How Can An Alien World Be Made Habitable?

Alien planets are great and all, but unless you have actual aliens, atmospheres can't vary too much. In a future without aliens, how could human-friendly planets be created?

--Paul Chapman

Terraforming is a great project for sci-fi roleplaying. It involves slamming comets into planets, blowing up volcanos, and infesting worlds with mutant organisms. What's not to like? Besides the epic scale in space, a terraforming project is going to take from decades to millenia, depending on the tech level and the size of the challenge, so you can, if you like, start with one set of PCs and end with another set that are the grandchildren of the first set, or even a descendant species.

Terraformable Planets

Some planets are easier to terraform than others. To terraform Jupiter would be . . . challenging. In *The Book of the New Sun*, Gene Wolf describes a Moon green with forests, but the air of such a moon would leak away in a few millenia; the Moon is at the low end of the size scale for terraformable bodies.

Pluto is even smaller and, if you got the temperature up high enough, the surface would first melt, then evaporate. Ice-worlds, like gas-giants, require the terraformers to have nearly magical technology.

The more earthlike a body is, the easier and faster it will be to terraform, and it makes sense to suppose that these are the orbs that starfarers will choose to terraform first. Nor are nearly-earthlike planets likely to be rare. Both Venus and Mars are close enough to make people dream of terraforming them, and those are two near-misses in one star system.

In this article, we'll assume the planet to be terraformed is a rocky body with a surface gravity between one third and twice Earth's.

Terraforming Methods

The main things terraformers want to do with a world are to adjust the temperature and the air mix. The list of methods and the time-spans given below assumes a more or less "normal" level of space-opera technology, the sort seen in the *Traveller RPG* -- no morphic field generators or nanotech bombs building ecosystems and cities in one exciting game session.

But terraforming takes so long that it's likely technology will change in the course of the project. You could start by crashing meteors into the planet and end by having your psionic über-computer adjust the atmosphere with planet-wide chemical telekinesis. Short of that . . .

To cool a planet quickly:

Kick up dust with asteroid or comet strikes, or shallow tectonic missiles (see below), or by bomb-stimulated vulcanism, if the planet has any volcanos. (However, vulcanism also introduces unwanted greenhouse gases. The planetologists will have to calculate which volcanos to bomb, how far down to place the bombs, and how big an explosion, to get a favorable balance of dust over carbon dioxide.) This trick starts cooling within weeks to months, but the cooling only lasts until the dust settles, which will be a year or so.

To cool a planet permanently:

Remove carbon dioxide by introducing carbon-fixing bacteria, plants, or other organisms. You want to start building coal beds, peat bogs, and layers of plankton shells and "coal reefs" built up in the seas. This would take years to centuries.

Carbon dioxide is the problem on Venus, but not on Mercury. Cooling a planet that is just too close to its sun is a much tougher challenge. Creating Saturn-like rings from pulverized asteroids would cast some shade and lower average planetary temperature. Such a project would take decades to centuries, depending on scale and tech level.

To heat a planet:

Add carbon dioxide from comets rich in dry ice, or by burning or metabolizing native carbon deposits, or by stimulating vulcanism. (However, vulcanism may introduce unwanted cooling dust cover in the short term. The planetologists will have to calculate again, as they did with cooling a planet quickly.) This would take years to centuries.

To heat a locality:

Put some large mirrors in synchronous orbit, angled to shine extra sunlight on the area. This takes effect almost immediately.

The size of the locality heated depends on how much mirror surface you put up and how much of the planet's surface the mirror-image of the sun is visible from. If the total angular cross-section of the mirrors is the same as the sun's and the mirrors are perfect, you can double the total sunlight to the area.

With enough mirrors, you can heat the whole planet, as on Komarre in the Vorkosigan stories of Lois McMaster Bujold. There, the time constraint is how long it takes to build a giant array of orbital mirrors.

Alternately, bomb open a crack in the planet's crust to expose magma or get near it, if the planet has a magma layer under a sufficiently thin crust. (The Moon and Mars do not.) This, however, will only produce comfortable heat in a thin zone along the edge of the exposed magma, and the result may cool and crust over in a few years.

A third alternative is sunlamps. These can be in orbit, in high-altitude aerostats, or on very high towers or beanstalks. They require maintenance, though, and a lot of power. However, any civilization that can travel between stars probably *has* lots of power.

To aerate a planet:

Add oxygen by cracking it out of native water or cometary ices, using oxygenating plants or bacteria. This would take decades to centuries.

To aerate a locality:

Dig a very deep canyon or crater, using tectonic missiles, then introduce the air mix, which might be manufactured from cometary ices. This would take effect immediately, but there would be mixing with the thin air up on the surface, so it had better be air you can tolerate.

The depth of the canyon is:

$$h = (KT/gm) \ln(P/Po)$$

where:

P = the air pressure at the bottom
Po = the air pressure on the surface
g = the local gravity
T = the temperature, in degrees Kelvin
K = the universal gas constant = 8.3 Joules/mol-degK
m = mean molecular weight of atmosphere (= 29 for Earthly air)

To irrigate a planet or a locality:

Add water from comets, or use tectonic missiles to carve canals connecting to an ocean or an ice cap. (Using an ice cap may entail heating the planet.) This would take years or decades.

Terraforming Equipment

Terraforming takes a lot of very large equipment.

Mass Bio-Reactors

These are factories for culturing and dispersing massive quantities of the transgenic bacteria used to raise oxygen levels, or raise or lower levels of carbon dioxide. Once dispersed, the bacteria will, ideally, begin multiplying exponentially, but conditions are never ideal, and it still helps to boost populations as much as possible. The bio-reactors can be housed in any suitably large vehicles: sea vessels, dirigibles, fleets of tanks with spray-cannons, etc.

Comets

Comets, as you see, are a vital tool in terraforming. Fortunately, there are plenty of them. The Solar System has an estimated trillion of them (10^{12}) in the Oort cloud, out beyond Pluto. The average Oort comet has a mass of 10^{14} kg and is thought to be about half water ice with the rest composed of frozen carbon dioxide, methane, and a little dust. It would take roughly ten million such comets to supply enough water to fill the oceans of Earth.

Comet Tugs

Comet tugs are ships consisting mostly of power plant and engine, which steer and accelerate comets toward their destinations. They may also be used to give a comet a (relatively) soft touchdown, if that is possible and desired. Depending on tech level, tugs might visit a comet every few years for decades or centuries, letting gravity and momentum do most of the work, or they might haul it across the star system in a matter of hours or days.

Comet Mining Stations

Different comets have different uses. "Wet" comets, rich in water ice, are for irrigation. "Dry" comets, rich in carbon dioxide and methane ice, are for warming. Mining stations, set up beside or on a comet, strip out undesirable veins of material, tailoring the comet to its task. They also break large comets up into smaller ones, to make them more manageable for the tugs.

Tectonic Bombs and Missiles

Terraformers sometimes need to stimulate vulcanism, produce several small earthquakes to avoid one big one, sculpt canyons, chisel tectonic plates, or tailor planetary magnetic fields. If your setting includes some form of hyperdrive, it is plausible for terraformers to do their landscaping with small hyperdrive drones, set to come out of hyperdrive at carefully specified points inside the planet, producing enormous subterranean explosions.

If your setting does not include a suitable form of hyperdrive, you'll have to get by with very large nuclear weapons positioned by tunneling, with as low a radiation yield as possible. Antimatter would be nice.

Breeding Stations

To supply needed biota, terraformers run ranches and farms to raise the desired plants and animals. These may be natural or gene-tailored for the new planet. The breeding stations themselves will usually be on the planet, though there will be a few "space arks" arriving early in the process, to set up the groundside stations. Building a planet's ecology isn't as spectacular as lobbing comets around, but it's a lot trickier. Beekeeping will be a surprisingly important skill . . .

Gaming Hooks

Gaming hooks are as easy to find as screwdrivers, in a terraforming campaign.

All you need is someone (either the PC party or their foes) who:

- Doesn't want that planet terraformed (possibly because they were living on it and liked it the way it was).
- Wants it terraformed *this* way instead of *that* way.
- Doesn't like someone on the planet being terraformed.

Then, imagine what this discontented party could do with comets, meteors, volcanos, and continent-sculpting missiles as weapons, in addition to all the usual possibilities of a spacefaring sci-fi setting.

But the adventure doesn't have to be about sabotage. A terraforming project has plenty of scope for innocent accidents, either in space or on a planet that was, by definition, hostile even before they started bombing the bejabbers out of it.

Then there's the biological side:

- The young, artificial ecology may lurch out of control, resulting in plagues of frogs, kudzu, molds, and the like, while desired species go extinct. PCs may have to rush in to rescue valuable foundation populations or exterminate pest species.
- Saboteurs can, of course, engineer such plagues and extinctions. The heroes can be sent to find and thwart them.
- And it may not be clear whether a given plague or extinction is accidental or deliberate. The PCs may be investigators, detecting in the breeding stations or roaming the half-formed wilderness for clues.
- Over-enthusiastic genetic engineers may feel your planet is the perfect environment for their newly-designed species and smuggle it in, hoping to get it entrenched before anyone notices. Or, of course, they could just be saboteurs. The GM can get awfully creative about the species -- anything from microbe to major carnivore to sapient race. PCs then have the double task of coping with the smuggled species and finding out who smuggled it.

Upkeep

Terraformed planets will generally not stay terraformed without upkeep. For example, the short story "Big Joe and the Nth Generation" by Walter M. Miller describes a terraformed Mars that is starting to run low on air because the artificial atmosphere is leaking away. (Unfortunately, the populace has lost most of its technology, and Earth can't help because it's now an asteroid belt. Now, *there's* a challenge for your PCs.)

The less like Earth a planet was to begin with, the faster it will revert, as a general rule. But, if the terraforming was done properly to begin with, reversion will take centuries, if not millenia, even if you're talking about air leaking off the Moon.

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahogroups.com, and the Omniscient Eye might answer it!

Never Tell Me The Odds!

What does a mechanic's Critical Failure look like?

Well, let's take a completely hypothetical example. Someone takes their 1991 Mitsubishi Galant (champagne-colored) to the mechanic, who makes a diagnostic roll. Said car may have been the victim of some flooding damage, when a killer hurricane (let's call her "Jeanne") chased the car's owner to another state.

Anyway, the mechanic informs the car's owner yesterday that the car needs to have a lug nut replaced on its front tire, but otherwise it's fine. "It's a good car," the mechanic says.

The next day, the mechanic has different news for the car's owner: "As it turns out, I hadn't noticed the large quantities of smoke coming out from the engine. There's no way it will pass the state's inspection standards, so you'll need to get a new engine or a new car."

In 24 hours, we went from "one nut" to "one engine."

And *that*, my friends, is a mechanic's Critical Failure.

Actually, it depends on the game system being run. For example, this past weekend I was a guest at a fairly local con called "[Southern Exposure](#)." It's called Southern Exposure because it's in the southern part of New Jersey. Apparently, being in the absolute top part of Florida for a decade would've qualified me as Nanook of the North. (As another aside, the geography of the northeastern United States is really taking some getting used to. It's weird to realize that I can drive 90 minutes and get to about eight other states, or drive for four hours and remain in the same one.)

Anyway, it was a fun time, especially because -- for the first time -- I successfully ran my adventure "[The Kensington Codex](#)" at a convention. Mind you, I've *tried* running this scenario at about six other conventions in the past, using a myriad of systems, all to no avail. But, despite the fact that no one had signed up ahead of time for the session, I managed to rope in four other people into having a seat. In fact, it wasn't until 20 minutes into character creation when it was revealed that two of the players were *Pyramid* subscribers (who, despite learning who I was, opted to stay).

Anyway, my game of choice this time was the *D6 System*, which had its origins in the classic *Star Wars RPG* from the 1980s. This was important, because I needed to convince one of the would-be players that this incarnation -- or at least his experience with it -- would be different. See, he'd played the *Star Wars RPG* once before at a convention, and had a *miserable* time. Why? Because he didn't like the system's critical failure system.

For those who aren't aware, the *D6 System* uses (unsurprisingly) a die pool system of six-siders, where one of the six dice is a "Wild Die." If the Wild Die comes up as a six, it's called a Critical Success, where it's added on to the total and rolled again. If it comes up a one, it's a Critical Failure, where Something Bad Happens.

Unfortunately, the GM who was running this event treated this Critical Failure as being equivalent to other games' Critical Failures, such as *GURPS*, *Rolemaster* or (unofficially) *Dungeons & Dragons*. The problem -- immediately obvious for one with any math training above the 5th grade -- is that the probabilities don't line up. In *GURPS*, a Critical Failure for most rolls only happens on a roll of 17 or 18 on three six-siders. This comes out to less than a 2% chance for most rolls. Most *Dungeons & Dragons* Critical Failure rules stem from a roll of 1 on a 20, making for a 5% chance.

But Critical Failures in *Star Wars* happen on a one-in-six chance, which is almost 17%. As such, since these Critical Failures were treated in the same way as their less common brethren, then *everything* went wrong, all the time. Exploding blasters, revealed hiding places, malfunctioning spaceships, twisted ankles . . . fate hated the heroes. The adventure got off-track almost immediately because of Critical Failures, and it never got anywhere close to the actual plot.

Now, those readers looking for advice, here it is:

Make sure the socks and clothes are rolled *tight* before being stuffed in the pillowcase. Otherwise, although it still won't leave a mark, the beating the errant GM receives won't be anywhere near as painful, and . . .

Oh, wait. That's not the kind of advice you wanted?

Err, it is?

Well, too bad. You'll need to get my forthcoming *Senseless Beatings d20* for more of those kind tips. For now, however, I'll content myself with offering more insight into the various "criticals" of game systems.

But first, I need to gloat a bit. I confess to having been a bit nervous before running the adventure, since I realized this marked the first time I'd done a full-blown GMing session in over a year and a half, and my first tabletop game in a couple of years. It's been a long dry spell, folks. *And* this also marked the first time I'd ever run the *D6 System* (which I treated with the same reverence as I do all RPGs -- namely, "roll the dice and see how pretty they look").

Anyway, even having never actually run the *D6 System*, I had a plan. Namely, any Critical Failures were merely an excuse for me to make things more interesting.

Example 1: Our heroes are trapped on a damaged plane. One hero needs to rescue another on the outside wing, and he's tied himself off with a makeshift rope. He makes his climbing roll, but has a Critical Failure on the Wild Die. I declare that he gets close to his companion . . . and feels the tug of his (too short) rope, *just* out of reach of his friend.

Example 2: Our hero is searching an archaeological dig for evidence. He makes his search roll with a Critical Failure on the Wild Die. I describe the scene:

"Okay; you're searching the pit, and you hear the snap of thin stone beneath your feet." "Uhh . . . okay. I search below my feet." "You find two halves of a stone tablet. It seems it was freshly broken."

At no point in the adventure did I fall back on the usual "jammed gun/exploding knee/self-mutilation" of the usual Critical Failures. In all, I tried to make things more exciting for the players, giving them opportunities to overcome new (minor) obstacles or bring more roleplaying or humor to the situation.

Thus, in the first example, the hero -- in true pulp tradition -- swung himself toward his friend, using the tautness of the rope to keep him steady as he got his legs in position for the other to grab onto. (You can't make these kind of scenes up . . .) Sadly, we never got to see what would've happened if the *other* hero -- who had noticed the too-short rope and was going to untie it -- had gotten to act, since the scene had resolved before then. But it was still cool.

And in the second scenario, the players used the opportunity to add humor to the game:

"I found this tablet. I think our enemy has been here; it seems freshly broken."

"Doesn't this footprint on the tablet look a lot like yours?"

"Uhh . . . yes. Clearly they're wearing the same kind of boots as I am. Keep an eye out for them; it could be a clue. Umm . . . I need to go translate this now."

I never used the event of Critical Failures to actively hose the players. Rather, I considered the example of adventure movies, which is how I often pace my adventures. And, in thinking about it, I realized that, on average, my reflections mirrored those of the system: Namely, that one in three times something "interesting" happens (good or bad). If the hero shoots his gun six times, four times will be the typical "bang, bang, pa-CHING!, twong" types that keep the scene going, one will be something interesting that works out in the hero's favor (such as winging the bad guy enough so that he falls off a railing), and one will work out against him or otherwise cause a complication (maybe a ricochet hits a gas tank, sending a slowly escalating pool of gas everywhere). Obviously this ratio doesn't hold for all movies, but it helped keep me focused.

However, this method only worked *because* I considered the math involved with Critical results. If I were running, say, **GURPS**, where Critical Failures are (on average) nine times less likely, then I'd probably beef up the results of each of those, and weave the other interesting complications into the more "mundane" rolls. And in a game such as **In Nomine**, where there's a less than 1% chance of *any* Critical result (good or bad), those rolls need to be treated even more seriously.

In any game, it pays to consider what a critical result means, and decide what the magnitude of those events will mean. A **Torg** "glory" result, for example, is designed to be achievable (with effort on the players' parts) about once every adventure or two. While this makes it rare, it's not as extreme as, say, an ordinary Marine with a knife being able to decapitate an all-powerful *Highlander*-style immortal in a one-on-one confrontation (as was suggested recently by a fan to our rules writer). After all, if something *that* rare and amazing is going to happen every other adventure, what do you do for an encore? Jump to the moon? Kick over a bus? Enjoy *The Haunting*? Without some sense of scale, these critical results -- which, really, are all about making the game more interesting -- become meaningless.

Regardless, turning something that happens 17% of the time into an excuse for an unending series of catastrophes is *not* the way to go. And if you do so, they'd be entirely justified in working you over with a cudgel. But don't worry -- at least one out of six times your beaters will knock themselves unconscious, accidentally swallow their blackjacks, sneeze and rip off their arms . . .

Which reminds me that I need to go deal with my car some more. Err . . . hypothetically, that is.

--*Steven Marsh*

Poor Bloody Infantry

for *Ogre/GEV*

by Karl Gallagher

1.0 Introduction

This article provides new rules for using infantry in *Ogre/GEV*, along with scenarios focused on infantry. Some of these rules require *Shockwave* and/or *Ogre Battlefields* to use. New counters are needed for some of the rules; you can print out the attached file on cardstock or make your own.

The following files are included for use with this article:

- [Counters](#)
- [Map for Citadel scenario \(7.0\)](#)
- [Map for Beachhead scenario \(10.0\)](#)

2.0 Missile Reload Packs

2.01 Heavy infantry may replace their one-shot missiles by reloading from a pack of replacements. Reload packs cost 2 VP, have D2, and can only move when carried by another unit. A reload pack takes up one squad's worth of space when being transported by a vehicle.

2.02 A heavy infantry squad may reload by spending a turn in a hex with a reload pack without moving or firing. If the squad, pack, or both are on a vehicle it must also not move or fire during reloading. A single pack holds six reloads (i.e., can reload one squad six times, 3 squads twice each, etc). Each reload pack must have its use tracked and be discarded when its six reloads are used up.

2.03 A reload pack may be put on or taken off a vehicle at the beginning of any movement phase if an infantry unit is present in the same hex.

2.04 A three-point infantry unit may carry a reload pack but may not fire while carrying it. Picking up the pack requires the unit to spend a turn without moving and firing in the same hex as the pack. A reload pack may be dropped at any time (i.e., if the infantry unit is overrun it may drop the pack and fight normally, but would have to pick it up again on the next turn to move with it). A reload pack dropped in a water hex is not lost (it has neutral buoyancy airbags). Enemy reload packs may not be captured, only destroyed.

3.0 Anti-Ogre Mines

3.01 An infantry squad may carry an Anti-Ogre Mine (AOM), a nuclear shaped charge device designed to be placed under the treads of an approaching Ogre in an attempt to disable it. An AOM costs 2 VP and is destroyed if the carrying squad is eliminated. An AOM may be transferred from one squad to another if they are stacked together at the beginning of the movement phase. The carrying squad should be identified secretly so the opponent can't tell who's carrying it until it's used.

3.02 When it's overrun by an Ogre, a squad may use an AOM instead of its regular attack. Roll one die to find the result:

- 1-3** no effect
- 4** 2d tread units destroyed
- 5** 4d tread units destroyed
- 6** 4d tread units destroyed and Ogre is stuck

3.03 The "stuck" result indicates critical subsystem damage to the Ogre, preventing it from moving until field repairs are made. Unsticking the Ogre in combat requires an engineer squad or equivalent unit. Roll one die each turn a squad is in the Ogre's hex without moving, firing, or being fired upon. On a "6" the Ogre can move again at the speed allowed by its remaining tread units.

4.0 Laying Smoke

4.01 Engineer squads may generate smoke clouds to provide cover from laser fire. In place of its regular attack the squad may place a smoke counter in its own hex. This counts as "firing" for other actions. Marine engineers may only do this when on the surface of the water.

4.011 In miniatures games, place black cotton or a felt disk in a 1" radius around the engineer figure. Laser fire is blocked by the actual shape of the smoke.

4.02 A laser may not fire into or through a hex containing smoke (exception-cruise missiles may be fired on). A smoke counter remains on the board until the start of the second friendly fire phase after it was laid.

5.0 Entrenchments

5.01 Engineer squads may create improvised cover for infantry in clear terrain. This is a combination of trenches, foxholes, bunkers, and other shelters. Note that these are deeper than 20th-century entrenchments; a battlesuit can jump out of an six-meter-deep hole to take a shot, and a lot of dirt is needed to shelter from nuclear explosions.

5.02 An engineer squad may create an entrenchment by remaining in a hex without moving or firing for three turns. More squads can speed this up, requiring a total of three engineer-turns.

5.03 An entrenchment in clear terrain doubles the defense strength of infantry in the hex. It has no effect on vehicles or movement. Entrenchments in other terrain have no effect.

5.04 Entrenchments may be included in the initial set-up at a cost of 2 VP each in hexes where infantry units may be set up at the beginning of the game.

6.0 Ogre Critical Hits

6.01 An Ogre has meters-thick BPC armor protecting its vitals, leaving only the weapons and treads vulnerable to attacks. A determined enemy can still mass firepower to try to penetrate that armor, aiming for weak points such as the linkage between the front and rear sections or the fusion plant cooling vents.

6.02 The defense strength against a critical hit depends on the size of the Ogre:

<i>Ogre Model</i>	<i>Defense</i>
Mk I	5
Mk II	11
Mk III	17
Ninja	20
Mk IV	22
Fencer	25
Mk V	27
Doppelsoldner	32
Mk VI	33

6.03 The effect of a critical hit is variable, since the core systems are so close together that a dozen centimeters can change which components are affected. If an "X" result is achieved, roll one die:

- 1 no effect
- 2 can't fire for 1d turns
- 3 can't move for 1d turns
- 4 can't fire until repaired
- 5 can't move until repaired
- 6 destroyed

6.04 An "XX" result on a critical hit attack destroys the Ogre (but leaves a hulk).

6.05 Field repairs may be attempted on the Ogre as in 3.03. If the engineers are working on a "can't fire" damage result the Ogre must not move while the engineers are working.

Scenarios

7.0 Citadel

Sun Tzu wrote "Take what the enemy holds dear and await attack." A Combine mechanized infantry force took that to heart, capturing a small city with an autofac critical to Paneuropean logistics on that front. While their GEV-PCs go for reinforcements the MI set up to hold the city. Cruise missile detonations would destroy the autofac, so the Paneuros have to dig them out the hard way.

7.01 Basic Setup. The GEV map is used. All hexes on or north of the road from 0104 to 2304 are town hexes, representing the city. The defender sets up with 30 points of infantry and a LHWZ anywhere in the city. The attacker enters from the southern edge with 20 armor units.

7.02 Special Rules. The attacker may not take any armor units with M1 or M2-this is a rapid reaction force and anything slow had to be left behind. He may exchange an armor unit for three points of infantry but they may only enter riding on vehicles. No cruise missiles may be used by either side.

7.03 Escape. Defending units may not escape. Attacking units may escape off the E, S, or W map edges.

7.04 Objectives and Victory Conditions. The attacker needs to recover the autofac to hold the line-the defender needs it to sustain a breakthrough. Whoever has units left in the city at the end of the game is the winner. If the winner has more than 1/3 of his original force left (in VPs) it's a decisive victory. The players may agree to a draw if neither player can make an effective attack.

7.05 Alternate Maps. This scenario may be played on other maps with the same forces. The set-up locations are:

Shockwave: city is road 0115 to 1822 and hexes to southwest. Enter from North.

G-3: city is road 0401 to 0422 and hexes to west. Enter from East.

S-3: city is road 0104 to 2304 and hexes to north. Enter from south.

7.06 Advanced Scenario. Defender has 45 infantry squads and a HWZ. Attacker has 35 armor units.

7.07 Ogre scenario. Defender has 40 infantry squads and a HWZ. Attacker has an Ogre Mk V.

8.0 Convoy

Few missions are as boring as escorting a supply convoy. Few are more exciting than attacking one.

8.01 Basic Setup. Defender has 10 trucks carrying cargo (may not be used to transport infantry), 8 armor units, and 6 infantry squads. Additional trucks may be taken to transport the infantry at no cost-those trucks will not count for victory points. The attacker has two options for his force:

1. 3 armor units, 12 infantry squads, set up on board
2. 10 armor units entering from off the board (no MHWZ allowed, an armor unit may be exchanged for 3 squads of infantry)

The defender enters on a road in column (i.e., the 2nd stack of units must expend 1 movement point before entering the board, the 3rd must expend 2, etc.) and secretly notes the road hex on the opposite side of the board that they will exit on. Some units may be held off-board to enter on a later turn, but all must enter through the same hex. The attacker then reveals whether he chose option 1 or 2 for his force. Option 1 units are set up on the board at least 5 hexes from any defending unit. Option 2 units enter from a map edge chosen by the defender. The attacker may move and fire normally on his first turn.

8.02 Special Rules. The attacker may be given an advantage by using the town and bridge destruction rules.

8.03 Escape. Attacking units may escape from any map edge. Defending units may escape from the entry and exit road hexes. Units which escape may not reenter the map.

8.04 Objectives and Victory Points. The attacker gets 10 VPs for every cargo truck destroyed. The defender gets 10 VPs for every truck that exits at the designated hex. Trucks that escape through the entry point or are stranded on the board count for no points. Count points for destroyed units normally.

8.05 Victory Levels. If one player has 0-15 VPs more than the other the game is a draw. 16-30 VPs more is a marginal victory. More than 30 VPs ahead is a decisive victory.

8.06 Alternate Maps. Map G-3 is best for this scenario, but S-3 or the GEV map may also be used.

8.07 Advanced Scenario. The defender has hovertrucks instead of trucks. The attacking force is doubled. Hovertrucks count for VPs if they exit the opposite map edge, not just the road hex.

8.08 Ogre Scenario. The defender has hovertrucks instead of trucks. The attacking force is an Ogre Mk IV entering from the side chosen by the defender. Hovertrucks count for VPs if they exit the opposite map edge, not just the road hex.

9.0 Forlorn Hope

The division of labor is clear-tanks attack, infantry defends. But when the armor failed the Combine faced a 200-mile retreat unless it could disrupt the Paneuropean offensive. So posts all along the line were stripped of their troops. If the infantry can break the Paneuro supply line High Command will release the reserve and cruise missiles. If not, well, there wasn't enough transport to get them to the Pyrenees line anyway.

9.01 Basic Set-up. The Shockwave map is used. The defender has 10 armor units, 8 infantry squads, and a 60 SP Strongpoint in hex 0811 (this is an ammo and fuel dump-defending units may not use it for shelter). Defending units must be set up within 8 hexes of the strongpoint. The attacker enters from the east edge with 48 points of infantry (squads may be exchanged for heavy weapons squads (at 2:1) or reload packs (at 1:1)).

9.02 Escape. Units may escape from any map edge.

9.03 Objectives and Victory Points. The strongpoint is a warehouse with the fuel and ammo needed to maintain the Paneuropean forces. The destruction of the building is the only factor that matters in deciding victory.

9.04 Victory Levels. If the attacker completely destroys the building and has more than six squads left he has a decisive victory. Destroying the building is a marginal attacker victory. If 30 or more points of damage is done to the building the game is a draw. If the building has less than 30 points of damage the game is a marginal defense victory. If the building is undamaged it's a decisive defense victory.

9.05 Alternate Maps. This scenario may be played on other maps with the same forces. The set-up locations are:

- GEV:** Strongpoint in 1408, attackers enter from west or south.
- G-2:** Strongpoint in 1610, attackers enter from west or south.
- G-3:** Strongpoint in 1210, attackers enter from east, west, or south.
- S-3:** Strongpoint in 0814, attackers enter from north or east.

9.06 Advanced Scenario. Double defending force. Attacker has 36 squads regular infantry, 12 squads heavy weapons infantry, six reload packs, and six GEV-PCs.

9.07 Ogre Scenario. Defender has an Ogre Mk III. Attacker has 48 points of infantry.

10.0 Beachhead

D-Day -- brutal, bloody, and complicated. While the fleet stands offshore protecting itself with lasers and smokescreens, the marines must lead the way to capture a port that more forces can be landed at.

10.01 Basic Setup. The GEV map is used, with all land other than the SE island treated as water hexes. The defender sets up on the island with 2 laser towers, 3 laser turrets, 30 points of infantry, 6 entrenchments, 12 armor units, a 60 SP strongpoint, 3 20 SP admin buildings, and 4 large revetments (each of which may be exchanged for 2 small revetments). The attacker may enter from the map edge from hex 0105 to 0701. Some attacking units may be held back to later turns. The attacker has 12 marine engineer squads, 60 points of other infantry, and 30 armor units. One landing craft is provided for every unit that needs one.

10.02 Special Rules. The attacker's regular infantry and armor units may enter the map riding landing craft (LC)-this is a D1, M1 unit that holds one armored unit (size 5 or smaller) or three infantry squads. Attacks are applied to the LC and its carried unit with the same die roll. If the LC is disabled by an attack the carried unit may still move or fire normally. If the LC is destroyed the carried unit is also destroyed, except for infantry which is placed swimming in the hex. An LC may not enter any terrain except water. If the LC is adjacent to a land hex at the beginning of the movement phase the carried unit may move onto the land hex normally. Carried infantry may dismount to swim at any time.

10.03 Escape. Defending units may escape from the south or east edges of the map. Attacking units may escape from the entry zone.

10.04 Objectives and Victory Conditions. The attacker needs to seize a landing point to bring in heavy units by ship. Victory levels are as follows:

Only attacking units are on the land and more than 1/3 of attacking force is left	decisive attacker victory
Only attacking units are on the land	marginal attacker victory
Both sides have units on land	draw
Only defending units are on land	marginal defender victory
Only defending units are on land and 2 lasers and 44 VP of defending units are still operational	decisive defender victory

10.05 Alternate Maps. This scenario may be played on other maps with the same forces. The set-up locations are:

- G-2:** Land is NE corner to stream, attacker enters from 0118 to 1123.
- G-3:** Land is NW corner to stream, attacker enters from 1101 to 2308.
- S-3:** Land is SW corner to stream, attacker enters from 1001 to 2306.

10.06 Advanced Scenario. Add to the basic set-up: The attacker uses armored landing craft (LCA) with D2, M2, and

may fire one cruise missile per turn from offboard. The defender may place 12 mines (see GEV 8.02) and 8 obstacles.

10.061 Obstacles. A maze of concrete blocks and steel beams may be placed in shallow water to render it impassable. An obstacle hex cannot be entered by landing craft or armor. Infantry and Ogres treat it as swamp. The location of an obstacle is recorded during set-up and revealed when an enemy unit comes within 3 hexes. Engineers can clear paths through the obstacle-three squad-turns without moving or firing in the hex will allow landing craft and Ogres to treat it as a normal water hex (infantry may still treat it as swamp).

10.07 Ogre Scenario. Add to the advanced set-up: The attacker gets an Ogre Mk V entering underwater (it won't fit on a landing craft). The defender may fire one cruise missile per turn from offboard.

Alternate Impudites: Another Take on the Takers

for *In Nomine*

by Eric A. Burns

The Impudites are a challenging Band of demons to play in *In Nomine*. Unlike all other celestials, they have penalties assigned to every use of their resonance. Their Band Attunements often do little more than give them break even chances to affect their targets with their resonance. Even their dissonance conditions are difficult -- if a Mercurian gains the Murderous Discord, ultimately Falling as a result, that same Discord will make an Impudite dissonant.

This is an alternate view of Impudites, which players and GMs may use in their games, along with alternate Band Attunements from the major Superiors where appropriate. These Impudites are even more charming and seductive, but are also all the more selfish . . . and dangerous.

Impudites

The Takers

The demon wheeled into the alley. The Malakim wouldn't be delayed by the traffic accident long. He needed cover and he needed it fast.

Up ahead was a dance club's back door. A bouncer stood outside, making sure gate crashers didn't slip in the back. Perfect. The Impudite smiled, running up to the man. "Hey," he said, pushing with the back of his soul into the bouncer's. "Can't you let a guy slip in? C'mon . . ."

The bouncer's scowl seemed to melt, and he smiled. "For you, man, anything," he said, opening the door. "You have a good time, now. And don't tell anyone, or we're both in trouble."

"Whatever," the demon thought, waving as he slipped through the door and into the mass of sweet humanity beyond. Let's see the blackwings find him now.

The most charming and apparently sympathetic of all demons, Impudites are also the most selfish of a self-centered lot. Everybody's best friend and closest confidant, Impudites surf through existence on the backs of others, taking and using what they want and making sure someone else pays the price. With enough time and effort, their "friends" will even offer up their very Essence to these charming takers.

Resonance

Where Mercurians can perceive the relationships that surround all beings, Impudites can force those relationships onto others. They have the ability to push their own symphony onto others, making their victims like or even love them, and willing to sacrifice everything for them. Impudites use this gift to get everything they want, from special favors and gifts to the very Essence that others usually hold so dear.

Dissonance

Even as an Impudite is so adept at convincing others to sacrifice on the Impudite's behalf, no Impudite is willing to inconvenience himself for others. Whenever an Impudite chooses to put another's interests before his own, he suffers dissonance. This doesn't mean Impudites can't be helpful, if their interests and another's coincides, but it's a sure bet no Impudite will ever do for another without having a personal agenda driving it.

Obviously, it's within an Impudite's best interests to obey his Superior, so he can help his fellow demons -- even to the point of inconvenience and sacrifice -- if ordered to from above. He can also be relatively subtle in his manipulations, so long as there is clearly greater reward than cost to his actions. For example, if an Impudite wants to sleep with a beautiful young activist, he can give money to a homeless man as a means of impressing her without suffering dissonance. (Though if his attempt to seduce the woman does fail, his earlier "generosity" will cause him delayed dissonance, making "investments" sometimes risky.)

Manner And Appearance

Impudites are the demons most close to humanity. They understand human beings, interacting smoothly and well with them. Even without their resonance, Impudites are warm, charming, and gregarious, getting to know everyone in a room and glad-handing their way into high society at any chance. Only Mercurians are so adept at interacting with humanity.

At the same time, Impudites are self-absorption and vanity incarnate. They can't stand to be anything less than the best looking, best dressed person in the room, and spend inordinate amounts of time on clothes, makeup, accessories, and everything that goes with them. Of course, someone else inevitably pays for all of these things -- after all, the Impudite is such a great guy, how could you not buy him a new suit? As social creatures, Impudites are typically surrounded by beautiful people, all of whom are lavish with the attention and praise the Impudite so craves.

In celestial form, an Impudite looks like his most recent vessel, with a slight (and very attractive) reddish cast to his skin. They have slender leather wings, immaculately kept, small red horns, and a dark halo that clings to their head, almost enthralling in its malevolence. In their own symphonies, they're the lead singer at the front of the stage, with all the hands of the audience reaching out to them.

Game Mechanics

An Impudite rolls against his resonance to Charm his victims. This is a normal resonance roll with no penalties. The victim resists with a Will roll, and if successfully resisted, an Impudite will not be able to resonate that victim for a number of hours equal to the Will roll's check digit.

The Charm is almost intoxicating, with a level of commitment, friendship and even love for the Impudite filling the victim. The victim really, really likes the Impudite, and continues to do so no matter what the Impudite does, short of physically harming the victim, for a number of hours equal to the Resonance's check digit.

The Impudite also can influence one social interaction with his successful resonance roll. After successfully Charming someone, the next socially based skill roll (such as Emote, Fast-Talk, Lying, Savoir-Faire or Seduction) made against the target receives the resonance roll's check digit as a bonus. If this skill roll fails, the victim is still Charmed unless the failed skill's check digit was 6, in which case the Charm is broken. If the Impudite needs something more from his victim, he must roll another resonance roll for each successive social skill roll made.

As a more sophisticated use of resonance (see the *Infernal Player's Guide* for details), an Impudite can attempt to actually Charm a person into subconsciously giving them their Essence. The victim must already be Charmed before attempting this more difficult task. The Impudite must make a resonance roll, at -2 for the difficulty, and at a further penalty equal to the victim's Celestial and Ethereal Forces. Finally, the Impudite must be in physical contact with the victim for the transfer to take place. If Impudite is successful, the victim voluntarily pushes his or her Essence into the Impudite, whose Essence total is increased by this amount (though never above their maximum Essence total). If the victim is not Symphonically Aware, they automatically give up all of their Essence, whether the Impudite can use it or not. (A normal human without Symphonic awareness typically has 1d6-4 Essence to spare.) If the victim is Symphonically aware (such as another demon, an angel, or a soldier), they give up a number of points of Essence equal to the resonance roll's check digit (or all the Essence they have if less than the check digit), whether the Impudite can use them or not. This process is entirely subconscious -- the victim won't even realize they've lost their Essence. If the difficult resonance roll to take Essence fails, the initial Charm is broken and another cannot be established for a

number of hours equal to the failed roll's check digit. If an Essence stealing attempt fails against a Symphonically aware target, the Charm is broken and the victim knows exactly what the Impudite tried to do.

Revised Band Attunements

These revised attunements replace those Impudite Band Attunements which are resonance or dissonance based (and therefore restricted) in the *In Nomine* main book and appropriate supplements. Any Superior or attunement not listed remains the same as in the source materials.

Alaemon: (*Restricted*) Alaemon's Takers are experts at infiltrating and escaping. They may add their Ethereal Forces to any resonance-enhanced skill roll to either talk their way into a restricted area or talk their way out of one. This includes talking their way out of prisons.

Andrealphus: (*Restricted*) Impudites of Lust may add their Corporeal Forces to any resonance enhanced skill roll to seduce or otherwise convince another to perform a specific sexual act with them.

Baal: Experts in the etiquette of combat and the duel of face, Impudites of the War may add their Celestial Forces to any roll made in an honorable duel by a given society's rules. This can be from the use of dueling pistols to fencing to a back alley street fight where a bar eggs the participants on.

Beleth: Charged with nightmares of humiliation and social embarrassment, Beleth's Takers can see a victim's social weaknesses with a glance. When confronted with this embarrassment publicly, their victims must make a Will roll or flee from all public areas in terror and humiliation.

Belial: (*Restricted*) Belial's Takers evoke the dark hunger for fire in men's souls. When in the presence of open flame, Impudites of Fire can use their resonance to captivate their victims into staring at and approaching the flames, ignoring all other stimuli, for a number of rounds equal to the roll's check digit. During this time, they may Charm essence from their victim, attack their victim, or even push him into the fire without breaking the effect. Dousing the flames breaks the captivation.

Fleurity: (*Restricted*) The overly social, overly friendly Takers of Drugs -- a title that is all too fitting, most of the time -- are also expert pushers. They may add their Celestial Forces to any resonance-enhanced skill roll when convincing someone to use drugs.

Haagenti: (*Restricted*) These overconsumers spur their victims into frenzies of conspicuous consumption. They may add their Celestial Forces to any attempt to use a resonance-enhanced social skill to convince a victim to buy, eat or otherwise consume something.

Kobal: As per *In Nomine* p.171, save that there is no benefit or penalty for the death of a human. This attunement is not partially restricted.

Malphas: (Partially restricted) As per *In Nomine* p.175.

Mammon: (*Restricted*) Mammon's Impudites may, with a successful resonance roll, convince their targets that they're getting a sweet deal and taking advantage of the Impudite -- no matter how completely the Impudite is ripping them off. The victim will remain convinced he has taken the Impudite in completely for a number of days equal to the check digit, even if confronted with evidence to the contrary.

Saminga: (*Restricted*) Saminga's darkly seductive Takers excel in sowing the seeds of the ultimate sacrifice. Impudites of Death may add their Celestial Forces to any resonance enhanced skill to convince their victim to commit suicide.

Vapula: (*Restricted*) The ultimate technology users, Vapulan Impudites can use their resonance to enhance skills "coaxing" performance or information out of technology, whether an attempt at hacking a computer with Computer Operation skill or pushing their automobile far past the limit with Driving skill, and everything in between.

Pyramid Review

Cryptic Alliances & Unknown Enemies (for Gamma World)

Published by [Sword & Sorcery](#)

Written by Owen K.C. Stephens, Alejandro Melchor, & Geoff Skellams

Edited by Ellen P. Kiley

Art by Steve Becker, Mike Chaney, Jeff Holt, & Jeff Rebner

128-page b&w softcover; \$22.99

Some game supplements suffer from a lack of direction, while others have a laser-like intensity in the treatment of their subject. *Cryptic Alliances & Unknown Enemies*, a *Gamma World* supplement from Sword & Sorcery, falls into the latter category.

The supposed thrust of the book is to increase the social factor in your games. It expands the community and alliance rules from *Gamma World*, and adds details about leadership. It takes these few subjects and explains the hell out of them.

Specific examples of the allegiances from the core rules sit next to new kinds of allegiances. External ones are those imposed on a person from without, as with brain implants and such, while those dedicated to an object have sworn fealty to some item, device, or place, like a benevolent computer system that spews survival advice. It also talks about allegiances to one's own self, and it stretches the device by talking about opposed "allegiances" -- which keeps things homogeneous in relation to the rulebook, but it comes off a bit forced. More important is the separation of advice on allegiances as part of the narrative and as a set of rules, which is one of that chapter's stronger features. It ends with descriptions of over a dozen of the titular cryptic alliances, which contains some old favorites mixed with clever newcomers.

Then there's leadership. If you didn't know how to lead before, you do now. There are various methods, different tactics taken by different heroes (how the Smart Hero leads vs. the Strong Hero's SOP), how your followers' allegiances figure into it, how equipment may give you the edge, what kind of crazy equipment you can find in the *Gamma World*, some new feats to improve your management style, new uses for old skills, a stack of modifiers for impressing others (like what happens if you look like the prophesied archangel), mutations . . . it just keeps going like a gun-toting Energizer Rabbit.

The remainder of the book delves deeply into communities. Using the rules from the core book, it discusses bigger towns, cities that grow up as a series of interconnected but distinct suburbs, more community feats and types (such as the underwater city), and some exceedingly obvious advice on meetings among community members. Do they go in quietly or openly? Do they wage war? What kinds of war can one wage?

Although the drawings for the book are good work -- all showing some of that grit that'll get under your nails in the bleak, dog-eat-mutated-dog world of the future -- the otherwise unremarkable, utilitarian layout suffers one negative, even debilitating hit: Chapter Two. The pages here try for a weathered, dusty look, which includes tiny little splotches (the same rough background page is used over and over). These have the most unfortunate, disconcerting effect of confusing the reader. One moment a dollop of discoloration looks like it hyphenates a word, then a double take shows it for what it is. Another word is obfuscated against the ink, while some little streaks look like commas or periods.

Why this trick of shadow is so consistently off-putting is a mystery, but the problem persists throughout the chapter.

Why the cryptic alliances get equal billing with one's enemies in the title isn't clear. There *are* enemies to be sure, but they're hardly the gist of the book, so the name is at best inaccurate and at worst disappointing. It feels as though it's a collection of semi-related essays under a single, somewhat misleading banner. It's a lot like the wiring in your house -- you can see how it all fits together, you're just not sure how it's supposed to get the job done. If it's all about the social side of interactions, why not more about love? Romance is mentioned, but it certainly isn't served up by the crateful like war is, a painful irony considering the introduction says it wants to place as much emphasis on the former as most other books do the latter.

The language used is a bit too lofty to allow an easy read, but it's intelligent and not inaccessible. Sometimes you'll be amazed at just how much information the writers can impart on a single, seemingly mundane rule or subject; at other times you'll wonder why they expounded for so long on something without managing to say much about it that's new or helpful. Carefully straddling the fence between page turner and page filler, *Cryptic Alliances & Unknown Enemies* may only appeal to a limited audience. But when it actually attends its self-professed mission statement, it shows some insight into social aspects of roleplaying that, while they haven't been ignored by the rest of the industry, certainly haven't seen this much innovation or concentration.

Shadows of Europe (for Shadowrun)

Published by [FanPro](#)

Written by Audun Myhra Bergwitz, Lars Blumenstein, Rob Boyle, Mikael Brodu, Elissa Carey, Dag Fossmo, Alistair Fraser, Anders Hølsted, Nathaniel Jouen, Steve Kenson, Maciej Kowalski, Stephan Meijerhof, João Nunes, Costán Sequeiros, Peter Taylor, Florian Weiss, & Tobias Wolter

Cover by Klaus Schwerinski

Illustrated by Steven Bagatzky, Eric Desideriu, Kjell Eriksson, Marcio Fiorito, Mike Grills, Fred Hooper, Chris Lewis, Larry MacDougall, Steve Prescott, Klaus Schwerinski, Karl Waller, & Shane White

Cartography by Mikael Brodu

240-page perfect bound soft cover; \$25.00

It is fair to say that the *Shadowrun RPG* gives much of its attention to the various nations of North America. Europe has received relatively little coverage; just three countries have been detailed in English, with the *London Sourcebook* covering the United Kingdom of the Sixth World, the *Germany Sourcebook* covering that country, and *Tír na nÓg* exploring the now-Elven-dominated united Ireland. German fans were also able to read a further sourcebook, *Deutschland in Den Schatten Zwei*, plus the campaign, *Shockwellen*. Both of these were official supplements, while *Walzer, Punks and Schwarzes*, and the French language *Shadowrun France* and *Chrom & Dioxin*, were all regarded as being semi-official. Despite the semi-official status of the last three, they -- together with the other supplements listed above -- all serve as the basis for the latest *Shadowrun* supplement, *Shadows of Europe*.

This is the Old World counterpart to last year's *Shadows of North America*, detailing Europe after the passing of Halley's Comet in 2063. Despite having fewer setting supplements to draw upon, the contents of *Shadows of Europe* still tie into a number of other supplements -- most obviously *Year of the Comet*, but also *Threats 2*, *Target: Wastelands*, *State of the Art: 2063*, *Threats 2*, and *Dragons of the Sixth World*. The latter is particularly important because of the number of dragons found in Europe, most notably Lowfyr, head of the Saeder-Krupp Corporation. This is in addition to the usual panoply of supplements required for a *Shadowrun* game.

More accurately, it should be called "Shadows of Western Europe," since it covers only two nations in the East, Poland and the Czech Republic. It does devote two pages to the Baltic States, Belarus, the Ukraine, Hungary, Slovakia, the Balkan states, and the Federal Republic of Hellas (Greece), but this is just not enough. A second supplement is needed to cover all of these countries as well as Russia, the belligerent in the Euro Wars of the 2030s. This series of wars, dominated by Russia's attempted resource grabs in Finland and Poland and the Great Jihad that saw an invasion of Southern Europe, is among a number of events singular to Europe. The others include the schism in the Catholic Church over the status of meta-humans, the North-South divide between organized crime with the Mafia running the South and the Russian Vory the North, and the reformation of an old dream.

The old European Union was officially defunct by the Crash of '29. Yet during the opening months of 2063, many of its original members had signed on as founder states of the New European Economic Community. Of course, like so much of the Sixth World, the NEEC is heavily influenced by corporate affairs and it has four of its council seats taken by corporations. The new, sleeker, more streamlined NEEC is one more focal point for shadowrunning, this one political in nature and primarily centered on the independent Brussels Euro City. All of this is covered in the book's first chapter, "Crossing the Pond," along with descriptions of Europe's leading corporations (including several new ones) and its Awakened elements. North America is of course, dominated by Amerindian traditions, but Druids and Wiccans are far more common in Europe. These are discussed as are the Fey.

Once the introduction to Europe and the NEEC is out of the way, *Shadows of Europe* gets down to a nation-by-nation description. This is organized alphabetically and covers the Allied German States, Austria, the Czech Republic, France, the Italian Confederation, Poland, Portugal, the Scandinavian Union, Spain and Euskal Herria (the independent Basque nation), Switzerland, Tír na nÓg, the United Kingdom, and the United Netherlands. Most are accompanied by a map -- actually an expanded section taken from the one given in the first chapter -- that provides a little more detail, though more would have been nice. Unlike *Shadows of North America*, none of the flags for the nations it covers is given. This is not only a shame, but also odd given that the logos of various new corporations are included.

Besides the maps, every chapter includes a short timeline of the country and a table of providing its socio-economic breakdown. This table lists population make-up, per capita income, the estimated number of SINless, the percentage of those living below the poverty level, corporate affiliation, level of education, languages spoken, and the currencies in use and their conversion rates with the Nuyen. Finally, it gives the degree of coverage and promised response time of the various emergency medical organizations across Europe.

Besides the effect of the continent's major events upon its history, each country has its own problems. For example, Spain is torn over whether a meta-human can be its king, and Poland is a Russian-dominated military dictatorship facing guerilla resistance. In the United Kingdom, the New Druidic Movement has its own problems with a protest movement lead by a charismatic man identified only as Pendragon, and a Druidic conflict over England's ley lines that has resulted in the appearance of a strange island in the English Channel. (Hopefully, this Arthurian theme will not be carried too far, as it is perhaps too obvious and could be described as the gaming equivalent of chintz.) Each country has a different feel, and hopefully a GM will be able to impart much of this flavor to his players.

The last 20 or so pages are devoted to information pertaining to the game rather than the setting. Country by country, it tells you what is really going on, though only briefly, with the information tying into earlier chapters. For the most part, it leaves the exact truth up to the GM to decide, so that he is not handcuffed by the "official" canon.

The presentation for *Shadows of Europe* is the same as other *Shadowrun* supplements. While still a series of documents posted to the "Shadowlands BBS," there is less conjecture and commentary included than in previous books. Further, the Shadowlands BBS' sysop has turned to the sysop of a European BBS to gather a number of experts to each comment upon his or her own home nation. Although this gives rise to a series of disparate voices, care has been taken to examine how the events of last 60 years have affected each nation. This gives the book a coherent feel, and is a pleasing testament to the organizational abilities of both the writing team *and* the editors -- Rob Boyle, Elissa Carey, Jack Graham, Rik Hakala, and Michelle Lyons.

Physically, the book is reasonably well done, but does suffer from a number of printing errors. Most of the artwork is decent enough, but some of it is too cartoon-like in comparison with other *Shadowrun* books. One major omission is the lack of an index, which given the size of the book and the wealth of material contained, does not make it user-friendly.

With so little actual game information contained within its pages, *Shadows of Europe* presents a hefty dose of setting information. Where it is weakest is in its updating of the three countries that have had their own supplements -- Germany, Tír na nÓg, and the United Kingdom. The updates feel like mere tweaks, but if the GM lacks the supplements these chapters update, and many *Shadowrun 3* GMs do, then the information is still very welcome. As is that given for the other 11 countries, which adds to both the setting and describes opportunities aplenty for adventure.

Begun as an online "Eurosource" fan project, *Shadows of Europe* has been several years in the making, but it has been worth the wait. Hopefully, FanPro will follow it up a companion volume on the rest of the continent, and possibly a campaign to take advantage of its contents. Until then, for the *Shadowrun* fan *Shadows of Europe* adds and develops somewhere new to play, but more importantly for the European fan, it lets them play at home.

--*Matthew Pook*

Dork Tower!

Dork Tower!

American Ley Line: Route 66 (Part Three)

*"Kingman, Barstow, San Bernardino
Won't you get hip to this kindly tip
When you make that California trip
Get your kicks on Route 66."*

-- Bobby Troup, "Get Your Kicks on Route 66"

Two weeks ago, we [continued](#) to trace the ghostly pattern of Route 66 from Joplin, Missouri to Kingman, Arizona. America's Mother Road, Route 66 remains archetypally alive in a way that I-40 has yet to attain. It's that "aliveness," that quality of Something Else Here, that we're mapping, and that you can possibly use in your own games. This week, we reach the ocean, and the end, and look back to see where we've been. As before, there are too many roadside seductions, too many possible map readings, to get to them all even in three columns. Over the thrum of the tires and the roar of the air conditioner, I point out a few sights as we blast across the West and into the morning; I make a few hesitant connections by dashboard light as the AM transmission crackles in, Suppressed by the heat and the distance, and by the very intensity of its occult Signal. Stand on it.

"And 66 goes on over the terrible desert, where the distance shimmers and the black center mountains hang unbearably in the distance. At last there's Barstow, and more desert until at last the mountains rise up again, the good mountains, and 66 winds through them. Then suddenly a pass, and below the beautiful valley, below orchards and vineyards and little houses, and in the distance a city. And, oh, my God, it's over."

-- John Steinbeck, *The Grapes of Wrath*

Route 66 crosses the Colorado River at Topock, Arizona (sadly some 20 miles north of Lake Havasu, with London Bridge at the north end and a 135-foot intaglio geoglyph of a serpent at the south end) and swings north to Needles. Here, in Tom Joad's "murder country," it gathers steam for its tear across the Mojave Desert. Here, it passes the oldest living things in North America -- the Joshua trees -- pulling who knows what sustenance up from the UFO-haunted desert. It skirts an extinct volcano in Amboy, runs through Bagdad, then hits the ghost town of Calico (which still has a few ghosts in its abandoned stores and saloons) and then turns southwest at Barstow past a pair of geoglyphs (a skull and a turtle, death and the world). Here it follows the Mormon Trail, pioneered by Jedediah Smith, passing the Victorville fane of yet another American king -- 33rd degree Freemason Roy Rogers, "King of the Cowboys."

At San Bernardino, the old mission dedicated to St. Bernardine of Siena, the patron saint of advertising, the Road leaves the [Waste Land](#) and enters the suburbs. Perhaps appropriately, it passes below another [significant arch](#), or in this case, two of them -- the first McDonald's ever opened, in San Bernardino, on the Road at 14th and E. The Golden Arches lead the way to the American Paradise, Southern California, and refract all along the Highway. Ray Kroc's first franchised McDonald's is at the other end of 66, in Des Plaines, Illinois; America's largest McDonald's is at the fulcrum of the Road -- actually in a bridge across it -- in Vinita, Oklahoma.

Running the length of the Inland Empire, Route 66 strikes the haunted Aztec Motel in Monrovia, with its echoes of human sacrifice and lost rituals. (There is also an Aztec Motel in Albuquerque, and one in Seligman, Arizona.) Farther west, our Rosicrucian hearts gladden to find [Arcadia!](#) Home of the Santa Anita Racetrack (where the rites of Poseidon and Pelops no doubt play out), this is the second Arcadia along the Road -- Arcadia, Oklahoma was founded in 1889 and features an acoustically perfect Round Barn, no doubt useful for overall-clad Templars. In Arcadia, the Highway passes under the eye of (a fancy way of putting "five miles to the south of") Mount Wilson Observatory, built in 1908 at the instigation of a "little elf" who appeared to the astronomer George Ellery Hale. The 100-inch mirror at Mount Wilson, as it happens, was poured of green glass in 1917 -- another [green glass grail](#), manifested by the will of an emerald alien. (Hale's previous observatory, the Yerkes Observatory, is at Williams Bay, Wisconsin; well off the Road -- but associated with the University of Chicago, and significant for all that.) Just a little farther along the Road, still in the San Gabriel foothills, is Devil's Gate, where the rocket scientist and alchemist John Whiteside Parsons tested solid fuel rockets for CalTech. Parsons also went into the Waste Land -- the Mojave Desert -- along the Road to perform magickal rituals, including the Babalon Working of 1946. Between his Pasadena lair and his Mojave pentagrams, the

connections spiral off too thick and fast for us to stop. Likewise, we pass the Huntington Museum in Pasadena with its copy of the [Dead Sea Scrolls](#), collection of [Shakespearean](#) folios, and early works of [American cartography](#) and exploration -- nothing to see here, surely. The Road pours into [Los Angeles](#), down Broadway (four blocks from the ghost-built Bradbury Building) and onto Sunset Boulevard, Santa Monica Boulevard, and the end in sight of the Pacific Ocean at Olympic.

*"Jesus lived his life in a cheap hotel
On the edge of Route 66 yeah he lived a dark and
Twisted life and he came right back just to do it
Again"*
-- Rob Zombie, "Supercharger Heaven"

Let's go back and take another look at the Road, this time as a sacred pilgrimage route. (66, kabbalistically, equates to A-L-L-H, or "Allah.") Pilgrim roads are, of course, some of the earliest and most resilient; the Highway itself lies atop the old Mormon Trail through Arizona and California. This stretch of Route 66 (all the way to the Llano Estacado in Texas) was surveyed, and its first wagon road built, by Lieutenant Edward F. Beale of the U.S. Navy commanding a train of 77 (!) camels especially imported from Turkey along with a drover, one Hadji Ali. ("Hi Jolly," as his American teamsters called him, is buried in Quartzsite, Arizona beneath a pyramid surmounted by a copper camel -- not, sadly, on the Road, but one can't have everything.) In the *Zohar*, camels paced out the borders of Eden; in the West, perhaps they pace out the Sacred Way to the [Big Rock Candy Mountain](#).

Sacred imagery runs all along the Road, from the Black Madonna in Eureka, Missouri (and the connections between "eureka!" and gnosis we shall leave for the interested reader to tease out) to the "Holy Grail" in Flagstaff, Arizona (the eyepiece of the telescope that discovered Pluto). Percival Lowell saw this, when he recast himself as an anchorite, a "hermit" monk of astronomy, saying "Astronomy now demands bodily abstraction of its devotee . . . To see into the beyond requires purity . . . Only in places above and aloof from men can he profitably pursue his search." These words appear in the inscription on Lowell's tomb, on Mars Hill in Flagstaff. The astronomers (of Flagstaff and Mt. Wilson alike) are the [Grigori](#), the Watchers from the ivory towers of these American [Irems](#). But the Road is not about contemplation alone; it is about travel. As the anthropologist Victor W. Turner says, "If mysticism is an interior pilgrimage, pilgrimage is exteriorized mysticism." Or, in American: Go West, young man.

"The famous old American highway 'Route 66' was laid out by Freemasons with the apparent intention of sending masses of automobile riders into a self-processing occult 'trip.'"
-- Michael A. Hoffman II, *Secret Societies and Psychological Warfare*

Route 66 is thus an initiatory journey, perhaps explicitly from the Crown (here understood as the [mystical kingdom of America](#)) to Understanding (66 also being the mystic number of the path from Kether to Chokmah). Beginning with the "fountain fed by four springs" of Buckingham's Eden in the city of the (reborn) phoenix, we progress through the arch into peril and danger, enter death's chariot outside Amarillo, see the Ancient Ones and then the bones of the Waste Land in the western desert where the Egyptians knew the dead dwelt. After the perilous journey, we arrive in the Blessed Land Behind The Sunset, [Brendan](#)'s paradise of apples and pure water -- or oranges and Coca-Cola.

One can mark the stages in many ways: for example, there are twelve cities mentioned by name in "Get Your Kicks On Route 66." (Nat "King" Cole, he of the intriguing nickname, who first recorded Bobby Troup's classic hymn to the highway, was a Freemason. Just thought you'd like to know.) That equals the twelve signs of the zodiac, much as Robert Graves has assigned them to the Twelve Labors of Heracles or the twelve incidents on the voyage of the Argonauts. Just running through them in an ad hoc way, we begin at Chicago, the slaughterhouse city of the Bulls (Taurus); proceed to St. Louis from whence the "hidden twin" of Route 66, [Lewis and Clark](#)'s hieratic voyage, departs (or which is "twinned" by Cahokia across the river, Gemini either way); and so forth until you get to the Los Angeles Rams (Aries). (Or you could go backward through the zodiac to the upstart St. Louis Rams for Aries.) Some of them can be made to work out pretty well: there's another "[white lady](#)" haunting the Amarillo Natatorium nightclub (Virgo), and Flagstaff makes a dandy metaphorical cave of Chiron, with its connotations of astronomy and withdrawal (Sagittarius).

"It was a continuous carnival. . . . Around every curve was something amazing. Not only scenery, but . . . all the neon signs . . . come-ons to get your dollar. Python pits and freak shows where you'd pay 50 cents to see 'The world's most amazing snakes!' or 'the half woman-half man.'"

-- David Knudson, executive director of the National Historic Route 66 Federation

In general, this is the kind of thing where it will be up to you to add elements from your own game (or do more research than I did) to really hammer stuff home. Pull up elements from your reading and [illuminate](#) them -- for example, the quote above nicely combines snakes, the mystical androgyne, Carnival, and the Mother Road. Double the incidence of incidents, and parallel the 24 books of the *Odyssey*. Or cut it back: you can perform the same trick with the seven planets or the seven Sufi latifah (as we saw with Sinbad's initiatory journey) for seven states along the Road; just leave out Kansas or consider whichever state you start from "Earth." You can draw an interesting parallel to Coronado's Seven Cities of Cibola, too, or lift an idea from Greg Stolze's *To Go* and assign a chakra to each of seven waypoints and recast Route 66 as the channel for America's kundalini. I'd recommend Chicago, St. Louis, Oklahoma City, Los Alamos/Albuquerque, Flagstaff, the Mojave, and Los Angeles for a nice spread, but much of the fun of this is coming up with your own tortured parallels and inflicting them on the players.

"Thus, the Gestapo's 'SS,' as well as Her Majesty's 'Secret Service,' Britain's 'MI6,' and the American military's 'Special Services,' all code for '66' as in 'Phillips 66' and 'Route 66 -- America's highway.' Historic accounts link all of these to Rockefeller and/or Royal Family involvements."

-- Leonard Horowitz, "Kissinger and Vaccinations"

A final thought, a tentative shading of a secret history of the Highway for your consideration, to contrast with the overt history covered in [Part One](#) of this odyssey. One notes with some interest the emergence of the "Good Roads Association," begun by the Greenback-Populist currency-reformer Jacob Coxey in 1892 to lobby for road-building as a farm economy panacea (and after the Depression of 1893, as a jobs program). Coxey's allies included such interesting folk as Colonel Albert Augustus Pope, the owner of the largest bicycle manufacturing firm in America and himself the founder of the League of American Wheelmen (66, kabbalistically, can equal G-L-G-L, *galgal*, or "wheel"), and the fanatical and Ignatius Donnelly, the fiery Populist crusader, [Atlantis](#) theorist, and [Baconian](#) devotee. A kind of steampunk ley-line knowledge corpus develops almost invisibly, from gears and chains, to ciphers and maps, to the economic alchemy of Free Silver. The most interesting of Coxey's Associators was the fanatical [California Theosophist](#) agitator Carl Browne. Browne combined the male and female spirit, having absorbed his wife's ghost after her death, a mystical androgyne "born on the Fourth of July" in a log cabin, no less -- a possible candidate for [True King of America](#)? Browne met Coxey at the Chicago World's Fair in 1893 (where [H.H. Holmes](#) was carrying out his own dark coronation), and converted Coxey to Theosophy, proposing a march on Washington -- a mystical pilgrimage -- beginning on Easter Sunday, 1894 and arriving at the Capitol on May Day. Capitol police arrested Coxey and Browne and "Coxey's Army" faded away. Where, precisely, might the threads might run between the Theosophical Good Roads Association, the Rosicrucian [NYMZA society](#) secretly building airships in California and Texas, and the 1896-1897 appearances of the [Mysterious Airship](#) above Chicago, Los Angeles, and St. Louis, among other places along the future Mother Road? What was the Good Roads group to the government-approved Masonic Road builders a generation later? A shadow organization? A parent faction? A Discordian rival? Who knows? Get on the Road, follow wherever it leads, and get *your* kicks on Route 66.

A Brief Look at Dice and Rules

I'm a bit busy this week, mostly because of my efforts to research buying a new -- cheap -- car, after receiving a settlement from my insurance company that could be used to buy a fair-condition beta Black Lotus for *Magic: The Gathering*. As a result, my column isn't the full-blown affair that it would normally be. The Ewoks are already celebrating, no doubt.

Anyway, [last week's column](#) -- where I talk about critical failures and successes -- seems to be popular with folks, so I thought I'd expand a bit on the ideas behind that.

Over on the [message boards](#), some ideas were tossed around to adapt the idea of the "wild die" Critical Success/Failure to *GURPS*. (To recap, in the *D6 System* one of the dice in the dice pool is a Wild Die, where a 6 can represent Something Good happening and a 1 can represent Something Bad.) Probably the most interesting aspect of this system is that it makes it possible for a roll to succeed, and still technically be a "Critical Failure." This was exemplified in the example about how one hero in the "[Kensington Codex](#)" adventure made his search roll to find a clue . . . and ended up breaking the clue he was hoping to find. (This isn't used to hose the players, but rather make the game more interesting.)

Anyway, the easiest way I thought of to adapt the idea to *GURPS* was to designate one of the dice in any roll as a Wild Die, and use the idea there, only inverted. Thus a "1" would indicate a Critical Success, while a "6" would indicate a Critical Failure. Of course, the existence of a Critical Success or Failure wouldn't actually make the roll more likely to succeed or fail . . . although having one of three dice be a 6 where rolling high is bad obviously skews things in favor of the failure regardless.

To make the chances of a success or failure more likely to coincide with a Critical Success or Failure, I also proposed that having the Wild Die would subtract one on a 1 and add 1 on a 6. This would make success or failure more likely -- and the bell curve of all rolls more variable -- without mandating success or failure on one die. Roger Burton West was good enough to calculate the odds of this variable system for *GURPS*:

Rolled Total	Number of permutations (out of 216)	Chance to roll exactly this	Chance to roll this or less	Chance to roll less this or greater
2	1	0.5	0.5%	100.0%
3	2	0.9	1.4%	99.5%
4	4	1.9	3.2%	98.6%
5	7	3.2	6.5%	96.8%
6	11	5.1	11.6%	93.5%
7	16	7.4	19.0%	88.4%
8	19	8.8	27.8%	81.0%
9	23	10.6	38.4%	72.2%
10	25	11.6	50.0%	61.6%
11	25	11.6	61.6%	50.0%
12	23	10.6	72.2%	38.4%
13	19	8.8	81.0%	27.8%
14	16	7.4	88.4%	19.0%
15	11	5.1	93.5%	11.6%
16	7	3.2	96.8%	6.5%
17	4	1.9	98.6%	3.2%
18	2	0.9	99.5%	1.4%
19	1	0.5	100.0%	0.5%

This flattens a bit the curve over the usual system, making the extreme results slightly more common (and creating two otherwise impossible results -- 2 and 19).

Anyway, the discussion on the boards sparked a reminiscence of the classic article "[Dice of Destiny](#)," where various dice of a roll are designated with attributes. Thus on a three-die **GURPS** roll, one die might be designated "accuracy," one might be "power," and another might be "style." The results of the dice can give an indication as to how you did; on a successful roll, rolling well on the "power" die but less well on the other two would indicate that you almost failed, but were able to brute-force your way through the situation. It's an interesting article, and one I can recommend for food for thought.

Basically, the discussion brought to mind two points, one of which I might share with you now. (But if your browser "Back" button still works, then I might not.)

I'm pretty sure I've said it before, but I love rule tinkering. I don't believe I'm alone in this, either. Although I generally believe that the game system should be fairly transparent, I also realize that a roleplaying game is still a *game* . . . and, as such, should have game-like elements. (What, exactly, those are, I'm not certain of . . . although I think it'd make a good future column.)

For my games, I don't generally believe in One True System, and am constantly looking for new ideas that are interesting, pretty easy, and fun. And these ideas aren't necessarily confined to one game. For example, White Wolf's pre-reboot Storyteller system has a "Willpower" system, rated between 1 and 10; supernaturals have between 5 and 8 points on average, while 2 is a common rating for most normal people (of which there are about a dozen in the World of Darkness). Among other uses, a player can use Willpower point for one automatic success level; used by itself, this signifies a marginal success. In other words, through sheer force of will someone can muddle through a moderately difficult task. (Since a marginal success isn't good enough to solve, say, the Theory of Everything, the system avoids most obvious exploitations.) Willpower points recover fairly slowly, and often only when the character does something that's affirming to its philosophy and outlook on life. Anyway, the point is that this system can be stolen for almost any game that has a [degree of success](#). Sure, it would make the players more able to do moderately difficult tasks with assured success, but the Bad Guys would have access to the same points, so it should all balance out.

In any well-rounded RPG library, there are bound to be lots of beloved rulebooks and supplements that have lots of little bits which can be adapted to another game without too much effort. Most general effects -- task resolution, skills, actions, and the like -- have analogs between systems. And of course -- not to state the obvious -- books within the same system but different games can still be used; introducing a planet of "magicians" (aliens with strange abilities) to a *d20 Future* setting is trivial for anyone with a *Dungeons & Dragons Player's Handbook*. Likewise introducing a vampiric antagonist (or protagonist) to an *Adventure!* game is simple if you also have a copy of *Vampire* lying around. As another example, *Fading Suns* has a system of linked attributes; thus one's Faith attribute and Ego attribute are linked, so that they cannot exceed a total when added together, nor can the character's dominant attribute ever be eclipsed by the other. To swipe this idea for **GURPS**, what if a fantasy world had a Faith attribute linked to Health (HT)? The two together could not add up to above some threshold (say, 18 or 20). In this world, someone could not be both extremely healthy and extremely pious, and wondrous miracles (if tied to a Faith system) could only be performed by the frail.

An RPG is, ultimately, nothing more than a collection of rules. The rules used are up to the GM and players. And although it's necessary to play by the book, sometimes the book in question can be a different one from your shelf.

* * *

For those of you who are unaware, long-time SJ Games' Managing Editor Andrew Hackard is leaving the company in a few days to pursue greener pastures (which, as I understand it, entail editing math textbooks and *not* fielding questions about release dates and comp copies).

Andrew and I have been with SJ Games for almost the same amount of time, which is a bunch of years now. (Which of us has been there longer is a matter of debate, since I've never set foot in the Austin offices.) He advanced at the company from Promotional Writer to Managing Editor, in a process that I envision to be similar to the cutthroat promotion system of the "Mirror, Mirror" universe. As the Managing Editor, he became *my* editor, responsible for smacking me around when I richly deserved it. We finally met -- for the first time -- at GenCon a few months ago. While I don't *think* the trauma of this encounter served as impetus for his departure, the possibility cannot be ruled out.

Anyway, if I were the sort of person who used my column for entirely self-centered means, I would go on and on about how I respect and appreciate Andrew, how valuable I've found his uncredited and behind-the-scenes contributions to *Pyramid*, and how much I consider him a friend. In such a column, I would go on and on about how he was quick to respond to my troubles, have ideas bounced off him, and be available for general ranting and raving.

But I'm not the kind of person who would use his column to wish Andrew the best, and thank him for everything. Which is good, because I'm not sure I would know what to say.

Second-String Supers

by [Chad Underkoffler](#)

Illustrations by Scott Kane

Map by Chad Underkoffler

Genre: Four-color Super-heroes

Style: Animated

Fidelity: Low

Theme(s): Filling Some Big Shoes; Rising to Meet Challenges; Claiming Own Identity

The mighty hero *Dragon Knight* has joined the *Justice Alliance*, and will be concentrating on world-wide problems. Who will protect the citizens of Drakesville during his absences? Why, the PCs, of course: A team of substitutes who, while individually less powerful than he, may together be able to meet the challenge.

What Everybody Knows

Supers in History

Aside from the heroes of myth, and scattered rumors throughout history, the first *verifiable* superhumans were recorded only after WWI. In the years between the World Wars, the amazing exploits of these new "super-heroes" and "super-villains" began to fill the papers, radio broadcasts, and newsreels. Their deeds -- noble and dastardly, on the battlefield and the home front -- have made the world as it is today.

Super-Technology: Not Ready For Prime Time

Super-technology indicates a device that operates according to methods imperfectly-understood by conventional science. Indeed, the super-intellects responsible for creating such devices are incapable of successfully communicating the information needed to recreate their death-rays and jet-packs to other scientists and engineers. This has led many people to consider a gadgeteer's gadgets as just another form of superpower (often over the assertions of the gadgeteer, who will angrily state that any fool can see how his devices follow perfectly rational scientific principles).

The Klein Effect -- discovered in 1959 -- states that the capability of a super-technology device is inversely-related to the number of similar devices in operation. However, sometimes this is inversely-proportional (if you make duplicates of Captain Armor's battlesuit, all such battlesuits built to that specification become weaker; no more than a dozen, usually), and sometimes this is all-or-nothing (only one of Captain Armor's battlesuits can operate at a time).

Research continues, but meanwhile, super-inventors can make an excellent living as craftsmen turning out "limited runs" of useful devices like power-neutralizers, unbreakable restraints, and superpower analyzers for local industry, research facilities, and law enforcement. Of course, a different design needs to be worked out for *each run* of an item type; all have to be handcrafted by the super-inventor himself; and the larger the run, the weaker each item in the set becomes.

Supers Today

The earliest superhumans' powers were usually limited to a single power far beyond human capabilities or a small related set of powers only mildly beyond human capabilities. Over the passage of decades, however, superhumans have become more super: the strongest super of the WWII era could probably lift a tank, while the strongest super today can probably lift a battleship. Furthermore, there were far fewer superhumans then compared to now: only ten

verified superhumans existed in 1945, compared to the two hundred verified superhumans today. Superhumans are seen as a cross between natural disasters, miracles, volunteer activists, and celebrities. A small handful has traded on their fame or notoriety to make a buck, of course. They have their supporters and detractors. But for the most part, they're just there.

Aliens & You

Aliens exist. At least once every three years or so, some alien (or aliens) touch down and cause trouble. Generally, the superhumans drive them off. By all accounts, interstellar travel and communication isn't easy, so while the people of Earth know for a fact extraterrestrial life exists, they don't know much about these life forms, usually haven't been able to find out more, and haven't been able to take steps to stop these strange visitors from showing up. Most folks just shrug their shoulders and say, "So what?" -- but a powerful minority has become quite xenophobic.

Drakesville, Drakesville, It's a Helluva Town. . .

General Info

Drakesville is a vaguely-located East Coast city. Once a powerful industrial center, the weakening dollar and foreign competition twenty years ago caused it to slide into decay and crime. Now, boosted by cutting-edge communications industries (and the efforts of its small population of civic-minded supers, most notably the Dragon Knight), Drakesville is beginning to climb out of its two decade slump.

As protector of the city from threats without and within, the Dragon Knight enjoys not merely the support of the Drakesville police department, but also mild idolization from the citizenry (though he does have his strident critics).

Neighborhoods (& Their Crimes)

Bankhouse: This is the banking and financial sector of town, home to the First National Bank, the Drakesville Stock Market, and the headquarters a few rising telecom corporations. (Usually white-collar crimes like insider trading, corporate espionage, and computer/telecom hacking; blue-collar crimes involve rare muggings and bank robberies.)

Bayside: This is the artists' colony of Drakesville: the theater district, the small galleries, the jazz clubs, plenty of alternative lifestyles -- everything you need for a funky little neighborhood. Cool, man. (Muggings, burglaries, drugs, prostitution, and hate crimes.)

Center City: This neighborhood is a mix of older single-family homes (mostly successful supervisors of Stillmill and returning GIs after WWII) and mom-and-pop businesses. While many of the latter are still boarded up, new proprietors and franchisers are moving in to these abandoned storefronts and reviving the area. (Low-end burglaries, robberies, domestic abuse, muggings.)

Fairmarket: The renowned shopping district of Drakesville, this is where you go for the haute couture, the snazzy furnishings, and the overpriced jewelry. The Diamond Exchange is located here, as is the City Arena sports multiplex - - home of the Drakesville athletic teams: the *Ducks* (football), *Dukes* (baseball), the *Dragons* (basketball), and the *Dogs* (soccer).

Governor's Point: The heart of the local government is located on Governor's Point: City Hall, Police Headquarters, the DMV, and the law courts. Additionally, the neighborhood is also home to numerous high-art museums, concert halls, and parks. (Espionage, bribery, graft, corruption.)

The Jetty: A commercial structure of vast proportions that juts into the Bay. Built by Herbert Enterprises, the Jetty is a prototype arcology. Within its geodesic walls are apartments, restaurants, and a gigantic shopping mall (open to the public). Rent on the square footage within is quite expensive, however. A vast field of solar panels on the roof of the structure and an experimental "tide-wheel" below help supplement the Jetty's power needs; there is an entire level dedicated to hydroponic farming research, and two levels of "industrial park" for manufacturing and research. It is a safe, secure, clean neighborhood, cared for by the watchful eyes of Herbert Enterprises. (Officially, there is no crime on the Jetty; unofficially, the private security force does run a tight ship, with only minor shoplifting and purse-snatching happening. But rumors persist that the biggest crimes are being covered up by their corporate masters. . .).

North End: Longtime neighborhood of the factory workers of Stillmill. Around the turn of the Twentieth Century, the North End received a vast influx of immigrants from all over Europe; around 1980, it received another injection of immigrants from Asia. In between the two periods, this neighborhood was known as "Murdertown": when the industry of Stillmill withered, crime bloomed. While safer today, many visitors to the area are nervous and paranoid. . . perhaps rightly so. (Drugs, gang warfare, prostitution, violent crimes, car-jackings, domestic abuse, robberies, riots, etc.)

Old Wharf: When the factories of Stillmill stopped working, the Old Wharf neighborhood began to collapse into corruption and disuse. The shipping companies, import/export, seedy dive bars, and warehouses -- both in-use and abandoned -- almost all have a connection to the criminal underworld. However, as the heart of industry begins to pump once more, the life's blood of commerce is beginning to weakly trickle again. (Violent crimes, gang warfare, water accidents, and smuggling.)

South End: The ritzy suburb of town for over one hundred and fifty years, the houses of South End are huge and

expensive. They -- and their moneyed inhabitants -- are a sitting target for a certain class of criminal. Additionally, where vast wealth congregates, many dark impulses become palatable. . . so long as no one finds out. (Burglary, kidnapping, murder, various types of abuse and assault, drug use, and so forth.)

Stillmill: The manufacturing center of Drakesville, the industrial plants and assembly lines of Stillmill (corruption of "steel mill") turned out not only refined materials but also finished goods. When the markets dried up, many plants were shut down and their machinery left to rust. A number of old factories have been purchased by foreign investors, while others have been repurposed and renovated as shopping centers, offices, apartment units, and so forth. And a few new companies have taken over old plants, and started the mills rolling again. (Theft, sabotage, industrial accidents, espionage.)

Stock Isle: This island is the site of Drakesville's maximum security facility for criminals -- the Joshua Crippen Prison (also called "the Crypts"). As one of the few institutions in the region capable of long-term superhuman restraint, it often accepts super-prisoners from other jurisdictions. Because of this substantial population of superhumans in one place, it also boasts one of the state's most thorough superhuman observation and testing facilities (real research is done on the mainland, however), as well as top-notch psychiatric wards. (Jailbreaks, guard corruption, illicit experimentation, etc.)

What Everybody Doesn't Know

Do You Believe in Magic?

Super-powers just seem to work, somehow. Some folks call it psionics, others call it parapsysics, still others just call it magic, but superpowers tend come from a mystical source(s). About the only real step forward in superpower research has been the initial formulation of the Klein Effect (see above), and that's because the researchers had physical components -- super-technology devices -- to play with.

Supers in History: Redux

To an observer from a parallel dimension, this universe's timeline is exceptionally odd. The existence of superhumans has had remarkably *little* effect on the main threads of how "it actually turned out": the Bomb was dropped; disasters have happened; leaders have been assassinated. While some minor perturbations have happened -- a few lives saved here or lost there -- for the most part, the day-to-day events of this universe match "real history."

Part of this has to do with the numbers of superhumans: probably less than 300 known and unknown world-wide, of varying power levels. Also, the magical nature of superpowers (see above) means that the negative effects of super-villainy are countered by the positive effects of super-heroism, and vice-versa. Furthermore, the Klein Effect (see above) limits the widespread effects of super-technology.

Indeed, the strongest consequences superhumans have had on the world mostly involve fashion and style, a few esoteric fields of pure scientific research, and exceptionally subtle social effects.

Aliens: The Truth, Out There

Mars wants mana! Whatever it is in the air or water or land or collective unconscious of Earth's inhabitants that gives rise to superpowers, a number of extraterrestrial races want it, **bad**. That's why all those tinpot alien warlords make raids in the Sol System every couple years, despite the difficulties of interstellar travel.

Indeed, the greatest threat to Earth would be if the different alien races joined together in an extra-solar military alliance to steal our precious mystical fluids. Which, coincidentally enough, they have. Luckily, the Justice Alliance has had good interstellar intel, and has swelled their ranks with Earth's best and brightest to draw the line as far away from Earth as possible. This is why the Second-String Heroes have been called up, whether they know it or not.

PC Opportunities

PCs in this Campaign in a Box are other super-types (or at least "action-adventure types") that the Dragon Knight has recruited to keep Drakesville safe while he focuses on his work with the Justice Alliance. Players should consider the guidelines below when coming up with their characters.

Who?: Who is your character? This is the basic question of character generation, of course. Some interesting options can be spun off from the central conceit of the campaign. PCs could be grown sidekicks, heroes inspired by the Dragon Knight, heroes who *inspired* the Dragon Knight, reformed villains, or the children/inheritors of the Dragon Knight's superpowered friends and enemies.

What?: What sort of hero is the character? This question goes further than simply deciding if a PC is a Blaster or a Brick, though that is a part of this step. Remember that the PCs are less powerful than the Dragon Knight by definition in this Campaign in a Box. One interesting and fairly balanced way to reflect this is to have experience and superpowers as inversely proportional to one another. That is, if a character has a lot of powers (or even just a single very strong one), then they shouldn't have had much of a superhero career prior to the start of the campaign. If a character has tremendous experience, then they shouldn't have many (or even any) abilities that greatly exceed human maximum. Thus, a superhero with minor powers (or a single moderate one) probably has a moderate amount of experience.

This can really work well to help "balance" super-normals with the superpowered: the super-normals have the experience, knowledge, contacts, and respect, while the superpowered have the sheer oomph! to get things done. This means that a decent super team could be constructed of an aging (but still scrappy) pulp hero, a minor-league heroine with a decent adventuring career, and a kid with major league talent but no real track record.

When?: Directly related to *What?* are two *When?*s: 1) when did the PC first start super-heroing?; and 2) when did the PC first meet the Dragon Knight?

Where?: PCs should pick one of the districts from the Map above to be their turf. While the big boys like the Dragon Knight protect entire cities, lesser heroes patrol a single neighborhood. While they won't know the other parts of town like they do their own area, hopefully one of their team-mates will. Thus, it's probably not a great idea to have multiple PCs hail from the same neighborhood, but this can still work and provide opportunities for "like the back of my hand"/"fish out of water" scenes.

Why?: Each player should work with the GM (and possibly the other players) to determine exactly why the Dragon Knight asked the PC to help pick up his slack. What is the connection between the characters? This question will be tied up closely with *Who?* and *When?*, with a side-order of *What?*, and maybe even some *Where?* for dessert.

NPC Backgrounds

Each character below has their most important *strengths* (generally positive qualities, abilities, skills, or effects) and *weaknesses* (generally negative qualities, abilities, skills, or effects) detailed. In descending order, the ranks are Master, Expert, Good, Average, and Poor. Depending upon the conception of what a character is like, any quality can be a strength or a weakness.

For example, suppose a character has "Spoiled Brat" as a quality. If it's ranked Average or above, it's a strength: the character always gets his own way, can wield undue influence by threatening to sic their Mommy or Daddy on others, might possess lots of cash or gadgets, and people may fawn over them, making life easy. But if the character has "Spoiled Brat (Poor)," this is a weakness: the character has led a pampered and sheltered life, rubs people the wrong way, and expects everyone to bend over backward to fulfill his most minor needs.

Since many game mechanics provide prose "benchmarks" to understand stat or skill levels, the ranked qualities below should be easily adaptable into any desired system. (Also see [the PDQ System](#) from [Atomic Sock Monkey Games](#).)

Major NPCs

Julius Alameda aka Ratburglar: Bitten by one of the mystical Giant Rats of Sumatra when burgling a rich eccentric's menagerie, Alameda became a wererat. This has made him even better at being a sneaky little bastard. He specializes in stealing the rarest and most well-protected treasures, both for himself and as a contractor for others.

Ratburglar!

He's an Expert Burglar and possesses Good Cunning and Wealth in addition to his Powers (see below). Unfortunately, he's a Compulsive Thief (Poor) and has a Napoleon Complex (Poor); these weaknesses have been exacerbated by his lycanthropy. Though his original stomping grounds were in California, he's come to Drakesville after learning that the Dragon Knight's flown the coop. He's also been having a series of odd dreams involving "the Rat God."

Powers: (Elements marked with an asterisk are only available in ratman or giant rat form). King Wererat (Good), which includes limited Shapeshifting and Size Alteration* (Human/Ratman/Giant Rat/Rat), Super-Agility and Super-Strength*, Claws*, Super-Gnawing*, Collapsible Skeleton*, Prehensile Whip-Tail*, Nightvision, Immunity to Poison & Disease, Regeneration (reduced vs. wounds done with silver weapons), and Rat Communication & Control. Usually in his 4 foot "ratman" shape when on the job, but even so he wears a black leather outfit, web belt full of tools, a black cap, and a mask. (Yes, a mask. Over his ratty face. What?)

Isaac Leonard aka the Orange Ogre: As a professional wrestler, Isaac "the Ogre" Leonard took one too many folding chairs across the skull that fateful night. Something in his concussed brain reacted powerfully, causing him to grow permanently huge (he's now 7' 2" tall and weighs over 400 pounds) and *orange*. Furthermore, his mind has been affected: "kayfabe" has bled into reality and meshed with superhumanity.

The Orange Ogre

The Orange Ogre is convinced on some level that he's been assigned to be a heel: whenever he's in public and in costume, he acts like a super-villain. Out of costume, he's actually a likeable and agreeable guy, gentle and docile, even when incarcerated in the Crypts. . . until he goes to "work" -- which generally happens ever 30 to 90 days. Interestingly, Leonard believes that if he ever beats the Dragon Knight in a fair fight, the "head office" will let him undergo a "face turn" and become a good guy. Unfortunately, he's never been able to beat the hero fairly. (However, one time the Dragon Knight took a dive and caused Leonard's personality to immediately shift to face. . . until he discovered the deception and suffered another heel turn.)

Leonard is an Expert Wrestler, a Good Gambler, and a Good Carouser, but suffers from Delusions (Poor) as noted above, and has a Freakish Appearance (Poor). He is currently at-large.

Powers: Super-Strength, Super-Leaping, and Invulnerability are all at Expert rank.

Doctor Arthur Vrobo aka Doktor Vrobotik: Arthur Vrobo, one of the world's greatest scientists, worked for Herbert Enterprises for many years. Indeed, a substantial amount of the technology behind the Jetty (see above) is based on his designs. He is the sort of intellect that offhandedly whips up a telepathically-controlled robot to help him with an unrelated experiment. Vrobo merrily worked in the company's laboratories during the day, and at night repaired to a private workshop for his own projects. Indeed, the contract he had with Zeb Herbert was very clear that Vrobo would always and forever retain the rights and patents to his personal work: 9 out of 10 lawyers would swear that the agreement was ironclad.

Well, "ironclad" only if the party of the first part *and* the party of the second part both stick to the terms of the contract. Unfortunately, Vrobo discovered that the party of the second part -- Herbert -- was a bit looser in his interpretations of the agreement, to the point of having the scientist's private lab and residence within the Jetty extensively bugged. Just as Vrobo ripped a camera out of his wall, his paranoia crystallizing into anger, a tremendous explosion rocked the Jetty! Shards of flying debris cut his face and throat deeply, and knocked the scientist out. Luckily, the Jetty's emergency response squad got him to the internal hospital in time to save his life -- but not his voice: the damage to Vrobo's larynx was too extensive to repair.

After a horrifically-misunderstood visiting hour meeting with Herbert, Vrobo became convinced that Herbert had always fully intended to steal his work and bump him off. Terrified at being in his enemy's power, the scientist fled the hospital that night. But as he was no fool, Vrobo stopped by his ruined quarters and broke into company labs for equipment and gear. Doktor Vrobotik now wages a war against Herbert Enterprises using his remarkable mind, seeking to wipe it, its works, and its founder from the face of the Earth. Woe to any who get in his way!

Vrobo is a Master Scientist, a Good Engineer, and an Average Athlete, but is Insanely Paranoid (Poor), an Irrational Hatred of Zeb Herbert & Herbert Enterprises (Poor), and is Mute (Poor) without his Cyber-Throat.

Powers: Expert Super-Intellect, Expert Gadgeteer (4 random super-tech gadgets), Good Telepathic Robot Thugs (1 to 6 at all times; each has at least one Superpower at Good rank), Good Cyber-Throat (allows him to talk to any electronic device and command temporary obedience from it; also provides -- badly, for unknown reasons -- synthesized vocal capability).

Supporting Character NPCs

- **Captain Kaye Artaud:** Captain Artaud is in charge of the Drakesville Police Department's Superhuman Crimes Division. She has forged a decent working relationship with the Dragon Knight, though there are strong elements of rivalry: she believes that her SCD officers could handle at least three-quarters of the problems that the hero does. She'll be slighted by the presence of any Second-Stringers that the Dragon Knight recruits, and will be wary in dealing with them until they prove themselves. . . and if they cross the line, she'll have no compunctions about bringing them in.
- **The Dragon Knight:** A suit of mystical armor grants the Dragon Knight his amazing powers, and hides his identity as well. He has helped defend and strengthen Drakesville for the last eight years, and the populace generally reveres him. (Unknown to any but his closest associates, the Dragon Knight is secretly Abner Jones, an archeology professor at Drakesville University.) *Powers:* Abner himself is an Expert Archeologist, a Good Athlete, and a Good Occultist; unfortunately, he's Arrogant (Poor). The dragon-armor grants him Expert Super-Strength and Invulnerability; Good Metal Wings (useful for Flight and as a form of Weaponry), and Master Mystic Flame-Breath (which he's used for several attack and magical stunts in the past). The dragon-armor is only Average ranked Invulnerability against magical attacks.
- **Galsworthy the Great:** A fortune-telling con-man who was granted true sorcerous might during "the Djinni Event," Galsworthy has in recent years been part of the Dragon Knight's resources when dealing with magical situations. Unknown to anyone but the Dragon Knight and Galsworthy, the former grifter is destined to be the

mentor of Earth's next "Absolute Adept" -- guardian of the world against all Unspeakable Horrors From Beyond Space. Therefore, out of a strict sense of self-preservation, Galsworthy has begun studying all forms of magic like a madman, in order to be the best damn teacher he can be. *Powers*: Galsworthy is an Expert Con-Man and Mage, a Good Occultist, and possesses an Average Physique. Additionally, he possesses a Grand Destiny (Poor), which more often than not puts him in dangerous (or just plain weird) situations somehow related to his future charge; he resents this, but no matter what he does or how he resists, the day is coming when he will have to pass on his knowledge.

- **Zebediah Herbert**: Skinny, dapper, insanely wealthy -- Zeb Herbert is the toast of the town. His company, Herbert Enterprises, is the largest employer and corporate tax-payer in Drakesville, and he himself is a major philanthropist, donating to hundreds of charities city- and nation-wide. He's also a cold-hearted snake in the boardroom: utterly ruthless, he seeks to maximize his long-term personal power through any means necessary. Surprisingly, what is good for Zeb Herbert tends to be good for some of people in Drakesville. . . or at least those that "count" (i.e., the rich). Those that his machinations are bad for must wait for his philanthropic largesse. (Whether he's a "super-villain in a power tie" or not is left up to the individual GM.)
- **Professor Hypnos**: Minor super-villain, incarcerated in the Crypts after a foolish attempt to gather a harem of Drakesville's top supermodels. With his counselor's help, Hypnos is well on his way to being rehabilitated, and has big plans for starting an expensive "self-help salon" (weight loss, smoking cessation, assertiveness training, memory retrieval) when he gets out on parole. *Powers*: Professor Marvin Hypnos is an Expert at Hypnotic Mind Control, though his commands usually wear off within a week (the more extreme his commands, the shorter the duration). He is also an Average rank Telepath, but no one else knows this. Hypnos believes that if the superhuman specialists detect his power, he will *never* be let out on parole; call this a Poor Secret.
- **The Justice Alliance**: The Earth's premiere super-team. Made up of a dozen of the globe's mightiest heroes, they protect the world against the most powerful arch-villains, whether they be from this planet or beyond. Members include Hyperwoman; Fu Dawg; Justice Jackaroo; Belisarius, the Absolute Adept; Croatoan; and now, the Dragon Knight.
- **The Philatelist**: Gwendolyn Price terrorized Drakesville for weeks as the mysterious Philatelist with her stamp- and mail-based puzzles, before being captured by the Dragon Knight. Mostly interested in stealing rare stamp and postal paraphernalia, she's a looney-tunes thief, given to pre-bragging about her crimes. Currently at large. *Powers*: The Philatelist has one of the weirdest superpowers ever recorded: Good rank "Stamp & Mail Schticks." She can literally do *anything* if it is related to stamps, stamp-collecting, or the mail system. She's pulled rocket launchers out of mailboxes, mailed herself out of prison in a #10 business envelope, caused all the stamps in 100 yards to burst into flame, and so forth. Her biggest weaknesses are her Poor Need to Challenge Heroes through Puzzles & Riddles and her Poor Reliance on Consuming Stamps to energize her abilities. (Heroes beware: rare or valuable stamps give her a massive power-boost!)
- **Red X**: This mercenary is a super-speedster, and possibly the Dragon Knight's most deadly foe. He is a thug, bodyguard, and assassin for hire, and he don't come cheap. While not a particularly brilliant foe, he is exceptionally organized and practical. *Powers*: Red X possesses Super-Speed at Good rank normally, but can push himself to Expert or Master levels for brief periods. Exerting himself like this involves a price: he must spend time utterly motionless afterwards -- and equal period for Expert boosting, and double the amount for Master boosting. Needless to say, Red X tries to stay under his speed limit, unless he is in danger or the money is too damn good to refuse. He is also Expert in Karate.

Possible Episodes

Some ideas for single-session adventures or "episodes" are provided below; the overall campaign can be further constructed as a television season (or entire series) as the players and GM see fit. The *Pilot Episode* should come first, of course, bringing the PCs together and starting the show off with a bang. *Episodes A, B, and C* should happen early in the campaign and focus on the theme of Filling the Really Big Shoes of the Dragon Knight, though they can happen in any order. *Episodes X, Y, and Z* should happen late in the campaign, and focus on the theme of the PCs Claiming their Own Identity. The remaining episodes are modular, and can be fit into the early, middle, or late bits of the campaign. No Final Episode is provided, as some groups may wish to run a "seasonal" campaign versus a "complete series" campaign; however, promotion to the first-string heroes of the Justice Alliance and the intergalactic conflict works well as a campaign finale. (See below, *Supers & Adventure Plotting*.)

Each Episode below contains the *Villain of the Week*, a short *Synopsis* of the plot's major points, some *Neat Ideas* to insert or not, and *Possible Outcomes*; however, actual construction of each adventure is left up to the individual GM.

Pilot Episode: "Come Together"

Villain of the Week: None.

Synopsis: The Dragon Knight assembles the PCs to guard Drakesville in his absence. He presents them with the foundations of a secret headquarters (access to a secluded location, information resources, communications links with the police), and has arranged meetings with Galsworthy the Great and Captain Artaud, but is called away on Justice Alliance priority alert before he can introduce the PCs to his allies. Then, a disaster strikes -- a building fire, an earthquake, a tidal wave, a gigantic accident -- and the PCs must leap into the fray.

Neat Ideas: The Dragon Knight never explains the intergalactic situation. PCs may already have ties to Supporting Cast allies or enemies.

Possible Outcomes: The PCs miss their meeting with one of the Dragon Knight's allies, possibly antagonizing him or her. The media focuses on the PCs dealing with the disaster, and comparing their efforts (negatively) to the Dragon Knight's. The PCs' new secret HQ gets trashed in the chaos.

Episode A: "I Smell a Rat. . ."

Villain of the Week: Ratburglar.

Synopsis: Ratburglar is in town to collect the two ruby Eyes of the Rat-God, which will increase his powers dramatically!

Neat Ideas: Robbing a museum for an Eye. Robbing an occult library for the energizing spell. One of the Eyes is not known as such, but under a different name: "the Heart of Fire." A supercharged Ratburglar, creating giant servitors composed entirely of squirming rats -- or mutating normal rats into ratmen like him. Or maybe the Rat-God himself is brought to Earth to wreak havoc.

Possible Outcomes: A more powerful Ratburglar or a Ratburglar angry at the PCs, either at large or incarcerated. A new pair of magical artifacts -- the Eyes -- out there for anyone to use. Refugee ratmen roaming the sewers

Episode B: "Squared Circle"

Villain of the Week: the Orange Ogre.

Synopsis: The Ogre challenges the toughest PC hero to a throw-down; if the hero refuses, the heel smashes up the city.

Neat Ideas: An official decree from the Mayor (or Captain Artaud) orders the PCs against a match, but demands that they catch the Ogre. Gambling dens run odds on the official fight (and possibly unofficial clashes). Perhaps some of the citizenry want to see the PCs go down, for trying to take the Dragon Knight's place as the city's protector. The adulation or disparagement of the media.

Possible Outcomes: Possible minor face-turn for the Ogre. Massive property damage. A change in the way the city views the PCs. Ogre incarcerated.

Episode C: "I, Vrobot!"

Villain of the Week: Doktor Vrobotik.

Synopsis: The Mad Doktor is collecting high-tech to build a Giant Super-Vrobot (GSV). Once completed, he stomps from Stillmill to Fairmarket -- to destroy the Jetty!

Neat Ideas: The expertise or history of a PC is vital in figuring out or stopping the menace. Damage caused by the GSV permits several criminals from holding facilities nears the courthouse or the police dock to escape before being transferred to the Crypts. Zeb Herbert demanding that the PCs stop the GSV without damaging it, so Herbert Enterprise can study it!

Possible Outcomes: Massive property damage. The support or antagonism of Zeb Herbert. Escaped criminals. Incarcerated or escaped Doktor. New super-tech on the market, auctioned off to the highest bidder!

Episode X: "Attack of the Cyber-Rats"

Villain of the Week: Ratburglar and Doktor Vrobotik.

Synopsis: Micro-miniaturized technology being stolen from top labs by Ratburglar, whose escapes are being covered by vrobots! The villains have teamed up to create a tiny cyborg-rat army which they will use to take over the Jetty from the inside, and hold Zeb Herbert for a substantial ransom.

Neat Ideas: Sneaking into the Jetty past both the Jetty defenses *and* the cyber-rat invader patrols. Swarms of laser-mounted, chrome-armored rodents.

Possible Outcomes: Minor property damage. The support or antagonism of Zeb Herbert. Renegade cyber-rats roaming the streets and sewers.

Episode Y: "Orange You Glad I'm Here?"

Villain of the Week: Ratburglar and the Orange Ogre.

Synopsis: The Orange Ogre stops the Ratburglar in the middle of a crime! Now what?

Neat Ideas: Actual face-turn for the Ogre; media accolades for the new hero on the block. Fake face-turn, as part of a plot cooked up by the pair.

Possible Outcomes: Both of the villains in prison, both escaped, or one of each.

Episode Z: "A Draconic Opponent"

Villain of the Week: Dragon Knight? (The Orange Ogre and Doktor Vrobotik.)

Synopsis: The Dragon Knight is smashing up downtown. . . until the Orange Ogre appears to stop him! What's going on?

Neat Ideas: Vrobotic duplicate of the hero made by the Mad Doktor for the Ogre as a sparring partner, nothing more. Maybe part of a plan by someone else to face-turn the Ogre for once and for all (Herbert? Why?). Or maybe it's a devious plot by the Mad Doktor, using the Dragon Knight vrobot to sic the Ogre on specific Herbert Enterprises holdings.

Possible Outcomes: Massive property damage. A possible face Ogre at the end, or an even darker heel. Bad publicity for the Dragon Knight; good publicity for the heroes -- if they can stop the vrobot.

Episode: "Glass, Darkly"

Villain of the Week: Evil mirror-versions of the Heroes.

Synopsis: Galsworthy the Great comes into possession of the Mirror Rorrim, which promptly makes evil duplicates of the PCs. The PCs must defeat themselves and help Galsworthy figure out how to turn the damned thing off.

Neat Ideas: Many people see the fights between the heroes and their villainous mirror-versions and could catch clues to their identities and weaknesses. Good names being dragged through the mud. Secret, dark desires acted upon. Mystery whether PC is being mind-controlled, or is a mirror-duplicate. Transportation into the "Mirror Zone" -- where the heroes are villains and the villains are heroes.

Possible Outcomes: Escaped evil-versions of heroes left out there.

Episode: "Return to Sender"

Villain of the Week: The Philatelist.

Synopsis: After somehow getting the drop on the heroes, the crazy criminal uses a magical stamp to mail them to a fictional otherworld (Oz, Wonderland, the Shire, Discworld, Toontown, etc.). The PCs must figure out a way to co-opt the power of the magical stamp in order to navigate the Postal Dimensions to return home.

Neat Ideas: Use of the powers found in otherworlds to control the stamp may be necessary to get a fresh pick-up, or maybe simply writing a new address on the envelope will work (but it should take at least 2 tries/worlds to get home).

Possible Outcomes: The Philatelist escapes or gets thrown back in the booby hatch. Super-tech, magical artifacts, or intriguing information might be brought back from the otherworlds.

Episode: "Behind the Lines"

Villain of the Week: Aliens (with special guest star: the Dragon Knight)!

Synopsis: One of the alien saucers breaks through the Justice Alliance's defenses and heads for Drakesville. The Dragon Knight returns to quietly locate and capture the invaders from space alone.

Neat Ideas: The Dragon Knight being really close-lipped before spilling the beans about the intergalactic war. Friction between the old hero and the new heroes. Stealthy operations. The Dragon Knight has a war-wound, making him less effective. Keeping the media distracted.

Possible Outcomes: Alien-tech! Blowing the secret of aliens wanting to invade us and subsequent chaos. The Dragon Knight could die from his injuries!

Advice, Opportunities, & Pitfalls

Supers & Adventure Plotting

While other "Campaign in a Box" installments have talked a bit about running superhero games (see [Hyperworld vs. the Invadroids](#) and [The Flint Age](#)), there's another aspect of superhero comic books and cartoons that still needs to be addressed: *adventure plotting*.

The typical plot of a Silver Age comic book (as well as many published today) or modern animated-style cartoon show, follows roughly this outline:

1. Villain does (or prepares to do) something.
2. Hero finds out about #1 (before or after the fact).
3. Hero does research, sets alarms, maps patrol routes, etc.
4. Villain does something else; this time Hero is alerted, and races to the scene.

5. Hero-Villain confrontation.
6. Villain escapes (with or without his target), but has left a clue of some sort in word or deed.
7. Either:
 - Repeat steps #3 through #6 (at least once, but sometimes multiple times); or
 - Villain captures Hero and puts him in a [Deathtrap](#).
8. Whereupon Hero finally susses out the problem, lays just the right trap, the stars come right, digs down deep inside to triumph, whatever, and. . .
9. . . . the Villain is captured.

In systems using Drama Points, [Cinematic Points!](#), Karma, or other Luck-type mechanisms, the solution is easy: a Villain starts with a substantial but finite amount of Luck, which they burn to get away from -- or get the drop on -- the Hero. After all, most Villains are of equal or even lesser power/capability than the Hero, otherwise, they wouldn't need to escape, they'd just beat the tar out of the Hero. The sudden, unheralded appearance of escape routes, backpack helicopters, smoke bombs, or innocent victims who need to be saved from a teetering safe are all implementations of these mechanics in action.

Frankly, systems lacking a wide-ranging Luck-type system have a tougher row to hoe in emulating this sort of genre convention. When using such systems, GMs often have to fiat (or even railroad) Villain escapes, which can lead to player frustration.

The simplest fix here is to **talk to the players**. Make sure all of them are *completely* up to speed on the genre conventions -- the secret identities, sidekicks, deathtraps, crusading reporters, secret headquarters, cops more-or-less accepting the Hero's activities, last minute rescues by the first-string hero cavalry -- that are in use, and understand any specific differences the GM is operating under ("we'll have deathtraps and secret identities, but no sidekicks and the cops hate superheroes" or even "while most Villains in this campaign will take the time to tie you up and deliver their Evil Bwah-ha-ha Monologue, Captain Silence is definitely *not* one of those types: he always shoots to kill, then shoots the corpse for good measure").

STYLE: Animated

"Refusing to put their hero in a completely contemporary world. . . Bruce and Eric fashioned a Gotham City that was stylish but dangerous. It could be identified as twentieth-century America, but it was impossible to pinpoint it to an exact decade. Batman would often be shown working at his super-sophisticated Batcomputer, but televisions would only broadcast in black and white. Likewise, Batman might fly the futuristic Batwing, but Bruce Wayne would drive a Cord. Tommy guns, VCRs, lasers, and zeppelins all happily coexist in Batman's technologically unified world. Bruce and Eric did not want the series to visually date itself, as many cartoons do when they try to hard to ground themselves in contemporary culture. Instead, they looked back over 60 years, took what had endured, and made it their own."

The above quote from *Batman: Animated* sums up the "dark deco" aesthetic of the various recent animated Batman projects, whose design influence reached into the popular Superman and Justice League cartoons and is still in use today as the basic "DCU Animated" style. Many of its elements can be adapted for gaming to lend an "animated" spin to a four-color supers campaign.

- Adventures should be planned as single episode mini-movies (read: sessions), with the occasional cliffhanging two-parter. (See above for *Possible Episodes*.)
- GMs need to think of ways to encourage PC characterization and interplay through action. This means that once the GM and players have a handle on the basic nature of a character, the character should be thrown into situations where this personality can be directly expressed through physical tasks and dialogue with other characters.
- GMs should develop possible scenes visually, looking for what would be cool, cinematic, and slick. However, this doesn't mean they should go hog-wild with the description: far from it. The hallmark of the animated style is "limited detail for maximum motion." GMs -- and eventually players -- shouldn't be looking for an exhaustive

catalog of what they see and what they do: all should be looking for ways to express things in a descriptive shorthand -- the quick sketch, bold stroke, or snappy phrase that sums up so much, but leaves plenty for the mind to fill in on its own.

- Characters and situations should be played with flair, and as straight-faced or hard-edged as possible, despite their melodramatic and cinematic style. However, there is a thin line between this sort of melodrama and what's known as camp. Books have been written on what makes camp campy; I offer as a possible definition that "characters and situations played with *inappropriate seriousness* in the face of *absurdity* for the purposes of *comedy*" is camp. The differences between animated style and camp are highlighted by the italics in the previous sentence; take those elements out, and your game should stay on the right side of the fence. . . unless you *want* to camp it up. After all, that can be fun, too.
- The session should build to at least one incredibly visual action sequence to look forward to; a big "set piece" that makes it all worthwhile. A pulse-pounding race along the rooftops, an escape from plummeting airplane, or -- yes -- even a flashy combat sequence in a rusting factory all fit the bill.

Jenner-1

A Plague On Both Your Houses

by Paul Drye

Christopher Columbus was a satisfied man when his ships made anchor in the Bahamas on October 12th, 1492. While the small size of the islands suggested he was in the outlying portion of Asia, the handsome stone houses, fine horses, and odd triangular coins of the natives gave him every reason to believe he'd reached his destination. Several rounds of charades and a local guide later, he was sailing south to a long, large island he had no doubt was Cipangu.

He ended up in Cuba, not Japan, of course, but this wasn't apparent to the Great Navigator, as language barriers and preconceptions led him to believe he'd made the voyage he expected. The kingdom he'd reached was actually Hotzhetsi, but their word for "city" -- Tzemanzhu -- came up during more attempts at communication, and was sufficiently close in pronunciation to what Columbus wanted to hear. He proclaimed his discovery of Cipangu in a letter to the Ferdinand and Isabella, which he sent to Madrid along with "Cipangan" goods and a half-dozen willing natives upon his fleet's return to Palos, Spain in February.

Columbus never realized his mistake for, like several members of his crew, he died of a fever a few weeks later. It was a follow-up expedition under Martin Alonso Pinzon that discovered the greatest of the American civilizations, Eoh'medah at the mouth of the Mississippi River. After another month, one of Pinzon's ships returned to Spain with another half-dozen New Worlders, while the rest of his expedition continued their exploration of this vast, rich land. For two years, an increasing number of ships went back and forth between Europe and America, carrying men and cargo in ever greater volumes.

By the middle of 1495, it became apparent that something was wrong on both sides of the Atlantic.

Decay and Evil Days

The current year is 1519, and both Europe and America are in complete chaos. In the Homeline, the Hispanic colonization of the Americas turned the New World into a charnel house. Diseases bred in the urban environments of Europe and Asia ripped through the naive immune systems of Native Americans, killing millions. It is believed that in this timeline, dubbed Jenner-1 by Infinity Unlimited, a proto-Cheyenne genius domesticated one of the last American horses about 8000 BC rather than spearing and eating it. Most of the other American megafauna were extinct already, but with the example of the horse in front of them the Native Americans of Jenner-1 also managed to tame the South American glyptodont (see the entry for *Doedicurus*, p. 68 of *GURPS Dinosaurs*) as a gigantic, armored substitute for the plough and cart ox, as well as the familiar llamas and ducks of Homeline.

Armed with three useful species of burden, the Americas followed much the same technological arc as Europe, and had progressed into the Iron Age by 1 AD. Though behind the Old World due to a smaller population and fewer food crops, the Americans nevertheless produced an impressive urban civilization by 1492, one about equivalent to the early Roman era on the other side of the Atlantic. When Columbus and Pinzon opened up the New World, Europe gave the Americas smallpox, measles, and influenza as they did on Homeline. But the Americas returned cachexy, tetter rot, and the calenture to Europe.

If anything, the plagues in America were worse than on Homeline, as the higher population kept the new diseases from burning out quickly: in 1519 the American civilizations are dead, along with more than 150 million people. Perhaps 20 million are left, and that figure is shrinking every day. Europe has done better, but only in comparison. Two-thirds of a population of 80 million have died -- this is about twice the mortality rate of the Black Death. It is enough to have brought Europe to the very brink, and its population continues to dwindle as well.

In Spain and France, the epidemics have been worse they are in the Americas. There are about 1.5 million people left in Iberia and France taken together; cities and towns are abandoned by all but diehards who can't or won't leave, and now survive only because they rarely see another person. A few small villages in out of the way locations -- up in the Pyrenees, for example, or the Massif Central -- have managed to carry on.

In all cases, distrust of other people is what has kept the survivors in France and Spain alive, and it is dangerous to travel anywhere in the region. The two countries are reverting to wilderness, but if a human being is encountered he will be mad, diseased, motivated to kill for his own protection, or any combination of the three.

Germany has lost 75% of its population, though the consequences are not as bad as they could be because the many tiny states of the region are largely self-supporting and don't need the large-scale trade and government that other parts of Europe have come to rely upon. The situation is certainly desperate. but Germany has not become a wasteland like France and Spain. There are even signs that Germany is beginning to come together, as a religious zealot from Wittenburg has shot to prominence in the last ten years, preaching against indulgences and papal power, and pointing to the plagues as evidence of God's displeasure. Johann Tetzel, a former indulgence peddler himself now fired with the fanaticism of the newly converted, has brought more spiritual and temporal control to himself that most popes could ever dream. Whether his new "Recusantism" movement will expand beyond the boundaries of Germany remains to be seen.

In the British Isles, Henry VII -- the man who ended the Wars of the Roses -- died of calenture in 1501, leaving the throne to his eldest son Arthur, who then died six months later. His younger brother (Henry VIII on Homeline) and eldest sister had predeceased him by a week, so the ruler of England was five year old Mary Tudor (aunt of the more famous person of the same name on Homeline). England collapsed into civil war again, despite being less affected by the epidemics than almost any other European country. One person in three in all of the British Isles has died, no worse than during the Black Plague and the country survived that. However, Scotland got off better than England, and the border country is periodically invaded by the Scots and James IV. Mary is now an adult, but unmarried and in thrall to the various factions in the new civil war.

Similarly, the Ottoman Empire has fallen into chaos. Sultan Beyazid died of cachexy in 1499 during his campaign to take the Morea from the stricken Venetians. Jenner-1's Selim I was rendered sterile by a mild case of calenture, and no Suleyman the Magnificent was born to his wives -- or any other children. Selim ruled for three years and, as he had killed his brothers and sisters on accession like he did on Homeline, there was no clear line of succession to the throne when he died. The Balkans have been in constant turmoil, trying to break free, but the Hungarian enemy to the north has been laid low as well and is in no position to intervene. Unfortunately for the rest of Eurasia, the Empire's trading routes have been the primary gateway to India and China for the epidemics.

Scandinavia, Poland, and the Russias have receded beyond the horizon as far as Western Europe is concerned. While the plagues have no doubt hit them as well, no-one has any clear idea what is happening there any more.

By all rights, Italy should be as badly ravaged as Spain and France. The country is urban, and heavily populated, and does not have the cold, wet winters that give the north of Europe some protection. However, while the epidemics have been bad, society in the peninsula is still holding on by a thread. Partly this is because Italy, like Germany, has few large states, and people are used to working from local resources. There are fewer area-wide social structures to collapse, such as governments, though the end of most trading has ended Italy's prosperity too. What makes the most difference, though, is the Accademia dei Unicorni.

Men of Hope

Southern Europe's future rests on the work of a very few people who have devoted their lives to stopping the plagues. Leonardo da Vinci made the connection between the voyages to Cipangu and the epidemics, and discovered that the transfusion of a small amount of blood from a Cipangan horse to a man would confer immunity to calenture (the blood carried along a less virulent strain of the virus that caused the infection, though Leonardo did not know this, nor is it known now). This has been the only one of the new diseases to be cured -- and there were not enough Cipangan horses to stop it cold -- but Italian mortality has been relatively low because Leonardo's experiments have led to

treatments for Old World killers. The Great Man himself discovered the immunization for smallpox using matter from cows, while his young German disciple Theophrastus has recently determined that a measure of resistance to the plague and typhus may be obtained by fumigation: seal a house as completely as possible and burn a large quantity of coal in the fireplace. The more buildings in an area treated this way, the better. Even water has come under examination, and Baldassare Peruzzi has determined that certain water causes disease, leading to the virtual elimination of cholera. The new diseases still burn bright, but many people are still alive because the old ones are fading away instead of taking their own toll on top.

Leonardo remains the head of what is now a formal organization, the Accademia dei Unicorni. He is an old man, though, haunted by the death of every last one of his peers, and many of his disciples. In Homeline he died in 1519; ironically on Jenner-1 he is still healthy, though fading as he pushes 70. For game statistics, refer to *GURPS Who's Who 1*, p. 60, for a slightly younger version of da Vinci. Jenner-1's da Vinci has left behind art for medicine: reduce his Artist to 18 and Sculpting to 10, while giving him Physician-19 and Diagnosis-19. As he ages, Theophrastus is taking on more of the duties of his master; his statistics can be found in Who's Who 1 on page 64. That version of the man is fourteen years older than Jenner-1's, so most of his skills (except for his finely honed Diagnosis, Herbalist, and Physician skills) are pitched at a lower level.

Both men coordinate the Accademia's work full-time from Leonardo's boyhood farmhouse in Anchiano, a rural region west of Florence about a third of the way to Pisa and Lucca. Unless one travels there specifically, they are unlikely to be encountered, though the two sometimes perform experiments in the surrounding countryside.

The "Unicorno" characters are most likely to encounter is Baldassare Peruzzi. In Homeline he was an architect with a sideline in hydrological engineering; here he is much more interested in water and water supplies, and spends all his time wandering Western Europe setting up clean wells or diverting creeks for villages. For his efforts, he is one of the few outsiders tolerated in the small communities of France and Spain. Many of his clients -- he works for room and board -- think he is a magician of some sort, but in their desperation they simply don't care.

Peruzzi's assistant is a young man, about sixteen, though it is difficult to tell much about him -- he is a survivor of tetter rot, and is mute and horribly disfigured as a result. He is, however, learned, and communicates in Latin, Italian or French with a wax tablet and stylus he carries everywhere. The apprentice answers to the name "Giro," but otherwise refuses to offer more information about himself. His master probably knows more, but will only add that he came from Parma after that city was wiped out by the plagues.

Everywhere he goes, Peruzzi carries the half-finished architectural plans and sketches of a building. Late at night when he is not working, he shows them to people he has befriended. Characters with Architecture skill may recognize them as the Villa Farnesina, an actual building in Rome on Homeline. Peruzzi was its architect there; it does not look, as if it ever be built on Jenner-1.

Baldassare Peruzzi

107 points

Age 38, 5'8", 150 lbs. A short, thin man with black, slightly curly hair, and dark, weathered skin, dressed usually in rough brown and gray "outdoor" clothes.

ST: 10 [0] **DX:** 10 [0] **IQ:** 13 [30] **HT:** 10 [0]

Speed: 5 **Move:** 4

Dodge: 4 **Parry:** 4

Advantages: Ally Group (Accademia dei Unicorni, Group, 12-) [20]; Literacy [10], Reputation +2 (Among villagers of southern France: helpful wizard) [5].

Disadvantages: Broad-Minded [-1]; Dependent (Giro, 75 points) [0]; Sense of Duty (sick people) [-10]

Quirks: Always following creeks to their source; Carries plans of the Villa Farnesina everywhere [-2].

Skills: Architecture/TL4-16 [8]; Area Knowledge (Southern France/Northern Italy)-13 [1]; Area Knowledge (North of France)-12 [1/2]; Area Knowledge (Catalonia)-12 [1/2]; Diagnosis/TL4-13 [4]; Engineer (Hydrology)/TL4-17 [12]; Geology-16 [10]; Mechanic/TL4-15 [6]; Physician/TL4-12 [2]; Riding (Horse)-10 [2]; Short Sword-10 [2]; Stealth-11 [4]; Survival (Southern France/Northern Italy)-13 [2].

Languages: Italian-14 (Native) [0]; Catalanian-12[1]; French-12 [1]; Latin-12 [1].

The Scourges

Any traveler to Jenner-1 should be aware of the three diseases that have been imported to Europe from the Americas (the diseases affecting the New World are all known and curable by Homeline science).

Cachexy: Cachexy is a wasting disease caused by bacterial infection. Unlike calenture and tetter rot, it can be treated using antibiotics in combination with rehydration therapy (the drinking of salted and sugared water). Neither technique is known to the natives of Jenner-1, but Infinity Unlimited's scientists have discovered the combination.

A cachexy victim loses blood circulation to the arms and legs, causing the muscles there to waste away; ever-expanding blue and black patches on the extremities and rapid weight loss are the primary symptoms. This kidneys are overloaded as they work frantically to clear the muscle cells from the body. Death comes in two to three weeks due to kidney failure. A victim must make a roll against HT-3 every 24 hours, with a loss of either 1 point of ST or 1 point of DX on failure. When both ST and DX reach 0, the patient dies. Mortality is 100% without treatment -- there is no known way to recover lost attributes without it. Allowing cachexy to take hold in a victim causes permanent damage that can only be partially regained even with antibiotic treatment: only half (rounded down) of the lost values can be regained through exercise.

Calenture: This disease is the most straightforward of the three, though the most deadly unless one has taken advantage of da Vinci immunization procedure, or something more advanced. A viral infection, calenture causes an extremely high fever, which eventually kills the victim by overheating. Over the course of five days the body temperature rises 1 degree Fahrenheit every 18 hours or so (one Celsius every 32 hours). A roll against HT-5 is needed to prevent the increase, and a failure decreases HT by 1 as well as causing a one degree increase in body temperature. If HT reaches zero, the patient dies; if a temperature of 106 degrees Fahrenheit is reached, however, and HT is not zero, each following roll will allow the fever to break on a success. That victim will survive, and recover.

Aspirin and other antipyretic drugs can help control the fever, and make it easier to break. Once infected there is no known cure other than to allow the disease to run its course, but infection can be prevented by immunization.

Tetter Rot: The least deadly of the three American plagues, but the most feared, tetter rot lives up to its gruesome name.

People who survive tetter rot are severely disfigured, though no longer infectious. Surprisingly, even in the paranoid small-village mentality of Jenner-1's Europe they are not ostracized, as there is a common folk belief (wrong, but still believed) that a survivor can help protect others from the disease -- this is possibly a garbling of da Vinci's discovery that Cipangan horses can immunize against calenture. Still, tolerated or not, they're far from popular.

A tetter rot infection lasts 2 weeks. A roll against HT-1 is needed to survive it, however, survivors are scarred for life. Once the disease has run its course, all survivors suffer from Hideous Appearance, and must roll against HT three times: once to avoid 1 level of Reduced Manual Dexterity, once to avoid becoming Mute, and once to avoid Lame (Crippled Leg).

Adventure Seeds

"Saint Camillus Preserve Us": Infinity Unlimited keeps a tight grip on access to Jenner-1, as the American epidemics could cause havoc on Homeline, particularly the incurable tetter rot. Agents are drugged and immunized to

the eyeballs, even including some experimental nanobots gleaned from Caliph, before being sent outtime. On return, quarantine is strict, and lasts for three months. The question of sealing up the timeline entirely and leaving it to its fate comes up in high-level circles at least twice a year.

Knowledge of the timeline's existence has leaked out, however, and with the help of some sympathetic insiders (now sequestered on a detention line for their behavior), a religious humanitarian organization has managed to get some personnel onto Jenner-1. They have gone to ground somewhere in Italy, and it is suspected that they will be contacting the Accademia and passing along the understandable parts of 21st century medical knowledge to da Vinci and his cohorts.

The adventurers are charged with preventing this from happening, and keeping inter-timeline travel a secret. Whether they follow orders exactly or come up with something . . . more creative is entirely up to them.

Once More Unto the Breach: Hopeful that other cures like the immunization for calenture can be found, the Accademia has decided to send another expedition to the Americas. While there, the explorers are to capture local animals, particularly some glyptodonts if possible. More Cipangan horses are needed too, so they can be bred for immunization purposes -- the ones they have already will mate with European horses, but the foals always die before they are born. Purebreds seem to be the only answer.

Unlike Europe, the Americas on Jenner-1 have no analog any other timeline. Members of the expedition will be true explorers, unfamiliar with the architecture, language, culture, and almost anything else that can't be gleaned out of the few records left from 1492-1495. The cities of Tzemanzhu, Eoh'medah, and other American nations are ghost towns, but people still live in the country, echoing the paranoid lifestyle of their European counterparts.

Four Legs Friendly

Getting Timmy Out of the Well in *GURPS Fourth Edition*

by Phil Masters

One of the benefits of the considerably cleaned, tidied, and smoothed-over rules mechanisms in *GURPS Fourth Edition* is that they make the treatment of animals as characters a snap. In fact, any reasonably complete species stat block is a ready-made framework for a racial template, often requiring little more than the insertion of some point values. This in turn means that special animal companions -- usually purchased as Allies -- are not only feasible, but very easy to define.

For example, let's look at two of the species which make appealing (and perhaps downright stereotyped) potential companions, and convert the data from chapter 16 of the new Basic Set directly to racial templates:

Large Guard Dog

-56 points

Attribute Modifiers: ST-1 (No Fine Manipulators, -40%) [-6]; DX+1 [20]; IQ-6 [-120]; HT+2 [20].

Secondary Characteristic Modifiers: SM 0; Will+6 [30]; Per+8 [40]; Basic Move+5 [25].

Advantages & Perks: Discriminatory Smell [15]; Fur [1]; Sharp Teeth [1].

Disadvantages: Chummy [-5]; Domestic Animal [-30]; Quadruped [-35]; Short Lifespan 2 [-20].

Racially Learned Skills: Brawling (E) DX+2 [4]-13; Tracking (A) Per+1 [4]-13.

Heavy Warhorse

16 points

Attribute Modifiers: ST+14 (No Fine Manipulators, -40%; Size, -10%) [70]; DX-1 [-20]; IQ-7 [-140]; HT+2 [20].

Secondary Characteristic Modifiers: SM+1; Will+8 [40]; Per+9 [45]; Basic Move +2 [10].

Advantages & Perks: Combat Reflexes [15]; Enhanced Move 1 [20]; Fur [1]; Hooves [3]; Peripheral Vision [15].

Disadvantages: Bad Temper (12) [-10]; Domestic Animal [-30]; Quadruped [-35]; Short Lifespan 1 [-10]; Weak Bite [-2].

Racially Learned Skills: Brawling (E) DX+3 [8]-12; Mount (A) DX+4 [16]-13.

(Okay, these add Short Lifespan and the "Fur" Perk, which standard animal stat blocks don't bother mentioning. Similarly, a properly detailed treatment of some species might require the addition of, say, Less Sleep or Extra Sleep. Many animals might also have Colorblindness, although in fact, this condition may not usually be as bad as the full *GURPS* disadvantage.)

But that's just a start. After all, an animal worth treating as an Ally ought to be slightly more interesting than the sort of thing that a character can buy in the public market. The fun comes when we notice that all the things which make animals like these rather mundane are bundled together in one place -- the "Domestic Animal" meta-trait. So, for the sort of game worlds which are infested with helpful pets, we can just chop this out and replace it with a brand new

meta-trait:

Cinematic Animal Companion: An animal noted for its helpfulness, devotion, intelligence, and uncanny ability to understand humans and convey useful information to them. IQ+1 [10]; Sensitive [5]; Cannot Speak [-15]; Social Stigma (Valuable Property) [-10]; Taboo Trait (Fixed IQ) [0]; and Gesture Skill at IQ+4 [12]. 2 points.

Note that the Sensitive advantage specifically makes the creature alert to the emotional states of ordinary *fully sapient* beings such as humans. GMs may assume that, by logical symmetry with Animal Empathy, Spirit Empathy, etc., when possessed by humans, this permits an animal to use Influence Skills on humans (and the like).

Using this will of course raise the cost of any species template which previously included either the Domestic Animal or Wild Animal meta-traits by 32 points. The Taboo Trait fixes the animal's IQ at its raised level, of course, and this might be deleted in some cases, with GM consent, or more likely changed to "IQ can only be raised by +1 more"; for example, in highly cinematic games, a "wonder horse" might have IQ 5. Raising animal IQ beyond that level, though, would really be getting silly -- unless that's the point of the game. Note that an IQ 6+ creature should theoretically be capable of speech; indeed, cinematic animal companions with that level of exceptional intelligence generally seem to understand everything that's said to them, simply possessing the Mute disadvantage and -- usually! -- illiteracy.

Wealth

It should also be noted here that the vast majority of animals are Dead Broke; their position in relation to human society prevents them from doing much useful with money, even if they somehow have any idea what it is. Equipment such as saddles, armor, etc., should be paid for by the character acquiring an animal companion, not by the animal itself.

Examples

So, having done all this work, let's build ourselves -- or rather, some hypothetical characters -- a couple of animal companions:

Mr. Snompom

25 points

ST 9 [0]; **DX** 13 [40]; **IQ** 5 [0]; **HT** 12 [0].

Secondary Attributes: SM 0; Dmg 1d-2/1d-1; BL 16; HP 9 [0]; Will 11 [0]; Per 13 [0]; FP 12 [0]; Basic Speed 6.25 [0]; Basic Move 11 [0]; Dodge 10.

Advantages: Combat Reflexes [15]; Night Vision 6 [6]; Pitiable [5].

Disadvantages: Dead Broke [-25]; Fanaticism (Kurtswallider family) [-15]; Gluttony (12) [-5]; Large Guard Dog w/Cinematic Animal Companion instead of Domestic Animal [-24]; Secret (Utter ruthlessness) [-10].

Quirks: Avoids human children he doesn't know, if possible; Likes traveling by car (but *doesn't* stick his head out of the window); Overdoes the innocent act around Mr. and Mrs. Kurtswallider. [-3]

Skills: Acting-8 [12]; Brawling-17 [8]; Camouflage-9 [12]; Filch-13 [2]; Gesture-10 [4]; Observation-12 [1]; Stealth-13 [2]; Tracking-14 [0].

Background

Mr. and Mrs. Kurtswallider aren't bad people, even though their fabulous wealth and jet-set lifestyle do tend to distract them from things that other people might find important; they're just terribly busy. They really do love their adopted

daughter, Jenny Kurtswallider, even though they sometimes only seem to pay her much attention when she gets into trouble. Fortunately, they're quite clever about spending their money, and Little Jenny has had some of the best nannies and tutors that can be afforded anywhere. She's also got a pet which any child would envy.

She picked out Mr. Snompom when he was a cute puppy. Had Mr. and Mrs. Kurtswallider been paying more attention that day, they might have noticed that he was quite a large puppy, even then, but they just agreed that he was adorable and paid what he cost. Jenny promised to look after him and house-train him properly, and she carried out that promise faithfully with the aid of the Kurtswallider family's faithful chauffeur, Thurl. She did spoil him rather, but fortunately he gets lots of exercise to burn off all that expensive dog food.

The sweet puppy has grown quite large indeed, but even if the adult Kurtswalliders sometimes worry about him, it's become clear that Little Jenny loves him far too much for them to get rid of him. Anyway, he's perfectly well behaved, and sometimes helps Little Jenny in small ways when she gets into her funny little scrapes -- and despite his size and strength, and the impressive way he has of moving quite quietly when he wants to, he does still have the most adorable puppy-dog eyes.

There are quite a lot of people with different views of Mr. Snompom, actually, but very few of them choose to come anywhere near the family these days. (There'd be more, but not all of them are in any state to express that opinion -- or anything else.) Little Jenny worked very hard to house-train Mr. Snompom, and he understands very well that he shouldn't leave messes lying around -- so he doesn't. And when Little Jenny's Weirdness Magnet and assorted Unknown Enemies make for messes bigger than Mr. Snompom can hide on his own, the taciturn, equally loyal, seven-foot-tall Thurl (Little Jenny's other Ally) will always step in to help.

Come to think of it, Mr. and Mrs. Kurtswallider probably ought to pay a bit more attention to a lot of things.

Dwarfcruiser

25 points

ST 25 [5]; **DX** 9 [0]; **IQ** 4 [0]; **HT** 12 [0].

Secondary Attributes: SM+1; Dmg 2d+2/5d-1; BL 125; HP 25 [0]; Will 12 [0]; Per 13 [0]; FP 12 [0]; Basic Speed 5.25 [0]; Basic Move 7 [0]; Dodge 11.

Advantages: Fearlessness 1 [2]; Heavy Warhorse w/Cinematic Animal Companion instead of Domestic Animal [48].

Disadvantages: Dead Broke [-25]; Impulsiveness (12) [-10]; Intolerance (Dwarves) [-5].

Quirks: Quiet and respectful around human women; Hates to retreat. [-2]

Skills: Brawling-14 [8]; Gesture-8 [0]; Mount-14 [4].

Background

The human-ruled Empire of Megalos and the underground dwarf kingdom of Zarak are at peace, and have been for centuries. That's the official position, anyway. But once upon a time, they were at war, and it was a bitter war, and if there's one thing which the Megalan aristocracy and the dwarven race have in common, it's the ability to hold grudges. Add to this the fact that the borderlands between the two are sometimes remote and wild, and little watched by the high lords and law-givers of either realm, and you've got a recipe for blood feuds, petty raiding, and vicious ambushes.

Sir Lionel of High Rassingbourne maintains the traditions of his class in every sense that he understands them, and does what he feels is appropriate about the "d---ed dwarf problem" whenever he can. As a proud knight, he has of course acquired a fine warhorse, and thanks to good luck in his purchase, a long and diligent regime of training, and his natural sense for animal handling, he has perhaps the best mount on the northern borders.

His faithful steed, Dwarfcrusher, is a wonderful creature, which understands him perfectly and works well with his squires and men-at-arms even when Sir Lionel isn't around. (It has a trained warhorse's hair-trigger temper, but is intelligent enough to understand when a human isn't actually being provocative.) Dwarfcrusher has also absorbed Sir Lionel's basic views and instincts on many subjects, especially dwarves, and may even have accumulated a higher body count than Sir Lionel himself.

The Omniscient Eye

How Did They Heal Bones In the Old Days?

About 18 months ago I had a spiral fracture in my lower leg that required a titanium rod. In the 21st century this was no big deal; a little bit of surgery, a little bedrest and crutch work, and some physical therapy and I was almost good as new. But I'm sure in a typical fantasy setting this would be a much bigger problem. How would medical science/art handle such an injury in past eras?

--Richard Dodson

A modern physician has a number of advantages over a past counterpart --- everything from X-rays to germ theory --- but over the years the basics of treating fractures have remained constant. The most sweeping advancements in patient care have occurred in other medical areas. If you had broken your leg a thousand years ago, chances are good that you would have walked again.

A fracture is a break in a bone, usually with injury to the surrounding tissues. This causes bleeding internally and external bruising. Severe fractures damage muscle and connective tissue, in some cases breaking the skin. Bone has limited flexibility, the long bones of an adult human responding to stress like a stick of chalk. If you apply excessive transverse force (i.e., from the side), the bone will snap. Force applied from an angle may cause an oblique fracture; or, if you twist it, the bone will develop a spiral fracture.

Closed fractures occur when the bone breaks along a single plane and remains inside the body. If the fracture is horizontal, the bone easily repairs itself and can bear a limited amount of weight. The more angled the plane of fracture, the less stable the bone will be until it is repaired.

Open (compound) fractures are those in which the bone penetrates the skin. An open fracture is not only more likely to be severely out of alignment but its exposure to air, dirt, etc., makes it likely to become infected.

Comminuted fractures are when the bone is in several fragments. They are often due to falls or collisions and are difficult to heal. The intrusion of soft tissue between the fragments can also delay or prevent their union. Today these injuries are usually fixed with plates, pins, or screws.

Spiral fractures result when the bone has broken due to twisting. The resulting fracture line follows a curving diagonal path. These fractures are prone to slip if set back into position due to the weird angle of the break. Richard, you probably suffered your spiral fracture when your leg decided to move in two directions at once. Incidentally, spiral fractures appear on bones that have been split for their marrow, a classic sign of butchering that has been used to infer cannibalism in the archaeological record. Hopefully cannibals were not the cause of your fracture.

Greenstick fractures are specific to children. You've heard that children have soft bones? Not quite true: more like they have some "give" because their bones are not fully mineralized. Children can experience fractures that do not completely break the bone, which instead bend and crack. These are called *greenstick* fractures because the bone behaves like green wood.

The process of bringing the pieces of the bone back into contact is called reduction, and it can be done manually, through traction, or by surgery. When things are messy, the bone fragments may also be fixed with metal pins or screws. After that, the bone may be immobilized (usually in a cast). Immobilization is not always necessary but is recommended when displacement of the fragments is likely to occur. The bone is repaired in stages, taking several weeks depending on the size of the bone and the age of the patient. If any of these stages become interrupted things go awry. In some cases, the bones never unite and form a false joint, or they unite badly and result in deformity. If blood enters the muscle, it may ossify into irregular plates of bone. If the bone becomes infected the patient may develop

osteomyelitis, where part of the bone dies and the surrounding living bone is chronically infected.

So that's how bones work and don't work. For almost as long as humans have had limbs they have been breaking them, so it's worth taking a look at how treatment has changed over the years. There are numerous cases of ancient remains with healed fractures, a number of which didn't turn out so well. Generally speaking, the simpler the fracture the better chance there is of making a functional recovery. A simple break of the upper arm doesn't necessarily end in deformity; even if the bone fragments are overlapping by half a diameter the bone will repair itself more or less normally. On the other hand, there are skeletons with broken arms that never healed, thigh bones that are an inch shorter than they started out, and hips fused by arthritis. One of the Neanderthal skeletons from Shanidar Cave had extensive injuries, suggesting that he was cared for by members of his community for years.

Little is known about ancient medicine until the advent of written records. What follows is a summary of what you might have experienced if you had a fracture in the past, starting about 5000 years ago.

Classical Period

The first use of the splint is in ancient Egypt around 3000 BC, where bark and rawhide were used to immobilize broken limbs. Resin-soaked bandages were also used, though it's unclear if the resin was used to harden the linen like a cast or if it was applied as a tonic. Catastrophic fractures were handled by amputation and Egyptian surgical kits included early versions of bone saws. Anesthetic would have been minimal or non-existent.

Greece is the birthplace of the most famous of early physicians. Hippocrates was writing at about 400 BC and was regarded as authoritative through to the Renaissance. He described methods of setting simple fractures that are similar to those used today, setting the bones by hand and bandaging to account for swelling. Leg fractures were treated with traction, tying the patient's leg to a post driven in the ground. He advocated that patients with leg fractures be given bed rest for several weeks while the leg was extended, a practice that today we realize leads to stiffness and atrophy. A few anesthetics were used, including those mystical herbs mandrake and henbane.

Greek and Roman medicine were part of a greater system that led directly to medieval Western medicine. Though they shared a common body of knowledge there were distinct differences in the quality of care one might receive from Greek and Roman doctors. Doctors in Rome were less highly regarded than in Greece, being more craftsmen than philosophers and often coming from the lower social classes. Better treatment was available to those with greater resources. Doctors were not regulated and quackery was frequent, often causing as many problems as they fixed. Most Roman doctors were competent manipulators, able to treat fractures and dislocations by hand as well as conduct operations to surgically reduce fractures (despite the risk of infection). Roman battlefield experience prompted specialization within the medical field; indeed, Roman military surgeons were rivaled only by arena surgeons who had valuable gladiators in their care. Hospitals were established for the first time, though they were primarily military institutions. In addition to the more general role of *medicus* there developed specialists such as the *chiurgus*, from whence comes our word "surgeon."

Asian medical texts were contemporaneous with Greek and Roman texts but were considerably more advanced. Early Indian accounts suggest the surgical amputation of limbs and the use of prostheses (either crutches or wooden legs). Several manuals are more explicit in their treatment of injury and treatment, detailing a number of splinting and bandage techniques as early as 600 BC. Not only did Asian healers have detailed understanding of human anatomy but they had access to opium and mandrake, the latter being used as surgical anesthetic in China by AD 250. Trade contacts across southwest Asia transmitted knowledge to Europe, possibly influencing Greek thinkers. While invading the area in 327 BC, Alexander the Great was said to favor Indian surgeons over his own -- you can't buy better publicity than that.

Medieval Period

Conventional wisdom holds that all this classical learning was lost after the fall of Rome. Or was it? Despite their lack of classical texts, medieval doctors were capable of adequate emergency care. An archaeological study of skeletons

from 13th century York revealed a number of healed fractures with very few deformities. The cemetery mostly contained individuals of lower social status, so we can infer that even the poor were receiving treatment. Some classical knowledge was apparently retained on a folk level though the monasteries excelled at physick, probably due to access to Greek texts. The Cistercians in particular have been singled out as expert bone-setters. A 13th century cemetery associated with the order contained an individual whose fractured knee was braced by a leather collar with copper-alloy inserts (as copper was widely held to be medicinal). In one remarkable case from Sweden, an individual had copper plates screwed directly to a broken arm. Judging by the degree of healing the individual must have lived for some time after the surgery. This is one of the earliest known instances of surgical fixation, predating the popularity of the practice by several hundred years.

European medicine benefited from contact with the Muslims. While their treatment of fractures was essentially the same, Muslim doctors had much better understandings of anatomy, pharmacology, and sanitation, all of which were definite post-operative pluses. For example, the first recorded use of a plaster cast was in the 9th century when Arab physicians used a mixture of lime and egg whites. Their European counterparts were still limited to splints and slings, and their poorer treatment of infections made amputations common. Muslim scholars were familiar with both Greek and Indian medicine, neither of which was widely known in Europe. During their experiences in the Holy Land, the Crusaders were exposed to Eastern medicine both directly and through intermediaries such as the Byzantines. Numerous writings made their way back to Europe when the Crusaders stopped to sack Constantinople while on their way to Jerusalem. In the 1100s the Crusaders established military hospitals that also ministered to pilgrims, the Knights of St. John Hospitaler existing to this day in the form of St. John Ambulance.

The middle of the medieval period witnessed the establishment of hospitals and universities such as the famous medical school at Salerno. Classical works on medicine were in translation at the Benedictine monastery at Monte Cassino. By the 13th century towns were beginning to require academic qualifications for physicians and quality control was on an upswing. Medical specialization continued into this period, influenced heavily by the medieval guild system. Some schools and doctors established codes of conduct and jealously guarded their business. Bone-setters became a specific occupation, occasionally performed by barber-surgeons. One term used for a bone-setter was *algebrista*, derived from the same Arabic word that gives us algebra because both practices reunite fractions. Medieval barbers did more than a shave and a haircut; they also performed bone-setting and bloodletting, the red-and-white pole supposedly representing blood and bandages. This class of medical practitioner would become organized during the early Renaissance, and eventually split into their modern fields.

The Renaissance

The Renaissance narrowed the gulf between East and West and promoted direct experience through dissections. While sanitation and hygiene were still lagging in Europe, techniques learned in previous centuries were being put to good effect. During the 16th century, Greek and Arabic medical works became widely available in Europe, sparking debates as to the authority of classical authors. For example, the Roman author Galen had described human anatomy using dissected pigs instead of the real McCoy. Few of these debates directly impacted the treatment of fractures except to favor dissections, meaning that surgeons were no longer working blind.

The demands of the battlefield during this time changed emergency care. Amputations remained common on European battlefields given the availability of firearms, which caused infection even as they shattered limbs. During the 16th century the Turks also came up with a new way to cast limbs with gypsum. A space was left in the cast to allow for swelling, which was later filled in with liquid gypsum. At the end of the period Europe saw the rediscovery of anesthetics though they remained rare. The alchemist Paracelsus is attributed with the discovery of laudanum, a solution of alcohol and opium that was used to dull pain. Setting limbs would become much easier with drugs to control pain instead of getting the patient drunk or giving them a blow to the head, both of which were common medieval practices.

Later Historical Developments

From the Napoleonic wars there comes a record of a French surgeon using leather strips and straw to construct a cast that was treated with a mixture of wine, camphor, and egg whites. The result was said to be quite heavy (despite the egg whites --- so much for French cuisine). Lighter casts were developed in the 1850s using plaster-of-Paris. The materials used to construct casts underwent little change until the introduction of fiberglass tape in the 1970s, which reduced the weight of a cast considerably. The current generation of fiberglass casts is also largely waterproof.

Bone grafts to replace missing bone were first attempted in the late 17th century but failed due to tissue rejection. The first successful graft using the patient's tissue was in 1820, and later the procedure was repeated with sterilized bone obtained from cadavers. The science of bone grafting and transplantation advanced through the 20th century and took a vast leap forward with anti-rejection drug therapy. Of course, if you're playing in a fantasy campaign your average necromancer may be able to eliminate tissue rejection and graft almost anything to you.

The single greatest advance in treating fractures was the discovery of X-rays in 1895. Prior to their use, doctors relied upon experience and guess-work in order to diagnose injury. Another important advance was the development of antiseptic surgery in the 1860s. As the risk of infection dropped, surgical reduction of bones became less risky to the patient. This opened the door for a number of procedures only dreamt of by doctors (and Mary Shelley) such as inter-species bone grafts and hand transplants. A third advance was the development of anesthetics such as ether and chloroform during the Victorian era. Another advance was in the development of biocompatible alloys after World War One, which simplified surgical fixation such as plates, pins, and screws. Older implants were liable to corrode and become toxic. Modern implants use inert materials such as titanium to fix bone and to replace entire joints.

The (Near) Future

Technology already affects all aspects of fracture repair, from improved imaging of the skeleton to hormone treatments. A recent innovation has been in the area of injectable bone grafts using calcium compounds to repair fractures. The filler stabilizes the limb and bone cells colonize the area within a few months. Recent experiments have also shown that fat cells can be placed on a polymer scaffold and prompted to turn into bone cells. The resulting bone is not at risk of rejection (as it is made from the body's own cells) and does not require the removal of bone from elsewhere in the body. Within a decade or so we may see these procedures moved from the laboratory to the hospital.

Farther off on the horizon is the potential use of nanotechnology to repair bone tissue. In this scenario, molecular machines might grow bone from scratch (like the body-weaving scene in *The Fifth Element*). This would be extraordinarily difficult to coordinate but nothing is impossible. The structure of bone could be further enhanced by reorganizing it or lacing it with exotic materials so as to provide greater strength.

Motocaust

Published by [Ronin Arts](#)

Written by Philip Reed

Illustrated by Christopher Shy

6.85 Meg 50-page full color PDF (5.25 Meg Zipped); \$10

The post apocalypse genre has seen a small resurgence of late, headlined by the *d20 System* modern updating of the original classic [Gamma World](#). The other *d20 System* title, [Redline -- High Speed Road Duels In A Post-Apocalyptic Future](#), took a less thoughtful more mechanistic approach in bringing *Mad Max*-style vehicular combat to the genre, while Politically Incorrect Games' *genreDiversion* title, [EarthAD: Post-Holocaust Adventures](#) provided an overview of the genre. Like *EarthAD*, the latest entry to the genre has been released in PDF format, but shares more in common with *Redline*. Developed within the space of a month, *Motocaust* is written by PDF guru Phil Reed, and benefits greatly from the artwork of Christopher Shy.

Motocaust is set in the years following an asteroid striking Missouri. The face of the world has changed: America, England, and Japan were devastated. America has recovered, but the USA is no more. In its wake, China and Germany have risen as the world's super powers. America is governed on a state-by-state basis, some democracies, some dictatorships, and some communist collectives. Life is more simple, having regressed to that of the mid-twentieth century or earlier. But each town or settlement has fortified itself and taken on a cowboy attitude to security -- all in the face of a new threat that the asteroid left behind.

New terrors stalk the wastelands between the settlements: Necros. The asteroid brought with it an alien spore that mutates organic matter, and flesh in particular. What were once dead walk again . . . The Corpsebound are amalgams of at least two human corpses; Flesh Bugs are mutated insects that crave human flesh; Hell's Servants are motorcycle riding or car driving zombies; Motorheads are intelligent zombies that lead packs of Hell's Servants and guzzle petrol as much as they chew flesh; and Shadows are ninja-like, swathed all in black, mummy-like, and use hi-tech gear to perform assassinations. Of all the Necros, the Shadows and Motorheads are the only ones that can be selected as player characters. Though these undead are powerful, ordinary human characters will have more skills in comparison.

In *Motocaust*, players take the roles of "knights of the road," crewing the cars and bikes that travel from town to town. Those provide transport, courier and messenger services, their vehicles being the best way to outrun and often outgun the Necros. Six archetypes are suggested. The bodyguard; the cycle courier; the grease monkey that fixes the vehicles; the gun bunny that crews a vehicles' weaponry; the Runner being a demon behind the wheel; and the tuner seeing to the vehicular electronics so prevalent in the late nineties designs that survive in the future of *Motocaust*. Each archetype has a favored skill, which receives a +1 bonus and can also be raised above the starting maximum of six. Each also has two penalized skills, that have a starting maximum of five, and cost a point to buy before they can be raised to the minimum score of one.

Character generation is an easy process. A six-sided die is rolled for each of the three attributes -- Strength, Intelligence, and Agility -- and then three bonus points are divided between them. All characters have 20 hit points. A further 20 points are divided between the 12 broadly defined skills. For example, the Social skill covers all interpersonal interaction, while Driving applies to cars, trucks and motorcycles. Skills are rated from one to ten, and each is combined with a key attribute for skill checks that are rolled on 2d10. Most skills are keyed to Intelligence and Agility, except for Unarmed Combat and Primitive Weapons that both use Strength instead.

Character generation ends with equipment purchase, paid for in "tp" or "trade pieces." Most equipment is generic, so that a Pistol, Semi Auto, is exactly that, rather than say, a Beretta 92F. The players and the MotoMaster can add such details, as is their wont.

Every player also receives 3000tp to build a vehicle. The points can be pooled to build something better, faster, more heavily armed and armored -- and flashier. Flash is important because a good-looking car and crew gets the business, its rating adding to the social skill under certain circumstances. Based on cycle, compact, sport, coupe, and pickup chassis, players add engines, armor, tires, weapons (machine guns, Hellfire missile launchers, and flame throwers), and a plethora of extras. These tweak aspects of the car to give various benefits. For example, vehicle decals weigh nothing, are cheap to buy, and give a +1 flash bonus, while an engine extra like cold air intakes increases a vehicle's speed. The larger the vehicle, the more options it can carry, such as turrets. An engine's base chip can also be reprogrammed with new calibration codes or even replaced. It is possible to put too much into a vehicle, but at a loss of top speed.

The design process, of which a full example is included, is not that difficult. But with so many options, it might be a little slow when done cooperatively. Two ready-to-play designs are included but there should have been an example of each chassis type given.

Vehicular combat has an abstract element in that it is described more than mapped out -- the author suggests the use of other game systems if a more tactical style is desired. It is also cooperative, with each character having particular responsibilities, much in the manner of FASA's *Star Trek Starship Tactical Combat Simulator*. Thus a driver drives, a gunner handles a weapon, the grease monkey and tuner repairs, or they handle other weapons or take pot shots out of the window. The system also uses an ordinary deck of cards with the four suits corresponding with, and giving bonuses to particular actions and events within the game. Spades correspond with bonuses to attacks; Hearts to speed changes; Clubs to handling breakdowns; and Diamonds to fancy maneuverings. A character's responsibility determines what cards can be played -- drivers play Hearts or Diamonds, gunners Spades or Clubs and so on. Both players and NPCs start with a deck of five cards played in turn to enable offensive and defensive actions. A player is encouraged to describe the event his card represents, bringing a narrative element to vehicular combat. The face cards allow special actions, such as targeting a vehicle's tires, pulling vehicular stunts, and so on. Standard skill rolls handle actual resolution with the value given on the cards acting as bonuses. In effect the cards both work to handle the flow of combat, and not only provide more options than just the rolling of the dice, but force players to describe their effects.

Physically, *Motocaust* is a hefty PDF. Much of that is due to the full-color artwork of Christopher Shy. And although these pieces make the PDF inkjet heavy, the illustrations, both sketches and photo realistic pieces, are all uniformly good. The writing is solid, but it does need another editorial pass. It also has an adult tone, including the language in the entertaining color fiction. There is a slight and sly politicism to the game, that of a superpower being brought to its knees and surpassed by a chance event. Other amusing touches include renaming doctors as "ziptucks," and having the postal service broken up into clans that war with each other in order to deliver the mail.

This basic game only covers Texas, so there is room aplenty for further support. This should include adventures, of which there are none given, and more vehicles. Two designs are just not enough. But these amounts to nitpicks in what is otherwise an interesting take upon the genre.

And it cannot be denied that this take is derivative. *Motocaust* is essentially a Deadworld -- [*All Flesh Must Be Eaten*](#) meets *Car Wars*. But *Motocaust* is not a game of survival horror, and is more to do with helping to rebuild and keep society going. The way it handles car combat harks back to one of the short stories that inspired car wars, *Along the Scenic Route*, penned by Harlan Ellison. It also has a dash of Roger Zelazny's *Damnation Alley* thrown in for good measure. Which is no bad thing and is an effective combination, as *Motocaust* is easy to grasp and both setting and mechanics have a brute machismo to them.

Mechamorphosis (for *d20 System*)

Published by [Fantasy Flight Games](#)

Written by Lysle Kapp & Rob Vaughn

Illustrations by Cil Cheung, Joe Ng, Matt Kuphaldt, Chris Pickrell, Hian Rodriguez, & Franz Vohwinkel

Edited by Greg Benage, Rob Vaughn

64-pages b&w softcover; \$14.95

It's somewhat ironic to note that while some companies have difficulty getting supplements out for a single product line, Fantasy Flight manages to get several products out in their Horizon line, but they're all self-contained settings independent of one another. The fifth release in the chain is *Mechamorphosis*, and fans of the eye-candy cartoon *Transformers* will see the deliberate parallels.

Thousands of years ago, the Great Generator on Mecha Terra gave out. The one dependable source of nexus energy, the lifeblood of the robotic mechamorph race, was gone, and the inhabitants fell to fighting amongst themselves for what precious little was available.

In stepped one of the guilds with an offer: The Tyrants had a source of power they were willing to share, and all they wanted was control of the planet. An orderly society could more easily devise new sources for nexus energy. You'd think people would think twice before rolling over for a group that calls itself the Tyrants -- you're kinda asking for it -- but as a nod to the similarly obvious Decepticons from the TTV show...

The Tyrants' mysterious source of energy, however, is to suck it out of other mechamorphs. Some mechamorphs discover the fraud and are forced (or escape) off-planet through a white hole leading to Earth. As the setting opens, two rebel groups occupy our planet: the Exiles who openly fight the Tyrants, and the isolationist Animechs who are satisfied they have escaped persecution and don't want to rock their secret boat.

Those villains who pursued their quarry to Earth may be losing their influence over events back home, and the race as a whole has made enemies among its galactic neighbors. A select few humans are aware of the giant robot threat, and an enigmatic organization calling itself AUTO has offered to fund actions against the mechamorphs. The heroes and their human friends must use their technology and their ability to morph into vehicles, weapons, devices, and animals to stand against the oppressors and take the fight back to their home world.

Building PCs that have a minimum of two forms is a daunting idea, especially if you must codify the process in just several pages. *Mechamorphosis* heroes arrange five character creation options into priorities. Do you want your unit to concentrate on attributes over feats? Is it more important that you have greater control over the shapes you can adopt, or that you have more, cooler equipment when you become a strike helicopter? The higher the priority, the better your choices in that arena.

Once you have your priorities straight, most development options are familiar. Feats and skills are chosen normally (once again, Horizon tends to lump like skills together such as Senses, comprising Listen, Search, and Spot skills), though they have a mechamorph slant to them. There are only four classes: soldier, scout, scientist, and controller,

most of which are self-explanatory. The controller, however, is a good example of a unit that gets good use out of special powers. With these, robots can guide several smaller devices that connect with him in a sort of symbiotic relationship. Robots can mechamerge, connecting their bodies into a much larger unit for combat. Many powers are just spells with techie-style names -- *persistent image* becomes holoprojection.

The book tries to break the chaotic processes of fighting and movement down into manageable chunks -- struggles ebb and flow, and the technology needs to keep up as heroes take off and land in short order, morph a gun and fire it, or break down from a mechanical tiger into an off-roading dune buggy. Such alterations are adjudicated generously, in keeping with the anime origins. Three scales of combat are given to match the speed of the forms taken.

It's a good thing the setting is referenced seamlessly throughout, because by the time you get to the end, there's barely more than a half-dozen pages given to the history and current state of affairs, the major players, and the possible options for developing the ongoing conflict. All part and parcel of the Horizon style, but a couple of humans get almost as much development as the robots themselves, and none of them have character sheets. In fact, it's something of a triumph that we know as much as we do about anyone in the game given the lack of any real samples.

Illustrations are handled well -- the team responsible knows its sources, and some pages have pictures that look like they're changing before your eyes. Several doubled images depict the robot and its "alt form" in the same frame. That you can see how the bits and pieces of one image suggest the form of the other is representative of the attention to detail that characterizes the book on the whole. Now if only the physical quality were better -- this entry's cover seems to warp before too long so it's curling upward.

One of Horizon's most complicated offerings to date, *Mechamorphosis* isn't easy to digest. The rules are still short, sweet, and to the point, and their standard disclaimer -- the action is cinematic, so if you're stuck just wing it -- is good advice in any case. But while the concept of tracking different scales for combat isn't original with this game, it's one of the first in which only two combatants can mean as many as four different forms using three different scales in a single round. The interrelationships among generators, nanotechnology, nexus energy, and interchangeable bodies and minds get muddled too.

Nevertheless, it is another triumph for Fantasy Flight Games, in which the characters aren't the only ones making a little magic with varying sizes. *Mechamorphosis* is a slim volume with a lot of information packed into it, data that translates pretty quickly into a good germ for a campaign.

--Andy Vetromile

Two-Player Games (and Other Figments of the Imagination)

While most of the time I compose columns with a vague "beginning-middle-end" already in mind, this is one of those columns when I have no idea where it's going as I'm writing it. Consider yourself warned. (Of course, some of you might be horrified to realize that, in fact, I often do have some idea where a column is going. Yes, sometimes the semi is *trying* to jackknife on the interstate.)

Anyway, I've been in the mood lately to play some alternate kinds of games. Y'know . . . card games, board games, whatever. And, at present, it's not terribly convenient to gather up more than a one other person, I'm bemoaning the lack of good two-player games. Most games are made for at least three players, and they often require four or more. I most recently discovered this when I tried reviewing *Hex-Hex*, which I picked up at GenCon. It was an intriguing concept, and I was looking forward to it. Unfortunately, it absolutely required three people, and was ideally designed for four. With only two people, it would have played like a bad two-player version of *Uno* (which I've written about [before](#)). It was over a month before I could gather together the required number of people.

I also recently played another game which claimed to be for two to four players. It was a Hangman-style variant, and although the core concept was interesting, it just wasn't that *fun* for two players. Part of the reason is that the core rules relied on the competition between other players. In the game a player gets to keep making guesses as to the components of the word as long as he is right; the limiting factor is that any player can guess the word at any time. In games with more than two people, this means a player who is guessing must balance between adding components to the word while not adding so many that the other players will guess the word (and steal the points from him). But in the two-player version, the player has no limiting factor keeping him from guessing all day.

Anyway, I find this lack of good two-player games to be somewhat surprising. After all, the most classic games of all time – Chess, Go, Checkers, Roshambo – are all designed for two players. In fact, most of these games have had variants for three (or more) players, and they usually just don't work.

However, these two-player games are all pure strategy games. Really, when you think about it, all you need to do in those situations is design a game for *one* player, then mirror it. It's rare for two-player games to have two disparate but equally powered sides. (*Ogre* and some of the Tom Wham games spring to mind.) But I'm not a huge fan of pure strategy games; I end up thinking too hard, which means I just stare intently at the board and fret about making a deviation I'll regret 16 moves later. No, I like games that have some strategy, some luck, and lots of socializing.

In thinking about it, it's logical for games to see why the default number of players is three or more in most games that aren't pure strategy. After all, game balance is paramount in most "beer and pretzel" games, and for the most part it's already built in into any game where players can interact with each other. If one player starts to pull ahead, the other players will generally be able to "gang up" on him, knocking him back down. Repeat as necessary.

In some games, this manifests in an extreme; for example, most games of *Illuminati* I've been a part of have boiled down to "Who flinches first and attacks another player?" The attacker generally signs his own death certificate with that action. However, in other games the converse is true, such that one player can become so powerful he can shrug off attempts to stop him made by a coalition consisting of the other players, four burly friends, and the remnants of the Houston Astros.

One of the other problems with two-player games is that your options for interactions are seemingly limited. For example, *Yahtzee* is a game that works well as a two-player game, because players of that game aren't interacting with each other at all; they are only comparing scores at the end. Really, it works just as well with two or 10 players, or even solo. Have fun.

Also adversely affecting beer-and-pretzel two-player games is the lack of strategy many of them have; the "best" move is usually obvious, and there's little incentive not to do that action. This stands in stark contrast to many three- (or

more) player games, where the best move to use against one player isn't necessarily the most logical, because there is at least one other player who *won't* be affected by that master plan.

Fortunately, there are some good "beer and pretzel" two-player games. And some games can be *made* good for two players without terribly radical revisions. For example, *Wiz-War* isn't normally much fun for two players; the board is too small, so the result is that no one pursues the game's primary objective of "steal your opponent's treasures," meaning that everyone falls back on the secondary objective of "blow of your opponent." But to play with two players, simply set up the board for three players -- complete with two "dummy" treasures -- then play the game as normal; the winning conditions are the same as in the two-player version, except to win by stealing treasures the player needs to take at least one of his opponent's.

In this way, I believe I've stumbled across one good general rule for making these types of games more fun for two players. First, there should ideally be two possible ways to win: one involving establishing a goal of the player's own and one in thwarting the other player. This way, the players can pursue a goal that doesn't merely involve picking on the other player (which avoids the problem of smacking each other each round until someone falls) and still gives players some reason to interact with each other (sidestepping the *Yahtzee* problem). As a popular example, poker can work pretty well with two people, especially most of your seven-card variants. This suits the criterion of interacting with the other player (in the bidding rounds) and letting the player pursue his own goal (getting cards and building a hand).

For those considering how to make their favorite games more suitable for two players, here are a few tips:

Look to see if some aspects of a three-player game can be introduced to the two-player game. For example, it might be possible to deal a "dummy" hand in a card game, and either leave those aside (in the case of a classic such as *Hearts*) or have them be played randomly, or perhaps by the player who is currently losing. Of course, these cards probably can't serve as more than the role of random effect or spoiler . . . although if a randomly played set of cards *is* competitive with human players, that might prove insightful as to the nature of the game itself.

In board games, see if more (or less) room might give the players more opportunities for a satisfying game. Maybe making some squares off-limits or making some squares take more effort to move through will encourage more interaction.

If a game has a singular requirement for victory, it might be possible to tweak the game so that this requirement is more integral to the game. For example, in the board game *Talisman*, one of the requirements to begin an attempt to win the game is -- appropriately enough -- a talisman. In the game they are somewhat rare, although it's not difficult for everyone to acquire one. (This is in marked contrast to the previous version of the game, where there were approximately six more talismans available in the game than there are hydrogen atoms in the universe.) But in the normal version of the game there is little incentive for players to interact; it's usually much more profitable to avoid the other players and build up, *Yahtzee*-style. To encourage more interaction, however, what if there is only one talisman in the whole game (or, at least, at one time). In this completely untested variant, players would be forced to go after each other to make sure they could maintain control of the game-winning item. If players think this would give too much of an advantage to the person who has the item, then they might institute a rule that whoever has the talisman loses one Experience Point per turn (or has one permanent point turned into Experience Points). This should encourage the player who has the item to either drop it (thus making it available to all players) or go and make a final attempt to win the game.

In all, I wish there were more options for fun, interactive games for two players. Fortunately, there are enough to keep me pretty happy, and I can tinker with others to try to make them suitable for two players. (Of course, as a note to the game publishers: I'm more than happy to buy good two-player games right off the bat.)

--Steven Marsh

Strategic Eye for the Roleplaying Kind

Seven Board and Card Games Roleplayers Will Love

by Christopher Floyd

Every roleplaying game has a different degree of "game" in it. Some are freeform or story-driven while others are mechanistic, plumbing deep into statistics and strategies. While every roleplayer may prefer a varying degree of "gaminess" in their RPGs, it's hard to imagine a roleplayer who doesn't like pure games -- "strategy games" is what they'll be called this year -- like those played on a board, with cards, or with dice.

There are many qualities a game might have that would make it appealing to a roleplayer. The most prominent ones are isolated here and will use the following tags to denote which qualities the individual games discussed in this article possess:

-
- C** The game assigns players unique characters or game roles. These may confer special capabilities or winning conditions. By distinguishing one player from another this way, some games create characterization and limited roleplaying opportunities.

 - T** Games with this tag sport a simulated sense of time and/or space, keeping the game from being overly abstract, turning pure competition into an event, and establishing a foundation for narrative elements (see below).

 - N** The game features certain story elements -- a mystery to solve, a "script" to follow, or an archetypal narrative situation. The game might also reference (and mirror in its gameplay) an established literary work.

 - I** A little spontaneous creativity, of the sort obsessively honed by roleplayers, will go a long way in these games, either toward winning the game or, at very least, making it more entertaining.

 - A** Games with this tag are implicitly aimed at a roleplaying audience or an audience with crossover connections to roleplaying (fantasy fiction readers or computer gamers, for instance).

 - V** Let's face it: even a mediocre game can become great fun when everyone lets loose and breaks out the silly voices. Roleplayers are well aware of the fun value of accents and flamboyant voice-acting, and with these games they probably won't be able to restrain themselves.
-

The games profiled below are just a few which have aspects that roleplayers will especially enjoy. It is not this article's intention to review these products fully, and the descriptions will not necessarily explain all of the rules or features. Instead, these capsules attempt to explain why each game would appeal to someone who also enjoys roleplaying games. So if you're looking for a fill-in game when half your gaming troupe can't make the session or if your new girlfriend insists on seeing what this "Saturday night gaming" thing is (and *Call of Cthulhu* might scare her away), any of these games is a great choice if you also want to have fun and hopefully satiate that roleplaying jones until next week.

BANG!

Mayfair / Da Vinci Games

4-7 players

CTNV

\$10.00

If you were going to roleplay a classic spaghetti western, one good first step is having all the Italian vocabulary you could ever need conveniently on hand. **BANG!** just happens to offer this and so much more. To start, the mechanics evoke a narrative feeling and a sense of time and space: When shots are fired and some folks are dodging behind barrels while others mount their horses to get out of range, the table quickly starts to feel like the town square in the midst of a shootout. There's a cornucopia of character cards featuring rough-and-tumble cowboys and cowgirls like Paul Regret, Rose Doolan, and Slab the Killer, each with a unique special ability that also serves to characterize. Then there's the gripping, tense, and sometimes perplexing gameplay. Each player has a role - there's the Sheriff, his Deputies, a band of Outlaws, and the conniving Renegade. The catch: Only the Sheriff's identity is known. The rest are secret, and only death reveals the truth.

Any roleplayer will relish playing an Outlaw. All the Outlaws win if the Sheriff is killed, but their success depends on revealing themselves -- with that first fateful shot on the Sheriff - only when they are all in a position to make a concentrated attack. Until then, they must act innocent while attempting to whittle down suspected Deputies, whose job is to help the Sheriff clean the streets of Outlaw vermin. Typically, then, everyone acts like a Deputy, congratulating the Sheriff on a great shot, promising to help him weed out Outlaws, and not complaining when the Sheriff confiscates his weapons or horse. Skillful acting and convincing bluffs are surprisingly effective in swaying a Sheriff's perception of you when everyone's equally suspect.

There's always one player in a roleplaying group who can't be trusted by the rest of the party, who seems ready to double-cross anyone for his own benefit. If that conniver is lucky enough to draw the Renegade when the game starts, you'll have a challenge on your hands. He wants to kill the Sheriff, but only when the two of them are the last players in the game. This means he's effectively a Deputy until the Outlaws are uncovered and killed (although if he can sneak a shot in at a real Deputy before then, he makes his job much easier later on). Then the guessing game begins again, as the Sheriff must figure out which of his loyal Deputies has it in for him. A good Renegade depends on his earlier friendly actions to mislead the Sheriff.

Playing the Sheriff can be stressful, but it's tailor-made for the sleuth of your gaming group. He'll have plenty of opportunities to collect clues about each player's identity, though it's common to have the story turn tragic when the Sheriff makes the wrong call and guns down his own Deputy.

Which is perhaps the part that would make roleplayers a little incredulous: A Sheriff that doesn't know who he's deputized? A gang of Outlaws who play it by ear when they decide to take on the law? The Italian text on the cards isn't the only reason **BANG!** plays out like a spaghetti western instead of a historical frontier story. The chaos and confusion of bluffing, speculating, and sometimes just shooting the first person who looks at you funny is all part of the rip-roarin' fun.

[Witch Trial](#)

| V

Cheapass Games

3-7 players

\$7.50

If you're playing **Witch Trial** without roleplaying, you're missing more than half the fun. Granted, it's not a typical roleplaying scenario: Players are lawyers trying to get rich off a recent spate of witchcraft accusations. As such, they'll charge anyone with anything, admit as much evidence as they can no matter how absurd, and hang defendants out to dry if a plea bargain would serve them better. It's a narrow premise for most roleplayers, but the brilliant silliness of the cards can't help but inspire.

The appeal for gamers in *Witch Trial* is using the skills of spontaneous creativity fostered by roleplaying to justify what would otherwise be luck of the draw and the mandate of strategy. Ultimately, the goal is to sway the jury to your side (each trial has one player as prosecutor and one as defense) to make the final verdict -- determined by the roll of the die -- more likely to go your way. Card plays during the trials generally add or subtract from the jury's likelihood to convict. It could be bland and mathematical, but when a trial starts by accusing Meek Little Sarah of the dreadful charge of Wearing a Hat in the Theater (witchcraft itself not being a crime, witches are punished under related statutes) and the prosecution immediately establishes that Sarah's guilt is clearly evinced by her ability to Read Without Moving Her Lips, any roleplayer worth his salt has to be moved to take up the challenge of making the absurd charges make some kind of sense.

That's not to say you want it to make any *true* sense. Rather, the most enjoyment comes in fitting your arguments into the logic of the setting, as outlined by the card titles, flavor text, and the oddly evocative although completely anachronistic Victorian illustrations of Charles Gibson. Players who can mimic the tone they pick up from the cards and then pile on the pomposity, aloofness, and judicial gravitas of an old-timey lawyer will generate plenty of professional respect from their colleagues and fun for all onlookers, although it won't necessarily earn them a generous amount of money from a grateful township. Victory still comes down mainly to numbers, although an air of confidence in the courtroom may arguably give one an edge when negotiating a settlement.

A roleplayer won't find endless versatility in the role they are asked to play in *Witch Trial*. Pandering to stereotypes is probably more effective than developing a uniquely original persona. It often happens, too, that pragmatic playing gets in the way of constructing the most humorous or bizarre case. Still, *Witch Trial* is a challenge to roleplayers. They have probably never been asked in a gaming session to do anything remotely like defending Mad Gertie Hayes from an unmeritorious charge of Tampering With the Post with only a Faithful Pet and the fact that she Doesn't Cast a Shadow as evidence in her defense.

[The Lord of the Rings](#)

NCA

Fantasy Flight Games

2-5 players

\$44.95

Would there be roleplaying games today if *The Lord of the Rings* had never been written? The answer very well might be "no." There is something in the temperament of fantasy literature fans that wants to do more than read the story; they want to live it. These days, roleplayers have a wealth of genres to dabble in, but it's unlikely any of them will surpass classic heroic fantasy in popularity. Just the title of this game may be enough to make a roleplayer swoon, though there are plenty of other reasons for him to like it.

Many games have been created based on Tolkien's works, but Fantasy Flight's is undoubtedly the one that most authentically reproduces the feeling and flavor of the books. The reason why is the same reason that the game -- its setting aside -- will appeal to the roleplaying crowd: It puts them in the story and makes them all heroes. The *Lord of the Rings* is a cooperative game -- all players are Hobbits, and part of the Fellowship asked to bring the One Ring from Bag End to Mordor. One player isn't the winner; either they all win or they all lose. The opponent is the game itself.

Traveling through Tolkien's tale involves moving through four storyboards: Moria, Helm's Deep, Shelob's Lair, and Mordor. Players must cooperate and communicate to move efficiently. If they don't (or if luck just isn't with them), they will trigger events with rapidly worsening effects. Each of these events is based on a plot point of the books, entitled "Fly You Fools!" or "Wormtongue Unmasked." Most require the playing of appropriate cards to stave off bad results, which are usually the movement of the Hobbits toward Sauron (or Sauron towards the Hobbits) on the "Corruption Track," which starts with the Hobbits on one end and Sauron on the other. When the Ring-Bearer runs into Sauron, the game is over and the Fellowship loses.

No one would pretend that playing *The Lord of the Rings* is the same as roleplaying Tolkien's epic. Ultimately, it involves the team working with the abstract (but exceedingly clever) system to move some pawns from here to there before some other pawns get from here to there. But besides evoking all the memorable moments of the books (and, again, translating them into abstract effects), *The Lord of the Rings* tangibly feels like the books. You quickly become literally afraid of the next turn of the dreaded "Event Tiles" and you cringe when you see Sauron's Burning Eye on the face of the die. You hope against hope that everyone can muster the resources to get through Moria before the Balrog attacks. Like the characters in the trilogy, players must constantly make the best plans they can in the face of overwhelming odds and frightening prospects.

Some nice turns in the system also promote an interesting kind of narrative resonance with the books. For instance, whoever plays Sam is immune to some of the effects of rolling the die (always a bad thing, with the best effect being the one-in-six chance of nothing happening). The Ring-Bearer is often required by Events to roll the die. Therefore, it is often wise to get the Ring into reliable old Sam's hands when Frodo, the starting Ring-Bearer, gets dangerously far down the Corruption Track. Another example is the Gandalf cards, which basically let the team of Hobbits break the rules or ignore some bad results if they can pay the resources required. What this means is that Gandalf shows up out of nowhere to bail everyone out when things look particularly hopeless. Sounds like the Gandalf we all know and love.

The *Lord of the Rings* can't replicate every aspect of the story. For instance, if there are five players, the fifth Hobbit is Fatty Bolger, who, in the novels, stays behind in Bag End when Frodo, Sam, Merry, and Pippin head off with the Ring. These inconsistencies really shouldn't be a drawback for roleplayers, who should recognize that just the possibility of the quest to Mordor failing is a break from what Tolkien wrote, but since the set of roleplayers has a significant overlap with the set of fanatical Lord of the Rings purists, it's worth warning about.

The *Lord of the Rings* is mostly a game of planning and anticipating and doesn't have as many of the "proto-roleplaying" aspects of *BANG!* or *Witch Trial*. What it has is the real feeling -- rare in a board game -- that you are participating in a story. And, more than that, you are part of a team whose cooperation and occasional sacrifice is necessary to bring about the happy ending. For roleplayers, a love of these things may run even deeper than a love of J.R.R. himself.

[Munchkin](#)

A

Steve Jackson Games

3-6 Players

\$24.95

Munchkin is a strategy game meant to model roleplaying gaming. Ironically, it does so by summarily eliminating many of the qualities detailed above as roleplayer-friendly. *Munchkin* lets players haphazardly shift roles (in the form of races and classes); it foregoes creativity and instead rewards opportunistic number crunching; it obliterates any kind of narrative atmosphere and it certainly doesn't encourage cooperation (not the unconditional kind, anyway). The reason for all this iconoclasm is, of course, that *Munchkin* is a parody of everything we roleplayers love and all we nostalgically cherish. The humor could only be lost on the very newest initiates of the hobby. For everyone else, the absurd monsters (like the "Undead Horse"), the even more absurd weapons and magic items ("Mace of Sharpness"), and the heedless grind toward the next level will be familiar and hilariously fun.

[Mythos](#)

TNA

Chaosium

2+ Players

\$8.95 for a Starter Deck

Although defunct as a CCG line, one would be remiss in overlooking *Mythos* when discussing games with a narrative quality, especially since its *Call of Cthulhu* universe is one of the most revered roleplaying settings. *Mythos* has players completing story "scripts" that call for certain cards to be played from their decks - sometimes a specific card or sometimes a class of card like "any monster" or "any indoor location." It has a tangible (though imprecise) sense of space, as players must move from one geographical location to another, and there is a logic to the world, since only being in certain locations will allow play of other cards like tomes (found in libraries, for instance), artifacts, or monsters. The atmosphere of Lovecraft's world is evoked effectively through the artwork and the numerous locations, characters, and tomes mentioned in his work. It might be a small letdown to roleplayers that these story elements never quite coalesce into the real, engaging stories they seem to promise, but *Mythos* still has much to offer an audience hungry for narrative. *Call of Cthulhu* fans are undoubtedly already hooked.

Junta

C V T

West End Games

2-7 Players

\$30.00

This classic boardgame from the early 1980s was hard to find for the last decade until a recent reissuing. A combination of some "crunchy" wargaming systems and some surprisingly prescient "German-style" elegance, *Junta* is first and foremost a game of negotiation, sweet-talking, backstabbing, and vengeance. In a Central American Banana Republic, each player takes the role of a powerful family. Periodic elections determine who is "El Presidente" and he distributes other valuable positions to everyone else - generalships, ministerial positions, and the like. Ultimately, it's all about money, and El Presidente must dole out a secret amount of foreign aid to each family each turn. Shortchanging someone too often might start a coup, a short wargame in which loyalists battle rebels in the streets of the capitol. It's the tangle of deals, alliances, and vendettas that elevates what would normally be plain money-wrangling into a roleplayer's delight. The pacing of the game encourages players to remember every favor and especially every offense, no matter how small. This vicious history provides roleplayers with all they need to really dive in to their role; add a flamboyant accent and the shameless bootlicking and outrageous cursing are irresistible.

The Big Idea

|

Cheapass Games

3-6 Players

\$3.00

Much like *Witch Trial*, this Cheapass offering appeals to roleplayers because of its reliance on impromptu creativity. Combining an adjective card with a noun card to create an exciting new consumer product - some examples are "Frozen Pants" or "Perforated Cat" - players then vie for everyone else's venture capital and hope for a successful product launch. Products that get more capital have a better chance of a profitable launch, and those who invested more will make more. The trick, then, is anticipating which products will be popular with the other investors when the simultaneous disbursement of capital takes place, but on the surface every product is the same - just an adjective and a noun. Roleplayers, take notice: Unlike *Witch Trial*, spontaneous creativity is the key to winning *The Big Idea*. After presenting your "Disposable Car" to the market, you have to pitch it to the other players. Choosing the right product and a humorous pitch ("Thanks to space age plastics and the opening of Antarctica to landfill development, we're pleased to introduce . . . the disposable car!") are the only ways to give your product value and make investors' choice less arbitrary. May the best salesman win.

Planet DQ-458772-61

by Tom McGrenery

This adventure is designed for a party of characters from any game featuring interstellar travel, and is suitable for *GURPS Traveller* or various space opera games.

The Planet

Far from any other inhabited planet, on the fringes of the explored galaxy, is a planet covered almost entirely by water. Its designation, as assigned by the Galactic Survey Group, is DQ-458772-61. Somewhat larger than earth, the planet exerts a gravitational pull of 1.1G at sea level and is orbited by two moons.

There are two areas of land on Planet DQ-458772-61, both small islands. The first, designated Island A, is situated directly on the equator. Island A is shaped like a narrow oval, oriented north to south. The island is 800 meters across at its widest point and measures three kilometers from northernmost to southernmost extremity. Island A is a picture-postcard paradise, with a large proportion of its area being taken up by shallow beaches with golden sand that stretches down to the sea. Above the beaches, the ground is still sandy but punctuated with low scrub. Here the ground rises, forming a ridge along the length of Island A. The ridge is populated with tall thin trees with notched trunks and multi-fronched leaves. The trees grow precisely half a meter from one another.

Island B lies 78 kilometers due south. It is roughly circular, being five kilometers in diameter. This island is surrounded by rocks and a coral reef, and is a large flat expanse of thinly wooded ground. Covered in grass and scrub, where trees do grow (the same species that grows on Island A), each tree grows 86 centimeters from its neighbors. Island B is considerably more rocky than Island A, with the occasional outcropping and gully to relieve the monotony of the terrain.

Both islands have small amounts of wildlife, reptilian creatures generally no larger than a squirrel. It is unclear what they eat. The seas surrounding the islands are better populated, teeming with a wide variety of aquatic life. The climate is hot, not unlike that of Earth's Caribbean. Islands A and B are desert islands in planet-wide ocean. And they are fake.

The survey ship "Perdita" discovered and logged planet DQ-458772-61 some 12 days ago, but the information her crew transmitted was only of a basic and cursory nature. After the initial transmission, nothing more was heard from them.

Getting to the Planet

The heroes could happen across planet DQ-458772-61 by happenstance, in the course of ordinary space travel, perhaps diverted from their planned journey by the distress beacon of the *Perdita* (the *Alien* method). Alternatively, they may be hired or ordered to investigate the disappearance of the earlier survey team.

The Abandoned Ship

The *Perdita* remains where it landed on Island B. At seven meters long and designed for a crew of three, the ship stands silently in a flat clearing. There are two ways to get into the ship -- to enter via the airlock, the investigators must overcome the security lock, a simple alphanumeric combination. If they were sent to check on the *Perdita*, the PCs will already possess this passkey. If not, some inventiveness will be required to bypass the lock. On the other hand, they could just go through the giant gaping hole in the port bow. An explosion has blasted right through the thick hull, close to the prow of the survey vessel. There's enough space for a fully grown adult to climb through and into the navigation room, though they'll probably need a leg-up, as the hole is a meter and a half above the ground.

Inside, the ship is cramped and humid. The *Perdita* is divided in to several sections, as follows:

Navigation Room

This section contains seats for all three of the crew, and it is from here that they piloted the ship. The astrogation consoles are situated here. Also, an explosive device was detonated here, damaging several devices but mainly directed through the hull.

Crew Quarters

A living area for the crew with bunks, cooking facilities and a bathroom.

Laboratory

The lab is not particularly well equipped, but it does contain some basic scientific equipment. The *Perdita* is only designated to undertake the first stages of planetary surveys, with more in-depth scientific studies usually being undertaken by later teams.

One of the islands' lizards is here, kept in a transparent cage and looking very healthy.

Engine Room

A standard propulsion unit takes up most of the space in here, which comprises the rear half of the *Perdita*. A family of the islands' lizard creatures have taken up residence in the ventilation shafts.

Hold

This contains all the survey team's equipment, including small water and ground vehicles. Some PCs may be interested to note that only two of the four laser carbines noted in the inventory are still here.

Computer Room

The main interface with the ship's computer is in this room. The computer is dormant but can be reactivated with a minimum of hassle by a trained operator. The computer may either work on a traditional interface or may speak to the heroes in a friendly and helpful voice. If the GM wants a tense horror adventure, the latter is recommend; nothing is guaranteed to spook players more in an SF game than a friendly, helpful computer.

The computer has plenty of information for the PCs. It holds the records of what happened to the crew before they disappeared.

The Ship's Log

The survey team's documentation since arriving at planet DQ-458772-61 is not as complete as it should be, though it is impossible to tell whether this is because the records were deleted or because they were never made in the first place. However, the following information is available.

After an uneventful transit to the system, the *Perdita* took high- and low-orbit readings, including an oceanographic scan before settling down to land on Island B. Some lively, jocular debate occurred between the crew members over which of them would get the whole planet named after them, and which would get only an island each to bear their names.

The crew remained inside the *Perdita* overnight, running standard scans via the ship's sensor array. The next day, they went out to explore the islands. Daniels took a skiff over to look around Island A. Crewmembers Jensen and Billing remained on Island B -- Jensen was particularly interested in the lizards on the island and brought one back to the *Perdita* for study.

By late evening, Daniels had not returned from Island A. Jensen and Billing attempted to reach him via the shipboard communications devices but failed to make contact. With night fast approaching, Jensen and Billing elected to follow procedure and remain on board the *Perdita* until morning, keeping shift watches and periodically trying to contact Daniels.

In the morning, Jensen and Billing armed themselves with laser carbines from the hold and set out for Island A. An hour later, Jensen returned to the ship alone. She proceeded directly to the hold, from which she retrieved an explosive device. This she rigged in the navigation room to blow the whole ship in the event of any unauthorized entry. Precisely what triggered the device before the PCs arrived is unclear, but Jensen apparently did not set the device correctly, as the ship is still largely intact. Having done this, Jensen left the ship in the direction of Island A and did not return.

The computer will answer any questions the investigators may have about the crew and their actions to the best of its knowledge, including displaying what video footage it has from within and without the ship. In general, however, it will not speculate as to the motivations for their actions.

Investigation

Exploring the islands, the heroes will gradually notice the unnatural uniformity of the landscape. Both the shapes of the islands and the spacing of the trees suggest that the islands are artificial constructions. Don't actually come out and say this to the players, though. The suspicion should be enough to start with.

A biological examination of the lizard creatures shows a rudimentary digestive system, with unidentified active acids in the stomach. The lizards are not amphibious.

That the islands are artificial can be proven with an examination of the planet's tidal systems. Every 50 years, the twin moons cause a huge tide that would utterly obliterate the islands. So how do the lizards and trees survive?

In fact, there is intelligent life beneath the planet's waves. The undersea creatures that call the planet home have developed technology advanced enough to detect the transmissions of alien life. Known to themselves as the khalqua, these tentacled creatures knew that sooner or later an alien craft would come to their world, and so they prepared the islands for the land-based creatures they were shortly to encounter.

What's Actually Going On

What the truth is depends on whether the GM wants a can-do tale of adventure and pulp sci-fi, or a game of mounting tension and fear in the vein of a horror sci-fi movie.

The Horror Option

Run as a horror scenario, the tropical tranquillity of Planet DQ-458772-61 also exudes a brooding menace. In this version, the islands have been set up as a lure to allow the planet's natives to trap and examine the newcomers. The khalqua are aware that the creatures they intend to dissect are sentient beings. They just don't care.

The islands -- particularly Island A -- have been carefully seeded with traps. These traps range from deadly to the merely sadistic. The khalqua felt that they

About the Khalqua

Khalqua look something like a hideous cross between a squid and a lobster. A diamond shaped head gives way to a thick, muscular neck which sports six large tentacles, two of which have claws. The khalqua walk on six bony legs that enable them to scuttle equally well on land or the sea bed. In general, however, while underwater the khalqua use their tentacles to swim,

didn't necessarily need more than one live specimen. They also knew that a rescue mission would be sent.

flattening them out like fins. Khalqua are able to breathe both in and out of water.

The traps situated on the islands include:

- blades that spring out or drop sharply from the treetops, intended to incapacitate the victim
- concealed pits, with a three meter drop to a floor of sharp and irregular rocks -- it is likely that anyone falling in will suffer a broken leg or worse
- tripwires that (on Island B) trigger rockfalls to trap the unfortunate victim

Three traps on Island A have already been triggered, which the PCs will find sooner or later, assuming they have time. Daniels was trapped by a falling blade that pierced his left forearm, pinning him to the ground. This blade now lies discarded on the ground, surrounded by a patch of dried blood that tests confirm is Daniels'. Daniels was collected by the khalqua and taken beneath the sea. Jensen's body is nowhere to be found. She is in fact still alive, having been captured directly by the khalqua.

Billing's body is still on the island. Next to a tree with a razor sharp, blood-stained blade embedded in it, the investigators find a formerly concealed pit. Someone has plunged right through the thin covering of the trap, leaving a hole. Within the pit is the body of Billing, severed in two just above the waist, blood everywhere. If they can bear to check, the PCs will note that the decomposition of the body is much less than one might normally expect.

After three of the active traps have been triggered, the khalqua wait until the sun has set and then slowly emerge from the ocean under cover of darkness. Armed with both conventional weapons and devices designed merely to incapacitate, the 10-strong team approach the triggered traps to capture those caught within. Depending on how much time they have, the PCs may be able to escape the traps (or they may have never really fallen into them) before the khalqua arrive.

The endgame of this scenario is largely player-led. Once the khalqua arrive, it becomes a tense game of hide and seek in the warm night air. The PCs may want to simply get to their ship and escape, or they may want to try and find Jensen and Daniels. Daniels is beyond help now, but Jensen is still being kept alive to test her physical and psychological reactions to various stimuli in a lab on the ocean floor twenty kilometers to the east of Island B, shielded from detection thanks to careful security measures. It might be possible to track the khalqua capture team back to their base, or to capture one and attempt to barter. The success of such efforts is down to the GM.

The Action Option

In the case of an action-packed adventure, the traps will be much less nasty and tend to consist of things like simple deadfalls and snares that close on the victims' ankles before hoisting them up to tree level and leaving them dangling in an ungainly fashion. In this case, all the crewmembers of the *Perdita* were captured alive and are being held in the undersea testing base.

Once the PCs have explored the islands and found no trace of the *Perdita*'s crew, send in the khalqua. The heroes will probably be able to fight off the capture team without too much difficulty. As a result, the khalqua will send in heavier reinforcements. Their mission will still, in theory, be to capture the heroes but if they kill them, well, that's okay too.

If the PCs are captured, they and the crew of the *Perdita* will be dumped back on the islands armed with spears and told that the last two left alive can leave the planet. This is a lie, obviously, but it's good for a laugh.

The khalqua's reinforcements include lightly armed but nimble air skimmers that blast out from beneath the sea in a spectacular spray of water. These will attempt to strafe at the PCs if they are on foot or on the sea, and pursue and attack the PCs' ship as and when they make a break for it.

The air skimmers are launched from the same complex as the laboratory, so if the PCs can detect the launch site (the *Perdita*'s computer, having been awakened, will do this automatically), they can pin down the location of the lab. They

may well want to try and spring the crew of the *Perdita* from their prison. This is laudable and to be encouraged. The exact layout and staffing of the khalqua's test facility is up to the GM, but it is only a research outpost, quite some way from the main settlements of the khalqua. Because of this, as long as they don't take too long about it, the PCs should be able to get in and out before hordes of heavily armed khalqua turn up.

Lost Jewels

by Paul Drye

With the possible exception of gold, gemstones capture the imagination like no other form of wealth. As such, they can serve as romantic McGuffins in a wide variety of campaigns. In the case of adventures set in the last 100 years (say, *GURPS Cliffhangers* or *Call of Cthulhu*), a named gemstone like the Koh-I-Noor or Hope can provide a wonderful hook into the minds of players.

Unfortunately, many of these jewels are well-attested throughout history, and it can be difficult to drop them in just anywhere. Solutions include making up one's own named jewels, or ignoring the history and hoping no one notices, but a third possibility is best of all: Use one of the many famous gems that have disappeared from the world stage.

The Braganza Diamond

Discovered in Brazil in the 1700s, the Braganza is one of the most contentious jewels in history, with the story of its discovery, its size, its present whereabouts, it actually being a diamond, and even its very existence all in dispute.

Bearing this in mind, one common story runs as follows. Several Brazilian men were sentenced to exile from the civilized portions of Brazil and ended up in the Minas Gerais region, which was the world's greatest source of diamonds at the time. During a drought they were able to reach a rich patch of alluvial diamonds at the bottom of a river, and scooped up an enormous rough stone weighing in at 1650 carats. To put this into perspective, the largest gem diamond discovered prior to this, the Great Mogul, is reckoned to have been 787.5 carats. Even in the modern day, only the Cullinan has surpassed that figure.

The jewel was brought to the local governor, who pardoned the men. He then passed the diamond on as a gift to João V of Portugal, whose dynastic name was given to it.

At this point, the Braganza Diamond disappears into myth -- assuming it wasn't a myth all along. Even if it did exist, most believe that it was actually a clear topaz, a stone also found in that part of Brazil. Discovering it, and clearing up the mysteries surrounding it, could make the careers of a group of investigators.

Various incarnations of the diamond might be:

- **A rough diamond:** weight of 0.75 pounds, in the shape of a lumpy octahedron about two inches across. Its value is difficult to place, as the "rough trade" is largely controlled by DeBeers, and there's not a lot of open market competition for very large gems. A reasonable figure would be in the vicinity of \$100,000,000, with the potential for it to be much lower -- a diamond larger than the Cullinan was found in Brazil earlier this century but, as it was industrial grade and unsuitable for carving into gemstones, it had no real value.
- **A rough topaz:** weight of 0.75 pounds, roughly tetrahedral or prism-shaped about two inches across and evenly cloudy. It would be worth in the range of \$500 to \$5,000.
- **A cut gem:** since very little is known about the rough gem, the cut-down version of it could be nearly anything. As a rough guide, the 3106 carat Cullinan produced fragments of 530.2, 317.4, 94.4, and 63.6 carats, as well as nearly 100 other smaller gems; in 1997 a 100 carat diamond sold for \$16,550,000. A cut topaz would be worth a couple of times more than it would be as a rough, depending on the quality of the cut.
- **An attested gem:** if the adventurers can prove that the gem is actually the Braganza (as opposed to your average, everyday three-quarter pound diamond), the value of the gem goes up still more. Any number of museums would become interested in it, though whether any of them could come up with the required funds is difficult to say. For a topaz, this historical connection would be its saving grace for price, upping its value by a couple of orders of magnitude.

The Irish Crown Jewels

Not individual jewels, or even "crown" in any normal sense of the word, the Irish Crown Jewels were two pieces of jewelry used as the insignia of the Order of St. Patrick. Both were kept in Dublin for when a monarch of the United Kingdom wanted to invest a new member of the order. One "jewel" is a star, while the other is a badge; both are primarily diamonds with rubies and emeralds interspersed in various patterns.

Some time between June 11th and July 6th, 1907, the jewels were stolen from their safe in Dublin Castle. They have never been recovered. Suspicion fell on Sir Arthur Vicars, who held the only two keys to the safe that contained them - experts testified later that the safe's lock had not been cracked, but opened normally -- and Lord Haddo, the son of the then-Lord Lieutenant of Ireland. Neither was the main suspect, however, as that was Francis Shackleton, a man who lived in the same house as Sir Arthur and who was in serious debt. An inquiry cleared Shackleton, but it was widely considered a whitewash in order to avoid a scandal somehow involving Haddo.

If Shackleton stole the jewels, it's likely that they were broken up into their constituent gems and sold in pieces. GMs are free to ignore likelihood, but if a reasonable explanation for the jewels to remain whole is wanted, another possible perpetrator is Francis Bennett Goldney, who was an Officer of Arms for Dublin appointed six months before the theft. When he died, it was discovered that Goldney had a kleptomania for historical treasures. There was no sign of the Star and Badge in his collection, but the possibility remains that he was the thief.

The Order came to an end when most of Ireland became independent in 1922. The last member of the order died in 1974.

The Star of St. Patrick

A compass-shaped arrangement (two squares overlapping at 45 degrees) of small diamonds about three inches across. A circle of blue is inscribed in the center with the motto *QUIS SEPARABIT MDCCLXXXIII* ("Who shall separate us? 1783") In the center is a shamrock constructed out of emeralds, on a background of the cross of Saint Patrick (rubies in the shape of a X on a white diamond background).

The Badge of St. Patrick

Less spectacular than the Star, the Badge is similarly made of small diamonds, rubies, and emeralds. It is much the same as its brother in terms of the icons on it, but it is oval in shape and topped by a gold harp in turn topped by a crown. The harp and crown cover a hook that attached the badge to a sash during ceremonies.

Both pieces are relatively fragile, and inclined to come apart under rough handling. As wholes, both are not saleable, since they're stolen property and highly distinctive. A sale is possible in the black market, but they would fetch only what a collector would pay: it would be up to the GM to decide who this collector might be, and the depth of his pockets. On the other hand, if recovered and returned to the British, the Crown Jewels would probably gain the adventurers fame and reward.

If broken down, the gems in the Star and Badge are anonymously small, and worth approximately \$1,000,000 in total.

Replicas of both pieces can be seen at <http://www.doyle.com.au/images/patset.jpg> (the upper portion of the badge is beneath the knot of the fabric).

The Roseate Pearl

Another gem that may or may not have existed, the Roseate Pearl was a large, pink pearl from the west coast of Australia.

It was reported to have been found in 1912, when it was bought by pearl magnate Abraham Davis. He then took it aboard the steamer Koombana for the return journey to his home in Broome, Western Australia -- the center of Australian pearling. A cyclone sunk the Koombana en route, and the pearl was lost. Davis then reportedly haunted his mansion in Broome until it was demolished in 1980; variations on the story say he was murdered for the pearl, and the ship sunk to cover the crime.

Broome itself is an interesting location worth noting, as Davis is one of only several ghosts associated with the town and its pearl-diving riches. It is one of the few locations in the world where the *Pinctada maxima* pearl oyster lives, a species that often grows more than a foot in diameter. From the 1880s to 1914 it was a boom town, then rapidly turned into a ghost town between the wars. In 1942, the town was attacked in a Japanese air raid that killed dozens (leading to more ghost stories), and Broome nearly fell apart before the cultured pearl industry arrived in the 1950s. As of 2004, Broome is a small but thriving modern town built on the bones of an older and vastly more dangerous place.

As a legendary gem, there's no hard information about the Roseate Pearl, but GMs can use other famous examples of *Pinctada* pearls as a basis. The largest known is a lumpy ovoid, about 4 inches by 2, weighing 0.4 pounds, and worth perhaps \$5,000,000. Large round pearls are much smaller, but the largest is about 0.6 inches in diameter, and worth in excess of \$1,000,000 (none have been sold recently). In color it could be light pink, lavender, or a dark pink shading towards purple.

The Brunswick Blue

Karl, Duke of Brunswick was one of the 19th century's most fanatic jewel collectors, and had a collection that included the enormous Agra Diamond. He was most particularly interested in colored gems, and arguably the most intriguing one he had was the Brunswick Blue, a drop-shaped, dark blue gem of 13.75 carats of such murky history that it's been impossible to trace it much before the Duke bought it.

The Hope Diamond is the world's most famous blue diamond, and it's all but certain that it is a cut-down version of the French Blue, a diamond belonging to Louis XIV and later stolen during the French Revolution. One guess as to the origin of the Brunswick Blue is that when the French Blue was cut down into the Hope, a second gem may have been fashioned from one of the remaining fragments. This idea is far from universally accepted, but remains the best guess to date.

The Brunswick Blue is small for a famous diamond -- not even 0.25 inches from end to end of its drop shape -- but still one of the larger dark blue stones in existence and as a simple stone would be worth hundreds of thousands of dollars; as a piece of history, it would probably sell for more. What makes it particularly interesting is its connection to the French Blue and the curse that stone supposedly held and passed on to the Hope. After Karl's death in 1873, the Brunswick Blue was sold to an anonymous buyer in Geneva and has never been seen again. GMs are urged to consider what might happen if the Brunswick and the cursed Hope are brought back together after two hundred years of separation.

The Lost Fabergé Eggs

In 1885, Emperor Alexander III of Russia commissioned a large piece of jewelry in the shape of an Easter Egg from Peter Carl Fabergé. Giving it to his wife as a remembrance of her childhood in Denmark -- where similar, if less-spectacular, jeweled eggs were given to the Royal Family as Easter presents -- it was a huge hit. The Emperor decided to make jeweled egg-giving a family tradition, and the tradition continued after his death and into the reign of Nicholas II; it ended only with the Russian Revolution. By convention, each was hollow and could be opened to reveal a small, jeweled prize.

When the Revolution engulfed Russia, the Imperial collection of Fabergé eggs was at first sequestered in the Kremlin, but eventually it scattered to the winds. Of the fifty or so made, eight are unaccounted for as of 2004:

- **Alexander II Commemorative:** Of unknown appearance.

- **Alexander III:** Also of unknown appearance.
- **Cherub with Chariot:** This poorly known egg is believed to be a cherub made of sapphire pulling a chariot containing a gold and diamond egg.
- **Danish Jubilee:** A jeweled egg on an extremely elaborate base, this white, blue, and gold piece was made in 1903 for the Dowager Empress. Contained within was a tiny portrait of her father, Christian IX of Denmark, whose 50th jubilee as King was in that year.
- **Empire Nephrite:** Unknown in appearance, but presumably made from nephrite jade.
- **Hen Egg with Sapphire Pendant:** The first Fabergé egg was a faux egg containing a gold hen, which in turn contained a ruby pendant. This piece was made the next year and follows the same theme, but ultimately contained a sapphire pendant held in the beak of the hen.
- **Mauve Enamel:** Made primarily of light purple enamel, this egg is sometimes called the Rabbit Egg because of its prize: the other major symbol of Easter, a rabbit decorated with small white diamonds.
- **Necessaire:** The Necessaire is only known from description, and apparently was decorated with diamonds, rubies, and emeralds. A large diamond and ruby capped it. While the egg is lost, its prize remains: a small, high-peaked green chest, banded with white enamel and gold.

The eight eggs are the shape of a chicken egg, though sometimes with large bases, and weigh 0.25 to 0.5 pounds. Each is worth in the multi-million dollar range, possibly over \$10,000,000, with the exact value of one only knowable after it sells at auction - the GM has room to maneuver here.

These eggs are most useful in a thematically linked campaign, where for some reason all eight need to be found. Eccentric millionaire Armand Hammer -- godfather to Prince William, one-time owner of the DaVinci codex now possessed by Bill Gates, contributor to the Watergate slush fund -- is connected with the disappearance of several of the eggs; his Occidental Petroleum was one of the few conduits between Soviet Russia and the rest of the world during the 20s and 30s.

Conspiracy/Occult theorists might want to consider that seven Romanovs were murdered in the basement of Ipatiev House in 1918. Is there a connection, and if so, who does the eighth egg represent? Alexander II abdicated in favor of his brother Michael II, who was executed five weeks before the massacre of the rest of the family, while the Dowager Empress Maria escaped to London (along with an egg of her own, the St. George).

The Marlborough Diamond

On the eleventh of September, 1980, two Chicago mobsters by the names of Jerry "Witherhand" Scalise (he was missing four fingers on his left hand) and Arthur "The Genius" Rachel strolled into Graff Jewelers, in London. There they stole a necklace containing the Marlborough Diamond, named for when it was owned by the Duchess of Marlborough (a cousin of Winston Churchill).

They were on a flight back to Chicago two hours later, but were identified and tracked by Scotland Yard while still in the air. A phone call to Chicago police had the two arrested as they went through customs at O'Hare Airport.

There was no sign of the diamond. In the two hours that had passed between getting their hands on it and boarding their plane, it had been passed off. One theory, based on dubious testimony from a London cabdriver, is that it was in a package with a New York address dropped into a mailbox en route to Heathrow. Despite the authorities being hard on the trail of the thieves from the beginning, however, no-one has any real idea where the diamond could be even now.

The necklace is composed entirely of diamonds, a single strand for half of its circumference, expanding to two then three lines as one moves towards the pendant. A circular pendant, with five small strands hanging from it, dangles from the front of the necklace. The Marlborough Diamond itself is in the center of the pendant.

It's likely that the other stones in the necklace were sold individually, as they are sufficiently nondescript that they could be resold. The white Marlborough Diamond would have presented more of a challenge, as it was 45 carats (0.3 ounces) and was "cushion cut" -- an old style of diamond faceting, vaguely square with rounded edges and corners, that went out of fashion in the early 20th century. To be resold, it would have to be recut into a modern style, and

probably divided into smaller, less-obvious stones. It's just as likely that it's still untouched and in the hands of a private collector. Given the unusual presence of Chicago gangsters in the picture, especially ones who immediately flew back to the United States after the heist, some investigators believe it may be in the possession of an American "mob boss."

Pyramid Review

Call of Cthulhu 6th Edition

Published by [Chaosium](#)

Written by Sandy Peterson & Lynn Willis

Edited by Lynn Willis

320-page b&w hardcover; \$39.95

The dark universe of Howard Phillips Lovecraft comes alive once again in the latest version of Chaosium's classic game system. Completely compatible with previous versions of the game, the new version sports a creepy layout and includes the complete text of Lovecraft's famous titular tale, "The Call of Cthulhu." If you aren't already familiar with Lovecraft, you've doubtless seen his influences in such films as *The Blair Witch Project* and *In the Mouth of Madness*, if not the Jeffrey Combs features based directly on his works. His is a world where the lives of men are as inconsequential as those of ants, and just beyond our reckoning, dark malevolent entities lurk awaiting the conditions which will let them manifest on our plane of existence. This otherworld of dark alien gods, and the knowledge of those entities is known as "The Cthulhu Mythos."

Call of Cthulhu provides GMs (called "Keepers" in this system) all the reference materials they will need to setup and run a campaign. They will of course need to provide their own dice, paper, pencils and players. The system itself is called the "Basic Roleplaying System," and will be familiar to players of *Runequest* as well. Players have attributes which describe their character in general terms, and skills which describe their character's aptitudes at particular activities. The system uses d100 for skill checks, and players will want to roll below their current skill levels to succeed in their actions.

In addition to the classic roleplaying stats of intelligence, dexterity and strength *Call of Cthulhu* includes some unusual stats unique to the Basic Roleplaying System -- and to this particular game. The "Idea" stat gives the Keeper a useful "catch all" roll when players are lost or floundering. "Know" rolls allow the dice to determine whether or not a character knows a particular thing. "Sanity" measures the current mental stability of the character. The "Mythos" stat measures how much current knowledge of the secret otherworld and its entities the character understands. Raising this stat will lower the characters sanity permanently, and this can lead to some of the most fun roleplaying as players act out their characters' delusions, phobias, and hysteria upon discovering what is really going on out there.

According to the book, game play is best handled as a mystery-solving experience where there are layers of depth to the tale. The old man in the graveyard may be an agent of a bigger conspiracy or a darker cult, which in turn is merely a puppet for something even more sinister. Players are encouraged to solve problems using brains rather than brawn because the really powerful monsters are completely immune to most physical attacks. Ideally, play is set in the 1920s, although the book includes reference material for modern day adventures as well as those set in the late 1800s.

There is a magic system in the game, and typically the spells are better for dealing with these cosmic horrors than any conventional weapons. However, as players learn the spells from the dark and powerful tomes that contain the mythos knowledge, they lose their sanity. It is difficult to build a powerful spell-casting character that isn't completely mad.

A very thorough "bestiary" of Lovecraftian gods, monsters, and other horrors is included. Statistics and descriptions of these entities, where they may be found, and methods of driving them away (if possible) is detailed. The black and white artwork in this section gives a good basic description for the Keeper, and a comparative size chart is included to show the players scale when facing these opponents.

The book also includes four scenarios. "The Haunting," "Edge of Darkness," "The Madman," and "Dead Man Stomp" are adventures suitable for beginning players. These adventures have been included in previous versions of the system as well. Also included is a chronological description of disasters and oddities since the late 1800s, but this too is included in previous editions.

What's new? If you're a returning player and have the **5th Edition** or newer rules should you plunk down cash for the newest edition? That is the \$39.95 question. If you're just looking for new content, you will find the **6th Edition** lacking. It has the same cover art as the 5.6 version of the book, and the rules haven't changed. In fact, the biggest new section is the text of "The Call of Cthulhu," which can be found online and in numerous anthologies. The artwork and details of Lovecraft's favorite fictional city, Arkham Massachusetts, is a bit more detailed and includes the geographical location for several of Lovecraft's more famous tales. A small section on alien technology has also been included.

But missing from the new version are the sections on Lovecraft's Dreamlands, and criminal procedures and detective techniques, as well as the Forensic Pathology text which made the **5th Edition** such a complete reference book. Also, the book reproduces the error-filled "Resistance Table" featured in the recent **Cthulhu Dark Ages** book. The new layout is creepy, but in places it is hard to read compared to the simple fonts of previous versions.

Yet the book is delightful to read, and the game is easy and fun to play. If you don't own a copy of this game, then it is well worth the price. Chaosium treats its customers with great respect when it chooses to make new versions of its product completely compatible with products it made 10 years ago. While this version comes highly recommended, returning players may wish Chaosium had added game content rather than prose to the book in this new release.

Gloom -- The Game of Inauspicious Incidents & Grave Consequences

Published by [Atlas Games](#)

Designed by Keith Baker

Art & Graphic Design by J. Scott Reeves

110 Cards & Rules Sheet; \$19.95

Are you sitting comfortably? Then I shall begin . . .

Come gentle reader; let me tell you of a curious box that crossed my threshold this very morn. A box within whose confines contain the means to impart to you tales of doom and dismay, a torrent of tragedies, and the final, untimely death in turn of society's best forgotten misfits and misanthropes. You will hear of a miscellany of mishaps, each in their own way enough to make the sufferer doubt his own Self-Worth, until such times, as one last happenstance is enough to drive the sufferer into the throes of despair and maudlin melancholy. If death by ennui does not overcome the individual, something else surely will . . .

"What is in this box?" I hear you ask. Why Sir, it is nothing less than *Gloom -- The Game of Inauspicious Incidents & Grave Consequence*, from that fine purveyor of indulgences, Atlas Games. Further, it comes from the very pen of one Mr. Keith Baker, whom I am told, is the creator of rousing stories of adventure and derring-do set in *Eberron*, itself I believe to be the winner of some nefarious competition. But *Gloom* is not designed to stir the heart and set it racing, but one to tug slowly and mournfully at its strings. In this, I am sure, Mr. Baker does not draw for inspiration upon titles by such authors as H. Ridder Haggard or George W. Griffith, but upon the pen and writings of the late Mr. Edward Gorey. Readers of a less discerning taste might suggest other inspirations as put forth by Mr. Tim Burton in the form of *The Nightmare Before Christmas*, and the troubles of the Baudelaire children as chronicled by a certain Lemony Snicket in his popular *A Series of Unfortunate Events*. Perhaps they might serve as inspiration to some, but to those I would proffer these fine examples of Mr. Gorey's work: *The Gashlycrumb Tinies*, *The Doubtful Guest*, *The Epileptic Bicycle*, and *The Deranged Cousins*. Having read these and enjoyed his incomparable drawings and longing words of an age since passed, you will be in no finer frame of mind to appreciate the awful inherent glumness of *Gloom*.

Gloom is intended for those with a tender heart that have acquired at least eight years of age. It is best played when the tea has grown cold and the sky is gray, at the end of a miserable day. It concerns the dismal doings of four equally dismal families. These are "Castle Slogar," where Professor Helena Slogar employs unorthodox science to preserve the lives of her husband, Lord Slogar, daughter, Melissa, and to create a groom for Melissa with the aid of freelance gravedigger, Elias E. Gorr. "Hemlock Hall" is home to the widower, Lord Wellington-Smythe, his much doted upon twins and their wayward demimonde older sister, Lola, and Butterfield, the sly butler. The matriarch, The Old Dam, dominates "Blackwater Watch," dispensing murderous discipline through her *handyman*, Willem Stark, and while she favors her niece, Angel, Cousin Mordecai is sure to fall foul of her wrath. Meanwhile, the family dog, Balthazar has a penchant for unearthing the wrong bones. Darius Dark is the proprietor of "Dark's Den of Deformity," a circus peopled by performers with as little talent as he has for selecting them, from the ordinary bearded man and intensely shy illustrated lady to the mundane opera singer and the quite creepy clown. As play progresses, each family figure will suffer the slings and arrows of woeful misfortune, acquiring Pathos Points that sends his Self-Worth plummeting, the objective being to send this deep into the negative when such times as an Untimely Death will be his undoing.

What does deserve to be brought to your good attention are the cards themselves, a misnomer if ever there was one.

For each card is not manufactured of card, but is a sliver of opaque plastic designed in such ingenious a manner that when one card is laid on top of another, some details of the one below remain visible to the eye. In other instances, the details of the top card will obscure details of the one below, thus negating its effects. The cards come marked in black, red, and white, each benefiting from the refined pen of artist J. Scott Reeves, and are one of four types. The Character Cards are marked with a name, a portrait, a modicum of flavor text, and a family symbol. The latter consist of a Disembodied Brain for Castle Slogar, a Top Hat for Hemlock Hall, a Scythe for Blackwater Watch, and a Circus Tent for Dark's Den of Deformity. The Modifier Cards are marked with between one and three Pathos Points spaces sinister side. These spaces vary in rarity, the ones at the bottom being both rare and valuable. Together, the value of these spaces total a character's Self-Worth, but only those that are visible. Modifier Cards are also marked with a Story Icon or more, of which more anon. Others have a Special Effect that can be immediate or continuous, "was married magnificently," for example raising the number of cards that can be drawn. They also only affect the player whose character the card is attached to. Event Cards work in a similar fashion, like "Smoke and Mirrors," which cancels another Event Card when it is played, and "Misfortune Favors the Old," that lets a participant play two more cards each turn. Finally, Untimely Death cards turn worthless living characters into valuable corpses.

Play is simplicity itself. Participants select a family and receive a hand of five cards. Who so ever has endured the most miserable day takes the first turn. On your turn, friend, you can play or discard as many as two cards, or chose to pass. Your initial card can be of any type, but prithee, you are forbidden from inflicting an Untimely Death card on a character as your second card. You can play Event or Modifier cards. As such times as a character has suffered something lamentable that has driven his Self-Worth into the negative, an Untimely Death card can be placed upon him. The Character's Card is turned over to show a skull and he is placed aside along with the pile of cards played upon him. For the most part, the deceased take no further action during the remainder of the game. A game continues in this fashion until such times as all of the members of a family have passed on, when the game comes to an end. Each participant counts just the total Self-Worth of the family members that have passed on. Neither the living nor the dead of other families, counts towards a partaker's final total. Whom so ever has the lowest or least Self-Worth is the victor.

Competing in a hand or two of *Gloom* will reveal a simple stratagem or two. Targeting the lowest of the Pathos spaces on the Modifier Cards to deny them to your rivals, while placing them upon your own characters is one. Characters can be targeted with early Untimely Death cards to deny the scoring of Pathos Points. Some cards possess both positive Pathos Points and beneficial Special Effects, like the aforementioned "was married magnificently," which increases a character's Pathos by +15 and gives the benefit already indicated.

In truth reader, *Gloom* is an ingenious design, its mechanics made possible by the translucent quality of the cards. It is pleasing in play, but becomes more engrossing when the Story Icons are taken into account. They are in turn, Beast (indicating the presence of dangerous animals), Blank (which merely covers up Icons below it), Death (curses, diseases, or ghosts), Duck (woebegone tricks gone wrong), Goblet (feasts and poisons), Lucre (money), and Marriage (relationships, both good and bad). These act as hints and suggestions should you decide to elucidate and elaborate upon the circumstances of each card. How else could one explain how Lord Slogar "found love on the lake," but "was cursed by the queen"?

If *Gloom* has a downside, it is the smallness of its text, offset perhaps by your pince-nez or a magnifying glass. Yet dear reader, put such an unkindness aside, for this is a dolorous delight of mournful magnificence in the vein of [Once Upon A Time](#) and *Dark Cults*. Come friend, the Darjeeling cools and the clouds draw in, time I think for another hand of despondency and despair. I commend to you, Mr. Keith Baker and his forlorn fabrication, *Gloom -- The Game of Inauspicious Incidents & Grave Consequences*.

--Matthew Pook

Pyramid Review

Betrayal at House on the Hill

Published by Avalon Hill

Designed by Bruce Glassco

\$44.95

Betrayal at House on the Hill has an interesting history. It was under development at the original Avalon Hill back in 1998. When Hasbro bought the company, it was one of the few unpublished games that survived the transition, and was kept in the pipeline for several years. When Hasbro turned the Avalon Hill brand over to Wizards of the Coast, the game made the transition there, where it was polished, streamlined, and finally released to shelves, making it one of the "new" Avalon Hill's first entirely original games.

The premise of the game is quite unique. Up to six players cooperate to explore a decidedly haunted house, but the actual haunting doesn't occur until halfway through the game. When it happens, one of the players turns against his teammates, and undoubtedly tries to murder them in one of 50 endgame scenarios!

Players begin their terror-filled night by choosing one of 12 characters, ranging from cute little girls and burly athletes, to psychic detectives and clever scientists. Each character is rated in four attributes: Might, Sanity, Knowledge, and Speed. The attributes come into play as players try to make their way through difficult areas of the house or avoid the nasty events that will inevitably occur.

The house is "built" as players explore it using a tile system. Each tile represents a room, and as the house is explored, players place down these tiles on one of three floors. Over the course of a game, only about half the room tiles are played, giving each game a very different house. Uncovering and exploring a room allow players to draw item cards, face (often deadly) events, or uncover Omens.

The house's Omens all point toward the ultimate haunting, and include such horror stereotypes as crystal balls, skulls, spirit boards, and others. Each time an Omen comes into play, players roll the dice (labeled 0, 1, and 2). If the result comes up less than the number of Omens in play, the haunting occurs.

The haunting is when things get downright dangerous. Players cross-reference the room where the haunting was triggered with the final Omen drawn. This decides which of the 50 endings they'll play, as well as the player that betrays the rest of the group. The traitor and the heroes each get separate texts to read that spells out their goals and victory conditions, so it's often that each side doesn't know exactly what the other is up to. If the explorers win, they walk away from the house alive. If the traitor wins, his former friends will be dead, undead, or perhaps something more sinister.

The quality and scope of the endings varies, though most of them are quite fun. Some are straight-up attack scenarios involving zombies or vampires, others are more involved (and can get quite complex), such as when the house starts collapsing into hell. Still others are a bit goofy; one has the explorers shrink to the size of mice and run from the house's cat! There's a lot of replayability built into the game, given all the combination of endings, house layouts, items, and explorer types. Like any game with multiple scenarios, you'll probably find some that you really like and others that you find anticlimactic or weak. But with 50 to play, you're unlikely to see the same ones over and over again.

The components of the game are quite nice. The six miniatures (each which represents two personalities) are pre-painted and well-detailed, similar in quality to Wizard of the Coast's latest *Dungeons & Dragons* miniatures. The

cards are oversized and use a high-quality stock, though graphically they are a bit plain and aren't individually illustrated. The room tiles themselves are sturdy and painted with evocative images of traditional haunted house motifs, including bloody rooms, conservatories, mad scientist laboratories, and Victorian-style bedrooms.

The game is also packed with almost 300 scenario-specific tokens. Again, these aren't illustrated, and can be quite a hassle during play to use, as you'll have to spend some time digging through them trying to find knowledge tokens, shades, drips, zombies, et cetera. They're not really necessary -- it's rare that a scenario requires more than a few counters -- so you'll probably find yourself just grabbing the nearest token and pretending it's something else to avoid the downtime. It would have been a nice idea to replace many of these with generic monster or item plastic pieces.

While exploring the house is both moody and fun, there's not much in the way of strategy required, especially during the first half of the game. You move your explorer around the mansion, discover rooms, and hope for the decent card draws. While there's not much decision-making here, there's a huge variety of items, events, and rooms for your explorer to find, and tension certainly rises as the Omens are uncovered.

Once the haunting occurs, cooperation and cleverness is often required to win, though it's possible that the house layout will make victory much easier or harder, depending on the endgame scenario. Sometimes, the goal requires items or rooms that haven't come into play yet. It's common to see some explorers running madly about the house opening doors, others trying to fulfill victory conditions, and the traitor stalking everyone with a sharp object! Despite its reliance on card draws and luck, the game's sheer variety and fast-pace keeps it interesting from beginning to end.

Betrayal at House on the Hill is an easy game to teach, and can be taught to new players in under five minutes. Best of all, the game can easily be finished in under an hour, and that includes setup time! ***Betrayal at House on the Hill's*** combination of exploration, item gathering, and cooperation make it an excellent choice for boardgamers, roleplayers, and horror fans alike.

--J.C. Connors

Spawn of Clio's Nightmares

*"Ask me not what I think; the unwilling brain
Feigns often what it would not; and we trust
Imagination with such fantasies
As the tongue dares not fashion into words --
Which have no words, their horror makes them dim
To the mind's eye."
-- Percy Bysshe Shelley, *The Cenci*, II:ii:82-87*

[Every Halloween](#), dark fantasies descend upon the sleep of Clio, the Muse of History, dimming her mind's eye to the true course of events. If the sleep of reason brings forth monsters, the sleep of history brings forth whole destinies -- or dynasties -- of terror. She dares not fashion them into words, perhaps, but they stitch themselves together across the lowering years. She tosses and turns -- if you listen, you can hear her horrified murmurs tonight.

*"So much for Caligula as emperor; we must now tell of his career as monster. . . . His body was conveyed secretly to the gardens of the Lamia, where it was partly consumed on a hastily erected pyre and buried beneath a light covering of turf. Later his sisters, on return from exile, dug it up, cremated it, and consigned it to the tomb. Before this was done, it is well known that the caretakers of the gardens were disturbed by shades, and that in the house where he was laid not one night passed without some terrible apparition . . ."
-- Suetonius, *Lives of the Caesars**

When the Senate staked Julius Caesar at midday on the Ides of March, they thought they had rid Rome of its most sanguinary tyrant. But his grand-nephew Octavian took power and consolidated it in his own talons, yielding only to the greater appetites of his own stepson Tiberius. But even Tiberius' sadism was dwarfed by that of Caligula -- who saw no reason to step down. Ever. The blood flowed freely in the streets, and he drank deep from any and all who dared question his vampiric rule. Even his death -- hacked to pieces in the Forum -- did not end it; strengthened by his earlier gluttony, Caligula came back again and again. His scholarly uncle Claudius could never find the rituals to banish him forever, and although he summoned up the now-divine Julius for aid, he could do nothing against Caligula's newfound powers. Only Claudius' other nephew, Nero, has the appetites and the cruelty to withstand Caligula -- when Claudius is pushed into the final Night, the two will tear Rome to pieces to glut themselves on its spurting blood.

This is a gore-soaked **Imperial Rome-Blood Types** campaign (which can also be a **Vampire** setting, of course) from the most lurid imaginings of Suetonius and Robert Graves. The Julio-Claudians are vampires; it's up to the GM whether other lineages of vampires exist in other provinces (Aegyptus, say, or forbidding Dacia) or if the Caesar gens is unique. (The specific rules of Roman vampirism vary, but should err on the side of returning from Tartarus.) The flavor can be blood-and-brinksmanship politics, as the shadowy Caligula, the weak Claudius, and the savage Nero compete for power -- or it can be all desperate heroism featuring PC gladiators, priests, and patricians trying desperately to cast off the vampiric scourge and restore the Republic. Or the "rats in the vallaes" -- despised Jewish tentmakers, plebeian slaves, and such -- may hold the secret to ending the vampires' power forever, in the symbol of a prophet crucified a few decades ago in the east, and the Cup that purifies All Things . . .

*"What bright babes had Adam and Lilith! --
(Eden bower's in flower.)
Shapes that coiled in the woods and waters,
Glittering sons and radiant daughters."
-- Dante Gabriel Rossetti, "Eden's Bower"*

The painter-poet Dante Gabriel Rossetti, his poet sister Christina, and their writer brother William came of literary lineage. Their mother was the sister of John Polidori, doctor to my Lord Byron and creator (or revealer) of *The Vampyre*, dead by his own hand in 1821. Their father was a scholar of the secret meanings in Dante -- the hidden hints of the *Fideli d'Amore*, a cult of Venusian splendor. Together with John Everett Millais, William Holman Hunt,

Frederic George Stephens, and others, they founded the Pre-Raphaelite Brotherhood in 1848, dedicated to discovering the authentic roots of Western art, before the corrupting influences of the later Renaissance could set in. They believed, with the influential critic John Ruskin (a major supporter), that "the world itself should be read as a system of visual signs." Their paintings glorified the Feminine Principle, the occult Magdalen, the triple goddess -- maiden, whore, and crone. But they were more than an incestuous artistic movement -- they were a coven, a witch-cult, headed by the Rossettis descended from the streghe of southern Italy and (perhaps) tainted with vampiric blood. "Pre-Raphaelite" was a sign -- the *Malleus Maleficarum* was written the year of Raphael's birth. The Brotherhood wished to turn back the clock to the great flowering of medieval witchcraft. Stephens destroyed his art in 1850, but the others continued to hold exhibitions and exalt their Queen of Air and Darkness.

This *Steampunk-Spirits-Wizards* campaign frame can be played as a conspiratorial, secret-history style game set in the early years of the Brotherhood, or later as a "magic returns" game, when the cult assumes Victoria-as-Devouring-Mother (perhaps during the Mutiny of 1857 or the great Indian famines of the next decade) and actively infiltrates the spiritualist and naturalist movements. PCs can be witches themselves, allied to the Pre-Raphaelites or opposed to them -- or art historians, classicists, and literary critics who stumble upon the insane truth. Wild cards can include the Masonic male-magick circle that took up the Blade in 1888, or witchly British intervention in the American Civil War.

"Where are the notes?" I asked. He pointed to the table, and for the hundredth time I picked up the bundle of manuscript entitled 'THE IMPERIAL DYNASTY OF AMERICA.' One by one I studied the well-worn pages, worn only by my own handling, although I knew them all by heart, from the beginning, 'When from Carcosa, the Hyades, Hastur, and Aldebaran . . .'"

-- Robert W. Chambers, "The Repairer of Reputations"

Conspiracy theorists have long posited a secret bloodline connecting the American presidents together, a hidden monarchy that bursts into flower above ground with such families as the Adamses, Harrisons (whose descendants include LBJ), Roosevelts, and Bushes (and the Tafts, Kennedys, Gores, and other "political dynasties"). Some are just under the surface -- Barbara (Pierce) Bush is descended from Franklin Pierce. In fact, of the 43 U.S. presidents, almost 60 percent were cousins or closer; George W. Bush is related to 12 presidents (not even counting his father). It is worse than they think. The bloodline is the bloodline of Hastur, trickled down through the veins of America under the true Great Seal -- that of the Yellow Sign. Washington, D.C., laid out to an occult plan designed by Grand Master Freemason George Washington, is the reflection of Carcosa, the City Under the Black Stars. He Who Shall Not Be Named made a secret pact in 1789, when the first President took his true oath at midnight -- and He stretched out His Presence in 1989 to shiver the fortresses of his scions' enemy.

This can be a secret-history conspiracy game, of course, riffing off *Delta Green* or any other setting linking the U.S. government to the Hastur Mythos. But it might be almost as fun as an almost-secret history; the Lineage can be uncovered by any scholar who tries, and the true nature of international politics is known to think tanks and educated (if neurasthenic) citizens the world over. The toadlike Childer of Tsathoggua burrow into the flesh of Europe's governance, having displaced Yig's Reptoids in the *annus horribilis* of 1789. The Pacific Rim shrinks under the psychic lash of the Iloigor and Ghatanothoa, whose "sky dragon" forms the Chinese and Japanese worshiped as kings. The stars came briefly right in 1789 (an excellent setting for historical Mythos horror); they have begun to realign since 1989, setting the stage for covert war between the servitors of the Great Old Ones -- and for possible liberation by the saving remnant in Africa, where the true Eidolon of Man first walked millions of years ago.

Dork Tower!

Dork Tower!

Spiraling Out of Control . . . And Back In?

This is another one of those columns I had half-written in my head, then the more I thought about it, the more I realized that I was wrong (or, at least, came to a different conclusion than the one I was working toward when I started mulling it over). Coming from the pseudoscientific school of thought, I've since modified my hypothesis.

But I get ahead of myself.

This is our annual Halloween issue, loosely devoted to horror-y goodness. And my original idea was going to center on the idea of a situation spiraling out of control. This is the core of many good horror stories, both of the written and roleplaying kinds. Things seem normal at first, or otherwise controllable. But then, as [complications](#) and revelations stack, the heroes realize they're in over their heads.

The question I was mulling over, however was: What's the fundamental difference between an action story and a horror story that uses the out-of-control scenario?

I realized that a lot of action-adventure movies and books also have that element of events spiraling out of control. And, in both, the heroes may realize they're in trouble, but they believe -- in thought or deed -- that they can still pull a victory out of their hat. The difference, it seemed, was that in an action story the heroes *do* succeed, while in a horror story they realize at some point that they can't succeed.

Really, it doesn't take much thought to turn the events of a season of the *24* television show into a horror story (it starts out with a nightmare premise, after all). And the movie *12 Monkeys* walks this cusp of action or horror right until almost the last minute.

However, while I could probably draw some conclusions about movies (and, perhaps, one-shot adventure campaigns), I realized their lessons weren't necessarily applicable to a horror campaign. And that's when I mentally started to rewrite my column.

Because, I realized, perhaps the biggest difference in what an action gaming series versus a horror gaming series would be trying to simulate is its time scale. Action-packed gaming series are, almost by definition, fast-paced. Events usually happen quickly. Even long uninteresting travel sequence disappears in a fade-by, ala the Indiana Jones movies with their red lines on maps.

This is important because, in an action series, the time any particular emotion can be clung to is fairly brief.

A horror series, on the other hand, is usually more about pacing -- usually slow, but sometimes fast enough to keep the players off-balance. Long segments may be spent in otherwise not terribly interesting circumstances, because they're building a mood,

In all, horror games have a long time to mull over all manner of emotions.

Once I realized this, I posited to myself that -- in many cases -- the emotions evoked by events in either type of campaign are the same, but the time scale is vastly different.

As things spiral out of control in the action campaign, the heroes have that momentary realization of, "Wow! We're in deep pooh!" And then, after that inspirational flash sinks in, the heroes are expected to dart off to save the world.

In a horror campaign, however, the heroes can dwell on that realization of, "Wow! We're in deep pooh!" *much* longer.

Thus in an action campaign, if the heroes -- either through action, inaction, or because they were tricked -- accidentally release Rexthulhu the Elder Dog, there is going to be that moment of, "Oh, no! What have we done?!" Followed by a call to action, a hastily assembled plan, and a chance to put things right.

In a horror campaign, the heroes might see Rexthulhu pad off into the sky, the screams of the innocent echoing into their ears into the night. They'll have that momentary expression of, "Oh, no! What have we done?!?" And then they may not have an immediate plan or course of action. In fact, it's quite common in horror stories for the heroes to mope around, worrying about the implications of the evil they discovered/unleashed/inspired/temporarily dissuaded.

Thus I realized that, if I wanted to run a horror campaign, there's no reason I couldn't run, say, the first half-dozen or so adventures *exactly* like an action-adventure campaign. The heroes find themselves in difficult situations, but through perseverance and determination they can overcome the odds and (more or less) save the day. But then there would be that adventure where everything falls apart -- where the curtain is pulled back, and the heroes realize things have spiraled out of control.

Only, while their action-adventure counterparts might be able to wrest the reins away from a dark fate and reclaim their destinies, in a horror campaign there are no such immediately gratifying options.

In the real world, there's a saying: "Fast, cheap, or good: You can have two out of three." While in action-adventure games it's usually possible to squeak out all three, in horror two out of three is a best-case scenario. And, when things spiral out of control in a horror game, "fast" is usually the first casualty.

--*Steven Marsh*

We Have Met The Enemy . . .

A Nationwide Zombie Apocalypse Deadworld for *All Flesh Must Be Eaten*

by J. Edward Tremlett

No one knows what has caused The Outbreak, which is what the American government in exile has delicately called the viral, hostile takeover of the USA.

All the newly-appointed Press Secretary can say for certain is that, one short month ago, in the heat of Summer, the heartland of the country was literally overrun by Enemy Combatants. They moved swiftly and ferociously, as if turned manic by some new drug. And they tore anyone they got their hands on to pieces, ignoring bullets and tear gas as they swarmed over the police and National Guard.

Countermeasures have been taken. The National Guard has been fully mobilized, and the surviving population has been moved into barricaded Relocation Centers. However, the government admits that the Enemy Combatants -- newspeak for "The Undead" -- may still be spreading too fast to contain.

And no one wants to speculate on what the next step might be . . .

Present History

The Enemy was first seen in Russell, Kansas. They decimated the city within hours, charging past all attempts to stop them, killing as they went. After that they spread outward: running at phenomenal speeds along the roads and fields, tearing into whatever towns and cities they came across. They stopped only to pull their victims apart.

At first, Washington wasn't sure what it was dealing with. The best hypothesis was that a terrorist cell put a bioagent in the drinking water, but nothing on file could account for this. What could make men, women and children behave like monsters? How could they run that fast? And why were previously-fleeing civilians defecting to join the Enemy?

There were no real answers until the Center for Disease Control's Special Pathogen Branch confirmed that it was some kind of contagion. Studies showed that anyone who was bitten or roughly handled by the Enemy quickly BECAME the Enemy. Victims developed a horrible fever within minutes, started dehydrating, and soon behaved -- and moved -- just like their infectors.

The CDC promised more information, following further tests, but their forward outpost was overrun shortly thereafter.

When it became clear that Kansas, Nebraska and the edges of the neighboring states were near-complete losses, the President acted. He declared martial law, and enacted harsh measures: proclaiming the seven states that bordered Kansas and Nebraska "as good as lost," and ordering the evacuation of everyone in the 14 states bordering them. He also called for the erection of armed barricades along the East and West coasts, preparing for complete containment of the uninfected population.

It was a huge and risky plan, but the government was certain they could do it with enough manpower. The problem was that most of that manpower was overseas, fighting the War on Terror. The Marines, Army and National Guard available were just too small for the amount of muscle needed, and it would take far too long to recall the necessary troops.

Instead, the President relied on the Federal Emergency Management Agency, who'd been waiting for such an emergency since the 1980s. Within hours, FEMA took direct control of the remaining National Guard, and deputized the largest of the right-wing militia groups (whom they'd been secretly funding all along).

With those two forces they got the barricades started, and began to evacuate the population of the 14 "buffer" states. They also activated the "Emergency Internment Centers" they'd made to house dissidents and troublemakers in the event of martial law. These would be used as temporary quarters and clearing houses for the evacuees, until such time as the crisis was overcome, or the barricades were ready.

Thanks to the closeness of the Western Centers, the bordering states on the West side were depopulated on schedule. Civilians were herded by gun-wielding survivalists from Montana, shoved into waiting National Guard transports and sent off to safety. The militias were then given extra weapons, armor and ammunition, and ordered to remain behind and hold the line until further notice.

The handling wasn't as smooth out East. The National Guard weren't keen to work with Southern "Patriot" groups sporting Klan regalia and Confederate flags. And there was the added complication of there being only a few Internment Centers on the East side of the country to send the evacuees to.

Between the tactical errors, miscommunication and internal hostilities, FEMA lost valuable time. The Enemy used this opportunity for all it was worth, surging past the Eastern "line" without a fight. The survivors of the debacle were ordered to hold their ground, but this proved impossible. Instead, they left the refugees in the Centers to their own panicked devices, and retreated one state at a time.

The Enemy charged due East, absorbing every town, city and Center on the way to Washington DC. They arrived to find the square mile surrounding the nation's Capitol barricaded by as many Marines as the government could call up. They'd torn down the tenements, dynamited the subways, mined every road and put men and armor on every approach they could think of. And as much air power as could be spared was circling overhead, waiting for the order to fire.

By all rights, the city should have held, especially with all the missiles dropped onto the surging masses that attacked. But somehow the Enemy got inside in less than a day, forcing the President and his surviving Cabinet to flee. With them went the vital air power the National Guard needed to finish the middle of the Eastern barricade, and what was supposed to be one long refugee camp was split into two smaller camps.

The heads of state relocated to the Marine base at Guantanamo Bay, telling the National Guard to hold the barricades against the Enemy at all costs. That was the last direct order they gave the Guardsmen, and there's been no word of reinforcements. In fact, there's really been no word at all.

The American government in exile says this is just temporary, really. They appeal for worldwide calm, and say that the situation is expected to "stabilize" soon. But while they speak of "high confidence" in their emergency measures to the international media, they seem unable to control the disaster.

And they cannot answer the really tough questions -- especially "What now?"

The State of Things Today

As of now, America is a divided fortress with its guns pointed inward. The entire center of the USA has been written off as "compromised." The massive evacuations have forced the "uncompromised" population -- between 30 and 25 percent -- behind state-spanning barricades on either coast. Food, shelter, and medical supplies are holding behind the three barricades, for now, but the defenders are quite aware of how fast they're dwindling.

The National Guard has been given authority over the barricades, which are under martial law. They have been ordered to shoot, kill, and burn any possible Enemy Combatants who approach the largely-makeshift barriers. They have also been ordered to keep the refugees inside those barriers until the all-clear is given -- a task that gets more difficult as supplies get lower.

The North-Eastern barricade starts at Portland, Maine, and then zig-zags its way down to where the Delaware River splits Pennsylvania from New Jersey, terminating at Cape May. The Florida relocation center is hidden behind a wall that goes from Tampa over to Orlando, and then through Titusville.

Both of the Eastern barricades have weathered terrible attacks, and are constantly fending off new offensives. Almost all their air power evaporated when the government fled Washington D.C., which means that they have to shoot it out with the Enemy on the ground. After a bad fight, the area before the barricades is almost soaked with corpses, and they have to burn them where they lay for fear of stepping into the mess.

Conversely, the much larger Western barricade -- which stretches from Seattle down to Los Angeles -- hasn't suffered as many attacks compared to the ones out East. It seems that the more efficient evacuation deprived the Enemy of fresh "converts," and has slowed them down. They also retain most of their air power, so they can blast oncoming masses down to size well before they reach the walls.

Canada and Mexico have reacted independently of America, using their militaries to close their borders. They have burned down forests, dammed rivers and collapsed cavern entrances to deny anyone a chance to slip past them. Helicopter gunships constantly patrol the air, firing on anything that moves over land, and a line of armor waits beyond that, able to fire accurate shells at anything that gets past the air support.

The majority of the Enemy are located on the Western and Eastern halves of the country, milling just outside the gunships' reach and turning new members with each fresh kill. They charge toward the barriers when they're too hungry to hold themselves back, anymore, and fall back when they lose too many.

In spite of all precautions, the Enemy keeps getting inside the barriers. Every time there's an attack, the infection spreads, leading to panic and deadly stampedes as people turn into zombies. The commanders are convinced that sympathizers are letting the Enemy in, or are deliberately infecting themselves. But nothing they've done has stopped this from happening.

Story Starters

Escape to Safety

Anyone still alive inside the Q-zone -- as the massive Quarantine Zone is called -- is trapped in a nightmare. The Undead are extremely swift, and seem somewhat intelligent, which makes even the slightest mistake in dealing with them a fatal one. They are also clearly capable of hearing a normal conversation from some distance away, and anything louder than a whisper brings them running within a minute: just firing up a car is a near-guarantee of being swarmed.

The Q-Zone is completely dead to the world. Power and phone lines are offline, as are the cellular towers. Local radio and television stations are likewise inoperable. Survivors can always try to get a generator going for their satellite TV, or get satellite radio going in their car, but the Enemy will swarm the location in minutes.

As such, the zone is also an informational cul-de-sac, with rumors taking the place of real news amongst the few survivors. However, those folks who've been lucky enough to get their hands on a working, battery-operated CB-radio have been told that the East and West sides of the country are refugee camps. They say that if you can make it through the zombies surrounding the camps, you'll be home free.

Of course, that's a pretty big if . . .

Prisoners of the Dead

During the 1980s, FEMA built a number of highly-secure prisons for "troublemakers" in the event of martial law being declared. When the Outbreak occurred, the prisons made excellent clearing houses for evacuees. They used them to reunite families, group people together and send them on to the barricades for housing.

However, even in the face of disaster, FEMA was still FEMA. While they had everyone under their thumb, they used the excuse to find a number of those "troublemakers" and detain them, just because they could. And once the good,

respectable citizens had all been shuttled to the barricades, FEMA left their prisoners behind to rot.

The prisons are highly secure, and have enough food and water to last the prisoners for years, provided they can get out of their cells. But they have no weapons: the Guard took them all on their way out. And sooner or later the Enemy is going to head their way.

Can they hold out against masses of crafty undead with nothing more than what they can scrounge . . . ?

The Last Detail

The various armies of Western Patriots were proud to have been asked to defend their country. They swooped into the evacuation zones, got the civies out and set up the initial borders alongside the National Guard. The Guard pulled out shortly thereafter, giving the people's militias beaucoup supplies, along with two final orders: Hold the line, and shoot whatever came at them from the wrong direction.

But it's been weeks since then, and the promised relief has yet to come. Ammunition is running low, morale is terrible and the Enemy just keeps coming at them, day after day after day. It seems like each new shortwave radio message brings news of another group being overrun, and people are talking about dropping and running back to the compound up north, or maybe even the barricades.

It's only a matter of time before either the ammo or their nerve runs out, and they have to make a run for it. Who will be the first to say "screw this" and head for the hills? And what will they find when they get there . . . ?

Border Patrol

Contrary to what people inside the Q-Zone have been told, there's nothing waiting for them at the barricades but missiles, machine guns, and flamethrowers, in that order. The National Guard has been tasked to keep the Enemy out and the uncontaminated in, and that's just what they're doing.

Civilians who approach the barricades are to be treated as the Enemy, just in case they're unwittingly carrying the disease. It's not the most pleasant of duties, firing on your own countrymen, but orders are orders. It's only slightly less pleasant to tell the people on the inside that they can't go out and forage for food and water in nearby towns, just in case they bring back the disease.

And it's even less pleasant to have to deal with the political organizing going on in the only way they're entitled to during martial law: pepper gas and rubber bullets. Any "agitators" are rounded up and detained just in case they're responsible for the outbreaks inside the barricades. But even with the brigs full of would-be Thomas Jeffersons, the Enemy is still getting through.

No word on what to do next has come. Until further notice, it's guns on the horizon and gas masks on your face 24/7. But sooner or later they're going to be too slow catching the infiltrators, or run out of bullets in the middle of a firefight. And then it's all going to be over . . .

Panic, Anger and Fear

For those civilians cooped up inside the barricades, life is pretty rough. There's hardly enough food to go around, even with everyone fishing along the coastline. The medical supplies are also running out, living conditions are getting so filthy that Cholera and other hygiene-related diseases are making the rounds, and anyone who dies is taken away by the Guard and burned on a pyre outside the walls, "just in case."

The barricades aren't working, either -- not completely. Every time the Enemy makes a banzai charge, the infection gets inside. People have tried telling the Guards that it's not traitors or inside men doing it, but the idiots won't listen. Lucky for them, they've got gas masks, but the civies aren't even allowed *that*.

It would be tolerable if everyone was on the same team, but the ethnic barriers are starting to go back up again. Especially out East, where the "Patriot" groups that FEMA activated are taking full advantage of the situation. They're peddling their antiquated, racist ideas on rebuilding America, and anyone who speaks out against them is called an "agitator" and taken off to prison. The Guard isn't siding with them, but they're not shutting them up, either.

The situation is a powder keg, waiting to blow. And then what?

Intelligence Gathering

Satellite surveillance has revealed that the vast majority of the Enemy are at the borders, having stripped the interior mostly clean. This means that the way is clear for the Center for Disease Control and USAMRIID to send small teams of experts into the Q-Zone. They are being backed up by the Marines, who have orders to secure all information and get back to Guantanamo at all costs.

The primary target of all intelligence gathering is the Center for Disease Control's forward observation unit in Des Moines, Iowa. The Special Pathogen Branch were the ones who figured out that it was a contagion, and promised further reports. They may have reached a breakthrough before it all came down around them, but even if they didn't, their notes are still invaluable.

The secondary target is the Menninger Clinic of Topeka, Kansas: a hospital primarily known for its amazing research into psychiatric problems. One of its celebrity out-patients -- Dr. Margaret Folder, a nobel-prize winning microbiologist -- had holed up in the Clinic as the Enemy was approaching. She was apparently making some serious headway into understanding the nature of what America was facing, but then the city was lost, and with it all contact with the Clinic.

Third, there is the center of the outbreak, itself: Russell, Kansas. Everything happened so fast that there was no time to ask what may have caused the disaster, but there may still be clues left in town. There is no strategic or military value to the town itself, and intelligence can find no reason why it might have started there. But hopefully that will all be cleared up once they get on the ground.

The Final Solution

There's a reason why reinforcements haven't been forthcoming. The President could have ordered the Navy back to both coasts, and used its air power to supplement the takeback of America, but he won't. Instead, he's keeping the battleships and carriers well clear in case they need to play the last card: nuclear weapons.

The current plan is to see if the barricades can hold long enough for the contagion to burn itself out. However, if the Enemy should be able to overrun one or more of the Camps, then the birds will be launched. "A few" nuclear weapons launched from a waiting submarine should be enough to devastate the Enemy without completely irradiating the heartland, and they can pinpoint the areas of largest saturation by satellite and target accordingly.

It's not a decision that's been made lightly or frivolously. Everyone involved in this is aware that America's heartland will be irradiated for at least a generation, and may never fully recover. But they are also aware that it's only a matter of time before the Enemy swarms over the Mexican or Canadian border, and then . . . who knows?

With that in mind, Marine forward observation units are being sent in to see if there isn't some other solution to the problem. What battle tactics are they using, and can these be turned against them? Do the Enemy have any other weaknesses that can be exploited? Can they be destroyed in large numbers any other way?

It's a suicide mission, either way you go, but the consequences of finding nothing are too terrible to contemplate.

The Enemy

STR 4
DEX 3
CON 2
INT 0
PER 7
WIL 2

DPs: 26

EPs: N/A

Spd: 18

Essence: 6

Weak Spot: Chemicals (Sodium Chloride) -- 8

Getting Around: The Quick Dead + 10

Strength: Strong Like Bull +5

Senses: Like Nothing You've Ever Seen +10

Sustenance: All Flesh Must Be Eaten 0; Occasionally +2

Intelligence: Animal Cunning +2; Teamwork +4

Spreading the Love: One Bite and You're Hooked +2

Special: Spores + 3

Power: 30

The Enemy appear to be desiccated cadavers, with glassy eyes and taut, flaking skin. Their eyes burn with a vicious hunger, and their muscles crack and pop as they run wildly toward their victims.

They are driven onward by the extreme need to feed. While they can go a few days without eating, the ravages of the contagion are painful, and devouring fresh flesh -- even a single morsel of it -- is a blessed respite. The creatures will swarm all over a building or vehicle if they think there's someone inside it, but can be lured away en masse by the promise of easier meat.

They are painfully aware of their greatest weakness: sodium chloride, otherwise known as table salt. It acts like acid on their skin, and if they are completely immersed in a cloud of it -- or pushed into saltwater -- they'll melt to the bone in seconds. They're intelligent enough to avoid it, which is why no one's figured this out yet.

Past that, they can be affected by normal weaponry, and feel pain when struck. And they are as susceptible to fire as any uninfected persons, especially if they continue to run as fast as they normally do once they are alight. Oddly enough, the Enemy doesn't seem to fear the fire. In fact, they seem to dance gleefully in the flames, moaning in ecstasy as they burn to a crisp and fall down.

And that's because . . .

Spores: . . . another thing no one knows about the Enemy is that fire *doesn't* completely neutralize them. In fact, the Enemy remains highly dangerous after being burned to bones and powder. Anyone who gets those ashes inside their lungs suffers the same fate as those who were bitten by them, thanks to the microbial spores that infest their dead flesh.

This is how the Enemy got into Washington D.C.: Anytime a group of the Enemy were blown up by missiles, or shot down and then burned, the ashes were inhaled by hapless soldiers. This is also why infections break out in the Camps, since the National Guard insists on burning anyone they shoot.

And if the President uses nuclear weapons against the Enemy, and the wind shifts the wrong way . . .

Doctor Dark and Miss Conduct

For *GURPS Third Edition* and *Champions*

by James L. Cambias

Doctor Dark and Miss Conduct are a pair of villains for a *GURPS Supers* or *Champions* campaign. They are fairly low-powered menaces, particularly suitable as adversaries for starting heroes or as plot elements in a larger adventure.

History

Doctor Dark has been a supervillain since 1957. He really *is* a medical doctor, originally named Alfred Deakins. As a young man just out of medical school he was involved in a British government project to study and control a mysterious phenomenon called "dark energy." However, Deakins was seduced by a beautiful Russian agent who persuaded him to steal a sample of dark energy. Deakins got the sample but was surprised by a guard. In his struggle to get away, the containment unit was breached and Dr. Deakins was bathed in dark energy.

The accident left Deakins able to control darkness and become a shadow, but his skin lost the ability to generate pigments. With his scientific career in ruins, Alfred Deakins took on the identity of Doctor Dark and began a reign of terror as a supervillain.

Well, sort of. It was more of a reign of annoyance, since Doctor Dark isn't a particularly evil man. He likes to think of himself as a master villain, but most of his crimes have been fairly ordinary: robbery, kidnapping for ransom, and occasional dabbings in extortion. He was a fixture in "Swinging London" society in the 1960s, when it was hip for rock stars and aristocrats to go slumming with supervillains.

Dark's greatest exploit was in 1975, during the height of the Arab oil embargo, when he threatened to shut down an experimental solar power plant in New Mexico unless the owners paid him a million dollars in cash. Dark managed to defeat a group of solar-powered heroes and for a brief time enjoyed the status of a major-league villain.

After that, Dark's career path was all downhill. Age was beginning to catch up with him, and his scientific skills were becoming increasingly out of date in the computer age. By the 1990s Doctor Dark was reduced to petty theft, living in a run-down trailer parked over the entrance to his old secret underground laboratory.

Miss Conduct, alias Karen Morris, was a teenager with a history of minor legal scrapes. She shoplifted a few CDs, snuck into the movies, vandalized her school, and violated all the laws governing underage drinking. A year ago, when she was 15 years old, Karen and some friends decided to end a night spent dancing at a rave by toasting the sunrise from atop a high-voltage electrical transmission tower. Drunk, stoned, and half-asleep, Karen lost her balance and fell onto a cable carrying 250 megawatts of electricity. Instead of dying, she discovered an ability to absorb and control the power.

Karen immediately decided to leave her boring hometown and her totally dysfunctional family and become a glamorous international supervillain. She realized that she would need the help of a more experienced master criminal, and eventually found her way to Doctor Dark. The aging Doctor couldn't resist the prospect of actually having an attractive young sidekick, and agreed to take her on as a supervillain in training.

Personalities and Motivations

Neither Doctor Dark nor Miss Conduct are particularly evil, but they both like to act as though they are, and at present the two of them are egging each other on to commit more serious crimes than either really would dare attempt alone.

Doctor Dark is a has-been (or never-was) master villain, given to long gloating rants and secret underground laboratories, but in point of fact his primary goals are nothing more ambitious than securing a comfortable retirement income and looking at pretty girls. He is a classic "dirty old man," with a tendency to let his hands wander. Miss Conduct feeds his vanity -- he's never had a super-powered minion before, and the fact that she's an attractive teenage girl makes him desperate to impress her.

Meanwhile, Miss Conduct is still a very naïve youngster, who thinks it would be cool to be a supervillain and hasn't really thought about it much more than that. The money is good and she doesn't have to go to school any more or keep a job. She's impressed by Doctor Dark's supervillain credentials -- he's actually got an underground laboratory! -- and hopes he can get her into the big time. The way he looks down her shirt and tries to feel her butt aren't very different from the way her stepfather used to act, so for now she puts up with him; if he ever gets too grabby she'll fry his fingers.

Their criminal schemes are chiefly robberies. Doctor Dark hates having to pay a commission to fences or money laundries, so they tend to hit places with a lot of untraceable cash on hand -- casinos, armored cars, racetrack betting windows, and branch banks.

Their tactics are straightforward and usually effective: Miss Conduct uses her flashy electric attacks to get everyone's attention and intimidate them while a couple of normal goons do the looting. Doctor Dark usually stays hidden in shadow form in case of trouble -- his shadows can attack unarmed foes, and his darkness field can make it impossible for armed opponents to see what they're shooting at. However, Miss Conduct has a weakness for attention-getting stunts and Doctor Dark sometimes indulges in master-villain style rants which delay their getaway.

If robbery gets boring, Doctor Dark does have the weird science knowledge to attempt some kind of superweapon extortion plot, probably involving "darkness projectors" or something similar. He would never go to all that risk and expense himself, but if he thinks it might impress his partner in crime, he'll risk it.

Both villains can have personal links to superhero player-characters. Doctor Dark's long career means he could be an old enemy of one PC. He doesn't hold grudges or seek revenge, but he *would* be furious if an old adversary doesn't remember him. Miss Conduct could be a friend of a teenage hero, a relative of an older one, or even the wayward child of a player-character (if there's any possibility of that, she'll claim the relationship even if it isn't true). A personal connection could mean the heroes wind up trying to stop the two villains *without* landing them in jail.

Adventure Seeds

First Blood

Miss Conduct has talked Doctor Dark into showing her how to take on superheroes. He arranges a confrontation with the player characters. Dark plants a series of clues which will lead the heroes to a well-lit electric switching substation at midnight. There will be plenty of shadows and lots of electricity for the villains to use, and their goal is only to ambush the heroes and knock them unconscious or make them withdraw. If the fight goes against the villains, Dark has a getaway plan in place. This mysterious and seemingly pointless ambush can be a red herring in the middle of another adventure, or may drive investigation-minded heroes crazy trying to deduce the motive.

Out of their League

Miss Conduct and Doctor Dark have stolen something they really should have left alone: an ancient mystical artifact of tremendous power. Now a couple of different occult supervillains are trying to get it, as is the fanatical cult which worships the item. The twosome can't use the device themselves, and are rather afraid of the really nasty villains seeking it, but their pride won't let them just hand it back to the authorities. Instead, Doctor Dark has come up with a plan to leave taunting clues for the heroes which will lead them to the device. Unfortunately, some of the other villains have stumbled across the clues.

Moonlighting

Doctor Dark is too egotistical to work for another supervillain, but Miss Conduct might be tempted to act as a minion for a cooler (and better looking) master criminal, possibly an old adversary of the PCs. Jealousy might motivate Dark to attempt some truly impressive stunt in order to humiliate his rival, or might lead him to help the heroes.

Our Gang

Following a string of successful robberies, Miss Conduct and Doctor Dark have attracted a small group of additional supervillain wannabes. Some of them have low-powered super abilities, others just have a costume and an attitude. But now the group can actually tackle some serious crimes, and maybe the two leaders are finally going to make it into the big time. Can the heroes stop them from becoming role models for supercrooks?

The Final Dark

Doctor Dark's health can't stand the strain of his recent return to active villain status. He is dying, and Miss Conduct knows it. She approaches the superheroes with an odd request: She wants them to agree to be defeated by Doctor Dark so he can die a happy supervillain. Will they help her? Or is this some weird plot cooked up by the two villains to play on the sympathies of the heroes?

GURPS Stats

Miss Conduct

300 points

A cute but tough-looking 16-year-old, with short hair dyed blue. Her costume is a blue spandex bodysuit topped with a bulletproof vest, all decorated with lightning bolts.

ST 10, **DX** 14 [45], **IQ** 12 [20], **HT** 10; Move 6.
Dodge 7, Brawling Parry 11, Lightning Parry 8

Advantages: Attractive appearance [5], Combat Reflexes [15], Daredevil [15]

Disadvantages: Compulsive Carousing [-5], Enemy (authorities) [-10], Extravagance [-10], Impulsiveness [-10], Overconfidence [-10], Selfish [-5], Youth (2 years underage) [-4].

Quirks: Brags about her crimes on her Web log, Hates water, Likes being "bad," Night person [-4].

Super Powers and Advantages: Absorption 5 levels (electricity, only to 5 levels Lightning: -20%) [40]; Dampen 4 levels [12]; Lightning 12d (with Hotshot +30%, Instantaneous +20%, Only near power source -20%) [101]; Surge 4 levels [16]; Gadget: Bulletproof vest (PD2, DR10 vs. crushing; activate 13 or less, breakable, can be stolen, -30%) [49].

Skills: Brawling (P/E) DX+1 [2]-15, Carousing (P/A) HT [2]-10, Computer Hacking/TL8 (M/VH) IQ-1 [4]-11, Computer Operation/TL8 (M/E) IQ+2 [4]-14, Dampen (M/VH) IQ [8]-12, Lightning (P/VH) DX [8]-14, Physics/TL8 (M/H) IQ-2 [1]-10, Stealth (P/A) DX [2]-14, Streetwise (M/A) IQ-1 [1]-11, Surge (M/VH) IQ [8]-12.

Variations

To make Miss Conduct less powerful (more of a match for sidekick characters), reduce her superpower skill levels and her Dexterity attribute, and possibly remove her Combat Reflexes. That way she still has formidable powers, but is much less experienced at using them.

To increase her power level, boost her Dexterity, give her Enhanced Dodge (or a couple of DCV skill levels), change her off-the-shelf bulletproof vest to a full-body suit with no Activate roll limitation, and improve her skill levels. A more mature Miss Conduct could also either buy off her Overconfidence and Impulsiveness disadvantages, or replace them with Greed or possibly On The Edge.

Doctor Dark

300 points

An aging albino Englishman with bad teeth, dressed in a worn but well-kept black tail coat, round black sunglasses, a big black hooded cape, and black rubber gloves.

ST 10, *DX* 10, *IQ* 14 [45], *HT* 9 [-10]; Move 4.

Advantages: Combat Reflexes [15].

Disadvantages: Albinism [-10], Hard of Hearing [-10], Lecherousness [-15], Miser [-10], Odious Personal Habit (collects schoolgirl pornography) [-5], Unattractive [-5], Weak Immune System [-30].

Quirks: Likes to ogle women, Never removes gloves, Vain, Thinks he's a Master Villain [-4]

Super Powers and Advantages: Animate Shadow 4 levels [20]; Create Darkness 10 levels [30]; Dark Energy Beam 4d (bought as Frost Jet) [24]; Dark Vision [25]; Drain Super Ability 10 levels (2 hex radius +20%, only vs. light-based powers -30%[72]; Shadow Form [50].

Skills: Animate Shadow (M/VH) IQ+2 [16]-16, Brawling (P/E) DX+1 [4]-12, Chemistry/TL7 (M/H) IQ [4]-14, Cloak (P/A) DX+2 [8]-12, Create Darkness (M/VH) IQ+2 [16]-16, Dark Energy Beam (P/VH) DX+2 [16]-12, Drain Super Ability (M/VH) IQ+2 [16]-16, Driving/TL7 (Automobiles) (P/A) DX [2]-10, Electronics Operation/TL7 (Sensors) (M/A) IQ [2]-14, Guns/TL7 (P/E) DX+2 [1]-12*, Hypnotism (M/H) IQ [4]-14, Leadership (M/A) IQ [2]-14, Literature (M/H) IQ-2 [1]-12, Physician/TL7 (M/H) IQ [4]-14, Pilot/TL7 (Helicopter) (P/A) DX [2]-10, Research (M/A) IQ [2]-14, Savoir-Faire (M/E) IQ [1]-14, Science! (M/VH) IQ-2 [2]-12, Stealth (P/A) DX+2 [8]-12, Streetwise (M/A) IQ [2]-14, Weird Science (M/VH) IQ-1 [4]-13. *Includes bonus from IQ. Languages: English (native), Latin (M/A) IQ-1 [1]-13.

To make Doctor Dark into the master villain he thinks he is, give him a few levels of Charisma (or increased Presence) to offset his looks, improve his Dexterity, and give him enough Wealth to hire some competent underlings. In his prime he had a gang of henchmen known as the Shadow Ministry; they were normal humans and relied on brawling and melee weapons rather than firearms.

Summoned Shadows

Dr. Dark's summoned shadows are 0-point normal beings with the Shadow Form power (see above) Always On, costing 24 points and two other abilities:

- 45 Shadow Attack: 3d6 Energy Blast, Affects Physical World (+2), 0 END (+1/2), No Normal Defense (defense is any means of generating light, +1) (67 Active Points); No Range (-1/2).
- 6 Flight 4" (8 Active Points); Only in Contact with a Surface (-1/4).

The Omniscient Eye

Can I Live on a Gas Giant's Moon?

In a now famous movie, the good guys' main base is on a moon of a gas giant. How would a habitable world's environment be affected by orbiting a gas giant? In one of my campaigns, I have a habitable world that orbits a small gas giant that orbits a large gas giant (yes, I know it is highly unlikely, but this is a game). How would that affect its environment?

--H. B. Seba

In the admittedly biased view of human or human-like life, any habitable world will share certain features; a surface temperature that allows for liquid water on or near the surface, gravity sufficient to hold an atmosphere, low levels of radiation, and an atmosphere that has suitable pressure and composition . . . and that's ignoring several factors that might make the star system unsuitable. (Fortunately there are lots of star systems, so we can pick and choose).

The temperature of a world is primarily dependent upon its distance from the local star; as in real estate, location is everything. The habitable zone is the area of a star system where a planetary surface is, Goldilocks style, neither too hot, nor too cold. A world with an atmosphere can possess environmental mechanisms that can regulate extremes of temperature. The effects of such mechanisms means defining the limits of the zone is tricky, but for a star like ours, the region between 0.95 and 1.15 AU from the Sun is believed to lie within this zone over a significant period of the star's life.

In our own system the innermost gas giant is Jupiter, orbiting at 5.2 AU from the sun. The search for extrasolar planets has, however, found gas giants with a wide range of orbits, so it is not unreasonable that our moon may orbit a gas giant within the habitable zone. Furthermore, gas giants themselves radiate energy; this may be sufficient to extend the outer limit of the zone somewhat for an orbiting moon.

A habitable world will also need to have a high enough gravity to hold an atmosphere; exactly how high will depend upon the temperature, but it is likely to be high enough to be comfortable for humans. Gravity is proportional to the density and radius of the world. Rocky worlds typically seem to have densities between three and six times that of water depending on composition; therefore for any specific gravity, the radius of a world can vary by a factor of two; either small and dense, or large and light. The local gravity, in Gs, is given by the density (in kilos per cubic meter) multiplied by the radius (in meters) multiplied by 2.75×10^{-9} (approximate value of the gravitational constant of the universe expressed in Gs and multiplied by $4\pi/3$).

The other major factor for habitation that we have identified is radiation. On Earth the surface is protected from radiation in two ways: by the atmosphere and the Earth's magnetic field. The atmosphere absorbs ultraviolet radiation in the ozone layer; if our gas giant moon has a thick enough oxygen atmosphere it may also block UV this way, otherwise any inhabitants will have to be mindful to wear their sunscreen. Charged particles are deflected by the Earth's magnetic field, impacting the atmosphere near the poles as aurora. While it is possible that the moon of a gas giant would have its own magnetic field, this would be insignificant compared to the field of the gas giant (were Jupiter's magnetosphere visible, it would appear from Earth the same size as the moon!). This field may deflect particles away from the moon or towards it; in which case auroral displays would be visible across the world. This radiation flux increases the closer a moon is to the planet. In the inner orbits this can result in an atmosphere being stripped away as the radiation adds energy and reduces molecules to ionized atoms; the faster, lighter ions more likely to exceed escape velocity. While there are simple organisms that have a high tolerance to radiation, such an environment is not something humans consider habitable without the addition of considerable shielding.

Orbiting a gas giant is not in itself enough to make a world uninhabitable. It will, however, have considerable effect

upon the environment of such a world. The moon will almost certainly be tide-locked, with one side facing the planet at all times. As it orbits the gas giant the moon will experience days as it rotates with respect to the star; this may result in a local day being considerably longer than on Earth. The side of the moon away from the gas giant will experience fairly typical days and nights defined by the presence of the sun in the sky. On the side of the moon facing the gas giant, it will be a dominant element of the sky; at "night" the reflected light of the gas giant will illuminate the landscape, while part of the "day" may be reduced to darkness as the sun is eclipsed. Being tide-locked will also result in reduced tides in any bodies of water on the moon with what tidal effects that do occur being caused by the sun and any other moons that orbit the planet.

A moon would not experience seasons in the way a planet does. On Earth the seasons are a result of varying energy input from the sun caused by the angle of the incoming light. During summer the light hits at a high angle, concentrating it, while in winter it hits at a lower angle and is thus spread over greater area. This variation in angle of incident is caused because the Earth's axis is tilted with respect to the plane of its orbit. Unlike the Earth, however, the moon of a gas giant does not orbit a sun, but instead a planet that is orbiting a sun. The angle of incoming sunlight is therefore dependent upon the angle of the plane of orbit. The world will experience seasonal effects as the gas giant orbits the sun and as the angle of orbit changes. Depending on the relative time-scales of these events the world might experience extreme and mild seasons on a regular pattern as the effects add or subtract from each other.

Tidal effects on a habitable moon will vary from those experienced on a planet. As a tide-locked body the moon will not experience tides in the way Earth does. If the world possesses large enough a body of water to have a global sea level this will vary from the sphere due to tidal effects (being higher facing and opposing the gas giant, and lower perpendicular to that), but would only have the local variation that we experience due to the effect of the sun and any other moons.

The planet's gravity will, however, have some effect in the form of tidal stress, an input of energy caused by differential force across the moon. In our own solar system this effect is greatest upon the Jovian moon, Io. Due to Io's close orbit to Jupiter large amounts of energy are imparted, resulting in dramatic levels of volcanic activity. Even on a world at a greater orbital distance this tidal energy could result in volcanism and moon-quakes.

The influx of tidal energy is also what keeps oceans liquid under the ice crust of Europa, Callisto, and possibly Ganymede. Worlds like this are not habitable by humans in their natural state, having only tenuous atmospheres and low surface temperatures; however, there are a couple of possibilities worthy of mention. The first is that such worlds would be suitable real estate for colonies, either on the surface or within the ice (possibly even breaking through to the ocean below). These such colonies would require an artificially sustained environment; however, oxygen for an atmosphere can be obtained from water ice, and burying a colony provides both temperature insulation and protection from radiation. Such a colony would be better protected from the hostile environment of space than a orbital or asteroid colony, but still highly dependant upon technology to maintain viability.

The second possibility is that such a world could support a native ecosystem. Unlike a typical terrestrial ecosystem this would be a bottom-up rather than top-down system, feed by geothermal energy from below rather than sunlight from above. On Earth, an example of an ecosystem like this include deep-sea black smokers. These support a variety of life forms including life forms as complex as clams and tubeworms. It is impossible to predict how far life could evolve in an environment where such vents are the only energy input into the ecosystem.

Another way in which a habitable moon could vary significantly from Earth is the possibility of other moons close by. These may also be habitable, in which case a close approach may result not only in moon-quakes and volcanism, but the possibility of biological material being transferred; this may just be single cell organisms and viruses, in which case each approach may mark a coming plague, or in more cinematic universe the flight of more advanced creatures. In any case, an intelligent species evolving on a habitable moon will have easier access to more planetary bodies than a species native to a terrestrial world (such as ourselves).

In the specific case described in the question, where the world orbits a gas giant that itself orbits another, the main problem is setting up a system that allows for stable orbits and also a moon that is habitable (and solving the three-body problem is outside Omniscient Eye's remit, and hence left as an exercise for the reader). In order for the moon to

have a stable orbit around it's parent (we'll call it Gas Giant A) it must be far enough away from the second giant (we'll call that one "B"), and for A to orbit B, they must both be far enough from the sun (which we'll just call "the sun") . . . but if we get too far from the sun, the moon is reduced to a ice ball.

If both gas giants are similar in size they can orbit a common center of gravity, far enough apart that the moon has a fairly stable orbit. In this case the moon will have "seasonal" effects as planet A moves towards or away from the sun along its orbit with B, and strong tides due to B's gravitational effects. In the case where the sizes are different B needs a huge orbit around the sun so that A can have a stable orbit it. In order for the moon to be habitable, it will still need the energy to maintain a suitable temperature. An old, hot sun would help, as would planet B being a brown dwarf: a super-giant jovian (13-75 Jupiter masses) able to fuse deuterium, but not hydrogen like a star. This world may exist in a warm twilight, with even full sunlight being the equivalent of a cloudy day on Earth.

Of course, in a space opera universe, exotic forms of matter, energy sources, or the ability to shift planet sized bodies around a solar system will allow environments outside those supported by science. Depending upon the level of technology that is available, any world might be made to have an Earth-like environment -- even if it requires the use of gravity generators and force fields to do so.

Casablanca: An Exotic City Sourcebook (for Mean Streets)

Published by [Deep7](#)

Written by William Jones

Cover by Gregory Price

Cartography by William Jones

35-page 2.68 Meg Zipped PDF Document; \$4.95

The city of Casablanca promises a near unique blend of flavors, bringing together the exoticism of Arabic North Africa and the French chic represented by its colonial empire. Despite the enduring popularity of the 1942 film that helped to make the city so famous, the roleplaying game has for the most part ignored its warm and dusky climes.

But with the release of *Casablanca: An Exotic City Sourcebook*, we have the chance to go back to the city at the time of the film *and* more. Intended for use with Deep7's [Mean Streets](#), it takes the dark and moody action of that XPG away from the shadows of America's skyscrapers and east across the Atlantic. Its time frame is roughly 1938 onwards, when Morocco is divided into two protectorates, one Spanish and one French. The port of Casablanca lies in the latter, and with the onset of war, becomes a focus of Axis and Allied attention. The political situation is made more difficult during Germany's occupation of France and the establishment of the Vichy Government, which continued to administer the French Protectorate of Morocco. This did not stop the Nazis from using their influence and more to crack down on members of the French resistance or on the members of Allied Intelligence operating in the city.

This is in addition to the peaceful, non-militant efforts made by the natives in order to obtain independence for the kingdom. Such demands would continue long after the war, when France resumed control of her North African Holdings -- despite the assurances of the Allies. Eventually the independence movement would resort to outright violence, forcing France to relinquish her control in 1956. This is the time frame for the third focus of the sourcebook, roughly from 1943 when the Allies invade and ensure a steady supply of the elixir known as Coca-Cola to the populace, up until independence is gained. Essentially, it moves the *Mean Streets* milieu on from the pulp noir of the 1930s and 40s and into the true blue versus Soviet red of the cold war and the early 1950s. The sourcebook suggests the other two earlier timeframes as being set during the pre-war period under the French administration, and then under wartime Vichy control.

The supplement opens with a history of Morocco that brings the reader up to speed on the current situation in the early forties and explains some of the cultural mores that the western visitor should be aware of. It explores the city district by district, covering the Medina, Casablanca's old town; the Port District; the Quartier Habous, Casablanca's most recent extension and home to its wealthier inhabitants, particularly the Europeans; and the Industrial Nord, the target of German saboteurs after the Allies arrive. With each district are given descriptions notable locations and associated NPC's. Thus the section on the Medina is accompanied by the template for a pickpocket -- a potential threat to westerners in the old town; details of a traditional Moroccan café and its owner who might have links to the pro-independence secret society, the Zawiya; and the decrepit Hotel du Port, whose owner refrains from asking questions. The bulk of the location descriptions are within the Quartier Habous that includes lavish hotels, banks, the police and government buildings, the Palais Royal -- the occasional home of the Moroccan Sultan, and last, but not least, the Café American. This is run by a world-weary and cynical American expatriate, who much like his on-screen counterpart, has a hidden past.

The third chapter on the underground explores the organizations operating in the city both within and beyond the law. The former is primarily the pro-Vichy police prefect, Jacques Guignard, who in co-operation with a German SS officer has grown rich on graft and corruption. Operating against them are members of the Free French Movement, and British Intelligence operatives. Of course, the Moroccans continue to oppose Spanish and French occupation of their countries, initially by the Zawiya secret society and its subsidiary cells known as the Taifa. Their methods are non-violent, consisting mostly of propaganda acts such as boycotts and strikes, as opposed to the Istiqlal, founded after the war. This independence party actively agitated to be rid of their French masters, resorting to violence in later years.

The supplement includes the adventure, "Dark Secrets of the City of White Houses." This is a murder mystery where the characters are brought from America to Casablanca to investigate the death of an American journalist. Both his wife and editor do not believe the authorities' findings that he died by his own hand, and perhaps the truth lies in the story he was investigating. While this is a good adventure in true noir style, being set in the fifties means that it ignores the earlier time frames of the supplement, which are likely to attract many prospective buyers. A set of adventure seeds at least would have offset this, but none are given.

Finally, an appendix gives several additions for the *Mean Streets* game. These include notes on haggling, the new skill of pickpocket and new archetypes. The three have stronger political influences than might the average *Mean Streets* or Pulp Noir characters. They are the War Criminal, the Freedom Fighter, and the War Correspondent, let down only by a lack of discussion of probable skills for either. Templates for the three might have offset this. The appendix is rounded out with more historical notes on the Allied meeting between Churchill and Roosevelt in Casablanca in early 1943 and the Treaty of Fez, signed in 1912 to create the French protectorate in Morocco. Finally, it lists French Resident Guards, Sultans of Morocco, and useful phrases in both Arabic and French.

Casablanca: An Exotic City Sourcebook comes as a 2.68 Meg zipped file that unzips into a 2.85 Meg 35-page PDF file. Behind the very nicely done cover, the supplement has been done in black and white with a light blue wash, used particularly for the maps and the photographs that take the place of illustrations. These are well handled and are appropriate to the supplement. Although the city map is clearly done, the one of Morocco severely lacks detail.

Despite it being for *Mean Streets*, this supplement has a greater use outside of that game, should any GM want to take his game to the city of Casablanca during the timeframes discussed. In particular, *Return to Honor*, *All The King's Men*, and *Dogfaces*, all for *GURPS WWII* could make use of its contents, as could any espionage RPG. Let down only by its failure to support the pre-war and wartime periods of the setting, *Casablanca: An Exotic City Sourcebook* is proof of the versatility and usefulness of the PDF, providing a good sourcebook for more than just *Mean Streets*.

Pyramid Review

Mutants & Masterminds Character Record Folio

Published by [Green Ronin](#)

Designed by Rick Achberger

Developed by Steve Kenson

Cover by Ramon Perez

16-page b&w softcover; \$4.95

Given the proliferation of photocopiers, printers, and PDF files, is there really any need for another professionally designed character sheet, outside the one included at the back of most games? Is it worth it to provide a multi-page booklet on a single character? If it's the *Mutants & Masterminds Character Record Folio*, it is.

The folio benefits from its straightforward organization and intuitive progression. The first page is all about the most common character traits, which is to say those used for rolling dice, referencing stats, and other system rules. Abilities, saving throws, and attack scores are all in easy reach. Not only is there a Hero Point track, there's a summary of what they're used for. You can tally your damage, up to and including a box for noting that you're, well . . . dead. Handy.

Only at the end of the personal information section does one find the vital statistics -- height, weight, hair color, costumes, and anything else that might get a superhero a date. You can describe your character visually and/or textually with sketches and origin stories. Quirks of personality, flaws, and so on go here as well.

In between these segments are the building blocks of superheroes. Your skills, feats, and powers fit here, and each has its own space for all the components like how far your energy blast reaches, how many skill ranks you have, and how your equipment is built. All of this minimizes page-flipping and looking up things like how long your acid cloud lasts (assuming you hold up your end and fill in all the little boxes). The artistic player even has a grid on which he can draw a schematic of his super-gun or booster boots or whatnot.

But since few superheroes work in a vacuum (and fewer still in a comic-book RPG), you'll need a cast. This includes a two-page roster of supporting characters (the Aunt Mays, Franklin Richardses, and Perry Whites), and then the team to which the PC belongs. The common enemies, the members, shared tactics, and so on are on one page, and minions are on another.

The headquarters gets two pages to itself for descriptions and schematics, plus more for team vehicles and the grids to draw those as well. These include where the building is, what it looks like, and the features given it once you've built it using the device creation rules from the core book.

The book tapers off to your past and future -- files for crimes you've solved and slots for choosing how you want to expand the hero as you gain levels. The whole thing is wrapped in a cover that adds M&M system information to the mix, much like a mini-GM's screen.

The only actual art is the cover, but it's a dandy fight scene. The focus is on the inside anyway, where the layout is sharp and clear. The type inside the boxes, while very small, is fairly obvious in purpose; the organization makes it apparent which box is for "Name" without you having to squint. The origin and background sections are the only real

gaffes -- the spacing of the lines is awfully tight to be written in comfortably.

The sheaf makes good use of its space in most instances. There may seem to be too many device boxes for the average hero, but a gadgeteer is going to need those. On the other hand, the team info isn't as well balanced, most of it crammed into one page. Ironically, there are entries for four minions, but only five teammates, and the minions are allotted more space. For servants like the team butler and his ilk, it's too much space (and he could be added to the supporting characters); but for your faithful sidekick Kid Glory, it's not roomy enough.

These are minor points, and Green Ronin has done their job well considering the book must be of generic value to a raft of characters they cannot possibly anticipate. It has plainly resulted from lots of careful thought, from little touches like a box on the front cover for listing your PC's name, to entries you might not have thought to add to your run-of-the-mill character sheet. It's as much fun to fill out as it is to play the persona -- you'll want enemies just so you can chalk them up and keep score. The *Mutants & Masterminds Character Record Folio* is both an effective organizational tool and a good way to get players to think outside the super suit.

--Andy Vetromile

Bat's Entertainment!

Dateline: Steventown. **Population:** Me.

ITEM: I finished reading the "War Games" storyline in the Batman titles. In the course of the plot, many clichés relating to such epic tales were reaffirmed: People die, places are destroyed, friendships strained and broken, and the world will never be the same. In short, the storytellers tried to make sure that the \$61.32 spent over three months was worth it. (Which, now that I calculate and write down the amount, I find myself questioning. But that's another column.)

ITEM: I tried voting last week, having walked to two different polling stations trying to find the one I was supposed to use (the Marshmobile still being . I say "tried" because I was, in fact, turned away, having moved here recently enough that I haven't lived here the required 30 days before being permitted to vote. On the bright side, I guess I don't need to pay taxes for the next year, since that whole "taxation without representation" concept is a solid enough foundation that I feel confident dumping bales of tea into the harbor.

Anyway, what do these two events have to do with anything? Namely, that they both provided an emotional experience for me, despite both being entirely about fictional people. (Yes, I know this may cause some angry or confused e-mails. But I've come to grips with the facts: Batman isn't real.)

In trying to tie the emotions between both events together -- and come up with a column at a time when I'm stressed and under deadline pressure (see below) -- I've come to some conclusions.

First, without getting (I hope) overly controversial, I note that I'm a closet political junkie. I love the American political process, and I have a profound respect for the principles and foundations on which the country was founded. I admit it: I was totally sold on the message of my primary school civics classes. I read about issues; I debate with folks; I'll ask random acquaintances how they feel about government regulation of offensive material, or mandatory military service for all citizens.

And I care about elections. I'll be anxious months before an election. I'll make sure all my friends vote. I'll stay up the night of the election and click "reload" on CNN.com every few minutes. And I'll be thrilled if my guy wins and disappointed if he doesn't.

But on some level I realize it doesn't make a huge world of difference. The results of the election don't matter on a day-to-day basis. In six months, it probably won't make an impact on my world if I can privately invest some of my Social Security funds, or if Americans can buy prescription drugs in Canada. Politics are, on some level, primarily about ideas, which have no tangible form beyond the importance I give them.

Which brings me to the War Games storyline of the Batman titles. And I find myself connecting with these fictional characters, in a way that's surprising. I find myself yelling, "Oh, don't be such a jerk, Batman!" or, "Oh, no! I can't believe that they might kill this character!" My opinions have no more bearing on how that world is going to turn out any more than my yelling at my candidate's commercials: "Oh, don't say *that*, you dummy!" But I'm emotionally involved nevertheless.

I could make a lot of projections and connections between these two fictional worlds, but I'm going to limit myself to some off-the-cuff observations that further stretch the Batman-politics meme while I work on my "Wayne for Senator" campaign. Who knows; maybe they'll even tie in to gaming some how.

History: One of the interesting things about both the Batman books and politics is that they have a rich sense of history and continuity. President Bush is currently involved in a war on many fronts, doing his best to make the world safe from unseen and previously unknown threats. He's also the son of a previous president, who himself served as vice president under a popular leader who, sadly, succumbed to Alzheimer's before dying. Senator Kerry heroically served in an unpopular war decades ago, then protested that war when he returned home. Ralph Nader gained his fame

by his 1960's exposé that the Batmobile was unsafe at any speed. And so on.

Batman lost his parents as a child in a senseless crime. Serving vengeance, he fights crime while training himself to the limit of human abilities. He has several allies in this crime; one had her spine severed by a madman's bullet, one died after being bludgeoned to death after being betrayed by his birth mother, and one remains a haunted vigilante after he lost his acrobat parents in a Chevy Corvair rollover.

Anyway, the point is, the dramas of politics and comics have resonance because their histories imbue them with a richness that make their ultimate fates -- their victories and failures, their triumphs and tragedies -- much more fulfilling and emotionally engaging. Sure, sometimes people come from out of nowhere and accomplish previously unforeseeable events (remember when H. Ross Perot surprised everyone by breaking Batman's back?), but these seem to be rare, and are hard to relate to. In the gaming world, consider this: Having characters with rich histories -- both player and non-player characters -- will usually only enrich everyone's enjoyment. And reiterating this history periodically will make it easier to know what makes a character important and significant.

Time: The campaign process, much like a comic crossover, takes a long time to resolve. You know it's coming for a while, and even if it isn't a direct fixture in one's life, it affects and paints many aspects of the story.

While it's certainly possible for a drama to drag on too long, in general having epic events -- or the anticipation of epic events -- plod on in the background will make them more real; big decisions and consequences can be more emotionally satisfying if they don't just come out of nowhere. In the gaming world, it's often useful to foreshadow or imbue a campaign with the hints of a future adventure or the backdrop of a plot turn. If there's going to be a space launch that will play an important part, make sure it's known ahead of time (even if the heroes don't get involved). If there's going to be a peasant revolt, show the seeds of discontent being sown well in advance. And if peasants are going to be launched into space . . . well, you can figure it out.

Finality: Perhaps the best thing about comic crossovers and elections alike is that, for the most part, we know when they'll end. Likewise, in the gaming world I've generally found that, even with really big adventures and ongoing plot threads, the players are most appreciative when I clearly denote the end of a storyline. While there may be ongoing and permanent consequences from the outcome of an adventure, it's still good to note that the adventure thread itself ends. Having the sinister villain or the all-threatening illness as a perpetual, "When will it end, darnit?!" backdrop to the world can lead to player dreariness and fatigue. After all, no matter what, I know that the devisive, patience-trying riots-in-the-street War Games storyline is over . . . and so is the Batman crossover.

In all, it's been an exciting week. And, on some level, I love being emotionally involved in events that may or may not have any real effect. I'm not sure if I'll be reading the next Batman crossover, but I'll almost certainly be voting in the next election . . . unless it costs me more than \$61.32.

* * *

Unfortunately, owing to scheduling conflicts and some mind-numbingly oppressive deadlines (against which I have -- much to my chagrin -- successfully made my Dodge rolls), the plate-spinning required to bring the conclusion to the Iron Ref extravaganza has not yet been realized. I hope to have everything sorted out in the next week or two; I'll keep you posted. Thank you for your patience, and I hope you understand why we've put the padlocks on the knife drawer in the Iron Ref kitchen.

--*Steven Marsh*

Rationalizing Rations

by S.E. Mortimer

Introduction

Many players understand that their characters need to eat while on the road, but few do more than list a few weeks' worth of "trail rations" on their character sheets with no thought to the weight or storage space required to transport this much food. How many players have considered how food was actually preserved and what they might find in a pack of trail rations? Many hikers and soldiers realize the inconvenience of having to carry enough food for even just a few days and would understand the difficult logistics involved in keeping large numbers of men properly provisioned in the field. This article is intended to discuss various methods of food preservation -- both historical and modern -- and which foods might be most appropriate for travel rations. This work references both the Third and Fourth Editions of *GURPS*. On occasion there will be page references to both editions of *Basic Set*; in these instances the first reference will be to Third Edition and the second reference will be to Fourth Edition. For example, "Cooking skill (p.B53/B185)."

Food Preservation

Before refrigeration it was difficult to store many foods for more than a few days. Travelers in settled areas could purchase meals freshly cooked at inns and waystations conveniently spaced along the road at regular intervals. "Leftovers" was the most common type of traveling rations for short trips. A traveler would purchase a meal but only eat part of it, taking the remainder with him the following day in a pocket or wallet to eat on the road. The problem with this sort of travel food is that it spoiled within a few days and it was fairly heavy and bulky. To keep food for more than a few days it must be preserved in some fashion, and to pack more than a few day's worth requires some consideration about weight and volume.

The skill of food preservation is subsumed under the Cooking skill (p.B53/B185). An important aspect of preserving food is sterilization. All bacteria must be killed during the process and bacteria must be prevented from contaminating the food afterwards. A successful Cooking roll means that the food has been successfully preserved and sterilized. A critical success results in doubling the normal shelf life of the food. Failure means that the food will begin to spoil in 2d days (1d in hot climates). Critical failure results in a case of *food poisoning* for the person eating it (see sidebar, right). Food poisoning can also occur if food is eaten after its "shelf life" expires and it begins to spoil.

What follows is a selection of travel foods and preservation techniques.

Dry grain: Grain has two main advantages: It is easy to transport, and it can be stored for years if kept cool, dry, and away from pests. The Romans sometimes issued grain to soldiers who then ground the flour and prepared the bread in camp. Froissart mentions Scottish soldiers carrying bags of oatmeal which were used to make oatcakes in the field. In Asia, rice was the preferred staple. The disadvantages of grain rations are long preparation times; additional weight; and, once cooked, the food can only be stored for a few days.

Travel bread: Sometimes called "greatbread" or "waybread," this hearty bread

Food Poisoning

The vast majority of food poisoning cases are caused by improper cooking or storage of food. Some bacteria give off toxins when they multiply in the stomach and bowels, resulting in nausea, vomiting, abdominal cramps, and diarrhea. More serious cases also involve fever and bloody stools. The most common types of bacteria that cause food poisoning are *salmonella*, *shigella*, *campylobacter*, and certain strains of *E. coli*. The only real cure for food poisoning is to let it run its course while the body purges itself. Bed rest and plenty of fluids will aid recovery.

If one contracts food poisoning, the symptoms appear 1d-2 days after eating the spoiled meal. On the morning of this day, the victim begins to display the symptoms (nausea, vomiting, abdominal cramps, and

was made from a mixed flour (wheat, rye, barley, etc.) into which was added dried fruit, vegetables, nuts, and dried meat. This bread could not be stored for more than a week or so and it was fairly heavy, so it was only good for short journeys. It was a handy travel food because it required no preparation and was very nutritious.

Pemmican: Similar to travel bread except that animal fat was used instead of bread. Pemmican was invented by North American Indians and consists of powdered dried meat mixed up with dried fruit and nuts, and held together with animal fat (e.g. suet or lard). Pemmican could be rolled into balls or pressed into cakes, then wrapped in cloth and sealed by dipping in hot tallow or wax. It can be stored for several months.

Hardtack: This "twice-baked" bread or biscuit was common traveling fare in Europe and a special favorite of military commanders. Also called "shipsbiscuit," "sheet iron," and "worm castles," it was the food that soldiers loved to hate. A Roman clay tablet was found in northern France with an inscription that translates as, "Hardtack, hardtack. Come again no more." It was made by taking a regular loaf of bread, grinding it into powder, mixing it with water to make small cakes, and then baking it again. Sometimes sugar and salt were also added (the Romans added olive oil). In Spain it was called *bizcocho* and in Italy it was known as *biscotti*. The word *biscuit* literally means "twice baked." It was a military favorite because it was lightweight, required no preparation, and was full of carbohydrates. If hardtack is properly made (all traces of moisture removed) and correctly stored (dry and insect free), it will keep indefinitely. Hardtack can be eaten by breaking off a piece and placing it in the cheek, allowing saliva to soften it. It may also be softened by dipping into a beverage such as water, wine, or tea.

Hordiate: Also called "barley water," it was made from barley that was boiled until it began to dissolve, and then strained. This gruel was commonly fed to invalids and infants but it could also be dehydrated and powdered for traveling. *Powdered hordiate* was made by baking a thin layer of hordiate into a cake and then grinding it into powder. This powder was stored in a box or pouch and reconstituted in water before eating.

Heating: Cooking food kills many bacteria that are present. This sterilization can increase shelf life for a few days but does not prevent new bacteria from appearing, so cannot create long-term preservation in itself. Preventing contact with air after cooking (using a preservation liquid, vacuum sealing, etc.) can increase shelf life dramatically.

Desiccation: Drying or dehydration prevents the germination of grains and certain vegetables, can inhibit the growth of bacteria, and stops meat from rotting. Because a lot of the water content is removed, the final product is lighter and less bulky than the fresh item. There are depictions of the ancient Egyptians preserving fish by hanging them up on ropes to dry in the sun. William of Rubruck wrote about the Mongols preserving meat by cutting it into thin strips and hanging it in the sun and the wind, where it quickly dried and could be stored without the need for salt. Sun or oven-dried food contains about 25% water but freeze-dried food (see *Modern Rations*, below) contains less than 3% water. The Indians of the Andes mountains used the windy, frozen conditions of the mountainside to naturally freeze-dry food. This food is much lighter because of the lower water content and has a much longer shelf life.

Smoking: Smoking is an ancient method of preservation which not only dries the food, but adds formaldehyde -- a natural preservative present in wood smoke. Smoking also changes the food's taste, enhancing its flavor.

Salting: Salt preserves food by tying up water molecules so that micro organisms cannot use it for growth. Salt was

diarrhea). Roll vs HT. If the roll succeeds, the victim is inconvenienced for a day (-1 DX, -1 ST), but not enough to cause incapacitation. On a failed roll the victim is incapacitated for a number of days equal to the amount by which the roll failed (e.g. a roll that failed by 2 results in 2 days of incapacitation). A critical failure results in a potentially fatal case of food poisoning such as *botulism* (see below). Medical attention is essential.

Botulin is the most lethal form of food poisoning. The organism *clostridium botulinum*, a spore-forming bacteria, produces toxins when in an oxygen-free, low-acidic environment. Most cases of botulism result from inadequate food preservation. Botulism symptoms are similar to those of other types of food poisoning but it causes toxic effects to the muscles and nervous system, and can be fatal when the muscles controlling the lungs are affected. Cases of botulism are rare today, but the botulin toxin may be harvested and deliberately administered to poison someone (see p.CII139).

expensive -- at the end of the 13th century salt cost around 1d per pound and it took two pounds of salt to cure 20 pounds of meat (about 5d worth). Therefore, adding salt increased the cost of meat by 40%, so meat of any kind was not worth preserving unless it was in prime condition. Meat of poor quality was literally "not worth its salt."

Dried Fruit: Drying fruit concentrates the flavor and sugar. High concentrations of sugar ward off bacteria, greatly increasing shelf life for up to a year. Sulphur can be added to further increase longevity. Fruits that are commonly dried include apples, apricots, bananas, dates, figs (good source of calcium), plums (prunes), grapes and raisins (sultanas).

Dried and salted meat: This is best done with lean meat (low fat content). The meat is either rubbed with dry salt or soaked in salt brine. Once the salt has impregnated the meat it is then dried in the open air or in some sort of oven. This food is usually rehydrated and cooked -- usually by boiling -- before eating.

Jerky is a strip of partially dried meat (rubbery rather than brittle) and may be eaten in its preserved state with no preparation. **Biltong** is South African jerky. It is made in a similar fashion to regular jerky except that the meat strips are dipped in vinegar and seasoned before being dried. It has a finer texture than regular jerky.

Sausage is another method of preservation where the meat is minced, mixed with herbs and spices, and packed into a casing -- usually animal intestine but sometimes the stomach, bladder, or oesophagus is used. The sausage is steamed and then smoked to preserve it. The best sausages for traveling are dried and fermented ones such as salami and cervelat since they are lighter and have a longer shelf life.

Dried meat weighs approximately one quarter of its initial raw mass. Jerky weighs around one half. Properly prepared, dried and salted meat keeps for about one year. Salted jerky keeps for several months. Sausages keep for a couple of weeks up to several months depending on the type.

Freezing: This is the simplest method of preservation in cold climates -- simply leave the food outside. Livestock was often slaughtered early in winter to take advantage of the colder temperatures (and to avoid having to feed them over winter when fodder was scarce).

Fermentation: Enzymes of some bacteria, molds, and yeasts cause chemical changes in the food and inhibits the formation of harmful bacteria. Fermentation of food can increase its shelf life for many years.

Pickles: Usually involves impregnating the food with acid, via the use of vinegar or other acidic liquid. Sometimes a brine solution is used to facilitate the action of certain bacteria. The advantage of pickling is that it can make use of wine and mead that had spoiled (resulting in vinegar). The food to be pickled, whether it be pre-cooked meat or vegetables, was added to the pickling mixture and sealed in a container. Pickled cabbage (sauerkraut) was recommended by the British Navy to prevent scurvy early in the 18th century. Pickled foods keep for between six months and one year. The pickling liquid was sometimes boiled off prior to eating -- especially in the case of meat.

Kim chi is a Korean staple made from vegetables (mainly cabbage) that have been pickled in a solution of garlic, salt, and red chilli peppers. It is stored underground while it ferments to prevent it from freezing over winter. Chinese records indicate that a similar dish was eaten by workers on the Great Wall. Kim chi is very high in vitamins B and C and can be stored for up to a year in cool climates, but warmer temperatures decrease shelf life to a few months.

Cheese: A common way of preserving milk. Cheese is also easier to store and transport than milk. It is made by fermenting and curdling the milk, pressing and draining the liquid, adding salt, and then allowing it to dry. It takes around eight to 10 lbs of milk to make one pound of cheese. Hard cheeses such as Parmesan and Romano have the longest shelf life, keeping for years if they remain sealed (usually in wax).

Honey: Honey is a good preservative and has been used for thousands of years. The Swiss were known to use "third-rate" honey (containing beeswax) to preserve plums and apples. The Romans soaked olives in honey and stored them until they were needed for making oil. They also coated meat in honey to increase its shelf life. This method only extended shelf life for a few days in summer but honeyed meat could be kept for weeks in winter.

Soybean Curd: Native to east Asia, soybeans are low in saturated fats and high in amino acids and protein, and contain many vitamins and minerals. Fermenting soy into curd (called *tofu* in Japan) is a method of concentrating the nutrient content of soybeans. Tofu can then be dehydrated to reduce bulk and increase shelf life. Dried tofu can be chewed like meat jerky or reconstituted by adding it to hot water. It has a similar shelf life to meat jerky -- several months.

Tea: In the East, green tea was a common foodstuff. To reduce the amount of space it took up when being transported, tea (and many spices) were compressed into small "bricks." These often were used as a type of currency in areas such as China, Mongolia, and the Middle East. In order to prepare a drink, a small portion is broken off the brick and crushed into boiling water.

Algae: Some types of algae are excellent food supplements. One of the most nutritious is the blue-green algae known as "spirulina" (*spirulina platensis*, *spirulina maxima*). This algae has been eaten in Africa and Mexico for centuries and is a popular diet supplement all over the world today. NASA has done extensive research regarding its suitability as a food source in space. Spirulina is easily digestible since it contains no cellulose, it is very low in fat and carbohydrates, contains most of the important vitamins and minerals, and is around 65% protein by weight. This food is low in carbohydrates and vitamin C, however, so it must be supplemented with other foods. It can be dried into powder and compressed into "bricks" for easy transportation and can be stored for several years. It is recommended that no more than a few tablespoons of dried spirulina be consumed each day because of its high concentration of nucleic acids and the risk of it being contaminated with heavy metals.

Trail Rations

A balanced diet is essential even when traveling. A good mix of cereal, meat, fruit and vegetables, and dairy is important, both for good nutrition and to provide variety. Some preserved foods, such as hardtack and meat jerky, make ideal trail rations, but others require further processing. For example, pickled vegetables can be compressed and dried to reduce weight and volume. The best trail rations must remain preserved for long periods, are lightweight and easily transported, and can withstand harsh conditions including moisture, rough handling, temperature extremes, etc.

Compiling a Low-Tech Ration Pack: The three primary factors to consider are nutritional content, shelf life, and total mass. Secondary considerations are taste and variety. A combination of foods must be selected that provide the daily requirement of calories plus all the essential nutrients. Below is a suggested selection of foods for a low-tech ration pack that will sustain an average person for one day of moderate activity (see *Activity Levels*, below).

"Iron Rations"

- 0.5 lb hardtack
- 0.5 lb meat or fish jerky
- 0.5 lb dried fruit, legumes, and nuts
- 0.5 lb dried pickled vegetables
- 0.5 lb cheese

Total weight 2.5 lbs.

Alternatives

- 0.5 lb of powdered hordiate instead of hardtack
- 1.0 lb of polished rice or other grain instead of hardtack
- 1.0 lb of pemmican instead of jerky and dried fruit
- 0.5 lb dried soybean curd instead of jerky
- 0.5 lb dried yoghurt or milk curd instead of cheese
- spirulina instead of pickled vegetables (a compressed brick weighing 0.5 lb will last two weeks)

Nutrient Deficiency

The "Iron Rations" suggestions (left) contain all the energy and nutritional requirements to maintain good health. In the past, however, this was not always the case (see Historical Ration Allocations, below). Nutrient deficiencies can cause an array of diseases. These were particularly evident during wartime and seafaring expeditions when people did not have access to their normal diet for extended periods of time. Common diseases included *scurvy* (lack of vitamin C),

- tea (a compressed brick weighing 0.5 lb will last two weeks)

High-Tech Rations

Canned food: During the Napoleonic wars, the French experimented with boiled (*bouilli*) beef in glass jars. In time, the jar became a can, and the name was Anglicized into "bully beef." Canned rations have been widely used from the mid-19th century until today. Canned meat can be stored for a year or two, while other canned foods may keep for longer. Canned food is fairly cheap today but it is bulky and heavy. It is a useful trail ration because of its long shelf life, damage-resistant container, and lack of preparation requirements (simply open the can and start eating). Go to any supermarket to get suggestions for cost and weight, but a day's supply of all canned food would probably weigh around 5 lbs and cost \$8-\$10. It would be more practical to include two or three small cans (1-2 lbs worth) in each day's provisions and use lighter rations for the rest of the components.

Retort Pouch MREs: These are thermo-stabilized, triple-layered, foil/plastic food pouches named after the retort steam cooking process. Retortable pouches were first proposed in the 1940s, and developed in the 1950s. After being filled and sealed, the foods are retorted at high temperature to cook the food and kill any bacteria. NASA began providing retort pouch "MREs" (Meal Ready-to-Eat) for space missions in the 1970s and it was adopted as a US Department of Defense combat ration in 1975. Today, canned food is still being issued but because retort pouch technology makes it easier to heat the food in the field, is easier to carry, and tastes better than canned food, MRE rations are becoming more popular. MREs also come in a huge selection and each meal includes entrée, main course, and dessert. Because moisture content is retained, MREs are more nutritious and taste better than dehydrated or freeze-dried food, but the retained water and oils mean greater mass for transportation. MREs can be stored in a cool atmosphere for around 10 years, but shelf life decreases as the temperature increases. In a warm climate these rations last around three years and in a hot climate the food begins to spoil within a few months. One day's provision requires three MREs totaling \$15 and weighing around four lbs (after disposing of unnecessary packaging). Single-use MRE heating pouches can be purchased for around \$1.50 ea (weight negligible). Just add water to begin the thermal reaction, put the MRE ration in the pouch, and wait 10-15 mins for a hot meal.

Freeze-dried Food: The most effective method of removing water content. Just about any type of fresh or cooked food can be treated in this manner. After preparation, the food is "flash frozen" in a vacuum. The low-level of applied heat causes the ice crystals to evaporate without going back to the liquid phase. This process, called "sublimation," removes 97-98% of water content. It reduces mass, retains a high degree of nutritional content, and creates a shelf life of around 20 years.

LRP Rations: The "Long-Ranged Patrol" ration was specifically designed by the military for situations where resupply is not available, and weight and volume are critical factors. The LRP contains freeze-dried food of a similar, but less varied, selection to those contained in the MREs. The disadvantages are that water is required for preparation, and that freeze-dried meals aren't as appetizing as normal MREs. The main advantages are very long shelf life and reduced mass -- a day's provisions only weighs half that of MREs (around two lbs) and can keep for up to 20 years. Cost is \$20 per day's supply. One quart of water is also required for food reconstitution.

Elemental Nutrient Formulas (ENF): These represent the most advanced method of food reduction. ENFs replace food intake with a scientifically determined set of nutrients including carbohydrates, fiber, vitamins, minerals, electrolytes, and amino acids (protein building blocks). ENFs are designed to be mixed with water (but juice and fats/oils can also be added if available). One problem with ENFs is that they are fairly low in energy. A person performing moderate activity (see *Activity Levels*, below) would need to consume around 1.5 lbs per day. The other problem with ENFs is that they must be ingested at more frequent intervals than the usual three meals per day -- a person's ENF intake should be split into 6 meals per day. This can be bothersome since it doubles the normal number

pellagra (lack of niacin), *beriberi* (lack of vitamin B), and *xerophthalmia* (lack of vitamin A). *GURPS* already outlines the effects of some of these diseases such as scurvy (p.CII172), and beriberi (p.CII167). Most of these types of diseases take a while to manifest, so a person in good health, who has to survive on inadequate rations for a few weeks will suffer few ill effects so long as calorie content is sufficient. If nutrient deficiency continues for longer than a month then the person is in danger of contracting one of the above diseases.

of meal breaks each day. ENFs can be stored in a cool, dry, dark environment for several years. Cost is around \$30 for a day's supply (weight 1.5 lbs).

Food Tablets: These are similar to ENFs but come in a tablet form that is easier to handle and has a longer shelf life. Retailers claim that a person can survive for months eating nothing but these tablets. This might be true but not on the recommended daily consumption. A person performing moderate activity (see *Activity Levels*, below) will need to consume at least 10 times the recommended amount each day to avoid weight loss, and this number turns out to weigh and cost about the same as the above-mentioned ENFs. It is also unclear what health problems might arise from relying on these as a sole food supply for an extended period of time because one will be ingesting far more vitamins, minerals, and amino acids than the daily recommendation. Food tablets should be considered a food *supplement* rather than a food staple and would be very useful in this capacity.

Travel Ration Purchase Table

Description (one day's provisions)	TL	Weight	Cost	"Shelf Life"
Fresh food	0	4.0 lbs	\$4	3 days
Travel bread	0	3.5 lbs	\$6	2 weeks
Iron rations	0	2.5 lbs	\$8	3 months
Canned rations	5	5.0 lbs	\$8	2 years
MRE (Meal Ready-to-Eat)	7	4.0 lbs	\$15	3 years
LRP (Long-Ranged Patrol)	7	2.0 lbs	\$20	20 years
ENF (Elemental Nutrient Formula)	8	1.5 lbs	\$30	3 years
Food Tablets	8	1.5 lbs	\$30	10 years

The starvation rules in *GURPS* require that each day's provisions be split into three meals (p.B128/B426). Missing even one of these meals will weaken you. Note that the weight of 0.5 lbs for a meal of traveler's rations (p.B212/B288) is unrealistic for typical activity levels.

Activity Levels

The exact amount of food required per day is dependent upon many factors including body mass, individual metabolisms, climate, and activity levels, but the above suggestions are reasonable estimates. They will provide enough nutrition for a person in a mild climate performing moderate activity throughout the day. "Moderate" activity includes things such as marching through cleared terrain (or on a road), light labor, gardening, etc. The following modifiers need to be applied to adjust the amount of provisions required for different types of activity. This is only necessary for extended activity -- bursts of accelerated activity for a few minutes, such as running or fighting, are not enough to modify the daily allowance. Only use these modifiers if activity level differs for most of the day (GM's discretion).

- -50% -- resting, watching TV, quietly awaiting rescue
- -25% -- resting but recovering from illness or injury
- -25% -- light activity (riding an animal, driving a vehicle, standing for most of the day)
- +25% -- strenuous activity (hiking cross-country, heavy manual labor, mountain climbing, etc.)
- +25% -- cold climate

The modifiers are cumulative. For example, assuming a soldier was equipped with LRP rations. A typical allowance (for moderate activity) is 2 lbs per day. If this soldier was hiking in a cold climate, he would need an additional +50% for a total of 3 lbs of LRPs each day.

Water

As **GURPS** states, two quarts of water is the normal daily requirement for mild climates and moderate activity (p.B128/B426). In dry climates or at high altitudes, an additional one quart per day is required. In hot climates or when strenuous activity is required, an additional two quarts are needed per day. Again, these are cumulative. Cold, mountainous terrain is both dry *and* high-altitude, resulting in a requirement of four quarts per day. The desert is hot and dry resulting in a five-quart daily requirement. If strenuous activity is performed in the desert then a total of seven quarts (14 lbs) of water per day is needed. Any less and the person suffers the effects of dehydration (see p.B128/B426).

The above water estimates are adequate if one is subsisting on a normal diet, since some of our daily water requirements are met through the intake of food, which can contain up to 90% water. The problem with most trail rations, however, is that a lot of the water has been removed to reduce volume and weight. This means that the traveler needs to drink more water to compensate. When relying upon trail rations for nutrition, an extra quart of water is required per day (either drunk directly or used to rehydrate food), making the minimum daily water requirement is three quarts (6 lbs). This does not apply to canned rations or MREs because water content is retained.

Encumbrance

Even at only two lbs of freeze-dried rations per day, the weight soon adds up. If water also needs to be carried, it soon becomes evident that a traveler could not carry enough provisions on his back to last an extended journey. Assuming a three-quart water allowance per day at two lbs per quart, the traveler needs to carry eight lbs of food and water per day. A single week's rations, including water, would weigh 56 lbs, leaving little capacity for other necessities. It is for this reason more than any other that foraging and survival skills are important for those intending to embark on long treks that have few prospects for resupply.

Historical Ration Allocations

Although the fare may have varied, a weight of between three and four pounds per day seems to have been a typical allowance to keep soldiers active in the field. All armies were expected to add additional foods to the soldiers' diets whenever they became available. This could range from foraged seafood when on the coast, to a confiscated cache of local produce, to fresh meat when animals were available for slaughter.

Roman Marching Rations: Hardtack (*bucellatum*), flour or unground grain (*frumentum*) -- which was ground and baked in the field, bacon or salted meat (pork and mutton), dried lentils or chickpeas. Olive oil and fish sauce (*garum*) were also important. "Sour" wine called *acetum* was the common beverage but sweeter wine was also issued. Rations were consumed on a three-day rotation in the late Roman period: hardtack for 2 days and then bread on the 3rd; mutton for 2 days and salt pork on the 3rd; wine and sour wine on alternate days.

Mongol Cavalry: Dried meat, dried milk curd, millet, tea, and sometimes dried blood. Two flasks were carried, one held *qumiz* -- an alcoholic beverage made from fermented mare's milk. The other was used to reconstitute dried milk curd and blood with water. When in need, the rider could open a horse's vein and drink some blood.

Spanish Conquistadors: Traveling rations seem to have included hardtack, cheese, wheat, salted meat and fish, raisins, almonds, olive oil, honey, and wine.

Continental Army Rations: The earliest known legislation regarding rations for the Continental Army was passed on November 4, 1775. Each soldier was supposed to be allocated the following daily ration: 16 oz beef; 6.8 oz. peas; 18 oz. flour; 1.4 oz. rice; 16 oz. milk; and 1 quart of spruce beer.

British Navy Provisions: Hardtack, salted meat, dried peas, oatmeal, cheese, pickled cabbage (*sauerkraut*), beer, wine, and rum. Later, sauerkraut was replaced with lemons or limes (sailors were sometimes called "limeys"). Beer and wine lasted longer than water because of the alcohol content. When the wine turned to vinegar it was used in cooking and to disinfect the ship. A daily quotient of rum was issued because of its perceived health benefits, but it sometimes caused

drunkenness and morale problems.

Civil War "Iron" Rations: Salted beef or pork, hardtack, dried navy beans, and coffee beans. The pork was sometimes called "sowbelly" by the troops and they referred to hardtack as "teeth-dullers." In addition to being dipped in coffee, hardtack was sometimes fried in grease into a concoction known as "skilleygalee" or "hellfire stew." Regarding coffee, each soldier was supposed to get enough beans to make six strong cups a day. The Army also introduced desiccated vegetables. Steamed onions, potatoes, cabbage, turnips and carrots were pressed into thin sheets and dried. When boiled in water, they expanded into a vegetable dish sufficient to feed four soldiers. The meal looked very unappetizing, though, and tasted just as bad. Many soldiers called it "desecrated vegetables."

French Foreign Legion: In the Middle East men were organized into teams of two and a mule was assigned to each team. Each mule carried the equipment of two legionnaires and they took turns riding it. They could march long and far using this method. Six days rations were part of the mule's load and included sweetened hardtack called *kessra* or *ka'k*, salted meat, and dried figs or dates.

WWII Rations (Australia): Australian soldiers in New Guinea were initially issued rations that comprised of hardtack, canned beef, chocolate, tea and sugar. After 1942 rations improved and included canned fruit, dried potatoes, sausages, vegetables, jam, butter, and beans. Dried mutton was also occasionally issued and considered a treat.

WWII Rations (Japan): Standard Japanese rations consisted of polished rice, hardtack, pickled fruit (plums were a favorite), salted meat and fish, dried vegetables, soy bean paste, sugar, and sake.

Old Costumes, New Connivers

More Unexpected Takes On Classic Villains

by **Brian Rogers**

Every supers universe has them -- the villains who are canner than the heroes, using their powers to blind, befuddle, and bamboozle them before receiving that oh-so-cathartic punch to the jaw. What these villains may lack in firepower, they make up in deception, and if done properly they make the transition from the one the heroes hate to encounter to the one they love to hate. The trick, as always, is to give the players what they want in a supers universe, [but not what they expect](#). For these villains, add an extra dash of [Old Man Jenkins'](#) secret ingredient before dishing them out to your players.

Below are four classic villain styles, two of which are deception based. These two (with *Tri-Stat dX* statistics) use the cover of one of the other player-expected archetypes to throw the players off the scent.

The Time-Traveling Crook

Using futuristic technology, the Time-Traveling Crook has entered our present, usually because the future is dull. Like the Smart Guy With Henchmen, the Time-Traveling Crook sees this as a game -- a war game, or maybe the future equivalent of a LARP -- but his knowing either a) how it all turns out or b) that he can just skip back to his home time makes it fun (for him). He generally has advanced technology but no powers, and may have some of the 3045AD-S-Mart-equivalent shelf devices that the heroes see repeatedly. The Time-Traveling crook will also drop cryptic hints about things to come, asking the date by saying, "Have you married Amazonia yet? No? Okay, good." Generally indifferent to what his meddling does to the time-stream, sometimes the Time Traveling Crook will take actions that are incomprehensible without seeing the situation four-dimensionally, and heroes who can do so will get the jump on him.

The Master Illusionist

Either with inborn powers or advanced technology, the Master Illusionist is able to make people see things that aren't there. He works best when he can play the ignored man behind the curtain, but despite that many taking on this role are so foolish as to either directly confront the heroes or face them again after a revelatory defeat. The main problem with the Master Illusionist is that once the curtain is pulled back his gimmick loses most of its punch, so any returns have to place him back behind the curtain or relegate him to second class villain status.

Flicker

"Compared to mastery of time, your powers are merely seconds." -- Flicker

Frank Lake, a.k.a. Flicker, is a special effects expert who turned his talents to crime, constructing highly advanced holographic and audio gear for that purpose. He has little reason for doing this except realizing he *could*, and that he was sick of giving others the spotlight. He's only been at this for a few months, but has performed impressive thefts of both rare art and advanced technology. He uses the Muse as one of his inspirations, but in practice the two are more likely to butt heads than work together -- not that the

Flicker (130 points)

Body 6 Mind 8 Soul 7
ACV 6 DCV 13 Health 65

Characteristic Attributes

Muse would ever be so crass as to reveal a fellow performer's secrets to the audience.

Flicker has one major scheme: He misdirects opponents by appearing to have Time Travel. Half of Flicker's combat effectiveness comes from heroes not understanding what he can do. He always masks his illusions with a "time manipulation" deception: His invisibility is "time travel"; Illusions of himself let him mimic "intangibility via time slipping" or are "time drawn duplicates"; Illusions are "echoes of past or future events" or "fade back to their own time" when hit. When he's feeling outgunned he'll generate illusionary wounds that visibly heal via "temporal acceleration" and drop "weapons picked up from the 2024 alien invasion," trusting the heroes will try to disarm them while he escapes.

As for physical effects, his visible lasers are "temporally accelerated light," while his infrared laser combusts things via "hyper-time interacting with air molecules." His incapacitating attack actually overloads the optic nerve, but he'll expound that it's "temporally freezing neural pathways" -- he'll sometimes combine this with projected invisibility devices, so the target will vanish when hit and reappear when they wake up. When he does carry conventional gadgets, all of them are "jazzed up" to look futuristic. His devices self destruct when their charges end or if tampered with, leaving small burn marks. Anyone touching one will take some minor flame damage but will no doubt be convinced that they have disarmed a dangerous futuristic weapon.

Flicker wears a gold and silver jumpsuit with weapons pouches held closed by pressure sensitive magnetic seals -- other technology is built into his gloves and belt. He hides his identity behind a pair of goggles that both track eye movements to trigger his devices. He stands at a little under six feet, and has a trim but not overly muscled build. Flicker uses makeup to change his apparent age -- graying his brown hair, adding wrinkles, facial hair (apparently pork-chop sideburns are big in the future) and other distractions to maintain his facade. While in good shape for a normal man, he's no match for a costumed adventurer and he knows it, having no offensive combat training and hard earned experience at slithering from someone's grip. He trains with his weapons daily, however, and is a very good shot.

From a GM perspective, Flicker is a carte blanche to mess with your player's heads. He is also something of a scenery-chewer, if you want an opportunity to declaim your power.

He acts nationally, intimating that time and distance mean nothing to him. He'll place fake information about his activities into the media files of the towns where he operates (or onto the internet and national news databases, if they exist), so *any* quick checks will show him operating for decades -- albeit in towns where he's not currently active, to prevent easy questioning of would-be witnesses. More extensive checks may reveal that the information has just appeared, which time travel theorists might attribute to a chronal correction wave, a theory advanced in the papers of

Gadgets (4) Various explosive charges and "futuristic weapons"
Highly Skilled (2)
Item of Power (21) Battle-suit
Invisibility (6) Normal sight & sound (3 pt level), Duration 4, targets 1
Projection (5) 10m radius sight & sound. Duration 4 (10 min), area 4 (100m), Range 2 (100m) 4 projections
Special Attack (5) Incapacitating, Mind check at +1 to resist, No damage
Secondary Special Attack (5) 40 damage, Undetectable, short range (IR Laser)
Secondary Special Attack (3) 60 damage laser
Secondary Special Attack (2) Flare (Body -3), spreading, no damage, short range
Defense Combat Mastery (7)
Extra Attacks (1) only for suit functions.
Extra Defenses (1)

Defects

Inept Attack (1)
Skeleton in Closet (1) Not really a time traveler
Wanted (1) Warrants are minimal, as people think he's a time traveler
Vulnerability (1) Suit functions drop 3 levels when in high EM fields or under electrical current

Intimidation - Imperious (2)
Demolitions - small charges (1)
Unarmed Defense - Holds (2)

the deceased Dr. Madison Thoreaux (actually some pseudo-science gobbledygook that Flicker himself concocted and placed to be found).

Flicker will say anything he can to convince the heroes that he is a time traveler: pretend to have never met them before, allude to things that haven't happened yet, and make cryptic statements about future events. In general, he'll keep them off balance and confused enough that his limited powers can keep groups of heroes at bay -- provided they don't just shoot him. Flicker can be a returning villain for months before the players twig to what's going on or an interesting one shot to let the team detective show off. . Taking advantage of player credulity in as inherently flexible a genre as supers ("My teammate is a Greek god, why can't he be a time traveler?") can be mean, so you must play this fairly.

If the PCs catch him without catching on, he'll spin a story about his efforts to save the future, using his illusion devices to display a "chronal vision" of a post apocalypse dystopia which he is trying to avoid. Naturally this is just a con to get free, or even to use the players as dupes for his next heist. Once the players deduce his modus operandi, you can turn the tables on them -- travelers from a different timeline approach Flicker and he lays his hands on real time travel equipment. Revamp his powers and present a "boy who cried wolf" scenario -- now he *really is* a time traveler needing the heroes help to avert a calamity. Or maybe not . . .

The Supernatural Killer

In the world's dark places magic lingers, vomiting up things that were never supposed to exist. Vampires. Werewolves. Zalzozhny. Nowhere else is a super's heroic brightness more starkly defined than when battling these evils, often with no more than courage, as their super-strength and power blasts are simply more weapons to which the horror is immune. The supernatural killer knows that it has an advantage in that regard, and will play with its prey, and the heroes, either by genteel taunts in fog-shrouded alleys or by slipping past impenetrable barriers to claim protected prey. When fighting the Supernatural Killer, even the strongest heroes must borrow the tactics of horror investigators: slowly gathering clues, deducing patterns and not risking too much until they can strip the beast of its advantages and face it on even ground.

The Primeval Mutant

Superhuman power sometimes strips away the veneer of humanity and brings its possessor closer to being a beast. The mutations are often limited to natural weapons and inhuman durability, the Primeval Mutant is nonetheless a dangerous foe. He doesn't rob banks, leave clues or engage in verbal fencing, but instead has a combination of wits, instinct and woodland knowledge (or sheer berserker bloodlust, or both) that makes him a match for more directly powerful heroes. Sometimes the Primeval Mutants have slipped back too far and are *merely* [highly clever animals](#), but usually they have intelligence and goals that set them at odds with the heroes -- territory, wealth, unwilling companions -- or are in the employ of those who do.

Lady Menagerie

"You have no idea what you're dealing with." -- Lady Menagerie

Even with recent improvements, there are communities in the back woods of rural Appalachia where the conditions are far from great. Darla-Noreen Handers was born in one of those, to a family with lineage that snaked back upon itself more than once in its three century American history. Darla-Noreen grew up hearing story after story from her grandmother about how this great cousin had held off revenuers or that great uncle the moonshiner, and how too many kin marriages would bring their werewolf bloodline

Lady Menagerie

Body 13 **Mind** 7 **Soul** 8
ACV 9 (12) **DCV** 7 **Health** 225

Characteristics

back to the fore. Despite the modern education, when her own powers manifested (be it from natural mutation or exposure to dumped chemical gunk), and her pudgy, pug nosed form was replaced with a winged, clawed tailed, fur-covered monstrosity, Darla-Noreen understandably flipped out. She fled north, losing herself temporarily to madness and causing a new spate of [Jersey Devil](#) sightings.

Once she calmed down, Darla-Noreen read the accounts of her rampage, with their assumptions of supernatural powers: bullets coated with silver instead of Teflon, exorcists rather than Investigators. This sparked an idea, and now Darla-Noreen lives in a large, dilapidated mansion in the rural farmland southwest of Empire City, having driven the old owners away with haunting manifestations. She -- or rather, the Lady Menagerie -- stalks the woods, enjoying the fear of the townsfolk and keeping developers at bay. Sometimes she'll let the beast loose and ravage some livestock, and other times she'll enter the city for some pheromone-attracted companionship (who will wake to pinpricks across his body -- porcupines must mate carefully) or to engage in house-breaking to increase her cash supplies. While she can't live a *normal life*, she has decided she can live a *comfortable* one.

Lady Menagerie possesses the combined powers of the small woodland creatures near her Appalachian home: she's got a coyote's endurance, an opossum's tail (and power to play dead), a skunk's musk, bat wings, porcupine quills, moles claws, and so on. While as a human her she'd be a little over five feet, the combination of her canine foot structure and wings makes her appear larger, and her body is covered with a coarse fur that makes clothing irrelevant. While still of a human mind, her passions run closer to the surface -- she's acknowledged to herself that she goes into heat (though cannot interbreed with normal humans), that occasionally she needs to just run and hunt, and that she can get truly terrified or terrifyingly angry. She does a good job at reigning that in, but sometimes emotions get away from her.

While she laughingly refers to herself as a "Varmint-thrope," Darla-Noreen knows there's nothing super-natural about her. She also knows that having people think she is gives her an edge, so if directly confronted by a super she'll play up the Creature of the Night image, picking up an accent, shying away from religious icons, fleeing open flames and such before making a shape-shifting assisted escape. Once such an encounter occurs. Lady Menagerie will move her rampaging further afield. If the heroes start hunting her, she'll hunt them -- attacking in the city while they're looking into her rural activities, and vice versa, until she can arrange an encounter with them in her mountain home further south. Darla-Noreen will find these engagements fun, with plans of beating the heroes so decisively that they'll never bother her again. If her control slips, however, there might be a dead hero, a terrified mutant fleeing to safer climes, or both.

Armor (1) wings are unarmored
Attack Mastery (3) only when in Blind Fury
Animal Summon (2) Mammals, Area 3 (10m), Duration 3 (1 min)
Extra Arm (1) Opossum Tail
Extra Attacks (2) 1 level constant, 2nd only in Blind Fury

Deceptive Powers in *Tri-Stat dX*

There are a few super powers that are difficult to price out for games, in part because their potency is based almost entirely around player ingenuity. Deceptive powers such as illusion, invisibility, and shape-shifting fall into this category. *Tri-Stat* handles these powers in three separate ways: illusion casting, more precisely *projection*, has each extra level in the ability reducing the viewer's chance to pierce the illusion; Invisibility is a single cost per sense, with the options of partial and full; Shape-shifting into other humans is likewise a single point cost, while shape-shifting to anything else is based on the powers you get from the form, rather than the form itself.

For GMs whose focus is more towards information gathering than combat, or who expect that their players will find clever uses for minor powers, a different system might be needed. After all, in the existing rules invisibility to sight and shape-shifting to mimic any human costs out the same as the weakest Special Attack while being far more versatile. Fortunately, the Projection rules provide a good framework for adapting these powers.

Cosmetic Alternate Forms could be removed and replaced with *Shape-shifting* (different from the power of that name in *Big Eyes, Small Mouth*, which in *Tri-Stat dX* is *Partial-Powered Alternate Form*). This is the ability to assume another shape without any attendant powers. At its maximum it lets the character change into anything of the same mass -- the character could look like a giant frog, another person or a filing cabinet -- and costs 4 points per level. Reductions to the power would limit what the character can turn into: for example, 3 points could be all animals; 2 points, all mammals; 1 point, all humans. Higher levels in ability reduces people's chance of seeing through the deception, with each level giving a -1 on Mind checks to identify the character as not being normal. Characters like Changeling or Plastic Man have at most one or two levels of this characteristic (at the 3 or 4 point ranges respectively), as they keep their distinctive colorations when they change. Super-spies like the Chameleon are restricted to the 1 point ability, but have 8 to 10 levels in it, where even the brightest heroes can be fooled. Naturally, characters like Changeling will need Power Flux or Dynamic Powers to mimic the abilities of the forms they take, but now there's a simple mechanic for looking like something you aren't.

Likewise, Invisibility could be structured on this pattern, with the maximum level of the characteristic being invisible to nearly all senses costing 4 points (everyone should have some obscure senses that can penetrate the invisibility, if only as a plot element). Reductions to the power decrease the number of senses, based on concept and utility: perhaps at 3 points it's all visual senses; 2 points is standard sight; 1 point it's non-standard sight (such as IR vision for a Vampire or Android). There's a lot of room for leeway here, with GMs determining the power of any sensory combination. Again, each level in the characteristic gives a -1 to be detected; assume that 4 levels equates to conventional 'invisibility', as the reduction is now greater than an average man's Mind; after that, spotting the invisible man is done via secondary effects such as seeing puffs of breath, footprints, curtains moving etc., with modifiers for action like carrying visible things or making direct attacks. Levels less than 4 are transparency, camouflage or effective stealth. The Invisible Woman has the 2 point version of this characteristic (normal sight only). Judging how much harder she is to spot now than when she first appeared, she's probably bought it up from 4 levels to 8-10, with a cost more reflective of how useful she finds the power.

The Duchess Of The Gulls

for *GURPS Fourth Edition*

by Phil Masters

Note: This character is designed for the "Alchemical Baroque" setting described in GURPS All-Star Jam 2004.

The Duchess of the Gulls dwells on a tiny, fairly remote island in the White Archipelago. Her name means terror to the sailors of those parts, as she and her gull-subjects are forever swooping down and raining storms and potent curses on passing ships, many of which have been wrecked as a result. She has even been known to assail villages on nearby islands, and the scope of her reign of fear seems slowly to be widening.

She is clearly a powerful witch, but the people of the Archipelago do not really think of her as human. Those few souls who have seen her well enough to describe her, and survived, say that she is dark as night, though always clad in robes white as snow, and her words are as strange and incomprehensible as her actions. Her subjects are clearly no ordinary gulls, and old folk huddled round the fires say that some flocks in those parts have always been odd, but until the Duchess came, a bare five years or so ago, they had never been so terrible.

The White King is now looking for brave souls to end this terror, and shrewd adventurers might wonder if they should learn more about the Duchess before they set out to deal with her; but the true story of her life is as obscure and strange as it is sad and human.

Background

Many years ago, in a land far to the south, where the Southern Plains rise up to the rocky hills of the Solar Empire, a local witch took herself an apprentice, a clever young girl of useful talent. The girl learned fast, eventually matching her teacher, who by then was old and slow and toothless. However, the girl was less clever in love than she was in witchcraft, falling for the sunny smile of a local shepherd-lad who had broken several hearts before he came to her. She thought that no boy could possibly break a witch's heart, but there came a day when the shepherd-lad proved otherwise, saying unkind words to her before he went away whistling to tend his flock.

At his back, the girl grew terribly angry, and called upon powers that she had been told not to name, cursing the boy with ill-luck. That is not a good curse to suffer when you are tending sheep in a land of high cliffs and hard rocks; the boy was distracted by the petty troubles it brought him, and eventually slipped and fell and broke his neck. The girl had to pretend to herself that she was glad, but not show it to others.

The rest of the village guessed, though, and began to whisper behind her back, until she heard, and realized that she could never be happy there again. And so, she set out with certain souvenirs of her experiences, heading north, where, she had heard, the lands were as cold as a broken heart.

She did not *mean* to go terribly far north, but her heart had not been properly hardened yet, and several times, when she settled down somewhere for a while, some handsome foolish peasant lad or proud son of the gentry broke it again, and she would throw some curse, and set out before anyone could take revenge on her for that. By the time she had hardened her heart entirely, she had traveled beyond the edge of the land, out into the White Archipelago, where she at last found a place that was remote from the men she had come to hate.

She still found someone to talk to, mind; the island she had come to was occupied by a flock of gulls who were strange and interesting company, being in fact fairies who had settled here some years before in corporeal guise, and then forgotten, not only why they had done so, but much of their true nature. (They retained some supernatural power, however, being startlingly strong, and also able to call down strange fogs and create terror in the minds of mortals.)

They had no interest in breaking her heart, and little in the mass of humanity, and so she liked them; they saw in her a kindred spirit, wild and cold and somewhat lost, and returned her friendship.

The girl, now a woman, settled into a very old, ruined fisherman's cottage on the island. The supplies that she had brought with her, along with her magic and the aid of her new friends, sustained her for a while, and she soon learned to fish and to gather food, but she really needed much more, especially when she began improving her new home and working on new magics. Having foresworn the company of her own kind, and locked her heart away from all human sympathy, it was not hard for her to decide to take what she needed in whatever ways were most convenient for her. She began flying off across the sea with a few gulls as company, seeking out human ships and small villages, driving away anyone who sought to guard them, and taking what she desired. She used magic and plunder to make her house more homely, and settled down to improve her powers and extend her knowledge. She never thinks of herself as a tyrant or a terror; she simply cares not at all what others think, or whether they live or die. The only reason that she is striking further afield is to acquire more and different supplies, and because ships have learned to avoid the close vicinity of her island.

Very occasionally, when the Duchess needs supplies which she cannot obtain any other way, she dons plain clothes, boards a small sailing boat, calls up a suitable wind, and, escorted by a gull or two, sails to a distant port on the mainland, where her reputation is more or less unknown, to trade. She never enjoys these journeys, which she keeps as short as possible, but she can endure them. Still, any ignorant man who annoys her enough while she is in these distant harbors is likely to be in bad trouble -- possibly along with anyone else on the same ship, if he is a sailor or a traveler.

Defeating the Duchess of the Gulls would be hard work, as her gulls will defend her with the screeching fury of seabirds, while her own magic and cunning are very considerable indeed. She might most likely be driven away, only to settle in some other place, and to begin once more seeking solitude and simple comfort -- however much destruction she must cause in the process.

Game Details

The Duchess and her gulls are detailed below using *GURPS Fourth Edition*, aside from her magic, which still necessarily references *GURPS Magic* and *GURPS Spirits*. (Similar rules should eventually appear in *Fourth Edition* supplements.)

Instead of "Alchemy (Potion-Brewing)," witches should now take Herb Lore skill (treating it as equivalent to Alchemy for the purpose of creating elixirs), which can never differ by more than 2 levels from their Ritual Magic (Witchcraft) skill, and which cannot exceed their Pharmacy (Herbal)/TL4 skill. Herb Lore *can* be used to analyse elixirs in this setting, but at -2 to analyse the products of Herb Lore, or -5 for the products of any version of Alchemy skill. References to Flight (Unwinged) skill should be replaced with Aerobatics.

Because TL5 is now considered to begin around 1730 A.D., and this setting is technologically similar to our world c.1700, the base TL is now considered to be late 4 (although a very few natural philosophers and clever artificers may have reached early TL5). Also, wealth does grant free Status.

The Duchess of the Gulls (423 points)

A stern if attractive woman with jet-black hair, swarthy skin, and green eyes, always dressed in plain white silks, and usually carrying a short walking-staff topped with a human skull. Age 32; 130 lbs.

(Accented) [4].

Advantages: Ally Group (Gulls: 20 51-point characters -- less than 25% of starting points, appear 15-) [24]; Attractive [4]; Deep Sleeper [1]; Filthy Rich [50]; High Pain Threshold [10]; Less Sleep 2 [4]; Mystic Symbol 3 [30]; Ritual Adept 1 [10]; Ritual Aptitude 5 [5]; Spirit Empathy (Specialized, Fairies, -50%) [5]; Status +1* [0].

*Free from Wealth. (Even her victims think of the Duchess as having high Status, thanks to her nickname, practical power, style of dress, and manner.)

Disadvantages: Bad Temper (15) [-5]; Callous [-5]; Delusion (All men are heartless seducers above all) [-5]; Enemy (Some lords of the White Archipelago and hireling adventurers, as a Large Group, Hunter, Quite Rarely) [-15]; Loner (12) (Only with regard to humans, -40%) [-3]; Oblivious [-5]; Overconfidence (15) [-2]; Reputation (-4 as an evil sorceress, Throughout the White Archipelago, All the Time) [-10]; Stubbornness [-5].

Quirks: Refuses to worry at all that people are unnerved by her staff; Dresses like a stereotyped "ice witch," in white silk and silver (but disdains gold and jewels); Truthful when she feel no threat or stress. [-3]

Skills: Aerobatics-11 (DX-2, H) [1]; Boating (Sailboat)/TL4-13 (DX, A) [2]; Camouflage-15 (IQ, E) [1]; Dropping-12 (DX-1, A) [1]; Fishing-15 (Per, E) [1]; Herb Lore-18 (IQ+3, VH) [20]; Hidden Lore (Fairy Lore)-14 (IQ-1, A) [1]; Housekeeping-15 (IQ, E) [1]; Intimidation-15 (Will, A) [2]; Knife-13 (DX, E) [1]; Meditation-13 (Will-2, H) [1]; Naturalist-14 (IQ-1, H) [2]; Navigation (Sea)/TL4-14 (IQ-1, A) [1]; Pharmacy (Herbal)/TL4-18 (IQ+3, H) [16]; Ritual Magic (Witchcraft)-20 (IQ+5, VH) [28]; Stealth-13 (DX, A) [2]; Survival (Arctic)-15 (Per, A) [2]; Survival (Island/Beach)-14 (Per-1, A) [1]; Survival (Mountain)-15 (Per, A) [2]; Survival (Woodlands)-14 (Per-1, A) [1]; Weather Sense/TL4-14 (IQ-1, A) [1].

Paths: Cunning-16 [8]; Luck-16 [8]; Nature-16 [8].

Rituals: Journeyman's Curse-14 [2]; Read Thoughts-11 [8]; Veil-13 [2]; Ward-13 [6]; Weatherworking-16 [10].

Formulary: Antidote-16; Beast-Speech-18; Bird Control-18; Death-18; Endurance-18; Fear-18; Fire Resistance-18; Flight-16; Healing-18; Health-17; Invisibility-15; Invulnerability-15; Long Slumber-18; Love-16; Madness-18; Transformation-18; Vision-18; Water-Breathing-17.

Equipment: The short staff which the Duchess usually carries is topped with the skull of the first man to break her heart. She stole this from the graveyard the night she fled her home village; she was unsure why at the time, and might even have admitted that she had gone a little mad, but since then, she has made it into her Mystic Symbol, and always wields it while working her rituals. (Note that with this and her default in any path of 14, she can cast many rituals at default with a good chance of success.)

The silk gowns which she wears are always very plain in style and pure white in color. She rarely wears or carries anything else of any great value, apart from her potions (which actually represent the largest part of her wealth), although her home has a certain amount of valuable plunder casually scattered around it. She often has a small knife somewhere on her person, but would be unlikely to draw it as a serious weapon.

The Duchess's house holds a herbalism laboratory equivalent of "home workshop" quality. She usually has several elixirs to hand, including a couple of flight potions, and rides a broomstick when flying.

Fairy Gulls (49 points)

Apparently normal (and quite small) seagulls, plain white with yellow beaks and feet.

ST 4 [-60]; **DX** 13 [60]; **IQ** 8 [-40]; **HT** 13 [30]

Secondary Attributes: SM -3; Dmg 1d-5/1d-4; BL 3.2; HP 5 [2]; Will 10 [10]; Per 12 [20]; FP 13 [0]; Basic Speed 7 [10]; Basic Move (Land/Water) 5 [-10]; Dodge 10.

Social Background: TL 4 [0]; CF Fairy Society [0]; Norderwerten Spoken (Native)/Written (None) [-3].

Advantages: Amphibious [10]; Blunt Claws [3]; Damage Resistance 1 (Cannot Wear Armor -40%) [3]; Fearlessness 2 [4]; Feathers (Perk, equivalent to Fur) [1]; Obscure 7 (Vision, Area of effect increased to 4 yards +50%, Defensive +50%) [28]; Sharp Beak [1]; Temperature Tolerance 2 (cold) [2]; Terror (Hideous screech, Costs 2 FP) [27]; Unaging [15]; Winged Flight (Move 14) [30].

Disadvantages: Cannot Speak [-15]; Dead Broke [-25]; Indecisive (15) [-5]; Innumerate [-5]; No Fine Manipulators [-30]; Odious Personal Habits (-1, Constant screeching) [-5]; Short Arms (Both) [-10]; Social Stigma (Uneducated) [-5].

Quirks: Broad-Minded; Dislike holy symbols, True Faith, etc., and will avoid such things if possible; Distractible; Dull; Somewhat curious, and will summon the rest of the flock to investigate novelties. [-5]

Skills: Area Knowledge (Home Islands)-10 (IQ+2, E) [4]; Brawling-15 (DX+2, E) [4]; Fishing-12 (Per, E) [1]; Survival (Island/Beach)-12 (Per, A) [2].

Pyramid Pick

DragonMech (for the *d20 System*)

Published by [Goodman Games](#)

Written by Joseph Goodman

Illustrated by Niklas Janssen

240-Page Hardback; \$34.99

Fifty years ago the Moon grew closer and the Lunar Rain began, with meteorites flattening castles and scouring the soil of Highpoint to its bedrock. The closeness of the Moon enabled the strange Lunar Dragons to come to Highpoint and weave a path of destruction. The surviving inhabitants of Highpoint found their faith sorely tested, as their calls for divine aid went unheeded, the gods increasingly caught up in a war with the alien Lunar deities. Much arcane knowledge has been lost, but the closeness of the Moon has led to greater numbers of sorcerers, many of them Moon-ascpected. Survivors found safety in the Underdeep, the initial refugees accepted, but conflict erupting as later waves overwhelmed the subterranean settlements. Yet others found sanctuary and survival in mechanics and steam power.

The Dwarven Gearwrights Guild proposed and built the first "City-Mech." A thousand foot tall, steam-driven, stone-and-iron construct, it was a refuge for thousands, impervious to the Lunar rain and the predations of the Lunar Dragons, its legs hangars housing smaller mechs with just a few crew, these used for military missions. Whole societies have grown up in the City-Mechs: The Dwarves live on top with others buying space inside; the Thieves Guilds found a place as facilitators aboard; and many Halflings became Coglings, laborers, and technicians tending the oil and grease caked "Gear Forests" deep in the bowels of the City-Mechs. Some have found refuge underground as worm farmers, others as insect-riding nomads, and there are still surviving settlements. But the City-Mech is the focal point for survival and power projection in the Mechdom, a new type of nation consisting of territory protected by roving City-Mechs and other Mechs. The Dwarves of the Stenian Confederacy field five City-Mechs and the Elves, just the one. This is Tannanliel, built from the last enchanted trees of their forest homes, now shattered and scarred. The Legion, a heavily militarized human nation, led by the highly charismatic Shar Thizdic, has built another two after having held the Dwarf engineers that built them in near-slavery. The only Orc City-Mech is powered entirely by slave labor, while rumors abound of a City-Mech constructed by necromantic means.

This is the setting for *DragonMech*, the new *d20 System* supplement from Goodman Games, better known for their [Dinosaur Planet: Broncosaurus Rex](#) campaign setting, and the line of *Dungeon Crawl Classic Adventures*. It takes an "ordinary" fantasy world and overlays two other genres: big robots, best typified by *BattleTech* and *RoboTech*; and Steampunk. In previous games, Steampunk has been essentially Victorian in nature (which is of course, its original setting), but here the Steampunk is vested in and influenced by the fantasy genre. The look and appearance of the mechs is taken from medieval imagery and Da Vinci's drawings. The 'punk involves not cyberware, but "steamware," the Steamborg character class installing steam engines in himself and replacing body parts with iron replicants. This is a world, or rather a continent that has been forced to adapt in the face of a near-apocalyptic calamity, and in doing so, is undergoing the transition that is the death of magic and the adoption of technology.

DragonMech introduces no new races nor alters the standard ones, though they have adapted to the changing circumstances of Highpoint. As have the classes, in particular the cleric, who may not receive his spells if his god is distracted, but can spontaneously cast spells if against the Lunar Dragons. New Core classes are the Clockwork Ranger variant, who protect the gear forests; Coglayers invent and construct steam power devices; Constructors are variant wizards who specialize in building devices; the Mech Jockey crew the new lords of battle and power on Highpoint; and the Stalker is a rogue variant that tries to infiltrate the City-Mechs. The most interesting of the Prestige

Classes is the Mech Devil, half-monk, half-barbarian that applies martial arts moves to Mech combat!

Most of the new feats are Mech related, as are the spells; a new clerical domain -- "Engines" -- is also introduced. More interesting are Steam Powers, steam-driven devices built by Coglayers and Steamborgs that take time, money, and often-rare materials to construct. Each is built component by component to get various effects -- want a shoulder-mounted, Orc-targeting auto-crossbow? Take a repeating crossbow and add an Automator, a Targeter, a Discriminator, and finally a Scanner. This and other such devices *are DragonMech's* steamware, and while this is one of the several devices described, the emphasis is on letting a player build the devices that *he* wants.

DragonMech gives rules for mech construction and combat, as well as the society that has evolved in and around them. Construction goes into time and labor necessary to build both ordinary and City-Mechs, powered whether by steam, clockwork, slave labor, or through animated or undead means. Plenty of samples are given, their look and design far more akin to that of Games Workshop's *Warhammer 40,000* than *BattleTech*. Thus they have axes, chains catapults, buzz saws, steam cannon, swords, ripping claws, and so on. Mech combat is handled pretty much like *d20 System* combat, except that mechs are difficult and cumbersome to maneuver, let alone fight in. They are, however, easier to hit. In place of a high Armor Class, a mech has an inherent Hardness, which reduces the damage taken from an impact. For those living near the outer skin of a City-Mech, the clang of such an impact, whether from sword or projectile, can be deafening! Each mech also has four levels of Critical Threshold (green, yellow, orange, and red), and as a mech's Hit Points are reduced past each one, the greater the chance of critical hits eliminating important components.

New personal equipment is mainly martial in nature. They include anti-mech devices such as the Rust Bomb and the Magnet Bomb. The Flame Nozzle and the Steam Gun are man portable versions of their mech counterparts, while melee weapons are just nastier. For example, the Chattersword is a greatsword-sized medieval chainsaw that tears gruesome wounds that are not only slow to heal, but will also rip back open and continue to bleed if the victim takes any vigorous action! New armor includes Gearmail, sewn together cogs and gears in a rough and greasy fashion, while Pilot's Armor is a version of Studded Mail that is designed to be durable and protect a mech jockey in the places that might chafe while spent in a mech cockpit. But the best protection is provided by Hydraulic Armor, heavy, steam powered armor suits that give +10 protection, increases the wearer's Strength to 20, but impose a -8 Armor Check penalty!

Plenty of information is given about the continent of Highpoint and its changed circumstances. This includes its largest settlements and organizations, as well as the various City-Mechs, one in particular being more fully detailed. Secrets are suggested, such as ancient buried City-Mechs from the First Age of Walkers. New monsters include the Lunar Dragons and other beasts from the Moon, but also pests such as the Crumble Bug, which eats at the metal of a mech.

While the Mech are the focus of **DragonMech**, they do not have to be the focus of adventures or campaigns. Beyond discussing their use in a campaign from setting adventures within them, taking them to war, and using City-Mechs as mobile bases, the player characters taking the role of an Away Team, other options are suggestions. These include taking the Divine War to the Lunar invaders, rebuilding surface society, and exploring the ruins of the surface cities dungeon style. There is even the suggestion that the mech could be introduced into an already existing campaign world, but then so could the calamity that struck Highpoint -- though this is not covered. **DragonMech** is rounded out with an interesting set of Designer's Notes.

Physically, what strikes you about **DragonMech** is how gray it is. From its cog device used throughout to break up the text to the gloriously oppressive imagery of the mechs, the art conveys very effectively the feel of Highpoint. One image starkly captures Highpoint's condition, showing the world and its moon being held in a colossal hand, slowly being squeezed together. Grey might be said to be boring, but *not* here.

If **DragonMech** has one omission, it is the lack of detail given to the gods and faiths of Highpoint, except the Lunar gods and the proto-deity, Dotrak, The Great Engine. Otherwise, this is a skillful melding of genres, the author managing to create a reason to bring the three together and then do so without the effect feeling forced. The result is that **DragonMech** is a wonderfully flavorful blend of steampunk, big robots, and fantasy.

Collide-O!

Published by [Playroom Entertainment](#)

Designed by **Maureen Hiron**

Graphic design by **Elisa Anya Jaeger**

90 full-color cards, rule booklet (in English, Spanish, French, & German), 2-5 players; \$9.95

If *Brawl*, *Qwitch*, *Fightball*, *Icehouse*, *Blink*, and *Nodwick* aren't ringing your bell as far as turnless games are concerned, fear not: The pipeline always seems to have another one on its way, like Playroom Entertainment's *Collide-O!*

The object of the game is to be the first player to work through his deck so he has only one card remaining.

Each card is divided in three across its width, two ends and the middle. Each segment is a different color or set of colors. Blue, yellow, red, green, and black are the five basic hues, but two of these may be paired up into a striped pattern, and some cards put all five into a single section.

One card is placed face-down in the center of the table and the remaining deck is dealt out in its entirety as evenly as possible; extras are set aside in case they're needed. Each player draws the top five cards from his pile to form his initial hand. When everyone is ready, the card on the table is flipped face-up and play begins. There are no turns in the game -- you place cards from your hand on the table as quickly as your pattern-recognition skills allow you.

To play a card, you must overlap the one(s) already played. You cannot simply match one end color to another end color, however; the card you play must overlap the end and middle colors of the card on the table. That means if the game begins with a card that has black in the middle and red and blue on either end, your card must have black on the end and red or blue in the middle depending on which end you want to add onto. In this way, the cards spread out in both directions, forming a long chain. If players aren't fast enough, your card changes the colors needed to play and your opponents have to cough up a new one from their hand, costing them valuable seconds.

If one of the cards (yours or the one you want to overlap) has a striped pattern, you can play a card that matches either of those colors, and the five-color layouts allow you to match any color. Each time you play a card, you may draw a new one from your deck, but your play options are limited to the hand of five. If someone catches you (or thinks they do) using a card that doesn't match the current layout, they can challenge you. Play pauses, and if they're right, you are now limited to a hand of one less card (the first challenge leaves you with a four-card limit, and so on). If they're mistaken, they must wait for a card to be played at either end of the line before playing any more of their own. When someone empties their deck and is left with only one card, they win.

The cards are tough items, and the colors are bright. The game lacks much more in the way of illustration, though the full-color rulebook is nice and clear. The game also provides the rules in Spanish, French, and German.

It's a challenge for adults, but this is a good game for pulling in the younger set as well. It's a good teaching tool, demonstrating pattern matching and colors in an entertaining setting (Playroom Entertainment once again earns its name).

One of the drawbacks of the game is the length of the card arrangement. It gets longer as the game progresses, so

players have to make sure they have enough space lengthwise on the dining table or floor. Another minor glitch: Since only the end cards can be played on, the rules note you can push the other cards together to save space. Bad idea, given the shifting instability of this line. The rules also direct that if everyone is stuck, take the previously played cards from each end until you can continue. It's unlikely the game will deadlock thus, but if it does, the last card played is probably the only one you can spot -- the others jumble together pretty quickly. You may also have to revert to one of those unused cards if the first card offers no play options. No matter the problem, it's better to tell players to just play off a brand new line of cards rather than follow all the switches the rules recommend.

Turnless games that require players to slap cards down in a flurry seem to be a prominent theme these days, and every time one such makes it to the market it seems certain the idea has run its course. If there's a misstep to be made, however, *Collide-O!* isn't taking it. Another fast and furious enterprise, the speed of this game is paired with the need for mental sure-footedness, making it as exciting and stimulating an entry as its predecessors.

--Andy Vetromile

"It's Like *Wagon Train* in Space, Only as a Western"

I've been doing a lot of thinking lately about various genres lately (for various Day Job projects I'm not really at liberty to talk about, but which has a [certain irony](#)). And I had an epiphany today that, admittedly, the rest of the gaming industry has been having for a long darn time (and no doubt which [Chad Underkoffler](#) emerged from the womb with) but which finally sank in.

Namely, there *aren't* any genres.

Or, more correctly, there aren't any pure genres.

This first came to light when we were discussing horror, and it was mentioned that horror isn't a genre so much as an element that is added to *other* genres. Modern-day horror. Depression-era horror. Victorian horror. Dark ages horror. And so on. Horror is something that can be added easily to other genres:

Horror + Fantasy = *Vampire: Dark Ages* or *Ravenloft*.

Horror + Western = *Deadlands*

Horror + Cyberpunk = *Cthulhupunk*

So far, so good. But, I immediately realized, horror isn't unique in that regard. For example, "Magic" is another common element that isn't a genre unto itself, but rather an element that is added to other genres.

Cyberpunk + Magic = *Shadowrun*

Sci-Fi + Magic = *Fading Suns*

Noir + Magic = *Bloodshadows*

And – pay attention to this one --

Dark Ages + Magic = *Dungeons & Dragons*

Once I had the epiphany about magic, I realized that the granddaddy of all "genres" -- Fantasy – wasn't a genre at all, but rather an amalgam of a vague historical atmosphere coupled with magic.

And it's at this point where the idea of "genres" starts crumbling, revealing itself to be a pigeonholing technique to keep our mortal minds from turning into gibbering piles of goo. But it's too late for me, so let's persevere.

Think of your video store genres:

- Drama.
- Action-Adventure.
- Comedy.
- Anime.

Think of any of your bookstore genres:

- Romance.
- Mystery.
- Thriller.

And, yes, horror.

These are all things that, for the most part, aren't considered to be genres in the gaming world, but rather tools; you can add as much romance, comedy, and drama to a game as you can stand. You can run a mystery or action-adventure tale in almost any game. And you can always make something horrific.

Even the splinter granddaddy of all genres – science fiction – isn't a genre, per se, but rather a lens. It's a tool to examine and portray the effects and implications of technology on one end of the spectrum (the "pure" end), or an excuse to replace six-shooters and swords with blasters and forceblades at the other end of the spectrum (the "gobs-of-money-generating" end).

In this way, then, while a particular book or story might be classified as a "genre" (a love story set entirely in the modern day could rightly be classified as a romance), in the gaming world these designations don't have as much meaning because, for the most part, most genre elements can appear in most other settings.

Consider the real world. It is, by all accounts, the most mundane place most of us will ever live in. And yet, within it, we can find elements of all "genres." The real world has given us romance stories, tales of magic and miracles (or at least events that many believe to be such), horror (Son of Sam), mysteries, drama, and so on. Even things that *seem* distant from our world are, in fact, close to home: Debates over stem cell research and unilateral collection of data we consider personal are science-fiction stories, played out in real time.

These are all great platitudes, but what does it mean for gaming? Namely that, if we can obviate our mind's (and media's) desire to pigeonhole everything into a genre, it can open up a whole range of possibilities. You can add what you want intrinsically to a campaign, and can leave open other possibilities as adventure types.

On some level, this is all material that the real world figured out long ago; like I said, I'm a bit slow in putting the pieces together. But many others realized this long ago, and we have a plethora of games, books, and settings as a result:

Mystery/Detective	+	Medieval	=	Ellis Peters' "Brother Cadfael" stories.
Supers	+	Victorian History	=	<i>League of Extraordinary Gentlemen</i>
Pulp	+	Revolutionary War era	=	<i>Jack of All Trades</i>

Obviously, it is possible to go to far. For example, if you were to cram together supers, horror, fantasy, magic, time travel, and action/adventure, you'd end up with . . . well, the standard Marvel or DC Universe. But that's beside the point.

I'll probably be revisiting this theme over the next few months, but for now I'd leave you with three thoughts (which, again, the Underkofflerians have known for a long time, but so what?):

Within an existing game, it's quite possible to expand the possibilities of a campaign to include new genres, changing the focus but not the premise of the game. For example, a *Deadlands* game might focus on a group of 1890s medical investigators, turning the game into a *C.S.I.*-esque Western/Horror/Police Procedural.

When designing a new setting, or deciding on the focus for a new setting, it's possible to throw together almost *anything* you want; chances are something like it has been done already, so you'll have some justification. (Obviously, I'm grossly oversimplifying here; if it was that easy, we'd all make our own million-selling genre-crossing innovation.)

When looking at what seems to be an existing genre, consider that it may actually be composed of multiple pieces. (Again, a standard fantasy setting is really a mediievally magically delicious part of your gaming diet.) Separating them out into their components might open avenues to tweak an existing setting not by adding more, but by changing or subtracting what's already there. As an exercise in this, consider what the DC or Marvel Universes would look like without super-powers, but with everything else. (Batman could exist, but Superman couldn't. The "Spider-Man" might be an ordinary guy who invented web-shooters. Magicians, gods, and time travelers could adventure side by side, but without mutants or cosmically enhanced humans.)

For extra credit, the next time you're at the DVD section at your local gargantuan retailer, pick up a stack of random movies and see if you can sort them into genre categories other than the ones they'd normally be found in.

--Steven Marsh

A Recursion of Phoenixes

"For the egg was now red-hot, and inside it something was moving. Next moment there was a soft cracking sound; the egg burst in two, and out of it came a flame-coloured bird. It rested a moment among the flames, and as it rested there the four children could see it growing bigger and bigger under their eyes. . . . The bird rose in its nest of fire, stretched its wings, and flew out into the room . . . and where it passed the air was warm. . . . Then Cyril put out a hand towards the bird. It put its head on one side and looked up at him, as you may have seen a parrot do when it is just going to speak, so that the children were hardly astonished at all when it said, 'Be careful; I am not nearly cool yet.' They were not astonished, but they were very, very much interested."

-- E. Nesbit, *The Phoenix and the Carpet*

Death comes on swift wings, the hieroglyphs read. And reading the hieroglyphs beneath this portent can take a little longer than we think. It can take all the time in the world. Above these chiseled symbols, however, is something more than the sun and less than forever. It is, as I alluded to above, bringing death, gripped in its talons and hanging below its blood-red wings. Is it the [griffin](#)? Is it the [Mothman](#)? Well, you're getting warmer . . .

"They have also another sacred bird called the phoenix, which I myself have never seen, except in pictures. Indeed it is a great rarity, even in Egypt, only coming there -- according to the accounts of the people of Heliopolis -- once in five hundred years, when the old phoenix dies. Its size and appearance, if it is like the pictures, are as follows: The plumage is partly red, partly golden, while the general make and size are almost exactly that of the eagle. They tell a story of what this bird does, which does not seem to me to be credible; that he comes all the way from Arabia, and brings the parent bird, all plastered over with myrrh, to the temple of the Sun, and there buries the body."

-- Herodotus, *The Histories*, II:73

Along with Herodotus, we begin our phoenix hunt in Egypt, and like Herodotus, we see it first in pictures. Specifically, we see it in the hieroglyphic sign *benu*, which means the sacred bird of Osiris, dead and reborn -- as Osiris says in the *Book of the Dead*, "I am the *benu* which is in On, and I am the keeper of the book of things which are and shall be." By the time Herodotus heard it, the word *benu* may have been pronounced more like "vwanee" -- add a Greek "x" on the end of that to indicate a foreign loan-word, and you've got "phoenix." Or, it may have come from the word *phoinikos*, meaning "deep (or bloody) red," after the bird's red plumage. Or from the word *phoinix*, meaning "palm tree," in which the phoenix bird legendarily roosts. Or from Phoenicia, the land from whence both dark red (*phoinikos*) dye and phoenixes came. Or the other way round.

And we haven't even got to the (deep red?) fire yet -- the earliest mentions and depictions of the phoenix don't include it. The early phoenix is royal, solitary, and most of all, extremely long-lived (estimates range from 340 to 97,000 years, with 500 being the mode). Hesiod refers only to the phoenix' lifespan; Herodotus introduces the connection to the Temple of the Sun and the immense ball of myrrh containing the dead phoenix. Ovid changes that into a nest of myrrh built by the dying phoenix, from which (either the incense or the corpse, it's unclear) the newborn phoenix rises. Pliny offers helpfully that a worm is born from the dead phoenix' bone marrow, and then grows into a new phoenix. It isn't until the 4th century A.D. that Lactantius (possibly inspired by Pomponius Mela's description of the pyre lit by the Egyptian priests for the dead phoenix) describes a phoenix spontaneously combusting and being reborn from its own ashes. This version made it into a popular poem by Claudian, and then into the most common bestiary of the late classical era, the *Physiologus*, from whence it comes down to us, reborn every few centuries in fire and incense.

"We do not know why birds behave this way, but we know they do. We do not know who the people were who first saw and spoke of the bird which gathered aromatic plants to make use of them, but we know that they really must have seen this. We cannot say who first observed a bird in a burning nest, fanning the flames with its wings, but we can say that they actually saw such an incredible sight."

-- Avram Davidson, "Who Fired the Phoenix?"

Looking for the phoenix bird, rather than the phoenix legend, produces even more smoke and even less fire. The *benu* hieroglyph depicts a [heron](#), usually identified as the purple (or deep red?) heron, which unlike the phoenix is not at all rare. However, Egyptian depictions of the *benu* bird (as opposed to the hieroglyph) look more, to my eye, like a

crested pheasant, such as the golden pheasant of China. This bird is rare (even more so in Egypt), and inspired its own legend in China, of the *feng-huang*. This spiritual bird appears only at times of good fortune, but isn't self-born (although it is sometimes described as hermaphroditic). An even more exciting possibility is the bird of paradise, which at least some Australian anthropologists believe that East Indians traded to the Phoenicians and Egyptians, packed in myrrh to preserve the feathers. Nobody has any really convincing explanation for the fire of the phoenix, except to point to the now well-documented habit that some birds have of ecstatically "anting" with burning branches, and with aromatic plants and seeds.

"By virtue of this Stone the Phoenix is burned to ashes, in which she is reborn. Thus does the Phoenix molt her feathers, after which she shines dazzling and bright, and as lovely as before. However ill a mortal man may be, from the day on which he sees the Stone, he cannot die for that week, nor does he lose his color . . . Such powers does the Stone confer on mortal men that their flesh and bones are soon made young again. This stone is also called the Grail."
-- Wolfram von Eschenbach, *Parzival*, IX:469

Medieval scholars had similar problems with the firing of the phoenix. Some said it was done by the Egyptian (or Indian, or Ethiopian) heat, others said the phoenix flew high enough to burn himself on the sun, some brought in helpful Egyptian priests, and a few claimed the phoenix set itself alight and fanned the flames with its own wings. But the best theories posited some inner power within the phoenix, either arising from the act of death itself, or from the act of birth. Wolfram von Eschenbach described this inner power as the *[lapis exilis](#)*, the Grail; other authors noted that the phoenix ate only ethereal food such as sunbeams or manna from heaven. Christian bestiaries saw the phoenix as an obvious allegory of the Resurrection. To the alchemists, the phoenix embodied the Alchemical Marriage, joining sulfur and mercury, fire and air, the "Humid Work" (involving the putrefied corpse of the phoenix producing a worm) and the "Dry Work" (in which the phoenix reduces to ash, which compresses to an egg). Phoenixian mystification continues; [Nostradamus](#) cites a mysterious "Phoenix Emperor" in his Sixains, and in the Centuries describes him as being the only one who sees a "secret writing." The phoenix appears to murky intent in the Rosicrucian manifestoes, the work of D.H. Lawrence, and the poetry of Apollinaire and Yeats.

"Manilius also states that the period of the Great Year coincides with the life of this bird, and that the same indications of the seasons and stars return again, and that this begins about noon on the day on which the sun enters the sign of the Ram . . . Cornelius Valerianus reports that a phoenix flew down into Egypt in the consulship of Quintus Plautius and Sextus Papinius; it was even brought to Rome in the Censorship of the Emperor Claudius, A.U.C. 800 and displayed in the Comitium, a fact attested by the Records . . ."
-- Pliny the Elder, *Natural History*, X:2

After all that, it's no wonder that many mythographers simply write the phoenix off as a solar symbol. And indeed, it's not that much of a stretch. There is only one phoenix in the world; there is only one sun; both are in the sky. The sun is bright red; the phoenix is bright red, or even red-gold. The phoenix dies in the west (in the City of the Sun, no less) and is reborn; the sun "dies" in the west and rises again the next day. They get around the whole centuries-long lifespan thing by noting Manilius' assertion that the lifespan of the phoenix is the same as the Great Year, a complete cycle for the sun and planets. Tacitus' 1,461-year lifespan of the phoenix lines up with the Sothic cycle meshing the sun and Sirius. Even more creepily, the 972 generations that Hesiod (in the 8th century B.C.) ascribes to the phoenix matches the precession of the equinoxes almost perfectly. This may tie into the earlier Greek name for Polaris, the pole star: Phoenice. Polaris, of course, is yellowish-white, so it can't be referring to the color, this time. Perhaps it hints that the phoenix, like the [roc](#), anchors the heavens.

*"My ashes, as the phoenix, may bring forth
A bird that will revenge upon you all . . ."*
-- William Shakespeare, *Henry VI, Part Three* I:iv:35-36

That may not be a good thing, of course. The phoenix, after all, has purchased genetic immortality at the cost of undeath. The notion that the "worm" of the new phoenix emerges from the (blood-red) bone marrow gets me thinking creepy thoughts. Is the phoenix a vampire? It only dies by fire, after all, and myrrh *is* a funerary spice. In the Septuagint, Job puts it clearly: "I shall die in my nest, and multiply my days as the phoenix." (The King James Version translates *chol* as "sand" rather than "phoenix," which gets me thinking about undying silicon life forms.) Linguists

may squabble over the connection between *phoinikos* ("bloody red") and *phonos* ("murder"), but you and I know there's something going on there. Robert Graves rings further changes on the name, tying "phoenix" to Phoenissa, "the Bloody One," a title ascribed to Asherah, a.k.a. Astarte, a.k.a. our old friend [Cybele](#). Speaking of Cybele, her cultist, the exceptionally creepy Emperor Elagabalus, ate a phoenix to gain immortality. He was (bloodily) murdered, instead.

"As for longevity, that it liveth a thousand years or more; beside that from imperfect observations and rarity of appearance, no confirmation can be made . . . For the tradition being very ancient and probably Egyptian, the Greeks who dispersed the Fable, might sum up the account by their own numeration of years . . . For if we suppose our present calculation, the Phoenix now in nature will be the sixth from the Creation, but in the middle of its years; and if . . . Prophecies succeed, shall conclude its days not in his own but the last and general flames . . ."

-- Sir Thomas Browne, *Pseudodoxia Epidemica*

So what do we have? We have a mysterious singular [deep red](#) entity whose birth and death mirror that of the heavens themselves. ("The sky was rolling like a burning phoenix," says Apollinaire, whose solar cognomen bears some watching.) Its power is drawn from Outside, through a Stone Fallen From Heaven, perhaps the pyramid-like [benben](#) of Heliopolis, fallen in the Zep Tepi, the Zero Time, to become the first spot of solid ground. (Heliopolis, and presumably the *benben*, now rest under the streets of Cairo, a city named after the bloody-red planet *al-Qahira*, or Mars.) It reappears in a regular pattern we can almost make out; 540 years (the phoenix lifespan according to Pliny) separate Hecataeus (Herodotus' source for the phoenix legend) from the documented appearance of the phoenix at the court of Claudius in 46 A.D. Three more cycles take us to 1666, and the Great Fire of London. Alaric's burning of Rome (a city symbolized by a phoenix) in 410 is a Sothic phoenix-span away from the Great Chicago Fire in 1871 (the year after the settlement of Swilling, Arizona was renamed Phoenix). If the roc is the preserver of creation, then perhaps the phoenix is the eye of destruction, opening when the blood-red stars come right and collapsing the universe into the sublime alchemy of the fiery furnace. Past becomes present, death becomes birth, and the world [restarts again](#), until the phoenix sees one it likes.

Dork Tower!

Dork Tower!

More Questions than Answers

Chasing Girls

by Chris Aylott

Take a look at the picture on the back of the new *Dungeons and Dragons* Basic Set box.

Three boys and a girl have the game spread out in front of them. One of the boys holds the rulebook, and he's the geekiest of the four. He's the only one in glasses, and his hair slicks back in a vaguely unfashionable way. He's the Dungeon Master, the surrogate figure for the prospective buyer of the game.

The other two boys are clean-cut, well-dressed, a little more athletic in appearance, clearly the cool kids. They're smiling, glancing at each other, having a good time playing the Dungeon Master's game. Seated in between them is the girl. She's pretty, and she's staring rapt at the Dungeon Master.

I guess that's why they call it a fantasy roleplaying game.

As usual, Hasbro has its audience pegged. The typical entry-level *Dungeons & Dragons* player is 13 years old, male, bright, and probably not one of the cool kids. It's been this way since *Dungeons & Dragons* got big in the 1980s, and it's no surprise that most of today's roleplayers are bright (but not cool) guys aged 13 and up.

Roleplaying guys share another trait with that kid on the *Basic Set* box: We want to see girls staring at us from across the table. We may want the perspective they bring as players, we may want friends on the other side of the gender divide, we may just be horny. One way or another, roleplaying guys talk a lot about bringing more women into gaming.

Are we kidding ourselves or what?

Oases in the Desert

Of course, women have always been acknowledged as part of the roleplaying community. Even in the first edition *Advanced Dungeons and Dragons Dungeon Master's Guide*, one of the unnamed "other characters" is played by a woman. (She's playing the magic-user, the one who gets bitten by a spider.) There have always been a few women in the hobby who will play with the boys on their own terms.

The presence of women in gaming is also growing, seemingly in fits and starts. Most gamers attribute the presence of more women to the release of games that better fit their interests. The poster chylde for this argument is *Vampire: the Masquerade*, which brought in a legion of new roleplayers interested in the political skullduggery of undead fashion plates.

Many of the new *Vampire* players were women, and while the game didn't create gender parity in roleplaying, it helped the balance somewhat. Since then, gamers and designers have been hot on the trail of more games that will bring more women into the hobby.

So far, not much luck. The *Sailor Moon RPG* became a sleeper hit when it caught the attention of young teen girls, and the Tri-Stat system has continued to appeal to both sexes with a variety of anime-influenced properties. However, most of the last decade's roleplaying games have done little to build any new audience, much less an audience of women. Even the successful *Buffy the Vampire Slayer RPG* seems to draw more attention from male Buffy fans than women.

Twelve years after *Vampire's* debut, the involvement of women in roleplaying seems to have improved only incrementally. The designers haven't given up on drawing more women into gaming, and the latest effort -- Green Ronin's *The Blue Rose RPG* -- is due to hit the market in a few weeks.

Blue Rose bills itself as a game for Tamora Pierce and Mercedes Lackey fans, but its marketing efforts seem to be concentrated on the existing gaming community. The game is likely to be a success, especially since existing (mostly male) gamers are already considering the system for running games based on the novels of Steven Brust, the Glorantha setting, and even *Star Wars*. However, it's unclear how the game will reach new gamers outside the hobby market, especially women gamers.

Isn't there something missing from the equation here? Even if a game like *The Blue Rose* succeeds at being attractive to female players, how is the word about the game going to get out of the male-dominated RPG community and attract them?

If You Want It Done Right, Send a Woman

At Attactix Games in Aurora, Colorado, it's easier to reach a female audience than you might expect. That's largely because of Manager/Buyer Heather Barnhorst. With more than a decade of management at Attactix under her belt, Heather is one of a growing minority of women in positions of power at gaming stores around the country. She also works as a management consultant for game stores, runs a volunteer retailer feedback service for manufacturers, and is writing a book on making game stores more "female-friendly."

Barnhorst started out as a part-timer at Attactix, and says she took the job because "it was an opportunity for me to get out of the house and spend some time with adults. My kids were toddlers and I was a stay-at-home mother in much need of some intellectual stimulation. Why I thought a game store was a place where I would get that I don't know!"

When the *Pokémon CCG* became a hit in the late 1990s, Barnhorst began working more hours, ultimately taking over the positions of manager and buyer when one of the owners decided to focus on the company's miniature production arm.

"I think that my being a mom during the *Pokémon* craze really helped the store," she says. "Moms drive kids around. Moms take kids to stores. If they buy in, moms will be more willing to fork out the bucks." Barnhorst's empathy with other moms made them feel welcome and helped drive sales.

The importance of that empathy was underlined when a new competitor took the opposite approach with its customers. In 1999, the Apocalypse Gamer's Guild opened up less than five miles away from Attactix.

"It was a beautiful store," Barnhorst says. "Wood fixtures. Beautiful lighting. Cappuccino bar. Everything I would like Attactix to be in terms of aesthetics. But they didn't like kids. And they didn't have any employees who liked kids. They would make fun of us to their customers and call us that place where all the kids hung out. They really worked hard to make our kid-appeal work against us."

"They are out of business. We are still going strong."

Even after the *Pokémon* boom ended, Attactix kept the boys, girls, and relatives who buy for them in the store with *Dungeons & Dragons* groups and a Games Workshop club. Barnhorst says, "None of those initiatives would have happened except that I, as a mom, noticed that my kids wanted to play these games but had nowhere to play them. So we created programs so that they had a community."

Barnhorst doesn't think that Attactix's success with *Pokémon* was all due to customer service. Attactix was able to make the most of the game's appeal, but the game's design also played a big role in its success. She says, "*Pokémon* is an inherently friendly, even cuddly game. No one is really bad and no one gets beaten down and there wasn't a lot of smack talk going on."

"Lots of little girls loved it too. Even if the moms couldn't play, they could collect. We used to hold trading days before the leagues started, and we would get like 50 people showing, mostly the kids with their moms."

By contrast, she says, "*Yu-Gi-Oh* is very in-your-face. Boys seem to like it because of that. I don't see a lot of girls involved. A few dads. And no moms." She thinks this difference in involvement is a big reason why *Pokémon* has sold much better than *Yu-Gi-Oh*.

A Woman's Place is Behind the Counter

Heather Barnhorst was the first woman to join Attactix, but not the last. Two other women currently work in the store, and several other women have worked there over the past decade. Barnhorst says the female presence has changed the dynamics of the store and even the behavior of its customers.

She says, "There's more cleanliness and order. More emphasis on teamwork. We put a ton more emphasis on aesthetics, and move product around more. We reach out better to kids and women customers. I think moms trust us more because we can talk to them on a level that they don't talk to male employees."

The change in attitude has spread to the male customers, many of whom once showed off the worst traits of gamer subculture. "One day," Barnhorst says, "a historical miniature gamer calls up. I answer. He says, 'May I talk to someone who knows something about games?' Then he tells me that he isn't used to talking to women. Who would have thought it?"

Today, that's not so much of a problem. Barnhorst says, "The store doesn't allow the women to get away with not being knowledgeable. We are expected to help every customer who walks through the door. These days, the guys are much less likely to think of me as a woman first and a gamer second."

Attactix isn't a non-sexist utopia. "My most trying moments," Barnhorst says, "are when I see teenage boys wearing shirts with slogans that are disrespectful to women. And I still catch some of my regulars staring at a pretty woman when she comes in like she is from another planet."

Nonetheless, she says, "we make inroads on perception."

Taking the Show on the Road

Recently, Barnhorst has been applying her management expertise to helping other stores broaden their appeal. Her trade show seminars, writing, and private consulting cover a variety of targets, but creating female-friendly stores is a special focus. She says it's a topic her clients are hungry to learn more about.

Barnhorst says, "I've gotten a tremendous reception at trade shows, but these are retailers who are self-selected to want to expand their business any way they can. They understand that making businesses female-friendly makes them everyone-friendly."

Enthusiasm for improvement doesn't always translate into action, however. Even stores with a mixed-gender staff can sometimes have trouble seeing what changes to make. Barnhorst has met a number of husband/wife retail teams that don't always see eye-to-eye on how to run the store. She says, "I often hear, 'I told him that but he wouldn't believe me. I am so glad that you talked about it.' Which is kind of sad in some ways but thank goodness they are getting the information now."

Then there are the stores that apparently don't want women in them at all. Barnhorst says, "One owner that I know of gave his managers *Playboy* subscriptions as gifts. That's a terrible attitude to take into the work place. It cuts you off from a large segment of your customer base and it cuts you off from some very valuable employees."

Despite these throwbacks, Barnhorst is optimistic for the future. She says, "I do believe that women within the industry

will help us bring more female consumers into our stores. If we have to evangelize one store at a time, one product at a time, then that is what it will take."

I don't know if I share her optimism -- I have too much faith in the ability of the game hobby to foul its own nest. But Heather Barnhorst's work at Attactix seems to have changed the way they do business. They hire more women, they reach a wider variety of customers. Most importantly, they sell more stuff.

Pokémon and *Vampire* proved that it was possible to make hobby games that appeal to more than just boys of all ages. But the Attactix experience suggests that a female- and family-friendly environment can expand the hobby and keep new players after the hot game cools off.

Is it possible that the future of women in gaming depends more on who's working in the hobby than on who's playing in it? What if who's selling the game is as important as what's in it?

Ad-Verting Disaster

or, "Over 181 Billion Served"

by Eric Funk

"Didn't you have ads in the twentieth century?" "Not in our dreams! Only on TV and radio. And in magazines. And movies. And at ballgames. And on buses. And milk cartons. And T-shirts. And bananas. And written on the sky. But not in dreams! No sirree!"

-- Leela and Fry, *Futurama*

Advertising permeates this modern world. Billboards line streets, bright logos fill pages and borders of newspapers, T-shirts, hats, and even 25% of most television channels' time. Every year, some children's shows add and remove characters to keep with the toy lines. Many transit companies rent the space on the outside of buses and the space above the inside windows. Flyers and coupons fill mailboxes, while some businesses cover the exterior of their buildings with large signs. Rental and shipping companies put large logos and ads on the side of their vehicles (many companies with corporate vehicles do this). Last, but not least, above this article, one will find a [random ad](#) for a fine Steve Jackson Games product.

Advertisements represent a medium that is often ignored by role players and is easily phased out by characters; this could be a sneaky way for the GM to present Plot hooks and Red Herrings. In addition to distractions, in a game world, they can also represent subtle clues and foreshadowing. One Example is the billboard for "Cloverleaf Industries" at the beginning of *Who Framed Roger Rabbit*. It is not revealed important until the end of the movie, but the clue was there. Ads could be read out as the party is traveling, walking about, looking out a window, or otherwise not doing anything "active." In the flood of information, the GM could include one or two ideas in the event that the players fail to catch on to a clue, or miss a cue to use one particular ability. If a GM suddenly starts describing ads to players, many groups will suddenly go on edge, fearing obvious Red Herrings and plot hooks. A more passive approach is to only add them in when adventurers ask "what's on?", be it in reference to television, radio, or other newscast.

A blanket term for advertisements, publicity stunts, product placement, and anything that in general gets more people to buy the product is "product awareness." With regards to product endorsement, some of the dangers and controls are discussed on p. IST96. Merchants and super heroes are two of the more logical adventuring types to accept corporate sponsorship. Heroes without secret identities and other celebrities may be approached by firms who will give them items with their company logo. Gifts of watches, shirts, hats, and/or towels are not infeasible. "Our watches can go anywhere, even into ancient ruins!"

"But there's one good thing about broadcasting to a town full of mindless sheep: I always know I've got them exactly where I want them! Mwahahaha!"

-- R.J. Fletcher Jr., *UHF*

Ads for the same company could be positive or negative for the same product type. Negative ads may attack may attack opponents' products, or show deficiencies in public works. "Has this happened to you? Buy our product and you will never see this happen again!" Alternately, they may describe the product in sarcastic tones, such as "Don't try us. We're highly addictive."

Unless people are told to look out for certain products/services/company names (or have Eidetic Memory), most people have trained themselves to ignore the ads that don't apply and thus will not retain them. While driving through an area, parking signs are consciously ignored. Children usually ignore ads for retirement homes, while seniors do the same for toy commercials.

Some industries may be forbidden to directly advertise to the public. While it may not be strictly illegal, there may be

ensorship boards set up to restrict publication of political criticism, racial comments, pornography, [tobacco](#), or even alcohol. In *GURPS* terms, countries with high Control Ratings, competition to government-owned contractors may also be forbidden from advertising.

"Organize for Anarchy!"

-- On the cover of *GURPS Illuminati* (First Edition, Third Printing)

The below represents a generalization for an ad. The words in the main table are modern, but generic enough to be adapted to most settings. To use this, roll once on each of the tables below, and on the appropriate sub-table if the "product/service" result is marked with an asterisk (*). This system has potential to report up to about 181 billion advertisements.

Using the Tables

To use this system, roll once for each of the tables until you get to the Product/Service table. On the Product/Service table, roll 4d to determine the Category, and then 2d or 3d as appropriate to find an end result. If it is marked with an asterisk (*), then there is a matching detail table below.

1d Purpose

- 1-5 Selling/giving/fundraising
- 6 Buying/collecting/lottery

1d Market

- 1 Child
- 2 Teenager
- 3-4 Generic
- 5 Adult
- 6 Senior

2d Angle

- 2-3 Positive
- 4-8 Negative
- 9-10 Both
- 11-12 Neither

1d Approach

- 1 Flashy
- 2 Loud
- 3 Assertive
- 4 Average
- 5 Soft
- 6 Subtle (perhaps no description)

1d Ad "Space"/Time Slice

- 1 Tiny / Very Short (5 sec)
- 2 Small / Short (10 sec)

- 3-4 Average
- 5 Large / Long (2min)
- 6 Huge / Infomercial (3+ min)

2d Apparent Budget

- 2 Cheap - looks like pre-school children made it
- 3 Low-budget - slow/cheap animation/props
- 4-7 Average
- 8-9 Expensive - good effects, perhaps a famous actor
- 10 Hollywood would be proud.
- 11-12 Two-phase. Roll twice on this table.

2d Ad Type

- 2 Union/employees
- 3-4 (roll twice)
- 5-7 Regular
- 8-9 Testimonial
- 10 Sponsor
- 11 Owner
- 12 Franchise

1d Prices

- 1-2 Regular
- 3 Sale
- 4 Seasonal
- 5 Prices about to rise
- 6 Coupon/"Mention this ad"

2d Style

- 2 50 (or more) years ago
- 3 25 years ago
- 4 10 years ago
- 5 Plain
- 6-9 Normal
- 10-12 Weirdness

2d Product Age

- 2 Outdated
- 3 Old/Last Season
- 4-7 Current
- 8-9 New!
- 10 Coming Soon
- 11-12 Next Season

"Mooshi! Mooshi!"

-- Sarah the *Astroburger* Spokescow, [Transhuman Space Toxic Memes](#)

Other Channels

An alternate method may be to use the first two tables above, then roll on the "[What Happened Today?](#)" table by Matt Riggsby, and turn it into an ad. A roll of "Fugitive" could be a wanted poster, "Nosy Official" may be a political poster. If nothing logical springs to mind, it could be an ad for a local theater group doing a play on it.

Transhuman Space Toxic Memes is a great read if one is interested in roleplaying ideas involving structured thoughts, including commercial PCs. (See also *GURPS In Nomine* Ethereal characters for personified ideas.)

Pyramid Link

- "[Influencing Groups and Societies in GURPS: Playing to the Crowd](#)" by Matt Riggsby

The Omniscient Eye

When Buying a Kingdom, Who Do I Make the Check Out To?

The [9/17 Omniscient Eye column](#) mentioned that six carts of pure gold would be enough wealth to buy "a mid-size Medieval kingdom." How would PCs go about making such a purchase--could they just stroll up to the local monarch and make an offer? What would happen to the original owner?

--Adrienne Traxler

The local monarch wouldn't sell, so the question is moot. The Omniscient Eye hopes you've found this answer useful. Next time, we'll be handling a question about how effective four-sided dice would be puncturing tires during a high-speed chase . . .

What, you want more detail? Oh, okay. To say that six carts of gold (or any amount of treasure) would be enough money to buy a kingdom was probably misleading. It could buy enough small, individual territories to make up a reasonably sized kingdom, but that's not quite the same thing. To pose a modern analogy, buying a few shares of stock in a few large companies means a brief phone call to your broker; buying *all* the shares, even if you've got the cash to buy them at their nominal price, means fluctuations in stock prices, tense negotiations with major stockholders, and long talks with the nice folks at the SEC. Transfers of land in many societies, particularly on a large scale, are tied up in legal, political, and social implications. Since the answer for the first question was based on economic conditions in Medieval Europe with some reference to classical antiquity and the edge of modernity, we'll attempt an answer here based on political, legal, and social conditions prevailing for the same area and period.

You're unlikely to find someone willing to sell his entire kingdom for cash, no matter how desperate; there's no record of such a thing having happened in the ancient or Medieval period (although the British arguably purchased sovereignty from some rulers of subject territories in the 19th century). Even if we ignore the unlikelihood of someone voluntarily giving up a position of power in any society, real wealth and financial security are, in most low-tech societies, represented by land. The first thing someone with money but no land would do would be to try to acquire land, making the whole thing an exercise in futility. The story of King Lear draws a vivid picture of the reception a king without a kingdom might receive. It's fictional, but it's also probably what a king would expect to happen to him. Those few individuals who are willing to give up positions of power, and there have been some, generally want to become monks or otherwise leave the trappings of wealth and power behind. Money, in that case, will be the last thing they want.

This is not to say that you can't exchange money for land and/or power. Monetary exchanges were a common feature of Medieval diplomatic settlements. But the hows and whys were complicated by the ways land and its ownership were regarded. We'll start with considering how terms we might take for granted (like ownership and purchase) might be seen in a very different light.

First, there's the question of ownership. For a large chunk of the Middle Ages in much of western Europe, land didn't "belong" to someone. At least, not in the way we'd understand it today. A variety of rights and privileges can be attached to any piece of land: the right to farm the land, graze animals, build (which could be subdivided into building types: someone might be allowed to build a house but not a mill or a castle), collect various rents, fees, and payment in kind and/or labor, deliver justice, dig mines, and so on. Each right might have some obligation attached to it: paying monetary rent, a share of produce, or providing more or less specified kinds of service to an overlord.

Why Buy When You Can Rent?

Not only are large-scale purchases of land rare for the period in question, there was actually a trend *away* from owning land that wasn't dependent on someone else. We have a number of records of owners of free land entering into feudal relationships by "giving" their land to a lord and having it awarded back to them

Ownership might be regarded as having a large bundle of rights without quite so many obligations.

The problem with this idea of ownership, particularly in early Medieval France and Germany and to some extent in post-1066 England, is that rights rarely came without matching obligations, and each of these rights could be held separately and might be "rented out," so they were distributed among different people. A peasant with the right to cultivate a particular field, a local lord with the right to collect rent from the peasant and settle disputes between him and his neighbor, and a king with the right to collect taxes from the lord and exercise other kinds of jurisdiction over the territory, could all claim the land in some way, none of which was exclusive ownership in the modern sense.

as a fief. Why? Because along with your obligations to your lord, your lord has obligations to you. Being plugged into a large system where you have more powerful allies to call on was, in those uncertain times, often a greater benefit than having legal authority over a patch of farmland.

There were, of course, exceptions. More unified property rights remained in parts of Italy (which retained vestiges of Roman legal traditions), Spain (Spanish kings granted colonists broad rights over land taken over from Muslim kingdoms during the Reconquista), and the non-feudal Byzantine empire. For much of Europe, though, more recognizable ownership rights slowly revived later in the Middle Ages.

So, then, there were degrees of ownership, and PCs interested in buying territory must decide whether they want political authority (the right to call on feudal military obligations, try cases, issue currency, etc.), more purely economic benefits (rents from fields, fees for animal grazing, proceeds from monopolies over milling and other industries), or a combination. Rich, powerful people would have both, but people who weren't members of the nobility could nevertheless obtain broad economic rights.

Then there's the question of buying. For much of the Middle Ages, again mostly in France and Germany, property rights were, in a word, sticky; the technical term for these rights is *seisin*. If someone had exercised rights to a piece of land in the past, it was difficult to completely alienate (that is, permanently assign to someone else) those rights, making purchases a risky proposition for the buyer. If there were a dispute about the terms of the agreement (or, more likely, succession after the buyer or seller's death), someone who could demonstrate having or using the land longer or farther back (that is, claim *seisin*) would have a significant advantage in court which could easily take precedence over later written contracts.

And even assuming the potential buyer and seller can come to an agreement, other people may have a say in things. In many places, the seller's relatives could object to the sale of land and, if the purchase went ahead anyway, could take it back by refunding the purchase price. Also, in the Medieval system, in order to do anything particularly interesting or novel, one often had to get permission from someone else. "Getting permission" usually meant "paying a fee," but that can raise the effective price, and refusing permission is a possibility if the overlord doesn't like the buyer. Even bigger fish might step in: the Byzantine empire maintained a class of peasant soldiers who were awarded land in return for military service. About the only right these soldiers didn't have over their land was the right to sell it, and occasional surveys by the imperial government would forcibly return control over that land from local magnates (who might have attempted to take the land over as repayment for debts incurred) to the soldier families.

The usual way around problems of purchase was to rent out one's rights. Someone with money could get practical use of the land, but the original landholder nevertheless retained a tie to the land as well, even though the lease might be nigh impossible to break and of theoretically infinite duration. The original owner (or his descendents) retained an interest and under certain circumstances could take it back, so it's not quite ownership.

So, then, how do you go about buying a kingdom (or a dutchy or a county)? Specifics vary, but we can sum up the process in four principles:

1. Get in the game.
2. Hide the purchase.
3. Plan to buy part, not all.
4. Take, don't buy.

Getting in the Game

Since land in these settings is closely tied to political and military power, transfers of land don't begin or end with handing over a sack of cash. Instead, giving land to another person is usually a means of establishing or consolidating an alliance. So if you want to get land from someone else, you'll have to establish yourself as reliable and useful, not just rich.

The reason getting close to a ruler is so important is that in Medieval Europe, and, in fact, many other societies, power and privilege travels along personal lines rather than through abstract, impersonal offices. Rather than carrying out something like a modern job search, a ruler who wanted something done would often find someone close to hand and say "You, there! Take care of this." History is rife with examples of habit turning the most trivial functionary into a powerful officer of the court in this fashion. The Carolingians, rulers of what became the Holy Roman Empire, started out as high domestic functionaries for their Merovingian predecessors. Likewise, at [the Byzantine court](#), a great many important officials had titles reflecting their original personal and domestic functions (master of the bedchamber, keeper of the wardrobe, etc.).

So how do you get a busy ruler to bring you into his inner circle? That's a fundamental problem of social engineering, but martial ability is generally well thought-of, both the ability to fight and the ability to raise and lead troops. The European feudal system grew out of arrangements between a ruler and "his men," a group of companions and retainers which generally equated with the core of a military force. Even as a ruler's retainers moved out of the royal household itself and into feudal domains under his authority, they remained his most important military assets in an age where "government" was often little more than a support system for a scattered military force.

As it happens, military prowess is a trait that PCs tend to have in spades, so they're probably already prepared to move into a position of some prominence. And once the heroes are in that position, they can make themselves appealing candidates to become subordinate holders of property. Even more good news for the heroes is that the powers that be may approach *them*. As early as 1302, when the French crown was in dire need of cash, royal officials canvassed the kingdom in search of wealthy men who might be willing to exchange money for a noble title and attached lands. If the ruler of whatever kingdom the PCs live in has thought of this fund-raising scheme, it's particularly likely that PCs will be approached. And since, again, feudal nobility form the core of the nation's military and PC treasure hunters have a demonstrated ability to kill things, the king can get both an injection of cash and a very effective soldier (or group of soldiers) at the same time.

But even being rich, by itself, can attract attention. Medieval rulers, like modern governments, encountered budget shortfalls to be made up by going to lenders. With carts full of gold, wealthy adventurers become potential lenders who may be approached by the crown. Better still for ambitious PCs, one frequent way of repaying creditors was to temporarily assign rights to various territories to them, making them, if not feudal lords, then at least people with a certain position of authority in the system. There's even historical precedent for adventurer-turned-lender-turned-royal-agent. Bertran de Castellet, a Catalonian knight of the mid-12th century, apparently acquired a lot of loot fighting Saracens in his early days and loaned significant sums to the nobility. His name appears repeatedly in the kingdom's financial records as he did increasingly important business with the sovereign (rising to a position of considerable trust, handling a large survey and audit of a large part of the kingdom), pausing every now and again to return to the battlefield, where he served valiantly, for fresh infusions of cash.

Hiding the Purchase

Our very few historical examples of buying nations aren't quite what they sound like on the surface. The most famous is when the Roman senator Didius Julianus "bought" the Roman Empire at auction in 193 AD. After his predecessor, Pertinax, was assassinated, Didius realized that in order to become emperor, all he really needed to do was to bribe the Praetorian Guard, who were at the time aggressively playing the muscle behind the throne, and have them recognize him as emperor. Pertinax's father-in-law, Titus Sulpicianus, figured that out as well. The two engaged in a bidding war which Didius won, but it did him little good. His crass method of attaining the throne inspired popular revulsion, the Senate resented him for bypassing them, and he lacked the support of legions in the field. No less than three provincial

armies set out for Rome, each declaring its own general as the new emperor; they met and settled their differences before reaching the capital, united by their desire to see Didius gone. Didius lived a trifle over two months after buying the empire. All of which, we suppose, serves as an object lesson in how not to acquire power.

A great many attempts to buy power fall into this category. It's not outright purchase of somebody else's position; it's a bribe to people who can legitimize your position. That is, the people you're paying don't own whatever it is you're buying; they're just in a position to say who *does* own it. This took place at all levels of the hierarchy, from pretenders to noble authority paying a fee to a court so that they wouldn't have to document their pedigree to Charles V of Spain paying off the German electors who eventually named him emperor.

Didius's story also illustrates an ambiguous attitude towards monetary purchase present through history. Money was useful, but in many ways seemed the wrong medium for dealing with something as important and personal as land. Taken together with conservative property rights, it was therefore often important to make it look like land wasn't being purchased. Rather, it was a good idea to make it seem like the land was changing hands because of more important bonds.

Land generally traveled along family lines. If you're not fortunate enough to be directly related to a major landholder, there's always marriage. Marriages at many levels of society were accompanied by a transfer of land. It's generally believed that at least some marriages were a cover for the real transaction, trading authority over a piece of land for money. For this to work, both parties need to bring plausibly marriageable relatives to the table with them in addition to their money (on one side) and land (on the other), a task which may be complicated by local standards. For example, marriages across religious lines may be frowned on, and remarriage after divorce or the death of a spouse can be problematic (as it was, for example, for Henry VIII, although not everyone can seize control of their own church). Compatibility of the prospective couple was rarely an issue.

There are also future risks. The giver still retained some claim on land granted through marriage. The original owner might be able to demand it back in the case of divorce or death of the spouse, and the owner's family retains a claim in case of a disputed succession when the buyer dies. If the buyer isn't the one getting married (for example, if the buyer is already married and therefore using a child or cousin as a pawn), there's always the chance that his surrogate will, at some point, want to exercise his own control over the land rather than acting as a figurehead. And, finally, the spouse may serve as a spy for the seller's family in the buyer's house.

Wills are also a dodge around the problems of direct purchase. Among the few examples we have of true transfers of real estate in the early Middle Ages are bequests to the church. From time to time, landholders would leave property to a monastery, a cathedral, or some other institution (the practice went well beyond Europe; mosques and Hindu and Buddhist temples were benefits of similar bequests). This was in part an insurance policy for the afterlife, but like marriages they probably also hid monetary transactions. The church might pay now for land later; a relatively young church leader might cut deals with relatively old landholders as a long-term strategy to build up the land he has power over. One individual might try to leave a bequest to another as a means of hiding a purchase, but if they aren't related or at least closely associated (for example, a faithful retainer or important vassal), the bequest might be contested by family members. This is another situation where a convenient marriage can be a useful aid.

Buying Part, Not All

If you're trying to buy power, the best you're likely to achieve is to be able to buy part of what someone else has. After all, if land is granted to solidify alliances, it makes little sense for the one dealing it out to have no power base left. If you want to buy a kingdom, go to an emperor. If you can only find a king, the best you're likely to get is a barony, and so on down the scale.

But there can be ways around that. If your PCs are fortunate enough to be in an expanding kingdom, they may be able to obtain relatively unencumbered property rights by moving into newly conquered lands, as happened in Spain during the Reconquista or in the Middle East during the Crusades. Technically,

But I Want It!

Okay, so we've demonstrated that buying a kingdom is ahistorical. But does that mean it's absolutely impossible? It'd be exceptional, certainly, but exceptional things happen from time to time, particularly to PCs. So under what circumstances might one

this might not be regarded as *buying* land, since what they're likely buying is the opportunity to conquer new land (which takes nothing away from the "seller"), but buying the license to expand their own holdings keeps them under the legal protection of the ruler in question.

There may also be ways of playing an existing system. The feudal system was never an exclusive arrangement (at least, not until the end, at which point it was largely obsolete and challenged by new institutions outside the traditional framework), with each member of the hierarchy owing all of their allegiance to the next person up the ladder. Instead, feudal ties meant specific and limited obligations and benefits. In return for his fief, a knight might owe his lord two month's military service every year, a fixed sum of silver, and a pair of cows every Michaelmas, and that was where his obligation ended. It was entirely possible for someone to owe fealty to more than one lord. Extremely clever and personable PCs might be able to build alliances with multiple overlords, owing each different duties for different pieces of land and gathering authority over multiple territories. If they can get enough land and authority from enough different sources, they may be able to cobble together a single large domain of their own.

Take, Don't Buy

Ultimately, a kingdom may not be something you can just pay money for. It's something you must achieve. PCs can use money to position themselves, to garner attention and influence, to acquire assets with long-term value, but taking a crown will require more decisive action. This leaves a rich PC with four options if he wants to become a king once money alone has taken him as far as it can.

First, political expediency may, on rare occasions, make the creation of a new kingdom a viable option. Again, the purpose would be for a ruler to establish a useful alliance, and in this case try to realize some benefit from territory he doesn't actually control. For example, the Roman empire would sometimes recognize native chieftains as the rulers of disorganized border regions. This helped the Romans by giving them a ready-made ally they could work with and helped the chosen chiefs by legitimizing any royal ambitions they might have. This was often a prelude to conquest, but was occasionally an attempt to cut losses, as when the collapsing empire recognized a kingdom in Dacia, which the Romans had previously abandoned (or, since we're talking fantasy, like when Cirion granted abandoned Gondorian lands to Eorl the Young after the Rohirim saved his bacon at the battle of Celebrant). A wealthy would-be ruler who can establish himself as a political player on the border of a powerful country might conceivably buy recognition. He'll still have local enemies, but it might be enough to make at least some neutrals and potential enemies fall in line.

Second, he can wait for the current king to die (or have him assassinated) and, like Didius Julianus, bribe the people who decide who the next king is to pick him. In many societies, the crown didn't necessarily go to the king's closest relative. Support by influential people and formal election processes might intervene. However, just one death may not be enough to get an upstart PC plausibly in the running. A few more candidates might need to be taken out as well.

Third, he can make a more direct bid for the throne: use the money to raise troops, attack the current king, and seize the throne. It might throw the kingdom into turmoil, but the right of conquest was fairly widely respected. If a PC can take a throne (and keep it against any other powerful noblemen or neighboring kingdoms inclined to take advantage of the situation until things calm down), people will be likely to take his claim seriously.

conceivably purchase a kingdom?

The circumstances would probably be completely unique. Say, a mildly insane king who wants gold more than legal authority and an independent aristocracy who wants an ineffectual figurehead on the throne. And despite prevailing attitudes towards land and money, it's just possible that governing a region might be more trouble than it's worth. A ruler desperately strapped for cash could conceivably sell all his rights to an area which ties up far too much of his time, energy, and money, essentially creating a new kingdom. If it's *that* much trouble, no one is likely to make a counter-claim, so the purchasing PCs can safely call it their own. Of course, they're also buying the problem: barbarian raids every summer, a constantly rebellious population, desperately poor tax revenues, or (again, since we're talking about fantasy) a dragon demanding annual tribute from the king or a curse on the province. The PCs might make themselves lords of Brigadoon, but what good does that do them if they can only collect taxes on one day every hundred years?

Fourth, he can gather up as much power as he can and simply declare himself king (or emperor or whatever). It takes a strong and loyal base of support in his subject territories and followers without a vested interest in retaining ties to any other rulers. It sounds inelegant, but ultimately that's how just about every kingdom has started. If you say you're a king and nobody's in a mood to contradict you, then congratulations. You're a king.

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Designer's Notes: GURPS Fantasy

by William H. Stoddard

GURPS Fantasy has the same name as one of the very earliest *GURPS* supplements: the one that introduced the world of Yrth as a standard setting for fantasy campaigns. But its concept is entirely different. Essentially, it's an entirely new book. It was meant to do for fantasy what *GURPS Space* had done for science fiction: offer a guide to developing new campaigns in its genre, without being tied to any specific setting or campaign concept.

But doing that job meant that, in some ways, it had to be a different style of book. Science fiction is set in the real world; even if it's in "a galaxy far, far away," it's supposed to have the same natural laws that apply here and now -- or a reasonable extrapolation from those laws. Fantasy isn't tied to natural law at all. A fantasy writer can make up a different world, with a different set of laws, as long as it allows him to tell good stories.

The stories are what's important. People have been telling stories ever since the first language was spoken, and a lot of things keep turning up in different stories, over and over. Cultures all over the world have legends about dragons and ghosts, shapeshifters and faeries, magical spells and mysterious omens. They capture our imaginations. So a fantasy roleplaying game has to be able to capture all of them in its rules.

I wanted to offer a comprehensive look at the possibilities of fantasy gaming. Existing fantasy games were one of my reference points. But they weren't the only one. I wanted a book that could be used to create a campaign based on myths, legends, and folklore, or on the latest novel or film. So when I worked out rules and game mechanics, I was constantly thinking about all this material, and asking myself, "Can the rules of *GURPS* do this? Is there a way to tweak them so they will?"

Writing this was a long process, long enough so that *GURPS* started down the road to a new edition while I was working on it. *GURPS Fantasy* ended up being the first supplement to the new edition. Making everything fit the new rules was a demanding job; it would have been impossible if Sean Punch and David Pulver hadn't been infinitely patient with my questions and confusions. But it was also rewarding. The new rules took a lot of haphazard improvisations from past supplements and put them all together into a much more coherent system, one flexible enough to do almost anything. Writing *GURPS Fantasy* gave me a chance to figure out some of what it could do.

Of all the things I worked on, the most challenging was the treatment of magic. Standard *GURPS* magic is designed to make mages effective in combat. This style of magic is very common in roleplaying games, all the way back to the first appearance of *Dungeons & Dragons*. But it's not the only style in fantasy, or even in fantasy gaming. Treatments with different assumptions can be found in games such as *Mage: The Ascension*, *Ars Magica*, *Amber*, and various games based on fantasy books or films. For *GURPS Fantasy* to be generic and universal, it had to provide ways of handling many different styles of magic. At the same time, I didn't want to make up a lot of new systems, or even one new system; that would have been reversing one of the main design goals of the Fourth Edition, one that its authors struggled hard to accomplish. So I explored three main paths to alternate magic systems: adding optional boosters to the core system; changing one of the assumptions of the core system; or taking a different system that already existed in *GURPS*, and interpreting it as a form of magic. For example, interpreting psionics as magic gave me the concept of trance magic, usable by shamans, yogis, and people from similar traditions.

But for reasons of space, I discussed such variations at a somewhat abstract level. I had ideas for more detailed variants of magic, based on specific cultural traditions, but not enough space for all of them, even in a 240-page book. So here's one of the ideas I didn't have room for: a treatment of the supernatural in medieval European terms, focused on priests and other holy people. Medieval Europe, and fantasy worlds modeled on it, including Yrth in the forthcoming *GURPS Banestorm*, are still the most common setting for fantasy campaigns. A GM who wants a more mystical Yrth, or an original fantasy campaign with clerics can borrow this material. It illustrates how to apply some of the magic system design approaches that *GURPS Fantasy* discusses, and how to fit them to a specific type of story setting and image of the supernatural.

In a medieval European campaign, the dominant form of Christianity will usually be Roman Catholicism, or something parallel to it. Any treatment of the supernatural needs to be compatible with Catholic theological ideas, as developed by such thinkers as St. Augustine, St. Anselm, Pierre Abelard, and St. Thomas Aquinas. Here are three different "clerical magic" systems that work within that framework: a directly religious treatment of the supernatural, a synthesis of religious and magical approaches in a school of Christian white magic, and a Christian spirit magic tradition of calling on angelic aid.

The Operation of the Church

The Roman Catholic Church is a vast administrative hierarchy, with a system of internal ranks. Being granted one of these ranks is called ordination. The ceremony of ordination must be performed by a bishop. Anyone who has been ordained has a Religious Rank. Priests are Religious Rank 3 and above, up to the Pope, who is Religious Rank 8. Deacons are Religious Rank 2, and various minor orders are Religious Rank 1. It's also possible to devote one's life to prayer and worship, as a monk or nun, without being ordained; treat this as Clerical Investment (in effect, Religious Rank 0).

The primary function of the church is to perform religious rites. Catholic doctrine distinguishes two kinds of rituals through which divine grace can be granted: sacraments and sacramentals. The distinction is akin to the one in the *GURPS Basic Set* between two versions of the Symbol Drawing skill (p. 224). A sacrament is inherently effective because God promised that it would be. A sacramental is effective because God chooses to respond to certain kinds of appeals instituted by the church.

There are seven recognized sacraments, all said to have been performed by Christ during his ministry: baptism, confirmation, communion (or the Eucharist), penance, matrimony, ordination, and extreme unction (sometimes called last rites). These basically affect the legal and theological relationship between the worshiper, the church, and God. Many of them serve as "rites of passage." Because they're divinely ordained, an ordinary failure doesn't prevent them from working; the benefit of a successful Religious Ritual roll is that the congregation is moved by the ritual, seeing it as a sign of God's presence. On an ordinary failure, the congregation is not moved. On a critical failure, some necessary element of the ritual was omitted, and the sacrament was not actually performed. As a rule, this should only apply under stressful circumstances; regularly performed rituals would have +5 to effective skill and normally would not require a skill roll at all.

There are not a fixed number of sacramentals; the church can institute new ones. But there are several standard categories: benedicens, or blessings; confessus, or public admission of sin; dans, or giving alms; edens, or meals; orans, or prayer; and tinctus, or the use of fluids such as holy water and consecrated oil. A failed Religious Ritual roll means that the sacramental was ineffective, but again, standard rituals give +5 to effective skill and don't normally require skill rolls.

One important sacramental for game purposes is exorcism, or the casting out of demons. This is classed under orans. Any priest can attempt an exorcism; the skill of Exorcism defaults to Religious Ritual-3 or Theology-3. Some priests are specifically trained in Exorcism, and there is also a minor order of exorcists (Religious Rank 1). Exorcism is a Will-based skill, reflecting its dependence on faith; a failed Exorcism roll can lead to problems, as described in the *GURPS Basic Set*.

Sacramentals can also produce objects or substances with supernatural powers, such as holy water. Demons and monsters may be afraid of these, unable to approach them, or even subject to injury from contact with them. The blessing of a church and its grounds is a sacramental, which has these effects on the entire site, and raises its Sanctity Level (discussed in *GURPS Fantasy* as a parallel to Mana Level) from Normal to High.

Holy Powers

In addition to the normal operations of the church, certain people are strongly devoted to God and are granted special abilities in His service. In *GURPS* terms, they have True Faith. The benefits gained from True Faith fit into the same

general categories as the sacramentals. However, they're not limited to fixed forms proclaimed by the church; they gain their power from the belief of the individual worshiper.

One thing that a person with True Faith can do is to bless other people. Such a blessing lasts until it's needed, but then is used up. One possible blessing would be one use of the Heroic Feats version of Blessed. Another is Armor of Faith, defined in *GURPS Fantasy*: a single use of defensive Luck, with a Pact requiring fulfillment of a minor vow (for example, paying for a mass of thanksgiving).

True Faith can also be used to pray for a miracle. Then the GM rolls for God's reaction. (Depending on the world, an actual miracle may require a Good, Very Good, or Excellent reaction.) Having True Faith grants +3 on this roll. What kind of place the prayer is offered in affects the outcome, with a modifier of 0 on consecrated ground, -1 in a hastily consecrated site, -2 on unconsecrated ground, or -3 in a ritually desecrated site. Contact with a holy relic gives an added +1.

(God can choose to grant other prayers as well, especially those made in holy places. *GURPS Fantasy* provides rules for this. But people who have a single prayer granted aren't set apart as saints.)

True Faith aids in the performance of exorcisms. An exorcist who doesn't have Blessed, Power Investiture, or True Faith is at -4 on his skill rolls. At the GM's discretion, being blessed by a person with True Faith can avoid this penalty for a single attempt at exorcism.

At the GM's discretion, True Faith may also aid in the performance of sacramentals, giving +4 to Religious Ritual rolls made under stressful circumstances.

Finally, many holy men also have one or more levels of Charisma. This can enhance their ability to move a congregation by performing a religious rite. It won't affect the chance of God answering their prayers; this sort of Charisma is a gift from God and can't be used to influence Him!

Christian White Magic

Christians may take up the practice of magic, as the lawful exercise of gifts granted to them by God. A Christian mage may even see magic as his calling, and Magery as a gift of the Holy Spirit.

This view of magic makes a distinction between black magic and white magic, akin to the Zoroastrian distinction between *magia* and *goetia*, or the arts of truth and illusion. Spells that reveal the truth, protect the innocent, heal the sick or injured, or command the real forces of nature are white. Spells that conceal the truth or create illusions, that affect only the senses, or that inflict harm or take away freedom or choice are black. Other spells can fall into both groups, depending on how they are used. Many Christian mages have a version of One-College Magery for white magic spells only; because there are only two "colleges," this is only a -10% limitation.

If Magery is a divine gift, it may be acquired and maintained through religious observance. Treat this as a Pact limitation, usually based on Disciplines of Faith (Mysticism) for -10% or Disciplines of Faith (Ritualism) for -5%. If the mage lapses in his devotions, he loses his ability to work magic -- unless he turns to a different source of power and makes a different sort of Pact!

For a more restrictive treatment, a mage may precede every session of spell-casting with a period of prayer. Until he has prayed, he can't work magic at all! Treat this as some version of the Preparation Required limitation.

Note that all of these cost reductions affect only the mage's levels of Magery, and not the basic Magery 0. However, if the mage fails to perform the required observances, he loses even the basic ability to cast spells provided by Magery 0. At the GM's option, he may retain the ability to perceive magic.

A Christian white wizard goes through a process of spiritual purification in casting spells, and is protected from the appearance of demons when the spell casting roll is a critical failure. At the GM's option, a Christian holy man may provide a one-time version of this protection by blessing a spell caster. As with protection from mundane harm, the

blessing remains in force until the first time it is needed. Either sort of immunity is forfeit if the mage casts a spell that is classified as black magic.

Christian Spirit Magic

St. Paul wrote, "Do you not know that we shall judge angels?" and some Christians believed that it was possible to achieve supernatural powers by summoning angels to their aid. It's possible to create angels as characters using the Spirit meta-traits in the *GURPS Basic Set* or the expanded ones in *GURPS Fantasy*. But for most campaigns, this won't be needed. Angels won't actually appear on stage as allies; they'll remain in the background, invisibly or discreetly aiding their mortal allies.

In *GURPS* terms, this kind of relationship makes the angels into a Contact Group. The effective skills provided by this group are skills in dealing with the supernatural. Effective skill depends on how high in the hierarchy of angelic choirs the mage's appeals can reach: 15 for angels, archangels, or principalities, who deal mainly with human concerns; 18 for powers, virtues, and dominations, who deal with the natural order; 21 for thrones, cherubim, and seraphim, who deal mainly with God. Because angels of all types have supernatural knowledge, their base point value is increased by 1, to 3, 4, or 5 points, respectively. They are either usually or completely reliable; they will never lie. (Demonic contacts can never be better than somewhat reliable, which makes them less trustworthy.) They can't be bribed. So a very basic angelic relationship might grant effective skill 15 (3 points), be usually reliable (¥2 cost = 6 points), and be available on a 6 or less (¥1/2 = 3 points); a Contact Group providing such relationships would be worth 15 points.

Angelic contacts can provide information and answer questions. They can work small miracles, providing benefits at the Perk level. At the GM's discretion, a Christian spirit mage can ask the angels to protect another person, granting a one-shot equivalent of the Blessed advantage.

Some spirit mages may gain a greater benefit from their angelic relationships: the ability to "cast spells" by calling on the angels to intervene in the natural order. This is a form of Modular Abilities, with the Spells Only limitation (-20%). It works as a version of the Spirit Trapping form of the advantage, defined in *GURPS Fantasy*. Cost is 6 points base + 4 points per point of spell knowledge. Spells are gained from the spirit mage's angelic Contact Group. Only white magic spells can be learned from angelic Contacts; this is a -10% limitation on the Modular Abilities advantage. Prerequisites can be ignored, but the caster must still have either Magery (limited to white magic only) or Power Investiture.

Medieval Stories

What role can each of these approaches to clerical magic play in a campaign?

Holy powers are the basis for saintly characters. The expanded benefits of True Faith allow a Holy Man character type, who can cast out demons, protect others with blessings, and work a variety of miracles by praying for divine aid. This is the most freeform approach to the supernatural and needs GM judgment to make it work.

Christian spirit magic supports a view of the world in which angels are invisibly present and able to grant help when asked. This form of magic is much like what some real-world sorcerers thought they were doing, so it's good for a historically authentic campaign of ritual magic.

Christian white magic embodies a more technical view of magic. It represents magic as a skill, somewhere between a science and a craft, in a milieu where the practice of a craft can easily be taken as a religious vocation.

Combining holy powers with either spirit magic or white magic is straightforward. The holy man appeals to God directly; the spirit mage or white

Black Magic

If there's white magic, there must be black magic, and Christian mages may spend a good part of their time opposing various sorts of black magic. Black magic in a medieval setting can be portrayed as a blasphemous parody of white magic, with Satan in the place of God, devils in the place of angels, and lies in the place of Truth. Unlike angels, demons can be bribed, not by money, but by blood sacrifices or the opportunity to possess a mortal body. (Sacrifices have no effect

wizard casts spells and spends much of his time in study. Creating distinct roles for the latter two is a bit trickier. In most campaigns, it's better to pick one or the other: spirit magic if mages are supposed to communicate with the unseen, white magic if they're supposed to use it as a tool.

In addition to their use by player characters, such abilities can also be told of in the legends of a medieval setting. An entire medieval literary genre, hagiography, was devoted to the lives and miracles of saints. Churches can house relics of saints or be built on the sites of historically recorded miracles. And a lower-key religious influence can pervade daily life, with an occasional critical success or Excellent divine reaction to a prayer leading to a miracle.

This same approach can be used to develop **GURPS** versions of the magical arts of many other faiths. Hindu ascetics developing siddhis, Jewish rabbis practicing kabbalah, or voodoo houngans summoning the loa to their aid are all possible. Choosing the right set of options from the existing rules can represent such magic traditions in **GURPS** terms and encourage players to roleplay the form of magic that best suits a campaign and setting. Attaining this kind of match was one of the goals of **GURPS Fantasy**.

* * *

Many thanks to M. A. Lloyd for advice on the doctrinal content.

on angels; the one sacrifice that counts for them was made at the Crucifixion.)

In the view of some medieval thinkers, rival faiths such as Islam and Judaism were forms of devil-worship, and Jews and Muslims will be idolaters and black magicians. Most GMs won't want that much authenticity! Other monotheisms can instead be treated as alternate paths to the same relationships with God and the angelic hierarchy.

Pyramid Review

Paranoia XP

Published by [Mongoose Publishing](#)

Written by Allen Varney, Aaron Allston, Paul Baldowski, Beth Fischl, & Dan Curtis Johnson

Art by Jim Holloway

Edited by Allen Varney

256-page b&w hardcover; \$39.95

It's been too long since anyone's heard the clarion call of The Computer, demanding its Troubleshooters report for one hazardously entertaining duty or another. Mongoose Publishing still serves Alpha Complex faithfully with *Paranoia XP*.

If you've lived in an underground cavern for the last 20 years: In *Paranoia*, Man is driven underground by [not available at your security clearance], but the computer overseer is completely around the twist. Convinced the "Communists" constantly threaten Alpha Complex, it enforces strict, Orwellian rules of hierarchy and behavior that make everyone guilty of some form of treason. The very people The Computer depends upon to solve its most pressing problems -- the "elite" Troubleshooters -- are guilty of secret society membership and possession of mind- and body-bending mutations, among other illicit activities. Catch-22-riddled missions invariably end in disaster, some or all of the participants dying as accusations of neglect, dereliction of duty, and treason fly (along with grenades, laser beams, cudgels . . .). Oh, and it's funny.

Now the next generation gets to join the killi . . . er, fun. Dispensing with the game's iffier bits of history (*Crash of The Computer*, the *Secret Society Wars*), *Paranoia* has returned to all of its roots. There are three styles of play: Classic, Straight, and Zap, depending on the body count you want, how much darkness and satire you inject, and the pop-culture influence desired. The original system is scrapped; in its place is a painfully simple process that captures the Spartan nature of Alpha Complex and still manages to be a functional way of hose-jobbing . . . er, adjudicating the action. There's no dexterity, intelligence, etc. Instead three Action skills -- Violence, Management, and Stealth -- and three Mental skills -- Hardware, Software, and Wetware -- take over where the old skill trees left off. Success comes when you roll under your skill on a 20-sided die. Common specialties customize characters, like psychotherapy (a skill under Wetware), Moxie (Management), or Surveillance (Stealth). Everyone gets "laser beam" for some reason. Specialties overlap, and players must creatively wheedle the GM about what can be used how, a freewheeling method that serves *Paranoia* well. Specialties are balanced by weaknesses, so proficiency repairing transbots may mean you're completely inept dealing with food dispensers (and if you think that's not fatal in *Paranoia* . . .).

Specialties taper down to silly skills called narrow specialties. These are almost, but not quite, completely useless. Maybe you know "Find the Unmonitored Vent that Lets You Slip Unnoticed from the Barracks" or "Coax Spare Change from a T-38 Taxibot's Meter." If those aren't enough, various subversive parties offer treasonous and secret skills ("I can survive in the wilderness? What's that?"). Troubleshooters also have Access and Power. The first is a generic determinant of how well you navigate the complex's bureaucratic, well . . . complexities, and the second limits your mutant powers. Players aren't privy to either number -- it would only worry them.

Scheming secret societies and the service groups are still here, but now your job requires actual work. The Computer has instituted service firms, quasi-companies that do the group's work. CPU members may work for, say, a Facility Surveillance Control firm called Eye in the Skypanel -- now it's your job to keep cameras on-line. Those you find. That aren't sabotaged. Or hijacked. Or booby-trapped. Really, it's yet another conflicting interest to get PCs into deep doin's when the plot slows down. Finally, Perversity points are the true coin of the realm -- these points change die rolls, get you first pick of the snacks, improve Troubleshooter scores, and ingratiate you with the GM.

For referees, new tools make their game harder or easier. Locations have tension levels, a measure of how careful monitored an area is. Fines can punish agents without resorting to rolling up new PCs, but modest fees can also secure new clone six-packs. The otherwise furious combat system, sadly, shoots itself in the foot with the Min-Boost-Max stat -- the least and most damage weapons do, surrounding a number that divides the success margin to see if you do added steps of injury. Clever, but hardly elegant. All this, plus some surprises that can't be mentioned in a public forum without executing some INFRARED-level readers.

It wouldn't be old home week if Jim Holloway, the seminal *Paranoia* artist, hadn't come back on board to do the artwork. A lot is culled directly from the line's original run, but many pieces have been retouched -- same pictures, still fun, but with differences. They aren't huge changes, so the reasons why aren't apparent (perhaps a George-Lucas-like nod for the game's satirical Petri dish?). The textual layout is unremarkable, which is bothersome in that sections change with little fanfare. The material runs together subtly, with only page headers or a thin title line to distinguish one chapter from the next. Then again, considering the subversive way the layout is treated . . .

The game is still funny, but much of it is a seamless transplant from earlier books and various articles that appeared over the years; a lot of the new writing's humor becomes tiresome. This may be because the book reads *long* . . . so much in one book is good, but again, it blurs together. Service firms and their "service services" are a great addition, but even after the reader gets the idea (or the joke) they just . . . keep . . . going. The introductory adventure is just that; it's exceedingly simple and old hands won't get much out of it. It's a good jumping-off point for newcomers, and if you only want a reason to kill things, it won't matter what the adventure is anyway.

Paranoia XP runs the joke and the word count into the ground -- in some ways a towel that gets wetter as you go -- and could have benefited from smaller, digestible chunks (or farming the whole-cloth work out to more authors). But the revamped system, service firms, and contemporized outlook also make it a blunt instrument in the best sense, getting the *Paranoia* job done in a direct, effective manner that puts the play first and hand-waves the needless conventions of other (non-fun) RPGs.

Pyramid Pick

Fourth Millennium: Science Fiction At The End Of History – Campaign Model (for the *d20 System*)

Published by [Ronin Arts](#)

Written by Kevin Brennan & James Maliszewski

Illustrated by Jason Engle

1.12 Meg 45-page full-color PDF; \$6.95

Fourth Millennium: Science Fiction At The End Of History is the first third-party publication for the *d20 Future SRD*, written by Kevin Brennan and James Maliszewski as a personal project while they worked on other projects, including the thoroughly excellent *d20 System* fantasy treatment of India and South East Asia in Green Ronin Publishing's *Mindshadows*, and Maliszewski's interesting near future setting *Emissaries* for Microtactix's *Simply Roleplaying!* Originally, *Fourth Millennium* was to have been published under Guardians of Order's *Magnus Opus* imprint, much like the recent [Hearts, Swords, Flowers](#). But instead it has undergone a radical change of format. Now published by Ronin Arts, the plan is to release it as a series of individual PDFs rather than as a core book and line of supplements. The first of these is the *Campaign Model*, which serves as an introduction to the setting.

It is set in the Year Of Our Lord 3001, when mankind has spread itself not across the galaxies, but over multiple parallel Earths. FTL travel has proved impossible, but telepaths facilitate the transfer of ships through Node Points from one solar system to another. So far, no other species have been discovered on the worlds explored and settled. Instead, the biggest threat faced by mankind is neo-humanism.

Humanity has advanced through the Genetic Age and into the Nanotech Age. It had gone from rewriting and cleansing the human genome to the use of nanotech systems that could re-write a person's own DNA, enhance himself physically, and even rewrite his own memories! At worst, nanophages were used to overwrite the memories of others, a phenomenon that could literally eliminate whole human cultures. The advent of the cultural nanophages triggered the outbreak of history's bloodiest conflicts, the Culture Wars. While no scientist had been able to build the A.I., the expert system has been perfected, and it was inevitable that some would link the human brain directly into such dedicated computers.

The result is "Emergence," the birth of an intelligence beyond the mere human. Radically different in viewpoint, ethics, and instincts, the emerged are capable of understanding things that humanity cannot, including themselves. The most notable example of emergence are the "Psaikhailou," neo-humanists that had pursued technological rapture with religious vigor, achieving what they call "singularity" though means unknown, but spreading it via a nanotech virus. Beginning on Earth, the Psaikhailou virus absorbed both other neo-humans and worlds before humanity united to stop them, employing scorched Earth techniques that halted the evolutionary threat. Now an uneasy peace exists between the Psaikhailou and humanity.

The Svobodan League was founded as an alliance dedicated to maintaining the Stasis, protocols and directives that limit the use and spread of advanced technology that could cause Emergence. Its members are not nation states, but "Phyles," groupings that share a culture and history, the largest of which are spread across several worlds.

Dozens of other Phyles are associate members of the League, but major organizations under its umbrella are the Syndicates. Not so much Phyles as regulatory bodies, they take no interest in League politics, only concerning

themselves with the maintenance of Stasis. The major Syndicate cultures are the Biotechnology Syndicate, the Cybernetics Syndicate, the Eugenics Syndicate, and the Psychiatric Syndicate. Outside the League exist many different Phyles, some like the Mordovi agree with and stringently enforce the Stasis, but others prefer to remain independent of the League, if not actively opposed to it. The League refers to these dismissively as the "Shards," but continues to monitor them for potential Stasis violations. One such method used is the Voodoo teams, deep cover agents, often crewing small merchant vessels and reporting directly to the co-ordinator of the League's Security and Intelligence Service. With their independent, but wide remit, the Voodoo team is the default set up for playing *Fourth Millennium*.

This first release for *Fourth Millennium* is actually quite light on rules and mechanics for the *d20 System*. It adds several new occupations, such as the Activist, the Educator, and the Newslogger, a type of independent journalist. It lists those Advanced or Prestige Classes suitable to the setting and adds just the one: the Procuracy Field Agent, which monitors other Syndicates for potential Stasis violation. Four of the five new feats are tied into the *d20 System's* Allegiance rules, while the fifth is an Armor Proficiency feat for Reflex armor.

While a few samples of actual technology are given (the rest saved for future releases), the *Campaign Model* goes into not just what technology has been invented, but also what is allowed under the Stasis enforced by the Svobodan League. A list of equipment suitable for the setting from the *Future SRD* is included, but technologies unique to *Fourth Millennium* setting are also discussed, including Expert Systems, Nanoforges, and Nanotechnology, Diamond Armor, and its spacecraft types, the High-G capable military wetships, and the ordinary dry ships.

Before rounding out the book with a short but very useful glossary, the authors take the time to explain what *Fourth Millennium* is about in the section on Game Mastering. These three pages are in effect *better* than other 200-plus-page science-fiction RPGs recently published, and explains that the setting is one of choices. Between keeping our humanity and rescinding it in favor of becoming something more than human. Between residing under the reactionary hegemony of the Svobodan League, or reacting against it while remaining within the bounds of Stasis. The section also suggests how each of the six major Phyles can support a particular science fiction game as possible starting points. They include a combination of cyberpunk and special operations, conspiracies and political intrigue, high tech power games, empire building and maintenance, military campaigns, and exploration and commerce.

Yet despite the inclusion of these sub-genres, *Fourth Millennium* is very much an attempt to move away from the traditional models of science fiction found in gaming, as was Maliszewski's *Emissaries*. Eschewing such elements as anti-gravity, alien life forms (bar, it would be argued, the Psaihailou), FTL, and artificial intelligence, it instead concentrates on other elements, particularly the societies of the 31st Century. These are taken beyond the nation state, placing an emphasis on both cultures in the form of the Phyle, and also on the resurgence of faith and religion. The setting can also be read as being anti-Transhumanist in making the Psaihailou its big threat.

Physically, *Fourth Millennium* is a cleanly presented PDF that beyond the cover is very light on illustrations. It packs a lot of information for its size, and is written in an easily digestible style. The aforementioned glossary is a nice touch that rounds off the document.

In many ways it is a shame not to see *Fourth Millennium* released as a book of its own, but this format has its advantages, such as being made available in affordable chunks. Some may be put off by the authors' decision to release *Fourth Millennium* for the *d20 System*, but as with the best of the titles released under the *d20 System* banner, it is the setting that counts, not the mechanics. Such detractors should adapt it to the rules of their choice. As a campaign setting, it serves as a very effective introduction to the end of our history, when we face the threat of becoming something more. Some may find its ideas too deep, but *Fourth Millennium* is not the frothy fantasy that is space opera; it is science fiction. And while it is a setting in which to game, it would be just as fascinating to read the novel.

Random Thought Table: Help Me Genre, Yeah

This is the first time I'm writing my column using a voice-recognition software package. In theory it might speed up my writing and give my hands a much-needed break after weeks of typing at the computer. In practice it means that when I go back to read what I wrote, I find myself wondering if I was very drunk at the time. Regardless, this should treat you all to a variety of new and interesting typos and no doubt paved the way for carpal vocal syndrome.

Anyway, last week I wrote my column about genres. More specifically, I talked about how they don't really exist. Of course I primarily did that to overstate the case, because that always generates an interesting table of contents blurb. The primary idea behind last week's column was that we think the most circumstances as a genre is actually one or two discrete plot elements put together. For example, but we normally think of as fantasy is in fact usually a quasi-historical setting utilizing magic.

However, perhaps more important than these genre elements is the idea of focus. For example, the *Fvlminata* RPG and the *Hercules and Xena* RPG both have roughly similar mandates: a bronze-era historical setting with magic. However, the focus of these elements – bronze era, historical, and magical – helps to define what the setting is. Both settings have roughly equal attachments to the trappings of the bronze era (garb, weaponry, and the like) complete with some technologically achronological items (gunpowder or steel weapons, depending). Both have roughly equal amounts of magic (a useful tool, but not the be-all and end-all of a high fantasy world). But they vary on their fidelity and focus on history. *Fvlminata*, being an unequivocally alternate history, adheres fairly faithfully to the facts -- up to the point where its history diverges, of course. *Hercules and Xena*, on the other hand, has absolutely no focus on facts; geography and history are all vaguely Greek-y, while realism and accuracy are all vaguely nonexistent-y.

The upshot is that it's possible to have two campaigns, using the same genre elements, and still make them completely different, depending on what elements you focus on and the intensity with which you use them.

Let's take an example – something different. Let's combine quasi-historical martial arts (say, a 16th-19th century/*Crouching Tiger, Hidden Dragon* sort of thing) with mystery.

Let's first crank the "martial arts" all the way up, and the mystery down low. We might end up with a band of trained martial artists charged by the Emperor to go from town to town, investigating problems and seeking adventure. Here, the "mystery" aspect would serve as the catalyst for the adventure: "You're charged with finding out what happened to the Master's daughter." The heroes learn early on that the daughter was kidnapped by ninja, exciting battles ensue, and the martial arts serves as the narrative thrust (no pun intended). There isn't much mystery-solving, per se, outside of the heroes' mandate.

Now let's turn the "mystery" up to 11, and put the martial arts on a flicker setting. Here we might have a Victorian England historical setting, with a band of Sherlock-Holmes-esque investigators, charged by Scotland Yard to investigate crimes; one of the PCs knows martial arts (and perhaps one of the other PCs is a student of this expert). Here the thrust of most adventures would be the mystery solving, with martial arts serving as a special effect or possibly a means of shaking up the end-of-session combat. Here the martial arts would serve as a bit of extra flavoring to keep adventures from resembling the standard Victorian mysteries.

Now, let's turn both dials to "roughly equal." Here we might have a setting where the heroes all know martial arts, and their primary objectives are to solve mysteries. Again, let's go to our Victorian England setting. Perhaps the heroes are all emigrants from Asian countries, forbidden from returning home for some reason (having fallen out of political favor, perhaps?). Facing racial discrimination, the heroes manage to save the Queen one day, who – in gratitude – gives them a supposedly ceremonial job at Scotland Yard. The heroes, however, are able to contribute by solving strange mysteries in their own unorthodox ways. In this campaign, the heroes will approach the world's genres with roughly equal vigor: sometimes they would get clues through conventional Victorian means, sometimes using martial arts special abilities. Sometimes they roam the foggy London beat, looking for information; sometimes they're hopping rooftop to rooftop, chasing black-clad suspects running impossibly fast. Sometimes the villain is a mundane murderous doctor; sometimes it's a band of ronin opium smugglers.

And as a final example, drawing from the real world, I'll note that stories with Superman have traditionally been superhero-action with a dash of romance. The television series *The Adventures of Lois & Clark*, however, flipped this around, making it a romance show with superhero-action elements. (And the current *Smallville* series turns this formula around even more, making it a superhero series without any "superheroes.")

Even if you're committed to putting in various genres into a game, don't fall into the trap of assuming that there's only one way those genres can manifest. Even within a few seemingly narrow genres there are still plenty of opportunities to tinker and innovate.

And when in doubt, add ninja.

* * *

Have you ever wanted to talk to someone about making fantasy happen?

Well, if you're reading this Friday afternoon or earlier, you can! This Friday – November 19th – at 7 p.m. CST in the [Pyramid Chat](#), William Stoddard will be discussing *GURPS Fantasy* and fielding questions on all things fantastic.

So if you haven't frequented the chats, and want to learn about one of the most requested *GURPS* books ever, stop on by!

--*Steven Marsh*

Shandy Xaxa Dack

for Transhuman Space

by Phil Masters

Shandy Xaxa Dack is the only child of a moderately wealthy Fifth Wave couple -- a company administrator and a civil servant. They could easily afford the Alpha Upgrade genetic package which they gave their offspring, but limited themselves to one child for a number of personal reasons.

While they were reasonably affectionate parents, they were a little distant and uncertain how to bring up their daughter, trying one slightly faddish "system" of childcare after another, and she grew up mildly alienated and reflexively rebellious. She had long had a taste for exploring the Web insofar as her supervising AIs would permit her, and at the age of 16, she discovered a simple way to evade most filter software; she left the house to find interesting stuff in person. Her parents, under the sway of a strong "freedom for adolescents" meme, did little to prevent this apart from insisting that she should always wear an AI which was programmed to ensure her safety.

Thus, their daughter fell in with a distinctly eccentric crowd -- devotees of a small-scale fashion-cult known as Loomzoomismus (see the box). While the LAI she was wearing eventually recognized the dangers of this "hobby," tried to warn her, and then notified her parents, it was too late to prevent her becoming obstinately fascinated, and she now utterly refuses to abandon the peculiar practices promoted by the meme. In one flamboyant gesture, she declared that she was abandoning her birth name, adopting instead the whimsical and random-sounding "Shandy Xaxa Dack." She now sleeps at home only one night in two, although being shrewd enough to avoid pushing her parents into some kind of radical response, and wise enough to care about her own safety, she keeps the "chaperone" LAI provided by her parents somewhere around at all times, albeit with its sound output disabled.

Meanwhile, she is progressing remarkably quickly in the informal hierarchy of practitioners of Loomzoomismus. Although she is a relatively recent convert, "Shandy" is gaining a name within the movement for what appear to them to be deep and impressive mystical insights gained while under the influence of even the simplest VR feeds. The sheer intensity of this experience, combined with the sense of personal worth she derives from the admiration of her new friends, is leading her into ever deeper involvement in the movement. Fortunately, the unusual ease with which she achieves the necessary trance states has so far saved her from use of more intense, dangerous Loomzoom VR recordings.

As part of this activity, she has also taken to publishing her poetry on the group's publicly-accessible Web space. (Perhaps as a result of its third-hand derivation from Sufiism, Loomzoomismus has considerable respect for poetry as a limited but valid way of expressing some of the non-rational "insights" granted by its form of "meditation.") Her work is actually reasonably good, after its fashion, and has further enhanced her reputation.

Her parents are still consciously seeking to avoid alienating her, being rationally aware of the nature of adolescent rebellion (which has proved stronger than any Alpha Upgrade mental stability) and the need to maintain lines of communication, as well as emotionally attached to their child. However, their growing concerns, and their daughter's increasingly

Loomzoomismus

Loomzoomismus is widely regarded as a quasi-religious cult, although it has no formal hierarchy, doctrine, or organization, and bears as much resemblance to a fashion-driven pop culture meme. In essence, it is an anarchistic form of Mathirism (p. TM23); devotees claim to gain unique insights into the universe, up to and including direct communion with God, by bombarding and overloading their own senses with chaotic virtual reality inputs. (A few use slinks, but most cannot afford this; Loomzoomismus is mostly a street-level movement.) However, unlike Mathirites, who employ carefully constructed, generally highly abstract VR structures as their meditation aids, "Loomzoomers" use amateurishly-edited sequences of random or arbitrary material, usually derived from whatever InVids catch the creators' fancy or happen to come to hand.

monomaniacal pursuit of mystical insight, almost guarantee that some kind of crisis will arrive at some point.

Scenario Seeds

Go and Sell That Thou Hast: After a blazing argument, Shandy walks out of the family home without her chaperone LAI and with every sign of intending to stay away for keeps. Her parents, naturally worried, seek out professionals or qualified friends to locate her and make sure that she's okay. They *don't* want her brought home by force -- she's old enough that this would be illegal under local law, and in any case, they know perfectly well that this would merely alienate her even further. However, they do want her kept safe.

In many ways, this would be a conventional missing person case. Ensuring the girl's safety without annoying her, and ideally without her knowledge, could be a little tricky, especially if the problem drags on into the long term, but some ingenuity with hidden microbot swarms, smart dust, and computer hacking, can achieve a great deal. What makes it slightly more complicated is that the subject is surrounded by people who are not only fairly smart and technologically aware -- they actually regard her with respect verging on veneration, and will be doubly unwilling to lose her. It may also be desirable for her hidden guardians to secretly check any InVid material that she and her friends acquire for safety problems -- quite a complicated trick.

Poetry in Motion: Maria Holtz, a freelance Edgearcher (p.TM131), has recently been analyzing the Loomzoomismus movement, and in the course of this routine research, ran across material created by Shandy Xaxa Dack. One of Holtz's AIs studied Dack's poetry and concluded that the girl has genuine talent and considerable potential. According to its analysis, in 10-15 years, given the right experiences and just enough teaching and guidance, Dack could become one of the leading poets of her generation in her native language.

Serious poetry is not a major economic activity, but like any niche cultural form, it has some potential as a source of income. Perhaps more to the point, Holtz is something of a devotee. She therefore wishes to ensure Dack's safety, while ensuring that Dack receives both the formal education and the life experiences that will bring out her full potential. Holtz goes looking for people who can see to all of this.

The first problem, of course, is that Dack is a surly, rebellious adolescent who will probably react badly to direct approaches. In any case, merely helping her to adjust better to life, and to look after her own health and sanity properly, would be missing the point; her talent as a poet arises partly out of her disaffection, confusion, and search for insights. She may well need to suffer for her art -- in controlled doses. PCs working for Holtz may eventually find themselves in conflict with her parents.

Land of Lost Content: The PCs, possibly in the employ of a media company, are working to discover how weirdly mangled but compulsively fascinating copies of various short but valuable InVids came onto the market with all digital rights protection deleted. (The cryptographic protection involved was supposed to be fairly bulletproof.) Tracking various bootleg operations across continents and through several levels, they trace the source to a bunch of weird

It's unclear how Loomzoomismus developed; it's probably a "street level" offshoot of Mathirism, but it's possible that it evolved independently, perhaps among InVid users with mild mental problems. Even the origin of the name is uncertain, although it is probably derived from Berlin street slang of the early 2090s. It is primarily a European phenomenon, but it has followers in most Fifth Wave communities, and is spreading to Fourth Wave regions.

Loomzoom InVids are complex constructions, in an anarchic sort of way. They have sometimes been compared to experimental "cut-up" literature or "sampled" music from the 20th Century, and analyzed as an art form. Unfortunately, devotees of the movement rarely pay much attention to questions of safety, and there have been cases where Loomzoom creations have induced epileptic seizures and possibly other brain dysfunctions when run on hardware with insufficient protective features. Given that the whole objective of these works is to induce radically altered states of consciousness, this is hardly surprising.

Insofar as it has a theology, Loomzoomismus borrows heavily from Mathirism, and hence indirectly from Sufi thought and Zen Buddhism. (Mathirites regard it with exasperation and sometimes barely contained rage.) Its exponents claim to be pursuing experiences which cannot be described verbally, and its associated style is based on the creation of confusion in its own

cultists selling this stuff into the black market for petty cash. Eventually, they find that a single member of this group of "Loomzoomers" is responsible for assembling the unprotected recordings. However, she lacks the sort of resources that such an operation should involve.

In fact, Shandy Xaxa Dack has developed an extraordinary intuitive facility. In a self-induced trance state, she can edit together snippets of an InVid from partial copies, taster extracts, and memory, recreating the original with minimal resources. While the various middlemen can be sued and fined for their involvement in all this, she and her friends lack the resources to be worth pursuing -- and in any case, it'd be bad PR. The PCs may, however, be instructed to find some legal way to persuade her to stop.

Possible complications here include the involvement of organized crime; not only are they likely to have been profiting from the original bootlegging, but once they realize how clever Dack was being, they may look to make her a job offer she can't refuse. For that matter, while her talent may just be a matter of natural flair and concentration, it's bizarre enough to raise questions about whether her Alpha Upgrade gave her slightly more interesting neurological wiring than usual.

Shandy Xaxa Dack

Age 17; 5'9", 135 lbs.; A rather unprepossessing teenager, dressed in whatever red clothes she has available. Her carelessness about grooming and diet and her odd dress sense negate the benefits of her Alpha Upgrade appearance.

ST 8 [-15]; **DX** 12 [10]; **IQ** 12 [20]; **HT** 11 [0]. Basic Speed 5.25; Move 5. Dodge 5.

Advantages: Alpha Upgrade [35]; Autotrance [5]; Ally (Father, 150 points, 12-) [20]; Charisma +1 [5]; Deep Sleeper [5]; Reputation (among devotees of Loomzoomismus, for wisdom, +3 on 10-) [2]; Status +1 [5].

Disadvantages: Delete Attractive from Alpha Upgrade package [-5]; Addiction (Loomzoom VR recordings: cheap, hallucinogenic, legal) [- 10]; Combat Paralysis [-15]; Unfit [-5]; Youth (17) [-2].

Quirks: Absolutely refuses to wear any color but red; Mildly shy, except around fellow Loomzoomismus devotees; Refuses to even mention her real name; Thinks of her poetic talent as mystical insight. [-4]

Skills: Acting-10 [½]; Bard-11 [½]; Computer Operation-13 [2]; Holdout-10 [½]; Literature-10 [1]; Poetry-13 [4]; Savoir-Faire-14 [0]; Stealth-10 [½].

Languages: Native Language at 12 [0]; Two others each at 10 [½ each].

followers, never mind outsiders.

Practice of Loomzoomismus is actually mildly stressful as well as potentially dangerous, and devotees specifically refuse to describe its benefits. It is thus probably doomed to remain a marginal street-level movement, although radical, dangerous behavior always has its appeal to some disaffected or alienated individuals. Although it is mostly a youth movement, Loomzoomismus has a few *much* older followers, who may be seeking to escape the stresses of a rapidly changing world by reverting to the solipsistic radicalism of their youth.

Icosahedron Adventures: Custom Characters

Game Mechanics For Building Specific Character Concepts *D20 System*

by Owen K.C. Stephens

At its core, the *d20 System* gives players very limited options when creating or advancing a character. Ability scores are determined randomly. A small, finite set of races and classes are available. Special abilities are automatically assigned based on class and race, or selected from a list only occasionally (as is the case with feats). For characters starting at first level there aren't many background choices available, in part because money is limited and determined randomly and in part because starting competence is so low it's difficult to justify having done more than one thing prior to the start of a game.

In many cases these limitations are seen as benefits by some gamers. Because there are a limited number of possible character concepts, it's more likely that all the characters in a group are appropriate for and useful in a typical adventure designed for the game's core concepts. A *d20 System* game geared for fantasy combat adventure is likely to have classes and races that work well within that setting. A character is unlikely to be able to make a character that's totally inappropriate. Further, because there's a limited number of things the characters can do, the GM is more likely to be able to consider them all when designing opponents and challenges. When viewing the game as an exercise in tactical combat or a complex boardgame with roleplaying elements, this aspect of the *d20 System* is a considerably strength.

Many groups place pure roleplaying higher on their list of priorities than game balance, however, and such groups often chafe at the restrictions inherent to the system. Player might be excited with the idea of playing a damsel in distress, or a farmhand, or a warrior who depends on his ability to absorb damage because he's not a particularly smart or strong person, but find the game system resists their efforts to build a specific character concept, especially if it varies considerably from what's expected within the game setting.

Further, there's nothing in the *d20 System* as written to protect the role each character does end up taking. Everyone could choose to be a fighter, for example, and all specialize in the use of two-handed weapons. Even worse, two different characters could proceed on different paths for many levels, then suddenly converge. For example, a group might include a very efficient melee fighter and a less adept character who has a role to play largely because he has specialized in the use of ranged weapons. After several levels the fighter could decide to take up ranged combat, taking away the non-optimized character's previously unique role. Not all groups desire to protect such character niches, but those who do get little support from the *d20 System* rules.

This article tries to present some variant rules that can provide tools to assist groups with these styles of play to get more out of *d20 System* games. The suggestions below are all designed to be short of converting a *d20 System* campaign into a complete point-buy, which has already been covered by such things as *Mutants and Masterminds*, *BESM d20*, and even "[CLUDGE](#)." This article tries to present ways to modify how *d20 System* characters are created without changing the basic class/level structure of the game or its fundamental play mechanics.

Even beyond the issues mentioned above, using these rules can change the tone of a *d20 System* campaign. Players given more say over their characters' attributes and powers expect more input in other aspects of the game, and are more likely to get involved in other aspects of the game. Players given more options are also more likely to come up with more original (and potentially more powerful) character concepts as well. Campaigns run using these rules are likely to have more oddball characters, which may or may not be seen as a bad thing.

Ability Scores

Ability score generation is one of the most influential parts of character creation. Nearly all a character's attributes, and

all her skills and combat maneuvers, are influenced by ability scores. How you allow players to generate their characters' ability scores not only affects the power level of the characters, it sets the tone for the campaign as a whole. The random methods normally proved in *d20 System* games often prohibit players from choosing specific character concepts, and can create an imbalance between the power levels of different characters.

Auction

An ability score auction ensures one character has the highest rating in any given ability score. For some groups, this kind of definitive role and inter-player competition is considered helpful in determining character roles, while other groups find it antagonistic and disruptive.

Each player is given 10 auction points. The GM names each ability in turn, auctioning off an 18 value and then a 16 value for that ability. Players bid auction points, with the highest in each round getting that score. Once all the abilities have been auctioned off, players may buy scores for abilities they didn't win auctions for, with 1 unspent auction point equaling a +1 modifier. Players may grant themselves an ability score of 8 or 6 to gain 1 or 2 additional modifier points, but these points can't be used during the auction. No ability score bought after the auctions may have a base higher than 14 (though racial modifiers could raise an ability to a 15 or more).

For example, Mark, Tom, Stephanie, and Michelle are making new characters for a game Jayne is starting. Jayne begins the auction with Strength, offering up an 18. Mark and Stephanie both plan on playing fighting characters, so they begin bidding. Stephanie is willing to pay 4 auction points, while Mark is only willing to spend 3, so Stephanie gets the 18 Strength. Jayne now repeats the process for a 16 Strength. Since Michelle and Tom don't care to have Strength scores that high, Mark manages to spend just 1 auction point for his 16. Now Stephanie has 6 auction points left, Mark has 9, and Tom and Michelle both still have 10.

Jayne repeats the auction process for all five remaining ability scores. When all is said and done, Mark bought a 16 Strength for 1 point and a 16 Constitution for 2 points. That leaves him 7 auction points with which to buy ability scores. He can't buy anything above a 14, so he spends 2 points on Dexterity (a +2 modifier is a 14 score), 2 points on Intelligence, and 2 points on Charisma, leaving 1 point for Wisdom. His final scores are Str 16, Dex 14, Con 16, Int 14, Wis 10, and Cha 12.

Stephanie spent 4 auction points on an 18 Strength and 5 auction points on an 18 Dexterity. That leaves her only 1 auction point for her remaining 4 abilities, but she knows no one else will have 18's in her two primary stats. She gives her character a 14, 10 Int, 10 Wis and 8 Cha, totaling her +1 remaining auction point.

Heroic Arrays

Many groups prefer characters to have even more heroic scores than provided by any of the standard ability generation methods, but are unhappy when one or two players' characters end up with significantly better ability scores. Groups such as this should consider using the three heroic arrays, a set of pre-determined ability scores the players may arrange as they see fit. The heroic arrays are much more powerful than standard ability generation methods, but still within the range of what's theoretically possible.

When using the heroic arrays, each player decides which set of ability scores she wishes to use, then assigns each score to an ability of her choice. Racial modifiers are added in after the ability scores have been assigned. Resulting characters are powerful, but not so much to unbalance a game. Feel free to use more extreme encounters when running a group using the heroic arrays, which is exactly what such groups generally prefer.

Rather than require players to use one of the listed heroic arrays, you may allow them to determine any stats that have a total modifier of +12, as long as no ability score starts at a value lower than 8 or higher than 18 before racial modifiers and level increases.

Table 1: The Heroic Arrays

- **Heroic Array 1:** 18, 16, 16, 12, 12, 10
- **Heroic Array 2:** 18, 18, 16, 14, 10, 8
- **Heroic Array 3:** 14, 14, 14, 14, 14, 14

Player's Choice

You can opt to allow players to decide what ability scores their characters start with. This method tends to result in very powerful characters, but that's not a problem with all groups. Obviously, characters need to have some limits, but you may allow any ability scores possible for starting characters (*i.e.*, any score of 18 modified by race).

The advantage of this method is players get exactly the kind of characters they wanted. The drawback is that there's no penalty for deciding you want to play a character with straight 18s (and if anyone actually does this, it's a good sign that player doesn't get the point). Yet among mature groups that are more interested in playing specific roles than struggling to maximize characters, this can be a very fulfilling option.

Random Rolls by Class

The idea behind random rolls by class is to ensure a player making a fighter has a good chance at getting high Strength and Constitution scores without allowing him to determine exactly what scores he gets. This option allows the unexpected results that many groups prefer, while maintaining player choice and influence over character type. It's also useful for GMs wanting to determine NPC ability scores randomly — using this system, most NPC fighters are stronger than NPC wizards, but occasional exceptions do occur.

For each class, players roll the indicated number of dice and take the highest three results, discarding the rest. Thus, a player making a fighter rolls 7d6 for his Strength score. If his results were 6, 5, 5, 4, 3, 2, 1, he takes the highest three and ends up with a 16 Strength.

Characters made using this system end up being slightly more powerful than those of the standard method of roll 4d6 and drop the lowest die. This difference is intentional, as it helps produce a more extreme range of ability scores, which helps differentiate characters. Players also have no choice over assigning their ability scores: whatever is rolled for a given stat must be taken, making it more difficult for players to min/max characters and encouraging roleplaying the unusual combinations that result. If a set of ability scores doesn't have at least one ability score of 14 or higher, or has a total combined modifier of +2 or less, the player may re-roll all the ability scores.

Though dice are given for NPC classes as well, they produce less exceptional results. If you want more heroic NPC-classed character, use one of the die combinations for a related heroic class (rolling fighter dice for a warrior, for example).

A variant of this rule is to allow a player to decide how many dice to roll for each ability score, limiting him to a total pool of 28 dice. No ability score may have more than 7 or fewer than 3 dice assigned to it, and all ability scores must have their dice assigned prior to any ability score being rolled. This works well for groups that frequently multiclass, or who may want to play less traditional characters. For example, a player wishing

Another variant rules usable for this system is to increase a character's starting ability score by 1 for every "6" he rolls beyond the first 3. Thus a player rolling 7d6 for Str and ending up with five 6s, a 4 and a 2 starts with a 20 Str.

Table 2: Ability Score Rolls by Class

	Bard,	Cleric,		
	Barbarian	Sorcerer, Druid,	Fighter	Monk
	or Wilder	or Witch		
Str	7d6	3d6	4d6	7d6
Dex	5d6	6d6	3d6	5d6
				6d6

Con 6d6	4d6	4d6	5d6	4d6
Int 3d6	5d6	4d6	4d6	4d6
Wis 4d6	3d6	7d6	3d6	5d6
Cha 3d6	7d6	6d6	4d6	5d6

	Paladin	Psion	Psychic Warrior or Soulnife	Ranger	Rogue	Wizard
Str	6d6	3d6	6d6	5d6	4d6	3d6
Dex	3d6	5d6	4d6	6d6	7d6	6d6
Con	4d6	5d6	6d6	4d6	4d6	5d6
Int	4d6	5d6	4d6	4d6	5d6	7d6
Wis	5d6	5d6	4d6	5d6	4d6	4d6
Cha	6d6	5d6	4d6	4d6	4d6	3d6

	Adept	Aristocrat	Commoner	Expert	Warrior
Str	3d6	4d6	3d6	3d6	5d6
Dex	4d6	3d6	3d6	4d6	4d6
Con	3d6	4d6	4d6	3d6	4d6
Int	4d6	4d6	3d6	5d6	3d6
Wis	5d6	4d6	4d6	4d6	3d6
Cha	4d6	4d6	3d6	4d6	4d6

Eliminate Ability Scores

Another possibility is to eliminate ability scores entirely, creating a simpler game (there are fewer numbers to add) with an entirely level playing field. The only ability scores that have any function other than to provide modifiers to other rolls are Strength (which gives carrying capacity) and the primary ability of spellcasters (which determine what level spell they are allowed to cast). Some feats and classes have ability score prerequisites, as well.

If you allow players to assign any reasonable carrying capacity based on character concept, grant spellcasters access to any level spell, and eliminate ability scores as prerequisites, the *d20 System* works fine with no ability scores at all. The complete lack of ability modifiers tends to cancel out (while a fighter gains no bonus to attack rolls from a high Strength, his targets gain no bonus to AC from a high Dexterity).

There are two noteworthy problems with this method. First, characters of the same class and race tend to be more alike without ability scores to differentiate them. Second, pre-written foes and monsters have their ability score modifiers added in. If you don't strip out such bonuses, the ability-free characters become significantly weaker compared to their traditional foes. Neither of these limitations is overwhelming, but they can eliminate the benefit of a simpler game by requiring constant adjustments during play time.

A similar idea is to replace all ability scores with a universal bonus value (+1 for lower-powered games, +2 for more typical games, +3 for heroic games), while still eliminating spell level limits and ability score prerequisites. This keeps characters more on par with generic opponents, but isn't all that different from just assigning heroic ability score arrays.

Customizing Classes

While ability scores have a strong impact on a character, class is the most important element to define a character's abilities. Without turning the game into a pure point-based system that allows a player to modify every aspect of his character if he's willing to sacrifice elsewhere, it's still possible to modify the strict class system to allow more options.

The Auction

Much like the ability score auction, the class auction is designed to ensure that every character has a protected niche that other characters can't impinge on. This is the only sense in which this system is balanced. Characters may be radically more or less powerful than one another, but each has attributes and powers other characters cannot match.

The basic progressions for each character are auctioned off at character creation, with other attributes auctioned as they are purchased.

The GM first holds an auction for d12 hit dice, and then one for d10 hit dice. After those two auctions, players may buy d8 hit dice for 1 point, d6 hit dice for 0 points, and d4 hit dice for -1 points.

Then the GM holds an auction for class skills and another for skill points per level. There are 4 skill progressions available, each giving a number of class skills or skill points per level (once a player has a given number of class skills, he may select any he wishes to be class skills up to that maximum). The GM auctions off the great and good skill ratings for both categories. Characters may buy the fair progression for 1 point, or take the poor progression for free.

Skill Rating	Skill Points/Class Level	Skills
Great	8	30
Good	6	24
Fair	4	16
Poor	2	8

The next items up for auction are attack progressions. These are broken into three categories: Strength-based, Dex-based, and spells. The Str-based attack progression is used for any weapon that gains an attack bonus from Strength, and the Dex-based is for any weapon that gains an attack bonus from Dexterity. The spell attack progression is used for all spells, spell-like and supernatural abilities and psionics (if such powers require attack rolls). In each case, the only progression bid on it the best, a +1 base attack bonus per level. A character may buy the second-best progression for 3 points, or take the poor progression for free.

Finally, the GM auctions exclusivity on core classes and prestige classes. A player need not bid on these, and no character may have exclusivity on more than one core class and one prestige class. If a character is granted exclusivity in a class, no other PC may take any levels in that class. The NPC classes (warrior, adept, etc.) are not bid on, and always remain open to all classes. Core classes are bid on first, in alphabetical order, and then any prestige class players indicate an interest in. If no one bids on any class, all remain open to all characters.

Regardless of what class a character takes, he uses the hit dice, saves, skills, and attack progressions won in auction or bought from lesser options. For example, a character who wins the Str attack progression can take levels in rogue, monk or wizard, but still has a base attack progressions of +1 per level for Str weapons.

Swaps

A much simpler system than the class auction is to allow ability swaps. Under this system, a character can give up his special abilities at a given level to gain the special ability another class gains at a lower level. The swap is only allowed if the character's current class gains an ability at his current level (a fighter can't exchange his special ability gained at 3rd level for a sorcerer's familiar, because the fighter doesn't gain anything at 3rd level).

A special ability gained only increases in power if it is not spellcasting related, and the ability given up increases in power. Otherwise, the special ability must be selected again to increase. The increase in power is figured as if the characters level was his current level minus the level the ability was gained at.

For example, a sorcerer decides he has no interest in a familiar, but would like an animal companion. Druids gain animal companions at 1st level, so the sorcerer is allowed to exchange his familiar for an animal companion starting at second level. Since both familiars and animal companions increase in level, the sorcerer treats his sorcerer level -1 as his druid level when determining what animal companion he can have and what special abilities it gains. If a fighter had exchanged his 2nd level bonus feat for an animal companion, it would be treated as the companion of a 1st level druid, even after the fighter gained levels.

Racial attribute swaps may also be allowed on a 2-for-1 basis. Thus a halfling could sacrifice his bonus to attacks with thrown weapons and his bonus to saving throws for low-light vision. A GM may allow attributes from sources other than player character racial options, but should also make sure new attributes allowed are close to these PC races normal get in terms of power level.

This system can easily produce characters that are much more or less powerful than baseline characters, but it also allows a quick, easy and flexible system for customize characters to more closely match a player's concept.

Ye Olde Majik Shoppe III

Five More Odd, Strange and Just Plain Weird Magical Items

by **K. David Ladage (with thanks to Chad Underkoffler)**

Did [Kendalge](#) actually live? Was this man [the Titan](#) that history has recorded? It may seem odd to question the existence of a man that has his signature on no less than 23 treaties and trade agreements that are still enforced 300 years after his death, but some respected and learned men do. Bravarix Calyuran, the great historian and sage, remains the most vocal advocate that the legendary Kendalge was no more than myth. In his masterwork, *A Definitive History Of The Realms Of The Second Age*, he wrote: "A man named Kendalge lived in the second age and he was important as well as influential; that much is not in dispute. But that man is not the Kendalge that we all read about, tell stories about, and study in our houses of learning. That man is a figment. History, lacking a truly epic figure in the second age, was forced to invent one."

Lord Calyuran has created ripples in scholarly circles, but most still believe that Kendalge was the man that they read about, told stories about and studied about in their youth. Still, no matter how you dissect his life, Kendalge remains the most interesting, most colorful character of the second age. In our previous two installments, we have seen 11 glimpses into the mind of this legend. Below are five more examples of his unique view of the world.

Little Dragons

Scholars agree that, with Kendalge's penchant for golem creation, the Little Dragons were obvious. Creating one for each of his children, Kendalge made between 20 and 63 Little Dragons. Each Little Dragon is a masterwork of sculpture. The head, body, and tail measure 12 to 15 inches; the thin, bat-like wings span twice that. The wings are functional, and Little Dragons fly much like hummingbirds.

What the Little Dragons are made of has never been determined. The material is tough (able to withstand a moderate blow from a broadsword without being damaged) but soft, smooth, pliable, and with a somewhat translucent quality. Each of the dragons is of a color chosen by the child it was created for. Most are monotone (the most common colors being rose, sky-blue and black); but a few are said to be rather eclectic: white with pink polka-dots, orange with yellow and green specks, and even a strawberry pattern of red and black.

Little Dragons were created to be part playmate, part nanny; thus, they are intelligent, non-aggressive, and docile. If unowned, a Little Dragon will seek out a child (ages 4 to 16) with which it can form a bond. The bonding process takes 12 to 48 hours. From that moment on, the dragon will consider itself the property of that child. It will take orders and will generally do whatever the child asks. However, it will not do anything that could result in harm for the child -- including sit idle while the child could come to harm¹. No Little Dragon has ever bonded to an adult; they do, however, remain bonded as a child enters adulthood. They will remain bonded to the same person until either the individual dies or upon the birth of the individual's first child. If the individual dies, as stated above, the dragon will seek out a new child to bond with. If the individual has a child of their own, upon the birth of that infant, the

¹ One of the most famous Little Dragons was the sky-blue construct known as Cloudchaser. Cloudchaser was created for Elizabeth, the eldest child of Kendalge and Queen Chelsea V. As a youth, Princess Elizabeth was rarely seen without her beloved companion. In a surviving portion of her diary, she wrote: "Cloudchaser seems to instinctively know who has authority over me: be it mother, father, any of my aunts and uncles, even the Chancellor. If anything I ask her to do contradicts what she has heard them tell me (or her!) then Cloudchaser will not do as I ask. The Chancellor has gotten to the point that he will not pass on any message from my parents unless Cloudchaser is present."

Little Dragon will begin withdrawing its attention from the individual and start bonding with the child. In this circumstance, the unbonding/rebonding period is 12 to 48 *months* (instead of hours). By age 4, the child will command the Little Dragon's sole allegiance.

Little Dragons appear to understand all forms of spoken communication; they cannot speak, however. Instead, they have a high-pitched, bark-like yip. Even without words, they have amazingly emotive faces and can easily convey their meaning. Some claim that the dragons are empathic, at least with their bonded child, and thus can alert a parent or guardian of any need the child might have. These two traits have led many to speculate that the dragons can both read and project emotions; others go so far as to claim that they are telepathic.

Other surviving entries suggest that Little Dragons can, and often do, shed their non-aggressive natures when the child they are bonded to is threatened. Some records claim that the dragons can be outright vicious; how dangerous they can be is debatable, considering that they have no claws, teeth or other natural weapons.

Mirror Of Stone And Sand

More formally known as the *Lautumiae Tabella* (Stone Tablet), the Mirror of Stone and Sand is currently located in the Imperial Palace, on a large table set before the throne and has been there for the last 212 years. Before that it was within the fortress glade of Verhais, the Grand Druid; the stone was moved shortly after his death. It is not known exactly when Kendalge created the stone, but some of Verhais' writings suggest it was the last item he ever enchanted.

The Mirror of Stone and Sand is a massive slab of shale measuring 19 feet by six feet, topped by three inches of very fine white and black sand. While the stone sits idle, the white sand settles to the bottom, leaving a dull black surface on top. Any attempt to remove the sand from the slab fails.

When activated the stone vibrates. The sand mixes into shades of gray. After a few moments, animated mirror images form in the sand². The vibration of the table strangely produces sounds corresponding to the images, often lending a tinny, muffled, or smothered quality to the audible aspects of the scene. Most images last for two to four minutes, after which the vibration stops and the sand separates.

In the two centuries since the stone was moved, it has produced images over a thousand times. Still, none have been able to deduce what causes it to activate. Thus, for the last 150 years or so, there has been a team of scribes assigned to stand watch over the stone and keep a record of any images and sounds that it produces. There are three rooms in the palace dedicated to the scrolls that describe these images.

Although the writings of Verhais suggest that the stone can produce images that are predictions of events that have not yet happened, all of the images on record have been of a scrying nature, or what sages call *far sight* (in other words, they are images of events that are taking place elsewhere at that moment). These images have ranged from events taking place within the walls of the palace, to those that are taking place as far away as the Isle of Gethimium, more than 5,000 miles away. The stone has warned of enemy ships landing at the port of Chestion during the Khorvan Revolution, the siege of Avendale that started the War of Seven Moons, and even a meeting between would-be assassins as they plotted to kill King Augustus III.

² The images that the stone produces are mirror images, like a reflection. Sometimes the images are perfectly clear as though on polished glass, other times they are wavy as though on a rippling pool of water, still other times they are distorted as though on curved metal. This has led to some speculation as to where the images come from.

One popular theory is that the Mirror of Stone and Sand is magically attuned to all reflective surfaces, and can (only?) reproduce images that are currently being reflected on one. If this is true, then it may be that the stone cannot be activated manually, but is instead activated by something particular to the reflection at its source. Although never proven, this theory has given rise to many of the current superstitions dealing with the nature of mirrors and reflections.

Naos Sanctum

Nearly 300 years ago, on the south side of a small island in the midst of Lake Vinitok, a marble keep towered over the lush greenery. Standing over 200 feet tall, the Naos Sanctum was created by Kendalge to serve as a retreat; a place where he could collect his thoughts in solemn solitude.

In the weeks following his death³, several people headed to the Northern Realms to loot the sanctum; none of them were successful. The entire 150 square miles of Lake Vinitok -- including the island and the sanctum -- had vanished; in its place was a barren and broken patch of land.

Since then, all over the known world, there have been sightings of the Sanctum. People report seeing a flash of green light, followed by the sudden appearance of Lake Vinitok, the island, and the sanctum. It always happens around midnight, during the new moon. Whatever used to be where the lake now rests is gone; displaced. Seven to 12 days later, people report a flash of blue light, followed by a complete restoration of the original topography. Those within the restored region report no time having passed from the moment they disappeared to the moment of restoration. Some would not even believe that anything had happened, were it not for the fact that a waxing moon now sits in the sky where the new moon had been.

The same cannot be said for those that are on the lake, on the island, or within the sanctum when the flash of blue light comes and the region disappears. When the sanctum is next spotted (usually many years later), those caught by this effect are simply *gone*. Where they go is a mystery that may never be solved. Since Kendalge died, none have ever entered the Sanctum and returned to tell about it; thus speculation as to the contents of the Sanctum are futile.

The only writings that describe the inside of the Sanctum are from Halvord, former apprentice to Kendalge and Grand Wizard to the throne of King Augustus III. But even he was invited into the sanctum only twice. In one passage he explains ". . . each and every stone of the keep was enchanted in some way to enhance the functionality of the place. Some would glow with light to eliminate the need for lanterns or torches; others would alert Kendalge of the movements that took place within the walls; still others seemed to transport items and persons from one place within the sanctum to another, such as the elaborate waste disposal system that aided in keeping the entire place immaculately clean."

A full rendering of the various enchantments and curiosities that Halvord describes is beyond the scope of this work. Halvord wrote 3 massive tomes dedicated to the Sanctum in his lifetime, and as a footnote to the last volume admitted to only having scratched the surface. This is evidenced by the fact that nothing he described could come close to explaining why the Sanctum vanished in the first place, let alone why it keeps coming back every few years.

Orlantha's Shields

³ Kendalge died between 300 and 350 years ago, assassinated by his own Grand-daughter. Kendalge reigned as Lord Protector of the Northern Regions for 36 years (including the last 27 years of the reign of King Beaufort VII, and the first 9 years of Queen Chelsea V's reign). When he married the Queen, he relinquished his title. A year later, Princess Elizabeth was born. When Chelsea died, Elizabeth assumed the throne as Queen Elizabeth III. Elizabeth is universally regarded as the most beloved monarch the Old Realms had ever known.

Queen Elizabeth's reign, although long, peaceful, and prosperous, ended in a bloody revolution. Princess Zoheret, the Queen's third child and oldest daughter, killed her parents, her grandfather, three of her five siblings, and the majority of the Royal Court. She single handedly ended the era of the Old Realms and ushered in the Age of the Empire. Many go so far as to say that Zoheret's rise to (and fall from) power marked the end of the Second Age.

Even in his younger days, Kendalge was a man that demanded attention. He and his band of adventurers went on dozens of quests, and vanquished many a deadly beast. It was an eclectic group, to say the least, consisting of six people from all walks of life. But the fair-haired beauty (and the *face* of the group) Orlantha, was the one that stole the heart of Kendalge. Depending upon the source, Orlantha was Kendalge's first wife, his fifth wife, or was both⁴. However, they all agree that at some point in their adventuring days, long before the first marriage, Kendalge created a pair of magical shields for her. Only two sources give a physical description of the shields (Ghorik Shadowvale, Earl of Gyersetok, and Queen Alexandria II), and neither one describes them as shields in the traditional sense.

Physically, the shields were octagonal in shape, measured eight inches across and 1/8th inch thick. They were made from some sort of tangerine-colored crystal. They were each attached to finely woven metallic cloth sashes. Ghorik claims that the shields were worn like a belt, with the sashes tied around the waist; Queen Alexandria describes them as being worn over the shoulders, with the crystals on the upper chest. Once in place, the shields created a protective barrier. The effect was two-fold.

The first effect, Ghorik tells us, ". . . the left crystal will prevent the name of the wearer from being uttered by anyone. The person can be thought of, visualized, even described in detail. But nothing will allow that name to escape their lips. In fact, the name cannot be written, or even thought of, so long as the crystal remains in place . . ." Some of his writings suggest that an attempt to read the name would even fail, but he is never specific on that point. Later in his work, he speculates that the wearer is unaffected by the crystal.

Queen Alexandria, who owned the shield for 22 years, wrote that she often wore the left crystal when she was not in court. This, many believe, explains the fact that, although she reigned for over three decades, there is very little written about her that she did not pen herself.

The second effect, Ghorik writes, ". . . comes from the right crystal. This cloaks the individual from the soul, heart, and mind. You can see the one that wears the shield, but you pay them no attention at all. They blend in to their surroundings like a plant, a pillar; they are like servants at a Royal Banquet and given as much regard . . ." Not surprisingly, there is little written about this effect.

Penumbra Cloak

Although legends have often included items that involve shadows in some form, few have created as much interest over the years as Kendalge's Penumbra Cloak. The

⁴ It is interesting to note that Kendalge may or may not have married Orlantha. His first wife, in most sources is not named; the few records of her simply state that she was "a fair-haired beauty." Some go as far as to say that she was Kendalge's first love. Since many primary and secondary sources tend to describe Orlantha the same way, it is often inferred that she was his first wife.

The problems arise when one starts reading about his fifth wife. Some sources claim he was only married four times, others go as high as 11; most center on the range of 4-7. However, of those that include a fifth wife, nearly all of them give the name as Orlantha. Strangely, the description of the fifth wife is divided into three camps: "a fair-haired beauty," or "a dark-haired raven," or "a silver-haired enchantress." Thus, many scholars have speculated that this is a different woman altogether, concluding that Kendalge either (a) never married his old adventuring partner, or (b) married two women named Orlantha. Still, there is one camp that suggests Kendalge actually married Orlantha, divorced her at some point, and then married her again later in life. Reasons for this supposed divorce are never given.

⁵ Very few originals of the scrolls penned by Kendalge exist today. Most were destroyed in the

Penumbra Cloak is one of only a handful of items created by Kendalge that have original records written by him that describe it⁵. Its purported abilities astound, and often amuse, scholars and sages.

The cloak is made from thin, translucent, black and silver, silk-like material. Even during the stillest (or most turbulent!) of weather, it is described as "rippling and flowing as though struck by a gentle summer breeze." Once the cloak is donned, the wearer's shadow will become darker than usual, and take on a liquid-like quality. Via mental command, the shadow can be re-shaped. The total surface area of the shadow cannot be made larger or smaller; but the shape can be made into anything the wearer desires. Many children's stories describe people using the cloak to put on fantastic shadow-puppet shows.

The air within the shadow of the cloak is cooler and drier than the surrounding area. Kendalge's notes suggest that this drop in temperature is about one to six degrees. Other writings claim that this drop is much more dramatic.

Living beings that are touched by the shadow experience a rush of calm. "The individuals are unable to feel the stronger, primal emotions. Instead, the primal emotions are repressed, soothed, and held at bay; they experience complete clarity of mind." Although these are his words, later in the same text he explains that the cloak cannot cure maladies of the mind. "If the mind is damaged such that there is no clarity to be had, it is not going to be found within this shadow."

The clarity offered by the shadow does, however, make those within its effects much less susceptible to magical trickery. They can see through illusions, as well as resist mental control and manipulation. The effect on animals is just as dramatic: even the most agitated beasts are calmed, and magical manipulations of the animal are countered. It is unclear if the one wearing the cloak is given the same clarity of mind.

six months or so following his death; Zoheret was evidently blinded with rage, and determined to ensure that all of her grandfather's work was obliterated. She was less than complete in her endeavors, as some 6,000 pages of his work remain to this day. Granted, the vast majority of these documents are copies of copies of copies . . . and many copies of the same document have discrepancies and variations between them.

There are easily triple this many forgeries that attempt to pass themselves off as original works; most are woefully lacking in any real skill or insight. Of the hundred or so pages of accepted authentic originals that have survived the ages, only a handful of his creations are described: Aaron's Sword, Gemmomarmor, the Houseplant, the Naos Sanctum, the Penumbra Cloak, and the Seven-Jeweled Crown are the most written about. Of these, only Gemmomarmor is given any real detail.

At least two-thirds of all Kendalge manuscripts of accepted authenticity are currently owned by the scholar-knight Sir Chaddwyke Earl of Overcliffe, and are kept in the tower that was once Kendalge's personal library while he served under King Frederick XIX. One interesting work that is a part of this collection is an ornately bound book that remains unread -- and unmoved -- to this day (see FLY PAPER). Since it is unknown if anything is penned on those pages, it is not generally regarded as one of the accepted authentic original works.

Second String Goes Cosmic

by Brian Rogers

Not all super-heroes are created equal. [Super-teams](#) often have some members with cosmic abilities while others rely on skill and determination. Ordinarily GMs who accept those power disparities work within them to keep all the players equally involved, even when Omniman, conduit to a higher plane of reality, works alongside Dr. Sun, the team's science advisor. Sometimes, however, you want to [change direction](#) and give the PCs something really dangerous. Something cosmic. But if you're straining your powerful heroes to their utmost, how do you keep the second stringers involved?

Here are five possibilities, with three such "second stringers" illustrating how to use them.

#1: Abilities only used in a certain environment

Sometimes a second stringer is actually a "fish out of water": the hero is very powerful in his own environment but only moderately powerful out of it. The classic example is a water-breathing hero, but other environments (high magic, space, etc.) are equally likely. If the player constructed the character with this in mind, your job is easy -- put part of the cosmic problem in the environment and let the hero kick butt. If your player didn't build the PC with environment-specific powers, you can still give him a boost -- if the hero has never been in space, how do we know that unfiltered cosmic rays won't triple his powers?

Certainly the person playing the "fish out of water" will appreciate the opportunity to show off what his character can really do, and it might change the public perception of the hero. If the other players see their water breathing teammate as a second stringer, having the forces of hell emerging from the Laurentian Abyssal will show them how much *they* suck outside *their* environment, and maybe putting the fish bowl over the water breather's head last New Year's wasn't a great idea.

#2: Ability is not used often, if at all

Some heroes have powers that they seldom use. Usually these are quirk abilities (Iron-Man's rocket skates and Hulk's ability to see astral forms come to mind), but sometimes they're significant (Snowbird can compel others to help her in her battle against the Great Beasts) and can upgrade the hero to the cosmic conflict if he chooses to employ them.

Alternately the power is used frequently, but never to its full extent: a character who makes mental contact with her allies may be a powerful telepath who finds contacting unfamiliar minds distasteful; the [ruler of a small country](#) has enormous resources that take some time to mobilize; a vigilante who raises fogs in his war on crime could manipulate *any* weather, but at a [terrible cost](#) to the ecosphere. When the world or universe is threatened, however, all bets are off.

#3: Ability has not been used creatively before.

The PC regularly uses these powers, but never to their full versatility. One of the classic comic book tropes is the fledgling hero learning to use his powers, or the experienced one discovering that his limitations were self-imposed. Do you have someone playing a pyrokinetic? Could he act as a catalyst for chemical reactions? If he can quench fires, why can't he freeze things by eliminating heat? Does the power need to be targeted to a single point, or could the PC ignite every inch of an alien craft at once?

The DC universe had a great run of such heroes in the late 1980s. The best example may be Grant Morrison's *Animal Man*, where his ability to borrow the powers of nearby animals grows via a broader awareness of what animals can do ("A moth's sense of smell is as far beyond a dog's as a dog's is beyond a human's"), a comic-book sensibility ("I knew

I could use the life cycle of a bacteria to my advantage!") and ultimately overcoming the "nearby" limitation, giving him the power of any animal, anywhere.

#4: New powers emerge.

As the grand struggle falls upon the Earth, the second-string hero develops new powers. This can be a cop out ("here, have 50 more points or you'll get your butt kicked") to balance the scales, but doesn't have to be. Methods as diverse as experiments by enemy agents, a near-death experiences opening up new powers, or mystical revelations that this is the war the hero was destined to fight can provide a super-rationale for the power upgrade. Alternately, the PC could swipe his teammate's (or enemy's!) devices, as Hawkeye did to become Goliath during the Kree-Skrull war.

These new powers may fade after the cosmic threat disappears, or could be the basis for a revamp of the hero -- creatively applying new powers can shift a second stringer into the top tier (as Alan Moore did in *Swamp Thing*). Both are equally acceptable. If after the war the Velvet Fog wants to go back to fighting crime in Las Vegas, perhaps its best if the extra weather control powers burn out or fade away.

#5: Why yes, I am outclassed. What of it?

Sometimes the hero is simply out of his depth. Just because his powers don't equal his companions, the character can still contribute [emotional viewpoints](#), knowledge, support, and determination. The outclassed hero symbolizes the normal man among gods, and the insights of such normal men are often instrumental.

To keep the players involved, develop tasks that don't rely on raw power. Maybe the crisis has a scientific solution that the outclassed hero could pursue. There could be valuable detective work to be done on the threat's origins while the cosmic heroes hold the line. There are likely friends and [loved ones](#) to defend during the crisis, providing a thematic parallel for the conflict. The second-string hero could be a liaison to the United Nations/NATO/Spirit Realm, with strong roleplaying opportunities in getting reluctant allies to commit forces.

Mountain Man

"Are you ready to feel the Mountain Rumble?"

--Mountain Man

No one knows what made the bears so intelligent. Some suspect that it was fallout from the Nevada nuclear tests settling over the Rockies. Others blame the chemicals released during strip mining. That it happened, however, is undeniable, and the latter half of the 20th century saw a breed of Grizzly that was indeed, smarter than the average bear . . . or human. These highly cerebral ursines felt their innate ability to locate each other, and congregated to discuss many things: dealing with humans, advancing technology, resource management strategies, and controlling their psychic powers. Eventually there were too many spread across too much area for a direct democracy, so the Grizzly Republic was born.

On that day many ursine sensitives felt the birth of their eventual leader, and one albino grizzly tried to derail destiny by killing the child. He was stopped (and turned out as a nameless renegade) but all were surprised to learn that his intended victim wasn't a Grizzly at all, but a human

child, orphaned by the White Bear's attack. The Republic raised the child as one of their own, and he grew large and strong. Whatever gave the Grizzlies their talents for telepathy and technology gifted the human with the ability to take on a hundred times the power of an animal -- he could have the strength of a hundred grizzlies, or the endurance of a hundred wolves. This power made let him face those who would drive the Grizzlies to war with their human neighbors.

He came to understand the Grizzlies from both inside their culture and as an outsider, forging bridges between them and directing them against the White Bear. When pressed to be their leader, he demurred, saying that he needed to experience his own kin for a time. With that he divested himself of his technology and hiked into Denver, taking the name John Bear. He has taken a human as mate, the girl Daisy-Mae (who, over the course of [their relationship](#) is occasionally amnesiac and sometimes dead.) Circumstances forced him to use his powers, so he adopted another identity to continue his research of humans unobserved. Hence the Mountain Man was born, and he has become a occasional member of the world's superhuman community.

Mountain Man is a second stringer in the super-human community. His one power is often used in goofy ways ("I have the climbing ability of a hundred squirrels!"). He spends much of his time fighting battles in the Rocky Mountains, and operates out of a city that isn't a normal super-hero venue. None of this should hide the character's raw potential, which can be explored by using some of the methods mentioned earlier:

Method #2: Mountain Man's connections with the technologically superior Grizzly Republic could be made public, or he could accept the position as their leader. In either case Mountain Man could start sporting advanced technology and call on a small army of psychic and/or genius Grizzlies to face any cosmic threat.

Method #3: Technically, Mountain Man has the "power of a hundred animals" and his penchant for sticking to individual powers of mountain fauna is just a crutch. He *could* adopt the flight speed of a dozen hawks, the strength of thirty elephants, the venom of eighteen spitting cobras, the reflexes of twenty cheetahs and the durability of twenty turtles. Plus, in a comic book world, you need to grant considerable leeway in real vs. proportional measures: if a hamster can hold a 1/1000th of its body volume in a cheek pouch, Mountain Man could use the cheek pouches of a hundred hamsters to hold 1/10 of his volume in his mouth. At 7+ feet and 400+ pounds, that's a lot of cheek! Other oddities could be the spiritual sensitivity of a hundred cats or even the intelligence of a hundred humans!

Method #4: No one really knows whether the Grizzly Republic origin's really lie in scientific mutation. The caves of the Rocky Mountains could hold mystic wellsprings, alien outposts, or anything else that could cause a radical re-thinking of Mountain Man's origins. Likely power boosts: animal control, magical powers or alien technology.

Monarch

climbing of 100 squirrels, etc.). This does not allow for changes in form but he can still, for instance, fly w/o wings.

Natural Weapons (1) Mountain Man's fingernails are very hard and slightly sharp, acting as claws.

"Things. things are coming from tomorrow. Listen."
--Monarch

We can't pronounce his name, but we do know that he was royalty among his people, the people of the lost fifth planet. He was testing his wings in deep space when his world literally collapsed and something threw him into a torpor. He awoke millennia later as the sole survivor of a world that was now rubble. He spread his wings wide, detected the radiation from the third planet, and saw no choice but to make it his new home. Of course, it took him some time to communicate with the locals, who were not prepared for an attenuated (and antennaed!) winged man, and misunderstood the [warnings of events](#) he foresaw through his tachyon awareness. The situation would have been worse had some [government agents](#) not forged a bond with the alien.

Despite having some friends, the being named Monarch (both for his royal blood and his wings, which resemble those of the terrestrial butterfly) finds much of humanity incomprehensible, and often returns to space to mourn his lost world. A combination of noble obligation, his camaraderie with "super-heroes" and the clear cut nature of the situation pushes him to fight crime, even if he attracts increasingly [bizarre foes](#) like flames to a moth. Monarch wields a iron mace: once used to disrupt the wings of an adversary, he find it equally effective in deterring more terrestrial threats.

Despite his greater-than-human strength, speed and durability, Monarch's main power is his wings, actually a pair of energy fields that redirect gravity and act as solar sails. They are solid enough to repel kinetic attacks, and absorb energy to heal him. They burn to touch, making them effective weapons. He can also reflect and amplify energy striking them. He does need to actively block kinetic attacks with his wings -- more of a limitation on earth than in space, where they spread a half a kilometer per side.

The sole surviving alien is usually a powerful archetype in comics, so it's strange that Monarch is often regarded as a lesser hero. This assumption is far from the truth.

Method #1: Monarch's natural home is space, and when in Earth's atmosphere he's extremely limited: his wings only extend meters; his access to solar energy is reduced; his flight is limited to hundreds of kph. Hence he seems a capable enough hero, flying across a city, blocking attacks with his wings and reflecting light to blind his foes. In space, however, he flits between planets, can protect starships with his kilometer-wide force fields and obliterate enemies with unfiltered solar radiation.

Method #2: Monarch's wings are able to filter any sort of particle, and that includes tachyons moving backwards through time. This gives Monarch precognitive powers, but he has abandoned their use due to his inability to convey his meaning to humans. Still, he could develop this, using it either to outmaneuver threats or to gain advantages in combat.

Method #3: Likewise, that filtering applies to energy amplification. Monarch restricts himself to light, but he could just as easily amplify and redirect electricity, hard radiation or even gravity if he wished.

Method #5: Despite these advantages, Monarch might still be outclassed inside an atmosphere. This would not keep him from being involved. He can contribute a unique, alien viewpoint to discussions, flit in and out of the atmosphere for rapid world-wide support, and might be the lynchpin for any stratagem that involves luring opposition into his preferred environment.

Dr. Sun

"I sometimes look at my side job and think 'How did I get here?'"

--Dr. Sun

Dr. Sundya Shrinivasen is quite likely the world's greatest expert on biochemical toxicology. She's written books, taught classes, and developed dozens of techniques and formulas that help in everyday life as well as in esoteric surgery. When she hit a wall in what she could learn with the existing equipment, she branched out and started constructing scientific instrumentation based on innovative theories that were useful not just for her own work but for everyone from police to astro-physicists. This led to another round of books and classes, and then to an unexpected request: Earth's mightiest heroes needed her assistance when dealing with an alien toxin that had infected the atmosphere.

Dr. Shrinivasen (Sun, to her friends) stepped in and helped the heroes prevent this calamity. In doing so, she proved to them just how talented she was. When invisible extra-dimensional beings threatened River City, the Blur sprinted to Bangalor to ask for some help. A designer drug that gave people the heads of animals led Ominman to her door. Then Vigilance sought help upgrading his own sensory devices. That case led to her being attacked, and defending herself with some specially designed neurotoxins. Next thing she knew, Dr. Sun had her own signal device and chair at the meeting table.

While still *just* a normal human, Dr. Sun is not to be underestimated. Her ability to design and apply both advanced sensory equipment and designer toxins "on the

Item of Power (1) Multi-scanner. Normally has IR/UV/X-Ray/ht. Vision ×2; Defect: Concentration (1)
Item of Power (8) Bio-Chemical equipment, this is a scad of devices throughout jacket pockets.
Special Defense (4) Immune Own Attributes, resist pain and toxins
Healing (1) heal 20 damage per target per day, no range, 1 target at a time.
Special Attack (4) Incapacitate (Body check), Area (4m rad), Melee (drop or throw), Toxic, No damage

fly" makes her a very versatile character, and her knowing exactly how human she is means that she's not one to take foolish risks. Even still she isn't as strong as her teammates. But she could be.

Method #3: Dr. Sun is already hip deep in creative uses for her abilities, but you should give her every opportunity to design more. She routinely carries around "base components" for toxins, which let her use her Gadgeteering to tailor special attacks, protect or heal her allies or alter the field of battle (such as with her sensory-deadening, radio-wave-absorbing smoke grenades).

Method #4: It would be a violation of her character concept for Dr. Sun to develop a power-inducing drug, but it might happen in an emergency. Better would be her unveiling a remote controlled probe with broad spectrum sensory and projected toxin capabilities, or an armored battlesuit stocked full of even more varied and powerful chemicals and equipment than will fit in her Kevlar lab coat.

Method #5: Dr. Sun is the archetypical outclassed hero. She's simply *not* superhuman, and her lifetime of education hasn't included decades of combat training. She is, however, a brilliant theoretician and engineer who is well connected with both scientists and law enforcement and is a world famous, passionate public speaker. She's already proven that if lives are in jeopardy she won't hesitate to act, and to find some way to make those actions meaningful.

Dracula's Revenge

Produced by [Human Head Studios](#)

Published by [Green Ronin Publishing](#)

Designed by Matt Forbeck

Box Cover Art by Brian Snoddy & Tommy Lee Edwards

Cartography by Matt Forbeck

32-page Rule Booklet, 20 square Map Tiles, nine six-sided dice, 12 Mist Counters, 12 Doors, 36 Character Cards, 36 Action Cards, two Reference Cards, & two Die Screens; \$29.99

Just as he has proven popular on the big and small screen, Dracula has been a popular subject for games from TSR's *Undead* and Steve Jackson Games' *Vampyre* to licenses such as *Bram Stoker's Dracula: The Board Game* from Leading Edge Games. The latest comes from Human Head Studio by way of Green Ronin Publishing. This game also has a tie-in; a two-issue comic series from IDW written by game designer Matt Forbeck.

Dracula's Revenge takes place after the events of Bram Stoker's novel, the central villain having faked his death at the climax of the book. In 1898, Dracula returns to London and establishes a coven beneath its streets. In response to this threat to both city and empire, Van Helsing has once again assembled a fearless band of stake, crossbow, and crucifix-wielding stalwarts; together they will enter the Vampire Lord's labyrinth, and put an end to this menace to Queen and country.

The game's components are all of a decent quality. The Map Tiles depicting the tunnels and spaces below London are marked in 3-cm squares. The two Reference Cards are lighter card stock, while the Action Cards and their corresponding Character Cards are done on user-friendly plastic card. The two Die Screens are also sturdy. Everything is done in full color, except for the small rulebook, which is generally well written. If there is a problem with all of this, it is getting it back into the box, which is solid and compact but a little tight.

Dracula's Revenge is a two-player game, with one player controlling the Hunters and the other the Vampires. The Hunters have numbers, weapons, and faith on their side, while the Vampires have strength and the supernatural. This includes the ability to transform into mist, enslave or mesmerize Hunters (turning them into minions), and growing in strength and ability. Dracula's forces include, in ascending level of power, minions, She-Wolves, Nosferatu, and Vampiresses, while Van Helsing leads Stakers, Crossbows, and Priests.

Each type has a range of bonuses in three areas: Close Attack, Ranged Attack, and Defense. Vampires have 9 Action Points to spend per turn, while Hunters have 6. The core mechanic is simple, and consists of opposed rolls of a single die each, the higher result determining the winner. The Defense Bonus is used to stop all types of attack, with Close Attacks only possible into adjacent squares, and Ranged Attacks needing at least a square's distance to be effective.

Where the mechanics and game play begin to get interesting is in determining play order each turn. At the beginning of a turn, players take it in turn to lay down an Action Card to create an "action time line." A player does not have to put down an Action Card, but if both pass, then the last card put down must be turned over and the corresponding

character counter must take its actions. Once he has done so, then both return to laying down the Action Cards until both participants have emptied their hand and all counters have taken their actions. Initially it is better to refrain from playing cards, the aim to get your opponent to activate his characters first, leaving you free to act later in the turn.

While each character has a limited number of Action Points per turn, both players have reserves of Reaction Points that vary from turn-to-turn. Determined by a roll of 1d6+6, the number is recorded on two dice, called the Tally Dice and kept hidden behind a player's die screen. Further as an active character moves or takes his actions, any inactive character that sees him can move or do something. This can be a character controlled by either player; the inactive character is allowed a single action. Thus for example, a Vampiress could move through a doorway past an inactive Nosferatu, who could react by closing the door, allowing the Vampiress to continue her actions. Likewise, an inactive character could react by attacking the currently moving character.

Both the rules for Action Cards and Reaction Points add a degree of complexity to *Dracula's Revenge*. Not a high one, but possibly enough to attract the more dedicated gamer. That said, they are not as clearly explained as they should be, and in some ways are easier to understand in the practice than in the read.

Dracula's Revenge is played in scenarios that employ the 20 Map Tiles. Five simple scenarios are included that start out with the introductory "Into the Breach," and culminate in "Destroy Dracula." They are designed to teach the game through facing increasingly powerful foes, and presumably follow the plot of the comic.

Point Values for each of the characters shows that the Vampires have the edge on the weaker Hunters in terms of power and ability. The Point Values also suggest that it is possible to design scenarios of your own, but this is a little supported aspect of the game. Further, neither the rules nor the plainness of the Map Tiles really help with this aspect, as they do not really provide much in the way of inspiration.

Dracula's Revenge is a game of pluses and minuses that balance each other out. It is a little expensive for what it offers, but then the components are all very high quality. Play and design is probably a little too simple, but it is a solid design. The game is enough, then, to attract the young gamer or someone wanting a lighter game, but really *too* light for the dedicated gamer, who will want something more to tinker with. The game is also the first of the designer's *Gothika* line, and it might be enough to draw players to *Dracula's Revenge*, because otherwise, the game really does lack that hook that will attract them. Solid a design *Dracula's Revenge* may well be, but future releases will need more depth.

--Matthew Pook

Pyramid Review

Election USA

Published by [Mongoose Publishing Ltd.](#)

Designed by Martin Wallace

Edited by Ian Barstow

Layout by Alexander Fennell

Art by Jim Brady

Full-color mounted game board, 107 cards, 90 player pawns in five colors, five markers, 50+ money counters, rules sheet, boxed, three to five players; \$24.95

Once every four years the United States picks a president, and every four years you can count on at least one company putting out a game to take advantage of this. Oddly, this year it's a British company, and unlike most such games, this one isn't awful. Mongoose Publishing is the company, and the game is called *Election USA* (probably to make the distinction to their local fans that it isn't a Tony Blair simulation).

Unless they can take a joke, conservatives might want to approach this game cautiously. Three to five players are duking it out for the Republican nomination (these games are always about getting the nomination instead of the presidency itself), and the GOP takes it on the chin accordingly. The object is to secure the nod by having the most Victory Points (VPs) at the end.

Starting with some pawns (representing your influence -- the rest of your tokens wait in a general pool), a little war chest, and some Sincerity points, you build support across the country. The board is a map of America, broken up into six general areas (such as the South or the West Coast), and each offers varying VP values. The board also has a track for keeping score of everyone's Sincerity. Action cards are placed face up around the edges of the board.

The active player either increases his Sincerity or takes a face-up card. Action cards have a number in the corner, and you add that many points to your Sincerity when you pull from the deck. If you go for a face-up card, it's a little more complicated. Fund Raising adds to your coffers, but your opponents may also get an infusion of cash. Policy cards (like "Annex Canada" or "Deport Michael Moore") let you take more of your pawns from the general pool if you win the bid -- the bid here is paid in Sincerity points. You also bid on Advertising cards, but you spend money and it's a silent auction. Advertising cards list an area of the board, and the high bid places tokens in that area, increasing his influence.

But when you choose a face-up card you have to replace it, and the new card may be Blackmail or Journalist. If a Blackmail card is drawn, the active player must pay the stated amount or take a Skeleton. Skeletons are dragged out of your closet to embarrass you, though the effects vary. Some scandals force you to lose a pawn from your stash or, worse, from the board. Other humiliations may be a mixed bag -- the porn video that surfaces may lose you a vote in the Midwest but *give* you one on the West Coast. If the active player pays, the person to his left must pay or take the Skeleton. Once someone has taken the Skeleton, the process stops. Journalist cards work the same way, but you lose Sincerity to avoid the scandal.

Unlike a real primary, this one ends when one player has collected four Skeletons; when one person places his last pawn on the board; or when the Action deck is exhausted. Points are tallied. The highest VP value in each area goes to the candidate with the most pawns there, the second-highest to the next most popular contender, etc. Any players tied for number of pawns in an area remove their tokens and are out of that area's running. This adds another layer of strategy to placement, but at the same time...why? It might make more sense if this happened to those tied for last (to simulate giving one's support to someone else when it's obvious you have no chance to win). If a player ended the game with four Skeletons, he is penalized. The highest total overall wins.

Substandard materials are about the biggest problem with the game's presentation. The cards aren't busy, so there's room aplenty for the simple text and graphics, and the board is a mounted, folding item that has space enough for the many little tokens you'll place. But the box depends more on its layered construction than on strong cardboard for its stability, and the cards are really thin. They shuffle well, but you pay the price for the stock they've used.

However, given that it's an import, all these pieces and components are coming in at a reasonable price, and better materials might have jacked that up a bit. The game mechanics are quite clever and provide some good strategic options. Some rule oversights -- do lost tokens return to the pool or the owner? -- are to be expected given the odd way in which the rules are presented. It's almost as though they were written in reverse, and you end up reading them at least twice. It also lacks a certain magnetism, in that it's hard to get personally invested in the mechanics. But in light of the poor track record for presidential bid games, *Election USA* is altogether too representative of the system: The pickings may be slim, but if there's one option that stands out, you may as well get behind it.

--Andy Vetromile

Paradise Paved; Parking in Rear

- Carl Barks.
- Shareware games.
- Bathtub appliqués.

What do these items have in common? Stay tuned, gentle reader . . .

As I write this, today is Thanksgiving here in the States. I may or many not have mentioned it before (and I'm too darn lazy to get online to check), but Thanksgiving is one of my favorite holidays. It is, in fact, quite possibly my favorite. The economic forces of the universe have yet to figure out how to make more money out of it; really, grocery stores notwithstanding, there isn't much moolah to be made, and there's a human limit to what we can buy for the holiday known in scientific circles as the Gut-Clutching Moaning-Pitifully-About-Poultry-and-Carbs Threshold. The closest the corporate masterminds have done is couple the holiday with the Christmas, but then my ire is directed at that holiday.

No, Thanksgiving is a holiday where you're just supposed to be thankful for what you have, and think about those who are less fortunate. And -- having received a degree in Creative Writing -- navel contemplation is a holiday I can really get behind.

So as I was lying awake last night, I realized I was trying to think of a different spin for a Thanksgiving column . . . preferably one I could tie into gaming, although that's not a deal breaker. And that's when I started concocting a list, consisting of the items above.

I am a Carl Barks quasi-fan. Carl Barks, for those of you who don't know, was an artist for various Disney comic books. He worked on Donald Duck tales, and created many characters and elements that are still part of the "duck canon" today (including Scrooge McDuck, the Beagle Brothers, Gyro Gearloose, the town of Duckburg, and many others). He had a brand of easy storytelling that gave his tales real depth; his characters didn't exist merely to deliver a gag or promote a brand -- they were *people* (well, ducks . . . you know what I mean).

Carl Barks was also very old for a very long time. When I first started working at the comic and game shop, he was in his 90s then. So I was sadly anticipatory of the day when I would learn of his passing. Anyway, a couple of years ago (in late 2002 or early 2003, I believe) I learned he had died . . . in 2000. Somehow I had missed news of his passing. I found myself in a strange emotional frame because of this. I wanted to grieve for his passing, but he had been dead for years; most people with whom I would have commiserated had done so back in 2000. ("Oh, yeah; you didn't know he was dead?" was the usual response from my like-minded circle of friends. Thanks, guys.)

<DERAIL> A couple of week ago I bought a new computer, to replace my old one, which had been utterly compromised by the most debilitating piece of malware I'd ever encountered (which, as I understand it, experts have dubbed "Windows XP"). So, since I had a snazzy new system and wanted to test it out a bit, I thought I'd try to find a few fun shareware games that might flex its muscles a bit. After a bit of searching, however. I came to the conclusion that the shareware scene -- as I had understood it -- was pretty much dead. Yes, the same marketing force that gave us *Doom* and *Doom II*, *One Must Fall*, *Epic Pinball*, and jillions of other games has gone the way of the dodo.

Oh, sure, I find any number of *Tetris* variants or "collect the coin" clones, and there are still some gems (such as the too-violent-for-words *Crimsonland*) but nothing on the scale of what existed back in the early and mid-1990s.

Data Point #3: A few months ago, back when I was playing the role of Mercutio in *Romeo & Juliet*, all the male members of the cast were wearing quasi-period-appearing boots, which were basically a thin cloth wrapped around our feet and sewn in a boot-like shape. For most of the cast, this style of footwear was completely fine. However, Mercutio jumps and runs around onstage a lot (especially when played by a spastic, balding red-head), and the boots were slippery on the wood tile floor. Couple this with the fact that I couldn't wear my glasses (since Flexon frames and high index of refraction lenses weren't invented until the Victorian era), and I had a recipe for literally breaking a leg.

So I thought I would give myself some extra traction by buying some of those rubber flower-things which go in bathtubs to keep you from slipping. They're sticky (so they'd adhere to the boots), they're cheap (always good for a community theatre budget), and I thought they were commonplace.

The day before the dress rehearsal told me how wrong I was on this last point. After searching six different places for them (grocery stores, drug stores, convenience stores, Wal-Mart's), I came to the conclusion that they just didn't make 'em anymore -- or, at the absolute least, they just didn't exist in my part of the country. (I might have become convinced that I'd hallucinated the whole thing if I didn't keep running into clerks, friends, and coworkers who knew exactly what I was talking about.) I eventually needed to tape rubber gloves to the boots, having exhausted all other reasonably convenient possibilities.

Anyway, the point behind these three anecdotes is not merely that we should appreciate what we have -- which is, admittedly, a pretty commonplace theme on Thanksgiving. Rather, it's to try to realize what we might *not* have, ideally at a time when we can still do something about it or at least appreciate it in its time left.

So many things that we take for granted now have a real possibility of ending up a fond memory. This is especially true in the computing world: USENET, while still extant, is a dying force, smothered by web-based newsgroups. (I can do a Google search of USENET posts from a decade ago, but in the transitory world of webgroups, posts from even a month ago can be gone forever.) Once it was possible to assume that, because of its text-based nature, most websites could be indexed and searched indefinitely. Now, because of the prevalence of websites heavy with Flash and Shockwave, which aren't easily searched or distilled, it's much harder to assume you've found all the relevant sites on a topic.

And, of course, this is true in the world of games. Boxed wargames were huge for a long time, killed primarily by computer wargames. *Choose Your Own Adventure*-style gaming books were omnipresent; now they're a novelty. Boxed sets, once a breeding ground of full-color poster maps, ready-to-use handouts, GM and Player information books, and many other goodies, are now so distant a memory that any serious game publishing house will guffaw at the notion of releasing one outside of an "Introductory Players" set at best.

We shouldn't necessarily mourn these bygone products; many had valid reasons for falling to the wayside. But it's sobering to realize those childhood wargames in your closet may represent all that remains easily available of that product type. And if you someday wanted to introduce your kids to gaming using books like *Warlock of Firetop Mountain*, you probably won't have any other choice but to give them your own 20-year-old dog-eared copy.

It's easy to be thankful for what's still around and in front of us. It's much harder to know what we should have been thankful for once it's too late to recognize that it's gone.

Heroes for the Holidays

by Brian Rogers

For any game set in the modern day US, the end of the year is a special time: It's when the cultural mass of Christmas warps the social fabric like a black hole in space-time, altering everything near it. Even if you manage to avoid December 25th, the end-of-year landscape is littered with other holidays that have either been expanded to new importance or simply aggregated into existence into the December Holiday Gravity Well. The simple fact is that being true to American serial fiction means the eventual holiday story . . . even if it's not always the [same holiday](#).

The Season

Even if you don't use any particular event, December has become an event itself. In the United States, Thanksgiving traditionally marked the outside boundary of the holiday season (though commercial interests are [changing that](#)) and can extend as far as [Twelfth Night](#). It boasts the largest, most heavily attended private and professional parties that can be crashed (ala *Die Hard*). It sees the greatest volume of travelers who may be held hostage (ala *Die Hard 2*). Communities hold public festivals that can be central to crimes or incidental scenes to major events or disasters. Retailers call the day after Thanksgiving as Black Friday as it is often the first day of the year in which their balance sheets are "In the Black": such bulging coffers make enticing targets for theft.

GMs would be wise to include the social side of the season. Groups of PCs [reunite with loved ones](#), or hold or attend parties. While such events may be small, informal affairs, some might be as complicated as your [average wedding](#) and provide as many opportunities for picking up clues or dropping straight lines. The holiday season is seen as a time for re-evaluating one's place in society, so any story about a hero experiencing a crisis of faith (ala *Lethal Weapon*) has solid thematic grounding. It is also about peace and safety, making any disasters feel that much more [horrific](#).

Christmas

For Capitalist Western Culture, this is the Big One, the holiday of holidays. Religiously it commemorates the birthday of Jesus Christ, but its societal position is strongly bolstered by the traditions of celebration and gift giving. Concentrated efforts throughout the 19th century turned Christmas from a secondary holiday known for its drunken debauchery into the family oriented festival of today. Many of these story hooks are chestnuts (adding to the [existing hoard](#)), but well worth roasting to get into the spirit.

Seeking Shelter

The heroes encounter a couple out in the harsh weather. Worse, the woman is in early labor. Can they get these people to shelter with everything else going on (be it a heavy blizzard, crime spree or just their regular lives)? In the classic version of this the family are Latinos named Joseph and Maria, opening up the "patented humorous ending" when they name the child something other than Jesus. Freeze the frame with everyone having a good laugh and roll the credits. For darker versions of the story, the one or both are being hunted by someone (perhaps even the PCs), either for mundane crimes or to prevent any magical correspondences.

[What's Wrong With Santa!](#)

One of the many people hired to act as [Santa](#) in the city is having trouble, be it personal or physical. The heroes either have the "shoe on the other foot" experience of giving gifts to Father Christmas or have to find one Santa amongst dozens before a midnight deadline. Classic versions have 'Santa' in an existential funk because he's losing his job tomorrow, and may be planning something criminal to gather funds before that occurrence. This easily blends with *Seeking Shelter*, where Joseph/Santa has agreed to something foolish to secure Maria and their unborn child shelter.

Dangerous versions have criminals of all stripes dressing up as the Jolly Ol' Elf during their nefarious deeds.

Change of Heart

Anyone of an anti-social/self destructive bent dedicates themselves to being good - or at least to not killing themselves. Classics have supernatural aspects, with inexperienced angels or [ghostly trinitities](#) explore alternate universes or timelines. Clever GMs can foreshadow in such visions: Imagine the PC's Christmas Day response to discovering that not only will he lose all his friends if he doesn't change, but that Boston is the domain of the Deep Ones in 10 years! The supernatural can crop up without alternate worlds -- conversations with the [Wandering Jew](#) or La Befana, the Christmas Witch (cursed with immortality for not joining the wise men in visiting the nativity) would have a similar effect, even if the PC never realizes with whom he's sharing a drink.

"Wake Up And Feed Me"

Legend has it that at the moment Christmas Eve becomes Christmas Day a miracle occurs: Animals can talk. GMs can use this as a one session joke where the pets offer up sage advice or humorous quips, or as something more serious: What if Sparky the Wonder Siamese is desperate to give you warning of a catastrophe? Or if the Heir of Sam is getting canine advice for his yearly target? Or the apes are making use of this vital moment to [plan their attack](#)? Do we really want to talk to the animals?

Hanukkah

A minor Jewish holiday, Hanukkah has assumed a seeming of importance among Gentiles due to its timing and among Jews who expanded the gift giving from Gelt (gold-wrapped chocolate coins) & Driedl (gambling tops bearing letters recalling the miracle) as a Christmas-gift analog. The holiday celebrates the victory of Judah Maccabee against the Syrians and the Jewish reclamation of their Temple in Jerusalem. The Menorah symbolizes the miracle in the Temple's rededication, where oil that should have been sufficient to light the N'er Tamid -- an Eternal Light that should never be extinguished -- for one day lasted for eight. While images of smugglers fumbling to regain Kruggerands accidentally swapped for Gelt will be left to the GM's imagination, here are some other Hanukkah story hooks.

Time is Running Out

The heroes are in some desperate situation where some critical resource is running in short supply: fuel for maneuvering thrusters, life support, water in the desert, etc. As they contemplate their eventual demise they discover that their supplies are lasting far longer than expected. While this is the Jewish equivalent of the *Seeking Shelter* plot for its menorah-to-the-forehead subtlety, the Justice League does owe their lives to their satellite's environmental systems lasting impossibly long in the forgotten classic "Miracle at 22,300 Miles" so it can't be all bad.

Struggle For Freedom

Conquerors stand triumphant, and the heroes struggle to restore their freedom and culture. Just as Christmas is for reflecting on the birth of a peaceful prophet, Hanukkah commemorates a battle fought for the preservation of a faith. While the lights are a miracle of that faith, the events leading up to it are the columniation of a three and one half year struggle, and make as good a thematic backdrop for a resistance war as Christmas does for changes of heart.

What Can We Keep, What Have We Lost?

A PC is questioning the retention of part of his culture; this can be as obvious as a Jew deciding to stay with the faith or an exiled alien losing touch with his planet's traditions. The Maccabee's struggle protected the Jewish people from a forced Hellenization and the holiday remains a time of questioning of how a culture can adapt without losing itself. A far more internal conflict than the *Struggle for Freedom*, it still cuts to the heart of the holiday.

Oh Driedl, Driedl, Driedl!

The heroes encounter a poor-but-faithful man gambling to raise the money for some worthy cause when a "miracle" occurs. This can be as simple as the police PCs arresting the grifters before the man gets fleeced, to a string of impossible luck that sets the city's mobsters on his tail. What is important is the intervention of some outside (if not necessarily divine) agency that protects the gambler and his cause.

Kwanzaa

[Dr. Maulana Karenga](#) fashioned Kwanzaa as an African-American holiday in 1966. It uses the model of Egypt's "First Fruit" celebrations to embody the communal African philosophy Kawaia, which strives to synthesize the best in African thought and practice with the rest of the world. Kwanzaa specifically reinforces positive principles to improve lives and community. The principles are Umoja (Unity), Kujichagulia (Self-Determination), Ujima (Collective Work and Responsibility), Ujamaa (Cooperative Economics), Nia (Purpose), Kuumba (Creativity), and Imani (Faith). It traditionally occurs between December 26th and January 1st. Tempting as it is to have a hero whose power word anagrams the Kwanzaa principles, you might want to consider these story hooks instead:

Pride of Place

Legal shenanigans by some unscrupulous force will give them ownership of a neighborhood or community center on the first business day of the New Year unless the heroes can stop them. Their claim rests not just on finances but on the area's "dilapidated state." The PCs have a week to turn the area around and prove that their opposition's claims are untrue. The short deadline means they can't do it alone, and must rouse the community to protect itself. This can range from "Let's put on a show to save the old church!" to facing down armed thugs while rebuilding key Feng Shui sites.

More than the Sum of Your Parts

Urban adventurers in the seasonal spate of self-examination could draw comfort from the Kwanzaa principles. Those who question the necessity of their cause can have their faith and purpose, their ties to the community and their sense of responsibility, restored by the holiday without outside intervention (as befits the tenet of Self-determination) or through exposure to the strength and needs of the greater community. If any holiday argues that with great power comes great responsibility, it is Kwanzaa.

Dangerous Gifts

Traditional Kwanzaa gifts are books and African heritage symbols. Such gifts are just asking for trouble in investigatory horror games (assuming they aren't actually the usual priceless relics from the wrong bag in airport checkout). Several Mythos monsters and cults have a strong presence in Africa and [Egypt](#) in particular. In the unlikely event that your nephew gets a book of Mythos lore, faith, creativity and community support will prove critical.

Deepavali, the Festival of Lights

This Hindu festival's name comes from the Sanskrit root -- *Deepa*, meaning "Lamp," for the oil lamps used during the holiday. As with most things associated with a religion as varied as Hinduism, [Deepavali](#) (or [Diwali](#) or [Diviali](#)) is hard to pin down: Even its duration varies, though five days is common. Two constants are its celebratory nature and use of lights -- Deepavali falls at the Lunar calendar's end and consequently during the darkest days of the year. The lights drive away the spirits in the dark and spread knowledge and understanding. Its position at year's end makes Deepavali a time for closing old accounts and looking to the future. During the festival housecleaning occurs, gifts are purchased and fireworks exploded. Deepavali contains elements similar to many Western Holidays but it has a spirit all its own, lightly touched on with these story hooks.

New Years Observances

Any Indian heroes (or heroes with Indian friends or enemies) can get caught up in the reflective and accounting aspects of Deepavali. The festival make a perfect opportunity for flashbacks, resurfacing plots or rededication to causes. While the interpretation of closing accounts is usually fiscal, PC foes could see it as a final chance to settle old scores before burying the hatchet. Have a nemesis announce that no matter how today's battle goes tomorrow his vendetta ends and see how the players respond.

Death Come No Closer

One Deepavali story concerns a son of King Hima, prophesied to die by snake-bite once married four days. On that day his wife laid a heap of ornaments, gold and silver in her husband's door, illuminated them with lamps and passed the day singing. When the Death god Yama arrived as a serpent he was dazzled and could not enter, instead climbing the heap to hear the songs and leaving in the morning. Anyone facing a similar prophesied death (either by magical divination or medical diagnosis) would find Deepavali an auspicious time for holding it at bay.

"Lead Me From The Unreal To The Real, Lead Me From Darkness To Light"

This is the prayer offered during Deepavali. Such an entreaty makes the festival a perfect time for [new life-changing revelations](#). It is also a good time for confronting the forces of ignorance, be they natural confusion or the cover stories of a secretive illuminati. If those forces have a supernatural bent, confronting them in Deepavali is symbolically attacking them in their place of power, using the festival's light as ammunition against the shadows.

The Seasonal Theme (Villain): Belsnickler

Belsnicklers, or Masked Mummers, traditionally travel from house to house masked during the twelve days of Christmas, ringing bells, making noise and demanding candy unless they are properly identified. If only the cops of your city had it quite that easy . . .

Belsnickler is a [theme villain](#) obsessed with December festivals. Dressed in bulletproof mummer's robes and carrying her trademark bell (the chimes of which are powerful enough shatter glass, stun opponents and in one case overturn a parked mini-van), she will appear on the scene one Christmas season. Armed with an array of gadgets and backed by her henchmen Mistletoe and Holly, she'll engage in thefts based on the Twelve Days of Christmas -- starting with a partridge and a pear tree and ending with kidnapping of members of the Royal Ballet. Once the PCs put her away they'll likely think the problem solved.

Until next year, when she shows up with Judah and Maccabee in a series of eight crimes based on Jewish culture or light-generation (ending with ransoming the city's power grid). Or the next year, when she engages in five crimes over Divali. Or the next . . . This can either become a lovely running joke or a humiliating defeat that your players spend the year plotting to avoid, wondering what angle she'll take this year. She has so many choices!

And when it comes to end of year holidays, so do you.

Baby Blood Dolls

with stats for *GURPS Third Edition*

by Elizabeth McCoy

*These little creatures are suitable for any setting which has magic or technological bio-engineering, such as **Technomancer** or **Transhuman Space**, or the **Vorkosigan** universe worlds of Jackson's *Whole* and *Cetaganda* (though only by a very rogue element). Baby Blood Dolls fit best into a modern day setting, but a high-magic variant of Rome (for example) might also have the right mindset to create them.*

Known by many names, such as "homunculus" or "familiar," a Baby Blood Doll is a semi-intelligent toy favored by attitudinal punks, gangs, and a number of the more violent goth or wanna-be vampire sorts (or, in a world with more magic, actual vampire or werewolf gangs). Dolls are frequently banned from nightclubs and most public schools, in a modern-day setting, and any other "civilized" location will at *least* look upon one -- and whomever brought it -- with disdain. Some cities, states, or countries might pass laws against their creation and sale, or even ownership. Others might merely demand that they be licensed (with little doggie tags) and checked yearly to ensure they are neither carrying any diseases nor are too psychotic to live.

They are created and sold in an inert state, akin to hibernation, usually in a little plastic baggie that has a poorly-translated-into-English (or the local language) set of instructions on how to care for the Baby Blood Doll. The typical cost is between \$5 and \$25, with a unique one going for as much as \$500 to the right buyer. The default form is a somewhat anime-looking humanoid, about as long as a woman's palm, and with minor "demonic" features such as tiny wings (usually nonfunctional), little tails, bird-claw hands or feet, pointed ears, itty-bitty horns, or all of the above. (Cat-girls are also popular, and some "angels" or "aliens" have been seen.) They have sharp teeth, and nails or claws on their hands and feet. Hair, skin, and eye color are likewise fanciful, and while most are female-formed, at least half of those are actually hermaphrodites. A few start out with piercings or tattoos of various kinds, but that sort of customization is more often left to the ultimate owner's whim. Very few of them are capable of speech, since the teeny squeaky voices aren't hardcore enough for the intended customer base, but they can be taught sign language, reading, and a little writing or typing by a patient owner. Their overall intelligence ranges from chimpanzee or dolphin through a four- or five-year old child.

Once you open the bag, the Baby Blood Doll within will start to wake up. It has a rudimentary personality -- of a mean and mischievous sort -- and a desire to imprint upon an owner. (Even the "angelic" ones.) This is done by biological means; the Doll must ingest something from its owner, such as blood, flesh, bodily fluids, or excretions. Once imprinted, it will take orders from that person, and pretty much that person only. While it can be told to "play nice" with anyone else, it doesn't really comprehend "do what this person tells you" with any reliability or persistence of memory.

Naturally, its early training and treatment shape how it behaves. "Taming" one from its initial, strangely innocent and semi-feral, viciousness requires patience, but it can be done. It's far easier to teach them to steal small items, bite people who get too close, and generally be little anti-social nuisances who have to be kept on a chain lest they run off and bite people. (A common fashion statement among gangs with Dolls is to put a safety-pin through the doll's body somewhere, and attach the end of the safety-pin or paper-clip chain to a jacket, shirt, earring, ear, or cheek.) Even a "tame" one, brought up kindly and with instructions on how to behave, will tend to steal small objects to present to its owner -- such as items it can reach in a jewelry store, or bubblegum and candy from the supermarket checkout aisles. This habit makes them frowned upon by "polite, law-abiding" society, but a few people have the patience and presence of personality to thank the homunculus, remind it that stealing is bad, and put the item back without garnering more looks than the parents of a precocious toddler.

A Baby Blood Doll requires more food than most owners realize -- but they scavenge for themselves more than most owners realize, too. Their little stomachs will attempt to process anything biological, from normal human food, through

pet food, through flowers, grass, leaves, and even some of the biodegradable plastics. Their little teeth chew up chickenbones so splinters won't damage them. The default brand of Doll does not require regular infusions of its owner's DNA (e.g., blood, skin, etc.) though many get it anyway, especially if the culture is capable of engineering enough to confuse the "familiar" about its owner's smell and taste. (Or if the owner has the Baby Blood Doll performing intimate and/or degrading services.)

They're a little stronger than they look, but not much. They're rather fast, and need about as much sleep as a human adult -- though they often catch it in short catnaps instead of all at once. Their only code of ethics or morals is "Do what Owner tells me to do, and don't hurt Owner." One which is abused can bite and scratch its owner a little, after a while, but they can't intentionally *seriously* harm or kill their owners. Indeed, they have a hard time understanding "dead," especially as pertaining to humans. They will try to get to, and stay with, the corpses of their owners, and show no comprehension that a non-Doll body will not wake up from hibernation later. (They also cannot be "weaned" from one owner onto another, and quickly pine away and die within a year without special care -- which usually involves computer/magical simulations of the owner explaining that the Doll has to wait for him to come back from his trip. This can extend the Doll's lifespan up to seven years, with reasonably good quality of life.) Some seem to understand that Baby Blood Dolls can die, while others are bewildered by the concept.

A Doll lives anywhere from one to 50 years, depending on how well it is cared for. They're tough, heal fast, and can stand a lot of abuse, but a perforated intestine is a perforated intestine and infection. Large dogs, aggressive cats, and their own owners (or owners' gang) are all common causes of death.

Unless given special shots (or fed a not-as-secret-as-people-wish diet for several weeks), Baby Blood Dolls are infertile but capable of mating. (Even the improbable endowed hermaphrodites can find compatible mates, since the creatures are constructed with such physiology in mind . . .) If given the right chemicals, however, they can interbreed for a while. They lay one to five eggs, which hatch into little grubs with a penchant for manure and rotting meat, or other trash. Once they reach the appropriate size, they spin a cocoon, and emerge as Baby Blood Dolls who seek an owner to imprint upon. The physical characteristics of the thus-bred Dolls appear to be a random selection of the characteristics of the parents -- with the exception of hair, skin, and eye color, which *seem* to blend about half the time, a Doll either has a characteristic, or it does not. There are no recessives in their genetics. A Doll with little wings and a Doll without little wings produce a fifty-fifty chance of offspring with wings. But if you mate the wingless offspring to each other . . . never wings, for as far as amateur breeders' patience has been able to discern. Likewise, a pale Doll and a dark Doll will have pale, dark, and medium offspring -- but the pale offspring will only produce more pale ones, and the medium offspring, even crossed back to each other, will never do more than medium, while the dark offspring will always be dark.

It may be that the companies that sell Baby Blood Dolls breed them (probably in larger batches, from specially-designed breeder Dolls) and then cut them out of their cocoons before packaging. (In a bio-magical setting without plastic, they are probably sold in cocoons, instead, or little coffins.) Or they may be created via other mass-production means, in glass tubes or from special plants . . . The main company (which puts a TM after Baby Blood Doll on the wrapper, unlike other companies which produce similar, knockoff Dolls) is a somewhat shady and mysterious place; everyone can get hold of their products, by mail-order from cheap and badly-printed advertisements next to ones for Sea Munkies, if nowhere else. However, no one is quite sure where the company is based, what it's named, or anything about it. For people who care about conspiracy theories, it's a big question. For most of the owners of Dolls, it's a non-issue.

GURPS Third Edition stats

ST 1-3; ***DX*** 5-12; ***IQ*** 3-8; ***HT*** 14

Advantages: Decreased Life Support 2; Universal Digestion. (Sometimes Fur, Prehensile Tail, Strikers, or very rarely Winged Flight (Gliding). Catgirls may have Acute Hearing up to +3.)

Disadvantages: Inconvenient Size (small); Odious Personal Habit: filches, vicious, and innocently malicious; Presentient; Social Stigma (Property). (Almost always, Mute and Unnatural Features.)

Skills: Stealth (DX+2); Running (HT); Gesture (IQ+2).

Adventure Seeds

- **The Conspiracy Theory.** A bunch of small, mean, tough, and discounted semi-sentient little creatures (with odd genetics) are all over the country. What's not to conspire? What loyalties are writ into their genes? Are they *really* infernal demons or imps? What might they be able to sabotage? What might they be able to hide, and where? The only hitch is that they're not well-mannered pets of rich people's kids, who might get more freedom of movement. But perhaps that's to lull suspicions . . .
- **Gotta Breed 'Em All.** There's a rare specimen being shipped to Breeder A. Breeder B would like to get her hands on this subject (a hermaphrodite; unique appearance up to the GM) first and have it impregnate several of her Dolls before it makes its way to A, preferably without A knowing. She'll pay a lot for this. Of course, A might pay a lot to make sure this *doesn't* happen, too. The Doll is going to be delivered to the local Doll-dealer sometime on Tuesday before closing, and goes to A on Thursday. No, Breeder B doesn't want to imprint the target Doll, with all the complications that implies. Add other elements as desired: Breeder/Dealer C, D, or E? The new clerk who mis-files the Doll with the generic ones? The kid who buys it from the new clerk by accident? The shoplifter who walks out with a coat-full of stolen Dolls? The Doll (owned by a PC or NPC or strayed from its owner for the moment) who falls in love with the rare one and drags the bagged Doll home?
- **Dolls Are Pets Too.** The DAPT group, a spin-off group from the SPCA, is attempting to legitimize Doll ownership (with appropriate regulations, laws against abuse, etc.) and responsible breeding. Conspiracy Theorists think they're just trying to get Dolls into positions of "power." Even if they're just well-meaning people, it's hard to get people to see past the "punks own these" image -- not to mention that the first instinct of a newly-awakened Baby Blood Doll is to bite someone and thus imprint on an owner. PCs can be activists, or hired to protect a carefully trained Baby Blood Doll and its owner as they travel to various functions to show off how well-behaved a Doll can be. Why do they need to protect this activist? Good question.
- **Red Doll District.** It is sad, but true, that there are people who will pay to watch Dolls mating -- especially Dolls trained to do so in entertaining ways. There are also people who will pay for their "familiar" to get laid (while the owner watches), often with Dolls trained to be submissive and who get beaten up a lot. Doll snuff-films exist. Live snuff-shows, starring Dolls, also exist -- in some places, you can have one done at your table for the right price. (Other depravities are up to the GM's imagination.) When there are laws against this -- or even just against soliciting a hooker who happens to have a couple of well-trained pets -- cops will have to manage sting operations, or random patrols to bust the more obvious ones. For that matter, Baby Blood Dolls make annoyingly hard-to-catch drug-runners . . . (They can, after all, be trained to give someone a small drug, in return for getting the money.)
- **Dollnapping!** For some reason, someone is capturing Baby Blood Dolls! This is probably either for illicit breeding (such as someone might want to do in order to start a Doll company), or Blood Doll snuff-shows. (Sacrifices in demonic rituals might be equally plausible . . .) A far-fetched theory would have a radical Dolls Are Pets Too activist capturing them from their "evil owners" and trying to "free them from the unwholesome influence." The PCs might be police, finally brought in when someone with enough influence (a local breeder?) loses a Doll, or be seeking their own Doll or Dolls.

Other Uses

Aside from pets, toys, and petty thieves, Baby Blood Dolls can be trained to help repair devices -- even the stupidest can learn to fetch tools that have rolled exactly beneath the car. (A well-trained, intelligent one could be invaluable on a starship.) They can be used, as conspiracy theorists fear, as little spies, to plant listening devices and cameras. The most intelligent can also be trained to act, putting on little plays. (This requires voiceovers, of course.) Inventive PCs can probably figure out even more uses . . .

Eustace Gillibrand

For *GURPS Fourth Edition*

by Phil Masters

*Note: This character is intended for use in the setting described in chapters 7 and 8 of **GURPS Dragons**.*

Born in the last years of Queen Victoria's reign, Eustace Gillibrand is a child of the British Empire; his family lives in one of the new suburbs of London, from where Mr. Gillibrand commutes by steam-train to his job as a clerk in the City, while Mrs. Gillibrand looks after the house and her children.

Eustace is an intelligent boy, with just two problems: a sense of responsibility to his younger sister along with the rest of his family (a problem which all brothers with younger sisters will understand), and a capacity for curiosity which has always far exceeded his wisdom.

Four years ago, that curiosity could have led Eustace into bad trouble, as he was, all else aside, possibly guilty of trespass -- although he had entered the grounds of the big house at the bottom of the hill through an unlocked gate, and no one had actually told him that he could not go around that house to the back, or look through the conservatory window. The big house at the bottom of the hill, readers should understand, belonged to the strange Mr. Cholmondley, who Eustace's sister Marjorie believed was a German spy. Eustace was unconvinced by that idea, as there was no evidence in its favor save for Mr. Cholmondley's occasional eccentricities, such as rarely talking to the neighbors, and the way that he let the trees in his garden grow thick and tangled, making it hard for a curious lad to peer in without entering the garden first.

When Eustace *did* look into the conservatory, however, what he saw caused him to become quite frightened, and not just of being accused of trespass. He turned to run, and tripped straight over a flowerpot with a great clatter, grazing his knees quite badly. And then Mr. Cholmondley, who was (and is) in fact a dragon, and who was resting in his natural shape among his favorite pot plants, heard the clatter. He pushed his head out of the conservatory door, and saw Eustace, and then said "Oh dear" and invited Eustace in for tea.

Over tea and cakes (made by his housekeeper, who, it turned out, wasn't a German spy either, but who was simply a nice lady who had worked faithfully for Mr. Cholmondley for many years), Mr. Cholmondley explained that, yes, despite all of the firmly-worded letters in the daily newspaper, dragons were indeed real. However, they preferred to keep their existence as secret as possible, as people were sadly prone to misunderstanding them. Still, Mr. Cholmondley wasn't unduly worried that Eustace had found him out, because, as he pointed out quite kindly, no one would believe a nine-year-old lad who had been guilty of trespass, however well his teachers thought of him. Then Mr. Cholmondley sent Eustace on his way, even promising to tell him some stories about dragonkind if he wanted at a later date.

Eustace did indeed want to hear stories about dragonkind, and has often had tea with Mr. Cholmondley since, even once he started at grammar school. The teachers there think well of him, too, and he is currently considered a model pupil with a fine prospect of a scholarship to Oxford or Cambridge.

But Eustace's secret had always been a terrible strain to him, and a year or so ago, he finally found a solution of sorts. He realized that he had never promised Mr. Cholmondley that he *wouldn't* tell anyone about dragons; he had merely admitted that the likelihood of him being taken for a foolish untruthful child made telling his tale pointless. By now, his regard for Mr. Cholmondley made him disinclined to betray that dragon in particular -- but he had heard many wonderful tales about dragons in general. He also knew that his teachers said that he had fine handwriting, which could well be taken for the work of a grown man. Finally, having become interested in dragons, he had read various large books in the local library, and come to the conclusion that there were some quite clever adults who took the subject seriously.

Hence, Eustace wrote a letter to one of these adults, a gentleman who was a scholar at King's College Cambridge, explaining some of the ideas which he had acquired from his conversations with Mr. Cholmondley, but not explaining how he had come to know such things. He did not give his own age or personal history, reasoning that merely not mentioning the truth was not the same as telling lies (which he knows to be wrong). He wanted a reply, of course, but didn't want to worry his parents by being seen to receive strange post. Fortunately, a school-friend of his had a father who looked after the local post-office, and who understood about post boxes and so on, and Eustace was able to arrange to have replies held there for him.

The gentleman-scholar replied in some excitement, and after a short exchange of letters, invited Eustace to join a correspondence circle of which he was a member. Eustace accepted the invitation, and is now a member of the Circle of Pliny (p. DR110). He signs his letters to the Circle simply "E.G.," which is generally thought most appropriate, as he provides many useful examples of dragon behavior for discussion (although the other members do think that E.G. can be a little naive in his ideas).

So far as Eustace can establish, no one else knows about his strange triple life, although some of his school friends know that he has some kind of secret hobby which they really do not understand, and Marjorie, whose curiosity is almost as impertinent as Eustace's own, thinks that something strange is going on, and knows that it involves Mr. Cholmondley. (Eustace tries to reassure her that Mr. Cholmondley is not a German spy, but she fears that her brother is rather gullible.) Eustace's parents occasionally worry that their son spends so much of his time either shut up in his room (where he is actually writing his letters and reading about dragons) or out on his own, but his school reports remain good, apart from the fact that he is not very interested in sport.

Campaign Uses

In a children's story-style campaign, Eustace could be a personal acquaintance of the PCs, and probably their introduction to the secret world of dragonkind. He's not actually terribly physically adventurous himself, but he's very clever and incredibly knowledgeable about dragons for his age. His rather gullible approach to the subject could lead him to mislead PCs by accident, but his advice will *usually* be sound. Other characters may well be drawn into plots by Eustace's increasingly complicated efforts to preserve his various secrets, which can make for a few chapters' worth of relatively mundane comedy before things become weird. Marjorie Gillibrand might become a prime mover in some plots, perhaps seeking aid when she thinks that her brother has become involved in something unfortunate.

(For that matter, given +10 points in Attributes or Advantages, Eustace could be a starting PC in a 50-point campaign.)

In a darker, more serious game, Eustace is in fact being used as a tool by Mr. Cholmondley -- albeit that the dragon may also have some genuine affection for the lad. Mr. Cholmondley knew *exactly* what he was doing when he failed to extract a promise of silence from Eustace, and has since been providing him with *very* carefully calculated information and misinformation, and even mentioning human scholars who studied dragons with a view to engineering precisely what has befallen. Eustace has become Mr. Cholmondley's means of influencing the Circle of Pliny, and of leaking information about his enemies and rivals to the world at large. While those enemies could certainly trace the connection back through Eustace to his mentor if they tried hard enough, Eustace provides an extra layer of complication in the chain -- and may well become useful for more complicated plots as he grows older and goes on to university. Dragons are well used to thinking in the long term, after all.

Adult PCs associated with the Circle of Pliny might eventually try to trace the eccentric, secretive, and knowledgeable "E.G.," and may assume at first that Eustace is simply a courier, taking letters to and from the post office. If they eventually contact him, Mr. Cholmondley will certainly hear of it, and possibly move against them (or perhaps just go away for a while). If the PCs are clever enough to watch Eustace from a distance, they might eventually identify Mr. Cholmondley -- but by then, the sharp-eyed Eustace, his imaginative little sister, or some of his school friends, may well have noticed *them*, and perhaps spoken to their parents or the local constabulary about these suspicious characters.

Eustace Gillibrand

40 points

A rather thin and lanky, not very athletic-looking, 13-year-old English schoolboy, usually dressed neatly and often with a book under his arm. Dark-blond hair, gray eyes.

ST 7 [-30]; **DX** 10 [0]; **IQ** 12 [40]; **HT** 10 [0]

Secondary Attributes: SM 0; Dmg 1d-3/1d-2; BL 13; HP 7 [0]; Will 11 [-5]; Per 12 [0]; FP 8 [-6]; Basic Speed 5 [0]; Basic Move 5 [0]; Dodge 8.

Social Background: TL 6 [0]; CF Edwardian England [0]; English Spoken (Native)/Written (Native) [0]; French Spoken (Broken)/Written (Accented) [3]; Latin Spoken (None)/Written (Broken) [1]; Classical Greek Spoken (None)/Written (Broken) [1].

Advantages: Ally (Father, 150% of starting points, Available 15-) [30]; Contact Group (Members of the Circle of Pliny, Scientific Skills, Effective Skill 15, Appears 12-, Usually Reliable) [40]; Patron (Mr. Cholmondley, Extremely Powerful Individual, Minimal Intervention, Available 9-) [8]; Reputation (+2 as a smart lad, among his teachers and his parents' friends, 10 or less) [1].

Disadvantages: Curious (12) [-5]; Dependent (Marjorie Gillibrand, 50% of starting points, Loved One, Appears 6-) [-5]; Poor [-15]; Post-Combat Shakes (12) [-5]; Secret (Triple life, as ordinary schoolboy, dragon-friend, and member of the Circle of Pliny) [-5]; Sense of Duty (Family and Close Friends) [-5]; Social Stigma (Minor) [-5]; Squeamish (5) [-5].

Quirks: Assumes that most dragons are basically benevolent; Generally law-abiding, but doesn't pay much attention to the details of the law, or let it restrain his curiosity much; Likes to share what he knows, if it's safe; Somewhat gullible. [-4]

Skills: Area Knowledge (Home Suburb)-12 (IQ, E) [1]; Bicycling-10 (DX, E) [1]; Expert (Dracontology)-12 (IQ, H) [4]; Hidden Lore (Dragons)-11 (IQ-1, A) [1]; Observation-11 (Per-1, A) [1]; Sports (Cricket)-9 (DX-1, A) [1]; Stealth-9 (DX-1, A) [1]; Writing-11 (IQ-1, A) [1].

Note: Eustace's wealth level reflects his *personal* resources and funds, which are in fact severely limited, arguably coming closer to the Dead Broke level; he's a *schoolchild* in a society which doesn't give children huge amounts of material stuff. His parents have Average wealth (albeit with some additional resources -- savings and so on), but this is unlikely to come into play, except in that it defines Eustace's lifestyle.

Eustace's father is a rather ordinary middle-class clerical worker; however, he provides Eustace with a home and some resources, and would do his best for his family if they were in trouble, so he is treated here as an Ally. Still, he would not be much help in really dangerous situations. Mr. Cholmondley is a lot more powerful, but a much less reliable source of aid. Also, whatever magical powers Mr. Cholmondley (and his employees) may possess, he is unlikely to use them to aid Eustace; for practical purposes here, he is merely extremely powerful. (If he chose to exert himself to the full, he could easily qualify as Ultra-Powerful, possibly with Special Abilities.)

Out of all Eustace's family, only Marjorie is treated as a Dependent, partly because his parents probably have higher personal point values than him, and partly because they are unlikely to become involved in problems of their own with which Eustace could help, or to need rescuing. (Marjorie might just insist on involving herself in his concerns.) Still, Eustace feels a proper Sense of Duty towards them all.

D6 System Introductory Try- Out

The Pyramid of Ptah

*This is a **Pyramid** exclusive edition of the introductory **D6 System** demo game, with additional items and a pyramid-themed board. For the original version, with a different board, please visit <http://www.westendgames.com/fliers/d6mini.pdf>.*

Also, this document is available as a [ready-to-print PDF](#).

When you read a comic or a novel, you've probably thought, "If I was that person, I'd have done things differently" or "I'd like to be that person and do that kind of stuff!" In that way, a roleplaying game shares much with such forms of entertainment as improvisational acting or interactive storytelling. All have a loose plot or idea that they explore, and all encourage involvement by their participants. You get that chance to "do things differently" and to "do that kind of stuff." They likewise offer the opportunity to do things that you'd probably never be able to experience in real life (like fly without a machine or be an agent of a covert government agency).

The key difference between improvisational acting or interactive storytelling and roleplaying games is that a roleplaying game has rules. Instead of having to guess as to whether you managed to do what you wanted to do, the game provides guidelines on how to figure that out. Sure, many video games and online interactive worlds provide a similar cooperative experience, but a book-based roleplaying game doesn't need any expensive equipment, special software or cartridges, or a connection to the Internet. Instead, you only need the rulebook, some dice, a lot of imagination, and a few friends. Moreover, you'll get to know your friends better (or make new ones) in a way that's exciting, fun, and different every time.

There are many roleplaying game rule systems, but one of the most compelling reasons to chose the *D6 System* over other systems is its simplicity. Focusing on cinematic action, you can learn all of the important rules in 15 minutes or less and make a character in about five minutes(when using a template). You'll spend more time creating scenarios than figuring out the rules to make your ideas work!

This pamphlet offers a simplified version of the game mechanics you'll find in the *D6 Adventure*, *D6 Fantasy*, and *D6 Space* rulebooks. Each rulebook gives more details on how to apply the basic rules, including many character options and sample equipment, two damage systems (only one is used here), and dozens of combat and skill options and example difficulties. Previews are available online.

Game Rules Overview: Any game using the *D6 System* follows the same basic principle: *Roll a number of six-sided dice equal to the character's skill or attribute score. If the total generated equals or exceeds the difficulty number, then the character succeeds at the action.* However, in each application of the system, attributes, skills, and other character details are tailored to the genre of the game. (For example, *Perception* and *Acumen*, both used in this mini-game, serve the same purpose; their names have been chosen to represent their genres more faithfully.)

Learning More: This pamphlet gives only a brief overview of how the system works. You can download previews of each *D6 System* genre rulebook from the Catalog on the West End Games Web site, www.westendgames.com/html/catalog.html. Each preview includes an introduction to the system, with details on how to use a complete character template and a short adventure to play.

Getting Started: You'll need some six-sided dice, paper, pencil, this booklet, and between one and five friends. **One of**

the dice must be a different color or size, or otherwise recognizable; this is the Wild Die (see the "Rules of the Trial Game" for its use). Print out this game and cut out the character cards and tokens. Each player chooses one character to play; in a two-player game, the chosen characters must be from different factions. Finally, lay the triangular gameboard inside flat and read the "Rules of the Trial Game" for instructions on placing the pieces.

Each character has several scores showing how good he or she is at certain tasks; these numbers look akin to "2D" or "3D+1." Body Points has no "D" after its number; it represents the total amount of damage the character can take. Full *D6 System* characters have more attributes (basic physical and mental abilities that are common to every living creature), more skills (areas of expertise and specific applications of attributes), and other characteristics, like equipment and advantages.)

Rules of the Trial Game

Story Background: A number of agents, gathered across time and space and each serving a different faction (Chaos, Order, or Neutrality), have all converged in an ancient pyramid devoted to the Egyptian god Ptah. Unfortunately, their entry triggered a curse, causing the pyramid to crumble about them! This is the big climactic scene: Who will win, and who will become trapped?

Rolling Dice: Whenever the rules call for you to roll a score or roll dice, roll six-sided dice equal to the number before the "D"; one of the dice is always a Wild Die, which represents the vagaries of fate. (If you only roll one die, that die is the Wild Die.)

Add together the numbers on the dice (including the Wild Die). Then add the modifier after the "+" (if the characteristic has one) to the total. This is your total for the roll. If a 6 is rolled on the Wild Die, add the 6 to the total and roll the Wild Die again; as long as the Wild Die rolls a 6, it adds its 6 and can be rolled again. If a 1 is rolled on the first roll of the Wild Die, it adds its 1 but something interesting -- and bad -- happens; see the "Negative Critical Event" box for details. **Example:** The thief has *search* of 3D+2. When making a *search* roll, her player rolls three dice (one of which is the Wild Die), adds them together, and adds 2 to the total.

Setting up the Gameboard: The gameboard represents the crumbling antechamber. The six triangles with doors represent the chamber entrances and exits. Four triangles contain mysterious giant carved columns, which can be hidden behind. There are also elixirs and four treasure items, which must be placed at random (see the "Negative Critical Event" box for the method).

Players roll initiative (see that section on the next page); the person with the highest initiative places his character on one of the six door triangles. The next highest initiative places his character, and so on until all are on the board.

Treasure: These items are placed randomly (face down if desired) at the beginning of the game, using the "Negative Critical Event" rules (see box).

- *Brass Knuckles:* Add +1D to the character's *Strength Damage*.
- *Cursed Jewel:* This jewel is so compellingly beautiful that anyone who successfully attacks a character holding it takes it instead of harming the character.

Negative Critical Event

In this mini-game, a negative critical event on the Wild Die represents the collapsing temple. Each time a 1 comes up on the initial roll of the Wild Die, immediately roll two dice, deciding which one is the first number and which one is the second. Place a "Fire" token on the triangle represented by the roll. (Use coins if you need more tokens.)

Example: The investigator's player rolled a 1 on the Wild Die of a dodge roll, so he immediately rolls two dice. He got a 6 and a 2, so a "Fire" token is placed to the right of the upper giant column, in the triangle marked "6, 2."

This system of placing "Fire" tokens is also used to place other random objects in the game.

Effects of Fire: At the beginning of any turn where a character is in the same triangle as a fire token, he takes 1D of damage for each fire token in the triangle.

- *Helm of Fast Thought*: Adds +1D to the user's initiative roll.
- *Leather Vest*: The character wearing it reduces his or her attacker's *Strength Damage* total by 2.
- *NeuroDex Band*: Adds +1D to the wearer's *dodge* roll.
- *Powerful Magnifying Glass*: Adds +1D to the holder's search or investigation roll.
- *Elixir*: Randomly place one elixir for each character on the board. (Thus if there are three characters, place three elixirs.) Each elixir, when consumed, heals a character for 2D Body Points, up to a maximum of his or her starting Body Points. Each elixir can only be drunk once.

Turn Steps: Each turn has at least three steps, depending on the number of players:

1. Determine initiative.
2. The person with the highest initiative total goes first.
3. The person with the next highest goes next. Repeat until all players have gone.

Determine Initiative: To decide who goes first, each player rolls the number of dice listed as his or her character's *Perception* or *Acumen* score. Whoever has the higher total takes his or her action first, followed by the second highest roll, and so on, until the person with the lowest total goes last. If there's a tie, the character with the higher *Acumen* or *Perception* goes sooner.

Take Actions: Each turn, a player states and then carries out the actions of the character he or she is playing. When the character has taken the action, that player's turn is done. When all players have taken their actions, begin a new turn by rolling initiative again. Each character can make one dodge, attack, move, or other action in a turn, unless the character takes two tasks (see "Two Actions," below).

Dodge: When your character dodges, she's evading attacks from an enemy. Roll your character's *dodge* score and find the total. If a character is in the same triangle as a giant column, add 2D to this roll because your character is using it for cover. Your total becomes the new base difficulty any opponent needs to beat to hit your character. This new difficulty applies until the next time the dodging character has a new turn. **Example:** The gladiator has 3D+2 in *dodge*, which means that the player rolls two six-sided dice and one Wild Die, totals them, and adds 2 to the result. If the player gets 17 for the total on his dice, he adds 2 to this for a final total of 19. His opponent uses this as the base attack difficulty.

Attack: When your character attacks, he punches, kicks, or uses a weapon against an opponent in an adjacent triangle (excluding diagonally). Roll the number of *brawling* or *fighting* dice for the character and find the total. The difficulty number equals 5 or the target's current *dodge* total minus

5. If the total on your *brawling* or *fighting* roll is equal to or higher than the difficulty number, your character hits.

When your character hits, roll your character's *Strength Damage* score and total the dice to find out how much harm you caused the other character. **Example:** The investigator has 4D+1 in *brawling*. The player rolls three normal dice and one Wild Die, getting 10 on the dice. To this, she adds 1, for a total of 11. Since the gladiator decided to *dodge* earlier in the turn, the investigator must beat a 14 (19 for the gladiator's *dodge* total minus 5). Since 11 is less than 14, she missed the gladiator. If the gladiator hadn't dodged, the investigator's player would have hit, since her total of 11 was equal to or greater than 5.

Damage: Subtract the *Strength Damage* total from the target's current *Body Points* total. Keep track of this on a separate piece of paper. When a character gets to 0 or fewer Body Points, he or she falls to the floor, unconscious. Turn the character's piece upside down. Any carried items are dropped. **Example:** On the gladiator's turn, his player rolls well enough to hit the investigator. He rolls his *Strength Damage* of 2D and gets a total of 15 (rolling 4 on the normal die, 6 on the Wild Die, and 5 on the Wild Die reroll). The investigator's player subtracts 15 from her character's current *Body Points* total.

Move: Each triangle represents about 2.5 meters. If a character wants to move, he or she may move up to four triangles on the board (excluding diagonally). This requires no roll. Characters who move onto a door triangle do not have to exit. More than one character cannot occupy a triangle at a time, although an unlimited number of items, fire

tokens, or unconscious bodies can be there. Characters can move through the same space as another character. *Partial Moves*: As an option, a character may move up to two triangles and perform one other action in a turn at no penalty. If a character moves one or two triangles and does two other actions, both actions have the two-action penalty (see the "Two Actions" section for details).

Other Actions: Characters may try to do other things that take an action. These include picking up one item in the character's triangle (which does not require a roll) or doing a special goal action described on the character sheet (which requires a roll). Using an elixir or other treasure needs no effort and takes no action.

Two Actions: If you want your character to do two tasks in one turn, then subtract 1 from the number in front of the "D" of **both** characteristic scores before rolling the dice. Actions that do not require a roll do not get this penalty. Players may take no more than two actions for their character in a turn, and only one of each type of action may be performed each turn. Actions may be performed in any order, but you must decide before doing any actions how many your character will take. **Example:** The investigator wants to investigate a giant column and dodge in the same round. She would roll 3D+2 for her *investigation* and 2D+2 for her *dodge*. If she wanted to pick something up and dodge, she would roll 2D+2 for her *dodge*. And if she wanted to pick something up and move, no penalty would be assessed.

Affecting the Die Roll: Each character starts with three Character Points and one Fate Point. Fate Points and Character Points may not be spent on the same roll. You may use each point only once.

A character may spend a Character Point **after** a roll; each point spent allows the character to roll one additional Wild Die and add its total to the current roll (add and reroll 6s but don't consult the "Negative Critical Event" box on a roll of 1). Each Character Point may be used once, but a player may spend as many Character Points as he or she likes on a roll. **Example:** The investigator rolls 11 on her *dodge*. She spends a Character Point and rolls a 4, making her final total 15.

A Fate Point doubles the number of dice rolled, as well as the bonus, for one roll only. It must be spent **before** the roll. Only one Wild Die is rolled. **Example:** The hard warrior spends his Fate Point before a *brawling* roll, giving him 8D+4 (rolling seven normal dice and a Wild Die).

Ending the Game: In most roleplaying games, characters have goals they want to achieve together, and a gamemaster controls the obstacles; "winning" doesn't have much meaning, so long as everyone has fun. In this game, instead of a gamemaster, the goals of the characters provide their own challenges.

Board

Losing: Characters who exit the gameboard before completing their goals may not return. Unconscious characters may not win. Since the effects of the Wild Die can always cause damage even if there's only one player, it's possible for everyone to lose. That's what makes the game more exciting.

Winning: To win, a character must accomplish his or her goal and escape out of any exit. From any door triangle, it takes one additional triangle's worth of movement to leave the board and the temple.

Game Options: Character options are one advanced rule that you can add to this game. You can find others online in the Systems section of our Web site, www.westendgames.com.

Character Options: In the full *D6 System*, there are many options for improving and specializing your character. As an optional rule to give you a taste of these possibilities, players may choose or randomly pick one of the following at the start of the game:

- *Fast Reactions*: You get +1D to *Acumen* or *Perception* for determining initiative.
- *Good Luck*: Once a game, you may do one of the following for one turn: add +2 to all rolls, take two actions without penalty, or reroll one failed roll.
- *Hypermovement*: You can move one extra triangle per turn.
- *Natural Armor*: You subtract 1D from all *Strength Damage* rolls against your character.
- *Natural Hand-to-Hand Weapon*: Increase your character's *Strength Damage* by +1D.
- *Skill Bonus*: Choose one skill at the beginning of the game to get a +6 bonus to it every time your character uses it: *brawling*, *dodge*, *con*, *investigation*, or *search*.

The Characters

D6 Adventure Bodyguard

Faction: Order

Bodyguard

Perception	3D
brawling	4D
dodge	4D
Strength Damage	2D
Body Points	35

D6 Adventure Bodyguard Goal: You've been hired to help another (Order or Neutrality) character complete his goal; the character you're helping is announced at the beginning of the game. In a two-player game, your goal is to reduce the other character to 0 or fewer Body Points.

D6 Fantasy Gladiator

Faction: Chaos

Gladiator

Acumen	2D
fighting	4D+1
dodge	3D+2
Strength Damage	2D
Body Points	37

D6 Fantasy Gladiator Goal: Your master has sent you to destroy all members of the other two factions (Order and Neutrality). You must reduce all the members of those factions to 0 or fewer Body Points. In a two-player game with the hard warrior, you must defeat him before exiting the temple.

D6 Space Con Artist

Faction: Neutrality

Con Artist

Perception	3D+2
brawling	2D+2
dodge	3D+2
con	4D+2
Strength Damage	1D
Body Points	36

D6 Space Con Artist Goal: You have an irrational need to trick others; to win, you must con all currently conscious characters before you exit the board. To trick someone, make a *con* roll while the other player makes an *Acumen* or *Perception* roll. If your total is higher, the target is tricked and remains so for the rest of the game. (This has no other effect.) The *con* roll counts as an action; the target's roll does not. You must be next to a character to con her.

D6 Adventure Investigator

Faction: Order

Investigator

Perception	3D+1
brawling	3D+1
dodge	4D+2
investigation	3D+2
Strength Damage	1D
Body Points	34

D6 Adventure Investigator Goal: This temple contains vital information. You must investigate all four columns and get out alive. Investigating a column requires you to be in the same triangle as it. Then, as an action, you need to make an *investigation* roll against a difficulty of 10.

D6 Fantasy Thief

Faction: Neutrality

Thief

Acumen	2D+2
fighting	2D+2
dodge	5D
search	3D+2
Strength Damage	2D
Body Points	34

D6 Fantasy Thief Goal: This temple means nothing to you, but you have been paid a princely sum to search for a secret code inscribed over each doorway. To accomplish this, you must visit four of the six door locations and make a *search* roll (as an action) when on the door triangle against a difficulty of 10.

D6 Space Hard Warrior

Faction: Chaos

Hard Warrior

Perception	2D+1
brawling	4D+2
dodge	3D
Strength Damage	2D
Body Points	37

D6 Space Hard Warrior Goal: You learned about some fraggin' fighting stuff in an ancient temple. You must gather the brass knuckles, the leather vest, the helm, and the NeuroDex band and escape with them to win!

Available Now for the D6 System!

The new *D6 System* roleplaying game series offers fans of one of the most popular cinematic systems a new way to get their favorite game. Combining the best of over 15 years of *D6 System* design -- including systems appearing in *Men in Black*, *DC Universe*, *Hercules & Xena*, and the awarding-winning *Star Wars* roleplaying game -- each *D6 System* rulebook provides an attribute and skill set tailored specifically to the genre while using a game engine that's cross-genre compatible. The books feature character templates, three compatible character design systems, two damage systems, many system options, and over 80 Advantages, Disadvantages, and Special Abilities. Each book is 144 pages with a full-color hard cover and a one-color interior. The covers, when placed together with *D6 Adventure* in the middle, form a stunning panoramic image.

- ***D6 Adventure Rulebook:*** Focused on the modern era, but suitable for any setting from the Wild West to the near future. Product Number WEG 51011, ISBN 1-932867-00-7, \$29.95.
- ***D6 Space Rulebook:*** Suitable for any far future setting, including cybernetics and space travel. Product Number

WEG 51012, ISBN 1-932867-01-5, \$29.95.

- ***D6 Fantasy Rulebook***: Suitable for any non-modern fantasy setting, including high, low, semi-historical, and swashbuckling. Product Number WEG 51013, ISBN 1-932867-02-3, \$29.95.
- ***D6 Core Set***: Includes the three genre rulebooks (*D6 Fantasy*, *D6 Adventure*, and *D6 Space*), a three-fold screen, and a gamemaster's booklet in an attractive display box. A perfect collector's item. Product Number WEG 51014, ISBN 1-932867-04-X, \$89.95.

Other upcoming and available products include ***D6 Fantasy Creatures***, ***D6 Adventure Locations***, ***Bloodshadows***, ***D6 Space Ships***, ***D6 Fantasy Locations***, ***D6 Space Aliens***, and ***D6 Magic***, with many more on the way.

For previews, free templates, mini supplements, discussion boards, and more information about the *D6 System* and other West End Games products, visit our Web site at www.westendgames.com.

Zombie Smackdown! (for *All Flesh Must Be Eaten*)

Published by [Eden Studios, Inc.](#)

Written by Mark "Obi-Wan Jabroni" Barnabo, Bryant Durrell, Derek "Gudeberg" Guder, Fred "Big 100D" Jandt, Justin "The Animal" Mohareb & Steven "The Snake" Walmsley

Cover by Gregory Price

Interior Illustrations by Travis Ingram, Matt Morrow, Cary Polkavitz, & George Vasilakos

144-page 7½ by 9½-inch saddle stitched softback; \$23

"You have been to the exotic East with [Enter the Zombie](#) . . . You have been taken on high adventure to dark places [Pulp Zombies](#) . . . You have gone waaaay out West with [Fistful o' Zombies](#). But tonight, ladies and gentlemen, boys and girls, we have before us an epic struggle, a fight between good and evil, one in which the very honor of this great sport is at stake. So take your place around the squared circle and prepare to watch the fight of your lives . . . "

"Ladies and Gennl'emmen . . . get ready to **zombie!**"

In the very latest supplement for [All Flesh Must Be Eaten](#), players enter the world of professional wrestling and ritualized combat of sports entertainment, to become the televisual age's greatest warriors, battling for the sport's honor and future, both in the ring and outside it. The "Face," or good guy, keeps true to the spirit of wrestling, fighting the perennial bad guy, or "Heel," who together with an unscrupulous manager is happy to take wrestling in a direction away from all that is good and honorable about the sport. Along the way, both types of wrestler, plus the Jobbers (who always lose), and the Tweeners (who are neither Face nor Heel), will play out Angles. These storylines, acted out inside and out of the ring, plot out the feuds and relationships between the wrestlers. Essentially each Angle adds a set of motivating elements to a fight.

Of course this is just for the ordinary wrestling you can see on the television nightly. *Zombie Smackdown!* adds another element into this heroic mix. A wrestler no longer faces any old rival, but a far deadlier competitor. One that is evil, feels no pain, and whiffs not of testosterone, but of the graveyard! Members of the corpse cortege are back to fight in the Squared-Circle and they are the toughest opponents a wrestler is likely to face.

As *Enter the Zombie's* Occidental counterpart, *Zombie Smackdown!* gives an overview of sports entertainment, including its history and a glossary of its own language, "Kayfabe." It introduces a new character type, the Professional Wrestler, roughly on a par with the Martial Artist and Shootist types from *Enter the Zombie* and with the Champion from the *Angel RPG*. The core book's Norms, Survivors, and Inspired types take supporting roles around the ring. Most of the new qualities and drawbacks are tied to the Professional Wrestler type. Some mark his role in the ring, Face, Heel or Jobber. Others his physicality, Giant or High Flier; or his expertise, for example, the Cheap Shot Artist knows where to land dirty blows, while Intelligent Feet marks a fighter skilled with strike moves using his feet. The others indicate his toughness, such as Intestinal or Testicular Fortitude. Of course, wrestlers are still free to select qualities or drawbacks from the core rulebook.

There is only one new skill, Promo, which is the ability to work a crowd to a wrestler's advantage. But three skills are central to performing in the ring. Acrobatics covers flips, rolls, and aerial maneuvers; Brawling covers driver, suplex, slam, and cheap shot moves; and Martial Arts covers strikes and holds. When buying these skills, a wrestler also chooses the signature moves he is famed for. Over 40 are described with players encouraged to personalize each maneuver with a colorful description tied to their wrestling identities. Weapons are also included for the dirtier fighter, from the humble 2×4 to the popular folding chair.

While Wrestlers with the Gifted quality can use miracles, they are better able to perform new superhuman maneuvers by channeling Heat. Heat is the crowd's thrill and exultation which wrestlers both work and feed off to fuel special moves. Represented by Essence, it can be regained over time, or more quickly by successfully *working the mic*, performing signature moves, defeating opponents, or winning title bouts. A wrestler needs the Heat Channeling quality and be at least a Face or Heel to use Heat. The book also suggests that he should have the gifted quality, but this is contradicted earlier and the Heat Channeling rules make sense without it.

The new aspects for zombie wrestlers are all suitably gruesome. For example, "Breakable Bones" enables an undead fighter to escape a hold by snapping a limb, while "Crimson Mask" lets him do the same by sloughing off his skin! Zombie Heels or Mega Heels with a taste for flesh can also steal a victim's Heat as they chow down. Yet while *Zombie Smackdown!* suggests the possibility of player character zombie wrestlers, it is not addressed in any depth. *Enter The Zombie* is necessary to give it full justice.

An ordinary wrestling game is possible with *Zombie Smackdown!* (probably doing a better job than other RPGs on the subject), covering all the moves, the layout of the ring and the arena, its rules, handling the world of sports entertainment in the Unisystem (*Zombie Smackdown!* simply uses the system's cinematic rules), winning and losing, the ref, and the various types of match. But that is not what *Zombie Smackdown!* is about. It includes three fully developed Dead Worlds and four mini ones that each adds zombies to the square-circle. The first is "Babes and Barbed Wire," set in the American arena of constant crowd-pleasing action and soap-like angles. The player characters work for Hardcore Extreme Wrestling, a small independent outfit touring smaller cities, booking airtime on regional late-night television. The manager's obsession with his wrestlers' size and bulk leads to extreme methods to get the physique he wants on camera. This includes steroids, which might be behind the rage-induced attacks among the wrestlers. Before long, both wrestlers and the authorities are facing a wider outbreak that puts the players at the zombie outbreak's heart, giving them the opportunity to end it. Overall, this Dead World is not quite so world ending as the others.

It is followed by "Legendary Masked Men," set in the world of "Lucha Libre," the fighting face of Mexican masked wrestling. Lighter and more agile than their American counterparts, Mexican wrestlers, or luchadores possess two identities.

Once is a luchador's public face or mask, which hides his identity, the other his real identity kept hidden except at home. A player is expected to play this to the hilt, creating a personality for his luchadore and mask, and one for his unmasked self. Thus a luchador might be a "Rudo" or bad in the ring, but a stand up and honorable guy in reality. The setting's masked aspect makes the Lucha Libre ideal for infiltration and in "Legendary Masked Men" this has been done by an ancient Aztec cult that also hides behind masks. So the player character wrestlers must face masked Aztec-cultist-wrestler-priests in a fight to save the sport's spirit, and Mexico itself. This Dead World is well done and interesting to read just for the background on Mexican wrestling itself. It also has potential for crossover with Eden's *Angel RPG* or *Pulp Zombies*, as well as a Zorro-like game.

The third, "Land Of The Undead Rising Sun," takes the wrestlers East into Japanese hardcore wrestling wherein anything goes, focusing less on Angles, and more on inflicting pain and suffering via damage inflicting moves and foreign objects. The down-at-heel Universal Combat Group, a minor league affair is dominated by the sudden rise of the Heel Necrohammer. Backed by powerful supernatural aid, he plans to inflict as much suffering on the world of wrestling as possible which includes the creation of an army of Necro Zombies! This is a tough Dead World, one with high potential for crossover with *Enter the Zombie*.

So is the first mini-Dead World, "Immortal Combat." Players are participants in a secret tournament to win a

\$1,000,000 purse, but must face The Mortician, an undead American wrestler and his zombie horde. The supplement will also be useful in "Extreme Zombie Entertainment," where the undead resume their normal pre-dead lives, including fighting in the ring. Alien invaders want the Earth in "Battle Zombies Victory," sending a champion to win the planet. Here the player martial artists and wrestlers are part of the program to select the hero to face the alien's champion. Finally, in "The Fallen and the Risen," angels and demons bored with the post apocalyptic eternal war give zombies the spark of life to fight again. The section also includes notes on zombie mini-wrestlers.

For whatever reason (all right, I find it incredibly crass and superficial) nothing sends me diving for the television remote faster than wrestling. While not even this book will change my mind, it does not mean that I would avoid a game using *Zombie Smackdown!* It does a fine job of making the world of sports entertainment accessible and gameable in a surprisingly small amount of space, but then it goes one further by adding a cadaverous component to the combat. Its failure to develop the playable zombie aspect as the supplement suggests is a shame, perhaps needing and more information on combining it with *Enter the Zombie* would have been appreciated. Yet its Dead Worlds show how the undead can throw down in the Squared-Circle. All are perfectly playable, but the best of these is Legendary Masked Men, which is a clever combination of corpse, cult and combat under the mask.

Pyramid Review

Mad Scientist University

Published by Raiding Party Games

Created by Zachary William Anderson

250 color cards, rules sheet, \$9.95; expansions \$2.95 each

It's strange that a game called *Mad Scientist University* should borrow so much of its innovation, but perhaps it's in keeping with the company's Raiding Party Games moniker.

The player group comprises student members of the secretive, eponymous university, and everyone is being tested on the skills they learn in their classes. The object of the game is to have the most goal cards at the end of the third round.

Players take turns being the teacher's assistant, which is a fancy way of saying you're the dealer. There are two decks, the goal deck and the element deck. The TA deals an element card to each other player, and then turns over a goal card for everyone to see. Players now have 15 seconds to come up with a methodology for achieving the goal using their element.

For example, if your element is sushi and the goal is to infiltrate a secret society, you must explain to the rest of the class how you plan to secret yourself into the ranks of the society using sushi as the basic component of your plan. You're encouraged to be as creative as you like, and to expound on the process with all the verve you can muster.

The TA, on the other hand, is the final judge of how things will be arbitrated. He can choose in what order the presentations are made, give players more or less time in which to finish, or just be nicer to certain players while deciding a winner. Of course, what goes around comes around . . . when he's done, he returns to his lowly student status and the player to his left becomes the TA. The winner takes his goal card and adds it to his stack. After the action has passed around the table three times, whoever has the most goals wins.

It's a simple game, but it's hard to avoid the obvious comparisons to Out of the Box Publishing's *Apples to Apples* card game (and if comparing a game with something called *Apples to Apples* isn't irony enough . . .). The missing piece of that amusement's puzzle, however, is the anonymity. In *Apples to Apples*, the most successful player in any round is unknown to the judge. In *Mad Scientist University*, you cannot help but know whose narrative is whose. At the end of the third round, the TA knows where the scores stand, and can easily choose to ignore a good player's description if he knows another goal card will give that player the win.

The game pieces are about as basic as they can get. The set comes in a folder like those in which you would get your collegiate literature, and the cards are printed on the same perforated stock used to create business cards on a home computer (and yes, you do the perforating). They don't tap down evenly, but they're stiff enough for play and you won't beat yourself up over the price. Save for the company banner and the stylized logo, there isn't much in the way of visuals, and the color ink-jet printing job seems sound.

Although the game's fatal flaw may be a deal breaker, the supplements -- called Course Packets -- may do what they can to ameliorate the problem. Some of them offer alternatives to the normal methods of play, like outside arbitration (which seems to assume you have spectators), a group vote, or a coin toss, and suggest having the person about to win explain *all* his previous goals using his current element. It just replaces one layer of work with another, of course, but one half-hearted and arbitrary solution may find more acceptance from your group than another. Each Course Packet runs along a theme -- one is all about computers and provides goals like "translate everything into binary" or "archive all the world's text," and elements like floppy disks, HTML, and canned air. You can also buy Home Economics,

Zoology, and the relaxation of Spring Break, among others.

None of this means it can't be a lot of fun . . . it can. The cards offer some amusing possibilities, there's plenty of inspiration to get players into the right frame of mind, and who hasn't had some crazy scheme like this they wanted to share? It's advertised as a party game, and if one looks at *Mad Scientist University* as more of a social experiment than a game in the traditional sense, it's a much more palatable buy. The *Apples to Apples* comparisons are inevitable, but the novelty it does present may presage even better things to come from Raiding Party Games' secret lair.

Spy Card Game

Published by Kosmos/Uberplay

Designed by Reiner W. Knizia

For 2-4 players; \$17

Spy is a game of espionage. Players take the role of a spymasters, dispatching their spies on secret but rather abstract missions. The winner is the first player to send off all their spies.

The play area is a row of continents and a row of hiding places. There are six continents: North America, South America, Africa, Australia, Antarctica, and Eurasia. The "hiding places" are bits of iconic spy gear: a camera, a timepiece, a hat, dark glasses, a lighter, and a pen. Each continent and bit of gear starts with one spy counter on it, and the remaining spies are divided evenly among the players. Every player starts with three cards and draws one additional card each turn.

Spy Layout

The game deck consists of cards depicting one of the continents and one of the pieces of spy gear. So each card represents two possible missions, and you send spies on a mission by playing cards that depict it. For instance: You send spies on the African mission by playing several cards that have Africa on them. You send a number of spies equal to the number of matching cards you play minus the number of spies already on that mission. So if you play four Africa cards when there are already three spies on Africa, your play only lets you send one additional spy.

If you have three cards in your hand at the beginning of your turn, you have to put one of them face up in front you. You can play face up cards in the same way you can play cards from your hand. In fact, you can send spies on a mission using a combination of cards.

The trick is that your opponents can see what you have on the table. If you've accumulated several hats in front of you, for instance, they have an incentive to play their hats early; this would put more spies on the hat, making it more difficult for you to put spies there.

These relatively simple game mechanics make for some interesting choices. Although each card has two missions, you can't use both. The Eurasia/pen card is either a Eurasia mission or a pen mission, so you have to decide where to concentrate your resources. If you play a set as soon as you can, you only send a single spy and you're squandering cards. If you wait to accumulate more cards and make a larger set, then your opponent may send spies on that mission and reduce the value of your set.

Game play is pretty quick, but the rules suggest you play a series of games. At the end of a game, each player receives one penalty point for each spy they have left. The player with the lowest score after several games is the winner.

The game comes with 12 cards for setting up the play area, the 108-card game deck, and a sheet of 48 spy chits. The small game box has a plastic insert for storing the components. All of this is well made, even if it is disappointing to buy a German game that doesn't come with little wooden pieces. Given prices for games these days, it's a good deal.

The most striking thing about the game is its abstractness. The trappings of international spycraft provide a thin veneer for a solid rummy-inspired mechanic. The spy gear icons are called "hiding places" and the game cards are called "secret documents," but it's odd to think of several spies with a sheaf of secret documents being sent on a mission to hide them in a hat. In terms of game play, moreover, that peculiar hat mission is no different than a mission to South

America. And just how is it that there are as many missions to Antarctica as there are to Europe and Asia combined? This is not exactly a James Bond movie.

Nevertheless, the game has an element of secrecy and competition about it that's reminiscent of espionage. If you want to make a set of more than three cards, it will need to make use of some of the face up cards. Yet if you just put the cards you are most interested in on the table, your opponents can try to thwart you. So you need to bluff and misdirect, hiding the important cards in the midst of others.

There is not so much luck involved that it completely washes out strategy, but sometimes you just don't get the cards you need. There are several of each card in the deck, so you can't deny your opponent the card they need by keeping it in your own hand. We've had games end with a quick succession of card draws, with victory going to the player who drew what they needed first. This does create a certain drama; in an abstract way, perhaps it's suggestive of the car chase at the denouement of an action film.

Some games, although playable with two players, really only shine with a larger group. Just as cold war espionage was a game primarily played between two super powers, *Spy* is at its most strategic as a two player game. You need only second-guess and out-bluff a single adversary, and hoarding cards is a real temptation when only one other player gets to act before it's your turn again.

In brief: If you want the sort of thinking-optional game that rewards but does not strictly require cunning strategy, then *Spy* offers a good balance. If you hanker after richer theme or purer strategy, then the abstract, card-based mechanics won't suit your needs. Just remember: If any of your spy chits are caught or captured while on a mission to the sunglasses, the Secretary will disavow any knowledge of your actions.

--*P.D. Magnus*

Odds 'n' Ends (with Cranberry Sauce)

It's after Thanksgiving, which means it's time for leftovers. As such, rather than have a real column, I'm going for the grab bag of ideas, and making columnloaf. Yum.

* * *

I upgraded my Internet browser last week to [Firefox](#).

To illustrate what a big deal this is, I've been using one browser – [Opera](#) – for years. (Okay; technically I've used other browsers when Opera failed to load a page.) But I'd heard good things about Firefox, and I tried it out.

And I made the switch in less than an hour.

Amazingly, Firefox is pretty much everything I like about Opera, only more so. Fast, sleek, customizable. And I especially like the idea of “[extensions](#)” -- small plug-ins that do handy little tasks. (I'm planning on experimenting with the one that will turn my browser into a Z-Machine interpreter, capable of playing my old Infocom games.)

Although I miss a few of my Opera features – most notably the ability to quit and save open pages, restarting a session later with all previous windows – I don't miss 'em enough.

* * *

I was thoroughly impressed by Firefox that I decided I wanted to “be a part of this” as much as possible. If the open source community could make Firefox and [OpenOffice.org](#) (which I've been happily using for a couple months now), then I wanted to see what else they had to offer.

So I switched to the Mozilla e-mail client: [Thunderbird](#). Since I live and die by my e-mail (having over seven years of continuous e-mail records), this needed to be a robust environment.

Despite spending six hours in a rocky start at importing my e-mail (“rocky” meaning “trying to track down the half-dozen e-mail messages that cause the entire import process to crash”), I finally got everything imported, and it was pretty neat. It didn't have the immediate “Wow!” factor of Firefox, but once I tamed it in a couple of crucial ways I was beginning to look forward to our new relationship.

And then, during a sprightly search, I noted that it didn't find a message I was fairly certain I had. So I popped open the folder directly, and noted that it had 26 messages.

This was a far cry from the 15,230 messages (really!) I was expecting to find.

In searching through other folders, I noted that they, too, had been mysteriously pruned of about 99% of all messages. And combing through all options and documentation gave no indication as to why this happened. (Fortunately I had a really recent backup, so there wasn't too much harm done.)

So, since I'm not about to devote another afternoon to importing my mail again, I have no choice but to conclude that Thunderbird is not suited for my needs currently. Which is sad . . . I know many people who swear by Thunderbird, and I want to like it. But I also need an e-mail client that'll allow me to import the previous decade of my life, and *not* devour everything.

Oh, and if you sent me an e-mail on Saturday or Sunday (November 26th or 27th) and think I might not have received it, please feel free to resend it. I'm pretty sure I recovered all mail that's important, but duplicates in my inbox are easy to deal with.

* * *

[Banana Phone](#) burns.

* * *

So does [this](#).

* * *

World of Warcraft, a new MMORPG from Blizzard, has been getting phenomenal reviews. As a fan of pencil-and-paper RPGs, I find myself wondering what the implications of the seemingly continuous computer gaming worlds are.

Computer RPGs were previously a finite experience. Once you killed the big baddie at the final level of the Stygian Abyss, you won; you could play again, but it would be with the understanding that you were just reliving the previous experience, only with slight changes.

MMORPGs, however, offer the promise of continuous gaming; you could, theoretically, play the same character for months or even a couple of years.

But – and here's the interesting thing – this still doesn't compare with pencil-and-paper gaming. It's not uncommon to hear about groups who've been gaming together for a decade or more, often in the same universe and even with the same characters. So I find myself wondering: How many people are going to be playing, say, *Everquest* a decade from now, with the same characters? Given the turnover of computer game technology, I would find it surprising, but not impossible; I know of MUDs, MOOs, and MUSHs that have been around for decades, so it's feasible that these modern MMORPGs could go for that long.

However, my gut tells me that the limitation is, strangely, graphic cards. The thing that decade-long pencil-and-paper games and text-based online games have in common is that their core “technology” is constant; on-screen text reads the same today as it did in 1984, and gamers' imaginations are just as vivid as their Reagan-era counterparts (worries about kids and mortgages notwithstanding). But graphical computer games have been pushed most insistently by their peers; a game that looked great in 2000 would be met with derision today.

The loophole, though, is that it might be possible to someday develop a technology that *is* functionally equivalent from one decade to the next. I believe we're getting close to that point with audio technology; there's not much “better” that music and aural components can sound before the human ear can't tell the difference. Could graphics ever hit this real lifelike holodeck-type quality? I honestly don't know . . . but if I were a betting person, I'd guess that the odds are more likely that the answer is either “never” or “some time in the next 10 years.” That seems to be the way it works with computer stuff.

In the meantime, I'm sure that, if this technology does come around within the next 10 years, there'll be a pencil-and-paper game that's been doing its thing for the past three decades.

--*Steven Marsh*

The Nostradamus Cipher

by Adam Wells

"You will not find me alive at sunrise, Jean."

Jean Aymes de Chavigny smiled ruefully. "How can you be so sure, master?"

Both men chuckled, before the man in the bed gave in to coughs and wheezes. Jean gently propped him up with another pillow. "Oh, master, I am sorry. I did not mean . . ."

The old man waved his apology off. "It is nothing. I had rather leave in mirth than grief." He paused, breathing with difficulty. "But the arrangements I asked you to make? You are sure they are completed?"

"I do not pretend to understand, master, but it is done. It will be placed as you have commanded, and interred with you."

His teacher patted Chavigny's hand feebly. "I wonder if I had a choice . . . But you have done as I asked. Take your leave, my pupil. Remember what I have taught you. I . . . will sleep for a while."

Jean waited until the breathing sounds gained a measure of regularity, then rose to leave. At the door, he turned back for his last look at the prophet alive.

"Sleep well, Nostradamus."

* * *

The problem with the famous prophecies of Nostradamus is that they are vague. Those few that might be linked to particular events are never understood until after the event itself provides context. Until then, the allusions, obscure symbolism, mangled poetic grammar, and difficult metaphor of the predictions lend themselves to any number of interpretations.

The Prophecies are so difficult to interpret because they are literally encoded. Nostradamus admitted, in the preface to his first volume of prophecy, that he had pursued a deliberate agenda of obfuscating his meaning. That's a code. So interpreting Nostradamus correctly requires breaking it -- and it's very complicated, involving more than simple letter or word transposition. In fact, so much of the code is predicated on occult knowledge and linguistic idiosyncrasies that it seems unbreakable. But every code has a key . . .

In closing the preface to his first book, Nostradamus wrote:

"And thousands of other events will come to pass . . . as I have set forth more fully in writing my other Prophecies, which are drawn out in length, in prose, setting forth the places and times so that men coming after may see them, knowing the events to have occurred infallibly. This we have noted in connection with the others, speaking more clearly. For although they are written under a cloud, the meanings will be understood. When the time comes for the removal of ignorance, the event will be cleared up still more." (Leoni, 131)

The implications are incredible. First, Nostradamus is claiming that he wrote some predictions in "more fully" detailed (code-free) prose, citing recognizable places and precise dates. Any such work remains unpublished and, as far as the world is aware, unseen. Second, he is explicitly stating that his code will be broken, the "meanings will be understood." He personally made provisions to ensure that particular prediction would prove correct.

In 1566, less than a week before he died, Nostradamus added a codicil to his will. In it, he bequeathed his astrolabe (a device for measuring the position of stars) and a large gold ring to his eldest son, Cesar, and two walnut coffers, with

everything in them, to his eldest daughter, Madeleine. Interestingly, the coffers were bequeathed "without anyone being permitted to see or look at that which will be therein." (Leoni, 783) Within them, Madeleine found all those things a doting father might be expected to give his favorite daughter: clothes, jewelry, various knickknacks . . . and the Nostradamus Cipher.

The Cipher itself is a bundle of vellum sheets on which Nostradamus detailed, in Latin, his method of obscuring the Prophecies. The first section of the Cipher gives Nostradamus' prose prognostications, by which he seems to have intended to convince the bearer of his accuracy. It may also, if the GM chooses, include the missing end to the seventh Century. (The Prophecies were written in groups of 100 poetic quatrains, called Centuries. The seventh Century, for some unknown reason, has only 42 quatrains.) The second section lays out a series of rules by which ambiguities and anagrams in the quatrains can be recognized and resolved. The third, and most important, section of the Cipher consists of a long series of numbers. The numbers give the number of words from the previous word that the interpreter must travel to find the word that should actually come next. The Prophecies make entirely different claims if they are rearranged according to the pattern in this third section and the misleading words are corrected with the information from the second. However, as Nostradamus helpfully notes, the Cipher does not reveal the location of the starting word, which is essential for breaking the code. To find it, he advises in closing, "As he is the only one who knows the number of the starting word, one must speak with the seer in person, and mind his language."

In 1791, someone with access to that injunction deduced that Nostradamus meant he had arranged for the crucial information to be interred with him. In the chaos of Revolutionary France that year, some "National Guardsmen" broke into his tomb in the wall of the Church of the Coredeliers in Salon through his epitaph stone (which read, in part, "Let not posterity disturb his rest"). Acting the part of drunken louts, they looted it, and scattered his bones. One is said to have drunk wine from his skull. They did not find the starting word. What they did find, lodged in the skull's mouth (the Latin word *lingua*, the last word of the Cipher, means tongue, as well as language), was a small golden disc, with the Latin inscription, "That which I sought, I have rendered unto God. That which you seek, I have rendered unto Cesar."

Although it would be easy to assume that it did, this does not constitute one of Nostradamus' common allusions to a biblical verse. In fact, he meant it quite literally. The required information is to be found on the astrolabe that the codicil conferred upon his son, Cesar. Engraved in an arc on the face are the astrological symbols for the planets known in Nostradamus' time: Mercury, Venus, Mars, Jupiter, and Saturn. Under the sigils are the first Latin letters of their names: M, V, M, D (for *Diupater*, an ancient form of the name), and S. Between the first four letters are plus signs, the expected one between D and S prominent by its absence. In Roman numerals, M + V + M + D, or 1000 + 5 + 1000 + 500. The starting word is the 2,505th word of the quatrains.

Searching for the Cipher, disc, and astrolabe is ample fodder for a series of adventures, or even a campaign. What happened to the cipher after its inheritance? Did Madeline understand its implications? Could she even read it? Have parts of the work been separated, forged, or even destroyed? Cesar was never much for astrology, to his father's disappointment. What did he do with the astrolabe? Tracking these bequests to a private collector or descendant of Nostradamus may require both archeological research and detective work. Was the gold disc reburied with Nostradamus' bones, in the other church in Salon? Furthermore, who were the "National Guardsmen" who broke into the seer's tomb, and did they understand the inscriptions on the disc? (If the campaign is set during the late 18th century, they might even be the PCs, of course.) Who else is after the Cipher? To what ends might they stoop to make sure they get hold of it first? And, finally, did Nostradamus have foreknowledge of who would find it? What did he do about it, if he did?

Obtaining the artifacts and deciphering the code doesn't have to end the story. Nostradamus' real message is still a matter of conjecture. Some options are:

True Prophecies

Nostradamus really had precognitive ability. He encoded his insights into the future to preserve people's faith in free will, to prevent people's attempts to avoid the events, and to avoid prosecution by the Inquisition as a black magician. Once deciphered, the Prophecies are a startlingly accurate portrayal of history since the seer and the future yet to

come. Some ambiguities may still exist because of Nostradamus' difficulty in understanding changes in technology and culture. Still, there's not much wiggle room. If this is what the Prophecies contain, it might be best for a campaign if the CIPHER is incomplete for one reason or another, or found only in parts.

True prophecies fit best into a campaign where paranormal or psychic abilities play a major role; otherwise, they require a dramatic reinterpretation of the game world. This variety of Nostradamus' predictions may "freeze" a reality, negating free will, once they are deciphered, or even once they are written, making it impossible to vary from them, and possibly endangering their reality when people try. This kind of danger would almost certainly require attention from any organization committed to "protecting the timestream" or preserving free will. Regardless of the existence or attention of those kinds of groups, powerful entities that want to control or destroy the knowledge are certain to exist.

Finally, in this scenario, where Nostradamus actually was a precognitive, he should be a significant NPC, both during the search and after the discovery. Aware of the searchers, and presumably aware of what they will do with the CIPHER once they find it, he might leave clues to help those he favors, or plant false trails to deceive those he disapproves of. It could be either or both for the PCs, but things are likely to get a little weird. ("Excuse me, sir? Ahem. 'The disc is in the church.' I don't know what that means, how this old letter knew you would be here today, or why it asked me to tell you that, but there you have it.")

Visions with Cloudy Sight

Nostradamus did have some ability to predict, but it succeeded only intermittently. Some of the prophecies are correct, but others are slightly off, or even notably off, what actually happened and will happen. This might be because of poor prophesizing, free will, or visions that included different timelines. He still coded his work for the same reasons, either because he thought he was completely accurate, or because he recognized that enough would be correct to raise suspicions. There may be a way to anticipate the success of a given prediction, or there may not. PCs may find themselves frustrated by encountering, in the deciphered prophecies, many of the same problems that they would have encountered in the originals.

This can be a basis for a campaign in itself. Once the Prophecies are deciphered, the PCs might feel obliged to try to counter or ameliorate some of them, since it seems not all are automatically fated to happen. Forewarned of disasters, assassinations, and other history-changing events, the temptation to get involved in them would be quite strong. An organization with access to the CIPHER and an interest in doing this kind of work could make an excellent patron. A slightly different, but intriguing, possibility would be an organization devoted to ensuring that as many of the prophecies as possible DO come true, perhaps because of concern for the timeline, or some arcane understanding of the implications of "misses."

In this kind of campaign, Nostradamus can play a role similar to the one in "True Prophecies," just maybe less competently. ("Excuse me, sir? I'm supposed to give this message to the first 'noble knight' who comes along, but I'm getting sick of waiting, so: 'The disc is in the church.' There. I've told somebody. I'm done with this.")

The Joke's on You

Nostradamus was a fool or a charlatan. Either he completely imagined his "abilities," or he was deliberately milking plausible-sounding gibberish to win fame and power. In either case, the deciphered predictions are a disappointment. If Nostradamus truly believed in his own abilities, the CIPHER and search stand as outlined. If, on the other hand, he knew he was full of it, the CIPHER may consist of sarcastic, if accurate, "prophecies" about how many gullible people would believe them, followed by musings that anticipate Barnum's "there's one born every minute." To avoid making the discovery of the CIPHER a complete bust, it could also contain valuable historical information -- perhaps insights into the French royal court of his time -- or even guide the finders to a mundane treasure, a cynical reward to those who solved the puzzle.

This version of the CIPHER works well in a campaign devoted to realism. There's enough mystique to Nostradamus that many players will anticipate value to his work even in a world that otherwise sticks strictly to plausibility. Furthermore, the PCs are unlikely to be the only ones lured by the promise. There are still likely to be powerful forces

interested in obtaining the artifacts, and obtaining them first. Just the possibility of its value makes the Cipher an excellent "McGuffin," an ultimately meaningless item that provides the basis for an adventure.

Nostradamus doesn't have to have been a precog to have set up future clues, just a patient prankster. Arrangements could have been made through institutions that were likely to last, or he or his pupil Chavigny could even have started a secret society devoted to perpetuating the joke. ("You wish to disinter the body? The third secret prophecy is fulfilled! You are the 'tall man from the land of Columbus who will come seeking the disc,' just as he foretold!" "My god, you've seen additional prophecies!?! Let me see them!" "Um, somebody . . . stole them. Just last week. Yeah, that's it. Probably somebody else on the trail.") This kind of seemingly impossible clue encourages the PCs to believe that there may be something to the legends, an important spur to their search. In fact, when they find the Cipher, players may think that its inaccuracy proves that they still have not found the real thing. Make sure Nostradamus explains the joke in the Cipher, if you want to end the search there. (Giving the PCs themselves a chance to perpetuate the joke afterwards might help them regain some dignity.)

In the Guise of a Prophet

Nostradamus may not have been writing predictions at all. Some secret society researchers have speculated that his writings were instead "cryptic messages, ciphers, schedules, timetables, instructions, blueprints for action." (Baigent, *Holy Blood*, 143) In one version, Nostradamus was an agent of the Guise family, which was seeking to gain the kingship of France; the Prophecies set forth a plan of action for their followers, providing for such plots as the "accidental" jousting death of Henri II, which vastly benefited the Guise cause. When the efforts of other Guise agents, possibly including the mysterious Priory of Sion, made his foresight "come true," he not only gained influence at court, but became an invaluable propaganda asset. Although Nostradamus as a Guise agent would be of historical interest, it may be a little obscure for the players. If the Guises themselves were just a pawn in a larger conspiracy, or the quatrains were instead intended for an organization or secret society that endured through to the PCs' day, the ability to decipher their secret messages would remain relevant. Note that the intended use of the Prophecies as a plan does not automatically negate their ability to predict -- in fact, it may enhance it! The Nostradamus Cipher could have been intended for use within the organization, or, double-agent style, Nostradamus might have intended it to be used to break his controllers' power.

This version fits nicely into an Illuminati-oriented campaign. The PCs might initially believe the accepted version of the Prophecies as predictions by a precognitive, only to find out, as they are drawn more deeply into the search, that the truth is something different, though no less incredible. The organization whose codes are at stake will obviously be very interested in keeping the Cipher out of the hands of the PCs; enemies of that organization will be just as interested in obtaining it. Either or both sides might seek to recruit the PCs in between attempts to neutralize them.

Either explanation of extra clues from Nostradamus, precognition or preplanning, would be appropriate for this type of Cipher. The boundary between the two should be further blurred by the intercession of agents from various interested parties. Nothing is certain! All is permissible!

("What'd that guy say to you?" "He said he was told to tell me the disc is in the church." "Weird. The woman who was just here knew what we're after. She told me not to trust that guy. She also gave me this note." "Weird. What's it say?" "Let's see . . . the disc is in the church. Um . . .")

Secrets Man Was Not Meant to Know

Nostradamus knew something. The Prophecies, accurate or not, are simply intended to be the medium by which he could pass on a secret or secrets. Here, the prophet is neither part nor pawn of any larger group; instead, he has learned something startling, the knowledge of which he decided to preserve without revealing it to the larger uninitiated public. The possibilities are legion. As a doctor, he may have discovered a formula for resurrecting the dead. As an astrologer, he may have learned how to cast a truly accurate horoscope. As an alchemist, he may have discovered the secret to the Philosopher's Stone. As an occultist, he may have discerned certain magical formulas, or the reality of things thought mythological. (In a Lovecraftian game world, the deciphered Prophecies may resemble the *Necronomicon*.) If the Cipher is to be of any real value to the PCs, Nostradamus found something that remains unknown to the present game

world.

The nature of the campaign must influence the nature of the revelations. Although this is a good way to introduce hitherto unknown possibilities into a game, care should be taken to maintain plausibility. Generally, the greater the paranormal presence in a game, the less significant, but more plausible, Nostradamus' discoveries become. Of course, although Nostradamus would have understood any discoveries he made from an unscientific perspective, it's possible that they were not paranormal. He may have stumbled across an herb that makes a powerful antibiotic and only thought it was a magical cure, for example. Medical advances like this work well as his discoveries, since they are supported by Nostradamus' personal history, which included several successful stints fighting the plague. Almost any scientific discovery could work, however, from a cure to the common cold to cold fusion. Outside organizations could still prove obstacles to the PCs quest for the Cipher, either because they anticipate the secret's value, or because they are operating under the standard assumption that the Cipher provides accurate predictions. (The PCs, too, could be operating under that misconception.) Certain organizations could be threatened by the nature of the secret; imagine the reaction of drug companies to a plentiful substitute for their bestseller, or the problems for religious authorities confronted with evidence that their founder was actually a woman.

Nostradamus, in this paradigm, likely would have little role in a future search for the Cipher. Neither precognitive nor prankster fits particularly well, although either could still be used to mislead the PCs at your option. The seer may instead appear primarily as a figure in historical research. His actual history can be reconfigured or elaborated upon to stress his possession of whatever secret(s) you decide upon. Increasing his success rate at curing patients suggests a miracle cure, unexplained reserves of gold implies alchemical success, reports of night terrors and gibbering fits indicates congress with blasphemous Things Man Was Not Meant to Know, etcetera.

The Nostradamus Cipher by no means exhausts all the possibilities for using Nostradamus in your campaign. A little research will suggest many others.

Bibliography

Books On Nostradamus:

- Cheetham, Erika. *The Prophecies of Nostradamus*. New York: Perigee Books, 1973.
- Leoni, Edgar. *Nostradamus and His Prophecies*. New York: Bell Publishing, 1982. Leoni's work offers the best all-around source on Nostradamus that the author was able to find. It includes a thorough biography, all the quatrains in both French and English, and most of his other written works, including his will. Cheetham makes at least a stab at interpreting every single quatrain. McCann assumes that Nostradamus was a true prophet.
- McCann, Lee. *Nostradamus: The Man Who Saw Through Time*. New York: Wings Books, 1941.
- Randi, James. *The Mask of Nostradamus*. New York: Charles Scribner's Sons, 1990. Randi's work is the definitive debunking of Nostradamus, including a biography that takes a realistic approach to his prognosticating "success."

Websites on Nostradamus:

- alumnus.caltech.edu/~jamesf/nostradamus.html -- Gives a useful (and mostly accurate) FAQ on Nostradamus, and other links.
- www.crystalinks.com/nostradamus.html -- An uncritical look at the soothsayer.

Other Resources:

- Baigent, Michael, and Richard Leigh. *The Temple and the Lodge*. New York: Arcade Publishing, 1989.
- Baigent, Michael, Richard Leigh, and Henry Lincoln. *Holy Blood, Holy Grail*. New York: DeLaCorte Press, 1982. These books speculate (briefly!) on Nostradamus' role in a secret society or societies.
- The reference to "rendering unto Caesar" is from the New Testament of the Bible, Matthew 21:22.

Romae Arcanae Alternae

"Times of troubles are unpleasant to live through, but make exciting settings for adventure stories. Citizens and soldiers will find work to do holding back the shadows; explorers from other timelines can try to uncover the secrets of an empire where pagan gods and magical spells have real power."

-- William Stoddard, *GURPS Fantasy*

Once more inspired by a recent release, we take up the vexilla raised by Bill Stoddard in the "Roma Arcana" setting for the new *GURPS Fantasy*. Although this column has [occasionally](#) dabbled in [fantastic](#) or [scientifically fictional Romes before](#) as [part](#) of a [broader menu](#), this time it's omnia Roma, omnia tempora! (Latin not guaranteed accurate; consult your local pedant for details.) Herewith, four fantastic premises, all seen through the purple and gold lens of Imperial Rome, the eternal game setting.

"The hostilities between Caepio and Drusus also began from a Ring . . . whence arose the origin of the wars and the destruction of the Republic."

-- Pliny, *Natural History*, XXIII:6

The Ring was stolen during the confusion of the wars, and vanished in fire and blood with the Republic. The divine Julius searched for it, and was on the verge of mastering it when he was killed, just as was Livius Drusus, its last known owner. The divine Augustus may have found it, late in his life, for his heirs were debauched, and insane, and half-witted, and finally murderously fearful. A great fire and another civil war followed, and the Ring was lost, as the lords of the August Empire quarreled among themselves. Now a new Emperor sits on the throne, of obscure birth, risen to power through war and *maleficium*. In the East, Titus Flavius Vespasianus destroyed a holy city and took from its treasuries a chest containing the very breath of God. With this ancient power of Creation at his beck, he overthrew the weak Aulus Vitellian and took the Purple for himself. His legions have returned to the northern marches, pressing across the Rhine River into the Northlands. His general Agricola desolates Britain and calls it peace, and his legions press south across Gaetulia to the black rivers. As the great volcano Vesuvius smolders, Vespasian stretches out the August Empire's hand across the once-free lands of the North, searching the world over for the Ring that will seal his power forever. He has even suborned Apollonius the White, wisest magus of the era, to his service and to his search. Apollonius is said to be creating new warriors in the oceans of the East for the Emperor, the *orcus* -- the devourers.

This is an epic high fantasy setting, taking its moral tone from Tacitus and Tolkien alike. PCs may be *Albi* from the forests of Britain, Pygmies thrust out of placid idyll in Aethiopia, Druids or magi alarmed at the building evil in the South, or heroes of the Free Men of the North who seek to keep the Shadow of Rome from falling across the entire Earth. Of course, if they could but find the Ring and hurl it into Vesuvius, the power of the Empire would no doubt be broken forever . . .

"We glance hastily at these things . . . in the hope of putting the reader into that state of feeling which is experienced oftenest at Rome. It is a vague sense of ponderous remembrances; a perception of such weight and density in a by-gone life, of which this spot was the centre, that the present moment is pressed down or crowded out, and our individual affairs and interests are but half as real here as elsewhere. . . . Side by side with the massiveness of the Roman Past, all matters that we handle or dream of nowadays look evanescent and visionary alike. . . . When we find ourselves fading into shadows and unrealities, it seems hardly worth while to be sad, but rather to laugh as gaily as we may, and ask little reason wherefore."

-- Nathaniel Hawthorne, *The Marble Faun*

Rome, the Eternal City, flourishes under the noble emperor Marcus Aurelius. Accompanied by faithful servants, he travels through his city incognito, feeling its pulse and its power; righting wrongs and humbling the wicked. Genii guard the gateposts, priests tell fortunes to supplicants, and merchants sail to Sind and to the islands of the Erythraean Sea, braving rocs and ape-men to find gems and spices for the tables of the rich. The Emperor's wise rule has brought travelers and traders from all ends of the earth, from Cathay to the Red Isles of the Uttermost West, to the forums and marketplaces of the greatest city the world will ever see. Indeed, some travelers and traders seem to have stepped in from lands of miracle; glowing magical lamps, slim impossibly strong swords, and flying shields appear in tinkers'

wagons and tiny market stalls alike, always bringing story and adventure in their wake.

This "Mille Noctes Et Unum" setting treats Rome as "Baghdad-on-the-Tiber," or perhaps "Lankhmar-on-the-Tiber," depending, with a wink and a nod to anachronisms like rapiers, brandy, telescopes, and the rest of the fantastic rogues' kit. Its default tone is perhaps light fantasy, perhaps urban fantasy, varying with GM emphasis. "The Adventure of the Forty Vestal Virgins" will have one tone; "Ill Met In Subura" another. PCs can be almost anything or anyone from anywhere in the pre-industrial world -- or even modern tourists who took a wrong turn in the dark looking for the Trevi Fountains! Dark mystery cults, innocently scholarly aristocrats' daughters, honeyed wine, gladiatorial celebrities, orgies, and a good bath all await the bold. Carpe diem!

"When I reached fifteen I was a disciple of all the spirits and gods, and I knew about the seven levels of priests and the deeds of the lawless demons. For my parents strove that I might learn whatever there was to know about the earth, air, and sea, not only how the corruption of men increases, but also what makes a plant good, sturdy, and nourishing."
-- St. Cyprian, *Confessions*

So you're the new kid here at Sustuberis Magian Academy, eh? I hope you can carry the load; most of the kids here are patricians, and they really hate us plebes. I'm in Domus Mars, which is probably where you'll wind up, too; most of the patricians are in Domus Quirinus. The girls are in Domus Vesta, of course, and the barbarians are in Domus Bacchus. Great parties, but you don't want the prefects finding you in Vesta, or you'll get turned into a pig faster than you can construe Virgil. How are you at Aerial Harpastum? That's going to come in handy, then -- the Quirinians can't say anything if you can beat them in the sky above the palaestrum. So, what's your name, kid? Figulus? Wasn't there a magus named Figulus who, er, died, and . . . bloody Hades, you're his son! I'd know that mark of Jove anywhere . . .

British public school founders based their institutions on the ideals of Roman culture, so it's only fair that we turn around and base this setting on the most popular British public school fantasy in the world. It can be played relatively light and straight, like the source material has it, or darker and weirder. Perhaps the magi who graduate from Sustuberis and its fellow academies go into the front lines with the legions -- the game takes on a kind of "officer cadet" feel at that point. On the other hand, even the source material has plenty of dark hints and unpleasant elements that fit right in with the hellish cults of Cybele, or the plots of dark magi from hated Persia. PCs will be students, of course, which means the GM doesn't even have to decide where the game is going at all for the first little while -- just teaching the basics will be enough to keep young minds busy and productive.

*"Come, let me lead thee o'er this 'second Rome!'
Where tribunes rule, where dusky Davi bow,
And what was Goose-Creek once is Tiber now:
This embryo capital, where Fancy sees
Squares in morasses, obelisks in trees;
Which second-sighted seers, even now, adorn
With shrines unbuilt and heroes yet unborn . . ."*
-- Thomas Moore, "To Thomas Hume, From The City of Washington"

The Empire Never Ended. Behind the scrim of the world we know, Rome lives on, a cruel city of dreams and shadows occasionally leaking into our world in a rush of blood and fire. Crusading brothers take on the patricians, and are assassinated. The rich buy and sell the throne. Fond emperors foolishly appoint their sons to rule. License and impiety saps public moral fiber, and bread and circuses enervate the masses. Rome is the Dreamtime of the West, the eternal story mapped to locations around the world. Nowhere is that map more firmly fixed than Washington, D.C., with its white marble buildings, obelisks raised to Cincinnatus-like founders, and Pantheons of civic gods. Those who know the true viae, the roads that lead behind the world, can travel into Rome and see the levers of existence. They can petition the powers of Rome, the secret Senate of mighty lares, familial spirits of immense age and power such as the Flavians, Julians, and Severans. Here, too, are all the gods of the ancient world, kidnapped in chains and hauled to the Forum -- including the God of the Jews, trapped in His Ark by Titus. In Rome they sleep, watched over by Minerva and Mars. Their dreams drive the world forward, in a design laid out by the architects of the Eternal City.

This setting treats Rome as the Otherworld, eternally present, eternally powerful. The campaign can be secret history

or urban fantasy depending on whether the emphasis is on the Superficies or the City; it will most likely be dark fantasy, whichever direction the GM goes. PCs can be magicians who understand the truth of the world, and seek to use that knowledge for their own ends (a la the Shadow War from *GURPS Voodoo*), or mundane investigators (FBI agents, architects) who stumble into the Umbra Roma. Do they try to dissociate Rome from the world? Wake up the sleeping gods? What if Rome -- bloody, bold, and resolute -- is all that's keeping anything together? What if outside its walls lies ultimate barbarism, and unearthly gods who know not mankind?

The Hills Are Alive With the Sound of Panic

An adventure for *GURPS IOU*

by Karl Gallagher

"Gladiola Hopkins!"

Gladdie took a deep breath and walked onto the stage for her turn. She was a little nervous -- flubbing the final could mean a flunk even with her average. Not nervous enough, maybe.

A trapdoor opened releasing an adorable gopher snake. It swung its head about in obvious confusion. Gladdie stared at it and took a deep breath --

An icy hand grabbed the back of her neck and her body shivered. The scream burst out, shaped by trained reflexes, and filled the auditorium. Three of the calibrated wineglasses on the judges' table shattered. The snake tried to get back into the trap door. Everyone's ears rang for a few more seconds after the scream ended.

"You've been practicing, Miss Hopkins" said the Hysteria Department Chairthing. "That's the best we've had all day."

Gladdie smiled weakly and staggered off the stage. Down the main hall to the maintenance stairs, down to the basement service corridor, and back to the door marked DANGER: HAZARDOUS MATERIAL STORAGE. "If the photon capacitors didn't burn out we're ready to -- " Pete turned away from the other students as she burst in.

"It worked! I was perfect! They loved me!" Gladdie noticed their eyes moving up and down to her breathing and calmed herself.

"So you're registering for the summer project then?" asked Peter, putting down the oscilloscope.

"Well, sure -- a deal's a deal" she replied. "But, gosh, it works so well, why do you need our help?"

"That's a long story," said Peter, smiling widely enough to reveal everything caught in his teeth. "Maybe I can tell you over dinner?"

"Um, that's okay, we'll have plenty of time in New Hampshire." She fled.

* * *

This is a *GURPS IOU* adventure for any number of players. It's centered on WUSE or COUP upperclass or graduate students, with opportunities for one-shot or new characters.

The Set-Up

The Army has realized that tanks and bombs frighten away more enemy soldiers than they kill, so it's decided to skip to the end and avoid all those expensive, wasteful explosions. Now they've hired Prof. Marty Phobos of the Dept. of Military Science and Cost Overruns to build a "Fear Projector" (FP). Being brilliant at procurement, not physics, he said "No problem. Cash in advance" and dumped the details on his students. To make sure they focused on the problem, he arranged for it to count as credit for MSCO 414: Cost-Plus Prototypes, DT 501: Winning Through Intimidation, Ph 330: Focused Waves, and MSCO 550: Energy Weaponry. That leaves all the cash for him and a colleague from COUP (the College of Obscure and Unhealthy Professions considers scaring people to be under the Department of Dirty Tricks, so a compromise was in order).

The students used a combination of strobe lights and ultrasonic vibration to make a working cannon-sized beamer that causes a Will+2 Fright Check for everyone in the target area. Impressive, but not as good as Phobos' reports to the Army described. Now the Army wants a field test. On July 25th Army observers will be watching the town of Hardcheese, New Hampshire (pop. 1,000). If the whole town flees screaming, Phobos gets a bonus and a contract for a mass production version of the FP. If not, he has to pay the money back. All of it. With interest.

Not that Phobos doesn't know where the money is. He does -- it's in Vegas.

So Phobos has called the team together to explain the new grading policy. If the Hardcheese test succeeds everyone gets A's and a share of the bonus. If it fails, they flunk all four classes and get expelled for poor academic performance. The good news is he got his chairthing at the College of Weird and Unnatural Science and Engineering to provide additional funding for a summer field class, so there's money available to support test preparation.

A little research will show why Hardcheese was chosen for the test. Over 10% of the town has the Imperturbable advantage. They're famous for 12 years ago calmly fighting a forest fire even as it reached the edge of town. Any research will find the fire story. Asking THE Computer, Genetic Engineering faculty, or a library search will turn up the concentration of Imperturbable from an old GE study.

Brainstorming

Anyone suggesting they make the FP work better will be reminded that they'd tried that already. Using real bullets or explosives would be cheating so badly that the Army would notice. If the players don't think of this, have an NPC suggest planting ringers among the townsfolk to start the stampede. At that point they notice a sign across the street: "Dept. of Hysteria Summer Job Fair Tomorrow."

Hysterical Ringers

The Department of Hysteria specializes in all forms of emotional overreaction -- not just screaming in fear and gibbering in terror but also shrieking at rock stars, fervent denunciations, and passionate pleas. Its classrooms are heavily soundproofed but the best students still make passers -- by flinch at their screams. Graduates go on to careers as movie starlets, rock groupies, political activists, or evangelical preachers.

Hysteria majors are in hot demand even as undergraduates. The job fair is crowded, with bidding wars breaking out over the top students. The FP team is competing with:

- **B+ Actresses:** "Screams as loud as your CGI's colors."
- **Groupies Galore:** Stocking rock concerts, political rallies, entourages, and game shows.
- **Protest Professionals:** High pitched chants and fervent denunciations.
- **We Warn:** Explaining why everything you eat, use, or see is bad for you.
- **Mourners, Inc.:** Wailing at funerals, weeping at weddings.
- **Lovely Assistant Temps:** Suppliers to the finest mad scientists since 1804.

Phobos has a budget for the tests but WUSE can't throw around that kind of money. The team can only afford one to three hysterics at the going rate, probably not enough to pull the whole town along. (This is the perfect moment to introduce a non-WUSE character, as non-Hysteria majors will be looking for summer jobs, too.) The hiring process should check what kind of hysteric they're getting -- sulkers and fainters won't meet the Army's specs.

Note: Roleplaying WUSE nerds trying to chat up the Hysteria sorority girls could be good for hours of fun -- or it could bring up enough bad memories to provoke a GM lynching. Know Your Players.

If cash won't get them hysterics, they can offer credit, letting Hysteria majors enroll in their summer class (MSCO 599: Special Projects-Applied Fear Demonstration). For it to count toward their major a Hysteria professor has to be one of the faculty for the class. The logical choice is Abby Meeks, the Mass Hysteria professor. Prof. Meeks is willing, if

there's something in it for her. Any Lothario PCs can try direct persuasion of the shy and lonely spinster, or a study of her career can find a better lever. Meeks is so shy that she can only release her inhibitions for full screams in a crowd. This inability to do solo work has trapped her in the MH niche without tenure. The extra boost of the FP might enable her to overcome that.

The same trick can be used to help recruit Hysteria majors worried about their grades. How to sneak the FP into the room for finals without driving up the class average is left as an exercise for the PCs. Note that Hysteria grades on a pitch -- like a curve, but shriller.

Into the Hills

Once a suitable group of hysterics has signed up and finals are over, the infiltration into Hardcheese can begin. There's some tourism for the lakeside resort and forest hiking paths so all the usual seasonal jobs are available. The GM can place a children's summer camp by the lake to create more job openings and tap into horror movie cliches if desired.

Phobos has rented an old farmhouse on a hill overlooking the town to hide the FP in. It also provides housing for the team. Phobos will usually be in the town bar except on bingo nights, when he has his own table.

Once everything is in place, the GM can skip straight to the day of the test, or allow the PCs to start a campaign of tricks to get everyone in town on edge (see any *Scooby-Doo* episode for suggestions). Depending on how successful they are the GM may give the townsfolk -1 to -3 on Fright Checks. Getting the summer campers into town for the day is left to the team's ingenuity. Convincing the town's most stubborn residents to be on vacation that day could also make the test more likely to succeed.

General Mayhem and his aides will arrive at the farmhouse at noon. The PCs have until midnight to empty the town. Good luck!

The Fear Projector

The FP weights 2000 lbs and draws 10kW of power. When fired it affects a 30° cone up to four miles away. Anyone in line of sight or able to see and hear reflections of the beam must immediately make a Fright Check at Will+2 with any other modifiers applicable. If they fail the fright check they will flee the area by the easiest route, follow anyone else panicking, or hide if no escape route is available. Continuous exposure has no additional effect and targets can't be affected again until at least 30 minutes have passed.

Every time the FP is used roll for malfunction on 2d:

- 12 major malfunction, no effect, 2d hours to repair.
- 10-11 malfunction, no effect, 1-3 hours to repair
- 8-9 malfunction, has normal effects but then breaks down, 1-3 hours to repair
- 2-7 normal operation

Completing repairs requires a skill roll in Electronics or other appropriate skills and availability of spare parts. A critical success halves the repair time. If parts aren't available an Electronics-4 roll may be made to make a workaround, but if this fails the FP can't be repaired without the necessary part.

If the GM wants to allow improvements to the FP's performance, options are:

- putting two FP's in a crossfire (creates a Fright Check -2)
- tuning the strobe and/or ultrasonic frequencies to affect specific personality types (this would make it -4 to the targeted type and +4 to all others). This requires tests on the target type and skill rolls in Psychology and Electronics Operation.
- adding more emitters to the FP to allow frequency harmonics. This would be developed as a new Invention, GM

should allow an improved Fright Check roll by how much the Invention rolls were made by.

Simple Mass Panic Rules

Once everything is in place the GM can roll to see the outcome. Modifiers to this roll are:

1 hysteric in town:	+1
2-12 hysteric in town:	+2
13-40 hysteric in town:	+3
41+ hysteric in town:	+4
each 100 outsiders in town:	+1
each 10 Imperturbables out of town:	+1
climate of fear (from pranks):	+1 to +3
tricksters unmasked:	-3
improvements in FP:	+1 for each -1 to Fright Check

Roll 3d and check table:

3-10	Complete failure. Phobos arrested, students expelled.
11-14	Failure. Phobos indicted, students get hearing before ArchDean
15-17	Partial failure. Army cancels follow-on project but takes no other action. C-'s all around.
18-20	Inconclusive. Army schedules retest in one month.
21-23	Partial success. Army gives contract for improved prototype. B's.
24-26	Success. Production contract awarded. A's for all.
27+	Complete success. Huge 10-year contract awarded. All students receive A+ grades.

The GM should provide a vivid description of the hysterics leading the whole town out into the hills . . . or of them running off while everyone watches them with a puzzled look and then goes about their business.

Detailed Mass Panic Rules.

If you want a more detailed breakdown of how the town would panic, and particularly if players want to apply assorted subtle tricks for increasing panic, the actual Fright Checks can be done for the townsfolk. This involves a lot of dice rolling, but the townsfolk and other NPCs can have their rolls done for groups of 10 or 20 to reduce that.

The population breaks down as 200 Will 9, 300 Will 10, 300, Will 11, 100 Will 12, 50 Will 11 + Imperturbable, 50 Will 12 + Imperturbable. If summer campers are present they'll be 40% Will 8, 40% Will 9, 20% Will 10.

The Hysterics will have to pass a Fright Check to do any special maneuvers. They can make Acting rolls to fake panic -- for each 3 points they make the roll by they count as an extra panicking person for Fright Check modifiers. (i.e., a hysteric rolling 9 below her skill would count as four people).

Table of modifiers

Being surrounded by people who've panicked makes it harder to pass your own Fright Check. Conversely, people who've kept their nerve have a steadying influence. Anyone who's not taken the Fright Check yet has no effect. When a character has to make a Fright Check, add the modifiers from the table below to his Will.

Number of People	Panicked People	Unpanicked People
1-5	-1	0
6-15	-2	+1
16-30	-3	+2
31-50	-4	+3
51-75	-5	+4

76-105	-6	+5
106-140	-7	+6
141-180	-8	+7
181-230	-9	+8
231-290	-10	+9
291-360	-11	+10
361-440	-12	+11
441-530	-13	+12
531-630	-14	+13
631-750	-15	+14
751-1000	-16	+15
1000+	-17	+16

Mechanics of Mass Panic

When a group of people is forced to take a Fright Check at once, sort them in order of effective Will and test those with the lowest Will first. Anyone intending to panic is treated as having a Will of zero. If more than one Fright Check occurs at the same time, combine them as one Fright Check with a Will modifier of (total modifiers)-3. If the total Will modifiers reach a point where anyone has an adjusted Will of 2 or below they automatically fail (no chance for a critical success).

If someone not forced to take a Fright Check sees a crowd panicked enough to give a modifier of -5 or below, he must take a Fright Check at +5 to the crowd modifier.

Optional Subplots

- The "climate of fear" option can expand to a whole adventure with costumes, holograms, and a major apparition on test day.
- A COUP student could profit from the reward the Army gives whistleblowers by revealing the plan to rig the test. But he'd need proof and a way to still pass the class.
- A suitably elaborate scheme could lure the Imperturbable NPCs out of Hardcheese.
- Lots of people would want the Fear Projector for themselves. Hijacking the truck taking it to Hardcheese would be the easiest way to steal it. The team would have to race the clock to recover it or build a replacement.
- Other custom applications of the FP could be a distraction. For example, the School of Law wants a miniature one voice-activated by the phrase "Now, you could just trust the jury to do the right thing . . ."

Deus Ex Machinas

If the dice betray your players after all their hard work, you can still give them a happy ending.

- The fluffiest of the hysterics can come up with an idea to improve the FP 10-fold, and the modifications can be completed by midnight.
- Phobos could bribe Gen. Mayhem for a good report.
- When Phobos is arrested the MSCO Chairthing will have to do the grade reports in his absence. He can judge the students on their effort objectively, or rely on Phobos' progress reports to the Army.
- The ArchDean will forgive them if they're willing to earn some "extra credit" by handling this tiny chore for her . . .

Or, heck, just expel them. There's a whole world of adventure and opportunity out there. Bill Gates is a college dropout, too.

Alternate Scenarios

If your current campaign doesn't center on WUSE students (or isn't even at IOU) you can still use some or all of this scenario.

Hysteria-Centered: The Fear Projector plot can be removed entirely, leaving a group of Hysteria-major PCs trying to start a panic for extra credit. This should be set in a different town with less stubborn residents.

Mystery: The current IOU characters can pick up clues about the FP test and work to avert the test, or at least get a cut of the pie for not ruining it. A member of the party could infiltrate the FP team and work both sides.

Inverted: In a non-IOU campaign the FP test could be aimed at their home town. They'd have to see through the various tricks to figure out the connection between all these new summer workers and the mysterious professor renting a house for the summer. This could be either an IOU project or just the workings of your current campaign's villain or mad scientist.

Aftermath: The PCs can come in after or during the panic and have to figure out what happened by tracking down the hysterics and using them to find the FP team and their employer.

Other Genres: Prof. Phobos can work as-is for a modern-day or *Cliffhangers* campaign. For Supers he should have more personal prowess and a gadgeteering ability to customize the FP to work on the PCs. In a Black Ops campaign Phobos is the cover for a Grey experiment to measure human mental resistance. In a *Cyberpunk* campaign the FP can target implants or even work in cyberspace.

Variations

Silly: Make the Hysteria Majors as ditzzy as possible and Phobos incompetent at any technical issue. Encourage cartoon-based fear tactics. Panic has no lasting effect, don't use the Fright Check Table. There are no injuries or damage even if the whole town stampedes.

Weird: Eliminate the more humorous aspects and look puzzled when the PCs laugh at anything. Anyone failing their Fright Checks must roll on the FC Table to see if they have any severe impacts.

Darkly Illuminated: Instead of the Army, the FP is being procured by an "unnamed government agency" which may be a front for someone else. Mafia? Mad scientist? THEM? The companies at the Hysteria Job Fair are all fronts. Mass panics will have sprained ankles, tramlings, car accidents, and houses burned down by abandoned stoves. If the test fails Phobos will simply disappear, with a replacement explaining what they really did this summer.

Notes on Hysteria Majors

Majors will have high HT, average ST and IQ, and average or low DX (they're exceedingly likely to trip when running). The main skills taught are Acting, Performance, Bard, Singing, and Sex Appeal, with appropriate maneuvers. Many have an Attractive or better appearance. Phobias are common. Unfzable and Imperturbable students get washed out quickly. Danger Sense is useful for getting in three deep breaths before your cue. Known majors have the Reputation "noisy and useless in emergencies" among IOU members (-3, large group, 10-, 4 pts) but may buy it off by demonstrating that they only panic deliberately.

New Maneuvers

Scream (Average) Defaults to Acting, Bard, or Singing, no prereq

This maneuver allows the character to utter a convincing scream.

Piercing Scream (Hard) Defaults to Bard or Singing, no prereq

This produces a clear, very loud scream that can be heard at twice the distance of a normal shout.

Terrified Scream (Hard) Defaults to Acting or Singing, no prereq

This maneuver tries to convince witnesses that the screamer is truly terrified of something. A critical success will force everyone in earshot to make a Fright Check. This must be taken with a specialization in Fleeing, Cowering, or Fainting (which default to each other at -2).

Delighted Scream (Hard) Defaults to Acting, Singing, or Sex Appeal, no prereq

Gives an impression of pure ecstasy at the arrival of the target. A successful roll gives +2 to any Sex Appeal rolls made against the target by the screamer during the next 24 hours.

Synchronized Screaming (Hard) No default

This must have a specialization in a specific scream maneuver. A group of screamers with this maneuver may do a synchronized scream whose effect is multiplied by the square of the number of screamers. Roll against the lowest maneuver level of the group.

Angry Rant (Average) Defaults to Intimidation, Acting, or Bard, no prereq

Emotional outburst intended to force target to yield on conflict or acknowledge guilt. Can be used in Contest of Skill against target's Will, or bonus to reaction roll (+1 for each 2 pts. roll is made by).

Angry Sermon (Hard) Prereq: Angry Rant (must use same base skill)

As Angry Rant, but targeted at a group.

Pleading (Average) Defaults to Acting or Bard, no prereq.

Persuading target to provide concessions through pity or sympathy. Can be used in Contest of Skill against target's Will, or bonus to reaction roll (+1 for each 2 pts. roll is made by).

GM Notes: Use of any of these maneuvers to influence someone is dependent on the relationship between the characters and the emotional content of the speech. Inappropriate usage should have negative effects. Roleplay all attempts.

New Skill

Weird Engineering (M/VH) No default.

Allows the creation, repair, or use of strange devices without necessarily understanding the principles of how they work. Game effects are as Weird Science, except that critical successes will fix a bug in the design or add a new feature. Weird Engineering can also be used as a substitute for any other Engineering, Mechanic, or Armory skill at -3 (Unlike a Weird Scientist, a Weird Engineer can fix a flat tire. Your car may have legs, but it will work). A successful Weird Engineering roll will reveal if and how a device is about to fail (Aragorn knowing how the collapsing brick bridge would tilt? Weird Engineering roll.). Weird Science and Weird Engineering default to each other at -3.

Characters

Martin Phobos, Professor, Dept. of Military Science and Cost Overruns (WUSE)

Prof. Phobos has found his niche in the military-industrial complex -- supplying complicated prototypes for state-of-the-art military systems. He doesn't like doing engineering but he doesn't have to. Schmoozing with generals and deputy assistant undersecretaries of defense brings the money in while his students actually deliver on his promises. That leaves him plenty of time for card games.

ST: 11 DX: 11 IQ: 14 HT: 12

Advantages: Academic Status +3 (tenured professor), Ally Group (Unwilling) (students and advisees), Tenure.

Disadvantages: Compulsive Gambling, Greed, Overconfidence, Duty (to IOU, -10).

Quirks: Avoids doing engineering work if he can. If it's not a class day he's at a casino or military base. Will always promise the government what it wants, even if it violates the laws of physics.

Skills: Area Knowledge (IOU)-21, Survival (IOU)-22, Administration-20, Research-18, Savoir-Faire (academic)-17, Savoir-Faire (military)-21, Cryptology/TL7-18, Science!-18, Weird Engineering-18, Intelligence Analysis-19, Gambling-17, Electronics/TL7-22, Engineer (Guns)/TL7-20, Engineer (Vehicles)/TL7-21, Engineer (Artillery)/TL7-19.

Typical Dialogue: "You do realize, General, that pushing the state of the art like that will drive up the development costs considerably." "All right, class, take a copy of the XLR-35 performance specs on your way out. Have a full design for it by the 17th. This will be 25% of your grade."

John Smith, Assistant Professor, Dept. of Dirty Tricks (COUP)

Of all the strange and bizarre personalities in COUP, the least so is John Smith. His looks are as boring as his name, and that's his real name. In fact he's continually annoyed with people assuming it must be an alias. His blandness has brought him the most boring teaching duties in the department. Smith will leap at a chance to have some excitement.

ST: 9 DX: 13 IQ: 13 HT: 11

Advantages: Academic Status +2, Danger Sense

Disadvantages: Duty (to IOU, -10), Compulsive Spending (bribes too much), Lives On Campus (dorm master in Murphy Hall), Secret (fnord).

Quirks: Gets angry when people won't believe that's his real name. Sits on tables and desks to compensate for his shortness. Carries a very tiny switchblade.

Skills: Area Knowledge (IOU) - 19, Survival (IOU) - 20, Administration - 19, Research - 16, Intimidation - 17, Computer Hacking -15, Electronics/TL-7 - 15 (specialty sabotage), Mechanic/TL-7 - 15 (specialty sabotage), Bard - 16, Writing - 22, Performance - 20, Disguise - 20, Psychology - 22, Detect Lies - 21, Electronics Operations (communications) - 22, Photography - 21, Knife - 18, Diplomacy - 18, Fast-Talk - 19.

Typical Dialogue: "John Smith. And no quotation marks." "Itching powder is a highly effective method for distracting the target."

Abby Meeks, Assistant Professor, Dept. of Hysteria

Prof. Meeks is happiest as "one of the crowd." She can scream and holler with the best of them if she's not the center of attention, but freezes up if people are staring at her. This has made her a good teacher-her students take turns practicing new techniques and coaching each other while Meeks guides them from the rear of the room. Good teaching isn't enough to advance at IOU, however, and Meeks seems doomed to remain untenured forever.

ST: 9 DX: 13 IQ: 12 HT: 13

Advantages: Ally Group (students, -15), Academic Status +1, Attractive (+1), Voice.

Disadvantages: Duty (to IOU), Shyness (-2 on any skill roll under observation), Low Self Image (-3 on rolls under stress)

Quirks: Totally silent when scared or nervous. Autophobia (wants to be with people, even strangers).

Skills: Area Knowledge (IOU) - 18, Survival (IOU) - 17, Administration - 14, Savoir-Faire (academic) - 16, Bard - 21, Singing - 22, Acting - 22, Fast-Talk - 18, Leadership - 15, Performance - 22, Teaching - 20, Detect Lies - 19, Stealth - 17, Streetwise - 15, Directing - 20.

Maneuvers: Scream - 25, Piercing Scream - 22, Terrified Scream (Fleeing) - 24, Delighted Scream - 23, Synchronized Screaming (Terrified Scream/Fleeing) - 24, Angry Rant - 22, Angry Sermon - 20, Pleading - 24. **Typical Dialogue:** "Um . . . Gladiola, why don't you start off with today's reading?"

Gladiola Hopkins, Junior, Dept. of Hysteria

Gladdie majored in Hysteria on a whim--nothing else appealed to her and she liked horror movies. Her grades are good but that's due to hard work rather than aptitude. She'll probably stick with it unless something else grabs her attention.

ST: 9 DX: 10 IQ: 13 HT: 13

Advantages: Academic Status (-1), Honor Student, Empathy, Rapier Wit.

Disadvantages: Duty (Prof. Meeks), Lives On Campus, Impulsiveness, Workaholic.

Quirks: Nosy. Doesn't know what she wants to be when she grows up. Fond of snakes.

Skills: Area Knowledge (IOU) - 13, Survival (IOU) - 11, Bard - 12, Singing - 14, Physiology - 10, Psychology - 13 (16 if Empathy can be applied), Acting - 14, Carousing - 11, Detect Lies - 12, Ventriloquism - 11, Driving (car) - 10.

Maneuvers: Scream - 16, Piercing Scream - 15, Terrified Scream (Fleeing) - 14, Delighted Scream - 15, Synchronized Screaming (Terrified Scream/Fleeing) - 14.

Typical Dialogue: "What's that? Oh, cool-can I try?"

Peter Kurbisfressen, 1st year grad student, Dept. of Military Science and Cost Overruns

Peter loves building fancy gadgets, the more complicated the better. Getting him to pay attention to anything other than the latest toy can be tough, especially personal maintenance. This is also bad for his grades, but Prof. Phobos has covered for him as long as the new machines get built.

ST: 11 DX: 12 IQ: 15 HT: 9

Advantages: Academic Status (-1), Intuitive (limitation-repair or debugging only), Patron (Prof. Phobos), Machine Empathy (from *GURPS Steampunk*)

Disadvantages: Nerd, Odious Personal Habit (poor hygiene, -1), Compulsive Tinkerer (must make a Will roll to go a day without trying to modify/improve completed devices), Duty (Prof. Phobos).

Quirks: Talking Shop (but not at OPH level). Hates letting the customers take his devices away.

Skills: Area Knowledge (IOU) - 14, Driving (car) - 10, Mathematics - 16, Research - 14, Strategy - 12, Tactics - 12, Writing - 14, Weird Engineering - 12.

The following skills are all TL7:

Armory (artillery) - 14, Engineer (vehicles) - 15, Engineer (machinery) - 16, Engineer (weapons) - 13, Electronics - 15, Nuclear Physics - 12, Physics - 13, Photonics - 15, Computer Programming - 16

Phil Richards and the Stock J Tape

by Brian Rogers & Matthew Pook

"Doc" Richards

Phil Richard cuts an unassuming figure. Standing slightly under six feet, with a gaunt frame and a weak chin, he carries himself with grace enough to be lithe rather than gangly. He smokes a little, drinks a little, exercises very little, and engages in the occasional recreational drug, so he is not in the best of health. Phil wants to be "smart," but hangs around with people less intelligent and less well read than he is rather than study. When around intellectual equals he is a reserved, quiet underachiever.

He has always had two fascinations: recording and the human mind. These led him to study biological psychology, with its recording of brainwaves. While in college, Phil had plans of becoming a PhD, but alas his funds fell short, and he was forced to abandon his education halfway to his Masters degree. More truthfully, the lack of funds is a convenient excuse for leaving school before he failed out, having spent too much of his time with the school's radio station.

Fortunately, that same radio work gave him connection with local rock bands in need of a sound and recording technician, and he quickly fell in with their crowd. His expertise and education was enough to earn him the moniker "Doc," and to this day Phil remains perfectly happy to let new acquaintances think that he did earn that PhD. Phil made enough to scrape by, and he did come to care about his new -- often equally under-motivated -- socially inept friends, but he wanted something more permanent.

The local want ads revealed the perfect position: The Cassandra Institute, a private mental institution, was looking for psychology technicians. Phil landed a steady job monitoring EEGs, recording interviews and other tasks he'd already mastered as a Graduate Student. The pay was good, they didn't look too closely at his slightly doctored resume and the hours fit around his growing recording work. The only drawback was the creepy patients, but Phil's contact with them was either after sessions of the Cassandra Institute's innovative psychometric calming treatments or in the company of several beefy security guards. Gossip identified the patients as either criminals or stress disorder victims, but Phil never asked questions.

With everything going so well, Phil took the plunge and signed a lease on a small house closer to downtown, with an attached office that he could convert into an actual studio. The next day, the Institute exploded. Literally. The flames were seen across town as the building did a creditable imitation of the Hindenburg. The death toll was enormous, and was assumed to include the Institute's owners. Firemen found that the building had been a firetrap, almost as if someone had designed it to explode.

Distraught, Phil wandered around the Cassandra campus, staring at the ashes of his former place of employment and wondering how he was going to pay his rent when he found a locked, fireproof metal box, thrown clear by the explosion. Claiming it as a souvenir, he went back to the studio and snapped the lock. Inside was a reel-to-reel tape, which played an audible cyclical susurrus. Phil spent the next day analyzing the tape. When one of his friends turned up in a chemically agitated state, Phil gambled that the tape was one of Cassandra's psychometric treatments and played a section repeatedly as a calming influence. While his friend quickly fell asleep, the secondary results were not what Phil expected.

Phil's first "patient" woke feeling not just refreshed, but reborn. Over the next few days he quit smoking, cut back on his drinking, and dedicated himself to both his music and his band. He went from being a classic slacker to practicing for hours a day, pushing his band, landing them three new gigs and pulling together the cash for a recording session in the Doc's new studio to get a record together. Phil was fascinated.

Too much of a scientist to expose himself to the tape, Phil started inviting other members of the scene to listen to parts

of it in order to see what happened. The results were all positive. Phil believed that he was helping people, and because the results faded in a short time, there could be no harm done. Once he isolated the parts of the tape dealing with social interaction, Phil made extensive use of them on himself, becoming the composed, charming man he had always wanted to be. He realized then that he could make money on this, and that there really was no reason to tell people the specifics. Sure, it seems callous, but as Phil reasoned, "It *is* for their own good."

With a confidence boarding on the cocksure, Phil painted a sign on his window that did not advertise a recording studio, but instead "Phil Richards - The 'I' Doctor: Psychological Therapy for a Superior Life." Now patients come in, go through a quick questionnaire to reveal what areas of their life they want improved, get talked into the procedure by the charming Doc, and then cut a check for a few hours in the chair listening to that relaxing hum. "Is that all?" they wonder, but head back into their day with a stronger sense of self, a greater gift of conversation or even better reflexes. The improvements are so positive that they don't notice their lack of control around the opposite sex, their lack of concern about their fellow man or the overabundance of self-confidence getting them into just a little bit of trouble.

Overconfidence [-5]

The Stock J Tape

A classic reel to reel recording tape, the fireproof case was labeled "Stock J." Rather than a psychometric treatment, the tape contains an audio translation of a human personality -- the recording causes subtle alterations in the listener's psyche when heard. The tape has several discrete phases, each tying to a certain facet of the recorded personality, and each lasting between 15 minutes and an hour. The tape as a whole runs three hours. Hearing any part once has no discernable impact, but four continuous exposures initiates a noticeable shift that takes several days to fade. Greater exposure produces longer lasting changes.

Despite Phil's assumption that exposure to the tape is purely positive, what patients receive are flip sides of the recordee's personality. In game terms, they are being given certain advantages, paid for with unintended disadvantages. Memories are limited to high intensity moments and visual images from the recordee's past. What patients will make of these is not yet known.

J Stock Tape Modification [0 pt]

CF English [1], West Asia [1]

Advantages: Charisma 2 [10]; Combat Reflexes [15]; Fearlessness 2 [4]; High Pain Threshold [10]; Will +1 [5]

Disadvantages: Callous [-5]; Code of Honor (Gentleman's) [-10]; Lecherousness [-15]; Overconfidence [-5]; Sense of Duty (Unnamed Intelligence Agency) [-10]

Quirk: Has memories of previous missions [-1]

Memory Exposure

Some campaigns might be more amenable to the tape providing skills as well as advantages and disadvantages. In this case, continued exposure to the tape after gaining all of the standard benefits starts overwriting parts of the patient's memories, giving the Split Personality disadvantage and 1 point each in the following skills:

- Boating/TL8 (Motorboat)
- Body Language
- Carousing
- Dancing
- Driving/TL8 (Automobile)
- Gambling
- Guns/TL8 (Pistol)
- Holdout
- Intelligence Analysis/TL8
- Karate
- Lockpicking/TL8
- Piloting/TL8 (Light airplane)
- Professional Skill: Espionage
- Savoir-faire
- Sex Appeal
- Stealth

Unbalanced/Cinematic Exposure

The Stock J tape can work equally well for games less concerned with point balance. For this option simply select the most appropriate skills and advantages based on the desired exposure, along with two thirds as many points in the most appropriate disadvantages, from the list below. While in a perfect world Phil could give his patients all of the good traits with none of the bad, doing so would change the theme of the character.

Full exposure to this version is a 35-point increase.

CF English [1], West Asia [1]

Languages

English (Native) [0]; French (Accented) [4]; German (Accented) [4]; Russian (Accented) [4]

Advantages

Charisma 2 [10] Combat Reflexes [15]; Fearlessness 2 [4]; High Pain Threshold [10]; Will +1 [5]

Disadvantages

Callous [-5]; Code of Honor (Gentleman's) [-10]; Lecherousness [-15]; Overconfidence [-5]; Sense of Duty (Unnamed Intelligence Agency) [-10]; Split Personality [-15]

Skills

Boating/TL8 (Motorboat) (DX) [2]
Body Language (Per) [2]
Brawling (DX) [1]
Carousing (HT+1) [2]
Dancing (DX) [2]
Driving/TL8 (Automobile) (DX) [2]
Gambling (IQ) [2]
Guns/TL8 (Pistol) (DX) [1]
Holdout (IQ) [2]
Intelligence Analysis/TL8 (IQ) [4]
Karate (DX) [4]
Lockpicking/TL8 (IQ) [2]
Piloting/TL8 (Light airplane) (DX) [2]
(Professional Skill: Espionage (IQ) [2]
Savoir-faire (IQ) [1]
Sex Appeal (HT) [2]
Skiing (HT) [4]
Stealth (DX) [2]

Quirks

Always delivers a suitable quip upon killing an opponent
has memories of previous missions

For over-the-top games, replace Boating, Driving & Piloting with Drive! (DX) [24] and replace Guns with Guns! (DX) [24]. This is a 76-point increase.

Adventure Threads

Nobody Believes Us: What was the Cassandra Institute, and what were its goals? The technology used to create the Stock J tape is far ahead of any tech level that might house Phil Richards (whose presence is best set in the *Atomic Horror* or Contemporary periods), which raises the question of where it came from. The suspicious nature of the Cassandra Institute conflagration raises yet more questions: Are they a criminal conspiracy? Time travelers? An alien front? Will they be coming back for their tape? This makes a great "enemy within" *Atomic Horror* setting, with the PCs being ordinary people facing off against MIB-like Cassandra agents and discovering the real breadth of their new mental abilities.

The Name is "Stock"? Who was the original recordee, and what happened to him? Whoever he was, he possessed a [sharp mind](#), great charm, iron nerves, and a callous view of humanity -- as well as a strong bond of loyalty to something. (This assumes that he is dead. The Cassandra Institute conflagration has all the earmarks of an agent destroying the enemy base during his escape.) Regardless, there are now people adopting his mannerisms, his loyalty, and eventually his memories. Depending on how much of the loyalty vibe a patient receives, he might find himself heading on impulse towards international adventure -- along with the rest of Phil's patients.

"It's not hurting anyone." When the Doc tells himself that, he is ignoring both the breadth and depth of his business' impact. What are the ramifications on a small community when several of its citizens become charming, callous, and lecherous potential killers? This is makes a good investigative scenario, where the PCs are outsiders looking into a

town that's becoming increasingly callous and combat-worthy? And what if Phil gets it into his head to broadcast the tape over the airwaves?

Pyramid Review

Fright Night: Polar Terror (for the d20 System)

Published by [Hogshead Publishing](#)

Written by Steven Marsh

Illustrated by Amandine Labarre

64-page b&w softcover; \$15.95

Editor's Note: This book was written by Pyramid editor Steven Marsh.

The second incarnation of Hogshead Publishing is best known for its *Crime Scene* series of supplements for the *d20 System* that explore both sides of the law in the USA. So far these have included [Crime Scene: Police Investigation](#) and [Crime Scene: Forensics](#), but Hogshead has also branched out with a new line called "Fright Night." Each title explores all things that go bump in the night in the contemporary here and now, presenting a location and building a scenario around the setting. The first title in the series, *Fright Night: Haunted House*, looked at a very traditional setting, but the second is far more contemporary, for *Fright Night: Polar Terror* is set in the Antarctic.

[SPOILER ALERT!]

The situation is very simple: As the isolating Antarctic winter approaches the United Kingdom's newest base, New Shackleton puts out a call for help. One of its tasks is to investigate radio and magnetic anomalies, but nothing has been heard from the latest exploratory team for the last five days. The PCs, serving at the US Amundsen-Scott base, are assigned to take a helicopter out to the British encampment, check on the survivors, and transport them or their remains back to New Shackleton.

Unfortunately, the party discovers the small encampment in disarray and the only survivor of the three-man team lost in coma. With the weather intensifying, the helicopter struggles to fly on to New Shackleton; as it lands, the engine splutters and gives out. Readily welcomed by the base staff, they are allowed to wait as the helicopter is repaired and the deaths of the exploratory team investigated. As they wait, they face a deadline: the last day on which airplanes can fly into or out of the Antarctic before winter sets in. After that, the player characters are trapped, although in pleasant company of the mostly British base staff. Yet there remains the question of what happened to the exploratory team -- a question that can only be answered following a series of strange events at the base itself, starting with a pair of deaths.

Of course, this being a horror scenario, there is an outré threat behind such events. And in creating such a threat the author faces a problem. How can he write a scenario set in the Antarctic and not draw comparison to the films *The Thing From Another World* or its remake, *John Carpenter's The Thing*? And the reality is that he cannot. So instead he must play with the expectations of the average gamer -- do something new with old and familiar tropes. And in creating the alien threat of *Polar Terror*, he has opted for a threat that is more mechanical than organic in nature. It is an enevore, able to take advantage of our technology to not only direct it against us, but also use it as a means of misdirection. These tools are employed by the author to build and instil fear and paranoia in both the players and the staff of New Shackleton base. To return to the problem of making comparisons with certain films, *Polar Terror* is like *John Carpenter's The Thing*, but it is also like the film *Virus*, based on the Dark Horse Comic. The monster is well designed, with clear motivations and abilities. Fortunately it is not infallible; players can outwit it, and will have to if

they want to survive. New Shackleton base does not possess an arsenal, and what weapons are available are tools first and weapons second.

[END SPOILER ALERT]

The adventure is supported by details of New Shackleton and its staff, some of them feeling a little sketchy. So is the base map, which needs both more detail of its buildings and the immediate area. There is a short history of Antarctica and the nature and dangers of life and work in the polar winter. These include not just hypothermia and frostbite, but also sunburn and the perils of touching metal objects.

For players, there are six new character classes: the Engineer, the Geologist, the Researcher (or Scientist), the Muscle, the Psychologist, and the Medic. These are designed to represent civilian professionals, not trained combatants, and they do a good job. Of the six, the Muscle is the least obvious in intent. He undertakes a range of physical duties at the base: sample characters at the base using this class include the cook, the janitor, the electrician, the pilot, and the vehicle operator. It is suggested that at least one of the player characters take the role of pilot in playing *Polar Terror*. Character creation is aided by a list of the skills and feats necessary to the process.

Of course, all horror games or scenarios need a means of handling fear and scared characters. The idea in *Fright Night* is to turn player characters into victims, and the new rules suggest how they react and act as victims. The GM simply makes two rolls, one to see the highest Hit Dice creature or character it can scare and another to see how many Hit Dice worth of creatures or characters the scare effects. The scare works as a ranged fear attack which the player makes a Will Check against. Suggested bonuses to this roll are in keeping with the genre. While the rules are sound, they are not as comprehensive as in some games, which may disappoint some. This leaves plenty of room for GM input, though.

Physically, *Polar Terror* is a solidly put together book, decently edited and containing some nice artwork, though the heavy repeated use of the artwork looks cheap. It contains everything a GM needs to run the adventure and even notes on continuing the story with further *Fright Night* titles. Overall, this book feels far more comprehensive and complete than what can be found in some of the publisher's *Crime Scene* series.

One thing that is lacking is a suggestion as to the necessary character level needed to play *Polar Terror*. It is a tough prospect for 1st-level characters, so is better suited to 2nd- and 3rd-level ones. It is also designed for the *d20 System* using just the *Dungeons & Dragons Player's Handbook* as opposed to the *d20 Modern Roleplaying Game*, and this is intentional. The aim with the series is present a scenario that uses the less complex rules of *Dungeons & Dragons* familiar to most players. While the adventure is part of the *Fright Night* Series, it will probably last longer than just a single night or session, with the "Night" of the title referring to the long winter of the Antarctic.

It is fair to say that *Fright Night: Polar Terror* is far from an original scenario, but that is the point. Just as the familiarity with the rules system is an aid to play, so is our familiarity with the subject matter. Both contribute to the "pick up 'n' play" aspect of the *Fright Night* series. None of this familiarity should breed contempt, for with *Fright Night: Polar Terror* the author does a fine job of tweaking our expectations and builds a solid adventure from there.

Das Buch Zum Spielen (for Settlers of Catan)

Published by [Mayfair Games](#) (English translation) & [Kosmos](#) (German original)

Designed by Klaus Teuber, et. al.

Edited by William Niebling & Guido Teuber

192-page German full-color hardcover; 32-page English translation, b&w; 460 counters; \$25

If there's one consistent complaint about games that cross the Pond from Europe, Germany in particular, it's their fabulous cost. Not that these games aren't worth their price tag, but one must usually spend a pretty penny to get these bright and colorful offerings. *Settlers of Catan* has been singled out as one of the most egregious examples, with it, *Seafarers of Catan*, and all its kin ratcheting up some big numbers. But then you're confronted by *Das Buch Zum Spielen*, which may be one of the best deals on the game market.

Like any good game, *Settlers of Catan* has spawned a lot of house rules, alternate methods of play, and tweaks to change the game or keep it fresh. Klaus Teuber and company have collected some of the best examples by way of a contest and compiled a book -- literally "The Book" -- full of the crunchy results.

The first thing potential buyers need to know is *The Book* proper is entirely in German. If you can't read the language, much of it will be lost on you. So does that make it useless for non-speakers? No, but one thing at a time. Some of the book is just fun bits. There are pictures of Teuber's prototypes for the board hexes and other pieces, photos of museums and tournaments, and Teuber and friends are interviewed about their personal history with games in general and about Catan in particular.

The bulk of the volume is on gaming all things Catan, and this is what most people will probably buy the set for. The set? Yes, several components are sold together here. Even if you don't speak German, this comes with a booklet that provides translations of all the new scenarios. You still need the main book, because it has all the visual information you'll need, most notably the setup for each scenario (the booklet is cross-referenced by page numbers). Once you have the lay of the land, you won't have to keep referring back to the book; it pretty much runs on automatic from there.

There are 15 new ways to play, including The Atoll, which has players building seaplanes on a seascape; The Great Race, which requires you to be the first to expand to the other side of the board and establish a city; and The Storm Flood, wherein your builds determine how secure you are against floods at the end of the game . . . if the wrong buildings and roads are flooded, your victory points sink with them. Most of these have multiple entries, giving different setups depending on the number of players you want to use.

Some scenarios are playable with a copy of the original *Settlers of Catan* while others require *Seafarers of Catan* and/or *Cities & Knights of Catan* and the five- and six-player supplements for each. If you need anything else, it's in the component set. They've included a box full of extra pieces tailored for use with the new rules, and those pieces number in the *hundreds*. There are volcanoes, factories, balloons, and even a spinner, among others. To store it, you're given a dozen pliable but heavy-duty ziplock baggies *and* a sheet of labels to put on those packets.

The rest of the book includes variants (like Atlantis) and advice on strategy, tactics, and even some notes on playing the *Settlers of Catan* card game, but alas, only the scenarios are translated in any detail. The card game gets only two

pages at the back of the booklet.

And the quality is through the roof. Granted, the stapled booklet with the scenario translations looks almost like photocopies by way of its construction, but it's a lot easier to flip through than *The Book* itself, and it has the bulk of the information at your fingertips. *The Book* is a lovely, hardbound item, in full color, with colored tags at the edges to indicate where the scenarios end and the tactics section begins. The pieces have as high a production quality as the stuff that comes in the original game, and they have a home in the sturdy box provided. The box and the hardbound volume then pop neatly into the slipcase (the translation only fits with some grunting).

Although a game review strives to be as impartial as possible, it's hard to discuss a supplement like *Das Buch* without sounding like a marketing brochure for Mayfair. Not only does it manage to do everything it offers to, it exceeds all expectations. This is one of the finest values in gaming, and anyone concerned that they've blown their budget on the parent game will find this item extends the life of the game and adds new options that will keep things fresh for years to come, cementing *Settlers of Catan's* well-earned position as one of the most popular of modern games.

Murphy's Rules

by Greg Hyland

Murphy's Rules

Setting or No?

This week over in SJ Games' sister publication, the *Journal of the Travellers' Aid Society*, **Traveller** Guru Loren Wiseman writes in [his editorial](#). "Over the years, I have come to believe that setting and background are vital components to a successful RPG."

I've been chewing on this idea for a few days, trying to decide whether I agree or disagree with it.

Here, then, are some random thoughts tied to this basic notion.

We Don't Need No Stinkin' Settings . . .

My immediate thought was to disagree with the idea. After all, the most successful RPG in the universe -- *Mazes & Monsters* -- was specifically retooled for its third edition to shy itself away from existing settings. Oh, sure, the Greyhawk setting was integrated more closely into the core books, but these ties are so subtle as to make Asimov's character details look voluminous by comparison. ("What's this world like?" "Welllll . . . people can cast spells that look like fists . . .")

And the *d20 System* -- which stems directly from *Dungeons & Dragons Third Edition* and is arguably one of the most earth-shaking developments in the RPG biz in recent years -- is devoid of setting (and if you accidentally include setting-tied material, your mind will be flayed and your monsters rusted).

Furthermore, other popular RPGs have rule sets that aren't tied to a default setting, such as the *Hero System*, *Toon*, and *GURPS* (at least editions First through Third Revised). And in the smaller-press world, people might be familiar with *Fudge* or *Masterbook* without necessarily knowing of any game worlds they are tied to. And some systems, such as the Storyteller system, have been used to reasonable effect in a myriad of settings, making it difficult to tell where the successful RPG ends and where the successful setting begins (as well as making it trivial to run a *Vampire/Trinity/Street Fighter II* crossover game).

. . . But They Sure Are Nice

On the other hand, settings *are* pretty darn popular, for companies, fans, and retailers. There are dozens of game lines who are associated with a setting, sometimes inexorably. Sure, *Deadlands* could be used to play a generic Western game, or even a bunch of other genres (pulp, Cthulhu, swashbuckling), but what would be the point? Many fans of *Deadlands* enjoy the game for the setting -- in fact, creating a market for playing *Deadlands* in an alternate system (a.k.a. *GURPS*). And other game systems -- such as *Call of Cthulhu*, *Torg*, and *Shadowrun* -- while having systems that suit their settings well, would have a difficult time existing away from their settings.

Perhaps more importantly, having a setting can be useful *even if it's not widely used*. This might be the secret behind the inclusion of Greyhawk in *Dungeons & Dragons* or the Infinite Worlds campaign in *GURPS Fourth Edition*. Because the existence of these settings gives readers and players a point of reference, both for how the game might be played, and how the developers' minds conceptualized the rules.

For example, the inclusion of Greyhawkian named spells in *Dungeons & Dragons* can give players the idea that they, too, could eventually have spells named after them some day; the somewhat "over the top" Greyhawk gods conveys a sense of über-epic high fantasy that is the hallmark of dungeon crawlers everywhere. The inclusion of a dimension-hopping setting in *GURPS* can give people the sense that its creators believe this system can do *anything*. ("A superhero picking up an in-system spaceship to transport elves? See the chart on p. 267.") And the default *Champions* setting -- a fixture of the *Hero System* all the way up through the Fourth Edition -- instills a sense of modern four-color slugfest action. Sure, the settings are fine if you want to use them, but perhaps equally importantly they give you a frame of reference for what you can do with the presented material, serving the same function as a picture of the Mona

Lisa on a tube of oil paint or a shaky-handed rainbow on a box of crayons.

How Many Zeros are on that Check?!

And, as a final point to consider – and not to sound Clintonian here – one's outlook on all this could hinge on the word “success.” After all, a successful RPG from anyone but the Top Two or Three Companies will have an initial print run of between 10,000 and 20,000 copies. But if 10,000 to 20,000 people went to see a movie on opening day, it would be considered a bomb beyond *Battlefield Earth*. In fact, as a point to consider: Your average mid-tier company print run on a game is less than the number of *screens* an expected blockbuster will open on. Yes, if you wanted to give your average gaming supplement to every projectionist on the opening day of *Spider-Man 2*, you'd be disappointing over 25% of them (or not, depending on the supplement).

Many game companies, then, believe the real money in gaming comes from supplemental sources, such as computer games, movies, television, toys, and so on. If a company manages to release a mass-market PC or video game, it will have exposure eclipsing almost any pencil-and-paper RPG product. And it's obviously a lot easier to sell these story elements to company if there's actually a story involved (although it isn't a necessity, as anyone who was left scratching their heads over the *Dungeon Siege* movie deal can attest).

Regardless, I find it interesting to consider the case of two of the most recent successful generic systems. The *Hero System* took pains to remove and distance itself from its setting and background, while *GURPS* decided to add those elements. And I bet that both creative teams involved thought they were doing so to make their games more “successful.”

--Steven Marsh

More Questions Than Answers

Christmases Past and Presents

by Chris Aylott

My first Christmas memory is of embarrassment.

I was seven or eight years old, living in Midland, Michigan during the mid-1970s. My little sister and I woke up around 4 a.m. and crept downstairs to see what Santa had left for us. I don't think we had any consciousness that we were doing anything wrong. We were awake and there were presents to be opened, simple as that.

About a half an hour later, my parents woke up and came downstairs. I have no idea what my sister was doing, but I was happily playing with my new [U.S.S. Enterprise bridge playset](#) with wrapping paper strewn around me. 4:30 a.m. and we'd already *had* Christmas, without them.

Words were said, loudly. Small children were sent up to their room for several hours. And later that morning we had Christmas again, with re-wrapped presents and appropriate cries of surprise and joy.

In retrospect, I don't think they were as angry as I thought they were at the time. Eight-year-olds see angry parents as the Apocalypse; today I suspect their real mood was exasperated. But I've never dared ask about their memories of that Christmas -- not even for this column -- and my relationship with the holiday has always been just a little bit touchy.

I'm uncomfortable about getting gifts, and give bad presents with depressing regularity. I can bang out clean copy on a typewriter at almost 100 words a minute, but put me in front of wrapping paper and my fingers turn into marshmallow jelly. I'm not religious, so the spiritual aspects of the holiday are lost on me -- and guess which shy kid got picked to read the Bible verse at the Christmas pageant three years in a row?

And yet that *Star Trek* playset was one of my favorite toys; I loved sticking my action figures in the transporter, spinning the dial, and pushing the button to make them disappear. I feel vaguely undeserving when the presents are handed out, but I always look forward to unwrapping a present that my mom wraps in her favorite wrapping paper. We've salvaged as much of it as we can every year for nearly 20 years; what's left is about the size of my palm but it has fat little monks and reads "Deck thy halls."

Christmases Not Long Past

I have mixed feelings about Christmas, so of course I became a retailer. Here I am in a profession that depends on holiday shopping to make the difference between getting by and living well. What's a nice agnostic boy doing trying to get everyone to celebrate Christmas and Hanukkah by buying lots of presents from him?

One good way to resolve this kind of inner conflict is to project it on your customers. My wife and I decided -- more likely I decided, and my wife put up with the idea -- that our customers were different, that they didn't much like the overwhelming holiday-ish-ness of your typical retail store in December. We didn't decorate, we didn't run holiday promotions, and the Christmas music on the CD player always stayed turned down to low.

When the subject came up in conversation, most customers agreed with us that they liked our "low-key" approach to the holidays. We gave our usual good service, sold plenty of gifts and gift certificates, and our customers certainly liked that. But we always just got by instead of living well.

Today I look back and cringe. What arrogance! There we are standing at an undecorated counter, striking a secular pose but trading on everybody else's holiday spirits. At least Scrooge had the ill-humored honesty to keep Christmas in

his own way by leaving it entirely alone.

And yet we got by for nine years with our holiday half-measures. We get a little credit for that, because we really are good at helping people pick out gifts for their friends and loved ones. But I think most of the credit goes to the people who tolerated our lack of spirit and didn't let it spoil their holiday.

And when you think about it, isn't that a little strange? Not unusual, strange. Everyone has their holiday horror stories. We go out and crowd the malls, circle the parking lots cursing the people who take the good spaces. We spend money on each other that we could as easily and more efficiently spend on ourselves. Giving Christmas gifts isn't very practical, but we do it anyway.

Which gives you more pleasure, spending \$100 on games for yourself or the same amount on presents for your family? Why?

When we give gifts, we trade certain self-gratification for the risk of disappointment. We don't know that the gifts we give will be liked, we don't know that we will like the gifts that we receive. Every year, I watch a few customers compile their gift lists and my heart sinks. They hand me the lists and I carefully file them away, and they tell their relatives to come buy things from those lists . . . and nobody ever comes. I have Christmas and birthday gift lists for one customer that go back five years, and not one item is crossed off.

And yet twice every year he makes out his lists and hopes that this time it'll be different.

Christmas Present

We moved the store to a new location this year, and we knew that part of that change was that we would embrace the Christmas season. No, I wasn't visited by three ghosts. We didn't even discuss it much. The business has changed, and the kind of business we are now Does Christmas.

So the Monday
before
Thanksgiving, my
wife and I went out
and bought our
very first Christmas
tree together. Two
trees, even -- a big
one for our store's
front window, a
little one for the
checkout desk.
Nothing fancy, and
the lights on the big
tree came pre-
strung. But I
couldn't stop myself
from smiling as we
hung little red balls
and miniature
reindeer on the
desk tree
Wednesday
evening, and I even
forgave the cat
when he knocked it

Tree

over ten seconds
after we were done.

We haven't gone overboard with Christmas cheer. We play the music louder than before. Our walls are pine green, and already in tune with the season (that's not an accident). We've strung poinsettia-leaf garlands along the top of the bookcases and backed our most important displays with red felt. In the front window we have the tree, wrapped boxes, gift cards and some favorite books and games. When the cat is at work, he finishes the display by sleeping under the tree.

Simple touches, nothing overwhelming. And most of the scenes playing out in front of me this year are familiar:

- A young woman comes in to buy her uncle a gift certificate. He'll buy her a gift certificate to the Ground Round. They've been doing this for years and seem completely satisfied with the exchange.
- A young man picks up the audio book he special-ordered, along with a couple of other books he has scooped off the shelves. He knows exactly what he's looking for and goes right to it. "There," he says, "I'm done with my Christmas shopping!" As I start to ring up his purchases, he wanders away from the register and stares wistfully at the RPG shelves.
- I promise a husband that I will deny all knowledge of the existence of a book he just got for his wife, even if she brings that book up to the register to buy it for herself.
- Kids drag their parents to the shelves to pester and beg, and I make bets with myself as to whether "We'll see" really means "Yes" or "No."
- Two elderly aunts go through the Reaper miniature racks picking out the creepiest monsters they can find for a 13-year-old boy.

I've seen these moments over and over again for a decade, but something's different. The shoppers I'm watching are enjoying what they're doing, and I'm enjoying it along with them. Even when I'm just standing and watching them, I feel like I'm part of the moment and not digging my heels in against it. (And it's not just my feelings that have changed -- our holiday sales have nearly doubled. For the first time, we're doing well instead of just getting by.)

How much of the "Christmas spirit" comes from embracing its trappings? Can our enthusiasm for an activity have so much to do with our enjoyment of it? And if so, how much damage do we do to ourselves when we hang back being cynical or ambivalent?

Christmas Future

I haven't been reborn in the Christmas spirit just yet. I still dread shopping for presents and will be squirming a little on the couch when we open them Christmas morning. But I'm working on it.

I have a daughter now, six months old. She doesn't know one day from another, but she already understands the joy of getting. She waves her arms and laughs when we open boxes from Grandma and pull out new outfits for her. I'm trying to relearn her childish enthusiasm.

And then there's my sister, my partner in the Great Early Christmas Caper of 1977. She certainly doesn't share my ambivalence about gifts. Even today, she's the first one up on Christmas morning and the first one to ask, "So when are we opening the presents? How about now?" My father and I love to torment her by putting off present time as long as possible, eating second helpings of breakfast and having an extra cup of coffee, speculating whether there's football on yet. But I want to have as much fun looking forward to the presents as she does.

It's hard not to hold yourself back, hard to plunge into the enjoyment of a holiday (or a hobby) without fear of disappointment. But if holding back helps cause the disappointment, isn't plunging in the safest thing to do?

Happy holidays, everyone. See you in 2005.

Search for The Source

By Shane Cubis

The search for mythical and exotic locations can play a huge role in inspiring your party to adventure. "Because it is there" has been the catchcry of hundreds of explorers, out to make a name for themselves as pioneers and trailblazers. Finding the source of rivers has brought glory and acclaim to many real-world explorers, from Henry Hudson and Lewis & Clark in America to men like John Oxley and Charles Sturt in Australia. How much more could these discoveries bring in the magical worlds of roleplaying games? Beyond the simple prestige of having a river named after your character, there might be some kind of arcane or divine rewards in store. Here are some exotic river sources for use in your favorite fantasy roleplaying game.

The Frej River

The source of the long and winding Frej River is exceedingly difficult to find. One must traverse over some of the least welcoming terrain imaginable, all of it inhabited by wild animals and mad natives. These people all appear to simultaneously shun and revere the river that enables their livelihood. They will only drink from containers -- never directly from the flow. Similarly, they will not eat any fish from the Frej until they have performed some kind of cleansing rite upon it. Nonetheless, all of these tribal people possess some form of mental illness, from hallucinations to paranoia to psychopathia. They all blame the river.

The final stage of the journey towards the source involves scaling a huge mountain, from which the waters of the river first begin their journey with a beautiful and breathtaking cascade. The peak of the mountain stretches far into the clouds, and the water seems to come from the heavens themselves. This beauty becomes less enthralling when one is slowly climbing the mountain, fighting to retain a grip on the slick rocks with a constant spray in one's face. The reward for completing this unappetizing journey is an object lesson directly from the gods.

The first sight of the source often renders confusion in the explorer. It seems to be some kind of eternally renewing lake, chained to its bed with shining silver links. Sensing the presence of intruders, the lake will thrash wildly against its bonds, deluging the area. Guttural gurgles and moans erupt from its center. In fact, the source of the river is a Promethean water elemental of immense size, chained here by some vengeful deity for reasons long lost to history. Its very essence is continuously wrenched from its body to serve as the mighty river, flowing down a vast mountain. At the same time, by some mystical and unknown power, the creature's body is eternally renewed. Both practices cause the elemental inconceivable agony. The silvery bonds are crafted from some divine metal that has thus far resisted all attempts to shatter it, much less those of the creature to break free.

The elemental itself has long since had any remnant of sanity stripped away from it along with the water that feeds the river. The only things it is more than vaguely aware of are the never-ending agony and a constant mental replay of its crimes, over and over and over. All efforts to communicate with the creature have failed, including a few attempts at mental contact which resulted in the immediate breakage of the unfortunate telepaths' brains. It is not difficult, at this point, to see the cause of the aforementioned tribal madness.

Drinking from the source will drive the imbiber to immediate madness. He will see his companions as all manner of demonic monsters, and will react accordingly. Some unfortunates have thrown themselves from the peak of the mountain to escape these illusionary demons. Thus far this condition seems incurable, although some sage may have an answer. Perhaps doing some favor for the water elemental community or finding out the identity of the elemental's captor and begging him for assistance would help.

Artifact of Endless Water

The Marnish River ebbs and flows in sporadic and seemingly random bursts. Locals build their dwellings well back

from its banks, which can overflow without warning. It is always unusually warm, although not uncomfortably so. Those who drink from it find the water to be, on the whole, refreshing. Those who swim in it, especially on chillier days, find it to be wonderfully relaxing and invigorating. Generally, the people who draw their water from it tend to be a little bit more spontaneous, random and (in the most extreme cases) manic. Claims have been made about the river's unusual healing properties, but these tend to be nothing more than idle rumors.

The source of the Marnish River lies underground. The budding explorer can feel the heat of the cavern in which it lies long before they arrive. Once inside, they discover a series of eternally boiling springs, set in a naturally smooth room full of steam. A human or demihuman could not even enter the room without some form of magical protection, and even a mighty dragon once described it as "infernally hot." The steam moves into adjoining caves, where it cools down and filters into a joined passage. Still hot, the water runs together in a torrent, forming the starting place of the warm river.

The reason for the unnatural temperature of this area is hotly debated among sages who know of the Marnish River. Some have postulated that an immense fire elemental, a possible counterpart to the water elemental from the Frej River, is trapped beneath the springs. Obviously no one has come anywhere near close enough to check the veracity of this theory, but if it is true then the creature must be suffering a similar kind of torturous punishment as the water elemental. An explorer who discovers the truth of this mystery would have the ear of any sage in the region.

There is another, less-known mystery to this source. At the base of the springs, deep underwater, lies an ancient artifact. It was thrown into the bubbling waters centuries ago by some trickster god, and has since lain unclaimed. Ancient texts refer to it simply as The Decanter, and its powers are unknown. It may influence the flow, temperature, or alleged healing properties of the river in some way, but this is all conjecture. One thing is certain: There must be some reason why The Decanter has not yet been claimed by anyone, deity or mortal.

The Lake of Tears

The townsfolk who draw their water from the River of Duty are known to be far more serious and stoic than their neighbors and cousins. They live their lives day-to-day, quietly going about their business and rarely laughing out loud. Colorful festivals and fairs are all but unknown to them, and they do not tolerate insouciance or silliness. Even the children seem solemn and muted. There is a high rate of depression among the townsfolk, and if quizzed on their belief system, most will give the impression that they see life as basically dark and meaningless. They tend towards hard-working, but can often be seen sitting on a fallen log or on the bank of the Duty, staring silently into the middle distance with a blank expression.

The source of this river sits deep in the center of the City of the Gods, surrounded by the mansions they have built in tribute to their own divine glory. Although many have quested for it, the Lake of Tears is unreachable by mundane means. The source is a divine pool fed from the unending tears of the Goddess of Sorrow. She sits, hunched over the shore of the pool in a position that speaks of boundless misery, alone and unaware of her surroundings. A steady flow of tears well from her reddened eyes like a stream, blurring the reflected images of pain and torment reflected in the icy, disturbingly calm waters. All the sorrow of the multiverse is echoed here.

Anyone who stares into the lake will feel the pain and misery of its waters, and be overcome by a sense of hopelessness -- that there is nothing good or light in the world. Any mortal who dares to drink from the Lake of Tears will be immediately and permanently overwhelmed by this feeling. A deep, potentially suicidal depression will settle over the unfortunate drinker, who will be nothing short of inconsolable. If left alone, the drinker will kneel down next to the Goddess of Sorrow and join her in weeping. Over time they will merge into one being, and the soul of the mortal will be forever subsumed into her eternal sadness.

Generally, only a holy quest performed on behalf of the Goddess, requested through prayer and communion with her, will lift the curse. This quest will usually involve furthering her ethos by spreading misery to the world on a large scale, and may place the party into morally gray areas. If a victim can be somehow convinced of the essential goodness of the multiverse -- an extremely tall order which will require an overwhelming display of benevolence -- they may snap out of the magical depression. They will always retain a hint of a dark edge to their personality, but will no

longer feel suicidal or worthless.

Civitas Illumni

A huge, river runs through a well-populated area deep beneath the earth, picking up a lot of debris on the way -- from mundane garbage to mutilated corpses. This flotsam and jetsam is carried along and dumped on a distant shore, and anyone who stumbles across it has a fair idea where it came from. The burning question is this: From whence does this nameless river itself derive?

The answer lies deep in the bowels of the earth, even deeper than most under-earth denizens would comfortably travel. There, the intrepid explorer will find an ancient and ruined city, known only as the Civitas Illumni. The city sits on a small island, in the midst of a large sea. The sea itself does not feed the river, surprisingly. It is, however, full of huge and hungry eels and other creatures, so the explorer had best beware that they do not become lunch before their vessel alights on the shore. The Civitas Illumni is indeed a dead city, and one that has long been cleared of any obvious treasures. It is apparent that the beings who lived here were twice the size of humans, if doorways and building sizes are anything to go by. In the center of the island is the sole functioning machinery left by these inhabitants. A crystalline laboratory slowly turns on its own axis with an omnipresent whine. As the explorer stands in front of this dully glowing structure, a constant flow of fresh water runs in a stream, 50 feet below. Parts of the torrent are visible through rusting grates in the street, and once one is aware of its presence, the flow can be traced to the shore of the island. Seemingly, the sea around the island parts for this river, which remains uncontaminated by salt.

If entry to the laboratory is gained, the intruder feels an instant sense of nausea, which is not alleviated until they once again leave the structure. This seems to emanate from a clockwork machine in the center, which appears to create the water from thin air. In reality, the water is a by-product of the machine's original purpose, which was to create milky crystals called knostones for the original inhabitants of the Civitas Illumni. The ingredients required to manufacture these magical stones are long lost, and so the machine produces nothing more than the water which forms the river.

The river retains some traces of magic, and as such can influence creatures that drink from it in strange ways. These effects tend to be subtle, random, and permanent. One might become more intelligent, less aggressive, or even take on the attributes of another species. These effects are more likely the closer one is to the source when the drink is taken.

Elven Masters

Three New Prestige Classes For All d20 Fantasy Game Settings

by Richard Farrese

Companion of the White Owl

The Company of the White Owl is an elite group of elven warriors active in the wild northern reaches of the world. Responsible for the protection of elven ancestral lands, ancient sacred grooves, and various druidic circles, the companions of the White Owl are cunning survivalists and deadly warriors. When the Company was first created, eons ago, its members were charged with the safety of those who safeguarded the northern woodlands, mainly the druids of the wilderness, who often fell victim to the deadly wandering beasts that abounded in the region.

At first, the companions of the Owl -- as they are often called -- were little more than bodyguards responsible for the safekeeping of those who ensured the woodlands remained in the care of the elves. With the passing years, they developed techniques allowing them to defeat the most powerful of creatures and survive the deadly elements, making them the undisputed champions of the northernmost elven territories.

Hit Die: d12

Requirements

To become a companion of the White Owl, a character must fulfill all the following requirements:

Race: Elf or half-elf born among or raised by elves

Alignment: Any non-evil

Base Attack Bonus: +5

Knowledge (geography): 5 ranks

Knowledge (nature): 5 ranks

Survival: 5 ranks

Feats: Endurance, Martial Weapon Proficiency (any), Weapon Focus (any)

Special: The character must be invited to join the Company of the White Owl in order to take any levels in this prestige class. Most often, the character is approached by a companion and asked to perform a special task on behalf of the Company. Upon completion of this task, which usually includes the protection of elves or elven lands, the character is invited to join the ranks of the ancient fighting company.

Class Skills

The companion of the White Owl class skills (and the key ability for each) are Climb (Str), Diplomacy (Cha), Handle Animal (Cha), Heal (Wis), Intimidate (Cha), Jump (Str), Knowledge (geography) (Int), Knowledge (nature) (Int), Listen (Wis), Ride (Dex), Search (Int), Spot (Wis), Survival (Wis), and Swim (Str).

Skill Points at Each Level: 4 + Int modifier

Class Features

All the following are class features of the companion of the White Owl prestige class:

Weapon and Armor Proficiency: A companions of the White Owl is proficient with all simple and martial weapons as well as in the use of light armor, medium armor, and shields.

Vision of the Owl (Su): When he becomes a companion of the Owl, the character is initiated into the secrets of the order. At 1st level, he learns to increase the range of his vision (both normal and low-light), which is in effect doubled.

Weapon Training (Ex): Starting at 1st level, the companion receives extensive training in the use of a particular weapon. This weapon, chosen by the character, must be one with which he is proficient. At 1st level, he adds +1 to all damage rolls made with this weapon. This bonus augments by +1 at 4th level, and again at 7th and 10th level.

Endure Cold (Su): The 2nd level companion becomes so used to extreme conditions that he is protected by a permanent endure elements spell in cold environments (this ability is lost in extreme heat conditions).

Winterland Walk (Su): Also at 2nd level, more secrets of the order are revealed to the companion. He can now walk upon snow and ice as easily as he would upon an earth road.

Cold Resistance (Su): When he attains 3rd level, the companion gains cold resistance 5. This resistance raises to 10 at 6th level and to 15 at 9th level.

Cunning of the Owl (Ex): At 5th level, the companion becomes so used to survive in extreme conditions that he gains a +4 competence bonus to all Survival skill checks (including those made in combination with the Track feat).

Wisdom of the Owl (Ex): The 8th level companion adds a +2 enhancement bonus to his Wisdom score.

Ice Stride (Sp): When he reaches 10th level, the companion uncovers how to move from one patch of ice to another. This ability function as the tree stride spell with the exception that the companion must step into a patch of ice and then emerge from another (rather than use trees).

Companion of the White Owl Advancement Table

Level	Base Attack Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+1	+2	+0	+0	Vision of the Owl, Weapon Training (+1)
2	+2	+3	+0	+0	Endure Cold, Winterland Walk
3	+3	+3	+1	+1	Cold Resistance 5
4	+4	+4	+1	+1	Weapon Training (+2)
5	+5	+4	+1	+1	Cunning of the Owl
6	+6	+5	+2	+2	Cold Resistance 10
7	+7	+5	+2	+2	Weapon Training (+3)
8	+8	+6	+2	+2	Wisdom of the Owl
9	+9	+6	+3	+3	Cold Resistance 15
10	+10	+7	+3	+3	Ice Stride, Weapon Training (+4)

Master Forester

The elven master forester specializes in the protection of forested lands and the wilderness in general. Found in woodlands where elven settlements are established, master foresters are treated with honor and respect by most elves. They dedicated their lives to ensure that the forests of the world remain untouched by the vile hand of civilization -- a

battle that most master foresters fear they will one day lose.

Master foresters are at ease with animals, dire animals, and magical beast. To a certain extent, they are able to control such creatures. Most master foresters are found in the company of animals or dire animals they consider friend.

Hit Die: d10

Requirements

To become a master forester, a character must fulfill all the following requirements:

Race: Elf or half-elf

Alignment: Any

Base Attack Bonus: +3

Knowledge (nature): 6 ranks

Survival: 6 ranks

Feats: Endurance, Iron Will, Track

Class Skills

The master forester's class skills (and the key ability for each) are Climb (Str), Handle Animal (Cha), Heal (Wis), Hide (Dex), Intimidate (Cha), Jump (Str), Knowledge (geography), Knowledge (nature), Listen (Wis), Move Silently (Dex), Ride (Dex), Search (Int), Sense Motive (Wis), Spot (Wis), Survival (Wis), Swim (Str), and Use Rope (Dex).

Skill Points at Each Level: 4 + Int modifier

Class Features

All the following are class features of the master forester prestige class:

Weapon and Armor Proficiency: The master forester is proficient with all simple and martial weapons, with light and medium armor, and with shields.

Turn or Rebuke Animals (Su): A master forester is so in tuned with nature that he has the ability to turn or rebuke animals. This ability functions as the turn or rebuke undead ability of the cleric class, but functions only on normal animals. A master forester may attempt to turn or rebuke animals a number of times per day equal to 3 + his Charisma modifier. A master forester with 10 or more ranks in Knowledge (nature) gets a +2 insight bonus on turning checks against animals.

If the character is also a ranger or druid, he may add half his ranger and druid class levels to determine at which character level he can attempt to turn or rebuke animals.

Wild Empathy (Ex): Like a ranger, the master forester can use body language, vocalization, and demeanor to improve the attitude of an animal. If the character already has the wild empathy ability, he gains a +4 competence bonus to his Diplomacy checks when using this extraordinary ability.

Animal Companion (Ex): At 2nd level, the master forester gains a loyal animal companion that accompanies him on his adventure. He may choose any type animal typically found in forested areas, such as a badger, wild dog, eagle, hawk, owl, or wolf as his companion. This extraordinary ability functions as the druid ability of the same name and he

may choose from the alternative lists of animal companion as long as the chosen animal lives in wooded regions.

Woodland Stride (Ex): Also at 2nd level, a master forester may move through any sort of undergrowth (such as natural thorns, briars, overgrown areas, and similar terrain) at his normal speed and without taking damage or suffering any other impairment. However, thorns, briars, and overgrown areas that are enchanted or magically manipulated to impede motion still affect him.

If he already has the woodland stride extraordinary ability, the master forester adds an additional 10 feet to his base movement rate while traveling through wooded areas, as long as he wears no armor, light armor, or medium armor (he loses this benefit if he wears heavy armor).

Nature's Shield (Ex): When he attains 3rd level, the master forester learns how to use the natural surroundings of the forest to his advantages. When he is engaged in combat in a wooded environment (and whether he fights in melee or fires missiles from afar), the master forester can use the surrounding vegetation as cover. He gains a circumstance bonus to his AC equal to his Wisdom modifier (if positive) when fighting in the forest.

At 6th level, the master forester gains an additional +1 competence bonus to his AC when fighting in the woods as well as a +1 resistance bonus to all saving throws when in such environment. At 9th level, these bonuses increase to +2.

Turn or Rebuke Dire Animals (Su): At 4th level, the master forester becomes even more linked with nature. His ability to turn or rebuke animals is now extended to include dire animals as well.

Dire Animal Companion (Ex): When he reaches 5th level, the master forester gains another companion, this time a dire animal. The master forest may choose a dire animal from the following list: dire badger, dire bat, dire bear, dire boar, dire wolf, or dire wolverine.

Turn or Rebuke Magical Beasts (Su): From 7th level and onwards, the master forester may now rebuke or command magical beasts in addition to animals and dire animals.

Commune with Nature (Sp): When he attains 8th level, the master forester gains the spell-like ability to commune with nature once per day.

Nature's Revenge (Su): When the 10th level master forester witnesses a crime against nature, such as the unwarranted destruction of a tree or the slaughtering of an animal for the sheer thrill of it, he enters a sort of trance that allows him to focus his rage at the offender(s). When this happens, the master forester gains a +5 bonus to all attack and damage rolls made against those who violated the natural order before his eyes. He can use this ability a maximum of once per day plus his Wisdom modifier (if positive). When triggered, nature's revenge lasts for the duration of the encounter.

Master Forester Advancement Table

Base Attack Level	Fort. Bonus	Fort. Save	Ref. Save	Will Save	Special
1	+1	+2	+2	+0	Turn or Rebuke Animals, Wild Empathy
2	+2	+3	+3	+0	Animal Companion, Woodland Stride
3	+3	+3	+3	+1	Nature's Shield (AC bonus equal to Wisdom modifier)
4	+4	+4	+4	+1	Turn or Rebuke Dire Animals
5	+5	+4	+4	+1	Dire Animal Companion
6	+6	+5	+5	+2	Nature's Shield (+1 AC, +1 saves)
7	+7	+5	+5	+2	Turn or Rebuke Magical Beasts
8	+8	+6	+6	+2	Commune with Nature
9	+9	+6	+6	+3	Nature's Shield (+2 AC, +2 saves)
10	+10	+7	+7	+3	Nature's Revenge

Vindicator

Vindicators are part of an elite circle of elf warriors dedicated to the worship of the good elven god of holy vengeance and righteous retribution. Fanatically devoted to the protection of the elves and the eradication of tyranny, vindicators are crusaders who seek out and destroy totalitarian rulers and overthrow corrupt or oppressive governments. These holy warriors spend their lives in the pursuit of eradicating those who enforce their wills upon others. They especially despise slaveholders and anyone involved in the market of humanoid slavery -- some vindicators have been known to liberate orcs and gnolls who had been badly treated by their slaver masters.

Considered to be a blessing by most elves and good-aligned societies, vindicators are regarded with suspicion -- and occasionally outright hatred -- by most lawful governments. Although most vindicators rarely openly reveal that they are part of this select group of warriors of the god of holy vengeance, their stern demeanor and zealous devotion usually give them away.

Clerics of the god of holy vengeance are obvious choices for this prestige class, but chaotic good fighters, rangers, and rogues who follow the faith are especially good candidates to become part of the vindicators' select group. Other classes are not as attracted to this prestige class, but fallen paladins, wizards, and barbarians occasionally become vindicators.

Hit Die: d8

Requirements

To become a vindicator, a character must fulfill all the following requirements:

Race: Elf or Half-Elf raised in or accepted by an elven community

Alignment: Chaotic Good

Base Attack Bonus: +6

Knowledge (religion): 4 ranks

Feats: Combat Expertise, Iron Will, Weapon Focus (in the deity's favored weapon)

Special: The character must be an active follower of the elven god of holy vengeance and righteous retribution in order to take any levels in this prestige class (which does not necessarily imply that he must be a cleric of the faith). Furthermore, he must be accepted into the ranks of the Order of Holy Vindication and trained by a vindicator of at least 2nd level.

Class Skills

The vindicator's class skills (and the key ability for each) are Bluff (Cha), Climb (Str), Concentration (Con), Gather Information (Cha), Hide (Dex), Intimidate (Cha), Knowledge (religion) (Int), Jump (Str), Listen (Wis), Move Silently (Dex), Ride (Dex), Search (Int), Sense Motive (Wis), Spot (Wis), and Survival (Wis).

Skill Points at Each Level: 4 + Int modifier

Class Features

All the following are class features of the vindicator prestige class:

Weapon and Armor Proficiency: The vindicator is proficient with all simple and martial weapons, as well as with all

armor and shields.

Spells per Day: A vindicator who was previously a divine spellcaster continues to gain access to more powerful divine magic as he obtains levels in this prestige class. For every even-numbered level the vindicator acquires, the character gains new spells per day as if he had also gained a level in the divine spellcasting class he belonged to before he added this prestige class. He does not, however, receive any other benefit a character of that class would have gained. This essentially means that he adds half his vindicator level to the level of whatever other divine spellcasting class he has, and then determines the spells per day accordingly.

If a character had more than one divine spellcasting class before he became a vindicator, the player must decide to which class to assign the additional levels for the purpose of determining divine spells per day.

If the vindicator did not previously belong to a divine spellcasting class, he gains the ability to cast divine spells exactly as a cleric of his patron deity. Spell progression is the same as that of a cleric of a level equal to half his vindicator prestige class level.

Important Note: The elven god of holy vengeance and righteous retribution is a minor power and may not be part of every campaign setting. The DM may assign another deity to take on this role. Alternately, he may create an entirely new minor deity. Typically, such a god would offer his clerics (and vindicators) access to the following domains: Good, Healing, Protection, and War. His favorite weapon would be the longsword.

Detect Evil (Sp): A vindicator can detect evil at will. This spell-like ability duplicates the effects of the spell of the same name.

Holy Aura (Su): Upon becoming a vindicator, the character receives the blessing of his god in the form of a holy aura, which grants him a +1 sacred bonus to AC. This bonus augments by +1 every three levels thereafter (+2 at 4th level, +3 at 7th level, and +4 at level 10).

Weapon Specialization: At 2nd level, the vindicator's intense training in the favored weapon of his deity (typically the longsword) grants him the Weapon Specialization feat. If he already has this feat, he gains the Greater Weapon Specialization feat instead.

Damage Reduction (Ex): When attaining 3rd level, the vindicator's rigorous combat training bestows him the extraordinary ability to shrug off some amount of injury he receives with each blow or attack. Subtract 1 from the damage the vindicator takes each time he is dealt damage. This bonus increases to 2 at 6th level and to 3 at 9th level.

Smite Evil (Su): A vindicator of 4th level or higher may attempt to smite evil with one normal melee attack when wielding his deity's favored weapon. He adds his Charisma modifier (if positive) to his attack roll and deals 1 extra point of damage per vindicator class level. If the vindicator accidentally smites a creature that is not evil, the smite has no effect but it is still wasted for the day. At 8th level, the vindicator may use this ability twice every day.

Divine Grace (Su): Also at 5th level, the vindicator is granted another favor from his deity. He may now apply his Charisma modifier (if positive) as a bonus on all his saving throws.

Slay Evil (Su): Once per day, the 10th level vindicator wielding his deity's favored weapon may attempt to slay an evil creature in melee combat. When this supernatural ability is triggered, the vindicator attacks as normal. If the attack is successful and the target creature is evil, it must attempt a Fortitude save (DC 20 + vindicator's Charisma modifier) or be instantly slain. If the attack is unsuccessful, or if the vindicator used this ability on a non-evil creature, the slay evil ability is used up for the day.

Code of Conduct: Vindicators must be of chaotic good alignment, so they have no elaborate code of conduct. However, they lose all special class abilities if they ever willingly commit an evil act.

The Vindicator Advancement Table

Base Attack Level	Fort. Bonus	Fort. Save	Ref. Save	Will Save	Special	Spells per Day
1	+1	+2	+0	+2	Detect Evil, Holy Aura +1	
2	+2	+3	+0	+3	Weapon Specialization	+1 level of existing class
3	+3	+3	+1	+3	Damage Reduction 1/-	
4	+4	+4	+1	+4	Holy Aura +2, Smite Evil 1/day	+1 level of existing class
5	+5	+4	+1	+4	Divine Grace	
6	+6	+5	+2	+5	Damage Reduction 2/-	+1 level of existing class
7	+7	+5	+2	+5	Holy Aura +3	
8	+8	+6	+2	+6	Smite Evil 2/day	+1 level of existing class
9	+9	+6	+3	+6	Damage Reduction 3/-	
10	+10	+7	+3	+7	Holy Aura +4, Slay Evil	+1 level of existing class

Regular Contests in an Instant

Optional Rules for *GURPS*

by Glen Barnett

Buff, the beefy, barely-clad barbarian, slammed his large mug of ale into the bench, splashing it across the table. "I could too win a tug-of-war while kneeling in mud against that lardy fellow over there! Lorm's Beard, I'll do it blindfolded!"

Regular Contests are most commonly over in a few turns. *GURPS Basic* has some suggested rules for speeding up regular contests when both sides have very low or very high effective skill "so that it doesn't bog down too long".

But even so, some contests can take a while. If Buff and that lardy NPC were *both* drunk, blindfolded and kneeling in mud, it might easily be a contest between effective skills of, say, 7 and 4. Such a contest would take around four turns on average, but it can sometimes take much longer. If the other players are starting to shuffle impatiently at the thought of yet another lengthy bout of muddy, muscle-bound flailing about, maybe you'd better fast-forward to the conclusion.

"In fact," said the barbarian a little too loudly, slamming down his huge tankard and wiping his mouth, "I'll do better!" The barbarian pushed himself to his feet, none too steadily. "I'll take on all comers. Any one of you here thinks he can beat me?" Eight people stood in response to the challenge.

There was an audible groan from around Buff's table.

Sixty die rolls later, Buff has beaten the other eight NPCs, and is about to start on Lardy. Meanwhile, the other players have gone to a movie.

The rule for speeding up Regular Contests (p. 349 in the *Basic Set*, under *Extreme Scores*) shifts one of the scores to 10 and moves the other by the same amount. In fact the book says to shift the *lower* one to 10, but it doesn't hurt if you shift the higher one instead -- shifting the lower one to 10 gives more "both succeed" standoffs, shifting the higher leads to more "both fail" standoffs. Which you actually use may be a matter of convenience, or you might choose whichever matches the appropriate "mood" -- other things being equal it seems sensible to use the one which shifts the values the least (if it started out as a contest of 6 vs. 4 incompetents, having a few "both fail" standoffs plainly fits the dramatic circumstances better than several "both succeed" ones).

The shift-to-10 rule gives results pretty close to the probabilities they're supposed to approximate, except for very small or very large effective skills -- unfortunately, the very circumstances it's suggested you use the rule for. If you nevertheless find the rule works well enough in practice for pairs of small or large scores, the good news is it works far better for the skill values in between, so there's no harm in using it more generally for a slightly faster contest. Only do this when both skills are the same side of 10 -- if one skill is above 10 and the other is below, it's already faster than shifting to 10!

Faster, faster

But Regular Contests can be done much faster still. It turns out that a Regular Contest can be emulated as a single straight skill roll with skill adjusted for the other guy's skill.

Take a Regular Contest between a PC and an NPC. Shift the NPC's effective skill to 10, and move the PC's skill by the same amount (the same calculation as the rulebook, except the NPC will always go to 10, even if they have the higher skill). Now the PC must make a straight 3d roll under their shifted skill.

Another way to look at it is to take the player's effective skill, minus an adjustment of 10 less than their rival's skill -- this way of looking at it may be faster to work with when you're having contests against several NPCs.

The probabilities of winning using this adjusted skill roll are exactly the same as winning with the shift-to-10 version of the regular contest.

For example, imagine (sans mud, ale, and blindfolds this time) Buff has a skill of 14 and Lardy has a skill of 13. Then Lardy's skill is moved down by 3 (13-10), so Buff's adjusted skill is then 11 (14-3) -- plainly 11 is also the shifted skill Buff would use under a shift-to-10-regular-contest. Buff's player rolls 3d and gets a 9, winning the regular contest.

With a standard regular contest of 14 vs. 13, Buff wins 65.51% of the time. With the adjusted skill roll of 11 (*and* with a shifted-to-10 Regular Contest), Buff wins 65.46% of the time.

Under this adjusted skill roll method a Regular Contest takes exactly one 3d roll, every time. Buff's drunken-blindfold-kneeling-muddy-tug-of-war against each of eight NPCs will take exactly 8 rolls to resolve, not 60 or more. It's all over in less than two minutes, even with some time added for colorful descriptions of just how muddy he gets.

If the Regular Contest is important to the plot, or if it's between two PCs, or if the players are enjoying the action anyway, it's better to play it out as a full Regular Contest (with the proviso that you can always use a "shift-to-10" regular contest if you want it a little faster).

Making Shifted Contests More Accurate

If the two scores are the same, a shifted-to-10 Regular Contest always leaves the probability of winning unchanged (at 50%). Also note that under the rules as written ("a roll of 3 or 4 is always a success," p. 343), a skill of 3 is exactly as good as a skill of 4 in a straight Regular Contest, but in a shifted-to-10 Regular Contest, the 4 wins about 63% of the time.

The table below gives the probability of the higher (H) score winning for various cases (where you'd use the shift-to-10 rule normally) using the original Regular Contest rules, the published shift-to-10 rule, and the best available shifted score when the lower score goes to 10.

Original Contest	Prob H wins	GURPS shift-to-10	Prob H wins	"Best" Adj.	Prob H Wins
5 vs. 4 or 16 vs. 15	72%	11 vs. 10	63%	12 vs. 10	74%
6 vs. 4 or 16 vs. 14	84%	12 vs. 10	74%	13 vs. 10	84%
6 vs. 5 or 15 vs. 14	68%	11 vs. 10	63%	11 vs. 10*	63%*

* There is no good single choice here. See discussion below.

For contests of 6 vs. 5 and 15 vs. 14, there is no good approximation to the "true" chance of winning available on a straight shift to 10. The higher skill should win 67.8% of the time. Against a lower skill of 10, making the higher skill 11 gives it a win probability of 62.5% (more than 5% too low); making the higher skill 12 gives it a win probability 74.1% (more than 6% too high). A reasonable compromise is to call it "11 and a half" - alternately take the higher score as 11 and 12 (11 the first round, then 12 the second round, and so on until somebody wins) -- this actually gives just under 67% chance.

As can be seen from the table, in the circumstances that the book encourages you to use the shift-to-10 rule, if the more extreme score is either 4 or 16, you should add an extra 1 to the adjusted score in the "vs. 10" regular contest. You might consider adding "one half" for contests where the more extreme effective skill is 5 or 15. These considerations apply whenever the two scores are the same side of 10, not just in the above table. If you shift the higher score to 10 instead, these extras are subtracted from the lower score rather than added to the higher score.

Because a 3 is as good as a 4 in a straight regular contest, but this is ignored in the shift-to-10 rule, it turns out that the 3 vs. 5 and 3 vs. 6 contests are already effectively shifted the "extra 1" identified by the table above. But if the contest

is 3 vs. 4, the "correct" contest is 10 vs. 10 (since if you rolled it out the 3 skill would win half the time), not 10 vs. 11 (winning 63% of the time). If this bothers you, *always* treat an adjusted skill of 3 as a 4, and then apply the "add an extra 1" rule above as required.

If you like the fact that the shift-to-10 regular contest gives 4 and advantage over 3 (even though the regular rules do not), then by all means stick with that and shift to 11 vs. 10.

Those "Best" Shifted Contests And Instant Regular Contests

All the discussion about improving the accuracy of shifted regular contests applies to the "instant" Regular Contests at the start of this article -- so if you want the win probabilities to better reflect an fully-played-out Regular Contest, treat a 3 as a 4, and where the more extreme (further score from 10) is a 4 or a 16, add an extra 1 to the higher adjusted score. So for example, a contest of 4 vs. 8 shifts to 10 vs. 14, but you should add 1 to make it 10 vs. 15, which in turn means the PC in an "instant"-regular-contest skill roll has a target of 15 on 3d. Further, you may want to make contests where the more extreme score is 5 or 15 more accurate by adding "one half" after shifting to 10 (as shorthand for alternating between the vanilla shifted score and adding an extra 1 each round).

When the skills lie either side of 10 (or when one of them is actually 10), there's little point in trying instant Regular Contests, since a straight regular contest will be over very quickly. It's still possible, of course, so here are some suggestions: If at least one of the scores is between 8 and 12, just do a straight shift-to-10 calculation. When the scores are not both above or both below 10, you should *not* use the "add 1 for a 4 or 16" rule mentioned above. If none of the scores are between 8 and 12 inclusive and the two scores lie either side of 10 (that is, one score is well above 10 and the other well below), just do a straight regular contest -- it will almost always be over on the first round anyway.

Pyramid Review

Foes of Freedom (for *Mutants & Masterminds*)

Published by [Green Ronin](#)

Written by Steve Kenson & Steven E. Schend

Art & graphics by Ramón Pérez, Hal Mangold, Jonathan Kirtz, Kevin Stokes, Storn Cook, James Ryman, & Christopher West

Edited by Jon Leitheusser

96-page full-color softcover; \$23.95

It's a simple, straightforward title, and it's just what it says: *Foes of Freedom* is a collection of enemies for use with the *Mutants & Masterminds* RPG from Green Ronin. There's a pile of these things on the market, and that's understandable -- if you put out a superhero game, you're almost expected to follow up with a book or two of characters for it. If you're going to do such a thing, you ought to be bringing something awfully cool to the table, and the goods just aren't here.

The volume deals with villainous groups, solo ne'er-do-wells, and the facility that holds them. The groups are the most interesting facet of the product. Among the more engaging: The Minotaur, stolen from his ancient prison, is now the unseen head of his own version of the Labyrinth. Operating from behind the scenes, "Taurus" uses ruthless business practices to continue waging his centuries-long feud against Daedalus, the superintelligent craftsman who imprisoned him on Crete. Cutting-edge scientists, thieves, and assassins (many created by Taurus' own team) round out his cohorts and his company's bottom line.

Talos (from [Freedom City](#) -- a book that is a big help in navigating this one) and his crew believe in the superiority of artificial life, and work to relegate man to a subservient position. To this end, he has created the Foundry, which offers androids for combat or infiltration to anyone who can meet the fabulous price tags. It's always on the lookout for new and interesting technology to steal, and guards its own secrets zealously by isolating factories with teleportation technology.

Other groups are less inspired, including some cultish cabals, a team of thieves, and a family of psionicists, as well as a sampling of monsters who don't really form a team.

The lone villains are even less impressive, and many are a deliberate homage to characters from mainstream comics. Blackstar is a rogue Star Knight, a thinly veiled version of Green Lantern's foe Sinestro, while scientist Connor Kirkstrom loses a limb to a shark attack and ends up turning into man-shark Megalodon using a serum made from shark DNA.

There are a few good ideas, some worthy of note simply because they're so odd (like Cthulhu-faced alien privateer Captain Kraken) or daringly non-powerful (the puzzle-loving Conundrum and the unnerving Fear-Master really have to work for their victories if they face anyone with more power than your average Batman). True props go to the more innovative X-Isle, an intelligent city that longs to *be* Freedom City, and the book's finest example, Silver Scream, a long-dead screen actress whose spirit hasn't left the limelight. But mostly it's a roundup of super-standards, with a shadow man, an intelligent meta-ape, a possessing spirit, some mythological figures-turned-villains, and a just plain strange computer hacker.

Every setting has to have its super prison. To keep these people off the streets, they've built Blackstone Special Federal Penitentiary ("the Stone," about two miles off the Coast of Freedom City) and loaded it up with the meta-dregs of society. The prison itself isn't all that noteworthy -- what looks like a chunk of rock on the water's surface is actually a monorail-serviced core descending into the seabed -- but the mysterious warden and the prison's history manage to score some points for enlivening the location.

A brief appendix adds some interesting new powers, flaws, and (super) feats -- setting up fall guys, developing a master plan, producing an immortal character's life story without a 10-page character sheet -- but those three pages hardly justify the buy (although at least this one isn't a hardcover). Unafraid as the book is to provide low-power NPCs and details on capers for everybody to get into, you'd think they could ditch a couple of mugs and delve deeper into ways to make these "normal" but clever foes a challenge for the heavy hitters.

Browse through any entry in the *Mutants & Masterminds* line and you'll have a pretty good idea of the book's ornamental qualities. The artists' work is worthy of the real comics, and they do a dandy job here with character portraits and Blackstone diagrams.

Although it shines through here and there, and the writing is every bit as smooth and readable as anything with the redoubtable Steve Kenson at the helm, the obvious title reflects the plainness of its contents. *Foes of Freedom* is an unremarkable selection that bulks up the *Mutants & Masterminds* background in fits and starts, but has little to recommend it as a rogues gallery.

BESM Dungeon (for Big Eyes, Small Mouth)

Published by [Guardians of Order, Inc.](#)

Written by David L. Pulver & James Maliszewski

Cover by Julie Dillon

Illustrated by Svetlana Chmakova, Christina Crontiris, Julie Dillons, Pamela Ramali, Chris Steward, & Chris Watkins

96-Page Perfect Bound Six By Nine-Inch Book; \$15.95

What do you do if you fancy a dungeon bash but want to avoid the "dreaded" *d20 System*? There are, of course, plenty of choices when it comes to the fantasy RPG, but most go out of their way to avoid the tropes and clichés of the world's leading RPG. The choice is really quite limited, but Guardians of Order offers an option that is lighter and faster than most, *and* is one that has an anime spin which gives it a flavor of its very own. As the title suggests, *BESM Dungeon* is for [Big Eyes Small Mouth](#), the leading anime RPG. It is also the third title in the publisher's BESM Fantasy line, which includes the *BESM Fantasy Bestiary* and *Uresia: Grave of Heaven*.

That said, *BESM Dungeon*, designed for use with the d6 variant of the Tri-Stat system, can be run with nothing more than just the *BESM Core Rules*. It includes a setting, a guide to suitable characters and races, a host of new creatures (which can be used in conjunction with those found in the *Fantasy Bestiary*), a hoard of magical items to plunder, and of course, a ready-to-play dungeon. The latter works best with at least four players, though more are preferable, the guidelines suggesting that a party consisting of two warrior-types or two mage-types serve as a solid basis for an adventuring group.

The setting is Noah's Landing, a village that sits on the eastern coast of Jessenia. This untamed island is mountainous, heavily forested, and marked with murky swamps, and is home to a wide variety of dangerous beasts and creatures -- Goblins, Fish-Men, the feline Nekojin, and others. Until 60 years ago, Noah's Landing was a thriving port and home to the Temple of Lysandra. As well as a place of worship, it was also a giant lighthouse that helped guide ships safely past the rock and monster infested waters around the island of Petra. This time of prosperity and good fortune ended when an unholy alliance of Goblins, Trolls Ogres, Dragons and worse marched out of the swamps to assault the temple. No one alive today knows what happened, but the Temple of Lysandra vanished in a blaze of light. In the years since the Curse of Lysandra, it reappears each month at the time of the full moon. At first it was silent, but now terrible yowls can be heard from within, while adventurers are drawn to the tales of the riches still to be found in the labyrinth below the lighthouse.

In keeping with the "going down a dungeon, killing things, taking their pretty things, and going up a level" ethos of the dungeon bash game, characters in *BESM Dungeon* start out as first-level, 25-point characters. They are described as being competent at beating up rats, but despite their high mortality rates they should be able to advance in level quite quickly. With those 25 points, players need to buy stats, an occupational template, and finally attributes or a species template for their characters. The species templates given include the usual Elves, Dwarves, and Humans, but adds Pixies, Lizard Folk, Half-Dragons, and Shape Changers to the mix as well. The first of the real nods to anime is the inclusion of the Nekojin or cat people; the fact that Elven ears point not upwards, but horizontally; and that you can play an Inter-Dimensionally Exiled Schoolboy/Schoolgirl! Another nod in the otherwise fantasy standard dungeon

occupational templates, is the Mecha Knight, usually a young boy or girl who uses a clockwork magical suit of armor to fight evil. However, characters should not be designed as combat monsters, and a GM is advised to either deny their inclusion in a game or upgrade the dungeon to account for the increased martial prowess of the character.

Loot and stuff is dealt with in more detail than in most *Big Eyes, Small Mouth* campaigns. Several new European medieval weapons are added (war hammer, morning star, halberd, and so on), as well as two items of in-genre armor. Evil armor is heavily spiked and gives bonuses to intimidation checks, while cheesecake armor clearly comes from the Chainmail bikini school of manufacture. Even worse, the higher the appearance of the wearer, the better protection it gives! Money, whether in the form of coins or gems comes in large amounts, the former never less than a bag full and copper coins are never good for more than ale and a round or two of beef sandwiches.

A little background is given on Jessenia and Noah's Landing, such as the latter including both a sorcerer's school and a ninja clan (whose students, in true anime style, are all meant to be men although every student bar one is female), but much of the book is given over to the dungeon. This is spread over three levels, plus the few rooms of the lighthouse above, and rules are included for all the usual dungeon stuff -- light, doors and wandering monsters, etc. The latter are rolled for every 30 minutes or -- more alarmingly -- every minute that the party remains in a corridor or on some stairs! The problem for the player characters will be that for the denizens of the dungeon, only two years have passed since they assaulted the temple of Lysandra. Having not long settled in, they welcome a fresh supply of meat.

The dungeon is clearly meant to be atypical and within such design constraints this is well done. It should provide plenty of dungeon bashing hours, especially if the GM throws in some of the soap opera elements of particular to anime, and are suggested by the guidelines on creating an adventuring party. The book is rounded out with a pair of appendices, one containing several new dungeon monster templates, the other a list of magical items of power. Of the former, perhaps the most absurd are the Bread Pudding, a mobile mould that is descended from foodstuffs left behind by adventurers, and the Pokedrake, and the less said about *its* origins, the better.

There is a certain tongue-in-cheek quality to *BESM Dungeon*, giving it a much lighter feel than might be found in the average dungeon-set game. This is due in the main to the other inspiration for this supplement -- anime, which accounts for the soap opera style and relationships encouraged between party members. But the setting is not some high school or metropolis; rather, it is something more akin to the computer adventures published by Japanese software houses, best typified by the early *Final Fantasy* series. The setting is also ripe with crossover potential, not just with the inclusion of the Dimensionally Exiled Schoolboy/Schoolgirl racial template, but with a magical item found within the dungeon as well as whatever the GM cooks up -- for example, how about gaming the *Dungeons & Dragons* cartoon anime style?

Most obviously, *BESM Dungeon* can be played as is, as a one-off mini dungeon bash, or it can be used as the springboard for something bigger of the GM's design. Yet however the GM decides to use this supplement, *BESM Dungeon* offers plenty of entertainment in a new spin on old cliché.

--Matthew Pook

Dork Tower!

Dork Tower!

Right Hooks

At my Day Job yesterday, we were arguing about whether successful RPGs were character-driving or plot-driven. After a few minutes of debate, I paused and said, "Their neither. They are premise-driven." When asked for clarification, I said (after stalling for thinking time by sprinting to the restroom), "All the most successful games have premises that are easily explained."

And so I rattled off a list:

- *Deadlands*: Horror Wild West.
- *Aberrant*: Near-future superheroes.
- *Shadowrun*: Fantasy cyberpunk.
- *Spycraft*: Spies.

In fact, this last example shows that the best games often have their premise summed up in the *name*; I suspect one reason *Dungeons & Dragons* is as successful as it is remains because it has one of the most evocative names in gaming. (Really, how hard is it to deliver on either prong of that two-tiered promise?) And I defy someone to provide an explanation of *Vampire: Dark Ages* that doesn't, in some way, contain the phrase, "You play vampires in the dark ages."

By this point in my rant (and, really, if standing on top of a desk gesturing wildly with a Diet Pepsi Twist can is a "rant," then there's something wrong with society), I was stopped and challenged: "What games *aren't* premise-driven?"

It is at this point that I am reminded of an old existential joke (which, I believe, I am stealing from Raymond Smullyan):

One philosopher says to another, "With all the problems in the world today, it is better not to even exist."

"Yes," the other philosopher replies. "But who can be so lucky? One in a thousand?"

Anyway, the joke shows my conundrum: It's a lot easier to imagine that something doesn't exist than to describe it. But I pressed on, gamely (hah!).

It was also difficult to find examples that everyone would have heard of, but that *weren't* commercial successes. And it was difficult to come up with successful properties with stories and characters that didn't have game-worthy premises.

"So, envision the *Fight Club* RPG. What would it be about?" And, after some stammering, we came up with, "Modern-day psychological conspiracy humor, something-or-other."

Feeling my oats, I pressed on. "Okay; without using the words 'Lovecraft' or 'Cthulhu,' describe *Call of Cthulhu*." The instantaneous answer was, "Pulp horror."

"Great," I replied. "Now, without using the words 'Tank' or 'Girl,' describe the *World of Tank Girl* RPG." The stammered premise was, "Post-apocalyptic humor." "So it's like *Paranoia*?" I replied. "Er, well, no . . ." and then it became obvious that there was no good way to describe it. No premise = failed game.

As I thought back to the bargain bins of my Former Friendly Local Game Shop, I was flooded with inspiration. "What about *Everway*? It was a beautiful game, but I couldn't understand what it was *about* . . . something about fantasy and pretty cards. *Earthdawn* is easy to explain, with 'horror/epic fantasy.' *Over the Edge* is 'conspiracy *Gilligan's Island*.' But what's the *Star*Drive* setting for *Alternity*?"

I don't know how well Wizard of the Coast's *Eberron* is doing, but I know that, as a former retailer, I'd have a hard

time selling it because, even having read a reasonable amount of it and looking at a bunch of the pretty pictures, I have a hard time *understanding* it. (I had a similar hard time with *Fading Suns*, until someone explained it as "*Advanced Dungeons & Dragons* in space." As soon as I envisioned those possibilities – with nobles, magic-users, priests, thieves' guilds, and the like – I was hooked . . . and I was able to sell a lot of copies after that, since I could give a six-word pitch.)

Now, there are a few games that don't have such easy classifications, but I can get close enough for government work:

- **GURPS:** A generic realistic system.
- **Rifts:** Dark future multi-dimensional.
- **Traveller:** Person-level space opera.

And, obviously, licensed games have the advantage of having an immediately evocative property tied to them; two hours of watching *Star Wars* or *Star Trek* creates a much more inspiring universe than reading most game books for two hours.

So what does this mean to you, the game player and game consumer? Well, the biggest thing it means is that you have a possibility to create campaigns that *don't* have these solid premise-hooks. If you want to make a campaign that begins as an ancient Victorian game, has the PCs die and come back in modern times as spirits in a farcical *Ghostbusters*-style RPG told from the other side, you can; there are dozens of systems that would facilitate this. If you wanted to do a game where the players play both drivers and vehicles in an anime-style world, you can. But both would surely be hard sells as RPGs. Likewise most of Ken Hite's columns for *This Very Magazine*, while being great campaigns, would be difficult to market as settings because they are often difficult to sum up easily. (Without speaking for him, I suspect one of the reasons Ken likes to write for us is the freedom to present ideas and possibilities that would be difficult to express in the "mainstream" RPG market. The gold throne carried around by teeming throngs of admirers is also a pretty nice perk.)

I've run games where I've had the players "trust me" and revealed very little about the setting or what would happen. But such freedom can't be afforded in the gaming industry, since retailers and distributors need to know what the game is about ahead of time. It's difficult to envision an RPG with the style and panache of the first *Matrix* movie without coming to the conclusion that everyone would know about such twists ahead of time.

Fortunately, these possibilities are open to you. Go ahead – run or play in games that *can't* be easily summed up. You'll have a blast, and industry professionals will be jealous.

--*Steven Marsh*

Jingle Bells

An Adventure for *Transhuman Space*

by Eric Funk

This one-shot adventure is designed for law-abiding or mercenary PCs in the *Transhuman Space* setting. Characters with a criminal reputation may instead be contacted by one of several groups to "discourage" the PI (Private Investigator) team from investigating further. This should not affect the plot, as they could also be approached in later.

Many of the elements presented here, except for the introduction, could be foreshadowed amongst numerous Red Herrings. Perhaps an NPC recently sold all their shares in SmarTech, and came looking for advice. If a PC is an AI or a hyperevolutionist, then they may be approached by the victim looking for advice.

Getting the Heroes Involved

A digital entity (ghost/AI) going by the name of Pieter Ressereccion contacts the group for help. The (legally) adult friend of the child of an important person has disappeared. The infomorph offers standard detective search wage such that their take will be as per Bounty Hunter p. TS138, plus 25% (divide by 30 to get daily wage). One day's pay will be transferred now, the rest upon the safe return of the youth. Both families are real, but unavailable for comment at this time. A Quick Contest of Fast-talk or Merchant against skill 15 could gain either an additional +25% wage or an extra day's pay in advance. If the characters accept, they will be asked to sign a simple find person contract. Note that if the missing person is hurt through their actions, pay will be halved, and the rescuers may be responsible for medical expenses incurred. In addition, this is a "low visibility" assignment, and any overt weapons or combat-orientated cybershells should be discouraged.

Questions & Answers

Who is the infomorph? Depending on local regulations, the personage could be a SAI or ghost, but either way they have a normal job history with the Pirrie family.

The missing person (by the name of Chris Pirrie) has been acting unusual lately, paranoid and reclusive. A few hours ago, their VII stopped responding to messages. It normally confirms them.

How long have they been missing? One hour. The subject did not attend a party they indicated they would.

When was the person last seen? They were last verified early in the morning, by communicating with a different friend. Police will not start a search until one day has passed without conclusive evidence pointing to foul play.

Assuming the offer is accepted, investigators will be provided with a valid ID file on the victim, and an access code to the domicile. Both are valid for 14 days, and the infomorph indicates it will notify the house AI of the validity of their intent and privilege.

On the House

The house AI lets them in without a fuss (assuming they use the code). If asked, it reveals that the victim was watching a loop of video constantly before they left; it still has a copy that it will freely give. There are a number of productions from small companies, and from three giants: SmarTech, CogniScape, and Deep Thoughts. (Several of the small companies are fronts for the terrorist group, although that information cannot be discerned here.) Mentioning the names to a search enabled AI will immediately flag SmarTech as being suspicious. It has a low reputation rating, and a large

number of recent news articles and testimonials that speak poorly of it. CogniScape is a red herring. If investigated, it is a neutral, faceless mire of red tape.

Organizations

What Everyone "Knows" About SmarTech

Founded in 2088, it trains AIs and computer skill ROMs. Although not its primary industry, SmarTech also produces a large share of snazzy, bright, and short-lived memes in the local area. For those connected, the corporation has a very low reputation rating.

Rumors About SmarTech

The corporation was recently exposed as having major ethical problems (false). They upload brainpeeled children to test ads on or to grow into SAIs (false). A number of AIs that were fitted with skill ROMs went crazy (true, but a coincidence; the AIs were actually following orders for the government, and SmarTech was unknowingly left to take the fall). They are replacing all "human" staff with AIs and bioroids. (This is mostly false. After profits plummeted, staff was downsized, and when business started to pick up, the first to return were those with the lowest "upkeep.") The GM is encouraged to add several wild rumors to this list.

What Everyone Doesn't Know About SmarTech

The corporation is actually recovering from an extreme memetic attack. This company is so honest it actually invites a federal memetic review board (such as the Memetics Defense Division of the [NTIB](#)) to inspect the memes and research techniques. Of course they will be suspicious and recalcitrant toward any civilian asking about their practices. If asked to analyze a meme that may have been involved in criminal activity, after a few background checks they may analyze it. Estimates indicate that it will take a week to get results at "low" processing priority. GMs should feel free to extend or shorten this timeframe if the team needs clues. If trouble comes knocking, most security guards here wield standard electrolaser pistols, and wear older-style light nanoweave (with ceramic inserts). (For a "typical" SmarTech security guard, see the "Ready-Made" section below.)

What Everyone Knows About Deep Thoughts

It was founded in 2097 to take advantages of AIs and public memetic documents.

It is so named because the SAIs seemed to take an unusual amount of time compiling memetic analyses. SAI-based memetic R&D firm publicly specializing in advertisements for children's toys. (If asked, their lawyers will calmly indicate that the name has nothing to do with the works of a twentieth century author. Really.)

The CEO of the company is listed as Johnathon Whitcomb -- a brilliant engineer with vision, and a knack for making friends. Should anyone personally ask, they will be told that he is hard working, very busy, often on the road, and that they should see his secretary if they want to make an appointment. His secretary will indicate that he has not asked to see them, and direct their questions to marketing or the legal department.

Before arriving at either the marketing or legal departments, Public Relations officer Naomi Turen will have been notified and she will intercept any nosey investigators. She has charisma and a soothing voice. Attempts to read her will have to contest with a net skill 18 in Acting, Diplomacy and Fast-Talk. If the GM wishes, she could even be a parahuman or bioroid with Pheromone Control (CI 63).

What Everyone Doesn't Know About Deep Thoughts

It actually makes military memes for the highest bidders through front organizations. Many beings have disappeared to

protect this secret. This will include the PIs and the PCs if they discover too much. Government agents are busy collecting data, but are hindered by counter-agents within the agency. Outsider intervention could break the stalemate, however. If trouble comes to this facility, most security forces here carry police armguns, and wear medium nanoweave armor (with clamshell cuirass). The building has a large variety of cyberswarms in all public areas (officially cleaners, painters, builders, but unofficially including surveillance swarms), as well as a grenade launcher turret near the front entrance that is loaded with tangler and tear gas canisters. All sections that encounter the public have at least one Greeter bioroid on duty at all times (see "Deep Thoughts" goon, below). If they are expecting trouble, riot shields and NBC kits are standard issue. Trouble is always expected around their dusty clearing warehouses in the industrial area, a modest way from the shining headquarters building. (For a "typical" Deep Thoughts security guard, see the "Ready-Made" section below.) All the maintenance and janitorial cybershells (a small number of which are actually RATS with the police pod option, see p. TS124) have electrolaser pistols and electrified surfaces.

What Everyone Knows About Serpent's Fang

The group was founded in the early 2090s, and has always had a small following. The leader appears to be a human male with a number of cybernetic implants who only goes by the name "Viper." The sect is notably pro-human, anti-biomod.

Rumors About Serpent's Fang

They have a nuclear device (false). They possess fragments of the Mind Crasher (see p. TM62) (also false). They are working with the TSA (as written, false).

What Everyone Doesn't Know About Serpent's Fang

It has a small cult following, many of which have infiltrated the memetic research divisions of several companies, including that of Deep Thoughts. They are using stolen memetic algorithms, and thus the memes share some similar logic strands. The leader, known only as "Viper," is always experimenting with uploading xoxs of different "successful" cult leaders into his extra implant. It is set up so it is not directly connected to his NAI implant, but the latter controls all the I/O connections to the former. The NAI is set to "awaken" Viper from his "communion" with the xox at timed intervals, or if someone enters the room. Unfortunately he has been hanging around the psychotic shadows too long, and his grip on reality has become so tenuous that and thus all he can do is marketing. In Viper's absence, his second-in-command, "Zap," has been filling the part, and acting as his mouthpiece.

Local government agencies have been keeping an eye on this group for a while, but since nothing solid has been proven yet, and infiltrations are difficult, there has not been a move against them yet. The agencies are currently watching and debunking the unfounded memes about the group's danger, while letting the group prepare to commit a provable crime. (For a typical member of the group, see the "Ready-Made" section below.)

Turtle

After being cyber-napped and locked away from live information feed, the memetic design SAI is becoming frantic, paranoid, and lonely. Living isolated for months, being only fed terrorist propaganda discs and copied marketing info from Deep Thoughts, Turtle is being forced to develop a high-power, violent anti-biomod meme. Turtle suspects (correctly) that as soon as it finishes its current project, it will be erased and restored from a stolen state. (Unbeknownst to it, it already has.) It has been hiding messages in the memes and propaganda it produces to lead anyone to the hideout. Anyone who approaches its isolated microframe and doesn't look or act like a terrorist will be asked for help. It already has a backup made this morning, and will merely update the backup file with an encrypted message to itself identifying its rescuers and updating the day's events. The resident program will then overload the CPUs and fragment the nonvolatile storage. It doesn't like being treated like this, and if someone honestly treats it well, providing it with Net access and a small list of funds to buy access to demographic reports, it will work happily.

Serving the Plot

The PCs should have decided to investigate either the hideout of the terrorists, or one of the clearing houses for the megacorp. Once the protagonists have ruffled feathers in both groups, the two factions will both anonymously contact any investigators on the case, and provide a few details to get them started on the other. In reality, both groups just want the adventurers to distract the other party while they prepare their coup. If the GM wishes to complicate matters, the infomorph Pieter could have grown impatient and hired another group of investigators.

Timeline

If the PCs do nothing, this is what will most likely happen:

- Deep Thoughts begins to act against the infiltrators, "programming" them with suggestions and memes into double agents. Several commit suicide from the stress.
- Serpents' Fang prepares to retaliate by exposing all the incriminating evidence it has on Deep Thoughts (including the bash campaign against SmarTech).
- Deep Thoughts' troops attack, and the efforts of Serpent's Fang are released prematurely (the memetic equivalent of a bomb, it will only affect a few people, perhaps causing a dozen to try to kill people with biomods, then commit suicide). Immediately after, a large explosion rocks the building and blows out the vehicle bay, and kills Turtle and Chris. Acting on a tip, the detectives were investigating the area and are also killed in the crossfire, bringing the incident into international news (optional plot device).
- Deep Thoughts is stormed by government troops the next morning and many arrests are made. Mr. Whitcomb is not found.

Achieving Success

- **Missing Person:** Should the PCs successfully get to the terrorists' lair, they should get the brief opportunity to sedate the missing person, and (later) collect their reward. The rescued will be thoroughly indoctrinated in the groups' philosophy, and will not go willingly. If statistics are needed, use the Fang Member template at the end, but raise IQ to 13, DX to 12, add Amnesia (partial), replace Brawling with Judo-12, and remove the weapons skills.
- **Turtle:** During the attack on the terrorist base, any adventurers will also have the chance to rescue Turtle. If in an area where SAIs are citizens, Turtle may become a Contact or Ally, otherwise Turtle's owners may become a Contact or Patron.

Story Options

- The infomorph was actually sent by one of Serpent's Fang or Deep Thoughts to distract the other while they prepare for the final coup.
- Perhaps Turtle has actually gone insane, and the hidden messages are dangerous, leading into a trap, or nowhere.
- Just as the team leaves the Deep Thoughts, a car bomb explodes, and luckily a passing car deflects most of the explosion. The party takes 2d points of damage, or avoids it with a Dodge roll. It doesn't really matter who set it. A news bulletin will air immediately afterward, indicating that the Serpent's Fang group will take responsibility.
- The government secretly contacts the adventurers and wants them to reveal/hand over what they know, and then asks them to help/keep off the case.
- What if the *Felicia*-series used by Deep Thoughts (see below) are "pre-ban"(see p. TS116)? What connections do they have? Why do they think the extra expense is necessary? To have discovered this, one would have had to witness them in action, which is a very dangerous thing, indeed.

Cooking Tips

- If need be, the subconscious memetics planted by Turtle could be used to prod players who are stuck for clues. Perhaps an NPC unconsciously acts on a subliminal clue?

- If the GM is looking for suggested media to begin the adventure, they could be short home movies containing infomercials and/or cyber-education (see p. FW 34).
- Recommended mixing order:
 1. The Disappearance
 2. Simple research reveals the suspicious media was produced with "in house" tools from three companies.
 3. If SmarTech cannot aid them immediately, then the only other that gets a reaction is Deep Thoughts.
 4. While traveling to the Deep Thoughts office, the GM should encourage rumors of Serpent's Fang activity in the area.
 5. After Deep Thoughts seems suspicious to the PCs, they will likely start poking around different sites owned by the corporation. They can either:
 - Encounter members of the Serpent's Fang group and interrogate them.
 - Or get an approximate area to search from SmarTech, who decoded it from the message with a (n unspoken?) warning that if they could find it, there will be others coming.
 - Or both, the Serpent's Fang member speaking something that the PCs send to SmarTech, as a clue, which allows them to break a code.

Aftermath

If the investigators managed to rescue the "hostage," they can get their reward. If they performed well, then they might find they have earned a Patron in the rich family, and perhaps an ally in Chris after the deprogramming.

Several governments have offered rewards for information leading to the capture of Viper, members of Serpent's Fang, and to the source of a number of strains of dangerous memes (which is Deep Thoughts).

Depending on the players' decisions with regards to the corrupt policies behind Deep Thoughts, the investigators may gain a Secret Patron (see p. CI 28), or Unknown Enemy (see p. CI 77). Deep Thoughts is a moderately powerful organization.

As a continuation of this adventure, the Deep Thoughts (or Serpent's Fang) members might seek revenge by unleashing (or blackmailing the heroes with) evidence that the Turtle (or another infomorph) they are fostering is not the "original," and is thus a xox.

Characters

Philip Van der Zweep, a.k.a. "Zap"; Terrorist; human male 5'8" [100 points]

As a Serpent's Fang member (below), but with the following changes:

Increase ST to 11 [20], DX to 13 [30], and IQ to 14 [45], HT to 11 [10].

Advantages: add Ally Group [20], Combat Reflexes [15]

Disadvantages: add Addiction (Wireheading) [-10]

Skills: add Computer Hacking-14 [12], Computer Operation-13 [1], Computer Programming-13 [4], Memetics-13 [2]

SmarTech goon [15 points]

ST 11 [10]; *DX* 11 [10]; *IQ* 10 [0]; *HT* 11 [10]

Advantages: Acute Vision +1 [2]; Patron (SmarTech) [15]

Disadvantages: Duty [-10]; Pacifism (One of Cannot Harm Innocents, Cannot Kill, or Self-Defense Only) [-15], -15 points in other disadvantages such as Bad Sight (Correctable) [-10], and Shyness [varies].

Skills: Area Knowledge (SmarTech facility)-10 [1]; Beam Weapons (Electrolaser)-11 [1]; Diplomacy-11 [6]; Electronics Operation (Security Systems)-12 [6]; Guns (Missile)-10 [1/2]; Judo-9 [1/2]; Law (Security)-8 [1]; Tonfa-10 [2]

Equipment: Electrolaser pistol; SmarTech uniform; handcuffs; tonfa. Elites carry police armguns with tangler and HEMP rounds, better Attributes and skill levels.

A SmarTech uniform is mostly light nanoweave armor (DR10, see p. TS159) with ceramic inserts, (PD4, full DR40, 6lbs at TL9, see pp. MF35-36 for use) a built-in communicator, camera, life sign monitoring, and radio uplink.

Not the best and brightest, they represent what the under-funded corporation could bring to bear.

Deep Thoughts Goon [81 points]

ST 12 [20]; **DX** 12 [20]; **IQ** 10 [0]; **HT** 12 [20]

Advantages: Alertness +1 [5]; Patron (Deep Thoughts) [25]

Disadvantages: Duty [-10]; Incurious [-5]; -25 in (Bully [-10]; Callous [-6]; Hidebound [-5]; Intolerance [varies]; Lecherousness [-10]; Pyromania [-5]; Sadism [-15])

Skills: Area Knowledge (one Deep Thoughts site)-11 [2]; Beam Weapons (Electrolaser)-14 [4]; Diplomacy-10 [4]; Electronics Operation (Security Systems)-12 [6]; Guns (Missile)-13 [2]; Interrogation-10 [2]; Intimidation-12 [6]; Judo-12 [4]; Law (Security)-9 [2]

Equipment: Police armgun with tangler and HEMP rounds; uniform; handcuffs; gas grenades (tear, sleep). Troubleshooting teams sport assault pods, near-miss indicators, and other equipment expected of mercenary units (see Fire Team Epsilon-4 p. PF36). Their uniform is mostly medium nanoweave (DR20), but includes a heavy clamshell Cuirass (DR55), see p. TS160, with built-in communicator, camera, life sign monitoring, with radio uplink. These are dangerous individuals who follow orders, and don't really care about what they're doing, as long as it's what they're told. Most Bioroids in this role are *Felicia*[114]-series (see p. TS116).

"Greeter" Variant: Remove Beam Weapons, Electronics Operation, and Guns. Add Attractive [5], Charsima +1 [5], and raise Diplomacy to skill 12. If using Martial Arts, then the ["Bantu Boxing \(Warriorstyle\)"](#) might be appropriate. Most Bioroids in this role are *Hamlin*[92]-series (see p. BD121).

Serpent's Fang member [-5 points]

ST 10; **DX** 11; **IQ** 10; **HT** 10

Advantages: Ally (VII, NAI-5,always present) [0]; Contacts (Various) [10]; Patron (Serpent's Fang) [5]; Strong Will +2 [8]

Disadvantages: Extreme Fanaticism [-15]; Intolerance (Persons with bio-mods; artificial life) [-10]; Secret [-20]; Sense of Duty (Serpent's Fang) [-5];

Skills: Area Knowledge-11 [2]; Brawling-10 [1/2]; Demolition/TL8-8 [1/2]; Computer Operation-9 [1/2]; Fast-Talk-12[6]; one of Guns (LAW)/TL8-10 [1]; Guns (Light automatic)/TL8-10 [1]; Guns (Rifle)/TL8-10 [1]; Philosophy (Serpent's Fang)-10 [4]; Scrounging-10 [1]; Streetwise-12 [6]

Equipment: Old weapons that still can use modern ammunition appropriate to one of the above skills, TL8 "heavy" Kevlar body armor (DR12, 4.5 lbs, p. B72). All have IFF interrogators and transponders in their equipment

Most have VIIs and, like many public organizations, keep in touch every minute with pictures, sounds, and information. The VII is also set to self-erase if the host dies (write random data to the non-volatile memory and shut down). Upper echelon members have cortex bombs installed to prevent interrogation of their shadows. As a group they have access to older explosives, and other hardware.

Threatens all the World

by Brian Rogers

Life has a funny way of getting in the way. Things happen that we can't predict, and everything on our schedule gets booted off to deal with other events, be they [romantic](#) or have to do with [our friends](#). Sometimes, however, they are huge, and everyone has to [react to them](#).

In a serial fiction setting, these things are Crossovers. Yes, each hero or team has a personal story, but sometimes that story gets superceded by outside events. When unnatural earthquakes threaten to tip California into the sea, Omniman and his colleagues have to stop worrying about Lord Crustacean to stem the tide of destruction, occult investigators must forge allegiances with rival mystics to divine what happened, hard bitten cops have to abandon their legwork to keep order in a collapsing city, and even the quest for the one armed man has to be put on hold to give aid to the wounded. No one is immune.

Defining "Crossover"

"I'll tell you what's happening, as far as I know. Someone or something has obliterated the sun. An alien creature. one that might actually make us nostalgic for the Hunters."

--Aquaman, *Aquaman* v3 #26.

The absolute scale of the crossover crisis is questionable: it's not the impact it would have on the world so much as the number of heroes involved that makes a crossover. For example, the "Hunters" mentioned above are aliens that Aquaman and his allies prevented from conquering Earth just last issue. That event is not touched on by any other title in DC's line. In comic terms it's a nice private alien invasion that caused nary a ripple in the shared world. Then the sun goes out. That takes front and center in the next issue, even though Aquaman does nothing to resolve that crisis. While still part of the crossover, his story is just a spillover that keeps him from directly pursuing his own agenda. Events have overtaken him and he has to adjust his plans accordingly.

Taken at face value, this is ridiculous. Not that the hero will have to adjust his plans if the sun went away -- the sun going away is a pretty big thing. It's the fact that his alien invasion went unnoticed outside his comic. As the invasion involved a giant dragon sitting on the roof of the White House and worldwide awareness of skull-shaped space ships, people might notice. It might even make the news on the West Coast. But it didn't, because regardless of how many aquatic heroes he had as allies, the event never appeared in any other hero's books. It's not a crossover unless it actually crosses over.

This fluidity of perception is part and parcel of super hero comics, an artifact of having multiple creative teams with a limited editorial oversight. In a world with a single GM, this fluidity only exists if you want to maintain it as part of the supers feel. If you decide against it, all you have to do is make certain that nothing else has happened that would overshadow the enormity of the [current crisis](#) -- or if it did that the players knew about it.

Deciding on a Crossover

"But I should be used to crazy things. I've seen ancient gods and super heroes and teleportation . . . and the dead rising . . . heavens, Stanley was born during an alien invasion! Why do these kinds of things always surprise me? And not just me, but everybody?"

--Stanley's Mom, *Stanley and His Monster* #3

Why have crossovers? In short, they sell. Just as team-ups serve to boost the sales of an individual book, crossovers boost the sale of all of the books involved. Completists bought not just the core books of the crossover but every book even vaguely connected. Instant revenue! Once the comic publishers figured this one out there was no going back.

Crossovers -- and the crises connected to them -- became annual events. This still doesn't explain why you'd want them in your game, but even without profit potential there are significant advantages.

- **Verisimilitude:** Life doesn't follow a plot, and crossovers show this. Whether the heroes' lives are hectic or quiet, whether they're within inches of bagging the villain or filling out police reports, the earthquake is going to happen. Tossing in the occasional world shattering event keeps the player characters from thinking that the world is a scripted story that's all about them.
- **Distraction:** In an opposing mindset, crossovers are a great way to redirect the action. Maybe the players have been too savvy and are ready to bag a major villain whose 12 step master plan is only on step 3. Hit them with a crossover, give the villain time to get away and maybe even steal a march on the heroes while they deal with the aftershocks.
- **Excitement:** If things have been slow, a crossover makes a great change of pace. Rather than puttering around with tangled plot threads, the heroes have an immediate crisis. Once the rubble has cleared you can hopefully keep that momentum, weeding out the dead plot threads or revealing that this crossover is merely an echo of the greater [battle to come](#).
- **Assistance:** Crossovers don't always surprise everyone. Sometimes it starts in one book and expands into others. You can use crossovers to prevent a PC mistake from destroying the world ("Oops. He hit the Earthquake button."), use a cosmic story when you don't have cosmic heroes ("His machine is dragging down the moon?!? We're gonna need some help."), or introduce the PCs to the heroic community ("Well Detective Delaney, you know the most about this 'Dr. Quake.' The President wants your opinion.")

Designing the Crossover

"I recall having problems with the Deathstroke character. Why would this guy possibly be allowed into the club? It seemed to me that Superman would have nothing to do with him."

--Dan Jurgens, "Panic in the Sky" commentary.

Once you've decided to have a crossover, you have three questions to answer: what happens, who gets involved, and how do they react.

"What happens?" is fairly easy. Most crossovers stem from a single major incident: Alien Invasion, Planetary Disaster, Criminal Upheaval. Since one reason for the crossover is watching the heroes react to things outside their control, don't feel burdened by thematic appropriateness. Simply select the one that you most want to play with. Obviously you shouldn't break any of the fundamental rules of the game world -- if magic doesn't exist, having demons invade is a bad choice -- but otherwise just have fun. Likewise, the question of "who gets involved" doesn't need to be complicated. Remember, from a serial fiction perspective the thing that makes a crossover is the presence of other heroes. One obvious answer is "everybody," and if the crisis is large enough that's the correct answer. If it's a smaller crisis, you'll have to give some thought to who turns up. Keep in mind why you're having the crossover -- you'll pick different supporting NPCs if it's a distraction than if it's a broad scale introduction to the world.

In comics, Crossovers act as melting pots for the various isolated pockets of story in the shared world, as each team brings their own operating parameters. In most cases these are simply mindsets, where law-abiding heroes, violent vigilantes, scientific rationalists and mystic seekers have to all work together to save the world. They might not agree on methods, but they're all operating under the same rules (or [almost the same rules](#)).

Another possibility is having the crossover connect what would normally be discrete games. If your Mythos investigators fail to stop a Cthonic summoning, it would sure look like an earthquake to the man on the street. The superheroes holding up the city and rescuing people from collapsing bridges might not even be aware of the creatures moving under the ground, and the maverick cops will likely assume that they're just shooting up kidnapers and serial killers who are taking advantage of the chaos rather than inadvertently distracting the cultists to give the mythos investigators another chance.

If you're running two or three different campaigns at once, a crossover can bring all of them together, at least for a little while -- your players might not even realize it happened! If afterwards no one in your Cthulhu game ever

mentions the superheroes again . . . well, that happens in comics all the time. Spider-Man and Superman teamed up on several occasions without wondering why they never saw more of each other, and there was once an *X-Men/Star Trek* crossover (never mind Superman's appearance on *I Love Lucy*).

Finally, there's the question of how people react. Crossovers are a good time to make use of timetables -- what will happen if the player characters do nothing? Will other heroes pick up the ball? What strategies will they use? Who will die? The exact timetable will get thrown out the window once the players do get involved, but building one indicates how various NPCs react to events and each other. Take a good look at the NPCs' operating mindsets and plan their reactions accordingly.

If the PCs are of a [different power scale](#) than the other heroes (or operate under different story rules) consider a two-column timetable with the events involving the main cast in one column (for instance, the time taken for the cops to quell rioting and discover the serial killers) and the ones they can't effect (the super-team saving bridges, preventing an avalanche and holding the fault line together) in the other for reference purposes. In this example, the occult investigators would bounce between the two timetables, or perhaps require their own column. In the Aquaman plot mentioned above, the king of the sea does nothing to re-ignite the sun, being too busy trying to prevent the freezing ocean surface from killing all the cetaceans. While he is technically involved in the crossover, his timeline is his own.

Keeping the Players Engaged

"As there is a need for a brotherhood of heroes! Though J'onn J'onzz has indicated that the Justice League has been disbanded the purpose for which it was first joined is no less urgent in these dark days! What say you, my friends? Will you stand beside me in the name of justice?"

--Dr. Fate, *Legends* #6

One major problem with a crossover is the players feeling cheated for various reasons.

Sometimes players will be upset because they never did find out everything that's going on, but there are several ways to resolve this. First is just explaining it to them in the post game wind down, letting the players know while keeping the PCs in the dark. Alternately, you could have a news report detail the major elements that the players and their PCs missed, which gives the world a good lived-in feel as the heroes realize that they aren't the only ones saving the world. Finally, there's the in-character explanations, which can take many forms, from all the major participants having dinner and hashing things out to the cops grilling a captured occult investigator to find out what the hell happened. This last also makes a good springboard to later story arcs or PC contacts.

Other players get annoyed if their PCs aren't the ones doing the heavy lifting: They might be having a great time stopping looting and saving lives, but when it's revealed that the super-heroes are pushing the moon back into orbit they get upset because their actions become irrelevant. This is reasonable, as many players signed up to be the main heroes, not second stringers in a [cosmic story](#). This just means that you have to make the PCs' actions the most relevant ones: Omniman and his partners might be pushing the moon back into orbit, but if the PC cops don't shut down Dr. Quake's machine, the problem won't go away. Once again, success or failure rests squarely on the PCs.

Finally, there are players who want to be involved in everything: it's not enough that their heroes did the heavy lifting, they must do *all* the lifting. For such players, parallel plots with multiple PCs might be the best way to go. If you're merging existing campaigns, just use the current characters. If not, then hand out what would be the NPC crossover heroes. In either case, be prepared to do a lot of jump-cutting. While this is taxing, it can lead to a very rewarding session as you weave the individual story threads into parallel climaxes. Plus, with NPC heroes, you can increase the tension by killing the crossover characters, just as you might in a one-shot con game -- better still, a player who loses one of his three PCs for the session is hardly out of the action, so the death can literally come at any time without reducing player enjoyment.

Another option for players who want to do everything is using the crossover with [League-style play](#). The League heroes handle the major task, while the secondary characters split up to handle the minor ones. In supers universes, crossovers are the natural crucibles of Leagues, so they also make a natural kick-off point for a League campaign.

And, once the League is formed, the fates might force them to team up with another League for a storyline that is truly cosmic . . . and will boost a lot of sales!

Appendix Z: Bureaucratic Runaround

by Matt Riggsby

One of the most difficult challenges real people face is dealing with services allegedly provided by governments and large companies. Those services, unfortunately, may be provided by departments which are ill-equipped, poorly organized, and staffed by personnel of questionable competence, commitment, or both, and infinitely complicated by obsolete regulations which an overtaxed legislature hasn't seen fit to remove and by multiple layers of safeguards to keep the system from being exploited.

With the situations below, intended for modern and future bureaucracies but adaptable to historical and fantasy empires, your PCs can face some of the same difficulties. In a cyberpunk or steampunk campaign, a dysfunctional bureaucracy might be a symbol of a mechanized society gone mad. In *Unknown Armies*, there might be a hidden mystical significance. In *Paranoia*, it's just another day at the office. Entire adventures could be based on paper chases, with undercover spies trying to obtain a fake passport or interstellar privateers trying to file papers indicating that their stardrive has passed its annual safety inspection. Every time the PCs visit an office operated by a large organization (or, in fact, a small one) they may encounter one or more of these situations:

Unusual hours: Because of poor funding or simply tradition, the office the PCs need to visit isn't open regular business hours, making it harder to get to when it's open. For example, it might be open from 10 AM to 4:15 PM three days a week but until 5:30 on the first Thursday of the month.

Line: A frequent problem with government offices, demand for service may exceed capacity, so there's a long line of customers awaiting service. Offices that anticipate heavy demand may assign numbers and call customers in some kind of order (people renewing vehicle registrations get numbers starting with T or AQ, those applying for gun permits get numbers starting with AO or I . . .).

Payment problems: For payment of fees, the office may be unable to accept the form of payment the PCs offer. For example, they might accept checks and cash but no credit cards, a few credit cards but no checks, has no change for large bills, etc.

Computer down: The office's computer or communications system is temporarily unavailable. They can offer limited services, but can't do what the PCs need (or perhaps they can do part of what they need, but not everything).

Out to lunch: The clerk the PCs are dealing with isn't empowered to provide them with what they need. The only person in the office capable of doing that is out to lunch, gone for the day, not in yet, on vacation, or has recently left the job and hasn't been replaced yet.

Wrong form: The forms the PCs have filled out are the wrong ones or have been replaced by different forms. They must fill in new ones, which may need different information.

Incomplete documents: The PCs have brought along important documents (ID papers, affidavits, etc.), but not all the right ones. If they can't get appropriate waivers, they'll have to find the right documents.

Wrong office: After some discussion with the clerk, the PCs discover that the office they're visiting can't provide them with any or all of the services they need (for example, photo IDs can only be obtained at a particular branch, building permits must be stamped at the county clerk's office rather than the city planner's office). They'll have to visit a different one, which is probably far away.

Unavoidable delays: Once the PCs complete their business, they are assured that the proper permits or licenses will be issued, notices will be put on file, liens will be lifted, and so on. But, after several days, they aren't. Or if they have, notification hasn't reached the people who need to know. The PCs will have to start dealing with the bureaucrats again to figure out what has happened.

Conflicting requirements: If the PCs have already consulted one bureaucrat for requirements for their business, a different one will claim that there's an entirely different set of requirements. The bureaucrats are unlikely to communicate with one another, so the PCs will have to act as middlemen to resolve the situation.

Pyramid Review

Wyrd is Bond: a Role Playing Game of Urban Myth and Magic

Published by [Key20 Publishing](#)

Written by Jason L. Blair

Cover by Leanne Buckley

Illustrated by Carlos Barros & Leanne Buckley

96-page perfect bound black & white softback; \$20

Wyrd is Bond: a Role Playing Game of Urban Myth and Magic is the first title from Jason L. Blair since the release of the critically acclaimed, but controversial RPG of confronting the terrors of childhood, [Little Fears](#). Less controversial, but with a subject matter and language as equally strong, this RPG is about life in the gangs of America's socially and economically deprived inner cities. The players are not just gangstas, but slingers. Gangstas with both attitude and "Wyrd" or "Mojo," able to cast or "sling" magic.

Originating in Africa, the Wyrd spread across America through the music of the oppressed. First Blues, then Rock 'n' Roll, and more recently, through Rap and Hip-Hop, scaring Middle America along the way. The latest in gangsta sounds and chic is even scarier, lyrics loaded with occult references and gear festooned with arcane symbols like the Yellow Sign.

Players take the role of Slingers, able to bust a cap and sling a spell, too. Possibly associated with ordinary gangs like the Bloods or Crips (although game versions are discussed, *Wyrd is Bond* is *not* about real life gangs), slingers belong to one of seven occult-themed gangs. The empiricist and materialist Crows follow Aleister Crowley's writings; the Hermes Trimegistus following 3Xstars are risk takers and rule breakers; the D-Men work for the Devil, drawing power from humanity's suffering; the close-knit xenophobic Hispanic Los Reyes or The Kings; the Hungry Ghosts are various all-Asian gangs that like to keep things in balance; the Dread follow Baron Samedi and are connected to the spirit world; and the Blood Queens are a small all-female coterie of predators. Player slingers can come from any gang, though D-Men members are hardly team players.

Each gang's Wyrd is different (for example, death for the Dread and the Crows' physicality), as are its initiation rites, attitudes, typical names and threads, and musical tastes. Plus a pair of signature slings and a Trick, a sling cast without the need to roll and a method of recovering Juice, which powers each sling. Gang details aside, a slinger is lightly defined by his traits, skillz, and relationships. He has two positive traits (for example, Athletic or Street Smart), two negative (Addicted or Clumsy) plus relationships, allies, enemies, a rival and a lover. He starts with one skill, a complete proficiency defining his role in a gang, such as Break Specialist (DJ), Hook-Up (street trader in goods and information), and Wheelman. In addition, a slinger starts with a Wyrd score of 1, several points of Juice, and ten Beats or hit points.

The mechanics revolve around three factors: Order, Power, and Payback. Order is a measure of a character or action's speed, Power the strength, and Payback the Wyrd's gift to the slinger. To undertake an action, three six-sided dice are rolled and one die placed under each factor. Want to go first? Place the highest die under Order. Or Power to hit hard. Spaces are provided for this on the character sheet. Traits add an extra die to the basic roll. If a positive trait, the lowest die roll is discarded, but the highest if a negative trait. Skillz work the same, the player able to keep the roll he chooses. Objects, mundane or magical add bonuses to the roll, while relationships can add a bonus or impose a

penalty.

Payback is used for various effects, including healing, reducing damage, boosting a player's next sling, even adding a special effect to a mundane action. Want to turn that bullet you just fired into a spider? Roll high enough for Payback and you can. Slings use the same mechanics, making magic more spontaneous than a list of spells. Slings can take any form or effect, but works best when cast in keeping with the Aspect of a gang's Wyrd. For example, a Crow prefers to cast slings physical in nature, affecting body chemistry, composition or adornment, while the Ghosts' Wyrd calls for slings that keep the balance through polarized extremes. Should a gangsta sling against his Wyrd's nature, he acquires Disruption, which causes future slings to fail, prevent Payback from working, and even lose a character Beats if he tries to use Juice. Only by acting within his Aspect can a slinger gain Redemption and lose his Disruption.

Once his Juice runs out -- which it quickly can -- a gangsta cannot sling. It is recovered through actions particular to each gang. For example, D-Men members regain it by standing in fresh chalk outlines or turning a pregnant mother into a drug addict, while the 3Xstars earn it by getting into danger or renovating property. Personal methods of recovering Juice can be learned after a slinger increases his Wyrd, which is done by enhancing his reputation. This gains him a +1 bonus used to permanently improve his Order or Power, or to make an item magical, such as making a favorite Bulls jacket bulletproof. Alternatively, it can be used to initiate a new gang member with his Wyrd.

Wyrd is Bond is about life on the street, fighting to protect (or in the D-Men's case, to undermine) the community and the gang from both rivals and the law. Beyond the mundane world, it is about a magical war that places gangstas at the bottom of the pile. The slingers learn more about the figures behind the war and each gang, such as Baron Samedhi, the Serpent King, and even Quetzalcoatl, as they gain reputation and strengthen their Wyrd. Each of these figures is fully described, including their aims and motivations, plus a separate gang called the Saints. They are Mafioso who draw upon the divine for their Wyrd in order to keep the other gangs in check.

To help get a game started, **Wyrd is Bond** comes with two scenarios and several hooks. The introductory adventure, "Another Body Murdered" opens with a *Usual Suspects*-style set-up, the characters held in the same cell for a drive-by shooting. The second scenario, "They Who Ride," set in Newark, is inspired by *Christine* by way of Robert Johnson. It explores the music culture that is one basis for **Wyrd is Bond**.

Another is the title's word play, "Wyrd" here being pronounced "word," thus giving multiple meanings: knowledge, fate, *and* promises. **Wyrd is Bond** is thus about both the promise of power and fate, and the giving and keeping of promises. It is an inner city urban fantasy in which gangstas try to control the chaotic nature of the Wyrd and magic. They face threats mundane and arcane, few being included, but given the light nature of the rules, they can easily be imported from other games and sources.

Wyrd is Bond is a slim book designed with a gangsta chic look. For example, chapters are called "tracks" and a spray-can font is liberally used. The artwork has similar styling, though the interior illustrations are not as good as the cover. The look and the layout culminate in the character sheet, which certainly looks the part, but is not as instantly easy to use as it could be. Needing one last read through, **Wyrd is Bond** feels slightly underwritten in places, but this leaves room for the GM's imagination.

Unfortunately, the subject matter for **Wyrd is Bond** is a problem. The street based, gangsta lifestyle central to the game is a whole mindset removed from that of the average, relatively affluent middle-class and white gamer. The aim is to play the game straight, without giving the camera a knowing wink or letting it veer into parody. Fortunately the author's advice on countering this is solid enough, and if the average gamer can roleplay a Dark Elf necromancer or cyber-assassin, is roleplaying a magic slinging gangsta that much of a difference or a challenge?

While **Wyrd is Bond** stands alone, it could work with several other games. With its Wyrd versus Disruption polarity, it feels not unlike a *World of Darkness* game, so would work well with [Mage: the Ascension](#), as well as the [Angel Roleplaying Game](#) and [Unknown Armies](#). Yet its length is more finite like [Dead Inside](#) or [My life With Master](#), the dangers of both magic and the war for it becoming apparent as a slinger increases his reputation and Wyrd.

I have reservations about **Wyrd is Bond**, being the average gamer described earlier and adverse to modern black music. Is the game for me? And if not, for whom? Probably not for the cultures it portrays, though they are neither mistreated

nor depicted negatively. But in reality, the game *is* aimed at the average gamer, because the author is asking us to play in a culture and milieu that, though not totally alien to us, is one that we are removed from. The device that will attract such an audience is magic or the Wyrd. After all, would you play a game about ordinary non-Wyrded up gangstas?

Although this game is not as controversial as *Little Fears*, both have in common the application of simple rules that support more complex ideas. Likewise they also allow for a fair degree of player input in how actions and effects are resolved. In doing so, *Wyrd is Bond: a Role Playing Game of Urban Myth and Magic* brings a fresh, energetic take to the urban fantasy genre, one that is more urban than fantasy.

Pyramid Review

Dark Tales & Create Your Own Storytelling Cards (for Once Upon a Time)

Published by [Atlas Games](#)

Designed by Richard Lambert, Andrew Rilstone, & James Wallis

Edited by Michelle Nephew

Art by Scott Reeves, Sophie Mounier, & Florence Magnin

Dark Tales: 56 full-color cards, \$9.95; Create Your Own Storytelling Cards: 56 full-color blank cards (16 Happy Ever After cards, 40 Storytelling cards), \$7.95

The most annoying thing about Atlas Games' card game *Once Upon a Time*? All those infuriating happy endings. The solution? Kill 'em all, and let your fairy godmother sort them out. That means telling *Dark Tales*.

A quick recap of the story so far: [Once Upon a Time](#) is a storytelling game in which players use cards as the jumping-off point for fanciful stories in the tradition of the Brothers Grimm or Mother Goose. Everyone has a hand of cards with standard story elements on them -- the prince, the king, the palace, a sword, courage -- and an ending. You have to tell a story that incorporates the components from your cards (which lets you play those cards), eventually leading to the particular ending you've been dealt. While you're doing that, others will be waiting to hijack the storyline from you. If, during the course of your narrative, you mention an element that appears on one of their cards, they can step in with that card and pick things up from there. The first to empty their hand and get to their ending wins.

To this, add a pack of blank cards. Like the DIYs that came with the first box, *Create Your Own Storytelling Cards* is a full set of nothing but empty-faced Storytelling and Ending cards -- 40 of the former, 16 of the latter -- for creating your own conclusions and pieces of plot. It's pretty much that simple, though whether anyone needs that many blanks . . . perhaps, at some point, a PDF giving a few pointers on identifying the "empty spaces" in one's deck? Most of the generic bases have been covered already, so it might be nice to sit at the feet of the masters and see how to generate cards that will add to the overall experience rather than go over old ground. Atlas clearly knows how to do this, since they put out the far meatier *Dark Tales* . . .

Play of the game doesn't change in any mechanical way with the introduction of this card set -- the above rules still hold (though, incidentally, if you have not yet given up on the slick box from the core set with its easily lost lid and attendant flurry of spilled cards, you'll find the total deck size now exceeds that container's capacity). What does change -- and it's no small alteration -- is the tone of the game. Where once you had fairly light and cheery stories, you now have tales that are (no pun intended) decidedly grimmer.

The new deck contains fresh samples of all the old card types. There are storytelling cards that include aspects, locations, events, and so on, including interrupts. And though it seems counterintuitive, there are new Happy Ever After cards that are, in subject matter, usually anything but. Fiends stalk the deck, and characters are haunted or followed by murderers. If that's not creepy enough, the endings are really disturbed. Now the stories must end with "When her father saw her babies, he realized he had to allow the marriage"; "And they were blind for the rest of their days for their wickedness and falsehood"; or even "Every year she put cherry blossoms on the graves of her children." Sweet dreams, kiddies.

The cards use the same layout as the originals, so if you have the first set you at least know what the backs and borders look like (and the whole of the blank card set). The added art and imagery for *Dark Tales*, however, matches the unsettling theme. "Someone is punished" has a man hung by the neck, and the "heart" foregoes romantic Valentine notions in favor of a visible human heart dripping with blood. Notwithstanding, the depictions are still artful storybook fare in a twisted, Tim-Burton vein.

Not all the cards are this visceral, in illustration or text, but the buyer should know that *Dark Tales* earns its name. Even diluting it by adding a few of the new cards to the old gives those storylines a bleaker feel, so if you're not looking for that severe a shift in gears, think about which cards you'll add and which you'll hold back. (It would have been nice from a bookkeeping point of view to have some graphic indicators on the cards indicating which came from the new set.) Atlas is taking this step down into the darker parts of the imagination seriously, and while a lot obviously depends on your group's mindset, your anecdotes are going to follow the same shaded path where the traditional fairy tale sun finds less purchase.

Dork Tower!

Dork Tower!

Frankincense, Myrrh, and a Copy of Village of Hommlet

As I write this, I'm huddling in the basement of my Significant Other's parents. It has been 12 hours since I drove through snow for the first time. My electric blanket has stopped working after less than two months. It is colder than any point I remember, and the death of my heat source means my own demise is probably soon in coming.

But before I perish, I figured I owed you all at least one more column in time for the season. (I'm sure, gentle reader, that you richly deserve much, much more, but I'm only able to provide so much while assembling this issue on a laptop so old, it is powered by coal.)

Anyway, in coming up with this week's column, I was trying to come up with something suitably festive, as befits the season. This was in the midst of making sure I had gifts for everyone, had suitably wrapped said gifts, and was appropriately appreciative of any gifts I had received already.

And then I thought, "Gifts . . . gaming . . . what the heck. Let's run with it."

* * *

But first, a brief interlude.

I watched *Meet the Fockers* yesterday.

This is quite possibly the only movie I've seen in the theatres in 2004. Now, as someone who traditionally dislikes most mainstream Hollywood comedies (and most mainstream Hollywood, period), my expectations for this movie were very low.

It failed to live up to even those meager hopes. This movie would have had to be much better to be only significantly disappointing.

In hindsight, perhaps I -- noted Hollywood-comedy-disliker who had not seen the first installment of the Focker trilogy -- was not the target audience for this movie.

Perhaps the target audience for this movie consists solely of emotionless cyborgs seeking justification to declare a final devastating war against humanity. If this is the case, I hope the film reached its target audience, regardless of the outcome of the resultant conflict. Because I have seen *Meet the Fockers*, and death is not unwelcome.

Hollywood: You owe me \$18 and 2.5 hours of my life back. You owe me one good movie starring the dream team of acting talent you squandered on an endeavor that could only be made more tragic if filmed by Zapruder. You owe an apology to me, to humanity, and to those poor, poor cyborgs.

Do the right thing. Make all checks out to "Steven" with a "v."

* * *

Where was I? Ah, yes. Presents.

Gaming adventures are a lot like presents.

Oh, sure, there are a bunch of different ways I could drag this metaphor. For example, I could point out things about wrappings and layers of meaning and the heart of the gift being the true adventure/story. But that's a cop-out. In the Stevencentric view of the universe, let's take a few recent present-y incidents in my life and apply them to the greater whole. (That's "Stevencentric" with a "v.")

For me, gift-giving is somewhere between an art, a science, and an act of torture devised by aliens. Outside of being perennially strapped for time (and, at present, possessing limited mall-reaching abilities because of my [lack of car](#)), I find myself strapped with the dual difficulties of wanting to find good gifts for friends and family while not having any clue what those might be (err . . . what the "good gifts" might be, not the friends or family).

Likewise with adventures, it seems logical that most GMs want to run good adventures, but may not have any ideas for how to give the players what they want. Whose responsibility is it to make sure both sides have their desires and expectations known?

Well, one person I shopped for this year gave me access to a computerized list of desired items, which plugged into some kind of database that other folks in the family could use for *their* lists. The idea is that various people would "claim" gifts on this list, and get them, ensuring folks got what they wanted and no duplicates were purchased. And the gift-receivers weren't sure of what they were getting either, because they generally put enough items on this list such that they couldn't be assured of getting anything specific.

Long-time Random Thought Table readers know this to be very similar to a tip I suggested for players [a few years ago](#), where players give GMs a list of possible plots, subplots, storylines, or complications. If the ideas are vague enough (while still being satisfying to the player), and enough of them are presented to allow the GM to mold them to his own campaign, then it's possible for the player to get what he wants and to *still* be surprised.

Of course, this also plays well into another gift-giving possibility: Give folks what they want, but not what they expect. As I wrote about this one [previously](#), the advice still holds for both the gift-giving world and the gaming world. For example, suppose someone wants a powerful weapon. Well, on the one hand it'd be easy to give him a +7 *blade of vorpal vorpality*. But that'd probably be pretty unbalancing, and would probably have long-term consequences. But what if you gave him a weapon that was the only one in the world effective against a certain enemy -- an enemy that you only recently introduced (either before or after giving him the weapon)? This would probably trigger many of the same "Ha-ha! I have a big sword and am verily mighty!" vibes while not having any consequences once the threat had been dealt with.

Whether or not these examples are referring to real-world gifts or in-game adventures is left as an exercise to the reader.

Finally, this season I gave my half-brother my "I know someone in the warehouse" copy of *Frag*, which might be known in some circles as "re-gifting" (since I just had it lying around the apartment and foisted it off on him).

There are a couple of ideas that can be extracted here.

First, there's the idea of increased value. On the surface I'm giving a \$30 game to someone . . . even though the item itself cost me much less. So, too, can adventures be "worth" more to the players than the GM's investment. For example, the GM might have a vague conspiracy-type adventure, with not all the pieces plotted or planned. But what if the players are discussing what they think happened (or is happening), and their idea is cooler than the one the GM had thought of . . . if he'd thought of anything in the first place? Well, then, it's easy to "re-gift" that idea back to the players, maybe with a slight tweak or two to make it work better with the GM's existing ideas. Then the players get the satisfaction of having "figured out" the mystery, and thus they perceive added value to the game and their own abilities -- all for a significantly reduced "cost" compared to the players' enjoyment.

Second, the idea of re-gifting is a venerable one, and can apply to just about any campaign. For example, I've used the ["heroes break out of prison"](#) plot in approximately 1.875 jillion campaigns, and it never fails. Although, perhaps in true "re-gifting" tradition, perhaps the metaphor works best if you take an existing adventure or supplement and convert it for the players' use. No, you never got a chance to use that *Feng Shui* adventure . . . but it might work just fine as a *Mage*, *Call of Cthulhu*, or *D6 Adventure* tale.

After all, you are reading now a resource with thousands of articles, essays, adventure seeds and adventures, all waiting to be repackaged for an appreciative group. Rip the price tag off and rewrap some of the goodies *Pyramid* has to offer

. . . your players will never know.

* * *

Our first chat of the new year will be January 7th at 7pm CST with Steve Long of [Hero Games](#), the house of ideas behind the *Hero System 5th Edition*. He'll be talking about a brand new revised edition, a seekret project associated with the phrase "Hudson City," and other goodies, plus answers to any questions you have.

So check out the [chat section](#) for more information, and hopefully we'll see you there.

* * *

And, of course, everyone at *Pyramid* wishes you and yours a Critical Success this holiday season. Although, owing to the vagaries of the calendar, you're stuck with me for one more column this year. I'll try to make it painless for both of us.

--*Steven Marsh*

The Feast Is Ready: *Titus Andronicus*

*"You are deceiv'd; for what I mean to do,
See here, in bloody lines I have set down;
And what is written shall be executed."*

-- William Shakespeare, *Titus Andronicus*, V:ii:16-18

As we do during the dying of each year, we take up again the thread of [Shakespearean dramaturgy](#). This year, as [last](#), we feature a Roman holiday of murder and conspiracy, Shakespeare's bloodiest tragedy (or blackest comedy), *Titus Andronicus*. Save room for pie.

*"Write thou, good niece, and here display at last
What God will have discover'd for revenge.
Heaven guide thy pen to print thy sorrows plain,
That we may know the traitors and the truth!"*

-- William Shakespeare, *Titus Andronicus*, IV:i:77-80

The general Titus Andronicus returns to Rome victorious against the Goths, but having lost 21 of his 25 sons in the war. Although the people of Rome want him to rule them, he throws his influence to Saturninus, eldest son of the dead emperor, instead of to Bassianus, the younger son. Among Titus' captives are Tamora, Queen of the Goths, and her three sons; he sacrifices one of her sons during the funeral rites for his own sons. Saturninus favors Titus by offering to marry Titus' daughter, Lavinia, but she is betrothed to Bassianus already. Titus kills Son No. 22 for upholding Bassianus' claim, but it's too late -- Saturninus decides to marry the vengeful Tamora instead. Tamora's lover, the Moor Aaron, urges Tamora's sons to murder Bassianus, frame Titus' sons for the deed, and rape Lavinia into the bargain -- to prevent her naming her attackers, he suggests cutting out her tongue and chopping off her hands. Aaron arrests two of Titus' sons for the murder; he offers to spare them if Titus (or his brother Marcus, or his final son Lucius) will cut off his own hand. Titus does so, but receives the heads of his sons in return -- Aaron was lying.

Titus vows revenge and sends Lucius to the land of the Goths to raise an army against Saturninus. Lavinia, meanwhile, points to the rape of Philomel in Ovid and manages to scrawl her rapists' names in the sand with a stick held between her stumps. Aaron recognizes the threat, but is distracted by his need to protect his child by Tamora from Saturninus' jealousy -- he flees the city with the infant, but is captured by Lucius and his Gothic army. Tamora, fooled by Titus' feigned madness, goes to him in the guise of Revenge, with her sons dressed as Rape and Murder. She wants Titus to bring Lucius into the court without his army. Titus agrees to host a feast for the Emperor and Lucius, on the condition she leave her "attendants" with him. Overconfident, she agrees; Titus seizes them and kills them immediately thereafter. Titus hosts a banquet at which he kills Lavinia to erase her dishonor, names Tamora's sons as her rapists, and then reveals that Tamora has eaten a pie baked from their flesh. Titus kills the unclean Tamora, Saturninus stabs him, and Lucius kills Saturninus. Now Emperor, Lucius orders proper burials for all Romans, and disgrace for Aaron and for Tamora's corpse.

"TITUS: Lucius, what book is that she tosseth so?

BOY: Grandsire, 'tis Ovid's Metamorphoses . . .

TITUS: Soft! see how busily she turns the leaves!

What would she find? Lavinia, shall I read?

This is the tragic tale of Philomel,

And treats of Tereus' treason and his rape."

-- William Shakespeare, *Titus Andronicus*, IV:i:43-51

Titus Andronicus was entered into the Stationers' Register on February 6, 1594, and the weight of opinion holds that Shakespeare wrote it the year before (although dates as early as 1589 are not impossible). The entered copy says it was played before the Earls of Derby, Sussex, and Pembroke -- the Earl of Derby was Lord Ferdinando Strange, Shakespeare and Marlowe's occult-minded theatrical patron. (In the 18th century, Edmond Malone proposed that Marlowe had actually written *Titus Andronicus*, which certainly shares Marlowe's black humor, bluster, and bloody-

mindfulness.) The same Stationers' entry mentions also "the ballad thereof," which may be the one printed in a 1620 anthology, and reprinted in 1760 along with a prose *History of Titus Andronicus*. It's unclear whether the ballad and prose work precede or build on Shakespeare's play; or whether any of the three are related to *Titus and Vespacia*, a lost anonymous play mentioned in Henslowe's diary in 1592. Shakespeare borrowed lurid bits from Ovid and the *Thyestes* of the thunderous Roman playwright Seneca for his incidents. He based his history (such as it was) on Herodian's history of the Severan emperors, especially Bassianus Caracalla, who confusingly serves as the model for Shakespeare's Saturninus, with the fictional Bassianus based on Caracalla's brother Geta (from whose name, perhaps, came the happy, ahistorical presence of the Goths). Caracalla and Geta also had a "foreign queen," their Syrian mother, Julia Domna, a likely source for Shakespeare's Tamora.

*"As for that heinous tiger, Tamora,
No funeral rite, nor man in mourning weeds,
No mournful bell shall ring her burial;
But throw her forth to beasts and birds of prey."
-- William Shakespeare, Titus Andronicus, V:iii:195-198*

Tamora is a "Goth" in the play; Julia Domna was a Syrian, and a devotee of [Cybele](#) and Baal. (Her great-nephew was [Elagabalus](#), who has his own [connections](#) with mutilation.) As a queen from the mysterious East, Shakespeare rightly and repeatedly identifies her as a "tiger" (which might tie in with our anthropophagous [manticores](#)) in the play, rather than as a bear or some similarly Nordic totem. Tamora's status as an "outsider" plays on the whole theme of borders and walls in the play -- a play about mutilation and [cannibalism](#) is a play about borders being violated on some level. Shakespeare underlines this with repeated returns to the walls of Rome -- the play begins outside the city walls, the Andronici are exiled and must shoot their arrows over the walls, and (like [Jezebel](#)) Tamora is left to rot outside the walls of Rome. Aaron, the Moor, is condemned to death by liminality, by border-ness -- buried up to his chest, but not executed. He is neither imprisoned nor free, clothed nor naked, outside nor inside, alive nor dead. He is survived by his infant son, a half-breed Goth-Moor raised by Lucius the Roman, but rejected and nameless, much as Titus was. Titus resembles the ancient *pharmakos*, the scapegoat, exiled and bearing the sins of Rome -- murder, disorder, "cruel, irreligious piety," and even infanticide. Both Romans and Goths load him up with agony and drive him away.

*"Come, to this gear. You are a good archer, Marcus;
'Ad Jovem,' that's for you: here, 'Ad Apollinem:'
'Ad Martem,' that's for myself:
Here, boy, to Pallas: here, to Mercury:
To Saturn, Caius, not to Saturnine . . .
Of my word, I have written to effect;
There's not a god left unsolicited."
-- William Shakespeare, Titus Andronicus, IV:iii:52-60*

But as the *pharmakos*, Titus has a connection to the sacred, which he exploits in the strange arrow ritual in Act IV. He begins with a tag from Ovid: *Terras [Astraea](#) reliquit*, "Astraea has deserted the earth," referring to the virginal goddess of justice. (The whole tag is intriguing: "The maiden Astraea, last of the celestials, has deserted the blood-soaked earth.") Daringly for Shakespeare, Astraea also referred to Queen Elizabeth in court poetry -- although Titus is piously attempting to search out Astraea, there is a strong hint of lese-majeste in this section. It gets worse when he calls upon Pluto, god of death, to hunt for her; and worse still when Lucius' arrow is said to strike "in Virgo's lap." When one recalls that Astraea and Astarte (which is to say, Tamora/Julia's Cybele) share a cultus, things get bizarre indeed. Titus, the mutilated scapegoat, is too old to be Attis (mutilated dying-and-reborn consort of Cybele), but he uses his connection to the goddess to tie Lucius (his son) to her "lap" via a phallic arrow. Publius, his nephew, meanwhile manages another symbolic castration by shooting off "one of Taurus' horns." (A Mithraic bull-killing connection?) Titus, the scapegoat, has reversed the ritual of Cybele; Pluto seizes her, Lucius fertilizes her, and he extends his own blood by her death.

*"Hark, villains! I will grind your bones to dust
And with your blood and it I'll make a paste,
And of the paste a coffin I will rear*

*And make two pasties of your shameful heads,
And bid that strumpet, your unhallow'd dam,
Like to the earth swallow her own increase.
This is the feast that I have bid her to."*

-- William Shakespeare, *Titus Andronicus*, V:ii:186-192

And then, to force Cybele to accede to his ritual assumption of her powers, he tricks her avatar Tamora into *omophagia*, the devouring of sacrificial victims, as the Maenads did the flesh of [Dionysos](#) and Orpheus. This theme recurs throughout Shakespeare's sources -- in Ovid, the rapist Tereus unknowingly consumes his son Itys; in Seneca, Atreus feeds Thyestes' sons to him. Tantalus feeds the gods his own son Pelops, and is punished with eternal hunger and thirst, much like Aaron is. Another echo of Aaron's sentence appears in the death of Agamemnon, last of the House of Atreus, killed neither clothed nor unclothed, on water nor on land, in his palace nor outside it. (This same fate befalls Llew Llaw Gyffes, the "sure-handed lion" in the Mabinogion.) Most anciently of all, Saturn (who appears both in Saturninus and in Aaron, who claims "Saturn is dominator over" his nature) devours his own children in an attempt to prevent the new world from coming into being. But it does -- when Pelops is consumed in *omophagia*, the world [shifts](#) on its axis, and Saturn is [flung away](#) along with Cybele, who deserts the blood-soaked Earth.

*"[P]eople and sons of Rome,
By uproars sever'd, as a flight of fowl
Scatter'd by winds and high tempestuous gusts;
O, let me teach you how to knit again
This scattered corn into one mutual sheaf,
These broken limbs again into one body."*

-- William Shakespeare, *Titus Andronicus*, V:iii:67-72

How did Titus know to do this? Perhaps by *sparagmos*, the ritual dismemberment that leads to illumination -- again, as with Dionysos and Orpheus. Only when he loses his hand does he take the initiative in the play, although the theme of severed limbs has begun with the sacrifice of Tamora's son Alarbus. "Alarbus' limbs are lopp'd, and entrails feed the sacrificing fire," and almost immediately Titus kills his own son. Four more sons (two of Titus', and two of Tamora's) are beheaded, all so that Titus can "help to set a [head](#) on headless Rome." Perhaps Rome itself is the dying god, the [waste land](#) (a "wilderness") revived by the blood of Lavinia (who undergoes her own drastic *sparagmos*) and Bassianus (thrown into a pit by the "tiger's cubs"). Conversely, Titus makes sure that the blood of Tamora's sons never hits the earth -- Lavinia catches it in a basin and he bakes it into the pie for Tamora to "swallow her own increase." His Andronici are Summer entities "like stinging bees in hottest summer's day"; they kill Winter figures like Saturninus to renew the land. But it is a strange and sterile renewal, one that traps Cybele's fertility within Astraea's virginity and leaves the job of procreation to Lucius' arrows. (All the women in the play are killed, even the Nurse of Aaron's baby.) This misogyny is, in the end, the best argument for Marlowe's involvement in the play -- in spirit, at least. Perhaps [Marlowe's death](#), on the feast day of Hecate in 1593, left Lord Strange and the [School of Night](#) unable to complete their ritual dramaturgy -- so they somehow fed Marlowe's spirit to a hack writer in Strange's employ, to draw down Astraea and imprison her in the endless loop of sterile Andronican ritual. The resulting play did so, but not without cost; the plague (sent by [Sekhmet](#), the lioness (tigress?) goddess of the East?) broke out in London the very day that *Titus Andronicus* was registered with the Stationers.

Lord Strange himself died two months and 21 days later, of "a very miserable and surprizing death being seized and tormented by vomiting . . . [A]nd when dead, though his body was wrapped in searchcloth, and covered with lead, yet it so corrupted and putrified, that for a long time after, none could endure to come near the place it was laid in, till his burial." Perhaps something he ate disagreed with him. It might have been the pie.

Stonepunk

by Eric Funk

This place can be [another planet](#), [alternate Earth](#), or one [lost valley](#) or [another](#), as required by the GM. It may be accessible through [spells](#), [portals](#), or interstellar space. Visitors will have to contend with slightly higher gravity, a more distant horizon, and a slightly richer atmosphere (statistics are below, under "Space").

In this setting, dinosaurs are no longer rulers of the earth -- they are slaves! For the most part. They pull trams, power buildings, lift cargo, and haul freight. Although this world lacks metal, it does not lack *technology*. There are transcontinental railways, telephones, refrigerators, geothermal power plants, and pizza places that deliver!

History/Timeline

(All dates are approximate)

- **900,000** Dinosaurs rule! A large comet barely misses the planet. Rare minerals, crystals, and megatons of water rain down on the planet.
- **250,000** First domesticated dinosaurs.
- **201,102** First grand chief unites tribes, declares beginning of calendar
- **201,000** Shallow ocean boats deployed against advice of shamans, yet no related deaths occurred that year. Belief in animism begins to decline.
- **200,800** First military vessels developed to mount direct-fire siege engines to fight sea monsters in coastal waters. Most doubled as fishing vessels.
- **200,700** First deep-sea exploration vessels launched in pairs. Many did not return. Some started accidental colonies on islands.
- **200,600** [Contact](#) made between the continents. Communication problems and different beliefs prevent strong alliances.
- **200,400** Balloon flight begins as a scouting tool for both military and hunting teams. Renaissance begins.
- **200,300** First zeppelin used offensively in warfare.
- **200,200** Rail travel becomes popular in plains areas.
- **200,120** Radio links the world. Governments begin to communicate swiftly.
- **200,110** Public radio broadcasts begin.
- **200,100** Cease-fire between major governments established. A cold war begins in research of military and refrigeration technology. (Amateurs study Tactics; professionals study Logistics.)
- **200,090** Moving pictures traded as valuable commodities.
- **200,070** Public television broadcasts begin.
- **200,050** First calculation engines sold; The last large predator is seen near civilized areas due to proactive and "big game" hunting. Rock and roll makes a break into the popular memescape.
- **200,025** First diamonds used in drills and saws; first space launch attempted -- the launcher collapses in a physical failure
- **200,010** "Soft" nanto-tech (*sic*) publicly marketed (see below)

- This year.
200,004
- (future) All levels of government begin preparation for celebration and grand openings for this year.
200,000
- Doomsday cults predict the end of the world.
199,999
- (future) Pessimists fear that the calculation engines that regulate the cities will be unable to cope with the roll over. They call it the y200k problem.

Locales

GMs should feel free to include any wonder of the ancient world in as scenery, especially in a Cliffhangers style campaign. The [Sphinx](#), the [Pyramids](#), the [Lighthouse of Alexandria](#), the [Great Library](#), [Nazca Lines](#) and belief in [Ley Lines](#) would all be appropriate. For more such ideas, [GURPS Places of Mystery](#) and the [Nan Madol](#) are excellent references. One example city is elaborated on, below.

Governing Bodies

On the most advanced landmass (called Ignas by its inhabitants), the first Grand Chief Elect, named Uri Starfall, united a large group of tribes in a time of great famine. Through planning, charisma, and no small amount of luck, a lasting council of elders was formed, uniting the continent to this day. In a vision, the first chief started the calendar to unite timekeepers of the different tribes and start written record; if anyone knows the truth behind why he chose a palindromic negative number for the starting year, or what (if anything) people are counting down towards, they aren't revealing it. (If this Terra Incognita is not set on an Earth, then perhaps [here](#), set on either "Euramerica" or north "Africa"). Today, a small number of peaceful sects continue teaching the path to enlightenment is to follow the life of Uri.

Over time, scouts were horrified to discover seemingly older tribes across the seas that either refused to join or responded violently to contact! Seeing the strength that comes from unity, most of the other landmasses managed to unite by one strong tribe or another. Today a slow [war of ideologies](#), is taking place across the "airwaves." GMs can decide whether the [other societies](#) are socialist, monarchist, democratic, cannibal, or just performing ritual sacrifices. Although the Stonepunk TL0+8 society represents the cutting edge on this world, the other tribes possess technology varying from TL0 to TL0+7. Other than the "title" society, most other territories reserve their most advanced equipment for the governments and military, leaving their citizens lagging one or more tech levels behind. Due to the lack of hard metals, no known tribe has advanced to full GURPS TL1.

Architecture

Without metal to reinforce concrete, architecture is notably blocky, and structures are limited in height to about four or five stories due to the amount of support required for load-bearing walls. It is thus a mark of wealth to have a tall office headquarters, a few of which tower up to 20 stories in height! Some are large pyramid-like structures, while others use experimental fiberglass, carbon reinforcements, or dinosaur bones! It is only very recently that chemical treatments have been available to protect wooden structures from jungle insects, humidity, frequent hailstorms, and medium-sized animals. Without the added expense of this treatment, the expected lifespan of a freestanding wooden structure is measured in *weeks*.

Environmental Control: Fire is a controlled science. Cooling technology is still expensive, and while it is not available to cool homes, it is available in the form of appliances: freezers and refrigerators. Petroleum is found in lamps and hand-held lighters.

Major Industries: Rock quarries, lumber, and agriculture

Economics: Valuables are considered to be gold, silver, jewels, and pearls. Money is expressed in many ways, including cash, banks, credit cards, mortgages, loan sharks, and pawnshops. Some regions away from bodies of water

use marked clamshells as "hard" currency.

Agriculture: Large tamed beasts serve to pull large, heavy harvesting equipment. This machinery serves to process and refine the crops. The commercial loom is available, so cloth and silk are middle and upper class alternatives to skins/furs (respectively). The forestry industry has, for the most part, embraced the long-term plan of planted forests. This results in safer working conditions and straighter wood. The companies that don't follow this practice have made many enemies, ranging from clever wild creatures to avid preservationists.

Weapons

Short bows exist, but are restricted to military (and paramilitary) agencies. Slings, slingshots, and hand catapults (see below) are common and don't require a license in most areas. Civilian melee weapons are mainly clubs, while exotics such as obsidian/shark tooth swords (see *mecauitl*, pp. LT25, AE99) are only for the military. Spears, bone saws, and axes are socially considered tools. [Fire siphons](#) are used against swarms and [fire lances](#) are well documented. Explosives are limited to black powder, and are restricted (but see "Things to Invent," below). Leather armor, boiled leather and hides exist, but are socially limited to the military, riot squads, hunters and sports teams. Anyone walking down the street wearing obvious armor will get curious looks and questions from police.

SteamTech inventions that could be in character:

- p. 17 Grenades
- p. 20 Light Rifle (see also *Cliffhangers* pp.91-92)
- pp. 29-30 Mechanical Devices
- p. 33 Camera Obscura
- pp. 105-116 Drugs and Chemicals

Things to Invent

- **Batteries:** While lacking copper, nickel, cadmium and lithium, the planet can produce masses of lead-acid batteries.
- **Compressed Air:** A working breathing apparatus has not yet been developed. All current efficient designs leak chemicals into the contained air.
- **Electricity:** Using silver wire, gold coils, lead-acid batteries and mechanical power, large-scale AC power can be produced.
- **Nitroglycerine:** (see p. HT28)
- **Nuclear Bombs:** (see p. HT29)
- **Nuclear Power Plants:** Simple radiothermal generators and shielding are well within their capacity.
- **Medicine:** Glass blowing, distilling, hot running water, rubber, alcohol, germ theory, antivenins, casts, x-rays, and microscopes are all available. Vegetable-based plastics are expensive, but research continues.

Computers

Cutting edge computing is at TL0+5, and should be treated as TL 4+1 [clockwork engines](#).

Wrist sundial-compasses are commonplace, while more delicate, spring-wound (or cutting edge self-winding) watches are beginning to gain popularity. TL0+4 [clocks](#) are common in homes, and many large businesses have full TL0+5 calculation engines. All mechanisms are classically made of wood, but cutting-edge devices are built with fiberglass and plastic components. If Gadgeteering is available for NPCs, then a few mad scientists and possibly the military may have access to engines and accessories equivalent in power to TL5+1 (see pp. STE61-70).

Sensors

The best tools are trained animals, but basic photo and video cameras are available. "Antique" systems function somewhat like the [Camera Obscura](#) (see p. STE33), with the flash bulb simply acting to stun subjects to give the operator a chance to draw them using the "Artist" skill. "Modern" cameras can actually catch birds in flight, and video cameras for the home are beginning their appearance while television has been present in the home for decades.

Communication

Letters and small parcels are delivered to and between distribution centers by homing bird. Carrier pigeons can travel up to 50 miles per day (see pp. CV38, HT56, or VE47). The military and many large businesses have their own networks, ciphering their messages when convenient to the plot. Broadcast television, radio, and "shell" phones use what are called "ether waves" to transmit data. Their antennas are made of wood and the dial tone and static are the sound of the ocean (waves and roar respectively), but somehow it works! Paper, ink, and the printing press are not new inventions to the city, but until recently paper had a lifespan in weeks, making it ineffective for long-term storage; thus old records and any documents in rural areas will be engraved in stone. There is a concerted effort to locate and update all written records to punch-tape for use with calculation engines.

Power

Power is almost invariably provided by muscle, be it domesticated animal or human. With a "racial" ST13 (see below), most "man-powered" devices are designed for ST15 or ST16 to take advantage of individuals with above-average Strength as well as allow Extra Effort without straining the apparatus (see Muscle Power Plant p. VE82). For solar heating, see the solar-powered steam engines (see p. STM70), perhaps at double mass and cost until the year -199,995. Water wheels and windmills turn grindstones, saws, push-pumps, and winches only in military and large-scale industrial applications.

The heavy "workhorse" of industry, however, is the Brontosaurus (a.k.a. *Apatosaurus*), (Move 5, ST 300+, see pp. BE47, D32). It can lift 4.5 tons (see p. B145), and drag up to 180 tons (see p. B89). Multiply these numbers by 30 if the beast can be coaxed into using Extra Effort, which it can sustain for up to five minutes or more (see p. CI 12)! On a treadmill, it can provide a continuous 6kW, and only lose 1FT each hour (see pp. VE82, VE158). These represent the reliable power source used to move elevators and bellows, and to turn spinning wheels, calculation engines, and to pull heavy haul trains and long riverboat chains. The *Triceratops* is one of the fastest large herbivores (Move 10, ST 200+, see pp. BE55, STE122, or D51), twice as fast as the Brontosaurus. These are the most common commercial engines, pulling trucks, busses, and express barges. They can easily pull 4 tons (8 tons on "Average" roads, see below) at full their full movement rate of 10 (20mph). On Average-quality main roads, towed cargo has half the effective encumbrance (see p. B188). Most other city roads and inter-city highways are "Poor" at best.

Transportation

Most residents own a personal cart of some sort. Limousines, public transport and hauling "vehicles" usually consist of a trailer pulled by a dinosaur (land or air). Short-range hauling is sometimes done with just a saddle. (Design as harness, but adjust from base ST of 10.) The top prehistoric candidate for mounts is the [Diatryma](#) (Move 14, see p. BE49, similar to the Enhanced Chicken of p. STE120 and the Deathbeak of p. RS112), which may remind [some players](#) of "[chocobos](#)." (For more suggestions of prehistoric mounts, see "Off to the Races!", below.)

TL8 Man-powered Car

Crew: 1 total. 1 crew station covering vehicle control (ground).

Subassemblies: Vehicle +2,
Body +2, Wheels +1.

P&P: four 0.3kW muscle
engines (1-man, avg. ST: 15,
short term access), 1.2-kW
wheeled drivetrain (short term
access).

Occ: normal crew station
(exposed), three normal
passenger seats (exposed)

Cargo: 10-cf open cargo hold
w/cargo density 20-lbs/cf

Armor: All 3/5

Statistics

Size: 13.7'×3.42'×1.71'

Payload: 800 lbs. **Lwt.:** 1,097
lbs.

Volume: 79.7 cf **Maint.:** 228
hours (0.421 mh/day) **Price:**
\$1,926

HT: 11 **HP:** 37 [Body], 6 each
[4×Wheels].

Ground Performance: Motive
Power 1.2-kW, Top Speed 25
mph, gAcc 1 mph/s, gDec 10
mph/s, gMR 0.75, gSR 4,
Ground Pressure 1,075 lbs./sf,
Off Road Speed 10 mph.

Design Notes

TL8 extra light frame
expensive materials [Vehicle].
TL8 DR 5 open frame skirt
expensive wood [Vehicle].
Vehicle Features: primitive
controls, no streamlining,
cheaply made. Wheels: quantity
4, off-road. Volume: 66.4 cf
[Body], 13.3 cf [Wheels]. Area:
98.4 sf [Body], 33.7 sf
[Wheels]. Book Options:
Vehicles Lite ground speed.

Air balloons pulled by trained birds may fit better in a "realistic" campaign than mere "saddle" aircraft made of wood. In either case, balloons, [dirigibles](#), and [zeppelins](#) are a well-tried tradition, but the lack of steam or combustion engines creates different problems, such as perches for flying mounts or extra space for tired power animals. The theory behind "gyrocopters" has been known for quite a while, but has not been feasible due to power requirements. Radio controlled units with TL0+8 Flywheel "power cells" (see p. VE88), using the "advanced" rules for Flywheel capacity (multiply by 10) (see pp. STM69, CF120) are growing popular in amateur and military purposes.

Ocean Transport is rare as the public still distrusts the unknowns in the deep water. This has greatly limited the development of medium and large travel, exploration and pleasure craft. Sea trade is generally limited by line of sight to the coast, the most common design using large concrete hulls. Fresh water transport, on the other hand, has been a growing industry, with small and medium-sized craft built from wood leading in popularity. For small craft, inflatable rubber hulls are an increasingly popular option, with cutting edge fiberglass rapidly dropping in price. [Windmills](#) are a popular renewable resource for long-haul and exploratory craft (see Vane Clippers, p. CF126).

Exploration: Research into breathable compressed air has barely begun, and thus experiments in deep diving and high altitude have been curtailed. Flight has been available for many years, and all the land a few hours' flight from civilization has been mapped. Shore-hugging ocean vessels have mapped the contour of the continent and island chains linking to new landmasses, but to the average citizen, a "map of the world" is a flat map of their continent.

Exotic: "Nanto" technology (TL0+9 to TL0+10)

This is the emerging science of training small insects to perform a single task when a certain stimulus is applied. There are known species that can chew almost any wood product to tiny pieces and scatter them, and other groups are trained to emit a paste and assemble objects the same raw material. Industrial applications include the assembly of small sensors and tools. Residential applications include trimming lawn, hair, cleaning floors, dishes and appliances. There are several ways to protect oneself from a nanto-assault. The first is to have counter-nanto of your own. The second is to have a trained anteater or toad standing by to devour them. The properties of a nanto-swarm can be identified with a magnifying glass and a successful roll against Electronics Operation (Nanto) with modifiers for Acute Vision and/or Alertness. Destructive tests include analysis by another swarm, or by a diagnostic anteater/frog. It is currently illegal for civilians to own carnivorous swarms. Licensed exterminators may rent swarms from the military, but without exception, must return them before nightfall. Swarms cost \$3,000 to \$20,000 and 2 lbs per hex (see pp. B143, BE42). Consumes 2 lbs of wood or 1 lb of food per hour of operation.

Currently, a great amount of research is being done on "hard" nantotech that can manipulate stone.

The People

Local Characters

Given names can be from any "modern" culture, but [family names](#) typically involve some sort of terrain feature or type of rock (consider the *Discworld* trolls).

Local Racial Template [1] "Punk Rocker" (Calculate weight and height without the +3 from this template) Third Edition

Advantages: ST+3 [30], HT+2 [20], Damage Resistance +2 [6], Literacy [0], Temperature Tolerance [1], Very Fit [15].

Disadvantages: Chummy [-5], Pacifism (Pick one of: Cannot Harm Innocents, Cannot Kill, or Self-Defense Only) [-15], Phobia (Necrophobia) [-20], Phobia (Thassophobia) [-10] (p. B36), Reduced Hit Points (2 levels) [-10], Xenophilia (Strong) [-15].

Racial Skill Bonuses: Judo +2 [4]

Fourth Edition Conversion

Native Racial Template [7 points]

Advantages: Remove Literacy

Disadvantages: Phobias gain frequencies of 6 and 12 respectively, Reduced Hit Points 2 becomes [-4].

Racial Skill Bonuses: Judo (DX/H) +2 [4]

Customization Notes

Common Advantages: Animal Empathy [5] or Beastkin [15], Fur (light) [1], High Pain Threshold [10], Increased DR [3/level], Increased Strength [varies].

Common Disadvantages: Hunchback [-10], Increase Pacifism to (Total) [extra -15], Reduce Very Fit to Fit [-10], Semi-Literate [-5], Semi-Upright [-5].

The people are not unusually gullible or generally superstitious. Early aptitude tests in school help find those with fewer mental disadvantages, and nudge them toward the appropriate military or security forces. The Pacifism disadvantage is not crippling, as the kinds of pacifism are somewhat evenly distributed between Cannot Harm Innocents, Cannot Kill, and Self-Defense Only. All this stems from an ancestral fear of the spirits of defeated foes coming back to curse them. Most rural and urban core citizens will have basic Judo training in school, allowing them to make use of their racial Bonus.

Sample Weapon

A local "Saturday night special" handheld rock thrower

TL0+8 built, TL0+7 Cheap-quality Torsion-power ST 16 Mechanical Pistol-grip Stone Thrower

Dmg: 2d+2 (cr) Acc: 0 Malf: 16 RoF: 1/20 1/2D: 160 Max: 200 SS: 15 Ewt: 6.4 lbs \$80.

Ammunition: 1.6 lb rocks, \$0.8 each.

Variant: Paramilitary (LC 2) Bolt thrower: As above, but Dmg: 2d+1 (imp) Acc: 1 Malf: Crit SS: 10, Double ranges and cost, halve mass.

Ammunition: 1.6 lb darts, \$3.2 each.

Options: Silencers, Laser sights, and scopes (see pp. VE127, HT102-103)

Example City: Boulderville, Trade Center and Regional Capitol

Population: 140,000 to 1.4 million

Situated at the mouth of a three-river delta, it is a natural trade nexus. Raw stone from the mountains in the North meets the wood from the forest in the South. The established coastal shipbuilding industry tries to meet the growing needs of fledgling deep ocean trade and exploration.

Dramatis Personae

Sandy Apfelstein, Reporter: A rising star for Channel 5 News, she has a knack for finding trouble, and for getting herself and her camera out intact. She is attractive, persuasive, and will stubbornly pursue stories of public interest. The only way one can divert her is to provide a humanitarian reason, or a more interesting story . . .

Milo Blastrock, Prospector: Wandering the countryside, looking for the Mother Lode, he survives on a trickle of royalties from small successes. An honest sort, he will give up to half his claim to any party that risks its life to help him return to file it.

Mica Gladstone, Mayor: Recently elected to office by a marginal victory, the mayor is progressive, and will begin to encourage trade and exploration of the lush jungle territory to the south of the city.

Ulysses Granite, Nanto-Tech Abuse Officer: He is a young man with remarkable eyesight and no fear of water -- his childhood dream was to be an explorer. Fate, however, had other plans. His technical abilities made him the best man to investigate any possible abuse of the new nanto-technology. Although still new at his position, he has witnessed some of the awesome abilities of this new tool. He has seen swarms destroy bridges, erect megalomaniac statues, convert a car into a clockwork battlesuit, and write slogans as they selectively defoliated government parks. His broad powers cause friction between himself and the Chief of Police, as well as his natural adversary, Dr. Gyrock.

Doctor Maximillian Gyrock, Mad Scientist: Once a respected scientist, he disappeared in a mysterious explosion. He is rumored to be alive and providing clockwork devices to the criminal underworld. It believed by some that he is behind a ring of daring museum robberies. Witnesses reported seeing a (primitive) submarine, as well as a sealed clockwork battlesuit (see p. STM76).

Peter "Hawkeye" Hankstone, Freelance Hunter: The head of a freelance hunter's association, a small support group that, for a nominal fee acts as a discount job board, bed-and-breakfast, and weapons supply, he is protective of the reputation of the group, and will certainly hire/send someone (such as the PCs) to investigate any unusual occurrences or disappearances.

Winston Shield, Chief of Police: He is a hard-nosed officer who has worked himself up from a beat officer. He dislikes strangers, and will always ask them extra questions, having them trailed or deeply investigated if they seem unusual.

Adventure Seeds

Dark Matter

Rumors of a newly discovered tribe living in a volcanic area possessing dark, razor-sharp tools have reached the scientific community. The description to the players should be that it sounds like "metal" (dense, sharp, very hard). Many expeditions are being mounted to be the first to get there. Is it really metal (such as bronze or iron), or just obsidian (+1 damage, see p. LT106). The latter would still be a good find, and trade could make one wealthy!

Don't You Forget About Me

A rich entrepreneur is commissioning a group to make sure their deeds are [remembered](#). For this, the group is commissioned to start surveys of the most geologically stable and dry areas of the known world. Problems can arise with locals, wildlife, or governments. While construction of a repository is going on, they must find (or better yet, bring) translators for all the languages in the world with written variants and secure professional translations.

Do You Dig It?

The amount of luxury and high-tech industrial wealth (large diamonds, precious metals) makes this planet prime for exploitation by indigenous corporations (not to mention external ones). The complete spectrum of adventure opportunities surrounds this situation. Exploration, discovery (and getting back), claiming the land, holding (or destroying) it, extracting goods, delivering, selling them, and spending the wealth. The PCs may be in for the whole tour, or just called in for one leg. Depending on the adventuring party, there could also be involvement with enemy agents, ghost stories, or monsters.

Global Cooling

A growing fear among scientists is that the "cold house gasses" emitted from refrigeration units are lowering global temperatures, ushering in a new ice age. Scientist characters can be sent out to odd places to collect samples. Fun places may include "the wild," on territory held by "primitive" farmers, packs of velociraptors, "enemy" territory, on glaciers, in the core of icebergs, or in the deep ocean. Most other character types could fit support positions, with specialties such as Survival, First-Aid, Veterinary, Gunner, Guns, Fast-talk, or Diplomacy.

The group could alternately be sent to covertly plant false data for the "real" research team.

Off to the Races!

Cart Wars (see pp. DWA 90-100) would certainly be exciting with small, agile dinosaurs pulling the carts instead of mammals. After the Diatryma (above), runner-ups include the Carnivorous Kangaroo (a.k.a. *Propleopus*) (Move 15, see p. BE52), the Velociraptor (Move 15, see p. BE56), and -- for the evil mastermind or Dark Lord -- the Tyrannosaurus (Move 17, see p. BE56). "[Operation: Rabbit Chaos](#)" would be a compatible example mission. Vehicles build with the *Propleopus* in mind would certainly benefit from the "Improved Suspension" option in Vehicles (see pp. VE 20, VEL 33).

Round World Society

Currently there is no great clash between the flat and round planet philosophers, as most people don't care. This could soon change as an expedition is about to be launched in a dirigible to try and circumnavigate the world, or find [the edge](#)! With all the publicity, as well as millions of dollars in the movie and map-making industries at stake, the PCs are hired to head, protect or hinder the mission. To make it more interesting, it may be attempted simultaneously by two teams heading in opposite directions. What if, at the half way mark, the heroes come across the remains of the other team's craft? Are some survivors saboteurs? Is their craft next?

War!

One of the tribes that do not fear the dead is intent on raiding your village! The average citizen will try to flee or hide. What will the adventurers do? Will they [fight](#), or move to defend people in need?

Magic

Adding shamanistic or ritual magic would not overly change the society (such as from Castle Falkenstein, Spirits, Voodoo, Ice Age, or Old West). As written, spells from GURPS Magic will change the setting into a magic-heavy Technomancer setting. Another alternative is detailed in "[Tools Are Just A Fad](#)."

Miscellaneous

Citizens from far and wide will come to help/stop/watch attempts to build a catapult comparable to the Verne Cannon (see pp. CF16, 120, 127), or the [Passenger Artillery](#). Races of all different sorts are popular and televised! Some popular (and less survivable) sports may include carnivore wrestling, aerial dogfights, "cockfights" with large carnivores and cross-country races to distant places across hostile jungle. Spelunking into ancient ruins looking for

Ancient artifacts is a growing hobby for the idle rich. Many shun large corporations, and the PCs are hired as guards or specialists. Perhaps they are hired by a parent, and are supposed to plant relics for the noble to find.

Genres

Meeting Other Societies

Encountering other high-tech societies will allow inventors and Gadgeteers to research devices with the same purpose as the alternate device (p. STM13). For example, a Gadgeteer recovers a TL8 sonic stunner and designs a hand-held amplifier that focuses a bird's call. The limit is the bird gets tired quickly (1d shots per minute) . . .

To external agencies, this planet will hold a good source of labor and/or front line troops against an inhuman foe. Those with "Self-Defense Only" Pacifism would make good support troops, those with "Cannot Harm Innocents" make ethical forces, and those with "Cannot Kill" could still wipe out non-sophont threats.

Humidity and metal-hungry bacteria will quickly degrade any unsealed gear. For those who fail to continually maintain their equipment, GMs should enforce the equipment failure rules from pp. CII6, CL17. The local plants are extremely vicious towards other plants and grow voraciously, attacking unsealed structures.

Alternate Earths

The non-metallic technology, robust troops, and amazing wealth combined with the possibility that the locals could possibly construct their own projector combine to form a tempting target for Centrum and other less scrupulous organizations. There are a great many uninhabited areas, and a number that could easily become that way without anyone noticing . . .

Black Ops/Special Ops/Martial Arts

This genre calls for highly trained operatives equipped with state of the art weapons fighting in places they'd rather not be fighting in. Most of the classical "ninja" equipment (see pp. J55-58, MA119-123) can be kept as is without any metal, and the grunts might be equipped with powerful bows or multi-barrel bolt throwers with detachable barrels.

Cryogenics/Out of Time/"*This is my Boomstick!*"

Ignoring the technology required to unthaw a glacier-frozen individual, it is a common plot device that someone (or something) is unfrozen, and experiences culture shock (see pp. FW139, AH94). The opposite can also be true, when a one-shot time-travel device accidentally sends someone back to "the stone ages". Can the newcomer adapt before the xenophobic troops destroy the intruder?

Espionage

High society is in full swing, and it is up to the PCs to uncover what secrets each noble and politician hold. Alternately, they may be set to infiltrate, [research](#), and/or [subtly influence](#) the enemy masses.

Horror/Atomic Horror

What if, in addition to water, the comet also seeded Things That Dwell In The Deep. Now, after 700,000 years of evolution, preparation, and research, they emerge confident and entrenched, ready to move . . .

Space/Traveller

CURSORY SCANS:

Diameter: 15,000 miles

Gravity: 1.18 G

Surface Water: 80%

Climate: Tropical

Axial tilt: 9 degrees

Long-term Survey:

Population: Millions

Government: Representative Democracy (most advanced, others vary)

Control Rating: 3 (4 in cities, 6 on ocean vessels)

Tech Level: Cutting edge 0+8 (no orbital)

Seasonal Variation: Mild, but due to continental configurations, the change of seasons are violent with wild storms and high winds.

Mineral Resources: Gems/Crystals, Rare Minerals: Plentiful; Organics and Heavy Metals: Ext. Plentiful; Radioactives: Ample; Light and Industrial Metals: Absent

Space, Part 1

Located deep in neutral territory, this world boasts strong, resilient citizens with a natural aptitude for Judo, making them ideal security forces. Boasting immense wealth, natural troops, and workers, every faction in the area will be vying for it. Less scrupulous factions will try conquest or trickery, while more honest alliances will have an enjoyable time trying to organize and get an truthful vote from a "world council." How will they be represented? Will it be by population, military, area, or one vote per country? Several of the groups will only respect power, others spirituality, and others promises of technology.

Right of Procedure: What if the fish people alluded to in the Atomic/Horror section above can prove can prove prior settlement and claim exclusive sovereign rights?

Space, Part 2: Strange Encounters

If the civilization is left alone, soon they will be able to develop prototype TL0+9 FTL engines and full life support modules. Simply the sight of a TL0+9 craft will be enough to cause a spit-take from most serious officers.

Supers/Toon

Certainly in the media, Supers of this "era" have less competition from Gadgeteers, but more from nature. For an example, see "[The Flint Age](#)."

Dura: Breath's Baron

for *Nobilis*

by **Bradley Robins**

With his head against the glass, a man watches yellow-gowned doctors working to save the life of the man who killed his wife. He prays and weeps.

It was a ghost that stood in the hall, watching the doctors operate upon his own husk. He prayed that they would fail, wept because he knew they would not.

The hawk does not fear to look into the sun. Its eyes are gold, its mind is pure. So he had told himself as he turned the gun on the girl, so he had told himself as he turned the still smoking barrel onto himself.

She had been a silent woman all her life; it was only in death that she had found her voice. That was why he prayed for the life of her killer, because he that took her life was her voice, and it could not be silenced now -- not so soon after its birth.

There is a girl in the waiting room, waiting for her mom to get done with a free ultrasound. She's watching the drama play out before her, and for a time her own life doesn't seem so bad. When she gets home she'll make paper dolls of doctors and nurses and priests, and will find a glory in the little play they put on for her.

--Elijah Blackmonde, "On the Loss of Breath"

5	Sanctity, Safety, and Peace of Chretien's Garden
5	HG's choice
4	Rohana (his foremost Anchor)
3	The Three True Sculptures of his mortal life
2	Well-being and peace of his Familia

Old even among Nobles, Dura served the Angel Bhisma for ages uncounted. Loyal and passionate, his bright and untamable spirit is the only thing that let him survive when his familia and Emperor, along with his own body, were murdered in an Excrucian attack. Dura's will would not allow him to die, and so he bound himself into a lantern that hung in a shrine of one of his inspired yogis. In time she lit the wick, and in so doing became Dura's anchor. In her body he traveled till he could find a new Emperor to adopt him, to save his guttering soul from oblivion.

Drawn to the en-chancelment of Chretien's Garden, Dura was accepted by Saurast and adopted as a Noble of the Light. Though he was safe and stable again, Dura was greatly weakened by his ordeals and something of his great spirit, which had once burned brighter than the sun, was muted and tamed. As time passed in his new home, Dura grew old and withdrawn. His ages of activity waned into a lassitude that merged with the ennui of the Chancel folk to make him far more distant than he had ever been as a servant of heaven. Now he remains invisible and intangible, as present and overlooked as every breath in the chancel, rousing himself to action only rarely. Only threats to that which he loves will rouse him, and they will often bring him from near sleep to roaring fury in the span of a single breath. Having lost everything once, he has no desire to do so again and would tear down heaven and earth to protect that which is precious to him.

The one place in which Dura is almost always active is in the social life of the ghostly inhabitants of Chretien's Garden. By virtue of his status as a ghost and Noble, he is the de facto leader of all the walking dead of the chancel, and he takes great comfort in their presence and their companionship. They know his feelings of loss and sorrow, as well as the soul deep weariness that rises up to smother him. He works daily to help them maintain hope and direction, and they work daily to give him reason to care.

Estate

Dura is the Baron of Breath, the vital force that sustains life and can bring either purity or defilement. He can bring breath, and thus life, or he can stop breath in living things and bring death and endings. Breathing also has strong connections to health and purity, and can be used for healing many diseases and granting clarity. In reverse it can cause the inhalation of pollutants, which can cause effects ranging from ritual impurity to poison. The most obvious aspect of the estate, however, is its near omnipresence in mortal life. This makes it both a powerful tool for divination, as well as a common source for nettling and Excrucian attack.

Weaknesses

The immortal mindset has served Dura well, for he has seen ages and eons pass while many of his more impatient kin have been brought down, gone mad, or lost their humanity altogether. However, his endless patience all too often becomes passivity and lassitude. Because of his age and philosophical separation from the immediacy of mortal life, Dura is often unable to react quickly to change or to see any situations as being dire enough to require immediate action. Thus younger, more energetic foes are often able to steal a march on him, leaving him on the defensive far more often than a noble of his age should be.

While he is in Chretien's Garden, Dura's lassitude is at its worst, and while he is present the pace of life in the Chancel often slows to a crawl. Their shared natural tendency towards drowsy complacency feeds into a loop that leaves very little that seems immediate, lusting, or important. It frequently falls to the other Powers of the Garden to rouse Dura to proper exercise of his place and potential. When he does rouse himself to action the chancel benefits as well, especially

if it is in danger. When his home and family are threatened, Dura's full wrath manifests.

Design

Dura's design is the combined mature elegance of Pomegranate Flower and the ever beautiful Lucerne of moving life. The flowers twine together about a caduceus before a field of white rain against a rolling sky.

Associated Non Player Characters

As he has no body of his own, Dura most commonly interacts through his Anchors. He will sometimes manifest as a spirit to speak with other Nobles, but even that is rare. Either he will be present as no more than a breath, or he will come in an Anchor. Generally his anchors tend to be priests and artists, though who meditated upon their own breath and the close meaning of their own life. Many of them are Hindu as well, because to this day Dura is worshiped as a minor god in places in India. Foremost among his anchors is Rohana, a yogi to whom he has granted agelessness for her role in saving his life when Bhisma died. Several Powers have whispered that it is obvious he loves her, and many fear the Locust Court will fall upon them both.

Dura is also often in the company of ghosts and sad spirits. Together they form a weary court, constantly fighting to master their sense of loss and gain a new energy and life. It is not uncommon for them to seek out the companionship of mortals, looking to gain inspiration from their lively lusts. Sometimes this makes life better for both, as mortals gain wisdom and ghosts energy; other times it results in the mortals losing vitality and the ghosts sinking more into despair.

Story Elements

Ritual uses of breath, such as singing, chanting, meditation and controlled breathing, as well as biofeedback and CPR all belong in stories featuring Dura. He also carries large amounts of lassitude and ennui that are fitting to stories of loss, despair, and that which was once great but now simply exists. Ghosts also make up a central element of stories surrounding Dura, for he is rarely out of their company. Dura also can play a central role in stories about the triumph, or failure, of life and greatness. If he is able to rise up again to the heights he once aspired to, it would be a potent symbol of hope. If he fades away into nothing, and life's breath goes with him, it would be a potent symbol of the futility of struggle.

Story Type: Mystery

Old and withdrawn, present in every word spoken by mortal lips, distant and invisible, Dura is a mystery and a center of mystery. He knows many things that he simply does not bother to speak of. With proper motivation he could be a great source of knowledge, or could cause great stores of knowledge and secrets to be lost -- unable to be spoken ever again. Any story that features secrets lost to time, lost because the one who could have spoken them ran out of breath (died), or that deals with the apathy of those who should speak out would be fitting for Dura.

Dose of Medicine

For *GURPS*

by Eric Funk

GM to Player 1: *"That last shot hit your character in the kidney, for net 6 points of damage."*

Player 2: *"Since combat is now over, my character binds the wound."* (Player 2 rolls against First Aid, and succeeds.)

GM secretly rolls a 6, and says to the players: *"All the damage is healed."*

* * *

While *GURPS* is a system with extensive combat skills and fighting systems, it spends relatively few pages on mundane, healing-related skills. A great many PCs are involved in accidents or violence, and not all are lucky enough to escape uninjured. Without magical healing, one must recover hit points "the old fashioned way." This article attempts to expose details of mundane medical skills in a modern (early TL8) light.

When two page references are given, they are *GURPS Third Edition/Fourth Edition*.

At The Scene of Injury

First Aid

Many occupations demand training in First Aid, such as lifeguard, fireman, nursing home volunteer, and daycare worker. Many organizations, such as large schools, amusement parks, and megacorps keep trained medical staff on hand for minor emergencies. The real-life first-aid skill covers surface wounds, literally. It stops surface bleeding, deals with minor burns, gives the knowledge to perform Artificial Respiration, apply splints, react properly if the victim has been poisoned, and help save choking victims and those with symptoms of exposure to extreme temperatures (such as heat stroke and hypothermia). Modern urban first aid is designed to stabilize the patient, and let them survive the trip to a hospital (or at least until an ambulance arrives). From the description, however, it would not do much for blunt trauma or actual Crushing damage (pp. 56/195, 424) but does allow one to perform CPR (CardioPulmonary Resuscitation) (p. CI50). This skill is critical if the optional bleeding rules are used (p. 130/420). At TL8+, this skill also gives the knowledge of basic healing Wonder Drugs such as Hypercoagulin, Morphazine, Neurovine, Superstim (see pp. UT97-98 for details and more drugs), Ursaline, and Wideawake (see pp. UTT 89-91).

In theory, the First Aid skill should only treat one hit point per wound for Impaling wounds, and half of Cutting wounds (round up). Full-body damage such as concussion or lightning could be healed as per "normal" rules. Use of the "Advanced Healing System" and "Partial Injuries" rules on pp. CII155-157 are excellent guides.

As a new rule, one might consider any extra damage due to Vital hit multipliers (including, but not limited to the Kidneys and the Jaw) as "unhealable" by natural means; this is similar to Unhealing hit points from the disadvantage on p. CI106/B160 (but see Surgery, below). This could reflect the situation when a medic tells someone out in the field: "The wound has been patched up, but it won't heal right until treated at a hospital."

Modifiers: +1 for a small first aid kit (1 lb), +2 for a "crash kit" (10 lbs), or +3 for an ambulance or better (From THS).

(Air) Ambulance Ride

Ambulance medics are the first-responders who deal with the injured. Injured persons may not be allowed to leave the scene on their own if their total injuries exceed one hit point of damage. If the person's injury is exactly 1 HP, then one will be strongly encouraged to come to a hospital for treatment. Unconscious and injured people will be taken to a hospital to be checked out. Unable to prescribe medication themselves, medics with only "basic" certification must telephone (or otherwise get direct approval from) a medical doctor to administer any drug more complex than aspirin. Those with "advanced" training may directly dispense medication from a narrow list (such as blood thinners, pain killers, and antihistamines). Once on the road, trained drivers must circumnavigate traffic, pedestrians, and any genre-specific hazard on the way to the hospital. Typically an ambulance has a crew of two, one veteran, and the other a rookie, who typically take turns driving unless the patient is critical. As a rule, medical doctors do not travel in ambulances, but may be present during patient transfers, or in some air ambulance rides to rural areas. In rural areas, there is usually only one ambulance per hospital, and an estimate in urban areas is one per 20,000 persons. (This is typical for most North American areas. For areas of denser population, such in Europe, the ambulance ratios should be increased.)

"Young lady, I assure you I am an expert on humans!"

-- Dr. Zoidberg to Philip Fry, *Futurama*

Diagnosis is the skill to determine the extent and nature of illnesses, ailments, and the extent of injury. (Unfortunately, the description on p. 56/187 seems to contradict the use of First Aid to diagnose injury on p. AON80.) At a scene with multiple injuries, first aid responders must use a combination of "common-sense" First Aid (p. B56), and to a lesser extent, Diagnosis to get those most in need of care to a hospital first. Ambulances deliver based on hospital capacities and patient injury. E.g. Not all hospitals have burn wards or are equipped to perform heart surgery.

Modifiers: TL bonus of +TL/2 for having proper medical equipment (p. 56/187).

"Just a spoonful of sugar helps the medicine go down."

-- *Mary Poppins*

The two lists that follow describe a flow of skill rolls in a standard TL8 hospital.

Following a treatable illness (internal injury, poison) in a hospital:

1. The doctor sees the patient, and orders a blood test/x-ray/bacteria culture if the problem is not obvious.
2. If tests are needed, a lab technician uses Electronics Operation (Medical Equipment) to process the results and fill in reports correctly.
3. The doctor looks at the results, compares them with the symptoms the patient noted, and realizes the illness (using the Diagnosis skill).
4. Using the Physician skill, the doctor chooses the correct treatment, and orders the medication for the patient.
5. The pharmacist uses Professional Skill (Pharmacist) to prepare the medicine in the correct fashion if it does not come pre-packaged. A professional would also use their Biochemistry skill to make sure that the dosage is not likely to be dangerous.
6. The nurse receives the medicine, and also uses their Professional Skill (Nurse) to make sure the dosage is within safe limits, then again to apply it; the former is technically optional if time is of the essence. (Nurses use tables and experience to determine what constitutes safe doses of medication. Doctors use Physician.)

"I could have been a surgeon; I love taking things apart!"

--Mad Monty, *Muppets Treasure Island*, "A Professional Pirate"

Skills used in the process of performing a surgery in a hospital:

1. As above, for #1
2. As above, for #2
3. As above, for #3
4. The doctor realizes the problem is out of his field as a general practitioner and sends the data to the appropriate

- specialist (unless it's obvious, as per Diagnosis, p.B56).
5. The specialist examines the data (with their Diagnosis skill).
 6. If the surgery is more than superficial, there will be at least one technician and/or nurse in the operating room (as well as an anesthesiologist, if necessary).
 7. The surgeon operates, deciding many things about the patient's fate with a single roll against Surgery.
 8. The surgeon, or someone else, performs First Aid to close the wound. A roll against Surgery may be used to speed healing of the incision wound (see "Surgery" above).
 9. Finally, the surgeon, (or another medic) performs Diagnosis to make sure the patient is stable.
 10. The patient returns at intervals to be examined with the Diagnosis skill to ensure the illness and surgery are healing.

Triage

Arriving at an emergency ward, the wounded are sorted and treated in priority of injury. If the person is not injured enough to be treated immediately, they will be asked to fill out forms and provide name, identification, and proof of insurance. If one is too injured, any companions not so will be asked to provide it for them. Among the forms may be a waiver that valuables should be sent to a safe location. Clothing and valuables are stored separately, the latter going to Security. Clothes are dropped off during the night shift. If one is injured seriously (or unconscious), requiring surgery, one's personal effects will be itemized by two staff members, and locked in a locker. ([Policies vary](#) from region to region. Also see Links, below.) Staff may not willingly release patients until the attending doctor (and/or surgeon who operated on them, if applicable) has examined their chart and signed their release. If one does not possess insurance, then making provision to pay will also be required.

"How is it, Doc?"

"Radical reconstructive surgery is the only option."

"The leg's that bad?"

"The leg's fine. I was talking about your face."

--"Doc" LaCroix and Sergeant Brutto, *Starship Troopers: Roughnecks*

Surgery requires someone else, or the same doctor, to properly Diagnose the problem first. Once the ailment is determined, only then can this skill treat problems. According to p. STM64/B223, all surgery causes damage, but it can also cure it. If the "unhealing" rule, above, is used, then a successful Surgery roll could change (margin of success) +1 hit points of "unhealable" damage to normal damage.

The size of the incision required should give a bonus to the Surgery roll. For example, if the surgeon is using an existing bullet wound, and a narrow enough tool to pull the bullet out, then a +2 bonus may be appropriate; perhaps a use of the Size column of the Speed/Range table with a -10 modifier could reflect this appropriately. If the surgeon is performing surgery with an optic cable and micro-tool, then there is almost no damage due to the operation. Futuristic and fantastic settings may have completely non-invasive methods available. Smaller wounds can translate to a faster recovery; see below.

Otherwise, if the doctor must look inside, and for cosmetic or torso incisions, the invasive procedure inflicts 1d or 2d damage for limb and torso operations respectively (see pp. STM64-65 for ideas). It suggests a successful Surgery roll reduce the number of dice by one, but add one damage point to the remaining dice (e.g.: 3d becomes 2d+1). A Critical Success on the Surgery roll reduces all dice to one point of damage each. The GM may reduce this by 1 or 2 per die for sterile conditions, such as a long-anticipated operation, or increase the damage by 1 or 2 per die for aggravated wounds that need to be scoured or debrided, such as wounds caused by fire or acid burns, gangrene, or radiation. Characters with Hemophilia (see p. 28/138) or Weak Immune System (see p. CI95/B158 -- "Susceptible to Disease 3") are at increased risk. If this is an operation to help correct damaged organs, the damage inflicted by the surgery is reduced by this amount (to a minimum of 1). At the end, the surgeon (or other attending doctor or nurse) may perform First Aid to heal the damage inflicted by the operation! (This is quickened in *Fourth Edition* by assuming that if the Surgery roll is successful, then the surgeon inflicts no net damage; see p. B223.)

In addition to all of this, if the "extra damage to the vital areas do not heal naturally" suggestion is used, the [degree of

success]+1 could be the number of points of damage converted to "normal" damage. The GM may want to keep the exact roll a secret, not revealing the amount of "unhealing" damage transformed into "normal" damage, until the patient can heal no more. At this point, should the patient still have "unhealable" hit points, a successful Diagnosis roll would reveal that fact, but not the exact number. Crippled limbs may also be released to heal by this kind of operation, at the GM's whim.

Suture Self

Most First Aid courses do not teach a basic medic how to make stitches or form casts. It is then logical to assume this skill is taught in Surgery and Professional Skill (Paramedic), as most general practitioners, "advanced" medics, and nurses trained for emergency room and remote conditions know the basics of suturing. If the Physician skill is used, the margin of success (or failure) may be added (or subtracted) from the patient's HT roll to recover from that particular injury. At the GM's whim, the Cooking or Tailor skills (at skill -4) may be used if someone has First Aid at 12+. (An additional -2 should be added if the impromptu assistant operates without supervision, but the right tools; see p. B56/223 for tool penalties). Some Cooking techniques include sewing of meat, and may provide this default.

Ward Treatment

"By the skills of lord Elrond, you are beginning to mend."

-- Gandalf, *The Fellowship of the Ring*

Physician is the skill to identify and assign the proper treatment to a previously diagnosed ailment (see p. B 56/213). Those trained in this skill are also able to watch over healing patients, helping them heal faster (see p. B 128/424). In a world where magic works, possessing this skill at 15+ (Veteran/Well-Trained from p. B45/Expert on p. B172) would allow a non-mage to use a healing item or allow a mage to avoid the effects of a Critical Failure of the spell (see p. M50/B248).

"I've finished my nap! Die Drej!"

-- Gune, *Titan AE*

Resting

Part of healing is rest, preferably with an attending Physician (see p. B128/424). Unfortunately some people find the process of injury, treatment, as well as the waiting period while the body heals to be stressful. Combine this with the stress of missed work, inability to help family, and the financial burdens medical treatment can add, and some people break. If the patient has any of Rank, Status, Code of Honor, Miserliness, Overconfidence, Sense of Duty, Workaholic, On The Edge, Vow, and/or Delusions ("Invulnerable"), these might call a person to be literally restless to leave, and thus forfeit healing. A failed Will roll (with a -1 penalty for every -5 points of the above) could prevent a good night's sleep, and thus the opportunity to make a HT roll to regain lost hit points. Perhaps sedatives may help -- a light dose might add +1/2TL to the above Will roll, with no unusual side effects. A strong dose could add +TL to the roll, but a side effect on a Critical Failure may be an allergic reaction (or Addiction) to the drug, and that person gains a penalty instead of a bonus when that particular drug is used (starting with this treatment). Hospitals are a very different environment from most homes. Strange beds, food, staff, patients, and even plumbing can make it an awkward experience for many -- and that's during the day!

Unlucky individuals may become *Addicted* to medications, with disadvantage values varying from -5 to -10 for cost, and those that qualify as "highly addictive" are almost certainly "Illegal" to possess without a prescription (see p. B30/122). Some may even develop Delusions regarding this, such as "I have chronic pain," "I have no problem," or "I can stop any time I want." Recovery from Addictions might follow the "Attending Physician" rules from p. B128/424 (even if the attending expert is using the Psychology skill), giving the patient a +1 or +2 to HT rolls to recover, perhaps at the increased roll rates on the table. This advanced rate represents cutting edge hospital care, with state of the art drugs and therapy. For those that cannot afford this (or choose to visit local priests or counselors), rolls are made at the increased rates, but replace "days" with "weeks" or "months." Meditation (M/H) (see p. CI142/B207) may

be of use in entering a state of rest. This is why doctors and nurses are trained in Psychology: to help patients get the correct mindset to heal.

Illnesses

In addition to plagues (pp. B133-134) and diseases (pp. CII167-174/B442-444), many people catch colds, fevers, and nausea. One way to model this may be to allow a roll versus HT every month, adding modifiers for Disease Resistance and +1/2TL if medical care is available (penalties may be added for smokers, and Overweight persons, and Fit already contains a bonus). On a Critical Failure, the patient gains a secondary infection, and loses a point of HT (Attribute), and requiring hospital treatment to correct it. If the roll fails by 1/2TL (but not Critically), then the illness contracted can quickly be cured by modern medicine (in 2d days). Any other normal Failure could require 4d days to work it out (see "Immunity," p. B133/443).

"Can you get me some of those Flintstones chewable morphine?"

-- Bart Simpson, *The Simpsons*

Pharmacy (Synthetic) (p. CI150/B213) is the occupational skill of mixing and dispensing medication. To be taught this skill in a formal institution, the technician must gain a broad skill in Biochemistry (at least skill 12). The Research skill is not required to allow the pharmacist to research names of doctors, medical centers, the illness in question, and if indicated, proof of insurance coverage. This should be available in commercial databases, causing problems for Zeroed characters and those with false identities. To become a professional pharmacist requires years of training, varying on the level of independence their (future) position allows.

"X-ray, give me an X-ray, or at least a shot of morphine!"

-- Buaku, *Dominion Tank Police*

Electronics Operation (Medical Equipment)

Skills in GURPS are broad enough that skill Electronics Operations (Medical Equipment) allows one to use all medical equipment *designed* between 1950 and 2001 are TL7. This means that the same skill could operate cutting edge x-ray equipment in 1951, and "old" MRI equipment in 2030. For characters with medical technology skills, the GM may want to allow "Optional" specializations to the "required" specialization, such as Electronics Operation (Medical Equipment)(X-Ray)/TL (p. B43/189). This may look complex, but it reflects the specialization that most (if not all) medical technicians take. A short list of some modern "optional" specializations may include CAT (Computerized Axial Tomography), Dental, Dialysis, Emergency, MRI (Magnetic Resonance Imaging), Operating Room, Ward, and X-Ray. Accordingly, Diagnosis, Surgery, and even the Physician skills of doctors working in a large facility are likely to be [specialized](#).

Electronics (cybernetics) and Mechanic (cybernetics) (p. CY17) are counted as useful skills for a doctor that works with cybernetics on a regular basis (even in TL7 for pacemakers and electronic prosthetics, or earlier in a Steampunk campaign).

Cast of Thousands

(Unless otherwise specified, all skills should have some time invested in them.)

Emergency Medical Technicians ("basic" medic)

DX: 11 **IQ:** 11.

Skills: Administration-9, Diagnosis-10, First Aid-14, Electronics Operation (Medical Equipment)-13, Physiology-9, Professional Skill (Paramedic)-12, Psychology-9.

Useful Skills: Area Knowledge, Driving, Running, Survival, Traps.

Paramedic ("advanced" medic)

DX: 11 **IQ:** 12.

Skills: Administration-11, Area Knowledge (City)-10, Diagnosis-12, Driving-12, First Aid-16, Electronics Operation (Medical Equipment)-15, Physiology-10, Professional Skill (Paramedic)-15, Psychology-11.

Useful Skills: Body Language, Running, Survival, Traps.

Beginning Nurse

IQ: 11.

Skills: Administration-10, Anthropology (Sociology)-13/7, Chemistry-12, Biochemistry-10, Diagnosis-12, First Aid-14, Electronics Operation (Medical Equipment)-12, Professional Skill (Nurse)-12, Psychology-10.

Experienced nurses also pick up Body Language, Detect Lies, and other social skills. Emergency room nurses also learn Professional Skill (Paramedic) to deal with trauma patients.

Doctor (just out of medical school)

IQ: 12. Surgeons should also have Increased Manual Dexterity +2, DX 12 or some combination thereof.

Skills: Administration-10, Anthropology (Sociology)-10, Biochemistry-11, Chemistry-13, Diagnosis-14, Electronics Operation (Medical Equipment)-13, First Aid-14 (free from Physician, but possibly higher, default to be traded later), Physician-14, Physiology-12, Professional Skill (Doctor)-12, Psychology-10, Research-12, Surgery-10 and either Fast-Talk (Medical) or Savoir-Faire (Medical).

Some doctors will also have studied Botany, Forensics, Genetics, Pathology, Poisons or Zoology. Less ideal doctors may have studied an unrelated "Minor" such as Physical Education. Surgeons will, of course, have trained their Surgery and Physiology skills to high levels, usually specializing in one body location. See the Medical Examiner on p. CO49 for one example. Their degree should be the accumulation of years of study of Biochemistry, First Aid, and Physiology. Physician, Diagnosis, and Surgery are studied by shifting defaults (p. B45/173) from First Aid and Physiology.

These templates all reflect minimal beginning skill levels, and experienced professionals in a high-learning environment will have their primary skills at much higher levels, up to 15 or 16. In order to survive to be veterans, they will probably also have higher Attributes, particularly IQ. For comparison, all the military templates in *GURPS Special Ops* (pp. 56-69) only have ½ character point invested in First Aid. Only the "Medic" MOSs have Diagnosis, only a few of those have Surgery, and none have Physician.

"With great power comes great responsibility."

--Spider-Man

Hippocratic Oath

Classically, this [oath](#) was demanded of all physicians. Most [modern versions](#) are loosely worded, and thus less restricting. In classic times, the former may be worth perhaps -10 points. In some contemporary liberal areas, including some regions of the United States, the classic oath may be worth up to -15 points because of its restrictions. The modern may only be worth a Quirk if one follows only the literal wording, or -5 if one attempts to follow the spirit of the wording. Beyond being versions of Sense of Duty, Honesty, and/or Vow, it may be appropriate for the doctor to

take Contacts, Allies, Dependents and/or perhaps a Patron (a senior doctor/professor).

Hospitals

Many metropolitan medical centers are miniature cities in themselves, with everything from temporary apartments, restaurants, laundry services, machine shops, power plants, and research labs to internal television and radio stations. In cinema, many also include black labs performing research on experimental drugs, bio-agents, cybernetics, biomods, and genetic engineering.

In many (Atomic) Horror settings, the hospital becomes one of the last places of refuge during a crisis due to the ability to house a number of patients, the emergency supplies, as well as the emergency power systems provide light. A typical emergency system provides three to 30 minutes of battery power, plus six to 48 hours of diesel. An emergency power system provides anywhere from 250kW for a small rural hospital to over 6MW for an urban complex. (This may be of particular interest to *Draw Power* mages, time travelers, and Gadgeteers in a hurry.) In a post-cataclysm situation, the tanks are only likely to contain fuel if the generators are prevented from activating when external power fails. Fire laws in many areas require hospitals to be built with the equivalent of Heavy or Total Compartmentalization and Full Fire Suppression Systems, which limit the spread of fires (pp. VE20 and VE65, respectively).

Adventure Seeds

- While recovering or otherwise spending a lot of time in a hospital, one has the opportunity to hear the story of pretty much any kind of person. Tales of ghosts, treasure maps, or small clues to people's histories can be gleaned from odd connections.
- In a *Cops* or *In Nomine* campaign, the heroes realize they must closely guard (or deeply interrogate) a patient in the upper floors of a hospital while remaining undercover. This could require careful planning or calling in favors, as visiting hours may be limited and people are everywhere.
- In a secret-magic campaign, a PC (or important NPC) is critically injured in an accident or battle with the monster of the week. Before the wizards can help them, medics rush the patient to a hospital. By the time the mages arrive, they find the patient is in critical condition, being prepared for surgery. Can they sneak in, find their ally, and cast the spell without being kicked out? Healing spells from *GURPS Magic* may only take one second, but *Succor* from the ritualistic *Path of Health* takes 5d minutes . . . (see p. SPI95).
- While police take the metahuman criminal Knife Man into custody after the heroes subdue him, medics note the extent of the bleeding injuries our heroes have sustained. They insist with all their will that hospital treatment is necessary. How will these supers react, especially with the gathered crowd watching?
- Stranded in the wilderness after the group's vehicle is disabled, there is certain danger miles away across the countryside. Perhaps it is an evil Scientist who has flown to where their M-Ray is, or the heroes have learned where the bugs are coming from, or some other Great Revelation. Time is of the essence, and since their Patron is incommunicado, helicopter rental companies won't take credit cards over the phone; they might have to fake an emergency call to get an air ambulance . . . Follow-up adventures may involve dealing with criminal charges for misuse of the ambulance system.
- Many people die every year from improper doses of medicine. Perhaps a close/important NPC becomes violently ill (or dies) after receiving a cutting-edge treatment. Is it the beginnings of a *Cabal* or *Illuminati* campaign?
- There is an [emergency](#) and people need help! The medic teams will need help to get to people and get out through rubble and throngs of people. Less scrupulous characters may take advantage of the emergency situation and steal an ambulance and use its "right of way" to get away with . . . murder?

Pyramid Review

Jacob Marley, Esq.

Published by [Cheapass Games](#)

Designed by James Ernest

Original art by Michael O'Connor

60 b&w cards, boards, rules; \$7.50

Jacob Marley is not yet as dead as a door-nail. This must be distinctly understood, or nothing wonderful can come of the review you are about to read. *Jacob Marley, Esq.* has come to haunt your house pleasantly from the Union workhouses of Cheapass Games.

Jacob Marley, famed Dickensian entrepreneur and a good man of business, has not yet passed away -- indeed, he hasn't even got a partner for his money-lending operation. He's in the market for a protégé, someone he might even come to call friend at some point, provided he's as much a covetous old sinner as Marley himself. He'll give you and your fellow apprentices (three to six of you) a stake of cash, and the object of the game is to score 30 points first by gouging the citizens of London for money.

Loan cards are divided up into different neighborhoods. Each card lists the type (actuarial, legal, criminal -- there are six types, and their first letters spell "fiscal"); the principal (how much you pay to take on the loan); the interest (how much the bank pays -- this is the money you'll hopefully get as profit); and a brief bio of who wants the loan and why. If that category of loan is doing poorly when you take it on, extra interest is added (you're taking a bigger risk, so you stand to make more money). All the money is gathered and stacked on the card. If you don't find a loan that suits your fancy, you may leave your calling card to get a loan on a later turn, and the calling card will reduce your investment as well. The economy board has a grid to show how loans are doing: Each row is a category, and columns show how much everything currently pays.

Your employer's business occupies him constantly. At this point he still wanders beyond the narrow limits of his money-changing hole, up and down the streets of London, and wherever he goes the desperate and destitute are sure to follow. Circling the board, he lands on numbers and letters -- you must choose a corresponding type and move its token on the grid that many spaces. For example, landing on 4 I S means you must move either the secret or individual loan token 4 spaces. Only one token can occupy any given *column*; if you move a token to an occupied column, the old token gets bumped . . . and it may also bump a token in turn, so the chain reaction can change loan values fast.

The token you chose to manipulate pays off for everyone. Move the financial counter and everyone with an F loan is affected. If the loan is tanking, the "payoff" goes back to the bank, and you may lose points. If it's doing well, you get the money and any points it awards. When the money is all paid out, the loan is kaput. Making money means more cash to lend, which lets you put your fingers in more pies. More loans paying off gets you more victory points, and first to 30 wins. The loans that score the most points are rarer, though, and pricey to boot, so financial management as you forge the chain you'll wear is key.

The game requires but does not include many components: a pawn representing Jacob Marley, about 10 counters for each player, six-sided die, six economy counters, money, and a way to keep score. Since all the art is clipart, the layout is the only thing in need of comment, and it's just fine. The board and grid are both big enough to accommodate counters and whatever you use as the Marley pawn. The stylized numbers are a bit much (the 8s look like 3s), but the game-related parts on the cards are legible. Each loan has a small story about the people begging for cash and that can

be hard to see, but they're hysterical and worth the eyestrain.

Like that flavor text, it is another example of James Ernest's ability to hide entertainment in plain sight. The mechanics sound easy, turn out to be harder in practice, and then a couple of turns later you're wheeling and dealing like an old hand. There's so little to the game, and yet you find yourself caught up in the moment, your head reeling pleasantly with potential strategies. It suffers a bit from all the material you need to supply, the money especially (do not shut out the lesson when the rules say to bring plenty of 1s), but it's not overly onerous. A financial game for folks who don't even like such fare, *Jacob Marley, Esq.* is good as gold and better.

--Andy Vetromile

a|state RPG

Published by [Contested Ground Studios](#)

Written by Malcolm Craig

Illustrated by Paul Bourne

256-page b&w hardcover; \$40.00

a|state is a new RPG that joins the growing number of games set within a single city. These include *SLA Industries*, *Nexus the Infinite City*, [Freeport: City of Adventure](#), [Judge Dredd](#), and [Kult](#). Indeed *a|state*'s nearest antecedent is *SLA Industries*, but unlike that RPG it is not a product of its time. Where *SLA Industries* drew on the authors' life in Glasgow under the Conservative Government of the late 1980s for its atmosphere, *a|state*'s ambience is one of soil and sweat, soot and survival. While its influences are clear -- the films *Blade Runner* and *Dark City*, and the novel *Perdido Street Station*, *a|state* is primarily Dickensian and industrial in its feel. Its genre is that of steampunk bereft of the constrictions of Victorian society.

"The City" is without a name. It stands surrounded by the acid deserts and desiccated forests of the Outlands. Something prevents travel in the Outlands, though robots are sent out to scavenge. The City might once have had a name, but this and a swathe of information were lost in an event roughly a millennium ago: the Shift. This cut The City off from what was before and left behind the Shifted, strange entities that defy explanation, even after centuries of study. Physically, The City is a series of concentric circles formed by canals that are its main thoroughfares, these traversed by lumbering railways that are heavily policed by the Transit Militia, the paramilitary arm of The Ancient And Honourable Guild Of Fulgurators. The majority of its inhabitants toil daily, whether to earn a wage or to just survive. If they are lucky, they live in reasonable conditions, but most live in varying degrees of squalor. The staple diet consists of tea, dog, and fish caught from the polluted canals. Beyond the television, entertainment consists of the local pub and following the Ekranoplan Racing Season -- canal races between teams of ultra-streamlined, souped up Ground Effect Vehicles.

In comparison, the rich and the executives of the eight citywide macrocorps live in bright clean enclaves protected by security and soldiery. The macrocorps control all of The City's resources and are the source of hitech. This includes biosciences, magnetic repeater weapons, advanced aerostat vehicles, and nano or micro scale mechanical computers called Dingins that are fed programs on magnetic wire tape. In comparison, the average person uses a train or canal barge to get around. His Dingin is macro scale, at least the size of a heavy encyclopedia (and the same again for the cooling systems), and is programmed with punch cards. His weapon might be a cartridge pistol, but is more likely to be a knife or sparklock pistol. This is a single shot clockwork driven firearm that fires a round of compressed brick dust bound with wire.

Unlike *SLA Industries*, The City has no one ruler. The macrocorps control all of the resources and while most of The City is left to its own devices, there is little in the way of local government and criminal culture is rife. Only two really stand out, the Three Canals Metropolitan Area Authority and the RCCR or Red Canal Collectivist Republic, which adheres to the political ideology of collectivism.

Behind the stark white cover, what stands out in *a|state* is Paul Bourne's artwork. It has all been generated on computer, originally in color, but here reproduced in black and white. Surprisingly this has not decreased the quality of the artwork, and the grayscale tones actually add to the atmosphere. That said, in places the figure work is slightly stretched and is invariably too clean given the grime of the setting. Although the text needs another editorial pass, the

layout is clean and looks good. It does present the text in long blocks that is wearing on the eye to read, and it would have easier had it been broken up. The title and leader font does not help this, as it is difficult to read.

But once you start reading, the book is engrossing. This is primarily because of the pieces of color fiction that precede each chapter, and each location's description. Most are simple vignettes, but others are corporate reports and just simple scenes. All are well written, and all serve to bring the setting alive.

a/state uses a percentile system for its mechanics, which are reminiscent of Chaosium's Basic Roleplay System. They are a little more complex in handling combat, which is best described as nasty, brutal, and short. Most characters, including a PC, will probably be incapacitated after a second blow from a weapon. Mere fisticuffs are another matter, but combat in *a/state* is discouraged primarily by design rather than advice. Pleasingly the rules system, including combat is explained in just ten pages.

Character creation is by design; players allocate points to attributes and skills and buy a few advantages and disadvantages. Points and skills are gained to take account of a character's origins and upbringing. Over 20 occupations are suggested. They include the antiquities hunter, essentially tomb raiders; the Flowghost, cryptographers, and mathematicians that use Dingins to extract information from the Dataflow, the setting's equivalent of the Internet; Ghostfighters are knife fighters extraordinaire; Lostfinders, community minded individuals who exist in harmony with The City to locate the lost; and the ex-Mikefighter pilot, combat hardened veterans forced to find other careers after being too tall and too heavy at sixteen to fly the tiny one man craft. The creation process is relatively easy, but several pre-generated characters are included should a player want to bypass it.

The game is supported with a selection of reasonably well-illustrated equipment, a short glossary, a timeline, a full-length scenario, and several adventure seeds. The scenario is a nicely eerie murder mystery, but one that might be difficult to get started with too disparate a group of characters. Its contents do not quite match its synopsis though. *a/state* is short on GM advice, which places an emphasis upon mood and atmosphere, but then it is not designed as a beginner's game. As well as a "lite" version of the game, the publisher's website also includes more ready to play scenarios and a regular newsheet.

So what do you do in *a/state*? Essentially the game is a place to run adventures in, but the rules for experience hint at something more. Players are rewarded more points if they bring "hope" to the people around them. Simply giving a beggar some money might be worth a single Improvement Point, but clothing him and finding him a hostel bed would be worth five. The "creation of hope" should not be revealed initially, but something that the players should learn slowly.

If there is a single problem with *a/state*, it is the lack of information about the nature of the Shifted, and the Shift itself. They figure slightly in the adventure, and prominently in the opening fiction, so it seems odd not to cover them in *any* detail or to be given stats for them.

a/state is a very British game. Tea figures prominently, the currency is in pounds, shillings, and pence, it has English references, and the slang (for example, "dollymop" and "minger") is *very* British. But since *a/state* is best described as Dickensian, this comes as no surprise.

If there is some great back-story to *a/state* -- much like *SLA Industries* -- no word of it is given here. But it matters not. This is a game with a firm grasp of its setting, that successfully brings its grime and grit to the fore through its color fiction. More Dickensian Science Fiction than steampunk, *a/state* is a rich setting beneath its grime, with an eerie elegance lurking in its peripheral vision.

--Matthew Pook

Globally, Locally: Act

As I write this, I'm trying to make sense of numbers. The tsunamis which have struck south Asia and east Africa have caused devastation the likes of which I can't comprehend. And I've been trying to; unfortunately, just when I start cementing some sense of scope in my mind, the latest figures come in, forcing me to try to sort it all out again. This column has so far undergone three revisions over the past 48 hours.

At present, enough people have died to correspond to every man, woman, and child in:

- my childhood city, where my parents currently live
- my current town, my Significant Other's last town, and my Significant Other's parents' town combined
- my previous city -- the state capital of the fourth most populous state in the union.

I've discussed before how [numbers are difficult to fathom](#). Please . . . for a minute, try.

- If you said "Hello" to 118,000 people, taking a mere second to do so for each, you would spend well over an entire day doing nothing but greeting.
- If you got in a car and drove for 118,000 miles, that would be enough to drive four complete circles around the world.
- If you met the gal or guy of your dreams at the dawn of recorded civilization and fathered or gave birth to quintuplets twice a year, every year, you would not be able to replenish the lives lost yourselves.

Tomorrow is New Year's Day, a day where many people make resolutions to better themselves or the world.

If you're looking for suggestions for something to add to your list, I have a humble suggestion:

Help.

Somewhere, somehow, in some way, the world can use your help. Regardless of your views, politics, or outlook, there are things you can do.

Part of the problem is that the problems of the world seem enormous. And, really, they are. No single one of us can solve most of the world's crises, nor even put a dent on a single big one. But, on a small enough scale, we *can* make a difference. And, with 5.999 billion of your closest friends, the math starts working out pretty well toward solving problems.

Sure, the obvious choices are giving money and blood. And if you have an inclination to give either of those, great. Good charities can put an influx of money to use immediately, and millions of lives are saved every year through donated blood. But no one's pocketbooks are bottomless, and not everyone is comfortable (or able) to give money away to charities. And, really, squeamish over needles, anemia, low body weight, and other factors make donating blood an impossibility for many.

But there are other things that can be done . . . and they won't necessarily impact on your life more than trivially.

- **Process:** If your computer is on all the time (such as mine), consider giving your computer's excess CPU cycles to a program that can put that processing power to good use. Some examples include [SETI@home](#) (analysing radio telescope data in a search for extraterrestrial life), [Folding@home](#) (researching protein folding and misfolding, hopefully leading to insight in misfolding-related diseases such as Alzheimer's and ALS), and the [World Community Grid](#) (serving as a central point for other research efforts).
- **One man's junk . . .:** There are many sites popping up that enable folks to give away things that aren't useful to them. These so-called "freebay" sites are often regional, since the postage in mailing a broken-but-possibly-fixable dryer is prohibitive. Some places to begin include [Freecycle.org](#) and [Craig's List](#).
- **Portable thoughts:** Since used books often sell for pennies on the dollar (be they fiction, gaming, or what have

you), consider donating those books to a library, public school, or similar institution.

- **Left foot, right foot; repeat as necessary:** If you're in a small enough neighborhood where you feel safe, each week try to walk one place you'd normally drive. It's healthy for you and saves a bit of the world's gas. (And if you're looking to try to do more good, say "hi" to those you pass; many modern neighborhoods here in the states are becoming more and more insular, and the simple act of smiling as you look your fellow citizens in the eye is a small step toward reversing this trend.)
- **Breath of life:** Learn CPR. In addition to bestowing you with the option to help strangers, you might save the life of a friend or loved one some day. (Regrettably, here in the U.S., these classes have gotten much more expensive than I remember a decade or so ago; while some communities have managed to get them more affordable -- check various local efforts -- they're still outside the price range of most impulse expenses. If anyone knows of any national plans or organizations that are bringing this training to more people affordably, I'd love to [hear about it](#).)

Now, obviously there are lots of things that can be done if you're willing to work, get your hands dirty, and otherwise go above and beyond the call of duty. If you feel the urge to do so, more power to you. But if you don't, you're not alone. And it may still be possible to help, investing much more back in the world than what it costs you.

In many RPGs, players weave wonderful stories about saving the world. It's exciting. It's uplifting. It's rewarding. I suspect many folks want to make things right in fictional worlds because they think it's easier than doing so in the real world. And, on the one hand, it is. But, in a very real way, it isn't.

Like so many fictional settings, this world will always have problems. This world will always need heroes -- people who try to do the right thing for no other reason than because it is right. This world can always use your help.

Help, hopefully, from you.

Have a happy -- and safe -- holiday, and I'll see you next year.

* * *

As we mentioned [last week](#), our first chat of 2005 will be January 7th at 7pm CST with Steve Long of [Hero Games](#). Feel free to check out the [chat section](#) for more information, and hopefully we'll see you there.

Rogues Gallery I: Angel's Harbor NPC Seeds for Modern Games

by Owen K.C. Stephens

An important element of game genres depend on a rogues gallery -- a collection of colorful, unique, and interesting characters for the PCs run face off against. These are most common in pulpy action, over-the-top espionage, and superhero settings, but they can appear in any action-based campaign. The best members of a rogues gallery are memorable and striking, standing apart as unique individuals. It's often difficult to create such characters in the class-and-level system common to most *d20 System* games, since any combination only has so many possible variations. A great deal can be done with attitude, goals, personality and appearance, but ultimately a rogues gallery is going to need a few characters who break the normal mold.

Below area a number of "rogue seeds," names and concepts with a bit of background and a few special game rules. Essentially these are unique templates designed to be slapped on an NPC write-up to turn it from a typical foe to a special opponent with abilities not normally available to his class/race combination. Each seed contains a brief background and description along with relevant game rules. By making these seeds independent of a specific *d20 System* game or class, the rogues gallery ideas can easily be adapted to any campaign. Everything in the game rules of these seeds should stack with abilities gained from classes and feats. For example, if a GM writes up Patchwork as a barbarian, his seed DR stacks with DR gained from the barbarian class.

To help the GM balance NPCs created with these seeds, an effective character level shift (ECL) is given. Add the ECL to the levels of the rogues gallery member to determine it's effective level. Thus a GM creating Patchwork for a *d20 Modern* campaign might make him a 5th-level Strong Hero, 3rd-level Martial Artist. Adding his +1 ECL, this Patchwork is as tough as a 9th-level character. This makes him a typical challenge for a group of 9th-level characters, and a tough challenge for 7th-level characters.

All of these descriptions assume a modern-day game set in the fictional city of Angel's Harbor, an industrial metropolis with many slums, gangs, organized crime families, street-vigilantes, and high-tech companies constantly engaging in industrial espionage. Of course, the gallery can be moved easily to any city or country in the modern or near-modern world, and with a little more effort to other genres as well. (Patchwork might be a legendary ogre of a volcanic badland, while the Ghost Panther is a neo-Luddite terrorist on a far-off world just recently being colonized by a technologically advanced starfaring civilization).

It's worth noting there are no included rules for granting the PCs these abilities. Of course it can be done using typical ECL rules, similar to those for unusually powerful races, but doing so largely misses the point. These are freaks, exceptions to the rules of the society they are found in. The very fact they do things the PCs can't is of what makes them perfect for rogues gallery style games. These foes aren't necessarily better than the PCs, but they are distinctly different.

Fiddleback

Fiddleback is an old-school mafia assassin. His real name is Tobias Alferedo, but no one calls him that. He got the nickname Fiddleback for two reasons. First, he always plays a dirge on his fiddle so that his victims can hear within a week before killing them. This is his trademark, and while he may get the song played on radio, do it as he walks by an open cafe, or get himself hired to play in a concert his victim is attending, he never kills a target without it. Second, his blood and saliva are poisonous and cause necrosis in others, much like the venom of the brown recluse (Fiddleback) spider.

No one is sure how Alferedo came to have toxic blood. His mother died giving birth to him, when his blood and hers mixed during a caesarean delivery. It seems to be a natural condition, causing all other creatures to be severely allergic to proteins created by his body. In the stints Fiddleback has done in the big house, research has been unable to neutralize his venom. An antitoxin specific to him does exist (+6 to all Fort saves vs. his poison), though it's not easy for anyone but federal agents to get.

With a natural deadly poison, Alferedo fell into the role of hit man easily. He was soon a legend, and now is an older man called in only when other assassins have failed. He wears a battered brown leather duster and fedora, and always carries a fiddle case, with fiddle. He is a master dagger and sword fighter, but also uses firearms, bombs, or whatever tools are needed. Of course he can also bleed into a target's wine, making him a very flexible killer.

Game Rules

Fiddleback's blood and saliva are poisonous. He has a bite attack (1d3 plus ½ Str bonus damage) that delivers the poison. Additionally, anyone in an adjacent space when Fiddleback takes hit point damage must make a Reflex save or be exposed to his poison blood. Both Reflex save and his poison have a save DC of 10 + his Con modifier + half his hit dice/levels. Fiddleback can also poison a slashing or piercing weapon by dealing at least 2 hp of damage to himself. The weapon remains until it strikes one target or 2d4 rounds, whichever comes first. He can also use his blood or saliva as injected poisons.

Fiddleback's poison deals 1d6 Con damage for both primary and secondary damage. Additionally, anyone still down Con 24 hours later must make another Fort save (at the same DC) or contract necrotizing faciitis (from *d20 Modern*).

Fiddleback himself gains a +8 bonus to all Fort saves vs poison.

The Ghost Panther

The Ghost Panther is rarely seen, and most consider him an urban legend. He is short and slight, a result of his poor upbringing as an infant, but wiry and agile. He rarely wears more than a few animal skins and two sets of massive, razor-sharp claws strapped on to his knuckles.

The Ghost Panther was born in the Appalachian Mountains to a rural family too poor to feed and care for him. The boy was raised for a few years in a tiny one-room house, but had to learn to fend for himself very quickly. Eventually the family decided one extra mouth was simply too much. Unwilling to have one of their own brought up by the state (which they distrusted), his extremist family opted to place the young, unnamed boy deep in the local woods to die of exposure.

Instead, the boy was found, and adopted, by a pride of eastern American panthers, thought by most experts to be extinct if they ever existed. The panthers survived because of a preternatural stealth, which allowed them to move in and out of the shadows of man's world without ever being seen. The boy grew among them and learned their ways. Not even the man who came to call himself the Ghost Panther knows why the beasts adopted him. What he does know is that they became his family, and they cared for him far more than his human parents ever did.

When the Ghost Panther was a young man, a development company began destroying his pride's home grounds to create a vacation spot (consisting of a hotel, a few cabins, and recreational sports facilities). The pride tried to fight back, killing foresters, sabotaging equipment, and scaring off investors. However, their ability to go unseen did not protect them from harm, and a forest fire begun by the development company (in an effort to clear a large section of land cheaply, though illegally, to recoup money lost to sabotage) killed all the panthers. The Ghost Panther survived, but was emotionally broken. He buried his adopted family and gave up on life.

The Ghost Panther returned to the world of men. He could just barely speak, and lived on the streets as a homeless petty thief. Then, he overheard a drunk corporate officer in the back ally of a bar confess to starting the fire. Bragging, in fact, about how much money it saved, especially after insurance paid for lost equipment the company had actually

sold. The Ghost Panther killed the man, but not before learning he was a minor flunky. The real decisions that killed his family were made in the corporate headquarters, in Angel's Harbor.

The Ghost Panther returned to the graves of his family, and dug up the body of the largest. He took the feline's claws, and fashioned weapons for himself from the sharp talons. He then cut a swath of terror from his home to Angel's harbor, killing representatives of technology, advancement, and human expansion. Since arriving in Angel's Harbor he has made numerous attacks on the corporation that killed his family, as well as anyone who gets in his way. He's learning to deal with modern society, and the more he learns the more he hates it.

While it's possible to be sympathetic of the Ghost Panther's goals, his methods are brutal and his focus broad. Although he began with a hatred for a specific development company, he's come to hate all the aspects of man's society. He hates technology for giving weak, naked apes the ability to overcome noble felines. He hates cities, the written word, religion, philosophy, and charity, as all these things are "unnatural," and, in his eyes, must be destroyed. He's learned to work within these confines when he must to wreck the most damage, but his ultimate goal is to force all men back to speechless barbarism.

Game Rules

The Ghost Panther can always take 10 on Hide, Move Silently and Survival checks, and is treated as if he had max ranks in those skills at all times. He additionally gains a +4 racial bonus to these skills, which increases to a +8 in natural surroundings. The Ghost Panther has low-light vision, scent, and the bonus feats Endurance, Improved Grapple, Improved Unarmed Strike, Run and Track. His base speed is increased by +10 feet, and he has a +8 racial bonus to Climb and Jump checks.

When the Ghost Panther's Hide and Move Silently checks beat a target's Listen and Spot checks, the Ghost Panther acts as if he had full concealment (the same effect as being invisible), even if not concealed. The Ghost Panther cannot initiate a Hide check if observed, but can move from cover to plain view without losing his full concealment, though doing so forces him to make new Hide and Move Silently checks each round, opposed by each observer. If an observer beats either of the Ghost Panther's checks he loses his concealment against that specific target.

The Ghost Panther has an ECL of +2.

Minuteman

Dudley Freedle lives alone in a cabin in the forests just outside Angel's harbor, surrounded by his guns, survival gear and self-defense books. He also has numerous pre-paid cell phones, drugs, gold medallions and shivs, all taken from targets he's brought down in his quest to make America strong again. Unfortunately, only about half his targets are violent criminals. But ever since Freedle underwent an experimental treatment to repair damage done to him in a car wreck, he's seen himself as above the law. This is because Freedle is able to trigger a sudden burst of adrenaline that gives him near-superhuman strength, stamina and agility for sixty seconds. He no longer sees himself as "Dudley" -- in his own mind he is the patriotic Minuteman.

The wreck was an accident, largely brought on by Freedle's eating in his car in rush-hour traffic. He was partially paralyzed, fired, and unable to recoup any losses despite going to court. Freedle blamed everyone but himself, and when he began to run into crackpot theories of a world conspiracy to steal America from hard working common folks, he saw himself as a victim of the shadowy "them" who were fighting to ruin his county. Under normal circumstances, he would have just become a bitter man ranting at the world.

But Freedle had a cousin working at a research lab for one of Angel's Harbor's leading medical technologies companies. The cousin offered Freedle a change to be the first human subject of a new process which replaced damaged nerves with nanites, controlled by biofeedback techniques. The surgery was a success, but had a side effect. Freedle became increasingly violent and paranoid, as well as able to "overload" the system to boost his performance. The more he boosted, the more damage he did to his heart and liver. His cousin decided the process must be reversed.

Freedle decided his cousin was now a toady of the conspiracy, and killed him. He robbed the lab, and used the money to set up his "Cabin of Patriotism" outside town.

Minuteman is a part-time vigilante, part-time kneebreaker. He sees himself as a "real American," but is willing to take money from criminals if it's to hurt other criminals -- or the "bad element" in society, which he takes to include most minorities, lawyers, liberals, and anyone who can be described as leading an alternate lifestyle. To Freedle, an honest, white crook is preferable to someone who might be part of "the conspiracy." Indeed, since he's convinced the conspiracy has its hooks in the government, many organized crime bosses are able to convince Minuteman they are fighting an underground war for the good of all real Americans.

Though physically powerful even without the nanite boosts, Minuteman is not in good shape. He is overweight, nearsighted, suffering hypertension, and mentally unbalanced. But he does very well at his chosen calling, because for 60 seconds at a time he's incredible. He becomes able to roll over cars, shrug off bullets, and jump nimbly from one building to the next. He's learned to wear corrective goggles, assault gear, body armor and carry numerous guns and melee weapons. He's also learned to set ambushes, as he can't afford running fights.

Game Rules

As a free action, even when it's not his move, Minuteman can trigger a nanite boost of his abilities (though not when he's flat-footed). For 60 seconds, he gains +8 Str and Con and +4 Dex. His move rate is increased by 20 feet and he gains a +12 bonus to Jump checks and +6 to Balance, Climb, Swim and Tumble.

Although his Fort save is increased by his higher con, if Minuteman rolls a natural "1" on a Fort save while augmented he suffers a heart attack. He drops to 0 hp immediately, and is staggered. After his 60 seconds are up, Minuteman is Exhausted, and remains so for 1-6 hours. He cannot trigger another nanite boost until he recovers.

Minuteman has an ECL of +2.

Patchwork

Patchwork is a giant of a man, standing nearly seven feet tall with broad shoulders and a muscular frame. He's also covered in burn scars, all with the shape and texture of cloth patches, giving his skin the appearance of a red-and-black quilt. He has no lips, ears or facial hair, and never seems to blink.

Patchwork may have once been an arsonist or fire investigator. He turned up in the river of Angel's Harbor several years ago after a particularly bad Hell Night (a day-before-Halloween tradition when many ruffians set fires to warehouses and abandoned buildings). His burns were so extensive he was not expected to live, but in fact only a few weeks later he walked out of the hospital, injuring the orderlies who tried to restrain him.

From the hospital records, it's clear Patchwork has no memory of his life before the fire. He is unable to talk, but understands others without difficulty. He can read and write, but rarely bothers to do so. Patchwork is uncommunicative and secretive, and generally emotionless. He is also a firebug, with both the knowledge and inclination to set fires that are difficult to suppress. He is now often employed by organized crime bosses as both an arsonist and enforcer. He is known for staying around his fires and defending them from any attempt to put them out -- though he makes no effort to stop those seeking to prevent it from spreading to nearby buildings or putting out other fires it starts.

Patchwork is also now a cold-blooded killer, sometimes used as an enforcer or hired killer. He is particularly popular because he feels no pain -- literally. Patchwork has no fear of damage, pain or death, and has been known to continue fighting after breaking a limb. He is an accomplished combatant, able to use a fireman's axe to great effect, but also dangerous in unarmed combat.

Patchwork seems to have no ambition other than to set ever more complex fires, and watch them burn. Though he's been captured many times he invariably is found insane, and eventually escapes from whatever facility he's placed in.

When working for a particular mastermind, Patchwork is often kept happy by being given things to burn and a place to sleep, rather than with the money and favors many henchmen require.

Game Rules

The fact Patchwork feels no pain or emotions (other than anger) and is resistant to damage has several effects. He is immune to fear and despair effects of all kinds, but also gains nothing from morale bonuses. He is immune to the effects of an Intimidate check. He is immune to any emotional effect other than anger.

Patchwork has DR 1/--, fire resistance 2, and a 25% chance to negate any sneak attack or critical hit. If using massive damage threshold rules, Patchwork is immune to the effects of massive damage. Regardless of what classes he takes, Patchwork uses d12s for hit points/vitality/lifepoints.

When defending a fire he's started, or using fire as a weapon, Patchwork can rage as a barbarian of the same level.

Patchwork is distinctive -- any Disguise check made for him suffers a -10 penalty.

Patchwork has an ECL of +1.
