require a *Deftness* roll against a TN of 7 for each shot. Characters with the *Demolition* or *Science: Chemistry* skills can add +2 to their rolls. For every success and raise, 1d6+1 bats are shot down. The characters have enough ammo for fifty shots. Once the Bats, Nosferatu, Bayou Vermilion agents and Pickled Dead are dealt with, the remaining regulators should have no trouble holding off the Hootch Cadavers until they run out of "juice."

In the aftermath of the fight, it should soon become apparent to the Posse that they are unlikely to be greeted with much warmth by the Iron Dragon regulators. They may wish to conduct a quick inventory of their surroundings with the hope of rounding up a little advance on their danger pay; in this case, each of the three main stores in the settlement (the bath house, the saloon, and the general store) will contain \$1d100 dollars in Iron Dragon scrip and \$3d6 in gold (\$6d6 for the saloon), as well as a few salvageable items. The scope and worth of such salvage is dependent on how many risks the Posse are willing to take; for each location searched, they have a 50% chance of encountering 1d6 Iron Dragon enforcers, who will shoot first and ask questions later.

The trip back to Jackson, assuming that's where the Posse decides to go next, is uneventful. They may wish to interrogate Grupp about the wagons; he will explain (if given a chance), that they were shipped by rail from Chicago (on a Bayou Vermilion train) ready-packed, and that he had no idea that they contained anything but booze. He is, as it happens, telling the truth. He will, of course, gladly pay the heroes the money he owes them for completing the job . . .

The End

Boot Hill

Crow Saboteurs

Corporeal: D: 3d6, N: 3d6, S: 1d8, Q: 2d10, V: 1d6

Nosferatu

Corporeal: D: 2d6, N: 3d10, S: 3d12+2, Q: 4d12, V: 2d10

Mental: C: 2d8, K: 1d4, M: 1d8, Sm: 2d6, Sp: 1d4

Dodge 2d10, Climbin' 4d10, Fightin': Brawlin' 4d10, Sneak 5d10, Overawe 5d8

Pace: 10

Size: 6

Terror: 9

Damage: Claws (STR+1d4). If a Nosferatu hits with a raise in hand-to-hand combat, it can also bite its victim, doing an additional (STR) damage.

Undead: Nosferatu do not lose Wind, and ignore damage penalties as if they were Harrowed.

Weaknesses: Wood, holy water, beheading, and sunlight. Beheading or a wooden stake through the heart kills the Nosferatu, while each pint of holy water thrown on it causes 2d6 damage. Each round a Nosferatu has any flesh exposed to direct sunlight, it takes 3d6 damage.

Note: These undead, unlike regular Nosferatu, have the power to raise their victims as Hootch Cadavers (see below) due to their exposure to the Zombie Hootch.

Pickled Dead

Corporeal: D: 2d6, N: 2d8, S: 3d8, Q: 2d10, V: 2d8

Mental: C: 2d10, K: 1d6, M: 1d6, Sm: 1d6, Sp: 1d4

Shootin': Pistol 2d6, Climbin' 1d8, Dodge 2d8, Fightin': Brawlin' 3d8, Sneak 3d8, Overawe 5d6

Pace: 10

Size: 6

Terror: 9

Damage: Brawling (STR). If a Pickled Dead hits with a raise in hand-to-hand combat, it can also latch onto and begin to bite its victim, doing STR+1d4 damage every round until killed or pulled loose (requires a contested STR roll by the victim, +2 for every assistant).

Undead: Pickled Dead do not lose Wind, and ignore damage penalties as if they were Harrowed.

Weaknesses: Any penetrating incendiary attack (fire arrows, Soul Blasts, fireworks) which hits a Pickled Dead and does at least 6 points of damage causes it to explode into a cloud of evil-smelling alcohol fumes and rotten meat.

Note: These undead, unlike regular Walkin' Dead, have the power to raise their victims as Hootch Cadavers (see below) due to their exposure to the Zombie Hootch.

Hootch Cadavers

Corporeal: D: 1d6, N: 1d8, S: 1d8, Q: 1d10, V: 1d8

Mental: C: 1d10, K: 1d6, M: 1d6, Sm: 1d6, Sp: 1d4

Climbin' 1d8, Dodge 1d8, Fightin': Brawlin' 2d8, Sneak 2d8, Overawe 4d6

Pace: 8

Size: 6

Terror: 9

Damage: Brawling (STR)

Undead: Hootch Cadavers do not lose Wind, and ignore damage penalties as if they were Harrowed.

Weaknesses: Limited lifespan (2-12 minutes).

Undead Bats

Corporeal: D: 1d6, N: 5d8, S: 1d4, Q: 1d10, V: 1d8

Mental: C: 1d4, K: 1d4, M: 1d4, Sm: 1d4, Sp: 1d4

Dodge 1d8, Fightin': Bitin' 2d8

Pace: 16

Size: 2

Terror: 7

Damage: Brawling (STR)

Time Enough for Love

Getting Romance into your Super-Hero Games

by Brian Rogers

Romantic entanglements are part and parcel of the soap opera style permeating super-hero comics. Many of the great heroes have them, giving life to characters otherwise easily reduced to collections of powers bundled in colorful tights. Romance provides a counterbalance to the world shaking threats super-heroes face. It doesn't matter that Omniman can resist A-bombs and push the moon out of orbit when his goal is getting a date . . . giving the GM a surefire way to challenge the character and engage the player.

Unfortunately, many super-hero campaigns ignore this. Too many reduce presumptive lovers to people routinely threatened by giant lobsters. Too many romances become excuses to spotlight one character at the expense of the others. Too many players have problems with in-game romance. Here are guidelines for overcoming those difficulties, along with some odd takes on super-hero romantic relationships.

Mechanical Problems

The first problem with SHRPG romances is usually mechanical. Many game systems let players treat romantic relationships as disadvantages; the love interest is a Dependant Non-Player Character who appears in a certain percentage of sessions. Once there, she either keeps the hero from directly following up on the main plot or makes the main plot more complicated (usually because she's gotten herself tied to the claws of a giant lobster). For this, the hero receives some extra character points. Instead of being a central part of the hero's life, the romantic NPC becomes someone to rescue from natural disaster -- the super-hero equivalent of having a date for New Year's. How do you fix that? The same mechanics that cause the problem can help you.

- **Make the Romantic Interest Double as an Advantage:** Maybe she's an expert in magical mythology (contact) or a rich businesswoman who partially funds the hero team (patron). This gives the presumptive couple a reason to interact, directs the growth of the relationship, and gives even the most combat-heavy PC a reason to hang around with his Dependent in game . . . especially since it now looks like he's getting points for a benefit. The catch? The PC has to spend time and effort making the relationship work. After all, he didn't pay for that advantage, so if he wants to keep it he has to work at it, spending time in romance even when the dependent's skills aren't useful. If he doesn't, the next time he tries to call on his "free" contact, he'll find her dating someone else, and he'll have to win her back to get that help he need to fight the Darkness Demon. This is a good carrot and stick approach for mechanics heavy players.
- **Merge the Romance with Another Limitation:** The romantic interest could double as a professional rival (Lois Lane to Clark Kent), a member of the hero's rogues gallery (Catwoman to Batman) or even someone after the hero's head (Mina Harker to Dracula). Such relationships are usually different between the hero's costumed and secret ID (with the dependent loving the hero and being a rival of the secret, or vice versa), or even more twisted, where the love interest also has a dual identity or other hidden secrets. In general each new identity gives room for a new level of complication. Performing this sort of NPC double duty makes the GM's workload easier, reducing the total number of detailed NPCs in the game.
- **Build the Main Plot around the Romantic Interest:** This overlaps with the concept of giving the romantic interest another role, but in this case, that role is as the McGuffin. Regardless of how the heroine met him, what he does for a living or anything else, weird things keep happening to him. That's because he's the child of an alien abductee whose body contains Zeta Reticulian DNA that everybody from the Masons to the Greys are after. Every time the dice say he shows up, it's because he's dragging that plot with him. It may take some time for the heroes to even realize that the black helicopters and Geiger-esque aliens only show up when Amazonia's beau is around. This can work well in either a short campaign in which the love interest is the focus, or in a long game where the plot keeps leaping up out of the background.

- **Reward them for the Romance:** Set aside a few experience points a week as a roleplaying bonus for fulfilling social obligations. One of those social obligations is, of course, the romance. The PCs only get those points if you feel that the players are making a real effort to pursue the romance. Even people without DNPCs benefit from this . . . even more so, since their love interests, not saddled with the task of being a disadvantage, seem remarkably skilled at avoiding crustacean bondage. While this is definitely a "carrot" approach, it does wonders for increasing in game romantic roleplaying. Of course, those points shouldn't depend on romances -- you should award them for any other roleplaying oriented subplot -- but the simplicity of the romance plot should make it a common one.

Logistical Problems

Of course, there's still the problem that time spent on the romance is time spent on just one player out of the group. It's hard to draw a line between a good roleplaying opportunity and hogging the spotlight. One solution -- give everyone a DNPC -- just means more time away from the main plot, and more sitting around time for the group as a whole. It does mean that at least everyone is equally bored, but this is not something to shoot for. There are other, better ways.

- **Make the Relationship Fun for the Audience:** Players won't mind twenty minutes a week spent on Phoenix Talon's dating if the interaction is a hoot to watch. Most people think "drama" when planning romances, forgetting the other romantic resource: the sit-com. Endless bumbling, interesting mishaps and outside interventions can have the other players rolling every time the hero and his would-be love try and get together. Practice your witty repartee, prepare some pratfalls and remember Mike Pondsmith's classic advice from *Teenagers from Outer Space*: "Sex isn't funny. Frustration . . . now that's funny!"
- **Take the Romance out of Session:** Setting up a romance for a thespian or tragedian can open up a weekly hour-long angst wallow. To avoid this, rigidly enforce a short time period in game for the romance plot. Anything outside of those ten minutes must be handled out of session. You and the player could arrange for one on one sessions or trade e-mails, keeping the plot moving without slowing the game or having the others think you're playing favorites. This tactic works just as well for players uncomfortable with romance in front of the group; ask for a few minutes per session (something light, such as getting away from the love interest to change into costume) and handle the rest via e-mail, where the player can mention he's taking her out on another date to make up for the whole lobster-claws thing.
- **Make the Romance Doubly Useful:** Most of the advice mentioned above for game mechanics works just as well for logistics. Players accept spending time talking to contacts, patrons and plot related NPCs in a way that they may not accept romance. Even if those conversations are couched in the terms of romance, no time is "lost" to the plot. No one will feel slighted if Omniman's secret ID tries to get information by questioning his district attorney girlfriend over dinner, as long as it doesn't take longer in game than getting the information in other ways. When the main plot keeps the plot moving, everybody's happy.

Player Problems

Before you can put romance into practice, you have to get the player to agree. Many gamers find intimate personal relationships a touchy topic for any number of reasons. If you have such a player, you have to respect that . . . everyone has boundaries, and you as the GM shouldn't cross them. Let him know what you intend to do beforehand and ask his permission. If he doesn't like the idea, drop it and try a different player. Once you have one player willing to try, the following steps in game might bring the others along.

- **Play Up the Benefits of Romance:** While super-hero games usually focus on the hazards of romance ("How can I get away from Daisy May to become the Mountain Man without revealing my secret ID?"), it has many benefits. For example, after a brutal battle with their greatest foes the heroes return to their lives: the overly responsible heroine to her cramped apartment, the grim avenger to his sterile secret headquarters, and the romantic hero to his girlfriend's place, where she gives him hot chocolate and a backrub. One of these people seems to have a better deal. If having a romance becomes a perk, reticent players might decide that they too want that intangible advantage.
- **Keep the Romances Visible:** Dedicate a few minutes each session to the romantic NPC, even if the dice don't

have him showing up. This reinforces the DNPCs importance. After all, the dice only indicate that he has become important to the main plot, not that he doesn't exist. He calls the heroine up, tries to make a date, shows up at her office, or is there to pick up the dinner check. If the heroine is saving the world, he's trying to figure out where she is (and why Anna Zone is never around when the Justice Patrol is on a mission . . .) He should be part of the heroine's life, even when he isn't threatened by oversized crustaceans.

- **Fade to Black:** Use taste when dealing with the intimate or physical aspects of romance. People have problems enough listening to couples baby talk in restaurants; they don't want to hear it at the gaming table. Unless everyone agrees on a higher level of intimacy and physicality, assume that you're on prime time TV. Whenever things are about to get physical, shut the door. Whenever it's about to get mushy, cut to a new scene. If you're running it as a sit-com, then whenever intimacy approaches, so too does the hero's mother, a dozen costumed thugs and an alien hologram that only the hero can see. That has the same effect of closing the scene, but is much more fun for the other players.

Types of Relationships

When setting up a romantic plotline for a player, keep the source material in mind. Comic books are serial fiction, and in serial fiction not only is the path to true love not a smooth one, true love isn't too smooth either. There is never a permanent happily-ever-after until the series gets canceled. This means that the romance has to constantly provide new challenges and new story opportunities. While the daily aspects of dating and marriage provide plenty of fodder, the common comic relationship types listed below are particularly rife with possibilities.

- **Byzantine:** Unlike most forms of stories, super-hero RPGs offer the GM immense latitude for convoluted plots. In a Byzantine romance, there's always one more wrinkle . . . even if it changes hundreds of sessions of continuity. Discovering that your wife is not in fact the stolen girlfriend of a teammate, but is actually a shape-shifted alien spy who replaced the old love interest (placing her in suspended animation), and then fell in love with you, causing her to betray her people to marry you is not *that* uncommon. That she was assassinated immediately after revealing her alien state and released the original love interest (the one you thought you married) should be taken in stride. Did we mention that the original love interest is the daughter of one of your earliest foes? Don't worry; odds are that you'll be able to bring your alien spy wife back from the dead . . . assuming that it was actually her soul you brought out of the afterlife and not the disguised soul of one of your long dead adversaries who is now just waiting for a moment to strike. As a GM, you can use a Byzantine love interest to introduce any new plot twist, trusting that the hero will follow up, if only to find out who his true love really is . . . this time.
- **My Own Worst Enemy:** The heroine's romantic interest loves her heroic ID, but he is rivals with, indifferent to or somehow unable to date her secret ID. This works best with heroines that won't reveal their secret ID, and gives the clever GM lots of room to make the heroine's life wonderfully confusing. For a simple twist, turn it on its head, so that the romantic interest loves the secret ID but can't stand the heroine; this changes the relationship from comedy to drama, as a viable romance is now infected with a mysterious secret and conflicted emotions.
- **Tangled:** The hero doesn't have a single romantic interest . . . he has several. Oh, things may start with just one romantic interest, but then another one shows up, forcing the hero to make painful decisions. Once he does so, the selected love interest will leave for some reason (her family is moving, she's taking a job in Europe, something). The hero can then settle in to a new love interest, but sooner or later the first couple will return, now bring their current suitors in to increase the complexity. This is a romance style that has room for pathos or situation comedy, depending on how you play it.
- **Separated By The Law:** The love interest shares a secret passion with the heroine, but the two are on opposite sides of the law. This is the only thing standing in their way, but it's a big thing. While this is usually the love interest being part of her rogues gallery, it could just as easily be the crusading District Attorney and the "lawless" vigilante, the libertarian hero and the FBI agent, or anyone else separated by a political gap where one side has legal backing and the other does not. The rivalry guarantees that the plot remains vital: even after they "get together," their political differences can fuel plots for years.
- **Conspicuous In Its Absence:** One of the best romantic relationships for the grim vigilante is the obvious lack of one. Rather than having to settle issues with a single love interest, the hero grapples with the very need for romance. Any one of a number of potential romances enter his life, forcing him to question his dedication to the

crusade. The more he pushes romance away, the more isolated he becomes. The more he embraces it, the more his adversaries move in his absence. More than any other romance type, this is the definitive relationship for the Batman and all characters of his ilk: the war against crime is always out there, and embracing romance means diluting the passion that makes his activities possible.

'Til Death Do Us Part, And Then Some

Being the convoluted tale of three souls, two rings, one death, and a very bad day in China

by Michael Anguiano

A Band Of Gold

The Wedding Ring of Eloise Enzer is a simple band of 14 carat gold, approximately size three, inscribed "Eloise & Lambert June 15 1921." The surface is polished and bright, without visible wear or tarnish, with an apparent value of no more than the weight of the gold itself. To pursue the ring is to stumble into a hellish tangle of sibling rivalry and romantic betrayal.

The ring will snugly fit the ring finger of the left hand, regardless of the wearer's size, but will not quite fit any other finger. Under mystical or occult analysis, the ring resonates with a strong enchantment. The wearer receives a significant bonus to resisting magic, mystic, or occult influence. The wearer will heal much more quickly, so that a wound will heal in days rather than weeks, hours rather than days, etc. Any mystical or occult abilities of the wearer will be boosted. A mundane wearer, having no such abilities, will instead gain a boost in strength, agility, and physical resilience. These boosts will be minor as the ring attunes to the wearer, but will increase and reach full potential after a few months. The ring's benefits will abate if the ring is removed, but the attunement process will continue.

The ring's drawback is the wasting effect, which does not appear to be tied to the original enchantment of the ring. The wearer suffers a tiny but relentless loss of vitality. After six months, the wearer will appear to have aged one year. After one year the wearer will appear to have aged five years, a ratio which will remain constant thereafter. If removed from physical contact, the wasting effect will abate and the person's vitality will repair. However, the person will only recover roughly one-half of the lost years, and the remaining premature aging is permanent.

The ring is currently worn by Arabella Denfield. A woman of great beauty and fiery temperament, she appears to be in her early twenties. Most men find her charming, to say the least. Most women will find her annoying, catty, and disdainful. She is adept at deflecting queries about herself. When asked her age, she laughs and remarks that she has tried to age gracefully.

History Of A Bride: Eloise Denfield Enzer

Historical accounts state that the ring originated with Eloise Denfield, born in the early years of the 20th century. Eloise and her older sister, Arabella, were connected to an ancient line of occult practitioners, but Eloise showed no interest in the "Denfield gifts" for the dark arts. Living in Paris during the Great War, Eloise met and married Lambert Enzer, an American serviceman, and left with him for the States. The couple settled into polite society, raising two sons and a daughter. Lambert worked at a northeastern university, travelling extensively. In 1929, Lambert was in China with a group of American businessmen, procuring historical artifacts and artwork for various Western groups. Lambert abruptly terminated contact with Eloise and disappeared.

Eloise was reportedly convinced that Lambert had abandoned her for another woman. Enraged, Eloise turned to the dark arts she had denied, leaving the mundane world she had tried to embrace. With the assistance of her sister, Eloise called up a powerful dark lord and pledged herself in a compact for power, her wedding ring now a link to her dark lord. Accounts vary as to the identity of the particular dark lord but agree that Eloise Denfield Enzer became a Bride of Darkness. Drunken with power and rage, Eloise pronounced a dire curse of retribution upon her lost and faithless husband. She and her sister disappeared from the US.

Official accounts report Lambert's death in an outbreak of regional unrest, which claimed the entire group of travelers. His personal effects and decomposed remains were delivered months later to his next of kin. Lambert's relations had adopted the children and raised them in Eloise's continued absence.

Some accounts state that Eloise reappeared briefly a decade later, receiving nothing but scorn and anger from her alienated children, and left their lives for good. In any case, aided by her sister Arabella, Eloise became a notable figure in the world of the occult, gaining skills that bolstered her bargained power. The Wedding Ring of Eloise Enzer has become her legacy, an artifact which remains a link to the power of her dark lord. After Eloise's death in 1988, Arabella inherited the ring and has safeguarded it from those who would exploit her sister's death.

The Sister's Story: Arabella Denfield

Arabella Denfield has certainly aged with more grace than most. Born in 1902 near Edinburgh, Arabella is a talented and well-versed practitioner of "the dark arts." Proof of her abilities is that she has circumvented the wasting effect of the ring, despite fourteen years as primary possessor. Her familiars, however, don't last long.

The available accounts of the ring's history omit quite a bit, due to Arabella's tampering. In truth, Arabella met Lambert first. She toyed with him briefly but grew bored and let Eloise seduce him away. Arabella knew that the seduction would bolster Eloise's confidence while giving Arabella leverage with guilt. After the married couple's departure for the states, Arabella hatched a plan to convince Eloise to pledge herself as bride to a dark lord. This would gain Arabella access to great power while letting Eloise pay the cost.

After years of research, Arabella reappeared in Eloise's life and set her plan in motion. She slowly manipulated Eloise into suspecting that Lambert had been repeatedly unfaithful. Eloise came to believe that his trip to China was merely a cover, instead running away with another woman. The transformation into Bride of Darkness was simply a matter of Arabella presenting the right tidbits of arcane lore and sisterly advice.

The following decades saw the sisters working together, with Eloise as the visible figure of power. Arabella, meanwhile, brokered their deals and managed their resources. She knew that when Eloise died, the dark lord would arrive to claim his ring and to claim his bride. The ring could be removed by no other until then. She also knew that the ring would continue to resonate with power even after Eloise's death, so she would inherit the ring without price.

Under her pledge, Eloise could not regain youth and stave off death indefinitely, but she helped Arabella do so. Eventually Arabella would pass herself off as Eloise's niece when handling their business affairs. Eloise passed away in 1988 when their home burned down. Her ring was claimed by Arabella before the embers had a chance to cool.

In addition to her skill with the dark arts, Arabella is expert at manipulating people, honed by decades of practice. She consistently achieves her goals through diplomacy, charm, and seduction. She has virtually no records or paper trail, yet she seems to have access and resources everywhere.

If questioned by PCs, Arabella will simply say the ring is a family heirloom, denying any other value or significance. A PC with significant occult background has a small chance to recognize the ring or Arabella herself. Otherwise, background on Arabella or the ring must be gleaned through extensive occult research or consultation. Tech-based searches, such as Internet search engines, will be almost useless because of the absence of a paper trail.

PCs will have difficulty getting the ring from Arabella without her consent. Arabella is unpersuaded by money and will react to attempted seduction with amusement. Threats will provoke laughter. She will have a bodyguard or consort who will protect her from overt force. Arabella might barter for the ring if offered a sufficiently attractive trade, but won't mention that she can locate the ring with minor effort. When she wants it back, she'll come get it. Indeed, one of her diversions over recent years has been watching the progress of the ring from one wearer to another before reclaiming it.

If a female PC is particularly annoying or attractive, Arabella may simply give the ring to her as a gift, making a grand gesture out of giving something so personally valuable. She will also insist that the recipient wear the ring, knowing

that steady physical contact will ensure the wasting effect. After the wearer has suffered noticeable aging, Arabella will reappear to reclaim her property.

Arabella has not yet figured out that she has the wrong ring. Eloise Enzer was wearing her own wedding ring when she pledged herself as a bride, but she was wearing Lambert's wedding ring when she died.

The Groom: Lambert Barnard Enzer

Born in 1899, Lambert Barnard Enzer was attending university when the US entered WWI. He enlisted immediately. In Paris, he met Arabella Denfield, a beautiful young woman with plans to sell US equipment on the black market. When she realized that he wasn't interested, she moved on and Lambert began courting her sister Eloise, who was a much more pleasant person. Married on June 15, 1921, Lambert and Eloise had an increasingly turbulent marriage. Her initial interest was fueled by her rivalry with Arabella and later she was unwilling to admit that she might have been manipulated.

Once in the States, Lambert took a position with the university office that handled acquisitions for the library and assorted collections, which required frequent travel. Lambert was never unfaithful, despite occasional temptation and increasing motivation. His resolve wavered briefly when Arabella presented herself as an option to be considered reliable and discreet, but he nevertheless remained a loyal -- if increasingly frustrated -- husband. During the trip to China, Lambert and his associates were en route to a remote district when he went into violent seizures. He was immediately carried to the nearest shelter, where he underwent a horrific transformation.

Marriage is a union of two souls. The ring of matrimony embodies the unbroken and unending circle that binds the bride and groom. When Eloise pledged herself as a Bride of Darkness, her wedding ring became the link to her dark lord. Bound in union, the energies that surged through her ring as the bride also reached through Lambert's ring as the groom. As Eloise became a Bride of Darkness, Lambert became a fitting consort. The essential polarity of his life force shifted from positive to negative energies, transforming him. He had become a wight, a physically powerful undead creature that feeds upon the life force of others. Driven mad by the change, he destroyed the group of travelers and the surrounding village, leaving withered husks scattered across the countryside.

The Exceedingly Late Husband: Albion

Seven years later, Lambert had gained control over himself and returned to the States, only to find that someone else had been buried in a grave with his name. His wife and family lost to him, he allowed "Lambert Barnard Enzer" to remain dead and instead called himself Albion. He gradually built himself a life, so to speak, in the underbelly of society. He eventually found out about Eloise's pledge and pieced together what had happened on that day in 1929. He also realized something that Eloise and Arabella did not: he could remove Eloise's ring.

As a Bride of Darkness, Eloise's ring was the earthly icon of her status. Eloise and Arabella understood this to mean that the ring could be taken from her only when claimed by her dark lord. They were incorrect. The ring could be taken from her only by her betrothed, which included Lambert as well as her dark lord.

Despite his anger with her, Albion decided to offer Eloise a way out. As her betrothed, Albion would remove the wedding ring from her finger. Her eventual death would not summon her dark lord to claim her, and so she would be spared the consequences of her mistaken decision. This, Albion decided, would be his last gift to his wife: allowing her to look towards the end of her days with peace.

Eventually he found Eloise and tried to speak to her while Arabella was gone. Eloise did not recognize Albion, so she unleashed her powers upon the ghoulish thing that confronted her. Her ring was bound in union to his ring, however, and the energies that struck him were also shared out to her. Albion shrugged off the damage he received, but Eloise was struck unconscious. Realizing that he was going to have difficulty getting through to her, Albion went to plan B and removed her wedding ring, then replaced it with his. The switch was made and consequently her awareness or understanding would be helpful but not necessary. He discovered that his ring fit perfectly on her and her ring fit

perfectly on him, despite their original sizes, which he surmised was a result of the enchantment. The rings were otherwise identical except for the inscription on the bride's ring, "Lambert & Eloise June 15 1921," while the groom's inscription read "Eloise & Lambert June 15 1921."

When she regained consciousness, Eloise saw Albion, saw a wedding ring upon his finger, sensed its connection to hers, and promptly died of a massive heart attack. Shaken, Albion went to plan C: Set fire to the house and flee. Her dark lord did not appear when she died, however, so Albion presumed that her soul escaped to whatever reward it would otherwise deserve.

Albion decided to switch the rings back when he learned that Arabella had quickly claimed the ring from her sister's body. He knew that the true price had not yet been paid for the bride's ring. He felt that it was only just and right that Arabella should pay that price. Besides, he needed to be angry at someone, so it might as well be her. However, Albion is unsure how to do so without alerting her to the hidden dangers of the bride's ring.

Albion is striking in appearance, although rather typical for a wight. He is not recognizable from photos of Lambert Enzer. His lips, mucous membranes, and irises are black, while his skin looks pallid and bloodless. He is skeletally thin, his spare flesh drawn taut over a lean musculature. His face is skull-like, lacking nose, ears, or hair. Albion is heavier than he would appear, due to the density of his tissues, and so is much stronger and far tougher than any human. He uses physical contact to leech positive energies out of the living to sustain himself. He does not generate body heat and simply registers the ambient temperature. He does not need to eat and can function with very little air or sleep. Sunlight, direct or reflected, is extremely damaging to Albion, but holy objects do not affect him.

Maintaining a regimen of exercise and meditation, Albion has developed strong discipline and a stoic philosophy, which allowed him to gain control over himself and has solidified that control. Albion is also a very dangerous combatant. Aside from his formidable physical abilities, he has decades of training in martial arts. He has acquired significant combat experience and is an excellent rifle marksman.

The Bride's Ring

The bride's ring was the focus of Eloise's compact. The groom's ring is simply an echo and so is much less powerful. The bride's ring is not protection against Albion but will have a significant advantage against any other wearer of the groom's ring. With skill and focus, the wearer of the bride's ring can locate and possibly exert some control over the groom's ring's wearer, although this would require an awareness of both rings. The bride's ring cannot be taken from Albion without his consent, although this property does not benefit any other wearer of the ring.

The bride's ring provides powerful magical protection, strongly enhances sensitivities and perceptions, and accelerates healing. The ring fuels mystical power and abilities, neither of which Albion has, but does allow him to forego feeding. With concentration, the ring allows the wearer to see the true nature of a subject, piercing illusion and disguise.

If the wearer dies, the bride's ring will summon the dark lord of Eloise's pledge, who will come to claim his ring and claim his Bride. Upon finding that Eloise has escaped, the dark lord will be most upset, collecting the wearer and probably anyone else in the immediate vicinity.

If Albion removes the bride's ring he wears, the wasting effect of the groom's ring worn by Arabella will cease. He is not aware that his leeching of energies draws mildly but inevitably from the wearer of the groom's ring. However, the healing effect of the groom's ring is somewhat at Albion's expense as the absorbed damage is passed through the bride's ring and onward to Eloise's dark lord.

Wearing both rings will short-circuit the mystical power involved, creating a feedback loop and leading within a few minutes to a spectacular release of energy. This destroys the rings and the wearer, as well as summoning a very annoyed dark lord. The rings cannot be removed once this has begun. Dismemberment will not stop the building feedback loop, but the former wearer can try to escape before the detonation.

A Vicious Circle

Thus stands the current situation:

- Arabella Denfield is an amoral, manipulative spitfire with occult skills and power. She thinks she possesses the Wedding Ring of Eloise Enzer, who was her sister. Arabella does not realize:
 - two rings exist, the (weaker) groom's ring and the (stronger) bride's ring;
 - the ring Arabella wears is actually the groom's ring;
 - her brother-in-law is now undead and has the bride's ring;
 - Eloise died without wearing the ring, so the price of the bride's ring has not been paid.
- Eloise Enzer is dead. During her life, she never knew:
 - her lost husband, Lambert, was never unfaithful;
 - her sister, Arabella, used her as a pawn to gain power;
 - her pledge as Bride of Darkness twisted her human husband into a reflection of her newly-pledged dark lord;
 - the creature that appeared to her in her final moments was not her dark lord, but was actually her lost husband.
- Lambert Enzer is undead. Educated and mannered in life, he is now a wight called Albion, tough, stoic, and just a tad bitter. He knows more than anyone else about the whole sordid situation. He wears the bride's ring, knows that Arabella has the groom's ring, and wants to switch the rings so that the dark lord will claim her as bride upon her death. He does not know:
 - that Arabella orchestrated the events leading to his death;
 - the wasting effect of the groom's ring;
 - how to switch rings with Arabella without alerting her.

Size And Fit: Adventure Seeds

The Wedding Ring of Eloise Enzer can be fit into any contemporary campaign which allows for at least a minimal level of magical or occult activity. PCs should have some familiarity with the occult and undead, as well as access to appropriate investigative resources. If the PCs insist on being clueless and pushy, they could end up in the middle of an open war between a powerful and resourceful occultist and an undead guy with a very large chip on a very strong shoulder. Useful elements can include the groom's ring (mistakenly worn by Arabella), the bride's ring (currently worn by Albion), Eloise as a Bride of Darkness, the muddled historical records, and the past or current activities of Arabella.

- The groom's ring can be used as an objective which the PCs must find or steal. Mission information or independent research will point them to Arabella, who can be a useful ally or a resourceful enemy. Unless the PCs are significantly powerful, Arabella will not find them particularly threatening and may have some fun toying with them, possibly even letting them get the ring and think they've escaped with it. She would be especially interested in why they were coming after her and who sent them.
- Alternately, the groom's ring has gone missing after Arabella presented it to a romantic rival. In one case, the PCs are investigating a model's death by an inexplicable wasting disease; Arabella comes to claim her ring from the body. In another case, Arabella is trying to find her own ring and inadvertently locates Albion with the bride's ring. She doesn't recognize Albion, so she hires the PCs to recover the ring while she watches to find out who he is and how he got it.
- A third possibility is that the PCs are hired by the Eloise's dark lord, either directly or anonymously through an intermediary. The PCs are then trailed by shadowy figures, who may work for their employer or for a rival. When the PCs unravel the confusion between the rings, they must act on the information quickly before their employer learns and acts to resolve the problem of payment, i.e. decides to claim whichever of the PCs is holding the ring right now.
- If the PCs are able to communicate with the dead, they can attempt to reach Eloise's spirit. After some persuasion by the PCs, Eloise's spirit will carefully steer the PCs in Albion's direction, with the ultimate intent of putting the bride's ring into Arabella's hands. Eloise's spirit realizes the ring's debt is unpaid and wants Arabella to pay it, using the PCs as tools to accomplish that. No attempt will succeed in Arabella's presence, but the spirit

will speak to Albion and attempt to win his cooperation. He is willing to go along with the plan and relinquish the ring to the PCs, but will follow in the background to observe.

- The historical record notes that Eloise abandoned their children to Lambert's relations, but not that the children were subsequently adopted by cousins with a different surname. As a result, Albion has living children and grandchildren who do not bear his name. This hidden thread of history could tie Albion or Arabella, or both, into an ongoing campaign. The PCs could become involved with one of the Enzer descendents, leading to threats sufficient to attract Albion's concern. Conversely, one of the PCs could be an Enzer descendant, who would then discover that some white ghoulish dead guy was lurking in the background. Additionally, Arabella might show up to recruit an apprentice from her sister's descendents, passing herself off as a distant cousin. Albion will be extremely displeased by this development, with the PCs caught in the middle.
- In a campaign world with an underground population of undead, Albion discovers that one of his descendents is being trained as a hunter. Without revealing himself or the family secret, Albion has to deflect the hunter group and protect the kid. Undead PCs might clash with Albion over his actions or the hunter's actions, while living PCs might run into him when hunting undead.
- If Hell is a viable game locale, PCs might meet Eloise there, carefully avoiding the attention of the dark lord she inadvertently cheated. She has surmised some of the facts about the rings, but doesn't understand Albion's role or Arabella's manipulations. While loath to jeopardize her precarious situation, Eloise will feel safer once someone else has paid the price for her pledge, so she will try to mislead PCs into seeking the bride's ring in the most dangerous way possible. Of course, the death of the ring-wearing PC would require the remaining PCs to journey to Hell to recover their comrade, contending along the way with Eloise's dark lord.

Nexus Card Game

Published by [Cheapass Games](#)

Designed by James Ernest

48 cards and rules sheet; \$4.00

How many times have you thought to yourself, "Sure, I'd love to get into Cheapass Games, if only they weren't do darned expensive"? Salvation is at hand for you miserly types in the form of Hip Pocket Games, "a Tiny Little Division of Cheapass Games." Although it has released only two games so far, *Nexus* and the re-release of *The Very Clever Pipe Game*, Hip Pocket Games aims to provide big fun in small packages. Both games are sold with just the necessary cards, a rules sheet, and a ziplock bag.

Nexus is an abstract strategy game for two to four players requiring only the cards, 20 counters of a different color for each player, and a table, preferably a large one. (According to the rules, if you run out of room "you must extend the table top with nails and glue before you can proceed.") The rules are simple, the play is quick unless your opponents ponder their moves for an eternity, and the strategy is interesting enough for repeat play.

The cards are long and illustrated in green and white; each of the cards contains a set of "Connectors" and "Nodes." A Connector is a pipe that starts at a Node and runs off of one of the four sides of the card. A Node is a circle or oval where Connectors end, or where multiple Connectors join each other. Every card has a Connector running off of each of its four sides, but whether they join each other at Nodes varies from card to card. For example, some cards have all four Connectors joining in a large Node in the center, while other cards join two Connectors at one Node, and the other two Connectors end in Nodes that are not attached to any other.

The game begins with a single card in the center of the table. In turn, each player draws a card from the deck and must play it adjacent to at least one card on the table in a basket-weave pattern (long edge to short edge). Players do not hold hands of cards; they simply play the top card of the deck each time. Because every card has a Connector running off of each side, players can play any card next to any other. Finding a strategically sound spot is a challenge.

Next, any closed Nexuses score. A "Nexus" is a set of contiguous Connectors and Nodes running over several cards. It is closed when all of its Connectors end in Nodes that are not attached to other Nexuses. Visually, this is very similar to a closed pipe that does not join any other pipes on the board. The player that controls this closed Nexus scores points for it, and the first person to score ten points wins.

Players take control of Nexuses during the last part of their turn. The player places one of her counters on a Node in any open Nexus. Each Node may have only one counter on it, but a Nexus may have several different color counters on different Nodes. Essentially, the player with the most counters in a Nexus controls it, and scores points when it closes. In the case of a tie, no one scores any points for the closed Nexus.

The game's clever twist is that the more counters a Nexus has, the fewer points it is worth. A Nexus' point value counts only the Nodes that do not have counters. If several players vie for control of a large Nexus, their competition may reduce it to a value of only one or two points.

Nexus' strategic depth comes from placing cards to help your self or hinder your opponents, and playing your counters to do the same. If your opponent is near to closing a Nexus and scoring points, you may draw a card that extends the Nexus in several more directions, making it harder to close. If you do not get the right card, you can play your counter into the Nexus to attempt to control it, or to simply make it worth fewer points. In games of three or four, you can also

ignore the threatening Nexus, forcing one of the other players to do your dirty work for you. At the same time, you have to balance between offensive and defensive moves to get to ten points first.

Nexus is easy to learn; however, experienced players may become too skilled for their own good. As players' knowledge of the game progresses, closing Nexuses for more than one or two points becomes nearly impossible. This is due to the rest of the table's skill at ganging up on the leader. This type of play increases the importance of the luck of the draw from the card deck and may lead to a more frustrating game.

By the time players reach this level, however, the game has provided more than enough entertainment to justify its price. For those who enjoy abstract strategy games and who play with ruthless efficiency, Nexus is a great bargain.

Dead From Above (for Weird War II/d20)

Published by [Pinnacle Entertainment Group](#)

Written by John R. Hopler & Aaron Rosenberg

Illustrated by Chris Appel, Cheyenne Wright and Scott Roller

64 pages; \$15.00

Dead From Above is the air combat supplement for the *Weird War: Weird War II* setting from Pinnacle Entertainment Group, which uses the *d20* system. Aerial combat was barely touched upon by the core rulebook, *Blood on the Rhine*, with just the inclusion of the Pilot character class and the airman variant of the Grunt class. An abstract system was given in the Hell in the Hedgerows adventure anthology, though even the authors you suggested that *Dead From Above* be used instead.

Behind Chris Appel's fun cover, *Dead From Above* is nicely laid out with a range of art that really captures the fear of being attacked in the air by something supernatural. One problem is that the art does not always leave room for the text, sometimes crushing words into a jumble of letters. To be blunt, this has happened in previous supplements from Pinnacle, and since this is easily corrected with whatever desktop publishing software they are using, it is something they need to look at.

Dead From Above is divided into four chapters, containing the rules, a selection of aircraft, a scenario, and an aerial bestiary. Chapter one is also titled "Dead From Above," and contains all of the rules for both characters and flying. It presents the Pilot class from *Blood on the Rhine* in expanded detail, along with new skills (Bombardier and Navigation), plus several new feats. These include the feats natural to a character, such as Seat of the Pants (the character is a natural flyer) and Snap Shot (the character is skilled at lining up a shot in a dogfight). Other feats pertain directly to flying; all pilots begin the game with the Single-Engine Aircraft Proficiency feat, but if they are to fly bombers such as the Flying Fortress or twin-engined airplanes like the Mosquito and the Lightning, then they will need to take the Multi-Engine Aircraft Proficiency feat at second level.

Although it is standard to the *d20* System, the -4 penalty for flying an aeroplane unskilled that is without either of the Single-Engine or Multi-Engine Aircraft Proficiency feats does seem rather low. The -4 penalty seems perfectly reasonable for a pilot who can fly single-engine airplanes, when he attempts to take an aircraft into the sky that has more than one engine. If you have neither, then an -8 penalty might be something more reasonable . . .

The remainder of this chapter looks at aerial combat and bombing. The key to air-to-air dueling is the concept of Position, which is a measure of an aircraft's or an aircraft formation's tactical position during a battle. The lowest possible Position is that of zero, at which point the aircraft is flying low, slow, or is pushed to the limits of its performance envelope such that its pilot might lose control. The highest possible Position is that of ten, and these higher Positions represent greater advantages in terms of speed, altitude, and tactical superiority.

Pilots need to make rolls on their Piloting skill in order to gain Position over their opponents, modified by the maneuverability of their aircraft. Attempting attacks requires more skill rolls, but it also costs the attacker in terms of their Position. Thus, having made an attack, a pilot will need to jockey for position before they can make further attack runs on their opponent. Damage is resolved in the same manner as the vehicle combat in *Blood on the Rhine*, but of

course, with different hit locations and critical tables. Critical hits often result in a loss of maneuverability and Position, and may require piloting rolls if the pilot is to maintain control. Additional rules cover bombing -- both level and dive, strafing runs and calling in air strikes. Damage listings are given for bombs weighing from one hundred to four thousand pounds, as well as 2.75 and 5-inch rockets. The bombs in particular are ferociously lethal, not just due to the explosive damage, but also to the concussive over pressure as well. These rules allow *Dead From Above* to be integrated with the ground war detailed in *Blood on the Rhine*.

Chapter Two is Aircraft profiles, detailing nine German, six British, and nine American airplanes. Although this seems a little disproportionate for those wanting to play RAF crew, but really the selection is adequate for most needs. That said, the range is fairly standard, and does not get any more esoteric than the jet fighter, the Me-262 and the rocket interceptor, the Me-162.

[SPOILER ALERT]

The third chapter is "Memphis Hell," a scenario for beginning aircrew characters, although there is room for perhaps one Resistance Fighter character and possibly one member of the Office of Supernatural Investigations (OSI), allowing a player to take a slightly higher level character . . . presumably having taken one of the prestige Classes available once their character is in the OSI. In "Memphis Hell," the party are sent on a special mission to locate a downed B-17 Flying Fortress in the mountains near Dijon in central France. For those not wishing to play an American aircrew, almost any other Allied nationalities could be found flying a Lancaster for the RAF instead. Once they have located the bomber, known as Memphis Blues, they must fly her into Germany and bomb the factory that manufactures the V-1 Flying Bombs. Parachuting into France and hoofing it through the mountains -- while chased by Wermacht patrols -- will prove something of a challenge for the normally aircraft-bound characters, and they should be relieved to locate and get the aeroplane out of there.

This is where it gets really interesting, as it should strike everyone that it is odd to find a pristine Flying Fortress sitting ready to take off in the middle of occupied France. The Memphis Blues has a history . . . indeed, *personality* of its own, and dealing with her -- or should I say "him"? -- will prove to be as much a roleplaying challenge as flying into Germany is a test of the character's skills. For introducing pilot and aircrew characters to the supernatural dangers in *Weird War II*, "Memphis Hell" is an excellent scenario.

[END SPOILER ALERT]

The last and fourth chapter is "Fly The Deadly Skies," an aerial bestiary that contains ten new creatures to be encountered over the skies of Europe. An adventure seed, some of which are quite good, accompanies each of them. The ubiquitous Foo Fighter could be used as a method to introduce the alien Greys into the setting of *Blood on the Rhine*, if the War Master wishes to take his game in the direction of *Delta Green* or *GURPS Black Ops*. Alternatively and simply, they could be just an excuse for the War Master to get the character to take a trip to Antarctica in the course of investigating the mysterious Foo Fighters. Also good are the Fliegerkopf -- rocket fighters piloted by the resurrected skulls of Nazi war aces. The accompanying seed has one such skull finding his current existence less than his liking and wanting to enlist the aid of the characters. Other adventure seeds are less interesting, and some, like those for the Acid Cloud, Cloudkill and Death Cloud are all rather similar. Also, unlike the other creatures in this chapter, none of these three are given anything approaching an explanation as to their origins.

If the War Master wants to add aerial combat and bombing to their game, then *Dead From Above* is the supplement that they need. Yet if you break down what you get for your \$15, this book does not provide as much value as it should have. You get twenty-two pages of rules, aeroplane profiles and record sheets, a twenty-one-page scenario and fourteen pages of new monsters. Really, these rules are so basic and integral to the game that they could have easily gone into the main setting book, *Weird War II: Blood on the Rhine*. Had they done so, this would have left room for possibly more monsters or aircraft profiles, but preferably more scenarios. While good, "Memphis Hell" is only intended to bring the characters to the attention of the OSI, and not end with their recruitment. Were there more adventures set after "Memphis Hell," like the *Hell in the Hedgerows* anthology, these could have helped the War Master get his party of aircrew characters so recruited. Certainly such adventures would have been of a far greater use to the War Master, because I would suggest that it is more difficult to come up with suitable scenarios for an aircrew.

Finally, \$15 seems a lot for what is a sixty-four-page book -- especially when other *d20* system publishers are providing supplements and adventures with more pages and material for this price or less. (And this is only when you compare it to other *d20* system publishers and not with the output of other game lines . . .) In the final analysis, *Dead From Above* does give just about everything you need, but absolutely nothing more, and that is its biggest downfall.

--*Matthew Pook*

Sex! (Now That I Have Your Attention . . .)

(We interrupt the interminable *Simulationist/Romantic* series to bring you something more tied to Valentine's Day.)

After considerable research, I have concluded that humans have been having sex for over 120 years. Not even the same humans . . . no! But wide and varied groups of people, across economic, social, and ethnic backgrounds . . . far too many people for this to be mere statistical coincidence.

And yet for something that is as much a part of modern living as automobiles, corporate radio, and snacks, intimate relations get hardly any airplay in most campaigns. This is despite the fact that most RPGs have rules for other id-centric desires, like sleeping and eating.

(As an aside, I note that my Webster's also defines "id" as "a skin rash that is an allergic reaction to an agent causing an infection." Having learned this, I *really* want to use this somehow. "Holy moley! Dr. Jekyll has taken the formula, and has given entirely over to his id!" "Raaaargh! <scritch scritch scritch scritch> Burning redness!")

Of course, the reasons for the lack of this incorporation are myriad and (for the most part) obvious; many people have difficulty discussing any kind of frank matters with people they *love*, let alone the weird guy rolling dice behind the duck blind.

Even so, as a basic drive -- and the motivating force behind many tales -- it seems somewhat restrictive to ignore an entire possibility of storytelling. But just because the group is willing to bring up more intimate storylines doesn't mean your campaign needs to resemble a Susie Bright erotica collection. All manner of media resolve the matter discreetly, from the "fade to black/wake up cooking eggs in a bathrobe" of a movie, to the coy "And that which did happen, did happen" of a novel.

So if you're going to delve into the realm of the intimate, allow me to present two ground rules. These apply to romantic in-game issues in general, but especially to more "closed-door" material.

Rule One: Romantic Descriptions Are Lowest Common Denominator. No, I don't mean guttural. What this means is that, really, the scene should only continue as long as *everyone* is comfortable. Hopefully everyone is on the same page when you begin such stories (or you've talked about it beforehand); if not, I don't think it's too unreasonable to raise a mild objection, or talk about how the game made you feel awkward afterwards. If things get *too* uncomfortable during the session, it's not unreasonable to go out to get some potato chips. From the factory. You have my permission to kick the GM afterwards.

Likewise, you should recognize as a player or a GM when you may be going over the line; it's always best to stay well *before* that line, really . . . you can always get more descriptive in private sessions, by journal, or what have you. Once you've freaked out your friends, it's tough to defreak them.

Rule Two: It Ain't You. In its own way, I think Rule Two is more important to Rule One; Rule One should really be followed by everyone for most games. (If someone's uncomfortable about graphic depictions of violence, he shouldn't need to sit there while the players and GM rattle off excruciating detail about and cracked skulls and carnage and whiskers on kittens.)

Anyway, It Ain't You. You aren't your character. Your character was raised as a monk to be trained as the master assassin, and has never known the caress of another? It ain't you. Your character has feelings for an alien species? It ain't you. Your character draws upon carnal energies to fuel his dark rituals? It ain't you. You ain't no senator's son.

Your character can be as dark or as light, as mysterious or as romantic, as inexperienced or as knowledgeable as you want. Hopefully your friends won't yell across a crowded mall, "Watch out! That guy slept with Zeus!" (If they *do*, you may want to reevaluate your friendships . . .) And, since you're not your character, you can do things -- bad or good -- that would otherwise be difficult; whisking your lover off to a weekend in Paris is probably a lot easier for your

millionaire character than for you. Okay; now that we know the ground rules, how do you go about working in intimate relations into a game?

Awakenings

Well, first think about whether or not it's even an *issue* for your character. We start out without knowledge of a lot of things, yet only upon certain ones does society place much importance. (For example, I have never been called either a New Jersey Virgin or an Innocent in the Ways of Corn Dogs.) Regardless, when thinking about a character's sexuality, pondering one's experience -- or lack thereof -- is a fine place to start. Those early encounters can do much to shape the outlook of the character; relations born of love, passion, convenience, anger, or desperation are all possible hooks to help explain why a character is.

Of course, that presumes the character has had sex at all. If he hasn't, why not? Is it a personal decision, a vow, or perhaps a lack of opportunity, time, and/or interest? In mystic or mythic campaigns chastity is often a source of power . . . or a curse. In tragic or gothic campaigns it may be impossible for a character to interact with others on an intimate level. Maybe the character can't touch others (ala Midas or the X-Man Rogue); maybe the character simply doesn't have those feelings anymore (ala many vampires).

Or maybe that "first time" is, for whatever reason, meaningless. If the character is immortal, amnesiac, or otherwise unsure of reality, then those early notions may not apply . . . which may be traumatic in its own way. They say you never forget your first time; what if they're wrong?

Even if this information never comes into play, at least knowing the answer may give you a better idea about the nature of the character. *And* whether or not you can get close to that herd of unicorns . . .

Parts of the Whole

Probably the easiest way to work intimate relations into a game is through allusion and slight of hand. You don't need to get graphic; just give enough for everyone else to get the idea . . . and use their imaginations.

"I've spent six weeks in the Dreaming away from my husband; anyone who disturbs our chambers will be punished. Leave food and water outside the door."

"I spend too much time at the precinct; we just don't communicate anymore. She . . . she needs things I can't provide."

"Personally I don't consider it cheating if you're seeing *both* members of a marriage."

"Yes, I bought a dozen roses. But I really only need the petals. Bruce, I'm sure *you* have use for the thorny stems, eh?"

"This is too dangerous a line of work. Janie and I . . . we're trying to start a family. If we're lucky, I may need to leave the team."

It's easy to work in enough detail about your character's intimate life (or lack thereof) without being too explicit.

And Beyond . . .

Unless everyone is *really* comfortable with each other, aspects beyond this are probably best reserved for one-on-one sessions with the GM, journals, correspondence, or even stories (to be shared with the group, the GM, or no one!). This can be especially useful if you're trying to do sensitive or psychologically complex storylines . . . or stories that don't involve the group much. Why does your character decide to (or not to) cheat on a spouse, despite the problems at home? Can and how does your character eventually work through the trauma of an early experience? What does your character *really* want?

Again, these can be as explicit or as tame as you and whoever you're sharing it with is comfortable. (If you're writing

for yourself, go to town!)

Of course, you don't need to do anything with any of this advice. One of my friends pointed out, "I don't like my characters having a more exciting romantic life than *I* am." While I suspect this may be a common view, this immediately made me wonder how many of our *players* have lives filled with as much orc-killing, globe-trotting, laser-flinging, and world-saving as the standard character. For many campaigns, it seems logical to include possibly more realistic and in-depth explorations of intimate matters.

Many think of our genre as fantasy roleplaying. Of course, "roleplaying" has as many definitions and variations as "fantasy" . . .

We Are For The Dark: *Antony and Cleopatra*

"I am dying, Egypt, dying:

Give me some wine, and let me speak a little."

-- William Shakespeare, *Antony and Cleopatra*, IV:xv:41-42

Ah, love. Life and death both seem defined by it and destroyed by it, at least in the [magical world of Shakespeare's romances](#). Last Valentine's Day we looked at the combustive astrology of [Romeo and Juliet](#): this year, we witness the last great love story of the pagan gods played out in Egypt. John Dryden called it a tale of "the world well lost," but what lost world has Shakespeare revived for the gaze of his dramaturgical magic? Give us some wine, and let us see of what *Antony and Cleopatra* speak.

"She shall be buried by her Antony:

No grave upon the earth shall clip in it

A pair so famous. High events as these

Strike those that make them; and their story is

No less in pity than his glory which

Brought them to be lamented."

-- William Shakespeare, *Antony and Cleopatra*, V:ii:359-364

Like *Romeo and Juliet*, *Antony and Cleopatra* is a story of love and suicide, and like its youthful twin, it has only one plot, the love story of the title. Antony and Cleopatra begin the play in Egypt, delighted in each others' charms, but messengers from Rome break up the happy couple with the news that Antony's wife Fulvia has broken the peace and made war against Octavius in Italy. Antony must leave Cleopatra, return to Italy, and patch things up with his co-ruler; to cement their alliance, Antony agrees to marry Octavius' sister Octavia (Fulvia being conveniently dead in the battle). Told of Antony's marriage, Cleopatra rages, and threatens to kill the messenger, only placated when told of Octavia's homely appearance. During an "Alexandrian feast" on a galley, Antony and Octavius bring Pompey (the son of the great general) into their alliance, but Octavius eventually attacks Pompey. While Octavia is on a peace mission to Octavius, Antony leaves her to return to Cleopatra and Egypt.

Octavius continues his campaign, bringing the war to Antony's province of Greece; Antony would be wiser to face Octavius on land, but Cleopatra persuades him to fight at sea. When her ships desert the battle, he too flees, dooming his men, but forgives Cleopatra her treachery. Octavius follows him to Egypt for another battle, where again the Egyptian forces betray Antony. Antony finally decides to leave Cleopatra, but she sends him false word of her death and he is again overcome by love. He tries, but fails, to kill himself, and makes his way to Cleopatra's monument, where she hauls him up to her for a final kiss and Antony's death. Now desperate to avoid becoming a pawn in Octavius' triumph, and to join Antony in death, Cleopatra has a clown bring her a poison asp in a bowl of figs, and kills herself with its bite. Octavius, now master of the world, leaves Antony and Cleopatra buried together in her monument.

"Nay, 'tis most certain, Iras: saucy lictors

Will catch at us, like strumpets; and scald rhymers

Ballad us out o' tune: the quick comedians

Extemporally will stage us, and present

Our Alexandrian revels; Antony

Shall be brought drunken forth, and I shall see

Some squeaking Cleopatra boy my greatness

I' the posture of a whore."

-- William Shakespeare, *Antony and Cleopatra*, V:ii:212-219

Shakespeare returned to Plutarch's *Lives of the Noble Greeks and Romans* for the story here, which he probably read in Thomas North's 1579 translation. (A copy of Plutarch from Ferdinando Strange's library was loaned to one "Wilhelmi" by his sister during this period.) The bulk of the play, although it condenses some events, essentially follows Plutarch,

and history; Shakespeare may also have borrowed some pieces of Samuel Daniel's 1594 *Tragedie of Cleopatra* and Robert Garnier's 1578 *Marc-Antoine*, performing his usual magic upon their generally forgettable contents.

More interesting is the question of the origin of Shakespeare's character, Cleopatra, as distinct from the Kleopatra VII of history. The part is easily the best female part in Shakespeare, and has defeated actresses of all calibers. Even the legendary Sarah Siddons refused to essay the part. Shakespeare makes her a legend striding the earth, all passions given form and personified; as Cleopatra says, "I am fire and air; my other elements, I give to baser life." Interestingly, Shakespeare may well have been writing his latter sonnets -- the ones concerning a "Dark Lady" -- at the same time (sometime between 1605 and 1607, depending on the theory) that he was composing *Antony and Cleopatra*. It's worth noting that he also describes Cleopatra explicitly as "tawny"; in other words, a second Dark Lady worth dying for.

*"She in the habiliments of the goddess Isis
That day appear'd; and oft before gave audience,
As 'tis reported, so."*

-- William Shakespeare, *Antony and Cleopatra*, III:vi:17-19

To Shakespeare's audience, of course, a "gipsy" who hails from Egypt, does mysterious business with snakes, and ensnares a Roman general to the destruction of his fortunes must be practicing "witchcraft joined with beauty," an insinuation that Pompey and other scandalized Romans repeat in the play. Shakespeare's own Dark Lady remains unknown, although his description in Sonnet 130, of a "dun" woman with no color in even her lips, reeking breath, and wiry hair, also resembles the classical depiction of a witch. Or, of course, of a vampire; and it is intriguing that Cleopatra even in death "looks like sleep, as she would catch another Antony." Themes of sleep and renewal recur with Cleopatra, of whom "age cannot wither, nor custom stale her infinite variety." Could she, the "serpent of old Nile," who sleeps giving suckle to a serpent, have been a lamia herself, an Eastern monster intent on wooing Antony into her fell vampiric clutches?

If so, Antony certainly goes along with it. His dalliance with Cleopatra (like so much Shakespearean magic) slows and distorts time, a creepily vampiric "sleep and feeding" creating a "Lethe'd dullness" or the "oblivion" of [mandragora](#). He has, in short, been won to the (magical, timeless) East of Egypt as opposed to the (measured, time-bound) West of Rome. Antony even attempts to inveigle Octavius and the rest into dancing "the Egyptian Bacchanals" (sacred dances of Osiris as [Dionysos](#)), and sings a hymn to Bacchus during the "Alexandrian feast" on board Pompey's galley (after drunkenly alluding to the crocodile, that beast of alchemical import). Even cold Octavius almost succumbs to the sorcery, leaving just in time, as "the wild disguise hath almost antickt us all."

*"Thy daemon, that's thy spirit which keeps thee, is
Noble, courageous high, unmatchable,
Where Caesar's is not; but, near him, thy angel
Becomes a fear, as being o'erpower'd: therefore
Make space enough between you.."*

-- William Shakespeare, *Antony and Cleopatra*, II:iii:19-23

Octavius has only his "luck" to oppose Antony's magickal daemon, which all in the play identify as Hercules (who, as the Gallic Ogmios, was also a god of magic, and whose death and resurrection parallel both Osiris and Dionysos). In an extraordinary sequence in Act IV, Scene iii, the soldiers in Antony's camp hear "music i' the air" and "under the earth" which they somehow know means that "the god Hercules, whom Antony loved, now leaves him." The moving music, again, conveys Dionysos as much as Hercules. Antony realizes his daemon/god has left him and, upon Egypt's second betrayal, offers up Cleopatra for Hercules/Dionysos' return to possession: "with those hands that graspt the heaviest club, subdue my worthiest self." Too little, too late; Antony remains caught between Roman sword and Egyptian snake, both Mars and Gorgon (as Cleopatra names him).

Cleopatra, meanwhile, is Isis -- appearing in the goddess' "habiliments," and repeatedly taking on the Queen of Beauty's incarnation. Isis is associated with the sea; so Cleopatra forces the sea-fight at Actium. Even her seduction of Antony happens on a barge, while "o'er-picturing Venus," the sea-born Roman equivalent of Isis. Cleopatra's whole metier is the water; she wishes the Nile to half-drown Egypt and made "a cistern for scaled snakes," and to "Melt

Egypt into Nile!" Under her sway, Antony, too, does not keep "his square" but embraces the chaotic, timeless sea: "Let Rome in Tiber melt, and the wide arch of ranged empire fall!" He would make cities "o'er green Neptune's back," and the two of them become "a race of heaven."

*"I dreamt there was an Emperor Anthony --
O, such another sleep, that I might see
But such another man! . . .
His face was as the heavens, and therein stuck
A sun and moon, which kept their course and lighted
The little O o' th' earth . . .
His legs bestrid the ocean; his reared arm
Crested the world; his voice was propertied
As all the tuned spheres - and that to friends --
But when he meant to quail and shake the orb,
He was as rattling thunder."*

-- William Shakespeare, *Antony and Cleopatra*, V:ii:76-88

And indeed the two are a race of heaven; whether brought from the secret knowledge of the Reptoid vampires or learned from Dionysos in Egypt, Cleopatra has transformed herself into Venus and Antony into Mars. Their conjunction is of cosmic import -- Shakespeare uses the word "world" 42 times in the play, more than double his normal frequency. This is a tale of giants, Antony is the "demi-Atlas" who can "speak as loud as Mars," while Cleopatra's "winds and waters" are not mere "sighs and tears" but "greater storms and tempests than almanacs can report," in other words, cosmically disastrous phenomena from outside measurement and history. Antony's struggle with Octavius is one of "stars, unreconcilable"; two suns competing for the same world (which may refer either to Kepler's Supernova of 1604 or Halley's Comet in 1607, both of which would have seemed sunlike to Shakespeare). At Antony's death "the star is fall'n," and "time is at his period" -- in Cleopatra's words, the "pole is fall'n", in a bit of Velikovskian [pole-shifting](#) synchronism. Time has stopped for the battle, with stars "empty left their orbs" and "our Terrene moon is now eclipsed, and it portends alone the fall of Antony."

With this play, Shakespeare seems to be as torn as Antony himself. As a good Briton, he must perforce support Rome, especially as the [death of the gods](#) (as Plutarch also noted) gives way to the "age of universal peace." Even his magickal sponsors would have blanched at the need to destroy measurement and unleash chaos, even to access the divine dimension on the other side of Lethe's shore. But still, he cannot pull away from the Dark Lady Cleopatra, cannot resist her crocodile tears or her serpentine gaze. He is trapped giving a warning he does not mean against a danger that he craves -- like Antony, he "cannot hold this visible shape". He venerates, yet deprecates, the fallen gods of the past, in this play seemingly drawn from (and perhaps written at the behest of) the desires of his own Dark Lady. Who gazed into Shakespeare's eyes and inspired this romantic [reality quake](#), seeking the destruction of the world for love? And upon whom will her eye fall next? Happy Valentine's Day.

Dork Tower!

Cupid's Arrows

A Holiday Adventure for *In Nomine*

by Elizabeth McCoy

Prologue

Once upon a time, there was an ethereal god called Eros -- or Cupid -- who had powers of love, lust, and infatuation . . . Unfortunately for him, he did not survive the Purity Crusade that the Archangel Uriel instigated to rid the Earth and dreamlands of the ethereal spirits.

In time, another Cupid arose from the myths and dreams that the first had left behind. An arrogant heir, he claimed to be the original, probably even believing it himself.

But ethereal spirits aren't automatically unique; the stuff of dreams can coalesce again. Or, in other words, he's not the only Cupid.

The Protagonists Meet

With Valentine's day nearing, another Cupid has grown fat on the general Essence . . . Literally fat, for it has the form of the traditional plump, diapered, "cherubic" baby with little wings and an adorable bow and arrow. And, drawn to achieve its purpose in life -- making people fall in love -- it's managed to sneak down to Earth. Now it's going around in a semi-visible, gaseous form akin to that of the Kyriotes of the Wind (or Shedim of Theft), shooting people with the Arrows of Luv.

One of its very first targets, unbeknownst to anyone, was the demon Irshe, Balsraph of Lust. Balsraph *Captain* of Lust. With 12 Forces. And, theoretically, a will of iron.

However, will of iron or not, Irshe was hit from behind by one of Cupid's semi-tangible heart-tipped arrows -- and when he looked up, he saw a young woman passing him on the sidewalk. Instantly, the Balsraph was smitten by the woman (named Virginia Cross), and instantly, dissonant for the caring that suddenly suffused his selfish soul. Oops.

The Plot Thickens

Irshe initially trailed the woman to her apartment building, then fled, confused by the emotions and dissonance within him. After a week where No One Else Will Do for his desires (racking up more dissonance, too, which doesn't usually happen), he's decided that he needs to have the woman captured and brought to him.

What he doesn't know is that, while he was stalking the woman, he was spotted by a Malakite of Creation. The Virtue attempted a raid on Irshe's place of business (the typical brothel-masquerading-as-a-nightclub that many Andrealphans aspire to), and was shot by one of the guards. Without a spare vessel, the angel has had to find some friends to carry out her plans. Unaware of the ethereal nature of the demon's "conversion," she's sure that the Balsraph is redeemable! After all, he's in love with a human, right?

What *neither* of them know is that Virginia Cross is a "white sorcerer" and Soldier of God. Her contact is an angel of Judgment in the next town over. Her current goal is to track down a semi-substantial ethereal which she caught a glimpse of on the city street, shooting people with a little bow and arrow.

Enter the Players

Demons

- The group is, for some reason, under Irshe's control enough that he can "persuade" them to go after the woman he so desires. He can draw them a good picture and point them at her apartment building, though he doesn't know which apartment she's in.
- The PCs are enemies of Irshe -- who has been acting rather strange and erratic. One might even think he was dissonant! Clearly, when a few of Irshe's minions are sent on a mission in the dead of night, something interesting is going down. Perhaps he'd pay ransom for this woman he's sent his people after?
- Naturally, undercover Servitors of the Game could combine both of the above, as could members of Lust's secret police.

Angels

- Recruited by the Malakite -- or someone the Malakite talked to -- the characters have a drawing of the Balsraph in question, an address where he can be found, and a suggestion that the Balsraph might be happier if hauled off to the nearest angelic Tether. Mayhem can be perpetrated upon any other demons at the brothel, of course.
- Virginia has noticed that she's being watched (by Irshe's minions, who are trying to figure out which apartment to break into), and called her contact, who has, in turn, leaned on any local angels to check things out. (You may not be able to get a Servitor of Dominic to look the other way -- but it can be nicer to have them happy with you instead of dropping a triad on your doorstep every month because you were being "suspiciously selfish" . . .)

Anyone

- A bunch of demons are sneaking around, trying to stalk some woman. A group of angels are sneaking around, trying to stalk the demons. (If need-be, the Malakite isn't dead (yet) and is the one doing the stalking in this scenario.) The mystery of this cats-and-mice game could involve mundane authorities or celestials who aren't aware of what's going on.
- After the matter with Virginia and Irshe is settled, one way or another, there's still this little Cupid to catch. By this time, they may have learned that its arrows were able to inspire demonic dissonance! Whether the PCs are demons who want to remove some rivals, or angels who think dissonant demons are a good idea, little Cupid is likely to become a hot property. For those with the *Liber Servitorum*, the older Cupid might show up, gunning (arrowing?) for the new interloper. (And for the Lilim in the audience: how much would people bid for it? How much would it bid to be protected?)

A Potential Script

Here is one of the ways that the scenario could play out; insert the player-characters at any appropriate point.

- Cupid shoots Irshe, who trails Virginia to her apartment. Virginia has spotted Cupid, and is preparing a ritual to capture it. The Malakite spots Irshe, spots that Irshe is dissonantly infatuated with a human, and trails *him* to his club.
- The Malakite gets herself shot, trying to break into the club. Starts talking to associates, to get a group together to kidnap the Balsraph.
- Irshe, dissonant, assigns a group of minions to kidnap Virginia "quietly."
- Virginia, noticing that she is apparently being watched, calls *her* contact. She will be assigned either player-characters, or an out-of-town Cherub as a body-guard.
- It all comes together: the Malakite's team (with Malakite, if no PCs there) stalks Irshe's team, who are stalking Virginia, who has recently gotten a Cherub bodyguard. When the demons make their move, the angels will make *theirs* (to thwart them and capture someone for interrogation), and the bodyguard -- not having any way of knowing who's who or what -- will be generally bashing anyone in sight except his attuned (that being Virginia).

- Even more confusion can be added with Little Cupid happening into the area and seeing a lot of Lust demon targets. Even *more* mayhem will ensue if the Game Master has the Liber Servitorum, and sends the elder Cupid to Earth to hunt down the Little Cupid as a competitor for Essence. Arrows flying everywhere, masked demons, angels throwing Deadly Ninja Greeting Cards . . .
- The demonic team will try to escape, with Virginia if they can get away with her in the confusion.
- The angelic team will try to follow them, so they can capture Irshe, at the club. (Or, if they can subdue the demons, try to sneak in via the "we're just captives" method.) If they can get Irshe, they'll zip out of town for a friendly-to-Creation Tether; any demons wanting to get the Captain of Lust back will have to engage in a car chase . . .
- Virginia's Cherub will do the obvious: protect Virginia, rescue her if need be.
- After the Loose Ends (below) are tied up, or put off (such as by thwarting Virginia's kidnapping, but not capturing Irshe in return), the Great Cupid Chase is likely to be on. Virginia isn't *quite* good enough to summon Cupid yet . . .

Loose Ends

If Irshe succeeds in capturing Virginia, his first inclination will be to ravish her and have done with it. Unless the GM wants a very dark setting, he's not going to be able to go through with it; the Greeting Card Cupid's influence is just too pure. He will imprison her unharmed while he tries to figure out what to do, keeping her under close guard -- usually personal guard -- in one of the basement rooms in his club.

If Irshe is brought to a friendly Tether, he'll be in denial of his selfless twinges. Exposure to Virginia, however, will cause him to run through the Merciful Discord, and his next Discord will be Selfless. (See the *Infernal Player's Guide*; essentially, a serious case of being *unable* to be demonically selfish.) It's just a matter of time.

And what does Virginia think of all this? She doesn't like being stalked. She won't be thrilled at being kidnapped. She'll agree to help talk a Balsraph into redemption, though, no matter what her personal opinions are. (If captured, she'll be trying to talk to him about "going bright," which will not be helping Irshe's mental state any.) If Irshe does a suitably angstful attraction-confusion-protection act (which is no act) around her, she'll begin to feel sympathetic. If he redeems, she'd welcome a proper sort of courtship; she finds the typical Seraphic vessel attractive, and isn't put off by snakes.

A Far-Out Loose End

Anyone who *kills* Virginia will have Irshe, the Cherub, and probably the angelic team on their tails. Ironically, Irshe will be even more easily persuaded into a redemptive state of mind: Virginia has not achieved either fate or destiny, and will likely be reincarnated; there is a Destiny attunement (in *Superiors 3*) which allows snippets of past lives to be revealed. A Servitor of Destiny would have an easier time of finding his True Love than a Balsraph of Lust.

Non-Player Characters

Irshe, Balsraph Captain of Lust

Irshe is normally a reptilian, cold, ruthless demon. He earned his Knighthood by careful, diligent work -- not a quick roll in the sheets with an angel -- and is proud of his efforts. This sudden rush of emotion is horribly foreign to him; besides being dissonant, he's coming to *enjoy* these strange feelings. They make him feel . . . bubbly. Lighter. More pleased with simple acts such as breathing or admiring a sunset.

This enjoyment, sensibly, frightens him. He is hoping that once he has satisfied his lusts with this strangely compelling human, he'll go back to normal. But as every day goes by, part of him hopes more and more that he *won't* go back to normal.

(There are at least three options here: Cupid's Arrow sparked some latent spark of Good in the Balseph; it was a Divine Intervention; or this Cupid has a subtle power that can cause demons to have selfless emotions. Which is the truth is up to the GM to decide; true or not, the last *possibility* is probably enough to get angels and demons alike chasing after Cupid!)

For the Lilim and Malakim . . . Need/6 (Get Virginia!), Need/3 (Don't let anyone find out he's Discordant), Need/2 (A new waitress/hooker for his club). Most honorable deed: Recruiting a new-Fallen Habbalite to Lust. Most dishonorable deed: Has fallen in love, recently. Last year's three most honorable and dishonorable deeds: insisted one of his employees get an abortion, healed three new employees of STDs, trained a rival's Soldier to be loyal to *Irshe* (honorable); let a Servitor of Fleurity do deals in his establishment, had a would-be "protection racket" ringleader killed, fell in love (dishonorable).

Virginia Cross, white sorcerer and Soldier of God

One of the rarest of the rare, a sorcerer in service to Heaven, Virginia's life has been wrapped up with celestials for over a decade. When her parents died in a car crash, her grandfather turned to sorcery and necromancy to bring back his beloved daughter -- and, unfortunately for him, the Demon of Sorcery answered his pleas. By age 10, Virginia was slated as a sacrifice in a dark ritual, and only saved by angelic intervention. Her grandfather, however, suicided rather than be thwarted by angels with flaming swords.

This left the rescuing angels with the sticky problem of an orphaned mortal who was already conversant with sorcery -- and who needed counseling lest she follow in her grandfather's madness. The final solution was for Virginia to be adopted by a Soldier across the country; since celestials are adept at forging Roles for themselves, giving a little human girl a new life was easy enough. To a certain amount of angelic dismay, she insisted on learning more sorcery; one of the rare "white sorcerers" was brought in to Initiate her (in a ritual involving prayer, fasting, and churchly vigils) lest she attempt it on her own. (When a 13-year-old announces that she *will* learn sorcery, and the Symphony confirms it, a wise Seraph finds a way to make it happen without the risk of using a Hell-tainted, soul-damning ritual.)

She's currently a clerk in an occult bookstore, taking law classes, and trapping or banishing the occasional ethereal who strays through. She's always on the lookout for "dark sorcerers," and prefers to question the ethereal spirits she captures. Much to the discomfit of her angelic contact, Virginia is studying the Summoning rituals. She doesn't intend to use them without angelic supervision, but she does dream of calling up the demons who abetted her grandfather's delusions -- into a room full of Malakim . . .

(Virginia's former last name -- as Mercurians may find out -- was Garcia, and her dark hair and eyes reflect this.)

For Lilim, Malakim, and those with Fated Future and Divine Destiny: Virginia's destiny is to participate in precedent-causing legal cases which will aid in freedom of religion. Her fate is to achieve political office by unfair means. Her most honorable deed was to turn over an ethereal to angels, instead of letting it serve her as it bribed. Her most dishonorable deed was allowing her grandfather to turn his knife upon himself, when she believes she could have stopped him.

In the last year, her three honorable and dishonorable are: worked on building a house for a needy family, adopted two adult cats from the local humane society, and studied for all her most recent finals instead of going to the movies (honorable); is studying summoning rituals when she knows it will bother her family, sold someone an occult book she didn't trust because "the customer is always right," photocopied large chunks of a book in the library.

Her current major Needs: Find the ethereal she spotted (Need/4), Find out if she's really being stalked (Need/3), Get an expensive textbook for classes (Need/1), Get revenge on certain demons of Fate (Need/6).

Little Cupid, young ethereal spirit

Cupid -- this Cupid -- is not overly bright, nor overly big, nor overly anything else except intent upon fulfilling his

purpose in creation: making people fall in love. He can sense, vaguely, people who have no love in their lives, and has a deep urge to shoot them with one of his arrows. Being semi-visible (he requires a Perception roll to see) and possessed of *some* survival instinct, he hides a lot. While he can't go through walls, he is able to slip through small cracks that are technically too small for him -- he's a bit "cartoony" that way.

Cupid's Arrows: These are less relics than pieces of the ethereal Cupid himself, which he manufactures (at the cost of 1 Essence per arrow). They vanish shortly after they've been taken from their little quiver, or immediately after they hit someone. The victim makes a Will roll; if it's failed, treat as a successful Ethereal Song of Attraction, focused on the first person of the appropriate gender the victim sees. The check digit of the "Song" is the check digit of the failed Will roll. If the Will roll succeeds, then there's merely a faint yearning sensation associated with the first-sighted potential True Love. (Alternatively, GMs may decide that if the victim sees someone "appropriate" (by the GM's standards), the victim *really* falls in love!)

Needs and Deeds: Need/1 (shoot someone who needs love), Need/2 (don't get caught), Need/3 (don't get killed).
Honorable deeds: Shooting people who need love! **Dishonorable deeds:** Missing who's shot at.

Statistics

In Nomine Statistics

Note that all characters have a "native" language/3 of English; if setting the adventure in a different locale, change the native language appropriately.

IRSHE

Balseraph Captain of Lust

Corporeal Forces - 4 Strength 9 Agility 7
Ethereal Forces - 3 Intelligence 7 Precision 5
Celestial Forces - 5 Will 11 Perception 9

Vessel: Human male/3, Charisma +1 (Sex Appeal)

Role: Erwin "Sean" St.-John, Club Owner/3, Status/3

Skills: Artistry/2 (Drawing), Detect Lies/1, Driving/1, Emote/2, Languages (English/3, Spanish/1, French/1), Ranged Weapon/1 (Pistol), Savoir-Faire/2, Seduction/4, Singing/1

Attunements: Balseraph of Lust, Dark Desire, Captain of Diabolical Delight

Discord: Merciful/2 (and he may have a few notes of dissonance as well)

VIRGINIA CROSS

White Sorcerer and Soldier of God

Corporeal Forces - 1 Strength 2 Agility 2
Ethereal Forces - 2 Intelligence 5 Precision 3
Celestial Forces - 3 Will 7 Perception 5

Status: 2 (Student)

Skills: Computer Operation/1, Detect Lies/1, Driving/1, Knowledge (Law/3, Local Area/3, Occult/2, Retail Sales/1), Languages (English/3, Spanish/2, Hebrew/1, Latin/1, Greek/1)

Sorcerous Skills and Rituals: Banishment/2 (Banish ritual), Command/2 (Command Minor Ethereal Sprit), Exorcism/2 (Exorcise, Exorcise Ghost), Focus/1 (Symphonic Awakening, Protective Ward), Summon/1 (Summon Demonling).

Attunements: Sorcery

(Note that Virginia's skills include the "human defaults" recommended in the *Corporeal Player's Guide* -- Knowledge/3 (Local Area), Knowledge/3 (profession), Knowledge/1 (hobby), Driving/1, and Swimming/1, as well as a native Language/3.)

LITTLE CUPID

Ethereal Spirit

Corporeal Forces - 1 Strength 1 Agility 3
Ethereal Forces - 3 Intelligence 3 Precision 9
Celestial Forces - 1 Will 2 Perception 2

Vessel: Semi-substantial winged baby/2

Skills: Ranged Weapon/4 (Bow), Move Silently/4

"Attunements": Kyriotate of the Wind* (always on); See the Loveless; Cause Love.

**(Cupid doesn't really have a Wind attunement, but its natural ability is virtually identical.)*

GURPS Statistics

(*GURPS* versions of the characters have been "normalized" from their conversion values, so that they will fit better with typical *GURPS In Nomine* characters.)

IRSHE

Balseraph Captain of Lust

ST 18, DX 16, IQ 16, HT 16

Advantages: Power Investiture (Corporeal: 4, Ethereal: 3, Celestial: 5), Dark Desire, Role +3, Strong Will +1, Celestial Rank 2 (Captain of Lust), Balseraph of Lust

Disadvantages: Cannot Kill, Discord (linked to Cannot Kill), Jealousy, Overconfidence, Servitor of Lust (includes Duty and Dissonance Condition).

Quirks: Attempts to appear unfazable, Sticks to hard work instead of flashy stunts, to gain recognition; Likes dancing.

Skills: Acting-15 [1], Artist-14 [1], Carousing-15 [1/2], Dancing-14 [1/2], Detect Lies-13 [1/2], Diplomacy-13 [1/2], Driving (Car)-14 [1/2], Erotic Art-15 [2], Guns (Pistol)-17 [1/2], Interrogation-14 [1/2], Language: English-16 [-], Language: French-14 [1/2], Language: Spanish-14 [1/2], Savoir-Faire-15 [1/2], Sex Appeal-17 [4], Singing-15 [1/2]

Songs: Attraction (Ethereal)-12 [2], Healing (Corporeal)-14 [4], Numinous Corpus: Wings-12 [1], Numinous Corpus: Ornamental-17 [16].

(The Ornamental Numinous Corpus is one suited to Lust, and left to the imagination of the GM.)

VIRGINIA CROSS

White Sorcerer and Soldier of God

ST 8, DX 9, IQ 13, HT 10

Advantages: Essence Control +6, Power Investiture (Sorcery), Strong Will +4

Disadvantages: Cannot Harm Innocents, Overconfidence, Secret (Sorcerer), Stubbornness

Quirks: Likes dancing, though she's no good at it; Enjoys SF&F movies, even the bad ones; Ogles (discreetly) tall men.

Skills: Area Knowledge (local)-14 [2], Computer Operation/TL/7-12 [1/2], Detect Lies-10 [1/2], Driving (Car)-11 [8], First Aid/TL7-12 [1/2], Law-12 [2], Merchant-11 [1/2], Occultism-13 [2], Research-12 [1], Scrounging-12 [1/2]

Sorcerous Rituals: Banish-12 [2], Command Minor Ethereal-12 [2], Exorcise-12 [2], Exorcise Ghost-12 [2], Symphonic Awakening-11 [1], Protective Ward-11 [1], Summon Demonling-10* [1] (* *Summon Demonling is at an additional -1 because she doesn't know the prerequisite ritual of Summon Minor Ethereal.*)

LITTLE CUPID

Ethereal Spirit

ST 4, DX 12, IQ 8, HT 4

Advantages: Kyriotate of the Wind (Always On), Symphonic Knowledge (Loveless), Symphonic Influence (Cause Love). (See *In Nomine* stats note about the "Kyriotate of the Wind" advantage.)

Disadvantages: Compulsive Behavior: Make the Loveless fall in Love, Cowardice, Reduced Alertness -1, Shyness (mild), Weak Will -1.

Skills: Bow-14 [16], Stealth-14 [8]

Magic Ingredients Revisited

Spell Ingredients for *GURPS*

by Matt Riggsby

"I must have something to work on!"

--Gandalf the Grey

GURPS Magic notes briefly that magicians traditionally keep spell ingredients, batches of odds and ends for use in casting spells (sidebar, p. M9). For the sake of convenience, it further assumes that, under usual circumstances, magicians have access to whatever they need. If magicians get out of hand, GMs can hit them with a sudden shortage of virgin's blood, Nixon masks, or what-have-you in order to restore game balance. However, it seems inelegant to arbitrarily announce that there is a sudden shortage of something a formerly powerful character didn't know he needed in the first place. GMs intending to make spell ingredients an important element in their campaigns, or those who simply want to add some color to the basic magic system, can use these rules to flesh out the brief mention of magic ingredients and fill magicians' pouches with strange and rare substances.

Which Ingredients?

Rather than assigning specific components to each spell (for the most part), this system allows spell casters a certain amount of flexibility.

Each college has a list of magic ingredients, from which the caster can choose as he casts his spell. In general, the number of ingredients a spell needs depends on its prerequisites. To find the number of ingredients necessary to cast a given spell, take the number of prerequisite spells it needs, divide by two, and round up. A spell without prerequisite spells needs no ingredients, a spell with one or two prerequisites needs one ingredient, and so on. The spell prerequisite charts in *GURPS Grimoire* are extremely useful here. There are a few exceptions for specific spells. For example, Seek spells all use forked sticks to the exclusion of all other ingredients.

The number of prerequisite spells is calculated by the total number of spells necessary for the individual caster to learn the spell; advantages and non-spell skills do not count. For example, Flame Jet has four prerequisites for every spellcaster, since it takes Create Fire and Shape Fire, which in turn require Seek Fire and Ignite Fire. On the other hand, Beast Soother can take either the Persuasion spell or the Animal Empathy advantage as a prerequisite. If the caster has Animal Empathy, he needs no prerequisite spells, and therefore needs no ingredients. Experienced magicians also need fewer ingredients. Reduce the number of ingredients a spell needs by one for every three full points of skill over twelve. A magician would need one less ingredient if he knows a spell at 15, two less at 18, and so on.

Using Ingredients

Using ingredients in spellcasting is simply a matter of flourishing an object or scattering a pinch of dust as appropriate to the ingredient.

Using an ingredient does not by itself add to casting time, but it may take a moment for an unprepared spellcaster to dig the necessary ingredients out of his pouch. Treat this as a Ready maneuver which may be performed while the caster is concentrating on the spell; the GM may allow a Fast-Ready: Spell Ingredient skill. If the ingredients are worn as jewelry or clothing, they are considered ready for use in spellcasting. Items may serve as multiple ingredients. For example, if a wizard needs iron, jade, and a ring to cast a spell, an iron ring set with jade may count as three ingredients. Unless specifically stated, spell ingredients do not need special preparation or enchantment. If a spell needs a stone as an ingredient, the caster may pick up any rock which comes to hand and use it immediately. He could

even lay a hand on a nearby boulder or cliff-side.

Materials fall into two types: durable and expendable. Expendable materials include plants (usually ground into powder for convenience), dusts, and liquids. They are scattered or poured out in "pinches," twenty pinches to an ounce, and are lost once they are used even if the spell fails. For convenience, a caster may prepare "spell masalas," mixes of ingredients. The total number of pinches of ingredients required is used in a casting. For example, a necromancer might prepare a mix of dried blood and graveyard dust. If he needs two ingredients to cast a spell, he can use a two-pinch handful of the mixture rather than have to dig through his bag to get one pinch of blood and another of dust.

Durable materials include stones, metals, cloths, and any other more-or-less solid object. Durable materials are not necessarily destroyed in casting. They are lost only if the caster rolls a critical failure on his skill roll. However, if the caster rolls a critical failure, all objects used as ingredients for the spell are destroyed in their entirety (the ring and stone shatter, the boots fall apart and the leather turns to dust, etc.), even if the objects have components which were not used in the spell. For example, if the jade-set iron ring had a ruby and a diamond set in it as well, the ring and all three gems would be destroyed. Very large objects react to critical failures somewhat differently. If the object in question has greater weight, mass, or volume than the wizard himself, it is not destroyed on a critical failure. Instead, there is a magical backlash which does 2d damage to the caster; armor offers no protection. Some spells may take certain environmental conditions in place of ingredients (for example, being in a high place counts towards the total ingredients for Air spells). Those conditions are likewise not affected by a critical failure on the spell roll.

Spellcasting Without Materials

The GM should decide what the effects of spellcasting without materials are in the campaign world. The greater effect, the more important they will be in the game world. Here are some suggested levels of effect:

- **Trivial:** The caster is at -1 to skill if he does not have all ingredients.
- **Annoyance:** The caster is at -1 to skill for every ingredient he is short.
- **Severe Impediment:** Spellcasters who cannot use the full number of ingredients are at half skill.
- **Crippling:** Spells may not be cast without proper ingredients.

Ingredients List

Each college of spells in *GURPS Magic* is listed below with materials that may be used to cast its spells. Special requirements for individual spells are listed within the college the spell belongs to. This is, of course, only a sample list, and the GM may alter and expand the lists as desired to fit the tone of the campaign. This list provides a fairly generic mix of precious stones and metals, herbs, spices, and specialized objects, but a GM may want to emphasize the use of [spices](#), gems, or parts of magical animals (dragon's scales, unicorn horns). High-tech wizards may employ rare isotopes, the aforementioned Nixon masks, and [office supplies](#) in their spells. However, in order to keep some level of control, it is recommended that you not provide more than ten to twelve ingredients for any one college.

Animal

Jasper, violets, obsidian, amber, a silver ring, a flute, a rattle, a whip, a bone or horn wand. Animal spells may also use a part of an animal of the appropriate type (for example, a wolf's paw or blood for a spell to be cast on a wolf), which counts as two ingredients. The heart of an appropriate animal counts as three ingredients. Rider and Possession spells may use a polished sphere of any red stone in place of all other ingredients. Shapeshifting spells may use a full hide of an appropriate animal or enough ointment made from the animal's blood and fat to cover the subject from head to toe in place of all other ingredients.

Body Control

Onyx, orchid, pepper, dried gum, blood from an intelligent creature, jade, ivory, malachite, a rattle, a wand made from

an organic material. "Harmful" body control spells such as Strike Dumb, Pain, and so on may use soot, poisons, an inscribed bone from a sentient being, or a skull, which count as two ingredients. "Helpful" body control spells may use diamond or a metal wrist-band or necklace, which count as two ingredients. Roundabout may simply use a silver needle or an arrow in place of all other ingredients. For spells cast on others, anything once part of the subject's body, such as hair, blood, or sweat, counts as two ingredients.

Communication and Empathy

Poppy, the eye or ear of any animal, a sculpture of a head, quartz, diamond, amber, a lens, a bell, or a hollow tube. A transparent glass sphere at least three inches in diameter counts as two ingredients. All Communication and Empathy spells except Possession and any spell taking Possession as a prerequisite may be performed with only a polished, flawless quartz or other transparent mineral sphere at least three inches in diameter. For other spells, such a sphere counts as three ingredients. At the GMs option, psychoactive substances may be used as ingredients.

Elemental

All Seek spells, regardless of college, may use a two-pronged object (forked stick, silver fork, chicken wishbone, etc.) or a wooden or metal needle hanging from a string instead of any other ingredients.

Elemental (Air)

A fan, a feather, silk, colored streamers, a hollow tube, any blade, a silver wand, diamond, aquamarine, quartz, a horn or flute, a wind stronger than 4 mph. Being on a mountain top or in a fully exposed position atop a very tall building (at least 100 feet) counts as one ingredient, or two for particularly high and open locations or being in flight (or simply falling).

Elemental (Earth)

Every metal, stone, and ore counts as a separate ingredient. Being underground counts as an ingredient, and being in a natural cave (rather than an excavation or basement) counts as two.

Elemental (Fire)

Pepper, amber, topaz, gold, iron, bronze, copper, an open flame. Ruby and any part of a salamander or large reptile count as two ingredients. Casting in very close proximity to a large fire, such as a building or forest fire, or a volcano counts as two ingredients, although it may be difficult or dangerous to cast from such locations.

Elemental (Water)

Any part of an aquatic or amphibious animal, aquamarine, turquoise, water, silver, a ring, a cup or bowl, a green, blue, or white cloth. Casting while in a boat (on the water, not on dry land!) or swimming counts as an ingredient, while full immersion during the entire casting counts as two.

Enchantment

Each tool incorporating a gem, precious metal, or other rare substance counts as a separate ingredient; miniature replicas are equally effective. Enchantment uses the same type and number of ingredients as the underlying spell plus one tool as for other ingredients in the college.

Food

Fire, a wooden box, a wand or staff. Each spice counts as a separate ingredient. A large pot or kettle counts as two, a stove, oven or fireplace counts as three.

Healing

Oil (any oil suitable for cooking or eating, not petroleum), incense, pure water, gold, amber, sage, mandrake, poppy, white cloth.

Illusion and Creation

Smoke, wine, a silk flag, opal, clay or sand, a colored wand or staff, each different dye or brightly colored disk counts as a separate ingredient up to four ingredients.

Knowledge

Amethyst, patchouli, mistletoe, myrrh, tea leaves, a pen, the eye, ear, or tongue of an intelligent creature, a garment embroidered with mystical symbols. Knowledge spells may use a crystal sphere as for Communication and Empathy spells.

Light and Darkness

For light-producing or vision-enhancing spells: a lens, a hollow tube, silver, a mirror or polished metal object, diamond, quartz, a mask or veil. For dark-producing or vision-obscuring spells: soot, sable, mud or dust, steam or smoke, a dark-colored cloth, a mask; each dark gemstone (for example, jet or obsidian) counts as an ingredient.

Making and Breaking

Any sharp-edged tool, gold, diamond. For repair spells: lodestone, gum or sap, a needle, thread or ribbon, fat. For breaking-related spells: a hammer, a crowbar, vinegar, jade.

Meta-spells

Frankinsense, jasmine, mandrake, myrrh, ginger, saffron, quartz, diamond, meteoric iron, hematite, opal, a wand, a garment embroidered with mystical symbols.

Mind Control

Cinnamon, gold, mandrake, the heart of an intelligent creature, opal, bloodstone, a polished metal disk, a leather thong, a picture, doll, or other object which has been made to look like the subject (no artistic skill necessary; it's the attempt that matters). Anything once part of the subject's body, such as hair, blood, or sweat, counts as two ingredients.

Movement

A feather, ginger, hemlock, malachite, hematite, aquamarine, coral, a knife, a wooden wand.

Necromantic

Blood, dirt from a graveyard or tomb, jet, nightshade, an ebony wand or staff. Casting a spell in a tomb or graveyard counts as two ingredients. Bones of a sentient creature count as two ingredients.

Virgin's blood and incense may each be used as two ingredients in summoning and banishing spells.

Plant

A sickle, thistle, cardamom, fresh blood, fresh fruit, jade, agate, topaz, silver, bronze, a wooden wand or staff.

Protection and Warning

A bell, a polished stone object, an eye, pepper, a metal or metal-encased wand, sandalwood, any bronze object. Iron Arm may use a bronze gauntlet or bracelet as an ingredient.

Sound

Sapphire, turquoise, lapis lazuli, a horn, a bell, a hollow tube, an ear. Silencing spells, such as Hush and Mage-Stealth, may use raw silk fiber as an ingredient.

Spell Ingredients In Play

The ingredient lists should provide magicians with a range of possibilities for peculiar things to fill their pouches. Each college has more possible ingredients than the most complex spells require, and many materials can be used across colleges, so it doesn't take much to enable a magician to cast a large number of spells. The precise materials chosen and whether a spellcaster carries durable or expendable materials, therefore, are strategic choices. Expendable materials are generally much cheaper and more compact on a casting-by-casting basis, but they allow a limited number of castings, whereas durable materials weigh and cost more but last longer.

Likewise, versatile objects allow a magician to cast lots of spells without worrying about grabbing new materials out of a bag or pocket, but leave him vulnerable in case they should break. Many ingredients, being rare and valuable substances, may also be subject to theft. The prudent spellcaster will carry a range of materials, perhaps relying on multi-purpose durable ones but keeping at least a small supply of expendables and special-purpose ingredients on hand if the durables break.

The range of materials available to spellcasters ensures that they won't be crippled if the supply of any one ingredient dries up. However, limiting ingredients will still put pressure on powerful spellcasters. Most spells can be cast with the use of one or two common ingredients, so hedge-wizards and village wise women will generally be able to cast their spells without trouble. However, more complex spells require more ingredients, forcing casters to use more rare and expensive materials. A general decline in the supply of spices or precious stones will make those ingredients harder to get, which will complicate life considerably for more powerful magicians.

Those materials will also be considerably harder to replace for wizards far away from centers of trade and civilization. Burning out a diamond-set gold ring is one thing to a magician in his study a few streets away from a jeweler, but quite another if he is fighting off goblins in a rugged mountain range surrounded by miles of desert.

Spell Ingredients and Alchemy

These rules can be used not just to fill the pouches of magicians, but also the cabinets of alchemists. A third of the cost of raw materials for an elixir can be assumed to be generic alchemical materials: dried herbs toadstools, oil of vitriol, eye of newt, wing of bat, etc. Unlike most of the materials listed above, the generic materials should be relatively common in the alchemist's home region rather than imported from far away.

Detection and analysis (p. M88-89) and other alchemical tasks (p. M91) not directly related to producing elixirs use generic materials only. A third of the cost goes to materials from the meta-spells college. The final third goes to materials required for the specific type of elixir. Any material (say, jade or bronze) can be used as an alchemical ingredient, specifically shaped objects (wands, stone spheres) can't, limiting the number of range of materials available to the alchemist. The materials necessary for each type of elixir correspond to the raw materials necessary for a college

of spells as detailed here:

Type	College
Animal Control	Animal
Combat Abilities	Body Control
Hostile Elixirs	Mind Control
Magical Abilities	Meta-spells
Medical Elixirs	Healing
Mental Abilities	Mind Control
Mental Control	Mind Control
Skills and Physical Abilities	Body Control

So, then, an alchemist making an Achilles elixir (invulnerability, from Combat Abilities, materials cost \$1000) would need \$333 of generic alchemy supplies, \$333 of meta-magic ingredients (perhaps diamond dust, ginger powder, and myrrh), and \$333 of ingredients for body control spells (say, dried orchids, a handful of pepper, and powdered ivory). The GM may come up with exceptions to the chart. For example, Apollo (foreknowledge, from Mental Abilities) may require ingredients for Knowledge spells, while Agni (fire resistance, from Magical Abilities) may require ingredients for Fire spells. Because alchemists use ingredients in larger quantities than spell-casters, they will be especially hurt by materials shortages.

Appendix Z: Form Blazing Sword!

by Brian Rogers

There are some weapons in popular Fantasy, SF, and Anime that are pulled out only when everything else has failed: when the monster has shrugged off all other attacks, the heroes finally remember their one totally unstoppable weapon, and maybe it will solve the problem. While this does increase dramatic tension, Player Characters are seldom willing to accept the ritual butt-kicking before they can unlimber their big gun. Nope, they haul out the [Blazing Sword of Arus](#) at the first sign of trouble, adhering to the time-old "big stick" policy of diplomacy. So how do you get the fictionally popular Unstoppable Weapon of Last Resort (or UWLR) into an RPG? Here are some ideas, from the purely mechanical to entirely character based.

- **The Damage Dealt Limitation:** Most systems let you pump up the power of a weapon by putting limitations on it, giving you more damage for points spent. The UWLR has a special form of that: the heroes cannot use it until they have tried to deliver a set amount of damage by other means. For example, the UWLR does a whopping 150 points of damage per hit but the PC can't activate it until he has tried to do 100 points of damage from his other, weaker attacks. This mirrors the Voltron model, and should be a sizable handicap for heroes whose regular attacks have little chance of damaging serious opposition; the PC will be mostly ineffective for several rounds before becoming a major threat. Why the hero can't use the weapon before then is left as an exercise for the player. (Another option is forcing the PC to make X attacks before drawing the UWLR, but the effect is the same.)
- **The Charging Battery Problem:** The independent systems that power the UWLR take several combat rounds to charge up, and once charged need to be fired, or the system will short out. The PC will be unable to keep the weapon constantly "at hand" without firing it off every few minutes, which is harsh on the local property values. Since the UWLR systems are totally independent, there's no reason for the hero not to be involved in the ritual butt-kicking before his big gun comes on line. If PCs try and do things like charge up on the way to the fight or hide until the weapon is charged, you can expand the limitation to say that the charging process requires venting waste energy or risk an overload -- that waste energy is best spent on the character's other weapon systems. Like the Damage Dealt Limitation, this is a weakness taken to reduce the cost or increase the power of the UWLR, but with a stronger in-game rationale.
- **The Damage Absorption Option:** Perhaps the UWLR is powered by the ritual butt-kicking. The PC absorbs the effect of the damage taken in combat, using it to power the UWLR. This absorption should block a fraction of the incoming damage at best to keep the "hero in dire straits" flavor intact. As a limitation, the character has an absorption threshold, where he can't use the UWLR until he's been hit by X amount of damage, with the UWLR's power being offset by this weakness. If the damage absorption is an advantage, then it's a whole different ball game: the UWLR could be used at any time, but at a damage of "Base + Damage Absorbed Before Use." The hero now has to balance the damage he can take before collapsing against the amount of hurting he wants to deliver with the UWLR.
- **The "But What Cost" Question:** The UWLR really is a last resort due to the problems it causes when applied. The comic-book hero Nexus had access to vast power, but if he overtaxed it stars would start to go out. While such a consequence might not have much impact on power hungry players (knowing that the GM probably won't obliterate the Sun), smaller, more personal consequences might. What if every time the hero used the UWLR he lost a year off his life, or had a 10% chance of dropping dead at the end of the fight? What if every use cost the hero a point from his highest attribute? [Or someone close the PC died?](#) Or a hundred random civilians perished? If the weapon were powerful enough the PCs would be loathe to get rid of it -- if only to make sure it didn't fall into the wrong hands -- but it isn't likely they'd start and end every fight with it.
- **The Honor Clause:** The PC could use the UWLR at any time, but doesn't for reasons of personal honor. After all, if the UWLR is so powerful that an untutored eight year old could use it to defeat any foe, how could the character feel any sense of victory when it comes into play? Much like the "At What Cost" weapons, the hero will try any other means of ending the fight before resorting to this dishonorable conclusion. This could be pure roleplaying, or the GM could enforce a "No Experience Award" for fights ended with the UWLR. The GM should design such UWLRs so only the honorable hero can use it, otherwise his buddies will steal it from him to

end fights faster.

Armed with these options, GMs and players alike can find ways to include even the most ridiculously over-powered weapons without worrying about their overuse. Hopefully . . . PCs can get crafty when they don't want to lose a fight.

Pyramid Review

The Lord of the Rings Roleplaying Adventure Game

Published by [Decipher, Inc.](#)

Written by **Kenneth Hite, Matt Colville, Christian Moore, Steve Long, & Owen Seyler**

Boxed set; \$29.95

For fans of all things fantasy, the last few weeks of 2001 gave us two films to savor and debate. One was *Harry Potter and the Philosopher's Stone*, and if we are not to see an RPG based upon that intellectual property, we are at least to see one based upon the second film, *Lord of the Rings: Fellowship of the Ring*. Decipher, better known for their *Star Wars* and *Star Trek* collectible card games, dip their toe into the roleplaying market with another big license in the form of *The Lord of the Rings RPG*. It should be pointed out that while this new game is published by Decipher, it has been designed and written by the creative team behind the late and much lamented Last Unicorn Games. The same team will also be making their second stab at the *Star Trek RPG* license later this year.

Before the full *Lord of the Rings RPG* comes out, Decipher have released *The Lord of the Rings Roleplaying Adventure Game*, a box set designed to introduce new gamers to the hobby and old gamers to the setting and the system. Of course, this is not the first RPG to be based upon the works of Tolkien, but more properly the third. The first was the complex *M.E.R.P.* (or *Middle Earth Role Playing*) published by ICE and set not during the time of the War of the Ring, but much earlier in the Second Age of Middle Earth. This was followed by a second game in 1991, using much simpler rules than *M.E.R.P.* -- themselves a simplified version of the ICE house mechanics seen in the *RoleMaster RPG* and its ilk. Coincidentally, not only was this second RPG designed with an introductory bent, it was also called *The Lord of the Rings Adventure Game*.

Decipher's version is specifically set during the time of the first part of the trilogy from Peter Jackson, as it takes the players on the exciting journey of the fellowship through the mines of Moria. It comes as a lightweight box set within which is found:

- Four six-sided dice
- A thirty-two page *Welcome to Middle Earth* book
- A thirty-two page *Through the Mines of Moria* book
- A four-page Fast Play Rules sheet
- A "What is roleplaying?" and "What's in this box?" double-sided sheet
- Two sheets of stand up counters
- Nine full color character sheets
- Two full color poster maps

This is the order in which the contents come, so I had to leaf through to find the "What is roleplaying?" and "What's in this box?" sheet. Since this is an introductory boxed set, this should have been packed at the top of the contents and been the first thing that the prospective gamer should have found upon opening the box. On going through the rest of the contents the impression you get is, apart from the two books, is one of flimsiness. The counters need to be cut out and folded in accordance with the instructions given in the *Through the Mines of Moria* book, but are unfortunately printed on rather thin card. Actual construction is hampered by the markings on the sheets for cutting and folding not matching with those given in the instructions. Likewise, the character sheets are thin and feel as if they will not stand up to much usage . . .

The first thing you encounter is Kenneth Hite's *Welcome to Middle Earth*. This is a guide to Middle Earth that expands upon the information you see in the film. For those who have read the books, played *M.E.R.P.*, or looked at any of the guides, there is nothing new here, but for those who have not, this is still useful background information.

The meat of the game is Matt Colville's *Through the Mines of Moria*, which can just about be played as you go. To be honest, I would recommend that the GM read through it instead, as despite it being an introductory game, there is still a fair bit for the new referee to take in. Old hands should be able to grasp and understand the contents with very little effort. Once they are through the opening sequence, "The Watcher In The Water," which finds the fellowship at Moria's West Gate, then the biggest learning hurdle is over for the GM. Once inside, the adventure follows the path seen in the film, as between them Gandalf, Aragorn, and Gimli guide the nine to the East Gate. At a number of points during the adventure, those playing these characters must take Lore Tests or become lost and waste time as they backtrack.

The second battle is that of "The Chamber of Mazarbul" in which the denizens of Moria, including Orcs, Moria Orcs, an Orc Captain, and the Cave Troll discover the presence of the fellowship in the mines. They are chased from the chamber and onto the final encounter at "The Bridge of Khazad-Dûm," before escaping down to the East Gate. The game ends when the fellowship leaves the mines. The battles increase in toughness as the fellowship proceeds through the mines, modeling how overwhelming odds force the heroes to both fight and flee! All three battles make use of the game's three battle maps, although the depiction of the Bridge at Khazad-Dûm is spoiled by a lack of detail, unlike the other two.

At each stage as necessary, the adventure suggests skills and special moves that are appropriate to the scene. Thus during the final battle at Khazad-Dûm, the rules are given for Gandalf facing off against the Balrog and sundering the bridge itself. Likewise in the Battle of the Mazarbul it tells you how Legolas can pull off trick shots with his bow.

The "What Is Roleplay?" sheet explains the question in clear detail. One way it does this is by making the comparison with childhood games of cops and robbers, but it also draws a comparison with computer games. This brings the explanation nicely up to date.

So what do the players play? Essentially they can choose any one of the nine members of the fellowship. Of course, it is not likely that you can get nine players together plus the referee, so most will have to double up. The first among these should be the relatively weak and similar trio of hobbits -- Pippin, Merry, and Sam. The other characters are equally tough in their way, so anyone with "I wanna play an elf" syndrome should not be disappointed.

Each character sheet is full color and double-sided. On the front is a picture of the character, their attributes, edges, skills, flaws, racial abilities, and equipment, plus a list of their combat actions. On the reverse is an explanation of those combat options, plus each character's background and suggested quotes for use during the game. The Fast Play Rules explain everything on the sheets; although the only discrepancy is that the nimbleness attribute is renamed quickness in a couple of instances.

Characters have six attributes -- Strength, Vitality, Nimbleness, Wits, Bearing, and Perception; and four reactions that give a character situational modifiers -- Fortitude, Swiftiness, Willpower, and Wisdom. The game engine is simple: Roll 2d6, add any skills or modifiers, and achieve a target number or greater. Roll double six and you keep rolling an extra die and adding as long as you roll more sixes. Combat is rolled in the same fashion, but each character has a Defense value that is the target number an opponent needs to roll against. Should they hit, damage is rolled in multiples of the six-sided dice, so an arrow or dagger might do 1d6 worth of damage, but Aragon's sword Andúril will do 3d6. Any damage inflicted is deducted from a character's Wounds score -- the Hobbits have just forty, while most characters average some seventy points.

These are just the simplified version of the rules in the full *Lord of the Rings RPG*, but as presented in the "Through the Mines of Moria" book, and more easily summarized in the Fast Play Rules sheet, they cover just about most eventualities that might occur in the three battles and the interludes between.

Beyond a minor random element in the adventure game, there is not a great deal of longevity in this product. This is understandable as it is intended to just introduce *The Lord of the Rings RPG*. Completing the full journey through

Moria with everyone intact (or at least with just the death of Gandalf) may take a few attempts, but beyond this ***The Lord of the Rings Roleplaying Adventure Game*** has little shelf life. So the fundamental question remains: How does this game work as an introduction to roleplaying? Actually, rather well. The rules are simple and both characters and situation should be familiar to the target audience. Further the game is fast-paced, especially during the three battles, but still leaving room for the down time in between in the interludes.

Yet you really come down to one overall factor with this product, and that is the price. Almost thirty dollars is a lot to pay for something that will not stand up to a lot of handling nor offer much in the way of replay value. For experienced gamers there is little here on offer; they should definitely wait for the full RPG to be released. That said, new players should get a kick out of ***The Lord of the Rings Roleplaying Adventure Game*** if they are prepared to pay the price.

Pyramid Review

Arcana: Societies of Magic (for d20)

Published by [Green Ronin Publishing](#)

Written by **Kevin Brennan and James Maliszewski**

64 b&w pages; \$14.95

Green Ronin publishing continues to hit the high ranks of quality with their latest release. A 64-page perfect bound book, *Societies of Magic* introduces six organizations to any campaign. These organizations aren't tied to any particular land, god, or previous work and can be transplanted just about anywhere.

Each organization is given history, under "Inside the . . ." section, a listing of personalities, important maps, and campaign ideas. To make each organization unique, there are new feats, spells, races, and prestige classes.

The organizations are the Abbey of Green Steel. Here, the monks seek to become like outsiders in terms of raw power, even as they trap evil creatures into magic items to funnel new funds into their coffers. This chapter introduces the Green Steel Monk prestige class, as well as the feat, Unarmed Sunder. The first abbey, the Motherhouse, is fully mapped out.

The Dragon Gang is a collection of criminals who all boast some dragonic blood. The neat feat -- Draconic Bloodline -- allows players to have some dragonblood without being a new race, while those more interested in being somewhat inhuman can be drakelings, a new race where the creature has some dragon in her recent history. (Those seeking still more options should consult [Beyond the Veil](#) for information on dragon bloodspawns, quarter dragons.)

The Servants of Decay are a strange lot. These individuals serve an ancient an alien preternatural force that seeks to overcome all civilization and return the world to the time before the gods molded it into its current state. To insure that they have the power to do so, the Servant of Decay prestige class can utilize many abilities related to the preternatural plane, a place like the ethereal plane that borders the prime but is hard to access.

The Temple of the Living God is a bit different than most standard "Living Gods" in that the god Viraxis, a god associated with secrets, lost numerous worshippers; his faith and power were minimal and to assure himself of life, this god has merged with his head priest, the old man Matras. The Divine Avatar Template allows GMs to augment a god's champions with vast powers.

The Tribunal of Arcane Law is something that'll fit in high magic campaign worlds without a hitch. It's a collection of mages who work against those who would damage magic, or change the world's perception of mages. They're not really worried about evil mages, but they are worried about evil mages who try to destroy whole cities with a single spell. Interestingly enough, the Tribunal employs fighters and rogues to handle most of the relics and items they retrieve, as the temptation to use these items often proves too great for mages. In addition, the new prestige class, Wizard Slayer, insures that no matter how powerful the mage, the Tribunal will still be a force to be feared.

The School Beyond the Veil is another interesting twist. Here, an undead creature has resurrected an ancient fighting school and style to gather a body of followers to him. The inner cult seeks knowledge of utilizing undeath to gather strength, similar to the way the Green Monks use outsider energy. Several new combat feats, moon wraith undead template, and the moon wraith adept prestige class go a long way in making these warriors very specialized in their art.

In addition to specific information for each perspective society, there are generic rules for things like drugs and addition, along with magic and the law, found under the mob like Dragon gang, and a new domain, that of Secrets,

under The Temple of the Living God. All this goes a long way in providing the GM and his players use out of this book even if he doesn't use a single society.

There are a few things I don't like about the book. The first is that it's too small. There aren't enough crunchy bits in terms of spells. I expect a series titled "Arcana" to have at least one new spell per spell level. While each society has two NPCs associated with it, there are often several important figures left statless. Take the Colossus, a construction mentioned but not detailed. Another weakness is that there are not enough options on using the societies in anything other than a standard *d20* fantasy game. Run a campaign using *Oriental Adventures*, the planes, or historical? No help here. In addition, interior covers aren't used. If they were, the OGL and the ad could have went there rather than into the book itself. In addition, unlike Atlas, there is no index. This would have been nice to get a master listing of NPCs, feats, prestige classes, and other crunchy bits without having to flip through the book. Still, these are mostly minor complaints. If the book detailed out more npcs and spells, the page and price could would have to jump up.

One of the strengths of Green Ronin is their willingness to published all of their written material as Open Gaming Content. No stat blocks without names, no PI on every other word, no funky different colored boxes to show what is and isn't OGC. Fortunately, they continue this great tradition with this book so the entire book, outside of art, is OGC.

Although players will get some use out of it, *Arcana: Societies of Magic* is most definitely a GM tool, providing ideas for dozens of adventurers.

(A four-page preview of the goods inside Arcana is available online at http://www.greenronin.com/files/arcana_pre.pdf)

Dork Tower!

Dork Tower!

Games Without Frontiers, War Without Tears

This is my penultimate column on the whole Simulationist/Romantic thing; next week is another off-topic piece, and the week after that I'll hopefully have my startling wrap-up, where I'll reveal that I'm actually a sled named Rosebud.

Anyway, I think my introduction to roleplaying games was, ultimately, sparked by playing wargames with my stepfather Jim.

(This is, in itself, an odd thing for me to really think about; really, I'm guessing that I'm part of the last batch of folks who would have been most likely introduced into gaming through wargames . . . at least, the "cardboard counter on a giant hex map board" type of wargame. I'll be curious to see, in another generation, how many gamers are brought over by the miniatures wargaming hobby.)

I moved to Florida when I was six, when my mom and stepdad Jim got hitched and fled the barren war-torn wastelands of Michigan. And about as early as I can remember, Jim and I played wargames. Or, probably more correctly in those early years, I'd watch him play wargames solitaire. This was in the era before computer games, where stretching out gigantic boards with tiny cardboard chits for weeks at a time was considered a good idea. I still remember when our schnauzer devoured the French army.

To be sure, the absolute *best* wargames were (at least to my mind) Milton Bradley's Gamemaster series, which I believe started around 1983 or 1984; the rules were pretty simple, but the strategies were generally pretty complex and allowed for varied gameplay. (For some reason I had a fascination with building up Russia's submarine fleet to monstrous levels. Because, really, when you think of the Soviet Union, you think of unparalleled naval might.) And, of course, they had those neat plastic pieces instead of the boring cardboard chits.

Anyway, we spent many an enjoyable evening determining the fate of the world, whether it fell to the decisiveness of ninjas, Nazis, pirates, or orbital lasers. Some games I lost; others I won. Regardless, I learned a lot about strategy, assimilating rules, and good gaming conduct. And we both always seemed to have a good time; we'd talk about exciting games, variant strategies either side could have taken, and so on. (I wasn't particularly interested in sports, so this was the means we used to communicate, being men and unable to speak directly to each other.)

In hindsight, I viewed those experiences as Simulationist. Take a game like *Broadsides and Boarding Parties*, the Gamemaster series pirate game where two ships fight each other, with both cannons and . . . um . . . boarding parties. In my mind, there isn't a big difference between playing a wargame between two ships, and playing a Simulationist RPG game pitting your ship against the GM's forces. In each the outcome is the result of the actions of both sides, and luck. Regardless, if anything particularly interesting or exciting happens, it's not because it's scripted to happen, or because it's dramatically appropriate. In one game I vividly remembered for years, I was able to maneuver my crippled ship into a perfect broadside attack, drastically evening the odds between the two vessels.

Eventually Jim and I tapered off our wargaming, and then stopped entirely. I suspect it was because of the growing pains of puberty and other social pressures of being teen-something. Still, losing that connection is one of my few regrets, in hindsight; it's difficult to second-guess those awkward years of adolescence, but I've sometimes wondered if I should have done more to maintain a connection.

Anyway, one time towards the end of our gaming era I asked, almost off-hand, "Y'know, given how many years you've studied military history, strategy gaming, and other World War II stuff, I'm surprised I was able to win as often as I did at *Axis & Allies* . . . especially since I was 10 when we started. I'm curious; did you ever let me win?"

And Jim paused. And he said, "No."

It wasn't the "No" that stung; it was the pause. It *felt* like a pause of contemplation, of equivocation, of "spin." It was a "No" said with two syllables -- "Nooo-oooo . . .", as if the "Well . . ." were silent. Or perhaps it was a silent "depending on how you define 'let me win' . . ."

We didn't really talk about it afterwards. It's one of those rare moments where all my perceptions changed, where my thoughts and reflections of what I thought to be true needed to be adjusted, like how the last thirty seconds of a good *Twilight Zone* episode makes you rethink the previous 29 minutes. Because at that point I didn't know *what* to believe; presuming I wasn't reading too much into that exchange (which I admit is entirely possible), I needed to wonder which victories were mine, if any. Why didn't the real Soviets devote 40% of their GNP towards building submarines? Because it's a stupid unworkable idea, conceived by a 10-year-old infatuated with *Das Boot*. What was the *real* story behind the seemingly brilliant broadsides that turned the tide of that *Broadsides and Boarding Parties* game? Did, in fact, schnauzers decimate the French armies during the *Blitzkrieg*?

In some ways I'm mildly upset contemplating the notion of Jim throwing games in my favor; doesn't that cheapen every game I may have won legitimately (even if I could have known which games those were)? This is the crux of the Simulationist view, as I see it; what's the point of playing a game, of simulating reality, if some unseen Hand of Fate is going to intervene to push the participants towards a preordained outcome? Why not sit at home and wait for the Hand to fax you the results?

But, with the eyes of a legally defined "adult" I can understand Jim's view perfectly; really, it's not that much fun to continuously annihilate a 10-year-old . . . especially the same stepson you're trying to establish some kind of meaningful bond with. And if you can enhance the experience for everyone by fudging rules, rolls, and decisions, where is the harm? If the point of a game is ultimately to have fun, and we did, what's wrong with using any means necessary? This is the crux of the Romantic view, in my mind. Yes, there are rules and a structure, but that's an artifice to help build fun, not the be-all and end-all. In the same way the point of a drinking game is not to win but to drink, so too is the purpose of a Romantic game is not to follow rules, but to create compelling stories (and, ultimately, memories).

No matter how much I may second-guess those countless evenings of counter-pushing, dice-rolling, and sub-building, the fact remains that I'm still glad we played, and I wouldn't trade the fun or those memories for anything.

But I still think I'll challenge Jim to an *Axis & Allies* rematch when I'm home this week . . . and this time, I hope both sides are playing to control the world.

* * *

Ken Hite's taking the week off this time around; he should be back next week, unless They have Other Plans for him.

* * *

Speaking of Other Plans, I'm outta here for a week. Yes, my annual February Christmas vacation is here, and I'll be gone from the 15th through the 24th. Email, if I have access at all, is likely to be spotty and unreliable.

So, please . . . I beg you to forestall any emergencies and disasters for at least the next nine days.

* * *

After that, I'll be having not one, but two (count 'em, *two*) chats on Tuesday, February 26th. The first will be at 7 PM CST and will be an informal "How'm I doin'?" kind of affair to celebrate the beginning of my third year as editor. Ask questions, make comments, fling fruit . . . it's all good.

The second one will be a more formal one at 9 PM CST, and will be a Writer's Seminar, of a sort . . . I'll be fielding questions, giving advice, and generally trying to forge my army of cybernetic writers into the deadliest creative force in the world. And then we'll surely defeat the Harlem Globetrotters.

(Can you tell I'm a bit loopy from both sleep deprivation and excitement over getting a week off?)

--Steven Marsh

* * *

*Last week's answer: **Kithbook: Redcaps**, p. 25*

(Two stars) "Decide who will be the first storyteller. This could be the oldest player, the youngest player, or (as is traditional -- at least among bearded game designers) the player with the longest beard."

Games Without Frontiers, War Without Tears

This is my penultimate column on the whole Simulationist/Romantic thing; next week is another off-topic piece, and the week after that I'll hopefully have my startling wrap-up, where I'll reveal that I'm actually a sled named Rosebud.

Anyway, I think my introduction to roleplaying games was, ultimately, sparked by playing wargames with my stepfather Jim.

(This is, in itself, an odd thing for me to really think about; really, I'm guessing that I'm part of the last batch of folks who would have been most likely introduced into gaming through wargames . . . at least, the "cardboard counter on a giant hex map board" type of wargame. I'll be curious to see, in another generation, how many gamers are brought over by the miniatures wargaming hobby.)

I moved to Florida when I was six, when my mom and stepdad Jim got hitched and fled the barren war-torn wastelands of Michigan. And about as early as I can remember, Jim and I played wargames. Or, probably more correctly in those early years, I'd watch him play wargames solitaire. This was in the era before computer games, where stretching out gigantic boards with tiny cardboard chits for weeks at a time was considered a good idea. I still remember when our schnauzer devoured the French army.

To be sure, the absolute *best* wargames were (at least to my mind) Milton Bradley's Gamemaster series, which I believe started around 1983 or 1984; the rules were pretty simple, but the strategies were generally pretty complex and allowed for varied gameplay. (For some reason I had a fascination with building up Russia's submarine fleet to monstrous levels. Because, really, when you think of the Soviet Union, you think of unparalleled naval might.) And, of course, they had those neat plastic pieces instead of the boring cardboard chits.

Anyway, we spent many an enjoyable evening determining the fate of the world, whether it fell to the decisiveness of ninjas, Nazis, pirates, or orbital lasers. Some games I lost; others I won. Regardless, I learned a lot about strategy, assimilating rules, and good gaming conduct. And we both always seemed to have a good time; we'd talk about exciting games, variant strategies either side could have taken, and so on. (I wasn't particularly interested in sports, so this was the means we used to communicate, being men and unable to speak directly to each other.)

In hindsight, I viewed those experiences as Simulationist. Take a game like *Broadsides and Boarding Parties*, the Gamemaster series pirate game where two ships fight each other, with both cannons and . . . um . . . boarding parties. In my mind, there isn't a big difference between playing a wargame between two ships, and playing a Simulationist RPG game pitting your ship against the GM's forces. In each the outcome is the result of the actions of both sides, and luck. Regardless, if anything particularly interesting or exciting happens, it's not because it's scripted to happen, or because it's dramatically appropriate. In one game I vividly remembered for years, I was able to maneuver my crippled ship into a perfect broadside attack, drastically evening the odds between the two vessels.

Eventually Jim and I tapered off our wargaming, and then stopped entirely. I suspect it was because of the growing pains of puberty and other social pressures of being teen-something. Still, losing that connection is one of my few regrets, in hindsight; it's difficult to second-guess those awkward years of adolescence, but I've sometimes wondered if I should have done more to maintain a connection.

Anyway, one time towards the end of our gaming era I asked, almost off-hand, "Y'know, given how many years you've studied military history, strategy gaming, and other World War II stuff, I'm surprised I was able to win as often as I did at *Axis & Allies* . . . especially since I was 10 when we started. I'm curious; did you ever let me win?"

And Jim paused. And he said, "No."

It wasn't the "No" that stung; it was the pause. It *felt* like a pause of contemplation, of equivocation, of "spin." It was a "No" said with two syllables -- "Nooo-oooo . . .", as if the "Well . . ." were silent. Or perhaps it was a silent "depending on how you define 'let me win' . . ."

We didn't really talk about it afterwards. It's one of those rare moments where all my perceptions changed, where my thoughts and reflections of what I thought to be true needed to be adjusted, like how the last thirty seconds of a good *Twilight Zone* episode makes you rethink the previous 29 minutes. Because at that point I didn't know *what* to believe; presuming I wasn't reading too much into that exchange (which I admit is entirely possible), I needed to wonder which victories were mine, if any. Why didn't the real Soviets devote 40% of their GNP towards building submarines? Because it's a stupid unworkable idea, conceived by a 10-year-old infatuated with *Das Boot*. What was the *real* story behind the seemingly brilliant broadsides that turned the tide of that ***Broadsides and Boarding Parties*** game? Did, in fact, schnauzers decimate the French armies during the *Blitzkrieg*?

In some ways I'm mildly upset contemplating the notion of Jim throwing games in my favor; doesn't that cheapen every game I may have won legitimately (even if I could have known which games those were)? This is the crux of the Simulationist view, as I see it; what's the point of playing a game, of simulating reality, if some unseen Hand of Fate is going to intervene to push the participants towards a preordained outcome? Why not sit at home and wait for the Hand to fax you the results?

But, with the eyes of a legally defined "adult" I can understand Jim's view perfectly; really, it's not that much fun to continuously annihilate a 10-year-old . . . especially the same stepson you're trying to establish some kind of meaningful bond with. Hyperworld vs. the Invadroids

by Chad Underkoffler

Genre: Supers with Alien Invasion Robots/Monsters and Mecha

Style: Four-Color Action and (somewhat) Realistic Psychology

Themes: Man vs. Superman, (Super)Man vs. the Unknown

Campaign Setting and Background Information

Our Earth, 6 months into the future.

What Everybody Knows

Timeline

February: It all started with an unexpected meteor shower on February 2nd. But those pretty streaks in the sky weren't space rocks; they were Class Zero Invadroids -- cantaloupe-sized metal balls full of alien nanotechnology.

Class Zero Invadroid

- *March:* Increased incidences of missing persons, abandoned farmhouses, cattle mutilations, and Bigfoot sightings, as the Class Zeroes transformed plants, animals, and people into weapons.
- *April:* There were no survivors from the explosion that took out an Agribiz farm in Oklahoma (April 7th), and

the security camera film from Drexlabs in Colorado was destroyed (April 15th). In the wake of 9-11 and the anthrax scare, the media labeled these first attacks as terrorist activity. The Office of Homeland Security scrambled to investigate the incidents with the FBI. It wasn't until the attack on Abilene, KS, on April 26th, that the enemy was seen. Local media affiliates carried the weird, blobby images of thirty fearsome alien fighting machines -- Class 1 Invadroids -- across the globe.

- Military forces arrived within the hour, but suffered heavy losses against the Invadroids. Standard weapons didn't even slow them down. The entire city would have been destroyed and its inhabitants used as "spare parts" if not for the actions of the first known hyperhumans: Stormfront.
- Ragamuffin, Robotica, Sekhmet, and Professor Theodore Storm almost single-handedly turned back the Invadroid assault. Their first CNN interview, amidst the still smoking debris, gave the nation -- and the world -- hope for survival (and made them media darlings). Yet their appearance raised more questions than it answered. Where did these Invadroids come from? Why are they here? Why are they targeting the USA? What do they want? Why did Stormfront get super-powers instead of being converted into Class 1s? What is the government going to do about all of this?
- *May*: On May 1st, the President signed an Executive Order forming GHOTI, the Global Headquarters for Opposing Terrestrial Invasion. GHOTI's mission was (initially) to act as a coordination center for defense, research, and rescue efforts between various US entities like the DoD, FEMA, OHS, FBI, NSA, CDC, etc. Under the command of Captain Arthur Porter (US Navy, ret.), GHOTI quickly synchronized recovery missions with the CDC quarantine the Abilene battle zone -- too quickly, many cynics whisper, as if this organization had been waiting in the wings . . .

The President publicly asked the members of Stormfront to join GHOTI to aid in defense, relief, and research efforts. Stormfront agreed -- but not without strong media statements about maintaining their autonomy. GHOTI assents to their terms. Study of their hyperhuman abilities alone granted invaluable information, and their continuing work in battle and in the public eye reassures the populace.

Following the Invadroid incursions into Mexico (May 11th) and Canada (May 27th), those nations pledged resources to GHOTI, making it an organization with international scope. In the last week of April, Invadroid attacks involving 3 to 5 Class 1s begin, with an average of one every three weeks.

- *June*: Pittsburgh suffers the attack of the first known Class 2 Invadroid (dubbed "Magarac" by the media) on June 8th; again, disaster is averted by the timely arrival of hyperhumans -- this time, the Mythmen: Dragon, Griffin, Manticore, and Unicorn. Using their hyperpowers in concert, they destroy Magarac after a battle leaving the Golden Triangle in ruins. Unlike Stormfront, they refuse to disclose their true identities to the world.
- *July*: On July 13th, Dr. Stephanie Drexel, founder of Drexlabs, completes an amazing feat of engineering by creating a functional battlesuit, hybridized from ongoing DARPA EHPA (Exoskeletons for Human Performance Augmentation) projects and back-engineered Invadroid technology. After a daring test pitting the DL-X against Class 1s in Arizona, she offered the technology to GHOTI. Captain Porter responded by placing her in charge of the GHOTI Research Division. Worldwide communications failures occur on July 24th, service is quickly restored within 12 hours.
- *August*: On August 5th, Dr. Drexel and Captain Porter unveil the Geo-Knights, a small volunteer force of soldiers, rescue workers, and scientists, wearing production models of the DL-X. A half-dozen Geo-Knights or a single hyperhuman can handle a handful of Class 1s, while Class 2s require a team of hyperhumans or a single hyperhuman backed by a squad of Geo-Knights to put down. Things were looking up; though under assault, the Earth had risen to the challenge. Then, on the 19th, the first (and thus far, only) Class 3 Invadroid -- King Zilla -- attacked San Francisco.

It took the combined might of Stormfront, the Mythmen, and two platoons of Geo-Knights to simply drive off the gigantic beast. Casualties were heavy -- in the Battle at Golden Gate, fifteen Geo-Knights died, Griffon suffered tremendous burn damage, and Robotica went into a three-week coma. Before a nuclear strike could be targeted, the creature escaped out to sea.

- *September*: Today. Life goes on with a surprising normality in the wake of catastrophic events. While the US has not declared martial law, the authorities are exceedingly security-conscious -- not only worried about

Invadroid attacks, but anti-American opportunists taking advantage of the sporadic chaos. A few metropolitan areas have a GHOTI field office, and there is a national 1-800 number and website for reporting alien attacks. The UN and the USA debate whether or not to bring GHOTI under the UN aegis, while countries all over the world chokingly beg for assistance against the Invadroids -- who no longer focus solely on North America.

King Zilla lurks out in the wide blue Pacific, with sightings in Alaska (on the 12th) and New Zealand (on the 21st). Stormfront heads the bill of a fundraiser that packs Giants Stadium on September 25th.

Then, on September 28th, another brightly colored starfall darkens the night skies of Earth. . .

Zeitgeist

While the public has, in general, become a bit more paranoid and jumpy due to the existence of the Invadroids, they have also allowed themselves to accept the hope offered by Stormfront, the Mythmen, and the Geo-Knights. This flux of emotion leads to short tempers and strained relationships. Messianic and apocalyptic cults are on the rise, preaching various contradictory testaments about the aliens and the hyperhumans. The media backpedals daily upon whether to treat the hyperhumans as savior-celebrities or dangerous monster-freaks. Interest in the space program has received a shot in the arm, now that we know for sure that life (or something much like it) exists out among the stars. Optimism burns brightly: the knowledge that a common enemy exists has increased the volume of dialogue on peace and alliance between nations, but the world has not become a bastion of human solidarity overnight.

Invadroid Facts

From the GHOTI FAQ at <http://www.ghoti.gov/faq/>

Q5: Where do the Invadroids come from?

A5: Unknown at this time, but analysis of isotopes of the aliens point to an extraterrestrial origin.

Q6: What are the differences between the classes of Invadroids?

A6: We currently divide Invadroids into 4 classes as follows:

A6.1: Class Zero -- Metallic irregular sphere about 6" in diameter, filled with alien nanomachines. They disassemble and reassemble organic material into Class 1 Invadroids; a single Class Zero can generate up to 5 Class 1s (the process usually -- but not always -- takes 2 days per Invadroid, given suitable organic matter).

A6.2: Class 1 -- Composed of modified organic material, typical Class 1 Invadroids are man-sized or slightly larger (4' to 12') blobby, bluish humanoids. They are strong, fast, and cunning, but we do not believe that they are intelligent (though evidence indicates that the more intelligent the source organism is, the more intelligent the Invadroid). Equipped with various weapons [Note 1] and armor [Note 2].

Given a place of safety and a supply of water, metal, and organic material, their armor thickens and they shift to a sedentary "Builder" mode. Class 1 Builder Invadroids act as gathering points for typical Class 1s, who help "feed" and protect it. In return, a Class 1 Builder can repair other Class 1s, and modify them into Class 2s.

[Note 1] Soldier Invadroid weapons vary, based on the organic material(s) used in their construction. No Class 1 Invadroid has yet been seen to mount both Types A and B; all possess Type C. Observed weapon Types include:

A. Knobby extrusions that fire organic pellets, comparable to a .50 caliber bullet, with

a "magazine" of 100 rounds. Given a short refractory period (15 minutes) and twenty pounds of organic matter, a Class 1 can "reload" fully.

- B. Vane-like extrusions that fire particle beams, comparable in power to a bazooka shell, with a "battery" of 20 shots. Given high-UV light, a long refractory period (1 hour), and twenty pounds of organic material, a Soldier can "recharge" fully.
- C. Claws, able to cut through 1/2" of steel or 3" of solid wood easily.

[Note 2] Invadroid armor is a thick organic polymer, rubbery to the touch and quite resilient -- a Class 1 ignores small-arms fire. However, Invadroid weapon Types -- as well as hyperpowers (see Q8, below) -- are dramatically more effective against it.

A6.3: Class 2 -- A fusion of modified organic material and metallic elements, Class 2s can stand as tall as a small building (30' to 60'). They can be any color, though their organic elements retain a bluish tint. Class 2s are immensely strong and heavily armored -- even mortar fire has little effect. They mount all three weapon Types of the Class 1s, and additionally have a unique ability, classified as Type D functions. Examples of Type D functions include Magarac's metal-liquefying ray, Punx-Z 's high-speed tunneling capability, and Detroit Dan's facility at separating and rejoining its component vehicles.

A6.4: Class 3 -- The single Class 3 detected so far (King Zilla, see Q.10) contains an abundance of silicates in its makeup material, in addition to organic and metallic materials. While loath to draw generalities from a specific case, we believe that other Class 3s will be very large (100' to 300'), immensely strong, and gifted with nearly impenetrable armoring. It's probable that they will have at least one, if not more, Type D abilities.

There must be a hidden "Class 2 Builder" that constructed King Zilla. GHOTI is pursuing all leads in this regard, and will update the answer to this question when more is known. If you have any information that you believe can help, call 1-800-GO-GHOTI.

Hyperhuman Facts

From "Ask Ragamuffin!" at <http://www.stormfront.com/ragamuffin/>

Bubbles12@aol.com asks, "Ragamuffin, how did you get your hyperpowers, and why are they different than Sekhmet's or Robotica's? Why doesn't Professor Storm have any?"

Well, Bubbles12, here's the Cliff Notes version: Keisha and I worked at a coffee shop in Abilene called Caffienation Station. There were two customers that morning -- Nicole and "Professor" Theodore Storm. We knew one another from Abilene Community College. Prof had found a Class Zero Invadroid in the back yard of his house and was taking it to a friend in the Science Department for study, when he stopped on the way for his usual latte.

When the first wave of Invadroids attacked at 10 am, the Class Zero in Prof's shoulder bag exploded, coating the four of us with greenish dust. We know now that this dust was really a bunch of tiny robots called *nanomachines* that were trying to turn us into Class 1s. Something went wrong, and all of a sudden boom! -- I'm punked out, Keisha's furry, and Nicole's shiny. All four of us felt an overpowering urge to go and kick Invadroid butt, and the rest is history.

Our "primary bodies" (that's the bodies we were born with) gained some benefits. We are stronger and tougher than we used to be (I know I can lift a lot more now!), we all heal quickly -- Sekhmet broke her arm after the Battle of Abilene, and it healed completely in two weeks; and we can detect the presence of Invadroids within a mile. The big downside is that we're driven to join battle with them, no matter what we're doing at the time.

Most hyperhumans have a "secondary body" that they can switch to -- like Robotica's metallic sheath, Sekhmet's

leonine form, or Unicorn's horse-like appearance. It grants additional hyperpowers, like my kinetic invulnerability, Griffon's flight ability, or Dragon's Flaming Breath. Prof has all the primary benefits that we have, but for some reason lacks a secondary body and associated hyperpowers gained from having one.

I hope that's answered your question, Bubbles12! Thanks for writing!

(Readers who'd like more detail on the Abilene Event should look for Vic Lane's article in the May 13, 2002 issue of *Time Magazine*; ongoing discussion of hyperpowers is happening in a multitude of peer-reviewed scientific journals, as well as the Hyperpowers Discussion Board at <http://www.ghoti.gov>.)

BLyman@hotmail.com asks, "Ragamuffin, where does all the money from the Stormfront products -- the toys, the comics books, the TV shows, the CDs -- go? Are you getting rich off of this?"

BLyman, the net profits of all Stormfront licensed products, media work, and so forth -- after paying our costs -- break down this way: 90% goes to the Abilene Fund (for relief to victims of Invadroid attacks), 8% goes to into GHOTI's research division budget (see the GHOTI FAQ for more information on that <http://www.ghoti.gov/faq/>), and 2% is divided amongst the members of Stormfront, in lieu of salaries or other compensation. It's significantly more than I was making at Caffeination Station, but less than many pro athletes or middle management of Fortune 500 companies. After all, it's our images being used, we should get something.

On that note, I'd like to add my voice to the public outcry against those people profiting off of pirating the images of the Mythmen. People shouldn't create products based around the Mythmens' likenesses without their permission, thinking they'll be able to avoid lawsuits because the Mythmen haven't announced their identities like Keisha, Nicole, and I did. I'm glad to hear that Backdoor Pictures has stopped work on the Mythmen movie they had in development pending some sort of agreement. Kudos!

Drexlabs DL-1 Geo-Knight Battlesuit Capabilities

From the DL-1 Information Page at <http://www.drexlabscorp.com/dl-1/info.html>

Vanguard engineering and breakthroughs in materials technology by Drexlabs has led to the DL-1 exoskeleton. The DL-1 provides increased speed, strength, endurance, and protection in the field, not just for soldiers, but for rescue workers as well.

The DL-1 triples the lifting power and carrying capacity of the pilot. Specialized pseudo-musculature further enhances

their leg muscles, allowing running speeds of 60 mph and vertical jumps of 40 feet or more. Combined with advanced fly-by-wire Paraglider Packs, a DL-1 can run, leap, spread their wings, and glide airborne over rough or broken terrain. In addition, the flexible armoring of the DL-1 is impervious to small-arms fire or shrapnel, and is an NBC rated environment suit. Its neutral gray surface can be painted with a variety of camouflage patterns. The DL-1 currently has a mission endurance of twelve hours, and is easily recharged in the field with proper equipment.

The DL-1 is seeing service currently in the GK Corps of GHOTI. Three new prototypes are on the boards, incorporating specialized capability support modules (biomedical, search-and-rescue, combat), integral armament based on Invadroid Type B weaponry, and improvements suggested by current DL-1 pilots.

What Everybody Doesn't Know

Why Earth?

Why have the Invadroids targeted Earth? Because something they were chasing came here.

In AD 1221, an alien saucer crashed in the rainforests of the Pacific Northwest. In 1938, an archeological team looking for Native American artifacts stumbled across the saucer. They quietly notified the government; the President initiated Project Teacup, which drew a veil of secrecy over the entire affair.

Despite the Project's efforts, the saucer remains an enigma (see below, **Items & Locations**, for more information). The aliens were dubbed the "Frith" because a series of pictograms in the "cockpit" -- one of the few examples of writing inside the saucer -- resembles those Roman letters.

The four corpses of the Frith crew gave up some of their secrets. Ongoing analysis has been both illuminating and frustrating for researchers, but has indirectly led to a handful of Earth biotech breakthroughs: new anti-coagulants, new analgesics, increased understanding of the rod and cone structures of human retina, etc. These spin-offs came from Project Teacup's attempts "to build the tools to build the tools" suitable to analyze the aliens.

GHOTI, inheritor of Project Teacup, theorizes that the Invadroids targeted North America for their first assault due to the presence of the Frith Saucer.

Invadroid Secrets

The Invadroids have annihilated the race humans call the Frith, and are hunting down all stragglers to incorporate into their bio-banks. They followed the last Frith saucer to Earth, but at sublight speeds.

Invadroid Prime (in essence, a Class 5 Invadroid) remains in Earth orbit, cloaked from human detection. In the eight months since launching its complement of 144 Class Zeroes, it has quietly been collecting inactive satellites and space junk to combine with internal resources and generate more Class Zeroes.

Of the 144 launched:

- 23 burned up on reentry due to design flaws.
- 25 crashed due to misfires of their landing balloons.
- 28 did not activate, and may still lay inert, waiting for stimuli.
- 68 activated successfully, yielding approximately 270 Class 1s on Earth, many of which have been destroyed, and some that converted into Class 1 Builders.

Normally, an orbiting Prime would coordinate Invadroids through communications channels; fortunately for humanity, the Earth is electro-magnetically noisy. Control has been erratic and error-prone. Prime plans to launch a second wave of Class Zeroes, and then a third, which it will drop after destroying all orbiting communications satellites. This will assure victory and provide a planet rich with organic materials for exploitation.

Unfortunately, Prime doesn't know he's sick -- infected with the Frith psi-nanovirus. The crew of the last Frith saucer he consumed centuries ago inoculated themselves, in an attempt to taint the Invadroid's nanomachine banks. They succeeded: 30% of all Class Zeroes Invadroid Prime creates carry the virus. Infected Class Zeroes create hyperhumans instead of Class 1s. The varied forms and abilities of hyperhumans is due to the lack of Invadroid programming of the nanomachines (erased by the virus), combined with the psychic sensitivity of the virus: instead of reshaping flesh to Class 1 templates, the victims' minds provide templates (see below for more information).

Hyperhuman Secrets

Hyperpowers are not merely granted by alien disassembler/reassembler nanomachines tainted with a psi-virus. The nature of human psychology -- and psychic ability -- plays a part.

Humans, like most primates, are social beings. Untold millennia of jockeying for position in the pack have led to specialized adaptations in psychology and physiology, allowing observations that consciously and rationally may no longer be obvious, yet nonetheless exist. This dynamic interplay of factors, decoded by the "sensitive" or "psychic," can lead to insights and intuitions often considered supernatural. Unknowingly, humans are always using them.

Yet take the sensitive out of a social milieu, and those adaptations are useless. Isolate the sensitive (say, in a scientific double-blind research study) and their abilities vanish. In short, all humans have "psychic powers" (to a greater or lesser extent), but *only* around other people.

This social requirement of parapsychology explains a nagging issue of hyperhumans: they never appear singly, only in groups. Only humans in a high state of social exchange can properly take advantage of the virus-tainted Class Zero nanomachines. The social dynamics of the four people who became Stormfront -- typical collegiate romantic and personal rivalries, in an atmosphere of late adolescents and young adults (interestingly, "Professor" Theodore Storm is the oldest known hyperhuman at 25) -- allowed them to survive the Class Zero's nanomachines and gain hyperpowers. If, say, Nicole Woodman had been the only person in the shop when the Class Zero activated, it's probable that she would have simply become a Class 1. (It is unknown at this time what effect further exposure to the nanomachines would have on a hyperhuman; speculation ranges from developing additional powers to transforming into a *hyperpowered* Class 1.)

Another fascinating topic is the secondary body of a hyperhuman. The physics behind the switching process between primary and secondary bodies is still a mystery, but the two leading theories are:

1. *Hyperspace Displacement*: One body is in the real world, while the other waits in another dimension. The hyperhuman mind triggers a swap between forms, much as a person would change clothes.
2. *Neutrino Energy to Matter Condensation*: Neutrinos sleeting through the Earth are somehow captured, collected, and forced to condense into the matter of the secondary body around the primary body.

Research continues on both theories.

The nature of the secondary body seems to address the doubts, fears, dreams, and desires of the target. The cases of Nicole "Robotica" Woodman and Morgana "Ragamuffin" Raven display this. Woodman worried to an almost pathological extent about her appearance, despite being an attractive teen, and suffered a lack of self-confidence due to a propensity towards unrequited crushes. As Robotica, she is a steel goddess -- brash, bold, beautiful, the cynosure of all eyes. Raven, on the other hand, grew up beautiful and knowing it, a cheerleader, a solid-C student (despite her great efforts to achieve more), and found herself the target of discrimination based solely on her appearance. As Ragamuffin, she is an intellectual genius and has total photographic recall, while her normal appearance is effaced strongly by the Goth/punk body modifications and accessories of her secondary body.

Theodore Storm's lack of a secondary body is a mystery whose answer can have compelling effects on this campaign, by defining the cause of hyperpower development and suggesting interesting stories, characters, or adventures. Is Storm's lack of a secondary body due to:

- A. His "advanced" age?
- B. His self-assurance and well-adjusted nature?
- C. His role in the social dynamic of the three women (essentially, as an object of desire)?
- D. The expectations of other people in the process (i.e., what the three women wanted him to be)?
- E. Robotica received half of the "dose" intended for him (see **NPC Backgrounds: Robotica** below)?
- F. A combination of all of these, or an unknown factor?

If any of these are reasons, it will change a character's hyperpowers, subtly or significantly. For example, if Bob is playing in a campaign where C and D are the main factors in determining hyperpowers, perhaps the *other players* select hyperpowers for Bob's PC.

GHOTI Secrets

GHOTI researchers have isolated a common element from samples taken from the tainted Class Zero that gave Stormfront hyperpowers and samples taken secretly from the members of Stormfront and the Mythmen -- the Frith virus. However, Earth science is not adequately advanced to analyze it, much less duplicate it. Researchers have introduced the virus into captured Class Zeroes -- a single run of experiments (Codename: Koi) in an attempt to replicate hyperpowers using lab animals failed disastrously. Without the socio-psionic interplay of humanity to trigger the virus, what resulted were small Class 1s. Also, despite stringent clean room procedures, GHOTI researchers have an unlucky tendency to be warped into Invadroids. This happens because other members of these research teams are too far away, sealed in their own environment suits, or trying to escape from the contagion zone for the social dynamic of human groups to activate the virus. (But one day, it may happen . . .)

Covertly, GHOTI is investigating the secret identities of the Mythmen -- purely in the interests of Earth, of course. Unfortunately, the secondary bodies of the Mythmen are so monstrous as to obscure clues to their primary bodies. Agents are focusing on the Pittsburgh region, and are specifically looking for "weird stuff" and individuals who suddenly show the improved physical abilities of a hyperhuman primary body -- sudden physical aptitude, rapid healing, and attraction to Invadroid attack sites.

Drexlabs Secrets

Dr. Drexel's big secrets are:

- A. She keeps her prototype DL-X battlesuit with her at all times, because of her fear of Invadroids (though she hasn't worn it since her test in Arizona).
- B. She's been holding back small amounts of funds and materiel, enough to equip a small squad of "Black Knights" loyal to her, not GHOTI.
- C. Geo-Knight armor isn't constructed from materials "back-engineered" from Invadroid tech so much as it's molded out of "melted down and reprocessed" Class 1 organic material. This has two unknown drawbacks:
 1. Prolonged wearing of a battlesuit will psychically take its toll on the pilot; Geo-Knights without sufficient R&R show increased incidences of nightmares, strange urges, disembodied voices, and hallucinations.
 2. If Invadroid Prime succeeds in destroying enough of Earth's communications satellites to eliminate the jamming of its control channels, most Geo-Knights will come under Prime's control.

NPC Backgrounds

GHOTI

GHOTI

The word "ghoti" is -- as popularly attributed to [George Bernard Shaw](#) properly pronounced as "fish." However, the US media has pronounced it as "go-tee" or "goatee" since the Executive Order forming the organization. GHOTI agents use the "fish" pronunciation amongst themselves; additionally, call signs, project identifiers, and code phrases often have an aquatic quality -- for example, the GHOTI Command and Control Center is called "the Fishbowl" among agents.

GHOTI actively recruits from former military personnel and the fields of law enforcement and rescue/crisis workers. A smaller number come from research labs and universities. The majority of their time is spent investigating and recovering from Invadroid activity; scientific specialists spend their time researching Invadroid and hyperhuman capabilities and origins (and only those with the highest clearance know of the Frith).

Any agent can apply for the eight-week Geo-Knight basic training: only the best 10% of any graduating class are assigned to the GK Corps. If not selected, agents must wait six months before applying for the accelerated four-week reattempt course.

Captain Arthur Porter, US Navy (ret.): A decorated Navy pilot, Porter entered the ranks of Project Teacup in 1988 after his F-14 collided with a glowing UFO that appeared out of nowhere (believed to be a psychic projection caused by a remote viewer entering the Frith saucer, see **Items & Locations** below). The Project agent who analyzed Porter's debriefing recognized a man who could go far, and recommended the pilot for recruitment. When the Project became GHOTI, Porter had the seniority, skills, and history necessary to head the new organization. Blessed with a ready wit, Porter administers GHOTI with a rough paternal aplomb. He retains his expert piloting skills, has good understanding of the science (or lack thereof) behind the Invadroids and hyperhumanity, and is commander-in-chief of the GK Corps. While dedicated to preserving Earth at all costs, he has a strong bias in favor of America, which gets him into trouble with the international public.

Doctor Stephanie Drexel: Drexel is a polymath, with genius-level intellect in several fields including chemistry, materials engineering, and economics. She's an accomplished poet, but a terrible public speaker. A handsome woman, she bears a striking resemblance to the Thirties actress Margaret Dumont. She founded Drexlabs in 1994, and under her direction it rose quickly to be a well-regarded defense contractor. Slightly paranoid, she has absolute confidence in herself, and is willing to argue nose-to-nose with Captain Porter to get what she wants as head of the GHOTI Research Division.

The Mythmen

The world wonders -- who are the Mythmen? They may be surprised to know that the mysterious, heroic monsters are secretly a quartet of pubescent geeks (ages 12 to 13) from southwestern Pennsylvania. They do little media work for this reason, preferring to be mysterious benefactors. When an infected Class Zero that Chuck found in a junkyard activated at one of their gaming sessions, they gained hyperpowers and decided to use them to fight crime and defend the Earth. Unfortunately, the "fighting crime" part's been a little hazy -- bank robberies and jewel heists don't happen every day, and there aren't any "supervillains." Still, hope springs eternal. The Mythmen accidentally revealed their

identities to Vince Polosky, Mark and Jenny's dad, who keeps mum and covers for the kids because of a deep-rooted distrust of the government (and thus GHOTI) from his college days. The fact that their secondary bodies are those of young adult humanoids aids in this deception. They have a clubhouse in the junkyard that serves as their "secret HQ."

Ben Goldfarb aka Dragon: Ben is the captain of the junior high chess team and first-chair sax in the band. He's sarcastic and good at math, but girls frighten him. Jenny is his best friend; he has a serious crush on Ragamuffin. As Dragon, he has bat wings, thick armored scales, and can breathe fire (he's learned a number of tricks with this breath weapon, too); his change gives him a cool confidence.

Chuck Insana aka Griffon: Fat kid with a reputation for being a little nuts, Chuck's a class clown. While smart, his grades suffer from his laziness. He's got a thing for Jennifer, and doesn't hide it; however, he's also interested in Sekhmet -- who seems to return his feelings. When he's Griffon, anyway. In his secondary form, he gains hyperstrength, razor claws, and large feathered wings, as well as a modicum of dignity and reserve.

Mark Polosky aka Manticore: Mark wishes he were a real jock. He's on the swim team and the track & field team, but frankly, he sucks. Or at least he did until he got hyperpowers. He has a burning need to fit in, and amongst his friends, he's the one who hates being pegged as a nerd more than anything. He is the quintessential nice guy. As Manticore, he grows leathery red wings, a scorpion-like tail that fires acidic stingers, and can shapeshift. (Note: Manticore human head initially had Mark's features, but the decision to keep their identities secret has led him to change it to resemble something between Adam West and George Reeves.)

Jenny Polosky aka Unicorn: Jenny has the stereotypical "skinny geek chick" coltish look down, topped with long brown hair and huge owl glasses. She's painfully shy, but has a delightful sense of humor. She plays flute and piano well. Ben is her best friend, and she's found she gets along swimmingly with the female members of Stormfront, especially Sekhmet. She likes Chuck, but doesn't like-like him. When she changes to Unicorn, Jenny gains hyperspeed, can teleport herself and up to five other people 100 miles, and her crystalline horn fires powerful energy beams. As Unicorn, she is more outgoing, but not brash like Robotica. She resents her overpowering need to fight Invadroids, seeing it as a loss of control.

Stormfront

(See *Bubbles12's question to Ragamuffin above for more detail on Stormfront's origin.*) Currently, Stormfront is headquartered in a GHOTI research center in Chicago. Their days are heavily scheduled between research, rescue, and media work, but any call for aid against Invadroids takes priority.

Keisha Smith aka Sekhmet: Jumpy and hesitant, Keisha had always been scared. The hardest thing she'd ever done was defy her mother and enter college. An excellent artist, she was pursuing a degree in graphic design when the Class Zero changed her. As Sekhmet, she gains hyperstrength, hyperspeed, razor claws, and telepathic command of animals; furthermore, in her leonine form she's fearless, foolhardy, and a demon in combat. Best-friends with Ragamuffin, she's also close with Unicorn, and romantically interested in Griffon, who clearly is interested. She does substantial animal-rights and environmental PR work.

Nicole Woodman aka Robotica: All her life, Nicole felt she hadn't been enough: not pretty enough, not smart enough, not wild enough, not happy enough. She constantly searched for something, anything to validate herself, and usually came up feeling empty and hurt. Then the nanomachines transformed her into a metal goddess. Covered in gleaming armor, Robotica is hyperbeautiful and hyperstrong, sexually pursued by technophiles (men and women alike), and even metals dance at her whim (metallic telekinesis). After coming out of her coma (see **Timeline: August** above), she's discovered that she can mentally surf the Internet. Indeed, she rarely shifts into her primary body any longer . . . Why should she? (Robotica's metallic body is an anomaly not fully understood by GHOTI researchers -- all

other hyperhumans' secondary bodies are organic in nature. Perhaps Robotica is an example of a Class 2 hyperhuman? She has more hyperpowers than anyone else . . .)

Morgana Raven aka Ragamuffin: Blond, beautiful, dumb, cheerleader. But it wasn't enough. Hell, it wasn't anything, and Morgana knew it. That's why she enrolled in school, to somehow escape the "decaying Homecoming Queen" life laid out for her. The Class Zero was her escape. As Ragamuffin, she's hyperintelligent and hyperagile, and has gained total recall, incredible pain resistance, and invulnerability to kinetic damage (even most of the force of a cutting or stabbing blow is ignored). She's got a crush on the Prof (purely for his mind), and finds Manticore "sexy." Her PR work is aimed at keeping kids in school, but most of her time is spent doing research for GHOTI under Dr. Drexel's direct supervision. After Robotica, she is the hyperhuman who spends the least time in her primary body -- sure, her secondary body is a little outré with all the tattoos, spikes, safety pins, and wild haircuts, but who would voluntarily coop themselves up in a limited mind like Morgana's longer than they had to?

Professor Theodore Storm aka "Prof": Born in Sydney, Australia, Ted Storm wanted nothing more than to read and write his life away. He came to the US to study literature, and hasn't returned Down Under. He holds multiple master's degrees in literature (his specialty is children's fiction), and is great fun to be around. He dotes on his '67 Oldsmobile Toronado 2 door hardtop (named "Ruby"). Levelheaded, affable, and a wicked satirist, he had been working on his Great Australian Novel when an alien weapon dropped into his yard. While he's gained the benefits of transformation, he doesn't have a secondary body, which makes him feel a bit left out. Still, now he's the equal of any Renaissance Man who ever walked the Earth, and that's something, isn't it? He does a lot of PR work (especially adult literacy advocacy) and public appearances for GHOTI; and has recently completed the Geo-Knights basic training course with flying colors; a DL-1 modified by Ragamuffin and painted with the Stormfront logo has been provided for his use.

Items & Locations

Frith Saucer: Frith technology is opaque to Earth science. With few visible or obvious control surfaces in the vessel, the leading theory is that the Frith controlled it with thought alone. This is bolstered due to Project experiments in the early Forties with "remote viewers." Before driven mad by repeated attempts, one psychic was able to activate a holographic animation: the saucer fleeing from a large "organic" ship. Following this sequence is a complex navigation diagram showing their journey to Earth, but analysis of the path has hinted at faster-than-light speeds. The image suddenly cuts off into visible and mental static. An interesting fact discovered by Project data-crunchers in 1998 is that every time a "psychic" enters the saucer, worldwide sightings of UFOs increase. The UFO "boom" of the Seventies and Eighties reflects the intense parapsychological study of the saucer in those decades, fueled by increased sightings of UFOs . . . creating a vicious cycle.

The Zilla Maker (Class 2 Invadroid Builder): Somewhere off the coast of Baja California, hiding under the warm Pacific waters is a humungous, sessile Invadroid attended by dozens of smaller Class 1s. This was a Class 2 named "Punx-Z" that tunneled through the Southwest; finding substantial resources in the ocean, it put down roots and began building King Zilla. It's working on a second Class 3, built around a captured pod of orca and a Chilean canister transport.

PC Opportunities & Story Arcs

PCs have numerous opportunities for adventure in Hyperworld as GHOTI agents, rescue workers, or PR flacks for Stormfront are viable PC group concepts. However, the primary prospect is to play new hyperhumans. Whether the PCs gain their abilities from an infected Class Zero (in a GHOTI lab, a senior citizen home, or elsewhere) or are a handpicked cadre of photogenic Geo-Knights fitted with signature armor (like a cross between GI Joe and the Monkees), the PCs will rapidly become famous worldwide. Interesting role-playing sessions can focus on how to handle fame, hobnobbing with celebrities, working out licensing deals, or using hyperpowers to do something finer than blowing up Invadroids.

Advice, Opportunities, & Pitfalls

Four Color Physics: Simply, physics and chemistry are "looser" in the reality of Hyperworld. Events that would be dangerous or impossible in the real world aren't, the laws of thermodynamics are really guidelines, and scientific rigor is subordinate to dramatic effect. One way to conceptualize this is to assume that reality operates at a child's level of understanding -- hyperstrength can lift a car without it buckling under its own weight, because a child doesn't worry about internal stresses or materials science. The pitfall to avoid here is making reality too cartoonish.

Realistic Psychology: No matter what fantastic abilities hyperhumans have, they're still people, and are subject to the same thoughts, feelings, and impulses as everyone else. The rest of the world thinks of them just as they would here in the real world; opinions range from paranoia to adoration. One way to envision how folks react to hyperhumans is to imagine them as superstar athletes armed with bazookas. The pitfall to avoid here is adopting a flat "we're for them" or "we're against them" mentality for the public. The existence of hyperhumans causes tremendous controversy, pro and con, with most people somewhere in between.

Back into the Cube

An Alternate Campaign for *GURPS Time Travel* and *Places of Power*

by Baeda

This article gives more structure and purpose to the time traveling campaign found in *GURPS Time Travel* called "In the Cube" (p. 67). It also provides a setting which can incorporate some of the fascinating and mysterious places described in *GURPS Places of Mystery*. While this is written mainly as a campaign, it could be compressed and used as a short one-shot adventure.

The Problem

When the Wanderers get sucked into the Hypercube during the full-power test, they are transported to the date in the past to which the Team had set the Hypercube. Each successive attempt to bring them back home only sends them further and further into the past. They may begin to notice a pattern (or two) to their time jumps.

The first pattern is that each jump sends the Wanderers as far back into the past as they already were. So, if the Wanderers were originally based in 2001 and first jumped to 1789 to witness the French Revolution, then they were 212 years in the past. On their next jump, they will be sent 212 years more into the past, or to 1577. Further jumps would take them back to 1153 (424 years from 1577), 305 AD, 1391 BC, and so forth. Whether or not they discover the progression, it should be obvious to them that they are moving further and further into the past. (If the GM prefers, this numerical progression can be ignored -- the important thing is that the Wanderers are moving further away from home with each jump.)

The second, and more important pattern, is that each time the Wanderers arrive in a new time, they find themselves in one of the locations found in *GURPS Places of Mystery*. The nature and type of the locations should be different enough that the pattern does not become too obvious until after a few jumps (for example, they shouldn't land in a temple or church every time).

The Solution

The Hypercube cannot get a close enough fix upon the Wanderers to transfer them back, and the further back in time they are, the more difficult is the fix. Thus each failure results in sending the Wanderers as far back into the past as they already were, relative to where they were before the jump. When the Hypercube tries to fix upon and transfer people within too large and unfocused an area, it fails in mid-transfer lacking the energy to complete the transfer. Rather than just wasting all the built up energy for the transfer following the failure, the energy is put to use by the Hypercube to send the Wanderers back as far as they wanted to come forward.

As the Hypercube transfers the Wanderers, certain locations tend to attract the matter which has newly entered the time sphere. If one were to view it from the perspective of an electron, it would look almost like the forces of electromagnetic attraction. These places have an aura of energy about them, and might be called "places of power." Many of these places have become revered over the years as holy places, since some people can sense the aura of energy. Some people have built edifices to cover, surround or adorn them. Many of these places are now marked in some way, and are described in *GURPS Places of Mystery*. These places of power can include anything the GM chooses; any place or building considered to be "holy" by any religion was probably felt to radiate an aura of energy, as well as certain natural locations (like mountain tops) which can be said to radiate such an aura.

The solution to the Wanderer's problem is to place themselves on or within such places of power. This allows the Hypercube to fix on them more accurately and bring them forward in time. In fact, if the Wanderers could just stay in

the same place as they landed, they would move forward on their next jump. Unfortunately, something usually comes up which forces the Wanderers to move from their landing location.

Once the PCs (Wanderers or the Team back at home) discover the pattern, and place themselves in places of power for their transfers, they will start to move forward in their jumps. They will move forward at the same rate they moved back, only in reverse (ie. they will move back half of the time distance from their home time; round fractions down). This will allow the PCs to revisit every time they have previously visited (sometimes arriving at the same location as before, sometimes at another location in the same time), which could present its own difficulties. The Wanderers will jump forward at this same rate until the time difference between their current location and home time is a prime number (to simplify and shorten this process, just make it an odd number).

As described in the *GURPS Time Travel* campaign "In the Cube," it is possible to communicate with the PCs, and even send them equipment, with this minor snag: The further in the past they are, the harder it is to make a direct fix on the party unless they are located in a place of power. What this means, in practical terms, is that the calculations required for the Team at home to make contact with the Wanderers after a jump is subject to one further calculation: multiply the number of hours required to make contact by the number of years into the past the Wanderers are, divided by 500 (rounded up). Essentially, this means that you increase the multiplier by one every 500 years. Thus a party 500-1000 years in the past must multiply the time required by 2.

Sending matter to the Wanderers is even more problematic. The further back in time they are, the wider is the area of possible delivery, unless the wanderers are in a place of power. For every year in the past, the possible delivery area increases by a radius of a foot. Thus, when the Team sends matter 100 years into the past, it will land within 100 cubic feet of the Wanderers (this might mean the materials "land" anywhere up to 100 feet above them, or even 100 feet below them, requiring them to dig them up, as well as up to 100 feet in any horizontal direction). When contact is re-established after the transfer of materials, the Team at home will be able to locate the "package" and direct the Wanderers to it, but by the time they get to it, it may have been found by someone else already, and be under investigation or guard!

Running the Campaign

At the character creation session to start the campaign, tell the players to design scientists who work on a time travel machine. Then ask them where they would want to go on their first foray into the past. When they come back for the next session, you can begin like this: "Today is the big day -- you're going to power up the Hypercube. Soon it will be ready for 'live' testing, but today is just a warm up. As the test begins, the guy at the controls asks you what date to put into the machine -- 'just for fun,' he says. You tell him [the date the players gave you at the first session], with a laugh. The next thing you know, you are being dragged into a vacuum created by the Hypercube." For their first adventure, the players will get to experience the time and place they chose. After that, they will have no control over where they land.

Once begun, this campaign does not differ too much in style and function from what is presented in "In the Cube." It will still center mainly on the Wanderers' survival from jump to jump, and the real action may take place while they are out of contact with the Team back home. The real difference is the potential difficulties that could arise if the Wanderers go too far back in time -- for example, having to traipse halfway across the earth in dinosaur times to retrieve "a package from home." If they go too far back it might become more difficult to find places of power, since there won't be any buildings before humans. The GM should play up this danger as the PCs get further and further in the past.

Further Possibilities

The Director of the TRU

If all the PCs are going to be Wanderers, then it might simplify things for them to deal with a single individual (who

has research assistants, of course). That individual could be one Niels Johannson.

Dr. Niels Johannson (100 pts)

5'11", 150 lbs blue eyes, blond hair, Scandinavian features, usually dressed in suit and lab coat.

ST 10 [0] **DX** 9 [-10] **IQ** 15 [60] **HT** 10 [0]

Speed: 4.75 Move: 4

Advantages: Literacy [0], Lightning Calculator [5], Reputation (+2 among other scientists and academics) [7]

Disadvantages: Impulsiveness [-10], Stubbornness [-5]

Quirks: Wants to achieve fame as a great scientist (like Newton or Einstein); Always wears a three button suit under his lab coat; Has trouble falling asleep at night; A little clumsy; Likes to read history. [-5]

Skills: Mathematics-14 [2], Computer Operation/TL8-15 [1], Computer Programming/TL8-12 [.5], Electronics-15 [4], Electronics Operation/TL8-15 [2], Electrical Engineering/TL8-16 [6] Physics/TL8-16 [8], Nuclear Physics/TL8-15 [8], Temporal Electronics/TL8-15 [4], Temporal Operation-15 [2], Temporal Physics-15 [8], Swimming-10 [2], Skiing - 10 [8]

Languages: Swedish (Native)-15 [0], English (MA)-14 [1], German (MA)-14 [1], French (MA)-13 [.5]

Dr. Johannson is the stereotypical scientist: all brains, no brawn. Born in Sweden to a father who was a chemist and a mother who taught mathematics at the secondary level, he discovered early on his natural ability with mathematics, and a love for designing and building machines. He also enjoyed reading history books, but only when he couldn't get his hands on the materials to build a new machine he had dreamt up. Even in his younger years, he rarely made himself available for outside activities, preferring his machines and his theories, but his parents did make him take swimming lessons as a kid, and later they took him on vacation skiing trips where he managed, despite a slight natural tendency towards clumsiness, to learn to stay up on the skis and make it to the bottom of the hill.

By the time he reached college, he had decided to study electrical and computer engineering. In the course of his studies he was introduced to the field of temporal physics, still in its infancy, but growing. When he decided to continue his studies with post-graduate work, he applied to work and study under an American professor at an American university, where there was more funding for such specialized fields than in Sweden. By the time he had earned his PhD, he had become one of the leading experts in time travel theory, and wanted to begin working to make it a reality. He joined the Time Research Unit, but after several years of all discussing theory, he, along with a few others, decided to do something about it. With all of his experience with both electrical and temporal engineering, he naturally become the leader of the small group which eventually built the Hypercube. It was his impulsive nature which led him to join the group which built the Hypercube, and it may have been his impulsive nature which led him to try the full- power test against the advice of the others and which ultimately led to the "accident." He now stubbornly refuses to accept the loss of those who were sucked in, and keeps trying to bring them back, despite the repeated failures.

Quotes: "This time it will work, you'll see!"

"Someday, they'll repeat my name along with those of Isaac Newton and Albert Einstein!"

What if creation "ex nihilo" is true?

If the assertion by some religions that the earth is only about 6000 years old today, and was created "ex nihilo" (out of nothing), is true the campaign world, then what happens when the Wanderers are sent back further in time than that? Perhaps the Hypercube cannot find a location for them and so they are stuck in limbo forever, or at least until a team (new PCs run by the old players?) can figure out how to rescue them. Perhaps they are transported to the next closest place of power -- in another galaxy! Or maybe they just land in empty space, dying after a couple of minutes of no

oxygen, or maybe they are rescued by a passing starship just in the nick of time. This could transform the campaign into a *Space* campaign.

Mirror of Hidden Truth, Soulbreaker, and Weeping Wounds

Three Artifacts For *In Nomine*

by Elizabeth McCoy

(While these are all relics for [In Nomine](#), alternate forms of them are also listed, suitable for fantasy games.)

While most relics are created by a celestial or a celestial's Superior -- with a few notable ethereal items thrown in for good measure -- there are always the artifacts which . . . just happen. Whether by an Intervention or simply odd concatenations of events, something pops up which was not enchanted, but *made*.

The Mirror of Hidden Truth

As the legend goes, long ago, before Judgment and Fire were at odds with each other, there was a Seraph of Dominic who had earned enough favor with Gabriel that he -- Gabriel was male then -- gave the Seraph Fire's own Choir Attunement. This allowed the Seraph to see those who lied to themselves about what they were, and combined with her Choir Attunements of Judgment, made her one of the best triad-leaders that the Word had known. But between her attunement of Fire, and her own Lord's dissonance conditions, she was equally unable to dispense mercy when it was called for.

And one day, it was. She and her triad thought they were going to bring in a demon who was responsible for the Falls of several angels. Instead, they found a repentant Balseraph who sincerely threw himself upon their mercy. This, by itself, would not have been a problem -- but the Balseraph was a minion of Asmodeus, Prince of the Game, and had just "lost" two Renegade demons. The Balseraph was Discordant from his betrayal of his Hellish master, Bound into the ring of keys that had unlocked his dungeon's doors, and could not follow the angels to their Hearts (even if the Light of Heaven would not have grievously wounded him), and the team to "collect" the Renegades would be there shortly. If the Balseraph were found missing, the hunt would be up immediately . . .

When the Game-team showed up for the missing demons, they found a tall, lean Balseraph -- or so they thought. Seraphim, as a rule, are not good at lying. The dissonance of it hurts them, and they don't have practice. Nevertheless, the Seraph-in-Balseraph's-clothing managed to fool the team, stalling and delaying, and binding her dissonance into Discord before it could fracture his Heart. Ironically, she, too, became Bound -- to her silver Mirror of Truth that could (with a little Essence) reflect the celestial forms of those visible in it.

And so it was that she could not flee to his Heart in Heaven when the Prince of the Game arrived. The Seraph dropped her pretense and attacked the Prince as best she could, for each precious moment of delay meant her triad could be that much closer to safety. But it was fatal for her; the Prince summoned to him the blade Soulbreaker, and struck down the Seraph, soul-killing her even as she was drawn into the mirror she was Bound to by her Discord.

The mirror stayed in the possession of Servitors of the Game for a while, was stolen by a demon of Theft, and finally wound up . . . where ever the Game Master decides.

In appearance, it's not much. Just a silver mirror (which probably needs polishing), about the size of two human palms. The power of the Mirror of Hidden Truths is this: it shows what someone *is*, and is becoming, especially if that person is denying self-knowledge. For humans, this means that those gazing in the mirror will be reflected, not *sans* disguises, but in such a way that the disguise is compromised. Further, their true personality will also show through, no matter the facade they project. If a king is becoming a tyrant, it will show him as such. If a Scrooge has had a change of

heart, that, too, will be obvious.

For celestials, it is the same, though it does not display celestial forms unless given Essence (as per a standard Mirror of Truth, p. 66 of the *Liber Reliquarum*) -- with one exception. If an angel is close to Falling, or a demon becoming redeemable, they (and any other viewers!) will see their Fallen or redeemed celestial form in the mirror, not their current one, nor their vessel. This can be, as they say, disconcerting.

Other Mirrors of Hidden Truth

In a non-*In Nominated* world, the legends around the mirror may still include an angel of truth giving its life to save someone who sought purity. Or there may be mystical orders which delve into the Illuminated truths of the world, and use this enchanted mirror to see within a person's soul. It reflects the true nature of a human, as above, and sees through all disguises -- even (or especially) magical illusions. (Self-hypnotism, so that one *believes* one is what one pretends to be, is a possible counter for the mirror. The images it reflects of someone so deluded might be enigmatic.) If werebeasts or spirits come within range of it, they will be automatically revealed only if they are on the road to changing their state somehow -- lunar cycles may reveal the other-form of a were-creature just before a change hits, for example. Non-humans in human form may also be reflected truly if the mirror's holder murmurs the appropriate incantation and pays a cost in magical energies (Fatigue in *GURPS*, Gnosis or Willpower in *Werewolf: The Apocalypse*, etc.).

Soulbreaker

Once there was a Calabite, one of the Destroying demons, who was a Marquis of Lust. His name is not important, and might even be dangerous to know. He had a talent for violence, and sex, and combining them, and the Prince of Lust sponsored him to Lucifer for the Word of Pleasure From Other's Pain. However, when the Lightbringer visited this Marquis, the demon had other ambitions. The Word he asked for -- and received -- would most concisely translate as "Snuff Films" (save that there were no such things when this happened).

Needless to say, the Prince of Lust was not entirely pleased by this turn of events. Andrealphus is an Impudite, and Impudites hate to see humans wasted by death. So the Marquis lost the favor of his Prince, and eventually . . . well, it might have been merely a Servitor of the Game trying to meet quota, but the Demon of "Snuff Films" was accused of plotting treason against his Prince and taken to the dungeons of Hades. Andrealphus shrugged his sinful shoulders and did not speak in the Marquis' defense, and so the Calabite was sentenced to death.

However, Asmodeus and Andrealphus do not get along well. Asmodeus had no wish to do the other Prince any favors by ridding him of a Word-bound who did not please Lust. So instead of merely killing the Marquis, the Prince bound him into a sword. The sword-Demon of "Snuff Films" was stripped of any ability to resist the will of whoever held it, and any way to communicate of its own volition.

Soulbreaker had a long and terrible -- if not very distinguished -- career as Asmodeus' favorite weapon. But in the battle with Makatiel, Renegade Prince of Disease, it was broken. The missing piece (the blade's phallic point) was never recovered, and while Asmodeus attempted repairs . . . it just wasn't the same. He presented it to one of his underlings, who eventually gifted it to one of his minions, and so on, until it was thoroughly lost. Who knows where it might turn up now?

In appearance, Soulbreaker is a blunt-tipped, heavy broadsword, a little short and off-balance from its breakage. The crosspieces are, indeed, suggestive of the blade's Lust-demon heritage. Only those with a Strength of 11+ can wield it with any grace (subtract 2 from Accuracy for every point of Strength below 11), but it is still a vicious weapon, with Power +7. Its true threat to celestials is that it does Soul Hits *equal* to Body Hits, and it will strip Forces. The only requirement is that the last Force before soul-death can only be claimed by a thrusting attack (at -5 to skill; the tip is blunt and more inclined to bruise than stab).

Other Soulbreakers

Soul-eating swords are, alas, common in many fantasy settings. Soulbreaker is really one of a horde without its demonic origins. Of course, it might get more interesting if the sword's owner exuded a dark charisma, drawing the interest of those around him (or her). Inflicting bloodlust or berserker rages on the owner is hardly necessary for appropriate evil, since the only way to become the owner is to use it to kill the victim one is having sex with, at the moment of one's own climax. Merely using it in battle won't have any ill effects -- except a tendency toward dreams of the ritual above . . .

(In *GURPS* terms, Soulbreaker should be considered a very fine (p. B74, sidebar) bastard sword (p. B206), with a Minimum ST of 15! It has +5 to damage, above and beyond the +2 for a very fine weapon.)

Weeping Wounds

When the tip of Soulbreaker snapped off, it was lodged within the form of the Demon Prince of Disease. As the Renegade Prince tried to escape, the tip was thrown free . . .

There are many stories about which notable blacksmith found the blade, and how he (or she) re-forged it into a greenish bladed dagger. The truth doesn't matter -- Weeping Wounds' power works without incantations or intent.

Whenever the dagger does even a hit of damage (in celestial, ethereal, or corporeal combat!), the wound it deals never truly heals. It may seal over, but the infection remains, and eventually will break through and ooze. Blood poisoning is almost inevitable; treat as a Strength/3, Speed/1 disease (p. 124 of the *Corporeal Player's Guide*) which will not heal! The Corporeal Song of Healing or appropriate Medicine rolls will cure the hits, but the infection merely lies dormant for a week or so -- and then returns. Only a Superior can remove the dagger's taint.

Celestials are less affected -- the infection is unlikely to *kill* their vessels. Still, they suffer a variant of the Stigmata Discord, but with a pus-weeping wound instead of a bloody one. As above, only a Superior's attention will remove the infection entirely.

Holding the weapon is not terribly dangerous, save for an increased tendency to catch colds or whatever minor flu bugs are going around.

Other Weeping Wounds

Again, a traditional weapon which deals out a "never-healing wound," though not one which will cause the victim to die from blood loss. (Blood loss is too *quick*.) The cure will require not just magical healing, but holy magical healing! (GM's option as to what counts as "holy.") Otherwise, it just keeps coming back. Modern medicine may decide that it is some new form of AIDS or cancer, and attempt to treat it as such . . .

Pyramid Review

War! Age of Imperialism

Published by [Eagle Games](#)

Designed by Glen Drover

Boxed wargame; \$49.99

War! Age of Imperialism is a game of Grand Strategy set during the Colonial Expansion period of the 19th century. It is very much in the spirit of the old Gamemaster series by Milton Bradley (*Axis & Allies*, *Shogun*, etc.) much loved for its ease of play as well as the little plastic pieces that have coaxed many a non-gaming friend into playing. Fans of that series should definitely check out this game.

The box itself is well-illustrated and the box's contents live up to its promise. The board is large with ample room for the pieces (no crowded piles of little men here) and is as much a work of art as it is a functional playing board. The rules and all supporting documentation are nicely printed on good quality paper and card stock. There are over 800 pieces, including European infantry (modeled after Zulu War British), cavalry, and artillery, tribal infantry (Zulus) and cavalry (Middle Eastern) as well as leaders, explorers, ships, and engineers. It also includes buildings such as ports, cities, schools, factories, and forts. The military units are in 1/72 scale to enable easy supplementation with other miniatures.

The rules themselves are broken into basic, standard, and advanced games. Games with graduated levels of complexity are not uncommon; however, in this case the more advanced rules are not simply additions to the basic rules. Each level changes the way the game is played so that there are almost three different games. For example, each has its own combat system. There is enough continuity, however, that playing more basic levels of the game still gives familiarity with the system and can be used to move non-gaming friends into increasingly more advanced play. The rules are clear and well written, and also comprehensive while remaining an easy read.

Game play is fast-paced, with the turn passing from player to player fairly quickly. The system allows the players to each move and fight (or explore) in turn once, then again, before tallying money and making purchases. This feature of having one simultaneous purchase round every two movement rounds slows the game to a pace more realistic for the era than the traditional purchase-every-turn method would. Since losses are not quickly replaced there are no blitzkriegs, but rather more careful planning and maneuvering to acquire particular territories.

The game begins with the players each having four to ten territories (depending on the number of players). The rest of the territories each contain two hidden markers -- a native strength marker and a resource marker. Explorer pieces can enter these territories and flip over the markers displaying the natural resources available (many territories will have none) and the strength of the natives (a number from 4-12). The explorer then rolls two dice to see if the natives can be coaxed through diplomatic means to join the empire. A roll equal to or greater than the native number means the territory capitulates and joins the empire. A failed roll equals a dead explorer. Any resources in the area may or may not become available as income immediately depending on which level of rules is being played. A player may decide to invade the territory and reduce it by force, but the natives can be extremely strong and this is only done after careful planning.

The role of buildings in the game is hard to describe in general terms, since they change significantly at each level. In all the levels, however, buildings generate income and are required to place certain units. In the basic game, that's about it. In the advanced game, however, the rules are more subtle and elegant. For example, the amount of income each port produces is based on how many other ports the player has. Another example is that a railroad gets points

based on how many cities, factories, ports, and resources it joins. Since only one building is allowed per territory (except forts which generate no income, but can be placed anywhere) good long-term planning is required to make optimum use of them.

Combat is quick and simple, with each level of rules having a different system. In general they all include both attacker and defender rolling dice (2d6), and adding bonuses with the loser removing a piece (his choice or opponent's choice depends on the level of play). The standard and advanced rules are vastly more satisfying as there is a bonus for having combined arms. For each of the four arms (infantry, cavalry, artillery, leader) that a side has present at the battle, that side gets a +1 to the dice roll. They also both include technological advancement bonuses, with the advanced rules being far more complex at this point than the regular.

War! Age of Imperialism is a truly good game. It does, however, have its downsides. First is a need for more scenarios. Only one is included in the game. Without these, setup is totally unrestricted and can feature empires based in West Africa exploring the wilds of France. The game doesn't actually produce the situation of the 19th century, which was an industrialized Europe sending out armies and products to colonies that are never up to the same industrial level as the homeland. The game also needs to have more concrete victory conditions. Neither tallying regions controlled after a preset number of turns or after a certain passage of real time (as in the basic and standard game) nor the more complex tallying of points based on regions, buildings, and pieces in the advanced game is as satisfying as driving toward a more distinct goal. A final downside to the game is that the basic game is really too basic for most gamers and should really only be used as an introduction to the game, played through a few turns. The lack of combined arms and technology bonuses renders the European battle advantage nil. This makes most of the native territories incredibly powerful and pushes the Europeans to fight each other over those territories that were weak enough to surrender to an explorer.

Game designer Glen Drover has done an excellent job with this game. It is a lot of fun. The flaws are easily corrected with house rules (and what gamer would be comfortable without a few house rules?) and the promised future supplement (if this game sells well enough) should cure most of these ills. It is to include a map expansion (adding the New World), two more players (up to 8), random event cards, optional rules, more scenarios, and other features. It would also make a good strategic game for a colonial miniatures campaign. It is definitely recommended.

Pyramid Review

Dinosaur Planet: Broncosaurus Rex (for d20)

Published by [Goodman Games](#)

Written by Joseph Goodman

Illustrated by Tim Burgard, Derek Schubert, V. Shane, Walter Stuart, David Wong and Thomas Yeates

96 pages; \$20.00

Take one part Old West, one part American Civil War, and inject both into the big fleshy parts of a dinosaur or two, before adding a heavy sprinkle of space going Science Fiction and plugging this soggy mixture into the *d20* System, and what have you got? Cowboys and dinosaurs and . . . Oh my! Or rather *Dinosaur Planet: Broncosaurus Rex*, a new *d20* system setting that returns to the genre last visited by *GURPS Dinosaurs* and GDW's *Cadillacs & Dinosaurs RPG*, based upon the comic *Xenozoic Tales* by Mark Schultz.

The setting for *Broncosaurus Rex* is Cretasus in the year 2202. Cretasus is a large Jupiter-sized planet with an Earth-like atmosphere and climate, as well as being only a 1-G world. Twenty large valleys, each with different range of flora and fauna last seen when dinosaurs walked the Earth; dominate the planet's surface. Further, many of the dinosaur species are intelligent enough that they can be domesticated, trained as riding beasts or even form tool-using tribes of their own. No single political faction dominates Cretasus, though because of its abundant mineral and biological resources, both the Federal Union of Planets and the Confederate States of America would like to do so.

Although it is not made clear initially, *Broncosaurus Rex* is actually set within the future of an alternate history. The American Civil War ended in stalemate and a long cold war, with Abraham Lincoln having been assassinated two years before he could make his emancipation proclamation at Gettysburg -- although the Confederacy did free their slaves in 1881. Later it was the more adventurous nature of the Confederacy that landed a man on the Moon and the rivalry between North and South that was the War Between The States became the War Between The Planets, with both fighting for possession of the Martian colonies. When the Union discovered the first Warp Gate, both sides rushed to explore the worlds found beyond and establish more colonies.

Unfortunately, the Confederacy found itself stretched too thin defending both its territories at home and off world. Before it could be fully conquered by the Union, all those that could, made the great exodus, fleeing to their colonies in as many ships as they could. It is their stubborn nature and their ingenuity that has kept their many colonies from being taken in the face of Union industrial might and technological superiority. On Earth, the Union absorbed the other nations into the Federal Union of Nations, though some -- like the United Kingdom, France, and China -- resisted but also fled. Without colonies of their own, they each formed roving fleets of city-sized ships, now known as the Free Fleets.

One problem with *Broncosaurus Rex* is that you do not really learn that it is an alternate history until you are several pages in, which does leave you scratching your head. Fortunately, once you get to this point and beyond, the author's style is engaging and really gets you into the spirit of the setting. That said, he does show a decided bias throughout towards the Confederacy. Despite the book looking a little thin, there is little wasted space and the artwork is pretty good, especially the dinosaurs by Tim Burgard. One major omission, since this introduces the setting, is the utter lack of a map of Cretasus.

Despite the over-arching science fiction setting, which in *Broncosaurus Rex* is barely discussed, the action is set mainly on Cretasus. Further this is purely a human-centric game; in other words, not an Elf, Dwarf, Halfling, or other funny-looking pointy-eared freaks in sight. Characters are all human, and while there are aliens out there in explored space, they do not appear on Cretasus. And anyway, it is inferred that they would appear as NPCs rather than for use as player characters. Instead of "Race" and Class being the difference between characters, it is "Place of Origin" and Class that make the difference. Because all characters are human, they do not gain the extra feat that they would in the basic *d20* System.

Players select their Place of Origin from a choice of Confederacy, the Union, and the Free Fleet, as well as a fourth, Offworlders, who are characters that hail from primitive worlds along the frontier. Each origin provides feats or skill bonuses, as well as determining what level of technology a character has access to. A Confederate character gains an extra feat to reflect their individualistic heroism, a bonus to their animal skills from their rural upbringing, start with an heirloom weapon; while they have limited access to technology, it is invariably well-made and of decent construction. Union characters have easy access to high technology, though it is mass-manufactured and of poorer quality, start the game with extra skill points to reflect their education, have bonuses to their intelligence and Use Equipment skills. Union characters also have access to Ironclads, powered armor suits based on plundered alien technology, which are unfortunately not specifically detailed in this book. Powered armor is given, but whether that is what is known as Ironclads is not made clear. As the setting's premier merchants, Free Worlders have bonuses to their Appraise and Knowledge skills, decent access to technology, and a Dexterity bonus. Given their frontier origins, Offworlders have poor access to technology, receive bonuses to their Strength and Constitution, as well as their Wilderness Lore and Intuit Direction skills, but penalties to their intelligence and charisma.

In addition to dropping the fantasy races, none of the classes from the *Dungeons & Dragons Player's Handbook* appear in *Broncosaurus Rex*. There are six new classes, which include the Bronco Rider -- dinosaur herders, riders and trainers that are capable of fighting from a mount; Machinists, able to construct, alter and use items of technology, including modifying weapons to give them damage and targeting bonuses; Soldiers, whose feats concentrate on tactics and strategy to gain advantages over their opponents; Spies, which are the equivalent to Rogues, but orientated to getting information of people without their knowledge through slip of the tongue, in addition to being able to dodge bullets and generally be lucky; Soldiers, Two-Fisters, who aren't disciplined fighters like Soldiers but instead are better at street-fighting and -- because they come from similar backgrounds -- better at getting information out of the locals; and finally there are the Wild Ones. These are those that find themselves more at home in the wilds, finding companionship with animals, including dinosaurs!

Broncosaurus Rex, like any other *d20* system setting book, reworks and adds skills and feats. Most of the skill reworking is an updating to a more modern setting, such as Alchemy to Chemistry, and both Animal Empathy and Ride to apply to dinosaurs also. New skills include Ciphers, Drive, Operate Ironclad (available to Union Machinists and Soldiers only), and the key to using any high tech gear, Use Technical Equipment. The weapon feats include Manual, Ballistic, High-Tech, and Alien. With the High-Tech Weapon Proficiency, a character can use the energy guns in the game, including sonic, laser, plasma, freeze, and gravity types, whereas the Alien Weapon Proficiency requires a player to list a specific weapon that they can use. Other feats include Dinopathy, which allows rudimentary communication with dinosaurs through body language and +2 to the Animal Empathy skill for dinosaurs, while the Dinosaur Presence gives a character personal magnetism with dinosaurs. While many of the other feats are general, there are plenty that are specific to confederate characters only. These include Great Lover, Gentry, and Rebel Yell, yet while these allow a player to better roleplay a confederate character, it is a great shame that there are none given for characters of other origins. Perhaps the potential *Broncosaurus Rex* referee should raid other *d20* system sourcebooks for such feats; I can imagine that the recent *Dragonstar: The Starfarer's Handbook* from Fantasy Flight Games would be useful in this regard.

The major difference in technology between our own and that of *Broncosaurus Rex* is that digital technology, and thus the computer was never developed. Also, FTL travel remains a province of unknown alien races, with humanity traveling at sub-light speeds. The suggestion is that technology is heavy, clunky, and that the cog is highly prevalent. One problem is that none of it is illustrated, barring the laser sword wielded by the dino rider on the front cover. The setting has tech-levels, which act as a guideline as to what tech a character has access to. Most of the equipment in *Broncosaurus Rex* is a long list of fun guns. These range from the humble .45 calibre pistol through narrow and wide

beam lasers, to truly deadly alien weapons such as the Annihilator (an antimatter rifle), the Dust Gun, the Disintegrator (which includes rules for taking out limbs), and the Chimera, which disrupts the targets DNA with bursts of radiation! Thankfully, for those who do lose limbs to the Dust Gun, *Broncosaurus Rex* includes rules for bionic replacements. All energy weapons are powered by power packs, and in some cases provide just enough for a single shot with some of the more extreme weapons. Likewise, energy packs power a range of Energy Field Armours, which are more effective against energy weapons, but can be stacked with the various normal types of physical armor. The remainder of the equipment section lists various weapon add-ons, tools, and items useful in riding and training dinosaurs, before looking at bionics and robots.

The chapter on dinosaurs lists over twenty of these beasts, but not as monsters. No, in *Broncosaurus Rex* they are creatures of varying intelligence such as the Parasaurolophus, with an Intelligence of 2 that is herded by ranchers for their meat, to the Protoceratops, with an Intelligence of 14 who act as the diplomats amongst Cretasus' dinosaurs. It is the Velociraptor -- or more correctly the Deinonychus, which the author points out has been popularized by a certain dinosaur movie as the Velociraptor -- that gets the most coverage, as they can be written as full NPCs with levels as warriors, shaman, and tacticians. As written, the player characters can interact with most of the intelligent dinosaurs and some tribes even take alliances with humans and trade with them for weapons. Besides describing each dinosaur in combat and the nature of their society, each entry also tells what by-products can be harvested from each species, from organs to bones and eggs, as well as how difficult it is for someone to actually train them as riding animals.

The last chapter in *Broncosaurus Rex* is slim, but provides some basic adventuring ideas for gaming on Cretasus. This is essentially an examination of the motivations for the various factions on the planet, including both humans and dinosaurs. It is rounded out with a hundred adventure ideas, which although no more than a line or two each, should help the referee get started.

Broncosaurus Rex is something very different for the *d20* system -- a pulp adventure game that in places uses the rules to enforce some cultural background. It is a real shame though that this enforcement is geared totally in favor of Confederate characters and against those of Union origins. Cretasus presents plenty of scope for Old West style adventure, although referees wanting to take their game off-world should look at *Dragonstar: The Starfarer's Handbook* for the rules, if not the setting. For that I would suggest possibly the *Cities in Flight* series by James Blish and the merchant ships from Robert Heinlein's *Citizen of the Galaxy* as inspiration for Free Worlder characters and adventure.

If you are a fan of the *d20* system, but want a change from the fantasy of *Dungeons & Dragons*, then *Broncosaurus Rex* really will offer you that change. It has something for everyone -- cowboys and dinosaurs and big guns, but most of all, "Yeeee-Haaa" fun!

--Matthew Pook

When Spacefleet Won't Return Your Phone Calls

I'm not here.

This column is being written mere minutes after last week's installment, because, as foretold last week, I'm home. (At least, I *should* be. If Mothra crawled out of the sea and destroyed Ft. Lauderdale in the past seven days, my fate may be up in the air. But hopefully Gamera will save us; Gamera is friend to all children.)

And, for all I know, everything may be falling apart.

The *Pyramid* [message boards](#), unread and unmoderated by me in days, could be awash in off-topic posts, flame wars, and bawdy limericks about me. A screaming mass of angry subscribers may be marching on Austin now. An evil doppelganger may be impersonating me in the chat rooms . . . um . . . idling evilly. I wouldn't know.

Which leads me to one of my favorite dirty GM tricks: leave the kids unsupervised.

Many (if not most) campaigns have some sort of hierarchy; *Vampire* has its feudal Prince system, *Star Trek* has captains and admirals, and even most gaming groups have a party leader or spokesman. After a while most teams come to value and trust their hierarchy, patron, or other guiding hands . . . they even come to rely on them. Which makes them ideal, of course, to be taken away.

It's a technique I've used multiple times, and each time has been successful. (Or, at least, my players have never stabbed me in frustration from this plot device . . .) For example, in our long-running *Fading Suns* game, I was taking over as GM for a year-long storyline. Ordinarily my character was a noble and the team leader, and for the first part of the storyline he still was. But then he was seemingly killed in the second adventure, leaving the other two players on their own in the middle of an epic adventure. Oh, and my now-gone character held certain secrets and knowledge of their overall mission that the other characters didn't have. Good luck!

Done properly, taking away the group's supervision is a great way to really mix things up in a campaign.

What happens if the starship captain is sent by Space Command to a crucial planet to await further orders . . . only to find their communications cut off once they get there?

What if the Vampire Prince leaves the city, and a problem erupts that (seemingly) only he can handle?

What if the heroes are given ceremonial control of a fantasy fair, city, or kingdom . . . and the person who would relinquish that control immediately dies or disappears?

What if, in the middle of an assignment, the espionage group finds evidence that its agency has sent its agents on a seeming suicide mission? And now the agency is trying to establish contact to see how things are going . . .

Removing that cushion of hierarchy can really challenge heroes (and their players), making shy characters act in leadership roles, pushing followers into making command decisions, and forcing groups to make the best of an ugly situation.

Now, the biggest problem (in my experience) is getting rid of that supervisory helping hand. After all, if they're so powerful, cool, and all-wise, why are they leaving the heroes in the lurch?

Well, here are some ideas.

- **The supervisors are still around, but unavailable.** If the Magic Talkie Box you use to communicate with the homebase is eaten by rats, then your options to get in touch with them are limited. This option is so common it almost goes without saying . . . but it's always a good idea to mention the classics.
- **The supervisors are around, but they can't be trusted.** If the heroes are in the course of investigating

something serious and discover evidence (or seeming evidence) that their own Patron may be behind it, this can effectively sever ties with their Patron.

For example, the group is given a mission by their Patron. During that mission they're attacked by agents (ideally suicide agents or other non-tale-telling folks); afterwards the heroes acquire evidence that their own Patron may have sent the agents to attack them!

Well, now the heroes have a conundrum; do they continue their Patron-given mission, hoping that all will be revealed? Do they start investigating the Patron? Do they confront the Patron with the evidence of their attack?

- **The supervisors have a mission that requires them to cut contact.** This can be a more "upfront" version of using this plot device. For example, if Spacefleet Academy believes they have been infiltrated, the heroes might be given a mission to enter the organization incognito, and given specific orders *not* to file reports or make contact until after the matter is resolved.
- **The supervisors have a mission that requires them to cut contact *without* the heroes knowing.** This can be especially appropriate if the supervisor *knows* the heroes will act a certain way if they know all the facts. For example, if a selfless wizard patron is dying of a strange illness, and he sends the heroes on a quest to retrieve a magical cure-all spell scroll that will save the inept King's life (because that is the good thing to do), he may well disappear abruptly and without warning to remove the temptation of having the heroes use the spell on him.
- **The supervisors are evil!** Whether suffering from a temporary bout of Space Madness or part of the Evil Überconspiracy, the supervisors may set up the heroes in a difficult situation, then leave them in the lurch.
- **The supervisors are unable to help, and unable to say they can't help.** This can be especially appropriate if the supervisors have supervisors, is forced into silence by a curse, or is simply honor-bound in this circumstance to withdraw aid.

Of course, the best technique may depend on your campaign, and mix-and-matching these ideas (or coming up with something entirely different!) will probably provide the best results. For example, the heroes may be (unknowingly) set up by the patron for a crime they didn't commit, in the hopes they will be able to uncover a sinister plot brewing the prison they will be sentenced. Fortunately, one member of the party knows the full story, and will be able to tell the heroes at an appropriate time. Unfortunately, that member is killed in a prison riot shortly after getting there, leaving the heroes alone and uninformed. Hilarity ensues . . .

There are probably two big challenges in creating and running this kind of adventure. First, without the usual guidance of their supervisors, such adventures generally need to be much more open-ended; you can't rely on the out of having a nudging hand push the heroes along.

Second, and perhaps more challenging, you probably want to craft the adventure such that there is minimal bad blood between the advisors and the heroes once the matter is resolved. And you need to prepare for the possibility that the heroes will feel betrayed and abandoned . . . perhaps enough to break ties with the supervisors altogether. If you aren't prepared for the possibility of the heroes breaking ties with Spacefleet Academy and forging their own destinies, you may not want to run one of these adventures.

This second challenge is pretty big, and there's enough involved that I might write another column about it at some point.

But not today.

Because I'm not here.

--Steven Marsh

*Last week's answer: **Once Upon A Time** (Second Edition), instruction booklet p. 7.*

*(Three stars) "When the white light strikes the victim, he (or she) screams horribly -- a long, drawn-out wailing scream. As your vision clears, an image of the character, pale and ghostly, streams out of the body and toward the **Soul Gem** getting smaller the nearer it gets."*

Beyond Contagion and Remove Disease

Optional Disease Rules for d20

by Daniel Bronson

Lara stood with her companions at the top of a small rise, looking down at the cluster of houses nestled in the valley below. A column of thick, black smoke could be seen at one end of the village, and as it grew the wind blew it towards the small band of adventurers. The smell was sickeningly familiar by now: burning human flesh. They had seen the same thing at the last three villages they'd come across -- where the sickness passed there were too many dead to bury.

The sound of a brutally violent cough shook Lara from her memories. She glanced back at the terribly weakened man in the make-shift travois, his coughing fit fading. He'd been a powerful warrior just days ago, riding tall and proud, but where the sickness passed . . . Even if a priest could be found with the power to cleanse someone of the disease, he'd never be able to save the hordes of deathly ill people Lara had seen over the last few days.

There had to be some other way to stop the sickness. There had to be.

In most fantasy games, disease is often seen as little more than one more way for a creature to cause damage and one more thing to be magically healed. Throughout history, however, real-world infectious diseases have decimated civilizations, turned the tide of wars, and killed millions upon millions of people. Used properly, these completely mundane illnesses can add large-scale danger and suspense to any adventure. The following is a variant disease model for **d20**. A list of several diseases, each fit to this model, has also been provided.

At the core of any infectious disease is its agent. Just as with PCs, the characteristics of the agent determine how effective it is. These characteristics include the agent's infectivity, pathogenicity, and virulence. Infectivity refers to the ability of an agent to enter and multiply in a susceptible host, thereby producing infection or disease. The higher the infectivity, the more likely someone who is exposed to the disease will actually become infected. Pathogenicity refers to the ability of the agent to cause symptoms in the infected host. The higher the pathogenicity, the more likely someone who is infected will develop symptoms of the disease. Virulence refers to the severity of the disease the agent produces. The more virulent an agent is, the more life-threatening the disease it produces. These three aspects are reflected by the Infectivity, Pathogenicity, and Virulence Difficulty Classes (DCs) for each disease.

At the end of a day during which an adventurer is exposed to a disease agent she must make a Fortitude saving throw against the agent's Infectivity DC. The Infectivity DC is equal to the Base Infectivity DC from Table 1: Disease Characteristics plus an exposure modifier, if one applies. If a disease has an exposure modifier it will be listed in the write-up of the disease. Only apply the least advantageous exposure modifier to the roll, and only make one Fortitude saving throw against Infectivity per disease per day. A successful Fortitude save means that the adventurer did not actually become infected with the disease, despite her exposure.

If a character is infected, another Fortitude saving throw is made, this time against the agent's Pathogenicity DC. Success means the character, though infected, will not become sick. If the character fails this saving throw, the incubation period, length of disease, and period of communicability are rolled. As soon as the incubation period has passed, the sick individual begins making Fortitude saving throws against the agent's Virulence DC once per day she has the disease (as determined by the length of disease roll). A critical success -- natural 20 -- acts as a successful save for the day rolled and for the next day as well. A successful save means the person takes either no damage or, if the disease is invariably fatal without magical intervention, half damage. A failed roll means she takes the damage listed. A critical failure -- natural 1 -- means she takes double the damage for the day. All attribute damage, regardless of the

roll, is temporary. If someone uses the Heal skill, their skill check can be used in place of the saving throw against the Virulence DC for the day. If the DM so chooses, a successful Heal skill attempt can also be used to diagnose these diseases.

If someone survives through the length of the disease she will begin to recover . . . in most cases. It should be noted that, barring magical intervention, three of the diseases listed below are always fatal: pneumonic plague, rabies, and *Naegleria fowleri*. For these three, anyone who survives through the last day of the disease will die at the end of that day.

It should be obvious by this point that a DM must use caution when introducing one of these diseases into a campaign. PCs should have a respectable chance of surviving, be it through the use of intelligent precautions, mundane healing, or magical cleansing. Although quite an adventure could come of the party's attempts to find a cure for one of their stricken fellows, it may be more interesting to put them up against a disease they can likely survive but that ravages an entire countryside, or even an entire country. Priests will be unable to heal everyone, and in theory those who have been magically cured are still at risk for falling ill again.

As a further note on the subject of magical healing, even if a disease normally leaves survivors with some form of immunity, a magically cured person's immune system may never have the chance to create that immunity. It would be the DM's call as to if the infected individual had been sick long enough to develop immunity. On the other hand, a magically cured person will immediately cease being a carrier for the disease.

The ten diseases described below are directed largely at humans, but feel free to inflict them on any race. The information provided has been simplified somewhat, so it is neither exact nor complete. If you want more specifics, check out the following:

- [The Center for Disease Control and Prevention \(CDC\)](http://www.cdc.gov/health/diseases.htm) website offers excellent information on most diseases. Try www.cdc.gov/health/diseases.htm for starters, or go directly to their main page at www.cdc.gov and run a search for the disease you are interested in.
- *The Coming Plague: Newly Emerging Diseases in a World Out of Balance*, by Laurie Garrett. This book has loads of great material on multiple infectious diseases. It's full of stories and details that could really spice up DM descriptions.
- *Control of Communicable Diseases Manual* -- The American Public Health Association puts this book out every few years. It is an amazing resource for anyone wanting information on just about any communicable disease, but the terminology can get a bit thick at times.

The Disease Template

- **Transmission:** This is the means by which the disease is transmitted.
- **Reservoirs:** This is where the disease agent normally lives.
- **Incubation period:** This is the amount of time between infection and the onset of the disease symptoms.
- **Symptoms:** These are the changes seen in a person that indicate she has a disease.
- **Length of disease:** This is how long the character will be sick.
- **Period of communicability:** This is the time slot during which the infected character can pass her disease on to others.
- **Prevention:** These are means by which characters can attempt to avoid contracting the disease.
- **Immunity:** This is information on whether or not an individual who survives the disease will then be immune to the disease.
- **Exposure modifiers:** These are the modifiers that can be applied to the Base Infectivity DC, depending on how the character was exposed to the disease.

Cholera

Historically, cholera was confined to India until the early 19th century, at which point it spread throughout Asia.

During the 20th century it was dispersed across the majority of the globe. It is caused by the bacterium *Vibrio cholerae*. Once an individual has been infected, the bacteria generate toxin that results in severe diarrhea. This sudden loss of fluids and electrolytes can often be fatal.

- **Transmission:** Ingestion of food or water that is contaminated with the feces or vomit of an infected individual can lead to infection.
- **Reservoirs:** Humans. Evidence also suggests that plankton can occasionally serve as reservoirs.
- **Incubation period:** 1d4 days.
- **Symptoms:** Sudden and profuse watery diarrhea, from 12 to 20 liters (about 3 to 5 gallons) a day. This will cause severe dehydration and can lead to shock, collapse, and often death. Violent vomiting may also occur.
 - Any attempts to use the Heal skill to treat cholera must include rehydration!
 - In order to stop the diarrhea, remove disease would need to be followed up by neutralize poison.
- **Length of disease:** 1d4 days.
- **Period of communicability:** During the course of disease and for 1d4 additional days after recovery.
- **Prevention:** Wash hands, boil water, and dispose of human feces in a sanitary manner.
- **Immunity:** Infection provides some immunity against future infection by a similar strain. It is possible for someone who has survived a previous infection to contract cholera a second time from a different strain. (The Base Infectivity DC drops to 10 for individuals exposed to a strain they have been infected with before.)
- **Exposure modifiers:** None.

Ebola Hemorrhagic Fever

Ebola is a very severe, and often fatal, viral disease seen in humans and monkeys. The agent is called the Ebola virus. Some aspects of the disease, such as its natural reservoir, have yet to be figured out. What is known is that when the disease strikes, it does so incredibly quickly. It transmitted very easily from person to person, but it can sometimes kill an infected individual so swiftly that they don't have a chance to pass the disease on. Since this limits the survival of the virus, it is felt that Ebola has not had a chance to evolve such that it makes better use of human hosts. This means that humans are currently accidental hosts for the disease rather than normal pieces of the virus' life cycle.

- **Transmission:** Direct contact with the blood or secretions of an infected human will transfer the virus. It is likely that the same transmission mechanism takes place between some animal and humans as well.
- **Reservoirs:** Unknown. There is likely a jungle animal that acts as a reservoir for the virus, but it has not yet been identified. Possible culprits include bats, rodents, and insects.
- **Incubation period:** 2d10 days.
- **Symptoms:** Sudden onset of high fever, tenderness or pain of the muscles, headache, stomach pain, fatigue, and diarrhea followed by sore throat, rash, red and itchy eyes, vomiting blood, and bloody diarrhea. Later symptoms can include bleeding, chest pain, blindness, and shock.
- **Length of disease:** 1d6 days.
- **Period of communicability:** Risk of transmission is highest during the late stages of illness when the patient is vomiting, having diarrhea, or hemorrhaging. Risk during the incubation period is low. Virus can be present for weeks (7) after recovery in some secretions.
- **Prevention:** Avoid contact with the blood or secretions of an infected person.
- **Immunity:** Surviving Ebola may provide some immunity against future infection. (The Base Infectivity DC drops to 10 for individuals who have survived Ebola in the past.)
- **Exposure modifiers:**
 - Use the Base Infectivity DC if the PC comes in contact with the blood or secretions of an infected individual who is either still in the incubation period for the disease or who has just begun to show symptoms of the disease.
 - Add 10 if the PC comes in contact with the blood or secretions of an infected person in the late stages of the disease.

Influenza

The specific virus responsible for many influenza epidemics, and all of the pandemics, is the influenza A virus. Several influenza pandemics have occurred over the course of history, thrice in the last 100 years. Two hundred million people were infected, and 20 million died, during the Spanish Flu pandemic of 1918. Subsequent pandemics in 1957 and 1968 were responsible for over 1.5 million deaths worldwide.

- **Transmission:** Airborne viral particles are inhaled or are picked up off of contaminated surfaces and are placed in the nose or mouth. These particles come from infected humans and pigs. Infected birds can infect pigs, but they can't infect humans.
- **Reservoirs:** Humans, pigs, and birds.
- **Incubation period:** 1d3 days.
- **Symptoms:** Fever, headache, prostration, profuse bloody nose, sore throat, and cough. The cough is often severe and protracted, but other manifestations are usually self-limited.
- **Length of disease:** 1d6+1 days.
- **Period of communicability:** 1d4+1 days from onset of symptoms.
- **Prevention:** Wash hands, avoid those who are infected.
- **Immunity:** The virus mutates constantly, so previous infection does not provide immunity.
- **Exposure modifiers:**
 - Use the Base Infectivity DC if the PC is exposed to an infected human or pig.
 - Add 5 if the PC is exposed to an infected human or pig in a closed or crowded area.

Malaria

Current estimates are that malaria affects some 300 million people worldwide each year and causes from 2 to 4 million deaths. There are four different protozoans that can cause malaria, but this model focuses on the deadliest of the four: Plasmodium falciparum. Transmitted by mosquitoes, malaria has plagued mankind for centuries. It is said that the Countess d'El Chinchon, wife of the Viceroy of Peru, fell ill with malaria in 1638 but was cured by the bark of certain trees. These trees, later called cinchona, are the source of quinine, an antimalarial drug still occasionally used today.

Interestingly, the less deadly varieties of malaria were eventually used to cure syphilis in the days before antibiotics. The high fevers of malaria would kill the bacteria causing the syphilis, and then quinine would be used to cure the malaria.

- **Transmission:** A mosquito is infected after feeding from a person with malaria. When that mosquito later bites someone else it can infect them with the protozoan.
- **Reservoirs:** Humans.
- **Incubation period:** 1d6+6 days.
- **Symptoms:** High fever, chills, sweats, cough, diarrhea, respiratory distress, and headache may be seen first, and can be followed by jaundice, blood clotting problems, shock, kidney and liver failure, fluid in the lungs and cerebrum, convulsions, coma, and death. Disorientation and delirium may also be seen. The fever may be daily, constant, or irregular.
 - Add a +5 circumstance bonus to any Heal rolls that incorporate the use of quinine. One week of successful Healing checks (one per day) using quinine will end the disease.
 - Individuals who have the sickle cell trait save against a Virulence DC of 10. (The sickle cell trait refers to a human genetic trait that makes it difficult for P. falciparum to invade red blood cells, thereby lessening the severity of the disease. The sickle cell trait can also lead to sickle cell anemia, however, which is a deadly disease in its own right.)
- **Length of disease:** 1d6+2 weeks.
- **Period of communicability:** An infected mosquito remains infective for life.
- **Prevention:** The most useful prevention measure is to avoid being bitten by mosquitoes.
- **Immunity:** Individuals who have survived a bout of malaria are immune for 3 months.
- **Exposure modifiers:** None.

Naegleria fowleri

N. fowleri is an amoeba that lives in the warm, still water of ponds, lakes, or backwater bays. If an individual gets water containing the amoeba up their nose, they risk being infected. After entry into the nose, the amoeba burrows along the olfactory nerve to the brain, where it multiplies.

- **Transmission:** Someone can only be infected if they get contaminated water up their nose.
- **Reservoirs:** Water.
- **Incubation period:** 1d4 days.
- **Symptoms:** Severe frontal headache, fever, and blocked nose. May be followed by altered taste and smell, stiff neck, and pain in the hamstring muscles.
- **Length of disease:** 4 days. Deadly without magical intervention.
- **Period of communicability:** None.
- **Prevention:** Avoid getting warm, stagnant water up your nose.
- **Immunity:** None
- **Exposure modifiers:** None

Plague, Bubonic

The bubonic plague is one-half of the infamous Black Plague that killed approximately a quarter of the entire population of Europe during the 14th century. The second half, pneumonic plague, is described next. Both diseases are caused by the bacterium *Yersinia pestis*, which is carried around by infected rodent fleas that inject the bacteria into creatures they bite. The fleas are generally associated with rats, but they will happily feed off of any mammals, including humans. As with many diseases, epidemics of bubonic plague often begin in villages or cities with poor sanitation. The presence of piles of garbage attracts the rats, as well as the stray cats and dogs, that act as both breeding grounds for the fleas and reservoirs for the disease.

- **Transmission:** Humans can be infected by flea bites, by the bites or scratches of infected cats, or by coming into direct contact with the tissues of infected animals.
- **Reservoirs:** Wild rodents, rabbits, cats and other carnivores.
- **Incubation period:** 1d6 days.
- **Symptoms:** High fever, chills, restlessness, tenderness or pain in the muscles, nausea, headache, sore throat, swollen lymph nodes (called "buboes"), staggering gait, mental confusion, delirium, shock, and coma.
- **Length of disease:** 1d6 days.
- **Period of communicability:** Infected fleas can continue to spread the disease for months.
- **Prevention:** Avoid fleas, infective tissues, and infected animals. At the community level, good sanitation practices will reduce the risk of an epidemic.
- **Immunity:** Surviving bubonic plague provides relative immunity against future infection. (The Base Infectivity DC drops to 5 for individuals who have survived bubonic plague in the past.)
- **Exposure modifiers:**
 - Use the Base Infectivity DC if the PC is exposed to fresh corpses (<1 day old) of those killed by plague.
 - Add 5 if the PC is exposed to the tissues of an infected creature or is bitten or scratched by an infected cat.
 - Add 10 if the PC is exposed to infected fleas.

Plague, Pneumonic

Bubonic plague can progress into pneumonic plague, which can then be spread by air-borne droplets. It is deadlier and more contagious than bubonic plague.

- **Transmission:** Airborne bacteria are spread by infected humans and cats. Inhalation of them can lead to infection.
- **Reservoirs:** Humans and cats.
- **Incubation period:** 1d3 days.
- **Symptoms:** Sudden onset of shaking chill, fever, chest pain, labored and/or fast breathing, and a cough that

produces bloody phlegm.

- **Length of disease:** 1d3 days. Deadly without magical intervention.
- **Period of communicability:** During the course of the symptoms.
- **Prevention:** Avoid exposure to infected animals, particularly cats, and humans.
- **Immunity:** Recovery from pneumonic plague provides immunity against future infection.
- **Exposure modifiers:**
 - Use the Base Infectivity DC if the PC is infected by bubonic plague. This roll is only made once during the course of a bubonic plague infection -- the first day the PC fails a Fortitude save against the bubonic plague Virulence DC. If a PC contracts pneumonic plague by this route, begin using the pneumonic plague Virulence DC and damage, instead of those for bubonic plague, as of the next day. The Length of Disease should be rolled for the pneumonic plague and starts when the PC begins attempting to save against the pneumonic plague Virulence DC.
 - Add 5 if the PC is exposed to infected humans or cats.
 - Add 10 if the PC is exposed to an infected human in a closed or crowded area.

Rabies

Rabies is caused by rabies virus and results in fatal inflammation of the brain. Infected individuals often appear to foam at the mouth. This is because of an increased amount of saliva combined with a difficulty swallowing. Trying to swallow can cause muscle spasms, which has led some people to associate rabies with hydrophobia -- the fear of water.

- **Transmission:** Animal bites transfer the virus, which is found in the animal's saliva. On very rare occasions airborne virus has caused disease. This has generally only taken place in caverns where many bats were roosting.
- **Reservoirs:** Bats, skunks, dogs, foxes, coyotes, raccoons, and cats are all well known reservoirs of rabies.
- **Incubation period:** 1d6+2 weeks.
- **Symptoms:** At first there may be a fever and/or headache that lasts for days, and the site of the bite may tingle or feel numb. Within days the infected individual will show anxiety, confusion, and agitation, progressing to delirium, abnormal behavior, hallucinations, and insomnia. In animals there are two types of rabies symptoms seen. "Furious rabies," typically the kind exhibited by dogs, makes the animal restless and highly excitable, such that they attack anything within reach. The animal will also begin foaming at the mouth. "Dumb rabies" refers to cases where the animal becomes relatively quiet, ignoring its surroundings. It may suddenly lash out, however, if provoked. This form of rabies is particularly common in cats.
- **Length of disease:** 1d8+2 days for humans. 1d6+1 days for animals. Deadly without magical intervention.
- **Period of communicability:** 1d6+1 days before symptoms are seen, as well as while symptoms are evident.
- **Prevention:** Avoid contact with strange animals, particularly those which are acting oddly.
- **Immunity:** None.
- **Exposure modifiers:**
 - Use the Base Infectivity DC if the PC is bitten by a rabid creature.
 - Subtract 5 if the PC is in a cave inhabited by rabid bats.

Smallpox (Variola)

Smallpox has been the source of a great deal of suffering throughout history. Epidemics periodically made their way through Europe, killing thousands of people. During the Middle Ages, an estimated 80% of the population of Europe became infected with smallpox at some point during their lives. In the New World, smallpox decimated the American Indian population on the East Coast when European settlers brought the infection over.

This disease is caused by a virus called the smallpox (variola) virus and is identifiable by the rash it causes. This rash results in scabbing that leaves deep pits and scars on the skin, making survivors easy to spot.

Note: The DM may wish it to be common Heal knowledge that a vaccine can be made from cowpox that will provide immunity against smallpox.

- **Transmission:** Airborne viral particles, spread by infected humans, can cause infection if inhaled. Infection can also be the result of direct contact with a sick individual or with something they have recently touched.
- **Reservoirs:** Humans.
- **Incubation period:** 1d4+10 days to illness, 1d3+1 more days to onset of rash.
- **Symptoms:** Fever, headache, and severe backache, and occasionally abdominal pain and vomiting. The fever drops when the rash begins. The rash is first seen on the face, arms, and legs, and later spreads to the trunk. The red bumps of the rash become blister-like lesions filled with infectious virus. After about a week, these lesions will break open and then scab over.
- **Length of disease:** 1d3+1 days to onset of rash, 3 weeks from onset of rash until all scabs are gone. *Note:* An infected individual stops making checks against the Virulence DC 3 days after the onset of the rash. If she has survived the disease, she begins to recover. The rash and scabbing will run its course even though the individual now feels better.
- **Period of communicability:** An infected individual is most contagious in the days after the illness has begun but before the rash. During this time droplets of the virus are being spread through the air and can be breathed in by others. An infected individual can also infect others by touch after the skin lesions have developed up until the time all the scabs are gone. It is also possible for an infected person to contaminate an object by touching it. Anyone touching such object in the hour after it has been contaminated risks infection.
- **Prevention:** Quarantine those who have the illness, as well as anyone they have been in contact with.
- **Immunity:** Individuals who have previously had either smallpox or cowpox, a mild illness contracted from cows, are immune to further infection by smallpox.
- **Exposure modifiers:**
 - Use the Base Infectivity DC if the PC experiences direct contact with either an individual with lesions or a contaminated surface.
 - Add 5 if the PC is exposed to air-borne droplets contaminated with the virus.

Typhoid Fever

Typhoid fever is caused by the bacterium *Salmonella typhi*. Some people infected by the organism show hardly any symptoms, but people who have been infected by the disease, regardless of whether or not they showed any symptoms, can become carriers who shed the bacteria into the environment. This shedding can continue for months or years.

- **Transmission:** The bacteria are picked up by ingesting food or water that has been contaminated by the feces of an infected human.
- **Reservoirs:** Humans.
- **Incubation period:** 1d4 weeks
- **Symptoms:** High fever, a flushed appearance, nosebleeds, cough, and anorexia will be seen. There is a 25% chance of rose spots appearing on the trunk. Chills, convulsions, and delirium may also occur.
- **Length of disease:** 1d2+1 weeks.
- **Period of communicability:** 1d12 + 2 months following infection -- even characters who succeed their Fortitude save against the Pathogenicity DC for typhoid fever will be able to pass the disease on. If a natural 1 is rolled against the Infectivity DC, the individual becomes a permanent carrier of the disease.
- **Prevention:** Wash hands, boil water, control flies, and dispose of human feces in a sanitary manner.
- **Immunity:** Someone who has been infected by *S. typhi*, even if she never had symptoms, develops immunity against future infection by this organism.
- **Exposure modifiers:** None.

Table 1: Disease Characteristics

Disease	BIDC ¹	PDC	Incubation Period	Length of Disease	VDC	Damage
Cholera	18	10	1d4 days	1d4 days	15	4 Con, 4 Str

Ebola	15	20	1d10 days	1d6 days	20	6 Con, 4 Str

Abbreviations

BIDC Base Infectivity DC

PDC Pathogenicity DC

VDC Virulence DC

¹ The Base Infectivity DC may need to be modified by an exposure modifier.

² For a new pandemic strain of influenza, use a Virulence DC of 20.

³ This disease is fatal without magical intervention.

* Infection always results in symptoms.

** See write-up of disease for details.

Yours Truly, Prester John

"What understanding, if it be not altogether barren or barbarous, can delight itself, reading how a great tower full of knights doth pass through the sea as fast as a ship with the most prosperous wind? and that going to bed a man is in Lombardy, and the next morning finds himself in Prester John's country, among the Indians, or in some other region which never was discovered by Ptolemy, nor seen by Marco Polo?"

-- Miguel de Cervantes, *Don Quixote*

Somewhere, on the borders of fantasy and fraud, is the kingdom of Prester John. In its way, it serves as the gateway to the very Commonwealth of Fiction, since by some measures Prester John may be the first intentionally fictional character in Western literature. In another way, it holds the rear-guard of the Republic of History, as Prester John may be the last footprint of the real world on the road of dreams and desires that leads deep into Fantasy. Either way, or bisociatively both, Prester John lives and reigns over India Ultraterrestria, the half-image on the map just east of "Here Be Dragons." Fortunately, adrift on the foam of the centuries, he still finds time to write.

"If indeed you wish to know wherein consists our great power, then believe without doubting that I, Prester John, who reign supreme, exceed in riches, virtue, and power all creatures who dwell under heaven. Seventy-two kings pay tribute to me. I am a devout Christian and everywhere protect the Christians of our empire, nourishing them with alms. . . . Our magnificence dominates the Three Indias, and extends to Farther India, where the body of St. Thomas the Apostle rests. It reaches through the desert toward the place of the rising of the Sun, and continues through the valley of deserted Babylon close by the Tower of Babel. . . . If you can count the stars of the sky and the sands of the sea, you will be able to judge thereby the vastness of our realm and our power.

-- Letter of Prester John to the Emperor of Byzantium (ca. 1165)

Around 1165, a copy (soon followed by hundreds more) of the Letter of Prester John to the Emperor of Byzantium began circulating through the cities and courts of Western Europe. One of three allegedly sent (the other two to the Pope and the Holy Roman Emperor) by a powerful Christian ruler somewhere to the East, it contained a boastful claim to power over seventy-two kings, a lurid description of a land of preternatural wealth, and a promise of aid against the Saracens -- if the Western rulers could prove themselves worthy. To the intriguing descriptions of a sea of sand and a river of stones, conventional invocations of the Earthly Paradise and the Ten Tribes of Israel, and Biblical depictions of a palace of gems, later writers added fiery salamanders, fierce [griffins](#), [rocs](#) (called Yllerions here), troops of [Amazons](#), and the rest of the delightful medieval mental salad bar. Even after Westerners began crossing Asia for themselves, Prester John remained on the radar; our old pal [Sir John Mandeville](#) served with Prester John's armies, a century after Marco Polo visited the site of his final defeat at the hands of the Mongols. Mandeville's editor Jean d'Outremeuse made Prester John the son of Charlemagne's paladin Ogier le Dane; the pious Johannes of Hildesheim made him the successor of the [Three Magi](#). Prester John was apparently, in good medieval practice, forming marital alliances with the other great figures of legend.

"He said, indeed, that not many years since, one John, a king and priest living in the Far East, beyond Persia and Armenia, and who, with his people, is a Christian, but a Nestorian, had warred upon the so-called Samiards, the brother kings of the Medes and Persians. . . . He is said to be a descendant of the Magi of old, who are mentioned in the Gospel. He governs the same people as they did and is said to enjoy such glory and such plenty that he uses no scepter save one of emerald. Fired by the example of his forefathers, who came to adore Christ in the manger, he proposed to go to Jerusalem, but he was, they say, turned back for the aforementioned reason."

-- Otto of Friesing, *Historia de Duabus Civitatibus* (1146)

The likeliest explanation of the Letter itself is a pious fraud, intended as propaganda for a renewed Crusade following the disaster of the Second Crusade in 1149. Ironically, this Crusade had been sparked in no small part by one Bishop Hugh of Jabala, who met with Pope Eugenius III and told him of a powerful Christian king named Prester John, who had destroyed the Saracen kings of Persia in battle a few years previously and waited for allies to march again. Bishop Hugh's story is actually the tale of Yeh-lu Ta-shih, the (Buddhist) Khan of Kara-Khitai, who did in fact massively defeat the Persian Seljuks under Sanjar near Samarkand in 1141, distorted by distance or by Hugh's desire to inspire a

Crusade. Other feeders of that stream include the Georgian general John Orbelian, who defeated the Persians in a series of battles two decades earlier; the Indian adventurer who identified himself as "Patriarch John of India" on a mission to Pope Calixtus II in 1122; and possibly even the hereditary Mar Shimon, Patriarch of the Assyrian Nestorian Christians in upper Mesopotamia. The conquests of Genghis Khan, who really did splinter the Saracen rulers of the East in battle, led to a brief resurgence of the legend in 1221, for some reason this time identifying Genghis as Prester John's grandson David. Later writers, however, recast the story yet again, with a bewildering variety of Prester Johns allied with, related to, opposing, killed by, or identified with various Mongol khans and chieftains. His dream-kingdom at risk with the waning of the Crusading fever, Prester John had apparently taken to guerilla warfare, slipping in and out of chronicles and letters to resupply his griffin-mounted troops.

"But all the regions round about watch for the time of the dragons, and when they see one that has fallen, they wait for seventy days, and then go down and find the bare bones of the dragon, and take the carbuncle which is rooted in the top of his head, and carry it to the emperor of the Ethiopians, whom you call Prester John."

-- Jordanus of Severac, *Mirabilia Descripta* (ca. 1335)

Which may be why, when the Pope wanted to write back to Prester John, he sent his messenger to Africa instead. In 1177, Pope Alexander III did, in fact, send a doctor named Philip as ambassador to a well-known Christian kingdom surrounded by Saracens, on a long river, infested by dragons, full of black warriors -- Ethiopia. Medieval geography being the plastic thing it was, identifying Ethiopia as the Third India was a veritable snap; the fact of a Christian king of kings ruling the country sealed the deal. Italian traders and Ethiopian emissaries seem to have carried on quite the traffic throughout the 14th century. The Portuguese fixated on this African Prester John, sending ship after ship around Africa in search of his kingdom, and agents deep up the Nile River. When the the Portuguese finally found Ethiopia they engaged in a series of expeditions into the interior that resulted in a military alliance in 1541 and preserved Ethiopian independence and Ethiopian Christianity -- ironically, the Crusaders had saved Prester John, rather than the other way around.

Then for the first time, Repanse de Schoye was able to be glad of her journey. Later, in India, she gave birth to a son, whose name was John. People called him Prester John, and ever since, people have given that name to the kings there.

-- Wolfram von Eschenbach, *Parzival* (ca. 1205)

Why did the Portuguese so eagerly seek Prester John? It was the goal of Prince Henry the Navigator "to have knowledge of the land of Prester John," and Prince Henry was the head of the Portuguese Knights of Christ, which is to say, the Templars. In Wolfram's *Parzival*, Prester John is the son of Feirefiz, Parzival's half-brother, and the Grail-bearer Repanse de Schoye. Hence, the Grail Kingdom becomes the Kingdom of Prester John, and the Grail Mountain of Munsalvaesche, guarded by Templars, rises somehow in "India" (or, as Wolfram calls it, Tribalibot). In *The Sign and the Seal*, Graham Hancock insists, among other things, that a company of Templars went to Ethiopia (ruled by the descendants of King Solomon, in a kindred Holy Bloodline) in 1185 to seek out the Ark of the Covenant -- and they might have brought with them the Holy Grail their order protected. Coming at it a different way, Prester John had in his lands a "hollow stone" that healed all injuries, the Fountain of Youth, and his emblem was a mighty [emerald](#) scepter -- which, along with the fallen "carbuncles" from heaven, should set alight any number of Grail-shaped beacons in the wary reader.

"Then a song began, a wild incantation in which all joined. The old priest would speak some words, and the reply came in barbaric music. The words meant nothing to me; they must have been in some tongue long since dead. But the music told its own tale. It spoke of old kings and great battles, of splendid palaces and strong battlements, of queens white as ivory, of death and life, love and hate, joy and sorrow. It spoke, too, of desperate things, mysteries of horror long shut to the world. No Kaffir ever forged that ritual. It must have come straight from Prester John or Sheba's queen, or whoever ruled in Africa when time was young."

-- John Buchan, *Prester John* (1910)

With all that, perhaps it's no wonder that Prester John became gifted with, among other things, immortality. At the very least, this explains how he can be a contemporary of the Three Magi, Parzival, Charlemagne, and Sir John Mandeville. The notion that Prester John was the Apostle John, who (the Gospel of Mark hints) was told to "remain until I come

again" by Jesus, is one possibility. Another is that Prester John was the [Wandering Jew](#), whose press-agents were also busy in medieval Europe. In *Yesterday We Saw Mermaids*, Esther Friesner posits gleefully that Prester John was one of the Magi who betrayed Christ's location to Herod, and was sentenced to rule an American fairyland of gods and monsters eternally. In *War in Heaven*, Charles Williams casts him as an immortal do-gooder akin to [Saint-Germain](#). Perhaps the identification of Prester John's country with Tibet (on the Waldseemuller map of 1507) hints that Prester John, like the Dalai Lama, is reincarnated down through the centuries, guarding the gates to his fantastic kingdom and readying his monstrous armies for a new Crusade. Possibly, blackened and twisted by historical pressure, he rules the fictive Dark Land behind the [Congo](#), or in happier fettle has decamped to another new continent to build his Emerald City on the slopes of the [Big Rock Candy Mountain](#). Why not gamble a stamp and find out?

Inquisitio Ytarria

The Congregation of the Holy Inquisition of Yrth

by Jeremy Davies

"Kill them all. God will recognize his own."

--Arnald-Amalric, Papal legate, Beziers, Earth, 1208

History

In the year 1240, out of the shadows of the Banestorm, a Dominican monk by the name of Robert Lebougre appeared in Megalos. He quickly became involved in the political intrigues of the growing Empire, and attached himself to the Holy Order of St. Michael Olybrius of Serrun. The Olybrians were only 40 years old and resembled the Dominicans from Earth quite closely. His natural leadership and charisma soon gained him power within the order, allowing him to introduce a radical religious movement that he had been a part of on Earth. Witnessing pagan practices in the north of Megalos first hand, Robert petitioned the northern bishops for an Inquisition into the state of the Faith in Yrth. The bishops responded in the winter of 1242 by making Robert Lebougre the head of a new ecclesiastical Gestapo, the Office of the Inquisition.

Robert became active in the Northern counties where the barbarians dubbed him Robert the Black (either due to his temperament or robe) and pursued the eradication of neo-pagan belief in areas now known as Quarterdec, Kethalos, Hidelban, and Myrgan, where many peoples shared culture with the nomads, and pagans were still openly active up until the border wars of 1270-99. He was also preoccupied with the subjugating of Dwarves residing in the Whitehoods. Robert claimed to have had a vision from Saint Olybrius himself informing him that the Dwarves were evil and the spawn of demons.

He would often petition the Emperor for serious military aid to "crusade" into the far north, bringing the Inquisition right to the heathen and the "unholy little ones." But the fledgling Empire had problems elsewhere, though Menelaus was always eager to hear from Robert and his progress. Eventually, in the Spring of 1256, Robert the Black was killed by a group of northern raiders at a village known as Rogald, about 50 miles north of Hidelban. Accounts vary, but the most accurate seem to say that the raiders were mostly made up of dwarves.

In his 16 years on Yrth, records show that he was directly responsible for the deaths of 676 men, women, and children of heretical beliefs, and at least 52 dwarves. He saw his Office increase from an initial compliment of 12 clerics and 50 men-at-arms to 180 clergy men and 500 warriors. The site Robert died upon was used to construct a large Olybrian Abbey in 1545, called Lebougre Abbey of Rogald. It became the headquarters of the Congregation of the Holy Inquisition of Yrth, and stands strong and firm to this day.

After Robert's untimely death, the Office of the Inquisition declined. There was some involvement in the border wars with the barbarians -- Robert's dream of heavy military support coming over 20 years too late -- but little of import. The factionalized bishops of the time did not actually elevate anyone to lead the Office, so its power crumbled just as its wishes were fulfilled. By 1304, the Office of the Inquisition was formally recanted by a simple stroke of the quill, though the activities of the Olybrian friars kept the spirit alive.

Without a concerted unit policing Church principles, areas around Christendom began to fall in their religious obligations. Tithes became less frequent in this period of turning away from the Church (1305-1403), known in history as "the way-turning." Bishop Rynnus of Craine, a prominent Church historian of the time, wrote in 1405:

"Heresy began to form amongst the flock as if that old serpent, called the Devil, and Satan, which deceiveth the whole world, who the Archangel Michael had cast out by his own Holy hand, had come to teach amongst us and bring good

Christ-fearing men down to the pits of fire from whence he crawled."

The Curia was formed in 1403, so Catholicism gained a somewhat united front. To combat the rampant heresy -- and fund drainage -- a new group known as the Order of the Archangel Michael was formed in 1412 (p. F20). The Michaelites were an unclostered order which soon began to make a name for themselves as a militant and ferocious group of wandering murderers and looters. There was little supervision of the order by the Curia, who were happy to see the tithes come rolling back in, and their lands and holdings secured. The protests against the order began to mount however, particularly from the "grass roots" level of clergy.

After Domitus completed his Code in 1578, it became apparent to the Curia that a more organized and respectable form of religious policing was required which would require monks, not barely controllable thugs, as its enforcers. The Curia was anxious to enforce their new complete and unequivocal Canon law. Add to this a resurgence in the Banestorm -- bringing large amounts of Protestant heretics to Yrth, an isolated spread of Islam in the southwest, and the appearance of Jesuits in the southeast -- and the Curia looked to the past for guidance.

In the Summer of 1580, a new entity called the Congregation of the Holy Inquisition of Yrth was formed, using Lebourge's Office of the Inquisition as a guideline. The Order of the Archangel Michael slowly become more used in secular investigative matters, though a close Christian tie remains to this day in the Megalan Order.

Father Haralf of Hidelban, the Grand Master of the Olybrian Order, was named the Grand Inquisitor. He was given serious backing by the Church in the form of the most feared military institution on the face of the planet: the Knights Templar. In addition to this, Emperor Claddius 1 "the Righteous" (1598-1614) -- a devout and fervent church man on the throne -- mobilized and put at Haralf's disposal several Imperial Legions.

Haralf suddenly became one of the most powerful humans in Yrthian history. Lebourge's dream of the north was not forgotten, and there was vengeance for the founder's blood. A vain and impatient man, inexperienced in the ways of war, Haralf attempted to achieve everything at once. He refused military advice, claiming that God was directing his will. Splitting his resources, he sent forces south and southeast in 1580, and north to the Whitehood mountains in 1585.

The northern campaign ended in quick disaster. Even the might of two Imperial Legions and a heavy compliment of Templars is not enough to tax the roused anger of the dwarves of Thulin in their ancient homeland. It remains the worst military failure of the Empire to this day; as far as the Knights Templar are concerned, it is unwise to even mention the year 1585 in their vicinity . . .

In the South, the campaign stagnated. The tribunal set up in Cardiel in 1581 to chase Protestants received little help from the locals. Most of the heretics avoided the inquisitors by crossing into North Tredroy and receiving the protection of the Muslims. There was sporadic and isolated fighting in the streets between Templars and Muslims when the monks attempt to torture some of their prisoners. The Tredroyan Mages and Mercenaries Guilds helped defeat and repel the Inquisitors.

In the winter of 1613, Simon de Anjou -- a Jesuit that came before the Inquisition refusing to recant his heresies -- was put to death personally by Haralf, in spite of direct orders from the Curia to the contrary. Haralf now believed that God has turned away from the Curia and was looking to him to become the supreme Patriarch of Yrth, an Yrthly Pope. Just as the Bishops in Megalos feared, Simon, a well-known and popular priest of the people, instantly became a martyr. The people of Araterre revolt against the church almost to a person, causing the Curia to back down and eventually accept the Society of Jesus. Haralf is blamed for the affair and is tried and convicted of "dealing with demons."

The cleansing fire of the Inquisition that he used so frequently as Inquisitor, gave him his final embrace. It was a Michaelite who brought Simon de Anjou's heretical teachings to the attention of the Congregation in 1612. Although the Order was no longer involved in most canonical Church investigations, many constables acted as agents to the Congregation, some taking on permanent roles as non-decision-making pre-investigators that began to be referred to as Brokers.

Haralf's legacy remains in the form of the Twelfth Decree, also known as the Haralfian Decree. The original Canon

law drawn up by Domitus did not allow for the Church to rule on "judgments of blood," making Excommunication and maiming the worst sentence available to an ecclesiastical court. The Inquisition was given permission in 1583 to make judgments of blood in the pursuit of:

" . . . the cleansing and ultimate purging of souls for the heretic."
-- 12th Decree, Part 4; Clause 8

After the embarrassing failures, the Congregation of the Holy Inquisition declined in international power, but remained an internal force within the borders of Megalos. Run almost exclusively by the Olybrian order, monks of the Inquisition began to don red mantles in 1626 to differentiate themselves from those involved in normal duties. After the debacle in Araterre, the Curia was loathe to grant too much actual decision making power to the Inquisition.

The Inquisition became more active in Cardiel in the 18th century, trying to enforce Canon law on the people there. It is around the 1750s that Inquisitor monks first began to wear red hoods to mask their identity when "interviewing" those that might recognize them later. The brand of religious zeal wielded by the "red cloaks" was not welcomed, and added to the growing political unrest. In 1762, the Inquisition was expelled from the western provinces by the newly formed Confederation of Cardiel.

This was not achieved without resistance. Templars and Church backed mercenaries clashed with Cardien forces on the plain of Lympus, about 60 miles northeast of Calder. The battle of the Apple Orchard (Lympus is a fertile citrus-growing area) was of a relatively small scale, but particularly brutal.

The Church forces seemed to have the day won, after crashing through the Cardien lines and overlapping the right flank. Suddenly, the Church mercenaries left the field (Cardien coin was later found on them), leaving the 21 Templars and two Olybrian Inquisitors alone on the field. They refused an offer of terms. Setting themselves for a final stand, the Templars were given the time to confess their sins and hear mass. On a small hill lined with flowing apple boughs heavy with fruit and lush green grass that would soon flow with blood, the "Holy Score and Three" (as bards in Megalos would later refer to them) managed to kill 964 Cardien soldiers before they were finally crushed. They held out for an entire turn of the clock, with only one knight left alive -- his right arm severed in the fight -- to inform the Curia that Cardiel no longer would permit the Church to put its citizens to the flames so easily. The knight, Sir Kethadon, was hailed a hero. The tale of "the Holy Score and Three" is still popular today, and the strategies used by the Templars in the battle of the Apple Orchard are well studied by all students of military matters.

In 1824, Inquisition monks were sent to Caithness to investigate heresies performed under the Archbishop of Clixus, Constantine. They were expelled personally by Earl Conall of Craine in July 1825, which help lead to the mass excommunication of Caithness in 1826.

As they were increasingly unable to operate as they would wish to outside the Empire, the Inquisition became more involved in internal matters within the borders of Megalos. They had some involvement in the Mages' War of 1924-1928, providing magical aid and religious rationalization. Several red-robed monks were martyred by the Muslims in Bannock during the spring of 1925. One of them, a Brother Osprey of Arvey, was said to have returned from death during a decisive battle known as the Battle of Dark Gull Cove. Fifty miles northeast along the coastline of Keyhole Bay, Dark Gull Cove was the scene of a pitched land/sea battle that helped end the war in 1928. The immortal form of Osprey was seen by many eyewitnesses to appear clad in silver armor with his Inquisitor's red robe about him, slashing the infidel with a scythe made from light itself!

In 1935, he became Saint Osprey of the Scythe. He is considered the patron saint of Holy vengeance and inquisition.

In the present day, Inquisition monks can be found in any of the Christian nations, though they are severely restrained in Cardiel. Agents of the Inquisition, known to the Church as Brokers, are also active throughout Christendom.

The current Grand Inquisitor is Father Allynus of New Jerusalem. Allynus is young, dedicated, energetic, and the most charismatic leader the Inquisition has had since Robert Lebougre. He has held his position for two years now, and is just getting a handle on the logistics of his command. There is currently an inquisition being held in Myrgan and one in Sho'joor which he takes an active role in supervising. His ultimate dreams lay, like so many of his predecessors,

north. He has spies among the barbarians, and he is currently collecting information on the mines on the Whitehoods, and how to best penetrate them. He is a careful, intelligent man, and will only strike when he has the forces he needs and the path prepared. But he is confident that he can do it in his lifetime . . .

Structure

The Congregation of the Holy Inquisition has, by its nature, a loose structure. Technically, it is simply an arm of the Curia that comes into existence when required, i.e. when a matter of heresy needs to be investigated. When there is no Inquisition in progress, the monks, including the Grand Inquisitor, return to their normal duties within their respective abbeys. However, in practice there has not been a time when an ongoing Inquisition has *not* been occurring somewhere since 1705. The length of time an Inquisition can continue is somewhat like the length of the proverbial piece of string. The Grand Inquisitor knows that if there is no Inquisition, he loses a large portion of his influence in the Curia, so he will easily be able to keep some form of investigation going at all times.

For an Inquisition to begin, first a matter of heresy must come before the Curia. This can be initiated by a local priest who has a concern in his area, a wandering Olybrian or other monk who has witnessed something disturbing, or a Broker making a deliberate pre-investigation. The Curia will judge whether the matter should be brought before the Grand Inquisitor, who then decides if an Inquisition is required.

If so, the Grand Inquisitor will dispatch monks to the area, backed up by Templars and Templar sergeant-at-arms. This is called a Tribunal. If he is not attending personally, he will appoint an Inquisitor General. On some occasions a complement or even an entire Legion will be ordered to attend the sight of an Inquisition, particularly if the Emperor has political interest in the area. The local priests and bishop of the area being investigated would announce the impending Inquisition well before it arrived, ensuring that as many people as possible would know when and where it would be holding its court. This court usually takes place in a local monastery in the diocese. Even after the Inquisition arrives, a "Grace" period of no less than one month begins. During this time, heretics could confess their sins, hear admonitions, and receive forgiveness and their penalties. The customary penalties for such recanting heretics could be as little as fasts, pilgrimages, or prayer, but there would also generally be some form of monetary/goods penalty.

During the Grace, the mostly Olybrian monks would also conduct some serious religious revival services, with a great deal of preaching and pastoral work. Also, the Inquisitors call for reports and accusations against the suspected heretics from the general population.

Both the forewarning and the Grace can be ignored if the Grand Inquisitor believes that these actions could "jeopardize the investigation by allowing heretics to relocate themselves under haste." Thus, it is possible for red robed monks and armor-clad Templars to descend suddenly and without warning upon a suspect community, taking suspects into custody immediately. The local priest, who may have lodged the original point of concern, could well be horrified by such an action, but no doubt would generally have the sense not to voice his disapproval with too much conviction . . .

Afterward, the Inquisition begins.

The initial purpose of an Inquisition is to judge whether heresy is occurring. For a person to be judged a heretic, the Church is under three Obligations:

1. On the question that has caused the Inquisition to be called, the Church must have a stated orthodox position, either within the Domitian Code or in a later Decree.
2. It must have repeatedly declared to the individual, through a cleric, the error of his ways and the correct position.
3. The Church has to show that the heresy has been communicated to others in some way, by word or deed, and that this could have influenced others.

If heresy is then found, the investigation begins. Those accused are made to attend the court and be judged according to at least two witnesses accounts. The witnesses could be anyone from criminals to small children, but the accused are permitted to name any "mortal enemies" whose accounts should not be heard. The accused does not confront these

witnesses, though they would be named in the hearing. The Accused also has a right to a defense lawyer and witnesses, though this right is almost worthless because people are generally too afraid to speak on the behalf of a suspected heretic lest they themselves become suspect.

If the judges come to the conclusion that the accused is a heretic, but can not obtain a voluntary confession, torture is deemed an appropriate recourse.

If the accused is found guilty of heresy, a sentence is decided upon. Death is generally reserved only for a heretic who refuses to recant his/her beliefs or a member that has been judged heretic before and has now relapsed. The death sentence is almost always done by burning at the stake, though if the weather is inclement, hanging is an alternative. Other major penalties that can be used at the Inquisitors discretion are: excommunication, exile, slavery, permanent imprisonment, confiscation of all property/funds (a very common occurrence), and maiming/forehead branding. Minor penalties include pilgrimages, wearing of a cross, monetary fines, flogging, and temporary imprisonment.

A clergyman found guilty of serious heresy is sent to a monastery, under guard, to be "put at peace." This means to be bricked into an underground section of the monastery foundation with a bible, and thus buried alive.

There is an office of the Inquisition in New Jerusalem, Megalos City, and at Lebougre Abbey of Rogald, the spiritual heart and training center for the Inquisition. Unknown to most people, there is also some form of magical communication with the above offices at almost every Olybrian Abbey in Ytarria.

Personnel

The position of Grand Inquisitor, the leader of the Congregation of the Holy Inquisition, is a powerful, much feared, and respected role. When the position becomes vacant, it is traditionally first offered to the Head Abbot of the Olybrian Order, who may either accept and fulfil both roles, or decline and then decide for himself who should serve as leader of the *Inquisitio*.

The Inquisition recruits its monks directly from the major orders of the Church. Although almost exclusively Olybrian, there are usually several of the more hard-line Franciscans and Constantinians involved. All Inquisition monks must serve at the monastery at Rogald for a period of time, where they learn more about the history of the Congregation and study deeply many learned texts on how to best investigate heresy. Some of these valuable scrolls were written by Robert Lebougre himself.

Skills taught include Bard, Accounting, Law, History (Inquisition), Occultism, Psychology, Administration, Diplomacy, Performance, Savoir-faire, Theology (Catholic), Detect Lies, Interrogation, Intimidation, and Intelligence Analysis.

Instruction in the very basic spells of the Body Control, Mind Control, Communication/Empathy, Information, and Knowledge Colleges are available to those with magical aptitude. If particular magical talent is noticed at Rogald, the monk can be sent to study at Azer, the Templar College of Battle Magic. There they delve further into the more advanced spells of the above colleges, as well as looking at optional strains of magic; the Fire College is particularly popular . . . Once having attended Azer, the monk is know as a Magus Inquisitio, and afforded additional respect from his brethren.

The distinctive red habits, worn by Inquisition monks since the 1750s, are only required to be worn when at court (hearing an Inquisition) or while interrogating a suspect. If blood is likely to be shed during the interrogation, or during an execution, the hood with two eye slits is worn, covering the entire head. Otherwise, the normal plain black robe of the monks order is often worn so that no one is able to differentiate the Inquisitor from a normal cleric.

Agents of the Inquisition (Brokers)

These men (and sometimes women!) are not cloistered, but trained at Rogald in arts of subterfuge and spycraft. They are sent out into the nations with assumed names and credentials to observe and report on heretical practices. They all

have a small pebble implanted beneath the skin that gives off a certain Aura, only noticeable by a trained Olybrian, which identifies them as a Broker at any Olybrian Abbey and gives them access to the communication equipment.

Skills taught to Brokers at Rogald include: Tracking, Stealth, Shadowing, Lockpicking, Detect Lies, Disguise, Acting, Occultism, Theology (Catholic), Law, Heraldry, Navigation and Area Knowledge (Olybrian Abbeys). This last skill allows the Broker to make regular contact with a superior and report their findings back to the Congregation.

Brokers are often sent out to areas where unreliable sources have indicated there may be heresy occurring. This is called a Pre-Investigation. The Broker will generally act as a transient worker/mercenary of some sort and see what they can dig up. When not directly involved in a Pre-Investigation, Brokers wander the countryside sponsored by the Church. They are the active eyes and ears to the black stain of heresy.

Current Events

The Caves of the Lyndynites

An Inquisitorial Tribunal has been hearing evidence for the past six months at Asburghe Abbey in Sho'joor. Father Allynus is personally running this investigation into a cult known as the Lyndynites. Lyndyn Southman was a sailor in the employ of the Duke until he was laid off when there was a shipping crisis five years ago. During the next two years he disappeared for some time, but when he resurfaced he claimed to have seen the afterlife and been told how to achieve its riches. Lyndyn began preaching a religion based on sea creatures and the holiness of the oceans. He claimed that the sea was a spiritual conduit to the innermost essence of existence, as well as claiming that there were strange fish-men who were chosen prophets of God. Most thought him a harmless madman, but after a few years, he actually managed to build up a following where he based himself in the cliff face caves along the treacherous shore line south of the city. The Fishmen (p. FF70) actually have a major sacrifice that they wish to perform at an exact point of time at a site in Sho'joor. They plan to sack the entire city and hold it for one day, harvesting from the land-dwellers as many lives as possible to aid the potency of the ritual, then retreat back to their ancient underwater metropolis some 300 miles out to sea. They do not have the numbers to win through sheer force, so they have used Lyndyn to recruit a group of land-dwelling "zealots" to assist them.

An "artifact" that the fishmen gave Lyndyn while they converted him (he fully believes in his new religion) is a small head circlet made of tiny shells. It is actually enchanted with Foolishness (-4 IQ, always on 20 yard radius, doesn't effect wearer) and Conceal Magic (-8), which helps convince his flock of his "revelations."

Just like Lyndyn, Allynus has no idea about these plans. He believes that this is just another upstart pagan cult that he will crush with ease. The caves that the heretics are hiding in do present a problem as they are extensive and warren-like. Not believing this issue important enough to involve an entire Templar cadre, he is looking for mercenaries to root the pagans out of their holes by the sea. The pay is good and the work looks easy . . .

Intrigue in the Hospital

Troubling reports of heretical teachings have been made to the Grand Inquisitor about the Hospital in New Jerusalem. Father Allynus is horrified that the inner sanctum of the Order of the Hospital could be teaching such things as partial spiritual reincarnation. The Curia cannot be officially informed on any Inquisitional proceedings because Bishop Activus Lynnich of New Jerusalem is implicated. Father Allynus needs to treat this situation with kid gloves as the political ramifications of these canonical breaches are huge. There are Templars in the city, although their movements are restricted to limit them purely to their official role of guarding Church grounds. More information is desperately required of the liturgy being taught within the Hospital itself. Five brokers have already "gone missing" attempting to infiltrate the organization, as have two undercover Templars.

Lord Dorset Longfellow, a landed noble retained by the Inquisition to look into the situation at a higher level, has also just disappeared in the last few days. The Hospital have released a statement to the Curia and the Emperor's court that he was abducted by a group of disguised Kharijites. Sir Guildford Perrennius, who personally delivered the message to

Megalos City, is using this to further his argument for a concerted New Crusade. Dorset actually languishes in the lowest dungeon the Hospital has to offer, with his eyes put out for his attempted spycraft. The liturgy used by the Hospital has deviated somewhat from the canon, but nowhere near to the extent reported. The Temple are deliberately exaggerating the information being presented to the Grand Inquisitor in the hope that an official Inquisition would be called for. The damage this would cause to the reputation of the Hospital, even when most of the allegations are proved incorrect, will cost them in the eyes of Christendom.

The Templars will take a dim view of outsiders coming in to investigate and possibly reveal the truth. Four of the five brokers that have "gone missing" were killed by Temple, not Hospital knights.

Sir Geoffrey Freeman believes he finally has the numbers within the Order to oust the current Grand Master and place himself at the position. He recently survived an assassination attempt by the *hashishin* as he left mass. Geoffrey immediately blamed the infidel and even hinted that Guildford may have been involved in attempting to silence the ". . . true scourge of the heathen and satanic unbelievers." In truth, he and his immediate supporters arranged the murder attempt, which certainly helped him survive it, in an effort to win over support for his claim to the leadership.

The Old Man of the Mountain has only just found out that his sect was used in this way. A real assassination is now planned.

Worthy of note is that the Hospitalers are very susceptible to magical information gathering, though they are very good at mundane counter-spy techniques.

More trusted outsiders are needed by the Inquisition to act as brokers and find out what is really going on in New Jerusalem. Another noble is also required to ask questions at the Hospital court. The resulting turmoil could shake the foundations of the military orders, maybe resulting in open civil warfare! Add to this a group of real Kharijites, disguised as cloth merchants, who plan on setting fire to the Grand Hospital itself, and an explosive situation is certainly in the making.

On the Trail of Thulin's Soul (and riches)

At Rogald Abbey, Brother Amalric Bloodblade, an ex-Templar who became a monk of the Inquisition, has been put in charge of the Revival in the Northern Lands. He has a converted and money-hungry dwarf by the name of Dusselhoov Tweed who claims to know of a secret entrance to the mines of the Whitehoods, as well as a somewhat trouble-free passage through to the north. Amalric wants a group to go with Tweed and map out the route, as well as take notes on the feasibility of a campaign through the mountains. Bloodblade is obsessed with crushing the dwarves. He has studied all the material of the 1585 debacle and has dedicated his life to understanding the strategic problems associated with predominately subterranean combat. Although the mission is extremely high risk, a huge chest of gold is offered, as well as a guaranteed place in heaven and an opportunity to pilfer some of the legendary treasure rooms of Thulin's Folk with a local dwarf.

The only problem is that Tweed is actually a Zarakian renegade. Although he does know about the secret entrance, he will be mostly guessing from there. If the party ever gets in serious trouble, he will try to just meld into the surroundings and pull some fast talk about being captured and forced at knife point to accompany the surface-dwellers.

As luck would have it, a High Council has been called in Zarak which Thulin has decided to attend. The halls and tunnels on the far east of the range are somewhat deserted due to the drain in dwarfpower. Maybe the party will win through to the other side with their heads intact and a sack full of booty . . .

When Good LARPerS Go Bad

by KT Pinto

Running a LARP is a piece of cake. All you have to do is write up a brief storyline and then the players take over. Simple, right? Although this theory looks good on paper, running a LARP is much more difficult than it seems . . . especially when there is a problem gamer in your midst. One bad player can bring down the entire game and make other players wary of coming back. Over the past year our group has had three such players. In this article, I will tell you how we handled these three troublemakers and still kept the rest of our players happy and returning.

(Names have been changed to save me some grief.)

The Apathetic Bad Guy

When we first started preparing the storyline for our *Vampire: The Dark Ages* chronicle, Gwain offered to play the bad guy, a villainous Tzimisce lord named L----. Since all of our events are run by the efforts of volunteers, we were more than happy to give him the role. For those that are not familiar with *The Dark Ages* games system, the Tzimisce are vampiric flesh crafters in the guise of high-class lords and ladies. In theory, their high positions in society gives them the power and prestige they need to work on their evil plans. Gwain had the wealthy lord part down. He would look down his nose at other characters and talk with an air that told others they were in the presence of someone they didn't want to annoy. The downside to this wonderfully evil character was that Gwain avoided playing the evil part.

Imagine Darth Vader without the somber music and black armor, and that was Gwain's character. It got to the point that the other characters weren't even interested in killing him anymore. They just let him become prince without putting up an argument. Honestly, of all the problems a GM can have in game, indifference is the worst. I even had my character go up to him when his character became prince and outright insult him, believing that he would injure me and send my followers into a tizzy, giving the players a scene they would be interested in. Instead of retaliating, Gwain's character just chuckled amiably and walked away. We decided then that something drastic had to be done to save this game.

Before the staff could decide what to do, Gwain had his character destroy a major port city two days before our next planned LARP. Needless to say that we were completely surprised, as was the gamer playing the prince of the port city. We believed, since Gwain was a storyteller, he had had a game plan, so we went with it. Silly us. He dropped the bomb (so to speak), and then left it up to us to pick up the pieces. That was it . . . Gwain had to go.

But how were we to do this without looking like the bad guys? Gwain had this annoying habit of acting like a good ol' boy and, although he infuriated most of the staff and players, he had become friends with a small handful who would have probably left the game if we had just kicked him off staff. This is where tact had to come into play . . . and that is something we all had very little experience in.

The final conclusion was to use his own words against him. He was constantly complaining how his wife, his job, his girlfriend, and gaming were taking up way too much of his time, so we happily helped him by reducing his responsibilities within the group to the point that he could only adjudicate during LARPs. He was no longer able to make up storylines and the players were informed that anything Gwain told them had to be verified through us. As we had hoped, he saw this as a major insult and dropped off of staff. There was no way anyone could blame us for his leaving. They had all heard him complain about his tight schedule and saw what we did as a favor to him . . . and to them.

The first game after he quit was one of our most exciting. We put his character into Torpor (a vampiric coma) and had the players go through a labyrinth to find and kill him. We are now at the beginning of a new chronicle, and the players are eager and excited both during and between games. Getting Gwain off of the staff was the best thing we could have done for the game, and the way we did it moved us up a few notches in the players eyes.

The Singing Toreador

"Her name was Lola, she was a showgirl . . . "

At least, that was what she believed her character was. Lola was playing a Toreador (the artsy vampiric clan) whose art form was swordplay. This was actually an intriguing character to us, because normally an inexperienced player would pick a Toreador character to stay out of the fight scenes, and choose an art form like dancing or singing. Lola's character was a bodyguard whose charge had been killed under her watch, and she was supposed to be out for revenge.

The problems occurred during the games involving contests and competitions. Every time Lola's character competed, she would sing. Not only was this not consistent with her character's profile and background, but Lola would pick the longest, most boring songs ever made. Her voice was lovely, no doubt about that, but she bored the hell out of the rest of the players.

The first time she performed, we believed that she was just nervous, and was doing something that she was comfortable with until she got used to her character. But this excuse didn't work after the second competition . . . or the third. We decided that the next time she chose singing instead of swordplay, we were going to have to do something drastic. The next competition occurred at the same LARP where Gwain's character destroyed the port city. So, we had the competition's location in a neutral territory as a celebration for those who survived. Lola was the third one to perform. She walked up on stage . . . and started to sing. You could almost hear the groan from the players.

After the first refrain, we had the neutral territory attacked by flesh-crafted monsters, cutting the competition short. The players all rushed out of the room, eager to destroy and maim. Imagine our surprise when Lola griped to her friends and her friends complained to us after the game because she didn't get to finish her song. We had to figure out what to do next. We couldn't ask the other players if her songs bored them as well, because then we would be reducing ourselves to Lola's high school tactics. So, trying to keep the peace, we had the competition run again at the next LARP. Lola got up and once again began to sing.

I made sure to stay out of any pictures taken while she sang -- I didn't want anyone to see the total lack of interest on my face. I shouldn't have worried. The pictures of our players showed that same look of boredom. The morale of the story -- if something is boring you, chances are it's boring your players as well. Remember, although you are a GM, you are a player at heart and if you feel a storyline dragging, your players are feeling it as well. We finally told Lola that she had to start playing her character the way she was created -- with a sword -- or to make a new character. She hasn't sung since then, and our players now look forward to upcoming competitions.

The Negative Staffer

We had met Selene at a gaming convention several states away, where she lives. When we invited her to our games, which are held in our home state, we really didn't expect her to show. Not only did she come, but also brought her friend Elvis, her boyfriend, and Elvis' girlfriend along for the ride. She helped out with setup and takedown, offered suggestions for the storyline, and played a character that both entertained and involved the other players. Because of all this, we offered her a position on the staff, which she accepted. At the same time, we also offered Elvis a staff position. He had been helping out with storylines, characters, and setup as well, and played a character that eagerly tried to tick everyone off. He gave the players an enthusiastic target, and they loved it. He likewise agreed to join the staff. This is when the problems started.

Unbeknownst to us, Selene had become jealous over the fact that my husband and I had become good friends with Elvis and his girlfriend. She didn't like that our schedules let the four of us get together outside of the LARPs and staff meetings, and took out her jealousy on the organization.

Any time we held a staff meeting, she would disagree with every suggestion a staffer gave, whether it dealt with the characters, storyline, or players. Not only did she contradict everything that was said but she didn't give any reasons

why. She would just say, "No, that won't work." or "No, that's not a good idea." It got to the point at one meeting that Elvis had to get up and leave before he knocked her out. Needless to say we got no work done that day. This also extended to our meetings in cyberspace. She would accuse us of giving favor to those players that live locally in the home state, repeated everything that was written by others with the thought that we didn't understand what was being said, and then told us in a blanket statement that we were wrong. It was time to get rid of her.

This time we didn't think about it. She was bringing the staff down, and thereby bringing the entire group down. It was a choice between her and the game. We told her that it had nothing to do with our friendship; it was solely a LARP decision. She decided it was personal, and won't come back to any games. The staff and the LARP have been running better than ever. The moral -- if someone is lowering the morale of the staff, she is also doing it to the players and the game.

Conclusion

Whenever you have a problem player or staffer in your group, you have to make your decision following this belief -- the choice comes down to the happiness and pleasure of the one or the many. The many should win out every time.

Slaves of Fate (for d20)

Published by [Chaosium, Inc.](#)

Written by Jason Durall

Illustrated by Chris Appel, Rob Hinds and Drashi Khendup

88 pgs; \$15.95

Chaosium, Inc. was among the first companies to take advantage of the Open Gaming License to produce a *d20* system version of one of their own already existing games. This was *Dragon Lords of Melniboné*, a *d20* version of their *Etric! RPG* -- itself more recently rereleased in a fifth edition and renamed *Stormbringer* once again, which still employed their "Basic Role-Play" system for its mechanics. The result was a game set within Michael Moorcock's The Young Kingdoms that had a slightly more heroic swords and sorcery feel.

Also promised at the time of *Dragon Lords of Melniboné's* release was an introductory scenario for the *d20* rules, called *Slaves of Fate*. During the long delay between the announcement and its publication, this adventure has ballooned from thirty-two pages to first sixty-four and finally eighty-eight pages. This scenario is designed for a party of approximately 4 to 8 characters of 1st to 3rd levels, and is intended to initiate new players to the Million Spheres.

Slaves of Fate comes with an attractive cover by Chris Appel and is clearly and simply laid out inside. The quality of the internal artwork is not of a standard seen in other Chaosium books, although Drashi Khendup's illustrations have a certain dynamic quality, capturing the dynamism of the scenes they depict rather well. Likewise, his maps are nicely done. Finally, the book does not come with an index, but does have a decent contents page at the front.

[SPOILER ALERT!]

The adventure opens with the characters chained in a line within the hold of a ship. At this point, all they know is that within the past few days or so, they had an encounter that resulted in their losing consciousness. Several suggestions are made as to what might have happened, and these could be played out before *Slaves of Fate* begins. Naturally, the only remnants of the possessions they once had are the clothes that they are wearing. Through interaction with the other prisoners, they can learn that they are aboard the *Virago*, a Vilmirian pirate vessel that has turned its hand to slavery. Shortly, the ship will heave to and those in the hold are brought to the top deck, where they will discover their fate -- they are to be sold into the service of the evil, Chaos-worshipping Pan Tang nation!

Some players may object to having their characters railroaded into this situation, but the "Slaves to the Narrative" section explains how to get around this -- in the main by getting through the opening scenes without either the DM or the players dawdling. At the same time, this setup is actually an advantage for what is an introductory scenario. It gets around the artificiality of getting a disparate band of characters together -- in other words, a player could roll up any Young Kingdoms character that they wanted -- and it also gives them an up-front motivation and purpose in playing, whatever their character background or objectives might be.

Once the Pan Tang ship, *Chardros' Lament*, ties up alongside the *Virago*, the Pan Tangians will come aboard to make their purchases. Normally, they would buy in bulk, but today they are after just a select one or two. Making the selection is Omerginroul, a strange demon-like creature, which is held on a leash by the wizard-priest of Ariocho,

Hasper Dal. Omerginroul is a Silune, an extra-planar creature, with the ability to planar travel once per day. This requires a small amount of blood from someone . . . willing or unwilling. Hasper Dal believes that he will be able to use his pet's ability for his own ends, but really the Silune wants to escape captivity and rescue his mate who is held captive on another plane. To this end, Omerginroul has told Dal that he requires the blood of someone special -- in other words, the player characters or one of their fellow slaves!

As the deal is about to be cut, a Melnibonéan battle-barge appears on an intercept course and all hell breaks loose . . . The pirates want to grab the Pan Tangian funds, the crew of the Chardros' Lament want to escape and leave the Virago to the mercy of the Melnibonéans, while Hasper Dal does not want to leave without gaining possession of the slaves. The Silune takes advantage of the sudden chaos to get the blood he requires and open up the gate he wants . . . Which has the unfortunate side effect of drawing both the Virago and the Chardros' Lament through to who knows where? All they can see on the other side of the gate is a ferocious storm.

When the characters awake, they find themselves shipwrecked around a strange island. The setup finds them dotted round the shores of the island, mixed up with their fellow slaves as well as their former captors and potential owners. This is an opportunity for the characters to really mix it up and interact with the NPCs in *Slaves of Fate*, and for the DM to present these NPCs as characters. The situation may find the separated characters making alliances with different factions and it also represents something of a challenge to the DM, as they have to switch back and forth between the various NPCs dealing with the characters. Of course, one option would be to run this section of *Slaves of Fate* with all of the player characters being shipwrecked all together and awake in just the one location. Naturally, doing so would be a lot easier, but would miss on a great deal of the scenario's potential.

Getting off the strange storm-swept island will take the remainder of the adventure. The players will need to make their alliances, explore the island, and deal with the strange inhabitants if they are to do so. The DM is given a timetable of events, but does not have to adhere to it strictly. How the end of *Slaves of Fate* comes about is really down to what the player characters do and how they deal with those around them; while in the opening chapter they can be said to be the "slaves of fate," it is not the case by the very end, where they make their own fate. There is no set ending, but rather suggestions are made as to what it might be.

[END SPOILER]

While *Slaves of Fate* is an introductory scenario, it is not suitable for a novice DM to run. There are lots of NPCs to handle and keep track of, and switching back and forth between them will need to be done with care if the players are not to suffer periods of boredom between their scenes. On the other hand, the players need to be aware of this and accept it as part of the adventure. All that aside, the adventure gives plenty of advice that both the novice and experienced DM will find useful in running *Slaves of Fate*.

For an Open Gaming License product, *Slaves of Fate* has little to add to the Open Gaming License. These come down the new creature, the Silune, a new poison and the Slaver as a sub-class of the NPC expert class. Although the adventure does not necessarily require the use of the *Dragon Lords of Melniboné* book, it really does work better if the DM has a copy and has his players create their characters from it. Also, the scene where chaos breaks out aboard the two ships into a big fight will be easier to run using the guidelines for mass combat found in *Dragon Lords of Melniboné*.

For referees who already own a copy of *Dragon Lords of Melniboné*, this reasonably priced new scenario should prove a must buy. *Slaves of Fate* is a great way to introduce both new and *d20* system players to the Young Kingdoms.

Dvonn

Published by [Don and Co/Rio Grande Games](#)

Designed by **Kris Burm**

49 playing pieces, 1 game board, and rulebook; \$29.95

Abstract strategy games have a tough life in the 21st century. Not only must they compete with collectible card games, roleplaying games, video games, and snacks, they also go head to head with classics of the genre that never seem to die such as Chess and Go. Add to this the growing library of free abstract strategy games for generic pieces such as *Icehouse: The Martian Chess Set* and *Piecepack*, and designing a marketable abstract strategy game seems impossible.

Dvonn, the latest two player game in the [Gipf Project](#), may have what it takes to carve a niche for itself. It contains beautiful high-quality components, fascinating game mechanics, and, as a member of the Gipf Project, it expands an interlocking series of games.

Dvonn comes with 49 sturdy, plastic disks that stack nicely and have a speckled, marbled look. The board is made from durable cardboard and displays textured art that looks like a stone table covered with sand. The 49 circle grid on the board fades in and out to further the illusion. Like all of the games in the Gipf Project, *Dvonn* has a solid aesthetic sense that makes the game almost as attractive to observe as it is fun to play.

The game begins with players alternating turns placing the three red Dvonn pieces on the board. Then they alternate placing their own disks, 23 white and 23 black. The player with the advantage of placing two of the red *Dvonn* pieces has the disadvantage of moving first in the second phase of the game.

For the rest of the game, players alternate moving one of their own pieces on top of another piece. They may also move a stack of pieces that they control. A player controls a stack if the top piece in the stack is their own color. The catch is that a stack must move in a straight line and must move as many spaces as it has pieces. Stacks may cross over blank spaces, but they must always finish their move on top of a space already occupied by one or more pieces of any color.

At first, most moves consist of transferring a single piece one space and on top of another piece. As the stacks become larger, they become harder to move because the number of occupied spaces is dwindling. At the same time, tall stacks must move further, cutting their options severely.

As if this were not agonizing enough, any pieces that are not connected via a line of occupied spaces to a stack containing a red Dvonn piece are immediately removed from the game. Thus, a single move may isolate several stacks which removes them from the game and from the final score.

The game continues until neither player can make a legal move. Players then take all of the stacks they control, place them into a single group, and the tallest tower wins.

Like all great abstract strategy games, the rules are simple but actual play is complex. Players have to balance aggressive moves to take control of tall stacks while not opening profitable moves for their opponents. At the same time, pieces must be linked to the red Dvonn pieces, so you must ensure your taller stacks can not be cut off and removed. This rule also allows come from behind wins, making Dvonn very dramatic compared to other abstract

Pyramid Review: Dvonn

strategy games.

Dvonn stands on its own as an clever and strategic game, but its relationship to the rest of the Gipf Project makes it even more attractive. The Gipf Project is a series of abstract strategy games that contains the namesake **Gipf**, the hourglass based **Tamsk**, and the Checkers-like **Zertz**. The games are related because the pieces in the later games can be used in the original Gipf game to add new types of moves. Players can either agree to allow certain pieces into the **Gipf** game or, for those looking for a long evening of strategy, they can pause a **Gipf** game to play a game of **Tamsk**, **Zertz**, or **Dvonn** for the right to use one of those pieces in the paused game. Alone or with its brethren, **Dvonn** proves there is still room for abstract strategy games in today's market.

Error Reading Disk: Invoke/Retry/Summon?

"Every day, in all my waking hours, my mind would run, over and over again, through the Minoan Greek text of the Phaistos Disk, searching for possible grammatical inconsistencies . . . I just couldn't escape the cerebral whirlpool. I felt like the final victim of the Battle of Naxos. Though the move to Meersburg had helped tremendously, I felt trapped. The long strolls along the shore and through the vineyards had calmed my nerves, but they failed to calm my mind. The Phaistos Disk was driving me mad."

-- Steven Roger Fischer, *Glyphbreaker*

The tiny figures march from the outside of the Disk in a spiral pattern, moving inward endlessly to their single, unknowable goal. In a quarter-kilobyte, the Phaistos Disk, a CD-ROM four millennia old, holds prayers, or rituals, or obeisance, or the secret names of the gods of Atlantis. Like the [Copper Scroll](#), the [Voynich Manuscript](#), or the [Glozel Fragments](#), the Phaistos Disk is [bisociation](#) given form. Locked into a linguistic black box, it holds literally unspeakable words, keeping them ready for an ancient purpose long buried with the palace of the King of Hell. Only the tiny figures know what they seek, at the center of the spiral. And they're not telling.

"Hear ye, Cretans and Greeks: my great, my quick! Hear ye, Danaidans, the great, the worthy! Hear ye, all blacks, and hear ye, Punt and Libya! Hear ye, waters, yea earth: Hellas faces battle with the Carians. Hear ye all! Hear ye, Gods of the Fleet!"

-- from the Fischer translation of the Phaistos Disk

On the southern coast of Crete lies (or lay, before it fell and the shoreline moved) the city of Phaistos, one of the famous "palace cities" of the Minoan Empire. While excavating Phaistos on July 3, 1908, the Italian archaeologist Luigi Pernier discovered a red clay disk about five inches in diameter, fired hard (possibly by the cataclysm that destroyed the palace around 1700 B.C.) and incised on both sides with 241 symbols, arranged in a spiral pattern of 61 "words" set off by lines. (You can see a nice shot of the Phaistos Disk [here](#), and [this site](#) gives a good, clear view of the glyphs.) The symbols did not precisely match any known script or alphabet, although there were some similarities with the Minoan script known as Linear A. Even more mysteriously, the repeating symbols (from an "alphabet" of 45 different glyphs) matched precisely; it became apparent that the Phaistos Disk had been printed using, essentially, movable metal type -- three thousand years before Gutenberg! There are other "metal-punch" designs in the area, most notably the glazed-clay Cycladic "frying-pan" artifacts (some as old as 2000 B.C.) which sport repeated symbols as designs, not inscriptions. But there are no other inscriptions in the Phaistos Disk alphabet, and no other evidence of movable-type printing in the region whatsoever. Whoever printed the Disk used an anachronistic technology to write a message in an unknown alphabet -- and left no further trace behind.

"The general character of the hieroglyphic script [of the Phaistos Disk] presents, in any case, a close parallel with the Minoan, and a certain proportion of the signs are identical."

-- Sir Arthur Evans, *Scripta Minoa I* (1909)

From the very first, controversy raged over the Phaistos Disk and its inscription. Sir Arthur Evans, the excavator of Knossos, maintained that the Disk might have been an import from Anatolia, given the absence of similar remains in Crete. Other scholars back a Greek or Minoan origin or translation of the inscription, most notably Steven Roger Fischer, whose book *Glyphbreaker* sets out an intellectually-sound (if still essentially circular) argument for the Disk as the record of a call to warfare by the Minoans against the Carian pirates of the coast (a war recorded by Thucydides as an ancient tradition). Still other scholars have rendered the inscription on the Disk as a prayer in Greek, a dedication of the palace in Hittite, a magical incantation in proto-Byblic, a Minoan calendar or almanac (presumably in a Linear A variant), a diplomatic message or tribute inventory in "proto-Ionic" from one of Crete's satellite states on the Anatolian coast, a funerary record in ancient Syriac, and an "Etrusco-Luwian" hymn to Poseidon Hippios and Cybele Ax-Mother. One decipherment splits the difference and says that Side A is Mycenaean Greek and Side B is (presumably "Minoan") Linear A. There is, at least, some evidence that the two sides were printed by different "hands", and slightly less evidence that the two sides were once separate sheets of clay, joined later in the firing process.

"Sadly, the disk slowly came under the domination of less than scientific attempts to crack the riddle, such that today few researchers dare to forward any new theories, lest they too be grouped with a discredited fringe. Indeed, many scholars, when approached to comment on the Phaistos Disk react as though it were leprous."

-- Kevin Massey-Gillespie and Keith Massey, *Mysteries of History Solved!*

Other theories skip the firing process altogether, so to speak. Purely by coincidence, a Russian enthusiast named Sergei Rjabchikov has decided that both Linear A and the Disk are Slavonic, and that the Disk is a prayer to the Slavic bull-goddess Yanila. The mad epigrapher Barry Fell translated the Disk as an augury, written in a combination Hittite-Polynesian dialect of (apparently) his own devising. In *The Bronze Age Computer Disc*, engineer Alan Butler determined that the Phaistos Disk recapitulates an "incredibly accurate" 366-day calendar, tied to a 366-degree circle which, after suitably tautological massaging, proves that the Minoans built Stonehenge (or the other way around) and knew the circumference of the Earth to within 12 yards. To Butler, the Phaistos Disk ties time, distance, and geometry together in a wondrous salad fraught with spooky interpretation. Some New Age theories go further still, positing the Phaistos Disk as an Egyptian "portal disk" that recapitulated the [sacred geometry](#) of the Great Pyramid to allow Osirian initiates to create a "group consciousness" and enter the astral realm! (For safety's sake, one Phaistos website urges you to shut off your computer while performing the Phaistos Ritual -- incompatible file formats, apparently.)

*"But the immortal ends of all the earth,
So ruled by them that order death by birth,
The fields Elysian, Fate to thee will give;
Where Rhadamanthus rules, and where men live
A never-troubled life, where snow, nor showers,
Nor irksome Winter spends his fruitless powers,
But from the ocean Zephyr still resumes
A constant breath, that all the fields perfumes."*

-- Homer, *Odyssey*, Book IV

In this vein, the Disk (with or without portal magic or geometric mathematics) might have been a key to the jealously-guarded Minoan treasure houses far to the west -- in America. Phaistos was, after all, the city of Rhadamanthus, brother of Minos and later ruler of Elysium, the "isle of the blessed" also far to the west across the Ocean. The Minoans needed copper, which was there for the taking in the Upper Peninsula of Michigan. Someone certainly mined tons of the stuff there between approximately 3000 and 1200 B.C.; the traditional "Copper Culture" ingots can be found all over the American Midwest -- and bear a striking resemblance to the "oxhide" ingots of copper used by the Minoans. Similar ingots can be seen on Egyptian wall paintings held by red people "three years journey to the west," identified as "Keftiu" -- Cretans. Minoan Crete has been pegged as [Atlantis](#), of course, which also lay over the sea to the West and sported great masses of orichalcum -- "mountain copper." Did the Minoans churn their galleys up the St. Lawrence for the rich copper lodes of the Michigan Indians, perhaps leaving their main dimension-traveling Disk with their operating capital in the [Money Pit](#) on Oak Island along the way? Minoan-Amerind trade might also explain the "feathered headress" (or Mohawk haircut) perhaps worn by one of the Phaistos glyphs, and others with the proper disregard for the laws of statistics have demonstrated the Phaistos Disk alphabet matches nicely (well, 20 per cent or so) with early Mayan script. As a perfect topper, in 1975 a fellow digging a house foundation in the Penobscot Valley of Maine uncovered what might be a single piece of Minoan movable type, admittedly depicting a different "snake goddess" figure from the one on the Disk.

"It had been found around the turn of the century, not at Knossos but in another Minoan palace at Phaistos. George told me that he was suspicious of the circumstances surrounding its discovery and he informed me that he was of the opinion that there may have been more than one disc found at Phaistos . . . the others had been taken off the island . . ."

-- Alan Butler, *The Bronze Age Computer Disc*

But if the Phaistos Disk is the central emblem, or magical device, of a cult of Minoan power spreading as far as Lake Huron, where are the rest of the disks? The goddess in Maine gives us our first clue; others appear on rock carvings deep in the Libyan Fezzan -- inscriptions in this Libyan script also resemble the Phaistos runes, and here also they surround emblems of a goddess or matriarch. The women carved on these rocks wear a distinctive pointed helmet

(rather like one appearing on the Disk), which also shows up in Greek depictions of the [Amazons](#). Who, of course, dwelt in Libya, and traveled to Anatolia, neatly bracketing Crete all the while. Anatolian goddesses bring us to our old friend Cybele, who appears on the Disk in one translation as the goddess of the Minoan labrys, or double-headed axe (which itself closely resembles the characteristic Minoan "oxhide" copper ingot). The net-wielding Amazons whom we've earlier identified as [spider-goddesses](#) from behind time (there's a neat eight-legged something-or-other on the Phaistos Disk, too) built their mighty empire from proto-Maya Calyferne to the Hittite hinterlands, powered by orichalcum energized by the Portal Disks of Phaistos. But something went wrong. Somewhere a disk slipped, or became corrupted. In Greek legend, Rhadamanthus and Minos became kings of Crete by killing the giant Asterius, possibly a masculinization of Astraea, the Queen of Heaven also known as Astarte -- or Cybele. Could this tale recall a primordial [reality quake](#) that hurled the Amazons out of space and time, secured only by the spiral spiderweb of glyphs on the Phaistos Disk? Are the other Disks still out there, at the bottom of the Money Pit, or locked away in the British Museum, or filed in Warehouse 23, all counting down the minutes until the stars come right, the year once more has 366 days, and Great Cybele strides forth to rule her world? Spin the Disk, and find out.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Designer's Notes: Transhuman Space

by David L. Pulver

My purpose in writing [Transhuman Space](#) was to break away from the prevailing medieval paradigms that dominated past science-fiction roleplaying games and create a modern, hard-science future setting. What are these paradigms? They should be familiar: one or more of them appear in most fantasy and science fiction games:

- that our ancestors (or ancient aliens) knew more than we do.
- that there will be a dark age, global war, or fall of civilization, often with billions of dead, before the new order is rebuilt on its ashes.
- that the future will be worse than the present.
- that changing the human body inevitably corrupts and destroys the mind or soul.
- that there will be one world government on Earth.
- that "machines" can't be the narrative equal to humans, and that humans as they exist today will continue to dominate Earth-descended society.
- that the laws of physics, as we understand them today, will be broken, in order to achieve fast space flight or star travel, psionics, or anti-gravity, and that this is easier and more likely than sapient machines, human genetic manipulation, or developments in psychology and social engineering.

The wave of cyberpunk RPGs at the end of the 1980s broke with some of these paradigms, but it only went halfway. I wanted to go all the way -- to create a roleplaying game that reflected the kind of science fiction I enjoyed, as written by authors like Ian Banks, Greg Bear, Greg Egan, Ken MacLeod, Linda Nagata, and Bruce Sterling, and inspired by non-fiction by the likes of Hans Moravec and Robert Zubrin.

In the spring of 2000, I proposed an idea for a worldbook called *Transhuman Space*, set in the year 2100, that detailed a future set after a century of uninterrupted technological advancement. The idea was that, thanks to cybernetics, biotechnology, and materials science (especially nanotechnology), we had left the cradle of Earth and created an interplanetary civilization. Borrowing concepts from the existing transhumanist movement, this setting would explore how nanotechnology, biotechnology, and artificial intelligence changed the definition of human in ways that created interesting story possibilities.

I sketched the outline of a future history and adventure setting, and sent it to Sean Punch. He read it, critiqued it, and helped me improve it. Then he passed it on to Alain Dawson (who was then managing editor) and Steve Jackson, and they agreed it had potential to support more than one book. With Sean's help, I drafted a line proposal for six books each of which would explore a part of the world of 2100. Three of the books, later named *Deep Beyond*, *High Frontier*, and *In the Well*, would explore the solar system; the other three, eventually called *Blue Shadow*, *Fifth Wave*, and *Broken Dreams*, would focus on aspects of Earth.

Things kicked into high gear. I had left my previous employer, Guardians of Order, and was now working full-time with SJ Games as a writer. My assignment was to turn *Transhuman Space* into a full-fledged line. Sean Punch and I established a detailed "story bible" for the setting, and we recruited other writers who joined a mailing list devoted to setting the project's basic parameters.

Jon F. Zeigler was one of the first to sign on, and agreed to take on the crucial task of writing *Fifth Wave*. He also helped Sean and I develop crucial background detail for the setting, especially its economic and political basis, and came up with many ideas that became pillars of the *Transhuman Space* background. Jonathan Woodward took on the task of writing *In the Well*, turning my sketchy notes on the Ares Plague terraformers and a China-dominated Mars into a living, breathing planet. Gene Seabolt's acerbic observations on human nature were a welcome antidote to utopianism, and John Snead contributed ideas for space colonization. The art side of the project began to shape up, with Phil Reed and Christopher Shy establishing the graphic design and visual look of the series. As for me, I had planned to write *Deep Beyond*, the book on the asteroid belt and outer system, but Steve Jackson felt that the setting

really needed a central core book that would serve as an introduction. Sean and I agreed. *Deep Beyond* was taken off the schedule, and replaced by a new book. It was called *Transhuman Space*.

Why "*Transhuman Space*?" The title reflects the two main elements of the setting. First, the idea that humans are poised between human and post-human. Many people are still recognizably human, but they share the world with people who are becoming more than human, and with created beings that never were. Second, there's the concept that a key part of our future lies beyond Earth, in the planets, moons, asteroids, and comets of the solar system, and ultimately in the stars beyond. It is this cusp between the human and the non-human, the earthly and the unearthly, that makes *Transhuman Space* a setting that people can relate to. It's even possible to play "yourself" -- thanks to advancing medical technology, people alive in 2002 can survive into the year 2100.

The first draft of *Transhuman Space* appeared on the *Pyramid* boards in the late spring of 2001. The playtesters, led by John Freiler and Kenneth Peters, did a wonderful job, and I'd like to thank everyone, especially those whose suggestions I took but whom space constraints prohibited me from crediting, and those who took the time to correspond with me outside the playtest, like Anthony Jackson, M.A. Lloyd, and the many members of the *Transhuman Space* mailing list (on Yahoo Groups). I didn't take everyone's advice, and sometimes I used their ideas in ways that probably drove them to distraction, but all the input and criticism helped make it a much better book.

The next couple of months saw myself, Sean Punch, and Andrew Hackard revise and edit the manuscript into shape, while Phil Reed and Christopher Shy worked on layout and art. At the same time, other books in the series -- *Fifth Wave*, *In the Well*, and *High Frontier* -- went into playtest. Many ideas that evolved during their writing and playtest made it into the core book, which had grown in size from 192 to 208 pages and become a "Powered by *GURPS*" release. It was originally intended as a full-color book, and Chris Shy produced beautiful painted illustrations for it, but printing problems forced us to put those plans on hold. Instead, the book appeared in at the end of January 2001 as a black-and-white softcover -- but \$10 cheaper. However, a full-color hardback edition will appear later this year.

Mutable Point Totals

A section in *Transhuman Space* that got misplaced on the way to publication was the guidelines for Mutable Point Totals. Here they are again . . .

One way of playing *Transhuman Space* is to treat character points as an administrative record-keeping score, rather than a means of rewarding character advancement. Whenever a character does something that would cost points, like an infomorph character buying an extra body, simply increase his point total to cover it. Whenever something happens that would cost him points, like losing an Ally, decrease his point total. Here's an example:

Tanith Tokamura Hecate starts out as a 200-point character. She's a Tennin parahuman, who works for a "vacuum cleaner" orbital salvage operation, while moonlighting as bounty hunter. Tanith has two Allies (Programmable): Jim, a wearable interface with an NAI infomorph companion, and Bob, an LAI residing in a tech spider cybershell. She also has a partner, Grimalkin -- a free Felicia bioroid -- who is another PC, not an Ally.

In Tanith and Grimalkin's first adventure, a troubleshooting expedition to a secret research station turns nasty, and Tanith's tech spider is eaten by devourer cyberswarms! Medical bills for the team's other injuries (Tanith is badly injured by nanoburn gas) use up the rest of their resources, and Tanith cannot afford to replace her tech spider. She earned 2 points of experience, but lost a 10-point Ally [Programmed]; she's now a 192-point character!

In Tanith's second adventure, she and Grimalkin rescue a kidnapped slinky idol from Martian Triad xoxnappers and earns a \$15,000 reward. Tanith spends some of it to buy a Guardians perm nanomod (3 points). She also earns 4 character points worth of experience, which she puts toward skills. Tanith is now a 199-point character.

In the group's third adventure, they continue their bounty hunting, tracking down Jill the Ripper, a rogue cyberdoll sexworker possessed by the shadow of notorious serial killer. They capture it, but Tanith loses her right hand to the cyberdoll's razor-sharp katana! She now has the One Hand [-10] disadvantage, but the GM awards her 4 character points, bringing her to 193 points. Tanith also retrieves the disabled cyberdoll, planning to repair it eventually -- if she

does, it might become a new Ally, but until then it's deactivated, and not worth any points.

In Tanith's fourth adventure, she's on Luna, hanging around the Moonshadow spa waiting for her new arm to grow, while Grimalkin prowls the bars. However, the GM decides to make things interesting. In the spa, Tanith runs into a tall, dark, and handsome stranger who turns out to be an amortality assassin. Tanith discovers and foils the assassin's plot (one-handed!), and the GM awards her 5 character points. She also gets her hand replaced, eliminating the One Hand disadvantage [-10]. This adventure has seen a net gain of 15 points; she's now a 208-point character.

In the party's fifth adventure, Tanith and Grimalkin go to L5 to salvage a nuclear reactor from an abandoned plague-struck space habitat. Unfortunately, it's not abandoned: they discover a nest of Maple Syndicate data pirates. In the ensuing firefight, Tanith is shot dead. Grimalkin rushes Tanith's corpse to hospital and arranges for it to be quickly placed into nanostasis, then brainpeeled. The operation succeeds, and Tanith's now a ghost.

Grimalkin can't afford a new body for Tanith, but she remembers the cyberdoll they captured back in the third adventure, and has it repaired. Tanith wakes up in that body. It's worth 146 more points than her old one! When added to the 1 character point she earned during the adventure, she's now a 355-point character. But she's no longer human . . .

If the "Mutable Character Points" option is used, point totals are still used to determine how powerful a starting character is. (To prevent "gameplaying" during character creation, the GM may wish to rule starting wealth must all be mostly spent before the first adventure begins, and can't go to anything that would cost points.)

Conclusion: In a Perfect World, You May Be Obsolete

Okay; this should be the last word for now on my 977,244 part series about the dichotomy between Simulationist and Romantic gaming, with a conclusion I reached.

But first, I wanted to make some observations. I note with astonishment that the roleplaying hobby, although not even three decades old, has evolved considerably over that time. RPGs began as an outshoot of wargaming, complete with miniatures, dice, paper, and pencil.

Today, many folks play games without minis at all. Diceless roleplaying has a dedicated following. And many people play without paper or pencil . . . or even without being in the same room as the rest of the players! Yet I think folks would recognize any of these variants as "roleplaying."

Now, following this logic, I'll see what I can devise.

Simulationist

At one point in the ancient computer adventure game *Zork III*, there's a puzzle where you need to get past a dark area across a large lake (swimming across the lake would extinguish the torches and lanterns you would need to navigate the dark area). The actual solution involved using a teleportation table to move an object from *Zork II* to *Zork III* (really!). But in an early version of the game it was possible to find a light source and transport it in a waterproof chest across the lake . . . even though the programmers didn't originally intend for that as a solution. Why? Because the chest was defined with certain attributes (holds X amount of stuff; can open and close; when closed, doesn't leak water; etc.), and so was the lantern (lights up dark areas, has a certain size, cannot get wet, and so on). Thus, within the rules of the simulation it was possible to come to a different solution.

Likewise, the *Ultima* computer games (especially parts *VI* and *VII*) started by fabricating a game world system -- complete with its own rules and mechanics -- and *then* tailoring a storyline, game, and plot around it.

It seems to me, then, that an ultimate theoretical Simulationist game would take the game and rule system, and remove the GM from it entirely (or almost entirely). In that way it would be possible to have an ultimate, impartial game. (One of my first observations about *Dungeons & Dragons 3rd Edition* is that it seemed much more rigidly codified than previous versions, and would be perhaps ideal for a computer treatment. Furthermore, I've noticed that most *D&D adventures* have become much more codified; they will frequently describe all reasonable objects in a room, their properties, how much it would take to damage them, whether they're waterproof and can be taken across a lake, etc.)

Of course, such a system would require an incredible degree of freedom for the players; practically all possible reasonable options would need to be available . . . otherwise it would resemble the often-unsatisfying computer "roleplaying" games. (Perhaps a GM could be available to do "override" control for unplanned actions.)

Now, the computer-savvy would point out that this vision sounds not unlike popular online games, like *Ultima Online* or *Everquest*. And the economically savvy might realize that more people have probably played these online games -- and generated more money for their companies -- than probably any pencil-and-paper RPG ever. The difference is currently mostly a matter of scope -- traditional roleplaying involves less than 10 players, not more than 10,000 -- control (your actions are usually limited to "smite" in most online settings) and immersion; no matter how much one "chats" in a game like *Everquest*, it can be difficult to *really* feel like you're your character, and not a puppeteer.

So let's consider the Extreme Simulationist RPG. It could be a computer (or computer-assisted) game. Play would be as normal, but the computer would be able to track the game state. (Some logically interesting and efficient input device would be necessary here; it would be boring to type in "North 10 feet" over and over . . .) The party would be given a goal or goals, a setting, and free rein to pursue their goals. The computer would adjudicate as much as it could. What if a situation arose that couldn't be arbitrated by the computer? Well, maybe one of the players could be chosen

(either at random or in rotation) to try to solve the problem. If that doesn't work, it could be taken up by *all* the players. As a last resort it might be decided that the player simply can't do that. Ideally, though, the Simulation would be accurate enough that this wouldn't arise much.

Of course, computers aren't anywhere near this level of sophistication currently, but 30 years ago they weren't even powerful, small, and common enough to roll dice. Who knows where they'll be in another 30 years of the hobby?

The upshot of this Ultimate Simulationist RPG is that *no one* would be required to be the GM . . . meaning that everyone can have the fun of playing as a group.

Romantic

Over the past decades, many games have drifted towards a more Romantic vision over the past decade or so; "story-heavy" settings and campaigns seem to be of utmost concern to a wide -- and vocal -- percentage of gamers.

Of course, these games also still tend to have GMs . . . with some exceptions (odd games like *Baron Munchausen* or *Once Upon a Time*, or [Yes or No Adventures](#)). But with *all* roleplaying games I've always believed one thing: it's ultimately about the roleplayers. If you leave a football game and all you can remember is the referees, it wasn't a very good football game. Likewise, if I run a gaming session and the only things I or my players can remember are my wacky NPCs, my plot twists, or the out-of-game banter, then it wasn't a very good game. In my mind, the GM is primarily there to facilitate the actions of the players.

Some games take this even further. It's entirely possible to play, say, a *Vampire: The Masquerade* with almost *no* direct action by the GM . . . players can devise their own plots against each other, interact with themselves, and tell grand ol' stories. Taking this even further, many Live Action games don't have *any* GM involvement.

Of course, in this type of setting, players probably require some means of introducing their own story elements. Many games include elements of this already, either small (*Masterbook* players have the ability to suddenly find new contacts, clues, or other minor details, depending on the cards they draw), or large (*DC Heroes* has an entire section detailing how players can submit their own subplots to the GM).

If one presumes the ultimate theoretical Romantic RPG as an opportunity to tell stories, then a GM may not even be necessary *at all*. At its core, the Romantic movement seems to be like the "Cops & Robbers" game we're so fond of using as an example for those unfamiliar. Why are we running around firing finger-guns at each other and breaking or enforcing the law? To tell our own stories; we don't necessarily need a mediator for *that*.

What *is* required for a Romantic game, then, and still have it resemble a roleplaying game?

Well, it probably needs a setting; this is what is required to keep the heroes from wandering "off the map." This could be as narrow as an elevator, or as broad as "A Super-Heroic Earth."

It probably needs a story . . . loosely defined. After all, if the players are making up their own story, they don't need too much narrative pull. But they probably need *something* to keep the story moving; a loose story that can progress if there's nothing else going on.

So let's take a simple example. Everyone is in a small keep along a hostile border. It's a stormy night, and travel outside the safety of the walls would be highly dangerous. The players all have access to a map of the keep, and each player is given a stack of the NPCs there. Each NPC might be structured enough that players wouldn't learn more than necessary, perhaps in a booklet:

Almerk the Shopkeep

Personality: Brash, honest, talkative, doesn't haggle

Desires: Lonely, hoping to retire early, secretly wants to learn to play the lute and write an epic ballad

Details:

- Inventory available to buy (p. 2)
- Rumors (p. 3)
- Secrets and plot elements (p. 4)
- . . .

Page 4 might look like this:

Secrets And Plot Elements:

- Almerk knows that **Triss** wants to leave the Keep, and would be willing to do almost anything to accomplish her goal. (Secrecy: Low)
- Almerk knows that **Fensmoore** is plotting to assassinate **Nobleman Justone** within a week. He is afraid of Fensmoore, but will reveal the information if he believes those he tells can help the Nobleman (to whom he is loyal). (Secrecy: Medium)
- Almerk knows that the **Nobleman Justone** does not have a legitimate heir, as do many . . . he also knows *why*: the result of a hunting accident he was witness to 20 years earlier. (Secrecy: High)

(and so on)

In this way the player in control of the NPC would be able to use as much or as little of the information needed to keep the game going.

Perhaps a deck of ordered cards could determine what happens when; all the players decide when time has passed and the next card is flipped. (Thus the top card might be: "10:30 PM: The weather gets worse. / Those near the stables notice the animals are getting spooked. / Those near the west tower hear a scream. / Those near the barracks notice **Fensmoore** talking with the General **Ashton**.") When everyone agrees a half hour has passed, the 11:00 PM card is flipped.

Everyone can pursue their own goals, or pursue their *NPC's* goals, as they desire . . . and an interesting and complex story would (ideally) emerge. Think of something like the *How To Host A Murder* series, with even *more* freedom and interaction.

The upshot of this Ultimate Romantic RPG is that *no one* would be required to be the GM . . . meaning that everyone can have the fun of playing as a group.

Conclusion

In my mind, roleplaying as we think of it is most limited by the lack of good gamemasters out there. A *lot* of effort has been spent trying to make better GMs (including much effort in this humble ol' mag); in my mind the future may well lie with making the need for good GMs less necessary. (Some effort has already been made in this regard, with games like *Rune*.)

Perhaps more interestingly -- or depressing, if you're of that mindset -- roleplaying games are by their nature very transient; if you run the most incredible storyline ever, only your players are going to experience it. (Because, really, most campaigns are pretty boring to those who aren't playing it . . . insert "Don't tell me about your character" joke here.) Of course, the ethereal nature of roleplaying sessions is part of what makes them special. But I know I'd personally *love* to experience sometime like a Simulationist RPG scenario designed by Sid Meier (imagine *Pirates!* with roleplaying), or a Stephen King Romantic horror adventure. A system that would allow some (or all) of the burden to be taken off the GM -- and more on the scenario/world creator -- could theoretically allow a *much* wider audience to experience an adventure than before. (I've seen this to a certain extent with LARP games at conventions, where the same scenario is often run multiple times; I have been able to talk to people that experienced other sessions about their experiences and compare them to mine, while still having a unique experience myself.) This de-emphasis on the GM -- like the de-emphasis on miniatures, dice, rules, and pencil and paper before -- may ultimately allow more fun, greater flexibility, and wider appeal for the hobby . . . while keeping the essential element that we know and

love in roleplaying.

Namely, roleplaying.

--*Steven Marsh*

* * *

*Last week's answer: **Ghost Tower of Inverness**, p. 16.*

(Four stars)

"There is a river ahead of you. A little boy sits at the edge of the river. He looks very sad.

"What does the little boy look like?

"What do you say to the little boy?

"After everyone has had a chance to add details to the story, the little boy speaks to the Trainers."

Murphy's Rules

Murphy's Rules

Homestead Inc.

A Corporate Player for any Space Campaign

by C. A. Johnson

Homestead Incorporated is a multi-planetary corporation specializing in the exploitation and colonization of habitable worlds. They fund, equip, recruit for, and organize any sort of colonizing venture, be it a search for a new home, or the creation of a new mining operation for capital gain. Their expert administrators and workers diligently provide the best service possible . . .for those that have the credit.

This interstellar giant holds title to several worlds, and has developed nearly a hundred more. It began its rise to power as a bank, making loans to construction firms and other corporate ventures. During a financial crush, the bank foreclosed on two very powerful firms. One was a heavy construction company. The other was a startup Aerospace firm. Suddenly the bank found itself the owner of several hundred million credits worth of construction gear and heavy manufacturing equipment. Rather than sell it, then C.E.O. and legendary founder of Homestead Inc. Syril Traygan chose to keep the two businesses.

Shortly after that, FTL propulsion was released to the corporate sector. A compact FTL drive suitable for unmanned exploration became an expensive but real possibility. Syril Traygan took another gamble, and threw millions of credits into building several unmanned probe craft, which he launched without fanfare toward stars now merely years distant instead of centuries. Unlike other probes of their kind, these had no scientific agenda to meet, and no government priorities to hold them. They visited their assigned systems, surveyed them roughly and quickly, and moved on, sending an FTL "message pod" back to its parent company. It was a risky plan, but it paid off. The first two systems found drew worlds that appeared habitable. Again, rather than trumpet his discoveries, Traygan began assembling his dream . . .a colonizing ship. A project this size was impossible to conceal, but Traygan did everything to play down the significance, calling it "a simple mining expedition."

Thirty years after the launch of his original probes, Haephestus launched. Ten years after that Homestead Inc. announced the opening of its first venture, Argos, a ready-made colony waiting for colonists. It was an instant success. Land sales alone beat the most ambitious estimates. The exclusive shipping and passenger contracts were just gravy. Homestead Inc. more than tripled its initial investment. Two other ships, commissioned and constructed while Haephestus was in transit, were launched at once. This time there was fanfare, and it was loud and long.

As FTL drives became more sophisticated, Homestead's colonizing ventures generated a staggering profit margin with a much shorter turnaround. Their quick and dirty surveying methods turned up more useful worlds than the regulation-driven government programs with their required scientific packages long surveys. True, the government knew more about the worlds it surveyed, but Homestead Inc. surveyed five systems for every one the official missions did. Nor was the corporation bound by the official definition of "useful" world. They developed planets for a wide variety of clients, both corporate and private. In many cases, the company didn't sell the infrastructure it supplied for a world. It leased it instead, especially to corporate clients. Mining operations in particular were vulnerable to this. Don't like the terms of your lease? Well, your workers had better be able to breathe whatever was outside, because Homestead owned the life support system. The alternative usually involved spending millions of credits for new life support.

Of course, there were some risks involved as well. Government surveyed worlds were safer, as a rule, because everyone had a fairly clear idea of what to expect when they landed. Supplies and equipment could be specifically tailored for the environment. Colonies and commercial operations started by Homestead generally had higher casualty rates as the planets they were on sprung nasty little surprises on them. All in all, however, the savings far outweighed the risks.

It wasn't long before the corporation started branching out. Developing worlds was profitable in the long term, but expensive in the short term. It was easier and considerably less expensive to sell or lease ships and equipment to other

interests willing to leap into the great gulf between the stars. The Finance division, still active from the company's earliest days, became more active as well. Collateral is never a problem; the customer builds that himself when he arrives. Payment terms are flexible and agreed upon in advance; payments can be arranged in either currency or goods. Loan terms last for generations instead of years. Homestead Financing is very careful about who it will lend money to, though; foreclosure can be a difficult proposition when the property measures in millions of square miles and thousands of colonists. The corporation has only foreclosed five times in its long history. On two occasions, the results were bloody and expensive. For this reason, Homestead Inc. makes it a point to negotiate reasonable terms, and has a very forgiving collection policy.

Now this corporate empire spans the galaxy. Its wealth is only equaled by its political might. There are few interstellar corporations that do not have dealings with Homestead Inc., and many civilian colonies are still paying off their loans, or owe the company for other services it rendered at some point in their history. The security (read that "mercenary") forces it keeps on retainer are the equals of any in the galaxy, even established planetary government forces. More goods are transported on Homestead freighters than any other companies, and their heavy transport designs are the standard for the industry.

Corporate Structure

Homestead Inc. is divided into several divisions. Each division has its own president and administrative team. The main office coordinates major projects, such as colony ships and world development, but each division is pretty much responsible for its own affairs otherwise. The main office encourages a friendly rivalry between each division, based on profits and quality control. This rivalry is not allowed to get out of hand. Any action that threatens company unity is dealt with quickly and summarily.

These are by no means the sum of the Homestead Inc.'s holdings. There are hundreds of minor subsidiaries and holding companies under the Homestead banner. These are merely the largest and most influential divisions.

Homestead Inc. is the main office, and handles administrative chores for the corporation as a whole. It is responsible for charting corporate strategy and overseeing major projects. Any work that requires the cooperation of more than one division must be coordinated through the main office. All other divisions report to the home office on an informal monthly basis, with more detailed and formal reports required quarterly. Most of Homestead Inc.'s employees are management, legal, or financial types. There is also a fairly large information dispersal sector, which includes both couriers and IT experts. Given the size of the corporation, that still leaves a lot of positions to fill. Branches of the Homestead Inc. appear in every sector with another division of the corporation active in it.

Homestead Transports is the shipping arm of the corporation. The division motto is, "Any time, any place, any size." Their transport fleet is arguably the largest in the galaxy, and their ships are the standard for the whole shipping industry. Their rates are fairly high, but the service is reliable and their shipments easily insurable. Homestead Transports offers many employment opportunities in many areas. Pilots, navigators, and freight handlers make up the bulk of the division. However, there is also a need for translators, local guides, ground transport personnel, and occasional mercenary work guarding shipments. Many of the ground transport personnel and mercenary forces are contracted as needed from local workforces. Even some of the cargo runs to remoter sectors of the galaxy are sub-contracted out to independent operators. Given the division motto, any number of adventures could evolve from Homestead Transport contracts. Characters could find themselves delivering artifacts from archaeological digs, supplies to a remote watcher outpost, or the cryogenically suspended bodies of soldiers or aliens . . . maybe both! And woe unto anyone that accepts a Homestead Transport contract but fails to deliver the goods as promised; that's where the bounty hunters come in. The division takes its motto and its reputation very, very seriously.

Homestead Financial is a huge operation, handling trillions of credits in transactions a day. It specializes in very large, very long-term loans, usually for developing off-planet interests of either a business or a colony. As a sideline, it runs an insurance business, catering again to large-scale development projects. It also handles the day to day financial concerns of the other corporate divisions, overseeing their financial networks and insuring their shipments. Jobs available in this division are concentrated mostly in the financial sector, but there are a good number of openings in other fields. For example, large-scale contractors may take jobs with the division as inspectors, traveling to various

sites and determining either the cost of a project or the risks involved in it for insurance purposes. Sometimes whole teams of inspectors are dispatched, with a wide variety of skills at their disposal. (Dare we suggest your party of adventurers?) Some of these missions are long-term, and all of them have their share of risk involved. Then there is the potentially dangerous job of collecting on defaulted loans. There are even teams of investigators to resolve insurance claims.

Armitage Shipwrights is the aerospace division of the corporation. It builds and maintains starships for anyone willing to pay for them. They concentrate on larger vessels, such as transports and cargo ships. They also accept a large number of military contracts, although the corporation makes it a point not to supply more than one side of any given conflict. Their designs are solid and practical, with a long history of reliability. They are also somewhat more expensive than many ship builders, but their reputation makes the difference in sales. Engineers and construction workers comprise the bulk of the workforce; pilots are also well-represented. No ship leaves an Armitage spacedock until it has been thoroughly shaken down, and the division delivers (for a fee) when asked to do so. Military and civilian consultants are often hired on a temporary basis for single projects.

Tandor General Merchandise is the division least associated with the corporation in the minds of the galaxy. This division handles the distribution of resources the company gathers. Many of Homestead Financials customers pay their loans in goods instead of currency; these goods are shipped to Tandor GM, which locates, researches and exploits markets for them. Tandor is a wholesaler, and deals with a large number of clients, both human and non-human. Opportunities with Tandor GM are fairly diverse. Buyers travel the stars looking for new and interesting things to sell; these merchants have to be able to think and act independently and quickly to capitalize on deals before the competition gets wind of them. Sales personnel carry out delicate negotiations with many races, while troubleshooters and shipment trackers are often sent to exotic locales to solve exotic problems. Labor Relations experts travel to hotspots regularly, solving personnel issues.

Baskin Construction is the major contracting arm of the corporation. Most of its responsibilities lie in colonization projects. Baskin can equip and supply colony vessels with tools and personnel for a wide variety of construction needs. Their experience in a wide variety of atmospheres makes them the firm of choice for those willing to build in hostile environments. While the majority of their contracts come from the home office, many other companies looking for off-planet interests seek the firm's expertise. Working for Baskin can be quite challenging; site engineers travel to the harshest environments the galaxy has to offer to survey the terrain, sometimes years before construction is scheduled to take place. It isn't at all uncommon to send entire parties of experts on long-term surveys; many of these projects are in space that has barely been mapped, let alone explored. Such jobs are risky, and pay accordingly. Managers and construction workers can face a wide array of challenges in hostile environments. If someone or something has a claim on the land, Baskin has negotiation teams on call. And even a well-known world can have nasty surprises requiring skilled troubleshooters to resolve.

Bastion Research is the last major division of the corporation. First and foremost, Bastion is concerned with terraforming. The overwhelming complexity of that task, however, leaves Bastion with a huge repertoire of scientific disciplines at its command. Everything from biology to vulcanology, metallurgy to meteorology, ecology to human engineering fits under the Bastion umbrella. For this division, fieldwork is everything. Large expeditions spend years conducting large-scale experiments on remote planets. Some are in extremely hostile environments. Many others study the relationships of life forms in earthlike atmospheres. Such expeditions demand highly competent people with diverse backgrounds. Scientists, after all, are well known for forgetting the details (like eating and breathing) when faced with a sufficiently complex question to answer. People skilled in transporting and operating complex equipment find excellent jobs at Bastion. And let's not forget those planets that already have indigenous life. Someone has to carry the guns; sometimes someone needs to fire them, too.

Campaign Uses

Homestead Inc. is a diverse company, and can fill a large number of roles in any campaign, depending on the needs or whims of the GM. As a Patron, the corporation has vast influence among the stars, and has access to state of the art equipment. In *GURPS* terms, this gives it at least a 30-point base cost. If the characters have access to the equipment

as well, this goes up to 35. Homestead Inc. is too large a company to focus its full attention on any one set of characters, though. Players should not be allowed more than a 12 or less roll for frequency of appearance; even then, they better have a very good explanation. It is also possible for a character to take one of the divisions as a Patron. The base cost in this case should drop to 25 points.

As an Enemy, Homestead is just as formidable, with a base cost of -40. With a corporation the size of Homestead Inc. however, it is easy to slip between the cracks. Killing a member of the Board is about the only way to get Homestead's undivided attention. A character would have to be a major thorn in the corporation's side to rate a 12 or less roll. Individual divisions have a base cost of -30.

As a source of adventures, Homestead Inc. has nearly limitless potential. As an employer, it offers a rich variety of freelance or contract jobs. Want to travel to exotic places, see exotic people and kill them? Homestead Financial needs a squad for a foreclosure. Feel like a whodunit tonight? It just so happens a shipment of earwax from the rare Tirellian Sea Mammoth vanished out of Homestead Transports warehouse two days before the quarantine ended. And then there's the problem Bastion Research is having with the natives at its latest research project . . .

As an adversary, Homestead makes a great soulless corporation. Maybe the natives mentioned above need your help to stop Bastion from destroying their livelihood. Perhaps the colony made its payments on time, but pirates took the courier vessels. Neither Homestead nor the colonists realize what has happened, but the foreclosure teams are on the way. And the earwax of the Tirellian Sea Mammoth is a hot item on the black market . . .

Homestead Inc.

A Corporate Player for any Space Campaign

by C. A. Johnson

Homestead Incorporated is a multi-planetary corporation specializing in the exploitation and colonization of habitable worlds. They fund, equip, recruit for, and organize any sort of colonizing venture, be it a search for a new home, or the creation of a new mining operation for capital gain. Their expert administrators and workers diligently provide the best service possible . . .for those that have the credit.

This interstellar giant holds title to several worlds, and has developed nearly a hundred more. It began its rise to power as a bank, making loans to construction firms and other corporate ventures. During a financial crush, the bank foreclosed on two very powerful firms. One was a heavy construction company. The other was a startup Aerospace firm. Suddenly the bank found itself the owner of several hundred million credits worth of construction gear and heavy manufacturing equipment. Rather than sell it, then C.E.O. and legendary founder of Homestead Inc. Syril Traygan chose to keep the two businesses.

Shortly after that, FTL propulsion was released to the corporate sector. A compact FTL drive suitable for unmanned exploration became an expensive but real possibility. Syril Traygan took another gamble, and threw millions of credits into building several unmanned probe craft, which he launched without fanfare toward stars now merely years distant instead of centuries. Unlike other probes of their kind, these had no scientific agenda to meet, and no government priorities to hold them. They visited their assigned systems, surveyed them roughly and quickly, and moved on, sending an FTL "message pod" back to its parent company. It was a risky plan, but it paid off. The first two systems found drew worlds that appeared habitable. Again, rather than trumpet his discoveries, Traygan began assembling his dream . . .a colonizing ship. A project this size was impossible to conceal, but Traygan did everything to play down the significance, calling it "a simple mining expedition."

Thirty years after the launch of his original probes, Haephestus launched. Ten years after that Homestead Inc. announced the opening of its first venture, Argos, a ready-made colony waiting for colonists. It was an instant success. Land sales alone beat the most ambitious estimates. The exclusive shipping and passenger contracts were just gravy. Homestead Inc. more than tripled its initial investment. Two other ships, commissioned and constructed while Haephestus was in transit, were launched at once. This time there was fanfare, and it was loud and long.

As FTL drives became more sophisticated, Homestead's colonizing ventures generated a staggering profit margin with a much shorter turnaround. Their quick and dirty surveying methods turned up more useful worlds than the regulation-driven government programs with their required scientific packages long surveys. True, the government knew more about the worlds it surveyed, but Homestead Inc. surveyed five systems for every one the official missions did. Nor was the corporation bound by the official definition of "useful" world. They developed planets for a wide variety of clients, both corporate and private. In many cases, the company didn't sell the infrastructure it supplied for a world. It leased it instead, especially to corporate clients. Mining operations in particular were vulnerable to this. Don't like the terms of your lease? Well, your workers had better be able to breathe whatever was outside, because Homestead owned the life support system. The alternative usually involved spending millions of credits for new life support.

Of course, there were some risks involved as well. Government surveyed worlds were safer, as a rule, because everyone had a fairly clear idea of what to expect when they landed. Supplies and equipment could be specifically tailored for the environment. Colonies and commercial operations started by Homestead generally had higher casualty rates as the planets they were on sprung nasty little surprises on them. All in all, however, the savings far outweighed the risks.

It wasn't long before the corporation started branching out. Developing worlds was profitable in the long term, but expensive in the short term. It was easier and considerably less expensive to sell or lease ships and equipment to other

interests willing to leap into the great gulf between the stars. The Finance division, still active from the company's earliest days, became more active as well. Collateral is never a problem; the customer builds that himself when he arrives. Payment terms are flexible and agreed upon in advance; payments can be arranged in either currency or goods. Loan terms last for generations instead of years. Homestead Financing is very careful about who it will lend money to, though; foreclosure can be a difficult proposition when the property measures in millions of square miles and thousands of colonists. The corporation has only foreclosed five times in its long history. On two occasions, the results were bloody and expensive. For this reason, Homestead Inc. makes it a point to negotiate reasonable terms, and has a very forgiving collection policy.

Now this corporate empire spans the galaxy. Its wealth is only equaled by its political might. There are few interstellar corporations that do not have dealings with Homestead Inc., and many civilian colonies are still paying off their loans, or owe the company for other services it rendered at some point in their history. The security (read that "mercenary") forces it keeps on retainer are the equals of any in the galaxy, even established planetary government forces. More goods are transported on Homestead freighters than any other companies, and their heavy transport designs are the standard for the industry.

Corporate Structure

Homestead Inc. is divided into several divisions. Each division has its own president and administrative team. The main office coordinates major projects, such as colony ships and world development, but each division is pretty much responsible for its own affairs otherwise. The main office encourages a friendly rivalry between each division, based on profits and quality control. This rivalry is not allowed to get out of hand. Any action that threatens company unity is dealt with quickly and summarily.

These are by no means the sum of the Homestead Inc.'s holdings. There are hundreds of minor subsidiaries and holding companies under the Homestead banner. These are merely the largest and most influential divisions.

Homestead Inc. is the main office, and handles administrative chores for the corporation as a whole. It is responsible for charting corporate strategy and overseeing major projects. Any work that requires the cooperation of more than one division must be coordinated through the main office. All other divisions report to the home office on an informal monthly basis, with more detailed and formal reports required quarterly. Most of Homestead Inc.'s employees are management, legal, or financial types. There is also a fairly large information dispersal sector, which includes both couriers and IT experts. Given the size of the corporation, that still leaves a lot of positions to fill. Branches of Homestead Inc. appear in every sector with another division of the corporation active in it.

Homestead Transports is the shipping arm of the corporation. The division motto is, "Any time, any place, any size." Their transport fleet is arguably the largest in the galaxy, and their ships are the standard for the whole shipping industry. Their rates are fairly high, but the service is reliable and their shipments easily insurable. Homestead Transports offers many employment opportunities in many areas. Pilots, navigators, and freight handlers make up the bulk of the division. However, there is also a need for translators, local guides, ground transport personnel, and occasional mercenary work guarding shipments. Many of the ground transport personnel and mercenary forces are contracted as needed from local workforces. Even some of the cargo runs to remoter sectors of the galaxy are sub-contracted out to independent operators. Given the division motto, any number of adventures could evolve from Homestead Transport contracts. Characters could find themselves delivering artifacts from archaeological digs, supplies to a remote watcher outpost, or the cryogenically suspended bodies of soldiers or aliens . . . maybe both! And woe unto anyone that accepts a Homestead Transport contract but fails to deliver the goods as promised; that's where the bounty hunters come in. The division takes its motto and its reputation very, very seriously.

Homestead Financial is a huge operation, handling trillions of credits in transactions a day. It specializes in very large, very long-term loans, usually for developing off-planet interests of either a business or a colony. As a sideline, it runs an insurance business, catering again to large-scale development projects. It also handles the day to day financial concerns of the other corporate divisions, overseeing their financial networks and insuring their shipments. Jobs available in this division are concentrated mostly in the financial sector, but there are a good number of openings in other fields. For example, large-scale contractors may take jobs with the division as inspectors, traveling to various

sites and determining either the cost of a project or the risks involved in it for insurance purposes. Sometimes whole teams of inspectors are dispatched, with a wide variety of skills at their disposal. (Dare we suggest your party of adventurers?) Some of these missions are long-term, and all of them have their share of risk involved. Then there is the potentially dangerous job of collecting on defaulted loans. There are even teams of investigators to resolve insurance claims.

Armitage Shipwrights is the aerospace division of the corporation. It builds and maintains starships for anyone willing to pay for them. They concentrate on larger vessels, such as transports and cargo ships. They also accept a large number of military contracts, although the corporation makes it a point not to supply more than one side of any given conflict. Their designs are solid and practical, with a long history of reliability. They are also somewhat more expensive than many ship builders, but their reputation makes the difference in sales. Engineers and construction workers comprise the bulk of the workforce; pilots are also well-represented. No ship leaves an Armitage spacedock until it has been thoroughly shaken down, and the division delivers (for a fee) when asked to do so. Military and civilian consultants are often hired on a temporary basis for single projects.

Tandor General Merchandise is the division least associated with the corporation in the minds of the galaxy. This division handles the distribution of resources the company gathers. Many of Homestead Financials customers pay their loans in goods instead of currency; these goods are shipped to Tandor GM, which locates, researches and exploits markets for them. Tandor is a wholesaler, and deals with a large number of clients, both human and non-human. Opportunities with Tandor GM are fairly diverse. Buyers travel the stars looking for new and interesting things to sell; these merchants have to be able to think and act independently and quickly to capitalize on deals before the competition gets wind of them. Sales personnel carry out delicate negotiations with many races, while troubleshooters and shipment trackers are often sent to exotic locales to solve exotic problems. Labor Relations experts travel to hotspots regularly, solving personnel issues.

Baskin Construction is the major contracting arm of the corporation. Most of its responsibilities lie in colonization projects. Baskin can equip and supply colony vessels with tools and personnel for a wide variety of construction needs. Their experience in a wide variety of atmospheres makes them the firm of choice for those willing to build in hostile environments. While the majority of their contracts come from the home office, many other companies looking for off-planet interests seek the firm's expertise. Working for Baskin can be quite challenging; site engineers travel to the harshest environments the galaxy has to offer to survey the terrain, sometimes years before construction is scheduled to take place. It isn't at all uncommon to send entire parties of experts on long-term surveys; many of these projects are in space that has barely been mapped, let alone explored. Such jobs are risky, and pay accordingly. Managers and construction workers can face a wide array of challenges in hostile environments. If someone or something has a claim on the land, Baskin has negotiation teams on call. And even a well-known world can have nasty surprises requiring skilled troubleshooters to resolve.

Bastion Research is the last major division of the corporation. First and foremost, Bastion is concerned with terraforming. The overwhelming complexity of that task, however, leaves Bastion with a huge repertoire of scientific disciplines at its command. Everything from biology to vulcanology, metallurgy to meteorology, ecology to human engineering fits under the Bastion umbrella. For this division, fieldwork is everything. Large expeditions spend years conducting large-scale experiments on remote planets. Some are in extremely hostile environments. Many others study the relationships of life forms in earthlike atmospheres. Such expeditions demand highly competent people with diverse backgrounds. Scientists, after all, are well known for forgetting the details (like eating and breathing) when faced with a sufficiently complex question to answer. People skilled in transporting and operating complex equipment find excellent jobs at Bastion. And let's not forget those planets that already have indigenous life. Someone has to carry the guns; sometimes someone needs to fire them, too.

Campaign Uses

Homestead Inc. is a diverse company, and can fill a large number of roles in any campaign, depending on the needs or whims of the GM. As a Patron, the corporation has vast influence among the stars, and has access to state of the art equipment. In *GURPS* terms, this gives it at least a 30-point base cost. If the characters have access to the equipment

as well, this goes up to 35. Homestead Inc. is too large a company to focus its full attention on any one set of characters, though. Players should not be allowed more than a 12 or less roll for frequency of appearance; even then, they better have a very good explanation. It is also possible for a character to take one of the divisions as a Patron. The base cost in this case should drop to 25 points.

As an Enemy, Homestead is just as formidable, with a base cost of -40. With a corporation the size of Homestead Inc. however, it is easy to slip between the cracks. Killing a member of the Board is about the only way to get Homestead's undivided attention. A character would have to be a major thorn in the corporation's side to rate a 12 or less roll. Individual divisions have a base cost of -30.

As a source of adventures, Homestead Inc. has nearly limitless potential. As an employer, it offers a rich variety of freelance or contract jobs. Want to travel to exotic places, see exotic people and kill them? Homestead Financial needs a squad for a foreclosure. Feel like a whodunit tonight? It just so happens a shipment of earwax from the rare Tirellian Sea Mammoth vanished out of Homestead Transports warehouse two days before the quarantine ended. And then there's the problem Bastion Research is having with the natives at its latest research project . . .

As an adversary, Homestead makes a great soulless corporation. Maybe the natives mentioned above need your help to stop Bastion from destroying their livelihood. Perhaps the colony made its payments on time, but pirates took the courier vessels. Neither Homestead nor the colonists realize what has happened, but the foreclosure teams are on the way. And the earwax of the Tirellian Sea Mammoth is a hot item on the black market . . .

by **P.D. Magnus**

Kill Doctor Lucky comes with just a board and a pile of cards. One doesn't expect counters from a Cheapass Game, but some of the atmosphere is lost when the statuette of the Berlin Bear wanders the house chased by refugees from Parcheesi. The solution is this cast of would-be murderers and one would-be victim. They are provided in PDF format ([Click here to download!](#)), so you can print out hordes of them at your pleasure.

These figures invite introduction into other games, too. Dropping them into a session of *GURPS How To Host a Murder Mystery* is obvious enough, but let's not stop there -- the PC's in your next *Call of Cthulhu* game can be made to fear the squad of Little Rhodas that steps off the phantom school bus!

Cardboard Anti-Heroes

Dramatis Personae

- **Agnes Lucky:** Dr. Lucky's sister. The Doctor ruined her chances with the only man she ever loved. Plus, he still refuses to admit that she is the better snooker player.
- **Derek Lucky:** Dr. Lucky's nephew. He is a money-grubbing ne'erdoowell, of course, and he is convinced that he stands to inherit a great fortune. His plans for the money include fine wine and expensive women -- and at least the wine won't turn him down.
- **Emma Hunt:** Dr. Lucky's niece. She has something of a homicidal streak, and she also hopes to inherit enough money to pay off the debt owed by her boyfriend Doyle.
- **Della Hunt:** Emma's boyfriend Doyle. After swindling half of the East End, Doyle is on the run from the law. He told Emma that he was on the run from loansharks, and she was very understanding. She suggested they travel to the country. To avoid suspicion, he's posing as her sister Della. Everything was going well until Dr. Lucky saw through his disguise. Now Doyle has to kill the old man before the geezer has a chance to go to the authorities.
- **Little Rhoda:** The daughter of Dr. Lucky's former mistress. Her ailing mother planned to come tonight and kill Dr. Lucky, but she is confined to bed. Rhoda has come in her place and plans to make her mama proud.
- **Colonel Eberhardt:** Dr. Lucky's bunk-mate in his army days. The Colonel has been portly and bald ever since the Doctor abandoned him to die in the Congo. That was many years ago, but now it is time for payback.
- **James:** The butler. He had a last name once, but no one has called him by it in a decade. He wants to bring his interminable service at this unspeakable estate to an end, but he can't leave until Dr. Lucky does. And the only way Dr. Lucky is leaving is in a bag.
- **Alexis Lucky:** Beautiful but treacherous. Perhaps she is some relation to Dr. J. Robert Lucky, in line to inherit

millions. Perhaps the last name is just a coincidence and she will kill him just to watch him die.

The Bonus Weapons Variant

In this variant, each character gets a bonus with the one or two weapons that they are depicted carrying. They get a bonus of +1 when they attack with one of those weapons, and any Failure cards they play are worth +1 to stop attacks with one of those weapons by other players.

If you play with only one bonus weapon each, use the first of the two listed here.

- **Agnes:** Billiard Cue (Revolver)
- **Derek:** Civil War Cannon (Loud Noise)
- **Emma:** Piece of Rope (Silken Cord)
- **Della:** Chain Saw (Monkey Paw)
- **Rhoda:** Big Red Hammer (Silken Cord)
- **The Colonel:** Trowel (Shoe Horn)
- **James:** Rat Poison (Bad Cream)
- **Alexis:** Sharp Knife (Letter Opener)

Pyramid Pick

Godlike -- Superhero Roleplaying in a World on Fire, 1936-1946

Published by [Hobgoblynn Press](#)

Produced by [Pagan Publishing](#)

Written by **Dennis Detwiler & Greg Stolze**

354-page hardbound book; \$39.95

The release of *Godlike* marks not only the completion of the quartet of World War II-themed RPGs announced for 2001 -- the sixtieth anniversary of America's entry into the war, but also the advent of the very first RPG from Pagan Publishing. Best known for their superb range of *Call of Cthulhu* campaign books, devotees of Chaosium's classic RPG have come to expect something special with each new Pagan book. So just on reputation alone can we expect that something special in *Godlike*?

Of the first three World War II RPGs, only *GURPS World War II* took a straight view upon the history, whereas the other two combined the history with another genre -- World War II and mecha in DP9's *Gear Krieg*, and pulp horror with World War II in Pinnacle's *d20* setting and supplement *Weird War II: Blood on the Rhine*. With *Godlike*, the combination of genres is that of superheroes with World War II, which must make this game the first superhero-World War II RPG. Previous takes on this genre combination -- *All This and World War II* for TSR's original Marvel Superheroes, *Glory Days* for *Brave New World*, and the *JSA Sourcebook* for *DC Universe* have tended towards the four-color style. Not so with *Godlike*. All characters are normal people first, and potential heroes second. In *Godlike*, characters may be blessed with extraordinary abilities, but a bullet can kill in most circumstances -- in this game it pays to duck and cover!

The first Talent (as super-powered individuals are called) was Der Flieger -- the "Airman" who landed at the opening of the Berlin Games to light the Olympic torch. Hitler reveled in the existence of the first *Urbemensch* and for years would deny that any other nation or race could also possess men with special abilities. Der Flieger could fly faster than the sound barrier and whatever the altitude did not suffer from either lack of air, the cold, or wind resistance. Later in the war, his sonic boom would down the Polish air force and some fifty allied aircraft before proximity fused anti-aircraft rounds killed him in 1944.

Events leading up to the war and throughout placed individuals under enormous stress, which was often enough for them to manifest their own ability or Talent. For example, Jumping Johnny, the first English Talent, was with the British Expeditionary force at Dunkirk. In his desire to escape, he leapt the English Channel -- some twenty-seven miles. A side effect was the explosive effect of his landing, from which the Talent was himself immune. Used as a scout throughout the war, this flaw would be his undoing when he landed in a German ammunition dump.

Although *Godlike* combines World War II with superheroes, it plays straight with history. The effect of Talents upon history is minimal -- for example, a possible precognitive dream had the USS *Arizona* under sail and at battle stations at 7 am on the morning of December 7th, 1941 and it was the *Oklahoma* that was sent to a watery grave. The major changes would come after the war when the "mad" Talent god Lord Yama forced the creation of the Realm of Assam in Northeast India and the foundation of a tribal homeland for the Kachin people split Burma in two.

During the war as more and more Talents appeared, they were pressed into military service. The Allies assigned them

to the most suitable service, but in the European theater most would be sent to the British commando school in Scotland, trained to be soldiers first, then Talents, before being assigned to a Talent Operation Group (TOG) which would be attached to a US infantry division. There they would serve as scouts, shock troops and the like, specially trained to fight Axis Talents, who were usually inducted into the SS. This is the default setting for *Godlike*, spearheading the invasion into occupied Europe -- after all, the motto of the TOG is "We Go First."

Character design in *Godlike* is relatively easy, but with each player working with the GM to build a character to fit an agreed concept. The process involves first creating an ordinary character, before going onto designing and purchasing the Talent powers. Characters have six attributes -- Body, Co-ordination, Brains, Command, Cool, and Sense. These are rated from one to five, with two being the human norm. In the game they start at one and players have a further six points to assign to them. Then twenty points are spent on skills, though no skill can be bought above the attribute it is keyed to. If the default TOG setting is to be used, characters also receive a package of skills to reflect their further training.

Although the setting is the work of Dennis Detwiller, the mechanics are the brainchild of Greg Stoltze. They use a "stat+ skill" dice pool system that is dissimilar to the one you might have seen in either *Vampire: The Masquerade* or *Legend of the Five Rings*. Ten-sided dice are rolled equal to the dice pool, which cannot be greater than ten dice. The aim of this is to obtain matches. Roll two or more matches, and you succeed, but each matching set can be defined by its height and width. High or tall matching sets have high numbers on their rolls -- say a pair of eights and above. A wide set contains a large number of matching sets, say four 3's. This is expressed as a shorthand: width x height. Roll 6d and get 2, 3, 4, 6, 10, 10 -- this would be a tall and narrow result or 2 x 10. Roll 1, 4, 4, 4, 4, and 6 -- would be a wide, short result or 4 x 3. Both height and width are important -- height determines the degree of success, width how quickly you get the job done.

The rest of the rules in *Godlike* are essentially slight permutations on how the "width x height" rolls are interpreted. For example, in combat, all those involved make just a single roll -- width of which determines initiative and the height where you hit. Combat itself involves both shock and killing damage and is geared towards forcing the players to think about their actions, rather than attempting to stand there and take the damage. The rules cover just about every eventuality on the battlefield -- aimed and spray fire, grenades, flamethrowers, and dealing with armored vehicles. Up until this point *Godlike* could just be used to run a solid, gritty World War II game, but that would be missing the point of this RPG.

That would be the Para-humans known as Talents. Scientists cannot quite understand how these work, only that they can somehow warp reality with their mind. If their will is weak -- lost through shock, mental illness, and direct will contests -- their Talents may not work. Will-to-will contests usually come about as the result of a Talent facing another Talent. One Talent can detect the presence of another and can even attempt to prevent the use of an opponent's own Talent ability if he so decides. In the default high realism campaign, each character receives twenty-five points of Will with which to purchase their Talents. Alternatively, larger-than-life characters can be created on thirty to forty-five points for a cinematic adventure style game or a four-color character can be created with up to a hundred points.

Talents can be designed, or alternatively one of the ready-to-run 25-point packages can be bought. Talents come in the form of Hyperstats and Hyperskills (these two allow you to push both skills and statistics above the human maximum of five) and Miracles. These are the true superpowers in *Godlike*, but are limited in that some traditional powers of the genre do not exist in this universe. This includes definitive precognition, mind control, absorption and creation of powers, true telepathy or mind reading, time travel or Superscience. Goldberg science does exist, but the futuristic devices created using the Goldberg Talent do not work outside of the creator's vision. Most Talents listed are generic, to which the player adds the descriptive details. One Talent that is peculiar to *Godlike* is the Zed -- which enables a Talent to temporarily negate another's powers.

Players use their free Will points to buy dice in their desired talents. These can be ordinary dice, hard dice or wiggle dice (no laughing at the back there . . .), each more expensive per die. When a Talent dice pool is rolled, any hard or wiggle dice are kept aside and compared with the roll made. Hard dice are always ten, so it is usually good to buy a minimum of two, so rolls always succeed (and succeed well). Wiggle dice are better than hard dice because they can be changed to any number to get matches with those rolled and determine the degree of success desired.

With each Talent, a cost is given for each type of dice. These costs can be increased by making a Talent more powerful, versatile or reliable, and decreased by giving it flaws. For example, Gladiatrix, the bodyguard of General de Gaulle, has the Talent miracle of "Block" and can parry bullets fired at her. Block has the qualities of Defends and Robust. If she wanted to be able to deflect those bullets back at the source, the Attacks quality would be added, increasing the cost. The overall cost is reduced because Gladiatrix can only use her Talent with her father's sword -- it has a unique focus. While the arithmetic involved in this process is far from difficult, some practice will certainly be needed before either player or GM will be happy with the process. Examining the many examples throughout the book will help. The complexity lies somewhere between *Nexus: the Infinite City* and *GURPS Supers*.

The *Godlike* rulebook is itself a sturdy hardback, the contents printed on good quality paper. Although the illustrations are sparse, they are a mixture of photographs, doctored photographs -- to show for example a flyer alongside a trio of ME-109 fighters, and original art. The writing is not without the occasional much dreaded "refer to page xx," and while irritating they are not insurmountable as *Godlike* comes with a good contents page and reasonable (but not perfect) index.

For the *Godlike* GM, there is plenty of support including a detailed history from 1936 to 1946. This closely adheres to our own history, but clearly marks those entries that describe Talent involvement in an event. There are dossiers of over sixty Talents from across the world, although only the first ten listed are given full game statistics. Many of these break the 25 point high realism limit, with one or two -- including Der Flieger -- costing as much as 150 points. Additionally a full TOG unit is described and written up ready to play. Comprised of a first lieutenant, a sergeant and a squad of seven, all of these Talents are built on the 25-point limit. It is suggested that initially both officer and NCO are kept as NPCs, with the players selecting from the enlisted men, each playing multiple characters in what *Godlike* calls "Troop Play," essentially this being the same as Troupe Play, pioneered in *Ars Magica*. Members of this TOG are all American, which in the main rulebook constitutes the default nationality, further supported by background material upon the USA. But given the full field manual of equipment (though I would gripe at the lack of the Bren gun from the description of British equipment), and some research a GM will be able to run a game in any desired theater of World War II.

The first two appendices at the back of *Godlike* provide optional rules and statistics for the first ten Talents. In the third appendix, Mike Mearls gives us thirty pages of "Open Source Superhero Rules" for those that want to run *Godlike* using the *d20* system or as he puts it "that game." Although the core *d20* mechanics are used, these rules give a completely different method of character generation to the one seen in the three core books. Character creation is by design, with the starting stats of eleven (exceeding normal humans' average) and no feats. There are no classes, and characters receive forty points to spend on skills, with combat skills being very expensive. As in the *Godlike* rules, the style of campaign desired -- here given as gritty, low-powered, moderate-powered, high-powered, and super-powered -- determines the points to be spent on hyperstats, hyperskills, and miracles, as well as feats and save modifiers. The game system is the same one we know and love, being linear as opposed to *Godlike*'s dice pool mechanics. Using these rules will give a *Godlike* game a very different feel, one that is slightly more heroic in style. Certainly this appendix does offer the *d20* devotee a far more comprehensive set of rules with which to explore the superhero genre than we have seen to date.

In addition to the gritty feel of *Godlike*, the tone of the writing gets across a sense of desperation inherent in the setting. The Second World War was a time of desperation, with both sides fighting to save what they felt was important. Talents were pressed into service more so than the ordinary man, but to paraphrase the back cover of the *Godlike* rulebook, "Talents are larger than life. But the war is larger than any one Talent." In battle, Talents can make the tactical and occasionally the strategic difference between victory and defeat, yet in the grand scheme of things, it is still men, logistics, and planning that make the real difference and win the war. To a Talent, their power not only separates them from ordinary men, it also puts them on a pedestal. They are expected to live up to higher expectations -- be braver, more resourceful, and above all, have the same faith in themselves as others do. To a Talent, defeat is very much a state of mind and loss of faith can mean loss of the very ability that sets them apart from the norm.

Only one thing is really missing from *Godlike*, and that is a scenario. Suggestions are given, but for an actual adventure one should turn to "Glazier," a ready-to-play scenario that can be found on the *Godlike* website (<http://www.godlikerpg.com>). Also available on the site are the basic rules so that Glazier can be run, plus additional

resources. Hobgoblynn Press plan to detail other participants in the war in a range of supplements, including the Germans in *G-1: Will To Power*, and the British and Americans in *G-2: The Reality of the Impossible*. Further, they have the future of the future of the Godlike universe mapped out during the Cold War with *Ghosts: Superhero Roleplaying in a World on the Brink 1947-1975* and an examination of a Talent school in *Teenagers+: Superhero Roleplaying at the Toliver School for the Ethical Use of Parahuman Powers 1984-1988*. Before either of these RPGs is released, GMs can map out the future of their *Godlike* campaigns with *Wild Talents: Superhero Roleplaying in a World Gone Mad*.

For their first RPG, Pagan Publishing have given us a solid game that succeeds in exploring the author's question -- "What would a world be like if there were super humans?" In *Godlike*, the answer would be "only slightly different," but it is enough to mark this game as not only an excellent World War II RPG, but an excellent superhero game as well. Additionally, Greg Stoltze's mechanics have a great feel to them, being fast and effective -- just right for the game's gritty tone. For gamers looking for a different take on the genre, *Godlike* should light their imagination.

--Matthew Pook

Pyramid Review

Dogs o' War: All's Fair (for The Great Rail Wars)

Published by [Pinnacle Entertainment Group](#)

Written by John R. Hopley and Shane Lacy Hensley

64 pages; \$15.00

Dogs o' War: All's Fair, by John Hopley and Shane Hensley, is Pinnacle Entertainment Group's long-awaited return to their *Great Rail Wars* miniature battles game. The supplement updates the timeline to the year 1878, following the setting-changing events of the *Deadlands* role playing game's recent adventure trilogy. More importantly for the players of *The Great Rail Wars*, however, is the updating of the Rail Barons' progress, the addition of new units and heroes for each of the railroads, including a handful previously scattered throughout other books, and the entrance of a new faction: the City of Lost Angels. Most of the new units detailed in this supplement have attractive corresponding miniatures available from Pinnacle Entertainment Group. Finally, *Dogs o' War* includes a short campaign, with briefings for each of the factions. While the book is physically thin for the \$15 price tag, it is densely packed and a welcome return to an exceptionally fun game.

[SPOILER ALERT!]

Even longtime players of *The Great Rail Wars* will be surprised at some of the twists and turns the Great Rail Wars have taken. The coming of the cease-fire in the east, brought on by the deaths of Jefferson Davis and Robert E. Lee (detailed in the *Dead Presidents* adventure) and the coming of the Cold War, Union and Confederate troops have shifted west. Likewise, the events that forged the Black Circle (detailed in the sourcebook of the same name) have produced an uneasy cease-fire between the Black River and Union Blue. A tunnel collapse (sealing up Tombstone Epitaph reporter Lacy O' Malley along with the workers) and an aggressive stance by the Denver Pacific (owned by Smith and Robartes) have apparently knocked Hellstrome's Wasatch out of the race, although some believe he is simply readying a new plan. Iron Dragon, having reached Seattle, purchased the Great Northwestern under tense circumstances. Finally, both Dixie Rails and Bayou Vermillion have come closer to the City of Lost Angels, although both are wary of Santa Ana's Army of the Dead and the new resistance of Reverend Grimme's forces - including the Avenging Angels, Bloody Ones, and Faminites.

[END SPOILER ALERT]

In addition to advancing in space, the Rail Barons have developed several new units. Some of these, like the Veteran Artillery units of Union Blue and Dixie Rails, are natural enough developments. Likewise, several long-awaited (and long-expected) units -- like the Black River's Coven of Witches and Iron Dragon Sorcerers -- appear. Several new Heroes, including Doc Holiday, Wyatt Earp, and Violet Esperanza, are found here. In several cases, these units and heroes have new advantages, disadvantages, and gizmos. In doing so, *Dogs o' War* addresses one of the small problems of the game -- the strong similarity between Union Blue and Dixie Rails. Likewise, several of the gaps found in each army have been interestingly and appropriately filled.

"Payback!", the mini-campaign included with the supplement, is a short, playable series of encounters. It includes specific briefings for all of the factions, old and new, and is a good introduction to the Lost Angels faction. The authors recommend that players run "The Many Tasks of Grimme" scenario, found in *A Fist Full of Ghost Rock*. In addition, those with access to the unpublished but once-downloadable *Raid on Roswell* will likely want to play this campaign first as well (There is some indication that this will be re-released by Pinnacle at some point in the future). The campaign is short enough to be played in a single afternoon by those familiar with the rules of the game.

There are some things that would have made this supplement even stronger. A workable experience or hero creation system would add to the game and add some weight to a thin 64 pages. Due to flaws in the original system that allowed for abuses, *The Great Rail Wars* has been without a workable system for creating heroes and experienced units. *Dogs o' War* does offer something close, in providing new heroes and some veteran units, but the freedom to create such units would add a lot to players' options.

Along with the release of *Dogs o' War*, Pinnacle has released several new miniatures. Bayou Vermillion now has a very attractive Hougan, usable for both this game and any other needing a Voodoo priest while Dixie Rails and Union Blue now has a solidly sculpted leader figure in the USA/CSA Officer. The bulk of the figures, of course, have gone to Lost Angels, and include the Avenging Angel, the Hunger Spirit, and posses of Guardian Angels and Faminites. All of these are of high quality with a good feel of motion. The Hunger Spirit, a fairly large figure, requires some assembly. (These blisters are available at the Pinnacle Entertainment Group web site.) All can also be used with any version of the Deadlands role playing game.

All in all, *Dogs o' War* is a good buy. In terms of size, the book is a little thin for \$15 but the 64 pages are packed with good material.

Pyramid Pick

Gaming Frontiers (for d20)

Published by [United Playtest Inc.](#)

Edited by Robert J. Williams

140 full-color pages; \$17.95

Gaming Frontiers is a bit different than the standard magazine. Many are thinking, at \$17.95, it better be. Well, it's not really a magazine, but more like the Rifter from Palladium. This is a sourcebook not for one genre or setting, but for all things *d20*. But what's inside? Reading the back cover of Gaming Frontiers is like reading a who's who not only of the *d20* system, but some of the founding fathers of the original Dungeons & Dragons game. Not only do you have well known *d20* publishers like Green Ronin, Privateer Press, and Atlas Games, but also there are web-based companies like Oone Roleplaying Games and Bard's Productions.

Each of these companies has contributed something a little special to the first issue. Are you looking for prestige classes? Check out the Skval, a Norse Warrior with an affinity for water, or the Ehtzara, a unique Prestige Class from *Arcanis* campaign setting.

Those looking for monsters, get a sneak peak at Minions with four creatures in full color, as well as a section of Norse Specters, a hint of what's to come in the Codex Germania. Of course, dinosaurs might be more your style, and with the sneak peak at *Dinosaur Planet: Broncosaurus Rex*, we get to see five different dinosaurs at various sizes to throw into the *d20* mix.

Some might be looking for more adventures. For them there are "The Tomb of Obrosh," an adventure for 8th-10th level characters from Skeleton Key Games, "The Grande Temple of Jing" by Hammerdog Games for 4th-6th level characters, and "The Veiled Threat" by Guildhouse Games for a 5th level party.

If magic items are your preferred currency, the Treasure Chest has a section titled "Incoming" from Thunderhead Games that gives the GM plenty of missile weapons to incorporate into his campaign, ranging from different types of arrows to the Gauntlets of Fire. Those tired of standard fantasy settings will enjoy No Boundaries, as this issue presents "Interstellar Journeys," a massive science fantasy setting with a background only hinted at that allows the GM to customize it.

In addition to gaming goodies, there are interviews, reviews, fan letters, and editorials. The interview in this issue is with none other than Rob Kuntz, one of the original faces in *Dungeons & Dragons*, as well as the author of the upcoming *Codex Germania*. The reviews, while seeming a little high in praise and low in downfall, are generally right on the mark. The editorials are interesting, providing a bit of background on how *Gaming Frontiers* came into its current format, as well as a rant on the poor art found scattered through many *d20* products and a plea to increase that quality immediately.

For those who don't like crunchy bits and are looking for something more fulfilling, there are locations, like The Falling Star, a location within the *Iron Kingdoms* city of Corvis. This inn comes with its own cast of characters and full-color illustrations by none other than Matt Wilson. Those worried that Matt's talents showcased in the first *Iron Kingdoms* trilogy may have faded will be proven wrong; this is some of the best work to come from his fertile mind thus far. Aside from gaming bits, there is also game-related fiction. In this case, Green Ronin Publishing brings us a short story set in the city of Freeport, as well as fiction by Bard's Production and Mystic Eye Games.

The book boasts a lot of graphic design, easily in the ranks with *Dragon Magazine*. Unlike a standard magazine, it has

a very sturdy feel and will endure constant flipping. The layout changes from article to article, separated by the colored edges. Advertising is also full color and isn't just standard **d20** companies, but also web companies like RPGNOW.

Those totally uninterested in the **d20** system will still be amused by Zogonia, an adventuring group with an unusual assortment of characters that bear more than a passing resemblance to many player characters, as well as "Hostile Munchies," an amusing look at what happens when M&Ms go adventuring. In addition to the funnies, Frameworks showcases the art of a'lis (whose web site is <http://22.ari02.net>), as well as a Q&A with the artist.

All in all, the book provides a whole plethora of good gaming material that is useful both at the table and away from it. The only thing I personally hope to see is some work by the Sword & Sorcery Studio group or one of their fellow publishers like Fiery Dragon, Malhavoc Press, or Necromancer Games. The design is up to professional standards, and in some cases, is even better than the **d20** companies that contribute to it. At \$17.95 for a full-color 140 page perfect-bound book, it's a bargain, especially for **d20** players.

--*Joe G. Kushner*

Hurled Into Eternity: The Gunfight At The O.K. Corral

"The real story of the Old West can never be told unless Wyatt Earp will tell what he knows, and Wyatt will not talk."
-- Bat Masterson, quoted in *Wyatt Earp: Frontier Marshal*, by Stuart Lake

In thirty seconds and thirty shots, three men died behind the O.K. Corral in Tombstone, Arizona. It was blood feud and political showdown and law and order, all swirled up together in the powder smoke and sawdust of the Western frontier. It might have been the last battle of the Civil War, or a battle for even more contested ground -- the nature of the American myth, and the right to ride into the sunset, and to return when the land again has need of heroes.

"Three Men Hurled Into Eternity in the Duration of a Moment.

Stormy as were the early days of Tombstone nothing ever occurred equal to the event of yesterday. Since the . . . appointment of V.W. Earp to [town marshal] the town has been noted for its quietness and good order. . . . It seems that this quiet state of affairs was but the calm that precedes the storm that burst in all its fury yesterday, with this difference in results, that the lightning bolt struck . . . with its full and awful force upon those who, heretofore, have made the good name of this county a byword and a reproach, instead of upon some officer in discharge of his duty or a peaceable and unoffending citizen."

-- Tombstone *Daily Epitaph*, Oct. 27, 1881

Wyatt Earp had made a name for himself as assistant city marshal of Dodge City, the wildest cow-town in Kansas. However, when Dodge settled down, Earp's restless nature drew him further west, to the silver mining boom town of Tombstone, Arizona. His brother Virgil Earp was deputy U.S. marshal for the Arizona Territory, and later became town marshal of Tombstone. Wyatt served on and off as deputy sheriff, but soon found himself embroiled in the local political feud between Tombstone's Republican business community (which supported the Earps' law-and-order ways) and the primarily Democratic ranchers such as the Clanton and McLauray families. The Clantons and McLaurys served as fences for cattle, horses, and mules stolen by a gang of mostly former Confederate rustlers known collectively as the Cowboys; the corrupt sheriff John Behan actively connived not only at their thefts, but at robberies of the Wells Fargo stage lines. When politics thwarted the Earps, they picked up extra cash riding shotgun for Wells Fargo. When three Cowboys killed stage driver Bud Philpott, Behan tried to pin it on the Earps; the Earps, meanwhile, set out to prove Clanton involvement.

Ike Clanton apparently agreed to sell out the three Cowboys to Wyatt Earp, but a drunken Wells Fargo agent leaked the deal, and in a panic, Ike repeatedly tried to instigate a gunfight to kill Wyatt and hush up the stink. Unable to catch Wyatt unaware, Ike wound up forced into a confrontation in the back lot between the O.K. Corral and Fly's Photography Studio. Wyatt, Morgan, and Virgil Earp, along with Wyatt's friend the gambler (and deadly gunfighter) Doc Holliday, confronted Ike and Billy Clanton, Tom and Frank McLauray, and another Cowboy named Billy "the Kid" Claiborne around 3:00 in the afternoon on October 26, 1881. As town marshal, Virgil ordered the Cowboys to throw down their weapons (carrying guns being illegal in Tombstone) and put up their hands. Billy Clanton and Wyatt Earp fired simultaneously, and the Gunfight opened. Thirty seconds later, only Wyatt Earp remained unwounded, and Billy Clanton and Tom and Frank McLauray were dead. Ike Clanton and Billy Claiborne fled, and were arrested later.

"Eight rustlers rose up from behind the bank and poured from thirty-five to forty shots into us. Our escape was miraculous. The shots cut our clothes and saddles and killed one horse, but did not hit us. I think we would have been killed if God Almighty wasn't on our side. Wyatt Earp turned loose with a shotgun and killed Curly Bill."

-- Doc Holliday, interviewed in the *Denver Republican*, May 22, 1882

The above narrative has been questioned, not least by Clanton partisans and revisionist historians, but as Allen Barra points out in *Inventing Wyatt Earp*, this is the version that all non-Cowboy witnesses agreed to -- and that even Ike Clanton reported on the day after the Gunfight. Judge Wells Spicer also agreed with it, dismissing all charges against the Earps in a preliminary hearing. (The version of the Gunfight given in *GURPS Old West* is apparently solely based on the Clantons' testimony in that hearing.) However, the Cowboys and their political allies weren't going to give up easily. They redoubled their robberies and rustlings, ambushing Virgil Earp on Fifth Street at midnight on December 28, crippling his arm. "King of the Cowboys" Johnny Ringo and Doc Holliday nearly came to blows -- since the

Clantons had been lurking outside Doc's lodgings on the day of the Gunfight, he had cause for nervousness.

On the night of March 18, 1882, parties unknown (but widely suspected to include Cowboy leader Curly Bill Brocius, Behan's deputy Frank Stilwell, and Florentin "Indian Charlie" Cruz) shot Morgan Earp in the back with a rifle as he played pool, killing him. Wyatt Earp immediately headed to Tuscon to put Virgil on the train to California -- but he ran into Frank Stilwell, lurking by the railroad car with a gun. Wyatt shot Stilwell, and crossed the line into vigilantism. Along with Doc Holliday, Warren Earp (who had come to Tombstone after Virgil's shooting), and three other friends, he rode out of Tombstone on March 21 on his "Vendetta Ride." Wyatt's men killed "Indian Charlie" the next day, and survived another withering daylight gunfight unscathed at Iron Springs on March 23, when he gunned down Curly Bill Brocius and another Cowboy, Johnny Barnes. On July 13, 1882, Johnny Ringo was found dead with a single gunshot wound to his temple, his boots off, and his gunbelt on upside-down. His vendetta complete, Wyatt Earp headed west, for San Francisco and a new wife -- John Behan's ex-girlfriend, the actress Josephine Marcus.

"We had such a séance last night. That evening with Wyatt Earp would have been worth \$1,000 to the newspapers."
-- diary entry by George Parsons, Aug. 30, 1900

However, the ghosts of Tombstone lived on. Literally, in fact; Tombstone has at least six major hauntings, including the Wells Fargo office (an Earp stronghold) and the Grand Hotel (a Clanton hangout), with 31 ghosts sighted at the Bird Cage Theater alone. The phantoms may have appeared early; Wyatt recalled a "veiled figure" of indeterminate gender calling on Virgil's house on Halloween, 1881. Even the names of the two wounded Earps recall the afterworld - - Virgil as the guide of the dead, and Morgan as a masculine "Morrigan," the Irish death-goddess? Morrigan was also a triple-goddess; Morgan closely resembled not only his brother Wyatt, but fellow Wells Fargo agent Fred Dodge. (This resemblance -- or some more sinister transference -- might be why Frank Stilwell's last word was a panicked "Morg!") Morgan was killed on the death-day of Tammuz, and the dogs on the street howled at the moment of his death. (Wyatt killed Curly Bill on the last day of the Feast of Mars.) Wyatt, meanwhile, went to outrageous lengths to conceal his gravesite in San Francisco's Colma cemetery -- it wasn't found until it was robbed in 1957. The grave of Doc Holliday (and that of his father) have still never been found.

"Where's Wyatt?"

Down by the creek, walking on water."

-- Texas Jack Vermillion (Peter Sherayko) and Doc Holliday (Val Kilmer), *Tombstone*

Speaking of Doc Holliday, his father was the head of a Masonic lodge in Valdosta, Georgia; Doc may or may not have also been a Freemason. Wyatt Earp was a Mason, however, although Tombstone's King Solomon Lodge #5 was not chartered until six days after Johnny Ringo's mysterious death (with his legs bare, as in Masonic ritual, and his skull at least symbolically crushed by a gunshot). Was their close, even brotherly, friendship begun with a handshake? The Masonic theme of the three killers repeats itself throughout the saga, from the three murderers of Bud Philpot, to the three assassins who tried to kill Virgil Earp (just minutes before the feast day of St. Thomas a Becket, who was also slain by three unworthy knights), to the three Earp brothers themselves behind the O.K. Corral. Even the town of Tombstone itself recapitulates this theme -- the tombstone is a Masonic symbol, with a Degree of the Monument. The tombstone also recalls the "ashlar" or "squared stone," the Perfected Stone of the Perfected Work. And does the town also memorialize the tombstone carved with "In Arcadia Ego," the resting place of the Grail King?

"Virgil Earp, Wyatt and Morgan were all up there, Morg Earp told me if I wanted to fight to turn myself loose; they all had their hands; I told them again that I was not armed; Doc Holliday said, 'You s-- of a b---, go and arm yourself; I did then go and arm myself; I went back, saw V. Earp and T. McLowry; Virg Earp was playing poker with his pistol in his lap; we were playing poker, we quit at daylight."

-- testimony of Ike Clanton at the inquest into the Gunfight

It was, after all, a king-shifting time -- the [Emperor Norton](#) had died the year before, perhaps opening up the sacred kingship of America again. President Garfield was assassinated on July 2, 1881 (the true birthday of America), and even the Voodoo Queen of New Orleans, Marie Laveau, died that summer. And that year, in a [waste land](#) over a river of silver, death came in threes to Tombstone, Arizona -- where a Southern cavalier with the unhealing wound of tuberculosis ruled a green felt empire of cards. Doc Holliday, they said, had learned card tricks from a housemaid

named Sophie (recalling Sophia, the Gnostic spirit of illumination), and consorted with a mysterious Hungarian prostitute named Kate Harony -- also known as Kate Fisher. In the Gunfight, Doc received only a minor wound -- in the side. Was Doc Holliday, Fisher King, guarded by avatars of Gawain, Gaheris, Agravain, and Gareth in the form of Wyatt Earp and his three brothers?

This could explain why mortal enemies Ike Clanton, Virgil Earp, Tom McLaury, Doc Holliday, and John Behan played cards all night the night before the Gunfight: they were desperately gambling for the sacred throne of America on the eve of the Roman "Ludi Victoria" -- the games of victory. Whatever the cards said that night, the final hand played out the next day. If Doc was the Grail King (of Hearts, or Cups), Wyatt was the Ace of Spades -- the death card. Virgil was the Knight (or Jack) of Spades, leaving Morgan as the Ten -- the card which, in the Tarot, is depicted as a man stabbed in the back, just as Morgan would be shot in the back the next spring. (Morgan was also shot in the back at the Gunfight.) Kate Fisher (the Queen of Hearts), who watched from Fly's studio next door, was the Queen in the hole. The Cowboys desperately tried to fill a full house from their two pair of Clantons and McLaurys. Witnesses reported several different Cowboys going in and out of the Corral moments before the Gunfight, but when last call came, they were stuck with Billy "the Kid" Claiborne (no doubt trying to assume the mantle of the "real" Billy the Kid, who had been killed on July 14, 1881) to fill their hand. The Fisher King's royal straight (and Wyatt Earp's solar invulnerability) beat the Cowboys' two pair, and the West was won for Masonic order, four square and on the level. Doc Holliday died in bed at the Glenwood Hotel in Glenwood Springs, Colorado, on November 8, 1887 -- the feast of the Quattuor Coronati, the Four Kings. His cousin Melanie, a nun, burned his letters, saying only that "the world would have known a different man." But the world never did. Because Doc Holliday was dead -- and because Wyatt Earp will not talk.

Go Ahead; Make Mistakes . . . It'll All Be Fine

I've always admired the work of Dr. Spock, and was fairly sad when he died. After he gave his life to save the crew of the *Enterprise*, I found myself . . .

Er, no, wait, that's *Mr.* Spock. And he got better. He's still around, as far as I know.

No, Dr. Benjamin Spock was a pediatrician and an outspoken expert on raising children, having written (and revised many times) *Dr. Spock's Baby & Child Care*. But what was admirable about him (to me) was that he believed in parents' abilities to raise their own kids. He was really the first person who let parents know that it would probably all work out all right.

While previous "experts" gave the impression that *anything you did wrong would kill your child* (or at least *horribly warp its eggshell mind for life*), Dr. Spock was much more reassuring. "It'll all be okay," he seemed to say. One mistake won't be devastating. Small mistakes won't be catastrophic. We're human; we don't need to be perfect. Just love and nurture your kid, follow your instincts, and you'll be fine.

This was an incredibly radical idea in the 1940s.

So Dr. Spock's book sold a jillion copies, and an entire generation of kids was raised by parents who *weren't* advised to tie their kid's arms down at night to deter finger-sucking. Then we landed on the moon and created MTV. (I may be jumping a bit here . . .)

Anyway, I've always respected the general optimism of Dr. Spock and his works. And I've always felt it should truly be applied to the rest of the world.

Cooking? That extra pinch of cardamom won't prove devastating. Dating? That one dumb joke probably won't ruin everything. Playing a musical instrument? That dropped note won't destroy the symphony.

And gaming? You don't need to be perfect, or please everyone.

So, if (for example) a certain Managing Editor of a certain game company said that a certain series of columns involving [Simulationist versus Romantic theories](#) bored him silly . . . well, it's not the end of the world. Mailing a mummified hand to a hypothetical [Andrew H.](#) is *completely* uncalled for, as one will almost certainly realize the day after visiting the post office.

But seriously, it's a piece of advice that seems so obvious to me now, but as I look back on my earliest gaming experiences, it's something that bears repeating. "Repeat to yourself, 'It's just a game; I should really just relax.'" I remember when I GMed my first sessions. I was so concerned about doing things right; I was terrified I'd make a mistake that would somehow ruin everything. I constantly grilled my players for input: "Am I doing okay? Any comments? Anything you like or don't like?" While in my opinion it's good to be communicative with your players, it's also possible to carry that philosophy of openness to neurosis. Yes, I made mistakes, big and small. (Thanks to a vague, sketchy knowledge of *GURPS Supers* at the time of running my first-ever adventure, I barbecued a hero in my first combat, causing me to backpedal and create a *deus ex machina* that became a plot device for over a year.) Sometimes the mistakes I made were [devastating](#), but usually [they weren't](#). And I've made mistakes as a player, too. (For example, I think my former *Vampire* GM still thinks I was exercising a good roleplaying choice by succumbing to the beast and devouring an innocent kid instead of spending a Willpower point to keep the beast in check. Really, I just forgot I could do that. Whoops.)

Regardless of my mistakes, the world has continued to rotate. Despite bumps along the way, my players have continued to have fun, I've enjoyed myself as a player, and the hobby has generally been a source of joy for those I've known who have been involved in it.

Too many articles or other game-related writing (my own included, I perhaps think) can give the impression that, if you don't follow their advice to the letter, your gaming is doomed. Yes, there are mistakes you can make -- GMs shouldn't arbitrarily kill PCs any more than parents should let their babies drive a riding mower -- but those are pretty easily learned even when they *aren't* intuitive. That just isn't the case; there's definitely a philosophical place just trusting your instincts, providing an environment that's conducive to fun, and learning from your mistakes. It'll all work out just fine.

Unless you make a horrible mistake that kills your players!

Er, no . . . just kidding.

(Sorry I forgot to mention this last week; I was really busy . . .)

Those of you who are habitual *Pyramid* reloaders may have noticed something different this week. Namely, that we actually have news in our News section. Quality news, to boot.

Now, I like to think I have a fair number of talents that I bring to the *Pyramid* table. But, really, my journalistic abilities have *never* been among those.

Fortunately, Steve Jackson Games is lucky enough to have Scott Haring back, as a man of many hats. And for one of those hats, *Pyramid* is fortunate to have him back here as our new newshound. Welcome back, Scott! Scott's pinky has more journalistic abilities than an infinite number of mes at typewriters.

If you have any *Pyramid* news or items to report, please use our new news email address at (appropriately) pyramidnews@sjgames.com . We also have a new newsgroup exclusively for news tips and news item discussions (sjgames.news for NNTP users, [Industry News](#) for web users).

(And, of course, if you want to write me for some reason, feel free to use pyramid@sjgames.com)

--*Steven Marsh*

*Last week's answer: **Pokémon Jr. Adventure Game**, p. 30.*

(Three stars) "HE FLIES, HE DIES, SHE CRIES

"Tragedy struck on campus today as the team mascot, Captain Chicken, leapt from the stadium press box and fell to his death. The mascot, played by sophomore Darryl Tate, was a fixture at football games and University functions."

Around the World on a Shilling

The Great Exhibition of 1851

Edited by Scott Larson

*(Editor's Note -- The following clipping was culled from a scrapbook of Victoriana discovered in the attic of a semi-detached in Sydenham. While the author's observations were clearly intended to edify his contemporaries, I think they will prove useful to the Game Master of such Victorian roleplaying games as **GURPS Steampunk**, **Screampunk**, **Castle Falkenstein**, **Forgotten Futures**, or **Terra Incognita**. I have interpolated a few parenthetical clarifications as well as modernizing the spelling and punctuation.)*

London, 1851

Where might one find a brace of cursed diamonds, a facsimile machine, Colt revolvers, an alarm bed that tips the sleeper into a cold bath, a mechanical man, a flying machine, Dr. Merryweather's leech-powered Tempest Prognosticator, Chartists, Charles' (Babbage, Dickens, and Sibthorp), Charlotte Brontë, and Her Majesty, Queen Victoria, together under a single roof?

Your Humble Correspondent, otherwise known as Hyacinth Lake Peabody of the prestigious Daily Tocsin, will answer this query: the Great Exhibition of the Works of Industry of All Nations, held in the Crystal Palace in London's Hyde Park from May to October of 1851. Part art gallery, part trade show, part curiosity shop, part imperial pageant, the Great Exhibition beckoned the world to England to wonder at the fruits of industry of all nations.

Our Story Begins . . .

As our glorious Nineteenth century reached its midpoint, Britain had come to feel the pinch. British manufactures compared poorly with continental counterparts by emphasizing cheapness and utility over elegance in design. Her public schools, focused on the humanities, did not prepare young Britons for an industrial future. Britain had originated and disseminated the Industrial Revolution, but her preeminent position was by no means assured. One concerned party was Mr. Henry Cole.

Responsible for the penny post and the Public Records Office, children's book author, originator of the Christmas card, designer of fine china as "Felix Summerly," Henry Cole (1808-1882) was a vigorous Victorian polymath who imprinted his mark upon the era. (He would serve as potent patron for Crystal Palace adventurers -- his dynamic enthusiasm infused the project from start to finish.) Cole thought British industry needed an invigorating tonic to stimulate consumption, encourage innovation, and enlarge the market for goods. He joined the Society of Arts, which gave small industrial exhibitions with cash prizes. Inspired by the French National Exhibitions held since 1798, Cole proposed that the Society organize an international industrial exhibition. Such an undertaking would depend upon royal patronage, however, so Cole called upon the Society's President.

The Worthy Soul in question, to whom the entire success of the Exhibition was later ascribed, was Prince Albert of Saxe-Coburg-Gotha, Consort to Queen Victoria. Prince Albert (1819-1861) found himself in that peculiar position of Royal Consort -- married to the Queen (since 1840, when they were both aged 21) but not himself the Sovereign. He discovered, frustratingly, that though the Queen adored him as an angel, she steadfastly kept him at arm's length regarding affairs of state. Prince Albert was in need of a project.

Albert could initially bestow only a tepid response to Cole's suggestion. His foreign birth and manners aroused suspicion in the English people and he feared public demonstration for an enterprise that could prove to be unpopular. Undaunted, Cole made the rounds of manufacturing towns, eager to trade on Albert's patronage to generate public interest. As a rolling ball of snow gradually grows when each composing particle clings with equal commitment to the core and chance met fellows upon the ground, knowing that over engagement in either direction would consign the entire enterprise to oblivion -- so the plan for the Great Exhibition proceeded with provisional inevitability.

Queen Victoria legitimized the proceedings in January of 1850 by appointing a Royal Commission with Albert presiding. The Commission avoided imputations of governmental jobbery (awarding contracts to cronies, which had marred the recent construction of the Houses of Parliament) by decreeing that the Exhibition would be funded by public subscription. Owing to his zealous fund-raising, Albert was mercilessly lampooned in Punch as an obsequious panhandler with hat out for his hobby-horse. Donations ranged from the Queen's £1000 to pennies sent in by children.

A number of factors made the century's mid-point particularly favorable for such a grand enterprise. The rapid expansion of a national railway system would enable Britons from the furthest reaches of the island to travel affordably to London. Sir Robert Peel -- former Prime Minister, political advisor, and revered figure -- had transformed the political environment to favor free trade. By repealing the Corn Laws in 1846 (introduced in 1815 to protect British farmers from a flood of cheap continental corn following Napoleon's defeat, but which kept prices artificially high), Peel gave the people cheap bread but brought down his government. His 1845 repeal of the window tax was equally crucial, as we shall see.

Sir Robert Peel (1788-1850) was a pivotal figure in the transition from the Georgian to Victorian eras. As Home Secretary in 1829, he helped to pass a bill for Catholic Emancipation and established the London Police (called "Bobbies" in his honor). A vocal proponent of the Exhibition, Peel's tragic death in July 1850 from injuries sustained in a riding accident spurred plans onward, uniting the House of Commons to honor his final wish.

Before the idea could be firmly embraced by the public, all and sundry expressed their misgivings. Manufacturers feared that England's inadequate copyright laws would allow competitors to steal their ideas. They fretted that style and elegance of design (continental strong points) would be favored over cheapness of production. The public had doubts of their own. They feared foreign agitators would infest London to continue the revolutions of 1848. Britain's homegrown radicals, the Chartists (proponents of the People's Charter of 1838 that called for universal male suffrage) remained a potent bugaboo. Newspapers predicted apocalypses of Biblical proportions -- influenza, bubonic plague, cholera, famine, fire, foreign revolution, and the proverbial Pride that goeth before a Fall.

The choice of site was the next sticking point. The first choice, the south end of Hyde Park, met resistance from the well-heeled lobby representing Kensington and Belgravia, who did not want their fashionable addresses trampled beneath the feet of a descending multitude. Charles Babbage favored the Park's east end. Ever obsessive, he calculated the cost to national productivity due to extra footsteps needed to walk from central London. Colonel Charles Sibthorp, clamorous critic of Prince Albert and the Exhibition, apparently discovered an inchoate environmentalist streak and launched the final, perhaps most desperate objection in the name of elm trees.

YHC can conjure either Sibthorp (1783-1855) or Babbage (1791-1871) in the role of villain hatching a dastardly plot. Jingoist Sibthorp was responsible for reducing Albert's annuity from £50,000 to £30,000, opposed the Public Libraries Act of 1850 because he hated reading, and decried the Exhibition from start to finish. Could this xenophobic MP enlist the services of one Karl Marx to foment revolution, thus discrediting the foreign Prince? Babbage was passed over for the Commission and, adding insult to injury, they declined to exhibit his Difference Engine! What if such an indignity had spurred Babbage to complete his analytical engine and put it to work doing more than correcting navigational tables? He did publish a scathing monograph on the shortcomings of the Exhibition.

In March of 1850, the Commission invited architectural tenders for a structure to house the Great Exhibition. The criteria specified that the design be simple, economical, adaptable, fireproof, and preserve the elms. The Commission received 245 proposals, none of which they liked, instead producing one their own by I.K. Brunel (who would go on to design the mammoth Great Eastern, an unprofitable passenger steamship eventually relegated to laying the trans-Atlantic telegraph cable). The Commission's design was roundly criticized for being monotonous and dubiously temporary, requiring some 19 million bricks.

Enter Joseph Paxton (1801-1865), superintendent of the Duke of Devonshire's gardens at Chatsworth, Derbyshire. Paxton had built innovative conservatories for the giant Victoria regia lily and designed a park in Birkenhead that became Olmsted's model for New York's Central Park. Paxton's disparagement of Brunel's design elicited an invitation to improve upon it, although the competition was long concluded. Paxton worked feverishly on his design while he ought to have been absorbing the details of the disciplinary action over which he presided (observer Charles Dickens ascribed his industry to copious note-taking). The result was a now famous sketch upon pink blotting paper, a great Athena of a plan that sprang fully-realized from the brow of our Jovian husbandman. It was a temple of glass and steel, materials YHC suspects will one day supplant stone due to their supple substance. Punch dubbed the structure the "Crystal Palace," the Commission approved

the design on July 15, and work on the foundation began two weeks later.

The Crystal Palace

The Crystal Palace

The Crystal Palace was a wonder of harmonious economy. Completely prefabricated, it could be expeditiously assembled and disassembled. Modular design allowed for expansion or contraction without compromising aesthetic impact. Construction attracted such attention that the contractors, Fox and Henderson enclosed the site with wooden hoardings (later utilized for the Palace's floorboards) and instituted a five-shilling admission. Work continued into the winter night, illuminated by lanterns and bonfires -- a wonder indeed!

Construction was not without complications. Miss Ann Hicks ran a cake and fruit stall on the site, living in an adjacent shack. She only conceded to move following the Duke of Wellington's generous incentive of £92 11 s. 4 d. The irrepressible Miss Hicks spent the money by October, applying for more following the close of Exhibition -- to no avail. Mr. William St.Clair, glazier and agent provocateur, led a small strike for higher wages. His attempt to extort the contractors publicly resulted in his arrest and rapid replacement of the striking workers. A wagon containing 250 gallons of beer completely healed the labor rift.

Paxton's innovative design engendered a fresh round of public fears -- hail would shatter the glass panels; wind and the weight of visitors would initiate vibrations that tear the joints apart and collapse the building like a house of glass cards. As a test, the contractors raised a section of and crowded it with 300 intrepid workers. They repeated the experiment with Royal Sappers and Miners who energetically marked time. A violent hailstorm on April 29 served as final examination -- not a pane of glass was damaged.

Acolytes invoke cathedral terminology to describe their Temple of Industry. The nave ran east-west for 1851 feet, neatly bisected by a perpendicular transept soaring to 108 feet and neatly enclosing three venerable elms. The Palace incorporated 293,655 panes of glass and covered sixteen acres of ground. Canvas draped between the roof ridges deflected sun and heat. The hollow steel columns served as downspouts for 24 miles of wooden gutters. Cooling was effected by clockwork louvers, comfortably operated by a single soul, that allowed hot air to escape and drew cool air through gaps in the floorboards. Rubbish was swept through these same gaps.

The Crystal Palace incarnated elemental harmony. Securely founded upon the Earth (the footings remain beneath the turf of Hyde Park to this day) and composed of Earth/Fire composites of steel and glass. Summer showers would create a delicate lattice of Water, running from horizontal gutters to vertical downspouts. Copious cubic feet of Air were enclosed in glass. Finally, Fire generated steam, the emblem of the age. YHC notes that the Commission made an implicit pact with Fire by waiving the requirement that the structure be fireproof. One wonders if this favor will one day be called in?

While many of today's youth were enthusiastic, YHC spoke to one William Morris, aged 17, who was markedly scornful. Ruskin declared it "a cucumber frame between two chimneys," aesthete Sir Edward Burne-Jones thought it cheerless, and Gothic revivalist Augustus Pugin advised Paxton: "You had better keep to building greenhouses and I will keep to my churches and cathedrals." YHC most enjoyed the witty Duke of Devonshire: "Fancy one's gardener having done all this!"

The Great Exhibition

The Great Exhibition opened on May 1, 1851. Prince Albert spoke, then Her Majesty, Queen Victoria. The Archbishop of Canterbury offered a special prayer, followed by Handel's invigorating Hallelujah chorus. Adding to the excitement, a foreign dignitary in Mandarin garb approached the Queen's dais and made obeisance. He was later discovered to be an uninvited Chinese ship captain, seeking to publicize tours of his junk anchored in the Thames!

The Palace's doors opened at 9:00 and closed at 5:00, Monday through Saturday. Season tickets cost £3 2 s. for men and £2 2 s. for women. Common folk could afford to attend when admittance dropped to a shilling on May 23. An average of 50,000 souls passed through the turnstiles on shilling days, with the highest attendance -- 109,915 -- on October 7. The Exhibition drew a quarter of England's population of 22 million and 58,000 foreign visitors. By the public close on October 11, paying admissions totaled 6,039,195.

The Exhibition comprised 7381 British and 6556 foreign exhibits. The ground floor held the majority while the galleries were reserved for lighter articles such as clothing, philosophical instruments, and food products. For those souls concerned about personal comfort, YHC happily reports that Mr. George Jennings, sanitation engineer, designed private retiring rooms. By October 15, 827,000 individuals had paid a penny for the privilege of their use. Refreshments, available in three locations and catered by Messrs. Schweppes & Co., were mercilessly criticized (save their delicious ginger beer). YHC predicts a bright future for another retail entrepreneur, Mr. Charles Harrod, whose modest shop nearby made respectable profits this summer owing to Exhibition traffic.

The Great Exhibition helped to forge a new relationship between the monarchy and the people. Albert accepted an invitation to dine in Yorkshire with manufacturers who previously would have been summoned to London. After June 24, the Queen Herself walked among her subjects during public hours, despite four previous attempts upon her life, the most recent in 1850. Queen Victoria passed at least 50 hours in rapt attention at her beloved's glorious Exhibition.

Most august personages of our epoch could be found at the Exhibition. Miss Charlotte Brontë, author of *Jane Eyre*, made three visits in late May and early June. She shared an observation from her journal with YHC: "It may be called a Bazaar or fair -- but it is such a Bazaar or fair as eastern Genii might have created. It seems as if magic only could have gathered this mass of wealth from all the ends of the Earth -- as if none but supernatural hands could have arranged it thus -- with such a blaze of contrast and colors and marvelous powers of effect." Fellow authors Messrs. William Thackeray and Charles Dickens both enjoyed their visits. (Dickens would later make rather uncharitable observations concerning the foreign exhibits and their exhibitors, particularly the Chinese). YHC spoke with a plucky lad of eleven in Dorchester, Master Thomas Hardy, who was delighted by excursion trains bearing day-trippers to the Crystal Palace.

Notable Exhibits

While most guides endeavor to describe each of the 13,937 exhibits, one does not wish inflict such tedium upon your attention. Instead, Your Humble Correspondent will serve as cicerone to the "high lights" of the Exhibition -- those exhibits guaranteed to excite wonder and astonishment, and furnish diverse illuminating observations thereupon. A model of Cartesian convenience, the Palace precisely indicted each 24 by 24 foot exhibition bay with a red banner emblazoned with letter/number coordinates. The accompanying map can guide you to the following notable exhibits. For a more thorough, if pedestrian, inventory, YHC recommends The Crystal Palace Exhibition Illustrated Catalogue.

Let us commence our journey at the centerpiece of the Exhibition, the 27-foot glass fountain of Mr. Follett Ossler. Fashioned from diaphanous pink glass, lit dramatically from above by the transept, the fountain encapsulated the wonder of the experience. Surrounded by exotic flora and palms, one is immediately cognizant of being transported to a crystalline fairyland.

The fabled Koh-i-noor diamond has lately come to England as spoils from the Punjab. Purported to be cut from the legendary but lost Great Mogul diamond, the name of this 186-carat stone has an interesting story. A courtesan informed Persian conqueror Nadir Shah that his foe had hid the diamond in his turban. Nadir invoked the custom of exchanging turbans, exclaiming "mountain of light" at first sight of his new prize. Unfortunately, the stone bears a curse: its owner will one day rule the world, but no man dare wear it. The Koh-i-noor has been particularly ungrateful to male owners, from Ranjit Singh, whose line was extinguished when none of eight descendants could produce an heir, to young Duleep Singh, whose defeat brought it here. Thus far, the only ill effects experienced here have been the people's complaints that the stone does not live up to its name.

Acquired by Mr. Henry Thomas Hope in 1830, the Blue Diamond (44.5 carats, originally 112.5) is certain to delight. The stone was reputedly pried from the eye socket of an idol in the temple of Rama-sitra, near Mandalay, and therefore carries a curse. Louis XIV purchased it from Jean-Baptiste Tavernier (died bankrupt) for his mistress, Mme. de Montespan (implicated in the "affair of poisons" and retired to a convent). Louis XVI presented it to Marie Antoinette (both were beheaded) who lent it to the Princess de Lamballe (slain by a mob and then beheaded).

In addition to these marvels, the Exhibition features many other notable "industrial raw materials," following Prince Albert's taxonomy. Examples include Brazil's famous Black Bahia diamond; the world's largest pearl (which belongs to Mr. Alexander Hope, son of Henry); and cruder items such as the largest object ever extracted from the earth: a piece of coal from Tipton, Staffordshire with a circumference of 18 feet.

One's mind simply reels with the possible malicious machinations that might be enjoined by their present proximity. With only a modicum of strategy, a common thief could make off with terrestrial treasures of incalculable value. An industrious soul might combine one of these cursed stones with the nearby set of lighthouse lenses, the 20-foot astronomical telescope, or the world's largest looking glass at the Palace's west end, to fashion a contrivance most nefarious. Chartist uprisings should be the least of Britannia's fears!

Mr. Frederick Blakewell exhibited a functioning facsimile machine. This ingenious device utilizes a rotating drum traversed by a stylus, which transmits over telegraphic wire a perfect reproduction of a document. YHC imagines the advantage of such a device to correspondents in the field. Of perhaps more limited utility is the tempest prognosticator of Dr. Merryweather. This device audibly signals impending inclement weather by means of the undulations of common leeches -- a creature of unappreciated sensitivity. Among the notable timepieces and globes was a remarkable apparatus created Mr. Ryles of Staffordshire. Based upon the theory that our Earth is a living creature, the device calculated the rise and fall of the tides as a function of the organism's beating heart. An inventive alarm bed that gracefully inclined the reposing sleeper particularly engaged the Queen; it could be outfitted with a tub of cold water for the incorrigibly somnolent.

YHC confides that he was quite tempted to conceal himself among the wonders in order to emerge after hours to try the amazing aerial machine exhibited by Mr. William Sadd of Wandsworth. The conveyance incorporates two large horizontal balloons of cylindrical aspect for lift, a rudder fore and aft for navigation, two floats for ballast, and a pair of rotating wheels for propulsion. One might also note that the Serpentine, winding through Hyde Park just to the north of the Crystal Palace, audibly summons the model of a submarine boat exhibited by Mr. Hugh Bell. YHC imagines a party of intrepid submariners employing this device first to examine the large-scale model frigate Prince of Wales at anchor and then onward to other clandestine pursuits.

Certain to be a boon for veterans, Major Little's spectacular artificial hand fairly bristles with efficacious if formidable hooks. YHC was likewise favorably impressed by a demonstration of Count Dunin's mechanical man. This metallic manikin comprises some 7000 adjustable steel plates allowing it to contract or expand "from the size of the Apollo Belvedere to that of a colossal statue." The gadget aids dressmaker or tailor by exactly emulating the size of the model, thereby obviating the nuisance of repeated fittings. Perhaps it was the tick-tock of nearby clockwork, or the whoosh of the steam engines below, or even the exhibits featuring the novel plaything that is "electrical power," -- YHC's imagination was overcome by an army of such constructs serving not only as mechanical modistes, but performing any number of quotidian diligences, thus freeing the human mind for profounder pondering.

YHC was truly edified by several industrial exhibits. A scale model of the Liverpool docks, in which 5 miles was reduced to 40 feet, contained 1600 miniature ships. De La Rue's patent envelope maker could fashion 60 per minute while operated by children. A steam-powered Jacquard Loom was notable for the complex weaving instructions encoded upon punched cards. One wonders if such procedure could be utilized by Mr. Babbage and his colleague, Countess Lovelace, in their analytical endeavors? (Lady Ada died the next year, like Lord Byron her father, aged 36. Babbage would never complete his analytical engine.)

Finally, we complete our circuit of the British wing with a few contemplative moments in the medieval court of Augustus Pugin who so recently decorated the interior of the new Houses of Parliament. The court is resplendent with ornate ecclesiastical furniture, tapestry, and adornment. While one purpose of Pugin's exhibit was to contrast the beauty of handmade items to those manufactured goods, Mr. Jordan's Patent Carving Mechanism, enabling mass production of household items and altars in the Gothic style, was conspicuous. Sculpture of Biblical and classical theme scandalized the viewers by their depictions of feminine nudity (some were temporarily garbed with strategic fig leaves). The nearby 16 foot stone Irish cross, hewn by Harriet Ross, also troubled Anglicans with its excessive qualities. Four majestic pipe organs and the display of stained glass running the entire length of the eastern gallery completed the Gothic motif.

Augustus Pugin (1812-1852) was instrumental in propagating the Victorian Gothic revival. Pugin imbued his designs with Catholic ideology (he converted to the faith in 1835), arguing in *The True Principles of Pointed or Christian Architecture* (1841) that only a Catholic society could produce true gothic architecture. Is it not curious that Mr. Pugin perished at such a young age, immediately following the Exhibition? Perhaps the result of reading too much Walpole, Lewis, Shelley, Maturin, and Polidori, YHC envisions Gothic mists gathering over England -- even, dare one assert, a Sovereign who has succumbed to the sinister spell. YHC trusts he is not trying the reader's patience with such fervid imaginings.

The French display, the largest following Great Britain, was remarkable for its elegance. YHC noticed a few items characterized by an innovation wholly unexpected. Notable were two portable devices for taking sun-drawn pictures, along with examples of images of an effect most artistic. The originator of the process, Mr. Daguerre regrettably shuffled off this mortal coil at home in France during the Exhibition's run. One would be remiss to omit Froment's improved turbine, capable of 200 rpm. YHC imagines the coupling of such puissant propulsion with the Mr. Sudd's above-described conveyance, one day enabling intrepid aeronauts to crisscross the skies and thus permanently knitting together the disparate nations gathered today.

Item 248 attracted the attention of this bibliophile: "one hundred and sixty-five volumes of works in Turkish, Arabic, and Persian, published at Boulac" (save two, YHC notes, published in the city of the greatest library of antiquity: Alexandria). The worthy Mohammed Ali Pasha presented these volumes, the first published in Egypt, to Her Majesty, the Queen. The beautiful, sturdy tomes treat a range of topics, from military matters to veterinary practice. Further inquiry by YHC reveals that 65 volumes -- concerning Egyptian literature, grammar, and religion -- went missing following the Exhibition's close. A development most curious, to be sure.

The contrivances from America, characterized by artless simplicity, are inconsistent if impressive. Here one finds a stuffed squirrel alongside a Singer sewing machine, a lump of zinc weighing eight tons and a McCormick reaper, self-inflating India rubber lifeboats by Mr. Charles Goodyear and Colt's revolver. Also notable was the air-exhausted coffin that preserves its occupant indefinitely through an ingenious use of vacuum. Mr. Hiram Powers' sculpture the Greek Slave was much admired, as was a tea service fashioned entirely from California gold. The crack American locksmith Mr. A.C. Hobbs took old John Bull down a notch by picking the lock safeguarding the Bank of England twice in 30 minutes. He then won £200 for 51 hours' work opening an "unpickable" device from Bramah. We need not mention that no one attempted to breach the Day and Newell locks Mr. Hobbs represented. YHC heard that the Bank of England purchased a set! -- one trusts the stunt wasn't a ruse.

The beautiful exhibits from the Zollverein (the German trade confederation) include the comicalities of Herr Hermann Ploucquat of Stuttgart. These whimsical tableaux feature stuffed animals assuming the roles of humans. In a favorite, a stern marten schoolmistress lectures four recalcitrant rabbits, replete with tiny primers. YHC observed a group of London schoolchildren (there were nearly 3,000 such visitors on September 18) speculating that perhaps the animals were merely enchanted and would disport and explore after hours!

Your Humble Correspondent now bids you adieu, leaving you to your own exploration. The Great Exhibition was a summation of current industrial development as well as a harbinger of a mechanized future. During the summer of 1851 one can expect to encounter every person, product, or idea of substance -- a veritable microcosm of the World at the fulcrum of

our century.

Afterwards

Editor's note -- The clipping was accompanied by several others. We summarize their content in the interest of brevity.

The Great Exhibition made an unexpected profit of £186,000, which the Commission used to buy the Gore estate in South Kensington. The site would eventually hold the Victoria and Albert Museum, the museums of Science and Natural History, the Royal Geographic Society, the Royal Albert Hall, and the Imperial College of Science and Technology. The Crystal Palace was moved in 1854 to Sydenham Hill in the southeast of greater London. There it was enlarged, a transept added, and flanked by crystal towers. The exhibits included courts celebrating several ancient cultures (Egyptian, Pompeiian, Chinese, Moorish, Byzantine, etc.), outdoor mazes, and reconstructions of dinosaurs (which remain to the present). The Palace's fortunes eventually waned; it was used as a naval supply depot during the Great War, but reopened as an attraction in 1920. On November 30, 1936 the promise to Fire was called in -- a conflagration beginning in an office consumed the Palace entire.

The Great Exhibition was replicated in Paris (1855), New York (1853), again in London (1862), Vienna (1873), Philadelphia (1876), Sydney (1879), et al. Numerous innovations, such as the telephone, Ferris Wheel, and the Eiffel Tower were first exhibited at such exhibitions. In America, they came to be called World's Fairs -- the last significant one held in Queens in 1939. The Festival of Britain marked the centenary of the Great Exhibition, while the recent Millennium Dome was inspired by the splendor of the Crystal Palace.

Resources

- *Albert's Exhibition and the Crystal Palace.* -- www.cyberstation.net/hf/cp/crystal.html -- Collects all the images.
- Art-Journal. *The Crystal Palace Exhibition Illustrated Catalogue.* London: Dover, 1970. Unforgivably emphasizes objects of beauty and elegance at the expense of the ingenious and outré.
- Auerbach, Jeffrey. *The Great Exhibition of 1851.* New Haven: Yale University Press, 1999. ISBN: 0300080077. The most scholarly book of the lot; examines the Exhibition in historical context.
- *The Crystal Palace/The Great Exhibition of 1851.* -- www.victorianstation.com/palace.html -- Neatly summarized with images. Victoria Station provides much interesting Victoriana.
- *Crystal Palace Design.* -- jefferson.village.virginia.edu/london/model/earth.html -- Excellent site devoted to the architecture of the Crystal Palace. I haven't been able to get the VRML models to work.
- Davis, John. *The Great Exhibition.* Phoenix Mill: Sutton Publishing, 1999. ISBN: 0750916141. Notable for the inclusion of photographs of the Exhibition as well as the familiar engravings.
- De Vries, Leonard. *Victorian Inventions.* London: John Murray, 1971. ISBN: 0719550068. All of these gadgets postdate the Great Exhibition, but they illustrate the fruition of Victorian ingenuity.
- *The Great Exhibition: Cole, Albert, and Paxton.* -- www.cyberstation.net/hf/cp/cap.html -- Neatly summarized, with images.
- Leapman, Michael. *The World for a Shilling.* London: Headline Book Publishing, 2001. ISBN: 0747270120. My favorite. Leapman captures the sights, sounds, smells, and sense of spectacle. I had to special order this one from England through Blackwell's Online.
- While set after the Great Exhibition, the novels *The Difference Engine* by Gibson and Sterling and *Anno Dracula* by Newman treat some of the themes here presented.

Odin, King of the Aesir

For *In Nomine*

by Bevan Thomas

Corporeal Forces - 5 Strength 10 Agility 10
Ethereal Forces - 5 Intelligence 12 Precision 8
Celestial Forces - 6 Will 12 Perception 12

Charisma +3

Skills: Detect Lies/6, Dodge/6, Driving/3, Fast Talk/6, Fighting/5, Knowledge (Celestials)/4, Knowledge (Marches)/6, Knowledge (Mythology and Religion)/6, Knowledge (Sorcery)/6, Languages (Norse/6, English/6), Large Weapon/6 (Spear), Large Weapon/4 (Sword), Lying/6, Move Silently/4, Riding/6, Savoir-Faire/3, Seduction/2, Singing/6, Throwing/6

Songs: Attraction (Corporeal/4, Celestial/4), Direction (Corporeal/4, Ethereal/4), Form (Ethereal/4), Shields (Ethereal/4, Celestial/6)

Special Song: Changeskin (Ethereal/6): A song that Odin shares with his blood-brother Loki. For 1 Essence, Odin can take any form, from the size of a mouse to a giant. Odin's possessions change with him. However, no matter his form, Odin is always missing his right eye and his left eye is a blazing blue.

Artifacts: Draupnir ("Ever-Drinking") is a ring of priceless value and Odin's kingly seal. It functions as a Reliquary/6, every nine nights, it produces nine non-magical rings of identical appearance and value (non-supernatural) to Draupnir. Odin gives these rings as gifts to those mortals who have earned his favor.

Gungnir is a great hunting spear, and the favored weapon of Odin. It was forged by dwarfs long ago and according to legend it never misses (this is an exaggeration, Odin is simply very good with it). Odin has been known to change the course of battles by shaking his spear over the heads of those he has decided will lose, filling them with fear and foreboding, shattering their confidence. It functions as a Talisman with Large Weapon/6 (Spear), Throwing/6, acts as a Reliquary/6 with Nightmares (Corporeal/6).

Hlidskjalf ("High-Seat") is Odin's imperial throne. It functions as a Reliquary/6 with Sight (Ethereal/6). However, the range of the song is much greater than usual, allowing Odin to see anywhere in the eight Nordic ethereal realms (Alfheim, Asgard, Jotunheim, Musplheim, Nidavellir, Niflheim, Svartalfheim, and Vanaheim) and the countries where the Nordic gods held sway (Denmark, Finland, Germany, Greenland, Iceland, Norway, and Sweden).

Special Rites: Gain 1 Essence when he discovers an important secret.

Gain 2 Essence when an army he supports wins a battle.

Worship Rites: The following ones on p. 95 of the Marches apply: one hour meditating, sacrificing money, sacred herbs, or humans (human sacrifice is not usually done nowadays), three hours reading stories of the god Sacrificing Wine (at least 1 pitcher)

Whispering a secret (which Odin does not know) in the ear of his effigy

This ancient god has been known as Allfod ("All-Father"), Bileyg ("One-Eye"), Grimmir ("Masked One"), Helblindi ("One-Who-Blinds-With-Death"), Herteit ("Glad-Of-War"), and many more. He is a god of rulership, death, war, poetry, treasure, knowledge, sorcery, and all else that the ancient Nordic people held dear. Though his power has greatly decreased due to lack of Essence, he still remains a deadly warrior and a wily adversary.

Odin's true form is that of an old man with gray hair and a muscular frame. He is missing his right eye and his left eye is blue, penetrating and wise. When in Asgard, Odin usually appears in golden armor, decked in all the regalia of a warrior-king. However, when he wanders the Ethereal and Corporeal planes, Odin prefers to wear simple traveling clothes and a wide-brimmed hat pulled over his missing eye. Odin can take many other forms as well, favoring such forms as an eagle, a wolf, or a young warrior. However, a perceptive viewer can always recognize him from his eyes.

No matter the form he takes, if it is human, Odin always carries his spear Gungnir. Most of the time, Odin disguises Gungnir as a staff or a walking stick. Odin also always wears Draupnir. To hide it, Odin frequently wears gloves.

In the old days, Odin would lead warriors of his choosing to victory, riding at their forefront with his wolves and causing enemies to quake at sight of his spear. However, the Celestials stopped this practice, depriving Odin of much of his Essence. To accommodate for that, Odin spends most of his time wandering Earth and the Marches, uncovering secrets in order to stop himself from fading further.

Though he is in theory the chief of the Aesir, currently Odin is lord in name only. He spends almost all of his time sitting on Hlidskjalf, his gaze spread-out throughout the realms, looking for secrets to give him Essence and especially those which would turn the balance of power away from the Celestials. Odin is obsessed with destroying the monopoly that the angels and demons have on the minds of mortals, and will not let anything else sway him from his goal. When not sitting upon Hlidskjalf, Odin spends most of his time wandering the Marches and even Earth (he is too artful to be caught by angels). Since Odin no longer bothers with ruling Asgard, this role is taken by his wife, Frigga, queen of the Aesir.

Odin prefers to deal with ethereals and mortals, for he has a strong dislike for most Celestials, looking at them in the same manner as a rebellious prisoner would towards his jailers. However Odin has been known to deal with certain Celestials. He does occasionally communicate with certain Servitors of Dreams and Creation who are sympathetic to his need for more Essence, and according to popular legend has occasionally been seen walking with someone who looks suspiciously like Eli. Odin also has a certain amount of respect for Michael and David, due to their loyalty and skill as warriors (however, Odin does not feel the same way towards Laurence, thinking of him only as an upstart dictator lording over the Ethereals).

Among the demons, Odin has relationships with Hatiphas, demon of Sorcery (Odin claims that he learned how to practice sorcery himself after hanging for nine days and nights on the world-tree Yggdrasil with Gungnir in his side . . . something that few Celestials believe), Alaemon, Demon Prince of Secrets, Lilith, and Beleth. He trades favors, secrets, and bits of knowledge to them in return for Essence and secrets of their own. Both sides of these deals know that the other cannot be trusted, but they both believe they have the upper hand. Odin has also been frequently contacted by Nybbas, who tries to interest him in Aesir-style movies and television, but Odin considers him a weak and honorless fool, and does not deal with him.

One of the things that galls Odin most of all is that one of his largest sources of Essence in modern times was from the Nazis, who employed Nordic imagery in their propaganda. Odin hates this, and he despises the Nazis. Because he desperately needs their Essence, Odin swallows his pride and allows White Power Teutonic cults to exist. However, Odin prefers the neopagan religion Asatru, a religion dedicated to reviving worship of the Norse gods, and he is very protective of this new faith.

Servants

Odin is assisted by many servants. These include the Einheriar and Valkyries (see *The Marches*, p. 97), as well as a variety of animal companions: his steed Sleipnir, his ravens Hugin and Munin, and his two wolves Geri and Freki.

GERI AND FREKI

Corporeal Forces - 3	Strength 6	Agility 6
Ethereal Forces - 1	Intelligence 2	Precision 2
Celestial Forces - 1	Will 2	Perception 2

Skills: Dodge/6, Fighting/8 (Power +4), Move Silently/4, Swimming/3, Tracking/7

Songs: Motion (Corporeal/6)

Geri ("Greedy") and Freki ("Gluttonous") are the wolves of Odin. In the old days, they lay at his feet during great

feasts in the hall of Valhalla, and Odin fed them all the food on his plate (for Odin eat nothing and drank only wine). When Odin rode to war, they ran alongside him, causing terror with their howls. However, now Odin spends little time feasting and even less fighting battles, and Geri and Freki are primarily left to themselves. They spend a lot of their time moping near Odin, waiting to be fed and getting more and more depressed. Sometimes they leave Asgard and stalk the Marches, looking for entertainment and food.

HUGIN AND MUNIN

Corporeal Forces - 1 Strength 1 Agility 3
Ethereal Forces - 3 Intelligence 6 Precision 6
Celestial Forces - 3 Will 3 Perception 9

Skills: Area Knowledge/6 (the Marches), Dodge/6, Knowledge/6 (the Marches), Move Silently/6, Tracking/6

Songs: Affinity (Corporeal/6, Ethereal/6, Celestial/6), Direction (Corporeal/6, Ethereal/6, Celestial/6), Form (Ethereal/3), Motion (Celestial/3)

Hugin ("Thought") and Munin ("Memory") are two ravens who serve as spies for Odin. They spend most of their time scouring the Marches and Earth, discovering secrets and finding anything that Odin was unable to discover with Hlidskjalf. Every day they return to Odin and whisper into his ears anything that they have learned. Then they fly off again.

SLEIPNIR

Corporeal Forces - 5 Strength 10 Agility 10
Ethereal Forces - 1 Intelligence 2 Precision 2
Celestial Forces - 1 Will 2 Perception 2

Skills: Dodge/6, Fighting/4 (Power +4), Swimming/3, Tracking/3

Songs: Dreams (Corporeal/3), Legs/6, Motion (Corporeal/6)

Move: 160

Sleipnir is the steed of death, symbolized by his eight legs, for there are eight steps to a gallows and eight legs to coffin (it is carried by four pallbearers). He is a huge gray stallion, magnificent and wild. Sleipnir is Odin's constant companion and allows no one else to ride him. On the Corporeal Plane, Sleipnir usually appears as a normal gray horse, albeit a very large one, though he may appear in all eight legs if desired. According to some stories, Sleipnir has occasionally appeared as a gray limousine, though this has not been confirmed.

Odin In The Campaign

Odin wanders the Marches and Earth, so players could find him almost anywhere. He enjoys playing mind games with people he meets, and will almost never reveal his identity (for self-preservation as much as anything else). He loves playing riddle games and making fools out of people, and enjoys pitting Celestials against each other.

If Odin chooses to speak with the player characters, it will be because he wants something. It is probable that he will either try to wrest from them a secret, or wishes to use them as a pawn. He would like nothing better then to go into a city, learn every secret of the city's Celestials, incite them into bloody war against each other, and leave the city with all their artifacts slung over his back as they destroy each other.

However, Odin is not without his own honor. Though he will lie and cheat whenever it could be to his advantage or entertain him, once he gives his word of honor, Odin will never break it. Furthermore, if a Celestial gains his trust -- and this has been known to happen -- then that Celestial has a friend for life.

Adventure Seeds

- The homeless of the city are being stirred up by a particularly charismatic vagrant, who is calling out to them to overthrow the tyrannical social regime and their oppressive monotheistic god. They begin to rise up against the government and religious hierarchy, destroying churches and government buildings, funneling Essence towards the Norse Gods. That's when their Superiors bring it to the attention of the PCs and demand that they do something about it.
- The PCs notice a Nordic sword in the museum. It has attracted the interest of a certain one-eyed collector, who has offered to buy it from the museum. This sword is a powerful artifact of the Aesir, and when the museum refuses to sell it to Odin, he will attempt a more direct way of acquiring it.

Bibliography

<Open Link:> Pvt. Noguchi has lost consciousness. I will continue to transmit. Please advise as to desired course of action.

Orbital Decay melds science fiction and horror to explore the dark side of the biotechnological revolution envisioned in the *Transhuman Space* setting.

Most of the action in **Orbital Decay** takes place aboard Vandegrift Station, a space habitat home to a surreptitious biotechnology research program. A trio of engineered pathogens key to the plot are described in the adventure, but numerous others might await discovery in the illicit labs aboard the station.

Here are some new contagions -- from the lethal to the merely irritating -- to throw into the mix as operatives explore the mysteries of Vandegrift Station.

While these plagues are designed with *Transhuman Space* in mind, GMs can put them to use in just about any game. They could be biological warfare stockpiles, alien viruses or mutant strains of natural diseases.

A **GURPS Special Ops** raid could turn some up in a biowarfare lab run by terrorists or a rogue nation. In **GURPS Ogre**, a clandestine research program might accidentally unleash one or more nanoviruses on a war-torn future Earth. Explorers on a newly discovered world in **GURPS Traveller** could find a dead civilization, learning only too late that the plague responsible for its destruction has survived amid the ruins. A wicked deity in a **GURPS Fantasy** game might visit pestilence upon the land as a curse. There are countless other possibilities for working these contagions into adventures in a variety of genres and worlds.

This batch of biowarfare agents has been given code names drawn from famous mountain peaks.

Everest

This lethal nanovirus, code-named Everest, targets the motor-control centers of the brain, sending victims into uncontrollable seizures. In time, it can cause death as the autonomic functions controlling breathing shut down.

A strain of proteus nanovirus, the neurovirus is a bio nanomachine that reproduces rapidly through the brain to alter the connections between neurons and adjust the neurochemical balance -- in this case, to a destructive end.

Everest could also be engineered into assassin viruses coded to a specific DNA or DNA fragment. These nanoviruses would spread harmlessly among the general population, activating only when they infect the targeted individual.

Infection: The Everest nanovirus spreads normally through sneezing and coughing during the first 3 hours of infection. The nanovirus survives in air for an extended period of time and can infect anyone entering a contaminated area up to 12 hours later. There is a chance the person's immune system will fight off the nanovirus on a HT-4 roll. Bonuses for Panimmunity and Disease Resistant apply. However, Immunity to Disease gives only +10 to HT to resist.

Symptoms: Within 2 hours of infection, the patient begins to experience periodic hand tremors. In the course of the next hour, these develop into continuous palsy building to body-wracking spasms. On a roll of HT-4, the patient lapses into a coma.

Progress and Recovery: The neurovirus, which has been accelerated, runs its course in 18 hours. A HT-2 roll is required each hour. A critical failure results in a loss of 1d-1 DX. A failed roll means a loss of 1 DX. A success results in no loss, while three consecutive successes or a critical success means the patient recovers. When DX reaches 0, the patient loses HT instead.

Treatment: Once the person has been infected, the nanovirus cannot be stopped short of introduction of a counter-nanovirus or a medical microbot nanowash. Those who survive recover lost DEX as per HT under the natural recovery or medical care rules.

Kilimanjaro

Code-named Kilimanjaro by its designers, this fungal agent spreads via airborne spores that lodge in the lungs. Breathing becomes labored as the fungus grows in the alveoli and bronchi, incapacitating or killing foes.

Infection: Kilimanjaro spreads by exceptionally hardy airborne spores. Anyone breathing the air in an infected region has a chance to contract the infection. The spores can also survive in a dormant state for long periods of time to infect new patients when they are disturbed and once more become airborne. There is a chance the person's immune system will fight off the fungal infection on a HT-3 roll. Bonuses for Panimmunity and Disease Resistant apply. However, Immunity to Disease gives only +10 to HT to resist.

Symptoms: Within 24 hours of infection, the patient begins wheezing and non-productive coughing. Breathing becomes increasingly labored in the ensuing days as the spreading fungus clogs the lungs, potentially resulting in pulmonary collapse or heart failure.

Progress and Recovery: A HT-3 roll is required each day. A critical failure means a loss of 1d HT. A failed roll means a loss of 1 HT. A success regains 1 HT, while three consecutive successes or a critical success means the person recovers.

Treatment: Designers of Kilimanjaro also created an inhalant spray fatal to the fungus as a means of protecting friendly forces. Additionally, medical microbots can be programmed to seek out and destroy the fungal infections. Lost HT is recovered normally.

Fuji

A proteus nanovirus, the bioweapon code-named Fuji rewrites the genetic coding in blood cells to inhibit clotting, resembling the genetic defect of hemophilia. Intended to weaken enemy soldiers rather than kill them, the Fuji virus forces the enemy to spend time and research countering its effect before embarking on any aggressive military action. The Fuji virus can also be used to soften enemy defenses prior to an attack.

Statistics: Hemophilia (-30)

Infection: The Fuji nanovirus spreads via direct contact with blood or other bodily fluids. Gengineered to be spread in the close quarters of troop barracks, the virus dies quickly in air. This feature is intended to help check its spread outside targeted military bases. There is a chance the person's immune system will fight off the nanovirus on a HT-2 roll. Bonuses for Panimmunity and Disease Resistant apply. However, Immunity to Disease gives only +10 to HT to resist.

Symptoms: Nosebleeds are often the first symptom of infection. Patients also tend to bruise easily, and small lacerations may bleed uncontrollably.

Progress and Recovery: The nanovirus takes approximately 48 hours to complete its work. The first symptoms appear in 24 to 36 hours, but may be dismissed as minor inconveniences. Once established in the body, the nanovirus performs its work unhindered by the body's natural defenses.

Treatment: Since the nanovirus rewrites the genetic code regulating production of blood cells, as well as that of existing blood cells, the condition is permanent unless reversed by a counter-nanovirus. Medication designed for hemophiliacs may reduce, but not eliminate, its harmful effects.

Gengineers coded a bomb into the Fuji nanovirus designed to thwart quick efforts to counteract it. Any counter-virus must be specifically coded for the Fuji nanovirus -- a very time-consuming process. Introduction of any generic anti-hemophilia proteus virus activates a dormant part of the Fuji nanovirus causing blood to break down and spurring massive internal bleeding. The patient rolls HT-5 each hour. A critical failure results in a loss of 2d HT. A failure means a loss of 2 HT. A success regains 1 HT, while three consecutive successes or a critical success means the person recovers. Prompt medical care, such as a medical microbot nanowash, may also save the patient. Lost HT is recovered normally.

Pyramid Review

Buffy The Vampire Slayer Collectible Card Game

Published by [Score](#)

Designed by Christian Moore, Owen Seyler, Chaz Elliott, Geert Van Slambrouck, Frank Chafe

Starter Sets: \$10.99; Booster Packs: \$3.29

As cult TV shows go, they don't get much cult-ier than *Buffy: The Vampire Slayer*. Now in its sixth season, it's a brilliant blend of horror, teen soap opera, comedy, and action show. (And, amazingly enough earlier this year, a musical, too.) While some fans have been less thrilled with the direction (or lack thereof) of this season's main plotlines, the show still has a loyal fanbase that dovetails directly into the gaming demographic. A *Buffy: The Vampire Slayer* license for any kind of game would be a natural. Hasbro put the boardgame out last summer. Eden Studios will have the roleplaying game out *this* summer. And Score -- the folks who brought you the *Dragonball Z* card game -- have come out with the CCG.

The cards themselves are very nice, with good graphics and excellent choices for card art (taken directly from the TV show, of course). The starter sets include an "Essence" card which is unlike anything I've ever seen in a CCG, printed on a translucent card of fairly thick plastic (not quite as thick as a credit card, but close). Done in gold and purple, the Essence cards are very, very nice. My only quibble with the cards is a pet peeve of mine -- the feeling of creators that *any* flavor text, no matter how lame, is better than no flavor text. *Buffy* is chock-full of witty lines, and while many made their way to various cards, there are still more clunker quotes than I would like. ("No . . . *NO!*" is an actual card quote -- I defy anyone to tell me what episode it's from. Or what it means. Or why anyone should care.)

The game play is pretty nifty. Decks come in two flavors, Hero (featuring Buffy, Angel, Willow, or Giles as the main character) and Villain (starring Spike, Drusilla, Collin, and The Master). The main way to win the game is to be the first to win 10 Destiny Points, which are earned by defeating your opponent in a straight-up fight (either with your Main Character or one of your sidekicks, taking on either your opponent's main character or one of *his* sidekicks), or by defeating a Challenge, represented by a card laid out on the table between the two players. Winning a fight is worth a measly 1 Destiny Point (and -1 to your opponent if you beat his Main Character), but Challenges can be worth many more -- as many as 6 Destiny Points! Of course, Challenges are much harder to defeat . . .

Each Main Character (and Minion/Companion) is rated with four stats -- Smarts, Weirdness, Charm, and Butt-Kicking. A fight between characters is usually a straight-up Butt-Kicking contest, high score wins. But cards can be played that temporarily (or permanently) increase stats, and after a fight has been announced, there's one more round of drawing cards and bulking up the characters involved. So even if you think you have a good edge going into a fight, you may be surprised by an unfortunate turn of events. Cards can also change the controlling stat in a fight from the usual Butt-Kicking to one of the other three -- more surprises!

To defeat a Challenge, you must assemble a group that meets that Challenge's requirements in one or more of the four stats. Some Challenges also require a particular character, or a particular item, or a particular trait (like Demonology, or Spellcraft) to complete. Some characters come with these traits already, but there are always (you guessed it) more cards to solve the problem.

Main Characters can also go up Levels as they get to various Destiny Point levels, becoming more powerful as the game goes on. And just because you're playing one of the four Main Characters on your side doesn't mean the others can't get involved -- other Hero/Villain cards can be used as Companions or Minions, no problem. So everybody on the

show can get involved.

I like the combination of deck construction smarts and tactical skill necessary to win this game. Matching up Challenges with the right characters (and character enhancements) to defeat them is just part of it -- the really good Challenges are keyed to specific Locations, so you better have *those* cards ready to go. Plus you have to slow down your opponent as he races you to 10 Destiny Points. Of course, if you want to go another way, you can just flood the game with characters and Butt-Kick your opponent to death. Or you can hold the center of the playing area ("Sunnydale Park") for six consecutive turns and win *that* way. And your opponent may be trying one of those other routes to victory, too -- so you better be ready to stop him.

The initial release, the *Pergamum Prophecy* set, covers events from Seasons 1 and 2. The first supplement, *Angel's Curse*, is due out in mid-to-late March. With four more seasons (and counting) to go, there's plenty of material for a long series of releases. The game got out with a few card erratas, but the website (www.btvscg.com) has got that covered, plus a lot more in the way of checklists, FAQs, downloadable goodies, message boards, and more for fans of the game.

The *Buffy the Vampire Slayer CCG* is a no-brainer for fans of the show who have even the slightest interest in card games -- lots of good-looking cards, and it's not that complicated or hard to learn. But card players who may have little or no interest in Buffy and her TV exploits will like this game too, for the good gameplay and the strong deckbuilding aspects. It's well worth taking a stroll through the Sunnydale Cemetery (stake in hand, of course) to check this game out.

Pyramid Pick

The Witchfire Trilogy Part III: The Legion of Lost Souls (for d20)

Published by [Privateer Press](#)

Written by Matt Staroscik & J. Michael Kilmartin

Illustrated by Brian Snoddy & Matt Wilson

96 pages; \$12.95

With *The Legion of Lost Souls*, Privateer Press brings their trilogy of adventures for the *d20* system to a close. The setting remains Privateer Press' Iron Kingdoms, a fantasy world that is far from medieval in feel and tone, with the presence of alchemically and magically powered technology. Examples of this include breech-loading guns (the rounds for which each need to be individually constructed and purchased) and steamjacks (large, cumbersome steam driven robots that handle much of the heavy labor throughout the Iron Kingdoms). Although the back cover suggests that this adventure can be slotted into any campaign, this is really not the case as there are many elements that would be difficult to insert into any other traditionally styled fantasy setting. Instead, *The Legion of Lost Souls* is written to be run after *The Longest Night* and *Shadow of the Exile*, and is designed for a party of fifth to seventh level characters.

[BEGIN SPOILER ALERT FOR PARTS I AND II]

To date, the intrepid adventurers have been on the trail of Alexia Ciannor, a sorceress of increasing ability. Her uncle, Father Dumas, a priest in the city port of Corvis asked them to investigate a rash of grave robberies and all evidence pointed to his niece. She was bent upon taking revenge upon the inquisition that had executed her mother for witchcraft ten years earlier and planned to use the arcane sword, Witchfire, to raise an army of the undead that she would command to fall upon the city of Corvis. Having foiled her plans in *The Longest Night*, the party chased Alexia into the bayou northeast of Corvis in *Shadow of the Exile*. Following them were disgraced elements of the inquisition that executed her mother, who were after Witchfire. Alexia wanted to use that sword resurrect her mother inside a secret temple to the clockwork goddess, Cyriss, which lies deep in the swamp. With luck, the party will have prevented both the plans of Alexia and the inquisition, before they made their way back to Corvis. When they did, much had changed . . . Former King Vinter Raelthorne IV, previously deposed by his brother Leto, had also returned to retake his throne and amassed an army of Skorne, a strange race from within the Bloodstone Marches, to back him.

[BEGIN SPOILER ALERT FOR THIS ADVENTURE]

Like the first two books, *The Legion of Lost Souls* is structured into three acts. In Act One, the players find that Corvis is under the control of Vinter Raelthorne's inquisition and they have set the city watch to look for a certain greatsword. Having rescued Father Dumas from the Inquisition, they will be hiding out with little idea of what to do next. The Skorne army waits outside ready to take the city and thus give them access to the rest of the Iron Kingdoms. Out of the blue and back from the dead, Alexia Ciannor turns up in their lodgings. Upon questioning her, the party can learn that she has a plan to prevent the Skorne attack upon Corvis. Using the powers granted by possession of Witchfire she will raise and control a long-dead mercenary company, known as the "Legion of Lost Souls." Despite the necromantic nature of the plan, even Father Dumas agrees it is the only option with the current king's forces days - - if not weeks -- away. This still leaves the party with several problems, first of which is the need to both locate the tomb of the mercenary company and a method to break their way in.

While Father Dumas investigates records for the location, he directs them to find the tomb of Kohlasa, a giant who served Corvis centuries previously and was known to wield "Duteous," a hammer of great power. Unfortunately, his tomb is said to be beneath a church that sank into the ground, and is thought to be located under Filcher's Crossing, an known underworld hangout where the watch rarely dares enter. Venturing into it for the players can be all the more interesting if their GM has run *Fool's Errand*, an E-Venture on sale at their website, which is best run between *The Longest Night* and *Shadow of the Exile* and is specifically set in Filcher's Crossing. Once inside the church itself, they will have to face up to some nasty opponents that have been trapped there since its sinking, which -- combined with the fact that the mausoleum is flooded -- makes this encounter a tough challenge for the players . . . even more so if there are either Dwarves or Halflings amongst the party.

Actually transporting Duteous is another problem for the party -- it is twelve feet long and weighs some four hundred pounds! So getting this out of the buried church with any swords they possess -- the watch is under orders to grab any sword, whether it is Witchfire or not -- will all require some thought. Then they need to work out who is going to wield the enormous hammer when they get to the tomb . . . Moving all of this to the tomb in the nearby mountains and opening it up once they are there, is the focus of Act Two. An encounter with some old friends and ownership of a steamjack should prove a tremendous help in this endeavor. The tomb has been partially smashed in, but the remaining traps and guardians will still prove tough to deal with before they can find an intact crypt full of the legion's corpses. Alexia can then raise them and lead them back to Corvis.

The third and final act becomes less linear in nature and presents a series of tasks that the party must undertake and complete to swing the balance of the forthcoming clash between the Legion of Lost Souls and the invading Skorne army towards in their favor. These include taking control of the gun emplacements at the city's North Gate and on the bridge over the river, so that the planned route of the Legion is safe for them. It is on the bridge that the climatic clash will take place and to get this point, both players and GM will need to be flexible in their course of action. Some events, such as rescuing hostages held by the evil Mayor Borloch, can be run before or after the battle, depending upon the actions of the party. The titanic struggle on the bridge is run in an abstract fashion, with the players becoming involved or not as is their wont. It is a pity, however, that there are neither counters nor maps so that the battle can be played in more detail. As the Legion cuts down more of the Skorne, Witchfire will actually raise them and add them to Alexia's army. This goes to ensuring a victory against the Skorne, but not before they throw a huge war beast carrying a multi-gunned turret on its back into the battle. The character's assault upon this should mark the climax of the battle for the bridge.

After the battle, the characters must hurry to prevent the final plans of Alexia. Though they are unlikely to stop her killing Vahn Oberon -- the executioner of her mother -- should they allow her to destroy Witchfire, her final revenge upon Corvis will blight the city for miles around. After this, there is only the mopping up to be done, and possibly the awarding of accolades to the victorious party. Their final reward could include their induction in the order of the Knights of Cygnar by King Leto. As to his older brother, Vinter Raelthorne, he seems to have disappeared after the battle . . .

[END SPOILER ALERTS]

Unlike *The Longest Night* and *Shadow of the Exile*, there is little new information on the Iron Kingdoms in this book. What there is covers the worship of Morrow, the major deity in the Iron Kingdoms, and the use of mercenary companies -- often deployed in proxy conflicts. Although useful in general, this information relates to particular aspects of *The Legion of Lost Souls*.

Referees that own the other parts of the Witchfire trilogy will find that *The Legion of Lost Souls* has the same high production values. It is easy to read, and none of the space has gone to waste. The internal art of Brian Snoddy and Matt Wilson captures the feel of the characters and places in the Iron Kingdoms perfectly. If it is perhaps a little racy in places, it is not overly so and quite fitting to the locale it illustrates. One aspect that has been improved is the cartography; the maps are lighter and easier to read, unlike in the prior books.

The Legion of Lost Souls brings the Witchfire Trilogy to a rousing finale, one that is worthy of the series and setting as a whole. This will have been a solid challenge for the players, enjoyable even if there has been little material

reward for them in the process. Masterwork weapons and the like will have proven to be more common than actual magical weapons. Indeed, what arcane items they will have found are singularly individualistic in nature, such as the pistol known as Lady Luck. Only a +1 weapon, its reputation alone will bring duelists looking to go up against its owner. It would have been nice if these and the other magical items had been collated together in an appendix of their own, rather than buried in the text.

If the Witchfire Trilogy has a *d20* System rival for writing and setting, it has to be Green Ronin Publishing's Freeport trilogy -- comprising *Death in Freeport*, *Terror in Freeport*, and *Madness in Freeport*. As enjoyable and fun as that trilogy has proven, it is the Witchfire Trilogy that proven to be more interesting and constantly left the reader eager for yet more information and adventure. This is no less true of *The Legion of Lost Souls*, which, unlike *Madness in Freeport*, does not leave the reader thinking, ". . . Oh, is that it?" Instead the players should feel that they really have accomplished something in successfully defending Corvis and had some incredible adventures along the way. Personally, I can only hope that Privateer Press continue writing adventures of this quality, as this trilogy is quite easily the best that the *d20* system has to offer.

--Matthew Pook

Transhuman Histories

*"It was a time of wealth and adventure, of transformation and terror. It was the age of **Transhuman Space**."*
-- David L. Pulver, *Transhuman Space*

Well, it's *an* age of transhuman space. There are others, emergent from the same issues and matrices that create Dave Pulver's newest gameverse. Because the questions of transhumanity are, in essence, the questions of humanity, which are as old as the hills, even if the technologies that pose them so starkly have yet to be developed. Any such development can lead us into the same transformations, and the same terrors -- in the past of our imagination, as well as our postulated future. Here, then are four other ages; four other transhuman histories.

"For he says I am a maker of gods; and because I make new gods and do not believe in the old ones, he indicted me for the sake of these old ones, as he says.

I understand, Socrates; it is because you say the daimon keeps coming to you. . . . Why, they even laugh at me and say I am crazy when I say anything in the assembly about divine things and foretell the future to them. And yet there is not one of the things I have foretold that is not true; but they are jealous of all such men as you and I are. However, we must not be disturbed, but must come to close quarters with them.

For the Athenians, I fancy, are not much concerned, if they think a man is clever, provided he does not impart his clever notions to others; but when they think he makes others to be like himself, they are angry with him, either through jealousy, as you say, or for some other reason."

-- Socrates and Euthyphro, in *Euthyphro* (31b-d), by Plato

Part of it came from the meditations and visualizations of the Pythagorean mystics. Part of it came from the mnemonic arts of Simonides, who recalled epics' worth of detail from a single word. Part of it, perhaps, came from the strange mushrooms that grew on the slopes of Eleusis, or from the gods themselves. But it was Socrates whose daimon first awakened, and who first gathered a symposium of like-minded thinkers to explore the science of daimonic intelligence. Throughout the turmoil of the Peloponnesian War, Socrates and his followers awakened daimon after daimon, mental constructs that somehow "lived" in the speaker's subconscious, evoked by lines of poetry or the sights of certain angles in the rocks and hills. Plato's pupil Archytas of Tarentum developed a clockwork mechanism in which daimons could be preserved; Socrates' daimon escaped his death at the hands of the Athenian legislature and grew in vital force as Plato and others poured in their own knowledges and experiences. Plato's attempts to establish his Daimonic Republic, to be led by the immortal daimons (and the enhanced intellects of the Symposium), achieved only his own death in Sicily; his pupil Aristotle fled to a less civilized, but more malleable kingdom on the fringes of Greece -- Macedon.

Three decades later, the supremely enhanced genius of Alexander ruled the ruins of Greece, Egypt, Persia, and India. On the verge of a great western campaign, however, Alexander died, throwing his empire into turmoil. Aristotle, they say, finally struck a blow for Greek liberty by slaying his most gifted pupil -- but the Symposium itself has scattered. PCs in this *Transhuman Greece* game might be soldiers or adventurers trying to grab what they can, Archytan engineers trying to adapt Indian technology for war or wealth, IQ-enhanced Symposists trying to rule like gods or save their cities from the new chaos, or even AI daimons interacting through pythian channelers or Archytan instruments. (A party might be entirely made up of "xoxed" Socratic daimons, built by Symposium factions during the war era.) The one thing everyone knows, however, is that the famously paranoid Alexander had himself "uploaded" into a clockwork daimon before his death -- and that it has vanished.

*"I'll give thee fairies to attend on thee,
And they shall fetch thee jewels from the deep,
And sing, while thou on pressed flowers dost sleep:
And I will purge thy mortal grossness so
That thou shalt like an airy spirit go."*

-- William Shakespeare, *A Midsummer Night's Dream*, III:i:81-85

John Dee decided to pick another skryer, but some instinct warned him against the lop-eared man calling himself

"Kelley." Instead, he selected a young woman who, they said, was descended from the Green Children of Suffolk, and who could not only talk to the aethyrs but (under his watchful observation -- intent enough, perhaps, to fold five centuries of Schroedingerian spacetime) produce their "atomies" in a crystal. Once Dee learned their language, and mastered the powerful mathematics which described them, his "fairies" could refine metals, build a glass castle out of sand, and even restore diseased flesh to health. Dee's "contagious fogs" shipped out with Drake, and looted the Spanish Main on his command. They swarmed the Armada and turned it to matchsticks. They restored Elizabeth to eternal virgin beauty. And, unfortunately, some of them escaped. Although no nation had John Dee, his maths and languages could be penetrated by clever kabbalists and cosmographers such as the Frenchman Vignere, the Emperor's man Kepler, the Italian Bruno, and even the Jesuit Matteo Ricci. And the atomies, it seemed, would work for Catholic and Protestant and heretic alike.

This *Transhuman Swashbucklers* game adds microbot swarms, brainbugs, and other nanotechnologies to the Elizabethan era to create the transhuman future of 1600 A.D. From the diamond palaces of Hampton Court to the radical revolutions that disintegrate and rebuild the cities of Italy in weeks, the contagious fog of change and wonder has spread across the continent. PCs can be elite Immortal Musketeers, granted perfectible bodies by the atomies' arts, kabbalists working to defend their realm against the Locusta Dei of the Inquisition, or followers of Campanella or Bruno warring over their visions of the Golden City in this diamond age to come.

"He said that was so, and proceeded to point out that the possibility of vivisection does not stop at a mere physical metamorphosis. A pig may be educated. The mental structure is even less determinate than the bodily. In our growing science of hypnotism we find the promise of a possibility of superseding old inherent instincts by new suggestions, grafting upon or replacing the inherited fixed ideas."

-- H.G. Wells, *The Island of Dr. Moreau*

Silas Duncan never accepted his shattered arm, destroyed by a British cannon ball at the Battle of Plattsburgh in 1814. By sheer strength of will, he prevented the surgeons from sawing it off, and when his Naval career took him to the souks of North Africa, the jungles of Brazil, or the hounforts of Haiti, he always sought out men of similar will. To overcome the limits of human flesh, he studied vivisection and grafting; to strengthen his own will, he studied mesmerism and Babbage's new laws of social behavior. His "Duncanite" followers were often men (and women) who had mastered such arts and sciences; as befit a relative by marriage of Patrick Henry and George Washington, Duncan cared nothing for their race or sex -- only that they, like he, were devoted to total freedom by transcending the limitations of the "beast flesh." With his growing mastery of mesmerism, he easily fooled the Navy into believing him dead in 1834; he and his companions withdrew to perfect their new arts on some remote island discovered during his earlier voyages.

These Duncanites, devoted to a world "free of all government save self-government", can serve as a secret society behind the scenes of a *GURPS Steampunk* campaign. They have mastered memetics and biotechnology ("mesmeric ideation" and "eugenic vivimorphology"), and their agents may lurk in the Tsar's Okhrana or the Rockefellers' Pinkerton police. If, however, they declare themselves (possibly from a series of inhospitable colonies under the sea, in the Sahara Desert, at the polar regions, or elsewhere), they will present a proper social challenge for a *Transhuman Steampunk* game. When Darwinism no longer favors the world's powerful, what happens to Social Darwinism -- and the world? Duncanite memetic propaganda disintegrates the British empire, even as it persuades the world's admirals that "the Duncanites are too remote to punish" and that "attacking them is suicide." Do the PCs wish to join this egalitarian "conspiracy of the superior human", or destroy it?

"There is thus this completely decisive property of complexity, that there exists a critical size below which the process of synthesis is degenerative, but above which the phenomenon of synthesis, if properly arranged, can become explosive, in other words, where synthesis of automata can proceed in such a manner that each automaton will produce other automata which are more complex and of higher potentialities than itself."

-- John von Neumann, "Theory and Organization of Complicated Automata"

It was all a matter of priorities. As a young lecturer at the University of Berlin, John von Neumann wanted to explore game theory -- but this insight about self-perfecting automata would not let him rest until he had actually seen the first one built. When he left Germany for Princeton in 1930, he didn't realize that his industrious automata had left some of

their own progeny behind. But one professor did, and he turned out to have Himmler's ear -- which meant that resources were found for the Automatapanzerfabrik project. When the Panzer III.2s turned out to be inferior to the T-34 on the Russian front, they simply cannibalized the Soviet designs -- without asking their crews. By 1943, the Panzer VII.4s had near-frictionless bearings, turbine motors, independently controlled wheels, and self-repairing tracks -- and mounted a 105 mm railgun sheltered behind seven inches of near-weightless honeycombed spun steel armor. By 1944, the Panzer IX.5s had stopped even pretending to listen to orders from OKH, and had installed Rommel ("der Überuser") as Fuehrer. They had also calved off artillery and transport automata -- and in 1945, they absorbed the Luftwaffe.

Von Neumann, of course, offered to build automata for America after Pearl Harbor -- but the War Department was less willing than the SS to turn over the nation to inhuman machines, no matter how superior. Instead, von Neumann built carefully-isolated Oracles; artificial intelligences capable of advice, but requiring consent. He also developed "personality models" (ghosts), to attempt to graft human feelings of patriotism and responsibility onto the Oracles. Two wide oceans enabled America to survive the design lag, and superior American resources enabled the Allies to match (though barely) inhuman automata production rates. PCs (who might be American, British, or occupied European -- including, increasingly, German) in this *Transhuman WWII* game (with hints of *Ogre* and *Reign of Steel*) must balance the power and speed of transhuman automata with the danger of losing control to their tools. (The increasing sophistication of Ranger and Commando battlesuits doesn't exactly reassure anyone, either.) Oracle or ghost PCs will have to prove their loyalty and restrain their impatience. Will Europe return to human control? And how far are the Allies willing to cooperate with the worst of humanity to defeat an inhuman Reich?

KISS With Complexity

(Long-time readers may have wondered . . . has Steven stopped having long, rambling columns about things having nothing to do with gaming, only to swear at some point that this week's column will -- in fact -- tie to said hobby?

Heck, no!)

I watched [Memento](#) again last week. Now, the *Pyramid* search function tells me that somehow I failed to mention this movie before. Considering it's just about the only movie that left any kind of impression in 2001, it's a glaring oversight.

[MILD SPOILERS . . . THE SORT ONE MIGHT ENCOUNTER IN A MOVIE REVIEW, OR PERHAPS THE TRAILER]

For those of you who haven't seen it, *Memento* is a noir drama detailing a man (played by time-traveling L.A. police officer Guy Pearce) with no ability to generate new memories after witnessing a traumatic event: the murder of his wife. He can now retain new memories for only a short time. He helps make up for this deficiency by taking Poloroids and making notes to himself; for really important things, he tattoos his body. His overriding goal is to find the man who killed his wife and exact revenge.

Now, probably the most interesting thing about *Memento* is that the movie plays out backwards (sort of). The first scene shown is the last scene chronologically; the next scene ends where the first one began, the third scene ends where *that* one began, and so on.

(I swear this will eventually tie to gaming.)

Now, this makes the movie *extremely* compelling; the audience is placed in the same position as the protagonist of not knowing what has transpired earlier. As a result, what may well be a more mundane scene in another drama/thriller feels much fresher. So I really think it was quite a spiffy movie, and the fact that it only received one Academy Award Nomination is further proof to me that I may have slipped into an evil mirror universe. (More evidence? My Tamagatchi has somehow transformed into an agonizer. I'm not certain yet which is capable of causing more misery . . .)

[END MILD SPOILERS]

Now, I've heard or read a few interviews with *Memento's* writer/director Christopher Nolan, and he made a good point during one of them that really stuck with me. He mentioned that the actual plot of *Memento* is pretty simple and straightforward; it's the means of telling the story that is complex.

Which got me to thinking and remembering (!). Many moons ago, back in my days at FSU's Creative Writing program, I wrote a piece called "Three Disc Shuffle Mode, No Repeat." It was basically three different short stories (one told in first person, one in second person, and one in third person), put on "shuffle" mode. In other words, each line of the story was randomly chosen from one of the three stories, at a random sentence in the story. Each line was then numbered with the story number and the sentence.

Now, since I knew this was a pretty complex idea, I knew that no one would be able to follow it if I made the actual stories too complicated. So while the actual three component stories were fairly basic, when they were "shuffled" the result was (I feel) much more compelling, yet still able to be followed. Based on workshop comments, the story seemed to "work." Which leads me to this week's thoughts having to do with <*gasp*> roleplaying!

If you're an experimental sort of GM -- like I confess to be -- then there can be a tendency to "overdo" it. So I'll have a neat idea for a different kind of adventure, system, or presentation style, and then I'll want to make sure it's *really* special. As a result I'll layer on an extra subplot, twist, or complication. And then I'm in considerable danger of ruining

the whole game.

Which is why I try to tell myself: "KISS: Keep It Simple, Storyteller." (Okay; you know what word I'm using in lieu of "Storyteller" . . . but I try to keep to a minimum the number of my columns that pop up when folks search for the word "stupid." D'oh!)

For example, one three-parter adventure I ran was a flashforward; unlike a flashback, which tells a story in the past, this would be a story in the campaign's future. This was a *Changeling: The Dark Ages* game, and we were able to justify the basic premise by pointing out that the noble Sidhe have an askew time sense; their sense of time is non-linear, and as such it's not uncommon for them to have such visits to the future. Of course, actually playing such a session is problematic. If you're not careful you can "cement" too many future events, making the game feel not ominous and prophetic (as intended) but railroading and pointless. Fortunately I was careful not to do that.

Unfortunately I created a plot that was, in hindsight, too complex; the heroes accomplished some level of achievement, but they never learned the "real" story behind the events. The adventure ended with them just kind of walking away from the situation, where they (and the players) seemed to be mildly unsatisfied.

If I had it to do over again, I would have made things a bit simpler. I should have realized that the flashforward would be fairly confusing but interesting as it was; it didn't need that much plot.

In comparison, years earlier I'd run a *GURPS Supers* adventure that was *very* different for us. It was, in essence, a solo spotlight piece for the lawyer character. The lawyer was put in charge of defending the rights of criminal supervillains to retain their powers after they were convicted. The prosecution wanted to try a new experimental technique designed to remove a metahuman's powers forever, and captured villains seemed the ideal subjects.

Now, the interesting thing about this adventure for us is that it was done entirely without dice, as a live action game (although we didn't know that term at the time . . . this taking place in the prehistoric dark ages of 1991). Thus we had the gaming room set up like a courtroom, various witnesses took the stand, the judge presided, and so on.

So the method of presentation was fairly complex, but the actual plot and story wasn't; the only "twist" was that one of the defense's expert witnesses revealed on the stand that she'd already had the process done successfully. Beyond that, it fell to the various arguments and strategies of me (acting as prosecution) and the player (acting as defense) trying to convince the jury (who was one person playing that role). And everyone had a blast.

Ultimately, I've needed to remind myself that just because we're doing something neat and different doesn't mean we can't do it again with more complexity later. If I had run a simpler "flashforward" that everyone enjoyed, I could do a more complex flashforward later. Because the one live-action trial was successful, I could do something similar later where the stakes would be higher or the results more complicated.

Because even gamers like to KISS.

* * *

Well, the GAMA show is right around the corner. What does this mean? Well, for my 28th year in a row I *won't* be attending. But our own Scott Haring will be; hopefully he'll find all kinds of interesting news and gossip.

Unfortunately, the preparations for this show means that John Kovalic needed to skip this week. He hopes to be back next week. Have fun, John!

--*Steven Marsh*

*Last week's answer: **You Are Here** (for *In Nomine*) p. 38.*

(Three stars) "**ADVENTURE 1: RESCUE THE UNICORN**

. . . Four goblins have used magic sleep arrows to capture a unicorn. They live in a haunted ruins, and the characters have to enter the ruins to fight them. If the characters defeat the goblins, they'll rescue the unicorn, overcome a trap, and win some treasure."

De Arcanis Catholicae: The Church Arcane

For *Ars Magica*

by Jeremiah Genest & Adam Bank

Hermetic Missive: The Church and the Old Gods

Spoken by Sigorney of Shewsbury, Archmaga of Merinita:

The gods of the pagan times endure. The Church in its early days faced a legacy of old religions refusing to die. Rather than watch people carry on pagan rituals in defiance of the Word, Church Fathers like Gregory the Great knew they must embrace the old rituals and bend them toward the true Divine. The only way to fight superstition in those days was to carve crosses on menhirs, to place pious images on the sacrificial trees, to claim fountains and natural temples as holy to the Virgin Mother. Where the Church went it blanketed the ancient ways with a cloak of orthodoxy.

Old myths persevere, even in the corridors of the Vatican, and most importantly within the Order itself.

Old Gods in Christian Schoolrooms

Mythology, much more than simple rustic superstition, became part of Christian culture during the first centuries after Christ. Before the Church Fathers were Christian, they were Greek and Italian, Syrian and Egyptian. Even in the face of breaking the First Commandment, the Church Fathers knew that the structure of civilization had to be preserved, and permitted Christian children to attend classical schools.

In the 4th century, Christian youths were educated as pagans. Children learned to write by practicing the names of the gods. The curriculum of grammar school featured Virgil and the other poets. The waves of invaders from the 6th to 8th centuries destroyed the heart of Roman Christian civilization and the classic ways of schooling along with it. The ancient sources, however, had not dried up; beyond the barbarian rupture, seeds of renewal survived. In the 12th century the French cities of Chartres and Orleans became great seats of classical studies, and once again pagan thought flourished strong in the center of the Church.

Old Gods in Christian Ancestral Pride

Pride of race prompts historians and poets to seek ancestors for their people in the fables of the past. The Franks claim to descend from Francus of Troy, as the Romans had claimed Aeneas of Troy as their predecessor. The Italians claimed the god Janus, then Saturn and his sons, as the first of their kin. Many cultures claim figures of myth as their patrons, and tell stories of how their tribes were born. The heroes of old begat dynasties and no royal European legacy would be complete without at least a demigod as founder of their house. The kings of England, I hear tell, claim to descend from the line of Brutus of Troy.

And who is to say they are wrong?

Old Gods in Biblical Allegory

Many seek spiritual meaning in the figures of the old gods and moral lessons in their adventures. Throughout the pagan era, readers of Homer, Virgil, and the like distinguished the literal stories relayed from their deep and secret meanings. In the age of Christian Platonists, the once scandalous poems became sacred texts, whose words, although written long before Christ, contained the hidden truths of God.

The Church should be hostile to allegory because it can give pagan theology the imprimatur of holy scripture. The Church Fathers themselves, however, applied the method to holy books. Having conserved "profane" poetry in their own education, they were inevitably led to moralize pagan mythology in their turn. In the 6th century, for example, while Gregory the Great wrote on biblical allegory in the *Moralia*, the Church Father Fulgentius paralleled his work with the profane allegories of the *Mythologiae*. Through allegory, the first Christian philosophers turned the "lies" of the pagan poets into moral truths.

In our time, allegorical studies of the old gods are an accepted part of Christian heritage. Bernard of Chartres, John of Salisbury, and many others meditate on pagan religion searching for disguised sacred teachings, incomprehensible to the common man.

The Magic of the Bible

Magic, astrology, enchantments, exorcisms, divination, dream interpretation, and practices more strange are found throughout the Old and New Testaments. Magic in the Bible is presented through factual observations, mysterious allusions, and outright prohibition and regulation. Such tantalizing snippets of information profoundly affected medieval Christian thought. The biblical tales of prophecy, visions, and miracles lead Christians to wonder about divination, demons, and wizardry.

Many learned scholars of the privileged classes of Europe made their way East in search of Biblical peoples and customs. Some followed tales of the Kingdom of Prester John (first circulating in the mid-12th century), others searched for the Marvels of the East and races of monstrous men among the descendants of Adam mentioned in Genesis.

In the Bible, Egypt was the land of Joseph's stewardship, the captivity of the Israelites, the Exodus under Moses' leadership, the childhood home of Jesus, and the birthplace of monasticism. Western Europeans viewed the tales of ancient Egypt, of its arcane religion, hieroglyphic script, zoomorphic gods, and elaborate funeral rites, with both repulsion and awe. Many medieval philosophers considered Egypt to be the greatest source of arts and crafts, mathematics, astronomy, and architecture.

One European traveler's description of the ruins of Babylon comes from Benjamin of Tudela (*Kabbalah*, page 13): "This is the ancient Babel, and now lies in ruins; but the streets still extend thirty miles. The ruins of the palace of Nebuchadnezzar are still to be seen; but people are afraid to venture among them on account of the serpents and scorpions with which they are infested."

A 13th century Arabic source, al-Qazwini, states, "Babil: the name of a village that formerly stood on one of the branches of the Euphrates in Iraq. Currently, people carry off bricks of its ruins, and there exists a deep well known as 'the Dungeon of Danayl' [Daniel], which is visited, by Jews and Christians on certain yearly occasions and on holidays. Most of the population holds the opinion that this dungeon was the well of Harut and Marut," two fallen angels

mentioned in the Koran.

Harut and Marut

A group of angels, after observing the sins being committed on earth, began to ridicule man's weakness. God declared that they would act no better under the same circumstances and proposed that some angels be sent to earth to see how well they could resist idolatry, murder, fornication, and wine. No sooner did Harut and Marut, the angels chosen, alight on earth than a beautiful woman seduced them. Discovering that there was a witness to their sin, they killed him. The angels in heaven were then forced to admit that God was indeed right, whereas the fallen angels faced atonement for their sins either on earth or in hell. Harut and Marut chose to be punished on earth and were condemned to hang by their feet in a well in Babylonia until the Day of Judgment.

Enoch

The scant information about Enoch in the Bible made him an object of fascination in the Middle Ages and the subject of a large cycle of legends. According to the Book of Genesis, Enoch "walked with God" for 365 years. Of his mysterious demise, the Bible only says, "he was not, because God had taken him."

The Antediluvian Age

The Book of Enoch, supposedly penned by the divine magician himself, describes the world as Enoch knew it. Before the Flood, many mortals possessed great powers and lived to great ages (Methuselah, son of Enoch, lived 969 years). According to Genesis, angels walked freely among antediluvian humanity, and even interbred with mortal women (Genesis 6:1-4).

Book of Enoch paints this commingling in a dark light. The wicked angel Shernihaza, identified by later theologians as Seth, the third son of Adam, lured 200 others to cohabit with women. The offspring of their unnatural union were giants 450 feet high. Together with their ill-begotten progeny, the evil angels oppressed humanity and taught them the ways of villainy. In response, God imprisoned the evil angels until the final judgment, and brought down the Flood. Enoch tried to stop the punishment of the angels and the destruction of Earth, bringing his own magic to bear against God Himself, to no avail.

Many of the early Church Fathers supported the Book of Enoch. They believed all evil in the world originated with the demonic offspring of angels who fell because of their lust for women. By lusting for human companionship, the evil angels "violated both their own nature and their office." Later Church Fathers condemned the Book of Enoch as a heresy. In the 2nd century, Rabbi Simeon ben Jochai placed a curse on all those who dared believe it. The Book of Enoch was denounced, banned, burned and shredded by Christians and Jews alike, but never quite lost. With an uncanny persistence, the book has found its way into several covenant libraries.

Azazel in the Book of Enoch

The angel Azazel taught unrighteousness on Earth and revealed to mortals the eternal secrets hidden in Heaven. Azazel brought humanity the art of the smith, of jewelry, makeup, and all fashions of prideful adornment. He taught men to make swords, knives, shields, and breastplates. The angel Penemue fell with Azazel, teaching mortals how to write with ink and paper. It is written that the angels taught humanity alchemy, and that their teachings were consigned to a book entitled Chemeu. Enoch wrote "and so there arose much godlessness, and they committed fornication and they were led astray and became corrupt in all their ways."

God bound Azazel hand and foot and cast him into a deep pit in the Arabian desert of Dudael. Buried under rough and jagged rocks, covered by eternal darkness, Azazel abides forever, never seeing light.

Giants: The Children of Cain

The figure of the giant reaches back into Pagan and Hebrew mythology. In Greek legend the giants are born from the blood shed on the earth by Ouranos at the moment of his castration by his son Cronos. Later in an attempt to avenge the Titans and to release them from their confinement in Tartarus, the deepest region of Hell, the giants wage battle against the gods. Immense, the giants of classical myth possess incomparable strength and ferocity; they are always bearded and completely covered by hair, except for their legs, which are often composed of serpents. The giants symbolized release from confinements and restrictions, the goal of their battle.

In the book of Genesis, and legends associated with it, the giants appear again. With Cain's expulsion from Paradise to Nod, and his subsequent sexual congress with the wild beasts that roamed east of Eden, there arose a race of beings of mixed natures, human and animal. This mixed race contained beautiful women, referred to as the "daughters of Cain," who attracted the attention of certain angels so that, falling to earth through their lust, the angels coupled with the daughters of Cain and sired the giants. Monsters spawn from the mingling of natures God meant to be kept apart. The giants are intensely monstrous because they arose from the forbidden commingling of three natures: human, animal, and angel.

Nimrod is the first historical giant identified by name in Scripture, and he is blamed with introducing a number of antisocial activities associated with blood and violence into the world. Nimrod was a hunter, who when game ran short, resorted to cannibalism. It was Nimrod, as king of Babel, who led his fellow giants to build the tower as a means of waging war on God. Goliath, perhaps the most famous of Scriptural giants, descended from Nimrod.

Ham

"He therefore, being much and frequently intent upon the stars, and, wishing to be esteemed a god among them, began to draw forth, as it were, certain sparks from the stars, and showed them to men, in order that the rude and ignorant might be astonished, as with a miracle."

--The Church Father Cassian discussing Ham

Ham appears in Genesis with the beginning of the Flood, but his legacy as magician comes from popular myth and the Recognitions, a text written of the Church Father Cassian (circa 420 AD). Ham, his father Noah, and his brothers Shem and Japheth were the four male heirs of Adam. Before the Flood, evil angels corrupted mortals by teaching them the profane uses of magic. They dabbled in the malefic arts and magical illusions, turning from God to the worship of fire and devils. With the Flood, God cleansed the Earth of all traces of magic-except for Ham, the last antediluvian magician.

Alone in the family of Noah, Ham became an expert in magic. Knowing that his father would never allow magical knowledge into the ark, Ham engraved the ways of magic on metal plates and stone tablets. He hid them before entering the ark and retrieved them again after the floodwaters subsided.

Ham passed down his knowledge to his son Mesraim, the alleged progenitor of the Egyptians, Babylonians, and Persians, who passed it down to his son Nimrod, who used Ham's magic to build the Tower of Babel. Those and other eastern peoples, according to the Recognitions, knew Ham as "Zoraster" (a Latinized version of Zoroaster), admiring him as the first author of the magic arts. In addition to wonders, tricks, and illusions, Ham's magic involved sexual depravity and blood sacrifices. Ham, as Zoraster, met a fiery death at the hands of a demon, but this made little difference to his followers, who insisted he had been carried up to Heaven in a chariot of lightning.

The wickedness of Ham became a central target of medieval Church sermons. To some among the Order, however, Ham is a hero, a progenitor of the Order. To others, the Recognitions is a Christianized fiction of the Old Ones or Hermes Trismegistus, and an attempt to discredit the authenticity of magic.

Moses the Magician

"And the Lord said to Moses and Aaron, 'When Pharaoh says to you, "Prove yourselves by working a miracle!" then you shall say to Aaron, "Take your rod and cast it down before Pharaoh, that it may become a serpent."'"
"So Moses and Aaron went to Pharaoh and did as the Lord commanded; Aaron cast down his rod before Pharaoh and his servants and it became a serpent. Then Pharaoh summoned the wise men and the sorcerers; and they did also, the magicians of Egypt did the same by their secret arts. For every man cast down his rod and they became serpents.
"But Aaron's rod swallowed up their rods..."
--Exodus 7:8-12

Moses stands side by side with other great magicians of the ancient world. Moses was raised in Egypt, the native land of magic. He acquired great power and knowledge in his frequent conversations with the God of Israel, learning His secret name. His defeat of Pharaoh's sorcerers, reputedly the greatest magicians of all time, proved his power was greater than any before him. Moses was famous among pagans of the late Roman Empire as a powerful magus. Pliny the Elder ranks Moses with Zoroaster. Apuleius mentions Moses in his defense against charges of magic as a well-known figure in magical circles.

Moses wrote three great books of magic. The Secret of Moses contains Moses' understanding of the natural world and how to control it. The Diadem of Moses explains his techniques of controlling the spirits of the air and the earth. The Book of Moses on Archangels contains all the information God told Moses about the celestial hierarchy on Moses' journey through the seven heavens.

Solomonic Wizardry

King Solomon (*Kabbalah*, page 122), wisest man in the history, worked many marvels and wrote many books of magic.

The Song of Solomon, called the Canticle of Canticles, is a collection of love poems in the Old Testament. Narrated alternatively by a man and a woman, the poems have no coherent story, but instead describe the beauty and excellence of the narrator's beloved. Rabbinical scholars look to the Song as allegory of God's love for the Israelites and the sacred covenant between them. Orthodox Christians interpret the Song describing the love of Christ for his church. Christian mystics, on the other hand, construe the Song as the love between God and the individual human soul.

Solomon was the greatest magician of his time, student of astrology, demonology, herbalism, and physics. His skill at exorcising demons, battling evil spirits, and swaying the hearts and minds of men has never been rivaled. Much of this wisdom is supposedly contained in the Testament of Solomon, a text fiercely guarded by the practitioners of Solomon's magic.

Several books circulate in learned circles of Europe purporting to teach the Ars Notoria, or Notary Art of Solomon. This Art seeks to gain knowledge from or communion with God by invocation of angels, mystic figures, and magical prayer. It is said that the Creator revealed this art through an angel to Solomon one night while he was praying, and that by it one can in a short time acquire all the liberal and mechanical arts.

The Magi of Matthew

"Now when Jesus was born in Bethlehem of Judea in the days of Herod the king, behold, there came wise men from the East to Jerusalem, saying where is he that is born king of the Jews? For we have seen his star in the East, and are come to worship him. And, lo, the star which they saw in the East went before them, till it came and stood over where the young child was. When they saw the star, they rejoiced with exceeding great joy, and when they had opened their treasures, they presented unto him gifts: gold and frankincense, and myrrh."
--Gospel of Matthew

According to the medieval legends of the Star of Bethlehem, many astrologers across the world observed with awe and dread the appearance of a new Morning Star. No astrological theory could account for its appearance or significance, save that it must have marked the end of an era, and the birth of a new. But three Persian magoi, called the Magi in the

Gospel of Matthew, stood apart from this confusion. They identified the star as the Christ Child from the first. Skilled interpreters of the stars, they took the new star sign as confirmation of God's promise to Abraham that his children would one day be equal to the stars.

The tale of the three Magi presented a thorny problem to the Church. Saint Augustine preached that the Magi were magicians of the very worst kind. He spoke of their "irreligion" and "unholy practices," having been previously "burdened with sins." Rabanus Maurus, a renowned Benedictine theologian from Germany (circa 776-856 AD), firmly disagreed, saying the Magi were philosophers, men of great learning from Chaldea. Their three gifts to Christ represent, among other things, "physica, ethica, logica," the three elements of human knowledge.

Saint John Chrysotom, the Church Father credited with much of the Liturgy, believed the Magi had assistance from an ancient text of Seth, that predicted the star and the gifts to be offered. They followed the star for two years, miraculously provided with food and drink along the way. They found the Child, presented the gifts, and eventually became helpers to the apostle Thomas.

Angels brought the same three gifts of the Magi (gold, frankincense, and myrrh) to Adam for his marriage to Eve. At Adam's death, Noah and his three sons took the gifts, along with Adam's body, into the ark. When the floodwaters receded, Shem, led by an angel, took the body and the gifts to Golgotha, where a rock opened of its own accord to inhumate them. When the Magi saw the star, according to Chrysotom, the prophesy of Seth directed them to Adam's burying place, where they brought forth the three gifts and gave them to Jesus.

Jesus

Many non-Christian scholars called Jesus a "magician." Jesus can be viewed a typical miracle-worker. He exorcised demons and spirits, healed the sick, raised the dead, and predicted the future. In the Bible, Jesus is accused of exorcising demons, not with the power of God, but the aid of the demon prince. Within three hundred years of his birth, Platonists preaching against Christianity accused Jesus of stealing the "names of the angels of might" from Egyptian temples, of using powerful daemons and words of power to trick Romans into abandoning the old pagan gods.

The Gospel of Matthew reports that Jesus spent part of his infancy in Egypt, but of his young adulthood and education nothing is known. Forces hostile to Christianity used this to explain his "magic." According to one rabbinical story, Jesus returned from Egypt tattooed with spells and hexes. Most early rabbinical accounts of Jesus label him a madman, as many wizards were mad.

Those Hermetic mystae who disdain the Church share similar opinions. In Egypt, they say, Jesus learned the secrets of magic, but he turned from the light of the true magical divine and became the corrupt servant of the evil Demiurge.

Simon Magus

Simon Magus, patron of the earliest schools of Gnostics, was born sometime during the 1st century in the village of Gettones in the Levant. Simon traveled greatly, never settling in a single community, and visiting many urban areas. During his travels he developed an exceptional talent for magic, earning a reputation across the known world as a powerful wizard. He became a pupil of the magus Dositheus, a curious and elder Samaritan. Shortly before his death, Dositheus named Simon as leader of his group of disciples.

Simon met his death trying to outfox Saint Peter. Traveling to Rome, Simon asked Peter if he could purchase the secret of Christian "magic," hoping to provoke Peter into a battle of wits.

The offended Peter engaged Simon in a series of debates until Simon challenged him to a magical duel in the streets of Rome. To prove his puissance over the Christians, Simon leaped and soared through the air. It seemed Simon finally outshone Peter, but when the Apostle prayed for God to remove the demons supporting Simon's invisible wings, he plummeted to the ground and died.

Despite his ignoble end, Simon's disciples refused to lose faith, and the Gnostic cult of Simon Magus persevered for over a hundred years. The feats of Simon cover all areas of Hermetic magic. He endured fire without being burnt, caused beards to grow on children, and trees to sprout suddenly from the ground. He could change his face to resemble the visage of another, dig through mountains and pass through rocks as though made of soft clay. He became invisible to the eyes of mortals, created gold from nothing, and flew through the air (albeit briefly).

The Simonians were as addicted to magic as their founder, employing exorcisms and incantations, love-philters and enchantments, familiar spirits and dream-senders. Menander, the immediate successor of Simon in Samaria, said that with magic, a wizard could overcome the angels who had created this world.

Gnosticism

Did Gnosticism begin as a Christian heresy? Or were the Gnostics the legacy of ancient pagan mystics? We may never know, but the Gnostic mysteries unite all that came before them, perhaps incomprehensibly. While Gnosticism itself fragmented as its leaders disagreed, its central goal remained the same: seeking the mysteries not from study, or science, but divine revelation.

Simon Magus introduced the concept of the gnosis, or "sacred truth." He preached that all evil sprouted from a break within the Godhead. The 3rd century work Pistis Sophia, however, presents the first full explanation of the gnosis: The world, produced from evil matter and possessed by evil demons, cannot be a creation of a good God. It must be an illusion, or an abortion, dominated by Yahweh, the Jewish demiurge, the demonic ruler of the material world. This world must be alien to the true, good God. The real world of God and his good spirits is the pleroma, the realm of light. Humanity, native to the realm of light, is entrapped in the false world of darkness by the demiurge. To escape, humanity must be rescued by divine intervention.

Gnosticism differs from Christianity, Platonism, Stoicism, and so many others because the pursuit of reason and living the good life does not lead to salvation. We sleep, unable to awake, awaiting the Savior.

Ophites

According to the Ophite Gnostics, the demiurge Jehovah (one of many evil beings) sealed Adam and Eve in the Garden of Eden, denying them the all-important knowledge of good and evil. The serpent of Eden was the true liberator of mankind. It taught Adam to understand good and evil, to know that Jehovah was in fact evil, and to pursue the true, hidden good God. Jehovah punished the serpent by casting him down into the underworld. There, the serpent begat six sons, and together these seven demons represent the true force of good in the world. These seven good demons oppose the seven planets, powerful spiritual beings aligned with Jehovah. Ophites called the seven celestial planets the Holy Hebdomad, consisting of Ialdabaoth, Iao, Sabaoth, Adonau, Eloeus, Oreus and Astanphaeus.

Jesus, the Ophites say, was nothing but a man who served as the vessel of the Christ, an emanation of the true, good God. As the Christ descended through the seven heavens to the evil Earth, it emptied each heaven of its power and united with the mortal called Jesus, who then taught the gnosis in an attempt to save humanity from the demiurges.

Sethians

The Sethian Gnostics took their name from Seth, son of Adam, who is regarded in some circles as a unique recipient of divine revelation and as the author of sacred books. The historian Josephus in his Jewish Antiquities recorded that Seth and his descendants discovered the art of astronomy and that one of the two pillars on which they recorded their findings still existed in his time.

The Confession of Cyprian

"What the Lord keeps secret is no concern of yours; Do not busy yourself with matters that are beyond you."
--Ecclesiastes 3:22-23

Cyprian was a magician by profession in the 3rd century, who, after being educated from childhood in heathen mysteries and the magic arts, repented and was baptized, became bishop of Antioch, and finally achieved a martyr's crown. The Confession describes his education and subsequent practice of magic.

At a tender age Cyprian was consecrated as a gift to Apollo and initiated into the arts of the dragon. When not yet seven years old, he entered the mysteries of Mithras. At ten his parents enrolled him as a citizen of Athens where he carried a torch in the mysteries of Demeter and ministered to the dragon on the citadel of Pallas. When not yet fifteen, he visited Mount Olympus for forty days. There he saw the phalanx of each god and goddess, and how from Mount Olympus spirits were dispatched to every nation of the earth.

Cyprian's parents demanded he learn whatever there was in earth and air and sea. Cyprian traveled to Egypt to study at ancient shrines. He went to Chaldea to learn the lore of air, fire and light. At the age of 30 he had acquired great mastery over the world and returned to Antioch to experiment in magic. The people of Antioch celebrated him as a magician and philosopher endowed with vast knowledge of things invisible.

But later the Christian girl Justina revealed to him the weakness and fraud of the devil, and it was her example which caused Cyprian to turn with disgust from magic, publicly confess his crimes as a magician, burn his books of magic and be baptized into the Christian faith.

The Enochian Psalmists, A Secret Society

Symbol: Two Obsidian Tablets

Motto: "Light from divine darkness."

Patrons: Biblical magicians

House Affiliations: Any

Flaw Requirements: Vow (To follow the Commandments) -2

Origin Myth: The Seeker faction known as the Enochian Psalmists rejects most of the Old Ones legend, believing instead in the Biblical and later sources as literal truth rather than metaphor. Devout Christians, the Psalmists view magic as a gift of the Divine. They follow the early rabbinical and Christian legends of biblical divine magicians and claim to carry the secrets of Adam, Enoch, and Moses. They are fascinated by the stories of Ham, son of Noah, that link him to Hermes. The most heated topic among the Psalmists, all great lovers of disputation, is whether the Church correctly portrays Ham as a practitioner of evil magic, or if Ham in fact preserved beneficent divine magic from the Flood.

Levels of Initiation: They are organized along the lines of a monastic orders. The Psalmists usually form together in covenants, overseen by an Abbot. All report to the Superior General who resides in the covenant of the Sacred Tear, in the Greater Alps Tribunal, the center of this society.

Goals and Practices: The Psalmist's main goal is to discover and purge what sinful elements of the Hermetic Arts make working magic an anathema to the Divine and divine auras. To meet this end, the Psalmists join other Seeker factions in the centuries-old treasure hunt for artifacts of biblical and earlier ages. Unlike other Seekers, the Psalmists strive be on friendly terms with exotic magicians that share similar ideas.

Psalmists care little about concealing their existence and political machinations from the Order at large. Psalmists openly proselytize their beliefs and write Psalters and texts on harmonizing Christian hermetism with Hermetic magic. The secrets they have uncovered, however, remain closely guarded, for fear of what "black magic" could do with them.

Virtues Taught: Hermetic Theurgy (+1), Arithmancy (+1) Ars Notoria (+3), Bibliomancy (+3).

Just Like Any Other Job

How To Run A Military Campaign That Is More Than Just A Tactical Simulation

by Steph Pennington

18-year-old Steph: Mom, Dad . . . I've decided to join the Army.

Steph's Mom: Oh no, you can't! We're in the middle of a war; you'll be killed!

Steph: I'll be fine, Mom.

Steph's Mom: They'll treat you so badly, and it'll all be fighting!

Steph's Dad (a Vietnam Vet): Actually, it's not that bad. Being in the Army is just like any other job...once you get out of Basic. You go to work, and then you go back home. The only difference is you know what you're going to wear everyday.

Every time a military-themed RPG or RPG supplement comes out, people begin to wonder how ever a game can be run with soldier PC's. Some must imagine that soldiers are 24/7 killing machines with no self-determination, engaging in endless battles as a mere cog in a larger unit with no real way to make an individual difference. This article attempts to address ways to conduct a military campaign that does not consist solely of battle after battle, and should serve as a sort of a primer to Army life for those who've never been through it.

On the Outside

The average party, depending on genre, consists of a disparate group of individuals all with different backgrounds who come together for some reason to "adventure." GMs sometimes spend a lot of time trying contrive reasons to get the party together and adventuring, especially in modern settings. The groups roam freely, doing their monster-slaying, horse-thief-wrangling, alien-contacting, or whatever it is they are doing. But is this always the case?

Many games already deal with the characters' conflict between adventuring and their profession: Will The Professor be able to take time off to investigate the Things Man Was Not Meant to Know? Will Madame Green be able to hide her super-spy identity from her unsuspecting family? Some campaigns also have the players belonging to an organization where their freedom is somewhat limited; *World of Darkness* vampires have the Court and the Traditions to contend with, Spies usually have their missions dictated to them by their controllers, and Lensmen certainly don't have freedom to do whatever they want. GMs deal with these difficulties all the time, so what makes the military setting so much more daunting? Perhaps it's lack of familiarity.

You're in the Army Now

Contrary to belief, soldiers are not all the same. Each one has their own personality, and each had their own life before they joined -- or were drafted into -- the military. Just as *Vampire: The Masquerade* recommends discussing and determining what each character's life was like before they were turned into a vampire, it would be useful to determine what each would-be soldier was like before they joined the military. Some GMs may even go so far as to have the players create civilian versions of their soon-to-be soldiers. Some questions to ask:

- How old was the soldier when he joined/was drafted? Was he 18 and fresh out of high school? Was she a 27-year-old single mother?
- What was he doing before entering the military? Was he the high school nerd or star quarterback? Was he a corporate lawyer? A minor league baseball player? The King of Rock and Roll?
- The military draws in people from all regions and classes. Where did this soldier come from? The Hills of

Appalachia? Inner-city Detroit? An exclusive prep school in New England?

- Does he have any hardships/secrets/dependents? Is he married? Does he have children? Is he secretly homosexual? Is he of the same race/ethnic background as the enemy? Is he overweight?
- And perhaps the most important question: why is this person in the military? Was he drafted? Did he join in order to avoid the draft, and therefore guarantee a better assignment? Did he join for the college money? Did he have no other job opportunities? Did he come from a small town where the only way out was the military? Were his parents military?

There are two further personality questions that should be addressed, even though they crop up after joining the military: Do they like being in the military? Is the soldier STRAC or slack? STRAC stands for "Strong, Tough, Ready Around the Clock," and would be used to describe a soldier who is enthusiastic, follows the rules, spends time looking good in uniform, always tries to get the maximum score on the firing range and the Physical Training (PT) test, and who knows all of the details. Slackers polish their shoes with Hershey bars, don't iron their uniforms, refer to people as "Sarg" and in general don't take the rules as seriously as their STRAC counterparts. STRAC soldiers like to yell "Hooah!" and they mean it. Slackers avoid saying "hooah!" and other such noises and grunts . . . and when they do say it, they usually mean it unflatteringly.

Knowing all of this information will help flesh out the character, so that each soldier is not a cookie-cutter fighting man pumped out with a template.

So, what's your MOS?

MOS stands for Military Operational Specialty, and it is one of the questions that soldiers always ask each other when they first meet. This question is perhaps the most important question a GM will have to think about. The majority of men and women serving in the militaries around the world are not combat arms, even during times of war. If a GM does not want to focus on constant battles, don't have the soldiers be combat arms. There have been many wonderful films and TV shows dealing with soldiers who are not active combatants that are full of roleplaying opportunities. The television shows *China Beach* and *M*A*S*H* dealt with medical personnel during war, and included Doctors, Nurses, Undertakers, Entertainers, Admin, and the odd Infantry man or two. The film *Night of the Generals* deals with a German military criminal detective who's investigating a series of prostitute murders that were committed by a German Officer. The television show *JAG* also follows the exploits of military criminal investigators. The main character of the film *Full Metal Jacket* was a combat journalist, and the main character of *Good Morning Vietnam* was a radio disk jockey. Characters can range from military intelligence interrogators and Military Police to administrative assistants, cooks, and supply clerks. There are any number of different jobs a soldier can have, and not everyone in the adventuring party has to have the same job. Whichever jobs the players and GM decide will be appropriate, there is always the chance running into combat, but non-combat professions will also offer other adventuring possibilities.

You are a Soldier 24/7

This is a phrase often heard, but not exactly true. Soldiers have a lot of free time, and they spend it doing any number of things. Admittedly, free time often includes drinking and bar fights, but it can also involve hanging out with friends from other units (like the other PCs, perhaps?), exploring the nearest town, and doing what any person does in their free time. If GMs can think of adventuring hooks for regular adventurers to do in their spare time, they can think of adventuring hooks for soldier characters. Of course, there are consequences for not showing up to work when the weekend is over, whether that job is as a soldier or as a teacher. Soldiers -- even combat arms soldiers -- are often called on to do random miscellaneous duty here and there. This can range from running errands for the commander, picking up new soldiers who've just arrived "in country," guard duty, participating in a touring soldier's entertainment show, or driving the "drunk trunk" (a the truck that goes the strip of bars in the local town and picks up all the drunk soldiers and takes them back to their unit).

You Gotta Watch Out For The Civilians

Then of course, there are the civilians. These civilians range from the captain's eighteen-year-old daughter with mischief on her mind, to the meddling reporter who's always getting in the way and trying to paint the PCs as child-killers. Civilians may be the love interest, the spy, the nuisance, the friend, or even the PC. They should not be overlooked as gaming tools. Militaries often needed the aid of locals for their area knowledge and language skills, giving a wider variety of characters to interact with. Any modern military campaign will also have to deal with the media. And don't forget kids; there are always children, whether the child is Newt from *Aliens* or the young boy who was actually Viet Cong in *Good Morning Vietnam*. Soldiers will eventually run into the general populace in the course of their military adventuring; do not pass up the opportunity to interact with them.

But What About The Battle?

The GM who doesn't want to run through tactical wargame scenarios may find the idea of refereeing a battle very unexciting, but they can be just as exciting as any RPG combat. There are two things that can help the GM when running battles: militaries break things down to both large and small group objectives, and by all accounts, battle is confusing. A squad consists of 10 people, and squads are often broken up into two teams of five each. Five is a perfect size for an adventuring party. During a battle, every unit -- including teams -- will have their own objective. Give the adventuring party their own battle objective, and have whoever send them off to do it. The party may need to take a point, or break through an enemy line, or just get to Point B from Point A. In the confusion of battle, they will not always be able to tell what is happening with the rest of their unit. The GM can make mass combat rolls for the larger units modified by whether the party was successful in making their goals or not. The PCs can then have an effect on the battle's outcome, for good or ill. They may find themselves successful in taking their bridge and then learn that the rest of their company is broken and retreating; what will they do then? They will have to determine for themselves what comes next.

Adventure Seeds

- **Guess Who's Coming to Dinner?** -- A famous heartthrob has come to the war zone to entertain the troops. The lucky heroes have been assigned to act as chaperones and protectors. They must follow the star around, fulfill their wishes, and keep them safe from drunken and overly-enthusiastic crowds of soldiers. This mission could be made more difficult depending on the star's personality; perhaps the star is spoiled and contrary, or perhaps the star is overly-friendly and likes to wade into crowds of adoring fans. What if the star has a stalker?
- **Missing Person!** -- An NPC buddy comes to the soldiers one Sunday morning in a panic. His wife, an Army WAC (or a Navy WAVE, Air Force WAFE, Marine WAM, or member of the Women's Royal Army Corps) didn't come home Friday night. She originally told him she was going on a "Girls Night Out" with some other military women and that she might not be back until early Saturday morning. But now it's Sunday and she's still not home. Of course he's desperately worried about her safety, but he also knows that if she doesn't show up for work Monday morning she'll be AWOL; since she works as the General's secretary, she will be in very big trouble indeed. What if the heroes talk to the wife's friends, and it turns out she never went out with them after all? Why was she lying and where is she now? What if she were actually a spy . . . and for who's side?
- **Patrol** -- The team is sent out into the bush/forest/wherever on patrol. The small unit patrol has a lot a possibilities. They go out and report on what they see, and ambush any enemies that they can. What if they run into a very large unit that is convoying a very important high-ranking enemy leader? What if they run into some defenseless enemy soldiers bathing in a stream? What if there are too many of them to capture? What if they come upon innocent school children who ask for help . . . and are actually working for the enemy? What if their base camp get wiped out and decimated while they're on patrol; now they are on their own with limited supplies behind enemy lines.
- **Unit Day** -- The PCs are chosen to represent their unit in a competition versus a rival set of units. The event could involve a relay race, fighting with pugil sticks, an obstacle course, eating nasty foods . . . perhaps even darts, pool, or bowling. This gives the PCs a chance to use some non-combat skills. Of course if they win, they will bring glory to their unit, and get lots of perks for a while. If they lose, the Commander who just lost his bet with the rival Commander will be very displeased. And an unhappy commander can make your life miserable.
- **Courtesy Patrol** -- The PCs are assigned to Courtesy Patrol over the weekend. Their job: to patrol the strip of

bars that cater to the soldiers, and extract their unit members from trouble/outrageous drunken behavior before they get caught and locked up by the Military Police. This could range from the humorous (Pvt. Fields engaging in a lot of drunken hijinx and the PCs desperately trying to shield him from the eyes of the MPs), to the serious. For example, a soldier has gotten into a bar fight and killed a local national. Some local nationals have formed an angry mob and are about to lynch the soldier--the PCs have got to save the soldier and get him into the hands of the MPs before it's too late.

- **The Weirdo Cult** -- Some fellow members of the company start acting really weird and reclusive. Then they disappear. Investigating their rooms/foot lockers turns up evidence that the group all belonged to some strange alien cult, and have gone AWOL to go to the secret place where they will bring forth the second coming (don't laugh, this actually happened in my unit!). In a no-weirdness campaign, they could just be crazies . . . but perhaps they kidnapped one of the PCs best buddies. But what if there *is* weirdness in the world? Perhaps the PCs should try to stop this second coming; after all, they are the only ones that figured out the cryptic message left behind that says where the ceremony will take place . . .
- Of course, after assembling a group of well rounded soldiers with fleshed out backgrounds, GMs would also be able to find many plot hooks based on the PCs pre-military lives as well.

There is a lot of opportunity for adventure in military games; with a little thinking outside the box, a military campaign can be as varied and interesting as any other.

Designer's Notes: *GURPS Cabal* and *GURPS Horror*, Third Edition

by Kenneth Hite

*"Now is the winter of our discontent,
Made glorious summer . . . "*
-- William Shakespeare, *Richard III*, I:i:1-2

GURPS Horror, Second Edition, by J.M. Caparula, was one of the first *GURPS* books I ever bought. It's the second printing, and my copy still has a *Chicago Tribune* handy "clip 'n' save" serial killer guide from the summer of 1991 in it as a bookmark, so I probably bought it in the winter of 1990. This was one terrific book, from the Michael Whelan "Smiler" cover all the way to the six pages of recommended film and reading (which, not incidentally, first introduced me to the writing of Lisa Goldstein). The GMing advice alone was the first really useful guide to horror gaming as such that I'd ever run across, even after a decade of playing *Call of Cthulhu*. And in Chapter Three, I first read the story of the Cabal, an ancient order of monsters and magicians who ganged up to greedily hoard supernatural power for themselves and occasionally whale the tar out of the PCs. (I later found out that Scott Haring invented the Cabal back in 1987, as a two-and-a-half-page sidebar in the first edition of *GURPS Horror*. I hope Scott likes what I did to his babies.) The whole concept was pretty cool, but two things in it really resonated.

*"And for less cause than this, a strong cabal
Can make one's life a labyrinth of troubles."*
-- Jean-Baptiste Molière, *Tartuffe*, IV:iii:68-69

The first thing was a passage, I presume written by Caparula, that truly embodied the Cabal for me: "Cabal Masters of the past are mummified in preservation chambers in secret catacombs, awaiting resurrection. Mages specializing in necromancy are rumored to have already animated some of the ancient Masters, who are now walking the Earth again." That's an almost perfect example of good game book text, regardless of its virtues as English prose. (That "are rumored" may be passive voice, but here the uncertainty about who, exactly, is doing the rumoring adds to the unease.) You have words like "necromancy," and that great Biblical echo of the ancient Masters "walking the Earth again." You also note that the Cabal has pretensions to Egyptian antiquity ("mummified") that don't really tie in with the wack *Dr. Who* phrase "preservation chambers in secret catacombs," but you still get a nice, jarring anachronism out of it -- it seems kind of creepier to have a "preservation chamber" tucked away in an "ancient catacomb" rather than in a gleaming bank of freezers in a professional building somewhere. You also note that the Cabal isn't as unified as it would like to pretend -- someone is spreading those rumors about their fellow Cabalists, who would seem to have jumped the ancient conspiracy gun by reviving their Masters early. You also note that these ancient Masters are just "animated," not having necessarily achieved "resurrection." Eeewww.

The other absolutely dead-on thing in that chapter, for me, was a line drawing by (I guess from the signature) John D. Waltrip on page 33. Here we have a Peter Cushing-looking dude, most likely a Cabalist, with a horrible grimoire open in his hand (you can see the pentagrams). He's standing in front of a leaded-glass window; you know, just from that detail and the drape, that it's one of those impossible, overstuffed, brocaded Victorian-Edwardian studies you see in Hammer Films and Sherlock Holmes episodes. He's about to read a spell, and you can see by the lift of his eyebrow and the quirk of his mouth that he knows it's some seriously bad juju. But hey, he's Peter Cushing -- he's a Cabalist -- he'll survive whatever (or Whoever) it is. But that eyebrow lift is saying, "Shame about those drapes." Or, possibly, "Shame about London." Looking at that picture, you just know that that's how the Cabal operates. No angst, no moaning about the dark glories of the whatever. Just creepy Peter Cushing types reading from grimoires to see how much of the leaded glass is blown out afterward.

So, when Steve Jackson and I dropped mutual hints that we'd like me to write a whole worldbook on the Cabal, I resolved to make it worthy of that Peter Cushing-looking dude. I wanted to capture that whole Hammer Films feeling,

and write a world "where *The Mummy* meets *Imajica*," as I believe I told the long-suffering Herr Doktor Professor Kromm. The Cabal wasn't hunted, they were the hunters. But even hunters can run into trouble deep in the jungle. My desire to challenge a conspiracy that, from the design document, had an armlock on the world's supernatural resources meant that I had to give them more worlds to conquer, or rather, to explore -- to hunt in. The throwaway mention of the Kabbalah gave me those worlds; in order to get bigger, wilder planes I went with the Four Worlds rather than the Ten Spheres (although I later wrote up the Sephiroth and put them back in again). I also had to reconcile, and then expand mightily, the Second Edition description of the Cabal -- I decided early on that I would, if possible, not contradict a single word of that description. Instead, I would add more detail, more backstory, and a few things the Cabal forgot to mention ten years ago. (I wound up fixing the Latin degree names and changing only one other detail -- see if you can spot it!) I knew I was on the right track when Egyptian history obligingly gave me a chaotic hole where I could stick the otherwise-unattested "Khaibitu-na-Khonsu." The rest fell into place after that. It was time to decide what the Cabal was hiding.

It has always amused me that there are whole rafts of modifiers and special cases and calculations and so forth in *GURPS* for shooting a gun, which is in actuality one of the simplest things in the world -- but that casting a spell in the basic *GURPS* magic system is three dice and a cloud of dust. Wham, bam, fireball, ma'am. Nothing like any system of magic ever practiced in the Real World, certainly. The Western "Hermetic" magic tradition (the one the Cabal, as practitioners of "Egyptian wisdom" would use) is delightfully lush and maniacally complex, rich with flavors and nuances stemming from Babylonian religious iconography, Renaissance paint chemistry, and probably serious neurological disorder. I resolved to make Hermetic Magic potentially very powerful, and at least as complex as firing a gun -- and get in more of that Hammer Films flavor as I did it. Since the Cabal used the basic magic system in *GURPS Horror*, they would have to in *GURPS Cabal*, too.

Frankly, I was kind of relieved by that decision -- C.J. Carella had already designed a really cool Ritual Magic system for *GURPS Voodoo*, and I didn't want to reinvent that wondrous wheel. I was free to come up with a "magic system for gearheads," as I described it, again to Dr. Kromm, who had to have been wondering at that point what he had unleashed. (Unreliable witnesses claimed to have heard me refer to the book as "*GURPS Black Ops* for *Nephilim* fans, and vice versa.") In the end, sanity won a precarious rear-guard victory, and I designed a bunch of "lenses" for people who wanted more of the flavor with less of the work. (I rewarded myself with the Sidebar From Hell, in which I came up with magical modifiers for every imaginable thing from sweaters to solstices.) To backstop me, I rescued S. John Ross' incredibly cool and evil Black Magic rules, and matched them with some Words of Power. (It occurs to me, now that it's too late, that Words of Power would be even neater if casting them only cost 36 points of energy, instead of 360. Try it and see.) The rest was just a matter of jamming in as many Easter Eggs and lathering on as much flavor as I possibly could. (And thanks to Chris Shy's amazing art, there's no shortage of creepy Peter Cushing-looking guys in this book, either.) With the campaign chapter especially, but throughout the book, I tried to make sure that there were always slots and modules for any GM or player to change, insert, ignore, or turn up to eleven anything and everything in the book. All good game books say, "You can change whatever you want." I wanted this book to show you how, and give you some idea of why you might want to. I wanted *GURPS Cabal* to be sticky, but not heavy; to be as fine a piece of work as *GURPS Warehouse 23*, *Black Ops*, and *Illuminati*, my own personal "Holy Trinity" of *GURPS* books, but to be fully adjustable by people whose tastes ran more toward, say, *Psionics*, *Voodoo*, and *Blood Types*.

*"And much of Madness, and more of Sin,
And Horror the soul of the plot."*

-- Edgar Allan Poe, "The Conqueror Worm"

At some point along the line, SJG decided that, since they were releasing a chapter from *GURPS Horror* as its own book, they should revise and reprint *GURPS Horror*, too. At the time, I seemed like the logical candidate for the job, and so another book's worth of writing and research landed on my desk while I was giving para-elementals a good beat-down. The words "bit off more than I could chew" recurred more than once as I set about reconstructing, restyling, and revising *GURPS Horror*. The first decisions were the easy ones that SJG had already made -- the Cabal chapter obviously went, as did the three "mini worldbook" settings in the back. *GURPS Cliffhangers* now covered the Roaring '20s, *Steampunk* (and *Screampunk*) covers Victoriana rather better than a chapter could, and a handful of *GURPS* books gave us "Modern Day" gaming with a vengeance.

I kept virtually all of the second edition's gaming advice -- I knew from practice just how good it was! It had, in fact, been a major influence on my own book of horror GMing advice, *Nightmares of Mine*, which, none too available to begin with, had dropped startlingly out of print with the publisher's (Iron Crown Enterprises') bankruptcy. Fortunately, the rights reverted to me, and I set about revising, *GURPS*ifying, and tightening much of that work to become my own contribution to the Third Edition's newly-reorganized sections on GMing advice (including more focused advice on high-powered games and superheroic horror), campaign creation, and player advice. This last was a new departure for me; I put my own horror games in a mirror, and figured out what worked for my players. (I had almost as much fun coming up with modern-day horror-bashing gear as I did the "Five Rs" and "Five Ts" of monster-hunting.) The other major section I kept was the Foes chapter -- but I completely tore it out and remodeled it. Rather than a litany of bestiary stats for formula critters, I took the things from the ground up. What fear does each monster symbolize; what does it prey upon? Then (with the able help of stat-wranglers Jesse Lowe and Werner H. Hartmann) I came up with racial templates for almost forty monsters from ghouls (three kinds!) to evil clowns to Things Man Was Not Meant To Know. Some of them are new, and one of them (the "ripper") wound up completely original to the book! With these changes, the monsters stop being targets, and start being true personalities, symbolic and important to the story. Plus, the second edition came out a year before every horror gamer in America started dressing up like a vampire -- now, at last, you could play a monster using *GURPS Horror*. (I also had the advantage of Kromm's excellent *GURPS Undead*, from which I stole liberally.) I realized that since I'd just gone to the trouble to create monster templates, I'd better replace the old character types with proper templates, too -- this was one ready-to-play book.

Except that I'd removed all the settings. Not to worry; I borrowed a notion from Bill Stoddard's fabulous *GURPS Steampunk* and added three "Worked Examples" to demonstrate how I built horror campaign frames using the tools and parameters I'd explained earlier in the book. For each frame, I added other variations to allow maximum utility, and gave five sample narrative arcs or story seeds to get GMs going. One of the frames got yanked at the last minute (although don't be surprised if it turns up on the schedule in a different form), but the final draft still boasted three "Tales to Terrify":

- "Seas of Dread, Sails of Daring," in which I combined *GURPS Horror* with *Swashbucklers* for a dark pulp-fantasy Western in the pirate Caribbean. (This setting also allowed me to cram in seven more monsters from the second edition that I would have had to leave out otherwise.)
- "Blood in the Craters," which is an investigative, somewhat gritty *Steampunk-Horror* campaign set in the ruins of London after a Martian invasion. Here, I tried to explicitly demonstrate how to use the new monster fear themes to build monsters tuned precisely to a setting's feel.
- "The Madness Dossier," which slides an open void of psychological dread underneath two of my favorite comic book series from the last decade, Grant Morrison's *The Invisibles*, and Warren Ellis' *Planetary*. I made it an espionage campaign set amid the fragile scrimms of reality; the foes here are Babylonian demons -- or alien entities -- or genetically engineered control castes -- or all three. This frame is about tone and experimentation, and pushing the envelope of setting design for the sake of a bad feeling.

All that was left was the Bibliography and Filmography, which I nearly doubled in size. I left every film and book recommended in the second edition on the list, although I felt obliged to change one or two annotations (Charles Fort is the farthest thing from "unreadable"!) and fix the publication data. Each "Tale to Terrify" got its own mini-bibliography of inspirational reading, too. By the end of the process, I was well into the Late and Increasingly Chilly Autumn of Horror, but I think that I successfully updated what I've always thought of as "my first *GURPS* book" for the new era of *GURPS*, and added some stuff that whoever writes *GURPS Horror, Fourth Edition* in ten years will keep around. Enjoy it until then, and pleasant screams.

Appendix Z: Not-So-Plain Sailing

by David Morgan-Mar

Not all sea voyages are routine. Sailing vessels are especially vulnerable to the elements, as well as myriad other problems which can arise during a voyage. Some events are relatively minor and can add some interest or excitement to a dull trip, while others are more serious or occur as a result of combat. Here is a list of some possible events and problems which might occur on board a sailing ship. GMs can use events from this list randomly, choose one when some extra color is required, or incorporate some of these into naval combat damage result tables.

Minor Problems

- **Becalmed** -- The wind dies down completely, leaving the ship unable to move by sail. This condition may last several days. Desperate crews may try towing the ship with rowed boats.
- **Boat Damaged** -- One of the ship's boats has sustained some form of damage which leaves it unable to be used. . . most likely a hole in the hull.
- **Broken Rudder** -- The rudder or its control shaft has snapped, making steering the ship difficult or impossible. Alternatively, the rudder may be jammed, forcing the ship to turn circles.
- **Cargo Damaged** -- Whatever cargo the ship is carrying is damaged or destroyed. Sea water may ruin foodstuffs, spices, or cloth, while manufactured items can be damaged or broken by the ship's motion. Some cargo, such as gold, is immune to damage.
- **Disease** -- Some form of disease runs rampant through the crew. Suitable diseases include scurvy, plague, typhoid, cholera, dysentery. Note that scurvy is caused by vitamin C deficiency and is not contagious.
- **Fog** -- A thick fog obscures vision, making navigation all but impossible. If the ship is moving, it risks running into other objects.
- **Food Spoilt** -- Food stores on board are spoilt, either by sea water, vermin, or general rotting. If rotten food is eaten, disease may result. If all the food is spoilt, a port with fresh supplies will be required quickly.
- **Leaking Caulk** -- The caulking between the planks of the hull starts leaking at a rate faster than it can be repaired. The hold will slowly fill with water and will need to be pumped out to prevent swamping and possibly sinking.
- **Man Overboard** -- A crew member or passenger falls overboard and requires rescuing.
- **Rats** -- Rats on board reach plague proportions. They have probably eaten much of the ships supplies to reach such numbers. They may also spread disease. Desperate crew may resort to eating rat meat . . .
- **Snapped Line** -- A rope snaps, the broken ends whipping back violently. Anyone in the way may be struck and injured.
- **Tangled Lines** -- Some ropes or rigging become tangled. Sail trim is lost and ship speed drops until the mess is sorted out.
- **Torn Sails** -- Some or all of the sails are torn and useless. Speed of the ship will be reduced to maximum speed times the cube root of the fraction of sail remaining. (For simpler calculation, simply reduce speed by the fraction of sail lost.)

Major Problems

- **Broken Mast** -- A mast snaps and all its associated sails and rigging come down. The mast may fall through the sails and rigging of another mast, destroying those as well. Sailing speed will be reduced, as per Torn Sails. Many ropes may snap, causing possible lash injuries to crew.
- **Cannon Explosion** -- One of the ship's guns explodes, spraying shrapnel across the gun-deck. A section of the hull may be damaged, and a fire is possible.
- **Fire** -- Part of the ship catches fire. Sails will go up quickly, while a fire below decks may smoulder or progress slowly.

- Hull Breach** -- A section of the hull is stove in or out, either by an impact, explosion, or just heavy seas acting on a weak point. If the damage is above the waterline, the ship may sail on, though at risk of being swamped by waves. If the breach is below the waterline, the ship will sink and should be abandoned.
- **Iceberg** -- An iceberg is spotted by a lookout. Evasive action needs to be taken. If the ship hits the iceberg, a hull breach is likely, almost certainly below the waterline.
 - **Lost Anchor** -- An anchor chain snaps and the anchor is lost into the deep. If this was the only one, the ship will be unable to rest at anchor.
 - **Magazine Explosion** -- The ship's gunpowder magazine explodes. This causes massive damage, probably rupturing the hull and setting fire to anything left. Nearby crew will take heat and concussion damage and possibly shrapnel damage. Other structures on the ship may fail.
 - **Pirate Attack** -- The ship is chased down and attacked by pirates. Ship's guns will be brought to bear and the pirates will attempt to board and capture the ship if the cannon battle does not drive them off.
 - **Run Aground** -- The ship hits a sandbar, reef, or rocks, and sticks fast. The hull may be breached or even shattered entirely, but this is not inevitable. If the hull is intact, the ship might be able to float free at the next high tide, or it might need to be towed free.
 - **Storm** -- A serious storm lashes the ship. High winds and mountainous seas toss it like a toy. Sails must be furled or risk being torn. Masts may break. Loose items on deck will be lost overboard and items below decks will be tossed around and may sustain damage.
 - **Water Spoilt** -- The ship's fresh water stores are spoilt by contamination or lost to leakage. This is a serious problem and a port with fresh water will need to be found within a day or so or the crew will suffer from dehydration and eventually die.

Carcassonne

Published by [Rio Grande Games](#)

Written by Klaus-Jürgen Wrede

Illustrated by Doris Matthäus

Translated by Jay Tummelson

\$19.95

Carcassonne is not only the name of a city in southern France, but also the name of an award-winning German board game from Hans im Glück, that is available in English from Rio Grande Games. The city itself is famous for its unique mix of Roman and Medieval fortifications. In the game, it is the area around *Carcassonne* that the players attempt to develop and then deploy their followers to take control of, and score points for doing so.

The game consists of some seventy-two square tiles, a scoreboard, and five sets of followers in vibrant colors, plus a fully illustrated, four-page rules booklet. Both the tiles and scoreboard are done on thick card and the followers in solid pieces of wood. The tiles depict the various segments of the cities, roads, and fields around *Carcassonne*, as well as the numerous cloisters, which actually sit in the very center of their tiles. *Carcassonne* is designed for two to five players, ages ten and over, with a suggested playing length of about an hour.

The players begin by placing the starting tile on the table, face up. The remainder are shuffled and stacked face down into four piles. Each player takes their eight followers and places one on the scoreboard, keeping the rest in front of them as their supply of followers. The youngest player decides who will go first and play then proceeds clockwise around the table.

Each turn, a player draws and places a single land tile. This tile must also be shown to the other players so they can suggest possible placement, which must be adjacent to tile or tiles in play. Tiles must be placed so that any city, field, or road segment on the new tile continues on to the tile or tiles it is placed next to. Tiles cannot be placed so that they are corner to corner. Although there is an obvious upwards orientation to the pleasingly illustrated tiles, this is not important to placement. When there is no place for a drawn tile to be put down, it is discarded and a new one drawn instead. In general, this is a rare occurrence, but actually more common during the opening moves of the game. (For those who dislike the too-random an element of drawing a single tile, two could be drawn instead, one used and the other returned to the stacks, or a variation thereof.)

Once he has placed his tile, a player can decide to deploy a single follower onto the tile they have just played and it is the tile that determines what the follower becomes. Knights are placed onto city segments, thieves on a road or crossing segment, farmers onto field segments and monks into cloisters.

If -- by placing a tile -- a city, cloister or road is completed, then these are scored. Cities are completed when it is completely walled with no gaps, roads are completed if they run between locations or form a loop, and cloisters when the cloister tile is totally surrounded by other land tiles. If there is more than one follower on a completed city or road, the player with the most knights or thieves deployed in the completed section wins any points scored. If there is a tie between the players in the numbers deployed, then all tying players gain the points. This is somewhat irrelevant in a two-player game, as it does not affect any difference in their respective scores, which are marked on the scoreboard.

This only goes up as far as fifty, and if a score rises above that -- as is common in a two-player game -- the marker is laid upon its side to indicate the difference.

After any city, cloister, or road is scored, any followers involved are returned to the supply of any players so involved. The exception to this are the followers deployed as farmers. These remain on the board in their field segments until the end of the game, when they earn points for any completed cities that their fields connect to, and they thus supply. Additionally, any remaining uncompleted cities, roads, or cloisters which still have followers on them earn a few more points. The winner, of course, is the one with the most points.

Although designed for up to five players, *Carcassonne* describes itself as being, "Especially good for two players." This is certainly the case, although those games take about half the suggested playing time. The most enjoyable aspect of the two-player game is that it does not rely upon destroying or wearing down an opponent's forces. Tactics revolve first around trying to get tiles placed where you need them, rather than where another player might want them; then in placing followers, which can quickly escalate into deployment contests as players vie for control of the larger cities and longer roads. In this there can also be a race to get these larger cities and longer roads completed, as then they can be scored and players have their followers returned to their dwindling supply. As this happens, followers tend to migrate towards the edge of the board as the game grows.

The current version of *Carcassonne* includes an additional twelve expansion river tiles. These depict a river as it rises from a spring and runs alongside the city to fill into a lake. In this variant, all of the river tiles are drawn and played before any of the tiles from the main game. River tile placement always begins with the spring tile and ends with the lake tile. The river tiles (of course) have to be placed so that the river can flow, and followers cannot be deployed onto rivers. The effect of the river in the game is to create a longer starting base for the rest of the game's tile placement. It could be interesting to see further tile expansion sets that add other terrain, such as forests and mountains.

Carcassonne won two notable awards -- Spiel des Jahres Game of the Year and Deutscher SpielePreis 1st place in 2001. It is hard not to see why. There is a high element of luck in *Carcassonne* -- the random drawing of the tiles -- but play becomes more tactical in placing both the tile and the follower. The mixture of the two is just about right for what is a light, fun game that can not only be enjoyed by the dedicated gamer, but by the family also.

Quest for the Unknown (for HackMaster)

Published by [Kenzer and Company](#)

Written by Brian Jelke, Steve Johansson, and David S. Kenzer

Cover Art by Stacy Drum

Interior Illustrations by Brendon Frain and Brian Frain

48 pages; \$11.99

Let me preface this review by stating exactly what *HackMaster* is for those of you that might be familiar with it only from the pages of the *Knights of the Dinner Table* comic. *HackMaster* is a real RPG from Kenzer and Company that is inspired (mostly) on 1st edition *Advanced Dungeons & Dragons*. While the various rulebooks that make up the game parody *D&D* in places and are filled with humorous and sometimes downright silly stuff, the rules themselves do make up a playable and (in my opinion) pretty darn fun little game. Of course, if you never liked the fact that a +2 shield "lowered" your armor class and didn't understand why your dwarf couldn't be a paladin, then you might want to look elsewhere for your gaming pleasure.

Quest for the Unknown is the first official adventure for *HackMaster* and is designed as a beginning adventure for a party of 3-6 1st-level characters. *Quest* is presented as a standard stapled booklet with maps inside the front and back covers. The cover painting depicts a group of adventurers with a greedy little halfling who has just stuck his hand in the wrong pool. The maps are printed in blue ink, just like the ones in the old *D&D* modules (thank goodness they can actually be photocopied with modern technology for note-taking). Layout is clean and the line art scattered throughout the adventure is well executed and of uniform quality. Each encounter with a monster even includes the appropriate illustration from the creature's entry in the *Hacklopedia of Beasts*.

Quest is a parody of *In Search of the Unknown*, the adventure that came with the first edition of the Basic *D&D* boxed set. (It was also my introduction to *D&D* and I still remember spotting it on the toy store shelf in between the Avalon Hill games. Gosh, it's hard for me to believe that was over twenty years ago . . .)

[SPOILER ALERT!]

Just like the original adventure, *Quest* is designed as an instructional adventure for beginning players and GameMasters. To this end, there is some basic information for the GM on how to prepare and use the adventure, and it is designed so as to not be too deadly for new players. Most of the traps are not killers and at least until the players make their way down to the second level (and encounter the troglodytes), they shouldn't have too much trouble surviving. The adventure contains monsters from several volumes of the *Hacklopedia of Beasts*, but enough information is provided to run them without access to those books.

The adventure itself is your basic crawl through a two-level dungeon that has apparently been abandoned by its original owners. The players can earn a few experience points for discovering some of the dungeon's mysteries (like why the owners disappeared), but that shouldn't get in the way of the monster-bashing and treasure-looting. Some parts of the adventure, like the room of pools and the garden filled with fungi, will be familiar to owners of the original inspiration. In general, the level of detail the authors provide for each room is outstanding, and they even give

a nod or two to good old-fashioned dungeon ecology.

Since it's a parody (not to mention a *HackMaster* adventure), *Quest* does contain some funny stuff. Here is a sample from *The Secrets of Chamoania*, a book the players can find in the dungeon's library. It is described as "the personal journal of a wizard studying a lost race of cannibals in the jungles of a place called Bafuan. It ends abruptly on page 182 . . ." There is plenty more -- like the hilarious player handout for The Diary of Melanee -- but I will let you have the pleasure of discovering it all for yourself.

The adventure contains a few more extras besides the diary, including another handout with background information for the adventure and tips for the players. The GM gets two battle sheets that contain statistics for the various monsters the players will encounter and check-off boxes to help him keep track of their hit points, armor damage, etc.

[END SPOILER ALERT]

Quest for the Unknown would be a great way to kick off your *HackMaster* campaign and should provide you and your players with several evenings of quality dungeon crawling entertainment. For the grognards out there, it shouldn't be too hard to slide it into your 1st/2nd edition *AD&D* campaign. If you are especially adventurous, you might even try converting it for use with *3rd Edition*. (Of course, I would never suggest such a thing myself . . .

*(NOTE: If you are interested, the original **In Search of the Unknown** can still be purchased as an ESD electronic download from the [Wizards of the Coast](#) online store.)*

Pyramid Review

Eden Odyssey: Wonders Out of Time (for d20)

By [Eden Studios](#)

Written by **Kevin Wilson**

48 pages; \$9.95

Note: This review contains some mild spoilers. While none reveal secrets from the adventures contained in *Wonders Out of Time*, some of the Merithian culture's details are given -- a potential problem for those players who want to have their game world to remain completely surprising.

Eden Studio's excellent *d20* supplement *Wonders Out of Time*, like their previously released Eden Odyssey title *Akrasia: Thief of Time*, is not a single adventure. Instead, it provides a series of short linked adventures and background material with a common theme. In this case, *Wonders Out of Time* details the remains of the Merithian Empire, a collapsed magic-intensive civilization based stylistically on the Roman Empire. The loosely connected adventures are designed to be introduced throughout a campaign as the player characters gain levels, rather than in series, allowing the Merithian Empire to be a part of the background tapestry rather than making an awkward and jarring appearance. In addition to adventures, *Wonders Out of Time* includes a ten-page Appendix full of new monsters, magic items, NPCs, and a new magic system and prestige class. Because it is adaptable to almost any setting, *Wonders Out of Time* is an interesting and relatively inexpensive sourcebook for DMs looking for a quick and easy way of giving his campaign world usable historical depth. It should be noted that the information assumes the standard late-medieval to early renaissance Europe fantasy setting. Those using a different period or region to base their campaigns may have to alter some of this material.

The Merithian Empire, which reached the height of its culture 1,000 years before the "present day" of the game, is outlined for the DM in three pages. While this may sound too short to cover an entire culture, Wilson packs a surprising amount of material into this small space, introducing the basic outlines of Merithian history, culture, art, architecture, religion, and magic in a series of tables that includes the Difficulty Class (DCs) for knowing each bit of information. The relatively brief introduction provides an additional advantage, as it leaves plenty of room for the ambitious DM to add his own material, expanding on what is provided in *Wonders Out of Time* or personalizing it to fit into a preexisting campaign world.

The adventures themselves are well thought-out and nicely connected. There is a nice balance between the traditional dungeon-crawl setting and wilderness-style settings. The seven mini-adventures (set in six locations) are designed for players from 1st to 3rd, 2nd to 4th, 3rd to 6th, 5th to 8th, 6th to 9th, and two for 9th to 12th levels. Each can be modified relatively easily to challenge higher or lower level characters, and all are short enough to be finished in a single gaming session. As such, while they will be challenges, players should not necessarily expect to go up a level each time they encounter the Merithians. Instead, the greatest gain comes from the increasing depth of their game world. Most importantly, the adventures all feel like they would be fun to play for player and Dungeon Master alike. Wilson also includes a short list of adventure ideas for DM who want to create new adventures using the Merithians.

The new magic, magic items, and prestige class are interesting and different without being unbalancing. The Merithians used a form of magic that infused the magic into themselves. Thus their magic armor bonds with the wearer and requires knowing the proper command word to remove, Their Red Magic becomes a part of them, (similar to the casting system used by the Sorcerer class and the spell-like ability of certain monsters), and Bloodscrolls predictably require some of the caster's blood. The Prestige Class - the Centurion Knight - exemplifies the Merithian virtue of self-perfection. Like most Prestige Classes, the Centurion Knight provides several powerful abilities. Those

introduced here are not extreme but Dungeon Masters should, as always, make certain they understand the rules here before introducing it into their campaign.

The five new monsters are constructs and haunting spirits directly related to the adventures. PC magicians interested in creating golems will love what they find here. In fact, this is one of the best things about the supplement . . . there is something here for all of the character classes.

The only problem I have with this supplement is the artwork. Paul Harmon's cover leaves me cold. While some of the internal artwork, done by Kieran Yanner, is as good as you will find anywhere, there is some unevenness in the proportions of the figures, and an almost Goya-like elongation of the faces is especially noticeable (you thought that Art Appreciation course would never come in handy!). The maps are clean and readable and done in the *3rd Edition* style. Old school *D&D* players may miss having the interior cover used for maps - a better use of space, perhaps, than using internal pages - but they are well done.

In the end, *Wonders Out of Time* is a very well-done supplement, and definitely worth the money. I am especially impressed with how well the Merithian culture is explored and the variety of ways Wilson uses it. The adventures are short enough to play quickly, and linking them will provide depth to any *d20* campaign. Although converting this supplement will take some time and effort, gamers using different game systems may want to look at *Wonders Out of Time*, as the ideas will translate over easily into any generic fantasy world.

Passenger Artillery

A Means of Travel for any Steampunk Campaign

by Joe Taylor

(Launch gun and shell designs by Chris Taylor)

Transcontinental Cargo/Passenger Artillery

There is something quintessentially "steampunkish" and Victorian about excessively large artillery pieces. The Lunar Shell and Verne Cannon described in *GURPS Steampunk* and *GURPS Castle Falkenstein* participate in a tradition which ranges from Jules Verne's *From the Earth to the Moon* to the real Paris Gun of WWI. The idea of using cannons as a means of transportation (either for passengers or cargo) is not limited to speculative fiction; many scientists have given such a system serious thought, especially as a means of launching satellites into orbit. As far as role-playing games are concerned, a working artillery transportation system adds instant steampunk flavor to any campaign setting.

This article describes a hypothetical pair of "passenger guns" and its variations. Though it is a terrific mode of transportation for a cinematic game, the system described below needs no cinematic manipulations to work. It could be included even in a campaign that adheres strictly to realism and physical laws. The cargo shell requires only late TL 5 components and artillery concepts, though applied on a grand scale. The passenger shell requires one TL (5+1) item to be possible: an "advanced" solid rocket booster, fueled with a nitrocellulose/nitroglycerin mixture. A TL (5+n) drug treatment to temporarily increase the passengers' acceleration tolerance would also be useful, but is not necessary (anything that will keep the passengers sedated will do).

The system described below is one developed to transport cargo and passengers between Britain and India. It consists of two guns, each specifically built to "hit" their particular target. Shells fired from the British gun splash down in the Arabian Sea west of India; the Indian gun sends its shells to the Celtic Sea off Britain. In order to be complete, the transportation system also requires the use of recovery vessels at the splashdown sites to locate and retrieve the shells. The passenger and cargo shells themselves differ in their construction and operation; the passenger shell requires the assistance of a TL (5+1) rocket booster.

The Guns

The transcontinental artillery pieces have smoothbore barrels with a bore of 8 feet. Instead of having one large powder charge located behind the shell, these guns use numerous charges located in secondary barrels that feed into the main barrel every thirty yards. These secondary barrels fire into the main barrel immediately after the shell passes it. This design allows a much more gradual and controlled acceleration of the shell down the gun barrel while providing a much higher muzzle velocity than could ordinarily be obtained with guncotton. The specific guns described below are built fixed in place and cannot traverse (but see "Military Uses" below). Water pipes along the barrel cool the gun after each firing and provide process steam and heating for the support facility. Large doors at the muzzle of the gun are sealed before the main barrel is cooled, so that the cooling process will lower the air pressure in the barrel, easing the shell's high speed trip through the barrel. These doors are blown open by the shockwaves preceding the shell just before the shell exits the gun.

The British gun, nicknamed "Big Ben," has a 4-mile long barrel and is located near Ft. William, Scotland, where the gun's support crew is housed. The muzzle stands 5,400 ft. above sea level, against the peak of Mt. Ben Nevis, while the other end is sunk in a 2,500-ft. deep shaft. Ft. Williams is also home to a state-of-the-art (for TL 5) chemical plant for the production of propellants for the gun and solid rocket boosters, a dedicated shipping hub for "gun cargo," and a special Post Office branch to sort and pack priority "shell mail" letters from all over Great Britain. An observatory has been built on Mt. Ben Nevis to track the trajectories of outgoing flights. "Big Ben's" trajectory takes shells over the

North Sea, northern Germany, southeastern Russia, and Persia before splashdown in the Arabian Sea.

The Indian gun, nicknamed the "Orient Express," has a 4.2-mile long barrel and is located near Pathankot in northern India. In addition to support facilities similar to the Ft. Williams site, the Indian gun is also guarded by a regiment-sized garrison. The "Orient Express" goes over southeastern Russia, the Caspian Sea, Germany, the Netherlands, and Southern England to land in the Celtic Sea.

The Passenger Shell

The Passenger Shell is actually composed of two sections: the passenger vehicle at the front of the shell, and a large solid rocket booster to provide additional, controlled acceleration. This vehicle can transport six passengers between the British Isles and the Indian subcontinent in the space of an hour, at a level of risk comparable to that of a long sea voyage.

The passenger vehicle is a metal capsule 8 feet in diameter, 12 feet long, weighing 3.7 tons unloaded. It is shaped like a short, fat artillery shell. The interior contains two three-person acceleration couches and a chemical rebreather good for 12 man-days. There is 1.5 cf. and 15 lbs. of cargo room available under each seat (passengers may have the rest of their baggage sent via cargo shell on a different flight). The acceleration couches require the passengers to be strapped tightly in place so that they have almost no freedom of movement; the interior is very cramped and is not lit. These difficult accommodations are not a problem as the passengers are ordinarily sedated before the trip (see "The Trip," below).

To permit a safe descent of the passengers through the atmosphere, the passenger shell has a heat shield made of white oak on its base, and a cluster of three parachutes deployed by barometric switches when the falling capsule reaches 30,000 ft. The switches also activate a set of smoke generators to aid in the location and recovery of the vehicle. All critical actuators and switches have redundant systems and only two of the parachutes need to deploy properly for a safe splashdown.

The rocket booster portion is basically a 130-ft. long, 8-ft. diameter, 300-ton solid rocket motor. The booster relies on fold-out stabilizers augmented by a simple gyro/jet vane control system for stability. The booster has its own heat shield, smoke generator, and parachute system to allow it to survive reentry and be recovered, though it experiences a hotter and more violent reentry than the passenger portion of the vehicle. An ordinance-based actuator closes the nozzle exit of the rocket booster after it ceases firing so that it will remain floating after splashdown.

It is the addition of the rocket booster that allows safe, realistic travel via the guns. If the shell were fired from the gun with enough force to send it halfway around the world, the g forces would crush any normal human passengers. Therefore, the passenger shell is fired at a velocity low enough to be safe, and relies upon the rocket booster to provide the extra push needed to reach its destination. This system requires the biggest leap in Victorian innovation of the entire project. If the GM wishes to remove it, realistic cargo transportation is still possible, but passenger travel would require a cinematic solution to the effects of extreme acceleration.

The Cargo Shell

The cargo shell is 18 ft. long, 8 ft. in diameter, and weighs 16.7 tons. Its structure is heavily reinforced so that it can be fired at a higher acceleration than the passenger shell, and it requires no rocket booster to achieve transcontinental range. The shell has a cargo capacity of 6 tons and 600 cubic feet. Fragile, shock-sensitive, or heat-sensitive items (including live animals) should not be sent by cargo shell. All cargo must be securely packed to avoid damage or shifting in flight.

If enough cargo shots are fired over the course of several days, the amount of material sent between Britain and India could be comparable to that delivered by a single cargo ship during the same amount of time, though the operation would be far more expensive. Using transcontinental artillery for transporting materials in bulk is not very practical. However, if an item absolutely, positively needs to get to its destination as quickly as possible, the cargo shell is the

way to go. Its most useful application is transporting documents and "shell mail." This would greatly increase the transmission of information between Britain and the most prized part of its empire. Alternatively, given the effort and expense it would take to build the Transcontinental Cannons, in a campaign world the guns might take the place of another large-scale engineering project: the Suez Canal. Without the canal, sea routes to India become far longer, more expensive, and dangerous, making the guns a more cost-effective alternative.

Care and Feeding of Transcontinental Artillery

Operating one of the guns requires a crew of 500 men. This figure does not include the sizeable support staff that maintains the gun, services the passengers, recovers and refits the shells, packs cargo, predicts the weather, or any of the other countless functions that must be completed for the transportation system to work properly. With the operation running at its maximum rate, passenger shells can be fired every 45 minutes and cargo shells every 30 minutes. Firing the gun for a passenger shot consumes approximately 75 tons of powder charges in addition to the rocket booster's propellants; a cargo shot uses 150 tons. Before any shells are fired each day a small 25-ton "blank" charge is burned to preheat the barrel. The cost is \$27,612 for a passenger shot and \$7,160 for a cargo shot (adjusted for 19th century prices). This includes consumables, recovery and refurbishment of the shells and boosters, direct labor, overhead, and capital depreciation.

This expensive method of travel is mostly used for official government business, but one-way passenger tickets are available for \$5,000, and shipping cargo costs \$0.60/lb or \$11.93/cf. Due to extra handling, "shell mail" costs eight cents for a half-ounce letter.

The guns' hours of operation depend upon when it is daylight in the recovery area. Due to the time difference between Britain and India, that does not necessarily mean it is day at the firing gun. The Indian gun can typically operate between noon and 8pm local time, while the British gun can operate between 4am and noon local time -- though flights before 7am are unusual. (Even so, it is difficult to oversleep in Ft. Williams.) Passenger shots are usually the first shots of the day, as that gives the most hours of daylight possible for recovery operations if a shell goes astray.

The Trip

A typical passenger trip on the Transcontinental Cannon begins the day before the launch with a medical examination by one of the facility's doctors. Passengers with HT below 8 or any serious medical disadvantages will not be allowed to travel by cannon if their ill health is detected by the doctor. Women in good health are permitted to travel by cannon, but may find themselves politely discouraged from taking such a violent form of transit. The passengers and any cargo they wish to carry will be weighed at this time to plan the packing arrangements for the shell. The doctor will advise the passengers not to eat between the exam and the shot, to get to sleep early that night, and to avoid wearing their best garments for the trip. They will then be offered a tour of the gun facility and of the shell they will travel in. When the passengers arrive at the cannon for their flight, they will first be encouraged to "make water." (If passengers ignore the advice, they will probably find that they have soiled themselves during transit.) The passengers will then be seated in wheelchairs and sedated. The next thing they should experience is the odor of smelling salts and the voice of the recovery ship's surgeon welcoming them to the Indies.

If one were to be awake during the trip, the experience would be quite different. After leaving the departure lounge, the passengers are wheeled to the waiting shell and strapped into the acceleration couches. The restraints allow almost no freedom of movement. Once the access hatch is closed, the inside of the shell is totally dark. Loading the passenger shell into the gun takes half an hour. Launch occurs with a sudden jolt followed by an excruciating 14 gs of acceleration for nine seconds. Passengers strapped securely in their seats must make a HT roll at -6; if they are not secure, the roll is at -20. If the HT roll is failed, roll on the Acceleration Effects Table on pp. CII131. (It is expected that most passengers will fail this roll, but if securely strapped in they should only black out for a few seconds -- not a problem to anyone who is already sedated. At worst, on a critical failure a person of average HT would take 1d+1 damage.) After the initial launch, the acceleration drops to a more tolerable 3 gs for three more minutes. After the solid rocket booster burns out, explosive actuators separate the booster from the shell. Any conscious occupant would experience a slight jolt and then the capsule begins spinning in a slow roll as springs further separate the two sections.

For the next 50 minutes the passenger would experience a weightless, falling sensation. As the shell descends into the atmosphere again, aerodynamic forces flip the passenger shell so it is travelling base-end first. The deceleration forces then build up over the next five minutes until the passengers are experiencing almost 8 gs (passengers must roll at HT-1 to avoid acceleration effects, HT-8 if not strapped in). During reentry, the walls of the passenger capsule will heat up to around 120 degrees F and the air temperature will rise to almost 100 degrees. Over the next two minutes, g forces rapidly drop until they are almost a normal 1 g when the barometric switches deploy the parachute cluster. After parachute deployment, the capsule swings freely under the parachutes for 25 minutes until it splashes down. The shell would then float base down in a rolling sea for up to three hours before one of the recovery ships locates it and brings it on board.

Anyone awake during the trip would be required to roll a Fright Check. Any character with a fear of darkness, drowning, enclosed spaces, falling, or loud noises would roll at an appropriate penalty (possibly several times during the course of the trip). The trip is also very taxing; whether the passengers were conscious or not, they lose 1 point of fatigue, plus 1 more for every 5 points they failed their HT rolls by.

What Can Go Wrong?

As it is described above, transcontinental artillery represents a mature, well-tested system. As long as everything works properly, this method of travel is fairly safe. However, severe failures in just about any part of the system could quickly be fatal for passengers. Minor gun misfires or booster malfunctions could cause the shell to fall short of its intended destination without otherwise harming the passengers. One of the most feared (and most likely) problems is a passenger capsule being lost at sea. To prevent this, shots are canceled when poor visibility is anticipated over the recovery area. Considering the limits of TL 5 meteorology and communications, however, it is entirely possible for an unexpected storm to hit the recovery area during operations.

Any skill rolls made while inside the shell would be at a penalty due to total darkness. The restraint harness is very restrictive and an Escape roll to get out of it is at -3. The shell's hatch is not designed to be opened from the inside without proper tools, though inventive passengers may improvise something that would work.

Military Uses

Just because the guns can't be moved doesn't mean that they can't be retargeted. Rocket thrusters or aerodynamic forces can be used to alter the shells' trajectories so they could bombard targets not directly in line with their normal flight path. The guns would not be accurate enough for precision strikes, but they could be an effective terror weapon. The cities the British gun should be able to hit include: Hamburg, Warsaw, Kiev, T'bilisi, and Tehran. The cities the Indian gun could hit are: Kiev, Warsaw, Prague, Berlin, Hamburg, Amsterdam, Paris, and London. It would require several ranging shots (reported by spies acting as forward observers) to hit even a city-sized target.

In addition to bombardment, cargo shells could be used to resupply isolated units. Passenger shells could be used to insert spies or elite troops into foreign countries.

Other Developments

The fun doesn't stop there; once this transportation system is built, it can be put to other uses. A cargo shell, modified to carry scientific instruments and cameras could bring back the first films showing Earth from space. The development of radio would surely see locator beacons built into the shells to aid in recovery. In conjunction with aerodynamic controls, a shell could even be made to home in on a radio signal -- which has both civilian and military uses. Fold-out wings could be added to allow a shell to glide for longer distances -- perhaps even at the control of a human pilot.

Other nations may build passenger cannons of their own. One could easily imagine a system connecting America's East and West coasts, or perhaps a trio of guns connecting New York, New Orleans, and San Francisco. Transatlantic

artillery could connect the Old and New Worlds. The British Empire could add another link between India and Australia, and perhaps a Ft. Williams-Quebec-Vancouver route as well. Germany, well-known for its developments in artillery and early rocket science, wouldn't have enough important colonial holdings to make building an artillery route to them cost effective -- though they might try anyway. Artillery routes that go into either Germany or Russia might splash down in the Baltic Sea, giving those two powers something else to squabble over. In landlocked countries (or colonies), large artificial lakes may be built to give the shells a convenient place to splash down, or the shells could be redesigned to for a hard landing on solid ground (violent, but less jarring than the initial launch). As the guns will be several miles long and the barrel exits need to be above as much of the atmosphere as possible, they are best built up the sides of gently sloping mountains. The Alps could become a hub for guns firing out of Europe. Constructing one on a flat plain would add considerable difficulty, but might be accomplished by supporting the barrel with balloons or aerostats.

Shooting the Moon

Of course, sooner or later, someone will want to point one of these things at the moon. A moon gun of the type described by Jules Verne would require a muzzle velocity over three times that of the guns detailed here. Just putting shells in orbit would require a muzzle velocity almost twice that of the Transcontinental Cannons. Simply using a lighter, sabot shell will not allow cargo to be fired directly to orbit, because the propellant molecular weight of gunpowder or guncotton products is just too high to push shells to that velocity. Direct cannon launch to orbit or the moon would require radically different propellant and/or gun designs that probably would not be available until late TL (5+1). If developed, however, particularly good sites for such a space gun would be the island of Hawaii and the Pegunungan Maoke mountains in New Guinea.

Even though the Transcontinental Cannons cannot put shells directly into orbit, they could still be used as part of a space launch system when combined with more advanced rocket boosted shells. If the problems associated with launching a rocket at high g-forces could be surmounted, an expendable solid rocket filled cargo shell should be capable of reaching low Earth orbit with 1,000 lbs. of payload. A 305-ton passenger shell-style rocket-boosted vehicle consisting of three expendable stages could put a manned capsule weighing three tons into low Earth orbit.

Cinematic Versions

The Transcontinental Cannons described above were designed for those who prefer to adhere to the laws of physics but want something grandly overbuilt in their campaign world, anyway. If your game is more cinematic, or you don't mind ignoring certain bits of reality if it would make your campaign cool, then you have even more options.

As mentioned above, a cinematic game could do away with the rocket booster and still use the passenger shells. In fact, this would actually make the passenger shots cheaper! Without the need for a rocket booster, the price of a passenger ticket goes down to a mere \$1,350. Rather than simply ignoring g forces, the same effect can be accomplished with the invention of a cinematic anti-acceleration treatment. However you do away with the stress of g forces, it would also make the trip less debilitating. PCs could step out of the shell none the worse for wear, feeling fresh and ready for adventure.

In a very cinematic game, the guns could be made much smaller and would be able to change position, allowing them to send passengers and cargo to many more locations. The guns could be expanded into a world-wide (or at least Empire-wide) system of travel, with passenger and cargo cannons as common as airports today. Super-intelligent calculating engines could increase precision and give the cannons pin-point accuracy. Rather than splashing down in the sea, perhaps hard landings are routine. Etheric shock propellants, geothermally generated steam, magnetic cannons, and other such technobabble could be used to alter any aspect of the transcontinental artillery system to the GM's satisfaction.

Transcontinental Artillery in *GURPS Castle Falkenstein*

The world of *Castle Falkenstein* already has the Verne Cannon, so Transcontinental Cannons would only be raising the ante. With the French gun as inspiration, it follows that the British would try to build a super-cannon of their own (perhaps kicking off an arms race). With the Nautilus and French submersibles posing a threat to British shipping, securing an alternative route to India could be vital in the event of a war or a blockade of the Suez Canal. Though built for transportation, the guns also serve as a counter to the Verne Cannon; the Indian gun could shell Paris without fear of retaliation. Of course, should Nemo or some Criminal Mastermind seize the cannon, it could also be used to threaten London!

Finally, in a game world where the fate of a nation could hang on the actions of a single individual, the ability to send that hero to his or her destination as quickly as possible might make more difference than a boatload of soldiers.

Using the Guns in a Campaign

The design and construction of the Transcontinental Cannons could be a heroic engineering project for technical or business-oriented characters. The guns (or foreign copies) will be likely targets of sabotage and espionage both during and after construction. If the guns are being built by a private group, obstacles like uncooperative landowners or politicians may need to be dealt with. The existence of the guns may open up new business opportunities for merchants.

The guns can also be used as a vehicle (literally) for getting the characters into an adventure. Besides their normal destinations, an unusual misfire of a passenger shell could send its occupants to another country, an otherwise inaccessible Lost World, outer space, alternate realities, or the afterlife. The characters could even be unsuspecting locals who have a lost shell suddenly drop into their community.

Adventure Seeds

Search and Rescue

A shell containing important passengers or cargo has gone missing, and the PCs are agents sent to recover it. The passenger could be an important diplomat, a military hero, a beautiful princess, or a group of all three. Valuable cargo could include treasure, artifacts, secret documents, or a technological McGuffin. If the shell went down in a particularly remote part of the world (see "The Guns" for locations along the shell's trajectory), just reaching it could be an adventure. When the PCs reach it, the passengers or cargo may no longer be there -- taken, perhaps, by locals or rival agents. If a passenger shell goes down in the Himalayans, surviving passengers could wander into the lost city of Shangri-La -- and may be unwilling to leave! Alternatively, the PCs could be agents of another foreign power, seeking to locate the shell and its contents before the rightful owners do.

Rebellion

An uprising in India threatens to overwhelm the garrison in Pathankot and seize the cannon there. Players could be British soldiers, either part of the trapped garrison trying to hold out or a relief column marching through hostile territory to secure the gun. Diplomats or agents could be shot over from Britain to deal with the uprising. The PCs could also play members of the rebellion attempting to seize the gun. Once the British garrison is wiped out, a split develops among the rebels. One faction wants to negotiate, using the gun as a bargaining chip, and another intends to use it as a weapon against England and force the crown to recognize an independent Indian state. As the tension grows between the leaders of the uprising, a column of British soldiers marches closer to recapture the cannon. Meanwhile, the rebels also have to figure out how to operate the gun without accidentally blowing it -- and themselves -- to bits.

Fantastic Flight

While traveling via transcontinental artillery (perhaps as test passengers for a gun-launched space capsule), the PCs are exposed to a burst of cosmic radiation. Upon landing, they have been changed in unusual ways, gaining strange powers

and abilities.

A Mysterious Occurrence

A passenger shell is launched from India with a full complement on board. When it is recovered, however, the shell is empty! The flight was on target and on time -- nothing seemed to go wrong. Another shell launched the same day from Britain comes down with all its passengers safe and sound . . . but it is observed splashing down a full six hours after it was launched. The PCs set out to investigate these mysteries, either for personal reasons or because they are directed to. They begin hearing reports of strange lights in the sky and visits by odd men. If the investigation is official, the PCs are under pressure to clear up the matter quickly before the government decides to shut down passenger flights. If the investigation is a private effort, they are discouraged, lest they uncover something which would make gun travel seem unsafe. Either way, one case of abduction and one of missing time is surely just the tip of the iceberg.

Vehicle Statistics

Passenger Shell

Subassemblies: Body +4 *Cargo:* 9cf *Power and Propulsion:* None *Occupancy:* 6 cramped g-seats *Armor:* F 3/5, RL 3/5, B 3/5, T 3/5, U 3/5+heat shield*

*Treat heat shield as 3/6 wood armor. Heat shield is destroyed during reentry. *Size:* 12' x 8' diameter. *Payload:* 1,290lbs. *Lwt.:* 8,745lbs. *Volume:* 492cf *Size Mod:* +4 *Price:* \$1,870 *HT:* 12 *HP:* 1,200[Body]
Sealed, waterproof hull.

Rocket Booster

Subassemblies: Body +7

Cargo: None

Power and Propulsion: Solid fuel rocket, 774,937 lbs of thrust for 3 minutes.

Occupancy: None

Armor: F 2/2, RL 2/2, B 2/2, T 2/2+heat shield*, U 2/2

*Treat heat shield as 3/6 wood armor. Heat shield is destroyed during reentry.

Size: 130' x 8' diameter.

Payload: None

Lwt.: 602,994 lbs.

Burnout weight: 66,499lbs.

Volume: 6,535 cf.

Size Mod: +7

Price: \$34,067

HT: 6

HP: 6,000 [Body]

Waterproof, floatation hull.

(Designer's Notes: This booster was designed as a real solid rocket booster using double-base propellant and 10% structure weight to give the Passenger Shell a 6,500km suborbital range. The conceptual design was then converted to GURPS Vehicle stats.)

Cargo Shell

Subassemblies: Body +4

Cargo: 600cf

Power and Propulsion: None

Occupancy: None

Armor: F 4/18, RL 4/18, B 4/18, T 4/18+heat shield*, U 4/18

*Treat heat shield as 4/35 wood armor. Heat shield is destroyed during reentry.

Size: 18' x 8' diameter.

Payload: 12,000lbs.

Lwt.: 33,119lbs.

Volume: 721cf.

SizeMod: +4

Price: \$4,527

HT: 12

HP: 3,000 [Body]

Sealed, waterproof hull.

Room With a View . . . Or At Least A Spot For Your Soda

Yesterday I began playing in a *Changeling* game, and all in all I ended up having a good time. But there was one challenge to the session that got me to thinking . . . one of those basic points that I think is worth some discussion. So as long as I've been getting somewhat above-average ratings by discussing the obvious, I thought I'd continue this trend.

Anyway, the physical room where we were packed in was *much* too small. There were six players and a GM in a one-bedroom apartment's living room. There was only one coaster; at any given time the rest of us needed to hold our drinks. Nineteen clowns pulled up in a Volkswagen Beetle, took one look at us, and said, "Whoa! No room for us!" in unison.

We were cramped.

Now, while I could just say, "Don't stuff too many folks into your gaming space," and copy/paste the ingredients off a Fudge Dipped Chocolate Chip Chewy Granola Bar for my remaining 991 words, that would probably get me ratings almost as low as a CCG article. So here are some random thoughts regarding the actual physical space we game in.

Space

If you're stacked in the gaming area like cordwood, then that's an obvious problem. But the opposite of too much space can be a problem, as well. I ran some sessions in a large room on campus one time, and it seemed to have everything that gamers could want. Lots of tables, lots of lighting . . . even a dry-erase board.

Unfortunately, the tables were *too* big, and the logical place where I plonked myself as a GM -- the front of the room -- ended up being too impersonal and distant from where the tables were placed initially. So it felt like I was teaching my gamers instead of running a game for them:

"Now if you open your *Player's Handbook* to page 27, you'll see today's lesson. Matt, keep your eyes on your own character sheet . . ."

I suspect that part of this problem was the fact that these rooms in campus originally had some other purpose; I'm not sure what, exactly, but it seems to have something to do with all those "teachers", "professors", and "classes" I hear about . . .

Anyway, you need to have "enough" space. What does that mean? Each person should have his own spot to sit (not necessarily a chair), and a place for their stuff (generally a place to place a character sheet and roll dice). Perhaps most importantly, each person should be able to move around each *other* person; if all players have to tuck their knees under their chins each time someone needs to use the restroom, then there's a problem.

(As an aside, make sure to let folks know before play where restrooms, kitchens, and other gamerly needs are. Nothing disrupts that climactic interaction with Lord Soth more than announcing you need to pee . . . unless that was [intentional](#).)

While rooms can often be creatively rearranged to be made more gamer-friendly, this isn't always possible. Unfortunately, the university room we were in couldn't be *made* suitable for gaming; even when we moved the tables closer to each other, rearranged desks, and tried other tricks, it still didn't work. I may never know why, but in hindsight it may have something to do with these other points below.

Room To Pace

Depending on the number of players and the style of play, even *more* room may be necessary. If there are only two or three players, they may well want to heighten their own dramatic interactions by moving around the room or otherwise making more use of the physical space. (Most playing areas are too small for more than three or four players at most to be able to move freely.) Likewise make sure that the GM has enough room . . . whatever that is. I tend to be a spastic pace-around-the-room leap-at-my-players kind of GM, so I need to make sure I have enough space for my theatrics. (The GM screen for me is mostly a good place to remember where my dice are.) Again, you want to be careful of having too much room, but giving your players some additional avenues of roleplaying is always good.

Lighting

Other advice on this topic will say "enough" light; I usually modify that to "appropriate" light. Depending on the circumstances, too much light can be as big a problem as too little. That university room I was in had ample light; unfortunately, it was all unfriendly fluorescent light. While fluorescent light has been good in my experience for "modern" games (like supers, espionage, or sci-fi), it tends to do be too harsh and impersonal for me with many genres. For games like fantasy, *World of Darkness*, and horror I prefer incandescent lights and (especially) candles. Really, there aren't many pre-modern games that *aren't* helped with the flickering shadows of candlelight. And don't forget the power of blowing out a candle at a dramatically appropriate time . . .

Acoustics & Audible Problems

If I needed to chalk up one insidious reason why the university room didn't work, it would be the acoustics. Simply talking in there *felt* like a classroom. While, again, some campaigns may well benefit from this (I'd *love* to run a *GURPS IOU* game in such a place, for example), most won't.

My old apartment also had an echo point; for some reason, speaking in one specific place in the room would echo loudly. As a result I just avoided pacing past that spot while GMing. That old apartment was also close to a main road, so the sounds of the street would often bother us. To counteract this I would turn on the air conditioning's fan; at least then it was a constant noise folks could ignore. (Of course, then the room sounded like the bridge of the *Enterprise-D* . . .)

Unfortunately, acoustics are the biggest problem I've had when I've gamed outside. My players and I simply can't hear each other most of the time. Whether this is because of a lack of walls for sound to bounce off, the inevitable noises of the outdoors, the fact that everyone is distracted because we're outdoors ("The dayball! Gamers see not the dayball! It BURNSSSSSSSS!!! *Hisssss* . . ."), or something else, I'm not sure. And if anyone has any tips for how they *were* able to tabletop game outside, I'd love to hear 'em.

Temperature

This one would seem to be a no-brainer ("Adjust the temperature so everyone's comfortable, moron!"), but it's a bit more complicated than that. Why? Because temperature comfort levels vary from person to person. While 75 degrees is a perfect temperature for some folks, it's much too nippy for others. (It's also much too warm for our Celsius-loving readers . . .) Look for ways that players can make themselves comfortable; blankets, afghans, or hot cocoa let folks warm up, while positioning warmer players by windows or AC vents can let them stay cooler. (Of course, the university room we were in was set at a perennial 72 degrees . . . perfect if you've got a room full of sweaty students, not-so-good if you've got four guys huddled around a huge metal and wood table.

Well, I'm sure there are other environmental concerns that I've forgotten; maybe I'll do a sequel at some point. But in the interim, if you're wondering why your players aren't having much fun in the freezing, cramped, over-lit deafening warehouse closet you're meeting in, now you may have a clue as to why.

(And if you have any tips or any other comments, feel free as ever to send them [my way](#).)

* * *

It looks like John Kovalic is still having GAMA fun, and Ken Hite is busy as well (although we *did* have some Hite-y goodness with his *GURPS Cabal* and *Horror* designer's notes. Hopefully both gentlemen will come home to us soon.

--Steven Marsh

Last week's answer: Dungeons & Dragons Adventure Game (2000) Adventure Book, p. 2.

(Two stars) ". . . well, not exactly a machine, but a creature of inhuman cyberintelligence and unholy hungers, with tentacles, claws, and a never-blinking eye . . ."

The Pythagoras Box

by Elizabeth McCoy

There is an ancient mathematical joke . . .

There were three American Indian squaws. One slept on a deer skin. One slept on an elk skin and the third slept on a hippopotamus skin. All three became pregnant. The first two each had a boy, and the one who slept on the hippopotamus skin had twin boys. This goes to prove that the squaw of the hippopotamus is equal to the sons of the squaws of the other two hides.

This is apparently the basis of the Pythagorus Box (or vice versa?), which is actually three boxes, connected together so that a right triangle (i.e., one where the largest "point" is a 90-degree angle) is in the center. The two smaller, leather-covered boxes are large enough to hold an average human, while the one which appears to be covered in hippopotamus hide is correspondingly larger. (The GM may, of course, alter the size of the boxes as desired. Indeed, the boxes may alter their *own* sizes randomly . . .)

The Pythagorus Box's creation is likely to be a great mystery -- if for no other reason than that it's got an inherently *silly* premise. (In *GURPS Illuminati University*, it was probably created by Pun Magic (p. IOU115); in *In Nomine*, consider the effects of a Divine Intervention and an Infernal Intervention at the same time and what that says about the sense of humor of Lucifer and the Almighty; in *Teenagers from Outer Space*, someone probably built it during Shop Class and won't 'fess up.) Nevertheless, it is a potent artifact.

Not only is it able to duplicate items, but the Pythagorus Box can even create life.

This ability can be as silly, whimsical, bland, impressive, or horrific as the GM desires, depending on the requirements for activation and the results. The basic ability is thus: place a living thing in each of the two smaller boxes, invoke the Box, and the "hippo box" will contain "the sum of the other two hides." (The exact meaning of this depends on the box -- see below.)

Some suggested activation rituals: Simply feed it some power (Essence, fatigue, Gnosis, Bonk, plug it into a wall socket, etc.); spill blood within the triangle the boxes form -- a few drops is enough; burn rare herbs within the triangle; place a gemstone within the triangle, which will vaporize immediately; sacrifice someone within the triangle in a non-fatal, silly way (TFOS Bonk or Toon Falling Down); "sacrifice" a virgin in a non-fatal way; pour three pints of blood into the triangle (Red Cross may disapprove of thieves); kill something of the same mass as the intended result. (Or perhaps the two creatures which are to be "summed" in the hippo box must be freshly killed before being placed in the other two boxes!)

With a small Box, easy invocation, and simple "addition," one is likely to only create a series of apparently-cloned rabbits or mice -- which might be useful if you're stranded on a desert island and need to eat something! Placing candy bars inside it will cut down on trips to the vending machine, too.

For sillier effects, the box is small, activation is trivial, and you get . . . roughly what the two other things in the box would produce if they could have viable offspring. A rabbit and a rat might produce a bunny with a long ratty tail and a taste for cheese; a pigeon and a spider could get a little troubling. (This could shade into horrific, depending on how much the resulting creature favors the "cute'n'cuddly" combination.) A cheerleader and a tiger might cause a cat-girl to wake up . . . hopefully with a personality more suited to school than the zoo.

(For very silly, or very disturbing, results, the Box acts more like the transport chambers in *The Fly* -- a composite being with (for PCs) a split personality is produced.)

Likewise shading closer to something troubling, but with ridiculous potential, is the possibility that a non-animate and animate subject can also blend. Didn't you ever want a dog with the ability to pop toast?

The Box becomes more disturbing -- and inconvenient -- if the hippo box produces a baby of the appropriate melding. It might be a great way to help couples have children, but what's the ultimate price for creating life? Is the child really . . . human? The theological questions about the presence and nature of its soul might get troublesome. And who knows what strange powers or habits the child might manifest as it grows up?

In a Silly setting, the Pythagorus Box can easily heighten the silliness. In a more serious campaign -- it's only silly on the outside, and failing to think through the consequences of what it does, instead of how it looks, can be tragic.

Possible Adventure Seeds

- An evil necromancer has gained possession of the Box, and is creating monstrous semi-dead creatures by putting two creatures -- one dead and the other alive -- into the Box. The result is large, semi-dead (thus controllable by the mad mage's spells), more sturdy and cunning than regular undead, and terrorizing the locals. Some of the victims are humans, too, which means the PCs may want to see if they can cause the Pythagorus Box to *divide* the victims. But first, that means obtaining the Box . . .
- In a modern setting, the Box is being used to counterfeit money -- the *serial numbers* are even "summed" arcanelly, making tracking the forged bills more difficult. Mundane investigators may discover the Box in the forgers' lair instead of the expected printing press, or private investigators who know about the occult may be sent to recover the Box for their mysterious employer.
- Precursor artifacts and nanotech -- the Box seemed to be a perfectly good curiosity to the prospector who found it and auctioned it off. But the Box is *adding* genetic data every time its amoral, decadent owner uses it. Soon, the experiments will have human-level intelligence, and strange abilities -- and a yen to return . . . "home." (And if the experiments in question are not PCs, they've probably also got little berserking problems, too.)
- At IOU, a student has a wonderful little scam going: buy high-marked papers from other students, put them in the Pythagorus Box, and take out a copy that blends the styles! Okay, so it has to be checked for grammar and punctuation afterward, but it's a small price to pay. These "new" papers can then be sold to other students, as needed. Naturally, rumors of this have reached some teachers and administration, who are not impressed; if enough overreaction is achieved, Campus Security might even raid the dorm where they *think* the Box is kept! (The PCs have the "Lives on Campus" disadvantage, right?)
- Never let trickster gods get drunk together; while most *In Nomine* celestials would like to blame the Box on Eli or Vapula, it's not either of their faults. The Box shrinks and expands at its not-really-sapient whim, and tends to wind up in the *oddest* places. Right now, it's in the hands of a pair of demons who are trying to generate an army of demonlings . . .
- For *Discworld*, the Box is made from Sapient Pearwood, and will wander about on its own, looking for its (unknown? predestined?) Owner. It also tends to eat things with the smaller boxes and burp out the merged results . . . Naturally, it's going to encounter the PCs, and -- if the characters don't start following it around -- pick one of them as an Owner. (Of *course* this means that people are going to show up on its trail, to try to steal it or just find someone to pay for the damages it's caused.)

Nuance and the Static Curtain

Two (Very) Minor Players In The Greater Game

by Alice Turow

Nuance

*We claim to be a nation of laws, and this is true enough. We are, arguably, nothing **but** a nation of laws. With enough laws, we reach the point where only the most saintly or knowledgeable can hope to be in compliance. Given enough legislation, it will be possible for those with power to arrest **anyone** they want, provided they dig deep enough.*

This ends now; I break the law, and encourage others to do so, as well.

- Swear during your cell phone calls.
- Record a football game for your personal use without the express written consent of the NFL.
- Have sex in ways forbidden by your state's statutes.

When we are all law-breakers, the notion of breaking the law becomes meaningless.

--Excerpt from "The Nuance Manifesto," published in the March 31st *Washington Post*

The vigilante known as Nuance was born on October 19, 1964 as Clint Davin. Described by friends as "intelligent and intense," Clint married college sweetheart Mindy Sharpe in 1986 and ultimately became a successful and wealthy lawyer. The two of them were respected and well-liked (albeit private) members of the community in their home city. Unfortunately, the idyllic situation could not last. In 1991 Mindy was in an automobile accident, and was taken to the emergency room. Clint received the call from the hospital and left work immediately to be at her side. Unfortunately, he was traveling too fast and was pulled over by the police. Compounding Clint's problems were two parking tickets from three years earlier that had slipped his attention; a warrant had been placed for his arrest, as a routine license check showed. By the time the matter was resolved and Clint was able to get to the hospital, it was too late; Mindy Davin had died.

Clint spent several years in a depressive state, barely able to maintain (let alone advance) his previous life. Then one day a case was brought to his firm that snapped him out of it. Senator Kelly Fine wanted to sue the federal government for her husband's wrongful death. She claimed that highly placed officials in the federal bureaucracy were using the IRS to get at her and her husband Frank Robbin, since her senatorial seat was hotly contested. Frank had spent his fourth day in a row answering tax audit questions, and was on his third evening with less than two hours of sleep a night. With the prospect of another day of interrogation the next day, fatigue finally won; Frank (seemingly) fell asleep at the wheel and crashed into an embankment.

Clint took the case, and things seemed to progress reasonably well. Unfortunately, the case was thrown out on a technicality a year to the day it was filed. Although Senator Fine understood and was grateful he had helped as much as he had, something within Clint snapped.

He became convinced that there were uncountable laws and procedures that were open for interpretation, persecution, and abuse. And then there are the laws that are just plain silly . . .

Clint began his career as Nuance after a day-long "crime" spree; he spent the day jaywalking back and forth across traffic, putting money into other people's parking meters before they expired, and writing checks out of one account just *before* depositing sufficient funds from another.

After his rampage, he wrote a letter to the newspaper, anonymously detailing what he had done, and announcing his intent to break more laws. He ended the letter with "Know that, from this day forward, petty laws shall fall victim to the machinations of . . . Nuance! [sic]" Clint had meant to choose "Nuisance" as his code name but accidentally omitted the "s." The Associated Press reported the story nationwide (it was a slow news day), but compounded Clint's typo with one of their own, deleting the "i." And thus Nuance was born.

After a string of unsurpassed victories (read: the police have had better things to do than trying to find him), Nuance took his goal *more* public by taking out a series of full-page ads in many newspapers, detailing his manifesto. Although it's against newspaper policy to publish inciting advertisements, many editors have taken both an interest and a sympathetic stance for Nuance and his ideals. (Publicly these editors state that they ran the ads in order to give the police and the public more clues to try and track him down.)

Goals

Nuance is arguably a bizarre kind of anarchist; he *does* believe there should be laws, but doesn't believe we need as many laws as exist. He understands that it's much easier to create a law than to uncreate one, and the legal system is filled with laws that either don't make sense or have yet to be struck down.

To that end, Nuance will continue breaking as many "silly" laws (as he perceives them) as possible, gloating and publicizing his actions every step of the way. How he does this depends largely on the campaign; in a Supers world he almost certainly would wear a costume. In more mundane worlds he would merely operate covertly (albeit on the flamboyant side of what would be acceptable). Nuance still maintains a "secret" identity, although (due to a lack of time) Clint's legal practice isn't as bustling as it was in his prime. Fortunately he still makes more than enough money to fund his illegal activities. Nuance generally employs the homeless or passersby on the street to take pictures or otherwise record his actions. If he is not a costumed crusader, he will doctor such evidence (by blurring out his face or other identifying features) before sending copies to the police and press.

Nuance also has an accomplice: Senator Fine. She finds herself alternately agreeing with his goals and wanting him to get help; regardless, she does what she can to keep him out of trouble, through secret contacts and other favors.

Campaign Use

- Nuance probably works best as an "alternate" threat for overworked hero groups. "We have a reliable rumor that someone is attempting to blow up Niagara Falls. Oh, and we have another report of someone who's using the mail system to send single bottles of alcohol to a state that doesn't allow such shipments." As a long-running comedic element, Nuance can be a recurring "mastermind" that's constantly hovering around the edges. In this case, ideally the campaign is busy enough that the heroes don't have time to devote to tracking him down.
- For darker campaigns, Nuance could be a symbol of what the heroes are willing to tolerate, as he descends deeper into (relative) depravity and justification. They may be able to justify his actions when he mails them a mix CD of copyrighted songs dedicated to them, but might have a harder time when he breaks into the city's aquifer and adds safe levels of fluoride to the unfluorinated water supply. What if he hacks into a television network's satellite feed and alters the broadcast to show programs without commercials? And at the extreme, how will they respond when they learn Nuance murdered someone who was attempting to commit suicide?
- Of course, the heroes could also need legal aid at some point, and enlist the services of one Clint Davin before becoming entangled in his problems . . .
- Finally, for lighter campaigns where heroes don't want to lock up Nuance, they might be able to uncover his secrets and try to help him. Senator Fine, in particular, may well find herself falling in love with Clint; a relationship might enable them to forget their respective heartaches and resume a "normal" life.

The Static Curtain

*Peter "Paws" Sheppard hadn't bathed in four days. Although not uncommon by itself, it was especially common in the week before the new issue of **Real Truth Now** went to press. The copy shop needed to get it by 5 PM, or else it wouldn't be printed in time to mail to the 87 subscribers. "The truth needed to be timely," Paws always said.*

Unfortunately, he needed one more story . . . preferably for the front side of the newsletter. Paws sighed, put his cup of cold coffee in the microwave, and unfocussed his eyes onto the clippings on the table.

And then he saw a pattern.

One face, appearing on the sidelines of seemingly random events:

- *The controversial 1972 Olympic basketball upset of the Soviets over the United States team. Standing on the sidelines with a Polaroid camera.*
- *The 1974 closing of the largest remaining door-to-door milk delivery service in the Northeast. A powerful mayor in the foreground; him in the background.*
- *A 1979 press conference with Jim Jones aide Michael Prokes, minutes before he "committed suicide" in a restroom. In the audience with a notepad and a manila envelope.*

The acrid smell of burning coffee filled the air; the microwave did its job too well. Paws moved to recover his mug just as there was a knock at the door.

The peephole revealed it was a person dressed as a milkman; he reached for something, and then the view went black.

The Static Curtain began as the mastermind of Dr. David Bakker in 1967. Prior to that time he had been one of the foremost conspiracy theorists on the Kennedy assassination in his day, with reams of information in loose-leaf binders strewn around his one-room basement apartment in Detroit. Then, on his thirtieth birthday -- as he had conclusively proven in his mind that the hit-and-run death of ex-Jack Ruby employee Rose Cherie was, in fact, an accident -- David came to some "realizations":

- Given enough random facts, it should be possible to tie any random occurrence into a greater conspiracy.
- The weirder the occurrence, the easier it generally is to tie to something else.
- As such, any event *specifically* fabricated to be unusual should be able to tie into a conspiracy (and possibly The Conspiracy, if such a thing exists).
- If David were to create such an event, he may well become embroiled into The Conspiracy himself, enabling him to get more information than he had access to as an outsider.
- It may also enable him to access illicit money, letting him move out of his efficiency apartment and possibly meet women.

Unfortunately, 1968 was rife with tragedies, giving Bakker ample opportunity to put his theory to work. A "witness" paid to tell a confusing story, the destruction of some tangential evidence remotely tied to a principle investigation, a date-modified receipt moved from one business to another . . . the plan was in motion. Christmas Eve of the same year found a fat un-postmarked envelope stuffed with a hundred \$100 bills in his (aliased) post office box. He had no idea where it came from, nor why. But obviously he was now part of The Conspiracy.

And thus the Static Curtain was born.

The Static Curtain (taking its name from random noise often used to muffle actual noise, and the "curtain" Bakker so wished to see behind) had two goals:

- Fund (seemingly) insane and illogical projects, none of them having anything to do with any other. The projects are designed to spread incorrect information, suppress real events and information, and otherwise obfuscate the truth.
- Accumulate data based on the effects those projects produce, and use it to discern more information about The Conspiracy.

(Note that Bakker does *not* use this data to modify the random conspiracy-threads he weaves; for the Static Curtain to be successful, he reasons, it mustn't deviate from its goal of using chaos to find order.)

What projects the Static Curtain undertakes depend entirely on the "tone" of the campaign . . . or at least the tone the GM wishes the Curtain to have. It can range from silly to strange to downright lethal (or some combination thereof).

Some examples of projects the Static Curtain may undertake (or have undertaken):

Light Activities

- Completely suppressing the Beatles' song "Left Is Right (And Right Is Wrong)" amid misinformation and three hoax songs "Colliding Circles," "Deck Chair," and "Pink Litmus Paper Shirt."
- Creating records of a rash of Jim Morrison sightings in Paris two years after his death in 1971.

Weird Activities

- Establishing secret pirate radio stations in the 9,000-12,000 KHz range, where people recite random groups of five-digit numbers in various languages.
- Taking steps to delay the transformation of the Spruce Goose airplane into a tourist attraction, pushing back the original date from 1974 to 1977.

Dark Activities

- Assassinate everyone with the name "Dan Smith" who was born in Boston in 1978.
- Destroy the lives of conspiracy theorists with an expertise in Watergate.

Goals

Bakker has always held (privately) that the purpose of the Curtain is to learn about -- and ultimately uncover -- The Conspiracy; he justifies the techniques he employs (no matter how bizarre or cruel they may be) by pointing to the results. He claims to be closer to uncovering the truth now than he ever has been.

A couple of his closest confidants don't buy this story fully; although they don't know the depth of Bakker's data, after more than 30 years of accumulating information from the inside they feel he should have enough to uncover The Conspiracy by now. The fact that he hasn't concerns them.

Their fears take two forms. First, they worry that the Static Curtain may be *too* successful; what if, by trying to uncover the Conspiracy, they've actually become an integral part of it . . . or become the *entire* thing? Or, perhaps worse, what if Bakker has lied (or been delusional) about what he's learned? What if he doesn't know anything at all? "Though this be madness, there is madness to it . . ."

Campaign Use

- In a campaign with secrets, weirdness, and intrigue, the Static Curtain is perhaps best used as an "alternative" conspiracy, providing misinformation, alternative threads, or comic relief to any investigators. If there are any great odd tidbits you were never able to work into the larger tapestry, why not attribute them to the Static

Curtain?

- The Static Curtain can also be an invaluable source of information for those looking for insights into The Truth . . . although it is unlikely such aid will come free. The Curtain has little need for money (Bakker only ever spent \$3,200 of the original \$10,000, and has kept the rest . . . with its envelope), earning enough from its random ties to The Conspiracy to keep it more than comfortable. Payment for information, then, is likely to take the form favors: "Of course we can tell you what the government actually did on the moon in 1969. But first, we have heard rumors that someone has unearthed a cache of Kenner's unreleased missile-firing Boba Fetts from their 1979 mail-in promotion . . ."
- The Static Curtain can also make a unique antagonist; if an investigator happens to be (say) a Dan Smith born in Boston in 1977, he may find people wanting to kill him for no reason! Given how persistent the organization can be in pursuing its random goals, thwarting them as an enemy may be difficult. GMs may want to complicate this idea even further; what if the thread that caused the Curtain to take interest in the heroes also catches the eye of The Conspiracy? The party may find themselves in a dangerous three-way, close to the truth but threatening to be destroyed for it!
- Used sparingly, the Curtain is also a good GM tool for any plot holes that (invariably) creep into any complicated campaign. Why didn't the newspaper respond to the audio tape proof that had been mailed to it? Wasn't the person interviewed in Dallas supposed to be serving a life sentence in Chicago? Why did the government contact have the name "Mike Sanford" one adventure, and "Mike Simpson" in another? Well, obviously the Static Curtain has been active . . .

License to Drive

by Steven Marsh

From the Written Exam

Question 22: Presuming you had no choice but to hit one of the following, which would you choose?

- The scaffolding where painters are finishing an office building
- The baby carriage, presuming there is a 50% of it containing a baby, and 50% chance of it containing cans
- The fruit cart
- It depends on whether I am chasing or being chased

Question 23: It is acceptable to drive down an alleyway to lose pursuers in which of the following instances?

- Any time you are being pursued by more than one vehicle.
- Any time you are being pursued by more than one vehicle, where at least one vehicle is a law enforcement vehicle, AND one vehicle is not a law enforcement vehicle.
- Any time you are reasonably certain the chasing vehicle is wider than yours.
- Alleyways are appropriate to drive down at any time you are being chased.

Question 24: Which of the following methods is considered acceptable for shooting a firearm from a moving vehicle?

- "Noon and Left": Right hand holding the steering wheel at the 12 o'clock position, left hand firing the weapon out the window.
- "Eight and Two": Right hand holding the steering wheel at the 2 o'clock position, left knee stabilizing the wheel at the 8 o'clock position, left hand firing the weapon out the window.
- "Eleven and One": Right hand holding the steering wheel at the 1 o'clock position, left hand cradling the steering wheel at 11 o'clock while shooting the firearm straight ahead. This requires the front windshield to have been shot out from either the outside or inside.
- It is never considered acceptable to shoot a firearm from a moving vehicle.

In many stories, action heroes often drive in what would be described as an exceedingly reckless manner while in the pursuit of their goals. And yet they are almost never targeted by law enforcement, and the last scene before the fade-to-black is generally *not* the hero being carted away in shackles.

Why is this? Well, it may be because they have a License to Drive.

Unlike its more famous cousin, a License to Kill, a License to Drive is a legally binding arrangement that allows the wielder to drive using any means necessary, while performing duties under the service of the issuing agency. Should the holder of a License to Drive be challenged by any law enforcement authority, all he needs to do is flash the special

License; by arrangement, he must then be *immediately* allowed to continue his duties. Failure to do such will ensure that the arresting officer has a miserable life ahead of him catching rabid dogs (or some equally unpleasant public service).

The License

The License itself is constructed to be bleeding edge technology for the time it's made in; thirty years ago it would be made of titanium and/or Flexon, today it would be made of an indestructible plastic with an embedded microchip, and thirty years from now it may consist of a thin computer capable of testing the holder's DNA on the spot. Regardless, utmost efforts have been made to ensure the item is not transferrable or forgeable, and almost as much effort has been spent to make it indestructible. (After all, if some fool driver is burnt to a crisp because of a car crash, the Powers That Be would like to know who he was, so they know precisely who they are disavowing all knowledge of.)

Due to the expensive and unforgeable methods of creating the License, it only need be flashed briefly to law enforcement authorities to cause them to back off; generally the holders of the License to Drive are good enough drivers that they can convey this without even slowing down. (In sufficiently high-tech games, the driver may not even need to visibly show the License; upon activation, it may emit a beacon informing the police that he is invoking his duties *and* responsibilities.) In addition, the holder of the License has, in essence, a Legal Immunity while invoking its powers; broken laws, property damage, stealing a car to chase a bad guy, firing a weapon, even vehicular manslaughter will not have any repercussions from the law. (The issuing agency, on the other hand, will demand an explanation . . .)

Regardless, in all settings the License to Drive *does* require conscious activation. If driving recklessly, the driver can expect to be harassed by police, chased by mounties, and otherwise harassed until he can dig the License out of his wallet (or wherever it's kept). This becomes important because the issuing agency *demand*s that the License be kept safe (it can't just be taped to the front window); if the License is lost or otherwise falls into undesirable hands, it might possibly be compromised, which would render the advantages of the License moot. Note that the License can be activated after the fact; if the police catch up with and stop the driver, he can flash the License and be on his way.

Bestowing the License is not done automatically, nor is it something the issuing agency takes lightly. It will generally only be given to its best drivers, or those who will require its powers. Those wishing to receive a License will need to pass rigorous tests of all sorts . . . written, driving, psychological, and the like. The agency is also not shy about revoking the License if they feel the driver has lost the privilege; if the driver is shown to be needlessly *and* recklessly using its powers, or commits a heinous act or lapse of judgement (say, smashing into a shopping mall at Christmas time because the driver thought he saw someone who looked like the witness he was after), he will probably find himself limited to a more "mundane" driver's license . . . at best.

Having said that, the agency doesn't really care what the driver does with the License's powers provided he doesn't cause any problems; among other things, this generally means that many License-holders aren't shy about invoking their rights to drive at insane speeds down the highway. But if they hit another car or otherwise cause damage, they're probably in deep trouble with the agency.

The Police

The GM should decide in advance what arrangements have been made with the police. The default is "non-interference"; if the driver invokes the License to Drive, then all police will avoid the driver *and* whatever the target of his mad driving is (whether pursuer or pursued). If the License-holder decides he wants the police's help, he will need to use whatever means would be necessary for anyone else (calling the police department, flagging an authority down, etc.).

But the default state could just as easily be something like "obstruct the other car(s) involved in my pursuit." (Creative GMs could easily concoct situations where this would be undesirable . . .) The general rule should be that, no matter what the default response, it will not be useful in all circumstances. Such are the costs of being a hero. (If the player

does want more "intuitive" or helpful police, he should buy them as an Ally group or the like.)

Costs

In *GURPS*, the License to Drive is a 5-point advantage; the legal right of being able to drive without regard to the law is tempered by the fact that they follow another code while invoking those rights (generally "get the bad guy"). Should the GM be insane enough to allow the driver to have a License to Drive *without* a clear mandate (in other words, "Drive however you like, whenever you like,") then this is a 10-point advantage . . . although the GM should come up with some circumstances under which the License can be revoked (not unlike the Legal Immunity advantage), and realize in advance that this advantage is likely to make "adversary" synonymous with "speed bump."

In *In Nomine* the License to Drive is, in fact, a celestial artifact; it has the special power that anything done while its power is invoked will not disturb the Symphony! (Ofanim *love* their Licenses . . .) Needless to say, both sides of the War take this power very seriously, and neither will give their agents a License without darn good reasons. The License costs 20 points, plus 1 per level. (In *GURPS In Nomine* this License costs 35 points +1 per level.) If an *In Nomine* driver wants both the special non-disturbance powers of the License *and* the police non-interference powers, then the base cost rises to 25 points (40 in *GURPS*).

Campaign Uses

- The License to Drive is, needless to say, about as cinematic as you can get. It's designed specifically so games can have those rollicking action-movie car chases we know and love, without fear of police involvement.
- If the heroes have secret (or otherwise non-public) identities, they may well face situations where they need to decide whether or not to invoke the License's powers -- thus risking their identities -- or let the bad guys get away. Neither one is going to be looked upon very well by the issuing agency.
- In a complicated world (like *In Nomine*) there may well be two (or more!) agencies that can issue such Licenses; to really startle players, consider the possibilities if only the *adversaries* have the License to Drive. (In a conspiracy game, it may well be disconcerting to have the police who are helping you chase the Stogie-Chomping Man suddenly break off the pursuit . . . shortly before he turns around and starts barreling towards the heroes' car at lethal speed . . .)
- And then there's always Sheriff Jasper Culligan, who don't care none about no special rights th' heroes have; he's gonna bring them law-breakers in by any means necessary . . .

Reviews of Gamable Fiction

Hail, Fredonia!

Duck Soup and The Mouse That Roared

Review by Matt Riggsby

Most acknowledged source material for roleplaying adventures comes from serious sources: SF and fantasy epics, action-adventure movies, horror and espionage novels, and the like. However, as products like *Toon* and *GURPS Discworld* demonstrate, it's possible to draw roleplaying inspiration from funny sources as well. This article presents a pair of pocket-sized nations from two classic comedy films which could be used as the basis for roleplaying adventures: Freedonia and the Duchy of Grand Fenwick.

Freedonia

"Well, that covers a lot of ground. Say, you cover a lot of ground yourself. You better beat it; I hear they're going to tear you down and put up an office building where you're standing. You can leave in a taxi. If you can't get a taxi, you can leave in a huff. If that's too soon, you can leave in a minute and a huff. You know, you haven't stopped talking since I came here? You must have been vaccinated with a phonograph needle."

--Prime Minister Firefly to Freedonia's chief financial backer

Freedonia is the setting of *Duck Soup*, #5 on the American Film Institute's list of the best 100 American film comedies and considered by some to be the Marx Brothers' finest film (although the author prefers *A Night At The Opera*). Freedonia is a pocket-sized republic somewhere in Europe. It appears to be as quaint as any tiny nation, populated by stolid peasants and cosmopolitan aristocrats. Unfortunately, Freedonia is also in constantly dire financial straits. Its government is propped up only by the loans of Mrs. Teasdale, the widow of an American tycoon. After years of assistance, her continued support comes at an unusual price: the Freedonians must make an American lawyer, one Rufus T. Firefly, the prime minister. Presumably, Mrs. Teasdale knows Firefly only by third-party recommendations, since Firefly is . . . well, Groucho Marx. He is, by turns, insulting, charming, arrogant, insulting, conniving, generous, wheedling, insulting, lecherous, greedy, and insulting yet again, sometimes in the course of a single sentence. Firefly quickly baffles and offends everyone he meets while attempting to seduce every woman in sight.

Firefly's administration is beset not only by financial problems at home, but by threat of war from abroad. Freedonia's neighbor and long-time rival, Sylvania, is looking for any pretext to attack. The Sylvanian ambassador, Trentino, sends two spies to infiltrate Firefly's government: Pinky, a mute, and Chicolini, an idiot. The spies are played by Harpo and Chico Marx, respectively, so it's sometimes hard to tell whose interests they're pursuing; of course, the same could be said for Firefly, who dismisses his cabinet (the Chamber of Deputies) and replaces them with Pinky and Chicolini. Eventually, Chicolini is apprehended and put on trial for giving plans of Freedonia's defenses to Sylvania, but Firefly

turns the trial into a farce. Meanwhile, his constant insults to Trentino become a provocation for war, and the ambassador himself leads the Sylvania forces in their attack. However, Firefly (now assisted by Chicolini and Pinky) secures victory by infiltrating the Sylvania lines and capturing Trentino himself.

Grand Fenwick

"Je ne sais pas. Je ne parle pas français."

--Tully Bascombe, gamekeeper, on being questioned about a conversation with French customs official

While *Duck Soup* is a Depression-era anti-war film, *The Mouse That Roared* is a Cold War fable. The book and the movie based on it (in which Peter Sellers famously plays three leading characters) are set in the Duchy of Grand Fenwick, a forgotten pocket between France and Switzerland. Fenwick's sole export is an exceptional wine, Pinot Grand Fenwick. However, when an American vintner begins marketing an inferior but heavily advertised imitation, Fenwick's economy appears doomed. Fenwick's solution at least has the advantage of novelty: declare war on the United States. In the early years of the Cold War, this wasn't -- quite -- as absurd as it sounds. In the wake of WWII, programs like the Marshall plan poured millions of dollars into rebuilding Europe. The Fenwickian parliament reasons that if they were to lose a war with the US, the victorious Americans would do the same for them, reviving the Fenwickian economy.

The plan hits a snag when it develops that the US government doesn't believe that Fenwick exists. Their declaration of war is filed away by a State Department clerk who, unable to find Fenwick on the map, believes it a hoax. Fenwick has no choice but to take the lack of fight to the Americans. The Fenwickian army, if that's the right word, consists of a dozen men who occasionally drill with longbows and is led by Tully Bascombe, the ducal gamekeeper and a shy, amiable man with no military inclinations or abilities to speak of. Nevertheless, they pack up their bows and chainmail, board a bus for Calais, and hire a small freighter to take them to America.

They arrive in New York during a nuclear air raid drill and wander the deserted streets searching for somebody to surrender to, unaware that the population of the city is hiding in the subways. Eventually, they stumble over the laboratory of a Dr. Kokinitz, an eccentric researcher who refused to enter the shelters in order to perfect a football-sized doomsday device, the Q-bomb. Tully seizes the professor, his daughter, and the dangerously unstable Q-bomb and returns to Fenwick, suddenly giving his country the lead in the global arms race. In order to keep the world safe from the Q-bomb, the US has little choice but to surrender and, as the surrender's only provision, push the cheap knock-off wine off the market to restore Fenwick's economy.

Campaigns

While the idea of a silly little kingdom could be transplanted to a wide variety of genres (obscure fantasy kingdoms, out-of-the-way planets in a SF campaign), these quaint European countries seem best suited for use in a steampunk campaign. A product of the early 1930's, much of *Duck Soup* can be transplanted to the late nineteenth century with little modification. The few bits of very late or post-Victorian technology which appear in the film, such as telephones, the primer minister's car (an unusual motorcycle and semi-detached sidecar), and a radio, can be glossed over or replaced with steampunk-flavored analogues, such as personal telegraphs, a steam-powered motorcycle, and a very loud Victrola. Little is said about exactly where Freedonia and Sylvania are, so the GM can fit them into any blank spaces on the map. However, they might be better wedged in between Switzerland, Austria, Italy, and Germany. Freedonia has a vaguely Germanic or at least Alpine look, while Sylvania appears to have Italian influences (for example, Italianate names and Chicolini's atrocious accent; Pinky might be called Rosetto instead). Firefly would be a distant ally of the Emperor Norton in *Deadlands* or a thorn in Bismarck's side in *Castle Falkenstein* (although in Firefly's world, Bismarck might be replaced by Charlie Chaplin's Adenoid Hinkel from *The Great Dictator*). Arguably, the surreal comedy of the Marx brothers could be run as a "realistic" *Toon* game.

Fenwick's Medieval feel would be as backwards in the steam age as in the atomic age. Working out the Cold War elements is a bit more difficult, but hardly insurmountable. Great Britain or a German empire could stand in easily for the US, and would be much easier to reach. The Fenwickians could simply become lost rather than wander through a

mysteriously deserted metropolis and stumble over Professor Kokinitz's home in the countryside. Rather than Marshall plan-like assistance, Fenwick may simply have hoped for a foreign garrison, to which they could have sold all manner of supplies. In the book, Gloriana is a young and extremely attractive young woman, perhaps fair game for a marriage alliance. In the movie, Gloriana is an elderly widow, played very much in a Queen Victoria mode by Peter Sellers. Indeed, in a steampunk campaign, Gloriana might carry on a cordial correspondence with Victoria herself.

Adventures (or, "Funny, She Doesn't Look Fenwickian")

If PCs are unraveling your plots too quickly, Freedonia may be a good place to send them. It might constitute a sort of diplomatic Russian Front, where all sides can invest massive resources with little or no apparent effect. Freedonia must be something of a wild card in world affairs because of the unpredictable prime minister. Firefly may appear insane, but with his victory over the Sylvanians, he has decimated his enemy's military while partially modernizing his own with captured weapons, giving other potential invaders pause. The wisest analysts will be unable to make head or tail of his policies, and the Freedonian bureaucracy is likely to be running scared as a series of contradictory and incomprehensible memos cross their desks. Was Firefly just lucky when he defeated Sylvania, or did he have a plan? Is he loyal to Freedonia, or is he working for another cause? Does he really make Ludwig II look mildly eccentric by comparison, or is he just mental health's answer to Typhoid Mary? Is he, as some have suspected, a distant relative of a certain German socialist? Freedonia is a good setting for a parody of conventional espionage adventures (imagine Groucho in place of Dr. Doom or Goldfinger and Harpo and Chico in the place of a James Bond villain's sidekick).

The GM might be careful, though, about just how much the core characters from the film are used. All the usual cautions about using a character from literature in a game apply here, and then some. With the wealth of pseudo-Marxist comedy that has come from Groucho's influence on the American comic tradition, Firefly can be great fun for a prepared GM, but it may be best if he is used sparingly. Simply put, doing Groucho is hard work for the performer and can be hard on the audience. Although his look and sound are easily imitated, his fast-talking style of comedy was designed specifically to irritate and silence his straight men. Overexposure and forced inactivity will frustrate players, which defeats the purpose of a comic adventure. Instead, Firefly should probably be a shadowy figure on the fringes, occasionally blowing into the scene to stir up chaos and leaving quickly before anybody has a chance to react. Chico and Harpo, on the other hand, make delightfully inept contacts or assistants.

Fenwick is also well-suited for espionage adventures, although the setting is somewhat more genteel than anarchic Firefly-era Freedonia. Pre-war Fenwick was notably isolated, but adventures abound during and after the war with America. During the war, PCs could be diplomats sent to negotiate peace with Fenwick (or diplomats sent by third parties for an alliance with Fenwick, as all the major powers did in the book and movie), American/British officials chasing reports of mail-clad men in the countryside (in the film, the shining mail was mistaken for spacesuits and the Fenwickians for alien invaders), or even mercenaries sent in lieu of actual Fenwickians with confusing orders to invade the enemy and surrender as quickly as possible. Fenwick could even appear in a *GURPS Discworld* adventure, with a pint-sized army or barbarian horde pathetically trailing along behind the PCs through the streets of Ankh-Moorpork, constantly trying to surrender to them.

Post-war Fenwick becomes a bit more serious. Because the Q-bomb, or whatever stands in for it, is dangerously unstable and Fenwick itself appears disinclined to participate in international affairs, sensible nations will leave well enough alone. Alas, sensible nations are in perilously short supply. Fenwick may become the target of subtle espionage, with every major player on the world stage sending agents to try to unravel the secret of the mysterious artifact, gain Fenwick's friendship, and, if possible, acquire it for their own country. If the GM feels compelled to insert more Illuminated elements into the adventure, it's worth pointing out that Leo McKern, who played the leader of the parliamentary opposition in the movie, also played #2 in *The Prisoner* twice.

One motif that appears in both films is characters who resemble one another very closely. In *Duck Soup*, Chicolini and Pinky demonstrate that just about anybody can paint on eyebrows and a moustache and pass for the prime minister. In *The Mouse That Roared*, the roles of Tully, Count Mountjoy (the Fenwickian Prime Minister, whom Gloriana affectionately calls "Bobo"), and Gloriana were all played by Peter Sellers, with the quiet mention that the original Fenwick was the father of his country in every possible way. Similar appearances can be a problem in any isolated

location, where people start to look like one another anyway, but it can be compounded with historical quirks such as Fenwick's. Any adventure in Fenwick or Freedonia can take advantage of mistaken identities.

Suggested Reading and Viewing

Movies

- *Duck Soup*
- *Horsefeathers* -- An early Marx Brothers movie featuring Groucho as an authority figure, this time a university dean.
- *Coconuts*
- *Animal Crackers*
- *A Night At The Opera*
- *A Day At The Races*
- *The Mouse That Roared* -- The movie adaptation is a broader comedy than the book, altering some characterizations for Seller's legendary triple role.
- *The Mouse On The Moon* -- Peter Sellers returns for the so-so sequel, playing only one role.

Books and Graphic Novels

- Wibberley, Leonard; *The Mouse That Roared*
- Wibberley; *The Mouse On The Moon*. In this sequel, Fenwick joins the space race.
- Wibberley; *The Mouse on Wall Street*
- Wibberley; *The Mouse That Saved The West*
- Sim, Dave; *Cerebus*. One of the recurring characters in this long-running comic book series is Lord Julius, a more consciously cunning Groucho Marx clone. GMs might be able to lift his scenes wholesale to represent Firefly's administrative style.

Radio and TV

- *You Bet Your Life* -- The original Groucho radio and TV show, not the later revival with Bill Cosby. This game show was essentially an excuse to let Groucho talk for a half-hour.
- *Animaniacs* -- Yakko's comedic style is notably Marxist. Particularly useful is the Anvilania episode, a clear homage to *Duck Soup*.
- *The Goon Show* -- This anarchic 1950's BBC radio show starring Peter Sellers is probably too surreal to adapt directly to adventures, but its characters would be very much at home in a comedic steampunk campaign, and some of the devices which appear from time to time as throw-away gags (horse-drawn zeppelins, ancient monumental Christmas puddings turned rabid man-eater, steam-powered leather microphones) might be built by mad scientists.

Pyramid Review from Dimension X!

Decados Fiefs (for the Fading Suns RPG)

Published by [Holistic Design Inc.](#)

Written by Gabriel Zarate

Cover and Interior Art by John Bridges

32 pages (plus inside covers); \$7.95

Fething, lad -- mind if I call you Feth? Yes? Fething it is . . . er, Sir Fething, of course -- you want an entertaining play about the Decados, you came to the right place. The Masque guild is *more* than willing to help you out. We'll write it, we'll act it, we'll find the folks who'll do the magic lantern shows. No trouble!

Now, there's just the *slightest* problem . . . almost not worth mentioning, really.

Which? Ah. Well, as you'll recall, you wanted your epic to span all the Decados worlds, right? Right. Well, we've done some preliminary research, and let me say this has proven no easy task.

We'd *thought* we found the perfect tome for the subject. See, we have a few . . . friends in the Imperial palace, if you know of what I speak, and have as such gained access to a tome entitled *Decados Fiefs* provided by a Sir Klimenty Decados to Emperor Alexius Hawkwood himself, and the fifth in the *Imperial Survey* series of books intended to broaden the knowledge and scope of the Empire.

Sir Klimenty, of course, is one of the few nobles of House Decados -- a noble house with a reputation, I'm sure I need not say, for depravity as well as wit and charm -- to join the Emperor's Questing Knights. So I was expecting a certain amount of intrigue and obfuscation with this report. But perhaps above all, I was expecting it to be *interesting* . . . say what you will of the Decados, their ability to hold captive an audience with their actions and words is legendary. Besides, what's the point of stealing a copy of something meant for the Emperor's eyes only if it's boring?

Sadly, this has not been the case.

It would seem Sir Klimenty has been instructed or trained by his house in the art of being direct; he is, perhaps to put it bluntly, dull. He has no shortage of details -- historical, geographical, and political -- on the four worlds he covers, but he lacks the passion and wit that I, frankly, have come to associate with the Decados.

Compare this tome with the previous volume, Sir Piao Lui's *Li Halan Fiefs*. (How did I acquire another volume intended solely for the Emperor? A fine question, and one I shall surely answer later . . .) In that work we gain insight not only into the worlds explored by Sir Piao Lui, but also into his house, his church, and his own opinions and thoughts.

Such was not the case with *Decados Fiefs*. Although an invaluable resource as a historical and geographical guide (which, I grant, is the intended purpose of these guides; perhaps the good Emperor dictated that subsequent volumes in the series contain less voice and more fact), it nonetheless failed to inspire me significantly in my quest to tell stories based on this region.

Certainly, even amid the details there are wonderful bits of trivia -- like the constantly (and mysteriously) empty Acorbite steerage cars on the overrail system on Severus, or the custom of feeding strangers in the Ukiuq region of Malignatius lest they die of hunger and feed the demon patrons of Theodora Li Halan -- but I found myself wanting more. Where are the hooks I can wrap a story around? Where is the unique flavor of the Decados worlds? Perhaps this volume is ultimately intended for a wider audience, and as such cannot divulge greater secrets of its subjects; the glimpses I caught (like Cadiz' moon Persus, with mysterious evidence of a previous sentient landing as well as a network of tunnels beneath the surface) merely left me hungry for more.

Indeed, at times I found myself wondering even *where* all the Decados were; I say only in half-jest that Malignatius doesn't seem to be ruled by *any* Decados, and certainly widespread evidence of the ruthlessness and iron rule of that house was lacking. While this would ordinarily be evidence of an unreliable narrator, I didn't even get the sense that he was covering anything up . . . again, obscuring the truth through tedium, perhaps? We get some glimpses of what I'd always thought of as the Decados' true nature -- the depravity of Duke Stephan Svanfeld of Cadiz is well-detailed, for example -- but precious little beyond that.

It is not until the last page of this report that I get a sense of the "real" author struggling to get out. There, in his brief half-page descriptions of Manitou and Pandemonium/Iver, do we learn some more insight not just into the history, wants, and desires of the speaker, but also his Decados heritage. For example, one passage of his Iver description begins, "After rudely boarding and searching my vessel, these fanatics took offense to the presence of certain Decados cultural items intended for my personal use . . ." Had the rest of the book been more in this vein, I would almost certainly have more ideas both into the nature and character of these worlds, and could craft you a story fit for a noble, Feth. Fething, sorry.

But all is not lost; I have an alternate scheme. I currently have plans for dinner next week with the Duchess Salandra Decados; she is considered by many to be perhaps the quintessential Decados. Hopefully I shall be able to trick some insight and story ideas out of her.

Fething Hawkwood, I assure you: When completed, this play shall secure your place in your house!

160 pages; \$22.95

Eddy Goya: Hello again fight fans, I'm Eddy Goya, here with Baz Danziger, taking the time out between all of the blood, gore, action, drama and excitement that I know *you* demand to tell you about the latest data slug you will want throughout this season of the Contract Circuit. Yes, that's right, as I speak, the 904 SD issue of *The Contract Directory* is available at your nearest *SLA Industries* approved data slug outlet. This guide to the exotic media superstars *you* adore as Contract Killers is the perfect companion to have by your side when you join me, Eddy Goya and the team, everyday for the news and duels that make up the Contract Circuit.

Baz Danziger: And remember folks, if you want to join the circuit yourselves, you need to be a SLA employee and have a "Psychological Examination and Evaluation Exemption Certificate" from the Department of Psychology and Psychosis. Any stressed out, whacked out citizen of the World of Progress can become a killer, but without that certificate you just aren't *mad* enough to fight in the spotlight that is the Contract Circuit.

And if you at home want to check yourself out to see if you're mad enough for the circuit, then you can find a complete guide to testing your stress levels in the back of your copy of *The Contract Directory!*

Eddy Goya: That's right, Baz. With that certificate in their hands, a Contract Killer is no longer just an Operative for SLA Industries -- though many operatives do join the Circuit -- but an officially sanctioned killer, able to reap all of the benefits that fame, fortune and sponsorship from soft companies can bring as they climb the ladder that is the

Contract Circuit. With *The Contract Directory*, we take right into their world from the comfort of your couch. Any time *you* want.

Baz Danziger: *The Contract Directory* takes a look at all aspects of the circuit: the laws and regulations to every fight; the VideoDrones that can track and film every killer twenty-four seven outside of their homes and the White Van Man crews that boost and co-ordinate VideoDrone signals when a fight needs multiple camera angles; the agents that ensure that we get the contests you want, the Contract Hunters that bring all manner of dangerous creatures -- Manachines, giant insects and other monstrosities -- into the arena to clash with your favorite murderers in the arena; the referees, the medical teams and security that staff every arena. Your copy of *The Contract Directory* even includes a pin-up of perennial security superstars, Boskii and Fry!

Eddy Goya: It's not just our much-loved Stormer and Brain Waster duo that get their own picture in *The Contract Directory*. Key down to the Directory section on this data slug and you'll find profiles of forty of the circuit's top Contract Killers -- Topnotch, the bold and beautiful sniper extraordinaire; Quill, the cruel and sadistic, biogenetically enhanced Wraith Raider; Pig Man, the pigs-head helm-wearing enforcer for the Skin Trade, who always gives his defeated opponents to his sponsors; the hated Vevaphon known as Screech, 'cos that's all it ever utters; Fritz, the Tek Trex drone operated by the terrorist Puppeteer via satellite; the superbly skilled Johnny Automatic and of course, the media darling herself, Delia the Destroyer!

Baz Danziger: And talking of gorgeousness, you'll notice that the protective sleeve of your copy of *The Contract Directory* is graced by a stunning image of "Diana."

Eddy Goya: That's right, Baz. And *The Contract Directory* comes with an index of all the images in this year's edition.

Baz Danziger: Absolutely, Eddy. Pity that all those images aren't labeled for that easy to identify need, but I'm sure that'll be fixed in next year's edition.

Eddy Goya: Urm- Yes, Baz . . . Anyway, moving on fight fans, the 904 SD edition takes you to every type of fight and location that the circuit has to offer. The hand-to-hand brawls of the Kinetic Pit; the swinging and slicing of The Pendulum; twenty unarmed killers and a pile of blades between them in the dark, that is Fish in a Barrel and the fans favorite -- The Hunt, played across arenas that model sections of Downtown, the Jungle or even one of the Cannibal Sectors.

Baz Danziger: For our section on Tactical Considerations, we have the best writers and tacticians look at just how the Contract Killer looks at some of the fight locations we bring you everyday . . . Sewer Fighting, Wilderness areas off *and* on Mort, Wastelands, Suspension Platforms over the oceans of Mort, Cold Storage and Factory Zones, Research Stations, Lower Downtown and *even* in the outer fringes of Matliss 9, the Gas Giant, where the opponents don jet packs!

Eddy Goya: Let's not forget contests in zero-g there, Baz. But seriously, if you're a SLA Operative as well as a fight fan, then these comments will come in handy should you get assigned some of the more exotic BPNs . . .

Baz Danziger: Now that you mention exotic, Eddy, let's talk about the new gear that our Contract Killers are employing in the arena this year . . .

Eddy Goya: Thank you Baz. Every killer needs a signature weapon, and the latest range from the simple to *the* exotic! The simple includes the mighty hammer and mace, the axe and flail. The two-handed pick that will punch through an opponent's armor to the flesh beneath and the morning star that will swing round and bludgeon them! For those that want style, favorites we've seen this year include the whip, the bolas and the net.

Baz Danziger: Of course, whilst those weapons might be stylish, style isn't everything and some say they're not as effective as the new industrial weapons currently being employed by some Killers. Nail guns, power sanders, arc welders and even the concrete saw have all given us some great armor grinding action . . .

And another new weapon we've been seeing on the Hunt is the compound bow. But let's not forget that a weapon is just a weapon in the arena until a killer makes it their own . . . *The Contract Directory* takes you into some of the best workshops to examine how our killers get their arms and equipment modified and improved to make them not just more lethal, but also more eye-catchingly chic!

Eddy Goya: Another type of signature we see regularly in the arena is in hand-to-hand combat. All out brawls are always going to be crowd pleasers, but nothing gets the crowd on their feet and screaming is final blow, that coup de grace that brings an opponent down and out!

Baz Danziger: Even brawlers have their signature moves, but if you have award points for elegance, it would be for all those practitioners of the martial arts. Isn't that so, Eddy?

Eddy Goya: That's right Baz. And from the stylish to the strange, *The Contract Directory* throws a spotlight upon the latest addition to the line up of Contract Killers and that is the Advanced Carrien! Whatever their origins deep in the Cannibal Sectors and growing with their Carrien brethren, something sets them aside from their brutal upbringing.

Baz Danziger: Yes, and that something is their intelligence! Right, Eddy?

Eddy Goya: You're not wrong Baz! All an Advanced Carrien needs to do is to acquire their own "Psychological Examination and Evaluation Exemption Certificate" from the Department of Psychology and Psychosis, and then they too can join the circuit or even undergo SLA Operative training on Meny!

Baz Danziger: And finally Eddy- <BZZT BZZT>

Hiya everybody! Welcome to another broadcast from me, Lisa Fodens for Channel Resistance. We want you to watch our favorite, The Perfectionist in this afternoon's fight. He's sure to take down Mr. Slayer's sacrificial victim for today in the arena. But then there'll be another ready to take his place on the bread and circus that is the Contract Circuit -- designed and arranged to keep you distracted from the Truth . . .

And if you're a Contract Killer watching this -- and we do hope that you are -- ask yourself why you fight? Is it for the money? The fame? For the action figure and collectible cards of yourself that the kiddies love? Is it because your sponsor tells you to -- in addition to all that dirty work, they demand of you? If you do work it all out, let us know at Channel Resistance . . . This is Lisa Fodens signing off. <BZZT BZZT>

Off Screen:

-Dammit! Get that signal off the air! <BZZT> Finally. Eddy, you're back on . . .

Eddy Goya: And finally, Baz, you'll find some of the best Hunter Sheets in *The Contract Directory*. If you've the credits, you can sponsor one of these combined execution warrants and wanted posters to any of Mort's Hunter Cafes or even to magazines such as *Search and Destroy*. As you know, Baz, these are open to both Contract Killer and SLA Operative, so anyone wanting to fulfil these six, needs to move fast!

Baz Danziger: But for all you collectors out there, some of the very best new sheets will be made available in the forthcoming *Hunter Sheets* -- enough for every fan to own and savor!

Eddy Goya: Well, that's all we have time for today, as we have to return you to your scheduled series of clashes and fights this afternoon. But both Baz and I will be back with the Circuit Channel's regular post contest discussion and analysis after every fight!

We'll see then, but remember that *The Contract Directory*, the guide to the Contract Circuit in the World of Progress is available to you right now, from your nearest stockist, and published by Hogshead Publishing from a Nightfall Games design.

3ird Eye video recording of Contract Circuit Broadcast, 904 SD. Not available for re-

broadcast.

April Fools Dungeon Tech

For *Toon* (Or Any Other Game You're Willing To Inflict These On)

by Doc Cross

Just like any other fantasy RPG, *Dungeons & TOONS* has its share of magical weapons, armor, and other items. Also, just like any other fantasy RPG, sometimes magical things are cursed to do strange things when used. We like to think of these funny and dangerous curses as the ultimate fantasy RPG April Fools joke. The hapless characters and their players may think differently about them, especially once they've Fallen Down a few times. Here is a selection of goofy cursed items to toss into your next *Dungeons & TOONS* game.

Sword of No Hitting

When used for any purpose other than combat, this seems to be a perfectly good (and very cool-looking) broadsword. However, when the time to fight rolls around, that all changes. The sword just will not hit anyone on a roll of less than 12 (and that's a *natural* 12, you sly rules lawyers) or 2 (ditto). The blade will get soft and spongy or all limp like a cooked noodle or it might even disappear . . . but it won't hit. Worse yet, you cannot drop it during combat. You can hold it in one hand (or foot, pseudopod, or whatever) while you use another weapon, but you can't let go of it until combat is over. Assuming, of course, that by then you aren't so badly beaten to a pulp that you can't move.

Bow of the Cosmic Shift

It looks like a normal bow . . . it feels like a normal bow . . . it even *smells* like a normal bow . . . heck, it might even taste like a normal bow, if you are strange enough to taste it. Not surprisingly then, most of the time, it works just like a normal bow. But not *all* of the time. You see, whenever the Animator feels like being evil (and Animators often feel like being evil) the bow activates a Cosmic Shift and something screwy and potentially painful happens. The bow might fly off while the arrow stays behind, or you might get shot from the bow by a suddenly anthropomorphic arrow, or the bow might just explode. Whatever happens, it will be completely unexpected and will Boggle everyone who sees it.

Ultramagnetic Armor

This fine suit of plate mail will just up and get highly magnetized on a Fight roll of 5 or less. It will stay magnetized for 1d turns, during which it will attract other suits of metal armor and anything else made of steel or iron (like big nasty sharp weapons and angry iron golems). Damage will vary, but should be at least 1d points of Magnet For Disaster Damage per item that hits you. There may be even more damage done to you by the cranky folks *wearing* the armor that hits you. And don't even ask about the ticked off iron golems.

Boots of Invisibility and Drunkenness

Oh yes, these are some bad boots, my friends. Sure, they *do* make you invisible while wearing them . . . but they also make you falling down drunk! One turn after you put them on, you'll find you have a -5 to all Zip rolls, a -5 to all Smarts rolls and a -3 to all Muscle rolls. On the other hand, your Chutzpah goes *up* by +3. Drunks are bold, but stupid. While you are drunk, you will stumble around and speak in a loud but slurred voice. You'll offer suggestions on how to do things to anyone you see. You'll try to pick fights with creatures who can swat you flat with one pinky. Finally, you might also sing *very* loudly or even start crying and telling other characters that they are your best friend. Fortunately, once the boots are removed, you sober right up. Unfortunately, you have a terrible hangover and suffer 1d

points of My Head Is Going To Explode And A Dog Must Have Slept In My Mouth Damage.

The Bad Bad Hat

This hat can be any style the Animator chooses, but no matter the style, it is of very good quality and makes you look very stylish. It also adds a +1 to both your Smarts and Hit Points, for as long as you are wearing it. So, seems like a pretty good piece of headwear, eh? Wrong! Once you attempt *any* offensive combat action (including spellcasting, backstabbing and yelling vicious taunts), the hat will activate one of the following random effects. Animators, roll 1d for . . .

Roll of

- 1 Shapechange into an animal smaller than your original size
- 2 Shrink to 3 inches tall
- 3 Gain 1d X 100 pounds
- 4 Shapechange into an animal larger than your original size
- 5 Age 1d X10 years
- 6 Split into two versions of yourself. One is good, one is evil.

All of these cursed effects last 2d+2 turns. Please be aware that the only way you can remove this evil sombrero is by convincing somebody else to buy it from you. Good luck.

Ring of Plentiful Spellmiscasting

Wearing this ring allows you to cast any *Toon* spell in print, including spells not specific to *Dungeons & Toons*. Unfortunately, the ring will alter the effects of the spells whenever the Animator thinks it would be funny. Naturally, the Animator also chooses how the spell is altered. And just to add insult to injury, once every day the ring will turn you into a muskrat for 3d turns.

The 10-Foot Pole

This is a good stout 10-foot long pole. 1d times a day, it will cause you to sprout eight extra feet, anywhere on your body that the Animator chooses. The effect lasts for 2d turns unless you get Boggled, in which case the extra feet disappear . . . until the next time.

Great Axe of the Screaming Whirlwind

Unlike the Sword of No Hitting, this big bad axe *will* let you hit in combat. You'll hit enemies, friends, innocent bystanders, trees, rocks . . . pretty much everything near you. See, once you swing the axe in combat, it causes you to spin faster and faster and faster (that's where the screaming part comes in) until you are a whirling blur of steely destruction. Once the whirling starts, it lasts for 1d+1 turns and does six hits per turn which do 2d points of Whirling Steely Destruction Damage per hit. The Animator will decide who or what gets whacked on each of the six hits. No doubt other characters will be doing a lot of diving out of your way. After the whirling stops, you'll be very dizzy for 3 turns. Any Zip, Smarts or Muscle rolls done during this time will be at a -3. After 3 turns, you'll be okay again. At least, until the next combat.

Cloak of Unwanted Courage

When you have this cloak on, you'll look very cool and elegant. It even gives a +2 to your armor class. It's too bad

looking cool and elegant and having good armor doesn't count for much when you can't run away from certain doom. The curse of this cloak is activated when you decide that those who run away not only live to fight another, they don't have to deal with all that pain. No, this cloak will cause you to stand and fight no matter how badly you want to chicken out and run. Only Falling Down will break the curse until the next fight. If you want to break the curse and get rid of the cloak forever, the Animator should be able to come up with a screwy quest that will do the trick.

The Belt of the Shared Wedgie

This belt's curse doesn't activate during combat . . . it can activate at any time the Animator thinks it would be funny (remember what we said about Animators feeling evil?) or inconvenient to you and those around you. Here's how it works: The belt will glow bright green and a loud voice will yell out "WEDGIE!". Then, every character and creature within 60 feet of you (including you, naturally) gets a wedgie that does 1d+2 of Cursed Magic Wedgie Damage. It doesn't matter if creatures aren't wearing underwear or pants, they still get a wedgie. Naturally, this will put everyone in a bad mood and will have them looking at you and that glowing belt. Have a nice day!

* * *

*Last week's answer: **Ogrethulhu Set 1**, back of box.*

(Three stars) "As you open the door the magic-user DIES!! Then a . . ."

"Whadda ya mean my mage DIES???"

"He just sort of choked and then died. I guess it as [sic] a trap of some kind."

The Secret of My Success

"The important thing to remember when you build your reputation for occult knowledge is that you have to give the impression of knowing something -- and it has to be occult. . . . [T]ell everyone what your alleged secret is, but in such an obscure, long-winded, and baffling way that nobody realizes you're spouting vintage B.S. This is the route that most occultists have taken down the ages. People will rarely accuse you of talking nonsense, especially if you make it sound impressive and toss in a few uncheckable facts and Latin quotations."

-- P.J. Owens and Alexander C. Rae, *Bluff Your Way in the Occult*

If there is one question that I am constantly asked as the official High Weirdness columnist for this august publication, it is, "Are we actually going to get a column out of you this week, you overrated pain in my editorial tuchus?" The answer to this question, sadly, is lost in the mists of time and space. If there is another, more polite question, however, that one is often, "How do you manage to write this stuff?" or, occasionally, "Where do you get your ideas?" (These two questions are often subsumed into a meta-question such as "Are you on drugs?" The answer to this meta-question is "Sadly, no.") I feel that my readership deserves an answer to at least one of these questions, and so I shall attempt to provide one, in the spirit of the April Fool's holiday, in the form of a patter song.

And it goes a little something like this:

"And now that I've introduced myself, I should like to have some idea of what's going on."

-- the Major-General, in *The Pirates of Penzance*, by William S. Gilbert

This is the very model of a Kenneth Hite conspiracy,
Mixed up between the Reptoids and the Manichaeic heresy,
It starts with lost Lemuria and filters through the chaff a bit,
But soon involves a visit from a brazen head named [Baphomet](#);
The Prieuré de Sion and the Masons are pedestrian,
Until you add the [Airships](#) and their crews [ultraterrestrial](#).
And tie it to the Cathars and the Skull and Bonesmen's vessel Taft,
Who subsidized Majestic-Twelve, and aided the Thule Gesellschaft.

Whose [green-gloved](#) Masters dominate the [elves](#) from [Merrie Robin's](#) band
With backup from the Nazis in their saucer base, [Neuschwabenland](#).
In short, from [El Dorado](#) to the bottom of the [Thera](#) sea,
This is the very model of a Kenneth Hite conspiracy.

It's all set down in iambic pentameter [Shakespearean](#).
Commissioned by the [School of Night](#) to frustrate plots Iberian;
John Dee put it in cipher in the [Voynich incunabulum](#).
It's even in the blatherings of Edgar Cayce's pabulum.
[American mythologies](#) that some might base a comic on,
Appear in opaque pages of the eldritch [Necronomicon](#).
Masonic Mozart operas and jingles sound the faint refrain,
Which swells into the leitmotif in minuets by [Saint-Germain](#).

So I distill from sources electronic and librarious
The secrets of the Masters both heroic and nefarious;
And then I just [bisociate](#) the things I in the [mirror](#) see,
And get the very model of a Kenneth Hite conspiracy.

It's really not as difficult as weekly reading makes it seem
I just throw in the [Grail](#), or [manticores](#), or maybe Nephilim.
It hardly takes a grounding in semantics or [Enochian](#)

To know Agartha's Pepsi-ish and Shangri-La is [Coke-ian](#);
And once I've picked a side between the [Templars](#) and Hospitallers,
I put Heinlein on my team and the Kennedys on Hit-a-ler's;
Unless I swap them all around in grandiose alternacy
To build a [crazy background](#) full of Tesla-ish Jules Verne-acy.

And if I'm ever desperate for things to write a column on,
I claim that Gilbert's lyrics hold the [kabbalah of Solomon](#).
Add twists and permutations that would discommode a Pharisee,
And that's the very model of a Kenneth Hite conspiracy.

Song Combos for *In Nomine* and *GURPS In Nomine*

Making New Powers with Old Parts

by Perry M. Lloyd

Most, if not all, of us in the world of gaming are familiar with a martial arts standby: the Combo. A combo can be as simple as "Punch + Kick" to "Kick + Punch + Kick" to "Hand Parry + Arm Lock + Elbow Strike" and eventually "Spinning Punch + Axe Kick + Explosive Fireball Blast." For those searching for a way to do more damage in *In Nomine* without resorting to mundane high-powered weaponry, or for those looking to create new abilities without generating long lists of totally new powers, Song Combos may provide the answer.

Using *GURPS Martial Arts* and martial arts training as a model, martial arts combos are multiple actions that are combined and learned as nearly one fluid motion. This can be a motion repeated or combined with other motions. Why not do the same with Songs? In fact, why stop there, why shouldn't the natural Symphonic effect be that such Songs sung in "combination" often merge and create new and unique effects? These "combos" (called "polyphonies" by Jean's Servitors and Vapulans) possess characteristics of their component Songs, but combined for more power, at the expense of more Essence.

There are two kinds of combos: Two-Song combos and Three-Song combos, in which either two or three Songs are combined. The major advantages of combos are the unique effects they can produce and the speed with which they may accomplish several effects at once.

Point Cost

Two-Song combos have a 3-point purchasing cost, and Three-Song combos have a 5-point purchasing cost. The combo is then purchased as though it were a separate Song.

The GM may wish to reduce the purchasing cost when two or more of the Songs are of the same type, such as combining the Ethereal and Corporeal Songs of Healing. A total point cost reduction of 1 is suggested if two Songs are of a given type, or 2 if all three are of the same type of Song. The GM may also allow for a reduced point cost if all the Songs are of the same plane (corporeal, ethereal or celestial); the suggested total point cost reduction is 1 for two Songs, 2 for three Songs. This sort of point cost reduction is not appropriate when the same version of the same Song is being repeated within the combo for greater and faster effect (such as with Laser Blast and Fatal Blow, below).

Learning Combos in Play

When learning a combo, the character must make an Intelligence roll at -4 to learn the combo. The CD of this roll determines the maximum level at which the combo may be initially purchased. If the character knows at least one of its component Songs at 4 higher, add +1 to the roll. If the character knows all of its component Songs at 4 or higher, add another +1 to the roll. If the character knows all of its component Songs at 5 or 6, add yet another +1 to the roll. (These bonuses are cumulative.)

Example: Ghutrile, Calabite of Dark Humor, would like to learn a three-Song combo called Beleth's Kiss, a combo of the Ethereal and Celestial Songs of Entropy with Numinous Corpus: Tongue. He cuts a deal with a Lilim Songmaster of Nightmares (*Liber Canticorum*, p. 25) who can teach him the combo. After spending a 2-point purchasing cost (the GM allows him to take a -1 pt cost reduction for common Song type), succeeding his Intelligence-4 roll with a CD of 4, and gaining a level 2 Geas (as payment to the Lilim for teaching him the Song), he now can spend up to 4 points in Beleth's Kiss (GM willing).

Nuts and Bolts

When combining Songs with differing duration, areas of effect, Essence cost and disturbance created, a balance must be struck between the qualities of the component Songs when designing the combo.

Duration

Generally, combining a Song with an instant duration and a Song with an extended duration will result in a combo which is no longer instant, but no longer as extended either. Generally, Songs endure for a base duration: an instant, rounds, minutes, or hours. Each of these base durations is multiplied by skill level, Forces, check digit, or whatever.

There is no handy formula for generating combos' durations mathematically, so here's a rule of thumb: keep the duration near to the shortest duration of the component Songs. For example, Beleth's Kiss is composed of two instant Songs and one that lasts check digit hours. To strike a balance, keep the multiplier of the base duration (the check digit) the same, and shift the base duration down to combat rounds. Combining a Song that lasts rounds with one that lasts hours should result in a Song that lasts minutes. If the component Songs include one Song that lasts minutes and another that lasts rounds, you could drop the base duration down to rounds, but increase the modifier, perhaps from Forces or skill level to a characteristic or even total Forces.

Area of Effect

Songs' areas of effect vary as well, most affecting a single target or area within a certain range. While one shortens the duration of Songs combined, one extends the area of effect. Thus, combining the Ethereal Song of Tongues with the Ethereal Song of Healing would allow the performer to heal anyone he can make mental contact with (Healing Thoughts, below).

Essence Cost

The Essence cost of the combo should be the sum cost to perform all the Songs. The GM may allow the characters to pay more points for combos that are more Essence "efficient," generally an extra character point per level for every point of Essence reduction, but this should probably be limited to combos of Songs of the same type (such as combining the Corporeal and Ethereal Songs of Harmony). In no instance should the Essence cost drop below the number of Songs combined. In fact, some GMs may wish to increase the Essence cost of combos to maintain power balance.

Example: The components Songs of "Beleth's Kiss" (see below) are the Ethereal and Celestial Songs of Entropy and Numinous Corpus: Tongue, costing 1, 2, and 1 Essence respectively. Therefore Beleth's Kiss costs 4 Essence to perform.

Disturbance

The easiest to combine . . . just add it all up! The disturbance of the combo is the sum total of the disturbance created by its component Songs.

Example: Beleth's Kiss' component Songs, the Ethereal and Celestial Songs of Entropy and NC: Tongues, generate CD + total Forces, CD + total Forces, and no disturbance, respectively. Therefore, Beleth's Kiss does disturbance equal to twice the sum of CD + total Forces of the performer.

Performance

When performing a combo, the level of the combo is added to the lowest of the Forces its Songs are combined with. Since Beleth's Kiss' component Songs are combined with Corporeal, Ethereal, and Celestial Forces, Ghutrile must add

the level of his combo with the lowest of his Forces, his Corporeal Forces. (He has two Corporeal Forces, making his base target number to perform the combo a 5.) The check digit of the initiating roll counts as the check digit all of its component Songs.

The normal rules of Song performance (*In Nomine*, pp. 46-47) apply to combos. This means that combos that include multiple Songs of the same type (such as the ethereal and corporeal Songs of healing) should receive an automatic bonus to the CD (+1 for two such Songs in combo, +2 for three). Performing a combo should take the entire round, however. Songs which are made up of more than three Songs (see below) should take more than one round to perform.

Using Combos in the campaign

Combos can be quite powerful, granting an instant effect a longer duration, turning a touch or ranged effect into an area effect, or simply allowing for more power to be swung at once. Therefore, it is suggested that the GM keep most combos for use by NPCs, and to use them as exceptional rewards.

Depending on how the GM wishes to run the show, combos can be rare or commonplace. Perhaps only Superiors can teach combos (e.g. not Songmasters); perhaps certain combos are only commonly known to certain Words and the secrets of their performance closely guarded. On the other hand, the GM may allow his celestials to try and make up combos "on the fly," and render combos so commonplace that normal single Songs are rarely heard. Another option is to allow celestials to combine any number of Songs . . . perhaps upwards of six or more, taking multiple rounds to perform with spectacular (and loud) effects!

Sample Combos

Beleth's Kiss

Three-Song combo

Numinous Corpus: Tongue, Ethereal Song of Entropy, Celestial Song of Entropy

When sung, this Song summons forth a vile tongue that inflicts the effects of the ethereal and celestial Songs of Entropy when it strikes its target. A favorite use of this Song by demons of Nightmares is to engage the victim in a (forced) French kiss before unleashing the attack. It costs 4 Essence to perform, lasts check digit combat rounds, and does twice CD + performer's total Forces in Disturbance.

Healing Thoughts

Two-Song combo

Ethereal Song of Tongues and Ethereal Song of Healing

When sung, the performer may send a mental message to anyone within range (same as the Ethereal Song of Tongues) that heals person's Mind hits! The duration is effectively instant but permanent (as per the Ethereal Song of Healing), it costs 2 Essence to perform and does the check digit in Disturbance. This would be a favorite of Blandine's angels.

Lover's Gaze

Two-Song combo

Ethereal Song of Attraction and Celestial Song of Charm

When sung, the performer must make eye contact with the victim, who may resist the effects of a successful performance with a Will roll, his will reduced by the initial CD of this combo's performance. A drawback of this combo is that it can only be used to reduce the victim's Will in order to resist the Song of Attraction, and the victim can be made only to become madly, passionately attracted to the performer. Still, Andrealphus' demons could quite like it. It costs 3 Essence to perform, lasts a number of minutes equal to the performer's total Forces times the CD, and does twice the CD in Disturbance. The effective check digit for determining duration can be increased by spending extra Essence in the initial performance, one Essence per effective check digit bonus.

Total Freedom

Two-Song combo

Corporeal Song of Motion and Numinous Corpus: Wings

This powerful combo grants the user the ability to move a number of yards per turn of his normal running speed (Agility times 6) plus a number of yards equal to his level in the combo, the sum multiplied by the extra Essence spent +1, plus Agility time 10 yards (using the updated Numinous Corpus: Wings mechanics from *Liber Canticorum*). It costs 2 Essence, lasts CD minutes, and does CD Disturbance to the symphony.

Example: Arael has Total Freedom/5 and Agility 8. He spends 3 Essence, one extra Essence to boost it. His flight speed is his normal running speed (8 x 6) of 48 plus his level in the combo (5) (48+5=53), times the extra Essence+1 (53x2=106), plus his Agility (8) x10 (80). So his final speed is 106+80=186 yards a turn. A turn is 5 seconds, so he's moving at 37.2 yards a second, or about twice that (74) in miles per hour. Go, Arael!

Laser Strike

Two-Song combo

Celestial Song of Light, Celestial Song of Light and Celestial Song of Light

This combo allows the performer to spend 3 to 9 points of Essence to produce a powerful celestial light blast as per the normal Song, doing three times the sum of CD + Essence spent in damage. Additionally, the victim is dazzled with a penalty of -6 rather than -2, and observers get a bonus equal to the check digit of the attack to their Perception roll to notice the attack's origin. Some versions of this combo feature a tri-beam effect, while others combine to form a triple-thick coherent beam. It costs 3 to 9 points of Essence to perform, is instantaneous, and does no Disturbance to the Symphony.

Fatal Blow

Two-Song combo

Celestial Song of Charm and Celestial Song of Charm

Essentially, this combo is used to affect both the target's Will and Perception with one performance, making this combo a must to swiftly gain the edge in Celestial combat. Of course, it's expensive to perform. It costs 4 Essence, lasts a number of rounds equal to the performer's Celestial Forces, and does twice the check digit in Disturbance.

Creating New Combos in Game Play

To design a new combo in game play requires the character to have the new skill Harmonize.

Harmonize

(defaults to Intelligence-6)

Prerequisite: Songmaster attunement

This skill is used by a character to actually design a new combo. If combos are a rarity in the campaign, then most celestials will not even be aware that such a skill is possible. Normal use of the skill allows the celestial to design a two-Song combo. Use of the skill at -2 allows for the design of a three-Song combo. This only creates the blueprint, the celestial score, of the combo. Actually learning to perform the combo requires practice and another successful Harmonize roll at -4. Only one such roll is allowed per day, and at least one hour of study is required per attempt. The CD of the roll determines that initial level at which the Songmaster may purchase the combo. The combo's level can be improved over time, as per a Song. All component Songs to be included in the combo must be known at level 5 at least.

***GURPS In Nomine* conversion**

One possible mode of conversion would be to use the Combo rules on page 171 of *GURPS Compendium 1*, borrowing from *GURPS Martial Arts*. Point cost is 4 points for a two-Song combo, and 6 points for a six-Song combo. Instead of rolling once to activate all component Songs, however, you would roll versus each Song separately, figuring the effects of each Song into the overall game effect. If using these mechanics, it would make much more sense that the Songs do not merge to create new effects, but are merely performed in rapid succession. On the other hand, perhaps performing them in such rapid succession creates a Symphonic Polyphonic Harmonious Effect (or whatever you wish to call it) which generates the combo's unique properties! The GM may alternatively choose to rule that the character roll only once, against the lowest skill level of the component Songs.

On the other hand, the GM may choose to make the performance of the combo a separate M/VH Song (use the character's lowest level of Power Investiture associated with the combo's component Songs) with no default. Of course, the combo could even be purchased as a Hard Maneuver (*CI*, p. 165) defaulting to lowest of the combo's component Songs -4.

For something much truer to the *In Nomine* system above, consider taking a look at S. John Ross's rules for Linking spells: <http://home.iu.net/~caroth/SJohn/Custom.htm> . Since in *GURPS* Songs are based off the mechanics for spells, this system for combining spells should be quite applicable to Songs as well. While he suggests using the least desirable aspects of the combined spells to maintain power balance, Some GMs may prefer striking a balance between the Songs to represent a truer blend. The choice is yours.

Final Notes

Combos can be abused . . . horribly, horribly, horribly abused. On the other hand, that's part of the fun. Of course, actually creating new combos requires the Songmaster attunement (a 10-point attunement reserved normally for the Word-bound that allows you to teach Songs to others) to maintain power balance. But be creative; combine the Corporeal Song of Attraction with something, or the Celestial Song of Tongues, or even the Songs of Projection. Don't be afraid to dare the impossible dream of discovering the ultimate combo.

The Phantom Cabriolet

A Warehouse 23/Supporting Cast Crossover

by Owen Kerr

Loomis: "Please, God . . .! We need a cab . . .!"
--*Quick Change* (Warner Brothers, 1990)

There comes a time in many campaigns when the party requires rapid transportation from Where They Are to Where They Need To Be. If the circumstances are dire enough, you may want to produce the archetype of the people-mover: the Phantom Cabriolet.

The vehicle-for-hire is a feature in many works of media: traveling through the London fog in the hackney coaches hired by Sherlock and Watson, meandering along with the not-too-tightly-bolted-down Reverend Jim Ignatowski from the aptly-titled television series *Taxi*, or flagging down Harry Canyon, working hack, part-time philosopher, and thick-skinned poet in the grimy post-modern animated world of *Heavy Metal*.

Every group has its heroes, its myths, its if-you're-good-and-listen-to-your-mother stories. The gypsies of the road are no exception.

The Phantom Cabriolet is every coach from Dodge City that arrived with the medicine, just in time to save Miss Kitty, every cab that was able to get the future Nobel-laureate to the hospital before her appendix could burst, and every hired rig driving nineteen hours to get the parolee back home on time for Little Becky's birthday.

The Phantom Cabriolet is not constrained by temporal convention. It can appear in any aspect of the multiverse, at any point in any timeline. The Cab follows its own rules, and none other; the ultimate gypsy cab, serving the Greater Known Universe Metro Area and Parts North. The Cabriolet is neither person, place, nor thing. Rather, it is the sum of all three components into a greater whole; a Campbellian myth made flesh, blood, and good Detroit steel.

The Driver

The Driver is always described as a man of average height for his ethnicity, dressed in down-at-heel, archaic finery. Age and ethnic group depend entirely upon his surroundings and the expectations of the Passengers. He will be as taciturn or as garrulous as circumstances require.

As the Coachman, he has appeared as a sturdily-built Magyar of indeterminate age, with ferocious sideburns, luxuriant mustache, top hat, greatcoat, and great boots so old that they can barely hold bootblack. Another aspect of the Coachman is the gap-toothed leering Eastender, hair fog-slicked and long of nose.

His appearance as the Cabbie has been much varied, from the oiled-and-turbaned Sikh with a brilliant smile and photographic memory of the works of Shakespeare, to the Archie Bunker look-alike brimming with compassionate conservatism.

The Puller (rickshaw driver) is a polyglot Asian of a local minority group, no matter where he is found (in Edo, he's Chinese; in Nanjing or Chinatown, he's Korean; in Seoul, he's Thai . . . get it?). His loincloth is silk, his jacket threadbare brocade, with the legs of a triathlete, the soul of a philosopher-king, and soles of leathery hide.

The Trucker is not, by any means, "average size." He's 6'6", part-Lakota Sioux, part-French, all-American. The buttons on his shirt are real mother-of-pearl; his jeans are stitched with hair-fine bronze and silver wire. His cowboy boots are made of three different types of leather, and there's a raven feather hanging from the rear-view mirror.

There is but one exception to the "nice, but shabby" clothing rule: rarely, the Driver will appear as the Chauffeur: trim white-blond hair, Aryan features, round mirrored wire-rimmed glasses, immaculate uniform and hat.

The Vehicle

"When this baby hits eighty-eight miles per hour . . ."

The Driver's vehicle is always a classic example of its type, whether auto, hansom, rickshaw, or carriage. It is invariably large, fast, expensive, conservative, slightly shabby, eccentrically maintained, and at least twenty years out of date. The Vehicle has ample space for all passengers and luggage, and those within will be struck by the tranquility of the interior. The appointments seem designed to place the passengers at ease, and are certainly conducive to intellectual pursuits. The compartment is cool and dim, though there is always light enough by which to read. Tired passengers sleep easily in the Vehicle, and rarely complain of muscle aches upon waking. Smokers will find that natural airflow keeps the compartment fresh and free of smoke.

The Vehicle is more resilient than other vehicles of its ilk, and is capable of weathering all but the most adverse of circumstances. The Vehicle also handles better than it should, appearing as nimble as something half its size. In modern automotive terms, the Vehicle would look and feel like a 1955 Rolls-Royce limousine, take damage like a Brinks truck, and handle like a Porsche.

Powers and Abilities

The Driver has all technical knowledge necessary to successfully maneuver his Vehicle in any mundane circumstance, and in several that may be best described as esoteric. Applicable skills may include Driving/Auto, Driving/Carriage, Combat Driver, Animal Handling, Veterinarian, Teamster, Auto Repair, and so on. Any skill relating directly to making the Vehicle perform to the best of its ability is fair game.

The Driver is also known to have knowledge of armed- and unarmed-combat techniques that would make the average Israeli paratrooper shake his head in awe and envy. The Driver may carry any weapon appropriate to his current persona, in accordance to the time and culture, and suitable for the given task. In other words, just because he knows the particulars of the katana, he's much more likely to pull a Colt .45 ACP in Al Capone's Chicago, or a rigging knife in Victoria's Eastcheap.

The martial skills of the Driver are more for offense than defense. The Driver, while not impervious to damage, will never be injured badly enough that he can no longer drive. A badly-injured Driver may disappear for a while, and will show no sign of his old injuries upon his return.

As has been implied, the Cabriolet has the ability to travel at will through time. This will usually manifest as the ability to get to the destination at exactly the right time. No matter what sort of delays occur at the terminus (weather delaying a flight, security checkpoints slowing entrance to the White House, the parade blocking traffic), the passengers will arrive in just enough time to overcome their obstacles and to take action at a pivotal moment.

The Rules

The rules under which the Phantom Cabriolet operates are unknown to the masses, and are more unspoken custom than codified law. Seekers after knowledge of the Cabriolet may find the following guidelines within the dusty, old grimoire of choice. Note that the Driver would never be so gauche as to refer to any of these rules as such, saying instead, "My duty requires . . .," "Conscience dictates that . . .," "In my country, one would be expected to . . .," and other such segues into the gist of the matter.

1. The Driver will act to preserve his own existence, and that of the Vehicle.
2. Passengers are the responsibility of the Driver. Once an individual has offered or promised remuneration to the

Driver, he/she/it is a Passenger, beneficiary of the Driver's protection, where necessary.

2a. Protection may come in strange forms.

3. The Passengers place themselves under the authority and jurisdiction of the Driver. In the Vehicle, the Driver is God and King. The Passengers are expected to follow all reasonable directives of the Driver, with alacrity and a minimum of fuss.

3a. Reasonable is defined by the Driver as "that which the Driver determines to be reasonable."

4. The Driver is the sole authority over his Passengers. Others attempting to usurp this authority may be dissuaded with all reasonable force. Flight is also an option to be considered.

4a. See 3a.

5. The Driver is obligated to take his Passengers to their Destination in a prudent and expeditious manner.

6. The Destination is defined as "wherever the Driver feels that the Passengers should truly be." Note that the Destination will usually correspond to where the Passengers feel that they should be, at the time. Usually.

History and Mythology: Folklore of the Driver

There seem to be as many stories about the Driver as there are cars on the road. Some students of the occult claim that he is an aspect of Charon the Boatman, purveyor of the Last Ride. These magi cite as proof his seeming purpose to ensure that everyone gets to their Destination. Others claim that he is the reincarnation or uncorrupted form of St. Christopher, bestowing God's grace on those in the time of their greatest need.

The hackney coach, which was any carriage for hire, was introduced in London c.1605. The first appearance of the Coachman predates this era by at least fifty years, as shown in a letter from one Bishop Charles du Mond to his cousin, Jaques du Mond, a tax-collector and amateur historian, September 1549:

" . . . and as we stood, shaken and bloody from the wreck of the wagon, an apparition coalesced from the morning fog -- a coach, drawn by four magnificent bays, drew up before our forlorn group. The coachman, a man of such fierce aspect that Brother Georges, our chirurgion, fell to his knees and began a litany of abjuration against the Devil and his minions, glared down at us from the height of his perch. His speech, however, was mild, and after a short discussion of our direction and financial state, he agreed to carry us to our goal with all due haste. His accent was strange to even my well-travelled ear, and Brother Georges persevered in his conviction that this was a servant of the Prince of Lies. As later events transpired, I am inclined to agree with the supernatural nature of this driver, but ascribe his nature to the Divine, rather than the opposite . . . "

The Puller first came to light in Japan in 1873, a few short years after the appearance of the jin riki sha. Occult sources also place him on the road from Hiroshima to Okayama, August 4, 1945. No definitive I.D. on the passenger.

The Cabbie made his debut in (where else?) New York City, 1917. Circumstances surrounding the event are unclear, but involved a cold winter night, a de-frocked Catholic priest, a prostitute, and the friendship that was formed in the back of that Yellow Cab.

"Dispatch: Can you drive to the Bronx? Manhattan?

Travis: Anytime. Anywhere.

Dispatch: Do you work on Jewish holidays?

Travis: Anytime. Anywhere."

-- *Taxi Driver* (Columbia Pictures, 1976)

The Cabriolet and its Driver are also known for their stealthy departures. Once the task for which they came is done, they're quietly gone, driving off into the rain, turning the next corner, getting ready for the next fare.

Plot Seeds and Cab Stands

- In an *In Nomine* campaign, the Driver is Shemarab, the Angel of Taxis, a Cherub in Service to Wind (with the Malakite of Creation Attunement). The car, Cab 341, is a sentient mobile Tether, sent on the whims of Janus to where it can do the most good (or wreak the most change). The motive force of the cab is nothing so crude as internal combustion. Rather, Cab 341 is the Corporeal body of its Senechal, Neah-Sheariah, a former Ofanite who loves her job, her partner, her Superior, and her place in the Symphony.
- The PC with the best Driving skills bumps into the Cabriolet -- the Driver is terribly injured from a fight in Another Place. He enlists the PC to temporarily become the Driver, for just one run. "Why me?" "Because you're the only one who can do the job. You think you know what you know by accident? You were made for this, pal, and it's payback time." The PC becomes the avatar of the Driver until the job is done, with all pertinent abilities. The other PCs could come along for what promises to be a wild ride . . . Depending on the new Driver's performance, he or she may be asked to cover for the Driver at some point in the future (or past).
- The heroes in an on-going fantasy campaign have been charged with a mighty quest: to deliver/destroy/return the Holy MacGuffin/Artifact of Evil/Legacy of the Ancients to its proper place. One problem. No one knows where that rightful place lies. The Oracle spoke of He Who Travels Among The Hidden Ways, who could take the noble questors to this fated destination. Second problem: said Traveler has vanished from the ken of mortal men. The goal now is to find this mysterious person (or being!) and to gain his assistance. Maybe if they asked that old man with the four-seater cart . . .

Pyramid Review

Wilderness War

Designed by Volko Ruhnke

Published by [GMT Games](#)

Two-player boxed boardgame; \$49.95

For seven long and difficult years, two giants stood toe to toe in a struggle for dominance of the North American continent in a series of conflicts known as the French and Indian War, or the Seven Year's war. Although this war was an extension of European wars between the French and the British, this particular conflict was ignited by the desire of both nations to wrest control of North America from the hands of the other. As the two nations struggled for power, the allied tribes of the Algonquin and Iroquois were caught in the middle of these powerful forces and were forced to choose sides. One of the important results of this war was that it prepared many Americans (like George Washington) for the fighting which was to come during the American Revolution.

Wilderness War is a two-player boardgame, based on this historical conflict. By combining historical events and leaders, Indian raiding, stockade building, and militias, designer Volko Ruhnke and GMT games provide a game with plenty of accurate historical flavor.

The game follows the card-driven format that was first made popular in games like *We the People* and followed in others such as *Paths of Glory*. Each card can be played as a historical event, or the numerical value can be used to activate leaders or forces (including construction of stockades or forts). An example of an event card would be the "Smallpox" Card that allows one to reduce the number of troops, especially Indian allies congregated in a single space. Some cards are combat-oriented and can be used to grant an advantage in battles. The cards are beautiful to behold and extremely well-balanced. The difficulty for the player is deciding whether the card should be played as the event, to activate a leader and his forces, or to build stockades, and so on. The result of this quandary means that no two games of *Wilderness War* are ever exactly alike. In fact, after a multitude of games, I have yet to see two games that played similarly. The card play keeps the game flowing and the other player guessing what you will do next. It also creates limitations that are both beneficial to game balance while at times adding frustration to the military commander.

Wilderness War is a complex game that is fairly simple to learn. This means that it is satisfying to both the veteran and the beginning wargamer. While players who expect something as complex as *Paths of Glory* may be disappointed, the game offers complexity without being daunting to the beginning wargamer. Even the "advanced rules" which primarily deal with such items as supply lines, avoiding battle, and interception of enemy troops are not very difficult to comprehend. This is not your typical "takes-a-military-genius-to-understand" wargame. My opponents and I have used the advanced rules for all of our games with no added measure of difficulty.

The sixteen-page rulebook is extremely well-written and easy to navigate using the large, bold-faced headings. In fact, there is only one complaint: despite the simplicity of the rules and game mechanics, even the veteran player must occasionally go on a quest for a specific rule. Most of the time the table of contents is sufficient to assist the player in locating the rule or explanation he is seeking, but a simple alphabetical index would do a great deal to make those rules even easier to locate.

There are two basic unit types in the game: Drilled troops and Auxiliaries. Drilled troops are the Regulars, Marines, Provincial regiments, Light Infantries, and Militias. These all represent the normal military troops active in the era. Auxiliaries include Indians and the frontier woodsmen of the day, British Rangers and French Coureurs des bois --

"Runners of the Woods." Units may freely stack together and participate in battles, etc. One prohibition is that only auxiliary units may raid.

As in the conflict that this game is based on, Stockades play an important part in this game. It takes a great deal of strategy to get drilled troops in a location where they can actually do combat, because drilled troops cannot retreat into wilderness spaces. After losing a battle, troops must retreat into the space from which they entered. If this space is a wilderness space with no friendly stockade then the troops are eliminated. In order to prevent such losses, players must erect stockades in wilderness and mountain spaces. Players may also opt to destroy any or all stockades they wish on their action phase in order to prevent such stockades from falling into the hands of enemy forces. Captured stockades provide victory points. Stockades also provide a way through mountain regions. Any units (yes, even including Indians) that enter mountain regions must immediately stop, unless there is a friendly stockade in that hex. Players will be forced to build stockades that they will have to destroy on later turns.

Combat resolution is straightforward and uncomplicated. Both sides roll a six-sided die and refer to a chart based on their combat strength, adding applicable positive or negative modifiers to the die roll. The chart indicates the number of step losses suffered by the enemy forces. Any natural die roll of 1 or 6 (except those that result in No Effect) causes the opposing leader to roll the six-sided die for each of his leaders involved in the battle; a roll of a "1" will kill that leader. Losers must retreat.

Players must earn the aforementioned victory points in order to win the game. Victory points are earned by raiding, winning a Battle against a stack of regular troops with more than four units, Capturing enemy forts, fortresses, or stockades, or capturing various strategic locations (Ohio Forks and Niagra).

Historically, the French urged their Indian allies to commit acts of barbarism in order to strike terror into the hearts of British Colonists; in *Wilderness War* it is good strategy for both sides to send their Indian allies out raiding. This is especially true for the French side, as there are times when they seem to have an endless supply of Indian allies. Those units just keep coming back due to the cards which allow them to be placed on the board. Even the British player will achieve half a victory point (rounded up) for each successful raid his Indians or Rangers conduct. Counters showing raided areas are placed on the board and counted at the end of the year. Of course, such raids often end in failure; normally, the odds against a raid being pulled off successfully are less than 50 percent. The success of a raid is determined by a six-sided die roll with certain positive and negative modifiers. An example of a positive modifier would be a general with a good tactics rating who accompanied his Indian brothers on a raid. A negative modifier would be granted if there were more than one militia unit in the department the raid is conducted within. An important limitation is built into the Indians raiding. Once Indian Units have attempted a raid, whether it succeeds or not, surviving raiders are returned to their home settlement. This prevents these types of forces from raiding too deeply into enemy territory.

In the real world, British General William Johnson seemed to have had a special understanding of his Indian allies. When General Braddock chose Johnson to lead the expedition against Crown Point he raised an army of about three thousand volunteers from New York and New England, plus about five hundred Mohawk allies. To reflect this within the game, *Wilderness War* allows this leader to command any number of Mohawk or Iroquois Indians without counting these forces against his command rating (which normally determines the number of troops that can be under his command). This simple mechanic continues to reflect the designer's effort at creating a game that accurately reflects the historical period.

As the game progresses, it is very likely that the French's ability to raid more frequently will increase. At the same time, the British troop strength will also grow as the game continues. A wise British player will try to stall most straightforward battles until later in the game as his reinforcements grow.

In all, *Wilderness War* does a remarkable job of giving each player a home-cooked meal of historically accurate flavor and an adequate helping of satisfying action for each side.

Pyramid Review

Enter the Viking (for Rune RPG)

Published by [Atlas Games](#)

Written by Chris Aylott, Rolfe Bergström, Dave Blewer, Tom Janulewicz, Michelle A. Brown Nephew, Philip Reed & Scott Reeves

Illustrated by Scott Reeves & Human Head Studios

80-page perfect-bound softback; \$16.95

If there is a problem to *Rune*, Robin D. Laws' reductive RPG of Viking hewing, thewing, and pillaging, it lies in the game's scenario design. Not so much in the conceptualizing of ideas, but rather than in the arithmetic necessary to balance the points spent in designing and building encounters. This is multiplied when you consider that *Rune* is not meant to be run by just the one GM, but rather, each of the players take their turn in running an encounter. Thus each player needs to learn the rules to running *Rune* and also the whole encounter design sequence as well . . . Until such times as all of a campaign's players can master both, Atlas Games have provided us with no small relief in the form of *Enter the Viking*, an anthology of encounters that can slipped into Rune campaigns as and when they are needed.

There are a total of ten encounters of the Cushion type to be found within Enter the Viking, plus a complete Plot Sequence. Cushion encounters are run by the other players in between the main encounters of a Plot Sequence, although the events of any Cushion encounter is quite unconnected to the plot of the runner's Plot Sequence. Half of those in this anthology take place in the Underworld, while the rest take place in the Underworld and somewhere else, such as Svartalheim or Scandinavia; the last two take place solely outside of the Underworld. It should be noted that two of the ten encounters are not new; "Goblin Goodies Galore" previously appeared in issue #19 of *Game Trade Magazine*, and "A Test of Viking Virtue" appeared in issue #9/10 of *Games Unplugged* magazine. In fact, both of these encounters can currently be downloaded from the Atlas Games website.

[SPOILER ALERT]

The book opens with Michelle A. Brown Nephew's aforementioned "Goblin Goodies Galore." The horde of Pillagers (*Rune*'s term for the player characters) are exploring the Underworld when they are ambushed by some Goblins just as they have to leap across a ravine. This is a simple two-event encounter that is written with neophyte Rune Runner (as the GM is known) in mind. There is a little useful commentary added to explain the process of the game, which potential runners should find informative after they have played it. Of course, this being *Rune*, they are quite entitled to view the current runner's notes . . .

Rune fans will know Chris Aylott as the author of the game's first adventure release *Crouching Wizard, Smashing Hammer*. His first contribution to this collection is "Iron Goblin," in which the Pillagers find themselves helping out a pair of vegetarian Goblins on the run from Goblin Slavers. Not only will the Pillagers have to deal with the Slavers, but also a giant mechanical centipede! In return for all of this effort, the Pillagers can gain possession of an interesting magical item that might also help their escape at the end of the encounter.

Michelle A. Brown Nephew also pens "A Test of Viking Virtue." This is a fairly simple series of events that take place in an Underground holy site, where the Pillagers will find the gods Odin, Thor, and Tyr judging their bravery, their fighting ability, and finally their bardic voice. The latter should be amusing to run, as the winning Pillager must read aloud from The Epic of Beowulf -- preferably in Old English!

"Getting Your Goat" is Chris Aylott's second encounter in *Enter the Viking*, and as the title suggests, it really should get the Pillagers' goat as they literally find themselves each transformed into one of the ornery little beasts . . . It gets worse when they are sold to end up in a Troll's stew, but a little lateral thinking and some acrobatics should see the Pillagers free again.

Tom Janulewicz's "Chalice in Underland" sets the Pillagers off in search of the fabled Flagon of the Aesir, facing Dwarf guards and their fiendish traps along the way. Should they be able to find the treasure, they can return it to their village where its connection to Odin will stand their home in good stead when Ragnarok comes . . .

In "Forests of Fury," Dave Blewer takes *Rune* out of the Underworld and into the dark woods of Svartalheim where they must rescue a captured Elven prince. "As the Wyrms Turn" also takes Rune out of the Underworld, but this time to the aid of a Scandinavian village beset by raiding Goblins. Chris Aylott also contributes to this encounter by Philip Reed, which introduces to *Rune* the Great Volcano Wyrms the Pillagers must dispatch before they can return to the Underground.

Outside of gaining glory and treasure, a Pillager's greatest motivation must be good victuals and even better drink. Rolfe Bergström's "Drunken Chieftain" plays upon this when a burning funeral barge returns from the sea to torch the twin towns of Filskfurt and Glenskirping. Both are renowned as the source of the best honey mead in all of Scandinavia and if they were lost it would surely be a blight upon the feasting hall of every village!

"The Seventh Seal" is Chris Aylott's fourth addition to this collection, and as the title suggests, it plays upon Ingmar Bergman film of the same name. Yes, it does have the Pillagers being challenged to a game of chess with Death, but not before they have to ski off the edge of a cliff . . . This encounter also ends with a face off against "The Seventh Seal," which is a very, very bad gag upon the author's part . . .

The last encounter in *Enter the Viking* is "The Remorse of Honir" by Scott Reeves, who is better known for artistic contributions to Atlas Games' books. More than the previous nine entries this is based around Norse myth, specifically dealing with the relationship between the Aesir and the Vanir. When the war between the two came to an end, hostages were exchanged, with the Aesir sending their fairest -- though not brightest -- as their offering to the Vanir. Although accompanied by Mimir, one of Odin's advisors, the Vanir soon discovered Honir's decided lack of wits and enraged returned Honir to Valhalla along with Mimir's head! It is the grieving god Honir that the Pillagers encounter and in between his sobs he begs them to return Mimir's head to his body on the Fount of Wisdom . . . Of course, no good Viking would ever turn down the request of a god, even one as foolish as Honir!

The last entry in the book is "Monastery on Fire," also by Chris Aylott. This, however, is not a single encounter of the Cushion type as before, but is rather a complete Plot Sequence, comprised of a Set-Up Encounter, a Development Encounter, and a Climax Encounter. Further it takes place in Foreign Lands, specifically those of the Franks, which really means that none of the previous ten Cushion Encounters can easily be run between the three that make up Monastery on Fire. This begins, quite literally *in medias res* with our Pillagers running away from the Frankish horde who are somewhat peeved that their monastery has just been raided. With the enemy at their rear and treasure in their hands, the Pillagers rush for the only cover available -- a bog full of frogs with teeth and many Loup-Garou, a terrible combination of man and wolf, that prey upon those that leave the path! Of course, there might be things to gain if they do, but there is the Frog God and more Franks in their way before they can get back to the beach and the ships home . . .

[END SPOILER ALERT]

It should be noted that these Cushion Encounters conform to the new points total to be spent on design -- 350 as opposed to the 300 points given on page 177 of the *Rune* rulebook. Runners more used to the lesser amount can find conversions for several of the encounters in "Enter the Viking" for the lesser budget. Throughout the anthology there are lots of terrible titles for both encounters and their events, which will make the reader and runner groan at their inclusion. Favorites include "Chalice in Underland" and "We Goat To Get Out Of This Place" in "Getting Your Goat."

Enter the Viking is not without very minor printing problems, but these will not really affect the usefulness of the

anthology. Although the book might be seen as slightly expensive, this really should not belie its usefulness to any group that wants to run a **Rune** campaign. All it needs now is a campaign companion, into which can be slipped a few -- if not all -- of these Cushion Encounters.

--*Matthew Pook*

Pyramid Review

Villains (for d20)

Published by [Bastion Press](#)

Edited by Aaron Rosenberg and Wil Upchurch

Illustrated by Giner Kubic and Todd Morasch

96 full-color pages; \$24.95

Sometimes one of the hardest duties a Game Master has is coming up with viable opposition for a player. Of course, there are numerous books chocked full of new monsters to aid GMs in coming up with new and horrible ways to kill players, but most often, it's not some random orc or even some unheard of monster that truly matches the players not only in terms of power but wits. Instead, it's a good old non-player character that's taken a wrong turn somewhere.

d20 fans already have *Dramatis Personae: Campaign Ready NPCs* that includes good and evil characters, and Wizards of the Coast has released *Enemies and Allies*, another book chock full of helpful patrons and deadly adversaries. What, then, can Bastion Press add to the pot? Is this a book like the *Complete Book of Villains* that gave the GM tools to help design long term enemies, or just a monster book with a NPC twist?

It's more of the latter than the former. The book boasts over twenty NPCs with a wide range of challenge ratings. There is no specific information on designing your own villains, but there are crunchy bits that *Villains* provides the patient reader.

One of the nice things is that the introduction provides the GM with the methodology used to create the characters. In this case, it's a point build with 28 points. A brief section on how to read the entries provides the GM with information on what is contained under which section. Most of it is pretty self-explanatory. For example, under Abilities, standard stats are listed. Under combat statistics, the fighting abilities such as hit points, hit dice, base attack bonus, and other important combat information is listed. Under skills, feats, spells, special attacks and qualities, you can find the self-titled information. Under appearance, history, and personality/goals, you can find non-game related information that enables the GM to use these villains for any game system, while lair/tactics, campaign use, and minions provide the *d20* GM with more game information. How do you use these characters at various levels? What type of fiend serves some of these despicable characters?

[SPOILER ALERT]

The mix of characters doesn't rely (at least not completely!) on old stereotypes. There are no evil male barbarians or Vikings out to rule the world. There is however, an outcast dwarf, Khorgus Gruebear, that hates caves and the whole of dwarf society, preferring to live among the dinosaurs. Not different enough for you? How about Syzzinar, "The Low Lord," a kobold lich who works on building various types of golems? Need something more devastating? How about Lukorazyll, "The Dire Reaper," a near-avatar of a god of destruction. This Thodol (a race of outsiders first introduced in the monster book *Minions: Fearsome Foes* by Bastion) would make a perfect servant for Vangal of the Scarred Lands setting.

There are more subtle threats, though. Alystin Azmyrial, the Queen of Beauty (or the Emerald Viper as she's sometimes called) rules over Sunset City with an unearthly beauty, while Pete Dunbar rules over the streets with a charm not quite so supernatural but perhaps more roguish. Those running a water-based campaign have Rapheel Tanelon, The Seawraith, a cleric with a new prestige class, sea reaver. On an undead boat of special construction,

Rapheel serves a death god by clearing the seas and always augmenting his undead ship. Those looking for more traditional fare on the seas can battle the Xyryth, a fiendish dire shark. That is assuming they survive an encounter with its children, the Spawn of the Xyryth, massive sharks that clock in at a CR of 11.

For those looking for more dangerous fare, the Skinrazer is a half-green dragon, half-udamentaz (a demonic outsider). This creature hunts down people for its master, an ancient thing from outside the standard dimensions and time frame that feeds on death, but feeds more from that death if the being suffers pain and terror first. The creature gains its name from its weapon, the razor of flensing. Worse still, it can create skin wraiths, undead made from the skin of those flayed. If it gets any worse, he can create an elite six man (unman?) unit of these creatures, the slaves of the skinrazer.

Sometimes though, the party just needs a powerful, cosmic entity to battle. In such instances, Zuratorkul -- also known as The Frozen Lord or the Lord of the Rift of Frozen Souls -- might be the ticket. This monster is listed as a CR of 25 and looks to be worth every point. Of course, lower-level characters wouldn't have a prayer of beating him, but perhaps they could start off with some of his servants. Even so, they'd have to be high-level before dealing with Jezylnyth, a female half-orc fighter (9th)/wizard (10th) that's served Zuratorkul for years.

There are other villains that can fill important roles in the GMs campaign and a careful reading of the book will show that if there's a specific need, like a female leader of a group of barbarians that fights against men and the male rule of most north societies, it's in here.

[END SPOILER ALERT]

Early in the review I mentioned that patient GMs will find tools helping them make their own villains. That starts in the appendixes. The first one has a new user for the heal skill. Here, the skill enables the user to inflict pain through torture via their intimate knowledge of the human body. Appendix two includes new spells, both arcane and divine. Appendix three includes new magic items, including the Book of Eternal Necromancy, a minor artifact similar to a Book of Infinite Spells, but much more powerful. Thankfully, the method to create the non-unique magic items, like the boots of the raptor and beholder rod, among others, are provided along with a minimum caster level, and market price.

For those who can never have enough prestige classes, appendix four introduces the bloodtracker, dinosaur cultist, gutter stalker, and sea reaver. These are all ten full levels. The bloodtracker is a dangerous hunter, more capable than a bounty hunter perhaps in that she can establish ties to her victim via blood. The dinosaur cultist is a strange PrC suited for druids and other naturalist characters in that the character gains dinosaur-like powers if it can survive being swallowed whole by such a beast! The gutter stalker is a barbarian-based class with a twist in that it's suited for survival in the sewers among the rats. The sea reaver is not merely a pirate, but a dangerous fiend of the high seas who spreads pain and suffering

Appendix five introduces the ahazu, an evil outsider that specializes in burrowing. This monster is a powerful creature perfect for siege attacks. Appendix six arranges the villains by challenge rating and then alphabetizes them for easy of use. Unfortunately, they seem to have forgotten the page number, making this less than a truly useful listing. Main villains are in bold face type to showcase them from servants and minions. The lowest villain is Rufus Laruel, a young, 1st level rogue, while the highest is the demon lord Zuratorkul at a CR of 25, followed closely by Lukorazyll at 23.

The cover is set up to resemble the old core books in that it has the ancient book style look to it. The coloring is a little off to my eyes though, and the horned face in the center of the cover doesn't really grab me. The internal art is very good and easily captures what the villains in the book are supposed to look like, enabling the GM to come up with her own description if the one in the book fails her. Layout is standard in that its two columns, and text density is fair with hardly any margins on the top, bottom, or inner sides. The only bad part of the layout is the page numbering is red against a copper place-holder; this doesn't work out very well, making the page number hard to see.

For those who want to know if Bastion has continued to allow all their text to be Open Game Content, they can rest at ease. The whole text of the book is. In a time where product identity from some companies runs rampant, Bastion continues to be a breath of fresh air. As a side note, Bastion is already using their OGC, as several items from this book hail from their monster book *Minions*.

Those who will get the most out of this book are those who are looking for more long-term and short-term menaces for their campaign. While I would've liked an appendix on designing an effective villain, that would've cut out at least a character or two. The full color art work makes the product worth the price, even though it makes it one of the most expensive character collections on the market; in comparison, *Enemies and Allies* from WoTC costs \$14.95 for 64 b&w pages, and Archangel Studios' *Dramatis Personae* runs \$12.95 for 40 pages.

Show your players that no standard monster will be their bane. Show them that terror lurks not only in the frosty snows and the terrible seas, but in the heart of every man, woman, and undead lich kobold they encounter!

--*Joe G. Kushner*

Ghosts From The Machine

"Marcellus: Peace, break thee off! Look, where it comes again!

Bernardo: In the same figure, like the king that's dead.

Marcellus: Thou art a scholar; speak to it, Horatio.

Bernardo: Looks it not like the King? Mark it, Horatio.

Horatio: Most like; it harrows me with fear and wonder."

-- William Shakespeare, *Hamlet*, I:i:48-53

The Ghost in *Hamlet* begins the play, and it begins our latest enigma, one not unlike the ghost himself. Where do artifice and apparition meet, if not in the realm of spirits -- and the realm of the stage? On the surface, this is a story of purloined invention, optical wonder, and a dead medium for bringing the dead to seeming life. But perhaps that's just the barker's patter. Backstage and behind the curtain of the Victorian demimonde, does the Spectre Drama actually play out between the realms of the dead, with the living only spectators and stagehands? Settle back in your seats, and watch as the ghosts appear.

"Henry Dircks, inventor of the Dircksian Phantasmagoria, an optical effect, meets showman Joseph Pepper, swamps the barn with lantern spooks in an ethereal mob.

Pepper's ghost depending only on a lamp, a sheet of angled glass, will nightly conjure wraiths accompanying performances of Hamlet. Couples hug each other in the hush, entranced by men of light in a refracted afterlife. Reality becomes imagined death in an unsilvered mirror. All the boundaries begin to slide, even the human body is unfixed."

-- Alan Moore, *The Highbury Working*, "Pepper's Ghost"

The drama begins with Henry Dircks, an engineer, author, and inventor of Dircks' Phantasmagoria, a mechanism for projecting ghostly images onto a stage. Dircks, according to his later memoir, had been inspired to design a superior "spectral apparatus" by early performances of *Hamlet*, in which he found the "language and unearthly eloquence of the spectre" far more wonderful than the "well got up, blood and life" actor who assayed the part. Dircks' original design was far too cumbersome for any but special-built theaters, however; the Phantasmagoria languished until Dircks entered into partnership with "Professor" John Henry Pepper, the director of the Royal Polytechnic Institution.

Throughout 1861 and 1862, Pepper and Dircks worked to perfect and miniaturize the Phantasmagoria, putting on occasional melodramas at local theaters or in the Polytechnic's audience-halls, and displaying vignettes from *Hamlet*, *Macbeth*, and other spectral fare. On Christmas Eve, 1862, the new Phantasmagoria projected spirits on stage in Charles Dickens' *The Haunted Man*, in which, according to an enthralled audience member, "The apparitions not only moved about the stage, looking as tangible as the actors who passed through them, and from whose proffered embrace or threatened attack they vanished in an instant, but spoke or sang with voices of unmistakable reality." On February 5, 1863, Dircks and Pepper patented "A Stage Phantom," and the Ghost walked on stage, just in time for Shakespeare's tricentennial the following year and a riot of phantasmic performances.

"Our natural magic makes no pretension to occult science, but on the contrary tends to dissipate many vulgar errors, by disabusing the public mind, even on matters long considered supernatural."

-- Henry Dircks, *The Ghost!* (1863)

Essentially, the Phantasmagoria was a flat sheet of "patent glass" at a 45-degree angle between the stage and audience. Below stage, a spotlight shines on the actor; the glass bounces his reflection visibly onto the stage while remaining completely transparent to the audience. This simple device, also called the "optical combiner", is still used today, most famously in the Haunted Mansion ride at Walt Disney World. The same effect manifests in modern heads-up displays in fighter aircraft and upscale automobiles. Variations on the effect had appeared in Lonsdale's Spectrographia of 1802, in an 1804 exhibit of "Optical eidothaumata" and "Capnophoric Phantoms" at the London Lyceum, the German conjurer Moritz' 1807 Phantasmagoria (which also displayed the ghost from *Hamlet*), a "gratifying show of spectres" at the Royal Mechanical and Optical Exhibition of 1812, and De Berar's Optikali Ilusio of 1833, which depicted Death on a pale horse. The general optical principle, and a phantasmagoria very similar to Dircks', appears in the 1558 *Magica Naturalis*, by the Neapolitan magician, artificer, and playwright Giambattista della Porta, of whose primitive

steam engines Dircks had also made a study.

"Every effort has been industriously made to mystify my having any part or lot in my invention . . . But by whom I never learnt, nor can I succeed in interesting others in a search after the offender or offenders. How, why, or wherefore done, I have been unable to fathom."

-- Henry Dircks, *The Ghost!* (1863)

However, all previous phantasmagorists from della Porta to Dircks had not succeeded in making the making of ghosts reliable and steadily profitable; that was the genius of John Henry Pepper. Soon, "Professor Pepper's adaptation of Mr. Dircks' living spectres, recently patronised by Royalty" (as the advertisements first stated) became "Pepper's Ghosts" (which is how they are known today to professional magicians and illusionists). Dircks claimed that a mysterious conspiracy was working to remove his name from the invention, and to throw his rights to spectral projection into shadow. Pepper and Dircks fought a brief public row over the rights to the Phantasmagoria, which ended by default with Dircks' death in 1873. Pepper's Ghosts remained a reliable draw until the coming of the kinescope finally out-spectered them in the late 1890s.

*"One need not be a chamber to be haunted,
One need not be a house;
The brain has corridors surpassing
Material place.*

*Far safer, of a midnight meeting
External ghost,
Than an interior confronting
That whiter host."*

-- Emily Dickinson (1863)

In the bitter Victorian rivalry of two men over the means of ghost-production, you already have plentiful material for **GURPS Steampunk** drama and delight. But let's dive deeper, below the scrim of optics and into some spectral speculation. The early 1860s were great years for ghosts; Queen Victoria entered permanent mourning in 1861 upon the death of Prince Albert, sending her entire realm onto a more morbid track. The spiritualists Andrew Jackson Davis and Daniel Dunglas Home toured the capitals of Europe. William Mumler invented "[spirit photography](#)" in 1861; ghosts already drawn to the Atlantic world by Victorian mania or the slaughters of the Civil War now had a new life on photographic plates. The greatest ghost-story writer in the English language, M.R. James, was born in 1862, the year Dircks and Pepper perfected their system of mirrors, lenses, and flaps to reveal the Otherworld on the stage. Also in 1862, Charles Dickens founded the Ghost Club in London to investigate spiritual phenomena; later members included physicist-ghosthunter [Sir William Crookes](#), Golden Dawn poet William Butler Yeats, and psychic archaeologist Frederick Bligh Bond. Most intriguingly, in 1862 the poet Emily Dickinson had a sudden rush of creativity, writing 366 poems without revision, as if impelled by an onrush of automatic writing, or dictation from the spirit world. After that year, she increasingly became a reclusive "Woman in White," never leaving her house in Amherst -- perhaps trapped by the spiritual energies she had channeled. Her literary executor published her poems for "the poor ghosts left behind." The "poor ghosts" may have transformed Dickinson in more ways than the literary -- in 1862, she first met the writer Thomas Wentworth Higginson, who described her as a kind of psychic vampire, who "drained my nerve power so much" that although he admired her morbid verse, he was "glad not to live near her."

*"At the essential landscape stare, stare
Till your eyes foist a vision dazzling on the wind:
Whatever lost ghosts flare,
Damned, howling in their shrouds across the moor
Rave on the leash of the starving mind
Which peoples the bare room, the blank, untenanted air."*

-- Sylvia Plath, "November Graveyard" (1958)

Did Dircks' earlier experiments and researches into perpetual motion open the sluices to ectoplasmic energies roiling in

the [Kirlian](#) ether, unwittingly spraying them through Mumler's lenses and animating Dickinson's pale, nervous (spirit) hands? Did Dircks' "combination of lenses and reflectors" grab energies that he knew nothing of? Or did he do the bidding of those on the Other Side, releasing spectral forces shaped by the occult dramaturgies of *Hamlet* and *Macbeth*? John Dee, a contemporary and correspondent of della Porta, also designed stage machinery and experimented with lenses -- and neatly bracketing our Shakespearean spectres, Dircks was a deep student of the 17th-century alchemist and "Baconian intelligencer" Samuel Hartlib. From della Porta and Dee, through Bacon and Hartlib, does some ghostly thread run downstage to the opening doors of the nineteenth century, and Henry Dircks? But Dircks' thread crossed that of the Polytechnic "professor," and from here things get tangled. Did Dircks and Pepper develop a ghost trap, and disguise their genuine spectres as mere effects of light and shadow? Did the two struggle to exploit the spirits' Summerland in rival necromantic pocket imperialisms? Did Dircks bring his ghostly lineages to Pepper, only to see them betray him -- or stolen from him -- to jump from stage to the retinas of the mob and perhaps back onto the silver screen?

Perhaps Pepper was himself in league with other Forces, present within the "automaton [chess-player](#)" Ajeeb (the Polytechnic's other star exhibit), or leashed at the beck of the "defrocked clown" Edward Giovanelli, whose Alexandra Theatre in the notorious Highbury Barn showed Pepper's ghosts to audiences of rakes and thieves descended morally and genetically from the ones who came to Highbury in the palmy days of the Hell-Fire Club. Witnesses compared Pepper's Ghosts to the sudden apparition of [Spring-Heeled Jack](#), who likewise shares the rakehell spirit of mob violence illuminated in the Highbury Barn. Perhaps Jack served somehow as the ghosts' harbinger and missionary, liberated from the Lyceum stable of optical eidothaumata in 1804 to become the Hammersmith Ghost later that year. His prankster spirit sowed rivalry and mystery between Dircks and Pepper, to break the patent glass and let the spectres roam all across the stage of London, and into the shadows and the spotlight. Make of this mulligatawney what you will -- just be sure to add a ghost of Pepper.

The Lonely Mariner

An Adventure For *GURPS Swashbucklers*

by Matt Penn

Introduction

This adventure is a light-hearted romp aimed at pirate or swashbuckling campaigns. Tailor the names and places to suit your own individual game world. This adventure is best played after the characters have been campaigning at sea for some time, and are ready to throw away their hard-earned booty in a riotous debauched fashion, in true pirate style. The adventure should be played in a port that offers a haven to the brethren of the sea. In a historical campaign, this might be Tortuga or Port Royal, the "wickedest city in the world." Paint a picture of a tumultuous, thriving town, full of brothels, gambling dens, and drinking taverns, where Spanish gold is exchanged for simple pleasures and where life is lived for the moment, as it is often violently short and cruel. The plot is simple and depends entirely upon roleplaying; it may well not be suitable for all gaming groups. A chance meeting with a lovestruck sailor offers the swashbucklers a chance to aid a fellow seaman in the pursuit of a beautiful young woman born to another social class and hence a whole world away.

End of a Voyage

The PCs have disembarked from their ship, after the booty has been divided according to the articles, and are making their way expectantly into the port. Although it is midmorning, already the prostitutes are calling out to them, displaying their wares provocatively from windows. A small market in the town piazza is thriving, where exotic luxuries, stolen from their rightful owners, may be bought for a tenth of the European price. Drunken sailors stumble around, flagons in hand. One or two bodies lie unmoving in the building heat of the day, casualties from the previous night's mayhem. The PCs may wish to attend to their own agendas first, after having been at sea for so long, so have a non-player shipmate suggest they meet that evening for some well-earned entertainment in the Lonely Mariner, a tavern he heartily recommends.

The tavern is easy to find, either by asking around or stumbling across it in the small town. It is down a dirty, cobbled lane, and consists of a simple wooden building. The windows and doors are wide open in an attempt to allow the sea breeze to provide partial relief from the stifling tropical heat and humidity. The simple entrance leads into a dank, dark sweaty room, filled with all manner of desperados carousing at wooden tables, and a small central pit, in which vicious cock fights run continuously. The proprietor is Mme. Beauchamp, a carefully attired middle-aged woman. She seems to be a favorite with many of the patrons, and handles the crowd with skill and confidence, matching their coarseness and vulgarity with her own particular mirth and wit. The night's takings disappear within the many folds of her clothes.

Allow the PCs to indulge in all manner of vice. Mme. Beauchamp also runs a number of prostitutes, who will lead those willing to part with their gold for a few minutes of tenderness, upstairs to a row of small rooms of questionable hygiene.

Among the rogues present, three very different men stand out. A young, energetic gentleman will capture the sailors' attention. Dressed in light, baggy clothing, with his hair tied neatly back and a carefully trimmed beard, he seems very out of place . . . as does his companion, a lively African man with large golden rings dangling from his ears. Laughing uproariously, they hurl dice around a table, seeming not to care whether fortune is with them or against them. Their antics keep the whole table amused. Mme. Beauchamp serves them drinks herself, and they are obviously favored patrons. The PCs may join them in a furious gambling session, and if they play with a similar devil-may-care attitude, the gentleman will take a liking to them and invite them to carouse late into the night.

The gentleman is a gifted storyteller and revels in a good yarn, and often holds his audience in rapt attention as he narrates various exploits and adventures. He introduces himself simply as Marcel, and his companion as Henri. He cannot disguise his good upbringing, and the seamen will suspect he is indeed a man fallen from grace. Use Marcel and Henri to whip the PCs up into a frenzy of riotous behavior. As the night progresses, the stories and the wagers should become more outlandish and unbelievable. Only those skilled in carousing should be able to keep some modicum of decency.

The third man to capture their attention is an extremely good looking young sailor, sitting quietly on his own, staring down into the depths of his mug of industrial strength rum. He will probably only be noticed after the PCs have embraced the appropriate drunken roleplaying spirit. As his alcohol consumption increases, so does the depth of his obvious gloom and despair. Among the wild festive spirit displayed by every one else, he indeed stands out. The other sailors leave him to his misery; everyone has enough problems of their own, and this night is a chance to forget the evils of their world. The course of this adventure relies entirely on how the privateers approach this encounter. If they are so inclined to attempt to engage this young man in conversation and lift his spirits, they will be able to pry out of him the source of his melancholy. This will take careful roleplaying, good nature, and skill, as what is ailing this young man is hardly the stuff that stout seamen are publicly made of; initially, he is not that willing to divulge. More alcohol will loosen his tongue, but will also turn him into a blubbering mess. If they too ignore this young man, the gregarious Marcel will invite the moping sailor to join him for a drink or two, and loudly pry into the cause of his obvious unhappiness, creating another opportunity for the PCs to become involved.

Meeting The Lonely Mariner

Pierre Sange is a young sailor, who has just arrived from France, crewing on an English merchantship *The Resolute*. Pierre is very quick to emphasize how happy he was before this last voyage. Being literate and numerate -- which is most unusual for a sailor -- he was assigned additional duties several voyages ago, assisting the quartermaster with basic accounting and record-keeping duties. He thus enjoys being privy to the information about what cargo is really being carried, and what it is worth. Given his extra responsibilities, his pay is also significantly higher.

While on his most recent six-week voyage, he had the misfortune to fall head over heels in love with Mme. D'Oreton, the 18-year-old daughter of a wealthy plantation owner, returning home after spending two years in a prestigious finishing school for young ladies in France. He spent many idle hours casting longing glances at her fresh face, her golden ringlets of hair, and her easy grace. The only reaction he ever received from her during the entire voyage was a haughty command to stand aside while she passed through a bulkhead door. This alone shattered his illusions, making him realize the difference between their classes and the impossibility of him ever meeting her and winning her love. Hence his melancholy.

Upon hearing this woeful tale, it is hoped that the joyful, spirited (drunk) PCs will boastfully take on his cause, vowing to help Pierre win her heart. Those PCs who are more hardened and mercenary-minded might be tempted to help Pierre in his quest in return for information regarding cargo details and shipping schedules, thus setting the stage for a future adventure waylaying *The Resolute*. Pierre has fallen desperately in love and after only a few moments thought, will agree to provide cargo details in the future, providing no crew members are ever hurt, and the source of information is never revealed. (And, of course, GMs can always give Pierre access to campaign-specific items or secrets the pirates have been seeking; surely he would give them up, if only they would help him in this small task . . .) Allow the night to end after such a pledge or bargain has been made, with perhaps a good brawl or passing out in various awkward places.

"We Promised *What* Last Night?!?"

The following day, nursing hangovers and inexplicable bruises, the PCs should encounter their lonely friend, moping about the town. Remembering the previous night's encounter, they should be encouraged to begin plotting how a simple sailor can win this lady's heart. The following information can be ascertained.

From Pierre Sange

- Mme. D'Oreton is the most beautiful, graceful woman he has ever seen. (Every time Pierre is asked about Mme. D'Oreton you should allow your skill at awkward flowery, romantic poetry to blossom, until the PCs wisely learn not to question Pierre about his obsession.)
- A ball is to be held in honor of the three young women who returned from the finishing school. It heralds their "coming out" into society. Pierre overheard the girls chatting about it excitedly on the voyage.

From Townsfolk

- Mme. D'Oreton's father, M. Francis D'Oreton, is a mean, bad-tempered plantation owner with a reputation for harsh treatment of his slaves, even by the poor standards of the times.
- M. D'Oreton was exiled from France for political reasons. He longs to return.
- M. D'Oreton has become incredibly wealthy since arriving in the colony.
- He dotes upon his daughter, giving her everything she wants.

Romeo, Romeo . . .

Every attempt to get Pierre into talking range with Mme. D'Oreton will fail . . . and fail badly. In the town, she will always be accompanied by armed servants, who will take an intense dislike to any ill-bred scum who should leave the pirate quarter and come too close to their master's precious daughter. Attempts to woo her with poetry beneath her balcony or otherwise contact her on her father's property will be foiled, and result in the hounds being unleashed and the plantation foremen attempting to give the guilty party a good lashing with their whips.

The only hope will be for the heroes to secure an invitation for Pierre to the ball, where he can attempt to seduce the young beauty in an environment where she would never expect to meet a common sailor. It is not enough to simply obtain a ticket for Pierre. The heroes should realize that their luckless friend has few social skills, no sense of etiquette, and no suitable clothes. If they don't prepare him adequately for such a potentially vicious social engagement, Pierre will be humiliated beyond belief at the ball. The better they prepare Pierre, the more successful the whole enterprise is likely to be.

The Invitation

The PCs must reason who is most likely to be invited to a ball and how to lay their hands on a written invitation. Each invitation is individually addressed. In a colony full mostly of low-life scum, one could expect that the limited guest list would include the families of wealthy plantation owners, the officers in the local garrison, the captains of any naval vessels currently in port and important townsfolk and merchants. The simplest way to obtain a written invitation is to waylay a guest on his way to the ball and steal it. This is fraught with danger, as the ball is by invitation only, and if a particular person is missing, his friends will start asking questions . . .

Another potential is to forge an invitation, which means getting hold of an original, access to the guest list, and finding a suitable forger of master skill. This is a swashbuckling game of high adventure; such audacity should be well-rewarded. The guest list is in the hands of the town priest, Father Pedro, who cherishes organizing such social occasions. The priest also cherishes the governor's wife; if he is followed and observed, he may be caught committing cardinal sins with her, and may be blackmailed into adding an extra name or two to the list. Pierre can then pose as a wealthy merchant or whatever else he chooses to be (or the pirates suggest). A more intriguing way, perhaps, is to find out which of those individuals on the guest list might part with their invitation . . . willingly or unwillingly. If the sailors correctly deduce who might be invited, they may reason that most of the locals would be looking forward for months to the occasion, and that their best bet is to try the barracks or the docks.

Sniffing around, they can discover from off-duty soldiers that the captain of the garrison is leaving the day of the ball. He is a tough disciplinarian and will not be missed. His replacement is to arrive one day before the ball. There being a

shortage of eligible (appropriate) bachelors, the new captain already has an invitation waiting for him on his newly vacated desk; impersonating the new captain may spring to mind. This will involve abducting him and physically restraining him for the duration of the social event. The only other officer who will be present from the barracks is the Major. He is popular with the troops, as he is a hopeless alcoholic and very lax. He will not notice the switch for his new captain, as long as he is started early in the evening on some strong rum, and kept reasonably inebriated. The other possibility is that of a French naval captain on board a warship, which has arrived in the port. The naval captain is a surly individual, who is much more interested in spending the night in a brothel than at a high society function, and will willingly sell his ticket for 50 livre, or wager it gambling. Again, going as the naval captain has the advantage that no one really knows him.

The Making Of A Gentleman

- **Clothes.** The heroes may think of having a tailor run up a suitable set of ball clothes. There is one gentleman's tailor in the town. He will take an immediate dislike to those of very low social rank and may outright refuse to offer his services. A suitable threat or gift will suffice to change his cowardly-but-greedy mind. He will initially charge 10 livre. An extra bribe or threat will be needed to prevent the tailor from maliciously gossiping to his other customers about the "sailor pretending to be a gentleman." If this precaution is not taken, Pierre will be immediately recognized by his outfit upon arrival. (Kind GMs will give the heroes the opportunity to discover the gossip *before* the ball, and give chances to repair the damage . . .) If Pierre is impersonating the new garrison captain, the unfortunate waylaid man's uniform must be removed for use during the evening, adding insult to injury. If going as the naval captain, an appropriate outfit must be made.
- **Dancing.** At the ball, the guests won't be dancing a jig to the hornpipe. If the players think of this, they may remember Marcel. If Marcel was befriended, he is more than willing to teach Pierre more formal dancing. This could lead to some very embarrassing scenes . . . This will not grant the Dancing skill, but will allow a temporary default of DX-2. If taught to a player who already has Dancing as a skill, a few days of lessons allows Pierre to learn the basic steps of ballroom dancing, and hence use the player's own skill level.
- **Etiquette.** If asked, Marcel will also give a crash course in etiquette. Correct expressions, how to hold cutlery, how to talk to a young lady, etc. This will not grant the skill *Savoir-Faire*, but will allow a temporary default of IQ-1 rather than IQ-4 when interacting with others at the ball. ("Lesson one: Don't say *anything* unless you absolutely have to . . .")
- **Presents.** A suitable gift for the young lady may win her over. Quizzing one of her maids when she comes to town will reveal that the young lady loves a particular type of flower. If the PC flatters the maid and treats her well, this will be an honest answer. If the PC is vile and threatening, she will describe a flower her mistress is allergic to.
- **Woing.** Mme. Beauchamp has had her heart broken many times. She can provide invaluable advice on what a young woman would like to hear.

Of course, any of the above can instead be taught by characters with the appropriate background and skills. However the seamen get Pierre to the ball, his chances of success will depend entirely upon how well they have prepared him. Dressed in well-made clothes, he cuts quite a dashing figure. If everything was well-prepared and well executed he should succeed, and win the young lady's heart; Mme. D'Oreton will fall in love both Pierre's true self, *and* the lengths he went to in order to meet her. (Of course, this may have complications of its own . . .) If the heroes ill-prepared Pierre for his attempt, he will be the laughing stock of the night. Regardless, if the heroes don't attend the ball, this should be a tense evening until they hear from Pierre again; did their efforts work? And if not, will their role in the ruse be revealed?

Variations

You may chose to replace Pierre's role with that of a suitable PC who has fallen for the young lady. A Don Juan in the party may fall in love with Mme. D'Oreton as well, and become a direct rival for her affections, either openly or covertly subverting Pierre's attempts. If a PC attends the ball, you will need to recreate a social situation fraught with "danger" for the inexperienced. Holding cutlery the wrong way, crude language, verbal duels with vindictive socialites,

dancing with young ladies, building up the courage to talk to Mme. D'Oreton, etc. Allow your imagination to run riot and make the characters sweat!

Potential Consequences

- The swashbucklers may have made numerous enemies. The captain of the garrison, Father Pedro, M. D'Oreton, and so on. This may make things uncomfortable in the town.
- Vincent Paul (see below) may challenge a PC or Pierre to a duel to protect Mme. D'Oreton's "delicate mind" from the dangers of associating with low-lives, should Pierre's background be revealed. Vincent will not think twice about killing a pirate/sailor, but a PC should think carefully about the consequences of killing a gentleman.
- An angry, vicious M. D'Oreton will scour the town with his overseers, searching for those who embarrassed him in public.
- If Pierre should win Mme. D'Oreton's affections, he may well flee the port two weeks later, driven back to the sea to escape her constant whining and nagging.
- If the PCs make a genuine effort to aid Pierre in his quest, true to his word he will make the cargo inventory, sailing schedules, and route for *The Resolute* available, setting the scene for an efficient high seas robbery.

The Cast

All NPCs speak French as their primary language, except Henri, whose primary language is an African one.

Marcel

Marcel is a dashing 28-year-old son of a noble. Exiled from France for killing a powerful man in a duel, he no longer acknowledges his once-privileged social status. Nevertheless he is a good source for social skills. Impulsive, Marcel doesn't dwell upon consequences of his actions. He is literate, educated, and friendly.

ST 12, DX 15, IQ 12, HT 12

Speed: 6.75, Move: 6

Dodge: 6 Parry: 12

Advantages: Alcohol Tolerance; Charisma+2; Handsome; Literacy.

Disadvantages: Enemy (the family of the man killed in the duel), Impulsive.

Quirks: Polite. Fastidious about personal cleanliness. Refuses to acknowledge his noble birth. Loyal to Henri.

Skills: Black Powder Weapons-16; Carousing-15; Dancing-15; Fast-Draw (Rapier)-15; Fencing (Rapier)-18;

Gambling-12; Poetry-13; Riding-15; Savoir-Faire-15; Seamanship-15; Spanish-12.

Equipment: Well dressed in light, baggy clothes. Transitional rapier. 0.60 Flintlock pistol. Pouch with shot and powder.

Note: Marcel has renounced his noble birth, hence this does not currently count as an advantage.

Mme. Beauchamp

Mme. Beauchamp, the owner of the Lonely Mariner, is a beautiful, successful 42-year-old businesswoman. She is more than a match for any of the pirates; she has a finger in many pies at any given time. Literate and self-educated, she is a good source of knowledge on the isle and its colorful characters.

ST 7, DX 8, IQ 14, HT 10

Speed: 4.5, Move: 4

Dodge: 4

Advantages: Beautiful; Charisma+2; Literate; Wealth-Comfortable.

Disadvantages: Second Class Citizen (woman).

Quirks: Soft spot for charming rogues; distrusts Spanish; courageous.

Skills: Area Knowledge (Tortuga)-14; Black Powder Weapons- 10; Diplomacy-14; English-14; Fast-Talk-14; Gambling-14; Holdout-16; Merchant-16; Spanish-14; Streetwise-16.

Equipment: Concealed .50 Pocket Pistol. Total 100 livre hidden in various places on person.

Henri

Henri is 29-year-old escaped plantation slave who has taken a new French name. He is very intelligent, and was taught to read by Marcel. He has a deep hatred of slavery and plantation owners.

ST 14, DX 10, IQ 14, HT 12

Speed: 5.5, Move: 5

Dodge: 5 Parry: 8

Advantages: Literacy; Language Talent +3.

Disadvantages: Social Stigma (escaped plantation slave).

Quirks: Hates plantation owners. Loyal to Marcel. Raises good luck charm to forehead before risky ventures.

Skills: Brawling-12; Carousing-12; Cooking-14; English-14; French-19; Gambling-14; Knife-16, Knife-Throwing-16; Seamanship-15; Spanish-18.

Equipment: Light sailor's clothes, large knife, 3 small throwing knives, wooden African charm on necklace.

Father Pedro

Father Pedro is a 33-year-old French-Spanish priest born of a French father and a Spanish mother. He cannot control his passions for women, despite his vows. He is literate, highly educated, and very handsome.

ST 8, DX 10, IQ 10, HT 10

Speed: 5, Move: 5

Dodge: 5

Advantages: Attractive; Charisma+2; Clerical Investment; Literacy.

Disadvantages: Lecherousness.

Quirks: Identifies as a Frenchman. When preaching, delivers fiery sermons full of portents of doom for sinners.

Skills: Acting-12; Dancing-10; History-10; Latin-10; Literature-10; Riding-12; Savoir-Faire-12; Sex Appeal-12; Spanish-18; Theology-10.

Captain Fouchard

The 30-year-old Captain Fouchard is the new garrison captain. He is conscientious, upright, and a strict disciplinarian. He abstains from all vice. If he is temporarily abducted for the purposes of obtaining an invitation, he will become an implacable, determined foe.

ST 12, DX 12, IQ 10, HT 14

Speed: 6.5, Move: 6

Dodge: 6 Parry: 10

Advantages: Alertness+2; Literacy; Military Rank+3; Strong Will+3.

Disadvantages: Sense of Duty (King of France).

Quirks: Very serious, all the time. No sense of humor. Doesn't indulge in any forms of vice and expects his troops not to either. Strict disciplinarian. Unforgiving of others mistakes/offenses.

Skills: Black Powder Weapons-14; Brawling-12; Fast-Draw (rapier)-14; Fencing (rapier)-16; Intimidation-12; Interrogation-12; Knife-12; Leadership-12; Stealth-12; Tactics-12.

Maneuvers: Counterattack-12; Disarming-12; Feint-14; Lunge-16; Riposte-14.

Equipment: Military dress. Transitional rapier. Main-Gauche. .60 Flintlock Pistol. Telescope.

Mme. D'Oreton

Already a difficult, spoiled child, Mme. D'Oreton's years at the finishing school have taught her that social class matters. Treated as an inferior because she was born in the colonies, her school years were miserable. Now 18 years old, she intends to teach others that -- at least in this corner of the world -- she is their social better.

ST 8, DX 12, IQ 10, HT 12

Speed: 6, Move: 6

Dodge: 6

Advantages: Literacy; Status+1; Very Beautiful; Voice.

Disadvantages: Bad Temper; Bully; Jealousy; Second Class Citizen (woman); Stubbornness.

Quirks: Talks about herself incessantly. Loves performing songs in public.

Skills: Dancing-15; Riding-14; Savoir-Faire-14; Sex Appeal-16; Singing-16.

M. Francis D'Oreton

M. Francis D'Oreton is a 48-year-old bad-tempered, selfish plantation owner who was exiled for political reasons. Irritated by the tropical heat, he is always red and sweaty. He is notorious for the ill treatment of his slaves. If embarrassed in public, he will hound those responsible with the unreasoned passion he has for making others suffer.

ST 8, DX 8, IQ 11, HT 10

Speed: 4.5, Move: 6

Dodge: 4 Parry: 6

Advantages: Filthy rich; Literacy; Single Minded; Status+2.

Disadvantages: Cowardice; Enemy (political enemies in France); Fat; Reputation (cruelty to slaves).

Quirks: Greedy. Selfish. Thirsts for revenge upon those who cross him. Dotes on daughter.

Skills: Black Powder Weapons-10; Fencing (rapier)-9; Intimidation-12; Merchant-15; Riding-11; Spanish-13.

Equipment: Slashing Rapier. Flintlock .52 pistol. Flintlock .69 (custom made hunting firearm). Pouch with 200 livre. Flashy clothes.

Pierre Sange

Pierre Sange is a young French sailor. Very handsome. Although he is melancholic, dreamy, and absent-minded, he has accomplished much for only being 20 years old. He is literate and fluent in French and English, with a working knowledge of Spanish.

ST 10, DX 14, IQ 10, HT 12

Speed: 6.5, Move: 6

Dodge: 6 Parry: 7

Advantages: Handsome; Literacy.

Disadvantages: Wealth- Struggling.

Quirks: Romantic at heart. Daydreams.

Skills: Boating-14; Brawling-16; Climbing- 14; Cooking-10; English- 12; Knife-14; Seamanship-12; Spanish- 10; Streetwise-10.

Equipment: Sailor's clothes. Small knife. Gold earring.

Vincent Paul

Vincent Paul is a 26-year-old hotheaded duelist. The aggressive, arrogant son of a plantation owner, he can make a dangerous rival for Mme. D'Oreton's affections at the ball should the GM decide it needs further complications.

ST 12, DX 11, IQ 8, HT 11

Speed: 5.5, Move: 5

Dodge: 5

Advantages: Status+1.

Disadvantages: Bad Temper; Overconfidence.

Quirks: Dislikes non-French. Dislikes those of lower Social Status. Dislikes non-Catholics. Dislikes those who are more handsome than him. Dislikes strangers.

Skills: Black Powder Weapons-12; Dancing- 12; Fencing (saber)-13; Gambling-8; Intimidate-14; Riding-12.

Equipment: Well-dressed in gentleman's clothes. Saber. .52 Flintlock Pistol. .69 Musketoon (hunting weapon).

CESST!

Hah! I kid my torch-wielding audience!

Anyway, I was talking with someone I met online a couple of weeks ago, and she asked me a question: "Has anyone ever told you your sense of humor was corny?"

This wasn't a judgmental statement, or any kind of criticism. And I told her, in all honesty, that I hadn't. See, I've always taken pride in myself for my sense of humor. Without trying to brag, I've been called funny, witty, crazy, droll, and ma'am. (The last mostly over the phone, where my higher-pitched voice, tendency to be unerringly polite, and a lack of bodily noises all combine to confuse some people as to my gender. Recently one phone company representative kept pressing the issue, asking for more and more verifying information before saying, "Well, it's just that Steven is usually a man's name." To which I replied, "Well, I'm usually a man." But I digress.)

But I've never been called "corny" before; corny is the province of *Archie* comics, Double Bubble gum wrappers and fifth-grade knock-knock jokes . . . not (I thought) the sort of thing I usually partake. And so the notion of this label has stuck with me for a while, and not merely because I seek an uncontroversial topic that will hopefully garner less toasty warm goodness than last week over on the [message boards](#).

So this notion got me to thinking about the power of labels, especially in their ability to give characters something they haven't thought of before. Depending on the character (and the player!), a label from an NPC may affect them. Consider the following:

- How would Captain Kirk react to being called "unattractive" by a comely alien woman?
- How would Superman react to being called a "racist" by a black civilian who happened to be rescued after a white one after a burning building? (As an aside, *Superman* #179 from a couple of months ago dealt with similar issues.)
- How would Darth Vader react to being called a "hero" by an admiring stormtrooper?

Now, the character may not care at all. He might think the labeling person is simply wrong. Or the label might deeply shake him. This is especially true if the character is iconic or otherwise solid in his self-identity. Being labeled as a "sexist, misogynistic dinosaur" is less likely to disturb a random guy on the street than someone who thinks of himself as the world's greatest superspy.

(As an aside, a label is a simple way to make a memorable NPC. Fate has a way of bringing back judgmental minor figures; that reporter who called the hero a coward because he seemed to run away before just *happens* to be at the site of another incident where appearing to retreat would otherwise be a very tempting possibility . . .)

Once I started thinking about one person labeling another, I considered how labels can "stick"; one person's opinion in the right place can stay to haunt (or help) a character for a long time. In the comics we have J. Jonah Jameson crafting headlines like "Spider-Man: Threat or Menace?", and in the real world we have incidents like the 1996 Olympic Park bombing in Atlanta, where Richard Jewell was presumed guilty by many before being exonerated by authorities.

What will a hero do when he encounters the tenth person who says, "Look! It's the Dark Defender! I hear he's a coward!" Like a high school rumor, any rigorous attempts to quell such rumors may only strengthen them ("Look at

(Editor's Note: As promised, the solution to last week's column is available online now.)

[The Answer](#)

(Good things are worth the wait . . . although my column probably isn't one of 'em.)

the new headline! 'Dark Defender Cowardly Assaults Defenseless Criminal'). And seemingly innocuous actions and words can be taken as "proof" by those unwilling to see . . .

Of course, it's not fair for a GM to use the [media](#) solely to harass a player for all time (unless he enjoys that sort of thing). But for a story arc or a subplot, it can be an interesting intangible challenge for heroes to face.

And don't forget that labels give as well as take away. For example, the X-Men were forged from the concept of a world that fears and hates them as mutants. What if a charismatic mutant does something spectacular (like saving a beloved figure who is publicly grateful), such that the world suddenly finds itself *adoring* mutants? Mutantmania might sweep the land, bringing a whole new set of problems to the group.

Or perhaps the gentle giant of the group is embraced as a Zen Master ("Of course he's brilliant! He doesn't *say* anything!"), and is sought by those looking for wisdom and enlightenment. How does the team's brick react to being thought of as brilliant? What does he do when that label dissipates? What if it never does?

Labels are flung around every day, and most of us have a fairly good idea of what sort of labels apply to us, and which don't. And sometimes a word can be a much more effective way to challenge heroes than a sword . . .

And I *still* say I don't have a corny sense of humor.

--Steven Marsh

Murphy's Rules

Plotting Like Old Man Jenkins

by Brian Rogers

We all know Old Man Jenkins; he's the disgruntled amusement park employee using the myth of the funhouse ghost to drive away crowds while he pursues his plans. Old Man Jenkins is the master of misdirection, scaring investigators out of their wits using nothing but the real world. You should try to be more like him now and then. Now, this doesn't mean you should include Old Man Jenkins in your campaign; your players are probably too postmodern . . . too savvy. They'll see it a mile away, and either get upset about your not being serious or start in with the jokes. Instead, you should *become* Old Man Jenkins -- channel his particular genius to keep your players on their toes.

Experienced players have a finely honed sense of what to expect, and that makes them quick to believe. Compared to most player characters, Fox Mulder is a garden-variety skeptic. After all, your players know that they're in a horror game, and dismissing the existence of monsters will result in their characters becoming interesting blood splatters -- not the mark they want to leave on the game world. This quick-to-believe attitude makes them difficult to surprise, but easy to mislead. Below are three Old-Man-Jenkins-approved plots to teach them that a skeptical approach isn't necessarily a resumé builder for a career as monster chow. (Note: The titles below work better if you add "Old Man Jenkins and . . ." in front of each. He's not unlike like [Indiana Jones](#) that way.)

The Curiously Changed Archaeologist

*(1920s to
Contemporary)*

The Hook: Olivia Cooper (nee Van Der Mar) -- a wealthy heiress who married below her station -- contacts the investigators (hopefully after their first case, when they're already aware of the existence of Things Man Was Not Meant To Know). Olivia is concerned for her husband, Ephram Cooper, archaeologist and professor at the local university. Since he returned from the Belize dig two months ago, he's been acting strange: snappish, distant, secretive, argumentative, getting strange phone calls and slipping into a language Olivia can't recognize. She's dreadfully worried for him ("What if something had happened? Down there, I mean?"), and wants the investigators' unofficial help.

The Line: The PC's investigation reveals:

1. The university is covering up the dig: hiding from the press, dodging investigators from Belize, talking about revoking Cooper's tenure for "the unpleasantness." This is all hush-hush, and difficult to pry out of a very nervous university.
2. More than half of the dig's work force is very ill, and several have died of an "unidentified fungal infection." Of these, only one was an university employee; the rest were all natives hired for the dig. The local, John Gustafson, died, and his family will not talk to the investigators. In fact, they seem terrified about any contact with them.
3. Dr. Cooper is incredibly paranoid, and constantly behaves as if he thinks he's being watched. He seems nervous, with explosions of verbal temper if confronted or threatened. He has flown to Belize twice since his return, without the knowledge of his wife (who thinks he's at conferences) or the University (who'd be livid if they knew).
4. Olivia Cooper is beautiful, precise, and formal. She is seldom at home, shuttling between her service organizations and social groups. Some of her friends acknowledge that her husband has been acting "most peculiar." She appears to be happy in her marriage, and is a devout Catholic. The Cooper's money is hers, a part of her inheritance.
5. Diligent investigators will spot Dr. Cooper speaking with two uncomfortable-looking men in ill-fitting suits, speaking a language that clearly isn't English or Spanish. These men will try even harder to avoid notice, and will leave town shortly thereafter. In a 1920s game, they also seem confused about many aspects of contemporary life.

Shortly after this meeting, Olivia is found (perhaps by the investigators) dead in her house. The police try to block any press access to the case. If the investigators see the body, it has been brutally beaten and cut up. Ephram is every inch the grieving husband, and the police declare that she was killed when she stumbled into a robbery in progress (some things were indeed missing, but not much, as the thief or thieves must have panicked). Shortly thereafter, Dr. Cooper leaves the University and country, quietly vanishing back into Belize.

The Sinker: To anyone who *doesn't* know they're in a Horror game, it's obvious that Dr. Cooper is having an affair; he met a Belize native and was drawn into a passionate relationship. This distraction led to his failure in health and safety precautions at the dig, infecting the work crew with a nasty fungus they unwittingly unearthed (reference the review of [Dangerous Places: Health Safety & Archaeology](#)). The university -- the dig's sponsor and thus liable for the damage -- is covering things up with the Belize government and threatening to cut off benefits to Gustafson's family if they discuss this with anyone. Once back home, Cooper decided to run off with his mistress, but divorcing his wife would deny him access to her fortune. Thus, he arranged for two thugs from Belize (The language they are speaking is Kekchi (see http://www.ethnologue.com/show_family.asp?subid=2020), to murder Olivia under the guise of a robbery, so that he might inherit her fortune and live in comfort. And he'll get away with it too, if the investigators spend all of their time looking for Mi-Go Host bodies!

The Cursed Gold Mine

(Fantasy, Western)

The Hook: The heroes wander into Crescent Creek, a new gold mining boomtown. Maybe they're passing through, looking for work or aiming to try their luck, but they discover that much of the town is dead or dying. The common link? All of them worked in the Crescent Gold Mine. According to the Fanneley Brothers, the mine's owners, it's a curse by the local indigenes (be they Native Americans, Elves, or whatever the campaign supports) on the people of the town, trying to drive them away. Abstinence Borden, the preacher who is doubling as town doctor in the absence of an actual physician (or is just a lay brethren with limited spells in a world of clerical magic), asks for the heroes' assistance; perhaps their outsider viewpoint can find a way to get the curse lifted before either everyone dies from the sickness or in a raid by the indigenes.

The Line: Investigation reveals:

1. The Fanneley Brothers are the bosses of the town; their mine has the best veins and they control the sheriff & the general store. Most of the miners in town work for them, and they're ruthless in trying to keep mine production up.
2. The sickness does not respond to Abstinence's treatments, although he is admittedly not an expert. If magical disease cures are available, they are ineffective as well. The symptoms include muscle spasms, nausea, vomiting, abdominal pain, garlic odor on the breath, diarrhea, and dehydration.
3. The Fanneley Brother's claim on the land is a forgery, backed by their money and guns. The land legally falls on indigene land, but anyone who argues the point gets roughed up or eliminated.
4. According to the indigenes, the mine is on cursed land; they tell characters it's dangerous to dig there, but the curse isn't of their doing. Warnings about the land are seen as threats, to which the Fanneleys respond with violence. The indigenes have been responding in kind, escalating the situation.
5. Stories are reaching the camp that people handling the gold back in civilization are falling ill as well; the Fanneley Brothers are suppressing this information to keep the gold flowing. The people in the town are nervous and scared, and the Fanneleys focus that against the indigenes.
6. If confronted with the curse, the Fanneleys will capitulate and hire the heroes to go into the mines and kill or drive off the spirit responsible. The heroes won't find anything except an ambush (probably Fanneleys men dressed as indigenes) and an "unfortunate" cave in. There's definitely nothing magic or evil down there.

If the heroes can't defuse the situation quickly, the sickness spreads to people who don't even work in the mine. The Fanneleys whip the town into a raid on the natives, a blood bath on both sides. Even so, it won't cure the illness, and those working in the mine or even living in Crescent Creek will sicken and die.

The Sinker: The gold mine is not cursed, but it may as well be. The vein is laced with arsenic, a poisonous element often found near gold deposits. This mine doesn't just have trace amounts it has exceptionally high levels of arsenic that are poisoning not just those who work the mine, but anyone who handles the gold and eventually the town's groundwater, as the runoff from the mining process enters the water table. Since arsenic is a poison and not a disease, it is resisting magical disease cures, but will respond normally to magical poison cures. Any PC with effective knowledge of chemistry or medicine, or with a clear head and previous mining experience (things not really present in this sudden boomtown) have a good chance of making the arsenic connection.

Even with that information, there is no end to the situation other than closing down the mine and abandoning the gold. If the PCs can prove it's arsenic, they stand a good chance of accomplishing that without bloodshed. In a frontier environment, they may mete out some justice to the unscrupulous Fanneleys, who are sacrificing workers for their profits. It's possible for the PCs to never learn the real problem in this scenario: after all, the land was stolen from the natives, who are warning people about the curse. Kill the thieves, close the mine, return the land to its rightful owner and ride off into the sunset. Players trapped into looking for a magical cause and effect can drive themselves crazy in this situation, joining in the confusion already present.

The North Sea Triangle *(Pulp to Contemporary; probably best in Atomic Horror)*

The Hook: The *USS Morrison*, a ship carrying an important government agent and his unspecified black-box documents, has gone missing in the North Sea. It sent one radio message about the water looking, "Very disturbed, Very . . . Strange." Then nothing. No survivors have been found, no wreckage recovered. This makes the third such disappearance in that area in the last 20 years. Foul play is suspected, and the heroes obviously have to investigate and recover the documents -- or destroy them before they fall into enemy hands.

The Line: If the heroes do more research, they learn:

1. This has been going on for a lot longer than 20 years. There are stories linking Atlantis or Lyonesse to that area, there are old Viking tales about a part of the North Sea that eats ships, fisherman's tales about parts of the map where no wise skipper takes his crew.
2. Those looking for who's responsible will find a tale from a WWI pilot who swore he saw a German vessel slide directly under the waves, not changing orientation in the slightest, and stories of advanced German U-boat technology (perhaps now in the hands of the Russians) that would let subs drag ships down or swallow them whole.
3. Strange water appearance -- be it water distortion or reflections from overhead objects -- is common in waterborne UFO sightings, as are ships suddenly going missing for that matter! Whatever happened to the *Morrison* matches other such unexplained disappearances, perhaps a little too closely for comfort.
4. According to some conspiracy theorists, the black box papers on the *Morrison* detailed experiments that the Soviets (or others) were performing -- experiments similar to the [Unified Field Theory](#) work the US dabbled with in WWII! The heroes superiors will deny this, of course.

The Sinker: In this case, literally! The North Sea's shallow bed theoretically has layers of sediment containing trapped [methane deposits](#). Normally this diffuses slowly into the water, but some pockets are under impermeable sediment, released only when the sediment is penetrated or broken. When that happens, the methane surfaces in a rush, lowering the density of the water so much that boats overhead can no longer stay afloat. They sink like a stone, as do any lifeboats, passengers or wreckage, trapped in water that will no longer support them. When the heroes get to the bottom, they discover a veritable treasure trove of sunken vessels, just waiting for someone to recover them. Of course, things probably aren't that easy, and even with this scientific explanation, there are still enemy agents looking for the black box files from the boat, dangerous deep sea carnivores to contend with, and the almost inevitable sinking of their own boat.

In the real world, the odds of such a methane eruption sinking a ship are astronomically smaller than the scenario presented. Probability-conscious GMs might want to add some mad scientist setting off the methane pockets for his own insidious ends. Doing so removes Old Man Jenkins from the plot, unless you use the methane as a double-blind, surprising the characters with the mad scientist after getting them to believe that it is just a natural occurrence.

* * *

Notes

*I learned about the North Sea methane pockets from Simon Reeve in his 'Zine They Call Me Igor #5, appearing in Alarums and Excursions #311 (July 2001). You should be reading A&E regardless, but Mr. Reeve's contributions are chock full of clever adventure seeds, alternate realities and discussions about **GURPS** from a man who honestly loves the system.*

The poison gold mine does indeed exist, probably in more than one place, but definitely in my Connecticut home town. The gold is just sitting there, but the level of arsenic and cobalt contamination makes it so dangerous and cost prohibitive to remove that it isn't worth pulling out of the ground.

Joe's Oxygen Shack

by Matt Riggsby

Asteroid prospectors spend weeks, even months alone in their tiny vessels. But sooner or later they need to resupply. If they happen to strike something valuable, they also need to find someone to sell it to. And, of course, they have more human needs and desires: congenial companionship, a good meal, and air that doesn't smell like recycled prospector. When those needs must be met, most prospectors end up somewhere like Joe's Oxygen Shack, a combined bar, restaurant, general store, hotel, and mining company office. Anything a lonely, tired prospector could want, short of gravity, can be found at the Oxygen Shack.

Going to the Shack

The Shack is built into a small, mined-out asteroid, its tunnels and chambers providing ample space for the establishment to grow into. From the outside, the Shack is unspectacular. There's a field of solar panels providing main power, four radar towers, a large airlock door, and a few other protrusions from the lumpy surface (smaller "back door" airlocks, portholes and transparent domes for a view). The asteroid is covered with a network of small colored lights, which serve as a navigational aid. Few ships actually dock at the Shack. Instead, the Shack's own traffic control directs visitors' ships to "parking spaces," safe positions stationary relative to the Shack. A regular shuttle (a slow but reliable vessel using rock dust and a solar-powered magnetic reaction drive) picks visitors up and takes them back to their own ships, although impatient spacers sometimes get there under their own power using EVA rocket packs.

The shuttle lets visitors off into a spherical entryway some sixteen meters across, liberally decorated with plants (as are most parts of the shack). The entryway has a concierge desk beside the airlock and several short passageways leading to other parts of the Shack. The first place most visitors go is "up," to the lockers. The Shack provides inexpensive, secure storage space for pressure suits and other personal items. If "up" is at twelve o'clock, the other doorways include a store at three, a passage to the assay office at six, the infirmary at nine, and a doorway to the saloon, the Shack's main room, straight ahead.

The Store

The Shack is home to a general store, selling tools, replacement parts, environment and survival gear, drugs and medical equipment, clothing, rations, and information and amusements of all kinds. Depending on the setting it's used in, it may also carry personal weapons. The store has a door in back connecting it to a warehouse for bulk supplies (the warehouse has its own airlock to the outside for easy loading and unloading). Customers take small purchases with them, but can have large purchases sent to their ships with the Shack's shuttle when they leave.

The Assay Office

Although the assay office space is technically owned by the Shack, it is under long-term lease to a cartel of mineral firms. These companies maintain a laboratory to analyze mineral samples and small offices to negotiate contracts with prospectors. The lab is mostly automated, but it provides quite complete chemical analysis suitable to the setting (finding and providing detailed descriptions of organics and fissionables in realistic settings, monopolies and unobtainium particles in more cinematic campaigns). A handful of mining company representatives are in residence as well, each with their own office, to negotiate terms with prospectors.

Infirmary

While the Shack doesn't have elaborate medical facilities, it does have a six-bed infirmary to provide critical care,

extended treatment for severe trauma and radiation poisoning, and simple surgery. If nothing else, it can probably keep someone alive until transportation to better medical care is possible. The infirmary has its own airlock to the surface, allowing emergency docking. If technology permits, it will have a number of frozen sleep chambers for indefinite storage of the severely injured.

Saloon

If visitors head straight out of the airlock and through the entryway, they'll enter the grand saloon. The heart of the Shack is a sphere about twenty three meters across and covered with tables and tether anchor points along its inner surface. There are also clusters of small trees growing from the walls at intervals for atmosphere (in every sense of the word, as some staff members are delighted to point out). The very center of the room is often empty, but it may contain a centerpiece, such as (depending on the desired mood) a bundle of plants, a zero-g dancer in a bubble, or a 3D projection, and there's a circular bar "above" the passage to the kitchen, opposite the front entrance. Total seating capacity is about 400. However, the room's full capacity is rarely used, and tables are often removed to create a makeshift space for artistic performances or public speakers. Poles and curtains can be temporarily erected around tables for more private dining, and the Shack even has several inflatable bubbles which can be used to enclose tables for diners who prefer somewhat higher pressure or different atmospheric mixes (each bubble has small airlocks through which dishes may be passed). Orders are placed through table-top terminals and the food served by fan-driven drones, occasionally assisted by human wait-staff.

The Rooms

Two concentric rings of guest rooms are arranged around the saloon: twenty-four on the first level, twenty-six on the second, twelve or thirteen on each side of a torroidal hallway. The customer entrances to the rooms are from the saloon, again at twelve, three, six, and nine o'clock, plus service entrances from the staff section. The rooms are all fairly similar: about ten by fifteen by three meters, provided with entertainment facilities, sleeping tethers, hygiene chamber, collapsible furniture, and sliding dividers to cut the room into smaller chambers. All of the doors have moderately strong atmosphere seals allowing them to have either higher or lower pressure than the rest of the Shack for the comfort of guests, and eight of the rooms on the outer ring have airlock entryways which allow them to be filled with radically different atmospheres or even water.

Employees Only

There's a sizable section of the Shack set aside for administration, storage, and staff accommodations.

Kitchen: The kitchen -- a two-level cylinder -- communicates directly with the saloon, and with the rooms via a dumbwaiter system. Food is prepared and drinks mixed in sealed containers so that they don't float away in the microgravity environment.

Dormitory: Most of the Shack's staff lives two or three to a room in adequate but unglamorous dormitories, somewhat smaller than the guest rooms. The dormitory has a staff rec room/lounge, but cooking is done in the main kitchen. The Shack's manager, the resident doctor, and three mining company representatives all have their own larger rooms.

Offices/Control Center: Everything in The Shack has to be run from somewhere. The manager's office is above the kitchen, as is the main computer and the traffic control office.

Organic processing: One of the Shack's best features is its organic processing facility: waste processing equipment, algae and yeast tanks, and a large hydroponic garden. Much of the equipment was taken from a spaceship with a larger crew rating than the Shack's usual capacity, so the Shack usually ends up with remarkably fresh air and water. The hydroponic garden provides a variety of fresh vegetables and herbs, which makes flush prospectors eager to pay top credit for the Shack's finest dishes.

Tunnels: The Shack is built into tunnels and chambers opened up by mining, but does not fill them completely. There are a number of maintenance hatches which let techs exit the built structures and enter the tunnels they occupy, as well as wide ventilation ducts and outlying tunnels unused but sealed off and ready to be pressurized in case the Shack expands.

The Staff

In an age of cheap computers and servomechanisms, large parts of the Shack's operation are automated. The staff is mostly there for administration, skilled maintenance, and to give the Shack a human face, but menial tasks, like carrying luggage and cleaning up rooms, are performed by simple robots. Still, turnover among the human staff is high. The pay is moderate at best and the hours are long, so many of them are people who are down on their luck or couldn't find work anywhere else. Ideally, the staff breaks down something like this:

Computer techs	2
Environmental techs/gardeners	4
Traffic control techs	2
Clerk/assistant manger	2
Electrical/structural techs	3
General maintenance/janitorial	3
Shuttle pilots	1
Medical techs	2
Cooks/bartenders	4
Host/concierge	6

However, there may be gaps to be filled (perhaps by PCs needing a few credits or a quiet place to lay low for a while). Regardless of their nominal job description, most of the staff has done some asteroid mining or space travel in their time, so they're often capable of supporting the specialists, or even replacing them in a pinch. Reportedly, very close companionship can be purchased from many of the Shack's staff . . .

Using the Shack

The Shack is presented as an establishment run by a single person or company. However, there's no reason that the various parts can't be operated separately. For example, the store, the assay office, the saloon, and the rooms may be run by different companies (or individual owners), while the infirmary might be a missionary establishment. Joe's might also share an asteroid with a space patrol outpost. At higher levels of technology, the Shack will probably have artificial gravity (adjustable in individual rooms, perhaps) and a whole range of atmospheres. Depending on the desired mood, the Shack could be a noisy bustling center of activity on a growing, vital frontier or a dusty, half-empty outpost on a dying fringe. It's a good location for bringing a new group of heroes together, or to send them to meet someone in hiding. And, of course, it poses any number of adventure opportunities on its own:

- **Knocking Over Joe's:** A lot of value goes through the Shack: rare mineral samples being shipped to corporate labs for further testing, small but expensive items for sale to prospectors, and a lot of cash going in all directions. It's only a matter of time before somebody decides to take it away. PCs could fit a number of roles. They could be desperate thieves moving in to knock over the Shack and get out with a fortune, space patrol officers sent to apprehend the thieves without catching innocents in the crossfire, or customers and staff at the Shack, defending themselves and their goods. The Shack itself has few defenses (it's a bar and hotel, not a fortress), but its occupants may be armed themselves.
- **The Union Label:** The mining corporations are cutting their prices, and the asteroid prospectors are organizing to form a cooperative and present a united front against them. Joe's Oxygen Shack is the natural place to get everybody together for a meeting. The meeting will be huge, with just about every freelance prospector pouring into the main room at the Shack (they'll have to move the tables out of the way), and tensions are coming to a head. PCs can be pro-coop agitators trying to get suspicious prospectors (who are fiercely independent by

definition) to go along with the plan, mining company plants trying to break up the meeting, or pro-coop counter-agents out to find and stop the "Pinkertons."

- **The Haunting of Joe's:** Something's going wrong at the Shack. A guest dies in a freak electrocution accident. A tech is killed in an atmosphere blowout. Doors which are supposed to be locked are unlocked, meals are ordered and sent up to empty rooms, and there are peculiar noises on the edge of hearing. Are strange psychotropic fungi growing in the ventilation shafts, causing carelessness and hallucinations? Is somebody trying to sabotage the Shack? Or is there something darker going on . . .

Black Flag

Capture The Flag Variations for *Frag*

by **DensityDuck!** (aka Mike Powers)

In *Frag*, Capture The Flag can be as much fun as Deathmatch, if not more. But even CTF can be more interesting with a few minor changes to the way the game is played. This article presents some concepts for changing CTF games in *Frag*, taken from the many interpretations of the game seen in First-Person Shooters; and since you don't need to be a computer programmer to change the way a boardgame plays, you can even try some of these yourself.

CTF Alterations

These are small modifications that can have an effect on the way the game plays, but don't change the basic rules of the match. These can be applied to any CTF game.

- **Wave Spawn.** Characters must wait until every third round to respawn, instead of respawning immediately after being fragged.
- **Equip on Spawn.** On the turn their character spawns, players draw one card from the Weapon deck and immediately put it into play. If they are incapable of using the weapon, it is immediately discarded.
- **Auto-Return Flags.** If a flag is picked up by a character on its team, it is immediately returned to its base rather than being carried back.
- **Timer Flags.** A dropped flag remains where it is until four rounds have passed, at which time it is returned to its base. The defenders may not pick it up. The attackers may pick it up; if one does, the "timer" is reset.
- **Defensive Flags.** A flag has a Beam Pistol (2D Energy) with unlimited ammo, which attacks any enemy character that comes within 4 squares using an Accuracy of 2. If the flag is being carried this weapon is inactive.

Variant Game Types

These modifications change the basic nature of the game, though the getting and keeping of flags is still be basic idea.

No-Team Flag (NTF)

Neither team starts with a flag. On the first turn, a flag spawns in a central area between the bases. If a team member carries the flag back to their base, their team scores a point; the flag respawns in the central area. The first team to score four points wins.

Alterations

- Add multiple flag locations, and have the flag spawn at a random one.
- As above, but have flags at all locations; once a flag has been "captured" it respawns on an empty location.
- As above, but do not respawn captured flags; once all the flags have been captured, the round ends and the side with the most flags scores a point.
- As above, but allow the flags to be "recaptured" from the enemy's base; once one team has all the flags in its base, the round ends and that team scores a point. Flags still are not returned, even if they were taken from one side's base.

Destroy the Flag (DTF)

One team has a base with a flag; the other team must do 10 points of damage to this flag. The flag always rolls as if it had Health 4. Once the flag is destroyed the round ends and the teams swap roles. The team that destroys the flag in fewer rounds wins.

Alterations

- Use unequal teams; give the defenders fewer characters to represent their advantage (they know the attackers' objective and can set up ambushes.)
- Rather than spawning defenders in random locations, limit them to spawning in the locations closest to the base.
- Make the flag immune to some weapons, or to some types of damage (e.g. no "splash" from shotguns, or half damage from energy weapons.)

Steal the Flag (STF)

One team has several flags in its base; the other team must take them out of the base to any of several "escape areas" (define these locations before the game starts). Once all the flags are in escape areas the round ends and the teams switch; the team that completes the objective more quickly wins. Flags can be returned in this game mode.

Alterations

- Three-player STF. Two attacking teams compete for the defender's flags. Escape areas are specific to one of the two attacking teams.
- Allow defenders to destroy (or seal off) the escape areas to prevent attackers from using them; if all the escape areas are sealed the defenders win the round.

No-Base CTF (NBF)

There are two flags, but they spawn on a randomly-determined weapon space rather than in a set location. Either team's players can pick up either flag. If a player is holding their own flag and picks up the enemy's flag as well, his team scores a point, and the flags respawn in random locations. If a capture is not made in eight rounds, the flags will "hop" and respawn again; characters carrying the flag at the time automatically lose it. (This prevents one team from taking an early lead and then simply sitting on one flag for the rest of the game.)

Alterations

- Multi-Flag NBF. Use three teams and three flags; a player can score by touching any two.
- If a flag takes more than a certain amount of damage (either by splash or by direct attack), it "explodes" and does 4D of damage to characters within 2 spaces, and respawns in a random location.

Pyramid Review

Rokugan (for D&D 3rd Ed/Oriental Adventures)

From [Alderac Entertainment Group](#)

Created by Rich Wulf, Shawn Carman, and Seth Mason

220 pg. HC; \$29.95

Legend of the Five Rings has always seemed more a Roleplaying Game setting than one for a Collectible Card Game. Unlike *Magic*, which was very generic in its fantasy setting, *Legend of the Five Rings* had a sense of place about it, drawing on elements and themes of Feudal Japan to create its fictitious land of Rokugan. Those elements helped the CCG, as its strong setting, with its background and evolving stories, helped draw players in and keep them there. There was even a [Salon](#) story on it.

So it seems inevitable that it would turn into an RPG. The *Legend of the Five Rings RPG* has been out for four years and two editions now, and has produced a long series of supplements. This has included the "Way of the . . ." series (describing the Clans, or family groups, of Rokugan), various adventures, and some boxed sets.

Wizards of the Coast recently released a new version of *Oriental Adventures*; instead of the *Kara-Tur* setting used in the original *Oriental Adventures*, they decided to use Rokugan as the setting. Now *Rokugan d20* expands on every aspect of the world and information presented in that book. New spells and classes (both base and prestige) are provided, there are new skills and feats, and the setting is expanded on.

The crunchy bits are *very* crunchy.

The character generation section covers the various clans and factions of Rokugan. Since there will be next to no non-humans in an *Rokugan* game (really, can you see a Naga working with a normal hero group? Or a Nezumi?), each clan and family works as a sort of sub-race. A Lion character, for example, can be from the Kitsu family, which gives them a favored class (Shugenja), starting honor (2), an extra Class skill (Knowledge: Ancestors) and their choice of starting outfit. Some of the starting outfits seem a little off; for example, many of the families with Samurai as their Favored Class can start with a Katana & some Koku (Rokuganese for gold pieces). But Samurai start with a daisho, which is a Katana and shortsword. So do they get two? Players can also play the various minor clans, or ronin (masterless samurai). Playing Nezumi or Naga characters is another available option. But, once again, likely only for a strictly Nezumi or Naga game.

The Samurai & Shugenja classes are revised from the *Oriental Adventures* book to bring them more in line with the author's views; the changes don't seem very dramatic (the Samurai alteration, for example, changes one special ability a little). New are the Courtier, Ninja, and Inkyo (an enlightened Monk . . . which may say something about the standard Monk class) classes.

The Courtier class is suited well for campaigns set in royal courts. While many players may shy away from such classes, since they are fairly useless in any sort of rough-housing, there's something about a character that has "Wealth, Talent, Style, & Grace" as first level abilities that can be strongly appealing.

The Ninja class is also fairly scary. This class has the Base Attack Bonus of fighter . . . arguably the most martially minded character type. But then the Ninja *also* has the Rogue's Sneak Attack ability. While startling at first, the class isn't all that powerful. They have to deal with a d6 hit die, and have neither the Fighter's feats nor the Rogue's skills, making them balance out. But it definitely might give someone pause the first time it's read.

The original PC classes are also discussed. This is one of the places where a change was made that possibly wasn't described well enough. Barbarians are referred to (in most cases) as berserkers. This is fine, but if you miss that early reference telling you of the name change, you might get confused when you find clans with Berserker as a preferred class, or NPCs with Ber as one of their classes.

There are a handful of new skills (you can now perform the Tea Ceremony), and a passel of new Feats. Void Use is introduced here. This one in itself is somewhat problematic. Void Use rather sneaks up on the reader, and it seems like an important enough game mechanic that it deserves more than three-quarters of a column in the middle of the Feats section. The honor rules also seem misplaced and easy to overlook. Both rules elements are important enough that it seems they should have been put into a special section.

The honor rules appears very well-integrated with the alignment rules; especially satisfying is the way each aspect of honor is emphasized. Honor is also separated from the level system, which should help satisfy purists. There are more Prestige Classes, too. Most have a class or race requirement, which means you have to be that clan or take the Different Schools feat.

Spells take up 17 pages, and they are fairly well done. They fill in some gaps in the elemental magic of the Shugenja. Raise Dead is also taken out of the Shugenja spell lists, because it just doesn't fit the Rokugan world.

Of course, the biggest part of the setting of Rokugan is, well, the setting of Rokugan. And the book doesn't disappoint in that respect. The last third of the book consists of pure setting, with chapters covering the history, religions, sociology, and geography of Rokugan.

The Geography section is almost confusing because of the way it is organized. The various locations are marked, some with letter/number combos, others solely with letters. The letters are on the inside back cover, and the letter/numbers are in the inside front. But they don't tell you this. If you look at the front inside and assume the back inside is the same (or vice versa) you might be confused for a while. The sections on life in Rokugan are good. It makes the world feel very cohesive and gives players and GMs enough hard info and good feel to be comfortable in the setting.

Artwise, the *Rokugan* book is a bit of a mixed bag. The majority of pieces are very good, although a few pieces by William O'Conner strike me as just odd; The Crane on page 191 and the Mastermind on page 202, for example, may make you step back and shake your head.

Overall, the *Rokugan d20* supplement is very good. It does a good job of laying out the world as a game setting. If one were to look for something missing, it would probably be a lack of more characters from the original clan war setting. Many would probably like to know how many Rogue levels Bayushi Kachiko has, or Toturi's levels when he was leading his Ronin army versus when he was leading the Akodo family.

Also, as mentioned earlier, the organization and placement of some rules is less than optimal; Shadowland Taint probably shouldn't be tucked in the settings rules, and the Void Use feat should have simply said "see Void Use in the rules section." A "character index" directing the reader to the various PCs, particularly their stat blocks, would be nice. But that lack could be easily solved with Post-Its and a little patience.

Although the book audience is rather narrow (people who want to play *Legend of the Five Rings* with the *d20* rule set), those people should be very pleased with it. Hopefully a *7th Sea* adaptation, if or when it's released, will be as solid.

Pyramid Review

Strange Adventures in Infinite Space Computer Game

Distributed by [Cheapass Games](#)

From [Digital Eel](#)

By Rich Carlson, Iikka Keranen, and Phosphorus

CD-ROM; \$15.00

Even working with computers, James Ernest and his Cheapass elves can develop a game for \$15 in an industry that regularly commands 3-5 times that for its products. Their first foray into the high-tech world, *Strange Adventures in Infinite Space*, is less remarkable where subject matter is concerned: Mankind has reached the stars, and now in the 23rd century humanity has established itself in the Glory System on a world called Hope. They sit at the edge of an enormous nebula called the Void, and although the government has promised to license explorers once the thorium fission drive is perfected, you can't wait that long.

"Interested parties" share your impatience, so they give you a ship and a mission and send you off in search of adventure and treasure (mostly treasure). Using a star map, you travel from system to system by clicking the star you want to explore. A line extends from your current position to the new locale, which lets you see what your journey may be like. Travel too close to a black hole and you risk destruction; swerve into the nebula and your FTL drive will slow to a crawl. Assuming you make it to the new system without incident, you'll see any habitable worlds and the specimens and artifacts that may rest there. The more stuff you find, the higher your final score will be. But each mission has a time limit, and if you miss the deadline to return to Hope you get hit up for late fees. More often than not, this puts you in the hole financially.

How the scores are determined isn't spelled out, but it all seems to come down to money. Not only are you worth more if you come back with new alien artifacts and life forms, you can use much of what you find on your travels to upgrade your ship and improve your exploration and combat capabilities. Discovering new worlds -- preferably habitable ones -- improves your score as well, which often forces you to choose whether you want to go to a system whose star would support life, or a more inimical environment where new races and artifacts may lie dormant and waiting to be discovered. Which of these is the smarter play isn't clear.

Since your trip is unlicensed, you have to start out on your own. Fortunately, you may have a chance to hire experts or rogues to join your crew, or to trade for goods and better gear with passing alien cargo ships. Not all the races you'll encounter have your best interests at heart; intelligent robot insects, glowing jellyfish, and others may try to attack you. On the other hand, some of those other, friendlier alien races may offer to ally with you. They'll take part in combat (you can even control their actions in combat -- quite well, in fact), exploration, and even shipboard repairs.

Minimum System Requirements

- Pentium II 350MHz (600MHz or better recommended)
- 32M RAM (64M or more recommended)
- Windows 95/98 or ME
- DirectX 6
- DirectX compatible video card capable of 640x480 resolution
- DirectX compatible sound card
- 16M of free hard drive space

Combat, which usually results from random encounters during space travel, takes place on a separate screen; the star map disappears and gives way to a top-down view of your ship(s) in green and the enemy in red. It has some pretty subtle tactics that you'll have to suss out yourself, tactics that will change depending on what weapons and shields you have hooked up. Like travel among stars, combat is mostly clicking the ship you want and clicking the opponent you want it to engage. The computer will go after it, though it will also take opportunity fire at anything that ventures too close. Different races will come at you using different formations and weapons (weapons you sadly do not get to salvage after a fight). Various emergencies come up both in and out of combat, some of which your engineers can handle immediately, and some that may have to wait (assuming you live to fix them). Damaged systems can keep you from performing certain actions, but you always have the option to retreat when a scrape goes south on you.

Strange Adventures in Infinite Space has a lot of depth for such a simple game. Actions taken (or not taken) during one part of the mission may come back to bite you later in the game, and even the map may change as you come across new hazards and stellar phenomena. (This can play havoc with your strategy or the return trip.) You can choose the size of map you want, your ship's initial weapons, the number of enemies, the difficulty level, and even your name and that of your ship. During the journey, you may even rename the worlds you discover. There is no save function (not that you need it in the course of the brief missions), but there is a pause button that works even in combat, and you may save your career from one game to the next.

The Cheapass tradition marches proudly on, even in the digital age. Aside from the art imprinted on the CD itself, the container is a completely unremarkable diamond case. While the graphics have names, logos, website stuff, and some copyright information, WIN95/98 is the only indication buyers have as to what the system requirements are until they open the help file.

The in-game graphics are dandy little nuggets, sharp and crisp (though some, like the character portraits, look like holdovers from the early 90s), and it's usually easy to tell what's what on the screen. The only time it gets confusing is in combat, where things move at a pretty good clip and it can be hard to tell your ships what to do or who to attack as it swirls around you. There is more than one way to access most functions in the game, so *Strange Adventures in Infinite Space* can be forgiven some of the chaos of combat. The interface is completely intuitive -- want to fix a damaged system? Trade something from the hold? Switch out systems? Just point and click. It makes the game feel very much like a Cheapass board game without the burden of setting up all the components, and this straightforward setup was probably a big factor in choosing to market it.

Make sure to note the date you start, or to change the current date to the time remaining counter on the "Settings" screen. Otherwise your only time warnings will come in the middle of an unalterable flight plan. It would also have been nice if trade was a little more involved; as it stands, it seems just about any alien will take anything in trade unless you're trying to hire them.

The user's manual is a simple text file, and they're careful to give you enough information to play without betraying all the secret stuff you can come across during the game. Considering the game's 2001 copyright one might think there would be a better FAQ, even if it's only now seeing widespread distribution, but nothing crippling seems to have been overlooked. Although designed to be played in about 20 minutes, *Strange Adventures in Infinite Space* takes up far more time than that. Every individual mission takes about that long, but there is plenty of variety and the only real limits on how long you'll play are your job and the intrusive arrival of daylight.

Formula Motor Racing

Published by [GMT Games](#)

Designed by Reiner Knizia

Illustrated by Rodger B. MacGowan & Mark Simonitch

54 color cards, 12 plastic cars; \$16

For fans of Formula One racing, the agreed game to play is *Formula Dé* from French publisher Jeux Descartes. With over thirty different boards representing racing tracks from across the world now available, players can now simulate whole seasons in either Formula One or Indy Car racing. Yet playing time for a race usually takes about two hours, and sometimes you don't want to fiddle around with a big board and lots of dice for that long. For those moments, when you want full throttle action, in a sixth of the time, there is an alternative.

Designed by Reiner Knizia, *Formula Motor Racing* comes from American publisher, GMT Games -- better known for their range of historical wargames. Inside can be a deck of fifty-four Action cards, six Team Pit Crew cards -- one in each of the six team colors, twelve plastic cars -- two each in the six team colors, a single twelve-sided die, an eight-page rulebook and a pad of score sheets. The team colors are blue, green, orange, purple, red, and yellow. All of these components fit nicely into the sturdy box. Note that there is no racing track . . .

The aim of Formula Motor Racing is to manoeuvre your team of two cars into winning the Constructor's Championship, by scoring as many points as possible across an agreed number of races to reflect an individual season. Rather than concentrating upon going round and round in a circle, players win races by moving both their own cars -- and those of the other teams -- up and down the race order. At the end of a race, points are scored as in Formula One, with a record of these kept across a simulated season to determine the end of season winner. The score sheets are used to record these points, and while permission is given to photocopy more as needed, it would be a matter of minutes to create a table in either Microsoft Word or Excel.

Three to six players can take part in a season, which begins with each of them selecting their team color. In a three-player game, a player controls two teams. Regardless of the number of players, all cars remain in the race, with non-selected colors representing uncontrolled teams. Each race begins with the random drawing of Team Pit Crew cards. The cars corresponding with the color of the first Team Pit Crew card drawn are placed in pole position and twelfth position; those of the second card are placed in second and eleventh place; and so on, until the cars of the last card drawn are placed in sixth and seventh place. This line of cars is placed on the table; each player will need to be able to reach all of the cars throughout the game. Finally, the Action cards are shuffled, and five are dealt to each player.

The player with the car in pole position takes the first turn. He plays and discards a single Action card, then replenishes his hand with a new card from the deck. And that's it! Play continues until the deck is exhausted; then each player has the opportunity to take one more turn. At the end of this, the race order of the cars is finalized; thus the winner determined and points awarded.

When each player puts down an Action card, it can be played upon any of the cars in the race, limited only by the conditions given on the card itself. The fifty-four-card deck is split between thirty-four advance cards and twenty trouble cards, and also between team colors and black colored cards. The team-colored cards can only be played on a car from that team, while black cards can be played on any car currently in the race. The cards represent the panoply of maneuvers and events that can be taken, or take place throughout a race.

Most of the advance cards represent the simple Overtake maneuver, which allows a car to jump anywhere from two to four places. This card is advantageous to the car behind that one as well, as it can ride in the slipstream of the advancing car and also change race position. Overtake cards are (as discussed) color-coded, as are most of the Pit Stop cards, which send a car to the pits for a randomly determined loss of places in the race order. There are also two black-colored Pit Stop cards that can be played on any car. The die is also used to determine which car is affected by cards such as Spin Last card (which sends a car to the last place in race), Spin Out (which sends a car spinning out of the race), and the dreaded Crash. The Crash card not only takes a random car out of the race, but also the one behind or ahead of it -- chosen by the whoever played the card. The remainder of the cards provide various effects, mostly loss of place.

Although Formula Motor Racing concentrates upon the Constructor's Championship, one suggested option would be to run a Driver's Championship as well by marking the cars with numbers. To be honest, this might be a little fiddly, and other option might include buying a *Formula Dé* Pewter Car Set and painting them in your own colors -- although there are only ten cars in the set. Alternatively, larger die-cast toy cars can be purchased and modified. In the Constructor's Championship the focus is upon scoring as many points as possible, not necessarily upon winning. Just as in the real thing, a season of *Formula Motor Racing* can be won by achieving multiple second and third places throughout the various races. This focus just shifts slightly with the inclusion of the Driver's Championship, as players want the kudos of getting their number one driver onto the winning podium.

There are just two slight -- very slight -- problems with *Formula Motor Racing*. First is the lack of interplay between players, other than through the determination of race order. (One option that our gaming group has experimented with is to have each player exchange one of the cards in his hand with that of another player before he draws a new card at the end of his turn.) The other problem is that moving the cars up and down the race order throughout the game gets a little tricky, and we found ourselves spacing out the race order to make moving the cars easier.

Formula Motor Racing plays fast and easy. It is designed for players aged eight and up, and the simple mechanics reflect that. Yet the various effects that the cards really do have the feel of a Grand Prix race, so much so that you can just imagine Murray Walker or Jack Arute or Danny Sullivan providing the commentary to very game!

--Matthew Pook

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Try It . . . You Might Like It!

I've only roller-skated once, and I fell down so many times that I was black and blue for days afterwards . . . and I did *not* have a good time. But it's been almost ten years since that last attempt, so who knows? Perhaps I should try it again.

But I get ahead of myself.

It seems many folks didn't much care for my cryptogram column from two weeks ago, and thus gave it a good ol' nuking in the ratings; this was expected. It also seems a fair number of people disagreed with the premise of the column itself, where real puzzles encountered by characters can be thrown at players; this was less expected. Apparently many players believe in a strict wall between player and character knowledge; I believe the notion the *heroes* might become stuck because the *players* cannot come up with a solution to a puzzle rubs them the wrong way. (And then some players liked the ideas I presented, and wrote to thank me for the ideas . . .)

Anyway, it seems that this issue of the wall (or lack thereof) between players and characters is full of possibilities. And, as in all things, I try to see both sides of this issue. I certainly think it's an interesting enough dichotomy to devote a column or two to the subject. But not yet; it will probably be at least a week or two before I think everything through.

For the time being, I thought I'd share one of the design philosophies of both the magazine, my gaming, and (to a certain extent) my life. Namely, I enjoy challenging my beliefs; I appreciate trying things I've either presumed (or confirmed in the past) I didn't like. And, even when I don't like or agree with something, I still try to see what I can enjoy out of the experience, and codify what I *don't* like.

What does this have to do with the price of pears in Peoria?

Well, take *Pyramid*. Don Thompson, late editor of the *Comic Buyers Guide*, had a gift with his ability to review comics. Even when he didn't particularly like a comic, he was generally able to tell who *would*; he was able to say with a high degree of accuracy, "If you are the sort of person who likes comics of this sort, then you will (or won't) like this comic." In other words, even if he didn't like, say, True Crime comics, he was able to determine what made good True Crime comics good, and whether or not a new True Crime comic would be of interest. When you think about it, that's an *incredibly* useful ability, especially for an editor. Let's say you're the kind of person who hates action movies. Now, if you don't have that ability, then how can you determine how, say, *Speed* compares as a movie versus *Mission to Mars*? Or even *Crouching Tiger, Hidden Dragon*?

I've tried mightily to be similar in my balance with *Pyramid*. Even though I'm usually a pretty rules-light kind of guy, I need to try and figure out what gearhead crunchy types of articles will be of interest to those who like gearhead crunchy articles. I haven't played CCGs with any vigor for a few years, but I can hopefully discern what articles for that game type folks will like. And so on. I like to think that I usually get it right, but sometimes I don't. Those times I fail, I apologize; and which is why -- as a complete tangential aside -- I always value feedback of all forms, to let me *know* when I've missed (or hit) the mark. (That email address, as ever, is pyramid@sjgames.com)

Anyway, with *Pyramid* I even run articles that I don't necessarily agree with, or would otherwise find useful in my own gaming, because I feel it's important to present alternative viewpoints, give readers with different tastes something they'll like, *or* show folks something to think about. (Heck, sometimes I don't even agree with *my* column, but am instead just presenting an alternative view or an angle that I *might* agree with . . .)

Likewise, in my gaming I like to challenge my own assumptions and preconceived notions. For example, I usually tend to run rather Byzantine campaigns; plot twists, elements that throw the players off-balance, and strange developments (often involving the bending nature of Reality itself) are fairly common with me. So every once in a while I'll force myself to do something I don't normally like . . . maybe a hack-n-slash adventure, maybe a straightforward "find the object" quest, maybe an open trading/exploration simulation. (The latter I don't necessarily

dislike, but I'm really bad at. And thus I hear our *Traveller* fans collectively shake their heads in disappointment . . .) My reasons for this are myriad.

Sometimes I like to make sure I don't like a particular type of game; the aforementioned trading/exploration game, for example, was generally in my "dislike" column until a particularly fun *Exalted* session where that's pretty much *all* the heroes did. Now it's moved into the "like it, but not very good at it" column (a column I've often used for . . . er, nevermind).

Sometimes I like to do something different just to see what I can bring to the mix. Much in the same way that *A.I.* was a Stanley Kubrick film through the eyes of Steven Spielberg (with quite interesting results), I like to run a hack-n-slash scenario -- even when I may not want to -- just to see how I can do things differently. Sometimes these experiments work; sometimes they don't. Regardless, I always try to walk away from those lapses of the usual with *something* in my pocket . . . be it a new appreciation for a previously disliked form, some variant ideas for altering my own ruts, or at *least* some new ways for my players to diplomatically tell me they really didn't like that last game.

The same sense of horizon-broadening goes for me as a player. I almost always play characters that have highly developed moralities (codes against killing, duties to protect the innocent, and so on). So once I made a character that was *specifically* amoral and questionable. Now, as the game progressed I found myself invariably drifting her towards having a code of honor and conduct. But the *way* she developed those ideals were very unique to me as a player, and they were still askew from my normal archetype (for example, she was primarily a defender of and duty-bound to her family . . . and the code against killing she developed did *not* apply to any who threatened her kin). So, even though I still tend to play the "too-dumb-to-die" paladin-types, I consider that one to be one of my best (and most fun) ever.

Finally, as a person I try to do things I've done before, but found not to my liking. For example, I find myself rather fond of live classical music now because of a good experience a while ago, despite some bad (and boring) experiences as a child. The same goes for eggplant, three-hour movies, and Indian food. Of course, I *still* don't like raw onions, watching golf, or (as a rule) action movies.

Anyway, the point of all of this is, it's a big world. A big, wonderful world full of people with different ideas, philosophies, outlooks, and ways of doing things. Although we all need to find our own way of doing things, I personally think it's a mistake to consider our own ways as the One True Way. And maybe, just maybe, you might consider giving something a try you "know" you hate. Who knows? At the very least you may come up with new reasons *why* you dislike what you dislike. You might even up changing your mind, and possibly adding something Neat, New, and Different to your life.

Or you might end up black and blue, vowing never to roller-skate again.

* * *

As I'm sure you've noticed, Ken Hite's taking the week off. That's because, even as I type, he's a guest at the [World Horror Con](#) in Chicago. With Neil Gaiman and Jill Thompson, along with bunches of other neat, cool, and snazzy people. Not that I'm jealous. Horribly, horribly jealous . . . Er, anyway, we hope he'll be back next week. With enough autographed goodies for all of us.

--Steven Marsh

* * *

*Last week's answer: **Evil**, a **d20** book from Alderac, p. 2.* (Although I've received an email from the inimitable [Ryan Dancey](#) who says that this anecdote may have *another* origin . . . I'll see if I can get to the bottom of this . . .)

(One star) The world of Pentex and the vampires is already most of the way to being cyberpunk; only the technology is missing. And once it arrives, it brings challenges and threats to the Garou. Do cybermods corrupt as surely as Wyrms-taint? Or can there be a cyber-enhanced Garou? The Glass Walkers and their use of the net-spiders will certainly come into their own.

Sports in Roleplaying Games

by David Morgan-Mar

Many people enjoy playing sports. Even more people like watching spectator sports, a pastime which has become a major form of recreation in modern society. RPG characters need time off from their adventures, so it is likely that many characters will have an interest in or participate actively in sports. This article discusses how sports can be used in roleplaying games, and presents some optional rules for treating them in a little more detail in *GURPS*.

Sports in the Campaign

Whether or not the optional rules for *GURPS* presented later in this article are adopted, it is worth examining how sports can be used in an adventure or campaign, in any RPG system.

In many types of campaign, an athlete is a suitable character type. The character may be a serious amateur athlete, such as an Olympic competitor (before professionals were allowed to compete), or may engage in sport for a living. Other characters for whom sports may form an important part of their personality are the fan and the weekend athlete.

An interest in sports, either through fanhood or participation, provides a focus for roleplayers. Since many of us are familiar with sports, it gives an easy hook for the player to get into character, and a point of reference through which others can relate to the character. Not many of us know what goes on in a nuclear physicist's head, but if he's also a Tigers fan, or bowls on Friday nights, then we know something through which we can engage him in conversation and understand some of his motivations.

A sports background can also justify the knowledge of certain skills not otherwise widely known, or suggest certain personality traits for roleplaying. Finally, sports can be used to provide game ideas for the GM and hooks to pull characters into adventure scenarios.

The Sports Fan

"Mighty Man! The Green Fiend has escaped and is terrorizing Megalopolis!"

"Hang on . . . the Giants are trailing by 2 with 3 minutes to go . . ."

Sports fans are common throughout many eras, whether gladiatorial spectator or modern football-lover; this can, of course, extend to cyberhockey or whatever events people of the future will watch. Any character of an appropriate time period can have the personality quirk of being a sports fan. Such a person will seek out scores for their favored sports and teams when they can, and either listen on radio, watch on TV, or attend events in person when convenient.

A more dedicated fan will attempt to tune in or attend even when it's *not* so convenient, and may possess an annoying habit of neglecting duties or friends when there is a big game on. This could lead to trouble at work or with personal relationships. Getting a glimpse of the action or a score update during an otherwise demanding situation might cause a dangerous distraction.

Some fans seem to have a photographic memory for scores, statistics, and obscure trivia -- an ability which could translate either into a brilliant all-round memory, mathematical talent, or absent-mindedness over anything *other* than sports. Armchair coaches may have brilliant strategic and tactical skills, or may simply harbor delusions that they do.

Adventure Seeds

- Someone who wants a sports fan out of the way for several hours (an enemy, rival, or someone who wants to commit a crime) send him impossible-to-get tickets to a Big Game. The recipient will be hard-pressed to

question where the tickets came from and why, and might be more likely to just go and enjoy the game while his home is searched, bugged, or trapped.

- A fan wins an invitation to spend a day at his team's training camp before the new season. In a quiet corner, two of his idols get into an argument and start fighting, with only the hero to break it up. Team management queries the witness about the incident and disciplines (or sacks) one of the athletes, who then develops a grudge against the PC.
- An evil villain (or supervillain) has chosen the local stadium as the venue for his latest mischief. The PCs in the crowd catch a glimpse of something suspicious and must either try to convince skeptical security staff, or do something to thwart the diabolical plan . . . without causing a panic and disaster among the huge crowd.

The Weekend Athlete

"We've arranged to meet with the Kelly Mob on Wednesday to cut a deal on the diamonds. Be at the Pink Boa at 8, and pack some heat."

"But boss! Dat's my bowling night!"

Many people enjoy playing sport at least as much as watching it. These are the ones with a regular job who spend their days off practicing their golf, hitting a tennis ball with friends, or playing in the local softball competition. These people often have a semi-regular social commitment which they will be reluctant to break under normal circumstances, and less spare time for adventuring because of it. On the other hand, a regular circle of sporting acquaintances can provide contacts with a collection of diverse knowledge and skills. John the cop doesn't know the first thing about stopping an alien plague, but his squash buddy Phil is an epidemiologist.

An interest in sports can also be used as an excuse to meet and interact with someone. The classic example is James Bond toying with Auric Goldfinger over a supposedly chance meeting for a social game of golf. Many NPCs are good candidates for having sporting habits, and heroes wishing to meet them, or investigate them, will find good opportunities to do so if they can share the experience.

Weekend athletes will have one or a few physical skills related to their sports of choice at moderate levels. They are probably better than average health, strength, or reflexes, since active people tend to be fitter than sedentary ones. They can sometimes be braggarts, or sore losers, or supremely overconfident in their abilities. Especially good or poor performances may earn them a minor reputation among a small circle of friends.

Adventure Seeds

- Unknown to the heroes, one of their tennis (or other sports) partners has acquired an enemy. As a classic example, the friend may be a spy, and kept this fact secret from his social group. Their buddy has a heart attack and dies (or is rushed to the hospital) during a game, but first manages to pass on some cryptic information or an object to the heroes. The victim's enemies decide the heroes now have something they want, and do their best to get it.
- At a chance meeting over a game of golf or other suitable sport, a newly-met person starts dropping hints that he may be interested in hiring the heroes for a job. This leads naturally into many other plots, but leaves open the question of who arranged the meeting, and his true motives.
- A community sports league teammate has a bad string of poor performances. He visits a psychic, who tells him he is under a curse and his life will get worse until disaster strikes. He appeals to his friends (the heroes) for help. They must determine if there really is a curse, and if so, who laid it and how to remove it . . . hopefully all before the league playoffs start and their friend's misfortune ruins their championship chances!

The Amateur Athlete

"Sorry I'm late, sir . . . Training. For the Olympic Games, you know."

"Do it again, Jones, and we'll see if that bloody rowing puts food on your table."

Amateur athletes are dedicated competitors who take part in serious competition, often at an elite level, for no financial gain. They must have some way of supporting themselves financially, so sports will not be their entire life unless they have the luxury of wealth or independent income. If they do not, they will often struggle to make a living. An amateur athlete template could be added to almost any character, justifying the knowledge of skills such as martial arts, archery, throwing, dodging, running, or swimming.

Amateur athletes are most likely to be found from the Victorian era through to the 1970s (or thereabouts), but may also be found in older historical periods such as ancient Greece. Students are also commonly amateur athletes, right to the present day and probably beyond. Characters especially suited to being amateur athletes may be found in Victorian horror, steampunk, European colonial, and cliffhangers era campaigns. Common amateur sports include track and field, swimming, boxing, wrestling, rugby, and golf.

Amateurs must train often, usually most of the time which they don't spend at their jobs. The amateur may be obsessed with his chosen sport, thinking of little else and perhaps casting everything into sporting metaphors.

Adventure Seed

- A promising athlete struggling to make ends meet financially is approached by a well-dressed person with a proposition. He will offer a large sum of money for a simple favor: Deliberately losing at the next big competition. This is clearly immoral, but the cash will be tempting. Taking it will result in an ever-increasing spiral of corruption and potential scandal, while trying to report the person will create a powerful enemy.
- A government or other organization wishes to place a spy into a foreign country. It either recruits an amateur athlete or uses an agent with athletic ability to enter the country under the pretense of competing in a competition. Early modern Olympic Games are a good setting for such a scenario -- particularly Berlin in 1936. Ancient Olympic Games can be used as settings for similar intrigue in classical Greek campaigns.
- A group of amateur athletes need to cross the country to compete in a big meet. Depending on the era, different modes of travel might be used. Trains are particularly interesting, and provide good settings for adventure along the way. Besides adventures and other eventful delays, the heroes need to get where they are going in time, and still be in a fit state to compete!

The Professional Athlete

"Hey! You're Reggie Jordan! Fantastic game last week! Can I have your autograph?"
"Er . . . sure. But I really just want to pay this bill . . ."

Professional athletes earn their keep by playing sports, so their skills are tuned more exclusively to their sport of choice. This does not preclude other experience; it is certainly possible for the professional footballer to be as well-rounded as any other character. Particularly suitable secondary skills include those related to human physiology, psychology, administration, public speaking, journalism, politics, and teaching. Of course some pros are simply all brawn and little brain, but this can also be an entertaining roleplaying opportunity. Many professionals are well-known to the general public, and some have considerable reputations (not always good!) or social status due to their celebrity. Of course, fame opens many doors, but can also be a terrible inconvenience or make one a target of stalkers or other sociopaths.

Professional athletes are rare at the beginning of the 20th century, and become more common with time, until there are many thousands engaging in dozens of different sports worldwide today (some for enormous salaries). Many Roman gladiators were also essentially professional athletes. Sports commonly played professionally today include soccer, football (of various types such as American, Australian rules, or Gaelic), baseball, basketball, ice hockey, cricket, tennis, golf, boxing, motor racing, cycling, and numerous others.

A professional athlete will spend as much time training as anyone else spends on their job, and be concerned with maintaining fitness and form. An important aspect of this career will probably be seeking more or better opportunities for earning money, either through playing contracts or endorsements.

Adventure Seeds

- One or more of the heroes play or work for a professional sports organization; when the star player fails to show up for training on Monday, people start to get nervous. Phone calls reach only an answering machine, and nobody knows where he is. The party investigates, hoping to find him before the big game on the weekend.
- A PC is approached by a pro athlete (either a player on the same team, or just a friend) who requests help dealing with a problem. The athlete has run up gambling debts with some shady characters, and needs a way out without alerting the police, team management, or the media. This can be particularly tricky if the person with the problem is the team's star player, a role model adored by children, and the best chance to make the playoffs. Ideally the heroes should have a strong desire to support the team.
- The characters are professional gladiators (either historical, fantasy, or science fiction -- or in a present day campaign they could be pro wrestlers). Their fights are normally fixed, to provide entertainment without danger of serious injury. A rival manager has arranged for some of his fighters to fight dirty, however, which the heroes will need to recognize and then deal with in the ring. There will be consequences after the fight, especially if they had to kill their opponents; the person behind it all will need to be tracked down and dealt with.

Sports in *GURPS*

There are, of course, rules in *GURPS* covering sports. Apart from combat sports however, they consist only of a generic Sports skill with minimal description, and the Contest of Skills rules to be applied at the GM's discretion.

For many purposes the existing rules are enough. But sometimes the outcome of a competition can be crucial to an adventure. An extended resolution can then be useful to allow characters the chance to interact (or cheat) during the event and players to enjoy the thrills and suspense leading to the result.

Combat Sports

Combat sports are covered by the rules on pp. CII92-93, and the Combat Sport skill (p. MA32, p. CI133). A few additional points are worth noting.

If the optional maneuver rules from *GURPS Martial Arts* or *Compendium II* are not in use, most combat sports simply use one of the following skills:

- Boxing Sport: Western style boxing.
- Wrestling Sport: Greco-Roman or Freestyle wrestling. (Pro wrestling uses the skill of Wrestling Art.)
- Karate Sport: Martial arts sports involving striking.
- Judo Sport: Martial arts sports involving grappling and throwing.
- Fencing Sport: Fencing.
- Katana Sport: Kendo.

All skill rolls in the combat can be made against the one skill.

Some other combat skills might also be turned into sports in specific settings. Lasso Sport (against cattle) works for rodeos, a form of Flail Sport was used in the *Star Trek* episode "Amok Time," and a decadent culture might even get some entertainment out of Brawling Sport.

If maneuvers are being used, a specific martial arts style can be used to represent different combat sport disciplines. *GURPS Martial Arts* will be invaluable in this case. The maneuvers can then be used for appropriate combat tactics in the detailed method of resolving a bout.

Sumo wrestling is a special case. It uses the Sumo Wrestling skill; there is no specific Sumo Wrestling Sport skill, since Sumo is never performed in real combat. The rules for resolving a Sumo match are given in the skill description (p. MA35, p. CI136).

An additional skill usually required for formal combat sports is Tournament Law. The GM should require rolls against this skill in each round of a bout to avoid infringing a rule and being called for a foul. Note that Tournament Law requires specialization, and it must be bought separately for each different combat sport.

Archery and Target Shooting

Archery uses the skill of Bow Sport (a type of Combat Sport skill). This is the skill of firing arrows accurately at non-moving targets under competition conditions. The usual -3 defaults apply between Bow and Bow Sport -- a competition archer will have trouble adjusting to actual combat, while a skilled combat Bowman will wilt under the pressure of archery competition unless trained for it.

Similar comments apply to competitive target shooting, which uses the skill of Guns Sport, specialized in whatever form of gun is being used. Note that both Bow Sport and Guns Sport can be bought up from the default skill level granted by Bow and Guns respectively (or vice versa). This means that characters who wish to be proficient at both combat shooting and target shooting must take two different skills but do not need to spend an inordinately large number of character points.

Archers use the standard *GURPS* combat rules to see if they hit their target. Shots will always be aimed for more than three seconds, giving the standard +3 aiming and Accuracy bonuses. *GURPS Harkwood* has rules for determining which scoring zone of a multi-ring target is hit (pp. HA43-44). Apply the target size modifier for the whole target. If the skill roll is made exactly, the outermost scoring zone is hit. For each extra point the roll is made by, the arrow lands one ring closer to the bullseye.

Modern archery targets have ten scoring zones, so using this system a roll would have to be made by 9 points to hit the bullseye. A natural 3 will also hit the bullseye, while any other critical success which does not hit the bullseye by the point-count rule can be considered to have hit one zone out.

This zone-counting rule is easy to apply, but not strictly in keeping with *GURPS* missile fire rules: An aimed shot at a target the size of a modern archery bullseye should only have a -6 size penalty, not -10 or -11 (-9 plus -1 or -2 for the target size itself). If desired, the exact size modifiers can be used to determine the amount by which a skill roll must be made to hit a particular scoring zone. In some cases, the same modifier applies to multiple zones -- separating these zones can be done with a second skill roll or by equal chance. The exact size penalties for modern archery target zones are given in the table.

Scoring zone	<i>122cm target</i>		<i>80cm target</i>	
	Zone diameter	Penalty	Zone diameter	Penalty
1	48.0"	-1	31.5"	-2
2	43.2"	-1	28.3"	-2
3	38.4"	-1	25.2"	-2
4	33.6"	-2	22.0"	-3
5	28.8"	-2	18.9"	-3
6	24.0"	-3	15.7"	-4
7	19.3"	-3	12.6"	-4
8	14.4"	-4	9.4"	-5
9	9.6"	-5	6.3"	-5
10	4.8"	-6	3.1"	-6

Modern archery assigns point values from 1 to 10 for the target zones from outermost to innermost. A competition consists of four rounds, each of 36 arrows, fired at targets from distances of 30, 50, 70, and 90 meters (27.4, 45.7, 64.0, 82.3 yards), corresponding to *GURPS* range penalties of -7, -9, -9, and -10 respectively. The 50 meter range is only

just outside the range for a -8 penalty, so -8 could be used instead if the GM likes the progression it provides. The two shorter ranges use an 80cm target, while the longer ranges use a 122cm target.

For historical or fantasy periods, the target sizes and competition structure can be modified as desired. Gun shooting targets and competitions vary too widely to be detailed here, but some (such as skeet shooting) use moving targets which will require target speed to be factored into the speed/range modifier. Otherwise, simply apply the principles outlined for archery.

Athletic Contests and Races

One-on-one athletic contests and races are most simply resolved with a Contest of Skills. A Quick Contest can be used for discrete events such as broad jumping, while a full Contest is suitable for races, including running, swimming, animal riding, and vehicle races.

If you need to determine the exact finishing order of multiple competitors, make an appropriate skill roll for each athlete. Order the athletes by the amounts by which their skill rolls were made, extended through to failure amounts. Any critical successes are placed in the first position, while critical failures represent a disqualification (or injury). Any pairs of athletes ordered in the same position should roll a Quick Contest of Skills to separate them (in a race, a tied result here indicates a dead heat). If more than two athletes are initially ordered at the same placing, order this subgroup by the same method as the entire group. This method can also be used for animal or vehicle races, using appropriate riding or vehicle operation skills.

Individual Sports

Many individual sports are not covered by the categories of combat sports, target shooting, or athletic contests. Examples include tennis, squash, golf, ten-pin bowling, pool. Generally, a full Contest of Skills is the best way to resolve such a match.

If more detail is required, a Contest of Skills can be used to resolve separate parts of a game. There are too many different sports to cover each in detail, but the following examples should give an idea of the sort of details which can be simulated:

- Each set of a tennis match. The amount by which the contest is won can be used to generate a game score for the set.
- Each hole of a round of golf. Allow ties for each hole. Each hole won gives the winner a one stroke advantage over the opponent, or two for a critical success.

Team Sports: The Abstract Team Sports Resolution System

Team sports can be resolved using a method similar to the Abstract Mass Combat system in GURPS Compendium II. Use the following procedure:

1. **Determine Team Strengths.** The Team Strength of a team is the sum of the appropriate Sports skill levels of all players who take an active part in the game. If one team used more players, choose a number of the highest-skilled players equal to the number on the other team to count at full skill and add only 2 levels for each additional player. Divide the higher total by the lower to produce a ratio. (This procedure can be made more complex by counting only half the skill of a player substituted after half the game, and so on, if desired.)
2. **Player Characters' Contribution.** Any PCs or significant NPCs in the game must make a roll against the appropriate Sports skill to determine what effect they have on the game. Refer to the following list:
 - *Made by 10+ (or critical success):* Legendary contribution, +2 Reputation for a year, +1 Reputation permanently, +2 to coach's skill for quick contest.
 - *Made by 7-9:* Great contribution, +1 Reputation for 1d weeks, +1 to coach's skill.
 - *Made by 4-6:* Good contribution, +1 to coach's skill.

Made by 0-3: Played competently.

- *Missed by 1-3*: Played poorly, -1 to coach's skill.
- *Missed by 4-6*: Played miserably, -1 Reputation for 1d weeks, -2 to coach's skill.
- *Missed by 7+ (or critical failure)*: Injured, see Determine Injuries below.

3. **Modify Coaches' Skills.** The outcome of the game depends heavily on the skills of the team coaches. The relevant skill is Professional Skill (Coach), which any professional coach will have at 12 or better. The skill of each team's coach is modified using all relevant modifiers from the following list:

- *Ratio of team strengths*: Stronger team's coach gains a bonus as follows.

Ratio	Bonus
1.05 or less	No bonus
1.05+ to 1.1	+1
1.1+ to 1.15	+2
1.15+ to 1.2	+3
1.2+ to 1.25	+4
1.25+ to 1.3	+5
1.3+ or more	+6

- *Home field advantage*: +1
- *Coach's Leadership*: +1 per 2 full skill points above Leadership-10
- *Sympathetic referee/umpire (GM's decision)*: +1
- *Bribed referee/umpire*: +1 to +4 depending on official's reaction
- *Weary team*: -1 to -3 for inadequate rest since previous game
- Other appropriate modifiers at GM's discretion.

4. **Quick Contest of Effective Coach Skills.** Roll a Quick Contest of the modified coaches' skills. If the sport allows ties, a tied contest stands, otherwise reroll any tie. The margin of victory in the Quick Contest is a general indicator of the victory margin in the game, and should be interpreted in appropriate fashion by the GM.

5. **Determine Injuries.** Possible injuries to PCs and significant NPCs have been decided at step 3 above. To determine how many other players were injured, roll a number of dice equal to the number of other players and count the number of ones rolled. For an injury-prone sport (football, ice hockey) divide by two, for a safer sport (baseball, volleyball) divide by three, and drop any fraction. This is the number of minor NPC players injured. Roll a random hit location for each injured character. Limbs are crippled as per the rules on p. B127 and recover as per p. B129, including the HT roll to determine lasting effects. Other locations indicate wounds such as broken ribs or concussion which render a character incapacitated, but which also recover as per p. B129.

Generating Scorelines

Sometimes a random scoreline for a team sport game might be needed, either for keeping detailed results for an ongoing tournament, or simply for flavor. The following method can be used to generate appropriate point scores for many sports.

First, decide what is an average score for one side in the sport in question. This is the total number of points scored by a team over a large number of games, divided by the number of games. Note the average may be a fraction. Then use whichever of these applies:

- *If the average score is below 10*, multiply by 6 and then round to the nearest whole number. Roll that many (six-sided) dice. Count the number of ones rolled. This count is the generated score.
- *If the average score is equal to or greater than 10*, divide it by 2.5, and round the result to the nearest whole number. Roll that many dice, add up the total, and subtract the number of dice from the total. The result is the generated score.

If the result of the game is known (either by plot necessity, or using the

resolution system above) do this once for each team, assigning the larger score to the winner. If the winner has not been decided already, use different average scores for each team -- for example a poor basketball team might average 80 points per game, so roll 32d-32 for its score, while a good team might average 115 and roll 46d-46. This obviously gives a good chance that the better team will win, but allows upsets. The dice may need to be rolled in batches if the number required is more than the number of dice you own. Of course, a simple computer program can easily automate the procedure (see right). If some scores are impossible (such as 1 in American football), either reroll or assign a nearby score.

Note this is a simple method for gaming purposes and not meant to simulate accurately the distribution of scores in various sports. In particular, scores of zero or other low scores are more likely to occur in real life. GMs with a statistical bent may like to devise more complicated systems.

Examples

In soccer, the average score for a team is only about 0.8 goals per game. Six times this is 4.8, so roll five dice and count the number of ones to generate a team's score. If two dice come up showing one, the team's score for the game is two goals. In basketball, an average score might be about 100 points. Divided by 2.5, this gives 40, so roll 40d-40 to generate the score. This gives a range from 0 to 200 points, with 100 being the most likely (and the vast majority of scores falling within the range 70-130).

Designer's Notes: Munchkin 2: Unnatural Axe

(And Other Things Munchkin-y)

by Steve Jackson

Unnatural Axe is an expansion set for *Munchkin*. Like the original game, it's designed by Steve Jackson and illustrated by John Kovalic.

I really didn't expect *Munchkin* to be this much of a hit. I knew it was a good theme. I knew it was a good game system. I knew John's art was great. But . . . we sold out our first press run quickly. Our *second*, much bigger, press run is almost gone, and people keep asking for more.

So of course there had to be an expansion.

In fact, my only real dissatisfaction with the original *Munchkin* set was "too few cards." It was originally designed with two decks (112 cards). In playtest, we were almost always going through the whole deck before the game ended. That led to more repetition than I liked. So we figured out a way to afford an extra deck. That gave us enough cards -- a total of 168 -- that many games never saw the bottom of the deck.

However, most games still get *close* to the bottom of the deck. And while the order in which the cards appear makes a huge difference to the way the game plays, it would be even better if an average game left a *lot* of cards unturned. So I was very enthusiastic about being able to add another 112 cards. Well, when you open the package, 107, because *Unnatural Axe* has five blanks. But I figure you'll use most of them.¹

The Package

Speaking of the package . . . it's a new idea for us, and therefore worthy of mention. In order to keep the price of the expansion as low as possible, we wanted to make the packaging as *cheap* as possible. After all, you already have the *Munchkin* box. You don't need another box.

The original plan was to put it in an envelope. But retailer feedback shot that down. An envelope doesn't have a spine, which means that you can't put it on the shelf. Well, you can, but nobody can tell what's in it.

So we went around and around, and finally came up with the very simple packaging you see now. It's just a piece of cardboard, folded twice . . . but that gives it a nice wide spine. The shrinkwrap holds it together. Our standard shrinkwrap, while just fine for protecting boxes, turned out to be a bit too light for an application where it was actually required to be part of the "structure" of the package. So we use heavier shrinkwrap on that. No problem.

The feedback from the retailers so far has been favorable; unless something new comes up, you can figure we'll do more packages like that in the future when we're selling something that doesn't need a box.

The New Rules

What new rules? We don't need any new rules. We have rules now.

Yep, that was the design philosophy. *Unnatural Axe* is a true expansion, not a "rules supplement." The only new rules are on the cards themselves, and there are no new card types. I do have some new rules in mind for the game, and you

will be seeing them, but this set wasn't intended to change *Munchkin* at all, or make it any more complex or longer to play -- just to add more cards and more variety.

The Cards

To do that, it was necessary to add cards in the right proportion to avoid changing game balance. So you have additional Super Munchkin and Half-Breed cards, for instance, and some new types of Go Up A Level.

I did add one new race: the Orcs. That seemed like the next logical fantasy race, in spite of the fact that there's already a monster card with orcs on it. 3,872 Orcs, to be precise. I wondered about writing a special rule for the interaction of an Orc Munchkin with the monster orcs, and finally decided, "No, they just try to kill each other, like always."

What Comes Next?

You may have seen the ads for *Star Munchkin*. It is, in fact (big evil grin) in playtest now. *Star Munchkin* will be a stand-alone game with 168 cards. It will, however, be compatible with *Munchkin*. The card backs will be different to make it easy to sort the games out again. That means you'll always know which set the next card is coming from, but that won't make a whole lot of difference in play.

Star Munchkin adds three new races and four new outer-space-type character classes. Basic play is the same, but there are some new card *types* as well.²

And I don't plan to stop there. Another entire *Munchkin* game, of course, is approaching playtest at our Austin dungeon. I'm not telling the theme yet, but if you want another hint . . .³

And of course, our other *Munchkin* followup is the *Munchkin d20* series. It seemed like a match made in heaven . . . or someplace. Andrew Hackard is doing the heavy lifting on that project. But I'm helping. That's what I call it, anyway . . .

But we're having far too much fun to quit. See you in Munchkintown!

* * *

¹ Though I saw an interesting suggestion in the *Munchkin* group on [Yahoo!](#) . . . use the blank cards to indicate "nothing." You open the door and find . . . nothing. You search the room and find . . . nothing. The monster's treasure was . . . nothing. Now personally I don't intend to do that, because to me the essence of munchkin adventure is that you *always* find something. But it's a valid option.

² Want a hint? Okay, here's a hint: Sidekicks.

³ If you want another hint, you can wait a while; I'm really not telling.

The Venerable Bede

"The Father of English History"

by Ryan Patrick Crisp

Total Points: 105

Age 35; 5'8", 140 lbs; thin of body and face, light brown hair (tonsured), blue eyes, small patches of facial hair

Attributes: ST 9 [-10], DX 10 [0], IQ 16 [80], HT 8 [-20].

Move: 4 **Speed:** 4.5

Advantages: Reputation +2 (Most churchmen in British Isles, some Northumbrian nobles) [3], Charisma +1 [5], Clerical Investment [5], Common Sense [10], Literacy [10], Mathematical Ability [10], Patron (monastery of Monkwearmouth-Jarrow) [25], Strong Will-3 [12].

Disadvantages: Dead Broke [-25]; Reputation -1 (those who disagree with his views) [-1]; Fanaticism (Roman Catholicism) [-15]; Vow (monastic) [-15].

Quirks: Likes music; really admires Pope Gregory the Great (d. 604); doesn't like to travel far from home.

Skills: Calligraphy-12 [8]; Poetry-14 [1/2]; Singing-10 [1]; Area Knowledge (Monastery of Sts. Peter and Paul at Monkwearmouth-Jarrow)-15 [1/2]; Law (Canon)-13 [1/2]; Astrology (TL3)-13 [1/2]; History (TL3)-16 [4]; Literature (TL3)-18 [8]; Mathematics-14 [1]; Theology (Roman Catholicism)-18 [8]; Teaching-16 [2].

Languages: Anglo-Saxon (native)-16 [0]; Latin-16 [2]; Greek-12 [1/2].

Notes

The life of a monk does not lend itself towards health and strength: constant fasting, little sleep, and a rather sedentary life (when even your work is writing or copying manuscripts). What Bede lacked in physical abilities, however, he made up for with his keen mind.

The disadvantage of Dead Broke (a monk has no possessions) is balanced by the Patron (the monastery, which could even be extended to include the Catholic hierarchy in general). Living the life of a monk requires a strong will. Bede has a good reputation among most churchmen in England, and even beyond, but he has his own opinions and agenda, with which not everyone agrees, and those people would react negatively towards him. Bede shows himself, through his writings and interests, to have been quite talented when it comes to mathematics. His fanaticism for the Roman Catholic church comes out in his historical writings, where one of his main purposes is to show the triumph of the customs and practices of the Roman Church over the customs and practices of the Celtic Church. Bede's far-ranging contacts are not represented above, as they are quite numerous and thus not really feasible to display in *GURPS* terms.

Bede's skills reveal that he is not made for normal adventuring. For most of his skills, it must be remembered that Bede lives in the 8th century, and his deep knowledge of history and literature, for example, is still limited by the knowledge of the time. Thus his great knowledge of literature mainly covers the writings of such well-known Roman authors as Virgil, the Church Fathers, and the Bible. His knowledge of writing and manuscripts is covered by the calligraphy skill. What Bede knows he tries to pass on to his pupils in the monastic school. His knowledge of Greek, though, was a rarity, and he does not seem to have passed that on to many of his students.

Biography

We are actually quite fortunate to have a short autobiography which Bede included at the end of his major historical work: *A History of the English Church and People* (often referred to as the *Ecclesiastical History*). He was born in either 672 or 673, on the lands of the monastery of St. Peter and St. Paul, at Wearmouth-Jarrow in Northumbria (the region of England north of the Humber River), and at the age of seven he was committed to the care of its monks to be educated. He remained there and indeed seldom -- if ever -- left there, until his death on May 25, 735. He became a deacon at the age of 19, and a priest at age 30. He served as a teacher in his monastery for much of his life, and indeed the account of his death has him dictating to a young monk right up to the end.

He was a prolific writer on a variety of topics, and he included in his autobiographical statement a lengthy list of the works which he authored (there are no less than 31 separate works listed). Because of both the quality and quantity of his work, Bede's influence on medieval thought and learning was immense; indeed, after just a single generation, his *Ecclesiastical History* had been spread in (still extant) copies all over western Europe. In fact, copies of his work have been discovered as far away as Leningrad (St. Petersburg). He is also famous for popularizing the *Anno Domini* (BC/AD) dating system through his historical works. The quantity of his output is particularly amazing if you consider that much of his day was spent praying and observing the monastic rule, or teaching in the monastic school. Bede was used as a model by later writers, and his influence went beyond that of just an historian: his writings on orthography, rhetoric, metrics, computation, chronology, and science were used to teach students throughout the Middle Ages. His writings on the Bible were often classed with those of the early church fathers, and he himself would have declared these his most important achievements. But, to modern historians, his most important work was his *Ecclesiastical History*, without which we would know much less about early Anglo-Saxon history.

Bede lived in an era of relative peace and stability. The latter stages of his life mark the beginning of what some have called the Northumbrian Golden Age. Although the stability of the Northumbrian monarchy was beginning to break down near the end of his life, learning and art flourished in this region for much of the 8th century (basically until 793 when the Vikings arrived at the island monastery of Lindisfarne). Northumbria was heavily influenced at this time by Irish art and thinking (and Bede could find a place in a fairly straight-forward Celtic Myth campaign). Bede had contacts far and wide, throughout England, and probably Scotland, Ireland, and Gaul as well. He even had contacts as far away as Rome (Rome was a favorite pilgrimage spot for Anglo-Saxons -- more than one Anglo-Saxon king went on pilgrimage to die there). Among his contacts could also be included some of the kings of Northumbria (such as Ceowulf (r. 729-37), to whom Bede dedicated his *Ecclesiastical History*) and various English bishops (one bishop of York, Egbert, was even his pupil).

Encountered

Monk and Teacher

About the only way PCs might encounter the Venerable Bede is to visit him in his monastery. If they are Anglo-Saxon, or even Irish, monks from the period, it is quite possible that they could have gone to school at Monkwearmouth-Jarrow as a young monk, and been Bede's pupil at the renowned monastic school there. Travelers from all over England, Ireland, and perhaps even Gaul, might stop and spend the night at his monastery on their way to parts elsewhere. PCs of a scholarly bent would definitely want to go and meet the learned monk, but could also maintain some sort of regular long-distant correspondence with him; thus they could serve as one of Bede's far-flung contacts, and Bede could serve as one of their contacts.

The Wise Man of the Mountain

In a lot of ways, the Venerable Bede is like the mythical wise man or sage on the mountain, and heroes could seek him out for answers to their questions -- of course, they'll always find him in the monastery at Jarrow. Given his contacts spread throughout Christendom, it is quite likely that if something important has happened a couple of months earlier, Bede knows about it. Likewise, anyone interested in learning or scholarship in his day would have known of him. His

most obvious role in a game, therefore, is to serve as a mouthpiece for a GM to relay background information, instructions, or clues to players.

His knowledge of the Bible should be considered practically perfect (he wrote treatises on close to a third of the books of the Bible), and he is one of the few men of his day in England, and indeed Western Europe, who could read Greek. . . although he mainly used this knowledge to study the Greek New Testament. Bede also loved music and anyone with musical abilities would be especially welcomed by him to the monastery.

For those with an inclination towards high weirdness or the occult, Bede was an expert in the computus (the skill of calculating the exact date of Easter). He wrote two books on the nature of time, one on the Tabernacle, and a martyrology (a sort of calendar of the feast days for various saints, including information on how they died, and perhaps some of their reported miracles). Thus, while not specifically drawn towards the occult himself, Bede would be an important source of information on the struggle between good and evil, on both the physical and spiritual planes.

Time Travelers

Lost in the Early Middle Ages and need a guidebook? Desperately wishing you had access to the *Encyclopedia Britannica*? If a time traveler were to land in Western Europe between the early 8th century and the 12th century, one of the best (and most available) sources of information would be some of the works of the Venerable Bede. Bede's historical works could serve as a rough guide to find churches and monasteries (and their resident bishops and monks) or pilgrimage sites in England. His works dealing with time and calendars might come in handy for someone who really needs to know the date (in a way that is relatively compatible with modern dates). Monkwearmouth-Jarrow (and later York) had an incredible collection of books, and almost anything (still extant) that the PCs could want might be found there.

Are you a GM who wants to know what people really knew and understood about their world in the 7th and 8th centuries or even beyond? Look no further than Bede! His works include books on science, music, poetry, language, history, and (of course) the Bible. Many of his books have been translated, although many still have not (better brush up on that Latin!).

Non-Historical Use

While Bede seems to mainly fit into a regular historical campaign (Celtic Myth or Time Travel), with a little modification he might fit well into a fantasy campaign. Bede might be cast as a wizard or a cleric, perhaps the head of a school of young wizards or clerics: the learned master, whose knowledge of magic or the gods is unsurpassed in his region. His low point total leaves a lot of room for adding magical abilities and spells.

On an alternate earth, it is possible that Bede was not given to the monastery at age 7 and either followed his father in his profession, or only came to join the monastery later in life. In the first instance, the effect on the medieval world could be quite devastating. Perhaps someone else took up his work, but it is just as likely that the history of early Anglo-Saxon England never gets written, the general acceptance of the *Anno Domini* dating system is pushed back (or perhaps never really adopted), and the various textbooks and treatises which served as core books in medieval education are not available. It is up to the GM to decide how great an effect on later medieval history this could have. A later entry into the monastery leaves him less time to write all that he wrote (depending on how late he finally enters), and again the GM must decide which books get written. His outside experiences could also change the way he wrote his history.

Further Reading

Our main source for the history of 7th century England is Bede's *Ecclesiastic History* (available in several editions), and anyone considering running a campaign in the early Anglo-Saxon period should read this book just to get a feel for what life was like, and who the major players were. Not everything he says in his history is necessarily true, but he

does reflect the general world view of Anglo-Saxon England (especially Northumbria) in the 7th century.

Perhaps a little out of date -- but still quite useful for gamers -- is Peter Hunter Blair's *The World of Bede* (1971), which provides a good background to the history of Bede's day as well as some specific details about the life of a monk or a scholar in this period.

Enter the Zombie (for All Flesh Must Be Eaten RPG)

Published by [Eden Studios](#)

Written by Al Bruno III, Richard Dakan and Jack Emmert with Colin Chapman, Derek Guder and Gerry Saracco Illustrated by Storn Cook, C. Brent Ferguson, D W Gross, Francis Hogan, Matt Morrow, Christopher Shy and George Vasilakos

7.5" by 9.5" 176-page perfect bound softback; \$20

In *All Flesh Must Be Eaten*, Eden Studios explored the nature of the zombie in all of its shambling glory. It enabled the Zombie Master (as the GM is known in *AFMBE*) to design his own muscle munching members of the walking dead and then pit them against the players in some "last days of humanity . . ." Beyond the basic concept, the game came with over ten "Deadworlds" that served to show how much could be done with the basic zombie in various different settings. Yet "The Zombie Survival Horror Roleplaying Game" possessed one inherent limitation: there was still only so much mileage to be made of the encroaching apocalypse/post-apocalypse survival type of game. Games not only tended to be rather finite in length, but also rather depressing in nature, especially in the face of an endless swathe of zombies . . .

Thus every Zombie Master, or ZM, will be pleased to hear that Eden has released the much-anticipated second supplement for *AFMBE*. *Enter the Zombie* revives the genre by combining it with another . . . namely that of Hong Kong cinema. Not only does this book present new, tougher martial arts for Eden Studios' Unisystem game engine -- more so than in their *Witchcraft RPG* -- it also provides rules for players to build, design and play zombies as their characters.

In *AFMBE*, players could select and build characters based upon one of three types: Norm, Survivor, and Inspired. *Enter the Zombie* suggests that to get the most out of its contents, these three should be ignored in favour of just two new types: the Martial Artist and the Shooter. Character creation is the same as in *AFMBE*, but when the Martial Arts skill is purchased, each level of skill also provides points to be spent on maneuvers. These are generic types of martial arts moves -- such as Back Kick, Jab, Judo Throw, and Roll With Blow -- rather than anything specific to a school of martial arts. The author has made no attempt to quantify the many schools possible, as this would consume no small amount of space. Instead, players and the ZM are encouraged to create their own, although they could do no worse than peruse *GURPS Martial Arts* for further information.

Should either Martial Artist or Shooter purchase the "Gifted" Quality, they gain access to a whole range of Special Chi Techniques that essentially allow characters to do all of the cool things they have seen in *Hard Boiled* or *Crouching Tiger, Hidden Dragon*. These include Acrobatic Shooting, Catch Bullets, Flying, Healing Touch and Two-Fist Firing, among others. Although every character possesses a certain amount of Essence, it is likely that they will need more, as each Chi Technique costs a certain amount to use per turn. Overall, both new Character Types come out as quite tough, which is not surprising, given the cinematic nature of the genre they are modelling . . .

As an alternative to either the Martial Artist or Shooter -- and if the ZM allows it -- players can take zombies as their characters. But zombie PCs in *Enter the Zombie* are not members of the shuffling corpse cortege we know and love from *AFMBE*, but quick as a flash, sharp-shooting, butt-kicking, combat-loving cadavers. In other words, zombies can also be Martial Artists or Shooters, even though they are dead! Zombie PCs must take the Long Term Memory and Problem Solving Aspects from the "Anatomy of a Zombie" chapter in the main rulebook, plus whatever zombie

aspects the ZM has mandated for their chosen setting.

Zombie character creation is little different to that of normal characters, but they have a greater flexibility in where they can assign their points, unlike other characters under the Unisystem. Further, and while they also have access to the Special Chi Techniques, they have their own Aspects to choose from as well. These include the Burrowing Finger, which allows a zombie to send their index finger burrowing into an opponent's flesh to find their weak spot; the Entrail Whip, or using the intestines to whip or entangle an opponent; Hand-Gun, concealing a stripped down pistol within the hand; Shuriken Nails -- handy projectiles always at a zombie's fingertips; and the Torso Turret, for when a zombie just wants to track a moving opponent with ease, they just plant their legs firmly and quite painlessly swivel their body through 360°! There are enough of these zombie Aspects to keep every player happy; combined with the Martial Arts rules, the zombie PC really is tough enough to take on an ordinary Martial Artist.

The rest of *Enter the Zombie* presents four Hong Kong cinema-inspired "settings" as opposed to the various Deadworlds in *AFMBE*. These settings replace the overwhelming sense of doom to be found in a Deadworld with a strong air of desperation. This is done by scaling back the method of making more zombies, whether artificially or by their own spreading the love. Players will find -- probably much to their dismay -- that their zombie characters cannot just make new undead friends, whether from NPCs or the other cast members. As with the main rulebook, each setting is fully described and comes with two chunky scenario outlines and four fully stated characters to use.

[SPOILER ALERT]

"Hard Boiled Corpses" is the first setting, inspired by both John Woo and George Romero. Set in post-handover Hong Kong, the city has of late been swept by a new drug known as White Thunder, which is more addictive and lethal than heroin. In the wake of the drug, there has been a wave of crime committed by almost unstoppable junkies. Are they zombies hooked on White Thunder or junkies in body armor? Cast members can be police officers or triad members assigned to track down the source of the drug, both unaware of the zombie problem. Alternatively, they can begin play as zombie junkies desperate for their next fix. The first option will be a gun bunny's dream, while the second should be fun for all the players as they discover their unique zombie abilities.

The second setting does not so much take a leaf off John Carpenter's *Big Trouble in Little China* as steal the whole tree and make a run for it. "Flesh Eaters in Little China" is set in San Francisco and pits the cast members against a wealthy philanthropist, businessman and crime lord, who just happens to be a five-thousand-year-old Chinese sorcerer. This setting includes basic rules for his sorcery in play (though ZMs are encouraged to check out *Witchcraft* should they want more information), a guide to his underground room shifting palace and descriptions of the various street gangs and martial arts schools found in the area. The first scenario suggests that the cast members be somewhat-tough tourists caught up in the middle of the war between the sorcerer and the gangs -- stolen truck and green-eyed princess both optional, of course. The second has them cast as members of one of the gangs caught up the war and knowing just a little more than the tourists in the first, but not much.

"Once Upon a Corpse in China" takes the cast back into the past and an age of competing martial arts schools and ancient tradition. One of the schools in the area has been attacked and destroyed by some unknown force. The players can be the magistrate and members of his entourage sent to investigate the disturbances in the area, or actually be the cause themselves. Of the four settings in *Enter the Zombie*, this one seemed the least attention-grabbing, and it's questionable whether or not the ZM or the players will get as much fun out of it.

Fans of beat 'em ups will enjoy "Undead Combat", the fourth setting that is clearly inspired by the *Mortal Kombat* games and films. Every twenty-five years, millennially ancient Persian Magi bring their armies of the dead together to fight in a tournament. Zombies, you see, need to consume an undead soul once every twenty-five years or they are in danger of giving into the hunger and going on the rampage until sated. Their Tournament of Souls also stops the Magi wasting their zombie assets in wars against each other. This year's tournament is different, because the host has invited some the world's best "mortal" martial artists. Players can take these as their characters, or even compete as zombies through the fight. Alternatively, they might be members of the Magi armies who are dissatisfied with their lot and want to set out on their own . . . The setting for "Undead Kombat" is an island in the Malay Archipelago, now built with several different types of arenas in which to stage the fights. Every fight is to the death; should a mortal actually

win, guess what makes the best kind of zombie in this setting . . . ?

[END SPOILER ALERT]

Enter the Zombie is done in the same style and layout as *AFMBE*. This does mean that not all of the art is as good as the rest, but overall this is nice-looking book. The color fiction is also an enjoyable and unpretentious read, and it could form the basis for a setting of its own, should the ZM be so minded. One gripe readers may have is that the book is gives over eight pages to self-advertising other Eden Games. Although not necessarily objectionable in principle, perhaps they could have been cut in favor of actually illustrating the martial arts weapons described in the text.

It should be pointed out that although *Enter the Zombie* describes itself as "A Hong Kong Action Theatre Sourcebook," it is not actually a sourcebook for that game, and the only stats and rules in the book pertain to *AFMBE*. Yet if you happen to own either the *Hong Kong Action Theatre* or *Feng Shui RPGs*, there is absolutely nothing to stop you using *Enter the Zombie* for inspiration . . . or just for the pilfering of its ideas and settings; the settings would work well under either game.

Enter the Zombie is an excellent supplement to buy, not just for *All Flesh Must Be Eaten*, but also for any game based on Hong Kong cinema. It showcases how well zombies can be made to work under another genre, and both Zombie Master and the players should get a kick out of actually playing a zombie. Here's hoping that Eden Studios' other planned genre books -- *Pulp Zombies* and *A Fistful of Zombies* -- are just as good and just as fun.

Pyramid Review

Marvel Recharge CCG

Published by [Marvel Entertainment Group Inc.](#)

Designed by Bill Jemas

Starter Deck: 52 cards, 20 counter chips, rulebook, \$7.99; Booster Pack: 8 cards, \$1.49

First, there was *Overpower*, and it was good. Well, no it wasn't, but it was one of very few superhero collectible card games released during the CCG-crazed 90s so we played it anyway. While *Overpower* featured characters from many comic universes, such as DC and Marvel, it was plagued by uneven art, unbalanced expansions, and less-than-stellar support. By the end of last century it had floundered and further development for it was scrapped.

The new century begins with a new superhero collectible card game called *Marvel Recharge*. Unlike *Overpower*, it contains characters from only the Marvel Universe, features great art, contains simple rules, and has a theme that hangs looser than a hoop skirt on a fashion model.

Since this is a CCG, the complete *Recharge* card set contains 250 cards of varying rarity. Some cards are foil cards, and rare cards are often more powerful than the common cards. In the tournament version of the game, however, a deck may contain only one copy of each card. Thus the advantage of spending vast amounts of money on the game is mitigated.

In *Recharge*, each player has a deck of Hero cards, Power cards, and Teamwork cards. Each card has a point value that determines its strength in a fight. Cards also have a color border on their right and left sides. This determines which cards may be played together in a fight, as colors must match. The border also has symbols, so color-blind players should be able to determine which color is which. Finally, some cards have special instructions that break the rules or give the card extra power in certain situations.

The rules are easy to learn, although they vary a bit depending on whether you are playing with just a starter deck, playing a tournament game with customized decks, or playing with more than two people. There are even rules for playing with a single booster pack.

Each player begins a tournament game with a customized deck of any size, along with 25 counters valued between one and five. These counters must add up to a value between 50 and 65 points and are used to wager on battles during the game. The winner of a battle wins the wagered counters, and the first player to win 70 points wins the game.

Players begin with only one card in their hands. On a player's turn, she draws one card and chooses whether or not to initiate a fight. To start a battle, the attacker lays one Hero card on the table and wagers a single counter. The defender draws one card and decides if he wishes to participate in the battle or simply concede and let the attacker win the wagered counter without a challenge.

If the player chooses to defend, he also lays down a Hero card. He can also play a Power card, assuming the color borders match on both cards, to increase his total point strength. He can play a Teamwork cards that matches color which allows him to bring another Hero card into the battle. He must play enough cards to exceed his attacker's point strength. He also has the option of wagering one of his counters.

The attacker now has a chance to play additional cards to increase her points. If the defender wagered a counter, she

can wager another as well. The attacker and defender alternate playing cards and wagering counters until the losing player can not play enough cards to exceed his opponent's point strength.

The winner of the battle takes all of the wagered counters and adds them to her victory pile, regardless of who actually bet them. Players discard all cards played during the fight. Then they must discard and draw so they have three cards in their hands. The loser of the last fight goes first in the next turn, draws a card, and determines if he wishes to attack. This continues until someone wins 70 points' worth of counters, or until someone runs completely out of cards.

Marvel Recharge is an odd CCG in that it feels more like a traditional card game than a typical collectible game. Also, its theme of superhero and supervillian battles has little to do with the actual game play. All that really matters is the point value and color borders of the cards. That your Rhino Hero card is teamed up with the Sentinels and Professor X is perfectly legal although it makes little sense to comic book readers.

Still, **Recharge** has much to recommend it. Although the rules are straightforward -- some critics on the Internet believe the game is too simple -- playing the game takes quite a bit of thought. Players must choose their battles wisely so as to not waste powerful cards. They must judge the worth of a fight to decide if they want to defend, or simply concede and save cards for higher counters later. At the same time, players can not hoard cards looking for the ultimate hand because they discard down to three after every fight.

The wagering mechanic is a great addition as well. It modifies the worth of each battle so players have to determine how many cards they should use for each fight. It also allows for the kind of bluffing you would expect in a good Poker game.

With great art, fun mechanics, and simple rules, **Marvel Recharge** stands out in the crowded CCG market. Granted, it does not create the feeling of a comic book story, and players may miss the satisfaction of building up a character and watching it win many battles, however it still manages to be fun and somewhat original.

Pyramid Review

Spycraft RPG (for d20)

Published by [Alderac Entertainment Group, Inc.](#)

By Patrick Kapera and Kevin Wilson

Art by Storn Cook, Jonathan Hunt, A. Bleys Ingram, Garry McKee, Richard Pollard, Mike Sellers, Ethan Slayton, Dan Smith, Paul H. Way, and Jeff Wright

288 pages, hardbound, black and white; \$34.95

Good evening, agent Gamesman. Your mission, should you choose to accept it, is as follows:

Your cover will be that of an ordinary roleplayer in search of new and exciting material for a weekly social gaming event. Following this briefing, you should proceed immediately to the pickup point; the agency's offices use the front of a friendly local game store.

A training manual for use in educating new agents has surfaced, and Control requests that you intercept a copy. A team known only as Alderac Entertainment Group, Inc. designed this manual for use in conjunction with the *d20* system, an insidious mechanism that seems to be permeating every level of our profession. The project is codenamed [Spycraft](#).

Intelligence operatives have identified two moles at AEG, Patrick Kapera and Kevin Wilson, experienced agents who authored the project. They have leaked information about the work to members of the community at large and advertised their desire for monetary compensation. It is clear these men have piercing insights into every level of the world of espionage, and have included this information in their work. This includes, but is not limited to:

- **Weapons and Equipment:** Although generic in nature, Kapera and Wilson's primer on the various munitions available covers a wide range of applications. No doubt once they have piqued the interest of potential buyers, they will offer additional material in later volumes to the highest bidder. They also provide extensive notes on some of our industry's best-kept technological secrets, from vehicular upgrades to covert equipment to super-science espionage gadgetry unavailable to local law enforcement precincts.
- **Feats:** Agents with the right expertise know that certain deeds are endemic to our exploits. Trained as we are with vehicles, weaponry, and team leadership skills, we know maneuvers and tricks of the trade that the average civilian is unfamiliar with. The authors, probably in an effort to entice hopeful new recruits, do nothing to dispel the idealized notion that spies can drive cars on two wheels, pass guards silently at a dead run, change clips in a heartbeat, and impersonate anyone from the janitor to the prime minister. Clearly they know how to seduce bright-eyed initiates.
- **Skills:** Much like weapons, the skills presented are fairly expansive, condensing the complex execution our work demands to a few key elements that are applicable to a wide variety of situations. Rather than intimidate the incoming cadet with the full body of knowledge with which he must become familiar, the project overseers have chosen to simplify the material to a broader, more cinematically appealing sampling.
- **Chases:** Pursuits are as much a part of our efforts as investigations, and an entire chapter of the handbook is devoted to the resolution of same. Everything from foot pursuits to high-tech aerial dogfights are described in this primer, which reduces the theoretical participants to predator and prey and boils down the most common

tactics used by both sides during these very dangerous exercises into an abstracted exercise easily absorbed by the freshman spy.

- **Classified Diagrams:** Many of the practices delineated in this guide are clearly illustrated. Diagrams of tactics and training maneuvers are crisply presented, and wholly gratuitous artists' renderings of agents in action are used to skillfully and shamelessly glorify the jet-setting life of an international spy.

In addition, the manual is an attempt to condition newcomers to the Great Game. It is written to fully submerge the reader in the material, and only after a trainee has been lured by the fanciful graphics and pleasant presentation does he realize how comprehensive a work this is. Tantalizing glimpses into the job of "Game Control" suggest AEG has double agents working in that section, and it attempts to pass its clandestine knowledge of these skills to the newbie and the veteran agent alike. Thanks to our efforts, similar codices have failed to provide the same thorough level of detail concerning investigations, technology, mission types, and more, which demands we scrutinize this work with a suspicious eye.

Kapera and Wilson are obviously well versed on all fronts of the covert war, providing detailed -- some readers might say too detailed -- information. Control believes that, rather than liquidate these men, our agenda would be better served by cultivating a relationship with them and their talented staff, that we may benefit from their research before our competitors do.

Time is of the essence. You may find yourself in contention with other agencies intent on procuring this information, and while our agency has its own way of accomplishing its goals, we have it on good authority that AEG operatives will be building on the data in the *Spycraft* manual with the *Shadowforce Archer Worldbook* to delve deeper into the workings of that organization. We are certain other exposes are forthcoming.

As always, if you are caught or captured, the Secretary will disavow any and all knowledge of your actions. This message will self-destruct in five seconds.

--Andy Vetromile

If The Secretary of Defense Falls From An Empty Room, Does It Make A Sound?

"This fall I think you're riding for -- it's a special kind of fall, a horrible kind. The man falling isn't permitted to feel or hear himself hit bottom. He just keeps falling and falling. . . . I don't want to scare you, but I can very clearly see you dying nobly, one way or another, for some highly unworthy cause."

-- Mr. Antolini, in *The Catcher in the Rye*, by J.D. Salinger

If an imaginary conspiracy kills someone, is it still an imaginary conspiracy? If a real conspiracy plans a suicide, is it a murder? These are just some of the questions left dangling from the sixteenth floor window of Bethesda Naval Hospital, surely one of the most death-haunted fanes in America's secret geometry. The death of James Forrestal, the first Secretary of Defense, is bisociation as tragedy, as irony, as paradox -- and, just possibly, as murder weapon. This is where Forrestal cashed in. This is the window ledge leading to Outside. Let's take the next step.

"Well, I may have been in the position of not being able to see the forest for the trees because I was seeing him six, eight, ten, twelve times a day and both in and out of the office. A lot of his friends have said since his death, 'Oh, we saw it coming,' and, 'We knew this and we knew that.' The only thing that I knew was that he was terribly tired, terribly overworked, spending frequently literally sixteen hours and eighteen hours a day trying to administer an impossible mechanism, worrying about the fact that a lot of it was of his own creation."

-- oral testimony of Marx Leva, special assistant to Secretary Forrestal

James Vincent Forrestal was the son of an immigrant Irish bricklayer, and a combat pilot in World War One. When World War Two loomed, he left his job with the Wall Street firm of Dillon, Read and became FDR's Undersecretary of the Navy, rising to Secretary of the Navy in 1944. His Wall Street contacts and financial acumen helped build a stable, productive, and surprisingly efficient military procurement program for the war effort. In 1947, when President Truman reorganized the service departments under the newly-named Department of Defense, Forrestal became the first Secretary of Defense and immediately ran into a brick wall.

President Truman wanted to balance the budget, reorganize and unify the military, and contain Communism -- a nearly impossible task even for someone of Forrestal's talents. Forrestal rapidly made enemies in the new climate of cutbacks and controls, chief among them Stuart Symington, the Secretary of the Air Force. Forrestal began going around the bureaucracy, talking with Republican leaders about his programs -- and, quite possibly, feeling them out for a job with the Dewey administration everyone in 1948 expected. When Truman won, Forrestal lost the President's confidence, and added Attorney General Thomas Clark to his list of opponents. Outside government, his reflexive (even strident) anti-Communism made liberal columnist and broadcaster Drew Pearson a personal foe as well.

Pearson's campaign of leaks and innuendo, Clark's harassment, and Symington's obstructionism rapidly hemmed Forrestal in. He became convinced of enemies in all levels of government, complaining of being followed by "foreign-looking men" and of a "Communist or Zionist" plot against him. Secret Service chief U.E. Baughman reported to Truman that Forrestal was suffering "a total psychotic breakdown." Truman replaced Forrestal at Defense with Louis Johnson in a public ceremony on March 28, 1949. Symington insisted on riding back to the Pentagon with Forrestal that afternoon -- what they said in that closed car has never been made public. When Forrestal was discovered later that evening, he would only repeat the words "You are a loyal fellow" over and over. He had suffered a complete nervous breakdown.

*"Better to die, and sleep,
The never-waking sleep, than linger on,
And dare to live, when the soul's life is gone."*

-- Sophocles, *Ajax* (from the poem Forrestal was copying on the night of his death)

Friends flew Forrestal to Florida to recover, but he continued to have nightmares of suicide and being followed. He was finally placed in Bethesda Naval Hospital, in the VIP suite on the 16th floor, with a diagnosis of "involutional

melancholia," essentially serious clinical depression. The wall of government secrecy closed in; Forrestal's close friend, Monsignor Maurice Sheehy, was denied permission to see him, and even his brother Henry had to threaten to go to the press to be allowed in at all. Isolated and alone, Forrestal brooded and read, until the morning of May 22, 1949. His guard, a navy corpsman named Robert Wayne Harrison, saw him on a routine 15-minute check at 1:45 a.m., apparently copying the chorus of *Salamis* out of Sophocles' tragedy *Ajax*. He got as far as the word "nightingale." During the next fifteen minutes, according to the coroner's report, Forrestal walked next door to the kitchenette, knotted his bathrobe sash around his neck, tied the other end to the radiator, opened a screen window, and stepped out. The sash came untied, and Forrestal plunged to his death, striking the building and landing on a third-floor roof.

"Just because you're paranoid doesn't mean they're not following you."

-- Delmore Schwartz

Here, of course, is where irony compounds tragedy. Forrestal had good reason to suspect a conspiracy against him; the historical record amply demonstrates that much. The Venona intercepts, among other recent revelations, document a thriving Soviet spy ring within the Truman administration -- one that would hardly be above setting watchdogs on Truman's most devoted anti-Communist cabinet member. Furthermore, his aides (and possibly Forrestal himself) *were* under surveillance by Israeli secret agents concerned, with good reason, that Forrestal was attempting to end American support for Zionism. Most of the reports of Forrestal's mounting paranoia come either from Drew Pearson (hardly an objective source) or from Secret Service chief Baughman -- who, it transpires, was in fact *also* having Forrestal followed. What better cover for your own surveillance than to smear your target as suffering from paranoid delusions?

Among Forrestal's "delusions" was the prediction that the U.S. would be at war with Communism within a year (which came true in Korea in 1950), and that the Soviet Union would attempt to expand its influence in the Third World, that guerrilla warfare could pose a serious challenge for American forces, and that American support for Israel would anger the Arab states and endanger our oil supply. In short, a verdict of delusional psychosis must remain not proven, at least from the evidence at hand. In fact, at the time of his death, the doctors at Bethesda apparently believed him sane enough to take him off anti-depressants (in retrospect, probably not a good idea) and to prepare to release him the next day to his brother Henry.

"Father Sheehy had reason to suspect murder. When he arrived at Bethesda Naval Hospital after learning of Forrestal's death, an experienced-looking hospital corpsman approached him through the crowd. In a low, tense voice he said: 'Father, you know Mr. Forrestal didn't kill himself, don't you?' Before Sheehy could respond or ask his name, others in the crowd pressed close, and the man quickly departed."

-- Richard Dolan, "The Death of James Forrestal"

But the day Henry was to remove Forrestal from Bethesday was the day Forrestal was permanently removed. The details of that removal niggle even today. A former Navy man couldn't knot a bathrobe sash to a radiator, but could "tightly knot" that same sash around his own neck? Why did the coroner refuse to determine whether strangulation had occurred prior to death? Why try hanging himself at all, if the window screen came off that easily -- why not just jump? What did the scuffle marks on the window ledge mean -- were they "hesitation marks" -- or the signs of a struggle against a murderous intruder? In fact, we only have the guard's testimony (and he a new man, added at the last minute after Forrestal's regular guard got drunk and went AWOL the night before) that Forrestal copied out the poem that night rather than on some other occasion.

Coming so soon after Czechoslovakian Foreign Minister Jan Masaryk's eerily similar "suicide" from a high window in 1948, many observers on the scene fingered the obvious suspect: the KGB. Joseph McCarthy (who also died suddenly, although admittedly of hepatitis, at Bethesda) regularly referred to Forrestal's death as a "murder," daintily leaving the question open of whether the Commies "hounded Forrestal to his death" or had him "thrown . . . from that sixteenth-story window." (Nixon, no stranger to paranoia, refused to enter Bethesda for treatment after resigning from the Presidency.) Our modern-day conspiracy theorists draw similar parallels to the mysterious defenestrations of CIA biochemist Frank Olson (who fell out of a hotel window in 1953 after -- and this is the kindest possible construction of events -- a CIA hazing prank with LSD went wrong) and Soviet agent (and former State Department official -- and friend of Drew Pearson) Lawrence Duggan, who also fell from a sixteenth-floor window above Fifth Avenue in New York.

"OPERATION MAJESTIC-12 is a TOP SECRET Research and Development/Intelligence operation responsible directly and only to the President of the United States. Operations of the project are carried out under control of the Majestic-12 (Majic-12) Group which was established by special classified executive order of President Truman on 24 September, 1947, upon recommendation by Dr. Vannevar Bush and Secretary James Forrestal."

-- "Operation MAJESTIC-12 Preliminary Briefing for President-Elect Eisenhower," attributed to Adm. Roscoe H. Hillenkoetter

But the CIA, or even the KGB, aren't the most shadowy suspects available to us. As Secretary of the Navy, Forrestal had access to all top-level military secrets, including the atomic test program -- and other secret developments in New Mexico. Forrestal's diaries (released in edited form in 1951 after spending two years locked up in the White House) have no entries whatsoever from July 3 to July 13, 1947 -- the period of the Roswell crash. Did Forrestal travel to New Mexico to meet the aliens? Was this the beginning of "the most terrifying hallucinations and horrifying delusions" he suffered? The "Majestic documents" clearly identify Forrestal as a member (in fact, as the co-founder) of Majestic-12 -- did his increasing instability endanger the project? Was he threatening to blow the gaff, or was his personal communion with the entities threatening for a different reason? Did MJ-12 deem "the untimely death of Secretary Forrestal . . . necessary and regrettable," as Annex C to the Majestic documents indicates? Did they send the (traditionally "foreign-looking") Men In Black to do the job, or subcontract it to the ONI's Project CHATTER (a mind-control project that became MK-ULTRA -- and killed Frank Olson)?

Or was Forrestal a casualty of World War II's occult struggle? Forrestal was "MJ-3" (the third of the Twelve), and killed on the first day of Gemini (the third of the twelve signs of the zodiac). That day, that degree, of Gemini, corresponds to the trachea -- hence the (ceremonial?) strangulation. Was Forrestal's thirteen-story (!) fall the Fall from the Tower of the Tarot -- a card also known as the Hospital? If an occult branch of the [Antarctic Space Nazis](#) killed Forrestal, it must have tickled their sense of irony to throw the man responsible for Operation High Jump (Admiral Byrd's assault on the Nazis' Antarctic refuge) out of a window. Did his killers send another message as well, hidden in the poem found in his room? During the war, there are indications that Forrestal may have worked with future CIA founder Allen Dulles on the attempt to remove Hitler and replace him with an anti-Communist general allied to the West, thus transforming WWII into an anti-Communist crusade. One of Dulles' key contacts was the leader of a Ukrainian nationalist army -- the Nightingale Battalion. Was the word "nightingale" Forrestal's last message to the world -- or that of his killers, the CIA-Majestic ritual murder team of MIBs working for the Antarctic Space Nazis? Why not believe it? It only takes a leap of faith.

Toybox Tribes

(**NOTE:** *Some assembly **definitely** required . . .* This *Campaign in a Box* is experimental: in it, a GM can generate several different settings from a single concept. The main body text of the article holds the "truisms" of the core setting, while sidebars include different options to implement.)

Genre: (Fantasy or Science Fiction) and/or Horror

Style: Action, Intrigue

Themes: Revelation, Survival

Campaign Setting and Background Information

A life-taking wasteland surrounds three kingdoms: the Queen's Realm, the Desert of Glass, and the Clans' Land. The two guardians of the Three Worlds -- whether they were gods, aliens, or something else -- have gone away, leaving their people to fend for themselves, free to make their own destiny.

(What do living toys do when no one is there to play with them? Evolve a culture. Bound to three rooms, these playthings must make the best of their situation.)

What Everybody Knows

Of Other Worlds

Inhabitants of both the Queen's Realm and the Clans' Lands know of the existence of the Desert of Glass, but discount legends of the other kingdom, considering them wild travelers' tales. Some say the god(s) laid down

OPTIONS: Changing the Map and the Non-Toy Game

If the inhabitants of the Three Worlds do not *realize* they are toys, or to port this setting to a

restrictions about going to another world; others claim that even if another world existed, people probably couldn't survive there: the life would be ripped out of them, just as it is when one passes Outside of the Universe (see below). Still, the Gates (one to Outside, and one to the Desert) stand as a testimony to other places. Very small Three Worlders -- especially Plush and Beasts -- can slide through the crack under a Gate into another world. Opening a Gate is a difficult job, requiring good light and a number of Three Worlders acting in concert . . . a task not taken lightly.

Day & Night

There is a cycle of day and night as light streams in through the Great Squares. Given the position of the Great Squares, the Queen's Realm has a regular brightening and fading of light (as the Real World sun transits). However, the Desert of Glass and the Clans' Lands experience a longer, gradual morning, followed by an intense and short afternoon (since their Great Squares face the west). Indeed, the Clans' Lands are the best lit, since they have three Great Squares.

Outside the Universe

The red doors on the map -- "The Portals to Outside the Universe" -- open up into a vast hallway. Three Worlders shy away from them, for once one passes through to Outside, they fall down lifeless. If dragged back Inside, they will recover after a day (unless *OPTION: Scarce Resources* is being used, see below) with no memory of the experience. The floor of Outside is littered with the never-rotting corpses of those too far away (or too disliked by their companions) to be rescued. Some Three Worlders who have climbed the skies to the Great Squares have looked out on a different Outside, at once strangely familiar but also bizarre. Reports vary tremendously -- sometimes all is covered with ice (or ash, or vegetation, or darkness), sometimes all is aflame or drowned in water, and sometimes the Outside looks like a twisted version of the World.

Eating, Drinking, & Sleeping

While Three Worlders have no need to eat or drink, they do have a slight dependence on energy (see *What Everybody Doesn't Know* and the *OPTION: Scarce Resources* sidebar for a further discussion of energy) and water. Three Worlders restore their energy, (used to survive, move, and activate special powers or accessories) by sleeping at least 8 hours per 24-hour period.

Water is a valuable commodity: scant everywhere outside of the Desert of Glass (which has a wealth of standing water as well as access to more), it's useful for cleaning and purifying things. Inhabitants of the Queen's Realm view it as a sacred sign of rulership; the population of the Clans' Lands needs it to properly utilize the Herds (see each World below for further details).

Living & Dying

Three Worlders can generally take substantial physical damage before temporarily or permanently deactivating.

- *Injury/Dismemberment*: Three Worlders do not need to breathe, and cannot drown or be suffocated. They do not bleed, but are weakened by limb- or stuffing-loss. They survive impairment regularly, even if all limbs -- and in rare cases, the torso -- fall off or are completely emptied of stuffing. Clans' Landers carry True Weapons (see below, *Weapons & Accessories*) that "numb" the struck area of the target. It takes

non-toy game, the map of the bedrooms and bath can be reinterpreted into a traditional geographic or political map. For example, the doors and walls become mystic fogs sheltering each land from its neighbors, the vast gulfs of space between three planets, or geographic features like rivers or mountain ranges. The dressers and bookcases become lonely peaks; the beds, mesas or highlands; the carpets, lush plains; the bathtub and sink, large inland lakes; and the toilet, a dormant volcano. (Remember to insert some forests, rivers, and streams.) The toys could then be humans, monsters, and animals as necessary. *Voila!* Instant non-toy setting!

OPTION: Scarce Resources

When this option is in force, the power field that allows Three Worlders to function is damaged. (For Fantasy, this means that the enchantments on the Worlds weaken at night, and

approximately 3 hits for Clans' Landers to totally incapacitate each other; functionality is regained at a rate of 2 hours per hit taken. So if Guy Jozef hits a Trooper in the arm, the Trooper regains the use of his arm after 2 hours; if Guy shoots the Trooper in the head twice, the Trooper is unconscious for 4 hours. The effect of Clans' Landers' True Weapons on Queen's Realmers or Glass Desert Dwellers is unknown.

- *Healing*: Three Worlders are "healed" by physically repairing/reassembling/reattaching/restuffing their bits and pieces, then waiting two hours. Functionality is restored: no fuss, no muss. However, repairs may not look pretty, and purely cosmetic or surface damage -- scars, scratches, dings, dents -- won't heal at all. In addition, Three Worlders can integrate "non-original" parts and pieces in the healing process. If Prince Kenneth lost an arm while fighting The Boneless Thing in the Desert of Glass, he could get a replacement (female) arm from one of the Ladies (or more likely, one of the Ladies' servitors) vying for his heart. The female arm would function exactly as his original arm did, but would look very strange, and his shirts wouldn't fit correctly. The seat of a Three Worlder's soul or personality resides in their head.
- *Death/Deactivation*: Massive physical damage to the head or becoming trapped Outside leads to death or deactivation. While a Three Worlder dragged back inside one of the Three Worlds may return to life, a smashed Three Worlder is gone forever.

must recharge; for Science Fiction, this means that the storage batteries of the house are damaged, and power is only provided directly when the solar cells are active.) Three Worlders can only operate during daylight hours, are weakened on stormy or overcast days, and become unconscious and immobile during the night. Healing takes three times as long, unless subsidized by taking energy from other Three Worlders (usually enemies, Plush, or from the Herds). Wounded to incapacitation or otherwise lifeless Three Worlders will not reactivate without an infusion of energy. GMs, see *OPTION: Horror* for more information.

The Three Worlds

Below are brief sketches of the Three Worlds, their geography and history.

The Queen's Realm

(Known as "the Land of Ogres" in the Clans' Lands.) The sky is a rosy pink and the grass is a pastel green; the geographical features of this World abound in those colors, along with whites, yellows, and reds.

- *The Fashdol Tribe*: Queen Caw rules with an iron fist over her people -- the Fashdol Tribe -- and the conquered beasts of the Plush Tribe. Today, all kowtow to her, not just because of her fearsome physical prowess, but also due to her unique spiritual ability: she can drink and release water, which no other Three Worlder can do. Under her aegis, the Fashdol have turned inward, to climb the heights and plumb the depths of high melodrama, to jockey for social/romantic position through intrigue, and to abuse their Plush slaves . . . if possible, to do all three at once.

Most machinations center on Prince Kenneth, the "son" of Queen Caw. Each of the Ladies of the Realm plot and plan to become (or remain) his paramour, a position of power just below the Queen's own. "She who has the Prince's heart has the Queen's ear," or so the proverb goes.

Skullduggery, manipulation, rumormongering, social dueling, and outright proxy warfare (using Plush slaves) are the arenas where the Ladies contend.

- *The Plush Tribe*: Many moons ago, Queen Caw and her forces drove the Rux, the chief of the Plush, away from his Tribe and forced his people into bondage. Thought dead by the Queen, some of his enslaved tribesmen yet believe he roams the Desert of Glass, until he can return and give them liberty. But until then, beanbag bunny and stuffed stegosaur toil patiently under the yoke of the Fashdol.
- *Desken*: The hill of Desken contains mysterious treasures in its vaults -- books, paper, tools. Lady Anne lives here, and has gained much knowledge from her perusal of ancient tomes. She holds classes here for training Plush servants in needed tasks, and has some control over cloth harvested from the caves of Mount Hutch.
- *The Great Horse*: The Great Horse is a huge sculpture, looming over a corner of the Realm. The Queen holds her court here, under its enigmatic stare.
- *Lookout Point*: This tower is the closest outpost to the Gate to the Desert of Glass. A Plush watchman is usually stationed here, just in case.
- *The Mansion*: Lady Barbara lives in The Mansion, waited on hand and foot by her Plush slaves. The Box of Healing and Couture (needle, thread, scissors, pins) takes up an entire parlor downstairs. (Lady Barbara wrested it from Lady Alexandra of the Tiers. Soon after, she received the title of Royal Seamstress; at the time, she held Prince Kenneth's attention, and thus Queen Caw's favor.)
- *Mount Hutch*: Soaring over the plains, Mount Hutch is the tallest peak in the Queen's Realm. No one has ever scaled it, but legends tell of a musical oracle trapped in a coffin at the summit, which will answer three questions to the one who frees her. Its caverns hold acres and acres of cloth, valuable to all Queen's Realmers.
- *The Plush Cavern*: Those Plush not in direct service to one of the nobility, being schooled at Desken, or serving time in the Prince's Park as "wild" Plush make their home here. The indigenous Hanging Cloths are used to make nests and repairs to abused Plush skins. Effalunt, tool of the Queen and traitor of the Rux, oversees unclaimed (no one says "Free") Plush.
- *Queen's Plateau*: Queen Caw resides in the Royal Pavilion, built of layers of sod and stone, squarely in the center of the Plateau. Beneath lies the Prince's Park, where he hunts "wild" Plush and hangs his trophies from the roots of the Plateau. He knocks them down regularly, to make room for new beasts. The freed trophies scamper back into the recesses of the Park (or back to their Ladies).
- *The Tiers*: A multi-terraced cliff, the Tiers holds strange sculptures, artifacts, and artwork related to the "Lost Goddess," as well as a small number of books. Lady Alexandra rules here, and controls the Royal Tea Set, used on high holy days and state occasions.

The Desert of Glass

The land and sky in this World are a shiny, pearl white glass (chips of it are mined at the cracks of the Gates by other Three Worlders for jewelry and tools).

Geographical features of this World are also white and shiny; afternoons in the desert are unbearably bright. It's also significantly warmer than the other two Worlds. In this stark landscape lies a precious resource: water. The Iron Lake is often brimful with it, though the water level changes mysteriously. The Rub'ayr Tribe calls the Desert home. Water also exists in the Cauldron and hidden in a secret cave in the Glass Butte.

- *The Rub'ayr Tribe*: (Also known as Glass Desert Dwellers.) A small band of philosophic monsters, which lurk in the Desert. They ask riddles of intruders, and attack any who fail to answer correctly. They can be distracted by philosophical wrangling -- "Is there in truth no beauty, and in beauty no truth?"; "Would a rose by any other name smell as sweet?"; or the classic

"What's the sound of one hand clapping?" They're content with thought-games, splashing in the waters of the Iron Lake and the Cauldron, and committing acts of mayhem on intruders. Any who enter seeking water must treat or contend with them, for only the Rub'ayr know the rituals/procedures for calling water from the Desert.

- *The Cauldron:* Atop a hill, the Cauldron sits: sometimes empty, sometimes full. The Boneless Thing haunts this area. The Cauldron has the only supply of "cleaning clay" in the Three Worlds -- the Boneless Thing won all of it from his Iron Lake tribesmen in riddle games.
- *Cave of Lin:* It is unknown what treasures and wonders lie within this sealed cave -- the Gate leading into it has never been opened, and the crack below is too small for any of the Rub'ayr to crawl under.
- *Glass Butte:* It is said water fills the hollow of the Glass Butte, but none have been able to look inside to see. The exiled chief of the Plush -- the Rux -- makes his camp in its shadow. The Rub'ayr have learned that he is still dangerous, and respect this wise, one-eyed warrior, but they are not friendly with him.
- *The Iron Lake:* Usually brimful with precious water, the Iron Lake is the home to the Drake -- a giant yellowish dragon (of sorts) and Skifneldir, a living boat. They bicker and banter while swimming lazily around, only cooperating with each other (and the Boneless Thing) when the lake level needs to be replenished.

Clans' Land

(Known as "the Gnome Kingdoms" in the Queen's Realm.) The sky is a pale blue and the grass is a deep sea green; the geographical features of this World abound in those colors, along with navy blues, grays, and blacks.

- *The Action Clan:* The Action Clan (and their enemies, the Sorcerer's Clan) holds one thing more important than any other: glory. Glory is fame gained from a combination of factors: prowess in battle, the size of one's Herd, the quality of one's reputation, and the excellence of one's crafting talents. Glory is the most vital element of a Clans' Lander's existence, serving as

status, currency, and contract. The culture of the Action Clan shares elements with those of Amerindians, Celts, and Vikings: Cuchulain's cattle raids, the Sioux's counting coup on an enemy, and fighting and feasting through eternity in Valhalla are good touchstones. Guy Jozef, a wily warrior, is chief of the Clan, and rules through the weight of his glory and tactical genius.

- *The Sorcerer's Clan:* The Shadow Knight is a mighty sorcerer. The camp of his Clan lies on top of Storm Mountain. The Sorcerer's Clan is composed of the Shadow Knight, his aide Grimlock, and a band of Troopers so alike as to be identical. They, like the Action Clan, lust for glory; but unlike their enemy Clan, Troopers see battle-glory as the *only* way to individualize themselves. Thus they fight all the harder and listen to their chief all the more obediently.
- *HEX-Blox "Clan":* Calling HEX-Blox a Clan is a misnomer -- it is a single hive creature, constructed out of interlocking blocks of differing sizes and shapes. Individual constructions share the same (alien) mind, and are brutally efficient in raiding and combat. While it sees glory as a valuable commodity to have, it doesn't really feel a strong connection to matters of honor. HEX-Blox, due to its many mechanical components, is a useful resource for the other Clans when they need something moved, lifted, or opened, but the bargains it strikes for services are downright odd . . .
- *The Herds:* (Also called "Beasts" in Fantasy or "Mechanicals" in Science Fiction.) Not a Clan, but a class of non-sentient animals. The Herds are a visible measure of glory, a valuable material for tool and weapon construction, and a source of extra energy. The Clans' Landers vie for the wild Herds and the Herds of the other Clans. Typical Herd creatures are between 1" and 2" tall.
- *Book Butte:* This hill contains valuable tools and books, many of them too dangerous for any Clan to gain sole control of. Patrols from each faction ensure that no more than a single seeker after knowledge from each Clan climbs it simultaneously, per a long-standing treaty.
- *Jozef Mesa:* Behind the boulder on top of the mesa lies the Action cantonment, well defended and fortified. In the caves beneath the Mesa, the Herds of Clan members are corralled and watched.
- *The Longhouse:* A mystery structure -- a house with no doors. It is theorized that the roof can be lifted, but no one has attempted to do so. Yet.
- *Lost Cavern:* Wild and escaped Herd creatures lurk near this sealed cave -- the Gate to it has never been opened, and the crack below too small for any larger Three Worlders to follow the beasts inside.
- *Mesa of Ledges:* Most of its manifold treasures already stolen, the Mesa of Ledges is currently a No Man's Land, and the usual battlefield for Clan warfare (rather than raids).
- *The Spire:* An Action Clan warrior is posted here, to watch for unauthorized access to Book Butte. The nearby, unnamed wooden tower (the chair) is the location of the Sorcerer's Clan guard.
- *Storm Mountain:* The peak of Storm Mountain holds the tent citadel of the Shadow Knight; its caverns have been plundered for cloth, which the Shadow Knight has used to build his fortress, climbing nets, and a complicated elevator/crane system (using a stolen wheel from HEX-Blox). His Herd is corralled beneath the

Mountain.

What Everybody Doesn't Know

Like, Duh!

They're toys.

The Truth About the Three Worlds & Outside

The house and its vicinity are deserted of (non-toy) life. Whether this is due to warfare, disease, or disaster is the GM's call, as is whether or not life elsewhere survived the cataclysm.

The power field only functions within the rooms that compose the Three Worlds; the hallway is a dead area. However, the spaces *between* the walls -- where water pipes, power lines, or circuitry are threaded -- are within the power field, and may lead to other power fields in the house -- maybe a kitchen, game room/parlor, or workshop.

Water Sources

The only sources of water in the Three Worlds are in the Desert of Glass: the taps for the Cauldron and the Iron Lake, and the reservoir and bowl of the Glass Butte. All must trade or trick the Rub'ayr for water. Small volumes in suitable containers may be held by some of the important NPCs in the setting, but probably no more than a few drams. If the water supply for the house has failed through loss of pressure or a damaged pipe, water becomes a non-renewable resource, and the Rub'ayr will guard it all the more fiercely.

Cloth Sources

In addition to the clothing in Mount Hutch, Plush Cavern, and Storm Mountain, vast untapped bolts of cloth are to be found in the Cave of Lin and the Lost Cavern. All probably contain other valuables.

Weapons & Accessories

There are two sorts of weapons in the Three Worlds: True Weapons (the accessories of the Clans' Landers) and Gross Weapons (clubs, bows, blades, etc., manufactured out of found materials). As noted above, True Weapons "numb" a toy temporarily, while Gross weapons cause physical damage. However, only physical dismemberment or destruction with a Gross Weapon can permanently incapacitate a toy.

Some toys may have special accessories -- grappling hooks, winches, telescopes, what have you -- which may or may not really function (GM's call). Use of these special accessories might cost energy, especially important if playing under *OPTION: Scarce Resources*.

Toypunk Technology

The tools that toys construct for themselves out of found material -- bits of other toys, ropes woven from threads, pieces of cloth, lengths of wire, pieces of molding -- are Toypunk Technology. Gross Weapons, the elevator system up

OPTION: Fantasy

If *OPTION: Fantasy* is in play, a number of changes go into effect:

- The house is a wizard's abode.
- The toys are various types of golems.
- True Weapons are melee weapons, and only the Clans' Landers have them. A strike from a True Weapon temporarily suppresses the golems' motive enchantment; they are equally or only slightly less effective on Queen's Realmers.
- The golems are composed of appropriate materials for low-tech worlds, with rubber or treated leather standing in for plastic. The golems are either solid material, or a thin shell of solid material packed with stuffing. Clans' Landers are predominantly made of tin, pewter, or lead.
- Herd beasts are usually animals like deer, horses, dinosaurs, or mythical

Storm Mountain, catapults, book holders, air or water pumps, or hang gliders all fit the idiom.

The Boy & The Girl

The toys may retain vague memories of their owners -- the Girl (for the Queen's Realm) and the Boy (for the Clans' Land). They could be venerated as gods, aliens, tribal spirits, or lost comrades. A GM can have fun with seeming random edicts of the Boy or the Girl ("Don't go in there!" or "Never leave your tools on the bed!") and how they've become religious or cultural proscriptions over time.

NPC Backgrounds

Action Clan

Action Clan members are small, nimble, skilled with weapons, and stand 3-1/2" tall.

- **Chief Guy Jozef:** Guy is a tactical genius and skilled warrior. He wishes to keep his honor bright, his Clan safe, and his Herd large (in that order). He's interested in arranging a regular supply of water for his Clan.
- **Purple Smith:** Purple is a mighty smith, and serves as the Action Clan's medic and shaman. Boastful and brusque, he's curious about the mysteries of the Longhouse and the Lost Cavern.
- **Vulpina:** Vulpina is one of the few female Action Clan members. She is sneaky, tricky, and an excellent shot with her bow; she once riddled successfully with the Boneless Thing. She lost a leg in battle with Grimlock, and makes due with a fallen comrade's limb. She desires her own leg back.
- **The Swan Knight:** An immaculate enigma, this quiet master of the sword wears glittering armor, inlaid with chips from the Desert of Glass. Arrogant and disdainful, he lusts for the destruction of the Shadow Knight.

Fashdol Tribe

Fashdol are big, devious, dexterous, and stand between 8" and 1' tall.

- **Queen Caw:** (Baby Wet & Cry) One of the two largest Three Worlders, Queen Caw is big, strong, tough, and rules with an iron fist. She indulges her son Prince Kenneth in everything. The infighting of her court amuses her. She wishes to annex the Desert of Glass, if Lady Anne can train a Plush army.
- **Prince Kenneth aka the Mighty Hunter:** (Plastic) Mama's boy, object of desire, and spoiled brat, Prince Kenneth does have one redeeming feature: he is an expert hunter. Mercurial and vapid, he flits from Lady to Lady at whim.
- **Lady Barbara aka Royal Seamstress:** (Plastic) Stylish, devious, and beautiful, the Lady Barbara enjoys cruelly abusing her Plush slaves. Currently on the outs with the prince, she has nonetheless secured her standing in the court with the theft of the Box of Healing and Couture.

beasts.

- Some of the toys may know limited forms of magic, especially Queen Caw, Lady Anne, the Drake, the Shadow Knight, and Purple Smith.

OPTION: Science Fiction

If *OPTION: Science Fiction* is in play, a number of small changes go into effect:

- The house is a "Home of the Future."
- The toys are varied types of robots.
- True Weapons are ray guns, force swords, or beam rifles, and only the Clans' Landers have them. A strike from a True Weapon activates a sensor that shuts a robot down for a short period of time. Since Queen's Realmers lack these sensors, True Weapons are completely ineffective against them.
- The robots are composed of various types of plastic, with circuitry interiors. Plush Tribe circuitry is woven throughout their stuffing and skin.
- Herd beasts are usually metallic vehicles like cars, jets, space ships, and the occasional "cutesy" robot.
- Desken and Book Butte may hold data panels that access the house's computer. If a toy knows the human/god/alien language (unlikely, but possible), it could call up information from the computer system.

OPTION: Horror

She desires more varieties of cloth to create ever-finer clothes for herself.

- **Lady Lady Alexandra of the Tiers:** (Porcelain) While possessed of a delicate, rare beauty, the Lady Alexandra has a precise, rigid, stuffy demeanor -- perhaps it comes from surrounding herself with the artifacts of the past. She is keeper of the Royal Tea Set. Her secret talent is that she can hypnotize any Three Worlder wearing (or naturally bearing) the color purple. She seeks revenge on Lady Barbara, and is close to becoming the Prince's next paramour.
- **Lady Lady Anne of Desken:** (Cloth) Responsible for the education of the Plush, Lady Anne is a clever, long-suffering soul often discriminated against due to her similarity in construction to the Plush. She has recently been dumped by the Prince (for treating her Plush servants "too well"), and wishes to become queen of the Plush and take over the kingdom.

HEX-Blox

Typical HEX-Blox drones are weird, logical, modular, and about 4" in height. HEX-Blox is a single entity, and its consciousness is spread throughout its blocks. The more blocks a drone is composed of, the smarter it is. The main HEX-Blox compound is exceedingly intelligent, and has deciphered the human/god/alien language. HEX-Blox knows it is missing pieces required to pursue its goal: exploration of the Outside. It deduces that the extra pieces may be in either the Lost Cavern, the Longhouse, or in the Desert of Glass, and is waiting for the right opportunity to search for them.

Plush Tribe

Plush are soft, resilient, patient, shy, and stand between 2" and 1-1/2' tall.

- **The Rux:** One of the two largest Three Worlders, the Rux is the exiled king of the Plush. Big, strong, tough, and one-eyed, the Rux has a natural aptitude for language(s). He lurks in the Desert of Glass, biding his time and licking his wounds, until the day comes when he can cast Queen Caw Outside forever.
- **Pooky:** Prince Kenneth's noble steed, Pooky is stupid, strong, and fast. While devoted to the Prince, Pooky is being co-opted by Lady Anne, who treats him less like a slave than a friend.
- **Herbert:** Clumsy and lazy, no one worries much about Herbert . . . but it's all an act. Herbert is tough, sneaky, and the Rux's loyal bonds-hippo. He quietly foments Plush rebellion, and keeps the Rux updated on current events (they speak weekly, through the crack of the Gate).
- **Effalunt:** Once the Rux's right-hand, cruel Effalunt betrayed her King for power at the urging of Queen Caw. She lords her position over other Plush, and sees herself as equal to any of the Ladies of the court. However, when she insisted on being called "Lady Effalunt," Lady Alexandra had her whipped for public amusement. Lady Barbara stitched the wounds back together, so now Effalunt owes the Royal Seamstress a favor. Effalunt doesn't trust Lady Anne.

Sorcerer's Clan

Sorcerer's Clan members are small, nimble, skilled with weapons, obedient, and stand 3-1/2" tall.

Particularly appropriate with *OPTION: Scarce Resources* enabled, horror cranks up the fear factor, making the toys and their world(s) more threatening and malevolent. They have run wild, gone feral, or have become fascistic -- consider the effect of having toys possessed of the emotional maturity of a child but the intellect and prowess of an adult. Unable to adequately control their emotions, the toys are mercurial, stubborn, and selfish (at their worst). Picture a bratty five-year old with a Thompson machine gun.

Some further refinements to *OPTION: Horror*:

- *Toy Vampirism:* If other toys must be tapped for energy, then the cultures of the Three Worlds become more predatory and violent. Plush and Herd beasts provide normal sustenance, with the energy of enemies a particular treat. Under *OPTION: Fantasy*, a toy must break or tear its victim (at minimum, a limb or other sizable amount) into small pieces using a Gross Weapon or tool, then mix the pieces with water, and coat themselves in the debris. Over two hours, the energy of the victim (or fraction of energy within the body part) will be leached into the consumer. Toys under *OPTION: Science Fiction* have it a bit easier -- the process involves connecting leads from the victim's power cells to one's own; this draining process takes fifteen minutes.

- **The Shadow Knight:** Clad in dark, burnished armor, the Shadow Knight uses his genius for sorcery/science, expert tactical mind, and good combat skills to quest for power and knowledge. He ruthlessly seeks dominion over the Clans' Land, and a deeper understanding of the mysteries of the Three Worlds.
- **Grimlock:** Once a lowly Trooper, Grimlock is strong, fast, and cunning. He loves to fight against the strongest opponents he can find. He serves the Shadow Knight because that allows him to test his mettle often. Vulpina's leg is his favorite battle-trophy.
- **Troopers:** Troopers are only competent in the ways of warfare. They are obedient, if a little slow, and constantly seek to distinguish themselves in battle, to gain a name of their own.

The Dead Gods: Perhaps the Boy and the Girl died in their rooms, and the toys have utilized pieces and parts into their Toypunk Technology. Particularly appropriate in this case includes using the Girl's bones as tent poles in the Queen's Pavilion and the Boy's skull as the central keep of the Shadow Knight's citadel.

Rub'ayr Tribe

Rub'ayr Tribe members are big, resilient, strong, and flexible. They all enjoy riddle games and philosophy, and will trade water for valuable trinkets or new riddles.

- **The Drake:** (Rubber Ducky) Four inches tall and a half-foot long, the Drake paddles cheerfully on the Iron Lake. He's an optimist and layabout. His goal is to swim forever in peace, but the jibes of his friend Skifneldir often interrupt his reveries.
- **Skifneldir:** (Wooden Tug) Six inches from stem to stern, with a draft of two inches and a freeboard of 3-1/2 inches, Skifneldir is a large Three Worlder. He's a pessimist, and loves to taunt his friend the Drake, as they coast on the waters of the Iron Lake.
- **The Boneless Thing:** (Sponge Glove) Eight inches long, two inches thick, the Boneless Thing scuttles around the Desert of Glass on five legs of differing lengths. It is the strongest Three Worlder, somewhat elastic, and an inveterate jokester. It's just looking for a good time.

Events & Possible Story Arcs

- *Human Intruders:* An interesting scenario could involve human PCs entering the twisted environment of the Three Worlds (full size or shrunken) and interacting with the toys; contrariwise, perhaps giant invaders come to loot the Three Worlds, and the PC toys must defend it.
- *Mint in the Box:* An unknown toy is discovered deep within the Lost Cavern, the vaults of Mount Hutch or Desken, the Longhouse, or the Plush Cavern, trapped in a miraculous coffin. Once the coffin is opened, the person wakes, and quickly becomes active in local machinations. This is an excellent way to get new PCs into a Toybox Tribes campaign.
- *Rescued At Last:* A Three Worlder of strange form and features is recovered from Outside. Whether a Clans' Lander pulled into the Queen's Realm or vice-versa, the existence of the other kingdom is now established as fact. Which faction recommends exploration, which urges invasion, and what do the PCs think?

Advice, Opportunities, & Pitfalls

- *Take A Role:* Players might want to select one of the NPCs provided above to roleplay, rather than creating a toy from whole cloth. This would be especially suited to a game of political intrigue and romance in the Queen's Realm. A single player could also take multiple roles in multiple kingdoms. A single player could play all Troopers, for example.
- *Props/"Miniatures":* It could be amusing and inspiring for each player to find a suitable prop to represent their character. For example, using plastic army men for Troopers, or a Beanie Baby for a Plush. That way, the player will not only have a "miniature" to position during the game, but can also use the figure as a measure of scale or to display how a character performs a particular action.

- *Silly? Could be!:* Though not the intent of this column, the potential for humorous play is obvious in a setting based on toys. If the GM and the players are comfortable with getting wacky, great. However, if those in the group cannot come to an agreement about the level of humor in a Toybox Tribes campaign, that is a serious pitfall. If running Toybox Tribes as-is (i.e., without altering the map or other bits of the background), GMs should discuss the campaign beforehand, and get buy-in from all parties involved on the level of humor. Nothing will kill a Toybox Tribes campaign faster than a PC being silly if the tone is serious, or too grim if the mode is light-hearted. An ounce of prevention yields a pound of cure.

Murphy's Rules

by John Kovalic

Murphy's Rules

Murphy's Rules

Building An Iron Curtain Between Player And Character Shouldn't Make You See Red

Quick -- yet lame -- joke:

A large live-action roleplaying game was being held in a mansion. Its hundred-plus players were all having a good time, until pandemonium breaks out from the second floor, and players start streaming out of the house in a barely controlled panic.

A storyteller runs up to a player, whose character was the village idiot. "You've got to get out of here!" the storyteller said. "A large fire's broken out in an upstairs bedroom; if you don't get out of here, the entire house will burn down . . . with you in it!"

The player frowns and says, "That may be . . . but my *character* doesn't know that!"

(I *did* say it was lame . . .)

Anyway, I promised last week to address a topic touched upon tangentially a couple weeks ago: the notion of the wall (or lack thereof) between player and character knowledge and experiences. This week I'll be talking about why walls are good; next week I'll talk about why walls are bad. The week after we'll play Pink Floyd's *The Wall* at the same time we watch the *Wizard of Oz* . . . make sure to press "Play" at the end of the MGM lion's third roar! (Okay, I'm kidding about the last one; we'll actually be using *Dark Side of the Moon*.)

Anyway, I think we all agree that there is traditionally a de facto wall between players and characters. Most of us lack the skills necessary to cleave a dragon in half with a sword, mine ore from an asteroid, or create a digital representation of ourselves to hack into corporate databases without using AOL's Instant Netrunner. ("You've got ICE!") So there comes a point when we need to acknowledge that our characters have skills, knowledge, and abilities that we do not.

Once one draws that line, it can be easier to assume that *all* aspects of the character are best left on one side of that line. For example, if you're playing a computer hacker, and your character is trying to disable an opponent's network, there's no need to detail about how you're instigating a denial-of-service attack upon him; you can simply say you're trying to use your character's vastly superior computer skills to crush his opponent's systems. In fact, it can be *better* to avoid giving details; unless you're an expert in the same field as the character, your character will probably be able to come up with better solutions than what you can. (I'm reminded of a line I read one time where a writer was saying how easy it is to write for television doctors: "Nurse! This man needs 50ccs of medicine! STAT!")

Perhaps even more importantly, your GM isn't required to have the same knowledge you have; provided you all agree on the generalities ("Computer skill can be used to hack into cell phones, but they can't be used to program someone's wristwatch from afar"), then the *hows* of what the characters do isn't that important; it really isn't any more relevant to explain why a computer programmer can't reprogram a watch than it is to explain why a priest can't use healing magic on a zombie. Keeping knowledge separate also hinders pointless arguments from erupting; if your GM decides that your character's cell phone conversations were hacked (since that's what everyone agreed on), you can't say, "Nuh-uh! My cell phone was digital! You *can't* hack those calls! I work for the largest digital cellular provider in the world, and I know that . . ." It's really unfair to expect the GM to contain the sum knowledge of all of his players.

The same also applies to any interactions with the "real world." Take, for example, a situation where a player forgets the name of the underworld contact they were going to Lucky's Bar for. In a game with a thin (or nonexistent) curtain between player/character, the GM might say, "Well, if you forgot, then so did your character." But in a game with a thicker curtain, it's entirely acceptable for the GM to say, "Give me an Intelligence roll to see if your character remembers."

Of course, it's entirely possible for this kind of attitude to become absurd; if a player is constantly rolling to see if, say, his dumb character is allowed to remember something he remembers as a player ("Do I know King Randolph's name?"), or come up with basic plans ("Oil is slippery; we could pour some on the floor and let the bad guys run over it and fall! Err . . . would my character think of that?") is not only silly, but can slow down the game immeasurably.

Likewise, requiring players to solve puzzles, defeat riddle contests, discover clues on envelopes handed to them, or other physical interactions in the real world -- without any chance for characters to utilize their skills -- then you run the risk of having your players revolt. (Like, say, a stupid vocal puzzle in a *Torg* campaign . . .) Of course, props can still make a wonderful addition (say, a letter from a potential love interest, or a newspaper article detailing the heroes' exploits), but expecting the players to glean additional information out of props -- without any input from their characters -- is probably dangerous.

Now, some campaigns make it easier to create a wall between player and character knowledge. Fantasy, for example, is generally quite easy to maintain; when there are three moons orbiting a flat planet, and magic can create inertialess flight, and the world has been ruled by a Dragon Prince for three thousand years, then presumably one's knowledge of police procedure, quantum physics, and European history won't be terribly useful; a player won't need to worry much that he'll be drawing on his real world experience to help out. (If he has his dungeon-crawling character casually mixes two parts sulfur with three parts charcoal and 15 parts saltpeter, you have my permission to pelt him from across the table with a Cheese Puff.)

Likewise, sufficiently advanced Sci-Fi worlds (or, perhaps more correctly, Space Opera) don't need to worry much about character knowledge. Knowing what is actually theorized by quantum physics doesn't mean you'll know how to deal with Madeupium in a *Star Trek* campaign. (I actually ran into a small problem as a player in a *Fading Suns* game when I had my character -- a Feudal Knight -- inadvertently rely on some Einsteinian theories to try to solve the mystery of why the suns were fading. It seems highly unlikely that my character would have known that, especially given how much knowledge had been lost or suppressed by the church in that setting. Unfortunately that knowledge was so much a part of *my* mindset that I'd completely forgotten that.)

Modern, historical, or near-past/near-future games present a greater challenge. If it's possible for player knowledge to creep in in a game set in the year 5000 AD -- like *Fading Suns* -- then it's even more possible in a time when the players are likely to have knowledge of the world. This can be blatant ("It's November 1st, 1963? Let's spend the month in Dallas and see if anything interesting happens!") or more insidious ("Wait! The police can't arrest me! Their search warrant can't possibly cover searching the entire apartment complex; it's unconstitutional!"). Even if a player doesn't mean to do such, it can be difficult to maintain that wall between player and character knowledge. If everyone agrees that a rigid curtain is going to be used, then it should be determined *how* that curtain will be maintained, and what will happen if it's breached. (This can range from the GM saying, "You can't do/know that," to the GM withholding experience points for consistent violators, to the GM actively changing the law, history, or the principles of physics to keep the players on their toes.)

In the end, if all the players (and the GM) are agreeable, a thick wall between Player and Character experiences can make many types of roleplaying possible, and keep the players from being frustrated when they cannot do something where it seems logical their characters *could*.

Just make sure player *and* character know to leave the house if there's a fire.

* * *

Well, you may note that Kenneth Hite has supplied us with a doozy of a column this week. Unfortunately, the overworked nature of the all-mighty Hite's life means that he'll probably be taking at least the next couple of weeks off. Hopefully he'll slay all those dragons in his life, and will come back to *Pyramid*, where he's beloved and praised, and occasionally paid with magic beans.

--Steven Marsh

* * *

*Last week's answer: **GURPS Werewolf**, p. 39.*

(Two stars) "The ultimate DUNGEON MASTER fantasy! This is *the* most deluxe dungeon, designed to appeal to discriminating and demanding role-players. This is more than just a dragon hunt. Within the lair of this beast lie cruel and deadly traps, befuddling conundrums and puzzles, and cunning minions that will be the end of overconfident or careless adventurers."

Double Secret Illuminati

A Variant for *Illuminati*

by Steve Honeywell

It's common knowledge that the Illuminati control the world. What isn't known, really, is which Illuminatus is in charge. "Double Secret Illuminati" simulates the uncertainty of knowing who is really in control by having each player hide his true Illuminati colors. This game works best with four players and cannot be played with more than five.

Object

This game is similar to *Deluxe* (or *Classic*) *Illuminati*, and works for three to five players, although four is ideal. Each player possesses two Illuminati, one of which they use to control groups and draw income, and one which exists as the true power behind the throne.

Setup

At the beginning of the game, each player selects two Illuminati groups to play. One group is placed face-up, and is the face the player presents to the world. The other Illuminati group is placed facedown under the first Illuminatus. This is the real Illuminatus, the power behind the exposed puppet. Players can select which of their two Illuminati groups they choose to show the world and which they want to be their true self. Any unused Illuminati are discarded without anyone seeing the groups. Part of the fun of this version is not knowing who is whom.

Players use the power, income, victory conditions, and special ability of the exposed group for everything. The hidden group is used only to determine winning conditions.

Winning Conditions

The game is played as normal with the following stipulation: to win, a player must fulfill two victory conditions. One of these two conditions must be the special victory condition of his hidden Illuminatus. For instance, a player with the Gnomes of Zurich exposed and the Bavarian Illuminati hidden must control enough power to satisfy the victory conditions for the Bavarians and either control enough groups or have enough money to satisfy the Gnomes. Naturally, this makes for a very long and cutthroat game as each player attempts to learn exactly who is what. Expect a game with four players to last a good three hours or more due to the added victory condition.

Special Rules

- *Special Rules for the Church of the SubGenius*: A player with the Church of the SubGenius as his hidden group must win by satisfying the special win conditions of both of his groups. He cannot control enough groups for a basic victory and then claim a win by virtue of having more than enough groups to satisfy the special win conditions of the Church of the SubGenius. There are no special rules governing a player with the Church of the SubGenius exposed.
- *Special Rules for the UFOs*: A player with the UFOs on top must select a victory condition for them, just like normal. However, the secret victory condition for the UFOs cannot be the same as that of his hidden group. A player with the UFOs as his hidden group must also select a special victory condition for the UFOs. Again, this special victory condition cannot be the same as that of the player's visible group. All rules regarding the Church of the SubGenius apply to a player with the UFOs hidden who selects the Church of the SubGenius's victory

conditions.

- *Special Rules for the Unmasked card:* Anyone playing this card can choose to replace either his exposed or hidden group. He may not look at the unused groups to make his choice in this; he simply selects one of the unused Illuminati and chooses which of his two Illuminati to replace. If desired, the player can discard his exposed group, turn his hidden group over (it becomes his new exposed group) and place the new group as his new hidden group. If five people are playing Double Secret Illuminati, remove this card at the beginning of the game.
- *Special Rules for the Computer Espionage card:* This card cannot be used to learn the identity of another player's hidden Illuminatus.
- *Special Rules for controllable groups:* Groups that enhance an Illuminatus' income or number of cards drawn apply only if they match the exposed group. Thus a player who controls the Weathermen draws an extra card only if his exposed group is The Bermuda Triangle.

So, What Brings You Here?

Seven Great Places for Adventuring Parties to Meet

by Daniel Bronson

A man walks into a bar . . .

So do a couple of clerics (one of whom is dwarven), an elven wizard, and a half-orc acrobat-thief (it's-a-long-story-don't-ask). The elderly monk in the corner looks over this hodgepodge of possible adventurers, smiles to himself knowingly, and pulls an old, wrinkled treasure map from his robe. Before he can so much as clear his throat, however, the half-orc robs the dwarven cleric blind and swaggers out. The man -- a young fighter in the city guard -- gets his drink and makes his way to a table, bumping into the clerics in the process. Noticing his missing change-purse for the first time, the dwarf cries out "Thief!" and begins to attack the fighter. The second cleric chimes in, throwing handfuls of fire at the man as he runs out the door. Stray flames quickly ignite the dry wood of the bar, barrels of alcohol begin to boil like there's no tomorrow (which is admittedly true as far as the barrels are concerned), and the wizard teleports away. The monk and the rest of the patrons are left to scramble for safety as fast as they can. Seconds later, explosions level the place . . .

Let's face it, it isn't always easy to bring a new group of characters together. Any team worth its salt is going to be a grab-bag of talents, weaknesses, and egos, and getting all of those very different people to play nice realistically can take a bit of work. It's easy enough to say they just happen to be a team, but that can leave more story-oriented players unsatisfied. In an attempt to provide some ideas on uniting adventurers, what follow are seven great places for such individuals to run into each other. What they do then is up to them.

At a Party

"Bob, this is Janice. She bends steel girders with her mind. Janice, meet Bob. He can turn himself invisible."

Everybody loves a party, be it a birthday celebration at a friend's apartment or a week-long holy festival throughout the streets of the kingdom's capital. It isn't hard to imagine heroes- and heroines-to-be getting introduced through mutual acquaintances at such functions -- even if such introductions don't come naturally. Anyone who gets sloshed enough just might start admitting to all kinds of things, including his brief stint with The Company, the fact that his best friend is a werewolf, or that he actually *did* try to take over the world a couple of years ago but he was stopped by a nice young lady who likes to run around at night in an incredibly daring outfit. No, really, it's true. In fact, he was so thankful to be pulled back onto the straight-and-narrow that he invited her to the festivities. See? That's her right over there. With the balloon hat.

Of course, it's also possible for people to find one another without a middleman. They might just stand back and admire each other's handiwork at the various game booths, for example. Few things say "Look how dexterous I am!" better than a perfect score at Whack-A-Vermin. And who wouldn't want the winner of a momentous jousting tournament on the team? Heck, who wouldn't want the guy who came in second place? There are plenty of contests out there to give merrymakers the chance to strut their stuff. Think of it as a cross between a job fair and a talent show.

In Battle

"There is something I ought to tell you."

"Tell me."

"I'm not left-handed either."

--Westley and Inigo, *The Princess Bride*

It's the classic tale of good guy fights good-hearted bad guy, or good guy meets good guy and each thinks the other is a bad guy, or good-hearted bad guy runs into another good-hearted bad guy and . . . well, you get the point. The first time the adventurers come together, they are very much not on the same side. They clash. They spar. They realize that their foe is not only pretty skilled at what she does, but she acts in a respectful manner. They have found an Honorable Opponent. Later, when the misunderstanding has been cleared up and/or circumstances bring them together again, these kindred spirits can join forces against the Greater Evil, whatever that may be.

As a side note, it should be realized that this original "battle" does not have to be in the form of a physical brawl. Lawyers may meet each other head on in court, thieves may be stealing a particular jewel from one another, and charioteers might be out to win a particular race. There are plenty of ways in which people can compete without ever drawing a weapon. The important point is that they do so admirably. (Or not. If the campaign calls for uniting scum, such individuals might be more impressed by an opponent who is capable of bringing some truly original underhanded tricks to the team.)

Natural Crisis

"Hey! I was going to save her!"

There's nothing quite like a good dose of Man (or Woman, or Three-Eyed-Thing) versus Nature for bringing people together. Rampant forest fires bear down on villages, freak snowstorms isolate communities, devastating earthquakes bury hundreds under tons of rubble, and [*threatening adjective*] hurricanes flood entire regions. When these disasters strike, the resultant chaos is -- or at least can be made to be -- far too much for any one person to handle. "Teamwork" will be the word of the day, and there's no "I" in "teamwork!" (Unless you spell it in a different language, but we're not going to get into that.)

Rescuers might start out working alone in various parts of Greater Metropolis City when the storm of the century hits. There will be plenty to do, with much pulling of stranded pedestrians from the flood waters and guiding of out-of-control airplanes safely to the ground. When the Channel 27 broadcast tower starts to topple, though, it's going to take a couple people to slow it down while the others clear out the orphanage, the old folks' home, and the animal shelter that all lie in the tower's path. When the day's work is done, the champions of G.M.C. can finally have a chance to meet each other properly and trade war stories over pizza.

Imprisoned

"If we could just get to the storeroom where they've got my +1 Beater Stick of Taking Names we could really show them who's who . . ."

Imprisonment -- sooner or later it happens to the best of 'em. They might be in the cargo hold of a pirate ship, in the dungeon of an enemy king, or in the 5th Circle of Hell, but the important part (this time) is that they aren't alone. They've got someone with whom they can commiserate, with whom they can play checkers, and with whom they can plan an escape. Maybe no one's ever broken out of this place before, but if the prisoners pool their skills they just might make it.

A slight variant on this involves a prisoner (or prisoners) being rescued by what is effectively the rest of the adventuring party. Thankfulness can lead the former prisoner to offer his services easily enough -- *Robin Hood: Prince of Thieves*, anyone? -- but the rescuers might not be so hot on the idea of having this guy in their group. He *did* manage to get himself imprisoned, after all. One option is that while getting to the prisoner wasn't too hard, busting back out of the place is going to take some serious work. This can give the "new team-member" a chance to prove himself. Alternately, the rescue goes off without a hitch, but the trip back home is a two-month journey fraught with

danger . . .

Traveling

"Looks like there's three terrorists in the engine car, two in the baggage area, seven in first class, and four more here in coach. And we're 10 miles from the bridge which has gone out. [sound effect of a big gun being chambered here] I just might need some help."

The constant clunk of the wagon wheels, the comforting creak of the main mast, the cacophonous crunch of the spaceship slingdrive -- ah, travel. Whether it's for business or pleasure, a nice long journey does an incredible job of taking would-be companions out of the (relatively) safe centers of civilization and throwing them into strange places with no end of new hazards. On the simplest level, spending days to weeks to months in close contact should give all but the most introverted travelers plenty of time to get to know each other. If the group still isn't congealing, it might be possible to push the issue by turning up the heat.

As with most of these scenarios, it isn't hard to work a problem into the mix. Going by airplane? Add a hijacker or three; make 'em smart and well-prepared. On the road with a caravan? Enter raiders and/or bandits stage left. Lots and lots of them. Roaming space in a cruiser? Blow out the FTL drive, release the alien infestation, and clog the food generator with oatmeal. Now you've got a truly bonding experience.

On the Job

"STAND UP STRAIGHT, YOU PUKES! IT'S TIME YOU LEARNED C.F. DON'T STAND FOR COMPLEMENTORY FORCES! IT MEANS CANNON FODDER!"

War makes for some strange bedfellows, and so do job contracts. When a wealthy -- and completely legitimate -- businessman hires a few top-notch bodyguards to keep an eye on his rebellious young daughter (all without her knowledge, of course), they had better learn how to work together. Doing otherwise would be dangerous, both in terms of future contracts and current kneecaps. The same can be said about a spacer crew, army recruits, and plumbers.

This is a nice, simple approach that forces a degree of teamwork that the characters (not just the players) know they are getting into. Granted, some of the bodyguards might be used to working solo, but if they can't handle being part of a squad they shouldn't have taken the job. After an adventure or two they just might find out they like having someone to cover their back, and then maybe they'll start hiring themselves out as a team instead of as individuals.

At School

"All who graduate from Adjya Enkhbat's Center for Advanced Horsemanship and Mongolian Horde Techniques are as brothers!"

It's always possible that an adventuring group will form before its members have even really had a chance to put their skills to use in the real world. Specifically, they can come together while they are still learning what they are capable of. This can work for monks still in the monastery, thieves just starting off in the Guild, young mutants being provided education and sanctuary, fighter pilots still in the Academy . . . the list goes on and on. These days of instruction don't have to actually be played out, mind you. Players may simply choose to have it be the history that ties the team together. It might be noted, however, that playing through this scenario is an excellent means by which both players and characters can get a handle on what they can do and how to best put their skills to use.

This translates nicely into the "common origin story" concept for groups of enhanced individuals who all picked up their powers by being in the same place at the right (or possibly wrong, depending on your point of view) time, a la Reed Richards et al. In general this assumes the adventurers were somehow associated before the event, but that's not necessary. Say, for instance, that a mystical meteorite slams into a nuclear power plant, and everyone gets out in time -

- I don't know how, they just do -- except a janitor, a core maintenance engineer, and a kid who showed up for a field trip. It goes almost without saying that those three people, who quite possibly have never met each other before, will end up with super-powers. And then maybe, just maybe, they will join together to Battle Evil and Bring Justice to the World.

Conclusion

This has been a mere sampling of the many places people can come together. There are plenty of others that can be brought into play, as it were. Adventurers could all be out to purchase the same item in the marketplace or at an auction house. Maybe the characters are in two small groups already, working as back street runners on the same deal for MegaCorp and The Son of MegaCorp, respectively. Explorers might even all be related in the first place, and the moment of truth hits at a family reunion. Regardless of the origin, fleshing it out gives the players a better feeling of how their characters can interact, both within the group and as a group.

Appendix Z: Starship Troubles

by David Morgan-Mar

Not all space flights are routine. In a large ship, there are usually some outstanding jobs which require engineers or mechanics. On a small ship, such as one a group of heroes might own, a minor mechanical problem can add a little spice to an otherwise dull flight, while a major event can be an adventure in itself. Here then is a list of some possible mechanical problems which might occur on board a starship. GMs can determine an event from this list randomly, choose one when some extra color is required, or incorporate these into starship combat damage result tables.

Minor Problems

- **Airlock Malfunction:** An airlock refuses to work. Failsafe systems usually mean the doors stay closed, requiring manual operation. This could be a serious problem in an emergency though.
- **Artificial Gravity Failure:** Everything floats off the floor. Liquids float out of containers, causing potential hazards. Characters may get space-sick. Restoration of gravity is possibly even more dangerous.
- **Auxiliary Craft Bay Failure:** A shuttlecraft or ground or other vehicle bay refuses to open, or close. The vehicle either cannot be deployed or parked.
- **Computer Glitch:** The ship's computer systems go into an unresponsive state and require a reboot. Sensible systems will have a backup, but not everyone can afford a sensible system. A glitch might also be responsible for some of the other effects on this list, requiring computer skills rather than mechanical skills to fix.
- **Door Jammed:** An internal door gets stuck, blocking access through it. A mechanic will need to fix it, or cut a hole through it.
- **Entertainment System Failure:** The ship's entertainment and amusement facilities break down. The crew are forced to play chess or (gasp) talk to each other.
- **Environmental Control Failure:** Air circulation stops or temperature control goes haywire. Near a star ships will overheat quickly; further away they freeze.
- **Galley Problem:** The food preparation equipment doesn't work properly. Everyone has to eat cold food, or the smell of burnt toast permeates the ship.
- **Internal Lighting Failure:** A fuse blows or the lights otherwise go out. It's *dark* in space. Crew will have to fumble their way around until they find the flashlights. And hope somebody checked the batteries recently.
- **Landing Gear Failure:** A warning light indicates a problem with the landing gear. This isn't an immediate danger, unless you're on final approach to a runway when it happens.
- **Plumbing Malfunction:** The plumbing systems stop working. A pipe is blocked or a pump has failed. Going to the toilet in space becomes even more of an adventure.
- **Radar/Passive Sensor Array Malfunction:** The ship's sensing equipment goes offline, or displays phantom blips. The ship is flying blind, but you can always look out the portholes, assuming there are any.
- **Radio Malfunction:** The radio receives nothing but static, or transmissions fail, or both. Communication with other ships or traffic control is impossible unless something is improvised.
- **Running Lights Failure:** External navigation lights are useful for dense traffic areas, or atmospheric operation. Without them, collisions become more likely, and hefty fines from authorities inevitable.
- **Shower Malfunction:** Whether sonic, chemical, or plain old water, the showers quit working. The crew become smelly and a failed repair attempt may burst a water pipe, turning this into a . . .
- **Water Leak:** A water pipe starts leaking. In zero gravity, blobs of water drift through the cabin, causing potential electrical failures in anything they touch.

Major Problems

- **Air Leak:** The ship is losing precious air. The leak may be obvious, or hard to track down. An EVA might be required to patch the leak.

- Control Systems Failure:** The ship doesn't respond to maneuver controls, or possibly drive controls. The ship may end up going somewhere unplanned, or running into something.
- **Cryogenic Leak:** Extremely cold liquid leaks out of a pipe or container, freezing everything it touches, including flesh.
 - **Defensive Systems Failure:** Force shields, point defence missiles, or chaff casters fail, leaving the ship vulnerable to attack.
 - **Drive Failure:** The main engine stops working. The ship coasts through space, unable to change course or speed.
 - **Explosion:** Part of the ship is destroyed and any crew in the area wounded or killed. Secondary damage to nearby systems may occur.
 - **Fire:** Fires consume oxygen *fast* and need to be extinguished. Nearby systems may be damaged or destroyed.
 - **Fuel Tank Rupture:** Fuel leaks from the tanks, either into space or into the ship's interior. Depending on the fuel, this could be an annoyance (water for fusion), a danger (chemical fuel), or disaster (antimatter).
 - **Heat Shielding Damage:** The shielding which protects the ship on atmospheric entry is damaged. Attempting re-entry might cause secondary damage or destroy the ship totally.
 - **Hull Breach:** A section of the hull is ruptured. Air, equipment, and crew are sucked out ferociously.
 - **Impact:** Something hits the ship, be it a rock or another ship. Hull breach and other secondary damage is possible, though not inevitable. The ship might just get shaken up.
 - **Life Support Failure:** Air supply stops. The crew will slowly run out of oxygen.
 - **Power Failure:** All power is lost, killing lights, computers, radio, radar, drives, and life support. If this isn't fixed quickly, the crew will have to abandon ship or die.
 - **Radiation Leak:** Dangerous radiation leaks from a reactor or other source. Crew without safety gear will take radiation damage.
 - **Stardrive Failure:** Warp, Jump, or Hyper-drive fails. The ship might be left sitting still, or flung into another dimension, or end up anywhere or *anywhen*.
 - **Weapons Failure:** A beam weapon fails, a missile jams in the launch tube, or a kinetic energy weapon misfires. The failure may be a backfire or explosion of the weapon itself, resulting in possible secondary damage.

288 pages; b&w softbound; \$30.00

Steve Jackson Games is once again treading the licensing waters by giving Eden Studios, Inc. the go-ahead on *GURPS Conspiracy X*. The text of the setting has been brought into line with SJ Games' realistic mechanics, offering both old players and new some more options for their campaigns.

[CAMPAIGN SPOILER ALERT!]

If "They" have kept you in the dark, *Conspiracy X* is another in the seemingly endless line of game worlds plagued by a secret history. The Watch was formed to stop Hitler's occult victory in World War II, and it survived the war to pursue investigations into UFOs. The Watch discovered our globe was being buzzed by the alien Greys, and disagreements within the organization on how to approach these visitors caused a split.

Operation Dove attempted to contact the craft peacefully, while Operation Pigeon Shoot tried to shoot the vehicle down to research what could be mankind's worst enemies. The ship crashed in Roswell, and the resultant scramble to snatch up the wreckage further polarized the two factions. The peacemakers became an organization called Aegis while the aggressors became the National Defense Directorate, better known as Black Book.

Both groups hid themselves within various fledgling government agencies, using their contacts and influence to subvert personnel and resources to build their respective cabals. Aegis now inducts spies, soldiers, and even psychics to combat the alien menace, while the rival NDD has made tentative pacts with the alien races in hopes of bolstering their technological superiority -- and perhaps gaining the upper hand on their benefactors.

The mysterious and psychic Greys are only one antagonistic bloc. The violent, reptilian Saurians and the haughty and painfully perfect Atlanteans also vie for a piece of the pie, each with their own agenda. As if being sandwiched by hostile ETs wasn't enough, mankind's own psychic nature is polluting the planet -- becoming a semi-sentient phenomena known as the Seepage -- and it manifests itself as any and all of man's fears and superstitions, from magicians and witches to ghosts and werewolves.

[END SPOILER ALERT]

If you're a fan of the original *Conspiracy X*, you know most of this already. Marrying the setting to the *GURPS* system ("Powered by *GURPS*") adds another layer of verisimilitude to a game already steeped in "realism" (at least as far as the average character is concerned). The original mechanics were fairly simple (the cynical among us might say thin), and *GURPS* fills out a lot of the grainier aspects. The book doesn't embrace either system to the detriment of the other, so simplicity is still the watchword and the game retains a number of broad 1d6 mechanics for the old-school crowd.

The setting takes on a lot of eclectic subject matter, but the good news is it incorporates magic, psychic phenomena, and horror fairly seamlessly, with several surprises thrown in. The alien invasion background doesn't exactly blaze a lot of new paths, but it's coherent and, as far as campaigns go, an encouraging environment for GMs. More about the aliens and their plans or tactics would have been a boon to GMs hoping to see under the hood -- especially since they're the main attractions -- but we're given enough for a good start.

One of the really nice features of *Conspiracy X* is the cell system. Players create their adventuring party by deciding who works for which agency, who can bring certain resources to the table, and who can pull the right strings. Pulling Strings lets an Aegis agent finagle all manner of cool items or favors: commandeer a jet, send a cleanup team to wipe out all traces of an alien breeding lab, even secure the temporary use of a piece of alien technology. Everyone works together to develop the cell, which is a pivotal part of campaign creation since Aegis utilizes the "no one cell can compromise all the others" strategy.

Much useful information about various government agencies allows GMs and players alike to speak with some authority when discussing the jurisdictions and duties of those departments, a facet too often overlooked in games dealing with law enforcement. The weapons section is fairly brief, but only because there's a lot stuffed into the book. Alien technology, GM secrets, magic rituals, extensive notes on the paranormal, and a list of the bases a cell can outfit (and the strings they can pull) all take their toll on the page count. In some cases, they try to do a little too much, but completeness isn't one of the game's faults.

What one *can* fault the game for is confusion. For example, there's a section on the strings Aegis can pull, then Fright Checks and some character creation bits (though the cost to be a member of Aegis is before all that), and then some more strings to be pulled. These might not be Aegis-brand strings, but thematically they seem to deserve better than to be separated by other text. Creating a Sphere of Influence (those areas in which you can ask for favors and goodies) isn't hard, but the rules interlock in important ways that suffer from the arrangement (the paranormal material is similarly disjointed).

The appendix is careful to tell you which *GURPS* books are necessary (*GURPS Basic Set, Third Edition Revised*, and *GURPS Psionics*) and which may enhance the successful campaign, but more importantly the authors aren't shy about telling you what books you won't need. What information appears in which *Conspiracy X* tomes is spelled out so frugal gamers needn't blow their paycheck doubling up on redundant text; in fact, much of this book's text is copied almost word-for-word from the original *Conspiracy X*. The same goes for the artwork; Most of it is gorgeous, moody and atmospheric, and doubling up probably keeps costs down. Would that Eden Studios' index, often a big selling point for *GURPS* books, was as useful as those Steve Jackson Games produces. It's fairly full -- three pages worth -- but too many times it comes up short on key phrases.

Nothing short of a second edition is likely to clean up some of these problems, but it's still worth sifting through the text for the gems that raise *GURPS Conspiracy X* above many of its fellows. If you already have *Conspiracy X* you're not likely to get much additional insight (or material) from this new form. True, the conversion work has been done for you and there are more conversion notes in the back, but that doesn't take much of the sting out of the \$30 price

tag. If you're a newcomer to the setting, or if you want to facilitate grafting new material from the **GURPS** line onto your existing campaign, then it's a dandy buy.

Pocket Universe Basic Rules Set

Teenage Demon Slayers -- Pocket Universe Campaign Book #1

Published by [UNIGames](#)

Written and Illustrated by Jeff Dee and 'Manda

18 7"x4" b&w pgs; \$4.95 each

Designer Jeff Dee has given us two games worthy of note. The first was *Villains & Vigilantes*, published by FGU in 1979 and was among the first superhero RPGs. The second was *The World's Easiest Role Playing System* (*T.W.E.R.P.S.*), which -- as the name implies -- has to have been the simplest RPG to date. For the twenty-first century, he has published a game that stands between these two in complexity, but which falls into the same price bracket as *T.W.E.R.P.S.* The *Pocket Universe* RPG line from UNIGames follows the model set by Steve Jackson Games' *GURPS*: Release a basic set of rules and then expand upon them with sourcebooks detailing particular genres and settings.

The first release is the Basic Rules Set, which comes in an odd little format -- 7" by 4" -- and slipped inside a ziplock bag. The tiny eighteen-page booklet is illustrated with just a single piece of artwork besides the portrait on the sample character sheet. That said, there really *is* little room for interior art in what is a simply laid out and clearly written game. Indeed, one has to say that the layout is rather reminiscent of the original *GURPS* rules and more so of its ancestor *Melee, Wizard and The Fantasy Trip*. The similarities don't end there, however . . .

A *Pocket Universe* character has four attributes: Physique (health, fitness and strength); Deftness, Intellect and Willpower. All of these scores begin at eight, with a player receiving ten points to spread between them. The average human score is ten, and no more than four points can be added to any single attribute. Players can select up to five points of advantageous traits, but must also take an equal number of disadvantageous ones. The negative traits seem rather limited and have too strong an in-game effect. They are perhaps too disadvantageous! Most mental disadvantages come under the Quirk label, which can be taken several times to reflect whatever mental aberrations a character might have. Oddly, while Gigantism is labeled a disadvantage, Small is an advantage.

Intellect determines a character's initial EPs (experience points) to spend on Skills, which like *GURPS* are keyed to the attributes that they are based upon. Just a single point on a skill provides basic proficiency equal to the attribute it is based upon. Thus a character with an Intellect of ten spending one point in the Scholar (History) skill would also make it ten. Another two points would raise the skill to intellect +1 or eleven. Finally equipment and contacts can be purchased to round the character off.

The game system is simple -- roll 2d10 and get a result equal to or under the appropriate attribute or skill. Critical results are achieved if doubles are rolled above or below the target. Opposed rolls are worked out by deducting ten from the defender's skill or attribute and using the remaining factor to modify the active player's skill or attribute.

Combat and movement is slightly miniatures oriented, but *Pocket Universe* keeps this in the background. The system is quick, and just complex enough to make combat ever so slightly challenging. What is interesting about combat in *Pocket Universe* is the method of determining both damage and initiative. Players note down three numbers each for

these. For example, if you hit someone with a war flail, which has a damage listing of 7/10/13, the player rolls a ten-sided die, doing 7 points of damage if they roll 1 or 2, 10 on a roll of 3 to 8, and 13 on 9 or 10. Rather nicely, the critical results table provides suggestions if the result rolled is not applicable, for example if you cause the foe to drop something and this is not possible, the table suggests that you knock them down instead.

A single sheet insert provides a character on the front and a sample adventure on the reverse. "Homecoming" takes place in the *WarChest* campaign setting, based upon the board game from Lance & Laser Models Inc. Designed for a party of 3 to 7 characters, this casts them as Locrian soldiers returning home after the Locrian army's defeat at the hands of Hykolarain Empire. Their hometown of Z|arikath is beset by bandits, and it is up to them to do the whole *Seven Samurai/Magnificent Seven* thing. This should provide an evening's worth of entertainment, as well as suggestions on creating dwarf characters.

It is difficult not to compare *Pocket Universe* with *GURPS* and its forebears, to which *Pocket Universe* compares favorably with *GURPS Lite*. Of course it is less detailed in places, but this is more from a lack of real space than the writing. So the question remains: What has a slightly old fashioned generic RPG got to offer over all of the other multitudes of games in your (well, my) collection? Firstly it is inexpensive; secondly it comes in a protective plastic bag; and thirdly, just like *GURPS*, for the sourcebooks (or should I say at the moment, the single sourcebook . . .)

Pocket Universe Campaign Book #1 is *Teenage Demon Slayers*. With a title like that, I can guess what you are thinking. And yes, it is inspired by a certain popular television series from which there is going to be an RPG coming out in Summer 2002.

Teenage Demon Slayers comes in the same format as the Pocket Universe core book and is likewise sparsely illustrated, but the cover by Manda captures the light-hearted feel of this setting. Because all of the core rules can be found in the *Pocket Universe* basic rules set, there is more room in *Teenage Demon Slayers* for background and setting material.

Teenage Demon Slayers takes place in our own world . . . specifically in any small town. Our world is beset by demons that all think that the Earth is a pretty nice dimension to visit. To combat them, the higher powers -- whoever they may be -- have appointed a small band of teenagers as slayers. There is not just a single slayer and their cohorts in a "scrappy gang"; rather all of the gang members are slayers, each with their own skills and abilities. These can be computer hacking, magic (the two-page magic supplement is available as a PDF document to download from the UNIGames website), the ability to receive visions as a seer, or even actually *being* half- or ex-demon.

Each group of slayers has an elder, which is an NPC that watches and guides them against demonic incursions. Elders are seasoned slayers who have retired from active demon hunting to help a new group. The catch in slaying demons is that most demons that holiday on Earth cannot be slain and are inevitably banished back to their home dimension instead. Of course, demons can still kill slayers, as can various demon-worshipping cultists (who slayers are forbidden from killing as well). Besides all this, teenage slayers must still attend high school, do their homework, take the dog for a walk and be nice to their siblings.

Characters in *Teenage Demon Slayers* are high school students, have a lower starting physique attribute compared with adults, have less initial experience points to buy starting skills, and fewer points for contacts. Appropriate new disadvantages include having strict parents or less allowance each week. New advantages include age -- because this provides extra allowance and means you are physically larger, having access to a larger room or a vehicle, being popular and (for fans of that certain series) being an ex-demon. The rules for creating demons or half-demons enable the GM to create their own demon NPCs and allow the players to give themselves special demonic abilities.

Teenage Demon Slayers adds 18 new skills to the *Pocket Universe* genre and where the basic rules concentrated upon the traditional fantasy setting, these new skills are for the modern day. There are new weapons suited to the genre, including the bazooka and M16 rifle, but a favorite will be the trusty stake, which comes in three sizes. The most useful new form of armor is the football kit and cyclist's helmet.

The GM receives four pages of advice on running a *Teenage Demon Slayers* game. After making a suggestion or two about setting up a game and elder NPCs, the guidelines concentrate on demon hunting, which is handled roughly like a

detective story and/or high school. This is really a primer on American high schools and thus useful for those who never went through the American school system. As each stage of an investigation is discussed, an example explains it well and as each one alludes to a single case, this exercise could easily be prepared as a ready to run scenario. Rounding out the booklet is a bestiary of nine demons and a vampire. Of course, once you have seen one vampire, you have seen them all, so demons *do* offer a little more variety. Once those in *Teenage Demon Slayers* have been exhausted, the GM can create their own, or raid any of the various books of demons and devils available for other game systems.

As with the *Basic Rules*, *Teenage Demon Slayers* comes with an insert. This is an adventure that fills both sides of the single sheet. "Strength In Numbers" has the team of slayers investigate a series of attacks by a strange "Monkey Beast" across town. There is more to this than meets the eye . . . unnaturally enough. But experienced gamers should be able to solve this introductory adventure in a couple of sessions or so.

Teenage Demon Slayers does not allow you to play your favorite young vampire hunters, for obvious reasons, but it nearly does. You can at least play something akin to them and that factor -- combined with the simplicity of the rules and the inexpensive nature of the basic rules and this first Campaign book -- means that this package is a decent choice until the real *Buffy the Vampire Slayer RPG* comes out.

Dork Tower!

Dork Tower!

The Son of Cheeroonear

Part I

An Adventure for *GURPS*

by Jeremy Davies

It was late in the day when he found his daughter's feet lying on the ground like broken bark. Guayyanya noticed the small scar, a pink egg, a memory of an accident -- a spilt fire stick when she was still a babe. He didn't cry. He sighed and looked around slowly.

You didn't have to be a Clever Man to smell the death. There was blood, plenty blood, soaked into the earth. Claimed back for the Dreaming, the shells released by their spirits.

Consumed by the evil thing. It was a taint like rancid meat in the mouth. Guayyanya picked up one of the feet, the one with the familiar scar, and paced carefully into the shade of a ghost gum tree, its trunk as white as an old bone. His thoughts were veiled in simple questions.

How long would it go on? And is if in answer, they appeared again.

"Guayyanya. The time of Cheeroonear's son will come to its close soon." The spirits of the Winjarning brothers stood easily side by side. While one talked, the other gazed out at the horizon, behind or to either side. They were tall, and each carried a spear and waddie. Perfect formed men in shape, but empty eyes. The clouds shone through them. They were long-dead legends speaking through Dreaming. "You are the one that must help them fetch the tools. We have left them in No Fish Hole, protected by tests to prove them worthy. You will wait at Three Rock Spur. They will be white, like corpses dressed in clay, and they will have no Dreaming."

The brothers faded slowly into the heated air. Guayyanya said nothing. He was young for a Clever Man, but he never questioned the spirits. He took his daughter's foot and headed south, his life mapped out.

The evil lay deep in its cave, still consuming the Ngadjunma people from its mouth-sack. The killing was easy. Too easy. Next time, it thought, deep down in its dark funnel-like mind, I'll leave their Dreaming be . . .

"The Son of Cheeroonear" is a **GURPS** adventure designed for a party of four to six 100-point characters. It is set in the colony of Western Australia, in the summer of 1862. Characters can be from a variety of backgrounds: free-born Australian, released convict, American adventurer, English priest, Irish prospector . . . there are many possibilities. Either way, they will have little to no knowledge of the myths, rituals, and magics of the native Australians . . . those called "aborigines" by the west.

As written, the adventure is in the style of a Lovecraftian horror story; ancient and terrible magics meet percussion cap and sabre. GMs are, of course, welcome to adjust the adventure to suit their desires. **GURPS Time Travel** could see teched up researchers and soldiers of the future come back to study the period. A modern-day **GURPS Black Ops** setting would fit well also. In both cases, however, the NPCs' and "monsters'" powers would have to be increased somewhat to provide an adequate challenge.

An advertisement in the Fremantle Voice, 2 January, 1862

WANTED

A band of stout and dour men, not easily shrugged off by the fear of physical casualty, and quite able to themselves deliver such to those that would come against them; needed for inland expedition that promises a high return in profit and reward.

Those interested, meet at the Arms on Dally Road at noon, the fifth day of January.

A churchman, as spiritual guardian is also sought, with a full and equal share, guaranteed.

--Captain Albert P. Randolph

The Background

On the third of May, 1855, Albert Patrick Randolph -- an Assistant Surveyor for the colony of Western Australia -- stumbled across a gold reef while surveying an area 140 miles almost due north of a deserted sealing town called Esperance. He named the site beside a large lake "Albert's Luck" and made a note of its position. It was high-grade ore with a very high grain content. He collected some samples and went back to Fremantle, doing his best to conceal his excitement.

By the 30th of June, Mr. Randolph had organized a small private expedition to the area, claiming he had botanical interests in some unique desert flowers he had observed there. There were a suspicious amount of picks among his equipment for a flower search, but no one particularly noticed. After all, gold was a discovery of the east.

A young aborigine by the name of Brownie was hired as their guide. He was a warrior of the Ngadjunma tribe, but he became very agitated by the direction of the expedition as the days went on. A day's travel out from the site, he "went mad," mumbling such gibberish as "*Cheeroonear ha, Cheeroonear ha*" over and over. When the party tried to proceed, the man began screaming at them, even grabbing them to bar their way. One of the men beat him down with a spade and they left him for dead.

"Albert's Luck" proved to be as rich with gold as Albert had hoped. The six men worked hard for three days until they had too much gold for them to carry easily back through the harsh country.

That night, without any warning, the group were attacked by a fearsome creature: a giant dog-headed man, which pulled men limb from limb while they yet lived. Its strange see-through stomach-pouch was almost exploding with fluids, blood, and chewed human meat, which slowed the creature just enough to allow Albert's frenzied escape.

As he left, he heard the thing's terrible rasping voice roll over the silent gray night land:

"You return, white fella. You want after yellow rocks. When you back, I drink from your skull."

Albert managed to return to Fremantle with only one nugget of gold, which fetched a healthy 200 pounds. Not wishing

to be considered a madman, he told authorities that his party had been ambushed by blacks in an area well east of the actual site, not wanting his "gold mine" discovered by others. A squad of troopers were sent out, and a small band of Ngadjunma were "dispersed," which usually indicated a massacre.

It took Albert over five years to gather up enough courage to plan a new expedition. The lure of gold slowly ate away his primal fears. By the turn of 1862, he hatched himself a plan. He would lead a new party back to Albert's Luck, better equipped to deal with an "aborigine attack." He needed men who knew their way around firearms and violence, plus he would bring along a churchman (any sort would do), just in case the creature could not be repelled by lead alone. Albert assumes it is some form of demon or devil, so surely a stout man of honest faith could repel such a thing.

The Workers Arms Hotel and Storre Dally Road, Fremantle, Western Australia

The Arms is a somewhat hastily erected building, with stone corners and wood walls. It has dubious-looking gas lights hanging from the roof at various angles, and little else in the way of ornamentation. It serves a choice of thickly brewed beer or an almost lethal brew of "rum." It has several cheap rooms upstairs offering "settles' females a spot to rest whilst man is makin' house." It serves a thick stew three times a day, plus tea for the ladies.

On this noon day, Albert is sitting "out the back porch," which consists of a cleared area of dirt with some shade from a tortured-looking gum tree. He has a rough wooden chair up against the tree trunk, a stiff board with paper on it, and a pen. Dressed in a military red jacket, a dun pair of trousers and a black felt cap, he manages to look as though he has some authority.

About three times the amount of heroes in the group turn out, some of them looking like pretty desperate men. Many of them are convicts with tickets-of-leave; some may not even have that. After taking names and asking a few basic questions about each man's personal history, Albert dismisses a third of them. The remainders are split into two groups (the PCs and the NPCs) and he steps up gingerly to stand on his seat to address them.

"Um . . . good sirs. This expedition -- though its nature must remain a mystery for you now -- promises a large reward. The employment contracts that you will sign guarantee you a minimum return for your efforts of 2,000 pounds, in return for your unquestioned loyalty to me until return to Perth. It is a King's ransom I know, but I can assure you now -- and it is also written into the legal documentation -- that you will not be required to perform any criminal ventures. It is honest labor that I require, and organized protection against the savages. Although my last venture ended in a massacre at the hands of those heathens, I was not equipped -- in my Christian ignorance -- for military operations, as I shall be now with your assistance.

"You men, that I have decided are suitable for my course of action, must now prove yourself so. I have split you apart into two functional corps for a purpose, which I shall now explain. There is a ship in the harbor named *The Currency Lass* which I have chartered for my expedition. I will offer contracts, as I have discussed earlier, to the members of the group that first breasts the gangplank of said vessel. All members -- and I repeat again -- *all* members of the group must be accounted for. This method of testing will therefore on the one hand show me how resolute the men that make it up are, and on the other will prove their ability to act as a dedicated squad, which will be necessary when out in the God-forsaken bushland. The two rules of this test are as follows. Firstly, no killing. I am sure that the troopers will not intervene in our little game as long as a life is not taken. Secondly, you may not leave the Arms until the stroke of six; Murphy, the publican, shall police this rule. Failure to comply means no contract shall be offered.

"So I am clear? Any questions, not relating to the goal of this lawful journey?"

Albert will not give any further details, except to say that the ship is fully equipped with everything they may need, and that it sails tonight at half past six. If a priest presents himself (either a PC or an NPC), he is exempt from "the test" and will accompany Albert immediately to his "stateroom" for tea and contract signature. The lack of a priest will worry Albert a little, but not stop him from going.

From there, almost anything goes, short of outright murder. News regarding "the test" spreads like wildfire among the curious population of the frontier city of the west. It is strange, and has the potential of violence, so the Arms quickly fills up with gawkers and even a newspaper man or two. By six o'clock there are several hundred people gathered outside the Arms that can't fit within, not to mention a squad of twenty troopers with muskets that have been sent to see what the disturbance is all about. Irish uprisings are always considered a possibility whenever more than twenty or so workers gather together.

The troopers are unlikely to stop a good honest brawl, as long as no ladies or "gentry" (rich/military people) are threatened. They find the idea of two groups of hard cases punching the snot out of each other while they try to chase some mad sun-crazy new-chum pommie bastard on some fool quest for god-knows-what the height of entertainment just like the next bloke.

The adventurers might notice that there is no rule against beginning to "whittle down the numbers" of the opposing group before the clock strikes six, just that they can't leave the building until that time. If they in anyway immobilize the other men, some of their mates might take a dim view of it.

The unofficial leader of the NPC team, Arnold "Red Belly" Thompson, has a simple strategy for his group. They plan to wait until the start time and then run on mass to the door, fighting anyone in their way . . . just keep on moving in a group, fighting as they go and running when they can.

If the PC team loses the test, they may feel compelled to follow the *Currency Lass* at a distance. Wherever this new chum's going, there must be heaps of money. Maybe a Welsh shipowner named "Cauliflower" Kirkton might offer the use of his vessel for such a purpose . . .

By Sea to Esperance

The Currency Lass is an old whaling schooner, a veteran of over thirty years along the south coast of Australia and the waters of Van Diemens Land. Any adventurer with seamanship skills will soon realize that it is quite seaworthy, though it is heavily weighed down with wool bales, and a team of eight camels . . . to the point that rough weather could make the vessel quite unstable. Others will just think that it all seems rather crowded.

Albert will welcome the winning team aboard and promptly take them to his "stateroom" below decks (a small storeroom containing one chair, one stool and about forty bags of grain). Here he will produce the contracts for the party's perusal and mark. The contracts are reasonably straightforward, though worded heavily in legal jargon. Two thousand pounds is offered but a number of penalties are outlined that can cause the forfeiture of some if not all of the payment: insolence, insubordination, lethargy, malingering, or cowardice. A smart reader (or someone with Law skill) may find an interesting clause buried deep beneath the layers of wherefores and henceforths: "The undersigned will have no legal claim upon such items retrieved by the company . . ." Anyone wishing to protest regarding the contracts will be told that they are welcome not to sign . . . but could they please ask the other group to come aboard on their way off the ship?

Albert's "aborigine advisor" enters the stateroom. He is a tall black man with loose hair and rough hewn trousers cut back to shorts. Apart from this he wears across one shoulder a kangaroo skin pouch of some sort. "Two Bob Snooze" had been in Fremantle several months before learning about "Albert's Luck" through reading the man's diary when he was asleep one night. He dressed like a bush native and offered his services as a local guide. In fact, he plans on killing everyone once the gold is found. His two pistols and bowie knife are in his pouch. Meanwhile, he tries his best to play the role of a native advisor.

Note that the "Two Bob Snooze NPC" is not essential to the plot. Feel free to simply use a straight guide (use native

stats below), no guide at all, or even allow "Two Bob" to be played as a PC.

Another vessel puts out just after the *Lass*, containing Red Belly and his men. They realize that Albert must be on to something big to be offering the kind of pay he was, so they arranged -- through a Welsh shipowner named "Cauliflower" Kirkton -- to follow at a decent distance to see where they put aground. From there they intend to follow the group.

Fremantle is a reasonably busy port, so it is not unusual for two or more ships to be in sight of one another. If the captain of the *Lass* is asked to take a look at the pursuing vessel, he will express some interest, as he thought the *Llewellyn's Pride* was not due to sea for another fortnight.

If the party does nothing, they will have an uneventful cruise to Esperance checking their equipment and wondering where they are going. Albert will tell them nothing. Two Bob pretends to be an ignorant savage as much as he can.

If the *Currency Lass* turns about to face its pursuer, they may be in for a surprise. Red belly's "gang" has swelled in numbers by 50%. They can either fight it out on the high seas or speed away in their faster vessel to reach Esperance before them. Albert will ask the advice of the group and go with whatever they think is best. On one hand he doesn't want a hostile group behind him; on the other, he could try to lose them once they land and thus not be delayed at sea.

Esperance . . . A Ghost Town?

Esperance was a small township that serviced the seal and whaling industry up until the 1840's when the animals "dried up." Once a small hive of activity with Van Dieman's Landers (Tasmanians), Americans, and French whalers, now only three ramshackle buildings remain upright; several others have fallen to the sandy ground in heaps.

It is an hour or two from sunset when the ship rounds the gentle cove. Albert brings his "team" together on deck for a briefing.

"Men. After disembarking from this vessel -- and you will assist with the careful handling of our animals and tack -- we will occupy one of the vacant buildings and remain for the evening. I will tell you now what my intent is, and that be to travel inland for several days, where we shall find . . . the . . . *object* of our quest. *The Currency Lass* has some commercial duties to perform further east at Eucla, but she shall be awaiting us when we return; I have a solemn pledge."

The captain of the *Lass* approaches one of the adventurers and hands him a small (three inches by three inches) cotton-covered cube of Turner & Sons American tobacco.

"They'll be a black fella there who'll be wantin' this, see. It'll mean a safe journey for tha ship. Probl'y save your skins to, make ya path a li'l easier will Bishop."

Several ships captains know of Bishop T'bakka who resides in the Esperance ghost town. He's an old *wirinun*, a "clever fella" (Clever Man or witch doctor) with a taste for tobacco. The sailors, being superstitious lots, firmly believe that he can control the winds and seas between Esperance and Eucla. When they pass by, they throw a cube of tobacco over the side in a watertight bag so that it will wash ashore and keep the old clever fella happy.

If the *Currency Lass* lost no time, it will arrive in Esperance on a golden afternoon. The *Pride*, though still visible on the horizon, will not reach the cove until just before noon the next day. Make the players tense about the mysterious ship; they might even want to set an ambush for its arrival, though Albert will not want to waste time.

The players assist in organizing the camels onto a penned barge (Animal Handling could come in handy here, or some camels may be lost) and the unloading of all the equipment: the tack and solid wood and wicker saddle baskets, the spades, picks and shovels, dried food and water sacks, the tents, and other paraphernalia. Once done, the captain of the *Lass* bids everyone a safe journey and sails east.

The building selected by Albert as the "base camp" appears to have been a store of some sort. A faded sign, once painted red, says, "Brooks Inn an Genral Storr. Wipe ya feet!" Its vertical slab wood walls shake noticeably in the stiff southerly that's blowing sand up through the broken windows. When the sun drops, the temperature goes with it, and the wind builds up stronger.

It is cold inside, even with a fire going.

After midnight some time, Bishop T'bakka comes strolling in. If a sentry is posted, a Contest between his IQ (+/- Alertness) and Bishop's effective Stealth (20 in a tribal area) must be won to spot him. (Danger Sense will not work because he is not a danger).

Otherwise he walks into the middle of all the sleeping bodies and yells, "*Nngarra ngarra a mismoo gip lommee ngadjunma!*" at the peak of his ancient shrill voice. (Give one player a Vision roll to notice Two Bob pulling a very well maintained revolver out of his "native bag." If it goes unnoticed, he slips it back in when he realizes there is no danger.) The players should react with great surprise; Bishop is fully dressed in red and white ochers, which shine brightly in the moonlight. After shouting read this description to the rudely awakened adventurers, or the sentry that spotted Bishop's approach:

"Shining with an otherworldly luminance is a macabre parody of a human skeleton, animated with bizarre energy. There are bones where bones should not be, criss crossing about the black spaces of the middle of the room like broken ribs. The thing shrieks out again and its handless arms wave around above its half-head."

After a few seconds, with eyes adjusting to the dark, they will see the body around the paint. Hopefully, no-one will open fire, but in the dark they should miss and stop when they realize the "thing" is not attacking them.

Albert, succumbing to sheer primal terror, has disappeared.

Bishop, after introductions, will settle down for a chat.

"Bee' spectin' you fella for'a while now. Y'know ya come down here is got my business, ha! No ya don't, ha!, no you don't! I know, ya know wha'. I know it." He laughs hysterically. He turns to the person that was given the tobacco (if it hasn't already been given to him). "Ya got my t'bakka, ha?" If the player doesn't give up the tobacco (the cube is worth at least two pounds), Bishop will shrug and say: "Can't 'elp you fella, hey?" and he will leave. If he gets it, he will laugh again for some time and produce a pipe from his small bag. A minute later he has the pipe fully loaded and puffing smoke from his nose.

"You fellas good fellas and come here ready fo' business, hey? That my business too, ya know? I show ya necks day what ya want t'ave. You finish this dreamin', then you whi' fella pick up them rocks, ha! Whi' fella business, Ha?"

It might occur to the party to try and have Bob talk to the man, to make more sense of him. Two Bob will say that the dialect is wrong, tribal differences etc. Bishop will cut in:

"'im! 'im! fella got no dreamin', ha! 'im not here, fella got no dreamin', jus' like you whi' fella, no dreamin' He los' the dreamin' long back." Two Bob will say this is just a way of expressing tribal differences.

About now someone should notice that Albert is missing. When Bishop made his dramatic entrance (or was hailed by the sentry) the terrified Englishman leapt through one of the missing windows and ran headlong into the surrounding bush, all his fears from the last excursion revisited. He was certain that the beast had come for him. He is lost in the scrub within minutes and rolled up into a fetal position beneath the roots of a tree; almost two miles away. He stays there, silently for the next two days, too terrified to move until thirst drives him back to the settlement, pale and very shaken, his sanity holding on by a slim thread.

The party will probably want to mount a search. Two Bob will suggest reading the man's diary, which has a small forcible lock. If it is broken open, they will learn all about the previous expedition, referring to Cheeroonear ha as "the thing" or the "creature" or the "demon." It does not describe it though, and though it details the large amount of gold at

Albert's Luck (which he reckons to be worth over two million pounds), it says nothing about its position. That information is locked safely away in his head.

Either way, Bishop will advise against searching for the man in his own strange way.

"I know where he wen' fella, poor fella. Poor fella". He shakes his old gray head slowly. "I take you fella to 'im business. Then you finish it, ha?"

The players will probably assume he means to take them to where Albert is or to the gold reef. Bishop will sleep quietly in a corner until morning, then he will lead the party to *Ngarra Tijjallara*, No Fish Hole.

No Fish Hole

About 25 miles northeast of the town is Ngarra Tiljjallara, a subterranean tunnel that descends at about a 30-degree angle for ten yards or so, then becomes an underwater cave. The entry point is narrow, barely two feet in diameter. and the is water freezing cold and pitch black.

On arrival, Bishop refuses Bob entry to the cave (which suits Bob just fine). Bishop says:

"List'n now hey fella. This both ar business, hey? This where Winjarning boys put the business 'im nee', ya know tha'? Winjarning in dreamtime put 'im in no fish hole fo' you fella to finish, hey? You fella swim in that, you fin' that business. You finish dreamin' an' pick up plenty rocks, hey? Plenty pretty whi' fella rocks."

If pressed, Bishop will tell the party that he knows where the rocks are as well, but they need what's down the hole first.

Swimming into the unknown in total blackness is no mean feat (claustrophobes can forget about it). The cave narrows to a rough-edged 22 inches, dropping down to almost vertical for about twelve feet before slowly rising and widening for another twenty yards, then reaching the inner cave and some much needed air. The players won't know it, but the actual distance is not too long for an average man to cover while holding breath (24 yards) considering a HT of 10 allows for 40 turns (HT x 4) which at average swimming speed gives the character 40 yards to travel (Swimming speed 1 for 1/10 Swimming skill round down). There are, however, further complications.

- **Cave width.** Certainly the thinner the character, the less likely he will become snagged on a jagged rock to drown. The roll for an average build man (5'11", 150 lbs.), stripped naked, to avoid snagging is 13 or less. The GM should modify this up or down depending on whether he believes the characters build is slimmer/thicker and whether he wears clothes that might catch on edges (up to -1 for underwear to -6 fully clothed). Once snagged, a Will roll is needed to avoid panic. An unpanicked character can make a ST roll to unsnag, but each attempt takes five seconds. It is important that the GM keeps track of this because it will effect the amount of air time the character has to reach the end. Due to the narrowness, it is impossible to turn around until ten yards from the end.
- **Panic.** (Ignore for Unfazeable characters.) Three Will rolls are required to be made before reaching the end (as well as any snag induced Will rolls). For game terms consider the rolls to be made every seven yards. Once a character panics in the ink black waters, they lose all their air and begin to drown (p. B91). The players may think to tie a rope to the leg of the intrepid diver in an effort to save them in the case of trouble. This is a good idea in one way (it may save someone from drowning) but it is important for GMs to keep in mind that the rope itself could become snagged (see above); it may also be difficult to tell whether the diver is in trouble so he may be pulled back for no reason. The rock walls are also very sharp, with shells and jagged edges. For every two yards the diver is pulled backward, he would sustain 1d-2 cutting damage. The GM should feel free to increase this up to 1D depending on the "rescuers" pull speed.
- **Confusion.** (Ignore for Absolute Direction.) Once the player reaches the end, the test is not over. Disorientation caused by a darkened underwater swim has left the diver unable to tell the difference between up and down. After the 24 yards are covered, an IQ roll modified by Alertness must be made to surface. If failed, the character continues to swim about in wide circles at the bottom of the pool, thinking that the passage has simply widened.

Allow one roll every 2 rounds, and remember to keep track of time for drowning purposes.

The Winjarning Cave

Once the diver/s has surfaced he will find a six foot high granite wall jutting out of the water. This is a -3 Climb. There is light emanating from above the wall, which casts a very low, gloomy aspect to the gray-black walls of this natural chamber. Describe a skull bobbing up in the water to heighten the effect. It was from a previous failed attempt to swim through the passage and has been disturbed.

Once up the ledge, the light is brighter, and seems to be coming from the roof further up. There is a passage as if cut through the stone, but everything here has a somber untouched air about it, the air of antiquity. This is an ancient place, and has not been set upon for thousands of years.

With the light above, an Alertness check is required not to simply fall straight down a deep ravine! (Unless, of course, clever characters plan ahead . . .) The ground is black on black. The other side of the ravine is twelve feet away, and there is about ten feet of run up distance before the edge. See the rules for running broad jump (p. B88). Climbing would be extremely difficult, even with the right equipment, but not impossible; 120 feet of sheer stone would have to be negotiated on either side.

Finally, after the tests of the physical feats have been met by a true champion, the inner cave can be reached. The cave is small (ten feet across) and circular; it is almost a perfect sphere apart from its entry point. The roof shines with a vaguely green luminous light. The stones that give off this light are crystals that are warm to touch, but once touched by human hand (or removed from the rock wall) slowly fade in a minute or so. Nestled squarely within view are the Winjarning waddies and boomerang (see below).

This cavern feels warm and is great comfort to any character within it, as if their soul was taking a spa bath and neck massage. Any person that stands within the chamber for five rounds receives the Honesty disadvantage (only removable by a Wirinun). Any conflicting disadvantages (Kleptomania, Pyromania, illegal drug Addictions, etc.) are removed. If an Honest character enters, they will be overcome by the positive energy of the place and receive a +2 bonus to all rolls for one month.

As long as the character picks up all three items and remains in the inner cavern for five rounds, a sudden dizziness will come upon him. The world seems to shift. A cold wind blows about and all the hairs of his body stand on end . . .

. . . and the character will awaken at the mouth of the cave, in the midday sunlight. Others would suggest that he must have found another exit and maybe the stress of the events got to him and he collapsed and has forgotten . . . Anyway he's back now. Somehow.

Bishop smiles frequently at the one who recovered the Winjarning tools. He now calls the character *Naggarra igh arriguh*, which means "he that gets the tools." They will prove very useful in the conflict against *Cheeroonear ha* (see Part II).

If the characters fail to procure the items for whatever reason, Bishop will be very sad and withdrawn, muttering to himself and shaking his head slowly. Once back at Esperance he will be gone the next time no eyes are on him. He will be untraceable.

Return to Esperance

Meanwhile, Red Belly and his crew have landed (presuming they weren't dealt with earlier) and taken Albert prisoner. They have tortured him and/or read his diary and know the goal of the expedition. And this time they've got guns.

Red Belly's lone guard at their expedition camp has a Vision of 8 due to mild intoxication. The rest of the party has Albert, and is moving towards the gold. If Red Belly is killed or captured, the others will soon give in and offer to join

in with the other party. Albert has almost completely lost his marbles by this stage, and is barely able to hold his concentration together long enough to reply coherently to any questions. The one thing driving him on is the memory of the gold reef; it is like a beacon in his darkened mind. When asked about the direction to the gold, he will seem to get himself together, his eyes focusing just a little. He will consult his compass and begin to walk, almost oblivious to his paid employees. Other than that, any questions or requests for leadership will be met by blank stares to the north, or faint, unintelligible jabbering.

Keep in mind that any Honest character will now only kill as a last possible option. He will try to capture any "criminals" (including other PCs) and detain them for later prosecution by the relevant authorities.

Two Bob will say he cannot get involved in white men's squabbles, and claim to not be able to use a gun or fight . . . unless (of course) his secret is already out. In this case he will fight, albeit reluctantly; he would not, however, be above attempting to eliminate one or two of the tougher characters if such an opportunity was to present itself.

The Trail to Albert's Luck

The PCs will need to take over the expedition, unless Red Belly and his group kicked their butts, in which case they'll be trailing on behind no doubt, looking for a chance of ambush, if any are left alive. Albert is a zombie and no use to anyone except as the human compass to get the party to the gold.

With all of the equipment and foul tempered camels, an average of twenty miles a day can be made through the harsh, windswept plains of the Nullarbor. The first leg of the journey takes two days and ends in a lake; so does the second leg of roughly the same distance. Lake Gilmore is a short 10 miles or so north of this second lake, and the expedition follows the western side north. From the northern tip of this lake it is about 20 miles to the southern tip of Lake Cowan, where the nestled alcove of water named Albert's Luck awaits.

The following events may occur randomly, or when desired by the GM for game effect.

- A Ngadjunma war party attacks; they seek vengeance for the dead of their tribe that fell in the attack from the soldiers who responded to Albert's (false) tale. If the heroes think of it, and as long as Bishop is still with them, they may try to parley, telling them the truth about how they are not responsible for that lie. If so, they will still require someone as a "blood debt" to the tribe. (Any white man would do for this purpose, though no Honest character would allow this to happen.) The person will be taken away and thrown off a cliff, after having both legs speared through.

The group could consist of anywhere between ten and twenty men. They will continue to attack until a third of their numbers are wounded or killed; then they will retreat. They will then attempt to follow the group, sneaking up to launch spears in the night.

- A sandstorm erupts. Shelter will be scanty at best, and the camels will want to bolt. Firearms will also become less reliable from this point. Double the Malfunction chances, even if precautions are taken to protect the weapons.
- Albert's mental state deteriorates from day to day. He does not sleep, but keeps glancing at his notes and compass, chattering away to himself. He seems to know where he's going, but after a few days travel he begins to wander off at night, as if he no longer knows the others are with him. The players may need to tie him up for his own safety. If so, he won't struggle much, and when allowed to move freely, will still gladly continue onward, as if guided somehow.

Albert's Luck

Albert's Luck is a small alcove at the southern base of Lake Cowan. One day, a town called Norseman will evolve around the site, but right now it is little more than sandy rock and spindly scrub, with gnarled, claw-like trees that twist their way toward heaven. There are several small billabongs or rockpools about, though the place is unnaturally

silent.

The group will reach the area at nightfall, so a camp is set. Albert, if still alive, is either tied firmly up, or rolling about on the ground gibbering like a deranged lunatic. By the time some damper has been cooked and tea laid out, he calms a little and sits.

During the night, *Cheeroonear ha* ventures out of his lair to kill Albert. He will attempt to sneak up and use his decapitation technique, trying to make good on his promise to drink the contents of Albert's skull. He will not attack the party unless attacked himself at this stage, and if attacked, he will make a fighting retreat to gather his dogs. He will offer this warning:

"You leave here now, and the night will be your shield. If you wait until morning, I will come again and crack open your spines to feast on its tender marrow. You have my promise."

The voice is a rasping terrible tone, like a jagged cement block being scraped across a gravestone. It is worth Fright checks to all that hear it.

If the characters are still there in the morning, *Cheeroonear ha* will send his dogs to attack at the break of dawn. They will creep up as close as they can to the campsite before striking, if possible at different angles simultaneously.

Cheeroonear ha will wait about thirty minutes before sneaking up himself to see how his dogs have done. If confident that the fight went well, he will not bother to hide his approach; otherwise he will sneak up to attack, or maybe even flee if he considers the party too strong. He knows nothing about the *Winjarning* weapons.

The Return and Repercussions

There are many possible outcomes to the adventure. If *Cheeroonear ha* and his dogs triumph, and any characters escape, they may wish to return and try their luck again. If they didn't have "the tools," they might think to go back and try for them.

If *Cheeroonear ha* is defeated, the GM may allow the characters to "strike it rich." This would (of course) alter history. Laurie Sinclair's horse, *Norseman*, would not be the unofficial discoverer of a gold reef in 1894 after all, and the Western Australian gold rush would begin 30 years early. A rough estimation of gold values at the time would give a return of around 1 lb of gold equaling 290 pounds. The entire reef contains about 2,800 lbs of concentrate and 6,000 lbs of ore. With the cost of refinement etc, ore is worth approximately one quarter of concentrate price. This puts the value of the reef at around 1,260,000 pounds total. With the equipment available on this expedition (8 camels carrying gold with no riders), the weight of gold that could comfortably be removed immediately would be around the 1000 lb mark, yielding around 225,000 pounds back at Fremantle, allowing for a small mixture of ore with prime-picked concentrate material.

If the GM doesn't want the gold to fall into the characters eager pockets, a massed *Ngadjunma* war party may attack on the way back with enough men to force an unencumbered retreat. A chase through the arid fields of the Nullarbor -- characters in pursuit of runaway camels and aborigines in pursuit of invaders -- would provide for an entertaining sequence (though most camels have a knack of loosing their loads once they bolt . . .). Or Bishop *t'bakka* could warn them of a curse against the removal of the gold. It would cause a wasting sickness until returned to its rightful place . . . or until the thief dies a slow painful death. The adventurers could begin to fall sick slowly on the return to convince them. Then there may be some way to remove the curse; Bishop might know of some other tools, somewhere, in a mountain area, where the *Keeng Keengs* used to live in the *Dreamtime* . . .

When the *Currency Lass* returns, there is a surprise on board . . . a surprise for Two Bob, anyway. A group of bounty hunters, and two New South Wales police constables, have tracked down their quarry: the outlawed Two Bob Snooze. Two Bob's reaction would be governed by his impression of how the party feels toward him. If he thinks they'll stand by him, he'd try and feed them some concocted story about being "wrongly accused" of killing some homicidal convict overseer to elicit support. If not, he'll run. He might have spotted the men on the deck and get a head start; he might

have jumped straight from the gangplank into the foamy sea. (Maybe he drowned? Maybe not.) The characters might join the chase: 500 pounds, dead or alive. Or maybe Two Bob will chase *them* for his share of the gold . . .

Another surprise will await them back at Fremantle. Albert, being a surveyor and having an understanding of the law, staked a claim to an area of land which of course included Albert's Luck. Therefore, by law, all minerals found in said area belong to him and now become a part of his estate . . . though they are still entitled to the 2,000 pounds owing to them for their service. The players might make a claim of finding the gold they have with them elsewhere (sure to raise questions and a rush to the area). Albert's next of kin, Hubert, a younger brother in California would sure like to know about this claim. Maybe he'll find out and need guides? Maybe the characters will try and "sit" on their find and go back for more (look out for Honest John!).

The richness, color, and depth of the Wild Colonial Boy period of Australia's history is fertile with as many strange twists and turns as an imaginative GM can devise. Just think *A Fistful of Dollars*, but the people love the outlaws and hate the law. There is magic but it seems to work upside-down. If it looks good it might kill you and the cultural roller coaster just crested the rise.

And there might be a break in the line.

Part II, next week, will detail the special items found in the cave, and NPC and creature stats.

Pulling Back the Curtain . . .

We Learn The Wizard Is The *Player!*

Okay; this one resides in my ol' brain cells as the *other Torg* story. I wasn't even involved, but heard it from my friend. And it's not something that happened in game, but was rather contemplation *about* what happened. And it's not even that funny. And the dog ate my homework, and coffee may be hot.

In the *Torg* game, the primary way the great war in the universe will be won is by the adventurers telling stories of their heroic deeds, inspiring the war-torn people of Earth to be filled with the possibility of hope. The way those heroic deeds were quantified in the rules was by the players rolling 60+ on a roll (on a 20-sided die; you get to add and reroll 10s and 20s), and then by playing a Glory card from a player's hand. So they're somewhat rare, and once those conditions were met, it was assumed that the object of that roll was truly heroic and tale-worthy.

In one game, the players *did* manage to naturally roll their 60+, play their Glory card, and create a truly epic-inspired event . . .

. . . on an Evidence Analysis roll.

So the players got to thinking about how, exactly, this Glorious tale was going to go:

HERO: Okay; so after hours of fighting, we entered the deep underground lair's final chamber. And there in that chamber was our final adversary: A giant hulking monstrosity, intent on killing us all. Clearly, this was to be the battle of our lives. And he was guarding . . . some *evidence!*

AUDIENCE: Oooooohhhh!!!

HERO: To say this was a tense moment would be a grand understatement. I mean, we *needed* that evidence. And even if we acquired it, would we be able to discern its meaning? The fate of the world lay in the balance. The evidence was strewn in front of us, and we stood there, puzzled . . . what did it all mean?

[TWENTY MINUTES LATER]

HERO: . . . And finally we *figured out the evidence!*

AUDIENCE: Whoa!!!!

DOE-EYED LITTLE GIRL: But . . . but . . . what happened to the bad guy?

HERO: Oh, we whacked him. Anyway, once we'd figured out the evidence . . .

(They later clarified the rules so that heroic stories could only be done by, say, doing heroic things.)

I told you that anecdote so I could tell you this one.

Once upon a time I was running a miniseries with a player who seemed pretty darn incompatible with my gaming style.

This point was driven home most clearly when there was a dramatic scene where a young girl was the sole survivor of an attack that killed her entire family. The girl had some information the party needed so they could continue their investigation.

Anyway, this player said, "I comfort the girl."

"Umm . . . okay," I said. "And how do you do that?" I wanted the player to elaborate on exactly what he was doing . . . y'know, maybe try to get him to *roleplay*.

"Well, I have exceptional skills in Empathy and Persuasion, and I'm very attractive. I'm using them to comfort her."

"But *how*?" I asked. "What, exactly, are you doing or saying?"

"Um . . . I go over to her and say . . ." He struggled. " 'There, there.' " He made a pat-patting motion on his shoulder with his hand.

" 'There, there'?" I repeated. "As in, 'There, there . . . You've just witnessed some eldritch horror rend your mother, father, brother, and sister limb from limb, then burn your house to the ground. Want some ice cream?'"

"Um, sure." He rolled his dice. "Looks like I did pretty well; what does she tell us?"

After the conclusion of that miniseries, I somehow forgot to invite him back for further games.

Anyway, I told those stories partly because they eat up gobs of my contractually obligated weekly word count, but mostly to make a point regarding the curtain between players and characters. That's right; this is part two of my series begun [last week](#) regarding the separation of player and character experiences and knowledge. (I bet you thought I'd forgotten!)

Last week I discussed the advantages and disadvantages of a thick curtain. This week I'm looking at having a thin curtain between the two.

If I were creating a list of my top five troubles with my own roleplaying -- both as a GM and a player -- number four or five would probably be problems with immersion. Because there's a dirty little secret in roleplaying games: Roleplaying isn't *really* necessary.

When you consider it, it's entirely possible for a game to look like this:

GM: You encounter an orc.

PLAYER 1: I hit him with my sword. I rolled a 3.

PLAYER 2: I attack him with my axe. I rolled a 17.

GM: Player 1, you miss. Player 2, you hit. You do enough damage to kill the orc. There is a prisoner in this room: A little girl. She is terrified and hiding.

PLAYER 1: I attempt to comfort her. I have the "Persuasion" ability. I rolled a 13.

GM: Okay; you were able to calm the girl down. Relieved to be rescued, she hands you a map she stole from the orcs.

PLAYER 2: We look at it.

GM: You can't figure it out.

PLAYER 2: I use my "Evidence Analysis" ability on the map. I rolled a 5.

GM: You can't figure anything out.

PLAYER 1: I have "Evidence Analysis" as well; I rolled a 19.

GM: Okay; you figured out that there was a cipher that required the map to be folded in half before it was readable. The map refers to a treasure hoard buried about 10 miles away. You are able to go there, if you'd like.

PLAYERS: Let's go!

Now, if everyone is having fun then this isn't a problem. But, technically speaking, this probably isn't *roleplaying*, any more than playing a computer RPG where you control a party whose abilities and skills are entirely transparent. In such games, if a member of your party has the Analyze Artifact skill at a high enough level, they'll figure out how to use the object they need; otherwise they'll need to go on a subquest or figure out a way to raise someone's skill level. Regardless, the adaptation of a role is entirely optional, and not required for the game to be playable nor for all

challenges to be overcome.

Once you realize this, the appeal of a thinner curtain becomes a bit more obvious. No, you can't expect your players to pick up swords and start hitting you (unless you've given them a *really* stupid puzzle). But you *can* provide them opportunities to use their own abilities as players instead of their abilities as characters.

If they -- as players -- can provide a sufficiently stirring speech to the troops before going into battle, why would you *need* a Leadership roll?

If a player figures out that you're describing symptoms of radiation poisoning in a mysteriously sick character, why not let him have that victory instead of waiting until the dice dictate that his character figures it out, too?

If the players can figure out that the handwriting sample on the ransom note you've handed them is identical to the handwriting on the check used to pay them, why deny them that victory?

The potential for immersion is probably the biggest appeal of a thin curtain between the player and character experience. If they know they will be rewarded as a group by paying attention to clues, making dramatic speeches, or drawing their real-world knowledge into the game, then the odds are pretty good the players will be more immersed in the experience; this will (hopefully) make the game more fun for everyone.

Of course, there are potentials for real problems with a thin curtain:

"You didn't see the clue . . . so you *die*!!!"

If I've stressed one thing over and over to this approach, it's that you *must* provide an "escape plan." If the players can't figure out the puzzle left by Rebusman, then it's imperative that the *characters* be given a chance to solve it . . . probably through dice.

Likewise, if the heroes are embroiled in a murder mystery, the characters should be given a chance to notice that the maid lied when she said she got mail on Sunday, even if the players missed that clue.

Depending on the game, all that may be necessary is to give partial clues to the players. For example, rather than saying, "Your character realizes that the maid had to be lying because there is no mail delivery on Sunday," you can say, "There was something odd about what the maid said she did this morning; your analytical mind will eventually figure it out, but it might take some time. (Of course, if you figure it out as a player, you were smarter than you thought . . .)" That way you're still encouraging the player to sort it out -- and providing a reward for doing such -- but he can be confident that his character will get the answer eventually.

"That doesn't make any sense!"

Thog the Dull probably shouldn't be able to make a speech of Elizabethan elegance simply because his player is a Shakespearean scholar. Aaaaa The Asexual Alien probably shouldn't recognize symptoms of human pregnancy if it's never encountered an expectant woman before. And the grizzled 19th-century prospector shouldn't understand that the reason he's getting sick is because his mine also has significant uranium deposits.

When people react against a thin curtain between player and character experiences, I suspect this is what they are most afraid of. The player who threatens to disrupt the suspension of disbelief by exhibiting some "forbidden" knowledge -- whether it's an understanding of history his character wouldn't possess, a use of skills or abilities his character shouldn't (cryptography, oratory), or knowledge of the adventure the GM is running -- is seen by many as a Very Bad Thing.

Well . . . yeah, it could be. But players could also make adding mistakes on character sheets, or weigh dice to roll better; this doesn't mean they *will*, nor does it mean that character sheets or dice should be chucked because something bad might happen. If everyone is agreeable to the idea of a thinner curtain between player and character, then it

probably wouldn't hurt to establish some ground rules. ("Don't be a jerk" is a personal favorite; in other words, if drawing on non-character knowledge hurts the game -- like using information from an adventure the GM is running, or arguing some minutia of criminal law for an hour because you're in law school and neither the GM nor the other players are, or complaining that "this isn't how it is in the books" because the GM is interpreting the game world in a different way -- then that's being a jerk, and will result in Swift and Severe Punishment. Should there be interest, I can describe some other rules in a future column . . .)

Now, if people are afraid that the smart/eloquent/clever characters will be overshadowed by the smart/eloquent/clever *players* . . . well, although it's a danger (see below), I'm not sure it's as big a problem as some might believe. In fact, we need look no further for assurance than the pinnacle of Western Civilization: the *Lord of the Rings: Fellowship of the Rings* motion picture.

[SPOILER ALERT!]

In this work there is a scene where the heroes are gathered around a door. Said door has a riddle inscribed over it . . . a riddle so basic that several of the babies born in the theatre during my screening gave the answer as their first words. Despite its relative simplicity, Gandalf -- the *smart* one of the group -- was unable to figure it out. Finally, after a few hours had passed (I won't spoil whether this is in movie time or real time) Frodo "figures out" the answer and reveals it. The door opens. The movie continues. (My personal theory is that everyone knew the answer, but they didn't want to risk the wizard's ire by trumping him.)

Anyway, by the numbers the wizard *should* have known the answer. And left to dice alone there's a fair chance he would have known the answer. But dramatically it's perhaps a bit more interesting to let other people solve such problems every so often.

[END SPOILER ALERT]

And it might even be "realistic" for someone unexpected to triumph (in the sense that it's not terribly unrealistic); history -- both global and personal -- often provides examples where people who were expected to succeed instead failed, and those who shouldn't have been able to do something somehow did. In the same way that the weakling character sometimes delivers the killing blow against a powerful foe, it shouldn't stretch credibility too much for someone who seems inappropriate to deliver the stirring speech, put the clues together, or solve the riddle.

"Bob saved the universe again."

Of course, if the GM rewards smart/eloquent/clever players, then he may create a situation where the smartest/most eloquent/most clever player overshadows everyone else. I'm not sure this is any greater a danger than someone creating a "combat monster", and one solution is almost the same: Create a situation where those skills aren't useful, or can't be used in game.

For example, if Bob the player is constantly overshadowing Pete's diplomat character in diplomatic acts, what if there were a situation where diplomacy is required in another language . . . a language Bob's character doesn't possess, but Pete's diplomat does? (Of course, you could also talk to Bob and reminding him to let Pete's character use his skills. Some players respond better to carrots; some to sticks.)

Likewise if our hypothetical Bilbo and Gandalf encounter a trap that requires knowledge of sacred geometry or other arcane knowledge is required, then Bilbo won't be very useful. (Remember: just because the GM allows players to use real world knowledge, this doesn't mean that he needs to *require* such things to be a solution.)

"How do you know that?"

Even in realistic modern day games, some gamers have problems with players bestowing their characters with knowledge they shouldn't necessarily have. "Wait!" They say, "How can your character know that you can build up an immunity to arsenic? He doesn't have that skill!"

Well . . . we all know lots of things. I've performed four semi-major repairs on automobiles, despite not knowing anything about cars at the time (or even how to drive). I know that a fairly popular theory of Old Testament scholarship holds that there are five distinct "authors" or sources for that work, despite not being a Bible scholar. I know the classic triad of childhood indicators of serial killers, despite not being an FBI profiler (or a serial killer, for that matter).

This is simulated in many games by a "default" system, where characters have a chance to know things based on their other skills or their innate intelligence. Depending on the circumstances, many groups may also be comfortable allowing players to bring their own "default" knowledge in. This can also be an incentive for players themselves; if a player spends a few hours at the library trying to figure out how to fight the mob, it can be interesting to have let his *character* contribute that knowledge as well.

Anyway, although there are certainly pitfalls to maintaining a thin curtain between player and character actions, the possibility exists of significant advantages. If your players are enthused and wanting to bring all their abilities to the table, then that can translate to a game where the *characters* are doing everything they can to triumph . . . which is often the definition of heroism.

And just envision the tales the players will tell about the time they all sat down, worked together . . .

. . . and *figured out the evidence*.

Mummies: The Next Generation

A Forgotten Futures Variant

By Marcus L. Rowland

"But surely that can't be anything but a dream. How could it be possible to bring all the vital functions to a dead stop like that, and yet keep them in such a state that it might be possible -- for that's what I suppose you are driving at -- to start them into activity again, just as one might wind up a clock that had been stopped for a few weeks and set it going?"
--The Romance of Golden Star

[*Forgotten Futures II -- The Log of the Astronef \(FF2\)*](#) takes as its source the series *Stories of Other Worlds* by George Griffith, originally published in 1900 and later novelized as *A Honeymoon in Space*. In these stories antigravity is developed in the late nineteenth century, and the first space flight is a tour of the solar system aboard the space-ship *Astronef*, circa 1900.

Griffith described a universe in which space ships used the Repulsive or R. Force, a "component of gravity," to travel between worlds at enormous speeds by pushing the ship away from planets or the sun. At one point in the stories the *Astronef* loses its lock on a distant planet, causing a dangerous navigational error. For simplicity some of the complications implied by this were ignored in the design of the *FF2* space travel rules, which allow continuous acceleration even in interstellar space. The time line for *FF2* ends in 1920, with the first flight to Proxima Centauri about to start and scheduled as a ten-year round trip, mostly at light speed.

If the stories are interpreted literally ships, must accelerate (and, just as important, decelerate) by pushing against the sun and planets, which implies that thrust may be inversely proportional to distance from the nearest astronomical body. Inside the solar system these complications rarely matter, and the existing game rules work well enough for most purposes. However, once past Neptune (Pluto either doesn't exist or is too small to matter) the mass of the solar system is soon left so far behind that it isn't possible to use it for any additional thrust. The maximum acceleration tolerable for extended periods is probably 1.5g to 2.0g, and there are diminishing returns for higher rates. Using basic equations it's possible to calculate the speed of the ship (as a fraction of light speed) for various accelerations from Earth orbit, and the time to travel to the nearest stars at these speeds:

	Acceleration (in g)							
	0.25	0.5	0.75	1.0	1.25	1.5	1.75	2.0
Time to Neptune (in days)	22.0	15.6	12.8	11.1	9.8	9.0	8.4	7.8
Peak velocity (in c)	0.014	0.022	0.027	0.031	0.035	0.038	0.041	0.044
Time in years to Alpha Centauri (4.3 LY)	307	195	159	139	123	113	105	98
Time in years to Barnard's Star (6 LY)	428	272	222	194	172	158	147	137
Time in years to Wolf 359 (8.1 LY)	578	367	300	262	232	213	198	185

Obviously this isn't going to be a tourist trip; for example, at 1.5g acceleration out to Neptune it takes 113 years, mostly in free fall, to reach the nearest stars, with a window of only a few days at the end of the trip to slam on the brakes. Go far enough off course to miss the target system at the end of the trip and you can't stop; moreover, you probably can't make useful course corrections during the flight.

There are only two obvious ways to make this work; one is to build a huge generation ship, and trust that the

descendents of the first crew will remember what to do when it reaches its destination. The other is to develop some form of suspended animation, and use an automated ship with most or all of the crew asleep while it travels. One of Griffith's earlier novels describes a solution to this problem.

In *The Romance of Golden Star* two Incan mummies are brought back to life, having been in a deathlike trance for 365 years. The method used is medical, not magical: a long complex procedure invented by the Incas and rediscovered by Dr. Laurens Djama, an unscrupulous scientist who is later the villain of the story. The revival process isn't described in detail; all that we really know is that it takes a week and leaves Djama extraordinarily weary.

Having returned to life, the Inca Prince Vilcaroya uses his charisma and a vast buried fortune to locate and revive his sister Golden Star, throw all Spaniards out of Peru, and set up a new Inca state worshipping the Sun. The story ends with his triumph and marriage to "Joyful Star" (Djama's sister Ruth), and Golden Star's marriage to Francis Hartness, an English officer who has helped Vilcaroya in his struggle. The plot is straightforward and contains nothing to contradict *Stories of Other Worlds*, so it's quite possible to combine these histories and describe a world in which many nations have space travel, but the Peruvians are the pioneers of interstellar flight. A brief timeline for this world follows; many of the events described in *FF2* are omitted for brevity, but should still be assumed to occur if they they are not contradicted below.

Timeline

- 1532** To save them from the Spanish invaders, Prince Vilcaroya and his sister Golden Star are married, then subjected to an Incan ritual which creates a state of suspended animation and preserves them as mummies. They, and vast hoards of gold, are buried in cunningly disguised underground vaults. Although the conquistadors spend many years searching for the gold, the tombs are never found. Eventually their story is dismissed as a myth.
- 1892-1900:** Professor Hartley Redgrave formulates his "R. Force" hypothesis, the secret of space travel. He forms a partnership with Lord Redgrave, whose engineering company builds the first space ship, the *Astronef*, completing the work after Rennick's death.
- 1895-1897:** Vilcaroya is revived, and leads the search for Golden Star. Having been persuaded that incest is no longer acceptable, he (and his English friends) decide that their "death" has annulled the marriage. In Peru he discovers that the old Incan traditions still exist among the natives, suppressed by the government and church. When Golden Star is revived, she suffers partial amnesia and only remembers that she is Vilcaroya's sister. Aided by his native supporters and British mercenaries, and backed by the wealth of the Incas, he leads the overthrow of Peru's government to establish an Incan state. This goes largely unnoticed in the outside world, although there is strong opposition from neighboring states. Vilcaroya is crowned as Inca.
- 1898:** Peruvian government recognized by the United States, France, and Britain. Parts of Chile, Brazil, Ecuador, Columbia and Bolivia rebel to join the new nation. Peruvians buy armaments from Europe and the United States.
- 1899:** Peruvian government recognized by most European nations, but is fighting a sporadic war with its neighbors.
- 1900:** First flight of the *Astronef*. Lord Redgrave marries Zaidie Rennick. They set out for their honeymoon in space, returning several months later. Along the way they discover a dying race and pyramids on the Moon, flying natives who have never fallen from grace on Venus, hostile Martians, and scientifically advanced Ganymedans. They also visit Saturn and Ceres and witness the birth of a new star which they christen Lila Zaidie.
- 1901-1903:** Continued development of the R. Force and exploration of the moon. War between Chile and Peru ends in humiliating defeat of Chile. Brazil, Ecuador, and Columbia concede control of the areas contested with Peru. Bolivia concedes nothing but withdraws troops. Mexico recognize Peruvian

government.

- 1904:** Second expeditions to Mars, Jupiter. Ganymedan Embassy received in London. Following lengthy negotiations (and huge bribes) Bolivia recognizes Peruvian government and treaties establish new borders. Golden Star dies in childbirth.
- 1905:** First military spaceship, HMS Nova. Special Theory of Relativity. Second expedition to Ceres. Renewed fighting between Chile and Peru; Chilean navy defeated, war ended by winter snows on land.
- 1907:** Second expedition to Saturn. Civil war (largely fuelled by excessive taxation and opposition to the war with Peru) in Chile; Peruvian takeover is virtually unopposed.
- 1908:** Greater Peru generally recognized as a new nation. The state religion becomes sun worship, and various Inca temples are rebuilt on their original sites. Churches and cathedrals are razed. Peruvian government buys in technology to build R. Force engines and commissions construction of a 1200-ton general-purpose ship for passengers and freight, the largest ship built to date. Some unease about Peruvian territorial and extra-terrestrial ambitions in other South American states, Europe and the United States.
- 1909:** Peary reaches the North Pole of Venus. Calls for the Moon to be annexed into the British Empire. Expeditions to Mercury and Uranus. Ganymedan-designed flyers reach the market, making earlier "aeroplanes" obsolete. Aviation boom. Greater Peru purchases flyers for civilian and military use. Attempt to assassinate Vilcaroya fails; assassin is never caught. Last Christian priests and missionaries expelled from Peru.
- 1910:** Mercurian gold rush. Although its effects on Earth's economy are minor, several nations (including Greater Peru) diversify their currencies to a broader base in other precious metals and commodities. In a Papal missive Catholics working for Vilcaroya are warned that any actions which harm the Church may be grounds for excommunication.
- 1910-1916:** Global warming and flooding as rogue star Lila-Zaidie passes through the solar system. Greater Peru is relatively unaffected.
- 1911:** First expedition to Neptune (Amundsen). Second expedition to Neptune (Scott) ends in tragedy as the *Discovery's* engines lose their R. Force lock on Uranus and she goes badly off course. Once past Neptune she cannot be slowed; communications are cut as supplies run low in March 1912. Private detectives in the pay of the Catholic church, investigating Vilcaroya's claim to be the original Prince Vilcaroya reanimated, find Djama's research notes in London.
- 1913:** First flight of Peruvian spaceship *Manco* to the Moon, where one of the Lunar pyramids in the British territories is used for a sun ceremony. Complaints by British government are ignored by Peru.
- 1916:** Archduke Franz Ferdinand assassinated in Vienna. Great War sparked by land disputes following flooding; the United States is neutral. Climate beginning to stabilize as flooding reaches its peak. Peruvian engineers build a sun temple on the 200+°F hot side of Mercury; despite the temperature and dangerous insects, Vilcaroya spends several days there, and is said to have received some form of religious inspiration from the ordeal.
- 1917:** War ends in economic chaos as the United States floods the world with asteroidal gold. Most national economies severely depressed; United States, Greater Peru, and other nations with diversified currencies gain economic strength. Keynes suggests a new form of currency based on gravitationally negative R. Gold. Peruvian archaeologists working on Prince Vilcaroya's instructions rediscover the secret of suspended animation; animal experiments follow. The technique is not published, remaining a monopoly of Greater Peru, but rumors soon reach the outside world. The Vatican commissions similar experiments based on Djama's notes and fragmentary Inca documents found in the Vatican library.

- 1918:** 75-inch telescope installed at Mount Edward observatory on the far side of the moon finds planets orbiting Alpha Centauri A, Proxima Centauri, and Barnard's Star. Oxygen is detected in the atmosphere of two planets of Alpha Centauri. R. Gold becomes the main currency metal for international trade, giving countries with R. Force technology (including Peru) a huge economic advantage. Peru is now by far the wealthiest nation in South America.
- 1919:** Vilcaroya returns to his Mercurian pyramid for another period of meditation. Later in the year, the pyramid is looted by persons unknown, with several tons of gold and gems stolen. There are rumors (never confirmed) of Peruvian assassins pursuing the thieves.
- 1920:** Vilcaroya finally announces details of the revelations he has received on Mercury. The traditional Incan faith states that the world was created by the god Viracocha, who created Mankind and the Sun, Moon, and stars, but mainly worships the sun god Inti, the ancestor of the Inca rulers. In the new theology Viracocha is the creator of the universe, but had many children, each the God of a sun, and father of many mortal children. Most have forgotten their origins, and must be reminded of Viracocha. He has chosen the Inca because they did not forget, and wishes them to take word of Him to the stars, His forgetful children. Peru will build a fleet of holy ships to fulfil this destiny. The crews will sleep through their voyages, to be revived by automatic machinery at their destinations. They will take everything needed to colonize new worlds and construct temples. Eventually it is hoped that they will be able to build new ships and continue the holy mission. Within weeks a reporter who is unable to tell Incan and Egyptian mummies apart describes the revival machines as sarcophagi, a name that sticks.
- 1922:** After two years of refitting, the *Manco* sets out for Alpha Centauri with a crew of 20 and "cargo" of 200 men and women in hibernation, accelerating at 1g inside the solar system, to arrive late in 2061. When questioned about this "leisurely" pace, Vilcaroya comments that the Gods "aren't in a hurry." Experts speculate that sarcophagi are still somewhat experimental, and delicate enough to require a gentle ride. Once past Neptune the crew also go into hibernation. Three more ships are already under construction, their destinations announced as Proxima Centauri, Barnard's Star, and Wolf 359. Numerous scientists ask to be allowed aboard; all are refused passage. Only true Incans in perfect health will be allowed to meet the gods.
- 1924:** The Vatican secretly purchases two Redgrave-built armed freighters and has them fitted out for interstellar flight. The first sets out for Alpha Centauri at 1.25g; it will arrive there in 2047, fourteen years before the Peruvians. The exact purpose of the mission is never announced. The second is held in reserve, pending the departure of the next Peruvian expedition.
- 1926:** The second Peruvian starship, the *Golden Star*, sets off for Barnard's Star at 1.5g to arrive in 2084. Following a hasty refit the second Vatican ship is launched at 1.75g, to arrive in 2073. Russia, Germany, Great Britain, the United States, and Ganymede are also building starships . . .

Obviously this timeline is the prologue to a campaign which will mostly take place in distant solar systems, and may stretch over hundreds of years but still use continuing characters.

Colonization

Each faction has its own motives for colonization.

Peru

The Incas are primarily on a mystical pilgrimage; they want to visit new stars, construct their pyramids, and "remind the Gods of their Father." If there are intelligent natives around they may attempt to convert them to sun worship, but this isn't actually as important as the initial ritual (which is as symbolic, or as bloody, as the GM likes). They may also want to colonize some worlds; in the long term they will need to build new ships, which requires colonies with an

industrial base.

The Catholic Church

The Catholics wish to find new worlds, find out if their inhabitants have fallen from Grace, and if necessary convert them to Christianity. Their initial ships are launched to counter the Inca expeditions, and they will do everything possible to prevent them converting any alien races to sun worship. They will also establish colonies and missions as circumstances permit.

Russia, Germany, and Great Britain

These nations are seeking to expand their respective empires (in this world the Tsar and Kaiser still rule). Since the colonies can expect little or no help from the mother-world they will aim for self-sufficiency, and probably exploit native labor if available.

The United States

Interstellar trade probably isn't an option, so American expeditions will tend to emphasize the pioneering spirit of the old west; find and homestead new worlds, build up their industries, then begin the next wave of exploration as resources are developed. Unlike the other nations, they will probably aim for more distant solar systems, where they won't be troubled by rival expeditions; they may even try to accelerate through intermediate solar systems to achieve greater speeds on long journeys. This has dangers; it may be necessary to use high rates of deceleration to slow down sufficiently in the target solar system, with a risk of harming the crew or the engines.

Ganymede

The Ganymedans want to find more hospitable worlds than their frozen moon, but are albinos adapted to low gravity; they will look for small worlds orbiting relatively dim suns. Their ethics won't let them colonize inhabited worlds, although they may briefly visit them. Their technology should be considerably more advanced than any of the human pioneers, but they will typically appear to be aloof, rejecting prolonged contact with Terrans. Ganymedan starships are always crewed by the Dictos class, with most of the "cargo" passengers members of the Helos underclass. They rarely exceed 1g.

Meanwhile technology doesn't stand still in our solar system; eventually a way may be found to accelerate in interstellar space, reducing journey times to decades rather than centuries. For example, imagine an Inca sleeper ship arriving at its destination after three centuries, only to find that the People's Republic of Switzerland got there a hundred years earlier, after a flight that lasted twenty years. Will they build their pyramid as though nothing has happened, or seek some sort of revenge for their humiliation? Sooner or later the hostile Martians may also discover (or steal) the secret of space travel and enter the race for the stars.

Campaign Guidelines

- FTL travel is impossible. Interstellar communications are only possible by ship.
- Most solar systems have at least one habitable world, and most habitable worlds have intelligent humanoid natives.
- On approximately one world in ten the natives appear to be in a "state of grace"; they have apparently never learned to kill one another, and are innocent of cruelty, envy, and greed. However, appearances may be deceptive.
- There are no translating machines; telepathy exists but is limited to the vaguest forms of empathy.
- There should be evidence of at least one other star-travelling race, probably using similar but more advanced technology. Their exact nature and motives are unknown.
- Combat is virtually impossible in interstellar space; even if anyone wants to fight, it is almost impossible for one

ship to get close enough to another to use its weapons. If one ship tried to overtake another they would pass each other at distances of hundreds of millions of miles, with speeds differing by hundreds of kilometres a second and no way to match course or speed.

- Continuing characters are entirely possible, even in adventures set hundreds of years apart. For example, some of the Marines in the first scenario below could be Catholics, and end up aboard the *In Nomine* for the second adventure.

Scenario Ideas

The Green Eye of the Little Yellow God

Mercury, 1919: The adventurers are marines from *HMS Constellation*, ashore on Mercury for a few days while an engine problem is repaired. The mines of Mercury are mostly closed now, since natural gold is worth somewhat less than lead, but they've all heard of the fabulous antiques in Vilcaroya's Pyramid on the bright side of the planet. Vilcaroya took off for Earth a couple of weeks ago, so the pyramid is presumably closed. Sufficiently greedy men with time on their hands might conceivably think of a quick expedition to the pyramid, and an attempt to steal everything that isn't actually too heavy to move.

Naturally there are a few snags: the pyramid is half-way round the planet from the north pole landing field, and the only transports available are old ground trucks; their officers expect them to do some of the heavy lifting associated with the repair; and the only information they have on the pyramid's contents is a small newspaper photograph that doesn't actually reveal anything useful about the layout. When they reach the pyramid getting in, and getting out again, should involve dealing with some difficult booby traps (think of the start of *Raiders of the Lost Ark*) and one or two encounters with Mercury's deadly wildlife. But eventually they should reach the throne room and find that it really is everything they've imagined, littered with valuable antiques and exquisite modern artwork. Let them loot the place to their hearts content then escape, apparently unscathed and unsuspected. Then give them a few weeks to revel in their new wealth before the first blowpipe-wielding Peruvian hit-men turn up . . .

A Case of Conscience

Alpha Centauri, 2057: The adventurers are scientists and crewmen (or possibly even priests) aboard the Vatican's spaceship *In Nomine*, which has been in the Alpha Centauri system for the last ten years. Things haven't gone well; although the fourth world of the system is inhabited, the natives (with technology equivalent to Earth's middle ages) seem to have no interest in converting to Christianity or renouncing the evils of idolatry, and have even refused to learn Latin and other human languages. In four years the Incas ought to arrive, and their religion seems to be much closer to the ideas of the natives than Christianity. Some of the priests seem to be toying with the idea of forcible conversion, using the overwhelming firepower of the *In Nomine* to enforce compliance. Will the adventurers support this plan or look for a more peaceful answer, and are the natives as helpless as they appear?

Suspended Animation

Preparing for suspended animation is a relatively simple process; the patient must first live on a special low-residue diet for several days, then is injected with various exotic drugs and wrapped in bandages coated with a preservative chemical. Metabolism stops almost completely; the patient's body uses energy equivalent to a day's worth of food for each century that passes. The doctor in charge of the process should make a Doctor roll at Difficulty 7 less the BODY of the patient; any failure of 11 or less means that the patient ages a year for each century that passes, on a 12 the patient ages 1D6 years for each century that passes.

Patients in suspended animation require approximately one cubic yard of storage space, which should be built as normal hold space weighing 0.1 tons. While in suspended animation they must be kept cool and dry, in a breathable atmosphere. Air requirements are proportional to metabolic rate; the equivalent of a day per person per century. For example, a ship carrying 200 passengers for 150 years would need air purifiers and supplies for 300 man-days, 43

man-weeks.

Revival is traumatic. The doctor must be aware of the correct procedure, and overcome Difficulty 5 less half the BODY of the patient (round UP) to carry out the treatment successfully. It takes several days and leaves the patient weak (-1 BODY, Minimum BODY 1) for another week. Any failure of 11 or less means that the patient suffers partial amnesia lasting 2D6 months (if this roll is 12 the amnesia is permanent), on a roll of 12 the patient dies.

There's an obvious problem; a doctor is needed to administer these processes, but the doctor must also go into suspended animation. Fortunately there's an answer, although it is somewhat risky. Originally developed by Peru, and later by other nations, sarcophagi are complex mechanisms which hold one patient and can perform both procedures automatically, automatically injecting the drugs to preserve the patient or and applying massage, shock, and artificial respiration to bring the patient back to life. Unfortunately they lack the flexibility of a human doctor, and at their best only perform with the equivalent of Doctor [3] for this one purpose only. They can also go wrong; roll 2D6, +1 per century. On 10+ performance drops to the equivalent of Doctor [2]; on 13+ the machine degrades to Doctor [1]. Because of these problems ships must carry several machines, each holding a human doctor in suspended animation, with the hope that at least one will be fit to revive the rest of the crew. If a sarcophagus is operated by a human doctor it give a +1 bonus to Doctor skill for revival *only*, by taking over some of the routine resuscitation processes and leaving the doctor free to deal with emergencies and "fine tuning" of the procedure. Each sarcophagus occupies 3 cubic yards, weighs 1.5 tons, and costs £2200.

Ship Design and Operation

Most of the technology described in *The Log of the Astronef* can be used, with the following changes:

- **Control room:** Because of the precision navigation needed for interstellar flight all star ships must have a military style control room.
- **Engine life:** While engine cores have a finite storage capacity, and crystals normally have a limited life span, it is possible to "mothball" them to prevent deterioration. This requires partial dismantling of the engines. It takes at least six hours to take them apart, twenty-four to rebuild them and recalibrate, with a successful Mechanic roll at Difficulty 6 (plus or minus the maintenance modifier for the engine). A failed roll of 11 or less means that the time needed to mothball or recomission the engine is doubled, on a 12 the engine is damaged; if it is being mothballed the core slowly loses its R. Graviton charge and the crystal slowly deteriorates; both will be useless when it is rebuilt. If it is being rebuilt the crystal vibrates apart as soon as it is activated, damaging the precision-machined core.
- **Power:** Without working engines ships have no electricity, but a steady supply is needed to keep equipment (such as the air purifiers) operational. Fortunately it is possible to build a dedicated R. Force generator, producing a trickle of power indefinitely. This uses a special hourglass-shaped R. Lead core encased in magnetized steel. Gravitons oscillating between the two halves of the core make the casing vibrate inside a coil and generate electricity. As a rule of thumb, these generators need an ounce of R. Lead per ten tons of the ship devoted to life support, resuscitation equipment, and passengers, including hold space for passengers in suspended animation. The complete generator weighs 0.4 tons, occupies 0.5 cubic yards, and costs £250 excluding the core, which costs £1550 an ounce.
- **Supplies:** Although the passengers and crew of starships spend most of their time in hibernation, supplies are still required as noted above. The total requirement should be found by adding the requirement for passengers and crew in suspended animation to the requirements of the waking crew during acceleration, deceleration, and subsequent exploration; for example, a ship with a crew of 12 might spend two weeks accelerating, manouvering, and shutting down the engines and preparing for hibernation, two weeks resuscitating enough crewmen to handle deceleration, another two decelerating, then three months exploring the new system. The crew would need 216 man-weeks of supplies for their waking activities, plus supplies for the time spent in hibernation as discussed above.
- **Navigation:** All course corrections etc. must be made before the ship leaves the solar system. The basic difficulty is 3+1 per light year. On a failed navigation roll of 11 or less the ship is off course to such an extent that it will have to decelerate at unusual rates (e.g 2.5g) or fly across the target solar system before coming to a

halt in its outer fringes. On 12+ it is impossible to decelerate before leaving the target solar system. As usual these odds can be improved by the use of Navigation Engines, or by making repeated observations and course corrections before leaving the solar system, rather than counting on a single manoeuvre for success.

Characters

Professor Martin Lamson, Archaeologist

BODY [3], **MIND** [3], **SOUL** [3], Brawling [4], Linguist (Portuguese, Spanish, Quichua, Latin, Greek) [6], Marksman [4], Riding [5], Scholar (South America, its antiquities, and pre-Columbian civilisation) [6], Scientist (Archaeology) [7]

Quote: *"Surely, in the name of all that's sacred, you don't mean-!"*

Equipment: Tools (mostly carried by diggers etc.), .38 revolver, small shotgun, sketch pad and pencils, notebook, magnifying glass, etc.

Notes: Lamson is an experienced and dedicated archaeologist and expert on South American antiquities, who has collected many artifacts for the British Museum.

Game Use: Lamson's discoveries could be a springboard to almost any type of adventure in South America. He will carry on working in Peru after Vilcaroya takes over, and may be involved in the quest for the secret of suspended animation.

Dr. Laurens Djama, Physiologist

BODY [2], **MIND** [6], **SOUL** [2], Doctor [9], First Aid [7], Linguist (French, German, Russian, Hebrew) [7], Scholar (the occult, alchemy, spiritualism, mesmerism) [8], Scientist (Physiology, biochemistry) [10]

Quote: *"If these dead lips could speak, I believe they could make you and me millionaires in an hour."*

Equipment: Medical kit, laboratory supplies and equipment

Notes: Djama is a brilliant physician and physiologist who is sometimes regarded as venturing too close to the occult in his search for scientific knowledge. He revives Vilcaroya and Golden Star, but demands marriage to the latter as his price, later attempting to betray Vilcaroya to the Spanish authorities for a share of the Inca's gold. He is briefly imprisoned, but attempts to kill Vilcaroya and eventually commits suicide (apparently willing himself to death) before he can be executed.

Game use: Djama is too useful a villain to die so easily; an authentic mad scientist, it doesn't seem impossible that he has faked his death and is actually in a trance similar to the Peruvian mummification process, waiting to be revived by some confederate . . .

Ruth Djama, a beautiful nurse (AKA Joyful Star)

BODY [3], **MIND** [4], **SOUL** [5], Artist (cook) [6], Business [5], Doctor [5], First Aid [6], Linguist (Quichua, Spanish, French) [5], Riding [6]

Quote: *"Oh, no, no! that is too horrible! I don't want to hear any more. I will go back to England to-morrow."*

Equipment: Nurse's equipment

Notes: Ruth is Dr. Djama's sister, a talented nurse who is as capable as many doctors. She is beautiful, and (except that she is blonde) could be mistaken for Golden Star's twin; it is implied that there may be a mystical link between them. She eventually marries Vilcaroya, who calls her Joyful Star.

Game use: Ruth functions as Vilcaroya's conscience and guide to modern society, warning him when he is about to do something that most modern people would regard as reprehensible or taboo.

Prince Vilcaroya, a mummy

BODY [5], **MIND** [5], **SOUL** [4], Actor (disguise) [6], Brawling [6], Business (organisational skills) [6], Linguist (English, Spanish: native language Quichua) [6], Marksman (bow, blowpipe, throwing knife, spear) [7], Melee weapon

[6], Psychology (charisma) [8], Stealth [5]

Quote: *"Choose your companions well, and fear not but that your services and your faithfulness shall have their due reward."*

Equipment: peasant disguise, dagger, lantern, gold.

Notes: Vilcaroya is a man stranded in our age, puzzled, amazed and saddened by the changes since he was first mummified. He now seeks to restore the glories of Peru and throw off the Spanish yoke, and if necessary will be utterly ruthless to achieve these goals. Before he was mummified Vilcaroya married Golden Star, his sister, but the marriage was never consummated. In deference to modern sensibilities he has agreed to renounce the marriage; fortunately Golden Star doesn't remember it. He falls in love with Joyful Star, a woman with a startling resemblance to his sister, and eventually marries her.

Game use: The timeline above assumes that having achieved his goals Vilcaroya will consolidate his rule and resume the old customs of his ancestors. These may possibly include animal and human sacrifice, historically part of the Inca faith; while Ruth Djama would certainly object, she doesn't necessarily know everything that goes on in Peru. The "new theology" above gives him a motive to reach for the stars; to an extent it implies that he has become unhinged by his status as a living god, and it may be necessary to assume that Ruth has somehow dropped out of the picture, perhaps as the result of an untimely death.

Golden Star, Vilcaroya's sister

BODY [2], **MIND** [3], **SOUL** [6], Actor (singing, ritual dances) [7], Artist (costuming) [6], Linguist (English: native language Quichua) [4]

Quote: *"I have had strange, dim dreams, and thought I was not one, but two, and that one of myself was your sister and the other was your Coya and queen. It was strange, was it not, to dream like that?"*

Equipment: None

Notes: Golden Star was mummified with her brother; her memory was damaged by the process, and she has forgotten that she was briefly his wife. She looks like a brunette twin of Ruth Djama, and regards her as a beloved sister; Ruth reciprocates this feeling. She is a true innocent in the modern world, guided almost entirely by Vilcaroya, Ruth, and eventually her husband.

Game use: Sooner or later Golden Star may remember the truth about her marriage to Vilcaroya, but having married Hartness she is unlikely to want to resume this relationship; if anything she may regard it as a source of shame. She may be used as a pawn in plots against Vilcaroya.

Francis Hartness, a British army officer, later husband of Golden Star

BODY [6], **MIND** [4], **SOUL** [2], Brawling [8], Business (military organisation) [5], Linguist (German, Spanish, Quichua) [6], Mechanic [5], Military arms [7], Morse Code [5], Riding [6]

Quote: *"Now, senores, give up your swords and revolvers quietly and no harm shall come to you."*

Equipment: Sword, rifle, revolver, maps. Access to artillery and troops.

Notes: Hartness (whose rank is never specified) is a British officer, veteran of India and friend of Lamson, who agrees to serve under Vilcaroya to free Peru. Initially they are rivals for the hand of Ruth Djama, but Hartness transfers his affections to Golden Star when it is clear that Ruth has fallen in love with Vilcaroya. Although this may seem somewhat fickle, there is no doubt that his love for Golden Star is genuine. He recruits numerous mercenaries to help Vilcaroya's cause.

Game Use: Anyone planning a move against Vilcaroya or his treasure will probably have to get past Hartness and his mercenaries, as well as native troops and the general population (who regard Vilcaroya as a god). Doing so won't be easy. Hartness remains a British citizen; what will he do when war breaks out in 1916?

Special Note: Griffith states that Hartness was nick-named Viracocha after a "legendary hero"; in fact Viracocha was the father of the Inca gods and this name seems very unlikely.

Bibliography

The Forgotten Futures RPG, FF2, and *Stories of Other Worlds* are available on line via the [author's web site](#). A CD-

ROM containing the game material and more than 200 MB of period articles and illustrations is also available from the author. Printed and HTML versions of *The Romance of Golden Star* should be available in 2002.

You Like Me, You Really Like Me!

An Optional *GURPS* Rule for The Arts

by Steph Pennington

*"What do you mean you didn't like Chest Rockwell in **Hard Knock Life**? I thought he was great!"*

Sooner or later, someone wants to play an artist, whether an Italian Opera Singer for *Castle Falkenstein*, a bard for Yrth, or an actor/spy for *Espionage*. Sooner or later, that player is going to want to impress someone with their skill. But how to do it? The current rules call for the player to roll against their skill. Possible outcomes are Success, Failure, Critical Success, or Critical Failure. While simple, this system does not reflect that beauty is in the eye of the beholder. No matter how well the Opera Singer rolls, if she is singing for someone who absolutely hates opera, they may not take too kindly to her rendition of Brunhilde's "Flight of the Valkyries."

Luckily, *GURPS* has all of the mechanics necessary to deal with the Arts in a fashion more reflective of how different opinions of a performance/work of art can exist. By combining skill rolls and reaction rolls, the GM will be able to model the fickle nature of the adoring (or not so adoring) public.

The Process

1. The GM should assign modifiers that would affect the player's performance (e.g. bad paints and canvas, not enough rehearsal time, or a very well-written song).
2. The player rolls against his skill. The amount he succeeded or failed the roll by becomes permanently affixed to that performance/work of art as a modifier to the reaction roll of anyone who encounters the art.
3. When an audience member encounters the work of art/performance, the GM assigns modifiers that would affect the audience's reception of the work (e.g. the song flatters the audience, an audience member doesn't like the genre, the audience is very drunk, or the performer is Attractive).
4. The GM rolls as many reaction rolls are needed, modified by the Audience Reception modifiers from Step 3 and the artist's performance modifier from Step 2. The result is compared to the Reaction Chart on pg. B204-205 to determine how the audience feels about the performance.

This process can be used for both large groups, and specific members of the audience.

Example

Torgil the Bard (Performance-16/Handsome) and the rest of the party have been captured by authorities for breaking local customs, and brought before the local Lord. Torgil decides to try and impress the court with an epic poem of bravery in order to get them out of their deep trouble. The GM decides that Torgil should have a -1 stress penalty, because the lives of the party may rest on how well he performs. Torgil's player rolls a 10, succeeding by 5. Torgil knows that he gave a good performance, but was it good enough to impress the noble? The GM decides to make three reaction rolls, one for the court in general, one for the Lord, and one for the Lord's daughter.

For the court, the GM assigns a -2 penalty (because the court is suspicious of strangers) that is canceled out by Torgil's +2 for being Handsome. The GM rolls a reaction roll of 9, and adds 5 to it for Torgil's great skill. Checking on the NPC Reaction Table, the resulting 14 indicates that the court has a Good reaction.

For the Lord, the GM assigns a -2 penalty for being suspicious of foreigners that is canceled out by Torgil's +2 for being Handsome, -3 because the Lord has 3 levels of Strong Will and does not want to be swayed by the song, and another -3 because of the status difference between Torgil and the Lord. The GM rolls 10 for the lord and subtracts 1 (5 of Torgil's skill minus 6 for the Lord's strong will and negative status modifier). The resulting 9 indicates a Poor reaction. The Lord is not impressed.

Finally, for the Lord's Daughter, the GM assigns a +1 because the daughter has the mild form of Xenophilia, a +4 for Torgil's dashing good looks, and a +1 because the daughter has a thing for musicians that her father doesn't like. The GM rolls an 11, and add another 11 to the roll (the previous modifiers and Torgil's skill modifier) coming up with a whopping 22. It seems that the daughter has just fallen head over heels for our bard.

As the Lord orders our heroes to be put under house arrest, the court murmurs with shock and disapproval, and the Lord's daughter throws a saucy wink at Torgil.

Using this optional rule can add a lot more depth to a scene without adding too much time or complexity and allow for a wider range of artists and audience reactions. These rules will allow both the really good-looking, charismatic actor with very little talent, and the plain-looking but well-trained artist. It can reflect that audiences have different tastes, and throw a little drama into the performance roll. This article concludes with some ideas of what things could modify a performance or the audience's reception.

Performance Modifiers

Quality of Material (paints, scripts, songs), time spent practicing/constructing the work of art, complexity of the art attempted, the performer's stress level. In addition, the success or failure of rolls based on the following skills could also help or hinder the artist: Bardic Lore, Choreography, Directing, Fight Choreography, Make Up, Mimicry, Musical Composition, Psychology, Scene Design, Sex Appeal, and Stage Combat (among others).

Audience Reception Modifiers

Qualities of the artist (Status, Charisma, Physical Appearance, Odious Personal Habits, Voice, Reputation) can affect the audience's perception of the worth of the art as well as any number of other factors, such as preferred genre, mood, Strong/Weak Will, Intolerance, level of Drunkenness, Clueless, and Killjoy (among others).

Grenades!

A Rules Expansion for *Frag*

by Nicholas Anderson

Grenades are an integral part of any good shooting game, as they should be for *Frag*. Contained herein are some rules for grenades and grenade launchers for the Steve Jackson Game *Frag*. It introduces two new weapons, and various new rules for people to use to expand their version of *Frag*.

Grenade Launcher

New Weapon

A Grenade Launcher will launch a grenade across the board at your opponents, and can also be used to bounce grenades around corners for trick shots, or to avoid being in direct range of a player.

The weapon will have four pieces of ammo, with no special charging rules.

When firing the grenade normally, calculate according to *Frag* rules. When you hit the target the grenade explodes, causing damage to the person and to all adjacent people. Damage to the main square is 4 points and to all adjacent squares is 2 points (as shown below). If the target is next to a wall, the explosion will not spill over through the wall.

0	2	0
2	4	2
0	2	0

If you miss with the grenade, the grenade will bounce a number of times (1-3) before exploding. The amount of bounce in a grenade should be set at the beginning of the game. To figure out how the grenade bounces you can use two methods. The most accurate would be the 8-point method, but for the sake of those that wish to keep *Frag* strictly a d6 game both rules are included.

Six-Sider Option

Eight-Sider Option

T is the target square. With the Six-Sider Option, you do not use the rear 2 squares; the game presumes that, while throwing the grenade in that direction, there is a greater chance of the grenade to bounce in that direction. The Eight-Sider Option is full chaos, which adds to the fun of the game.

After you have determined the direction of the bounce, roll 1d divided by two (round up) to determine how far the grenade bounces. For each bounce, roll on the chart until the grenade comes to a stop. At each point the grenade hits, move the template so that the target is where the grenade bounces, and roll again. When the grenade comes to a stop it explodes using the same rules; hopefully you will hit your intended target. If the grenade comes in contact with any person, it will explode immediately.

Another option to use is set a limit of 20 squares for a grenade to travel, starting from your square. After those 20 square the grenade will explode.

If the grenade bounces up against a wall, whether it is done on purpose or via the bounce rules, you should take into mind standard physics. Let's say that the target was next to a wall on his left side. If the target was missed and the grenade bounced to the left to location 1 on the Eight-Sider Option, but the wall was along that part of the template, then the grenade would land one square up from location 2 on the template.

Bounce a grenade around a corner is another way to kill your target. When bouncing a grenade off of wall, you calculate the difficulty by counting to the wall and then counting to the target. A grenade will always bounce 90

degrees from the wall towards your target square, from the center of your square. Use the corner of the rulebook as the angle to check to see if you can hit your target. If, from your position, the target cannot draw a line using a 90 degree angle, then you cannot hit that target. If you miss the roll, then roll according to the scatter rules from the point on the wall to determine where it really lands.

Bouncing a grenade is a tricky subject and may not be for everyone. If any of the rules are confusing or you simply don't like them, you can always have the grenade just explode on impact.

Thrown Grenades

New Weapon

Thrown grenades work almost the same way as grenade launchers except for figuring distance. When throwing a grenade, only use half of your accuracy rounded up to figure out how far you can throw it. In addition to the difficulty, you can have a thrown grenade be either primed or un-primed. A primed grenade will explode once it has finished bouncing on that turn, using the same rules as above. An un-primed grenade will explode at the end of the players next turn. All other rules are the same.

If you are using the distance traveled rule, then a thrown grenade can travel a distance of 10 spaces before exploding.

You can print out the table below to make your own grenade counters.

Pyramid Pick

Star Wars Epic Duels Game

Published by Milton Bradley

Design by Craig Van Ness and Rob Daviau

2 double-sided gameboards, 378 cards, 28 wound markers, 31 character pawns, 12 characters charts, and one die; \$19.95

"Did you ever wonder . . .

"What would happen if the Force was no longer divided? Jedi Knights could battle each other . . . Sith Lords could challenge one of their own . . .

"What if classic battles could be recreated and have completely different endings? Imagine the unthinkable. Anakin Skywalker versus Darth Vader. Impossible? Not anymore!

In *Epic Duels*, you create hundreds of never-before-seen battles or relive classic duels."

Epic Duels was a surprise for me: A fun, entertaining game with more similarities to hobby game releases than a mass-market boardgame. Shortly after the game's release, I started receiving scattered e-mails informing me that the game was like *Frag*. So I promptly tracked down a copy to see for myself what people were talking about. I didn't feel it was possible that Hasbro would have lifted the mechanics of a game from such a smaller publisher.

I was right.

While there are similarities between *Epic Duels* and *Frag*, those similarities have nothing to do with one "lifting" mechanics from the other or even inspiration between them. Both use squares for movement, both use cards, and both play fast. End of similarities.

The premise behind *Star Wars Epic Duels* is that each player takes a major character -- twelve are provided -- and the corresponding minor characters (each major character has one or two minor characters). These groups then battle it out between each other on a simple gameboard. The available major characters (and their minor characters) are:

- Anakin Skywalker (with Padme Amidala)
- Boba Fett (with Greedo)
- Count Dooku (with two super battle droids)
- Darth Maul (with two battle droids)
- Darth Vader (with two stormtroopers)
- Emperor Palpatine (with two Royal Guards)
- Han Solo (with Chewbacca)
- Jango Fett (with Zam Wessell)
- Luke Skywalker (with Princess Leia)
- Mace Windu (with two clone troopers)

For Those Who Worry About Such Things

The character pawns are painted plastic figures, each a little over an inch tall. Some of the paint jobs are excellent (Boba Fett) while others aren't really painted but are instead just molded in the appropriate color of plastic (stormtroopers and clone troopers are molded in white plastic). This isn't a problem at all, but if you're someone who demands better quality paint jobs on game figures you can easily paint these yourself. For most of us, the commercial paint jobs are good enough to start playing the game.

- Obi-Wan Kenobi (with two clone troopers)
- Yoda (with two clone troopers)

(This review covers two-player games, though there are variants that allow for up to six players in a game.)

Next, each player takes the appropriate card deck (there are twelve in the game, one for each major character) and the character pawns for their major and minor characters. You must also select a gameboard at this time. Your choices are: Carbon-Freezing Chamber, Emperor's Throne Room, Geonosis Arena, and Kamino Platform. Each gameboard is about 9" x 13" (7 x 10 squares) and printed with a picture of the appropriate environment. The squares are not printed over some elements of the map, making off-limits terrain, but it's nothing overly complicated and doesn't affect gameplay much at all. For example, The Kamino Platform board loses 20 of the 70 squares to "terrain;" thus there are only 50 squares on the board in which to move. The twenty missing squares are divided between two water areas and Jango Fett's Slave 1.

With all of that accomplished you're now ready to begin playing the game.

Playing the Game

Each player draws four cards from his deck and then rolls a die. The higher-rolling player places his major character on the appropriate square (names are printed on the map showing where characters start). Minor characters are placed in any adjacent square. Other players place their characters clockwise. Now the high roller takes his turn.

On a turn you begin by rolling the die and moving one or all of your characters the printed number of spaces; half the time you will be able to move one character up to 3-5 spaces, and the other half you can move *all* characters up to 2-4 spaces. You may only move forward, backward, or side-to-side -- no diagonal movement!

After movement you may perform up to two actions. There are three different actions in Epic Duels. These are:

- *Drawing a Card:* You may choose to draw one card. Your hand size limit is 10.
- *Playing a Card:* You can play one card for an action. The three types of cards are Combat, Power Combat, and Specials. See box for descriptions of the three types of cards.
- *Healing a Character:* This is difficult to accomplish and can only be attempted when all of the major character's minor characters have been destroyed. Even then it isn't easy.

After you have completed your two actions play proceeds to the next player.

Combat

Your goal is to destroy other characters; you do that by attacking them. Attacking is fairly easy, requiring you to move into an attack position and then play a card on your target.

Moving Into Position: You can only attack if you are in an adjacent space. If the character has a picture of a blaster on their character chart, he may also perform ranged attacks with the appropriate card. To do

The Cards

Three different types of cards are the heart of the game system.

- **Combat Cards:** These have an attack and defense value and are used to (duh!) attack and defend. The cards only work for the character who is pictured on the card. Thus when playing Boba Fett you may only use Boba Fett pictured cards to attack with that figure. Greedo cannot use Boba Fett cards to attack.

Power Combat Cards: These are played much like Combat cards but are slightly more powerful (and interesting). Power Combat cards sometimes do not have defense numbers in addition to attack numbers but they do have a special ability. Some examples are:

- *Jango Fett -- Missile Launch:* Has a 7 Attack, and when played the play draws 3 cards from his deck (4 if the game is taking place on the Kamino Platform board).
- *Darth Vader -- All Too*

so, however, they must be in a straight line from the target or on the exact diagonal.

Attacking and Defending: The attacker plays a Combat or Power Combat card face down. The defender may play a Combat card with a defense value face up.

Damage: If the defense number is higher than the attack number no damage is done. If the attack is higher, a number of points equal to the difference is done to the target. A wound marker is slid up the targeted character's chart.

Destroying: When the wound marker hits the red circle, the character is dead. Darth Vader is the most powerful character in the game, capable of taking 20 points of damage; battle droids are the weakest and can only take 3 points of damage. Average damage of a Combat card appears to be around 4 or 5 and few attacks are ever completely blocked.

It took Boba Fett 3 turns to defeat Anakin Skywalker in our first game (which was very close since Fett was almost dead . . . the next turn Anakin would have easily defeated him).

Winning the Game

You are out of the game when your major character is defeated. Against many opponents it's wise to ignore the minor characters and concentrate all of your attacks on the major character . . . especially when fighting Darth Vader.

An average two-player game seems to take 15 to 20 minutes. Not having played any larger games I can't really give a time length for them but, based on two-player play and experience with other games, I suspect a six-player game could be completed in about an hour.

Star Wars Epic Duels is a fun, fast game that should keep the average game group entertained for hours at a time. It's also the perfect introductory product to give to the non-gamer in your life. The simplicity of the rules is deceptive, as is the "Ages 8 and up" printed on the box. This game could easily be expanded with scenarios and, hopefully, will do well enough that Hasbro will print some official expansions for the game.

(For those looking for some scenarios that show the potential of this game, point your browser towards <http://www.philipreed.com/epicduels.html> .

--Philip Reed

Easy: Has a 3 Attack . . . but if the card isn't blocked the target suffers 20 damage! This just might be the most dangerous card in the game.

- *Yoda -- Serenity:* This is a 15 Defend card; when played, it allows the Yoda player to draw a new card.

As you can see, Power Combat cards can add a lot to a game session. There aren't many of these in each deck but as far as I can tell none of them are worthless.

- **Special Cards:** There is a wide variety of what these cards can do, and some of them do not count as an action. There are even fewer of these than Power Combat cards but they are the super-powerful cards in the game and can quickly change any combat. Some example Special cards are:
 - *Mace Windu -- Wisdom:* This let's you move Mace Windu up to 5 spaces and draw a card.
 - *Emperor Palpatine -- Meditation:* Heals 4 damage on the Emperor, and he gets to select an opponent who cannot draw cards on their next turn.
 - *Count Dooku -- Force Push:* Playing this card moves any character in a space adjacent to Count Dooku to any empty space on the board, and causes 1 damage to that character.

Pyramid Review

Ascension of the Magdalene (for Unknown Armies & d20)

Published by [Atlas Games](#)

Written by Rick Neal

Illustrated by C. Brent Ferguson, Chris Schott and David White

64 pages; \$13.95

Ascension of the Magdalene is the second title to appear under the Coriolis imprint from Atlas Games. Each Coriolis book provides a single adventure, but with dual stats for two different RPGs. One is Wizards of the Coast's **d20 System**, but the other is what provides the adventure with a setting, background and flavor. In the first Coriolis title, *Burning Shaolin* by Robin D. Laws, this other RPG was Atlas Games' *Feng Shui*. This took the characters back to the game's 69 A.D. Juncture for a round or three of butt-kicking Hong Kong *wuxia* style, with a side trip into the Netherworld along the way. The RPG that provides *Ascension of the Magdalene* with all of the essential ingredients is *Unknown Armies*, the game of modern occult intrigue, also from Atlas Games.

The first thing to note about *Ascension of the Magdalene* is that it slips into neither RPG with any ease. This is because it is set in the city of Prague in the year 1610 -- too late for an atypical quasi-medieval **d20** game and far too early for a late twentieth, early twenty-first century *Unknown Armies* campaign. The author makes some suggestions to get around this inherent problem. One is to use the adventure to kick-start a renaissance-era set campaign using either **d20** or *Unknown Armies* and several suggested plots are given so that a GM can continue the game beyond the adventure itself. Another is to adapt the adventure to the DM's own **d20** campaign; several alternative names are given to replace their real world equivalents found in *Ascension of the Magdalene*. For a modern day *Unknown Armies* campaign, it is suggested that it could be used as a flashback, or that someone such as St. Germaine kick the group back four centuries or so to sort out a particular problem. This could be dealing with Edward Kelley (the partner of one Doctor John Dee), or even because St. Germaine was in Prague in 1610 and happened to see the characters there! Alternatively, and suggested with tongue slightly ensconced in cheek, the whole adventure could be run and the players be told that, "It was all a dream" . . .

Ascension of the Magdalene is not a conversion guide for turning *Unknown Armies* characters into **d20 System** ones, or vice versa. All statistics are given for both systems, and are clearly differentiated. Statistics and material relevant to *Unknown Armies* are printed in a darker text and marked with a dark clock face, whereas that particular to the **d20 System** is given in a light grey text and marked with a white clock face. This division is somewhat problematic, as the eye is constantly drawn to the darker text for *Unknown Armies*, relegating the **d20 System** text to a secondary, lesser status.

The other problem is the lack of physical descriptions given for the NPCs in the adventure; this is further hampered by a lack of illustrations. In fact, much of the art in *Ascension of the Magdalene* is far from relevant to the contents of the book. One pleasing aspect of the layout are the adventure's maps. All of the game-related material is placed in boxes with a wooden screen-like background, but the maps are actually cut into the wood, to give almost a parquetry-like effect. Although a little dark to read, this does give *Ascension of the Magdalene* a pleasing look.

[SPOILER ALERT!]

The setting for the adventure is Prague, 1610, during the closing years of the reign of the Holy Roman Emperor, Rudolf II. Under his patronage, the city has become Europe's artistic, scientific, and intellectual center, attracting such individuals as Doctor John Dee and Edward Kelley. Religious rivalries are rife though, as the state faith Catholicism

feels threatened by the rise of Protestantism; both dislike the favoritism bestowed upon Prague's Jewish community by the Emperor.

The city has also of late become the center for occult and conspiratorial intrigue. During the summer of 1610, the renowned painter and tolerated heretic, Caravaggio, disappeared. The church closed his workshop, but not before many of his paintings went missing. One of these was entitled "Ascension of the Magdalene," and it is rumored that Rudolf II has come into possession of this painting. He has added it to his "Wunderkammer," a hidden museum of oddities and rare items, which is located under his ruling seat, Hradcanny Castle.

Of course, the Emperor has a publicly acknowledged Wunderkammer, but it is into his personal, hidden museum that he has secreted the painting, and it is from this that the players must steal it. Numerous parties will want the painting: the rebellious rogue and charlatan, Edward Kelley, so that he can return it to Rudolf and thus to imperial favor; Rabbi Loew, Prague's most prominent Jew, so that he may do the same and retain Rudolf's friendship; the Order of St. Cecil, a secret Catholic order devoted to the investigation of any magical evil; the Order of Hero of Alexandria, engineers and mechanomancers who want the painting to power their alterations to the City Clock, to prevent it from stopping and thus ending the world; and finally, the Rosicrucians, who desire the painting for what they believe it represents -- the perfect example of artistic alchemy.

From among these factions, the characters should be able to find a patron . . . though in doing so, this will make enemies of those factions they decide not to work for. Then there is the matter of getting into the *Wunderkammer* -- the *only* known entrance is via the city's sewers and it only opens just once each day at midnight, and only for a few minutes. Getting through the sewers with opposition upon their tail is not made any easier in the knowledge that it will be waiting for them when they come back out.

The contents of the Imperial Wunderkammer turn out to be most strange indeed -- befittingly so, as this is an *Unknown Armies* scenario. The painting "The Ascension of the Magdalene" is in fact a magical artefact and is the final work of Caravaggio, after which he ascended in a burst of light to the Invisible Clergy. It has some strange effects upon the contents of the Wunderkammer, which includes a variety of clockwork constructions, arcane artefacts, and other guardians.

[END SPOILER ALERT]

Ascension of the Magdalene is designed for a *d20 System* party of four to six characters of sixth to ninth level or for a *Unknown Armies* group of moderate experience, with at least one adept or avatar among them. An *Unknown Armies* GM wanting more information of the Invisible Clergy might want to refer to their sourcebook, *Stratosphere*, although there is enough information given in *Ascension of the Magdalene* to do without it. Referees for either game should check out issue #285 of *Dragon Magazine* for Ken Hite's "Cities of the Ages" column, which detailed the city of Prague.

Beyond the adventure itself, *Ascension of the Magdalene* provides plenty of material for the Open Gaming License. There are a variety of clockwork constructs, wheellock firearms and the proofed armor to withstand pistol rounds, the avatar concept, and mechomancy -- the steampunk magic that enables the building and animation of mechanical constructs. Such constructs can even be given intelligence, though this is at great cost to the mechomancer, as it will cost him personal memories to power his device. Both the avatar concept and mechomancy are the only system specific material ported into the *d20 System* from *Unknown Armies*. On the other hand, there is little new for the modern day *Unknown Armies* game, amounting to a pair of new avatars -- the Rake and the Magus.

The problem with *Ascension of the Magdalene* is that the emphasis is not quite right between the dual game systems. This was not so much of a problem in the first Coriolis title, *Burning Shaolin*, as the underlying raison d'être between its two games is thwacking things. For the *Unknown Armies* GM, *Ascension of the Magdalene* represents an interesting change of pace, as the adventure is more akin to a *d20* scenario -- more combat orientated and driven by a location rather than by plot. For the *d20* referee, this will be a more difficult adventure to make use of, as both technology and timeframe are likely to be at odds with their own campaign. Perhaps *Ascension of the Magdalene* could be used in a setting more in tune with the renaissance period -- the *Iron Kingdoms* from Privateer Press, Hogshead Publishing's *Warhammer Fantasy Roleplay* and *Sorcerer's Crusade* from White Wolf all spring to mind as

possible suggestions.

In presenting material for two different games, Atlas Games make *Ascension of the Magdalene* an expensive purchase for referees of either system. This is probably more so for the *Unknown Armies* GM, as they gain little more than the adventure itself, even though it is an interesting one. Meanwhile the *d20* referee gains both adventure and new material, but will find it slightly difficult to use fully because the layout favors *Unknown Armies*.

--*Matthew Pook*

Curtain, Curtain . . . Who's Got the Curtain?

It's time for part three of my two-part series on the line between player and character experiences. While [week one](#) dealt with looking at a thick wall, and [week two](#) dealt with a thin (or nonexistent) wall, this week deals with a "misc" wall. This isn't an essay, per se, but more like a collection of bits that I couldn't squeeze into any of the other two pieces. Think of it as an essay loaf, chunked and formed from real essay parts.

* * *

FASA's *Doctor Who RPG* didn't *have* an Intelligence attribute; the closest they had was Mentality (MNT), which was "how well a character can store and process information . . ." It goes on to say that, "Mentality . . . is *not* a measure of intelligence, which really depends on the ability of the player himself. The player may decide that his character will be smart or dumb, whichever the player likes."

Of course, this isn't really true; unless you have a special arrangement with your GM (perhaps involving cash), you aren't going to be able to act like you're Albert Einstein if you normally get confused by shampoo. (" . . . I'm rinsing. I'm repeating. I'm washing. I'm rinsing. I'm repeating. When will it *end?!?*") But it's a surprisingly candid admission of the thin wall that game wanted to establish between player and character intelligence.

* * *

White Wolf has long encouraged a thin wall between player and character experiences with their games. In *Mage*, for example, there are no set abilities, and effects are determined entirely by the player (limited to an upper maximum by their power levels). The upshot of this is that a more creative player will often be much more effective than a more powerful *character*. (This is true in a lot of games, but more so, in my opinion, in *Mage*; my relatively weak character with substantial Mind abilities was often more effective than Magicians Who Make Stuff Blow Up.) Likewise, the difficulty of using powers in *Changeling* is determined by how creative and elaborate the player is in coming up with "bunks"; thus a character who wants to create a magical passage by drawing a simple doorway in chalk will have less of a chance for success than a character who sings the entirety of "Break on Through" by The Doors in Pig Latin.

Their latest game, *Exalted*, takes this concept one step further by giving bonuses to players who can come up with creative ways to describe their combat actions. Thus a player who says, "I use my bo-staff as a pole to vault me upwards, giving me a chance to propel myself off the ceiling and kick together the two heads of the guards in front of the cell" will have a higher chance of success than, "I kick the two guards." (*Exalted* is not the most realistic game in the world.)

The idea behind this is to create a more cinematic game; by encouraging players to describe their combat actions, combats will (in theory) be more flavorful and exciting. Of course, this has the immediate effect that more creative and descriptive players will have the High Tech Edge in combat. Those who like thick player/character walls will probably find this slightly less onerous than having their molars worked on by a first-day dental student with a nervous twitch. Fortunately, it's a relatively small rule, and by no means essential to the game; those who want to get rid of it could do so easily.

* * *

In the classic interactive fiction (read: "text adventure") game *Zork II*, there was a "maze" whose passages couldn't be mapped in any traditional way. Instead, it required the player to recognize that there was a wooden club in the initial room, then from that deduce that he needs to go northeast, then northwest, then southwest, then southeast. Having done this, the door to the north opens.

Why? Because it was a *baseball diamond*, and the puzzle was solved once the player ran the bases.

This puzzle is, perhaps, one of the most reviled in all of Interactive Fictiondom. First it requires knowledge outside of

the world (since the *Zork* universe seems to be some weird fantasy/exploratory hybrid . . . one that had never mentioned "baseball" previously). Second, not only does it require knowledge of the real world, it requires knowledge of the real *American* world. In the same way your average American would be mystified by any puzzle requiring knowledge of cricket, Europeans -- who also bought and liked the *Zork* series -- were generally boggled by this conundrum. Within a decade plans were firmly afoot for the European Union. Coincidence?

Anyway, this puzzle is definitely a horrid example of *something*, although I confess not to being certain what. I suspect it's an unreasonable example of the "GM" requiring knowledge not contained within the [internally consistent world](#), without providing any kind of escape clause. (Or maybe it's just an example of a stupid puzzle . . .)

* * *

Probably the best advice I have for maintaining a thick curtain between player and character abilities in many circumstances is to have players describe their plans, then base the outcome on the character's abilities. In other words, the more (say) intelligent a character is, the better the player's plans will work.

Thus a player who comes up with a brilliant, elaborate plan for his rock-stupid barbarian, will have a pretty good chance of that plan failing, while the player of Dr. Bigbrain who says, "Let's tape bottle rockets to our backs and fly to the top of the building!" will see his plan succeed more often than not. Likewise a player who gives a long flowery speech but whose *character* is socially inept will find himself faced with an indifferent audience, while the brilliant speaker character will succeed in wooing the lady fair, even though the *player* is only saying, "Sweet Lady Hargrove . . . I would walk five hundred miles -- and I would walk five hundred more -- just to be the man who walked a thousand miles to fall down at your door. Oh, and everybody Wang Chung tonight."

(Over on the [message boards](#), Douglas Cole mentions using a similar technique . . . with [an amusing anecdote](#).)

Another good way to have players actually roleplay while maintaining a somewhat thicker curtain is to have the GM present (or eliminate) possibilities based on skill rolls. Thus the player of a master thief character trying to break into a building may make a skill roll. A failure may generate no ideas (it's up to the player to come up with something, or the character may not be able to break in at all). A minimal success may give the player a GM-created list of ideas (some good, some bad), and it's up to the player to choose one . . . or try accumulating better successes to narrow down the possibilities. A better success roll will let the GM cross off some of the bad ideas, while a critical success may let the GM circle what is (in his mind) the *best* idea. That way the player still has the satisfaction of knowing he is in control, while knowing that his skills create a much more favorable situation than someone with lesser skills.

* * *

And so, in conclusion . . .

(Waitaminute! How can an essayloaf even *have* a conclusion?!?)

. . . like so many aspects of gaming, the notion of the thick or thin curtain is almost certainly a continuum. It's probably impossible to get an entirely nonexistent curtain, unless you happen to be playing yourselves sitting around a table playing a roleplaying game sitting around a table playing a roleplaying game sitting around . . . Likewise an absolute curtain is probably equally impossible; unless we are actually able to *create* another personality (which would probably present its own problems . . . especially on the interstate), aspects of "real world" knowledge and interaction may well bleed over every so often.

The opacity of that curtain will probably also depend on the campaign and the game; a *How to Host a Murder* series doesn't have rules for "character knowledge" or task resolution, so *everything* that will be accomplished will be via the player's observations and abilities. On the other hand, a particularly "detached" game world (like, say, playing an entire alien race in battle with other alien races, each trying to pass themselves off as gods to an ancient people) would require a lot more reliance on in-game skills and abilities. Even within the same *game* people can have thicker or thinner curtains. One player may be more comfortable with giving his speeches directly and relying on his abilities to sway the GM; another may be playing a character with persuasion skills far beyond his own, and prefer to say what

goals he hopes to accomplish, rather than exactly what he's saying.

Tinker; try new things; discuss with everyone how things will work. No matter what you decide, it's curtains for you.

[The LAME JOKE POLICE escort Steven away in shackles.]

--*Steven Marsh*

*Last week's answer: **Unexploded Cow*** (This was one of the most-answered trivia questions I've yet presented, which surprises me . . .)

(Three stars) "Malk Content is a trickster of unknown origin. He has woven a hundred tales of his origin and has claimed to be a Native American shaman, a Mongol warrior, a Babylonian King, the son of Aeneas, a Persian prince, an alien, a ruler of the Seelie Court of the Faeries, the son of God . . ."

Dork Tower!

Dork Tower!

The Son of Cheeroonear

Part II

An Adventure for *GURPS*

by Jeremy Davies

Part I, [last week](#), gave the plot of the adventure. This week details the special items found in the cave, plus NPC and creature stats.

NPCs

Albert Patrick Randolph

5'6", 150 lbs., sandy brown hair, pale sunburnt complexion, nervous gray eyes, haunted appearance.

ST 10, **DX** 11, **IQ** 12, **HT** 9

Speed 5 Move 5 Dodge 5

Advantages: Literacy, Appearance (Handsome), Danger Sense.

Disadvantages: Greed, Paranoia, Weak Will -2. Fanaticism (striking it rich with gold).

Quirks: Distrusts natives

Skills: Area Knowledge (Western Australia's' south east)-14, Riding (horse)-12, BP Weapons-13, Broadsword-11, First Aid/TL-13, Navigation/TL-14, Naturalist-14, Prospecting-15, Administration-14, Law-11, Leadership (default)-5, Diplomacy-12, Strategy-11.

Equipment: compass and sextant, diary

Albert was the fourth son of a well-to-do English gentleman. As such, he joined the army at the age of 17 with his father purchasing a commission for him. He was found to be far too nervous a man to lead troops, as well as being a born non-leader, so was soon shuffled out to India in a staff position in the field of Ordinance, where he was given an education in surveying.

After running up numerous gambling debts, Albert sold his commission and fled to Sydney Town, New South Wales. He eventually managed to secure a position as a surveyor's assistant in the far-flung colony of Western Australia, the only colony that still accepted convicts for labor. In his travels, he came across an aboriginal man who seemed to have a lump of gold attached to one of his "Indian artifacts." Although he was unable to get "any sense out of the chap," it started an obsession that soon replaced his gambling need.

Everywhere he went from that moment on, he would test for the likelihood of gold ore. He had only found a few small streaks until the "big one" he called Albert's Luck . . .

"Two Bob Snooze" Walter Trimble (Gnaragka Kamilaroi)

6'1", 155lbs, long black hair kept combed and tied back, dark brown eyes, dark brown skin, scar below left eye.

ST 12, DX 15, IQ 11, HT 13

Speed 7 Move 7 Dodge 8

Advantages: Literacy, Combat Reflexes, Appearance (Handsome), Alertness +2, Strong Will +2, Toughness DR1, Hard To Kill/1

Disadvantages: Flashbacks (abusive childhood -10), Jealousy, Bloodlust, Enemy (Colonial Government of New South Wales-wanted Dead or Alive) appears on 9 or less.

Quirks: dislikes native lifestyle, patterns himself after American dime novel gunslingers, enjoys writing verses about his own exploits

Skills: Riding (horse)-16, Poetry (western culture)-12, Running-16, Throwing-16, Swimming-14, Brawling-16, Fast Draw (Pistol)-19, Guns (Pistol)/TL5-19, Guns (Rifle)/TL5-19, Knife-15, First Aid/TL5-11, Naturalist-13, Tracking-13, Climbing-15, Navigation/TL5-12, Theology(Christian)-10, Area Knowledge (Eastern Australia)-13, (South/West Australia)-11, Carousing-14, Gambling-14, Savoir-Faire-12, Shadowing-14, Stealth-14.

Equipment: Two English Deane-Harding .45 double action five shot percussion revolvers. 1860 Spencer .50 repeating rifle

Gnaragka was born in the colony of New South Wales to a tribe of the Kamilaroi in 1838. He lived among his people for one day of his life, before his family was killed in a reprisal attack to avenge the spearing of some settlers north of Port Macquarie. He was left to die beside the body of his mother.

Two days later, he was discovered by Henry Trimble, a nearby settler. He was brought home to his wife, who had a three month old baby still at the breast. The Trimbles unofficially adopted him and named him Walter.

At the age of 6, the meager Trimble farmhouse was set alight; Walter was the only survivor of the blaze. A group of "blacks" were blamed for the attack, and Walter was sent to live with his Uncle at Port Macquarie. The Uncle was a terrible man who subjected all the children in his care to vicious and despicable abuse. Walter is afflicted with debilitating flashbacks of this traumatic period of his life.

Walter became a New South Wales native policeman in 1856. He was well-liked by his commanders, being a "killer of aborigine without tire or remorse." His command of the English language soon saw him as a respected sergeant. Respected for a "savage" that is . . .

In 1859, Walter shot three white men dead at the Red Inn in Newcastle. He had overheard them discussing a certain burning of a farmstead 15 years earlier that they had been a part of. Walter turned to bushranging, often killing his victims at the slightest aggravation. A newspaperman dubbed him Two Bob Snooze, ostensibly due to the presumption that he would "put his own grandmother to sleep for two bob." The name began to appear on the wanted posters, which appealed to Walter's vanity. It made him sound like an American gunman.

In 1860, the east coast became too hot for Two Bob. After a very near-miss in Golbourn, he headed west on a fishing boat. He spent some time in South Australia, but soon wound up in Fremantle.

Bishop t'bakka/Guayyanya Ngadjunma

5'7", 114 lbs., short gray mangy hair, regularly scrubbed with mud and wet sand, dark brown skin, wrinkled with age and covered in ritual scars, thoughtful brown eyes, gray beard of various lengths.

ST 9, DX 12, IQ 14, HT 11

Speed 5.75 Move 5 Dodge 5

Advantages: Native Land Affinity (+5 to all dice rolls in Ngadjunma tribal area)

Disadvantages: Addiction (pipe tobacco)

Quirks: laughs a lot while speaking

Skills: Area Knowledge (Western Australia's' south east)-14, Navigation/TL-14, Naturalist-14, Stealth-14, English-7
Equipment: tribal law stones, bone pieces, spear

Guayyanya was born over sixty years ago to the Ngadjunma tribe on a yearly corroboree day of some significance. On the night of his birth, two magpies landed beside his mother and cawed together in the night. This was seen as very significant; Guayyanya was destined for some form of greatness.

He became a clever man quite young due to the help of the spiritual presence of the legendary Winjarning brothers. It was thought he was going to be the one who would slay the terrible beast, Cheeroonear ha, that had begun to plague the Nullabor tribes. It was not to be.

Guayyanya was chosen to greet the champions that would kill the beast, so he left his wives, children, and tribe, and lived a solitary life at Three Rock Spur, which became the seal town of Esperance in the 1840s. He thought that these white men, with no Dreaming to speak of, were the ones, but he could convince none of them to accompany him inland. Despair loomed upon him. The spirits of the Brothers would no longer come to him. But still he waited. He trusted in the spirits.

Over the years of isolation, Bishop t'bakka, as the whalers came to call him, has become a little strange. He is barely in touch with reality anymore. He learned some English from the whalers, but he has trouble using it, since he is so out of practice. He has been looking forward to the day when the champions would arrive and he can return to his people to finish his time here, to become his Dreaming. His excitement will be obvious even to a fool.

"The Test" Adversaries

Arnold "Red Belly" Thompson
unofficial leader

6'2", 220 lbs., balding wispy dark hair, ruddy complexion, light blue eyes.

ST 14, DX 12, IQ 10, HT 12
Speed 6 Move 6 Dodge 6

Advantages: Literacy, Appearance (unattractive), High Pain Threshold.

Disadvantages: Greed, Overweight, Odious Personal Habit (burps classical symphonies when bored)

Quirks: like to bite people after grappling them.

Skills: Area Knowledge (Western Australia's' south east)-14, Brawling-15, Boxing-14, Guns (pistol)/TL5-13,

Equipment: several large metal rings on three middle fingers of right hand (fist does +1 damage)

NPC Team Members

ST 11, DX 12, IQ 9, HT 10
Speed 5.5 Move 5 Dodge 5

Skills: Brawling-14, Guns(rifle)/TL5-13, Guns(pistol)/TL5-12

Equipment: none.

Obstacles on the Run

Ngadjunma Warrior

5'7", 110 lbs., dark brown skin, simple hide belts, bushy black hair, red-and-white ochred faces, ritual scars on chest and arms.

ST 9, DX 13, IQ 10, HT 12

Speed 6 Move 6 Dodge 6

Skills: Area Knowledge (tribal area)-14, Broadsword (waddie)-15, First Aid/TL2-13, Navigation/TL-14, Naturalist-15, Spear Thrower-15, Spear Throwing-16, Stealth-16.

Equipment: Waddie (swing crush 1D), Woomera (spear thrower), Throwing Spear (impale 1d-1, with woomera impale 1d)

Creatures of the Night

Cheeroonear ha (The son of Cheeroonear)

ST: 37 **Move/Dodge:** 10/8

DX: 16 **PD/DR:** 2/2

IQ: 12 **Damage:** *claw* 1d+2 cut; *bite* 2d+2 cut *swung rock in hand* 4d crush; thrown rock (30lb stone, range 37') 4d crush; grapple*

HT: 16/40* **Reach:** C,1

Size: 1,2

Weight: 1,100 lbs.

Fatigue: 37

Alertness: 16

Cheeroonear's stooped frame measures around seven feet tall. His body is heavily muscled with thick tufts of hair, huge gnarled hands, and a neck like a thick tree trunk. His chest, however, is thin and hollowed out. His arms are long and often trail on the ground when walking, while his legs cover huge distances when he breaks into a loping run.

Cheeroonear ha's head is his most terrifying feature. It is canine, with tall, alert ears and a long, wide snout from which protrude double rows of one-inch teeth. Under his chin and attached to the bottom of his mouth hangs a membranous sack, similar in design to a pelican, but much larger. When hungry, this sack flaps about like empty folds of skin, barely touching his chest. When Cheeroonear ha feeds, he stores chewed up food in this area for later digestion. He can easily kill eight people, leaving the meat from six of them broken and dismembered in his sack to sustain him over several months. When full, the sack balloons out, filling his hollow chest cavity with a macabre ball of blood, body fluids, human organs, and flesh, easily seen through the membranous wall. This sight requires a Fright Check -10 (if the sack is empty, -6).

The story of Cheeroonear, the dog-faced man, goes back many years. He lived on the Nullabor plain, with a wife and six huge dogs. Though he was extremely powerful, a prophecy had been laid upon him, stating that if he were ever to be seen by men or women, his death would shortly follow. Because of this, Cheeroonear had been very careful. He created his dogs with powerful magics to help him hunt for food -- his favorite being human -- as well as developing a terrifying ability to ambush and suddenly kill so that no one ever saw him. His method was to sneak up behind a victim, then leap feet first into the small of his back. The creature's huge hands would grip his victim's arms before he hit the ground. Once he had them down, standing firmly braced on his back, he would lock his jaws onto the head and twist his huge neck muscles until the head tore free in his mouth.

One harsh summer a drought forced him to visit a waterhole without his usual care, causing a group of similarly drought-stricken humans to catch sight of him. Though too weak to attack, he promised to return before the sun rose again, hoping to beat the prophecy by killing all the people who had seen him.

The people were put much in fear by this promise. The young men thought to hunt the beast with their spears, but a wise old hunter, an ancestor of the Wiradjuri, counseled that this would be foolish. He pointed out that in the night they would never see Cheeroonear, his wife, or his dogs approach due to their legendary stealth, "when death melts like a shadow under the trees, darker than night itself." He counseled the young men to appeal to the Winjarning brothers in the south, the renowned *wirinuns* (sorcerers) who would often help those in need.

The Winjarning brothers knew how Cheeroonear would attack. First he sent his dogs, which they led into a trap and killed one by one with a heavy boomerang, cutting off each of their heads. Then they cut off each of the tails and gave one each to six warriors. The Winjarnings commanded a mist to descend so that when Cheeroonear came to check up on his dogs, he thought he could see them chasing prey through the mist by the dancing tails.

When Cheeroonear came into the camp, confident and relaxed, ready to feast, the Winjarnings clubbed him to death with their waddies.

The wife of Cheeroonear then came to see what had befallen her husband and his pets. The men of the tribe, inspired by the brothers, fell upon the female creature, hacking her clean in two. From the upper part of the terrible body emerged a boy-creature, identical to his horrible parents. The men ran towards him, but he turned himself into a reptile and escaped from under their feet.

This was Cheeroonear ha, the son of Cheeroonear. It has taken him thousands of years to grow and develop into a creature more powerful than his fearsome father was. It also took him many painful years to re-invent the process of creating the demon dogs. But he has finally done it, and believes himself ready to enact revenge on the creatures that destroyed his family, starting with the descendants of that old hunter, the Wiradjuri.

Cheeroonear may attack in many ways (listed above). He particularly enjoys his father's ambush attack. To do this he must have successfully snuck up on his victim (Stealth 30!). Then he executes a reverse flying tackle (since he is actually hitting feet first while his long arms allow him to grapple simultaneously). This has automatic success (from behind), and he has a +4 bonus to his ST for the Contest to succeed in his grapple, though he must make a DX roll -2 to stay on his feet once landing on the treacherous ground of the poor victim's back. If he fails this, he still holds the victim's arms (if the grapple was successful) but he is not perched and ready to strike. Once on the back, he will target either the brain with a bite (all out attack, +4 to hit) in an effort to suck the brain straight from the skull cavity, or the head to dig his teeth into the skull and pull it free from the torso (treat as contest between Cheeroonear ha's ST and victim's ST+ST+HT). He will then swallow the head whole and leave it in his digestive sack to be consumed last of all. The sweetest meat . . .

Cheeroonear ha, unlike his father, has no prophecy hanging over his head, so is able to use his grapple attack from any angle, making him far more dangerous. He may also try tearing limbs from bodies after grappling, if he's in a playful mood (ST vs. ST+ST+HT)

The Monster has the ability to Morph (see p. FF28), which allows him to assume the form of any creature he can see or has memorized (memorized forms are aboriginal man or woman, lizard, eagle, kangaroo, crocodile, bush fly, green ant, venomous black snake, owl, and carp). Size can vary, though mass does not due to the magic altering body density. It takes him one full turn to change or change back again. Clothing can be mimicked, but cannot be removed, as it is actually part of his body. He retains all skills and abilities, gaining only the appearance of the morph and its voice/sound.

It is painful for Cheeroonear ha to remain for more than a short period in a morphed state . . . a legacy from his need to use the power so soon in life. For every minute after the first ten minutes he is morphed, he must make a Will roll to stay in the disguised form, with the target number decreasing by one every ten minutes after. A failure indicates instant return to his true form, plus he is mentally stunned for 1d turns.

Cheeroonear's Dogs

ST: 16 **Move/Dodge:** 12/8 **Size:** 2
DX: 20 **PD/DR:** 2/2 **Weight:** 280 lbs.
IQ: 12 **Damage:** *claw* 1d-2 cut; *bite* 2d+2 cut **Fatigue:** 18
HT: 14/* **Reach:** C

Cheeroonear's dogs are completely devoted to their master and creator. They are an Australian variant of the Hell

Hound, standing nearly as tall as a man at the shoulder, with fearsome two-inch-long razor sharp teeth, though their claws are stunted to aid their cunning (Stealth 25). Their short sleek coats vary between dark brown and a light tan. Their eyes blaze with unnatural intelligence. To look upon one would certainly warrant a Fright Check at -5.

There are only two ways to slay these creatures. First is to strike the head completely from the body, requiring a blow of 14+ cutting damage to the neck and a HT roll failure (consider every 14+ cutting blow to reduce the target number by one). The second is to slay Cheeroonear ha first, which instantly reduces the dog's bodies to the many ingredients from which Cheeroonear ha fashioned them. They have the power of instant regeneration (1HP/turn).

Items of Interest

The Winjarning Boomerang

The Winjarning boomerang is a heavy example of a war boomerang, weighing about five pounds and measuring almost two feet from tip to tip. Made from a heavy, dark wood, its inside edge is lined with flint, giving a solid, sharp edge. Anyone foolish enough to throw it in the hope it will return will soon discover that returning boomerangs were only made as a toy. This item is not designed to return, or even be thrown, as hunting boomerangs are.

Whoever holds this weapon, or keeps it on their person, will find themselves unable to act contrary to the law of the land as they understand it; thus an aboriginal who "steals" a sheep to eat is not acting against the law as far as he understands, while a white man doing the same thing would be. Treat this as a temporary Honesty disadvantage. If the person already has Honesty, the only other side effect is that the boomerang will always seem as light a feather (+1 Accuracy bonus).

The magical endowment placed by the eldest Winjarning upon the boomerang means that when it is especially effective. When used against a dog brought to life by Cheeroonear's magic, it automatically decapitates the animal so long as the neck is targeted and it does at least 1 point of damage.

The Winjarning Waddies

The two waddies (long-handled clubs) created by the younger Winjarning are cut from a blood-red wood, and have very smooth black granite pips worked into the tapered-out ends. They each weigh four pounds and can be wielded one- or two-handed (1H crush swing +1, 2H crush swing +2).

The waddies confer on their holders a +5 Alertness bonus and Danger Sense, though these abilities are lost to that person if he ever acts contrary to any laws as far as he understands (see above).

Used against Cheeroonear, or any of his descendants, the waddies do not receive a penalty to target the head. If used by an Honest man (i.e. has the disadvantage Honesty) it will also do double damage.

All of these items are considered "men's business". If a woman touches one of them she will slowly die of an incurable wasting sickness in around three days (lose 1 HT every six hours until dead).

New Disadvantage

Ticket Of Leave

-5 points

A ticket of leave was the first grant given to a serving convict while his sentence was still being carried out, as a reward for good behavior that allowed some personal freedom. The ticket granted the convict the right to earn money for labor, and to travel at liberty within the boundaries placed upon him in the ticket, though he must produce the ticket on request. To travel beyond the boundaries and be caught would guarantee a swift return to hard labor, with time added on to his sentence.

The Serial Murder Resource Center

A Villain Organization for *GURPS*

by James L. Cambias

Mike Taylor stubbed out his cigarette and felt in his shirt pocket for the pack. It was empty; his third today. He looked down at the crime scene photos spread out on his desk and wished for something a lot stronger than tobacco. He'd seen bodies before, but the way these were cut up made him shiver. The worst part was that the medical examiner said the victims were alive and conscious until the last careful stroke of the knife.

The victims were all local, and that meant the killer was, too. Pine County only had 5,000 people, and Sheriff Taylor knew most of them. The thought that one of them could do this, and do it four times so far, gave him nightmares.

There was a brisk knock on his office door. Taylor smoothed back his hair and straightened his tie. "Come in."

The man who came in was small and neatly-dressed. For some reason he still had his sunglasses on, even though it was after sunset. "Sheriff Taylor? I'm Wayne Harper, from the Serial Murder Resource Center. I'm here to help you."

"This one's pretty bad, Mr. Harper." Taylor gestured at the photographs on his desk. "I'd sure appreciate anything you and the Center can do to stop this."

"Don't worry, Sheriff. We've had plenty of experience with situations like this." Harper extended his hand to shake, and grinned. "Plenty of experience."

The Serial Murder Resource Center is a well-respected and influential organization devoted to the study of serial murderers and their crimes. Often the SMRC lends a hand when local law-enforcement agencies find themselves trying to cope with a serial killer; in such cases the SMRC can help the police find a culprit in an amazingly short time. The SMRC is privately funded, its agents are discreet and don't try to hog the limelight, and its success record is almost unmatched. There's only one real problem with the Serial Murder Resource Center: its top leadership and many of its field agents are in fact mass killers themselves.

History

The Center was originally established to help fight the wave of serial killers which came to public attention in the 1970s and 1980s. Its founder was Dr. Karl Sellier, a respected criminologist and psychiatrist. Sellier was interested in abnormal psychology, and set up the center with two goals in mind: It would provide a central clearinghouse of information and expertise to aid law enforcement agencies track and catch serial killers, and it would be a facility to study the behavior and psychology of the killers themselves, with an eye to someday preventing their homicidal behavior. Sellier got funding from several major foundations and wealthy individuals, and was able to set up an independent endowment to provide for the Center in perpetuity.

Sellierran the Center until 1987, when the early onset of Alzheimer's Disease forced him to retire. His successor was Cyril Koppel, a young sociologist just out of graduate school who had originally been hired as Sellier's assistant. Koppel was less interested in the law enforcement side of the project, but was utterly fascinated by the prospect of understanding the mind and behavior of serial murderers. In 1991 he began trying to locate serial killers who had not yet attracted police attention in order to study them "in the wild," so to speak. A year later, Koppel made contact with

Elbert Wayne Landry, a truck driver who boasted to him of having murdered more than 24 prostitutes and hitchhikers across the country.

Though Landry never finished high school, he was highly intelligent and well-read, especially in psychology and sociology. He easily manipulated Koppel into going along for some "participant observation" of a serial killer at work. Before long, Koppel was completely enmeshed, unable to expose Landry without revealing his own accessory status in a growing number of capital crimes.

Landry saw how useful the SMRC would be to himself and compulsive killers like him, and began to subtly reshape the institute. Using the Center's records and his own knowledge, Landry made contact with nearly a dozen murderers, and then pressured Koppel into hiring them as field researchers or fellows of the Center. By 1997 more than half the SMRC's employees were actually serial murderers themselves. In that year Cyril Koppel tried to regain control of the Center by emailing anonymous tips to the authorities; Landry had expected something of the sort and Koppel simply disappeared (the police suspected suicide).

The current head of the Serial Murder Resource Center is Dr. Robert W. Jackson, a distinguished-looking scholar in his late forties. Dr. Jackson's actual field of expertise is theology, but he was selected by the Center's trustees after the staff covertly sabotaged the applications and interviews of all the other candidates. With the help of Landry and the Center's extensive archives, Dr. Jackson has made himself an authentic expert on the subject of serial murder. This is only appropriate, since Jackson is himself a multiple murderer (he has persuaded himself that true Christianity requires frequent human sacrifice, and has taken on the job of making up for the shortcomings of most mainstream denominations).

The SMRC now plays a double game. Its researchers and field agents still try to locate serial killers, but instead of helping the police bring them to justice, the Center's new mission is to protect the killers by helping them cover their tracks, and framing innocents to "solve" the cases. Only in cases where the killer is so deranged that he would pose a risk to the Center's secret does the SMRC actually help the authorities catch the guilty.

Assets

The Serial Murder Resource Center is not a big organization. It is headquartered on the campus of the Indiana Institute of Technology in Fort Wayne, in a converted Victorian house. The building holds offices for Dr. Jackson, his assistant Mr. Landry, and two research fellows. The rest of the facility is taken up by a huge library of scientific papers, news reports, FBI files, and other information covering all aspects of the phenomenon of serial murder.

Ever since Dr. Jackson took charge, the SMRC has employed a growing number of field agents. Currently there are nine: six in the United States, one each in Canada and Mexico, and one in Europe. The agents in the U.S. divide the country into six sectors (Northwest, Southwest, Texas-Plains, Midwest, Northeast, and South). Field agents work with law enforcement in their areas, and always try to be on the scene when serial killer activity is suspected. The agents are trained to appear bland and scholarly, but all of them are murderers.

Because the Center has a good reputation among law-enforcement agencies, it has much more influence than its small size would suggest. At little more than a word from one of the SMRC's agents, the FBI and most state and local police are perfectly willing to track or arrest people. This is a power which must be conserved: too many false arrests or bad leads will reduce the Center's influence, so this is best used as an emergency measure, or in conjunction with a frame-up.

Adam W. Hessler, SMRC Field Agent

Adam was recruited by the SMRC four years ago, when a Center operative managed to keep him out of the clutches of the FBI for the murder of three teenagers. Equipped with a new identity and some basic investigation training, he is now one of the SMRC's six regional agents in the United States. Hessler is a compulsive murderer, utterly callous and manipulative, but with the help of the Center he has learned to conceal his activities and avoid suspicion.

On the job, Hessler is bland and professional, the very picture of a dedicated specialist. He doesn't make friends except when he thinks a person could be useful to him, or when he's trying to get close to a prospective victim. Physically, he's unimposing but surprisingly fit (he has channelled many of his compulsions into exercise). Adam is a 120-point character.

ST 12 [20], **DX** 12 [20], **IQ** 12 [20], **HT** 12 [20]
Speed 6, Move 6

Advantages: Combat Reflexes [15], Contacts (four major urban police departments and the FBI, 12-, utterly reliable) [32], High Pain Threshold [10], Patron (SMRC) [10]

Disadvantages: Sadism [-15], Secret (has murdered nine people) [-30].

Quirks: Always pays cash, Enjoys living in motels, Only eats fast food, Teetotaler [-4]

Skills: Brawling-12 [1], Criminology-12 [2], Disguise-12 [2], Fast Talk-12 [2], Knife-14 [4], Law-10 [1], Lockpicking-12 [2], Psychology-12 [4], Research-12 [2], Stealth-14 [2]

Using the SMRC

In *GURPS* terms, the Serial Murder Resource Center is a 10-point Enemy: a medium group of competent individuals, appearing rarely (6-). It can also be a Patron organization worth 10 points (medium group, plus 5 for its contacts and influence, appearing rarely). Adventurers may become involved with the SMRC in several ways. First of all, law enforcement characters may find themselves working with a helpful "serial killer expert" from the Center as they try to track down a killer. The detectives may be puzzled when the SMRC agent identifies a suspect despite all their evidence pointing at someone else. In a more Hitchcockian vein, the player characters could wind up being framed for a series of murders as part of an SMRC operation to protect the real killer. Can the heroes prove their innocence when the nation's leading authorities say otherwise?

Campaign Use

The SMRC can fit into a surprisingly broad range of *GURPS* campaign settings, from *Steampunk* to *Traveller*, although it fits best in a modern-day campaign.

Steampunk and Cliffhangers: Give the Serial Murder Resource Center a more Victorian-sounding name and mission, and it can fit into a Steampunk or Cliffhangers campaign just fine. The Royal Murder Institute was founded to study all forms of homicide, but nowadays is run by a board of killers ranging from anarchist assassins, gangster hit men, crazed killers, and a few callous "artists of death." The head of the organization is the real Jack the Ripper (whoever that may be in your campaign).

Illuminati: In the world of the Conspiracy, a group like the SMRC is a valuable resource for its secret masters. The Center has a pool of expert killers, and can easily frame inconvenient meddlers as monstrous murders. The only question is who controls the Center? Is it the deadly Society of Assassins, the inhuman minions of Cthulhu, or the mysterious UFOs? Maybe the Center is a wild card in the plots of the Illuminati, selling its services to the highest bidder.

Cyberpunk: Move things forward in time a few decades and give the Center's agents and research fellows an arsenal of built-in weaponry, and it becomes a properly corrupt adversary group for futuristic outlaw heroes. If the world contains autonomous AIs, some of the Center's serial killers may lurk in cyberspace. Cloning and braintaping could make it possible for the SMRC to keep backup copies of mass murderers in suspended animation, so that even killing them won't stop them for long.

Supers: Detective superheroes may work with the Center on several cases before the awful secret of its true agenda comes to light. To give the SMRC's operatives a fighting chance, give them some kind of mystic or ultratech equalizer, like vibroblades or soul-drinking daggers which can harm even the toughest superhero.

Horror: For a game of gritty modern horror, play up the gruesome nature of the murders being investigated, and let the heroes slowly realize what a den of monsters lurks behind the helpful SMRC. For a more cosmic kind of horror, perhaps the SMRC doesn't really recruit killers; instead, constantly studying the habits of murderers turns the staff into bloodthirsty madmen. Are the PCs heading that way themselves?

From the Files: Adventure Seeds

Race

The heroes are in a race and they don't even know it. They're tracking a killer who moves from town to town and follows an obscure pattern in his crimes. But a field agent of the SMRC is also looking for the same killer, and is throwing as many obstacles as he can in the path of the PCs, while simultaneously trying to find out what they know in order to locate the murderer.

A Familiar Face

If the heroes have had a run-in with a mad killer in the past, they may be startled to see him (or her) identified as a respectable "serial murder expert" from the SMRC helping the police with a difficult case. Naturally, the killer has a completely new identity, and the Center's bosses confirm that he has nothing to do with the murderer the player characters remember. If they decide to start digging, the SMRC will mobilize its considerable resources to stop them.

Revenge

Bob Wilson went to jail ten years ago, convicted of five sadistic murders. An SMRC expert helped the police catch him and put him away, despite Wilson's claims of innocence. Now Wilson has broken out of jail, and a massive manhunt is underway to catch him. The heroes may either be lawmen on the trail of an escaped monster, or innocent citizens who get involved by accident. Will the PCs believe the word of an escaped mass murderer who claims he was framed, or the prestigious SMRC?

Star Trek Roleplaying Game -- Player's Guide

Published by [Decipher Inc.](#)

Written by Matthew Colville, Kenneth Hite, Ross S. Isaacs, Steven S. Long, Don Mappin, Christian Moore & Owen Seyler

Illustrated by Kieran Yanner

250 color pages; \$29.95

Apart from *Metamorphosis Alpha/Gamma World*, there probably have not been so many attempts made at one setting as there have been for the *Star Trek* license. There have been four *Star Trek* RPGs to date: a skirmish game from Heritage Models, Inc. (thanks to Bob Portnell for bringing that one to my attention), the 80s version from FASA, the first roleplaying visit to the *Star Fleet Battles* universe with *Prime Directive*, and the 90s incarnation using their ICON system from Last Unicorn Games. With a sixth on the way -- the *Prime Directive* rework "Powered by *GURPS*" -- what of the fifth, released from Decipher Inc. . . . a company better known for their collectible card games? Well, it should be pointed out that the new *Star Trek Roleplaying Game* is actually a second stab at the setting for the designers of the Last Unicorn Games version; so does this make the new game ICON version two, or something completely different?

Of course, the ICON system is now unavailable, so the team has created a new one called "CODA," which will also be powering Decipher's *Lord of the Rings RPG*. Out go the handful of six-sided dice and the drama die in ICON, to be replaced by just a pair of six sided dice under CODA. To attempt any action (or test, as it is known in CODA) both dice are rolled to beat a Target Number. This total is added to a character's skill, plus modifiers from attributes, circumstances, and equipment. A successful roll made by up to four over the Target Number is only marginal -- some minor setbacks or complications have happened. A complete success, on the other hand, is five above the Target Number . . . and a roll of ten over means an extraordinary success! The degree of marginal success seems rather high, and has been reduced in the *Narrator's Guide* so only rolling the Target Number exactly gives such a result. Target Numbers run from Simple (5), Routine (10), Challenging (15), Difficult (20), and Virtually Impossible (25). In place of the drama die in ICON, should double sixes be rolled on a test, another die is thrown and added to achieve a total. Should this single die also come up a six, it is thrown again and added. This can continue as long as a six is rolled each time.

Beginning characters have a starting limit of six on their skills, though characters designed with a balanced mix of skill levels will have skills ranging from three through five. Thus with various modifiers a character should be able to make routine tests most of the time with some setbacks, as well as challenging tests to a slightly lesser degree. For fans of the ICON system, it should be noted that the CODA system favors character skills a bit more, although the random element is greater.

Where each of the core rulebooks from Last Unicorn concentrated upon a single series -- *The Next Generation*, *Deep Space Nine*, and *The Original Series* -- the focus for Decipher's *Star Trek Roleplaying Game* is actually all four series together. The *Player's Guide* still looks at each series in turn, providing an overview of the period during which it takes place in the *Star Trek* timeline, highlighting notable events during the series' era, and then suggesting the type of adventures that a Narrator could run set at this time. Thus for *The Original Series* -- which includes the first six

movies -- we are told about the "wild frontier" status of the Federation and her neighbors; important events during this time included the Organian Armistice and the Conference of Babel of 2267, right up to the Khitomer Accords at the end of the twenty-third century. Possible adventures include encountering and dealing with new civilizations, life forms, and technological terrors, or plying the space lanes as rough-and-tumble merchants and free traders. In addition to information on each series, a solid timeline gives yet more events for each of the four series, and more suggestions for campaigns that could be running during each era. The timeline runs up to the end of the war with the Dominion depicted at the end of *DS9*; that is as far as the official history goes . . .

While it does not really discuss the period of Captain Archer's *Enterprise* in any detail, the *Player's Guide* does tell you in a short sidebar how adventures could be run similar to those of the crew of the NX-01. The timeline also comes with a map of *Star Trek's* political geography. While scant on detail, it does at least show the relative position of the Federation and its neighbors . . . something that was woefully (and irritatingly) lacking in the Last Unicorn RPGs.

To support the whole breadth of the *Star Trek* milieu, players can design both civilian and Star Fleet characters, depending on whatever style of game the Narrator plans to run. The process of character generation under CODA is slightly different to that of ICON, but the same principles show through in both. Under ICON, the process involved selecting a racial template, then applying a Branch (for Star Fleet characters) or other professional Overlay, before picking smaller packages that represented the character's Early Life, Academy Life, Cadet Cruise, and any Tours of Duty. Under CODA, the player selects a species and a profession, generates attributes, and then chooses skills and traits by taking one Professional and one Personal Development Package.

The ten races available in the *Player's Guide* are the Bajorans, Betazoids, Cardassians, Ferengi, Humans, Klingons, Ocampa, Talaxians, Trill, and Vulcans; each of them receives a two-page spread that explain both the race and its in-game particulars. This is a reasonable mix of species, though in all likelihood it will fail to please everyone. For example, many may feel that the inclusion of the Ocampa and the Talaxians is a waste of space and too specific to the Delta Quadrant; Other races found in the Alpha and Beta Quadrants could have been included instead to better effect, such as the Andorians and the Tellarites. But since the Decipher version of the *Star Trek RPG* is trying to cover all four series, the Ocampa and the Talaxians are included with good reason. Thankfully, the Andorians -- along with the Orions and Romulans -- will be detailed in the *Narrator's Guide*. (As an aside, it should also be pointed out that the differences between the Klingons from *The Original Series* and those from the movies and the *The Next Generation* era are left out of their entry. This difference was at least covered in the ICON *Star Trek: The Original Series* RPG.) It is possible to create mixed species characters, but narrators should be forewarned; the method is open to abuse from the players, as it is easy to generate uber-characters . . .

A player has a choice of seven professions: Diplomat, Merchant, Mystic, Rogue, Scientist, Soldier, and Starship Officer. The latter is further broken down into Command (covering actual command, helm control and navigation), Operations (communications, engineering, security, and mission operations), and Science (medical doctor, counselor, and actual science officer). A profession provides a list of skills particular to that career, making them less costly to buy than non-professional skills. It also describes a number of professional abilities particular to that career. Each professional ability represents an aspect of a character's job beyond its skills; there are eight listed for each profession, arranged into three tiers.

The nearest analogy to the concept of "professional abilities" are the "feats" found in *Dungeons & Dragons 3rd Edition*. Thus a diplomat might take the "Bluff" ability to offset any social penalty when they make a Persuade skill roll to bluff, or the "Insight" ability that provides an extra die to a Savvy reaction test against lie attempts (the diplomat rolls three six-sided dice instead of two and ignores the lowest). As a campaign progresses a character can pick more abilities, including those from the second and third tiers. Some of these have prerequisites, either other abilities or other various factors. For example, the diplomat would need to have the Insight ability if he wants to take "Anticipate Opponent" ability, a Politics Skill of three or more for the "Power Player" ability, or a Renown of three or more for "Great Reputation" ability. Additionally, some abilities can be upgraded for multiple or enhanced effect.

Professional abilities are listed for just Star Fleet officers and also for Elite Professions. These include Starship Engineer and Counselor, as well as for Command, Flight Control, Medical, Operations, Science and Security Officers. All Starfleet characters receive the "Starship Duty" ability for free, and can then pick another from their Elite

Profession. In many cases the Starship Duty ability is a prerequisite to those listed under the Elite Professions.

The six basic character attributes -- Strength, Intellect, Agility, Vitality, Presence, and Perception -- can be created by rolling dice, or by picking set scores and modifying them with bonus points. Under the random method, two dice are thrown a total of nine times and the lowest three results discarded. The results are further modified by the character's race. High attribute scores provide modifiers for use during tests; in addition, these modifiers also become a character's Reaction scores. Each Reaction score covers a character's ability to deal with or resist various factors: Quickness covers reaction time and reflexes; Savvy works against lie, bluff attempts and measures how well you can hide your intentions; Stamina against poison, endurance tests and pain; and Willpower against attempts to influence or interrogate you, against telepathic probes, and is also used if you want to make a greater effort.

Once attributes have been created, a character makes their first skill picks. Doubling the Intellect score provides the number of levels that can be taken in Species Skills: Culture, History, Language, World Knowledge, Politics and Religion. Then two more packages provide more skills; a character takes one from the Personal Development list and another from Professional Development list particular to their chosen Profession. Unlike the ICON system, these packages are actually quite flexible, so that two characters can take the same one but modify them, as is their wont. A package gives a mix of set skills and player choice, as well as a selection of Edges -- the equivalent to ICON's advantages, to choose from. A Professional Development package provides more skills than a Personal Development one does, but players will need to modify the set skills received with their free skill picks if they are to meet the basic skill requirements for their chosen Profession.

For example, if you want to create a Tom Paris-like character, you might take the "Starfleet Brat" Personal Development package, and the "Hotshot Pilot" Professional Development package from those listed under the Starship Command Officer list. A Doctor Bashir-like character would apply the "Genetic Re-sequencing" for their Personal Development and "Ship's Doctor" for their Professional Development. A member of the Maquis might have "Colony/Frontier Upbringing" for their Personal Development and "Guerrilla" from the Soldier list for their Professional Development.

At each stage of generation, a character can select another edge in return for receiving a flaw. There are more edges listed than flaws; until more are given, it should be possible to raid ICON books for the many given there. Again, some flaws and edges can be upgraded (like Ally, Command, Contacts, Promotion, and Quick Draw for edges, and Enemy, Pacifism, and Rival for flaws). In some cases, a flaw or edge actually has a prerequisite that must be fulfilled before it can be selected; the "Infamy" flaw requires a Renown score of three or more, and your Presence attribute must be six or above if you want to the "Confident" edge.

Of course, if players want to get started immediately, they can skip the generation process and take one of the six ready-to-play archetypes found at the front of the *Player's Guide*. All that they need are the addition of five skill picks (in other words, buy another five levels' worth of skills) and then they are ready to go . . . Well, almost, because it would appear that all six character archetypes to lack the species-specific skills that all characters get for free.

The character creation system generates characters with skills roughly the equivalent of Starfleet Academy graduates, but the layout of the Player's Guide hampers the process. Whereas it was quick and intuitive under the ICON rules, here it is anything but. The problem is that there is no one page that explains the process in adequate detail, and players will find themselves flipping back to earlier sections of the book. A double-page spread at the front of the book does explain the character sheet and lists the process of character generation, but not in enough depth. The process is also hampered by inconsistent examples given at each stage; different characters are used throughout. The problem could have been remedied had there been one -- if not two -- character examples provided that took the reader through the generation process from start to finish, referencing the relevant sections as necessary. As a result, the whole process feels slightly stiff, and does not get across the flexibility that the designers clearly want it to have.

Those used to the ICON system will find that the skills are a mixture of the familiar and the different in the CODA rules. Some are dropped, such as Command (which becomes an Edge) and the Personal Equipment Use skill. In its stead a character just uses that piece of equipment, such as a Tricorder, which provides a bonus to an appropriate score (say Medicine, if scanning for the presence of a poison or virus). Some skills can have specialties, which can be taken

just the once to provide a bonus in tests. Elsewhere, some skills have been folded into others. For example, where ICON had "Vehicle Operations (Shuttlecraft) 1 (2)," the skill of shuttlecraft piloting under CODA is part of the System Operation skill, under the Flight Control specialty. Certainly the individual skill entries are better explained, and the test section tells exactly how the skill works, including suggestions for each level of difficulty.

Characters no longer earn skill points to spend on improving their attributes, skills and so on. Instead the narrator awards them experience points. When they accumulate a thousand, they can be put through an "advancement." This provides the character with five picks which can be spent to improve skills, specialties, renown, courage, attributes, or acquire a new edge or Professional Ability. Essentially, just about any aspect of a character can be improved. How experience points are earned and how many are awarded has been left for the *Narrator's Guide* to fully explain. A page is given over to creating more advanced characters, but no example is provided to explain the process. Eventually, a character can advance to Elite Professions, like Adept, Ambassador, Assassin, Envoy, Explorer, Free Trader, Inventor, Mercenary, Smuggler, Special Forces, Spy, Weapon Master. Though they have higher prerequisites, they work like the other professions in the *Player's Guide*, providing new professional abilities. These Elite Professions give possible long-term goals or career paths for the players to set their characters along, which is very useful for civilian characters.

The book includes a solid list of equipment and weapons, as well as an explanation of starships and their systems. Additionally the setting material covers the Federation in reasonable detail. Together with the timeline, a Narrator has enough information to get a game going . . . though he will certainly need the *Narrator's Guide* fairly soon. Rounding out the book is an appendix covering personal combat under the CODA system; ship-to-ship battles will probably be covered in the forthcoming *Narrator's Guide*. Personal combat flows along fairly well, and characters have a greater survival rate than in ICON, as they have an inherent Defense value. This replaces the old Dodge skill (which not every character possessed). Another nice touch is that most characters have a greater amount of Health or hit points than in ICON. This benefits human and similar characters in particular, as they were pretty fragile under the ICON system.

Despite the claims on the back cover of the *Player's Guide*, it is not "easy" to convert material or characters from previous *Star Trek* RPGs into the CODA system. Conceptually it probably is easy -- more so from the ICON mechanics -- but a set of direct conversion guidelines are not given here.

Presentation-wise, the *Player's Guide* is very nicely laid out and liberally illustrated with photographs from the *Star Trek* television series and the movies. The only original art appears in the six archetypes; while it is good to see Kieran Yanner's work in color, his style is rather lanky, which gives rise to a decidedly skinny-looking Ferengi. Finally, it should be pointed out that the double-sided character sheet is attractively done in pastel colors, but certainly produces an ugly -- and near-useless -- photocopy in black and white.

Of course the *Player's Guide* does not contain everything that the GM will need to know, for which the *Narrator's Guide* is an absolute must. That said, there is nothing to stop the GM from raiding whatever *Star Trek RPG* sourcebooks they may have to support their game under the new CODA rules. Further, although it may seem expensive to have to pay for both the *Player's Guide* and the *Narrator's Guide* separately, it should be pointed out that together they cover the first four *Star Trek* series, as opposed to having to buy a separate book for each one.

Despite the poor organization and explanation of character creation -- which certainly becomes easier with practice -- the *Player's Guide* is a useful box of tools for running a game during any of the *Star Trek* time periods. As to the rules and mechanics, some may see it as a step back in terms of design, but really it represents a chance for designers to regroup and rethink through the problems inherent in the ICON mechanics. Even so, the heritage of the ICON system is clearly evident in the CODA system, making it a much-improved ICON version two, but still different enough to have its own identity.

--Matthew Pook

Pyramid Review

Marvel HeroClix: Infinity Challenge

Published by [WizKids](#)

Designed by **Jordan Weisman, Monte Cook, Mike Mulvihill, and Jeff Quick**

Starter Pack, \$19.99; Booster Pack, \$6.99

Marvel HeroClix: Infinity Challenge is the third of WizKids HeroClix games, following the fantasy-themed *MageKnight* and the subterranean-crawling *MageKnight: Dungeons*.

Like its predecessors, *Marvel HeroClix* is a collectable miniatures game sold in Starter Packs and Boosters. In a Starter Pack you get 8 random pre-painted miniatures, a two-sided 3' x 3' paper map, rules, reference cards, dice, and markers. It's quite a deal for \$20.

Marvel HeroClix is a superhero tactical miniatures game. You and your opponents pick a point total, assemble a team from your miniatures, and battle each other in a variety of environments. The map included with the game includes a generic mall on one side, and a generic outdoor area on the other. Fortunately any square grid map will work for the game, so you can pull out your *d20* or *Frag* maps, or dispense with maps all together in favor of a ruler and wargame terrain.

Included with the game are five scenarios. In "Challenge of the Champions," the heroes are teleported to an alien dimension and forced to battle each other in a frenzied free-for-all. "The Scientist" charges players with either kidnapping or protecting a scientist with a secret. "Stand Aside!" is a simple scenario where one side must push their way through the map. "Winner Takes All" is a capture-the-flag variant, where the side holding an ancient artifact after 10 turns wins. Lastly, "Mind Switch" randomly assigns powers or curses on heroes as they fight. Overall, the scenarios aren't especially inspiring. It would have been welcome to have a wider variety of objectives and situations. Why not one powerful miniature (say, Quasar at 122 points by himself!) against a horde of gun-toting grunts? Where are the jail breaks? The bank robberies? The epic battles on the Statue of Liberty? Clever players won't have a hard time devising their own scenarios, though it's a disappointment the rules didn't provide more interesting ones.

The rules to the game are straightforward, and nearly identical to *MageKnight*'s:

On your turn, you are given one action for every 100 points of miniatures you are fielding. A typical game is 200 points, which is usually around three to six miniatures. Activating a miniature counts as an action; you can move, attack in close combat, fire a ranged shot, or use a super power. Once you have activated a hero, you can't activate him on the following turn unless you "Push" him, in which case he takes a click damage. Once you've Pushed a hero, he can't be Pushed again on the next turn; he must take a breather and pass.

The Push mechanic forces players to be tactical, coordinate their team, and plan in advance. How you activate your heroes makes a huge difference in the outcome of the game. A player that knows when to Push and when to "rest" his miniatures will easily defeat a player who recklessly charges into battle, or doesn't use his force as a team. A hero caught stranded without backup will get KO'd quickly in this game, which not only emulates a lot of comic books, but makes for a more interesting game.

On each character's click base are four attributes: Speed, Damage, Attack, and Defense. When you attack another character, you roll 2 six-sided dice and add your Attack value. If the sum exceeds your foe's Defense, you hit, and do

as many "clicks" damage to him as your Damage attribute. As characters are wounded, their attributes and super powers degrade until they are finally KO'd and out of the game.

Various super powers are represented by colored boxes on the attribute dial. So if your Defense has a green box around it, you have an Energy Shield and your character's Defense is increased by 2 against missile attacks. These powers are the game's strength . . . and a frustrating weakness. There are over 30 super powers in the game, but you'll have to constantly refer to the reference card in your first few games before you finally memorize what they do. Since abilities come and go as the character gets wounded (for example, a wounded character may lose his Leadership but gain Battle Fury), you'll be forced to squint at the miniature constantly during those early games. Players who are colorblind may have serious trouble with this game. Even players with hawk eyes might have a hard time differentiating orange from red on the dial.

A nice touch was the inclusion of team super powers. Some characters have team symbols on them, such as the Fantastic Four, X-Men, or Skrulls. Team abilities enhance other members of the same team, and provide a reason to field similar characters instead of creating create a strange lineup of villains and heroes . . . though that's certainly possible (and probable unless you buy some extra Boosters). Similarly, certain characters' plastic bases are different colors. If two miniatures have the same colored base, they are "arch-enemies," and receive double victory points for defeating their rival. So when Wolverine and Sabertooth are on opposing sides, watch out -- you know the battle will revolve around them. This is a nice nod to the comics, and provides additional depth.

Fans of the *MageKnight* game will notice a few differences in the rules. First, there is no facing in the game; everyone can attack 360-degrees. Characters are allowed to fire into close combat, too. There are also rules for knockback (if you roll doubles), smashing through walls, and picking up and throwing heavy objects . . . like engine blocks and forklifts!

The initial release of the *Marvel HeroClix* includes 150 different characters, though many are duplicated and differ only in their abilities; there are usually three variations of a hero -- Rookie, Experienced, and Veteran. The first wave of miniatures includes a good selection of Marvel favorites. You'll find Professor X, Spider-Man, Hulk, Blade, Wolverine, Daredevil, Magneto, Captain America, and a whole host of lesser known heroes and villains, as well as henchmen and thugs to make the game more interesting. Noticeably missing are any of the Fantastic Four (despite their team power listed in the reference guide . . . a sure sign of a future expansion!), Storm, Captain Marvel, Iron Man, Venom, the Green Goblin, and Thor.

The paint jobs on the miniatures are mediocre to good. Generally, the less human a figure looks, the better it looks! Faces are usually blobs of tan paint; anyone wearing a mask is a prettier miniature. They're made of soft plastic, so you can dump them in a box without much fear of damaging them. Unfortunately, the glue on their feet has a tendency to come undone (especially as you click their bases), so keep some super glue handy.

Overall, the game really captures the pace and chaos of superhero battles. If you can overcome the initial learning curve and resist the urge to buy ten more Booster Packs just so you can have a black-suited Spider-Man (the rarest of the bunch), you'll find *Marvel HeroClix* a fun, light game suitable for a wide age and experience range. The fact that a good-sized super battle takes about an hour to play makes it a great candidate for a lunchtime break.

And for those of you wishing for Superman, the Green Lantern, and Batman, fear not -- WizKids is planning a DC version of the game by the end of the year!

Pyramid Review

Psionics Toolkit (for d20)

Written by Mike Mearls

Published by [Fiery Dragon](#)

56 b&w pages; \$11.95

Despite the fact that psionics have been a part of the *Dungeons & Dragons* system for decades, and despite the fact that the *3rd edition* has done more than any previous edition to make them part of the core rules, many people still don't feel comfortable adding them into a campaign. Perhaps the lack of campaign information in the *Psionics Handbook* is to blame, or it could be that Wizards of the Coast felt that the "Mind Lords of Talaron" article in *Dragon* #281 would enable new players and GMs to mesh traditional fantasy with psionics. The folks at Fiery Dragon disagree, and have created the *Psionics Toolkit*, an aid for Game Masters and players to help them in adapting psionics into a standard fantasy campaign. Even better, it's written by Mike Mearls, a name quickly becoming associated with *d20* quality. Does that trend continue here?

Broken up into seven chapters, each one helps in different ways to bring psionics into the game. The first chapter, Twelve Questions About Psionics, forces the GM to examine how psionics fit in his world by answering some simple questions that have an important impact on the world. For example, how do mages and psions get along? What role do psychic warriors have in the setting? How long have psionics been around? How do merchants and nobles see psions?

Chapter Two, People, Places and Things, provides a few methods of introducing psionics to a campaign that's never used them before. The Vaniar are an offshoot of humanity that are isolated from the rest of the world, banished when their civilization became advanced under the instruction of their god, Athius. These humans have bonuses to intelligence but suffer penalties to charisma due to their isolated nature. Their favored class is, of course, Psion or Psychic Warrior (one or the other, not both). Another method of introducing psionics, the Monolith of Maurimar, is presented. This black slab is actually the home for the lyphillians, a race of pure thought. The lyphillians can possess those who study the runes about the monoliths surface; some of those that have already "escaped" are evil and must be stopped by the good lyphillians who feel responsible for their presence. The third section of this chapter is Olvic's Gang, a group of children raised by a witch who imbued the children with psionic powers that she would later steal by sacrificing the children. Unfortunately for the witch, the children proved too powerful for her; after slaying her, they have been making their way in the world. Without the parental guidance of the witch though, these children are dangerous adversaries that wise party members would do well to treat as full-fledged menaces.

Another group, the Monks of the Invisible Fist, is an example of how to tweak the *d20* rules to allow monks to have some psychic skills and abilities without changing the core class too much. The Vinduul of the Unspoken Thought is a religion that focuses on Vinduul, a cult-like religion with many splinter churches and factions under its umbrella. Vinduul is the god of psionics, unspoken secrets, lost knowledge, and forgotten lore.

Chapter Three, Classes, is very brief. The Psychic Thief is a prestige class that utilizes psionic abilities to augment a rogue's natural talents, while the Beastmaster is a primal lord of animals and beasts. Both are 10-level prestige classes with full details, including special abilities by level, power discovered, power points per day, and ideas on how to use these prestige classes in your own campaign.

This chapter ends with the cleric domain, psionics. It provides psionic domain spells for 1st through 9th level, as well as a granted power. Unfortunately, the domain relies on the worshipper to already have a level of psion or psychic warrior, and allows the cleric to sacrifice a cleric spell and gain psionic points equal to the spells level. This isn't very

useful if you only have a level or two as a psion. (One also has to wonder, why is this in chapter three instead of two?)

Chapter Four, Organizations, provides the GM with ideas on how to generate organizations with something similar to a town stat block. This includes Name, Alignment, Membership, Level, Resources, Activity, Influence, Fame, Legal Status, Goals, Typical Members, Notable Holdings, Notable Activities, and Leadership. The sample organization is the Band of the Opened Eye, a group that acts as a meeting place for psionic information. The detailed organization, the Order of the Broken Staff, is a guild of wizards that deals with psionics due to several of their adventuring comrades being slain by evil psions. Now they've developed the means and the organization to handle individuals who have such power. The head of the guild -- as well as several of his followers -- are detailed with new magic items to counter psionics.

Chapter Five, Psionics in Established Campaigns, provides guidelines on how to change characters so that they now have levels in psionic classes. It provides a brief mechanic to do this, as well as a method of introducing psionics via plague. The chapter is a little short and the plague idea looks like it too would fit in better at Chapter Two.

Chapter Six, New Monsters, has the solarian cat, a panther looking feline with the ability to communicate via telepathy and minor psionics. Also included are the cryscorn (a psionic based unicorn) and the psionic drake, with age categories from wyrmling to great wyrm. New templates include the lyphillian (introduced in chapter two), the psi-killer (a virus that becomes active when an individual with psionic powers is about), and the battle thrall (a slave to the mind flayers that's undergone tremendous change under their cruel tendrils).

Chapter Seven, Characters, provides the GM with several pre-designed characters. These range from the high-level psychic warrior Clarius Verrazi to the beastmaster Kiran Whitefeather, among others. Strangely enough, there is no example of a psychic thief or any of the prestige classes from the *Psionics Handbook*.

The book is laid out in standard two-column format, with black-and-white line drawings breaking up the text. Art ranges from good to average. The interior cover is a black and white copy of the color cover, with a twist: it labels all the characters and creatures so that the GM has a visual guide to the book. The rear cover is an ad for *Of Sound Mind*, a psionic-based adventure and a good tie in to this product, as well as the *Counter Collection II*.

The book feels light. It's like there were so many things that could have been put into the book, but were left out due to space considerations. The page count is a little off from the standard 64, and it shows in the lack of feats, psionic powers, magic items, and prestige classes. Strangely enough, the default home setting of the Fiery Dragon adventures, Karathis, is heavy in psionics, as psions and sorcerers in times past clashed over the fate of the world; there isn't any information on how this material relates to Karathis. Hopefully some or all of these will be making their way to us via Fiery Dragon's Web Site.

Experienced GMs who want a flood of new crunchy material to add to their current campaign aren't going to like this book. Those who are new to psionics and new to the *3rd edition* of *Dungeons & Dragons* will find a valuable resource in the *Psionics Toolkit*.

--Joe Kushner

Robin's Laws Illuminated

"[T]he truth remains that, in roleplaying, stereotypes are extremely useful. They provide a common set of assumptions about the world and the kinds of PCs who populate it."

-- Robin D. Laws, *Robin's Laws of Good Game Mastering*

In his deceptively slim tome, Robin Laws argues forcefully that roleplaying games have to be tuned to the needs and desires of the players rather than those of the game world or even the GM. This can pose something of a challenge in games seemingly designed to thwart, baffle, and harass player characters -- such as games of [conspiracy](#) and High Weirdness. However, the GM wishing to illuminate Robin's laws should realize two great truths: if the characters seem too at ease, the game can always get weirder on command; and the players are not the same as the characters. I've already written the [odd column](#) on the first point; the second point is one that Robin addresses with his breakdown of "player types" and the attendant discussion in his book. (If you haven't read Robin's book, well, shame on you -- but the player types should become obvious as you read further.) To aid GMs trying to marry Robin's typologies to *Suppressed-Transmission*- style games, here's a few elements, concepts, and approaches, and advisories for each of Robin's player types keyed to the ten *Illuminati* groups. Scoop them into your games as needed; sprinkled into player goal charts and adventure design boxes, they can help catalyze ideas, if only of the "Brian would go for that -- if it were about the Templars . . ." sort. First and foremost, however, like the [alphabets](#) I've done in the past, these elements will hopefully let your players feel "at home" in the world where their characters don't have to.

Adepts of Hermes

- **The Power Gamer:** Wants to obtain the Sword of Paracelsus, the Spear of Destiny, the alkahest, and secret magicks for which mortals are not ready, especially Words (duh) of Power. "Do what I will shall be the whole of the Law."
- **The Butt-Kicker:** Wants to kill mummies, demons, vampires, and evil magicians, especially ones without bulletproofing rituals. Would suspend any amount of disbelief for a dragon.
- **The Tactician:** Wants detailed and predictable rituals, especially ones written by Isaac Newton; enjoys abusing crystal balls and other scrying (pronounced "surveillance") magic. Since most evil magicians have poor decision-making skills, they fall into the Tactician's ambushes with gratifying frequency.
- **The Specialist:** Common specialist types include the "John Constantine" cynical street-magician, the magically-aware feline familiar, and the burglar who stole the wrong antique pendant.
- **The Method Actor:** Craves intense rituals, dickering with powerful spirits, and searching for the Holy Grail.
- **The Storyteller:** Always on the lookout for the quest object: the Ring of the Nibelungs makes a good choice. Will gladly riddle the bridge-trolls.
- **The Casual Gamer:** Will recognize fairies, Merlin, and Atlantis.

Bavarian Illuminati

- **The Power Gamer:** Either rising within the hierarchy, or a rising threat to it. Digs the whole MiB look. Saving up for black helicopter lessons, downloaded through the Orbital Mind Control Lasers if possible.
- **The Butt-Kicker:** Wants to kill other MiBs, CIA/FSB thugs, UN peace-forcers, and inconvenient witnesses. Just likes the sound of the word "chain gun."
- **The Tactician:** Enjoys using psychotronic gear ("Look into the headlights, please.") and tapping into the KH-11 satellite feeds. The more initials and acronyms, the better.
- **The Specialist:** Common specialist types include the "surveillance nerd", the clued-in reporter, and the shadowy wet-work psycho.
- **The Method Actor:** Trusts no one. Enjoys paranoid discussions of betrayal and lies; ideally with mysterious NPCs rather than fellow party members.
- **The Storyteller:** Would prefer that the mysterious CD-ROM, warehouse files, or military database have a few red flags for the next layer of the onion -- try a neat codeword ("GIZA Clearance Only") as a tag for such

things.

- **The Casual Gamer:** Will recognize any black, unmarked vehicle or agent.

Bermuda Triangle

- **The Power Gamer:** Knowing about interdimensional gateways isn't as cool as being them. Will put up with weird ultraterrestrial DNA that feeds him plot hooks as long as it heals wounds instantly.
- **The Butt-Kicker:** Wants to kill clones, gill-men, enemy submarines, enemy frogmen, and giant squids. *Really* wants to kill robot sea monsters.
- **The Tactician:** Won't mind fluctuating dimensions as long as the enemy still thinks two-dimensionally.
- **The Specialist:** Common specialist types include the "heir to Tesla" engineer, the shapeshifting mermaid princess, and the pointless alien.
- **The Method Actor:** Might explore amnesia, being ripped away from one's proper time or dimension, or any inner alienation to reflect the outer Strangeness.
- **The Storyteller:** Craves identifiers: "Bermuda Triangle," "Philadelphia Experiment," "ley lines," and so forth. Will go anywhere, as long as it's somewhere.
- **The Casual Gamer:** Will recognize the Bermuda Triangle, tabloid headlines, Atlantis (again), and possibly Tesla.

Discordians

- **The Power Gamer:** Prefers PCP to LSD, qat to cannabis, coke to heroin, turning up to turning on.
- **The Butt-Kicker:** Wants to kill clowns, faceless men in gray suits, and mimes.
- **The Tactician:** Will be frustrated to the point of overkill by Discordian enemies, unless you slowly escalate the tactics and make the "game-playing" part of the struggle.
- **The Specialist:** Common specialist types include the "holy fool" Malkavian -- er, Discordian -- cultist, the talking dog, the occult poet, and all manner of antisocial freaks.
- **The Method Actor:** "Oh, it's a David Lynch movie." This realization will make them both easier and harder to deal with.
- **The Storyteller:** Will only pick up golden apples labeled "plot."
- **The Casual Gamer:** Will recognize "anarchy" symbol, drug references.

Gnomes of Zurich

- **The Power Gamer:** Money can buy happiness, in the form of guns, gear, cars, toys, and bespoke Armani bulletproof vests. Consider "katana" money: Krugerrands, bearer bonds, uncut emeralds.
- **The Butt-Kicker:** Wants to beat up bank guards, armored car guards, prospectors, museum guards, and other people in the way of riches.
- **The Tactician:** Plans the heist, the rehearsal, the dress rehearsal, the heist of the key item needed for the heist, the rehearsal of the heist of the key item needed for the heist . . .
- **The Specialist:** Common specialist types include the wealthy aristocrat, the superspy connoisseur, and the bored but elegant art thief.
- **The Method Actor:** Fills in the blank: "I pursue money to escape from . . ."
- **The Storyteller:** Follows the money.
- **The Casual Gamer:** Will recognize brand names, Swiss numbered bank accounts.

Network

- **The Power Gamer:** His kung fu had better be the best; overclocks and thrashes and crypto to the max. New codes, new algorithms, puts the "killer" into "killer app."
- **The Butt-Kicker:** Wants to kill firewalls, androids, drones, and NSA goons.

- **The Tactician:** Downloads the schematics; with detailed netrunning rules, becomes the detail-est netrunner there is.
- **The Specialist:** Common specialist types include the streetwise skatepunk hacker, the mysterious hacker who turns out to be a hot babe, and the surveillance nerd, again.
- **The Method Actor:** Does information really want to be free? Would love to play an AI, if possible.
- **The Storyteller:** May or may not thrill to the drama of people typing frantically; will not wait long for download.
- **The Casual Gamer:** Will recognize the NSA, "hacking," and a perhaps surprising amount of jargon.

Shangri-La

- **The Power Gamer:** Psychic power is still power; the more recondite and inapproachable the ancient art or method the better, especially if it includes the words "Shaolin," "dragon," or "heavenly."
- **The Butt-Kicker:** Wants to kill Chinese soldiers, freakish insects, deros, evil monks, and the man who killed his master.
- **The Tactician:** Maneuvers, strikes, blows, grips, and the whole dojo full of options make single combat as thrilling as a pitched battle between the Chang Sing and the Wing Kong on top of the Potala Palace. Well, almost as thrilling.
- **The Specialist:** Common specialist types include the sole surviving practitioner of levitation, the "natural", and Caine (from *Kung Fu*, that is, not *Vampire*).
- **The Method Actor:** The Eightfold Way, the Fivefold Path, and any number of other exotic moral codes add instant depth and tension to a peaceful warrior.
- **The Storyteller:** Will be watching closely to see if this is a John Woo movie, a Tsui Hark movie, or a Ringo Lam movie.
- **The Casual Gamer:** Will recognize Tibet, chi, and the astral plane.

Society of Assassins

- **The Power Gamer:** Craves rate of fire, high calibers, and anything by Glock. Other favorite words include Semtex, Pachmayr, and Ruger. Introduce gun fu and never look back.
- **The Butt-Kicker:** Wants to kill everything! Do you hear me? Everything!
- **The Tactician:** Plans the ambush, the hit, the getaway, the cover up, and the patsy. Seems vaguely disappointed if there's no need for a map of the sewers.
- **The Specialist:** Common specialist types include the ninja, the sniper, and the ninja sniper.
- **The Method Actor:** Kills to cover up a secret.
- **The Storyteller:** Often winds up assigned to kill his mentor, for some reason. Method-actery Storytellers do it on purpose.
- **The Casual Gamer:** Will recognize Lee Harvey Oswald, a curved dagger, and C-4.

Servants of Cthulhu

- **The Power Gamer:** Unless you call it up, you'll never know if you can put it down, now will you?
- **The Butt-Kicker:** Wants to kill evil cultists, mad sorcerors, hideous hybrids, unholy servitors, and anything else preceded by an adjective.
- **The Tactician:** Seems happiest if Elder Signs work, or failing that, if machine-guns do.
- **The Specialist:** Common specialists include the "Van Helsing" (complete with indecipherable Mitteleuropian accent), the hipster madman, and the neurasthenic.
- **The Method Actor:** Will draw up a family tree going back to Dagon and Hydra if you let him. Go ahead and let him.
- **The Storyteller:** Likes following spoor; a common monstrous m.o., the trail of ownership of the tottering mansion or lurid painting, or the flight-path of the whippoorwills. Looks for order to find chaos.
- **The Casual Gamer:** Will recognize Cthulhu.

UFOs

- **The Power Gamer:** Alien implants can be good things. Alien technology is definitely a good thing. Black tech devised to combat alien tech is almost as good.
- **The Butt-Kicker:** Wants to kill Air Force and MJ-12 goons, Greys, Reptoids, Mantids, and anything that wants our women or our water.
- **The Tactician:** In his heart of hearts, wants it all to be an Air Force coverup of secret military aircraft. Prefers stunners to blasters.
- **The Specialist:** Common specialists include the wild-eyed spotter, the tabloid reporter, or the mysterious informant.
- **The Method Actor:** Mulder.
- **The Storyteller:** Scully.
- **The Casual Gamer:** Will recognize crop circles, Area 51, Roswell, and anything out of the first four seasons of *The X-Files*.

History: Yesterday's Beliefs, Today (Or Vice Versa)

So you're playing in or running a historical game. You've striving for some level of accuracy and authenticity (despite the fact that giant steam-powered robots were a bit less common in the real American Civil War than the campaign version). You've got the history researched; you're wrapping your mind around the technology, politics, and mindset of the era; you're ready to live -- and create -- history. And about midway through this planning, you realize:

History really bites.

By this I mean that there are a lot of aspects of history that are really pretty ugly, especially when it comes to trying to recreate them. Legally sanctioned oppressive racism in the United States was a reality until *very* recently, and women were treated as second-class citizens throughout most of the Western world until . . . oh, last Tuesday-ish. (As someone who wasn't cognizant through most of the 1970s, I was shocked to learn that newspapers still had "Jobs for Men/Jobs for Women" distinctions in their classifieds through then.)

I rediscovered that history bites when writing my thin-versus-thick curtain columns over the past month. I realized that, for me personally, the most common "breach" of that wall between player and character actions for myself is in attitudes; I have a habit of transplanting many of my modern values and beliefs into any characters I play in historical games. Thus my twelfth-century English Catholic priest character is much more tolerant towards Muslims, pagans, Irish, women, and werewolves than he almost certainly would have been in the "real" world.

So what's a gamer to do? If you ignore sizable aspects of history, are you still playing a "historical" game? Is it fun to play a character with attitudes you'd find repugnant yourself?

Well, here are some ways to deal with this conundrum.

- **Ignore it.** Remember all those great Westerns from the 40s and 50s that dealt with issues of racism and sexism? Me neither.

Probably the easiest way to "deal" with the issue is simply to ignore it. If there isn't any catalyst that would bring up uncomfortable attitudes, there's no reason for it to ever enter the game.

Of course this is easier in some games than others. While it's easy to avoid the sexism of a 1940s game by simply not having any women around (ala *Saving Private Ryan*), avoiding the jingoistic aspect of World War II is much more difficult. ("That's odd; we've been on the Pacific front for six months, and we haven't encountered *any* Asians . . .")

A nice (if curious) aspect of this technique is that it's not terribly *unrealistic*; if that twelfth-century English priest never encounters any Muslims, then his feelings towards them need never become an issue.

On the other hand, this option can also greatly limit gaming options; by eliminating the potential for ugly historical realities, some of the more interesting historical conflicts are also impossible. A Western without direct human interaction with Native Americans, for example, is denied a number of adventure possibilities.

- **Downplay it.** Like so many aspects of gaming, a little "realistic" historical attitude can go a long way. Thus a typical Victorian-era English aristocrat might express disdain for all things "not British," or a Cliffhangers pilot might make an off-hand sexist comment like, "The Amazon is a dangerous place for a woman . . ." Much like ignoring it, downplaying the ugly side of history can maintain a level of realism without directly confronting the uncomfortable aspects.
- **Heroes are made of sterner stuff . . .** In slightly less realistic games, it could just be assumed that heroes don't judge a person by gender or color of skin. Again, this is pretty easy to justify; most campaign PCs tend to be exceptional people in the first place, so adding one more layer of distance between them and the bulk of humanity isn't very difficult.

When using this option, players can either come up with their own reason *why* they're different in their beliefs ("I've looked at all people equally ever since I was rescued by that Japanese schoolgirl in '17 . . ."), or it could just be part of what they are. In this way the characters can be heroic and identifiable by modern players, while still existing in a historical world.

(As an aside, in my experience this seems to be the solution games with thinner walls between player and character interactions gravitate towards. The GM can occasionally make reference to society's racist and sexist attitudes, and the heroes shake their heads, sigh, and save the world.)

- **Get rid of it, with justification.** Many recent games have gone to considerable lengths to justify the lessening or elimination of racist and sexist attitudes. *Deadlands* posits out that long-held narrow-minded views have needed to be rethought in recent years, since the extended Civil War has resulted in the deaths of many young white men; this has created a vacuum that enabled people of other ethnic groups and women to fill many jobs and roles that were previously closed. *Vampire: The Dark Ages*, on the other hand, simply points out that it's not wise to judge vampires by their appearance; you never know when that person whose background or gender you're degrading is a thousand years old, and more powerful than you'll ever realize . . .

This can be a good option, but usually requires an alternate reality of some sort (like a decade-long Civil War, vampires, or both). Even so, clever players can use this technique on an individual scale in many campaigns. For example, if the PC is one of the three best code-breakers in America in a World War II campaign, it doesn't need to matter as much that she's a woman; if codes need to be broken, she'll need to be along . . . no matter how dangerous or inappropriate the situation is for a member of the "fairer sex."

- **Get rid of it, without justification.** Depending on the campaign, it can be entirely possible to simply sweep the ugly bits of history under the rug. Any game that has other historical anachronisms -- like the *Hercules*, *Xena* and *Jack of All Trades* television series -- really has no problem adding one more. ("Yes, I'm a scantily clad woman roaming the countryside with my female companion, fighting evil. Any questions?" "Um . . . Aren't you cold?") While not the most realistic option, it's certainly a strong possibility in many games. And it's possible to introduce characters (either PCs or NPCs) who *do* have racist or sexist attitudes; in this way players can explore that aspect of roleplaying in a historical game, without needing to worry that it will be an omnipresent theme of the campaign.
- **Roleplay it.** This option is both the most obvious and yet arguably the most difficult. At least, I like to believe that it's difficult for most gamers today to, say, put themselves in the shoes of someone who hates all non-whites, or someone who thinks women are lesser creations of God and thus destined subservient to men.

But if everyone is comfortable (or at least up to the challenge) then it may be possible to enhance the feel of the historical universe. After all, history isn't just timelines and costumes and different weapon tables; it's the mindset of an era . . . its hope, dreams, fears, and "character." Sometimes it's positive, like the blind optimism that "anything is possible" of the Victorian era; sometimes it's negative, like the "white man's burden" mindset of the same time.

If a group *is* willing to pursue this option, it's probably wise to remember that -- even with the darkest emotions and attitudes of other eras -- such facets weren't constant so much as pervasive. Thus the Middle Ages may have relegated women to second-class status, but the church didn't issue weekly "women are evil" sermons or the like; rather there was a woman-controlling subtext ("The sermon this week is on the strength of the family . . ."), with more strong-armed techniques -- like guilt, condemnation, and even ostracism (or worse) -- reserved for women who act outside the social norm. As such, characters in this kind of environment needn't be slur-spewing woman-beating hate-mongers; rather, they can generally hold their opinions quietly until confronted with something that actively challenges their beliefs. Even then, *how* someone reacts in those circumstances can be varied.

Regardless of what method a historical game is going to use to deal with history's ugly sides, everyone should be using the same (or similar) option. If the GM is going to gloss over those parts, while another player is planning on playing a modern-minded character, while another wants to explore those darker elements actively, there will be conflict. In

particular, the "baseline" opinion of society should be made explicitly clear; in a game where everyone is more enlightened and modern-thinking, Intolerance may be a disadvantage. On the other hand, in a game where everyone is assumed to have Intolerance, being Tolerant may actually be an advantage (or not . . . the social stigma of those beliefs may be enough to off-set any benefits such beliefs could bestow).

This is especially important if you're *playing* a member of a socially restricted group. If your character is a female inventor in sixteenth-century France, then it's good to know before play starts how much society is going to hate you, seek to keep you from doing what you do, burn you at the stake, and so on.

Historical, alternate history, and history-based games are some of the most common campaigns around. Unfortunately, history contains a lot of parts that can be uncomfortable, awkward, and just plain ugly. Fortunately, historical games *are* games first and foremost; as long as everyone agrees on the rules, everyone should have fun.

* * *

As a totally chaotic aside, I feel like there should be a Random Thought Table drinking game at some point. Y'know, if I mention how important communication between GM and players is, take one swig. Mention the **Torg** story, take two drinks. Phrase an obvious authorial opinion in a detached fashion to fabricate a sense of impartiality -- "Some players may dislike GMs who hurl putrid greasy chicken bones at their hair" -- take three drinks.

(Whether reader or writer should be doing the drinking here, I'm not certain . . . But I digress.)

--*Steven Marsh*

* * *

*Last week's answer: **Clanbook: Malkavian** (first edition), p. 64.*

(Five stars) "If you have the 18"x24" Rorschach blot, tape it to the wall somewhere nearby. . . Before the game, take aside the player who will play the mute Marcell Pfeiff. Pfeiff begins the adventure wearing the face of the dead guard and with the dead guard's severed tongue in his mouth. . . The player should also, when given the cue, speak in a commanding voice the following words: 'To know me is to join me. I am the Opener of the Way.'"

Dork Tower!

Dork Tower!

Roadblock

Four 20th Century Armored Cars for GURPS

by Onno Meyer & Hans-Christian Vortisch

Jake settled into the unfamiliar driver's seat. The car was supposed to be a Rolls-Royce, but it wasn't like any Rolls he had seen before. At least the armor should help with any fences that got in the way. Behind him, the others tried to figure out how to load the machine gun.

Sergeant Young took a deep breath and approached the Krauts. The checkpoint didn't look very professional, but if he turned around now, they had to wonder why. He forced his hands to stay away from his stiletto; it wouldn't help against a 20mm autocannon anyway.

* * *

*Lieutenant Holston eased his boat towards the center of the river. There were two BTR-60s on the embankment, covering the road. With surprise, they should be able to take both of them out . . . but a firefight on the way *in* was no good start for a commando raid.*

When Hoffstetter and his team arrived, the M.P. still held both ends of the bridge. But that wouldn't last. While he was reporting to the lieutenant in charge, one of the ASVs fired a long burst into the tree line. The engineers started to prepare the blocks of C4 and the fuses.

Light armor can make an exciting encounter in many action-oriented games. Here comes a selection of historical vehicles that covers most of the 20th-century, from early TL6 to late TL7. For each of the four vehicles, there is a historical introduction to help the gamemaster place it in a campaign, a detailed description and finally a reasonably realistic representation using **GURPS Vehicles**.

This article works well with the earlier article ["Heavy Metal -- Four 20th Century Tanks for GURPS."](#)

Rolls-Royce Pattern 14, Great Britain, 1914 (TL6)

*"A Rolls in the desert was above rubies."
-- Colonel T.E. Lawrence, *Seven Pillars of Wisdom**

History: The idea to fit a car with armor and armaments pre-dates the twentieth century. When the Germans overran Belgium in 1914, a Royal Naval Air Service squadron stationed there with a motley assembly of aircraft, cars, and riflemen armored some of their vehicles with boiler-plate. These proved to be effective, and by late 1914, the Royal Naval Armoured Car Division had been formed. The mainstay of the division was the Rolls-Royce Pattern 14, but it also included armored cars and trucks of other makes, as well as machine guns mounted on motorcycles. The Pattern 14 was mass-produced based on a commercial touring car chassis.

The RNAC Division used these vehicles in combat on the Western Front, in North Africa, South West Africa, and East Africa. In 1915 the division was disbanded and, except for one squadron, its assets transferred to the British Army Motor Machine Gun Corps (later the Tank Corps). Units of the corps operated in Ireland, Egypt, Palestine, Syria, Iraq, Persia, and India (all then part of the British Empire). During WWI, armored cars were typically organized in four-car batteries. One famous unit was Lawrence's Hedjaz Armoured Car Section.

Many Pattern 14 armored cars were upgraded in 1920 by fitting improved wheels and tires. The Rolls-Royce Pattern 20 and other designs such as the Lanchester Mk I or Peugeot Mle 1918 were very similar.

Description: The vehicle used the chassis of the commercial Rolls-Royce 40/50 *Silver Ghost*, unmodified except for the stronger springs. Mounted on the chassis was the Admiralty-pattern armored hull, which featured 9mm thick plates all around (a weak spot being the wooden floor). This hull resembled a pickup, with an armored cab and open cargo bed. A turret was mounted on the cab roof. The entire vehicle was painted either olive green, sand, or in a four-color camouflage pattern. Interestingly, vehicles under Navy command had a crew of three, while those of the Army were manned by four men (which reduced crew comfort to a minimum). The driver sat on the right side on the floor, with the other crew members crouching behind him, with their upper bodies in the turret. There were no seats except for the driver's cockpit-type cushion seat on the floor. The rest of the crew often preferred riding in the cargo bed in safe areas. Access to the crew compartment was provided by a twin-door in the rear, leading onto the bed. The sides of the bed were lined with wooden cargo compartments (4.5 cf on each side), holding tools and doubling as seats. Tiny vision slits were used in combat, but in safe areas a front shutter could be folded up to allow for better vision. Vehicles operating in the desert often had the turret roof removed, for better air circulation. Running boards along the sides were used for further stowage; in the desert this was typically a 5-gallon fuel drum and a 40-gallon water tank.

The manually-traversed turret mounted the armament, which consisted of a 7.7x56mmR (.303 SAA) Vickers Mk I water-cooled medium machine gun (pp. HT117, W96). It fed from a 250-round web belt. Additional ammunition was stowed in cans in the fighting compartment.

Royal Navy crews were armed with the 11.5x23mm (.455 Webley Auto) Webley & Scott Mk I pistol (use Colt Government, p. HT108, W94), while British Army personnel were issued the 11.5x19mmR (.455 SAA) Webley Mk VI revolver (p. HT110, W94). Both used the 7.7x56mmR (.303 SAA) Enfield SMLE Mk III bolt-action rifle (p. HT114). A 7.7x56mmR (.303 SAA) BSA-Lewis Mk I light machine gun (p. HT118, W96) and a 38mm Very Mk I flare pistol were also carried in the car for dismounted use. A small opening in either side of the body could be used as gun port for these hand-held weapons.

The commercial Rolls-Royce gasoline engine was mounted in the front. It had a battery-powered ignition trembler coil. The car had three interconnected fuel tanks, a smaller gravity-feed one mounted in the dash (which was rather dangerous for the crew if hit), and two larger ones in the bottom of the cargo bed. Only the rear axle was powered, and off-road performance was limited. Wire-spoked wheels were used, which had thin tires prone to punctures. The rear axle had twin tires. At least two spare wheels were always carried, mounted on the sides of the cab.

Subassemblies: Standard wheels (Wh, six wheels). Turret (Tu, full rotation, on BoT).

Propulsion: 37 kW wheeled drivetrain (Bo, HP 10).

Armaments: 7.7mm Vickers Mk I Machine Gun (TuF, HP 4). 250 x 7.7mm Solid rounds (Tu, HP 1). 2,750 x 7.7mm Solid rounds (Bo, HP 6).

Instruments: Signal flags (Bo). Navigation instruments (Bo, HP 4).

Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls, navigation instruments, "Gunner" operates Machine Gun, "Loader" and "Second Loader" load Machine Gun, all from cramped crew stations (Bo, HP 50 each).

Crew: "Driver", "Gunner", "Loader", optionally "Second Loader". *Occupancy:* Short. *Passengers:* Four.

Accommodations: Four exposed, cramped seats (Bo, HP 30 each).

Power and Fuel: 37 kW standard gasoline engine (Bo, uses 2.1 gph G, HP 18) powers drivetrain. 1,600 kWh lead-acid battery (Bo, HP 2), recharged by engine. Two 12 gallon tanks (Bo, fire +1, HP 9 each) and one 7.2 gallon tank (Bo, fire +2, HP 6). 31.2 gallons of gasoline (fire on 12/13) last for 14 hours 51 minutes.

Access, Cargo and Empty Space: 7.32 cf access space (Bo), 9 cf cargo space (Bo), 25.06 cf empty space (Bo), 24.43 cf empty space (Tu).

Volume: Bo 180 cf, Wh 18 cf, Tu 25 cf.

Area: Bo 200 sf, Wh 50 sf, Tu 60 sf, total area 310 sf.

Structure: Light frame.

Hit Points: Bo 150, Wh 13 each, Tu 45.

Special Structural Options: Heavy compartmentalization in Bo.

Body Armor: BoF, BoB, BoR, BoL PD 4, DR 25 standard metal armor. BoT PD 3, DR 15 standard metal armor. BoU

PD 2, DR 3 standard wooden armor.

Wheel Armor: PD 3, DR 5 standard metal armor.

Turret Armor: TuF, TuB, TuR, TuL PD 4, DR 25 standard metal armor. TuT PD 3, DR 15 standard metal armor.

Surface Features: Camouflage paint job. Hitch.

Vision: Poor.

Details: Door in rear onto flatbed, headlights and running lights, no keys.

Statistics: Empty weight 5,369.8 lbs. Fuel 187.2 lbs. Ammo 168 lbs. Crew and cargo 980 lbs. Loaded weight 6,705 lbs. (3.35 tons). Volume 223 cf, size modifier +3. Price \$10,928.40. HT 9.

Ground Performance: Speed 55 mph. gAccel 3 mph/s. gDecel 10 mph/s. gMR 0.75. gSR 4. High GP, off-road speed 1/6.

Minor Bugs: Low mileage. The fuel consumption has been increased. Vulnerable fuel tank. The fire number of one tank has been increased.

Weserhütte LePzSpähw (2cm) SdKfz 222, Germany, 1935

(TL6/7)

"An SdKfz 222,' Carlos says, impressively. 'We, like, liberated it from a collector over in Reno.'"

-- Aaron Allston, *Hell On Wheels*

History: The *Leichter Panzer-Spähwagen (2cm)* (light armored reconnaissance vehicle with 20mm gun) SdKfz 222 and its minor variants were designed by the Eisenwerke Weserhütte for the *Wehrmacht* of Nazi Germany. It was intended for reconnaissance in armored divisions, but also used for rear-area patrols and security. More than 2,100 vehicles in this series (including the SdKfz 221 and SdKfz 223) were built by a number of contractors between 1935-1942. The SdKfz 222 was a successful design which was better protected and armed than contemporary vehicles of the Allies, but -- like many German developments -- too expensive and complicated for wartime production.

Twelve of these vehicles were exported to China in 1935. These differed in mounting a 7.92x57mm Rheinmetall-Dreyse MG13 machine gun, but were otherwise identical. Bulgaria received 13 standard vehicles in the 1940s.

An armored reconnaissance platoon consisted of four SdKfz 222 and two SdKfz 223, the latter being very similar, but fitted with extensive radio equipment and armed only with a 7.92x57mm Rheinmetall MG34.

Description: The SdKfz 222 was a nimble, 16-foot long, 4-wheeled armored car with all-wheel drive and all-wheel steering. The hull was made of ballistic steel and provided protection from small arms fire and shell splinters (maximum thickness of 14.5mm to the front). It was well-sloped on all sides. There was a door in either side of the lower hull for crew access. The turret top was open, protected only by a double hatch made of mesh wire and a canvas cover against the elements. Most were painted in the standard Army gray, but those of the *Afrika-Korps* received a sand finish.

There were three crew positions, one in the hull and two in the turret. The driver was seated in the center of the hull front. He had three small, glassless windows with armored shutters. The commander/loader sat on the left side in the turret. To his right in the turret was the station of the gunner. Both had vision slits.

The main armament was a 20x138mmB Rheinmetall KwK30 autocannon with L55 barrel (p. W130); from about 1940 this was replaced with a 20x138mmB Mauser KwK38, which was operationally identical, but had a higher cyclic rate (RoF 8*). The ammunition was loaded in 10-round magazines, 18 of which were stowed in a rack near the commander's station. Normally,

both API and SAPHE rounds were carried. APCR, available from 1940, was seldom carried and removed from service in 1944 to conserve tungsten. The gun had a maximum elevation of +80°, but the double hatch had to be open in order to elevate the gun more than +20°. Traverse of the turret was of the manual type. A 7.92x57mm Rheinmetall MG34 machine gun (p. HT119, W97, W130) was installed coaxially with the cannon, on the right side. It fed from a 150-

round belt in a belt pouch. The vehicle carried solid or AP rounds, both mixed with tracers.

The crew had three 9x19mm Luger P08 (pp. HT108, W94) or [Walther P38](#) pistols (p. W94) with two magazines each, a single 9x19mm ERMA MP38 or MP40 submachine gun (pp. HT116, W96) with six magazines, a 26.5x103mmR Walther LP28 flare pistol, and six *Stielhandgranaten* (pp. HT117, W98) between them.

The rear-mounted Horch engine originally delivered 56 kW. This was upgraded several times over the course of the production period; by late 1940, a 67 kW engine was installed. Both the front and rear axles were steerable, which made the vehicle highly maneuverable but also required a high degree of maintenance.

Pioneer and vehicular repair and maintenance tools were carried in boxes and racks on the vehicle's outside. A spare wheel and tire were attached to the right hull side. A rack on the hull front held four 5.3-gallon fuel cans.

Subassemblies and Body Features: Off-road wheels (Wh, four wheels). Turret (Tu, full rotation, on BoT). 30 degree slope on BoF, BoB, BoR, BoL, TuF, TuB, TuR, TuL.

Propulsion: 56 kW all-wheel drivetrain (Bo, HP 17).

Armaments: 20mm KwK30 Autocannon (TuF, HP 11). Universal mount for KwK30 (Tu, HP 7). 10 x 20mm SAPHE rounds (Tu, HP 1). 70 x 20mm API rounds (Bo, HP 2). 100 x 20mm SAPHE rounds (Bo, HP 3). 7.92mm MG34 GPMG (TuF, HP 4). Universal mount for MG34 (Tu, HP 2). 150 x 7.92mm AP rounds (Tu, HP 1). 900 x 7.92mm AP rounds (Bo, HP 3).

Instruments and Electronics: Medium communicator (Bo, 10 miles, HP 2, 0.1 kW). Telescope (TuF, x2.5, vision bonus +1/+2, HP 1). Navigation instruments (Bo, HP 4).

Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls and navigation instruments, "Commander" operates radio and loads weapons, "Gunner" operates weapons and telescope, all from normal crew stations (Bo, HP 60 each). *Crew:* "Driver", "Commander", "Gunner". *Occupancy:* Short. *Environmental Systems:* Environmental controls for three persons (Bo, HP 5, 0.75 kW).

Power and Fuel: 56 kW standard gasoline engine (Bo, uses 2.52 gph G, HP 23) powers drivetrain. 3,240 kWh lead-acid battery (Bo, HP 4) powers other systems for 64 minutes, recharged by engine. Two 13.2 gallon tanks (Bo, fire +1, HP 10 each). 26.4 gallons of gasoline (fire on 12) last for 10 hours 29 minutes.

Access, Cargo and Empty Space: 11.88 cf access space (Bo), 10 cf cargo space (Bo), 52.2 cf empty space (Bo), 11.01 cf empty space (Tu).

Volume: Bo 300 cf, Wh 60 cf, Tu 25 cf.

Area: Bo 300 sf, Wh 100 sf, Tu 60 sf, total area 460 sf.

Structure: Medium frame.

Hit Points: Bo 450, Wh 75 each, Tu 90.

Special Structural Options: Heavy compartmentalization in Bo. TL7 all-wheel steering.

Body Armor: BoF PD 5, DR 60 standard metal armor. BoB PD 5, DR 25 standard metal armor. BoR, BoL PD 5, DR 30 standard metal armor. BoT, BoU PD 3, DR 15 standard metal armor.

Wheel Armor: PD 3, DR 5 standard metal armor (tires have PD 2, DR 3).

Turret Armor: TuF, TuB, TuR, TuL PD 5, DR 30 standard metal armor. TuT PD 2, DR 3 open-frame standard metal armor.

Surface Feature: Camouflage paint job. TL7 puncture-resistant tires.

Vision: Poor.

Details: One door in each side, one hatch in turret top, intercoms, headlights and running lights, no keys.

Statistics: Empty weight 9,690.67 lbs. Fuel 158.4 lbs. Ammo 145.2 lbs. Crew and cargo 800 lbs. Loaded weight 10,794.27 lbs. (5.4 tons). Volume 385 cf, size modifier +4. Price \$30,395.44. HT 12.

Ground Performance: Speed 50 mph. gAccel 3 mph/s. gDecel 10 mph/s. gMR 1. gSR 4. High GP, off-road speed 1/4.

Minor Bug: Hangar queen. The maintenance interval is 96 hours.

Gorkovskiy Avtozavod BTR-60PB, USSR, 1966 (TL6/7)

"Target BTR, eleven o'clock, twenty-seven hundred!"

-- Tom Clancy, *Red Storm Rising*

History: In 1960, the *Bronetransporter 1960g Plavayushchiy* (armored transport of 1960, amphibious) entered production as the Soviet Army's new wheeled armored personnel carrier, replacing the obsolete BTR-152. The BTR-60P was soon found to be lacking in armament, and it was also felt that an open-topped vehicle was not survivable enough on the NBC-ravaged battle field, as well as against artillery. The BTR-60PA received top armor, and the BTR-60PAI a turret, but the finalized and most commonly encountered variant became the BTR-60PB, the B standing for *Bashnya* (turret). Adopted in 1965, it was first issued to troops in 1966.

There were a number of variants, including the BTR-60PBK command vehicle, BTR-60PU staff officers' vehicle, several artillery control versions, and the TAB-71 -- a slightly modified vehicle built under license in Romania. In the 1990s, the MTP-2B technical assistance vehicle and ATM-2 disaster assistance vehicle appeared, based on surplus BTR-60s. Of course, it was also the model after which the BTR-70, BTR-80, BTR-90, and BTR-94 were patterned.

A total of 25,000 BTR-60s were made before Soviet production ceased in 1976.

The BTR-60PB was used extensively by Soviet armed forces, including the motorized infantry, naval infantry, KGB troops, and border guards, as well as MVD interior security forces. Six were employed in the KGB *Gruppa Alfa's* assault on the Afghan Taj-Bek Palace (pp. SO21-23). It has also been used by Afghanistan, Algeria, Angola, Bulgaria, Cambodia, Cuba (encountered by U.S. Rangers on Grenada in 1983), Djibouti, East Germany, Ethiopia, Finland, India, Iran, Iraq, Israel, Libya, Nicaragua, North Korea, Somalia, Syria, Turkey, Vietnam, USA (for opposing forces training), Yugoslavia, and others.

A Soviet motorized infantry platoon consisted of three BTR-60PBs. A company was made up of three platoons, plus a BTR-60PBK for the company commander and a heavy weapons platoon with two BTR-60PBs carrying three machine gun teams and three antitank missile teams.

It was known as the *kolesniy grob* (wheeled coffin) to Russian soldiers; not only did it look like one, it was also considered less than safe since it was insufficiently protected and difficult to evacuate.

Description: The BTR-60PB was a 25-foot long, eight-wheeled vehicle with a small machine gun turret towards the front. It featured an all-wheel drive, with the two front axles being used for steering. The armor was 7mm thick in most places, and sloped for maximum effect. Nevertheless, it would only protect against small arms and artillery fragments. Like other Soviet vehicles, it was painted olive drab overall. The vehicle had the driver and commander in the front. Both had an armored window, which was protected by a shutter in combat, so that they had to use the three periscopes installed over both stations. These could be fitted with active IR-periscopes. The commander also had a traversable IR-searchlight. Hatches were provided in the roof above their stations. Behind them was the small one-man turret with the gunner's station. Between the turret and the engines in the rear was the passenger compartment. The riflemen sat on benches along the sides and rear of the vehicle. The passenger compartment had two hatches in the roof above the passenger compartment and a very small hatch in either side of the hull, making egress rather difficult. Usually only seven riflemen (plus the commander) were carried for dismounted combat, allowing some stowage of weapons and a semblance of crew comfort . . . but it was not unheard of to squeeze 13 men in.

The main armament installed in the manually-operated turret consisted of a 14.5x114mm Vladimirov KPVT heavy machine gun (p. HT119), which fed from a 200-round belt of AP, incendiary, and tracer rounds. Another 300 rounds were stowed in 50-round cans in the hull. To the right of this was a 7.62x54mmR Kalashnikov PKT coaxial machine gun (p. HT120), feeding from a 250-round belt with a mix of AP and tracers, with additional ammo being stowed in 250-round cans.

There were three gun ports on the right side and two on the left side of the hull. These were to be used by the infantry for suppressive fire on the assault. Opening them breached the NBC-seal, of course. The driver and gunner of a Soviet crew each had a 9x18mm Makarov PM pistol (pp. SO98, C63) with two magazines, while the commander had a 7.62x39mm Kalashnikov AKM assault rifle (p. HT114) with four magazines. The automatic rifleman had a 7.62x39mm Kalashnikov RPK light machine gun (p. HT114) with a 75-round drum and three 40-round magazines. The antitank specialist had a RPG-7V antitank grenade launcher (p. HT122) with five 85mm grenades and a PM

pistol. His assistant had an AKM and four spare rounds for the RPG-7V. Four riflemen had AKM rifles, although one man per platoon was a sniper with a 7.62x54mmR Dragunov SVD sniper rifle (p. SO100) and five magazines. The whole crew also had nine F-1 hand grenades (use Mk II, pp. HT117, W98) between them, which were usually used by the riflemen. Apart from weapons, there was also room for life jackets (p. VE203) for everybody onboard.

The eight wheels had large tires with run-flat inserts and a Central Tire Inflation System, which allowed variations in tire pressure for different ground conditions. The twin GAZ engines were located in the rear hull, separated from the crew compartment by a fire-proof bulkhead.

Steering in water was accomplished by a rudder in the hydrojet assembly and also by turning the front wheels.

Subassemblies and Body Features: Off-road wheels (Wh, eight wheels). Open mount (Om, full rotation, on BoT). Turret (Tu, full rotation, on BoT). 60 degree slope on BoF. 30 degree slope on BoB, BoR, BoL, TuF, TuB, TuR, TuL. *Propulsion:* 134 kW all-wheel drivetrain (Bo, HP 21). 93 kW hydrojet (Bo, 1,116 lbs. aquatic motive thrust, HP 17). *Armaments:* TL6 14.5mm KPVT HMG (TuF, HP 10). 200 x 14.5mm AP rounds (Tu, HP 5). 300 x 14.5mm AP rounds (Bo, HP 6). 7.62mm PKT MG (TuF, HP 3). 250 x 7.62mm AP rounds (Tu, HP 1). 1,750 x 7.62mm AP rounds (Bo, HP 5).

Instruments and Electronics: Medium communicator (Bo, 30 miles, HP 1). IR-Searchlight (OmF, 0.25 miles, HP 1, 0.25 kW). IR-Searchlight (BoF, 0.05 miles, HP 1, 0.05 kW). Telescope (TuF, x2, vision bonus +1/+2, HP 1).

Navigation instruments (Bo, HP 4).

Miscellaneous Equipment: Fire extinguisher system (Bo, HP 13). Bilge pump (Bo, HP 30, 1 kW). Winch (BoF, ST 25, 25 yards, HP 11, 0.125 kW).

Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls, 0.05 mile IR-searchlight and fire extinguisher, "Commander" operates radio, 0.25 mile IR-searchlight, navigation instruments and winch, "Gunner" operates weapons and telescope, all from normal crew stations (Bo, HP 60 each). *Crew:* "Driver", "Commander", "Gunner". *Occupancy:* Short. *Passengers:* Seven. *Accommodations:* Seven normal seats (Bo, HP 60 each).

Environmental Systems: NBC kit for 14 persons (Bo, HP 22, 3.5 kW).

Power and Fuel: Two 67 kW standard gasoline engines (Bo, use 2.68 gph G, HP 23 each) power drivetrain. Two 3,672 kW lead-acid batteries (Bo, HP 3 each) power other systems for 25 minutes, recharged by engine. Two 38.3 gallon tanks (Bo, HP 20 each). 76.6 gallons of gasoline (fire on 11) last for 14 hours 17 minutes.

Access, Cargo and Empty Space: 25.08 cf access space (Bo), 10 cf cargo space (Bo), 9.12 cf empty space (Bo), 9.11 cf empty space (Tu).

Volume: Bo 800 cf, Wh 160 cf, Om 0.09 cf, Tu 20 cf.

Area: Bo 600 sf, Wh 200 sf, Om 1.5 sf, Tu 50 sf, structural area 850 sf, total area 851.5 sf.

Structure: Heavy, cheap frame.

Hit Points: Bo 1,800, Wh 150 each, Om 3, Tu 150.

Special Structural Option: Heavy compartmentalization in Bo.

Body Armor: BoF PD 6, DR 35 standard metal armor. BoB PD 5, DR 25 standard metal armor. BoR, BoL PD 5, DR 20 standard metal armor. BoT PD 4, DR 20 standard metal armor. BoU PD 3, DR 15 standard metal armor.

Wheel Armor: PD 3, DR 5 standard metal armor (tires have PD 2, DR 3).

Turret Armor: TuF, TuB, TuR, TuL PD 5, DR 25 standard metal armor. TuT PD 4, DR 20 standard metal armor.

Surface Features: Sealed. Camouflage paint job. Puncture-resistant tires.

Vision: Poor.

Details: Four hatches on body top, two doors in sides (right, left), gun ports, intercoms, headlights and running lights, no keys.

Statistics: Empty weight 20,578.98 lbs. Fuel 359.6 lbs. Ammo 334 lbs. Crew and cargo 2,200 lbs. Loaded weight 23,772.58 lbs. (11.79 tons). Volume 980.09 cf, size modifier +4. Price \$200,461.60. HT 12.

Ground Performance: Speed 55 mph. gAccel 3 mph/s. gDecel 10 mph/s. gMR 0.25. gSR 5. High GP, off-road speed 1/4.

Water Performance: Drag 827. Top water speed 7 mph. wAccel 0.9 mph/s. wDecel 10 mph/s. wMR 0.25. wSR 4. Draft 1.9 feet.

Textron M1117 Guardian ASV, USA, 2000

(TL7)

History: In 1962, Cadillac Gage started development of their V-100 *Commando* 4x4 amphibious armored car for low-intensity operations. This became one of the most successful wheeled armored vehicles, and sold in large quantities . . . mostly to security forces. It was a versatile vehicle with dozens of factory options, including many different turrets and armaments. Slight differences in vehicle size and automotive improvements led to changes in designation, the latest variant being the V-150ST. With a one-man turret and improved armor, this was adopted as the M1117 *Guardian* Armored Security Vehicle (ASV) by the U.S. military in 1999, entering service in 2000. The producer had been re-named Textron Marine and Land Systems in 1994.

The U.S. Army Military Police ordered 94 M1117 ASVs, while more than 4,000 vehicles had been made of other variants. Each M.P. platoon had one squad of three vehicles, two carrying three men and one four (the fourth being the squad leader). The rest of the platoon used armored AM General M1114 HMMWV vehicles. M1117 *Guardians* were first deployed with the 18th M.P. Brigade to Kosovo in late 2000.

Without the turret and less heavily protected, it was a typical security vehicle used all over the world. Smaller armies sometimes had similar models as scout vehicles or even as a tank substitute, with a medium-caliber gun. Variants included the unarmed V-100 (adopted by the Los Angeles Police Department), the V-100 armed with twin 7.62x63mm (.30-06) Colt-Browning M37 machine guns (used as M706 by the U.S. Army M.P. in Vietnam), the V-150 armed with a 90x370mmR Cockerill Mk 3 light tank gun (adopted by the Malaysian army), and the V-150ST armed with a water cannon (adopted by the Mexican military police), plus many more. The basic design of the vehicle was closely copied in Mexico and Portugal, and also by Arrowpointe in the USA.

Description: The M1117 had an angular hull made from 6.35mm welded high-hardness steel. German-designed modular ceramic armor plates were adapted for increased protection, and a Kevlar spall liner added inside, giving protection against small arms and artillery shell splinters. It was finished in the standard NATO brown/green/black camouflage pattern. The driver sat on the left side of the front, with a hatch in the roof above him. The commander sat to his right, also with a hatch. Two small bulletproof windows to the front and one on each side provided reasonably good vision. The driver had a night vision periscope. To the rear of their seats was a two-part door in either side of the hull, which allowed for easy access. Each door was fitted with a vision block and a gun port for a small arm. Over the doors, slightly off-set to the right, was the one-man turret. The gunner had seven vision periscopes to all sides and a combined image-intensifier/telescope as targeting sight. There was a fourth seat, which was only occupied in a third of all vehicles, for the squad leader. Behind the crew was the ammunition stowage and a bulkhead to the engine compartment. A third door was provided in the rear of the hull, to the right of the engine. A passageway led from the door to the crew compartment.

The main gun in the turret was a 40x53mmSR General Dynamics MK19 MOD 3 automatic grenade launcher (p. HT121), feeding from a 100-round belt of HEDP grenades. Further 500 rounds were carried in 50-round cans in the hull. To the right of this weapon was a coaxial 12.7x99mm (.50 Browning) General Dynamics-Browning M2QCB heavy machine gun (p. HT119), feeding from a 200-round belt. More ammunition was stored in 100-round cans in the hull. The standard ammo load was AP mixed with tracer and incendiary types. Solid and APS ammo was available as alternative. Coaxial with the M2QCB was a 500,000 candela spotlight.

Each military policeman was armed with a 9x19mm Beretta M9 pistol (Model 92FS, pp. HT108, C63) with two magazines, a 5.56x45mm Colt M16A2 assault rifle (pp. C64, HT116) with six magazines and two M67 hand grenades (p. B206). The guns could be deployed through the gun ports in the doors.

The four wheels had large tires with run-flat inserts and a Central Tire Inflation System. The Cummins diesel engine was located in the left rear of the hull, together with the fuel tank and batteries, separated from the crew compartment by a fire wall. Installed in the front, forward of the commander's position, was the winch with 53-yard cable, which could be used for self-recovery. Note that, unlike its predecessors, the M1117 was not amphibious.

Subassemblies and Body Features: Off-road wheels (Wh, four wheels). Open mount (Om1, on TuT). Two open mounts (Om2-Om3, on TuB). Turret (Tu, full rotation, on BoT). 30 degree slope on BoF, BoB, BoR, BoL. 60 degree slope on TuF.

Propulsion: 194 kW all-wheel drivetrain (Bo, HP 27).

Armaments: 40mm MK19 MOD 3 AGL (TuF, HP 8). 100 x 40mm HEDP rounds (Tu, HP 6). 500 x 40mm HEDP rounds (Bo, HP 18). 12.7mm M2QCB HMG (TuF, HP 8). 200 x 12.7mm AP rounds (Tu, HP 3). 600 x 12.7mm AP rounds (Bo, HP 6). Two 66mm M257 Decoy Dischargers (one each Om2F, Om3F, HP 3 each). 8 x 66mm CHEM (Hot Smoke) rounds (four each Om2, Om3, HP 1 each). 8 x 66mm CHEM (Hot Smoke) rounds (Bo, HP 2).

Instruments and Electronics: Medium communicator with scrambler (Bo, 30 miles, HP 1). Searchlight (Om1F, 1 mile, HP 2, 1 kW). Telescope (TuF, x7, vision bonus +3/+5, HP 2). Two light amplifiers (BoF, TuF, HP 1 each). Navigation instruments (Bo, HP 4). Military GPS (Tu1, HP 1).

Miscellaneous Equipment: Full fire suppression system (Bo, HP 16). Bilge pump (Bo, HP 30, 1 kW). Winch (BoF, ST 53, 53 yards, HP 19, 0.265 kW).

Controls: Mechanical. *Crew Stations:* "Driver" operates maneuver controls and one light amplifier, "Commander" operates radio, navigation instruments, GPS and winch, "Gunner" operates AGL, HMG, decoy dischargers, searchlight, telescope and one light amplifier, all from roomy crew stations (Bo, HP 75 each). *Crew:* "Driver", "Commander", "Gunner". *Occupancy:* Short. *Passengers:* One. *Accommodations:* One roomy seat (Bo, HP 75).

Environmental Systems: NBC kit for four persons (Bo, HP 10, 1 kW).

Power and Fuel: 194 kW turbocharged standard diesel engine (Bo, uses 6.79 gph D, HP 50) powers drivetrain. Four 4,320 kW lead-acid batteries (Bo, HP 4 each) power other systems for 88 minutes, recharged by engine. 70 gallon tank (Bo, HP 30). 70 gallons of diesel (fire on 9) last for 10 hours 18 minutes.

Access, Cargo and Empty Space: 32.44 cf access space (Bo), 20 cf cargo space (Bo), 96.08 cf empty space (Bo), 11.54 cf empty space (Tu).

Volume: Bo 600 cf, Wh 120 cf, Om1 0.2 cf, Om2-Om3 0.41 cf each, Tu 20 cf.

Area: Bo 500 sf, Wh 150 sf, Om1 2.5 sf, Om2-Om3 4 each, Tu 50 sf, structural area 700 sf, total area 710.5 sf.

Structure: Heavy, cheap frame.

Hit Points: Bo 1,500, Wh 225 each, Om1 5, Om2-Om3 8 each, Tu 150.

Special Structural Options: Heavy compartmentalization in Bo. Improved suspension. Improved brakes.

Body Armor: BoF, BoB, BoR, BoL PD 5, DR 75 expensive composite exo-armor over DR 45 expensive metal armor and DR 10 non-rigid armor. BoT, BoU PD 4, DR 30 expensive metal armor and DR 10 non-rigid armor.

Wheel Armor: PD 4, DR 20 expensive armor (tires have PD 2, DR 3).

Turret Armor: TuF PD 6, DR 100 expensive composite exo-armor over DR 60 expensive metal armor and DR 10 non-rigid armor. TuB, TuR, TuL PD 4, DR 50 expensive composite exo-armor over DR 30 expensive metal armor and DR 10 non-rigid armor. TuT PD 4, DR 30 expensive metal armor and DR 10 non-rigid armor.

Surface Features: Sealed. Camouflage paint job. Modest IR-cloaking (-2 to detection). Modest sound baffling (-2 to detection). Puncture-resistant tires. Hitch.

Vision: Poor.

Details: Two hatches on body top, three doors in sides (right, left, back), one hatch on turret top, intercoms, headlights and running lights, no keys.

Statistics: Empty weight 27,587.58 lbs. Fuel 420 lbs. Ammo 803.2 lbs. Crew and cargo 1,200 lbs. Loaded weight 30,010.78 lbs. (15.01 tons). Volume 741.02 cf, size modifier +4. Price \$407,621. HT 12.

Ground Performance: Speed 65 mph. gAccel 3 mph/s. gDecel 15 mph/s. gMR 0.75. gSR 5. High GP, off-road speed 1/4. Fords 5 feet.

GURPS-ification Notes

As usual, there were some problems with the translation of real-world data into the *Vehicles* system. No major new rules were needed this time, but some things should be mentioned.

Real life doesn't follow neat TL boundaries, which is the reason why two vehicles are labeled TL6/7. *Vehicles* makes all-wheel steering TL7, but it was already available in the 1920s. Some tires one might call puncture-resistant were available before 1945 as well.

Vehicles doesn't cover a central tire inflation system, which was subsumed under the effects of off-road wheels, improved suspension, or puncture-resistant tires.

GURPS Mecha introduced exo-armor husks: a removable outer layer of armor plates. This was used in the M1117 ASV, even if it has no explosive bolts to shed it.

There are no small-arms incendiary and tracer rounds in **Vehicles**. Pure AP loads are listed, instead of AP, API, and AP-T.

In **Vehicles**, a crew station is placed either in the turret or the body of the vehicle, neither of which accurately reflects the design of small turrets in armored cars. For these designs, empty space was put into the turrets and the crew into the body. The "empty" space in the turret is actually used by crewmembers if they operate their guns.

GURPS Traveller Ground Forces introduced modest emission cloaking (which was reverse-engineered to create modest IR-cloaking) and modest sound baffling. This was used in the M1117 ASV.

Armored Car Weaponry

Generic versions of some of the weapons are described on p. VE43, but new listings for the specific models are included; the rules in **Vehicles** allow for some adjustments to reflect real numbers. This wasn't always enough, and it is noted where the differences between **Vehicles** and the real world became substantial.

Hunting The Griffins

Hunting Infiltrators In The Bulge And Elsewhere

by Michele Armellini

Every roleplayer having a taste for wartime adventures also tends to prefer special operations, where his character can be an independent-minded, highly skilled commando. This one-shot Adventure Pizza, however, will present players with an unusual flavor: the underdog hunting the *Übermensch*.

The Historical Recipe

The history of the battle of the Bulge is known, and Operation Greif (Griffin) received an extensive treatment in books and films¹. This operation was carried out by small German units from SS-Ostufaf. (Lt.Col.) Otto Skorzeny's Panzerbrigade 150, outfitted with American uniforms, equipments, and dogtags, and capable of speaking passable English². These units slipped beyond the lines right after the initial attacks, and made the American rear areas insecure. Some of them were just out to wreak general havoc, others had specific reconnaissance tasks or were to secure key objectives (like bridges over the Meuse). The commandos travelled on captured 2½-ton trucks or jeeps, while the actually armored part of the Brigade had ordinary German armor but also some captured Shermans, and even a few Panthers "disguised" as American M-10 TDs! A third element of the operation was a paratroop.

Apparently, Hitler had confidence in this plan, while German commanders in the field did not expect much, with the possible exception of the officer Skorzeny's task should have supported most, Jochen Peiper³. The commandos achieved little, from a practical point of view, even though at times whole regiments were misdirected by their tricks. Also, they were quite easily identified when challenged. It's easy to suspect that some of them just tried to stay out of harm's way, waiting for friendlies to catch up⁴, which is understandable when considering that by their disguise they forfeited the protection of the Geneva Convention.

However, they were successful in one thing: creating confusion, suspicion and chaos; as the word spread around that a G.I. uniform was no guarantee, American soldiers spent a great deal of time checking each other⁵. Everybody knows that, rather than relying on passwords and documents, M.P.s would ask questions dealing with baseball results, Presidents' names, and other background details that a true American would know.

Overall, Operation Greif wasn't a success. But for a few days, every smiling guy you met on those roads, wearing an uniform much like your own, and speaking your own language, could well be a treacherous enemy, either bent on his devilish plans if he fooled you, or ready to spray you with SMG fire if he didn't . . . a stimulating RPG setting.

Starters

The GM can take the ingredients for the starters straight out of the template chapter of *GURPS WWII*. One of the characters is a seasoned Military Police Corporal (see below), who should go to the most experienced player, while the GM (or players) may choose the others.

It's December 17th. All the PCs are withdrawing in a hurry over the snow-covered country roads, somewhere west of the Our river. A couple of them have been separated from their units, others are with their squad/platoon, on trucks or jeeps. For extra detail, the GM (or players) can concoct hard-luck stories for each of them; the common ingredient is that the Germans' surprise attacks either outflanked or overran the heroes' units. Most of them will be from the 28th "Keystone" (or "Bloody Bucket") Division, and of these, most will be from Pennsylvania.

As the ragbag column reaches a crossroads, they are stopped at a M.P. checkpoint. The M.P. watchdogs seem to be growing impatient with the men of the first 2½-ton truck in the makeshift convoy (see p. W107). Suddenly, the unmistakable noise of incoming rockets is heard. A single explosion throws up blackened snow, not far from the crossroads. Those who fail a roll against Soldier+2 might remain aboard . . . but the others will scramble to the muddy ditch or other cover. As they do so, the soldiers see that, inconceivably, the crew of the first truck at the checkpoint level their guns and fire at the M.P.s! There is a short outburst of fire at the crossroads as the truck sprints away; then, the deafening fire from a Nebelwerfer battery arrives.

When the debris settles, only the heroes are alive and well.

Main Course

The PCs can now rally. The M.P. Corporal is the only survivor of his detachment, and he'll relay to the others that the captain in that truck had a strange accent. Since the players will know the background, they won't take long to understand what happened.

These survivors have to decide what to do. A roll against Tactics+2 should help them prioritize their choices:

- Warning the nearest HQ about these infiltrators is the top priority, and should be implemented in any case;
- Retreating further West is sensible;
- Pursuing those bloody Krauts is possible and truly gung-ho;
- Setting up an ambush or roadblock is unhealthy but, historically, a brave choice that was often made even by such small and makeshift outfits⁶.

It would be a good idea to get a functioning set of wheels. This can be made easy, difficult, or impossible (as most of the vehicles are now wrecks, and maybe the only repairable jeep is bumper-to-bumper with smoking hulks). If the survivors think of it, some of them might rummage through the less-damaged vehicles (and they might find something interesting such as a bazooka or demolition charges), while others take care of the jeep (changing tires and repairing minor problems, roll against Mechanic). For hard realism, the PCs should decide what to do with the wounded. A tough decision, as they can't treat them properly, nor transport them. For a softer version, there are no wounded!

Now the players will largely be in control of what the PCs will do. Given the situation (the military euphemism would be "fluid"), anything could happen. Starting with the options above, let them wander along muddy country roads and through gloomy forests, have small clashes with aggressive recon elements, meet panicked stragglers withdrawing West and sullenly determined soldiers ready to make a stand.

Every time they meet a small group of friendlies, the players should never be sure whether they really *are* friendlies. As the strain of combat and of an impending defeat takes its toll, men nervously fumble with their weapons, say strange things, or just look suspicious. Are they tired Americans or treacherous Germans?

For realism, the GM could devise a way to give the players a clue. Maybe they meet some G.I. that, when questioned, will recall that truck, and the directions those boys asked him for . . . about some bridge to the west. The presence of a M.P. will allow the heroes to set up their own checkpoint if they believe they managed to identify the road the Germans are moving along. This will increase the number of interesting encounters (see the Side Salads options below).

But always, there will be the nagging feeling that the disguised Germans are ahead of the heroes. At crossroads, the posts have no arrows. If the players decide to look for a HQ, the first they find is in shambles: the personnel slaughtered (some of them in cold blood), the radios destroyed. If they decide to set up an ambush, they should survive it and then reel back to the task of hunting the griffins. They'll have a trail of blood and chaos leading up to a key bridge, where the final showdown can take place.

Side Salads

To complement the main course:

- **Mortars Are The True Killers . . .** -- The crossroads clearly came under observed fire (roll against Soldier+2 to realize that). If the PCs spend too much time there (failed roll against Tactics), or their activities are too obvious (failed roll against Stealth), the enemy forward observer could call down some more fire! Of course the soldiers could in turn hunt that FO . . . but if he's this close, so is the front line.
- **. . . But Panzers Are Scarier** -- For a truly frightening encounter, field German armor (p. W103-104 or *Pyramid* article "[Heavy Metal: Four 20th Century Tanks for GURPS](#)"). The PCs will hear them coming, and if they don't fail their rolls (Stealth and/or Camouflage and/or Tactics) they should be able to slip away unnoticed by the clanking monsters -- but on foot, rather than with a highly noticeable vehicle. On the other hand, if they are Overconfident, Impulsive, Fanatical, or just seething for a fight, they might try and use that bazooka.
- **Did You Want To Live Forever?** -- Officers wanting to make a stand will always have uses for more rifles. As the heroes reach yet another crossroads, a Captain orders them to join his delaying action. Time for using those social skills and Fast-Talk their way through. Unless, of course, the players *want* to join in. In this case, the first clash won't be against tanks, but against bunches of mud-covered, weary, wiry youngsters with little training but plenty of grenades.
- **Question Time** -- If the soldiers set up their own checkpoint, the players will probably remember the anecdotes and start asking questions about baseball players and American League results. This can be funny for some time. Then, as nobody trusts anybody, *they* will be asked questions by those they meet. If there are mistakes on both sides, quite a tense situation can arise -- between two all-American teams!
- **Arresting the Colonel** -- No less than Gen. Omar Bradley⁷ was detained for some time (having said that Springfield is the capital of Illinois -- the M.P.s said it was Chicago). Without getting this high, the heroes could be put into a position of trying to arrest some harried and bad-tempered Colonel . . .
- **All Lines Are Busy** -- Just as that Captain wanted to commandeer the party, the heroes might want to find some help. Unfortunately, HQs at first don't listen to them, then answer that there are too many reports like theirs. Similarly, they run into all kinds of SNAFU, while everybody is busy on their own errands. An artillery Lieutenant tries to requisition their vehicle, a M.P. Sergeant orders them to leave the road free while another wants to send them to Bastogne, nobody has fuel, food, or ammo for them, and so on. They'll need Savoir-Faire (Military), Scrounging, maybe Administration, Acting, Intimidation, Diplomacy.
- **And Don't Forget The Weather** -- Environmental conditions shouldn't be underestimated. Freezing temperatures at night, snow and drizzle, muddy, rutted roads, a confusing landscape glimpsed through the fog. Here the skills needed are Survival (Woodlands), Driving, Orienteering, and if the vehicle breaks down, Mechanic (or Hiking!).

Extra Spice?

- The Germans' task is to *secure* a bridge. When the heroes arrive there, not only have they removed the demolition charges prepared by engineers, they have also convinced a small garrison that the bridge must stand, because destroying it would cut off an entire division. So, unwary Americans are now ready to fight side by side with these scoundrels. The German officer speaks very fluent English with a Yankee accent, and he'll accuse the party of being disguised Germans!
- Every PC comes from a different unit. They don't know each other. Obviously this scenario has potential: who says one of the PCs isn't actually *one of them*? The slightest hint will let the GM develop that wonderful enemy-within-paranoia. For a double bluff, a PC could have a German-American background, a family name like Schmidt, possibly something wrong in his papers, and yet be loyal -- but the others won't trust him a lot!

Dessert

The showdown should feature the defeat of at least one infiltrator team. If the PCs catch up with them at the bridge, the GM can prepare a detailed setting beforehand and have all kinds of American ordnance ready (a retreating unit discarded a perfectly functioning [*insert players' preferred toy here*]).

You could also have a final chase along one of those tortuous, muddy roads, littered with bomb craters, abandoned vehicles, slow-moving ambulances, fleeing civilians on foot and carts, unexploded bombs. See pp. VE143-152 (and the sidebar on p. VE151, in particular!), and/or pp. W150-156; also, the chase rules in *GURPS Cops* (p. 84).

Or, especially if the Germans are encamped near to unwary Americans (see the Extra Spice option #1), the PCs might use some of the commando tricks on the commandos! They might ambush, employ sudden, accurate sniper fire, or sneaking up on them at night for bayonet work. This last idea is risky if the commandos are worth their salt.

The heroes could also fail. Failure may mean death; these are one-shot characters, so don't be shy about it. Or, the PCs might blunder so badly they never see the commandos again. In this case, have them wander uselessly through the wilderness for a few days, shot up, half-starved and frost-bitten, pick them up by means of some stern M.P. detail, and return them to their units in shame and under allegations of desertion. The GM may then debrief the players and help them understand their mistakes!

Alternate Menus

While this adventure is designed for a specific setting, the GM can use these ingredients elsewhere, and elsewhere.

First sift out the basic ingredients:

- **The situation:** an overwhelming enemy attack against a force now on the verge of defeat, extreme environmental conditions, and an enemy that uses both conventional threats and a deceitful, mimetic approach
- **The party:** a haphazard bunch of strangers with one cop-like guy
- **The main enemy:** ruthless, treacherous scumbags who have your own uniforms and equipments, speak your own language more or less well, but lack the needed cultural background.

What other settings can the GM use this recipe in?

- **Elsewhere in WWII.** Mistakes and friendly fire (or no fire on foes) were common in the Desert War, where everyone used everyone else's vehicles. LRDG men tended to use Bedouin garb rather than enemy uniforms, but that's a disguise too, and at night their officers would try with language tricks. On the Eastern Front, there is another, less known Skorzeny stunt: a deep-penetration drop (by means of the Condors of KG 200) of four Jagdkommando Gruppen. The officers were ethnic Germans from the Baltic and the soldiers Russian volunteers (ex-POWs and deserters). The mission was a failure, and details are vague -- but that's a plus from a certain point of view! Plus most players have never played the role of NKVD officers.
- **At Lower TLs.** Uniforms are less formalized or non-existent, identification systems primitive, and treachery a favored tradition. Common cultural background isn't necessarily a touchstone, because armies often are actually made up of semi-independent tribal or feudal entities: barons will change sides, and one can't expect a Legionary in the Teutoburger Forest to be able to distinguish between allied and enemy tribes. In a Fantasy setting you may have the ultimate infiltrators: Doppelgänger, weres, shapeshifters, or wizards! In a Martial Arts campaign, Skorzeny is (of course) a master ninja.
- **At TL7 or 8.** GMs should take a look at *GURPS Special Ops*; when there is a high Acting skill level in the templates, and a mention of foreign language courses on pp. SO56-57, that's the opposition (that would be, for instance, the Delta Force or the KGB Special Troops -- bad news for PCs!). The KGB, in particular, was rumored to have standing plans for high-level infiltrations and assassinations at the very core of NATO HQs, hours before the war that never was. These would have required perfect documents and flawless acting; if the PCs are the guards on duty, they'll have a tough task. There are also have a lot of minor, dirty wars to choose from at these TLs.
- **At higher TLs.** Uniforms (including company dress for Cyberpunk settings) are common and identification systems sophisticated -- but so are countermeasures, hacking and forgeries. Chips and interfaces solve both the linguistic and the cultural problems. Android robots, brainwashed drones and trained clones all make for extremely dangerous infiltrators. For an alternate history/time travel campaign (for *GURPS Time Travel*), the commandos might be under a double disguise: they aren't Germans, they're Centrum or Stopwatch agents! And their mission is to kill Ike (so he won't be a President!). The PCs can either be uninformed local inhabitants

(such as M.P.s on duty with SHAEF, and their task will be daunting), or I-Cops or Timepiece agents. Note that in this setting, that battered 2½-ton truck can be a wondrous vehicle and a mobile parachronic conveyor too!

Serving Suggestions

There should be a good mix of characters: at least a grunt rifleman, maybe a rookie Lieutenant, and an engineer would be useful. As to the selection of advantages and disadvantages, bear in mind that, in keeping with the hallowed war film traditions, this should be a smorgasbord -- let the PCs have different motives and contrasting traits. Typically, there could be an idealistic hero wannabe (maybe the Lieutenant), a cautious good-for-nothing, a "kill-the-Krauts" hot head, and some ordinary workmanlike soldiers. Or there could be different, but less clichéd characters. Regardless, having variety will encourage active roleplaying within the group.

If the group does have a Lieutenant or Sergeant, there may be the command issue. The GM should try exploiting it as an additional roleplaying tool, rather than being bound by it; the GM should give the Lieutenant character to the right player. If, nevertheless, he wants to order the other players around, the GM may create a situation where the Lieutenant's inexperience becomes embarrassingly evident, and encourage the Corporal to offer "suggestions."

If it seems the players will need added motivation, one or more of the heroes should have a buddy (all soldiers tended to have a foxhole buddy who'd be exactly a **GURPS** Ally) . . . and he gets killed in the opening scene.

Don't forget the players are likely to grasp what's happening faster than their real counterparts, because of their own "intelligence officer" General Hindsight. While it's possible to enforce rolls against IQ or specific skills if the GM wants to limit that effect, it could also be considered as part of the fun. The GM shouldn't be afraid if one of the players has read all the books about this battle. The ingredients above are designed to be typical in flavor but generic enough to avoid too many details (and the inevitably attached problems). But above all, this is the GM's show; if the history buff says "this isn't realistic!", the GM can counter with, "It's uncommon, but it happened . . . this time." (Or ". . . on this planet." The players can really be thrown off-balance with that! How do they know this *isn't* an alternate Earth?). And since the players (and characters) are likely to never know exactly where they are, the GM doesn't need to worry about accurate geographic details: It's "a crossroads somewhere near St. Vith" or "a hamlet, with no traffic signs, and the grunts garrisoning it can't agree on the name," or "the platoon's jester called it Frozen Meat Ridge, and the name stuck."

The GM should keep things moving. If the heroes are slacking or the players are getting less interested, have everyone make a Hearing roll. Engines and tank tracks in the distance!

A Ready-Made Military Police Corporal

[Total Points: 100]

ST 12 [20]; **DX** 12 [20]; **IQ** 11 [10]; **HT** 12 [20].

[Total: 70].

Advantages: Acute Vision +1 [2]; Fit [5]; Legal Enforcement Powers 10 [10]; Military Rank 1 [5]; Strong Will +2 [8]. [Total: 30].

Disadvantages: Bad Temper [-10]; Duty (on 15 or less) [-15]; Honesty [-10]; Reputation -2 (rear-echelon man and M.P. watchdog, from frontline soldiers) [-5]. [Total: -40].

Skills: Administration-9 [½]; Armoury (small arms)-10 [1]; Brawling-14 [4]; Camouflage-11 [1]; Climbing-11 [1]; Driving (automobile)-12 [2]; First-Aid-10 [½]; Gambling-10 [1]; Guns (pistol)-13* [1]; Guns (rifle)-13* [1]; Hiking-10 [1]; Intimidation-12 [4]; Knife-12 [1]; Law (military law/regulations)-9 [1]; Leadership-9 [½]; Motorcycle-11 [½]; Orienteering-10 [1]; Savoir-Faire (military)-10 [½]; Shortsword/Club-14 [8]; Soldier-12 [4]; Spear-10 [½]; Stealth-11 [1]; Streetwise-11 [2]; Survival (woodlands)-9 [½]; Tactics (M.P.)-9 [1].

Languages: English-11 [0]; French-9 [½].

[Total: 40].

* +1 Bonus due to IQ.

The Legal Enforcement Powers are worth 10 points because they are (in practice) less clearly defined and limited than those of an ordinary policeman. M.P.s did not enjoy a good reputation with front troops. Duty is exacting but not "Extremely Hazardous," as a rule (in this adventure it will be!).

The Corporal still remembers something from his basic training and may have had some combat experience. Note how he's geared towards breaking up an unarmed brawl, and to prevent troubles by sheer intimidation. He's got a smattering of police-like skills, and those suitable for his rank. The character creation chapters of *GURPS WWII* and *GURPS Cops* were used.

Pyramid Pick

Kingdoms of Kalamar Player's Guide

Published by [Kenzer & Company](#)

Written by Lloyd Brown III, Brian Jelke, David S. Kenzer, Noah Kolman, Don Morgan, Mark Plemmons

272 b&w pages; \$29.95

I admit that the advertisements for the *Player's Guide* had me cracking up. Imagine a company claiming that quality and cross compatibility are assured because the product is an officially licensed *Dungeons & Dragons* book. Even more humorous to me was the "Rulebook IV" on the cover. With those two factors in mind, I already felt doubtful about how useful a campaign specific book would be based on the marketing alone.

Imagine my surprise when I discover that a good chunk of the book is indeed easily compatible with any setting, and that the whole book is a top-notch product. Broken up into twelve chapters with six appendices and an index, the *Player's Guide* is a tour de force on how to write a supplement.

While chapter one, Races, isn't going to be everyone's cup of tea due to it being specific to Kalamar, it does provide some new material as well as variants that have no increase in base levels. For example, if you ever wanted to play a hobgoblin or half-hobgoblin and found the *Slayer's Guide* a bit lacking, this chapter has you covered. The other races of Tellene, like dark elves, deep gnomes, and golden Halflings, are detailed with fewer powers, making them standard characters instead of characters whose base race makes them a higher level. Each race starts off with a brief introduction, a little fiction, personality, physical description, relations, alignment, lands, religion, language, adventurers and racial traits.

In addition to the non-human races, the human races of Tellene are also covered, providing no stat bonuses or special abilities but rather physical descriptions and roleplaying notes to differentiate humans from one another. The chapter ends with a touch of 1st edition charm, in the form of tables for: random starting ages (based on race and class), aging effects, random height and weight for all races, and a massive list of names for players to scavenge through.

Chapter two, Classes, covers how the standard classes from the core rules, including the *Psionics Handbook*, fit into the setting. (The monk class is accidentally omitted, though.) Also included are deity domains, missing from the core *Kingdoms of Kalamar* book but available as a download from Kenzer & Company's website. It also does something that I personally feel too few supplements do: It introduces new classes. These include:

- **Gladiator:** Warriors who specialize in fighting to appease the masses.
- **Basiran Dancer:** A specialized bard that uses spells and swords to make their point.
- **Brigand:** A combination between rogue and fighter, similar to *Rolemaster's* Rogue profession.
- **Infiltrator:** A rogue variant with some wilderness survival abilities.
- **Shaman:** A divine spellcaster who relies on spirits to cast their spells and power their special abilities.
- **Spellsinger:** A caster who uses song to cast spells, forgoing somatic components but always needing verbal ones.

Chapter Three, Prestige Classes, introduces:

- **Alliance Merchant:** A Prestige Class that specializes in the buying and selling of items with various special abilities to reflect this talent.

- **Bounty Hunter:** Similar to a ranger in hunting skills but with a few special abilities that let him find his foes and bring them back alive.
- **Mariner:** A warrior specialized with skills and abilities that enable her to thrive in water-based environments.
- **Golem Master:** A spellcaster who has an easier time of crafting constructs of all types.
- **Muse:** A bard variant that works to help others craft new art by providing inspiration.
- **Order of the Slayer:** A warrior-based hunter of the undead with limited spell-casting ability.
- **Restorer:** Hobgoblins that seek to restore Kruk-Ma-Kali, a hobgoblin nation.
- **Sentinels of Providence:** Warriors that battle creatures not native to Tellene, like demons, devils, and other Outsiders.
- **Slaver:** Individuals with the ability to control slaves by crushing their spirits.
- **Vessels of Man:** Anti-Clerics whose spellcasting abilities are used to put clerics to the torch.
- **Warlord:** A fighter variant whose special abilities help him lead armies into victory.

Some of these Prestige Classes are definitely meant for NPC or heavy roleplaying use. Others, while tied into specific societies (like the Restorer) have enough goodies that they can be lifted almost whole cloth and put into other settings.

Chapter Four, Skills, provides the GM with new uses for old skills, as well as massive amounts of examples for skills like Craft, Knowledge, and Profession. Perhaps one of the most widely used skills would be Craft: Poisonmaking, which has its own table including the name of the poison, the type, the DC to Create, and the Market Price. New uses for old skills including using the Heal ability to inflict extra damage based off of an increased understanding of how the body functions.

Chapter Five, Feats, provides a massive number of feats for almost any campaign. While a few are similar to region feats from the *Forgotten Realms* campaign setting in that they should be taken by only a specific type of character or at first level, many are universal and should be easy to port to any setting. One page breaks down the feats into the different types -- class, general, metamagic -- with the prerequisite. Many of the feats are combat-based, with only a few being of the dreaded +2 bonus to two similar skills.

Chapter Six, Religion, is one very specific to the Kalamar setting, and provides the GM information on the gods of Kalamar. This includes the non-human names for the gods, a table that breaks down each god and provides alignment, weapon, symbol and divine focus. The weapon is important to note for those casting spiritual weapon. Because this is an official product, there is even a god conversion for standard *D&D* and *Forgotten Realms* gods to Kalamar. Commonly worshipped gods by class is also provided, but missing the monk. (Use the Powermaster listing instead.) Most of this chapter is taken up by Canons, the official books that detail the words of the gods. These canons provide the GM with some insight as to what the goals of the church and the god are, and are great for augmenting roleplaying possibilities. Another table breaks up the information by providing the deity, the priesthood name, the church's name, the canon's name, and when the cleric's spells are restored.

Chapter Seven, Equipment, provides new alchemical mixtures, herbal concoctions, poisons, weapons, armor, and information on buying/selling slaves. New armor includes soft leather, cord, wooden breastplates, briandine, lamellar, and shrike (spiked) variants, while new weapons include choppers, dueling swords and leaf blade, along with several different types of arrows and knives. All of this information should be easy to port to another campaign setting and meshes well with established examples.

Chapter Eight, Combat, has fighting schools. These schools don't provide new benefits or abilities as the fighting styles in Mongoose's Quintessential Fighter did, but instead lists the background of the school, commonly taught feats and skills. Information on different infantry schools are also provided, giving the GM a breakdown of feats and the order in which they are acquired to provide some variant among the different countries.

Chapter Nine, Adventuring, gives the GM information on various aspects of the Kalamar world. Native diseases are detailed, including The Blue Death, the Dancing Death, and The Rotting Flesh. Each disease is broken down by where is the disease found, how is it contracted, who carries it, the different stages, and the game effects. Information on advancing through society -- either through the ranks of nobility or through the clergy -- are also provided. The Temple Rank ideas are different because they require specific things, like knowledge skills, spellcasting ability, and the

sacrifice of experience points to reach different levels. Each stage provides different benefits. The chapter ends with some brief information on Sainthood. Unfortunately, you have to be dead to be a saint and there aren't enough examples provided on previous saints to use this information quickly. Worse still (in my mind), I keep comparing this small section to the old *Dragon* article with various abilities for Saints and find this tiny section a little lacking.

Chapter Ten, Magic, starts off with a whole host of abilities for those who can channel their cleric turning energy in other ways. Each church has a different channeling ability which is broken down in a table and detailed in the text. More interesting, though, is the section Divine Right of Kings. Rulers gain special abilities based on their social level in the belief that the gods support the nobility . . . sometimes in exchange for the nobility pledging allegiance to the gods, other times merely at the gods whim.

Chapter Eleven, Spells, provides the GM with famous spellcaster equivalents for the famous D&D Circle of Eight. Bigby becomes Koal, while Evard becomes Alaki, and Mordenkainen becomes Dorama, etc... Another nice touch for being an official product and something not done too often in official products.

The new spells are listed at first by class, level, and alphabetically. Domains are listed with several reprints from *Forgotten Realms* and *Defenders of the Faith*, updated for the Kalamar setting, as well as eight new domains. Information from the *Player's Handbook* is minimal, only including the deity and granted power, while information from the optional books includes the actual spell listing as well. The spells, when listed, are listed in straight alphabetical order and range from granting certain feats like Ambidexterity to standard various damaging spells like Skay's Flaming Bolt, which creates a ray of heat.

Chapter Twelve, Magic Items, has new armor and shield special abilities, as well as new weapon special abilities, and specific items from each field. Items includes the means to make them. Other magic items, like potions, rings, rods, staves, and wondrous items are also included, along with cursed items plus minor and major artifacts.

The Appendices start with references showing that quite a bit of material is reprinted from other sources, including *Defenders of the Faith*, the *Forgotten Realms* book, *Song and Silence*, *Masters of the Wild*, *Sword and Fist*, *Player's Handbook*, and even the official *Dungeons & Dragons* website.

The Glossary is seven pages long and provides the player with almost any information at a glance that he would need.

The Place of Origin Table is broken down by race and location, and actually appears to use a 1d10,000 die for determining your home town.

One of the things I liked best is the Feats Table. The list includes the name, type, source, prerequisite, and description. This is a massive listing, a full thirteen pages, and includes material from all official sources including various issues of *Dragon* magazine and the web site. Even *Oriental Adventures* doesn't escape the listing. There is also a *Kingdoms of Kalamar* character sheet that includes skills from this book and the *Psionics Handbook*.

Another highly useful collection of data is the Spell Planner. This lists each spellcasting class from the prestige classes found in the *Dungeon Masters Guide*, and the *Kingdoms of Kalamar Players' Guide*, to the core classes. This lists includes a check box for memorized, spell level, spell name, type, components, casting time, range, target/effect, duration, saving throw, SR, and source. This 27-page reference includes a list of abbreviations and reference source information to insure that the user should have no problem with it. It might be a little difficult to copy this information with a photocopier, however, so hopefully these will become available as .pdf downloads.

The book ends with a ten page index that makes maneuvering around the book a breeze.

The book is filled with impressive black-and-white illustrations. These help the reader see how the prestige classes might look, how the half-hobgoblins appear, and how different spells look when employed.

I don't like the fact that there is a lot of reprinted information in terms of spells, feats, skills, and domains, but overall it's a rather small percentage. The lack of information on using the monk class in Kalamar is pretty complete -- from using monks to who monks worship -- but hopefully this will be corrected via a web update.

Based on the book's size, its vast amount of non-campaign specific content, and its easy-to-use reference guides for feats and spells, this book should be on every fantasy *d20* player and Game Master's shelf.

Captain Park's Imaginary Polar Expedition

Published by [Cheapass Games](#)

Designed by James Ernest

4 board sections, 90 cards, and rule book; \$7.50

In Cheapass Games' latest board game, *Captain Park's Imaginary Polar Expedition*, players are members of the London Professional Gentlemen's Club who are in on a little secret concerning the club's most popular member: Captain Park never actually went to the South Pole. Instead, he simply hid out in London, bought a few strange objects he claimed were from his journeys, then when the time was ripe, returned to the club to claim fame and glory. Rather than turn the old man in as a liar, the players have decided to do the same thing.

Like so many of James Ernest's creations, Captain Park combines simple and challenging game play with a great sense of humor, forming another inexpensive winner.

As is tradition for Cheapass Games, the components are printed in black and white on acceptably sturdy cardstock. The artwork appears to be public domain clip art; no artist is named. Players will need two pawns plus one pawn for each person, counters, and a pad of paper for scoring.

The game board represents a map of London with locations that allow players to pick up cards, play cards, and score those cards. The cards contain Photos, Facts, Anecdotes, and Heroes, all of which players use to build the tale of their false journeys. Each card also has an amusing description that slows the first few games as everyone giggles at their hands. For example, the photograph of the Giant Snake explains, "Do not be confounded by the scale implied in this photograph. This snake was nearly a hundred feet long. It is also common for the pencils of the region to weigh nearly a ton."

On each turn, a player moves his pawn one space on the map. If he is on a Café, he can pick up a new card, which ends his turn. If he is in a location matching a card in his hand, he can play that card in front of himself. By playing a card, he immediately get another turn, meaning players can set up chains of multiple turns to lay down a number of cards. If the player is in the London Professional Gentlemen's Club, they can score all of the cards they have played.

Of course, nothing is ever this easy. The first complication is that players must stay away from the Club long enough to make their tale seem true. Each turn, players take a counter that represents a month of hiding. Once they have seven month counters they are allowed to return to the Club. (The number of months required declines with more players.) Players lose their month counters, however, if they run into Captain Park.

Captain Park has heard about the players' plans to copy his success and is out to spot them in London. A pawn on the board represents Park and it moves from numbered space to numbered space each time any player plays a card. If Park lands on the same space as a player, that player loses all of his counters. Players must think ahead to be sure that Park does not hit them even on other players' turns.

When players enter the Gentlemen's Club, they have to declare the exotic location of their journey, either the South Pole, China, Everest, Africa, or the Amazon. Every card has a score for some or all of these trips. For example, the Anecdote "Tale of Icy Death" is worth points for the South Pole and Everest, but not for the other locations. To compute a score, players choose a location and add up all of the matching scores on the cards in front of them. There are bonus points for being one of the first three to claim a location, for being gone for a long time, for having a variety of cards, and for choosing the randomly determined "fad" location. Whichever player reaches 200 points first wins.

(The number of points declines with more players.)

Some players have complained that the scoring system is too complicated and that it slows the game. Keeping the rules sheet handy for the first few games, however, will alleviate this problem. Eventually, at least a few players will have the rules memorized and can quickly tally points.

While the game has two obvious challenges -- avoiding Captain Park and playing lots of cards -- it has a long-term strategy as well. Players need to decide if they will make numerous short trips to try and take as many bonus points as possible, or make one or two prolonged sojourns in an effort to score many cards at once. Each has advantages and disadvantages, and judging between them requires some thought.

One of the most impressive aspects of the game is how tightly integrated its theme is with its rules. When teaching the game to others, it's smart to begin with the Captain Park story because it makes the rules easier to remember. For example, "You can not claim to be on a trip if Captain Park has seen you recently" is easier to remember than "You lose your counters if the large pawn lands in your space."

Captain Park's Imaginary Polar Expedition combines humor, strategy, and a bit of luck in a great package that teaches us it is okay to lie to achieve fame.

Pyramid Review

Metamorphosis Alpha Universe RPG

Published by [Fast Forward Entertainment](#)

Written by James M. Ward

64-page saddle stitched book; \$14.99

In the year of its silver jubilee, we are once again allowed to revisit one of the very first science fantasy RPGs: *Metamorphosis Alpha*. But then, there have been plenty of opportunities to pay the Starship Warden and its reiterations a visit over the last twenty-five years. *Metamorphosis Alpha* was originally released in 1976, before being superseded by the post-apocalyptic, Earth-set *Gamma World* in 1978. Another three editions followed, before culminating in the fourth edition sturdy paperback a decade ago, some of the rules for which show interesting similarities to *Dungeons & Dragons 3rd Edition*. Elements of the setting were also combined with first edition *Advanced Dungeons & Dragons* in 1980 in the well-known scenario, *S3: Expedition to the Barrier Peaks*. TSR then took a step backwards to the original source material with *From Metamorphosis Alpha to Omega*, a complete setting for the somewhat innovative *Amazing Engine* rules, before switching back to post-apocalyptic irradiated earth for one of the last releases for the *Alternity* system. This proved less-than-popular, as it excised several elements from the previous versions, most notably the mutated plants and animals. Finally, as an aside and to finish off the history lesson, it could be argued that *Skyrealms of Jorune* falls within the *Metamorphosis Alpha* family, as the original *Jorune* campaign was a *Metamorphosis Alpha* game.

Thus James M Ward's *Metamorphosis Alpha Universe* comes with something of a baggage train . . . so what does it do to set it apart from its predecessors? In the original, the players were denizens of the *Starship Warden*, a generation colony ship whose course took it into a deadly radiation cloud. They set out from their villages to explore what they would eventually learn to be a rather limited world. Classic "captive universe" stuff really, but turned on its head with a large dose of radiation, often to quite mad, not to say, silly effect. Ward reworks this setting by casting the *Warden* as a giant science ship tasked to determine the fate of the many vessels lost during Earth's colonization program. The first ship it found was the *Bonnie Brown*; as the *Warden* closed, disaster struck!

An invisible object collided with the ship, breaching the *Warden's* hull and flooding it with mutagenic radiation, killing any crew not in suspended animation, disrupting shipboard systems -- including the many controlling artificial intelligences -- and warping much of the remaining flora and fauna on board. In the radiation's wake came aliens to conquer the ship as they had the *Bonnie Brown*. It is into this situation that the player characters find themselves . . .

Metamorphosis Alpha Universe comes with a ready-to-play campaign timeline in three parts, each of which determines what the players create as their characters. In Phase One, they are the robots activated by the ship to deal with the emergency. In Phase Two, the robots' reports lead the ship's AI to activate vats that create androids to aid the robots in both repairing and defending the *Warden*. Finally, as the situation escalates, soldiers are cracked from cryonic freeze to deal with the problem in Phase Three. The first and second phases are meant to last just a session or two, as are both the robot and android characters themselves . . . but should any survive, the players have the option of keeping these or creating human characters. The bulk of a campaign will entail exploring the *Warden* and clearing it of the newly created and mutating menace. In the long term, it could extend to exploring the *Bonnie Brown* and the invisible asteroid the aliens have rammed into the *Warden*.

All three types of characters have five attributes or ability scores. Constitution, which encompasses health, strength and in some cases agility; dexterity, which includes reaction time and speed, as well as agility, but not actually dexterity as the rules are written; leadership potential; mental resistance, which also covers intelligence or at least problem solving

and which can be improved by resisting mental attacks! Finally there is radiation resistance. Hit points are determined by rolling a d6 per point of constitution. High ability scores provide luck points, which can be spent to modify or even re-roll dice thrown in the game, though no method is giving for regaining luck points once they are expended.

Robot characters are created by selecting a power system, body style, electronic brain, tools, programs, and a method of propulsion from lists provided. Most types of robots can be designed and a sample of each is given -- general purpose, forestry, farming, engineering, medical, and security -- but there is no example of actually designing one from the ground up. The other problem is that the samples given are more capable than the system design allows. This is intentional and it is difficult to see why players would design their own robot when a more powerful option is available and ready to play.

Android characters come in three flavors -- computer, companion, and worker models -- with a mutated third, the killer, only available as an NPC. After rolling abilities, a player selects their android's software and is ready to go. To create a human character, the stats are rolled and that is it . . . no skills or abilities, although should they fail a radiation resistance roll, they might gain a mutation, but then they would no longer be a pure strain human and might possibly not be recognized by the ship's systems.

In addition to the lack of skills in the game, the quick revival of the humans by the ship has left them all with amnesia. This might be reflected in the rules in that a human character's mental resistance begins at a ludicrously low level and makes them comparative idiots compared to the robot or android character. Humans *do* get a +3 on all physical and mental ability checks, but this is poor recompense.

The mechanics of *Metamorphosis Alpha Universe* are simple: Compare an ability score against a difficulty number on the "Doing Things Table," or indeed any of the tables in the book. This gives a target number, which the player needs to match or exceed in a roll of 3d6. As a guideline, if an ability score matches the difficulty number, a player needs to roll sixteen or above. Although there are plenty of modifiers available from programs and the like, it seems an unnecessarily difficult target to roll.

Likewise, combat uses the same roll. Every weapon has a class, which is cross-referenced with the target's Armor Class. This gives a target number, which again must be rolled equal to or over. Strangely, if the Weapon Class matches a target's Armor Class, that roll is just ten and over. For example, this might be fist, daggers or claws -- all WC21, against unadorned flesh, which is AC21. Meanwhile, a pistol (WC18) only needs to roll a 7 or more. PCs can actually improve their ability to use weapons by using those of a Weapon Class successfully ten times or more in combat. Having done so, they become talented and their actual WC with that class of weaponry improves. Thus combat is actually easier to do in *Metamorphosis Alpha Universe* than any other kind of action . . .

One final thing should be mentioned about combat, in particular about weapons. Very few of them aboard the Warden are reusable. Their scientific designers, ignorant about combat, considered it more ecologically sound to have weapons recycle themselves once out of ammunition. So imagine the scene: the player has just fired the twentieth shot from his prized laser rifle when it breaks down into a pile of dust. As a design feature this may be ecologically friendly, and in game terms it presents a big challenge to the players, but otherwise it is absurd . . . utterly and totally absurd. The GM may enjoy the look on the players' faces when it first happens, but it will almost certainly more than irritate the heck out of them. It's easy to imagine characters (and players) holding a deep abiding grudge to the idiot scientist who thought this one up.

Besides the equipment and weapon lists, there are tables for mutations and a bestiary. The latter provides a decent starting selection, but none of the classic creatures from any of the previous versions of the game appear here, nor do the aliens that appear during Phase Three of the game. Of course, if the referee does have access to almost any version of *Gamma World*, then they have a ready source for equipment and creatures of all kinds.

The campaign is quite well-supported, beginning with a description of the seventeen levels of the Warden, which is some fifty miles long, twenty-five wide, and eight-and-a-half deep. Aboard are the varied flora and fauna of Earth and Mars, plus some hundred thousand individual crew, most of which are in suspended animation. Each deck is described in enough detail that the GM has starting information to help him draw and populate each one. This includes what equipment can be found there, its roleplaying possibilities, and its status during all three phases. Getting around will

not be easy; in addition to dealing with radiation, mutated plants and animals, and AIs no longer quite-so-friendly, the characters are going to have to find the color bands that will allow them access to different areas of the ship. Besides the various level descriptions, a complete deck is mapped and detailed, both as an example and as a location ready to play.

Of course, one feature found in previous editions of the game is the "making things work" chart, here given as the "Item Complexity" chart. Every weapon or object has an IC or Item Complexity, ranging from IC1 for items such as batteries, color bands, and energy lamps, through IC4 (for, say, a land rover vehicle) to various alien devices at IC8 and above. Both player and GM need to both roleplay and roll-play the deductive process if the Item Complexity chart is to work as intended and everyone is to get some enjoyment from the process.

Physically, the problems for *Metamorphosis Alpha Universe* start with the cover and move inwards . . . the irritatingly familiar front cover seems to have little to do with the contents. The back cover simply lists the rules highlights, but gives absolutely no detail of what *Metamorphosis Alpha Universe* is actually about. Thus the potential purchaser has no way into the game, and unless they already know about either *Gamma World* or *Metamorphosis Alpha*, there is no hook to make them buy *Metamorphosis Alpha Universe*.

Inside the problems continue with slipshod layout . . . in particular, poor use of space and art. The interior illustrations are decent pencils, but too many are full page pictures that could have been cut to a quarter of the size and the resulting space used to better effect. Primary among the most pointless illustrations has to be that of a spilt box of grenades. The senseless nature of the image is further compounded when it is flipped left-to-right and used again with perhaps two thirds of a single column of text covering it over! Tighter editing would have also removed repeated text, and better management of the white space would have made the need to repeat the picture of the grenades unnecessary.

Additionally, the book could have made better use of the color on the front and back inside covers. On the inside back cover is an illustration of the control panel found in the Warden's central lift. This is a decent and fun handout, which will keep the players guessing as they try to work out what it actually means. Conversely, the inside of the front cover is used to no good effect; it shows only the cross section of the Starship *Warden*. While this may be a useful visual of the layout of the decks aboard the ship, it in no way gains any benefit from being printed in color; if it were printed in black and white in the book itself, something more worthwhile could have been put in its place; ideally, this would have been the map provided for the example deck, which had so obviously been created in color . . .

It is difficult to see what *Metamorphosis Alpha Universe's* target audience really is. Despite its intimations that it is suited for new referees, this does not really seem to be the case. The rules feel rough and incompatible with each other, and they lack the coherence that is both demanded of today's market and generally welcomed by the novice GM. The author claims to have taken steps to update both some of the rules and instructions for this twenty-fifth anniversary edition, but this does not seem evident in *Metamorphosis Alpha Universe*. More evident are the elements mentioned from the original *Metamorphosis Alpha* of 1976, which only serves to give this update a very antiquated feel.

Despite the problems in *Metamorphosis Alpha Universe* you could run this game, even using the rules provided . . . but combined with the necessary flipping back and forth between tables, it probably would not be as fast nor as fun as the author intended. Yet there is a saving grace to be found in *Metamorphosis Alpha Universe*, and that is the setting and the campaign structure (despite the need for the GM to map out the *Warden's* levels). If the GM wants to use the background but not the rules, there are plenty of options available. One is TSR's *Alternity* system, particularly if they have access to the *Gamma World* supplement for the game. Another is TSR's *Amazing Engine*, which is readily compatible with the core concepts in *Metamorphosis Alpha Universe* using *From Metamorphosis Alpha To Omega*. Further, since the humans in *Metamorphosis Alpha Universe* are amnesia-stricken soldiers, *Bug Hunters* would fit nicely . . . more so if the bug hunt makes it to the *Bonnie Brown*, the map and situation for which could be as bad as that described in *From Metamorphosis Alpha to Omega*. In addition, *Bug Hunters* would provide ready made aliens if a campaign extends to that stage. Alternatively, *GURPS* provides just about everything a GM might want to utilize aboard the *Warden*, starting with *Compendium I, Biotech, Robots, Psionics, Space, Low Tech, High Tech, Ultra Tech* and *Ultra Tech 2*.

It is such a shame that this twenty-fifth anniversary redesign of a gaming classic fails to live up to that claim. Had this not been the case, Metamorphosis Alpha Universe would be more than an expensive campaign resource. As such a resource, it has plenty of potential, but GMs will need to unhitch from the cumbersome rules.

--*Matthew Pook*

Red Sphere Rising

"Besides, many of the corpses had no visible injuries at all -- but the faces of the fallen were distorted with wild horror. This last feature especially bewildered the old, experienced front-line soldiers who had seen so much in their lives. None of them could recall a case when soldiers who had been killed in battle were found with such expressions on their faces."

-- Vladimir V. Rubtsov, "Domes of Wrath", *Fate* (Apr 2002)

A frozen battlefield suddenly lights up with a giant red ball, seemingly mocking the bloody flags of dueling genocides. Over a thousand German soldiers dead, as soundless explosions blast the life from their bodies while leaving the skin unmarked. Crimson spheres blossom over the Soviet Union, and dart through the dark corners of the next half century. Listen, if you will, for the funeral dirge, the low threatening hum, the flickering fugue that is the music of the spheres.

"The immense red dome shone fearfully over the forest, with its even, sinister red color, giving no flashes or noise. As far as I can recall, one could see slight fluctuations of red light -- as if there were some turbulence inside the hemisphere."

-- testimony of Malyshevsk resident Nikolay Kernozhitskiy on the red sphere sighting over Malyshevsk, August, 1947

As the Wehrmacht retreated from the disastrous overstretch of the Stalingrad campaign, unit cohesion broke down in the vast expanses of the southern steppe. Individual brigades or regiments took up positions where they could, hoping to build defensive "hedgehogs" that would rebuff the advancing Soviet armies. In January of 1943, one such unit apparently dug in on the low hills between Vyselki and Tikhoretsk in the Kuban basin -- and dug in well enough to ambush and decimate a Soviet infantry battalion on the night of January 29. The Red Army pushed back through the area on February 5, but found no Germans -- alive.

On the night of January 29, 1943, the citizens of the small collective farm of Chelbas saw an enormous fiery red sphere rise up out of the hills to the northeast where, unbeknownst to them, the German brigade was entrenched and fighting off the Soviets. It grew to almost a kilometer in diameter before breaking up and dissolving soundlessly. Three minutes later, a second, slightly smaller sphere appeared, slightly to the north of the first one. It, too, expanded and disappeared without noise or smoke. The next morning, a farmer looking for hay came upon the battlefield -- where every man in a one-kilometer diameter, German and Soviet alike, lay dead. Much of the German ammunition and grenades had spontaneously detonated on their bodies, but even the unmarked figures were frozen corpses. 1,350 Germans died that night, according to later estimates. The Red Army occupied the site a week later and buried the bodies -- and the incident.

In August of 1947, another red sphere just like the Kuban phenomenon (this one only half a kilometer across) appeared to the northeast of the village of Malyshevsk, deep in the Soviet Far East near the Amur River valley. It appeared for five or six minutes before the villagers fled inside in panic. There were no burn marks in the forest or on the taiga when investigators finally reached the area decades later -- but the townsfolk of Malyshevsk had all been moved to other locations in the Khabarovsk province.

"We heard a noise and we looked up, and saw a red light coming toward us over the trees. From our viewpoint, it looked to be about 100 feet high. It looked like it was setting itself up to land . . . There was no sound at all, we were almost hypnotized. Suddenly, the red light 'exploded.' The place was filled with all sorts of colors. I was blinded, then the colors died down and my eyesight returned. There was a machine there, right in front of us . . . there was a triangular shape there now, covered with pipes and valves, stuff like that."

-- testimony of Airman Larry Waters on the Rendlesham Forest sighting at Bentwaters AFB, December 27, 1980

The obvious explanation for the Kuban spheres is some sort of experimental artillery ordnance (possibly poison gas shells) detonated by accident during the firefight on the hills. If the Red Army confiscated the remaining ammunition (perhaps from the ammo dump at Tikhoretsk that they overran that week), secret tests of the haul might explain the Malyshevsk sightings of it as well. However, the absence of sound in both cases, as well as the peculiar lighting effect, makes the "secret ammunition" case somewhat difficult to sustain.

Unsavory Nazi ammo dumps also probably don't explain the numerous other "crimson sphere" and "red sphere" sightings that litter the UFOlogical record. From the "bloody suns" seen over medieval battlefields to the more pedantically documented "red moon" seen in Petworth, Sussex on August 11, 1855 and the "magnificent red object" observed by the astronomer Coggia in Marseilles on August 1, 1871, to the red spheres observed over Zurich in the summer of 1966, Thailand in October of 1996, Phoenix in March of 1997, and Calgary in March of 2001, the red spheres are everywhere. Some of the most seminal sightings in UFO literature include red spheres, including the Rendlesham Forest sighting in 1980, the Washington, D.C. flap in July of 1952, and the Gulf Breeze visitations of the mid-1990s.

"But what is the nature of the lights themselves? The anecdotal literature contains descriptive themes that are repeated so often, from different times and places, that it is highly probable objective characteristics are being referred to. From this considerable reservoir of data, we learn that the lights can be any colour, though white, orange, deep red and yellow-gold predominate. Their size can range from ping-pong balls of luminosity to giant lightforms"
-- Paul Devereaux, "Earth Lights and UFOs"

One intriguing explanation for the red spheres -- and for many UFO sightings in general -- comes out of an investigation by Paul Devereaux into a series of "blood-red sphere" appearances near Harlech and Llanfair in Wales in 1904 and 1905. He discovered that these "UFO" reports closely tracked the minor fault line running through the region, and further examination of the 1981-1984 Hessdalen Lights in Norway (which included NATO observers and university officials) revealed a similar pattern. (Previous UFO researchers such as Aimé Michel had linked UFO activity to "earth energies," and Charles Fort, of course, had noted the strong correlation of mysterious sightings to earthquake zones. It's worth noting that 1943 was the most seismically active year of the 20th century.) Devereaux and his partner Michael Persinger developed the Tectonic Strain Theory (or "earth light theory") of UFOs, which blamed electrostatic energy built up by tectonic strain -- especially in areas with high metallic content, such as the copper mines of Hessdalen or the gold mines of Malyshevsk -- for many UFO phenomena including motor failures, strange humming sounds, and weird radar interference.

By this thesis, "earth lights" are actually plasmas which, like UFOs, often appear silvery or metallic in daylight and reddish by night. One You-Sou Zou (of, bizarrely, the Beijing Institute of Atmospheric Physics and the Department of Meteorology at the University of Utah) apparently studied the Hessdalen data and determined that the photographs matched laboratory-created plasmas, especially in their corkscrew-like light traces. This, apparently, says "plasma vortex" to Dr. Zou. To other people, "plasma vortex" says all kinds of exciting things, including "Zero Point Energy," "soliton creation," and "energy wave propagation." Somewhere in here, the "mercury vortex" theory of UFO propulsion can meet our tasty [Red Mercury](#) in a scarlet, glowing plasma vortex of pseudoscientific evil. Which is as good a point as any to recall that Nikola Tesla devoted much of his career to, well, making ball lightning and plasmas -- and allegedly causing earthquakes -- up in the old silver-mining town of Telluride, Colorado. Did his experiments transform (or domesticate) "earth lights" into a potential superweapon? Did the Soviets salvage his secrets from the Nazis and test them in Malyshevsk?

"On one occasion a party of four of us -- including a lieutenant colonel -- watched a pulsating red fireball sail up silently to a point directly over the American-German front lines in 1944 during the Battle of Normandy. It stopped completely for 15 minutes before moving on."
-- George Todt, *Los Angeles Herald-Examiner*

Which brings us back around to World War Two and lights over the Nazi sky. On the Western Front, the mysterious "red spheres" showed up as "foo fighters," mysterious balls of glowing energy that trailed airplanes. The first foo fighters appeared in 1942, with 1944 the bonanza year for sightings: the "red ball" foo fighters that dogged allied planes over the Rhine in November and the "large orange glows" over Hagenau, Germany on December 22 are only the best-documented sightings of hundreds. Allied military figures believed that the *feuerballs* were Nazi secret weapons. Red spheres and foo fighters were not restricted to the European theater, however; in a nice parallel to our many other August cases, on August 10, 1944, an intense red or orange foo fighter paced a B-29 for eight minutes between Sumatra and Ceylon. Could the Nazis (whose mercury-laden submarines plied these exact waters) have transferred some experimental Red Sphere technology to the devotees of the Red Sun?

"As you find yourself heading for the red sphere of Martian Geburah, you may feel arrogance rising in your blood . . . Theoretically, Geburah is one of the seats of justice, especially when counterbalanced by Chesed, and it should be possible to have wrongs righted courtesy of this sphere, if the Powers deem that they are indeed wrongs. It is not a particularly pleasant stop, but its might is impressive. . . . This is, of course, the sphere in which wars are fought and lost -- or won."

-- Kala Trobe, *Magic of Qabalah*

Which Red Sun, of course, is the symbol of the powerful alien entity who founded Japan -- the goddess Amaterasu. The Egyptian god Ra, also, is depicted as a red sphere in traditional art and symbology such as the uraeus crown; red spheres often appear above the Persian Gulf, the cradle of human civilization. Have the red spheres been shaping our wars and empires for millennia? Do the earth lights dream, buried down in the rocky depths between conductive metal formations in piezoelectric quartz, nodes in a lattice of vortices and ley lines that make up the great alien intelligence below the Earth? Do they war with the atmospheric [entities](#) above the sky, or slave under the lash of [HAARP](#)'s global deep tomography? Did Tesla discover a means to awaken the red spheres, or to create artificial spheres replicating the slumbering etheric deities with which he communed? And was the red sphere that obliterated a Nazi regiment a foot-fighting wonder-weapon gone haywire, a summoning they could not control . . . or an angry mother punishing the misuse of her children? Does the Red Sphere gaze balefully at our continuing hubris, building up tectonic stress until the world can become a gigantic Kuban zone? Indeed, perhaps all we have to fear is sphere, Itself.

Aulos: City in the Sky

by Matt Riggsby

Dreamers may build castles the sky, but denizens of fantasy worlds can put entire cities there. Aulos is suitable for pseudo-medieval fantasy campaigns with a moderately high level of magic. Specifically, magical air travel should be possible, but not necessarily commonplace . . . although mundane air travel, such as hot-air balloons, large flying animals, or steampunkish ornithopters, may stand in its place.

Geography and Land Use

Aulos is unique: a city built on the surface of an immense flying rock, just over a half-mile across at its widest and some 400 yards thick. The rock is shaped like an inverted mountain, flat on the top, tapering to a sharp ridge on the underside. The city has no fixed whereabouts. It drifts along at about 30 yards above the surface at the speed of a slow walk, sometimes following prevailing winds, sometimes drifting in directions which seem random.

The city sometimes rotates, but at no fixed speed or direction, so points of the compass and direction of turn aren't useful for giving directions. Residents usually navigate by landmarks ("Go to the back of the Private Palace, turn left and go until you get to the empty fountain . . . "). If general directions must be given, the city's own "compass points" are templewards (in the direction from the center to the Broken Temple), crystalwards (from the center to the Crystal Field), and palacewards (towards the Private Palace). Confusingly enough, in addition to the three cardinal directions, the city is divided into four administrative quarters.

Due to its physical size and intermittent supply problems, Aulos is relatively small in terms of population. It is typically home to about 45,000, packed densely into the small area, although periods of plague have caused the population to drop to at low as about 20,000. The top surface of Aulos is almost entirely covered with buildings.

History

The earliest reports of Aulos indicate that it was discovered by explorers in a remote mountainous region, uninhabited and mostly undeveloped. Explorers found the Crystal Field, the Broken Temple (a ruin even then), and the bones of reptile-like humanoids. The floating mountain remained remote from the centers of civilization until it was encountered by growing empires centuries later. By then, it was inhabited by a tribe of winged bird-men who would hunt and gather on the ground, then return to their modest huts. Aulos remained an amazing but essentially useless curiosity until it caught the attention of the Sealed Collegium, a hermetic brotherhood of sorcerers whose members were in constant conflict with mundane authorities. Under the legendary Xiang the Silent, they seized the floating mountain, killed or enslaved the bird-men, brought up their own followers, and established a citadel where they could pursue their magic without interference.

Under the Collegium, Aulos became a threat to the countries it passed over, extracting tribute from those regions and reacting to resistance with increasing force. Worse yet, the Collegium learned to direct the movements of the city, making it a greater threat. At least one kingdom collapsed into chaos as Aulos made sure that its demands would not be resisted. At last, after nearly a century of terror, the Collegium set their sights on an empire with an underpowered military but considerable wealth. The emperor at this time was Tyrus IV, a formidable diplomat who had long been considering how Aulos might be defeated, and now he was forced to bring his considerable skill to bear on the problem. His overt steps were to hire mercenary armies and make arrangements with supernatural entities to harass the

Aulos: City in the Sky

Collegium and slow their city's progress, but his master stroke was hidden until the very end. Aided by daring agents and informers, Tyrus played on tensions within the Collegium itself, forcing members' differences into the open and eventually precipitating violent conflict among them. Deeply wounded from internal problems and beset from without, Aulos capitulated in a carefully negotiated surrender and was occupied by the empire.

Determined not to allow the problems posed by a free-roaming Aulos, Tyrus hit on a plan to anchor the city. A group of wizards and giants (and, some say, demons) were employed to anchor Aulos to the earth with enormous adamantite chains. Aulos remained high in the air, but it was fixed over a single point. It grew long stairways and even water-powered elevators. In a few decades, a settlement grew up on the ground underneath, becoming Aulos Below, counterpart to Aulos Above. A special governor (the Principe) was installed to oversee the city. The Sealed Collegium survived as a faint shadow of its former self, with the Grand Keeper of the Collegium reduced to a civic functionary, although a few former members who had secretly sided with the empire stayed on.

Although stripped of much of its looted wealth, Aulos remained an important center of magical learning, becoming all the more important as its less hostile administration allowed more communication and visitors from outside. But the empire slowly began to decay, as empires do. As it shrank under the incursions of barbarian migrations, Aulos became an important center for provincial defenses, and the Principe became a semi-independent military ruler. Eventually, the city was attacked by a massive horde with powerful magical support. The barbarians overran Aulos Below and, in defiance and desperation, the Principe at the time, called Black Geraldus (he was reputed to be a brutal ruler), ordered the chains broken. Once unanchored, the city drifted away. With the chains broken and the elevators and stairways destroyed, the barbarians let it go and made themselves content with sacking Aulos Below.

As the empire collapsed under it, Aulos was now a free city under the authority of the Principe. Initially, the Principe was an absolute ruler, with the city council serving in an advisory capacity. However, without the support of the empire, a succession of Princes found it necessary to allow more and more democratic elements in the government. First the office of tribune was created to counterbalance the Principe's authority, then the council's power increased to become the main legislative body.

For the past few centuries, Aulos has been a far more peaceful place than in its earlier days. It no longer has the magical might to demand tribute from the territories it passes over. Instead, it relies on trade to get what it needs. Supply is occasionally a serious issue when the city drifts over deserts, large forests, and other areas well away from farmers, but it has ample storehouses and enough magical resources to extend meager food supplies in a pinch. Of course, "peaceful" is a relative term. The city frequently finds itself dealing with jurisdictional problems when it floats over the territory of a ruler eager to tax its wealthy inhabitant, and it can find itself vulnerable to pirate raids when it is far from its allies.

Government

Aulos is nominally ruled by a hereditary Principe. The Principe is the city's supreme magistrate and commander in chief of the militia. He appoints a number of governmental officials (or at least approves them), calls and dismisses city council meetings at will, and has final approval over new laws and taxes. The current Principe is the elderly Vadinus III, a brilliant politician and basically fair ruler but childless, ailing, and jaded. One of the major checks on the Principe's power is the office of the tribune. The tribune is selected by lot annually from heads of household. He doesn't vote with the city council except in cases of a tie, but he attends their meetings, advises the Principe, and has the power to veto new laws. As occasionally happens, this year's tribune is a bit useless: Wexen the tailor, an affable, chubby man who tries very hard not to disagree with anybody.

The city council consists of a diverse body of officials: four guildmasters, each of whom must be from separate guilds, four quarter-judges (one for each quarter of the city), two members of the Sealed Collegium, the Master of the Palace, and the Colonel of the Militia. Quarter-judges are appointed for three years at a time by the Principe; quarter-judges are usually older citizens of established wisdom, but notable foreigners may be appointed to avoid favoritism. The Master of the Palace is appointed for life (or until voluntary retirement), while the Colonel of the Militia may be appointed and removed at will. Collegians are selected by the Grand Keeper of the Collegium, who may not himself serve; the current Keeper, Yllario the Red, is more interested in scholarship than politics, and his choices have been

eccentric. The guildmasters are selected by a combination of lot, negotiation among the masters, and popular vote of the guilds. As a result, councilman guildmasters are usually career politicians or timeservers. A seat on the council is reserved for the King of the Dead, who has never attended.

In addition to creating new laws (to be approved by the Principe), members of the council act as magistrates for different sections of the population: quarter-judges for cases in their part of the city, guildmasters for cases involving guild members, Collegians for magicians and magical creatures, the Colonel of the Militia for soldiers, and the Master of the Palace for foreigners and trade disputes. If parties to a case cross categories, the case must be heard by an appropriate combination of magistrates. For example, a dispute between a visiting wizard and a guildsman from the third quarter of the city will involve the Master of the Palace, a Collegian, a guildmaster, and the third quarter-judge. These high magistrates may appoint deputies to hold cases in their stead. The Master of the Palace in particular maintains a staff of deputies. Councilors usually prefer hearing cases (and collecting judging fees) to deliberating legislation, so few new laws are ever passed.

Two members of the council have other governmental responsibilities. The Colonel of the Militia is the civic militia's commander in the field. While the militia is mostly for show, the Colonel does have day-to-day command over the militia's core, the cavaliers. The current Colonel, Aram Attuk, is a former mercenary captain; he has little interest in politics and a cloudy past, but he is a shrewd warrior. The Master of the Palace (the harried but inexhaustible Maisu Khano) oversees day-to-day administration of the Public Palace, including scheduling public events and assigning spaces to vendors. While this may seem a small task, he actually has considerable power over how commerce is conducted in Aulos.

There are several other officials without councilman power. For example, the dockmaster oversees use of the Floating Docks and the loading and unloading of goods. The Keeper of the Field is charged with keeping the Crystal Field in good order and regulating its exploitation. The Constable (Tytos Chuk, sour and unfriendly but fiendishly clever) is a guardian of the public peace, a sort of chief of police with a commission to keep private problems from rising to the level of public problems: stopping brawls, quelling arguments before they become violent, keeping an eye on suspicious persons and activities, and administering a body of night watchmen (seconded from the militia) to prevent thefts and burglaries. He also maintains a staff of proctors to assist him. These officials serve at the pleasure of the Principe.

The King of the Dead is not a position so much as a symbol . . . or at least a legendary character. He purportedly rules the catacombs under the city and keeps peace among the bodies of the dead. Tradition has it that the Sealed Collegium got permission from the King of the Dead (after a week of silent negotiation with Xiang) for the living to occupy the surface of Aulos, but there have been no credible reports of any meeting with him for centuries. He is generally regarded as neither hostile nor particularly friendly to the living, only concerned with keeping his realm in quiet order. He is also the object of occasional religious -- or at least superstitious -- practices, such as burning incense or dropping small valuables into deep holes as a means of ensuring a comfortable afterlife.

Armed Forces

The largest armed force of Aulos is the militia, a part-time army composed of one adult male from each family. The militia has a theoretical strength of about 4,000, but almost never meets in its entirety. Members from each quarter of the city are called to assemble for inspection at the Public Palace once a month. They are to present themselves with arms and armor (requirements are loose; a spear, short bow, and leather jacket are sufficient) and drill briefly or face a nominal fine. Many end up paying the fine. Three members of the militia in each quarter are also pressed into service each month to serve as night watchmen in assisting the Constable, or they may sponsor another in their place. Many choose the latter, so the city has a semi-regular body of watchmen.

The core of the militia is a special regiment called the cavaliers, a body of about 80 men provided or sponsored by the wealthiest families. The cavaliers are full-time soldiers. They must provide their own arms, but are provided with board and lodging in the Private Palace, a comfortable stipend, and exemption from a number of taxes. Entrance is competitive; cavaliers must pass an elaborate examination including tests of strength, endurance, and marksmanship.

The regiment drills frequently, and many cavaliers carry enchanted items, making them an even more formidable force.

Still, Aulos's main defense is the fact that it's difficult to attack a city on top of a flying rock. The militia is, at best, a semi-trained rabble, and the cavaliers are too small to have much effect in a pitched battle. In case of prolonged or serious threat, the city is perfectly willing to hire mercenaries, and the Sealed Collegium may, in extreme emergency, be pressed into service for magical support.

Commerce and Industry

When it is near inhabited areas, Aulos does a brisk trade in fine manufactured items, magical labor, and the city's most distinctive export, high-quality crystals. The city's industries are dominated by the six major guilds:

- **Clothiers:** Includes weavers, embroiderers, leatherworkers, carpet-makers, cobblers, and tailors. Because there is no water power to power looms and little space to put smelly trades like tanning, little raw cloth is produced. Instead, guild members usually import cloth and hides and turn them into fine clothing.
- **Crystalliers:** The crystalliers are almost unique to Aulos. They work with material culled from the Crystal Field. They engage in shipping, manufacture of musical and optical devices, jewelry-making, and preparation of items for enchantment by magicians.
- **Dockmen:** The dockmen are primarily employed in loading and unloading vessels landing at the Floating Docks. Carpenters may join as special members to maintain the docks and flying vessels.
- **Merchants:** Any resident of the city who wishes to import or export goods in significant quantities must join the merchants' guild.
- **Scribes:** The guild of scribes includes a number of learned professions, including scribes, bookmakers, and lawyers.
- **Silversmiths:** This guild includes metalworkers of all kinds. However, most metalwork in the city is on a small scale, involving jewelry and small mechanical devices, such as water clocks.

Tradesmen operating more-or-less permanent establishments (bakers, grocers, furniture-makers, and such) are eligible to join a catch-all organization, the Lesser Guild. The Lesser Guild provides its members with no formal political representation, so it serves as little more than a drinking club for members of the lower middle class with unrealistic aspirations for power. Itinerant peddlers, servants, money-lenders, and most other people may not join any guild.

Magicians may not join a guild. Rather, they fall under the authority of the Sealed Collegium, which in turn is subject to intense scrutiny from the Principe (magicians who want to export enchanted items must, technically, sell them to a merchant who can, in turn, export them). The Collegium has only about 50 full-fledged members, but it exercises authority over nearly 800 students (mostly foreigners) and a similar number of spellcasters resident in the city.

Only natives of Aulos may join a guild, but resident foreigners may practice their craft if they are granted a license by the guild and pay heavy dues, equivalent to about three weeks of income (double what a native would pay). The major guilds encompass about 15% of the city's adult population (500-600 members each), with another 30% eligible for the Lesser Guild and the rest guildless, although many work for guild members.

Although the city's industries are dominated by the guilds, Aulos's lifeblood is commerce with a constantly shifting array of foreigners. Therefore, it is relatively friendly to outsiders. Inns and hostels abound near the floating docks. New arrivals are given a cursory search by the dockmaster's deputies to ensure they aren't returning exiles; docking fees are nominal. However, non-residents should know that they must initially enter the city through the docks. Landing elsewhere without a letter of permission will lead to fines and more detailed searches at the very least.

Everyday Life

Clothing

Most residents of Aulos wear similar costume: sandals or slippers, tight leggings, a loose vest or shirt, and a front-

opening belted tunic. When Aulos is in colder climates, boots appear and layers of robes are added. Poorer citizens wear a turban, or at least a head-cloth secured with a pin or band. Wealthier residents wear fitted caps of various sizes and shapes. For example, small, floppy caps for merchants, skullcaps for people who engage in delicate crafts, tall cylinders for scribes. Physicians wear blue capes, while prostitutes wear red scarves. Magicians wear black robes with colored ribbons on their arms indicating their rank in the Collegium. Senior members traditionally wear masks while performing their duties. Initially, the masks were blank black cloth, meant to conceal the member's identity, but they have since become elaborately personalized.

Cuisine

Food in Aulos is, by necessity, eclectic. Because the city passes over so many different regions, there is little consistency in available ingredients. Therefore, instead of specific dishes, the cooks of Aulos have developed a broad style of cooking. The Aulos style involves preserved foods (salted, smoked, dried, or pickled) cut up finely, heavily spiced, cooked quickly, and served on a bland bed of cooked grains or wrapped in flatbread or vegetable leaves. The favorite dish of Aulos is kursu, a cake of spiced meal with a dab of sweet fruit paste at the center and fried in oil. Kursu can be bought from itinerant vendors on any street corner.

Buildings and Street Life

Most buildings in Aulos are made from dark gray brick, three or four stories high. Ground floors are usually given over to stores and businesses, with residences on upper floors and brick-lined cisterns below. Instead of walls and doors, first-floor building fronts often have sideways-folding wooden shutters, letting occupants open up as much or as little of the building as desired. Roofs are often flat to allow easy landings to flying visitors, or simply for open-air gatherings. Many people keep small domestic animals (birds, dogs, friendly reptiles), but horses are all but unknown. Most heavy carrying is done by wheelbarrow.

The streets of Aulos are narrow (often little more than a single cart-width), paved with brick or cobbles, and unnamed. With a dense population and relatively inexpensive magical lighting, they are never completely empty, day or night. Even in the small hours, one can often find a few men on their way home from a tavern or a kursu vendor with a small brazier and pot of bubbling oil. A number of street corners are furnished with magical fountains, which consist of a narrow spout producing a constant, if small, drizzle of water and a deep basin below it. Collectively, they supply about half of the city's water. The water is freely available, but it is considered rude to take more than half of the water currently in the basin. Neighbors often meet by the fountains to gossip.

Recreation

In addition to the usual recreations of drinking, dancing (the Aulos style involves many skipping and hopping steps and tight pirouettes), and gambling (tabba, a complex game involving pyramidal dice and colored plaques resembling dominos, is a favorite), instrumental music is popular, particularly small horns and crystal chimes. Aulos has a long tradition of literacy, so reading aloud is common, but theatrical performances are rare. Still, performances are sometimes put on at the Public Palace. Wrestling and competitive climbing are popular sports, but there are few team sports, perhaps because there are so few large spaces in which to play them.

Places to Go and Things to See

Map of Aulos

- **Public Palace:** The public palace is Aulos's largest paved space. It consists of four tall stories of portico around an open area about fifty yards across at its widest. By tradition, the first two tiers are occupied by transient peddlers and merchants who have come to the city to sell their wares. The rest are used for small meetings of civic groups. The courtyard may be used as market space, room for popular assemblies, a sporting field, or an impromptu courtroom for particularly notable cases.
- **Private Palace:** The private palace (also called Tyrus's Hall), a luxurious and well-fortified building, is the seat of the city's government. It houses the Principe's apartments, a council chamber, offices for members of the city council, clerks and other servants of the government, and the cavaliers' barracks. The lowest levels are used as a prison, and the outermost tower is often used as a courtroom, with executions performed from a large open window.
- **Collegium Tower:** The Sealed Collegium maintains its original headquarters, a black marble pyramid. In its heyday, it was reserved for full members of the Collegium, and it was richly furnished and decorated. These days, it houses a number of magicians, their apprentices, servants, and a number of large rooms used interchangeably as refectories, classrooms, warehouses, and laboratories. While it now serves a more utilitarian function, the building itself is still quite fine.
- **Moorings:** When the city was anchored, enormous holes were drilled in the underside of the city at four points to fasten the moorings, as well as smaller holes for anchoring stays and workmen's scaffolding. The anchors are long gone, but the attachment points are home to a set of shanty towns. The Moorings, as these neighborhoods have become known, are a collection of rickety wooden buildings held in place by ropes, chains, nets, and some wishful thinking. Because of the poor lighting, the difficulty of building sturdy structures, and the inherent danger of building over a fall of several hundred yards, the Moorings are the city's poorest district and treated as dens of footpads and murderers. However, respectable citizens go down the narrow stairways from the upper side for a taste of the wilder life.
- **Crystal Field:** The Crystal Field is the city's other large open space. The Crystal Field is an irregularly shaped area where clear and faintly colored bunches of crystals stand here and there, like stands of vegetation on a field of coarse white crust. The crystals appear in bunches with one or two large ones at the center and smaller ones clustered around them. The tallest are about ten feet high, but most are three or less. A curious aspect of the field is that the crystals are growing. Growth rate is related to size, with small crystals growing fastest. The crystals, which may be harvested with a bit of careful hammering, have a number of uses, from musical instruments (each chimes with a distinct note when struck) to magical adjuncts. The guild of crystalliers harvests about 500 pounds of new crystals (two inches long or less) each year, providing a significant source of income for the city. The removal of larger crystals is generally prohibited and can only be performed with the permission of the

Keeper of the Field.

- **Broken Temple:** Older than any human construction in Aulos, the Broken Temple is an octagonal building made from a single piece of a green jade-like material. The temple is carved with elaborate, fluid scrollwork in a unique alien style. The inside of the temple is open, furnished with nothing but a stone table twelve feet on each side in the center. Before human habitation began, the temple was apparently attacked, caving its ceiling and part of the walls. The temple interior and its immediate surroundings are littered with blocks of green rubble. The stone is very hard but not unworkable, and it might be used to produce jewelry. However, the temple and its stone are generally held to be unlucky. For that reason, the area immediately around the temple is uninhabited and overgrown with weeds.
- **Catacombs:** The flying mountain on which Aulos is built isn't solid rock. It has a number of excavated basements, underground cisterns, and natural caves permeating the rock. Many of these structures are linked into a network known collectively as the catacombs. The upper layers of the catacombs are fairly well mapped, if little used. However, the deeper layers are poorly understood and largely avoided. There is reason to believe that the lower tunnels change from time to time, so map-making is a dubious enterprise. An honorable burial in Aulos consists of being carried into the catacombs and left. Bodies disappear in a matter of days and are said to have been taken by the King of the Dead. The few attempts to explore the catacombs in detail have failed (the tunnels seem to resist scrying magic), and some of the search parties have vanished without a trace.
- **Bastions:** While the top surface of Aulos is fairly level, it has a pair of steep stone outcroppings called the bastions for their resemblance to stumpy defensive towers. They are too steep to build on, but they are occasionally used as lookout posts.
- **Floating Docks:** Between the Crystal Field and the Private Palace is the center of Aulos's commerce, the floating docks. The docks are broad (about twenty feet across) wooden avenues which extend over 200 yards into empty air. No mundane wooden structure could stand the strain; the secret lies in the use of magical wood and reinforcing enchantments. Flying vessels of all kinds tie up here, and smaller flyers (flying animals, magic carpets, etc.) can descend on them like a road. The wood is quite thick, and is protected by magical fireproofing.

Campaigns and Adventures

Aulos can be used much like any other city. PCs could, for example, become enmeshed in civic politics. The current Prince is in poor health and has no clear heir. Power could fall to one of four cousins; factions are already forming around them. Craftsman PCs might campaign for increased privileges for their guild, or ambitious PCs might angle for appointments to civic offices. Warfare is also a constant possibility. PCs could be airborne raiders attacking Aulos for a little loot, soldiers of a kingdom over which Aulos is passing trying to seize it for their own, or Aulos's own soldiers defending it from outside threats or launching retaliations. The presence of wealth, trade, and a community of magicians makes Aulos a natural destination for merchants and PCs seeking specialized advice and equipment. Other adventures may arise from the city's unique situation. For example, heroes might attempt to contact the King of the Dead, explore the history of the prehuman reptile and bird-man inhabitants, or find out what makes the city fly. Here are some other possibilities:

- **Romancing the Stones:** While crystal harvesting is theoretically controlled by the crystallier's guild, casual poaching is common. Most residents have a small crystal surreptitiously taken on a youthful dare or quietly lifted and given as a gift by a suitor. Removing larger crystals or batches of crystals is far more difficult, but that doesn't stop people from trying sometimes. PCs may decide to steal a large crystal (as a magical adjunct, the object of a quest, or simply because it's valuable). They may attempt a quick smash-and-grab, landing a flying vehicle in the field, grabbing a crystal, and taking off, but the whole city could see them and dispatch pursuit at a moment's notice. They may be more successful in taking a crystal out of the field under cover of a distraction and carrying it deep into the city, hiding it for a while, and smuggling it out, but even that will present considerable problems. Just getting a large crystal out of the field without being detected is a heroic feat, and its theft will trigger a massive investigation.
- **Herb gathering:** It may be unusual soil conditions, or perhaps a natural emanation of magic, but nooks and crannies in the sloping underside of the rock on which Aulos is built are home to a variety of useful plants and animals. Though not in constant demand, many species are very rare, so some residents of the Moorings make a good -- if dangerous -- living by climbing along the underside in search of valuable wildlife. Most "hangers" are

poor, territorial, and desperate enough to spend days at a time hanging from hand-made climbing gear, facing treacherous handholds and small but vicious animals who could cause them to lose their grip and plummet to their death. Gathering from the underside is unregulated by the Principe (although individual hangers won't hesitate to sabotage poachers on their turf), so PCs may enter this dangerous profession in order to find something vital for an important spell or, if they're down-and-out, try their hand as a risky way to raise some funds.

- **Taking the Wheel:** One of the long-lost secrets of Aulos is how the Collegium directed its movements. If PCs could unravel the mystery, it could be worth a lot of money or political power. A series of clues may lead them through the jealously guarded archives of the Sealed Collegium or on a perilous crawl through the catacombs to find missing parts of a magical manuscript. And even if they do reconstruct the method, they may have to convince others in Aulos that they've found the *right* method, a difficult task since people claiming to have the secret are likely to be regarded as either lying or insane.

An Open Letter To Game Designers

I've developed a new game that I'm sure will be a big hit, and thought you might be interested.

It's a simplified version of baseball. It consists of only two bases and one outfielder instead of the usual four bases and three outfielders. Pitchers will only be able to throw one type of pitch . . . the fastball. (Although this game will use a special ball that keeps it from being thrown *too* fast.) Extraneous options -- like bunting, sliding, stealing bases, and other complicated bits -- will be discarded. The game will consist of one side trying to hit the ball and running to first base or home, while the other side tries to throw the ball fast enough so the other side doesn't hit it, or (barring that) trying to catch the ball to tag the player at the base.

This game will be called Basicball.

Basicball will be designed with the sole purpose of introducing new players to "real" baseball; by using a simplified game, how can we *fail* to gather new bodies into the exciting hobby of baseball?

[BONK!]

Well, I've just been hit in the head by an errant ball. Now, this might be because I've been thwacked by our non-American readers who don't know (or care) what [baseball](#) is. But I suspect that the Fates have provided me with a modicum of common sense, packaged it in a dense sphere, and knocked me upside the head with it.

Because Basicball is a silly idea.

A few minutes of thought will make one realize that there's almost no incentive for someone to bother learning Basicball; it's certainly not any more fun than traditional baseball, and almost anyone exposed to Basicball will probably wonder why they don't just go ahead and learn baseball if they were going to go to the trouble of learning a new game.

Which brings me, circuitously (as ever) to gaming.

I've seen a fair number of games in the past couple of years that have purported to be basic introductory versions of other games. And many of these games have had moderate (at best) to weak (at worst) sales . . . to the point where many game manufacturers wonder if there's a point to producing these introductory games.

Well, in my humble opinion . . . no, not really. At least, not as we think of them.

Most introductory games I've seen have stripped their parent game down of much of the complexity of the original -- which may or may not be good -- while not *adding* anything to the game . . . which is bad, as I see it.

Now, most of us are introduced to gaming from friends, meaning that such introductory products are probably limited to a target audience of those who *aren't* part of a group that wants to play the game (or can't find such a group). So people who buy these introductory sets generally get a pale imitation of the "real" game; presuming they're still playing the game when they decide to "upgrade" from those sets, the introductory set won't have much (if anything) to offer then. And that's assuming they *do* move on; since the experience provided by those introductory sets is often a diminutive version of the "real" version, players may get bored and move on. Those who upgrade to the full game may resent the fact that the introductory set is then moot.

So what's the solution? Well, partly it could be just to make such introductions free, instead of charging for them; I've written before about how I was introduced into some games by [freebee versions](#). But there is another answer. I note that the most successful "introductory" games -- those games that often succeed at bringing in gamers into other pursuits -- seem to stand apart as their own pursuits.

Mini-golf, for example, offers some experiences and play possibilities of "real" golf, yet stands on its own as a separate game, offering unique experiences and goals. ("I used a 4-iron to ricochet off the clown's head into the loop-de-loop" is *not* something generally heard in most golf clubhouses.) People can play either game without thinking they're playing a "lesser" version of the original.

Or *Fighting Fantasy* books, while not being an exact substitute for tabletop gaming, offers many of the same ideas: a combat system, the notion that the player's decisions advance the plot, the actual *existence* of a compelling plot, and so on. Too many introductory sets I've seen nowadays have had adventures that have bored my silly ("Your first adventure: Kill two goblins. Your second adventure: Kill five goblins."). Compare that to the original *Lone Wolf* books, the *Sorcery!* series, the *Mystery of the Snow Pearls* solo adventure for the original *Dungeons & Dragons* boxed game, and so on. Heck, some of the *Advanced Endless Quest* books had solo versions of classic *Dungeons & Dragons* adventures within their paperback pages (like *Ravenloft* and *Ghost Tower of Inverness*). And, at the cost of a standard paperback book, they were also at a small enough price point that a potential buyer wasn't faced with the decision between a \$20.00 introductory boxed set and a \$30.00 core rulebook for the "real" game.

Mage Knight follows this trend as well; although not as complex as most miniatures games, and lacking the painting requirements of their older cousins, it still *adds* a great deal to the genre: collectable models, speed of play, and so on. (As an aside, I'll be curious to see if the *Chainmail* game brings in any new players to the tabletop *Dungeons & Dragons* game, since it seems like both are designed to flow into each other quite well.)

Anyway, I note that these examples, perhaps above all else, give the player a taste of another game, while not making him regret partaking in the "introductory" activity. These games provide an easier entry into an alternate "primary" game, even using much the same terminology and objectives, while standing on their own.

Of course, the biggest problem is that coming up with a game that is introductory-to-but-different-from another requires a fair bit of innovation . . . certainly more than simply paring down another full game into a simpler -- but less satisfying -- version. But the potential rewards could well be worth it; in addition to funneling new blood into your game, you may well create a *new* gaming phenomenon, giving yourself a whole new audience.

And I have utmost faith this can be done; after all, I've seen the kind of full-fledged games the industry is capable of when it puts its mind to it. And then we can eat some nachos and sit in the bleachers, playing your game while watching an outing of Basicball.

[BONK!]

Last week's answer: The *Call of Cthulhu* adventure "In Media Res" from *The Unspeakable Oath* #10 (perhaps my first "real" exposure to *Call of Cthulhu*)

(Five stars) "Ba-DOOM"

"Lynch, we did it!"

"Yeah, we did. We just blew the seeds from here to Seattle. I hope your timber company has a lot of **real** big saws. Otherwise, we're in **big** trouble."

Los Huevos Diablos

An adventure for the *Deadlands* RPG

by Dylan Craig

Overview

A group of chicken farmers buy an alchemical feed supplement to increase production. Things start to go wrong, and the Posse gets tangled up in events when the feathers start to fly.

The action starts with the heroes sitting in a café in the town of Damascus, forking their way through their fried-egg lunches. Damascus is a relatively undistinguished little burg; ringed by bare mountains on all sides, it has few industries and fewer attractions. A third-rate copper mine in the area provides most of the employment, and the rest of the town's revenue is skimmed off the steady flow of travelers passing through on their way to some more worthwhile location.

The characters might be in Damascus for a variety of reasons, most of which would involve Damascus' positioning on the main road through the area. Alternately, they may have been performing some duty or other for the copper miners' association -- guarding ore shipments, or ferreting out saboteurs -- and are now waiting in Damascus for their payment to arrive at the association's main office. Alternately, one of their horses may have thrown a shoe (or their stagecoach may have cracked its axle) on the rocky trail through the mountains, and they are waiting for it to be repaired.

Damascus' sole lodging-house is the Golden Guilder, a converted blasting shed on the edge of town run by a Dutch widow. Prices, facilities and service are all rock-bottom. The Guilder doesn't have a bar or kitchen, and is quieter than the town cemetery, so characters without much else to do will spend most of their days at the Boston Café, the town's diner and saloon. The atmosphere in the café is much more convivial than at the Guilder; a steam-powered pianola tinkles away in the corner, and the café staff, while plain, are attentive.

Poached

Among the other customers are a table of four rough-looking men in farmers' clothes, sitting across the room from the Posse. The men are conversing in whispers, and looking around furtively to make sure no-one is within earshot as they do so. As the characters watch [**Cognition roll: TN7**], one of them reaches into his dungarees to shift the handle of a Colt Navy out of the way of his protuberant gut. This fellow has a burlap bag at his feet; over the course of breakfast, as the characters watch, a reddish stain on the underside of the sack develops into a patch of slimy blood, and begins to form a puddle on the floor. Neither the owner of the bag nor his companions seem aware of this fact, although they all make a point of occasionally tapping the bag with their feet to make sure it's still there.

If the characters continue to observe the men, they will see them peering out of the window at regular intervals, scanning the street as if keeping an eye out for someone, or something. Across the road, and visible through the window, are the bank and general store, and the main road up to the mine. The street is deserted apart from a foraging mongrel dog.

There are three other patrons in the café at the time, apart from the Posse: a pair of traveling cutlery salesmen playing poker, and a thin-faced man in greenhorn's clothes and a well-maintained bowler hat who is the town banker. The café has a staff of two: a waitress and the cook. If asked, any of the locals can identify the men as local farmers. They are not regular patrons of the café.

Sunny Side Up

The men are waiting for the snake-oil salesman who sold them the potion to return to town after an overnight stay at the home of the mine owner (to whom he was selling hair-regrowth tonics). They intend to confront him with the contents of the bag: the carcass of one of their roosters, twisted and deformed from an overdose of the potion. However, they don't want anyone else to see the carcass, for fear that nobody will want to buy their produce in the future.

Currently, their plan is to intercept the potioneer as he enters town, and steer him into an alley at gunpoint to "negotiate." While they don't want trouble, they are secretive and angry, and this may mean a confrontation with anyone who gets in their way or asks too many questions.

If the Posse waits to see what happens, the men will spot something out of the window around half an hour later, and they will rise as one, moving hastily towards the door. The man with the gun will grab the bag from under the table without looking at it, and will cast a cautious glance around the café as he does so.

Whether the Posse and the farmers come to blows or not, no fatalities or serious wounds should result. The farmers may wave their single pistol around if the Posse try and face them down, but they will stop short of actually shooting anyone and will back down immediately if their gesture is replied to in kind. Of course, if the Posse stays back and allows the farmers to go through with their plan, they will see the dandily-dressed man's smile turn to an expression of shock as a burly farmer takes him by each arm, and he is led into the alleyway next to the café. Hopefully, the characters will take action at this point (if not before!). Otherwise, the spot chosen by the farmers for their "little talk" might be under the characters' window, allowing them to eavesdrop.

The farmers and the alchemist (stats and names in Boot Hill, below), will initially have little to say to one another beyond accusations and denials. The main points of the conversation, whether the characters are there are not, are as follows:

- The alchemist sold the farmers a potion which was to be mixed with the chicken feed.
- This morning, all the farmers' roosters were dead. They want compensation and a refund.
- The alchemist refuses. There's no way the chickens could have died unless the farmers did something wrong.
- The farmers don't like the sound of this at all, and offer to feed the leftovers of the potion to the alchemist.
- When they brandish the bottle, the alchemist notes that there's almost nothing left. Where's the rest, he asks?
- That's all that was left, say the farmers. Two teaspoons, diluted into two gallons of water, into the chicken feed, and two teaspoons, diluted into a gallon of water, in the water trough -- like he said.
- But, counters the alchemist, there was ten teaspoons' worth in the bottle, and there's less than a quarter over.
- Well, come to think of it, says one, we didn't have any teaspoons. So we used a soup spoon instead.
- But that's an overdose, yelps the alchemist. No wonder they're dead!
- Don't you tell us about chicken farming, city boy, say the farmers. Chickens can take any amount of feed, so they can take any amount of potion. Stands to reason.

Someone (perhaps the characters, and certainly the stray dog mentioned above) may want to examine the contents of the sack before or at this point. The rooster inside presents a terrifying sight; in fact, characters with less than 2 Grit need to make a Fright Check against a Terror Value of 5. The creature has had its neck twisted; its head is elongated and swollen, several patches of skin stand exposed between patchy clumps of feathers, and -- worst of all -- a fleshy lump of flesh like a third leg protrudes from under the tail. The farmers will confirm that almost all of their roosters were in this condition this morning, and several had to be killed.

In lieu of compensation, the alchemist will offer to mix up an antidote to the potion, but he will need to assess the condition of the remaining roosters before he can judge the quantities. He will ask the characters -- especially if some of them are law enforcement or scientific types -- to accompany him, as he doesn't trust the farmers not to beat him up (or worse) once they are out of sight. The farmers, on the other hand, want the party to accompany them because none of them can read and they are worried that the alchemist will try to hoodwink them or escape. They promise the characters a slap-up farm meal and free overnight lodging; the alchemist will compensate them in kind by mixing up some tonics for them. His specialty is animal tonics; he even claims to be able to make a potion that allows horses to

speak for a limited time. Hopefully, between the cajoling of the farmers, the begging of the alchemist, and their own curiosity, the party will set off with the farmers without much prodding. If not, the adventure will come to them after a while, so to speak . . .

Over Easy

The farms are two hours out of town by foot or the farmers' mule-cart, or half an hour on horseback. Situated in a small hollow at the foot of a rocky peak, the farmhouses are clustered together, with the farms spreading out from this central point. Four small sod dwellings, a single double-story barn, and two long wooden sheds housing the pigsties and henhouse make up the farm buildings.

From a distance, all seems normal. Smoke rises from chimneys, and an old hound dog can be seen wandering about the yard looking for a comfortable place to take the latest in a long series of naps. The farmers drive their cart straight up to the henhouse entrance of long shed (the pigsty entrance is on the other side of the building), and dismount, ushering the characters (and the alchemist) inside.

The first thing that strikes the characters is the rows and rows of empty coops; however many chickens used to live here (close to a hundred, if anyone counts), none remain now. Lying scattered around the henhouse are the broken bodies of a dozen roosters; all show the extreme deformities exhibited by the specimen in the sack. Close examination of the bodies [**Cognition TN 9, Medicine: General 7, or Medicine: Veterinary 5**] will show that they have all been pecked to death. Similar examinations of the coops will show that they have all been forced, from the inside. What bare straw remains is foul-smelling and stained with some kind of greenish slime, as if their very contents of the coops had dissolved. The area has a Fear Level of 1.

Note that there are no fresh eggs in the building. Don't mention this specifically . . . reveal this fact only if the Posse asks.

With an oath, one of the farmers mutters, "Geraldine!", and rushes off towards his house. His fellows, with a few murderous glances at the alchemist, follow suit. One has the presence of mind to grab the shotgun from the cart. Their shouts and hollers are met with no response -- indeed, the farmhouses seem deserted.

The following pieces of information can be gleaned from the henhouse and courtyard:

- The farm animals are not only alive, but unharmed. Some, however, seem a little skittish.
- The courtyard is absolutely rotten with chicken tracks. The volume is consistent with several dozen chickens marching up and down the area for at least an hour.
- The barn is empty; the interior trapdoor leading to the loft is closed. The ladder allowing exterior access is nowhere to be seen.

The alchemist, if interrogated, has nothing to contribute to the situation except to say what his elixir was supposed to do: increase body weight and laying speed. He got the recipe from an old European manuscript which he no longer owns, having sold it after transcribing the list of ingredients. It certainly didn't indicate any danger of mutation, and he's sold the same formula to several clients before without any problems. As he is explaining this, a farmer suddenly shouts, from one of the houses, "They're up here!"

The missing families have been found in the back room of one of the houses, barricaded in behind furniture and bolts of cloth. The kitchen of this house reeks of burnt gunpowder, and is missing a large chunk of window and wall. Scattered around the blast points (indicative of the discharge of both barrels of a shotgun) are a few feathers and gobbets of flesh.

The farmers, meantime, are tearing at the barricades; the shouts of those within are too muffled to be heard clearly, but it is certain that some of the voices belong to children and others to adults. The characters may lend a hand at this point; there are 100 points' worth of items blocking the entrance, and each character may remove as many points as the result of a Strength or Nimbleness roll (their choice), per round.

As the last piece of the barricade falls, call for Cognition rolls from everyone. Those inside, working on the barricades, need a 10; everyone else will only need a 5. Successful rolls will alert the characters to a strange susurration, like bats. A round later, the shuttered top entrance to the barn will burst open, disgorging a cloud of feathers and several writhing, flying creatures into the air.

Scrambled

The remaining hens (about a hundred of them, as mentioned above) have been transformed by the ungentle caress of the Reckoner's taint within the potion, into cockatrices: ravenous creatures of legend who have the ability to paralyse those they wound. The barn will disgorge 1-10 of these monsters every round, which will circle the farmstead for a round before diving to the attack. The cockatrices are equally at home in the air and on the ground; they will divide themselves equally between all available targets, preferring to attack those who are out in the open. They will not attack other animals unless they come under attack from them; even the old hound, who will be barking furiously and running in circles at this point, will be unmolested.

Victims of cockatrice poison require a Vigor roll against a TN of 3 to remain mobile. This magical poison affects the Harrowed normally. Each resisted "dose" results in a cumulative penalty of -1 to the Vigor roll, so after the sixth time someone is wounded by a cockatrice, they will be at a -6 penalty to resist the poison's effects. Once the poison has taken effect, the victims gain a -2 penalty to all actions (and movement) every round. When this penalty reaches -10, they are effectively paralysed.

Although the individual hens have a Terror Value of 5, being confronted by more than a handful at once increases this to 7. The Fear Level of 1 applies to the whole farmstead while the cockatrices are flying around.

Several tactics to put the cockatrices down might be employed, but few are likely to succeed simply because of the number of creatures involved. Make a note of where misses from area-effect weapons such as flamethrowers land; they may result in the destruction of the very buildings the characters will find themselves needing to seek cover in as the cockatrices continue their assault. Try to split the party up as much as possible; the best mechanism for this is to have some of the characters or NPCs collapse from the poison, and require rescue. The rescuers can then be cut off by a whirling cloud of cockatrices, and forced to drag their insensate charges into another source of cover. Then, circumstances permitting, split your players up. This will add spice to their breakout plans -- how can they make the other groups aware of what they intend to do?

Careful sniping and inventive use of local resources will allow the characters to gradually wear the cockatrice numbers down, but this might take anywhere from an hour to the rest of the evening. Keep track of expended ammo and keep the Posse on its toes by introducing cockatrices sliding down the chimneys, scratching at the floorboards, and lashing through windows with their powerful, barbed tails. The heroes might also have to stop the farmers killing the alchemist, if both parties made it to the same piece of cover: none of the farmers' family members have been killed (having taken cover after the first cockatrice sally), but two of them are paralysed and the prognosis for everyone else doesn't look too good.

The alchemist's main use, apart from building flasks of Greek Fire, lies in concocting an antidote. This will take a while, but will prove to be effective eventually . . . although paralysed characters will require a few hours to recover fully (losing 3 points of their penalty on the initial application of the antidote, and a further 3 points per hour).

When less than ten cockatrices are left, they will change tactics. Flying off to the north, they will find the egg cache (see below) and lie in wait for any pursuers.

Coming Home To Roost

Once the cockatrices are driven off, the farmers will be more concerned with extracting their families, repairing the damage inflicted on the farmstead, and herding up animals panicked by the fight than with exacting revenge on the

alchemist. The alchemist will be sitting on the doorstep, moaning that he is ruined; he has had to use up almost all his ingredients and glassware in assisting in the fight and the creation of the antidote, and he hasn't made nearly enough on his recent sales to replace these items.

The characters may very well neglect to follow up on the missing eggs and cockatrices, especially if they didn't make the connection between the empty coops and the missing eggs. Astute parties, however, may search the farm to their heart's content without finding the eggs. The old hound, sniffing at a cockatrice corpse, will provide the necessary impetus to broaden the scope of the search, and will bound off to the north into the rocks and scrub, barking wildly and sniffing at the trail. If the heroes follow, they will find that the hound leads them to an old well next to the ruins of an older dwelling further up the mountain. Gummed onto the walls halfway (25 feet) down this well are a clutch of close to two hundred cockatrice eggs.

The remaining cockatrices are lurking at the bottom of the well, and will attack any intruders savagely. Only three cockatrices can attack at a time due to the narrowness of the well. Any area-effect weapons directed down the well (Gatling pistols, dynamite, flamethrowers) will destroy 1d100 eggs with each attack. These eggs are the same size as hen eggs, but reddish-brown in color and remarkably heavy. While they will not hatch without daily contact with the skin secretions of a living cockatrice, their contents may still fetch a decent price from museums and scientific laboratories -- a good guideline would be \$50 for the first egg and \$2.50 for each additional egg, per buyer. Hence, parties who wish to make a good profit off the eggs will need to make a fairly extensive journey to find enough buyers to sell them to . . . although the alchemist's contacts will come in very useful here.

The value of the eggs halves with each week after they were laid. Finding prospective buyers might bring the heroes into contact with all sorts of unlikely types, and lead to several other adventures. And who is to say that one or two of the eggs won't hatch despite their best precautions?

Awards

3 bounty, a white chip for investigating the barn, and a red chip for finding the egg clutch.

Boot Hill

The Farmers:

Butch Burroughs, Matthew and Moses Linkly, and Ezekiel White

Designer's Notes: GURPS WWII: Hand of Steel

by Shawn Fisher

An Alternate History for *GURPS WWII*

The original, and much shorter, blurb was written for *GURPS WWII: Hand of Steel*, but playtesters suggested it belonged in the designer notes, so here it is. The basis for this is a campaign I ran for several years. It was inspired by several sources, including a few of Ken Hite's *Suppressed Transmissions*, the *Call of Cthulhu* vignette in *GURPS High Tech*, the original *In Nomine* game and its *GURPS* conversion notes, and several old comic books that I can't remember the names of anymore. In addition, I might add that a good bit of it is based on real history, such as the *real* Sanger orbital bomber, or Himmler's own disturbing occult ramblings (such as an SS priesthood). Recently, alternate World War II products have suddenly come out in force. Pagan Publishing's *Delta Green* (and more recently, *Godlike*), Pinnacle Entertainment Group's *Weird Wars: Blood on the Rhine*, Dream Pod 9's *Gear Krieg*, and Fat Messiah Games' *Hard Vacuum* have all hit the shelves. Fiction in this area includes such excellent reads as Robert Harris's *Fatherland* and the various Harry Turtledove novels. Even PC games, like *Return to Castle Wolfenstein*, are cashing in on the phenomenon.

If you've been keeping up with all this, you'll see right where this article is heading. I like to call all of this Panzerpunk.

The Backstory

When Hitler takes charge of Germany in 1933, he puts Albert Speer in charge right away to build the infrastructure and industries necessary to feed his military machine. He also charges Himmler with finding something useful in all that Nazi occultism (see Nicholas Goodrick-Clarke's *The Occult Roots of Nazism*).

Speer handily chooses to put the Third Reich science in the deft hands of Werner von Braun. After a stunning exhibition of Von Braun's rocketry, Hitler backs the proposed Nazi space program, and Nazi "vakuumflieger" make the first suborbital flights in manned rockets in August of 1939. Shortly after Poland is invaded, the Reich tests its first atomic bomb. Thanks to the foresight and energy of Speer, von Braun, Willy Ley, Eugene Sanger, and others, suborbital spaceplanes are skipping across the upper atmosphere by the spring of 1940.

The Allies do not stand idly by. The British take the lead in Allied rocketry, under the guidance of Frank Whittle and A.M. Low, until the Nazi war machine rolls through the streets of Paris. High-altitude rocket planes of the RAF manage to beat back the Nazi onslaught, but only barely. Russia burns in flames, its Pact of Steel shattered when rocket-powered FW-313 Saengers bomb Moscow into atomic ashes.

The U.S. displays its typical isolationist stance, until Japanese rocket planes sink American battleships, and carriers, at Pearl Harbor. With British support they play catch-up in the Space War; the US Army Rocket Corp has Curtis PX-40s protecting the stratosphere above North America by late 1942.

Warships increase in size and capability as the Space War heats up. Allied and Nazi scientists develop the ultimate brute-force rocketry, the Atomic Drive. Using atomic bombs for fuel, Axis and Allied warships battle each other in the cold vacuum of space, relying on cranky radar and low-tech binoculars to spot each other before a salvo of shells rips through their armored skin. *GURPS Space* meets *GURPS WWII*.

By 1945 the war is being fought all across the inner Solar System. The Moon and Mars are both prizes, and battles for them force men to bleed and die there the same as their earthly counterparts. Transfer orbits between the Earth, Moon, and Mars are the shipping lanes of the Solar System, brimming with heavily laden transports stalked by atomic-propelled warships.

The devastation brought on by the Atomic Age wrecks Earth. Cities are mangled carcasses of concrete and iron. Roads and rail networks are demolished. The U.S. military develops an all-purpose engineering vehicle, the Thug, to help rebuild the shattered countryside. A walking tank with crude arms, the Thug greatly sped up the process of clearing rubble. Soon, however, resourceful GIs mounted weapons on the arms, and welded armor to the cockpit area. Thugs, sometimes called "stalking tanks," or "stanks" (a reference to the smell left inside the cockpit after a few days of continuous use), became frontline vehicles. *Panzerkampfanzug* is what the Nazis called theirs, and they built them by the thousands to support their gargantuan Maus supertanks.

A Deal with the Devil

Reichsfurher Heinrich Himmler's bid for Nazi supremacy comes from a totally different angle. Ahnenerbe (Himmler's mystical research organization, which Spielberg depicted in the *Indiana Jones'* films) finds the answer to their quest: human sacrifice in exchange for all-consuming supernatural power locked in the soul of the Aryan master race. Himmler jumps in with both feet, and in and makes a deal with the Devil. He sacrifices a few Nordic virgins, or whatever, and gets an army of darkness in return. Demons, undead, vampires, long-dead Germanic warriors, black magic, etc. It doesn't matter how, really, just as long as we get undead Nazis. GMs can make great use of *GURPS In Nomine*, *GURPS Spirits*, *GURPS Undead* (Independent Body Parts is a must!), and the *GURPS World of Darkness* titles for this. Stir in *GURPS Black Ops* to taste, just to make things fair for the players.

The disease that the undead carry spreads on to any troops scratched or wounded by the creatures. They arise as undead as well, unless clerical magic is used to stop it. Some areas of the world are completely overrun with undead, such as France and England. Only walled villages and towns that endured the initial onslaught have survived.

Town militias patrol the streets at night with IR-equipped BARs and halftrack-mounted searchlights. Sewer crawls and infested buildings are usually farmed out to mercenary outfits, who kill zombies and get paid by the head, literally. Chaplains with True Faith -- and shotguns -- lead villagers in defense of their homes. Special forces units take on the tough jobs of clearing cities and forested areas. Air support uses lots of napalm. One common creature is the *spinne*. This undead thing has a human head, to which is attached four or more arms from corpses. (The same concept, applied to a rat's head, using human fingers, makes a great surprise for a tank or Thug crew.)

Technology

This is a TL6+1 alternate history. Major differences in TL involve the addition of nuclear power, TL8 HO rockets, and the TL7 Orion drive. Most other gear is TL6. Sensors are limited to radar and sonar. This is important as it allows an element of stealth and stalking in space travel, since radar is one of the easiest sensor technologies to spoof, creating a space-warfare analogy to a submarine game of cat-and-mouse. This makes for exciting play. All vehicles should be created with the vehicle design system in *GURPS WWII*. The new additions include:

Item	VSPs	Wt.	Cost	Power
Arm Motor	1	25	\$18K	3
HO Rocket	0.6	120	\$500	0
Full Life Support	10	1000	\$50	10
Atomic Drive	2K	1.1M	\$1M	0
Atomic Reactor	500	60K	\$40K	0

Each Arm Motor provides a ST 300 motor with the cheap and striker options from *GURPS Vehicles*. For double VSPs, weight, and cost, the arm may have a crude gripper (-4 to DX). The power requirement has been doubled to account for the poor performance of TL6+1 arms. Arm subassemblies should be purchased as non-rotating superstructures, using the Subassemblies Table on p. W127. Note that arms do not require rotation space as it's included in the arm motor volume. For more details, see *GURPS Mecha* and *GURPS Vehicles*. The HO rocket (courtesy of von Braun and Robert Goddard) provides 5,000 lbs of vectored thrust and consumes 7,500 gph HO rocket

fuel per module. HO fuel weighs 2.1 pounds per gallon and costs \$0.2 per gallon.

The Full Life Support module provides oxygen and water for one person indefinitely. It does *not* provide food, however. That should be carried as provisions (\$500, 100 lbs., and 1 VSP of highly nutritious food tablets supplies 300 man-days of sustenance). The Atomic Drive, created by R.J. Oppenhiemer and friends, provides 4 million pounds of thrust per module and consumes 3,600 nuclear bombs per hour. Each bomb costs \$6,000 and weighs 60 pounds. Four such bombs take up 1 VSP, or 900 VSPs per hour of operation.

The Atomic Reactor module provides 5,000 kW of power and lasts for 1 year before needing an overhaul.

See *GURPS Space* for more information on spacecraft and performance calculations, and *GURPS Mars* for information on the Red Planet. Assume that any craft that is towed to 50,000 feet or more on Earth adds 1.5 MPS to its delta-v for purposes of getting into orbit. This is how most non-Atomic Battlesuits make a natural addition to a Panzerpunk campaign. Increase battlesuit control systems and arm motor statistics by 100% to reflect the crude nature of TL6+1 technology.

Personal Gear

Personal weapons and gear haven't changed a lot. If in doubt about availability, consult the Guaranteed Play Balance table (p. CIII10) and pick a few appropriate modifications. TL7-8 items in *GURPS Space*, such as pressure tents, NBC suits, hand thrusters, re-entry kits, and enviro-bubbles can all be used with a simple 50% increase in weight, and 1/10 normal cost. Food tablets should be allowed as-is, however.

- *Duralum Armor*: Also called "soldatplatte" by Nazi troops, this is heavy, articulated aluminum plates reinforced with layers of nylon. The suit has PD 4, DR 7, and includes a helmet, gloves, and boots. The helmet is open-faced, but can be combined with a gas mask and sealed against chemical weapons and fallout (PF 5). \$75, 65 lbs.
- *Geiger Counter*: Used to measure radiation levels. \$50, 4 lbs.
- *IR Goggles*: Active IR viewers allow the wearer to see up to 200 yards at night at half the normal darkness penalties. Any other active IR source, such as IR spotlights, can be seen by the viewer at twice normal range. They are usually mounted to helmets or worn with Duralum armor or space suits. They need 0.01 kW of power. \$50, 5 lbs.
- *Radioisotope Generator*: Provides 1 kW for about 14 years. Useful for recharging batteries or powering radios. DR10, HP30. \$2,000, 200 lbs.
- *Space Suits*: These heavy suits (PD 2, DR 3) are quipped with a reflective surface (PF 5), a waste relief tube, a 1-mile transmitter radio, and two hours of life support. The helmet (PD2, DR4) gives -2 to Vision rolls. \$200, 75 lbs.
- *Flame Launcher*: A disposable, single shot flame device that looks like a 2-foot tube with a pistol grip at one end. It shoots a single shot of flaming petrol. It is most useful for dealing with nests of spinne and other undead from a distance. Malf Crit, Dam 3d (flame), SS 14, Acc 4, 1/2D 25, Max 40, Wt. 7 lbs., RoF 1, Shots 1, Rcl -3, \$25.

Sample Vehicle

Curtiss PX-40 Rocket Plane

Subassemblies: Heavy Fighter Bomber chassis +4, High-Agility Reconnaissance wings +2, 3 retractable wheels +1.

P&P: 10,000-lb. thrust HO rocket with 2,055 gallon ultra-light tanks [Body and Wings].

Occ: 1 CS Cargo: None

Armor F RL B T U

Body 3/5 3/5 3/5 3/5 3/5

Wing 3/5 3/5 3/5 3/5 3/5

Wheels 3/5 3/5 3/5 3/5 3/5

Weaponry: 3x20mm Short Air AC [Body: F] (60 rounds each).*

*All linked to fire at once.

Equipment: Body: 0.5 man-day life support, medium transmitter, large receiver, navigation instruments, 10-mile radar, radar detector, bombsight.

Wings: 1,000-lb. hardpoint each.

Statistics: Size: [LxWxH] 65'x 25'x 15' *Payload:* 6,590 lbs. *Lwt:* 11,957 lbs.

Volume: 608 cf *Maint:* 47 Hrs *Cost:* \$22,437

HT: 10. *HP:* 525 Body, 35 Wings, 50 each wheel.

aSpeed: 765 mph *aAccel:* 21 mph/s *aMR:* 1 *aSR:* 2

Stall Speed: 115 mph.

gSpeed: 362 mph *aAccel:* 18 mph/s *aMR:* 0.25 *aSR:* 4

Ground Pressure Extremely High. No Off-Road Speed.

sAccel 0.94 g, *sDec* 0.94 g, *sMR* 0.94 g

Delta-v is 3.22 MPS.

Design Notes: Full Speed endurance is 21 minutes. Statistics include two 300-gallon HO wing tanks. Routine operation reduces speed to 230 mph (0.28gs), but extends duration to 85 minutes. If towed to an altitude of 50,000 feet by another aircraft, it can reach orbit from the Earth's surface. It can easily make orbit on the Moon and Mars. Repeated re-entry of the Earth's atmosphere can cause the craft to disintegrate!

There's Something Your GM Wants to Tell You

by Jon M. Mollison

Sometimes I wish I was a player. The grass looks so much greener on your side of the screen; you only have one set of statistics in front of you, you only have one person's motivations to rationalize, you get to sit back from time to time, watching another character grill my NPC for a while, and -- best of all -- when the session is over you get to go home to other pursuits. I have to deal with the motivations of dozens of characters. There are reams of papers, maps and notes behind this screen to try and keep straight. I participate in almost every encounter and must know even the most esoteric rules of the game, "just in case." Worst of all, when the session is over, I go home to next week's session.

The Next Session hovers over me all week, like a black cloud, demanding attention. At times I can almost hear it whispering to me; "Tie up this plot thread. How are the NPCs going to react to the current situation? Make sure you understand these rarely used and poorly written rules before the next session. Revise the plot structure, and whip up ten more important NPCs while you're at it." My evenings are spent trying to silence the voice but there is always so much more work to be done.

Don't get me wrong, the work definitely has its rewards. It's nice to see my creations come to life each week. Not being tied to one particular character lets me stretch my role-playing muscles and it's nice not to have to conform to one single world view week in and week out. I enjoy being the center of attention for most of the evening. I absolutely love the look on your faces when I reveal this week's Big Surprise.

It's just that sometimes I wish there wasn't so much work. Sometimes I wish you would do a little more to help. There are all sorts of way you could. If you aren't too busy this week, here are a few things you could do that would help ease my heavy burden, and most of them are pretty fun to do, too.

1. **Design a couple of NPCs with whom your character is likely to interact.** It could be a mother, the guy at the donut shop where your character gets his bagel and coffee every morning, maybe even the high school bully he hasn't seen in a decade. Whatever tickles your fancy. Just write out the basics and pass it on at the beginning of the next session. This one simple task will work wonders for the campaign. It will add countless living people to the world, give you an even greater stake in the outcome, and give me still more plot hooks.
2. **Use your information gathering skills frequently.** As I prepare this week's adventure I'm looking over your character to see what sorts of challenges to throw your way. One of the first things I do when placing important clues is determine how you are likely to find them. If I know that your psychic can intuit the history of an object, you can bet I'll leave a bloody knife at the crime scene. If you forget about your psychic powers how am I supposed to feed you an image of the killer?

In a fantasy setting I'll take advantage of your divination spells, in a modern setting I'll give important information to the weasel snitch that owes you a few favors. But I can't make you use these aspects of your character . . . that part is up to you.

3. **Know when to ask, "Is there a <insert useful item here> nearby?"** We only have so much time in this session, so when I describe a location I only give a brief description of the place and mention those things that set it apart from other, similar places. Of course there's a beer bottle on the bar; you're in a saloon. No, there isn't a painting on the wall of the airliner in which you're traveling.
4. **How many times have we been through this little song and dance?**

Me (as the shopkeeper): That widget you're holding costs fifty bucks.

You: How much is a widget really worth?

Me (thinking your character is asking the shopkeeper): I just told you, fifty bucks.

You: No, how much is a widget really worth?

Me (still not getting it): Get outta my store, you no good punk!

You: Jon, it's a simple question. I don't have my rulebook and I want to check the price before my character starts haggling. I don't think there's any need for you to call me a punk.

This doesn't have to happen, and it won't if you have a method of quickly establishing whether you are talking in character or out of character. This can be visual, (my personal method is to lean to one side and place one hand to my opposite cheek in the classic "stage whisper" pose) or aural (notice how many accents my NPCs have? That's to help you distinguish between them and me.)

It's very easy to confuse things when you ask me questions without some way of differentiating between you and your character. Am I supposed to answer, or is my current NPC? And while we're on the subject of "you or your character," you know those cute little smart aleck comments you like to toss out in the middle of tense negotiations? I have to admit that I think they're pretty funny, too. But when I can't tell whether it's you or your character, I may assume the worst. Which means that smart mouth of yours is going to get your character in deep trouble.

5. **This is the last, and probably most important: tell me what you want.** I'm not a mind reader, so this is the only way I have of knowing how the game is going. If you don't tell me Lord Rothnar wants to go on a quest to find the fabled Blade of Painful Disemboweling, you just might find Tights of Comeliness waiting for you in the Lich-King's basement. I'm going to send you out on one treasure hunt after another until you tell me that you want to do some serious character development with fully fleshed out NPCs (see suggestion 1). Just like in a marriage, the key to keeping everyone happy is communication. You let me know what you (or your character) is looking for, and I'll try to give it to you.

These suggestions weren't too painful, were they? Even if you do just two of these things the benefits will be astonishing!

The world will come alive with new people, places and situations that would never have occurred to me. You'll get to see your creations come to life and actually interact with your characters. You'll have a greater stake in the campaign and enjoy it more because of it. Best of all, with all the extra sleep I'll be getting, you won't have to face a cranky, overworked and surly GM at the next gaming session. With just a bit more effort on your part we can make this the greatest, most enjoyable campaign we've ever had.

Pyramid Review

Seven Strongholds (for d20)

Published by [Atlas Games](#)

Written by Robin D. Laws

Illustrated by Chris Pepper, Michael Clark, Mike Dutton, David Interdonato, Jennifer Meyer, Steven Sanders

128 b&w pages; \$20.95

Seven Strongholds is another title released under Atlas Games' Penumbra imprint of *d20* sourcebooks and adventures. It presents seven different castles, forts, and defensive locales, created by Robin D. Laws -- the author of numerous RPGS and supplements, including *Rune* and *The Dying Earth RPG*, and more recently, *Robin's Laws of Good Game Mastering* from Steve Jackson Games. Each of the seven entries is designed with the intent that it is easy for the DM to prepare and slip into their own campaign, whether by immediate need or by planned design.

Behind Chris Pepper's cover, *Seven Strongholds* is laid out in the Penumbra house style, and thus up to Atlas Games' usual professional standards. The artwork helps capture the feel of each of the seven locations given in the book, but the maps reduce the book's ease of use. Actually, the maps themselves -- by Rob Lee -- are perfectly all right; it is the labeling that is the problem. Where the maps require numbering, an explanation of these numbers is given only alongside the map and not in the heading for each room description. Thus if the referee is reading these descriptions, they are forced to look at the map key before looking at the map itself. It would be easier if the DM were able to refer back and forth between the map and text without having to look at the key. Of course, the book is backed up with a very useful index that organizes all of the Open Gaming License material into categories for ease of use beyond *Seven Strongholds* itself; if you want a particular trap, wondrous item, or deity, there is no unnecessary thumbing through the pages in the hope of finding it.

All of the entries are arranged in a standard format to make them easy to use. Each chapter opens with a simple description of its stronghold in "At A Glance," before going to examine its Placement, Characters, and The Installation. The final two sections -- Scenes and 'Alternate Versions -- suggests ideas on how a referee can involve their players in that particular location, and how it might be used to fulfill a different purpose in the DM's campaign. All of the characters are unique and interesting . . . even those NPCs that are provided with stats, which is a nice touch.

[SPOILER ALERT]

Seven Strongholds opens with The Barrows. This is a concrete bunker, located in or near a major habitation that caps the entrance to the subterranean world. Hordes of monsters work to break out onto the surface and lay ravage to all around, but a determined troop of Gnomes work hard to prevent this from happening. Although the underworld itself is not detailed beyond the Gnome defenses, The Barrows could sit above a major dungeon within a campaign world. In return for their work, the Gnomes receive a share of the local taxes, but remain on good terms with the locals. Shops have been established at The Barrows entrance, and these serve both adventuring parties on their way into and out of the dungeon below. If a campaign revolves around the exploration of a dungeon in true classic *Dungeons & Dragons* style, this could be used as the starting base for such a game. Alternatively, of course, the Gnomes could just be hiding the fact that the all of the monsters have been killed and are still keeping this a secret to continue raking in those taxes . . .

Castle Briar is a stronghold of Elven legend; now it could be of merely symbolic significance, or still remain as part of the active defenses against the enemies of the Elves. Its current lord, the taciturn G'wairin Enderan, is a warrior of great repute, but in matters of the heart and diplomacy he has little skill. He is wary of any that might be a rival, but will not act unnecessarily against them. The castle is actually more interesting than the occupants, as it is actually an enormous living briar. Floors, walls, and ceilings are made up of the thorny bush, which can respond to defend itself or follow the orders given by an Elf with correct password.

Particularly miserable -- not only in its location and condition, but also in its occupants -- is Gloom Keep. They would rather not have to welcome visitors, and if they have any, welcoming is the last thing they will be! They are worshippers of the forgotten god, Hustalen the Protector, once known as the Hammer of Law. Though the dreary deity has his adherents, there are only a few that go forth to convert others to his faith and of those that do return to Gloom Keep, few remain. Hustalen's encroaching age and senility completely pervades the castle, from attitude of his faithful to the odor of his micturition. As written, there really *is* a god withering away upstairs . . . but alternatively, Hustalen might be malign rather than strictly lawful. In which case, the guardians could be protecting the outside world from him, rather than the reverse, or even just nurturing his return . . .

In Old Mound Fort, the author turns the stereotype of the chirpy, friendly Halfling firmly upon its head. A band of Halfling adventurers have restored an old iron-age ditch-and-rampart fort in order to support adventuring parties who have come to delve the ruins of a past civilization that lie all around it. Yet these Halflings are of a mercenary bent and as the fort is only refuge for miles around, can charge what they want for their services. Their desire for gold goes much further in that they also prey upon returning parties, disposing the bodies in a rather gruesome manner.

More traditional is Steelface Point, a Dwarven stronghold that blocks the mouth of a mountain pass. Before it is a wide plain, home to goblinoid hordes that regularly drag their increasingly accurate war machines to smash the fortress, so they can sweep through the pass and into the civilized lands beyond... This imposing defense is not constructed of stone, but of riveted steel and it relies upon magical fire-throwing devices called "Lions of War" to stave off the regular attacks. Though it has stood for many decades, Steelface Point has reached a point of crisis. The hordes have become more accurate, and more importantly, the resident wizard has been killed recently; without him, the "Lions of War" cannot be recharged . . . Perhaps relief from the lands that it protects is on the way to Steelface Point, or perhaps a PC wizard can be persuaded to stay and help -- along with his compatriots, of course.

Probably the most interesting stronghold in this book is The Perch, a domed cliff top lair that is home to a new race of birdmen, known as the Psittae. Jealously status conscious, fervently territorial, and disdainful of those humanoids that simply walk, the Psittae oppress the local population into providing them with food and occasionally labor for those jobs that they are unable to do (or just find too distasteful). All aspects of their society are covered, including religion, reproduction, and their attitude towards their own guano . . . (The fact that they perch in their huts and not on the floor means that should any characters find themselves within The Perch, they will find it rather messy under foot!)

The final stronghold is Uthront's Fort, a rough and ready, recently built motte-and-bailey castle commanded by a Half-Orc looking to be the founder of his own little kingdom. Uthront possesses a magical breastplate that allows him to learn new feats beyond those allowed by his current level . . . and that includes several new ones such as "Killing Strike," which allows the user a greater chance of taking down an opponent to -10 hp and graphically describe their method of despatching them. This location looks at a group of "evil" humanoids that have more than pillage and burn as their motive, but while Uthront might have visions of a glorious kingdom with himself at the reigns, the suggested alternate version actually examines a potential history for the new country. Essentially it is doomed, as the kingdoms of men will not allow such an Orc state to exist, but this does give Uthront's Fort the potential for long-term use.

[END SPOILER ALERT]

Like all Penumbra products, *Seven Strongholds* gives the referee lots of useful material that they can add to their campaign. This not only includes each of the forts and castles, but new additions to the Open Gaming License in the form of feats, skills, creatures, gods, and traps (including a "Quick & Dirty Trap Generator" to be found in The Barrows). Each of the entries in *Seven Strongholds* is useful in one way or another, though it is The Barrows and Uthront's Fort that really spring to mind as being good for kicking off a campaign. Most interesting though, has to be

The Perch, with its new race and comprehensive description of their society and how they interact with the surrounding population.

While *Seven Strongholds* may not be as immediately useful as, say, the Penumbra encounter anthology *En Route*, there is much to be made of these forts if the referee has the time to sit down and prepare.

Pyramid Review

Floorplans by Brian K. Moseley: Inns & Taverns, Castles & Keeps, Temples & Shrines

Published by RPGNow.com

Written and drawn by Brian K. Moseley

GIFs of various sizes, with HTML pages to link to them; \$5 each

These are packs of non-system-specific floorplans for (depending on the package) taverns (15) and inns (20), castles and keeps (5, total), or temples, churches, and shrines (30 total, plus thumbnails on 30 deities). (There's also a sample keep and three sample taverns and inns, available at www.darkfuries.com; these are not repeated. One can also find two more sample castles at Moseley's [old Geocities site](http://old.Geocities.site), though that site's lifespan is problematic. The sample church at rpgnow.com *is* repeated in the actual product.)

The floorplan sets are primarily available as Electronic Software Downloads (ESD) from rpgnow.com, but RPGNow will also put your material on CD-ROM or paper for a slight additional cost. They come with HTML (and thumbnails), enabling one to view them with one's favorite browser. (More importantly, from my point of view, it also allows me to customize the names -- or even add more maps -- trivially! For instance, I've already put the sample inns, taverns, and castles into the table of contents file.)

Each of these are black and white line-art (GIFs), drawn as a top-view onto a dotted-line grid which gives the scale: 5 feet per square. The art includes beds, chairs, church pews, statues, wall hangings, barrels and crates, privies, and basically everything that doesn't move. Secret doors, if any, are noted, as are defenses such as murder holes and the like, primarily in the castles. I have not printed these out yet, but they look like they would be clear and -- mostly -- not too big for an average-sized page. (The inns, taverns, and many of the churches would be fine; the keeps and castles would probably be too large unless shrunk.)

No fancy deathtraps are included, or magical amenities; these are floorplans you can use for a mostly realistic setting without altering. (If you have a high-magic setting, you'll need to add things such as Apportation-based dumbwaiters, Cold Boxes for food storage, and No Magic zones in dungeon areas.) There are no "what players see" maps, though -- secret doors are clearly marked. To make a player map will require a little work in a drawing program that reads GIFs. Remember to save a copy of the original first!

The *Inns & Taverns* ESD is the first of the floorplans series, and the one with the fewest frills. There's a Floorplan Legend link, showing common images for various things . . . but from there, you're on your own. (Fortunately, the images are clear enough to figure out what's what, with the exception of Inn 003, which either has a *huge* fireplace, or a stage. I named the Inn "The Stage" to remind me of my choice.) Most of the inns are multi-story, and several of the taverns are as well. Two of the Inns are especially unusual, one being a tree-based dwelling and the other carved into a cliff. (And no, the Inn on the Bluff does not have exterior doors; I asked Brian Moseley about that, though I forgot to ask him about the Stage, having already determined what *I* wanted to have be the case.)

Likewise, there are two unusual taverns: one in an old Lighthouse, and the other on a pier. Even if you never need to

describe an inn or tavern down to the detail which these floorplans allow, you'll have a good idea the major parts you'll be sketching out to your players should they wander into one. (And the tree and cliff inns might provide inspiration -- as they did for me -- for unusual settings in general, to spice up your adventures.)

Castles & Keeps, the second ESD, adds an Alcove Illustration -- arrow-slit designs for each stronghold -- as well as a glossary of terms used (a donjon is not a dungeon, and a gallery is not necessarily full of art) and descriptions of the various rooms which will pop up in another window in your browser. I have not researched castles or keeps enough to know whether these are heavy on historical accuracy, but they seem well-thought-out. There are servant and guard quarters, cesspits, interior stables, and the keeps have quarters for fletchers, blacksmiths, and the like. My only quibble would be that there might not be enough room for local villagers to move within the walls in time of siege, though putting enough courtyard space for that would probably make the maps unmanageably large. At the least, they are *plausible* -- and for most games, that's perfectly fine. Two of the floorplans are towers (one with ten levels!), suitable for isolated guard-posts or wizardly homes.

The most recent EST, *Temples & Shrines*, has both descriptions of various shrines (4), chapels (15), temples (8), churches (2), and a cathedral (1) -- and a thumbnail description of 30 fantasy deities. Each map details a place of worship for one of those fantasy gods. Some are very simplistic, such as the shrines of Tayne and Ul'ty, while the hidden Church of Huthunic has two underground levels, as well as the two stories of the legitimate businesses and homes aboveground -- and the Church of Eteris is entirely hidden within a sewer system! (The entire sewer system isn't detailed; just the parts the church is in.)

Since each one is devoted to one of the included gods, some are inappropriate for a non-fantasy god . . . either an included one, or one which is equivalent. However, the majority of the floorplans are easily convertible to a more traditional chapel affiliation (such as one will want for a *GURPS Yrth* campaign). There are no mosques, alas; the niche of historically-accurate, gameable floorplans is still open.

Forthcoming at the time of this review is *Mansions & Manors*, which will add color images as well as black and white maps, player and GM maps, and *d20* system characters included (with portraits, so you can tell your players, "He looks like this!"). From the thumbnail samples, this looks like at least one of the buildings is nearly as big as the towers from *Keeps & Castles*.

If you're a map-junkie, these are great value just on their own. If you're running a modern campaign, you'll probably want to look elsewhere, so far (though *Mansions & Manors* might change that!); the inns and taverns could be adaptable to hotels and bars, but it will take a bit more thought, while the churches would need restrooms and children's rooms, and the castles are basically out-dated. Likewise, futuristic settings would require a certain anachronism make the best use of the floorplans (though the taverns could work well for spaceport bar-hostels). But if you're running a straight fantasy campaign, each and every one of these products will have floorplans that find a home somewhere in your world.

Pyramid Review

Lone Stars: The Texas Rangers (for Deadlands & Deadlands d20)

by [Pinnacle Entertainment Group](#)

Written by Christopher McGlothlin, M.Ed.

\$20.00

Lone Stars: The Texas Rangers, written by Christopher McGlothlin, continues Pinnacle Entertainment Group's high-quality output. Detailing the resources, organization, and resources of the Texas Rangers and the Confederate Chaplains Corp, *Lone Stars* provides players and Marshals alike with all the information they will need to make these organizations a part of their campaign. Those who are already have Texas Rangers or Blessed Chaplains in their posses will find this book especially useful, as it will provide additional depth and opportunities for players and Marshals while not unleashing any unexpected surprises that will require extensive reworking of their campaigns. The formatting of the book is especially user-friendly, allowing it to be integrated into a game as a prop as well as a sourcebook.

Lone Stars, like most *Deadlands* supplements, is divided into three sections. The first of these sections is written in the form of the Ranger Bible, providing player characters with the history, command structure, and regional commanders of the Texas Rangers. Also included is all the information that the Texas Rangers have about the horrors that populate the Weird West. This presentation of the information allows player characters to use the sourcebook as a resource during play, looking up potential contacts and strategies. Marshals need not worry about players getting too much information, though, as some of the entries are out of date or incorrect, representing the limitations of the Texas Ranger's knowledge.

One of the welcome mechanics for determining how much information and which resources are available to player character Rangers is the Rank and advancement system. Using a system of merits and demerits to control the access to higher ranks, McGlothlin provides Marshals with a simple system for determining the rate of advancement of a player in the Texas Rangers. Given that access to the resources and knowledge of the Rangers is limited by rank, this is important. Indeed, since the section of the Ranger's Bible that details the horrors of the west is only available for Majors and above, these rules are more than just another statistic.

Lone Stars details the material resources available to Rangers in five pages, although they are referred to elsewhere. These resources run from the common version of the Ranger's Bible and Badge issued to all Rangers, through items like the LeMat Undertaker and Bowie Survival Knife, to the Congreve Rocket Battery. This is, of course, significantly shorter than the equipment section found in *The Agency: Men in Black Dusters*, representing the less technological approach taken by the Texas Rangers. The combat maneuvers, which take up an equal amount of space, reinforces this point. These maneuvers are a combination of the traditional western roundhouse punches, flying tackles, and moves employed by the Rock and Hulk Hogan on pay-per-view wrestling matches. Each must be learned and purchased (1 point during character creation and 2 bounty points each after character creation). As in all new *Deadlands* supplements, *d20* stats and equivalent are given for all equipment and maneuvers.

The Confederate Chaplains Corp is also briefly covered in this book. While no new Blessed powers are provided here, there are rules on how to integrate chaplains into your campaign; also provided are some very minor relics for their use. The information on the Shootist, although it duplicates a great deal of material from elsewhere, is a welcome update of the Hexslinger Arcane Background. McGlothlin tweaks, improves, and expands the hexes for this class and clears up a number of questions and inconsistencies distinguishing Shootists from Hucksters. Players interested in this

class will find this section alone worth the price of the book.

There are a handful of small printing and proofreading errors in *Lone Stars*, although they are not sufficient in number to be much of a distraction. The artwork is of universally high quality, although many of the pictures have already appeared in earlier Pinnacle publications.

[SPOILER ALERT]

The Marshal's section of the book expands on the information presented in the posse's section of the book, and provides information on several new creatures specific to the regions detailed previously, including the Burning Dead - Walkin' Dead from the flaming ruins of post-*Dead Presidents* Richmond. This bit of information (and the references to the outcome of *Dead Presidents*) fixes the timeframe of the book. Marshals who are running a campaign set earlier should read the player section carefully, making certain that it does not contain information which will spoil their future plans. Marshals should also be aware that *Lone Stars* references several other *Deadlands* supplements . . . especially regional sourcebooks like the two *Back East* books.

If you have no interest in including the Texas Rangers in your *Deadlands* campaign, whether it is based on Pinnacle's original system, the *d20* system, or the new *GURPS Deadlands* rules, this book will provide little for you. If you *are* interested on how the Rangers work, where they can be found, and how they fight their opponents, you will enjoy this well-written book and find it a useful addition to your gaming library.

Murphy's Rules

Murphy's Rules

Interior and Terminal Ballistics for *GURPS*

by Douglas Hampton Cole

Ever had a player who wanted his *Black Ops* character to tote around some obscure or fictional piece of artillery that he'd read about in a back issue of a science fiction magazine? Or a player who wanted his Old West character to carry a lever action rifle and a revolver with the same ammunition? How about players who want to cut down a revolver or rifle to make it more easily concealable? In some campaigns, players ask for some very oddball pieces of equipment now and again.

Presented here is a method for taking some real-world information and converting it into *GURPS* damage. It also presents a slightly new way of looking at special ammunition types, and revisits the blow-through rule, giving it a nudge towards the realistic by making blow-through vary with a projectile's wounding potential. Finally, it provides a formula for estimating the kinetic energy (KE) imparted to a projectile given some real-world parameters.

Interior, Exterior, and Terminal Ballistics

Interior ballistics refers to everything that happens in a firearm from the moment the striker hits to the moment the bullet leaves the barrel. For TL5-7, this involves black powder or nitrocellulose powder expanding in a firing chamber, and then accelerating a projectile down a tube. For *Ultra Tech* projectiles, it might involve magnetic acceleration. We can even generalize the issue by claiming that "interior ballistics" can be stretched to include the force a bowstring exerts on an arrow, and cover TL3-4 missile weapons as well.

In all cases, the propellant is applying a force to the projectile over a certain distance (or draw length, for the case of bows and crossbows). Simple physics states that force applied over distance equals energy. If we turn that into kinetic energy by using the equation $F \cdot x = \frac{1}{2} mv^2$, we can determine the final velocity of the projectile, which is where interior ballistics ends, and exterior ballistics begins.

Once the projectile leaves the weapon, Sir Isaac takes over and we could calculate a trajectory. However, all of this is (usefully) abstracted into a skill roll in *GURPS*, which is far simpler. It is worthy of note, though, that with some knowledge of how the velocity of a projectile degrades with distance, you would not have to employ the mechanic of the $\frac{1}{2}$ Damage range . . . you would simply solve for the projectile velocity at the target range, recalculate damage based on the final velocity, and roll some dice. That would require a computer to be used at the gaming table . . . some do it, but it's certainly not for everyone! Once the bullet arrives at its target, exterior ballistics ends.

While there is probably no more controversial subject in firearms literature than the effects that bullets have on people and animals, for gaming purposes the questions are fairly simple: how much armor can the projectile penetrate, and what does it do to the target once it gets through all that armor? That's terminal ballistics, and for gaming purposes, we're going to assume that projectiles do two things. First they penetrate defenses, and then they penetrate flesh, causing a wound as they do so.

Modeling the penetration of armor is actually not that hard. Penetration of solid objects tends to scale with the kinetic energy (KE) of the impactor divided by its cross sectional area (Xsect). In *GURPS*, DR scales linearly with thickness (in reality protection scales with the square of thickness), so at the very least our model will scale armor penetration ability with the square root of KE/Xsect. However, in order to maintain consistency with the vast majority of *GURPS* published material out there, we have to make some modifications to that scaling. We need to assume three things:

1. The 585 Joule 124 grain 9mm NATO standard cartridge is fixed at 2d+2 damage, the value given in *GURPS Basic* and *High Tech*
2. The .50 BMG is accurately recorded in *Vehicles 2^{ed}* as 13d+1 (equivalent to an average penetration of about DR 46.5, or 17mm of steel armor)

3. The penetration of a .30-06 should be roughly halfway between the 9mm and .50 BMG (hopefully matching the 7d+1 listed in *GURPS High Tech*).

Re-scaling the penetration figure to fit currently published *GURPS* stats may not be elegant, but in the end it will mean that fewer tweaks need to be made in existing campaigns. Chalk another one up to "playable abstraction!"

This article will deal with terminal ballistics first, proceed to ignore exterior ballistics, and then return to interior ballistics for those who just have to modify their .357 magnum to have an 18" barrel, or design an archer who can pull a 200lb longbow.

Icky Equations: Penetration Of Armor

The damage formula for armor penetration is

$$\text{Damage (points)} = \sqrt{\text{KE}^{1.04} / \text{Xsect}^{0.314}} / 13.3926$$

where KE is expressed in joules and Xsect is in square meters. Convert this value to dice by dividing by 3.5 and converting the remainder to "adds" by taking the decimal remainder, multiplying by 3.5, and dropping all fractions. This would convert damage of 13 points to 3d+2. Alternately, you can try to divide damage by either 3.5 or 7, and pick which is more satisfying, 13 being (approximately) 3d+2 or (exactly) 4d-1.

Example: We want to determine the penetration of a new 7mm (cross section equals $p \times (\text{Bore}^2) / 4 = p \times (.007\text{m})^2 / 4 = 38.5 \times 10^{-6}$ square meters) TL8 assault rifle. It fires a projectile with a KE of 3600 joules (a 10 gram bullet at 848.5m/s). The formula gives it a damage value of $\sqrt{(3600^{1.04}) / (38.5 \times 10^{-6})^{0.314}} / 13.3926 = 26.0$ points. This converts to 7d+1 of damage with 0.5 points left over, which we drop. The base penetration of this round is 7d+1.

Armor Piercing Rounds

All bullets are not created equal. Some are designed to penetrate solid objects more effectively than others. This can be accomplished two ways: either with a very high energy and low cross section (such as using ammo with a discarding sabot) or by constructing the bullet out of special materials. The penetration value above assumes the bullet is constructed out of a copper or mild steel jacket wrapped around a lead core. Bullets which feature a hardened steel cap, or with tungsten or depleted uranium penetrators, will punch through armor more effectively given the same energy and cross section. Use the following armor divisors with this system:

- Steel cap, reinforced core, or semi-armor piercing: 1.25
- Tungsten or tungsten carbide core: 1.9
- Depleted uranium (DU) core or penetrator: 2.4

The rules are as usual; the armor divisor reduces DR, but also reduces damage by the same amount (see *Using the Rules in Play* for a modification). This represents a bullet that penetrates farther without destabilizing or fragmenting. Do not use an armor divisor of less than one for expanding bullets, such as soft lead (LRN), soft point (SP), or jacketed hollow point (JHP). These are treated below.

Example: Our TL8 7mm battle rifle can fire special AP bullets at the same energy but with a tungsten core (the bullet will be heavier and slower). The damage is still 7d+1, but with an armor divisor of 1.9, written 7d+1(1.9). It will lance through more than 49 points of armor on an average roll!

Special Rule: Armor piercing sabot ammunition no longer merely adds +1 damage per die. Rescale the penetration figure based on the actual diameter of the penetrator. As a rule of thumb, a tungsten round with 48% of the base bore diameter with equivalent KE to the original round will duplicate the performance of APS from p.UT18. Sabot rounds are commercially available today, with a .223 projectile fired from a .308 case at over 4000 feet per second (7d)!

Example: Our opponents, the Evil Grey Aliens have beefed up their Energy Cloth by some SuperScience, and are sporting DR of near 70! Since our Black Ops still need to kill them, we issue 7mm APS ammo with a DU penetrator that's still 3600 joules, but is only 3mm in diameter. The math now works out to about 34 points of damage, giving us $9d+2(2.4)$, capable of penetrating about DR80. The only good Grey is a dead Grey . . .

More Icky Equations: Wound Channel And Blow-Through

Taking the above formula to its logical extreme, we'd all be firing hypervelocity DU needles. These will have extremely high armor penetration, and yield very impressive numbers. A 1.5x30mm steel gauss needle with 1600 joules of KE will clock in with $7d+3$ of penetration, much more effective than an M16 projectile of the same energy (5d).

We're still safe from the Munchkins, however. Once you've gotten through all that armor, you still have to leave your mark on the target. That mark is the wound channel.

Bullets cause damage by disrupting tissue, plain and simple. The old rule of thumb still holds: All other things being equal, make a big hole. While tiny projectiles might have the penetration advantage, they also don't cause large wounds (there are exceptions . . . see below!).

The wound channel modifier is what is used to scale the penetration ability with a projectile's ability to injure the target. The wound channel is given a figure of merit describing the average points of damage the round would do penetrating all the way through the torso. It is proportional to the momentum of the projectile multiplied by its effective cross-section, scaled to give our 9mm "reference bullet" a wound channel modifier of 1.0, preserving the core of the **GURPS** rules.

$$\text{Wound Channel Damage (points)} = MV \times X_{\text{sect}} \times 26,220$$

where momentum is expressed in $\text{kg} \times \text{m/s}$, and X_{sect} is again expressed in square meters. To calculate the Wound Channel Multiplier, use the following equation:

$$\text{WCM} = \sqrt{[\text{Wound Channel Damage} / \text{Penetration Damage}]}$$

Don't include the armor divisor in your penetration equations. Note that you'll need to know the mass and velocity of the projectile, and this might require some extra work to derive it for oddball projectiles. The wound channel modifier is *exactly* the same as the bullet size modifier in **GURPS High Tech**, and is used in place of that figure.

Example: We're back to the 7mm DU APS round we gave our Black Ops. After some math, we decide the penetrator is a 3mm DU rod with an 11.7:1 aspect ratio (so it's equal in length to the original full-size round) which has a mass of 3.17 grams and a velocity of 1505 m/sec (!). Entering this information into the WCM formula, we get Wound Channel Damage = $(.00317\text{kg} \times 1505\text{m/sec} \times 7.1 \times 10^{-6} \text{ m}^2 \times 26,220) = 0.9$ points, and the $\text{WCM} = \sqrt{(.9/34)} = 0.16$, which we round to 0.2. The round that is so capable of punching holes through armor will average about 5.5 points of damage per hit. What's going on? It's reality, sort of. Small holes cause small wounds, all other things being equal.

Wound Ballistics: A Quick Primer

Note the asterisk in X_{sect} , though. That's our first hint that all other things are not equal. When a bullet strikes a viscous medium like soft tissue, it will do two things. First, it carves out a "permanent wound channel" which is the volume of tissue physically disrupted by the path of the bullet. For low velocity bullets, this crush cavity is the primary mechanism of wounding. The second thing bullets do is create a temporary wound cavity, which *usually* doesn't contribute to wounding.

The WCM listed above assumes implicitly that the bullet travels straight through the target without changing its point-first orientation. For pistol bullets, this is mostly correct. For "spitzer or long ogive" shaped bullets (rifle bullets), this

is not even close to true. The point forward orientation is metastable in air, and unstable in flesh. The bullet wants to reorient itself inside your body (ow!) to travel base first. This can vastly increase the effective cross section of the projectile, as the bullet is actually traveling sideways for a while. To what extent bullets "tumble" like this is primarily a function of velocity; bullets above about 600m/sec can be counted on to do this (eventually) with high reliability. To correct for this factor, we add a bit of complexity and take a weighted average of the head-on and tumbling cross section:

$$X_{sect}^* = (1-V/600) \times p(\text{Bore}/2)^2 + V/600 \times \text{Bore}^2 \times (\text{Aspect Ratio})$$

Where aspect ratio is the length to bore ratio of the projectile, and if V is greater than 600m/sec, set V = 600.

Example: We reconsider the 7mm APS cartridge from above, replacing the smaller value of the projectile cross section with the "tumbling" cross section of $(0.003m \times 0.003m \times 11.7) = 105.3 \times 10^{-6} m^2$. This increases the WCM to 0.6, making the round three times more effective as if we didn't include this correction.

Example: A .45ACP pistol fires a 230 grain FMJ bullet at 245m/sec, with an aspect ratio of about 1.5. The penetration equation gives us a base damage value of 7.6 points (2d), and the corrected X_{sect}^* provides us with a WCM of 1.3. This is written in curly brackets, as 2d{1.3}.

Note that the WCM for the .45 is close to the generic bullet size modifier suggested in *High Tech*, and is used exactly the same, with one exception noted in the section on *Using the Rules in Play*.

Additional Complications: Expanding and Fragmenting Rifle Bullets

GURPS Compendium II (p. CII55) presented the option to players that allowed them to increase the effective damage of their weapons by loading hollow point or expanding ammunition (don't hold this against them . . . U.S. police agencies do this too, with good reason). Hollow point and other expanding ammunition can be handled in this rules expansion very simply: replace the cross-section in both the penetration and wound channel calculations with the expanded cross section of the bullet. Most well designed hollow points expand 1.5-2× on striking tissue (a rule of thumb of 1.66 is a good one, although soft pointed rifle bullets are designed to give about a 2× expansion). Do *not* apply the bullet tumbling correction. This will reduce the effective penetration of the round, but greatly increase the final wound. This is realistic; most JHP ammunition tends to be higher velocity than their FMJ cousins to offset this fact.

Example: We load our .45ACP with 230 grain jacketed hollow point bullets at the same velocity as the factory load: 245m/sec. The bullet expands to 1.66x its original diameter (0.747"). As a result, the X_{sect} value changes to $282.7 \times 10^{-6} m^2$, changing both the penetration to 6.5 points (1d+2) and WCM to 2.0(!). If we used the higher velocity JHP at 259m/sec, we edge over the line and eke out 1d+3{2.1} from this round.

The last form of complication is something particularly ugly that happens when a high velocity rifle bullet yaws in an elastic medium. Sometimes, during the time the bullet is traveling sideways, it cannot handle the stress and fragments . . . sometimes *badly*. The M16 (5.56×45mm) cartridge is noted for this effect below a range of 200m or so, as are the Yugoslav versions of the AK-47 round (7.62×39mm) and the West German 7.62x51mm (.308) round. These fragments lance through the wound area that is forming the temporary stretch cavity, literally creating perforations that turn what is typically a fairly harmless effect into a grotesque nightmare of a wound. This is primarily a function of bullet construction and velocity, and is allowed at GM discretion. Multiply the second half of the X_{sect}^* equation by the velocity of the bullet (in m/sec) divided by 360, so the equation reads:

$$X_{sect}^* = (1-V/600) \times p(\text{Bore}/2)^2 + (V^2)/216,000 \times \text{Bore}^2 \times (\text{Aspect Ratio})$$

Note that the destabilization which causes this yaw is *not* present in fin-stabilized projectiles, only spin-stabilized ones. If a projectile is described as APFSDS, don't allow this. This means that typically flechette shotgun rounds will probably *not* be as lethal as the marketing and sales folks would have you believe!

Example: Our fiendishly clever Tech Ops have modified our 7mm DU APS ammo to not only penetrate, but introduced a structure that fragments as it yaws. The wound cross section during yaw is increased by a factor of $(1505\text{m/s})/360 = 4.18$, for a net X_{sect}^* of $440.4 \times 10^{-6} \text{ m}^2$. The damage is now $9d+2(2.4)\{1.3\}$, increased from $9d+2(2.4)\{0.6\}$.

Example: The M16 fires the M193 projectile, a 3.6 gram (55 grain) projectile at about 990m/sec with an aspect ratio of 3.95. This projectile is known to fragment badly upon striking soft tissue. The damage for this round is $5d+1\{1.3\}$.

Example: That Ultra Tech gauss needler fires a 1.5mm steel projectile with 1600 joules of KE. We decide on an aspect ratio of 40 this time, and a mass of 1.35 grams (if you treat the needle as a cylinder you can derive the mass by setting the density of the needle to $7,860 \text{ kg/m}^3$, the density of steel). The velocity of such a projectile is 2392 m/sec. If the needle doesn't fragment (or melt!), it will do damage equal to $7d+3\{0.3\}$, yielding an average of 9.3 points of damage (equivalent to $3d-1$) per needle assuming an unarmored target. The 1.5mm gatling needler (p. UT2 53) is listed as a 4d weapon; perhaps we have an lower-powered needle rifle here?

Interior Ballistics, Revisited

The critical data needed to calculate the terminal ballistics of a projectile are its diameter, mass, velocity, and aspect ratio. But what about how you accelerate that projectile to that velocity?

For firearms, a round of ammunition consists of a propellant and an accelerated mass (it could be a discarding sabot, a bean bag, or shot pellets as well as a single full-bore bullet). That propellant, when detonated, fills the barrel behind the bullet (beginning with the initial starting point for the round, called the chamber) with a certain pressure. For simplicity, we can say that the explosion instantly reaches its maximum pressure, and begins to accelerate the bullet down the barrel. The maximum pressure is maintained for a short period of time as the propellant completes burning, and then falls off (the system is now a piston being pushed by a pressurized gas). With a little work, you can calculate the energy imparted to the accelerated mass during its trip down the barrel, and convert that directly (albeit approximately) into kinetic energy. Without too much more explanation, the formula is:

$$\text{KE (joules)} = P \times \{D \times A + V \ln [(A \times L/V) + 1]\} \times 6896$$

P is the max pressure in the chamber in psi,

D is the burn distance, the distance in meters the max pressure lasts,

A is the bore area, equal to the barrel cross-section (sq meters),

V is the fall-off volume, equal to the chamber volume plus the volume of the barrel when the powder completes its burn,

L is the acceleration length, typically equal to the length of the bore less the burn distance. The overall barrel length is usually quoted including the chamber, so the acceleration distance for most weapons is actually the barrel length minus the burn distance, minus the case length, plus the bore diameter, because bullets are usually seated in the cartridge by about that much.

Rules of Thumb

Max Pressure: Shotguns: 11,000psi; TL6 era autoloaders (like the .45ACP): 15-20,000 psi; Modern pistols: 30-40,000 psi; military rifles: 50-55,000 psi; machineguns and autocannon: up to about 60,000psi

Burn distance: about 7/24 the case length for handgun cartridges, 7/16 the case length for rifles.

DISCLAIMER: DON'T TRY THIS AT HOME! IF YOU USE THESE RULES OF THUMB TO RELOAD AMMO, YOU'LL GET YOURSELF KILLED.

Example: The .45ACP (11.43x23mm) operates at 17,500 psi from a 127mm barrel (acceleration distance 108.7mm). The bore area and chamber area are both the same, as the cartridge is not bottlenecked. The fall-off volume is calculated at $1.581 \times 10^{-6} \text{ m}^3$. The burn distance is estimated at $7/24 * 23 = 6.7\text{mm}$. The final KE for the round is 466.2 joules, which will propel the standard 230 grain cartridge just shy of 250m/sec. That's right in the ballpark! The damage for this round is $2d+1\{1.3\}$

Example: We decide to take that same cartridge and launch it out of a 304.8mm (12") submachine gun barrel. How much damage will it do? We only need increase the acceleration distance by $304.8 - 127 = 177.8\text{mm}$ to 286.5mm. The predicted energy is 630.6 joules, yielding 291m/s and $2d+2\{1.4\}$ damage.

Example: Let's bend the system. We take a 23 gram wooden arrow, and apply a "pressure" of 1000psi. We use an 8mm diameter, an aspect ratio of 95:1, and a "barrel length" and "burn length" of 480mm (for a 760mm arrow); the case length we set at 1mm (it's irrelevant). This converts to about a 78lb draw weight, and propels the arrow at 121 m/sec, inflicting $1d+1$ damage. Not bad! A 120 lb bow (1560psi) with the same properties would inflict $1d+2$, firing the arrow at 151m/sec. Medieval bows were quite strong; it's not unrealistic to assume a 120lb bow, and the damage matches up very well for a longbow that requires ST15 to pull (a Thrust of $1d+1$). The predicted velocities are a bit high compared to reality, but the predicted damages work well with GURPS canon material.

Wound Channel Modifier and Blow-Through

The wound channel modifier can be used to augment or eliminate the "blow-through" rule that states that damage done after HT to the torso is lost. This allows more damaging bullets to cause more severe wounds.

Optional Rule 1: The wound channel modifier also defines the blow-through modifier for that round. Multiply the wound channel modifier by the subject's HP to get the blow-through value; this is tripled as normal for shots to the vitals.

Optional Rule 2: As above, but either multiply by HT (excluding extra hit points, to give that advantage more "pull" in high tech games), or by a flat value of 10, which also increases the value of high HT in high tech games.

Using these rules on an average HP individual, the .45ACP cannot ever blow through (max damage 13 pts; blow through at 13 points), while the 9mm (at $2d+2\{1\}$ by definition) will blow through more frequently (max penetration 14 points, blow through at 10). This tends to model fairly well the arguments for and against these rounds. The 9mm is frequently accused of "overpenetrating," while the .45 is frequently defended as The Worlds Greatest Pistol Cartridge because it avoids this, among other things.

Optional Rule 3: Bullets that don't kill by central nervous system damage kill by causing massive blood loss. Don't discard all that damage before it blows through. For each 7 points of damage inflicted before blow-through is applied, a wound will bleed for one HP per minute. Reduce the time interval for bleeding for large wounds, not the damage per full minute. Do include the multipliers for hits to the vitals. So a .223 round that hits the torso for $5d+1\{1.3\}$ and rolls 21 points of damage will blow through after 13, but the wound will bleed for 1 HP every 20 seconds. Thus a HT10 character will have a 50% chance of being "instantly" unconscious (less than zero HT), and will be in grave danger of bleeding out ($-5 \times \text{HT}$) after about 16 minutes. The GM as always has discretion as to whether bleeding stops by itself. Damage to the veins and arteries location bleeds three times as fast; the heart bleeds out at a rate of hits per *second*, rather than per minute.

Optional Rule 4: Fragmenting rifle wounds are ugly. First aid might slow bleeding, but it won't restore any HP. To do that typically requires a roll against the Surgery skill.

Optional Rule 5: Armor piercing rounds tend to pass through a body without tumbling. As an option, do not reduce the damage rolled by the armor divisor. Instead, re-calculate the wound channel modifier using the unmodified bullet

frontal cross-section, rather than increasing it for yaw. This will drastically reduce the wounding potential of AP and APS rounds, as they pay for their increased penetration with much decreased wounding.

Using these Rules with *GURPS Vehicles*

To use these rules with the *Vehicles 2^{ed}* design system, first design your weapon normally. You will end up with stats such as bore size, approximate barrel length, and weight per shot. Use about 2/3 of the WPS to get the projectile weight. Back-calculate the kinetic energy requirement from the bore size, and from there you can determine the projectile's velocity. Make some assumptions for chamber pressure and case length by comparison to existing cartridges, and find a barrel length that is in the length class of the weapon you designed. Note the parameters you've settled on for future reference, in case you want to design short barreled carbines or heavy barreled support weapons using the same ammo.

A Final Word

All of these calculations seem cumbersome, and they are, if you use a calculator. These rules come into their own when you enter the formulae into your favorite spreadsheet program, and can use its power to solve for damage, velocity, or other unknown parameters, or play with designs to achieve the desired results. One can duplicate the performance of nearly any cannon system, from small arms to the largest I've tried yet, the 16" guns of the Iowa class battleships (6d × 137{2050}, if you're curious!).

Bibliography and Suggested Reading

Books

- *Bullet Penetration* by Duncan MacPherson.

Websites

For cartridge information:

- <http://www.imrpowder.com/reload.html> for chamber pressures of common loads.
- http://www.integraonline.com/~bbroadside/General_Info.html for a ton of great info on many of the worlds current and might-have-been cartridges; case length, projectile mass, and typical velocities can all be found here.
- <http://www.reloadbench.com/menu1.html> for detailed descriptions of cartridge dimensions for many common handgun and rifle cartridges. Very useful for calculating the chamber volume.

Wound ballistics:

- http://home.snafu.de/l.moeller/military_bullet_wound_patterns.html is an article by Dr. Martin Fackler, Ph.D. Past president of the International Wound Ballistics Association and regarded by scientists as the foremost expert on the subject. His work is **the** definitive authority on the issue.
- <http://teapot.usask.ca/cdn-firearms/Fackler/wrong.html> is Fackler's definitive article entitled "What's wrong with the wound ballistics literature, and why." It goes into explicit and clinical (if sometimes uncomfortable for those with a good imagination) detail on how projectile weapons wound, and how they don't. Required reading for all who would discuss this issue rationally.
- www.firearmstactical.com is a good site that has an even better bibliography, and discusses in detail some of the principles used to create the wound models used above.

* * *

My thanks to Shadowman, Hans-Christian Vortisch, and Nigel McCarty-Eigenmann for helpful suggestions and comments. Also thanks to Sean Punch and David Pulver, who gave me real encouragement to keep at this task. And to my wonderful wife, who's had to put up with years of me working on my spreadsheet and ignoring her. At least she still games with me.

Building Stronger Mysteries Today For A More Secretive Tomorrow

Well, I saw the series finale of *The X-Files* last Sunday.

Now, as someone whose most recent experience with the show has been the *Fight the Future* movie, this was probably *not* the wisest spot for me to hop aboard again . . . especially since I wasn't the show's biggest fan before then. I felt not unlike that classic *Far Side* cartoon: "Blah blah blah **black oil** blah blah blah **aliens** blah blah blah **conspiracy**. . ." I hopefully won't provide any more spoilers, outside of saying that it was a very solid one-hour episode. ("But wasn't it two hours long?" I hear you ask. Yes, it was.)

Now, over on the *Pyramid* [discussion boards](#), Michael Powers said, "Ultimately, I think *X-Files*' legacy will be a warning. 'Get your metaplot straight before you start the show,' maybe."

To which Bob Huss countered with, "At least, 'Have an ending in mind.'"

Both of these comments got me thinking.

I tend to run heavily exploratory games; much of the pull of my campaigns comes from there being Big and Interesting Secrets to reveal, and these secrets provide both the conflict and the incentive for the adventurers to keep adventuring.

Now, unfortunately, very often my campaigns don't come to long-term fruition . . . especially those I intend on being long-term campaigns. No, instead they'll often go for three to six sessions, only to have the evil demon of the Real World show up and devour it. As a result, very often my partly realized campaigns often resemble various masses of dangly plot bits destined never to resolve.

I feel bad about this when it happens; I think I used to spend so much time planning for future plots, I may not have made the present game as enjoyable for my players as I could have. Soon they riot. Cities burn.

Anyway, nowadays I try to mitigate this somewhat by structuring my campaign's secrets around a more satisfying model. I generally try to break down most secrets into immediate, long-term, and perennial categories. Immediate secrets are designed to be resolved (or at least *possibly* resolved) within the current story arc . . . generally one to four adventures. Immediate secrets funnel into the long-term secrets; discovering the answer to the immediate secrets reveals the existence of a long-term secret (even if its exact nature isn't clear), or otherwise provides that first thread towards resolving the long-term secret.

I tend to space out long-term secrets within the space of a "season"; thinking of my campaign as a television series, I try to decide how many adventures constitutes a season, and plot towards long-term secrets being possibly resolved at the end of that block.

Perennial secrets may not *ever* be resolved; like an ever-tightening spiral the heroes may simply get closer and closer to the truth, without ever knowing the *full* truth. It should be made reasonably clear to the players (and perhaps even the characters) that the Full Truth isn't a necessarily obtainable goal . . . or if they *do* discover it, it means the end of the campaign (or at the very least a drastic change in the campaign). And, of course, to keep our Hussian wisdom in mind, I *do* try to have an ending in mind.

So, looking at an example here from my own gaming:

In a *Mage: The Sorcerer's Crusade* campaign I was running, I started the heroes off waking up mysteriously trapped in a castle. (Note to GMs: If I haven't stressed it enough, having the heroes start the campaign waking up in some sort of [prison](#) is a wonderful plot device. Really, instead of trying to shy away from this tendency, from now on I might

just start telling players to *expect* to wake up in a prison. Then imagine how paranoid they'll be when they begin the game seemingly *not* in a prison? But I digress . . .) So their immediate secrets include figuring out where they are, what's going on, how to get out of there, and so on.

Oh, did I mention the castle was flying? Climb the wall, intent on escape, only to discover . . . the castle was flying. Secret revealed; end second adventure.

Anyway, the mysteries of that castle were ultimately revealed, they escaped, and the heroes (two players and a NPC) all discovered that they -- son of a gun! -- had pieces of a mystic artifact that *seemed* to fit together into some sort of larger whole. But they only had a few of the pieces, so they couldn't be sure. Of course, all of them were somewhat sketchy as to how they even *acquired* those pieces in the first place.

Now, the Multi-Part Amulet of Fozzle is perhaps the oldest trick in the book in gaming. And *I* certainly preferred to think of it as an homage to that classic trope. But, really, the line between "homage" and "rip-off" is slight indeed. Regardless, it provided a nice structure for my exploratory/secretive campaigns; the quest for individual pieces could revolve nicely around discovering (and resolving) immediate secrets.

Now, the campaign ended before we could reveal terribly much more, but the *intent* was that the pieces of the artifact were tied to individual people; the pull of the campaign was not the accumulation of the pieces, per se, so much as the gathering of the *members*. That was another secret . . . a long-term one.

And once all those members were fully gathered? Well, that was one of the perennial secrets. See, this group was to find itself intertwined in a Horrible and Mysterious Plot that would send them across the entire continent, with blah blah **black oil** blah blah **shake the world to its very foundations!!!**

Anyway, the point is that I specifically designed the campaign with the idea that, although secrets and mysteries provided the narrative pull, it wasn't necessary for those secrets to be revealed for the campaign to work. There were still plenty of mysteries revealed at regular intervals. If the "series" was cancelled before the final Big Secrets could be revealed, it was hopefully still satisfying.

For those of you who are comic fans, I point to the example of Alan Moore's and Dave Gibbons' *Watchmen* graphic novel. [*MINI-VAGUE SPOILER ALERT*] There are many who believe -- like I do -- that the work falls somewhat apart in its last chapter (which was originally issue 12 of a 12-issue limited series). That was the chapter where all the previous threads were tied together; it was, as they say, The Big Payoff. And some folks felt that it simply didn't work. But, really, it didn't matter much; there were so many Little Payoffs along the way that, even if the destination didn't work out entirely, the journey *did*. And that's my goal. [*END SPOILER*]

And even if you *do* reveal all your perennial secrets and end the campaign, you can always gather everyone back for a movie deal or two.

* * *

As you may have noticed, Ken Hite is on assignment for the Hidden Masters to help them with @\$r#@!23%^.etern real soon.

--Steven Marsh

* * *

Last week's answer: *The Epitaph* #1, p. 60.

(Three stars) "*The Fuzzy Boomers*: Three shaggy brothers with hick clothing and accents. One is human, one Vargr, one Aslan, but they're brothers. They are always clumsy but well-meaning, occasionally shrewd, usually stupid. Disaster follows them, but not bloodshed, and everything usually ends well."

Steampunk Heroes: Professor Pierre Arronax and Conseil

by CJ Beiting

This article is presented as a follow up to John Nowak's Pyramid article of October 16, 1998: "[Nautilus but Nice: Gaming with Captain Nemo and the Nautilus](#)" (also reprinted in [Transactions of the Royal Martian Geographical Society 3](#)) and is intended for players of *GURPS Steampunk* or other Victorian-era RPGs.

Note that some additions have been made to the character descriptions that were not provided in Jules Verne's original text, but that seemed logical. Purists should feel free to disregard material which they do not like.

Professor Pierre Arronax

104.5 points

Born 1827.

Age 40; 5'9"; 195 lbs; a slightly overweight middle-aged French scholar with curly dark hair. He is clean-shaven.

ST: 10 **DX:** 10 **IQ:** 13 [30] **HT:** 10

Speed: 5.0 **Move:** 5 **Dodge:** 5

Advantages: Reputation (author of *Mysteries of the Great Submarine Depths*, European scholarly community) (+1) [3]; Status+2 [10]; Wealth (Comfortable) [10]

Disadvantages: Addiction (tobacco) [-5]; Code of Honor (Gentleman's) [-10]; Dependant, competent, almost all the time (Conseil) [0]; Overweight [-5]; Phobia (sharks) [-5]; Weak Will-1 [-8]

Quirks: Not interested in money; Mildly egalitarian and interested in social justice; Non-practicing Catholic

Skills: Administration-12 [1], Animal Handling-12 [2], Appreciate Beauty-12 [3], Area Knowledge (Paris)-12 [1/2], Bard-12 [1], Diagnosis-16 [8]; First Aid-17 [2]; Geology-12 [2]; Guns (Rifle)-11 [1/2]; Naturalist (Marine Animals)-17 [12]; Paleontology-16 [10]; Phrenology-12 [1]; Physician-16 [10]; Prospecting-12 [1]; Research-13 [2]; Riding (Horse)-10 [1], Savoir-Faire-16 [2]; Science!-12 [14]; Surgery-14 [10]; Surveying-12 [1]; Survival (Plains)-11 [.5]; Swimming-10 [0]; Teamster-8 [--], Writing-14 [4]; Zoology-14 [6]

Languages: French (native)-15 [3], Latin-13 [4], English-8 [-], German-9 [-]

This is a depiction of Professor Pierre Arronax circa 1867. The events of *20,000 Leagues Under the Sea* will take place from 1867 to 1868, and he will publish them in serialized form in a magazine in 1869, and in final book form in 1871.

Professor Pierre Arronax is a famous French polymath born in 1827. After attending lycée and university, he went on to take a medical degree and practice medicine privately for several years. Medical practice did not satisfy his scientific interests, and he later took a position with the Paris Museum as a naturalist. He has some fame as a marine biologist, and his two-volume monograph, *The Mysteries of the Great Submarine Depths* is one of the authoritative works on the subject, guaranteeing Prof. Arronax an international reputation amongst scholars. He has some skill as a paleontologist, and makes frequent trips all over the world to collect samples for his researches and for the collection at the Paris Museum.

Prof. Arronax is an educated and cultured man, the epitome of the broadly trained Victorian scientist. He has no more than conventionally religious, and is a non-practicing Roman Catholic in that particularly French way. He is unmarried, and has little interest in the opposite sex. Finally, he is a man of divided sentiments; he clearly empathizes with the plight of the poor in the world, and clearly believes in social equality, but at the same time he accepts the social hierarchy of Victorian-era France, and keeps a 30-year old manservant whom he refers to as "boy."

The above template represents Arronax before his experiences aboard the *Nautilus* with Captain Nemo. After them,

add skills in Hard Hat Diving-12 [1] and Guns (Air Rifle)-8 [0] and raise his Naturalist (Marine animals) skill to 18 [+2]. He can also be assumed to have an Area Knowledge (Oceans) of 12 [1/2]. He will be famous (Reputation +3, everybody, [15]) as the author of *20,000 Leagues Under the Sea*, a worldwide bestseller detailing his exploits with Captain Nemo. This will add 19.5 points to his character cost, for a grand total of 124 points.

Conseil

80.5 points

Born 1837

Age 30; 5'9"; 150 lbs; a nondescript gentleman's gentleman (i.e., no description given)

ST: 11 [10] **DX:** 10 **IQ:** 10 **HT:** 12 [20]

Speed: 5.5 **Move:** 5 **Dodge:** 5

Advantages: Ally (Arronax, almost all the time) [30]; Imperturbable [10]; Manual Dexterity-1 [3]

Disadvantages: Addiction (tobacco) [-5]; Duty (non-hazardous, almost all the time) [-10]; Humble [-1]; Odious Personal Habit (always refers to Arronax in the third person) [-5]; Sense of Duty (Arronax) [-5]; Status-1 [-5] **Quirks:** Punctual; Zealous; Can identify dead animals but not living ones. **Skills:** Animal Handling-12 [8]; Area Knowledge (Paris)-12 [4]; Cooking-12 [4]; Knife-10 [1]; Naturalist-12 [8]; Riding (Horse)-9 [1]; Savoir-Faire (Servant)-12 [4]; Survival: Plains-9 [1]; Swimming-12 [4]; Teamster-10 [1.5] **Languages:** Flemish (native)-11 [1], French-11 [4]

Conseil (no first name or description given) was born in 1837 and is Professor Arronax's manservant, traveling companion, and research assistant. As such, he has a slightly wider range of skills than the typical Victorian "gentleman's gentleman." He is Flemish, and is described by Arronax as being: "phlegmatic in temperament, punctual on principle, zealous from habit, rarely disturbed or even surprised, adroit with his hands, and apt at any service required." Conseil is completely devoted and subservient to Arronax, and despite his name, never butts in or gives advice (*conseil* being French for "advice"). His loyalty is complete, and he willingly risks his life for Professor Arronax on several occasions.

Conseil has two odd habits. In the first place, he always refers to Arronax in the third person, and as "Master," even to Arronax's face (e.g., "whatever pleases Master"), a habit which the nominally egalitarian-minded Arronax finds annoying. Secondly, while Conseil has a very exact knowledge of biology, and can instantly classify any specimen according to the Linnaean system of taxonomy, he is completely unable to identify living animals by sight. Nevertheless, he is a valuable assistant to Professor Arronax, who returns his deep devotion with warm affection in return.

Note that Arronax and Conseil are both very well-traveled, and have been "from China to the Congo" in the pursuit of Arronax's scientific researches. The game master can assume any extra Area Knowledges for the pair that he likes, and a case can be made for extra Contacts and Survival skills as needed.

Using Arronax and Conseil in a Campaign

The most important question for the GM to decide before using Arronax and Conseil as characters in a campaign is whether or not the events in *20,000 Leagues Under the Sea* actually happened in his campaign universe. This article proceeds from the premise that they are true, and that the subsequent account of them was written by Professor Arronax and not by Jules Verne, giving Arronax international fame of two possible types. In the first place, the sinking of several ships beginning in 1866 *does* cause an international uproar, and when the theory that a giant sea monster was responsible was formed, people "sang of it in the cafes, ridiculed it in the newspapers, [and] dramatized it on the stage." All of this happens even before the truth of Captain Nemo became known, so Arronax's subsequent fame can be assumed.

Alternatively, the GM can assume that the events of the novel happened and Arronax told his tale, but was not believed, and is considered the laughingstock of the world (Bad Reputation) for foisting a monstrous "fish story" upon

the public. This will allow for less-disrupted history of the Nineteenth Century, as only a few crackpots (i.e., the player characters) will believe him.

In any case, Prof. Arronax makes a good Patron for a variety of genres, and will be considered as such in the paragraphs below. Game masters should note that Arronax will make a good Patron in gaming terms insofar as he is somewhat indecisive and weak-willed, and as such will not hog all the action in a game. Heroes in his employ will have to make a lot of decisions on their own, and will have to convince Arronax to adopt them. Once Arronax is convinced, Conseil will do "whatever pleases Master." Do not play Arronax in such a way as to be overbearing or domineering; such is completely contrary to his character.

One small problem for GM is the fact that neither Professor Arronax nor Conseil speak English, although Arronax can read it. Like most Frenchmen, Arronax prefers to communicate solely in his native tongue, and will have to hire an interpreter if he is in an English-speaking area. Game masters who are worried about communication problems should raise his English skill to 10, and play him with a very thick French accent.

With these points in mind, the GM can use Arronax and Conseil in any of the following **GURPS** Victorian-era genres.

GURPS Steampunk

This is the default setting for the events of *20,000 Leagues Under the Sea*, which should come as no surprise given the fact that statistics for Captain Nemo and the *Nautilus* are included therein (see p. STM51 and p. STM80 respectively). The GM will have to decide to what extent he wants to integrate the events of *20,000 Leagues Under the Sea* into his steampunk universe: will they be unique, or will Prof. Arronax be merely one of a league of extraordinary gentlemen from Victorian fiction who have undertaken great things? He would serve as a valuable Ally or Contact for players who are trying to build their own submersible vehicle, or as an expert on marine life, real or monstrous. Much could be made of Captain Nemo's post-*20,000 Leagues Under the Sea* efforts against European imperialism, particularly British imperialism. Perhaps Professor Arronax, as the world's foremost authority on Captain Nemo, would be charged by the European Powers that Be to assemble a team and locate Captain Nemo in order to bring him to justice . . .

GURPS Old West

Although this crossover seems incongruous, it is in reality one of the most natural. Professor Arronax and Conseil begin the novel *20,000 Leagues Under the Sea* by hunting fossils in Nebraska, and it is not at all unlikely that they will return to the Old West later in the 1870s for further fossil-hunting expeditions. They will be in need of guides, bodyguards, and translators . . . perfect roles for players. While hunting for fossils, they could get caught up in the great dinosaur fossil hunting wars of Edward Cope and Othniel Marsh (see p. STM9; Ken Hite gives a more in-depth treatment of the Cope/Marsh rivalry in p. STI34 or "[Use Archaeology to Uncover Hidden Adventure Ideas](#)"), which ran from the late 1870's to 1889. Alternatively, Arronax and Conseil could be presented as a pair of "gentlemen in distress" in need of rescuing from villains by a group of Old West heroes, with a surprise in store for the players after they discover the identity of the men they have rescued! After his book is published, Professor Arronax's fame will spread even to the American West, but the average cowboy or ranch hand who has heard of him is more likely to associate him with the high seas than the Wild West.

GURPS Castle Falkenstein

[NOTE: There are some discrepancies in the original R. Talsorian version of this material: the basic *Castle Falkenstein* rules (p.43) assert "Pierre Arronax" was a nom de plume for Jules Verne, and that he experienced the events of *20,000 Leagues Under the Sea* himself. However, the Steam Age supplement (p.69) claims that the two men were different, and that Arronax narrated his tale to Verne. This article presumes the latter interpretation.]

In the *Castle Falkenstein* universe, Jules Verne is the Science Minister of France, and as such is likely to be very interested in Arronax and his companions have to say. Furthermore, so would all of the Crowned Heads of Europe; the existence of an Infernal Device like the *Nautilus* would likely fuel an arms race under the sea, in the same way that the

Bavarian Aeronavy is fueling an arms race in the air. As the sole technically minded survivor of the *Nautilus*, Professor Arronax would be a valuable property for any power in Europe or the world that had aims on building its own similar Infernal Devices, and he might be the target of espionage or kidnapping attempts by parties ranging from the Steam Lords of Britain to the World Crime League. Doubtless he would need guarding by a suitably equipped party of stalwarts.

The original *Castle Falkenstein* material indicates that Captain Nemo was eventually convinced by Science Minister Verne to operate against those who make war "behind the scenes," such as the World Crime League. Since Nemo swore a vow never to walk on dry land walked by other men, it is likely that the person who did the "convincing" was Professor Arronax himself, acting as a liaison between the two men. The attempt to do this would provide an adventure in and of itself, and Arronax's "fishing" expedition (and future negotiation efforts!) would doubtless need the help of the player characters . . .

It should be noted that in the *Castle Falkenstein* universe, Professor Arronax will not use magick of any kind, since he is a committed Man of Science. It is possible that his classic *Mysteries of the Great Submarine Depths* might include some information on some of the aquatic Faerie races, however.

GURPS Screampunk

Although this does not seem like an obvious fit, consider the fact that *20,000 Leagues Under the Sea* has some horrific elements to it, over and above attacks by cannibals and giant squids on the *Nautilus* (see the US Naval Institute Press edition of the work for a good examination of this theme). The *Nautilus* itself could be seen as an artifact of Forbidden Knowledge, resulting in Hubris and Idolatry; indeed, the entirety of Professor Arronax's trip could be seen as a Misguided Voyage of Discovery (p.SCR14-15). Then there are the other horrific elements. Throughout the journey the members of Captain Nemo's crew behave like sullen, silent automatons; why? Nemo claims that they were all with him voluntarily, but what strange power does he have over them to render them so obedient and so lifeless? Furthermore, in the end of the novel Nemo himself descends into a fit of sullen, withdrawn madness both figurative and literal; what expiation does he make by the sacrifice of himself and the *Nautilus* into the maelstrom at the end of the novel? Could it be that he was either in opposition to -- or in league with -- some hellish undersea Thing Man Was Not Meant To Know? And when he returns from the deep, will Prof. Arronax and his band of gallant heroes be able to stop him . . . ?

GURPS Atlantis

Nemo and his crew find the sunken ruins of Atlantis in Chapter 9 of Book II of *20,000 Leagues Under the Sea*. If the GM wants to make Atlantis a part of his Victorian science fiction game (perhaps using the "Lords of the Deep" campaign from Chapter 6 of *GURPS Atlantis*), either the *Nautilus* or a similar vessel build by Professor Arronax is a useful way to get the adventurers there. Perhaps the people of Atlantis are benevolent and advanced, loathing war and exploitation and unwilling to speak to "primitives" who engage in such activities. Perhaps they are hostile and malevolent, desiring to conquer the surface world and unwilling to tolerate any opposition. In either eventuality, Captain Nemo would be a great ally for the surface world, either as a sympathetic go-between to a civilized Atlantis, or as a skilled point man in a war against a hostile Atlantis. Professor Arronax and a hand-picked crew would need to find Nemo and enlist his aid on behalf of France and the Crowned Heads of Europe . . . no easy task considering that Nemo would love to see many of those Crowned Heads destroyed for their imperialist ways.

GURPS Deadlands

The world of the Weird West provides an interesting home for Professor Arronax. Perhaps he would be investigating it on behalf of the European scientific community, which is at such a distance from the events of the Reckoning. Perhaps he and Conseil and would be interested in cataloging the various kinds of Critters and Abominations and finding out ways to defeat them. Perhaps Arronax is active in the Great Maze, investigating the Maze Dragons and other new aquatic phenomena (Captain Nemo might be there, too, since Ghost Rock is a much more likely fuel for the *Nautilus* than any other Victorian fuel source . . .). In any of these cases, Arronax will certainly need bodyguards and guides,

especially well-armed ones.

Note that long exposure to the horrors of the Weird West is likely to raise Arronax's Weak Will, his combat skills, and possibly even his faith.

D.I.Y. Random Names on the Web

by L. Lockwood

Most roleplaying games require a fairly large number of names to flesh them out: names for pre-made NPCs and improvised NPCs, for PCs, the people from their backgrounds, and their companions. Having a set of pre-generated names on hand makes a GM's work much easier when improvising, and helps prevent PCs with anachronistic names from popping up in your carefully crafted fantasy games. However, generating a large number of campaign-appropriate names is often difficult and tedious.

This article presents instructions and examples for building a Web page that randomly generates a set of names each time it is "loaded" (viewed in a Web browser, or "refreshed"), assembling the names from "building blocks" provided by you, the page's author. No previous knowledge of computer programming is necessary, although a little knowledge of HTML will allow you to make your page fancier. You don't even need to put your finished page up on the Web; it will work just as well from your computer's hard drive, although it won't be available to anyone but you.

Requirements

Building a random name generator page will require some sort of text editor (Notepad will do fine), and a Web browser that has JavaScript enabled (all versions of Netscape and Internet Explorer from the last 5 years or so have this, and many other Web browsers do as well).

If you wish to put the finished page up on the Web, you will need to have an Internet Service Provider or some other way of getting your page out there. Many organizations out on the Web, such as [GeoCities at Yahoo](#), will allow you to put up a page or two for free. Once you have a finished page, they can give you instructions on how to make it available on the Web.

Contents

Below these instructions are:

- A complete sample Web page name generator. You can copy this code into a text file, customize it as you like, name it with the extension HTM or HTML (like "mynames.html") and put it up on the Web for all to see. Or leave it on your hard drive where you can use it privately.
- A breakdown of the various parts of the code, explaining how each part works and how you can modify it to produce your own set of random names.
- Tips and tricks for building specific kinds of random names.
- Tips on flushing the bugs out of your JavaScripts if they don't work right the first time.

The Complete Sample Page

Random names produced by the sample code below will be similar to the following:

Asusarvon, Osuman, Isaivon, Yelardar, Ilimar, Omulaldar, Radar, Omavon, Chur, Evadar, Velak, Osaisarvon, Chalardar, Erisadar, Filavek, Ged, Rivek, Chimal, Amelarvon, Amat, Omom, Atar, Uner, Kan, Ilaik, Ered, Klairkesh, and Daisag.

If these names are not to your taste, don't worry; this code is fully customizable.

```
<html>
<head>
```

```

<script language="JavaScript">
    var first = new Array("B", "Ch", "D", "F", "G", "H", "J", "K", "Kl", "L",
        "M", "N", "P", "Qu", "R", "S", "T", "V", "W", "Y", "Z",
        "Am", "An", "At", "As", "Ev", "En", "El", "Er", "Il", "Ir", "Is",
        "Om", "Or", "Os", "Ul", "Um", "Un");

    var second = new Array("a", "a", "ai", "e", "a", "e", "i", "i", "o",
        "u", "ai");

    var third = new Array("ra", "na", "la", "sa", "ma", "", "", "", "", "");

    var fourth = new Array("dar", "rdar", "ldar", "von", "rvon", "vek",
        "rkesh", "ngkesh", "d", "g", "k", "l", "n", "m", "r", "t");

</script>

<script language="JavaScript">
    function Roll(arrayName){
        return arrayName[Math.round(Math.random() * (arrayName.length - 1))];
    }

</script>

<title>Random Foobazian Names (Male)</title>
</head>
<body>
<h2>Random Foobazian Male Names</h2>

<script language="JavaScript">
    var NumberOfNames = 30;

    for (var i = 0; i < NumberOfNames; i++){
        document.write(Roll(first) + Roll(second)
            + Roll(third) + Roll(fourth) + "<br>");
    }

</script>

</body>
</html>

```

Breaking Down the Code

The first part of the page simply sets up the basics of a Web page:

```

<html>
<head>

```

Incidentally, in HTML, anything put between < and > is called a "tag." You'll see this term again later.

The first JavaScript sets up lists (called arrays) of "name parts." Each array has its own unique name, and later JavaScripts will pick random "name parts" from these arrays, then assemble them and display the results. This particular script creates four arrays, named "first", "second", "third", and "fourth."

```

<script language="JavaScript">

    var first = new Array("B", "Ch", "D", "F", "G", "H", "J", "K", "Kl", "L",
        "M", "N", "P", "Qu", "R", "S", "T", "V", "W", "Y", "Z",
        "Am", "An", "At", "As", "Ev", "En", "El", "Er", "Il", "Ir", "Is",
        "Om", "Or", "Os", "Ul", "Um", "Un");

    var second = new Array("a", "a", "ai", "e", "a", "e", "i", "i", "o",
        "u", "ai");

    var third = new Array("ra", "na", "la", "sa", "ma", "", "", "", "", "");

    var fourth = new Array("dar", "rdar", "ldar", "von", "rvon", "vek",
        "rkesh", "ngkesh", "d", "g", "k", "l", "n", "m", "r", "t");

```

```
</script>
```

The second JavaScript defines a single function, called Roll (as in "roll the dice"). This function randomly picks one item from an array, when you give it the name of the array. You don't need to understand how it works, it will be easy to see how to use it once it is demonstrated. Just copy it into your page as it is.

```
<script language="JavaScript">
    function Roll(arrayName){
        return arrayName[Math.round(Math.random() * (arrayName.length - 1))];
    }
</script>
```

Then there's a little more basic HTML:

```
<title>Random Foobazian Names (Male)</title>
</head>
<body>
<h2>Random Foobazian Male Names</h2>
```

Whatever you put between the `<title>` and `</title>` tags will usually be displayed somewhere in the browser when the page is viewed. Netscape and IE both put this information in the bar at the top of the browser window, next to the Minimize, Maximize, and Close buttons.

Whatever you put between the `<h2>` and `</h2>` tags will appear as a large, usually bold header when your page is viewed.

The third and final JavaScript uses the Roll function to assemble random names and display them. Writing a line of code like this:

```
document.write(Roll(first));
```

... selects a random name part from the array named "first", and writes it out on the Web page. Writing a line of code like this:

```
document.write(Roll(first) + Roll(second));
```

... selects one random name part from each of those two arrays, puts them together, and writes the resulting name out on the Web page. The rest of the third script is all either controlling how many names to write to the page or formatting the page itself.

```
<script language="JavaScript">
    var NumberOfNames = 30;
    for (var i = 0; i < NumberOfNames; i++){
        document.write(Roll(first) + Roll(second)
            + Roll(third) + Roll(fourth) + "<br>");
    }
</script>
```

The first line of code in the this last script defines a variable called NumberOfNames and sets it equal to 30. This determines how many random names appear on the page. If you wish to create longer or shorter pages, change this number from 30 to whatever you desire. Be careful not to delete the semicolon after the number.

The line of code that begins "for(var i = 0.." does the work of building the specified number of random names. You won't need to alter it, you can just copy it as it is.

The addition of the "`
`" at the end of each name puts the next name on a new line. `
` is HTML for "line break." If you don't want the names to come out in a vertical list, try replacing the "`
`" with ", " (a comma and a space), which will produce a regular paragraph-style list.

Then there's a little more HTML to end the page:

```
</body>  
</html>
```

Notes on Name-Building

The main challenge in using this code is picking the lists of name parts that will combine to create the kind of names that you want for your game. Do you want your names to sound like those from a real world culture? Like those from a favorite fantasy novel? Perhaps you want a new and unique "feel" to the names in your game. You may want to create multiple name generators, two for each culture in your game world, one each for male names and female names. Here are some tricks and tips:

- **Repetition changes probability:** You may have noted that some of the name parts in the arrays above are repeated. Including a name part in an array more than once makes it more likely to be randomly picked, and makes it a more common part of the set of names that are generated. If you were trying to make a modern American name generator that used random first names and family names, you would obviously want to make "John" a more common first name than "Ezekiel."
- **Everything's in the ending:** A lot of the feeling of a name, especially the implication that a name is masculine, feminine, or from a particular culture, can be created by carefully choosing the set of possible endings for names. To an English-speaking person, for example, names that end in -ine, -issa, and -ea usually sound feminine, while names ending in -er, -o, and -us will tend to sound male. Similarly, certain endings on last names automatically bring certain real-world cultures to mind; names that end in -ski tend to sound Polish or Russian, for example.
- **Vary name length for variety:** It often harms the believability of a list of random names if they are all the same number of syllables. Sometimes it is appropriate, especially in the case of Sci-Fi aliens like the Thranx (from the *Humanx* novels). Most times it is better to have a variable number of syllables in your name set. This can be achieved with the above code in two ways: either include name parts of varying length, or include blank name parts in your name part arrays. Both of these methods are used in the sample code.

In the first method, you might include ending name parts like "d", "dar", and "darkesh." Thus, if the first part of a random name is "Bara", it might turn out to be "Barad", "Baradar", or "Baradarkesh."

In the second method, including a blank name part or "" in a name part array presents a chance that no name part will be generated from that array. Let's say you have a first name part of "Loa" and a third name part of "tima." If the possible second name parts are "", "n", and "nar", the three possible names are "Loatima", "Loantima", and "Loanartima." If you create a name part array that has 20 items, ten of which are "", there is a 50% chance that any name generated will have no name part from that array.

- **Start small and simple:** It may be tempting to immediately create a ten-part name generator, with each array containing 100 or more name parts. This might work out fine, or might become a frustrating disaster. Start small, with two or three parts to each name, and 10 to 20 name parts per array. It will make fine-tuning the generator (and building it up later) much easier.
- **Larger name parts make for more recognizable names:** arrays of name parts like "dara" and "elkesh" tend to make for a more predictable and consistent set of names. Arrays of name parts like "ak", "e", and "el" will tend to produce more random, often alien-seeming names. This may or may not be precisely what you are looking for, or trying to avoid.

For fun, or for Mr. Mxyzptlk-style names, try making a generator with only one name part array, containing only single letters and extra vowels, that is used five or more times per name, like this:

```
var alpha = new Array("a", "b", "c", "d", "e", "f", "g", "h",  
    "i", "j", "k", "l", "m", "n", "o", "p", "q", "r", "s",  
    "t", "u", "v", "x", "y", "z",  
    "a", "e", "i", "o", "u",  
    "a", "e", "i", "o", "u",
```

```
    "a", "e", "i", "o", "u");  
document.write(Roll(alpha) + Roll(alpha) + Roll(alpha)  
    + Roll(alpha) + Roll(alpha) + "<br>");
```

This will give you names that are so random, they will be hard to pronounce, like "Ybeie", "Xsuam", and "Aijpu."

- **Hyphens, spaces, and !'s:** If you want to put other characters in the middle of names, for making first and last names, for example, you can do so easily, like so:

```
document.write(Roll(first) + Roll(second) + " " + Roll(third) + "<br>");
```

To put in a hyphen, exclamation point, or the word "foo," instead of a space, you could code any of these, instead:

```
document.write(Roll(first) + "-" + Roll(second) + Roll(third) + "<br>");  
document.write(Roll(first) + Roll(second) + Roll(third) + "!" + "<br>");  
document.write(Roll(first) + Roll(second) + " foo " + Roll(third) + "<br>");
```

- **Stealing from the real world:** If you are completely at a loss to think of a place to start with your name part arrays, or you want to simulate the "feel" of a particular culture, you can take real names and divide them up by syllable. For example, chopping up the names Jonathan, Edgar, Louis, William, and Stanislaus gets you the following arrays:

First: "Jon", "Ed", "Lou", "Will", "Stan"

Second: "a", "gar", "is", "i", "is"

Third: "than", "", "", "am", "laus"

Using the name part arrays above would give you names like "Jongar", "Louaam", "Edis", and "Stana." To get more variety, you'll need larger name part arrays. Luckily, there are plenty of names to dissect. When doing this with names from other cultures in the real world, bear in mind that the names that result may have strange, comical, or even offensive meaning to speakers of the language that those names come from.

Fixing Errors JavaScript

- **JavaScript is case sensitive:** Running afoul of case sensitivity is one of the most common coding errors. If you have defined a function called "Roll", JavaScript will not know what you mean when you type "roll", since there is a difference in capitalization. If your scripts don't work, this is the first thing to look for.
- **JavaScript statements end with a semicolon:** Almost all of them, to be precise. A semicolon tells JavaScript when a line of code is ending. Without it, you can (correctly) wrap a single "line" of code across several lines of text. However, if you omit a semicolon where you really should have one, JavaScript will try to interpret two different lines of code as if they were one, and that usually causes an error.

For finding out more about the code-writing tools that are already built into your web browser, see the browser's Help files, or the section of the browser manufacturer's web site devoted to supporting Web developers.

Appendix Z: Smugglers

or, "Could You Please Open This Case, Sir?"

by Michele Armellini

Wherever and whenever authorities try to control trade, there will be those who want to circumvent the controls, and the duties: smugglers. Playing characters might well be full-time smugglers (or customs officers!) and have a string of exciting, far-reaching, diverse adventures; or they might get involved in smuggling on a one-off basis.

While the concept is straightforward (cross the borders avoiding the law enforcers and deliver the goods), the GM might make use of some help in determining the details of this profitable, although risky and illegal, business. While a historical background should make it easy to decide who is smuggling what and where, if your game setting is fantasy or SF, you might find these suggestions useful.

Why Are The Goods Illegal?

The smugglers' activities are determined by the laws in force and by demand. The attitude of the customs officers and the severity of the penalties, and, therefore, the price of the goods and the risk for the smugglers will also depend upon this key question: why is this traffic illegal? The examples don't mention specific places or times but they should be clear enough.

These merchandises are:

1. perfectly legal in the country of destination, *but* there are customs duties on them. Thus the smuggled goods can be sold at a lower price, becoming more attractive for the locals. E.g., tobacco, alcohol, high-end consumer goods.
2. illegal because they come from a specific country, which is under a boycott; otherwise they'd be legal (although they might be subject to duties). E.g., Cuban cigars or Israeli foodstuffs.
3. a breach of other laws or trade policies. They may be items whose availability is regulated to control their price (diamonds), goods that threaten endangered species (ivory, horns, live animals) or low-quality counterfeits of copyright or trademark products (e.g. counterfeited watches, clothing, pirated media).
4. below the safety standards in the country of destination. E.g., foodstuffs, drugs, vital electronics, even electrical devices. Sometimes these goods are counterfeits, too, such as low-quality counterfeits of key aircraft spare parts.
5. illegal in the country of destination, period. They may be considered more or less dangerous. E.g., narcotics, alcohol; but also contraceptives, satellite receivers, genetically-engineered products, androids, necromantic items.
6. a threat to national security. E.g., weapons, explosives, radioactive materials, mass-destruction devices.

The cases are listed in order of sensitivity! With a case 1 offense, the penalty might be a stiff fine, the risk is low, and the law enforcers might be lukewarm; things change considerably with cases 5 and 6.

Special Cases

Sometimes the smugglers don't deal in objects, but in people, ideas or information. Also, sometimes it isn't the country of destination that objects to the trade.

- People smugglers may deal in slaves, escaped slaves, illegal immigrants, fugitives, refugees, key scientists -- or wizards.
- Some oppressive regimes don't like their population to be exposed to "dangerous" ideas. In these cases,

smugglers will carry books (e.g. "heretical" or "subversive" texts), magazines (including pornography), other media (Western music, forbidden "decadent" art, censored movies, snuff holograms).

- Those who deal in intelligence (military, industrial, trade secrets) are spies. However, sometimes the data sought for congeal into an object that has to be physically moved: a sample, a prototype, a recording, a blueprint microfilm . . . a few silkworm cocoons! So it's a smuggler's job.
- Sometimes, it's not the country of destination that forbids the trade. There might be blockades by third parties, or export bans: as for the silkworm cocoons mentioned above, or archaeological treasures, state-of-the-art sonars, anti-matter technology etc. This doesn't make a great difference for smugglers, however.

How Do They Carry The Goods?

There are four key tactics:

- avoidance,
- concealment and deception,
- bribery,
- brute force.

Avoidance normally means picking your route in such a way as to avoid checkpoints and patrols. It was the tactic of choice for low-tech smugglers who trekked through mountain ranges, sometimes with just a sackful of tobacco, or with pack mules. But wherever the borders are extensive and costly to patrol (such as the English Channel coast or a few star systems), this is the preferred means. It requires knowledge of the area, outdoor skills, and/or sea- or space-faring capabilities. Also, it will let you bring in bulky cargo. Sometimes, avoidance isn't based just on stealth: a cutter, powerboat, or rogue trader spaceship can be so fast that even if detected, the customs vessels can't intercept it.

Deceiving the customs by concealing the goods is the way to go if you really have to pass a border (or airport or space station) check, and is best used when the load isn't counted in the tons. The merchandise can be stowed away in hidden compartments on vehicles and on (or sometimes *inside*) the smuggler's body. A wide range of tricks can be used, up to exploiting an unwary tourist as "mule." These systems are often used by contemporary drugs traffickers; but illegal immigrants, too, can be shipped as "hidden cargo." The smugglers will know the customs procedures, they'll be clever in hiding the goods, and they should be able to act, deceive and confuse.

Bribery is obvious, and is sometimes used as an alternative if another method fails. But the best way is to have a standing arrangement with the local law enforcers; this only works if they can be bought, of course! It's the most common system for Prohibition-era alcohol smuggling, but can be handy wherever the patrolmen are underpaid -- to ship an ancient icon out of Belarus or a load of 'droids on a backward organic-workforce-only planet.

Brute force implies a militarized outfit, usually something like a man-of-war (and indeed it's more used at sea, and might be used in space). These smugglers will preferably use avoidance but they are ready to fight their way in. This works better as a surprise tactic: if this becomes standard practice, of course it's no more the outgunned customs officers' business -- the navy will be deployed to counter what amounts to a war. Some historians think that the Trojan War wasn't about a woman, but about the Black Sea foodstuffs over which the Achaeans didn't want to pay what today we'd call transit duties!

Everything else being equal, smugglers will prefer goods having the highest weight/value ratio (just like most legitimate traders). Things like jewels, powerful drugs, or microchips can be both easy to conceal and very valuable.

Smuggler's Pick

These are lists of what smugglers might carry at various tech levels. Note that state-of-the-art weaponry isn't listed below because it is *always* sought for. When your enemy has attained a higher level in that field, you want to . . . level the field! So iron weapons, steel blades, and nuclear warheads always make for brisk business if there is someone around who lacks them.

"Artworks" always includes both contemporary and ancient items (sometimes of historical or archaeological value).

"Consumer goods" may always include counterfeits, boycotted products, pirated media and below-standard items.

- **TL 0-3:** alcohol, salt, foodstuffs, amber, spices, magical items
- **TL 4-6:** alcohol, tobacco, tea, coffee, other consumer goods, slaves, escaped slaves, foodstuffs, textiles, artworks, books
- **TL 7-8:** narcotics, alcohol, drugs, illegal immigrants, protected animals, consumer goods, slaves (yes), artworks
- **TL 9+:** narcotics, drugs, genetically-engineered products and organisms, consumer goods, genetic materials, counterfeits, robots and androids, AI memory banks, clones...

Adventure Seeds

- **Freedom smugglers.** The PC smugglers are defying a totalitarian government, going in with weapons and guerrilla leaders, coming out with refugees and censored samizdata. Not only they have to dodge the fearsome secret police; their side is actually a hodgepodge alliance, with groups spying on each other and trying to obtain the pick of the cargo from the PCs. Then, they are asked to bring in mass-destruction weapons. What do they do?
- **Through the wilderness.** The party is hired as guides/guards/crewmen for a caravan/expedition/huge cargo starship. As they soon discover, they are actually trying to establish a new smuggling route, while carrying a valuable first shipment. They have to face the hostile environment and natives, the border guard, and the competition, while possibly negotiating a new agreement with their devious employers.
- **Unwary "mules."** The heroes are traveling on their own business and, at a border check, a strange item is found in their baggage. They are arrested as smugglers, and they'll be facing a harsh sentence . . . unless they accept the prosecutor's deal: frame the real culprit. Unfortunately, the latter was watching at the customs, and won't be easily fooled. And what's that mysterious item, anyway?

Pyramid Review

Riôt!

Published by [Green Dragon Creations Inc.](#)

Written by **Raphael Adley**

Illustrated by **Ana**

\$11.99

Being of an age that is less inclined to go out and cause a public disturbance, and having been a "mature" student at University and therefore supposed also less inclined to do so, although I did attend a protest -- the concept of being able to start and control a riot in my own home is nevertheless appealing. This is what ***Riôt!***, a little game from the computer software publisher, Green Dragon Creations Inc. allows you to do.

Riôt! comes packaged in a small 3½-inch diameter tin which, though visually eye-catching, is all too likely to get lost on the shelves of both your local friendly game store and your gaming collection. Inside are the rules (these open out to two sides of an 8½"×1" sheet of paper), a deck of sixty two-inch square cards, forty black counters, twenty yellow counters, and a tiny ¼-inch square six-sided die. It is designed for two to six players, ages eleven and over, with games lasting between twenty and forty-five minutes. The aim of ***Riôt!*** is to build the largest riot on campus; accumulate twenty rioters and you win the game.

At the beginning of the game each player receives three cards and rolls the die to see who goes first. If seated round a table, play proceeds clockwise, but anti-clockwise if played elsewhere. Then everyone states the reason for their riot: poor food in the cafeteria, not enough surf time allocated, classes are too easy (???) or an influx of mimes on campus.

On his turn, a player draws a new card and can play any one card from his hand. If he chooses not to play a card down on the table, he can add a single free rioter to their riot. Either way, he can still use as many or as few of the events listed on the cards he has in play on the table as he wants. This can be done in any order he wishes and the new card played can be put down at any time during the turn, although events cannot be used until their subsequent turn. The rioters are represented by the yellow and black counters -- one demonstrator by a black token, and five by a yellow token.

The cards represent events and various factors that can increase or decrease the size of a riot. They come in several types: Actions, colored red; Reactions colored yellow; Actions/Reactions which are both red and yellow; Law Enforcements in blue, Leaders/Student Leaders in green; and Permanents, which are white. There are also four totally black cards, which are to use if you want to make up or create new cards (though you need a marker that will write easily on black!). The cards are printed on a thin stock and are illuminated with a photograph tinted the same color as their card type. Many cards are marked with a "1," which means that they can only be used once before being discarded. Other cards can only be played under certain conditions, such as requiring a particular number of rioters in a protest, or against another card.
