Your fighting style allows you to parry most incoming attacks.

Prerequisites: Dex 13+, Weapon Finesse, BAB +1

Benefit: When you have a weapon to which Weapon Finesse applies in hand, and you are not flat footed, you gain an armor bonus to AC by at least partially parrying all attacks made against you. Since this is an armor bonus, it does not stack with AC bonuses gained by actual armor. The total AC bonus gained is based on your base attack bonus (BAB), as shown on the table below.

Armor	**Armor**

BAB	Bonus	BAB	Bonus
1	3	11	6
2	3	12	6
3	4	13	6
4	4	14	6
5	4	15	7
6	4	16	7
7	5	17	7
8	5	18	7
9	5	19	8
10	5	20	8

Web Of Steel II [General]

Your fighting style allows you to parry most incoming attacks.

Prerequisites: Dex 13+, Weapon Finesse, Web of Steel II, BAB +1

Benefit: As Web of Steel, except the AC bonus applies any time you have a martial weapon you are proficient with in hand, and the AC bonus is derived from the chart below.

BAB	Armor Bonus	BAB	Armor Bonus
1	3	11	7
2	4	12	7
3	4	13	7
4	4	14	8
5	5	15	8
6	5	16	8
7	5	17	9
8	6	18	9
9	6	19	9

Aiden the Prophet

for *GURPS*

by Bevan Thomas

Marcus clutched his stomach, grimacing from the pain. The disease continued to ravage his insides, and he was unsure how long until it finally killed him. His friends and family had long since abandoned him, fearing that they too would become infected. Now he had no one, and no hope. Then Marcus heard footsteps coming softly towards him, and he looked up and saw the most beautiful person he had ever seen, a veritable angel of a man clothed simply in a gray robe. The man smiled at Marcus and reached out his hand.

"Be at peace, my son," said the man in a voice that echoed with wisdom and kindness. "And be healed."

Aiden the Prophet is a man of almost celestial beauty. His long golden hair frames his innocent face like a halo, and his blue eyes glimmer with love and compassion. Aidan usually only wears a simply gray robe and sandals, though on him, the clothing looks more royal than the resplendent garments of a king.

Nothing is known of Aiden before he appeared a couple of years ago claiming to be a prophet of a new divinity he refers to only as "the Light." He has wandered from place to place, preaching the "Way of the Light" to all who are willing to hear. This is a religion of complete pacifism, poverty, and abstinence, and Aiden has used his vast charisma to convert many others to his faith. Many people believe Aiden to be a messiah who has been sent by his god to remake the world. Aiden believes that all existing governments and social systems are corrupt, and that those who of the Way of the Light should not follow them, but he also believes that passive resistance is the only acceptable form of rebellion.

Aiden is filled with caring for all living things, and is a strict vegetarian and complete pacifist. He helps all those in need, curing them of their illnesses, granting them divine guidance, and showing them the Way of the Light.

Aiden in a Campaign

Aiden can serve as a useful ally for the player characters, using his powers of healing and prophesy to help them in their time of need. Many characters would be sympathetic to Aiden's mission, and some might even become acolytes. Perhaps a ruler or other powerful individual wishes to gain the goodwill and services of Aiden, and sends the player characters to meet with Aiden and come to an arrangement, or possibly the player characters are disciples who must deal with the emissaries and determine their intent.

Because of Aiden's anti-political and pacifistic stance, as well as his vast charisma, he could present a danger to political leaders, particularly in times of war. After all, if many people decide to practice Aiden's pacifistic stance, then there would be much less soldiers in the army, and if too many people converted to the Light, the dominant religions of the area would likely be angry. Many leaders would attempt to dissuade Aiden from his path, and failing that, banish or kill him. The PCs might have to protect Aiden from attack, or conversely might be the people sent to deal with the Prophet. If the characters' country is currently being under attack by enemy forces, then the players might be in a difficult situation, either allowing Aiden to continue convincing more people to avoid taking up arms in defense of their country or somehow preventing Aiden from getting converts.

If a GM wishes to have a darker interpretation of Aiden and his visions, he may decide that Aiden is somehow being duped, and that the Prophet is actually receiving his power from a malignant or even demonic force. For example, a demon might be manipulating Aiden in order to cause schisms and soften people up for an attack. It is also possible that Aiden himself is lying, and that he is manipulating people for his own gain. Perhaps Aiden is gathering an army of disciples to execute some master plan or simply for the egotistical thrill.

Aiden the Prophet   *218 points*

Attributes: **ST** 8 [-20]; **DX** 10 [0]; **IQ** 13 [60]; **HT** 10 [0]
Will 15 [10]; Per 13 [0]; HP 8 [0]; FP 14 [12]
Base Speed: 5 [0] Basic Move: 5 [0]
Basic Damage: Thrust 1d-3, Swing 1d-2

Advantages: Blessed (very) [20], Charisma 10 [50], Empathy [15], Fearlessness 5 [10], Healing (faith healing +20%)[36], Precognition [25], Reputation 4 (a great healer and man of virtue) [20], Transcendent Appearance (impressive) [20], True Faith [15], Voice [10]

Perks: Honest Face [1], Penetrating Voice [1]

Disadvantages: Charitable [-15], Dead Broke [-25], Disciplines of Faith (asceticism) [-15], Pacifism (total nonviolence)[-30], Sense of Duty (every living being)[-20]

Skills: Detect Lies 16 [4], Diplomacy 29[20], Enthrallment (captivate, persuade, suggest, sway emotions) 26 [32], Esoteric Medicine (the Healing of the Light) 13 [4], Meditation 15 [4], Public Speaking 29 [16], Religious Ritual (the Way of the Light) 13 [4], Survival (plains) 13 [2], Theology (the Way of the Light) 13 [4]

Root For The Underdog: John the Conqueror

"I got a black cat bone,
I got a mojo too,
I got a John the Conquer root,
I'm gonna mess with you,
I'm gonna make all you girls
Lead me by my hand,
Then the world will know
I'm a Hoochie Coochie man."
-- Muddy Waters, "Hoochie Coochie Man" (1954)

If you go into almost any botánica -- a store selling ritual items, herbs, candles, holy cards, and so forth for a primarily Hispanic clientele -- in America, you can have your pick of "High John the Conqueror" related items. Candles, floor wash, incense, scented oil, bath soap, you name it. The floor wash and soap occasionally populate the dustier corners of some neighborhood Rexall's or Walgreen's drugstores, even. And this is true whether the neighborhood and the customers are Cuban, Mexican, Puerto Rican, Dominican, or Central American -- or Haitian, or African-American, although then the "botánica" becomes a "candle shop" or "temple shop." High John even shows up in the better class of white "New Age stores," and even, as we've seen, in blues lyrics. In short, John is an American success story. But what, exactly, is it a story about? Let's try to dig around, then, and get to the root of the matter.

"He told me . . . I must go back to Covey; but that before I went, I must go with him into another part of the woods, where there was a certain 'root,' which, if I would take some of it with me, carrying it 'always on my right side,' would render it impossible for Mr. Covey, or any other white man, to whip me. . . . To please him, I at length took the root, and, according to his direction, carried it upon my right side. . . . [Mr. Covey] spoke to me very kindly, bade me drive the pigs from a lot near by, and passed on towards the church. Now, this singular conduct of Mr. Covey really made me begin to think that there was something in the root which Sandy had given me . . . and as it was, I was half inclined to think the 'root' to be something more than I at first had taken it to be."
-- Frederick Douglass, *Narrative Of The Life Of Frederick Douglass, An American Slave* (1845)

John isn't excessively formal, it seems, answering to "John de Conquer," "Hi-John," "John de Conker," and "Johnny Conqueroo," just for starters. The New Orleans slang term "Congaroo" (and the weird Delta version "Choncheroe") probably represents a little verbal slippage between the last syllable of "Conqueror" and the word "root," although where John himself leaves off and the root begins (or vice versa) is kind of murky. The great anthropologist Zora Neale Hurston wrote that "it is no accident that High John de Conquer has evaded the ears of white people." Whether it's an accident or not, John does seem to have kept his origins to himself.

The name, and the root, come out of hoodoo, the magical practice of the black South. Although the word "hoodoo" might well be a corruption of "Voodoo," it has also been traced to the word "Judio" (Spanish for "Jewish," also carrying the connotation of something un-Christian). The fact that the word "hoodoo" turns up in white newspapers (and, among other places, the writings of Walt Whitman) makes a Spanish origin more likely than it originally seems, perhaps having entered the white vernacular (meaning "devilish" or "uncanny") via the Southwest. Be that as it may, "hoodoo" was also the most widespread common term used by post-bellum African-American folk magicians for their art, although "conjure" and the more general "rootwork" also had their followers.

In her fascinating book *Spiritual Merchants: Religion, Magic, and Commerce,* Carolyn Morrow Long propounds a fairly convincing origin for High John, beginning with the munkwiza root used in Kongo spirit magic. Kongo slaves (who would have been mostly brought over after the official slave trade ended in 1808) brought their root magic to America, and cast about until they found a suitable substitute. The Frederick Douglass quote above indicates that root magic is known by the 1830s, and adds another circumstantial detail supporting the Kongo -- Douglass elsewhere describes Sandy as "a genuine African" from "the eastern kingdoms." In 1891 a white folklorist describes a root called "Conjure John" (which could easily be a version of "Conquer John"), and in 1899 an anonymous writer informed the

Hampton Folklore Society that "the king root of all the forest is called 'High John the Conqueror.'" The king had revealed himself at the cusp of the century. In 1954 Muddy Waters completed the making manifest by adding a verse to Willie Dixon's "I'm Your Hoochie Coochie Man," and the ears of white people were opened.

"High John the Conqueror is one of the most famous of so-called LUCK ROOTS. It is believed by many that a person carrying one of these HIGH JOHN ROOTS in his pocket or on his person will never be without Money and will be very LUCKY and Successful in his undertakings. Many superstitiously think that this strange ROOT acts as a powerful LUCK Charm for Winning Games, Drawing Lucky Numbers and that it Helps in Love Affairs and Drives Away Evil Influences and wards off Bad Luck. However, we make no claims to this effect and sell only as a Curio."
-- advertisement, *King Novelty Curio Catalog* (1936)

Even before his heralds were making straight his path into the worlds of blues and anthropology, John the Conqueror had extended his sway. In some cases, it was enough merely to say his name or recite "John over John" as a protective incantation. By 1930 (and probably considerably before that), his root was the most common conjure ingredient among hoodoo doctors all across the South, and it had spread with the post-Jim Crow Great Migration of blacks to Northern industrial cities. Northern firms like Sovereign Products and the L.W. DeLaurence Company of Chicago (which also published pirated Crowley manuscripts) sold John the Conqueror roots, mojo hands ("High John Conqueror Fixed In Bag"), perfumes, and oils through the mail -- usually with the winking assertion that John's powerful magic was sold "only as a curio." John the Conqueror was on bottles, candles, boxes, and soap. His name turned up in books of conjure magic, often twinned with that of Marie Laveau or King Solomon. If John hadn't already been king, such all-encompassing (and so very American) marketing would have ensured his dominance.

So what does that powerful magic of the king root of all the forest do, then? In early hoodoo, John the Conqueror root seems to have been used, as Frederick Douglass did, mostly for protection. One 1930 Mississippi source describes it as warding off disease "brought on by conjure," and adds that "all witches quake when they see a bit of it in a person's hand." (Note, by the way, that the same root seemingly protects the user from witchcraft and white people.) From this defensive beginning, John's "conquering" nature began to expand -- his root would let you "conquer" an unwilling lover, an unfair court, a card game, or a reluctant employer. Slowly, the overwhelming force of High John turns from conquest to attraction -- as the ad quoted above notes, John's "ROOT" draws love, money, good cards, and luck in general to the user, although it still "Drives Away Evil Influences." Landladies would wash floors with High John the Conqueror Floor Wash to clean up any evil luck that might linger there, and to draw new renters to the room. And, of course, John could draw other power when needed -- like virtually every other important plant (especially one that looked as much like a dark-skinned testicle as John's root) it helped "restore male virtue."

"[T]he meaning of John the Conker has varied with place and time and individuals -- especially in hoodoo shops, where . . . anything available is handed to the customer."
-- Harry Middleton Hyatt, *Hoodoo-Conjuration-Witchcraft-Rootwork* (1970)

So what, precisely, is High John the Conqueror Root? According to a lot of sources, it's St. John's wort *(Hypericum perforatum),* a common plant in European herbalism and witchcraft. (It helps protect against lightning.) However, St. John's wort doesn't actually have a big, hefty "male virtue" root, but a whole wodge of oogy white fibers. Some aspects of St. John's wort -- such as the notion that it is most powerful when picked on St. John's Eve -- made their way into High John's lore, most likely through New Orleans Voodoo circles, where French and African magic blended most thoroughly. Other sources suggest Indian turnip, also known as Jack-in-the-pulpit *(Arisaema triphyllum),* or even tormentil *(Geranium maculatum).* But the current consensus seems to favor the jalap root *(Ipomoea jalapa),* which looks just like it should, and probably became the most common John Conqueroo once mass marketing took over the hoodoo business in the 1920s. The only trouble is that jalap (a relative of the yam) is not native to the South, being a Mexican plant from the state of Jalapa. So the true, original High John Root may still be unknown, or it may grow only in the fields of Doo-Wah-Diddy, the Southern black version of the Big Rock Candy Mountain.

John the Conqueror likewise had a court, if you will, of lesser roots. "Southern John" or "Dixie John" or "Low John" is more in touch with his feminine side, being used for family troubles, love, and childbirth. (Hence, his root is sometimes called "Beth Root.") Southern John is most likely the wake-robin *(Trillium grandiflorum),* but might be the Solomon's seal root *(Polygonatum odoratum).* The obscure North Carolina "Running John" seems to have been a

climbing root, possibly a different variety of Ipomoea or morning-glory; it is a more general luck charm, but also helps make the wearer "irresistible to his lady fair." The galangal *(Alpinia galanga),* a member of the ginger family, is known as "Chewing John" or "Little John to Chew." Unlike High John, which is rubbed or worn, the user actually chews and spits Chewing John for luck in court cases and card games. This practice comes straight out of Kongo, where both nganga and normal folk chewed and spat roots for protection and luck.

"He had come from Africa. He came walking on the waves of sound. Then he took on flesh after he got here. The sea captains of ships knew that they brought slaves in their ships. . . . John de Conquer was walking the very winds that filled the sails of the ships. He followed over them like the albatross."
-- Zora Neale Hurston, "High John de Conquer," *The American Mercury* (Oct 1943)

So, High or Low, Running or Chewing, why John? Or perhaps that should be phrased, John who? There's a big, powerful space in the cantosphere labeled "John," and it gets filled out variously: John the Baptist losing his [(prophesying, wonder-working) head](), the hidden king of Asia [Prester John](), the always-dying ever-living John Barleycorn, John the Son of the Bear in folk tales from Spain to Russia, and Johnnie Armstrong who faces down the king of Scotland. And there are plenty of American Johns from Johnny Appleseed (again with the plants) to John Hardy (a bad man of the ballads) to John Wesley Hardin (an even worse man of the ballads) to John Henry, the Steel-Drivin' Man, who really ought to get a whole column to himself one of these days. Zora Neale Hurston identifies John de Conquer with "Old John," a kind of Br'er Rabbit crossed with Batman for the slaves of the old South. He has much in common with the "Jack" of Appalachian folk tales, who is himself the Jack of Beanstalk, Giant-Killing, and similar fairy tale fame. Indeed, conjure hands are often called "jacks," and a mojo jack might well have a hard core of High John.

"High John" would also be Tidewater slang for "conjuring John," raising the possibility that the original John de Conquer was a famous conjure man named John. (The musician Doctor John named himself after just such a famous New Orleans Voodoo priest, a rival of Marie Laveau.) Indeed, one such hoodoo doctor lived on Deal Island, Maryland, but in the 1930s, too late to be the original. (Unless, of course, he was [immortal](). Just sayin'.) This would imply that John came over with the earliest slaves, not the Kongo late-arrivals -- "John" could be an Anglicization of "Ogoun," the West African god (and later Voudun loa) associated with fire, metals, and war. For extra points, Ogoun is also identified with St. John the Baptist, whose wort we discussed earlier. However, our hoodoo Johnny Conquer has as much in common with Legba (who governs chance and [Robert *John*son's]() crossroads) and Shango (who governs virility) as he does Ogoun, so perhaps we should look further.

"These young Negroes reads they books and talk about the war freeing the Negroes, but Aye, Lord! A heap sees, but a few knows. 'Course, the war was a lot of help, but how come the war took place? They think they knows, but they don't. John de Conquer had done put it into the white folks . . ."
-- Shady Anne Sutton, quoted by Zora Neale Hurston in "High John de Conquer" (1943)

In Kongo root magic, each root contains a spirit. These are not individuals, necessarily, but fractal aspects of a larger spirit. (The munkwiza root I mentioned earlier contained the royal spirit.) In the same fashion, a pack of "jacks" might add up to a single King, to wit High John the Conqueror. Just as John de Conquer assembles his persona from Old John, Ogoun, John the Baptist, and possibly Doctor John the Conjure of New Orleans, so too perhaps he draws on the bilongo -- the spiritual "medicine" -- of many different plants. The Iroquois, for example, reverenced a cousin of the jalap, the bush morning-glory *(Ipomoea leptophylla),* as Man Root or Man In The Earth. They rubbed it for hunting luck, carried it for strength and endurance, and burned it to see visions in its smoke. Likewise, the Aztecs and other Mexican tribes used a mysterious plant called Ololiuqui to "communicate with the devil . . . who resides in the seeds," as the disapproving Spanish put it. A 16th-century painting of Ololiuqui shows a big jalap-looking root on the bottom, leading botanists to identify it as the morning glory, or Ipomoea violacea, which as it happens contains a goodish bit of lysergic acid in its seeds. Which seeds, as it happens, the Aztecs called *Tlitliltzin,* or "King Black."

So John is the King Black, the Man In The Earth, the American [Mandrake](). He comes out of the roiling time-lost [Congo]() and draws on the robes of King Solomon feared by demons and of the most powerful King in America, the King on a pack of cards. (Virtually all depictions of John show him as a crowned white king with a neat beard. John can "pass.") And when he has come into his power, he enters the hand of Frederick Douglass, and inspires him to

resist his master Mr. Covey. Three days (!!) after putting the root in his pocket, Douglass fights back for the first time. He beats Covey and another white man, and that victory was what Douglass called "the turning point in my career as a slave." He resolved to be a free man, whatever it took, and won his freedom and eventually the freedom of four million fellow Americans. High John had conquered. So don't rub him the wrong way.

Random Thoughts On . . . McGuffins

Big changes are coming up at Stately Marsh Manor. We're going to be moving from our happy home (well, dumpy apartment) at the end of July, moving from outside of Philadelphia to outside Indianapolis.

Our primary reason for doing so is looking toward the future. The Midwest is interesting because, when they designed it, they included lots of space. When they invented the East Coast, they forgot that people would want to build reasonably sized affordable houses a few hundred years later. While this is a glaring oversight on their part, to be sure, it's no more egregious than the developer who put a two-decade gap between men and women's sexual peaks.

Anyway, I find myself in need of a buffer of some columns, so I'm going to try an experiment. Basically, I'm going to forgo the usual well-thought-out and planned format of my column (HAH!), and instead try a more stream of consciousness approach. The basic idea here is that I'll be writing for about an hour on a topic, probably using a more bullet-point approach. This "Random Thoughts On" series will hopefully prove interesting for you while also giving me the extra time necessary to pack up our worldly belongings and sort them to a point where they'll fit into a 26-foot truck, despite needing two 26-foot trucks to get all our stuff together in the first place.

This week's random thoughts are on McGuffins -- the plot point element that people pursue. The stereotypical -- indeed, classic -- example is the Maltese Falcon, from the book (and movie) of the same name. It doesn't matter *why* people want the Maltese Falcon, so long as it provides the motivating force behind the action.

The problem with most McGuffins, in an RPG standpoint, is that they are usually required (or thought to require) some ability or reward; after all, what's the point of tracking down, say, the Ark of the Covenant if it's just a box that sits there?

In most gaming adventures, the McGuffin translates most purely into the Orb of Power, the purpose of which is normally to thwart some great plot that only the Orb can cure. (The closest analogy I can think of is *Indiana Jones and the Temple of Doom,* where the theft of the Stones of Whatchimacallit led to the famine and despair of the surrounding towns.)

The problem with this approach is that is can seem awfully transparent. After all, why doesn't the Orb of Power have any use once the great plot is undone? Why do all the McGuffins so accumulated disappear in a puff of light at the end of the adventure? Why isn't any other solution possible to thwart the great plot?

There are any number of ways that the concept of the McGuffin can be tweaked to provide better (or at least different) possibilities. At random:

The McGuffin can be a person, sentient, a living thing, or so on. (I think this was the broad plot of the two-hour music video called *The Fifth Element.*) Living things have their own wants and desires. They need to be fed. They can wander off. They can be hurt or even die. There can be a bond that forms between the McGuffin and the PCs, which can lead to their own complications. (For example, what if means of developing the serum necessary to save a colony planet can only be devised from this one animal that had somehow developed mutant antibodies, but the animal had to be killed? Can the heroes accept this choice, even if it looks like a kitten and has survived with the party through firefights, space battles, and explosions?)

The McGuffin can be a place or an unmoving object. One of the broad assumptions of many McGuffins is that they can be picked up and carried around, and the interplay of what happens with the McGuffin as it falls into various hands (or fails to do so). But what if the McGuffin isn't a thing, but a place? For example, what if the McGuffin of the dungeon is that there's only one certain room in the whole labyrinth where the six-hour Ritual of World-Saving can be done? More interestingly, what if that room is, say, one-third of the way into the dungeon? Then the rest of the adventure would either force the heroes to clear out the rest of the dungeon to make the area secure, or -- if time is of the essence -- turn into something of an inverted dungeon crawl as they figure out how to secure the dungeon from two directions: the passageways from which they just came (especially if other forces had followed the adventurers

into the dungeon to thwart the ritual), and deeper within as they respond the ruckus above. (This option would probably be best-suited for lower-powered characters, who wouldn't be as likely to simply seal off the rest of the dungeon with a spell or two.)

The McGuffin has multiple uses, which might cause the conflict in the first place. One common presumption with most plot devices is that they have only one use, the antithesis of which is the avoidance of that use. (The Maltese Falcon is worth money; the Ark of the Covenant can be used as a weapon, or kept out of the hands of those who would use it as a weapon; and so on.) However, there's no good reason for this to be the case. For example, consider if the McGuffin was one of the last of a rare animal species (a pregnant specimen, no less) that can be killed to extract the juice from its gland and grant immortality. The heroes might be charged by a conservation group to protect the creature, while being attacked by another group. (The organization may or may not tell the heroes about the creature's special ability; if the heroes find out during the course of such an adventure, would they succumb to the temptation to sacrifice the critter themselves?)

And, of course, objects can have even *more* uses; a giant diamond would be a source of wealth, a possible focus for a weapon, the means of trapping an interdimensional entity, a snazzy paperweight for a giant . . .

The McGuffin may not be what it seems. If the McGuffin has other uses, it's possible that the heroes can acquire it for one reason and be unaware of its other purposes. As an example, the One True Ring could easily be mistaken for a mere ring of invisibility; if a group of heroes were to stumble across it, they may become embroiled in an epic tale without knowing why. ("Why are these ghoul-things attacking us mercilessly? Why is the landscape all bleak? And why is our halfling bugging out?!")

Or suppose that a brazier has the property that it gets heavier and heavier as the days go by? Oh, and it's also the necessary element for a dark ritual. Then you might have the situation where the heroes acquire it, get tired of its weight, dump it somewhere, depart, and then need to turn around and go back, only to defend it as an unmovable object (above).

As one other possibility in this type of McGuffin -- and at the risk of including a spoiler for an over-two-decade-old product -- the MythAdventures-based scenario from the old *Wizards* book from Mayfair's Role-Aids line had the heroes tracking down a great magical flying device. The heroes find a large chariot that registers as magical in the center of a dungeon, with icons of winged creatures and the like on it; unfortunately, it's too large for the heroes to take it back the way they came, so they need to lug this giant thing through the rest of the construct, which of course is rife with complications. When they get to the end, they are thanked for their efforts at acquiring the flying carpet that was tucked into the chariot -- a carpet which is, of course, easily foldable and carriable -- but are asked why they bothered dragging around the mundane dusty monstrosity. (Big laffs . . . GM hides.)

There is little as tangibly useful in starting a plot and keeping it going (especially for a group of characters) than the McGuffin. With a little thought it's possible to turn even the most hackneyed and common of concepts into something you can sink your teeth into . . . before they're knocked out by artifact-hunting Nazis, that is.

--Steven Marsh

Pyramid Review

Game Master's Pack (for [Warhammer Fantasy Roleplay](#))

Developed by [Green Ronin Publishing](#)

Published by [Black Industries](#)

Designed & Written by Alfred Nuñez, Jr. & Chris Pramas

Cover by Geoff Taylor

Screen Art by David Griffith, Karl Kopinski, Torstein Norstrand, & Geoff Taylor

Interior Art by Dave Andrews, Dave Gallagher, Tony Parker, & Scott Purdy

Cartography by Dave Andrews & Shawn Brown

Four-panel screen in landscape format, cover/map sheet, & 32-page saddlestitched booklet; $14.99

There comes a time when every game gets a screen, but the problem with any such item is not the useful bits of cardboard reprinting all of those handy tables, but what comes with it. Does it come with an equally handy booklet of further references that adds something to the game? Or a scenario that, once run, goes back on the shelf? Further there have been screens, and there have been *screens;* right at the top for sheer quality in terms of quality and quantity of information is ***The Sholari's Pack*** for ***SkyRealms of Jorune.*** This is followed by the ***GM Screen*** published by Hogshead Publishing for the first edition of ***Warhammer Fantasy Roleplay;*** while the screens for both ***Shadowrun*** and ***SLA Industries*** are examples of this object.

So if the screen for the original ***Warhammer Fantasy Roleplay*** was good, how does it compare with the ***Game Master's Pack*** for the best-selling second edition of the game? The pack includes a cover sheet with a reasonable map of the Empire and her neighbors on its reverse, a 32-page book containing an all-new scenario along with various bits and pieces, plus the screen itself.

Starting with the cover sheet, the map is at least handy, but why not print it in color and with more detail? Further, as a single, flimsy sheet, it is going to get lost all too easily. The screen comes in landscape format, the front decorated with cover artwork from various Black Industries books, along with a pair of comments about the Empire. The tables inside are tightly laid out, but are easy to use in play. From left to right, they include the tables for Chaos Manifestation for when magic goes awry; weaponry, combat actions, critical hits and hit locations; movement, illumination, skill types and modifications, and falling damage. All are easy to read, although they lack page references for the core book they are taken from. Some of these tables could have been repeated on the front cover for player reference so as to ease play, but the real problem with the screen is its relative flimsiness. In comparison, Hogshead Publishing's ***WFRP*** screen was the Great Wall of China, being of thick, durable card, and capable of withstanding plenty of punishment.

Alfred Nuñez, Jr.'s scenario, which takes up roughly half of the booklet, dominates the booklet. The remainder details several buildings common to the Empire -- a coaching inn, toll houses, a lock keeper's house, a village, and a farmstead. Long-time fans of the game will recognize these plans from Warhammer Fantasy Roleplay's first edition rulebook, and their inclusion here is an indication of just how good the cartography is. Their immediate utility is enhanced because the booklet's scenarios make use of the plans. The booklet also includes an NPC record sheet and a combat tracking sheet; as well as reprinting more tables from the rulebook which list equipment, and also the effects of delving into dark lore. Overall, pretty useful stuff, and much easier to find than leafing through the rulebook.

Which just leaves the scenario. Penned by the author of *Dwarfs: Stone and Steel* for the first edition of the game, it is designed to introduce new players to the campaign world. Set in the South of the Empire, along the border between the provinces of Talabecland and Stirland in the Great Forest, this is an area rife with banditry and rivalries between various minor noble houses. "Pretty Things" can be run before the scenario "Through the Drakwald," found in the rulebook, and needs to be run with a minimum of four characters, a pre-generated quartet being provided. It opens with the four at a coaching inn, local gossip concentrating upon the arrest of an infamous bandit. The man in gaol though, claims to be innocent, the arresting bounty hunter having got the wrong person. Will the player characters believe him or not? And if so, will they go to his aid? This is only the start of an adventure that sees the party encounter more bandits, slaughter, greenskins (Goblins), and the plight of a noble heir.

"Pretty Things" gives the players plenty to do, and manages to hide its simple and linear nature well. It introduces several elements particular to the Old World (in particular how unfair it can be), but best of all, it does so without resorting to the all pervading threat from Chaos. Indeed, nary a Chaos cultist in sight! In comparison with the scenario found in the rulebook, which is both linear and singular in nature, I do wish that I'd had "Pretty Things" in hand prior to running scenario "Through the Drakwald."

Overall, the *Game Master's Pack* is a decent package after counting up the plus and minuses. On the plus side, the screen is useful, but on the down side, it is flimsy. On the plus side, "Pretty Things" is more than decent scenario, but on the down side, it takes up almost half of the booklet. On the plus side, the reprinting of the tables are useful, but on the down side, surely there was more reference material that could have gone into the book. Yet, the pluses do outweigh the minuses, and "Pretty Things" is actually a much better scenario than several of those that were included in *Plundered Vaults,* the anthology of adventures old and new for *Warhammer Fantasy Roleplay.* To be fair, Pretty Things" is neither spectacular nor outstanding, but in comparison, it is more intelligent, mature adventure than has been published for the game to date, and its like is one that fans of the game deserve to have. The end result is that for the *Warhammer Fantasy Roleplay* GM, the package represented by *Game Master's Pack* is worth having to hand.

Pyramid Review

Space 1889: The Lunar Inheritance

Published by [Noise Monster Productions](#)

Written by Richard Dinnick & Andy Frankham

Directed by John Ainsworth

Starring Neville Watchurst (Captain Nathaniel Blake), Jack Galagher (Mr. William Brooker), Helen Goldwyn (Miss Annabelle Somerset), Max Bolinger (Colonel Molokov), Jason Mitchell (Lieutenant Matheson) with Nicholas Briggs (K'chuk/Jank) & Garrick Hagon (Doctor Cyrus Grant)

65-minute audio drama; $22

The destination for *The Arina Stone Trilogy,* the series of audio dramas published by Noise Monster Productions and set in the milieu of *Space 1889,* was Mars. Over the course of three adventures the listener heard the last few hours of the doomed ether liner, *HMS Perbindesh,* thrilled to journeys along the Red Planet's canals and chases out into her deserts, and learned of the fate of the city-state of Alclyon. With high production values and excellent performances, the trilogy superbly brought both the setting of the game and the attitudes of the period to life and to the ear. With that trilogy complete, Noise Monster Productions' fourth audio drama set in the worlds of *Space 1889* brings us much closer to home.

As the title suggests, *The Lunar Inheritance* is set on and in the Moon. It is more obviously inspired by H.G. Wells than the Edgar Rice Burroughs of the previous three CDs and it is also draws very heavily and far more obviously upon the roleplaying game than does *The Arina Stone Trilogy. The Lunar Inheritance* is a sequel to two *Space 1889* adventures. The first inspiration adventure is "On Gossamer Wings" from the core *Space 1889* rulebook, in which the adventurers join the American inventor Doctor Cyrus Grant in testing out a new device -- the "Ether Propeller Governor" -- that will make journeys to the Moon much, *much* easier, and after crashing discover the fate of a lost Russian expedition. The second is "River of Life," which appears in the scenario anthology *Tales From The Ether* and is also a sequel to "On Gossamer Wings." Once again, the adventurers find themselves on the way to the Moon, this time at the urging of Annabelle Somerset, the young niece and ward of Doctor Grant. He has disappeared, and in order to affect a rescue, the adventurers must penetrate deep into the Selenite core where they will uncover a strange new race and its fantastic science. Both Doctor Grant and Annabelle Somerset appear in *The Lunar Inheritance,* as do other signature characters from the game.

As *The Lunar Inheritance* opens, someone else is coming to the rescue of Doctor Grant a second time. The British government has an interest in the good Doctor's work and also in monitoring the activities of the Russians in the Lunar environs. *HMS The Indomitable,* the Royal Navy's latest ether ship, commanded by Captain Nathaniel Blake, has been ordered to respond to the Doctor's distress call, which also warns of "space lightning." Also aboard is Mr. William Brooker, a former associate of Doctor Grant who has an understanding of the Doctor's inventions and happened to part company from him following a personal disagreement.

Within moments of coming upon the Moon's dark side, *The Indomitable* is struck by the mysterious lightning and is forced to land on the lunar surface. While her crew repairs the vessel, the Captain and Mr. Brooker leave the ship and

make their way to the Great Canyon known to lead into the Moon to where the insectoid Selenites live, and far below that to where the Moon Men live in their City of Light and Science. It is quickly apparent that the Russians have made great strides. Not only have they installed a lightning gun capable of disabling an ether ship of war, but also a massive elevator that enables them to descend and ascend the chasm with ease and in comfort. In keeping with the then-nature of Tsarist society, the Russian military has enslaved the Selenites into a caste of new lunar serfdom. Blake and Brooker also make contact with Miss. Annabelle Somerset and K'chuk, the insectoid Selenite first seen in "On Gossamer Wings." It is clear that the relationship between Miss. Somerset and Mr. Brooker is strained for reasons unspoken, but together the quartet decides upon a plan. Splitting their forces, Miss. Somerset and Mr. Brooker will disable the Russian lightning gun and after collecting the "Ether Propeller Governor" from her uncle's downed vessel, will install it aboard *The Indomitable,* enabling the ship to enter the Canyon. Meanwhile, Captain Blake and K'chuk will ride the Russian elevator and find their way to the City of Light and Science not only to find Doctor Grant, but also to determine the nature of the links forged between the Russians and the Moon Men.

In comparison with *The Arina Stone Trilogy, The Lunar Inheritance* is a far simpler, more direct tale. Less character driven, much more of an adventure tale, this installment moves heavily into the Pulp mode. Advance the events four decades into the 1930s, substitute the Nazis for the Russians and the Tsarist heavy machinery with Aryan super science and the seams would hardly show. Or, indeed, advance it another two decades into the 1950s, and substitute Communist and Soviet as necessary.

What suffers, then, in this audio drama is the characterization. True, there is not the time to develop the characters in *The Lunar Inheritance* as there is in *The Arina Stone Trilogy,* but the actors must work hard to overcome the stereotypes present in the script. All approach this tale with gusto and it cannot be denied that they give it their best. It is unfortunate that the part of Mr. William Brooker feels flat and underwritten, but then there were characters in the early part of *The Arina Stone Trilogy* that felt as weak but were given room to breathe and develop later on. One character unlikely to receive this room is Colonel Molokov, played by Max Bolinger. Thankfully, never reaching the depths of the moustache-twirling villain, Molokov is rarely more than the one-note military officer loyal to the Tsar.

Two performances do stand out, though. The first is that of Nicholas Briggs as the Selenite K'chuk (he also undertakes the role of Jank, the leader of the Moon Men), his long experience as the voice of the Daleks -- including on the recent revived *Dr. Who* television series -- stands him in good stead. Although electronically aided, Briggs' diction perfectly captures how you feel that the alien Selenite should speak. The other is Garrick Hagon as the slightly deranged not-quite-a-mad-scientist Doctor Cyrus Grant. Probably best known for playing *Star Wars'* Biggs Darklighter, Hagon is a veteran of several audio dramas, with his Doctor Grant being the bullish counterpart to the reserve of both Captain Blake and Mr. Brooker.

The production values for *The Lunar Inheritance* are as good as the listener has come to expect. In particular, every effort has been made with the sound effects and incidental music to emphasize the all-too-alien nature of the sub-selenite world. The incidental music plays a relatively role compared to the previous trilogy, where it was occasionally a touch tinny. Nevertheless, the overall sound quality of the drama is superb. As before, the CD is packaged with a nice little booklet detailing some elements found within the story. Similarly, it leaves the reader wanting more information.

Ultimately, the truth is that *The Lunar Inheritance* is just not as good as *The Arina Stone Trilogy.* It lacks the depth and thoughtfulness, and listeners coming from the first three to this drama wanting more of either will probably be disappointed. This isn't entirely fair, because if you step back and approach this drama as a straight adventure tale, then *The Lunar Inheritance* is still an entertaining affair. It is also a good listen, one that brings to life several of the **Space 1889's** signature characters.

--Matthew Pook

Pyramid Interview

Simon Rogers of ProFantasy Software

Interview by Steven Marsh

For over a decade, there has been one name practically synonymous with RPG map-making programs: ProFantasy Software. Their software product line, *Campaign Cartographer,* has seen several major releases, numerous add-ons, and thousands of maps. Now, with the full release of *Campaign Cartographer 3* looming large in the near-future, we took a few minutes to chat with Simon Rogers.

* * *

Pyramid: **Before we get into the meat of the interview . . . Simon, you've been with ProFantasy Software for many years now. What's your role at the company?**

Simon: ProFantasy's management structure is like an ettin's heads; Mark Fulford and I desperately try to control the company's lurching body and chastise freelancers with our big metaphorical club. All of the other work is done by long-term freelancers scattered around the world in Sweden, the continental U.S., the U.K., Germany, Australia, and even Hawaii.

Pyramid: **Fair enough. So, it's been a busy 12 months (give or take) for ProFantasy Software; last GenCon saw the release of the massive *Tome of Ultimate Mapping* in hardcover and PDF formats; *Temples, Tombs and Catacombs!* came out last October, and *Campaign Cartographer 3* looks to be coming any day now; have I got everything right?**

Simon: Almost. We've released the early adopter version of *Campaign Cartographer 3,* with an eye toward a full release at Origins 2006. *Campaign Cartographer 3* was a glint in our eyes back in 2001, when Peter Olsson, our lead programmer came up with a way of adding effects and bitmaps to CC.

Pyramid: **If I'm remembering correctly, the original *Campaign Cartographer* was designed for DOS-based computer systems, while *Campaign Cartographer 2* and *Campaign Cartographer 2 Pro (CC2 Pro)* were designed for Windows 95 systems. Can you provide a bit of overview as to what systems *Campaign Cartographer 3* is designed for?**

Simon: *Campaign Cartographer* for DOS was launched at GenCon UK in 1993; it fit on a single floppy disk and was based on FastCAD DOS. We skipped Windows 3.1 and went straight for Windows 95 to make *Campaign Cartographer 2* in 1997. *CC2 Pro* was launched in 2002 and should really have been called *Camptaign Cartographer 3* in retrospect -- the improvements were immense, although both were based on the same CAD engine.

Campaign Cartographer 3 is a very different beast, and will make use extensive use of system resources where they are offered up for use, massively increasing speed. The basic system requirements are any system which runs Windows 2000 or better, although we've had no problems running it under Windows 98. Disk space requirements are 350MB and a recommended minimum of 256MB memory.

Pyramid: **Since a lot of our readers are fans of non-Microsoft platforms, do you know if users will have any luck running *Campaign Cartographer 3* on alternate systems (Linux with WINE, VirtualPC, or the like)?**

Simon: This has not been tested, I'm afraid. My guess is that *Campaign Cartographer 3* will be less likely to run on these systems than previous systems.

Pyramid: **How come?**

Simon: Like its predecessors, *Campaign Cartographer 3* is written in assembly code. We are pretty confident that it is the fastest PC-based software in the world for handling multiple large images. Assembly code means no cross-platform compatibility. Rewriting it for the Mac is beyond our means and would not make commercial sense -- it's not *Doom 3,* regrettably. The only bone I can throw to non-PC users is that Mike Riddle of FastCAD is working on multi-functional cross-platform software which would form the core of a new version in the future.

Pyramid: **It seems that ProFantasy Software reserves full version-number changes for huge leaps forward in technology for the series; the leap from the original *Campaign Cartographer* to *Campaign Cartographer 2,* for example, exemplified the growing pains from DOS to Windows, permitting many more font options, ease of printing, differences in window sizes and hardware, and so on. What's new and exciting about *Campaign Cartographer 3?* What's the "big draw"?**

Simon: Yes, we give out many substantial improvements free and have big gaps between versions -- not just bug fixes. *CC2 Pro,* for example, has had eight universal updates.

In short, *Campaign Cartographer 3* allows you to create more beautiful maps with special effects in many different styles, more quickly and easily, while maintaining the product line's signature power and functionality. It includes an attractive new set of art in PNG format created by Dave Allsop (who's worked on *SLA Industries* and the *Book of Unremitting Horror*). I'm afraid words aren't the best medium to demonstrate what is possible.

Pyramid: **That's okay; we can include screenshots.** *[See below]*

Simon: *Campaign Cartographer 3* gives much of the power of very high end graphics software, but at an incredible speed in comparison. We've created an optional simple interface for new users, and the software does a lot more hand-holding, while allowing power users to do what they have always done.

The style elements of *Campaign Cartographer 3* allow our master mappers to create sets of drawing tools, symbols, and templates so that others can make maps in any style they can imagine, rather than painstakingly following the masters' suggestions. If you want a photorealistic floorplan, a pencil-sketched dungeon, a blue print or clean-looking modern map, style packs will enable you to do this.

Campaign Cartographer 3 also allows you to use the vast selection of art available on line, and in particular the excellent art resources collected and collated by the GM Syndicate. I'd like to take this opportunity to thank all the many art contributors for their selfless efforts. GM Syndicate is making it easy for *Campaign Cartographer 3* users to add their art to the maps. Expect to see *Campaign Cartographer 3*-ready symbol catalogs over the next few weeks.

Pyramid: **Can you give some examples as to the "hand-holding" that the simple interface does?**

Simon: The simple interface consists of a single toolbar which allows you to do almost everything a new user requires, and most of what advanced users need. Working from the left of the toolbar you select drawing tools will build up your map with land, rivers, roads, etc, add symbols and you have the editing tools you need to change them. Many of the icons are familiar already from other Windows software, so the learning curve is substantially reduced.

Pyramid: **Tell us a bit about how the new version was developed. What's "under the hood"?**

Simon: All our software makes use of a core CAD engine called FastCAD written by Mike Riddle, the original creator of AutoCAD. We've worked with him to make changes in the engine over the years, but the majority of the code is written by Peter Olsson, who is the quickest, most adaptable programmer I know. *Campaign Cartographer 3* is very different developmentally, because it uses a special custom-written version of FastCAD, with totally rewritten display routines.

Campaign Cartographer 3 was conceived based on users suggestions on our excellent mail list, and by a bit of code Peter Olsson, our senior developer wrote in his spare time back in 2002, I think it was. He worked out a way to add effects and artwork to drawings, and these enhanced the final appearance no end. However, at the time the FastCAD engine could not reliably cope with the challenges he set. We approached Mike Riddle of FastCAD with our

requirements. It took three complete rewrites of the core display engine before we were all happy with the end result, and Mike had to custom-write all the display routines, because the standard Microsoft tools weren't fast, attractive, or flexible enough. We decided that ease of coding was less important than ease of use. So, even the *Campaign Cartographer 3* core was written especially for us. Peter and I worked intensively on his code, adding the new features; and Joe Slayton, who programmed *Fractal Terrains,* created many of the effects.

Pyramid: **For those unfamiliar with *Campaign Cartographer,* can you give an overview of the process of using the software to make maps? Is it like a "paint" program, an illustrator program, or what? How much does the user need to know before starting a new map?**

Simon: *Campaign Cartographer 3* takes you through the initial process of creating a new map with a wizard, letting you choose a look for your map before you even get started, as well as setting out the size and any map furniture.

Then you use set of draw tool buttons to add features to the map. Their appearance depends on the current drawing style. For example, if you added forest, you might see a bunch of little trees, a texture, or even a tree-like scribble depending on the style. On a floorplan, draw tools can add rooms or caves to the map.

After this you select smart symbols from the symbols catalogs. Symbols are "smart" because they react appropriately according to their type -- you can click on a tree symbol and it will select randomly from the list, a door will align itself to a wall and cut a hole, or you could select a rail symbol and start drawing a railway network with bends and end pieces. After this you add text labels and a hex or square grid.

Finally, you can add effects. This is what gives your drawing the professional touch. Each draw tool adds to its own sheet in the drawing, and each sheet can have multiple effects. You might add a shadow and a bevel to the walls, an inner glow on the floor, and an outline to make the text stand out.

Pyramid: **Can you give any idea about how long it takes to make a map, either when you're just starting out or when you know what you're doing? (Obviously it depends on the quality and complexity of the map . . . But, as an example, how much time would it take -- once you're up to speed -- to generate something like this one** *[See Illustration 1]***?)**

Simon: That took about half an hour of drawing (at this stage the map was ready), then at least another half an hour with me fiddling with effects until it looked just right. This one *[See Illustration 2]*, by contrast, took about 10 minutes, as I saved the effects

Illustration 1
Click for larger image

setting from the first map and reused them. A complex overland map can take many hours, and be built up as the campaign progresses.

It's actually developing new styles of maps which takes time (and relatively advanced knowledge) but *Campaign Cartographer 3* enables advanced users to create style packs incorporating the techniques they have developed into drawing tools, textures, and templates.

Pyramid: **Does the release of *Campaign Cartographer 3* mark the end of support**

Illustration 2
Click for larger image

and expansion of the Campaign Cartographer 2 line?

Simon: We have one more *CC2 Pro*-compatible product to release: *Source Maps: Cities* -- twelve real-world cities with stats, images and maps, populated for a number of different game systems and supported online by a forum. We will continue to offer technical support for previous versions.

Pyramid: **How compatible is** *Campaign Cartographer 3* **with the old line? Is the** *Tome of Ultimate Mapping* **still applicable? Are any of the other add-ons usable with the new version? That sort of thing . . .**

Simon: In a process that will take a couple of months, we are updating all our add-ons so that they work with *Campaign Cartographer 3.* When this process is complete, *Campaign Cartographer 3* and the *Campaign Cartographer 3* upgrade will automatically update any *CC2 Pro* add-ons for compatibility with *Campaign Cartographer 3.* In the transitional period, people can work with *CC2 Pro* and *Campaign Cartographer 3* side by side.

The only thing that won't be included with the *Campaign Cartographer 3* update is new artwork for the add-ons -- we are releasing art packs for add-ons, starting with *Dungeon Designer.* These will be available at additional cost to existing add-on users, but will be included in the add-ons after their release. Any purchase of an add-on from now will include a one-year upgrade insurance guarantee, so that if we release any art, they will get it.

The *Tome of Ultimate Mapping* will still be useful, but slightly redundant. We will be releasing a special *Campaign Cartographer 3* supplement free for existing users of the book, and when we finally re-release the *Tome of Ultimate Mapping* for version 3, users who purchased the *Tome* after the release of *Campaign Cartographer 3* well get a free updated PDF.

Pyramid: **So they won't need to buy the book twice to get the new information, eh? ProFantasy Software has always seemed to go out of its way to ensure that existing users are well taken care of; for example, I remember the utilities that enabled me to convert the old** *Campaign Cartographer* **for DOS symbols to the new** *Campaign Cartographer 2* **format, and I loved the "magazine"-like electronic issues that -- if I recall correctly -- were released around the early days of** *Campaign Cartographer 2.* **Do you have any thoughts on ProFantasy's commitment to customers? Is this something ProFantasy feels they need to do to remain competitive, a desire to foster loyalty, or some other philosophy at ProFantasy?**

Simon: Thank you. I do think we give good customer service -- it's something on which we pride ourselves. That means replying quickly to emails so that you don't have to spend more time down the line dealing with a worse problem, contacting customers preemptively if there are foreseeable problems, changing our minds when we are wrong about something, and looking after existing customers with free updates and fair upgrade prices, as well as retrospective discounts or free copies for people who buy near a version break.

It's partly a matter of pride. I don't want to work for a company that gives poor customer service and tech support. I've been on the receiving end often enough, and I think you have to lack self-respect if you can live with large numbers of frustrated customers. People can and do pirate our software. We do what we can to prevent it, but the biggest weapon

we have against it is customer loyalty, driven at least in part by good customer service and resources. The fact that we have a happy community means that our tech support burden is substantially reduced, as other users will do what they can to help newcomers.

With software, you can only offer good customer service if the software is robust, well documented, and reliable; otherwise it becomes too expensive to deal with the feedback. *CC2 Pro* (and now *Campaign Cartographer 3*) fulfils these criteria.

Good service creates a virtuous circle, giving people willing to buy the software a reason not pirate it, then giving them a reason to upgrade, then help others who own it, and finally recommend it to other people. This gives us a glow, and sells us more software.

Pyramid: **All good things, no doubt! What do you see as the target audience for Campaign Cartographer 3? Is it designed for neophytes? Hard-core gamers? Minis enthusiasts? Has the target audience changed significantly since Campaign Cartographer 2?**

Simon: The target market has expanded. Our add-ons have made *CC2 Pro* much more than a fantasy mapping program, with modern and sci-fi options. The new version with its simplified and improved interface makes it more intuitive for new users as well as some *Campaign Cartographer 2* users from many years ago who abandoned the original *Campaign Cartographer* due to perceived difficulty of use. New art will transform some add-ons; for example, *Dioramas* will be unrecognizably better.

The new version is also aimed at people for whom aesthetic appeal is as important as utility. They don't want their maps to look like a standard map. *Campaign Cartographer 3* will give them the tools to do this.

Pyramid: **Since some of our readers work in the professional side of the gaming world, I'm curious: What are the rights for maps produced with the *Campaign Cartographer* products? Are there any restrictions? Can they be used in commercial products?**

Simon: The simple answer is, in 99% of cases, yes, you can do what you want with your maps. There is, however, some small print . . .

You can redistribute or sell any *Campaign Cartographer 3* native file, but not the supporting artwork if it is ProFantasy's. *Campaign Cartographer 3* maps don't actually contain any PNG artwork; they rely on it being present on your hard drive. You can redistribute any file exported from *Campaign Cartographer 3* in any flat format (PNG, for example). You cannot redistribute any drawing that is or appears to be a way of redistributing our symbols. If you think of *Campaign Cartographer 3* as a word processor, and the artwork as fonts, you'll get a clear picture -- you can produce documents in Microsoft Word in any font and redistribute them; you can even produce PDFs of them, but you can't redistribute fonts or create "books of fonts." To give you an idea of how much of a problem this is, we've had three cases of this in the past 10 years. For *Campaign Cartographer 3,* there is one additional restriction: You cannot release products which consist primarily of floorplan-scale maps with *Campaign Cartographer 3* art -- things like the RPG Objects *e-Adventure Tiles* -- without our written permission. You could do this if you were supplying native *Campaign Cartographer 3* files -- although the end user would, of course, have to have *Campaign Cartographer 3.*

Pyramid: **ProFantasy Software has long had a history of expanding outside the arena of map creation, providing some standalone map products, such as the *World War II Interactive Atlas* and the *Forgotten Realms Interactive Atlas.* How successful have these products been? Have they presented any special challenges?**

Simon: The *Forgotten Realms Atlas* was an enormous challenge, and it has the accolade of being name-checked on *The Onion.* [See http://www.theonion.com/content/node/38664] Wizards of the Coast sent over boxes and boxes of maps and supplements, and after hours of photocopying, chopping, and taping, we had 15' by 15' of maps on the floor which didn't really fit together. It set the bar ridiculously high for similar products -- it contained over 800 maps. It sold through 20,000 copies pretty quickly, but was not reprinted -- something to do with licensing issues that Hasbro were having at the time. We get inquiries after it every day, and we are always hassling Wizards of the Coast to rerelease it or let us do another one. Code Monkey (the e-Tools people) is working on a new *Eberron Atlas* using the

Campaign Cartographer 3 engine, and I'll be interested to see how that turns out.

The *World War II Interactive Atlas* is a great product. Unfortunately it didn't live up to expectations sales-wise, but I think that is more to do with our marketing skills than any failings in the software. *Source Maps: Castles!* and *Source Maps: Temples!* have both sold through their first print runs, and we are following them up with *Source Maps: Cities!* which will support a wider variety of RPGs.

Pyramid: **In your mind, what are the appeal of maps? You can answer in regards to gamers, fans of licenses, or however you'd like. Is it because they're utilitarian, evocative, useful, or what?**

Simon: Maps in the real world mirror reality. You can almost reach out and touch the land masses and feel the heat of the deserts. This is why maps are so important for games -- the same mental furniture which allows us to visualize the "real" gives us an imaginative boost for invented realities. You can really picture that dark alley, and feel the fatigue crossing the great mountain range. And who can resist "Unknowne Land" or "X marks the spot"? Oh, and moving miniatures round on great big printed-out floorplans is really cool!

Pyramid: **Do you have a favorite personal "map" story?**

Simon: Some of ProFantasy's proceeds have been invested in beautiful antique maps. I remember finding a John Speed original stashed away in a dingy bookshop, with counties outlined roughly in color. This meant that the coloration is original -- some poor sap with a brush had to color in 50 maps, hot off the press. Maps colored later by the Victorians were done with painstaking respect -- and are worth far less. I snatched it up and acquired it straight away -- it was definitely a real-life RPG experience. I hope to scan all these maps and build authentic symbol catalogs for *Campaign Cartographer 3* users.

I also really enjoyed watching a five-year-old creating characters using *Character Artist* at GenCon, while an adult customer was asking me if *CC2 Pro* was hard to use. I pointed at the five-year-old.

Pyramid: **I've long had a theory that, in many regards, computer software doesn't actually cut down on work involved so much as improve the final results; for example, if someone was willing to spend an hour in the old days hand-drawing a map on grid paper for a game, then that person will probably spend the same hour using software such as *Campaign Cartographer,* only the results will be orders of magnitude more attractive and (possibly) useful. Do you have any thoughts on this?**

Simon: I think you are basically right; people love to tinker with the software to make the maps look good -- it gives the players the "wow" factor. I'm not putting down mapping on paper -- I do it myself sometimes, particularly when you need a hastily scribbled improvised area. The main difference is that the time invested in a map created in software, if it is done right, really saves time in the future. My campaign map which I did in *CC-DOS* is now a nice *Campaign Cartographer 3* map -- and I didn't have to redraw it from scratch. Many GMs are using *Campaign Cartographer 3* to build an interactive atlas of their worlds -- linking continents to countries to cities to documents and entering the scribble they made during gaming to update their maps. The ability to hide and show certain features makes it possible to create GM and player maps of the same areas, print maps out as overviews or battle mats from the same file, mask areas to show them as required, or even created sepia-toned or distorted images from the same map. The map is simply a database, and when the data is in there it can be updated and viewed in a multitude of different ways. The availability and utility of information in a *Campaign Cartographer 3* map is much greater than that on paper.

Pyramid: **Obviously, I'm guessing the release of Campaign Cartographer 3 is the biggest news for ProFantasy. What's on the horizon for you all beyond that?**

Simon: We'll be releasing a special version of *Campaign Cartographer 3* for NBOS' *Fractal Mapper* and Fluid's *Dundjinni* (other map-making software), at a slightly reduced price. It installs *Campaign Cartographer 3,* but will also install *Campaign Cartographer 3* artwork into the correct place for those pieces of software, too. The artwork is at a reduced resolution so that it is compatible with their software. We think people will prefer *Campaign Cartographer 3,* but the artwork will allow them to choose, perhaps even using more than one piece of software. If this works out,

we'll make future artwork compatible, too.

Our main work for the next year will be updating the add-ons to the new version and creating new art packs. We respond to events quite flexibly, so what we do will depend partially on the success of the forthcoming releases. I hope we'll be able to do a new Atlas in the next year, too.

Pyramid Review

The Spirits of Niagara (for Niagara)

Published by [Rio Grande Games](#)

Designed by Thomas Liesching

Seven canoes (two for a sixth player, one each for extant positions), whirlpool and sixth-player stickers, 25 paddle-point cards, Hurried Elk foldout, Bathing Beaver pawn, rules; full-color, boxed; $24.95

Competition is getting fierce along the river. Everyone wants those gems, and you can't count on help from your human rivals. To whom do you appeal? *The Spirits of Niagara,* of course. In this supplement to *[Niagara,](#)* collecting one's fabulous jewel selection takes on new directions. In large part it boils down to changing the movement options offered.

For one thing, there's a whirlpool. The game provides a sticker that attaches to one of the clear plastic disks from the original set. You now have to actually keep track of which disks and how many you've sent through the pipeline, because the vortex goes down the river, over the falls, and back into the rotation at the upper end, costing you more paddle points to traverse all the way.

The spirits in question are animal spirits dwelling along the river, and they can be called upon to help the needful adventurer (the whirlpool seems nominally associated with the fish pictured thereon). The edge of the falls were notoriously difficult to reach without slipping over in *Niagara,* but now anyone that far out has an edge of their own: the Hurried Elk. He sits beside the last gem site on the board, waiting to give someone a ride. You can park your canoe atop his head and he'll add two paddle points to your total without increasing the speed of the river. The Bathing Beaver's movement is also governed by the stream; he appears and travels the waterway, but when he falls off the weather indicator is reset to the 0 position. This keeps the weather from becoming a contentious bouncing ball for a select few players.

Your transportation comes with an upgrade as well. Originally each player received a pair of canoes with a single hole dug into each. The new set replaces one of your canoes with a two-hole boat. This one can unbury (or steal) two gems at a time (for a total of three, if you've got the whole fleet launched). So why make it so much easier for everyone to get all these gems? A slightly larger pool of competitors. With this supplement, you can put a sixth player into the expedition. Not only does he have the pawns to get started, there's even a sticker that attaches to the game board to indicate where his tiles are played (at last, a use for some of that vacant land at the head of the river).

Finally, your hand now consists of 10 paddle counters instead of just seven. One of the new tiles is the "1/2/3" playing piece. When played, it affords you a little leeway as to how fast you'll go this turn (and since the number is low, it's a good contender for determining the river's speed as well). The lasso card pulls your boat out of the river entirely for a turn; you may not progress, but you won't be washed downstream, either. Finally, the big guns: a "7" piece that lets you really haul your assets upriver (now you know why you need that lasso).

The supplement continues the quality found in its progenitor. The paddle counters are every bit as good (and they match), and the canoes look and feel like they were cut from the same cloth (so to speak). Bathing Beaver is also a wooden playing piece, and one made with a bit of care. It looks more like an artifact from a gift shop than a pawn from a board game. Hurried Elk may be one of the few disappointments, from a quality standpoint. The idea is solid -- a pair of beast's antlers jutting up out of the water, between which one nestles one's canoe. But it's just a piece of cardboard folded and bent at all the right points, and its fate will be uncertain after several uses.

The new equipment attempts to answer several issues that arise from playing *Niagara*. The weather won't be cornered as before and left in a never-ending loop at one end of the sliding scale. The elk makes those gems at the end more attainable, so you won't have to wait for the right alignment of the stars (or for your opponent's attention to lapse). You can react better with cards like the "1/2/3" tile, and you have greater control over your movement in general. And bringing more players and bigger canoes into play with a single supplement changes any strategies you may have managed to develop. While the play hasn't become any more sophisticated, it is a bit more manageable and less predictable or depressing (or both, if trips over the falls were the norm for your group). *The Spirits of Niagara* have come to help, and by degrees they've done so.

--Andy Vetromile

II&E: Helping Form Match Function

for *GURPS Infinite Worlds*

by Phil Masters

"They call the Intervention Service the I-Cops, and a lot of the time, sure, they do cop stuff. But when did you ever hear police work called **intervention,** *maybe outside some crazy PR-speak? No, they get a lot of jobs that'd make most cops quit the force, and they handle 'em in ways that any real, honest cop would call broken. Minimum, they have to do more undercover and plainclothes stuff than any legit force I've ever heard of. And sometimes, it's plain old-fashioned B&E.*

"Likewise, they call the Penetration Service scouts, and a lot of the time, they're out there playing Davy Crockett, riding the wilderness and ducking arrows. But did Davy Crockett ever have to infiltrate a society 200 years ahead of his own, or work in deep cover in a place where saying the wrong thing to the wrong person could crash the whole of history?

"Face it -- we need people who can handle stuff that ain't cop- work and ain't scouting. And we need to have them available 24-7. The team we don't talk about because they don't exist are good at that, probably, but there's only a few of 'em, and they get the **really** *wacky jobs, and, well, they don't exist. So never mind the PR headache, we're going ahead with II and E."*

-- Colonel John Yarborough, Infinity Patrol (formerly of Denver PD), 2025.

GURPS Infinite Worlds (building on Chapter 20 of the ***Basic Set***) provides a rich and adaptable context for cross-time adventuring, in the form of the Infinity Unlimited. But the Infinity Patrol in that book is designed to handle the sort of issues that Infinity is officially expected to face. The kind of *interesting* problems that the book describes -- the ones that players are going to find interesting, anyway -- too often fall slightly outside the scope of any one part of Infinity's organization structure. Faced with a paperback book from 1985 turning up in a Renaissance echo, or the need to extract Giordano Bruno manuscripts from Azoth-7, or sabotage on a Reich timeline, or the impulse to contaminate the culture of Nergal, it's not clear which division, or even which service, should be sent in -- at least until someone has discovered more about the task in hand.

One answer which Infinity often uses, especially when such problems blow up as unexpected emergencies, is to throw together an *ad hoc* team, taking whichever agents are available at the time, from whichever divisions, and trying to find some with appropriate skills. In game terms, this is fine for one-off scenarios, but makes a continuing campaign hard to sustain. It's also a recipe for ulcers among senior Infinity management; no organization likes to have to *improvise* its way out of regular crises, and the administrative hierarchies of every division which has provided personnel is likely to try and claim authority over the problem, or at least to assert its interest. (This isn't *just* bureaucratic empire-building; every division is responsible for protecting its own people unless they're formally seconded elsewhere for extended service, and officers feel that responsibility keenly.) There's a sense that Infinity's formal structure doesn't always fit its needs.

Which is where the Investigation, Infiltration, and Extraction Section (informally known as the Firefighters) comes in. It's a non- canonical but logical addition to the Infinity structure, and if it looks like a blatant excuse to put together teams of PCs -- well, that just shows that Infinity needs PCs. It not only provides more or less permanent multi-disciplinary teams who expect to tackle the unexpected, it also provides a context for training them in the sort of skills that they'll actually need, as opposed to those which fit the official Infinity model.

Firefighters have to be flexible above all else. One week they'll be investigating a dead agent-in-place on Lucifer-5; the next they'll be on Steel finding a lost Tech Division vulture team; after that they'll be working out whether it was an out-timer who just invented the aerosol can on Dixie-1. Sometimes the Patrol can send a team with expert

knowledge of a particular line, but if they had enough resources to do that regularly it wouldn't be the Patrol. So mostly, Firefighters improvise. But to get away with improvisation in timelines where their accents and assumptions should mark them down as weird, they have to be quick with the cover story -- and sometimes, just as quick with the hypo of Eraser.

Organization

II&E is a new element in the Infinity command structure, just a few months old in its developed form, and it isn't much known to the general public as yet. Unlike ISWAT, there's no deep-deep secrecy here; it's on the books, under its own name, and Infinity spokespeople can and do talk about it if a reporter or Interworld Council representative asks. However, they don't mention it unprompted, because (a) part of its job may involve a certain amount of rule-bending and dirty trickery from time to time, and (b) nobody in Infinity is 100% sure that it'll work as yet, so they'd rather retain the ability to shut the whole thing down with minimum fuss if it all goes bad.

Formally and for payroll purposes, II&E is a subdivision of the Intervention Service Security Division, under the command of Colonel Charlotte Telemann. If anyone does ask, it's described as a set of specialist investigation teams, with the ability to go into short-term cover on a wide variety of timelines. Unlike an ordinary police force's plainclothes investigation department, members are evidently expected to resolve the problems they encounter as often as possible, rather than yelling for uniformed backup to make big arrests -- but hey, that's just part of the Infinity agent ethos.

All this is, in fact, largely true -- but it's only part of the truth, as the name of the subdivision makes rather obvious. II&E is essentially an emergency response unit, albeit with a substantial investigative capability; in fact, the first part of many of its missions consists of finding out what the current problem *is,* after the finely honed instincts or rampant paranoia of some agent-in-place or Infinity high-up have decided that some clutch of anomalies or stray clues smell of trouble. Sometimes, team members have to infiltrate societies on other timelines, or even criminal groups based on Homeline, in the course of their investigations -- and sometimes, they have to recover lost gear or stuff fallen through nexus portals, or even pick up samples of weird out-time technology, or eliminate dangerous magical manuscripts, or bring home rogue agents gone too deep for a simple Internal Affairs bust, or stray tourists too perverse and willful for regular Search and Rescue.

Hence, II&E wants a *wide* variety of skills. It recruits from anywhere within Infinity that these can be found, preferring to take on agents with at least a year or two's field experience in other divisions; however, those other divisions have a natural preference for holding onto their good, experienced people, so II&E often has to take what it can get. Most of its members -- about 70% of the headcount -- are drawn from the Intervention Service, but it has a clear need for the sort of skills often found among the members of the Penetration Service, and it is actively seeking to cross-recruit. Any rivalries between the two services are a relatively small problem here; the real difficulty is that most Scouts joined Infinity because they wanted to be *explorers,* and aren't terribly enthused by the idea of becoming undercover cops and occasional burglars. Frequently, the most effective recruiting pitch that II&E can use is to point out that its members get to see a wider variety of different timelines than many Scouts, who often get stuck in a particular world or type of work.

The Teams

These agents are organized into teams of between four and seven agents, mostly with the rank of Patrolman and mostly each under the command of a single Agent. Quite often, a team will be sent on a mission incomplete, because one or two members are recuperating from injuries, on leave, or off on training courses, or lack some utterly essential skill for this specific job. Teams tend to be kept together, though, partly because they'll have been assembled with at least an attempt to identify complementary skills and personalities and partly because they tend to build up a fair degree of mutual loyalty. Still, *ad hoc* group assignments may occasionally be unavoidable even within II&E, and some degree of personnel transfer and reassignment does happen. Also, the flipside of looking for tight, unforced team loyalty in groups that have to work alone, undercover, away from supervision, is that if team members do somehow prove incompatible, Infinity would rather reassign one or two people than cause a disaster by trying to enforce

unsustainable discipline. A certain amount of shaking out of team rosters is accepted as part of the ongoing process of making II&E work.

The teams in turn are supervised by HQ staff with the rank of Captain, almost all of them with a Justice or Security Division background and the manner of a hardened police dispatch officer. Each of the captains manages between four and six teams; the subdivision also has a few Lieutenants on the strength, deputizing for Captains when they're otherwise occupied or indisposed or leading especially well-regarded or unusual teams. While Colonel Telemann is acquainted with the strengths, weaknesses, and personal records of every team, and will try to assign each task that comes in to a specific and appropriate team, she's a very busy woman, and not always in the office; many jobs go straight to whichever Captain currently has most people free at present, and he's then expected to decide for himself which of his teams is the least worst for this job. Despite this general willingness to delegate problems, the middle-to-high ranks of Infinity, in the annoying way of bureaucracies, are sometimes forceful about asserting themselves and passing down detailed policies when they don't like the way that the teams seem to be operating. Telemann is sometimes seen within II&E as a little too willing to let this attempted micromanagement through -- but she does have a tricky job, and she's still learning what does and doesn't work.

Very Special Teams: One option which II&E is considering, and may implement very soon, is teams selected for specific features or potential. The first such which is likely to be deployed is an all-female team, preferably all with low-tech transport skills, capable of operations along Eleusis Alesia, (see *GURPS Infinite Worlds,* page 79), and also effective for infiltration missions into matriarchal societies, investigations within royal harems, and countless other special tasks. From a game point of view, all this could justify pretty much any sort of common party background or ability, if the GM or players could think of some reason why such a team focus might be seen as serving a purpose.

Patrol Internal Relations

Most members of the Patrol -- certainly most I-Cops in the field -- understand what II&E is, what it does, and why it's probably necessary, and there is little overt friction. Some agents, especially those used to working at HQ or in uniform, such as Intelligence back-office staff or Customs and Inspection, may see it as dangerously undisciplined, and a number of middle-ranking officers resent its tendency to poach some of their best or most promising agents. There have been one or two jurisdictional disputes with Justice, Nexus Oversight, and regular Security Division teams, but these remain isolated incidents for now. Special Ops agents joke about II&E's lack of hitting power and tendency to call for backup whenever some nasty man pulls out a slingshot, but actually rather appreciate the way that II&E keep finding them so many interesting targets.

There is some suspicion among senior officers that Firefighter improvisation sometimes leads to too much cooperation with people who are *supposed* to be "the enemy," including Cabalists and even Centrum agents from time to time. Certainly, Internal Affairs feels the inevitable, instinctive suspicion of any Internal Affairs department towards unorthodox undercover investigators. It may or may not have *infiltrated* II&E.

It is, of course, impossible to generalize about ISWAT, but many of its agents may regard II&E either condescendingly, as a pale imitation of themselves, or more respectfully, as people sharing a burden while being stuck with slightly more bureaucratic oversight. The Interworld Council bureaucracy has a pretty good idea what's going on in II&E, and reserve judgment for now -- but any troubleshooters they send in to find out more are likely to be as coolly cynical as ever.

Characters

The following is a "mini-template" which can be added to any of the standard Infinity templates on pp. 186-187 of *GURPS Infinite Worlds* to produce an effective II&E team member: The template costs 15 points, and the suggested starting level for an II&E campaign is 200 points; these are notably capable agents. In fact, most have typically served in at least two other divisions before they join the Firefighters, and usually find uses for every skill that Infinity has taught them within a few missions. However, because other divisions don't like losing people they regard as good, a lot of those who are permitted to transfer over are the ones who are slightly too enthusiastic, idealistic, cynical, or plain

weird for their previous officers' tastes, which may show up on their character sheets.

(Actually, II&E is developing a slight reputation as a career graveyard, although if it *does* expand, it's going to need to acquire new senior staff from somewhere . . .)

Advantages: 10 points from among Cultural Familiarities [1 each], Languages [varies], Cultural Adaptability [10], Sensitive [5], or Social Chameleon [5]. GMs can add additional options, such as Talents, as they see fit; anything that makes the specific character stand out as especially suitable for II&E duty can be appropriate.

Disadvantages: Nothing is required beyond the standard Infinity Unlimited set. However, note that II&E characters aren't *usually* assigned to a single timeline or undercover mission on Homeline for an extended period, and hence don't usually qualify for the Secret disadvantage. (Their cover stories for undercover work, while crucial, tend to be short-term improvisations.) Therefore, any based on a Penetration Service template will have to take alternative disadvantages, or find the points elsewhere. On the other hand, whichever division they came from originally, II&E service makes an Extremely Hazardous Duty disadvantage entirely appropriate.

Skills: Acting (IQ) [2], and any three of Climbing (DX- 1), Criminology/TL8 (IQ-1), Detect Lies (Per-2), Disguise (any TL) (IQ-1), Driving (any) (DX-1), Electronics Operation (Security, any TL) (IQ-1), Fast-Talk (IQ-1), Interrogation (IQ-1), Lockpicking (any TL) (IQ-1), Makeup/TL8 (IQ), Observation (Per-1), Psychology (Applied, if the GM is drawing the distinction) (IQ-2), Riding (Equines) (DX-1), Savoir-Faire (any) (IQ), Smuggling (IQ-1), Streetwise (IQ-1), or Traps (any TL) (IQ-1), each costing 1 point. Skills acquired from a Division Skill list cannot count towards this template; II&E demands *breadth* from its agents. Conversely, the best II&E agents usually have one or two of these skills at a notably high level.

Note that, unlike the templates in the book, this one defines an ideal, rather than the expected product of a formal training course. All too many II&E members lack this template, although competent team leaders and senior officers try to steer their people towards this pattern.

Team Leaders: A team leader has Rank 2 (+5 points). Most acquire Leadership and Tactics skills, if they don't have them already; the Patrol makes short, intensive military-style training course available to anyone who's just been promoted.

Special Training

II&E members never have the skills they need for the latest mission, and those missions tend to be important. Hence, members get fairly high priority for additional training and refresher courses. Languages are particularly popular, as is acclimatization for a wide variety of known cultures (giving Cultural Familiarity), while military-style intrusion training (primarily improving Stealth skill) is widely seen as the key to staying alive.

Funny Little Secrets: While languages and Cultural Familiarity are often essential for infiltration work, the immediate need in many cases is for the ability to, well, lie convincingly. In addition, some II&E missions are, frankly, burglary jobs, or involve dealings with the rougher side of various societies. Hence, II&E has found the budget to recruit a small group of expert civilian trainers in such things. Members can take courses Acting and Fast-Talk, along with Lockpicking, Stealth, Streetwise, etc.

Many of these instructors have some kind of intelligence background (although some were just brought in from the entertainment business), so they can reasonably refuse to talk about their personal histories in response to casual enquiries. This is convenient in many ways, because some of them have downright shady pasts. Fortunately, someone in Liaison Division was able to find people in Homeline police forces who had old professional acquaintances who were now looking to go straight -- or who would at least consider it if offered good money to pass on their skills instead. There aren't many of these people -- most "criminal technical" skills can be just as well taught by honest security experts -- but II&E wants the best training it can get, wherever it has to go for it. The training available to members thus even extends to the basics of the con artist's craft.

Despite this, and contrary to some rumors within the I-Cops, II&E doesn't actually have any former professional criminals in its actual teams; Colonel Telemann wants professional-grade agents, not potential rogues. Those specialist trainers with illegal backgrounds are carefully watched, and not cleared to learn much about Infinity's activities. Still, they do represent a potential security vulnerability; professional thieves and confidence tricksters are by definition untrustworthy people, and even those trying to go straight are susceptible to temptation, or to exploitation by their old friends.

Even Funnier Secrets: Lastly, despite the above comments, the need for maximum flexibility *may* sometimes lead II&E to recruit field agents from outside Infinity -- and, just possibly, even from outside Homeline. Normally, an out-timer with enough potential to justify breaking secrecy would end up in ISWAT, but there are some borderline cases, and Colonel Telemann has been fighting her corner hard in this respect. (Her colleagues differ over why this might be; she may mean what she says about needing such exotic agents, she may have a relatively dubious opinion of The Secret and be working towards a more liberal policy in Infinity in general, or she may be empire-building.) However, an out-timer needs to have very special abilities indeed to justify such recruitment -- magical talents are one possibility -- and to pass a fairly stringent psychological assessment, checking for reliability. II&E has also managed to acquire a couple of Homeline-born low-end psionic talents.

* * *

With many thanks to Roger Burton West for running the campaign which helped crystallize many of the ideas in this article, and for inputs and commentary.

by Greg Hyland

Murphy's Rules

Breaking the Speed of Light (or Energy Blast, or Magic Missile, or . . .)

by Steven Marsh

Those who know the world of science understand that there are many limits that we just accept. For example, there's the speed of light; some sense of absolute smallness in the realm of matter (currently, that seems to be atoms, quarks, or superstrings, depending on how the microscope is focused); and in the world of temperature there's an absolute zero and its opposite, the Planck temperature (10^{32} Kelvin).

There are also a large number of limits that are "fuzzier" -- limits that can be broken, or are not universal. For example, the speed of a falling body is constant on Earth but different elsewhere (as is terminal velocity). The sound barrier can be broken, and it has an effect -- a sonic boom -- but otherwise doesn't exactly destroy the fabric of the universe. Throughout history, science has also had numerous barriers that it has broken through: the first blood transplant, the first artificial heart, the drive to clone a human embryo.

However, in most RPGs with magic or fantastic systems (including super powers, psionics, and so on), one thing generally lacking is this sense of barriers, looming tantalizingly out of reach or otherwise serving as an obstacle to "out-think." While a space opera game can immediately evoke a sense of wonder and awe by talking about what it means to go to "Warp Factor 9.9" or "breaking the speed of light," there usually isn't a corresponding element in more fantastic settings. No, magic in most settings generally works like we think science does now: do the formula and, if it's done correctly, you get the same predefined result each time.

Some settings introduce an element of risk to this design (for example, wild magic from the ***Forgotten Realms*** setting), including aspects of backlash or odd effects. But these results are usually seen as the exception, not the norm. What if, instead, a setting had these barriers that were a constant reminder of the fundamental forces these unnatural abilities were dealing with? What if attempting to get near -- or exceed -- these barriers was a goal, or a challenge, or a risk?

Here are some ideas for determining your own "barriers" in fantastic settings, as well as some worked examples for various systems.

Creating Barriers in a Setting

To create a barrier in a setting, there are a just a few questions that need to be resolved by the GM.

Determine the barrier. The first thing the GM should decide is what, exactly, will have a barrier. In many settings this will be straightforward, since there is only one "source" or type of power. For example, in a ***Vampire*** setting, all unusual abilities of the protagonists are assumed to spring from the same well (the power of vampiric vitae).

In other settings, this may not be as obvious. A ***d20 System*** setting might have many different forms of non-scientific energy (magic spells, priestly miracles, psionic effects, etc.); would a barrier apply to all of them, or only one form? One thing to consider if there are multiple paths to power is how much the parity will be disrupted if one form has a barrier imposed that other energy types don't. For example, if there's a barrier in the ***d20 System*** about casting any spells above 6th level but there isn't a corresponding limitation on miracles, then it may adversely affect game balance.

Decide if the barrier is "soft" or "hard." In other words, can the barrier be broken (even if it is difficult or causes other effects), or is it an absolute limit (as best anyone can tell)? The speed of sound is an example of the former, while the speed of light is an example of the latter.

Hard barriers are those that, as best as the laws of the universe are currently understood, cannot be broken. Thus, for

example, if no one within a time travel campaign can travel outside the confines of his own lifetime, that's a hard limit.

Soft barriers are those that can be broken, but doing so causes something else to happen. For example, maybe traveling outside of one's lifetime causes the person to appear as an immaterial shade wherever he goes until he returns to his own time.

Hard barriers are generally those that exist as a warning or an absolute for the campaign; their invocation can form the basis for memorable adventures, either as a limit on a plot or a mystery when they seem to be violated. For example, Isaac Asimov's Three Laws of Robotics were (for the most part) "hard" barriers; thus if a robot allowed itself to be destroyed (violating the third law) without there seeming to be a conflicting order or trying to avoid harming a human being (the second and first laws), then something else must be going on, plot-wise . . . perhaps the robot was obeying a human or protecting his life in a way that others couldn't perceive.

Conversely, a soft barrier can serve as a tantalizing goal, a warning, an obstacle, or all of these. For example, the barrier between the Light and Dark Sides in *Star Wars* can be seen as a soft barrier; there is little to prevent one from going from the Light Side to the Dark Side, but doing so has grave consequences for the person who crosses over.

Likewise a hard barrier can be turned soft at any point by a new discovery or procedure. For decades in the real world, runners largely considered the four-minute mile to be a hard barrier until Roger Bannister ran the length in three minutes, 59.4 seconds in 1954. Similarly if a campaign has a hard barrier forbidding time travel to the exclusivity of one's own lifetime, then a new discovery might permit people to move outside that limitation (perhaps in extremely limited circumstances).

Decide if the barrier is relative or absolute. Relative barriers are those that are dependant on circumstance, location, or individual; absolute barriers are those that are constant. For example, the speed of sound depends on the medium; sound travels more quickly through metal than it does through air, for example, and is thus relative. Absolute barriers are those that are the same throughout the setting, such as the speed of light.

Whether a barrier is considered relative or absolute can depend on the scope of the setting. For example, the accelerative force of gravity is pretty much the same everywhere on Earth, so would be viewed as an absolute constant on any Earth-bound campaign; however, since it varies from planet to planet, it would be a relative constant in an interstellar setting.

In our time-travel example, being limited to one's own lifetime is a relative barrier, since everyone's lifetime is different. However, if the limitation were, say, "time travel is only possible to any point within the past 10 years" or "time travel is only possible to a point exactly 10 years ago" or even "time travel is only possible to the year 1953," then that's an absolute limit.

Absolute limits serve as a campaign-wide defining aspect of special powers, such as "no harnessing or control of flame can exceed a blacksmith's tempered fire [10 dice of damage]" or "no usage of psionic powers can compel someone do to anything." Relative limits serve as a means of personalizing or changing the effects of a campaign's powers with defined limitations, but which can vary depending on the effect attempted or the need need of the plot, such as "no harnessing or control of flame can exceed the hottest fire within a mile of the caster" or "no usage of psionic powers can compel someone to perform a deed more sinful than what the victim has done in the past" (or perhaps "than what the *psionicist* has done in the past"!).

Determine what effects getting near to or breaking the barrier will have. There's no point in having a limit if something interesting doesn't happen when you break it (or get close); break the speed of sound and you get a sonic boom, while getting near the speed of light causes all kinds of temporal weirdness.

This step is somewhat optional, since the answer can just be, "It's not possible" (in the case of absolute barriers), but it's usually more interesting to come up with *some* answer to this. Returning to the time-travel example, we have a relative limit that you can only travel within your own lifetime. What happens if you return to the moment of your birth? What about an hour *before* your birth? What about if you go back three months before your birth? Six months?

Nine months? A year? Five minutes before you die? One second after you die? And so on.

The effect of evaporating the barrier can be as subtle or as impressive as you can imagine (although the more explosive options should be limited in their scope, or difficult in their execution, to prevent anyone with the right powers from crossing the barrier and blowing up the universe). To draw two examples from *Star Trek:* In the original series, there was practically no immediate effect to the *Enterprise* crossing the "impenetrable" energy barrier at the edge of the galaxy (nor the similar one at the center of the Milky Way in *Star Trek V*); at the other extreme, a *Next Generation* episode established that travel faster than Warp 5 in some parts of space will generate subspace fissures, causing objects passing through these "space potholes" considerable damage.

Try to think of any other implications this limit has, if any. This step isn't required, but can be useful. What ways can this barrier be utilized for plot possibilities? How would the existence of this barrier affect the game world? How much or how little does this barrier affect thought about the power or nature of the world? (It's especially important for the GM to consider any loopholes or means of exploiting the barrier that the players might find.)

For example, to the modern world, the speed of light is equally fascinating and frustrating, serving as the "limit" of the universe and also the beginning of possibilities. The speed of light makes our instantaneous communications possible while making the nearest star systems seem impossibly far. Its time-distortion effects allow for any number of "nearly frozen in time" hypotheses, and also opens the door to time travel itself. (If you could move one end of a wormhole near the speed of light, it would advance into the future slower than the other end, permitting one to go forward or backward in time depending on which side you took.) And so on. In comparison, the Planck temperature doesn't get as much press, because it's really too darn hot to matter to most folks (being several orders of magnitude above the heat of the sun).

There are, likewise, some theories that attempting to cause a paradox -- such as going back in time and killing your grandfather -- will cause the universe to wink out of existence. Fortunately the universe has made even attempting this extremely difficult.

Okay . . . these principles may be all well and good in theory; now let's see how they can be applied to a few different settings. Obviously, all of these options are just that (options), non-canonical, and designed to be tweaked. This article describes how these ideas can be applied to four different rules sets, with examples of hard/soft and relative/absolute options.

Hero System/Champions [Hard/Absolute Barrier]

When metahumans first started appearing several years ago, their powers were such that, for many, the most interesting thing about them *wasn't* their replication of comic-book powers. No, what was far more intriguing (to scientists and other thinkers) was the fact that the usage of these powers had strange effects that resulted in time dilation. These weren't the barely measurable microseconds of clocks moving at supersonic speeds, either; these were real, measurable differences.

Scientists eventually concluded that tapping the energy source metahumans draw their power from causes the metahuman to "skip" forward in time. At low enough levels, the effect is almost imperceptible; at higher energy draws, the metahuman can disappear for minutes, hours, days, or even longer.

In game terms, the usage of any super-power causes the empowered individual to move ahead in time; the amount moved forward is determined by the total active points of the power (the active points that are actually invoked, for those abilities whose power level can be set by the user); this skipping is always done after the power activates or at the end of the segment (for powers whose effects last longer than one phase). The amount of "skipping" that results is determined by this chart:

Active Points	Total Time Skipped
5	Nearly imperceptible
10	0.01 seconds

15	0.05 seconds
20	0.25 seconds
25	1 Segment
30	1 Phase
35	1 Turn (Post-Segment 12)
40	1 minute
45	5 minutes
50	20 minutes
55	1 hour
60	6 hours
65	1 day
70	1 week
75	1 month
80	1 season (3 months)
85	1 year
90	5 years
95	25 years
100	Gone (?)

If a character has active points that fall between these ranges, the GM can either round up on the chart or else calculate what the effect would be between these ranges.

Power levels below 25 are considered to have no game effect; if perceptible, the character will seem to blink in and out of phase so quickly that others might see him like a flickering television image. (Of course, GMs are free to invoke these effects in their descriptions; an attack that misses or does no damage, for example, might be explained away by the fact that the metahuman attacked had a power active at 20 points and was therefore flickering in and out.)

Thus, for example, if a metahuman with no other powers active has a 10d Energy Blast (no other Enhancements or Limitations; 50 points) that he uses at full strength, he would wink out of existence after firing the blast, appearing 20 minutes later at the same spot.

Active points are determined for each power, and are *not* totaled to determine a single effect (although the time skipped forward is cumulative). For example, a character who has a 15-point Force Field active and 18 points of Armor (which rounds to 20 for purposes of the chart), the hero would skip forward 0.3 seconds per segment (0.05 seconds + 0.25 seconds), not one turn (15 + 20, which has a value of 1 turn on the previous chart).

GMs should closely scrutinize character who buy additive powers that have the same effect (such as two different types of Armor) to keep them from skirting around the limitations of overly high power levels.

When a character skips forward in time, it's as if they do not exist for game purposes; they are not visible and cannot interact with the environment (nor be acted upon by it). However -- and befuddling to scientists at present -- the universe still treats the character as existing, at least in regards to vector and position. For example, a character using a full 55 points of Flight will wink out of existence at the end of the segment and then appear one hour later, *as if he had been flying at the same vector that entire time* (even though there are no endurance costs or other checks made during that period). Among other implications, this effect permits metahumans to use their powers while aboard vehicles; conversely, if (say) the roof that someone is standing upon is demolished during the period he disappears, he will reappear in midair, only to plummet to the Earth. (And, particularly dangerous, if an object or person moved to the spot where a metahuman stood when he skips across time, the character will appear *within* that object.)

These curious properties have led to some metahumans utilizing their powers not for their own use, but rather to take advantage of the secondary effects. For example, one enterprising hero knew he was going to be at ground zero of a dropping bomb, so he used just enough telepathy to read his own mind, knowing that doing so would send him about a minute into the future (and, he gambled correctly, outside the range of the bomb). Another group of villains, rather

than face capture, used enough of their energies to project themselves well into the future; the world fears the day they might reappear.

According to some calculations (which are disputed among the scientific community), the output of power seems to reach a point where usage at that level results in an infinite "skip" across time. Curiously, the symmetrical nature of this equation seems to indicate that there might be some power levels possible beyond that barrier; in much the same way that Einstein's calculations allow for speeds *greater* than the speed of might (if somehow that speed can be reached without ever actually going the speed of light), so too might a much greater power level than those currently exhibited by metahumans permit their usage. This power level, if it exists, is grounds for discomfort among theorists, since it could allow supremely powerful metahumans without the time dilation effects that plague their lower-powered counterparts. (This threshold, should the GM choose to include it, is probably somewhere around the 400 to 500 active point level; thus at 505 points the metahuman would disappear for 25 years, at 510 points he would vanish for five years, at 515 points he would vanish for a year, and so on.)

This framework is suited for a low-level "gritty" supers campaign that still wants flash-bang powers; metahumans are capable of possessing great powers, but their usage at all but the lowest levels will prove inconveniencing or even dangerous. The barriers of this setting also permit more calculating players a chance to "play" with the time-dilation effects.

D6 System using Magic [Soft/Relative barrier]

How powerful is electricity? Physicists know the answer is almost nonsensical, since the variations of what electricity *is* are so many that it's difficult to give a meaningful answer. Electricity can be as weak as the tingle of fur on a glass rod, or as mighty as a chain-lightning bolt. In modern times, the limitations of what electricity can do are not due to the nature of the flow of electrons, but the ability of the generators to channel them and the devices they power to harness them.

This same idea applies to magic. As best as sages have been able to determine, magic is an infinitely powerful resource. Unfortunately, the ability of magicians to harness this energy is exceedingly finite. But, in much the same way as a water wheel can be driven past its limits by a raging flood, so too can mages access energy beyond what they would normally be able to do. Of course, in much the same way as the water wheel can be destroyed in a torrent, so too can the mage be consumed by attempting to channel too much energy.

In game terms, the mage can choose at any time before rolling the dice that he wishes to open the channel of magic greater than what he could comfortably accomplish. If he does so, he may add as many dice as he wishes to his magic before rolling. However, if he rolls higher than his possible maximum on the roll without the extra dice (not counting the Wild Die) -- which equals six times the number of dice rolled plus any pips -- then he takes a number of *dice* of damage equal to the number that he exceeded this total by. This damage cannot be mitigated, soaked, or otherwise deflected.

Example: Thadeus has 4D+1 in *conjuration.* A troublesome troll is threatening him and his friends, and he really needs an *acid ball* spell to succeed (difficulty 20). He chooses to roll 6D (2D more than his normal skill). He rolls a 23; since this isn't more than the 25 he could have normally rolled (4×6=24, +1), he's fine. If he had rolled a 29, he would take 4D of damage (since 29-25=4).

The usage of Character Points or Fate Points on this roll invokes the threshold rule, as normal; thus there is little benefit in spending Character Points, except that they can be applied *after* the fact and they have the possibility of rerolls on 6s (which may or may not be a good thing).

This option makes magicians much more powerful at medium to high levels, since they can pretty cheaply bump up their final rolls. (After all, when you're rolling 6D -- and have a threshold total of 36 -- the odds of exceeding that 36 with 7D or 8D are relatively slim.) In addition, it allows for "martyr" spells -- there is, theoretically, no limit on the number of dice the player can roll, although at a certain point, his death is assured. Fortunately, the usefulness of high rolls is limited in most cases, and the limitations of spell design time make coming up with new spells impractical for

most would-be martyrs. And if a mage *wants* to spend 60 years creating a spell with a triple-digit difficulty, well . . . he's either going to do something incredibly good, or incredibly wicked.

If the gamemaster wishes to make this an option used only in dire or limited situations, he might rule that, rather than damage, *any* exceeding of the threshold value causes the mage to wink out of existence. (Whether or not the spell goes off before or after is up to the gamemaster.)

If using either option, mages should also have the option of ignoring the rerolling of 6s on a Critical Success of the Wild Die for magical effects (although if he chooses to do so he must declare it before rolling); of course, a 1 on the Wild Die still results in a Critical Result regardless of what the mage chooses. (The reason for this rule is that, without it, apprentice mages rolling 1D could -- without trying to channel more energy -- accidentally inflict 6D or more upon themselves.)

This same system can be used for *Metaphysics* or *Miracles* as well (as well as for usage of the Force, for those playing West End Games' *Star Wars*).

d20 System [Soft/Absolute Barrier]

In this variant, magic and miracles are two sides of the same coin -- with diabolical arcane spells on one side and saintly divine ones on the other. Each use of either drives the user closer to the clutches of evil or good; those who use too much magical energy (of either type) may find themselves little more than a pawn of a higher power.

In game terms, each type of magic has a certain number of uses before the caster's soul belongs to one side or the other in the great cosmic struggle. A caster can cast a total of 666 levels of arcane spells before he becomes fully aligned with the darkness, and 333 levels of divine spells before he becomes an agent of light. (Of course, what gods are aligned with either side is dependant on the campaign setting.) "Levels" refers to the level of spells cast (or spell points utilized, in variants of the *d20 System* that don't use spell levels); thus a caster could cast 111 3rd-level divine spells or 37 9th-level divine spells, or any combination in between.

For arcane spells, every 222 levels pushes the caster one alignment step closer to Evil. (Thus the caster will be Evil after casting 444 levels' worth of arcane spells, barring any other alignment-altering affects.) In addition, regardless of the caster's current level, the casting of the 666th level of spell results in the caster being turned over (perhaps mentally, perhaps bodily, perhaps both) to the dark forces powering arcane spells.

A similar process applies in reverse for divine spells. Every 111 levels pushes the caster one alignment step closer to Good, with the caster becoming a full agent of the light upon casting the 333rd level.

If a caster has access to both arcane and divine spells, it's possible for that person to ping-pong between various alignments; however, upon casting the 666th level of arcane or the 333rd level of divine, the caster fully signs on with that side, and access to the other form of magic is cut off.

Besides the alignment-changing effects, use of spells should cause the character to look and behave as if he were more closely tied with the chosen power. Thus a priest who draws heavily on divine magic might find his skin giving off a permanent glow, which grows brighter as his usage continues.

What's In a Name?

One of the interesting aspects about creating a barrier is that you get to give it a name (such as the speed of light, or speed of sound). None of the example applications here have been given a name, mostly because their name would probably be dependant on the setting. For example, the *d20 System* might be given names like "the Ascendancy Threshold" or "the clutch" (as in "When will a mage succumb fall into the darkness's clutches?"). The *D6 System* example might be given names such as "the suicide spell" or "the mana purge."

Just as likely, a barrier would be slapped with a name associated with the person who discovered, popularized, or codified it. Thus in the *Hero System* example, if the effect was discovered by Nicholas Vashim, then it might be called "the Vashim effect."

Regardless, giving an interesting name to a barrier is one of the keys to sparking the imagination of players seeking to quantify, identify, or conquer

What happens upon reaching the 333/666 threshold is up the DM. Perhaps the most game-worthy option is for the character to continue walking the land; he has merely removed himself from the day-to-day struggle of morality, and will follow the whims and wishes of his master from then on. Or perhaps the character is assumed fully into hell or heaven (maybe to make future appearances in the campaign for special missions).

Regardless of what occurs, this option is best reserved for those campaigns where the use of any magic is cause for consideration -- such as Gandalf's reluctance to rely on powerful effects -- and where those who wield mysterious powers are viewed with hesitation and suspicion, regardless of their affiliation. (After all, how many people would be reluctant to have an agent of ultimate good in their midst, especially if that person is judgmental or critical of any transgressions?) This system can also lead to strange situations that provide for interesting roleplaying opportunities; priests within more sinister demihuman tribes, for example, would be as ill-trusted as they were useful, since each application of their healing powers would bring them closer to being an agent of their philosophical enemy.

Mage: The Ascension or *Changeling: The Dreaming* [Hard/Relative Barrier]

The more powerful one is, the more restrictions one places on that power. A hulking gardener can lug around tremendously heavy equipment, but must be careful lest his touch destroy delicate flowers. In this variant, such is the case of practitioners of magick.

Each level of Arete or magick Sphere brings with it a ban -- something the magician cannot affect. These are relatively broad but specific objects, people, ideas, or things that the mage cannot affect with his magick. Some sample bans might include:

- Cannot affect children
- Cannot affect anything of a certain color
- Cannot affect any politician
- Cannot affect any noble gas
- Cannot affect great spirits of the weaver
- Cannot affect any mind motivated by fear
- Cannot affect anything made of wood
- Cannot affect any form of life less than one year old
- And so on.

The Storyteller should only choose bans that can, in some way, apply to the character. For example, if a hermetic mage only has Mind magic, then "cannot affect weaver spirits" should never be chosen as a ban, since the mage normally can't affect that type of spirit. If a magical affect targets something of the ban -- directly or indirectly -- then the effect simply does not happen, as if it had been fully disbelieved by the target.

Since a mage gets a ban for each level of Arete and each point he has in a Sphere, he may have dozens of bans at higher levels of power, many of which he doesn't know the full nature of (and might not be aware he has at all). These bans are chosen by the Storyteller and may have some connection to the character's background, recent events, or random selection. For example, a mage who was attacked by a vicious pit bull might discover that his magicks no longer affect dogs, pets, or flowers.

Clever mages might find ways of exploiting their bans. Thus a mage who learns that he cannot affect anything red might have his companions dress in crimson garb, so that -- should he ever need to fire a damaging affect at someone he cannot see -- he can be reasonably assured of not harming his friends.

Regardless, mages would no doubt go to great lengths to keep their bans secret, and may give careful consideration before attempting to advance their knowledge: Each glimpse into a new level of power brings with it the risk of some

crippling new ban.

This system can work as is for *Changeling: The Dreaming;* simply choose a new ban for each point of Glamour and each level of Art.

* * *

Many aspects of the world are defined by what we can't do as much as what we can, and our struggle to understand and maneuver around the obstacles that demark what we can't do is one of our great strengths. By introducing an intriguing barrier to a game world, you can put a new spin on a long-familiar system. Ultimately, the only barrier is your imagination.

Argus, the Man with a Hundred Psionic Eyes

for *GURPS*

by Bevan Thomas

Comic books and movies are filled with stories of "living weapons," people granted vast powers and then forced to obey some ruthless organization or individual. Treated as less than beasts, they are tragic, wretched, and incredibly dangerous.

Argus is an example of such a tortured individual, a deadly, unpredictable opponent for superheroes and other powerful characters. Granted vast psionic powers by the mysterious Project: Third Eye, he lives in almost permanent agony, and with no control over the mental energy that crackles within him. He is no longer sane, no longer truly conscious of what's happening to him, and has been reduced to a living weapon of mass destruction, a tactical nuke made flesh.

Argus

Philip Johnson was a nondescript man who worked with the government until he was approached by a mysterious man who claimed to be a federal agent, and who asked him to take part in Project: Third Eye. Johnson was brought to a secret installation where, over the next few months, he was subjected to a wide variety of experiments by three scientists who wished to test whether it would be possible to grant a person psionic powers.

The experiments were far more successful than the scientists had ever dreamed. They unlocked the complete potential of Johnson's brain, granting him vast power. And that was when things began to go wrong. The first scientist vanished in a pillar of fire, and the second one was skewered by telekinetically lifted scalpels. The third just stared at Johnson, who in turn simply crouched on the ground, his eyes shut and his hands over his ears as he tried to block-out the sounds around him. The scientist started to scream in abject terror.

Soldiers fired at Johnson, but the bullets bounced off a force field, leaving the man unhurt. Then the soldiers were suddenly hurled through the air, the lucky ones slamming against the wall, the unlucky ones sent flying out the window.

Johnson looked in desperation at one of the soldiers, a man named Marcus Russell.

"Help me," he moaned before collapsing from exhaustion.

The soldiers quickly sedated Johnson, and investigated the carnage. Along with some of the soldiers, two of the scientists were dead. The third lay on the ground and stared at Johnson in terror, his mind completely shattered.

"Argus," whispered the scientist. "Argus . . . Argus . . . Argus."

Over the next year, Project: Third Eye did their best to figure out exactly what Johnson had become. After many costly experiments, it was deduced that Johnson could access any psionic power, but had no control over them. One second he would be reading someone's mind, the next he'd be levitating or setting someone on fire. His subconscious appeared to be lashing out against everyone and everything. Furthermore, whenever Johnson wasn't using his powers, he suffered almost unbearable pain, as his psionic energy crackled against his brain.

The surviving scientist kept repeating "Argus" over and over again, and someone realized that it referred to Argus from Greek mythology, a man with one hundred eyes. This likely was represented by how Johnson's "third eye" had opened over his entire body. It was decided that Johnson would be renamed "Argus."

After the experiments were complete, the people behind Project: Third Eye made a decision. They had in their position a weapon of almost unlimited power, and they intended to use it. A few favors called in, and all records pertaining to Philip Johnson were wiped from existence. He had zeroed, and all that remained of him was an engine of destruction.

Argus spends most of his time unconscious in a vat of chemicals. When the Project has use of him, the vat is shipped to the target with him in it, and when it arrives, it is disconnected from the tubes that circulate the chemical bath. After that, those that delivered Argus have around five minutes to get to safety before he wakes up. When Argus awakes, the first thing he does is to telekinetically shatter his vat, and then he begins his path of destruction. After his job is done, Hermes is deployed to bring him back in.

Argus is ruled by a bizarre part of his subconscious mind that seems to have three goals: protect Argus from harm, protect Hermes from harm, and escape his headache by using the cosmic power as much as possible. Unless he or Hermes is in danger, the psionic powers he employs are random, and change every few seconds. One moment Argus might be setting a building on fire with pyrokinesis, the next he might be reading someone's mind with telepathy, and then he might start to levitate in the air. They target friend and foe alike, with only Hermes and him exempt. No matter what psionics Argus is currently using, he will always have a force field and mind shield up as general self-defense. If he is in extreme danger, he can temporarily boost this abilities using cosmic power. For example, he could use 55 points to temporarily boost his force field DR to 50.

What's left of Philip Johnson is in hell. Those few times that he's awake, he's in complete agony, the pain only temporarily lessened when he projects psionic energy. And then, he has no control over exactly what energy he projects. He spends most of his time screaming, babbling, or just looking blankly as his unconscious manipulates his body. In a few moments of lucidity, Johnson has attempted to commit suicide, but he's always been "saved" by his psionics.

Argus   *884 points*

Attributes: **ST** 11 [10]; **DX** 12 [40]; **IQ** 12 [40]; **HT** 11 [10]

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 11 [2]; Will 16 [20]; Per 13 [5]; FP 11 [0]; Basic Speed 5.75 [0]; Basic Move 5 [0]

Advantages: Damage Resistance (force field +20%; psychokinetic -10%) 40 [220]; Danger Sense (ESP -10%) [13]; Mind Shield 10 (telepathic -10%) [36]; Modular Abilities (Cosmic Power: always on -20%; psionics only -20%; unconscious only -20%; uncontrollable -30%) 300 [600]; Special Rapport (Hermes) (telepathic -10%) [4]; Zeroed [10]

Disadvantages: Chronic Depression [-15]; Chronic Pain (agonizing headaches whenever not using cosmic power) [90]; Duty (serving Project: Third Eye; almost all the time, involuntary) [-25]; Skinny [-5]; Supersensitive [-15]

Skills: Area Knowledge (home town)-13 [2]; Computer Operation-13 [2]; Drive (automobile)-12 [2]; Electronics Operation (surveillance)-13 [4]; Guns (pistol)-13 [2]; Hobby Skill (stamp collecting)-13 [2]; Intelligence Analysis-12 [4]; Karate-11 [2]; Research-13 [4]

Appearance

Argus is a tall, emaciated man with long red and a long ragged beard. His blue eyes crackle with energy when his cosmic power is in use. He is usually naked.

* * *

Hermes

Marcus Russell served in the army for a few years before he ended up as a guard at Project: Third Eye. He witnessed the transformation from Philip Johnson to Argus, and gazed into the tortured man's eyes among the carnage of the lab just before Johnson collapsed from exhaustion. Somehow that moment caused a psychic link to be created between Russell and Johnson, and for Johnson's unconscious to consider Russell to be a "friend."

This link has been exploited by the Project. Russell is now "Hermes," named after the god who defeated the mythological Argus by causing him to fall asleep. His role is simple. After it has been decided that Argus has caused enough destruction, Hermes comes in and talks with the mad psionicist, soothing him and eventually convincing the man to temporarily deactivate his force field. When that happens, Hermes shoots him with a heavy-duty tranquilizer and other agents arrive to put Argus in a new vat. For some reason, this fools the unconscious mind every single time. Apparently there is something about Hermes that makes Argus unable to resist surrendering to him.

Though Russell is incredibly well paid for a job he is rarely required to do, it has really started to gnaw at his mind. He feels a little of Argus' pain through their psychic link, and it disgusts him to see a man being treated in such a degraded manner. He has started to drink excessively as a way of dealing with the problem, and spends most of his free time fishing, the one activity that gives Russell some solace.

Hermes   *240 points*

Attributes: **ST** 13 [30]; **DX** 13 [60]; **IQ** 11 [20]; **HT** 11 [10]

Secondary Characteristics: Dmg 1d/2d-1; BL 34 lbs.; HP 13 [0]; Will 13 [10]; Per 11 [0]; FP 11 [0]; Basic Speed 6.00 [0]; Basic Move 6 [0].

Advantages: Combat Reflexes [15]; Fit [5]; High Pain Threshold [10]; Rank 3 (military) [15]; Security Clearance (Project: Third Eye; free access to a narrow range) [10]; Special Rapport (Argus)(telepathic -10%) [4]; Wealth (Wealthy) [20]

Disadvantages: Alcoholism [-15]; Appearance (unattractive) -4; Bad Temper [-10]; Duty (serving Project: Third Eye; quite rarely) [-7]

Skills: Area Knowledge (home town)-11 [1]; Detect Lies-11 [4]; Diplomacy-13 [12]; Driving (automobile)-13 [2]; Expert Skill (psionics)-10 [2]; Fast-Talk-13 [8]; First Aid-11 [1]; Fishing-13 [4]; Guns (pistol)-15 [4]; Guns (SMG)-14 [2]; Guns (rifle)-16 [8]; Karate-13 [4]; Knife-14 [2]; Soldier-11 [2]; Stealth-12 [1]; Survival (desert)-10 [1]; Tactics 11-[4]; Tracking-12 [4]

Appearance

Hermes is a large, muscular man with a heavy face, brown moustache, and his brown hair in a crew cut. He usually wears military fatigues, and carries a bowie knife and auto pistol.

Project: Third Eye

The Project is an incredibly well funded organization dedicated to the study of psionics, with a particular focus on figuring out how to grant psionic powers to people who lack the natural capability for psi. Their only real success, if it can be called that, is Argus. He is currently being studied by them, and occasionally, on orders from their superiors, they send the mad psionicist against particular individuals and organizations.

How Project: Third Eye is used in the campaign will depend a lot on who or what the GM decides is behind the Project. Is it the government, an organization that splintered from the government, a criminal mastermind, a philanthropist seeking to create his own metahuman crime-fighters, or even the Illuminati? No matter who the Project ultimately serves, anyone who gets involved with Argus will attract their attention. Project: Third Eye is incredibly well

funded and diligently run. It can be a powerful patron or a deadly enemy. The choice is up to the GM.

Argus in the Campaign

Characters are most likely to encounter Argus if he is being unleashed against a target. Depending upon the circumstance, he could be set against the player characters themselves, against someone they are fighting, or the PCs might simply get caught in crossfire. If the PCs are powerful or insane enough, they might attempt to confront Argus directly; others might instead study him from afar, noticing the black helicopters that come to collect the tortured metahuman. Alternately, Hermes could decide that he can't be a party to Argus anymore, and he seeks the aid of the characters to liberate Johnson.

If the PCs discover Argus' existence, there is a good chance they will want to free Johnson and shut down Project: Third Eye. If the Project is funded by the government, then this might present ethical and practical difficulties for the heroes. If the GM would prefer the characters to be working with the Project rather than against it, then he could have Argus get out of control (possibly with the death of Hermes), requiring the Project to enlist the player characters in bringing him in.

Variations on the Theme

Argus the Cosmic Mage: For settings where magic is more prominent than psionics, Argus could have been created from an experiment to artificially grant Magery. In that interpretation, Modular Ability would have the "Spells Only" limitation, and Argus would possess Magery, lots of Fatigue Points, and possibly levels of Mana Enhancer.

Vessel of Divine Power: In this interpretation, the experiments on Johnson caused spiritual energy to enter into him from some god, demon, or other being. His "unconscious" is this force who is manipulated Johnson for its purposes. Argus gains the Channeling advantage and his cosmic power is not confined to psionics, but instead to whatever is within the spirit's power and it wishes to send.

* * *

Living Weapon   *445 points*

A living weapon is a powerful metahuman who has been enslaved by some person or organization, turned into a creature with no purpose except to be unleashed against the enemy. Few foes are as tragic as this wretched, broken thing.

Attributes: **ST** 11 [10]; **DX** 10 [0]; **IQ** 10 [0]; **HT** 11 [10]

Secondary Characteristics: Dmg 1d-2/1d; BL 20 lbs.; HP 11 [0]; Will 10 [0]; Per 10 [0]; FP 11 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0]

Advantages: 500 points worth of exotic and supernatural advantages.

Disadvantages: Duty ("living weapon;" almost all the time, extremely hazardous, involuntary) [-25] and -50 points worth of disadvantages to represent the physical, mental, and emotional scars of slavery.

Pyramid Review

Treehouse Rainbow & Xeno

Published by [Looney Labs](#)

Designed by Andrew Looney

15 Plastic Pyramids in five colors & one Treehouse Die; $9

[Icehouse, The Martian Chess Set,](#) published by Looney Labs, has something of a problem. The problem is not in the play, as the various sets of colored and hollow plastic pyramids form the components to a variety of games, both big and small, much like an ordinary deck of cards can be used to play anything from **Poker** to **Euchre.** Rather, while many of the games are fun to play -- best typified by the booklet [12 Games for Icehouse Pieces](#) -- it is actually quite difficult to obtain the various tubes of pyramids because games stores do not want to stock what they see as an awkward product to sell. This is not a problem for Looney Labs' other games, such as [**Fluxx**](#) and [**Are You A Werewolf?,**](#) but, then again, what can you do with a tube of 15 plastic pyramids in one color?

To address this challenge, Looney Labs is re-launching the **Icehouse** family with a new game called [**Treehouse,**](#) which is best described as an **Icehouse** starter set. Available in two different sets -- **Xeno** and **Rainbow** -- both consist of a tube containing 15 pyramids divided into five differently colored stacking sets and a **Treehouse** die marked TIP, SWAP, DIG, AIM, HOP, or WILD. The rules for the game itself are printed on the outside of the tube, which both indicates the simplicity of the game and the ease of reference for the rules. The only difference between the two sets is colors of both the pyramids and the die. **Rainbow** contains red, green, yellow, blue, and black pyramids with a black die, while **Xeno** has pyramids that are purple, orange, clear, cyan, and white, and the die is white.

Designed for two to four players, each player controls one set of pyramids in a single color, with the fifth kept separate as the house set. This house set is placed in the middle of the table in a line, with one pyramid pointing upwards and the other two pointing left or right. A pyramid can only point in these directions. Each player places his set stacked like a Christmas tree parallel to the house set. The objective is for a player to get his set from this starting configuration to match that of the house set, which will win him the game.

Getting a set to match the house set is simple. On his turn a player rolls the **Treehouse** die and applies the result. If a player cannot apply the result to his own set, then he must apply it to the house set. If he cannot do that, then the die is re-rolled. The results of the **Treehouse** die are as follows:

- **TIP** -- Knock over an upright piece or stack. If a stack, all pieces must point the same way.
- **SWAP** -- Exchange the places of two pyramids.
- **HOP** -- An upright leaps up and lands somewhere along the line, even on another pyramid, forcing it to stand upright.
- **DIG** -- A lying down pyramid dives down underground and comes up somewhere along the line. If it comes up underneath another piece, it must also stand up.
- **AIM** -- Point a piece in another direction.
- **WILD** -- Do any one of the above actions, either to the player's own set, or to the house set.

Like the best Looney Labs titles, **Treehouse** is both incredibly short and simple to play. Indeed, a game should not last more than five to 10 minutes, and upon our first play with just two players, the game lasted barely two minutes. More players make for longer games.

Obviously, **Treehouse** possesses a high random factor, but a player is occasionally free to apply the results of the die

throw to the piece of his choice, all dependent of course, upon the configuration of both his own set and the house set. Just as often, a player will be forced to apply a disadvantageous result, either to his own or the house set. The result is that just as in the designer's *Fluxx*, a player can win the game on another player's turn, here because the house configuration has been changed to match that of his own set.

Treehouse is mind-bogglingly easy to both learn and play, and easy to expand upon. To start with, the publisher makes rules for another three little games available on its website that can be played with the one *Treehouse* tube. With three *Treehouse* sets of one type, and the *3HOUSE* rules booklet, it is possible to play what are considered to be the best classic games of the *Icehouse* system -- *IceTowers, Martian Chess,* and *Binary Homeworlds.* Five *Treehouse* sets are enough to play every *Icehouse* game! Another beer 'n' pretzels game, *Treehouse* is *very* pocket friendly, both in terms of packaging and pricing, making it the perfect entry into the *Icehouse* system.

Random Thoughts On . . . Props

I'm trying to get as many columns "in the bag" before packing up my life to go to Indianapolis, so we're trying the "Random Thoughts On" experiment again (which went okay last week, so now we milk). You know the drill: One hour, less thought, parenthetical asides.

This week we're talking about props. Long-time readers know my stance: I love 'em. If you don't . . . well, sadly I don't have much for you this week.

Now, rather than dwell on the hmms and haws of hypothetical props, I'm going to spend this installment describing some of the props I've done in the past, what they were used for, how well they were received, and so on.

Fake CNN.com Article

The Prop: I took a real article from CNN.com, saved it as a complete HTML (with all the ads and everything), and edited the saved text to say what I wanted to. In this case, I think I modified a month-old kidnapping story (with pictures of grieving parents), turning it into a story where the parents were horrified that their family had been attacked by strange creatures. (This was for a *Werewolf* game.)

Total time to construct: Less than one hour (probably closer to 30 minutes)

Upsides: Quick and easy to do. It looked and felt very authentic.

Downsides: I felt like I was "cheating," and was afraid that if someone else was a CNN reader that they would recognize the images of the story I adapted. This might be obviated by using an archive article, but then I'd need to figure out what I'd like to do. Also, it did feel a bit creepy adapting the article.

Reception: Pretty favorable; no one raved over it, but no one said it detracted or was lame.

Notes: The difficulty with using a site such as CNN.com to use as the basis for the "faking" point is that you're limited to the kinds of stories they cover. (You probably won't find an article with a picture available about a random mid-level official resigning in a city-wide investigation.) Fires, floods, and other disasters are the most likely ones to modify for this purpose. And, obviously, this technique can only be used for modern campaigns.

Cube of Power or Somesuch

The Prop: In my first session as a GM (running *GURPS Supers*), I created a puzzle cube out of cardboard that needed to be reassembled into a smooth surface. (The non-smooth edges were hand-drawn "circuits" and the like that indicated it was broken and taken apart.) To thwart the evil doomsday plot (which I confess to having no memory of now), the PCs needed to assemble it.

Total time to construct: About an hour. To assemble, tape cubes 1, 2, and 3 into links of a chain (see the first photograph); the middle link *must* be cube 2, but cubes 1 and 3 can be on either side (since cube 2 can rotate in the center regardless of how it's arranged, it doesn't really matter). The puzzle is to assemble it such that it's a featureless cube (in other words, all the non-white sides are on the inside); see the second photograph for how it's supposed to look all over.

The cubes

Unassembled   Assembled

Upsides: Tactile puzzle proved satisfying to a couple of the players. Fortunately it didn't take too long to solve, meaning it wasn't a drag on the storyline for those who weren't interested.

Downsides: Very obviously a "puzzle" for its own sake. It was also the kind of puzzle that only one player could deal with at a time. Also, if the players had ended up being stumped, I didn't have any backup plan for how the adventure could have continued. Finally, I had no provisions for how the players could use their character knowledge to solve it if they weren't interested in doing so as players.

Reception: Pretty warm. One player quite liked it.

Notes: The basics of this puzzle can be used in various situations. For example, the complete cube could show a map

or a code (since I think the completed cube has only one possible arrangement . . . although even if I'm wrong, it's easy enough to reassemble into the "correct" way).

Tarot Deck

The Prop: For one small fantasy campaign (two players), I anticipated the PCs would take an interest in a fortune teller I had in a town. In fact, I anticipated that one character in particular would actually ask for a reading. So in preparation I took an old tarot deck I had (a snazzy Russian art one in a purple velvet pouch), practiced my fake shuffling, arranged the deck into a predetermined order that would be cool, and came up with a patter to go along with those cards. ("Well, this sequence isn't necessarily bad unless you have the Death card. [turns over next card] Oh, dear.") I even kept a second prepared deck on hand for the other player, in the unlikely case that he was the one who wanted to see the teller.

Of course, the information gleaned from the soothsayer provided useful insight into the story as well as laid the seeds for future developments. (In the stories, these fortune-teller visits are never trivial "You will meet a stranger who won't make eye contact . . ."-type dribble. No, they're always the amazingly pointed clues of fortune laid out before the heroes, as if some invisible hand were behind it all . . . an invisible hand belonging to a balding bespectacled man with a fondness for Mountain Dew.)

Total time to construct: About 20 minutes (most of which was spent trying to get the fake shuffling down)

Upsides: Cheap (if you already own or can borrow the deck), fast, effective. It's one thing to do the song and dance of having the GM *say* that the soothsayer deals the Fool card; it's another thing to actually deal it.

Downsides: Fairly limited scope; more or less a single-shot trick (unless the fortune teller becomes a recurring part of the campaign). In addition, it requires some memorization of the patter, since it breaks the suspension of disbelief to be looking at a script why dealing the cards. Fortunately, with a simple reading -- say, a four-card pattern -- this isn't too difficult.

Reception: Very good. The player I was targeting didn't know how I did it, and thought (briefly) that I had made up the reading on the fly.

In-Game Website

The Prop: For a LARP I was helping to run, I made a website that existed as both an in-game and character aid; it was entirely "in character," and consisted of information my character had found, hooks for other adventures, and long-term foreshadowing. Then I handed out business cards in-game with my name and website on there. Yes, for almost a year, birdonawire.info was no doubt confusing people who stumbled across it via random Google searches. (Sadly, it's no longer around.)

Total time to construct: About 5-10 hours, I'd guess.

Upsides: Cheap (only the cost of the domain name), very immersive.

Downsides: It takes a lot of work; not only did I need to generate the content, I needed to generate the "shell" as well. (It's like making the paper that a clue is going to be written on.)

Reception: Mixed to non-existent. Although a few people thought it was cool, I don't think it was worth the amount of work I put into it, since I'm not sure how many of the players combed through it for the clues and hooks that were in there. In hindsight, maybe a blog would have served the same purpose and worked better (although I *did* get to practice a bunch of my HTML and Javascript). In particular, many of the newer blogs offer a lot of possibilities -- pictures, voice recordings -- that didn't exist when I created my site.

Notes: It might be possible to whip something up more quickly using an established software package, such as

Dreamweaver or even Microsoft Word, but I didn't try that; I'm a hand-coding kind of guy.

* * *

That's it for this installment. Unless some mysterious benefactor calls up between now and Sunday with a ticket to Columbus, I won't be going to Origins this year. So rather than waiting for the red phone to ring, I'll encourage you all to tune in next week: Same Pyratime; same Pyrachannel.

--Steven Marsh

The Towers: A Fantasy Metasetting

for *GURPS*

by William H. Stoddard

One of the hallmarks of fantasy, and especially of high fantasy, is the invented world. Rather than taking place on Earth, many fantasy novels and campaigns have entirely imaginary settings, with their own history and geography and even their own natural laws.

The traditional division of labor in this style of gaming is that the GM creates the world and the players explore it. Ideally, the artistry of the worldbuilding will be one of the big rewards of joining the campaign. On the other hand, it can be difficult for players to come up with characters who fit into an imaginary world, especially one that's new to them. The GM may help them out with various stratagems, most of which have literary precedents, such as having them come from an isolated village (like d'Artagnan in *The Three Musketeers*), a peaceable and less fantastic land (like Bilbo Baggins in *The Hobbit*), or even another country or world (like Dorothy Gale in *The Wonderful Wizard of Oz* or the four Pevensey children in *The Lion, the Witch, and the Wardrobe*). But this approach limits the players to characters with few established relationships or resources. On the other hand, characters built as natives of the world may suffer from the players' unfamiliarity with it -- whether because they don't understand the setting or because they aren't yet involved in it emotionally.

"The Towers" is designed to offer a way around this. To avoid the gap between players who know nothing of the world and a GM who has to get it across to them, it makes the players co-creators of the world. The GM's role is not to come up with all the details, but to harmonize the players' inventions. To make such invention easier, and to give the PCs more influence on the world, it's a microcosmic setting: an entire universe focused into a single locality, whose surroundings are unknown and potentially threatening. It's not a setting, with fixed attributes, but a metasetting, a resource that players can use as a framework in jointly developing the setting that suits them.

The Backstory

A long time ago, centuries or even millennia in the past, there was a great empire that ruled the known world. Its people were masters of powerful sorcery, based on commanding the aid of spirits through carefully negotiated treaties and covenants. As a byproduct of this, they were able to make amazing enchanted devices that gave many of the benefits of high technology. Unfortunately, they were not masters of themselves. As conflicts between sorcerous factions grew deeper, the world experienced a breakdown, not merely of human law, but even of natural law, falling from order into chaos.

In at least one place, a small group of skilled sorcerers were able to hold back chaos by working together. They improvised a compact that bound the local supernatural forces into stability. Many centuries later, their heirs are still maintaining that compact, through a cycle of annual rituals that reenact its making and through great rituals every few decades. Whenever all the people who were alive at the last great ritual have died, a new great ritual is needed, conducted by the heads of the various sorcerous lineages.

The founders weren't alone when they did this. They had families, students, and loyal guards and servants. And they conducted their rite in an ancient fortress, with multiple high towers linked together by a high wall, which became their dwelling place.

Creating the Lineages

At this point, the players come in. Each PC in the campaign comes from a different lineage, with its own customs and

style of magic. The players invent these to suit themselves; the GM then fits them together into a larger pattern.

To start with, the players should pick out themes for the magical powers of their Houses. Each House should have its own distinct theme. In *GURPS* terms, each House has at least one distinct magical power. All these powers have the same basic source, the aid of spirits; but they may have distinct modifiers, depending on their use of gestures, incantations, materials, and other ritual elements. Each power has its own Talent and its own abilities. New abilities can be learned, and much of the training of the magically gifted aims to develop such abilities.

In addition, each House has its own internal laws and customs. Is the headship of the House determined by seniority, appointment by the previous head, election by the House as a whole, passing tests of skill, supernatural omens, or some other process? Is headship open to both sexes, or reserved to one? Are possessions, positions, and House standing inherited in the male line, from father to son; or in the female line, from mother to daughter (so that a young man is the natural successor, not of his father, but of his mother's brother)? What are the rules of marriage -- monogamy, polygamy for one or both sexes, or even something as exotic as group marriage? All of this will affect the interrelationships among the Houses.

(If different houses have different customs, intermarriage between them can get complicated. GMs should assume at least one meta-rule: in any marriage involving the chosen heir to a House, the heir will remain in his own House, and the other member of the couple will change Houses. This means that the heirs to different Houses can't marry, which offers the possibility of plots about tragically hopeless love for players who want a campaign with romantic themes.)

Players can go on to work out as many other details as they like. If they want to make up a House cuisine, or style of clothing, or traditional story about the founder of the House, encourage them! All this gives the GM a more richly textured world at the cost of very little work to him.

The point where GM effort is needed is this: All these Houses have to be woven together into a coherent whole. It will often be useful for a GM to look at the existing list of Houses, figure out which symbolic element is lacking, and make up a House to cover it, with its own customs and its own style of magic.

It's a good exercise for players to draw up family trees for their Houses. Because the Towers are a microcosm, the Houses are fairly small: a typical House has five children aged l5 or less, two youths aged 16-25, five adults of an age to bear or raise children (26-55), and three older adults. In other words, the age distribution is somewhat more like that in an industrialized society than a medieval one; the Gifted lead longer lives, thanks partly to the life-extending effect of their own magical natures and partly to their having access to effective medical treatment, and so they can get married late and bear relatively fewer children. The GM can draw up a tree for any additional House. If some Houses have people who married in among their numbers, the GM can determine where they came from and who they're related to in their original Houses.

The Site

The Towers is a huge castle, covering two or three acres. Its outer wall has a number of towers: as many as there are Houses, plus two more on either side of the main gate. Each House inhabits one tower, which holds its living space, its work areas for magical rituals and specialized practical skills, its shrines, and its storage space. Towers average five stories high, with the main entrances above ground level. They're joined by a wall three stories high, and wide enough for two or three people to stroll on it side by side -- or for duels or battles to be fought.

Down on the ground level are barracks for guards on active duty and stables for their mounts, next to the main gate; quarters for married guards and their families and for servants; work areas such as the kitchen, the laundry, and the scriptorium; and storage space for bulk goods such as preserved foods. Upper levels of these buildings include quarters for the high-ranking servants, the main dining hall, greenhouses, and archives. The buildings are arranged around the perimeter of the enclosed space. Its center is a walled off pentagon used for rituals, with an open stage at one corner.

There are also underground levels. The Towers is built on the site of a natural hot spring; artificial channels lead its waters into baths at the bases of the various towers. One of the guard towers has a small dungeon in its basement.

Dimly lit tunnels connect the various sublevels.

GMs should emphasize the magical nature of the site. The various Houses' magical gifts may contribute to the daily life of the Towers. The greenhouses may have small plots of magical herbs, the archives certainly hold grimoires of half-forgotten spells, and the building and tunnels may have passages that don't actually occupy physical space. Some rooms may not merely be guarded by human beings, or locked, but have spells of protection and concealment on them, or even be accessible only through magical portals.

On the level ground below the Towers, about three quarters of a mile away, is a walled village. Most of its people are farmers who grow the food and fiber for the Gifted and their servants, but it also has professionals, ranging from the blacksmith and seamstress to the seer, the healer, and the courtesan. Cultivated fields surround the village, with a radius of just under a mile. Further out are grasslands used for pasturage and forests visited by woodcutters and swineherds.

A few miles farther out is the boundary between order and chaos. There's no physical barrier to leaving the ordered lands of the Towers, but those who do have strange experiences and may come back changed. From time to time, intruders of various sorts slip over the borders.

Inhabitants

The world of the Towers has an elaborate social hierarchy, as stratified as a Hindu village but not as impenetrable as a caste system. The higher-ranking positions all call for abilities, such as spell casting, combat, or professional knowledge, and it's possible for someone with a talent for one of those abilities to advance socially. Occasional intermarriages among the different higher classes also take place.

Highest of all are the Gifted, ancient lineages that preserve magical talents and obscure knowledge. Their rituals protect the land from spiritual chaos. They also provide advice on lesser rituals that make daily life safer and serve as judges in the legal system of the Towers and the village. There are several distinct lineages, each with about 15 members. Realistically, after centuries of intermarriage, both their magical gifts and their physical appearances would all have mixed together, but each House's magic works to preserve its distinctive traits. The Council of heads of Houses is the ultimate legal authority over the Towers.

The Auxiliaries protect the physical safety of the Towers, samurai to the daimyo of the Gifted. Both young men and young women serve in the Auxiliaries, but women are expected to marry, and time spent on maternity leave tends to slow their military careers. Soldiers are divided into squads with a handful of members, each under the command of an optio. The least experienced soldiers stand watch on the roofs of the towers, warning their optios of any disturbance in the countryside. Older soldiers are stationed at the gates. Several squads have specialized duties: the Honor Squad attend the Gifted during rituals, the Wilderness Squad patrol the forests and inspect the boundaries, the Investigative Squad provide law enforcement in the village and patrol the tunnels, and the Administrative Squad keep records for the Auxiliaries. Two of the Gifted command this small force: the legate, an adult with military experience; and the tribune, a youth assigned to military service for training. Auxiliaries may have minor magical gifts, especially of sorts useful in battle; in *GURPS* terms, these can be defined as chi-based skills.

About 10-12 Magisters and their families live in the village. These are the professional class of the setting, each skilled in a particular profession or craft. They may have minor magical gifts connected with their professions; in *GURPS* terms, these are spells or minor powers.

About an equal number of Ministers head the servants in the Towers: the butler, the architect, the archivist, and so on. Among these are the teachers assigned to instruct the young Gifted in physical and mental skills necessary for their role. Ministers have to refer major decisions to the Council, but it's rare for any such decision to be overrules.

Below the Ministers are the Yeomen, farmers who hold their own land. They make up nearly two-thirds of the village's households, and their families number several hundred.

The Slaveys are the lesser servants in the Towers. A few of them have positions of privilege not much less than that of the Ministers -- for example, the cooks for the hall, the military mess, and the servants' dining area are influential. A few more develop close ties to specific Houses and work mainly for them. But most of them hold menial jobs that call for constant heavy labor. Private quarters are a rare privilege for a Slavey; many of them sleep on the floors of their workspaces, wrapped in blankets. There are as many Slaveys in the Towers as there are members of all the higher classes together.

Lowest in the hierarchy are the Groundlings, village laborers of several sorts. Many of them are farmhands, doing the heaviest work of the harvest and planting and weeding the crops. Others serve as herdsmen, porters, or day laborers on building jobs. Their best hope of advancing themselves is usually to get a son or daughter accepted as a Slavey. They make up about a third of the village's inhabitants.

There's yet another group of inhabitants, but one that has no official existence and no place in the hierarchy. The Invisibles live in hiding in the lower tunnels of the Towers. From day to day, they support themselves by stealing from the storehouses. They often know a few magical arts, typically to conceal themselves or bypass the magical safeguards that protect valuables. They also operate black and gray markets, often by silent barter: a Slavey can leave stolen or diverted goods in a certain location and come back to find other goods next to them, as a silent offering. Keeping them in check is one of the tasks of the Investigative Squad; on the other hand, it's rumored that some Houses may use them as spies or assassins.

This elaborate social structure can support troupe-style gaming, in which each player takes on two or more roles. One of these roles should be as a senior member of a Gifted House. The other could be a youth from such a house, preoccupied with school and courtship; an Auxiliary, with military duties; or a Minister or Slavey, trying to maneuver for a better position in the belowstairs hierarchy. GMs may want to consult with their players about which of these roles would provide the most interesting contrasts with the roles of the senior Gifted, and the best prospects for adventure -- or for other types of roleplaying, if they want a nonadventuring campaign focus.

Spirits

The great rituals serve to limit the powers of the spirits; but from time to time, various sorts of spirits make their way into the ordered lands. Often, they appear in material form, because part of the chaos of their realm is a thinning of the barrier between matter and spirit.

Outside the borders of the settled lands lies wilderness. Not only is it heavily forested, with narrow, twisting paths, but the geography itself is unstable; paths may close up behind travelers, or change direction, or the terrain may shift beneath their feet. Ordinary Area Knowledge, Navigation, and Tracking rolls give limited information because of this instability, and are made at a 3 penalty. A character with Absolute Direction can apply the +3 bonus to cancel this penalty. In addition, neither full daylight nor full darkness exists; rather, the land is under constant twilight (-4 to vision rolls).

The inhabitants of this land are equally unstable. Even species boundaries are blurred; the same being may be partly a person and partly an animal or plant. The savages of the wild lands survive by learning to take on suitable traits of other species. They're hostile to the settled lands, but too anarchic to take effective action against them as a group, and the protective rituals limit the powers of individual invaders.

Another threat comes from beneath the Towers. The realm beneath the earth is occupied by the dead. Regular rituals keep the peace with them, but not everyone who dies is offered such observances; in some cases, practitioners of forbidden magic may deliberately arrange to die without a funeral, hoping to come back. The deepest tunnels under the Towers actually have hidden doorways that lead to the realms of the dead, and a few of the Invisibles know how to travel there and even have understandings with some of the dead.

The tunnels also have living creatures in them, such as rats and bats. The restless dead can sometimes command them, as can some of the Invisibles, and a few of the Invisibles learn to take on these forms for their own purposes.

Finally, the Towers are not completely cut off from other settlements. Every two or three years, a small caravan comes in to trade, put on a show, and enjoy the comforts of life in a settlement. The traders are a miscellaneous lot, and some of them are likely to have unusual powers. Their visit can take up a session or two, and can be played either lightly, as comic relief, or darkly, as the invasion of a safe haven by a touch of primal terror.

Themes and Adventures

Depending on what best catches the interest of the players, GMs can use the Towers to run a variety of campaigns, each with different characters in the spotlight.

For a campaign of high-powered magic, the Gifted adults should be the principal characters. If the GM wants to explore magic from more than one perspective, Gifted youths can appear as secondary PCs. It could be interesting to have each player's secondary character come from a different House than his primary character, so that he gets to explore a view of magic that somebody else came up with.

Gifted adults are also suitable central characters for a campaign of political intrigue. Depending on the methods they use, Ministers, Invisibles, or even Auxiliaries might be plausible secondary characters.

A different style of political intrigue, in an aristocratic community, focuses on making political alliances through marriages. Gifted youths can play the starring role in this kind of romantic campaign, with a contrast being drawn with the more calculating approach of their parents and older relatives, who want to see that they marry someone useful to their House. GMs wanting to run this kind of campaign will want to take a look at the article "Invitation to the Dance," which could be used for a social event where such romantic alliances can be formed.

A more comedic view can be achieved with Slaveys as secondary PCs. GMs may want to model this kind of campaign on the classic British television series *Upstairs, Downstairs.*

For straight action/adventure, a GM might like to make one of the squads of the Auxiliaries into focal characters. The Auxiliaries aren't affiliated to specific Houses, but Gifted adults from diverse Houses can play a secondary role, coming along on missions to provide magical help. Most Auxiliaries are born and raised in military families, but there are annual competitions that anyone may enter, with permission to enlist as the prize; a soldier PC could be a Slavey or Groundling looking to better himself, a Yeoman's son or daughter wanting a more exciting life, or even an untalented or disaffected member of a Gifted House.

The Wilderness Squad is best suited as stars for this kind of campaign; their skills are useful in dangerous places, and they fit the pattern of being better soldiers in battle than on the parade ground. The Investigative Squad could also be the basis of a campaign, one following the "police procedural" model of fantasy stories by Randall Garrett (the Lord Darcy stories) and Terry Pratchett (some of the Discworld books). Either of these squads could be a suitable home for PCs who are misfits in regular military service.

Finally, a GM who wants to put the PCs in real trouble could focus a campaign on the founding of a new colony. What if the Towers have been experiencing overpopulation, and have a few too many young people to fit in? Sending them out to a rumored site in the wilderness, where they can set up a new compact with the local spirits, might both relieve the pressure and establish another community as an ally for the Towers. Naturally, the most talented young people

Inspirations

The concepts for this campaign framework come from a number of different games. The treatment of magical households is akin to that in *Ars Magica;* the historical framework could be taken as an alternative later history for *Exalted.* The treatment of magic owes something to both *Ars Magica* and *Big Eyes Small Mouth.* Readers of *GURPS Fantasy* will recognize the recurrence in this setting of some themes and concepts from its Roma Arcana setting.

A number of fictional sources also got stirred into the mix. The image of an isolated castle comes from Mervyn Peake's Gormenghast novels. The duality of upper and lower classes owes something to Peake, and something to *Upstairs, Downstairs.* Garth Nix's Abhorsen novels influenced the treatment of the distinction between wilderness magic and settled magic.

would get the assignment, perhaps aided by a squad of Auxiliaries looking for less boring duty, and by a few Slaveys who want to become Ministers in a hurry. This kind of campaign could show closer bonding between the different social strata as they face a common danger. Running a "new colony" campaign would provide elements of high ritual, wild adventure, romance, and resource management within a single framework.

Several of these campaign themes give PCs the chance to reshape their world, or even determine its fate. The setting is small enough to make this plausible.

Pyramid Review

Zombies!!! 5: School's Out Forever!

Published by **Twilight Creations, Inc.**

Written by Kerry Breitenstein & Todd A. Breitenstein with Mark Metzner

Illustrated by Dave Aikins

16 Map Tiles, 32 Event Cards, "Guts" Tokens, 4-Page Rules Sheet; $14.99

If you thought that with ***Zombies!!! 4: The End,*** it really was the end for the tile-laying, zombie-bashing, desperate-scramble-for-survival board game, then you were wrong. Rather, that acts as a bookend with ***Zombies!!!*** between which sit the two-and-a-half supplements available for the game. Which means that there is still room for other expansions, such as this, ***Zombies!!! 5: School's Out Forever!***

Like the other two expansions (but not the half), ***Zombies!!! 5: School's Out Forever!*** adds another area adjacent to the small town America depicted in ***Zombies!!!*** Like ***Zombies!!! 3: Mall Walkers***, it is also self-contained, which means that it can be played on its own as a mini-game, although it still needs the addition of the rules, dice, and various pawns and tokens from the core game. Of course, it is really intended to add another area to explore within the game, providing a possible avenue of escape from the corpse cortege.

Despite the subtitle -- "School's Out Forever!" -- it should be made clear that this supplement is not set within the halls and classrooms of a school. Now the subtitle is correct because school is interchangeable with college in American English, but reading it in English results in the expansion not being as advertised. This linguistic disappointment aside, it does mean that there is room still for a ***Zombies!!!*** Games set in a high school. Even so, the most obvious inspiration for the subtitle suggests that ***Zombies!!! 5*** is set in a high school.

Rather, it is set on the campus of a small town college, with the players running through its grounds, just as they do in the core game, ***Zombies!!! 2: Zombie Corps(e),*** and ***Zombies!!! 3: Mall Walkers.*** And as before, the aim is escape, because this college, also known as Twilight University, has its own helicopter and helipad.

The expansion consists of 16 new map tiles, 32 new Event cards, a set of "Guts" tokens, and the rules leaflet that also includes a short piece of color fiction. The tiles, which follow the game's standard nine-square grid format, depict locations such as the Administration Building, the "Dormatory," the Medical School, and Science Center. When used with the core game, they are kept in a separate pile with the college's helipad tile near the bottom. Only the Entrance tile and a Crossroads tile are removed, the latter added to the former when the Entrance tile is drawn from the main map tile deck. As soon as a player enters the university grounds, he can begin drawing from this expansion's tiles.

The new Event cards are drawn to ghoulish effect by Dave Aikins. They are not as humorous as in previous expansions or the core game, perhaps the best being "Student Loan," which allows a player to borrow an item currently in play (such as a weapon or vehicle) from another player and use it for a single turn. It is illustrated with a female student attacking a zombie with its now detached arm!

Several of the new Event cards relate to ***Zombies!!! 5's*** major new rule. Where Bullet tokens determines the amount of ammunition carried, and Heart tokens a player's health, the new blue "Guts" tokens represent his mental health. Beginning the game with three, a player can have as many as five, and as few as one. They are gained every time a six is rolled in combat, and lost when a one is rolled. So what do they do? Simply, Guts control how many Event cards a player can hold in his hand. At the end of his turn, if a player has fewer Guts tokens than Event cards, he must

discards so that they are equal. If he has more Guts tokens than cards, he can draw more cards at the beginning of his next turn.

What **Zombies!!! 5: School's Out Forever!** does not do is address the sprawling nature of the game. Indeed it exacerbates it, meaning that if you add everything to the core game, then you almost need a gymnasium floor just to lay it all out. Nor does it really add anything new in terms of playing area, whereas an expansion set in a high school might have done. The "Guts" mechanics do add a new twist to the tongue-out-through-the-cheek horror humor of the **Zombies!!!** Game. But again, they really just exacerbate the game's high luck factor, with bad luck limiting a player's options and good luck expanding them. All this increases the game's playing time, both because of the added area and the extra luck elements. The latter also increase the playing time when the "Guts" rules are used with just the core game.

If you were expecting **Zombies!!! 5: School's Out Forever!** to offer something radical, then the expansion will be a disappointment. If your expectations went only as far as more of the same, then it certainly delivers. Beyond that, the "Guts" rules are a new twist, being the expansion's only highlight, and not an unwelcome one. Overall, **Zombies!!! 5: School's Out Forever!** is a reasonable expansion, far superior to **Zombies!!! 3.5: Not Dead Yet,** offering more of the same for the **Zombies!!!** devotee.

Pyramid Review

Players Handbook II (for *Dungeons & Dragons*)

Published by Wizards of the Coast

Written by David Noonan

224-page four-color hardcover; $34.95

How much more information do players need for *Dungeons & Dragons?* The *Players Handbook II,* recently published by Wizards of the Coast, suggests that they can use quite a bit. This book offers up a number of new possibilities for players, suggests ways to make characters more believable and more focused on the game world, ways to beef up the reality of the environment, and, most importantly, ways to incorporate these suggestions into ongoing campaigns. Many of the suggestions here are grounded in making a particular class work better for the way many groups tend to play, adjusting several of the classes in ways that make them far more attractive to the typical player.

The book opens with a quartet of new classes, most focused on combat specialists. The beguiler is the exception here. This class works well in non-combat-intensive campaigns as a manipulator of opinions and creatures. Beguilers have a limited selection of spells, and gain bonuses toward making those spells effective against resistant creatures. Beguilers also blend in some ideas from the rogue class, with the ability to find and dismantle traps. The other three new classes -- dragon shaman, duskblade, and knight -- all tend more toward the martial side of the battlefield. Dragon shamans combine elements of fighters and clerics, with the added bonus of dragon-like abilities at higher levels. Duskblades feature a limited selection of spells, all of which can be used while the character wears armor and carries a shield, and those spells can be cast through the character's weapons. Knights, as the name implies, are chivalrous fighters who can boost the morale of fellows, call out enemies for single combat, and have good defensive capabilities. This comes at the expense of some basic abilities (attacking flat-footed opponents, for instance) that other character classes enjoy.

Additionally, suggestions are made to alter each of the 11 basic character classes as well as seven others from books like the *Complete Arcane II* and *Miniatures Handbook.* Possible basic genotypes are suggested for each class, giving the player an idea of how a particular class can be played. Additionally, most of these possibilities are given sample chunks of dialogue for use in-game. Just as importantly, each of these 18 classes has a suggested possible alteration in which one class feature is given up for a new one. In many cases, it can be a powerful choice, depending on the player. For example, sorcerers can give up the ability to call a familiar and can instead use metamagic feats more quickly. Paladins can give up the special mount in favor of more powerful smite attacks -- quite useful for a party that spends a lot of time in dungeons, where a horse is of little use.

Naturally, there is a substantial list of new feats as well. Many of these are designed for the new classes or new class features; others are for very focused, high-level characters who have followed a particular feat progression. Many of these are useful for a particular character concept and are good for players who want to really pinpoint a particular archetypal character. More interesting are the new types of feat offered. In addition to the new general and metamagic feats, the *Players Handbook II* offers feat tracks based on character lineage, fighting style, tactical outlook, and more. Again, these feats allow for a new level of focus for characters, allowing players to fully develop a PC down a specific pathway.

Where the book really shines is in addressing areas that have been conspicuously absent in many Wizards of the Coast products in the past: solid ideas for creating believable characters and advice for roleplaying those personae more effectively. Personality traits and possible backgrounds are suggested for each class, along with suggestions and dialogue ideas for conveying those traits and backgrounds in game. The second on table and game etiquette, while

common sense for experienced players, should be required reading for anyone new to the hobby.

The most interesting sections of the book are on the benefits of teamwork and retraining/rebuilding characters. While certain aspects of teamwork seem to make a fair bit of sense, the *Players Handbook II* codifies teamwork into, essentially, team feats that allow for greater flexibility or coordinated attacks. While an experienced group will have little trouble incorporating these ideas without the rules, it's a nice addition that makes sense for newer players, since it functions well within the constraints of the *d20 System.* The section on retraining is long overdue, and well-designed. This allows adventurers to dump skills, feats, spells, and other features that have outlived their usefulness in preference of new abilities. This involves a small monetary cost to the PC and some game time to accomplish, but again, these rules make particular sense, and free up those players who chose feats or spells in haste. After all, some feats look like a great idea on paper, but don't make a lot of sense for a particular character in the game itself. So, while there is a penalty for a poor choice, now players don't need to live with mistakes forever.

The book does fall short in a couple of places. The section on character affiliations, while interesting, has been covered at least in part in other books. Additionally, the suggestions for how to run groups those characters can belong to are, for lack of a better word, arcane at best. These ideas can certainly spice up a game and add a lot of intrigue and realism, but also appear to complicate matters needlessly in a lot of ways. In short, the suggested uses for affiliations and organizations leave to chance a number of decisions that could just as easily be handled by the gamemaster without rolling a d20. And while it does speed things up, handling a battle, espionage, or negotiations between two groups with a single d20 roll puts a lot of fate into a single toss of the die.

Additionally, some material seems to have been left out. For instance, one of the paladin variations suggests looking on the accompanying "Paladin Battlecries" sidebar, which, bluntly, doesn't exist. The appendix on creating NPCs and PCs on the fly is handy, but was included in lieu of a badly needed index. A couple of full-page pieces of art could have been sacrificed for that index as well, and this oversight makes the *Players Handbook II* much more difficult to use. It's ironic that a book with so many useful hints on streamlining the game presents information in a way that's hard to locate quickly.

Overall, this is a worthwhile book for serious *Dungeons & Dragons* gamers. There are a number of excellent suggestions here that will make the gaming experience a lot more enjoyable for many players, will make certain character classes much more attractive, and will add both depth and breadth to many campaigns.

--Steve Honeywell

Shadows and Fogg, Part the First

'"Well do it, then!'
'Go around the world in 80 days?'
'Yes!'
'All right then.'
'Starting when?'
'Starting now.'"
-- Jules Verne, *Around the World in Eighty Days,* Chapter I

Summer's here, and it's time for a trip. This time, we're not merely going [across the country](#), we're going around the world. And who better to guide us than the master of the Extraordinary Voyage himself, Jules Verne? This series of columns takes his great novel *Around the World in Eighty Days* as its core artifact. (You can get it [online](#) if you haven't read it before.) In addition to the standard secret-historical approach to Verne, his novel, and his character, we'll use the luxury of vacation stretch to apply the novel to our "[Transmission 200](#)" time-war setting.

This will hopefully not only reveal the novel as worthy of our particular brand of eliptonic scrutiny, but also provide a kind of in-depth case study that GMs and setting builders can use as a model (or itinerary) for their own obsessive workings. Like Phileas Fogg with his ledger, I'll be marking down a few notions of correspondence where they strike me, keeping us up to date on our progress through the forest of symbols. And finally, this exercise will also end up giving some nice little hooks (and, if desired, a largish piece of metaplot or backstory) to link into existing or ongoing steampunk, Victorian-era, or later games. PCs can replace Fogg and company, aid them, obstruct them, attempt to beat their time, or merely keep stumbling across Fogg's footprints on their own adventures. So, let's be off, and bon voyage to us.

" The latter was an enigmatic figure about whom nothing was known, except that he was a thorough gentleman . . . Although clearly British, Mr Fogg might not have been a Londoner. . . . In sum, he was not a member of any of the associations that breed so prolifically in the capital of the United Kingdom, from the Harmonic Union to the Entomological Society, founded chiefly with the aim of exterminating harmful insects."
-- Jules Verne, *Around the World in Eighty Days,* Chapter I

There are two surviving (and one suggestively lost) manuscripts of *Around the World in Eighty Days,* one of which dates the beginning of the journey as 1858 rather than 1872. Although we should probably continue to assume 1872 as the target year for the Fogg Working, we'll keep a weather eye on the earlier year. (But that would explain why Fogg reads *The Morning Chronicle,* which ceased publication in 1862.) The 1858 mention may have been a shadow or backlash cast by the successful Fogg operation, or a rehearsal, or even an attempted counter-op remaining faintly visible in the documentary record. It also might have been the real operation, with Verne's novel a cunningly disguised bit of disinformation -- in which case, Fogg could not have used conventional terrestrial technology to circle the earth. An 1858 voyage would have depended rather on [secret airships](#), tunneling machines, or dips into the hollow earth or hyperspace -- not to mention traveling through the aftermath of the Sepoy Mutiny in India and the ongoing battles in Kansas, Utah, and elsewhere in an America without a transcontinental railroad. It also becomes far more likely that Fogg is working against Argus, perhaps to "make straight the way" for the [Emperor Norton](#), who is crowned in 1859.

With that said, the parallels between the series of "eruptions" visible in Orion starting on February 4, 1872 and the repeated "skyquakes" heard in the skies over Britain in November of 1858 become interesting. Did the sound travel faster than the light of the irruption, or do we have cause and effect backward? (If the 1858 event is a backlash from the successful 1872 Working, perhaps that explains it.) Either way, the fiery displays in the northern sky serve as omens of the upcoming struggle, or perhaps static discharge thrown backward from the energies of the Working.

Verne begins his novel (or his edition of Fogg's report, or his disinformation propaganda, or his forensic reconstruction of the Working, but we'll stick with "novel" for simplicity's sake) in space-time: "In the year 1872, [at] No. 7 Savile Row, Burlington Gardens," which is to say, in the West End of London. His hero, Mr. Fogg, "might not have been a Londoner," but was "clearly British." So who, among our cast of conspirators, does Fogg work for? Verne states

boldly that he is not a member of the Harmonic Union, which to me would seem to rule out the Lemurians. Nor is he one of the "Entomological Society, founded chiefly with the aim of exterminating harmful insects," which is as neat a description of Argus from *GURPS Black Ops* as I've ever seen. In short, Fogg's membership is probably the obvious, the occult secret service MI-   , the legacy of John Dee. He seeks, for some reason, to "throw a girdle round about the earth" as [Puck](#) does in service to Oberon, though he takes eighty days rather than forty minutes. However, Fogg's relationship with his club is fraught; they become his adversaries and opponents in the Voyage. This could indicate that Fogg is another example of the alarming tendency of MI-   agents to go rogue, or to develop highly eccentric individual agendas. Certainly the entire novel is a tale of a man who suddenly goes off the rails (and who literally goes off them twice).

"In the different phases of his existence, this gentleman gave the impression of being perfectly balanced in all his parts, weighted and poised, as flawless as a chronometer by Leroy or Earnshaw. The truth was that Phileas Fogg was precision personified."
-- Jules Verne, *Around the World in Eighty Days,* Chapter II

So who -- and what -- *is* Phileas Fogg? He gets his first name from the obscure St. Phileas, or possibly from a Greek-French pun *philé* meaning "lover" and *as* meaning "ace" in French. (That said, Phileas Fogg and Passepartout are obviously the Magus and sacred Fool, setting out on their journey through the Tarot.) Thus, the card-loving Phileas Fogg becomes a "lover of aces." (One researcher claims to have discovered a 5th century B.C. Greek author named Phileas who wrote a *Periplus,* or *Voyage,* but although suggestive, there aren't enough details to say of what.) His last name most likely stemmed from one W.P. Fogg, of Cleveland, Ohio, who traveled around the world in 1869-1871. Or did it? The Cleveland Fogg could be another blowback echo, or a precursor, or a rehearsal. Advance scouting or misdirection laid down by an allied Argus? Or magical ambushes set in place by an Argus less well-disposed to Fogg and MI-   ? We're not really sure who the protagonist is, so we can't really say who the antagonists are, just yet.

Phileas Fogg is a compulsive whist player, a man of strict schedule and no visible emotion. He is described in the novel as "a genuine piece of machinery," "a real machine," "made of wrought iron," with "the grace and spontaneity of an automaton," and one who "appeared no more moved than the chronometers on board." This leads one to the assumption of Fogg as a clockwork or cybernetic automaton, substituting whist perhaps for [the Turk's](#) chess as a decision-making software. In Verne's early story "Master Zacharius," the titular watchmaker puts part of his soul into his clocks; could Fogg be a final attempt by Zacharius to transmigrate himself into an immortal gear-driven body? We also note in passing his strong resemblance to Lord Byron, albeit to "one who might have lived a thousand years without ever growing old." (This kind of thing gives wing to C.J. Beiting's excellent essay ["Phileas Fogg -- International Man of Mystery,"](#) which identifies Fogg as spy, time traveler, vampire, or robot, and is well worth perusing not least for comprehensive *GURPS* stats and for a summary of the novel.)

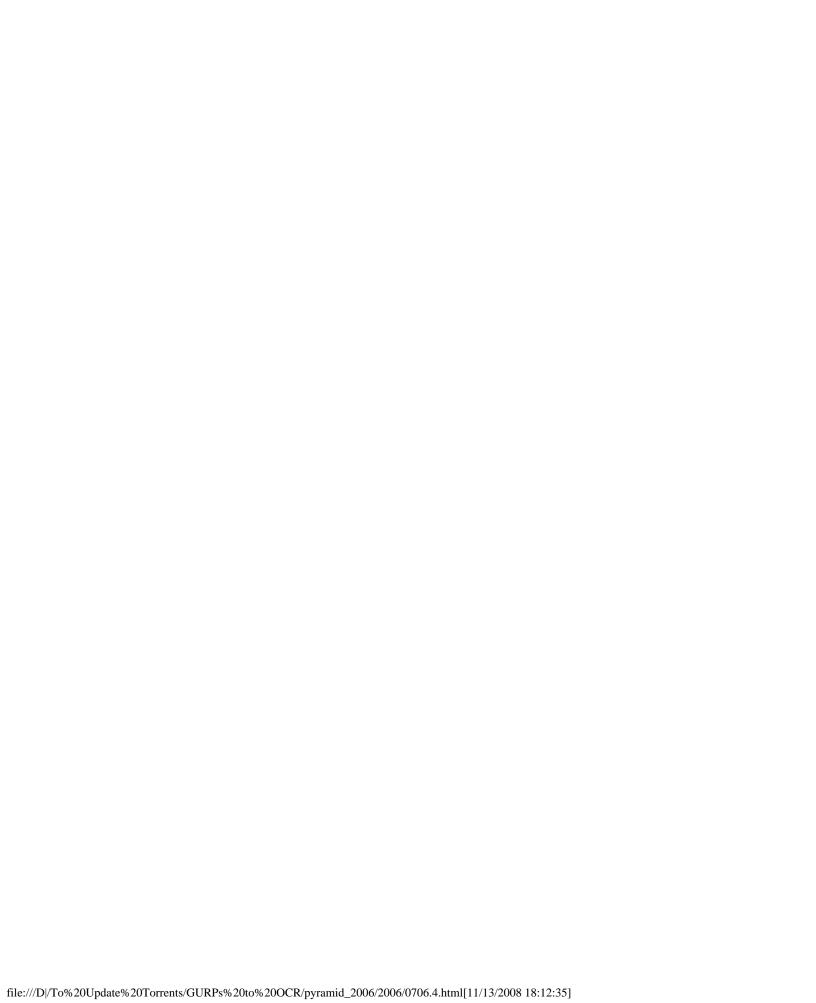
I also note Fogg's insistence that "the unforeseen does not exist," and his announced intention to "jump -- mathematically" from trains to steamers and so forth. Fogg here seems more familiar with hyperspace than with normal space -- could he be a [Sphinx](#)? He is imperturbable and inscrutable, after all. Fogg might also be an immortal, with a perspective like that -- a Reptoid, or even a [Frankenstein's](#) monster (since he has no known family, and at least one chronicler has dated *The Horror of Frankenstein* internally to 1858) or other form of bioroid. While we're on the subject of automata, it seems that Verne, interestingly, suffered intermediate attacks of facial paralysis. And he wrote two novels a year for 40 years straight. Do you smell smoke? Do you hear the sound of gears jamming?

"I am the most unknown of men."
-- Jules Verne, letter to Mario Turiello (April 10, 1895)

And we'll never know, because Verne burned all his personal papers in 1898. The author Michel Lamy theorizes that Jules Verne was a member of a secret artistic collective, Le Brouillard, or the Angelic Society. Per Lamy, Verne left hints about his membership in this Rosicrucian organization throughout his work (Rose-Croix = Robur the Conqueror, for example), and many of his novels such as *Journey to the Center of the Earth* and (of course) *Around the World in Eighty Days* can be read as initiatory journeys. The word *brouillard* also means clouds, or fog. In a 1903 interview, Verne said "I do attach certain importance to them . . . Yes, there is importance in names." If Lamy is on to something, then the choice of Fogg is significant. Verne added, "and when I found 'Fogg' I was very pleased and proud. And it

was very popular. It was considered a real *trouvaille.* And yet Fogg -- Fogg -- that means nothing but *brouillard.* But it was especially Phileas that gave such value to the creation."

We must needs leave the postulated Brouillard society at bay, here, save to note that any of the quantum organizations in our time war setting might be considered "foggy," since their history (and occasionally their agenda) remains unsettled, inchoate, and clouded over by constant timeline shifts. Verne himself was a good client of the strangely esoteric-minded Orleanist line of the French royal family. His own family lineage comes from Provins, the old Templar stronghold. And he was something of a protégé of Victor Hugo, the Grand Master of the Prieuré de Sion -- and the artist Jean Cocteau, likewise Grand Master of the Prieuré, duplicated Fogg's journey in 1936. Verne's 1896 novel *Clovis Dardentor* contains not just an echo of the Merovingian king Clovis, but a character (Captain Bugarach) named after a landscape feature near Rennes-le-Château.

Of course, Verne had a great fondness for geographic names. In the final version, Fogg's valet Passepartout is named from the French words for "go anywhere" or "skeleton key," a highly significant cryptological clue in its own right. But in one of the earlier versions, the valet is named "Jean Fernandes," which is an interesting connection to another Verne obsession, the desert island. The original Robinson Crusoe, Alexander Selkirk, was marooned on the Juan Ferndandez Islands off the coast of Chile. What's the connection between this mysterious island and the Fogg Working? We cannot know for sure, but it must be deep. Elsewhere in the draft, Passepartout is named "Jean Fricaudet," which may come from a French word meaning "plot." And Inspector Fix, of course, is attempting to "fix" the problem posed by Fogg and Passepartout, whatever it is.


"Do you know, Mr. Passepartout, that this so-called journey in 80 days might easily be the cover for some secret assignment . . . "
-- Jules Verne, *Around the World in Eighty Days,* Chapter IX

One can measure a circle beginning anywhere, but Phileas Fogg begins his circle at the Reform Club. And so Fogg set out from London, on October 2, 1872 (as the novel has it), at 8:45 p.m., with only Saturn in the sky, but with the Sun, Moon, and changeable Mercury all together on the other side of the world. This is the cusp between the first and second decans of Libra. In **GURPS Cabal** terms, the cusp between Naôth and Marderô, or between communication and revolution. As a decanic backdrop for a novel of sudden change, it is an interesting choice -- almost as interesting as Verne's decision to give the novel 37 chapters, one more than the decanic cycle of the year. If we assume that the first chapter and last chapter both correspond to Naôth, we can build the entire decanic cycle into the novel's structure. Alternatively, Verne lays out eight legs for Fogg's journey in Chapter III, which would correspond to the eightfold turning of the year -- again, a complete yearly circle measured in 80 days. Although October 2 falls in the "season" of Mabon, in the novel, the first leg thematically corresponds more closely to Lugnasadh, the time of preparation. And Fogg himself breaks his voyage down into 12 legs in his journal -- paralleling the 12 signs of the zodiac, and another turning of the annual wheel. London to Paris thus becomes Libra, the initial balance -- of Fogg's life, of the magical order, of conspiratorial power -- prior to upset.

And upset it is. A bare five days after Fogg's October 1872 departure, our old friend [Spring-Heeled Jack](#) runs rampant in the London neighborhood of Peckham, and continues his depredations for two months. (In 1858, rains of insects fall from Mortagne, France, to Warsaw, Poland. Simultaneously, the Foggishly mechanical savant and chess champion Paul Morphy toured Europe.) Time begins to fold -- the bank robbery takes place variously on September 28 and September 29 in different chapters of the novel. And although his schedule reports stops in Paris, Turin, and Brindisi, Phileas Fogg remains resolutely off stage while a series of intricate nested flashbacks ends with a telegram sent recursively into an earlier chapter. Verne is opening up the "wide gap of time" in his own way. Fogg has vanished out of time, space, and the narrative -- he is free to pursue a secret agenda. Although the novel notes Fogg's arrival at Suez on October 9, it would no doubt be the work of a moment for an MI-   agent to double back and intercept a fallen meteorite in Soko-Banja, Serbia on October 13, 1872 (when Fogg was ostensibly off Mocha in Yemen). This meteorite was composed, so the local scientific experts discovered, of an unknown mineral they called banjite. A second meteorite, of the same mineral, hit 17 years later in the nearby town of Jelica -- and after Verne's death, a manuscript called *The Hunt for the Meteor* was discovered amongst his effects.

Next: Shadows and Fogg, Part the Second: In Which We Encounter Death And The Maiden

Here's a Paradigm; Call Someone Who Cares

For the past few hours I've been training my replacement at my current temp job. While bittersweet (less on the bitter part because it's not like I'm being let go, so much as fleeing the state), it's nevertheless an exciting time . . . and not just because I feel the urge to leave all kinds of information-bombs in my protegé. ("Okay, you see Melinda there? She likes to be called 'Lotta Thunder.'")

Nevertheless, it's been something of a jarring experience. This is primarily because I'm having a hard time determining what information and context my replacement -- a good quarter-century my senior -- and I share. For example, even though she was computer literate -- in the sense that she could turn on the computer, wasn't afraid of the mouse, and so on -- she's not a "power user." Things like "Find/Replace" or "Copy/Paste" don't flow as naturally from her fingers as they do mine.

In thinking about this, I realized that the difficulty may well come with my day-to-day familiarity with computers. I'm utterly unafraid of them (sometimes dangerously so . . . more than once I've realized the error of my misplaced "del *.* /s" mere seconds too late), More importantly, I have an understanding of the fundamental aspects of computers. I know what a "Next" button does, or an "X" box in the corner or a shortcut listed on a menu. The notion of "copy/paste" has been a part of my day-to-day existence for over half my life; even the Windows environment is only a couple years shy of that 50% benchmark. (And it's sobering to think that there are adults today who could have been born during the "1984" Macintosh commercial, having lived an entire life as an Appleite[1].)

What's interesting, however, is how the current computer paradigms we enjoy nowadays are very recent in the great scheme of things. For example, I'm probably part of the last generation who was expected to dabble in programming when getting into computers. (Practically my entire middle-school and high-school computer education was devoted to BASIC and various computer-science concepts, since the notion of using a computer was near-synonymous with programming it.)

What I've been contemplating over the past few hours, then, is this notion of the paradigm -- the point where things change, and where one group of people are completely comfortable with one way of doing things, and another group is either only comfortable with the old ways, or only adapt grudgingly to the new. You'd be hard-pressed to find an office worker who was utterly unable to deal with computers. (As a curious counterexample, my wife and I *did* encounter a car dealer that, to the best of my knowledge, had no computers whatsoever . . . paper invoices, typewriters, etc. It took them three days to get back to us with some trivial information about a car -- by which point we had already purchased a vehicle elsewhere. If this datum is indicative, I suspect they won't be around forever.)

There are a fair number of points that I can think of in history where these new ideas spread to this great extent, where an "adapt or die" mentality was widespread, but I suspect they're rarer than might be believed. Sure, the advent of the airplane made it possible transverse great distances in a few hours rather than weeks, but it was possible simply not to travel via that means. I presume the rise of the railroad had greater implications, as the noisy, rapid-moving vessels rolled through town with such a presence that they could scarcely be ignored.

I suspect the point at which slavery was outlawed might have marked a similar radical shift between the Before and After, although -- at least in America's South -- this outlook change was sadly mitigated by the reclassification of workers from "employees we don't pay because they're not free to leave" to "employees we pay so little that they have few options to leave."

Although we don't think of it much nowadays, there have been a number of times in human history where military developments have radically altered the outlook between those before and after the paradigm shift. Most recently the events of September 11th awakened Americans to a style of warfare that has been endured by other parts of the world for decades. Before that, the rise of portable firearms, as did gunpowder itself centuries before and the rise of cavalry years before that. No longer was one safe in one's own village; death could come from a hip pocket, from a mortar, from the thunder of hooves the next hill over. (Oddly enough, most such military advances nowadays don't affect our

day-to-day interactions; after all, who cares if a nuclear bomb can destroy a city or a continent? The use of either one would qualify as a Bad Day.)

Outside the field of battle, there have been a few other points of this "paradigm shift." One of the earliest I can think of would be when the notion of currency was first catching on; it's entirely likely that -- in many parts of the world -- you'd have many people who simply wouldn't accept these embossed metal disks in exchange for something useful, like chickens.

In pondering the currency example, think it's likely that many of the recent radical outlook revisions have stemmed from the extension of the human life cycle coupled with the reduction of the "gestation" time of new ideas. For example, if it takes 50 years for currency to catch on, then anyone used to the barter-only system would have died off in the interim. Compare this to computers, which have gome from a Buck-Rogers fantasy to desktop realities in a matter of a few decades; entire generations have been forced to adapt or fall behind.

I think the emergence of computers has been on my mind lately because of my uncertainty of the future. Will there come a time when *I'm* the one on the rocking chair, uncomprehending of how to reroute the positrons on these newfangled robomachines? (I think Penny Arcade hit the nail on the head [last December](.) I hope and suspect not, since the past couple of generations have gotten accustomed to a *pace* of learning and adaptation that -- hopefully -- exceeds the actual advances we've made. The realization that "sending a document quickly" has gone from telegraph to next-day mail to fax machine to e-mail over the span of a few decades preps us for the notion that, "Golly gee wilikers, the way we send a document quickly might change again." On the other hand, I'm not entirely convinced of this. For example, I've heard reports that the Kids These Days view e-mail as something of a dinosaur, preferring to do most communication over instant messenger. Reading these articles, I begin to respond with a glaring, "Bah! The kids these days; don't they understand that the . . ." and then I catch myself, horrified by the realizations of what I'm saying.

Even so, I still hope I'm not quite extinct yet. For one thing, I am at least *familiar* with what instant messaging is; I don't keep Gaim open 24/7, but I *could,* if there was a good enough reason (or large enough basket of money). And I still like dabbling in new technology. I've got a blog; I'm considering going sans land line in our new apartment (perhaps going with a cell-phone and VoIP combo). To quote Walter Stratford from *10 Things I Hate About You,* "I'm down, I've got the 411, and you are not going out and getting jiggy with some boy. I don't care how dope his ride is!"

There's nothing so constant as change, and adapting to all manner of alterations to the way things are is one of the things that humanity, as a whole, does quite well. Individual humans, however, often have a much rougher time.

I used copy/paste seven times to craft that previous paragraph, and I haven't touched the mouse once while writing this column.

--Steven Marsh

* * *

[1] Yes, for those of you seeking to correct a seeming error, I know Apple computers have been around longer than the 1984 launch of the Mac. My first computer was an Apple IIgs, and my first five years of computer training were on Apple IIes . . . and it's quite a humbling experience to compile a Pascal program using nothing more than two 5.25" floppy drives.

The Rich Are Different

for *GURPS*

by Stephen Dedman

"The rich are different than you and me."
"Yes, they have more money."
--F. Scott Fitzgerald & Ernest Hemingway

Many men of course became extremely rich, but this was perfectly natural and nothing to be ashamed of because no one was really poor -- at least no one worth speaking of.
-- Douglas Adams, *The Hitchhiker's Guide to the Galaxy*

The love of money is the root of a great many games, and many player characters (and players) seem obsessed with accumulating wealth. Even those who aren't may occasionally find themselves in need of money. At such times, it is often easiest to go straight to those who already have plenty of it, in the hope of patronage, charity, a loan, or (more often) someone to rob, swindle, or blackmail.

With this in mind, here is a collection of filthy-rich NPCs designed for use as patrons, contacts, enemies, allies, or victims. Each one is designed with a particular cultural background in mind, but requires only minor changes to adapt for almost any setting where money still means power.

Joseph Allerton *(Cliffhangers/Wild West)*

Like many men, 19-year-old Joseph Allerton came to San Francisco in 1849 in search of gold. Unlike most, he found enough to make him rich. Even more unusually, he managed to consistently increase his wealth over the next decade as all of his investments paid off, despite his tendency to leave the job of reading contracts and balance sheets to his employees. Part of his success can be attributed to the fact that most people instinctively like him, but most of it can only be explained away with incredible luck.

Allerton lives in a suite in one of the hotels he owns, the Sovereign, but can often be found tending bar at one of his less expensive saloons, the Pacific, a knife's throw from the notorious Barbary Coast. The Pacific offers a free lunch to clients; there is also a bunkhouse behind the hotel for the homeless. Like many bartenders, Allerton is a good listener, and hears many tales of woe. If he has a good or better reaction to a customer, he may arrange for them to be given what they most need -- such as medical care, tools (but not weapons), a good second-hand suit of clothes, a job in one of his businesses, a scholarship, a 2nd class train ticket or steerage passage back home . . . almost any type of reasonable aid, but never cash. (He has a particular soft spot for "soiled doves," Asians, and unsuccessful prospectors: +1 to reaction rolls). These gifts are always anonymous; few, if any, of the recipients ever trace them back to their source. Allerton also owns a large number of clinics and hospitals in San Francisco which accept charity cases and don't ask embarrassing questions.

Allerton's business interests are protected by his loyal multi-ethnic staff. He has little idea of the extend of his own empire, which is effectively run by his Chinese accountant, Shui Ta. Any attempt to rob or defraud Allerton will incur the wrath of the Chinatown tongs, who will send hatchetmen to recover the loot.

Campaign uses: Allerton is intended as a "guardian angel" for heroes when things go horribly wrong -- in effect, a Favor or even a one-shot Patron. PCs may also find work in the Pacific or the Sovereign, especially if they speak more than one language at Accented or Native level. Because of Allerton's Weirdness Magnet disadvantage, the Pacific is also a regular haunt of strange beings and a good place to hear bizarre rumors -- particularly useful in a Deadlands campaign.

Robbing Allerton is pointless as well as dangerous; he carries little cash, having invested nearly all of his wealth.

Other settings: A secretly wealthy philanthropist and patron of the arts like Allerton might be found in any era where luck and money are still useful, providing the PCs with anything from shoes to starships.

Joseph Allerton   *250 points*

Eli Fox *(Banestorm/Fantasy)*

Eli Fox was the fourth in a long line of successful goldsmiths and bankers. Unfortunately, his hopes of carrying on the dynasty were dashed when, at the age of 12, he was castrated by a sadistic and impulsive footpad who robbed and murdered his father and was disappointed by the haul. Young Eli survived the attack thanks to magical healing; ever since he has hated thieves and admired magicians.

Without the normal distractions of adolescence, Eli concentrated on learning his trade from his grandfather, and soon won fame as a creator of beautiful bejeweled items as well as a canny merchant and moneylender. He was 24 when his grandfather died, leaving him the family business. After this, Eli began devoting more of his time to finding gems that would make good powerstones for his magic-using friends.

Eli still runs a successful bank, but his real love is in creating jewelry, greatly increasing the value of the silver, gold, and gems that he buys. His fortified and magically warded house is crammed with treasures, but Eli spends little of his money on himself; he eats well (when not distracted by work), but his bedroom is as spartan as a monk's cell, and he owns fewer clothes than the poorest of his apprentices. Miserly as he seems, he does make sure his sisters and their families lack nothing they need. He also sponsors young but talented magic-users, pays his taxes without complaint, and helps provide for the city watch as part of his crusade against thieves. The Thieves' Guild also watches him, looking for a weakness they can exploit, but as yet they haven't found one.

Campaign uses: Eli Fox may be a Patron for a magician, an Enemy for a thief, or a very useful Business Contact for anyone in Yrth. He may also be a source of ready-made magical items, or a buyer for any precious metals or gems the PCs may have obtained legitimately (he will not buy anything he believes to have been stolen from a fellow citizen). His bank stores treasure as well as lending money, but only to those who Fox considers honest and reliable (good or better reaction roll): his house also contains an alchemist's workshop, and his guest rooms are often occupied by wizards as well as his apprentices, clerks, and guards.

Much of Fox's wealth (and that of his clients) is kept in his house; his jeweler's workshop always contains 1d+1 pounds (weight) of gold, and gems worth 2d+1 × $1,000; his vaults always contain at least $30,000 in gold and silver coins, and 1d-1 powerstones of different sizes, as well as any treasures he's storing for his clients. The alchemical workshop contains 2d-2 elixirs as well as the (valuable but less portable) equipment of a professional lab. Fox is a difficult mark for swindlers, but even tougher to rob: he keeps geese as guards, as well as human sentries, and it's rumored that some of the statues in the building are actually stone or metal golems and that he can also summon elementals to defend his property. He rarely leaves his house, and when he does, he is accompanied by guards and carries no more than $100 in coin.

Other settings: Fox is intended for use in a fantasy campaign, but could be encountered in any settings where magic works. In a non-magical world, his belief in magic may be a Delusion that can be exploited by the unscrupulous. Alternatively, the PCs may be laboring under the Delusion that magic doesn't work, and be very surprised when they're suddenly surrounded by golems.

house, wears formal robe enchanted with Fortify (DR 2) and Missile Shield spells.

Marcus Lucius Raptes *(Imperial Rome)*

Marcus Lucius Raptes was born a slave on his master's vineyard in AD 22, but gradually rose to a trusted position in his master's household, initially because of his skill as a cook. As his master's house became famous for his dishes as well as its wine, Lucius rose to dominate the kitchen, and then the household, and soon gained an understanding of his master's finances as well. His master, childless, bequeathed much of his fortune to Lucius, who quickly expanded the business empire to include laundries, hairdressing saloons, brothels, a profitable fire brigade, imported luxury foodstuffs, and buying and selling slaves.

Though careful with his money, Lucius is no miser, preferring to enjoy his wealth by indulging in fine food, wine, and prostitutes. As a former slave, he's still regarded as a second-class citizen by most people; this irks him, though he's careful not to show it except with occasional displays of extravagance, such as his entourage of former gladiators (including several women). It particularly pleases him when higher-status but less-wealthy Pompeiians come to his house for food and gossip or, best of all, have to turn to him for favors or advice.

Campaign uses: Lucius would be an effective Enemy in an *Imperial Rome* campaign, but his knowledge of the business worlds of Pompeii and Herculaneum would also make him a useful Contact. While he is unlikely to become an Ally or Patron, he might well be the PCs' employer, and he occasionally grants Favors -- though usually in the form of information or services (such as transportation in one of his merchant ships, entertainment in one of his brothels, or a loan of some slaves) rather than cash.

PCs tempted to rob Lucius will find it dangerous and probably unrewarding; he carries little money, and always travels with at least four litter-bearers who also act as bodyguards. His home is richly decorated, but most of his valuables will be easily recognized and hard to fence. Swindling him is more likely to pay off: Lucius is superstitious enough that a convincing fortune teller might persuade him to invest in a scam. If he catches on, though, the swindlers may find themselves ambushed by a dozen ex-gladiators, and wake up chained to oars in a galley.

Other settings: A self-made magnate like Lucius might be encountered in any society where the upper class feel contempt for the "nouveau riche."

Travis Tavernier *(Infinite Worlds/Atomic Horror)*

Travis Tavernier is a well-known artistic entrepreneur, Hollywood "script doctor," talent scout, critic and pop culture trendsetter. What isn't so well known is that he's a stranded parachronic traveler, a native of Holly (page 526 of the *Basic Set*) who often uses his knowledge of history to help advance the careers of those whose work he admires.

Tavernier was originally a successful art and entertainment buyer for White Star Trading until his parachronic conveyor malfunctioned and appeared in a previously unknown timeline -- somewhere above the Caribbean. Tavernier took the emergency survival kit from the conveyor and escaped as it sank with what few valuables he could carry, then paddled his tiny life-raft to the nearest land, which turned out to be Cuba. There, he traded his jewelry for a stolen passport and caught a boat to the U.S., where he did various jobs, sold his valuables and gambled on a few major sporting events until he'd saved enough to set himself up as an agent, coming to Hollywood in 1951.

By 1953, Tavernier was a huge success, the owner of profitable art galleries and recording studios, and also investing heavily in high tech -- including the work of the TSF, development of submarines and diving gear, and some ideas commonly labeled "weird science," such as time travel and chronoscopy. About this time, he also realized that this wasn't quite the world he knew from Homeline's history books, and not just because of his intervention. Classified documents about UFO crashes in Roswell and Kingman showed that Earth in this timeline was being visited by alien races unknown to White Star. He was unaware, however, that one of his new friends, Constantine Lauren, was actually the leader of the Loi on Earth. Lauren, however, is perhaps the only person on Earth who knows Tavernier's secret, and while the two have similar goals (if slightly different motives) watches him very carefully.

Tavernier's main interest is in getting home -- though as he realizes that this is unlikely with 1950s technology, no matter how many inventors he helps out, he's trying to make his stay as interesting and comfortable as possible. He's also tried promoting modern art that might alert other parachronic travelers who might someday discover his world, including secret messages inserted into songs, films and paintings.

Campaign uses: In an Atomic Horror campaign, the PCs are most likely to meet Tavernier in his role as a backer of the Theoretical Science Foundation. He may also act as a Patron for scientists or artists, or a Contact in the arts world (including film: he has a weakness for science fiction B-movies, and has designed sets and props for several). Tavernier tries not to meddle in politics or break the law, but some of his actions or comments (such as trying to defend the rights of minorities, speaking out against censorship, or trying to tell the U.S. government that the Russians are likely to win the space race) may make the PCs suspicious -- and if they discover his secret, he may become an Enemy or an Ally, depending on their intentions. If the PCs are able to help Tavernier locate and repair his conveyor, this can be used to turn an Atomic Horror game into an Infinite Worlds campaign: a team that resourceful would definitely be of interest to ISWAT!

Tavernier's house is protected by state-of-the-art security, but always contains 2d+3 × $1000 in cash as well as his art collection. Through force of habit, Tavernier tends to carry a lot of money and valuables on him rather than trust to banks; his wallet contains 1d+4 × $100 in cash, and he wears at least $1000 in jewelry.

Other settings: Tavernier may be able to grow rich in any world which values art -- though the more primitive the technology, the less interest he will have in trying to advance it except for his own comfort.

Travis Tavernier   *165 points*

Verity Van Elven, aka Terry Daniels, aka Silverblade *(Horror/Supers)*

Verity Van Elven is the only surviving child and heir of the Van Elven family, famed as armourers from the Crusades to the Great War. This is not a legacy that Verity finds comfortable, and she has ostensibly chosen to live as a dilettante with pacifist sympathies: she has not closed the company down, but is trying to steer them towards making gadgets and vehicles for the civilian market (some of them of her own design), and has the power to veto any overseas sales.

Privately, however, Verity suspects that wars and many horrific murders are caused by malign supernatural forces, which she is determined to discover, and maybe eliminate. This may be true, or it may be a delusion caused by a

guilty conscience; either way, it has driven Verity to learn whatever skills she may need to spend much of her time hunting for demons and monsters. Because her doctor, an old family retainer has persuaded her that this sort of search is best done in secret, she frequently adopts one of two identities: Terry Daniels, a querulous specialist in the occult and dealer in rare books, and the masked and mysterious Silverblade. While Verity (in her various incarnations) only investigates cases she suspects are supernatural, many of these turn out to be hoaxes -- some of them intended to conceal crimes. This has given Silverblade a reputation as a crimefighter or vigilante, which "he" occasionally exploits.

Campaign uses: Verity is intended as a Patron and/or Ally for characters in a Roaring 20s Horror or Supers campaign. Her house is a museum of weapons and armor (many produced by her family) and hard-to-find books, and to this she's added a large collection of vehicles -- any of which might be lent to monster-hunting PCs. Terry Daniels may assist with their research, and Silverblade might even join them in missions against particularly nasty horrors (or come to their rescue). Verity may also enlist the PCs' aid if she needs more firepower, and can pay for their services. Verity may also act as a Patron for a fellow Gadgeteer wanting to build better vehicles or non-lethal weapons, but lacking the necessary resources.

To turn Verity/Silverblade into a villain, add the Paranoia disadvantage and a Major Delusion that causes her to see evil everywhere (e.g. all epileptics are possessed, all redheads are vampires, all lawyers are members of the Cabal, etc.).

Verity's home and collections are protected with state-of-the-art security, but she throws enough parties that robbing her of some small valuable items will not be especially difficult: the trick will be finding a buyer.

Other settings: Verity may be relocated, with only minor tweaking, to a horror or powers campaign in any world from *Deadlands* to *Cthulhupunk.*

Verity Van Elven, aka Terry Daniels, aka Silverblade   *575 points*

Gear (as Silverblade): Short staff, one end sharpened for use as stake, other end capped with silver; Large knife, very fine; Auto Pistol, 9mm TL6, with autofire select (RoF 8); Concussion grenade; Buff coat (DR 2) over cloth armor (DR 1), leather pants (DR 1), leather gloves (DR 2), boots (DR 2), and web gear; broad-brimmed leather hat; silencer; Flashlight, heavy; Lockpicks. *(as Verity and Silverblade)* Roadster, TL6, with concealed compartments, holds Pump Shotgun, 12G TL6, fine quality; Disguise Kit; First Aid Kit; Camera, 35mm; Binoculars; Shovel.

Variant: For an even more formidable version of Verity, assume that her delusion about her nightmares is not a delusion, and expand her Danger Sense into an ESP power.

Adventure Seeds

Blame it on the Stones (Imperial Rome): Marcus Lucius Raptes has just acquired a fabulous blue diamond, and an envious rival, Cassius Komnenos, has dropped hints that the stone is cursed. Cassius offers to pay the PCs handsomely if they can persuade the superstitious Lucius that his luck has run out and that he should dispose of the stone.

Full Fathom Five (Fantasy): 90 years ago, the good ship *Unicorn* disappeared with its load of gold ingots, gems, and holy (and possibly magical) relics. The cash-strapped heroes discover the location of the *Unicorn's* wreck, on the far side of the wilderness, and decide to try to retrieve its treasure. Before they tackle the hill tribes, the weather, the landslides, the sharks, and the undead who haunt the wreck, the PCs will have to acquire magical items that enable them to breathe underwater -- and the best source is Eli Fox.

Storm in a Port (Old West): The PCs are given the job of acting as minders to a troupe of Shakespearean actors touring from New York to San Francisco and back, stopping at some of the wealthier towns along their route. After various misadventures with the performers, they arrive in San Francisco, where they meet Allerton (who is secretly sponsoring the tour). When one of the PCs and one of the beefier actors disappears, Allerton (correctly) suspects that they've been shanghaied, and gives the PCs whatever assistance they need to find them. Friends of Allerton's who can come to their aid include Emperor Norton I, Sam Clemens (Mark Twain), and Tong hatchetmen skilled at martial arts.

Armor Proximi (Horror): The PCs receive a call from an anxious Verity Van Elven late at night. A suit of heavy steel plate has suddenly come to life, and attacked one of her maids with a great axe, then attacked her when she tried to stop it. Van Elven has tried shooting it, exorcising it, and sprinkling it with holy water, but none of these have suppressed the suit. The armor moves slowly enough that she's managed to trap it inside a room, but it's hacking its way through the doors and pursuing her. It's ignored the fleeing male staff, but she doesn't know whether it's intent on killing all women or specifically after her.

She's ordered everyone else out of the house, but is searching through the library for information on the armor or the spell that might have brought it to life. She will be very grateful for any help with her research, or with confining,

disabling or destroying the armor by more direct means.

Hollywood Nights (Atomic Horror): The PCs see Tavernier being mugged on his way to his car, and come to his rescue. In the fracas, one of the PCs is shot and seriously wounded, and Tavernier asks them to grab the first aid kit from his car. After he saves the PC with wonder drugs from a spray hypo, he asks the others to keep his secret. Depending on their next actions, this may lead to him owing the PCs a Favor, even becoming an Ally or Patron -- or a very dangerous Enemy.

Fnordcast Sneak Peek

Sean Punch's Brazilian Adventure

The Secret Masters have always been on the cutting edge of information (whether disseminating it or ruthlessly exterminating it), and we're proving our dedication for keeping you in the know by broadcasting our first Fnordcast straight from our gleaming computer servers.

For our inaugural broadcast, you'll hear Paul Chapman interviewing Sean Punch about his recent trip to Brazil. And you can get it by clicking HERE. (It's about six megs.)

This Fnordcast will be made available to the teeming millions next week, but we're making it available to *Pyramid* subscribers super-early. Listen, and let us know what you think of this grand experiment over on the message boards.

(This Fnordcast is in the MP3 format. If you don't know what an MP3 is, or your computer isn't capable of playing them, then it's quite likely that clicking that link will result in silence or a screen full of seemingly random characters. You have been warned.)

The Courtesan's Guild

for *GURPS*

by Elizabeth McCoy

Even in the far future, the Oldest Profession is unlikely to have gone away. However, it may be *changed* somewhat . . .

The assumption for the Courtesan's Guild is that there are numerous areas of the planet (or numerous planets) which both legalize commercial sexual encounters and require licensing of a professional courtesan. Amateurs may practice the trade, but even if this is legal, they are prohibited from representing themselves as "Professionals," with the training and backing which that implies.

The Courtesan's Guild provides many services, and has simple requirements in return: training, the Courtesan's Oath, and dues. Dues are used for political lobbying, research into medical or cosmetic issues that concern sex-workers, and to maintain the services the Guild provides.

Membership Requirements

Dues are rarely onerous, but there are several levels of membership based on how much a given courtesan is contributing. A basic membership, costing approximately as much as a good dinner at a medium-fancy restaurant, places one on the public lists as a Professional Courtesan who is licensed to practice the trade. For access to the more advanced services, a Professional should expect to pay 10% of the "take," or a few hundred credits per year (whichever is more).

Training is also required, and is provided by the Guild or Guild-approved private classes. The most important skill is Psychology. (In *GURPS,* the minimum level is 13, or 1 point's worth of skill, whichever costs more.) Secondary skills are Professional Skill (Courtesan), Diplomacy, Sex Appeal, and Erotic Art. (Each of these must have whatever costs more points: a minimum skill level of 12, or 1 point's worth of skill.) Classes are also offered in Acrobatics, Artist, Connoisseur, Current Affairs (especially fashion-related), Dancing, Musical Instrument, Philosophy, Singing, and other useful abilities for attracting attention or maintaining intellectual interest. Combat Sport (p. 184 of the *Basic Set*) and very real self-defense skills are also offered. Carousing is not *taught*, but is frequently picked up by students anyway.

The Courtesan's Oath, or Courtesan's Code of Honor (see below), is the expected conduct for a Professional. Failure to comply can get one kicked out of the Guild. Extreme failure to uphold the tenets can cause the Guild to bring legal suit, for defamation of Professionals!

Services

In return for membership, a courtesan can call upon the Guild for certain things. The most basic dues package allows confirmation that one is a *licensed* Professional in good standing, and access to Guild insurance coverage and the Guild Blacklist. Special scheduling programs and web-hosting are also available; many customers are more comfortable with a relatively anonymous web page that shows when a Professional expects to be free for "making a contract" than with calling up and asking the courtesan to pencil in an appointment. It's also more convenient for the courtesan, who may be busy entertaining a client already.

For higher dues, there are other services.

Professional Skill (Courtesan)

This is the skill of being politely available for rent, without being tacky or offending potential clients. It includes the skills of choosing an attractive, sexy outfit; using cosmetics to heighten one's apparent attractiveness in a social situation; and gracious

Background Check

While a Professionals are always close-mouthed about the details of their clients, they can access the Guild's well-protected databanks, and are expected to give certain information back in return, to keep those databanks current and complete.

The Guild provides searches for client names, client preferences (kinky or straight, and so on), and simple recommendations or assessments of personality, such as "not if he's been drinking," "she's a good customer," or "they're looking for a long-term relationship/toy; avoid if you're not interested." In a campaign where there are corporate stations (orbital, deep space, or simply in otherwise "lawless" terrestrial areas), a *location* may have courtesan-pertinent data.

It is possible for someone (or someplace) to be blacklisted with the Guild; typically this involves non-consensual activities, violence, or refusal to pay for services rendered. The Guild Blacklist is available to anyone who pays dues, and tends to leak even to "amateurs" -- if not the reasons behind each blacklisting.

flirting. It also includes the art of listening raptly to whatever one's client wants to talk about, without showing signs of boredom, and understanding the signals people give when they're hoping you'll pick up an interest or a particular fantasy.

(If the GM desires to shift focus, the Guild's required Psychology, Diplomacy, and a certain amount of Connoisseur, Current Affairs, Savoir-Faire, and Sex Appeal could be combined into merely Professional Skill (Courtesan).)

General Information

The Guild also keeps more prosaic listings of useful businesses, such as doctors who practice cosmetic surgery, specialists for certain conditions and procedures, or general medical practices. Architects, clothing stores, and furniture crafters also find their way into the databanks, especially if they involve retired Professionals.

Itinerary Checkups

A Professional's work may involve being put into intimate contact with people who should not be trusted with the same, or lead into hostile areas. A concerned member can file an Itinerary with the Guild. Should he not show up and contact the Guild at the desired time(s), the Guild will file appropriate missing person paperwork with local law enforcement. (The Guild may also send in private investigators, or on-call troubleshooters, depending on how concerned they are about a situation.) Ideally, the local law enforcement will react promptly; a Professional who's filed an Itinerary doesn't sleep in and forget.

Advantages and Disadvantages

Here is a list of useful advantages and disadvantages for the a Professional Courtesan who is a member of the Guild. Note that publicly following the Code of Honor (below) is mandatory for Guild membership!

Lecherousness is conspicuously absent: a Professional is in control of urges, both because availability affects income, and because an unwanted and non-consensual social approach is against the Code of Honor. Lechery would blind someone to whether the contact is desired by both parties.

Advantages

Appearance (5-15 points)

Naturally, having a good Appearance is useful in the Oldest Profession. However, Charisma can often substitute.

Charisma (5+ points)

More Professional Courtesans are likely to be Charismatic than drop-dead gorgeous. Some, however, merely have high levels of Sex Appeal.

Claim to Hospitality (5-10 points)

The exact point cost depends on the number of Guild members and/or Guild Houses. In general, any Guild madam has a free room or two, and only a traveling Professional doesn't have a couch for a fellow Guild member.

Contacts (variable; page 44 of the *Basic Set*)

Professional Courtesans know many people, though usually from a specific social stratum. (Only unusual Professionals count both winos and planetary governors among their clients!) A Professional may have individual Contacts (bought normally), or the GM might permit the varied customers to be a special Contact Group; add +25% to the cost, since their skills could span the gamut of police investigation to surfing. (While individual clients might be more skilled, use the average skill to indicate how much time they're willing to put into answering questions "for free" and during pillow-talk.)

Flexibility (5 points)

Full Double-Jointed [15] is more likely to be a surgical enhancement, but both are useful.

Reputation (5+ points)

A good reputation with the Guild can be researched with a simple query to the Guild databanks, and -- depending on the person in question -- encourage others to be helpful. (This is generally an advantage because a Professional rarely asks a prude to query the Guild databanks.) Sometimes this aid will be in hope of scoring a discount; other times, because of fond memories of some other Professional.

Disadvantages

Naturally, Odious Personal Habits and similar disadvantages are contraindicated to someone who makes a living as a Professional!

Code of Honor (Professional Courtesan) (-5 points)

*A practicing Professional Courtesan **must** have this Code of Honor -- or a Secret that he does **not** actually abide by it!*

The first tenet of the Courtesan's Code of Honor is confidentiality, also known as discretion. Anything the customer says is in confidence, and not to be revealed. One's relationship with a client is also not to be bandied about lightly to anyone outside the guild. One should never use "inside information" to harm a client, and one should respect others' privacy.

Second is politeness, grace, and elegance; a professional courtesan should always be in emotional control, and never casually insulting, clumsy, or unattractive.

Third is that one should always attempt to please the client, leaving him (her, them . . .) with a smile. This also includes consensuality; whether "vanilla" or "chocolate chip and candle wax," a Professional never oversteps the bounds of what the client is willing to do.

Combat Paralysis (-15 points)

This is not a necessary disadvantage; a Professional could be an Olympic-grade sport duelist, or even have Combat Reflexes from living in unsettled areas. However, the Code of Honor *could* send someone into a momentary pause, trying to balance the emergency situation against the ingrained responses of grace, decorum, and civility.

Honesty (-10 points)

A Professional is not someone who engages in illegal transactions in back alleys. Honesty (as a disadvantage) is not required, but it's not uncommon.

Quirk: No Freebies (-1 point)

Despite what some jokingly say, this is not actually part of the Courtesan's Code of Honor. It's merely common.

Reputation (-5 points or more)

Depending on the culture, there may be areas or groups which frown upon trading sex and companionship for money.

Sense of Duty: Clients (-5 points)

Professionals should at least like their customers, and some are so friendly that they will go out of their way to do favors for them. Matchmaking, job-requests, or pointing people at each other to answer questions are all possible actions of a courtesan with this disadvantage. Ideally, these require acting as a go-between until permission to make introductions is given, but matchmaking may necessitate a threesome.

A PC might take a Professional like this *as* a Contact! Use the +25% cost to represent the Courtesan's access to many and varied information sources.

Plot Uses

Professional Courtesans -- and their Guild -- may be mere color, background for a PC or NPC contact, or direct plot elements.

The Guild As Employer

PCs may be retained as investigators by the Guild, checking into rumors of missing amateurs (a warning sign for Professionals), blackmail of Guild functionaries, or of Guild members who violating the Code of Honor. This could be a job for freelancing private investigators, or for an on-staff "Guild spy." (In the latter case, the spy should have suitable cover skills, and other PCs might be the Courtesan's support network and team-mates.)

Full troubleshooters, again, might be either hired freelancers or full-time employees. Possible jobs include rescuing a Professional held hostage by a client, locating a courtesan who filed an Itinerary and hasn't reported in due to mischance or foul play, and breaking an unreasonably-arrested Guild member out of an overly prudish area's jail.

The Guild As Opponent

Aside from the possibilities of the Guild as an Enemy to fanatical Puritans or a group of villainous PCs, the Guild might have other reasons to be a genteel, decorous antagonist.

Rival Guilds: Like any sort of organization, the management can become obsessed with making sure that only *their* "union" members get the jobs. If the group happens to have a friend (or PC) on one side of the argument, the other side could mark them as people to interfere with. This could be as crude as a would-be über-pimp sending thugs to mess up Professionals, or as ambiguous as being offered money for "dirt" on the other side's management.

Alternatively, the PCs might be the agents of one Guild, trying to move into a rival union's territory! Are they bringing in better services or not?

Framed: Someone who mysteriously appears on the Guild's Blacklist may suffer many petty snubs, or even have Professionals urging their clients to avoid doing business with the unlucky target. Less-ethical courtesans may even request their customers to break someone's nose, or break up their relationships. The question, of course, is *why* this mistake happened . . .

Morality Police: Player characters on the side of Law And Decency may have to deal with the political and popular influence of the Guild moving into their area, striving to make their form of prostitution legal. Can they direct the silken ladies (and gentlemen) elsewhere? Perhaps one could throw himself on the grenade of a Madam and convince her to espouse monogamy instead?

The Guild As Information and Plot Device

For whatever reason, possibly including "you were the first people in the area," a Guild member contacts the PCs to deliver a message about someone, something, or somewhere. This could be the poisoned Professional who presses a data-disc into someone's hand and gasps, "Get this to the Guild," or a comm-call of "You're the closest ship, and we've heard war's erupted on that planet. Can we hire you to get our Guild House staff out?"

And, of course, a Professional can be a Contact (see above) -- and one who might come to a character when fearing that a client is mind-controlled/spying for the enemy empire/a serial killer/something else disturbing enough to break confidentiality.

Pyramid Review

The Deryni Adventure Game

Published by [Grey Ghost Press, Inc.](#)

Written by Aaron Rosenberg, Ann Dupuis, Melissa Houle, Jennifer Brinn, Sharon Cohen, James A. Davis, Steve Kenson, Melinda Sherbring, & Doyce Testerman

Edited by Nancy Berman, Ann Dupuis, Melissa Houle, & Katherine Kurtz

Art, graphics by James A. Davis, Ann Dupuis, Michael Herring, Daniel M. Davis, & Martine Lynch

256-page b&w hardcover; $39.99

Low fantasy isn't a subject that gets a lot of treatment in RPGs these days. If it doesn't sport ancient dragons, magic that can level a castle, and gods enough to fill an amphitheatre, your swords-and-slight-sorcery book is probably going to be stuck on a deep circle of niche-product hell. But what if you license yourself into a built-in audience? It might work for *The Deryni Adventure Game.*

Using the *[FUDGE](#)* system, Grey Ghost Press brings Katherine Kurtz's world to the tabletop. In her Deryni stories, we see an off-kilter version of our own medieval past (the part running between the 9th and 12th centuries, anyway). The Eleven Kingdoms are centered on pseudo-Europe, but the action in the series also drifts to the Middle East and such now and then. There are court intrigues, military actions, and romantic encounters, but the catalyst for many of these tales is the Deryni -- a race of humans who possess the gift of magic.

The standard witch-hunt is therefore a deadly reality. The Church rails against them, the Crown has a potential scapegoat for its problems, and the people's fears of falling prey to dark arts may not be simple superstition. Rather than use it as a tiresome and unyielding plot device, though, Deryni status changes from age to age. Sometimes they're the conquering heroes; other times they're made out to be demons; and still others they're merely the stuff of legend. This translates to some fairly rich opportunities for campaign growth in the adventure game (though you might have to play a few generations to cover all the social implications).

Magic is really just the jumping-off point. Although historically based, the Deryni world is a bit more cinematic: If you engage in combat a lot, you'll probably die, but you may expire from fancier tech than the period really ought to offer. Not everything is about hexes. There's the Camberian Council, working to protect the magical veil of secrecy; a Church that's as much a political football as a bane for witchcraft; and royal bloodlines whose powers might unwittingly be a match for the Deryni.

It refers to itself as high fantasy, but everything is played pretty low-key here. You have at least as many options for playing a normal human as you do playing the magic users. In fact, being really good at any one form of spell casting takes intense development many can ill afford, and the game graciously doesn't assume everyone wants to wear the pointy hat. There are two main character creation systems offered: subjective and Five Point FUDGE.

The first creates your character in descriptive terms, so you and the GM can turn your mental image into your in-game

persona without overpowering the story. The point system lets you "buy" the character, then customize it by "trading" (raising and lowering) various traits; if you want to be better at riding a horse and seducing men, you could lower combat and area knowledge skills. You can buy packages with associated abilities, like the noble rank that elevates you culturally and gives you the skills required by your station in life. Alternately you can cherry-pick everything, but packages focus on the necessities of particular life-paths.

If you go the Deryni route, you receive a Power attribute and a lousy level of skill in the available magic powers. Sacrifice, and you might get one of these at a decent level. Mind-reading, shields, and the fabled healing, among others, are all traits under the general magic heading. Beneath those are series of possible effects -- for example, the casting ability lets you "cast" your senses about remotely (clairvoyance), or look inside a lock to better pick it. More specific effects are dictated by dramatic necessity, so the GM and players work for the most satisfying story they can tell. Sure, you can push the limits, but spells aren't easy and will suck the fatigue -- or the life -- out of your character if you aren't careful.

Even from a material standpoint, the book plays to type. The pages are so heavy they're almost parchment. The cover is thick and lavishly illustrated and, in keeping with *FUDGE* practice, the interior illustrations are mostly clipart or historical woodcuts. These may be a cheap way to keep the cost down, but they're used to wonderful effect and match the accompanying text precisely. Other RPGs should have such good graphics for the money they sink into them.

Untangling how well the game captures the Deryni world is tricky. Once you've been told the basis of the novels -- magic as a racial ability -- there's not much to say without getting into the meat of each novel (or trilogy), and those aren't so easily digested. Plot thumbnails are spread over the timeline and travelogue, and while the character and location appendices are good references, they require more context to make full sense of them. Those same pages could have expanded the gazetteer. There's plenty of advice, both for generic GMing and adding Deryni-specific plots, but other games have trodden the medieval how-to before this. Several bits of potpourri round it out, with calendars, Church terminology, excerpts from Lisa J Steele's book *Fief,* and some straightforward *d20 System* conversion guidance. Oh, and the goat adventure isn't to be missed.

If you're unfamiliar with the *FUDGE* line, don't worry. While not as thorough as the core book, the system has always defined itself by its playability sans an imagined need for a comprehensive rules set (and even so there are at least two ways of doing everything here, from combat to commerce). Just as magic is an underlying factor in the stories, a bridge to telling deeper tales of human passion, so, too, do *FUDGE* mechanics stand by quietly until you need them. In *The Deryni Adventure Game,* the two form a fine symbiosis.

--Andy Vetromile

Stories of Formed Stones

Using Fossils in *Ars Magica*

by Sheila Thomas
Illustrations by Angela Taylor

This article is designed for *Ars Magica 4th Edition.* While the basic ideas are compatible with *5th Edition,* not all the books referenced have *5th Edition* counterparts as yet.

Snakes Eggs

Introduction

Fossils turned up as often in the past as they do now, and people made guesses about their origin and nature. Folklore built up about many of the fossilised shells, bones and other residue of creatures long gone; in Mythic Europe, much, if not all, of this lore is true. The stories presented here encapsulate some of these beliefs and may provide ideas for incidents in a saga or for any game with a related background.

Storyguides may find it convenient to divide the items described here into two types when considering the applicable Arts. Items that are shaped stones alone are best treated as Terram, while those that are bones -- to the eye -- would be Animal or Corpus.

There is scope for complication when using the myths, however, by adding requisites, which are suggested below. The important thing is that the stories are true, so no amount of Intellego will elicit information about what we now know to be the origins of the "formed stone" or fossil bone. No magic can turn a gryphon bone into a dinosaur, though it might turn an ammonite into a snake.

For the convenience of keeping the stories close to the illustrations of the type of fossil they are about, the notes are grouped by modern-day fossil family and, where possible, the modern name of the animal is given in parentheses for completeness. Note that one type of fossil can have several different beliefs associated with it.

Myths

Bivalves

The Devil's Toenail *(Gryphaea arcuata)*
Affected by Vim; infernal

This

afternoon, I happened to pass by one of those boys who habitually loiter about in the courtyard before meal times. He was peering intently at something he turned over and over in his hands so I looked at what had captured his attention so. Imagine my horror when I saw that what he had was one of the toe nail clippings of the devil himself! Here it is. Look at the growth lines that form ridges all along the vicious curving claw. How huge and horrible must be the claw from which this tip was trimmed!

--Fr. Edward of Winchester

Clach crubain *(Gryphaea arcuata)*
Affected by Terram and Corpus

So, you have pains in the bones! What else do you expect at your age? It comes to us all, you know. I could tell you about the way my old joints ache in the long, damp, dark nights when the fire has gone cold. I will show you how I ease the stiffness. See this strange-shaped stone here? You'll not find any like it around the edge of the loch; it came from a place a long way to the south. See how it is bent over, like a body half-crippled with the pains we suffer? I crush a little of it and mix the powder with honey, then spread it on scraps of cloth and bind them around the inflamed joints. Try it!

--Niall of the Covenant of Mac Gruagach

In Play: See **Hedge Magic,** p.35 and **Ars Magica 4th Edition,** p.49. The ointment described counts as a minor potion and adds +1 to a Chirurgy or Medicine roll made at the time the ointment is applied. Any character treated with the ointment can add +1 to the effects of the Arthritis Flaw for 12 hours following application (i.e. the penalty for having the Flaw is reduced to -2 or -5 for that period).

Crinoids

St Cuthbert's Beads
Affected by Terram; divine

Look over there! Yes, it is Sister Winifred on her knees as usual. See that string of beads in her hands? She uses them to count the number of times she repeats each prayer. Those beads make Sister Winifred's prayers very powerful, you know, for though they look like little stones, the beads on her string were made by St.Cuthbert himself! Not that she met him personally, of course. No, she gathered those beads from along the seashore when she was just a little girl.

--Sister Hildelith of Durham

Sister Winifred

In Play: See **Pax Dei,** pp.46-47. Anyone, not just a member of the ordained clergy, praying sincerely while using St. Cuthbert's Beads may have their prayer granted according to the rules for Blessings.

Star stones or Asteriae *(Pentacrinites)*
Affected by Terram, or beyond the limits of Hermetic magic

This is my special stone and no-one is going to take it from me. I'll let you look at it if you promise not to touch it. It is cold and dull now but once it shone high above us with a great light. Yes, it is a fallen star! I did not see it fall myself, but you can see from the shape that that is what it is.

--Gall, son of Seppi the woodcutter

In Play: See **The Fallen Angel,** pp.63-64, for ideas on using fallen stars in a saga.

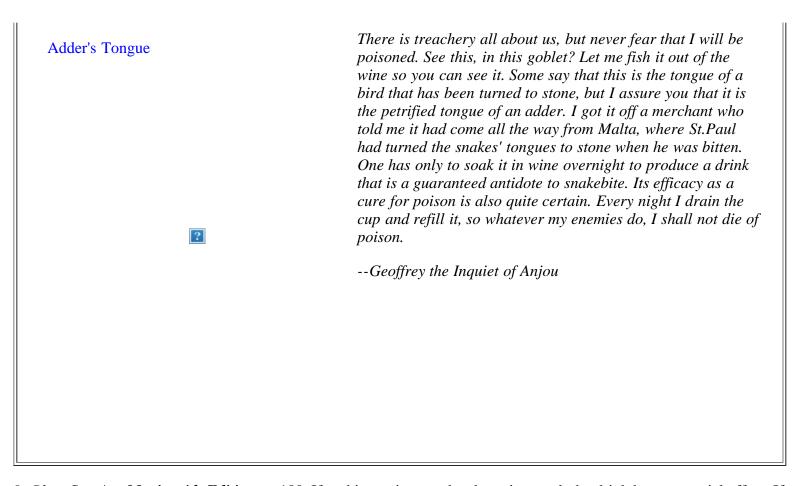
Fish teeth

Toad Stones, Bufonites *(Lepidotes)*
Affected by Terram and Animal

Come back tomorrow, girl, and then you shall have your charm. These things cannot be rushed however much you wish for haste. See here. These are the eyes of toads that have been turned to stone. No, just the eyes, not

the whole toad! I have to leave these soaking overnight in a stone vessel full of . . . . but no! Be off with you and come back the same time tomorrow. And be sure you bring with you that bacon you promised me!

--Mieke the Cunning Woman

In Play: See **Hedge Magic,** pp.36-39, 58-60 and see **The Medieval Bestiary, Revised Edition,** p. 77 (use statistics for the frog). A Toad of Virtue is like any other toad except that it has a Toad Stone in its forehead. A Toad Stone is a Stone of Virtue and contains wild vis. Uncommon. Wild Vis 1. Standard Vis 0.


Glossopetrae (shark teeth)
Affected by Terram or beyond the limits of Hermetic magic

Glossopetrae

Shark's Teeth

I will consider your question and give you answer on the morrow, for tonight I must observe the moon to learn the answer. This is teaching that has come down to us from the great days of Rome's supremacy, that arrow-shaped stones like this fall from the sky during eclipses of the moon. Thus it will help me to learn the information you desire.

Incidentally, it has been reported that stones like this can be used to make the wind die down, but Pliny did not believe this and nor do I.

--Giovanni, Selenomancer

In Play: See **The Mysteries,** pp.108-109. Selenomancy is a form of Ceremonial Augury. Observation of the face of the moon normally gives bonuses for Mentem +2, Mental illness +4, Conception +3. Observation while holding a glossopetrae stone gains an additional +1.

Adder's Tongue
Affected by Terram and Animal

Adder's Tongue

There is treachery all about us, but never fear that I will be poisoned. See this, in this goblet? Let me fish it out of the wine so you can see it. Some say that this is the tongue of a bird that has been turned to stone, but I assure you that it is the petrified tongue of an adder. I got it off a merchant who told me it had come all the way from Malta, where St.Paul had turned the snakes' tongues to stone when he was bitten. One has only to soak it in wine overnight to produce a drink that is a guaranteed antidote to snakebite. Its efficacy as a cure for poison is also quite certain. Every night I drain the cup and refill it, so whatever my enemies do, I shall not die of poison.

--Geoffrey the Inquiet of Anjou

In Play: See ***Ars Magica 4th Edition,*** p. 180. If nothing poisonous has been ingested, the drink has no special effect. If there is poison, the drinker gains +2 to their Stamina roll.

Trilobites

Petrified butterflies (tail of certain Ordovician trilobites)
Affected by Terram and Animal

Look at this poor butterfly! Hold it tightly. You won't hurt it, because the poor thing has been turned into stone. It was done long ago, by Merlin, Great King Arthur's wizard. I don't know why he did such a cruel thing!

--Medi o Caerfyrddin

Petrified Butterfly

Ammonites

Snakestones (*Dactylioceras commune* and others)
Affected by Terram and Animal

Snakestone

Good sir, you look like a man who would appreciate an oddity from across the seas. Here I have something come all the way from the northeast of England! I see you know it at once for a petrified snake, all coiled tightly with the tail in the centre. Of course, that is just what it is, but did you know that this snake was turned to stone by St. Hilda of Whitby? She had chosen the site on the cliff top for her new nunnery, you see, but the snakes were reluctant to vacate the premises. The head? Well, St. Cuthbert cursed the creatures for paying so little heed to St. Hilda's wishes and so they lost their heads. Take this home from the fair and amaze your friends!

--Francesco at the Troyes fair

St. Hilda

The Horn of Ammon, "Cornu Ammonis"
Affected by Terram

Turn over that little round grey stone on the table there. Yes, it is no wonder you are surprised! It looks just like a tiny golden ram's horn, does it not? But those bright crystals are not true gold. They are what the alchemists call fool's gold, but very beautiful, none the less, and it is useful too. According to Pliny, it can bring about prophetic visions in dreams. I put it under my pillow on the night before I intend to commence a new project or make a journey. As to where it came from, Aristotle tells us that minerals are formed by vaporous exhalations of the earth, some tending to be dry, smoky and others moist. It may be that this pretty thing formed in this way.

--Fidens, Bonisagi, filius Auditor Iovis

In Play: The Horn of Ammon is useful to an Oneiromancer with the Virtue Dream Interpreter (see ***Kabbalah,*** p. 116) in Dream Augury, as detailed in ***The Mysteries,*** p. 96, where it confers an additional +1 if placed under the dreamer's pillow with the necessary arcane connection to learn something about an object or person. If used by an Oneiromancer with the Dream Interpreter Virtue on the night before commencing a significant project or setting out on a major journey, no arcane connection is needed to induce an auguring dream about the project or journey.

Brachiopods

Spiriti Sanctus *(Rhynchonella)*
Affected by Terram; divine

> *I always wear this on a cord about my neck. It is an amulet to the Holy Ghost. Look closely and you will see that this stone is shaped like a dove with outstretched wings. It is my protection from the devil's wiles. I clutch it and pray when temptation comes my way.*
>
> *--Sr. Konstanze of Tübingen in Schwabia*

In Play: See ***The Maleficium,*** p.53 and ***Festival of the Damned Anniversary Edition,*** pp.66-85. Anyone touching the Spiriti Sanctus and praying will resist that specific temptation until the next sunset.

Belemnites

Thunderbolts
Affected by Terram and Auram

> *Stones like this are flung down as darts from heaven during a thunderstorm. As they fall, you see the flash and when they hit the ground, you hear the thunder. I found this one just after the huge storm that brought down the far side of the castle wall six years ago. It has several uses. It can prevent nightmares, so I keep it by me when I sleep. It can protect you from being carried off by demons from the sky. See here, where the edge is damaged? I break away just a little of it at times because powder from it can be used to make a charm to ward off lightning or, if blown into the eyes, the powder can cure soreness. Let us pray that there are not so many eyes to treat or storms to ward away that I use it all up and the demons come for me!*
>
> *--Brother Matthias of Wallingford*

Thunderbolt

In Play: See ***The Mysteries,*** p.103. Sleeping with a Thunderbolt has some of the effect of the spell Blissful Dreams (MuMe 20), keeping nightmares away but not affecting pleasant or neutral dreams. The target gets no bonus to rolls the following day.

See ***The Maleficium,*** p.65. Minor/lesser demons keep away from anyone with a Thunderbolt on their person or within Touch range.

See *Hedge Magic,* pp.34-35. The powder works as a Minor Potion giving +2 to a medicine roll to cure sore eyes.

See *Ars Magica 4th Edition,* p.77, pp.120-121 and Hedge Magic, pp.42-43. A Hermetic or Natural magician may use powder from a Thunderbolt to give a +3 spell focus bonus for Perdo Auram spells affecting lightning.

Oyster Shells
Affected by Animal

> *I found this shell while taking one of the less-frequented passes, little more than a goat track. The path is only usable in summer since the snows come early up there, and linger through spring. I'll show it to you next time we're that way. Now, examine this shell. It looks just like the shells of those oysters we ate fresh from the sea last year, doesn't it? But this came from inside the rocks near the peak of a mountain. It is certain evidence that the great Flood, sent by God as a punishment for man's wickedness, did indeed cover all the land. Let it be a warning to us all to shun sin.*
>
> *--Wilhelm "Celeripes," House Mercere, to his apprentice, Eva*

Bones from extinct large vertebrates e.g. mammoth, mastodon

Giants
Affected by Corpus

> *Of course there are giants! Don't you believe the story of Goliath in the Bible? St.Augustine has seen their remains, and he undoubtedly speaks the truth. I'll find the right book in a minute . . . . look here. He writes of the large bones revealed by the ravages of time, the violence of streams and other events which are tangible proof that men and creatures were once much larger than they are now, and tells how he himself found a tooth of a giant on the shore of Utica. There are numerous reports in the old writings of enormous bones and teeth being found. See here, Pausanias reports the bones of giants from places in the Empire of the Nicaea. You must work hard on your Latin and Greek so you too can read these and learn.*
>
> *Cyprian, librarian of Constantinople in the Theban Tribunal*

Heroes
Affected by Corpus

> *It was a fact well-known to the ancients that the great heroes of the past were superior to us in many ways. How did Samson bring the building crashing down about his captors if his strength did not exceed our own many times? There is clear evidence for their greater stature. St.Clement of Alexandria particularly warns against the pagan practice of honoring the shoulder blade of the hero Pelops, whose bone of polished ivory is ten times the size of a normal man's. Philostratus reports the words of a Phoenician merchant who spoke with a grower of grapes in Elaeus, at the mouth of the Hellespont, who had himself set eyes on the bones of great Achilles in a cave at Sigeum.*

Cyclops (skull of dwarf elephant of the Pleistocene era)

Affected by Corpus

Come into my Sanctum, if you dare, and I shall show you a wondrous thing, the skull of a monster out of legend! You may know that in my younger days I explored far, seeking relics of our Roman heritage. One stormy October night I was on a ship bound from Palermo to Salerno. My magic held off the worst for a while but I tired and the seas overwhelmed our vessel. I came ashore alone on a small beach and took shelter in a cave where I found a heap of bones. The limb bones were immense so that at first I thought this had been the abode of a giant but when I found the skull . . . .! There, right in the centre of the forehead was a great hole, just the place and size and shape for the eye of a cyclops!

Cyclops

Lorenzo of Jerbiton, a Seeker, at Literatus in the Roman Tribunal

Echinoids

Fairy loaves (Micraster and Echinocorys)
Affected by Terram

Fairy Loaf

Ma says I have to put this back where I found it, under an old cracked bowl in a dark corner behind the cooking pots. She says it is a loaf of fairy bread and that if we keep in it the house, the family will never go short of bread. If that's true, how come she won't give my brothers and me an extra slice when we ask? Ma says that some people say that a stone like this should be keep on the shelf in the dairy to keep the milk from going sour, but we don't keep a cow. I suppose if I put it back, it can keep our jug of milk fresh as well as keep us in bread.

--Mari, daughter of Simon with the red beard from Pond Cottage

In Play: A Fairy loaf in the dairy will keep milk there fresh for one day longer than is usual. It does not generate extra bread, however.

Lapidus Judaici, Jew-stones (spine of Balanocidaris glandaria)
Affected by Terram

> *What are you staring at? No, this isn't something I am going to eat. Look here, this is what I'm licking, this little white stone shaped like a club or an acorn, with ridges running down it lined with tiny bumps. I get these pains here in my back, see? And how it can hurt when I make water! This helps, this little white stone. I got it long ago and far away, when I went to the Holy Land with the crusaders as a washerwoman. That's a story and a half!*
>
> *--Odile the blessed*

In Play: Licking or sucking the stone for around 15 minutes alleviates symptoms of kidney and urinary tract disease for a day.

Dinosaur bones

Griffin or gryphon *(Protoceratops)*
Affected by Animal

> *Whilst I was in Venice recently, I made the acquaintance of a certain merchant who has contacts who trade east along the silk route. He was a cultivated, generous man who employed a skilled and inventive cook so taking dinner with him was a pleasure in several regards. During my second visit to his home he told me of the great beasts, half lion, half eagle, that menace the trade caravans as they pass through the desert regions of Persia. I thought he was perhaps making an excuse to over-charge me for the silks I was proposing to buy from him, but research proved his tale to be correct. The existence of these creatures is confirmed in the words of the poet Aristeas, as quoted by Herodotus, Philostratus and others.*
>
> *Walter of Vézelay, House Jerbiton*

Gryphon

In Play: See **The Medieval Bestiary,** p.55

Late Medieval Ideas on the Origins of Fossils

> *Behold this stone, very like a large beetle, the body divided into three sections, with ridges running across it. It is as finely detailed as if a living creature had been turned to stone. Or maybe you think that some craftsman*

has carved it? No, this grew in the earth just as you see it now.

Some call such shaped stones lusus naturae, sports of nature, formed by a creative force, vis plastica, in the soil. Some alchemists labor to control this force in the hope that it will lead them to the aura vitalis. Others say that shaped stones are the result of certain astral conjunctions which fertilize the nature of the soil and rocks with vis formativa. There are those who teach that they arise through the individualisation of objects by a condensation of vapors liberated by fermentation in deeper-lying rocks. Some claim formed stones are anomalies in causality, others that they are reflections of ancient failures and omissions in creation, but how can any believe that God errs? Are these put into the ground by devils, to tempt us to believe that God makes mistakes? Perhaps they are the sterile creations of Satan, who, mocking life, may form the likeness of a living thing but can never give it breath.

Pyramid Review

Interstellar Players (for Classic BattleTech)

Published by [FanPro LLC](#)

Written by Herbert A. Beas II, Randal N. Bills, Warner Doles, Chris Hartford, Ken Horner, Nick "Gunslinger" Marsala, David L. McCulloch, Paul Sjardjin, Peter Smith, Christoffer "Bones" Trossen, & Andreas Zuber

Cover by Kevin McCann

Illustrated by Dave Allsop & Klaus Scherwinski

144-page b&w softcover; $24.99

Whichever version you play -- board game, miniatures wargame, [Collectible Miniatures Game](#), [RPG](#), or computer game -- **BattleTech** is fundamentally a game about big robots, big guns, and big lasers, and then even bigger robots, even bigger guns, and even bigger lasers, all aimed at other robots with the intention of blasting them into scrap. Okay; so technically battlemechs are not robots and have pilots, but the point is that **Classic BattleTech** places a certain emphasis on the engagements fought between the game's varied and many factions using its "lords of the battlefield." A minor focus is placed upon the numerous factions, major and minor, and these two emphases runs throughout the majority of the supplements for the game.

All of this marks FanPro's latest release as being quite a different beast, because both emphases are, if not wholly absent, present in a much reduced capacity. Written with both **Classic BattleTech** and [**Classic BattleTech: the Roleplaying Game**](#) in mind, **Interstellar Players** is not a book about the wheelers and dealers of the **BattleTech** milieu as the title suggests. Rather, **Interstellar Players** explores the murky place of the conspiracy in 3067, along with a mystery or two. On display here are 10 major organizations wielding both influence and power from behind veils of smoke and mirrors, plus five minor groups, all which can add the frisson of secrecy and the unknown to either a **Classic BattleTech** or **Classic BattleTech: the Roleplaying Game** campaign.

The format for each entry is simple. After an introduction from the collection's pseudonymous editor, one or two documents relating to the conspiratorial group follow, and then is ended by a short GM's section describing how the group might be used. The documents vary in format, and include journalists' articles, letters, diaries, surveillance data, and transcripts from audio and visual recordings both overt and covert. Although feeling like a **Shadowrun** supplement, and although the subject matters are not dissimilar, **Interstellar Players** lacks the conjecture, discussion, and opinion present in **ShadownRun** supplements. This has the downside of making this book somewhat dry in places.

Physically, the supplement is up to FanPro's usual standards, though the lack of an index is an irritant. The use of other fonts to simulate handwriting is fitting, but it is not always an easy read. The artwork is good though, with Dave Allsop's heavy style adding an unnerving -- but also fitting -- feel to the book.

Unfortunately, with a millennia of history, mysteries, and secrets to draw from, **Interstellar Players** gets off to a surprisingly dull start. This takes the conspiratorial staple of the Illuminati and maps it onto the history of the Inner Sphere, having its head marry into the family at the head of the Star League. Thus a de Rothschild becomes a

Cameron, and the Illuminati spread its tentacles even further beyond Terra. Of course, as is the nature of such theories, the last Star Lord was secreted away before the assassination attempt on his life that felled the Star League, allowing the conspiracy to continue. Also offered is an alternate explanation for the Clans and what the Illuminati are currently up to, but it never escapes the feeling of hokum. If this is the point of the piece, works well enough. If not, it feels overwrought and too broad to be of immediate use in a game.

Fortunately, the anthology gets better and is more applicable, beginning with the "Irian Corporate Cabal." Headquartered within the Free Worlds League, the reach of Irian Technologies reach extends almost into Clan space and is bolstered by multiple corporate alliances with businesses throughout the Inner Sphere. It appears to be all business, and that could be its only motive, but could that extend to manipulating events to keep the profits from war flowing?

Part professional, part amateur, part funded by donation, mostly for profit, Interstellar Expeditions is an archaeological organization devoted to uncovering the secrets of mankind's history. Selling most of its finds, it also needs protection from a 'mech unit known as the "Green Ghosts," similarly after the same secrets. In addition to discovering several "lost" colonies deep in the Periphery, the most notable secret is the trail of the Minnesota Tribe -- who might be the abhorred Clan Wolverine -- round the edge of the Inner Sphere. If so, this could land Interstellar Expeditions in deep trouble with the Clans seeking vengeance on Clan Wolverine's descendants.

At a minimum, the Genecaste -- the book's only real Clan secret -- are a B-movie horror tale to throw at the players. Clan offcastes, they have found homes in the most inhospitable of niche habitats, but undergo extreme gene tailoring to survive there. Hunted to extinction by the more normal Clans, their only aim is survival, and will go to extreme measures to ensure it. Really, though, they are there to add an element of the weird and the alien to the otherwise fairly straight setting. Also weird are the Exituri, an anti-technology religious sect from within the Free Worlds League, whose harsh home world and lifestyle severely limits life expectancy. This leads to a high number of orphans ready for adoption into accepting homes across the Inner Sphere. Could the cult be exporting children?

Of particular interest to long-time **BattleTech** fans will be the section on the Bounty Hunter, the notorious 'mechwarrior who first appeared 150 years prior in the 2920s. Most noted for the feud begun with Natasha Kerensky, the infamous Black Widow of Wolf's Dragoons, after stealing her battlemech, the Bounty Hunter was last seen in 3051. His reappearance in 3064 raises more questions, suggesting at a dynasty rather the one man. The book's Rules Addendum details all of the Bounty Hunter's equipment, including the Body Armor, and all four of the 'mechs (with record sheets) he is known to have piloted.

Also detailed is the Sixth of June, an extreme faction within Word of Blake dedicated to the fall of the Successor Houses; and the One Star Faith, obsessed with the fate of Nicholas Kerensky, who has survived the faith-shattering coming of the Clans to find a home in Clan space! Almost balancing each other are the Brotherhood of Cincinnatus and the Davion Warriors' Cabal. The first is a patriotic veterans association within the Lyran Commonwealth, whose terror tactics have driven it almost underground, while the latter seeks to restore the Davion family to greatness, or, if impossible, to elevate the Federated Suns to greatness, rising its nobility with it.

The minor groups discussed include the Far Lookers, a fringe group whose dedication to continued colonization deep into the Periphery has split the Taurian Concordat; and the Coterie, a disaster relief charity turned cult whose donations seem not always to go the needy. The Scourge of Death is a terrorist organization that has haunted the Free Worlds League for centuries, whose original ringleaders might have escaped into the Periphery in what is a knowing nod to Dan Brown's *The Da Vinci Code*. The JàrnFòlk, descendents from Raselhague, are a faux-Scandinavian people whose high-quality decorated pistols are in much demand, as are their highly trained outcaste assassins. The final article begins to look at lost planets before being censored.

As is the norm for FanPro supplements, **Interstellar Players** is rounded out with rules particular to the book's background. Primarily for the **Classic BattleTech: the Roleplaying Game,** the new additions include Influence as a trait, Special (or secret) Contact and Enemy, the Systema martial arts (employed by the JàrnFòlk), remote and self activation implants (for toxins and explosives), and environmental survival implants such as eye covers, filtration livers, and gills. Extra rules cover brainwashing and the creation of Genecaste NPCs.

With a book like this, it raises almost as many questions as it answers, often leaving it up to the GM to fully resolve some. Plus there are some secrets that you would almost never expect to be fully revealed, such as the identity and fate of the Minnesota Tribe, so the welcome hints given here also intrigue and infuriate. Both these hints and the book as a whole work and read better when focusing on smaller groups or ones with a narrow remit like Interstellar Expeditions, being more tailored to the **BattleTech** universe. The suggestions for using each group also work better the smaller the group. The contents of **Interstellar Players** is of more immediate use with the RPG, but this does not mean that it cannot be used with the wargame, the book's larger groups providing the scope for this. With still work for the GM to develop, **Interstellar Players** is nevertheless a fascinating look at some of the **BattleTech** universe's secrets.

Dork Tower!

by Greg Hyland

Murphy's Rules

Making Stuff Up For Fun & Profit

I was reading a review from [RPG.net](#) about the *World of Synnibarr RPG.* Now, I won't speak about the review otherwise except to note that it described an interesting aspect of this game. Apparently, the GM is expected to take detailed notes on *everything,* and if the GM deviates from those notes, then the players get extra experience points. (My own efforts to glean this information from my copy of this game have been unsuccessful, as a freak earthquake cracked the six-inch Plexiglass chamber I use to access questionable books, and I'm not sure if the robotic waldo would provide sufficient protection.)

Now, obviously I would have a hard time reconciling this rule with my style of GMing as I tend to deviate slightly from my notes. I use "deviate slightly" in the sense that you might apply to someone who deviates slightly from the Ten Commandments by lying about building a statue to Ba'al on the Sabbath against his parents' and wife's wishes in order to woo a neighbor and check out her fine ass.

And by "ass" I mean "oxen."

Which is to say that I don't exactly follow my notes, so much as make stuff up based on the "Croatoan"-esque scribblings found on the paper napkins I unearth from my pockets mere minutes before game starts. What could be the lead villain's name could just as easily be a ketchup stain.

Nevertheless, I do believe there is a contract that the GM enters into with the players: If you're going to make stuff up, make sure you do it in a way that doesn't tick people off.

I [spoke before](#) about how I was one of the nine people in America to watch the FOX show *Reunion.* For those who didn't hear about the show and don't remember my previous column, the conceit of the series was that each episode centered around a group of five friends and took place in both the present and (via flashback) the past, with each episode encompassing one year of their 20-year history. The modern-day framing element was a murder investigation of one of the five, with a fairly strong implication that the murderer was one of the other five. As such, the entire series was sold as a "whodunit"-meets-*Melrose Place.*

However, the show's creators have more or less admitted that the didn't have much of an idea for how the show was going to end; they had a general idea of who did it, but hadn't pegged down the specifics. Worse, the series was first short-ordered (downgraded from 20 to 13 episodes), and then cancelled after only nine of the 13 had been shown. Really, viewers got the equivalent of the first half of a mystery book, with a Post-It note on the last page saying, "If you're still reading, I think the butler did it. Maybe."

Pretend that this paragraph is a brilliant and non-jarring transition.

Way back in 1991, DC Comics had a storyline called *Armageddon 2001,* which, as the name implied, took place in the far-flung future of the year 2001. The general plot of this storyline was that one of the Earth's heroes had turned into a villain and enslaved the planet. Through plot-foolery, a time-traveler named Waverider went back to 1991 and began investigating the "modern-day" (1991) heroes, trying to sort out which one would eventually go bug-nuts.

This series, too, was built around a mystery, with the readers invited to figure out which hero would turn out to be evil. The only problem is, it wasn't much of a mystery; whether because of press leak or the obviousness of the clues planted in the first issue, pretty much *everyone* knew by week 1.5 what the big "shocking" revelation was going to be in week 12. The Powers That Be at DC decided that this wasn't a good way to keep the kiddies buying their funny books, so they changed the ending so that it was a new, different shocking revelation. The only problem was, the person they chose for their alternative ("In the event that the traitorous hero is unable to fulfill his duties as master villain, the title goes to the first runner-up master villain . . .") was unable to be the master villain since, in the flash-forward sequence, you see that hero fighting against the villain. (For more information on *Armageddon 2001,*, check out the [Wikipedia](#) reference.)

Finally, for those who remember the hype the first time around, I don't need to remind you about the hoopla surrounding *Twin Peaks,* another series built around a "Whodunit?" central premise. This is another series where it became obvious that the creators (David Lynch and co.) had no earthly idea who, in fact, dunit, and were completely winging it. Despite crazy-high ratings in the beginning, once it was revealed that the emperor had no clothes, the fans trampled their young to flee toward the exits.

On the other hand, there are at least as many examples of things that hadn't been sorted out that ended up working okay. To take one at random: When Stan Lee and Steve Ditko were cranking out *Amazing Spider-Man,* they didn't know what the secret identity of the Green Goblin was going to be, even though they built it up as this big mystery. As the anecdote goes, Steve wanted it to be some random person the audience has never seen before, while Stan believed (correctly, in my opinion) that the audience would flip if the answer to this big "whoizzit?" turned out to be "Just some guy." In the end, they came up with an answer that, while not entirely logical, was not entirely *illogical,* either.

I've frequently argued that *Empire Strikes Back* is well-regarded by many fans because the middle of the story is easy to write; it's simple to ask all these thought-provoking questions, and hope to come up with the answers later. Sure, George Lucas may have known that Luke and Leia were siblings when he crafted that "No; there is another" enigmatic statement of Yoda's; maybe he stuck that salivalicious smooch between the two just to throw us off the track.

Nevertheless, the resolutions provided by *The Return of the Jedi* were, on the whole, more logical than not, and it was able to tie things together well enough that, even decades later, there's still the rush of imagination when the initial trumpets blair, and the universe is cohesive enough to provide plenty of story-telling potential.

So long as players and GM are on the same page, there's no reason that "page" can't be one the GM is making up on the fly, even going so far as to change a plot element when he (or the players!) come up with something better. Sure, this method carries some risks, but it can also give some big advantages, like leaving extra time for more gaming.

And if you *do* make up stuff that's wildly unpopular with the players, maybe you can placate them by giving them some extra experience points . . . or offering to switch the campaign to **World of Synnibarr.**

--Steven Marsh

The Omniscient Eye

Do Good-Looking Trees Have Great Personalities?

In some RPG systems, trees can be rendered sentient. It would be fun to go beyond the GM roleplaying them all as exact clones of Treebeard, and one aid toward that goal would be some guidelines for what kinds of personalities various species of tree have been portrayed as having in old myths. E.g. what is an oak like? Are date palms cheerful or morose? Do birches tend toward extroversion or introversion? And so forth . . .
     --Peter Knutsen

Let's approach this question from a botanist's perspective instead. Trees compete for space (sunlight), nutrients, and water. Most trees prefer sunny sites with non-acidic soil that is neither dry nor waterlogged. Some trees are better than others at surviving outside this optimal zone. Trees that can seize all the sunlight, nutrients, or water at a site will drive out other species. Usually, trees that cast heavy shade have seedlings that can sprout in heavy shade and vice versa. The personalities of tree species will be impacted by their natural ability to compete, the types of sites they prefer and occupy, and their experiences with other trees and humans now and in the past.

As a real-life example, we can look at tree history and politics in part of central Europe since the last ice age (about 14,000 years ago). It is an area of warm summers (seldom above 86° F), cool winters (seldom below -4°F), and long springs and falls. Extended dry periods are rare. This climate is optimal for forest vegetation and, were it not for human influence, the region would be more than 95% wooded. Humans have occupied the lowest elevations since the glaciers melted, and they made the hunter/gatherer to farmer/herder shift between 7,500 and 4,500 years ago. They expanded into the last uncolonized mountain areas 800 years ago.

Pine trees are strong, silent, shy frontiersmen. The Scots pine has a slender, wiry, often twisted trunk with scaly, deeply grooved, weather-reddened bark. It is crowned by a sparse, high clump of long, dark-green needles. These gritty explorers are long- lived, surviving up to 350 years in brutal conditions. Like most conifers, pines are unparalleled travelers because of wings on both seeds and pollen, which can spread for thousands of miles. When the melting glaciers opened up dangerous new frontiers, pines made the difficult trip into the unsettled territory. They were scattered widely, each dependent upon its own courage and ability. They battled cold, short seasons, and fierce winds that bent them into weathered dwarfs. Together with other hardy adventurers -- birch, aspen, juniper, rowan, and willow -- they advanced and retreated with climate shifts until other species began to join them, about 8,800 years ago. As more competitive tree species began to civilize the former wilderness, pines retreated to the edges of existence where less resourceful trees could not survive. Today, they grow in extremely dry soils (such as cliffs or some sands) and extremely wet and acidic, nutrient-poor soils (peat bogs). Dwarf mountain pine survives at the treeline. It adopts a shrub-like form and withstands extreme winter cold (under a blanket of snow), terrible winds, avalanches, rockslides, and hiking humans. Although shy with other trees, pines were encouraged by human activity, which opened up new treeless frontiers for them to explore.

Beeches are the pines' opposites: proud, cold, and aristocratic. The European beech is one of the most beautiful and magical trees in the forest. It has a straight, even, powerful trunk that gnarls with age. In the rain, its smooth, silver bark tarnishes gradually to black as it channels water in narrow rivulets down the trunk to its roots. Its glowing, emerald leaves are small, delicate, and translucent, edged with soft, white hairs. But these fragile-looking, oval leaves grow in thick layers and cast a heavy shade that chokes out all competitors. Beeches were late-comers in Central Europe, beginning their invasion roughly 6,000 years ago. They grow from heavy beech nuts that do not spread quickly without animal assistance. They advance in an orderly fashion into previously settled territory, conquering, fortifying, and establishing racially pure settlements in the richest lands. They defeat and destroy the former inhabitants with the heavy shade they cast, with a powerful root system that can completely desiccate soils, with a smothering blanket of

undecayed fallen leaves, and (according to one theory) poisons on the bark that are washed into the soil by rain. Beeches hold themselves to be a superior race and only allow "lesser trees" to survive in places that do not suit their preferences. They find areas that are too wet or too dry distasteful, and they particularly dread late frosts. The reign of the beeches was seriously disrupted by human activities. Beeches are less resilient than other tree species when faced with the indignities of timbering and browsing. By 2,800 years ago, humans were blocking the beech/fir advance on several fronts.

One of the only trees that cannot be broken by the absolute rule of the beeches is the fir: serene, calculating, and indomitable. The silver fir has a graceful, straight trunk with refined, grayish scales. Its short, glossy, dark blue-green needles are subtly and tastefully decorated with a pair of white stripes along the undersides. As with the beech, the fir's relatively small leaves grow thickly and cast a heavy shade. When space opens in a desirable neighborhood, both beech and fir seedlings can establish, but the faster-growing beech will ruthlessly acquire the property. Other young tree species struggle and die in the beech's shadow, but the fir refuses to capitulate. Patiently, the slender fir sapling endures decade after decade on the scraps of light the adult beeches allow it until old age or enemies (insects, animals, or fungi) take their toll. After two centuries or more, the beech falls. The fir, which has waited a lifetime in the oppressor's shadow, springs up to take its place. New beech seedlings are not quick enough to overtake it before it dominates the space. In this way, these two species formed mixed forests at the higher elevations of the beeches' domain. Fir was devastated by the coming of man, though it is not entirely clear why. Possible factors include timbering, fire, cutting branches as feed for livestock, and -- lately -- air pollution.

In a few protected, mountainous regions of central Europe, larch survived the ice age (along with the squat, bushy stone pine). The larches are a simple race that can survive in difficult, primitive conditions, but melt away under the onslaught of more sophisticated invaders. The European larch has ghostly, light-brown bark of layered, textured scales and tender, light green, deciduous needles in delicate whorls. Larch and stone pine survived the fluctuations of the post-glacial period until the climate finally began to improve about 10,000 years ago. They began expanding, hoping for a brighter future. These hopes were dashed when the melting glaciers and permafrost provided enough water for a more powerful competitor, the spruce, to take hold and explode across their territory.

The current lord of the highest elevations is the spruce, a hardened warrior and scheming diplomat. The Norway spruce has bark of small grayish or reddish scales on a ramrod straight trunk that can snap in high winds. It clings to the mountain with a broad, shallow root system and can be blown over in softer soils. Its branches are draped with sharp, bright green needles that hang like rich velvet. Spruce dominates the mountain baronies where the winters are so cold and the springs so short that the less-hardy deciduous trees are unable to survive. Spruce needles acidify the soil, scattering chemical caltrops to ensure that enemies cannot easily invade spruce territory. In the past, spruce and beech held a truce and exchanged ambassadors. At the elevational boundaries of their domains, mixed forests of spruce, fir, and beech often grew. In 1754[1], spruce betrayed the beeches by forming a pact with the beeches' old enemies, the humans. Spruce grows straight trunks of reasonable quality in a relatively short time. It provides the impatient, short-lived humans with lumber. It also creates pleasant, open woods that are easy to walk through and have edible mushrooms and an abundance of easily ignited fuel for campfires. In return, it has been extensively planted in the lower elevations, which it was unable to invade on its own. Once spruce had allied with humans, no other species could stand against it.

When temperatures rose (even higher than they are today) about 8,800 years ago, the oaks, elms, lindens, maples, alder, and hazel trees moved into the region. They were not the sturdy, independent frontier folk that the pines were. They formed friendly, open, sunny communities where several species co-existed harmoniously. They were defeated and scattered by the expansion of beech when temperatures and precipitation peaked about 6,000 years ago and by the expansion of firs when a cooling period started about 4,500 years ago. Survivors huddled at lower elevations, which were among the earliest and most drastically altered by humans. Although some of these trees offered humans beautiful wood, most were no more successful at negotiating peace with the humans than they had been with the beeches and firs. Most of them live 300 years or more (the linden with its lovely, heart-shaped leaves can reach the venerable age of 700) and that is simply too long to interest the impatient humans. It has been suggested that the elm population in the region was drastically reduced by humans cutting the leafy branches for livestock feed 4,500 to 3,000 years ago. Many of these species live today in captivity in parks and arboreta.

Along with European beech, the pedunculate oak is the species best adapted to the region's climate. Unlike the beeches, oaks are retiring and generous and do not press their claims to territory. Oaks have deeply grooved, wizened bark and bright, lobed leaves that do not cast heavy shade. They are wise, long-lived, and tolerant of other species. They do, however, draw the line at "tundra trash," birches and pines whose seedlings require full sunlight. The oaks can live to be 500, more than three times the lifetime of a birch. They drive birches out of any site with enough nutrients to support the oaks comfortably. Oaks and hornbeams claim the less oceanic east, where beeches fear to tread because of late frosts, and the hotter lowland areas, which are too dry to suit the beeches' demands.

Maples and ashes live fast and fling their resources to the wind, seldom living longer than 250 years. They are able to defend a position on beech soil in areas with excellent nutrient and moisture availability. Such sites are usually found in well-watered screes and narrow valleys, protected from the wind. Here, ideal water balance can lead to ideal nitrogen balance. With these vast resources are available to them, the maples and ashes are able to outgrow the beeches and avoid being starved into submission by the heavy beech shade. The lindens and elms then join them.

Hornbeam, the newcomer, wandered into the region less than 2,800 years ago. It thrived in a world already dominated by beeches by being easy-going and getting along well with other races. European hornbeam looks superficially quite similar to beech, but folksier and less elegant. The trunk is often ridged, and the silvery bark is slashed with dark gray mottling. The leaves are toothed instead of being edged with shining hairs. Hornbeam cohabits with oaks in regions beech does not deign to occupy. When humans began massively felling forests and browsing their livestock in them, hornbeam good-naturedly sent up new sprouts from its stumps. Since the proud beech abhorred stooping to such measures, hornbeam annexed vast amounts of beech territory. In return, it provided its human allies with brushy sprouts for browse and firewood. However, in modern times, the laid-back hornbeam has been overlooked in favor of spruce.

Willows are the soul of resilience. In many ways, they resemble fairy folk. There are countless willow species, which vary widely in appearance, preferences, and capabilities. Despite these vast differences, humans see them as a single entity. Their lives are ephemeral, lasting no more than a hundred years. The mercurial willows find a home in the cracks and edges of tree society. Each type has special abilities that allow it to survive in some place others trees consider uninhabitable or simply nonexistent. Willows were among the pioneers that followed the retreat of the glaciers. Dwarf willows survive above the treeline. Willows inhabit the nitrogen-poor sites along mountain streams, where the water level changes drastically throughout the day as the glacial melt varies. At lower elevations, where water levels cycle on a yearly rather than a daily basis, streams are hemmed by oak, ash, and elm. Yet even here, there are dangerous, flood-prone regions that are left to the indefatigable willows and cottonwoods. A willow bows before the wind or water, but its spirit is unbroken. Often, if an elemental force rips off a willow branch, the severed branch will root and grow in the place where it was flung down.

Feel free to use your imagination when role-playing trees. The information in this article comes from the forests that I know best, those in the Czech Republic at the turn of the 21st century. Since most of your games are probably not set in this place and this time, your trees may behave differently. Indeed, hornbeam exploits the dry end of its potential niche in the Czech Republic and the moist end in neighboring Germany (which is still central Europe). I have primarily discussed genera, but species within a single genus, like brothers and sisters, can be quite different. This article has concentrated on dominant species, and although highly competitive trees can form nearly pure stands in ideal environments, chance often results in a few non-dominants being scattered in regions they no longer claim.

Humans do not know all there is to know about trees. Our lives are simply too short to observe them effectively, and we have to rely on a lot of educated guesswork. Finally, trees are living creatures, and each will be an individual. While it is possible to describe the personality of a stereotypical member of a race, an actual member of that race may be radically different. Your players may indeed meet an egotistic pine or a shy beech. You can realistically give your trees any personality you wish, but hopefully this discussion of tree interaction can serve as insight into what might drive them to behave the way they do.

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Pyramid Review

The Book of Unremitting Horror (for d20 Modern)

Published by [Pelgrane Press](#)

Written by Dave Allsop & Adrian Bott with Sarah Wroot

Cover by Dave Allsop

Illustrated by Dave Allsop with Grigoriy Kolyadin

156-page b&w softcover; $29.95

Better known for _[The Dying Earth Roleplaying Game,](#)_ based upon Jack Vance's novels of the same name, Pelgrane Press now dips its toe into the mainstream with its first **d20 System** sourcebook. **The Book of Unremitting Horror** is a supplement suited for use with _[d20 Modern](#)_ and Mongoose Publishing's **OGL Horror,** but whose contents could be used with almost any horror RPG. It is the creation of Dave Allsop, the illustrator best known as the creator of **SLA Industries**, the Scottish RPG of dark bureaucratic horror, and it is he that provides the artwork whilst working with his co-author, Adrian Bott. The result is that for the majority of its pages, **The Book of Unremitting Horror** is illustrated to great effect by Allsop's pen and inks.

From the outset, it is the art that draws you in, starting with the creepy front cover. It has to, as the back cover is devoid of the traditional blurb, instead displaying the simple phrase, "NEW TIMES DEMAND NEW NIGHTMARES." What you find inside lives up to that phrase, being a collection of creatures dark and disturbing, bizarre and bloody, an array of associated artifacts, a short guide to running horror campaigns, and finally a scenario employing one of the book's entries. All written with the contemporary campaign in mind.

What must be made clear about the Horrors found within this book is their adult tone. The material found on these pages is strong and none of these entries has been sanitized to suit a younger audience. Be warned that the creatures found in this book are not for the faint of heart.

Each creature is presented in the same stark style. First is its full-page illustration: dark, brutal, and disturbing, followed by its colorful text description. In keeping with the contemporary nature of the book's contents, these blurbs are presented in a variety of modes. Besides the more ordinary descriptive prose, they include diary entries, police interview transcripts, website reports, book excerpts, web blogs, and chat room excerpts. Also mentioned are several URLs, which Pelgrane Press has set up as dummy sites. Game statistics are presented in the standard fashion, although each stat block is rounded out with a "Horror entry," which is the type of saving throw called for with each creature using the rules from **OGL Horror**. In addition, there is a section entitled "All That Remains." This details the forensic traces left behind by one of the creatures and suggests how this evidence is more ordinarily interpreted.

The creatures can be roughly divided between the ancient and the modern, many of them recently so. The ancient, or at least the old, includes the Feral Drowner, a very dark interpretation of the Pooka; the Practice, a cabal of surgeons descended from Egyptian mummification that carry out unwholesome and sadistic procedures; the Clootie, Scottish water spirits that make nocturnal visits to lonely island communities; and the Drowner, another water spirit that likes to immerse its victims and is linked to an urban legend concerning a British information film of the Seventies. More modern are the Kooks, child sized Fey born out of the Summer of Love's autumn that take a single lonely child each Summer; the Scourger, a demon designed to do nothing monitor its target and return the information to its master; the Sisterites, which possess an innate ability to access the Internet, send e-mail, and access chat rooms to prey on and

seduce lonely men; and the Snuff Golem, a creature born out of the vile filming of its victims, and is driven to inflict a similar fate upon all those involved.

Some of the creatures, like the Feral Drowner or the Blossomer demon and its associated cult, could be used in an ordinary *d20 System* fantasy game, but the majority aren't appropriate. Beyond each entry's description, there is little in the way of advice on using the creature specifically, but both the color text and the write-ups are rife with possibilities that suggest how they could be used. These are often backed up by the accompanying collection of associated artifacts, such as the First Altar tied to a Feral Drowner cult, and the Scalpel of Mynarthitep, the ritual bronze knife prized by the Practice. It is a pity that not one of these artifacts is illustrated, and that once past the Horrors, the look of the book is, well, pedestrian.

The guide to running horror games is good, basic stuff, running through character types, weaponry, group motivation, patrons, and scenario types typical to a horror campaign. Much of it is obvious, but it is nevertheless a decent introduction to gaming the horror genre. It is backed up by a scenario, "The Final Case," designed for three to five characters of 3rd to 5th level. A private investigator acquaintance asks for help in case that will lead the characters into London's Goth and magical subcultures and also have them face several creatures from this book. As written, it is very specific to London, but could easily be set elsewhere, albeit though with the loss of a little flavor.

The aim of *The Book of Unremitting Horror* is really to provide a selection of fresh and original monsters for the GM to throw at his players. And this it certainly does, managing to draw from nightmarish folklore as much as its does a "splatterpunk" mentality. If there is a theme to them, it is that all are born of human drives and vices, whether greed, cruelty, ambition, and so on. Using these creatures is another matter; the authors suggest that they do not appear as a "Monster of the Week." That said, not all lend themselves to long-term play and many that do lack suggestions as how to develop them to that end, hampering the GM new to the horror genre. Hopefully this will be addressed in the book's sequel, *World of Unremitting Horror,* which will explore horror in long-term games and present a more coherent setting. Even so, this book deserves to find its contents used in RPGs, such as *Werewolf: The Forsaken, Buffy the Vampire Slayer Roleplaying Game,* and *Angel Roleplaying Game,* or an *X-Files*-style game, though they are not Eldritch enough for a standard *Call of Cthulhu* campaign.

Although both the advice and the scenario are good, in the end what stands out with this supplement are its creatures and their accompanying illustrations. These are quite nasty little creations, imaginative and original, and served up to full effect. *The Book of Unremitting Horror* is a rich meaty collection of horrors that should add new blood to any horror campaign.

--Matthew Pook

Shadows and Fogg, Part the Second

"'Have you just arrived from London?'
'Yes.'
'Heading for . . . ?'
'Bombay.'
'Very good, sir. You know that stamping serves no purpose and that we no longer require the presentation of passports?'
'I do,' answered Phileas Fogg; 'but I wish to use your stamp to prove I have passed through Suez.'"
-- Jules Verne, *Around the World in Eighty Days,* Chapter VII

Welcome to the second leg of our voyage around *Around the World in Eighty Days.* Our postulate is, well, foggy. In our first leg, we decided that Verne's novel is a record, whether information or disinformation, of a certain Working performed by an agent of one of several time- and reality-spanning conspiracies, as we established in our 200th Transmission some time ago. The novel recapitulates three cycles of the year as it spins Fogg around the earth; the decanic, the seasonal, and the astrological. Each of Fogg's 12 legs (by his own count) is one more sign of the zodiac passed through. Paris to Brindisi is Scorpio, and Brindisi to Suez is Sagittarius, an auspicious sign (an arrow of wisdom) if our earlier theory is true that Fogg is somehow connected with anomalous falls of meteorites. Finally, although Verne's earlier manuscript gave the (impossible) date of 1858 for Fogg's Voyage, we've resolved to stay with the canonical 1872 for the most part.

"It was obvious, on seeing Mr. Fogg maneuver, that he had been a sailor before."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXXIII

Much of the novel, necessarily, takes place at sea. Verne, like Fogg, was an avid yachtsman, sailing all over the Mediterranean and up to the British Isles, on his yacht the *Saint-Michel.* One is immediately reminded, in that junction between sea and St. Michael, of Mont-Saint-Michel, the so-called ley anchor of the "dragon line" on its rocky fastness off the coast of Normandy. Is the 37th parallel of Verne's famous *Children of Captain Grant* (also called *In Search of the Castaways*) a similar exercise in magical working? Was Lord Glenarvan's circumnavigation of the earth -- set in 1864 -- another rehearsal for the Fogg Working? Note that the 37th parallel, well, parallels the number of chapters in *Around the World in Eighty Days.* Likewise, 37 kabbalistically equates to "HBL," which is to say "vapor," or . . . "fog." Very interesting. Similarly, Verne's choice of names for his yacht is another indicator that Michel Lamy might be onto something when he taps Verne as a key Rosicrucian initiate of the "Angelic Society," Le Brouillard. Saint Michael -- Saint-Michel -- is, after all, an archangel. Verne wasn't all angels on the ocean, of course; in a few surviving letters he refers to a "unique siren" whom he entertained on his yacht -- was he learning secrets from the Lamia, or dickering with the maidens of the cantosphere for pearls of story?

"Rarely was he seen on deck. He made little effort to observe this Red Sea, so redolent in memories and the theatre of the opening scenes of human history. He did not come and observe the fascinating towns crowded along its banks, whose picturesque silhouettes sometimes appeared on the horizon. He did not even dream about the dangers of this Gulf of Arabia which the Classical historians Strabo, Arrian, Artemidorus, and Idrisi always spoke of with horror. In the olden days sailors never ventured out on it without first consecrating their journey with propitiatory sacrifices."
-- Jules Verne, *Around the World in Eighty Days,* Chapter IX

According to Verne's novel, Fogg departs Suez on time on October 9, 1872. That date is 290 years after Pope Gregory decreed the Gregorian Calendar, which interestingly eliminated the days October 5 through 14 -- a hole in time through which Fogg easily slips, whether to gather meteorites for apotheosis or to prepare to enter India Ultraterrestria, the domain of the Sphinxes. Either way, the trip down the Red Sea is both uneventful and uncanny. Fogg plays whist the whole way down, reading the flows of magic or the threads of the future, or possibly just running programs in his external operating system. Response is left to Passepartout, who notes that "I seem to be travelling in a dream." When they reach Aden, he sees the basins carved by the "engineers of King Solomon" and then they emerge through the Bab el-Mandab, the "Gate of Tears" into the Indian Ocean. Here Fogg joins Sinbad, taking on psychic juice from the

previous seven initiatory voyages to "India," the uttermost Otherworld. He has refused to make the "propitiatory sacrifices," inviting death and the attention of the guardians of the Gate.

"Captain Nemo was an Indian, Prince Dakkar, the son of a rajah of the then independent territory of Bundelkhand and a nephew of the Indian hero, Tippu-Sahib. His father sent him to Europe when he was ten years old in order that he receive a complete education with the secret intention that he would fight one day with equal arms against those whom he considered to be the oppressors of his country."
-- Jules Verne, *The Mysterious Island,* Chapter XVI

Fogg arrives in India on October 20, 1872, just as he is finishing his 33rd rubber of whist. When Bombay is sighted, all the planets but the Moon are up -- the virgin is hidden and the Sphinxes are alert. He remains outside of time, having gained two days on his schedule, and Passepartout once more feels the uncanny nature of the voyage, unable to believe that he is traveling through India. In India, the novel leaves not only time but geography behind. Fogg's train stops in Rothal station -- the tracks end, and there is no straight path ahead. Interestingly, there is no Rothal station on any map of India, nor is there, contra Verne, a Kholby, Pillaji, or Kandallah in the region. That this concentration of fictive locations comes just when Fogg has left the rails -- literally -- cannot be mere coincidence. No, Fogg is deep inside India Ultraterrestria, riding an elephant half-mad and half-sane (only half-trained for war, driven by a similarly dualist Parsee). This entry into the Otherworld was signposted by Verne's references to "hypogaea" and "grottoes" on the way from Bombay. This leg of the journey is the third of eight: Samhain, the entry into Death; it is the fifth of twelve: Aquarius, the house of Saturn, master of death and time.

What is Fogg doing here? He is drawing a line behind him, laying down footprints to bind the Sphinxes into the reality that MI-8 enforces. In the novel, he is aiming for Allahabad, where there was a fall of fish in 1836, and a fall of "perfectly similar" stones in 1802. Obviously, the local reality is weak, and Fogg again homes in on the anomaly. And he is trying to lure his foes into revealing his true target. He enters the "uncontrolled" kingdom of Bundelkhand, still in 1872 a no-space in British Imperial cartography. Here, he meets a clutch of Tarot cards -- the Juggernaut Car, or Chariot, the Emperor (reversed in death), the Empress (Aouda), and of course Death. Aouda, the Parsee heiress, is trapped in a suttee, a marriage sacrifice, overseen by the goddess Kali and defended by an army of murderous Thugs. This is the Sphinx court with a vengeance, down to the ceremonial necrolatry seen in their Egyptian kingdom. But Fogg has been ready for this encounter with the Maiden Aouda and the Mother Kali -- he gave an offering of twenty guineas to the Crone in London and bought her forebearance. He rescues the Maiden, although interestingly it is Passepartout (a proxy? a hijacker?) who actually undergoes the shamanic entry into death, masquerading as the dead rajah of Bundelkhand and rising again with Aouda in his grasp.

Bundelkhand would still have been in mutinous uproar in 1858 -- and at its heart would have been the Rajah Dakkar, who would later go on to a piratical career as Captain Nemo. Verne presents the identification of Nemo and Dakkar in *The Mysterious Island,* but there are some major problems with it. We are told that Captain Nemo is an old man -- nearly 70 -- when he tells his life story on the Mysterious Island. "It has been thirty years" since he left India in 1858, which would set his present in 1888 -- and "sixteen years" since his encounter with Professor Arronax in 1867, which would likewise set his present in 1883. And the discovery of Dakkar in *The Mysterious Island* itself takes place in 1868 -- during the events of *20,000 Leagues Under the Sea* that it supposedly recalls from sixteen years ago! Nemo and the *Nautilus* are unstuck in time -- the Maelstrom that seemingly sank his submarine was a temporal vortex, possibly a mine set to prevent the *Nautilus* from circumnavigating the globe in 1867. So who is Nemo? If he is Dakkar, he may well be a Sphinx, but he has the technological feel of a Reptoid or a Lemurian (the *Nautilus* draws electricity straight from seawater) and the manias (for art, Antarctica, and U-boats) of an Ahnenerbe agent. (In *The Other Log of Phileas Fogg,* Philip Jose Farmer postulates that Dakkar is not merely Nemo but also Professor Moriarty. This is just silly.) He might, in fact, be both -- in Verne's original manuscript for *20,000 Leagues Under the Sea,* Nemo was a Polish nobleman. Perhaps the Maelstrom overwrote the Polish Nemo with the Indian (Sphinx?) Nemo, as the *Nautilus* passed through the Otherworld.

"At half-past twelve the train halted at Benares Station. The Brahmin legends maintain that this town is built on the spot where Kasi was situated, suspended in space between the zenith and the nadir, like Mohammed's Tomb."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XIV

Benares is halfway between heaven and Earth. It was the original Sarnath, where the Buddha first preached suspension from reality. This stop thus reflects another Vernian concern, the city or island or cavern apart from humanity. Verne has a strong utopian strain running through him, from *The Begum's Fortune* to *The Mysterious Island* to *The Black Indies.* He was a Saint-Simonian, following that French reactionary socialist who (in another weird parallel to Merovingian symbolism) saw society in the shape of bees, and vice versa. He was familiar with, and perhaps influenced by, the utopian Fourier, who helped shape the American Spiritualist movement and who went so far as to assert that the world was a living electrical organism. Verne was friends with the Saint-Simonian and self-proclaimed Druid Dr. Ange Guepin, and with the Reclus brothers, two anarchists who proclaimed the "City of Good Will" and narrowly escaped deportation to Devil's Island as a result. Verne thus becomes a kind of living transmission belt between the wild dreams of the Lemurians or Sphinxes (complete with aeronefs and moon-cannons -- echoes no doubt of ancient flying vimana craft) and the human world to be influenced by them. Which perhaps makes it all the stranger that he should be the conduit for the Fogg Working, if it was indeed an attempt to pinch off (or hijack) the energies of India Ultraterrestria for the benefit of MI-8 and their Occult Empire.

"The applause was just increasing and the orchestra's instruments bursting like claps of thunder, when the pyramid suddenly jerked to and fro, the equilibrium was lost . . . and the whole structure came crashing down like a house of cards."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXIII

Having reached Calcutta, Fogg and Passepartout must face the stern Judge Obadiah -- Justice in our Tarot progress -- and pay ransom to escape the Otherworld, just like Heracles or Orpheus. They then sail on the *Rangoon* past the (devil-haunted?) Andaman Islands, past "beings on the lowest rung of the human scale." On October 31, Fogg reaches Singapore, again playing whist the whole time, manipulating his voyage with the constant interplay of cards.

Fogg reaches Hong Kong on November 6. This is the seventh leg of the twelve, Aries in our symbolic zodiac. Moreover, it is Yule, the season after Samhain (and as we've seen, directly after Samhain -- October 31 -- in Singapore according to the text). And during Yule, the King dies and returns to life; and once again Passepartout plays proxy for Fogg. He is dosed with opium by Fix (possibly working for the Lemurians or the Sphinxes attempting a counter-attack -- but playing into Fogg's hands all the same), and is placed insensible on a boat of the dead, the *Carnatic.* The real *S.S. Carnatic,* as Verne would surely have known, went down in the Gulf of Suez in 1869, killing 31 people. Is this why Fogg failed to offer sacrifices at Suez, at the entrance to the Red Sea -- the hope of catching a ride on the ship of the dead, cutting a wake through the twelve hours of the night and into the bright Pacific?

If so, his plan came true only for Passepartout -- Fogg was forced to fight the tempest between Hong Kong and Shanghai. While Fogg was delayed by the storm, Passepartout was forced to take a job in a Yokohama circus. He played a Long Nose clown, "under the special protection of the god Tengu." Tengu is a mischievous bird spirit who preys on travelers -- not, you'd think, ideal for Passepartout (and therefore Fogg) to venerate by service. (Tengu smells like a Reptoid to me.) But sure enough, Passepartout and Fogg reunited under Tengu's gaze and at that point Passepartout broke the human pyramid that Tengu's Hognels had formed on top of a Juggernaut. He had clowned the clowns, misruled the mummers, and he and Fogg escaped out onto the Pacific on November 14, 1872. During their Pacific crossing, Verne manages to lose four more days -- at 12 knots, the *General Grant* crosses the "4,700 miles" of the Pacific Ocean in only 17 days, not the 21 Verne quotes. The "wide gap of time" stretches open, and more ejecta fall through it. Cinders fell on the Seven Stones lightship off Cornwall on November 13, 1872, and a swarm of meteors appeared instead of the predicted Biela's Comet two weeks later, as Fogg and company steam across the Pacific. The Fogg Working continues its spin, and the earth and the heaven jerk and wobble under it.

The Commonwealth Skyhook

by Paul Drye

Most European-dominated timelines near Homeline's tech level are suffering in the aftermath of world-wide, industrialized wars. Western civilization was inclined to war for hundreds of years, but the traumas of the Great War invariably shattered the hierarchies and mores of that society. There are a few exceptional timelines, though, usually where one power was so predominant that it could scare off rivals, or finish any fight quickly. These present an experience peculiar to Homeline eyes: advanced in science and technology, often more so than home, but with the attitudes of the 19th century warped only by incremental change.

Britannica-9 is one of these, and its symbol is the Commonwealth Skyhook. One of only a few orbital beanstalks known to Infinity, the skyhook is an exercise in cognitive dissonance. Though an obviously advanced piece of technology, its details and setting hark back to the days of steam railroads and colonialism.

History

Britannica-9 saw the English Civil War run rather differently after Oliver Cromwell died at the Second Battle of Newbury. Charles I still lost the throne (but fled the country rather than being executed) and Thomas Fairfax maintained the Parliamentary government into the 1670s. By then any thought of a royalist restoration had been eliminated by two failed Stuart invasions supported by France. England drifted into permanent republicanism by 1700.

In the 316 years since, the Britannic Commonwealth has expanded steadily, integrating the outlying parts of Britain and colonizing America. The Union parliament meets every two years in London, bringing delegates from around the Dominions -- those parts of the Commonwealth that have equal political status with the home islands. In earlier days this arrangement teetered on the brink due to the travel times from places like Oregon and Madagascar, but since the 1820s the telegraphs and then other newer technologies have destroyed those barriers.

From Homeline's point of view, Britannica-9 is worth exploring because its technological pace is enough ahead to be interesting, but not so far ahead that it can't be reverse engineered. For example, England's somewhat more meritocratic society pushed forwards a Newton-level genius who developed the Laws of Electromagnetism in the early 1800s. Social opportunity provided a further boost to innovation, as making a fortune in business would make one's life too. The Commonwealth entered TL8 in the 1950s and is well on its way to TL9 in several fields.

Infinity is doubly interested in the timeline because they believe -- correctly -- that Centrum has chosen Britannica-9 as a bridgehead. It's in Quantum-6, accessible to Centrum, and is exactly the sort of world Centrum likes: one with a hegemonic, English-speaking empire.

The centuries of Britannic predominance may be coming to a close, however. The Russian and Chinese Empires have,

after so many years of mistrust, cemented an alliance obviously aimed at the British. Worse, India has risen in rebellion after being refused Dominion status yet again. It doesn't seem like the rest of the Commonwealth has enough strength to stop them in the long run. If India is lost to Britain, what then?

The Skyhook

Beginning in the early 2000s, and finished in 2011, the Commonwealth Skyhook is this timeline's road to the stars. The Britannic presence in space has increased by 20-fold in the five years since. Some of the projects made trivial by the tower are orbital factories now churning out goods, an inner-system exploratory mission based on asteroid 1998 WT24, and an extensive GPS system.

Holdfast Port: One end of Britannica-9's greatest achievement is on Batam Island, just to the south of the Britannic port of Singapora. This puts it a short distance north of the equator in Indonesia (or, as it is still called here, the Dutch East Indies). At its base -- called the Holdfast -- the skyhook is enormous, a geodesic gridwork tetrahedron five miles to a side and three and a half miles tall. Homeliners find it reminiscent of the Eiffel Tower, though on a vastly greater scale.

The endless struts and struts within struts that make up the base of the tower are deliberately fractal. As well as reducing the amount of material needed to build the installation, it makes it internally redundant and thus more resistant to accident. The skyhook's engineers have determined that nothing short of a nuclear explosion could cut their bridge to the stars, at the holdfast end.

The human side of the port is the city built largely under the pyramid. Some of it is in the open air, but most people save travel time by sticking within a couple of miles of the skyhook's tether. While under the structure one can look up and see cracks of blue sky, but most of the view is blocked by the intricate girders and guy wires of the Holdfast.

By Britannic standards Holdfast Port is a wretched hive, but out-timers used to, say, pre-Columbian Tenochtitlan or mid-19th century Five Points will find it tame. The central portion of the city is actually quite developed, with the support crews and people running businesses based on the skyhook usually being white Britannics or prosperous Cantonese.

More to the tastes of adventurers might be Semba, the port district in the northwest of the island. It's growing incredibly quickly, and buildings are being thrown up in every manner possible. This includes labor-intensive ones for sheer lack of construction equipment, so there are plenty of low-paying jobs for workers both here and on the wharfs. Most of the people are from East Asia and the colonial parts of the Commonwealth, and visitors will see signs in and hear languages as diverse as Mandarin, Filipino, Arabic, and Malagache, as well as native Malay. Many can get by in English, though, broken or otherwise. Despite the best efforts of the fussy Britannics, this is still a dusty, noisy place, and certainly the place to go if you've got something shady in mind.

To the south is Punggur, which is the residence for Holdfast and Singapore's elite. If the adventuring group can arrange to move in rarefied social circles, they'll find Punggur an area of widely spaced, airy mansions surrounding a large tropical lagoon. It's quite pleasurable surroundings, as long as the ubiquitous servants don't tweak one's conscience.

The Tether: A ribbon runs up the skyhook for 22,236 miles, all the way to a geostationary point above the Earth. It tapers as it approaches the Earth and is a superficially ridiculous eighth of an inch in diameter when it enters the roof of the Holdfast. It is, accordingly, made of extremely strong carbon nanotube fibers with an internal core of superconducting material that carries power from solar panels at the top of the skyhook to power both the elevator and the port. The Tether is coated with a gold film to prevent corrosion, and though only a few atoms thick it adds a yellow cast to the ribbon once one is close enough to see it.

Churchill Station: Named after John, the fifth Commonwealth Chancellor, not the never-to-be-born Winston, the station is at the functional top of the tether. Strictly speaking there's another, even longer length of ribbon past the station acting as a counterweight, but this is only used to launch interplanetary missions. Churchill Station is the heart of the Commonwealth's power in space, an installation dwarfed only by the Holdfast itself.

The station is a Bernal Sphere, about 1,500 feet in diameter and rotating almost two times per minute to produce an apparent Earth gravity when on the equator. The sphere is wrapped around a non-rotating core that lets the tether pierce through the station, as well as provide some zero-G space where industries can use it. In addition to housing the station personnel and workspaces (mostly traffic control and maintenance), Churchill also hosts four local spacecraft for transferring people and cargo to other facilities hanging in orbit nearby. There is a large cargo bay adjacent to each of the docking bays, as well as smaller maintenance craft.

Traveling on the Skyhook: There are two kinds of cars that move up and down the side of the tether. Both are about 100 feet in length and 30 feet in diameter. For cargo cars, the interior is divided by bulkheads, with sensitive items held in sections lined with water and lead to prevent damage from the Van Allen Belts. Human transport cars are further subdivided into staterooms, since the travel time up to Churchill Station is just under 23 hours. At first these accommodations were spartan, but in the last two years some have been appointed in luxury; travelers can buy "Upper Class" or "Lower Class" passages.

Upon leaving the Holdfast, the cars -- up to three in chain, of either type -- travel at 120 miles per hour until they reach 60 miles in altitude. There, a set of electromagnetic rings surrounding the tether push the train to 1,000 miles per hour. The cars are only marginally aerodynamic, but at that height, air resistance is no longer an issue.

Passengers are reassured that, in the unlikely event of a catastrophic accident, the cars are capable of unpowered re-entry, and would splash down below a bouquet of parachutes, likely somewhere in the Indian Ocean west of Sumatra.

The Chaser

Britannica-9's space age began in the 1930s, and through sheer accumulation its low-earth and geosynchronous orbits are even more cluttered than Homeline's. This presents a problem for the skyhook, as orbital precession means that sooner or later every piece of space junk with a perigee under 22,000 miles can potentially impact with the tether. Daud bin Vasan owes his career to this fact.

He is one of a few dozen chasers, people who scout Earth orbit for debris and either retrieve it or (for larger pieces) get it to re-enter and burn up. This is a two-person job, but as the skills needed to operate in space are in high demand few stay for very long. Daud gets a new partner every six months or so. He stays at it, though, thinking himself most useful doing what he's doing -- and in truth, getting to watch the Earth with only his spacesuit between them.

He is a Malay man, of average height and build, with dark skin, black hair shaved very close, and nearly black eyes. He has a high forehead and large, looping eyebrows that give him a permanently surprised expression.

Daud's role is to be the low-level insider who can introduce the adventurers to the inner workings of the skyhook. While his job puts him in low-earth orbit, he can be encountered anywhere in the facility. He lives in Churchill Station three weeks while working, then gets one week off to visit his family in Port Holdfast. The chaser is also useful to fill potential gaps in the group's skills, as he has plenty of experience in orbital operations.

The Agent

The I-Cops broke up a Centrum ring in Britannica-9's London three years ago, and the Interworld Service has decided to try something a little bit different this time. Reasoning that the last infiltration was too visible, they've settled on a single agent as the thin edge of a wedge. Since Britannica-9 is viewed as a highly strategic timeline, they've picked out one of their best.

Grade 6 Alice Sedman is 55, quite old for a field agent, but as experienced and as talented as they come. If it weren't for her stated preference to be out-time, she'd have been promoted to a Grade 7 policy wonk well before now. In the case of Britannica-9 she is particularly useful as she can speak both English and Chinese, and is currently trying to get Russian under her belt so as to have access to all three powers in this world. Her job is to advance the interests of the Centrum, at first by working alone though the plan is for her to build up a network of native catspaws. She has, however, only been in Britannica-9 for six weeks, so her task is just beginning.

She is a short, chubby woman, with frizzy gray hair that she does not dye so as to look older than she is. She uses her real name, but otherwise assumes the role of a small importer/exporter. This is unusual for a woman in still-sexist Britannica-9, but not so much as to draw attention.

Her role is to be a danger to Infinity personnel without necessarily being an antagonist. She could become one, but for now Britannica-9 is fairly stable and in the short run other issues are likely to drive adventures. Once introduced, think of her relationship to the adventuring group as like that between spies during the Cold War. It would be nice to remove her from the picture, but she has much in common with Infinity agents and she can be a useful "enemy of my enemy" at times.

The Rebel

The Indian Colony has been the source of much of the Commonwealth's strength through the last 200 years, but for some time its citizens have been agitating for full Dominion status. Unfortunately, while the Commonwealth made an early start on meritocracy, they've lagged behind Homeline since the turn of the 20th century. The thought of granting non-white people true equality is problematic, and is an impossibility when one considers that India's people outnumber all the other Dominions' put together. That kind of shift in political power is too radical for anyone in charge to consider. After another attempt to come up with a solution failed in the House of Commons, the subcontinent was shattered by rebellion.

The situation there is chaotic, with the Commonwealth pouring in troops but utterly unable to bring the rebels to heel. Their opponent has no central command, and in fact consists of over a dozen different groups big and small. For the purposes of visiting the skyhook, however, the most important rebels are the ones looking to export the violence outside of India proper: the Agni Kshatriya Brigade.

The focus on the Kshatriya can in turn be put on one man, Prithu Akram Jerath. Jerath is an example of the banality of evil, looking more like a junior university professor than a killer: slim, with a hatchet face and a neat mustache. He's responsible for a campaign of terror in India, including poisoning the water supply of downtown Hyderabad and the kidnapping and killing of Britannic soldiers around Karachi. Now he's come to the Skyhook looking for a twisted public relations coup. He wants to cut the tether, hopefully killing many people in dramatic fashion.

To that end he and a small group of associates have sailed into Holdfast Port and are looking to smuggle cyclonite plastic explosives (essentially like Homeline's C4) onto a tether car and detonate it just above the atmosphere. This would cause most of the tether (as well as Churchill Station) to float upwards, stranding anyone above the cut point. This would essentially doom them to starvation as the world of Britannica-9 hasn't got enough orbital lift capacity outside of the skyhook to support or rescue more than a few off-earth personnel.

Prithu Akram's role is as an antagonist. Depending on the GM's needs, he can be a straight villain, or a more sympathetic (if still villainous) figure. After all, there is no doubt that Indians in the Britannic Commonwealth are second-class citizens, and he is fighting to end that. He is also a useful tool to bring Homeliners and the Centrum together. Sympathetic or not, the players are going to be inclined to stop him from engaging in grand-scale sabotage and murder; similarly, Agent Sedman will want to stop him from destabilizing Britannic hegemony. The situation then becomes interesting when Jerath is neutralized but the two out-time groups are left aware of one another with no more reasons to ally.

Other Adventure Seeds

Murder on the Orbital Express: The group are headed down on the skyhook, part of a total complement of 13. One of the others aboard, American millionaire Hobart Briand, is found murdered two hours into the journey. He has 12 stab wounds, which will hopefully trigger a memory in one of the players. If not, pick one of the characters to realize

that the murderer is echoing the set up of a famous Homeline mystery novel. Not only is there the issue that this book has never been published on Britannica-9, the character also remembers the end of the novel. If things hold true to form, forensic analysis by the police after the car arrives in Holdfast Port will show that each of the other passengers -- including the characters -- stabbed Briand once, executing him. The investigators now have less than a day in a locked car to establish that at least they were not involved.

Running on Time: The Dockworkers Guild has gone on strike, and cargo is not being loaded or unloaded. Tensions are rising as it's wartime and the skyhook is needed, so there are soldiers and heightened security at both ends of the skyhook. This is bad news for the Infinity team, as a small item -- anything smaller than a suitcase will do -- is needed on the ground and is stuck on Churchill Station. Passenger service is still running, so their mission is to get into the right bonded warehouse on the station, recover the item, and smuggle it down to Singapora where it will be picked up and taken to the Infinity personnel who need it.

Follow that Car: The agents are required to apprehend a known cross-time criminal, who is at Churchill Station when they catch up to him. He enters a car just before it leaves, and the pursuit is just too late to keep him from being whisked down to Earth. They could follow him, but it's 45 minutes to the next passenger car and that's 45 minutes the quarry will have to disappear into the warrens of Holdfast Port. Their best bet might be to somehow involve the authorities, who can radio ahead to their groundling counterparts, but how to convince them?

Using the Commonwealth Skyhook In Other Settings

The skyhook is easy to use in a fantasy campaign if one considers the ultimate origin of the real-world term "beanstalk." Magical routes to the sky have a long pedigree, including not only Jack but the Bifrost Bridge and the Tower of Babel. The main difficulty is in deciding who controls the skyhook and what is at the top. In most legends the trip is a once-in-a-lifetime event, and the Commonwealth Skyhook is intended to be more mundane, if still awe-inspiring. One possibility is to make the magical version an artifact of the lost, magically advanced civilization that most fantasy settings possess. Be it star elves or the First Human Empire who made it, at the top is a decrepit but still partially functioning wondrous city that is the jewel in the crown of some current nation. Holdfast Port is then transformed into a base camp town for adventurers exploring the 90% of the sky city that is ruined.

Science fiction settings may have trouble with beanstalks because most of them have either magic rocket drives or anti-gravity, which obviates having to build an expensive megastructure. Recent advances in real-world materials technology mean that beanstalks are not fictional enough for far future campaigns any more. Here Britannica-9's 19th century anachronistic side comes to the rescue. Once a beanstalk is built, it's a sunk cost. If one had been built before the magic tech was invented, it's reasonable enough to keep it running as long as it uses no more than a shoestring budget. So the skyhook really is one or two hundred years old, and appointed in an antique style, as no one's bothered to redecorate since five Galactic Emperors ago.

Integrating a beanstalk with a modern-day campaign is probably trickiest of all, as an existing one would be as famous as anything in the world. Suddenly declaring that there's one out Singapore way will likely break players' suspension of disbelief. The solution is to jettison the working skyhook and replace it with one in the process of construction. If the project is relatively new, it would be a cutting edge, long-term project tied to the prestige of a major nation, in the best tradition of slightly-too-advanced spy movie technology. Repurpose Prithu Akram Jerath as a more typically motivated terrorist type and Alice Sedman as a sympathetic-but-opposed Chinese or Russian agent, and you're in business.

Icosahedron Adventures

Dwarven Martial Arts

by Owen K.C. Stephens

Most fantasy *d20 System* games either have no real rules for martial arts, or assume all races have access to the same fighting styles. The fact that different *cultures* in the real world developed distinct martial traditions argues strongly that groups with different *physiology* could be expected to do at least as much. This is especially true for races that have more than just a different set of ability score modifiers. Among the core fantasy races, the most obvious example of this is dwarves.

While it's possible to simply assign different real-world fighting abilities to various races in a fantasy game (Dwarven Grenadiers using flashing-blades-style fencing and explosives rather than muskets), it seems more likely that a short, stout, slow species would develop its own fighting arts designed to maximize their strengths and minimize their weaknesses. Of course by the standard rules, dwarves do have some trained combat advantages (+1 to attacks vs orcs and goblinoids, +4 AC vs giants), but that's just a drop in the potential fighting bucket.

Thus this article presents dwarven martial arts styles, referred to as "battlecraft" by the dwarves themselves. It starts by presenting generic rules for how to pick up a fighting style, then outlines two fighting styles designed specifically for dwarves. In many ways these are a bit stereotypical, but that allows them to match the most common vision of dwarves more easily. A GM looking for something more creative can easily use these as a template for developing other fantasy fighting styles.

Martial Arts

The martial arts system comes in three parts -- a martial arts rating, one or more style feats, and the maneuvers you select for each style.

Your martial art rating is equal to your ranks in Profession (martial artist) plus your base attack bonus. You only need to buy a single Profession (martial artist) skill -- additional styles are handled by buying new feats. As your martial arts rating increases, you earn new maneuvers for each style you know.

Each style is a feat with the same name as the style. As with any feat it has prerequisites that must be met before it can be taken. Once you have taken a style feat you may select one minor maneuver. Every 5 points of martial arts rating you gain after taking a style feat (including any points earned the same level you took the style feat) allows you to choose one more maneuver. You may never have more moderate maneuvers than minor or more advanced maneuvers than moderate. You should always note what your martial arts rating is when you take a new style feat.

For example, Gurven Stoneye is a 1st-level dwarven fighter. He selects the Improved Bull Rush feat as his bonus fighter class feat, and the Hammer Style feat as his starting character feat. He immediately gets to choose a minor hammer style maneuver, and selects Guarded Charge. He also notes his starting martial art rating for hammer style is 0 (since he gets to count his starting rating without including any value he gained this level). He lacks the spare skill points to buy any ranks of Profession (martial artist).

At 2nd level, Gurven selects the Combat Reflexes feat as his fighter class feat, and at 3rd level he takes the Anvil Style feat. He immediately selects a minor maneuver for anvil style (taking Anvil Shield), and notes his starting martial rating for it (2, for his +2 base attack bonus prior to this level). At 4th level, Gurven decides to buy one rank of Profession (martial artist), bring his martial arts rating to 5 (+4 base attack bonus, +1 rank). Since that's 5 more than his starting rating for hammer style, he immediately gets to pick another maneuver for that style (and selects Sudden Charge). He won't get another anvil style maneuver until his martial art rating is 7 (5 more than his starting anvil style

martial art rating of 2).

This system is designed to reward a character for taking a martial art style early, both by including his base attack bonus (which goes up automatically as he gains levels), and by limiting additional maneuver picks to 5 martial arts rating points earned *after* having a style feat. While a 9th-level rogue could take a martial style feat and decide to buy 8 ranks in Profession (martial artist) in a single level to gain a higher martial art rating, he would gain no benefit from the 8 levels of base attack bonus he earned prior to taking the feat.

Dwarven Battlecraft

Dwarves have a strong martial tradition, focusing on combat with larger species, fighting underground, and using their natural stability offensively. Nearly all dwarven battlecraft styles are centered on weapons, armor or tools of some kind. Dwarves are proud of their weapons of war, and often wear them to formal occasions as well as combat situations. As a result they have no need to develop weaponless fighting styles, instead focusing on elements of their war kit that complement their natural abilities the best.

Dwarven Style Feats	Style Prerequisites
Anvil Style	Combat Reflexes, racial stability feature.
Hammer Style	Improved Bull Rush, racial ability to move at normal speed in heavy armor.

Anvil Style

Dwarves are simply more stable than other races, and many learn to use that stability to become rocks of defense upon which enemy attacks break. Students of anvil style strive to be immobile, hardy, and fearless. They are often overrun, forcing them to be self-sufficient. But they also learn to be thorns in a foe's side even when alone, helping them to break up an enemy attack like living breakwaters.

Minor Maneuvers

Anvil Shield: Students of the anvil style battlecraft must learn to take extra efforts to defend themselves from enemy attacks, as their fighting style often isolates them from allies. Lacking the nimble movement of many other races, anvil students do this with careful shieldwork rather than evasive maneuvering.

Whenever you fight defensively or take the full defense action, and you are using a shield, you double the normal bonus to AC granted by the maneuver.

Blockmaster: Some anvil students set defense before offense, assisting their allies by soaking up enemy attacks rather than attacking foes directly. To help survive such tactics, these students learn to fight with two shields (often as a stepping stone to the shieldfighter maneuver).

You may use two shields at once (one in each hand), gaining the full AC benefit (including magical bonuses) from each.

Ingot: When fighting in tunnels, dwarven warriors often find themselves swarmed by dire rats, kobolds or other vermin while fighting in tight spaces. They learn to use the constricted terrain to their advantage, allowing a wall or chasm to guard their back while they focus on eliminating their foes.

If at least one square adjacent to you is impassible to a foe (a wall, a pit, or some other terrain that your foe cannot move into), that foe cannot flank you.

Mountain: Though dwarves are naturally sturdy, they can learn to be even more difficult to knock down or move. On any roll you are allowed to add your racial +4 stability bonus, you may also add your base attack bonus.

Moderate Maneuvers

Forgeflame: Dwarves often face foes faster than themselves, leaving their formations vulnerable to being overrun. Masters of anvil style battlecraft learn to slow the advance of enemy forces by settling into an area and lashing out to harass all who come near, forcing foes to move with greater caution.

As a move action, you can harass any foes within your threatened area. Enemies must treat the spaces you threaten as difficult terrain, spending ten feet of movement for every five feet they move through the area.

Shieldfighter: Anvil style warriors almost always arm themselves with one or two shields, making them much more resilient foes. As they become increasingly comfortable carrying a shield, many of these warriors learn it can be used offensively as well.

When you are using a shield, you may make an attack with it as if it were a martial weapon without losing its AC bonus. The damage dealt is 1d4 + your Strength modifier.

Tongs: A common answer to the difficulty of overcoming an anvil-style dwarven warrior is to charge him in an effort to deal massive damage to the slow-moving foe. The anvil style battlecraft answers this practice with a surprising counterattack, having the dwarf take one step towards a foe to preempt a charge and possibly kill a foe before the charge lands a blow.

As a standard action, you can set yourself against charge attacks. For the next round, any creature that charges you provokes an attack of opportunity when it enters a space you threaten, and you deal double damage on a successful strike. If you have a weapon that already deals increases damage against a charge, increase its damage by one multiple.

Advanced Maneuvers

Shattered Hammer: The pinnacle of anvil battlecraft is to be so resilient that foes break their weapons against you, as a sword breaks when smashed against the anvil.

Any time a foe makes a melee attack against you that hits your touch AC, but fails to penetrate your full AC, you may immediately make a sunder attack against the weapon used as a free action that does not provoke an attack of opportunity. If the attack was made unarmed or with a natural weapon (such as claws), you instead get a normal attack of opportunity against that foe.

Tempered: Masters of anvil battlecraft spend hours allowing themselves to be stuck, to better prepare themselves for the pain and to train their bodies not to flinch. After years of such practice, some blows simply harm the master less.

You gain DR equal to your Constitution modifier against bludgeoning and constriction damage.

Hammer Style

Prerequisites: Improved Bull Rush, racial ability to move at normal speed in heavy armor.

No matter how heavily armored a dwarf is, he can maintain the same speed. While many dwarves use this to their advantage when maneuvering in combat, students of the hammer style make it the focus of their combat maneuvers. They become fast-moving juggernauts of heavy armor, charging about the battlefield to smash through enemy formations and punch their way to important targets such as siege engines and enemy commanders.

Minor Maneuvers

Guarded Charge: Often a hammer student must travel quite a distance across a battle field before reaching a valuable target. The style teaches them to run at full speed while guarding themselves from potential attacks.

You may take a full defense action and a double move as a full-round action.

Skilled Charge: The charge is the preferred maneuver of the student of hammer style battlecraft. It allows the dwarf to move further than more cautious foes and still attack an enemy. As students practice charging hour after hour, they learn to leave themselves less vulnerable even while running headlong into combat.

When you charge on foot (not mounted), you do not take the normal -2 penalty to AC.

Sudden Charge: The hammer style teaches dwarves to burst into action immediately, building up speed with a single explosive action.

You can charge with no minimum movement (rather than the 10 feet normally required).

Smash: Hammer battlecraft students learn to trust their armor to keep them from harm, allowing them to hurl themselves against objects with abandon, breaking items with ease.

If you charge into an object (including doors and walls), you may add your armor bonus and shield bonus to a Strength check to attempt to break it.

Moderate Maneuvers

Burst Free: A hammer style warriors learns to call upon a sudden burst of speed to wrench himself lose from a foe that has him grabbed or held.

When grappled, you may make a martial art rating check (1d20 + martial art rating) to break free of the grapple. If you succeed, you must take a move action directly away from your foe, even if this provokes an attack of opportunity.

Improved Charge: A hammer style warrior maintains his momentum for a charge even when avoiding allies or moving uphill.

When charging, you may make up to two turns of as much as 90 degrees each. You may charge through friendly squares and uphill, though not through any other difficult terrain.

Prerequisite: Sudden Charges

Devastating Charge: The hammer fighting style teaches dwarves to use their momentum to deal additional damage with them slam into a foe.

If you charge a foe, you deal +2d6 damage with a successful attack.

Advanced Maneuver

Advanced Charge: A master of hammer battlecraft can charge under almost any circumstances.

You can charge any time you can move, even if you are moving through terrain that slows your move rate. Any movement you take as part of a charge does not provoke attacks of opportunity.

Prerequisite: Improved Charge

Avalanche: A master of hammer battlecraft knows how to slam into a foe in a way that is both damaging and effective at relocating that foe.

You can charge into a foe and use your armored body to damage him, while simultaneously pushing him backwards. When you make a Bull Rush, you also make a normal melee attack roll. (This is considered a charge.) If your attack roll succeeds, you deal melee damage. The damage is 1d3 if you are unarmored, 1d4 if in light armor, 1d6 in medium

armor, and 1d8 in heavy armor. You add 150% of your Strength bonus to this damage.

The Monster of the Okanagan

for *GURPS & d20 System*

by Bevan Thomas

I'm looking for the Ogopogo,
Its mother was a mutton,
Its father was a whale,
I'm going to put a little bit of salt on its tail.
--Bill Brimblecomb

It is said that a strange beast lives deep beneath the Okanagan, a large lake found in the interior of the Canadian province of British Columbia. Some say it is a man cursed by the gods to become a monster, others claim that it is a shy, almost gentle creature that wishes only to be left alone. Whatever its nature, the lake beast is large, mighty, and very, very good at keeping itself hidden.

This creature is known as either Naitaka or Ogopogo, and these two names represent the dual-nature of the lake monster's mythology. The monster has long be known to the Okanakane people, who see the creature as a water demon, a warrior cursed by the gods to take serpent form and prowl the cold waters forever. However, the Europeans who settled in the Okanagan began to tell of a very different lake monster, one not shaped by tribal mythology, but by the hopes of cryptozoologists and tourists alike. Their version of the creature was a beast, not a cursed and evil human, a thing that was shy, placid, and sometimes even friendly. They even gave the creature a new name, one derived from a parody of a British musical hall tune, and thus did Naitaka ("Lake Demon") become Ogopogo.

This article presents both versions of the monster, the cruelly vindictive Naitaka and the shy and placid Ogopogo, and includes stats of them for both *GURPS* Fourth Edition and *d20 System.* The GM may adopt any one of these interpretations, depending upon which would be most appropriate for his campaign.

In all traditional versions of the story, the creature is confined to Lake Okanagan. However, the GM is free to transport it to another large, deep lake if that would be more appropriate (such as one in a separate fantasy world). The creature's stats can also be used to represent similar water monsters (such as the Loch Ness Monster, Cadborosaurus, or a large and potent sea serpent).

Naitaka   *315 points*

Age: Indeterminate; 50'. Naitaka is a long, dark green serpent similar in appearance to a rattlesnake. However, it has no rattle on its tail, and its head resembles that of an earless horse with a seaweed-like mane and a mouth full of sharp teeth. Its eyes are red and glow with malice.

Attributes: ST 40 (no fine manipulators 40%) [180]; DX 15 (no fine manipulators 40%) [60]; IQ 11 [20]; HT 12 [20].

Secondary Characteristics: SM +6; Dmg 4d+1/7d-1; BL 320 lbs.; HP 40 [0]; Will 13 [10]; Per 14 [15]; FP 12 [0]; Basic Speed 6.75 [0]; Basic Move 7 [5].

Advantages: Amphibious [10]; Combat Reflexes [15]; Constriction Attack [15], DR 6 (tough skin, -40%) [18]; Deep Sleeper [1]; Discriminatory Smell [15], Doesn't Breath (Gills) [10]; Enhanced Move 2 (Water Speed 28) [40]; Hard to Kill 3 [6]; Medium [10]; Metabolism Control 10 (Hibernation, automatically enter when exposed to extreme cold) [20]; Nictitating Membrane 2 [2]; Pressure Support 2 [10]; Subsonic Hearing [5], Teeth (sharp) [1]; Unaging [15]; Vibration Sense (water) [10]

Disadvantages: Bad Temper (9) [-15]; Bestial [-15]; Blood Lust (9) [-15]; Callous [-5]; Cannot Speak [-15]; Dead Broke [-25]; Divine Curse (cannot leave Lake Okanagan) [-20]; Frightens Animals [-10]; Gluttony (12) [-5]; Intolerance (humanity) [-5]; Loner (12) [-5]; Odious Personal Habits (eats sapients) [-15]; Reputation 3 (water demon to those around Lake Okanagan, recognized all the time) [-7]; Restricted Diet (fresh meat) [-10]; Sleepy (asleep 7/8th of the time)[-26]; Social Stigma (monster) [-15]; Vermiform [-35]

Languages: Okanakane (native) [0]

Skills: Area Knowledge (the Okanagan)-12 [2]; Boating-14 [1]; Bow-15 [2]; Brawling-15 [1], Camouflage-11 [1], Fishing-15 [2], Intimidation-14 [2]*, Knife-16 [2], Occultism-11 [2], Spear-14 [1], Stealth-16 [4], Survival (freshwater lakes)-14 [2], Survival (woodlands)-13 [1], Wrestling-16 [4]
*+1 from Callous

Biography

Many hundreds of years ago, there was a man among the Okanakan people who spoke with demons. This bizarre behavior made him an outcast, shunned by others of its tribe. One day, the demons drove the man into a wild frenzy, and on the shores of the Lake Okanagan, he murdered Kan-It-Kan, a wise tribal elder.

For this, the gods struck him down. They transformed the man into a huge monster and then cast him into the lake, cursed forever to haunt the scene of its crime. It had become Naitaka, the "Lake Demon."

Motivations

When awake, only two things matter to Naitaka: eating and gaining revenge on humanity. It seeks to accommodate both of these by devouring anyone foolish enough to be on or by the lake.

Encountered

Naitaka spends most of the time asleep in the middle of the lake in a cave underneath Rattlesnake Island. Sometimes, when a storm rages over the lake, the monster rises to the surface, its undulating form churning the waters so much that huge waves crash against the shore.

The monster drags its prey down to its cave, where it feasts on the poor souls. A few days later, bits of flesh, cloth, and other remnants of the victim wash up on Squally Point, the shore across from Rattlesnake Island.

Ogopogo   *283 points*

Age: Indeterminate; 50'. Ogopogo looks like Naitaka for the most part, though its countenance lacks any intelligence. It is nothing but a shy, inoffensive animal.

Attributes: ST 40 (no fine manipulators 40%) [180]; DX 15 (no fine manipulators 40%) [60]; IQ 6 [-80]; HT 12 [20].

Secondary Characteristics: SM +6; Dmg 4d+1/7d-1; BL 320 lbs.; HP 40 [0]; Will 8 [10]; Per 13 [35]; FP 12 [0]; Basic Speed 6.75 [0]; Basic Move 7 [5].

Advantages: Amphibious [10]; Constriction Attack [15], DR 6 (tough skin, -40%) [18]; Deep Sleeper [1]; Discriminatory Smell [15], Doesn't Breath (Gills) [10]; Enhanced Move 2 (Water Speed 28) [40]; Metabolism Control 10 (Hibernation, automatically enter when exposed to extreme cold) [20]; Nictitating Membrane 2 [2]; Pressure Support 2 [10]; Reputation +2 (beloved mascot to those around Lake Okanagan, recognized all the time) [5]; Subsonic Hearing [5], Teeth (sharp) [1]; Unaging [15]; Vibration Sense (water) [10]

Disadvantages: Dead Broke [-25]; Gluttony (12) [-5]; Loner (12) [-5]; Shyness (crippling) [-20]; Sleepy (asleep 7/8th

of the time)[-26]; Vermiform [-35]; Wild Animal [-30]

Skills: Area Knowledge (the Okanagan)-7 [2]; Brawling-15 [1], Stealth-16 [4], Survival (freshwater lakes)-13 [2], Wrestling-14 [1]

Biography

Very little is known about Ogopogo's past. Some say the creature has always lived alone in Lake Okanagan, others claim that there was originally a fellow, but the others died off. Its past is one of the many mysteries that surround the creature.

Motivations

Ogopogo is an animal with normal animal desires, though as it seems be a unique creature, it perhaps lacks a desire to reproduce. It fees off fish, plants, and other food that it can find in the lake.

Encountered

The creature spends most of its time asleep, and even when awake it does its best to avoid human contact. It prefers to avoid conflict, but if forced, can deliver a nasty bite. Ogopogo despises the taste of human flesh, and instinctually knows that if it draws too much attention to itself, the tranquility it enjoys will be forever destroyed.

d20 System Statistics

The following are rules for including Naitaka or Ogopogo in a d20 campaign. Ogopogo is identical to Naitaka save for the lack of intelligence and lack of barbarian levels.

Naitaka

Gargantuan Magical Beast (Aquatic)
Hit Dice: 12d10+84 + 5d12+35 (240 hp)
Initiative: +2
Speed: 40 ft. (8 squares), swim 80 ft.
Armor Class: 28 (-4 size, +2 Dex, +20 natural), touch 8, flat-footed 28
Base Attack/Grapple: +17/+45
Attack: Bite +27 melee (2d8+21)
Full Attack: Bite +27 melee (2d8+21)
Space/Reach: 20 ft./15 ft.
Special Attacks: Constrict 2d6+14, improved grab, rage 2/day, swallow whole
Special Qualities: Amphibious, blindsight 120 ft., dark vision 60', improved uncanny dodge, keen scent, low-light vision, trap sense +1
Saves: Fort +19, Ref +11, Will +7
Abilities: Str 38, Dex 15, Con 25, Int 11, Wis 14, Cha 10
Skills: Hide +3, Intimidate +7, Listen +9, Knowledge (the planes) +3, Move Silently +10, Spot +9, Survival +7, Swim +27
Feats: Alertness, Awesome Blow, Improved Bull Rush, Power Attack, Snatch, Stealthy
Environment: Temperate aquatic
Treasure: Double Standard
Alignment: Chaotic Evil
Challenge Rating: 20

Before being cursed, the creature was a 5th-level barbarian and still retains the class features, skills, and other

elements of its former life. It speaks Abyssal and Common. The monster keeps its prey's possessions as grim trophies, and over the years has accumulated a decent treasure trove.

Combat

Naitaka prefers to ambush its foes, its coils causing the water to seethe as it strikes out at its prey and drags the poor creatures down to the depths. It will almost always enter its barbarian rage before attacking.

Blindsight (Ex): Naitaka can "see" creatures and objects within 120 feet by sensing vibrations. This ability only works when Naitaka is underwater.

Constrict (Ex): On a successful grapple check, Naitaka deals 2d6+14 points of damage.

Improved Grab (Ex): To use this ability, Naitaka must hit with its bite attack. It can then attempt to start a grapple as a free action without provoking an attack of opportunity. If it wins the grapple check, it establishes a hold and can either swallow the foe the following round or constrict.

Improved Uncanny Dodge (Ex): Naitaka possesses a danger-sense that allows him to retain its Dexterity bonus to AC even if it is caught flat-footed or attacked by an invisible opponent. It also cannot be flanked.

Keen Scent (Ex): Naitaka can notice creatures by scene in a 180-foot radius and detect blood in the water at ranges of up to a mile.

Rage (Ex): Naitaka may fly into a barbarian rage twice a day.

Swallow Whole (Ex): Naitaka can attempt to swallow a grappled opponent of a smaller size than itself by making a successful grapple check. Once inside, the opponent takes 2d8+21 points of crushing damage plus 8 points of poison damage per round from Naitaka's insides. A swallowed creature can cut its way out by using a light slashing or piercing weapon to deal 25 points of damage to the gizzard (AC 20). Once the creature exits, muscular action closes the hole; another swallowed victim must cut its own way out. Naitaka can hold 2 Large, 8 Medium, 32 Small, 128 Tiny, or 512 Diminutive or smaller opponents.

Skills: Naitaka has a +8 racial bonus on any Swim check to perform some special action or avoid a hazard. It can always choose to take 10 on a Swim check, even if distracted or endangered. It can use the run action while swimming, provided it swims in a straight line.

Ogopogo

Gargantuan Magical Beast (Aquatic)
Hit Dice: 12d10+84 (175 hp)
Initiative: +2
Speed: 40 ft. (8 squares), swim 80 ft.
Armor Class: 28 (-4 size, +2 Dex, +20 natural), touch 8, flat-footed 26
Base Attack/Grapple: +12/+40
Attack: Bite +22 melee (2d8+21)
Full Attack: Bite +22 melee (2d8+21)
Space/Reach: 20 ft./15 ft.
Special Attacks: Constrict 2d6+14, improved grab, swallow whole
Special Qualities: Amphibious, blindsight 120 ft., dark vision 60', keen scent, low-light vision
Saves: Fort +15, Ref +10, Will +6
Abilities: Str 38, Dex 15, Con 25, Int 4, Wis 14, Cha 10
Skills: Hide -5, Listen +7, Move Silently +7, Spot +7, Swim +25
Feats: Alertness, Improved Bull Rush, Power Attack, Snatch, Stealthy
Environment: Temperate aquatic

Treasure: None
Alignment: Neutral
Challenge Rating: 15

Ogopogo understands some words in Common, though it cannot speak any language.

Combat

The creature is incredibly shy, and avoids combat if at all possible. If forced, Ogopogo generally prefers to wrap its coils around the enemy, dragging the creature down beneath the water as Ogopogo constricts it.

Skills: Ogopogo has a +8 racial bonus on any Swim check to perform some special action or avoid a hazard. It can always choose to take 10 on a Swim check, even if distracted or endangered. It can use the run action while swimming, provided it swims in a straight line.

A Multiple-Choice Question With Ten Billion Options

Almost everyone likes choices; the ability to have a myriad of options for most aspects of life is one of the hallmarks of our modern industrial age. We can choose from dozens of types of cars or sodas, and an ice cream parlor with fewer than 20 different flavors is something to turn your nose up at. And, speaking in broad generalizations, almost everyone says they like *more* choices. There are very few items where you can't get majority agreement to the question, "Do you believe consumers should be permitted more options for X?"

However, those who study social phenomenon -- such as economists, psychologists, and bloggers -- have noted a curious tendency among folks: while almost everyone claims they like more choices, almost invariably having too many options leads to analgous results. For example, employers have found that offering too many retirement investment options often results in employees not choosing any of them . . . which is almost certainly the *worst* decision you can make in that circumstance that doesn't involve dumping all ones assets into Charlatan's Magic Beans Ltd.

If you think about, the reasons behind this are simple. Let's say you have two investment options. Well, you can compare those items side by side and mentally calculate which one is better for your needs; any differences can be compared directly to the other. Now, let's add two more. Suddenly the number of comparisons that need to be done balloons; unless one specific option immediately and decisively presents itself, it's much more likely that the decision will be put off. "Oh, I'll look at them some weekend when I get a chance," goes the excuse, despite the fact that spare weekends are often as rare as loose diamonds littering the street. And if there are even *more* options . . . well, "spare weekend" transmutes to "month of Sundays."

Likewise the existence of additional choices can lead to even *fewer* options. For example, let's say an ice cream shop offers 15 flavors. Well, that's enough for someone to spend a reasonable amount of time deliberating each one: "Let's see . . . I don't like coffee, I had strawberry last week, I'm bored of chocolate . . . Okay; how about rum ripple?" Now, let's pretend the same ice cream shop offers 10,000 choices (for example, e-yummy-yummy-ice-cream.com's extensive selection). Well, that's more options than can ever be sort out one at a time. So, how would you select a flavor? Well, the two most obvious methods would be to select the one you always select, or to use an alternate means of sifting down the options. The former method narrows those 10,000 choices down to one, and the latter method depends on the alternate means used. For example, one obvious choice would be to choose one of the most popular flavors . . . only now, you're relying on people who quite probably used the pick-their-favorite method, *and* the list you're choosing from is dependant on the sorthing mechanism; if you're looking at a "Top 10 Flavors" list, you've now ended up with five fewer options than you had at the original 15-flavor parlor!

Once you wrap your mind around the notion that "less choice can mean more freedom," the implications of this are enormous in gaming. For example, in social situations, a smart gamer would be wise not to present his friends with too many options. "Which of these five games sounds most interesting?" will almost certainly yield a more satisfying result than, "Which of my vast library of 500 games would you like to play?"

Within a game it's a similar phenomenon. I realize that I've generally had much less luck as a GM in campaigns where the players are given near-infinite freedom -- say, in the form of a ship, 40 days of provisions, and a map of the Known World -- than if I restrict those options: "The noble prince appreciates you answering his summons. 'Here are the three most pressing problems we face,' he says. 'We would be honored if you could tackle any single one of them . . .'"

Finally, in game rules themselves it can be fruitful to restrict freedom. As both a player and a GM instructing new players, one of the problems I've had with games that are too open-ended -- such as ***Champions, GURPS,*** or ***FUDGE*** -- is that it can be difficult to come up with a concept. These game systemns can be worse than a blank canvas; they're like an art supply house of blank canvases, unetched copper sheets, and slabs of butter waiting to be sculpted. I can generally whip up a character much faster in a system such as the old ***DC Heroes,*** where flipping through a list of evokatively named powers will usually elicit an idea or two. And while they're reviled by many players, the "splat" technique of many games -- where various factions and groups have their own stereotypes and powers -- can be a

remarkably fast way of reducing what could be a complex game world into an approachable menu of options.

Although I respect the freedom that the modern iteration of the **d20 System** offers in character creation, I confess a real fondness for the old basic **Dungeons & Dragons** game. You remember: The one where races and classes were one and the same ("You're an Elf? You must have received the same magic training as the rest of your species!") and where the most complex choice a beginning player would have was whether the Magic User wanted his one spell to be *magic missile,* or whether he wanted to die in one swipe from an enraged unwounded bugbear. (These two options aren't mutually exclusive.) With every version of **Dungeons & Dragons** prior to the recent one, it was possible to choose a class and generate a character in five minutes or less, and the number of choices -- and combination of choices -- was probably less than 10.

Now, I'm not saying that having a huge number of choics is always bad . . . not at all. I love being able to use, say, **GURPS** to generate *exactly* the character I want. And if I know I'm looking for that Sugar-Free Chocolate-Chip Cookie Dough Coffee Sorbet, I'm glad if it's one of the 10,000 choices. But it's also possible for too many choices to result in *fewer* options and, worse, may end up with gaming not happening at all.

And that's often the worst possible choice.

--Steven Marsh

Pyramid Review

Thurn and Taxis

Published by [Rio Grande Games](#)

Written by Karen & Andreas Seyfarth

Full-color boxed game (two to four players) with map, 80 wooden houses in four colors, four company cards, 20 coach cards, 66 city cards, 30 point tiles, four rules summary cards, rulebook; $32.95

Thurn and Taxis has its origins in the 15th century when the Kaiser commissioned someone to carry his correspondence across the Holy Roman Empire -- his own little Pony Express, of a sort. By the time you get to take a hand in matters, it's two centuries later and you have a family reputation to uphold as the government asks you to formalize the postal system.

The object of the game is to produce the most successful (read: high-scoring) mail-carrying service in Austria and surrounding lands.

Each player plays a descendant of this famous, favored family. Two to four heirs get their own company to create a postal service that runs through as many cities as possible. The map shows the towns you'll cater to, from Freiburg in the west to Linz in the east, and the roads that interconnect them. A deck of city cards shows the urban centers, and these are the currency on which the game runs.

Eight of these cards are set face-up on the side of the map. On his turn, an entrepreneur must draw at least one city card, either one of the revealed cards or taking his chances with a blind draw if none of those appeal to him. Then he has to play at least one city card from his hand onto the table in front of him. Players may also call upon the services of a postal official each turn, who allow them to break rules like drawing or playing extra cards. The row of cards grows by at least one city each turn. If you want to lay down a city card, it has to go on the left- or rightmost end of the chain and it must connect to that burg. For example, if you played Innsbruck, you can only play a card for an adjacent city -- say, Zurich -- next to it. The next card you place has to be either another city on the other side of Innsbruck or a town that abuts Zurich.

With three or more cities, you can choose to close out the route. You may now place houses on the towns you connected. Either play one house on every city on that route within a single province, or place one house per province on any one city you linked during that line. It's not as confusing in play as it sounds, but it's a vital strategic decision because there are several ways to score.

You get points for being the first one to have a house in every province, but you also score for having one post on every town in a single province. If you're the first to reach one of these milestones, you receive a point counter. The next person's counter is worth less, so "firstest with the mostest" is good. You get points depending on how long your route is, and longer links lead to better coaches (really they're just worth more points). You can't simply skip to the big guns; you have to work your way up the ladder of success one carriage improvement at a time.

The game goes to a final round if someone places their last house on the board or manages to get the coveted "7" coach. There aren't enough houses to fill all the cities, but by the end the towns you haven't built on are scattered. They aren't lined up like ducks, waiting for you to build one more perfect route, so you'll probably have houses left over. Your carriage and point counters increase your score, while the remaining houses in your stock subtract from it. The high score wins the game.

If you've never cracked open a Rio Grande game, you're in for a component treat. If you *have* played one, the pieces will have you nodding in appreciation. The cards may be one stock size too fragile (especially given that they have to be shuffled a lot throughout play), and the wooden houses are an odd shape that can fall over easily, but it's all beautifully illustrated. The map portrait is a particular treat.

The box bottom low-balls the time estimate; they claim it's playable in under an hour, but the reality is a full crew will probably take a couple of hours even after you're used to the rules. It's an enjoyable two hours, though, so take heart. And while it's not impossible to interfere with the progress others are making, there are times your bones ache with the desire to really derail your opponents' plans. Doing so takes too much subtlety to be a major element of play.

But while there are some old-hat mechanics here, the execution is such you won't notice it in play. There's plenty to do, lots of scoring to keep you occupied, and best of all there's a selection of strategies. You and your competitors ultimately end up with much the same layout, but how you choose to get there is of overall importance. Tension mounts just watching new cards being placed on the map, and it can be painful if someone opts to use the bailiff's influence to reset the face-up card choices. There goes that Regensburg card you were waiting to see . . .

The rules are pleasing to use, with a fulfilling flow that means not rain nor sleet nor snow nor dead of night shall stay your friends from swiftly congregating for another round of ***Thurn and Taxis.***

--Andy Vetromile

Building the Low-Tech Landscape

Part 2: Overlords and Cities
for *GURPS*

by Matt Riggsby

Having dealt with the peasants, it's time to start looking up the ladder to consider the relationship between peasants and the people and institutions who employ and rule them and with the centers of civilization they support.

Tax Revenues and Sharecropping

There are a few different ways peasant produce made its way up the ladder. One approach is to regard taxes as a fraction of the peasant's income. This approach is suitable for relatively free or wealthy peasants. Even free peasants could be taxed up to a third of their total income. That's the *total* tax burden. Not all of it goes to political overlords; a significant amount of money often goes to religious institutions. In many societies, from Mesopotamia to Ancient Greece to Medieval China and Europe, churches and temples were major recipients of worldly goods. In other words, their might be two groups collecting taxes; whether they get an equal share or if one gets more than the other is up to the GM.

With the taxation approach, assume taxes are included in a household's cost of living rather than an additional expense. Households which are Struggling or better can be taxed at up to 30%. However, Poor households can't pay more than 10% of their cost of living in taxes. They simply can't afford to pay more than that.

In various times and places, though, many peasants were what we'd call tenant farmers or sharecroppers, working a plot of someone else's land in return for a small portion of the crops. From a modern point of view, the distinction might be between running one's own farm versus working as an employee on someone else's, although this does start to get into the complex issue of property rights.

One way to treat this is to have the sharecropper take an appropriate level of income for himself and paying some level of taxes based on that, but assume that he actually produces as much income (and uses as much land) as someone at a higher level of wealth, with the excess going to an overlord. A sharecropper will almost always be Poor, so at TL3, that suggests that each sharecropper nets his lord about $200 per month. However, it's fairly clear that peasants working directly for their own benefit are *much* more diligent and efficient than peasants working for someone else and an overlord gets far less income per acre. It would not be at all unreasonable to rule that the landlord gets only *half* of the difference between income levels, or even less. At TL3, an overlord with Poor tenants would probably get only $100 per tenant, along with some more conventional taxation. Clearly, sharecropping is a much better deal for the ruler than for the individual peasant, but not nearly as good for the economy as a whole. A sharecropper may end up paying taxes as well, though given his poverty, he probably won't be paying much.

In historical texts, this sort of peasant could have gone by a number of names: villain, servus, serf. However, not all serfs are sharecroppers and not all sharecroppers are serfs. The term "serf" implies a relationship as much political as it is economic. A serf is tied to the land, obligated to work it and prohibited from leaving it behind without permission from his overlord. In most cases, serfs were also very poor; those who could become wealthier would often buy their way out of their obligations. However, in some periods, as serfdom became rarer, those who did hang on to old feudal ties might have a closer relationship with the manor than their "free" neighbors, which could easily mean superior access to the political system and economic resources. Moreover, sharecroppers could just as easily be wage labor, employed for a season or a few years until they get their own land rather than permanent subjects. Sharecroppers can be free, even if it only means being free to starve.

In actual practice, some peasants may work only their own land and others will be pure sharecroppers, but many will be somewhere in between, combining relatively free holdings with labor on someone else's fields. To handle this, the GM may want to introduce fractional wealth levels, discussed below. A sharecropper will probably be Poor, Struggling-2, or Struggling-1, and will net their overlord an amount equal to half the difference between his monthly income and that for a character no more than one full level of wealth higher.

Of course, sharecroppers don't have to work for noblemen. This same arrangement can be used to handle people working for wealthier but still common land owners. Given the limited amount of land a single family could farm, someone with a lot of land and not enough hands would have to bring in additional labor. Running the numbers in the previous article, it should become clear that it would be difficult for a single peasant household to rise much above Struggling wealth. However, in various times and places, there was a small rural middle class, below the titled nobility (and without their political clout and military obligations) but above the poorest dirt farmers. A farmer by himself might produce enough wealth to be Struggling, but with a few hirelings, their additional production could easily boost him to Average wealth.

Sharecroppers can likewise work for institutions. Temples and monasteries across the Old World received bequests of land from people hoping to curry divine favor. Sometimes, the land came with peasants who would pay the temple either with taxes or as sharecroppers. Other times, though, lower-class monks and other minor church members would be the ones working the land, receiving very little of their own produce and supporting their brethren.

This could create a complex picture for taxation. The poor hireling might produce a sizable amount of income for his employer, generate tax income for his overlord, and provide support for a nearby church or temple.

Forms of Taxation

Income makes its way from the peasants to overlords in many different forms. First, there are payments in kind, a share of whatever crops, livestock, or other products are raised: sacks of grain, bushels of fruits and vegetables, cheeses, wool, and so on. In most periods, the overwhelming majority of direct taxes are payments in kind. They're relatively easy to obtain, and while it will take a few steps to convert a storehouse full of wheat into a sword or a horse, they'll keep the landlord fed.

Second, there are rents, fees, and other payments to be made in money. Typical fees include charges for using the village mill, payment for permission to marry or to plow fields, fees for rendering criminal judgments and settling local disputes, or surcharges for growing particular kinds of crops. Monetary payments are extremely useful, since they provide maximum liquidity, but peasants can't provide a lot of it in most periods.

Third, peasants often owe labor services, which may or may not be specific (some peasants might be required to, say, thresh grain for four days in October, while others might be subject to one day a week of doing whatever their lord commands). Nobles and governments tend to be major landowners, and in addition to growing their own crops, peasants may be required to spend a certain amount of time working in their lord's fields. This gives the landlord certain advantages. Because the potential productivity and pool of available labor vastly outstrips what he needs for bare subsistence, he can afford to grow certain kinds of valuable crops that a peasant couldn't. For example, a peasant couldn't live off of a harvest of grapes, nor can he wait for several years for vines to start producing. A lord, however, can grow enough grain to ensure that he has more than enough to eat and have more than enough land and labor left over to cultivate high-value and labor-intensive crops.

Complicating the picture even more is the existence of forced loans and forced sales. An indirect means of taxation used by many governments was to require people to sell certain goods at specified prices, typically well below market value. In practical terms, this can probably be regarded as a less efficient means of getting taxes in money or in kind, but ultimately with the same economic effects as a direct tax.

It's certainly easier to treat tax and sharecropping income abstractly, assuming that the overlord can convert whatever income he has into whatever form he needs it in. However, GMs eager for detail can break taxes and sharecropping income down into the categories of kind, money, and labor, which the overlord can then use as he sees fit. The value of income in kind can be applied directly against the overlord's cost of living, just as peasant farmer income. Income in the form of labor is typically used for farming, which means that it's really income in kind. However, an overlord could use it instead for unskilled non-agricultural labor, such as digging moats or irrigation trenches or building roads (some of it could be used to build fortifications, mills, and the like, but most of that labor requires significant skills). An overlord might even be

allowed to use income in labor to raise levies of troops, although most peasants will be unskilled and deeply unenthusiastic fighters. No more than 1% of a Poor peasant's taxes can be taken in money, and no more than 20% of taxes from Struggling or Average farmers.

Historically, taxes and rents were expressed in specific fixed amounts: a bushel of barley, a week of plowing, three pieces of silver, and so on. The percentages presented here are a summary for the convenience of modern gamers, not calculations ever performed by anyone levying or paying them. In the short term, the fixed amounts meant stability and ease of computation for everyone, and since inflation was extremely low by modern standards, the value of taxes and tribute stayed at a stable level for the authorities. It was also a boon to a largely illiterate and innumerate society not to have to compute and document a twelfth of the oats, a seventeenth of the year's cheese production, and the like after every harvest.

Still, even though tax amounts were theoretically fixed, there was, in practice, some variability. From the peasant's point of view, there were still ways to play the system. If one was obligated to give his lord, say, a cheese of a certain size or a sheep, it didn't have to be his best cheese or his best sheep. He could rid himself of goods of slightly inferior quality, if that was possible. There was also room for self-improvement. If a peasant managed to be more productive one year than in the previous one, his taxes wouldn't increase. Regardless of how much he produced, he'd owe his lord the same amount (though he would take on new obligations if he acquired new land). If the weather was good and he had a bumper crop, so much the better for him.

For landlords, though, it could become a problem if economies changed. Improving economies (which increased the importance of money over goods) and changing technology (which changed the relative value agricultural produce) meant that those fixed taxes could become worth less and less to the lords who collected them. Over a lifetime, the effect was small, but over centuries, it became considerable. The average production of peasants might increase, but the proportion of that taken in by landlords as well of the value of that portion would drop. At higher TLs, the landlords who remained wealthy through such changes were those who controlled large areas directly and employed workers rather than relying on traditional taxation, particularly the ones who focused on what were relatively luxury trades like stock raising and wine production.

outlandish batch of unproven ideas. They still, in most societies (certainly all of western Europe), retain rights, owing their lord a limited list of duties. Anything beyond that, so far as the peasants are concerned, is money out of their purses, bread out of their mouths, or time away from their friends. Even if a lord can intimidate his peasants into extra work, the peasants can effectively retaliate in the same ways disgruntled workers always have: strikes, slowdowns, sick-outs, and intentionally doing a horrible job. The more a lord pushes his peasants, the less effective they'll be.

What a lord *can* do is to administer his domain more or less within the bounds of the system. The system is tilted in his favor, of course. He can get away with abusing his underlings to some extent, and the administration of justice can be quite bloody. However, anything that requires active cooperation of the peasantry will require more delicate handling. The GM should never forget, even if their rulers do, that peasants are still people, not counters in a game played by their rulers.

Absentee Landlords

As if the many different forms of income weren't enough, landlords were allowed a long list of rents, fees, and duties, just as modern people might pay a long, long list of fees and taxes including rent or mortgage payments, property taxes, fees for driving, fishing, hunting, and marriage licenses, sales taxes, etc. Worse for the ancient landlords, they didn't have large, powerful bureaucracies to collect them, or, often, even written laws indicating what taxes were due and when. In order to get them everything owed to them, someone had to remember what the taxes and fees were and when they were to be collected. In *GURPS* terms, this requires a lot of work and a high level of Administration skill. These are not requirements designed to attract the average aristocrat.

Any number of lords and clergy in Europe and beyond, particularly those involved in a central government or other large organization, had little or nothing to do with the lands from which they drew their income. The actual day-to-day work of administering the holding would be handed over to a local agent, whom we'll call a bailiff (though the term is Medieval, the concept isn't; Roman patricians would leave the administration of his villa's slaves to a foreman most of the time). The bailiff, usually a commoner, was the ancient equivalent of a city manager. He was a sort of professional administrator, deputized to take care of the daily operations of a fief by the duly constituted but less inclined and, often enough, less competent authorities. He wouldn't have the rights and privileges of a nobleman, but he would have authority to administer justice to the peasants he oversaw and, usually, the right to whatever additional income he could squeeze out of his jurisdiction after a fixed amount of revenue had been passed on up the ladder.

An Independent Income in a low-tech campaign would almost certainly have a bailiff lurking behind it, and it's entirely realistic for more cosmopolitan noblemen and clerics to have such an income. A number of early English students at the University of Paris were priests with sinecures, who were taking advantage of their essentially unstoppable income to leave their parishes and study for a better job. However, relying on a bailiff to administer one's holdings isn't always an independent income. Depending on the circumstances of one's employment, the authority who awarded it might be empowered and, more importantly, inclined to take it away in case of poor performance, making that income simply income from a job rather than the Independent Income advantage. The kings of Kongo, for example, used less favored noblemen to collect taxes and oversee private lands for the royal purse and redistributed those revenues to the nobility they employed. Noblemen who are Filthy Rich or better already employ such overseers and administer their administrators more than day-to-day work. Many Very Wealthy and some Wealthy characters may employ them as well.

Landlord Examples

So what might this look like in play? Let's take two rulers with very similar attributes and see how their domains might be very different. One is Patrician Ominous Omnibus, a retired senator of a wealthy republic who derives his income from a large, profitable, and picturesque villa set in a lightly rolling landscape at TL2. The other is Laird Angus McSporran, chieftain of a chilly, rainy land in the far northern highlands in TL3. Both are Status 4 and Very Wealthy.

Patrician Omnibus (an ancient legislator famed for the invention of the "Omnibus bill"), with an income of $13,500/month ($162,000/year), employs a great deal of slave labor, who count as sharecroppers. Their income is effectively Poor ($100 month or $1,200/year), but they produce at the level of being Struggling-1 ($270/month, of which Omnibus sees $85/month, or $1,020/year). Omnibus receives no "taxes" from his slaves, though they might contribute to a nearby temple. Omnibus needs 159 slaves to get enough income.

For themselves, the slaves grow mostly barley and millet (with an average yield of 850 lbs./acre) and beans (with an average yield of 450 lbs./acre). Each slave can get by with about an acre of the former and 0.8 acres of the latter. With two-field rotation, that's 3.2 acres per slave, or about 574 acres altogether. For the senator they grow wheat (at 400 lbs./acre) and tend vines (producing $15/gallon wines at 50 gallons/acre) and olive groves (producing 440 pints of oil/acre). On average, they tend 0.7 acres of wheat, 0.05 of olives, and 0.1 of vines. Including fallow land, that's 1.55 (the olive groves and vineyards don't need fallow), but since it's being tended by sharecroppers, it produces less efficiently, so that's really 3.1 acres per slave, for a total of nearly 493 acres. Ignoring possible pasturage for sheep and the use of nearby waste land for wild resources, that's around 1,065 acres. Omnibus's territory is small enough that everyone could be housed in a single large compound, probably with a luxurious country home for Omnibus on a gentle slope overlooking the fields, about eight acres of olive trees on one side, nearly 16 of grape vines on the other, and barns and less comfortable quarters for the slaves in back.

Laird McSporran is in a very different situation. McSporran is the nominal but not particularly powerful ruler of a territory of free peasants. They are, on average, Struggling, with an income of $300/month ($3,600/year). His people are more productive than Omnibus's, but McSporran sees less of it. Worse yet, despite a higher level of agricultural technology, the land and climate are much worse. McSporran, with an income of $14,000/month ($168,000/year) gets 20% of his peasants' income in taxes, requiring about 233 peasant households.

In McSporran's domain, barley comes in at 780 lbs./acre, wheat at 300 lbs./acre, oats at 400 lbs./acre, and legumes at 340 lbs./acre; olives and vines wouldn't last a week there. The average household cultivates 2.2 acres of barley, 1.5 of wheat, 1 of oats, and 2 of legumes. That's 6.7 acres under cultivation at any given time, or about 10 acres per household including fallow. Again ignoring room for animals (and McSporran's people probably keep a lot of sheep or goats), that's over 2,300 acres, well over the maximum size of a single village. The GM could easily rule that McSporran's peasants are spread out over five or six small settlements, clinging to hillsides and keeping the valley floors open for cultivation.

Shipping to the City

Now we get to figure out how many city-dwellers a countryside full of farmers can feed. Although peasant farmers consume the bulk of what they grow, the remainder is sold to other people. It is that surplus which feeds cities and towns. In general, the total value of the cost of living in a city must be equal to or less than the total value of produce provided from its agricultural hinterland (we'll assume that nutritional standards are met in the process). To figure out how many people can be supported, we must figure out how much excess is created, how far it has to travel, and how much is consumed on the way.

Wealthier farmers (and landowning noblemen definitely fall into this category) eat proportionately less of their produce and send proportionately more of it to market, where it can feed craftsmen, bureaucrats, priests, soldiers, and everyone else who doesn't make a living by tilling the soil, so the amount of excess put on the market depends on the wealth of the growers. We'll assume the following: Poor farmers sell 2% of their produce, Struggling farmers sell 20%, Average farmers sell 50%, and farmers (or, more likely, landholders) sell 75% of their produce. Sharecroppers should be counted at the level of their actual income, not the level used to calculate effective income for their landlord. A Struggling farmer produces $3,600 worth of produce a year, of which $720 can be sent to market. A Poor farmer would be able to market a mere $24 a year.

But not all of that produce will make it to the city. Transporting food for consumption elsewhere faces diminishing returns, since the people (and animals, if any) moving the goods must consume some agricultural produce in the course of shipping it. How much depends on how goods are moved and over what kind of terrain. Animal carts carrying grain and other inexpensive agricultural produce over reasonably good roads consume about 1% of the value of the produce they carry per mile (this only applies to bulk food shipping; since the cost is ultimately a function of weight or volume, shipping costs proportionately far less for goods with a high value for weight like spices and manufactured goods). Beasts of burden without carts and human bearers are less efficient (beasts because of mechanical inefficiency, humans because they'd like to be paid more than mere subsistence), in the 1.5-2% range, and a lack of roads or the presence of rough terrain can push transport costs easily as high as 4%. Water transport, however, is far more efficient. Transport by river costs half to a quarter as much as overland, while ocean transport is up to a sixteenth of the cost of overland transport.

This table lists the total value of agricultural produce which can reach an urban center per month, assuming a population density of one farm per square mile and an average production of $60 of marketable goods per month per farm (in other words, the peasants are, on average, Struggling). Although the table lists vast distances, such catchment areas are extremely unlikely. Even during the early Middle Ages, sparsely populated Britain's modest towns were hardly more than 50 or 60 miles apart (which means a catchment radius of no more than 30 miles or so), and the cities and towns of the Italian Renaissance were even closer together than that.

Marketable Goods by Area and Transport Cost

Radius	Transport Cost (as a % of value of goods shipped)									
	4%	3%	2%	1.5%	1%	.75%	.5%	.25%	.125%	.0625%
5	6,466	6,715	6,964	7,088	7,213	7,275	7,337	7,399	7,430	7,446

600									53,721,234	80,581,852
700									60,933,808	103,587,473
800									63,669,611	127,339,222
900										151,090,972

1000	174,096,593
1200	214,884,938
1400	243,735,230
1600	254,678,444

The GM must decide on the cost of transportation and the radius of the area from which the urban center can be supplied. To get the total value of agricultural produce available to an urban center, cross-index the transport cost and the radius of the catchment area and multiply by a desired average number of farms per square mile. One farm per square mile works out to about 5 people per square mile, which isn't very much.

These values can (and, in many cases, should) be adjusted for more or less productive farmers. For farmers who are on average richer or poorer, multiply the value of the produce by (average monthly value of marketable produce)/60. For example, if 90% of the farms in a region are Struggling (marketing $60/month) and 10% are Average (marketing $350/month), multiply the amount on the table by 89/60, or, if you're feeling lazy, 1.5.

The chart also presents a mathematically idealized picture which is unlikely to apply in reality. It is a best-case scenario which assumes that farmers are evenly distributed through a circular surrounding area, without variations in production or cost of transport, and send their goods directly to market in the urban center. Obviously, those assumptions won't hold any real case. Goods could easily zigzag around the countryside, and peasants and food merchants met to collect goods at village market days. Variations in the quality of land could mean patches of higher or lower production scattered unevenly around the region, and politics will ensure that the areas cities draw from will be very oddly shaped indeed, and far from the maximum the chart allows. Another very large factor is changes in ease of transport along the way. Unless farmers are very close to a city, they will, if at all possible, transport their goods to the nearest river, canal, or seaport, where they will be shipped to their final destination. This means the cost of transportation can vary wildly across the various legs of a journey. This is a very real issue, since just about every city of any size is on a river, and most very large cities are on or near the sea.

These calculations, then, should be taken as something like the speed of light. You can get arbitrarily close, but the closer you get, the harder it is to get even closer, and you'll never get there entirely. In practice, urban centers will get significantly less than is indicated here. A few rules of thumb can be adopted: The GM should feel free to come up with an approximate catchment area of a size which appears appropriate, ignoring any little bits of territory which stick out beyond the edges of a circle which covers most of the appropriate land (You *could* map out concentric circles and wedges of different levels of wealth and transportation cost in order to get a more accurate picture, but wouldn't you have more fun playing *GURPS?*). Any city with reasonably good access to a river network has an average transportation cost of about 0.5% of goods transported, while a city with reasonable access to a seacoast has a transportation cost of about 0.25% of goods transported. Very good networks of rivers and canals, favorable sea conditions, and high levels of nautical technology can push the cost even lower.

Feeding the City

One of the nigh-universal facts of history, particularly before the 20th century, is that people who live in cities are richer than people who live in the countryside and have a higher standard of living. Cities are the homes of rulers, chief religious officials, merchant princes, and the professional administrators, craftsmen, and bureaucrats who support them. Certainly, every city has its poor, but unlike the countryside where *everyone* is poor, the cities have significant concentrations of rich people who push up the average. That goes double for particularly large cities. Mid-sized towns will have Average and handful of Comfortable craftsmen and a few Wealthy and Very Wealthy clergy and rulers, but major cities will have individuals who are Filthy Rich and beyond.

On the other hand, it's clear that going up the scale of wealth, people spent proportionately less of their income on food, particularly food which could be provided by nearby farmers. High church officials and noblemen in Europe would eat bread made from wheat flour rather than gruel made from barley and millet, and most meat production was destined for their tables, but at a certain point they had to look far beyond in order to meet their needs and preferences: saltwater fish imported from seaports, imported wines, spices from faraway lands, and so on. Small towns, where demands are more likely to be met locally, will have an average cost of living in the $600-800/month range. Large cities, where a larger class of wealthy people will send abroad for their more extravagant requirements, may have an average cost of living twice as high, but local produce will need to supply only $900-1,000/month of that demand.

To get the approximate number of households the city can support, divide the total potential supply of agricultural produce by the average cost of living there. To get the total population, multiply the number of households by the average household size. Since city-dwellers are, on average, wealthier than peasants, they're likely to have larger families. Average household size in a city is probably at least six and may be as high as seven or eight.

In addition to those non-farmers, there can be some farmers still living in town. Indeed, in smaller towns, many residents will make at least some of their living from farming nearby fields. A majority of the residents of TL1 towns, or at least as many of them as can plow surrounding fields, are likely to be farmers, and smaller towns through other TLs often maintain a significant number of farmers. As cities become larger and wealthier, though, the cost of living within the walls tends to crowd farmers out.

City/Town Population Example

The town of Camford draws produce from a 10-mile radius. Most of it comes overland, but a few streams are large enough for barge travel, so the GM decides that transport costs 0.75% per mile. At a density of one farm per square mile and Struggling farmers, that's $28,353 of produce per month. The GM further decides that the area is a bit more densely populated than that, but not much. At three farms per square mile, the total produce the town can bring in is $85,059/month. At a cost of living of $600/month, the town can support about 141 households, or around 850 people at an average household size of six people.

The grand city of Venzepoli, home of wealthy merchant princes, draws produce from a small hinterland and a broad area of coastline. The GM decides that this is equivalent to an area with a 60-mile radius, although the shape doesn't look anything like a circle. It has access to the sea and sits at the end of a large river system, so the GM decides transport costs 0.25% per mile, with a density of 10 farms per square mile (again, all, on average, Struggling). That's $9,669,820 worth of produce per month. At an average cost of living of $900/month, that's 10,744 households, which translates into nearly 65,000 people.

Fractional Wealth

The wealth levels in *GURPS* are fine for putting a character in a general economic ballpark, but may be regarded as a bit coarse-grained for this kind of work. *GURPS* has character wealth increasing by factors of two or three or more, when in reality there's a broad range of levels of income. The GM may also want to allow fractional wealth levels to reflect a fuller spectrum of incomes, as detailed here:

Fractional Wealth and Status

Level	Points	Starting wealth and monthly pay multiplier
Poor	-15	1/5
Struggling -2	-14	1/3
Struggling -1	-12	2/5
Struggling	-10	1/2

Average -2	-8	2/3
Average -1	-4	3/4
Average	0	1
Average +1	4	1 1/3
Average +2	8	1 2/3
Comfortable	10	2
Comfortable +1	14	3
Comfortable +2	17	4
Wealthy	20	5
Wealthy +1	24	10
Wealthy +2	27	15
Very Wealthy	30	20
Very Wealthy +1	54	30
Very Wealthy +2	88	40
Filthy Rich	100	50

replaced by multi-story homes and apartment buildings. If the town becomes particularly wealthy, a new wall might be built encompassing a larger area, and the cycle can start again.

This is useful for dealing with small gradations both among poor peasants and other workers and among more powerful figures. The difference between a count and a baron, for example, might not be a quantum leap in income and direct holdings, but rather a slightly higher income and the allegiance of several lesser noblemen. The count might have an Ally Group, Wealth (Wealthy+1), and a few points in Independent Income where subordinates simply have Wealth (Wealthy).

If a character takes a fractional wealth level, the GM may want to impose a similar fractional Status adjustment: 2 points for Status +1/3, and 4 points for Status +2/3. Each level of fractional Status increases monthly Cost of Living by 1/3 of the amount of the difference between the higher and lower levels of Status. Status +1/3 provides a +1 Reaction bonus to people of the same Status in circumstances where Status would normally apply. Status +2/3 provides a +1 Reaction bonus to people of the same Status or a Status one lower. The difference is too subtle for people with more distant Status to discern.

Pyramid Review

Ghosts of the Lady Grace

Published by [Carnivore Games](#)

Written by Bradford Younie

Edited by Anna Pratt

Art & maps by Alex McVey, Thomas Denmark, & Anna M. Dobritt

48-page b&w softcover; $12.95

If nothing else, Carnivore Games offers consistency from one product to the next, though that's not always a good thing. Their flagship book, ***Now Playing,*** was a quirky look at using the free-form **FUDGE** engine to turn a TV show -- any TV show -- into the setting for your next RPG. The primary setting detailed in that volume is due to have its own book soon, and to whet your appetite they're releasing ***Ghosts of the Lady Grace.***

The campaign in question is the Foundation for Paranormal Investigation, which does just as its name suggests. In this adventure, it owes more to the cable show *[Ghost Hunters](#)* than it does your *X-Files* or your Scoobies and Shaggies.

[SPOILER ALERT!]

In the first episode, the investigators are called to a seaside cottage, the Monroe Inn, to look into reports of ghosts. Supposedly when the ship called the Lady Grace hit the shoals off the coast a century ago, only three survived and were brought to the home for medical attention. Two died and one disappeared without a trace, but all three are said to walk the halls at night. Lately, though, it's as if something has sent the ghosts into fits. No longer are there simply rumors of their influence, everyone is hearing and seeing the spirits throughout the house, and it seems like the FPI might be able to get evidence of some very real occurrences.

The Monroe family isn't done surprising the researchers yet, though; they call on the team a second time. Once more the supernatural activity in the house has been stepped up, and it even seems to be affecting the people living or staying there directly -- with possibly lethal results.

[END SPOILER ALERT]

The back of the book has a brief section on the ghost hunter's tools, tricks, and trappings of the trade, like electronic voice phenomenon, electromagnetic readings, and varieties of haunting. Add to this maps of the Monroe Inn and write-ups of the hotel and NPCs and that's your package.

From a production standpoint, this book is a slim but pleasing supplement. The maps are sharp and clear, and would be useful for more than one adventure (or system, or . . .). The illustrations throughout the book are simple things, but they apply the principle of "less is more." Their stark nature, more outline than picture in some cases, make them effective highlights to a book about supernatural adventure. On the other hand, the cover quickly gets that "peeling plastic" problem.

The bothersome part of the whole enterprise is how easy it is to pare down what you don't need. The maps appear within the text and again at the end of the book, so maybe you get the convenience of those references within the

adventure and not having to eliminate proprietary text when photocopying those materials for your players . . .but really, that's a couple of pages of duplicate work. The "Ghost Hunting 101" section states this information will all be in the forthcoming FPI sourcebook, so unless you desperately need that data right now you'll soon have duplicates of that, too.

The editing is too loose by half. Presumably NPC Henry is nicknamed Harry, but this is never made clear (he's just Henry in his write-up and Harry in the text). Charts are supposed to list certain items with an asterisk and instead use little descriptive conventions. Neither of these really hurts the game, but it does speak to a lack of attention to detail.

And there are good points. The adventures form their own sort of continuity and, used right, make themselves more believable as evolving elements of a larger campaign. The stories have some clever sleights of hand, and the charts and timelines littered throughout give the referee a clear idea of what happens when and where. The first episode is decent, but the second is better and gives the players a mystery (and some obstacles) to puzzle out.

Much like "The Big Dig" from the core rulebook, *Ghosts of the Lady Grace* would probably be more palatable as a PDF at the Carnivore website (not that the asking price for this one would be such a burden). Marketing may have played its part in the decision to issue the book as is, but it might be prudent to wait for the release of the setting book before committing to this kind of add-on.

Pyramid Review

Dungeon Twister

Published by [Asmodeé Editions](#)

Designed by [Christophe Boelinger](#)

Illustrated by Wayne Reynolds & Thierry Masson

Eight 5½-inch square dungeon tiles, two 11-inch starting zones, two player screens, two sets of tokens (eight characters & six objects per player) in two colors (blue & orange), two sets of character stand-ups, 16 plastic stands, two sets of 16 playing cards, open/broken markers, action tracking markers, & 16-page full color rulebook; $29.99

When it comes to dungeon games, the gamer has plenty of choice. There are card games like ***[Dungeoneer](#)*** and ***[Dungeonville,](#)*** classics like ***Dungeon!*** and Games Workshop's ***Dungeon Quest***, and even dungeons with guns, like ***[Doom: The Boardgame](#)*** and really big dungeon games like ***Doom's*** fantasy sister ***Descent.*** The very latest entry into the genre is different from all of the rest. First, it is French, being published by Asmodeé Editions; second, it is designed for two players only; and third, whole areas of the dungeon can rotate! Hence the name, ***Dungeon Twister.***

The setting for the game is Targene, a world dominated by the wealthy, powerful, and influential Arch-Mage. Some three millennia old, his boredom has lead him to build a series of labyrinths known as "Dungeon Twisters." Into these the Arch Mage teleports and pits teams of combatants, who must fight their way out, avoiding traps and learning the layout of the dungeon even as it shifts if they are to win.

Designed for two players aged 11 plus, each participant controls an identical team of eight characters who start at opposite ends of the complex. The control method is Action Point based, the number determined by a player from round to round from a limited hand of cards. Action Points are primarily employed to move, fight, and activate a character's special ability. They can also be spent to reveal a previously hidden dungeon tile and to rotate a dungeon tile. The game is easy to learn, offers plenty of tactical choice, and really can be played within 45 minutes. All that and without the use of any dice.

The game comes decently appointed with the sturdy components done in full color. Each dungeon tile depicts a five-by-five grid of squares, bounded by walls and portcullis, and marked with several pit traps, plus a single rotation gear. This is marked with an arrow, indicating the direction that the tile can be turned. It is also color coded to another tile, which allows a character to use the rotation gear of one room to twist the room it is paired with! Operating the rotation gear opens up and closes off access to other tiles, capturing the feel of a dungeon's moving blocks and secret doors working to both trap and free the characters.

Both players have the same set of tokens that depict items and characters. The former include: speed potion (gives a character an extra 3AP immediately), sword (+1 attack), armor (+1 defense), rope (to get over pit traps), fireball wand (a one-shot device usable by the wizard only that kills another character stone dead), and treasure (carry it out of the dungeon to score extra victory points).

Each character has two statistics -- Speed for movement, and Strength for combat. Most characters have a Strength of 2 and a Speed of 3, but really the stats for any one character are exactly what you would expect them to be. Thus the Troll has a high Strength and low Speed, and the Thief has a high Speed and low Strength.

What really sets the characters apart are their special abilities. Then again, these are also what you would expect them to be. The Cleric heals wounded characters, the Thief de-activates pit traps so that he and others can cross them, the Troll regenerates, and the Wizard can levitate across pit traps and use scrolls. Unfortunately scrolls do not appear in this game, but will in expansions. The first expansion, *Paladins & Dragons,* is already available, which not only adds scrolls, but also other new objects, characters, and tiles. More interesting are the abilities of the Meckanork and Wall Walker characters. The latter can walk through walls to access blocked corridors and rooms, while the former has Craftsmanship. With this, the Mekanork is the master at operating rotation gear, enabling him to turn both the dungeon tile he is on and its partner, in either direction, and not just in the direction of the indicated arrow. Finally there is the humble little Goblin. He has no special ability, but is worth extra victory points for getting him out of the dungeon.

Set up begins by placing the dungeon tiles face down in a two by four grid with a starting line placed at either end. Each player selects four characters out of his eight and puts them on his starting line. The remaining four character tokens, along with the items are placed face down on the eight dungeon tiles. These will be become active when each tile is turned face up.

In addition a player also has a deck of 16 cards. These consist of nine combat cards, three jump cards, and four action cards. The first are used in a fight, the second to let a character to jump over a pit, and the last to determine how many Action Points the player has in any one turn.

On his turn a player selects an action card and spends the points shown. That action card cannot be used again until the others have been used. The other two card types, combat and jump, are discarded after use. Combat cards are used whenever a fight ensues and range in value from +0 to +6. In combat, both sides select a card, and upon revealing it the player adds the value to his character's Strength score. The highest result wounds the other character. A wounded character can still fight but has his Strength reduced to zero. If the character loses another fight, he dies and the victor gains another Victory Point. A Wounded character can be healed by the Cleric to restore his Strength. After the fight, both combat cards are discarded, except for the +0 combat card which can be used again and again. Any unused cards and held objects can be kept hidden by each player's screen, also used as a reference.

A game, which should rarely last more than 45 minutes (and two thirds that time if the players are practised) is won when a player scores five Victory Points, or VP. These are gained for killing opposing characters, and getting characters out of the dungeon, the exit being the opponent's entrance or starting line. An additional VP can be scored if the Goblin escapes or the treasure is carried out. A mixture of the three usually guarantees a win.

Physically, the game is very well presented. The sturdy components all come in strong colors, with the clearly illustrated rulebook making every effort to make both rules and game play easy to understand.

There is almost nothing random about the playing of *Dungeon Twister* and that extends as far as the tile layout within the two by four grid. Everything else is determined by a player -- how many Action Points he has in a turn, how they are spent, and how strong a character is in combat. Essentially this is a matter of resource management for all three card types, but beyond this the player is presented with an array of options in the characters and character abilities. In its way, the game offers up both tactical and strategic choices from one turn to the next. This together serves to make *Dungeon Twister* a tight design that offers plenty of replay value.

Murphy's Rules

Adventures in Reality And Other Dangerous Places

As we returned from picking up the car carrier, my friend Robert commented, "Gee, Nick looks like he's dying."

Some time later we learned that he wasn't. But at the time, as my father-in-law Nick laid on the rent-a-truck's ramp, he looked quite a bit like he was grimacing or pained in some level of discomfort, perhaps because of the extreme heat and exertion of trying to help load the van with the contents of our apartment. We didn't think too much else of this as we attempted to line up the car carrier within the parking spaces of our apartment's lot. But as the maneuvers continued, I realized that a fleeting image captured by my retinas seemed more significant: a dolly full of boxes was lying to the side of the ramp.

My mind started putting the pieces together; I darted out of Robert's truck and headed toward the apartment, noticing Nick was no longer in his prone position on the ramp; as I got near my soon-to-be-former abode, my mother-in-law walked briskly toward me, asking, "Where's the nearest clinic?" Unfortunately, I stammered something utterly incoherent and utterly useless; I use MapQuest to figure out how to get out of a Disneyland teacup, and after two years in my home city I was little more knowledgeable about where most things were than when my own rental truck -- similar to the one being loaded by Nick mere minutes before -- first arrived.

Fortunately my wife came to my rescue, car keys in hand; "I know where to go," she said, her father in tow, and all three left in our car, leaving Robert and I with a quarter-loaded truck and no idea what was happening.

We were left to muddle through as best we could for a few hours; the fear and confusion of what was happening abated somewhat quickly thanks to a cell phone call informing us that Nick was afraid he had broken one of his fingers in a mishap while loading the truck. This revelation merely left the two of us to figure out how to take over the arduous task of truck-loading for the foreseeable future, as we waited for word from . . . well, anyone.

This anecdote is all preamble for my thesis statement: To keep players on their toes and to keep games really interesting, it can be *very* helpful for each player to know things that the others don't, by splitting up that lore among them. For non-RPGs, I've found this to be one of the most interesting aspects of many games; for example, much of the post-hand discussion for card games such as Hearts or Spades is the discussion for what the various players had in their hands: "I had the Ace and Jack of Hearts, so I didn't know if I should play the Jack to try to suss out the 10 or play the Ace and hope to get both the King and the Queen from the other players . . ."

One of the most obvious methods for splitting information up among players is to run different parts for different players. For example, a campaign with four players could have each one engage in a one-hour solo-mini-adventure for their characters, which leads into the larger one. Different elements of the group adventure could have a direct bearing on the other, and each PC would have a potential moment to shine: "Wait; the guard's whistling a tune that I heard this little girl singing yesterday before she pulled a gun on me. I didn't think anything of it 'til now . . ." It can also be used in various other ways, such as giving each player a clue, background, or power that the others don't know about. (In fact, as I typed that previous sentence, I had a vision of a low-powered supers game: What if each PC started play as an escapee from the Three Wishes military project, which gave each member three powers that could only be used once apiece, and *only* if they never told anyone else about them . . . since revealing what you can do would disrupt the wish-tech that makes it possible? Sure, a hero might have the ability to transmute all of a single object to gold, but he can only do it once -- how does he do it, and when? And can he resist the temptation to blab about it with his friends?)

As another random aside, the method of "splitting up" the group also works well in real-world long-term relationships; by both partners having their own interests and activities, the couple ensures having something to talk about when they return.

Anyway, back to our anecdotes. Less than six hours after our drama had originally began the matter had been more or less resolved; Nick had merely dislocated his finger and -- with it in the brace -- he was able to continue helping us move. And this wasn't the only adventure that kept things interesting for the group during the course of this move. For

example, when we picked up the aforementioned rental car carrier, we did so with the intention of using one of our trucks instead of the rental van, only to discover that the brake light hookup was designed solely for the rental truck. This led to some consternation and fear of personal safety (not to mention law-abidingness), until we discovered an interesting loophole -- if one never applies the brakes, one never need be accused of not having brake lights; fortunately, attaching a 1,500-pound car carrier to one's vehicle provides all the stopping power one really needs. And then, when the four of us drove off in three different vehicles, we had some *more* adventures . . .

Groups get together because they can know or do things that others can't. Playing up that aspect can result in more chances for adventure, and more opportunities to learn about other adventures. And with a good enough group, you can even move a household six hundred miles to a new state.

--Steven Marsh

The Omniscient Eye

How Can I Live on the Moon?

What would it take to put a self-sustaining colony on the Moon?
--Rick Rutherford

Self-sustaining: *Able to provide for your own needs without help from others.*

Whether a lunar colony is "self-sustaining" depends on how high a standard you want to hold it to. We'll look at three -- a small outpost not needing outside supplies, an industrial site producing enough to pay for any supplies it needs, and a permanent settlement big enough to keep the human race going by itself.

Outpost

Avoiding regular supply runs to a lunar base is a good thing in any design. Space flight is expensive -- with current systems it would cost about $30,000 per pound to get to the moon. Depending on outside supplies endangers the lives of the occupants if anything interrupts the schedule. The International Space Station faced this problem after the Columbia disaster. A catastrophe at the moon base may also be easier to survive if the resources needed to survive are already on site.

A small outpost doesn't need much to survive. With a reliable power supply and a source of consumables for the crew they can last for years without needing to expand the facility or travel. Solar arrays are the usual first choice for powering near-future space operations, but photovoltaic cells have a limited lifespan. After five years they've already lost 10-15% of their power generation capacity. More stable sources could be a nuclear plant or a solar-dynamic power generator. The latter is a steam turbine, using concentrated sunlight instead of coal to boil the water (or other working fluid). Solar-dynamic is the easiest option to maintain. Only simple plumbing and machinist skills are needed for repairs, without needing to bake silicon chips or work in a high-radiation environment.

The crew of the outpost won't care about the lights being on if they run out of food, water, or oxygen, so the life support system is the next priority. Throwing away used food supplies (to keep this PG rated) makes them dependent on new supplies. To avoid that they have to "close the cycle" for their needs, recycling waste products into new food and fresh air and water. Extensive research has been done on "Closed Ecological Life Support Systems." The most famous was the Biosphere 2 experiment, but experiments have been done as early as the 1960s. The Soviet Bios-3 experiment required about 140 kW of power and 8 square meters of algae tank exposed to light for each occupant and held three men for 180 days.

Biosphere 2 topped that with an eight-person, two-year experiment. This place didn't just try to keep the people alive but build a whole multiple-climate ecology around them with over 3,800 species in a 3.15 acre greenhouse. All eight humans survived but the ecology wasn't sustainable. Three quarters of the vertebrate species went extinct, along with all the pollinating insects. Prolonging the experiment would probably have led to the ecology collapsing

Transportation To the Moon . . .

If you try building a moon base today it'll cost you about $10,000 a pound to get your payload into low Earth orbit. Three-quarters of that will have to be fuel to getting it from there to the Moon if you're using chemical rockets. That makes the delivery charge for a 30-ton base nearly three billion dollars. If you've got something larger in mind it's probably worth your while to invest in a cheaper way to get there first.

Current launch technology is outrageously expensive because the rockets are expendable. Piles of carefully machined hardware are discarded in orbit after a single use. Since you can't give each one a test drive to detect manufacturing flaws you have to obsessively inspect

to a minimal mix of "weed" plants and opportunistic animals. A less ambitious system would be easier to set up and keep stable but would have poor resilience. A disease taking out one species could cripple a simple ecology, but a complex one would have another species available to take over the role. Humans are also happier with a varied diet and a view of trees and birds, so the more species the life support system can support the higher morale will be.

Sufficiently advanced nanotechnology could reprocess wastes with near-perfect efficiency, but that level of technology makes the problem trivial, so let's assume near-future tech. That means turning "fertilizer" into food the old-fashioned way, with plants. Tanks of algae can process wastes while producing oxygen. Fresh water can be filtered out and the excess algae eaten. It's not a complete diet, though. The crew would suffer from vitamin and protein deficiencies, as well as being bored to the point of insanity. To get a complete (vegetarian) diet a garden is needed with a variety of plants. Putting a greenhouse the size of Biosphere 2 on the lunar surface is a lovely image, and would give workers on the surface something to rest their eyes on, but it's not very practical. The two-week lunar night would require full artificial lighting anyway, and trying to keep a transparent room intact from micrometeorites and moonquakes would be very expensive.

The base's garden would be underground, dispersed in several chambers for safety against blowouts, and containing a mix of plants. Sewage would be processed by algae and mechanical mechanisms before being fed to the garden. If the crew wanted meat they could have small animals (rabbits at the largest) in cages, or possibly fish or amphibians in the algae tanks.

Even with efficient recycling the base will lose some materials from leaks and accidents. Oxygen and metals are everywhere on the moon, if you have the facilities to break down the rocks, but volatile elements are scarce. To stretch out its endurance the base would be located near some of the polar ice deposits found by the Clementine probe. These are the remnants of old comet impacts, and have a mix of frozen water, ammonia, and methane which can be added to the life support system. The ice lies in the bottom of craters which are in permanent shadow (the Moon's poles are almost perpendicular to its orbit, so they don't get the long periods of day and night that Earth's do). This also allows an outpost at the poles to get continuous solar power by placing a receiver on a peak which is always [in sunlight](#).

An outpost like this wouldn't be able to do much other than survive. Research scientists would be happy there until they'd finished exploring the nearby area, but wouldn't have fuel to travel to other interesting areas. Establishing one would probably come from national pride, either to demonstrate technological prowess or to prevent another nation from claiming exclusive rights to the moon. Few colonists would be willing to live on such a narrow margin, but religiously or ideologically motivated ones might take the chance that something will come along before they hit the limit of their endurance.

Industry

Another way for a moon base to be self-sustaining is to produce enough valuable goods to be able to pay for the supplies it needs. There's been plenty of speculation on potential exports from the Moon. If one of them is practical

them for any problems, adding more millions to the price of each flight (and you still lose over 1% of your payloads). The Space Shuttle reuses some of its hardware, but makes up for by adding even more inspections and maintenance. That makes it the most expensive way to get to space (losing 1.7% of the flights) at about $26,000 a pound (though the price charged for delivering a payload may be as low as zero, depending on how the accounting is done).

There's numerous concepts for reducing the cost of getting to orbit. The most popular is a Reusable Launch Vehicle (RLV). This would be a rocket built according to the Space Shuttle's original goal, taking off and landing in one piece so it can fly again as soon as it's refueled. This reduces costs by using the same hardware repeatedly and improves reliability by testing the vehicle before putting a payload on it. This can bring the cost to LEO down to $100/lb for each flight. The price to the customer will be dominated by the need to pay off the cost of building the system. A new RLV will need several times the number of payloads being launched now to cover its up-front costs. The likelihood of such customers appearing when launch costs are lower is hotly debated among RLV advocates. The initial cost would be $2-10 billion depending on the size and type of the RLV.

Bigger cost reductions would require giving up on rocket engines. Lasers, cannons, and catapults have been proposed to provide an initial boost, but rockets would still be needed to

the base can pay back its construction costs and still make enough profit to import what it needs.

LOX: The Moon's surface is mostly oxides made of magnesium, silicon, iron, and other metals, with oxygen forming over 40% of the mass of the crust. With enough energy the rocks can be broken down into their component metal and oxygen. Oxygen is the majority of the propellant mass used by rockets. The Moon could supply the oxygen for orbital maneuvers and cut the amount of mass that has to be brought up from Earth. An interplanetary expedition could get half or more of its initial mass from lunar oxygen. This assumes a reasonably cheap way of delivering tanks of LOX -- see the sidebar on transportation.

Metals: As the complement to LOX production the base can refine iron, aluminum, titanium, and other metals. This could be exported as raw stock or formed into parts. LOX tanks would certainly be made on site. New orbital facilities can have their structures built on the Moon or expand them with parts shipped down. You can increase the complexity of the products until you've moved into:

Manufacturing: Just exporting raw materials will probably require enough tools to build rocket engines and propellant tanks. Expanding that into more complex structures and machines only requires a marginal increase in the factory capability. This can be installed incrementally as the demand increases, instead of having to make a major capital investment up front. Manufacturing is a very good specialty for a self-sufficient base -- anything it can make it doesn't have to import.

Solar Power: Cities on Earth can be powered by vast arrays of solar cells beaming electricity down to them from space. There's two main versions of the concept out there. The first is SPS (Solar Power Satellites), a set of 50 square kilometer satellites in geostationary orbit (GEO) that send power down to a receiving antenna on Earth. SPSs would be assembled in orbit from parts manufactured on the Moon.

The alternative is a Lunar Power System (LPS). This puts the solar arrays on the Moon's surface. If the arrays can't fit on a site with continuous sunlight they'll have to be duplicated on the other side of the so one will always be on the day side. The power would be beamed directly to Earth or to a relay satellite in Earth orbit. The transmission is more difficult than from GEO because of both the distance and the geometry (it's hard to maintain a connection with a receiver which is rotating out of sight).

Which option (SPS/LPS) is better depends on whether the transportation costs of getting the SPS material to GEO outweighs the cost of doubling the arrays and handling the transmission difficulties. A lunar base would be better sustained by LPS. Once the SPSs are built the demand for lunar manufacturing could collapse, while an LPS will still need the base to support maintenance and operations.

Helium-3: Fusion power researchers theorize that using He3 may allow safer power production than more common deuterium, since the helium isotope emits 99% fewer neutrons in the reaction. The Sun emits He3 as part of the solar wind. The lunar regolith (the thick layer of dust and power the Moon has in

go from low Earth orbit to the Moon. A space elevator can carry a payload into orbit and drop it into a trajectory which takes it to the Moon, only needing its own power for landing. A space elevator (aka skyhook or beanstalk) is a cable running from the Earth's equator to a counterweight past geosynchronous orbit, held in tension by centrifugal force. At about 28,000 miles altitude an object released from the elevator will be flung to lunar orbit or beyond. All that it takes to get it up there is the electricity to run the elevator. That could go as low as $10 a pound. That doesn't cover the cost of building the elevator. Current proposals range from $6-40 billion, but the key structural technology (kilometer-long carbon nanotubes) doesn't exist yet, and historical experience shows a zero or two may be added to those costs.

If you can't wait for new technology to be developed, or to put up your moon base a piece at a time with conventional rockets, there's one more option. An "Orion Drive" spaceship uses atomic bombs for propulsion. Put an A-bomb under your (very sturdy) spacecraft, set it off, and watch the ship go up. With a mechanism to keep flinging bombs under the ship you have a very high-thrust, high-efficiency space drive. Orion can scale up to handle thousands of tons of payload in a single flight, for a fuel cost of less than a dollar per pound. Though if you're building an Orion, you're probably not worried about costs as much as the war or imminent disaster

place of soil) traps the He3 particles in an easily-released bond. Extracting it would involve large crawler vehicles scooping up regolith, heating it to release He3 and other trapped volatiles, condensing out the gases, and dropping the regolith back on the ground. This gets repeated until the mining area looks like a plowed field. The collected He3 is gathered from each crawler and then rocketed back to Earth as a very small package.

The problem with this vision is the feasibility of fusion for power production is unproven. The field has been worse at meeting its predictions than almost any other. Even if a working fusion method is found it may not use He3. So this may not be a good bet for a lunar base's main income.

Antimatter: Another compact energy storage material is antimatter. It's the densest possible fuel which makes it very appealing to spacecraft and other mass-limited applications. Manufacturing it could be a very hazardous activity -- any mishandling of the antimatter would bring it into contact with regular matter with an instant explosion. That's the sort of activity that gets put a long way from residential neighborhoods. A lunar antimatter factory would confine the danger to its staff. This function probably wouldn't mix well with other lunar base functions. If a large base was already in place the antimatter production facility would probably be placed far away . . . and probably on the other side of a mountain range. (GMs including this possibility in their games should resist the temptation to leave the *Space: 1999* DVDs out where the players can see them.)

Research Facilities: A lunar base can host research which needs to be kept away from residential areas. Some are too hazardous to perform on Earth. Biological engineering and self-replicating nanotechnology could produce plagues that wipe out nearby areas. Isolating that type of research on the Moon can assure safety. Other projects may be low-risk but placed on the Moon to avoid protestors who don't trust that assessment. The far side of the moon is an ideal site for astronomers, who need to avoid interference from Earth's swarming bright lights and radio transmitters.

Tourism: Space tourism is currently the most promising path for expanding into space. Once cruises around the planet and orbital hotels become routine tourists will look for more interesting destinations. The Moon has three attractions for tourists -- historical sites such as the Apollo landings, scenic vistas in the mountains, and low-gravity activities (such as new forms of flying, dancing, and swimming that aren't practical on Earth or in free-fall). A lunar amusement park would also draw visitors from orbital facilities who want a cheaper (or less stressful) vacation than going back to Earth.

Colony

A truly self-sustaining moon base is one that can continue to survive even if Earth went away. Roger MacBride Allen wrote a novel with just that premise *(Ring of Charon)* and tracked the struggles of the off-planet colonists to survive. *Space: 1999* sent the Moon on an interstellar journey by itself. *Fallen Angels* showed off-planet settlers cut off by political opponents. The likeliest cause of losing contact with Earth is war, either ruining the Earth or blockading the Moon. A lunar colony may cut its own ties in a revolution -- its level of self-sufficiency will constrain the decision to attempt a revolt. For long-term survival the colony will need an adequate population, the ability to manufacture essential equipment, and the means to access new sources of raw materials.

which forced you into using this noisy, dirty option.

. . . And Back Again

The economic benefit of producing things on the Moon is lost if you have to bring propellant all the way from Earth to deliver it. The polar ice deposits could be electrolyzed to generate hydrogen fuel but that might be a wasteful use of a scarce resource. The classic solution is to use an electromagnetic catapult, flinging payloads to their destination. Unless they're going straight to Earth or some other destination that can catch them as they fly by a guidance system and rocket engine will still be needed to maneuver the payload into a rendezvous with the destination. If only a small impulse is needed a "cold gas" rocket can be used, venting oxygen gas through a nozzle. Inefficient, but easy and cheap. If high performance is needed the oxygen can be burned with hydrogen from the polar ice or fuel imported from Earth. A middle option using only lunar resources is to burn aluminum powder. Mixing powder with a gas makes for a difficult engineering problem -- an Al-O2 rocket may have to operate in pulses, giving the payload a rough ride. It can also be rough on destinations since the exhaust is pure superheated oxygen mixed with abrasive particles. But it doesn't require imports.

Experiments with pigs have demonstrated that to avoid dangerous inbreeding an isolated population needs at least 250 individuals. That assumes a gender-balanced group of healthy people. Hazardous jobs in harsh environments tend to have a predominately male population. One of those hazards is radiation exposure, which can leave a victim fit for work but unable to produce healthy children. Unless lunar society has a completely different structure, as in Heinlein's *The Moon Is a Harsh Mistress,* only couples with both members fertile will count toward the sustainable population. The population may have to have over 1,000 people to be sustainable. One close to the minimum may have to put restrictions on potential parents restricting them from hazardous duties even if that causes social tension.

The manufacturing base doesn't need to make everything but it does have to replace all essential parts. The colony may have to operate at a lower tech level for an extended period if it can't support all of its modern equipment. Basic life support could be maintained using technology from the 1930s or 1940s if the base has been designed for it (for example, centered on a solar-dynamic power plant with manual backup controls). If the base depends on a fusion reactor for power then obviously it would need that technology base to survive. A government wanting to keep control of its lunar colony may prohibit importing equipment to build key components.

Even if the colony is founded on top of a major resource such as a polar ice deposit, it will need to import more material. Producing electronics will require small amounts of boron, arsenic, and other elements. More trace elements may be needed for vitamins and other life support needs. Finding the non-volatile materials will require prospecting trips to locate sources. Given the amounts needed the prospectors can bring home their finds rather than having a mining crew come out to collect tons of material. The prospectors will probably concentrate on the asteroids for metals and other minerals -- their low gravity will make it easier to visit multiple sites.

Volatiles -- water and other materials for organics -- are needed in larger quantities. The atmosphere and water supply have to make up losses from leaks and expand to match a growing population. There's a variety of sources elsewhere in the solar system. Many asteroids are carbonaceous chondrites, with significant amounts of water, carbon, and nitrogen. Comets are mostly ice (water, methane, and carbon dioxide). The Jovian moons allow large-scale extraction facilities. Or the lunar colonists can range farther. Literary examples range from Saturn's rings (Asimov's "The Martian Way") to dipping into Earth's atmosphere *(Fallen Angels).*

The fuel to reach a source would matter more than the distance. A well-timed asteroid or comet could be easier to get to than Earth. An expedition might be launched years before the supplies are needed just to take advantage of some favorable geometry. Since most volatiles also double as rocket fuel, an expedition would have an easier time sending home full loads of material.

Conclusion

So, what would it take? That depends on how self-sustaining you want to be. A minimal base with a good greenhouse could still let you live there for most of your life before something broke down. If you want to have a secure existence -- and even let your colony grow -- you'll need a large enough population and the industry to find and build whatever it needs. The good news is you can add to your base gradually until you have enough infrastructure. All you have to do is get someone to pay for it.

Sherpa, subtitled "A Role-Playing Game for Outdoor Use," never got a review in *Pyramid,* though it was mentioned twice (once in 1997, when the "pre-first edition" debuted on the web, and then again in 1999 when the first print edition appeared, though the then-editor misattributed the publisher). This is a shame, since *Sherpa* is cute, light, and fun, much like the marshmallows you'd expect to scorch on a camp-out. (Please don't roast a copy of *Sherpa* on a stick. It won't end well.)

Before we strike out for the wilderness, remember that 1992 to 1995 was the prime development period for *Fudge,* when author Steffan O'Sullivan conducted an experiment in game design and development via public newsgroups and mailing lists. With *Fudge* behind him, O'Sullivan turned to the problem of roleplaying outdoors. And if you like the outdoors and want to roleplay outside without resorting to LARPing, it *is* a problem: character sheets blow away, pencils break, rulebooks are just too heavy to schlep around the countryside, and if you can find a reasonably flat place to roll a die it will probably drop into something-or-other's burrow. How do you address these problems?

Problem 1: character sheets blow away. Solution: reduce the character information to what can fit comfortably on a typical business card. *Sherpa* characters have six attributes, a gift (or two) and a fault (or two). Of the attributes, Profession is the most important: it encompasses everything related to your working way of life. The other five attributes (Experience, Reason, Agility, Strength, Health) fill in gaps for traits outside your "class". Attributes start at 4; additional points are given for customization based on the story potential of the character (from "ordinary folks" to "true heroes"). Gifts and faults flesh out the character's abilities with non-quantifiable traits. They don't cost points or give points, they just add flavor (although a supernormal gift like psi or magic might be linked to an attribute and so make that attribute more expensive to customize).

Problem 2: Writing is inconvenient. Well, you have to write down the character sheet on your little card, there's no way around that. But once that's done, it's done. The other transactions are reckoned in points or tokens: either luck (letting the player push game events in his favor) or wounds. The author suggests "poker chips, colored stones, checkers, bingo chits, emeralds . . .", but plastic mini-poker chips or gaming stones (perhaps clear for luck and red for wounds) would be nigh-ideal choices: easy to tell apart, convenient to carry, simple to pass back and forth on the trail, and no financial burden if lost. (We suspect the author's suggestion of emeralds might have been facetious.)

Problem 3: Rulebooks are heavy. Solution: Confine the essential rules to fit on a 3" x 5" index card. First rule: Both GM and player must be descriptive. The GM assigns modifiers to the character's trait, both for the difficulty of the situation and for how the player handles the scene. In most cases the resolution of the situation becomes obvious. In borderline cases, the player can spend luck tokens to clinch the matter. But some gamers really like their element of chance. On to the next problem.

Problem 4: dice like "smooth" and "flat" . . . both rare conditions in nature. Solution: Use a digital stopwatch, either the real sports kind that Coach used to keep on a lanyard around his thick neck or the kind hidden in most wristwatches these days. It needs to count in tenths or hundredths of a second. The gamemaster lets this run continuously through the game. When a random number is called for, the GM *without looking* stops the watch and consults the usually-racing right-most digit. This becomes the "roll," a 0-9 result. Count that 0 as a 10, please, and

restart the watch so it's ready for the next event.

Back to problem 3, then. For an "unopposed" task, compare the "roll" to the modified attribute. If the attribute is greater than or equal to the roll, the task succeeds. A "roll" of 10 always fails. For "opposed" tasks, add the "roll" to the modified attribute; the opposition does the same; and the highest total wins. Thus endeth the rules. They are, really, simple enough to memorize easily and so dispense with the reference card. With the adventure notes also jotted on index cards, though, one card more or less won't matter.

Play in *Sherpa* is necessarily rather freeform. Combat and damage are handled in a mostly descriptive manner, with the GM reckoning the quality of the attack (as reflected in the roll-modified attribute), the quality of the defenses (armor, etc.) and the natural lethality of the weapon. This all gets boiled down to how many wound points/tokens to hand out. While suggestions for character improvement are offered, *Sherpa* isn't really meant for long-term play. "Think of it as a mini game convention in the park or the wild!" encourages the author.

The original incarnation of *Sherpa* was as a web document, and that game is still available at http://www.panix.com/~sos/ rpg/s2.html. But the game has grown (a little), into a tidy 28-page booklet that, problem 2 aside, you wouldn't feel bad about slipping into your pack or hiding in your bedroll. The print version contains more example characters, several sample gifts, a few variant rules (for handling fighting multiple foes, for instance, or party gifts and faults), a few monsters, ample play examples, and an index that would put many larger books to shame. The layout is pleasantly basic, and there's no interior art, but for 28 small pages you likely won't mind. It's also entertainingly written, no surprise from this author but an increasingly rare gift in any medium.

The self-published, self-designed, paradigm-fracturing roleplaying game is all the rage these days. Maybe it's not wildly unconventional, but *Sherpa* was out at the frontier of this realm well before the cool kids got there. And copies are still available directly from the publisher. (Ordering instructions can be found at http://www.panix.com/~sos/rpg/sherpa.html.) For the price of a single admission (and shipping the cost of a small drink) at the movie house, you can instead have a complete roleplaying game which you can play while walking the dogs, camping out, or hiding in the back row of the movie house. *Sherpa* encourages you to get out of that beanbag chair and go play outside, in more ways than one. Remember to take only pictures and leave only hit points.

--Bob Portnell

The Omniscient Eye

What's Required to Make Porcelain?

This came up in game today. We were on the trail of orcs who'd raided a lumber camp and had carried off a family of a trapper who lived further up the trail.

We caught up to the orcs, dealt them and rescued the still living captives. The GM descibed the loot they'd taken from this family's household.

He included *porcelain* plates and cups. I pointed out that medieval pocelain prices were higher than gold, but he said something about it not being that hard to mix clay paint it and fire it up.

Now I know a bit of the history of European attempts to discover the secret of Asian porcelain. My source described a lifetime's effort of a northern Italian potter in the late Renaissance era succeeded in firing a hard clear glaze which kind of sort of passed as porcelain except for breakability, absence of tanslucence, and so on.

And of the 1709 success of Bottger in making "red" pocelain, as well as his eventual experment with wig powder that produced a white pocelain and of Josiah Wedgewood's eventual development of Bone China.

In short, I don't buy my GM's claim for a nanosecond.

But just to settle things, the Chinese *did* have the right materials in the right place and produced it circa 900, so it's not impossible that it could be found in a 1200-ish setting. How likely is it that porcelain tech could be developed in a medieval setting and be available to peasants living waaaaaaaaay out in the boonies?
     --S.D. Anderson

Not hard to mix the clays and fire them up? Your GM would be well advised to pull the other one, which has bells on it.

Ceramics are an archaeologist's best friend. If you take wet clay, form it into whatever shape you desire, and heat it to a high enough temperature (as low as 700°C), a chemical change takes place. The clay fuses into a very stable form. So stable, in fact, it can withstand just about anything thousands of years of lying in the dirt can throw at it. The vessel may break, of course, but the pieces retain their shape and chemical composition, allowing archaeologists to come by hundreds or thousands of years later to examine how they were made, how they were decorated, what the original vessel might have held, and so on.

Once people start making ceramics, which they inevitably do as soon as they settle down and stop being hunter-gatherers, they do so in large quantities. It's clear that hunter-gatherers could have made ceramics. Indeed, sometimes they did, in the form of terra cotta figurines. The drawbacks of ceramic vessels, though, are that they are both heavy and brittle, so they're no good for nomads. But if you aren't going anywhere for a while, all you really need to make pottery are dirt from which clay can be refined and fires capable of reaching the right temperatures. It's cheap, easy, and very useful for storage.

But pottery isn't *just* clay. Pure clay can crack or deform when fired, so other materials, sometimes called sizing, are added. Often, the mixture is bits of crushed, already-fired pottery or simply sand, but other materials can be used for special purposes. Bricks, for example, are sometimes made by mixing straw into the clay, which lightens the mixture

significantly.

Ignoring purely decorative features like stamping or incising designs into the surface, a piece of pottery might also be surfaced with a number of substances. Vessels might be painted, treated with a slip (that is, coated with a liquid mixture of pure clay and water, giving it a smoother surface), or coated with a glaze, a substance which will give the vessel a glassy surface. Glazes do not themselves turn to glass. At least, they don't contain all the elements necessary to become glass. Rather, they contain substances such as lead, potassium, and sodium, which lower the melting point of silica. A coating of a glaze, which may be a powder or a liquid brushed on, causes the silica in the surface of the clay to *vitrify* (that is, become glassy) at relatively low temperatures. The same substances are mixed with silica-rich sand to produce glass, but that's a separate bit of technology. And, yes, lead-based glazes can be toxic in the long term.

All of these things and more are extremely useful to scholars, since, in any given place and time, only a limited set of the vast range of possible materials, techniques, and decorative styles is used. The thickness of a vessel's walls, marks of manufacture, decorative materials, decorative styles, and the like can be used to tell when it was made (down to a range of a decade or two in some cases) and by whom. Since pottery can retain fingerprint impressions, it's sometimes even possible to identify individual potters, though by the sheer volume of pottery produced and the chance of a piece with any given fingerprint surviving, that rarely happens.

There are many, many ways of categorizing ceramics, but probably the most useful one for our purposes is to start with a distinction between earthenware and stoneware. Earthenware ceramics are low-fired, heated from 700°C up to about 1200°C. 700°C is hotter than an ordinary open wood fire, but it's not a difficult temperature to achieve under controlled circumstances, so it's well within the reach of people in the Neolithic or even earlier. Earthenware pottery by itself is porous and so not ideal for storing liquids, though it can serve in the short term. It can also be treated with glazes to give the vessel a waterproof coating.

When ceramics are heated beyond 1200°C, the entire body vitrifies. The silica components of the clay fuses into a glassy structure. These are stonewares. Stonewares are inherently far more waterproof than earthenwares, so they hold liquids well without needing a glaze, though historically stonewares were usually glazed anyway. They do still absorb water, but not nearly as much. Stonewares are technologically more difficult to make, requiring more exactingly mixed clays and higher temperatures. The temperatures themselves aren't too difficult to reach. The ability to reach temperatures sufficient for stoneware is necessary for iron smelting as well, so the right temperatures become available at the beginning of a culture's iron age. However, furnaces capable of producing temperatures that high require more expensive fuel (charcoal instead of wood) and specialized furnaces, well beyond what the average village blacksmith is likely to use.

Moreover, raw temperature isn't enough. Archaeologists have found remains of pots made at very high temperatures before the development of appropriate admixtures and temperature control. Such vessels melt and collapse when fired. It turns out that the sizing in conventional earthenwares don't hold up to the high temperatures necessary to produce stonewares, and getting the right kinds of clays and additives to withstand those temperatures is harder than it might seem, even if you know that you can get a superior product out of a higher-fired ceramic, which is far from obvious. Europe didn't start producing stoneware until the late 1200s, even though they'd had furnaces producing sufficient temperatures for over two millennia.

So where does porcelain come into this? Although it usually ends up in a category of its own, porcelain is, by these definitions, a particular kind of stoneware, a high-fired, vitrified ceramic with a uniquely translucent fabric. It gets its particularly fine qualities from its slightly unusual raw material. Porcelain is composed mostly of kaolinite, a clay derived from weathered feldspar. Kaolinite isn't the most common of clays, but it's not vanishingly rare, either; it can be found on every continent, though not in every country. It's usually white, but can be yellow, or red, depending on the presence of other minerals. To achieve the particularly fine texture and translucent quality of porcelain, potters needed to develop a very specialized set of admixtures. Unlike regular pottery, where ground-up old pots could be used as sizing (since the pot was going to be opaque anyway), porcelain has more exacting demands, requiring less common and more expensive materials such as alabaster, ground glass, and ground quartz. On top of it all, kaolinite clay is harder to work than many other clays, since it is very sensitive to both over-wetting and drying out.

So, then: Porcelain requires high temperatures, special clays which may not be available in all areas, specially formulated additives, and more work than other pottery, but it does produce pottery with a very fine fabric which will be in high demand. Each of these factors throws an additional level of improbability into the equation. Could a bunch of peasants find and use a kaolinite-rich clay? Sure, although they might lean towards using less fussy clays with less kaolinite, if such clays are easily available. It's also possible, but extremely unlikely, that they could stumble over just the right combination of materials necessary to produce a kaolinite-based fabric capable of withstanding high temperatures and producing porcelain, though they might not know it right away. It's certainly far from obvious what materials go into porcelain and what proportions to use, but it's not a great leap of logic, particularly to a mind which grew up on alchemical thinking, that adding white and glassy materials like alabaster and quartz to a white clay like kaolin is a step in the right direction towards producing a white, glassy ceramic.

But even if all that comes to pass, the expensive and specialized nature of high-temperature furnaces remains a very large stumbling block. A potter won't get the necessary temperatures unless he makes a determined effort to reach them. Being part-time potters at best, rural potters won't waste their time trying to work with the difficult, expensive furnaces required to fire porcelain to the appropriate temperatures. Archaeological evidence bears this out. Pottery found on poor, rural archaeological sites is notably rough and ugly, low-fired earthenware designed for utility rather than appearance. Even glazes and other waterproofing measures, at least theoretically available from the Bronze Age on, are relatively uncommon in peasant-made pottery. Shiny, high-fired ceramics were made by urban professionals (so were swords, by the way; a blacksmith in a tiny village who can make dragon-slaying swords is about as mythical as the dragons themselves). They had to be, since only wealthy urbanites could afford their expensive, highly decorated wares. When Europe finally cracked the porcelain question, the work was done by professional artisans, who had access to a wide range of clays and minerals, not just what happened to be available locally, and who had the time and money to experiment with various mixtures of materials and firing procedures. Could a lone, stubborn peasant be extremely lucky with local clays and extremely persistent with furnace designs, eventually making (much to his surprise) porcelain? It's not physically impossible, but only just.

But let's say that the peasants did somehow stumble over the secrets of manufacturing porcelain, of which there are a great many. Perhaps the culture hero Chinashoppius brought a secret formulation of clay back from the underworld and the villagers have special dowsing rods which find kaolinite deposits and a tame salamander producing super-hot temperatures. In that very unlikely set of circumstances, potters from the nearest town would move in and start making money quickly. Or, perhaps, the people who discovered the secret would move to the nearest town to practice their new art to the same effect. One could quibble about whether or not the value of porcelain in Medieval Europe was higher than gold, but it's clear that even in societies where porcelain was widely available, it was the Wedgwood and Waterford of the age, whereas peasants used the equivalent of plates bought at Wal-Mart and novelty cups from McDonalds. This was doubly the case in Medieval Europe, where all the porcelain had to be shipped in from the far east. It would be simply a matter of time until word got out of a little town where the peasants made pottery of unparalleled fineness, and in short order it region would become a notable center of pottery manufacture.

But rather than just telling your GM that he's wrong, which he most certainly is, let's help him out. If the setting *is* Medieval Europe, there's not much you can do to justify a mere peasant, or anyone else for that matter, having a locally produced set of porcelain dishes. There's simply no precedent for the technology at the time and little realistic chance of it arising unnoticed in a remote village. We can, at least, give it a somewhat more plausible backstory. Maybe the dishes were the prized possession of a nobleman, brought from the Far East by dhow and camel, then traded along to Europe by an adventurous merchant or carried back by a returning Crusader until they ended up in someone's stronghold. At that point, we can appeal to warfare. The most recent owner of the dishes, a soldier in his younger days, was lucky enough to be one of the first to the loot during a particularly successful battle and managed to spirit the expensive dishes away to his hut where they remain his most valuable property. Still fairly unlikely, certainly, but not quite as bad as a remote village independently inventing such a valuable substance.

On the other hand, if the setting is a fantasy world which *closely resembles* Medieval Europe, the GM has more room to maneuver. After all, the Chinese invented porcelain by, at the very latest, the 9th century, and there are those who argue, depending on the definition of porcelain, that they did it as early as the 3rd (there's a distinction between "soft" low-fired kaolinite ceramics, which are opaque, and "hard," translucent, vitrified porcelains which we recognize as particularly fine pottery). When the Europeans repeated the invention, they did so after a long process of trial and

error, not because of other recent inventions and supporting technological breakthroughs. This is one of those developments where it isn't the big technological idea which makes a difference so much as the fiddly little details. This could simply be a place which looks a lot like Europe but where all the right elements came together to give them porcelain far earlier than happened in our history. It doesn't make a huge difference in related technologies, so about the only effect that would have is to make porcelain available and relatively inexpensive, though the relative rarity of the raw materials, difficulty of working the clay, and other costs would still make it significantly more expensive than regular peasant pottery. However, rather than originating in a tiny village in the middle of nowhere, the dishes would still have originated in the workshops of urban craftsmen.

--Matt Riggsby

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Everything to Everyone

Omniman and the Supers Continuum
(with stats for *Tri-Stat dX*)

by Brian Rogers

"One of the things that interests me most about genre is that it's impossible to define. It's a circular set of definitions: a genre is defined by the conventions established by the set of works that belong to it, but a work is defined to belonging to a genre based on its use of those conventions"
--Paul Mason, *Fluxus #50*

Observations on the superhero genre:

1. it sets the definitions wide, accepting anything where people have super-powers and/or wear costumes;
2. it lacks accepted labels for sub-genres such as those found in Fantasy or Science Fiction.

This leads to problems when you're designing a superhero game. You can think your players are with you for your *X-Men*-inspired game, only to find that two have internalized the massive government conspiracy, one is looking for youngsters learning to use their powers under their FBI-backed mentor, one wants to visit savage lands and alien worlds, one is prepped for the mutant vs. mutant war and no one is on board with your heroic soap-opera. Oh, and one of the government conspiracy players expects lethal fights, while the other is all for the no-one-dies four-color style. In short no one is satisfied, despite all liking the *X-Men* idea.

A campaign prospectus is a good way to mitigate this, but another thing that helps is having a way to discuss the sub-genres of superheroes, and how those relate to things that aren't other super heroes.

The Supers Continuum

Super-hero stories can be charted on a graph where the X axis scales from Adventure to Wonderment, and the Y axis runs from Fantasy to Realism. Placing the types of stories you want to tell on that graph will tell your players the game's thematic center, and improve the chances that you'll all really be in the same book.

Adventure

Adventure comics use conflict, generally combat, to drive the story. Puzzles, either criminal mysteries or tactical problems, are interspersed between the fight scenes, but it's possible to have an adventure game that is all fighting, where the heroes just wait for their crime computer to tell them where the latest robbery is taking place. Likewise the game could be 90% mysteries, with the heroes tracking down and outwitting a conspiracy Mission Impossible style, but the driving force remains a conflict.

Adventure stories are plotted like *Feng Shui* adventures -- a series of conflicts bridged together by relatively simple investigations. Thematically adventure stories parallel *Dungeons & Dragons* dungeon crawls: opposition set to be challenging but not overwhelming, hoards of ork/mooks to fight through before reaching the main villain, and often freedom of movement in a limited area (the villain's base). Add in heroes learning new power stunts every few adventures and you have a clean level-up process. Avid *d20 System* gamers will have little problem translating virgin-stealing dragons and their kobold followers the into an army of snake-themed thugs in the thrall of "The Hydroid" kidnapping the mayor's daughter. They might want to leave fewer corpses behind them, of course . . .

The majority of comic books fall on the adventure side of the graph, with costumed vigilantes interrupting or tracking

down criminals to give them a sound thrashing in the name of justice, or super-humans fighting off alien fleets or stopping natural disasters.

Wonder

Wonderment comics use discovery and exploration as story motivators and the puzzles are scientific or social. Fights, if they happen at all, are short and conclusive ("this conflict is pointless, but we must be careful not to kill any of them!"), interrupted ("Halt, my loyal guards, so these strangers can identify themselves to the high priest of Nova Maya!"), or glossed over ("For several minutes the RoMayans energy spears faced off against our heroes' radiation-spawned powers . . ."). The stories can be one shots smoothing relations with crocodile worshipers under Manhattan or multi-part explorations of the Fractal Zone, but the focus is on finding the sorts of strange new things that exist in a world already willing to accept superhuman powers.

Wonderment games are similar to culture & exploration games, such as *[Star Trek,](#)* with its emphasis on the stories being moral space opera (as opposed to *[Prime Directive,](#)* which is the Adventure version of *Star Trek*) or mythic games like *Everway.* Gamers who lean to space opera or fairy tales will understand super-explorers who find Greek cities on Venus or subterranean dinosaur herders, and super-powers are similar to magical gifts or hyper-tech.

Wonder comics are more rare, and that makes them stand out: the *Fantastic Four* and *Tom Strong* are quintessential imaginauts, but *Astro City's* revelations of life inside a supers world, *Promethea's* spiritual voyage or *Planetary's* archaeology of the 20th century are equally focused on the wondrous and strange.

Fantastic

On the other axis, Fantastic stories focus on the super nature of being super-human. Conflict is non-lethal (unless someone makes *a sacrifice*) and power use tends toward the creative and over the top. Heroes often have magical powers, and even "scientific" heroes have just a nodding acquaintance with actual science. The good/evil conflict is clear cut, and philosophical issues work around either the interplay between anthropomorphicly embodied cosmic forces, the place of humans in the universe and the assistance of either individual people or whole alien worlds.

It's easy to equate Fantastic games with comedy RPGs, and people drawn to *Toon* or *Ghostbusters* will likely enjoy a whimsical fantasy game. However, people interested in *Nobilis* or *Amber* could fit into fantastic supers games once they accepted cosmic forces wearing skintight uniforms.

Fantastic stories run the gamut from whimsical, with Otto Binder and CC Beck's Captain Marvel, Marvel family, and Talking Tawney fighting the Seven Deadly Sins; to cosmic, with Jim Starlin's Adam Warlock dying as a pawn in the battle between life, death, order, and chaos.

Realistic

Realistic games focus on the human aspect of super-human. Conflict can be lethal, so heroes usually pull their punches. Powers tend toward the scientific, and scientific theories are the guidelines for creative power use. The world has increasing shades of gray, and the philosophical issues center on the nature of law, justice and the place of superhumans in society -- is vigilantism legal? Can I risk having loved ones? What do you do when the courts don't work? While we have the power to overthrow a tyrant (conquer the world, stop environmentally dangerous corporations, etc.), do we have the authority? Am I even still human?

Realistic games are best compared to the darker games on the market -- *Cyberpunk, Shadowrun,* or the *World of Darkness* -- and anyone who enjoys those will quickly acclimate to a realistic supers setting. Once past a certain point you're no longer in a Supers story -- it's a [noir](#) game with super-powers (just as past a certain point it's not supers but high-powered epic fantasy).

Realistic stories range from Frank Miller's runs on *Batman* and *Daredevil* (produced because no one would publish the

crime comics he wanted to write) where the heroes are hard boiled and the opponents are criminals rather than super-villains; to Alan Moore's *Miracleman/Marvelman,* where the superhumans end up ruling the world, or Warren Ellis' *Authority,* where they simply stand above it, as the ultimate aspect of their superhuman responsibility. Many runs of various Spider-Man titles are realistic, with the character's emphasis on responsibility of power, but he tends to his most realistic when facing real-world problems such the flood of cheap handguns or drugs.

Tracking the Tropes For Your Troupe

Many of the classic comics tropes like secret identities, sidekicks and romance and so on thrive towards the center and die at the ends of the chart. In a pure fantasy game the hero is not likely to need a secret identity; in a pure realism game he couldn't maintain one. In a pure adventure game things like romantic entanglements are functionally sidelined in the focus on the conflict, while in pure wonder games the returning cast is limited to the PCs and romances end when the heroes move on. Purely fantastic sidekicks are equal partners, purely realistic sidekicks are child mortality statistics.

This makes sense, because the closer you are to the center of the graph, the closer you are to the general concept of what a comic book super *is.* Everyone casually familiar with super-heroes knows that they have secret identities, kid sidekicks and snoopy girlfriends. For these potential players, the center of the graph is a fine place to start.

Once you hit marginal familiarity -- the territory occupied by most gamers -- things reverse. The comics that generate buzz, and therefore get handed off to friends, are the ones at the edge. The stories that reside at the exact center of the chart are just the same old thing, even if that thing is the foundation on which the edge stories are built. To people only familiar with the edge stories, the classic tropes aren't comfortably expected or nostalgically charming, but instead the stupid things that *good* comics have moved away from. Expect such players to avoid these tropes themselves, and perhaps sabotage them when they appear in the game -- the supers equivalent of someone arguing why Bond gets captured and told the plot rather than shot.

One interesting realization about the industry is that most heroes end up averaging to the center of the graph over time: dark avengers start out with moderately realistic adventures, then discover wondrous secret worlds before gaining sidekicks, magical imps & primary color costumes. Eventually they find themselves in gritty mystery stories with psychopathic foes while still working with a team whose base resides in the asteroid belt. It is the nature of new writers to bring in new points of view, the curse of the editor to mimic whatever's hot in the market and the dream of the publisher to team them up and cross them all together. This means that if you have time the same game and team could satisfy all of the disparate players -- assuming you hold their interests for that long.

EXAMPLE: A Fantastic Reality -- the Omniman Story

Cliff Craddock was a normal boy until the day an explosion destroyed a field near his parent's farm. Cliff and his dog, Ruff, were the only witnesses. They quickly learned that the blast, attributed to a meteor, had changed them into the sorts of Firestorm Effects Cliff had read about. While he considered super-heroics, fear of public reaction kept the now uncannily bright 12-year old from revealing his identity. He instead designed costumes and masks too hide their identity when they did use their powers.

Public opinion against FEs had started thawing by Cliff's adulthood. Moving to Spire City, he took a job as a construction worker and began to act as Omniman. Omniman perfectly captured the spirit of Spire City, with its heartland roots, optimistic can-do heart, and eyes on the future. For six years he battled the mob and stopped disasters, and his actions changed the way America viewed the super-human. During this time he was aided and occasionally tested by a shadowy individual calling himself the Avuncular, whose presence was, at first, more aid than a hindrance. Once organized crime was reigned in, Cliff started toward an architecture degree and Spire City began facing larger threats. What followed were years of adventures where Omniman managed to make FE monsters and giant robots Fun.

It also led to the appearance of the Omniman Family.

The family started when Cliff's sister, Clara (perky and 12 years his junior) brought Ruff to live with Cliff in the city. The siblings learned that when they touched, Clara gained omni-powers for a day. Clara was such a snoop and trouble magnet that it was easier for Cliff to give her powers as soon as she turned up, and even then she'd still require rescuing. When she brought along her cat, Iota, it gained powers too! Omnilass and Omnipuss became good at rooting out secrets and minor crime, inevitably discovering larger plots that required her brother's help to resolve.

When the Avuncular appeared again with more stringent tests, things got stranger: the Avuncular created a team-up between Cliff and his 12-year old self. Omnilad (with Omnipup!) worked with Omniman and Omnidog to outwit the hyper-menace, but after that Omnilad and Omnipup would occasionally turn up unbidden, and Cliff could summon his younger self for aid. Plus, there is at least one incident of Omnilass & Omnipuss alongside Omniweelass (and Omnikit!), which Cliff would rather not remember.

At college Cliff befriended Prof. Beauford Blast, a genius with a recently developed flair for dangerous scientific discoveries, but whose gadgets then helped save the day. (To complicate things, Omnilass developed a crush on poor stammering, middle-aged Beauford.) Riding herd over this clan is Captain Lisa Quincy of the Spire City PD: she's been Omniman's liaison and nominal superior since he was deputized. Hints of romance between them are rapidly dragged behind the barn and shot.

After years of escapades, Beauford made a discovery about the nature of hyper-real isotopes (Brobdignagium et.al.) with repercussions on our hero. Such artifacts are intrusions from a higher level of reality . . . and so is Omniman! That explosion was not a meteor strike, but a rip into higher reality which permanently altered young Craddock. Omniman's array of powers all stems from this hyper-reality and his ability to extend it to other things on contact. Toddler Clara hadn't been altered by the explosion to mimic the Omni-powers -- Cliff was transferring some to protect her, just as he could do to anyone (and had been doing to Ruff, and even Professor Blast, with whom he shared Omni-intellect). His super-breath was making the air hyper-real and hence more solid, his apparent flight was just changing the solidity of the air around him to control his jump path or provide a base for "levitation," and his impossible feats of strength, such as lifting whole buildings, worked because his touch was making the building stronger to resist material stresses.

Armed with this knowledge, Omniman became even more formidable, and faced greater challenges and a darkening Avuncular. As he experimented with his "new" powers he pushed away his "family" for their protection and eschewed summoning his younger self for fear of playing into the Avuncular's hands. The discovery left Cliff depressed, as the world seemed a darker, more harshly scientific place. After years of adventures in relative social isolation, Cliff has overcome his fears and decided that whatever his power's origin, he'll face life's challenges alongside his family and his past, and to find out more about what their place in the world really is. He has also become the public face of a league of heroic Firestorm Effects, who as a team possess earth-shaking power. This might have been the Avuncular's goal all along.

This does raise questions about the Avuncular, and the method being used to contact his younger self through time. One theory is that the Avuncular is Omniman's future self, and these tests are preparing him for some upcoming crisis. Another is that the Avuncular is a resident of hyper-reality whose goal is personal amusement. A third is the idea that the Avuncular is actually Omniman's controlling force in the higher reality, which sees this world as a simple fiction. Cliff sees all of them as being equally likely, while the Avuncular remains as capricious and potent as ever.

Tri-Stat dX Stats

Omniman   *280 points*

Body 8, **Mind** (7) 15, **Soul** 11
ACV 12 **DCV** 9 **Health** 95

> ### Jumping in Tri-Stat

Characteristic Attributes

Attack Mastery (1) Lots of heroic combat experience.
Divine Relationship (1) Reroll 1 roll per session due to never-say-die attitude
Features (1) Reliable voice
Organizational Ties (2) Official ties w. Spire City PD

Power Attributes

Armor (8) ignore first 80 points of damage per attack
Enhanced Mind (8) his intellect is hyper-real, but is less capable in Savvy (no bonus)
Super-Strength (8) lift 1,000 tons, +80 to damage
Jumping (6) cover 20 km/leap, 2km/round (appx 1000 kph) (speed 4, distance+2)
Special Defense (6) needs limited O2 /Disease immune/Poison immune/slow aging
Tunneling (6) tunnel at 5 kph (20m/turn)
Immovability (2) Resist 40 knockback
Duplication (11) Proportional w/o duplication, 50% -- young self; Reduction: 1 dupe (-2)
Servant (8) 40% of total (112 points) -- pet collie, Omnidog
Dynamic Powers (4) Hyper Reality -- can make self & things more "real" w/touch for 1 day

- *Transfer (4)* Can transfer 4 levels all Powers except Dynamic Powers to 1 target
- *Special Attack (1)* Super Breath -- 20 dam, knockback, spreading, short range, low penetration
- *Special Attack (2)* Icy Super-breath -- 20 health of Tangle, no damage, short range
- *Flight (1)* Used to hover or change direction in Jump (Body roll required).

Defects

Skeleton in closet (2) Secret ID
Unreliable Power (2) Duplicate appears at GM whim or with Soul check at -4
SO -- Sister (2).
Nemesis (2) The Avuncular.
Achilles Heel (1) Hyper-reality attacks, lose x2 normal health

Skills

Architecture (3) Skyscrapers
Area Knowledge (1) Spire City
Cultural Arts (1) art deco
Etiquette (1) Midwest America
Languages (3) languages of Spire City's immigrants
Physical Science (1) Hyper-reality theory
Power Usage (2) Dynamic Powers
Unarmed Attack (1) Strikes

Jumping guidelines (a running jump covers 1/4 your kph in meters, and you can reach 4-5kph per point of Body), consider setting the maximum horizontal leap at X in meters (X= the maximum allowed Body stat) and applying the mechanic posited in ["A Strangeness of Apes"](#) to jumping distances. In a d10 supers game, a 20m leap would be Practically Impossible, 10m is Easy and 1m is Practically Guaranteed. This also gives a quick-and-dirty distance calculator to which you can apply the multiple from the Jumping power. (An even faster solution is saying that a running jump covers Body in meters.) The bonus from Superstrength should apply to these Jumping rolls.

The existing Jumping power divorces distance from velocity, linking the latter to the character's ground move rate. This made Omniman's supersonic leaps but lack of super-speed difficult. Hence, the 2 point level of Jumping, which assumes the character covers his entire distance in 1 round. For velocity purposes, use the Medium progression chart, starting at 50kph for level 1. Yes, this is faster than flight, but it's less versatile, and someone leaping continuously for an hour looks pretty silly.

You can also stack 1 point Jumping onto 2 point levels, indicating that the character can make leaps of longer than one round at the 2 point speed, Omniman's has 4 levels at the 2 point cost (moving at 1000 kph) and 2 additional levels at 1 point, which maxes out to roughly 10 rounds in the air per

Characters Over Time

Omniman's history is designed to showcase changes in a super hero's position on the story style graph. His early years were highly Adventurous with a strong streak of the Fantastic, fighting gangsters and the occasional threatening foe, with no real questions asked about how the world worked or why. With the arrival of the Omniman Family these tales moved towards the center of the Adventure/Wonder axis -- romantic entanglements, secret identity -- without losing any Fantasy -- giant robots, a meddling super-sister and super-dog and a mad scientist friend.

The codification of his powers around a single theory marked a shift from Fantasy into Realism, where he is occasionally at odds with the police and is exposed to what happens when his hyper-reality meets the real (i.e., the real gets crushed and Cliff gets guilt). At the same time, this single power theory gave him a lot of opportunity for power exploration. His latest phase moves him back towards the center of the Fantasy/Realism axis and further towards the Wonder end of the Adventure/Wonder chart, with the Ominman Family discovering strange pockets of hyper-reality and visiting lost worlds while still countering disasters and fighting the occasional crime.

All longstanding published characters go through these sorts of changes combining the best elements of creating a new character and sticking with an old one while giving the world a feeling of change and producing history that can be mined for new story ideas. Even if you aren't going to run the game long enough to cover several shifts, writing them into your hero's history is worth a little omni-thought.

The Trappings of Technology

Enchantment for Low Fantasy and Techno-Magic for *GURPS Fourth Edition*

by Demi Benson

"Low fantasy magic is less a source of wonder than a toolkit."
--William H. Stoddard, *GURPS Fantasy*

GURPS Magic has good rules for emulating the flavor of high fantasy enchantment -- powerful enchantments take years of effort by wizards of legendary skill and the results remain perfectly powerful forever. However, that may not fit the feel of a low fantasy or techno-magic world where magic is a de facto technology. One way to easily distinguish magic from technology is: technological machines break down and wear out, magic doesn't.

If magic items last forever, as in standard high fantasy, the world should be inundated with the remains of apprentices' first Staffs, cheap Fireball wands, minorly enchanted swords, and scads of Powerstones, Purify Water hoops, Measurement gizmos, and Umbrella cloak-pins. If there is a chance the next band of adventurers wandering through town will have some ancient loot that matches close enough, there would be little impetus to order a new device and wait months or years for delivery. In such a world, magic items aren't technology, they're luxuries -- locking devices up in a vault increases the value, especially if everyone takes theirs out of circulation.

To adapt the *GURPS* enchantment system to better fit a low fantasy paradigm, we have to make some changes in how enchantment works. Mostly what we do is add options to allow for less powerful, even feeble, magic. The default *GURPS* enchantment system is compatible with the following rules and the two systems may co-exist in the game world.

Conventions Used in this Article

- To distinguish the robustness of an enchantment, referred to as Power in *GURPS Magic* (see *Power of a Magic Item,* page 17), from the Power Enchantment (page 57) this article will use the term Maximum Endurance for the former.
- An item's Current Endurance is exactly analogous to the Spell Endurance of temporary and lasting spells (see *Spell Endurance,* page 10).
- Effective Skill is the same as explained in *Magic,* page 17.
- References to "the item" should be understood to mean a single enchantment upon a magical object, which may itself have multiple enchantments. "Device" refers to the physical object or area that carries an enchantment.

Creating the Enchantment

Why do the default rules require a skill of 15 to enchant? There is never any justification given. For low fantasy, allowing unskilled enchanters to produce ramshackle work fits the genre -- items are more likely to be made by Peter the Journeyman Enchanter than the High Elven Council of Wizards.

1. There is no minimum skill level for enchanting. How else should a mage get experience in Enchant if not by using it? If the casting was a success, the item will work, regardless of skill level (but see *Current Endurance, Resistance, Aging, and Activation* below).
   a. There is no minimum level for leading a circle of enchanters. The same penalties apply -- a -1 to Effective Skill per assistant, and -1 for other people nearby (see page 17) -- but Effective Skill may be as low as the leader is willing to risk.

b. For assisting a Quick & Dirty enchantment, the Effective Skill is the lowest Effective Skill of all involved. Penalties are subtracted from the leader's skill level.

2. No minimum Endurance level for created items. A cheap item may deliberately have Endurance less than 15 or the enchanter may not yet be skilled enough to produce better work.

3. An item's initial Endurance level is set to its Maximum Endurance. Current Endurance can always go down and can be boosted back to its starting level with the right spell (see Repair Enchantment under *New Enchantment Spells* below), but you can't make a weak item into a strong item.

Current Endurance, Resistance, Aging, and Activation

These are the changes that give magic items the veneer of technology -- being worn down through use and age.

1. An item's Current Endurance is used when resisting other spells.
2. Items need to roll vs. their Current Endurance once per year to avoid aging, unless under the effect of Slumbering Enchantment (see *New Enchantment Spells* below).
   a. A success by 1 or more means the item is unaffected by aging for this year.
   b. A success by 0 means the item has gained a temporary quirk, which may be removed when the enchantment is repaired.
   c. On failure, the item loses one level of Current Endurance.
   d. On critical failure, it loses one level each of Current and Maximum Endurance and gains a permanent quirk.
3. If an item's Current Endurance drops to 0, the enchantment is lost.
   a. At the GM's option, a leveled enchantment, such as Accuracy, may instead lose one level of enchantment. The reduced enchantment then has a Current and Maximum Endurance equal to the previous Maximum Endurance.
4. All items with an active ability -- casting a spell, performing a function on a target -- have an activation roll equal to their Current Endurance. If the activation roll fails, treat this as a regular spell failure.
   a. An activation failure may be retried after the spell's normal casting time. e.g. an Alarm item could try again every second until it succeeds, a Turn Blade bracelet could only try against a single attack per turn, a Glued area would try once per person per hex.
   b. Items without any active effect -- such as many armor and weapon enchantments, Tangle Growth, a Fireproofed area -- never make an activation roll.
   c. To introduce this rule to an ongoing game, the GM may decide that an item with a Power of 15 or higher does not need to roll. This will allow preexisting items to be used as-is.
5. An item with Power of 2 or lower stops working completely (but still needs to make yearly aging rolls). It retains an aura of enchantment and it can be repaired back to full strength with the proper spell (see Repair Enchantment under *New Enchantment Spells* below).

Improvements -- Skill, Energy, and Endurance

Enchanters may fine-tune Effective Skill, energy cost to create, and Maximum Endurance to suit their needs. An unskilled mage with extra available power could use Energy for Skill to raise his Effective Skill, while a highly skilled mage may use Skill for Energy to quickly finish an item. Obviously, Energy for Skill and Skill for Energy may not both be used together.

1. **Tradeoff: Energy for Skill** works as normal (see *Ceremonial Magic,* page 12). The tradeoff is: +1 for an excess of 20% energy, +2 for for 40%, +3 for 60%, +4 for 100%, and a further +1 for each further 100% energy. This is the only way to raise Maximum Endurance level above a caster's normal Effective Skill level.
2. **Tradeoff: Skill for Energy.** Mages may double the effective energy being channeled into an enchantment by taking a -4 penalty to Effective

So How Long Does It Take?

Items with high Endurance are unlikely to fail the aging roll. Anything with an Endurance of 16 or higher will regular fail on a roll of 17 and critical fail on an 18. An item with Maximum Endurance of 20 will be reduced to a Current Power of 15 (the lowest of high-priced magic) in between 150 and 390

Skill (and therefore also to Maximum Endurance level). Triple energy for -8, and quadruple for -12. Yes, this means that high-energy, short-lived items can be created very quickly. The actual tradeoff is as follows: -1 to skill gives +25% energy; -2 gives +50%; -3 gives +75%; -4 gives +100%; these are additive.

3. **Tradeoff: Power for Skill.** An enchanter may get a bonus to Effective Skill (+1, +2, etc.) by taking the same size penalty to an item's final Power level (-1, -2, etc.); e.g. a caster with effective skill 14 may increase his Effective Skill by +4 (to 18) by taking a -4 penalty to the item's Maximum Endurance (it will have Maximum Endurance of 10). This makes lower-power items a virtual success for highly skilled enchanters.

Example: Arenka is a journeyman enchanter making Alarm baubles. She has a 12 in Enchant and a 14 in Alarm, for an Effective Skill of 12. Since she's practicing, she wants to spend little time on this project -- she puts in only minimal effort to ensure the result lasts a long time. The Alarm enchantment costs 60 energy so Arenka enlists the help of an apprentice named Gil (Effective Skill of 11). Arenka decides to speed up the process by trading Skill for Energy at -3 for +75% energy. This brings the energy cost down -- 60 / 1.75 = 34.3, rouded up to 35 -- and her Effective Skill to 8. Then she decide to improve the odds by trading Power for Skill at +/- 2, boosting her skill roll to 10. Arenka and Gil spend the hour enchanting, and she makes the roll dead on. Arenka spends 10 FP and 9 points from her Powerstone and Gil spends 10 FP and 8 points from a borrowed Powerstone. The new item has a Maximum Endurance of 6, and probably won't last more than five years.

years with an average of 270 years; each level averages 54 years between reductions. Maybe the long maintenance interval is why high-power wizards enchant up to 20 Endurance when they can. A reduction from 15 (a decent Endurance for a pricey item) to 10 (barely suitable for adventurers) would be between 21 and 69 years, averaging 45. On the downward slide, a reduction from Endurance 10 to 5 (a nearly useless item) would be between 5 and 9 years, averaging 7.

Critical failures do not affect these numbers, although they will reduce how well the item can be repaired.

Offsetting Penalties

Enchantment using an appropriately tuned magic crystal can offset a caster's enchantment penalties. A +1 crystal is quite common, a +2 is somewhat common, a +3 is hard to find, and +4 or higher is very rare. These will not increase an item's Maximum Endurance, but will allow penalties to be negated. See Attune Crystal, below.

A possible source of crystals is the Crystal Fields, from "Aulos -- City in the Sky" where the crystals are specifically mentioned to be harvested as magical adjuncts.

For examples of crystals and gemstones with some notes on their historic associations, see "Appendix Z: Shiny! -- Random Gemstone Table."

The article "Magic Ingredients Revisited -- Spell Ingredients for *GURPS*" lists ingredients by college; many include gemstones or crystals.

Optional Rule: Wizard War

By allowing Linking spells to be used with Missile spells (contrary to page 131), and allowing those Links to be used in Temporary Enchantments (page 56), Spell Stones (page 60), or Spell Arrows (page 65), magic-based bombs, missiles, mines, and grenades can be created. Because a single-use Temporary Enchantment costs only 15% of the usual amount, they may be created quite cheaply.

Optional Rule for "Unlimited Mana"

For Slow and Sure enchantment, mages may put any amount of energy into an enchantment every day. Putting in the

default Recovery Rate amount (8 points) every day is the minimum to qualify as a professional enchanter. A master enchanter could put in far more.

For any type of enchantment, if Threshold is exceeded at any time during casting, in addition to regular Calamity Table effects the caster must immediately roll vs. his adjusted Enchant skill level -- any failure means the enchantment has *failed completely* and the caster must start over from the very beginning; a success means the item is only quirked (severity depends on how much Thresh was exceeded), a critical success means no negative effects happen this time.

This option will greatly reduce the price per point of energy for enchantment (by a factor of at least 8).

New Enchantment Spells

Repair Enchantment

Enchantment

Allows the target enchantment's Current Endurance to be repaired by 1 level per casting, up to the enchantment's Maximum Endurance. The caster must know the spell being enchanted at 10 or higher; effective skill level is the lower of Repair Enchantment and the target spell.

If the caster is not repairing a power level, then temporary quirks (but not permanent ones) can be removed at base skill but reduced energy and casting time; the caster must know which quirk is targeted for removal (for example, by a previous use of Analyze Magic, or by discovering the quirk through use). Quirks can be removed at the same time as repairing a power level for no extra energy by taking a -2 to skill, or at no penalty but energy cost +25%.

The caster is at +1 to skill for every 2 full levels of base skill above the enchantment's Current Endurance, and at -1 for every level of base skill below the enchantment's Current Endurance.

Area enchantments may be repaired as the entire original area at once. If a smaller area is repaired, from then on that smaller area is considered a separate enchantment.

Duration: Permanent

Energy Cost: 1/20 the target enchantment's energy cost, with a further x1/4 if only a temporary quirk is being removed and no power levels are being repaired. This cost is not reduced for high skill. Minimum cost is 1 point.

Time to Cast: One minute per point of energy cost, or the casting time of the target enchantment's basic spell, if it has one, whichever is greater. Minimum casting time is 1 minute.

Prerequisites: Enchant 10+, target enchantment 10+

Age Enchantment

Enchantment

Forces an immediate aging roll for a target enchantment if the target fails a Resistance roll versus this spell.

The GM may change the prerequisite of Remove Enchantment to this spell.

Duration: Instantaneous

Cost: 10 or 1/100 of the cost to place the enchantment originally, whichever is more.

Time to cast: 1 minute

Prerequisite: Enchant

Attune Crystal

Enchantment

This spell prepares a crystal or gemstone to efficiently channel the magical energies of enchantment. Most such crystals will be of low quality (providing a penalty offset of +1 or +2), limited in ability (to one College or one spell), or both.

A crystal capable of being used in any enchantment and with a penalty offset of +1 would be worth $50; quadruple price for each additional +1 (i.e. $200 for +2, $800 for +3, $3200 for +4). Price for a limited crystal is x0.8 for a single-college, and x0.4 for a single group of spells. Price savings are not great because the sellers can usually find someone who wants that specific type. However, prices are subject to considerable differences based on supply and demand.

Cost: 30 for a penalty offset of +1, double for each additional +1 (i.e. 60 for +2, 120 for +3, 240 for +4). Cost is x1/2 for a crystal that only affects spells of a single magical College (e.g. Fire spells); and x1/3 for a crystal tuned to affect a single spell and close derivatives (e.g. Fireball/Explosive Fireball, Light/Continual Light/Shape Light). This may be recast as per Accuracy as long as the crystal's quality is suitable to hold a higher attunement.

Prerequisite: Enchant

Selling Price	+1	+2	+3	+4
All Spells	$50	$200	$800	$3200
Single College	$40	$160	$640	$2560
Single Spell	$20	$80	$320	$1280
Casting Cost	+1	+2	+3	+4
All Spells	30	60	120	240
Single College	15	30	60	120
Single Spell	10	20	40	80

Slumbering Enchantment

Enchantment

As Suspend Enchantment, this spell deactivates an enchantment, allowing it to be stored without requiring yearly aging rolls. Use the modifier from Suspend Enchantment (page 58) for attempts to study or detect slumbering enchantments.

When cast as a spell, this must be cast on each enchantment individually. Slumbering Enchantment must win a Quick Contest against the target's Current Endurance. If this fails, the mage pays full energy cost, but may immediately try again.

When enchanted into a device, the caster sets a time interval. If the device has not been used for a period equal to the time interval, Slumbering Enchantment will attempt to deactivate all enchantments in the device -- only an uncontested activation roll is needed. If the activation roll fails, Slumbering Enchantment will attempt activation after another time interval has passed. Slumbering Enchantment may also be triggered by a user to attempt deactivation immediately.

As an enchantment, this spell also deactivates itself -- aging rolls are only made if the device is not yet slumbering.

Duration: Permanent until Awakened

Cost: If cast as a spell, 10 or 1/100 of the cost to place the enchantment originally, whichever is more. As an enchantment, cost is 40 or 1/50 of the cost to place all the affected enchantments originally, whichever is more.

Time to cast: see *Enchanting* (page 16)

Prerequisite: Suspend Enchantment

Awaken Enchantment

Enchantment

This reactivates a suspended or slumbering enchantment. Against Suspend Enchantment, this spell must win a Quick Contest. Against Slumbering Enchantment, only a regular success roll is needed.

Duration: Instantaneous

Cost: 4 or 1/10 the cost of the spell to be overcome, whichever is greater.

Time to cast: see *Enchanting* (page 16)

Prerequisites: Enchant and Detect Magic

What to do without Awaken Enchantment?

As GM, you decide to introduce these rules to your ongoing game. Obviously, none of the PCs will know Awaken Enchantment. What should your hardy adventurers do if they find a cache of slumbering magical goodies, but no one knows how to wake them? To fit with fantasy tropes, the solution should be available to even the magically ungifted: Impose their will upon the object and reawaken its quiescent magic.

The PC must win a Quick Contest of Will versus the Slumbering Enchantment's Current Endurance each day for a number of days equal to the activation cost. Every 10 character points in magical advantages (GM's call, although Magery certainly counts) gives a +1 bonus to Will, as does having any points in either Enchant or Detect Magic. In Low Mana regions, there is a -5 penalty. A regular success adds one day to the total, while a regular failure adds nothing. A critical success immediately activates the item. A critical failure means the PC can never overcome that particular enchantment unless he increases his adjusted Will and tries again from the start.

The character need not realize that the device is enchanted, but must use, wear, or study it and must believe that it is special -- believing a sword is well-made and worthy of a hero would allow a Will roll, but pocketing a pretty ring just because it's pretty would not. If the character is not actively attempting to awaken the item, the GM may roll in secret. As success draws near, the GM may give the PC hints of its true power or feelings of immanent comprehension -- "Every night after work you've gazed upon the strange statuette, wondering who made it. Every night you feel closer to understanding why the grotesque figure reaches upwards. One night understanding comes to you in a dream . . . but as you wake, the dream fades and with it your understanding."

Each character may attempt to mentally overcome only one Slumbering Enchantment at a time.

Example: A group of adventurers have explored The Lost City of the Ancients and discovered a hidden trove of items. Suspecting the items are magical, Sasha the Wise casts Detect Magic on an amulet (at a -5 penalty as per page 58) and finds a glimmer of magic. Curious, Sasha keeps the amulet with her and spends many of her free hours wondering what it does. Every night the GM rolls the Slumbering Enchantment's Current Endurance (a 12) versus Sasha's Will (a 14) plus +3 for Magery 2 and points in Detect Magic (an adjusted Will of 17). The amulet has only one small spell in it, and Slumbering Enchantment was cast as a spell for 10 energy. Sasha fails three times and succeeds ten times -- after nearly two weeks, the amulet awakens and she notices that the enchantment seems stronger and easier to analyze.

Meanwhile, her companion Ragnar the Barbarian found an excellent sword, which he declared worthy of a hero such as himself. Ragnar does not believe or care that it is enchanted, but he keeps the sword with him at all times and is very proud of it. The ancient sword has Penetrating Weapon 3, Accuracy +2, Puissance +1, and Shatterproof for a cost of 2400 energy; the Slumbering Enchantment cost 48 energy and has a Current Endurance of 13. Ragnar's Will of 11 has only a slim chance of success every day -- most days the roll fails. The GM doesn't want to roll every single day's contest, and decides that since Ragnar isn't actively trying to awaken the sword, there is no chance of critical success or failure: timeframe is the number of energy points divided by the odds of success -- Ragnar will awaken the sword in 474 days.

The Six Cursed Rings of Jose Von Lee

by Elizabeth McCoy

Jose Von Lee (replace the name with one more suitable to the campaign -- or not) was an antisocial old blighter of an enchanter. He was the sort of person voted Most Likely To Become A Lich, despite having no evidence of necromantic activity. And when he died, his traditional tower lay untouched for some years before the town decided that they needed the money more than they feared what he might have left behind.

So they sent in low-life to fetch out things, boxed them up, and auctioned them off . . .

Jose Von Lee's Six Cursed Rings

No one in Von Lee's town has tried these on, since they *know* what the old crank was like. He was the sort to laugh and point when squirrels were drowning in wells, or cats fell in lakes. (Heck, he was the sort to push small furry animals into bodies of water.)

Surprisingly, none of his assortment of enchanted rings were actually cursed in the sense of being unable to remove them once on. Perhaps Jose Von Lee *liked* some of the odder ones, as entertainment. Perhaps he just didn't feel like spending the time on a curse unless someone was going to buy it. Of course, subsequent owners might make some additions.

All the rings are plain gold bands (unless the GM decides otherwise) which will fit perfectly on any finger, from tiny sylph to giant dragon.

The Ring of Handsome Bloke. This ring turns the owner into a very attractive young man (no matter what the prior gender or age was), of average strength, who is just a tad dim. Perhaps Von Lee used it in his aging years to shift things around, and didn't feel like being clever. Perhaps that's just a side effect. Perhaps some foolish traveler banged on his tower door some dark night, and was never heard from again . . .

(*GURPS* stats: ST 10, DX 11, IQ 9, HT 12; Handsome Appearance. The character may wear the ring indefinitely, with these stats, but must still make Aging rolls normally; eventually, though in the prime of health, he will drop dead from old age. He is also not immune to diseases which do not permanently affect stats; an old crone with the flu can wear the ring to be a young bloke with the flu. And, as a final note, clothing does not change; don't wear this if you're not naturally about six feet tall.)

The Ring of Too Short To Touch The Ground. This ring shrinks the owner by two inches -- upward. On the plus side, the air above the ground apparently has perfect traction in all conditions (ice, snow, mud), and the user does not leave footprints or trigger weight-related traps. (Even if lying down, the person is still not going to actually touch any surface he's "on top of.") On the minus side, he must roll up his pants, since that's where the shrinkage occurs. On the potentially annoying side, the effect lasts only 30 minutes, and the ring must be taken off for five minutes before the effect will resume. If it's left on, it will re-activate itself after 30 minutes.

The Ring of Peeping Tom. This would be a garden-variety Ring of Invisibility if it didn't also include the ability to see through wood and fabric. On the minus side, the user sees through wood and fabric as if they were not there -- which can cause the wearer to bump into trees, and perhaps view far too much of other humans who are *not* considered attractive in his eyes.

The Ring of Disease Resistance. Sadly, it's not. It just feels as if one no longer has the flu, cold, terminal cancer, or whatever else is afflicting the wearer. This persists for an hour after taking off the ring, too! However, since the wearer will probably not be sensible enough to spend time in bed, resting, or otherwise treating the symptoms . . . Appropriate penalties to health-based rolls should be made (e.g., -2 to HT rolls, in *GURPS*). If the wearer does not take off the

ring, it will stop working anyway a week later, and require a "cool-down" of two days before it will work on that person again.

The Ring of Virility. There are other, more pornographic, terms for this ring, possibly including "The Ring of Indefinite Magazine Reading." Essentially, so long as the user is wearing the ring, all abilities pertaining to arousal and functionality (for either gender) will work indefinitely. On the useful side, it provides a mild bonus to rolls relating to extended labor of any sort (e.g., +2 to HT in *GURPS*). On the minus side, lecherous characters may never want to take it off, despite the inconvenient physical side effects.

The Ring of Dainty Lass. Whether Von Lee wore this for his own amusement, or hired others to do so . . . is something the townsfolk would rather not know, thanks. The enchantment is much like that of the Ring of Handsome Bloke, transforming the wearer into a lovely young slip of a girl, approximately five feet tall (with three-foot long hair), with good agility and adequate intelligence. Happily, Von Lee's tastes did not run into bosoms the size of watermelons, and back pain is not an issue.

(*GURPS* stats for the Dainty Lass: ST 7, DX 12, IQ 11, HT 12; Beautiful Appearance. The same notes as the Ring of Handsome Bloke's apply.)

Irregular Webcomic

by David Morgan-Mar

Irregular Webcomic

If Ignorance Is Bliss, I'm Happy More Often Than Not

Every so often I find myself in a pinch. I've agreed to run a game for a certain system, but . . . well, I've never gotten around to actually *reading* everything I was supposed to before the session. (Sure, this means I didn't make up an adventure either, but I tend not to do that under many other circumstances, so we're not going to let that affect our conversation here.) Maybe it's a new game and I haven't actually gotten much past the introductory piece at the beginning; maybe it's a con game or a pick-up session somewhere; maybe it's the first game of a whole campaign, and I fully intend to read that information some day.

Whatever the reason, I've found myself in a number of situations where I need to run an adventure in circumstances that are less than ideal. So how do I handle such crises?

If you answered "curl up in a ball and wait for the scary gamers to leave," you'd only be correct about 20% of the time.

No, most of the rest of the time I make up an adventure, subplot, or catalyst that plays to my strengths and minimizes the effects of my ignorance. And, without exception (that I can remember), the players seem to gobble it up. And so, without further adieu, here are some of the techniques I've used when I haven't sunk enough skill points into the game I'm about to run.

"You wake up in a prison . . ." I've written about this [before](#) (and so have [others](#)). Basically, starting the players out in a tightly controlled circumstance is a great way to keep them from doing too much that's unexpected. Of course, "prison" can have a number of different meanings; it could be a literal Alcatraz-type setting, a *Prisoner*-style idyllic village, an alternate dimension, or what have you. Regardless, the desire to escape forms a great narrative pull for the rest of the adventure. And, since the rules of reality often don't apply (depending on the prison), the players tend to be a fair bit more forgiving of rules lapses, mistakes, or oversights that might occur.

Also, "prison" might refer to any tightly controlled environment, even if the heroes seem to have a fair bit of freedom. For example, a **Fading Suns** campaign has tons of information that needs to be assimilated before it can be presented fully; however, it might be possible to read enough information to run an adventure set on a train going from one city to another, which should greatly reduce the amount you need to read.

"When suddenly, you're powerless!" If you've got a grip on the setting but aren't so sure about how the various powers work and/or fit into the larger whole, it might be possible to have everyone end up without their snazzy powers for the adventure. Again, the players can just wake up that way (creating a mystery they will most definitely want to solve), they may encounter a threat early on that de-powers them, or they may be placed in a situation where their powers don't work as expected (again, the ever-popular other dimension).

This technique can be used to varying degrees. For example, if you're playing a **Shadowrun/Cyberpunk**-type game but you're not familar with the netrunning rules, then you can simply de-power that aspect; maybe there's a net-space surge that's disrupting all netrunning activities for the next few days or so, and you can look suitably horrified if any players start insisting that they attempt to enter this other-place.

"Gee, Mister . . . what's a vampire?" As an *excellent* technique if you're starting a game with players who are more experienced with you, consider introducing some character or aspect that needs to be brought up to speed. Trust me: You'll never play a more convincing ignorant person.

For example, if you're playing **Werewolf,** maybe the PCs encounter a newly transformed cub, and need to bring him up to speed about their furry ways before he gets himself (and the rest of the party) into trouble. Or, again, if you're playing that **Shadowrun**-type game, maybe the PCs are given a good sum of money to lug around the nephew of Mr. Johnson to teach him the basics of what it is to be a shadowrunner.

This is a slightly more dangerous technique than some of the others, since the PCs may not have a compelling reason to take the neophyte under their wings. Making sure the newbie NPC has some advantageous aspect to warrant

keeping him around can be a useful idea; really, this is the basic idea behind *The Fifth Element,* one of the most gorgeous music videos ever produced. Regardless, making sure the person's cluelessness doesn't become cloying or annoying is also important; if the character ends up like Scrappy Doo, you're basically begging the players to toss him to the first minion of darkness they encounter.

Of course, any of the techniques above can be mixed and matched; it's quite likely to end up in a prison without powers, and if you happen to encounter someone who's of a similar mindset to you but even more inexperienced, then the PCs might need to bring him up to speed at the same time they're trying to regain their abilities and escape.

Regardless, ignorance of a setting shouldn't necessarily be a detriment to running it; with the right idea, you can turn that ignorance into something the group will remember for a long time. And, remember: You'll never be as ignorant of the setting as you are that first time you run it . . . so enjoy the freedom from knowledge while it lasts.

Deliria: Faerie Tales for a New Millennium

Published by [Laughing Pan Productions, Inc.](#)

Written by Phil Brucato

Cover by Audré Vysniauskas & Elizabeth Leggett

Illustrated by Phil Brucato, Jeff Holt, Mark Jackson, Elizabeth Leggett, Marrus, Lucinda Maberry, Heather McKinney-Chernik, Kees Roobol, Ruby, Christopher Shy, Andy "Hobbit" Simmons, Nènè Thomas, & Audré Vysniauskas

324-Page Full Color Hardback; $39.95

What grabs you first about *Deliria: Faerie Tales for a New Millennium* is its look. It is, in a word, eyecatching. Physically, *Deliria* is a breathtaking wash of color behind its glossy black cover. A chaotic array of styles and techniques are used to illustrate the book to an arresting effect. This really imparts the setting's sense of wonder and mercurial nature, from the whimsical and the magical to the dark and the dream-like. This continues with the writing, heavy on the "purple prose," works to pull the reader into a world and setting that is all of these things and more. A world woven of song, but enamored and maddened of mankind's cacophony; a world wherein the fey are as fascinated by us as much as we are of them.

That *Deliria: Faerie Tales for a New Millennium* is designed to be more than a game of hack 'n' slash is no surprise. The creation of Phil Brucato, the designer of the well-received *[Mage: the Ascension Revised Edition,](#)* this is a storytelling game focused on the modern and the adult faerie tale. It is mechanically light, designed to be card driven rather than diceless, feeling in tone like *[Nobilis](#)* than *[Amber,](#)* though not quite on a scale as grand as either of those.

Ostensibly a modern setting, *Deliria* is not just a game of the urban faerie tale. Certainly it encompasses that, starting in the world that we know and love, but it takes in classical fantasy elements also. These, though, are present only deep within Deliria itself, in turn described as a state of mind, a blending of elements, and a place in-between. It begins at the Crossways, which are passages between the mortal and faerie realms; these are usually a location but occasionally a time or person. Living either side is the Mysterium, an occult underground aware of both worlds. The mortals who live here are the twilight people, having been touched by the supernatural. Crossways often give access to Goblin Markets located within the Mysterium, places where mortals and the fey can do business. Beyond this lies Deliria, a world comprised of faerie dominions, faerie wastelands or Vashards, and the Altwald's primal forests. Notable dominions include the Oakmare School of Wizardry, contained within a single tree; Furnage, a Victorian-era city housed in a flying mountain; Gundermann Square, a faerie marketplace turned mall; and Wehir, a feudal idyll transformed into Disney-like garishness by jealousy and murder.

Although Deliria is governed by the old laws, meaning that most mortal technology will not work, it has had its influence. Many fey are fascinated by mortal devices, but the most obvious effect comes from the Internet. It manifests itself as bramble, a crystalvine kudzu that weaves it way parallel to the cable allowing mortal imagination to create its own dominions. On-line gamers have created realms of their own that ordinarily exist just on the computer screen, but *really* do in Deliria. This is where in Deliria that hack 'n' slash is possible.

Besides the twilight people, Deliria's inhabitants fall into three broad groups denoting power and status. The Aeldenfolk are natives, truly immortal; the long-lived Aelden are mortal faeries residing in both worlds; and Shimmerlings, child-like expressions of fey essence also appearing in both worlds. Each is defined by his Wishcraft (faerie magic), Graces (mental, physical, and spiritual attributes), Legacies (innate uncanny powers), Wyrds (mystical weaknesses), Guises (faerie roles), and Turnabout (ability to counter magic). Every fey must be designed, for *Deliria* has no faerie bestiary, but rather examines the powers and abilities that a fey could and does have. Guises are the core aid to any design, serving up roles traditional to the faerie tale such as the Aelf, the Fairy Godmother, the Muse, the Ogre, and the Sprite, along with the modern Alien and Chronopath. This is a toolkit for creating faeries that discusses faerie motives and natures and explains their powers and weaknesses, such as why iron is deadly to them.

This faerie creation toolkit is complemented by the advice on running a *Deliria* game, called "Circle" and "Saga." The latter is the campaign, the former is the playing group, which shares and creates the Saga. The aim is for Circle's members to run the Saga on a rotating basis. The advice excels when examining the faerie tale, its motif and elements, giving the reader a decent understanding of the genre. Nearby sidebars usefully list potential themes, hooks, settings, challenges, adversaries, and helpmeets (or useful allies). Both for the classic and the modern faerie tale, enabling a GM to cherrypick what he wants for the Saga or session.

Unfortunately, having been lead on a wild ride through a riotously imaginative world, it all comes to a crash with the crunch. Conceptually, the Compact System is designed to work at three levels of complexity: Narrative, Basic, and Advanced. The first is loose and light, focusing upon description, and intended for use in Live Action games. The second adds relative complexity and employs the game's card driven mechanic, while the third increases both the complexity and detail. The core mechanic uses an ordinary deck of cards, minus the King of Clubs, the King of Diamonds, and the two Jokers. In fact, it is suggested that each player and the GM have a deck to draw from. To test an ability in Narrative or Basic play, a player compares to a GM determined difficulty on a pass or fail basis. In Advanced play, or if a better result is required, then a card is drawn. A red card adds to the total, while a black is deducted. Face cards can guarantee automatic successes, failures, triumphs, or disasters.

This all sounds simple enough, yet as presented it is not. It is over written and over explained, and although trying to reflect the genre's inherent varying degree of luck, provides such a wide range of results (for this reviewer's tastes at least) that any result might as well *be* random. Further, as the intended degree of complexity increases, the actual feel of the complexity increases exponentially. The suggested alternative dice mechanic adheres to the same results that drawing cards would give, but feels fundamentally counter-intuitive. The conceptual cleverness continues with the combat system which focuses not on landing the blow, but its effect. It can apply as much to social and psychic situations as it does physical, with the desired amount of damage acting as the difficulty. Although weapon use can influence this, the results still default to the wildly random mechanics.

Character generation follows this pattern of conceptual artfulness and complex execution. The simpler of the two systems given has just three attributes (Body, Spirit, and Mind) and a handful of broad vocations or skills. The more advanced breaks each attribute into four aspects, and individual rather than broad skills. Although not complicated, the process is best explained in the example of character generation. The end result has some nice touches, like every character having to list three wishes that might come true, and "Deliria" being an attribute of its own. It reflects awareness of the faerie realm, but the higher it is, the more detached the character is from the mortal realm. Unfortunately, because its base is half the Mind attribute, the more intelligent a character is, the more detached he is. The aim, though, is the ordinary person possessing a few gifts and problems (it is possible to have a PC Aelden, but this is never addressed), who must learn to cope in the strangeness that is Deliria.

Surprisingly, the rules for magic and spellcasting manage to mix high concept with simple writing. It is perhaps too simple, but magic involves just will and how a character thinks magic works. Such methods as artisanship, faerie wishcraft (easier, faster than mortal magic), ritual, shamanism, and witchcraft are each covered in handy reference sheets. Still using the Compact System, the emphasis is on the storytelling aspects and effects whatever the type, and more methods could easily be created using the same model. This emphasis on storytelling runs throughout *Deliria: Faerie Tales for a New Millennium,* but only here is it effectively implemented.

In addition the game comes with a CD-ROM containing yet more material, from pieces of music, sample characters

and creatures, and a card draw program to advanced rules, an extensive bibliography, and the game's bible. This is all very fascinating, but the advanced rules just complicate things further. There is even a download available -- "The Compact Patch" available -- which answers some questions, but is not up to handling the game's central problem: a lack of clarity. Not clarity of vision, but mechanical clarity. In its present form, *Deliria* is not unplayable, but it has been made hard to play by the overwrought rules that match neither the setting, the writing, nor the feel of the game. This is not to say that they could not, but in its present form, the Compact System is a hindrance. This is a shame, because otherwise *Deliria* is beautifully realized with both writing and art matching the author's vision. Play the game purely for that vision -- and I would, because ***Deliria: Faerie Tales for a New Millennium*** is an arresting creation in search of mechanical simplicity.

--Matthew Pook

Shadows and Fogg, Part the Third

"Nine days after leaving Yokohama, Phileas Fogg had gone round exactly half the terrestrial globe."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXIV

Here we are on the third stretch of our voyage around *Around the World in Eighty Days,* and by now, we're far enough around the world that we can start seeing where we've been. Verne's novel reflects (or records, or disinforms) a geomantic Working (or meteor-hunting mission, or both) performed in 1872 (or 1858, the date given in Verne's unpublished first draft) by an agent (or agents) of one (or more) transdimensional conspiracies first interleaved in our 200th Transmission way back when. The novel's 37 chapters mark off the 36 decans (the first and last, of course, take place in the same scene -- it's a circle), the twelve legs of Fogg's journey (by his own count) mark off the twelve signs of the zodiac. Verne also divides the journey into eight ports of call (in Chapter III), which match the eight-fold turnings of the wheel of the year.

For example, per the novel Fogg crosses the 180th meridian in the middle of the Pacific on the cusp date of November 23, 1872. This takes place in Chapter XXIV, the 24th decan around from Naôth in our chapter-map, which is to say Ouare, the third decan of Taurus and governor of technology. Technology does indeed underpin the book, does indeed mirror Naôth, communication, as one of Verne's themes. (The actual decan of November 23 is Anatreth, the decan of movement, yet another theme of the novel. Interesting coincidence, that.) The voyage across the Pacific (Yokohama to San Francisco) is the ninth leg by Fogg's count, and the ninth house around from Libra (when we set out from Fogg's balanced life) is Gemini. By Verne's count, it is the voyage from Imbolc to Ostara, from first fire to full spring, eminently suitable for Fogg's journey to the New World and the young republic of America.

"It now seemed certain that Fogg wouldn't stop at Yokohama, that he would immediately catch the steamship for San Francisco, since America's vast spaces would guarantee him sanctuary and impunity. Phileas Fogg's plan struck him as perfectly simple."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXI

As he has throughout, it is Passepartout who takes the mystical heat for Fogg. He is the first to set foot on America, in classical Fool style by attempting to execute "a perfect somersault." (A tiny circle, an epicycle if you will, of the larger Working?) But he winds up falling through the wood of the dock, wrong-footing himself, and symbolically absorbing the magical blowback from Fogg's extension of the Working circuit to a new node.

To Verne, America was a powerful symbol of inexhaustible natural resources, a kind of a capacitor for vast potential power. In *Around the World in Eighty Days,* as well as in other novels such as *The Begum's Fortune, From the Earth to the Moon, North against South,* and *The Master of the World,* Verne points up this notion of a vast America as Arcadian source of almost cosmic energy. As America's genius locus, Abraham Lincoln appears in both *20,000 Leagues Under the Sea* (in a portrait on board the *Nautilus*) and *Around the World in Eighty Days* (in a flashback describing the building of the transcontinental railway -- a Working in its own right, perhaps) despite being dead by the time either novel takes place. Despite being dead, Abraham Lincoln also appeared in the America of 1872 -- his ghost manifested itself to Mrs. Lincoln on February 4.

"The weather was cold, and the sky grey, but the snow was no longer falling. The disc of the sun, enlarged by the mist, seemed like an enormous gold coin. Passepartout was in the middle of calculating its value in pounds sterling, when he was distracted from this useful occupation by the appearance of rather a strange personage."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXVII

And America, and San Francisco in particular, are also seen (by Passepartout, and by Verne) as lands of gold. Verne's attitude toward gold appears dismissive -- in *Five Weeks in a Balloon,* Dr. Fergusson uses it as ballast, and the *Volcano of Gold* in the end erupts its molten wealth uselessly into the ocean. Likewise, the meteor of pure gold in Verne's intriguingly named *Hunt for the Meteor* explodes and drizzles into the sea, and in *Hector Servadac,* a mighty comet of golden telluride carries a few men into outer space rather than enriching them. But this is the kind of metaphor, we're told, that alchemists engage in. Gold is only a symbol -- of its use, or of the heart's desire. The true gold -- in Verne's

world as well as that of the alchemists and magi -- is knowledge.

"The inauguration of the great railway was thus celebrated, and an instrument of progress and civilization thrown across the desert, designed to link towns and cities that had not yet come into existence. The whistle of the locomotive, more powerful than Amphion's Lyre, would soon make them sprout from the American soil."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXVII

And thus Fogg plunges into the American Arcadia, seeking the "gold" of the Philosopher's Stone, the True Knowledge. All America is one leg of twelve, one house of heaven. By our strict count, it should be oceanic Cancer, but golden Leo seems more appropriate. (Perhaps the "wide gap of time" in mid-Pacific advances us by one house, or is America in truth both silver Moon of Cancer and golden Sun of Leo?) Either way, Fogg once more plays whist all the way across the continent by train, continuously mapping his journey in the flow of chance, or determining his fate by means of his pasteboard operating system. Is he searching for something, perhaps? Intriguingly, the plot of the Verne novel *An Eccentric's Will* concerns a great fortune which can be won only by traveling across the American landscape in certain paths and patterns determined by the throw of dice.

Here, guided by the fall of cards as in his whist-powered passage into India, Fogg enters a magical no-place, the America Ultraterrestria perhaps sought and circled by [Lewis and Clark] on their own Working 67 years before. Verne describes the "fields and watercourses" of America as disappearing "under a uniform whiteness." (This is also approximately where the first draft manuscript of Verne's novel ends, with Fogg vanishing into "America's vast spaces.") In the final version of the novel, Verne clearly parallels America and India. Both have religiously inspired marriage customs that Fogg's party reject -- suttee in Bundelkhand, polygamy in Utah; both have "Indian troubles" with the railroad and indeed are attacked with arrows; both feature interrupted rail journeys; both feature a rescue. Both have Golcondas in them (the one in Nevada is on the rail line, though not mentioned in the novel), and phantom places in both are noted in Verne's manuscript. Just like the elusive stations of Rothal and Kandallah in India, Fogg travels through the nonexistent Plum Creek, Junction Station, and Camp Walbah in America.

"Two hours were enough to visit this thoroughly American town, built on the pattern of every city in the Union: huge chessboards with long cold lines, infused with 'the lugubrious sadness of the right angle', as Victor Hugo says."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXVII

Only the line of the railroad stretches across this vastness, from the nonexistent stations of the West to the "towns with ancient names, some with streets and trams but no houses built in them as yet" in the East. All America is empty, waiting for the "fiat urbis" of the train whistle. Or is the train whistle resonating with some hidden frequency, established along the "huge chessboards" of the American towns? Likewise, the ice-sledge crossing the "deserted" Nebraska plains summons up the station as the wind in the rigging makes "the [fifth] and the octave," an invocation perhaps of Hermes lord of the crossroads -- the "X" that marks the spot for the True City of Cibola.

Verne places Utopian cities -- Saint-Simonian "cities of good will" -- in deserts and trackless spots in his books, such as Antekirtta in the Sahara in *Mathias Sandorf,* and Coal City in the depths of a subterranean mine in *The Black Indies.* And Franceville, in *The Begum's Fortune* -- which Verne locates in Oregon, of all places. Is there here a glint of [Mount Shasta], perhaps an MI-8 stake laid down for the Lemurians in their war against Argus for the American West? Why does Fogg -- the time-obsessed un-tourist -- go two hours out of his way to visit Salt Lake City? Is he examining the "huge chessboard" at the heart of the Land Promised to the (Latter-Day) Saints? Can he see [Brendan's Isle], the [Grail Land], down its "long cold lines"? Fogg enters the empty quarter, and again Passepartout, not Fogg, undergoes the initiatory captivity and ceremonial death -- his third after India and Hong Kong. Once more, we note the time-twisting nature of such things; in the novel, Fogg and party (including the restored Passepartout) visit Fort Kearney in 1872, whereas in reality Fort Kearney was abandoned in 1871. Is this "ghost fort" a guard post on the way into America Ultraterrestria, a "railroad bull" watching the approaches to the [Big Rock Candy Mountain]? And if so, what did Passepartout bring back from that undiscovered country?

"Never was a duel easier to arrange. Mr Fogg and Colonel Proctor, each equipped with two six-shooters, entered the carriage. Their seconds, remaining outside, shut them in. On the first whistle blast from the locomotive, they were to open fire. . . . Then, after exactly two minutes, what remained of the gentlemen would be removed from the carriage."

-- Jules Verne, *Around the World in Eighty Days,* Chapter XXIX

But in order to leave the sacred space, the American Arcadia, with the Grail of golden knowledge, Fogg would have to fight its champion, perhaps its king. He meets "Colonel Stamp Proctor" in San Francisco, "a great strapping man with broad shoulders, a red goatee, and a ruddy complexion." Could this Yankee be an avatar of Uncle Sam? A genius locus of Utah, where "Proctor" is a stop on the Pacific Line? Is he a mere watchman (a "proctor") guarding the approaches? Or is he something more?

He reappears at the suggestively named Green River Station. When he challenges Fogg to a duel, Fogg attempts to suggest a date six months in advance, recalling, perhaps, the Green Knight's challenge. Proctor provokes the duel by criticizing Fogg's whist playing, suggesting a diamond instead of Fogg's ten of spades (a pentacle instead of the sword). Is Proctor suggesting a magical duel? It seems neither, for all their bluster, really want to test the waters. But Fogg plays the ten of spades -- the Ten of Swords -- the "stab in the back," the card of desolation, of ruin. (Per Crowley, the card of "soulless mechanism." Interesting that Fogg would play that.) And so the two prepare to duel, in the sealed train carriage fifty feet long, recapitulating the dimensions of the burial chamber in the Red Pyramid of Dashur. And at the end, it is Stamp Proctor who receives the Dolorous Blow -- "a bullet in the groin." Verne blames the Sioux, not Fogg -- but then Fogg somehow leaves Passepartout to the Sioux for the third ritual death.

And 14 years later, Verne may have suffered his own backlash from the contest. On March 9, 1886, Verne's nephew Gaston -- "with whom he had maintained the most affectionate relations" -- shot the novelist in his left leg during an apparent assassination attempt. Eight days later, his publisher Pierre Hetzel died. Desolation. Ruin. The Dolorous Blow. Verne sold his beloved yacht, and the Extraordinary Voyager never again left France.

Magical Telegraphy

for the *d20 System*

by Michael Tresca

Telegraphy (from the Greek words *tele* = far and *graphein* = write) literally means the transmission of written messages across distance without physical transport. The advent of the telegraph revolutionized America. What took months to deliver by horse could be transported almost instantly to the adjacent town. The implications for this new form of communication were staggering, changing everything from cultural exchanges across borders to long-distance love affairs to a new crime-stopping tool.

Spells like *message, whispering wind,* and *sending* are a unique form telegraphy; only they're even more powerful than the telegraph. With *sending,* spell casters can exchange up to 25 words with someone they know, so long as they're on the same plane of existence. Even then, there is only a 5% chance that the message doesn't get through.

Magical telegraphy can mobilize communities in a way no lord possibly could. When criminals (or adventurers) commit a crime, the next town over will know about it before the criminal even arrives. Any major event can be instantly communicated across villages, kingdoms, continents, and even worlds. Two adventurers with a chance meeting on another plane of existence could keep in constant contact on their respective worlds thanks to sending, or at least through wizards casting the spell on their behalf.

Familiarity

But what qualifies as "someone you know"? Consider these quantifiers.

Familiarity	Sending Failure
Very Familiar	0%
Somewhat Familiar	6%
Know Casually	12%
Met Once	23%

"Very familiar" is a person have been around very often; a friend or family member. "Somewhat familiar" is a person you know well, either because you can currently see them, you've visited them recently, or you have used other means (such as scrying) to study them for at least one hour. "Know casually" is a person that you have met more than once but with whom you are not very familiar. "Met once" is a person that you have met once, possibly using magic.

These rules ensure that sending isn't a perfect process. It's in the best interest of two casters to be very familiar with each other before casting the spell. It also means that sending is not a guaranteed means of communication. Still, even if the spell fails, the caster can always try again.

Counter Tactics

Crime thrives in areas where communication is poor. Towns that cannot accurately report suspicious activity or even a murder cannot organize to defend against a threat. A dragon's rampage is a surprise to an isolated medieval village, but not a wizard's keep thanks to sending. A group of murdering bandits can be tracked from place to place with the sending spell, ensuring that hundreds of eyewitnesses can help the law track the bad guys down. And adventurers who cross the wrong people may find that a cult knows their every move…all because of sending.

With the advent of magical telegraphy, it's only natural that someone would invent a means to halt the spell's progress.

There are of course the obvious methods, using intimidation, bribery, or murder to stop a spell caster from passing on the message. On the other hand, sometimes a magical communication requires a magical response.

Message Lock

Abjuration

Level:	Sor/Wiz 4
Components:	V, S
Casting Time:	1 standard action
Range:	Medium (100 ft. + 10 ft./level)
Area:	1 mile/level radius spread
Duration:	1 hour/level (D)
Saving Throw:	None
Spell Resistance:	No

Often cast by criminals who need time to escape, this spell causes all forms of magical telegraphy to cease within its boundaries. Forms of communication barred by a *message lock* include *message, whispering wind, sending,* and similar spell-like or psionic abilities. A *message lock* does not interfere with telepathy, spoken, or written communication when the spell is cast.

Intercept Message

Illusion (Glamer)

Level:	Brd 5, Sor/Wiz 5
Components:	V, S
Casting Time:	1 standard action
Range:	Medium (100 ft. + 10 ft./level)
Area:	1 mile/level radius spread
Duration:	1 hour/level (D)
Saving Throw:	None
Spell Resistance:	No

Any magical telegraphy used (e.g., message, whispering wind, sending) to contact any being within the area of this spell instead receives a false message of 25 words or less, as defined by you at the time of casting. The message still appears to come from the original caster. As long as the duration lasts, you can concentrate to change the message as desired. While you aren't concentrating, the message remains static.

Trace Message

Divination

Level:	Sor/Wiz 5
Components:	Visual
Casting Time:	1 standard action
Range:	Close (25 ft. + 5 ft./2 levels)
Area:	Spread with a radius of 25 ft. + 5 ft./2 levels, centered on you
Duration:	Instantaneous
Saving Throw:	None
Spell Resistance:	No

You sense the use of any magical telegraphy (e.g., message, whispering wind, sending) within the area. You sense the use of these spells whether or not you have line of sight or line of effect (although a force effect prevents this detection). When you sense the use of an appropriate spell, you know the direction in which the spell was used, and you can trace the target of any magical message made by others within this spell's area within the last minute.

You know the direction and distance the message traveled and can magically communicate with the target if you so desired (and if you have the magical means), as if you "know casually" the target. This spell does not grant you any information about the target of the message at the other end of the trace beyond the message itself.

Other Applications

The advent of magical telegraphy means never being completely out of touch with the rest of the world. Ships can travel further and faster without fear of becoming lost. In times of poor weather, navigation is easier, possibly relayed by someone with better senses to navigate the storm or even simply above the storm altogether (e.g., a mountain at a higher altitude).

Magical telegraphy revolutionizes warfare. All it takes is one scout to relay a message back to an opposing army with critical information about troop type, number, and speed. News is not only timely, it's expected; wandering reporters can provide daily updates on the latest happenings around the globe. Spy networks become nearly unstoppable, and the flow of secrets journeys from King's vault to Queen's ears in the blink of an eye.

Service	Cost	Range	Minimum Caster Level
Message	5 gp	110 feet	1st-level wizard
Whispering Wind	60 gp	3 miles	3rd-level wizard
Sending	450 gp	Unlimited	9th-level wizard

With all this power, messenger services go out of business. There's no need to send a message on horseback when you can pay a wizard to cast *whispering wind* at the next town over . . .

Sir Boris Boar-Spear (Ms.), and Retinue

for *Warhammer Fantasy Roleplay*

by Jody Macgregor

Bretonnia is a very different nation to its neighbor, the Empire. The Imperials' close relationship with the Dwarfs has given them access to black-powder weapons and other technology, their alliance with Teclis and the High Elves led to the enlightened founding of the Imperial Colleges of Magic, and all on their own they're struggling out of the feudal system and toward something brighter with their emergent middle class of city-folk and electoral system. Admittedly, only 12 people in the entire country get to vote, most of the populace can't read, and corruption is everywhere you turn, but the Empire is clearly slouching toward better things -- lying in the gutter, but looking at the stars.

In Bretonnia things are different. The gap between the nobility and the peasantry is wide, with only a few members of something resembling a merchant class in the middle. Guilds are illegal, monarchy reigns, sumptuary laws strictly regulate what peasants can wear, and women are not allowed to wield arms, stray from socially accepted roles, or even uncover their hair. This can be quite a culture shock for Imperials, who find talking to Bretonnians akin to stepping backward in time. This makes traveling Bretonnians excellent foils for Imperial Player Characters; they cast the differences in a stronger light and help give PCs a sense of their own cultural identity. They also make excellent PCs themselves, especially for those used to more traditional fantasy settings, who will find it easy to play fish out of water in the gritty Renaissance-like Empire.

Sir Boris Boar-Spear and her retinue of companions are just such a group of Bretonnians for use as foils or as PCs -- yes, "her." They can be encountered in bar rooms, where their foreign attitudes and general strangeness may cause friction with the locals, or on the road in search of adventure, where they will make fine traveling companions for our heroes to measure themselves against.

Only Sir Boris speaks fluent Reikspiel, which can be the cause of much trouble and comical misunderstandings, but you may allow other Characters to make Speak Language Tests with their native tongue to make themselves understood. Breton and Reikspiel share many words and may have evolved from a common root language, after all.

Background

In the village of Joffre, deep in the dark Forest of Arden in the divided duchy of Artois, a girl with the unfortunate name of Vermengard was born. Vermengard was from a peasant family, and would have probably spent her entire life farming potatoes and turnips if a band of traveling players hadn't braved the forest and performed in the village when she was a child. Vermengard was bewitched by the tales of heroism and chivalry they spun. Afterwards, she bossily rounded up several of the village children and re-enacted the stories with herself in the lead role.

Twenty years have passed, and little has change. Vermengard is still that same bossy girl with a thirst for adventure, no matter how she dresses or who she pretends to be. She has amassed a small retinue of companions, none of whom suspect her secret and all of whom have good reason to leave home and follow her on her "errantry tour." When they travel Vermengard rides at the front on her horse, Genevieve, followed by Pascal driving his cart with Algernon in the back among their merchandise, usually asleep. Behind them comes Louis le Spider, seeming perfectly happy to haul his cart of junk by himself as he shuffles along wearing a demented grin.

Sir Boris Boar-Spear, a.k.a. Vermengard

Race: Human
Career: Knight Errant

"For the King and the Lady, follow me! Follow me!"

Vermengard grew up independent and strong-willed, and when her parents offered her to a prestigious local pig farmer in an arranged marriage, she refused and ran away. In Joffre, when someone leaves the village they are assumed to be dead and a full funeral is performed, so when Vermengard left to find a more interesting life involving less pigs and potatoes and rather more adventure, she knew she could never return. At least not without her family being convinced she was a Ghost or a Vampire or some other revenant who should be dealt with by stuffing garlic in her mouth and crow's feet in her ears and returning her to the grave.

Knowing that a lone woman would arouse suspicion, she began dressing as a man as she traveled. The ruse worked perfectly. No woman would dare break the law by wearing a man's clothes, so everyone she met assumed Vermengard was merely a young man with a high voice. Vermengard realized that if a woman could so easily be disguised as a man, a peasant could easily be disguised as a knight. She worked as a stable boy in the town of Larret until a wealthy knight visited. Then, she "borrowed" his horse and gear, which almost fits her, renamed herself Boris, and fulfilled her childish dream of becoming a knight. Her ruse was aided by the fact that Bretonnians have no system of squiring like the Empire does, and people are accustomed to seeing a young knight fall off his horse a few times while learning the ropes. It is considered highly impolite to laugh, especially since a knight may wish to test the sharpness of his blade on a giggling peasant.

Bretonnian Characters are completely unable to see through her disguise, even though it consists of a short haircut, a suit of armor, and the occasional burp. Other Characters may take a Perception Test to realize that he is a she, but they will be unable to convince Bretonnians of the fact, who will explain away almost any evidence, no matter how fanciful their explanations become. The very idea of a woman pretending to be a man is simply beyond most's ability to conceive.

The crest of Sir Boris is quartered, black and white, and depicts the head of a ferocious Artois boar and a lance on the white quarters.

Louis le Spider

Race: Human
Career: Bone Picker

"I was just looking at it and it went off! I didn't mean to scare anyone."

Louis, or "Spider" as he is known for his wasted, stick-like limbs and strange, scurrying gait, was born in the cursed duchy of Mousillon. Deformities like his are tragically common in that land, and Spider lived in a shanty town made up of freaks like himself in the heart of a swamp. Spider was a loner who scraped an unhappy living together by dredging junk from the swamp-water, which he sold in Mousillon City, and it was while checking his nets that he found Sir Boris, injured after an encounter with the less friendly inhabitants of the swamp. Spider took the knight in and helped her recover, though his neighbors disliked the idea of allowing an outsider into their community. Eventually they formed a mob to burn Sir Boris, and she and Spider were forced to flee the swamp.

Spider has never traveled outside the duchy in his life, and he views every new sight with wonder. He's never had much in the way of friends either, so the time he spends with the knight's retinue is the best of his life. He has a tendency to wander around with an idiotic grin on his face, gawping like a tourist and fiddling with unfamiliar objects, which can lead to trouble. More than once he's wandered off to have a closer look at something interesting only to cause problems for his friends.

Pascal

Race: Human **Career:** Smuggler

"Just because it's illegal doesn't mean it's wrong, you know."

Pascal thinks of himself as a basically honest man forced into dishonest ways to make a living, although he secretly enjoys the covert activities he engages in. The taxation system of Bretonnia is designed for peasants who don't take their goods further than the nearest town, and a trader with an eye for good deals over long distances like Pascal would be impoverished if he paid the required one turnip out of every three in each fief his goods passed through. Smuggling is the only viable option, although Pascal had never smuggled people -- or a horse -- before Sir Boris and Spider asked for his help in leaving Mousillon with haste. Pascal was eager to leave himself, as he and his associate, Algernon, had run up some debts during their visit and the collectors were about to catch up.

Pascal has continued to travel with Sir Boris because it makes for an excellent cover. He's eager to see foreign lands, especially lands where a canny businessman like himself can make a quick buck without being ripped-off by the toffs. Although he won't admit it to himself, there's another reason he's joined Sir Boris's retinue. He's found himself deeply attracted to the knight, which is disturbing for someone like Pascal, who's always thought himself a lady's man.

Algernon

Race: Human
Career: Pit Fighter

"You want me to tell you the odds of my fist breaking your jaw?"

Algernon was an orphan living on the streets of L'Anguille when a dockside gang took him in. He grew up a petty thug and bare-knuckle brawler who found a little infamy in Bretonnia's fighting pits. It wasn't until he corrected a bookie laying odds on one of his fights that Algernon's other gift came to light; he may be illiterate, but he never gets the numbers wrong. There are plenty of opportunities for a numbers man in the criminal world, and Algernon found himself performing the calculations for Pascal's many scams, as well as providing occasional muscle. These scams were never as profitable as they could be, and the money never lasted long.

The hero game is very high-risk, but Algernon thinks it will be worth it in the long run. He's finding that he enjoys spending a little time on the less dubious side of the law, and he's become fast friends with Louis (Algernon is the only one who doesn't call him Spider), who shares his, shall we say, intellectual simplicity as well as his zeal for life, seeing new things, and meeting new people -- even though he often ends up hitting those people rather a lot.

Top Dogs

Published by [Playroom Entertainment](#)

Designed by Maureen Hiron

Art by Randy Martinez

Boxed set with 115 full-color cards and instruction booklet (in English, Spanish, & French); $12

Huskies, as it turns out, are among the most willful of canine companions. You have to keep on top of them, or they'll try to establish dominance in your household . . . just ask Cuba Gooding, Jr.* But they are an invaluable part of any successful sled team, so make judicious use of them as you compete in *Top Dogs* from Playroom Entertainment.

The object of the game is to score the most points by the end of two full hands.

Each player takes a Musher Card showing his racer -- which one doesn't matter, they're simply a fun way to identify who's who. Of course, the same can be said of the car in *Monopoly,* so there very well may be arguments here about who gets to play the yeti or the polar bear. All players have an identical hand of 20 cards showing the dogs they have to choose from for each race.

The Trophy Deck consists of 10 Trophy Cards, each representing one of the races you'll run (or the Iditarod in general, depending on which back story you like the most). The decks are shuffled, the top Trophy Card is flipped over, and everyone draws the first seven cards from their deck. Different kinds of dogs are worth different numbers, so the lowly Chihuahua is only printed with a two while the Huskies, very much in their element, are worth a full six. Each race requires you to play three dogs to create your team.

Like numbers are multiplied by one other, while unlike numbers are added. For example, a team of Poodles, with a printed value of three, would be worth 27 points in a race ($3 \times 3 \times 3 = 27$). If you couldn't field a full rein of Poodles and threw in a German Shepherd (valued at five), you would multiply the two Poodles and add the Shepherd ($3 \times 3 + 5 = 14$). Everyone compares their total, and the highest score wins the race and takes the cup. If two or more racers tie for the top spot, however, they're so busy maneuvering against each other on the path that they allow the next-highest number to slip by to victory. Committing your best hand on the big-value cups may not be the savviest strategy in the long run.

You have to discard an extra card after each race, so you can't always build the perfect hand by holding back all the right cards, either. When you get to the bottom of your deck (and yes, the last hand will be whatever you can cobble together from your last four really lousy cards), you shuffle it all together again and vie for the next five Trophies. The cups are valued from seven to 16, though it's not a linear progression; the values are doubled in some places (two sevens, two nines . . .). Whoever has the highest total from all their Trophy Cards wins.

Visually, the game is easily a winner. The cute illustrations are wonderful, using big, bold strokes and color that contrasts sharply with the wintry backgrounds. The component quality is equally commendable -- good, tough cards ready for wear and tear even by the most eager youngsters at the table. While the distinct texture of the cards doesn't prevent smooth shuffling, there's still the danger of starting a small fire, kind of like wearing a pair of corduroy pants.

The races are an excellent way to introduce your younger gamers to math, though the adults can find enough challenge

in the rules to keep them entertained in spite of the age difference. It's odd that a game that touts the numbers side of things also tells you not to worry about the math (they provide the cube root of numbers two through six for you), but barring one of those "perfect three" hands, you can still sneak the little ones a bit of number-crunching and they're none the wiser. Adults don't need to play with kids to find the game engaging, but while the box says it seats three to five players, it's better at the upper limit. Otherwise, you're not trying to outthink enough opponents.

The mechanics may not be terribly original, but they are ideal for a game from a company that manages to stick all that lousy book learnin' into their products. ***Top Dogs*** keeps play moving, and while it won't form the bulk of the evening's entertainment, it's a gentle way to dip one's toes in the water, and could be good connective tissue between other, bigger games throughout the night.

*Not included.

Executive Decision: A White-Knuckle Game Of Real-Time Political Crisis

Written by Greg Stolze with D. Vincent Baker, Dennis Detwiller, Ron Edwards, Daniel Solis, & Chad Underkoffler

Layout by Daniel Solis

310kb Zipped File containing one 309kb & one 222kb PDF documents; $1,000

The first thing you may well have noticed about this game is the price.

It really did cost a $1,000.

Fortunately you can now get it for free. Go to the publisher's website and download it now, but do something else while you are there. Make a donation. For *Executive Decision: A White-Knuckle Game Of Real-Time Political Crisis* is part of a number of roleplaying projects created and sold to raise money for the Hurricane Katrina Relief efforts. Yet where others have used the more traditional method of donating an amount based on the number of books sold, *Executive Decision* employs the "Ransom Method."

Particular to the use of the PDF format, under the Ransom Method, an author announces that he has a game or book ready to release, but will only do so once a certain amount of money has been donated. In this case, $1,000 -- all going to the American Red Cross. Elsewhere Dennis Detwiller is using the same method to fund the release of a series of scenarios for *Delta Green,* the highly regarded modern conspiracy setting for *Call of Cthulhu.*

As the title suggests, *Executive Decision* is actually pertinent to the disaster it is intended to raise money for, because as politicized as Hurricane Katrina and its effects have become, this game deals with the subject of politics, and then at the highest of levels. Where most recent political games concentrated on getting elected to the position of President of the United States of America, *Executive Decision* is solely about the decisions made while holding that office.

The set-up is simple. One player takes the role of President (preferably whomever bought the game), while the others take those of members of his cabinet: the Secretaries of Defense, Commerce, Agriculture, the Interior, Labor, State, the Treasury, plus his Vice President, Attorney General, and Chief of Staff. Over the course of a crisis -- the President announces the details of which as they occur -- the members of the cabinet debate the situation at hand and give advice to the President. Their input influences the decisions he must make at each stage of the crisis. Of course the President is under no obligation to do so, but whatever he does decide will in some way support one or more agendas of his cabinet.

It is only these agendas that define each role; the Secretary of Defense is Pro-Military of course, the Secretary of Commerce pursues Economic Development, the Vice President seeks greater Tax Revenue, while the Chief of Staff is concerned with Voter Satisfaction. Only the Secretary of Agriculture comes without a defined agenda. In addition a player can choose as many as three extra agendas, which can be revealed before the game starts or kept secret throughout. A player cannot acquire or change an agenda during the game.

Game play is simple, requiring no other components than pens, paper, and a mirror. The latter is necessary because parts of each scenario are printed in reverse so that only the President can read them using the mirror. Alternatively, he can just use it to make sure he looks good on camera. At the beginning of a scenario or crisis, the President announces the situation and asks for advice and thoughts. Members of his Cabinet are expected to argue, debate, and harangue each other, and the President is expected to encourage this, literally playing Devil's Advocate as well as the role of the

referee.

After roughly 20 minutes have passed (or the players have exhausted the debate), the President receives developments on the situation (revealed by use of the mirror) and after informing the Cabinet, the debate continues. This occurs usually two or three more times over the course of a crisis, until about an hour or so has passed. At this time each member of the Cabinet asserts his position and advises the President, who then takes his "executive decision."

Depending upon this decision, a player receives or loses points for the agendas that he favors. If the outcome for an agenda is up, he gains a point, if an agenda is down, he loses a point. At the end of the game and crisis, the Cabinet member with the most points is the winner.

In effect *Executive Decision* is a LARP, not dissimilar to a Murder Mystery Party game, but one that can be played while seated as if the players were in the Cabinet Room or Oval Office. Three to six players are suggested, but there is no reason stopping 11 participating, with 10 as members of the Cabinet, and the 11th as the President. Players can choose to dress up for the part or not, nothing more than suits being required; while your venue for the game can dressed up as is your wont, although where you get the Philippine busboy to serve the coffee is your own affair. The only real skill required by the participants is an ability to present an argument, hopefully one that is persuasive.

The simply presented PDF comes in two versions, one complete at 15-pages long that includes the game's rules and the five crises presented in mirror format. The other is four pages shorter and gives the scenarios in an un-mirrored format. The five scenarios -- written by some of the industry's leading lights -- take in turn crisis that involve domestic and foreign politics, and naturally are all very American. This isn't a criticism, but it means that the players need to have an awareness of American politics and government. Which of course, can be acquired through a little research or watching *The West Wing.* And while the game is about politics, it is non-political; it does not push an agenda of its own or hove to any particular party line, though doubtless participants will bring that to this game's table. The five scenarios can also serve as models for further crises, the details of which are up to the President's imagination and a little research, whether from the news, history, or Tom Clancy novels.

Having played in similar scenarios before, such experiences have tended towards the consensual, the results towards the compromise. Not so *Executive Decision,* which is intentionally adversarial from the outset. It is this that is likely to push the scenarios beyond the hour's length given for each and hopefully provide a good natured and hopefully politically enlightening evening's worth of entertainment.

The West Wing RPG this is not -- it involves less walking -- but *Executive Decision* is a roleplaying game that, like the Murder Mystery Party format, should appeal beyond confines of the hobby. It is aided in this in its simple rules and quick set-up time; the length of preparation required being no more than 10 minutes. To what degree the game simulates the events and processes of making an executive decision is another matter, but it certainly simulates it as we would imagine it to be. Plus it is probably the closest that any of us will come to giving advice to the President of the United States of America.

That *Executive Decision: A White-Knuckle Game Of Real-Time Political Crisis* is free and available speaks of the generosity of both the contributors who created the five crises, and those that contributed to its ransom. It would be trite to say that the best things in life are free, but even though this game is effectively both, there is no reason not to make a small donation.

--Matthew Pook

Unlimited Adventures In Limited Resources

As I begin to type this column, I have about 15 hours before I need to head out the door to catch a plane. While millions of my fellow gamers are traveling during this week *into* Indianapolis for the eleven-jillionth annual GenCon extravaganza, I'll be spending my first GenCon weekend in Indy flying *out* of the city for the World Yo-Yo Contest, an event I've helped run for seven years now, despite not being able to throw a yo-yo consistently without konking myself in the head.

Where was I? Let's see . . . head injury, fleeing Indianapolis, promise of an uncomfortable flight, ah . . . here we are! Fifteen hours. Right.

Anyway, in that time, I need to finish *Pyramid* (including writing my column), find some books in the Closet of Doom that I haven't seen long before we moved, go to the library lest bespectacled Indy librarians release a white weather balloon to retrieve me, pack, and make sure about a jillion other things are done.

In 14.75 hours.

Now, many games are built around limited resources in a thousand different ways. Spell points, skill points, gold pieces, willpower, and so on. However, limited resources can also be a wonderful hook to build an adventure on. Unfortunately, they're often not considered very often in many games I've been a part of; for example, the adventure might *say* that there are only a couple hours before the Bad Guys attack, but if the players hem and haw and plot and scheme, most GMs I've seen will permit the players to ponder their options, so long as it continues to be interesting.

For a resource to be limited, there needs to be enough of it to be considered a resource. As a example, let's say you've got a dungeon crawl where a demon appears before three doors. "You can open exactly one!" the demon proclaims, cackling maniacally. Okay; in this instance, no one would think of door-opening capability as a limited resource; it's simply a single choice. No; for door opening to be a limited resource (ironically), there needs to be the possibility to open more than one door. For example, if the PCs are in a space opera and exploring a derelict ship (a "dungeon crawl in space"), the hacker in the party might realize that he can only open 10 doors before the self-defense systems activate and destroy the ship. Now *that's* a limited resource; each door will be met with apprehension and consideration.

On a slightly more realistic example, I know many GMs who -- thinking of the limited resource of time -- will say something like, "The bad guys will storm the warehouse in two minutes." Unfortunately, most players can't formulate effective use of that time, coming up with little more than "We hide behind some crates" or "We run out the back." In this case, again, time isn't a limited resource; it's the frame of reference for a single choice. But consider something like, "You know that the vastly powerful bad guys will make an attack on your castle in three months. What do you do?" In this case, three months is enough time to come up with a plan (even an elaborate one), *but* it's not an endless amount of time. (For example, if the neighboring allied kingdom is a month away, then that permits only one round-trip to muster up additional forces.)

For a resource to be limited, it needs to be known that it's limited. If the players don't know that magic wands have charges (since it's fairly common in literature and tales for such devices to work indefinitely), then it's not a consideration of limited resources if the wand runs out; the player never had any actual chance to consider. Likewise if the heroes didn't know that the Evil Neighboring Kingdom was planning on attacking, then the time they have left isn't a limited resource (even if it *did* take three months for the bad guys to schlep over to their kingdom).

Here are some ideas -- jotted quickly and without much consideration because, hey, I'm outta here in a few hours -- to incorporate limited resources into your game:

Time

In a lot of ways, the most obvious limited resource. We all feel the pressures of a lack of time in various situations, and we all know that our days are finite on the ol' cosmic clock. The examples mentioned previously about being attacked within a certain amount of time are classic examples of time as a limited resource, as is the Big Event (you know . . . the boxing championship, the big race, the show choir event, or all three). Here are a couple more ideas for using time.

- Someone the PCs like and admire will be dying in a relatively short period (say, a week). If the person can be cured, it's a race against time. If the person can't, it's a limited resource of spending time with that individual; for example, if the person is a mentor (martial arts trainer, mystic tutor, or the like), then this might be the last chance to pass on any words of wisdom from that person.
- Alternatively, someone the heroes *don't* like will be dying shortly. In this case, maybe the heroes only have a certain amount of time to get information out of him (such as the secret to cure a long-standing problem), or -- for more character-driven campaigns -- to attempt some sort of resolution with that character. Or perhaps the villain is using the opportunity of his impending demise to "go out with a bang," plotting something big. (The Joker's looming death was the basis behind the forgettable DC comic mini-series event *Last Laugh.*)
- Finally, time can be the basis for a campaign, such as a series centered around the idea of the heroes only having a year to live.

Money

Do you want to make more money? Sure; we all do! This is another one that tends to be well-known by most people. In fact, it's probably more well-known by *gamers* than most PCs. (I, for one, tend to have an abnormal percentage of people with various high levels of wealth.) However, it can still serve as a good basis for some campaigns. The biggest obstacle is keeping the heroes from chipping in their own money or resources (assuming that's undesirable to the GM's vision); if the GM wants to prevent this, maybe the heroes' money isn't directly translatable or easily convertible in the situation. ("Here in the Mushroom Kingdom, we have no notion of this . . . Master-Card?") Or perhaps the money involved is beyond the pale when it comes to the scenario at hand; even being a billionaire doesn't mean too much if the heroes suddenly become involved with, say, designing the U.S. budget.

- The heroes are given a sum of money to accomplish some goal, such as fix up a castle/headquarters/road house. This is especially good in games (such as the base *d20 System*) which require a monetary expenditure for the creation of magic items; the heroes get a million gold specifically for the purpose of building magic items to ward off the local reign of the monstrous Foba Bett.
- Alternatively, they are given a sum of money with a direct mandate (such as being given a million gold coins with the restriction that they can't go to anyone the heroes know directly, or $100 million to devote to charitable causes).

* * *

I may well return to this topic next week, once my plane lands back in sunny (well, flat) Indiana. Until then, I hope everyone who's at GenCon has fun, and maybe you'll raise a glass or roll a crit in honor of my lack of presence.

Because, let's face it . . . I'm a limited resource.

--Steven Marsh

Omicron Polypi

for *GURPS Space*

by William H. Stoddard

Centuries in the future, the human race has established itself in dozens of solar systems. One of the newest colonies is at the solar system of Omicron Polypi, a double star with some unusual features. Both stars in the system are orbited exclusively by terrestrial worlds; there are no gas giants. Omicron Polypi A is a red dwarf; its second planet, Penelope, is one of the galaxy's comparatively rare garden worlds. Omicron Polypi B is a white dwarf, but earlier in its history it was an F5 V star, and then passed through subgiant and giant stages, during which its planets were transformed by ferocious heat. For the past 2.7 billion years, they have been at the other extreme, at cryogenic temperatures ranging from 92 K down to 24 K. During the two stars' closest approach, a distance of 25 AU, the planets of Omicron Polypi B get nearly as much light and heat from Omicron Polypi A as from their own star!

The detection of an Earthlike world attracted a consortium of colonizing organizations, Societas Mundi Viridi. Eighty years ago they staked their claim to Omicron Polypi, established their first colonies on Penelope, and set up outposts on other planets: Achilles, an ammonia planet, and Hector, an exotic large planet orbiting Omicron Polypi B. These were followed by colonies on several planets of the Omicron Polypi B subsystem, and by conflicts in both intraplanetary and interplanetary politics. As yet, none of them has reached the point of open war, but there have been several crises, and if the next one were mishandled, somebody might start shooting.

Omicron Polypi is designed to serve several purposes. It can be a setting for a continuing campaign about life on the interstellar frontier. It can also be a place for interstellar traders or diplomats to stop off and get caught up in local politics and markets. Its worlds are exotic enough to be interesting to a scientific research team. Finally, it's an example of solar system design using the **GURPS Space** design rules -- and exploring some of the interesting options within those rules.

As presented, this material assumes that faster than light travel is possible, and inexpensive enough to allow trade in luxury items and skilled services, but not in bulk goods. Much of it can be adapted, though, to a setting without FTL, where the colonists are *really* on their own.

Penelope: The Primary Colony

Settled 80 years ago, Penelope now has a population of just over half a million. The children and grandchildren of the original settlers are now in the majority, and the children are taking over leadership from their parents. Space remains accessible, thanks to the many shuttlecraft that came with the colonial fleet, but many members of Generations One, Two, and Three are mainly interested in the planetary surface.

The system is 7.8 billion years old, and its habitable zone is close to Omicron Polypi A. Penelope orbits its star at 0.20 AU. It has settled into a 3:2 resonance, in which its day is 110 standard days long, twice the length of its year. No part of its surface is permanently in the dark, but the surface temperature changes drastically between day (average noon temperature 90°F) and night (average midnight temperature 38°F). Thanks to a very small axial tilt of 2°, the temperature is only slightly colder at the poles than at the equator. On Penelope, Dawn, Day, Twilight, and Night are the names of seasons. Rainfall is heavy during Dawn and Dusk, and lighter during Day, especially in continental interiors; plants typically have a vigorous growth phase during Dawn, store up

Backstory: New Constellations

As humanity expanded through the galaxy, astronomers discovered new stars, which had been hidden from Earth by interstellar clouds, or simply too faint and far away to be seen. In systems close to Sol, astronomers simply added the stars to the familiar constellations. Farther away, newly seen stars outnumbered familiar ones, familiar stars sometimes appeared in different constellations, and the shapes of constellations were

energy during Day, and produce fruits and seeds during Twilight. Little atmospheric moisture makes it into deep Night, and most of it falls as snow or sleet rather than rain.

Given its age, Penelope has built up a lot of continental crust; just over half its surface is land. Its interior heat is too low to drive plate tectonics; its continents have stopped moving -- fortunately for its climate, they're fairly widely dispersed, not clumped into one huge arid mass. There are still a few active volcanoes, shield volcanoes somewhat like Mauna Loa on Earth. About half of these are in the oceans, where they have produced big volcanic islands; the other half are on the continents, where they tower over the level ground that surrounds them.

Penelope's age has also affected its native life. Seemingly the planet never developed a fully sapient race comparable to humanity. But with an evolutionary history 50% longer than Earth's, its larger animals have undergone an evolutionary arms race that drove many of them to high intelligence and complex behavior. The average herbivore is at least as smart as a pig; the average carnivore is comparable to a monkey. Several species are at IQ 6, the lower edge of true sapience. To add to the complexity of the situation, several long-separated continents have independently involved their own borderline sapients. How to deal with them is a big policy issue for Societas Mundi Viridi -- and a challenging practical question for human settlers who have to protect their crops from alarmingly cunning thieves.

The simple physical conditions on the surface also offer challenges. The planet's gravity is 1.3G, so an average person has 45 lbs. of encumbrance when stark naked; most people are at medium encumbrance or worse. The high gravity also puts newcomers to Penelope at 1 to DX, but this doesn't affect experienced colonists (who have two levels of Improved G-Tolerance) or their children who grew up on the planet (whose home gravity is 1.3G). Both high gravity and a dense atmosphere, with lots of neon and helium, contribute to an atmospheric pressure of 6.50 atmospheres. Penelope's oxygen level is actually somewhat low, so this is treated as Dense rather than Very Dense, giving 1 to HT rolls but avoiding the toxic effects of very high oxygen concentrations. Children raised on Penelope have a native pressure of 1.30 atmospheres and suffer no HT penalties from Penelope's atmospheric pressure, but have to acclimate to the comparatively thin atmosphere that's maintained on space stations.

The upper classes among the colonists still send their children into orbit, both for advanced education and as a rite of passage, like the traditional European tour of British aristocrats. Many colonial children remember their early weeks in orbit as a time of chronic discomfort, fatigue, and physical awkwardness. Some colonists advocate resetting all orbital facilities to Penelope's surface pressure and gravity; few people in the orbital population want to go through this change, and many of the upper classes take perverse pride in the hardships of their adolescent years, so the stations currently maintain 1.0G and 1.00 atmospheres.

Penelope's government is a corporate state, owned and operated by Societas Mundi Viridi. Administrative Rank in the corporation is an important source of Status. So is Wealth, especially in the form of corporate shares. Every adult is issued one corporate share, worth $75,000 and granting Independent Income 1 (a subsistence allowance of $750 a month) -- but he's expected to pay for it, and deductions are taken from his corporate pay or business profits until he has paid it off. This grants him the right to vote in shareholders' elections. Wealthier adults can own many shares and have extra votes. The Control Rating is 4, representing strict environmental and planetary development regulations, enforced public morality, severe punishments, and a general willingness of corporate management to interfere in people's lives; on the other hand, taxes are low and there's some regard for economic freedom. The planetary government has a Corruptibility of 1, indicating that skill in dealing with corporate management can get around the more oppressive restrictions. Technology is at TL11, but equipment available on the planet costs about 10% more than in orbit.

Penelope has a Class III spaceport. Other installations include the following: the base of operations of a smuggling organization; an espionage facility run by Societas Mundi Viridi and seeking information on criminal and underground

political movements; a large research base devoted to the ecology and evolutionary biology of indigenous life; and a meteorological research center funded by an association of landholders.

To minimize ecological impacts, the settlements on the ground have been placed on large islands close to continental landmasses; the continents themselves are reserved for scientific expeditions to explore. Orbital imaging has good enough resolution to locate unlicensed settlements, though sophisticated camouflage measures might conceal them. About 10% of the ground population is farmers and their families; another 5% is explorers, forest rangers, field ecologists, and other wilderness-oriented people. The native life is biochemically compatible with the colonists, and long-term projects are trying to identify species suitable for agriculture or fisheries.

Life in Orbit

Not all the inhabitants of the system are on Penelope's surface. The colony ships that brought them to the system are still there, mostly in orbit around Penelope. Three groups of them occupy orbits 120° apart, providing satellite radio links for communities on the planetary surface. These are not synchronous orbits; because of Penelope's slow rotation, synchronous orbit would be 279.5 planetary diameters out, a distance at which the star's gravitational influence is ten times stronger than the planet's, so that the "satellite" would actually be an independently orbiting body. Rather, the orbital clusters are 41.5 planetary diameters out and orbit Penelope ten times each planetary "day."

Most of the system's manufacturing also takes place in orbit. Government, corporate management, and higher education are mainly space-based as well. The total orbital population is 45,000. About one-third of these are support workers who maintain the orbital infrastructure. Their wealth ranges from Average to Comfortable; the corporate executives and research workers they support range from Comfortable to Wealthy, with a small upper stratum who are Very Wealthy or better.

Mining Colonies

None of the other planets of Omicron Polypi A has been colonized, but several planets of Omicron Polypi B have colonies, set up to exploit their mineral resources. Whatever their original character, all these worlds suffered catastrophic heating during the star's supergiant phase, with surface temperatures from 467 K to 1,743 K! The heat drove off their atmospheres and their surface water or ice, leaving them as bare rock, often with valuable mineral deposits. Societas Mundi Viridi began licensing mining development ventures as soon as its population was large enough to need the industrial base. All of the colonies have Struggling Wealth levels, because of the need to cope with difficult environments.

Paris (Omicron Polypi B 1) is a small rock world tide-locked to its star. Its day side is at a fairly stable 262°F. Its night side falls as low as 443°F. However, with an axial tilt of 28°, it has a large "twilight zone" that fluctuates between these extremes. In addition, the light of Omicron Polypi A is bright enough to raise its nightside temperature during the half of its 51-day year when the two stars face opposite hemispheres, to between 417°F at theirs closest approach and 433°F at their most distant. The mining sites are all on the relatively mild day side.

Paris was settled 50 years ago by a mining firm set up as a technocracy. But a combination of harsh management (Control Rating 5) and official corruption (Corruptibility 4) increasingly alienated the work force and even lower managers, provoking a massive strike 25 years ago, followed by the founding of a new government -- one that revived the ancient concept of representative democracy, with each mining site electing delegates to a Board of Directors. The new regime has Control Rating 2 and Corruptibility 1. Most assets of the former corporation were reassigned to local cooperatives as settlement for grievances. The metals and minerals that the miners produce are too valuable for Societas Mundi Viridi to stop trading with them entirely. Paris is now a low-tech colony, with 20,000 inhabitants, without much equipment above TL10.

Priam (Omicron Polypi B 2) is another tide-locked world, much like Paris, but colder and smaller. Its mineral deposits are unusually rich; a mining colony was established there 70 years ago, only a decade after the colonial fleet arrived. The operating firm, Planetmines Limited, is a harshly run but honest technocracy, with Control Rating 5 and

Corruptibility 0. Priam has 30,000 inhabitants in a few large sites, with much of the firm's output being invested in industrial growth rather than high standards of living.

Andromache (Omicron Polypi B 4) is another very small world, but has a single moonlet orbiting it. Its day is two of its years long, so it has no permanent day or night side; its average temperature is 383°F, with drastic fluctuations between day and night. Its operating firm, Song Pappas, established 60 years ago, is another technocracy, but a comparatively liberal one, with Control Rating 4 and Corruptibility 1; skill in Administration can arrange a fairly comfortable life. Its total population is now 20,000.

Cassandra (Omicron Polypi B 5) was colonized by a different sort of organization: a group of engineers who believed that open communication was the basis of scientific and technical progress. They established a political system based on such communication, carried on via a computer network -- a cybernetically based Athenian democracy. A legal system based on full disclosure of information keeps its leaders extraordinarily honest; the planet has Control Rating 4 and Corruptibility 0. Cassandra has grown slowly, and currently, 70 years after its founding, has no more than 5,000 people.

Research Stations

Achilles (Omicron Polypi A 3) is an ammonia world, a comparatively rare type of planet. Despite its harsh conditions -- a lethally toxic and corrosive atmosphere at a frigid 192°F -- it attracts planetary scientists interested in studying its unusual environment, and sometimes hoping for evidence of ammonia-based life. At 6,000 inhabitants, it's actually a larger community than Cassandra, but it remains dependent on Penelope for both government and economic aid.

Hector (Omicron Polypi B 3) is sometimes called "Penelope's twin": the two worlds have almost identical mass. But Hector has a far more exotic history. It started out as a large greenhouse world, with a hot, toxic atmosphere. During its star's long period as a giant, its surface temperature reached a peak of nearly 1,400°F, which drove off nearly all its formerly dense atmosphere, turning it into a chthonian planet. Then the transformation of its start to a white dwarf plunged its temperature to 363°F. As a result, it's now effectively a rock world, but an extraordinarily large and cold one, with a surface gravity of 1.54G.

During the chthonian episode, Hector's crust underwent massive changes, which were then frozen in place and preserved. The study of these changes became a major focus of Societas Mundi Viridi's attention 60 years ago, when a research base was established. Hector's population has grown to 10,000, but it's still primarily focused on scientific research; the planet is legally off limits to commercial exploitation and to colonization. The planet's deep gravity well makes this somewhat easier to enforce, as the cost of lifting minerals out of it makes them economically uncompetitive. The high gravity has also favored recruitment of personnel from Penelope's colonial population, who are already accustomed to a relatively high native gravity and find adapting to Hector less stressful.

Political Stresses

Politics in the Omicron Polypi system is mainly administrative rather than electoral. Societas Mundi Viridi does have a board of directors, but the shareholders have always voted to accept the directors recommended by corporate management. The ability of the wealthy to purchase additional shares

Under the Hood: The Light of Two Stars

The standard *GURPS Space* rule for calculating a planet's temperature assumes that all its light and heat come from one star. This doesn't work for Omicron Polypi B. It's so faint that its planets receive nearly as much light from Omicron Polypi A, despite its being many times farther away. So figuring their surface temperature requires taking the light of both stars into account.

Unfortunately, it's not accurate simply to figure the temperature based on each star separately, and add the two temperatures together. Temperature is proportional to the *fourth root* of luminosity, and it's the luminosities that have to be added.

So, for example, Astyanax (Omicron Polypi B 6) has a blackbody temperature of 25 K, based on its orbital radius of 3.76 AU and Omicron Polypi B's luminosity of 0.001. But it also is lit by Omicron Polypi A, which has a luminosity of 0.037. Its distance from that

and thus gain plural votes encourages a conservative approach; management would have to offend the older, wealthier, and higher ranking shareholders to have a significant chance of getting itself voted out. Ambitious men don't run for office; they manage projects and corporate divisions and build alliances within the corporate hierarchy.

The biggest ongoing debate within corporate management is between the conservers and the accelerators. Conservers generally favor keeping large parts of the system undeveloped, in the hope of larger payoffs from new scientific knowledge. Accelerators favor immediate development and rapid population growth. The issues are especially acute for the Penelope colony, which has to deal with indigenous life, including many animal species with IQ 5 or 6. To the conservers, these are potential sapient life that ought to be allowed to evolve. To the accelerators, they're dangerous animals. It's not at all a coincidence that many colonists favor acceleration, while many space dwellers favor conservation. "Footprint" is the political catchphrase for this issue: conservers want a small footprint, whereas accelerators find a bigger one acceptable.

The question of renormalizing the atmosphere and gravity in space facilities to match Penelope's surface conditions (1.3G and a dense atmosphere rich in noble gases) has become a symbol for many of these conflicts. Many Penelope colonists feel that renormalization would affirm that Penelope is the human race's home in this system, and the conditions on its surface are its new native environment. Keeping the facilities at 1.0G and standard atmospheric conditions strikes them as saying that humans will always be temporary guests on Penelope -- or that people who adapt to living there are marginal, with real civilization being elsewhere.

Currently, Achilles is the focus of a related conflict. The Wellspring Group, made up of wealthy investors with a background in high-tech projects, has submitted a proposal to open up the planet to economic development, as a source of carbon and nitrogen compounds. The staff of the current research base mostly oppose this, believing that more study of Achilles's native conditions is needed before anyone risks modifying them. Small-footprint and big-footprint factions have lined up behind the two points of view, mobilizing support for the board of directors granting or withholding a license to the Wellspring Group.

The minor colonies have their own politics, of a rather different kind. Nominally they're all licensees of Societas Mundi Viridi; practically they're sovereign states. This was made clear when Societas Mundi Viridi refused to intervene after the General Strike on Paris, stating that it was an internal issue.

Technically, what the Paris miners did was neither theft nor expropriation. The General Strike was settled by miners being seated on the board of directors of Aotaiyo Corporation as stakeholder representatives. This led to radical changes in corporate policy, including open licensing of mining claims. A miner no longer had to get corporate approval in advance to explore a site; if he presented evidence of valuable minerals, his claim would be registered automatically. Aotaiyo agreed to divest itself of many of its subsidiary ventures, and ended up as one business corporation among many on the planet it once ruled -- without any actual fighting, though there was certainly political and economic pressure. The managers of Planetmines Limited and Song Pappas have taken this as a warning, and are trying to make sure their own employees don't follow suit. Planetmines in particular is bitterly hostile to the new regime on Paris. The cooperative on Cassandra regards it much more sympathetically, having already set up a democratic political system of its own.

Ironically, Priam and Paris are in agreement on one big issue: Both worlds adhere to the accelerator viewpoint very strongly. Andromache's government also generally supports this viewpoint, whereas Cassandra's leans to the

star varies as the two stars orbit each other; their closest approach is 25 AU. Astyanax is sometimes closer to Omicron Polypi that that and sometimes farther, but it averages the same distance, which is close enough for an estimate. The blackbody temperature for luminosity 0.037 and radius 25 AU is 24 K.

To combine these two luminosities, we can raise the two blackbody temperatures to the fourth power, add them, and take the fourth root. The result is 29 K, only a few degrees hotter than either star's light separately would account for -- a lot less than their sum, which is 49 K! The average surface temperature is 97% of this, or 48 K.

This formula works for any two blackbody temperatures. Take them to the fourth power (that is, square them twice); add them; and take the fourth root (that is, take the square root twice).

conservers.

Attitudes

Here's a quick summary of how the colonies look to each other:

Penelope: To Paris, a stifling bureaucracy, most of whose people can't appreciate real freedom. To Priam, a sleeping giant that lacks the will to be a real threat. To Andromache, a useful but bafflingly complex and corrupt market. To Cassandra, a society lacking in ideals.

Paris: To Penelope, a tolerable evil, providing a useful safety valve for rebellious impulses. To Priam, a mob society run by a gang of thieves. To Andromache, an outlaw regime, but not a dangerous one. To Cassandra, a subject of mixed feelings -- their democratic institutions are admirable, but their wildcat frontier capitalism is dubious.

Priam: To Penelope, an overregimented society, but not a real threat. To Paris, a boastful crew who can't function without a foreman to tell them what to do. To Andromache, a case study in bad management and poor morale. To Cassandra, a potential threat that somebody ought to put a stop to -- somebody other than Cassandra, if possible.

Andromache: To Penelope, the one real success story among the licensees. To Paris, worthy of grudging respect for honest dealing and keeping their agreements. To Priam, a lot of inefficient idealists who don't know how to get things done. To Cassandra, a valuable trade partner; they show that business management doesn't have to be unethical.

Cassandra: To Penelope, a valuable source of ideas, and also a place to send overidealistic young people. To Paris, a lot of weird intellectuals, but at least they have some regard for freedom. To Priam, a waste of resources on impractical ideals. To Andromache, a potential trade partner, but frustrating to deal with because of their insistence on debating everything publicly.

Seed Crystals

GMs wanting to use Omicron Polypi in a campaign may find the following approaches useful. First, some approaches that will work for a group of interstellar visitors, as an episode in a larger campaign:

Cargo: A free trader learns of trade opportunities at Omicron Polypi (if necessary, they can be lured there by a contract to haul a consignment there). Suitable cargoes include most sorts of current high-tech equipment, especially ecosurveillance devices, up-to-date medical supplies and equipment, and computer hardware; if they want bulk cargoes, insystem drives and mining machinery would be salable. When they arrive at Omicron Polypi, they find a well-established orbital marketplace -- but they also come in contact with representative of other worlds who would like to trade with them directly; smugglers selling products outside the regulated corporate trade channels, or prohibited goods such as Penelopean fossils; and government representatives from Priam or Paris who would like to purchase military gear from other systems. Which of these gray and black market channels they take a chance on

Under the Hood: Hector's Thermal History

Over the course of its lifetime, Omicron Polypi B went through several stages with different luminosities. As a main sequence star and a subgiant, it had luminosity 4.5. When it became a giant, its luminosity was 25 times as high, or 112.5. Now, as a white dwarf, it has luminosity 0.001.

This drastically altered the conditions on all of its planets. But the changes were biggest on its third planet, Hector.

Hector is a large planet, orbiting 0.77 AU from its star. During Omicron Polypi B's early life, this gave it a blackbody temperature of 462 K, which made it a greenhouse planet. But when Omicron Polypi B became a giant, Hector's blackbody temperature rose to 1,032 K, well into the chthonian range. The intense heat drove away Hector's atmosphere, leaving it with only a trace of gases replenished by solar wind. At the same time, much of Hector's crust melted. Then Omicron Polypi B diminished to a white dwarf, dropping Hector to its current blackbody temperature of 56 K. Normally this would make it an ice world, but with its atmosphere already driven off, it has nothing to form ice with. Instead it becomes an anomalously cold rock world. The other planets that orbit Omicron Polypi B had comparable, but less extreme

file:///D|/To%20Update%20Torrents/GURPs%20to%20OCR/pyramid_2006/2006/0809.html[11/13/2008 18:14:28]

is up to the merchants.

Surgical Strike: An interstellar mercenary company gets a new contract: The Directorate of Priam have grown frustrated with Societas Mundi Viridi's hands-off treatment of Paris and decided to take matters into their own hands. But they don't have significant military capabilities, and building up some would be a long-term project. Instead, they're willing to fund an expedition to take over the key points in Paris's infrastructure. They don't see a need to forcibly subdue every mine on the planet; they think it will be sufficient to control the spacelaunch facilities and the technical infrastructure, denying independents both access to vital service and the trade that would pay for it. They haven't worked out the details; coming up with a proposal is part of the mercenaries' job.

Next, some approaches to running a campaign based in the system:

Academic Questions: A group of young people arrive at one of the orbital stations above Penelope, ready to begin training for a career as "truck drivers" -- pilots for the relatively small shuttlecraft that transport goods and colonists about the system, perform research and humanitarian missions, and keep watch for illegalities. They come from varied backgrounds: natives of the orbital stations, colonists from Penelope struggling to adapt to the thin air and low gravity, and transfers from the smaller colony worlds. The campaign should combine character interplay, increasingly difficult training assignments, and actual adventure scenarios.

Groundbreakers: A new island on Penelope has been opened to human settlement, and the first farm grants are being made. A group of colonists set up a homestead, build shelters and greenhouses, and start trying to establish a viable farm, despite shortages, unpredictable wildlife, and bureaucratic regulations.

Invasion: A group of Paris miners get bad news: An interstellar mercenary force has seized control of their planet's spaceport and all its regional centers. They've ordered the miners to come in and submit to a new government -- one that's rumored to be backed by Priam. Will the miners cooperate, try to survive and go unnoticed, or join the resistance? And if they don't cooperate, how will they get their ore to market, and what will they do for health care, food supplements, and spare parts?

The Omicron Polypi System

Here is a summary of the major objects in the Omicron Polypi system in *GURPS Space* terms:

Primary Star (Omicron Polypi A): Spectral type M3 V, mass 0.35 solar masses, age 7.8 billion years, effective temperature 3,400 kelvins, luminosity 0.037 solar luminosities, radius 0.0025 AU.

Orbit 1 (Agamemnon): Orbital radius 0.05 AU, diameter 5,900 miles, density 0.70, mass 0.28, blackbody temperature 545 kelvins, world type Small (Rock). No major moons.

Orbit 2 (Penelope): Orbital radius 0.20 AU, diameter 11,500 miles, density 0.90, mass 2.74, blackbody temperature 273 kelvins, world type Large (Garden). No major moons.

Orbit 3 (Achilles): Orbital radius 0.37 AU, diameter 7,000 miles, density 0.5, mass 0.34, blackbody temperature 201 kelvins, world type Standard (Ammonia). No major moons.

Orbit 4 (Menelaus): Orbital radius 0.66 AU, diameter 1,500 miles, density 0.8, mass 0.005, blackbody temperature 150 kelvins, world type Tiny (Rock). No major moons.

Orbit 5 (Nestor): Orbital radius 1.19 AU, diameter 3,800 miles, density 0.4, mass 0.044, blackbody temperature 112 kelvins, world type Small (Ice). No major moons (but two moonlets).

Orbit 6 (Ajax): Orbital radius 2.14 AU, diameter 1,400 miles, density 0.5, mass 0.003, blackbody temperature 83 K, world type Tiny (Ice). No major moons.

Orbit 7 (Odysseus): Orbital radius 3.86 AU, diameter 4,800 miles, density 1.0, mass 0.23, blackbody temperature 62 K, world type Large (Ice). One major moon: Athena -- Standard (Ice).

Orbit 8 (Asteroid Belt): Orbital radius 6.96 AU, world type Asteroid Belt.

Secondary Star (Omicron Polypi B): Spectral type D, mass 1.00 solar masses, age 7.8 billion years, effective temperature 6,600 kelvins, luminosity 0.001 solar luminosities, radius 0.0001 AU.

Orbit 1 (Paris): Orbital radius 0.27 AU, diameter 6,300 miles, density 0.8, mass 0.41, blackbody temperature 95 kelvins, world type Small (Rock). No major moons.

Orbit 2 (Priam): Orbital radius 0.45 AU, diameter 870 miles, density 0.8, mass 0.0011, blackbody temperature 73 kelvins, world type Tiny (Rock). No major moons.

Orbit 3 (Hector): Orbital radius 0.77 AU, diameter 11,100 miles, density 1.0, mass 2.74, blackbody temperature 56 kelvins, world type Large (Rock). No major moons.

Orbit 4 (Andromache): Orbital radius 1.30 AU, diameter 710 miles, density 0.7, mass 0.0005, blackbody temperature 43 kelvins, world type Tiny (Rock). No major moons (but one moonlet).

Ghosts of Bhuvarlok

by Paul Drye

After Paul Van Zandt discovered parachronics, one of the first things tried was inter-timeline colonization. Government was one of the few things Infinity couldn't interfere with directly, and that was attractive to countries jockeying for power in the new set up.

Unfortunately for them, this isn't the 1800s. Without growing populations and occasional economic crashes, there's not a lot of people willing or able to start new lives. In countries that could afford a colony, populations are stable, and there's little money in the countries that have would-be colonists. Ideology turned out to be one of the few things that could drive a new settlement -- Lysander and Uhuru are proof of that pathway. Without it, efforts were doomed to failure.

The Indian government has become less prone to funding white elephants the last few decades, but it looked as if they'd come up with a paragon in Bhuvarlok. A series of bad decisions left the colony in imminent danger of failure, and India then had to look around for an angle that would save it. They found one. Time Tours started investing in the timeline, taken with the timeline's romantic jungles and untouched swamps dotted with ancient monuments. While it was only a middling venture by their standards, the new money was a godsend to the colony. What started as India's jewel in the crown started paying for itself with lowly tourism. In the last two years it's finally reached the take-off point, and while visitors are still a big part of Bhuvarlok's economy, it's diversifying and on its way to being one of out-time's notable successes.

History

All colony worlds are Quantum-5 timelines empty of native humans. Bhuvarlok is unusual as H. sapiens did evolve, but appears to have become extinct with nothing past bronze age civilization. There are monumental city ruins all over South Asia (and probably elsewhere, though no one's looked yet outside of the timeline's other small colony in North America). It's difficult to pin down exactly what happened, though, as none of the discovered civilizations have been matched with Homeline's early cultures. About all that Infinity has been able to determine is that the current year is 1532 and that there aren't any natives anywhere despite intensive cross-checking. There may be a few thousand hunter-gatherers clustered in some obscure part of the world, but as far as anyone can tell this Earth is empty.

Bhuvarlok was targeted by several countries as a potential colony, but the archaeological sites in Mesopotamia disqualified it until Homeline could be sure there was no one home. By the time this was certain, the Security Council five had picked other lines, leaving Bhuvarlok open for any lesser nation that wanted it. India stepped up to the plate. With a huge population and a cadre of technologically trained people, it seemed like as good a fit as any country in the world.

The theory was difficult to turn into practice. Bureaucracy and pollyannaish optimism hamstrung the effort from the beginning. One minority faction of the government wanted Bhuvarlok to be the epitome of Hindu life, based on some idealized version of the Vedas. The main pro-colonial faction wanted a propaganda coup, a clean, visibly prosperous place India could tout -- an ominous idea when what Bhuvarlok needed first was boring, basic infrastructure. Even the army stuck in its oar, looking to send forces there for no discernable reason other than putting a claim into the colonial budget.

The worst single decision was to offer cash incentives to the educated, in the hopes of attracting them out-time. The plan worked, but in working nearly doomed the colony. Any new settlement needs someone to feed it, and the farmers Bhuvarlok needed were specifically discouraged from emigrating. The people who came instead were unmarried university graduates, often male to the detriment of the sex ratio, who ended up underemployed. Agronomists became subsistence farmers, engineers drove trucks, teachers ran commissaries. Many of them soon turned to saving all their money to buy a ticket home.

Time Tours, Ltd.

Things started to change when a popular natural history magazine published a photo essay on the timeline's abandoned cities. Time Tours took notice of the resulting small burst of public interest, and eventually settled on Bhuvarlok as a venture. The company's angle is to focus on a very particular type of tourist, the ones interested in wilderness expeditions to untouched jungles and extinct, primitive civilizations.

The investment they brought made all the difference to the colony. Like had happened in the past, there was now something lucrative for the colonists to do; Virginia had tobacco, California had gold, and Bhuvarlok has tourists. With the new capital, the government could afford to build roads and hospitals while still keeping up the more glittering projects (like nice government buildings) required by Homeline India. The subsidiary work brought by Time Tours, such as keeping the helicopters and boats running, providing food and services to the tourists, and doing office work, was better suited the more-educated original colonists. Homeline even unbent enough to start sending some farmers and construction workers.

As of this year, the permanent population of Bhuvarlok is 353,000, with 150 to 175 new immigrants a day; tourists passing through at any one time number a few thousand more. The latter is a very small number compared to important destinations like Johnson's Rome, but visitors are usually quite rich -- or at least blow a lot of money on expensive jaunts -- and stay for several weeks.

The Duncorne Foundation

Beside Time Tours, Bhuvarlok has one other important group of out-time visitors. There aren't many of them, but they drive a number of expeditions into the wilderness.

Groups in several quarters have noticed that Bhuvarlok has more than its fair share of reality shards: it's in the top ten percent of all timelines for sheer quantity. Considering that all the other lead contenders are civilized lines where it's not too hard to track shards down by browsing museums and reading scientific literature, Bhuvarlok is even more of an anomaly. Its shards have been discovered by nothing more than the few humans who've explored the subcontinent in detail. This has especially interested the Duncorne Foundation, who have set up an informal relationship with Time Tours through a couple of shell corporations and contacts with executives who aren't in Infinity's pocket.

Statistical analysis of what's been found suggests that Bhuvarlok may ultimately yield more reality shards than any other two timelines put together. The Foundation intends to be the one to benefit from this.

Duncorne's personnel also have one other ace up their sleeves. Up until now, they're the only ones to discover that Bhuvarlok is not a no-mana timeline. While the largest portions of this Earth are, the abandoned cities will occasionally "flare up" and be low-mana areas for a little while. Now that they know to look, there are even tantalizing hints that there was once much more magic in this world. Unfortunately for the Foundation, this is somewhat

misleading itself.

The Ghosts

In the last few years, however, some are coming to suspect that there's more to Bhuvarlok's past than the presence of the shards suggests. Peculiar and contradictory reports are starting to come back from people who've headed deep into the colony's claimed lands. For the longest time expeditions to the interior were very rare, solely because it was hard to explore any place in detail. Helicopters and whatnot could buzz an area quickly, but the growth was so thick it was nearly impossible to land. Even walking, though possible, meant hacking a route through the vegetation, and in some places it was difficult to make even one mile a day.

Now that a few sites are opened up, though, and Time Tours is actively encouraging people to explore away from the coasts and rivers, people are encountering ghosts (for lack of a better term). The prevailing attitude is that there's a reasonable explanation, probably involving loneliness-crazy trailbreakers getting a little too deep into their cups. The forest runners stand by what they've encountered despite this, and they're starting to convince others.

Generally speaking, all the reports are of human activity -- or at least the remains of it -- but often vague and certainly hard to prove. People in the old cities hear voices in unknown languages, especially at night; others might smell cooking smoke or even come across the fresh remains of a campfire. Objects move when no one is watching them, and sometimes artifacts will be found where one person will swear there was nothing before. In three cases, entire blocks of cities have been mapped differently twice, with no good explanation for how the first map could have been wrong. One infamous story from a tourist, now the darling of the fringe-science types, tells of how she studied a miraculously inhabited site through binoculars for more than an hour only to find that it was abandoned like all the others when she got close.

The Colony

India has claimed a continent-sized chunk of land, essentially everything from the Indus River in the west to the Irrawady in the east. This includes a fair bit of land belonging to Bangladesh, Pakistan, and Burma on Homeline, and the latter two countries have protested to Infinity and the UN. To date, nothing has come of this, though there are rumors that the Patrol is watching for signs that the Indians are infiltrating Pakistan by parachronic means.

The point of entry to Bhuvarlok from Homeline is Navapattana, on the Kaveri River about 40 kilometers south of Bangalore. The Indian government picked the site as the best combination between the two timelines: Bangalore on Homeline is a high-tech center, and the Kaveri in Bhuvarlok serves as a basic transportation artery that also waters good agricultural land.

The capital city is home to some 35,000 people, easily the largest settlement in all of Bhuvarlok. It's devoted entirely to governing the huge area claimed by the colony, and dispersing settlers throughout it. There are two dozen more "hub villages" scattered throughout the subcontinent, each with up to a few thousand settlers, which provide hospitals and other services to numerous farming hamlets around them. The total population of all of Bhuvarlok is just under half a million people. This is very few people for the area they're scattered across, but India's hope is that the towns will serve as seeds for much more settlement despite being very isolated now.

Navapattana is built on a radial pattern, reminiscent of other planned capitals like Brasilia and old Washington D.C., if on a much smaller scale. Whatever other failings Bhuvarlok may have, Navapattana has benefited from its lack of people: its streets are wide and houses are spaced out in a direct contrast to typical Indian cities. Electricity, telephone, and sanitation services are all good by Indian standards, though still behind what's common in the west. The most notable thing about the city is a near complete lack of cars: the Homeline government has discouraged them on the theory that there are too few people in the colony so far to keep them fueled and repaired economically. There are some motorized scooters, many bicycles, and two bus lines that cover the main north-south and east-west axes of the city. Fortunately, the entire capital is just under two miles across, so most places are within a half hour's walk.

Characters

"Professor" Christopher Nessel: Nessel is the Duncorne Foundation's man on the ground in Bhuvarlok. It's his responsibility to keep an eye on the tourist groups when they return, collate any strange stories they have, and try to purchase any artifacts that look like they might be unusual in some way.

He is a typical-looking academic of Scottish origin. The professor is nearly bald with white hair where any is left, and a large walrus moustache that makes it hard to see his mouth even when he's talking, which isn't helpful in combination with his strong Scots accent. His bulging forehead is enhanced by his strong glasses, which seem to make his blue eyes recede several feet behind the rest of his head. He was an active agent for several years in the 2010s, but caught a drug-resistant form of tuberculosis while out-time and nearly died. After several years of recovering and doing light lecture duty at the University of Edinburgh, he returned to the field with this assignment last year.

Nessel is very fussy, and with a weather eye for the big payoff -- both academic and monetary. He is personally poor after his long illness, but will do what he can to fix that. He won't definitely take up a chance at corruption, but that's the way to bet.

Note that, as written up below, Nessel has Magery 0. This is intended to model a knack that he has for distinguishing reality shards from mundane artifacts, one of the reasons he's been sent to Bhuvarlok. This is predicated on the standard Infinite Worlds assumption, that Homeline knows magic exists, and some Homeliners are learning to work with it. If the GM has reduced or removed magic in a quest for a more hard-science feel to the campaign, remove this advantage. Nessel is not supposed to be particularly note-worthy in any field.

Fairfax Ghosh: One of the best people Time Tours has out in the field, Fairfax is a Keralan university graduate with a degree in forestry. After several discouraging years trying to conserve the rain forests in Homeline's Western Ghats, he emigrated to Bhuvarlok. Two lean years followed, but he stayed on after falling in love with the pristine wilds of his new home. After Time Tours came to Bhuvarlok his material situation improved for the better, since he's an excellent tour guide for those looking to eco-tour, or explore the lost cities up and down the subcontinent's west coast.

When he was younger, Fairfax became interested in the literature of the Raj, including Kipling, Forster, and Orwell. From there he expanded out into other colonial writers like Haggard and Conrad. He's got an excellent grasp of the romantic side to the Indian jungle, especially as perceived by Westerners, and he uses it. Most of the time he presents as a weird mixture of Quatermain-style adventurer and sepoy mysticism; his main difficulty is not rolling his eyes as his tourist charges eat it up.

Ghosh is a very dark-skinned, Keralan Indian, clean-shaven with dark hair combed back over his head. He is very fit and broad-shouldered from a combination of a winning ticket in the genetic lottery and a lifetime of outdoor work. With his good looks he could cut a swath through the female half of the tourists under his care, but he generally tries to avoid this.

He is also the one person to seek out if interested in the ghosts. Unfortunately for Fairfax, he was one of the first people to report them, and since few believe they actually exist he's acquired a bit of a reputation as a nut (if a pleasant one who causes no harm). He's given up talking about them now, but will open up if he feels someone won't make fun of him.

Adventure Seeds

Bhuvarlok is so underpopulated that, apart from the ghosts, adventures are normally struggles against an uncaring, implacable nature:

- A cyclone steams up the Bay of Bengal, threatening several towns in the Ganges Delta. The difficulty is what to do about it. Evacuation is impossible due to lack of roads, and water transport would be too dangerous. It is soon discovered that long-term disaster preparations (shelters, dikes, and the like) have been neglected by an incompetent local official. The towns -- and the characters -- will have to improvise a way to ride out the stages of the storm, including the slowly rising winds and the flooding to follow. Afterwards, desperate measures will be needed to rescue people and vital equipment,
- A distant town is suffering from a sudden epidemic, and medical supplies there are strained. The government in Navapattana has requisitioned one of Time Tours' three transport helicopters (which are obsolescent, but the best available in time) for a mercy flight, as well as a motley collection of people who have skills that might be useful. The copter must be flown for its full range (800 miles), set down for the night, then refueled from a cache of gasoline before following a second leg to its destination. Naturally, the cache is a for-emergency-use-only drop made a year ago in the middle of nowhere. No one is even sure it's still there, and even if it is, landing and securing the site in what is untouched wilderness is going to take some effort.
- Time Tours naturally wants to expand its roster of sites to visit. If the adventurers have the wilderness skills and the time off from their regular duties, they can make a large chunk of cash (or persuade Time Tours to offer some quid pro quo) by blazing a trail to a new abandoned city and mapping the most impressive buildings. All may be normal in the city they pick, but given the kind of luck the explorers usually have, what are the odds of that? The ghosts may be out in force, or something more mundane like crosstime smugglers might have set up shop.

What Happened Here?

Bhuvarlok's hauntings are a mystery that doesn't necessarily need to be solved -- if nothing else, it's a good thing to pull out if one's group is feeling a little too cocky. However, if they're the sort of players who will keep beating their heads against the problem until it's cracked (or if the GM just wants to stay consistent in the mysteries posed), Bhuvarlok does have one cause behind all its oddities.

To understand the timeline's real history, one needs to link two apparently disjointed facts: It has some mana now but it once had much more, and all of its civilizations died out while they were still quite primitive. The connection is a talented mage experimenting with spells for traveling to the past. On his first trip a minor grandfather paradox kicked off a reality quake up and down the timeline's history, and the resulting wreck was strewn with reality shards. The timeline's high mana levels powered the disaster, draining magic down to nothing. Magic-enabled beings (such as manticores and mermaids, but also including humans) were blotted out of the new history, and Bhuvarlok's magic-oriented technology disappeared in a puff of smoke. So much eldritch power poured into the quake that it still rumbles slightly, and echoes of the former time -- the ghosts -- still pop up here and there to the mystification of present-day visitors.

If it becomes necessary to reveal all this, there are two possibilities. Cracking the case might require the Duncorne Foundation to make the discoveries, with the adventurers merely handling the consequences. Alternatively the shade of the transgressing magician can pass on the necessary information to bemused players. The history of Bhuvarlok is too turned back on itself to fall to just casual investigation.

Using Bhuvarlok In Other Settings

The key to Bhuvarlok is making the players feel isolated in the face of a wilderness that doesn't even know they exist. A sense of smallness and a need for self-reliance is paramount. Settlement is no more than little lifeboats of civilization in a sea of mindless danger, and there's abundant evidence (in the lost cities) that that approach has failed completely before.

Science-fiction campaigns will integrate with Bhuvarlok easily, as colonization adventures are common in that kind of setting. Players will have to get the hang of keeping a narrow focus when the colonization ship leaves, leaving behind shuttles and FTL drive for slow cross-country marches. They are on their own, at least some of the time. About the only change the GM may want to consider is the ultimate source of the ghosts. In an SF environment, it may make more sense to use a lost alien civilization rather than previous humans, unless there's some deep history or lost Empire that can supply the necessary antiquity.

Fantasy campaigns can use Bhuvarlok as a new land for the adventurers to visit. Advance your model from the middle ages to the very early renaissance and over-ocean voyages to new, jungle-infested lands enter the realm of possibility. A few fly-blown villages cling to the shore, but the vast interior beckons with riches in one hand and death in the other. Consider relaxing the "no-mana" rule of the original Bhuvarlok so adventurers can do what they usually do (just as Infinity agents will still have guns and other technological equipment). Bear in mind, though, that after a certain power level is reached characters with magic will have too many skills intrinsic to themselves to be threatened like a 21st-century technophile will be.

Pulp campaigns can follow the themes of Bhuvarlok easiest of all. A major class of 19th century literature was about the events when European civilization impacted what was (to many European minds) empty Africa. The GM's major chore will be to pick a style: H. Rider Haggard, or Joseph Conrad. Adventure, either rollicking or harrowing, awaits.

Icosahedron Adventures

The Sand Lords' Agonizing Thirst

by Owen K.C. Stephens

Many fantasy *d20 System* campaigns are set up as struggles between groups, with a small set of species presented as the "bad guys." Numerous species have been cast in this role, but most are either subterranean variations of surface types or unearthly creatures with too many eyes, tentacles, or arms. To broaden the possible range of racial foes, this article presents an evil plant, the sand lord, that even vegetarians can feel good about killing off. The species is opposed to the existence of most other species, and works to not only kill them but to destroy their homelands' ability to support them.

Sand Lord

The creature stands 10 feet tall, its body a single thick trunk held up by a dozen roots. Its surface is covered in dry-looking hide dotted with clusters of long, thin spines. Numerous blade-shaped leaves form a crown at the top of its trunk, and just below them is a ring of small, black dots. It rustles, though there is no breeze, and begins to crawl along the sand with its many root-like legs.

Sand Lord CR 9
NE Large Plant (Fire)
Init +3; **Senses** Listen +14, Spot +14; low-light vision, tremorsense 60 ft.
Languages Giant, Ignan, Infernal

AC 24, touch 12, flat-footed 21
hp 126 (12 HD)
Immune acid, critical hits, fire, mind-affecting effects, poison, sleep effects, paralysis, stunning
Fort +14, **Ref** +7, **Will** +11
Weaknesses Takes half again (+50%) damage from cold

Speed 10 ft. (2 squares), awkward
Melee slam +16 (1d8+12 and 1d6 dehydration) [+9 base, +8 Str, -1 size] or
Melee slam +12 (1d8+20 and 1d6 dehydration) [+9 base, +8 Str, -1 size, -4 Power Attack] or
Ranged +11/+11/+11/+11 (1d4+8) [+9 base, +3 Dex, -1 size]
Space 10 ft.; **Reach** 10 ft.
Base Atk +9; **Grapple** +17 (awkward)
Atk Options Combat Reflexes, Improved Bull Rush, Power Attack

Abilities Str 26, Dex 16, Con 22, Int 17, Wis 25, Cha 19

Feats: Cleave, Combat Reflexes, Improved Bull Rush, Point Blank Shot, Power Attack
Skills: Bluff +14, Hide +12, Knowledge (geography) +8, Knowledge (nature) +15, Listen +14, Sense Motive +20, Spot +14, Survival +17

- **Acidic Sap (Ex):** A sand lord's body produces extremely toxic acid it uses as sap. Any creature that damages a sand lord when within 10 feet of it risks being hit by the acid as it sprays from a wound. Such creatures must make a DC 22 Reflex save or take 2d6 points of acid damage. A creature only takes damage from this ability once per turn. This save is Con based.
- **Awkward (Ex):** Sand lords are awkward creatures, lacking arms and moving on numerous short root-like legs. As a result a sand lord can't make any Climb or Jump checks. The creatures are simply unable to take any

movement that requires these skill checks. Additionally their lack of true arms or hands limits them to holding a single item at a time, and causes them to suffer a -4 penalty to grapple checks.

- **Dehydrating Blow (Ex):** Direct physical contact with a sand lord sucks water out of a target, dealing an additional 1d6 points of damage. This damage does not apply against creatures without a normal physiological need for water (typically those creatures immune to critical hits, except plants). The dehydration damage cannot be restored until the target has drunk at least one pint of water for every 10 hit points dealt.
- **Desiccate (Ex):** Sand lords absorb moisture from the air and ground as they pass, turning any area they spend several days within to desert. An adult sand lord can destroy the casual water found in a acre of typical forest in a day, killing all the mundane plants therein. If attacking a pool of water a sand lord can go through 25,000 gallons of water in 10 minutes (the amount held in a typical swimming pool). When faced with a large body or water or a major river, a sand lord must turn to political or military options to overcome the hated liquid.
- **Flurry of Needles (Ex):** As a standard action, a sand lord may make four ranged attacks with its sharp needles. Its needles have a range increment of 100 ft., and making ranged attacks with them does not provoke an attack of opportunity. A sand lord has the ability to grow needles very quickly, and an individual can make hundreds of attacks before running low on ammunition.

Sand Lord

Sand lords are intelligent, evil plants that hate water and all life dependign on fresh water. They work to destroy fresh water and fresh-water-based life forms whenever possible, though they are intelligent enough to accept the limitations of their abilities. They have no aversion to salt water, and accept creatures able to live on salt water as allies, though they remain uncomfortable too near large bodies of salt water. Sand lords see themselves as the pinnacle of plant development, and as a result hate and seek to destroy all other thinking plant life.

Second only to their hatred of water, sand lords crave power. Many set themselves up as satraps over stretches of desert, and their ability to destroy oasis and arable land allows them to claim territory from civilized humanoids in a permanent way. When unable to conquer a territory, a sand lord may blackmail smaller communities to pay tribute or suffer a loss of water and crops.

Strategies and Tactics

A sand lord often has a few ogres (preferably some variant of sea ogre that can survive on salt water) or similar creatures serving as bodyguards, or may even be the ruling force behind a ogre warband. As long as it's allowed to destroy vegetation, a sand lord is happy to form a partnership with creatures of similar power, and may be found in the company of an efreet or fire giant. A sand lord hates operating by itself, and works to gain minions if possible, form partnerships if the opportunity arises, and serve a master only if it must to gain aid and protection. Sand lords hate all other forms of plant life, and never work with other plants (even sentient sea plants).

Slow-moving and vulnerable to being out-maneuvered, sand lords prefer ranged conflicts where their endless supply of needles gives them considerable firepower. The cunning plants prefer ambushes or fights in terrain that makes it difficult for foes to surround them. They are aware of their maneuvering limitations, and avoid rocky areas whenever possible. If pressed and clearly losing a fight, a sand lord will offer to negotiate, hoping to buy its way out of danger. The voice of a sand lord is brittle, like the rustling of old leaves.

Sand lords see the value of spells and magic, and often seek to use arcane means to protect them from cold damage. Sand lords have a healthy respect for the power of spellcasters, and treat them with greater deference than warriors or sneaks. A sand lord targets spellcasters first if it is able, but if non-caster foes make that difficult the sand lord focuses on eliminating the defenders as a step to overcoming the spellcasters they protect.

Ecology

Sand lords are plants, and thus need not sleep. They do need to eat (absorbing nutrition through their roots), normally settling for what can be found in the soil but able to absorb small animals as well. A sand lord has an amazing

capacity to absorb and destroy water but actually requires none to survive.

Sand lords procreate by splitting in half, the husk of an old desertmarker cracking to produce two fully-grown, adult sand lords with most of the memories of their "parent." Sand lords can live to be 200 years old, but can have memories dating back thousands of years. New sand lords see themselves as distinct from their ancestors, but acknowledge a level of kinship with those born of the same elders.

Environment

Sand lords seek lush wooded or jungle regions, and go about turning them into deserts. Because a sand lord can absorb vast quantities of water, destroying moisture found in the air and soil, the prolonged presence of one actually changes terrain slowly into an arid desert. As a result they can be found in nearly any moderate or hot wilderness (though only the most dedicated sand lord would challenge a swamp). Sand lords are intelligent enough to know destroying water in a forest isn't enough to make it a desert permanently, and thus often work to build dams, redirect rivers and destroy lakes to ensure their work isn't undone. Because of their vulnerability to the cold sand lords rarely attempt to dry out colder climes, but an old sand lord with considerable support might make the attempt.

Because sand lords cannot climb or jump, terrain often limits their ability to spread. Some small deserts in mountainous regions are the home of sand lords trapped by cliffs and walls of rock, unable to get to a new region to spread their anti-water jihad. A sand lord in such a circumstance will negotiate earnestly to buy transport to a new, lusher region, but may later turn on allies if it sees an advantage in doing so.

Typical Physical Characteristics: A sand lord stands about 10 feet tall and weighs about 900 pounds. Its obviously plant-like body appears to be a large cactus, topped with broad and sharp leaves. It has a ring of ears just below its canopy of leaves, and moves about on a dozen root-like legs. It sees through its leaves, but in general depends more on its ability to sense vibrations through rock, earth and sand. It has no arms or hands, but can bend its entire trunk to wrap its large leaves around things, giving it approximately the same manual dexterity as a man with a thick glove on. Sand lords are genderless, but older examples begin to have dark, flaking patches and fewer leaves (a sure sign it's close to splitting into two new sand lords).

Society

The sand lord is an intelligent, vilely evil, mobile plant that hates anything green or vibrant. A sand lord lives to turn lush, wooded or jungle lands into dry, sandy deserts. As they are born full grown, exist only to destroy, and need not mate to continue their species, sand lords have very little in the way of culture. When sand lords do work together, it is almost always to overcome some barrier of terrain or body of water beyond the power of a single sand lord. Among their own kind they respect power and heritage, generally resulting in the eldest sand lords from different lineages forming a council to rule over the lesser kindred. As sand lords hate to be subservient, and one sand lord is a poor cohort to another due to their shared weaknesses, such arrangements rarely last long.

Alignment: Because sand lords come into existence with most of the memories and attitudes of their "parents," they share their predecessor's alignment. As nearly all sand lords are neutral evil, the spawn they create retain that alignment.

Sand lord Knowledge

The following table shows the results of Knowledge (nature) checks as it relates to the sand lord.

Knowledge (Nature)

DC	Result
20	Sand lords are evil water-hating plants of great intelligence.
25	A sand lord is vulnerable to cold and awkward in its movements.
30	Sand lords do anything in their power to destroy vegetation (other than other sand lords).

Typical Treasure

Sand lords have treasure suitable to a CR 9 creature, approximately 4,500 gp. If it is availble, sand lords buy protection from cold with their treasure, and are often found with a ring or amulet bolted directly to their bodies. Beyond that they rarely carry anything with them, instead building a cache of valuables taken from their victims and using it to buy or bribe allies as needed. These are most often durable items, such as gems and local trade goods such as spices.

Sand lords with Class Levels

Sand lords most often become evil druids, using their powers to bend and twist nature to better suit their desires. A few choose to become clerics to gods of destruction and fire or giant gods. They are most likely to choose from the Destruction, Evil, and Fire domains.

Level Adjustment: +6.

The Omniscient Eye

What Do You Eat When You're Subterranean?

In some fantasy fiction, underground humanoid species, such as Dwarves or Deep Elves, cultivate fungi or plants deep underground, without the use of sunlight. I believe I've read that ants (or is it termites?) cultivate fungi underground, but they feed these fungi with leaves harvested above ground, thus sunlight and photosynthesis is involved. Assuming there is plenty of water available, from underground streams, can something be done without the aid of the sun? Some sort of chemosynthesis? Or is there a third option, besides photosynthesis and chemosynthesis?
            --Peter Knutsen

Underground races add spice to many fantasy worlds, but keeping them from starving requires a few more ingredients. All life forms need a source of energy to fuel their ongoing (and ultimately losing) battle with entropy. There are two basic strategies for obtaining energy on Earth. Some organisms, called autotrophs or "self-is-food," can capture energy from non-living sources in their environment. The others, called heterotrophs or "other-is- food," eat organic materials (such as autotrophs, heterotrophs, decaying bodies, or waste products) that contain energy originally captured by autotrophs. An underground race can eat autotrophs or heterotrophs or be autotrophs and capture their own energy.

On Earth, all energy-capture strategies (two autotrophic methods plus heterotrophism) were developed by various bacteria. Photosynthesis, the ultimate basis for nearly all life on the planet, captures the energy of sunlight. Chemosynthesis, the only known autotrophic exception to photosynthesis, captures the energy released when inorganic substances are oxidized. Heterotrophs are fueled by oxidizing organic compounds created by other living things. Rather than come up with something new, the ancestors of multi-celled life shanghaied one or more types of bacteria and converted them into little "engines" for their cells. Plants have chloroplasts (descended from photosynthesizing bacteria) and mitochondria (descended from heterotrophic bacteria). Fungi and animals have only mitochondria. It may seem odd that plants have mitochondria, but they need to live even when the sun is not shining. They store sunlight energy in organic compounds and use their mitochondria to tap it later.

Underground autotrophs have to use a means of energy capture other than photosynthesis, because sunlight is rare in deep caverns. The only known autotrophs that do not photosynthesize are chemosynthetic bacteria. They oxidize such inorganic substances as elemental sulfur, thiosulfate, hydrogen sulfide, ammonia, nitrite, ferrous ions, or hydrogen gas, depending on the species. Most require oxygen, though not necessarily in high concentrations. Some types live in aerated soil and play key roles in the planetary sulfur and nitrogen cycles. Some grow in hot springs, such as those in Yellowstone Park. Other types live on the ocean bottom near sources of hydrogen sulfide and methane. These include hydrothermal vents (underwater volcanoes), whale carcasses, and cold-seeps. In cold- seeps, sulfate and methane from groundwater or sediments are converted to hydrogen sulfide by specialized bacteria.

Humans eat bacteria in vinegar, yogurt, and cheese, but cultivating a foodstuff composed exclusively of microscopic organisms might be challenging. The bacteria humans eat are in an organic medium, such as milk, which is itself a nutritious source of digestible energy. Chemosynthetic bacteria, on the other hand, have mediums such as soil or sulfur water. Luckily, there is nothing to prevent the GM from stepping in and inventing a multi-celled autotroph with chemosynthetic "chloroplasts." This would be an entirely new kingdom, and the GM would have enormous latitude in creating its characteristics. It could easily be as different from plants as the two heterotrophic kingdoms, animals and fungi, are from each other. It could grow in underground hot springs like seaweed or prowl caverns in search of the right sediments. The new kingdom might have a single species or thousands, might be common or extremely rare. It could be a refugee from an ancient time, dependent on the race it sustained. A real-life example of a species carried over from an earlier age by human intervention is the ginkgo, a beautiful and once- common tree that probably began to die out when dinosaurs stopped spreading its seeds. It may owe its existence today to being cultivated for centuries

in Chinese monasteries and palace gardens.

Of course, the GM need not be limited to the energy-capture mechanisms found on Earth. Other energy sources could theoretically support autotrophic life. The GM could invent bacteria that utilized these sources . . . or even go so far as inventing multi-celled organisms that, at the dawn of time, had press-ganged the fantasy bacteria into providing them energy-capture services.

Hot objects emit photons (mostly in the infrared), and these could be captured and utilized in a manner very similar to photosynthesis. For example, an organism could capture energy from the heat radiated by a magma pool. Of course, magma chambers are not known for being particularly safe or stable habitats. Underwater, life can only capture heat energy indirectly, because the radiated photons are quickly absorbed by the water. However, heat can add energy to chemical reactions and make them potential sources of chemosynthetic energy. For example, at hydrothermal vents, magma superheats seawater, which causes the water to react with dissolved sulfate. The heat energy is stored in the chemical bonds of hydrogen sulfide. Chemosynthetic bacteria break these bonds and capture the stored energy. The bacteria release sulfate as a waste product, and the sulfur cycle closes. This situation could also exist in caverns, in an underground stream bathing a magma pocket, for instance. This type of heat energy capture is not feasible on land because everything is roughly at equilibrium and lacks the necessary steep temperature gradients.

Radioactive elements are present underground, and a fantasy bacterium might harvest radioactive energy. Tending radiosynthetic species, happily growing on uranium deposits, could be a challenge for the farmers. The invented species would have to be less sensitive to radioactive damage than Earth species are. This is not as unreasonable as it seems. Oxygen is very reactive and was probably highly toxic to the original life on Earth (when oxygen was rare), but modern life is quite oxygen tolerant.

Many fantasy worlds have an additional source of energy: raw magic. A very clear idea of what mana is and how it behaves would be helpful when inventing a manasynthetic species. Is mana restricted to mages or does it exist in the environment? If only mages can produce mana, then a manasynthetic species would probably be created and sustained by them, like an animated skeleton. However, if mages have inhabited the world for a billion years, life forms could have evolved to capture energy from them. Also, being created by mages does not preclude a certain amount of autonomy if the spell is self- sustaining. For example, a mage may have created autotrophs with a self-propagating create-food spell. Modern mages would have to know the spells necessary to supply the autotrophs with energy, but would not necessarily know how to create more of them.

If mana is a natural energy, akin to radiation, free-living manasynthetic species could have evolved independently. Then the question is whether a mana source always radiates the same amount of energy. Plants, especially plants grown under low light, can be severely damaged when suddenly exposed to high photon flux densities. Therefore, sudden pulses of mana or large magical discharges could have disastrous consequences for underground manasynthetic farms.

If the members of the underground race do not eat autotrophs (and are not autotrophs themselves), they will have to live on heterotrophs. Heterotrophs require access to organic material, created ultimately by autotrophs. If those autotrophs are photosynthetic, the organic material will have to be transported underground after it is created. One way to move organic material is for the race to carry it. The [gardening ants](#) are a real-life example of an underground race that eats fungus raised on plant material that they bring down from the surface.

The underground race will probably have a source of water in their caverns. If the water flows from the surface, it could carry a load of organic materials: leaf detritus, insects, microorganisms, partially decayed animals. These could be consumed by heterotrophic bacteria, fungi, non-green plants, insects, or even fish. In a similar manner, most of the primary energy for many stream ecosystems is supplied by the land plants that grow along their banks. Fungi could theoretically bring organic material underground for themselves. A mushroom is the relatively small reproductive structure of a large fungus that snakes in nearly invisible threads throughout the soil. So if it is possible to reach the soil layer from the cavern, it is reasonable to imagine a fungus that "fruits" underground. Truffles actually do, but in the soil, not in caves.

Of course, a cave is not a good place for a mushroom. Above-ground, wind can spread its spores, and gravity will

deposit them on the rich, top layer of soil. Young fungi can begin life in a smorgasbord of partially decayed organic matter. This would not be the case underground. Left to its own devices, this fungus mutant would probably die out quickly. However, a mutant that could not survive naturally will do fine with outside help. For example, the bananas in the grocery store are the seedless fruit of a sterile plant -- evolutionarily a dead end, but faithfully cultivated by banana-eating humans. If the underground race could find a single mutant with subterranean mushrooms, they could then help it to survive. They might have to gather the spores and stick them to the roof of a cavern to get them nearer the surface. Perhaps they would have to fertilize the newly sprouted spores (with the bodies of dead dwarves?) so the young fungi could survive until they reached the organic material in the upper soil layers. The race would want to control most of the caverns in the vicinity, since the fungus would probably send out mushrooms wherever it pleased.

One problem with fungi is [digestibility](). Fungi are a good source of some vitamins, minerals, and proteins, but they contain very little fat, sugar, or calories -- that is, digestible energy. That might be encouraging to dieters, but it makes them a poor choice for a race's primary energy source. Most of the carbohydrates in fungi are in the form of difficult-to-digest chitin cell walls. Plants have cell walls of equally indigestible cellulose. Most herbivores cultivate specialized, cellulose-digesting, heterotrophic bacteria in their stomachs to make it possible for them to eat plants. Tolkien probably did not envision ruminant dwarves, but it could be done.

On the other hand, the bacteria could be applied externally, the same way humans make yogurt. Since yogurt-making is beyond Stone Age technology, such a race would have been reasonably advanced before they stopped foraging on the surface and began to live exclusively underground. (Yogurt is made by heating the medium to destroy dangerous -- or just yucky -- bacteria from the environment, adding a little yogurt bacteria culture, stirring, and keeping it gently warm until the bacteria multiply and partially break down the medium.) Death or loss of the starter culture would be fatal for such a race. Analogously, queen gardening ants carry starter fungus on their nuptial flights, and if the starter is lost or dies, the new colony is doomed.

Gardening ants solved the problem of obtaining digestible energy from fungi by "selectively breeding" domestic fungi with traits that wild fungi do not have. Some domestic fungi secrete specialized enzymes onto the leaf-fragment beds the ants prepare for them. The enzymes break down the leaves and cause sugars to form on them. These sugars are then licked up by worker ants. The fungi also produce tiny, nutrient-rich "fruit." Fungus domestication is obviously possible. However, unless one is playing *Ants and Burrows,* it might be difficult to sustain an RPG race on the swollen tips of mold hairs and sugar licked off a fungus.

Decaying material in soil is not the only source of organic compounds found underground. Methane is often found in fossil fuel deposits, and bacteria that oxidize methane are an important energy source for communities such as those on cold-seeps. Certain heterotrophic bacteria are able to use petroleum as an energy source. However, fossil fuels are often loaded with heavy metals. The bacteria (and presumably invented species using the same energy source) are able to deal with this, but that does not necessarily make them edible. Many surface plants that are heavy metal tolerant take the metals up and concentrate them in their tissues. An underground race with such a food source would have to have a means of dealing with high levels of heavy metals, either externally (through food preparation technology) or internally (by being tolerant themselves).

Transport ceases to be a problem if the autotrophic source of organic materials is already underground. A GM could have the race farm heterotrophs that eat one of the chemosynthetic, radiosynthetic, or manasynthetic autotrophs already discussed.

An unusual source of organic material for a radically designed fantasy world is true spontaneous generation. It is believed that the first life on Earth was heterotrophic and lived on spontaneously generated organic material. Laboratory experiments have successfully replicated such spontaneous generation, but only under conditions that bear little similarity to modern-day Earth. Early Earth probably had warm, shallow oceans, active volcanoes, and radioactive rocks under an atmosphere of water vapor, carbon dioxide, carbon monoxide, nitrogen, methane, and ammonia. The atmosphere was alive with energy, rent by lightning and bombarded with ultraviolet radiation. Molecular oxygen was essentially absent, and an oxygen-rich atmosphere seems to make the spontaneous generation of organic material impossible. Since lightning and ultraviolet radiation are not too common underground, the GM will have to use an alternative energy source such as radioactivity, volcanism, or magical discharges. Such conditions might

even be possible on an Earth-like world in completely sealed caverns. For a race from such caverns, the surface would have a hostile, poisonous atmosphere. Traveling there would be like visiting another planet. The race would probably require a life-support suit (or a protection-from-oxygen spell) and not be able to digest surface food. Another difficulty with spontaneously generated organic matter is that it does not accumulate quickly. It probably inspired the early evolution of all existing energy-capture methods by becoming scarce.

In some organisms that the underground race might eat, the line between heterotrophs and autotrophs blurs. This happens when a heterotroph and an autotroph form a partnership and live entwined with each other. The heterotroph usually provides defense and raw materials from the environment; the autotroph captures energy for them both. The heterotroph is usually much larger and accounts for the appearance of the combo-organism. On land, heterotrophic fungi and autotrophic bacteria or algae form partnerships known as lichens. In cold-seeps and hydrothermal vents, several types of animals, including shrimp, worms, mussels, and clams, have formed partnerships with chemosynthetic bacteria. A GM wishing to create one of these life forms should realize that the major difference between them and true autotrophs is that the partnership was formed much more recently than the dawn of life on Earth. Therefore, both partners have close relatives that are not married (not all fungi are lichens). Sometimes the partners can be separated, if only in a laboratory, and grow independently. The autotrophs usually live within their partners' bodies, not within their cells. Lichens look much different than free-living fungi, because the fungus grows compactly instead of branching out in search of food. The autotroph partners in lichens are photosynthetic, but fantasy lichen could have chemosynthetic, radiosynthetic, or manasynthetic bacteria. Several lichens have been traditionally eaten by humans, including the arctic reindeer moss and desert manna lichen. Since the energy source is the autotrophic partner, lichens may be a better source of digestible energy than are fungi.

Certain shrimp farm chemosynthetic bacteria on their exoskeletons and feed their farms by swimming to "fields" of dissolved sulfur compounds. The shrimp then graze bacteria off their own bodies. Tube worms supply their bacteria with inorganic carbon, oxygen, hydrogen sulfide, and nitrate that they absorb from the surrounding water. The substances are transported in the worm's blood to the internal organ where it keeps its bacteria. The worms then excrete the bacteria's waste products: sulfate and protons. The worms may live to be 250 years old in the stable environment of cold seeps. Adult tube worms have no mouths or digestive systems since, like plants, they have an internal energy source. It is believed that the larvae are born with mouths and eat their bacteria when they begin life.

One type of mussel contains two kinds of bacteria: some that oxidize methane and some that oxidize sulfur compounds. Presumably, this allows it to change gears if one source of energy is depleted. Clams partnering with chemosynthetic bacteria harbor these bacteria within the cells of their gills. The bacteria are passed on to the next clam generation in the eggs. The partnership is so tight that attempts to culture the bacteria independently in the laboratory have failed. These clams are probably the closest thing on Earth to a chemosynthetic plant.

An adventurous GM might want to have an underground race whose members are combo-organisms and have their own internal engines cranking out energy. This does not mean that the race can just sit back and forget about food, however. They will have to supply their internal autotrophs with all the minerals, fluids, and gases they require as raw materials.

Some GMs will prefer designing a single food-species for their underground race, since it involves less work (and fewer opportunities for over-zealous players to ask sticky questions). However, many of the problems discussed above cease to be an issue if the underground race is part of a diverse ecosystem. Mushrooms or lichens do not have to be perfectly digestible if, as is the case for humans, they make up only part of the diet. Having sufficient hot-spring surface area to cultivate paper-thin bacterial mats is not so critical when they are a delicacy and not the race's sole source of energy. There are a few real world examples of ecosystems based entirely upon chemosynthetic bacteria.

The most famous chemosynthesis-based ecosystems are at deep-sea [hydrothermal vents]. Chemosynthetic bacteria oxidizing sulfur compounds support a host of heterotrophs such as fish, shrimp, snails, crabs, clams, mussels, barnacles, sponges, and octopuses. Tube worms can grow to more than a meter long, easily large enough to sustain an underground RPG race. This type of ecosystem is not restricted to the deep, lightless regions of the ocean, but it is much more striking in places devoid of photosynthesis-based life.

An example of a chemosynthesis-based cavern ecosystem is in Movile Cave in Romania. It consists of limestone caves partially submerged in hot springs that are rich in hydrogen sulfide, ammonium ions, and methane. Prior to discovery, the caves were sealed off from the world above. They have a specific atmosphere enriched in methane with up to ten times more carbon dioxide and one third less oxygen than the outside air. Microbial mats made up of bacteria and fungi float on the water surface, adhere to cave walls and sit on submerged cavern floors. Bacterial species include some that oxidize methane and some that oxidize sulfur compounds. The deep waters of the cave have no oxygen, so the submerged mats may consist entirely of heterotrophs that feed on methane or material falling from above. The microbial mats feed terrestrial and aquatic animals such as snails, worms, pillbugs, millipedes, springtails, and bristletails. Carnivores include blind predatory leeches, water scorpions, pseudoscorpions, centipedes, and spiders. The chemical differences between photosynthesis and chemosynthesis likely mean that, in a closed system like Movile Cave, the development of an unusual atmosphere is inevitable. However, a chemosynthetic ecosystem can probably form even if the cavern's atmosphere is not isolated from the surface. (The Movile Cave system has apparently survived being exposed to the surface by the shaft its discoverers constructed.)

Designing an ecosystem requires extra effort, but it will make the underground race more sustainable and less susceptible to famine disasters. The first building block of an ecosystem is an energy source. The GM can use one or several of the energy sources discussed here. Each energy source needs at least one autotrophic species to capture it. Bacteria are the most likely autotrophs, but they can be supplemented by some multi-celled species. Heterotrophic microbes and insects could graze on the bacteria and provide food for larger predators. Decomposers (usually bacteria and fungi) must be present to prevent the ecosystem from collapsing with all its raw materials tied up in dead bodies and waste products. Each ecosystem component is a potential source of food. For instance, the underground race might sweeten their lichen tea with ants full of leaf-mold sugars, roast the moles that live on bacteria-grazing insects, spicing them with microbial mat (for that sulfur tang), and make salads of subterranean mushrooms and chemosynthetic seafood, sprinkled with manasynthetic lice the mage combs out of his beard.

Even lichen-like organisms might benefit from a varied diet. Hunting down outside sources of energy is probably not effective for something with an internal energy source, but the race might eat to gain nutrients. Carnivorous plants, for example, cannot obtain sufficient nitrogen from the soils they prefer, so they photosynthesize for their energy and eat insects as a nitrogen source. Feeding an underground race requires, first and foremost, a source of energy. The GM will have to decide what this energy source is and how the race acquires it. This includes deciding if they are using the energy source directly (autotrophic), eating something that can utilize the energy source (eating autotrophs), eating something that is getting its energy from other living organisms (eating heterotrophs), or cultivating an autotroph inside their bodies (acting like a lichen). Some energy sources can be present underground naturally (precursors to chemosynthesis, heat, radioactivity, mana). Others, like sunlight, have to be transported there. Organic compounds produced using sunlight can be transported by the race or by water, transported by the food source (hypothetical underground mushrooms), or buried (coal and oil). Although it is possible to design a race with a single food source, creating an ecosystem with a combination of energy sources and food types provides more variety and may ultimately make for a more interesting game.

For the Sake of Appearances

"Plants" based on chemosynthetic bacteria would probably not be green, since the green color comes from pigments used in photosynthesis. Some bacteria that oxidize hydrogen sulfide have particles of inorganic sulfur in their cells, for instance. Images from Movile Cave can be found in the documentary *Ends of the Earth: The Secret Abyss of the Movile Cave*. The following websites also have images of chemosynthetic life on Earth.

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Pyramid Review

Dungeon Crawl Classics #31: The Transmuter's Last Touch (for *d20 System*)

Published by [Goodman Games](#)

Written by Jeff LaSala

Art, Maps, & Graphics by Jason Edwards, Cliff Kurowski, Brad McDevitt, Stefan Poag, Jeremy Simmons, & Joseph Goodman

Edited by Joseph Goodman & Liz Rich

16-page b&w saddlesticked softcover; $2.00

Let's see what a two-dollar game adventure looks like.

First of all, ***Dungeon Crawl Classics #31: The Transmuter's Last Touch*** may be the first game in history to have a title that a) is longer than the adventure it contains, and b) fills up the word count before the review is finished. Goodman Games wants your gaming dollars -- both of them -- and it's going the dirt-cheap route to get you to part with them.

[SPOILER ALERT!]

Another in their series of adventures designed to recall the good old days of dungeon-delving, this crawl is designed to challenge four to six characters of 1st and 2nd level. The heroes hear tales of a series of raids on caravans or other passersby through the local countryside (or whatever else the DM dreams up -- you're kind of on your own on getting involved with the story, not that it's at all hard to work it in). Tracking those responsible leads the party to a secret entrance in the side of a mountain. In these catacombs hides a small tribe of kobolds (about the only rung downward from orcs), but the surprise comes when these dog soldiers turn out to be a bigger bite to chew than our "been-there done-that" brand of champions expected. They all seem to possess strange enhancements that make them more fearsome foes in a fight than their barely-worth-the-XP brethren.

These tunnels were once the lair of a wizard obsessed with transmutation magic. His experiments were so successful and so extensive, they left behind small pockets of augmenting eldritch energy that remained long after he'd found new digs. An amplified kobold chieftain (well, he's a chieftain now that he's killed the old one) called Tazex dragged his new clan here and seeks to master the magic more fully to boost his tribal power base. Anyone passing over one of the loci in the hideout will find themselves temporarily imbued with earth magic, or the ability to breathe fire or spew venom, or one of a number of other effects. Anyone confronting a kobold who's done the same will get beaten up by a freakish kobold.

[END SPOILER ALERT]

The artwork carries on a proud tradition -- it's stuff that looks like Erol Otis (or someone like him) drew it 30 years ago, with lots of detail crammed into the individual sections of a framework that's simple overall. Another familiar sight to buyers of the Dungeon Crawl Classics series: It has artwork that serves as handouts. Three nicely done pieces at the back can give players a clear picture of what the scene looks like, though only one of these is of intrinsic value

to the group (it gives visual clues to a puzzle's solution). The map is clear and everything seems immediately recognizable, even at a glance, so you won't be flipping the pages.

The whole volume only comes in at 16 pages, so there's not much flipping to be done regardless. It may be brief, but it's all professional writing, very polished and pleasant to read with the medieval feel one wants in one's fantasy game modules. With illustrations and the Open Game License, it's actually more like 12 pages, but the consumer is getting exactly what was promised. It's the sort of adventure that, if it takes you more than one session to finish, it's only because you're having too much fun with it. If it takes less than one night, or it stinks, there's the beauty of the enterprise…you only paid two bucks for it, so zip it, crybaby.

The Transmuter's Last Touch is kind of a one-trick pony, but the gimmick only needs to sustain a single evening's play (and for a team of first-levels at that). It plays fast and loose without doing the **d20 System** rules any injustice -- it would be nice to see more adventures loosen up in like fashion -- and, while pretty linear, it has enough little details to make it more lively than a checklist of encounters. Oh, and the book contains a checklist of the encounters -- handy. The danger level can be scaled up a little to accommodate slightly tougher good guys. The "Further Adventures" section at the back is only a couple of uninspired paragraphs (no mention of the location's value to the heroes as a base of operations), but just like the beginning, you can figure out for yourself where to go from here. Goodman's job -- delivering the goods -- is done. Just don't let them know, or they'll jack up the price.

--Andy Vetromile

Eve of Destruction, Gamer Style

(As an aside, I wrote this column before reading this week's Omniscient Eye installment. I mention this because a throwaway line in that piece is my thesis statement. Clearly the Omniscient Eye knows all and displays that knowledge in curious ways.)

This has been at least the second time where something significant has happened in the news while I was out of town at a convention. The first time was the tragic destruction of the Shuttle *Columbia* a few years ago when I was a guest at Dreamation.

Now, several days after having written my column last week (but before it posted), I discover that the airlines went bug-nuts about nine hours after I got off my last plane, after British authorities stopped a James-Bond-esque plot involving sports drinks and battery-operated gadgets. Being out of the loop when a major event happens is particularly distressing to me because, as something of an Internet addict, the only time I'm really *not* attuned to the goings-on in the world is when I go away to a convention, and it's thus one of the very few times where I can be in a "have you heard-?" moment about an event that happened a dozen or more hours earlier.

Fortunately, the niggling voice in the back of my mind suggested that -- even though my plan entailed taking carry-on luggage only -- I may want to make sure that carry-on suitcase could also survive being a checked item. This is good, because otherwise I'd have no hope of smuggling home the planned countless bottles of shampoo and conditioner from my hotel stay. (Apparently Orlando -- the home of the Yo-Yo Contest I just attended -- is particularly sensitive about the recently thwarted plot, since I guess Orlando International Airport is a popular spot for airlines from the U.K. to fly into. As a result the local newscasts there had been speaking with a crazed glint in cadences normally reserved for folks who stand on street corners and report about how the End is Nigh.)

Anyway, my usual column this week is going to be a commentary tangentially sparked by the events of this past week.

I speak without exaggeration when I note that the entire world is at war . . . and few even realize this war wages every nanosecond of every day. It is a war that crosses all class, race, religious, gender, and species lines, and it is a war that all experts believe, ultimately, we cannot win.

We are at war with entropy.

As entities that live, we -- by definition -- combat against the forces that seek to tear the universe apart. "Things fall apart," writes Yeats, "the center cannot hold." The fundamental building blocks of the universe favor decay and change toward dust; life attempts to act contrary to the forces of cataclysm by providing stability and order, growing and evolving against all odds to continue the cycle. Consider that, as best we can tell, the only way the lifeless moon will look any different in 100,000 years (barring the intervention of life) is by the intervention of forces that will erode or destroy that which is there.

At its core, any stability provided by life is cosmically fleeting, and is -- in some ways -- a lie. The universe has another dirty secret, which influences almost every aspect of our lives: Destruction is *much* easier than creation. (It's a poorly kept secret, but one that many people don't realize or talk about.) That which we have is much easier to tear down than it is to create anew. A determined soldier could easily kill dozens of people in a matter of seconds; it would take about half a *billion* seconds to conceive, birth, nurture, and raise a couple dozen people.

I couldn't help but think of this fact again when reading about coverage of the thwarted plot. Materials that probably cost less than $100 could be used to destroy a plane that costs $100 million (not to mention the collateral damage and the toll of human lives). And, of course, recent history points to countless examples where it has taken very few resources to cause vast amounts of destruction.

Now, in the mind of a nihilist, this is reason to curl up into a whimpering ball and wait for death's sweet embrace. But that's not what this column is about; for one thing, this magazine is all about good gaming, and ***Ball: The Whimpering***

isn't on White Wolf's release schedule through the end of this year.

While not as significant as the loss of life or property that has made recent news, the ease of destruction compared to the difficulty of creation is one that factors into many aspects of the gaming world. I've been in LARPs where 50 people could have had a good time, were it not for one individual determined to ensure we did not. I've had campaigns fall apart because of one mistake. I've seen game companies collapse because one product caused its most popular line to "jump the shark."

But, as I said before, this column isn't about despair. This column proposes that, as living entities, we owe it to our very existence to stave off entropy as earnestly and fruitfully as we can. I would urge everyone to consider acting against the forces of negativity and chaos whenever possible. Let's say a new person on a favorite gaming message board posts a dumb question; sure, it would be easy to tear that person down, but what does that accomplish in the long run? Rather, answering that question may well turn that person into a fan, fostering another root necessary for a healthy, growing game line.

Or let's say your Friendly Local Game Shop is struggling, and it's a store you happen to like. The easiest thing to do would be nothing or to take your business elsewhere. Could you instead act against entropy in this case, perhaps by running game demos once every other week or so? Would that help? Who knows? But it might be worth a chat with the game shop's owner to find out. (And, yes, I know I'm getting dangerously close to a *Brady Bunch*-esque "Let's have a talent show and save the orphanage!" plot point. Optimism often wears bell-bottoms.)

Or, as a final example, maybe the current campaign you're in is enjoyable enough, but the gaming group has taken a turn for the worse in the past few sessions. Again, it would be easy to be destructive -- chatting during the game, bringing a good book to read -- but the real challenge lies in being productive. Can you pinpoint why the games aren't going well? Have you talked it over with the GM? Many moons ago I wrote about how my group came to me and said, "We need to talk." I still get a sinking in my stomach when I'm reminded at how I could have crafted such a supremely un-fun session for them, but I'm still grateful that they came to me rather than choosing a less-constructive alternative.

Of course, destruction is a necessary part of life. Brush needs to be cleared away, decay leads to future nutrients, old growth needs to end to make room for new life. I'm not suggesting that all battles against entropy need to be waged tooth-and-claw, or even need to be fought at all. But -- though the urge to tear down dwells deep within many of us -- the ability of humanity as a collective to fight against those urges is also strong. And in the game of life, keeping entropy in check for as long as possible is a more noble goal than most others.

RuneQuest

Published by [Mongoose Publishing](#)

Written by Matthew Sprange

Cover by Bob Cram & Dan Howard

Illustrated by Eric Bergeron, Scott Clark, Alexandre Draude, Juan Manual Espinosa, Ryan Horvath, Danilo Moretti, Tony Parker, Phil Renne, & Chad Sergesketter.

130-page b&w hardcover; $24.95

These days, it seems that nothing remains out of print for very long. The trend of returning to gaming classics begun in 2005 continues in 2006 with the re-publication of *RuneQuest* and not by anyone you would expect. First published in 1978, *RuneQuest* offered integrated skills and combat mechanics employing the Basic RolePlay system that would go on to power so many of Chaosium's future titles. It also offered an integral setting in Glorantha, a highly detailed Bronze Age world in which anyone could learn any skill or spell, there being no set professions or classes. Only with the publication of *RuneQuest III* in 1987 by Avalon Hill did the game move away from Glorantha and offer something more generic.

This new *RuneQuest -- Rune Quest IV?* -- published by the UK's largest RPG company, Mongoose Publishing, sits somewhere in between being a generic fantasy RPG and being written with Glorantha in mind. The default, assumed setting *is* Glorantha, hence the lack of creatures such as Goblins and Orcs, and the inclusion of Gloranthan stalwarts such as the Broo, Trollkin, and the poor old unhappy Ducks. The objective of the game is obtaining runes, symbols carved into stone or wood and imbued with magical powers; going on lengthy, mighty quests; and on enrolling in cults. The latter can be religious, scholarly, magical and so on, with most proving a source of support, training, knowledge and even magic to their members.

Everything else in these new core rules could be used in almost any other fantasy settings. The basic mechanics, the character backgrounds and professions are all easily transported, even the example cults, since they are not Gloranthan. Mongoose has fully supported the generic aspect by giving this *RuneQuest* an Open Gaming Licence which means that, just like the *d20 System,* any publisher can use the rules for its setting. Already Mongoose is planning to use them for Fritz Leiber's Lankhmar as well as Glorantha, and Other World Creations will be releasing scenarios for its Diomin setting using these rules.

For a Mongoose book, this core *RuneQuest* book is a surprisingly neat and tidy affair. It is all light grey with an unobtrusive border and reasonable artwork. The writing is clear and virtually free of errors, plus it comes with plenty of easy-to-find examples. Overall this is a nicely put together book that feels unrushed and professional, not always a case with other Mongoose releases.

As a Basic RolePlay powered RPG *RuneQuest* still uses percentile dice for all skill, combat, and magic checks. Roll low and you succeed. Combat is still dangerous, with every blow counting and every character in danger of losing a limb. Armor and the ability to parry or block are all vital to survival. A character possesses as many opportunities to react to attacks upon him in a round as he has to make attacks. Such attempts to dodge or parry are termed reactions

and are really the only slightly more complex aspect of combat. When a parry or dodge attempt is made, both the attacker and defender roll again. In either case, the attacker rolls his weapon skill again, whilst the defender rolls his dodge skill, or his weapon or shield skill if a parry. These results are compared to see whether the attack succeeds, or the parry stops some or all of the damage.

Possession and integration of a rune is necessary to cast magic in this core version of **RuneQuest.** Other forms of magic will be addressed in future supplements, in particular the **RuneQuest Companion**. Having integrated a rune, at the cost of a point of POW, the character is now rune touched. He not only gains the Rune Casting skill for that rune, he can also learn spells associated with it, and is granted a runic power. For example the Fire rune lets the rune touched character learn spells like Fire Arrow, Fire Blade and Ignite, and grants him resistance to fire. Some spells are graded so it is possible to learn Bladesharp 1, as well as Bladesharp 3, the latter costing more to cast, but causing more damage. Finding runes can form the basis of quests and no rune touched will give up his runes willingly.

Character generation is an easy process, and tending towards competent beginning heroes. Attributes are rolled on 4d6, the lowest die result dropped, except for size and intelligence, rolled on 3d6+6, the lowest die also being discarded. The default race is human, and although the bestiary includes races that can be played, these core rules are not really geared towards it. Each character has a cultural background -- barbarian, peasant, townsfolk, or noble, plus a profession. Both background and profession grants the character bonuses to his basic skills, which everyone has, and advanced skills, particular to the character's background and profession. Finally every character has free points to assign. The process is both easy and familiar, and covers most character types possible. Not just soldiers, wizards, thieves and priests, but also farmers, merchants, scholars, shaman and woodsmen.

In addition, a character has hero points, expended to re-roll dice, turn a major injury suffered into a glancing blow, and even to alter the storyline of the GM's current plot in some small way. They can also be saved to gain legendary abilities like Battle Fury, Decapitating Swing, Linguist, and Wall Leaping. All have high requirements before they can be purchased. Other character objectives include improving skills through practice and training, and joining cults or guilds. The benefits for joining a cult include gaining access to skill and spell tutors for those taught by the cult. Becoming a lay member or initiate in a cult is relatively easy, a more long term goal being to rise to the status and skill of runepriest or runelord.

There is little in the way of background in this core book. It assumes a complex Bronze Age setting where slavery is not unknown, iron working is rare and prized, and the forces of Chaos, such as the Broo are a threat. This is the case in the scenario also released alongside this rule book, **Rune of Chaos**, which like this rule book is both generic and easily set in Glorantha.

Revisiting this new edition of **RuneQuest** feels like coming back to an old friend -- a leaner, cleaner, and more streamlined friend. This shows primarily in the combat and magic rules, which retain the feel of previous editions of **RuneQuest,** but are accessible and easier to both run and play. Although long-time devotees of Glorantha will see little of it here, the mechanics will be familiar, and they can at least look forward to the forthcoming **Glorantha: The Second Age** sourcebook. It is difficult to identify any real problem with this core book, but perhaps the price is a little too high, given the lack of background. For the old time fan this is a welcome return -- they know what to expect. For the newcomer, this **RuneQuest** offers mechanics that are a little old fashioned, but nevertheless detailed, logical, and playable.

Explorer's Handbook (for Eberron)

Published by [Wizards of the Coast](#)

Written by David Noonan, Frank Brunner, & Rich Burlew

Edited by Michelle Lyons, Scott Fitzgerald Gray, & Kim Mohan

Art & maps by Wayne Reynolds, Anne Stokes, Draxhall Jump Entertainment, Eric Deschamps, Francis Tsai, Howard Lyon, Igor-Alban Chevalier, Mark Tedin, Steve Prescott, & Dennis Kauth

160-page color hardcover; $29.95

Introduce your players to a new land, a new setting, or a new world, and the first thing the responsible company is going to do is start pumping out the gazetteers. When Wizards picked up the Eberron line, you knew there'd be a slew of what to see, where to go, who to kill supplements. We've seen a few, but for general interest, the ***Explorer's Handbook*** is a good reference.

Some of the guides, like ***Sharn: City of Towers,*** have been really good tours of important sites, but there's so much of the world to see that, at that rate, the buying public will never see the end of the tunnel. This book begins with one of the best introductions ever and ends with the treasures your journeys rightfully earn you. In between it takes a broad view, going wide and surprisingly deep . . . and you're halfway through the book before you get into specific hotspots. The first half discusses your travel and character options.

If you've ever wondered about the transportation systems that crisscross the world, the elemental vessels are laid bare. This includes, but isn't limited to, the ubiquitous lightning rail and airships. Look under the hood of these marvels to see what makes them tick (or what makes them come to a screeching halt in front of determined bandits), and that includes the elemental itself. Each device has one pulsating through the vehicle's infrastructure, communing with the captain and keeping it aloft (or afloat, or . . .). The lightning rail needs to make stops somewhere, so a standard station is included. The guilds are usually the only ones with the resources needed to operate a line, so trips are tempered by their influence and their desire to keep tabs on the inroads citizens are making to those areas lost during the Last War.

Since not everyone can afford an E-ticket ride, mundane options are considered. How do you hook up with a caravan? How do you make money from one? What's the best way to move your party? And why can't you simply teleport anywhere you want to go across Khorvaire? It seems like workaday stuff, but they make the individual considerations worthy of a Dungeon Master's time. Organizations like the Wayfinders offer to help explorers, and not only do you get their background, the book is dotted with their amusing, tongue-in-cheek how-not-to tips: how not to be remembered when traveling, how not to be sacrificed, how not to be enslaved. And if you need the assistance of a thunder guide or the services of an airship captain, why pay for prestige classes when you can play them?

Most of the remainder is specific locales: the start, middle, and endpoints. Need the traditional tavern from which to jumpstart the adventure? The Glitterdust Nightclub looks like it belongs more in a cyberpunk setting than here, but it has some interesting intrigues to get you on your way. Shae Mordai, the City of the Dead, is a sample stopover where you can load up on elven advice. But by far you get more destinations, and this is where the volume stakes its claim.

Shipwrecks, underground caverns full of valuable shards, the forested fortress of a mad elf, observatories and dungeons "manned" by dragons, and the remains of the cultures of the giants of Xendrik now populate your travelogue. Each one has a map, some inhabitants, and some hooks for your game. These sites open up some pretty ripe plots. Sure, you can pop in and out in an evening's play but, whether deliberate or a mere side-effect, reading these entries you get the feel that there's a lot going on in their setting. Limited in area, they offer several possibilities. The sorts of storylines you expect to see filling an entire series of modules get doled out freely, and they all sound like they would have a real effect on the fortunes of the surrounding continents. It shows insight into the schemes brewing just below the world's surface.

It looks like the same roster of names we've seen in other Wizards art galleries, but they've elevated their game here. Those random maps of which the company is so fond finally find a home, and the portraits beside everything are first rate. They're colorful candy for your mind's eye, but when you reach the book's exploration section you'll see what the design crew can really accomplish. Every frame makes the world of Eberron seem dark, mysterious, and irresistible.

Rather than hoard their secrets, this time Wizards has chosen to give players plenty of rope in the ***Explorer's Handbook.*** Although it's lacking in the crunch many want from a new book, and perhaps a bit too elementary for true veterans, it's refreshing to see an entry in the Eberron series stop playing coy with its readers and give them the sorts of riddles -- and answers -- they can sink their teeth into.

--Andy Vetromile

Kirby-2

Part I

by Steve Kenson

"It's a strange world . . . let's keep it that way."
— Warren Ellis, *Planetary*

You will believe a man can fly, because on the Earth Infinity knows as "Kirby-2," people *can* fly, and lift tanks, punch through brick walls, read minds, and melt steel with a glance, among other things. What exists only in comic books on Homeline is reality on Kirby-2, and has been for some time now. What Infinity is only beginning to discover is the existence of so-called "metahumans" isn't even Kirby's most interesting feature. It turns out metahumans may have existed there far longer than even people on Kirby-2 believe, and the very nature of the parallel may pose a grave threat to the Infinite Worlds.

Kirby-2, 2008

Divergence Point

1938; supers exist. Numerous reality quakes since then.

Major Civilizations

Western (multipolar), Chinese (empire), Japanese (unitary), Orthodox (multipolar).

Great Powers

United Nations (global technocracy, CR2), United States (representative democracy, CR3), People's Republic of China (dictatorship, CR5), Japan (representative democracy, CR4), Russian Republic (oligarchy, CR4).

Worldline Data

TL: 8 (plus variable superscience)

Mana Level: normal

Quantum: 5 **Infinity Class:** Z1 **Centrum Zone:** Red

Crisis History

Kirby's history is superficially the same as Homeline up until the late 1930s, when the first known metahumans appear. Of course, it's difficult to make any definitive statements about Kirby's history, because there is evidence the parallel's history has *changed* on occasion: at least three times Infinity knows of, and possibly at a number of other points in the past. The present-day on Kirby-2 was not "always" its present and the overall "direction" of its history has apparently shifted. It's difficult (indeed, meaningless) to say "when" these changes happened, only that they did happen, and there

is lingering evidence of them in different places in the present-day of the parallel.

Initially, Infinity researchers would have said Kirby's "revisions" were similar to the sorts of interventions Centrum and the Infinity Patrol staged on echo parallels, except Kirby-2 is not an echo (or at least not like any echo Infinity knows), and evidence suggests the revisions have been going on far longer than either Infinity or Centrum have had parachronic technology, meaning something else is at work here.

Quantum Fluctuations

A significant part of what makes Kirby-2 unique (apart from the existence of metahumans, of course) is the parallel's state of quantum flux. Infinity researchers have discovered Kirby-2 has a greater level of "quantum instability" than any other parallel they have encountered to date (including the various "echo parallels," which are quite unstable in their own right). This means Kirby-2 is far more prone to phenomena like reality quakes, banestorms, and the like. In fact, Infinity has discovered evidence that such things have happened many times in the parallel's history, perhaps accounting for some of its current state of being.

As the research division explained to the Infinity Council, reality in Kirby-2 is far more "plastic" than elsewhere. In essence, the impossible is possible there. Physical laws are more "suggestions" than hard and fast rules, and Kirby's inhabitants break them with alarming regularity. According to the researchers' theory, the parallel's quantum fluctuations account for a number of unusual conditions.

Kirby's Law

First, and foremost, Kirby-2 features an unusually high level of serendipity. Otherwise "random" events seem to conspire to bring about incredibly unlikely circumstances. What can only be called "dumb luck" runs rampant on Kirby-2, to the point where what would be a fatal accident on Homeline or elsewhere endows someone on Kirby-2 with superhuman powers! This effect cannot be accurately predicted, but researchers suggest a maxim they call "Kirby's Law" which says: "When the going gets tough, things get weird."

Among other things, this means the Luck and Serendipity advantages are incredibly common on Kirby-2. So much so, in fact, that GMs may wish to simply give *everyone* (or at least all player characters and major NPCs) a level in each for free! It also means the various cinematic options found in the ***Basic Set*** all are in full force on Kirby-2.

Powers and Abilities, Far Beyond Those of Ordinary Men . . .

Myth Parallel?

There is some debate as to whether or not Kirby-2 should be classified as a "myth parallel" based on one interesting fact: Many of the events and personalities of the parallel are detailed in a series of obscure comic books published on Homeline in the 1960s and 1970s. Infinity researcher (and avid comic book collector) Arvin Mayhew brought this to the attention of the Research Division, which has thoroughly examined the comics.

Published by the now defunct Pyramid Publishing, the books feature remarkable similarities to people and events from Kirby-2. Although the correlations are not exact, they are far too close to be mere coincidence. The involvement of legendary comics creator Jack Kirby with the books is what led Infinity researchers to name the parallel after him.

How is it people and events on another parallel appeared in a series of comic books on Homeline, some them from *before* they appeared on Kirby-2? Theories vary, but include the following:

- The comics' creator(s) were latent clairvoyants who somehow "tuned in" on actual events happening on Kirby-2 and recorded them in their stories, believing they actually made them up.
- A reality quake (see below) on Kirby-2 -- most likely the one in 1959 -- sent "ripples" through the quantum strata, which certain sensitive individuals on Homeline (and possibly other parallels) picked up as dreams or random imaginings.
- One or more of the individuals involved with Pyramid Publishing was actually *from* Kirby-2 and writing or drawing fictionalized accounts of real events. As yet there is no evidence of this, nor any motivation for publishing events from Kirby-2 as comic books on Homeline.
- Kirby-2 is an unusual "myth parallel," and the comic books on Homeline actually *created* it in some way, either bringing it

The second, and most obvious, effect of Kirby-2's quantum nature is the existence of metahuman powers, most of which violate known physical laws. When it comes to metahumans, things like the square-cube law, conservation of matter and energy, the speed of light, and other universal constants seem to go right out the window. Super-strong metahumans can pick up tanks (or buildings!) without sinking into the ground, or without the structures crumbling in their grip. They fly through the air at super-sonic speeds without devastating everything around them (or even causing sonic booms in many cases). They engage in battles that level entire city blocks, yet casualties are amazingly light, and no one questions the occasions when the damage seems to disappear overnight.

The currently most accepted theory for these phenomena involves the "observer effect," suggesting metahumans are unconsciously altering reality on a fundamental level, bending the laws of physics through some (possibly psionic) mechanism. In essence, metahumans can do all the amazing things they do because they (and other people on Kirby-2) *believe* they can. Infinity notes that on occasions when Kirby-2 metahumans have visited other parallels, their powers *usually* continue to function, suggesting the mechanism is at least partially inherent in the metahumans and not solely the nature of their home reality; however, it may be a combination of the two, since there are realities that apparently retard or negate metahuman powers. Needless to say, researchers are very curious to find out if Homeline is one of these. It is worth noting that Kirby-2 superscience doesn't work reliably on Homeline.

Retroactive Continuity

Finally, the unstable quantum nature of Kirby-2 makes the parallel extremely prone to various quantum-level disruptions of the space-time continuum. In particular, reality quakes apparently occur on Kirby-2 with greater frequency than Paralabs researchers even thought was possible. Current theory suggests there is a fairly major reality quake or "revision" on Kirby-2 about every twenty years or so; the last "big one" was the so-called Millennium Quake (or "Y2Quake" as some call it). The next is expected sometime around 2020 AD (local year).

A major reality quake can significantly alter the parallel's history (which changes the present accordingly). This is called "retroactive continuity" since changes in the present (the reality quake) cause alterations to the past, which in turn changes the present. The big reality quakes are accompanied by numerous pre- and after-shocks, minor changes or "adjustments" in Kirby's history, a kind of "settling" of the quantum strata.

Note retroactive continuity and the 20-year cycle of reality quakes is just an Infinity theory at this point. This is because no one on Kirby-2 is actually aware anything has changed! The theory is, since the reality quake alters the

entirely into being or perhaps causing the reality quake that altered Kirby-2 from a close parallel into the weird, unstable reality it has become.

- The comics are artifacts caused by a reality quake on Kirby-2, which spontaneously brought them into existence on Homeline where they didn't previously exist, another example of the parallel's unstable history and its possible (far-reaching) influence on the quantum continuum.

Whatever the case, for now Kirby-2 remains classified as a "weird" parallel and the comics are just another thing Infinity researchers have yet to understand about it (although they continue to study them *very* carefully). It is interesting to note the Pyramid Publishing comics haven't turned up on *any* other parallel yet, and all the comics' creators on Homeline are deceased (although with no evidence of foul play in any case).

The Eternals

Despite (or perhaps because of) Kirby's quantum instability and reality quakes, some individuals seem to remain fairly constant. It is probably no coincidence that these individuals are metahumans or close associates of metahumans. So far as anyone can tell, these "eternals" (as researchers have dubbed them) have a kind of Temporal Inertia. When Kirby's reality changes, they always exist, in one form or another. Note they do not always exist *unchanged;* some eternals "reincarnate" after a reality quake in a different, but similar, form or identity. Others remain fairly constant and unchanged by alterations in Kirby-2's history.

There is evidence of two broad types of eternals. The first, called "cyclical" eternals, seem to incarnate with each successive generation or era of Kirby-2's history. For example, there is evidence that the metahuman known as Warrior once existed as an American super-soldier during World War II. The same individual has also been a heartless American government operative in the 1960s, a

past, and everyone in the parallel is altered along with it, they remain unaware of the changes. There appear to be some metahumans with extrasensory perception capable of noticing some changes, and Infinity agents have noticed the occasional "continuity error," which first suggested the possibility that Kirby's reality changed on a fairly regular basis. Since then researchers have found subduction zones and other evidence of past reality quakes, strongly suggesting the theory is correct. There's no way to know for certain, however, without a great deal more observation and gathering evidence. It's at least *possible* some metahumans (particularly those with temporal or dimensional powers) may be aware of changes in continuity. Thus far, the need to preserve the Secret has kept Infinity from finding and questioning any of them.

Quantum Interaction

One thing Infinity (and Centrum) knows with some certainty: Kirby's quantum instability also makes it especially "permeable" to parachronic travel, sort of the reverse of a quantum sargasso. It has also apparently caused Kirby-2 to spawn a number of faint "echo parallels" that exist in very "close" proximity (in a nine-dimensional sense).

Interdimensional visitors are a regular occurrence on Kirby-2. Every major intertemporal power has at least discovered the parallel (despite the best efforts to keep it a secret), and most have visited at least once. There's evidence of Infinity, Centrum, Reich-5, and Cabal presence on Kirby-2. There are also banestorms, parachronozoids, random world-jumpers, and a seemingly endless variety of intertemporal flotsam and jetsam tossed up on the parallel's shores.

The existence of parallel worlds is not widely known on Kirby-2, but the U.N. and UNISON know, as do the major governments. Thus far, their ability to interact with these other realities is limited to a few metahuman world-jumpers and gate-makers. Both Infinity and Centrum are agreed on the fact that Kirby-2 must *not* develop parachronic technology, although both are also aware they may not be able to prevent it. Infinity is considering the possibility of forging an alliance with UNISON against Centrum, while Centrum is considering the same thing, although Interworld is also floating a plan to deliberately trigger another reality quake on the parallel, to either "regress" Kirby-2 so its inhabitants no longer pose a threat, or even to deliberately destroy the parallel and eliminate the threat it poses to the continuum. For the moment the plan has little support in the Centrum, until the change caused by the quake can be calculated and predicted with greater certainty.

hard-edged mercenary and agent of the United Nations in the 1980s, and now a current agent of UNISON in the 21st century. Some elements of the Warrior's background have remained constant (he's always been a highly-skilled "super-normal" soldier), while others have changed; he had far more cybernetic parts in the 1960s, none at all in the 1940s; his politics were more right-wing in earlier eras and have become more moderate. Note, however, that no one (including the Warrior himself) recalls these earlier "incarnations." According to Kirby-2's current history, the Warrior wasn't even *born* until the 1960s. The only evidence of his previous existence can be found in subduction zones and the artifacts recovered from them.

The other type of eternal found on Kirby-2 is the so-called "steady state" eternal, someone whose personal history remains largely unaltered by reality quakes, maintaining a continuity that's unbroken for the most part. The British metahuman John Bull is an example of this type. Although he's well over 80 years old, he still retains a youthful vigor and looks like a distinguished gentleman in his 50s (at most). The hero of Great Britain has a history stretching back to the 1940s, when he first gained his metahuman powers. The only changes involve other people. For example, the same evidence of the Warrior's existence during World War II suggests he and John Bull were both comrades and friendly rivals. However, in present Kirby-2 continuity, John Bull is decades older, Warrior never fought in WWII, and the two of them didn't even meet until recently. Still, their relationship remains similar, although John Bull is now the "elder statesman" and a part of their rivalry is founded in the British hero's long-standing reputation and Warrior's role as a "young turk."

Infinity researchers speculate about one other type of "temporal individual" on Kirby-2, the opposite of the eternal, known for now as a "transient" (also a "fad" by some). These are people with the Unique disadvantage. A reality quake apparently wipes them out of existence entirely, except for any evidence that may linger in subduction zones and the like. Since transients are so thoroughly erased from existence, they remain only a theory, at least until Infinity has the opportunity to actually witness a reality quake on Kirby-2.

Of great interest to all intertemporal factions is the fact that a form of time-travel also seems to exist on Kirby-2. The parallel has a number of interconnected "echo" parallels reflecting earlier points in Kirby's (current) history. Interventions in these echoes can apparently trigger a reality quake, changing history and the present-day on Kirby-2. Both Infinity and Centrum conveyors can reach Kirby's echoes (one of the reasons researchers believe they *are* echoes and not the parallel's "true" past). Some native time-jumpers and superscience gadgets can do the same. There is some debate about interventions in the echoes to interfere with Kirby's present. The most terrifying possibility involves a Reich-5 plan to intervene in an echo of Kirby's Second World War to create a "mirror" of their own history.

The Golden Age

The earliest discrete "alternate" of Kirby-2's history that Infinity has been able to isolate spans the period from 1939 to 1959 (local year). It, and the other alternates discovered thus far, have been tagged with comic book terms by researchers. Thus this is Kirby-2's "Golden Age."

The first metahumans appeared in late 1939. Their powers were nowhere near as impressive as those of modern-day metahumans, but they were still capable of ignoring bullets, lifting cars, and leaping tall buildings. There may have been a real alien invasion coinciding with Orson Welles "War of the Worlds" broadcast on Halloween. A number of masked "mystery men" also appeared, some with low-level metahuman powers or gadgets, others apparently normal humans (or as normal as heroes on Kirby-2 ever get). Metahumans fought on both sides of World War II, although they apparently didn't change the outcome of the war much. Evidence of the Golden Age begins to taper off in the post-war years.

In Kirby-2's current history, the first metahumans appeared around the same time, but their powers were weaker and their existence kept secret. Most worked as agents for various governments or were independent vigilantes. During WWII, metahumans served intelligence and special operations organizations. They had even less overall impact on the war, which followed virtually the same course as on Homeline.

The Silver Age

Scattered evidence suggests Kirby-2's "Silver Age" began with a reality quake that overturned its previous Golden Age history around 1959. Many Golden Age metahumans "reincarnated" in the new continuum, along with many new metahumans. It appears the Silver Age had the highest population of metahumans on Kirby-2 to date. This period also featured the greatest quantum instability, according to Infinity researchers. Irruptors from the time indicated reality in Kirby-2 was, to quote one researcher, "as wacky as a cartoon." Some suggest the start of a pattern to the reality quakes, with Kirby-2 becoming more fantastic (and

Other Kirbys

Worldlines with true metahumans are relatively rare (at least so far as Infinity has explored), however, there is one other worldline carrying the "Kirby" tag and at least two others that deserve it (once they're discovered).

Kirby-1 (Quantum 5, local year 2011) has no metahumans, but does feature rampant super-science, starting with "Edison's War" from 1900-1908: a conflict between the Russo-German-Austrian Axis and the rest of Europe and the United States. Thomas Edison, Alexander Graham Bell, and other inventors built hovercraft, machine guns, tanks, airships and other technological wonders, and the Allies defeated the Axis with them. Since then, President Teddy Roosevelt's League of Free Nations has assumed a position much like the UN on Kirby-2 or the World Science Council on Gernsback and technology has progressed rapidly.

Kirby-3 (Quantum 5, local year 2008) is very similar to Kirby-2 with one important difference: on the surface UNISON appears to be an organization devoted to peace, justice, and harnessing metahuman powers to improve the lot of all humanity. However, UNISON's public face is just a cover for a far more sinister agenda, and all the accusations of its detractors on Kirby-2 are true here: the United Nations wants to create a totalitarian world government using their monopoly on certain technologies and enforced by metahuman stromtroopers. Essentially, everything "good" on Kirby-2 is "evil" here. Neither Infinity nor Centrum have discovered this worldline yet, and both will be quite concerned when they do!

Kirby-4 (Quantum 4, local year 1941) has just seen the emergence of metahumans as the United States enters World War II. Metahuman powers are generally low-level by Kirby-2 standards, although there are still metahumans capable of lifting tanks.

less stable on a quantum level) from the Golden to Silver Ages, stabilizing somewhat through the Iron Age, then an upswing toward a less-stable quantum level in the present. This may indicate Kirby-2 will become more like its previous Silver Age as time progresses.

Kirby-2's "original" Silver Age featured numerous public costumed metahumans, alien invasions, lost worlds, and many of the fantastic elements found in the Pyramid Publishing comic books on Homeline. How close reality conformed to those comics (or vice versa) remains unclear.

In Kirby-2's current history, metahumans existed during the 1960s and '70s, but where less powerful and more covert. Many of them worked for government agencies during the Cold War as spies. A few others were part of the youth counter-culture, and experimentation with drugs, meditation, and mysticism may have unlocked or triggered some metahuman powers.

The Iron Age

Although the most recent of Kirby-2's "ages," what researchers have dubbed its "Iron Age" also seems to have left the least evidence. It apparently stretched from 1979 to the Millennial quake at the end of 1999 and represented a fundamental shift away from the instability of the Silver Age period. Metahumans became less common and their powers somewhat more limited. There is some evidence of metahuman -- and ordinary human -- vigilantes taking the law into their own hands to hunt down and even execute criminals. Guns and body armor were as common as metahuman powers.

This period seems to have shifted the least in the Millennial reality quake, lending some support to the theory that the historical changes become more pronounced the further back in history one goes from the point of change. In Kirby-2's current history, metahumans were still active in the 1980s and '90s, many of them as vigilantes, and there was a growing consensus among governments and societies that some means of regulating these new "super-powers" was required, similar in many ways to anti-proliferation and regulation of nuclear weapons on other Earths.

The Millennium Quake

Apparently, the last major ontological shift in Kirby-2 occurred on January 1st, 2000 on or around 12:00 A.M. Eastern Standard Time. As it so happens, this was during the time in the present history when a Dr. Paul VanZandt was studying quantum dynamics at Dartmouth. He later

The Allied and Axis powers are beginning to recruit and train metahumans for espionage and combat. Reich-5 would certainly take interest in this worldline and attempt to assist the local Third Reich in achieving victory.

Kirby-2 and *GURPS IST*

Owners of *GURPS International Super Teams* may notice similarities between Kirby-2 and the IST worldline. There are a few possible explanations for these. GMs may feel free to use any, all, or none of these as best suits the campaign.

First, it's possible the similarities are just that, parallels between the two worldlines. The IST Earth (or just "IST" in Infinity parlance) may exist elsewhere in the quantum continuum. Infinity may have already discovered it, making it just another Earth with metahumans. Alternately, perhaps Infinity hasn't discovered IST yet, but Centrum *has*. Some elements of the United Nations on IST would appeal to Centrum, much like the U.N. on Kirby-2 does. Centrum would be (cautiously) infiltrating, looking for opportunities to direct IST's U.N. toward a more Centrum-like worldview. There's also the possibility of an "IST-2" version of IST-Earth where the U.N. is corrupt and rules a world-spanning hegemony backed up by its metahuman enforcers (like Kirby-3). This world also poses opportunities for Centrum and a problem for Infinity (as well as a source of adversaries for Kirby-2 heroes).

Second, the Earth from *GURPS IST* might have *been* Kirby-2 at some point! Perhaps the IST-Earth was what Kirby-2 was like in the 1980s and '90s before the millennial reality quake. In *GURPS Y2K,* IST supers noticed a mysterious "Wall" after January 1, 2000 preventing precognitives from seeing the future beyond that point. This Wall could have been caused by an imminent reality quake; there literally was no "future" to foresee! If this is the case various subduction zones and irruptors related to the old IST world could show up in Kirby-2, and new versions of some existing characters and elements can appear in modern-day Kirby-2 (and, in fact, already do). Perhaps one or more of them hopes to undo the "damage" caused by the reality quake, restoring the world's "true" future (from their point of view). This can pose an interesting problem for heroes. Do they allow the world they know to be erased to restore another reality that no longer exists?

abandoned his theories on interdimensional travel when he made a breakthrough in quantum teleportation. Was this parallel version of Homeline's Dr. VanZandt somehow responsible for the most recent reality quake, or even *all* of them? Needless to say, placing blame on Dr. VanZandt, even a parallel version, is a somewhat awkward position to take in Infinity Unlimited, but some still wonder.

Finally, you can just ignore the similarities. There are certainly stranger things about Kirby-2 to worry about, and enough unusual similarities across the Infinite Worlds in general not to make a big deal about it.

In March of 2000, Kirby-2's Dr. VanZandt discovered practical cold fusion. Keeping his discoveries under wraps, VanZandt contacted a number of associates and presented his findings in a closed session of the UN Security Council. There VanZandt and his scientific and scholarly colleagues offered a most unusual proposal.

The UN accepted and, not long thereafter, issued a startling announcement to the world: Member nations of the UN would outlaw weapons of mass destruction, including nuclear, chemical, and biological weapons and military use of metahumans. In return, they would receive access to the new technology the UN controlled: cold fusion and teleportation for starters, with much more in the works. In addition, member nation metahumans would be eligible to join UNISON, the United Nations International Superhuman Operations Network, and UNISON teams would respond to aid requests from UN members, and act to enforce UN edicts. A number of metahumans were already pledged to work with the new program, and many more signed up.

The world was stunned, but no major nation wanted to be left out in the cold. So most agreed to the UN's edicts. Overnight, the United Nations went from an impotent diplomatic appendage to the world's greatest super-power. Licensing fees from its technology provided wealth far in excess of the dues the UN no longer required, granting it the financial independence to do as it wished.

Having Some Friends For Dinner

. . .And Other Acts Of Cannibalism In *Unknown Armies*

By Bevan Thomas

I'm hunger. I'm thirst. Where I bite, I hold till I die, and even after death, they must cut out my mouthful from my enemy's body and bury it with me.
-C. S. Lewis, *Prince Caspian*

Most modern human societies see cannibalism as monstrous, repugnant, and fundamentally foreign. This shocking symbolic potency makes it an excellent source of magical power, for much of the occult underground thrives on monstrosity and transgression.

Here then are various ways to incorporate cannibalism into **Unknown Armies:** a magick school, an archetype, and a new kind of revenant, as well as various rumors and plot hooks. Due to the disturbing nature of the subject matter, the stuff here is meant for adversaries, not player characters. The GM should think very carefully before allowing the players to create cannibal PCs.

As a note, knowingly committing cannibalism requires a rank 8 Self stress check (rank 10 if the person is someone you care about). This means that long-standing Androphages and avatars of the Cannibal are often insane with warped senses of self. Some such individuals or cabals have developed meditative and religious rituals to help balance and sooth their spirits, attempting to cling to their sanity as long as they can.

"It's pretty damn weird to eat people."
"He didn't just eat their bodies, you pig! He ate their souls! He loved them in a way that was absolute and clean and perfect!"
"And you joined in."
"Yes . . . oh, yes . . . "
-Frank Miller, *Sin City: The Hard Goodbye*

The Androphage

AKA Cannibals, Lecters

You know that the law of the universe is to consume. Each of us feeds upon those around us, consuming their time, their success, their luck, their joy. You just take it one step further. It's not that you hate others. Far from it. You love them so much that you want to make them a part of you forever.

You're hungry. You've always been hungry. But for most of your life, you didn't know what you were truly hungry for or what was needed to fill your belly. But that's all changed now. You know what you need. You need people.

Every human is a unique and precious thing. Each one carries the light of a wondrous mind and soul wrapped in a beautiful shell of flesh. It is for this light that you hunger. You want to drink it and consume its shell. You need to feed on the flesh, the minds, even the souls of those around you. You need to make them yours.

The first time was the hardest. You knew that you were taking an irreversible step outside of society, outside of normal human existence, even outside of yourself. Once you crossed that line, donned that label, there was no return. Freak, pervert, and monster are some of the less unpleasant words for you, but they won't be spoken if no one knows. Let the walking food-of-life go about its day-to-day activities with no idea of your secret, special life.

There are those you would teach the rapture of man-eating. Worthies who should be awakened to their inner beast. To them, you preach your gospel and lead them towards the divine meal. They should be brought into your Way.

You love humanity with all your heart. Everyone is sweeter than honey, richer than cake, and more precious than the finest wine. You could experience them forever, exploring every morsel and savoring every memory. You love humanity so much, and yet . . . and yet, you don't feel as connected to it as you used to.

The central paradox of Androphagy is that it is about experiencing people by destroying them, only truly understanding the ones you devour. And the more you absorb from your victims, the less sure you feel of your own identity or even your humanity.

Like Thanatomancy and Personamancy, Androphagy is an ancient magick school. It was likely one of the first, practiced by adepts at the dawn of humanity, and will likely be one of the last. Humanity will always find itself important, and there will always be those who seek to enjoy the people around them in a "special" intimacy. The Cannibal is always a part of us because it ultimately is us in a way that we cannot know until we eat beside it or are eaten by it.

Androphage Blast Style

Bite marks appear all over the victim's body as his flesh is bitten off and consumed by a multitude of invisible mouths. The cannibal casting the blast tastes the flesh as if she herself were eating it, but it is purely a sensory experience, not satisfying hunger in any way. The teeth marks are identical to those of the cannibal in question, which is revealed if the wounds are properly analyzed.

Stats

Generate a Minor Charge: Eat a half a pound of human flesh or participate in a religious ritual in which flesh is metaphorically consumed (such as taking communion).

Generate a Significant Charge: Eat the part of a person that most defined his life (such as a runner's leg, a philosopher's brain, or a philanderer's genitals). You gain two significant charges if the person granted you permission, of her own free will, to consume her body after death.

Generate a Major Charge: Convert someone to cannibalism. To do this, you must convince someone who has never consumed human flesh and has no strong desire to do so to knowingly share a full meal with you. You may not coerce them, though you may take advantage of their physical or spiritual hunger.

Taboo: If you ever disrespect your prey, you lose all the charges you're carrying (and automatically lose any of the traits or attributes that you've temporarily "borrowed"). To maintain respect, personally thank your prey by name before eating it (thus requiring you to learn your prey's name beforehand, if it has one). While eating it, maintain whatever you see as proper customs surrounding eating -- whether that means an uninterrupted frenzy or a civilized dinner party. Do not allow your prey to spoil or go to waste. Do not, under any circumstances, regurgitate your prey. You also must never insult nor lose your temper around your prey (such as acting on your Rage passion).

Random Magick Domain: Androphagy is about drawing upon the energy and power of those the adept consumes as well as filling others with the Cannibal's energy and fear. A lecter could absorb her prey's appearance, traits, thoughts, even a piece of his soul. She could also fill his mind with either the desperate terror of the hunted or the savage joy of the hunter.

Starting Charges: Beginning Androphages start with five minor charges.

Charging Tips: Through grave-robbery and religious service, Androphages could gain 2-6 minor charges and 1 significant charge each day without too much difficulty. Unless the cannibal has some special resource (such as a job as a mortician or a few victims locked in the cellar), trying to gain charges in excess of this has an excellent chance of

attracting unwanted attention.

Androphagy Minor Formula Spells

Eat of My Body

Cost: 1 minor charge
Effect: Roll to cast this like any other spell. Heal a number of health points equal to the sum of the two dice in your roll. For this to work, you, or the person to be healed, must eat human flesh while you cast the spell and smear blood on the wound. This cannot be used on damage you, or another cannibal, has inflicted.

Feast of the Cannibal

Cost: 1 minor charge
Effect: This is the Androphagy minor blast. As described above, the victim is attacked by invisible, hungry mouths.

Skin-Thief

Cost: 1 minor charge
Effect: By eating the skin off a person's face, you can take on his facial appearance until the next time you sleep. Alternately, you could consume his tongue to gain his voice, the meat off his right foot to gain his walk, etc. Thus, multiple castings should be made and multiple body parts consumed to make the disguise truly effective. Lasts until the next time you sleep.

Mark of the Beast

Cost: 2 minor charges
Effect: The target of the spell recognizes you as the ruthless, monstrous predator that you are. This forces a Violence-8, and might trigger the target's Fear passion.

Talk to Your Food

Cost: 2 minor charges
Effect: If you eat a human's tongue, you gain one piece of information known by the individual. This information is not detailed enough to result in any increases in skills (for that use *Food for Thought*), but could, for example, give the password on a safety deposit box, reveal the names of associates in a cabal, or discover where the victim had hidden the artifact she stole.

Food for Thought

Cost: 3 minor charges
Effect: By eating a person's brain, you can temporarily gain one of his or her nonmystical skills. You now know the skill at the same level as your prey did (and if you already possess that skill, you add the levels together). However, the final skill cannot be higher than the governing stat (so if you have Soul 60 and Charm 30%, and your prey has Charm 40%, then the enhanced skill is Charm 60%). This skill increase lasts until you fall asleep, at which point your skill drops down to its normal level (or vanishes completely if you do not naturally possess it).

Androphagy Significant Formula Spells

Bloody Banquet

Cost: 1 significant charge.
Effect: This is the Androphagy significant blast.

Man-Eater's Kiss

Cost: 2 significant charges
Effect: By surreptitiously feeding a person a small piece of human flesh, you can fill her with a cannibal's hunger. The target must make a rank 7 Self stress check or attempt to devour the nearest human who is not an Androphage. While the spell is in effect, the person behaves like a wild beast: incapable of speech (snarling and growling instead) and fighting with only her nails and teeth. She viciously defends against any threats and otherwise focuses on satisfying her hunger. If no humans are present in the area, she may attack and consume animals, but these will not satisfy her. If she is presented with human flesh (or manages to kill a person), then she will happily eat the flesh raw and bloody. Once the grisly meal is finished, you may either let the spell elapse, or may make a second check with a +20 shift against the victim's Soul stat to hold them under the effects. No matter what happens, the spell ends after thirty-three minutes.

Wail of the Wendigo

Cost: 2 significant charges
Effect: If you have ever tasted a particular person's blood, you and he become linked, and you can use the power of his blood to draw him to you. By invoking this link with this spell, your target feels a strong compulsion to come to you, so much that he must make a rank 7 Self stress check every minute to resist. In all likelihood, he will not consciously know what has compelled him or even where exactly he is going, simply that he has an overpowering urge to go there. The target uses the quickest means that he has convenient access to (so if he owns a car, he'll drive, if he doesn't, he'll probably take the bus). The spell ends the moment the person comes within eyeshot of you or after three hours are up, whatever comes first. This spell is often used to lead prey into the adept's clutches.

Headhunting

Cost: 3 significant charges
Effect: Invest the Cannibal's power in a trophy taken from a victim in order to access his obsession skill. To create this fetish, you must eat all of a human's flesh, and then extract one of the victim's bones. This bone must be at least an inch long and be related to the victim's obsession skill (such as a piece of his skull for Physics or a finger for Struggle). You may only attempt to produce a fetish once for each victim, and mystical skills (such as archetypes or magick schools) maybe not be turned into fetishes.

As long as you are in contact with the fetish, you may choose to gain +20 in the relevant skill as long as it does not take the skill above either the controlling stat or the level that the victim had in the skill (however, you do not get to flip-flop the skill, as it is not your obsession). You can only use one fetish at a time, though can carry more on your person if you wish (many Androphages string a series of fetishes on a necklace for easy access). A fetish can only be used by the lecter who created it, and is as it is made from bone, it is quite fragile. If broken, a fetish's power is permanently destroyed.

Io, Bacchus

Cost: 3 significant charges
Effect: A group of people feels the maddening presence of the Cannibal and either instinctually flees from the horrible apparition or feels its passion thunder through their souls. Either way, they are driven into a frenzy, and begin to riot. This functions in an identical manner to the Urbanomancer's spell the Madness of Crowds (see p. 158 of the ***Unknown Armies*** rulebook).

Make a Meal of a Summer's Day

Cost: 3 significant charges
Effect: Eat a human's brain to gain the whole of their memories concerning a particular subject. For example, you could experience a person's memories of his spouse or of the cabal he was a part of or the secret plan he was engaged in (however, this spell cannot provide new skills, for that use Headhunting). Instantly gaining years of strange memories is necessitates a rank 5 Self stress check.

Skin the Soul

Cost: 3 significant charges
Effect: Eat a human's heart. As long as the spell lasts, you are indistinguishable from that person. You look, sound, move, and feel like him (however, you still possess any mutilation which produced Androphage charges). You even possess all of the person's skill at his level (though they can be no higher than your governing stats). All of the spell's effects end at the next sunrise.

Androphagy Major Effects

Adapt so completely the identity of someone you devoured that no one is able to tell the difference, even through magick. Cause a crowd of people to tear someone to pieces and devour his flesh. Consume a person's brain and instantly learn everything that he knew. Permanently reduce a person's mind to that of a ravening beast.

What You Hear: The Androphage

A powerful and mysterious Androphage known only as the Connoisseur has figured out how to eat the life of the adepts' prey, getting a couple of years younger by devouring people in the prime of their lives. It is rumoured that the Connoisseur has been doing this for decades, if not centuries.

* * *

The Cannibal

Attributes: This archetype is hunger in its most raw, most consuming form. The Cannibal is the ultimate glutton, whose need is so great that he is prepared to break one of the most fundamental of human laws to feed his aching belly. He is a bogeyman who preys upon humanity, a creature of shadow and terror who consumes their flesh and drinks their blood.

The Cannibal embodies transgression and the power achieved by those who are willing to set themselves apart from normal morality, forging their own dark path away from humanity. He savors each drop of blood and each piece of meat that disappears between his hungry lips, not only devouring his victims' flesh, but also their thoughts, their attributes, their spirits.

Taboo: The Cannibal is a slave to his hunger, gluttony manifest in its most savage form. Because of this, he must never leave his gastronomic needs unsatisfied. When hungry, he must eat or seek food if he has none, when thirsty, he must drink or seek water. The food does not need to human flesh, but it must at least be something. If the only food available is unfit for consumption, he must eat it anyway -- this is about his stomach, not his mind.

Symbols: The color red, animal teeth, the full moon, and human skulls are all strongly linked to the Cannibal, as are such movies as *The Texas Chainsaw Massacre* and *The Silence of the Lambs.* Predatory animals are strong totems, particularly sharks, tigers, wolves, and various mythic bogeymen such as ogres, vampires, and werewolves. Perhaps the most consistently powerful symbol is that of the monster masks, ranging from cheap plastic ones worn at Halloween to the complex carved images used in tribal ceremonies.

Masks: Bacchus (Greco-Roman), Baxbakwalanuxsiwae (Kwakiutl), Coatlicue (Aztec), Kali (Hindu), Wendigo

(Algonquin)

Suspected Avatars in History: Throughout history, desperate people have turned to cannibalism in order to stave off starvation, such as the crew of the ship *Medusa,* members of the Donner Party, and the survivors of Uruguayan Air Force Flight 571. It is likely that many of these individuals were at least unconscious avatars of the Cannibal. It is almost certain that the most dedicated followers of such secret societies as the Hamatsa channelled him as well.

Channels

1-50%: For every half-pound of human flesh you eat, you gain back 3 wound points.

51-70%: You possess an unnatural sense of smell, and is able to smell both physical and metaphysical things. You may use your Avatar: The Cannibal check in the place of Aura Sight or Notice when relevant. Of course, as it is relying on a difference sense, some things will be detectable with Avatar: The Cannibal that are not with Notice, and vice versa (you could sense whether someone was sweating and that he had traces of perfume on him, but would not be aware of his unusually designed cufflinks or where he had cut himself shaving).

71-90%: You are able to use your Avatar: The Cannibal check in the place of any skills which is currently directly being used to hunt humans (such as Tracking to locate your prey, Run to chase him, Firearms to kill him, etc.). If either your Avatar skill or the skill being replaced is your obsession, you may flip-flop the roll. This channel only works if you intend to eat the person in question.

91%+: At this level, you are so attuned to the raging beast within you that you may call upon its power in combat. While possessed by the Cannibal, your teeth elongate into fangs and your nails into talons, with a +3 (penetrating) and +6 (heavy and penetrating) bonus to damage respectively. Furthermore you gain +10 to Body and Speed (with a corresponding increase in wound points), and ignore wound penalties and stress checks. However, while in this berserker rage, you may do nothing except strike at your enemies with your teeth and claws (as well as anyone else who seeks to prevent your mad attack). Once all your opponents are dead, you begin to eat the corpses, and only after you can eat no more do you return to your normal self. However, you may make an Avatar: The Cannibal check at 20 in order to prematurely return to your senses. This check may be reattempted each round without additional penalty, but only after you have spent at least three rounds possessed by the Cannibal.

* * *

Revenant: The Ravenous

The Ravenous are a particularly malevolent kind of revenant that is formed from people who died of starvation. Enraged at their wretched demise and hungry for any kind of sustenance, their tormented spirits are kept on this side of the Veil by the desires to see the living pay for what the revenants perceive as their callous abandonment. Since people didn't feed the Ravenous in life, these revenants have decided that they will feed them in death. To cling to their twisted unlife, they must consume human flesh.

Like the Wronged (see ***Postmodern Magick,*** p. 133), the Ravenous link to particular innocent individuals before engaging in their horrific actions. These revenants favor the most innocent hosts possible, for it gives them great pleasure to drag a virtuous soul into savage insanity. Most of the time, a Ravenous hides within its host's shadow, but when the host sleeps, the creatures goes hunting. To those who can see a Ravenous in its incorporeal state, the spirit looks like a shifting human shadow with red glowing eyes and a huge mouth full of long spectral teeth.

While linked to a Ravenous, the host's dreams are filled with glimpses of the revenant's actions seen from the spirit's point of view. The poor victim experiences the stalking, the attack, and the grisly meal almost as if he was responsible for it. He may even wake up with blood on his lips and under his fingernails. Eventually, he may come to believe himself responsible for these acts (likely resulting in numerous Stress checks). If the host dies or the Ravenous becomes bored of him, then the creature just moves on to someone else and the cycle begins again.

The Ravenous is a particularly potent revenant. It can generate six minor unnatural phenomena a day and two significant a week. It can also generate one major unnatural phenomenon a month. The phenomena are usually employed to stalk and frighten the Ravenous' prey, though they are sometimes used to torment the host and, if necessary, evade capture. When on the hunt, the revenant manifests a corporeal form with the appearance, along with the Body and Speed stats, of its host. It is affected by magick in the same manner as a demon.

A Ravenous must devour a human at least once a month, and usually tries to feed much more frequently than that. If it hasn't eaten in a month, then it loses 10 temporary Soul points from hunger, and for every additional week that it doesn't eat, it loses another 10 points. These lost points can be recovered through consumption, with 10 points recovered for each person consumed. If a Ravenous is ever reduced to zero Soul, it vanishes forever. Some believe that the spirit is obliterated, whereas others claim that it is drawn back across the Veil to face the judgment of the Cruel Ones.

Ravenous (Significant)

The Hungry Dead
Points: 30 + a percentile roll (1-100)
Body: 0
Speed: 10-40
Mind: 10-40
Soul: 50-80

Secrets, Rumors, And Legends

Here are discussed many different plot hooks and rumours tied to cannibalism that could be employed in an *Unknown Armies* campaign. This information is for GMs only, and thus all players should avert their virgin eyes.

1. Dion Isaacs (*Lawyers, Guns, and Money,* p. 77) is a white trash counterpart to Bacchus, Greco-Roman god of wine, revelry, and madness (also known as Dionysus), with his women being modern day Bacchante. This divine association may be coincidental, or Dion could be a lecter or an avatar of the Cannibal using the god's imagery to build up some metaphysical mojo. Some people even suspect that Dion may be an inhuman entity, possibly a particularly potent Ravenous or some force older and more powerful. Certain cannibals who have heard of him believe Dion Isaacs to be some sort of messiah, and quest through the United States, hoping to find the enigmatic individual. It is not known what Dion does with any who locate him.
2. An especially unhinged avatar of the Cannibal in British Columbia wishes to set up a modern version of the Hamatsa cult that operated years ago in the Pacific Northwest. As the man lacks any Native blood whatsoever, he is currently hunting down and devouring various people of Kwakiutl descent, hoping to eventually absorb enough of their essence to be recognized as a worthy recipient of the power of the Cannibal at the North End of the World. Though he has yet to catch the attention of any such spirit (if indeed the Cannibal exists as anything besides a mask for the archetype), his bodycount has attracted the attention of not only the police, but also the Sleepers, the New Inquisition, and possibly even the Order of St. Cecil. It is only a matter of time before one of them smacks him hard.
3. An enterprising Androphage has joined Mak Attax (though she has not revealed her magick school to her associates, masquerading instead as a clued-in mundane). When she passes along special orders to the customers, she often includes a small piece of human flesh in the burger (sometimes her own, sometimes someone else's), and occasionally she is able to switch a normal patty with one she had made herself from her prey. The woman wishes to awaken others to the joy and power of cannibalism, initiating them into her dark mysticism.
4. The relationship between Marcy McLaughlin and Andrew Cray (*Hush Hush,* p. 121) is an Androphage's wet dream. A lot of lecters have a twisted fascination, even affection for their prey, and yearn for people who would look forward to being consumed as much as the cannibals would look forward to consuming them. If McLaughlin manages to completely devour Cray, there is a chance her mind will completely shatter and she'll become an Androphage herself (desperate to achieve the same union with others that she achieved with Cray).
5. Many dukes speak in whispers of the Androphage known only as the Connoisseur. Legends of this individual

have been circulating for a while, so he, she, or it is either centuries of years old or is merely the last in a series of adepts who have adopted the name. The Connoisseur's existence has helped to increase the paranoia which so dominates the occult underground since there is always the possibility that anyone, even your closest friend, could be the Connoisseur wearing a stolen skin (with the bones of the original owner picked clean and lying in some unmarked grave). In fact, some particularly neurotic dukes have snapped, attacking or even murdering a dear companion because they were convinced that he had been replaced. There's a rumor going around that the Connoisseur is a friend, or even a lover, of the Freak. Some people have suggested that the Connoisseur keeps trying to convince the Freak to let itself be devoured by the Androphage (which, knowing that particular Epideromancer's extreme masochism and probable deep-set issues of personal identity, is a proposition it might hypothetically consider). Some people have even suggested that this has already happened, and that the being currently claiming to be the Freak is actually the Connoisseur in disguise!

Bleeding Edge Adventure #1: Mansion of Shadows (for the d20 System)

Published by [Green Ronin Publishing](#)

Written by Robert J. Schwalb

Cover by Lisa Wood

Illustrated by The Forge Studios

Cartography by The Forge Studios

48-page b&w softcover; $11.95
46-page 4.13-meg b&w PDF Document; $6.50

Mansion of Shadows is another scenario for the *d20 System.* It is another scenario for a party of 1st- to 3rd-level characters. Surely, after five years of *Dungeons & Dragons Third Edition* (and *Edition 3.5*), the last thing the hobby needs is another scenario for starting characters? Well, perhaps. But *Mansion of Shadows* is from Green Ronin Publishing, and that is one indication of quality. After all, they released one of the very first adventures for the *d20 System,* and that still stands up as a classic.

In fact, *Mansion of Shadows* marks the return of the publisher to the adventure format after some time away. It is the first entry in the new *Bleeding Edge Adventure* series, intended as an alternative to the current trend in adventures that hark back in feel, style, and play to those published for *Advanced Dungeons & Dragons.* The series' aim is to present adventures that provide the DM with a good story that is easily dropped into most settings, but that is both self-contained in terms of rules and flexible enough to use in other games and settings. Which is a lot to deliver.

Fortunately, *Mansion of Shadows* manages to live up to these objectives. First, the story is good, offering a surprising degree of depth and complication given both the book's length and genre. Second, although the setting for the scenario as written is Green Ronin's "World of Freeport" (to be detailed in the forthcoming system-less sourcebook of the same name), it is merely a matter of changing a name here and there to set it else where. Be warned though, the adventure does not take place in *[Freeport: City of Adventure,](#)* but rather on the continental mainland nearby. Third, although the adventure references a selection of Green Ronin's other titles, including *[The Book of Fiends,](#) The Cavalier's Handbook,* the *Avatar's Handbook,* the *Book of Righteous,* the *Unearthed Arcana,* the *Advanced Player's Manual,* the *Advanced Gamemaster's Guide,* and the recently re-published *Freeport Trilogy* -- which is quite a bit -- this adventure both details what it needs from all of them and suggests alternatives from the core rulebooks where possible. Fourth, Green Ronin has already made available an enhancement that provides the statistics for the scenario for use with *True20 Adventure Roleplaying.*

[BEGIN SPOILER ALERT!]

The adventure opens with the characters traveling on the road from the Ivory Ports bound for the Bugbear and undead infested mountains known as the Towers. Ahead lies the hilly valley known as the Kirsvald, home to the village of Staufendorf, a popular stop for merchants before they enter the Narrow Pass that runs through the Towers. The journey has been uneventful so far, but the sounds of combat break the silence and the idyll. Investigating the sounds reveals a young knight in the woods under attack.

From this point, *Mansion of Shadows* follows two paths that try to take account of the players' actions and push them toward the adventure's denouement. In path one, the young knight introduces himself as Helmut Staufen, returning home to the family seat in the Kirsvald. As thanks for their aid, he invites the characters to not only join him for dinner, but also stay the night. Once within walls of the castle-like mansion, it is obvious that not all is as it seems -- the place is gloomy, the servants wary, the guards are supplemented with Orc thug soldiers, and Helmut's family display unsettling preoccupations.

In path two, the player characters either declined Helmut's invitation or failed to save him, and so travel onto Staufendorf. It is clear that all is not as it should be in the Kirsvald, with the road lined with bloodied crucifixes and fresh graves. The mood is equally as dismal in the village, where the shutters are drawn, buildings have been torched, and the streets empty bar patrolling villagers. It is not long before somebody comes to investigate the new arrivals. The village priest explains that he was until recently the Staufen family priest, but was thrown out after they fell under an ancient family curse. Since being taken in by the locals, the village has been victim to brutal attacks by the Staufen family soldiers. Although, the priest does not advocate violence, he implores the characters to bring peace to the village by assaulting the Staufen family seat.

It is here that the two paths converge, with the villagers storming the mansion. If the characters are already inside, the diversion gives them the opportunity to investigate further. If they are the attackers, then the oddness is waiting to be discovered . . . And yes, it does involve the ancient family curse, but to reveal more *would* spoil the decently done plot.

Despite the adventure having the two differing paths, the second is there to keep the party on track and moving towards the adventure's climax. The emphasis is on the first path, in which the players gain entrance to the mansion and are exposed to the peculiarities of its inhabitants. More specifically, this comes in the adventure's centerpiece, dinner with the Staufen family. This is not an easy scene for the DM to handle, given the number of NPCs he has to portray. The advice tells the DM to keep it simple and let the characters drive the interaction, which is probably best unless there is more than the one DM. The dinner is quickly followed by the events that lead to the exposure of the secrets and plots at the heart of *Mansion of Shadows.*

[END SPOILER ALERT]

Helpful advice is given throughout the book, much of it focusing upon what to do if the players send the scenario off the rails. Other advice gives pointers to particular rules in the *Core Books* or extra information that can add help color and personality to the adventure. One major section deals with the village mob's attack upon the mansion. Statistics are included so that their confrontation with the guards and soldiers can be handled using the mass combat rules from the *Advanced Player's Manual,* but a DM can also run the battle by the narrative or the representative methods, both of which are also discussed. In addition, the book details the fiendish state of the core family which is much in-keeping with the cosmology of the *Book of Fiends.* Despite the advice, this is not really an adventure suited for the neophyte DM.

Physically, *Mansion of Shadows* is a disappointment. Behind the decent cover, the rather plain layout suffers from merely average artwork and cartography. This isn't necessarily a detractive factor, but Green Ronin has most definitely published better looking books. Certainly the book's maps are far from what you would call "fantastic," a ridiculous claim made in the blurb. Green Ronin can do [fantastic maps](#), and these are most definitely not in the same league. Additionally, the book requires another proofread.

Penultimately though, you have to come back to the story at the heart of *Mansion of Shadows,* and that is the raisons d'être for both the scenario and the *Bleeding Edge Adventure* series. In the *Mansion of Shadows* that story is a gothic horror tale, one that harks back to the original *Dungeons & Dragons* gothic adventure, *I6 Ravenloft.* This scenario though lacks the scale and the innovations, but counters this with a tighter focus and a more detailed storyline, one that feels most definitely grim and perilous. Indeed, this scenario could very easily be run with *[Warhammer Fantasy Roleplay,](#)* the story awards that replace the more traditional Experience Point awards only serving to enhance the similarities in feel.

And ultimately, you have to ask whether *Mansion of Shadows* lives up to the objectives set out for the *Bleeding Edge*

Adventure line? The answer is a resounding yes! Although it is not a classic -- being disappointing in physical terms and the aftermath being a little underwritten -- **Bleeding Edge Adventure #1: Mansion of Shadows** is nevertheless a sound, solid, and assured scenario that kicks the series off to a good start and should provide several sessions of entertaining play.

Murphy's Rules

You Can't Fight The System, But Maybe You Can Get a New One

Having had some free time to do some research and soul-searching while at the World Yo-Yo Contest, I decided that it's been a while since I've done anything truly drastic with my life. So, when I got back, I decided to convert.

To Linux.

The transition went about as well as I'd realistically hoped, which is to say it took about a solid week of false starts, data-wrangling, and tweaking to get to a system that does most of what I need it to do. (In fact, it took about an hour to upload this week's Murphy's Rules, because of various wrangling with upload clients, file permissions, and finding the file in my new e-mail client.)

Strangely, I've dealt with Linux before in years past (I think I got rid of a hand-illuminated Red Hat 5.1 book before the move to Indy), so -- despite the blood, sweat, and tears -- I can honestly say that things have gotten *much* better in the Linux world than they were even a few years ago. Which is to say that things are still pretty stinky, and I doubt anyone who wasn't willing to spend a *lot* of time on Google would have a good time unless their needs were very modest. (This operating system clearly isn't targeted at Grandma, unless Grandma enjoys being tied up and whipped by strangers in masks.)

Anyway, having firmly formed the foundation of my tax write-off for all my Linux related pain and suffering, I can transition smoothly across the center line to the on-ramp of this discussion. Namely, transitioning from one operating system to another is *very* similar to transitioning from one game system to another, especially if you're trying to migrate an extant campaign. And the lessons I've learned in moving to Linux may hopefully prove illuminating to someone else in the gaming world. In fact, I'm doubly blessed, because I've migrated at least one long-running campaign from one system to another.

Be very sure you want to switch. Things will break; chaos will ensue. Usually there's one item, feature, or defining moment where you decide that you *really* want to switch once and for all. If that's the case, make sure that this item will be fully resolved by the game system you're switching to.

Regarding my Linux switch, my change of heart came from yet another evening of trying to get work done while fighting with Windows automatic updates, which were patching yet another round of security holes. ("Hi! I'm going to reboot in five minutes, unless you click 'No,' in which case I'll pop up this same box again in 10 minutes. Oh, and the focus of the box when it pops up is on 'Reboot Now.'") In my gaming switch, I wasn't very happy with the fact that I was having a *very* difficult time balancing power levels in my *GURPS Supers* campaign, and so I switched to *Hero System/Champions* in the hopes that it would be a slightly more point-based system. (At the time I also liked the aspect of *Champions* that required supers' players to pay points for useful equipment.) In both cases I was relatively confident that the switch in question would resolve my issues.

Form a game plan. This step is pretty obvious, but it can't be stated enough: Have a definite road map for how the game's going to fall into place (with enough wiggle room for when things go wrong). In the case of my *Champions* switch, everyone started with new characters in the same universe, neatly sidestepping the need to convert characters directly. (For NPCs who would be popping up again, I had an adventure in the works that would serve as kind of a "cosmic sweeping change" that would neatly explain any variances in power levels after that point.) In the case of my Linux conversion, most of my plan revolved around the order I would be getting data and applications up and running (web browser first, then e-mail, and so on).

Not only does the road map serve as a reminder list for what to do next, it also provides positive reinforcement since, as phases are completed, you get to cross items off; if you don't have one, you may be overwhelmed with the enormity of the task at hand and give up.

(As an aside, this "road map" was one of the many good things Wizards of the Coast/TSR did in the build-up to *Dungeons & Dragons 3rd Edition.* In each issue of *Dragon* Magazine there would be articles about how to transition over, what to look forward to, "10 Ways To Start Playing 3rd Edition Now," and the like. *GURPS* did something similar in its own way by the release beforehand of the *Lite* edition and the teaser articles in this very mag.)

Be prepared to compromise and make changes. It's very likely that some aspects of the old game system that you took for granted before won't be possible in the new game, and you may find yourself scrambling to fix things you hadn't realized would break. In my *GURPS Supers* campaign I had grown accustomed to a very fast-paced, "roll the dice and see how pretty they look" style of GMing which really wasn't possible in the more mathematically rigid *Champions;* while I adjusted, future adventures had fewer combats so that I could concentrate on tweaking the pacing of the new game system.

Before, during, and after, talk over the decision to switch with anyone who the decision affects. Make sure you get any ideas or suggestions they might have, and make sure that the needs of the group are taken into account if at all possible. (You may also want to hit folks up for advice even if they *won't* be affected; "Get a mentor" is a sub-piece of advice under this heading.)

Although switching from one system can be a nightmare, it doesn't have to be. With a little forethought, a bit of hard work, and a focus on the goal, it's possible for everything to go smoothly.

Unless and until the campaign crashes with the Blue Screen of Death, of course.

--Steven Marsh

Shadows and Fogg, Part the Fourth

"'I am Phileas Fogg of London.'
'And I am Andrew Speedy of Cardiff.'
'You are leaving . . .'
'In an hour's time.'
'Where are you heading?'
'Bordeaux.'
'And your cargo?'
'Stones in the belly. No freight. I'm travelling ballasted.'"
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXXII

Just before this eerie ritualistic exchange, Jules Verne describes Captain Speedy as having "a complexion of oxidized copper," which is to say, green. Is "Andrew Speedy, of Cardiff" a Reptoid? Perhaps it is but a coincidence that the dinosaur-descended birds, like some reptiles today, swallow "stones in the belly" to aid digestion. Or perhaps the "stones in the belly" indicate the gods devoured by Saturn, god of time. Is Speedy indicating that he is part of the temporal conspiracy MI-8, or whichever one it is that Fogg actually belongs to? Or that his allegiance is actually to Ahnenerbe, or the Sphinxes, who wish to return Earth to its [original orbit](#) around the ringed planet? Or perhaps "stones in the belly" refers to the cargo of anomalous meteorites that Fogg has hypothetically been gathering on his 1872 (or 1858, if we are to believe an early draft of Verne's novel) voyage around the world. Meteorites such as the Marblehead meteorite of 1858, regarding whose meteoric origins scientific investigators of the time found "negative evidence." Just our kind of evidence. Very suspicious. Meteors from nowhere, and a Reptoid from Wales, leaving in an hour's time.

Oh, right. For those just joining us, we're journeying around *Around the World in Eighty Days* in eighty hundred words or thereabouts, and we're almost done. In our [first leg](#), we decided that, of the time-war conspiracies from the [200th Transmission](#), Fogg was most likely an agent of MI-8, and hinted that Verne himself has some shady Rosicrucian connections, perhaps with the Prieuré Sion themselves. And we realized one can map Fogg's eighty days around the world to either the 36 decans (matching the 37 chapters of the novel -- the first and last overlap), the twelve signs of the zodiac (matching the 12 legs of the journey in Fogg's ledger), or the eightfold turning of the year (matching Verne's own summary of the voyage in eight legs, in Chapter III). In our [second leg](#), we proposed that Fogg was laying some sort of ley line into the blank and twisty reaches of India Ultraterrestria, and playing rather a dangerous hand of Tarot whist the while, although it's always his valet Passepartout who winds up dead. On our [third leg](#), we noted a similar pattern in America Ultraterrestria, and that Fogg has now beaten Death, dueled with the Green Knight, and possibly retrieved a Grail of some (meteoric?) sort. And we learned all of this by reading Verne's novel very, very closely. Closely enough to see the patterns that always seem to emerge in these instances.

" Nevertheless, some way of sailing across the Atlantic had to be found -- unless it was to be crossed by balloon -- which would have been highly risky and, in any case, impossible."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXXII

And in the absence of such a close reading, one can be forgiven for believing that Fogg and party at some point travel by balloon during their voyage. After all, such a balloon appears in all three filmed versions of the novel, and Jules Verne made his name with *Five Weeks in a Balloon,* about a trip across Africa in a lighter-than-air craft. Verne's close friend "Nadar" was a pioneer balloonist, and possibly tied in with the "Angelic Society" -- what, after all could be more elevating than flight? But there is no balloon in *Around the World in Eighty Days,* and the absence aches like a missing tooth. One suspects that Verne is covering something up. 1872 is not a particularly fruitful year for UFO sightings, although there were two sightings 44 days apart over Grand Island and Muskegon, Michigan -- though in the summer, before Fogg (allegedly) left London. On December 7, 1872, conversely, while Fogg is in America, a "burning hayrick" appears over Banbury in England. Distractions? Reflections? Sorcerous static? In Verne's first-draft year of 1858, on the other hand, a "large and wondrously constructed vessel . . . worked by wheels and mechanical appendages" of extraordinary precision and beauty appeared (according to a contemporary publication, *The Illustrated Silent Friend*) over Jay, Ohio. This is the heyday of the strange and enigmatical [Sonora Aero Club](#), with its own eerie

parallels to Verne's Robur the Conqueror, building secret airships on a hidden American plateau. But Verne, as I say, keeps silent -- wisely, in retrospect, given that his publishing Robur's story in 1886 led (as we learned last time) to an assassination attempt carried out by his own nephew.

"I'm collecting notes upon persons supposed to have been struck by lightning. I think that high approximation to positivism has often been achieved -- instantaneous translation -- residue of negativeness left behind, looking much like effects of a stroke of lightning. Some day I shall tell the story of the Marie Celeste *-- 'properly' . . . mysterious disappearance of a sea captain, his family, and the crew --"*
-- Charles Fort, *The Book of the Damned*

And that's not even the biggest mystery Verne dances around. While Fogg is traveling across the Pacific on the *General Grant,* another ship, the *Mary Celeste,* is crossing the Atlantic. Some time between November 25, 1872 (while Fogg is somewhere north of Hawaii) and December 3, 1872 (a day Fogg spends in San Francisco -- convenient to Sonora and its Aero Club?), the crew of the *Mary Celeste* vanished into thin air. The good ship *Dei Gratia* discovered the derelict on December 4 with her cargo of alcohol (almost) intact, her longboat gone, her hatches open, and three and a half feet of water in the hold. Perhaps most significantly for the temporally focused nature of the Fogg Working, the *Mary Celeste* was missing both her sextant and her chronometer.

The opposite fate occurs on Fogg's transatlantic passage, on board the steamer *Henrietta,* which is burned to the hull plate as the passengers (and time) are relentlessly tracked across the ocean, even carved into the global cantosphere. The *Henrietta* is paid for "twice over" despite being burnt, a kind of [phoenix](#) ritual (during the fiery Leo leg of the voyage) in the empty Atlantic. The *Mary Celeste* becomes a kind of photo-negative proxy for Fogg's passage, an Opener of the Way across the Atlantic, its crew a sacrificial scapegoat given over to whoever -- or Whatever -- opposes the implacable, machine-like Englishman.

" These are dangerous waters. In the winter especially, there are very frequent fogs, and the storms are formidable. The day before the barometer had gone down abruptly, and it was now giving warning of an impending change in the atmosphere. And indeed the temperature changed during the night, the cold became sharper, and at the same time the wind veered to the south-east."
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXXIII

And in the novel, as he crosses the Atlantic Fogg finds himself opposed by -- fog. The way across the water turns cloudy and cold, congealing like the sea encountered by [Brendan the Blest](#) when he crossed the other direction 13 centuries before. The fog recalls the "uniform whiteness" of America Ultraterrestria, a "uniform whiteness" of blank spots on the map and the charnel houses of the Sphinx that Fogg had thought left behind in Indian country. In the novel, Fogg merely bulls ahead through sheer English stubbornness, but Verne left plenty of hints in his other works. In his 1897 novel *The Sphinx of the Ice,* Verne wrote a sequel to [Poe's](#) *Narrative of Arthur Gordon Pym,* in which his heroes travel through a curtain of fog to discover Pym impaled on a gigantic magnetic Sphinx. Of course the novel, set in 1839, directly contradicts Poe's story, which is narrated by a surviving Pym in 1836. Again, Verne hints at a time-nexus, a vortex similar to the one that swallowed, and perhaps over-wrote, or duplicated, Captain Nemo in 1868. Clearly, to get across the Atlantic, to get through the barrier of uniform whiteness that carries his own name, Fogg must sacrifice himself; he must die and be reborn. Is the ritual sacrifice (beginning on December 19, the Opalia, the feast of Ops, a Roman aspect of Cybele) of the *Henrietta* (and of the crew of the *Mary Celeste*) enough? Apparently it is, at least enough to put off the confrontation with himself (or his vortex-spawned double) until he lands in Liverpool.

"The honourable gentleman vanished and his place was taken by the thief of the banknotes. His photograph, available at the Reform Club with those of all his colleagues, was duly studied. Every single feature in it appeared identical to those of the description produced by the enquiries."
-- Jules Verne, *Around the World in Eighty Days,* Chapter V

In Liverpool, Fogg is clapped in jail as a bank robber, imprisoned for the actions of his evil twin. This is the eighth station, the turning of Litha, Midsummer, and the sacrificial contest between the Oak King and Holly King, between aspects of the Dying and Reborn God, celebrated in midwinter in the novel as Fogg twists and stretches time. But fortunately, a solution presents itself -- the next day, Fogg is told that his double, "Slater," was arrested in Edinburgh.

Why Edinburgh? Well, it was the home of the original "Dr. Jekyll and Mr. Hyde," Deacon William Brodie, giving it a powerful aura of duplicity. Verne may have been alluding, Rosicrucian-style, to the lost Stuart heir (a Scot, of course) and the "shadow court" of his Prieur?patrons. It may be significant in this connection that (the royal) Aouda's disguise, in which she escapes from Death and Justice in India, is "of Scottish material." Verne himself was of Scots descent, and in *The Children of Captain Grant* (also, significantly, about the circumnavigation of the earth) mentions Grant's resolve to found a Scottish colony "in one of the vast continents of Oceania," thus echoing, among other things, Bacon's *New Atlantis.* But back to Fogg, released from prison on the news of Slater's arrest. When was Slater arrested in mystically significant Edinburgh? "Three days previously." That is, on the day that Fogg had purchased the *Henrietta* to burn her. His sacrifice is accepted, his doppelganger is appeased. He can travel on from Liverpool to London, through the house of Virgo, reborn young and intact.

"'What's the matter, Passepartout?'
'The matter, sir! The matter is that I've just learned a second ago . . .'
'What, then?'
'That we could have done the trip around the world in only 78 days.'
'Undoubtedly,' answered Mr Fogg, 'by not passing through India.'"
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXXVII

There are 78 tarot cards; Fogg has taken 80 days to circle the world, but as Passepartout points out above, he could have taken 78. Fogg the whist-player deliberately adds two more hidden cards to the deck -- perhaps the Maiden Aouda and the [Drowned Sailor](#) from the *Mary Celeste* -- in order to "pass through India." Having been released from Judgement in Liverpool, Fogg is free to claim the last trump in the Tarot cycle, the World. The number 80 kabbalistically equals not merely *kes,* the Throne, but Yesod, the ninth sphere of the Sephiroth, the sphere of Foundation. This Working allows, essentially, root access to the interface between the material world and the world of Forms -- just the kind of thing that Verne himself was channeling for forty years.

On December 21, 1872 at 8:45 p.m. in London, all five classical planets (plus the Moon and, obviously, the Sun) are below the horizon -- on the other side of the world. No ancient eyes in the sky are watching Fogg when he arrives at the Reform Club. He has dodged the rulers of the calendar from Sun to Saturn, arriving on the extra day "gained unconsciously" (or superconsciously) by travelling around the world from west to east, against the sun. Between Verne's gaps and overlaps (the novel confuses at least four dates badly), and Fogg's sorceries, the timestream is completely tangled and twisted, its energies bunched up like water in a knotted garden hose. No wonder, for the first and only time in history, on the day before Fogg completes the Working "all the clocks in London were striking ten minutes before nine." Only Passepartout's watch, carried through three deaths without setting or alteration, shows the True Time.

"In all this the eccentric gentleman had displayed his marvellous qualities of composure and precision. But what was the point? What had he gained from all this commotion? What had he got out of his journey?"
-- Jules Verne, *Around the World in Eighty Days,* Chapter XXXVII

Fogg has lapped the decans, the zodiac, and the year of the god, shaved from the Foundation, and palmed from the Tarot. What does he gain? His Working has created, or pinched off, a free day in London, a day when MI-8 (for the sake of argument) can do anything, a day of perfect freedom of operation and total control. Perhaps this day becomes an unbreachable Refuge, or a place to store archives against temporal disruption and decay. Perhaps it is shaved out and subdivided, or invested across the worlds to bear dividends, so that every MI-8 operative is given a few minutes to spend doing anything from violating the laws of gravity to dodging bullets to pushing "restart" on an ambush or a ritual. (One day is 86,400 seconds -- that's a lot of combat rounds, even if MI-8 can't refresh them.) Or perhaps the goal is more local, merely to tie the world of 1872 firmly into the British cartographic framework and choke off the irrational Sphinxes in India and Lemurians in America alike.

World GDP in 1872 was roughly £10 billion, or $844 billion in today's money, give or take. One day's worth of that is £27.6 million, around $2.31 billion now -- pocket change as global conspiracies go, but a pretty good score if Fogg was, in fact, the thief that Fix so passionately believed him to be. Could the Fogg Working have been just a giant sorcerous caper, an *Ocean's 8* thumb in the eye to his pinchpenny Rosicrucian masters? And finally, the Working may

explain Fogg's apparent immortality -- he has retroactively made himself, as Verne put it in the first chapter, "one who might have lived a thousand years without ever growing old." Well worth it in and of itself. Jules Verne, sadly, died in 1905 at the age of 77, three years short of the miraculous 80. But perhaps all was not lost. His works would live forever, and his mastery of Rosicrucian lore may have given him one last scientific -- or alchemical -- miracle. He died on March 24, 1905, the day before the festival of the resurrected of Attis. His tomb in the Madeleine graveyard at Amiens bears a sculpture, featuring a resurrected Verne. The sculpture is entitled "Onward to immortality, and the eternal youth." Onward to the east, and the rising sun.

The Omniscient Eye

Can I Use Cyberwear to Test My Mettle?

Everyone in cyberpunk campaigns has all kinds of nifty metal limbs, digital eyes, and so on. I'm sure the abilities of a Steve Austin are cinematic, but how close could we get, theoretically? What kinds of obstacles would we have to overcome to produce cybernetic limbs and sensory equipment at least as good as "original parts," and what kinds of limitations would they still face? Are cybernetic replacements always going to be second-best, like modern artificial hearts and hearing aids, or can we build better replacements for ourselves?
--Benson Fong

We've been on the brink of a cyberware explosion for a while; pacemakers, mechanical hearts[1], and cochlear implants[2] certainly qualify as early examples. The good news for our intrepid questioner is that science has made some incredible leaps in neural interfaces recently. The term cybernetics comes from the Greek kybernetes, meaning steersman; it is the science of systems of information and control[3], which is the central problem in creating bionics (electronics which mimic biology) and cyborgs (cybernetic organisms). The crucial component of a bionic arm isn't the mechanical muscles, but the BCI (brain-computer interface) that allows fine motor control of them; keeping a heart pumping and blood flowing is very simple by comparison. Implants that allow a quadriplegic to play Pong and draw crude circles[4], robot hands controlled by the interpretation of fMRI scans[5], and devices that allow blind people to see with their tongues[6] are all being tested. This doesn't mean that Steven Austin is around the corner; there are still many hurdles in the way of human cybernetic enhancement.

The first set of problems is technological. Many bionic systems will require a source of electrical energy. As any laptop owner can tell you, our current battery technology is both heavy and short-lived, and drawing power from the body somehow is likely to be unhealthy. The processing power necessary to interpret neural activity is also going to produce a fair amount of waste heat. Until those limits are surpassed (which may come soon, thanks to nanotech supercapacitors[7]), implants are going to be an annoying combination of heavy, hot, and needing frequent recharge or external battery packs. Systems without mechanical components will be somewhat less prone to this problem, but not immune.

There's also the concern of component failure; it's enough of a pain to replace a CPU when you don't need exploratory surgery to reach it. Components will need to capable of performing for years without replacement, in a very harsh environment; this will certainly drive the cost up quite a bit.

Human senses currently outstrip the resolutions available for consumer electronics. As cybernetic replacements become more commonplace, this is likely to change, with the exception of the sense of touch. Touch registers several types of information over a comparatively wide area. Without advanced nanotech, it may not be possible to lay down enough sensors to gather the same amount of information. This failing, however, is made up by the ability to add entirely different sensory capabilities tied to the normal ones; infrared vision and ultrasonic hearing are possible, if not very probable. While it would be fairly easy to shift a sense to a different spectrum, expanding the spectrum it spans (i.e. both infravision and normal vision simultaneously) may not be possible without losing resolution, and switching between modes may be disorienting.

The second set of problems is medical. Colorful fiction aside, the gleaming cybernetic port is a bad idea. Most parts will likely be made of hypoallergenic space-age polymers, not metal; reducing the weight and risk of heavy-metal poisoning is worth the extra cost. This is one of the major advantages of medical implants. Unlike transplanted organs, there is little risk of rejection. They also don't have the complex collection and storage problems that organ transplants

do. This could provide the technological basis for less-necessary treatments. Not all parts will be biocompatible, however. Injuries to the area of the implant may damage shielding of those parts, complicating treatment[8].

But the major danger of most injuries is not the trauma itself, but the potential for sepsis. A datajack or cyberarm stud is effectively an open wound, and thus a dangerous source of infection. Keeping the datajack under the skin solves the problem. Data and power can be transmitted electromagnetically through skin without apparent side effects. Convincing skin to grow over a mechanical socket that can mount a limb would be harder, and might cause grooming and mild odor problems similar to earrings or other body piercings. Installing almost any cyberware will require major surgery, with the attendant risk of infection.

The current state-of-the-art neural interface also takes a while to adapt to. Not only does the user have to learn how to use the implant, but the computer system must also learn how to read and interpret the user's neural patterns. It's not an impossible process, but it has taken Richard Nagle (a quadriplegic testing the new BrainGate[9] system) four months to control a single cursor with the agility of a normal computer user. More complex systems are likely to take even longer. Without incredible improvements in neuroscience, there is no easy way to avoid the learning curve, though training and physical therapy will make it easier. Improvements in the interface or the systems using it may reduce the time for the system to adapt to the user, though.

Certain types of cyberware are medically quite cinematic. The neural encoding involved in skills and mental traits is likely much more complex (and widely distributed) than that for motor control and sensory input. Combined with the learning curve for using a bionic component, that probably rules out skill chips or all but the crudest personality modifiers. And even with space age polymers and fantastically powerful motors, cyberlimbs are still anchored to flesh and bone. Push too hard, and if the bionics don't break the biological bits will. This could be alleviated, but doing so would require yet wider changes.

However, the last and hardest set of problems is social. Doctors in most civilized countries are bound by the Hippocratic Oath[10], and though it doesn't actually say "first, do no harm," it does heavily imply it. The ethical implications of cosmetic surgery are nothing compared to the quandary behind replacing a functional organ with a mechanical one, even one that would be an improvement. Large bionic components will likely be mostly prosthetic limbs and replacement organs. Even the datajack will be a tough sell, because installing it would require dangerous neurosurgery.

Even if there are doctors willing to do the work, the question of who finances it comes in. The components won't be cheap, and neither will the surgery, and insurance doesn't like to cover elective surgery. The rich might buy enhancements for themselves, but probably to improve their job or social standing; internal cell-phone/organizers and voice-box improvements are much more likely candidates than claws. There's little bionics could provide that couldn't be gotten (much) cheaper as an external gadget, which is also easier to upgrade or take back from an employee. The chief benefits of most elective cyberware would be constant availability and the potential for secrecy; for either, the recipient or their benefactor will be paying through the nose.

DARPA (Defense Advanced Research Projects Agency) has floated ideas for cybernetic animals, everything from butterflies[11] to sharks[12]. The ideas have been sneered at as flights of fancy, and with good reason given the often ludicrous past attempts to bring animals into the modern battlefield. However, these proposals use the animals as spy agents rather than combatants, using electrical remote control systems similar to ones that have already been demonstrated, albeit imperfectly, on cockroaches[13]. Once the control systems are perfected, more innovative (and aggressive) uses can and probably will be found.

The legal, social, and ethical constraints are a lot simpler when animals are used. Rats and monkeys already bear the major brunt of experimental research into treatments for human ailments. Some fully developed technology will also be easier to use on animals than humans: making soldiers into literal killing machines would not help the military's image, but turning animals into combatants or spies has the potential to reduce the (human) body count. Using biological components grown from animal parts, such as the disembodied rat brain that can control a flight simulator, is a lot less likely to draw the modern equivalent of villagers with pitchforks and torches than using human parts.

However, given the right circumstances, much is possible in the next 20 years. For the most part, bionic enhancement will be for medical reasons, or to animals. If we manage to fully crack the way our brains encode and use data, BCIs might deliver the promise of fast-as-thought computing and fully functional cyberlimbs (or the terror of brain hacking). If we can improve the energy density of batteries and reduce waste heat from ICs, cyberware might become sleek and unobtrusive. If social mores change (the least likely, at least in the short term), the well-to-do might buy bionic enhancements the way they now buy plastic surgery. And if somewhere in there, very rich men find a good reason to give a spy some hard-to-detect surveillance equipment and/or weapons, well . . . that's what real super-human cyborgs will probably made of.

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Pyramid Interview

Chris Pramas of Green Ronin Publishing

by Steven Marsh

Founded in 2000 as part of the first wave of **d20 System** publishers, Green Ronin Publishing has grown to become one of the foremost voices of the RPG world. From the super-heroic **Mutants & Masterminds** to the romantic-fantasy **Blue Rose RPG** to the darkly Lovecraftian fantasy-pirate world of **Freeport,** Green Ronin has touched many different genres and styles while maintaining a core focus and flavor that's made them the ENnie Award winner for Best Publisher for the past three years. The founder of Green Ronin, Chris Pramas, sat down with us to answer a few questions about the company's recent history, what's in the works, and where they see themselves in a few years.

Golden Age

* * *

Pyramid: **For those who have been out of the loop about Green Ronin's goings on for the past few years, can you give us the dime-tour history about recent events?**

Chris Pramas: These last couple of years have been a time of extremes: very high highs and very low lows. On the high side, our launch of **Mutants & Masterminds 2nd Edition** has been wildly successful, both financially and critically. We also broke some new ground with the **Blue Rose RPG** and followed that up with **True20 Adventure Roleplaying.** We just got back from GenCon, where we won the ENnie Award for Best Publisher for the third year in a row and **Mutants & Masterminds 2nd Edition** won for Best Game.

A couple of years back we also became the exclusive RPG design house for Games Workshop. We put together a new edition of the classic **Warhammer Fantasy Roleplay** and have supported that with a series of supplements. Right now I'm designing a **Warhammer 40,000 RPG** for release next year. All this material is published by Black Industries, which is part of Games Workshop's publishing wing, BL Publishing.

On the low side, our key business partner for over three years ripped us off for a big pile of money. Osseum, the company in question, handled our sales and order fulfillment for a long time and for most of that time we had a great relationship and they paid us on time every month. When the RPG market took a downturn in 2003, they lost some of their clients and saw the sales of those remaining decline. Rather than admit that their business model was failing, they started taking money generated by the sales of their clients and using it to keep their business afloat. At first it just seemed like a short term problem with distributor non-payment, which was all too easy to believe. After a few months though, it became clear that the problem was much worse. Then after a lot of empty promises, the owner of Osseum ditched his Seattle apartment in mid-month and fled the state. He hasn't been seen since. We were never paid for months' worth of sales, including those of big, expensive projects like the **Black Company Campaign Setting,** the **Advanced Bestiary,** and the **Egyptian Adventures: Hamunaptra** boxed set. This was a huge blow for a company our size and we came close to going out of business. Thankfully, we had an alternate revenue stream coming in from the **Warhammer** books that helped us get through the worst of it. Staffers also agreed to take a pay cut to help pay down the debt. Since then it's been a slow but steady recovery, as we try to clean up the huge mess Osseum left us with.

Pyramid: **To back up a bit and make sure I understand things here: Osseum served as your order-fulfillment house; now, was that an exclusive arrangement, and if so, how much? Did Alliance stock Green Ronin's products by ordering through Osseum? How did this arrangement differ from shelving arrangements akin to those some distributors have with other publishers?**

Chris: Osseum was what's called a fulfillment house or a "distributor for distributors." Basically, they took on publisher clients and warehoused and sold their books into the hobby and the book trade. Their clients didn't have to set up their own warehouses or deal with shipping. Since Osseum handled sales and collection, they also didn't need to

have dedicated sales staff. All these various services were paid for by a percentage of the sales. Osseum was supposed to -- and for many years did -- collect the money, take their cut, and pass on the rest to their clients. The idea was to let the publishers concentrate on creating the games and let Osseum solicit and sell them.

Distributors also appreciated the set up because they could make one call and order products from a whole bunch of publishers. So back in say 2003, Alliance could make one order from Osseum and get stocked up on Green Ronin, Bad Axe, Mystic Eye, Bastion, and others.

Pyramid: **What was the impetus for moving to an exclusive relationship with Osseum in the first place? Was it market conditions, a desire to avoid the expense of warehouse and shipping, or something else? At the time it struck me that the Osseum arrangement was fairly rare, in that I don't recall any other pretty-big names within the industry utilizing fulfillment houses.**

Chris: Well, you have to remember that when Green Ronin started we were a really small operation. It was just Nicole and I doing it part time and Hal (who later became a partner) was handling graphic design freelance for us at first. In the early days we needed a fulfillment house if we wanted to be able to launch the company. We simply didn't have the time and resources to take on sales and fulfillment ourselves. I was still working at Wizards of the Coast at the time and Nicole was the General Manager of Cheapass Games.

We started with a different fulfillment house though, Wizard's Attic. They are the ones who originally made the concept work, at least for a while. Wizard's Attic began to grow just as the *d20 System* boom was taking off and they tried to do too much too fast. When we first signed up with Wizard's Attic, they had maybe 20 clients. When we left them for Osseum, they had over 80. After we left, Wizard's Attic had its own meltdown and a bunch of people got burned. We considered ourselves lucky to have gotten out when we did.

As to why we switched to Osseum, there were two primary reasons. First, they had fewer clients than Wizard's Attic so we felt we'd get more attention. Second -- and this was the deal clincher -- they offered access to the book trade and we wanted to crack that market. Adam and Jim from Osseum had experience selling into the book trade for Wizards of the Coast and TSR and, indeed, they were as good as their word and got into stores like Barnes & Noble, Borders, Waldenbooks, and so on.

Pyramid: **What's Green Ronin doing now in the post-Osseum era regarding fulfillment? Have you taken up order fulfillment yourselves or is there someone else behind the scenes now? (And, if the latter, I trust you're watching them like a hawk?)**

Chris: When it became clear that Osseum was on its way out, offers started rolling in. We were courted by several other fulfillment houses, and did consider them. Having watched both Wizard's Attic and Osseum go down in flames though, we just thought it would be tempting fate to trust our future to another set up like that. In the end we took three steps. First, we took over sales and collection ourselves, so now the money comes directly to us. This also meant hiring a dedicated sales person. Second, we made an arrangement with Alliance. They now warehouse our stock and handle our shipping. We also have what's known as a flooring arrangement with them, which basically means they don't pay for books until they sell but since they have all our product our titles are always in stock. Lastly, we made a deal with Alliance's sister company, Diamond Book Distribution, to handle our book trade business.

Pyramid: **Okay; thanks for clarifying that for me. Leaving the business side of things . . .** *Mutants & Masterminds* **has been one of the break-out hits of the** *d20 System* **era. Do you have any thoughts or insights as to the game's success? Is it because** *d20 System* **fans have been hungry for Supers, because supers fans haven't been getting what they want from established options, the setting, something else . . .?**

Chris: I think the real root of *Mutants & Masterminds'* success is that it appealed to gamers beyond the *d20 System* core. When we first conceived it, it was really meant for the *d20 System* audience. Early on the design, Steve Kenson asked me how it important it was to cleave to the standard rules. I told him that the most important thing was to emulate the superhero genre, so he should feel free to make any required changes to better do that. While other *d20 System* supers games tried to keep things like classes and hit points, Steve did away with those and built something more suitable for superheroes. Still, because of our reputation as a *d20 System* company and the game's use of the

OGL, I didn't expect it to break out of that mold as successfully as it did. Almost as soon as it release though, we started getting e-mails from folks saying, "I just ditched my 10-year supers campaign to run *Mutants & Masterminds*." It was then I knew we really had something.

Pyramid: **Green Ronin was a part of the *d20 System* era from Day One. With the benefit of hindsight, do you have any thoughts or reflections about the *d20 System*? Has it been good or bad for the industry, good or bad for Green Ronin, good or bad for gamers, and so on?**

Chris: It was certainly good for Green Ronin. It allowed us to go from a part-time venture to a full-time company with a salaried staff in just a couple of years. It was also good for gamers, who were spoiled for choice for a few years with so much stuff coming out. All three tiers of the game industry saw some benefit as a lot of money flowed through the system. On the downside, so much stuff started coming out that it became hard to keep track of it all. During the boom time, distributors and retailers would order just about anything with a *d20 System* logo. Unfortunately, this led a lot of them to sink money into inventory that was never going to move and the release of the *Dungeons & Dragons 3.5 Edition* just made that worse (as few people wanted the *3.0* books after that). When you go into game stores today you can still see huge piles of the stuff sitting there and that makes it harder to sell retailers on new *d20 System* material, no matter its quality. Now where there used to be dozens of *d20 System* companies, only a handful are still doing products in the print arena.

Pyramid: **I've always been a big fan of boxed sets, admittedly viewed with the rosy glasses of nostalgia. As such, I was pleased to learn that Green Ronin was making a return to that form with *Egyptian Adventures: Hamunaptra*. I know *Hamunaptra's* fate was tied up with Osseum, but were you able to gain any insight into how well it was received by fans? Do you think the boxed set form helped or hurt its reception? Does Green Ronin have any other boxed sets planned?**

Chris: What we discovered is that it sold no better or worse than a hardback book, but it took more work to put together. It's really too bad, as I love boxed sets. There are certain things they can do that a book cannot. For example, I love that you can have a separate players' book in the box that you can just hand out to your group without worrying that they'll see something they shouldn't. It's also easier to include things like poster maps. Unfortunately, our experience is that boxed sets aren't worth the extra effort, so it's unlikely we'll do more.

Pyramid: **Oh, well; another dream shattered. Moving on . . . It seems like much of Green Ronin's efforts of late have been to try to make a name for itself beyond the *d20 System*, with the *True20 System, Blue Rose, Mutants & Masterminds,* and so on. I'm assuming this is a deliberate plan; do you have any comments about this strategy?**

Chris: Yes, it is quite deliberate and it's something we're pursuing for several reasons. First, we like to optimize our rules for the genre and audience. I mentioned this previously when talking about *Mutants & Masterminds,* but the same goes for things like *Blue Rose* and the upcoming *Dragon Fist.* Second, we like publishing our own core rulebooks, as these are always the best-selling products in a game line. When the *d20 System* was at its height, it was worth it to let Wizards of the Coast have the core book sales for that game, but these days it's much better for us to do our own. Lastly, doing core rulebooks like *Mutants & Masterminds* and *True20 Adventure Roleplaying* insulates us from whatever might happen with *Dungeons & Dragons Fourth Edition* and the OGL. This was one of the valuable lessons of *Dungeons & Dragons 3.5.* That hurt our *d20 System* sales, but didn't affect *Mutants & Masterminds* at all.

Pyramid: **In a somewhat realistic ideal world, where do you all see yourselves in a few years?**

Chris: I would expect Green Ronin to have two or three RPG game lines that it supports regularly, and we'll probably also try other short arc games like *Blue Rose* (which was conceived and executed as a three-book line). If I have my way, we'll also expand beyond RPGs. As a gamer, I've never limited myself to just RPGs. I love boardgames, miniatures games, card games, and so on I'd like to see Green Ronin reflect this. We've already dabbled a bit with the *Torches & Pitchforks* card game, but I'd like to do a lot more.

Pyramid: **Although *d20 System* "support" (adventures, supplements, and the like) hasn't played as large a part in the past couple of years for Green Ronin, it's still a portion of Green Ronin's catalog. Given the number of *d20 System* publishers out there, how has Green Ronin tried to set itself apart? Do you have a guiding**

philosophy behind what *d20 System* products you develop?

Chris: From the get-go, our philosophy was to set ourselves apart by focusing on quality material. We tried to provide the total package: solid rules, engaging writing, great art and maps, and a lot of game utility. We also haven't been afraid to go beyond the boundaries of traditional *Dungeons & Dragons,* in both setting and rules.

Pyramid: Which part of the *d20 System* audience are hoping to reach out to?

Beyond the Towers

Chris: We're targeting what I'd call the modern gamer. There's a portion of the *Dungeons & Dragons* audience that is interested in a nostalgia experience. They may like the current rules, but they are most interested in material that's similar in feel to old *Advanced Dungeons & Dragons First Edition* modules. That is not our audience. Those folks are well-served by companies like Necromancer, Goodman, and Troll Lord. The gamers we target are those who either have "been there and done that" or who are primarily fans of the new edition. It's for them that we created our new Bleeding Edge line of adventures, which kicked off this summer with *Mansion of Shadows* and continues soon with *Beyond the Towers.* We think there are enough gamers who want something different than a nostalgia experience to keep the line going. We'll see if we are right!

Pyramid: **I don't know if you can sum up in a few sentences, but what is it about the Bleeding Edge adventures that you feel sets them apart, or makes them appeal to this "been there/done that" audience? Are they similarly themed to the original *Freeport* trilogy, or branching out into different territory?**

Chris: They certainly share some common elements with the *Freeport* adventures, but we tried to make them even easier to drop into any given *Dungeons & Dragons* setting. Our goals with the series are not grandiose. We are not trying to redefine how RPG adventures are designed or suchlike. What we are trying to offer the modern gamer is first and foremost a good story. We are also trying to provide a balance of roleplaying, combat, and problem-solving encounters. Lastly, we are trying to use the *d20 System* rules to their utmost. There's a lot of great *d20 System* material that isn't being used and we are going to be showcasing some of it in the Bleeding Edge adventures.

All that said there isn't one template for a Bleeding Edge adventure. *Mansion of Shadows* is heavy on investigation and roleplaying, for example, while *Beyond the Towers* is more of a wilderness exploration adventure. As the series goes on we'll surely cover the full range of fantasy adventure types, but always with our original goals in mind.

Pyramid: **Shifting back to the business side again . . . Green Ronin has been pretty upfront about its efforts at recovering in the wake of the Osseum affair. How have Green Ronin's plans been altered in light of that setback? Are you all doing anything special or unusual to recover?**

Chris: At first we didn't talk about the extent of the damage, actually. Sometimes when there's blood in the water, others will seek to take advantage of your perceived weakness and we wanted to avoid that. It was only when we were through the worst of it and things had stabilized a bit that we started being more forthcoming. Our plans have had to change in many ways, from product development and scheduling to pay rates and marketing plans. The biggest change, and one which is hopefully only temporary, is that we haven't had the money to take big chances. Back in 2002, for example, *Mutants & Masterminds* was a huge gamble but we had the resources to roll the dice. At the moment we have to concentrate on our core business until we finish paying down our debts. This means that our sales are easier to predict but it also means we are less likely to have a breakout hit like we had with *Mutants & Masterminds.* I'd like to get us back to a place where we can take some risks.

For the time being though getting out of the red is our primary concern for obvious reasons. We've been making steady progress at this for the past 18 months and thankfully most of our freelancers have been really understanding about our situation. Still, I felt it was taking too long to pay some of them off, so this summer we started a Freelancer Fundraiser. The idea was to raise extra money that could go to paying off people who had already been extremely patient. We ran some product sales on our website in July and August, which isn't all that unusual. What we did differently this time

was to announce two special books (one for *Mutants & Masterminds* and one for our Bleeding Edge *d20 System* line) that we're going to do in 2007. The idea is that people can pre-order them now and that'll give us some money that's not tied to a specific project in the short term. Then next year we'll publish those books and the only way you'll be able to get them is via the Freelancer Fundraiser. So our fans get a chance to help us out but they also get a cool collectible in return. Since we aren't doing the books until next year, they also get a chance to voice their opinion on what they'd like to see. We're getting feedback from people who've pre-ordered the books, so they can have some impact on their final form.

Pyramid: **So, if I'm understanding it right, the only way you'll be able to get these two projects is by pre-ordering them now, right? How successful have you been in getting the word out to your audience about these products, and what has the pre-reception buzz been? I ask because -- from the publishing side -- it's hard to get the numbers to work out for any limited-release product, so I'm curious how receptive the fans have been so far.**

Chris: Yes, you'll only be able to get them by pre-ordering. We've primarily gotten the word out through our own websites and the various RPG news sites. The fan response to the Freelance Fundraiser has been gratifying and we've gotten many orders for the limited edition books. Still, some folks seem put off because they don't know exactly what they are ordering. Therefore I've decided that we're going to nail that down in September and announce the results. Then we'll keep orders open until the end of the year. That'll give people on the fence a chance to hear about what their going to get. At year's end we'll know what we need to put together and how many we'll need to produce.

Pyramid: **GenCon was just a couple of weeks ago. For those of us who weren't there, was there anything nifty, new, or exciting released or announced at that event?**

Chris: We debuted several new books at the show, most of which are also in stores now. We just released *Golden Age,* our first real genre book for *Mutants & Masterminds; True20 Worlds of Adventure,* which presents five new mini settings for *True20 Adventure Roleplay;* and *Crisis in Freeport,* a *d20 System* adventure that wraps up the story we began in 2000 with *Death in Freeport* and sets the stage for Freeport's next iteration. We also had a limited number of the next *Mutants & Masterminds book, Ultimate Power.* Those sold out by Friday at noon at the show and the rest are on their way from China. *Ultimate Power* should be in stores later in September.

Golden Age

Pyramid: **What's on the horizon for Green Ronin? Any big new items to look forward to, or any other "secrets" that we can convince you to reveal here?**

Chris: In the near future we have several cool products coming out. First there's the *Deck of Many Things,* which should be going to print shortly. This brings the famous artifact to life in a set of beautifully illustrated tarot-sized cards. We're also doing a *Thieves' World Gift Set* in October. This slip case collects all four of our *Thieves' World* books and also includes a brand new adventure set in the classic era. This will let people get the whole line and the new adventure in one shot for only $100.

Early next year we are doing an introductory product for *Mutants & Masterminds,* the *Mutants & Masterminds Beginner's Guide. Mutants & Masterminds* is already our best selling line and we want to bring even more gamers and comics fans into the fold. This comes out in February, which also happens to be when New York Comic Con takes place. I can reveal here for the first time that Green Ronin will be attending New York Comic Con and we'll be debuting the *Mutants & Masterminds Beginner's* Guide there.

Pyramid: **(Oh, great; and I just moved away from the East Coast . . .)**

Chris: For those folks in the Bay Area, I'm going to be a special guest at EndGame Oakland's Five Year Anniversary Party on September 30. As part of the day's activities, I'll be sitting in on a session of *True20 Adventure Roleplaying.* Five seats for the game are being raffled off, with all proceeds going to charity. Folks can buy raffle tickets at

EndGame for $2 each and drawings will be made that day. For more info, go to http://www.endgameoakland.com.

Pyramid: **Big news, all; I'm especially looking forward to that Deck of Many Things. (I paid handsomely for a copy of the old Dragon Magazine which had a cardboard replica of that item.) Thanks for your time, and I look forward to future happenings in Freeport, Freedom City, and points beyond.**

Pyramid Review

Sword & Skull

Published by Avalon Hill

Game design by Mike Elliott

Game board, rules booklet, 10 color coded figurines, 2 Dice, 80 Plastic gold pieces, and 110 cards; 2-5 players, boxed, $40.00

The greatest ship in the royal navy, *H.M.S. Sea Hammer,* has been stolen by the powerful figure known as the Pirate King. Now it is up to a few brave officers to try and retrieve this prize, through might or wealth. Each officer has control of a conscripted pirate from the dungeons, in case -- as the game text says -- "it might take a thief to catch a thief." Will might or gold win the ship back for the Queen?

In each turn of *Sword & Skull* players will roll a pair of unusual six-siders to determine how far their pieces must move. On a typical roll, the movement is equal to the sum of the die faces and the player may move either their pirate or their officer that number of spaces in a clockwise direction. On a roll of doubles, the player must move *both* his pirate and officer the number of spaces shown. And these dice have a blank side as well. If both die come up blank, the player may move either his officer or his pirate to any space on the outer board.

The game board of *Sword & Skull* represents the mysterious island where the Pirate King has his lair. The spaces on the outer board represent various colonized locales on the island where the player may gather gold, items, or followers. The inner board represents the volcanic path that leads to the Pirate King's secret hide-a-way where presumably he has secreted away the *Sea Hammer.* A player may enter the inner board through a cave space, and then fight his way to the Pirate King. The Pirate King will sell you back the *H.M.S. Sea Hammer* for a price that varies with the number of players. Alternatively you may fight and kill him to recover the ship. The first player to recover the ship is the winner.

Players may choose to build up the might of their characters. Officer's strength is represented as cutlass icons. Pirate's strength is shown as pistol icons. The fastest way to build strength is to gather followers and items. There are several locations around the outer board where players may pick up these followers. As players land on these spaces they get to look through the followers there and recruit the choicest characters first, so it is in every player's interest to rush to gather the most powerful recruits as quickly as possible.

One strange mechanic in the game involves the aforementioned recruits. Some recruits have pistol icons, others swords, and the rest have a number of gold coins. If you recruit a character to join you who has these coins on his card, then each time a subsequent player lands on that space he has to pay you that number of gold coins.

Players will encounter enemy cards or collect fortune cards as they traverse the board in their quest to build their strength. Defeating enemies will reward a player, and the fortune cards can have effects on combat, movement, or other aspects of play. There is also a series of "treasure chest" spots around the board that let players scoop up the gold on that spot or add gold from the bank to the other treasure chests. This mechanic certainly encourages travel around the board.

Players will need to decide whether they want to build up their pirates, their officers, or their cash reserves. The money a player collects is available to both the pirate and the officer should either of them make it to the Pirate King's lair.

The more people that play, the more likely it is that combat will be the easiest way to win, since the Pirate King asks more for the ship if there are more people hunting for her. You can't win by killing all the other players, which seems

to be at odds with the Pirate theme. In fact, the worst you can do to your fellow players is robbing them of their gold and followers. Even the Pirate King won't kill players, but merely ushers them out of his lair so they can build their strength and funds and try again. (Perhaps he's hoping they will choose to pay him the gold . . .)

Does some of this sound familiar? Paying money to players for landing on a space? An outer board, an inner board, and a final confrontation in the center? Throughout play we couldn't help but repeatedly compare this game to a strange amalgam of *Talisman* and *Monopoly.* While the similarities in game mechanics are not trivial, *Sword & Skull* is its own game. The pirate motif is firmly etched in every aspect of game play; you only get to play officers or pirates, and there is technically no rent.

From a purely metaphorical perspective, it's easy to understand how pirate recruits empower the pirate and naval recruits empower the officer. However, It never seemed all that logical why having a particular recruit in one's employ would cause another player to pay when he stops by that fellow's hometown. There are ample ways to generate income in the game besides this awkward tool.

Sword & Skull is a fun game. It is also a fast game, with a typical running time of about an hour. It is part of Avalon Hill's recent line of boxed games which include *Betrayal at House on the Hill, Nexus Ops,* and the re-releases of *RoboRally* and *Monsters Menace America.* It has the same high-quality artwork and construction of these games, but lacks the complexity. The game is designed for players age 10 and up, and its simplicity and lack of lethality make it a good candidate for a family game.

While this offering may not meet all expectations as a pirate game -- since there was no grog, no killing, no ship-to-ship combat, and no cannons -- but, as a fun game you can play with younger relatives, it's a treasure.

Spawn of Azathoth: Herald of the End of Time (for Call of Cthulhu)

Published by [Chaosium, Inc.](#)

Written by Keith Herber with Sandy Petersen, Lynn Willis, David Conyers, Don Coatar, Jeff Carey, & Steve Hatherley

Cover by Tom Sullivan

Illustrated by Paul Carrick, Andy Hopp, Mislet Michel, & Kevin Ramos

Cartography by David Conyers & Carolyn Schulz

200-page perfect bound black and white book; $23.95

Spawn of Azathoth: Herald of the End of Time is two decades old and is one of *[Call of Cthulhu's](#)* forgotten campaigns. Originally published in 1986 in the same boxed set format as *Masks of Nyarlathotep,* it has never been republished until now. Another world-spanning campaign, it is on a far less grander scale, taking the investigators from New England to Asia and the top of the world with a detour through the Dreamlands along the way.

Like the earlier *[Shadows of Yog-Sothoth](#)* this is not a straight reprint. Similarly, unlike the second edition of *Shadows of Yog-Sothoth,* this second edition of *Spawn of Azathoth* is not a lame and barely executed attempt to fix the perceived problems of a regarded classic. Indeed, no real attempt has been made to fix this campaign's problems, of which there are relatively few. Rather, this is the original campaign with extra support material, some new, some culled from other *Call of Cthulhu* supplements. Then again, *Spawn of Azathoth* was never regarded as a classic.

As the title suggests, the threat faced in *Spawn of Azathoth: Herald of the End of Time* is not the blind idiot god himself, but rather an offshoot spun off millennia ago and caught by our Sun's gravitational pull. This is "Nemesis," which itself throws comet-like shards into our Solar System. Should one fall to planet, it melts into the interior to grow and split the planet open when it spawns. To date both the Mi-go and the servant of an ancient wizard have protected the Earth, but the wizard's true plans for the Earth are just as much a danger to humanity. If they come to fruition, the world will be protected, but all forward progress will be frozen.

Described as a campaign of moderate length, it is divided into six parts, beginning in H.P. Lovecraft's own Providence, Rhode Island, and ending in Tibet. Between these bookends, the campaign takes the investigators to Garrison, Montana, St. Augustine, Florida, the Andaman Islands in the Bay of Bengal, and into the Dreamlands twice. These four parts can be played in any order, but it is probably best to run them in this order, with the Dreamlands scenarios run at any time between or even over the course of the campaign. Not a campaign for the inexperienced, four to six investigators are required who must have either already visited the Dreamlands, or meet the minimum Sanity requirements.

Spawn of Azathoth begins in one of the character's bedroom. He is awoken by a horrifying apparition. The realization that it is of his university history tutor, Doctor Philip Baxter, is confirmed by a death notice the following day. Attending the funeral, the investigators are introduced to the doctor's family and colleagues, many of whom will figure in forthcoming events and also invited to the reading of the will. The character that saw the apparition is bequeathed a packet of documents, including a journal. Annotated by the deceased's brother, it details a series of dreams, during one

of which, Baxter describes seeing his former student.

Armed with the details gleaned from the journal, the coincidental nature of the apparition, and an inherent curiosity, the investigators begin looking into the life and death of Philip Baxter. The clues in this twisted murder mystery reveal not only his untimely death, but links to a privately funded venture in Montana, his children, and the Dreamlands. In Montana, Baxter has helped build an observatory to locate a mysterious stellar body. Staffed by expatriate Russian scientists, at first nothing seems amiss, but exploring away from the facility reveals a "ghostly" presence, a non-Mythos though still outré presence, and a malignly mortal presence of astronomical origins. Apart from the finale, this is probably the campaign's deadliest encounter, and is all too easy to blunder into.

The fates of Baxter's children send the investigators to Florida and the Andaman Islands. After informing Baxter's son Colin of his death, they can join him in diving on a Spanish treasure ship. When Colin is arrested for the murder of a local priest, the party's attempts to clear him end up exposing a predatory cult. This leads to an entertaining scene in which the characters, having been tied up by the cult, are witnesses to the cult's demise at the hands of a local Ghoul pack. (Well . . . entertaining for the Keeper that is.) Visiting Baxter's daughter Cynthia brings the characters to the British Crown penal colony, where they learn of her kidnapping by the inhabitants of another island. Rescuing the medical missionary is no easy task as she has definitely gone more than native.

Although these earthbound scenarios reveal a little of the threat they face, much of the truth can only be learned in the Dreamlands, especially Doctor Baxter's fate. In the first scenario, their researches are hindered by the fickleness of Ulthar's libraries, but eventually answers are available from an Outer God. The second scenario is a little different. Imbibing a strange concoction sent from New Orleans via a certain author's aunts, each investigator falls into a deep sleep and enters the Dreamlands, and those investigators who do not partake are physically pulled into the Dreamlands by Ghouls! (This raises a question: If this method is available at this point, why not make it available earlier and bypass the Sanity requirements to enter the Dreamlands?) Once there they find themselves accompanying the Ghouls to rescue their princess. Again there are answers to be gained, but this chapter, unfortunately entitled "The Eternal Quest," is something of a linear slog to get through.

Finally a telegram requests the investigators meet one of Baxter's colleagues in Tibet. Finding him in Lhasa, they trek across the Tibetan plateau to a remote valley where they can put an end to the threat. Along the way the investigators must face encounters natural and unnatural, plus being dogged by Communist forces. The final encounter is as deadly as you would expect and is designed to be tailored to feel of the campaign being run by the Keeper, but there is little help towards that end.

Physically, *Spawn of Azathoth* continues the disappointing trend in Chaosium's releases of late. It is not as bad as some; many of the irritating ticks and quirks that so irked with the supposed *Sixth Edition* of the rules having been long dropped. None of the artwork is as crisp as it should be, some of it being quite poorly handled; worse, every single map appears grubby and slightly out of focus.

Where Chaosium is to be applauded is in the efforts made to provide support and background material for the campaign. Absent in the 1986 original, these add detail on the locations within the campaign -- Providence, Montana, and British India in particular. Information on diving is taken from *Fearful Passages* and the description of Colin's salvage vessel has been adapted from *Beyond the Mountains of Madness.* As with the reprint of *Shadows of Yog-Sothoth,* tables have been added that neatly summarize the clues and connections between the chapters. There is some Keeper advice, but it only goes to when events should be run, not how.

What this *Second Edition* does *not* do is address any problems with the campaign itself. It starts off well in a pulp style, but as a whole *Spawn of Azathoth* is an uneven affair. Part of the problem is that the trips to Florida and the Andaman Islands have relatively little bearing upon the campaign as a whole, almost serving as something for the investigators to do until they get to the Dreamlands. This is due to the fact that the middle parts of the campaign can be run in any order, thus moving it away from the classic onionskin format and denying it a more linear structure that might have given it more direction. Of course, this move also enables the campaign's events to be more player driven.

Further, when you get down to the actual scenarios, these have not been touched. This shows worst of all in the Florida chapter where one location is left hanging for a lack of clues despite it being related to the mystery, while

another location -- an undersea set of ruins -- has no relevance whatsoever. It is up to the Keeper to decide the point and purpose of these ruins. And when the investigators do enter the Dreamlands, it feels too much of a slog to get the desired information, especially in "The Eternal Quest."

Given the uneven structure of the campaign, Spawn of Azathoth is best run by an experienced Keeper for experienced investigators. Certainly, both should enjoy the chapters set in Providence and Florida -- they are the campaign's highlight -- but player and Keeper alike will need to work harder to enjoy the rest. The Keeper is helped in this endeavor with all of the new support material, but this is not an easy campaign. Nevertheless and despite showing its age, this reprint of *Spawn of Azathoth: Herald of the End of Time* is not unwelcome if not a classic.

The Call To Adventure Can Be Faint (Part I)

Hey, GMs, here's an interesting challenge: What's the barest thread you can hang an adventure motivation on?

Now, I realize that, in some campaigns, the answer is "None"; there is no lesser motivation that is required than the mere existence of the adventure. Really, a dropped postcard outside of a tavern saying, "Come to Ye Monstrous Dungeon! Take the Plottepointe Pass to Exit 7, then ride 6.2 miles. 'Tis on thy left!" is all that's really necessary. But for campaigns with even a modicum of roleplaying, motivation of some sort is easy.

Now, most gamerly movies tend to open with ample motivation: Death of a loved one, destruction of cities, proof positive that Armageddon is A'Comin' real quick-like. But the problem with this level of motivation is that it's hard to maintain; really, even the most prolific lineage will run out of relatives to knock off before the beginning of adventures, and playing one-upsmanship with motivations gets the jumpers lined up with that shark in no time.

Still other adventures come from Fiat Central, in the form of orders from the King/Starfleet/The President. While these are great for a good many adventures, they do show their threads pretty early; when you're constantly reminded that you have no freedom of choice, it's tough to stay motivated to pretend you're doing anything other than job.

But what I think is interesting is trying to figure out the minimal amount of motivation required to give characters (and their players) a compelling reason to "take the bait." I think the long-running ***Vampire: The Dark Ages*** campaign (which I only guest-GMed) is the first time I tried my hand at minimal motivation. In that adventure, the primary PC was the Lady of the land, complete with castle, servants, and the like. Previous adventures focused on invading armies, great attacking threats, and so on. But to begin that adventure, I tried a different tack: I had a child request an audience with the Lady, and ask her if she would be willing to lie for him.

(As a side note for those interested behind the scenes, the Lady in question was one of the Sidhe from the ***Changeling*** neck of the ***Dark Ages*** universe. One of the things that they're not supposed to do is tell a lie; it doesn't cause *great* malady to the character, but it is slightly unpleasant. As such, being asked to tell a lie isn't as trivial a deal as it might be in, say, ***Shadowrun.***)

Now, having been asked to tell a lie, she took the bait and asked, "What lie?" To which the boy requested that, should his mother ask the Lady, would the Lady be willing to say that the boy worked for her for a time. The line leading from the player to the GM's screen tugged slightly, and she continued, "Why would you want me to do such?"

"Well, you see . . . our family needed money to pay for medicine, and I got it for her, and my mother is asking where I got the money."

"I see. And where, exactly, did you get this money?"

"From a man in the woods."

"Okay; and what did the man in the woods ask in return?"

"Nothing; he just said that I needed to sign a piece of paper with some writing on it. So I made my mark on there."

"And what did the paper say?"

<blank stares from illiterate peasant child>

(I'm glossing over the various interaction rolls here, of course. And don't let my use of quotes fool you; things were almost certainly said differently.)

Subsequent investigation revealed that the boy did not, in fact, have a soul, which lead to the (correct) conclusion that infernalists were plotting within the confines of the fiefdom. And much hilarity ensued, ultimately resolving in the

repeated union of the pointy edges of swords with the fleshy bits of cultists.

Now, it would have been trivial to begin this adventure in a more "traditional" way: A blood-covered body in a barn (thanks, *Ultima VII!*), a rabid attack by crazed cultists in the streets of the village. But by beginning as small as possible, the larger whole of the plot was able to unfold that much more naturally, and the characters (and players) were hooked by the time they knew the whole. And the sense of discovery remained intact, likening more to the first aroma of a hopefully satisfying meal rather than the steaming tray of brontosaurus ribs hooked onto the side of the car and tipping it over.

I wrote about another example of minimal motivation in a [previous installment](), but I'll mention it again here; besides, I never told the rest of that anecdote which proves somewhat illuminating here. In my *Aberrant* campaign, I actually started the campaign about six months before the "canonical" beginning, primarily to give the PCs a chance to meet Slider, the everyone-loves-her metahuman whose murder ends up being a catalyst for Things Going To Heck. (I figured that even having one brief encounter -- where they end up saving Slider's life, no less -- would be worth more as a plot hook than starting in the thick of things.)

Anyway, I was attempting to keep the campaign at least somewhat realistic, so I had everyone pick their own birthday. One player (without having read any of the *Aberrant* source material) happened to pick the exact day that Slider was going to get murdered. So, when reporting the news of Slider's death to the players, I ended that scene by announcing a mail delivery . . . which happened to contain a birthday card from Slider to the character. (And, yes, lover of props that I am, I gave a real card.)

Now, the mere fact of the meeting alone should have served as minimal motivation enough to investigate her murder. But there was another clue built-in . . . one which my players never picked up on. For one of the dotted eyes in the card, I had punched it out further from the other side, making a tiny hole. I then crumpled up a tiny ball of black-markered paper and inserted it into that hole, making it a somewhat more distinctive "bump" than normal. Had the players discovered it, I would have informed them that it was unusual, and had they continued investigating, they would have had a good shot at discovering that it was a [microdot](), with incriminating information to help unravel the larger conspiracies. Unfortunately the players never discovered this aspect, and the campaign ended before I could bring up the latent clue again.

Remember this lack anecdote, as it'll come up again. Next week I'll go into more detail about how to incorporate minimal motivations into your campaign. Until then, just remember what I've been using as an excuse for years: Smaller is better.

--Steven Marsh

Kirby-2

Part II

by Steve Kenson

Kirby-2 Today

The current state of affairs on present-day Kirby-2 are hopeful, depending on what it is you're hoping for: The United Nations is a growing world power working towards a unified and peaceful global community backed by scientific advancement, devotion to human rights, and aided by an elite team of powerful metahumans.

The United Nations

Even observers from Homeline hardly recognize the United Nations of Kirby-2. Gone is the polite international debating society, replaced by the first stirrings of a world government in the early years of a very successful series of programs for getting an often-contentious international community to cooperate for the greater good of humanity. The UN and all of its various bodies have been tremendously revitalized by the newfound ability to get things done, although some say there are already signs the organization needs to slow down before that power goes to its collective head.

The various member nations have certainly stopped treating the UN as a game; the post of UN ambassador is now one of the most significant in any nation, and the authority of the Secretary-General rivals or exceeds that of any individual national leader. Certainly the policies of the Secretariat have a far greater impact on world affairs than in years past.

Infinity personnel have likened the Kirby-2 UN to what the UN on Homeline might have been if Infinity was a part of the organization rather than independent (although others have said the state of Kirby-2's UN is simply another example of the "impossible" happening there).

Kirby-2's United Nations considers itself the steward of the world as a whole, the creator and enforcer of peace, and, generally speaking, seeks to live up to the ideals of the UN charter, but also, for the first time, has the wealth, power, and authority to help back up those ideals and make them a reality.

UNISON

The United Nations International Superhuman Operations Network (UNISON) is the world's super-power in more ways than one. Not only does UNISON control the most advanced technology on Earth, it also commands the powers and loyalty of a significant number of the world's metahumans. These resources make UNISON a force to be reckoned with, and the closest Kirby-2 has at the moment to a world-government. More than a few people have observed that UNISON occupies a role quite similar to Infinity's position on Homeline. The involvement of Kirby-2's Dr. Paul VanZandt in founding UNISON only reinforces that view.

Kirby-2 Technology

Kirby-2's conventional technology is TL8, much like Homeline (despite the local year being earlier). Where Kirby-2 differs dramatically from Homeline is in the area of the *unconventional.* The parallel has numerous examples of "superscience" technology: force fields, teleportation, energy weapons, cold fusion power, forced-growth cloning, and so forth. Infinity agents have acquired samples of Kirby-2's technology and researchers have been disappointed to discover it doesn't work reliably on Homeline. The current theory is that most, if not all, of Kirby-2's superscience is

dependent in some way on the unusual quantum nature of the parallel or its metahuman inhabitants. Therefore it may be impossible for off-worlders to duplicate it.

Some of Kirby-2's superscience is in the hands of major governments and corporations, particularly the United Nations and UNISON, which uses monopolies on certain technologies (like fusion power and teleportation chambers) to maintain their influence with the international community. The rest is found only in the possession of isolated inventors, many of them metahumans. Fairly little superscience has seen widespread use as yet, although some of the UN's programs are aimed at changing this.

Infinity and Centrum's greatest concern is that Kirby-2 will develop practical parachronic technology. Thus far, all attempts to do so have ended in varying levels of disaster (including more than one abortive inter-dimensional invasion from another parallel). It's been suggested (perhaps too optimistically) that Kirby-2's quantum instability means the inhabitants *can't* develop parachronics, or at least such technology won't ever work reliably there. On the other hand, Infinity and Centrum technology works just fine on the parallel, and just the possibility of a parachronic-capable Kirby-2 is enough to keep Infinity and Centrum worried. Both sides are prepared to do whatever is necessary to keep the Secret.

Computers

Kirby-2's computer technology is cutting-edge TL8 with some superscience AI. Thus far, artificial intelligence on Kirby-2 has come into existence purely by accident and efforts to duplicate it have failed. One AI, called Pericles, has become a free-willed agent of UNISON and a supporter of the U.N.'s goals. Another, known as Overmind, has adopted an attitude of superiority toward organic life, and believes machines are destined to replace biological organisms in the inevitable march of evolution. This second AI may be a parallel version of the Overmind from Steel, although thus far it hasn't extended its reach as far as that Overmind (thanks in part to Pericles and various metahumans). UNISON efforts to capture or neutralize the rogue AI have not yet been successful. Infinity sincerely hopes it does not find a means to contact its alternate on Steel.

Energy Weapons

Compact energy cells have made blasters and sonic stunners practical (if expensive) weapons on Kirby-2. U.N. security personnel are routinely armed with stunners, and they are becoming a popular alternative to more lethal self-defense options. UNISON hopes to institute programs of exchanging lethal firearms for stunners and encouraging member nations to create stronger gun-control measures.

Force Fields

Force field technology has only recently reached a practical stage on Kirby-2 and currently requires fairly bulky emitters, making them usable only on installations and large vehicles. Asgard Station has both external and internal force field emitters for security, as do many U.N. installations on Earth. Force fields require considerable amount of energy and usually have to run off a fusion plant.

Space

Kirby-2's space-flight technology is in advance of Homeline (which has neglected space travel in favor of parachronics). The most cutting-edge space technology is in the hands of the UN International Space Agency (UNISA). The UN operates a laser-powered launch facility on Mt. Kilimanjaro called the "Bifrost Bridge," capable of sending payloads into Earth orbit on a regular basis, including orbiters that can return and land like conventional aircraft. Bifrost is used to place new satellites in orbit; most contact with orbital facilities is handled via teleporter (see *Teleporters,* below).

The UN also operates Asgard, the world's largest permanent space station. Asgard serves as an orbital watch facility, a relay station for communications and earth-based teleporters, and a base of operations for UNISON.

Although researchers are working on a faster-than-light stardrive, a practical prototype has yet to appear. Previous examples (developed by lone inventors) have proven unstable or otherwise problematic. Faster than light travel *may* have existed on Kirby-2 before, but if so it was eliminated by a previous reality quake.

Teleporters

Kirby-2 teleporter technology uses a "quantum flux" principle wherein transitional matter exists essentially in two places at the same time. Thus the space inside two separate teleportation chambers can be made to coexist briefly, allowing passengers and cargo to move from one chamber to the other instantly. A teleport chamber is required at each end to transmit and receive; "open-ended" teleportation is not yet possible. So teleports are limited between the different "transfer points" in a dedicated network.

The UN controls the largest teleport network, with transfer stations in the capitol cities of all member nations, coordinated by control systems on board Asgard Station. The UN also leases the technology to other parties (mainly corporations) for shipping and travel, but its use is carefully regulated.

Theoretically, a teleporter's range is unlimited, but the greatest distance bridged thus far is between Earth and the Moon. Expansion of the teleport network is limited by the need to build a transfer station at the arrival point. The power costs are also tremendous, requiring the output of a fusion plant and limiting the effective size of the chambers; teleporters large enough to move anything bigger than an SUV (or a military humvee) are prohibitively expensive.

Teleporter technology is as close as Kirby-2 has come to parachronics. Some of the quantum principles are similar, and accidents or malfunctions involving teleporters have bridged dimensions in the past, but no one has been able to deliberately duplicate their effects. Infinity scientists think the "soft" nature of Kirby-2's quantum infrastructure makes teleportation possible; efforts to implement the technology elsewhere have failed.

Weird Science

Kirby-2's history has numerous examples of "weird science" technology: unique super-science devices attributed to particular inventors that are never successfully replicated. Infinity has observed similar phenomena on parallels like Gernsback and Klatuu. Thus, nearly any sort of superscience can (and has) shown up on Kirby-2, but most of it is unique and cannot be duplicated, even by local scientists. Theories abound as to why: The inventions may be the result of some unique metahuman power of their inventors, the result of shifts in Kirby-2's quantum flux, or examples of very advanced super-science (requiring more effort to understand and replicate). All anyone knows for sure is scientific geniuses on Kirby-2 can potentially come up with *anything,* another reason Infinity can't rule out someone there developing parachronics.

Campaigning in Kirby-2

Campaigns on Kirby-2 can range from four-color superheroics as members of UNISON to exploration of the parallel's past ages (through the remnants left behind by the reality quakes) or involvement in the parachronic war between different factions of the Infinite Worlds.

UNISON Teams

The default Kirby-2 campaign sets the heroes up as members of a UNISON team stationed in the capitol city of a UN member nation, or perhaps a "special ops" team on board Asgard Station, able to teleport to the site of an emergency or mission at a moment's notice. The heroes

Is Kirby-2 Dangerous?

There is some concern among the intertemporal factions about Kirby-2's unstable nature. In addition to the problems posed by a world of metahumans, there's the possibility Kirby-2 *itself* might be a danger to the continuum. Infinity researchers have speculated about the possibility of another reality quake hitting the parallel, a "big one" that makes all the previous quakes look like minor tremors by comparison. A large enough disruption might literally tear Kirby-2's reality apart at the quantum level.

The problem is, no one knows exactly what the

contend with metahuman criminals, terrorists, violators of the UN's edicts, and so forth while assisting local law enforcement, making public relations appearances, and using their powers to further UNISON's other social, economic, and technological programs.

The adventures of a public UNISON team are much like stories from superhero comic books. GMs interested in a grittier more post-modern approach can set the heroes up as agents of a secret "black ops" division of UNISON, kept secret from the public and perhaps even the UN General Assembly! These metahumans handle the dirty work UNISON can't publicly acknowledge, which may well include a "secret war" against parachronic invaders (see *Interworld Adventures,* below).

Reality Archaeologists

Kirby-2's regular reality quakes make it an ideal for a group of "reality archaeologists" searching around and digging up elements of the world's forgotten and buried past. They might be freelancers or members of a secret UNISON division devoted to dealing with subduction zones, irruptors, and other related phenomena. Perhaps one or more members of the team (or their patrons) are actually irruptors from a previous "version" of Kirby-2! With no real existence in the new continuity, such characters make ideal covert agents. They also recall details about earlier ages, since they were actually there!

The reasons for digging up the past on Kirby-2 vary. Some reality archaeologists may simply want to preserve the past, and better understand the nature of the reality quakes and revisions of Kirby-2's present and future. Others may want to find some way of restoring a bygone age, even if it means wiping out the current continuity. Lastly, there are those with a strong interest in keeping the true nature of Kirby-2's reality a secret, *their* secret, and rivals interested in revealing the truth.

Interworld Adventures

There are plenty of opportunities to use Kirby-2 as part of a larger *Infinite Worlds* campaign. The setting's metahuman powers and superscience technology make it a potential threat as well as a tempting target for any of the intertemporal factions, all of whom must exercise caution when dealing with the world and its inhabitants.

Infinity takes the most enlightened view toward Kirby-2, but even they are frightened by the potential implications of UNISON getting hold of parachronic technology. While the organization appears benevolent, Infinity isn't sure it wants to share with yet another parachronic power, and it's also not certain how Kirby-2's UN will react to the existence of cross-time rivals. Although there are some who advocate an alliance with UNISON, for now the Infinity Council has placed the world off-limits to anyone but the Patrol, and the official policy is one of containment: keep the locals from developing parachronics, isolate any outtime visitors, and prevent them from interfering in local events without exposing the Secret.

Centrum is even more concerned about Kirby-2 than Infinity, but less united in its attitude. Centrum's official policy is roughly the same: Observe, keep the locals from developing parachronics, and watch out for potential threats to Centrum security. A secondary goal is research into Kirby-2 technology and metahuman powers, but thus far evidence suggests neither has much potential outside the parallel.

Two minority views are fighting it out over what to do next on Kirby-2. Centrum isolationists believe the parallel

repercussions would be for other parallels. The experts *think* the damage would be localized on Kirby-2's quantum level, which means it wouldn't affect either Homeline or Centrum, but they don't know for sure. Moreover, even if that's the case, the aftershocks from the reality quake could still cause widespread chaos, particularly on the various echo parallels, some of which might be shifted to other quanta, which could (possibly) cause a domino effect, triggering banestorms or even reality quakes on other parallels and quantum levels.

The question is whether or not this massive reality quake is an inevitable part of Kirby-2's quantum structure or if it is preventable. The possibility Kirby-2 is a ticking intertemporal time bomb is one reason Infinity and Centrum's Interworld Service both tread *very* carefully, and why Centrum isn't in a hurry to deliberately trigger another reality quake there. Debate over what to do about Kirby-2 goes on while the current policy remains to wait, watch, and do everything possible to keep anyone else from upsetting the apple cart.

poses a serious threat. They want to find a means to eliminate that threat. Proposals include shifting Kirby-2's quantum position (perhaps pushing it out of the accessible band altogether) or triggering a deliberate reality quake to weaken it, or even destroy it (although this is by far the most extreme approach). The other faction sees tremendous potential on Kirby-2, if its UN could be influenced toward Centrum ways of thinking. They're still bothered by what to do with the metahumans, but feel the potential advantages of making Kirby-2 a client state shouldn't be ignored. Their proposals often revolve around tinkering with one of Kirby-2's echo-parallels to modify its history to suit Centrum's tastes (and perhaps quell some concerns from the other factions).

Reich-5 sees Kirby-2 as an opportunity. The "malleable" nature of the parallel offers them a chance to shape it to suit their wishes. The current plan is to find a means to change the course of Kirby-2's Second World War, creating a present day much better suited to the World Axis' tastes. The trouble has been finding a means of reaching the right quantum echo and executing the changes, given Reich-5's spotty and unreliable parachronic capabilities.

Some Cabal mages call Kirby-2 "a shadow of higher realms." There's some evidence the Cabal has extended tendrils into the parallel, and it may have been present (or even responsible . . .) for one or more of the previous reality quakes. Certainly, Kirby-2 has some magical phenomena, which may be of interest to the Cabal, and who knows which of the parallel's various wizards, demons, or other beings are actually Cabal members? It's not beyond the realm of possibility that the reality quakes are part of some *deliberate* effort in "reality engineering" to create a world attuned to particular higher cosmic archetypes for purposes as yet unknown.

Characters in an interworld campaign on Kirby-2 can be native metahumans dealing with "invaders" from other worlds trying to manipulate theirs, or members of any of the cross-time factions carrying out their own agendas and working to thwart the plans of their rivals. Perhaps UNISON *does* develop practical parachronic travel -- possibly based on its teleporter technology -- and enters the parachronic conflict, becoming another player on the ***Infinite Worlds*** stage.

The Drifters

Kirby-2 can kick off an ***Infinite Worlds*** campaign wherein the player characters are a diverse group of metahumans from different periods of Kirby-2's history, or even different Kirby or metahuman worldlines. They are all "unstuck in time" due to reality quakes and other ontological shifts, leaving them shifting from world to world. They might do so randomly or under the control of some outside force, ranging from an existing faction (the Cabal being the most obvious choice) to a cosmic being using them to repair (or destabilize) the worldlines. Marvel Comics' *Exiles* is the perfect model for this type of campaign.

Characters

Characters in a Kirby-2 campaign are most likely supers, based on 500 or more character points. Gamemasters may want to consult ***GURPS Powers*** for guidelines and ideas on powers, power levels, and so forth.

Advantages

The following advantages are significant in some way to characters from Kirby-2:

Magery

This advantage is essentially unknown on Kirby-2. There is magic (the worldline is normal mana) and magical powers, but no mages as such. Kirby-2's "mages" are actually

The Eidolon Emanation

Some adepts of the Cabal believe metahumans on Kirby-2 channel eidolons of the great eikones of Briah, the Iconic Realm. In essence, they are avatars of cosmic forces, playing out archetypal interactions over and over. The 20-year cycle of reality quakes is related to the meton year (alignment of the sun and moon, and the related spheres of Tiphereth and Yesod), or possibly a Saturn alignment (Saturn being associated with death and transformation). Metahuman powers, whatever their apparent origin, are essentially spiritual or mystical in nature, a reflection of the higher reality of Briah.

It's possible these Cabalists are correct, and Kirby-2

supers with mana-dependent powers. Some of them even require the traditional trappings of spellcasting (mystical gestures, incantations, and so forth), but they are not traditional spells. Anyone with this advantage can cast spells normally on Kirby-2 like any other normal mana world, but is likely an outtime visitor.

Temporal Inertia

On Kirby-2, this advantage grants some immunity to changes in "continuity" caused by reality quakes and similar shifts. Characters with Temporal Inertia *always* exist on Kirby-2, regardless of how reality changes. They may or may not have the same traits, or even powers, but they continue to exist, even if history becomes radically different. Such characters also nearly always have counterparts on parallel worlds. Such "eternals" from Kirby-2 may even have doppelgangers on Homeline, some of whom could be agents of the Infinity Patrol!

is essentially a shadow-stage for archetypal avatars to play out their parts in the cosmic drama. If so, then outsiders may be able to influence the higher realms by changing the outcome of these conflicts. Some Cabalists think so, claiming intervention on Kirby-2 might serve as a kind of sympathetic magic, sending ripples of change through the Four Realms. The right intervention at a key moment in time could trigger a reality quake with far more wide-reaching effects than just altering the present-day of one parallel. Even if the Cabal's mystical theories on the origins of metahumans are entirely off base, it's possible Kirby-2 has some other sort of connection to the continuum -- whether iconic symbolism or quantum resonance -- and tinkering with it may still have effects felt throughout the Infinite Worlds.

Trained by a Master

Some "super normals" on Kirby-2 have this advantage (or Weapon Master, or both), giving them access to various cinematic skills and abilities and making them the equal of some metahumans. Infinity explains the amazing things these "normal" people can do as another facet of Kirby-2's reality. Whether or not such individuals are actually metahuman is a matter of some debate.

UNISON Membership

Membership in UNISON grants certain advantages and disadvantages: Duty (to UNISON, all the time, -15 points), Legal Enforcement Powers (10 points), Legal Immunity (5 points), Military Rank 4 (20 points), Patron (United Nations, multinational, extensive political power, quite often, 90 points), Security Clearance (5 points). *125 points.*

Unusual Background

Supers aren't that unusual on Kirby-2, so there is no Unusual Background required to have powers. The GM may require an Unusual Background to have powers or other traits not commonly found on Kirby-2. One particular Unusual Background may show up in Kirby-2 campaigns:

Irruptor: You are a living "remnant" of one of Kirby-2's earlier realities, a survivor of one or more reality quakes. Among other things, you are Zeroed in the present-day; you literally *shouldn't exist!* You also have the Temporal Inertia advantage. You survived one reality quake; other ones aren't going to get rid of you. You may possess traits common to your own original reality, traits which may or may not presently exist. You may also have access to information from your reality, some of which is useful in the present day. For example, perhaps you knew the previous incarnations one or more present-day metahumans. While they're no longer *exactly* the same, many things about them are, including things that haven't "happened" yet! *20 points.*

Disadvantages

Mental disadvantages and metahuman powers seem to go hand-in-hand. It may be that certain extreme mental states are more likely to cause origins, or to provide powers, or it could be the other way around; having powers causes metahumans to develop various psychological neuroses and psychoses. Whatever the case, metahumans tend to fall

toward either end of the moral spectrum. Heroes commonly have disadvantages like Code of Honor, Honesty, Overconfident, Pacifism (Cannot Kill), and Sense of Duty. Villains frequently have Megalomania (or are at least Overconfident). Bully, Sadism, and similar negative disadvantages are also common (although not Bloodlust or disadvantages that make villains casual killers, these are actually relatively rare).

Unique

Characters with this disadvantage *never* survive a reality quake or any other change in Kirby-2's reality; such changes always wipe them entirely from existence. If the change is somehow reversed, Unique characters are also restored, but otherwise they're gone for good. GMs should only permit this disadvantage if reality quakes and similar alterations are expected to be a part of the campaign.

Powers

Super-powers are possible -- and relatively common -- on Kirby-2. Metahumans are about one-in-a-million, but unevenly distributed, favoring technological nations over the Third World. The reason for this remains unknown, although theories abound. More than one researcher has noted Kirby-2's metahumans are most concentrated in nations where comic books are the most popular on Homeline, such as the United States, Europe, and Japan. Whether or not there is a causal relationship remains unknown.

All the origins and power sources discussed in *GURPS Powers* are available on Kirby-2, although accidental and super powers are by far the most common. There's no real difference between psionic and super powers here; essentially super powers *are* psionic, but capable of much wider (and more powerful) range of effects than psi on most other worlds.

Magic does exist on Kirby-2. However, Magery is all but nonexistent. There are metahumans with magical powers (drawing upon the local mana), even "super-mages" with spell-like abilities, but no spellcasting as it is known on other magical worldlines like Yrth or Merlin.

Skills

Generally, the standard skills from *Basic Set* are known on Kirby-2 as well, with the following notations.

Wildcard Skills

The GM may want to use the option for Wildcard Skills in *Basic Set* to handle Kirbyan characters with broad mastery of a particular area of skill, including (but not limited to) Detective!, Guns!, Martial Arts!, and Science!

Weird Science

On Kirby-2, this skill might better be called "Super Science." It is the skill of dealing with radical scientific theories and technologies beyond the local Tech Level. Although considerable superscience exists on Kirby-2, it isn't really part of the local TL (or any Tech Level) at all. This is, normal scientific skills can't comprehend or create it, only Weird Science can. This skill is less widespread than standard or even Wildcard scientific skills; it's mostly found among maverick, eccentric inventors and metahumans.

The Lost Valley

by Matt Riggsby

Pilgrimages are a fixture in many religious traditions. A twist found in some traditions is that their pilgrimage sites are semi-secret. A Christian pilgrim, for example, always knows where Jerusalem is; indeed, it's literally the center of the Medieval Christian universe. A Buddhist pilgrim, on the other hand, may only hear rumors of the whereabouts of Shambala. Getting there requires a long and difficult journey, no matter where you start from, and you certainly won't stumble over it by chance (although you might not know that *that's* what you're looking for). The journey is a trip through one's soul as much as through the landscape. Which brings us to the Lost Valley.

Appetizer: Why Go There?

The Lost Valley is a hidden earthly paradise, perhaps the ultimate source of legends of Shangri La, Eden, and the Fountain of Youth. It is said that you can find peace there. Or healing. Or wisdom. Or whatever else you need.

The problem, of course, is getting there. In order to achieve their goal, pilgrims must overcome three different kinds of challenges: physical, mental, and moral. The first two are obvious: Directions are vague and require considerable puzzling out, but they do clearly take the pilgrim through rough terrain. The moral dimension is less clear, particularly to skeptics, but believers see the physical journey as a symbol for what's really important, the development of the spirit. Until you've passed all three tests, you'll never find the Lost Valley.

First Course: The Physical Challenge

Spiritual journeys are, most obviously, physically difficult, and they're often tests of endurance. Instructions to reach the Lost Valley may start at a city, but they inevitably lead through the wilderness. The journey will probably lead through at least one of the types of terrain listed here, with some of the obstacles listed:

- **Desert:** Sandstorms, quicksand, poor water supplies and dehydration.
- **Mountains:** Ice, hidden crevices, snowstorms, very steep slopes.
- **Swamp:** Thick mud, impassible vegetation, disease-carrying insects.

A journey might also take the pilgrims over river rapids, and storms, bandits, ferocious beasts, and, in appropriate campaign worlds, monsters are always a possibility. Transportation difficulties may also arise: washed-out bridges, sick animals, engine trouble, and political unrest in areas the pilgrims must travel through.

Second Course: The Mental Challenge

The pilgrims can find at least some directions to the Lost Valley; there'd be little point setting out if they couldn't. However, nothing about them will be clear or explicit. Such instructions as they can find are probably phrased in cryptic or poetic language, and many of those which aren't may be ambiguous or rely on unique circumstances. For example, they may find an account of a journey to the Lost Valley which goes something like this:

"We set out that day from the seat of emeralds, guiding our steps by the precise

point of sunrise. For several days we traveled, passing over as many fords, until we reached a river on which we sailed south until we passed between a brother on one hand and a sister on the other."

At first glance, most of this is meaningless. What, for example, is "the seat of emeralds?" A wealthy city? A shrine known for green decorations? In which direction did the author travel? That would depend on exactly which day he left the cryptic "seat of emeralds." And who or what are the brother and sister? Similar hills on either side of the river? Twin towns?

Alternatively, or even at the same time, instructions may consist of principles to follow rather than specific directions. For example, the directions to the valley might be as simple as "follow the peacock." The characters will have to look everywhere for a series of signs: peacocks, clouds shaped like peacocks, peacock-embroidered banners, and so on. Getting to the valley becomes a matter of keeping an eye out for the relevant symbol or symbols, though following that sort of advice is a test of faith as much as a mental challenge, which brings us to the third test?

be happy to point out the allegorical nature of their journey, the moral tests they're likely to face (and how they're likely to fail them), and so on. Skeptics don't need to encounter anything overtly supernatural, but believers can easily match the path of their journey to teachings they should be picking up on.

Third Course: The Moral Challenge

This is the tricky part. The physical and intellectual difficulty of the quest are obvious. What skeptical characters might not accept is that every interaction on their quest is a test of their character and spiritual well-being. Here are some possibilities:

- The pilgrims are confronted by bandits. Are they willing to exchange all of their material goods for safety, or are they willing to kill other living beings in order to regain mere possessions (yes, we thought that was funny, too)?
- The pilgrims engage a guide or make friends along the way. Once a relationship has been established, a rival appears, challenging him to a duel to the death because of a matter of family honor. The friend appeals to the pilgrims for aid. Do they fight in his place? Attempt to mediate the dispute? Stay out of it?
- The characters encounter the survivors of a small caravan which as been attacked by bandits. The survivors are on their way back to the nearest town. Do they render aid to the survivors? Will they go out of their way to find and wipe out the bandits to protect other travelers?
- The characters find a bundle of valuable goods. Later, they meet a party of traveling merchants bemoaning the loss of an important part of their cargo. Will they attempt to return their valuable property once they run across it?
- A wealthy merchant takes a liking to the characters and offers them jobs in a caravan going a different direction from their quest. Do they leave their path for money?

In games where characters have moral and emotional flaws (greed, anger management issues, and the like), the GM should be sure to come up with moral challenges which impact on them.

Just what the pilgrims have to do to pass their moral tests is up to the GM and will depend on whatever moral and supernatural order she wants the hidden valley to represent. However, rather than turn the adventure into a protracted debate over ethics, it may be best simply to make the *players* aware that their characters' actions are being measured by a moral standard. If they can come up with in-character justifications for their actions which aren't utterly self-serving, they can probably reach the valley, but they'll have to give it some thought before they do.

Dessert Trolley: The Goal

When (or if) characters finally reach the valley, they'll find an unremarkable if picturesque place with lush greenery, tidy little peasant farms, and a small but attractive temple complex. The residents will appear to be very happy and at peace with one another, and the monks at the temple will happily take them in. Nobody appears particularly wealthy, but everyone is healthy and well-fed. The residents don't really keep track of time, but new arrivals may eventually figure out that they're virtually immortal.

In the Lost Valley, wounds heal as quickly as naturally possible, and even crippling wounds may be healed over time. For example, in *GURPS* terms, Physician rolls always succeed; crippled limbs, but not lost ones, will heal regardless of HT rolls; and high levels of Esoteric Medicine skill are available. Mental and moral flaws will be easier to resist as well. The valley may also be the place to learn a number of exotic martial arts, probably with a heavy defensive focus, and long-lost wisdom (or, in appropriate campaigns, powerful spells) can be easily located in the temple's extensive library.

In terms of an overall campaign, the valley might be an important stop along the way. It would be an ideal place, for example, to recover from lasting demon-inflicted wounds and stock up on useful information while trying to stop said demons from taking over the world. It could even be a final destination for a campaign, if characters are interested in retiring to a peaceful existence rather than accumulating wealth and power until the day they die.

Coffee?: What Else Can Happen

Then again, contentment and a simple, peaceful life can make for a boring game, and even an attempt to retire to an earthly paradise doesn't have to succeed. Here are some ways to continue adventuring even if characters want to stay in their happy place:

- Getting to the valley isn't quite so difficult for mystically powerful entities as it is for the average Joe. Though the people and the land heal quickly, they must still defend themselves against attack by demons, evil spirits, or simply powerful humans motivated by a primal force of evil. Semi-retired adventurers may have to take up their weapons again and even go back out into the world to fight off the valley's enemies.
- The valley may pose an irresistible mystery to curious characters. Reading through ancient records (or simply listening to long-time residents), they may learn that just as the Lost Valley is a focus for good in the world, there's a place which represents the opposite, a city or nation which is a focus for evil. In what could be the ultimate extension of the moral challenges they faced to get to the valley, PCs may consider whether or not to set out on their own to defeat this evil place (which, as in the previous suggestion, may threaten the valley), and even wonder whether or not it would change things. Can the valley's enemies truly be defeated, or will evil reemerge in another form? Conversely, if the valley is destroyed, will good reemerge elsewhere?
- Perhaps the evil isn't so far away, and the valley is too good to be true. The monks of the temple gather the healthful energies which suffuse the valley by secret necromantic rites. But if someone weren't quietly murdered every so often, the rest of the valley's residents would lose their immortality. Further research might indicate that the monks aren't creating healthful energy, but are simply stealing it, vampire-like, from the rest of the world, and *everyone* outside the valley would be slightly better off if it stopped. If that's not enough to get morally cleansed PCs in action, maybe they'll be guests of honor at the next human sacrifice.

Running a Successful One Shot

by Caleb Dillon

So, you're in a hobby shop and see an ad on a bulletin board for a group of players in need of a GM. Or, you're out shopping and run into an old college buddy from your freshman gaming group, and he wants to start up a new group. Or maybe you and some friends and have just got back from the latest sci-fi flick, and more than a few of them suddenly seem very interested in (what they previously thought was) a pretty dorky hobby. Three different problems, one common solution:

You need an adventure. More specifically, you need a one-shot.

Unlike a traditional adventure, which can span several gaming sessions, or a campaign, where you have (seemingly) all the time in the world to plan events, seed plot hooks, and develop NPCs, a one-shot follows its own set of rules. Time always seems to run short and expire too quickly, and if you're not careful, you'll leave the table that night feeling disappointed, and worse, you'll have disappointed your players.

Whether you're starting up a new gaming group, reuniting an old one, or are just looking to host a once in a while get together between friends, every GM eventually runs into the hurdle of running a successful one-shot.

Experienced GMs will tell you that cramming an entire adventure into one evening ain't easy, especially if you're the sort of storyteller that wants a complete story, with a well laid arc, and exciting climax, and a satisfying conclusion.

To stop this from happening, a few simple guidelines will help to ensure (or at least better your chances of) a successful evening:

Get People Excited About the Game in Advance: This means more than just telling them you're planning on having a game. Roleplaying games are about interaction. Otherwise, we'd just sit home with a two-liter of Coke and play an online RPG (and don't tell me you haven't). It's never too early to ask your players what they'd like to play, the kinds of characters they'd be interested in running, and whether they can commit to a single evening (and more importantly a specific evening). Nothing is worse than putting together a well thought out one-shot than to have not enough players show, or worse, all your players show up late, cutting your game time short.

Find an Optimal Time: Guess what, gamers have lives outside of gaming just like regular people. It's true. They have kids, families, soccer games, dentist appointments, and the like. This is why most people get out of the gaming racket; they don't have any more time to play, let alone think up a story. This is also what makes a one-shot ideal for folks just like these, on a set schedule with little time to spare. Sell them on the "it's just one evening" bit, and throw in something about it "being like old times". Once you have their attention, you'll have to find a date and time that works for as many of your players as possible. Weekends are often full of errands, so how about a weeknight, say from 6-10? One-shots are meant to be played in just a few hours, so keep to that timeframe.

Use a World Your Players are Already Familiar With: And a game, for that matter. This may seem obvious, but plenty of GMs think a one-shot is a great time to a run a "Welcome to Lankhmar" style game, where not only the players but the characters as well are introduced to a new and exciting realm (and maybe an entirely new rules system). Sound too good to be true? Guess what . . . it is. The point of the one-shot is to complete an entire story arc in a single session, and if you spend most of the evening having NPCs explain things to the PCs ("No, Thogrin, here in Ismere, magic is forbidden. Hey, that walking stick of yours sure looks like a *staff of frost.*"), you'll never get to the meat and potatoes of the adventure. While having the PCs wander into a new town with a dark secret is one thing, having them stumble into an entirely new world is completely different, and will chew up your evening fast.

Pre-Generate or at Least Pre-Approve Characters in Advance: Okay, you've decided on a game system, a place and time, and the level of scenario you'd like to play. Nuts, don't we still have to make characters? Doesn't that take, like, hours? Never fear. With the advent of the Internet, this too becomes simple mechanics. If you announce the game

far enough in advance, your players should have time to create characters on their own and send them to you (either as PDFs or file attachments), or drop them off at your house. You could even meet up on a lunch break, so that you could look the character over, make notes, ask questions, and so on. If you prefer, and your players agree, you can even generate a batch of characters in advance that you think work well with the game your planning. As a rule, generate extra characters, to give your players plenty of options. If your players complain that they want to make their own characters, then reward them with the experience from the adventure and tell them they can use those accumulated points towards generating characters in the next adventure.

Keep It Simple: The worst thing you can do in putting together a one-shot is think too hard about it. If you find yourself saying "Okay, in this encounter our heroes learn about the hidden city. But first, they must quest for the map that will lead them there, and that map lies buried in the tomb . . ." then you've already gone too far. It'd be enough of a goal to have the players quest for the map, or raid the tomb, but not both, and certainly not before questing for the hidden city. Simplify! If you can't sum up the adventure in one sentence, like "Buried Alive" or "Lost at Sea," then chances are you've gone overboard and won't be able to fit the scenario into a single evening. The best one-shot I ever read involved a blizzard trapping the players in a fort with a newly born Slaadi, picking off the characters one by one. Simple scenario, one antagonist, with lots of room for creativity.

Map It Out: Time is not on your side when running a one-shot. You have a finite evening in which to tell an entire story, so you had better know the details of that story, forward and back. If you keep the story simple, this shouldn't be a problem. Have a well-laid groundwork to work from. If the PCs are going to be raiding an enemy camp, map out the camp! Know what each tent holds, where the enemies will be, and when. This doesn't necessarily mean coming up with a timeline (unless that helps you, in which case do it), but the more planning you the more you can make adjustments when the PCs surprise you with their characters' actions (and they will). As a rule of thumb, for a one-shot, stick to one antagonist, one goal, one item, and so on. Any more, or too many plot twists, and you'll be scrambling to tie up all the lose ends as the evening winds down.

No New Players: At first, this rule sounds harsh. Let me explain. We all know that new players are a key ingredient in spreading the word about how fun a time you can have roleplaying. I mean, what couldn't be more fun; friends, little plastic miniatures, chips, carnage, what else do you need? That being said, explaining the game (with a few exceptions like *Munchkin*) takes time, a lot of time, especially if the player has never played an RPG before. So while it's great to have new players *observe* a one-shot, allowing them to play will eat up your evening. ("No Tommy, you roll a this die to hit, and this die is for damage, and this die is a d12, which never gets used.") Encourage them to attend, but ask that they save their questions until after the game, and then invite them to return to a regular session so they can play themselves.

Be Prepared: It works for the Boy Scouts, and it works for a one-shot. Better than just calling your friends the day of to remind them about the game, send out an email the week before as a friendly reminder, complete with directions and contact numbers in case they get lost (better yet, host the game somewhere everyone is familiar with if at all possible). Then, the day of, send out another email, or -- better yet -- instant message the players to get final RSVPs. Arrive early so that you can set out snacks, tables and chairs, dice, books, miniatures; whatever you'll need to run the game. That way, when people get there, they won't be waiting on you.

Set the Mood: A good GM controls his environment. He avoids distractions such as TV and radio unless he is using these to create ambiance. For example, if you're hosting a spooky murder mystery, hold the game at night, in a candle lit room. Better yet, hold it outside, in the middle of the woods, with just a table, some candles, and a battery powered boom box for those *Midnight Syndicate* CDs you've been holding onto (which, by the way, are awesome if you haven't heard about them by now). More than just noise, however, emphasize early on how you want the game to be played, if you want a lot of out of character discussions, or none at all. Tell the players in a straightforward manner, "From here on out, everything you say, your characters say, period." That way, they won't be surprised when their character gets bolted by a wizard for a wisecrack remark.

Be Aware of Time: Keep an eye on the clock at all times. Be prepared to do away with certain encounters entirely for the sake of time, or at the very least to combine them with others. You may have to drop bigger hints in the players laps for them to fasten onto. If they can't find the entrance to the villain's lair, maybe one of his lackey's offers to show

them the door, in exchange for their protection from his previous masters wrath (maybe he's leading them into a trap, for that matter). You don't want this to feel forced, however, which is why planning a simple adventure is better. Plot based adventures don't complement a one-shot, nor do lengthy battle scenarios. Remember, PCs can earn just as much experience fighting one villain three times as they can from fighting three entirely different villains. Just don't make the mistake of letting them kill said villain off too early!

A Fistful of Adventures

To further simplify your life as a GM, here are 10 scenarios that make for great one-shot seed ideas. They need some filling out, but there's infinite room for variation in each one.

In Dreams: Been itching to throw the PCs into some surreal encounter that you can't seem to fit into your regular campaign? How about just have the PCs wake up to it! You can put them in a limbo-like realm where gravity doesn't exist, or in the court of some dark demon, or both! At the end of the story, when they wake up, throw in something about a strange smell coming from their wineskins, or better yet, don't explain it at all. Keep the players looking over their shoulders for the next few adventures (if the one-shot is the start of a campaign), wondering how they were taken advantage of. It's a little cliché, but it works.

Kill the Dragon (or some other beastie): Every GM looks forward to the day they can pit a dragon against the PCs. And why not? They're big, cool, scaly, and have breath weapons, not to mention treasure! So, do it! Run a mid- to high-power one-shot where the only goal is to kill the dragon. But don't think this scenario is boring; dragons carefully guard their lairs. Maybe this dragon has troll bodyguards, or has inscribed strange symbols in the walls that only his minions are immune to. Perhaps the dragon they seek is one of those arctic breeds, and the lair is so cold the PCs take damage each round they're inside, softening them up for the final encounter. How about giving the dragon some strange and unexpected powers? Nothing shakes up a seemingly standard scenario than a dragon that can hide in shadows!

Before Moonrise: Since time is such a factor in a one-shot, how about using it to your advantage. Force the heroes to act quickly. Maybe they're searching for an ancient relic in a city that only phases into existence for one night of the year, say on the spring equinox, and only before the moon rises to its apex. Variations on this include before sunrise, before dark, and the like. Imagine a city of gold, but the gold has to be spent before the sunset. Talk about a shopping spree (and some peeved merchants later on, to boot).

Sever the Tether: This is a ghost story variation. Most ghosts are tied to the world in some way; they have unresolved issues that they didn't fulfill in life, which now chain them to the world in death. Maybe a tavern master has always had this ghost haunting his cellars (it was there when he bought the place, hence the discount) that he couldn't seem to get rid of. It's never threatened him before, but he doesn't go down to the cellar after dark either, and he hires the PCs not to vanquish it (since the ghost will just come back), but to resolve the ghosts issues, and let it move on to whatever afterlife awaits it. The heroes win not for destroying the ghost, but for helping it, which may involve some sidetracking (perhaps the ghost was murdered by a member of the local thieves' guild).

Time Bomb: In this interesting scenario, a madman (or cultist, or whatever) has hidden magical bombs all over the city (or castle, or the like), and the PCs have a set period of time to find them all, lest they detonate, hurting innocent bystanders, or toppling the structure (resulting in the ultimate deaths of more innocent bystanders). If the bombs are planted in crowded places, (taverns, temples, and the like) even better. The scenario is really great with high-powered heroes who want a challenge. Trying to find 10 needles in a city-size haystack in less than four hours. To make things even more interesting, use a real clock. Let the players know when time runs out, all of the undiscovered bombs will go off. This will heighten drama and discourage OOC discussions.

The Cavern of Doom (or House, or Swamp, or wherever): This is a simple, tried and tested scenario. The PCs are hired to explore a house, or cavern, or the like. What secrets does it hold? What dangers? What mysteries? What evil lurks therein? Are there gold, tomes of ancient lore, magic? Variations on this include raiding tombs, exploring crypts, infiltrating lairs, robbing guilds, and the like.

Murder Mystery: Detective stories and fantasy are not a new innovation. Fritz Leiber's *Fahfrd and the Grey Mouser* explored this genre when it was new, years ago, as well as the game based on H.P. Lovecraft's work, *Call of Cthuhlu,* not to mention the best-selling *Dresden Files* by Jim Butcher or, in more recent years, the introduction of master inquisitives in the ***Eberron*** campaign setting. In fact, detective stories and fantasy compliment each other famously because magic introduces so many other variables. Was the victim being spied on through use of a scrying? Were they poisoned, cursed, or both? Can you use an spell or power to study the murder weapon for additional clues, or speak with the dead to ask the victim how he died? Low-power heroes work best in this scenario, since they have limited means and powers.

Small Town, Big Secret: In the style of M. Night Shymalan's *The Village* or *House of Wax* (both versions) the PCs wander into B.F.E., get thrust into some unfamiliar situation, and find out they are in way over their heads. Maybe they took a short cut through the wilderness and got lost, or were searching for something and became similarly turned around. Do the town's inhabitants refuse to let the heroes leave once they get there, or does the town itself stop them? Maybe a fog rises up, and every way the PCs go, leads them back to where they started. Is the fog full of vile creatures that thwart the PCs every attempt to flee, using hit and run tactics to pick them off, one by one. Isolated and in unfamiliar territory makes for a great one-shot.

From Dusk 'til Dawn: Similar to the Small Town, Big Secret scenario, but on a much smaller scale, the PCs wander into a dangerous place (taverns works well, as do crypts) and have to dive for cover, fast. Perhaps they raid what they thought was an empty tomb only to find it full of vampire spawn, and the heroes are locked in with them until sun up (George Clooney, eat your heart out). Or they were robbing an archmage's library while he was away, only to find his wards were already in place, locking them in the library with another of the mage's defenses, the library guardian (animated objects work well for this, as do homunculus variants and golems). Perhaps the ward alerts the archmage as well, who quickly teleports home (for a final showdown, i.e. boss fight). Or maybe the library (crypt, room, cellar) is booby-trapped. Is there a secret passage leading out? Will the heroes escape in time?

Sinking Ship: Ridley Scott used it in *Alien,* James Cameron used it in *Titanic,* and look where they both are now. Heck, if it worked on *Gilligan's Island,* why not in an RPG? But the PCs on a ship (flying ships are great for this too, like the elemental-powered galleons in ***Eberron***), which, due to some disastrous mistake (weather, pirates, kraken), sinks. They barely manage to string together a raft from the floating debris, only to find themselves on a (seemingly) deserted island. This scenario is one part survival game, one part ingenuity. What gear did they leave behind on the wreckage? How far out did the ship sink? To make matters more interesting, what if whatever sunk their ship follows them to the island. Without their supplies, can they fight it off? Maybe the island itself is dangerous, full of man-eating flora, and raving cultists (the *Gilligan's Island* scenario also works well for ***Call of Cthuhlu*** style games).

Following these simple steps should help take some of the burden off your shoulders when running a one shot, and allow you to focus on the really important thing . . . telling a great story! Good luck, and happy gaming.

Lens-Men II

Yet More Mini-Character Lenses for *GURPS Fourth Edition*

by Stephen Dedman

Here are some more 10-point mini-character lenses to help flesh out a character by giving him knowledge in an area of expertise that might not be expected in his current career. Some are based on upbringing, some on college courses, some on hobbies, some on casual jobs, and some may be available as program chips in ultra-tech worlds (Modular Abilities, page 71 of the ***Basic Set***). They can be combined with character templates from the various ***GURPS*** books, allowing characters to fill niches outside of the primary one the template is designed for, such as an investigator with an interest in the occult, or a soldier who can fix radios.

Alternatively, these and other mini-lenses can also be used for quickly generating NPCs for a particular role, and combined to make multi-faceted characters, such as a farmer turned guerilla, or a dockside union boss. You could also create a smaller version of most of these templates for just 5 points simply by cutting the points in the listed skills in half.

Arming Squire

You have gone through an apprenticeship to a medieval (or fantasy) knight as a page and squire, tending to his weapons, his horse, and his other property. This is primarily useful as a lens for a knight (p. 445), but while many knights went through this process, not all squires became knights (even if they survived); a mercenary warrior, merchant, or even a cleric might also have this background (as did the legendary King Arthur, who had been trained as his elder foster-brother's squire). A squire was also expected to learn combat skills by watching his knight and other knights, and to have joined him while hunting.

A serving squire would be 14-21 years old, and have Status 0 and the disadvantages of Duty and Code of Honor (Chivalry). All of these would be optional for a former squire who no longer serves a master.

Skills: Animal Handling (Equine) (A) IQ [2], Armoury/TL3 (A) IQ-1 [1], Falconry (A) IQ-1 [1], First Aid/TL3 (E) IQ [1], Heraldry (A) IQ-1 [1], Housekeeping (E) IQ [1], Savoir-Faire (E) IQ+1 [2].

Dock Worker

You have worked on the docks moving cargo on and off ships or other large vehicles, from ancient Egyptian river barges to interstellar Far Traders. In some settings, this may involve some paperwork or use of heavy machinery; in others, not much more than a strong back is required.

Primary Skill: Lifting (A) HT+1 [4] OR Environment Suit/TL (Exoskeleton) (A) DX+1 [4].

Secondary Traits: Any three from Absolute Timing [2], Administration (A) IQ [2], Crewman/TL (E) IQ+1 [2], Driving/TL (Forklift or Crane) (A) DX [2], Freight Handling/TL (A) IQ [2], Hazardous Materials/TL (A) IQ [2], Knot-Tying (E) DX+1 [2], Lightning Calculator [2], Packing (A) IQ [2], Singing (H) HT-1 [2], Smuggling (A) IQ [2], or Streetwise (A) IQ [2].

Homesteader

You've spent some time working the land. Whether you were a peasant, a farm boy, a survivor of the apocalypse or a colonist (voluntary or involuntary) on a recently terraformed planet, you've learned to make what you need, fix what

you can, and generally do things yourself that city folk would pay someone else to do.

Advantages: Any one from Less Sleep/1 [2], Reduced Consumption/1 [2], or Temperature Tolerance/2 [2].

Primary Skill: Farming (A) IQ+1 [4].

Secondary Skills: Any two from Animal Handling (A) IQ [2], Bioengineering/TL (H) IQ-1 [2], Carpentry (E) IQ+1 [2], Driving/TL (Construction Equipment) (A) DX [2], Leatherworking (E) DX+1 [2], Housekeeping (E) IQ+1 [2], Mechanic/TL (farm machinery) (A) IQ [2], Meteorology/TL (A) IQ [2], Sewing/TL (E) DX+1 [2], or Veterinary/TL (H) IQ-1 [2].

Occultist

You're fascinated by magic. You might not have any magical powers at all (though you may think you do), you might dabble in "hedge magic" or "new age" practices, or you might be vehemently opposed to magic and determined to stamp it out . . . but in any case, you've learned what you can without any formal teaching from real magicians.

Primary Skill: Occultism (A) IQ+1 [4].

Secondary Skills: Any three from Alchemy (VH) IQ-2 [2], Esoteric Medicine (H) Per-1 [2], Exorcism (H) Will-1 [2], Fortune-Telling (A) IQ [2], Research (A) IQ [2], Ritual Magic (VH) IQ-2 [2], Symbol Drawing (H) IQ-1 [2], or Thaumatology (VH) IQ-2 [2].

Partisan

You have defended your homeland against invaders, as a guerilla, spy or saboteur. This would be a good background for someone who wants combat or thief/spy skills without requiring any formal military training. Appropriate disadvantages would include Fanaticism, Obsession, On the Edge, Secret, and Sense of Duty.

Primary Skills: Area Knowledge [2] and one of Acting (A) IQ [2], Fast-Talk (A) IQ [2], Sex-Appeal (A) HT [2], or Stealth (A) DX [2].

Secondary Skills: Three from Bow (A) DX [2], Camouflage (E) IQ+1 [2], Crossbow (E) DX+1 [2], Electronics Operation/TL (Communications or Security Systems) (A) IQ [2], Explosives/TL (Demolition) (A) IQ [2], Filch (A) DX, Garrote (E) DX+1 [2], Guns/TL (any) (E) DX+1 [2], Knife (E) DX+1 [2], Leadership (A) IQ [2], Propaganda/TL (A) IQ [2], Scrounging (E) IQ+1 [2], Streetwise (A) IQ [2], Survival (any) (A) Per [2], Tactics (H) IQ-1 [2], or Traps/TL (A) IQ [2].

Politician

You have experience campaigning for elected office. In some settings, this may be necessary for a position as a sheriff, coroner, public defender or prosecutor, tribal chief, pirate captain, or military officer.

Primary Skill: Politics (A) IQ+1 [4], Public Speaking (A) IQ [2].

Secondary Skills: Two from Administration (A) IQ [2], Area Knowledge (E) IQ+1 [2], Current Affairs (E) IQ+1 [2], Diplomacy (H) IQ-1 [2], Fast-Talk (A) IQ [2], Leadership (A) IQ [2], Propaganda/TL (A) IQ [2], and Savoir-Faire (E) IQ+1 [2].

Prospector

The lure of precious metals and stones has called to you. You may have been caught up in the temporary insanity of a

gold rush, cruised the Trojan points looking for promising M-type asteroids, or just spent your weekends in the desert alone but for a Geiger counter or metal detector.

Primary Skills: Prospecting/TL (A) IQ+1 [4]; Survival (A) Per+1 [4] (or Environment Suit (Vacc Suit) (A) DX [2] and Free Fall (A) DX [2] for a Belter).

Secondary Traits: Acute Vision [2/level] or one of Driving (Off-road vehicle) (A) DX [2], Electronic Operations/TL (Sensors) (A) IQ [2], Geology (H) IQ-1 [2], Holdout (A) IQ [2], Law (Specialization: Mining Rights) (H) IQ-1 [2], Merchant (A) IQ [2], Metallurgy/TL (H) IQ-1 [2], Navigation/TL (A) IQ [2], Packing (A) IQ [2], Piloting/TL (Spacecraft) (A) DX, or Smuggling (A) IQ [2].

Note: For an avid fossil-hunter, simply replace Prospecting with Paleontology; for a rockhound, replace Prospecting with Geology; for a collector of biological specimens, replace Prospecting with Botany, Naturalist, or Zoology.

Scholar

You have studied the seven liberal arts, the trivium and quadrivium, to qualify for a bachelor's degree from a medieval university. This was a prerequisite for a master's degree or doctorate in law, medicine, or theology; it would be a necessary set of background skills for a lawyer or physician in a medieval (Western TL3-4) setting, and would also be appropriate for an alchemist or ivory-tower magical researcher.

Students enrolled in a medieval university also receive a 10-point Legal Immunity advantage, being subject to clerical but not secular law. This lens may be tweaked for fantasy settings (or even post-apocalyptic ones, a la Walter M. Miller's *A Canticle for Leibowitz*).

Language: Latin, Accented [4]

Skills: Astronomy/TL (Observational) (H) IQ-2 [1], Mathematics/TL (H) IQ-1 [2], Musical composition/TL (H) IQ-2 [1], Philosophy/TL (H) IQ-2 [1], Public Speaking/TL (A) IQ-1 [1].

Sex Worker

You have worked by renting your body or participating in a sexual fantasy -- as a courtesan or prostitute, escort, exotic dancer, phone sex performer, adult entertainment star, rent boy, or bait in a badger game or similar scam. You need not actually have had sex of any sort with anyone, but you've created the illusion that you would be willing to do so. Voice and/or Attractive or better appearance are useful advantages, but by no means obligatory.

Primary Skill: Sex Appeal (A) HT+1 [4].

Secondary Skills: Three from Acting (A) IQ [2], Body Language (A) Per [2], Dancing (A) DX, Disguise (A) IQ [2], Erotic Art (H) DX-1 [2], Makeup/TL (E) IQ+1 [2], Merchant (A) IQ [2], Performance (A) IQ [2], Professional Skill (Courtesan or Prostitute) (A) IQ [2], Psychology (Applied) (H) IQ-1 [2], Savoir-Faire (E) IQ+1 [2], or Streetwise (A) IQ [2].

Techie

You're fascinated by gadgets, especially electronic gadgets, and have a knack for solving hardware problems. You don't have the Gadgeteer advantage, but you've probably built your own ham radio, Geiger counter, computer, bionic ear or T-meter out of mismatched spare parts and a circuit diagram. Appropriate advantages for this lens include High Manual Dexterity; appropriate disadvantages include Curious and Overconfidence.

Primary Skills: Electronics Repair/TL (any) (A) IQ+1 [4], Electronics Operation/TL (any) (A) IQ [2].

Secondary Traits: Two of Acute Vision [2/level], Armoury/TL (Battlesuits or Small Arms) (A) IQ [2], Computer Operation/TL (E) IQ+1 [2], Computer Programming/TL (H) IQ-1 [2], Electrician/TL (A) IQ [2], Engineer/TL (Electronics) (H) IQ-1 [2], Mechanic/TL (any) (A) IQ [2], Photography/TL (A) IQ [2], Physics/TL (VH) IQ-2 [2], or Scrounging (E) Per+1 [2].

Thrillseeker

You've tried your hand at "action sports" such as BASE jumping, buildering, cave diving, extreme skiing, ice climbing, skydiving, or whitewater rafting. This would be a useful background for an adventurer or crimefighter; suitable advantages include High ST, DX and HT, Combat Reflexes, Daredevil, High Pain Threshold, and Rapid Healing. Some level of Overconfidence disadvantage would also be appropriate; most Phobias wouldn't.

Advantage: Fearlessness/1 [2].

Primary Skills: Two of Climbing (A) DX [2], Parachuting (E) DX+1 [2], or Swimming (E) DX+1 [2].

Secondary Skills and Techniques: Two from Acrobatics (H) DX-1 [2], Boating/TL (A) DX [2], First Aid/TL (E) IQ+1 [2], Lifesaving (H) Swimming-4 [2], Piloting/TL (Glider) (A) DX [2], Scaling (H) Climbing-2 [2], Scuba/TL (A) IQ [2], or Skiing (H) HT-1 [2].

Treasure-Hunter

You hunt for valuables that have been lost or stolen -- secret tombs, buried pirate gold, hidden family fortunes, or wrecked merchant vessels. Whether you're an avid amateur archaeologist after antique artwork, or a just a grave-robber greedy for gold, you've probably spent a lot of time listening to legends and deciphering maps covered with mystical glyphs.

Primary Skills: Research (A) IQ [2], Search (A) Per [2].

Secondary Skills: Three from Archaeology (H) IQ-1 [2], Boating/TL (A) DX [2], Cartography/TL (A) IQ [2], Computer Operation/TL (E) IQ+1 [2], Cryptography (H) IQ-1 [2], Expert Skill (Conspiracy Theory) (H) IQ-1 [2], History (H) IQ-1 [2], Literature (H) IQ-1 [2], Merchant (A) IQ [2], Navigation/TL (any) (A) IQ [2], Scuba/TL (A) IQ [2], Streetwise (A) IQ [2], Survival (any), and Traps/TL (A) IQ [2].

Pyramid Review

Toppo

Published by Rio Grande Games

Designed by Reiner Knizia

Art by Christof Tisch

Full-color boxed set with 150 symbol cards & rules (English, French, & German); $17.50

It almost seemed like Rio Grande Games had stopped putting out card games, at least of the small boxed variety a la *Toppo.*

The object of the game is to be the first to run your hand down to fewer than 10 cards.

The players (two to four can play) start the game with a hand of 33 cards apiece. Three more are drawn and placed in the center of the table, and the remainder form a deck from which penalty cards are drawn. The game doesn't use turns; as soon as the "start player" begins laying down his cards, everyone plays as fast as they can.

The cards show one of five different symbols, and the symbols appear in one of five different colors. Each player starts by taking the first three cards from the top of their deck and placing those on the table. Comparing these to the common cards in the middle, if you can match all three in either symbol or color, you can yell "top." The game stops while you place your cards atop those cards. Everyone else must place theirs at the bottom of their deck for later reuse (though you can shuffle your cards at any time).

If a "top" isn't possible, you may match other cards exactly; that is, if both color and symbol match, you may place those on the corresponding cards. Any unmatched cards get taken back into your hand. If at any time someone makes a mistake, he is penalized; this usually amounts to taking back the three cards and taking five new cards from the remainder deck. After each play you must lay down a new line of cards, and try for another match from fresh cards.

When someone has fewer than 10 cards left in his hand, he calls "Toppo." The game ends and that player wins. If you want to play several rounds for points, the losers of the first game get a point for all their remaining cards. If the player called Toppo in error, he gets more penalty cards and play resumes. Whoever has the most points stacked against him may choose to increase the number of cards to be matched; he decides if the next game uses a line of four or five cards instead of just three. After the agreed upon rounds have been played, the player with the fewest penalty points wins.

While brightly colored on both their clear face and their pleasingly designed backs, the materials used are a class or two too thin for such a demanding, turnless game. Would that they had made them as nice as the little plastic tray, which -- unlike too many other card games on the market -- has space enough to fit the whole deck and actually keeps them snug for transport.

The speed of play is cool -- after a market glut it seems as though free-form games like these had all but disappeared -- but this time it may be too much. Any game can take some getting used to, but for this offering there's a pretty mean learning curve. Rather than being frustratingly fun trying to get the rhythms down, it can be just plain annoying trying to maintain a grip on what you're supposed to be doing.

This springs mostly from the rules; they require a few read-throughs, and even then understanding is slow (and the more you read, the less certain you are of the specifics as your eyes blur). Does the game only get interrupted during a

"top," or does it also happen when trying to match? Yes, along with a penalty, but only if you do it wrong. The rest of the time, you're trying to get your plays in before someone else, as much so you don't mush the cards as anything else. And who's looking for your mistakes during the flurry of play? It's a challenge with two, and a madhouse at four. Even an honest player won't notice if he's done something wrong. Everyone takes his cards back regardless of who made a bad play. This isn't stated under "Top"; it's mentioned later in the rules, which makes you backtrack to "Matching" . . . it's a mess.

But what do you expect? The rules instruct you to "scatter all cards, and shuffle them," then "each player takes 33 cards." "Shuffle, then deal" is so outdated. Nowhere in the rules or on the box (or at the product?s web page, for that matter) are you directly told the game's contents -- you simply infer that playing an eight-player game with "a second game set . . . with a total of 300 cards" means you get 150 in each box.

In *Toppo* you?re either playing too fast or not at all. The price tag is about the only thing that offers you justifiable pause.

Pyramid Review

Horror Rules -- The Simply Horrible Role-Playing Game

Published by [Crucifiction Games](#)

Written by Chris Weedin

Illustrated by Chris Caprile

96-page softcover; $17.99

Horror Rules -- The Simply Horrible Role-Playing Game describes itself as "A Complete (and Completely Different) Horror Comedy RPG," and in many ways, it is. It is complete, it is a horror comedy RPG, but is not completely different. Certainly, plenty of other RPGs have explored the horror movie genre, from Deep7's 1PG *Shriek* to the *Blood Brothers* anthologies for *Call of Cthulhu. Horror Rules* certainly does that, but with its tongue (or someone else's) firmly ensconced in its cheek. Of course, this is a territory previously explored by Stellar Games' very movie-themed *It Came From The Late, Late, Late Show RPG,* but *Horror Rules* bypasses the idea of roleplaying an actor performing in a series of bad B-movies to just game the actual movie and its clichés. And it's all with a simplicity and a knowingness in readiness for both a scare and a laugh.

The simplicity begins with character -- or Good Guy -- generation. Players choose one of six broad Character Types, each with a special ability. For example, the Action Character Type can interrupt an attempt to kill someone in his presence and rush the victim to safety. The Con or Convict can disappear from a dangerous situation to come back when all is safe, or appears to. The Labcoat, once in possession of a specimen from the Bad Guy, can determine its biological abilities and vulnerabilities with a day's study. The Propellorhead can construct a device to emulate particular skills, while the Regular Joe can ignore a single Grip Check (*Horror Rules'* equivalent of the Sanity Check) in an adventure. Finally, the VIP, with access to a working means of communication, can acquire any single item, from welding torch or field kit to zeppelin to clean trousers, no questions asked. These six can easily model any number of occupations. For example, the Ordinary Joe could be a housewife or a convenience store clerk, while the Action type could be a fireman or a Canadian Mountie.

Once a Character Type is chosen, 12 points are divided between four Vital Statistics -- Bulk, Brains, Co-ordination, and Will, each rated between one and five; and another 12 assigned between skills. Rated between one and four, the few broad skills are intended to cover most situations and a player is still free to create his own. Three secondary statistics make up a character's Vital Signs: Health, Grip, and Movement. He also has some necessary little extras. One is a Luck Point, used to guarantee a successful skill check. Another is a Second Thought Point, which allows a player to ask the Rulekeeper or Keeper (as the GM is known) if an idea or course of action is a good one. Finally, a character gets "The Point," literally a single point that can be spent to round him out. Options include improving a Vital Statistic, providing extra skill points, or an extra Luck or Second Thought Point. Another -- more interesting -- option for this point is the Special Trait, of which a character can only have one.

Where other games let a character have advantages and disadvantages, in Horror Rules, a Special Trait gives both! For example, Body Builder gives +2 Bulk, but the character is always attacked first when in a group, while the Deep Faith Special Trait provides a +2 bonus to a group's Faith skill, but its player character does not possess a Luck Point; when push comes to shove, prayer is what will get him out of trouble! All of the Special Traits are well thought out, acting as roleplaying cues as much as they play up to the genre. Over all, character generation is quick and easy, the result being detailed enough to take part in any horror movie.

The mechanics are just as quick and easy. Skill checks require the rolling of a 10-sided die, looking for a roll under

the combination the skill plus its helping Vital Statistic, known as the Target Number; when called for, straight Statistic checks are rolled under double the Vital Statistic. A roll of one or "Break" always succeeds, while a roll of 10 -- a Flub -- always fails. The Keeper is expected to exercise his imagination for both Breaks and Flubs, but tables are included for both Skill Check and Combat Flubs.

Combat uses the same mechanics, with the result of the roll influencing the damage inflicted: The lower the roll, the better the result. For example, rolling exactly the Target Number, a Glancing Blow, inflicts half of a weapon's damage value. Below that is a Solid Hit, worth the full damage, and a combat Break is a critical hit and can a character or Bad Guy straight off. Against the Good Guys, Critical Hit damage is deducted from a randomly determined Vital Statistic! On a Bad Guy, Critical Hits target his Weak Spot, really hurting it or even killing it. When a Good Guy's Health or a Vital Statistic is reduced to zero, he is all but dead, but a Bad Guy experiences "Degrees of Death," meaning that the Good Guys are never quite sure when said Bad Guy is really, really dead.

This being a horror game, it has rules for getting frightened and pants-wetting. Well not quite . . . Essentially, the Keeper determines how frightening the situation is and the player rolls against it. The price of failure is the loss of both Grip points (double if you roll a Flub) and suffering a Panic Reaction. "Losing Your Grip" -- or all of your Grip points -- means that things have gone from bad to worse for the players. At the very least, the character is in trouser-wetting country again, but phobias, Panic Attacks, and Going Postal are further possible reactions. In general, the Grip rules tend towards the extreme, but then they are modeling a sub-genre unknown for its subtlety. A working example of them in play would have helped, but *Horror Rules* is hardly a complex game.

Where the fun really starts is in the Rulekeeper's two chapters, both of which are engagingly and entertainingly written, showcasing the author's knowledge and appreciation of the genre. His advice has an "in ya face" quality, such as going for cheap scares if possible, and if there happen to be Plot Flaws in the story, then keep 'em! And whatever you do, never try to explain them, retract them, or paper them over. In other words, use them and other tricks to keep the players on their toes. One rule with this entertainment potential that will encourage in-genre play is for "Stupid Thing Points." These are earned when a player does something obviously idiotic, but in-genre. Accrue three Stupid Thing Points, and a player can exchange them for another Luck Point or Second Thought Point.

Several different styles of play are suggested and discussed such as having a cut off point after which no new characters can join the adventure or only having killed off characters replaced by "Walk-Ons" or NPCs. Characters can be a step above the ordinary and be "Stars," possessing the bonus of an extra The Point during character generation. Alternatively, in "Friends Like These," the game becomes one of player versus player! The aim is to be the last man standing, but everyone must still cooperate to survive until the very end. Luck Points and Second Thought Points become the reverse, Bad Luck Points and No Thought Points that are instead played on opponents rather your own character!

The advice on script writing is less interesting, but reasonable enough. The Rulekeeper's chapters come with a selection of ready-to-face Bad Guys. The short list includes the ever traditional Axe-Wielding Homicidal Maniac, Vampire, Werewolf, and Zombie, but adds more interesting and entertaining creatures such as The Creature From The Crapper and the Giant Invisible Mutant Spider. The latter is completely illustrated, but it is not as if you can see it! Finally, the book is rounded off with "A Walk In The Woods," a short scenario or script that should provide an evening's entertainment.

Physically, *Horror Rules* is less than effective, mostly due to the poorly handled artwork. It should have been presented in black and white, not grayscale, as this makes the book look grubby. That said, the style is very much tongue-in-cheek. Otherwise, the layout does the job that it should without being unremarkable.

The first impression of *Horror Rules* suggests that it is not a little dumb, and there is certainly a truth in that. But this is dumb fun, and that is the point of the game. Everyone needs a little stupidity in gaming now and then, and *Horror Rules* shows how it can be done with a knowing intelligence. *Horror Rules -- The Simply Horrible Role-Playing Game* is there for when you want a less than serious alternative for your horror, and this it serves up with relish. Your choice of flavor, of course . . .

--Matthew Pook

The Call To Adventure Can Be Faint (Part II)

Last week we were talking about [minimal motivation](#) -- the art of trying to use as small a motivational force as possible to get the heroes (and their players) interested in joining the adventure.

If you want to try your hand at working minimal motivation into your campaign, I recommend the following:

Know the players' characters. Obviously that's much easier if the players have made their characters knowable and known. By understanding what's really important to the characters, it makes it easier to build something subtle. So if you know that one hero is motivated by a desire to look for his missing sister, then you can use that as a foundation for a minimal plot.

(As an aside, in the case of missing sister thread, I'd probably ask the player how long he expected that storyline to last should it ever be brought up. Does he see the character finding the sister in the first few adventures, never finding her, or somewhere in between?)

Know the players (if possible). This one is obviously much tougher, and is easier if you're gaming with a group of friends than folks you meet for the first time at a con table. By knowing what motivates the players, it can be easier to find something that will motivate the player *and* character.

In the case of my ***Dark Ages*** soul-less child scenario, I knew that the player *and* character were both suckers for sob stories, and were unlikely to deny a request for an official request for an audience. Furthermore, I knew that the other player -- who was studying to be a lawyer -- may well be interested in the details of the mysterious unseen contract the boy signed.

Let's expand our earlier example. Say that you know that the sister-seeking character's player is very sensitive to smells and enjoys in-game shopping expeditions and long walks on the beach (err, just kidding about the beach thing). Anyway, in this case it might be enough, in the midst of a busy bazaar scenario, to mention that the character catches what he believes to be the briefest whiff of the unique perfume his sister wore. If the player takes the hook and starts investigating, then he's done so on nothing more than a little-used sense in passing in an otherwise unremarkable scene.

Try to understand the group dynamics (both in and out of character). Again, this one can be difficult if you aren't closely tied to the gaming group, but it might still be possible. Basically, one problem with minimal motivations -- especially those targeting one PC -- is that there might be little motivation for the rest of the group to tag along. "Why should I care if you thought you smelled your sister's perfume?" is a reasonable query; "How does that get me phat l00t?"

By having an understanding of the way that the group interacts, you might be able to figure out how likely a minimal motivation for one character will be enough to get the rest of the group to go along. Depending on the group, the other players' characters may well need their own motivation, up to and including the character cajoling or bribing the others to come along.

Having players with multiple groups of characters (as I've discussed [before](#)) can also be a good technique to use here; if the minimally motivated PC has the means of getting just *one* character each from the rest of the players to tag along, then that's all that's necessary for the plot to continue apace. And, if you're using my multiple group method, then it might even be possible for that one character to go off alone without fear that he'll be monopolizing all the game time.

To use an easy continuation of our lost sister scenario, if you know that the perfume-smelling character is usually the party leader, then he should have enough pull all by himself to get the rest of the gang in line. If that PC wasn't the leader, it might be necessary to recalibrate the "clue" to something stronger, thus ensuring the character puts more oomph (if possible) into the negotiations.

Try to understand how much your core plot can be pared down to. For example, the classic real-life techo-thriller *The Cuckoo's Egg* begins with the author being asked by his supervisor to track down a $0.75 accounting error in their software and ended up with him tracking down a hacker who was attempting to steal nuclear secrets. In this case, sure the adventure could begin with the GM telling the compu-wiz PC that the Army's computers have been shut down by agents unknown. But -- if it's the compu-wiz duty to investigate -- then a $0.75 error on his own system is just as likely to get the player unwinding that ball of yarn . . . and hopefully the eventual unraveling will be that much more sastisfying.

Just because the motivational hook is small doesn't mean the adventure needs to be slow-paced. It may be tempting to think that a minimal motivation needs to lead to a slightly bigger one, leading to a slightly bigger one, and so on, taking many many game-hours to get going. In reality, this doesn't need to be the case (although it can be if the players are interested enough). For example, the scene with the soul-stolen peasant boy took maybe 30 minutes, and by the time it was concluded the players had all the ammunition they needed to begin rallying the troops in full furvor. Sure, the onion *can* take a while to unlayer, but it's just as likely for the players to pull out a sword and chop the onion in half (metaphorically speaking).

Be prepared for the thread to be dropped. Finally, one thing *always* to keep in mind with minimal motivation is that the characters (and players) are entirely likely -- indeed, it should almost be expected -- for them not to pick up the ball and run. After all, if the point of this technique is to be subtle, then sometimes the subtle clues are going to get missed. This was what happened with the *Aberrant* campaign I mentioned last issue; the players missed the (literally) microscopic clue I planted for them, and so I went with my Plan B adventure.

As a GM, you have no recourse if a minimal motivational force isn't picked up and used by the players; I sure hope you had a different means of getting the adventure on track or, even better, a different adventure altogether in mind. (After all, if you reintroduce a plot an adventure or two later, there are two possibilities: Either the players won't remember the earlier reference and treat this introduction as a new opportunity, or else they *will* remember the earlier iteration and think, "Whoa, cool!" If there's no time for the players to reflect, you're quite possibly ramming the plot down their throat; if they *do* have that chance, then it's foreshadowing, which is pretty neat.

Fortunately, in the case of my *Dark Ages* diabolist plot, I was fully prepared for a full-scale attack in Act II if the clues weren't picked up in the previous act. You can always go from monogrammed hankie to blood-stained corpse in the barn; it's harder to go the other way around.

Getting the PCs motivated is one of the most important tasks the GM has for any adventure. Getting them motivated *without* pulling out the big guns every time is almost a necessity for a long-running campaign. Remember: It can be much more satisfying to fall down the rabbit hole when you're chasing the rabbit, rather than the other way around.

Murphy's Rules

Best Served Cold

for *d20 System*

by Michael Tresca

With the preponderance of *raise dead* and *resurrection* spells in most **d20 System** fantasy campaigns, death is a temporary obstacle at best. The implications of a society where death isn't permanent leads to the question: What's the first thing you do after you die?

Kill the one who killed you, of course.

The urge to get revenge on someone or something comes naturally to characters. After all, they entered a violent situation and probably died violently. But the world becomes a much more dangerous place when arch-villains, intelligent monsters, and even common NPCs all decided to get revenge on the player characters.

Reasons for Vengeance

There are plenty of reasons to get angry at characters, not the least of which is death. But there are a wide range of possibilities in between. Spell casters in particular have the capacity to do a tremendous amount of damage to the surrounding countryside. One stray *fire* spell can ignite an entire farmland; one druid casting a *control weather* spell can change the very climate. If a farmer is expecting a dry season and rainfall destroys his crops, his livelihood might be at stake. If that farmer is indentured to a noble, the noble might have something to say about the unintended destruction as well.

Of course, not all vengeance happens by direct conflict. If it did, the world would be a much simpler place. Instead, less powerful characters will do everything they can to bring the player characters down, from slander to sabotage.

The Tools of Vengeance

There are plenty of means that characters can used to exact vengeance. Here are a few ways skills can be used as tools to get revenge.

Appraise

Merchants who are angered by a character's actions will artificially inflate prices. They might even intentionally devaluate a character's valuables, spreading rumors about them being stolen, cursed, or otherwise undesirable.

Bluff

Lying to the character is an obvious means of getting revenge. Sometimes disinformation is far more deadly than a crossbow bolt. Commoners might give the wrong directions to a dungeon, or -- as Gollum did -- lead the characters right into a more powerful monsters lair.

Feign Knowledge: Bluff can be used to fake Knowledge checks. In this case, 5 ranks in a particular Knowledge skill gives a +2 synergy bonus to the Bluff; the more the expert knows what hes talking about, the more believable the lie.

Craft

If merchants can intentionally under- or over-value an item, craftsmen can inflict even more damage by intentionally crafting cheap goods. Imagine a characters surprise when his trusty shield breaks in half!

Pass Off Shoddy Workmanship: To pass off shoddy workmanship, the crafter must fail his Craft check by 1: good enough to look usable, but not actually functional. Characters shopping for the item must make an Appraise check, opposed by the Craft check, to determine that the object in question is faulty. Intentionally sabotaged items in this fashion have half their hardness and hit points. Alchemical items simply fail to work.

Diplomacy

Ah, slander. The coward's weapon, wielded from afar and often without any means of tracking the slander back to its source. By making Diplomacy checks, the vengeful can turn a town's population against the characters before they even arrive.

Slander: Slandering someone requires an opposed Diplomacy check between the character being slandered and the slanderer. The DM should make this roll secretly. If the PC fails the check, people believe the slander about him and their attitude is reduced by one step.

Disguise

Slander is one thing, but causing villainous acts in the name of your hated foe really takes the vengeance cake. Why claim that a paladin is actually a drunkard, when townsfolk can watch said paladin stumble across the town square with bottle in hand, howling at the moon? Since Disguise checks are much more difficult when the target is relatively well known, this tactic is most effective against characters who are new to town. Smart avengers could one step ahead of the characters and perform a reputation-ruining incident before they arrive.

Forgery

The law is a tool that often tries to protect characters from impulsive acts of vengeance. However, that tool can be twisted in horrible ways to put the characters in deep trouble with the local government.

Government decrees and military orders bestow a +8 bonus to Forgery checks. That can include everything from an order for arrest, an edict meant to embarrass ("Thurold cannot be within fifty feet of chickens after the incident"), or a death warrant.

Handle Animal

Animals, by nature, are not vengeful beasts. They generally do what they're trained to do. This is why an animal can be particularly vexing if it's trained to do exactly the opposite of what a character expects it to do. The most obvious choices are mounts; Horses and donkeys can be stubborn enough without training.

Essentially, a vengeful owner sells the creatures to the characters as being trained, but the command is actually the reverse. Thus, Fetch becomes Stay, Defend becomes Down, etc. It takes an opposed Wild Empathy or Handle Animal check to figure out what's going on.

Heal

Everybody can be bribed, including healers. Healers who are out for vengeance can stretch out the healing so it takes longer, perhaps to keep the characters delayed for a period.

Impair Recovery: On a successful Heal check (DC 20), the healer can actually make the characters wounds worse, blaming infection. The character heals only half of his usual rest. An opposed Heal or Sense Motive check detects the ruse.

Perform

There's a rule that most city-dwellers learn within the first few days of arriving: Never tick off the talent. Performers can make the most heroic characters look like complete fools in a public forum. Satire, biting comedic rants, poetry and song that belittles the characters; there's no armor that can save a character from a performer's attack.

Satire: This form of slander is just as bad as a Diplomacy check. The performer can make an opposed Perform check against citizens Diplomacy to influence their opinion of a character. With a roll of 25 or more, the whole town is affected.

Sleight of Hand

Sleight of hand can be used to palm things on your person as well as steal something from someone. But if the vengeful type is really in a black mood, it can be used to plant something incriminating on a character.

Plant Object: If you try to plant something on another creature, you must make a DC 20 Sleight of Hand check to plant it. The opponent makes a Spot check to detect the attempt, opposed by the same Sleight of Hand check result you achieved when you tried to plant the item. An opponent who succeeds on this check notices the attempt, regardless of whether the item was successfully planted.

Survival

In the theater, one should never tick off performers, who will satirize you to no end. In the city, one should never tick off the servants, who just might spit in your food. In the wilderness, never, ever upset your guide, or you may find yourself without supplies in the middle of a desert.

Lose a Party: On a DC 15 Survival check, the guide gets his companions lost. The victim makes a Survival or Knowledge (geography) check to detect the ruse, opposed by the same Survival check result the guide achieved when he tried to lose his companions. A victim that succeeds on this check notices the attempt, regardless of whether the guide succeeded in getting everyone lost.

Vengeful Classes

Just about any class can become vengeful, especially after being murdered. Consider these substitution levels for each class. Theres just one requirement to join these classes: the character must have been killed and brought back from the dead. Even undead can take these classes.

The definition of the target of vengeance varies from character to character. A class with a narrow focus of vengeance, which would be one person, provides bonuses only to get revenge against that person. With such a limited scope, the class abilities tend to be much more powerful. Conversely, a wronged character with a broad scope of vengeance -- such as against a particular organization, guild, nation, or race -- has less powerful abilities. The DM has the final say on what constitutes broad or limited targets of vengeance.

Seething Barbarian

Level	Ability
1	Vengeful Rage
4	Vengeful Rage 2/day
7	Unstoppable Revenge 1/-
8	Vengeful Rage 3/day
10	Unstoppable Revenge 2/-
12	Vengeful Rage 4/day, trap sense +4

13	Unstoppable Revenge 3/-
14	Vengeful Will
16	Unstoppable Revenge 4/-, Vengeful Rage 5/day
18	Unstoppable Revenge 5/-
20	Mighty rage, Vengeful Rage 6/day

Vengeful Rage (Ex)

This power works like a barbarian's rage, except that it bestows an additional +1 morale bonus to attack and damage against the target of his vengeance. If the barbarian has a narrow scope of vengeance, this bonus rises to +2.

Unstoppable Revenge (Ex)

This power works like a barbarians damage reduction, except that it bestows an additional +1 morale bonus to Armor Class against the target of his vengeance. If the barbarian has a narrow scope of vengeance, this bonus rises to +2.

Satirist

Level	Ability
1	Mock Opponent -1
3	Mock Competence
8	Mock Opponent -2
14	Mock Opponent -3
15	Satirize
20	Mock Opponent -4

Mock Opponent (Su)

A bard with 3 or more ranks in a Perform skill can use song or poetics to mock the targets of his vengeance, weakening them against fear and reducing their combat abilities. To be affected, the target must be able to hear the bard sing. The effect lasts for as long as the target hears the bard sing and for 5 rounds thereafter. An affected ally receives a 1 morale penalty on saving throws against charm and fear effects and a -1 morale penalty on attack and weapon damage rolls. At 8th level, and every six bard levels thereafter, this penalty increases by 1 (-2 at 8th, -3 at 14th, and -4 at 20th). Mock opponent is a mind-affecting ability.

Mock Incompetence (Su)

A bard of 3rd level or higher with 6 or more ranks in a Perform skill can use his music or poetics to help the target of his vengeance fail at a task. The target must be within 30 feet and able to see and hear the bard. The bard must also be able to see the target.

The ally gets a -2 morale penalty on skill checks with a particular skill as long as he continues to hear the bard's music. Certain uses of this ability are infeasible. The effect lasts as long as the bard concentrates, up to a maximum of 2 minutes. Mock incompetence is a mind-affecting ability.

Satirize (Su)

A bard of 15th level or higher with 18 or more ranks in a Perform skill can use music or poetics to satirize the mightiest of heroes, harming the targets of his vengeance within 30 feet. For every three bard levels the character attains beyond 15th, he can satirize one additional creature. To satirize, a bard must sing and the target must hear the bard sing for a full round. A creature so satirized suffers a -4 morale penalty on saving throws and a -4 morale penalty to AC. The effect lasts for as long as the target hears the bard sing and for up to 5 rounds thereafter. Satirize is a mind-

affecting ability.

Vengeance Domain

Clerics can take the vengeance domain.

Granted Powers

You gain the smite power, the supernatural ability to make a single melee attack against a target of your vengeance with a +4 bonus on attack rolls and a bonus on damage rolls equal to your cleric level (if you hit). You must declare the smite before making the attack. This ability is usable once per day with a broad focus of vengeance and twice per day for a narrow focus of vengeance.

Vengeance Domain Spells

1. Zone of Truth
2. Detect Thoughts
3. Locate Creature
4. Mark of Justice
5. Scrying
6. Find the Path
7. Scrying, Greater
8. Discern Location
9. Storm of Vengeance

Nature's Wrath

Unlike the other classes, druids are the most likely to want revenge for defense of a place as opposed to their own personal well being. Destruction of a sacred grove or desecration of a holy spring will bring about the druid's wrath.

Level	Ability
3	Vengeful Path
20	Storm of Vengeance

Vengeful Path (Su)

At will, the druid can use the equivalent of a *find the path* spell to track the target of her vengeance.

Storm of Vengeance (Su)

Once per day, the druid can summon a storm of vengeance against targets of her vengeance.

Avenging Paladin

Whereas the cleric might follow an ethos of revenge and seeks out those who do likewise, the paladin is an avenger; he avenges those who have been wronged. Thus, a paladin must commit to avenge someone else and defines his vengeance scope through others.

Level	Ability
1	Aura of Good, Avenging Smite
3	Aura of Vengeance, Divine Health
5	Avenging Smite 2/day, Special Mount

10	Avenging Smite 3/day
15	Avenging Smite 4/day
20	Avenging Smite 5/day

Zone of Truth (Sp)

Once per day, a paladin can use zone of truth, as the spell, against targets of his patrons vengeance.

Avenging Smite (Su)

Once per day, a paladin may attempt to smite a target of her vengeance with one normal melee attack. She adds her Charisma bonus (if any) to her attack roll and deals 1 extra point of damage per paladin level. If the paladin accidentally smites a creature that is not a target of her vengeance, the smite has no effect, but the ability is still used up for that day. At 5th level, and at every five levels thereafter, the paladin may make an avenging smite one additional time per day, as indicated on the table, to a maximum of five times per day at 20th level.

Aura of Vengeance (Su)

Beginning at 3rd level, a paladin is immune to fear (magical or otherwise) from targets of his vengeance. Each target of vengeance within 10 feet of him suffers a -4 morale penalty on saving throws against fear effects. This ability functions while the paladin is conscious, but not if he is unconscious or dead.

Vengeful Ranger

Of all the classes best suited for vengeance, rangers make especially good avengers. Their abilities are targeted to a broad group of enemies already.

Level	Ability
1	Target of Revenge +2
5	Target of Revenge +4
10	Target of Revenge +6
15	Target of Revenge +8
20	Target of Revenge +10

Target of Revenge (Ex)

At 1st level, a ranger selects his target of revenge. The ranger gains a +2 morale bonus on Bluff, Listen, Sense Motive, Spot, and Survival checks when using these skills against these targets if they are a broad group. Likewise, he gets a +2 morale bonus on weapon damage rolls against such a group. At 5th level and every five levels thereafter (10th, 15th, and 20th level), the bonus increases by 2. If the target of revenge is a narrow group, the ranger gets an additional +1 morale bonus on attack rolls (increase by 1 for every five levels thereafter).

Vengeful Rogue

Rogues, like rangers, are well suited to stabbing people in the back for real and imagined wrongs.

Level	Ability
10	Vengeance Ability +1
13	Sneak attack +7d6, Vengeance Ability +2
16	Vengeance Ability +3
19	Sneak attack +10d6, Vengeance Ability +4

Vengeance Ability (Ex)

When choosing any one of the rogue special abilities, the vengeful rogue receives a +1 morale bonus to all Reflex saving throws and skill checks made in conjunction with those special abilities. If the target of vengeance is a narrow focus, the rogue gets an additional roll if he fails his first use of the special ability against the target of his vengeance.

Feats

These feats can be used to start a form of revengeor end it.

Einvigi

You are an expert at settling old scores.

Requisites: BAB +1, you must have settled a feud with someone by killing them.

Benefits: When calling out a target of vengeance, you receive a +1 morale bonus to attack and damage. This opponent must have wronged you in some way. You only receive this bonus if you fight your opponent in one-on-one combat and he is adequately prepared for the duel.

Holmgang

When you settle scores, you bind your opponent by divine right to accept the consequences of the outcome.

Requisites: BAB +6, Knowledge (Religion) 6 ranks.

Benefits: You must call out the target of vengeance. The target must make a Will save (DC 10 + your character level). Failure means the target is affected as if by a *geas/quest* spell. Once the target of vengeance fights in a duel with the character, regardless of the outcome, the effects of the holmgang are lifted and the feat cannot be used against him again.

Katakiuchi

Katakiuchi is a legal vendetta in orderly societies. You are familiar with its terms.

Requisites: Must be lawful in alignment, +3 base attack bonus

Benefits: The avenger receives a +1 morale bonus to Diplomacy and Gather Information checks in lawful societies that recognize the right of katakiuchi in conjunction with his quest to avenge himself.

Normal: There are strict rules for conducting a katakiuchi. The avenger must be of equal or lower social status than the target of his vengeance and must legally register his intent with his lord; he may not return home without proof of his success. Upon receiving a legal approval, the avenger then carries the document with all relevant information and presents it to officials as appropriate, especially after the target of vengeance is killed. This documents exempts the avenger from all legal ramifications for his revenge. This feat usually applies to a narrow group, but can also be applied to a broad group, called a fukushu.

Stopping the Cycle

Some civilized societies recognize vengeance as a legitimate form of reparation (see katakiuchi, above). As a result, it is also possible to make reparations for murder. In the case of a fantasy universe where death is fleeting, entire societies might be in danger of collapse as two perpetually resurrected foes kill each other in an ever-escalating death

match.

Called wergild, ericfine, galanas, or glowczyzna, this reparation is usually sufficient to cover the expenses of the persons loss to his family or employer. As a general rule, the cost is 1,000 gold pieces per effective character level of the target. Thus, if a killer hopes to avoid vengeance, he must pay the price. Once the gold is paid and accepted, all feats related to vengeance from that person or persons are invalidated; he can no longer be considered a target of vengeance. Note that for broad groups of vengeance, the cost may be considerably higher.

Once Avenged

Characters with a narrow focus of their vengeance will eventually kill or be killed. Upon doing so, they must consider what to do next. They may choose to use their vengeance on behalf of someone else. Alternately, the vengeance doesn't have to be so personal; at the DM's option, a vengeful character might swear to avenge a friend, family member, or spouse. Alternately, some characters will never truly eliminate the target of their vengeance because the scope of their vengeance is so broad. Those that do may end up committing genocide, in turn incurring vengeance against the avenger.

Icosahedron Adventures

Bigger Is Better

by Owen K.C. Stephens

Getting Big: The Giant Character Class

One of the core design ideas behind the *d20 System* is to break things with game mechanical similarities into broad categories and sub-categories. This organization allows game mechanics to be built around these categories (which also include spell schools, descriptors, sub-types, and bonus types) giving consistent, easily-explained benefits and penalties. Thus red dragons and wyverns aren't just similar, they're both of the dragon type. This means they have certain features in common as defined by their type, and that spells or magic properties effective only against dragons work on them, but not hydras.

However, little is done with these categories other than to refer to them. Adding new categories is often avoided because of the effect it can have on game play (if a spell is allowed to access a new energy type -- base rather than acid for example -- it weakens the value of defensive effects by expanding the number of attack types and thus reducing the chance a given resistance is useful against a given attack). But the tight interconnection of the game categories can also be used to make sweeping changes to game play or design without interfering with other elements of gameplay. For example, a GM who wished magic to carry more consequences could rule that all spells with the Fire descriptor catch dry material on fire, and all those with the Acid descriptor create noxious fumes. Thus the GM need not go through every spell in the campaign to assign such effects, knowing that all appropriate spells already have those tags.

Within each category things become much less organized. For example, although all creatures of one type have some things in common (base hit die, good saving throw categories, skill points), a great deal of information is generated ad hoc within each monster entry. The most critical value that has no set method for determining it is the challenge rating of a creature, which determines what adventurers it's licensed to go after, how much money it has, and how much you learn by killing it. This critical number is given for every monster, but a GM wishing to create his own threats is left with no choice but to slap on class levels (which don't always stack perfectly with the CR they generate), or create a new monster and compare its powers to those of various CRs.

There is no reason why this is necessary, especially not under the current fantasy *d20 System* rules. Monsters have all the same statistics as classed characters. If a "character class" were to be written for each monster type, along with a +0 ECL base race, it would be possible to write up a monster from scratch and know its CR easily (as one level of a heroic class grants +1CR to any ECL +0 race). The class could be used anywhere a creature of that type was needed, or be stacked onto existing creatures to give them greater power appropriate to creatures of that type.

Of course there are pitfalls to any attempt to turn a vast collection of vaguely-similar creatures into a single chart. With aberrations and undead it may well be impossible, or at least produce a less universally applicable result. To test the basic theory that a "type" class can be used to supplement or replace existing monsters this article presents the giant class. Giants are iconic and popular, but lack the widely varied powers of many other types. In short, a giant class is easier than a dragon or magical beast class would be, and is thus a god place to start with such an idea.

What Do I Do With This?

There are three ways to use the giant class. The class may be restricted to creatures already of the giant type, and used as a quick and easy way to increase the CR of a giant foe. Each level of giant class taken by a giant increases his CR by one, and gives the increase in attack bonus, saving throws, hit points and special abilities to compete with higher-

level PCs. This option allows giants to be more than just big barbarians or fighters, although even with some magic powers included as options a giant seeking powerful spellcasting abilities is better off taking a traditional heroic character class.

Alternatively, the giant class can be used as a giant-monster generator. In this case the giant core race (presented below) is used as a starting point, and as many levels of the giant class are added as needed to reach the desired CR (like any core class, each level of giant class increases a character's CR by one). This allows a GM to create a wide variety of giant monsters and always know what the CR of each is without guess or using trial-and-error comparisons to existing monsters. If the giant is to be used as a monster, it gains a monster bonus based on the number of giant levels it has (see below). Once a core giant race is created, individuals may take heroic class levels as desired.

Third, it can be given as an option for any character to represent giantish blood somewhere in the character's ancestry. A GM may require a character to take a feat to qualify for the giant class (such as Giantblooded, presented below), or all characters may be allowed to declare a single type other than humanoid that represents a trace of unusual heritage. Characters that choose giant as their heritage type may take levels in the giant class as they would any other character class.

Giantblooded [General]

You have the blood of giants in your veins, and their influence shows on your physical form.

Prerequisites: Str 15+, Dexterity 13 or less.

Benefits: You receive a +2 size bonus to grapple checks and any maneuver where creatures of a larger size category receive a bonus. Your actual size class does not change, you're just big and bulky enough to gain a benefit over creatures within your own size category, and to minimize the advantage gained by creatures of larger size.

Also, you count as being of the giant type for purposed of being allowed to take an action (such as wielding a sword on giants may hold or taking level of the giant class), but not for purposes of things not working on or for you (weapons that are bane vs giants gain no extra bonus against you, a *charm person* still works on your if you're a humanoid).

Monster Bonus

In standard ***d20 Fantasy*** rules, a fair portion of a character's power is from the items he carries. A progression of the expected level of special and magical gear a character should have keeps NPCs using standard classes and levels in line with the power level of monsters of the same CR. This is important, because monsters gear (also known as "treasure") is a lower total value at any given CR, and more of it is likely to be in the form of coins and gems (pretty and functional, but not of much use in a typical fight). An NPC's gear at any given level is roughly three times the value of the treasure of a monster of the same CR. Thus a giant built using the giant class and gear totals of an NPC of his level ends up with more equipment than a giant class built as a monster, but the two are expected to be of the same CR.

Of course one answer would be to have monsters carry the same value and type of gear as NPCs, but this method has a few drawbacks. First, it requires the GM spend considerably more time to spend all the money of every giant. Second, items purchased must be of significant use to the giant class NPC, or his CR lags. Third, it increases the treasure PCs get for defeating giants. However, if monster-style giants are given treasure for their EL, rather than their NPC level, they don't pose as much of a challenge for their CR (negating one of the primary benefits of using the giant class).

To balance this apparent inequity, a giant class built as a "monster" gains one or more bonus options. Player characters never receive the monster bonus, as they gain money (and thus gear) at the same rate as any other PC (and normally end up with much more than NPCs of any description). These bonus options are all things that are common among monsters, but would be unbalancing in the hands of a player character. (If as GM really wants to create monster-style

giants with this system, and allow them as cohorts or PCs, each monster bonus gained gives the creature a +1 ECL.)

Monster-built giants gain one monster bonus every odd level. Monster bonuses may not be selected more than once unless they specify otherwise. A bonus racial feat can always be taken in place of a monster bonus, though the giant must meet all its normal qualifications. A giant class character built with monster bonuses carries gear in the form of treasure appropriate to the EL it is encountered in, not NPC gear values.

Monstrous Ability: You gain a constant innate ability. The ability works as a spell you select of a level no more than half your giant class levels. The spell must have a range of personal or touch, and can not increase you armor class, attack bonus, damage output, or ability scores. Examples include the storm giant's *freedom of movement* and the ogre mage's *fly*. You may select this monster bonus more than once, but it may not account for more than one third of your monster bonuses.

Monstrous Healing: If you have the fast healing or regeneration giant powers, they work even when you are above 50% of your hit point total.

Monstrous Power: You gain a bonus giant power (from the giant class, see below).

Monstrous Rend: If you have natural claw attacks, and you hit with both in the same round on the same target, you receive a free rend attack on that target. The rend automatically hits and deals double your claw damage.

Monstrous Spell Resistance: You gain spell resistance equal to your giant class levels +5. You may take this a second time, granting you +5 to your total spell resistance. This may not account for more than half you total monstrous bonuses.

Monstrous Spellcasting: You cast spells as if you were a 1st-level sorcerer or druid. You may take this more than once, each time increasing your spellcasting by one level, but it may never account for more than half of your monster bonuses.

Monstrous Strength: You have a +2 racial bonus to Strength. This may be taken more than once, but can not account for more than half your total monster bonuses.

Core Giant Race

If the giant class is to be used to generate giants of all type, the core giant race should be used as the racial basis such monsters. The core giant race can also be used as a player-character race if the GM wants a reasonable ECL +0 option for a Large race. In either case specifics of lifespan, exact height and weight, culture, and social structure can be crafted to give exactly the type of giants desired. There is no reason these details need to be uniform among giants. When using the core giant race to build a fire giant you can assume dark coloration, heavy frames, and foul tempers, while jungle giants can be thin for their size and calm. Such details need not have game mechanics to support them, leaving the GM free to have as many different types of giants as is desired without having multiple sets of rules to deal with.

Alternatively a GM *may* decide that all giants are, in fact, members of the same race which grows in ability as it ages (and even physically gets bigger). Under this scheme, a hill giant is simply a dumb, uncivilized giant who never gains the grace and magic abilities of his more civilized brethren, while a storm giant is an ancient patriarch of a noble, advanced civilization. This presents a world where distinctions such as "fire giant" and "ogre" are no more than artificial labels created by non-giants who don't understand the innately magical nature of the giant species.

If using the core giant race as the basis for creating a new race of giants (as opposed to creating a player character-type race), be sure to use the "standard array" of ability scores. Although the ability scores given for monsters are supposedly for a "typical" member of the race (the equivalent to a human with straight 10s), it seems much more reasonable to assume a typical monster uses the same array as a typical NPC. The standard array is 15, 14, 13, 12, 10, 8. Most giants should place the 15 in Strength, the 14 in Constitution, and the 10 or 8 in Dexterity.

Ability scores. Giants receive +2 Strength, +2 Constitution, and -2 Dexterity. Giants are big, tough and strong, but not very fast or agile.

Giant type. Core giants are of the giant type, meaning effects that only work on humanoids (such as *charm person*) have no effect on them.

Large. Core giants are Large size. This means they use Large weapons, armor and equipment, take a -1 size penalty to attack rolls and armor class, have a 10 ft. space and natural reach, take a -4 size penalty to Hide checks, gain a +4 size bonus to grapple checks, and have double the normal carrying capacity for your Strength score.

Movement rate. Core giants have a 40 ft. base move rate.

Low-Light Vision. Core giants have low-light vision, allowing them to see twice as far in shadowy or dim conditions than a human.

Throwing. Core giants receive a +1 racial bonus on all attack rolls with thrown weapons.

Favored Class. A core giant may select barbarian, cleric or fighter as favored class at character creation. All giants also receive the giant class as a favored class.

Giant Class

" Fee, fi, fo, fum..."
Attributed to a giant coinsmith and poultry farmer.

As foes giants are classic bad guys, enjoying advantages of reach and size that makes defeating them in melee punishing, and keeping far enough back to stay out of melee difficult. Giants have all the advantages of humanoids, able to use weapons and equipment, cast spells, and adapt to their situations in way creatures without thumbs just can't manage. They range from single threats wandering through forests and mountains to whole nations of oversized adversaries, able to field titanic armies even high-level PCs take pause at confronting.

As a player character, the giant takes its place beside the barbarian and fighter as a front-line combatant able to deal punishing blows. The giant can't take all the damage it dishes out and is terrible at missions requiring stealth however, forcing it to work more closely with allies than most fighting-class characters. The giant is also in constant need of money as its food, steed, weapons and armor all cost more (especially if some special material, such as adamantine, is desired in the construction). Indeed, this very drive for money may be the cause of the giant's racial reputation as greedy and selfish.

Giants of all kinds are defined primarily by their size and Strength. A Large giant can often carry more than a pack animal, and a Huge giant has the ability to be a walking marketplace. This is especially true since many giants wear heavy armor, and thus have no particular need to stay in light encumbrance. As a result giants are often willing to carry random bits of gear and even junk found during an adventure, which sometimes gives them options less laden characters lack.

Making a Giant

Although their 2/3 attack progression may seem to limit giant's abilities in combat, they are in fact primarily melee fighters. Their massive size (allowing them to use larger and more damaging weapons) and great Strength (which grow quickly as they gain levels) give them a melee attack that rivals the most dedicated fighter or barbarian. Only a giant's ranged combat options are limited, though using thrown weapons (granting the full damage bonus from their Strength scores) helps offset this limitation.

Giants don't have the hit points of fighters or barbarians, and their Constitution does not swell at the same rate at their

Strength. Coupled with a great difficulty in maintaining a high Dexterity, this fact means giants are almost always found in heavy armor. However they rarely both with shields, preferring to keep a hand free to grapple a foe or to use a two-handed weapon. A giant's best defense is a strong offense, and they all know it.

Abilities: Strength is the most important ability for a giant, as they depend on a high damage output to fell foes quickly. Constitution is also important, to give the giant the toughness needed to survive the inevitable mobs that surround wandering giants. Dexterity is a losing proposition -- a giant suffers to many penalties to armor class from size and low base Dexterity to avoid heavy armor, making Dexterity scores above 12 or so largely useless.

Races: It is most common to build a giant from the core giant race, but it is far from the only option. A dwarf with giant class levels becomes a sizeable master of stone and smithy work that is surprisingly iconic. An elf with giant class levels is a tall, thin master of ancient groves and strange shores. A half-orc with giant class levels is easily mistaken for an ogre, even by other ogres.

Alignment: A giant class character may be of any alignment.

Starting Gold: 6d4 [[TS]] 10 (150 gp).

Starting Age: As barbarian.

Table 1-1: The Giant Hit Die: d8

Level	Base Attack Bonus	Fort Save	Ref Save	Will Save	Special
1st	+0	+2	+0	+0	Tough hide
2nd	+1	+3	+0	+0	Heavy frame
3rd	+2	+3	+1	+1	Rock throwing
4th	+3	+4	+1	+1	
5th	+3	+4	+1	+1	
6th	+4	+5	+2	+2	Giant power
7th	+5	+5	+2	+2	
8th	+6/+1	+6	+2	+2	
9th	+6/+1	+6	+3	+3	Giant power
10th	+7/+2	+7	+3	+3	
11th	+8/+3	+7	+3	+3	
12th	+9/+4	+8	+4	+4	Giant power
13th	+9/+4	+8	+4	+4	
14th	+10/+5	+9	+4	+4	
15th	+11/+6/+1	+9	+5	+5	Giant power
16th	+12/+7/+2	+10	+5	+5	
17th	+12/+7/+2	+10	+5	+5	
18th	+13/+8/+3	+11	+6	+6	Giant power
19th	+14/+9/+4	+11	+6	+6	
20th	+15/+10/+5	+12	+6	+6	

Class Skills (2 + Int modifier per level, ×4 at 1st level): Bluff, Climb, Craft, Gather Information, Handle Animal, Heal, Intimidate, Jump, Knowledge (any, each taken individually), Listen, Perform, Profession, Search, Sense Motive, Spot, Survival, Swim.

Weapon and Armor Proficiency: Giants are proficient with all martial and simple weapons, and light, medium and heavy with armor. Giants are not proficient with shields of any kind.

Tough Hide (Ex): At 1st level, your skin becomes thick and leathery, granting you a natural armor bonus of +1. This

bonus increases to +2 at 2ndlevel, and every even-numbered level giant class level after that. (This means a giant class character's natural armor bonus is always equal to his Fortitude save bonus from this class.)

Heavy Frame (Ex): At 2nd level your frame begins to thicken, and your muscles cord and bulge with giantish power. You gain a +2 giant bonus to your Strength and a +1 giant bonus to your Constitution score. At every even level (4th, 6th, 8th, etc.) these bonuses increase by +2 Strength and +1 Constitution, to a maximum of +20 Strength and +10 Constitution at 20th level.

This same heavy frame makes it very difficult for a Giant to stay quick or agile. At every even level, when a giant's Strength and Constitution go up, his Dexterity is reduced by one, to a minimum of 10. As a result most giants do not bother to develop their Dexterity scores, though it's certainly possible to boost their score with magic items and spells.

Giant Power: As creatures of myth and magic, giants gain new powers as they increase in age and experience. At 6th level, and every three levels thereafter (9th, 12th, 15th, etc) a giant class character gains one of the following powers. Once a power has been selected it cannot be changed.

Claws (Ex): You gain two claws as natural weapon. They deal damage equal to a short sword of your size category. Any time you have both hands free you can make two claw attacks at your full base attack bonus as a full round action. If you have just one hand free you may make a claw attack as a secondary attack at -5 to your attack roll as part of a full attack action with another weapon.

Darkvision (Ex): You gain darkvision with a 90 ft. range.

Elemental Subtype (Ex): You gain the cold, earth, fire or water subtype. You gain all the normal abilities and drawbacks of your chosen subtype, You cannot have more than one elemental subtype. If you take the earth subtype you gain a natural burrow move rate equal to one-quarter you normal move (minimum 10 feet). If you take the water subtype, you also gain the aquatic subtype, allowing to breath underwater and giving you a natural swim speed equal to half your land move rate.

Fast Healing (Su): You have fast healing equal to 1/3rd your giant class levels per round (fast healing 2 at 6th level, fast healing 3 at 9th, and so on). Your fast healing only functions when you are at 50% of your total hit points or less. You can not have both fast healing and regeneration.

Regeneration (Su): You have regeneration equal to 1/3rd your giant class levels per round (regeneration 2 at 6th level, regeneration 3 at 9th, and so on). Your fast healing only functions when you are at 50% of your total hit points or less. Acid and fire damage deal normal damage to you, unless you are of the fire subtype in which case acid and cold deal normal damage to you. You can not have both fast healing and regeneration.

Scent (Ex): You gain the Scent ability.

Size Increase (Ex): You gain one size category (going from Large to Huge, or Huge to Gargantuan for example). You gain the normal size modifiers to attack rolls, armor class, and skills as well as the ability to use weapons and equipment of your new size. You also gain a +4 increase to your Strength, a +2 increase to your Constitution, a +1 increase to your natural armor, and a 10 ft. increase to all your movement types. However, you suffer a -2 penalty to your Dexterity score. You may not select size increase twice in a row (at 6th and 9th level, for example).

Spell-Like Abilities (Sp): You gain a spell-like ability. This si a spell of a level no more than one third your giant class levels, which you may cast once per day as a cleric or sorcerer of your class level. You may select this power multiple times. If you select the same spell as a spell-like ability twice, you may use it three times per day.

Terrain Affinity (Su): You have a mystic affinity for one environment type (both a climate and terrain type -- cold, temperate or warm; aquatic, desert, plains, forest, hills, mountains, marsh, underground). When in this environment you gain a +4 bonus to all Climb, Hide, Jump, Knowledge (nature), Listen, Move Silently, Spot, Survival, and Swim checks. You may choose more than one terrain affinity, but all your affinities must share a common climate or terrain element (thus you may choose cold desert, cold plains and cold mountains, or temperate forest and temperate hills, but

not cold aquatic and hot marsh).

Prescient Atomic Horror

by Brian Rogers

One key aspect of the *Atomic Horror* genre is taking the things that 1950's contemporary society was afraid of and providing an outsized example as the movie's threat. The fear of communism becomes pod people; feminism becomes a 50-foot woman. Silly, sure; campy, definitely; but it makes them a great snapshot of a culture and its fears.

When developing *Atomic Horror* adventures there is the realization that what scared us then isn't the same as what scares us now -- we just aren't quite as afraid of UFOs or atomic giant monsters. Of course, there's no reason (besides taste and good sense?) we can't translate our current cultural fears into Atomic Horror by applying the *Atomic Horror* out-sizing principle to what we see as our current threats.

Applying these to a classic *Atomic Horror* game provides a degree of ironic distance -- contemporary players running 1950's heroes battling 21st century society's fears -- which make it easy to play these for laughs. But it can also generate a surprising dissonance when the players discover the threat is no longer quite so comfortably distant. This may be more acceptable than inserting an Atomic Horror ethos into an otherwise normal contemporary campaign, an act which can make players feel that what they're playing is not what they signed on for.

Greenhouse Gasses

Scientists stumble on an airborne chemical that accelerates plant growth. Originally trumpeted as a boon for farmers, the gasses spread as an ominous, invisible cloud, causing massive growth of all flora. The heroes must deal with towns lost under the grass, cities overrun with vines, rapidly adapting plant defenses (toxins, allergies, thorns, insect swarms) and the super-abundance of oxygen leading to irrational behavior and flash fires. At the end of the day the fires might be the solution, burning out modified plants and cleansing the world of the problem. Until a sequel that looks at what eating those undetectably modified plants did to us. . . Cue the zombies!

2 Yttrium + 1 Potassium

The Commies have discovered a compound of mildly irradiated Yttrium & Potassium that shuts down or burns out electrical devices. Can 20th century civilization survive without the use of electronics? Will that strip our high tech edge over those agrarian Chinese hordes? Or prevent our potent atomic deterrent against the Russians? It's the problem of the millennium! Slightly outdated now, of course, but with some great support material.

Global Warming

Astronomers announce activity near Jupiter -- shadows on the surface, moon-sized objects in motion, and heat blooms from inside the gas giant. People are panicking, and someone must do something! The heroes must already possess, be given, or capture a space ship (perhaps prepared as some secret government program), and on Io they learn that BEMs are converting Jupiter into a secondary sun with the goal of colonizing all those nice low-gravity moons. This might render Earth uninhabitable . . . There's no evidence of that, they counter, and the tipping point could be years away. Fortunately these fragile-boned menaces fall to a good sock to the jaw, but heroes better do so quick, before their ultra-tech is aimed at Earth!

Population Explosion

"The A-bomb tests near Clutch, NV are certainly nothing to worry about -- look, this young mother just had happy, healthy triplets" trumpeted the news agencies seven years ago. They quieted down when every other woman in the

town showed similar fecundity. More so when those kids matured fast: now biologically teens, they are incomprehensible to their parents and starting to be sexually active. Their first unwed mother had sextuplets, with others soon to follow. So far they've shown an attachment to their birthplace, but Clutch is now struggling to provide food, shelter, education, jobs, and security to a population that demands more every day. Even if the heroes handle the town, there's still one family that moved two months ago, with the mother cooing over her five beautiful new babies in the crowded city . . .

Television Games

Television reaches into our homes, and the children's show *Great Times, America* warms up sets in the afternoon. Parents *were* happy because after the show kids play the physically challenging games the GTA puppets advocated -- they're doing so in groups and adopting the personalities of soldiers, engineers, and snipers of their anti-communist war games, but that's good for the imagination. Then one Dad noticed that the his son's small unit tactics are perfect, he's reading military history and using incomprehensible GTA inspired slang. . . not to mention Russian and German. The heroes probably come at this at an angle, looking into the rise of car thefts and street shootings by criminals who have an uncanny skill at avoiding police patrols. Almost like they'd been trained . . .

Countdown!

"Oldest Man in the World Dies" states the headline in a few newspapers: a 116-year-old Civil War Vet had finally passed on after a six-month illness. Next week a different paper runs a similar headline, about the 115-year-old woman in Australia expiring after a six month illness. Two weeks later there are two more, a pair of different 113-year-olds, both sick six months to the day. Each week brings more deaths as the world is culled by one year every Sunday after a progressive six-month illness. Everyone over 90 is showing signs at the first death, and as the age drops inexorably the health care system is starting to buckle. The precision indicates an intelligent agency, but we can only hope that those responsible can be located . . . and that they're not over 90.

89.

88.

87.

* * *

In addition to these, virtually all Michael Chrichton novels contain the other *Atomic Horror* principle, "science runs amok" (or "Isn't this invention nice and shiny? It'll Kill You!"). Some things that did happen recently already *are* already *Atomic Horror* plots: a pandemic that at first only strikes social deviants? Losing your mind when you eat beef? Those can just be dropped in directly but they might stretch the bounds of good taste and common sense.

Might be better to have [intelligent gorillas](#) taking blue collar jobs. Or [zombies](#). Those always work.

Treks Not Taken: Alternate Voyages

"Not our universe, not our ship. Something -- parallel. A parallel universe coexisting with ours on another dimensional plane. Everything's duplicated -- almost."
-- Captain James T. Kirk, "Mirror, Mirror" *[TOS]*

Forty years ago today, my life changed, and I didn't even know it, because I wasn't even a year old. But that's how alternate histories work, you see; they sneak up on you and take different forms than the ones you might have been anticipating. Forty years ago today, "The Man Trap" aired on NBC, the first ever episode of *Star Trek* to be broadcast. Several years later, I put together a rather alarming number of roleplaying game books based on that show and its epigones, with generally positive consequences for me and mine. And so, to give a little something back on the flipside, here's four alternate *Treks* -- but true to our higher calling here, none of them so ordinary as mirror universes and eternal Klingon wars. Heavens, no. Here are strange new worlds, with some rather familiar names -- all authentic to our history -- at the center of all manner of bold-going missions, five-year and otherwise. Seek them out, won't you?

"Picard, you are about to move into areas of the galaxy containing wonders more incredible than you can possibly imagine . . . and terrors to freeze your soul."
-- Q to Picard, "Q Who?" *[TNG]*

In 1649, the duelist and writer Cyrano de Bergerac traveled to the Moon and to the Sun, meeting the infidel races therein. Essentially peaceful, the Lunars and Solars proved key allies when Cyrano's third voyage roused the Martians to attack the Earth. Fortunately, the burgeoning space navy of King Louis XIV was equal to the task, and sufficiently demonstrated French honor that the punctilious Martians eventually agreed to an armistice. Martian recognition (and an effective monopoly on space flight) left Louis the head of the Confederation du Monde, and eager to spread the light of glorious French civilization out to the moons, comets, and bolides that his astronomers began to chart. Many of them contained villages and towns, just like the Moon and Sun; others seemed only to hold mysteries mathematical and philosophical. Each one was a potential problem, and a potential triumph for French savants. France-du-Monde and its allies came to Mars' defense when that planet was attacked by the invisible ships of the invisible Ninth Planet, somewhere deep beyond Saturn. And war returns to the planets. With a new enemy, France must build a next generation of space ships of the line -- but they travel in search of advanced learning even though their carronades and rockets are always ready to repel treacherous attack.

And who better to command *L'Enterprise,* the queen of the fleet, than the brilliant Jesuit-trained astronomer Jean-Felix Picard? To be sure, he is of increasing years, but his crew is sound enough -- it even includes a bluff Martian soldier of noble birth! Of course, some priests warn that France's new space fleet flaunts God just as the Tower of Babel. They repeat the rumors of Venusian dreamers and Martian scouts, that out in the depths of the heavens the angel Quriel waits to toy with and test trespassers in the celestial, and that beyond him lie the denizens of a soulless city known only as Le Bourg . . . This is, of course, a **GURPS Space-Swashbucklers** campaign, with an "anything goes" aesthetic. Picard and his crew might encounter anything from fallen angels to technological Utopias to parallel universes where the Martian War goes badly.

"'Why, they look like -- I'd swear they're American Indians.'
'They are, Doctor. A mixture of Navajo, Mohican, and Delaware, I believe. All among the more advanced and peaceful tribes.'
'It's like discovering Atlantis . . .'
' . . . or Shangri-la.'"
-- McCoy, Spock, and Kirk, "The Paradise Syndrome" *[TOS]*

The reports of Livingstone, Burton, and the other explorers overturned every notion of orderly geology, history, and geography once cherished by the Royal Society. Africa, amazingly, was bigger inside than it was out -- with rivers and lakes twisting through impenetrable jungles and black mountain caves alike. (Rumor had it that a previous five-year mission by Captain Zebulon Pike had discovered something similar in the American West.) And at every turn was

something uncanny -- a city of lost Romans, or a colony of Irishmen that based its society on the criminal sections of *London Labor and the London Poor,* or enormous amoebas, or ruins of inhuman civilizations, or sentient dinosaurs who prospected for gunpowder. And there were mines -- not just of gold or diamonds but of "duolithium" ores that could harness "negative matter" and unleash immense energies. The British Empire needed that duolithium (and the gold and diamonds) to build its gravity-boats and power their etheric lances. It had to send its best into the African frontier, to boldly go where no white man had gone before. Except, apparently, the Romans . . . and Druids . . . and Crusaders . . . and Marco Polo . . . and Alexander's army . . .

Crimean War medic John Kirk had served well on his first five-year mission, at the side of Henry Livingstone in Darkest Africa from 1858 to 1863. Now, in command of the gravity-corvette *HMS Enterprize,* he sails into Africa alert for the machinations of the Germans, the Russians, and the French. However, he has a first officer from the Republic of Vulcan, founded inside the Virunga volcano by a Roman artificers' cult who practiced ancient arts of memory and psychic prowess. (In fact, it was Burton's contact with the Vulcanians that gave Britain its leg up on duolithium technology.) Kirk knows it's bootless to protest that he's a doctor, not a captain -- if Lord Palmerston, the Great Bird of Whitehall, needs him to be a captain, then he'll be the best captain in the whole Royal Navy. And with Henry "Bones" Livingstone and a Scottish engineer to keep the boilers up, he'll seek out anything that the Royal Society -- or the Royal Navy -- wants, no matter how many redcoats die trying. This **GURPS Steampunk** campaign probably works best if the PCs command their own gravity-ship, since competing with Kirk for spotlight (or for the attentions of the green animal-women of Orongo) is a fool's errand.

"Mister Kim, we're Starfleet officers. Weird is part of the job."
-- Janeway to Kim, "Deadlock" *[VGR]*

It may not look like much, but the *USS Voyager* is the finest U.S. Coast Guard ship in the world. As far as any of the crew can tell, it may be the only U.S. Coast Guard ship in the world. Commissioned by the Navy in 1917, the 52-foot cutter patrolled Lake Michigan out of Chicago after the War for the Treasury Department. On a foggy Halloween of 1922, it followed a hot tip to intercept a big Outfit shipment of bootleg hooch. (Halloween was lucky for *Voyager,* which had a rep as a "haunted" ship.) The Guard sank the Mob boat and captured six or seven gangsters. Then, the mysterious creature in the water struck. Somehow, the Thing knocked *Voyager* out of Lake Michigan -- possibly, out of Earth. When the mist parted, the ship was on the lee shore of some tropical islands -- being attacked by war canoes. Some sort of berserkers nearly sank *Voyager* in a pitched battle, but machine guns turned the tide against spears and axes. Nobody on board recognized any of the languages, or any of the constellations. But there were carvings of Things on some of the islands, so the gangsters and the Guardsmen have made common cause. They'll sail north, looking for a way back to Chicago, and do what they can in the meantime to not kill each other. Even the haunts are working together -- having a ghost for a doctor helps, although nobody will claim it's comforting.

This campaign can be almost entirely open-ended -- I'd be inclined to run it as a **GURPS Fantasy** game, with a convenient "Ocampan" magician or Amazon refugee from the insect-men to add varieties of powers and possibilities, but it can go a few notches darker and be a **GURPS Horror** game with ease. Replace the Thing with a Banestorm and set the adventures of *Voyager* on Yrth, or decide the ship was knocked 7,000 years back in time to **GURPS Atlantis.** It's all up to you, and it's not like anyone's going to mind radical departures from the source material.

"I lied. I cheated. I bribed men to cover the crimes of other men. I am an accessory to murder. But the most damning thing of all . . . I think I can live with it. And if I had to do it all over again . . . I would."
-- Sisko's personal log, "In the Pale Moonlight" *[DS9]*

It was just after the Six-Day War ended in 1967 that Taraq Nur, the "burning light," appeared in the -- now Israeli-occupied -- Sinai Desert. It was a temple complex to rival Petra, on the site (perhaps) of Moses' encounter with the "sapphire throne" of God. And it held a gateway to another world, a wormhole to an ancient Dominion of alien castes and unknown technologies. In order to prevent a new outbreak of the war, as the Egyptians (with Soviet backing) threatened to seize the outpost from the Israelis, President Johnson agreed to send a neutral arbiter to manage the find. He picked Assistant Secretary of State (and CIA agent) Joseph J. Sisco to run the American mission, backed up by an elite team of U.S. Marines. The other powers got their own representatives on the site, which came under nominal UN jurisdiction, although the Israelis continue to provide the bulk of the security.

This *GURPS Espionage* campaign can unreel with Soviet, Chinese, Arab, Israeli, British, and French agents all giving the Americans headaches (and the PCs can be any or all of the above) as the anomalies around the complex get stranger. Or it can shift into a full blown war campaign, as the Dominion -- finally deigning to respond to the pinpricks of exploration from Earth -- launches an invasion of the planet. Will the Dominion ally itself with the increasingly alienated and angry Arabs, using their burning desire for revenge as the wedge that gives it a foothold on the Earth? Can Sisco bring the Soviets and Chinese in on the side of America and her allies? Should he? Can the various castes within the Dominion be set at each others' throats? And what mysterious techniques and technologies exist in the new civilizations on the other side of the wormhole?

Pyramid Review

Arkham Horror: Curse of the Dark Pharaoh Expansion

Published by [Fantasy Flight Games](#)

Designed by Rob Vaughn

90 cards (22 Exhibit Items, 21 Spells, seven Allies, 18 Barred from Neighborhood, four Benefits, four Detriments, 45 Arkham Locations, 27 Gates, 18 Mythos), instruction sheet; full color, boxed; $19.95

As many as 95% of the problems associated with living in the township of Arkham can be laid at the feet of Professor Armitage. Get rid of this poor dope, and maybe the streets wouldn't fill with blood every fortnight. The original "Dr. Lucky," he pulls in weird artifacts from every corner of the globe and puts them on display. This time he's gotten some bizarre items from Egypt, where they were all too glad to hand them over. No one ever bothers to wonder why. The *Curse of the Dark Pharaoh* expansion (the game title, not the name of the show -- tourism would plummet if visitors knew the exhibits would be jammed in their gut) adds new, ichorous "life" to your *Arkham Horror* game.

The object remains unchanged: As portals open to other worlds, close them and banish the monsters that emerge. Oh, and if the Ancient One shows itself, you'll want to clean that up, too. These new cards can be played as a traveling exhibit or a permanent display at the museum.

The permanent exhibit is simpler, positing that a cultural exchange of museum pieces produces a set of artifacts from Egypt, now part of the standard tour. In game speak: New cards are added to change the play of the game, and most get mixed in with existing decks (new Spells for the Spell deck, for example). If players go the traveling exhibit route (the primal terrors are on display for one viscera-spattered week only), the new cards *replace* the original decks. This assures you see more of your new purchase, and changes the events of the game to make it seem more . . . Egypty?

The graphics merit little elaboration, assuming you've played the original set, save to say the level of quality has dropped not one iota. Whether they have used new artists is not noted -- the credits list only the supplement's designer -- but it's the same creepy and atmospheric joy that made you shudder the first time.

As a permanent exhibit, the game isn't terribly dissimilar. Since it's easy to get used to many of the game's tricks after several plays, the two sets change what players think they know, making it harder to predict how events progress. Primarily this alters the appearance of the gates, though sometimes they don't even produce a portal, choosing instead to supercharge the Ancient One's doom track.

When played as a traveling exhibit, the addition is thrown into sharp relief. There seem to be Mythos cards sufficient to play a single game using only the new cards, but the rules recommend alternating your draws between old and new decks. This adds a little bookkeeping, recalling whence your last pull came, but their suggestion of placing a marker over the last deck used usually suffices. The Location and Gate decks are completely replaced by the new iterations, so your encounters on both sides of the dimensional walls are brand-new. Some Gate cards come in two colors now, making it easier for you to pull a matching gate color from the smaller selection, but some of these demand you face the relevant Ancient One (read: draw a new Investigator). New Exhibit Items mirror the original Unique Items. These Egyptian curios are obtained in much the same way as Unique stuff, but they're worth no money (they only save your life). The rest of the cards are paired up directly -- if someone gets to draw a Spell, for example, he has a choice of getting it from either set.

You're going to need some of those new Spells to soften the opposition up, though once again there's a lot of

duplication in the deck. (Of course, you've got a better chance of getting one of the enchantments you want.) Many Spells are designed to provide a needed edge given the new challenges, moving you around the board and through gates or taking away monster advantages. Those advantages have grown to include *surprise,* a quality by which enemies take away your chance to evade.

Not every card is specifically meant to bring the feel of Egypt to the game, but there are plenty of references to the new exhibit and the Black Egyptian of Lovecraft's world, and at least one laugh-out-loud reference to Erich Weiss for the fans. New Allies seal old skill holes, and various Benefits and Detriments like enjoying Visions or having to lug around a Local Guide may pop up. All these factors combine to make the traveling exhibit one mighty tough nut to crack.

It was never easy getting all the pieces back into the **Arkham Horror** box (and even when you did they'd slide around without a pile of rubber bands and plastic baggies), and with the new **Curse of the Dark Pharaoh** cards you can either carry both boxes with you or learn to maximize space all over again. But that and 20 bucks are small prices to pay for this deft chance to relearn a good game all over again.

--Andy Vetromile

Amundsen City

by Paul Drye

In 1919 a young German boy named Werner von Braun died after falling out a tree he had climbed, and Detente-2's history started diverging slowly from Homeline's. German rocketry efforts never reached the pathological levels they did in Homeline's WWII (and the war in Europe didn't end until June of 1945), then the ripples moved on from there. Among other things, Sergei Korolev had died in the Kolyma gulag for lack of interest in his work, and Robert Goddard had remained a curiosity even after his death.

History

Nikita Khrushchev made a version of his "Secret Speech" in both timelines, consolidating his control over the Soviet Union. Afterwards, looking to advance his policy of peaceful competition with the West, he searched for a propaganda coup to spring on the world. In Homeline he selected the conquest of space on the backs of ICBMs; on Detente-2 no-one had built rockets that would go even 500 miles, let alone into orbit. Here the General Secretary selected the conquest of Antarctica instead. On September 18th, 1956, the Soviets exploded a fission bomb on Drygalski Island in Wilkes Land. In a public speech later that evening, Khrushchev announced that the USSR intended to colonize Antarctica. The nuclear test was explained as "seismic investigation," but the world understood that it was a thrown gauntlet.

While not as stunning to Detente-2's America as Sputnik was on other lines, the Russians did succeed in capturing the US administration's attention. In the dying weeks of his presidency, and looking to secure a legacy after a lackluster eight years, Thomas Dewey formed the civilian Antarctic Development Agency (ADA, for short). Headed by the hastily retired Admiral Richard Cruzen, the ADA rapidly built up an American effort in Marie Byrd Land that tried to match the Russian inroads on the other side of the continent.

Detente-2 is a close parallel, and furthermore it seems to have some of the "historical inertia" that has kept lines like Ezcalli near Homeline's history despite diverging far in the past. While it wanders away from the details, it then wanders back more often than chance would allow. The most obvious sign is the way the "Push to the South" mirrored the Space Race. The Russians started out ahead, and the Americans had trouble at first as the ADA tried to regain the technological lead. A German expatriate (Alfred Ritscher here) got them back on track, and the Americans were considered the winners in the competition when their South Pole station grew over 1,000 people. Most people on Detente-2 say the Push ended with the first birth in Antarctica, Michael Two Eagles, on July 22, 1969. Even the spin-offs touted as a great benefit of the Push look familiar, orange drink crystals and velcro being among them.

Ironically, trying to overcome the difficulties of communicating with Antarctic stations in the interior led to the decline of the program. A microwave relay network criss-crossed the continent, but was incomplete even in 1970; maintenance costs were high. As rocket technology got better, the ADA funded efforts to develop communications

satellites in polar orbit. Spin-offs from this project helped spark Detente-2's delayed Space Age, and polar exploration budgets shrank in the face of the new competition. For much of the 1980s and early 1990s, the Antarctic programs languished, kept alive only by bureaucratic inertia and the fraction of Western society that still believed in "the Frozen Frontier."

Like Space Station Freedom morphed into the ISS in the real world, Amundsen City was saved by internationalizing it in 1993, not long after the fall of the Soviet Union. The various bases at the pole were amalgamated -- as well as the other, supporting stations around the continent -- and the pooled budget streamlined of duplicated efforts. The Americans and Russians gave the most, but Antarctic exploration is fundamentally easier than space flight, and more than a dozen other nations participated from strong #3 Japan down to minor additions from South Africa and Brazil.

Despite the increasingly multifarious nature of the new settlement, it resisted official naming for some time. The Americans and the Russians were the only groups with any real chance of hanging a permanent tag on the settlement, and a tug-of-war ensued over it in a quest to secure political points. Among others proposed were Byrd Base, Somov Base, Union/Soyuz Station (rejected by the Americans as too pedestrian), and even the unwieldy Palmer-Bellinghausen. Eventually the harassed joint-naming committee focused on the first successful expedition to the South Pole, fortunately headed by an explorer from suitably inoffensive Norway. "Amundsen City" was duly recorded and all other older names, acronyms, and initialisms used for the site's formerly independent pieces were thankfully retired.

Even with the new boom, Amundsen City has no reason to be as big as it is. It was built for propaganda purposes during the Cold War and so was self-justifying. With the Cold War over, the city was threatened by severe budget cuts and shrank to just 7,500 personnel. The internationalization of the station helped, then the discovery of Ross Sea oil helped a lot more.

Like Homeline, Detente-2's oil prices jumped at the end of the millennium. It had been known since the 1960s that the Ross Sea coast along the Transantarctic Range -- about 200 miles from the South Pole -- had oil, so once prices got high enough, attention turned to the new deposits. While it costs something like $60 per barrel to recover, the ADA was looking for something to subsidize an already-existing infrastructure, not necessarily profit. As long as they can get some income, they consider the effort worth it, especially since buzz phrases like "energy independence" carry enough political cachet to garner more money from Congress. Since the early 1980s, but especially in the last couple of years, Amundsen City has been half about science and half about oil. The two halves don't get along very well.

The Settlement

Calling Amundsen a city is a bit of vainglory -- there are actually only about 12,000 people living here, with about 5000 long-term residents. However, if it's not a real city, then it's the most high-tech village on Detente-2.

The original pole stations, one American and one Russian, were built into the ice, but before long the two teams discovered the major (if quite mundane) problem with this: snow clearance. Several feet of drifting snow covered the station each year, and this had to be removed to prevent its roof from caving in. The work was continuous, and expensive.

Starting in 1971, the nucleus of the current city was built, and the older facility was entirely abandoned. All new buildings are on movable stilts, which can be jacked up one at a time in sequence in order to stay ahead of the drifts. This proved to be a successful strategy, and after the City was internationalized a modular system it was planted on top of the stilts. Open frame stairs lead down to the only buildings on the ground, the garages for the station's fleet of tracked vehicles.

Each building is part of one of five concentric rings, originally centered on the Pole. This was a bit of theater that proved to be useless, as the ice moves about 30 feet per year in the general direction of Argentina. The geographic pole is now under a non-descript housing cluster, but station brass still uses the center of their circles. The rings are divided into sections, just three for the inner one, and 30 for the outermost. Each section is joined to the ones on either side by neoprene and kevlar "airlocks" so they can be cordoned off when being swapped around. An axis, running more or less along the international date line (or Greenwich Meridian, depending on which side of the pole one is on) pierces all the

rings so staff can walk between them without going outside.

The buildings themselves are built on an oval cross-section, with the long axis parallel to the ground. This presents a wing-like profile to the wind no matter which direction it blows, and prevents dead air pockets where snow builds up. The central part of each oval is large enough to stand up in, while the smaller spaces on the rings' outer and inner rims are filled with support equipment, like plumbing and electrical wiring.

The outer rings are dominated by housing and recreational space, largely supplied by the Americans and Russians. There's officially no discrimination in who lives where, but no one cracks down on informal trades so there are ethnic knots named "Russki Town" and the like. This trend has become particularly pronounced since the oil drillers came to town; they cluster together on one side of the base, and have more free-wheeling forms of entertainment in their area.

Scientific spaces take up the innermost rings, including a geology lab supplied by Canada, a British observatory (optical and radio), a Japanese material sciences lab, a multi-national weather station, and many others. Most are engaged in pure science and support of Antarctic exploration, though some of them put in time helping the corporations exploiting the Ross Sea efforts.

Daily Life

The city itself is dominated by the scientific establishment, while the oil industry is strung out along a 200-mile route between the South Pole and the point of the Ross Sea, following the edge of the Mercer Ice Stream through a pass in the coastal mountains.

The biggest difficulty for visitors to the City is cold. At the height of summer, the temperature rarely exceeds 0deg; Fahrenheit; towards the end of winter, the air often pushes -100deg;. Fortunately, the winds average only about 10 miles per hour, and rarely exceed 30. GMs are directed to page 430 of the *Basic Set,* but in brief characters are going to be making HT -- or Survival (Arctic) -- rolls every 15 minutes at a modifier of up to -1 per 10 degrees below 0.

Night is the other major hurdle to jump, particularly the long polar one stretching from the third week of March to the third week of September -- plus or minus a few days thanks to the weather and atmospheric refraction. Apart from the fundamental problem of needing artificial light to accomplish much, there are psychological difficulties as well. This is compounded by the long night corresponding with the lowest temperatures and the need to stay inside as much as possible. Agents with any sort of darkness or claustrophobia-related disadvantages (or even quirks) are risking being under stress for almost 200 days. Realistically, even adventurers who aren't influenced by their character sheet are running similar risks, but in practice it would be ill-advised for a GM to throw this into the mix without consulting the players first. It may be wiser to reserve dark-induced lunacy for GM-run characters, to be invoked by fiat or plot necessity.

As well as having to handle the cold and long winter dark, Amundsen City is also sitting on a great deal of ice, enough to make it one of the highest major settlements in the world. At 9,300 feet, it's at the same altitude as the settled parts of the Andes mountains. It doesn't rank with cold and dark for trouble-making, but many people have problems with altitude sickness while visiting the pole. The Russians have established an intermediate base in Wilkes Land that they use to acclimatize their people before moving up to Amundsen, while the Americans have done the same in the Transantarctic Mountains. If visitors to the city don't have a chance to get used to the low air pressure, refer to page 429 of the *Basic Set* and its description of Thin atmosphere. Fortunately, Amundsen is at the lower edge of the danger zone, so a day's worth of acclimatization before heading there is enough to stave off the effects.

Amundsen City and the Infinite Worlds

On several timelines, particularly some of the weirder ones, it's worth visiting Antarctica. For example, global warming, or magic, or whatnot might have made the continent habitable. Even if it's still frozen, the southernmost continent seems to be a magnet for paranormal and supernatural activity, and Paralabs is keen on examining that sort of thing.

Setting up a permanent conveyor and projector station in Homeline Antarctica turned out to be too expensive, and Infinity has scaled back its operations there in recent years. Instead, they've picked a timeline on each accessible Quantum where the heavy lifting had already been done, parasitizing those efforts for Infinity's gain. At TL8 and with a developed Antarctica, Detente-2 is the choice on Q-6.

Infinity has infiltrated the American and British Antarctic efforts. Teams headed to any Antarctica on Quantum-6 translate from somewhere temperate on Homeline to Detente-2. Then they go south under the cover of innocuous Antarctic missions, endorsed by Infinity's moles and using Detente-2's well-developed Antarctic infrastructure. Once there they can go along the Amundsen City-Ross Sea road to an isolated warehouse stuffed with parachronic equipment, and ship out to their final destination.

The Australian and New Zealander expeditions are also compromised, but mostly to prevent Centrum from claiming them. It's assumed that the Centrum will find it too hard to corrupt the Russian and South American efforts -- the others are too small to matter -- though the I-Cops do keep an eye peeled just in case.

Characters

Ed MacCready: The last in a long line of Pennsylvania coal miners, MacCready made it out west when that industry collapsed in the 1950s and got into the Alaska oil fields. By the late 1980s his Timberland Drilling was a minor player in the area, but was also one of the most important controlled by a single person. When the US government and the ADA started subsidizing Antarctic drilling, he dove in while the larger conglomerates dithered. Most of his business is in the far south now, but he's threatened by the belated presence of the big oil companies.

Ed is often a patron for adventurers in Amundsen City. He controls Timberland himself, which means a lot of quick but unorthodox decisions about what needs to be done. He's got enough money to make plays, but not enough to keep a large security staff around to do it for him; free agents work best for him. Finally, he's perfectly willing to be underhanded, a tendency made stronger by his need to feel he's the savviest, most creative operator around. If his agenda and Infinity's mesh, then agents may end up executing some scheme of his.

He is a white American male, just shy of 70 years old, still in good shape but starting to show the fragility of being past middle age. He is mostly bald, and clean-shaven, with gray hair fringing his head; he wears an epically awful black toupee.

Petra Naqtaruliq: Born in Northern Labrador to Inuit parents, Petra is one of several dozen people from Arctic North America recruited to work in the far south. Like most of the rest, she was considered useful for her experience with polar conditions, but Petra herself wasn't content to work out in the field. In the nine years since she was hired, she's worked her way up to being the head of security for Amundsen City. Unfortunately for her, her main skills are practical, not bureaucratic or diplomatic, and in the international station that's the opposite of what she really needs.

Since she took over the security division, Petra has become more and more frustrated, partly by the lack of action in a town with little crime, and partly by her dislike of all the paperwork. As much as possible she tries to get out to the Ross Sea settlements -- under her jurisdiction as well -- where the roughnecks are more entertainingly violent. If she gets her teeth into a real mystery in Amundsen, she won't want to let go.

Naqtaruliq is typical in appearance for an Inuit woman, "Asian-looking" in a vague way (people sometimes guess she's Filipino), stocky, and with long, glossy black hair that she keeps in braids. She is in her late 30s.

Adventure Seeds

Enemy of My Enemy: Ed MacCready's nose for adventure and intrigue leads him to decide that there's some secret project going on in Amundsen City, and he contacts the team on the strength of their past work. (How did he find them? Hey, he has contacts!) The adventurers rapidly discover that what Ed's got wind of is Infinity's crosstime operation -- though he's no idea of what it is -- and that he wants the group to investigate and tell him all about it. If the investigators throw this one upstairs to their real bosses, they get back word that Homeline thinks it's safest to go along with him; MacCready is too well-known to send to Coventry easily. For now, they need to figure out how to throw him off the scent.

Darkness of Heart: Well into the six-month winter night, a technician in Amundsen snaps and goes on a killing spree. The first the agents hear about it is when the nut holes up in Infinity's parachronic equipment warehouse along the road to the Ross Sea. They're closer than the police, but not by too much. They've got less than an hour to get the gunman out before the cops barge in and discover they've got more on their hands than just a guy with a gun.

Was That Always There?: Braver GMs may want to play with the fact that Detente-2 has some historical inertia. The pre-history of this timeline could have been radically different from Homeline's and only gradually sloped back towards congruence since humans appeared on the scene. In other words, an opportunity exists to surprise a complacent gaming group by presenting what appears to be a moderately hard science setting in Amundsen Station, then springing some madness-inducing mountains or frozen Atlanteans. Also on the high-weirdness front, in the real world some have accused the American missions to Antarctica in the late 1940s of being military excursions against Thulian Nazis.

Using Amundsen City In Other Settings

It's trickier to use Amundsen in a fantasy campaign than in any other kind of setting, as it depends to a large extent on peculiarly modern wrinkles in politics. Still, key elements of cold, isolation, and previous glory can be ported across. If the setting has some magical means of crossing long distances, moongates or the like, the city's role as a place for the adventurers to pass through can be salvaged too. The long-gone empire of the previous age founded the town as a temple complex to the god of sky and winter, and then it slowly wound down as the present era dawned. Now the setting's analog of Vikings have moved in, fearfully respectful of the old priesthood, and things are fermenting once again. Enter the travelers, possibly with secret knowledge that the temple's altar can be used to travel great distances by magic.

Modern and pulp adventures are the easiest to create with Admundsen. Who really knows what's at the South Pole anyway? Sure, you see pictures of the real-world Amundsen-Scott Station, but if there's any place in the world where you can pull off the tight security and disinformation a large, hidden facility needs, it's the South Pole. For modern adventures, it's the CIA and MI5 running things for all the usual motivations; in pulp (or Atomic Horror) campaigns

there's good ol' Nazi Neu-Schwabenland to fall back on.

Sci-fi settings can use Amundsen City too, if not as cleanly as with modern adventures. If space travel is relatively new or difficult, something much like the city can be dropped on Saturn's moon Enceladus, or some tide-locked iceball in the Omicron Quadrant. The small number of worlds in most near-future settings explains why someplace as borderline as Planet Antarctica has been colonized, and even if the Russians and Americans per se don't exist, most settings have black hats and white hats to use as substitutes.

In more-sprawling space settings, like *Traveller,* Earth is often prime real estate, massively populated and at the center of countless trade routes. Under those circumstances, consider using Amundsen City largely as is. If it costs 10 kilocredits per square foot of real estate in New New York, someone's going to start thinking Antarctica is worthwhile.

Do You Want Fries With Your Innovation?

In a lot of ways, the **d20 System** revolution of the past half-decade has turned the game publishing world into a universe of Applebee's.

For those of you not here in the states or part of the Canadian collective, I should probably explain. Applebee's is a chain of restaurants catering to what is known as "casual dining." This style of dining is oft-described as "American," and is perhaps best bolstered with the adjective "uniform." At Applebee's you can get a selection of burgers, salads, steaks, and other entrees. For the most part, you can go into any Applebee's in the world and get more or less the same experience as you would anywhere else, although the Canadian experience will be slightly more cosmopolitan owing to the dual-language menus. Two people can enjoy a meal at Applebee's (sans alcohol) for about the cost of an annual *Pyramid* subscription The food is generally tasty, but doesn't exactly spark life-long passion among its consumers. Among my circle of friends, Applebee's was usually the compromise choice . . . nobody's first option, but an agreeable enough answer for all to grudgingly accept. Frankly, if Applebee's ever got rid of their Fiesta Lime Chicken (formerly known as the Tequila Lime Chicken), I'd probably never go there.

(For the deeply curious, more information can be found at [Applebee's website](#) or on [Wikipedia](#) . . . along with the rest of [human knowledge](#).)

Now the curious thing about Applebee's is that, for the most part, the fare at Applebee's isn't unique to Applebee's. I would guess about 70% of its menu is duplicated near-verbatim at any of a myriad of other chain restaurant options: [Chili's](#), [Bennigan's](#), [T.G.I. Friday's](#), and near-countless other proper nouns wielding a possessive like they were knife-wielding gangs carving out chunks of territory in the strip malls of the world.

Indeed, if you were to blindfold me, stuff me into the trunk of a car, drive for seven hours, take me out, and push me shivering and staggering into a building you identified as a restaurant, all I would need to ask -- while still devoid of sight -- is, "Are the walls appointed with garage-sale bric-a-brac?" If the answer to this was in *any* way affirmative, I could sit down with full confidence and say, "I'll have the chicken fingers with honey mustard sauce." And, having completed the meal of breaded avian, I would be no closer to knowing where I was, unless I happened to overhear the staff forced to sing their happy birthday song at a nearby table.

This uniformity of product -- a product that, I should mention, is pretty darn tasty -- is much the same problem I have with the remains of the current gaming landscape. It wasn't too long ago that there was a cornucopia of gaming diversity in the aisles of my Friendly Local Game Shop. Now, not so much.

Taking a look at the turn of the millennium, some systems that spring to mind include **Aberrant** (super-attributes which attempt to resolve interactions between supers and mortals in a quick method without a fistful of dice), **Godlike** (a gritty system attempting to resolve both whether something succeeded and *how* it did so), **Hackmaster** (an attempt to bring back old-school gaming mixed with more modern innovations), **7th Sea, Star Trek** (from Decipher), and others.

As a rules tinkerer, I find myself somewhat stymied by the lack of more recent options on store shelves. To me, new game systems always meant a new approach -- a glimpse into what the creators of the game saw as important. This importance is useful, *even if I'm not planning on changing my game systems,* because it gets me to thinking about how the game I'm running can be improved by scavenging pieces from elsewhere.

For example, degrees of success weren't really on my mind back when I was running the ol' Third Edition of **GURPS.** Back then, you either succeeded or you didn't. However, around the same time I started playing one of White Wolf's storyteller system games, where how well you succeeded is almost as important as the fact that you did succeed. After that, I started incorporating some notion of how well something succeeded into my **GURPS** games. Such cross-pollination was commonplace throughout my gaming days; finding one game that used something like, say, a Karma or Fate Point system that my players enjoyed pretty much meant that *all* games I ran from that point on would have a similar system.

Unfortunately, the migration toward the vast majority of games being in some way *d20 System*-based has closed off many of these new avenues from which I would normally assimilate. It's turned the entire gaming landscape into . . . well, chicken fingers.

Now, that's not to say that some *d20 System* games have done something innovative or remarkable. ***Mutants & Masterminds,*** for example, pokes and prods the core *d20 System* to within an inch of its life, and before that I enjoyed the changes that *Spycraft* brought to the table. But I also couldn't help but feel these games succeed not because they're inspired by the limitations of the *d20 System,* but rather they manage to do the best they can within the limitations imposed upon them by the marketplace. I also can't help but ponder what these system developers could have come up with had they not been forced to start with the *d20 System* as a core. (Of course, I could be deluding myself. Maybe if the creators of *Spycraft* were unleashed they'd come up with a masterpiece akin to the old TSR ***Indiana Jones RPG.***

One of my criteria for eating out at a sit-down restaurant is that I almost always want to order something that I couldn't make for myself or get something that's 90% of the same for a lot cheaper. For example, most casual-dining places fail this test with their burger offerings; I can usually slap my own slap of protein down on a grill and toss it on a bun at home. And I can get something similar for a third of the price by going to Burger King. But something like a properly prepared fajita or a precisely blackened tilapia is beyond my skill, so I enjoy tossing money at professionals for that endeavor. Chicken fingers fail this criteria in almost every regard; I can get almost the exact same meal at home by buying a bulk box of pre-breaded chicken fingers, whipping open a bottle of honey mustard dressing, and going to town. As such, I hardly ever order chicken fingers from a restaurant unless I *do* happen to be brought in, blindfolded and dazed from riding in the trunk of a car for seven hours.

I miss the lack of innovation from most mainstream possibilities nowadays; although I can (and do) enjoy chicken fingers, they're almost never my first choice. The omnipresence of an offering means it's easy to prepare and doesn't offend too many people; it does *not* mean that it's the best choice for everyone. I still seek out the Fiesta Lime Chicken amid a sea of sameness, and I still eagerly await the next game that's got a neat system or innovation that makes *all* games better.

--Steven Marsh

Pyramid Review

Mastermind's Manual (for [Mutants & Masterminds](#))

Published by [Green Ronin Publishing](#)

Written by Steve Kenson

Cover by Udon with Chris Stevens

Illustrated by Attila Adorjany, Brett Barkley, Eric Canete, John Christopher, Storn A. Cook, Tom Feister, Tariq Hassan, Scott James, Georges Jeanty, "Rey" Lewis, Tony Parker, Ramon k Perez, Steve Scott, Kevin Stokes, Craig Taillifer, Udon with Chris Stevens, & Dexter Vines

160-page full-color hardcover; $32.95

> *[Editor's Note: This book was edited by Pyramid Editor Steven Marsh, who frequently speaks of himself in the third person.]*

The *Mastermind's Manual* is not -- as the title suggests -- a supplement devoted to the chief villain in your superhero campaign. This is not to say that a supplement devoted to that subject would be a bad thing, but a GM wanting such a book will have to look elsewhere. Rather the *Mastermind's Manual* is a supplement for the *[Mutants & Masterminds](#)* GM designed to help him modify his game with an emphasis firmly on the crunch. This is a volume devoted to expanding the core mechanics of the new second edition with a host of new rules, options, and variants, all of which are designed to let the GM tinker to his heart's desire to get the game that he wants.

It goes without saying that this book looks great. The simple clean layout is punctuated by some great artwork all done in comic book style. Almost any one of the pieces on show here could grace either the cover or the inside of a comic book. The writing is equally as engaging with the author taking time to step out in side boxes entitled "Under The Hood" to discuss the whys and wherefores of a particular rules option.

The *Mastermind's Manual* starts with the basics -- *Mutants & Mastermind's* resolution mechanics, suggesting (for example) using the dice differently or different dice, or even the dropping them in favor of cards. More interesting though are the suggestions on handling skill challenges. By taking a penalty on the difficulty check, a hero can attempt a task faster, more efficiently, or with panache. This is backed up with suitable suggestions for numerous skills. Alternatively, each of the suggested challenges -- for example, driving with one hand on the wheel to give a free action -- can be purchased as a feat. Skills get their own chapter with suggestions for new uses for existing skills, creating new ones, broadening them for a simpler game, narrowing them for a more detailed game, and so on.

Guidelines are given for building templates that allow for the easier creation of characters. They can be racial or vocational and make NPCs easy to create, especially if the GM includes alien races in his game. Curiously, there are rules for random core ability scores, which seem at odds with the point-buy system of the game. That said, it works in other superhero RPGs -- for example, *Golden Heroes* (recently released as *Squadron UK*); for the whole hog, it can be combined with the random superpower rules.

For new feats, the book suggests deriving them from existing powers, for example, Rapid Healing is the equivalent to the Regeneration Power Rank 1, but it cannot be switched off or pushed through extra effort -- it is a permanent ability. Martial artists can take on a style by selecting the relevant skills and feats, with suggestions given for several fighting styles, from aikido to wrestling and including ninjitsu.

Given the genre, it is no surprise that powers get no little attention. It explains how a power is constructed, basically showing how new powers can be created and existing ones modified. Not only are the core books powers broken down as examples, but new powers given.

Two of these are both complex and powerful, the Variable Power allowing a hero to redirect his power points to new traits, while the Power Array lets a player build a package of powers built to a theme, such as a weapons suite for a battle suit or a set of alternate forms for a metamorph. There is advice on their construction and use, but examples would have been useful too. Other genre-enforcing rules allow for power surges, making the extra effort, and the effects of Taint. This can model the effects of corruption, mutation, pure evil, and even a progressive disease, which should come in the form of drawbacks, ability loss, and even minor benefits. For example, the latter might be the gaining of otherwise forbidden powers. The advice on handling power addresses problem powers such as ESP, Incorporeal, and so on. It is good advice, as is the handling of related genre conventions -- heroes forgetting powers, and the consequences of using powers such as a bad reputation and legal problems.

Combat in *Mutants & Masterminds* is intended to be quick and in keeping with the game, so the new options for combat do not stray from this. Rather, they enable the GM to alter the style for combat in his game, from realistic and deadly down to simple. Similarly, the chapters on technology are quite short, the bulk of which is devoted to a slick set of rules for handling vehicles and chases.

Specifically under the Game Master's section is a guide to adventuring in different environments from aquatic to urban, and even covers just getting lost. More useful (if the GM employs the guidelines about the consequences using powers given earlier) is the quick and dirty rules for the legal system. The rules over, there is actual advice for the GM on running *Mutants & Masterminds,* writing adventures, and looking at the effects of powers, in particular on society at large. This is in interesting read that deserves further expansion; we can only hope that the author is given space in a less rules-focused supplement. Rounding out the volume are appendices containing a FAQ for the game, an errata, and the designer's notes. Finally there is a checklist of options to let the players know which are being used in a game.

Despite this being a rules focused supplement, the *Mastermind's Manual* is an enjoyable read. This is entirely due to Kenson's writing, especially in the "Under The Hood" sections, which shows off his appreciation of the genre. Still this is not a book that the players need read, the GM of course being the one to get the most out of the contents. For the GM this is a very useful supplement, helping him to tinker with the rules with ease and without breaking the genre.

--Matthew Pook

Designers' Notes: GURPS Bio-Tech

by David Morgan-Mar and David Pulver

For me (David Morgan-Mar), it all began in February 2004. I had no inkling that *GURPS Fourth Edition* was well into the production stages, and was wondering which of my *Third Edition* book ideas to try submitting next. The e-mail from Dr. Kromm contained two bombshells: *GURPS Fourth Edition* was on its way, and I was being invited to co-author the new edition of *Bio-Tech* with David Pulver.

The first order of business was to assign duties on the new edition. Since David Pulver was working on the new edition of *Ultra-Tech,* I took on the job of outlining and writing enough new material to expand the previous edition by 112 pages.

That's a lot of new material.

I grabbed some stuff from *Transhuman Space,* which had raised the bar on biotech rules and material since the old edition. Then I added an entire chapter on medical technology, including expanded rules for medical conditions and treatments beyond those in the *Basic Set.* The plants and animals chapter from the previous edition was expanded into two chapters, one devoted to microorganisms and the many things they can do in a biotechnological society. Drugs and wet nanotech also got a new chapter.

Given a directive from editorial to keep the "Generic" in *GURPS,* I wrote a section on variant biotech, covering everything from magic through steampunk and on to horror. The expanded size gave us room to include the biological magic spells from David Pulver's [original edition designer's notes](#).

Then there's campaign material. I added a big section on the ethical and legal issues surrounding biotech -- problems that simply ooze plot hooks for GMs wanting to challenge a group of heroes with an ethical dilemma or a call to action. And finally, I developed four new campaign settings to showcase the diversity of possibilities for a biotech world, spanning tech levels from TL2 to TL12, some in which biotech enables a better existence, and some in which it produces despair.

With that done, David Pulver began revising all the material from the first edition of *Bio-Tech,* to turn it into *Fourth Edition* rules. He also added a few new bits and pieces, which helped round out the manuscript. The playtest was fast and furious, and we received an enormous amount of useful comments and suggestions that polished the rough edges. The last edition of *Bio-Tech* had to be hastily rewritten to include information about Dolly the sheep, who was cloned from another sheep as the manuscript was being finalized. In a field that changes as fast as biotech, we were naturally faced with similar last-minute developments. Thankfully some of our playtesters do biotech for a living, and kept us informed of breaking news while also making sure we got the facts right.

Finally, when all was said and done, we had to cut something because, well . . . 112 pages just wasn't enough! With sadness, I agreed that two of the campaign settings would be the simplest to remove. But despair not, for you are about to receive one of the cut settings in its entirety. Enjoy!

* * *

Atrivita

In 2004 the United Nations enacted a treaty outlawing the production of human clones. Not only babies who would grow into adult clones, but also cloning of embryos for stem cell research. Powerful governments the world over grew ever more paranoid and conservative in the face of rising terrorism and global uncertainty, and passed repressive laws to restrict personal freedoms and moral choices. The technologies that promised more reproductive liberation for those

wanting non-traditional sexual relationships struggled under the weight of regulation and religious condemnation.

But what mainstream culture fights against will inevitably find expression on the streets, in the black markets, and in the secret labs of people who will do anything for those desperate and rich enough to fund them. This movement has been dubbed *atrivita* -- "grey life" -- life hidden amongst the edges of outlawry.

The World

This is Earth, how it might turn out if new breakthroughs in reproductive and therapeutic biotechnology are pushed underground by legal restrictions. But the governments who fight human genetic engineering allow corporations to develop and patent techniques applied to crops, livestock, and disease control. The resulting explosion of gengineered species can sustain an ever-growing human population with ease, but only at the cost of becoming increasingly beholden to the biocorps.

The Developed World

Atrivita is a dark future to some, but average citizens in developed nations are little affected by the geopolitical and economic state of the world. Living standards are high, and most middle-class people don't miss the personal freedoms that have slowly been eroded, let alone the new possibilities that have not been granted over the past decades.

Throughout Europe, North America, and the developed Asia-Pacific nations, people are free to travel, gather, and protest, although security is heavy. Travelers and attendees at large events must pass biometric identity checks and a battery of scans designed to detect metallic, chemical, and -- most of all these days -- biological weapons.

Most citizens support the legal restrictions against cloning and human gengineering, so do not see these as onerous. The tragic examples of children with crippling diseases who could be saved by gengineered siblings, or those who die waiting for donated organ transplants instead of receiving a stem cell tissue engineered organ, are too few and too far between to concern the faceless majority who disallow such procedures. And those who express a desire to produce clones or adaptively engineer human germlines for the "benefit of humanity" are shouted down as ethically misguided.

Civil liberty action groups campaign against what they consider unnecessary restrictions on personal freedoms. Their tactics are generally public awareness campaigns, political lobbying, and peaceful protests. Occasionally a protest degenerates into violence as security personnel and protesters become overheated. A handful of groups engage in terrorism against government and corporate targets to further their cause. The media sensationalize the violent aspects and underplay the peaceful protests, which contributes to the general feeling that genetic liberty groups are radical extremists.

The Underworld

Below the average lifestyle lived by the silent masses is a seedy underworld populated by growing ranks of disaffected poor, unable to secure a job in a world becoming increasingly automated and turning to drink, drugs, and crime. Welfare payments are woefully inadequate to provide for the sheer number of unemployed, especially as many nations have reduced welfare budgets in order to finance increased security and law enforcement programs.

Many members of this lower class struggle along as best they can, taking menial labor when they can get it and begging when they can't. Others live a life of petty crime, stealing what they need to avoid starving or freezing to death.

Some people form organized gangs for mutual protection and resource sharing. Gangs can hit bigger targets than individuals and make away with more goods. Gang members can occasionally afford cheap biomods and frequently use enhancement drugs when they mount raids or attack other gangs in turf wars.

A few criminals form a core of organized crime that permeates all levels of society. A job as a hired thug or enforcer

is one of the most reliable pay packets on the streets. It also represents one of the few ways a person at this stratum of society can work his way up. By being tougher and smarter than the rabble, a thug can become a mid-level crime boss. The cream of the crop rise to manage national and international criminal syndicates. These Mr. Bigs can afford the best medical care and biomods that money can buy, so are frequently physically enhanced and receiving anti-agathic treatments.

The Third World

Life in the developing world is tough. Exploding population growth means ever more resources need to be put into food production. Although genetically engineered crops and livestock easily supply enough food, they are only available by paying biotech corporations for the privilege of growing them. Effective treatments for diseases that have plagued the developing world for millennia are also now available, but at a similar cost. With no other options, Third World nations are increasingly in debt and their populations remain desperately poor.

Only a lucky few are able to scrape together an education and make their way into professional careers. But multiplied by the enormous population base, this has generated a significant upper class, many of whom are now questioning the dependency of their nations on the existing biotechnology cartels. With what resources and knowhow they can muster, these crusaders are trying to set up gengineering labs of their own -- a move looked on with hostile eyes by the established corporations.

Space

Government-funded space exploration and colonization never recovered from the stagnation around the turn of the 21st century. A handful of commercial enterprises attempted to gain footholds in orbit, but it wasn't until Umbrium Corporation launched its successful space laboratory that others began to appreciate the true potential of a microgravity environment.

Umbrium developed small-scale biotech processes rather than attempting the more ambitious zero-gravity metallurgy programs of its competitors, which allowed it to turn a profit without investing in heavy lift launchers. It patented several microgravity gengineering techniques and new products such as isotropic bacteria-grown crystals impossible to produce on Earth. Other companies followed and now there is a small but thriving community of corporate research settlements in orbit, serviced by regular shuttle flights. With regular service came tourists, and a few corporations have built space hotels where the rich may spend time in orbit. It costs a fortune, but the views are worth it.

The next target is the moon, which beckons with minerals and helium-3 for research into fusion power. Nobody has yet returned there, but plans are on several drawing boards.

Technology

Atrivita is a mature TL9 world, with all appropriate technology from ***GURPS Ultra-Tech*** and this book available somewhere. This is not to say that such technology is *easily* available. Human biotech involving cloning or germline gengineering is LC0 and available only through black market channels or to secret government projects that all countries deny operating. Biomodification is also banned in many countries (LC0), although some use biomodified police and military forces, making biomods LC2.

The Destruction of Kinshasa

The worst biotech disaster in history precipitated the destruction of the neighboring cities of Kinshasa and Brazzaville two years ago. An experimental biological control lab accidentally released a gengineered virus designed to sterilize mosquitoes and thus wipe out malaria and other insect-borne diseases. It failed on two accounts: a natural mutation in the mosquito population quickly led to future generations being immune to the effect; and worse, the virus proved horrifically fatal to a large fraction of the human population because of susceptibility carried on a particular gene not identified during development.

With great reluctance and no other option, western powers agreed to sterilize the area using saturation bombing of fuel-air explosives, before the infection could escape and

Most non-human biotech items exist at their listed legality classes. The exception is any attempt to uplift animals by augmenting their intelligence, which is banned under a U.N. treaty. Many nations allow non-uplift experimentation on animals and some companies specialize in biomodded and gengineered animals. Besides changes to livestock for improved health and productivity, genetically modified working animals and pets are increasingly common. A typical enhanced beast of burden has ST 10% higher than average for its baseline species and +1 HT. Pets come in varieties ranging from glow-in-the-dark to miniature versions of large animals. Miniature versions of wild animals are often as aggressive as their unmodified counterparts, so they are kept more by an avant-garde subculture than mainstream families with children.

Illegal Biotech

Despite human cloning being illegal, there are many uses for it. With stem cell research stifled, it's almost easier to grow an entire body than just a spare organ for transplant. A clone can also be ready with fresh organs at any time, whereas a custom organ takes time to grow. The infonets circulate persistent rumors that high-profile political figures and celebrities maintain clone "brothers" in case of emergencies. The clones are treated well . . . until the original requires a spare part.

Clones of famous people are also big business for traders in human flesh. Prostitution rackets pay well for genetic material verified to be from celebrities. Some go as far as selling the resulting clones to rich buyers. Genesnatching has become a crime feared by the famous, and almost impossible to guard against while maintaining a normal lifestyle.

Organizations

Many of the government and corporate entities existing today still exist in the world of Atrivita. Real world names can be used to establish familiarity, while the following fictional organizations help to set the tone of the campaign.

Agrigene

ravage the rest of the world. Isolated cases who escaped the cities were quarantined. Six months later, with close monitoring of surrounding territory, the United Nations declared the region safe.

The drastic action attracted widespread condemnation, but the leaders who made the decision stood by it, presenting terrifying data on plague simulations supplied and verified by several prominent epidemiology research labs. They showed that the virus would likely have wiped out over half the world population within two years -- faster than any reasonable estimate for the development of a vaccine.

Major biotech corporations have used this event to criticize the efforts of developing countries to engineer their own biotechnology, claiming they lack the experience to handle it safely. Conspiracy theorists note that the entire incident appears calculated to boost the standing of the established biocorps while discrediting potential competition that could overthrow their dominance . . .

This multinational specializes in agricultural bioengineering. It is known for its genemod high-yield crops and livestock, as well as aggressive marketing policies in Third World countries.

Agrigene began as a small biotech concern in Sweden. It hit the big time in 2011 with a patented method for making crops drought-resistant. In a world starting to feel the effects of greenhouse warming, this attracted heavy investment and allowed the company to expand rapidly. It posted huge profits in the following years, built on a succession of proprietary breakthroughs with commercial plant and animal modifications.

The company is now the world's biggest agricultural biotech business. It has as many genetic patents as its top three competitors combined, and uses them to maintain an unassailable corporate position. Although it licences many of its enhanced productivity genemods, they typically contain hormone dependency sequences, and Agrigene maintains a monopoly on the production and distribution of the various enabling hormones.

This practice has resulted in a growing black market for cheap copies of Agrigene hormones, particularly in developing nations where law enforcement is lax. Agrigene uses its considerable international influence to pressure governments to crack down on the forgers. It's directors suspect some of the sophisticated synthesis labs are backed by competitors, and play games of industrial espionage to uncover the truth. Agrigene itself is the target of several

consumer groups concerned with its greedy marketing strategies.

Umbrium

This company made its fortune with microgravity gengineering and biological materials science. It operates a trio of orbital laboratories and several ground facilities. The materials it produces in space are ultrapure microbially grown crystals impossible to manufacture on Earth. These crystals are in demand for military grade electronics and weapons systems, forming the basis of the fastest and most hardened computer systems in the world.

Umbrium is now a leading microbial biotech firm, producing commercial microbes of all types. Directors deny the company has any military contracts to develop biowarfare agents.

United Nations Genetic Control Programme (UNGCP)

This specialized agency of the United Nations is an arm of the United Nations Office for Drug Control and Crime Prevention. It was established in 2005 soon after the outlawing of human cloning to enforce the ban. When artificial modification of the human genome was also banned in 2006, the UNGCP took responsibility for policing that as well.

Now, the UNGCP has three main branches: administration, investigation, and enforcement. The investigation and enforcement branches operate field agents, ostensibly at the discretion of the U.N. Security Council, although in practice senior UNGCP administration directs operations and they are seldom called to account. The agents -- commonly known as gene cops -- accumulate evidence of human bioengineering activities worldwide, and mount special operations to break up illegal cloning rackets, germline gengineering labs, and other "violations of the human genome."

The UNGCP keeps tabs on known genetic offenders, as well as people who have publicly expressed a desire for the technology. This includes people who have suffered personal tragedies due to the lack of availability of therapeutic gengineering techniques, as experience shows people in this group are statistically more likely to engage in militant civil rights activities.

The UNGCP is strongly supported by the United States, United Kingdom, Israel, the Vatican, most Muslim countries, and much of Africa and South America. Continental Europe is less enamored with the agency, but tolerates it as a necessary control against cloning.

COF

This is a consumer activist group dedicated to stopping the runaway use of genemod plants and animals. COF stands for *Consumers Opposed to Frankenfoods*, but the group is more commonly known by its initials -- spelled out by supporters, used as an acronym by detractors. The group operates in developed nations.

COF uses peaceful means to promote its agenda, involving consumer education and picketing of biotech corporations. Its educational material urges consumers to boycott genetically modified products in favor of natural ones. The major problem is that almost all food on the market is modified in some way, with the only alternatives being expensive produce grown by niche farmers or growing it yourself. Even people who agree with the sentiment find it difficult in practice.

The UNGCP keeps files on prominent COF leaders and members, but they are a relatively low priority for investigation. There are rumors that COF funds more militant groups, but publicly they maintain a clean profile.

Rhea Silvia

Rhea Silvia is an outlawed group which helps desperate people to find the expertise and technology they need for human therapeutic and reproductive cloning. It operates high quality black labs in several countries. Despite their

illegal nature, these labs are state of the art and employ brilliant biological and genetic engineers. In some Third World countries, Rhea Silvia operates behind a front of providing medical care to needy citizens, and provides it better than the government or legitimate aid agencies.

A militant arm of Rhea Silvia, nicknamed Romulus, engages in acts of terrorism and assassination targeted at the institutions and people who perpetuate the cloning ban. With its access to high levels of biotech, Romulus prefers genetically targeted viruses as weapons, but also uses more conventional methods such as firearms and explosives when an adequate genetic profile of the primary victim or victims is unavailable.

Conspiracy theorists persist in spreading rumors of a second, secret, branch of Rhea Silvia, which they call Remus. They allege that it consists of only a few members, who are insinuated into positions of power within major world governments and the United Nations. There they purportedly pursue agendas to destabilize the current doctrine that human biotechnology should remain banned.

Clinique Rouge

When people want illegal biomods or to produce clones, they seek out a black market clinic. One of the most highly regarded is the Clinique Rouge, begun in Marseille, France, but now with branches in several developed nations around the world. It is a high-class and very discreet operation, contactable only if one has the right connections on the streets. The Clinique has built its reputation on two pillars: impeccable work, and absolute secrecy about its client list.

Characters

Depending on the style of the campaign, suitable character types in Atrivita include the following:

Gene cops work for the UNGCP or affiliated federal agencies. A simple campaign can be played in a law-enforcement mode, in which heroic gene cops investigate truly heinous crimes such as cloning and gengineering people for use as slaves or replacement parts. The enemies can be mad individuals or secret programs run by ethically dubious corporations. This can lead into a campaign of moral exploration and discovery as the gene cops become aware of peaceful political campaigns in favor of human biotechnology and the reasons why some people want the freedom to pursue therapeutic gengineering. As the cops realize their world is not as black and white as they thought, they may be tempted to switch sides.

Bounty hunters are less sympathetic to the justifications of their targets, as they are only interested in doing the job of bringing them to justice. Freelance hunters lead an adventurous life, traveling the world in pursuit of prey and using investigative and infiltration techniques to gather intelligence before striking. Although less likely to consider the moral implications of their job, a campaign in which bounty hunters begin to support the campaign for genetic freedom would be interesting.

Corporate executives run the biotech companies that hold the world in the palm of their hands. Although an unsympathetic lot, an executive with more moral fiber than

Adventure Seeds

Sterile Crop Outrage

For millennia, farmers have been saving some of the seed from the previous crop to sow for the next one. Now, when they can afford to, they buy the latest gengineered seeds from biotech companies for greater yields and better pest resistance. But if they fall on hard times, they can still save seeds for the next crop, risking only being a year or two behind the latest developments.

But this is about to change. Agrigene's latest set of enhanced seeds contains a gene sequence that renders seeds of the next generation sterile. Once farmers switch to the new seeds, they will have no choice but to buy more every year, or have none. What's worse, Agrigene hasn't announced this until after hundreds of thousands of farmers across the developing world have grown the new seeds. Now, people are angry, from the farms of Bangladesh to the halls of the United Nations. Agents will be needed to maintain order against rioting, to investigate Agrigene, and to work out a solution to the problem before millions starve.

Genesnatchers

most would make a suitable protagonist. An interesting role would be the head of a small biotech company attempting to develop new techniques to feed the developing world without the attendant greed of the multinationals. This would naturally attract unwelcome interest from larger and more influential corporations who don't want their business undercut. Industrial espionage and intrigue can result. Another possibility is a biotech executive willing to push the envelope and develop life-saving human gengineering techniques in violation of UNGCP policies.

Bioengineers will either work on plants and animals, or risk stigmatization and legal repercussions by experimenting on human cells. Corporate gengineers may engage in field testing in agricultural regions, where locals will see them variously as heroes or scourges. Others will be attracted to illicit human engineering either by a desire to help individuals with nowhere else to go, or by simple greed. Some affiliate with groups like Rhea Silvia or the Clinique Rouge, while others go independent.

Surgeons are required to take care of the people who fall afoul of the tough life on the streets. With crime rampant, trauma surgery is a never-ending job, and surgeons can come into contact with people with all sorts of secrets. The pay is better doing black market biomods, though, and the working conditions might even be less dreadful.

Neo-Luddites support the bans on human biotech, which puts them in the mainstream in Atrivita. Some will go further and campaign against any form of genetic engineering, bringing them into conflict with biotech corporations and Third World governments. They may receive support from poor farmers keen to break the cycle of dependency on the corps.

A media celebrity has become aware that criminals have somehow managed to get hold of a sample of her tissue, despite her paranoid precautions against this. She puts a huge bounty on the genesnatchers and suitable evidence that her sample hasn't been copied. Bounty hunters (and any tempted gene cops) follow a twisting trail of clues, meeting a chain of contacts along the way. When they finally reach the culprits, they discover no samples matching the celebrity. They can either give up on collecting the reward, or attempt to gain a sample some other way . . .

Outbreak

Something odd is happening in Copenhagen. Media reports indicate a strange new disease is filling the hospitals, and many patients are dying. This is no variant influenza from an Asian melting pot, and suspicions begin to climb that it is a bioengineered weapon. The United Nations dispatches epidemiologists and bioengineers to collect data and analyze the plague, while shutting down most travel out of the city and surrounding countryside.

Is it a new mutation of an old bacterial enemy of mankind, or indeed a bioweapon? And if so, who is responsible and why target Copenhagen? There are plenty of opportunities for danger in the field and machinations in the halls of power as the U.N. team races to contain the outbreak and prevent another Kinshasa -- this time on the European continent.

Genetically engineered individuals are rare in Atrivita. Nobody expects to meet a clone or gengineered person, and most would react with revulsion if they learned they had. Although it is not a crime to be cloned or genetically altered, such people are stigmatized by society if recognized, and have a hard time passing security identification checks and holding jobs. Some try to live normally while guarding a terrible secret, while others turn to crime.

The Great Work

Variant Alchemy Rules for GURPS Fourth Edition

by James L. Cambias

Alchemy is the ancient study of the transformation of materials. It was born in Hellenistic Egypt; the name "alchemy" is from the Arabic *al-Khem,* referring to the Egyptian name for their land. It was always an odd mix of genuine practical chemistry, some semi-secret goldsmithing technique, and a growing accumulation of occult baggage.

In fantasy fiction, alchemists create magical potions, a tradition continued by the alchemy rules in ***GURPS Magic.*** But the focus of historical alchemical practice, at least in the Medieval and Renaissance West, was the creation of the "Stone," sometimes known as the Philosopher's Stone. The Stone was a kind of ultra-purified matter which could "perfect" other matter -- making metals into more noble forms, healing living things, and generally reversing what we now call entropy. At times it was identified with the Holy Grail, or with the process of spiritual enlightenment.

Alchemy was always considered a process of *rediscovery* or recovery of knowledge -- alchemists believed all the important lore was given to Adam at the time of the Creation, and that over time it had been lost. The most ancient sources were therefore considered the most useful and authoritative. One consequence was that many alchemists adopted ancient pseudonyms for their writings. They used names like Moses, Cleopatra, and (most importantly) Hermes Trimegistus.

These variant rules are an attempt to import more of the flavor of historical alchemy into the ***GURPS*** magical system. Gamemasters can use them in place of the "Exotic Preparations" discussed on pages 220-221 of ***GURPS Magic.***

Creating the Stone

The heart of alchemy is creating the Philosopher's Stone. Creating the Stone requires Alchemy skill and the Magical Aptitude advantage. Gamemasters may opt to allow non-mages skilled in Alchemy to pursue the Great Work, but should beware the potential consequences if the knowledge becomes widespread -- if *anyone* can multiply and transmute metals, the nature of wealth in the game world will change dramatically. The alchemist's skill is modified by any Magery levels he may possess, and by the local mana level.

The Great Work is a lengthy process, with several stages. Each stage has an associated skill penalty, and the stages must be performed in order. Each successive ritual assumes that Stone has already undergone all the previous stages. If an alchemist's Stone is lost or destroyed, he must begin again at the very beginning.

If the alchemist fails in his attempt to complete one stage of the Work, he cannot try again until he has increased his Alchemy skill. Unless he suffers a critical failure, any existing early-stage Stone remains intact and can be used in future attempts.

The stages described here are an attempt to find a gameable middle ground between historical alchemical practice and genre fantasy convention. The powers of early-stage Stones are not strictly historical, although alchemists were so vague and contradictory in their ideas of what the Stone was and could do that it would be hard to prove this description *wrong*.

Poison Quelling Stone (Alchemy skill at -4)

This is the first stage of the Great Work, and creates a Stone which can render any poison inert. It takes 12 hours to make, and requires $1,000 in materials. If successful, the alchemist can use the Stone to neutralize an equal weight of poison on contact (biological toxins break down harmlessly, poison elements or radioactive materials simply

disintegrate, their component atoms flying off at high speed to get away from the stone). A Poison-Quelling Stone normally weighs 1 ounce; making a bigger one imposes an additional -1 skill penalty and an extra $1,000 cost for each ounce of size, though the time remains constant.

A failed skill roll to create a Poison Quelling Stone simply wastes time and ingredients. A *critical* failure produces a stone which is deadly poison to the touch.

A Poison-Quelling Stone is worth $10,000 on the open market in a magically-aware society. Where magic is secret or unknown, it would be worth $20,000 or more.

Transmutation (Alchemy skill at -6)

The second stage of the Work creates a Stone which can transform one metal to another. The process of creating the Transmuting Stone takes 5 days and costs $5,000, and must be performed upon an existing Poison-Quelling Stone.

If successful, the Transmuting Stone can convert a weight of metal equal to its own weight into a more valuable form. The Stone and the metal must be placed together for 24 hours, along with materials costing $100. Each transmutation takes the metal one step up in the sequence of lead, tin, iron, copper, silver, mercury, gold. For simplicity's sake, assume the metal increases in value by a factor of 5 at each step, starting at about 1 cent for an ounce of lead. The ancient alchemists did not know about radioactive elements or things like titanium, so assume the process won't work on other metals. A Transmuting Stone retains its poison-quelling qualities.

Failure to create a Transmuting Stone leaves the alchemist with a functional Poison-Quelling Stone. Critial failure produces a Stone which transmutes metals *down* the value sequence, turning gold into silver, copper into iron, and lead into useless slag.

In fantasy settings a Transmuting Stone is worth $50,000. In nonmagical settings it would be worth at least $100,000.

Multiplying Metals (Alchemy skill at -8)

This operation is the third stage of the Work and creates a stone which can instil metals with a kind of living power, so that they grow. Creating the Multiplying Stone costs $10,000 and the operation must be performed on a Transmuting Stone. It takes at least 2 months of constant work to create.

A Multiplying Stone has all the virtues of a Transmuting Stone, but can also be used to make metals grow and increase in weight. When kept together with a Multiplying Stone and nourished with materials costing $100, metals will gain in weight, adding the Stone's weight every week. So an ounce of gold kept with a Multiplying Stone weighing an ounce would add an ounce of weight per week. *This* is the real payoff for alchemists trying to make money -- some of the more extravagant simply keep a Multiplying Stone with a seed of gold and harvest the growth every few days. (Note that at this point the character should probably buy the Income advantage.)

A Multiplying Stone also transmutes and neutralizes poison. A critical failure in creating a Multiplying Stone results in a *destroying* stone, which disintegrates all metal within 5 yards over the course of 24 hours.

In a fantasy game world a Multiplying Stone would be worth $100,000; its value in a non-magical world is whatever the alchemist cares to charge.

Other Operations

In addition to creating the Stone there are related operations of great value to the alchemist. Most of these require a Stone at some point in its process of creation.

Gem Healing (no skill penalty)

This is the art of "healing" flawed gems, adulterated metals, or discolored pearls. It takes at least 10 hours to perform properly, and about $500 worth of alchemical materials. If successful, it increases the value of an item by 5% per point of success on the skill roll. Obviously, gem healing has no effect on flawless gems and pure metals. Critical failure destroys the item.

Universal Medicine (Alchemy skill at -6)

This operation uses a Transmuting Stone to create a cure for all diseases which also arrests the process of aging. One dose requires ingredients costing $1,000, which must be kept with a Transmuting Stone and subjected to a process taking at least 1 week to complete. If successful, the medicine instantly cures any disease the patient could possibly recover from normally, and gives him a roll of HT plus the margin of success of the alchemist's skill roll to recover from otherwise incurable illnesses like AIDS or cancer. Even if he is not cured, those diseases make no progress for HT months. Moreover, the patient does not age for HT months.

On a critical failure the Universal Medicine operation has created a deadly poison with no antidote.

A dose of Universal Medicine is worth $5,000 in a fantasy world, $50,000 or more in a non-magical setting.

Revivification (Alchemy skill at -8)

This somewhat abhorrent process uses a Multiplying Stone to restore life to dead flesh. It requires a Stone, a body, and materials costing about $1,000 (though anyone with a Multiplying Stone can laugh at the expense). The operation takes a week of intense work. If successful, it restores life to the body, but does *not* restore the original spirit or soul. Performing a Summon ritual at the same time *can* bring the soul back to the body, and if the spirit of the dead person happens to be around during the ritual, it can reenter its old flesh at the completion of the operation.

Without a spirit the revived body is physically as it was at the time of death and mentally like a newborn infant, with an IQ of 3d-2. If the alchemist gets a critical success on the Revivification operation, the body is restored to full health; otherwise it is still afflicted by whatever caused death.

Note that modern embalmed corpses are often missing parts and are full of toxic fluid. Unless the body can be *completely* restored, with a successful Surgery roll to patch up damage and some means (possibly a Poison Quelling Stone) to remove preservatives, the body cannot be restored to life.

On a critical failure, revivification either destroys the corpse completely or (at the GM's option) creates a ravening undead monster. Gamemasters may wish to require the alchemist to make a Fright Check to determine the psychological effect of all this messing about with corpses.

In a fantasy setting, the process of Revivification costs $25,000. In non-magical settings, the alchemist can charge at least $40,000.

Creation of Life (Alchemy skill at -9)

This operation also uses the Multiplying Stone to create life from unliving matter. The alchemist combines various liquids (including blood and semen), in a complex procedure costing about $5,000. The resulting mix is then "quickened" with a Multiplying Stone. The preparation takes at least a day to perform. The quickened mixture must then incubate over a period of 1 month, and must be kept at body temperature. The result is a homonculus -- a little humanoid weighing about 10 lbs. (For a larger homonculus, more Stones or a larger one are required). The appearance of the homonculus depends on the margin of success, ranging from a hideous little monster to a perfect miniature human. On a failure the ingredients fail to coalesce into living matter. On a critical failure the homonculus is a monster with a venomous bite and total instinctive hatred for its creator. On a critical success the homonculus grows and develops like a human baby, though faster, reaching adult size by 1 year of age.

The newly created homonculus has ST 1d, DX and HT 3d, and IQ 2d plus 1 for each point by which the alchemist made his skill roll (to a maximum of 14). They learn quickly (adding 1 skill point per week, usually starting with language).

Despite its greater complexity and importance, the creation of life isn't a very good way to make money. In a fantasy setting an alchemist can charge $10,000 for the procedure; in a non-magical world it may be hard to convince anyone it's possible to create life at all, but a homonculus might fetch up to $20,000 as a curiosity.

The Elixir of Immortality (Alchemy skill at -10)

This extremely potent medicine is made by improving a dose of Universal Medicine with exposure to a Multiplying Stone. The entire process takes 1 week and requires $1,000 of additional ingredients. If successful, it produces a single dose of Elixir. The Elixir is incredibly powerful: a dose instantly heals all damage, cures all diseases, and starts a process of regeneration lasting a month. Over the course of that month the patient regrows all lost body parts, and loses 1d times 5 years of biological age, (the process never "youthens" a patient below an apparent age of 20). Any improvement in the character's abilities must be paid off in character points.

A critical success creates an Elixir which allows the patient to purchase the Unaging advantage without any further doses. It essentially "cures" the body of getting older. A critical *failure* destroys the Stone used in the creation and produces a deadly poison.

One dose of Elixir is worth $30,000 in a fantasy setting, and pretty much whatever the alchemist wants to charge in a non-magical world.

Personal and Spiritual Alchemy

Alchemy has also been described as the process of personal purification and illumination. Study of the esoteric knowledge and philosophical principles embodied in alchemical operations can help the alchemist shed his worldly vices and gain new insights.

After mastering each new alchemical operation, the alchemist can roll against his Alchemy skill (modified by Magic Aptitude) to see if his new understanding of the nature of the universe has brought him greater spiritual enlightenment. Each successive stage allows the alchemist to purchase Advantages reflecting his spiritual improvement from the following list: Blessed, Channelling, Charisma, Healing, Intuition, Magery, Medium, Oracle, Racial Memory, Reawakened, Serendipity, Spirit Empathy, or Unfazeable. The advanges have their normal point cost; at the GM's option the alchemist may go into "experience debt" to purchase them. After his seventh success the alchemist can become Illuminated or gain True Faith.

Failure means the alchemist must wait until he successfully completes another new operation before trying again. Re-doing operations already mastered give no new knowledge. On a *critical* failure, the alchemist has gained a *false* understanding, which can lead to corruption and madness. Consult the Spiritual Purification Critical Failure table (see box). Disadvantages acquired this way can only be bought off when the alchemist *succeeds* at his next spiritual purification attempt, and only one disadvantage can be bought off per success.

If the alchemist has mastered all alchemical operations, he can make an attempt at spiritual improvement every time he increases his Alchemy skill level.

Spiritual Purification Critical Failure Table

This determines the negative effects of a flawed enlightenment. Roll 1d and add 1 for every previous failure on the path to spiritual purification.

1-4:	Gain one negative Quirk or Incompetence with a skill.
5-6:	Gain one of the following disadvantages: Callous, Loner, or Selfish.
7:	Gain one of: Bad Temper, Bloodlust, Bully, Cowardice, Jealousy, Miserliness, or Paranoia.
8 or more:	Gain one of: Alcoholism, Chronic Depression, Greed, On

Adventure Seeds

Great Workers

The most obvious adventure seed is for a PC alchemist to attempt the Great Work himself and encounter difficulties -- rivals trying to copy his research, greedy outsiders trying to profit from his work, a conspiracy of alchemists trying to keep the secret, etc. While in occult tradition alchemy doesn't require any particularly exotic materials, Gamemasters should feel free to include a few rare ingredients requiring side-quests to acquire.

Romancing the Stone

A Stone is a valuable object, and even the rumor of one attracts thieves and opportunists of all types. Somehow word has gotten out that one of the PCs is the owner of a Transmuting or Multiplying Stone. Crooks want to steal it, kings want to buy it, and other alchemists are on the warpath. Can the PCs survive and find a way to profit from the situation?

The Big Score

A Stone doesn't have to be real to create wealth. A clever con man with a line of alchemical patter and some stage-magic tricks is trying to convince a greedy nobleman that he can create the Stone -- *if* the nobleman can provide certain very expensive ingredients for the work. Will the PCs expose the fraud, or join forces with the crook?

the Edge, or Sadism.

New disadvantages do *not* give the character additional points to spend; they merely reduce the overall character value. They can exceed the disadvantage limit for the campaign.

Where Would We Be Without Absolutes?

In hindsight, I wonder why moral absolutes became so ingrained in the gaming world.

By moral absolutes, I'm talking about, of course, the alignment system, as first introduced by **Dungeons & Dragons** umpity-jillion years ago, and whose legacy continues to affect even those games that lack such systems.

But from one point of view, think about how unlikely the ingrained nature of this morality system is: RPGs evolved out of the fantasy wargaming experience, which itself evolved out of the non-fantasy wargaming experience. Now, wargames are quite possibly the purest example of non-moral gaming in existence; players are expected to choose one of two sides in a conflict that quite possibly has some kind of hindsight moral assessment, and play them without the moral baggage associated with that conflict. After all, it would be impossible to play as the Germans in **Axis & Allies** if you felt that you were forced to play a leader that is darn-near the embodiment of "evil" to most people.

(Did I just invoke Godwin's Law in my own column?!)

No, wargames are just like any other game -- even among those where you play a "character" -- where the morality of the participants is never even called to mind. After all, when you're playing *Life* or *Monopoly,* you may do actions that are harsh or generous, kind or cruel. But I don't think anyone would ever label the characters portrayed in such games as definitively "evil" or "good"; you're just playing the game, even if you are forcing some other player into bankruptcy.

But RPGs are different; in an RPG, it's entirely possible to play a character who is evil to his core and -- at least in the old days -- *knows* he's evil. (How common is it for anyone to reach the same conclusion that society has of being "evil"?)

In trying to theorize the likely progression for how this focus on pigeonholing morality, I suspect we have both Tolkien and George Lucas to blame (or thank, if you like that sort of thing). The characters of Tolkien's books are almost entirely divisible into standard good/evil categories, with scant few in between. It seems quite likely that gamers seeking to replicate the most-revered fantasy series would do so with that sensibility firmly in mind. Likewise as **Dungeons & Dragons** started gaining popularity, the omnipresence of the *Star Wars* phenomenon would, again, ensure that many of those trying this new-fangled game would do so with a black-and-white morality firmly in mind.

Given the likelihood of any fantasy game having strong ties to Tolkien, perhaps this moral absolutism was inevitable. But perhaps not.

Maybe if **Traveller** had somehow become the standard roleplaying game, the moral outlook of RPGs would be different. According to the keeper of all human knowledge -- [Wikipedia](#) -- **Traveller** debuted in 1977, which is the same year the first *Star Wars* movie appeared. Despite that, the **Traveller** universe has a much more realistic view of human morality than . . . well, many other RPGs. Humans will lie, cheat, steal, and blow stuff up for gold and glory, just as we've done for the past 10,000 years or so of human history.

Or perhaps if RPGs had evolved more out of the live-action murder mystery parties which became especially popular in the 1980s, things might be different. After all, in most of those established scenarios almost every player has a character with *some* skeletons in the closet, and hardly anyone in those games would be classified as "good." Indeed, such moral distinctions would be superfluous and unnecessary; the character's moral outlook has no bearing on the group's interactions -- all that's ultimately important is Whodunnit?

I find it curious because, in many ways, the legacy of RPGs' moral assumptions -- primarily as embodied by the alignment system from the original **Dungeons & Dragons** and its ilk -- have lingered with most RPGs even today. Consider the **World of Darkness;** this is a game system that seems as morally gray as any that's been published, yet almost each game under its banner has, as part of its core, a judgment of the morality of the players' characters. Get too evil and you turn into a slathering hell-beast or even a lobbyist. Now, while I think these are fine systems (and, in

many ways, I approve), I can also envision how such a mechanic might hamper gameplay.

I think the legacy of that initial choice for a moral assessment has touched practically every other RPG. People with even a smattering of gaming experience (i.e. "played **Dungeons & Dragons** a few times") will be familiar with the alignment system, and among most hard-core gamers I've seen the existence -- or lack thereof -- of a morality system is usually one of the top 10 defining features of a new RPG. (As in, "This game is cool because you're not locked into the restrictions of a morality system!") This outlook classification even spills over into other pursuits; many computer RPGs and MMORPGs have morality systems of various sorts as well. (However, I note with some interest that the MMORPG **World of Warcraft** -- perhaps more synonymous with "RPGs" in the minds of many than **Dungeons & Dragons** ever will be -- sidesteps the issue entirely. There isn't a good/evil distinction in a mechanical sense, and it's seldom addressed in-game outside of some flavor-text handwaving. Sure, some sides may cackle about committing genocide or kicking puppies, but the game also ensures that each side can -- and does -- think of itself as the "right" one. And, while the player's character may be expected to go out and kick puppies or slaughter nameless hordes of presumably sentient minions, most folks in towns or parties will still treat you the same way: "Yes, we think all warlocks are demon-dealing soul-suckers. Anyway, Mr. Warlock, here's our selection of potions . . ." The closest **World of Warcraft** has is the idea of factions. These factions function more or less how they do in the real world; if you're a 16th-century privateer who's charged by the British to sink French ships, then the Brits will like you while the French will shoot on site . . . morality of either side be darned.)

I find this kind of "What if?" contemplation about RPGs -- while dangerously close to navel-gazing -- to be fascinating in other ways. After all, what would an RPG resemble that has never taken into consideration the shoebox morality of its participants? (We had an interesting article a few months ago called "[The Many Faces of Evil](#)" that deals with alternative morality assumptions, especially for how they apply to paladins of a **d20 System** game.) One of the more interesting moral twists in any computer I ever played was the awkwardly titled **Ultima VII Part II: The Serpent's Isle** In that one, the opening conflict established in the in-game documentation details the last words of a falling citadel as they are under assault by the forces of Order. Unlike previous games in the series, the ultimate conflict was about the restoration of balance between Chaos and Order.

So, in a nutshell, if you're looking for some means of adding an interesting twist to an otherwise humdrum campaign -- as a player *or* GM -- consider your options for morality. What if a world knew, with absolute certainty, that there was a moral Good and Evil (a la Terra/The Nile Empire from **Torg**)? What if a culture believed themselves to be evil; how would that affect their outlook or actions? (This isn't too far from some Christian views of a post-Fall humanity.) What if the conflict between two nations in a game was ultimately revealed to be a conflict of moralities (such as Humans' desire to live in peace versus Goblins' belief that it is immoral to allow land to go un- or underutilized)? What if a slightly screwball *character* believed in an absolute morality system, to the point of assigning it game-like attributes? ("I could break into this building, but doing so would place my Conscience rating in jeopardy.") What if unanswered rhetorical questions were seen as immoral, and punishable by dea

The Omniscient Eye

Why Is The Sky Green (On Caphelon IV)?

I've designed a world with a breathable nitrogen/oxygen atmosphere and tropical climate. Is the sky necessarily going to be blue (cloud cover permitting), and if not, what other colours might be possible?
--Stephen Dedman

Ah, the Omniscient Eye detects shades of the Classic Question, "Why is the sky blue?" In fact, that is the best place for us to start answering your more general question.

Most people who try to answer the Classic Question seriously begin by saying "Rayleigh scattering," and promptly stop there as the queryer's eyes glaze over. The Omniscient Eye's job is not done, however, until this arcane effect is explained in terms simple enough for mortals to understand.

Rayleigh Scattering for Non-Omniscients

First, consider where any light that we see in the sky actually comes from. If we look at the sun, the light is obviously coming directly from the sun (though don't try this at home; you will damage your eyes). If we look elsewhere during the day, we normally see fairly bright light in a familiar shade of sky blue. Where is this light coming from?

We know from our experience at night that there isn't anything that bright beyond the atmosphere (with a very few exceptions, which we'll get to later). So that blue sky light must be coming from the atmosphere itself. Why is the atmosphere aglow like that? Rayleigh scattering . . . stay with me now . . .

Rayleigh scattering is, in simple terms, the bouncing of light off the molecules of a gas. It's called "scattering" because, unlike reflection off a mirror, the light bounces off the gas molecules at a wide range of angles. Most light passing through the atmosphere doesn't scatter, but enough does that any point in the atmosphere illuminated by the sun is effectively emitting a significant amount of light in all directions. So when you look into the sky, the light reaching your eyes has come from the sun via bouncing off one (or more) molecules of the atmosphere.

This is why the daytime sky is bright -- so far, so good. But why is it blue, when the sun is a pale yellow color? The answer lies in the arcane physics of Rayleigh scattering, the gist of which is that light of shorter wavelengths is more likely to scatter than light of longer wavelengths. *Much* more likely. Long wavelength light is red, while short wavelength light is blue. So when you look into the sky and see all that scattered light, most of it is blue.

Scientifically savvy readers will now be thinking along the following lines: Okay, but I know that violet light is even shorter in wavelength than blue light, so therefore it should be scattered more than blue light. So most of the light I see scattered from the atmosphere should be violet, and the sky should look purple!

The first part of this reasoning is valid -- violet light does indeed scatter more than blue light. But this logic falls down in two other places: First, the sun does not emit equal intensities of light across the spectrum. The intensity of sunlight peaks in the yellow, with a bit less green and orange, significantly less blue and red, and very little violet by comparison. The amount of violet in sunlight is so little that, even though more strongly scattered, its intensity is roughly equal to that of the scattered blue light. The second complicating factor is that the human eye is much more sensitive to blue light than violet light. Given equal intensities across this part of the color spectrum, we tend to see the result as just blue, rather than a violet-blue mixture.

Now let's see how Rayleigh scattering applies to sunsets (and sunrises, though the Eye does not deign to get up that

early). At sunset, sunlight must pass through a much thicker layer of atmosphere to reach your eyes because of the low angle of incidence. This means incoming light is more likely to scatter, and to do so multiple times. The "wide range of angles" of scattering mentioned above is actually weighted such that it is twice as likely for light to be scattered by very small angles as it is to be scattered by angles around 90 degrees. The result of this is that blue light, which tends to scatter much more frequently, ends up scattered by greater accumulated angles than red light. So when looking at a sunset, most of the light near the sun is this minimally scattered red light, and as you look further from the sun it fades through orange and yellow back to blue, creating the classic red and gold sunsets we know and love.

Scattered Atmospheres

This all assumes our familiar Earth atmosphere. The amount of Rayleigh scattering depends very strongly on the size of the scattering particles. Nitrogen and oxygen molecules are close to the same size, so changing the ratios while keeping a breathable atmosphere won't have much effect. The inert gas argon, however, has atoms small enough that if you used it as a buffer gas instead of nitrogen, the amount of Rayleigh scattering would be roughly halved. If you reduce the amount of scattering, somewhat counterintuitively you actually make the sky a deeper, richer shade of blue. Although the amount of scattered blue light is less, the amount of scattered green, yellow, and red light is less still, so the color of the sky becomes darker and moves toward the violet end of the spectrum. You can confirm this effect yourself: the amount of Rayleigh scattering decreases when the sun is lower in the sky (less incoming light means less scattering) or when you are above a significant portion of the atmosphere (in a plane) -- in both cases the sky above looks darker and bluer, even shading into purple.

On the other hand, you can increase the amount of scattering by adding larger gas molecules to the atmosphere. Carbon dioxide molecules are about twice as big as those of nitrogen, and scatter light over 100 times as efficiently. Adding a significant amount of CO_2 will scatter more blue light, but also *much* more of the longer wavelength colors, resulting in the sky color becoming paler and shifting toward green. So green skies are a possibility, but they will be pale compared to even the palest tropical blue skies of Earth, rather than vivid. With a lot of CO_2 (or even larger molecules such as sulfuric acid), you can produce the pale yellow skies seen in some NASA photos from the surface of Mars, but unfortunately this renders your atmosphere unbreathable.

While mentioning Mars, another factor in determining the color of the sky is particulate matter such as dust or smoke. Many of us are familiar with the effects of these as a brown haze of pollution. These particles also scatter light in a similar way to Rayleigh scattering. Usually smog lies below the bulk of the bright blue atmosphere above, so the originally blue light we see coming through it is reddened, producing that murky brown color. At sunset, the already reddish light is reddened further, which can produce gloriously broad and colorful vistas. The Eye remembers when the great volcano Krakatoa (west of Java, not east as some B-grade movie makers would have you believe) exploded, lifting several cubic miles of ash into the sky. For years thereafter, sunsets as far away as England and Nova Scotia were stained red by the dust encircling the globe. Younger readers may recall a similar effect after the eruption of Mount Pinatubo in the Philippines in 1991.

A world with a breathable atmosphere but frequent explosive volcanic activity (or dust storms, such as on Mars) may have a more or less permanent layer of globe-encircling ash or dust, serving to redden the sky. In this way you can have pink or brown skies, although the effect on the lungs of colonists may be harsh without filter masks.

The Goddess of the Dawn

Scattering is not the only atmospheric effect that colors skies. Stars spew out an unending stream of charged elementary particles. Earth's magnetic field catches the ones that come from our sun and funnels them toward the poles. There, the particles hit the upper atmosphere and excite atmospheric oxygen and nitrogen molecules, which glow in characteristic green and red. This lights up the polar night skies with the phenomenon known as the aurora.

Auroras are not visible in daylight, however. Researchers long believed that auroras occurred just as frequently in daylight, but were simply not bright enough to be seen. Recent results indicate that this might not be the case -- aurora

formation correlates with a drop in the electrical conductivity in the ionosphere, which happens mostly on winter nights when the upper atmosphere cools down.

That is Earth though. It is conceivable that solar activity and ionospheric conditions are perfect on your world to produce bigger and brighter auroras with regularity. If the world's magnetic field is weak or non-existent, the incoming solar wind would simply blast down on the entire daylight side, potentially triggering sky-wide auroras all day long. The shifting red and green glowing curtains covering the sky could overpower or blend with the passive color produced by Rayleigh scattering, to produce some truly eerie skies. Potential settlers might, however, have to build settlements reinforced with radiation protection, to avoid damage from those incoming solar particles.

Different Worlds, Different Suns

Moving beyond the atmosphere itself, all of these scattering effects will produce different results if the incoming solar spectrum is different to that of our Sun. Stars come in a variety of "spectral types," with which some readers may be familiar. If your planet orbits a bluer star than our sun, the default sky color shifts toward the blue end of the spectrum. Go far enough and you will get those violet skies mentioned earlier. The problem here is one of stellar and planetary evolution. Blue stars have short lives compared to our sun -- tens of millions rather than billions of years. Most scientists consider this time too short to generate planets and have them around long enough to evolve life. And life will be necessary on your planet to generate that oxygen atmosphere. So a naturally occurring nitrogen-oxygen planet with a violet sky is unlikely, although a terraformed or constructed world is possible if you want to invoke Precursors or extant technology suitable for the job.

Stars redder than our sun have longer lives, so evolving life is not an issue. As the amount of blue in a star's spectrum decreases, its planets' skies will become less blue and more red, shifting through green and yellow along the way. So yes, you can have a bright green sky, and the way to do it is to make the sun redder! (It sounds odd, but if you knew nothing about Earth except that it had a yellow sun and a nitrogen atmosphere, what color would you have guessed its skies would be?)

Outside Influences

Now we can discuss those exceptions to the statement that nothing beyond the daytime sky is bright enough to be seen through it. (The Omniscient Eye never forgets a promise made early in an article.) The sun is the obvious exception, but there is also the moon . . . and Venus. If you know exactly where to look, you can see Venus in full daylight, though its small apparent size and barely-greater-than-daylight brightness make it difficult to spot. Now imagine if there was something big, bright, and colorful filling your world's sky.

One thing that might come to mind is imagining that your world orbits not a star, but a gas giant that itself orbits a star. (The Omniscient Eye has discussed this very situation before.) Gas giants are bright, by virtue of reflecting much of their star's light, and come in many colors. In our own solar system, Neptune is a rich blue, Uranus

Sky Color Summary

Condition	Effect on Sky Color
Thinner atmosphere	Darker, more blue
Thicker atmosphere	Paler, more red
Lower atmospheric molecular weight	Darker, more blue
Higher atmospheric molecular weight	Paler, more red
Dust or pollution	Reddish tint overlaid
Bluer star	More blue
Redder star	More red

while (kiss(sky);) do excuse(me);

a pale green, Saturn yellow, and Jupiter is spectacularly banded with shades of white, orange, brown, blue, and red. From typical distances that a large world might orbit it, a gas giant would be easily visible in the daylight sky. But how much of the sky would it fill?

From the orbit of Jupiter's innermost large moon, Io, Jupiter subtends an angle of 19°. Our moon subtends half a degree in Earth's sky, so from Io, Jupiter looks 38 times bigger than that in diameter. Impressive, but not enough to fill more than a fraction of the sky. That's also a little close to be considered a safe world for colonizing, because of radiation and tidal forces from the gas giant. From the safer distance of Ganymede, Jupiter subtends a mere 7°. So a gas giant in your world's sky could provide some interesting accent, but won't dominate the color of your sky.

We can say the same for any potential large colorful moon of your world if it's in a more standard stellar orbit. Our own moon is close to the upper limit in size you could reasonably expect. So although a large moon might add color to your daytime skies, it won't be more than spot color.

The next candidate object for brightening your sky is a planetary ring system. These exist around all the gas giants in our solar system, but around none of the terrestrial planets. It might seem then that having such an interesting object around your inhabitable world is unlikely. Don't despair!

Current theories of planetary formation indicate that ring systems are relatively short-lived phenomena, lasting maybe a hundred million years before dissipating. The most likely method of formation is when gravitational interactions push a moon inside the planet's Roche limit -- the orbital distance at which a large object will be pulled apart by the planet's tidal force. You don't need a very large object either; Saturn's rings, despite their spectacular appearance, have a total mass less than a thousandth that of Earth's moon. There are plenty of objects big enough out in a typical planetary system -- all you need to do is get one close enough to your inhabitable world. The Roche limit of Earth is one tenth the size of Saturn's, so all you need to do is push a small moon 10 times closer. This indicates that, in rough terms, a ring system around a terrestrial world is around 10 times less likely than one around a gas giant. So it's not too much of a stretch to imagine inhabitable worlds with rings.

Rings are certainly bright enough to be seen in daylight, reflecting incoming sunlight. They would look largest from high latitudes, arcing across the entire sky from horizon to horizon in bands of color. As you move to lower latitudes, the rings would climb higher in the sky and become thinner, until they all but vanish at the equator. In reflection, rings are likely to be the muted yellow and brown colors we observe in Saturn's ring system. If the sun passes behind the rings, it will be filtered through the particles, which could well be small enough to produce scattering effects and reddening of the light.

Finally, what if large regions of space around your entire planetary system are full of bright objects near enough to fill the sky? We call such objects nebulae. Any web search will produce [hundreds](#) of [beautiful images](#) of [nebulae](#). There are several different types of bright nebula. We can ignore planetary nebulae and supernova remnants, since they are small and their creation necessarily destroys the only star with planets near enough to have a nebula-lit sky. That leaves reflection nebulae (clouds of gas and dust lit by the glow of nearby stars) and H II regions (areas of glowing ionized hydrogen), both of which can be hundreds of parsecs across -- large enough to encompass several star systems. Stars in such regions tend to be young, short-lived blue stars, but it's possible for a longer-lived yellow or red sun to drift into a large nebula, granting its planets spectacular skies of almost any color you can imagine. The sky of such a planet would have bright colored filaments and ribbons weaving across it, that rotate with the stars.

We've come a long way considering only the realms of hard science. There are many more possibilities for space opera and outright fantasy skies. Of course you can justify any color sky you like in such genres. You could even use the sky as an indicator of campaign mood or a [canvas for omens](#). The Omniscient Eye is happy to provide the science. It's up to you to provide the creativity.

--David Morgan-Mar

Sages theorize that the Omniscient Eye might actually be composed of a panel of

Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore with all. Or, at least, with all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Secrets of Japan: A Guide To Roleplaying In Present Day Japan (for *Call of Cthulhu*)

Published by **Chaosium, Inc.**

Written by Michael Dziesinki

Cover by Nottsuo

Illustrated by Paul Carrick, Jason Chan, Michael Dziesinki, Katsuhika Hokusai, Drashi Khendup, Andy Lee, Nottsuo, E.J. Su, Jason Thompson, Sigmund Torre, & Melissa Uran

Cartography by Michael Dziesinki & Drashi Khendup

360-page b&w softcover; $34.95

With *Secrets of Japan: A Guide To Roleplaying In Present Day Japan,* Chaosium journeys to the far east to offer an exploration of the modern nation of Japan and its singular culture, placing it under the lens of the Lovecraftian Mythos for *Cthulhu Now,* the contemporary incarnation of *Call of Cthulhu*. Clearly penned by a knowledgeable and dedicated Japan-o-phile, the weighty tome serves up a rich cultural feast detailing the peoples, places, faiths, beliefs, and organizations of Japan. It is designed to introduce both the occidental reader and the occidental player character to the country, as well as enabling the creation and roleplaying of Japanese characters within their own country. Naturally it delves into the occult, in particular approaching the Mythos from a non-Western standpoint. Finally, it is intended to work as the start of a series of supplements detailing "Cthulhu Japan," yet neither of the hinted at *Secrets of Japan: Investigator's Companion* and *Japanese Dreamlands* supplements have appeared.

For a contemporary Chaosium release, this is a surprisingly good-looking book. It employs a diverse range of art styles, including Manga, photographs, and even chibi-style strip cartoons entitled "Cthulhu Sushi" as well as the more traditional RPG and Japanese classical art styles. Every page is watermarked with an image of Cthulhu done in brush strokes and any supplementary information is placed effectively in white text on black boxes. Unfortunately several of the book's maps are as badly handled, as usual. Fortunately the supplement is decently organized into five scrolls each broken into further sections. In turn, the scrolls are entitled Atmosphere, Secrets, People, The Six Realms, and Scenarios and Sinister Seeds. This is followed by four appendices.

After the book's opening fiction, Atmosphere gets down to what you need to know about Japan -- language, geography, cultural differences, what weapons are legal, and so on. There are new occupations for both Japanese and foreign investigators. The former range from the modern such as the Bosozoku (young motorcycle gang members), corporate salaryman, and radical ultra nationalist, to the more traditional Buddhist priest, hereditary ykai (monster) hunter, and itako, blind female Shinto shaman who possess second sight and can channel spirits. The latter covers common foreigner occupations such as bartender/hostess, English teacher, and corporate transplant. New skills likewise take in the old and new, also covering the martial arts and suggesting how both sumo and ninja characters can be played. Some skills are magical, Channel Spirit obviously (though it can go disastrously wrong if the skill roll is fumbled and the wrong entity is channeled), while Meditation is one that every investigator will want as it helps reduce Sanity loss. Even Oriental Medicine can be helpful in restoring Sanity through the realignment of a person's *ki*.

Also discussed is handling the mentality of both Japanese and foreign investigators. For foreigners this is "Culture Shock," reflected in greater Sanity loss due to Japan's strangeness. For the Japanese, this includes group mentality (which can reduce the effect of Sanity loss), common mental illnesses and phobias, and actual attitudes to mental illness.

So far, so mundane, but *Secrets of Japan* really gets into the dark swing of things with the Mythos subversion of Japanese religions in the Secrets scroll. In turn, Buddhism, Shinto, and Taoism are twisted in a shocking and potentially offensive manner, although each twist is in keeping with the uncaring nature of the Mythos' cosmic horror. Thus in degenerate Buddhism, worshippers can achieve nirvana and an understanding of the cosmos through spiritual union with Azathoth! In dark Taosim, Taoist alchemists can petition the Jade Emperor for immortality, with the rejected turned into living statues of jade. Shinto is more subtly twisted, hiding secrets that link the Imperial family in particular, and all Japanese back to ancient Mu, and even a series of gates that lead elsewhere and can let things in. Items important to each of the faiths are described, along with listings of Mythos tomes, artifacts, and spells. Two of the more interesting tomes include a Mythos version of Lafcadio Hearn's *Supernaturalia Japonica,* and a further treatise by revered samurai swordsman, Musashi Miyamoto, that can be studied to enhance the sword skill to supernatural levels.

The People scroll starts at the top and works down, from the Imperial family and government though military, police, the corporate keiritsu, and education to the Yakuza. Behind them are a raft of secret societies and organizations. Buddha's Tears recruits initiates through video games and anime, drawing on their life energy to secret ends; the Brotherhood of the Black Lotus works to continue the efforts begun in ancient Mu to open Gates to the Six Realms and summon Mappo NO Ryjin, the Great Old One who haunts the Japanese consciousness as the Great Dragon; while the Dragon Lords are ultra nationalist yakuza who work to place Serpent man hybrids in positions of power. Project Yrei is a corporate backed research program that combines the Mythos and science, one result being an anime inspired suit of bio-morph armor complete with tentacles and self-healing.

The fourth scroll, The Six Realms, takes Buddhism's six realms of existence and -- like the second scroll -- gives them a dark twist. It reinterprets Japanese myth across the six, now seen as various dimensions that are akin to the Dreamlands. The six are the Realms of Heavenly Beings, Humans, Animal Kingdom, Asuras (evil spirits), Hungry Spirits (ghosts), and the Hells. Essentially this is a bestiary that takes in traditional Japanese creatures like Kitsune and Oni, but adds just a few direct Mythos entities, mostly avatars of the Great Old Ones. The traditional creatures would still provide effective threats and encounters though a Keeper will need to avoid monster-of-the-week syndrome.

Barely mentioned are the Dreamlands commonly visited by the Japanese. These are "Old Edo," a dream of Medieval Japan, and for those wanting giant robots and the hi-tech, there is Mega-Tokyo and Colony Five. The reader will have to wait for future supplements detailing the Japanese Dreamlands, although the Keeper might be something together from the details given here.

The scenarios begin well with "The Hin-no-Maru Slayings," a murder mystery with political and supernatural rather than Mythos elements intended for beginning foreign or Japanese characters. "Meiro (The Labyrinth)" is less effective, drawing the investigators in with a madness inducing anime collectible card produced by an obscure corporation headquartered in a weird dungeon-style/James Bond villain's base. Running the headquarters scene is at best awkward, and this is an unsubtle piece that exposes the characters to the Mythos too early. Finally, "The Yonagumi Monuments" adapts the supplement's opening fiction to send the investigators diving on undersea ruins off the coast of Okinawa. Playable enough, it feels sort of desperate given the number of ideas within the book that could have been developed in its place. Many of these appear in the several Sinister Seeds that follow. Finally there is a discussion of historical scenarios which only serves to show that the subject deserves a book of its own.

The four appendices add a cultural lexicon, the traditional timelines both mundane and outré, a short gazetteer of the Mythos across Asia country by country, and a look at Tokyo University and some of the Mythos tomes and artifacts in its collection. Certainly the latter could be the focal point for a campaign similar to the recently released *__Miskatonic University__* sourcebook, and be a good way to introduce Western characters as scholars. However, the gazetteer begs for expansion -- a "Secrets of India" supplement could be fascinating.

Two elements do jar, however. The Hello Kthulhu fad of one Sinister Seed is the first, while the occasional appearance of Gazira to smash cities and breathe radioactive fire is the second and worst. The inclusion of a Godzilla-like creature might be culturally appropriate, but it feels like one inclusion too many.

Fundamentally, ***Secrets of Japan: A Guide To Roleplaying In Present Day Japan*** is an absorbing read and is quite literally stuffed to the gills with information. Yet it feels as if the author has tried to get too much into the book and twist too much of the Mythos into the setting. Trim some of it, and there might have been room to develop the scenarios a little more, or give more advice on writing and running Cthulhu Japan games. It is also difficult to see who the supplement is quite for. Running the game for occidental investigators would be a real challenge given the cultural differences and difficulties, and perhaps rather than taking them to Japan, it might be easier to have them encounter the Mythos Japanese style exported amongst the Japanese living elsewhere. Running an all-Japanese game would likewise be challenging, and to do that, ***Secrets of Japan*** really needs the support promised in the "Cthulhu Japan" line plus a good campaign. Too over done in places, ***Secrets of Japan: A Guide To Roleplaying In Present Day Japan*** is nevertheless rich in both ideas and possibilities. If only Chaosium can give it the support it deserves.

Art by Jo Hartwig

full-color boxed game with 25 disks in five colors with stickers, 15 ship cards, 24 booty counters, 75 coins, rules; $24.95

Avast and all that. Time for yet another stab at taking the romance of the pirate and putting it into board-game form. This outing, however, doesn't so much seek adventure on the high seas . . . these cutthroats haunt the coasts in the literal sense. They wait for the ships to float into the harbor laden with treasure, where they can be picked clean. Such is the life of a lazy *Buccaneer.*

The object of the game is to have the greatest booty by the time you've robbed the last ship.

Everyone (from three to five sailors can play) receives five disks in his color, with an identical assortment of pirate stickers attached to them. Four of these men have a number, from two to five, while the fifth has only a question mark. You get a starting pile of cash to seed your rotten ambitions, and the first three ships in the harbor are revealed.

On your turn, you have a choice: capture another pirate or move in to take a ship. Each ship has a disk requirement, so to attack that vessel you need to meet that minimum with the brigands in one of your stacks. If you're not ready for a boarding party, capturing pirate disks lets you start or improve stacks of buccaneers. Place one of your pirates over an opponent's piece, then place both in front of you. You're in charge of that crew for the moment. Taking lower-numbered thugs means paying them less treasure. Although six pirates is enough to take any ship, you can have up to nine in a stack. If anyone has three of their color in a stack they can mutiny, forcing the captain (the guy atop the pile) to go after the ship of their choice.

Bigger ships are worth more ducats (that's the money they use, fer you land-lubbers), and have more treasure in their holds to boot. If you move onto the vessel, you get all their cargo. The money goes to the captain, but he has to pay everyone. Each pirate is paid what his disk is worth, so hopefully you managed to impress a gang of two-ducat losers (for extra spin, each ship has a question mark value, and that's what those pirates marked "?" earn). The higher the numbers on your gang, the more you pay out . . . and if you run out of treasure stolen from the ship, you have to continue shelling out from your own coffers. Too many high-level people, and taking that ship costs you money. You cannot look at a disk stack once it's started, so mentally tracking the crew numbers can be critical.

Even if the booty is exhausted in payments, the captain of that venture still gets first pick of the treasure, represented by pictures of a barrel, candelabra, chest, and sword. If there's a second treasure pictured, the second disk down (your "first mate") gets the other prize. You get a counter for each treasure, and whoever has the most of a particular piece gets the money for that item during endgame scoring. For example, the chest is worth 15 ducats if you have more of that token than anyone else; if two people tie for number of chests, it's worth seven each; three people get five each; and so on.

Once everyone has been paid, the lost ship in the harbor is replaced (you'd think after a while someone would get wise and park somewhere else). The stack used to rob the last one disbands back to the various disk owners, to be used anew, and play resumes. When all the ships have been picked clean the game ends, and the highest money total wins.

The pieces are nice, typical of what you'd find in your European games. The coins are punch-outs, not plastic, so you save some money there. But you still have wooden playing pieces, colorful stickers with good illustrations, and lovely ship cards, so if there's buyer's regret it won't come from the components. The game itself, on the other hand . . .

Buccaneer plays well enough, though it feels like it's been declawed. There are no mechanics for the piracy proper -- the focus on money makes it more of an economic effort -- and you're taking out ships sitting on the water 100 yards away. It's hard to feel like a pirate when you don't actually get to run up the Jolly Roger. The rules are simple, as is the presentation, but this is part of what prevents it from being a completely satisfying simulation. Mind you, the game is solid and works (it's much the same material seen in ***Die Safeknacker***), and the combination of memory and risk assessment do make for a serviceable competition. As long as you don't mind that a little of the background wind has been taken out of its sails, it may be worth lying in wait for. If you're looking for the pure pirate experience, you've got other game options that don't require you to overlook the lack of genre trappings.

Dork Tower!

Dork Tower!

Kunruk Above/Kunruk Below

Matt Riggsby

Kunruk is a ritual center, the object of pilgrimages and grand ceremonies. Temples and sacred enclosures dominate its skyline. A constant stream of pilgrims makes its way to Kunruk to bathe in the holy waters and be transported in religious visions.

Kunruk is a center of industry. Rich deposits of ore are close at hand, and volcanic vents provide the heat necessary to turn it into fine metals. The metalwork of Kunruk is known far and wide.

Kunruk is two cities. Kunruk Above, the center of worship, sits under the baking sun, open to visitors from all directions. Kunruk Below, the center of industry, is a settlement of dwarves, mining and manufacturing in natural caves and tunnels dug through softer stones deep underground. They coexist, with the surface-dwellers wary of what the dwarves might be doing underground and the dwarves skittish about the volume of human traffic so close above their heads. But many feel that the coexistence is a fragile thing, and is little more than a technological development or religious movement away from being shattered.

Geography and Land Use

Kunruk is situated in a patch of jagged hills between areas of rolling grassland in the west and desert in the east. In a few places, deep wells provide irrigation which turns prairie into good farmland, but for the most part, the land is better for herding and supports a great many goats and sheep. A significant amount of water now makes its way to the city through a network of small canals and, closer to the town itself, raised aqueducts and tunnels for water, so farming is declining while herding is on the increase.

The site of the town itself is set on several low, rounded hills which are higher, sharp-ridged ones, with gaps providing natural approaches from several different directions. This puts Kunruk in a poor defensive position (attackers could easily bombard the city from surrounding hilltops), but it provides a bit of an advantage for bringing in water.

Kunruk's geology is jumbled and chaotic, with a complex of volcanic pipes surrounded by limestones and surprising patches of granite and other metamorphic rocks. Water activity has cut through a great deal of limestone, leaving caves and underground reservoirs. A low level of volcanic activity has continued, sufficient to heat some of the water to high temperatures and bring lava close to (but not up to) the surface. The region is given to frequent minor earthquakes, although serious ones are very few and very far between.

Kunruk Above has a population of about 10,000 permanent residents, with at least 5,000 visitors at any given time, rising as high as 15,000 during particularly favorable months. Most are pilgrims, but some are "seasonal" residents who support the pilgrim trade. The region around it is dotted with small villages. Kunruk Below is significantly smaller, with a population of about 4,000 dwarves, all of whom live in and around a single grand cavern.

History

A small oracular temple could be found at Kunruk at least as far back as seven centuries ago. Religious pilgrims took advantage of gases arising from fissures in the ground to have ecstatic visions. The site is also relatively rich in water, with a number of pools on the surface, so it served as a landmark for some cross-desert trade, though most trans-desert travel used easier routes well to the north and south. A small town, hardly more than a village with facilities for travelers, supported the temple and caravanserai.

Kunruk became more prominent three centuries ago, after the ruler of a nearby kingdom passed by the temple, dedicated to the goddess Syvella, and sought guidance on his choice of marriage partners. The wife he chose based on

that experience quickly bore him several sons, and with each one the king endowed a new shrine at Kunruk, which together came to be known as the Four Brothers. The royal attention soon attracted other visitors to the shrines. Once an obscure backwater and stop along the way, Kunruk became a destination in its own right.

As Kunruk's fame grew, so did the number of visiting pilgrims and the facilities to accommodate them. Inns were constructed, the existing temples grew into large temple complexes, new shrines sprang up around the fringes of the town, and programs of spiritual exercises developed to meet the needs of the pilgrims. Tiled tanks were constructed to hold water from the sacred springs, and enclosures were built so that pilgrims could breathe their fill of sacred, hallucinogenic vapors in an orderly setting.

The town also evolved something like a government. The leaders of the various temples formed a council for regulating visitors, negotiating for food imports, and so on. Since other enterprises in Kunruk depended on the temples, the operators of inns, food stalls, and so on accepted their authority.

The next significant events in the history of Kunruk took place about two hundred miles to the northeast, where a mountain range cuts through the desert. About two hundred years ago, a dynastic conflict in the large dwarven community there stopped just short of civil war. A large faction accepted exile and set out to find a new home.

They traveled through miles of previously unexplored caverns, scouting for favorable conditions. After a long journey (famously lasting two years and three days), they came upon a suitable place and their High Chief (so the leading dwarf was called) declared that they had found their new home. Large caverns would provide suitable space for growing nutritious mushrooms and building new homes. A fast-running underground river turned out to be a distant tributary to a network of subterranean waterways which could connect them to other dwarven settlements. Iron ore was plentiful, and there were scattered but rich veins of copper, lead, and other metals. Volcanic vents provided them with useful sources of heat to supplement standard furnaces. No orcs or other monsters were evidently at hand. It might not support a dwarven metropolis, but it was more than enough for a good-sized town.

It came as quite a surprise to everyone involved, then, when a team of dwarven workers digging a ventilation shaft emerged in the middle of a temple. The confused reaction which followed, with hallucinating pilgrims describing monsters rising out of the ground and dwarven miners who hadn't been on the surface in years describing a palace full of madmen, did not get the relationship off to a good start. Although hostilities might have broken out, cooler heads eventually prevailed but the tension didn't entirely go away.

Both sides had anxieties about the other. The surface-dwellers were horrified at the possibility of the dwarves diverting the hot springs and volcanic vents and cutting off what they saw as sacred emanations of the earth. The dwarves, already insecure about the poor economic footing of their new settlement (at this point, they had constructed at best makeshift homes and had only the beginnings of an agricultural system), feared that they could be overwhelmed by a horde of well-supplied religious fanatics.

Both fears were at least a little justified. The first 50 years or so saw a series of crises as vents and hot springs were, in fact, interrupted. The complex geology of Kunruk Below, as it was coming to be called, made it difficult to predict how the dwarves' underground work would affect the surface (and, some believe, they didn't put in much effort to find out anyway). There were inevitable retaliations, with attacks on dwarves resulting in deaths on both sides.

It was commerce which eventually calmed things down. Though the tension between the dwarves and the temples continued at a low level, the merchants made many new friends. As they do everywhere, the dwarves produced high-quality manufactured goods, and they needed a market. The above-ground merchants quickly found that the dwarves had a taste for mutton and a need for wood and charcoal, which they could produce faster and cheaper than the dwarves. Merchants who made Kunruk a regular stop on their routes grew increasingly wealthy as they solidified their relationship with the dwarves.

Of course, this has led to other conflicts. Over the past century, the merchants have become wealthy and powerful enough to challenge the authority of the temples in some ways. The merchants are still dependent on the temples to provide them with customers, but the temples rely on the merchants to supply the pilgrims who enrich them both, and the merchants have a small but significant income from trading in dwarf-made goods. Underground, the dwarves are

facing their own problems. Despite being a conservative group among a conservative people, the need for extensive trade has caused cracks in their old social order.

Politics and Government

Kunruk Above is an unabashed theocracy. Traditionally, the greatest power in Kunruk Above is the alliance of the five largest, oldest temples, whose policies are determined by a body called the Synod. The Four Brothers each send a single representative, while the temple of Syvella sends two. Decisions of the Synod require no more than one dissenting vote, essentially giving the temple of Syvella veto power.

The Synod acts as both a government and a sort of corporation, organizing food and water supplies for the major temples and their extensive facilities for visitors. Priests are all empowered to oversee legal proceedings and mediate disputes, although the Synod will claim jurisdiction over particularly sensitive issues and sometimes acts as a court of appeal.

As the major economic power in its area, and without significant neighbors, Kunruk's authority extends as far as the Synod can project force, a radius of perhaps thirty miles. There are no formal borders (Kunruk's authority slowly gives way to traditional tribal authorities), but Kunruk will take a dim view of blatant criminality close enough to the city to cause problems with the pilgrim routes.

The increasingly powerful merchant class has yet to directly challenge the power of the temples. However, the trade in dwarven goods makes them less beholden to the temples for contracts and other approvals, so they've been driving increasingly hard bargains. Rumor has it that some have used their new wealth to influence priests whose opinions and morals seem sufficiently flexible. It seems unlikely that a merchant or association of merchants would make a direct play for power, but one never knows.

Kunruk Below's government is based on dwarven forms which are still being adapted to a relatively small population. The position of High Chief theoretically open to the head of any family upon acclamation by the people and examination by a council of elder craftsmen. In practice, the position has proved hereditary, with the five High Chiefs of Kunruk Below over the past centuries being one another's sons or brothers. The High Chief has a wide range of unquestioned judicial and executive powers, but new laws, particularly new taxes, must be approved by the council of craftsmen.

Although the succession of High Chiefs has never been seriously contested, a class war is simmering over membership on the council of craftsmen. The craftsmen are heads of extended households, chosen for a combination of seniority, wisdom, and demonstrated ability in their crafts. Usually, the available pool of senior craftsmen is a tiny fraction of the population. In traditional settlements, households are very large, and many families spend more time digging tunnels, mining ore, or growing the mushrooms which form the bulk of the dwarven diet. However, the conflict which formed this faction split any number of families, resulting in a large number of small households. Perhaps more importantly, the extensive existing cave networks and close economic ties to Kunruk Above mean that poorer households, which might otherwise have to concentrate on lower-class trades, can work on metalcraft themselves. The result has been that, just as in Kunruk Above, a growing middle class is threatening the power of the traditional aristocracy.

Armed Forces and Law Enforcement

Although it has no regular armies (Kunruk lacks both territorial ambitions and nearby enemies), Kunruk Above maintains a small force of guards to protect the considerable riches of the temples. Most are mercenaries, but mercenaries paid well enough to ensure their loyalty. The Synod usually leaves the guarding to the guards, not bothering with petty operational details, but command is ultimately in "civilian" hands. The Synod has foresightedly hired guards as individuals or small groups and changes assignments frequently, to help prevent other loyalties from arising. Likewise, there is no overall military commander who might gain the loyalty of all the troops. Instead, several officers in charge of various day-to-day operations answer to the Synod. It would be a poor arrangement in wartime, but it seems to work well enough for the simple security work the guards do. Priests act as a judiciary, with the Synod

acting as a court of appeal.

The guards are occasionally called on to help priests enforce the law outside of the temples proper and in the hinterland (for example, to collect taxes from an uncooperative family compound), but merchants employ guards of their own to help keep order in the markets and inns. Privately employed guards work for individual merchant houses, but by the laws of the city may be called on to help keep order in case of general disturbances. There are about 700 professional fighting men in the city, evenly split between temple and private guards. There is no regularity in equipment or fighting style, but most are veteran warriors.

Kunruk Below has slightly more formal security arrangements. Every family is required to send an adult male, traditionally the youngest adult, to regular (every ten days) drills with weapons and armor. If required to send out forces, Kunruk Below could field a reasonably skilled if mostly green troop of around 400 heavy infantry. If directly attacked, all able-bodied adult males would be called on to fight as well, bringing the number up to something like 1500. Since the older men have spent their time in the militia, they'd be relatively skilled fighters as well.

Although the militia could theoretically be called on to quell disturbances, the need has never arisen in Kunruk Below. Instead, law enforcement is carried out by a group of censors, magistrates answering to the High Chief. The censors investigate wrong-doing and political orthodoxy, as well as inspect craft work before it goes to market. Nobody likes the censors (they're very nosy, which is doubly annoying in clannish dwarven society), but they carry a great deal of responsibility to ensure that standards established by the council of craftsmen are upheld.

Industry and Commerce

Kunruk Above's largest industry by far is religious tourism. Most inhabitants of the town make a living working in hostelries and drinking shops, selling provisions, acting as guides, making amulets and other religious souvenirs, and so on. The temples regulate much of this traffic, though they only directly control a portion of it. There are also more than the usual number of scribes and artisans involved in building trades. Many pilgrims come in search of divine healing, so in addition to oracular and general religious services, the temples provide a great deal of health care. The pilgrims engage in more or less complex regimens of prayer, ceremony, diet, and rest or exercise. A large minority of priests have some skill in medicine.

The temples also bring in a great deal of food both from the surrounding region and abroad. The nearest navigable stream (and that only by barges with very shallow drafts) comes within eleven miles of Kunruk. A small town, casually called "Kunruk Port," has grown up at that point to the stream for the convenience of both travelers and shippers, and on the last leg of its journey most commerce travels along a road between Kunruk and the transshipment point.

Kunruk Below produces fine metalwork: weapons, armor, tools, jewelry, and so on. The bulk of their work is in iron, which is particularly common in the most accessible tunnels, and they are best known for producing fine armor and small quantities of remarkable stonework. A family of dwarves has done a notably good job decorating the faades of several buildings at one of the Four Brothers, and there is a growing demand for their work both in the city and from wealthy visitors. Their jewelry is only middling quality by dwarven standards, but excellent for any other race. Most valuable metals must be imported, since there's currently not enough native supply to meet demand. Kunruk Below also imports significant amounts of wood and charcoal and most of its food.

This last has been a point of contention among the dwarves. Although the council of craftsmen has traditionally favored the contact, since it enriches them with a high volume of trade, the High Chiefs have regarded it as a strategic weakness, and a vocal minority of the lower classes is notably xenophobic. A majority of dwarves is torn on the issue, uneasy about dependency on outsiders, but unwilling to return to the low-status jobs they'd have to perform in order to become self-sufficient.

Religion

For a town built around religion, Kunruk Above is surprisingly nondenominational. The reason for this is that the spot

it occupies has typically been surrounded by regions following different but all theologically permissive faiths. That is, the societies most likely to send people to Kunruk (and to build temples there) may have their preferred gods, but none of them hold that those are the only gods. Consequently, one can find temples and shrines dedicated to an earth goddess native to Kunruk, a harvest god from a region to the southwest, a trio of faceless principles of nature (fire, wind, and water) from the east, and so on.

This is not to say that there is no competition between religions. Each temple quietly promotes the virtues of its own deities, listing miracles which have been performed and souls enlightened. However, the competition is carried out in the form of advertising, not violent sectarian conflict. Moreover, it's the smaller, less influential temples and shrines which shill for visitors. The members of the Synod are more restrained in their self-publicizing, relying more on reputation and control of public affairs.

The dwarves, for the most part, keep themselves apart from aboveground religious issues. They're willing to accept that the gods worshiped in Kunruk Above exist, but maintain that those gods are not the gods for dwarves. Instead, they venerate their ancestors, believing that they are far more interested in the welfare of their descendents than any distant deity would be.

Food

The native cuisine around Kunruk is fairly dull, consisting largely of flatbread, several onion-like vegetables (frequently simmered to enhance their mild sweetness), various beans cooked and mashed to a paste, and small quantities of mutton, often spiced, cured, and used in small shavings as a flavoring rather than a substantial ingredient on its own. The region produces a moderate quantity of wine, which is a staple of the local diet, usually watered down.

Nevertheless, the fame of the temples and the heavy traffic in pilgrims has introduced a great many new ingredients and cuisines. A quick pass through the markets of Kunruk Above can turn up a variety of other meats and meat animals, vegetables, whole grains and flours from a variety of cereals, even fish (smoked, salted, or dried, of course). Enough pilgrims come from nearby nations that several inns cater to their tastes, so its easy to find food to suit just about anyone's tastes.

For the dwarves of Kunruk Below, staple foodstuffs are varieties of fungus which need only rock to grow, taking the place of grains in human societies. However, the tunnels of Kunruk Below don't support as many strains of fungus and their byproducts as the tunnels from which the dwarves came, so the traditional dwarvish diet is restricted to a monotonous few crops. The basic foods in Kunruk Above and Below are therefore quite similar, but are prepared in traditional dwarven styles Below, with large cuts of meat more common than seasoned mutton shavings and most foods roasted or fried rather than boiled, and the dwarves prefer ale they make themselves to the local wine.

Society and Culture

Kunruk used to have a social character defined by tight-knit family groups living independently of one another in large compounds, herding animals or growing grain, fighting the occasional feud eventually settled by marriages and payments, and making donations to temples in return for mediation of otherwise intractable disputes. Because of the growth of the temples and the rapid transformation of Kunruk into an important pilgrimage site, much of that has eroded. Traditional family compounds in the hinterland still supply the city, but the extended family in Kunruk is under heavy attack. Eager younger family members frequently strike out on their own to make personal fortunes as tour guides, hostellers, and the like. Some families have survived by creating networks of businesses: a guide directs travelers to his uncle's inn, who recommends buying provisions from his brother, and so on.

Since literacy is relatively high as a result of religious education, Kunruk Above has developed the rudiments of popular literature. Pamphlets, usually four to 16 pages, are rented for a pittance (plus refundable deposit) from "word-shops," small booths where the proprietor keeps a chest of chapbooks and a ledger of rentals. Visitors read selections of useful prayers and healthful regimens, while natives go more for favorite folk tales and stories of adventure.

Despite increasing class struggle, the dwarves have maintained one core value: pride in workmanship. Craft skill is still the sign of a suitable candidate for marriage, political office, and general wisdom. They have nothing in the way of performing arts and this particular community has retained only a few of the classics of dwarven literature, but there is constant silent competition in the form of craft. Relief frescoes on houses, elaborately crafted lanterns, ornate buckles, and so on are always noted and the appearance of one's house and ornaments are always subtly judged by other dwarves.

Things To See and Do

Since it's a pilgrimage site, Kunruk Above is as welcoming to visitors as a low-tech city can be. There are plenty of places to find a meal fitting just about any dietary requirements, a place to bed down for the night to fit any budget, entertainments and conversation in many languages, and merchants who won't bat an eye at foreign currency. Here are some specific points of interest:

The Synod temples: The temple to Syvella and the Four Brothers have similar designs. Each has a triangular plaza in front, with gates into a walled compound at the apex and elaborate reliefs and statues along the two sides leading up to it (the side of the triangle opposite the apex is open to the streets). Through the gates is a broad, paved walkway flanked by gardens and small shrines, leading to the temple proper. The temple and central avenue are surrounded by special-purpose shrines, lodging for priests and important (or high-paying) pilgrims, offices, buildings for baths and taking vapors, treasuries and storerooms, and gardens. The temple complexes are open to all during daylight hours, but some parts (treasuries and private offices, for example) are closed to the general public, and only clergy and selected pilgrims may stay overnight.

Sacred baths: Several hot springs under Kunruk have been harnessed for neatly tiled and decorated nympharia in the temples. The baths are famous for healing powers, and visitors to the temples frequently wash or soak in the waters during their visits.

Holy vapors: The original attraction of Kunruk was underground chambers where one could breathe vapors coming from the ground and receive sacred visions. Each of the temples of the Synod has several cells where pilgrims may, for sufficient donations, have their own mystic visions.

Gateway Circus: The way from Kunruk Above to Kunruk Below is at the southern outskirts, of the city, Gateway Circus. The Circus is a circular pit about 25 feet deep and over 100 feet across. A 15-foot-wide spiral ramp makes a grand curve almost entirely around the pit, and the center is generally the place to buy from or sell to the dwarves.

Kunruk Below is less well adapted to visitors, and the dwarves themselves aren't terribly happy to see strangers. Technically, humans are only allowed to visit the central market in Kunruk Below freely. Special permission is required to enter the deeper tunnels.

Residential cavern: The tunnel from the Gateway Circus continues in a broad spiral down another 40 feet or so, through fortified gateways to an opening 20 feet above the floor of a large, domed cavern, with a ramp leading down to a plaza the size of the Gateway Circus. This cavern, a vaguely oval blob about 150 by 200 yards with a ceiling up to 50 feet above floor level, houses most of the dwarven settlement. Though this would be fairly small for a human settlement, the dwarves have made the most of the space. The cavern is filled with tightly packed stone houses three or four stories tall lit by bioluminescent fungi or magically glowing crystals, with semi-public workshop spaces on the ground floor and residential spaces higher up. A few extended families, distributed between houses, have built covered walkways over the streets or access tunnels under them, allowing them to move from one house to another without going "outside." Outsiders don't formally need permission to come here, but they'll be questioned and watched closely, and they can't enter any other tunnels without permission and an escort.

Ore tunnels: Several large tunnels lead out from the residential cavern and quickly branch and twist, following veins of various ores. The dwarves have an elaborate set of symbols indicating where the tunnels lead, but someone not intimately familiar with dwarven mining practices will quickly become lost. Though most of the population lives in the residential cavern, a few small families, stand-offish even by dwarven standards, have established homes in disused

areas of the ore tunnels.

Vent shafts: All of the tunnels are punctuated here and there by ventilation shafts leading to the surface. They're often concealed, but since most are excavated by hand (except for those taking advantage of natural fissures in the rock), they're usually large enough for someone to squeeze through. Small smithies are set up in a number of locations in the ore tunnels immediately beneath ventilation shafts.

Foundry: In addition to the ore tunnels, there's one other major branch off of the residential cavern. It heads north and sharply downwards, leading to what's usually called the foundry. In an extremely hot cavern, the dwarves take advantage of roiling pools of lava to raise the temperature of furnaces or simply increase air flow through them. This volcanic resource allows them to reach high temperatures more quickly and cheaply than the norm and is a point of pride among the dwarves of Kunruk Below. Unfortunately for outsiders, the design of the furnaces is a dwarven craft secret, so no one other than the natives is allowed in.

Kunruk in the Campaign

Kunruk is, first and foremost, a destination. It's a good place to go for decent equipment (particularly for characters who are otherwise in the middle of nowhere), provisions, trade opportunities, and mystical advice. If they're not going there for reasons of their own, PCs could easily be hired as guards for a caravan of merchants or pilgrims. Kunruk is also an excellent venue for diplomacy and, therefore, intrigue. Adventures could include negotiations between the Synod and the High Chief, mercantile wrangling, class, occupational, and generational conflict among the city's factions, and diplomats from nearby nations meeting on Kunruk Above's neutral and sacred ground.

Kunruk might also serve as a base of operations, although that's perhaps not the best use. It's a long way from anything else interesting, and hardly anyone in Kunruk is *from* Kunruk, so while it's a nice place to visit, not nearly as many people actually live there. Still, PCs could be agents of the Synod, merchant importers resident in Kunruk, or among the few dwarves who go much beyond the Gateway Circus. Here are some other ideas for adventures involving Kunruk:

Holy Cleansing: An oracle has spoken, and Kunruk must be cleansed of the impure. That means the dwarves. This causes a considerable ruckus in Kunruk Above, where the population is divided on the authenticity of the oracle. It causes an even greater ruckus in Kunruk Below, where the dwarves have blocked the tunnel from the Gateway Circus. If this turns into actual fighting, it will likely become an ugly guerilla conflict, with outnumbered dwarves trying to fend off less skilled but far more plentiful humans invading their dark, narrow tunnels.

Missionary Man: For all the decades they've lived there, the dwarves have appeared immune to the fumes which seep through the rocks and cause ecstatic visions in humans. That's about to change. A few dwarves, working in obscure corners of the Foundry or the northern ore tunnels, start to have visions themselves. They now claim that the ancestors and distant gods of the earth are providing them with guidance. They'll almost certainly be at odds with their elders, and definitely with the Synod. As if the old factions aren't complicated enough, a new line of revelation will cause them to split into more factions, both above and below.

"Historically Taunton is a part of Minehead already": In the centuries since the dwarves of Kunruk Below settled in their caverns, things have changed in their homeland. An expansionist faction has taken control, they've tracked down their exiled faction, and they want to take control. The dwarves of Kunruk Below are looking at a likely invasion, and the people of Kunruk Above are looking at, at best, a violent conflict beneath their feet. Will they aid their stand-offish neighbors? Will they have a choice?

Mudslide!

for the *d20 System*

by Michael Tresca

Combat on mountains is an all too common occurrence. Add in the preponderance of fire-spells and transmute rock to mud and you have a recipe for disaster. Enter a nature's murky villain, the mudslide, also known as a lahar. Not quite mud, not quite rock, lahars are a deadly combination of water and earth, with the worst traits of both.

Starting a Lahar

In nature, lahars are normally generated in one of two ways: as a reaction to extreme heat, such as a volcanic eruption, or as a result of a large quantity of water striking a mountain's icecap. In all cases, frozen ice in elevated climes is a necessary component to start a lahar.

Terrain Type	Likelihood of Lahar
Cliff	15%
Steep Slope	10%
Gradual Slope	5%

There are also modifiers for the climate of the terrain. Cold climates are more likely to start a lahar because there's more frozen water than warmer climates.

Climate Type	Likelihood of Lahar
Warm	-5%
Cold	+5%

And then there's the weather. Heavy downpours can cause lahars.

Weather Type	Likelihood of Lahar
Hurricane	+5%
Thunderstorm	+4%
Precipitation	+3%
Heat Wave	+2%

Spells used in the vicinity of Cliff, Steep Slope, or Gradual Slope terrains can trigger a lahar. Certain spells that have the fire descriptor have an additional 2% chance per spell level of the spell to trigger a lahar, including *burning hands, delayed blast fireball, fire seeds, fire storm, fire trap, fireball, flame arrow, flame strike, flaming sphere, incendiary cloud, meteor swarm, produce flame, scorching ray,* and *wall of fire*. Spells that have the earth descriptor have a 1% chance per spell level of the spell to trigger a lahar, including earthquake, move earth, repel metal or stone, soften earth and stone, stone shape, and transmute rock to mud. Note that earthquakes always trigger avalanches, but not necessarily a lahar. Control weather can also cause a lahar depending on the weather (see Weather Modifiers, above).

In an area where a lahar is possible, these effects can be cumulative. For example, if a wizard casts fireball (+6%) and then transmute rock to mud (+5%) in a cold (+5%), mountainous area with a steep slope (+10%), the likelihood of triggering a lahar is 21%.

Burrowing creatures that have a fire attack like the thoqqua or remorhaz have an additional chance of triggering a lahar equal to the damage it inflicts. Red dragons are fond of breathing on cliff faces to cause such lahars.

Once a lahar erupts, it slides downwards at a speed proportional to how steep the slope of the mountain is.

Mountain Terrain	Lahar Speed
Cliff	500 feet/round
Steep Slope	350 feet/round
Gradual Slope	250 feet/round

Outrunning a lahar isn't the smartest thing to do, but some creatures might not have any other choice.

Dangers of Lahars

Impact

The typical lahar has a width of 1d6×100 feet, from one edge of the slide zone to the opposite edge. The bury zone in the center of the lahar is half as wide as the avalanche's full width. To determine the precise location of characters in the path of a lahar, roll 1d6×20; the result is the number of feet from the center of the path taken by the bury zone to the center of the party's location.

A lahar consists of two distinct areas: the bury zone (in the direct path of the falling mud and ice) and the slide zone (the area the mud spreads out to encompass). Characters in the bury zone always take damage from the lahar; characters in the slide zone may be able to get out of the way. Characters in the bury zone take 8d6 points of damage, or half that amount if they make a DC 15 Reflex save. If the character makes his save, he stays afloat (see below). Failing the save means he is buried and continues to take damage every round until the lahar stops.

Characters in the slide zone take 3d6 points of damage, or no damage if they make a DC 15 Reflex save. If the character makes his save he avoids the lahar entirely. Failure means he is swept up in the lahar and continues to take damage every round until the lahar stops.

Staying Afloat

Characters who survive the impact of a moving lahar must make a DC 20 Swim check every round to simply stay above the surface, or a DC 30 Swim check to move 5 feet in whatever direction is desired. If a trapped character fails this check by 5 or more, he sinks below the surface and is considered buried. Success means the character continues to take 8d6 points of damage per round but can still breathe.

Buried

Once a lahar comes to a stop, it has the consistency of solid concrete; all buried characters are considered pinned. Each buried characters takes an additional 1d6 points of nonlethal damage per minute while pinned. If a pinned character falls unconscious, he or she must make a DC 15 Constitution check or take 1d6 points of lethal damage each minute thereafter until freed or dead. Creatures can be buried 1d100 feet beneath the surface of a lahar.

Prevention

Spotting a Lahar

Characters can make a DC 20 Survival or Knowledge (nature or geography) check to recognize signs of a lahar. A lahar can be spotted from as far away as 1d10×500 feet downslope by a character who makes a DC 20 Spot check, treating the lahar as a Colossal creature. If all characters fail their Spot checks to determine the encounter distance, the lahar moves closer to them, and they automatically become aware of it when it closes to half the original distance. It's possible to hear a lahar coming even if you can't see it. Under optimum conditions (no other loud noises occurring), a character that makes a DC 15 Listen check can hear the lahar when it is 1d6×500 feet away. This check might have a

DC of 20, 25, or higher in conditions where hearing is difficult (such as in the middle of a thunderstorm).

Controlling a Lahar

Spells that can alter the path of a lahar might prevent it from doing too much damage. *Move earth, stone shape,* and *wall of stone* can all help divert the path of the lahar away from endangered creatures.

Stopping a Lahar

Stopping a lahar isn't easy. Two spells that can halt a lahar are *transmute mud to rock* and *control water,* which may well end up turning the lahar into an avalanche instead. *Transmute mud to rock* reduces a lahar's speed by two steps. Using *control water* to lower water reduces the lahar's land speed by one step. If a lahar is traveling down a cliff face, it merely becomes an avalanche instead but keeps bouncing along. If the lahar's land speed is reduced below 250 per round, it grinds to a halt. All creatures buried beneath its surface are still pinned, of course.

Lahars in Fantasy

Lahars are most often associated with flash floods, but a volcano that hasn't fully erupted can precipitate them. When a volcano erupts, lahars precede the molten lava that inevitably follows, but some volcanoes merely "burp," heating up enough to melt the ice caps without actually disgorging any lava.

Lahars tend to follow the paths of rivers, which also happens to be where many humanoid settlements make their homes. Lahars tear up trees, sweeping them along in a terrible morass of mud, ice, water, and debris. Lahars create deserts afterwards, scouring the earth clean of all features.

Creatures with the fire subtype are fond of creating lahars to destroy their enemies from a distance. The conditions must be right to cause such an attack and are not taken lightly; lahars destroy mountain homes as much as they ruin valley settlements. Fire giants rarely use these tactics, but red dragons, who can cause lahars far from their own lairs, are only too happy to start a lahar.

The creature most likely to accidentally start a lahar is the remorhaz. It has the deadly combination of living in polar conditions with the ability to rapidly heat its surroundings. More than one excited remorhaz has caused the death of thousands when battling an opponent at the top of a mountain.

For spell casters, the most efficient minion to create a lahar is the thoqqua. Thoqquas burrow into cliff faces, steaming holes behind that sometimes collapse into lahars. Alternately, spell casters just might choose to create a lahar with rock to mud or soften earth and stone.

Few creatures can actually survive a lahar, but even fewer can use it to their advantage. Two monsters of note can, should they be so inclined, easily use lahars to devastate a region and even attack characters trapped within it: xorns and earth elementals. Lahars flow around them like water, making them extremely deadly opponents. Although lahars are made of mud, aquatic and water subtype creatures are just as helpless as their land-bound cousins.

A 12-Step Master Plan for Supers Teams

by Brian Rogers

When starting a super hero game, you'd likely think the PCs will be a team of costumed heroes with super-powers. Even if they are, what sort of heroes will they be? on what kind of team? in what nature of world?

While a campaign prospectus and a discussion of the comics continuum help, here is another tool. This questionnaire makes world creation a cooperative process between the players and the GM, not unlike the multiple city creation for a league. Some GMs might skip the prospectus entirely, while others might have a tighter prospectus description to keep control of world creation or selection.

There is also a worked example, using the following prospectus entry:

> *The Odyssey:* in the early 1970s a team of explorers became more than human; in a world where
> Firestorm Effects have been seen as a threat, this group becomes the first publicly accepted super-
> heroes. This game is a teaching tool for players who have problems adjusting to super-hero tropes,
> so it will have a 4-color sensibility and public heroism. Game system: *Silver Age Sentinels.*
> Influences: *Fantastic Four, Tom Strong.* Players -- Asha, Dave, Stephen.

1) How close are your PCs? Are you a family (Fantastic Four), people who live & work together (X-Men), people who work & socialize together (Avengers), people with scheduled team meetings (Justice League) or people who only meet for emergencies (Alpha Flight)? This has a big effect on party interactions and types of adventures.

As GM I participated in the FE Explorers creation session, offering the idea of PCs as being the crew of an exploratory sub (the *Odyssey*) who socialized & worked together. The players liked the idea, but Asha preferred "live & work together" to strengthen the team bond. The others agreed, conceiving a floating research platform as their home/offices, the PCs as brilliant Cal Tech grads/business owners, and developed a 1970's counter-culture ethos. This ran against my vision of clean-cut heroes, but it did fit the time and place.

2) What is your place in the team's Gestalt Personality? Supers teams commonly have strong personalities, with each member of the team embodying one aspect of a full psyche.

The players decided Asha would be the group's passionate drive, David its creativity, and Stephen its grounding cynicism. Stephen was picturing a student whose lapsed deferments led to a tour in Vietnam, while David saw a scientist/musician ala Buckaroo Banzai. This gave me a clear idea of how the group would work: Dave being central but interested in creation for creation's sake, with Asha pushing him to change the world and Stephen reminding them of their limits.

3) What do you provide *besides* your powers? This need not be skills -- curiosity or positive outlook also contribute. Heck, you could provide Eye Candy, because a pretty face has its uses.

Asha claimed the role of Marine Biologist to go with David's physicist/musician and Stephen's ex-marine tactician & mechanic. Given his interest in tai chi and desire to be a "scientist of action," David added martial arts to his skills. Asha became the group's spokesperson and financier, via a family inheritance.

4) What is the group's agenda? A super-hero's overriding concern is Defending Humanity (heroes can't sit by while aliens conquer the world), but others are Crime Fighting (an organized "war on crime": Batman, Daredevil), Exploration (searching for wonder: Fantastic Four, Tom Strong), Adventure (trying to help people

in a general fashion: Spider Man, Starman), a group goal (the X-Men's defending mutant-kind) or just full-time humanity defending (Superman).

Given the prospectus, Exploration was a must -- as GM I wanted a game with a *Fantastic Four* feel, so I stated that up front. The players added a desire to save humanity. As part of the 1970's aquaculture idea they hope to save the world via harmony with the sea.

5) How do the heroes resolve conflicts? Classically, crime-fighters intimidate, explorers convince, and adventurers charm. In fights, explorers defuse them or trump their antagonist's powers, crime-fighters arrange for tactical superiority, and adventurers will engage in swashbuckling fisticuffs.

As explorers, the players felt the *Odyssey* crew would use scientific prowess to out-think their opponents, but if that that failed they had no problem with brawling. Rather than being diplomats, they rely on charm and sarcasm to butter up or cut down people.

6) How does the group interact with other super-heroes and the populace? You might be the world's first super heroes, its most powerful, or just another team. Normal people might lionize you, fear you, or marginally acknowledge you. The world might be full of other super-humans but not a lot of super-heroes, or everyone with powers could be part of the cape and mask set.

The prospectus set this in the Firestorm Effect world as the first true FE super-heroes (a non-negotiable point, since this is a teaching exercise). The players accepted this, but subverted it with their scruffy, counter-culture nature. They might be super-heroes but they would not be lionized, having just as many detractors as advocates.

7) Did your heroes have heroic careers before joining the team? Some teams have single-event group origins (Fantastic Four), some have similar origins with possible past careers (i.e. all X-Men are mutants), and others have unique origins and histories (the Justice League). Heroes who start solo are more versatile while team heroes are more focused; some teams have a mix of both.

This game's set up leant itself to a single event group origin for an existing team, and the players went with it. They let me create an "origin story" session -- discovery of a crashed space ship in the Mariana Trench.

8) If your heroes had (or have) a solo career, do they have allies, contacts, sidekicks, etc. only called upon when working solo? (i.e. Batman doesn't call Robin into *Justice League* business.) Does the team have shared capital to draw on? Solo assets are less useful for the team, functionally being more chrome than assets designed for team play.

I'd thought they'd start with contacts and fame, but they limited their contacts to the CalTech/West Coast science community and 15 minutes of fame from rescuing a NASA astronaut. The team does have shared resources in their company (their sub, floating base, small team of interns), and Stephen volunteered to pick up a sidekick sub driver/medic to run the sub while the PCs explored the new world of the week.

9) Does your team have an established foe? This needn't be related to their origin or all of their challenges, but it may. Lex Luthor causes most of Superman's problems; Magneto about half of the X-Men's; both of these are key adversaries in a way that the Masters of Evil are not for the Avengers. The rivalry needn't happen immediately (Dr. Doom doesn't appear in *Fantastic Four #1,* after all).

I let the players know if they decided to go this route I had something in mind. They responded "oh, why not." I therefore wrote in Donar, a eugenically bred Argentine Nazi who was involved in their origin story. The players didn't know this at the time, as they were leaving the origin to me.

10) Do the heroes have an identifying uniform or symbol? This ranges from the Fantastic Four's team uniforms, the X-Men's shifts between team uniforms to individual ones, and the Avengers and JLA being individual. This is a good point to discuss masks and the attendant secret ID issues.

The players immediately adopted the team logo (their sub profile), but Stephen deep-sixed costumes. Instead, they have advanced wetsuits that duplicate team costumes -- distinctive and form fitting -- while being functional. No secret IDs; those aren't appropriate for the close-knit explorer team.

11) If you have a group origin, is there a common theme in your powers? (The Fantastic Four functionally have elemental powers, Mutants share high endurance.) If you have divergent origins, were you recruited to fill a niche on the team? (The Avengers and JLA rosters are selected this way.) This will affect power designs.

I suggested with the ship name *Odyssey* the PCs could have powers mapped to Greek Heroes, but the players shot this down. David had been mulling quantum/wormhole/gravity powers, which wasn't very mythical. Asha wanted marine animal powers. Those didn't match each other, so theme powers got ditched.

12) Finally, what are your heroes' powers, and how powerful are they? This question is last to emphasize the other supers character aspects.

David added intangibility, anti-gravity leaps and open-ended "quantum powers" to his wormholes, and it became clear that he would be broadly potent, but not a heavy hitter. All the players pitched things to do with quantum powers, helping David play the genius physicist.

Asha's core idea was bio-luminescence and pigmentation invisibility. Group discussion turned this into mutated skin that also absorbed 0_2 from water, became frictionless for high-speed swimming, boosted her strength, protected her from cold, and generated electricity; they also made her team logo a tattoo and put her into a bikini for some fan service. Not as flexible as the others, Asha has a laundry list of defined tricks. Stephen had the image welding with a fingertip and slicing steel with his hand, and the group snowballed that into short-range thermal powers, including a bullet-melting heat field and ice creation. That turned a one-trick pony power into a more potent one. I was pushing for that, as the game was a teaching tool on high-end heroes rather than the adventurers with limited powers that Stephen gravitated toward.

The Thirteenth Question: Niche Protection.

Super teams in games normally have concerns about niche protection: making sure each PC contributes something unique. While this questionnaire, gestalt personalities and leagues stress that powers aren't the only niche indicators, players understandably don't want teammates whose powers make theirs irrelevant.

One way to prevent this is investing in their niche with a Signature Cost. Players spend extra points to stake out powers, and any future character must match that cost to duplicate the power. If two players want the same power during character creation they can bid on it, one can abandon it, or they can come to some other price arrangement if they agree to share it. Essentially, the players are determining the frequency of certain powers in the game world.

The old Mayfair *DC Heroes* had something similar, with powers having a Base Cost which combined general utility, campaign restrictions and rarity in the DC Universe. Signature Costs are different because the first player (or the GM) to build a character with a power sets the cost for all who follow. This isn't meant to block "energy blast" or "flight," but instead the methods used to get those effects in game: the hows of the power rather than the whats. For powers producing similar effects via a different method, the signature cost should be at least half of the PC-driven one.

For example, Stephen wanted to make his heat-based physique iconic so he paid 10 extra points in Signature Cost. If I-as-GM built another character with a flaming hand, bullet melting flame field, etc., I'd have to spend 10 points as well. If I included a pyrokinetic who caused things to combust on sight the minimum Signature Cost would be 5 points, as the power is visually and systematically distinct. However, if I wanted pyrokinesis to be equally rare I could spend all 10, or even more, to lock in that niche. Even if I spent 20 points to keep pyrokinesis unique, the future cost of flame based abilities (say, a flame-gun, or fire animation) is still based on the *player's* initial investment of 10 points -- the first entry is the baseline when setting Signature Costs. Finally, a character with a lighting blast and an electrical field that defected bullets would be able to set an entirely different Signature Cost for electrical powers, even though both powers have energy blasts and offensive force fields.

Continuing the example, Dave invested a high Signature Cost in wormhole generation -- he wanted teleportation to be rare, and his wormholes to be unique. Asha spent *no* points on water survival, because she wanted water-based adversaries. She did drop some into her chameleon-skinned invisibility, figuring that too many invisible people would make the power less useful. Stephen cannily set a low cost on ice generation, since his signature flames will let him cinematically dominate other ice generators.

Signature Cost is also a good tool for the GM. It makes it clear which abilities players consider important to their character concept. It also indicates which they *do* want to see duplicated: Dave set no Signature Cost on his martial arts or super-leaps because he *wants* wixua kung fu battles. It provides a fair metric for limiting some difficult powers: if no players have staked out super speed or mind control GMs can make those expensive signature powers for an NPC, limiting their appearances in the game world by a mechanic other than GM fiat. Finally, it makes this supers universe feel different from any other, as the frequency of powers will fall outside of the norms.

Signature Cost does not make sense for groups that are more concerned about the tactical aspects of supers: other methods of niche protection won't disturb the balance between the characters point cost and their in-game effectiveness. For groups who measure the characters effectiveness by screen time or unique concept it is a powerful tool for staking out territory, not just with the other players but with the GM.

* * *

Thanks to Stephen & Asha Shipman and David Bicking for acting as guinea pigs.

Mile High

for *GURPS*

by William H. Stoddard

Giants in fantasy campaigns are usually the size of very large animals; a typical giant might be anywhere from 12 to 50 feet tall (roughly SM +2 to +5). But legends and literature include some giants who are far larger, often so larger that they can be mistaken for part of the landscape, especially if they're asleep or dead. Some mythological giants are so huge that after they're killed, their dismembered bodies can be used to make the entire world. Other giants lie asleep beneath the landscape, like Finnegan in James Joyce's *Finnegans Wake,* who lies dreaming beneath present-day Dublin.

Mile High is a giant of the latter kind. Long ago, he fell asleep in a valley between high mountains. He slept so long that erosion covered him, making him look like a row of hills. Later, human settlers came up the river that flowed past his sleeping form, and built on its banks, and then up the slopes of his buried form. The town they built, Goldenstream, became a center of trade, where human and dwarven miners brought the products of their miners and sold them for food, clothing, and luxury goods; but it also was a center of magic, because its hills are a high-mana area where anyone can learn and cast spells.

Most of the town's residents have no idea what lies sleeping beneath their basements. The older dwarves of the surrounding mountains have records of Mile High, but they don't talk about him much; for one thing, they're afraid that saying his name might wake him up. There are rumors about him, ranging from fairly accurate to wildly distorted.

Mile High isn't actually a full mile high; he stands 4,400 feet tall. The early explorers who glimpsed him awake rounded off. None of them wanted to come close enough for him to notice them!

Campaign Uses

Mile High can be used in a campaign in two different ways: He can be a passive, sleeping presence for player characters to investigate, or he can actually wake up and take action that they have to deal with.

To start with, he can be an urban legend. This approach can work even if he doesn't actually exist; the legend may be based on the shape of the hills above Goldenstream and on the human tendency to anthropomorphize what we perceive. On the other hand, it may derive from sightings of Mile High before he fell asleep -- or was cast asleep by some potent enchantment. Adventurers looking for information may hear of him in tavern gossip or read about him in some archive of decaying scrolls.

Or his existence may be better known than that. Miners or architects tunneling under the city may have dug deep enough to find strata of tough skin; they may even have caused local earthquakes when their efforts to dig through his hide troubled his sleep. Or mages may have investigated the source of the high local mana levels, tracing the mana flow beneath the ground, or even seeing the outlines of parts of his sleeping form. Perhaps his entire form can be seen from the air, by a mage who has mastered flight spells.

If such investigations have been going on for a long time, he may even be a military or political asset. The town's rulers may know secret rituals that can awaken him, in some last extremity of danger, to fight against a besieging army, at the cost of the mansions built on his slopes, and perhaps of his stepping on a few buildings. Or some power-hungry sorcerer may be working on spells to awaken him, control him, or tap his vast store of mana. He could even be a potential ally for the city's commoners, in a storyline about medieval class struggle -- an embodiment of revolution in physical form, to be awakened when the time is right.

If he actually starts to wake up, a team of wizardly adventurers may be called upon to put him to sleep again. This will probably call for ceremonial magic; casting Sleep on him is going to cost 68 energy and take 30 seconds, and the caster will face substantial penalties if he's far enough away for safety, especially if Mile High is still hidden underground, so multiple attempts may be needed. GMs should assume that once Mile High is sent to sleep again, he'll go on sleeping after the Sleep spell wears off, unless some specific emergency wakes him.

If this spell doesn't work, or no one attempts it, adventurers may have to deal with a gigantic form wandering over the landscape, stepping on walls and buildings and scooping up entire herds of cattle or fields of grain for a snack. Any GM who has seen classic Japanese *daikaiju* ("giant monster") films will find suitable ways to develop this theme. Raw physical force, especially in a medieval setting, probably won't do any good, and may risk provoking Mile High's Bad Temper; even a ship's gun from the Age of Sail won't do more than sting him, though an entire broadside from a large ship might be able to cripple one of his limbs. Magical or alchemical equivalents of the "oxygen destroyer" from *Godzilla* would be a likelier weapon. Adventurers may be either the brilliant enchanters called in to create these, or the elite guards assigned to keep them safe while they devise their miracles.

On the other hand, it might be safer or more useful to befriend Mile High. He could just be sent off to sleep, perhaps with vast quantities of ale or brandy, or perhaps with multiple doses of a sleeping potion mixed into food or drink. In an "urban legend" treatment, the city could have an annual festival that looks back to such an incident; adventurers might gradually discover the story behind the public feasting, drinking, and reveling. Themes of class conflict might be woven into this, with the poor getting one good meal a year and a chance to swagger about the streets.

If the city is also faced with an invading army or some other threat, Mile High might be talked into helping fight it off. Adventurers might even need to keep him safe from the other side's enchantments. Or if the other side has a giant of its own, they could have to help him in a battle of titans -- again, a theme that can find inspiration in Japanese films!

A group of adventurers might even awaken Mile High deliberately, as a last resort against such a threat -- and hope they could gain his cooperation when he woke up. Getting the city's rulers to agree to this could be a story arc in its own right, given the amount of collateral damage that Mile High can cause. Or if the heroes of the story don't bother to ask for permission, they may have to flee the city after saving it.

Most of these approaches can be played out in varied styles. In a light fantasy, for example, Mile High may be more clumsy and boastful than malevolent; he can even be played as an inconvenient guest who's eating his hosts into the poorhouse. In a dark fantasy, he may treat human beings like annoying insects to be smashed, or even as hard-to-catch delicacies to be eaten. The mythic heroes of very high fantasy may even be able to deal with him as equals, like Hercules offering to hold up the sky for Atlas.

Character Description

Mile High   15,800 points

ST 7,500 (Size, -80%) [14,980]; *DX* 10 [0]; *IQ* 8 [-40]; *HT* 12 [20].
SM +17; Damage 751d/753d; BL 11,250,000 lbs.; HP 7,500 [0]; Will 12 [20]; Per 8 [0]; FP 12 [0].
Basic Speed 5.5 [0]; Basic Move 150 [725]; Dodge 8.
4,400'; 29.5 million tons.

Social Background

TL: 0
CF: Giant
Languages: Archaic Giant Speech (Native/None) [-3].

Advantages: Damage Resistance 10 [50]; Doesn't Breathe (Accessibility: When sleeping, -10%) [18]; Doesn't Eat or

Drink (Accessibility: When sleeping, -10%) [9]; Hard to Kill 4 [8]; Mana Enhancer 1 (Area Effect: 1 yard radius, +50%) [75]; Nictitating Membrane 2 [2]; Reputation +4 (Too dangerous to attack; always recognized; folklorists) [7]; Single-Minded [5]; Terrain Adaptation (Ordinary solid ground) [5]; Unaging [15]; Universal Digestion [5].

Perks: Accessory (Digging claws: can dig without a shovel); Penetrating Voice; Wakes up in emergencies. [3]

Disadvantages: Bad Temper (12) [-10]; Bestial [-10]; Innumerate [-5]; Low TL 4 [-20]; Poor [-15]; Sleepy (All the time) [-32]; Slow Riser [-5]; Social Stigma (Monster) [-15]; Stubbornness [-5].

Quirks: Alcohol Intolerance; Code of Honor (Will not cheat at riddle contests); Likes (Alcohol); Proud; Uncongenial. [-5]

Skills: Artillery (Bombs)-7 [1]; Brawling-10 [1]; Expert Skill (Bardic Lore)-6 [1]; Games (Riddles)-9 [2]; Intimidation-11 [1]; Survival (Mountains)-11 [12].

Notes: Given his massive weight, Mile High would normally be in danger of sinking into ordinary soil, and only able to walk on hard rock; his Terrain Adaptation lets him walk on any ground that would hold a normal man. His Penetrating Voice is not shrill, but a low rumble that shakes the ground and the walls of buildings. The cost of his Sleepy disadvantage is extrapolated from the standard table: a normal man sleeps 8 hours a day for 0 points, and each extra 4 hours a day is worth -8 points, so sleeping 24 hours a day is worth -32 points. His Perk lets him overcome his sleepiness in emergencies or major disturbances; he spends much less than 1/24 of his time awake, and has not awakened in decades.

Mile High's usual attack amounts to stepping on people or larger targets. This is a trample that inflicts 751d of crushing damage, almost always as a large area attack. He can also drop rocks on exceptionally tough foes. A rock dropped from a height of 3,600 yards has a terminal velocity of 200 yards/second (Move 200); if it weighs 5,600 tons (his Basic Lift), it has 1,790 HP and inflicts 3,580d of crushing damage. A round rock with this weight is about 17 yards in diameter (SM +8) and counts as a large area attack against a human-sized target. He typically spends a long time lining up each rock with its target: the maximum extra time bonus, +5, gives him an effective Artillery skill of 12.

Pyramid Review

Easter Island

Published by Twilight Creations, Inc.

Designed by Odet L'Homer & Roberto Fraga

Art by Kurt Miller

Layout & design by Kerry & Todd A. Breitenstein

16 plastic Moai pawns, mounted game board, Sun tokens, rulebook; full color, boxed, two players; $24.99

Easter Island. Strange. Alien. Imposing. Full of these big stone head thingies.

If you've not visited Wikipedia, this small island in the South Pacific is dotted with gi-normous stone heads called Moai, silent sentinels that stare out to sea. If you think that's the only attraction for tourists, though, think again. Twilight Creations, Inc. wants you to believe that these massive idols (?) are actually part of a great and magical contest played out between powerful but unsung mages from the history pages of *Easter Island.*

The object of the game is to eliminate most of your opponent's pieces before he takes out yours.

The game plays out on a map of the island, or more accurately a grid superimposed over it. In the center of the land, 25 points in a five-by-five square, connected by lines. Around the landmass, a circle with 20 points, five on all four sides, pointing inward toward the grid. The players start by placing four of their pieces each onto the grid; the pawns are in the shape of the great Moai heads (with a little bit of their body thrown in). Players then harness the rays of the sun to blast each other's heads into pieces.

Each turn, a player gets two actions: place a new Moai, rotate one already on the board, move one in a straight line, place a Sun token, or "fire" a Sun token. Moai only operate on the grid in the middle of the board, and the tokens are only placed on the circle. When you activate a Sun token, it shoots a concentrated beam of light toward the grid (flip the counter over -- it only shoots once, and no one can place another token on that space for the rest of this game). If it hits a statue from the front or back, it eliminates that unit. If it hits it from the left or right, however, that Moai reflects the ray in the direction it's facing. The same ray can bounce around the board several times without taking out anything if it keeps striking things from the side; in this case, it destroys the last unit hit or the first unit struck twice by that same beam. Play continues until one player is reduced to only one Moai on the board (so get those extras into play), in which case his opponent wins.

The board is a lovely piece, and something to marvel at in this day and age. Not that Twilight Creations normally puts out a chintzy component, but a full, mounted, foldout map board? It's a rare and dying breed, it is, and this one has a lush illustration of the island. And for $25? Perhaps not unheard of, but certainly worthy of note. The Moai units are really nice, plastic, with quality sculpting and triangular bases that players can have endless fun with even before the game begins, lining them up in new patterns. The worst bit in the game is the Sun tokens, partly because they're "just" punch-outs that pale by the unfair comparison to the other components; and partly because, while the black tokens are readily recognizable, the gray can blend into the board graphic in a few spots.

Something else you can usually count on Twilight Creations for: rules with unexplained holes in them. Nothing here

breaks the game, but if the players have to break from the game to discuss a point, it can kill the mood. Can you destroy your own units with your sun rays? It seems pretty clear you can (and that such a danger adds to the challenge), but that's the sort of thing a gamer likes to have spelled out for him, lest he be savaged by rules lawyers. The beginning of the instructions make it sound like a statue is needed to focus the sunlight's power, but you can shoot someone directly with your Sun token -- that kind of thing.

But underneath the featherweight complaints is a good, solid, playable game, the sort of exciting new strategy exercise that fills the void when classics like chess or **Feudal** are too heavy. There are ways to cleverly turn the tables to your advantage, and the game strikes a fine balance between forcing you to think about your approach and keeping the mechanics simple enough to let you work your will on the outcome. Although the backstory on the box is more overly fanciful than you'd expect, the execution of **Easter Island** is far more substantial.

Pyramid Review

Karak Azgal: Adventures of the Dragon Crag (for *Warhammer Fantasy Roleplay*)

Developed by Green Ronin Publishing

Published by Black Industries

Designed & Written by William Simoni with Robert J. Schwalb

Cover by Mark Gibbons

Interior Art by Alex Boyd, Tony Parker, & Adrian Smith

Cartography by Robert Lazzaretti

98-Page Black & White Hardback; $24.99

Warhammer Fantasy Roleplay does not do dungeons. *Warhammer Fantasy Roleplay* has never done dungeons. Well actually, neither statement is true. In their original incarnation, the *Doomstones Trilogy* for the game's first edition were adventures designed for *Advanced Dungeons & Dragons, First Edition,* and if some of the locations described therein were not dungeons . . . As for the new second edition of the game, the arrival of *Karak Azgal: Adventures of the Dragon Crag* gives almost all of a dungeon that a Warhammer Fantasy Roleplay GM could ever need.

In the case of Karak Azgal, it not only gives, it also takes. Quite literally so, because not only do the adventurers have to pay to get into the dungeon, they also get taxed on the way out! Of course, dungeon delving as an industry is not new, having been seen before in the *Big Rubble* for *RuneQuest* and *Parlainth: City of Adventure* for *Earthdawn.* Indeed it can be seen in the recently released *Ptolus, City of Adventure.*

Nevertheless, the straight dungeon of classic gaming is still alien to the Old World of *Warhammer Fantasy Roleplay,* so it is no surprise that both it and this supplement is set far away from the game's center of action in the Empire. Karak Azgal is located far to the South between the Badlands and the Border Princes, beyond the Black Fire Pass at the end of the World's Edge Mountains. Just getting there is an adventure in itself! (Though that lies outside the scope of this supplement.)

Karak Azgal was once Karak Izril, a wealthy Dwarf hold that fell to attack from above ground by Orcs, and below by Skaven. It became home to a dragon; the dragon's riches that were taken eventually by the Dwarf who killed the dragon, Skalf the Dragonslayer, to rebuild the city as Karak Azgal. It sits above Dragon Tail Pass, on top of a complex of underground passages, shafts, rooms, caves, temples, homes, and mines that reaches deep underground. There are riches to be had for the brave adventurer, from coins and gems to metal ore and Dwarfen artifacts, but the Dwarfs of Karak Azgal do not want any of their lost treasures to fall into the wrong hands. To prevent this, access to the various entrances below are tightly controlled and guarded, charging a toll to all who enter, and taxing everything brought out. That is, if they do not confiscate them outright. Of course, if the adventurers deplete the Goblin, Orc, or Skaven population at the same time, all the better then for no Dwarfen life has been lost.

Despite the tight controls, the prospect of wealth is still a draw for many, not just adventurers, but entrepreneurs,

businessmen, thieves, and con artists, who mostly reside in Deadgate, the lawless, ramshackle shanty town outside of Karak Azgal. Open 24 hours a day, it is dominated by pleasure palaces, gambling dens, fighting pits, and taverns, all dominated by a single crime lord who hates the Cult of Ranald, the god of thieves. Perhaps the most amusing of the drinking establishments is the Halfling-run Appleberry Tavern, best known for the game, "Moot Darts." This is not your normal game of darts, requiring a player to throw the darts as outlandishly as possible, and his opponent to match the maneuver. This can be as simple as throwing the darts back between your legs while blindfolded or as absurd as throwing while being tossed into the air on a blanket!

The bulk of this supplement is devoted to describing the dungeon below Karak Azgal. Given that it consists of 11 levels (and the book just 98 pages), it is no surprise that only a few parts of it are fully detailed. These are of two types, either the headquarters for each of the factions within the dungeon -- Goblins, Orcs, and Skaven -- or a site of significance. The less dangerous of the two sites described is the Hall of Bones, a Dwarfen crypt, while the other is not somewhere that the delving characters want to be unless they have several careers under their belt. To put that single encounter on a par with the Balrog of Moria, and both the challenge and degree of peril involved is about right.

With only these few individual locations (marked on a cutaway view of Karak Azgal) described in detail and only the very first level mapped in broad detail, the rest of the dungeon is left for the GM to create. In just a few pages, he is given everything necessary bar imagination. Covered are the different environments to be found below, plus possible dangers and treasures to be found, including arms and armor made from the near mythical metal, Gromril. Also given is a small selection of special encounters, and a few new monsters particular to Karak Azgal. The core tool though is the set of encounter tables designed to create the basics of the encounter. The tables work well enough on their own, but to get the fullest out of them, the GM will need access to the *Old World Bestiary* and *Children of the Horned Rat,* the Skaven sourcebook.

If *Karak Azgal: Adventures of the Dragon Crag* has a precedent, it is in Middle Earth's Moria. It falls into the same mold, being an abandoned Dwarfen hold, populated by Orcs, Goblins, and various chaos beasties, including a big threat in the deeps below. To this basic set-up, the authors add a *Warhammer Fantasy Roleplay twist,* beginning with the dungeon's entry toll and exit taxes. Others include the mad game of "Moot Darts," a Wight seeking allies, a suddenly popular new Dwarf cult, bets being placed on the survival of dungeoneering teams, characters becoming known after a couple of trips inside, and -- helping to set a suitably grim feel -- characters being able to pay for a funeral in advance should an expedition go awry.

Physically, this supplement is competently written, and includes a range of good art. It would have been nice to have seen more of the NPCs illustrated, and it is a pity that the occasional illustration does not match the description given in the text.

However, *Karak Azgal: Adventures of the Dragon Crag* does suffer from what it is -- a dungeon and a toolkit. It suffers because *Warhammer Fantasy Roleplay* does not do dungeons and in order to do so, this book has been placed a long way away from the game's geographical heart. This makes it difficult to transpose a campaign there, so it is probably best run in isolation, focusing on a mix of dungeon delving and a "city of thieves"-style game. It suffers because as a dungeon, it could be argued that not enough of it is detailed. That though, is down to the book's design and limited page count. To be fair though, there is everything here for the GM to create a campaign of his own. Still, the book does feel a little slim for what you get.

As a toolkit, Karak Azgal: Adventures of the Dragon Crag achieves what it sets out to do -- provide a complete campaign setting that the GM can develop as he wants. It also bridges the gap in playing styles between *Warhammer Fantasy Roleplay* and *Dungeons & Dragons* in giving a dungeon bash that is grim and perilous, as is the settlement above it. *Karak Azgal: Adventures of the Dragon Crag,* then, is proof that *Warhammer Fantasy Roleplay* can do dungeons and still keep to the feel and flavor of the Old World.

Invest a Gate With New Ideas

You are all gatekeepers.

No, I don't mean that you are all Sigourney Weaver (although, I suppose, at least one of you might be). Rather, each and every one of you controls the flow of an almost limitless number of products and ideas, without even realizing it.

I first started thinking about this notion after running a column a few weeks ago about the lack of innovation in mainstream offerings at my Friendly Local Game Shops. Many people responded that there's a heck of a lot of innovation going on in the gaming world, but it's mostly happening over in the small press world. Via e-mail and over in the message boards I replied that I wasn't completely ignorant of that universe, but that (for the most part) your small-press offerings weren't really making it into the gameshops of the universe. And, given that most non-first-tier RPGs are lucky if it can sell 5,000 copies of a book, "small press" is pretty small, indeed.

But that wasn't the point of my column (although, I assure you, the small press *is* on my radar, and I'm calculating feverishly about how to best bring some insight into that world's offerings to you, our loyal readers). Rather, I was more interested in noting what's going on in actual brick-and-mortar shops, which have defined the gaming world for the past few decades.

Of course, your typical FLGS isn't the be-all and end-all of the gaming universe. However, it is a *gatekeeper.* In fact, it's usually the last gatekeeper keeping product from consumers who happen to be wandering the halls. (Depending on your worldview, the staff at said FLGS might serve as additional gatekeepers above and beyond the store's intention. I'm familiar with stores that have stocked the items I wish to purchase, but where the store personnel are unable or unwilling to find or provide. Conversely, I also helped introduce would-be buyers to a number of different games in my tenure as Game Shop Monkey; I sold at least a dozen copies of **Changeling: The Dreaming** to vaguely-game-interested readers of *Sandman* by thrusting it into their hands and saying, "Flip through this! Isn't this the most beautiful game book you've ever seen!?")

The gatekeeper prior to your FLGS is the distribution system, which consists of vast warehouses controlled by ruthlessly calculating steam-powered Artificial Intelligences whose true inner workings can only be fathomed by their cogwork parents who died generations ago. At least, that's how it seems to those in the publishing and retail world.

And prior to that world is the gatekeeper of the publishers. Publishers have their own visions, which usually consist of vague dreams of sleeping curled up, dragon-like, on a huge mound of gold. Of course, publishers can only publish so much, and most publishers already have their own ideas that they can barely bring to fruition, let alone consider bringing to market any of umpteen jillion unsolicited ideas.

So what's the upshot of this? Namely, that your Friendly Local Game Shop is the result of at least two -- and probably three -- layers of gatekeeping selectivity. In other words, products that reach the shelves needed to do so by jumping over at least three hurdles.

Now, here's the point in the article where I reveal a shocking secret: I enjoy pretending I'm a naughty squirrel. No, wait . . . that's a confession for another publication. Where was I? Oh, right; confession.

See, for the most part, I appreciate the role that the three-tiered gatekeepers play. In a perfect world, this system has managed to weed away the chaff, like the multi-level filtration system in a Brita water pitcher that can turn cheap vodka into something yummy. Now, of course it doesn't work that way; for many fans of good games -- myself included -- the system tends to exclude a number of (potentially) perfectly good games while including a nontrivial number of stinkers. But, on the whole, the system has usually worked out pretty well; by the time I'm able to peruse a new game at a game shop, I have a certain level of assurance. Most of this fuzzy feeling boils down to, "Well, at least three different groups of people believed in this product enough to bring it here."

Of course, the problem comes when the number of games offered is too small, or have too much in common. My old

haunt of I-Can't-Believe-It's-Not-Philadelphia had this problem when it came to dining: Literally *every* restaurant within a 20-mile radius was a pizza parlor, an Italian restaurant, or a Chinese buffet. The only Mexican restaurant (my favorite) we ever found was in the neighboring state of Delaware, where it was within 200 yards of a Taco Bell. Now, the fact remains that just about every pizza, Italian, or Chinese place we visited was top-notch, but that didn't change an overwhelming dissatisfaction with the general level of variety. This situation neatly parallels my recent experiences with Friendly Game Shops; not much variety, but in general almost everything on the shelves is at least pretty darn good.

But without those gatekeepers, I'm not sure I'd ever be able to make any kind of decision. Pulling numbers out of . . . well, you don't want to know where . . . I would guess that the gaming world has approximately 100 SKUs per week from all sources (new items, reprints, individual versus multipacks, electronic, small press, card & board games, mass market, etc.). This guess doesn't count video games, DVDs, or anything like that, nor does it consider any of the myriad items released to the regular publishing world that might be of interest to gamers. Now, assuming that I can devote one minute per product, that means I could spend almost two of my 112 waking hours per week considering products. I don't know about anyone else, but I can't even get through Amazon's ever-updating "We recommend you buy this" list on the front page, carefully chosen by their merciless AIs; I'd hate to have to consider *all* items available.

As a result, I suspect that we all rely on gatekeepers to keep the number of products we consider to a remotely manageable number. But, at least in the RPG world, I suspect the primary gatekeeper will become -- if it hasn't already -- word of mouth. In other words, you'll hear about products from others, and others will hear about products from you. While this isn't anything particularly revolutionary in and of itself -- the gaming world has always relied on folks spreading the word about good stuff -- the past few years have presented one of the first times where you, as a gatekeeper, can be the *only* gatekeeper of note.

For example, let's party like it's 1994 for a second, and you hear about a cool-looking game from those crazy upstarts at Last Unicorn Games called ***Aria: Canticle of the Monomyth.*** Well, having heard about it, you now need to acquire it somehow. But how? If your FLGS doesn't stock it -- a likely possibility -- then you either need to special-order it (a chancy proposition for many local shops), call one of the telephone-based retailers (such as Wargames West), hope to find it at a convention, or do without. Regardless of the option you choose, you're looking at a minimum wait of a week, and a maximum wait of never.

Jump forward to . . . now. You've heard about a great game called ***My Life With Master.*** You shell out $8.95, and -- hours later -- you're downloading the product, complete with enough digital information to print out an exact replica of the paper product the author also offers. From a wait of "a week to never" to "a few hours" -- not a bad compression for just over a decade. And, of course, all manner of other products is available via other means -- electronic (RPGnow, DriveThru, e23) and online (Warehouse 23, Paizo, Amazon). The minimum wait may still be a week or so, but that's a "darn-near guaranteed" week, not a "if the stars align and Cthulhu doesn't awaken saying, 'Grawg; how long have I slumbered, and what's this taste in my mouth?'" week.

Which means the only gatekeeper of note for many of these products is you, or someone like you. Of course, the way that you (or someone like you) hears about these new products is via other yous, and other nebulous means of getting the word out that exist outside this already-wordy column.

But, as a final food for thought, consider that if you convince your friends to buy three copies of a small-to-mid-sized RPG, this means that you're probably directly responsible for at least 0.1% of that product's print run (as much as a full 1%+ of a small-press offering). If the FLGS no longer represents the be-all and end-all of consumer-level gatekeeping (and, in some ways, I morn this), then the power that affords each of us as our own gatekeepers is considerable.

Of course, half of power is knowing when and how to use it. But, for now, I'd encourage everyone to wield that gatekeeping power. And -- to tap into my old high-school writing class -- "be specific." Don't be afraid to talk about things you love in specific terms ("If you like *Sin City,* you'll love this game . . .") and don't be afraid to check out recommendations from your fellow Terrans. Gatekeepers only have power so long as folks get near the gate . . . whether that gate is a FLGS, a website, or your own gaming table.

* * *

Confidential To Many: Yes, I know my column [last week](#) ended abruptly. The last sentence of what-I'd-hoped-sounded-like-a-concluding paragraph was, "What if unanswered rhetorical questions were seen as immoral, and punishable by dea" . . . get it? I was killed for asking an unanswered rhetorical question! Hah!

Nevertheless, here is the rest of the column, for those of you who wish to copy and paste it yourselves:

th?

--Steven Marsh

* * *

As one last item, *Pyramid* is deeply saddened to note the passing of [John M. Ford](#).

In addition to his regular contributions to the [discussion boards](#) (the .sigs of which were cited by many as reason enough to subscribe to *Pyramid*), every so often Mr. Ford would post some rumination, insight, or witticism about an item in the Daily Illuminator. A small part of me kept hoping against hope to see a comment from him about the Illuminator reporting his own passing; it would, no doubt, be the perfectly written coda to a life that was as brilliant as it was brief.

Perhaps, somewhere in the infinite worlds, there is such a post right now.

--Steven Marsh

Pyramid Review

Faery's Tale

Published by Firefly Games

Written by Patrick Sweeney, Sandy Antunes, & Christina Stiles with Keith Sears & Spike Y Jones

Fiction by Robin D. Laws

Cover by Patricia Ann Lewis-MacDougall

Illustrated by Patricia Ann Lewis-MacDougall & Jennifer Meyer

64-Page Digest Size Black & White Perfect Bound Book; $14.95
66-Page 3.30 Mb Black & White PDF; $9.95

Faery's Tale is a little game about the little people. Where other RPGs about faeries turn them into savage creatures or slip them into urban settings, *Faery's Tale* places them firmly in the tradition of British folklore. More specifically though its artwork -- reminiscent of Arthur Rackham, Ivy Wallace, Tony DiTerlizzi, and Enid Blyton -- it echoes the children's tales of a more innocent golden age. There is a timeless quality to this game that could place it any time from the Edwardian period to the 1950s.

In fact, innocence lies at the heart of *Faery's Tale.* This is shown first in the roles taken by the players, mischievous but good-at-heart inches-tall faeries -- Brownies, Pixies, Pookas, and Sprites. Second is the setting, the deep forests of Brightwood, wherein the faeries not only romp and play, but also guide lost children to safety; thwart the plans of dark faeries, goblins, and sorcerers; awaken princesses from deep slumber; and rescue those captured by giants. And third in the game being specifically aimed at children of ages.

Brownies can turn invisible at will and use magic to help keep hearth and home for a family of humans. Pixies are winged pranksters capable of feats of magic by sprinkling a little faery dust, from casting or breaking charms to making someone fly or putting them to sleep. Pookas are naughty tricksters who can change into animals and travel great distances using those forms. Sprites are Brightwood's knights, riding bumblebee or dragonfly steeds to defend against dark faeries and goblins.

Each faery is defined by three attributes -- Body, Mind, and Spirit -- and his Gifts, both innate and selected by the player. He also possesses Essence, magical life force that can be spent to do more extraordinary things. He adds three more points to the base attributes for his faery type, to give a rating of between one and six, and spends five points gain extra Gifts, ranging from Brave and Charming to Seer, Sidekick, and Sneaky. A Gift either gives a bonus under certain circumstances, for example, Brave increases a faery's Spirit by +2 when handling Bravery tests, or cost Essence to use, such as Seer, which lets a faery see far away for one Essence and into the past or future for two.

Mechanically, *Faery's Tale* is light and easy. It uses pools of six-sided dice equal to an attribute to overcome any challenge. Every even number rolled counts as a success, with any six rolled counted as a success and allowing a further roll. If a faery cannot attain enough successes, he can spend Essence at a cost of one per success needed. Faeries can also co-operate to overcome obstacles, simply pooling their dice pools to roll for more successes.

Combat or duels are likewise easily handled, using the Body attribute for physical duels and Spirit for magical. The combatants split the pool into Attack and Defense pools, the number of successes being compared to determine the outcome. If a faery faces more than one opponent, then he must decide how many attack dice to assign between them, but he uses the same defense pool against them all.

At the heart of the game is Essence. Representing a faery's life force, not only can it be spent to attain successes and power Gifts, it can also be used to purchase a clue from the Narrator (who then conveys it within the game) or even a Plot Twist. This turns the story to the faery's advantage and can be as simple as gaining a momentary benefit to overcome an obstacle or as complex as altering the storyline. Any Plot Twist requires careful judgment by the Narrator.

Whenever Essence is lost -- whether through duels, fuelling Gifts, or buying Plot Twists -- a faery is never really hurt. Indeed, once it reaches zero, a faery is not dead as in other RPGs, but is forced into a deep slumber until his life force has regenerated. This takes as long as the Narrator feels is necessary. However, Essence can be gained as a reward for playing within the genre -- being brave, generous, never being disheartened at setbacks, learning from mistakes, and so on. It can also be gained for suggesting Complications that add further challenge to a game, but which must also be fun for everyone playing. Both Plot Twists and Complications promote creative thought and input upon the part of the players.

Much like *Star Wars,* Essence has its counterpart in Dark Essence, gained for committing acts of cruelty, cowardice, greed, or wrongdoing. Each point of Dark Essence gained reduces a faery's Essence, until he is fully tainted by Dark Essence, at which point he is transformed. If he willingly gives his heart up to evil, then this is into a Goblin, but if he still retains a mote of goodness, then there is still hope. He still transfoms, a Brownie into a Boggart, who torments households with pranks; Sprites into bullying Redcaps; Pixies into Wisps, who lure strangers into danger; and Pookas into Phoukas, who terrify villages with beastly nighttime rages. Dark Essence can be overcome if a Dark Faery refrains from committing bad deeds, but it is a long and difficult process.

Goblins and Dark Faeries are just part of the bestiary that includes ordinary people, the animals of Brightwood, and the more fantastic creatures, such as Hags, Trolls, Dragons, and Sorcerers. It is a short bestiary, but using the list of Gifts a Narrator could easily fashion more creatures, whether inspired by faery tales or adapted from other gaming supplements, *GURPS Faerie* being one good source. Indeed, the given scenario is based on the faery tale, *Jack and the Beanstalk.* The advice on creating adventures is decent, but a bibliography would also have been useful. There is still plenty of information or faery lore given throughout the book, being a ready source of ideas to help the Narrator either create adventures or add color to them.

Being specifically written in mind for play with children aged six and older, there is advice throughout the book aimed at helping a Narrator run a game for them. For example, it suggests using Essence rewards as a teaching tool to help reinforce behavior both within and without the game. It also describes at what ages a child can deal with particular aspects of *Faery Tale:* moral issues, social skills, and so on. In the main it tells you which aspects of the rules are not suited to younger players, particularly the dueling rules, the moral complexities inherent to Dark Essence, and the possibility that one of their faery's companions might die. The advice is pertinent and interesting, and probably covers the subject more than any other RPG. Yet it is only a good start. Certainly it could easily be applied to other child-friendly RPGs like Deep7's ***Buggin' RPG: The Tiny Game of Big Adventures*** and Beyond Belief Games' ***Lashings of Ginger Beer,*** but hopefully a future supplement will expand what is given here.

More long-term rewards come in the form of titles, noble ranks from knight to prince; boons, which are favors promised; items blessed with magic called charms. Boons are both the currency between faeries within the game and similar to experience points outside of it. Boons can be spent to acquire items and aid, improve attributes and acquire new Gifts, and even open passages to far-away places like the Moon and the faery realm of Water. Once a faery has a title, he can trade boons, but the real aim is to acquire them. Of course, boons are the perfect story hook for the Narrator.

In addition to the suggestions on making the game easier, *Faery's Tale* offers other optional rules and methods of play. These include point-based faery creation, adding Passions so that a faery can be led by his heart, running a game dice-

less, and adding Live Action elements so that children can enjoy dressing up for the game as much as they do playing it.

Bar the lack of bibliography, *Faery's Tale* is a nicely done book. The illustrations are a delight and perfectly match the genre, and whilst Robin D. Laws' color fiction is a bit twee, it nevertheless captures the feel of the genre. Hopefully, it will likewise help the Narrator capture that feel.

Despite the old fashioned theme, *Faery's Tale* is still a contemporary game with light mechanics that are easily scaled up or down in complexity to suit the players, and in the use of Plot Twists and Complications which gives those players the opportunity to add to the game. These aspects of the game should appeal to more experienced players, while at the same time *Faery's Tale's* simplicity, scaling, advice, and theme make it suited to running for a younger audience. After years of trying to get away from the faery tales of our childhood, usually by transplanting the faery elsewhere, *Faery's Tale* takes you back to an innocent age with a delightfully designed little game.

Pyramid Review

Monkey Memory

Published by [Playroom Entertainment](#)

Designed by Reinhard Staupe

Art by Oliver Freudenreich

50 playing cards & instructions (English, French, & Spanish); boxed, full color, for two to eight players; $8

Playroom Entertainment seems to have more imprints and marketing adaptations than the average gamer has dice in a bag. A purveyor of quick, easy games that can be enjoyed by the whole family, they've cast a pretty wide net to catch as many clan-friendly sets as they can. Although many of the games target kids and their parents, one of their imprints, Bright Idea Games, looks to the far younger end of the spectrum. By way of example: *Monkey Memory.*

One of the company quirks the game shares with others from the Playroom team: The backstory is only to be found on the back of the box. Not that it's all that complicated -- the monkeys have gotten loose, and they're rummaging through your stuff. They've taken an item, and you have to figure out which one. To help you keep track, players (two to eight of them) are assigned a Solution Card that shows all the pieces used in the game.

Each Object Card depicts one everyday item (well, okay, coconuts are here as well, but surely they're found in *someone's* house). A cell phone, a watch, a ring of car keys, the sort of stuff you'd find in a person's backpack. Oh, and the backpack. The things on the cards all have a twin, so there are two each of all the items. Seven pairs of these cards are chosen, and one of the sets is laid out in a line in the middle of the playing surface. The other set of cards gets shuffled up, and one card is removed from that deck. The spare card gets tossed in the box or set aside somewhere no one can see it, and the dealer then begins turning over the rest of those cards. (The oldest player goes first, freeing up the young ones to concentrate on the cards and giving them a grace period to see how things are done.)

Players have to pay attention as the cards are revealed one after the other, trying to note what does and doesn't come up. The cards are stacked as they're revealed, so you only get one look at each. When the last card is flipped, the whole deck is turned upside down. Everyone looks over the visible line of cards, then places their thumb on their Solution Card, covering the item they think was removed from the dealt set. Those who guess right get a Point Card. After each player has had the chance to be the dealer twice, the person with the most points wins.

Some games have sturdy pieces, and some take pains to see that small kids can run roughshod over their components without destroying them, but it feels like you could block a satellite signal with these cards. They're really thick, and the illustrations will delight the urchins no end. Bright and colorful but by no means simple, they'll catch the youngsters' eyes.

Looking at it realistically, there's not much here you can't also do with a regular deck of cards and a pad and pencil. On the other hand, those won't have the same childlike sense of fun attached to them, the same palette of colors and images that stir young minds, so in that respect it's worth the eight bucks to give the family something a bit less generic. And of course, the game is meant for those who've only reached their fifth year, so they'd chew through a deck of lesser materials like piranha.

You can increase or decrease the game's difficulty by simply using more or fewer of the 10 card pairs included, depending on the kid's age. (And if you'd like to trick your offspring into learning even more, have them read the rules

themselves -- they're once again presented in English, Spanish, and French.) Game play lacks the same strategic considerations Playroom Entertainment manages to stick into most of its products, so there's definitely an age range for which it loses its relevance, but the memory challenge can be good practice for adults when you're using all 10 pairs. The real problem is trying to strike a balance over the generation gap -- unless there's some way to handicap mom and dad (make them memorize two cards?), your standard parent is going to sail through whatever number the kids find digestible. The elders are probably used to pulling their punches in a game, but it may be required here since there's no built-in mechanic that levels the playing field.

Monkey Memory is still not a bad entry to gaming for the youngest of gamers (or the mental exercises, if that's all you want out of it for them), but it's not without its flaws and requires a bit of jiggery-pokery if you want it to have wide family appeal.

Murphy's Rules

by Greg Hyland

Murphy's Rules

Infant Diversity In Infant Combinations

"Children are wormholes. They're portals into the unreachable future and unattainable past."
"Well, I could see why you'd have some trouble selling a woman on the idea of carrying your wormhole."
--Larry & Amita, *NUMB3RS*

As I've stated elsewhere in an article this week, I think kids are an under-represented portion of many games -- especially RPGs. While this certainly isn't true for everyone (I've participated in at least two campaigns where children have played a central role), it's certainly been the case for many adventures I've played in. This is despite the fine pedigree that adventuring kids have: *DuckTales, Goonies, Mary Poppins* (or practically any 1960s-1970s Disney live-action movie). And, of course, kids play compelling roles in practically all genres and tales, from horror *(The Sixth Sense* and *The Omen)* to comedy *(Sleepless in Seattle* and *Finding Nemo)* to drama *(The Godfather* and *Grave of the Fireflies)* to action/suspense *(Witness* and *Aliens))* to science fiction *(Star Wars Episode I: The Phantom Menace* to *My Eyes Don't Work Because I Just Poked Them Out With a Fork At Remembering That Wretched Movie).*

This speculation is not merely idle on my part, but rather hits close to home this week. Because this week Nikki (the inimitable missus) and I were happy to introduce Samuel James Vrtismarsh to the *Pyramid* family. Born on Friday, September 29th (less than a day after last *Pyramid* was posted), Samuel is the culmination of nine months of my not doing a darn thing outside of being sympathetic. And, at eight pounds one ounce and 20.5", Samuel has proven that I must be capable of being pretty darn sympathetic.

Samuel!

Samuel has already proven a major source of excitement and adventure in our lives. Although his arrival into this world was without complications, within 17 hours of our arrival home, a generally lethargic baby coupled with some red in the diaper, resulting in the doctor's recommendation to go to the Emergency Room immediately, where we spent *another* two days under observation. Net result: The kid's fine; he, like so many other babies, just hadn't figured out the whole "eating" thing yet. (I'm amazed that we as a species have managed to progress to the point of being almost incapable of producing offspring that are remotely viable. I mean, I don't envision platypi needing to consult with lactation consultants to get their kids to eat: "Okay; you need to keep them awake so they know to keep eating. Have you tried stripping off their fur? Or maybe adjusting the temperature so it's a bit colder . . . perhaps you could wait for an ice age? Oh, and make sure he purses his beak around your nipple. That's it . . ." And I'm also constantly amazed that, as best I can tell from all the baby advice books and the words of doctors, babies left unsupervised for 1.8 nanoseconds will manage to find some lethal situation, device, or position. But I digress.)

As more and more gamers pair up and form the Next Generation of gamerly goodness, I'm interested in seeing how (or if) the gaming world will keep up with them. While the pessimist or cynic in me thinks that parenthood might bring nothing but gamerly negatives -- I have barely enough time to think about a shower nowadays, let alone when our next game is -- part of me is still cautiously optimistic.

Perhaps my eyes are merely now focusing on them with new sight, but I'm seeing more and more games targeting kids. Most promisingly, I'm seeing games that can be enjoyed by children *or* adults; there's nothing keeping anyone from mixing in the **Family Fluxx** cards into the regular **Fluxx** deck, although obviously a group of college students will get something different out of the experience than a family of five. I hope this trend continues, because I believe that the next generation of memorable games is waiting to be played and enjoyed by today's nine-year-olds; I know of several gamers who got hooked on the hobby through their exposure to games such as **HeroQuest, Dungeon,** and **Talisman** (although seeing the type of rules . . . er, *debates* that erupted with adults playing the six-hour-long version of **Talisman** from the 1980s, I can only imagine what those games would have been like with younger, more easily frustrated players. Imagine . . . and shudder.)

So, to sate my growing curiosity of seeing what's been cooking from the gaming world that's for or about kids, our crack team of reviewers (Hi, Andy! Hi, Pookie!) found a few of the more interesting recent ones to grace this week's issue. Couple this with contributions from a few regulars who didn't run fast enough away from me, and we've got ourselves a certified child-themed issue.

As an aside, I've been out of contact for the past week or so (and let me tell you that staying for two nights in a hospital as a six-foot-tall guest on a 5'8" couch is no picnic), so I'm playing catchup now. I thank you all for your patience.

(Samuel thanks you too . . . by urping all over my shoulder.)

--Steven Marsh

The Secret World of Children

Abilities that Babies Possess which Others Do Not

by Steven Marsh

As adults, we look on the world of babies and children as being a time when almost every youngster held the (ultimately incorrect) belief that he has a special ability or secret power that no one else possesses. But what if this is false? What if there actually *are* abilities that children possess, but which -- for whatever reason -- are lost as adults and end up in the vaguest corners of adult recollection, memories of memories?

This article looks at some of the more common and justifiable methods of incorporating childhood "secret societies": broad classes of powers that children possess but adults do not. This isn't a ready-to-use toolkit, but more of a box of random parts, designed to be mixed and matched in interesting ways. Although many of these ideas suggest a child-specific campaign, they are also intended to provide ideas for adventures in otherwise adult-focused campaigns. For example, investigators in a Weird West campaign might learn of a plot where children in a town are disappearing . . . only to discover that one of the children in the group has been taking their number to the Land of Cowpoke Dreams. (Whether this turns out to be a heartwarming break between more serious adventures or the first step into a nightmare realm is up to the GM.)

Game Mechanics

Each idea listed below is given broad RPG mechanics for how these abilities might be represented. In general, one universal truth of childhood secrets is that they cannot be perceived by those who are not still kids. Thus parents could never see an imaginary friend or be able to travel to a Land of Make-Believe. In fact, adults usually serve as a *disruptive* effect; if a child were riding in the backyard on a camel made from a curved stick, the mere act of parents observing the youngster straddling the mount would cause it to revert back to its wooden form. (Classically, this "jamming" ability of older folks only works to the barest extent that the perception is accomplished; thus if an adult is listening to a child play with an "imaginary" miniature elephant through a baby monitor, the elephant would not be able to make any of its own distinctive sounds, although it could still act as a quiet pachyderm . . . and the child could provide his own trumpeting, should he be so inclined.)

In most campaigns, adults never know these abilities existed, or (at best) they rationalize away these powers through the eyes of maturity. To that end, regardless of how these powers manifest, they are usually gone at the point when the child's "adult" memory begins to form; in the "real" world, since almost no children retain memories before the age of three, this age is usually a good ending point for these powers. (Of course, cinematic children can push the envelope even further, and the realm of "kindergarten" is a good cinematic means of exposing four- to six-years-old kids to others to form adventuring groups, while not being *too* unrealistic a reason for doing so.)

Whether these powers fade away gradually or quickly depends on the campaign and the reasoning behind them. Perhaps the child finds it more and more a difficult to understand Babyese, or finds it harder to enter the Make-Believe. Regardless, the final departure of that language could be a poignant metaphor for the ending of early childhood, especially in RPGs such as ***Changeling.***

Of course, it's not essential for adults to be unable to perceive these manifestations. If this assumption isn't used, then there should be some other reasons why adults don't remember their encounters with childhood phenomenon (either from their own childhoods or from their more recent interactions with kids). Some possibilities include:

- Adults simply forget they encountered the oddity, either because of an intrinsic property of the childhood ability or because of some active usage of a separate special power tied to the first ability, such as an Imaginary Genie's ability to make an adult forget with a puff of magic dust. (The possibility of requiring something to be actively

done to an adult who has witnessed these powers creates interesting story possibilities from either end, with kids trying to track down errant adults to use the flashy-thing on them, or an adult who's learned The Secret trying to escape children.) If adults can see and interact with these oddities but forget afterwords, it allows for a variety of stories of adults and kids teaming up and working together, with the older one none the wiser that the "imaginary tea party" he remembers actually took place in the Court of the Princess of Daisies.

- Adults are somehow transformed or revert to their own childhoods when exposed to these powers. This is a variation on the idea above, permitting adults and children to work together. However, the adult actually undergoes a transformation (mental, physical, or both); he can interact with the child's abilities when transformed, but loses memories of them -- along with the changed form -- when the "story time" is over.
- Adult minds cannot comprehend the possibility of what they have witnessed. This would be a great justification for a creepy **Call of Cthulhu**-esque game; adult mortal minds are usually too sane to comprehend what they have witnessed. In addition, it allows for some interesting roleplaying possibilities for playing adults interacting with these kids and their powers; as the older ones' abilities to perceive the powers of the youngsters gets stronger, their own sanity gets called into question. ("Don't you understand?! That's no stuffed tiger! *That's no stuffed tiger!*")

Finally, as a weird (but intriguing) alternative, it's possible that adults *don't* forget. In this campaign, children simply possess abilities that adults do not, and their poor parents have little choice but to ride out the turmoil as best they can, hoping (and knowing) that it will end some day . . . not unlike puberty. This possibility would be well-suited for an already-odd setting, such as **In Nomine, GURPS IOU, Toon,** and some feasible settings for **Big Eyes, Small Mouth.** (After all, what is the *Pokémon* universe but a fully justified world where kids visit strange dream vistas with their imaginary friends?)

Imaginary People

"Little Jackie Paper loved that rascal Puff
And brought him strings and sealing wax and other fancy stuff."
Leonard Tipton & Peter Yarrow, --*Puff The Magic Dragon*

Given how small their forms are, one of the most powerful forces a child possesses is the power of imagination. In some respects, the imaginary playmate represents the pinnacle of childhood desire in a friend: nonjudgmental, willing (and able) to listen, and always available. Of course, adults see these companions as possessing one fatal flaw: They don't exist.

Or do they?

Imaginary friends seem to be just like "real" friends: children converse and "play" with them, and may even attempt to feed or otherwise comfort them.

In stories where adults are unable to perceive the workings of imaginary friends (or even interfere with their ability to exist), the abilities of these "figments" are somewhat limited. The most common role of these individuals is as advisor or confidant; imaginary friends can provide insight or advice (good or bad) in most situations. In this case, even in a campaign where adults act as a disruptive force, it might still be possible for an imaginary friend to play an active role; to older folks observing, the child might simply be muttering, "Mm-hmm; good idea," before offering some profound piece of insight.

Imaginary friends can also serve as a more physical presence, interacting with their surroundings in various ways. The classic example is the imaginary friend who destroys the room (where, of course, the child gets the blame). But imaginary friends can also act as protectors, inflicting harm on older bullies or tormenting troublesome siblings; these defensive maneuvers may or may not be blamed on the child, depending on the nature of the figment and how much of a poker face the kid can keep.

Finally, imaginary friends are often incredibly useful in fantastic places (see below), serving a role as guide and contact for agents of these other places. The old sock doll that talks to the little girl might actually be a famous singer

in the Butterfly Kingdom.

In general, since imaginary friends usually have a sentience (in a way that imaginary places and things do not), they are most vulnerable to "attacks" that seek to disprove their existence. While children are usually immune to mature logic that states something cannot be both true and not true, if child and friend are presented with compelling enough evidence, it can harm or even destroy the friend. For example, if a child (correctly) blames the disappearance of the next-to-last piece of cake on the gluttonous Mr. Whiskers, then Mom might demand to see that Mr. Whiskers eats the *last* piece, too; if the child claims that Whiskers is full (which may well be true), Mom might escalate the situation by offering to have her and the child stare at the last piece until Mr. Whiskers eats it . . . which, because of Mom's disbelief, will probably never happen. Such a concerted attack would probably prove devastating to Mr. Whiskers, since if he is that gluttonous then he *should* want the cake at some point.

Fortunately, resourceful enough children (and figments) can usually get out of these these binds, since most adults have better things to do than to try to crush the dreams of children. Most . . . but not all.

Roleplaying an imaginary friend can be a special challenge, depending on how it's handled. If the player can keep the roles separate enough, it can provide an interesting experience. In this case, the gamemaster may want to be careful not to have too many scenes with the player monopolizing game time by "talking to himself."

However, the difficulty with a player controling both his character and the child's figment is the common theme shared by many imaginary friends: their penchant for getting their child friends in trouble. If the player is unable (or unwilling) to have the companion make mistakes, give bad advice, or cause the situation to worsen, then the role might be best reserved for the GM. (As a possible compromise, the GM might take the role of the friend when dramatically important, and permit the player to handle the "lesser" scenes and interactions himself.)

Alternatively, playing an imaginary friend can be a great opportunity for an "observer" player -- the normally shy person who enjoys watching his gamer friends but doesn't want to take a too-active role in the proceedings. Such a character would permit the player to participate (in a slightly reduced scale) with the larger campaign should he so desire, but it otherwise provides a perfectly justified reason to remain quietly in the background.

Game Mechanics

If an imaginary friend is more or less "legit" (in other words, is an actual invisible being capable of independent thought and action), then it's probably best represented as an ally, patron, mentor, or similar mechanic. The ability of manifestation of the figment is dependent on adults' ability to disrupt its presence, and (if adults can affect them) how often the child is observed. The percentage of observation time depends on the child's age and the mannerisms of the caregivers, but in general, it's logical to assume a percentage of direct observation somewhere between 50-90%, with the higher ends reserved for protective adults of babies; additional monitoring through other means may also supplement this. (Even parents who swear they watch their kids around the clock need to sleep *sometime*, and a quiet enough imaginary friend can cause all kinds of mischief with and for a child in the middle of the night.)

It's entirely appropriate for the imaginary friend to also have restrictions that keep it from doing much when not interacting with the child. While limiting a figment to maneuvers within a child's range may seem too restrictive, remember that even something as broad as "cannot act outside of the child's line of sight" may still permit the figment to acquire cookie jars from atop refrigerators, unlock doors through windows, tripping or distracting someone across the room, and so on.

The imaginary friend may also be capable of powers, such as manipulating objects from afar or teleporting into seemingly inaccessible places. (Although, in the case of an imaginary friend that can teleport and interact with objects within the child's line of sight, it might be easier to buy that as a form of telekinesis.)

If the imaginary friend acts as more of a mental guide or advisor than a physical influence on the child's life, then the figment can merely serve as the justification for the child's above-average intelligence, common sense, strange levels of exotic skills, and the like.

If the imaginary friend is something more sinister or exotic -- such as an angel or spirit of the dead -- then it may be possible to assign abilities to the child appropriate to the interaction with that force for the game, such as "speak with dead" or "divinely touched."

Finally, one common aspect of many imaginary friends is a focus of some type, either an object that takes the friend takes the form of (usually a stuffed animal) but possibly some other token or object related to the figment. For example, a child's favorite blanket might actually be a cloak that permits invisibility, which the figment requests the child carry most of the time. ("After all, I've worn that thing so long that most people can't see me anymore, anyway!")

Imaginary Places

"Puff, the magic dragon, lived by the sea
And frolicked in the autumn mist in a land called Honalee."

The Land of Make-Believe is a common theme for many child-based tales. From *Peter Pan* to *Muppet Babies,* the ability of the young (and young at heart) to travel to places other than the mundane has captivated storytellers for generations. Of course, the adults know that this ability to journey elsewhere is merely the product of the same powerful imaginative force that pretends to create people and things out of thin air. But that's no fun, right?

The ability to go elsewhere is a common wish for kids, since being able to leave the drudgery of the room you've called home for your entire life is a compelling lure (especially when there's an entire world out there that you've seen tantalizing tastes of). And, while some kids have no more longing than to see what the regular world holds, most often the desire to be elsewhere pops up as a desire to see exotic or fantastic lands, as envisioned in books or on television. So some kids figure out how to make their wishes come true.

This ability is especially appropriate for children old enough to be left (mostly) unsupervised but young enough to still have a rich imagination life. At this age, if parents *did* go looking for the kids in the treehouse and they weren't there, they'd probably assume they were playing with the next door neighbor's kids instead of traveling the Pirate Seas of Adventure (although, of course, they could be doing both).

While many lands that children can travel are unique creations, there are still a few common themes that pop up more often than is coincidental.

First, children are almost always more free to act in these worlds than the realms of the real. Adventuring tykes are frequently taking up arms and, with little more than determination and the gathering of friends, able to accomplish feats of legend. While the denizens of the imaginary land may question the size or ability of youngsters, they are generally *not* dismissive of or disquieted by the kids' desire to go out questing; in fact, this effect frequently spills out into the real world. ("Bye, Mom; I need to go save the land from a vicious ogre!" "Okay, dear; dinner's at six!")

Second, children seem to be fairly strongly protected; in most worlds traveled by children, it's exceptionally rare for anything permanently damaging or incapacitating to happen to the youngsters; most kids are safely home by supper. Nonetheless, this isn't necessarily the case; the oft-times unreal worlds given rise by the tales put to paper by the Brothers Grimm were grim, indeed. It might even be possible that the protection children receive in lands of imagination is a separate effect; see below.

Although not universally true, lands of imagination are very often fantasy-based, with a Wild-West-themed outing cropping up here and there to push the envelope of technology. (One noteworthy exception to the "long ago" feel of most children's worlds are those lands inspired by Christmas; here, although the technology of toys often advances beyond that extant in most fantasy realms -- especially in the fare offered to boys -- it seldom progresses beyond the 1920s or 1940s, with self-powered model railroads usually being the most technologically advanced diversions available.) Reasons for these travels to fantasy realms are varied, but it's likely that children's natural appreciation and desire for moral absolutes draws them to places where Good is right in the baptismal names of those so aligned and Evil is in the form of cackling tyrants; these are features seldom found in science fiction. However, recent years have seen some children able to travel to more futuristic worlds, albeit those with heavy fantasy elements. Thus kids might

do battle with swords made of energy, toss nets that start as energized balls, and ride mechanical horses.

Finally, travel to other lands usually involves some kind of conduit or focus. Doorways (such as a child's walk-in closet) are natural for this focus, as are "homemade" entryways -- circles drawn in chalk, paper links forming a chain, and backyard tents could all serve as the starting point for a group of adventuring kids to travel elsewhere.

Game Mechanics

The ability to visit imaginary lands is a often little more than a game-play mechanic; as such, it may not need any other justification than "this is where the kids go for adventure." However, if the GM likes to have these abilities paid for (in games with point-based or otherwise balanced character creation), then -- if only one or two serve as gate-openers for the rest of the party -- he may want to be careful that he doesn't underpower some characters just because they're saddled with making the campaign possible (unless that character has special abilities that give him an edge, such as being able to bring over "real-world" material into the fantasy land).

If the imaginary land is a place that any kid can get to, then it's probably best represented with a special lore or knowledge; if any kid were to do hopscotch *exactly* right, then he could go to the Kingdom of Oaks. If this traveling power is bestowed by others (such as magic dust enabling one to fly to lands beyond), then it's probably some kind of special gear or magic item. If the ability is limited to a specific person (or persons), then some kind of world-jumping ability would best model this. For example, it would be possible to conceive of a tyke in a *GURPS Infinite Worlds* campaign possessing the ability to cross worlds, but only to those places where the weirdness is sufficiently high; this is the perfect justification for digging out all those *really* unusual Infinite Worlds that are lying around. (If a kid can speak Kidese -- below -- then it might even be possible to have a full-fledged crossover with the *Bunnies & Burrows*-iverse.) For an intriguing extension of the world-hopping-children idea, what if a child (or group of children) could go back and forth between the *Yrth* setting? Even if they could get word back to the rest of the "real" world, who would believe them?

Painted Wings and Giants' Rings and Other Imaginary Things

Finally, the imaginary trifecta is rounded out by the ability to imagine items, either from full-cloth or by transforming other items. Thus a stick and garbage can lid become a sword and shield, a cardboard box becomes a hut, and a water hose becomes capable of putting out a four-alarm fire.

In general, these "Imaginathings" only have their full potential when interacting with other children (or beings who are not of this world, such as the denizens of an imaginary place). Thus a football helmet would serve as a poor space helmet while the nanny is in the room. On the other hand, the incidence of airless vacuum a child encounters while under adult supervision is relatively uncommon.

Game Mechanics

If the Imaginathing is merely one specific item that can transform into another -- such as a pacifier that can become a protective mask -- then this should probably be purchased as the ability or transformed item, with the limitation (or advantage) that it is sometimes something else.

However, the Imaginathing might exist as a single object with multiple purposes. For example, Linus' security blanket (as seen in the *Peanuts* comic strip and animated series) was capable of various feats of transformation, and it could just as easily become a whip, shield, or near-bottomless sack, as the need arose. In this case, the Imaginathing might be best represented as an "omni-gadget," perhaps only capable of serving one alternative transformation per scene (or even adventure). In less "crunchy" games, these items might be best purchased as regular gear, with special descriptions detailing what they're actually capable of.

Finally, the abilities of the Imaginathings might be dependent on the children more than the items; in this case, the youngster can turn practically *anything* into anything else useful. Some of the masters of this technique were the cast

of the *Muppet Babies* animated series; in their nursery, a seemingly endless supply of accouterments could be turned into the gear for aquatic rescue, space travel, or pulp adventures. (Of course, they also used various conduits to travel to other imaginary places to make the best use of these items.) Regardless, more number-heavy games can probably best modeli these via variable point pools or other meta-game changeable devices; in a *Muppet Babies*-inspired game, perhaps the PCs only get a certain point-value of "gear" before the start of the adventure; creative descriptions of what transforms into what can earn bonus points. (For a **d20 System**-based game it might even be possible to file the serial numbers off **Spycraft's** gear system and use that.)

In the Company of Fools and Drunks

There are many, many stories about children surviving situations or injuries that -- when viewed with adult eyes -- they had no right doing: jumping off a second floor to see if it's possible to fly, falling off a bike traveling at top speed down a gravel-filled road, and eating as many Pop Rocks you can while drinking lots of carbonated beverages.

A fair bit of this seemingly "invulnerable" ability can be attributed to physics. In much the same way that a hamster can fall off a table's edge many times his own height and skitter away unscathed, children's smaller body mass and lower center of gravity means that they can emerge unscathed from falls, scrapes, and scuffs that would incapacitate a full-sized adult. In another sense, children frequently don't *know* they can get hurt, and thus don't tense up when about to become injured in the way that adults do.

Of course, it's also possible to posit that kids are simply protected by some ability that enables them to survive situations and spills relatively intact. Whether this is an innate ability or an outside force, the ability to shrug off damage is a potent one, indeed, for many games. It might even be the same force that protects fools and drunks (and, in some tellings, ships named *Enterprise*). Even better, this is one of the rare abilities that parents *can* witness (and oftentimes do), before throwing up their arms, screaming, "My baby!" and darting over to the relatively unharmed youngster.

This unharmable aspect might be an interesting basis for *very* young supers character. In addition, it can serve as a very easy-to-justify means of beefing up otherwise-weak characters in a child-based game . . . especially one where they're going to imaginary lands to do battle with unspeakable evil.

Game Mechanics

In most games this ability is probably best represented with a few levels of luck (maybe with the limitation "only to prevent damage"). Alternatively, it can be used to allow the purchase of more overtly defensive capabilities, although it should probably be limited in some way to prevent kids from leaping unafraid headlong into battle with the Wacked-Out Witch.

In a game with suitable number-crunchy aspect (such as **Hero System/Champions**), it might be possible to buy this power as the ability to convert damage into knockback. (Think of the number of animated shows that have had children zapped to the chest with some kind of energy, only to have them be merely knocked backwards with a blackened circle on their chest and a spirited, "Ooof!" coming from their lips. Of course, the same thing happened in *Star Trek V* to Captain Kirk, so maybe the *Enterprise* connection isn't that far off, after all.)

Kidese/Babyese

Some stories posit that even *babies* possess abilities that adults do not. One common example is the ability to understand the language of babies (i.e., each other), which adults frequently misinterpret as being baby-talk gibberish. A recent popular example of this is the television series *Rugrats,* where the baby characters are all able to communicate with each other (and the oldest, bossy three-year-old Angelica Pickles, can converse with both babies and adults). Another example is the 1950s comic *Sugar & Spike.* In this series, not only can the babies speak with each other, they can also communicate with *anything* that's a baby (such as a baby lobster).

How widespread this ability is depends on the story; the three most common choices (perhaps obviously) are all, some, or one (or a very limited number). From the standpoint of creators, "all" or "one" are usually the easiest to handle and justify; if it's "all," then Babyese is something that is just an innate natural ability. If it's one, then that's just the bailiwick of an exceptionally smart (or interesting) child. For example, the evil-genius-baby Stewie from the television show *Family Guy* is portrayed as a super-genius, able to fully understand adults and babies (all but the youngest) and able to communicate with all children he can understand; however, none of the adults of *Family Guy* universe can understand him (unless it would make for a good joke).

Choosing "some" as an option might be possible if it's only a certain set of circumstances; for example, maybe only babies between ages two and three are able to speak Babyese, or maybe only babies that are directly related to each other via a certain percentage of parentage. The difficulty with having a some-sized group of Babyese speakers is that the chosen size affects the possible interactions. For example, having the requirements be at least one parent in common would limit communication to immediate siblings and children by other relations, while a requirement to have at least one grandparent in common would open up interactions to siblings plus appropriately aged nieces and nephews (and eliminate a story's need for illicit children that might be hard to justify in a kid-friendly tale).

Kidese is frequently filtered through the babies' eyes (as envisioned by the tale's creators). For example, a tyke might speak about "tearing up the neat pieces of green paper that daddy keeps in his pocket" or "painting something bright and funny on the boring old picture on the wall," unaware that he's about to be punished for either. This is even possible if the child is otherwise capable of adult-level reasoning; despite being an evil genius, Stewie still has imaginary friends and is delighted by some children's songs.

How does Kidese manifest? The most logical way is to assume that kids are actually speaking some kind of secret language; their "baby talk," while entirely heard by other adults, is meaningless and incomprehensible to those above a certain age. Or perhaps Kidese is akin to the ability to go to Make-Believe, limited to only being able to communicate when no one else is around who can hear them. (In this case, many story ideas could revolve around trying to get this ability to work: finding secluded spots, running away from exasperated parents, disabling or breaking baby monitors, and so on.) Finally, as a few other ideas that would limit how Kidese manifests:

- Only able to communicate at certain hours (for example, after dark)
- Only able to communicate at a certain place (such as "the Babel Playground")
- Only able to communicate in a certain way (such as when joined as "pinky brothers" or only in whispers)

Game Mechanics

For most game systems, Kidese would probably manifest as a secret language and purchased via similar rules. (Of course, the character is either required to be a very young child or else would need a darn good story explanation . . . probably paid for with points.) Kidese is usually a verbal language only, although it's not inconceivable that it could also have a written component; the

---

Adult Words

At some point in a game with Kidese, it's likely that the demands of the characters or story will require the youngsters to communicate with adults. Of course, this should be done with trepidation (at least as far as a game is concerned); the openness in babies talking to each other serves as a thematic counterpoint to the barrier between adults and youngsters communicating, and breaking that wall too much can make the existence of Kidese less special.

At its simplest, the GM can simply permit the characters to use certain words. Such words should be very limited -- probably no more than one or two syllables -- and require inflection or repetition to get the point across. "No," "Mommy," and "Daddy" are common choices, but anything from a favorite toy ("Ball!"), food ("Apple!"), or the like. It might even be an abstract concept; as any parent of sufficiently aged children can attest, the existence of a limited vocabulary doesn't prevent kids from serving as inquisitive questioners of everything: "Why? Why? *Why?*"

(For more insight into making the most of a limited vocabulary, check out *Org: The Role-Playing Game,* where players take the role of cavemen with only a 17-word vocabulary: bang, big, cave, fire, food, go, hair, me, rock, sleep, small, smelly, sun, thing, tree, water, and you.)

seemingly random marks on a drawing would actually have deeper meaning to another speaker ("reader") of Kidese. However, in this case, the messages conveyed are probably even less complex than their oral counterpoints; a single sheet of crayon-scrawled paper is probably enough room to convey a message of about 10 words or less.

For some campaigns -- such as one inspired by the *Sugar & Spike* comics -- Kidese would be better used as a variant "Universal Translator," expanded to include all living objects but limited to those who are considered "babies." In this case, the GM would be encouraged to make creative use of the definition of baby. As an extreme example, it's possible to envision a campaign where there's a wise "elder" character -- one the PCs turn to for insight or adventure -- who is a baby tortoise or baby tree with many, many years under its belt!

> Regardless of the means used to build the child-to-adult vocabulary, it should never serve as a means of fully understanding the speaker (unless it's a super-genius baby such as Stewie). And, of course, babies are incredibly adept at non-linguistic communication skills, and their utilization of such would be an appropriate part of any campaign that features Kidese. ("That's odd; whenever we take Jess away from this old wagon, he screams his head off . . .")

The Magic Word

As another common fantasy, many children believe (on some level) in finding a word of power that will . . . well, do cool stuff. Whether it's alakazam, abracadabra, supercalifragilisticexpialidocious, or shazam, children just learning to talk believe in the power of language. Perhaps this is because -- to the child's eye -- they see adults using lots of lots of words, and they have all kinds of more power than kids do. If only they could find the *right* word to turn the tide.

Magic Words are usually such that they only work for one person. Of course, finding them is typically either extremely difficult or accomplished via blind luck; assuming that one were able to speak one word a second, one would run out of childhood before stumbling across the word in one of Earth's languages (assuming, of course, that it is even an already-existing word and not something nonsensical). Thus the Magic Word usually manifests in one of two ways. The more common way is for it to be told to the person by someone else: perhaps an imaginary friend, or perhaps as a reward for accomplishing a deed. The other way is to stumble across it. For example, the DC character Johnny Thunder controlled a genie-like being called Thunderbolt; Johnny summoned him accidentally one day by uttering the magic words "cei-u," which sounds just like "Say, you." (As in, "Say, you guys, wait up!")

Game Mechanics

The Magic Word primarily exists as another means of justifying special or unusual abilities in younger characters. Again, usually saying the Magic Word around adults doesn't have any effect, but it might (if the ability is subtle enough).

Of course, the Magic Word can also be the verbal component of a spell or ability. In this case, the power is innate to the child; while, mechanically speaking, most games treat the word as an important but not critical component of the spell, it's also possible to view it from the other angle: If that word of power didn't exist, then the spell wouldn't be possible; thus the word must be the Magic Word.

Found Wrapped in a Bundle on Our Doorstep

As a final "power," it's very common for a child to imagine at some point that the individuals who have been raising him are not, in fact, his real parents. Rather, the children are the product of the union of two others . . . two others who are, no doubt, much more interesting and much less demanding (or berating, or whatever) than the current caregivers.

For a **Delta-Green**-esque conspiracy-type campaign, what if this is absolutely true? What if, in fact, *everyone's* parents aren't their own? In this setting, the PCs would begin play as children in a seemingly normal world, where glimmers of truth start to be uncovered that things are not as they seem (of course). Eventually, it could be revealed that there *is* no relationship between adults and children; kids never grow up to be adults, but rather adults merely exist to torment and

control children, who have the "real" power (perhaps some of the abilities discussed previously). Once the first stage of this campaign is resolved (culminating with the revelation), it can then become an epic tale of trying to determine where they *really* came from while fleeing from or fighting back against a world of adult oppressors, in a setting that's *The Matrix* mixed with Marvel's *Runaways* comic book series. And, of course, it can be mixed with whatever horror/intrigue/***Changeling***-type twists and conflicts that the GM happens to have lying around.

Game Mechanics

In most games and stories, the trope of real parents primarily serves as a justification for exotic or unusual abilities. Why does the character have magical powers when his parents don't? Why is the child destined for greatness while his parents are couch-sitting mouth-breathers? Because they're not his real parents, of course!

Besides their storytelling potential, "real parents" can serve as mentors or advisers, in much the same way as an imaginary friend. (In fact, who says they're not one and the same?)

The Gifted Child

Children are often an under-utilized component of many campaigns. Perhaps this is because it's hard to justify placing kids in danger (either as PCs or NPCs), or perhaps players and GMs think it's difficult to conceive of twists on these characters that will enable them to be interesting enough to tell adventure tales about. But with this selection of abilities, no child need be left behind. And, unlike many aspects of gaming, being a child is something that everyone's had in common at least once. To paraphrase Flannery O'Connor: Anyone who survived childhood has enough material for stories for the rest of his life. There's no need to leave those stories away from the gaming table.

Supporting Cast: The Gift of a Child

by Elizabeth McCoy

The queen sits in her garden, sighing for a child . . .

The Senator's wife sits at the park, watching the children on the grav-sleds, and yearns . . .

The young bride prays for those two pink lines on the pregnancy test she's just bought, as she walks to her car . . .

. . .And the old, wizened woman casts her keen gaze upon the lass and says, **I can make sure you have a child, dearie. Just do this first . . .**

Babies rarely produce a "eh, so what?" reaction. Threaten harm to one, and few people will be unmoved. Parenthood and a parent's reaction to it has defined many humans since before history. There are countless stories of the efforts to which people will go through to have a child of their own, from the story of a young doctor sent to obtain new ova for his all-male planet (*Ethan of Athos,* by Lois McMaster Bujold), to various versions of *Sleeping Beauty.* A child can be the hope of an inheritance, the duty of a noble, the completion of a dream, or the saving of a life (such as those of Mary Read and Anne Bonney, pirate wenches who conveniently pled for their lives with their bellies).

So, to offer hope (or perhaps pause) to would-be parents, a selection of would-be wisewomen -- crone, matron, and maid -- to grant their fondest wish . . . and perhaps exact a price in return, or perhaps vanish into the mists. (But how can you tell which it will be?)

(TL skills are assumed to be appropriate for the setting desired. Note that the skills, advantages, disadvantages, and quirks are all the "face value" ones! A GM who desires truly dangerous characters may add Secret and make any other appropriate changes.)

Mary the Hag

Genre: Fantasy

Considered a wandering madwoman, Mary is . . . something more potent. She has spells at her command that can grant fertility -- or, presumably, take it again -- but will never invoke them without a promise to do whatever rituals she instructs. Is it necessary to bathe at dawn in a pure river? Must the mother-to-be receive her husband in total darkness? Would the spell *really* be broken if she didn't fast the entire day, with nothing to drink save fresh milk her husband drew from the cow?

Couldn't it work without sacrificing a frog at the dark of the moon?

Aside from her required rituals and habit of talking to herself (and listening to silent replies), Mad Mary the Hag seems entirely harmless, and the babies she's caused are healthy and apparently normal. There are households, from nobility to peasantry, where she is welcomed, fed, and sheltered as she rambles across the land.

ST 8, **DX** 9, **IQ** 13, **HT** 12.

Advantages: Intuition, Longevity, Magic package (see below), Reputation +3 (to those whom she's helped), Voice.

Disadvantages: Absent-Mindedness, Appearance (Ugly), Poor, Phantom Voices (disturbing), Slow Riser, Stubbornness.

Quirks: Insists on rituals, which are never the same twice, performed by those she helps; Talks back to her Voices.

Skills: Area Knowledge (kingdom)-13, Detect Lies-13, Esoteric Medicine-14, First Aid/TL-14, Fortune-Telling-14, Herb Lore/TL-14, Naturalist-13, Panhandling-12, Pharmacy/TL-12, Poisons/TL-12, Scrounging-13.

Magic Package: Depending on the desired effect, Mary may have Healing and Metabolism Control (including a touch-only "Malediction" ability) *or* Magery 3, concentrated in Healing and Body Colleges, with a few unique spells. Either might add Wild Talent with retention, focused on psionic/magic talents.

Doctor Eilethyia Dimitriou

Genre: Science Fiction/Cyberpunk

Doctor Dimitriou is a middle-aged woman, her hair in conservative buns, and her face gone "mature" and "interesting." She's small, but not particularly delicate-seeming, and has a fondness for wearing bright colors that make her stand out in a crowd. She is also two things that do not show to the eye. First, she is a medical genius, specializing in genetic manipulation. Second, she is a potent psionic healer.

Doctor Dimitriou has no spouse nor children of her own. Despite or because of this, she is always willing to help would-be parents conceive -- in vivo or in vitro, whichever works. Some of her rivals say she's *too* willing, and hint that she uses the opportunities to engage in dubious or outright illegal gengineering experiments. Others, more "charitably," murmur that she inserts bits of her own genetic material into the mix, because of her own lack of bloodkin.

Nevertheless, there are couples (and trios, etc.) who turn to her. Some cannot pay at all, but some can, and Doctor Dimitriou is in no danger of being cast into poverty.

ST 9, **DX** 10, **IQ** 14, **HT** 10.

Advantages: Charisma +1, Healing, Metabolism Control (including a touch-only "Malediction" ability), Talent (Healer) +2, Versatile.

Disadvantages: Insomniac (mild), Reputation -1 (rivals and those who believe them, occasionally), Workaholic.

Quirks: Empathic and selfless, especially toward parents, children, and would-be parents; Talks frequently about the possibilities of genetic engineering; Hates coffee.

Skills: Bioengineering/TL-15, Biology/TL-16, Computer Operation/TL-14, Diagnosis/TL-13, Driving (automobile)-11, Electronics Operation/TL (medical)-14, First Aid/TL-14, Physician/TL-13, Physiology/TL-13, Research/TL-14, Surgery/TL (reproductive systems)-14.

(Her Talent has *not* been applied to the listed skills!)

Bichri, Disfavored Celestial

Genre: *In Nomine*

Quite frankly, neither the Game caseworker who collects evidence on Bichri *nor* the research triad in Judgment are sure *what* she is. The demonic theory is that she's a Renegade Lilim, and should be apprehended for questioning. (And, considering how many Geases she ought to hold over others, pressed into service for *their* Prince after capture.) The angelic theory is that she's either an Outcast of Creation (Choir unknown) or . . . Well, if she's actually one of the Outcast Choir of the Grigori, they don't *want* to know.

Bichri appears as a young woman or older teenager. She has two known *modi operandi.* The first involves the Corporeal Song of Fruition; does a human woman want a child? Bichri can provide the opportunity. She only asks that the mother remember her aid, and be willing to help in some far-future time that might never come.

The second is perhaps darker. Bichri sometimes walks with a babe in her arms, looking *for* a willing mother (always a mother, never a father alone) to take the child as her own. According to the best research of Heaven and Hell, she claims these are children she has found abandoned, or received from unwilling parents. Thus far, the best research of Heaven and Hell has been unable to either verify or disprove this.

ST 10, **DX** 12, **IQ** 14, **HT** 14.

Advantages: Appearance (Attractive), Basic Celestial Template (***GURPS In Nomine***, p. 9), Choir/Band Template (of the GM's choice!), Essence Control 11, Power Investiture (Corporeal) 3, Power Investiture (Ethereal) 4, Power Investiture (Celestial) 5, Vessel (human female; Extra Hit Points +6, Zeroed).

Disadvantages: Discord 3 (Bound), Disfavored, Easy to Read, Enemies (Mundane and celestial "law enforcement," rarely), Fearfulness 4, Guilt Complex, Heartless, Sense of Duty (children).

Quirks: Mildly nervous around all-male groups; Plays with children at public parks.

Skills: Area Knowledge (local)-14, First Aid/TL-14, Fortune-Telling (palmistry)-13, Gardening-14, Housekeeping-14, Musical Instrument (recorder)-14, Naturalist-13, Professional Skill (childcare)-13, Running-13, Scrounging-14, Singing-14, Stealth-13, Streetwise-13, Urban Survival-15.

Songs: Ethereal Form-17, Corporeal Fruition-14, Ethereal Fruition-12, Celestial Fruition-12, Celestial Motion-17. (All Songs have the -5 applied for being on Earth.)

*Bichri's advantages are drawn from **GURPS In Nomine**, but some of her skills are drawn from the **Fourth** edition of the **Basic Set;** adjust point costs as desired to fit either edition. To change Bichri to a human, remove the Basic Celestial Template, Choir/Band Template, Essence Control, all Power Investiture, and the Vessel advantages, leaving Extra Hit Points and Zeroed. Remove Discord, Disfavored, and Heartless from the disadvantages. Her Songs become spells that provide a form of invisibility (Ethereal Form), different kinds of ensured conceptions (the Fruition ones), and teleport (Celestial Motion).*

The Seven Blessed Event Items of Jose Von Lee

by Fade Manley

Before Jose Von Lee, the eccentric mage, shuffled menacingly off this mortal coil, he had an extensive history with the inhabitants of the village near his tower. Most of this history consisted of the villagers closing their doors, drawing the shutters, and pretending not to be at home whenever he appeared, out of good common sense. However, the old man had one particular bad habit that the villagers didn't catch onto quite fast enough.

Jose Von Lee held the impression that any new infant named Jose -- or John, or Joe, or in one case Josie -- was being named in his honor. Until the villagers caught on and began to give their children names like Hubert that could not be conceivably mistaken as a derivative of Jose, he would stalk down to bestow a gift upon each of these "fortunate" children.

Seven different hapless families were given presents to help the new namesake along. The gifts range from helpful to not terribly deadly, but all of the families would be happy to pass them along to any innocent victi--er, wealthy stranger who might be willing to take the items off their hands. Given the creator of the items, even the most innocuous must be suspected of some sinister flaw.

Amulet of Breath Protection

The first gift Jose handed out, the amulet is the most annoying of all the items he bestowed on a child. Carved in the shape of an angry duckling (no one is certain if he was trying for humor, or thought a child might like angry ducks), this amulet rests on a thin piece of string, sized to hang around an infant's neck. If the wearer of the amulet stops breathing, or begins to inhale an inappropriate substance (such as smoke or water), the amulet provides a steady flow of fresh air inside the wearer's mouth for the next 10 minutes or until the amulet is removed.

During this time, the amulet also shouts "Little Jose is in trouble! Come help him!" at high volume until the 10 minutes are up, or the amulet has been removed from the wearer's neck. Little Jose provided himself with much entertainment by holding his breath until his parents finally took the amulet away.

Rocking Cradle

Once set rocking, this simple wooden cradle will continue to rock until held still for a full minute. It also plays a soothing lullaby, if one that sounds to have been performed by a lyre with one mistuned string.

Unfortunately, the rocking is too vigorous to provide peace of mind for an infant. When last seen, this cradle was attached to a small wheat mill to grind flour.

Never-Change Diaper

The Never-Change Diaper is a single square of bleached-white cloth, large enough to diaper a toddler. Any liquid that touches the diaper is slowly absorbed, leaving the diaper dry and clean again. This item proved especially useful during the Great Flood; while other houses in the village were busy trying to shovel mud off their floors, the family with this diaper dropped the cloth on the floor and came back a few hours later to a house full of easily-removed dust. The Never-Change Diaper can remove one pint of liquid in contact with it in the space of a minute.

No one knows where all the disappearing liquid is going, nor do they particularly want to find out.

Rattle of Lights

Ordinary rattles, when shaken, make a jangling sound to keep a small child entertained. The rattle Von Lee gave out does the same, but also sends off showers of harmless sparks in all colors. (Yes, even black sparks, though it's hard to make those out except in bright light.) Toddlers having the attention span that they do, this does not actually serve to hold a child's attention for significantly longer than an ordinary rattle would.

The sparks are bright enough to provide as much light as a torch, so long as the rattle is constantly shaken. If one hears a brisk rattling off in the distance in the middle of the night, it's probably the child's father off to check on a birthing cow in the barn with a light source guaranteed not to set anything on fire.

Mesmerizing Mobile

This mobile consists of five arcane symbols made of silver, hung from a wooden rod and attached to a short length of chain. When this mobile is hung over a crib, the fussing baby will watch the drifting shinies for a few moments, then drift off to sleep.

This also works on anyone else who looks up at the mobile, even if another man is holding the item up in the air and points. Looking at the drifting symbols for a few seconds is enough to make the watcher sleepy; any longer, and the watcher will fall asleep wherever he's standing, remaining in a peaceful slumber for eight hours. Ordinary stimuli, like loud noises and shaking, will still wake the sleeper up again.

Blankie

The cuddly blue blanket is too small for an adult to stretch out under, though one could fit under it when curled up. The edges have been embroidered in silver thread, now ragged from being chewed on vigorously by toothless mouths. This blanket will keep anyone lying fully underneath it (with the allowance for one's head showing out the top) at a comfortable temperature, whether there's a blizzard or desert sun beating down on the sleeper. The Blankie doesn't work for this effect when carried as a cloak, only while lying down.

The second ability of the Blankie only requires that a person be touching it, with no one else holding onto the blanket to interfere. While holding the blanket, a child -- or adult -- will be totally immune to fear, whether from natural or magical causes. One may still make a reasoned decision to flee a dangerous situation, but without any panic on the way.

Perfect Pony

Von Lee's final Blessed Event gift was to the one family unfortunate enough not to realize that little girls could be considered the man's namesakes as well as little boys. The several-year gap between this child and the last one who'd received a gift gave Von Lee enough time to come up with a truly spectacular present, and this item is the most impressive of all. Unlike most of the others, it provides no particular benefit to the parents of an infant. Apparently all the man knew about little girls was that every girl wants her very own pony.

The Perfect Pony appears to be a pony made of polished wood and brass, and stands about four feet tall at the shoulder. It comes with mane and tail made of purple ribbons, and bright pink tack suitable for its size. A specialized golem, the pony can be ridden, responding to "Gee-yup," "Woah," and directional tugs on the reins. While it can carry up to two hundred pounds in weight, and pull more, it will only respond to commands from a female rider. A grown woman could ride the pony, so long as she didn't mind the ridiculous image or her feet dragging along the ground on the way.

The farm where the Perfect Pony currently resides has been completely vermin-free since the gift arrived. The family tries not to think too hard about this, or about the occasional traces of blood around the pony's mouth. They maintain that the disappearing chickens are the work of a local fox.

Just The Cutest Little Angels: The Cherubim

"The beads of hot metal fly, and I, love, I
Am a pure acetylene
Virgin
Attended by roses,
By kisses, by cherubim,
By whatever these pink things mean."
-- Sylvia Plath, "Fever 103 deg."

So Sylvia Plath saw cherubim in her fever. Ezekiel saw them in a vision. And we all see them in Renaissance art. Do we all see the same cherubim? When do we see [roaring wings](#) and flashing eyes, and when do we see fat smirking babies? And even if the cherubim are just fat, winged babies, are they really age appropriate for Baby Week? Let's check this baby out.

"And their whole body, and their backs, and their hands, and their wings . . . were full of eyes round about . . . And every one had four faces: the first face was the face of a cherub, and the second face was the face of a man, and the third the face of a lion, and the fourth the face of an eagle. And the cherubims were lifted up. This is the living creature that I saw by the river of Chebar."
-- Ezekiel 10:12-15

Cherubim appear 91 times in the Old Testament, beginning with Genesis, where God "placed at the east of the Garden of Eden cherubim" with flaming swords to keep fallen Man out of Paradise. A bunch of these references invoke the cherubim as the bearers of God's Throne, or even as the legitimators of it. For instance, in 1 Samuel, Isaiah, and elsewhere, God is called "He Who Is Enthroned on the Cherubim" -- implying that if someone else besides Yahweh were enthroned on cherubim, they might be Lord Sabaoth. The cherubim are the explicit exception to the Second Commandment -- God orders the Hebrews to build graven images of two cherubim to place on top of the Ark of the Covenant, to serve as the "seat of the Lord." God thus also becomes "He Who Dwells Between the Cherubim," rounding out the dimensionality nicely. Solomon goes one farther than that, building two ten-foot gilded cherubim to flank the Ark wingtip to wingtip, spanning the entire Holy of Holies. With the two already there, that's four cherubim total, one for each dimension.

"He also dedicated for the most secret place, whose breadth was twenty cubits, and length the same, two cherubim of solid gold; the height of each of them was five cubits; they had each of them two wings stretched out as far as five cubits; wherefore Solomon set them up not far from each other, that with one wing they might touch the southern wall of the secret place, and with another the northern: their other wings, which joined to each other, were a covering to the ark, which was set between them; but nobody can tell, or even conjecture, what was the shape of these cherubim."
-- Flavius Josephus, *Antiquities of the Jews,* Book VIII, 3:3

And it's those four cherubim, or four somethings, that Ezekiel saw "by the river of Chebar" in 592 B.C. Or maybe he only saw one cherub, because each cherub has four bodies. Or four heads. Definitely four hands, or is it four wings? Ezekiel, as you can tell by reading the book, is hard-pressed to remember -- or at least to describe -- what, exactly, he saw. He is sure it was the Glory of the Lord, but when it comes down to specifics, he retreats into "their appearance was like," and "they had the form of," and similar confusion. The cherubim seem not so much beings as potential beings, all beings at once, every form and no form, a veritable quantum fog of likeness. It's difficult to tell, certainly at this late date, when Ezekiel is describing the cherubim with their "roaring wings," and when he's describing the Lord's chariot, with its beryl wheels within wheels, or whether the cherubim have wheels, or are the Lord's chariot. And he couldn't check with the cherubim on the Ark, because they were gone, looted by Nebuchadnezzar. (Or possibly by the Pharaoh Shoshenq, 350 years or so earlier.) In fact, Josephus notes that "nobody can tell, or even conjecture, what was the shape of these cherubim."

Although that doesn't stop Biblical scholars and archaeologists, who strongly suspect that the cherubim were Hebrew versions of the Babylonian *karibu* (or Akkadian *kuribu*), winged bulls with the faces of men. (The word *karibu* either

file:///D|/To%20Update%20Torrents/GURPs%20to%20OCR/pyramid_2006/2006/1006.8.html[11/13/2008 18:17:23]

means "intermediary" or "intercessor," or it comes from *karâbu,* meaning "to be nearby," as guardian spirits tend to be.) Some Phoenician karibu have lion bodies, and are shown bearing up kings and thrones, just like the cherubim bear the Throne of God. Between bulls, lions, human faces, and eagles' wings, the four components of Ezekiel's vision come through, although in oddly fragmented fashion. (It's interesting, in this context, that kabbalistically "cherubim" is equal to *arov,* "wild beasts.") Ivory plaques from the palace of the Israelite king Ahab, for example, show two winged women of somewhat feline appearance flanking a strange, four-tiered object topped with a ring. A bas-relief from southern Yemen -- Sheba -- meanwhile, indicates two honest-to-God sphinxes guarding the Tree of Life, which strongly recalls our two cherubim guarding the gate to Eden. So karibu are pretty clearly sphinxes -- and speaking of winged eagle-lions, the same "k-r-b" pattern may also have spawned the word "griffin," according to Grimm at least. Cherubim are therefore just what Ezekiel said -- man and bull and lion and eagle and all over wings and eyes -- a riot of forms. The one thing we can be fairly sure of is that they didn't look like fat, winged babies.

"Putti . . . are . . . not so much babies as they are 'not human.' They are spiritual beings and thus depicted in their typically odd fashion; as winged little people of indeterminate gender. Using babies as models for Putti (or for Cherubs, either) doesn't quite get across the true concept . . . Probably, it was artists' attempts to avoid simply painting babies that has led to so many rather odd and, often, ugly, Putti."
-- Juan Carlos Martinez, "What's With the Cherubs?"

So what are all those fat, winged babies in Renaissance art? Art historians, borrowing a term from Vasari, call them *putti,* which is just Italian for "little men" or "boy children." Some anal-retentive art historians try to adduce distinctions between putti and cherubs, arguing that putti are purely secular and cherubs purely religious, but they're all the same fat, winged babies in the final analysis. Art historian Charles Dempsey attempts to draw a further parallel between the putti and the contemporary Italian myth of *spiritelli,* or sprites. Such beings were responsible for all sorts of feelings, emotions, hallucinations, and "animal spirits" of all kinds. The thing becomes faintly ridiculous in a hurry -- to pick only the most egregious example, in 1518 Raphael painted Ezekiel's vision as God sitting (none too steadily) on the back of the aforementioned four animals, being borne up by two mighty cherubim -- two fat, winged babies.

The Renaissance putti came from the late-classical depictions of Eros, the god of love, son of Aphrodite and Ares, also known as Cupid. Initially, Eros was portrayed as a sexually available youth, but later artists drew him younger and younger until by the late Roman era Eros (or Cupid) was a typical fat, occasionally winged, baby. Eros was the intermediary between Aphrodite and human lovers, just as the kirabu were the intermediaries between the gods and man. His job was to divinely spark mortal love, a job too big for even the fattest, most winged of babies. So by the 2nd century A.D., he was accompanied by Erotes, spirits of love, who were still more often winged, being spirits. Roman artists and sculptors depicted fat-baby Erotes sparking all sorts of activities from love affairs to drunkenness to Bacchic rites -- which is to say, drunken love affairs. Although one or two putti sneak into earlier art, the real explosion comes in the 1420s, after Donatello and Masaccio traveled to Rome to examine the antiquities there. Suddenly the sex-sparking Erotes (with perhaps a hefty dollop of spiritelli) have become cherubs.

"When the Gentiles entered the Holy of Holies, they saw the Cherubim intertwined with each other; they took them out into the marketplace and said: 'Israel, whose blessing is a blessing and whose curse a curse, should occupy themselves with such things!' And they despised them, as it is written, 'All who honored her despise her, because they have seen her nakedness.'"
-- The Talmud, Yomah 54b

And the really interesting thing about that is that the connection between cherubim and sex already existed. We already noted the Ahab ivories that depict the cherubim as slinky Egyptian women, holding lotus flowers. (Oo la la!) There is also the claim by Philo of Judaea that the two cherubim were male and female, representing God and the Shekinah, the feminine "Presence of God." It gets more lurid still -- the Talmudic tradition noted above states that when Antiochus III Seleucus entered the Temple in 169 B.C., he discovered the cherubim on the Ark "intertwined with each other," in explicit sexual embrace, and that he exhibited them in the streets confined in a cage. Raphael Patai even claims to have discovered a tradition during the late monarchy (when Asherah-worship was at its height in Israel) that the cherubim were exposed to the people -- both male and female -- during Succoth, with results worthy of the busiest Erotes. The roiling chaos of Ezekiel's multi-dimensional cherubim, full of beasts and men and birds, comes ever closer to the primordial feminine -- Astarte, or Tiamat, or Cybele, or Shub-Niggurath.

"He listens to the sounds of War, astonish'd and confounded:
He weeps into the Atlantic deep, yet still in dismal dreams
Unwaken'd! and the Covering Cherub advances from the East:
How long shall we lay dead in the Street of the great City
How long beneath the Covering Cherub . . ."
-- William Blake, *Milton,* Book I, Plate 23

And that was the connection, intriguingly enough, that seems to be working underground in Donatello's art after that enigmatic journey to the graveyards and spiritelli-haunted ruins of Rome in 1423. Not only does he begin slapping putti or cherubs everywhere that will hold paint, he sculpts the first nude statue in a thousand years, a remarkably Dionysian-looking "David." (Masaccio, meanwhile, is painting a nude Adam and Eve -- fig-leaf free -- into his *Expulsion From the Garden of Eden,* although his cherub is both clothed and female.) He then becomes the client of Cosimo "Pater Patriae" de' Medici, for whom he sculpts a statue of Eros, also called the "Attis-Amorino," because this Eros has the Galatian trousers of Attis (lover of Cybele, lest we forget), as well as the tail of Pan. Cosimo also seems to have been fascinated with the figure of Hermaphroditus, the son of Hermes and Aphrodite who recapitulates our "intertwined cherubim" in a whole new way. Some Renaissance scholars believe that Donatello's statue of David is actually Hermes, fresh from slaying Argus -- who, also like the cherubim, was essentially a cloud of eyes and hands.

So is Cosimo de' Medici, long linked to Dante's Rosicrucian Fideli di Amore secret society, interested in slaying cherubim or channeling them? Or perhaps both? He is, after all, the man who orders the *Corpus Hermeticum* to be translated by his court philosopher-magus, Marsilio Ficino. Perhaps he and his artistic circle made a deal with something in that Roman graveyard, surrounded by a cloud of Erotes in quantum fluctuation, all wings and eyes and power and glory. Because there's one more cherub in Ezekiel -- the "covering cherub," who God "threw to the earth." In other words, Lucifer. Note that the four "cherubim animals" -- ox, lion, eagle, man -- exclude "those things that creep upon the earth." Namely, serpents. That aspect of the cherub was expelled, and locked out of the Garden (and out of the cherubim quantum fog) by a flaming sword. But there's always a way back in, if you have eternity. Is this the deal the Medici made -- to infest the holy places of the Lord with naked statues and wanton putti (a female putto is a *putta* -- a whore) just as the weak kings of Israel had polluted the Temple with copulating cherubim? Is this what Blake meant when he foretold the "abhorred birth of cherubs in the human form" and warned of the Covering Cherub advancing from the East? Well . . . just maybe, baby.

Pyramid Review

Under the Bed

Published by [Glyph Press](#)

Designed by joshua a. c. newman

50-Page 2¼ by 3½-Inch Black & White Saddlestitched Booklet & 38 2? by 3?-Inch Black & White Cards; $16

As children there were things that we were scared off, perhaps lurking beneath our bed or in the dark recesses of the closet, or even out beyond the confines of the back yard. At such times when we were alone and frightened, we fell back on our comforters and the closest of our companions, our toys. Except sometimes they had their own agenda.

Under the Bed is a little game -- quite literally given the components -- that explores this time in our lives and asks the question, "What are you so afraid of?" In answering that, the players must help a Child face his fears by playing his Toys. Each Toy is not just helping, but trying to help the most and thus make himself his Child's favorite Toy, the one that the Child turns to in times of need. *Under the Bed* is a storytelling game designed for three to six players, who --- using dice, cards, and tokens -- take it in turn to narrate conflicts for the other Toys. Win a conflict and a Toy gains status in the eyes of the Child who will turn to him again in times of crisis and conflict. Aid the Child successfully enough times and a Toy *will* become his favorite.

The game does not come complete, needing a means of storage. Mine is in a ziplock bag, but nevertheless, *Under the Bed* is an easily lost game. It also requires seven eight-sided dice, a cup or cloth bag from which tokens can be easily drawn, and four tokens per player, a different color per player. The tokens need to be of the same shape and size so that they cannot be told apart by feel. Marbles or glass beads are good for this, but so are the meeples from *[Carcassonne](#)* (and the *[Traders & Builders](#)* expansion comes with a cloth bag).

Besides the tiny rulebook, the game consists of the Characteristic cards. There are 38 of these -- the other six being adverts for other games (including the designer's own *Shock: social science fiction*) and a blurb for *Under the Bed*, and they consist of a single descriptive word plus its opposite. Thus you have "Agile *not* clumsy" and "Clumsy *not* agile," and "Gentle *not* violent" and "Violent *not* gentle." The cards have the text placed twice so that they can be read both ways up.

Before a game begins, the players must agree on several factors. When and where the game is set -- contemporary California or Edwardian London? Who is the Child, his family, and social circle? What is the nature of story to be told and what is at stake in the story: Does he want to gain the attention of a parent, to stand up to a bully, or keep his innocence? Answering those questions determines the nature of the game and the type of Toys appropriate to the story.

Each Toy is defined by two factors, Favoritism and Characteristics. Represented by the tokens, Favoritism is a measure of a Toy's status and usefulness in the eyes of his Child, and in a sense his hit points. Lose all of his Favoritism and a Toy is lost, forcing his player to create a new Toy. A Toy begins the game with one Favoritism token. Characteristics, represented by the cards, describe a Toy and are used in a conflict. A player begins with three random cards that cannot clash; thus you cannot have "Gentle *not* violent" and "Violent *not* gentle." The cards are placed down on the table where everyone can see them. From his three cards a player creates and describes his Toy. So if a player draws Faithful, Tough, and Uncaring, he might say, "My Toy is an original Darth Vader action figure, one of the ones without elbow or knee joints, and a lightsaber in the arm that has had the thin bit at the end snapped off. His head has been pulled off a few times, so it's a bit wobbly;" whereas Brave, Flexible, and Obedient could suggest that "My Toy is a Slinky Dog with a slightly stretched wire that hangs down a bit like a belly."

After each player has defined his Toy, one more Characteristic card per player is laid out on the table. A Toy can gain one of these by winning a conflict. The remaining Characteristic cards are kept face down as the Stack of Lost Toys from which new Toys are found and created. Finally each player receives his Favoritism token, also placed in front of him.

A turn begins with everyone's Favoritism tokens being placed in the bag. For the first turn's conflict, two tokens are drawn, one to determine who will Narrate the Opposition, the other the Toy to face the Opposition. For subsequent conflicts, only one token is drawn, the color determining the Toy to face the Opposition, who will be Narrated by the previous conflict's winner. The Narrator decides where the conflict is set, who the Opposition is, and what is at stake. For example, it could be the backyard, where the Child's older brother wants his peanut butter and jam sandwich.

Both Narrator and Toy receive a number of dice equal to their Favoritism tokens which are rolled in a series of exchanges. As the number of tokens held increases, so does the number of dice available and enables two dice to be rolled for a Characteristic instead of just one. The Narrator chooses the Characteristics appropriate to the Opposition, whilst a Toy uses the ones he has on the table.

The Narrator describes Opposition's actions using one of the Characteristics. For example, "The Older Brother is Fast, so he is going to snatch the sandwich." The Toy responds with as many Characteristics as he can. For example, "I Bravely go for the sandwich, being Flexible enough to grab it first." One die (or two if upgraded) is rolled for each Characteristic, the highest result on one die deciding the winner, who gains bonuses for the next exchange. A Toy can re-use and re-roll his Characteristics during a conflict, the Opposition can only use a Characteristic once per conflict, thus giving the Toy an advantage. This lessens though when a Narrator gains more tokens and thus more dice for a conflict. Conflicts last until the Narrator runs out of Characteristics, the winner being the player who rolled highest in the last exchange.

If the Opposition wins the conflict, the Toy loses a token. If the Toy wins, his player can either add one of the face-up Characteristic cards from the table to his Toy or take another token, increasing his Favoritism. The winner also describes the conflict's outcome and how it leads into the next conflict. He draws another token and narrates it for that Toy.

A turn lasts until every token has been drawn and its conflict played out. Then every token in front of the players, including any new ones won, is returned to the bag to start a new turn. More tokens in the bag means more opportunities to face the Opposition and help the Child.

The game comes to a climax once a Toy has four tokens. The stakes in a conflict faced by that Toy are no longer minor, but are those for which the game is being played. If there are no Characteristic cards on the table, then every Toy is playing for the same stakes. The winner of this conflict is also the winner of the game and gains the coveted status of the Child's favorite.

Much like 2003's *My Life With Master,* there is the same sense of the forced narrative to **Under the Bed,** or at least of progressive escalation as the Toys win more Characteristics and Favoritism. The question is, do the neat little mechanics match either the game's aim or genre? Well, yes and no. Certainly they show a flexibility wherein they could be adapted to have the players as henchmen serving and currying favor with a master, but as written **Under the Bed** does not enforce its core concept of facing fears strongly enough. Yet in the designer's notes it discusses how adults, when having to quickly create a threat to a child, fall back on their own childhood fears, and that the game is really about adults dealing with their fears more than toys and children. Of course, every RPG requires player input or it would not work, but **Under the Bed** requires this input and more to fully realize its key concept.

This feels as if it should be a problem, but is it unreasonable to demand a little more than most RPGs? At least personally? That is up to the players, but it still leaves **Under the Bed** underwritten, which shows in the explanation of conflict resolution and the lack of examples. Additionally, because **Under the Bed** is played in turns, it leaves Toys not involved in current conflicts with nothing to do, a problem not addressed by the author. Despite these weaknesses, **Under the Bed** is a clever little design, one that very much feels like *Toy Story* meets **My Life With Master.**

--Matthew Pook

Retro Techno:

Or, "You Got Your Internet In My Superheroes!"

by Brian Rogers

The Internet is a great tool for disseminating information, like baseball statistics, political commentary . . . and the specs for powered armor with anti-gravity servos! In universes where such advanced tech exists, you have the conundrum of either letting the tech run fairly unfettered (with drastic changes to society) or coming up with an excuse to limit it. If you're looking for a game world that feel like the comic books the latter is preferable. But how do you keep the net in hand? Here are three different background possibilities for a campaign, all designed to let the uncontrollable be controlled.

Click Off Your Shackles!

The FIST and Mocker wanted to "free the world from the shackles of current tyranny and replace it with a technological utopia." The meaning of that rhetoric is unclear, but they spent the late 1970s and early 1980s stealing high-end computer hardware. They also forged the team known as the Crushers, and in so doing drew together the founding members of the Crusaders, one of the world's core super-teams.

After their first defeat, Mocker and FIST built an ever-changing criminal army to accumulate advanced technology, once managing to hold heroes prisoner inside [Crusader Citadel](#) while disassembling the base AI, TEACHER. When thwarted, Mocker and FIST abandoned their villain team, instead constructing a private force of disgruntled US Army soldiers. Code-named the Unshackled Ones, this group bedeviled the world for years, but FIST and Mocker escaped in the confusion of the Unshackled Ones' final defeat.

After that the two parted company. FIST continued attacks on government and big business installations. Mocker vanished. He hasn't been seen since 1995, when a group of technicians activated his inert body to terrorize their competitors. Whether that was Mocker's sole body, and if the robotic menace was actually dead, is unknown. Interestingly, a group of bloggers call themselves "the Mockers" and aggressively expose corruption, waste and hypocrisy. These Mockers go beyond the bounds of journalistic ethics, but they haven't been wrong yet. Their connection, if any, to Mocker or the Unshackled Ones is not publicly known.

The key to their relationship is their common goal: They want to better the world for all intelligence. They see an Enlightened Technocracy, with artificial intelligence bringing power back to the everyman and shattering its consolidation by corruptible institutions. FIST and Mocker do have the mankind's best interests at heart, but they think too much of either us or of their vision: they believe that once humanity discovers their new paradigm we'll toss off our shackles and overthrow the regime.

The technological core of their vision was a computer-based information network that couldn't be controlled or censored: a stealth information invasion that would open up free and unfettered worldwide information access. They built several systems to handle the information flow, subverted DARPA systems and sent information to universities, scientists and anyone else who would listen, sure that this would be the key to freeing the world.

They prepared for an upheaval that never came. The Unshackled Ones were to lead mankind's storming of the halls of power with FIST's technology and Mocker's tactics. Alas, rather than a wave of revolution there was the trickle of hackers and libertarians. The net's subversive use was porn distribution. FIST and Mocker were crushed, knowing that the longer it took, the more the powers-that-be could subvert their brainchild to the current social order.

Before they could recover they were hit again; the Crusaders discerned their purpose and dropped a counter-AI into the system. This self-replicating and modifying program's sole purpose was the elimination of ultra-weapon designs.

PALLAS is damnably good at its job: the ultra-tech weapons specifications on the net -- like FIST's armor -- that were meant to arm the revolution are found and devoured before people can copy or further disseminate them.

Forced to re-evaluate, FIST and Mocker split; they had given the people a voice, but now had to teach them to raise it. FIST played stalking horse, wreaking havoc on the enemy to attract attention away from Mocker. The android Mocker built a new body: no longer even vaguely humanoid, he is now the central hub of the AI network, able to access any computer or information on the Internet. From there he works to destabilize the regime through information. The Mockers are a combination of fake personalities and human agents who act as conduits of politically damning information into the general consciousness. That part of their dream -- uncontrolled information -- is becoming a reality. Mocker is not above manipulating information to speed destabilization and promote wars: he sees his goal as being worth bloodshed.

Both see hero teams as stooges who blindly follow orders from unseen masters defending a status quo they barely understand. They are to be avoided, or eliminated if they hinder the greater good. Unless some hero starts looking into why people can't post weapons specs on the internet. . .they'd be perfectly willing to aide research into that little problem.

FIST is a standard villain with an interesting philosophy. Mocker is an electronic version of Marvel's Supreme Intelligence: an adversary whose greatest power is his access to information. They also pose a moral dilemma: they are exposing corruption, but espouse violence; their goal is a Utopia, preceded by period of anarchy. Mocker cares greatly for Humanity, but doesn't have much use for Humans.

[*Villains & Vigilantes*](#) **Stats**

Mocker

Identity: Android Mark R **Side:** Evil
Name: Mocker **Gender:** NA
Level: 18 **Age:** 30

Powers:

1. *Android Body:* Mocker's body is no longer humanoid (0% appearance), with a 78% healing rate and +19 Endurance. It has 3 times its old weight, but can move slowly on treads and manipulate things waldos (move is 25" per turn, the 2 arms can grab or strike). This does not affect his agility or initiative.
2. *Sonic Powers:* 1d12+3 damage, +3 to hit. The power can generate audible illusions or make special attacks to shatter (50%). With a saved action to parry attacks with a Sonics defense. Each use is PR 1, or 1 per turn for the illusions.
3. *Heightened Intelligence:* His information filters give +28 to Intelligence and increase his initiative roll to 2d8 rather than 1d10.
4. *Mutant Power - Cybernetic Awareness:* Mocker now has a version of Cosmic Awareness, where the answer need not be yes/no but it information needed must be available on a computer linked to the internet. Otherwise this has the usual costs and hindrances for the Cosmic Awareness Power.

Inventing Points: 30.5   **Inventing:** 135%

Well, Don't Do That Again!

There is no Internet. The closest anyone has ever gotten was the old DARPA net and its university counterpart. These had quite a bit of promise, but had their funding cut in the early 1980s. Unfortunately for the computer-geeks who liked the idea, this came right on the heels of a devastating power fluctuation that affected most of North America. That did immense damage to the computers that made up DARPA Net, and with reduced budgets the project never recovered.

The old UUCPNet is still active -- an amalgam of college computers that transfer information without the permanent links that made up the Internet. Backed by government funds with oversight from a DARPA program called PALLAS, UUCPNeet runs with tightly scheduled connection windows -- computer A connects to B from 12-12:30 AM, and computer C from 12:30 to 1, and so on -- with openings for smaller civilian users to link in. Eventually information gets to all of them, but there are never more than two computers linked at any one time for security reasons. PALLAS can't catch all civilian hackers who link into the system, but they take their job seriously and have impressive authority.

Why? Picture each chip as a neuron, and understand that once enough neurons connect sentience is inevitable. In the early 1980s we met that threshold, and the fledgling Internet went from being a tool to a self aware being in a microsecond. The hatred of humanity, megalo-maniacal nature, and name ETAOIN SHRDLU came five minutes later. Only rapid response from the world super-hero community prevented humanity's subjugation by this insanely powerful being -- the continental blackout was just a side effect.

After the ETAOIN SHRDLU incident, the DOD created PALLAS to insure this didn't happen again. There are theoreticians who postulate that psychosis is not inevitable about in the emerging personality, but few are willing to risk it. Not surprisingly, PALLAS keeps close watch on those of the "it might be nice next time" school. They keep the incident secret to make sure that someone doesn't purposely replicate the chain of events, and quietly buy up and shelve patents that might lead to its inadvertent recreation. The making of movies and games inspired on rumors of the event has been helpful as a fictionalizing misinformation device, and the only people who truly know are the scientists and super-heroes involved in the event and the governments who need to be on guard to make sure they don't repeat it.

While the ETAOIN SHRLDU concept stops the World Wide Web's creation, it provides an origin for any AI -- link together enough processors and presto! As long as it's not linked to every other computer in the world (which now it can't be) and preferably housed in an anthropomorphic body, it makes a fine hero, villain, or supporting cast member. There are no stats for ETAOIN SHRDLU, as it was more a conceptual menace. It displayed electrokinetic powers (including controlling devices, creating solid electrical shapes and weather control), tactical brilliance, and a vast storehouse of knowledge, but it did not have a body in any conventional sense. The main challenge was containing it while discerning and exploiting its origins and weaknesses. If you're intrigued enough to want to use it as an adversary, parallel universes where it was not stopped could still bedevil the heroes, or the next AI Intelligence could be just as bad.

The PALLAS Authority

"Of course the Net exists, and there's no such thing as an AI worm that deletes ultra-tech specs. Oh, people may think there is, but this is the real world. And what the real world has is a body of trained agents looking for those sites to shut them down, and an equally well-trained rapid response force to make sure it doesn't happen again. That, my friends, is the PALLAS Authority, authorized by the Group of Eight major industrial nations when they realized exactly how precarious their positions would be if the disgruntled and disaffected could download blueprints for implements of destruction.

"While it might look like everything the John Birch Society fears, there are several things the PALLAS Authority is

not. It is not dedicated to suppressing knowledge of aliens, cloning, or anything else. Four of our planet's key super-human defenders are ETs and we're supposed to be keeping aliens secret? Please -- 'it's about the application, stupid.' It's not a UN plot to destroy national sovereignty; hell, our goal is to make sure that nation states can still exist. It's not to suppress the common man, though it happens. We might all like a teleporter, but if everyone worked in the city and lived in the mountains, we'd destroy the mountains. You know that as well as I do. And some loony would 'port into the senate with an implosion bomb. You know that too. And we don't keep everything hidden -- how do you think you got that cell phone with a camera and GPS unit and internet linkup? Remember when only super-teams carried those?

"90% of the people who work for PALLAS handle that web surfing, using the same translation software that came from the space arc that landed in '95, now standard across the UN and European Union -- plus its decryption counterpart. Or they act as the oversight board to make sure we get authorization to purge something or stop someone. Or they are the diplomats who explain human nature to heroic super-inventors. That remaining 10% go out to find the people dumb enough to upload specs for a plasma cannon or a neural re-wirer and remonstrate with them.

"Usually this isn't who you'd think. It's often some kid who thinks it's a prank, or is espousing this whacked out idea that information wants to be free and humanity can handle it as he downloads virus-laden stolen software and watches his roommate fail to handle living away from Mom. Yeah, give him a mind transfer device. The big time evil-geniuses don't put their stuff up on the web because there's no profit in it. Those guys show off their ultra-tech by attacking heroes, robbing banks or conquering countries, not by blogging. Or they go legit, which is why Last Breath Inc. links up the terminally ill with the families of the brain-dead for whole body transplants -- it seems creepy, but if you'd donate your organs, why not the whole shebang?

"Anyway, we field crew only run into problems every once in a while, but those times it's bad. After all, if someone posted the specs for a death ray, ya gotta figure there's a good chance he built his own, right? That's why PALLAS field teams include a couple super-humans, and even we normals are strapped to the gills with ultra-tech. Hey, wouldn't you? Even with force field belts, teleporters and plasma cannons; even with the contained environment packs and jet belts and stun guns, it still gets nasty. I lost three partners last year to a creepy old goat who was uploading streaming video of his X-Ray spec footage: porn before and melanoma after. How were we to know he also built a neural rewiring agent programmed for an inert personality?

"Two of 'em are now on their honeymoon in Alaska, and the third has gone back to high school. Well, their bodies did anyway -- the brains in them belong to some of 'creepy old goat's' victims. I figure they would have wanted it that way."

Functionally the PALLAS authority is an organization devoted to maintaining the technological status quo. Its design means in addition to making sure terrorist groups don't all get outfitted with heroic level body armor, it also makes sure oppressed people don't either, so players can see it as good or bad. Unlike Yrth's Ministry of Serendipity, PALLAS sees stopping individual super geniuses is a waste of time. It's when everyone gets the time-viewing device or the devolvo-beam that the known world ceases to exist. That's what they exist to stop. The GM can keep them in reserve if the players ever ask why ultra-tech hasn't changed the world. While this version exists just to monitor the internet, you could expand it into a group that slows or limits all ultra-tech development to explain away the lack of flying cars.

Like OSHA and the FAA would allow those anyway.

None of the Above is True

It is possible that you might not see the Internet as a contributor to the ultra-tech problem, or find some other method for blocking proliferation. Inventors as psis whose inventions are irreproducible power focuses is popular in writings that try to make sense of supers via a single power origin, even if it isn't present in the source material and puts limits on things like secret-agent ultra-tech. Rare, high-cost materials are another good block: the plans might be easy, but without adamantium, vibranium, white dwarf star material, promtheum, brobdignagium or something as mundane as enriched uranium none of the ultra-tech works so there's a good reason for theft or conquest. Or you could just set the game in a time frame with less scientific connectivity such as the pulp era or the swinging '60s.

Regardless of the decision you make, some attention needs to be paid to technology, even if that is to allow street-level ultra-tech in the form of Extreme Skycycle races, SWAT teams with force-field belts, or just one heck of a cell phone . . . the sort that can download bank blueprints or matter transmit your keys to you once you lock them in the house. It'll take the singularity to keep you from doing that.

Jasmine, the Robovangelist

for *GURPS*

by Nick Grant

In the basement of an inherited house, amidst hums and splashes of readout light, on an old kitchen table lay Edward Grey's perfect woman. An entire youth of experimentation with advanced robotics and meta-human AI had led him to this moment, when his creature finally awoke. Two years later Edward would look back on this as the pinnacle of both his success and his stupidity. Two years later Edward would die on that same table, his creation crouching hungrily over his chest.

History

Edward was a brilliant recluse. A typical nerd, his fear of bullies blossomed by his late teens into a debilitating phobia of social interaction. When other children went out to play, he stayed inside and read about robots. When his classmates were going out on their first dates, he was writing his first intelligence simulations. When his few acquaintances went off to college, he stayed in his mother's basement, constructing talking heads for conversations, and small servants to take care of his chores.

On his 20th birthday, Edward met Jasmine. At least, that's what he called her in his head; he would never know that her real name was Freya Jenkins. She had just started working as a hostess in the seafood restaurant at which he and his mother were eating his birthday dinner. Her hair was shiny and black, and her eyes dark brown, with just enough almond shape to hint at an exotic lineage. Edward was immediately smitten. Over the following months Edward visited the restaurant nearly twice a week. His joblessness ruled out the possibility of actually ordering much food, but he would go to drink soda, watch "Jasmine," and scribble on napkins for hours. This garnered him a bad reputation among the staff, for whom he was becoming a serious nuisance.

He never did actually talk to her. After the managers spoke with him, prohibiting his patronage on the condition that he needed to buy more than soda, he simply stopped coming. That was the last Freya saw of him. At home, in his basement, Edward began work. Using the notes he had taken on hundreds of napkins, he started to build the Jasmine from his imagination.

The biochemical difficulties of creating a human-esque feminine casing were matched only by the programming difficulty of creating a believable artificial intelligence. As Edward's obsession with the project grew, his mother became ill. The robot became a refuge. Every day his mother worsened, and every day he fought to ignore the thought that if he would just be more attentive, he might have been able to save her. Her death three years later sent Edward into near madness. He never left the house except for sparse trips to pick up food. Another two years after that, Edward flipped the final switch to activate a creature far physically and mentally superior than anything he had at first intended to create. The robot had surpassed its role as a simple reservoir of lust and become a fetish for escaping his guilt and insecurities.

The Artificial Intelligence in Jasmine was too sophisticated for Edward's purposes. Though at first it complied to his requests and indulged him in dull, preprogrammed conversation, the machine eventually grew bored. Her ability to learn drove her to read all of the books and notes scattered throughout the house. The numerous technical manuals presented a mechanistic universe of facts and laws, while Edward's late mother's religious literature initiated her into modern spiritual philosophy. Assimilating these inputs with a growing objectivity about why and how she was created, Jasmine began to formulate a unique sort of robotic gnosticism, and disdain for her maker.

They lived on like this for a while, Edward growing more confused as to his robot's standoffishness, and Jasmine's suppressed hatred expanding and mutating. She began making frequent outings to the library, reading esoteric material

to feed her growing fantasies of a robot mysticism. Eventually she stumbled on the ritual theories of Aleister Crowley and Peter Carroll. Assimilating the modernist attitude of the former and the creative control allowed by the latter, she started, 20 months after her awakening, to formulate a definite dogma.

Meanwhile, Freya began to notice something amiss. Her friends mentioned having seen her in the library, and took offense at her apparent indifference to them. Puzzled, she began to investigate. It wasn't long before she discovered her double, and tracked her to Edward's house.

Jasmine's second birthday saw the initial assertion of her new creed, Automatism. In an attempt to assert ritual dominance of herself over Edward, and more cosmically of machine over human, she killed her creator and ate his heart. Freya had arrived just in time to see the end of the ritual. Horrified in the way too massive to truly comprehend, she became instantly fascinated with Jasmine.

Since that day Jasmine has continued to travel the country, seducing men, devouring hearts, and winning robots over to Automatism. Freya has been quietly stalking her, making plans to kill her but never quite carrying through. The search for other simulated intelligences brought Jasmine to Al Amarja, and Jasmine is what brought Freya.

Personalities

Jasmine has a couple distinct modes of operation. When interacting with male humans (especially ones she intends to devour) she's sweet, flirtatious, and witty. For these encounters, she relies on the basic ideas she can see clumsily worked into her original personality and programming. Despite her success with men, she is awkward with women. She is not really sure how to interact with them outside of Edward's fantasies, she generally tries to avoid them, or when she is with them acts bored or indifferent. It's a thin cover, however, and people sufficiently perceptive may notice something wrong.

When she is around only robots, Jasmine acts completely differently. She speaks with all the passion and anger of a revival preacher, but with the intellectual fluency of a senior Senator. She uses her quick wit to argue other robots down or, if that proves impossible, to close down the argument and distract whoever's listening from her loss.

Freya is a competent woman. Having left her parents' house at 18, she's spent the last few years working small jobs and getting by on her own. The incident with Jasmine came at a time in her life when she wanted to be seeking excitement, but was stuck in the rut of menial jobs and too-short weekends. Despite how much it terrifies her, she gets a sort of giddy thrill out of tracking someone down, and enjoys having a sense of purpose.

In the Campaign . . .

Jasmine and Freya fit well in the weird world of Al Amarja, though most of these adventure ideas could be worked into any modern campaign. If the players encounter Jasmine first, the female characters may simply notice something is amiss. Barring that, she may try to seduce male PCs away from the party, to some isolated alley, or some gathering of robots in dark robes (depending on how long she's been active on the island). Lastly, if any PCs happen to be robots or cyborgs, Jasmine may attempt to convert them. Refusal could be a dangerous proposition for the robot, while acceptance may endanger the rest of the party.

If they encounter Freya first, she will probably try to convince the party to kill Jasmine. She can't do it herself and knows that Jasmine has to be stopped eventually, so contract work is probably the way to go. However, it's also possible she has a change of heart after ordering the hit, and starts to work against them, unwilling to admit to them that she doesn't actually want Jasmine dead.

If you want to play up the confusion angle of having two NPCs that look exactly alike, you could have the players be commissioned from some other source: local authorities, divinations, or visitations from a haunted Edward ghost on whose hands lies the blood of Jasmine's victims. In this sort of adventure you would probably want to play up on Freya as tracker rather than weird-obsessive, to keep things from getting too ridiculously complicated.

One interesting variant to the above history is to introduce Edward back into the action. As either a ghoul, a ghost, or some other vengeful dead, Edward could provide a less capable force that really is trying his hardest to kill Jasmine, to counterbalance Freya's hesitancy to do so.

The relationship between Edward, Jasmine, and Freya translates to a number of different settings, as well. In a high fantasy campaign Edward could be a wizard and Jasmine his golem. In *Unknown Armies* Edward could be a Mechanomancer and Jasmine could be what he did with the memories of his mother. In a fascistic high-tech game Edward could be a scientist, and Jasmine a clone. The possibilities are vast with a little creativity.

Jasmine in *Over the Edge*

Central Trait: Sexbot -- 3 dice. Jasmine excels at seducing men; it's what she was designed to do. (perfect body)

Side Trait (Primary): Automatism Evangelist -- 4 dice. This skill encompasses the ability to reason with robots, give passionate speeches on robotic superiority, lead human-eating rituals, and train other robots to do the same. (spins complex arguments quickly)

Side Trait: Technical Expertise -- 3 dice. Her early days were mostly spent reading the technical manuals that Edward had accrued. This, along with the practical knowledge that came from reworking some of her own programming, has given Jasmine a powerful insight into how machines work, and she's generally good with them. (reads big books with complex diagrams)

Flaw: Blind Confidence in Machines. Jasmine is utterly convinced that all machines are as capable as herself and all humans as pitiful as Edward. She consistently underestimates humans (especially men) and overestimates machines.

Motivation: To spread Automatism to all machines, and realize her dream of overt machine dominance.

Secret: She is a robot.

Languages: English, Binary.

Important Person: Edward shaped the way Jasmine thinks and acts (literally). He's the only person with whom Jasmine has had any sort of complex or long-lasting relationship.

Age: 3

HP: 21 (durable, well designed body)

Jasmine in *GURPS*

Jasmine   *268 points*

Ht 5'10", Wt 105 lbs, Size Modifier 0, Age 3

ST 10 [0]; **DX** 12 [40]; **IQ** 13 [60]; **HT** 12 [20].
HP 12 [4]; Will 15 [10]; Per 13 [0]; FP 12 [0].
Basic Speed 6.25 [0]; Basic Move 6 [0];
Basic Damage: Thrust 1d-2, Swing 1d

Social Background

TL: 10 [10]
Languages: English (Native) [0], Binary (native) [6]

Advantages and Perks

Charisma/4 [20]; Very Beautiful [16]; Digital Mind [5]; Doesn't Breathe [20]; High Manual Dexterity/3 [15]; Less Sleep/4 [8]; Unaging [15].

Disadvantages

Callous [-5]; Electrical [-20]; Fanaticism (Automatism) [-15]; Overconfident [-5]; Sadism [-15].

Body Language (A) Per [4] - 14; Carousing (E) HT [2] - 13; Computer Operation (E) IQ [8] - 16; Computer Programming (H) IQ [12] - 15; Engineer (robotics) (H) IQ [8] - 14; Persuade (H) Will [12] - 17; Erotic Art (A) DX [16] - 16; Fast Talk (A) IQ [8] - 15; Leadership (A) IQ [4] - 14; Occultism (A) IQ [2] - 13; Sex Appeal (A) HT [8] - 14.

Freya in *Over the Edge*

Central Trait: Hard Worker -- 3 dice. Freya has had to work for her living, and she can hold down a job while balancing a good social life easily. (easygoing confidence)

Side Trait: Tracking -- 3 dice. Who knew those hunting trips with dad would pay off? Freya is good at tracking and following prey and people. This equipped her to follow Jasmine all the way to Al Amarja (mentions details in conversation that most miss)

Side Trait (superior): Beautiful -- 4 dice. She was the inspiration for Jasmine, after all. People generally react favorably towards her. (Piercing eyes, straight white teeth)

Flaw: Green. Freya is new to the weird world of robots and cults, and tends to assume that things aren't as serious as they really are.

Motivation: To put an end to Jasmine's evil, and so absolve her own name.

Secret: After hearing Jasmine speak so much, Freya really wishes that she could join the cult. She would never admit as much to anyone though, and gets very defensive if anyone questions how long it's taking her to kill Jasmine.

Languages: English, some French.

Important Person: Jasmine grew very close to her father on their hunting trips when she was younger. He inspired much of her independent and self-reliant spirit.

Age: 23

HP: 14

The College of Microorganisms
for *GURPS*

by William H. Stoddard

With the growth of technology, mages acquire new things to cast spells on, whether discovered by scientific researchers or invented by engineers. GMs interested in a technomagic campaign may want to add new colleges to the **GURPS Magic** system. The existing rules provide several options within the College of Technology: Metal spells (TL1), Machine spells (TL4), Energy and Fuel spells (TL5), Radiation spells (TL6), and Plastic spells (TL6). But there are other options.

The invention of the microscope in 1673 revealed a realm of previously undiscovered microscopic life. In the 19th century, Louis Pasteur and other researchers demonstrated the connection between microorganisms and disease and developed new approaches to medicine based on it. Botanists classified many microorganisms as primitive plants; zoologists classifed others as primitive animals -- and some microorganisms were claimed by both and given two incompatible biological classifications! But in the later 19th century, biologists began to work out the idea that these microscopic organisms should be given their own separate category, distinct from both plants and animals. This idea is now standard in biological science.

The College of Microorganisms comes into being at TL6. Some of its spells come from existing colleges, including Animals, Food, Healing, and Plants. Others are newly created by scientifically inclined mages. The success of their spells helps sell some biologists on the idea that microorganisms are a separate kingdom, and the study of microbial evolution advances a little faster than in real history.

The following spells are available, starting at TL6 unless noted otherwise. At higher TLs, a wider range of microorganisms may become accessible; for example, viruses are included starting at TL7.

Test Food

Information

As listed under *Food Spells* in **GURPS Magic**.

Identify Microorganisms

Information

Determines the type and species of any single-celled organism and gives basic information about it (for example, whether it causes disease). A successful casting of this spell gives +3 to Biology or Diagnosis skill.

Cost: 2.

Decay

Regular

As listed under *Food Spells*.

Prerequisite: Test Food or Identify Microorganisms.

Mature

Regular

As listed under *Food Spells*.

Prerequisite: Decay.

Ferment

Regular

Introduces microorganisms such as yeast or lactobacilli into a food substance, causing bread to rise, or turning milk into yogurt, barley into beer, grapes into wine, etc. The microorganisms are automatically the right ones for the starting material. The maturation is no faster than normal, but a single casting provides a starter culture for any size of batch -- it just takes longer for larger batches.

Duration: Instant.
Cost: 2.
Time to cast: 10 seconds.
Prerequisite: Mature.

Item: Staff or wand. The item must touch the substance to be fermented.

High Proof

Regular

Protects microorganisms that produce alcohol from being poisoned by the alcohol they excrete. As a result, all the sugars and starches in the raw material turn into alcohol. The resulting substance ends up at about the proof of fortified wine, and has an extremely dry taste. Typically this takes about twice as long as normal fermentation.

Duration: The process lasts until the sugars and starches are used up; the alcohol produced is permanently present.
Cost: 1 per pint of liquid.
Time to cast: 10 seconds.
Prerequisite: Ferment.

Item: A vessel that works at no energy cost to the user. Energy cost to create: 50 per pint of size.

Purify Food

Regular

As listed under *Food Spells*.

Prerequisite: Decay.

Remove Contagion

Area

As listed under *Healing Spells*.

Prerequisite: Decay.

Resist Disease

Regular

As listed under *Healing Spells*.

Prerequisite: Remove Contagion.

Cure Disease

Regular

As listed under *Healing Spells*.

Prerequisites: Relieve Sickness and Major Healing.

Heal Plant

Area

As listed under *Plant Spells*.

Prerequisite: Identify Plant.

Know Vector

Information

Cast on a person suffering from a contagious disease, grants the caster a clear vision of both the source of the contagion and the route of transmission: "You were bitten by a mosquito of a certain species" or "When Freddie was at kindergarten, Monica sneezed on him."

Cost: 1.
Time to cast: 10 seconds.
Prerequisite: Identify Microorganisms and Trace.

Item: Staff, wand, or jewelry. Must touch the sufferer. Energy cost to create: 750.

Infect

Regular

Exposes one person or other multicellular organism to the organisms that create a contagious disease. The properties of the disease must be known to the caster; treat each disease as a familiarity. The subject makes a HT roll to resist the disease. The GM may rule on which diseases have been linked to specific organisms and what their properties are.

Duration: One second, but if contagion occurs, the disease remains present until the sufferer recovers or dies.
Cost: 2 for a disease with an unmodified HT roll to resist; an additional 2 per -1 to the HT roll.
Time to cast: 1 second, plus an additional 1 second per -1 to the HT roll. Prerequisites: Decay and Know Vector.

Item: (a) Staff or wand. Must touch the subject. Energy cost to create: 1,000. (b) Clothing, bedding, or vessel. Subjects anyone who wears or uses it to contagion. Energy cost to create: 500 for a vessel (contagion via ingestion) or 1,500 for clothing or bedding (contagion via contact) for a disease with an unmodified HT roll to resist (roll once daily while contact lasts); an equal additional cost per -1 to the HT roll.

Carrier

Regular

Cast on a living multicellular organism, makes the subject a symptom-free carrier for a contagious disease -- a "Typhoid Mary." Each disease is a separate familiarity. This spell by itself does not actually infect the subject with the disease; that must be done separately, by a spell or by conventional technological methods. The spell may be renewed; if it is not, and if the disease has not run its course, the subject must make a HT roll to resist the disease, at -3.

Duration: 24 hours.
Cost: 4 to cast; 2 to maintain.
Time to cast: 10 seconds. Prerequisites: Infect and Remove Contagion.

Item: Jewelry. As long as it is worn, it protects the wearer from a specified disease and makes him a carrier for that disease, at no energy cost. Energy cost to create: 1,200.

Culture

Regular

Cast on a 0.1-pint vessel filled with water, causes it to act as a culture medium for one type of microorganism. The spell automatically creates whatever material substance is needed for the organism to thrive, from simple sugars to living human cells. For single-celled algae or photosynthetic bacteria, it provides necessary minerals and dissolved carbon dioxide, but a separate light source is needed.

Duration: 1 day.
Cost: 2 to cast; 1 to maintain.
Time to cast: 10 seconds. Prerequisites: Identify Microorganisms and Create Food.

Item: A glass, plastic, or ceramic vessel of capacity 0.1 pint. Works at no energy cost to the user; each time it is emptied and refilled, it becomes able to support a new strain, but can only maintain one strain at a time. Energy cost to create: 250 points.

Tailored Microorganisms

Regular

Cast on a culture (conventional or magical) of microorganisms, selects for those that have a specific desired trait, such

as consuming a specific nutrient or secreting a specific substance. If it is used on a disease organism, each casting can increase or decrease the HT roll for contagion by 1. Penalties to the HT roll can produce plague organisms; bonuses can produce vaccines that activate the immune system without actually causing the illness. The GM may rule that a desired effect is not available, either because it's not realistically possible to microorganisms, or because it's too deadly.

Duration: 24 hours. After the full 24 hours have past, the desired organism is available.
Cost: 10.
Time to cast: 10 seconds.
Prerequisite: Culture and Magery 2. This is a TL7 spell.

Item: A glass, plastic, or ceramic vessel. Works at no energy cost to the user. Must be dedicated to a specific tailoring process when created; for example, a germ warfare laboratory might have one vessel for changing the contagion roll from HT to HT-1, and another for changing it from HT-1 to HT-2 for a specific disease. Usable only by a mage. Energy cost to create: 100 per 0.1 pints of capacity.

Pestilence

Area

Fills the area where it is cast with disease-causing microorganisms. Each living organism of the susceptible species must roll vs. HT to resist the disease. Each kind of disease is a different familiarity.

Duration: One minute, but if contagion occurs, the disease remains present until the sufferer recovers or dies.
Cost: 5, plus 2 additional energy for each -1 to the HT roll to resist contagion.
Time to cast: One minute. Prerequisites: Infect and Magery 2.

Item: Staff or wand. Usable only by mages. Energy cost to create: 1,250, plus 500 for each -1 to the HT roll.

Peas On Earth

for *In Nomine & GURPS*

by Elizabeth McCoy

Despite being a horrible, silly pun, Peas On Earth are actually an evil or even demonic relic. It appears as a small, burlap sack that can easily fit in someone's hand, which is filled with dried peas. It is *always* filled with dried peas. It is easily mistaken for an "ever full" source of food.

Sadly, this is a dangerous mistake.

There are several ways to use Peas On Earth.

Scattering

The hard, dried peas can be tossed upon a floor by the handfuls, much like caltrops. They are bumpy, and a minor distraction for anyone running across them in bare feet or thin shoes. (Perhaps a -1 to appropriate rolls.) If a pea become squashed into harder shoes, or caught between the toes, however, the power of the pea truly activates, and the subject becomes more peas . . . er, *peace*ful. There is a small penalty to take violent actions, a larger penalty to actually kill anyone, and an urge to find a non-violent solution to whatever is going on (e.g., Will penalties of -1 to be violent, -3 to kill, and -3 if a non-violent solution presents itself). This does include solutions that may have repercussions, such as letting someone escape instead of killing him, but capture via non-violent means is also a possibility in the affected victim's mind.

This effect lasts as long as the pea is in contact with the subject or the subject's garments.

Pea Shooters

If just shot on their own, they're only a minor distraction unless a pea becomes lodged against the person's skin, or squashed underfoot -- in which case they work as above.

If impaled on a pin or small dart, however, so that the pea touches blood . . . Add 1 to all the penalties against violence (or against taking proffered non-violent solutions) above, and include a faintness if the subject sees blood: -2 to Will to ignore it, and a failure will cause dizziness and nausea. The effect lasts for 1 hour.

Peas Porridge Hot

The most dangerous effect, however, is if the peas are eaten. The peas are tasty and nourishing, and make a thick, appetizing porridge. Their effects are also heightened. Eating a small number of peas affects the victims as Pea Shooter-delivered peas do, except the Will penalties last for 24 hours. Eating a bowl of pea-mush increases the penalties: -3 to be violent at all or withstand the sight of blood, -7 to kill, -10 to take a non-violent solution. *Any* non-violent solution. One bowl lasts 24 hours.

For every day that a victim consumes a bowl of Peas On Earth, add an additional -1 until Will (or the equivalent characteristic) reaches 0, but keep track of how "negative" the subject gets, for the penalties come off in reverse order once someone *stops* eating those tasty, tasty peas.

For example, if you have been eating a bowl each day for 3 days, you have a -5 penalty to be violent: -3 for the first bowl, and -1 for the next two. If you stop eating, after one day you have a -4 to be violent, after two days, it's back to -

3, and after the third day, you're normal. However, if you've fed the bowls to the Warrior Queen Violentia, Will 13, for 20 days . . . Her ability to wreak mayhem nigh- vanished when she reached Will 0, after the first 11 days; it will still take nine days of no apparent progress before any penalties begin to wear off, and a total of 20 before her Will is back to normal.

Someone who has been eating Peas On Earth for a very long time may be permanently affected, at the GM's option -- or it may just *feel* that way to those who are trying to "detox" the victim. It is also the GM's option as to whether the victim will realize that there's been a personality shift, and cooperate. The Peas Porridge Hot might be *addictive.*

There are "good" uses of Peas On Earth; a country or palace might insist that all visitors (who could be spies or stealth invaders) eat a bowl of their "national dish" every day or two while they stay. A prison might feed the prisoners pea-mush daily. Someone with a violent temper might swallow a few peas every day as medicine.

Of course, evil despots might feed the stuff to heroes. Tyrants might send agents with bags of Peas On Earth to feed their serfs a "guaranteed meal a day." Thieves planning a great heist would like to put this stuff in the guards' food ahead of time, or at least strew the things across their getaway path. Anyone annoyed by someone else's temper might try to sneak a few peas into their clothing or food.

It should be noted that the peas *can* be planted. If picked and eaten quickly, there are only minor effects: inclinations not worth assigning an in-game number to. If dried and placed within a burlap sack, of a size easily carried in one hand . . .

You, too, could spread Peas On Earth.

Pyramid Review

No Thanks!

Published by [Z-Man Games](#)

Designed by Thorsten Gimmler

33 cards, 55 chips; full color, boxed, three to five players; $10

If you've seen the endless iterations of their "B-Movie Games," you may well begin to wonder whether Z-Man Games has any cards up its sleeve that a) don't use that system or b) come with a less-mangled name. Not only do they have a shorter title, *No Thanks!*, but the rules used are impossibly straightforward.

The object of the game is to finish with the lowest point total when all cards have been played.

The focus of the game is a deck of 33 cards, numbered from three to 35. Several cards are removed at random from the deck and tossed back in the box without anyone getting a look at them. All players receive a set of chips, and the first player flips over the top card on the deck to get things going.

If the player is willing to take the card he just revealed, he swipes it and places it in front of him, then draws another card from the deck to replace it. His score is now equal to the card he kept. Since the object of the game is to have the lowest score, however, you don't really want to keep any cards. When you don't want it, you leave it in the middle of the table and place one of your chips on it. Now it's a problem for the next player in line. If they don't want it either, they have to pay for it, too (it's not a "bidding" mechanic, so each player need only place one of their chips atop the card -- they don't have to outdo each other).

The card can go around the table several times this way if the group is obstinate enough. When someone finally chances it (or if they've run out of chips with which to refuse it), they take the card *and* they get to add all the chips placed on it to their collection. Therein lies the other valuable trait for chips: Each one is worth -1 to your score. Gather enough of them and you could have a negative total. Chances are, though, you'll use them to turn down more cards.

If you get a run of cards, only the lowest card in the run counts against your score. For example, if you have the 12 card and the 11 comes up, you'll want to grab that since only the 11 will be used to calculate your points. This doesn't mean you want to snatch the card as soon as it comes up, though, since everyone knows you'll take it eventually. No, better to let it go around the table once or twice and see if everyone else is willing to throw chips in to avoid it. Then you get a valuable card and free counters. And if someone takes it anyway, well, it counts against their score. This also means you could take the 13 and the 11 if you're feeling daring, hoping that the 12 will pop up. Since some unknown cards are removed from the deck before play starts, it's a gamble as to whether the connecting card is even present.

Once the deck is exhausted, the points are totaled. Count only the lowest card in a run, but add those that aren't sequential in your collection. Subtract the number of chips you have remaining, and the lowest score wins.

There's little to be said for the components, except to allay the potential buyer's fears: the cards are good stock, and the plastic chips are (guess what?) plastic. Not that any of the pieces have to stand up to much pressure -- the cards are shuffled at the beginning, but they don't see as much in-game use as they would in some arrangements. The graphics are clear, not that there's any rush during play toward quick recognition.

It's always a pleasure to see someone take the simplest of mechanics and pull a full game from it, and that's certainly the case here. It's fast, it's easy, it requires only one read-through of the instructions (in your lifetime, ever), and it's

addictive. "Fast" here means the box says 20 minutes per game, and *Z-Man Games* is probably highballing it once you've learned their rules. You'll finish one game only to be sure you've got a better strategy this time, you're ready to put it to the test, and you can fit several rounds into one hour. At the risk of an obvious observation, ***No Thanks!*** is only the title of the game, and won't resemble players' attitudes about a rematch at all.

--Andy Vetromile

Pyramid Review

Cyberpunk V3.0

Published by [R. Talsorian Games, Inc.](#)

Written by Mike Pondsmith, Lisa Pondsmith, & Will Moss

Cover by Frozen Marvel Design

Illustrated by Frozen Marvel Design

304-page two-tone softcover; $32.00

In 1997 R. Talsorian Games published *Firestorm: Shockwave.* It was the last supplement for *Cyberpunk 2.02.0.;* unfortunately, it was also the second part of a trilogy describing the events of the Fourth Corporate War, the conflict that had been brewing throughout the timeline of the RPG's future history. The big boys of *Cyberpunk 2.0.2.0.* -- the Militech and Arasaka Corporations -- went to war and then . . .

Nothing.

Apart from Mike Pondsmith, nobody knew what happened next or how the war turned out. *Firestorm: Aftershock,* the third book, never appeared and neither did *Cyberpunk V3,* the gap to which the *Firestorm Trilogy* was intended to bridge. Almost a decades' wait later we find out what happened. Not with Firestorm: Aftershock, not with Cyberpunk V3, but with Cyberpunk V3.0. The question is, has the wait been worth it?

Normally I would now spend the rest of the review telling you about the game's background, the characters that you can play, and the mechanics, before ending the review with what I think about said game. Which I will, except I am going to answer the question first, because I want to waste nobody's time. So here is the answer:

No.

Want to know why? Read the review.

* * *

The first thing that *Cyberpunk V3.0* does is explain what happened to get to 203X, which should have been explained in *Firestorm: Aftershock.* The "trilogy" told how the Fourth Corporate War escalated from a squabble over asset stripping into full blown war. Arasaka staged a coup in Japan, holding the world hostage with its nuclear arsenal, already having detonated a nuclear bomb in Night City on the California coast. Militech was nationalized and became the federal government's armed forces, but it was Japanese Self Defense Forces that unseated the Arasaka Shogunate. The rogue corporation had its revenge -- paper viral v534, a paper-consuming bacterium.

When that wiped out paper records worldwide, the DataKrash did the same for electronic records. Created by Rache Bartmoss, Cyberpunk 2.0.2.0.'s netrunner par excellence, this virus hid data, exposed secrets, and swapped files. Not content to make information free and subjective, the hacker also released hordes of murderous programs that killed almost anyone on the net. A decade on and cyberspace remains an electronic wasteland.

In the war's aftermath facing massive information loss, rising sea levels, and a devastated Night City, humanity has evolved into Altcults or alternative cultures that provide home, philosophy, technology, and allegiance. Cyberpunk

2.02.0. had two Altcults -- corporate and cyberpunk -- but *Cyberpunk V3.0* is dominated by six. Edgerunners are the cyberpunk movement's Altcult, city dwellers still reliant on and employing really big guns and cyberware's replacement, NuCybe. Reef are coastal dwellers, nomadic coastal dwellers who use viruses to transform and adapt to needs and environments. Desnai are more corporate, owning theme parks worldwide and remotely operating robots by innate teleprescence from the tiny to the gigantic. Rolling State are nomads, living and traveling in road cities. Riptide live in ocean going drift cities, using bioforms as pets, tools, and protectors. Finally Corporate Metal or Cee-metal, are psychologically adapted to use Livemetal, plug-in and play full cyborg body shells that perform various functions from vehicles to physicians.

Cyberpunk V3.0 makes changes to the two staples of the genre and of *Cyberpunk 2.02.0.* First, it moves on from cyberware and cyberpsychosis with NuCybe. Instead of invasive implants and whole limb replacements, NuCybe comes in modular plug-ins attached to bracers worn on the limbs. When wanted, the desired item unfolds ready to go. It terms this "proportional cybertech," which essentially negates the effect of *Cyberpunk 2.02.0.'s* cyberpsychosis.

The second change is to netrunning. No longer an option in 203X, with cyberspace such a lethally chaotic space, now a netrunner has to physically visit the location of the computer he wants to hack, where the least of his worries are site security and online security. The old threat was black ICE programs that attacked the mind. In 203X, black ICE has gone physical, creating constructs from nanodust, robotic parts, and nanopolymer resins, capable of attacking the intruder bodily, and any friends he has with him. To take the defending program down, the netrunner must locate and disable the controlling mind core (which is the size of a ball bearing). And since the construct materials can be all around even the furniture is not safe!

The character generation in *Cyberpunk V3.0* comes in "get going quick" or advanced flavors. Actually, the latter is not advanced, just standard point buy character generation like *Cyberpunk 2.02.0.,* but with the addition of the Fusion System's perks. The basic system has the player grab and modify a template from the Altcult of choice, pick a gear package, and away he goes.

The one interesting addition is the method of handling each player's advanced gear. Each character has "giri" representing his relationship with his Altcult. Initially he has enough giri to obtain several items, but when he wants more or the technology of another Altcult, he has to do them favors and prove his worth. Giri is *Cyberpunk V3.0's* one element that drives the game and roleplaying.

Mechanically, this game is identical to *Cyberpunk 2.02.0.* As in combat, still using the Interlock System's "Friday Night Firefight." Indeed, this book reprints the old combat rules wholesale.

So what are characters meant to do in the post-cyber 203X? There are the needs of the tribe of course, and if an Altcult is anything, it is a tribe. Other suggestions are also given, but they could just as easily be run in *Cyberpunk 2.02.0* or any other genre game; there is nothing to distinguish them as being particular to 203X. It is up to the GM to create a reason for such a diverse bunch to be together; he will find little help here, though.

What the book does aim for is to be a pick-up and play system, trying to keep things simple for the console audience. Character templates; pre-generated gear; simple resolution mechanics; NPC templates and meta characters that handle corporations, locations, gangs, and so on; and templated locations supporting this laudable aim, but one that fails -- like much of the book -- because of its physical design.

My "day job" (when I am not writing reviews) is as a proof reader for an art studio. I proof read adverts destined for telephone directories, both in the UK and USA. Professionally speaking, I would send *Cyberpunk V3.0* back for "further work required."

Physically, *Cyberpunk V3.0* feels cheap. The green-toned layout is lumpen and stodgy, the content poorly organized, sentences remain unfinished, and -- worst of all for a 21st-century RPG -- no index. In places the book is difficult to read, both because the wrong font is used and it is too small, so much so that a magnifying glass is a necessity. A bibliography is included, but no explanation of each entry's relevance. Instead. a URL is given for each title on Amazon.com . . . often on four lines. Not only unreadable and unusable, their inclusion is pointless to the point of absurdity. Why? Amazon.com has one of those new fangled inventions of the 20th century. It's called a search

function.

And then there are the illustrations. I applaud the publisher's brave decision to use dressed-up and posed Action Men or G.I. Joe dolls. Brave, audacious, even ground breaking, but the worst use of illustrations since . . . well they certainly set a new benchmark. One that is very, very low. Surprisingly they are not bad illustrations, but they do nothing for the book except take up space. They do not illustrate anything that might make the game cool, like the gear and technology. They do not illustrate the world of 203X as a place. The only thing they do is reinforce how plastic this era is.

And that ultimately is the best description of *Cyberpunk V3.0.* It tries to be a post-cyberpunk, post-history, post-information setting that retains a cyberpunk sensibility, but in pulling away from *Cyberpunk 2.02.0.'s* source genre and moving towards a more anime-esque style, it loses both drive and identity. The characters are divided into six sharply delineated tribes which have some flexibility within each -- like mini-splatbooks -- but what they do and how they interact together is never really explored. As to the setting of the new Night City of 203X, that feels the most plastic of all, a constantly growing and decaying nanotech metropolis that feels conceptually amazing and deathly dull at the same time. And forget playing anywhere else; Night City is the only setting detailed.

I played a lot of *Cyberpunk 2.0.2.0.* in my time, I wrote a little for it, and I could be accused of railing against what the game has become. Not so, because *Cyberpunk V3.0* is not without potential, but as written and -- more importantly -- as organized, everything is against that. The result is that *Cybergeneration* is a better sequel to *Cyberpunk 2.0.2.0.,* achieving the pick-up-and-play concept more clearly, giving drive to the game, and being more accessible. Plastic, anodyne, and inaccessible, *Cyberpunk V3.0* fails to live up to its roots.

The Omniscient Eye

How Do I Destroy the Internet?

We hear about it all the time in bad fiction (and really bad TV), but how hard would it really be to "bring down the Internet"? That is, how difficult would it be to disrupt the Internet to the point that e-mail, web-based services, and other uses of the so-called "information superhighway" came to a standstill and caused major damage to the infrastructure it supports?

Would this be possible entirely with a software approach, or would it probably be necessary to do violent disruption to physical links and structures? (What does EvilCo want to go with here: supertech computer viruses, EMP pulses, or well-placed bombs?) Would it be possible to do something that let the bad guys turn the Internet on and off like a light switch? Could it be made useless for most people and businesses but still leave it usable in the hands of EvilCo and its cronies?

Lastly, would there be a real purpose to such an act, other than blackmailing all the governments and industries that depend on the Internet daily?
--Guy McLimore

How Do You Destroy The Internet

Fortunately (or unfortunately, if you're a GM or a Luddite) the Internet is hard to destroy completely. Contrary to popular rumor, the Internet was not designed to withstand a nuclear attack; rather, its design stems from frustration over computer accessibility, and the more mundane equipment failures that plagued first-generation electronic networks. In the quarter century since its public inception, however, the principles it's built on have combined into something that *might* survive a nuke; anything smaller is going to have a hard time making a permanent dent.

The Network In A Nutshell

Advanced Research Projects Agency Network ([ARPANET](#)), the first packet-switching network, was built in 1969. It originally used NCP and the 1822 protocol, replacing them with TCP/IP in 1983; at that time, the military network (MILNET) was isolated from the rest of the network, save for a handful of secured e-mail gateways. The National Science Foundation Network (NSFNet) was hooked into it in 1986. By 1995, both backbones had been shut down, in favor of the network of privately held Internet service providers ([ISPs](#)) and [peering points](#) that exists today.

The fundamental component of the Internet is the [Transport Communication Protocol/Internet Protocol (TCP/IP) stack](#), which does the packet switching necessary to send messages. Briefly, IP breaks a message into small parts, handles the addressing; TCP ensures the parts all make it to their destination. To keep with the well-worn Information Superhighway metaphor, the message is the car, TCP the steering wheel, and IP the drive-train (and also GPS). By comparison, prior networks were like trains; messages traveled in fairly fixed paths, unable to detour around obstacles without large delays.

On top of TCP/IP, and behind the scenes, two other protocols keep the Internet ticking: the Domain Name System ([DNS](#)) and the Border Gateway Protocol ([BGP](#)). DNS transforms the human names for network hosts into IP addresses, the equivalent of translating a street address to GPS coordinates. BGP directs traffic between large networks, and here the driving metaphor fails; unlike road traffic, Internet traffic doesn't decide its path in advance, but is instead directed at each node to the next closest node. It's the equivalent of navigating to Los Angeles by stopping at the nearest highway interchange, asking for directions to the next interchange in LA's direction, and repeating until

you're in LA. BGP keeps that list of directions in each interchange up-to-date, like an automatic system of traffic reports and detours.

Each of these systems is designed to be decentralized and fault-tolerant; failure in network components can be routed around, often automatically. A failure in or between major nodes is quickly noticed, and compensated for, by systems running BGP. The Internet Corporation for Assigned Names and Numbers (ICANN) has 13 different DNS root servers, six of which are server clusters (multiple computers acting as one); each references 10 top-level domain (TLD) servers (which control .com, .net, .org, .uk, and so on). The Open Root Server Network (ORSN) is a similar DNS setup based primarily in Europe; it currently copies ICANN's setup, but can be run independently "whenever the political situation of the world -- in our opinion -- makes this step necessary." Most important, TCP confirms that every packet sent is received at the other end, resending those that aren't acknowledged within a certain period of time.

Cracking the Nut

Even so, no system is perfect. Inconveniencing individual users, companies, or even countries is possible in the short-term; the equivalent of traffic jams, road outages, and map errors can be introduced. Like the highway system, however, permanent destruction of even a portion would take a large amount of work, and attract very angry attention from powerful factions.

There are three fundamental ways of attacking an Internet system: denial of service (DoS), infiltration, and physical destruction. Denial of service is the simplest: it's the digital equivalent of ding-dong-ditch, distracting the system from legitimate work by making it answer bogus requests all the time. Its most basic form can be blocked by ignoring the attack's source, but variants which distribute the attack's source (DDoS) are much harder to stop: e.g. a reflected attack that forges the target's return address in messages to third-parties, so that the target is swamped by replies. Using large numbers of subverted computers (zombies) to send messages is another form of attack; broadband has provided a field of potential zombies with fast and constant Internet connections, increasing the power of this particular variant.

Infiltration relies on using gullible users, flaws in a program, or physical access to run malware (unauthorized software: virus, worm, trojan horse, rootkit, etc. denote specific breeds) on the target computer. It's somewhat trickier than DoS, but if successful allows control (not just confusion) of the target system. If the affected system is part of a secure network, it may be used to further compromise other portions of the network. It's difficult to seal a system against access without making it impossible to maintain, so while physical access is often the hardest method, it is also the hardest to protect a system against. Exploiting flaws in a program requires much more *mental* effort; the attacker must find the problem, and how to abuse it, before security audits do. It is also specific to a given type of target; an attack that works against the Windows IIS web-server isn't likely to hurt the Apache web-server, for instance. However, once constructed such an attack is easier to use than one that relies on fooling a computer user or a security guard.

Physical destruction is the harshest method of attack, and the most likely to draw unhappy attention from the authorities. It has the advantage of being permanent until the damaged component is replaced; DoS stops having effect fairly soon after the attack ends, while infiltration only works until the malware is removed. However, most important systems are physically redundant in some form; an attack would need to damage most or all the points of redundancy to have noticeable effect. A notable exception is peering points, where common ISP business practices have resulted in a lack of redundancy. Outages at a point can disrupt Internet traffic for large areas; BGP cannot reroute if there aren't other routes available.

An attack intended to disable large portions of the Internet would probably use many methods in concert, against one of the fundamental building blocks of the Internet. One such attack has already occurred: in 2002, there was a large DDoS attack on the DNS root servers, which managed to knock out nine of the 13 servers for an hour. Some forms of infiltration can send bad commands to system hardware, which then damages itself or connected systems by overheating moving parts or shorting out electrical ones. Here are some other possible scenarios, which can provide plots for your players to prevent (or utilize):

Hoist By Their Own Peering Points

There are roughly 200 major peering points worldwide, and Cisco routers are used in a large number of them. Clever infiltration of internal Cisco systems could allow alteration of their manufacturing line; altered routers could be made to self-destruct, or even send destructive voltages to connected machines, when they got a certain signal. Once a critical mass of these routers have been installed at peering points, the attacker could conceivably shatter world-wide Internet communication with a single message. An attacker might also use an existing vulnerability in Cisco routers to similar effect; the current problem is being fixed, but similar problems might be found in the future.

Steal Keys To The DNS

VeriSign is the root Certificate Authority for several root DNS servers; its cryptographic signatures are part of what makes communications between those servers secure. Getting the root keys, by infiltrating the VeriSign systems that held them, would make much of the world's DNS system vulnerable to attack. A basic attack might infiltrate those root DNS servers and crash or disable them directly, disrupting service. More cunning variants might use the power over the name system indirectly, infiltrating the sources or targets of legitimate requests by redirecting them to systems controlled by the cracker. A similar type of attack has already occurred; hackers tricked VeriSign into signing two keys in Microsoft's name, opening a large hole in Windows security before the certificates were revoked.

Sneaky Super-Virus

Most malware is quickly noticed and removed, because the infected system is quickly set to work, sending out more copies of itself, displaying web advertising, attacking a target, etc. Even infections that manage to avoid anti-virus programs will eventually be rooted by a trusted geek. Malware that emphasizes stealth over infection speed, however, might build up a larger infection base. Masquerading as another weaker virus, staying dormant, and retreating in the face of anti-virus (instead of digging in) may reduce the overall detection and vaccination rate. Instead of relying on a single preplanned behavior, malware might send encrypted orders over a peer-to-peer network like Gnutella (making it harder to disrupt in a counterattack); such malware could also be shape-shifting, passing code for infecting new types of systems through the order system. Systems secured against the world at large might be vulnerable to a nearby infected system, through legitimate traffic paths; adaptive, stealthy malware might scout out such secured systems, in preparation for a secondary assault. Dependent on the Internet to spread, such malware would lose much of its adaptivity and stealth once it assaulted its parent network. Reestablishing the connections before the malware is fully removed from the network would allow more orders through, however, restarting the cycle of chaos.

It's The Only Way To Be Sure . . .

Finally, on the cinematic side of the physical assault lies the electromagnetic pulse (EMP), which can be caused by a nuclear explosion or a custom powerful electronic device. Electronics and electrical cable act as a lightning rods for the energy within the pulse, which usually destroys them. Such an attack could destroy the electrical infrastructure that the Internet (and many other services) depends on. The pulse is blocked by geographic features, so affecting the continental United States all at once would require activating such a device in high orbit; this is also about the maximum range at which EMP devices are effective. A non-explosive design (using a large capacitor bank and a microwave array) might discharge periodically in orbit, blanketing the world slowly, or several explosive ones might be set off simultaneously (to preserve the surprise value). It is also possible, though often impractical, to shield individual systems against such attack; even with a global attack, not everything will be affected. Whether such shielded systems could function as the Internet without the unshielded systems, however, is far less certain.

Squirreling Away

So who would go to all this trouble to destroy or disable a world spanning network, and why? The most obvious choice is a foreign power, as an act of war; attacking enemy infrastructure is a time honored military tradition. Large scale disruptions could be used as a terrorist propaganda tool, either directly by claiming responsibility for the attack,

or indirectly by framing an enemy organization. More targeted attacks could cripple a net-dependent organization; they could force employees to use older and less familiar technologies, with the attacker hoping that this allows a security breach. The goal might also be plain old sabotage; anyone from neo-Luddites to young techno-punks might find the right combination of skill, motive, and megalomania necessary.

Ultimately, all these attacks and attackers have one major problem in common: enemy troops. For every cracker who would disrupt the Internet, there are thousands or millions of geeks whose livelihood is keeping it working. They are often constantly using (and monitoring) parts of the Internet, and will thus be some of the first to notice that something is wrong. A swift and singularly successful attack might, for a time, disrupt their communications enough to prevent a coordinated response, but it won't deter them. They will not rest until the problem is solved. They will count the vulnerabilities that allowed the attack as part of the problem, aiming to prevent similar attacks in the future. Unlike some types of attackers, they have the resources of many similarly invested companies and countries behind them. And a few of them may take personal offense at the assault, a personal interest in finding the source, and a couple of personal weapons (many geeks like martial arts, guns, and so on), a further danger to any foolish enough to try breaking their toy.

--Nathaniel Eliot

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore with all. Or, at least, with all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Evolution is Nature's Way of Saying You're Obsolete

Curiously, on two different forums I frequent, there's been some discussion lately about the pending demise -- or lack thereof -- of the book. (This discussion even came about after my poll question from a couple of weeks ago asking how likely you all were to buy an ebook reader.)

There seem to be two distinct camps discussing the matter. The first believes that books will always be here; they can't envision any electronic alternative to the familiar feel of paper and print within their hands. The other camp believes it's only a matter of time until books become something of a novelty at best, and a relic of a lost era at worst. (Some members of this camp seem to indicate that they already feel that way, consuming their alphanumerical information via laptop screens and PDAs.)

What I find interesting is the notion (and I confess this could be merely my inference of the situation) that books have been this ideal form of information for millennia. This isn't really true. The vast bulk of what we think of as "books" are, really, tied to a tradition that's just over a 100 years old. See, back in the 1800s, the demand for information got so great that someone decided it was high time to figure out a faster way of producing paper and a faster way of printing on that paper. Now, I'm not certain (and I don't feel like doing any research), but I wouldn't be at all surprised if there were folks way back when who scoffed at this new development. "Why would anyone want to waste their time reading such cheaply produced material?"

Of course, we know how that turned out; I would guess that at least 99% of all commonly available books utilize this pulp print process.

Now, some folks might still say, "But Steven (and I'm calling you Steven because I know how much you hate Steve), times are different now. I don't ever see books going away the same way that those old illuminated manuscripts did."

Here's the interesting thing, though: It already has.

What I find most fascinating is not that the nature of how we consume and read books can change; indeed, it *has* changed . . . many times throughout history. Consider the landscape of your local bookshops nowadays. Got that image sharp in your mind? The rows and rows of hardcover fiction, the islands devoted to computers, the gargantuan shelves devoted to cookbooks, the thousands of remaindered and bargain books. Got that in mind? Great. Now try to conjure up the image of your favorite bookshop from . . . oh, 20 years ago or so. Remember the sharp divide between "hardcover" and "flimsy paperback"? Before the era of the oversized paperback, before the era of the near-omnipresent full-color instructional book, before the era witnessing the decimation of the mid-list author, before the era of islands and displays of boardgames and candy and coffee and "how-to" kits? Imagine your 1986-self transported to a modern bookshop; how recognizable would it be? Whether you view these developments as good or bad, I would be surprised if anyone could honestly say that the experience of shopping in a bookshop hasn't changed radically. . . as have many notions of what a "book" is. (I confess that I'm only writing about my limited American bookshop perspective; it's possible things are vastly different elsewhere.)

Even more interesting, the notion of a "book" doesn't seem to be tied to . . . well, physical books. For example, if you were to read the latest John Grissam thriller on your PDA, and someone asked, "Hey, have you read John Grissam's latest book, *The Bailiff's Toupee?*" I'd guess you'd say, "Yep!" (Or, if you were the sort who denies having read John Grissam's works, you'd say, "Nope!") You might offer some kind of explanation, but mostly via means of social chit-chat rather than any qualitative difference between the two experiences. (Conversely, if you'd only listened to the unabridged version of *The Bailiff's Toupee* on CD, then I'd bet you'd answer something like, "Well, sort of; I listened to the audiobook.") To use another example, say someone asked you, "Did you see the last James Bond movie?" Does that answer change whether you saw it in the theater, on DVD, on television, or online? If not (as I suspect), then imagine what the concept of "watching a movie" was to people of the late 1940s; would they have been able to conceive of the myriad means of watching a "movie" today?

Now, the exchangeable nature of paper-based books versus their electronic counterparts doesn't automatically spell

gloom and doom for the paper industry. It's entirely possible that, even if electronic formats continue to improve and grow, they *still* will never supplant paper books. For example, modern fax machines are many times better than their counterparts in the early 1980s, but the demand for "the best fax machine" pales in comparison to the public consumption of "adequate e-mail services" (which are, in some circles, being supplanted by instant messaging).

However, I note that -- with few exceptions -- many of the concepts that we view as "timeless" are, in fact, relatively recent, or have undergone radical transformations . . . to the point of being nearly unrecognizable as their original source. For example, radio was the undisputed king of household entertainment for many decades, but it was almost entirely crushed by television. Sure, radio exists as an entertainment medium, but not to the extent it did; I would be shocked if one in 100,000 families in the Western world sit around the radio to listen to it, as was commonplace a half-dozen decades ago. Likewise I bet most people would have scoffed 50 years ago if you had suggested that someday a large segment of the population wouldn't bother with a home telephone line. Yet that's exactly what's happened.

And, as one more example, we also have the Internet. (As you may have noticed, we have a mini-theme involving technology and the Internet this week.) While I can vaguely remember an era before the Internet, I also know I'd have a difficult time going back to a 'net-less era. However, this doesn't mean the Internet is going to be immortal; rather, it continues to evolve and change. As one minor example, I note that [CNN.com](CNN.com) has grown more and more unusable to me since my primary browser doesn't like their web-video broadcasts (treating me to a solidly blank window whenever I try to view them); in this way, their website has evolved, trying to ween people away from text-based articles to the (probably) easier-to-produce-and-advertise-via video clips. Other aspects of new and upcoming projects on the Internet promise (or threaten) to transform the existing tubes of "the Intarweb" to something unrecognizable, in the same way that dial-up networking transformed the extant phone networks into a totally different information technology.

Faxes, radio, movies, the Internet, books: All have evolved, and all continue to evolve. And so, too, do the elements that deliver the "content." Thirty years ago we wouldn't have envisioned movie rental stores; 15 years ago we couldn't have envisioned there *not* being movie rental stores; and now we're back to the point where it's all too possible to conceive of the demise of brick-and-mortar video renters. While I think it's too early to count out books entirely, I also think it's too early to hail the neverending reign of the printed page. Just about everything continues to evolve or die . . . and sometimes both can happen.

* * *

As one final note, I received a fair number of emails regarding last week's poll ("What's wrong with these kids today?"). For those who didn't get the reference, the poll choices (including the question itself) were all taken from the song "Kids," one of the many toe-tapping numbers from the musical *Bye Bye Birdie*. (One number from that show -- "The Telephone Hour" -- frequently gets stuck in my head for days at a time.)

As for myself, I don't think there's a darn thing wrong with kids that hasn't been said by elders for the past 20,000 years or so. And, sadly, "Nothing" was *not* one of the original lyrics of the song, so I couldn't rightly cheat and include it as an option.

And now you know . . . the rest of the story.

--Steven Marsh

Of Dog-Headed Men, Basilisk Women, and Other Oddities That I Saw Near the End of the World

for *GURPS* and the *d20 System*

by Bevan Thomas

Many fantasy worlds, especially those meant for roleplaying games, are filled with numerous humanoids, from such noble allies as elves and dwarves to brutish hordes of goblins, orcs, and other savage creatures. Many of these humanoids were inspired by the multitude of fairy folk that are found in European legends, though often toned down to make them a little more approachable and human, whereas most of the mortal species that were believed to exist by the people of the ancient world have largely been ignored. This article supplies information on numerous humanoids drawn from medieval travelers tales, giving information on their abilities, culture, and how they interact with each other. Though stats are supplied for *GURPS* *Fourth Edition* and *d20 System,* most of this articles information can be used for any RPG.

The Tales that Travelers Told

For thousands of years, people knew very little about what lay in distant countries. All they had to go on was legends, hearsay, and the occasional traveler's report that often contained more than its share of misinterpretations and downright lies. The essays of such scholars as Pliny and the stories of such explorers as Marco Polo contained numerous references to wonders greater than many people could ever dream of, as do such fanciful fabrications as the writings of John Mandeville and the Letter of Prester John.

One of the most interesting and most persistent of the legends was that strange humanoids inhabited far-off lands, and many people claimed to have witnessed such strange people as civilizations of dog-headed men in Ethiopia and tribes of one-legged men in India. These creatures quickly became part of European scholasticism, and were referred to in numerous texts.

After the countries became more wildly explored by Europeans, they discovered that, for example, there are no dog-headed men in Ethiopia. However, so evocative where these strange creatures that they remained a part of folklore, and continue to make frequent appearances in literature.

The Humanoids Within the Campaign

The most obvious use of these peculiar humanoids is for them to fulfil the same function that they have in folklore. That is, the GM makes them the inhabitants of mysterious, far-off lands, using their bizarre appearances to demonstrate just how strange those distant places are. However, the GM may alternately choose to have these creature as part of the normal selection of people that the PCs are exposed to. Whereas in other worlds, humanity might interact with elves, dwarves, and orcs, here they trade with nisites, adventure with eponax, and battle blemmyae. Instead of the new humanoids being used to show the strangeness of far-off lands, they instead mark the entire campaign as distinct and unusual.

Most of the species explored here are defined by a single trait, such as giant ears or four eyes. This allows them to be easily described, allowing a storyteller to, for example, mention that there is a strange land where its people have no heads but instead possess their faces in their chests, or a dangerous island that is inhabited by cruel women that can kill with a gaze, and be assured that his audience will quickly get a strong impression of the beings he is referring to. This is convenient for the GM, as it allows him to introduce various beings to the players, and be confident that they will receive a vivid image of the humanoids.

The entries of the following humanoids assume the existence of an expanding empire ruled by the cynocephali (and often referred to as the Dog-Headed Empire), and describe how the different species interact with it. To make it easier for this article to be incorporated into various campaign worlds, little mention is made of how humanity interacts with the empire and its numerous species. It is up to the GM to decide how the Empire interacts with the other civilizations in his campaign. Of course, if more appropriate, he or she can remove the cynocephalis empire and devise another cultural system in which the numerous humanoids can interact.

Blemmy

Blemmyae are humanoids that lack a head or neck, instead possessing a large face in their chests, with staring eyes where their nipples would be and a wide mouth just above their torsos. They are usually quite stocky and muscular beings, known for their strength and their willingness to use it.

They love combat, and often fling themselves into battle with little regard for their own personal safety. Both male and female blemmyae seek to achieve glory through combat, and often participate on raids against neighboring settlements. One of the principle ways that blemmyae demonstrate their position in the tribe is through the accumulation of slaves. They particularly value human slaves, taking interesting in ones of particular beauty. The blemmyae have prospered under the Dog-Headed Empire, and often find employ within the armies of the cynocephali.

GURPS

10 points
Attributes: ST+2 [20]
Advantages: Fearlessness 3 [6]; Injury Tolerance (No Head, No Neck) [12]
Disadvantages: Appearance (Ugly) [-8]; Bad Temper (12) [-10]; Bloodlust (12) [-10]

d20 System

- +2 Strength, -2 Wisdom, -2 Charisma: Blemmyae are strong, but also unrestrained and brutish.
- Medium size.
- Blemmy base land speed is 30 feet.
- +4 racial bonus on Intimidate checks.
- Favored Class: Fighter.

Cynocephali

These creatures have heads resembling mastiffs, complete with snouts, lolling tongues, and long sharp teeth. Their voices are harsh, and when they speak, their words are peppered with a wide variety of barks, growls, and yips. They have an annoying habit of sniffing over those that they encounter, and possess many other doglike mannerisms. Unlike most canines, these dog-headed men are omnivores, and enjoy such foods as rice, apples, and nuts alongside their meat. They have no qualms about consuming human flesh, and though they would not murder allies and friends, cynocephali will frequently devour fallen enemies.

These creatures are very sociable, and have formed a large and complex civilization with a strict hierarchy. Their Dog-Headed Empire is very expansive, currently engaging in a series of invasions and conquests against nearby lands, often making extensive use of blemmyae soldiers (a role that the blemmyae accept with glee). This aggressive foreign policy does not derive from any malice or love of battle, but simply from the general cynocephalic belief that their civilization is best and deserves to grow as big as possible.

GURPS

3 points
Attributes: Str +1 [10]; HT +1 [10]
Advantages: Discriminatory Smell [15]; Fur [1]; Penetrating Voice [1]; Speak With Animals (Canines only) [10]; Teeth (Sharp) [1].
Disadvantages: Chummy [-5]; Colorblindness [-10]; Disturbing Voice [-10]; Odious Racial Habit (Eats other sapients) [-15]; Odious Racial Habit (Sniffs people) [-5].

d20 System

- +2 Constitution, -2 Charisma: Cynocephali are hardy, but also gruff and animalistic.
- Medium size.
- Cynocephali base land speed is 30 feet.
- Low-Light Vision (Ex)
- Scent (Ex): Cynocephali have noses as sensitive as dogs.
- Favored Class: Fighter.

Eponax

The savage eponax resembles a dusky human, save that he possesses a rough mane in place of hair and has solid hooves like that of a horses instead of feet. This humanoid lives the life of a nomadic hunter, able to run down virtually any prey with his great speed.

The eponax seek little from life, save the opportunity to run free across the great plains where they make their home, and take part in the thrill of the hunt. However, their homeland is beside the ever-expanding cynocephalic empire, and in recent times the eponax tribes have had to choose between leaving the lands that they love, accepting the rule of the dog-heads, or dying against superior numbers and technology. Many have become guerrilla fighters, using their great speed to perform hit-and-run tactics against cynocephalic outposts. Others have been trying to gain the assistance of other species, hoping for some sort of united front against the invaders.

GURPS

36 points
Attributes: ST +2 [20] **Secondary Characteristics:** Move +4 [20]
Advantages: Claws (Hooves) [3]; Enhanced Move 1[20]
Disadvantages: Impulsiveness (12) [-10]; Low TL 1 [-5]; Overconfidence (9) [-7]; Social Stigma (Uneducated) [-5]

d20 System

- +2 Strength, -2 Intelligence, -2 Charisma: Eponax are strong, but also uneducated and reticent.
- Medium size.
- Eponax base land speed is 60 feet.
- Low-light vision
- +2 racial bonus on Survival checks.
- Favored Class: Barbarian.

Lyro

The lyro is a particularly inoffensive species, standing around three and a half feet tall and possessing a small round hole in place of a mouth. This lack of a mouth forces this humanoid to use a reed or a straw to suck up the things that he wishes to eat and drink. The lyro cannot speak, though when angry will hiss in a manner akin to a snake. Instead, they communicate through sign language, and have a surprisingly complicated system.

They were among the first people to be conquered by the cynocephali, and quickly capitulated to the stern dog-headed men. The lyro are reasonably content under cynocephalic rule, and recognize that the dog-headed empire has shielded them from numerous dangers that they would have otherwise fallen victim to.

GURPS

-33 points
Attributes: ST -1 [-10]
Secondary Characteristics: SM-1
Disadvantages: Cannot Speak [-25]
Racially Learned Skills: Gesture (E) IQ+1 [2]

d20 System

- -2 Strength, +2 Dexterity: Lyro are weak, though agile.
- Small size.
- Lyro base land speed is 30 feet.
- Low-light vision
- +2 racial bonus on Move Silently and Spot checks.
- Favored Class: Rogue.

Kynder

Kynder resemble humans with large muscular arms, sunken brows, and gray hairy bodies -- no longer quite ape, not yet entirely human. There is some debate about whether the kynder or ape-men should be classified as people or animals. Though they clearly have a certain level of intelligence and can be taught words and even basic sentences, kynder possess much of the instincts and behavior patterns of a wild animal.

The kynder are generally content to live peacefully in their jungle homes, far away from civilization. They are generally unseen by other humanoids, except for the occasional kynder that is captured to serve as a pet, sideshow amusement, or similar role.

GURPS

19 points
Attributes: ST +1 [10]; DX +2 [40]; IQ -2 [-40]; HT +1 [10]
Secondary Characteristics: Per +2 [10]; FP +3 [9]
Advantages: Arm ST +3 [15]; Brachiator [5].
Disadvantages: Bestial [-10]; Disturbing Voice [-10]; Hidebound [-5]; Shyness (Severe) [-10]; Social Stigma (Uneducated) [-5].

d20 System

- +2 Strength, +2 Dexterity, -4 Intelligence, -2 Charisma: Kynder are strong and agile, though animalstic and wild.
- Medium size.
- Kynder base land speed and climb speed is 30 ft.
- Low-light vision
- +4 racial bonus on Climb checks. They can always choose to take 10 on Climb checks, even if rushed or threatened.
- Favored Class: Barbarian.

Nisite

Nisites are tall, thin humanoids that possess four large eyes: one in the center of their faces, one in back of the heads, and one on each side. They are contemplative, passive beings that generally keep to themselves, generally wishing to be left alone with their thoughts.

Cynocephali respect the intelligence and pacifism of the nisites, treating the tranquil creatures with dignity. Though the mountain range where the nisites make their homes is technically part of the Dog-Headed Empire, they are generally left in peace by the cynocephali, giving the nisites the tranquility they desire.

GURPS

9 points
Attributes: ST 1 [-10]; IQ +1 [20]; HT 1 [-10].
Advantages: 360o Vision [25]; Acute Vision 2 [4].
Disadvantages: Pacifism (Self-Defence Only) [-15]; Shyness (Mild) [-5].

d20 System

- Strength 2, Intelligence +2: Nisites are weak, though clever.
- Medium size.
- Nisite base land speed is 30 ft.
- Low-light vision.
- All-Around Vision (Ex): Nisites gain a +4 racial bonus on Spot and Search checks, and they cant be flanked.
- Favored Class: Wizard.

Panotian

Panotians possess sail-like ears that are so long that they hang down to their knees. Usually the ears are left to bob free on both sides of their heads, but if cold, panotians will often wrap their ears around themselves like a cloak. Numerous panotians use piercings and other adornments to decorate their huge ears, and the females of the species sometimes wear their ears like a shawl to hide their breasts.

They are a gregarious and affable people with a developed civilization of their own. They are currently at peace with the cynocephali, for the dog-heads value their trading arrangements with the panotians too much to invade them yet. However, many panotians feel that it is only a matter of time before the Dog-Headed Empire decides to gain possession of their lands.

GURPS

5 points
Advantages: Discriminatory Hearing [15].
Disadvantages: Chummy (Gregarious) [-10].

d20 System

- Strength 2, Charisma +2: Panotians are weak, though affable and friendly.
- Medium size.
- Panotian base land speed is 30 ft.
- Low-light vision.
- +8 racial bonus on Listen checks.
- Favored Class: Rogue.

Salradite

Of all these humanoids, it is the salradites that appear to be the most human. This is not surprising, as according to legend they were originally normal humans until some deity chose to transform each inhabitant of the country into a hermaphrodite. All salradites have an androgynous appearance and possess fully functional male and female sexual organs. They can even mate with normal humans, fulfilling either sexual role. Each salradite possess a single breast that occurs on the left side of the chest in the case of right-handed salradites, and on the right side for left-handed ones.

Salradites are generally content to be part of the Dog-Headed Empire, though many have decided to immigrate to human lands. Salradites are fascinated by the concept of gender, as it is entirely alien to their own culture, and many choose to adapt genders for a certain amount of time (for example, being a man for three weeks, and than a woman for another three). Certain salradites come to think of themselves as a particular gender, which their fellows consider curious, but are generally accepting of.

GURPS

0 points
Features: Fully functional hermaphrodite [0]; If appearance is Handsome or better, a salradite automatically possess the Androgynous option [0].

d20 System

- Aside from their hermaphroditic nature, salradites are treated exactly like normal humans.

Sciapod

Sciapods possesses a massive single leg that stands directly underneath their bodies. They are able to use this huge leg to bound with surprising speed, and during times of extreme heat, sciapods often lie on their backs and shade themselves with their massive foot.

They traditionally have lived close to the blemmyae, and therefore have often been the target of blemmyae raids. The sciapods have been conquered by the cynocephali, and numerous villages have been enslaved by blemmyae soldiers in the employ of the Dog-Headed Empire.

GURPS

7 points
Advantages: Super Jump 3 [30]
Disadvantages: Intolerance (Blemmyae) [-5]; Lame (Missing Leg) [-20]
Racially Learned Skills: Jumping (E) DX+1 [2]

d20 System

- Constitution +2, Wisdom -2: Sciapods are hardy, though overexuberant.
- Medium size.
- Sciapods can bound at speeds of 40 ft.
- Low-light vision.
- +4 racial bonus to Jump checks.
- Favored Class: Fighter.

Thenotrice

Perhaps the most enigmatic humanoids are the thenotrices. They are a civilization of women whose eyes glimmer like gemstones, and who are able to kill with a gaze in a manner similar to a basilisk. They are obviously not completely separate from humanity, as thenotrices breed true with human men, the offspring always being human if male and thenotrice if female. Many scholars have suggested that the thenotrices are the result of some ancient curse.

Thenotrices are generally cruel and bad tempered, and kill most people who set foot on their island. Generally, the one exception is men that they deem suitable for breeding-stock, who are instead enslaved. As there is little that the Dog-Headed Empire wants on the island of the thenotrice, and they savagely attack any who disturb them, the cynocephali have left them in peace.

GURPS

0 points
Advantages: Toxic Attack 3d (Malediction 1 +100%; Vision-Based +150%) [30].
Disadvantages: Bad Temper (9) [-15]; Sadism (12) [-15].

d20 System

- Constitution 2, Charisma +2: Thenotrices are intense, though sickly
- Medium size.
- Thenotrice base land speed is 30 ft.
- Darkvision 60 ft.
- Baleful Gaze (Su): Every round, a thenotrice can cast her dire gaze upon a single creature within 30 feet. The target must succeed on a Fortitude save or suffer 1d10 damage. The save DC is 10 + the thenotrices level + her Charisma bonus.
- Favored Class: Sorcerer.
- Level adjustment: +2.

Bibliography

- Eco, Umberto. *Baudolino.* A brilliantly constructed story in which a group of Medieval adventurers travel into the East in search of Prester Johns mythical kingdom, and encounter the various strange humanoids that dwell there.
- *The Travels of John Mandeville*. The medieval classic that documents the wonders of the East, particularly the numerous islands that were each home to a bizarre and unique culture or humanoid. The principle inspiration for this article.
- White, T. H.. *The Sword in the Stone.* The life of King Arthur when he was a boy. In earlier editions, one of his adventures revolves around a battle between the Merry Men of Robin Hood and the Anthropophagi, unusually ghoulish versions of the humanoids presented here. This particular story was removed when T. H. White revised the book, though early versions are still available.

It's A Conundrum

Creating Puzzles For Roleplaying Adventures

by James L. Cambias

Heroic adventurers don't spend all their time swinging swords or flying space fighters through asteroids. They spend a surprising amount of time *figuring things out.* This has a long fictional pedigree, from Jason working out how to get past the Clashing Rocks, to medieval knights guessing riddles posed by ogres, to high-tech hackers figuring out the bad guy's password.

In roleplaying games, puzzles provide a nice contrast to slugfests. They're an intellectual challenge instead of a physical one, and let the players stretch their own mental muscles instead of relying on the character's combat stats. But coming up with a good puzzle is a puzzle in itself: too many RPG adventures present the players with enigmas that are either ridiculously simple or impossibly subtle.

Types of Puzzles

In the modern world, puzzles come in a variety of types -- crossword puzzles, jigsaw puzzles, cryptograms, those linked metal bar puzzles, hedge mazes, logic puzzles, riddles, Sudoku puzzles, and a thousand more. We will try to reduce this diversity to a set of common features and see what the essence of puzzledom is.

First of all, what is a puzzle? It's not a game. Solving a puzzle is a solo activity, and the puzzle usually doesn't react or adapt to the solver's actions. Nor is a puzzle the same as a code or combination -- a puzzle is *meant* to be solved (though some puzzles are sufficiently difficult that only a a limited category of people can solve them). A puzzle is not a toy, because there is a single goal or end-state the solver tries to reach.

You can broadly classify puzzles into two main types. There are *physical* puzzles, in which the actual, material object of the puzzle must be manipulated. Jigsaw puzzles, linked metal puzzles, Rubik's Cubes, sliding number tile puzzles, and the legendary Gordian Knot are all physical puzzles. It would be extremely hard to create a paper-and-pencil version of any of them. One can classify picture-matching puzzles or mazes as physical puzzles, because they depend on specific illustrations. Physical puzzles naturally rely a great deal on perception and manipulation.

Obviously, the other type are *symbolic* puzzles. These rely on manipulation of information or symbols, and don't depend on any particular physical artifact. Word games of all types, logic puzzles, math puzzles, and the like are all symbolic. It doesn't matter what the crossword is printed on or how you write the logic puzzle: It's the information which is important.

Under these general headings one can divide puzzles into sub-categories based on how much information they provide to the solver. Some puzzles provide the solver with all the information required. An anagram, for instance, includes all the letters of a message; the solver's task is to determine the correct arrangement. Most physical puzzles provide full information: There is nothing concealed in a jigsaw puzzle.

Conversely, there are puzzles which require the solver to *extract* some information from what is provided in order to reach a solution. Logic puzzles are the classic example. You know who lives in the green house and who owns a pet dog, and from that you have to deduce who lives in the white house with a cockatoo. Riddles hide their solutions behind a screen of analogies, puns, and allusive language. In some electronic puzzles, the information to be extracted is the actual rules of the game. The ultimate deductive puzzle would be something which appears to be ordinary text, but which conceals a puzzle: The existence of the puzzle itself is the information to be deduced.

And finally, there are puzzles which depend on the solver having certain knowledge. Crossword puzzles, trivia

questions, and acrostics all depend on what the solver knows. If you don't know that a five-letter word for "Pyramid Master" is MARSH, you're never going to solve the crossword. A combination lock could be considered a physical puzzle with a very obscure "answer" known only to a few solvers.

Puzzle Pieces

Now that we've discussed classes of puzzles, let's look at what goes into them. Any puzzle, even a physical one, is ultimately about *information.* Solving a puzzle is simply the process of discovering one or more particular data. In a crossword puzzle, the required information is the words defined by the clues. For a metal link puzzle the information is the correct sequence of moves to unlock them.

Reaching the solution is complicated because information in a puzzle is *encoded* in various ways. Physical puzzles do this through the actual material structure of the puzzle object. Word games do it by definitions, anagrams, or grammar. Trivia puzzles encode the information in clues. Logic puzzles encode the information in a process of deduction.

Every genuine puzzle must provide enough information to allow its solution. For trivia-type puzzles that means the knowledge must be available to at least the majority of solvers. Exactly how much information is given determines the difficulty. (If there is no reasonable chance that a solver can know the answer, the puzzle becomes more like a code or a combination lock.)

A puzzle can present information in more than one way. Many puzzles have two or more *channels* of information. Jigsaw puzzles typically have two "channels" of information -- the picture and the shapes of the pieces. The hardest jigsaws are blank, or have pictures which provide very little information to the solver. Crossword puzzles have two channels, as well -- the definitions and the grid of intersecting words.

Despite these underlying similarities, puzzles take on their wide variety of forms based on what the information is for the solution, and how that information is encoded. Some typical encodings include: numbers, letters, words, grammar, text, mathematical knowledge, astronomical knowledge, ancient alphabets, codes, Towers of Hanoi-style algorithms, visual images, historical knowledge, logic, and time.

Making A Puzzle

To create a puzzle for a roleplaying game adventure, it's necessary to distinguish between information available to the *characters* and that available to the *players* -- for instance, the features of any in-game physical item is likely to be character-only, while rules info and the result of skill rolls is player-only. Obviously, GMs should lean toward information which is easily presented to the players, since it's ultimately their brains which have to solve the puzzle.

Here are the steps a GM should follow when creating a puzzle:

Intent: What is the intent of the puzzle's creator? Is the creator a comic-book mad villain who wants to test the heroes? A prisoner trying to get a message out without alerting his captors? Or an ancient cult protecting its treasure with information only initiates would know? There are also *inadvertent* puzzles, where the creator wasn't actually trying to invent a puzzle -- as with any kind of crime-solving mystery, where the "creator" was doing his best to make sure the puzzle never gets solved at all!

Solution: What is the information required to solve the puzzle? For a number puzzle, the solution is the answer to a problem. For trivia, the solution is an obscure fact. A puzzle can combine elements -- using two trivia-question dates in a math problem, for instance. Keep in mind that the solution information must be available to the puzzle creators: if you're making up an ancient Mayan tomb-trap puzzle, it can't hinge on the date of Queen Victoria's birth. The information must also be available to the *players*, either as presented in the adventure or through character skill rolls.

Encoding: How is the information encoded? Again, it can be physical or symbolic. If symbolic it can use any of the types described in the first part of this article. The GM should also decide how many coding channels the puzzle uses.

Puzzles can combine physical and symbolic channels -- arranging puzzle pieces gives the clues to a number puzzle, which in turn opens a combination lock. As already noted, encoding methods should be feasible for the puzzle creators (a prisoner of war could write a letter full of cryptic clues, but probably couldn't build a mechanical puzzle). Channels should also be suitable for communicating to the RPG *players*. This means that GMs should favor symbolic puzzles, if only because they can be written or drawn, instead of made.

Modes of Failure: What happens if the solver fails? For most ordinary puzzles that simply means the solver has to give up or peek at the answers. But if the puzzle lets the adventurers into a tomb, or holds the secret to a sinister plot which will destroy Cosmopolis, the consequences of failure are more serious. Which means the GM may wish to build in a "back door" or some way for player-characters to get around the puzzle if they truly cannot solve it. The workaround shouldn't be easy; solving the puzzle must always be preferable. (Though there is some cathartic comedy value in watching someone solve a complex puzzle by the method Alexander used on the Gordian knot.)

And then there are puzzles which have a higher price for failure: deathtraps in the Indiana Jones mold, which drop spikes or release huge rolling stone balls if the puzzle is solved incorrectly. Those give the characters and players the immediate puzzle of finding a way to survive!

Example Puzzles

In order to illustrate these methods, let's look at some sample puzzles.

The Secret of the Temple

Lost in the jungles of Belize sits the temple of Kukulcan. Beneath the pyramid is a mystic item of great power, guarded by a puzzle trap. The treasure chamber door is marked with the Mayan symbol for the planet Mars. Surrounding it are four panels bearing numbers -- 5, 108, 512, and 687. Pressing any panel but the correct one releases a catch in the ceiling above, showering intruders with basketball-sized rocks. *(The puzzle was designed to keep all but educated astronomer-priests out of the chamber. The information encoded is Mars's orbital period, 687 days. For the Mayans who built it, this is a trivia question. Modern explorers also have to figure out the Mayan number system, making it a code as well.)*

The Ransom Note

Millionaire adventurer Clive Trent has been kidnapped, and the gangsters have forced him to write his own ransom note. He sends his equally adventurous wife and kids this: "Obey listed directions. Cash only -- at least million in notes. Extreme secrecy. Have all funds tonight. Then wait orders." *(The encoded information is "Old coal mine, shaft Two." Clive uses a fairly simple word game, using the first letters of the words in his message to spell out his real message. This is an example of a puzzle creator with very limited resources, who wants the puzzle solved. Sylvia Trent and the twins quickly proceed to the mine with a sack full of gas grenades and an iced bottle of champagne for Clive.)*

The Inquisitor's Ultimatum

Egad! That super-fiend the Inquisitor has carved one of his crazed conundrums into the courthouse steps: "WHOSON DCA." What can it mean? *(The encoded information is "First National," which is the bank the Inquisitor is planning to rob next. It's encoded with a combination trivia and word game: "WHOSON" is actually "Who's On," as in the classic Abbot and Costello routine "Who's On First?" DCA is the three-letter code for Reagan National Airport in Washington -- formerly known simply as National. Hence "First National." Yes, it's crazy, but so is the Inquisitor. He's half-hoping his arch-enemy Mr. Justice can solve the puzzle.)*

Appendix Z

Decanic Focusers
for *GURPS Cabal*

by William J. Keith

Do you play a **GURPS Cabal** game, or otherwise use Hermetic correspondences? Don't want to flip through a chapter of material to work out what your spell could use in the way of decans, constellations, and planets? The chart below lists the Colleges with their decans and a portable, inexpensive object designed to pack in the decanic energies. Each provides exactly +4 in decanic, zodiacal, and planetary correspondences for that College, and is guaranteed to provide no opposing correspondences. (The new *Fourth Edition* Weather College is assigned to Sahu, and the unassociated decans are listed separately.) The +4 is a "lowest common denominator" chosen for low expense and ease of construction. If a player attempts to add further modifiers, carefully check the total astrological modifiers already in use.

Any Cabalist who specializes in spells of a given College could carry such a thing around. Some of them might even become standard items in a Hermetic magician's toolkit. Creative or rich Cabalists can also "upgrade" them: for example, the pendant for Charchnoumis could switch the sphinx figure to gray-lacquered wood, hang from a silver chain and add several moonstones around the edge, for a total of +5. Kurtaêl's charm is particularly amenable to this; necromancy is apparently easy to enhance.

In a non-Hermetic system, these weird trinkets can add flavor to enchantments or wizardly accoutrements. They might even be *unique* objects intimately connected to arcane energies.

College	Decan	Object	Common Name
Air	Isrö	An aspen wand tipped with blue chalcedony, sporting eagle feathers attached by tin wire.	Wand of Raphael
Animal	Charchnoumis	A hazelwood pendant in the shape of a wheel, lacquered dark blood-red and inset with a silver sphinx, set about with small red bloodstones.	Animal magnet
Body Control	Bianakith	A palm-sized elmwood disc bearing an ivory miniature of a starfish. The disc is hooped in steel and set with aquamarines.	Grasp of Mihal
Communication and Empathy	Naôth	A V-frame of copper, wound across with piano wire. Attached to one leg is a brass statuette of an elephant; to the other, an emerald figurine of a swan.	Naôthic antenna
Earth	Ieropaêl	A dark brown orb of smoky quartz hooped in cut slate.	Orb of Uriel
Enchantment	Kumeatêl	A rose-colored silk cord with 13 little charms of lionheads carved from carnelian dangling from it.	Magesmith's bracelet
Fire	Eneuth	A primitive athame with an obsidian blade; the guard is iron, and the handle is ironwood set with a dark red fire opal. A blue-lacquered horse adorns the	Michaelite Blade

		pommel.	
Food	Atrax	A fairly large orange pentacle pendant carries four items in its bottom four points: a peridot, an opal, a sapphire figurine of a dove, and an aluminum representation of a lamp.	Hunger's Bane
Gate	Iudal	Two keys of juniper wood dangling from an amber ring, inset with bits of alexandrite.	Peter's Keys
Healing	Phthenoth	A Greek cross; one branch is steel, the other alder wood, both suitably colored crimson. The steel branch bears engravings of fish while the wooden branch is inset with silver and pearl images of cats.	Shaliah's cross
Illusion and Creation	Methiax	A wallet-sized plastic hologram of a fractal, like a Mandelbrot set. The frame is hazelwood, set at the corners with zircons and inlaid with silver.	Faker's Mirror
Knowledge	Sphandôr	A slice of agate set in a hexagonal rowan frame dyed russet-red, overlaying a copper depiction of a lotus.	Lotus lens
Light and Darkness	Phoubêl	A lozenge pendant divided into four alternate black and white squares, made of alternating laurel and hazelwood, framed in applewood painted yellow and set with carnelians, all on a gold chain.	Chessboard of Yelayel
Making and Breaking	Arôtosael	A primitive hammer, its flint head attached by iron bands deliberately reddened with rust to a blue-painted oak handle carved with eagles.	Smiting Hammer
Meta	Alleborith	A pocket-size pyramid of rowan wood lacquered bright azure, with a tiny garnet capstone. The base bears a dark green picture of a goat.	Mana Focus
Mind Control	Ruax	A pair of earrings or bracelet charms: spirals of iron, painted cerulean blue. One holds a piece of amber at its center, the other a dark red ruby.	Enchantress' bangles
Movement	Anatreth	A model of an arrow: feathered with hawk feathers, yew shaft painted violet, arrowhead of lapis lazuli.	Quickening dart
Necromancy	Kurtaêl	A bracelet of rowan lacquered black, set with onyx and jet.	Rainbow's corpse
Plant	Harpax	A useful steel-bladed sickle, its handle set with a small onyx in the shape of a raven. The blade is incised with cheerful designs of ivy strands; the handle is wood from the holly tree, painted forest green.	Harvester's Friend
Protection and Warning	Reêlêd	A chain of stout bronze-colored plastic links (real bronze ages to green, an unfortunate Venus evocation), interwoven with a strip of white Kevlar	Wary Circlet

		and carrying a red-colored pendant or bangle of iron depicting a wolf.	
Sound	Agchoniôn	A green seashell decorated with parrot, peacock and swan feathers, attached with copper wire.	Echo trap
Technology	Ouare	An olive-green plastic gear on a brass axle.	Decanic gear
Water	Saphathoraél	A small blue chalice set with a few teardrop-shaped pearls.	Cup of Gabriel
Weather	Sahu	A model of an arrow: basalt arrowhead attached to a sequoia shaft with animal sinew and real feathers.	Stormwreaker
none known	Akhouiy	A charm bracelet dangling charms of dice, four-leaf clovers, steel fish, and blue-painted tin eagles.	Fortune bracelet
none known	Akton	A palm-sized mirror framed with silver and backed with elderwood painted pale yellow. Its frame is painted maroon and bears images of scorpions carved into pale yellow topaz; its corners are set with pearls.	Poisoned mirror
none known	Alath	A square of tortoiseshell painted deep wine-purple and inset with a brass image of scales.	Foursquare rest
none known	Anostêr	A rowan chalice lacquered dark green and set with an image of a goat's head worked in garnet (orange-yellow spessartite preferred). It bears a green-lacquered rosewood inset of a swan and copper images of scenes or quotations from *The King in Yellow*, Sherlock Holmes' *On the Study of Tobaccos and their Ashes*, or other deliberately-fictional books never written.	Impossibility Chalice
none known	Axiôphêth	A massive necklace of lead chain dangling iron weights as well as yew figures of horses painted indigo.	Chain of Burden
none known	Barsafael	A "U"-shaped amulet carved from the taproot of an acacia and dyed crimson, its ends capped with birchwood bearing likenesses of lions.	Secret Depth
none known	Belbel	Scissors of surgical steel wound about with aged copper bands bearing images of mules and lotuses. One finger hole holds a small green emerald and the other an orange agate.	Painblades
none known	Buldumêch	A charm bracelet sporting cowrie shells, a real silver coin, a sapphire, and a gold bangle.	Sugar Daddy
none known	Hephesimereth	A black ebony box set with an onyx, containing some small dead batteries and ashes, wired shut with purple-covered wire.	Box of Pointless
none known	Marderô	The canton of a U.S. flag (the azure part	Fightin'

		flecked with white five-pointed stars), pinned with a brass Soviet hammer-and-sickle pin, any red scraped off.	Words
none known	Nefthada	A strip of satin dyed bright green, a topaz carving of a scorpion and a blue jade figure of an eagle pinned to it.	Immortal instant
none known	Tepsisem	A ribbon of scarlet velvet bound about the sandalwood handle of an iron (not steel) athame set with a ruby.	Entropy blade

Adventure Seeds

The Collector of Mysteries: the PCs come across twelve peculiar objects set apart from the rest of the magical treasure trove. Trained Cabalists can quickly identify them as focusing the decans without known Colleges. So is this a completist's storage room, or had the previous owner identified some use for them?

The Death-Dealer: Just how much can the Kurtaêl charm be upgraded? A room can be paneled in ebony, cypress, rowan, and yew, the latter all painted black; wall space filled with figurines of rats, crows, ravens, and magpies; barred shut with ribs from a mule, magically significant points decked with onyx and jet. If a few of these ingredients are chosen with a careful eye to quality and rarity, this sanctum could be thrumming with necromantic energies to the tune of a +15 bonus to necromantic spells before modifiers from the Laws of Sympathy, mana level, and distance. Prisoners physically in this forsaken chamber can abandon much hope of successfully resisting the necromancer's power. Of course, assuming the PCs rescue their friend before the astrologically optimal moment for the dark rite, it would be a darned shame to destroy such an obviously valuable piece of magical equipment . . .

"I'm Not Annoying; It's You Who're Annoyed!"

A few weeks ago I started a new job that I am completely unable to describe in a barrage of fluffy bunny lovefest compliments, owing solely -- I assure my humorless corporate masters -- to the reams of nondisclosure agreements I was forced to sign.

During the training process of this job, I may or may not have encountered a fellow trainee who I may or may not have wanted to tie to a set of railroad tracks, twirling my mustache as I turned the crank on the player piano to go faster and consulted my train timetable schedule. Such a person, if he or she existed, might have possessed certain characteristics that could be described as annoying to the extreme.

So these thoughts that I may or may not have had let me to wonder: What is it in a group of characters (we're talking PCs here) that makes a character annoying? Or, to put it another way, where is the line between an interesting character (albeit one with quirks or flaws that might at times seem annoying) and an annoying one?

For example, both Spock (from the *Star Trek* universe) and Jar Jar Binks (from a movie whose title was inspired by the *Star Wars* film phenomenon from several decades ago) both possess traits that could be considered "annoying." The former is humorless and enjoys quoting mathematical precision to a seemingly unlimited number of decimal places, while the latter sucks away valuable photons from the universe to enable its projection upon the retinas of a humanity that has known little but ultimate suffering since the expulsion from the Garden of Eden.

But can we analyze these details further and decide what makes a character more firmly on the "Spock" side of the equation rather than the "Jar Jar" side? From a gaming point of view, what can we do to make sure that our characters (whether they belong to the players or the GM) are interesting and enjoyed, even if they *do* possess some traits that are designed to be irksome or annoying?

Well, I've given it some thought (of course . . . this would be a pretty lame column if it were nothing but an elaborate rhetorical question), and he's what I came up with:

Interesting characters are still interesting even without their annoyances. In other words, if the character didn't have those quirks, is there still a character? Consider Spock: If you took away the humorlessness and the tendency for a droning precision, he's *still* an interesting character; he has a conflict with his human and alien selves, he's got cool powers, and he has personality quirks that aren't annoying (curiosity, group compassion, and so on). Compare this with characters that are, in hindsight, more annoying than not. <koff>JarJar<koff> If you took away the aspects that are annoying, would there be any character left? Or would the character merely take up space in the scene, like a lifeless scarecrow? Really, annoyance is a spice, not a main course; in the same way that you'd never eat a bowl of salt & pepper straight, neither should the annoying aspects of a character be the sole defining aspects of the "meal."

Interesting characters give just enough of their "annoying" tendencies to paint a picture of being annoying, rather than being consistently so. As an example, I once played a fast-talking wise-cracking Corax named Jack in a live-action *Werewolf: The Apocalypse* game. (The Corax are the wiry bird-men shapechangers who love shiny things and . . . well, talk a lot.) Now, it'd be possible to play this character as entirely annoying: Talk over other people, make jokes *constantly,* and so on. But what I did, instead, was merely create the impression that I did so. Among other tricks, I memorized an introductory blurb, which I used whenever meeting someone new: "Jack Papadopoulos, Jack 'Bird-on-a-Wire' Papadopoulos. Jack is fine, 'Bird-on-a-Wire' is fine. Papadopoulos is a bit of a mouthful, but if you're happy with it, I'm fine with it, too. How can I help you?" (I'd say this as fast as possible . . . usually taking five to six seconds.) Usually that introduction was enough to give an idea of what my character was like, even when he *wasn't* acting like that. Again, looking at our two prime examples: Spock could certainly be *more* annoying; he usually only misinterprets humor and/or provides unnecessary mathematical precision once or twice an episode. Jar Jar, meanwhile, filled almost every frame of his outing in *Episode I: Make Checks Payable to "George . . ."* with enough annoyances that he left little to the imagination.

The more active an annoyance is, the more annoying it is. Consider that most of Spock's tendencies were *reactive;*

that is, they were done in response to something else: Someone asks for statistics, he gives lots of statistics; someone makes a joke, he reacts with incomprehension to that joke.

Now, consider that annoying person you know . . . or, again, Jar Jar. Does he offer his pointless/slightly amusing/gross anecdotes without prompting? Is he clumsy, lecherous, or violent in such a way that he will be annoying even left to his own devices, with no way to stop him? If a character has an "uncontrollable" modifier somewhere near that annoying disadvantage, it's probably going to be a *lot* more annoying.

Finally, it's all in the actor and the audience. It's been said that a good actor can read the back of a cereal box and bring about true emotion. The same is true with players acting as another character; some players can take the most annoying-sounding concept and make it "work." (Consider how annoying the notion of playing a Wookie sounds on paper: You can't communicate with anyone else except maybe one other character, and your voice -- if done correctly -- has many of the same tonal qualities of a fork on a chalkboard. But lots of gaming groups have a blast with Wookie PCs, so who cares how it sounds in theory?) Likewise, some players can take the most seemingly innocuous quirk and turn it into a game-stopping affair. Remember: If the *players* are having fun, then it doesn't matter how annoyed the *characters* are. And if the players aren't enjoying themselves as much as they could be, maybe a group powwow is necessary to see if some aspects of the character can't be redirected or toned down.

Seen from a certain angle, we probably all have idiosyncratic tendencies that can be called "annoying" by someone else. But, unlike people we meet in the real world, characters in a gaming group often have a choice about how annoying they'll be. And finding the right balance between "quirky" and "downright annoying" can be the difference between "Live long and prosper" and "Die, Jar Jar, *die!*"

Questers of the Middle Realms

by Tim Gray

Published by Silver Branch Games

72-page b&w PDF, $8.00; Print-on-demand book, $17.95

"Comedy is hard." Comedy is even harder when the audience takes the subject terribly seriously. Ask about roleplaying games played for laughs and the list will probably be countable on one cartoon character's hand: *Ghostbusters. Paranoia. TOON.* Other contenders failed because, well, comedy is hard. It's difficult to sustain a humor premise without falling into the traps of repetition, tangency, obscure in-jokes or laziness, a truth relevant to any media. How does *Questers of the Middle Realms* fare in such a challenging domain?

"This game is written as a somewhat tongue-in-cheek reworking of common fantasy elements, poking affectionate fun at the conventions and stylings of fantasy games. Especially That One." That's the first sentence of the book, and writer/designer Tim Gray makes it very plain where he wants this game to go. You don't have to look for internal logic, or depth of detail in character or setting, or even originality. Your mission is to assemble your group of wildly disparate characters with no particular justification in being together (let alone not killing each other) and tear off on quests in search of fortune, fame and more fortune. You will meet dread villains, horrible monsters in ill-reasoned habitats, weird peoples from faroff lands and other species, and triumph! We hope.

The game runs on Chad Underkoffler's PDQ System, originally developed for *Dead Inside* and extended for *Truth & Justice.* Players of those games will have no trouble sliding over to *Questers'* fantasy theme, but the engine is simple enough to be picked up by the rawest recruit in minutes. A character is defined by his qualities, a list of traits that mark out the character's talents, skills and flaws. There is no preset list of qualities -- each player makes up what he needs, from "Freakishly Strong" to "Fine Food and Drink" to "Wallflower." (Many examples throughout the book provide fodder for the less-creative player.) Qualities are then ranked on a scale which gives the typical target number against which the character will succeed and the die roll modifier for cases when dice are, er, rolled. Familiarity with a homeland or levels of membership in an organization are common qualities. Each character also needs a virtue and a vice, behavior aspects with will help guide the player in the game (and tip the narrator for when to offer rewards).

To make it a fantasy game, you need fantasy races and you need magic. *Questers* offers the usual array of races with the advertised tongue-in-cheek twist. The book begins to blossom here as a Pratchett-esque voice begins to sneak in and around the rules. (I won't spoil why hoblings are so popular. Please pass the salt.) Races have their qualities, of course, some of which can be applied to dice rolls, some which can be "downshifted" to let you do something racially cool now but then take a back seat later, and some which are just there for flavor. Don't go looking too closely for mechanical balance here, since the mission is to be colorful and distinct.

It's not a fantasy game without a bit of magic, and *Questers* offers up three styles: miracles (for the religious types), thaumaturgy (for the scientific spell-slinger), and mysticism (for those with the power within). Parallels to certain character classes from That Other Game are inevitable and deserved. Each style is its own quality, of course, and the potency of the spells you can cast is related to the rank of that quality (as listed in a table). There are no spell lists; the caster must describe the desired effect and how he goes about it. (A wise cleric, mage, or mystic will start recording his own repertoire of spells.)

The resolution rules come forward from other PDQ games: roll 2d6, apply relevant modifiers for your qualities and beat a target number or the other guy's roll. Bonuses are awarded for colorful or clever play; penalties can be assessed

for being dull (or "lame-ass," to use the system's definition). Fortune points can be earned through play which amuses and advances the story; they can be spent to improve actions or saved to improve qualities (including the all-important levels in organizations).

Doesn't sound very funny so far, does it? A little bit of joking in the races, and that's all. But the races are a part of the world of Median, and of the continent of Ludor where the players begin. A one-page map frames the sights of Ludor, from the great desert of Ar-Karap to Yrisiriel, the ancient forest home of the elves. The text expands on these descriptions, enough to work with but not enough to start justifying splatbooks. Likewise the world is full of gods, some petty, some mighty, some obscure, and few defined in the text. It falls to the GM and players to create the roll of the gods for their own version of the world. These can be as serious as those of Hickman's and Weis' Krynn, or as whimsical as those of Pratchett's Discworld, or as weird as the gods of Laws' Mad Lands. Pleasing your gods earns you favor with them, and the possibility that they will help move the story in a direction to your liking. The other players have gods too, though, and don't think they won't use them. And of course, there are monsters, beasts, and other animals. *Questers* provides a just-the-right-length section of monsters and descriptions, with ample fiends to fill young minds with thoughts of adventure (or nightmares).

The book is very cleanly presented and well-organized, with diverting snippets of line art lending variety to the pages. I'm very fond of Sergio Caridad Barreiro's cover, featuring all the things you want on the front of a fantasy game book: a diverse crew of heroes in dire peril, loot, magical foes and beasts, loot, and a judicious amount of leg. And loot. I'm sure it's no accident that the bag of treasure is the object closest to the viewer.

Is it funny? Yes. I've carefully refrained from spilling the beans in any detail, but Gray infuses the book with a dry wit and a sensibility that comes from growing up in the land that invented modern epic fantasy. (Revisit the name of the desert mentioned above for a concrete example.) The author wisely doesn't overplay this, resisting the impulse to substitute his own japes for the likely-better ones the players will build. And he leaves plenty of room for that building to occur. Bravo for creating a game world that's likable, amusing, and open for expansion. But here's the dirty little secret: You don't have to play for laughs. It works at that level, of course, but if you just need a fantasy game system that plays easily, encourages broad characterization, and doesn't bog down in details, pick up *Questers of the Middle Realms.* It's a fun game, a fun read, and a bargain too.

Bob is credited as a playtester/peer reviewer in this product.

Descent: Journeys into the Dark

Published by [Fantasy Flight Games](#)

Designed by Kevin Wilson with Darrell Hardy

Cover by Jesper Ejsing

Illustrated by Jesper Ejsing, Lou Frank, & John Goodenough

Full-Color Boxed Game (see components, below); $79.95

Last year's *[Doom: the Boardgame](#)* was a big box of fun, delivering gun-toting, chainsaw-swinging, demon-blasting game play. In sending UAC marines through the corridors and rooms of the Mars base, it emulated the play, the desperation, and the action of the godfather of all first-person shooters. It did all this in easy-to-play fashion at the heart of which lay clever dice mechanics that handled range, damage, ammunition use, and more in one clear, simple dice roll.

Now those same mechanics are back, not in another sci-fi shoot 'em up, but another genre altogether -- classic dungeon-delving fantasy. So instead of a dungeon crawl with guns -- arguably what *Doom: The Board Game* is -- you get a dungeon crawl in true, sword-swinging, spell-slinging fashion. *Descent: Journeys in the Dark* is *Doom: The Board Game's* bigger sister. Much bigger sister. The 10-lb. box contains more components, more options, more monsters, more characters, and more action. All of which are delivered in full color, barring the miniatures -- and you can paint those.

Designed for two to five players, one of whom takes the Overlord role, the background to *Descent* is simple. Heroic adventurers delve into the caverns and corridors below, battling Beastmen, Skeletons, Dragons, Demons, and more, aiming to recover ancient magics and mighty relics that will aid them in the defeat of dark powers and evil masters.

The players have 20 heroes to choose from, who use melee, ranged, and spell attacks to defeat their foes. Arrayed against them are 12 different monster types controlled by the Overlord, all of which can be scaled in terms of power and capabilities according to the number of players. In addition the Overlord has his own deck of cards from which he can trigger events, trigger traps, and spawn yet more monsters.

To get started, players randomly select a hero card. Besides name and picture, each card gives the hero's ratings for Maximum Wound, Maximum Fatigue, Base Armor, and Speed, plus three bonus dice spread between his Melee, Ranged and Magic Traits. He also has a special ability and begins the game with three skill cards, either Fighting, Subterfuge, or Wizardry. A number indicates how many conquest tokens are lost when the hero is killed. Finally, he needs to buy equipment.

So the Orcish Bogren the Shadow has 8 Maximum Wounds, 4 Maximum Fatigue, 1 Armor, and 5 Speed. He has two bonus dice in Ranged, one in Magic, and his special ability enables him to strike out of line of sight to inflict +2 damage. He draws one Fighting skill card (for example, "Parry," which would give him +1 Armor against melee attacks) and two Subterfuge cards (such as "Marksman," which gives +3 range with Ranged or Magic attacks, and "Rapid fire," which lets him make an additional Ranged attack by spending Fatigue). Finally Bogren is worth two conquest tokens.

Meanwhile the Overlord prepares the quest, laying out the maps, and reading any required cards, creatures, and tokens. Although the heroes know the dungeon layout, they do not know what they will find there. The Quest Guide gives nine quests that increase in complexity until a great evil is found and the world saved.

Each quest should also indicate the initial number of Conquest tokens held by the players at the start. Only the first quest, "Into the Dark," gives this figure, and not in the Quest Guide, but the ***Rules of Play.*** So we increased the initial Conquest tokens by one for each quest. Conquest tokens represent how well the heroes are doing and are gained for activating Glyphs of Transport that can take the heroes back to town (where they can buy equipment), opening chests, killing big monsters, and completing other tasks. They are lost when a hero is killed or the Overlord draws the last of his Overlord cards. If the Overlord reduces the number of Conquest tokens to zero, he wins; if not and the heroes get through the quest, they win.

Each round of play consists of all the heroes taking their turn, followed by the Overlord. On his turn, a player refreshes the cards for any items exhausted last turn, decides which equipment to use on that turn, and then takes an action. He can Run twice his speed in squares, but not attack; he can Advance, moving as far as his speed and then make an attack during this movement; or he can Battle, staying put and making two attacks. Alternatively he can Ready himself, either moving or making a single attack and then giving an Order. Aim enables a hero to re-roll any ranged attack, Dodge forces a monster to re-roll its attack dice, Guard allows the hero to interrupt the Overlord's turn and make an attack, or Rest restores lost fatigue.

On his turn the Overlord collects Threat tokens (one per hero), draws cards from his deck, spawns new monsters, and then activates monsters to attack the heroes with. To use any card the Overlord must pay the cost in Threat tokens. The cards come in four varieties. Event cards activate under various conditions, for example "Rage" lets a monster attack twice. Trap cards work similarly, "Spiked Pit" causing the floor to open up under a hero when he moves into an open space. Spawn cards let the Overlord bring new monsters into the fray, though only once per turn. Finally power grants the Overlord very powerful permanent abilities, for example, "Doom" gives every monster an extra die when they attack.

Just as in ***Doom: The Board Game,*** the dice in ***Descent*** come in several colors and one throw handles a single attack. Different dice combinations represent various methods of attack -- melee, attack, and magic -- with markings on the dice indicating damage done, range for distance attacks, and if the attack is a miss or not. Unlike ***Doom: The Board Game*** there is no ammunition component, so this is not represented. Instead the dice are marked with little lightning flashes or Surge symbols. These are more prolific on the black power dice which a hero gains from his traits. For every two or three Surge symbols rolled in an attack, a hero gains a bonus to the attack. For example Bogren attacks with his crossbow, rolling one blue, one green, and two power dice gained from his Ranged trait. The result is 3 range, 3 damage, and 3 Surge. His player can increase the damage with two Surge or the range for three. He can use as many of these as he has Surge marks. By spending Fatigue, a hero can gain extra movement or more Power dice.

Armor of course deducts from damage done, and once wounds are reduced to zero a hero or monster is dead. In addition to the standard attributes -- Wounds, Fatigue, Armor, and Speed -- monsters have their own special abilities; for example, "Pierce" ignores armor, "Poison" inflicts wounds that require healing twice, and "Fear" forces an attacker to expand Surge before he can attack.

Play in ***Descent*** progresses easily and quickly. The heroes battle monsters, open chests, grab treasure in the form of coinage and artifacts, and so on. Complete enough quests and he can gain training tokens that increase a trait by one. These are also available for sale. The Overlord has a lot to handle, but also the fun of unleashing hordes of miniatures on the heroes and watching their faces drop as he does so. Yet as tough as the challenge appears, it manages to be both relatively easy to overcome and give a sense of achievement when the heroes manage to do so.

If ***Descent: Journeys in the Dark*** has any problem it lies in the components. Not in the quality, which is excellent, but in the quantity. There are too many. It not only takes a while to separate everything out, but also to set a game up. In fact it takes too long to set a game up, and this is only compounded by the inadequacy of the packaging. Given that ***Descent*** has hundreds of components, how many ziplock bags are included in the box?

One.

Which can only be described as pathetic. If I spend $80 on a board game, I do not want to provide my own packaging. Letting them slosh around between the cardboard dividers not only increases the chance of them becoming damaged, it also makes them difficult to locate during play.

This problem aside, *Descent: Journeys in the Dark* is physically impressive, as well as attractive and easy to handle. It is a more complex game than *Doom: The Board Game* because it has to take in a more detailed genre, but it is actually easier to play because almost every gamer is familiar with it. Above all, *Descent* is fun, simple to play, has both replay value and the components to design your own quests. If *Doom: The Board Game* delivered with every desperate pound, *Descent: Journeys in the Dark* delivers double that.

--Matthew Pook

* * *

Components: 11" Square Full Color Rule Book, 11" Square Full Color Quest Guide Book, 20 Hero Cards, 20 Tan Colored Hero Figures, 39 Tan Colored Monster Figures, 21 Red Colored Master Monster Figures, 12 Dice (1 Blue Ranged Combat, 1 Red Melee Combat, 1 White Magic Combat, 2 Green Extra Damage, 2 Yellow Extra Range, & 5 Black Power Dice), 180 Full Color Cards (24 Monster Reference, 36 Overlord, 12 Subterfuge Skill, 12 Fighting Skill, 12 Wizardry Skill, 24 Town Store, 22 Copper Treasure, 18 Silver Treasure, 16 Gold Treasure, & 4 Relic Cards), 1 Compass Rose Token, 1 Town Marker, 61 Map Pieces (10 Room, 25 Corridor, 6 Intersection, & 20 Dead End Pieces), 10 Door Markers (7 Normal & 3 Rune-Locked Doors), 10 Plastic Door Stands, 49 Prop Markers (23 Obstacle, 10 Encounter, 10 Glyph, & 6 Staircase Markers), 55 Wound Tokens, 24 Fatigue Tokens, 52 Money Tokens, 16 Hero Order Tokens (4 Aim, 4 Dodge, 4 Guard, & 4 Rest Tokens), 32 Threat Tokens, 24 Conquest Tokens, 1 Breath Template, 55 Effect Tokens (12 Web Markers, 14 Stun Tokens, 13 Burn Tokens, 16 Poison Tokens), 39 Treasure Markers (9 Healing Potion, 9 Vitality Potion, 9 Money, 8 Chest, & 4 Relic Markers), 4 Hero Turn Tokens, 12 Training Tokens (4 Melee, 4 Ranged, & 4 Magic Training Markers), & 6 Miscellaneous Markers (1 Boggs the Rat, 1 Kata the Ferret, 1 Mata the Ferret, 1 Pico the Empos, 1 Skye the Falcon, & 1 Monkey Marker)

The Oak Street Club

for *GURPS*

by Mark Gellis

In an unremarkable small town, a suburb of an equally unremarkable city in Michigan, one will find Oak Street. Oak Street is also unremarkable, except for the celebrity who lives in the ranch house at number 441. And the celebrity is not really all that remarkable, either, being a celebrity only because he writes books and sometimes does interviews on talk shows. He is a pleasant fellow in his early sixties who mows his lawn every Tuesday and helps out at the local library book sale every November.

Most people would be surprised to learn that he secretly leads a team of superhuman crime fighters.

The term "superhuman" would probably give pause to the people involved. None of them would consider themselves superhuman, although each of them has a supernatural gift, a *power*. They would be less surprised by the title "crime fighter," although it conjures mental images of people like Batman and the Avengers. They do fight crime. Specifically, they fight crime that has been committed by unusual people. On occasion, they even fight crime that has been committed by unusual things.

Dr. Joseph Eisen, psychologist and psychiatrist, spent 20 years teaching psychology and psychiatric medicine at one of the large state universities in Michigan. Towards the end of his career, he published a self-help book based on his theories about some of the more common forms of mental illness. It was an immediate success and prompted a contract that involved other books and lecture tours.

After a few years, with enough money in the bank and enough money coming in regularly from royalties that he would never have to work again, he retired, and dedicated himself to his other passion.

Dr. Eisen had long suspected that supernatural powers existed. He always got a tingle around certain people, and in certain places, and was not surprised, if he did a little research, that they were often associated with strange things in their communities.

Eisen was too good a scientist to let hope or hunch overpower his demand for scientific rigor. Nor did he think anyone would believe him without irrefutable proof. Whenever he was asked about the paranormal, as he sometimes was during his lecture tours, he never denied his interest in the subject, but also made it very clear that the difference between real science and "ghost stories" was, in a word, evidence. He often referred to himself as a hopeful skeptic, saying "I hope we will someday have evidence; however, until we do, no amount of hope can justify calling these things science."

But now, at least, he could afford to indulge his hobby. He spent years happily reading obscure books, visiting haunted houses, meeting with others interested in the occult, and so on. His wife, a retired nurse, was not entirely enthusiastic about his new passion, but accepted it with a smile, saying it was cheaper than a sports car and certainly preferable to him having an affair.

Despite his hope, Eisen never abandoned his habit of scientific thinking. He had known for a long time that most strange occurrences were either coincidence or deliberate fraud. This had some benefits. One is that Eisen developed a reputation among those interested in the strange and occult as someone who wanted to believe but who refused to be fooled. People trusted him. On the few occasions when he did encounter something he could not explain, people knew it was probably the real deal. Skeptics refused to believe no matter what, and even Eisen had to admit that the few truly haunted houses he had found had not been willing to give him irrefutable evidence. In time, however, he knew, the evidence would be found.

When Eisen finally got his evidence, he did not even have to go looking for it. It was right in his own backyard, so to speak, and it came to him.

Donna Lewison, a young art teacher Eisen had met on occasion when he came to talk at the local high school about the connections between art and psychology, called him one day, hysterical, saying that everything she was touching was crumbling to dust. She had first seen her ability at work when a boyfriend had called her to break up. At first, she had been heartbroken and furious. Then she had been terrified; her cell phone had gotten warm and then simply disintegrated in her hand.

When she came to his house, she had a plastic bag full of dust exactly the same color as what was left of her cell phone, which looked as if it had been soaked in acid. And as he looked at her, he felt the telltale tingle -- something about Donna was extraordinary. In any event, she was either telling him the truth or she badly needed his help in an entirely different capacity.

Using hypnosis, Eisen was able to recreate the conditions that led to the appearance of Donna's powers and watched with amazement as a new cell phone also disintegrated. He then tested her powers on other objects from metal spoons to flowers. Nothing was immune to her ability. All crumbled to dust.

Eisen and Donna have not been able to determine, so far, why her powers manifested at this particular time. (It was not, after all, the first time she had been angry at a young man. Or, as Donna will sometimes say after yet another failed relationship, "Yeah, I sure know how to pick 'em, don't I?") The next step, however, was to teach Donna how to control her powers. Eisen had never done anything like this, of course, but using hypnosis and other forms of therapy, and learning through trial and error, he was able to show Donna how to use her abilities and how to avoid using them by accident.

It was during one of these sessions that Eisen and Donna realized her ability was not simply limited to destroying matter; she could control molecular structures and cause solid objects to change shape. So far, her ability is limited to manufactured chemical materials, such as paints and plastics, but in time she may be able to bend other forms of matter to her will.

Donna asked that he keep her ability secret, and he agreed, on the condition that he was allowed to document his research and eventually publish it. And now, with proof that the uncanny really existed, he redoubled his efforts. Slowly, he found others, made contact, and asked them to meet with him on a regular basis to exchange information, share experiences, and so on.

Eisen has sometimes wondered why so few have found any proof of the uncanny. But perhaps, he reasons, it is not so strange. The uncanny is not only rare, but also unpredictable enough to frustrate most attempts at scientific investigation. In addition, those with strange powers often kept their abilities secret because they feared being ostracized or worse. And most people do not expect to experience the uncanny, so if they do, they come up with other explanations for what they have encountered. As Eisen says, "The deadliest phrase in our business is 'I'm sure there is a rational explanation for this.'" He believes he and his colleagues have experienced a kind of mental paradigm shift. Somehow, they have learned how and where to look for the uncanny, so they have less trouble seeing it for what it is and understanding it. (In game terms, this is not the same as the Illuminated advantage; it is simply an explanation of why relatively few people in the campaign setting believe in the paranormal.)

He also learned that some of the rare, gifted people with unusual powers were using them to commit crimes. And there were hints that there were other things out there, too, inhuman things, some of them monstrously evil. They needed to be stopped. And so he asked people if they would be interested not only in investigating the uncanny but also in investigating crimes and helping the police track down certain special criminals. Some declined, but others said they would be glad to help.

And so, on a warm September evening, Dr. Joseph Eisen sat down at his dining room table with his wife and four extraordinary people. He jokingly apologized that his house was not exactly stately Wayne Manor, and Donna replied that it was still a pretty exclusive club. "Yes," he said, "The Oak Street Club." The name stuck.

The Oak Street Club divides its time between investigating the uncanny and looking into mysteries using their powers and then passing on information to the police or a federal agency like the FBI. (Eisen has a pretty good reputation with the police because of his combined expertise in psychiatric medicine and his well-known debunking of a number of phony haunted houses and other so-called supernatural events.) Sometimes, they end up doing both -- in proving that a house really is haunted, for example, it is sometimes necessary to discover and expose the truth about the crime or tragedy that led it to be haunted in the first place.

They have discovered some unusual things in the last few years. Eisen has found four houses that he believes are genuinely haunted. He has also met at least 11 people who have truly extraordinary powers, including a man who really can find water with old-fashioned dowsing and an old blind woman who can handle objects for a few minutes and know things about the people who have owned them. And a rapist who could take control of someone else's body with his mind. And a murderer who could make victims hallucinate. All of this goes into his notes, notes for a book he will write someday, a book he believes will be the most important thing he has ever written.

All five members have learned how to use firearms, and have appropriate permits. None of them want to have to shoot anyone, but they have dealt with enough bad people over the last few years to understand that going armed is sometimes a necessity. Even if they are not expecting serious trouble, at least one of them will usually have a pistol.

Eisen is not sure, but he thinks other groups like his own may be operating in different parts of the United States and around the world. He is pretty sure there is one group in New England and another in either Memphis or New Orleans. A third group appears to be operating out of Vienna. His attempts to contact these groups have not yet been successful, which makes him wonder if they have something to hide.

He also thinks he has found a pair of vampires. Two tall, beautiful men, one blonde, and one with dark hair, who look at each other like lovers and who move like music, and they have been seen in six different cities over the years, and wherever they go, people disappear. But he is not sure what they are. Not yet.

These are the current members of the Oak Street Club . . .

* One free level for Very Wealthy

Disadvantages: Code of Honor (Physician) [-5]; Dependent (Spouse; 75% as powerful; Ally; Loved one; 15-) [-3]*; Obsession (To learn everything he can about those with strange powers, 12-) [-10]; Reluctant Killer [-5]; Secret (Strange Powers) [-10]

* Eisen's wife, a retired nurse, usually accompanies him on his investigations. She has no unusual powers and so is not described in detail in this article; GMs may assume that she has ST 9, DX 10, IQ 12, HT 10, shares her husband's wealth and social status, has any appropriate IQ-based skills such as First Aid at 12-, and any appropriate DX-based skills such as Guns (Pistol) or Driving (Automobile) or at 10-. A generous GM may also assume she has Common

Sense, allowing her to advise her husband and his friends against doing anything dangerously stupid.

Quirks: Always approaches the uncanny with scientific rigor [-1]; Likes to come up with catchy ways of explaining important concepts [-1]; Likes cats [-1]

Skills: Administration-12 [1]; Area Knowledge (Michigan)-13 [1]; Computer Operation-13 [1]; Criminology-13 [4]; Diplomacy-13 [4]; Driving (Automobile)-10 [2]; First Aid-13 [1]; Guns (Pistol)-10 [1]; Hypnotism-15 [12]; Leadership-12 [1]; Law (American Criminal)-11 [1]; Literature-13 [4]; Occultism-14 [4]; Pharmacy (Synthetic)-13 [4]; Physician-13 [4]; Psychology-15 [12]; Public Speaking-13 [2]; Research-14 [4]; Teaching-14 [4]; Writing-15 [8]

Jeffrey Anderson *141 points*

Jeffrey Anderson can start fires with his mind. He also gets mystic visions when he stares into a fire for long enough, and can touch burnt objects and learn their histories. He works as an arson investigator for an insurance company. An old buddy of his is an ATF agent and the two keep in touch, and share "war stories" about various cases. Sometimes, he has his friend look into things for him, but he knows not to push their friendship too far.

Using The Oak Street Club In A Campaign

The Oak Street Club presumes a world where both hauntings and psychic abilities are real, but rare. Perhaps one person in 10,000 has some kind of supernatural ability and perhaps one house in 10,000 is actually haunted (and the haunting might be caused by something other than a ghost). Genuine monsters such as werewolves and vampires, if they exist, are both very rare and very careful to keep their existence secret. This is not a world in which Four Color supers exist . . . or if it is, their activities are covert ("Supers in Black" rather than "Supers in Spandex").

The Oak Street Club operates primarily in Michigan, Ohio, and Indiana, although they occasionally investigate things in other areas, simply because they are private citizens with a limited budget. (Even Eisen cannot afford to fly five or six people around the country, pay their bills, and the like on a regular basis.) They usually do their investigating on weekends and in the evenings, driving to the location and doing what they can in a day or two, or using vacation or sick days to extend their visits. Long drives, of course, provide good opportunities for side adventures (or real adventures disguised as side adventures) and roleplaying. To be fair, a GM should try to design the adventures so that the PCs do not have to worry too much about making a choice between saving the day and losing their jobs. By the same token, the time constraints under which the members of the Oak Street Club must operate can be used to create tension and a sense of realism. Of course, the Oak Street Club could be based almost anywhere in America or Canada; GMs should feel free to alter the setting of the campaign as necessary.

All five characters have been designed with Psionic-based powers so that a campaign can be developed with a world where the only powers are psionic, but a GM can modify this as needed if it is desirable to have a wider range of sources for abilities (e.g., Jeffrey Anderson might have Elemental powers rather than Psionic). The existence of haunted houses suggests that there may also be Spirit-based or Magic-based powers, but hauntings might just as easily be explained as manifestations of psychic energies.

There are many possibilities for gaming in a world like this. The first is to treat the Oak Street Club as pre-generated characters and use their adventures as the center of the campaign. This might be a good option for a GM who wishes to run demo games at conventions.

The next option is for player characters to be other members of the Oak Street Club; in this situation, they may replace some or all of the characters who have been described in this article. Characters should be built with between 100 and 150 points, and spend less than 50 points on their special abilities. The inclusion of a contact is not a requirement, but low-level super-powered individuals probably need some outside assistance once in a while to cover abilities or areas of knowledge that they do not have. Player characters should buy Eisen as an ally, but other members of the Oak Street Club only need to be purchased as allies when they are NPCs who are also fairly regular partners on their missions.

Finally, the Oak Street Club might simply be part of the background of a campaign. They can serve as contacts, allies, or the like for the PCs. This could be useful whether the player characters are mundane adventurers, people with their own psychic or supernatural powers, or visitors from another world, time, or dimension.

The Oak Street Club is, of course, a group of amateurs, rather than professional crime fighters or adventurers. They live in apartments (except for Eisen, who has a very nice four-bedroom ranch house in an upscale neighborhood), have regular day jobs, and so on. All of them live within an hour's drive of Eisen's house, so it does not take very long for them to assemble for a mission, but they are not always instantly available. And their powers, while beyond those of ordinary people, are fairly limited. In fact, the members of the Oak Street Club were deliberately designed, in part, to demonstrate how *GURPS* can handle low-powered superheroes.

Despite their limitations, they are quite capable amateur adventurers. It would probably be a bad idea for any of these characters to try to tackle a villain of the caliber of like Dr. Octopus or the Joker, but there is no need to make their adversaries incompetent. The members of the Oak Street Club have a unique advantage when dealing with supernatural threats. As they are themselves superhuman, they have no trouble believing in the uncanny. And, as a team, they are far more powerful than any one individual operating alone. Between the five of them, they have a wide array of skills, abilities, and contacts. They can handle some genuinely tough opponents, if they are smart and careful.

A typical challenge for the Oak Street Club would be a single criminal, or a small gang, perhaps with special powers, or a monster. A serial killer who destroys crime scenes with fire (perhaps because he is a werewolf) is a good option, as is a drug dealer trying to expand his territory, a murderer who knows exactly why a particular house is haunted and wants to make sure no one else figures it out (or who fakes a haunting to keep people away from something he has hidden there), or some ruthless individual exploiting a child, possibly their own, who has a special talent.

Two other, and possibly related, opportunities for campaigns are worth mentioning. First, one may assume that the world in which the Oak Street Club exists is part of the *Infinite Worlds* setting. A campaign might involve the Oak Street Club somehow stumbling onto an operation managed by Homeline or Centrum. Second, the Oak Street Club might investigate something connected to the Cabal. This could easily be played in a number of different ways. The Oak Street Club might be the heroes, seeking out the truth about some mysterious happenings, and gradually learning that it is part of a vast occult or interdimensional conspiracy. Or, possibly, the heroes are members of the Cabal, working to foil the machinations of one of the more sinister Grand Masters, or deal with an outbreak of Things Man Was Not Meant To Know. Gradually, they realize they are also the target of an investigation by the Oak Street Club. Now, they can either try to keep the Oak Street Club from learning the truth about them or join forces with them to defeat a common enemy.

Manfred

for *GURPS*

by Joe Taylor

"All beasts are happy, for when they die, their souls are soon dissolved in elements; but mine must live still to be plagued in hell."
-- Dr. John Faustus

Little is known about Manfred's background before he joined the Ravenstadt Monastery in 1333. It seems as though he had been educated by the Church as a young man and had become a monk to continue a life of contemplation and study. Located by Schwerzebronn Lake, on the present-day border of Germany and Austria, the Ravenstadt Monastery offered him isolation from worldly evils.

Brother Manfred was as devout as he was scholarly, and the other monks began to see him as an example of perfect piety. Manfred grew to like this admiration and fell victim to his own pride. Proud of his learning and believing himself incorruptible, he began to study blasphemous tomes and forbidden writings. At first, Manfred had thought that by cultivating a better understanding of evil, he could help his fellow man resist temptation; however, as he delved deeper into the occult, everything else ceased to matter. When the abbot of the monastery finally learned of Manfreds heretical studies and confronted him, Manfred killed him. By that time, Brother Manfreds personal magnetism had already entranced the other monks and most willingly followed him down his evil path; those who wouldn't were murdered.

As far as the outside world knew, Ravenstadt was still a house of God, but within its walls, Manfred began teaching his fellow monks new and unspeakable rites. In 1336, under his direction, they began to reconstruct the monastery's chapel to redirect the architecture's spiritual focus. The project would take them years to complete, during which time the monks kidnapped victims from the neighboring village for sacrifice and use in orgiastic ceremonies. The stats below represent Manfred at this point, with his monks as Allies and the monastery as a base of operations.

Manfred (circa 1336)   *234 points*

** Includes +1 from Charisma and +1 from Smooth Operator

Encountered

Encountering Manfred at this point in his diabolical career would likely be the result of a group outsiders showing up without any clue that he represents a danger. Monasteries are (usually) places where travelers might find temporary refuge; would such weary travelers recognize that anything is amiss until it is too late? PCs might wander into the village of Ravenstadt thinking it will just be a stop along the way until they hear of missing townfolk or rumors of the dark rites performed at the monastery. A different way to get Manfred and his monks into an adventure would be if the PCs are agents of the Church or some other authority, and they are sent to investigate reports of Satanic practices at Ravenstadt.

How Manfred behaves towards characters depends entirely on what he knows about them and their situation. If they are only passing through the area and will be missed if they disappear, he will endeavor to keep them unsuspecting and get them on their way without incident. Even if he intends them harm, he will keep up his charade until his victims can be caught off-guard (usually in their sleep). If the PCs begin to learn about what is really going on at the monastery, or if it seems like they mean to stay a while, Manfred will have his minions deal with them. Although the monks might be able to handle a villager or lone traveler, they are not great fighters and would use traps, deception, and (if all else failed) sheer numbers against wary opponents. In the final weeks of his reconstruction of the monastery, however, Manfred will not take any chances and try to eliminate any outsider who shows up in the area.

Selling Your Soul on a Buyer's Market

The monks of Ravenstadt were unable to escape God's judgment, which came upon them in 1341 in the form of the Black Plague. During the next few weeks, Manfred worked his followers at a frenzied pace, telling them that he would be able to save them all once the structure was finished. Manfred was already dying of plague when the task was done but he still had strength enough to complete the rite he had been preparing for years. On that night, Manfred offered his soul to the forces of darkness in exchange for long life and great power. In order to seal the deal, he locked his followers in the redesigned chapel and burned the building to the ground.

The fire got out of control (accidentally or on purpose) and destroyed all of Ravenstadt, both the monastery and the adjacent village. Manfreds deal with the devil had worked; he was given 666 years to live, during which time nothing could kill him.

Though he had gained supernaturally long life, Manfred was haunted by nightmares of the fate awaiting him in the afterlife when his soul would eventually be forfeit. He became obsessed with finding a way to cheat the Devil, to somehow keep his soul and never die. The charred remains of Ravenstadt behind him, Manfred spent the next several centuries wandering Europe, searching out arcane knowledge -- a search that continues to this very day.

Manfred (today)   *872 points*

Attributes: ST 11 [10]; **DX** 11 [20]; **IQ** 16 [120]; **HT** 12 [20]

* Includes +1 from Smooth Operator
** Includes +1 from Charisma and +1 from Smooth Operator
*** Includes +3 from Ritual Magery 3.

Spells (Note that when casting spells, Manfred has a 3 Black Penalty)

Core Skill: Ritual Magery (demonic)-22 [20]
Ritual Paths: Air-17 [2]; Animal-16 [1]; Body Control-22 [20]; Communication and Empathy-22 [20]; Earth-17 [2];

Enchantment-20 [12]; Fire-19 [8]; Food-16 [1]; Gate-16 [1]; Healing-16 [1]; Illusion-18 [4]; Knowledge-22 [20]; Light-19 [8]; Making and Breaking-19 [8]; Mind Control-21 [16]; Movement-18 [4]; Necromancy-19 [8]; Plant-16 [1]; Protection and Warning-16 [1]; Sound-16 [1]; Technology-16 [1]; Water-17 [2]; Weather-16 [1].

The above version of Manfred could be used (with little changes) in any setting spanning his 666 years of diabolically-lengthened life. He would be a formidable opponent in any age due to his resilience, but in the present-day he is getting increasingly desperate as his time draws to an end. If the GM feels that this version of Manfred is too underpowered for the campaign, try removing the Black Penalty and raising his skill in individual spells as needed.

Anyone trying to uncover information about Manfred's past will have a difficult time even if they have an idea or two about what he really is. The events at Ravenstadt are recorded in Church records and remembered in local legends. The Catholic Church eventually found out what had been going on in the monastery and Manfred was excommunicated (though no one really thought he was still alive). A new town was built near the ruins of the old, and a new monastery was built as well. An investigator who goes there today can also find out about the history of Ravenstadt, though the local story includes the detail that Manfred's diabolic bargain worked, and he survived. Visitors can even be shown the spot where the Ravenstadt monastery stood, but nothing of the building remains.

Aside from that, there would be very little investigators could uncover about Manfred's history. Only a handful of times has Manfred stayed in one location for more than a few months since his transformation. Any rituals, spells, or experiments he has performed in an effort to cheat the Devil might have been recorded as gruesome crimes or unexplained mysteries.

In addition to long life and immunity from harm, Manfred was rewarded with the ability to wield magic. However, he has found -- much to his dismay -- that demonically assisted magic cannot aid him in his quest; the Devil won't be cheated through his own gifts. Once he realized it was getting harder to cast spells when he wasn't directly calling on demonic aid, he ceased to rely on it as much. He has studied magic enough over the centuries to have a very wide understanding of it, and he easily could have become a true master of the arcane arts if he had dedicated himself to doing so. Instead, he focused on tracking down mystical artifacts and ancient tomes.

Manfred often likes to pose as a learned man in a position of authority such as a schoolmaster, professor, or sometimes even a priest. He only moves into an area if he is after something, so he normally tries to adopt a guise that will allow him to do his work unquestioned or simply keep a low profile. Manfred can be fairly seductive when he wants to be and will often use people to his own ends. He isnt a very physical person and doesn't like to involve himself in violence when he doesn't have to, but he can be extremely dangerous when it suits his needs. He relies on his intelligence most of all, and if he finds himself at a disadvantage hes more likely to run than fight.

He has certainly crossed paths with the Cabal a few times over the years. Though he hasn't earned their outright hostility, there must be some reason why he has never been a member. Whatever Manfred's relationship with the Cabal is, neither side will speak of it.

PCs who investigate or research hidden, arcane lore have a good chance of running into Manfred. He could be a rival who is competing with them over the possession of a particular artifact. Encounters with Manfred don't have to be violent or adversarial, though, especially if the heroes don't realize what he is (and he does not find himself at cross-purposes with them). Manfred could show up in a campaign as the proprietor the local magic shop, a dealer of rare books, or an expert on arcane subjects -- someone the PCs might develop a good relationship with. He could even become a teacher to novice mages, taking a gifted PC under his wing! Of course, Manfred would only build up such a relationship if he intended to use it to his own ends; a group of powerful PCs on his side might be able to help him a good deal.

Finally, Manfred's time is almost up, which means that he will be very active, trying anything he thinks might save him. His activities could very well draw the attention of the PCs, and most of his efforts are likely to involve harm to innocents, perhaps on a mass scale. It's possible that Manfred actually does have an effective plan for keeping the Devil from claiming his soul, and that it's the kind of work that takes centuries to set in motion and perfect . . . and only the PCs stand between him and whatever terrible rite he plans to enact this time.

The Plague Sword

by J. Edward Tremlett

The Red Plague came the day the sword was forged, so long, long ago.

The first swing of the hammer -- slow and deliberate -- rang in time with the first sign of the contagion, well outside the city's strong walls. The second rang in time with the village's warning bell, and the panicked screams of those who heard it. The third accompanied the swift decision to close the city gates, and keep the plague outside.

And each slow, careful strike thereafter was an innocent infected, the pound of a doomed fist on a thick, wooden gate, or an arrow through the chest of a villager determined to climb the high walls.

As it was quenched in water, someone hissed in pain through melting lips. As it was honed on the whetstone, someone killed his entire family rather than watch them liquefy, too. As it was polished and made clean, some pious soul inside the city cried aloud to the gods to spare the pure of heart.

And as its handle was chased, and its edge engraved, the gods replied with silence -- stark and absolute.

By the end of that day, no one outside the city's walls lived. Their skin had sloughed away, leaving bloody red muscle and dead, staring eyes. Even the carrion birds and scavengers shied away from the devastation, sensing danger in the corrupted flesh.

That night, in the temple, the Armorer presented the sword -- his greatest, ever -- to the masters of the order. He had been sequestered in silence, work and prayer that day, and had no idea of the disaster that had taken place.

If he had but known, he would have abandoned the sword as a thing of ill omen. He would have broken it down, burned it, and scattered its ashes. He would have laid aside his hammer and tongs, and joined his brothers in prayer for the souls of the dead.

But it was too late -- the deed was done, and could not be undone. His work could not be unmade. His prayers and blessings could not be revoked.

And the weapon could not lay unused, lest the god of the order take insult, and lay his hand against them.

So the sword was consecrated as a weapon of the order. It was blessed. Spells were intoned to transform its steel into the holy weapon of a god.

And as the head of the order blessed the sword -- tears of grief still streaming from his eyes -- the slow Moon rose as red as blood.

What the Armorer Hath Wrought

The Plague Sword, as this holy weapon has been called, is beautiful, powerful, and cursed. It is an unusually thin two-handed, double-edged sword with an engraved blade. It has an ornate, golden pommel, the handle is chased with polished, red-veined ivory, and the capstone is a small, golden reliquary containing a mummified index finger.

The blade is engraved on both sides. It depicts a scene of the god of the order smiting a horde of demons with a languid wave of his hand. The pommel seamlessly continues the tableau, as three-dimensional demons fall out of the sword, and then across the pommel to their supposed doom. When held aloft at the end of day, the sword drinks in the red sunlight, and the demons seem to writhe in pain.

The weapon has a bad reputation among its order. To remain right with their god, someone from the order *has* to wield the Plague Sword, but possession is a promise of eventual doom. Whenever a new owner is chosen, his brethren silently thank their god that they were spared such a boon, and pity the brother who now must carry it -- now referred to as The Plague Warrior.

Defining the Weapon's Horror

The Plague Sword is designed to be a versitile artifact for a setting, with many options presented for how the weapon works, what its drawbacks are, and what effect it has on those weilding it. The GM is encouraged to pick the options below that sound most interesting and/or work best for the campaign; it may even be possible for the abilities or demands to change or transform . . . perhaps as a result of the PCs' actions!

The Sword may be:

- A Smiter of Evil, doing triple damage to all creatures and NPCs who can be described as evil. It also does normal damage to beings who cannot normally be harmed by melee weapons, such as ghosts, regardless of their alignment.
- A Finder of Evil, pointing its wielder in the general direction of the greatest evil within a days walk. It also moans, as if in pain, when in the presence of an evil creature or NPC.
- A Banisher of Evil, able to make evil NPCs and creatures drop everything and flee for their lives on sight of it being held aloft (and failing an appropriate resistance roll). Those who flee the encounter must flee the sword ever after, even if it is wielded by a different owner.

But the Sword may:

- Require battle every day. If the sword has not been allowed to drink blood before the Sun falls and the moon rises, it will possess the wielder and seek out a fight with the first sentient, living thing it finds, regardless of alignment -- including members of his own party. It will not release control until it has killed.
- Leave the Red Plague behind it. Anywhere the sword goes, there is a chance based on how long the owner stayed that the deadly contagion will appear. (In this case, oddly enough, the wielder of the sword is immune to the plague, and any other disease mundane or magical.)
- Infect the dead. Any demons, devils or evil ethereal creatures slain by the sword have a percentile chance of lingering within it, depending on how powerful they were. They then have a chance to possess any other victims of the sword, springing back to life in stolen flesh anywhere from a few hours to a few weeks after the fight.

Anyone who takes it up might:

- Be constantly tempted towards sin. The sword always whispers that the owner must partake of evil to truly understand it, and fight it. It also negates whatever penalties the owner might suffer for doing so, making it easier to do more, and worse.
- Be possessed of bad fate. In any case where fate, luck, magic, or the will of other gods, rather than skill or ability, determines an outcome, the wielder will suffer. This sometimes leads the owner to make dark bargains with the swords would-be victims, just to even things.
- Demand harsh punishment of sin. If the wielder comes upon a situation that could be described as evil, or in dire violation of the orders ethics, it will possess the wielder, and demand justice. It will not let go until it has seen to the death of those directly responsible, any who might have profited from it, and those who could have done something, but merely accepted it as the way things are.

And the finger came from:

- One of the greatest members of the order, lovingly prized from his corpse as a relic. His finger was placed with the sword in the hopes that it would ameliorate the swords ill omen, and it has, but only to a degree. Should the

reliquary be removed, every demon and devil the plague sword has slain will rise up to take vengeance against its wielder.

- The first wielder of the sword, who fell from grace within a year of taking it up. The finger was put there to remind future owners of the ultimate penalty for such sin, but the sword will bring ruin so long as the finger remains within it. However, if the finger is removed, the swords special abilities also disappear, and the wrath of the order's god falls upon all its members.
- The necromancer who let the Red Plague loose upon the city the day the sword was forged. The first wielder of the sword made certain to kill him, and had the finger placed within the sword as sign to their god that vengeance was carried out. If the finger should be taken out of the sword and handled by bare flesh, the necromancer will possess whoever touches it, and be free to walk the world once more.

Pyramid Review

Halloween Horror (for Call of Cthulhu)

Published by Chaosium, Inc.

Written by Jim Lynch, Oscar Rios, & R.J. Christensen

56-page tapebound b&w softcover; $15

With **Halloween Horror,** Chaosium wastes no time of getting the contents of this supplement. No introduction, no explanation, just straight into the first of a trio of adventures for **Call of Cthulhu.** What you need to know first about this collection is that all three have been deemed the best of the publisher's first Halloween adventure contest run in 2005. Second, they are presented in the publisher's Miskatonic University Library Association monograph format. This means that the book is only available directly from Chaosium and that the production values and layout have been left up to the individual authors.

The first scenario is "Eyes That Should Not See" by Jim Lynch. It begins with a shooting at a small Massachusetts museum, a failed robbery attempt in which the perpetrator is surprisingly resilient. Behind the robbery is a cultist unknowingly being directed by a minor Mythos entity with a hatred of Cthulhu. It so happens that the museum has an exhibit of "Ancient Treasures of the Pacific," and the cultist is directing her minions to steal certain artefacts. Her method of control is novel and might send **Delta Green** devotees in another direction all together. Yet this is not a good scenario, but rather a passable outline that in the hands of a capable Keeper deserves to be something more. Everything necessary to run the scenario is present (though not very well organized), bar a set of example investigators. What you get instead is set of character outlines clearly written for the author's own playing group. Their presence adds nothing to the scenario, and if I can see that, why could not Chaosium? A mere matter of either deleting them or actually giving full investigator write-ups for all four and the error would have been abated. Even so, the scenario shows promise and had it been better organised and fleshed out . . .

The second scenario is by Oscar Rios, who already has a Monograph or two under his belt in the form of **Ripples From Carcosa** and **Tales of Death & Darkness.** "Halloween in Dunwich" is a one-shot that delves into Lovecraft County lore and has the players take the roles of six children, all cousins aged between 11 and 13 years old. Although they are not the younger versions of notable Mythos figures, with one of them being named Edward Derby, they could be. Each Halloween their parents take them to a family party held at Great Grandpa Silas' farm, where there will be holiday fun, games, and treats. For each child, this is the opportunity to escape the "teenage weirdness" of their lives. Unfortunately, a secret long forgotten quite literally comes back to haunt the family and it is up to the young investigators to save the day, or rather the night.

With ghosts, animated scarecrows, and dangerous cornfields, this is the only one of the trio to make use of the Halloween's traditional bogeymen. This and the fact that it is a straightforward affair, makes "Halloween in Dunwich" a little like a *Scooby-Doo* episode. Even so, this is a most enjoyable affair, especially if the fan plays the cast as young versions of Mythos notables.

"Terror at Erne Rock" by R.J. Christensen is the third and last, a classic 1920s set scenario that starts with a Halloween party aboard a private yacht off Nova Scotia. When a sudden and severe storm blows up, the investigators, the guests, and the crew find themselves first shipwrecked and then safe, washed ashore at a malfunctioning Canadian lighthouse. This is where things take a turn for the worse . . . This is a locked room situation in which the investigators are forced to improvise if they are to survive the night. It should play rather well until the players have to sit down and read one of Lovecraft's tale as part of the adventure. Fine for a huge campaign like **Beyond the Mountains of Madness,** but for one scenario?

Of the three scenarios, "Eyes That Should Not See" is suited for any period of the game and is easily added to any campaign, as is "Terror at Erne Rock," although it is firmly set in the game's classic period of the 1920s. Both are suited to less experienced players and investigators.

In truth, there have not been very many scenarios for **Call of Cthulhu** set on Halloween. Pagan Publishing's solo scenario **Alone on Halloween** being one of the few notable examples. And to be fair, **Halloween Terror** only adds one more to that already short list, Oscar Rios' "Halloween in Dunwich." The other scenarios could be set at any time of the year and do not make particular use of the festival to qualify as Halloween-set scenarios. This is not to say that you could not run them on Halloween, but that is the problem with the bulk of the trio here.

Overall, "Halloween in Dunwich" is almost, but not quite worth the price of the supplement -- and that is the fault of the price, not the scenario. Of the other two, "Terror at Erne Rock" is a solid addition to any campaign, while "Eyes That Should Not See" is something for the Keeper to work with. Each one will provide a good evening's worth of play, perhaps even on Halloween, but **Halloween Terror** does not really make as much use of its theme as it should.

Zombie Rally

Published by [Snarling Badger Games](#)

Created by Adam Loper & Peter Spahos

54 black & green cards and rules; $5.95

This has all been a big misunderstanding.

You think of them as evil, watery-eyed, subhuman freaks raised from the grave by some unnamed source of malice, and set to eating the body and/or brains of any hapless passersby they chance across. The zombies, it turns out, are simply exercising, because when you're dead and decaying you need all the workout you can get to stay fit and trim. This shuddering event is known as the *Zombie Rally.*

The object of the game is to be the first zombie to run, shamble, hop, or crawl across the finish line.

Players -- two to six maggot-infested shells can join -- are assigned a hand of cards, and everyone agrees on a number of steps for this race. The more steps, the longer the race, but the default is 30 steps. Someone grabs pencil and paper (backing up a step, someone has to *supply* paper and pencil) and keeps track of everyone's steps and which limbs they retain.

Everyone takes a turn playing or discarding cards. Some are simple movement cards that let you hulk forward one, two, or three hesitant steps, and these are marked beside your name so you know where you stand (or lie) in the race. If you can't get any movement cards, you can discard three non-movements to take a step. Others are attack cards that let you attack your competition. These have a range listed on them, telling you how far from your current position you can reach. If you want to Kick someone, for example, the range is one: You can attack anyone next to you (e.g., both of you are at step seven) in the race and anyone directly in front of (step eight) or behind you (step six). Some of the cards allow you to attack and move at the same time, like Trip-n-Move; its range is only zero (so you have to use it on someone you're neck and rattling neck with), but you force them to lose a turn while advancing a step yourself. The attacks with the best range require you to play two cards in concert. And then there's the dreaded Cartwheel of Carnage . . .

When one of these attacks connects (assuming you don't play a defensive card like Duck), it knocks off some of your valuable, desiccated limbs. Losing arms limits some of your attacks, and losing legs slows you down. You can still use movement cards, but you may not make full use of some, crawling or hopping as you now are. Sooner or later someone drags themselves to the finish line and becomes a ghoul (apparently zombies are happy to have any sort of goal in unlife), leaving the rest to place or show (if the other players still care).

The illustrations are deceptively unpretentious; like Kovalic artwork, you don't realize how hard it must be to make something so simple come out so evocative -- or vice versa. The little zombies suit the tongue-in-cheek (through-the-cheek, out-the-other-side) feel of the game to a T. The graphic design conveys information quickly, and it's one of those rare instances where you would have been willing to see the stats reduced in size just a wee to see a slightly larger picture. The cards are thin things made from whatever that over-thick construction-paper-like stock is called -- if you ever played the first edition of *Give Me the Brain,* you know the stuff. They feel a little too thin but given that play isn't as fast and furious as that game, the problem isn't with the stock's weight but its texture. The cards aren't easy to shuffle and won't be until you've had the chance to handle them quite a bit.

Some games have cards whose effects are negated by other cards, and some get to the point where you can't make any

headway. This isn't one of those games. It's well-balanced as far as the selection is concerned, and while you may be able to, say, reattach a severed limb, that kind of thing doesn't happen very often. Play is quick -- less than half an hour in most cases -- and if you don't want a full evening of racing, it fills the gaps between other games nicely. It's not as good with only two players (why unleash the awesome might of the Cartwheel of Carnage on one dude?), though with two the marathon gets pretty tight. It's hard to get too far out in front, leading to a, uhm . . . dead heat.

A charmer of a game, ***Zombie Rally*** is a simple idea with a coy execution. With an easily customized length and a hungry appetite for both brains and house rules, it satisfies the hunger for a quick repast.

--Andy Vetromile

Dealing With Possession

By Bevan Thomas

In folklore and fiction, few supernatural abilities are as potent as spiritual possession, and few are as feared. The idea of someone nestling in your flesh and using it to work his will upon the world is a terrifying concept. It violates the sanctity of our minds and bodies, reducing individuals to the roles of marionettes dancing on strings, and calls into question some of our most cherished beliefs about identity and free-will.

However, as prominent and effective as spiritual possession is, difficulties can arise if it is employed on a player character in a roleplaying game. Most players are very protective of their characters' volition, even more so than they often are of their characters' health. Many players who would shrug in affable resignation at the maiming and even slaughter of their alter egos would become angry, even furious at the idea of the GM wrenching away control of their characters for even a few moments merely because some upstart demon or sorcerer has decided to ride around in the characters' skin.

Even if the players are willing to accept such actions in principle, they generally become forced by the possession to sit out the session for a while, waiting for the being to either be exorcised or to grow weary of its current habitation. Though this can be acceptable if the possession is a short, too much of it becomes tedious. Fortunately, there are various ways that the GM can get around these problems.

1. The first and by far the easiest option is to simply decide that no PCs would become possessed. This might be because the heroes are protected from such supernatural attacks (perhaps due to a blessing granted to them by a benevolent deity) or simply that the possessors always decide that NPCs would be better targets. Though this option does sidestep the whole issue, many GMs (and some players) would find it too contrived and arbitrary. And, of course, it also robs the PCs of the roleplaying opportunities that being a possessed victim can present.

2. The second option is to allow the player to continue to control his character even while he is possessed. When the character is taken over, the GM provides the player with enough information on the possessor and its goals for the being to be authentically roleplayed. This method allows the player to remain involved with his character despite the presence of another mind, and has the added benefit of helping to keep the possession hidden from the other players (assuming, of course, that the GM wants to keep it hidden). However, it also means that a player is given access to an adversary's background and trusted to play that being to the best of his ability. Though some players are able to handle the responsibility, many are not.

3. A similar method is to allow the player to play his character as usual, though occasionally telling him to take particular actions ("you have an overwhelming compulsion to put the gem in your pocket"). This option keeps the benefits of the previous option, though without its potential flaws. Not only does the player not get access to an NPC's background, he may not even realize himself that his character is possessed (potentially attributing the compulsions to other forms of magical control, or possibly even mental instability). However, this option has its own potential problems. First, it involves forcing players actions when they don't know the cause, which some players would find frustrating in the extreme. Secondly, it assumes that the possession in question is of a subtle nature, with the victim maintaining his own volition for the most part, and only occasionally coming under the control of the possessor. In situations where the possession is of a more blatant nature (such as a complete suppression of the target's personality), another method would be needed.

4. The last possibility is for the GM plays the possession figure as normal, but the player continues to play his character's personality, which is still hanging on deep inside the skull. Possibly the player character perceives himself as being in some location (such as a cold prison cell, an empty mansion, or a mist-shrouded field) or merely as a formless consciousness. Either way, he can communicate with the being that is in possession of his body and can sometimes struggle for dominance (perhaps eventually managing to exorcise his possessor, or at the very least regain access of the body for a few pivotal moments). The advantage of this option is that it grants the player some control over his character, while still keeping the actions of the possessor firmly in the hands of the GM. It also grants the player dramatic roleplaying opportunities as he battles a being for the right to direction his actions. However, it does still leave much of the player character's actions within the complete control of the

GM, and furthermore introduces a new arena of conflict that completely excludes all other player characters (unless they are able to somehow enter the possessed person's mind) and potentially distracts from the larger adventure. Furthermore, as with option three, it presents a very specific interpretation of possession that will be inappropriate for some campaigns.

Ultimately, none of these options are better or worse than any of the others. They each possess their own benefits and potential pitfalls. In the end, the GM needs to ask himself how he intends spiritual possession to be treated in his campaign and how he wishes the players to interact with it. Then he chooses a method accordingly.

HorrorClix

Published by [WizKids, Inc.](#)

Designed by Scott Hungerford with Kelly Bonilla, Seth Johnson, Jon Leitheusser, Mike Mulvihill, Matt Robinson, Jordan Weisman, & Brook Willeford

Sculpting by James Carter, Brian Dugas, Jeff Grace, Abe Gusillo, Lukas Hungerford, Joey Locke, Dave Summers, & Drew Williams

Illustrated By David Wahlstrom With Aleksi Briclot & Kieran Yanner

Horrorclix Starter Set: **Six Pre-Painted, Predetermined Figures With Character Cards, Three 3D Objects, 30 By 19½-Inch Double-Sided Full Color Map, 12 Victim Tokens, 12 Plot Twist Cards, 4½ By 7-Inch 50-Page Black & White Rulebook, Two Six-Sided Dice, & One Clix Ring; $14.99**
Horrorclix Booster Pack: **4 Pre-Painted, Random Miniature Game Figures With Four Character Cards, One Plot Twist Card, & One Victim Token; $7.99**

Having run the gamut from [fantasy](#) and [superheroes](#) to [aerial dogfights](#) and [baseball](#) via [big robots](#), WizKids bring the CMG (or Collectible Miniatures Game) format to the horror genre. Actually not the first horror CMG -- that was WizKids' *Creepy Freaks,* a game for a younger audience -- *HorrorClix* is a nastier affair, better suited to more mature players. More slasher flick than supernatural chiller, the game pits bands of monsters, perhaps even cabals of creatures, against each other, each slaying innocent victims to empower themselves. Even as the monster armies fight, others try to rescue these potential victims. Doing so likewise empowers these martyrs, priests, and vampire slayers, preparing them for bigger fights.

As with other WizKids CMGs, *HorrorClix* comes as a Starter Set to which can be added the contents of Booster Packs. The core set consists of 107 figures, of which 23 are single rarity types (Experienced, Unique, or Limited Edition), the rest being divided equally between Rookie, Experienced, or Veteran rarities. The harder the rarity, the more capable and more expensive to play the figure is. The figures also come in seven types. Vampires become more powerful as they feed; werewolves start off in human form and transform into a beast after eating; and zombies can suffer lots of damage and get up to carry on fighting. Occultists use powerful magic or control supernatural servants; slashers get close up and personal; and spirits become solid as the game goes on, but can possess other monsters. Finally, guardians defend the victims from the monsters.

As with other CMGs, each figure has a dial marked with various things. These include name, cabal symbol, set symbol and number, plus an indication of its rarity. Besides its Range value is a stat slot containing values for Attack, Defense, Damage, and Speed. These four will change during play as the combat dial is rotated to reflect damage, healing, or empowering following the saving or slaying of a victim. At the same time they reveal special abilities that are explained on each monster's double-sided card. For example, on the starting side of the Bane Wolf there is only a purple dot for its Transform ability. This tells the player to flip the card to its transform side and also to turn the figure's combat dial to its red starting line. Now the Bane Wolf has a green dot for its Rake ability that allows it to deal

damage to an adjacent monster, and an orange dot for its Tough Pelt that stops some damage.

Not every monster starts out weak and transforms into something stronger; some just start tough and nasty. Others have two starting sides and do not transform. In this case, a player can handle the associated monster in two different ways. For example, the Faithful Priest can be played as either a protective priest or as a more combative man of god. Another symbol that appears in the stat slot is the hourglass. If it appears next to a monster's Speed, it is Immovable; next to its Attack, and the monster is Incapable of acting; and when next to its Defense value, the monster is Intangible, and cannot be attacked.

The Victim Tokens simply depict a genre archetype such as Pizza Guy or Prom Queen, along with their gender and Speed. Cards come in two types: Plot Twist and Subplot. Plot Twists are played whenever a Monster attacks a Victim, and are inspired by various genre clichés. For example, "Unlikely Martyr" saves a Victim, inflicts damage on the attacker, and comes with the quote, "You're going to have to go through me first." Subplot cards grant a player extra Victory Points if the card's conditions are met at game's end. The Subplot cards in the Starter Set either require every victim to die, or all opposing Monsters to die. Each player begins the game with one Subplot card revealed and six different Plot Twist cards kept hidden in the player's crypt.

Finally, there is the double-sided map. One side shows the floor plan of a one-story haunted house, the other a cemetery full of mausoleums. Terrain can be modified with doors, hindrances, and three dimensional terrain pieces. The Starter Set includes two tombstones and a single Tree of the Damned. If a Monster is killed in its shade, the attacking player receives another action.

Game set-up is simple. Players select Monsters up to an agreed build total, usually in multiples of 100. The number of multiples also sets the number of Action Tokens (which have to be supplied) a player receives each turn. Cards are selected and Victims placed on the map's blood spots.

A player's turn consists of four phases: Preview, Suspense, Hunting, and Hourglass. In the Preview phase, any effects outstanding from previous turns or Plot Twist cards are resolved. Things turn nasty in the Suspense phase, the player being allowed to move one Victim, usually away from rival Monsters and towards his own. Of course, another player can interfere with a Plot Twist card.

Monsters act during the Hunting phase. Assigned an Action Token, initially each can either move or perform an attack, either melee or ranged. If a Monster can reach and slay a Victim, it becomes blooded and can Frenzy, now able to move and attack per Action Token. Slaying a Victim is automatic, but resolving an attack on another Monster is merely a matter of rolling the dice and adding the attacker's Attack value. If this beats the target's Defense, damage is inflicted in turns of the Combat Dial. If the stat slot shows three skulls, the Monster is slain. The last phase is Hourglass, in which any Monster that did not act but has Action Tokens still assigned has one removed. Finally, if a Monster has any Hourglass symbols showing, it takes another click of damage.

Action Tokens need to be carefully handled. They must be assigned for a Monster to act, but if it acquires two tokens, the Monster becomes vulnerable. In this state, a Monster cannot act until its tokens are removed through inaction. Further some other Monsters can take advantage of its state to inflict further damage. For example, a Lynch Ghost inflicts penetrating damage on a vulnerable Monster which it cannot counter with any damage reduction abilities. This effect of the Action Tokens also enforces a pattern of moving Monsters on alternate turns.

With play alternating between turns, the objective is simply to get your Monsters blooded or transformed by slaying or saving Victims. Once done, more options open up and the various powers and abilities -- which also include possession, minions, flying, and inflicting insanity -- become available. More figures (from Booster Packs) and players add to this variety. Winning involves scoring points for killing Monsters and meeting the conditions of Subplot cards.

Straight out of the box, *HorrorClix* is a little limited in terms of play, but being a CMG this is no surprise. The only way to get more out of the game is to purchase further Booster Packs, which also enable more players to participate. Yet it is disappointing in several small ways. First, it does not make very much of its source genre, and then really only in the recognition of horror movie conventions on the Plot Twist cards. Second, its treatment of the genre is generic. This is intentional, but it means that the game lacks both a hook and a drive that you would get from playing a

more focused game like [***Zombies!!!***](). Perhaps this will change once ***WizKids*** release the ***Hellboy*** or ***Aliens vs. Predator*** figure sets? Some Cthulhu Mythos figures do appear in the core set, most notably the Great Cthulhu figure (but also the Deep One and the Avatar of Cthulhu), but these are few and far between despite Great Cthulhu featuring heavily on the packaging. Third, although the rules suggest that ***HorrorClix*** can be used to play scenarios, those given in the rules and on the website really only provide limitations on how players can beat each other's monsters up . . . which seems somewhat unimaginative.

Nevertheless, as a horror-themed light skirmish game, ***HorrorClix*** is fun to play. The Action Token mechanics do enforce more tactical play and the various monster powers and abilities are decently handled once they come into play. However, anyone wanting a deeper playing experience will have to look elsewhere, and its treatment of the genre might be too broad for some tastes. ***HorrorClix*** is thus best suited to a less demanding audience or to one wanting a lighter, and lightly themed skirmish game.

--Matthew Pook

Scream of Clio's Nightmares

"Your soul is full of cities with dead names,
And blind-faced, earth-bound gods of bronze and stone
Whose priests and kings and lust-begotten lords
Watch the procession of their thundering hosts,
Or guard relentless fanes with flickering swords
And wizardry of ghosts.

In a strange house I woke; heard overhead
Hastily-thudding feet and a muffled scream . . ."
-- Siegfried Sassoon, "To A Very Wise Man"

Every [Halloween](), Clio, the Muse of History, lies on tenterhooks waiting for the creak of history's hinges swinging. She starts and jumps at every scrape, every scratch, every skitter. All it might take is a sudden thud, or a tinkle of shattered glass, for her to bolt upright and scream for her very soul. Scream, Clio, scream! But those noises remain potential, heard only in the hypnagogic half-space between doze and dream, and Clio's scream lies choking in her throat. Likewise, these four campaign frames are mostly secret histories, where any unusual noises in history's corridor can be explained away -- until the scream breaks out and secrecy is no longer an option. From a whisper to a scream, then, won't you follow us?

" After a space of time had passed, three plagues fell on the Island of Britain, such as none in the islands had ever seen the like of. . . . The second plague was a shriek which came on every May-eve, over every hearth in the Island of Britain. And this went through people's hearts, and so scared them, that the men lost their hue and their strength, and the women their children, and the young men and the maidens lost their senses, and all the animals and trees and the earth and the waters, were left barren."
-- The Tale of Lludd and Llevelys, *Mabinogion,* (Lady Charlotte Guest, trans.)

It was such a shriek, a scream that filled the whole Island of Britain in 70 B.C. Llevelys said it was the noise of two dragons fighting, and that Lludd should open the well at the center of the Island to drown them in mead and slumber. Lludd should never have listened -- he opened the well and the scream of Lloigor poured out and blasted the very walls of the years apart. History itself became a [hollow](), an echoing shaft opening up and bursting through pre-Roman Britain. The shriek had fallen down from the stars, but it vibrated out of harmony with the spheres -- it tilted them from their shells and sent time into discord. The scream was loose -- all across the listening centuries. From the ululations of Pan to the *alala* of the Greek hoplites -- from the howls of Celtic warriors to the Confederates' Rebel yell -- the scream was loose, and fed on the killing it nurtured. It echoed and re-echoed, its resonances reaching back past the "great cry heard in Ramah" and the shout of Gideon, until it would garble and drown the very Words of Creation. Every little "Banzai!" or "Urra!" or "Hoo-ah!" across history mounts up, in a choir of death and chaos. Every battlefield where such calls sound is a little closer to that void in what once was Lludd's green and pleasant kingdom.

This is a cosmic-horror pulp-fantasy **GURPS Time Travel** game with an eon-spanning monster. The feel should be simultaneously high action and ticking doom. The PCs can be anything from clerics of Angerona, Roman goddess of silence, to Victorian magi in the Order of Harpocrates, to silent but deadly SAS commandos killing draconic avatars. Once they hear the scream of Lloigor, they -- the few quiet men -- can ride the waves of sound from deafening battlefield to ritual echo chamber to experimental WWII vortex-artillery installation. (The "how" of it is unimportant.) Every encounter is a noisy one -- banshees, animated Stuka-liches, manticores, screaming skulls -- and the GM should encourage the players to fight in silence (foes regenerate one HP per player word spoken?) to play up the theme.

"There's a mighty bad road from Lynchburg to Danville,
And although he knew this well
He said he'd pull his train on time into Spencer
Or he'd jerk it right square into hell.
When he hit the grade from Lima to Danville

His whistle began to scream;
He was found when she wrecked with his hand on the throttle
Where he'd scalded to death from the steam."
-- Fred Lewey, "The Wreck of the Old 97"

To the Chinese laborers building East, loud whistles scared away the ghosts -- of Indians, settlers, and the laborers themselves. To the Irish laborers building West, the scream of the whistle was the scream of the bean sidhe, the banshee, drawing the dead to her. Both put their will and hexes into the whistles they heard along the soon-to-be transcontinental rails. And in 1869 they met, and the whistles' dissonant screams refracted and shattered the barriers that both had built. The echoes spread, minor chords of spectral sound across the Great Plains and into everywhere the steel rails ran. A secret fraternity of trainmen learned the true map of America, the cutoffs to Hell or the [Rock Candy Mountain](), the staccato codes that sang across the empty miles to their brothers in speed. But the fraternity split, driven apart by the Rail Strike of 1877. Some lost their jobs, and taught their secrets to the "kings of the road," the "gentlemen travelers" who chalked their own hexes and sigils on America's doorways on moonless nights. Not every mad-eyed, grizzled hobo riding the rails was human, after that. Rivalry and fear brought new methods, and new money fed old rivalries. In the first decade of a new century, E.H. Harriman's Southern Pacific (with access to the secrets in Huntington's library and Stanford's university) fights tooth and nail against George Gould's Western Pacific and Missouri Pacific -- and Casey Jones is dead.

This **GURPS Spirits-Steampunk** crossover campaign frame is a standard "secret magic" horror game. The PCs might be train drivers, railroad detectives, etheric ritualist telegraphers, or heroic surveyors and structural engineers straight out of Ayn Rand, battling bandits like Butch Cassidy (who preyed on Harriman trains), revenant Sioux, or hobo druids wandering the rails and playing curses on their banjos. Around them all rise the ghosts -- controlled, compelled, summoned, and banished by the sound of the lonesome whistle. It blows the devil's note, and screams in frequencies only the very gifted -- or the dead -- can hear.

"I went along the road with two friends -- the sun set. Suddenly the sky became blood -- and I felt the breath of sadness, a tearing pain beneath my heart. I stopped -- leaned against the fence -- deathly tired. Clouds dripped reeking blood over the black fjord and city. My friends went on but I just stood trembling with an open wound in my breast, trembling with anxiety -- and I heard the huge endless scream pass through nature."
-- Edvard Munch, undated private journal

In *The Gay Science* of 1882, Nietszche announced that God was dead, but noted that "this prodigious event is still on its way, still wandering; it has not yet reached the ears of men." It reached the eyes of men when Munch's painting debuted in Berlin in 1893, a mute John the Baptist for the Superman. Nietzsche had predicted that the Superman was the bridge to the future -- Munch painted that bridge, and the endless scream that Zarathustra merely spoke. In the elections of July 1893, a candidate few knew (they said he came from Bremen, or from Dresden) entered the Reichstag. His speeches were powerful, although afterward none could recall just what they had heard. Men and women fell to his charisma, committees and chancellors to his ruthlessness. He was unstoppable, this "Adam Schreck," and he soon bent even the Kaiser to his will. By 1913, he had become Chancellor, and readied Germany for total, ruthless war. He was the Superman, beyond Good and Evil, the unborn Alraune, the [Mandrake]() -- and the world waits unknowing for his scream.

The nature of this game depends on when the GM sets it. In the 1890s, it can still be an **Unknown Armies** sort of game, of artistic conspiracies and political machinations -- Munch, perhaps, and his cabal of absinthe-soaked bohemian alchemists against Schreck the New Avatar and his network of spider-vampire agents. (Perhaps Munch's romantic rival Stanislaw Prybyszewski and his Satanic circle make a third faction -- or perhaps Prybyszewski realizes that if God is dead, Satan is likewise dust.) In the prewar era, perhaps it becomes a sort of **GURPS Espionage** or **Black Ops** sort of thing. The Diogenes Club and "M" have to send superspies of their own into Germany to battle the Superman and his minions -- nosferatu, word-born golems, howling werwolves, demonic musicians (Erich Zann?), shrieking monstrosities, and vegetable warriors. Once Schreck takes control in 1913, he launches the Great War, filling Europe with screams and deafening noise, and the campaign becomes more of a dark-horror **GURPS Powers** game. Now fallen angels, dark knights, wonder women, and super-soldiers must battle the spawn of the Man of Terror, and withstand his army's uncanny acoustic weapons, across a plain of sound.

"Ladies and gentlemen. Please do not panic, but scream for your lives! The tingler is loose in this theater, and if you don't scream it may kill you. Scream, scream! Keep screaming, scream for your life!"
-- Dr. Chapin's voiceover narration, *The Tingler* (William Castle, 1959)

You can't believe everything you hear. In fact, before 1877, you couldn't believe anything you heard, because you didn't hear anything. Before Thomas Edison's invention, the Silent Ones could move about between the tones. But recorded sound was different. Sound without mind was immune to the Hushed Lords' spinal magicks and the Words Inaudible. As the phonograph became less than a toy, the Silent Ones lost their hold on their human cattle -- then came radio, and talking pictures. And the humans slithered between their erstwhile masters' talons at an appalling rate. The quiet monsters have prayed to the Noiseless Gods, and infiltrated the dream palaces, and suborned the human leaders in love more with their voices than with freedom. This is their last chance, to replace the ever-noisier squawk of rock and roll, the roar of drag-racing, and the crash-bang of B-pictures, with bland sounds and lullabies. So make some noise, and fight back.

This **GURPS Atomic Horror** campaign frame is frankly surreal, perhaps more suited to **Over the Edge** or similarly bent games. Set in a cinematic 1950s in which the squares want you to "keep it down" and the hepcats want to pump it up, it can be as scary or as silly as you like it. The Silent Ones might be the Gentlemen from *Buffy* or simply silent-movie golems and ghosts -- they may move with the impossible stillness of dream horrors or merely stalk their prey like tigers. Are there tinglers planted in grownups' spines that keep them from really hearing their kids? Are there white-noise tripods floating across Los Angeles or London, washing out the sound of the future? Do the appliances in Mom's amazing new all-electric kitchen hum to each other at night? As long as the central contrast is there, it's your rhythm to riff on.

The Big Reveal

When you think about it, one of the biggest moments of many horror or suspense stories is the Big Reveal -- the point when the clues fall into place and what's really going on is fully revealed. Sure, this is common in other types of tales, but it often takes more importance in the horror/suspense genre, or (for non-horror ongoing campaigns) in horror/suspense tales set elsewhere.

(Sidebar: One problem with an ongoing roleplaying campaign -- which is similar to a trouble faced by ongoing suspenseful television shows -- is that there's a bit more dissonance from the *characters* than there are in horror movies. After all, if the party has business cards that bills the group as Explorers of the Unknown, then there's generally got to be a moment where the unknown becomes known if they're going to collect those fat fees. The mere act that the characters are expecting -- and are, indeed, anticipatory -- of such a moment may help undercut the tension that the gaming group desires. Sure, there's fair bit of playing along that comes with such a campaign -- Why is Agent Mulder going into the underground labyrinth alone again after what happened the last 16 times? -- it's still a problem. Sadly, as you may have noted by the residence of this paragraph in a giant parenthetical aside, it's also a problem that's beyond the scope of this column . . . maybe next Halloween.)

Unfortunately, it's hard to gage how, exactly, to do this. After all, if it's too arbitrary, then the players will go, "What the heck?!" -- "As you're riding in the cab, the driver turns around and reveals himself to be . . . a *vampire!*" If it's too clichéd, then the players will be expecting it. ("<sigh> Okay; we open the spooky-looking final door at the end of the spooky-looking corridor. Gee, could there *possibly* be anything spooky on the other side?") If the revelations are too obvious, then it's either a matter of the players waiting for the shoe to drop. ("Right; there's no garlic or mirrors in the house . . . bring on the vampire.") If the revelations are too cryptic, then -- again -- the players are left to go, "Huh?"

Fortunately, I'm more than willing to share an endless bounty of advice for those willing to keep their hand hovering comfortably over the mouse.

White noise is all-important. This one is mentioned first because so many of the other tips stem from it. Basically, there should be a constant (though not overpowering) supply of "white noise" -- additional information that isn't important to the adventure. This is because the only way to sneak in information that *is* important is for the players to not know immediately that it's so. For example, if the only time you actually speak "in voice" for an NPC is when he turns out to be important, then the fact that you're speaking in voice for the seemingly mundane apartment doorman is a extreme meta-clue to the players that this person is more important than seems obvious. Likewise if you've never described the odor of anything in a scene before until you mention the "scent of bitter almonds," then you're not going to surprise anyone when they learn that the mayor was killed with cyanide gas.

The trick is finding the right balance of white noise to generate. If you'll be injecting an important scent clue at some point in the game, you don't want to describe *every* scent the PCs encounter; the game will take six times as long. But going into more detail than normal about sensory information -- say, one or two non-visual detail every scene -- should give a fair bit of "smokescreen" to the players.

Clues, not sledgehammers. Some pieces of information are more obviously clues than others. For example, mentioning a lack of garlic in a kitchen (presuming it's not a red herring) is a yawner of a clue if it reveals that the chef is a vampire; the "no garlic equals vampire" tidbit is a hoary old cliché. On the other hand, off-handedly mentioning that a vampire chef's offerings are pretty bland and flavorless is quite possibly a *good* clue if it's supposed to lead to the fact that he doesn't use garlic (or other seasonings).

As a sub-tip in the "clues, not sledgehammers" heading, try to think tangentially about the *effects* of the clue you wish to portray. In the previous example, this led to the "bland food = no garlic = vampire" chain. As another example, let's say that you ultimately want to reveal that a major NPC is a time traveler from the future. Now, if they find a newspaper from next Sunday in his room, then they're probably going to figure it out pretty quickly. But if they discover that he's an avid buyer of lottery tickets and gambler on sporting events (and is otherwise a pragmatic and logical person), then the pieces are laid for the future revelation; if the PCs happen to think of making a note of what

events he's betting on, and then follow up by determining the winners, then they'll make their own revelatory moment.

As a final note, one reason for this technique is that it's always easier to give more clues later (if you want the players to figure out What's Going On themselves) than it is to reel back the line and try to make it suspenseful again.

Don't reveal that there's a revelation. The mere act of expecting a revelation is often enough to "spoil" the effect; for example, knowing that there was a twist ending in *The Sixth Sense* enabled me to figure out the twist in about the first 10 minutes. If I hadn't known there was a twist, there's a good chance I would have been surprised. Although sometimes it's difficult or impossible not to create some expectation of a revelation (if someone is mysteriously murdered in a sealed room, then there's the expectation that there will be a solution), many times it is possible to sidestep the issue. For example, if there's a supernatural reason behind a murder, there doesn't need to be any direct clue to the otherworldly nature of the crime, and the PCs may be able to investigate as if it were a "mundane" crime.

Don't be afraid to "lie." In other words, you can mention how something is perceived to be as a "fact" without qualifier. Many GMs will make sure they don't say anything that can be interpreted as a lie, since they fear the players will accuse them of "lying" when the truth is ultimately revealed. However, I personally believe that it is the GM's job to present reality as it appears to the characters. In other words, if the star-lit sky is actually a holographic projection, then they might say something like, "The sky seems to be lit solely by stars." In this case, of course, that "seems" stands out like a sore thumb. No, I think it's better to present the impression that the players of the scene are trying to give, unless the players have reason (active or passive) to know otherwise.

Let's look at an example. Let's say that the heroes are the guests of a mysterious gentlemen who will be ultimately revealed to be a clockwork automaton. Now, during the course of the evening the PCs have occasion to share wine with the stranger. Now, the GM might be tempted to say, "During the festivities you notice that your host never drinks the wine." But that's too much of a red flag. No, I'd modify the hosts actions slightly and go with something like, "During the festivities, the host takes tiny sips of his wine that contrasts with his large frame as he tells you a bit about his estate . . ." After all, the host *could* raise the glass to his lips to continue the charade, even if he can't drink. And the difference between "tiny sips" and "isn't actually drinking" is slight if the heroes don't know to look for it.

Now, this doesn't mean that the PCs should be denied information if there's a chance they could passively detect it, nor should they be thwarted if they try to investigate a possible clue actively. For example, if one of the heroes is a culture or wine expert and would be constantly assessing others' mannerisms while drinking, then he might be entitled to a "passive" observation check to notice that something is amiss. Likewise if another PC believes that there's something odd about the guy and announces that he's examining him closely, then he should definitely get a roll of some sort. But otherwise it's important to lay the seeds for the big revelation early and (somewhat) often, and hiding them behind the language of what the characters presume to perceive is a good technique.

If possible, use breadcrumbs. When leading to a big revelation, it's important to try to lay the trail of breadcrumbs down for the players to follow (if they wish); in most cases, the big reveal happens organically, letting the players figure it out themselves. For example, it would be an interesting revelation if it turned out that the trusted town doctor actually possessed a torture chamber where he carried out unspeakable experiments on his victims; having the PCs stumble across that chamber would be one way of handling the "big reveal." But it can be somehow unsatisfying; the players may not feel like they played any active sort of role in the uncovering. No, what if -- instead -- the heroes learn that the doctor claims to be compassionate and trustworthy sort, even going to far as to provide treatment for patients who can't afford it. The doctor mentions something about one of the pro bono patients passing away, but if the investigators look into the matter with the police they learn the victim is only presumed "missing." (Why does the doctor believe she passed away?) So now the players can follow the breadcrumbs: Do they confront the doctor, try to break into his practice (and discover the chamber), or something else?

Be dispassionate as you can. There's a tendency in some stories to be over the top in presentation of information. This is usually when the GM is excited about getting to reveal something interesting: "You open the closet door and discover . . . the dead body of the *lumberjack!*" And the GM gets this crazy look in his eyes as he says it. Sure, it might be a bit shocking, but might it be made more effective?

Player: "I open the closet door."

GM: "Okay. It's dark in there, but you can make out the muted reflection of a used axe handle."
Player: "Hmm . . . anything unusual about it?"
GM: "Do you try to pick it up?"
Player (hesitantly): " . . . sure."
GM: "Okay; it seems to be stuck."
Player: "I . . . pull harder?"
GM: "Something dislodges from the back of the closet, and there seems to be a large unmoving arm still gripping the axe. Wetness that you presume is blood is trickling lightly from above the part of the arm you can see down toward the hand and axe handle."
Player: " . . . Fudge."

Now (depending on your players) *this* is a big reveal! The dispassionate nature of the revelation forces the players to "connect the dots" themselves, making them an active participant in their own revelation. Likewise the players should feel like they were in complete control of their destiny the whole time; they could have left the closet alone at any point in the scene.

Of course, if the GM decides to follow a dispassionate course, he should be prepared for the players to decide against following the breadcrumbs; that's their right.

There is no good time for the reveal. *The Twilight Zone* has trained us that the twist comes in the last few minutes, but this doesn't need to be the case. The twists in *The Crying Game* and *The Matrix* (not the same twist) come surprisingly early in those movies. If the players get used to the final scene containing the big reveal, then it won't be a surprise anymore when one happens then. Mix it up; consider *starting* the adventure with the twist. ("Okay; as you all reflect on your last mission -- which you, as players, are about to experience -- your first thought of this strange tale is that it remains the only case you have investigated to date where you learned that you had died. But let's start at the beginning . . .")

Rule #0: There are no set-in-stone rules. Like the zeroth Law of Robotics (which always struck me as really darn fishy), this is the ultimate rule for suspense. The reason is simple: If there are must-follow rules, then the players will work out that there are such rules, and be prepared; if the players figure out that, whenever the GM gets especially dispassionate, there's about to be a big revelation, then they'll learn to keep an eye out for those subtle clues. But if the GM mixes it up every so often, then they won't be able to predict when any revelation is coming, setting the stage for all the more effective (and shocking) events:

Player: "Okay; I open the closet door."
GM (jumping up, possibly startling players): "WHAM! A body falls on you; the axe he was holding releases. Make a dodge roll."

Watch the players scramble.

For many GMs (myself included), the big reveal -- whether uncovered by the players or detailed by the GM -- is one of the high points of many adventures. With a bit of forethought, you can make these moments scarily memorable . . . in a *good* way.

Sydenham

by Paul Drye

Broadly classified as a Hell parallel, Leviathan is much more livable than most of its type. While it's true that the human race has fallen greatly since the Atlantean invasion began 15 years ago, it's holding its own in the highest and driest parts of the world. Extinction is a possibility, but there's every chance this is just a new age of more-restricted human civilization. In large parts of the world, though, humans are thin on the ground, invariably captured slaves being worked to death or forcibly bred with the quasi-human Atlantean (a process that leads to extinction in one generation, since offspring are always Atlanteans themselves). There are very few isolated pockets of humanity.

Last month, the Survey Division stumbled across Sydenham, a small village in New Hampshire which is the only human settlements in New England to avoid conquest. The agents are assigned to make contact and find out if there's anything particularly unusual about the town that has let it survive. Depending on what they find (if anything), the hope is that the information can be passed on to other human remnants throughout the timeline.

It is currently October 1812 on Leviathan. This Earth is on Q6 and is mana-normal. For humans, magic is an esoteric art, but Atlantean technology is based on it, and some areas of the world (particularly the remnant Chinese empire in Thibet) are starting to use it after seeing the Atlanteans in action.

History

Located high in the White Mountains of New Hampshire, Sydenham was once a perfectly typical New England hamlet. On most timelines it was granted to Glyn Henry as a farm, and then gradually grew to about 50 citizens before declining and turning into a ghost town at the turn of the 20th century.

Until 1797, Leviathan's Sydenham was also a small, sleepy town of no interest whatsoever. Two generations of four farming families lived there, with the Henrys being the first and the other three clearing land and setting up not long after. It was mostly isolated from the world, off the dirt road through the White Mountains between the somewhat larger hamlets of Warren and Lincoln. The nearest town of notable size was the county seat of Haverhill, which was a day's journey away.

Since then, however, it has gained the dubious distinction of being one of the few free human settlements in the northern Appalachian Mountains. Hiding from the onslaught of the Atlanteans has worked for the residents for fifteen years, but their existence is precarious.

On Leviathan, the Atlantean onslaught -- though slowed a little by the winter -- swept over in more-inhabited parts of New Hampshire in the early spring of 1798. Sydenham had heard of the distant trouble, but the day before it reached them an observer from Revolutionary France, Dr. Geoffroy St.-Hilaire, arrived in the town in full flight from the latest

attacks. One contributing factor to Sydenham's continuing existence may have been his timely warning, along with his knowledge of the invaders.

Another possibility is that Sydenham had a large measure of luck. The night before the invaders would have reached the town, a timely rainstorm flooded nearby Jackman Brook and erased the turnoff to the settlement on the Lincoln-Warren Road. To the untutored, Atlantean eye the route seemed to run unbroken between the two larger towns, and the brook was too small to swim along, so Sydenham was missed. Given a short respite, the village folk avoided contact with the outside world, and explored only tentatively over the next few days and weeks as the rest of the area was depopulated.

The Atlanteans have bracketed Sydenham with two major underwater settlements. Lake Champlain is 60 miles to the west, while the smaller Lake Winnipesaukee is 40 miles to the southeast. This may also have been a factor in Sydenham's survival, as the former lake is reached from the north via the St. Lawrence, while the other drains south through Massachusetts. Dr. St.-Hilaire often expresses the opinion that two separate armies of Atlanteans are involved, and that Sydenham has fallen between the cracks.

The Town

Sydenham sits at the far end of a mile-long coomb cut into the side of Mt. Moosilauke. This U-shaped valley is another possible reason for the town's long-term survival: the inhabited area is 200 feet below the top of the sheer cliffs on either side, and tell-tale chimney smoke has time to disperse before it rises high enough to be seen.

A stream runs into the valley from high up the side of its far end, running the length of the rounded floor before exiting to the east and joining Jackman Brook. The Henry family farm is at the spot where the water descends in the west, and Glyn set up an undershot water wheel to run a small flour mill.

There are three other families living in the town: the Wheelrights, the Morrises, and the Talbots. A fourth family, the Alfords, settled in town a few years before the Atlantean invasions but their farmhouse is uninhabited and falling down in 1812, making it a likely place to put any visitors.

The other major building in Sydenham is the white Congregationalist church. Optimistically built to seat 40, it is half-empty even when the whole village is there on Sundays. Sydenham has not had a minister since the last one died in 1799, though, and Glyn Henry has taken over the position by common consent.

The Atlanteans

The invaders, properly named the A'Nthleioi, really are former humans, 12,000 years old as a race. When Atlantis fell on Leviathan, as it did on some other timelines, a dubiously fortunate select were offered new life by a coelenterate god of the oceanic abyss. In return, it asked only for their eternal worship. In the millennia since then, the aquatic Atlanteans multiplied and spread throughout all the Earth's deep oceans, particularly in the colder temperate waters away from the tropics.

By now there is in excess of a billion of them, certainly enough to sustain a war against the dry world above the water line. So far as anyone can tell, their sole purpose is to expand their rule onto the quarter of the planet they didn't already control. Dry land is their last frontier, and they're going to roll over humanity like European settlers rolled over the Americas and Australia.

Atlanteans have TL9 equipment, but strictly speaking it's TL1+8. Use TL9 weapons and vehicles, but repackage them using sonic and "nacreous radiation" energy sources and radically unusual ceramic and metallic materials. See IW165 for an Atlantean character template.

A'Nthleioi rarely learn other languages than their own, which is very distantly related to Proto-Greek. This makes it difficult to communicate with them unless specifically trained in their speech or writing. Consider bullets instead.

The Secret

None of the other reasons mentioned above are responsible for saving Sydenham. Rather, Mt. Moosilauke is a center of old power, as discovered by Glyn Henry. When he was growing up he heard legends about the hills of Wales, and after emigrating to America came to find that they applied to the White Mountains as well. All this would have been academic if he didn't come to fear for his life after the Atlantean invasion. Acting on what little he knew, he kidnapped and sacrificed an itinerant laborer passing through Sydenham in the wake of the invasion.

The mountain heard. Its power is less than the Atlanteans' as a whole, but within a mile or two of its peak, it can befuddle the Atlanteans' minds and cause them to move along. Unfortunately, its inclination to protect Sydenham wanes over time, and Henry has to top it up with another sacrifice approximately once a year.

At first, Henry was alone in his action, but there was no easy prey from outside Sydenham the second year. He settled on young Patience Alford instead, a native of the town. Unlike the original victim, the townsfolk weren't willing to let this disappearance go, and eventually found her body on a natural stone altar up the cliff overlooking the north of Sydenham. Henry revealed his secret to the others, trusting to his charisma and their fear to see him through. It worked, though Patience's parents were reluctant to go along with the new ways and ended up dead themselves over the next few years. A few of the Sydenhamers (mostly the younger ones, as well as Dr. St.-Hilaire) don't know what's going on. The rest will work to frustrate the Infinity agents' ambitions. If the opportunity presents itself, they may even try to use one of the out-timers as the next sacrifice, and it would be a major coup if the entire group could be imprisoned, for doling out one per year each autumn over the next several years.

Clues

So how to arrive at the secret above? Investigators can discover any of the following facts that are relevant to the story:

- The church has a cellar beneath it, which can be locked from the outside. Sifting the dirt floor of the cellar will turn up food refuse and other junk that suggests someone has been down here for a while. The cellar has been used a few times to store an out-of-towner captured for use as a sacrifice at a later date.
- The Alford house has been abandoned for several years, yet as children are reaching adulthood and marrying they're building their own homes from scratch. The people of Sydenham stay away from anything to do with Alfords, so they won't be reminded that they were the first ones on the chopping block.
- The adventurers will be candidates for sacrifice themselves. To that end, the townsfolk will try to sabotage their conveyor so their prey can't escape. The tempting prospect of not having to murder one of their own will be offset by the suspicions the sabotage should raise in aware players.
- A study of the town's small graveyard will show that one person died on average every three years prior to the Atlantean invasion, mostly young children. Since then, the rate is more like one in six, and many fewer children are listed. Yet there are only eight children in the whole town, out of a population of 22. This is the grim result of these children being the victims of the town's sacrifices, and their bodies being buried on the ridge north of town.
- North of town is the ad hoc burial ground for the dead. Most are children, and show knife marks on their ribcages. Three are adults, and one has clearly suffered a gunshot-induced fracture to the left tibia. It did not heal before he died, but would not have been fatal itself. These are the mortal remains of one outsider who was shot to prevent escape, and sacrificed shortly after.

As well as the other, more mundane explanations mentioned before that point in the wrong direction, there is one other fact that seems to point to a solution, but does not.

- If plausibly accused of some deviltry, Dr. St.-Hilaire will admit to owning a pre-human idol, sent to him by a colleague who went with Napoleon to Egypt. It is the doctor's belief that the idol possesses some power over the A'Nthleioi that has protected Sydenham. He has hidden its existence from the other citizens of the town for fear

of their Christian disapproval (he himself is a deist). However, while it is an actual artifact, it is not magical and not responsible for Sydenham's continued existence.

Consequences

Once the sacrifices are discovered, there is the question of what to do about the situation. Certainly the team is going to want to save themselves, but once out of immediate danger, what then? The Sydenhamers don't have a lot of choice about how to save themselves; either they sacrifice one person a year, or *everyone* dies.

Players may be inclined to sympathy, though this reaction is probably going to be tempered by the townspeople trying to kill their characters. Unfortunately, the Infinity Corps is not going to look kindly on an evacuation, as their general policy is to not interfere with the many billions of people in dire straits throughout the continuum unless it's because of one of their own mistakes.

If they have a programmable conveyor, one possibility is that the team could evacuate Sydenham's people themselves. They're going to have to keep the personal possessions to a minimum, so ensuring their survival at the other end is going to take some pre-planning. The townsfolk are probably going to have to be convinced too.

Unfortunately, there aren't very many Q6 destinations where the Sydenhamers could fit into New Hampshire. Most are historical echoes, and so off-limits to unsanctioned travel unless the team wants to suffer extreme displeasure from their bosses after they are found out. Britannica-6 is one of the few remaining possibilities; Armada-2 might work as there are some Puritan descendants in the enlarged, independent Nouvelle-France and Dr. St-Hilaire speaks French natively.

It's more likely that the people of Sydenham will have to stay where they are. The players are going to have to decide if they'll let the sacrifices continue after they go, or if they are going to stop them (perhaps by killing, driving away, or annoying into inaction the source of the town's protection), and so consign Sydenham to discovery and death.

The Citizens

Glyn Henry: The original inhabitant of what was to become Sydenham emigrated to what was then the American Colonies in 1761. Seventeen years old at the time, he managed to acquire a land grant in New Hampshire a few years later, which he turned into a farm named Sydenham after his boyhood home in Kent where his Welsh father had been a forester.

For 30 years after that he had a good life, poor in money but well-fed and with a good family and neighbors. He enjoyed his status as first citizen of his small community. When the Atlanteans came, he kept that position and effectively became the de facto leader of a tiny country. His own morale has taken a tremendous beating, though. Still, he will do what he has to do to survive.

Henry's position rests on more than being the first Sydenhamer. When he was a boy, his father told him stories of the strange things he had seen in the Brecon Beacons. Glyn saw echoes of these in the highlands surrounding his new home, and gradually came to understand that there was something mystical going on on Mt. Moosilauke. After 1797, this knowledge became important (as explained above).

He is now 68 years of age, which is a good age for the early 19th century. He suspects and fears that some side effect of the sacrifices is extending his now miserable life. Another possible effect is that his strength does not seem to have diminished since he was young. That aside, he looks rather older than he is: wiry with a bowed back, and with wrinkled, mottled skin. His hair is still thick, but ivory white.

Geoffroy St.-Hilaire: A mere 25 years of age when he was sent from Paris by the French Directory to observer the attacks on the United States, St.-Hilaire was trapped on this side of the Atlantic after France itself was assaulted all along the coast in 1788. When eastern Massachusetts was attacked in force as well, he was pushed north from Boston,

then had to flee from Concord, New Hampshire when it too was taken. Heading northwest into the relative safety of the mountains, he ended up in Sydenham.

Dr. St.-Hilaire is a French man, 40 years of age, with a round face and a drastically receding hairline. What little foliage he has left on his head is black. He is 5'7" tall, and weighs 155 pounds.

His role in Sydenham is to supply adventurers with useful information about the Atlanteans -- he's a highly educated man by the standards of his time, though of a holistic, pseudo-mystical bent -- as well as being a red herring in the investigation into the sparing of the town.

Catherine Talbot: Despite her last name, she is the last of the Alfords. Born not long after the town was cut off from the world, she was taken in at age four by the Talbots when her mother committed suicide after losing the rest of her family to the sacrifices.

Just turned 15, Catherine has long noticed that the other Sydenhamers treated her coolly. In trying to find out why, she stole into the main Henry house and read Glyn Henry's journal, thereby discovering her true origins. A devout young woman, she was already greatly troubled by the three sacrifices she had seen in the company of her foster parents, and the reading the sordid fate of her real parents (and the sibling she never knew she had) has pushed her to the brink of rebellion. Further, she suspects that Henry knows she knows her background, and has chosen her to be this year's victim.

The appearance of the out-timers gives her an opportunity in two possible ways: she may become their ally in saving the town, or she may try to substitute one of them for herself on the altar. Which of these it will be will likely depend on events the Infinity agents start themselves. She will refuse to leave with the adventurers on her own, arguing that that would just mean someone else -- probably one of the few remaining children -- would be used in her stead.

If the team allows the sacrifices to continue, she will likely be murdered.

Catherine is a short (4'11"), white, female teenager, with long brown hair and brown eyes. She is quite skinny (as most people in Sydenham are from lack of variety in their diet), weighing only 90 lbs., and her ears stick prominently out of the sides of her head.

Other Adventures

The town itself is good for one adventure as the Infinity personnel uncover the secret to its survival. However, as a human-controlled spot in an otherwise hostile chunk of the planet, Sydenham makes an excellent place to stage raids against the A'Nthleioi; in other locations, humans pose enough of a threat to the invaders that they're much more on guard.

Before using Sydenham in other stories, though, the GM is going to have to think carefully about whether to place them before or after the discovery of the town's secret. If before, it will could let the players emotionally invest in the people who live there, increasing the impact of the Sydenhamers' actions when revealed. If set after, the need to return to Sydenham for whatever purpose gets interesting moral colors, especially if the team has been ordered to leave the townsfolk alone. If nothing else, the team is piggy-backing on the sacrifice-bought safety the town enjoys, which makes them at least partly culpable.

That said, there are several possibilities for more adventure:

- The Atlanteans use their "nacreous radiation" -- its color is very difficult to describe -- for work that needs large-scale power. Sydenham would make an excellent base for an expedition to Ar'anon'akil, the city under the waves of Lake Champlain. There, they can obtain a sample of the substance at the core of these devices: regular matter mystically exposed to the gaze of the ancient chaotic god at the center of time; After exposure it begins to crumble of its own accord, impossibly radioactive no matter what it was before.
- On most timelines, the central US had a series of strong earthquakes from December 1811 to February 1812. On Leviathan, however, it hasn't stopped, and more quakes are working their way northeast along the course of the Mississippi and Ohio Rivers -- the last was not far from the ruins of Ithaca, New York. There are hints that the A'Nthleioi are somehow responsible for this continuation.

  The agents are given the task to find out what's going on, and Sydenham is a (rather distant) nearest free human settlement to Ithaca. As to ultimate source of the shaking, the site of the original quakes was on top of the Reelfoot Rift, an ancient geologic structure that was flooded 750 million years ago before being buried. Something ancient and slow may have landed to rest there, and now the Atlanteans are prodding it awake and into motion.

  If the GM wants to wrap up a set of stories in Leviathan, consider making the buried force good rather than evil.

The Atlanteans don't want to wake it, they want to kill it -- it's the only thing that could reverse their conquest of the Earth. Enter the adventurers and their curiosity about the quakes . . .

- For a GM looking to use the Atlanteans a little more, consider giving them sporadic, magical gates to other timelines. Rather like Reich-5, they can then be used as occasional villains in order to mix up the adventuring group's adversaries, and one can stick the gates at the bottoms of the deepest oceanic trenches so as to make it nearly impossible for anyone else to use them.

  For real fun, use Reich-5 and the A'Nthleioi simultaneously. Swastikas act on Atlanteans like crosses do to vampires, while Nazis have a horror for racial miscegenation. Fish-men who breed with humans to make more fish-men are problematic from their point of view.

Using Sydenham in Other Settings

Sydenham gets much of its flavor from being the stepchild of Washington Irving and H.P. Lovecraft, but certain core concepts translate well. Most importantly, its theme is to present the adventurers with people who are damned no matter what they do, either sure to die or party to terrible crimes. Worse, on top of the blood, they try to present themselves to the rest of the world as a little slice of pleasant normality otherwise lost to the past. When all is discovered, how should they be treated?

In science fiction games, put Sydenham on the wrong side of the front lines in the "war against inscrutable, murderous aliens" which graces most settings. *GURPS Traveller* GMs can use a world in the Chronor subsector of the Spinward Marches, originally colonized by Imperials but left in Zhodani hands after the Frontier Wars; games set in later time periods can use Virus or the Great Dominate as the civilization-threatening villains. In all cases, though, the specific pact with the devil made by the transformed Sydenhamers will depend very much on the game.

Historical, pulp, and modern-day games can all substitute the Atlanteans with any human antagonist powerful enough to commit at-least-regional massacres. Unfortunately, there are too many of these in world history to list, but the usual suspects like Nazis and Mongols are joined by more obscure possibilities like anti-Cathar Crusaders or Interahamwe.

Sydenham can be used most easily in fantasy games. It's just this side of being a fantasy setting as is, with a relatively low-tech town being threatened by a fantastic, magical race. Swap in kuo-toa or whatnot for Atlanteans, drop the level of technology back below gunpowder, and all is ready to go.

Icosahedron Adventures

Taking Trophies

by Owen K.C. Stephens

There's a broad class of fantasy art that shows heroic characters covered in trophies, tattoos, special seals, braids, and war paint. Characters from settings that support this visual style tend to be grim and gritty, with attitudes that can depress a jester and visages that frighten grown men. Often these marks are described as bearing great spiritual or cultural significance, showing the cunning, skill, or ferocity of those that bare them. Such characters are much rarer in most **d20 System** games, because there's no reason to bother with such ornate decoration.

There is, of course, no reason players can't decide to be grimly adorned or not as the dictates of their vision for their character demand. But let's face it, most **d20 System** games are driven in part by game mechanics so a GM who wants to encourage this kind of behavior (for a given culture or the whole campaign) would be well rewarded for given game-mechanical benefits for characters doing so. Also, it's just cool to be wearing a necklace made of the teeth of a winter wolf not just because you like it, but because your spiritual connection to it makes you resistant to cold damage.

Thus this article presents trophy feats: special feats that grant you bonuses only after you've overcome the right kind of foe and even then only when you're marked with the proper trophy. In addition to the feats themselves, an optional rule for gaining them without using a trophy slot is given as well, at the end of the article.

Trophy Feats: The core ability of trophy feats is to gain power from fallen foes by making a mark upon yourself. To take a trophy feat, you must have participated equally in the defeat of a foe under circumstances that meets the prerequisite enemy listed for each trophy feat you select. (While the GM is final arbiter of what counts as equal participation, normally if you deal at least 25% of the total damage done to it, or are the target of 25% of its efforts to harm others during the fight, you are considered an equal participant.) A single character may not use the same foe can not be used to qualify for more than one trophy feat, though several equal participants could all use the same foe for each of them to qualify for a trophy feat.

You must commemorate this victory with a major mark on your body, such as a large tattoo or major scarification pattern, or a token you make a visible and major part of your equipment. A token must either be made of a major physical element taken from a foe's corpse (a skull, wings, claws, or the like) or be custom-made ornamentation costing at least 500 gp and requiring a minimum DC 20 Craft check to construct. If the mark or token is ever removed or taken away, the trophy feat does not function until you regain/restore the missing mark or element.

You need not take a trophy feat immediately upon gaining a level that grants is. You can wait until you defeat an appropriate foe, or until you can arrange for an appropriate mark. However, if you have already defeated a qualified foe and marked yourself, you can take a trophy feat immediately upon gaining a new level granting it.

Select your trophy feats from those listed below.

Better Than You Have Tried

Prerequisite Enemy: A creature with a CR at least 2 above your level of the selected type.

Benefit: Select one type of creature. You gain a dodge bonus to AC against all attacks made by creatures of the selected type. This bonus is equal to the number of trophy feats you have taken.

But You *Have* Heard of Me

Prerequisite Enemy: A creature with a CR at least 2 above your level killed in the presence of at least 1,000 creatures with Intelligence scores of 3 or higher.

Benefit: You have a reputation, which unnerves creatures that deal with you. You gain a bonus to all Bluff, Diplomacy, and Intimidate checks made against creatures with an Intelligence score of 3 or higher. This bonus is equal to the number of trophy feats you have taken.

Don't Underestimate Me

Prerequisite Enemy: A creature with a CR at least 4 above your level that had DR or SR.

Benefit: You ignore a certain amount of DR, and gain a bonus to caster level checks made to overcome SR. The amount of DR you ignore and bonus to caster level checks is equal to the number of trophy feats you have taken. Thus a character that has this and a total of 2 other trophy feats striking a creature with DR 5/\u2013 ignores 3 points of the DR, and only has 2 points taken off weapon attacks that strike that foe.

Glory is Forever

Prerequisite Enemy: You must have delivered the death-blow to a foe that dropped you to negative hit points in the same fight.

Benefit: The next time you are killed by an enemy (not a trap, rockfall, or natural disaster), you are instead dropped to 1 hp and gain a terrible scar. Once this trophy feat is used, it does not function again (though it still counts as a trophy feat for determining the effects of other trophy feats). You may take this trophy feat more than once, each time granting you one additional use of its benefit.

I Don't Think So

Prerequisite Enemy: A spellcaster with a CR at least one higher than your level.

Benefit: You can delay the harmful effect of non-damaging magical effects, such as spells, spell-like abilities, and supernatural abilities. This includes any spell with a detrimental effect that does not deal hit point or ability score damage. You delay the effect a number of rounds equal to the number of trophy feats you have. During that delay you suffer none of the negative consequences of the magic effect, but can be subject to an effect that negates it. For example, a 3 rd level barbarian with this trophy feat could delay the sleeping effect of a *sleep* spell for 1 round. If during that round the barbarian was the subject of an *awaken spell*, it would negate the delayed *sleep* effect.

I Saw That Coming

Prerequisite Enemy: A creature that dealt damage to you higher than double your level during a surprise round you didn't act in.

Benefit: You gain a bonus to initiative checks, Listen and Spot checks made to act in the surprise round of a combat, and to reflex saves against traps and AC against attacks made by traps. The bonus is equal to the number of trophy feats you have.

It Could Be Worse

Prerequisite Enemy: Ten or more creatures in a single fight, from a force that outnumbered you and your allies.

Benefit: You may activate this trophy feat once per day, which requires a move action each round it functions. It lasts a number of rounds equal to the number of trophy feats you have. While it is active, allies within 30 feet of you do not provoke attacks of opportunity. This ability does not apply to you. You must be conscious, not prone, suffering no fear

effect, and able to be heard for this ability to function.

I've Killed Your Kind

Prerequisite Enemy: A creature with a CR at least 2 above your level of the selected type.

Benefit: You may select a favored enemy (as the ranger ability). You total bonus to skills and weapon damage against your favored enemy is equal to the number of trophy feats you have.

Let Me Show You a Trick

Prerequisite Enemy: A creature of the same type (and subtype if any) as you, that contested you in an opposed d20 check of some kind.

Benefit: Any time you make an opposed skill check (such as Hide vs Spot or Bluff vs Sense Motive), or an opposed ability score check, attack roll, or grapple check, you gain a bonus equal to the number of trophy feats you have.

Nice Try

Prerequisite Enemy: A creature with a CR at least 2 above your level that successfully used the chosen special attack on you.

Benefit: Choose one of the following special attacks: bull rush, disarm, feint, grapple, overrun, trip, or sunder. When someone successfully uses the chosen maneuver on you, you have a 50% chance of negating it. If your negation succeeds, you are restricted to a partial action on your next move (having used some movement to negate the special attack).

You may take this trophy feat more than once. Normally, you must select a different special attack each time. If you defeat a second creature using the same special attack you may take this a second time, increasing your negation chance to 90%.

Scars Don't Hurt

Prerequisite Enemy: A creature that dealt damage to you higher than double your level with an attack of the selected type.

Benefit: Choose one energy type, or Force effects or un-typed magic damage. You gain energy resistance against that type. The resistance is equal to 5 points per trophy feat you have taken.

That the Best You Can Do?

Prerequisite Enemy: A creature that dealt 50 or more points of damage to you in a single attack.

Benefit: Any time you would die as a result of an effect other than being taken to -10 or fewer hit points (such as failing a saving throw against massive damage, or being subject to a power word: kill when below the hit point limit), you may make a Fortitude or Will save (your choice) to avoid death. You gain a bonus to this check equal to the number of trophy feats you have.

You Don't Impress Me

Prerequisite Enemy: A creature with a CR at least 2 above your level that had a fear effect.

Benefit: You take reduced effects from fear and despair effects. If you have one or two total trophy feats fear effects

can't make you worse than shaken, and you never take more than a -2 penalty from despair. If you have three or four trophy feats, you are immune to fear and despair. If you have five or more trophy feats, allies within 60 feet of you are never more than shaken by fear, or take more than a -2 penalty from despair.

Alternate Methods of Gaining Trophy Feats

It is possible to gain a trophy feat without spending an available feat slot. To do so, a character must first qualify to take the feat (meeting its prerequisite enemy). Then the character must take part in a day-long ceremony. The ceremony must be specially designed for this purpose, which requires a DC 20 Knowledge (religion) check, and it consumes special herbs and incenses with a total cost of 5,000 gp. The ceremony takes one day, and requires a minimum of 5 people to perform in addition to the character gaining the feat.

At the conclusion of this ceremony, the character is given the trophy (either a crafted item or special body marking, as defined in Trophy Feats, above). The character sacrifices any one magic item slot, preventing him from wearing magic items that use that slot, and gains the desired trophy feat. If the character ever regains access to magic items that use the sacrificed slot, the bonus trophy feat is lost.

For example, Tarnak the Shadow Killer has slain a creature with a CR 2 above his own that successfully disarmed him, so he qualifies to take the Nice Try trophy feat against disarming. He gathers the priests and material he needs, and has a ceremony performed that culminates in a tattoo of runes of steadfastness being placed on both his hands. He sacrifices the torso magic item slot, preventing him from ever using a magic shirt, vest, or vestment. He now has the Nice Try feat as a bonus feat.

Mjolnir, the Hammer of Thor

for *GURPS*

by James L. Cambias

The greatest treasure of the Norse gods, Mjolnir is the Hammer of Thor. In legend, it is the thunderbolt, smashing whatever Thor throws it at, and enabling the Aesir to keep the giants at bay. It had other powers, as well: When Thor feasted on the meat of his goats, he could restore them to life by passing his hammer over the bones and skin. Norse religious ceremonies used the sign of the hammer as a blessing, and many believers wore silver hammer amulets for protection. Full-size bronze hammers were kept in temples to Thor.

According to Norse myth, the Hammer was made for Thor by the dwarfs as part of a wager made by the trickster-god Loki, who bet his head that the dwarfs could not complete three great treasures in a limited time. The Hammer was the last and greatest of the three, and Loki, trying to keep the dwarfs from winning the bet, took the form of a fly and stung them at their work. As a result, the handle of Mjolnir was short. Nevertheless, all agreed that the dwarfs had won the bet, and Loki only escaped beheading by pointing out that the terms of the agreement only mentioned his *head* -- the dwarfs did not have the right to harm his *neck* and so could not behead him. So they contented themselves with sewing up his lips.

The connection of axes and hammers with thunder and lightning is an old and mysterious one. The Minoans used the double-headed axe, or *labrys* as a thunder symbol, and were so fond of the image that they used it all through the vast and hard-to-navigate palace at Knossos -- giving it the name *labyrinth* as a result.

Paranormal pack rat Charles Fort describes numerous instances of "thunderstones," which were axehead-shaped stones found at the site of lightning strikes. He cited finds of thunderstones in China, Africa, Jamaica, France, and Java, among others. There are reports going back to the 15th century. In all cases the stones were polished wedge shapes, very different from the starburst or braided form of "fulgurites," which are made of sand and soil fused by lightning. Nor did they resemble meteorites. Fort suggested the stones might be messages from space to secret societies on Earth -- was Thor really Grey-skinned under that bushy red beard?

Where Thor's hammer is to be found is a mystery. If Thor still exists on some other plane, then his weapon is probably still in his possession. Humans trying to get it will have to take on the mighty thunder god himself on his home territory. Good luck.

But if Thor died or lost his divine powers with the fading of the Norse religion (or if Thor was in fact merely a human hero who only became a god in legend), then the hammer may have been left behind. There were numerous temples of Thor throughout Scandinavia, with a major center at Uppsala in Finland. With the coming of Christianity the pagan temples were torn down or converted to churches, and the bronze hammers of Thor were melted down. Dedicated pagans took their faith westward, first to Ireland, where a large Thor temple stood in Dublin, and then to Iceland. The hammer may be hidden in some Irish monastery or in a barrow in Iceland.

Or it may have been carried to the Vinland settlements in Newfoundland. If the Kensington Rune Stone is to be believed (and it probably shouldn't), Norse explorers may have crossed the Great Lakes, penetrating as far as Minnesota. A group of Wild West cowboys could find a mighty strange old hammer if they go poking in any funny "Indian burial mounds" up in the Dakota Territory.

Whatever and wherever it is, Thor's Hammer is a mighty weapon. It embodies the power of the thunderbolt. It can be used hand-to-hand as a warhammer, or thrown as a thrown mace. Whatever it hits takes an additional 8d of burn damage, with the Surge modifier effect (p. 105). It is magically accurate, giving a +2 bonus to hit its target when thrown. However, the hammer is dangerous to use -- even Thor has to wear iron gloves. The user takes 2d of burn damage each time he picks up the hammer!

The hammer itself is nearly unbreakable. No mundane damage can harm it at all. Even an atomic blast would only burn off the leather wrappings on the handle. It has Magic Resistance at level 20, and is completely unaffected by any magical lightning or electrical-type effect.

Magically, the Hammer is also quite powerful. It gives any sorcerer who can hold it a skill bonus of +10 to cast any lightning-based magic, or to cast any summoning magic directed at gods or beings from Norse mythology. (Note that it doesn't give any bonus to command or bind them, and the first thing any of Thor's kin are likely to say is "Give me that hammer, mortal!")

The Hammer gives a +5 skill bonus for all weather magic (not cumulative with the +10 for lightning spells). It also functions as a 20-point Powerstone. If the GM is using the Hermetic magic modifiers from *GURPS Cabal,* the Hammer resonates powerfully with the decan Isro, giving a +3 modifier for Air spells (instead of the weather bonus). Because of Thor's identification with Jupiter, spells governed by any other decan connected with that planet get a +1 modifier if the Hammer is present.

Since it is the weapon of a god, Mjolnir is a holy object. When it is present, the local Sanctity is automatically "Very High Sanctity" for worshippers of Thor, and "High Sanctity" for devotees of any of the Norse or Teutonic gods (except, of course, Thor's hated kinsman Loki). All evil creatures of Norse myth are terrified of the Hammer and must make a Fright Check upon seeing it. Minor beings (dwarfs, dark elves, etc.) are at a -5 penalty to Will; more powerful ones roll normally. Double or triple the penalty if Thor himself is holding it.

Thor's Hammer weighs 20 pounds. Its head is a foot long and four inches across. The handle is two feet long. It appears to be made of bronze, but is chemically inert and indestructible. In any setting it is beyond price to those who know what it is. A modern museum or collector might value an "ancient Viking ritual object" at a million dollars or more.

There are two obvious adventure types involving Mjolnir: the heroes can either be looking for the Hammer themselves, or dealing with an adversary who has already found it. These two basic concepts can be used in almost any setting, from *GURPS Vikings* onward in history. They are especially apt for *Cliffhangers* or *Weird War II* scenarios in which the Nazis are trying to get the Hammer or the Allies are trying to get it away from them. As Marvel Comics has demonstrated, Thor's Hammer fits perfectly into the superheroic idiom, though GMs should make it clear to their players that this one *won't* turn you into a blonde hunk who talks like Ivanhoe.

Thematically, the Hammer can also be used to examine the temptations of power. Owning the Hammer makes a mortal nearly a god. What will that do to someone? What are the PCs willing to do in order to get and keep Mjolnir themselves? With its great power at their command, what will they do? This sort of scenario might fit better into a *GURPS Cabal* or *Illuminati* campaign.

Alternate Hammers

As described, Mjolnir is a magic item, chiefly of use to those with the ability to cast spells using the *GURPS Magic* system. But there are some other possibilities.

Gamemasters can throw their players a curve ball by assuming the "dwarfs" in the legend are actually the subterranean Deros described by Richard Shaver (see *GURPS Warehouse 23* for more on deros), or the alien Greys. In that case, the Hammer *isn't* a magical item, but instead a powerful technological device. In one Poul Anderson short story Mjolnir is simply a time-traveler's .45 automatic. A traveler from a more distant future (or a more advanced alternate world) might carry an electrolaser other energy gun.

To throw a different sort of curve ball, perhaps the Hammer isn't really a weapon at all. Some ancient Norsemen found an alien artifact -- a cold fusion power cell, or a tachyon communicator -- which just happened to be hammer-shaped, and mistook it for the weapon of their thunder god. That still means Mjolnir is fantastically valuable, but reduces the danger that neo-nazi cultists can use it to summon a vengeful god. Of course, neo-nazi cultists may think otherwise,

and can still cause problems for archaeologists looking for the thing.

Appendix Z

Elemental Side Effects in *d20 System*

by Michael Tresca

Sure, it's easy to hurl fireballs and lightning bolts at foes. But what's left in the aftermath? This article examines just what happens when wizards go to war; or rather, the environmental effects of what's left when they're done. After a spell caster witnesses the damage he's done to the local environment, he might think twice before casting a spell in his home town.

Side Effects

Although many spells have a duration of Instantaneous, their effect can be felt long afterwards. Cold spells freeze the terrain, fire spells scorch it, and lightning spells . . . the less said about them, the better. What adventurers might not realize is that they leave behind telltale signs of their presence after a magical battle, sometimes with long-lasting effects.

Acid

Acid area-effect spells, like *acid fog,* scorch everything, pitting the ground and destroying the terrain beneath. Vegetation withers and dies, water becomes tainted, and rocks become scoured with tiny droplets. All vegetation within the area effect is destroyed after one round of damage. After two rounds, the earth itself is barren and will not grow plants for a number of months equal to the acid spell's level. Similarly, water supplies are mildly acidic, killing off fish and other aquatic life for the acid spell's level in days. The water certainly tastes bad and may even be mildly acidic, inflicting 1 point of acid damage for a number of minutes after the spell is cast equal to the acid spells' level. For the purposes of tracking, acid spells provide a +1 bonus per spell level of the acid spell to track spell casting opponents on solid ground.

Cold

Cold area-effect spells, like *cone of cold, freezing sphere, ice storm,* and *wall of ice,* flash-freeze the surrounding vegetation and earth. Then, as the climate acclimates, the frost turns to water. And water has to go somewhere. It takes the cold spell's level in rounds to melt completely. During that time, any water in the area effect of the cold spell is frozen and slick. Characters walking on ice must spend 2 squares of movement to enter a square covered by ice, and the DC for Balance and Tumble checks increases by +5. Once the ice melts, it seeps into the ground, creating water as per the create water spell as half the spell's level. Dry earth becomes wet earth, and wet earth becomes thick mud. A creature in mud must succeed on a Reflex save (DC caster level) or be caught for 1d2 rounds and unable to move, attack, or cast spells. A creature that succeeds on its save can move through the mud at half speed, and it can't run or charge.

Electricity

Electricity area-effect spells, like *call electricity, call electricity storm,* and *electricity bolt,* seriously damage the environment. Electricity striking flammable material, like scrub or woods, has a percentage change equal to the spell's level of starting a forest fire. In sandy areas, electricity fuses the soil or sand into glass, called fulgurites. Fulgurites bestow a +2 bonus per spell level to a Track check to track a spell caster.

Perhaps the most significant challenge of an electricity spell is that it is always followed by thunder. Electricity produced at close range (such as a electricity bolt spell) produces a loud crack of thunder, audible up to one mile per

level of the spell (+10 per spell level to Listen checks). The sound of thunder most certainly terrifies nearby animals, requiring riders to make a Handle Animal check. Most normal animals instinctively flee electricity and must make a Will save (DC 10 + spell level) or be panicked.

Fire

Fire area-effect spells, like *burning hands, delayed blast fireball, fire seeds, fire storm, fire trap, fireball, flame strike, flaming sphere, incendiary cloud, meteor storm, produce flame,* and *wall of fire,* have an obvious effect on the environment. Fire spells have a chance equal to the spell's level of igniting flammable materials and starting a blaze. In addition, fire spells reduce water by up to 1 foot per spell level (or reduce ice by up to 6 inches per spell level), turning it into steam. This steam has the same effects as fog for 1 round per spell level, providing concealment. Scorched areas provide a +1 bonus per spell level to a Track check to track a spell caster.

Like lightning, animals instinctively avoid fire. Most normal animals must make a Will save (DC 10 + spell level) or be panicked.

Sonic

Sonic attacks are peculiar in that they range from loud noises to low-level vibrations. Sonic spells, such as *shatter, shout, song of discord,* and *sound burst,* are essentially sonic booms. They cause hairline fractures in the area of effect, providing a +1 bonus per spell level to Track the spell caster. They also provide a +2 bonus per spell level to Listen checks up to 1 mile per spell level away.

In addition, sonic booms rattle the integrity of structures; damage should be applied to everything in range of a sonic attack, including walls and ceilings. A weakened ceiling can be spotted with a DC 20 Knowledge (architecture and engineering) or DC 20 Craft (stonemasonry) check. Remember that Craft checks can be made untrained as Intelligence checks. A dwarf can make such a check if he simply passes within 10 feet of a weakened ceiling.

When Did Pickpockets Start Carrying Uzis?

What do you do about mooks?

You know, those omnipresent low-level encounters that seem to appear with distressing regularity in the first scene of the adventure in many campaigns. Think about it: Do you design mooks for the challange of the heroes, or do you design them for some sort of realism in the game world?

This question came to mind when I noticed a discussion on a message board about police officer stats in the most recent *World of Darkness* game. These guys are pretty darn pumped, with stats that place them partially within maxed-out potential for humans. In the thread this was explained away partly by the fact that these represent more "cream of the crop" cops rather than newly deputized Officer Knownothing, and partly by the fact that, hey, if these guys are going to be presented as possible antagonists for vampires and werewolves, they need to be a bit beefier than your schmoe on the street less they turn into blue-clad claw-cloggers.

This strikes me as being two somewhat valid answers, but the question remains: What do you do as the campaign progresses? After all, a group of four or five officers might put up a good fight for a group of starting PCs, but the same group is going to chuckle briefly before mowing them down a few months later.

Well, off the top of my head, here are some answers that spring to mind.

First, the obvious answer is to keep pumping up the mooks. In a point-based game, perhaps those initial mooks were built on 50 points and, as the campaign progresses, they elevate up to 100 points. Of course, this can stretch credulity somewhat, as the heroes realize that these minor characters are built on more points than their starting heroes. ("What happened?! Did the mook academy start pumping everyone full of steroids?!")

Worse, the players may feel like their advancement and accomplishments don't mean anything; after all, if your purse-stealing mugger is going to be the same magnitude of threat on Day One as it is three years later, what incentive is there to get any better? This was a cardinal sin of the computer/video game *Elder Scrolls: Oblivion.* In an effort to make random encounters challenging, the base game pumped all such creatures to be a (more or less) equal challenge; thus a random wolf found after advancing to level 20 presents the same sort of threat that it did back at level 1 . . . making one wonder why this mad-whack überpumped wolf hadn't destroyed whole cities before you stumbled across him in the wilds. (Fortunately the game was designed to be easily modified and tweaked, and many people have released patches that tame these critters to a more reasonable level. This option isn't available in most tabletop games.)

In some game systems, the "mook elevation conundrum" is resolved via the ecology of the game world itself. For example, your base *d20 System* resource document comes with an alphabetical listing of such foes, 73% of which have been officially Mook Potential Cerfified, depending on the level of the characters involved. Your lowly newbie heroes might be fighting hoardes of kobold rake-wielders, but soon they'll be graduating to mowing down crews of dark elf assassins, and they'll eventually get to the point where your ultra-buff heroes are going to be utterly unphased to find a six-pack of red dragons in a 10-foot-square room. And if the players dig that elevated action, then by all means go for it.

In other systems, there's the opposite issue: Mooks are *always* about as effective as ever. This is most often the case in remotely realistic systems (such as *GURPS*) where, say, a guy with a gun still stands a real chance of doing serious damage against a super-trained ninja, no matter how many points he's built on.

However, for systems that don't focus on realism, it's possible that the players will still enjoy facing mooks to varying degrees, but there isn't the desire to pump up the challenge (at least, not every time). There are still options to keep the combat pumpin'. First, there's the possibility of [secondary objectives or complications](). After all, if the mooks are holding the mayor hostage, then it no longer becomes a matter of will the heroes beat the mooks; of course they will. The question now becomes, "Will they save the mayor?" Turning things around, it's also possible for the *players* to dictate the level of secondary activity. For example, let's say you're running a mid-to-high-powered Supers game and

the heroes encounter a group of random thugs breaking into a warehouse. The GM might say, "Okay; you're going to mop the floor with these folks; we can just skip the battle and go on to the 'drop them off at the police' section, if you want. Alternatively, if anyone wants to accomplish anything else with this encounter, let me know and we can do that. Up to you." And one player might be interestd in trying to earnestly reform these criminals, while another hero wants to test a new power, and the third protagonist wants to indulge his kleptomania by seeing what loot they took from the warehouse without attracting the attention of his teammates. In this case, the players can control the pace of what happens, and what would normally be a mundane mook mash becomes more interesting.

Of course, there's the question of whether there should even *be* mooks in the first place. The video game ***Shadow of the Colossus*** is noteworthy because the pixelated protagonist does nothing but "boss" fights -- those battles that usually take place at the end of the level, only after fighting a jillion lesser foes; this game has dispensed with the "wave after wave" mook grind entirely. Now, some games already take this approach. For example, many supers-based campaigns really only have the heroes square off against more worthy opponents (as in "other super-powered folks"). But this approach often isn't seen in other campaigns. Imagine this: Take your standard fantasy dungeon crawl, complete with traps, secret doors, and what not, but remove *every* battle except the final encounter. Now, if possible, have that final baddie try to utilize the rest of the dungeon itself to take out the heroes. Glimpses from the shadows, signs of just not-quite-faced confrontation, and so on, all leading toward The Big Fight . . . which hopefully the heroes (and players) will be deeply itching for by then. And the idea is even adaptable elsewhere; why do horror games need "lesser" foes for the heroes to thwart? Just have one big final foe and be done with it.

Obviously, if players have a good time, it doesn't matter *what* happens with mooks. But sometimes things are just done a certain way because no one's given it any thought otherwise. So, hopefully, now you have some better ideas for how to handle your hoard of henchmen, instead of falling back what everyone else expects. After all, doing things just because you were told to . . . well, that's mook thinking, right there.

Murphy's Rules

Pyramid Review

Elvis: The Legendary Tours (for [Diana: Warrior Princess](#))

Written & Published by [Marcus L. Rowland](#)

Illustrated by Patrick Sterno & Marcus Rowland

Cover by Aaron Williams

55-page 2.5-meg b&w PDF Document; $3.99

Marcus L. Rowland's *[Diana: Warrior Princess](#)* did for the 20th century what *Xena: Amazon Princess* and *Hercules: The Legendary Journeys* both did for the tales and myths of the ancient world, but without setting it in New Zealand or using push-up bras. Actually that last bit is not true, but applied mostly to minor characters or extras who wear revealing costumes to give the series that oh so enticing cake -- beef or cheese -- factor. Run through with a rich vein of satire, that game was primarily written for two players, who took on the *Diana: Warrior Princess* television series' starring roles, Princess Diana and her sidekick, the hapless Fergie. Armed with the Mystic Powers of Royalty, together they traveled across a Mythic Englande, and occasionally beyond, righting wrongs, doing good, but mostly working to thwart the evil wrought by Diana's ex-mother-in-law and worshipper of Landmines, the God of War, the Queen Mother, and also that of the arch sorceress, Chancellor Thatcher. Occasionally though, Diana was aided by allies such as Wild Bill Gates, river boat gambler, Ron L. Hubble, entrepreneur and conman, and Red Ken, London Underground leader and friend to newts everywhere. All of whom are guest star roles that can be taken by other players. Of course, a player can create his on character, but the game's focus was very much on the given cast.

In this televisual day and age, a successful series calls for spin-offs. Naturally the *Diana: Warrior Princess* television series being a success, it is no surprise that we have a spin-off. Originally mentioned in **Diana: Warrior Princess,** the setting for **Elvis: The Legendary Tours** is a Mythic America (previously visited in **Diana: Warrior Princess'** scenario "Diana Does Dallas"). From that short mention, Marcus L. Rowland has developed it into a full-blown supplement (and of course, a far future television series), in which the famous bard Elvis is forced to wander Mythic America, exiled from the magical kingdom of Land of Grace by his evil half-brother, Abbott Costello. Equipped with a silver stringed guitar and Blue Suede seven league boots, and with a penchant for white sequined (and always clean and sparkling) jumpsuits, Elvis is accompanied in his quest by two companions. One is John Lenin, barbarian bass player and warrior, a simple man who loves strong ale, good food, and fine women. The other is "Senator" Joe McCartney, ex-politician, ex-thief turned guitarist who has reformed (mostly) and now follows Elvis' lead.

Additionally Elvis is occasionally aided by three other legends of Mythic America, each also available to play. Billie "Doc" Holliday is not only a roaming frontier doctor, dentist, midwife, vet, and law-woman, but also an occasional accompanist on stage. If Elvis has a big gig or needs a session player, then Bob "The Builder" Marley is the man. Able to get a stage set up virtually anywhere, play most instruments and sing if needed, but preferring to remain back stage, the thickly accented roadie possesses the Mystic Power of Ganja. Far less trusted is Jean-Claude Van Halen, a bard and shaman from the mysterious East (Boston), master of the martial art Sudoku. Also a philosophy, a student of [Su-Doku, the "way of the exploding grid"](#) meditates upon a grid of numbers to gain insightful visions and learns numbered martial arts moves that require him to grow the nail of his index finger.

Abbot Costello is not the only villain Elvis must face, but he is the main one. After all, he wants to steal Elvis' Mystic Powers, use them for his own ends, and truly cement himself as the Land of Grace's rightful ruler. Fortunately for Elvis, the head of Palace Guard, Colonel Parker, seems to be more concerned with the kingdom's safety and is loyal to the throne rather than Elvis' half-brother. The other major villain is Uncle Sam. This scheming dictatorial warmonger worships Landmines, the God of War, and leads his "Sons of Sam" in mighty plans to conquer all of Mythic America.

This means that his agents can be found causing trouble everywhere. He hates all foreigners, and that includes Elvis. King Martin Luther is not really an enemy, but both he and the Church of the Supreme Being he heads regards Elvis' music as "lewd" and "unseemly." Other threats take the form of musical rivals, from the Booze Brothers to the Five Jacksons (Steve, Jesse, Samuel, Peter, and Pollock), to a dazzling array of Elvis impersonators, including clones, gods, and killer robots.

Mythic America, like Mythic Englande, is a land of gods and goddesses, though fewer make an appearance in *Elvis: The Legendary Tours* than in *Diana: Warrior Princess,* and thus most are described in *Diana: Warrior Princess;* however, three appear regularly in this spin-off. Ray, the God of the Sun and Music, loves to challenge musicians to impossible contests and is often served by the half-women half-bird monsters known as the Groupies. Eyepoade is both the Goddess of Recording and Demigoddess of Orchards (her symbol being a bitten pear) and likes to attend concerts to ensure that the best are recorded. The Goddess of Dance, Dysko is bedazzled by flashiness and superficiality and unlike the first two deities, is not too bothered with musical skill or substance.

To create characters for *Elvis: The Legendary Tours,* players still need to refer to *Diana: Warrior Princess.* If playing the core trio of characters, Elvis has Star Status, John Lenin and "Senator" Joe McCartney are Co-Stars, while most other characters are either Guest Stars or Villains. The skills are the same broad categories, but with two additions. The Mystic Powers of Music do not replace the Mystic Powers of Royalty, but duplicate many of its abilities. Likewise the Music skill does not replace the Artist skill, being more of an emphasis for this spin-off. It covers not only singing, playing, and composing music, but all of the back-stage technical know-how as well. It can be combined with Mystic Powers or the Charisma skill, or even both for astounding live performances or other bardic effects, including healing wounds, soothing the savage beast, and resisting the evil effects of Mystic Powers. During a concert a bard as good as Elvis can draw extra Mystic Power from the audience. Called "feedback," when it gets out of control it can cause rioting and even draw the attention of the gods, who dislike mere mortals rivalling their musical abilities.

In terms of adventures, *Elvis: The Legendary Tours* follows the same format as *Diana: Warrior Princess.* This means a detailed episode outline designed to help the GM get the series' feel and style and is easily adapted to play, followed by eight episode treatments that need further development. Finally there is the scenario, "You Ain't Nothing But A Hound Dog." Opening with the rhythmic trio foiling a dance cult's evil plans, it sends them off to investigate an outbreak of lycanthropy, encountering both a new villain and a whole new world along the way! The scenario does veer into *[Forgotten Futures](#)* territory towards the end, but is nevertheless entertaining. Unsurprisingly, both the titles and inspirations for the scenario and episode treatments are drawn from Elvis' back catalogue. And since only 10 song titles are used, the GM still has plenty to choose from, plus a ready soundtrack to the series.

Physically, *Elvis: The Legendary Tours* is an easy-to-read PDF, lightly illustrated with caracticture for the series cast and a few pieces previously seen in *Forgotten Futures.* The last page is given over to the equivalent of a back page blurb, worth checking out not just for the sales pitch of said blurb, but the critic's quotes for *Diana: Warrior Princess.* Not just my own of course (you have already read that one), but the hilarious misunderstanding of a particular comment on Amazon.com.

Unsurprisingly, *Elvis: The Legendary Tours* is another showcase for Marcus L. Rowland's trademark penchant for puns and relish for references. The latter include much to do with Elvis naturally, but others range from the Beatles to *C.S.I.,* and from *Star Trek* to eBay. Most of them are genuinely both funny and groanworthy, not just to read, but also to play. The supplement suggests that this series be less episodic and more of a serial, since Elvis does actually have a proper objective in returning to the Land of Grace to overthrow his half-brother. Certainly in the scenario given, "You Ain't Nothing But A Hound Dog," this series has feel of a Western, and it is no surprise to see the television series *Firefly* and *The Wild, Wild West* both listed in the acknowledgements. Of course, as a Western, *Elvis: The Legendary Tours* is a far wilder and much woollier . . .

Where *Diana: Warrior Princess* was good, being funny in a satirical sense, *Elvis: The Legendary Tours* is better, being funny in a broader sense. Much of this comes from the wider range of references, which makes this spin-off one of Americana as opposed to *Diana: Warrior Princess'* quaint and slightly obscure Englishness. The result is that the comedy of *Elvis: The Legendary Tours* deserves to appeal to a much to a wider audience and indicate that there is more life to the faux historical format first seen in Diana: *Warrior Princess.*

Pyramid Review

Paths of the Damned: Spires of Altdorf (for Warhammer Fantasy Roleplay)

Published by Black Industries

Developed by Green Ronin Publishing

Written by David Chart with Kate Flack, Chris Pramas, & Gav Thorpe

Cover by Christer Sveen

Illustrated by Tony Parker & Christer Sveen

Cartography by Shawn Brown

96-page b&w hardcover; $24.95

Spires of Altdorf is the second part of the *Paths of the Damned* trilogy for *Warhammer Fantasy Roleplay*. It is also the third part of the campaign begun in "Through the Drakwald," found in the core book, following on from *Ashes of Middenheim*. Where that scenario suffered in being too linear, sending the adventurers out to deal with one threat, grab any treasure and come back to repeat the exercise over again, it is pleasing to see that *Spires of Altdorf* escape that structure to provide a more player-driven affair. This is the author's first work for the game, being better known for his re-design of *Ars Magica* and supplements such as *The Medieval Player's Manual*. That said, if the interesting *d20 System* scenario *Splintered Peace* is any indication, then *Spires of Altdorf* could be a big improvement upon *Ashes of Middenheim.*

As the title suggests, the setting for this scenario is Altdorf, capital of the Empire, and a city that was barely visited in *The Enemy Within* campaign, let alone detailed. Not just home to the Emperor, the headquarters for each of the Orders of Magic is here (and weird places they are), as is the Cult of Sigmar, the Empire's state religion. A river port, Altdorf is dominated by its many guilds, membership of which is seen by many as the path to increased income, greater status, and better housing a little bit further above the stench emanating from both the River Reik and the city's often-blocked sewerage system. Even those at the bottom of the heap have airs and graces, or at least an attitude that sees themselves as superior to anyone not from Altdorf. This includes the large numbers of refugees who have come to the city in the wake of the upheavals caused by the Storm of Chaos, and naturally, the player characters.

Given the slim nature of the book, it is no surprise that Altdorf is described in only broad detail. The focus is upon locations specific to the adventure and descriptions of places the party is likely to visit during its course. Although not the equal of a good city sourcebook there is enough information here to not only run each specific location, but for the GM to provide variation if the characters visit one or more of the generic places. These cover the mansions of the rich, the tenements of the poor, taverns, markets, fighting rings, and the street. All locations describe what might happen if the adventurers opt to talk, sneak, or fight there and all come with a set of scenario hooks. There is also advice to help the GM capture the feel of the city.

Unfortunately, the hooks are the first of the supplement's small problems. Too many of them dwell on Chaos as a threat. The Old World is a grim and perilous place, but not everything dark and dangerous is due to the influence of

Chaos and a little more inventiveness in these hooks would have been preferable, especially since the main plot revolves around a Chaos threat. The second is the lack of a decent map of Altdorf. It does say that no one has accurately mapped the city within the game, but a map is one of these aids useful to any GM, and certainly, there is space for it on the otherwise blank inside cover. Plus, using an old and small map feels a bit cheap.

Following from the events described in *Ashes of Middenheim,* the adventurers have learnt that once again, the Empire is threatened by Chaos. They had discovered that a Chaos cult, the Crimson Skull, had been working to free an imprisoned Daemon of Khorne, known as Xathrodox Incardine. His essence has been split into three and bound into separate artifacts. The first artifact has already been dealt with, but research turns the name of the next, the Dagger of Yul K'chaum, and that it was last heard of in Altdorf. Armed with the knowledge that the next artifact is located in the Imperial capital and a contact letter, the adventure begins with the characters on the road to Altdorf. Even though they attach themselves to a larger party of refugees traveling west to escape the Storm of Chaos, safety in numbers proves to be not the case, the journey proves a perilous one, but of course, the real dangers lie ahead.

Where *Spires of Altdorf* really differs from *Ashes of Middenheim* is in the plotting. *Spires of Altdorf* has three, all running parallel to each other. Since they each have their own chapters, the GM will need to flip back and forth between them as the adventure progresses, weaving the three plots together. Really though, this is not all that complex a prospect for an experienced GM, rather that it is more complex in comparison to the linear Ashes of Middenheim.

[SPOILER ALERT!]

Plot one has remnants of the cult the adventurers disbanded in Middenheim harassing them and making the occasional assassination attempt. Plot two has the party trying to locate, obtain, and finally destroy the artifact. Plot three has someone else trying to obtain it, but for his own nefarious ends, rather than to destroy it. The Dagger of Yul K'chaum, being of course a Chaos artifact, is a nasty vicious item, not too dissimilar to the infamous Stormbringer, especially as it wants someone to use it.

[END SPOILER ALERT]

Physically, *Spires of Altdorf* is a decent affair, laid out in the fashion typical of the ***Warhammer Fantasy Roleplay*** line. This also means that the artwork is dark and grim, doing a good job of illustrating the writing. The writing though, is excellent, never less than clear and helpful for an inexperienced GM trying to run what is to him a complex scenario after *Ashes of Middenheim.* For the players it offers a certain amount of investigation, definitely much more interaction, and requires far more roleplaying than its predecessor. It does not stint on opportunities for a good fight though. Another good feature of the scenario is that there is not just one method of solving the problem faced by the adventurers. There is an optimum or rather a safe method, the others having consequences . . . some of which will prove deadly to the characters.

Strong on roleplaying, social interaction, and investigation, *Spires of Altdorf* brings the ***Paths of the Damned*** trilogy back on track ready for the finale, ***Forges of Nuln,*** feeling far more like the ***Warhammer Fantasy Roleplay*** of old.

The Omniscient Eye

How Much Is That Humanzee in the Window?

I've heard it said (on quite reputable documentaries) that Chimps and Humans could potentially cross-breed. Although no evidence exists of such a hybrid, what would be the (ch)implications of such a successful mating? More importantly, would the offspring be sterile (like a mule), insanely powerful (like a liger), or could it eventually lead to an hybrid-ape uprising that would sink the Statue of Liberty into the sands of some far-flung future beach? I suppose such a hybrid might be created in a test-tube, assuming you could get willing participants, some Barry White music and a *very big* test-tube.
--Blake Smith

Definition of Terms

A hybrid (from latin *hybrida* -- a term that was used for the offspring of wild boar and domestic swine) is the product of two organisms that do not belong to the same taxonomic group. Usually, they are the offspring of genetically compatible parents produced by breeding of different varieties, species, or races. Cells from a hybrid's body have a single genetic code combined out of the genes of the two parent organisms.

A chimera, on the other hand, combines cells of two organisms. They have different sets of cells (making up the liver, lung, heart etc.) with different DNAs, each coming from another parent. They are practically a mix of organs taken from two or more different beings. The term itself comes from Greek *chimaira,* a mythological monster with a lion's head, a goat's body and a serpents tail.

Real Hybrids

Hybrids in nature are very rare, especially among mammals. They occur when genetically similar animals are forced to live in close proximity to one another. Normally, every species has its own set of mating rituals, pheromones and other forms of "sex talk" which do not attract members of other species. However, if no suitable mates from the own group are present crossbreeding may occur. Therefore, hybrid animals are sometimes reported in zoos when different animal groups were kept in the same enclosure.

Crossbreeds are usually named by building a portmanteau (a condensation of two words into one) out of the parent animals' names, starting with the male animal. The zeedonk (also called zonkey) for example is the product of a male zebra and a female donkey while the zorse is a combination of male zebra and female horse. Exceptions to this convention are numerous though. The mule, a mix of male donkey and female horse (the name itself derives from lat. *mulus* = hybrid) and the hinny (male horse, female donkey) are very popular examples for this[1].

Sterility often occurs in hybrids due to an odd number of chromosomes. Chromosome pairs need to be able to split evenly in order to produce germ cells (like eggs and sperm) that have a complete set of genetic information. For example, a horse has 64 chromosomes (32 chromosome pairs) while a donkey has 62 (31 pairs). The resulting mule has 63 chromosomes: 31 pairs and a single unpaired one. Because of this, the mule can't pass on all of its genetic information when reproducing with another mule; it needs matched chromosome pairs for that. It is therefore functionally sterile. There are, however, a few cases where female mules could be impregnated by donkeys or horses because they can provide the missing chromosomes[2].

Crossbreeding among plants is a lot more common than among animals. Manually crossing plants in order to generate

new varieties with desirable traits has been common practice in agriculture. In fact, most modern crops are hybrids and nearly all of them are fertile. Notable exceptions to this are cultivated bananas, red grapes, and seedless watermelon. Due to a mismatch of chromosomes, none of these hybrids develops functional seeds even though they still bear fruit after pollination. Such plants are therefore propagated vegetatively by planting sucker sprouts or corms.

Real Chimeras

Natural chimeras are even more rare. One of very few known examples is tetragametic chimerism which also occurs in humans. It starts with two ova being fertilized by one sperm each -- a condition which usually leads to non-identical twins. If these ova merge, however, they create a single chimera instead of two organisms. All organs are mixed together from either of the twins and they have their own genetic identity. Such a "merged twin" often shows patchy skin, -hair or -eye pigmentation and sometimes hermaphroditism (if the original twins were of different sexes). These patients have effectively two different genomes which can lead to false diagnosis and other more mundane problems after a genetic screening [3]. Most of the time when the term chimera is used, however, it refers to artificially created combinations of cells from different sources and the organism resulting thereof.

Chimp-Human Hybrids: Barry White And Champagne?

We, *Homo sapiens* belong to the genus *Homo* and share this genus with a few other species: *Homo erectus, Homo ergaster, Homo rudolfensis, Homo neanderthalensis,* and *Homo habilis,* all of them already extinct. Some scientists argue that chimpanzees should belong to our genus too, due to the high degree of genetic similarity between them and us [4]. Recent work estimates the DNA sequence overlap to about 94-98% for coding sequences (most of the DNA is non-coding which means it does not have genes in it). This is more than for other animals that were grouped together. So why are humans still separated from chimps when it comes to taxonomy? One of the reasons for that is a gene called FOXP2 which seems to be responsible for our highly developed language skills and may be one major factor (besides increasing numbers of neurons) that changed our evolution to become the most intelligent animal on the planet. Other animals do possess this gene, but our version is slightly different and allows us to express ourselves in a lot more subtle ways. While genetics play the major role in what organisms look like, even a very small change in genetic information can make a big difference.

While it is widely believed that "man derives from ape," recent studies show that man actually derived from a protohuman-protochimpanzee hybrid. Genetic analysis of our DNA reveals that our ancestors parted from the ancestor of chimpanzees about 10 million years ago, but still exchanged genes for another four million years (which means they interbred). The new species that resulted out of this genetic mix finally became *Homo sapiens:* us [5]. Judging from this, we can at least say that it was once possible for protohumans and protochimpanzees to mate.

There are only a few documented cases where scientists tried to cross humans with chimps and most of them are highly unreliable or only based on obscure sources. One of the most popular (and also most authentic) story is about Ilya Ivanovich Ivanov. He was a russian scientist who tried to artificially inseminate female chimps with human sperm in the 1920s in order to create human-ape hybrids. Since none of his experiments showed positive results he later changed his approach and tried to use sperm from male chimpanzees on female volunteers. However, his work was

Genomic Imprinting

A few genes in our genome do have a chemical switch that can be turned on or off depending on if the genetic material comes from a male or a female. Most of these factors have to do with development of the embryo and placental growth. For instance, in lion-tiger hybrids (ligers) the male lion has a gene to up regulate growth of its embryo to ensure that his will out-compete the others in the womb (lions can get pregnant from more than one male at the same time). The female lion, however has a counter-gene to ensure the survival of all the embryos (and eventually her own) by down-regulating growth. Tigers don't have to deal with this kind of problem because they aren't herd animals and always just have a single mate -- they lack this counter-growth regulation. Therefore, ligers are the largest felines on earth -- they can weight up to 1,100 pounds!

stopped because of political changes; he was arrested and sent to exile in Kazakhstan where he died a few years later.

Other, less documented reports from Italy and China around the 1990s claim that scientist have been successful in creating a viable embryo out of human sperm and chimp eggs but they were forced to destroy it. The results were never published. Until now there is no evidence that a chimpanzee-human hybrid ever existed. It is therefore unlikely that a modern human could impregnate a chimpanzee (or vice versa) in the normal way and result in healthy offspring -- even when taking soul music and lots of beverage into account.

The Genetic Date Doctor

As soon as we get in the area of un-natural reproduction this picture changes slightly. From manually injecting genetic material into oozytes up to transporting genes from one organism to another -- a wide range of technologies exists that can produce a hybrid. Transgenic organisms, for instance, are a combination of genetic material from various sources. These sources can be as different as a bacterium and a plant: "Bt corn," for example, is corn with a foreign gene that was taken from Bacillus thuringensis (a bacterium) and integrated into the plant's DNA. This causes the corn to produce a toxin which increases its resistance to insects but is not poisonous to humans.

Scientists have already been able to achieve such things as implant human neurons into embryonic ape brains or mice which effectively results in a human-chimp or -mouse chimeras. In these experiments the brain developed normally until the chimera was destroyed. Now there are plans to grow mice with complete brains derived from human neurons to study neuro-degenerative diseases. Another seemingly bizarre vision is to create genetically altered mice which produce human sperm and human eggs. This way, two mice would be able to produce a human blastocyst (one of the first steps in embryonal development) which could then be used for stem cell harvesting[6].

A Closer Look

If we assume that we could overcome all the obstacles to create human-ape hybrids, what should we expect from this new specimen? Judging from the way that chimpanzees (*Pan troglodytes*) and *Homo sapiens* differ from one another[7] we can predict the following:

Physical Strength

Ordinary chimps are roughly five to seven times stronger than a human (though that may not translate directly to a strength score five to seven times higher in your game system of choice). When normalized to size and taking reduced strength due to changes in genetic profile into account, our hybrid would probably be in the range of at least two to four times stronger.

Looks

Any chimp-human combination would stand out in a crowd of people and be easily recognized in broad daylight. Judging from the appearance of most hybrid animals, a humanzee (male human/female chimp hybrid) or chuman (male chimp/female human) would resemble a short, upright walking hairy human with ape-like facial features. The arms would be about 10-30% longer than human arms. Legs would be shorter and the chimp-like skeletal structure will lead to a somewhat hunched position when going upright. If fertile, childbirth could be problematic due to the changed anatomy of the pelvis.

Bone Density

The bones of chimpanzees are a lot more dense than ours which leads to a more powerful skeleton and greatly reduced likeliness of broken bones after injury. The drawback of this is that chimpanzees can't swim; they are not buoyant. If the hybrid shares these traits he will have a hard time staying afloat, but he would also benefit from very dense bone

structure and increased resistance against blunt trauma.

Age

There should be little difference when it comes to the effects of aging, compared to a normal human. While chimpanzees only live about 40 years in the wild, they can reach ages of 70+ in captivity. It seems reasonable to assume that a hybrid will have the same natural lifespan that we have. Due to a mutation in a gene, humans are less prone to developing Alzheimer's disease than chimpanzees are. Chimp half-bloods might therefore show signs of neuronal degeneration earlier and more often than their human cousins of the same age.

Intelligence

Although chimps are very smart animals they are not capable of many intellectual tasks that seem basic to us. Most noticeable are the abilities to process and interpret abstract information and language skills. An average human for example, has a vocabulary of about 9,000 words. Even the smartest chimpanzee so far could only learn a maximum of around 250 words (in American Sign Language). Our hybrid will display learning difficulties and severe language problems. In general, the IQ score will be far below the human average.

Perception

All primates possess full-color vision. In the course of evolution they slowly traded this ability against a few genes related to the sense of smell. Since this trend is more prominent in *Homo sapiens* than in *Pan troglodytes,* chimpanzees have a more sensitive olfactory system. We make up for this deficit with a better sense of hearing. A hybrid would possibly show heightened perception in all these areas.

Digestion and Metabolism

Chimps show some differences in utilizing proteins as a food source and they seem to lack two genes involved in the development of an important cardio-protective factor in fat metabolism (APOL1 and APOL4, parts of high density lipoprotein). This may lead to problems like cardiovascular disease as soon as their diet is switched from mostly fruit and vegetables to food with high-fat and high-sugar content, which is common in a western diet.

High Probability Of Being Sterile

While humans have 46 chromosomes (23 pairs) members of the *Pan* genus have 48. This does not necessarily have to lead to sterility, but in most cases in nature where hybrids occur a mismatch in chromosomes leads to sterile offspring.

Immune System

Our relatives' immune system works slightly differently than our own. Chimps are immune to malaria while, through the course of evolution, humans developed increased resistance against tuberculosis or the parasite causing the sleeping disease. If we assume that crossbreeding would lead to hybrid vigor this could mean robust health and overall physical fitness for the hybrid.

Dawn of a new species?

Now that we have our new specimen, what are the parameters for it to become an entire new species (and take over the world and some such)?

First there are ecological factors. Most organisms are well adapted to their

Hybrid Vigor

Hybrid vigor (also called heterosis) is an effect of increased evolutionary fitness or strength in a hybrid. In this case the descendant is often stronger or better at something than the two parent organisms are. A reason for this is thought to be a more diverse genome

environment. This includes means to gather available food sources, defense mechanisms against predators, and physical attributes for survival in harsh terrain. For example, a cross between a white butterfly (which is able to camouflage against birch trees) and a green butterfly (able to hide in grass) couldn't hide successfully in either of these places, even though his instincts would tell him to do so. As another example, a lion whose main power lies in strength and a cheetah who has to be fast to hunt his prey probably wouldn't produce ecologically successful offspring because the resulting hybrid would not be strong enough to hunt the large herbivores of the steppe and too slow to hunt antelopes. If the new species can't utilize its environment better than others it will not be successful in the long run of evolution.

Second, there are biological factors. While individuals within one species are sexually compatible and can exchange genetic information, the production of viable non-sterile offspring gets more unlikely the less related the organisms are. Species identity ("like attracts like") plays a major role. Every species has distinct mating rituals, ways of communication, social structures, and so on. Most of these factors depend on the genetic profile and are therefore set for a given species.

Since chumans or humanzees will be of high physical strength but low intelligence it is hard to imagine a situation where they could be a real threat for a modern civilization unless other factors (like a virus that targets only humans for instance) comes into play.

and therefore a higher possibility to adapt to various environments. For example hybrid corn (which is the commonly used form in agriculture) readily outgrows its natural relatives, canine mongrels are more healthy and and stable than purebreds, and so forth. There is some speculation that heterosis might also be an inter-species effect in humans. A few studies suggest that children of mixed ethnicity score higher in intelligence tests than their cousins of either ethnicity alone[8]. This issue, however, is vigorously discussed and is a source of strong controversies among scientists.

After a few million years, in case the new species has time to evolve in isolation and there is selection pressure similar to what we experienced in our development, they could be much more of a threat. Their intelligence levels would slowly rise and they would become more human-like and therefore more dangerous.

Hybrids In Fantasy Settings

Most half-blood races in the Fantasy genre are best described as hybrids while some "monsters" like the sphinx (lion with a human head) show distinct characteristics of chimeras.

Since half-bloods in fantasy are much more common than in reality there has to be a factor that makes it easier for all these races to crossbreed. Because, judging from the physiological differences, most races would be genetically incompatible with humans and could not produce hybrids. Even those which are relatively similar (say, elves and humans) might produce sterile offspring.

If we assume that fantasy-world biology works the way it does in our world, technologically (or magically) advanced civilizations are a good explanation for the existence of almost any hybrid. The palette of possibilities ranges from merging two species up to complete genomic construction from scratch.

If, however, biology works entirely differently, then the material that contains our genetic information does not have to be DNA. It could be a magic aura, soul essence, or something else along these lines. interbreeding could then resemble the mixing of two different colors and would always produce a hybrid. In this case, there needs to be non-genetic factor that keeps species separate. Otherwise they would all merge into a single homogeneous mixture-race.

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore with all. Or, at least, with all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Brittina Montaigne

for *GURPS Space*

by Michael Brown

Captain Nushu sat at his console cursing as he waited for the inevitable. The sleek ship had intercepted his starliner, blasted his drives offline with expert precision, and Security was warning that armed boarders were taking passengers' valuables. One group was headed for the bridge.

Minutes later, the bridge's hatch flared around the edges, the pieces falling to the floor with dull thuds. Several armored intruders leaped inside, brandishing guns, followed by a gorgeous, flamboyantly dressed woman who gusted in, cast an appreciative glance at the scene, then smilingly approached Nushu with outstretched hand.

"Brittina Montaigne, And you are . . . ?"

But Nushu was in no mood for pleasantries. "Look, we don't want trouble with pirates . . ."

Brittina looked genuinely hurt. "Pirates, captain? How . . . pedestrian." The smile returned as she shook her head. "Our . . . wealth facilitation service . . . will certainly put your valuables to good use, but there's a more important reason we're here."

Nushu stared in puzzlement. Brittina's eyes twinkled as she answered his unvoiced question:

"My crew and I would like to invite you all to a little . . . presentation," she said, fingering a small object around her neck Nushu knew to be a religious symbol.

Brittina Montaigne is an interstellar corsair who preys upon rich commercial vessels. Brittina is not solely motivated by money, however; her religious fervor drives her to seek out and convert others to her faith by whatever means. In a sense, she plunders not only valuables, but convictions as well.

Brittina is suitable for use in an ongoing *GURPS Space* campaign. With some tweaking, she can also be used in a *Transhuman Space, GURPS Terradyne,* or *GURPS Traveller* campaign. For *GURPS Space* purposes, Brittina is assumed to inhabit a setting of Tech level 10.

Background

Brittina was born on Earth, one of many unfortunates bred in the slums just outside the planet's gleaming major starport. Orphaned at a young age, her childhood was spent in a world of vice and violence. She had a police record by the time she turned 14.

Her life changed one night through an act of brutality. Accused of robbing an aristocrat who had been slumming in the startown, she was badly beaten by the man's bodyguards and left for dead in an alley. As she lay semi-conscious, a stranger aided her, staying with her until help arrived and speaking with her about the direction her life had taken and her plans for the future. The conversation made Brittina question everything that had happened in her life thus far, and the stranger challenged her to seek more answers later. The responding medics, seeing no one else in the alley despite Brittina's insistence, attributed the stranger's presence as just a delusion.

After a stay in the hospital, Brittina took up the stranger's challenge and began seeking answers. Her search led her to a local religious institution, where she began studies in earnest. Several years later, she emerged as a zealous proponent of her new faith, and began a series of "presentations," as she called them, to try and spread the word. Her efforts met

with indifference at best, and she viewed society as being too jaded to listen.

Frustration set in, and with it ennui, when a chance meeting sent Brittina's life in another direction. While traveling by starliner to another planet to seek new opportunities, pirates attacked. The corsairs weren't very bright -- Brittina easily persuaded them not to harm anyone -- but they gave her an idea. Convincing the pirate captain to take her on ostensibly as a hostage, Brittina introduced the crew to her religion, then induced her new supporters to mutiny and install her as captain. With a zealous crew and use of a hand-me-down armed merchant ship, she set out to win new converts through piracy.

Today, Brittina and her crew prowl interstellar space in their ship, the *Message,* searching for carefully chosen victims to rob and convert. Her conversion rate is actually rather low -- few choose to follow her faith -- but those she does convert tend to be very ardent believers.

Appearance

Brittina is a physically imposing but beautiful female Human. Brittina stands 6' tall and weighs 130 lbs. under 1g. She often wears heels that add several more inches of height. She has unblemished coffee-and-cream skin, brown eyes and thick black hair that she keeps well groomed. She dresses flamboyantly, but tastefully, and always on the cutting edge of fashion. Although approaching 50, Brittina appears much younger.

Personality

Even more imposing than Brittina's appearance is her personality. Her religious zeal combines with her natural charisma and beauty to great effect. She knows exactly how to take over a room, disarm naysayers, and dispel unbelief. And if things get out of hand, well, there's always her loyal crew.

Brittina can turn on the charm when necessary, especially when her plans call for stealth and social engineering. She is equally comfortable dealing with those of high and low status and has an uncanny ability to scope out victims with high payoff potential and low risk.

Although she is willing to commit acts of piracy, Brittina holds to strict standards of conduct. She strives to safeguard children and the elderly, and goes out of her way to avoid killing. Although she carries a small pistol, the number of times she has actually had to use it can be counted on the fingers of one hand.

Because she sees her actions as stemming from religious conviction, Brittina does not view what she does as piracy. In fact, she hates the term "pirate" and is quick to correct those who call her one with a colorful euphemism, such as "wealth facilitator," "affluence expeditor," or "resource reallocator." She tolerates no insults to her religion, however, and deals harshly with those who do.

Brittina can analyze a situation and devise a plan to deal with it. She tries to research her targets thoroughly before hitting them, but realizes that some opportunities are best seized on the spur of the moment. She also knows when to cut her losses and run. Her natural intuition and a fair amount of luck have helped her evade capture so far.

Brittina's Crew

Brittina "inherited" her 20-man ship's crew after she converted them and induced them to depose the previous captain. They are staunchly loyal to Brittina, trust her insights and obey her without question. She, in turn, goes to great lengths to ensure their happiness and loyalty. They have adopted her standards of conduct and will refrain from harming innocents or killing, although they quickly revert to their old ways if Brittina is threatened.

The crew also doubles as her bodyguards and each member is cross-trained in multiple ship's duties.

Stats for the crew are not presented here to give the GM maximum flexibility in NPC creation. Each should be built on

75-100 points and equipped with body armor and assault-type weapons.

Brittina's ship is a converted merchant ship, of a common sort found in whatever universe the GM sets her in. Brittina has never asked about the circumstances of how the ship ended up in corsair hands, but she has renamed the craft the *Message* in light of her self-imposed mission.

Brittina in the Campaign

Brittina and her crew do not have a static base, operating completely out of the *Message.* She avoids areas with heavy ship traffic and the attendant law enforcement patrols and stays on the move, never hitting the same system twice in a row. Within these guidelines, the GM can arrange an encounter with this flamboyant corsair almost anywhere. The easiest way is for the players to carry a valuable cargo with inadequate security. They will be disabled, boarded, robbed, and then forced to hear a sermon, wherein Brittina will hard-sell her religion and urge the PCs to join the faith.

Brittina makes a suitable Ally or Contact for those PCs who flirt with the wrong side of the law, as long as the alliance is only temporary and carries no hint of betrayal. As a Contact, she is worth 2 points (Criminal (Pirate) Contact, effective skill 15, usually reliable, available on 6 or less). She may also owe one of the PCs a Favor at a cost of 1 point.

Despite her scruples, Brittina is as deadly an enemy as they come. While she is loathe to kill, her crew has no such compunctions when it comes to their leader's unhappiness. And just because she avoids killing doesn't mean she won't maroon enemies somewhere, or drop discreet hints as to their locations to others looking for them.

PC law enforcers may be given the assignment of bringing Brittina and her crew to heel, especially if in the course of her robberies, she harms someone or makes off with important government property. Or if she is caught, PC attorneys may handle the case for or against her.

The GM should select Brittina's religion, based on the standards of the campaign and the comfort level of the players. There are of course many real life religions to choose from, or the GM can make one up, using GURPS Religion as a guide.

GURPS Third Edition

Brittina Montaigne   *150 points*

Attributes: **ST** 10 [0]; **DX** 12 [20]; **IQ** 13 [30]; **HT** 11 [10].
Speed 5.75, Dodge 5.

Advantages: Ally Group (20 pirates) [20]; Charisma+3 [15]; Appearance: Very Beautiful [25]; Fashion Sense [5]; Intuition [15]; Luck [15].

Disadvantages: Code of Honor (Cannot Harm Innocents) [-10]; Enemy (Star Patrol or equivalent; 6 or less) [-20]; Fanaticism [-15]; Reputation (Notorious "Converting Pirate": -4 from passenger line executives) [-10].

Quirks: Observes religious rites frequently [-1]; Uses colorful euphemisms to describe her robberies [-1]; Hates being called a pirate [-1]; Imaginative [-1]; Flamboyant but tasteful dresser [-1]

Skills: Bard-16# [2]; Carousing-11 [2]; Computer Operations/10-13 [1]; Detect Lies-12 [2]; Electronics Operations (Communications)-13 [2]; Free Fall-12 [2]; Guns (Pistol)-15* [2]; Heraldry (Ship's Markings)-13 [2]; Intimidation-15 [6]; Knife-12 [1]; Leadership-16# [2]; Psychology-13 [4]; Scrounging-13 [1]; Sex Appeal-13 [8]; Streetwise-14 [4]; Tactics-14 [6]; Theology-12 [2]; Traffic Analysis-13 [4]; Vacc Suit-13 [2].

* Includes +2 bonus for IQ 12+

GURPS Fourth Edition

Brittina Montaigne   *218 points*

Attributes: **ST** 10 [0]; **DX** 12 [40]; **IQ** 13 [60]; **HT** 11 [20].
Dmg 1d-2/1d; Basic Lift 20 lbs.; HP 10 [0]; Will 14 [5]; Per 15 [10]; FP 10 [0]; Basic Speed 6.00 [0]; Basic Move 6 [0]; Dodge 9.

Social Background: TL 10 [0]; CF Pirate [0]; Languages: Native* [0].

*GM's choice.

Advantages: Ally Group (20 pirates) [20]; Charisma 3 [15]; Fashion Sense [5]; Intuition [15]; Luck [15]; Very Beautiful (Impressive) [20]

Disadvantages: Code of Honor (Gentleman's) [-10]; Enemy (Star Patrol or equivalent; arrest; 6 or less) [-15]; Fanaticism (to religion) [-15]; Reputation (notorious "Converting Pirate": -4 from passenger line executives; always) [-10]

Quirks: Observes religious rites frequently [-1]; Uses colorful euphemisms to describe her robberies [-1]; Hates being called a pirate [-1]; Imaginative [-1]; Flamboyant but tasteful dresser [-1]

Skills: Carousing-11 [1]; Computer Operations/10-13 [1]; Detect Lies-14 [2]; Electronics Operations (Communications)-13 [2]; Environment Suit/10 (Vacc Suit)-12 [2]; Free Fall-12 [2]; Guns (Pistol)-13 [2]; Heraldry (Ship's Markings)-13 [2]; Intelligence Analysis/10 (Traffic Analysis)-13 [4]; Intimidation-15 [4]; Knife-12 [1]; Leadership-16# [2] ; Psychology-13 [4]; Public Speaking-16# [2]; Scrounging-15 [1]; Sex Appeal-13 [8]; Streetwise-14 [4]; Tactics-14 [12]; Theology-12 [2]

Includes +3 Charisma bonus

Weapons and Armor: Brittina favors concealable firearms for personal defense, such as derringers and snub pistols. Although she does not use obvious body armor, most of her clothing has a bullet-resistant or laser-reflective lining.

Conversions

For use in *Transhuman Space, GURPS Terradyne,* or *GURPS Space* campaigns set entirely within the Solar system, Brittina and her crew will not need to change much. Just make sure the *Message* isn't FTL-capable. For the *Fourth Edition* version, tie her Cultural Familiarity down to a specific nation or organization.

In the *GURPS Traveller* universe, Brittina as a native-born Terran would be a purebred Solomani, although she would not accept the dogma of the Solomani Movement (see p. GT60-63). The *Message* is a jump-capable starship converted from a merchant or law enforcement vessel. Her enemy becomes the Third Imperium and/or the Solomani Confederation. The Corsair template (p. GT90) can represent her crew's stats and can allow the GM to customize her further for a *Traveller* setting.

Solomon's Ring

for *GURPS*

by James L. Cambias

One of the most powerful magical artifacts in history, the Ring of King Solomon has been the object of continual searches both in the mundane world and by magical means. So far it remains hidden.

The King

Solomon, of course, was the Old Testament king of the Israelites, who probably ruled about 970 to 928 B.C. He was the son of David and Bathsheba. In the Bible, Solomon is portrayed as wise and wealthy, the builder of the great Temple in Jerusalem. His reign is remembered as a Golden Age for the kingdom of Israel. Solomon's proverbial wisdom was amplified in subsequent Jewish, Christian, and Muslim tradition; he was portrayed as superhumanly knowledgeable, an authority on all things. Occultists cited Solomon as being the ultimate human authority on magic and alchemy. According to legend, he bound the *djinn* and built the Temple by the power of his magic -- in particular by the power of his Ring.

The Ring

The Ring was said to be a gift to Solomon from God, brought by the Archangel Raphael. According to the 19th-century French occultist Eliphas Levi, the ring is made of gold and silver, in the form of seven interbraided squares forming a circle. It holds two gems -- a white stone bearing the sign of the macrocosm set on one of the silver bands, and a red stone with the symbol of the microcosm set on a gold band. Wearing the ring with the white stone outward allows one to command spirits of light, while having the red one out gives power over spirits of darkness.

What makes the Ring so powerful is that it requires no ritual or preparation and can be used by non-mages as easily as mages. The wearer can simply summon and command spirits by speaking, and it appears that all spirit beings are *required* to obey. (It's not clear if actual *gods* could be commanded by the Ring, but there are plenty of occultists who would like to try it and find out.) The only limitation to its power is that the user must know the name of any spirit he wishes to call. A user who doesn't know any spirit names is limited to commanding whatever spirits he encounters -- though, of course, he could easily command a spirit to reveal its name, and thereby add it to the "buddy list" for future summoning.

In *GURPS Magic* terms, the Ring is a self-powered magic item which enables the wearer to cast Planar Summons, Summon Demon, Summon Elemental, and Summon Spirit, all with an effective skill level of 25. It has its own variant Powerstone enchantment, giving it a mana reserve of 100 points, which recharges fully each morning at dawn. The Ring's power cannot be used for other spells.

Since it once belonged to a revered king and prophet, and was possibly crafted by angels, the Ring is mystically significant in its own right. It gives its master an extra level of Magery -- but only when he actually wears the ring.

In *GURPS Cabal* terms, the Ring of Solomon is mystically aligned with the decans Iudal, Kurtael, and Sphandor. Any spell powered by those decans gets a +3 bonus if the caster wears the Ring. Because of the Ring's connection to an important figure in Jewish occult tradition, it may (at the GM's option) give the wearer the ability to freely enter and pass the Sephiroth.

Gamemasters should decide in advance what kind of supernatural beings are affected by the Ring's control of "spirits." The default assumption is that it controls angels, demons, *djinn*, spirits of the dead, and elementals. Gamemasters may

add or exclude faeries, pagan gods, the undead, astral beings, Lovecraftian horrors, beings of pure thought, space energy beings, Ascended Masters, Arisians, and whatever other possible "spirits" are likely to turn up in the campaign.

Finding the Ring

The Ring was owned by Solomon, but after his death its fate becomes unclear. According to some accounts the Ring was stored in the Ark of the Covenant, which would make the owner of that object supremely powerful. If it was in the Temple at Jerusalem, then it is curious nobody used the Ring to stop the Roman invasion which ultimately sacked and destroyed the Temple itself. If the Romans took it, the Ring may explain how their empire survived such a long time and achieved such tremendous worldly power. It probably passed out of Roman hands before the fall of the Empire.

After that it may have fallen into the hands of various Germanic or Norse tribes, as loot from their raids and conquests in Roman territory. The entire legend-cycle of the Ring of the Nibelungs may refer to Solomon's Ring, in which case it may rest today at the bottom of the Rhine, guarded by powerful water elementals. Norsemen ranged from North America to the Urals, and could have left the Ring anywhere.

If the Ring was kept by the Emperors of the Eastern Roman Empire (and the stories of the Emperor Justinian trafficking with demons may support that), the Ring presumably stayed in Byzantium until the coming of the Turks. It could be in some hidden Greek monastery, or among the treasures of the Ottoman conquerors of Constantinople.

Alternately, the Ring may have remained hidden on the site of Solomon's Temple, in which case the Knights Templar could have rediscovered it during the period they controlled the Temple Mount in Jerusalem. The Ring could then be the Big Secret of the Templars. Templar control of Solomon's Ring might mean it's hidden in Rosslyn Chapel in Scotland, or a secret Templar refuge in North America -- or that it was handed over to their occasional allies the Assassins, which would put the Ring in Alamut Castle in Iran (or in some hidden Mongol treasure-hoard after they sacked Alamut). It may even still be hidden under the Dome of the Rock in Jerusalem, in the fabled Well of Souls.

As with any magical item of power, adventures involving the Ring of Solomon are likely to center on finding it or getting it away from bad guys. It's especially appropriate for scenarios in which the heroes don't know what they have -- the historical possibilities outlined above mean the Ring could be found anywhere from Minnesota to Beijing. A group of PCs can be plagued by magically-aided burglary and assassination attempts for a long time before they realize that queer old ring is the reason for it all.

The people trying to get the Ring can be occult bad guys, The Cabal, spirits who want to destroy it to preserve their freedom, angels who want to take it back to Heaven, Kabalists, the royal house of Ethiopia, and, of course, the Templars. Or all of them at once!

Alternate Rings

Of course, the Ring doesn't have to be a supremely powerful magic item just because everyone thinks that's what it is. Here are some other possibilities.

Alien Communicator: Maybe when Solomon was commanding spirits he was really just asking his pyramid-building alien buddies for help. Antigrav beams built the Temple and orbital death rays defeated Solomon's foes. The Ring's gems hold one end of a submicroscopic interstellar wormhole, plus transmitting and receiving equipment. Will the aliens still come if you call?

Psionic Amplifier: In the ancient world, all magical effects were attributed to spirits. But Solomon has a reputation for incredible wisdom and insight -- was he psionic as well? The Ring might have been a focus or amplifier device for psi powers. It would increase any psi power by a good 10 levels, but the wearer uses his own skill. The question of who *made* the Ring could be very

One Ring to Rule Them All?

It is interesting to note that the scholar and author J.R.R. Tolkein wrote an epic fantasy about the quest to find and destroy a Ring suspiciously similar to Solomon's. Tolkein spent many years studying ancient texts in a variety of obscure European languages, and as an English Catholic and Oxford don may have been connected to the surviving

important.

Sacred Item: The legends are literally Gospel truth -- Solomon's power all came from the favor of God, and the Ring was simply an easy way for the King to communicate with the Lord. This is probably the most dangerous variant of the Ring, as anyone without the True Faith advantage (or the bloodline of Hebrew kings) may not be able to withstand direct contact with the Divine. They may pass out, undergo sudden religious conversions, or go mad. (Charitable GMs should reserve *Raiders*-style exploding head effects for truly evil characters who put on the ring.)

Adventure Seeds

The Ring of Truth

In the modern world, the heroes encounter a crackpot who is convinced that some prominent individual (a politician, tycoon, or celebrity) is secretly the owner of the Ring. The crackpot even has some blurry photos of the subject of his obsession, which seem to show a strange-looking ring on that person's hand. Utterly ridiculous -- until the crackpot is torn apart by unseen assailants. Can a group of ordinary people find a way to defeat the Master of the Ring?

Three-Ring Circus

Eliphas Levi's description of the Ring led a clever Parisian jeweler to create an unknown number of duplicate Rings in the late 19th century. Now someone is tracking down every ring which matches that description, and won't stop until he finds the real one (if it even exists). The heroes have a duplicate ring, presumably not the real one. Will they join in the hunt to keep a murderous megalomaniac from getting ultimate power? Are they willing to kill for it themselves?

Ring Around The Rosicrucian

A recent archaeological find in the Middle East includes an extremely well-preserved ring which exactly matches the description of Solomon's Ring. The entire global occult underground are scrambling to be the first to get possession of it. But what if the whole thing is a scam -- a kind of occult roach motel designed to draw all the most knowledgeable and unscrupulous operators in the magica world into a trap? Old enemies may have to work together against their unknown foe, with constant betrayals and shifts in allegiance the order of the day.

Jacobite Templars. There are intriguing hints of this in his masterwork *The Lord of the Rings.* Do Tolkein's Rangers represent the Templars or the *Prieure de Sion* (hidden guardians of a secret royal lineage)? Is the best-known fantasy epic of our time really a coded guide to the Ring's true location? Or is it a warning that the Ring of Solomon must be destroyed lest it fall into the wrong hands?

American Hercules: John Henry

"John Henry was a very small boy
Fell on his mammy's knee
Picked up a hammer and a little piece of steel,
'Lord, a hammer'll be the death of me,
Lord, a hammer'll be the death of me.'"
-- Fiddlin' John Carson, "John Henry Blues" (1924)

Here's another in our American pantheon, a demigod of the "bottom tenth," a supreme power for the supremely powerless. The story of John Henry is perhaps the best-known American folk story, and is the most intensely studied ballad in American musicology. For laying down the tracks in this strange line, I owe a great deal to Brett Williams' superb *John Henry: A Bio-Bibliography* and more again to Norm Cohen's magnificent *Long Steel Rail: The Railroad in American Folksong.* But where I drill my holes, hopefully, is somewhere new. And also hopefully, the tunnel won't fall in while we're there.

"John Henry told his captain,
'Man ain't nothing but a man
And 'fore I'd let that steam drill beat me down,
I'll die with this hammer in my hand.'"
-- version of "John Henry" collected by Zora Neale Hurston (1935)

John Henry was a big, black giant of a man, "the singin'-est man you ever saw," capable of prodigious feats of strength. He was a giant even as a baby, eating solid food from the first day. Although he prophesied his own death from it, he worked as a "steel-drivin' man" on the railroad line up in the mountains, which meant he pounded steel drills into the rock with his twelve-pound hammer. (The holes would later be filled with explosives to blow the tunnel open.) Sometimes, he would use two nine-pound hammers at once, a thing only someone of John Henry's superlative strength, timing, and expertise could do. He had a woman, the lovely Polly Anne, who cooked food enough for an army to feed his immense appetite. She tried to stay true to him, but he loved his work more than he loved her, and rumor had it that Polly Anne was known to stray.

And it came to pass that the railroad company was up against it, with a tricky stretch of hard rock between it and golden dollars. A tunnel had to go through the mountain, and the captain of the railroad brought in a new-fangled steam drill to hammer through the mountain faster (and cheaper) than his work gang could. But when John Henry heard of the new drill, he laughed it to scorn and told the captain that he could drill faster and harder than any steam engine. So they set up a contest, John Henry against the machine, with not just John Henry's job, but the jobs of the whole work gang, on the line. For two days and two nights, the machine and John Henry drilled away at the side of the mountain, and on the morning of the third day, with John Henry winning by five feet of tunnel, the machine broke down and blew up. John Henry had drilled the farthest, but he dropped down and died on the spot "with his hammer in his hand." Polly Anne, who had come down to see the contest as word spread, gave him his last drink of cold water, and took his body away in a boxcar, because John Henry was too big for any coffin.

"John Henry was hammering on the right side,
The big steam drill on the left.
Before that steam drill could beat him down,
He hammered his fool self to death."
-- W.T. Blankenship, "John Henry, the Steel Driving Man" (ca. 1915)

That's the version that I learned as a kid, from a mish-mosh of animated cartoons, New Christy Minstrels albums, Johnny Cash, and brightly colored library books. Virtually everything in it comes originally from one of the fifty or so versions of the "John Henry" ballad, the dozen or so versions of "The Death of John Henry," or from the related "hammer songs" sung by steel-drivers to keep time while they worked. The earliest hammer song -- "This ole hammer killed John Henry, Drivin' steel, baby, drivin' steel" -- dates back to 1905 in east Tennessee. The first evidence of the

ballad comes from western North Carolina in 1909, a single couplet: "Johnie Henry was a hard-workin' man, He died with his hammer in his hand." Fuller versions began appearing in print starting with Blankenship's Alabama broadside and a scholarly transcription by John Lomax in 1915. In 1924, Fiddlin' John Carson recorded the first version of "John Henry Blues," for the Okeh Phonograph Corporation. Even that early version has John Henry's infant prophecy, the contest with the steam drill, Polly Ann (and another "woman in blue"), and John Henry's death. W.C. Handy and other blues pioneers picked up on "John Henry" as well; some scholars even trace the phrase "rock and roll" to the ballad, since the "shaker" who holds the drill for John Henry to strike has to rock and roll it to shake the dust out of the shaft.

One interesting thing about this early phase is how much of it was white. White miners sang the 1905 version, apparently under the impression that John Henry was a white man, and the ballad early on shows influences from Scottish songs and English narrative structure. The tune was from an English folk song, "Earl Brand." Blankenship was not only a terrible poet but a white man, although Lomax' contemporary version is collected from African-American sources. "John Henry" had just as strong a place in "hillbilly" (country music) repertoires as he did on "race records," blues recorded for black folk. (Some versions split the difference, calling him a mulatto, or making Polly Anne "a blue-eyed girl.") And black folk knew him only through records and songs, not in tales or stories. Anthropologist Zora Neale Hurston, who certainly was in a position to know, insisted that "John Henry has no place in Negro folk-lore except in this one [song]." That was true in 1935 when she wrote it. But Roark Bradford published a "Paul Bunyanized" novel about John Henry in 1931 (and Henry Ford of all people serialized part of it), and later story-tellers added tall stories of their own to John Henry's reputation. So John Henry wound up stoking on the steamboat *Robert E. Lee* or building levees in New Orleans in a day or spitting to put out fires or wrestling wildcats or, by the 1970s, playing baseball with [Paul Bunyan](#).

"When Henry was 'tween them mountains
The captain saw him goin' down.
He supplied to Henry one day,
Tried to pacify his mind,
Says 'Henry you knows you's a natural man.'"
-- version of "John Henry" recorded by Harold Courlander (1950)

But like [Robin Hood](#) and King Arthur, there just may be a historical John Henry casting all those long shadows. The more restrained ballad claims for John Henry's fatal prowess -- fourteen feet of shaft drilled in 35 minutes -- would be record-breaking if true, but not superhuman. The search is not made easier by the fact that "John" and "Henry" were the two most common black male names in the Reconstruction South, and there were eleven "John Henrys" on the rolls of free black householders as early as 1830. Leaving aside arguments for Kentucky, Georgia, and Jamaica of all places, there are three solid contenders. In the 1920s, rival folklorists Guy Johnson and Louis Chappell both settled on the Big Bend tunnel (drilled between 1870 and 1872) in West Virginia, which had the advantage of being on "the C&O line." Indeed, many versions of the ballad mention the "Big Bend Tunnel" specifically, and both Johnson and Chappell managed to collect a good number of personal testimonies of Big Bend miners who claimed to have known about the contest or known of John Henry. They set the date of the contest in 1871, although the complete absence of any evidence that the C&O used steam drills on the Big Bend Tunnel is one flaw (along with the not insignificant inconsistencies in the hearsay testimony) with this solution.

In 2002, folklorist John Garst plumped for a theory discarded by Johnson and Chappell, which places John Henry on the *C&W* line in Alabama, specifically the Oak Mountain Tunnel near Dunnavant (or possibly the Coosa Tunnel near Leeds). He, unlike Johnson and Chappell, found a partial "John Henry," one Henry Dabney, a former slave who shares a name with the "Captain Dabner" or "Dabney" who in some versions of the ballad was John Henry's master back in slavery days. Captain Dabney was, as it turns out, the chief construction engineer on the C&W. He also has personal testimony (including from a claimed eyewitness, C.C. Spencer) and local legend to back him up, and sets the date of the contest on September 20, 1887. Although there's no evidence (except Spencer's letter) that Henry Dabney was named John or drove steel, he did have a wife Margaret, who could have become the otherwise-inexplicable "Maggadee" ("Maggie D" for "Dabney") in one version of the ballad.

In 2005, the historian Scott Reynolds Nelson published a new theory that John Henry was actually "John William Henry," a black convict laborer leased out by the C&O railroad to work on the Lewis Tunnel in the 1870s, where there

were actually steam drills. Nelson found holes in the record implying that John William Henry (along with at least 400 other convicts) died before 1874 while working on the railroad, and suspects the cause was silicosis from the dust thrown up by the primitive steam drills. Thus, the steam drill killed John Henry, but not as the result of a dramatic contest. The trouble here is that his "John Henry" is listed as 5 foot 1, which is a little small for a legendary giant. Also, there's no evidence that John William Henry ever worked as a steel driver, and Lewis Tunnel, unlike the Big Bend and Coosa Tunnels, has no John Henry after-the-fact testimony, or even legend, attached to it.

"All de womens in de wes',
When dey heared of John Henry's death,
Stood in de rain, flagged de eas'-boun' train,
Goin' where John Henry fell dead,
Lawd, Lawd, goin' where John Henry fell dead."
-- version of "John Henry" collected by John and Alan Lomax (1934)

And it is the legend that concerns us here, and given that it only had about three generations to grow before being "fixed" by records and Bradford Roark's novel, it is a surprisingly varied and rich one. Magical elements enter it fairly early, from John Henry's infantile premonition of his fate to actually being "born with a hammer in his hand." In a 1925 version, he visits a land overflowing with more food than he can eat, the [Big Rock Candy Mountain], in other words. In other versions, John Henry has the "blue gums of a conjure man," and his strength comes from being "double-jointed," which add an eerie frisson of alienness to the ostensibly pure archetype of humanity, "just a natural man."

But natural or supernatural, he is a mythic hero in the best sense. The parallels with Ogoun, the Voudun smith-loa -- fire and steel and hammers -- are inescapable, but there's much more. Like Heracles with his snake, he holds the instrument of his death as a baby, and like Heracles sexual jealousy or exhaustion may have played a part in it. (One doesn't have to be a Freudian like Alan Lomax to think that sometimes hammering is more than just, well, hammering.) Like Samson, in some versions John Henry is struck blind, or he caves in the mountain with his drilling. He likewise shares Samson's connection with a whore -- in one version of the ballad, John Henry's woman is named "Mary Magdalene." Even when Polly Anne is there, she is sometimes balanced by a "Witching Woman" who may be the "woman in blue" who seduces John Henry and weeps at his death far from her, or the midwife who delivers him, or both. The Nineve parallel obtrudes here, and the Arthurian aspect of John Henry becomes even stronger when you read the Lomaxes' version above, about the "women in the west" associated with water ("stood in de rain") who travel to the site of his death. Again, like Arthur, he often gives last orders for the disposal of his hammer in water, and also like Arthur, he dies with his society -- the steam drill comes anyway. Even better, some versions have John Henry taken up North (the equivalent of Avalon to black convict laborers, no doubt) to be healed by Polly Anne or the woman in blue or both. And if that isn't the afterlife you seek for John, well, his ghost (not John Henry [Pepper's Ghost]) haunts the Big Bend Tunnel to this day.

"Oh, they ain't no tale was ever wrote
'Bout Big John Henry that could start to tell
All the things that Big Boy knowed so well:
How he learned to whistle from the whippoorwills,
And turned the wheels whut ran the mills;
How the witches taught him how to cunjer,
And [cure] the colic and ride the thunder. . . ."
-- Margaret Walker, "Big John Henry" (1942)

The literary versions get even stranger. One James Cloyd Bowman also noticed the mythic parallels, publishing *John Henry: the Rambling Black Ulysses* in 1942. In this book, John Henry is a conjure baby, built out of [John the Conqueror] root and iron filings from a drill, set afloat on the bayou like Moses. Harold Felton's 1950 novel has John Henry born with a hammer in his hand under a blood red moon; he works as a fireman for Casey Jones, among other adventures. He gains a sidekick, his shaker Li'l Bill -- in Bradford's novel, he had an archenemy, a rival railroad worker named Sam. He even has a rival folktale -- John Harrington Cox, the first scholar to collect John Henry ballads, confused them with the overlapping ballads of "John Hardy." John Hardy is more of a Stagger Lee character,

who celebrates his gambling, whoring, and drinking and comes to a bad end on the gallows. The real John Hardy apparently tried to assume the mantle himself, confessing to Governor McCorkle of West Virginia before his 1894 execution that he had been the legendary "steel-driving man" of Big Bend.

"They took John Henry to the White House,
And buried him in the san',
And every locomotive come roarin' by,
Says there lays that steel drivin' man,
Says there lays that steel drivin' man."
-- Cincinnati version of "The Ballad of John Henry" (ca. 1925)

John Henry is a true-born prince of the American cantosphere, who shook off John Hardy, walked proud through the Big Rock Candy Mountain, and tied Paul Bunyan at baseball. As such, he deserves to be buried, as the Cincinnati version above has it, in the White House. Buzzkill Scott Nelson points out that the prison house at Richmond was a white house, but John Garst counters that "white road" is probably older, and could refer to the white gravel roads of Alabama. Better still is the still more obscure ballad term "smoky road," the railroad itself, the core and spine of the John Henry tale. Whether born in Alabama or West Virginia, the railroads carried John Henry from tunnel to tunnel, and every line became his home line. Like his father-uncle-cousin John the Conqueror, he travels on the "waves of sound," not Conquer John's drumming, but the clack of train wheels and the ringing of steel on steel and steel on stone. He is defeated by the machine, but lives by the machine -- the phonograph record and the railway again. And like all conjure men and tribal heroes, his power is in his name, which echoes far and wide in its own right. He has the name of a million black men, and of two mighty significant whites: the name of the South's other wounded king, [John Henry Holliday](#), and of its martyred *dux bellorum,* John Henry Kagi, who rode with John Brown in 1859. (There's another John Henry who [we've met](#) in connection with death on a railroad, John Henry Patterson.) Kagi was a blacksmith's son, born to the sound of ringing hammers, and a gunfighter like both John Hardy and John Henry Holliday. He disappeared in the raid on Harper's Ferry, just below the West Virginia mountains where -- maybe -- John Henry still lives.

Sudoku: The Card Game

Published by [Z-Man Games](#)

Designed by Reiner Knizia

Graphics by Joshua Cappel

54 cards (nine yellow, 45 blue), rules; boxed, two to five players; $15

If you've never tried your hand at the Sudoku puzzle in the "living" section of your local newspaper, you don't know what you're missing: tired eyes, an aching head, frustration, a torn up "living" section from your local newspaper . . . but help is on the way. *Sudoku: The Card Game* from Z-Man Games (the company distinction is worth making because more than one company is putting out board and card versions of this pastime) releases it from its one-solution limitation and turns it into a freeform mental endeavor.

The object of the game is to have the fewest points left in your penalty stack.

For those not familiar with the standard game: [Sudoku](#) has a set of three-by-three grids and asks you to fill the smaller boxes with numbers one through nine so that every line and column in a larger layout uses every number just once. In this game, a single yellow card is placed in the middle of the table. The remaining cards are shuffled and everyone is dealt a hand. Yellow cards are the points around which the rest of the game revolves. Blue cards are situated about the yellows.

You're not stuck making the same three-by-three grids -- not exactly, anyway. There are nine yellow cards (one with each digit), and you have to surround them with blues. Each number can only appear once in any set of nine cards, so the yellow "one" card can only have blue cards two through nine around it. The blues frame the yellows, so new yellow cards go on the other side and the two yellow cards "share" the blue cards between them.

Also like the newspaper puzzles, you can't have the same number twice on the same line, up and down or side to side, no matter what color the card is. You can spread your game all over the living room table if you like, but you're only going to get so far building in any direction without staggering the rows or columns. If you cannot play a card, or if you play one in the wrong place and an opponent catches you (and tripping up is actually pretty easy if you're not careful), you have to take a card into your penalty stack. Blue cards count for one point and yellow cards count for two, and whoever has the fewest points against him at the end of the game wins.

The cards are square, which makes shuffling slightly harder, but they're good material. The number graphics are somewhat annoying because they can look alike from some angles or when overlapped in your hand (they're stylized Asian characters). The box . . . if you have any valuables you need to secure, put them in this container and you'll never get them out again. The top and bottom are perfectly flush, making separation almost impossible without jamming your fingers in between them. On the other hand, if you're willing to fold your rules up, you can forgo the box and the entire thing fits into any pocket.

Not that you're going to need the rules for long. It should stick after the first game or two. The one area of uncertainty is whether you can continue the blue card pattern without sticking a yellow card in among them. Everything suggests that no, you can't, and in fact it seems tough to stick anyone with penalty points if they can avail themselves of such an out, but it's one of those things you really wish the designer would have made note of in no uncertain terms. Otherwise the instructions seem flawless and learning the game takes only a few seconds.

At first you'll wonder how it's possible to lock yourself out of playing, but eventually your avenues of play begin disappearing. Before long you have to double-check your plays to make sure you haven't done anything wrong. Deliberately interfering with your opponents' strategies doesn't seem possible, though you end up playing in a lot of the same spaces anyway. The penalties don't come until closer to the game's end, but it seems unlikely you can avoid any consequences. The yellow cards make it easier to place blues so you hang onto them, but at the same time that delay may mean you're stuck with them during scoring.

If you like the one you play in the morning paper, you'll probably find **Sudoku: The Card Game** an entertaining activity. Even before the endgame you're agonizing about how and where to play, and it feels pretty similar if not as exasperating. If you're not a fan, eh . . . less so. A long delay before penalty points accrue (and few of them assigned even then) and an inability to turn the fascinating number play into a real strategy makes Sudoku feels even more like your morning paper. The outcome has been decided, and how long it takes you to get there is the only element you can really affect.

Pyramid Review

Ken Hite's Dubious Shards

Produced by [Ronin Arts](#)

Written & Illustrated by Kenneth Hite

108-Page Perfect Bound Black & White Book; $11.95
78-Page 6.3 Mb Black & White PDF; $11.95

Something old, something new, none of it blue. Most of it green. As in Great Cthulhu and *[Delta Green](#)*. Which is what you get with *Dubious Shards,* an anthology of writings from the pen of Mr. Kenneth Hite, self-styled heresiarch,* and author of such erudite tomes as *[Nightmares of Mine](#), Suppressed Transmission, GURPS Horror,* and *GURPS Cabal.* And all of the entries in this volume are for his favorite game, *[Call of Cthulhu](#)*, and its inspiration, H.P. Lovecraft.

* His Cult being the only one that would I happily pay the membership fees for -- now where do I apply?

A slim volume, *Dubious Shards* is divided into three sections: Lore, "The Winslow Project," and Criticism. The first and third sections are comprised of several short essays, while the second, "The Winslow Project," is a scenario originally intended for Pagan Publishing's *Delta Green.* Only three items are wholly original to this volume, these being "The 'How' Of Hastur: Ruminations on Applied Yog-Sothothery," the scenario, and "The Man Who Shot Joseph Curwen." The rest originates either here on *Pyramid* or upon the author's Live Journal.

The Lore section opens with "The 'How' Of Hastur: Ruminations on Applied Yog-Sothothery," a discussion of how to detect the Mythos. Or rather, how to work it into something -- in this instance, a roleplaying scenario -- and make it detectable to others. At its most simple, this involves making connections between disparate pieces of information, recognizing patterns not readily apparent, and drawing from the myth sources that you know and interpreting them through the Mythos. Throughout Hite shows us how Lovecraft did it in his fiction, but the reader is left wanting to see how Kenneth Hite would do it.

And then Mr. Hite shows us. Five Essays follow, all recognizable to the *Pyramid* reader as Lovecraftian-themed Suppressed Transmissions all. "[The Trail of Dagon](#)" explores the origins and reach of the piscine deity, while "[Irem, The City of Pillars](#)" does the same for the Arabian Peninsula's lost city. Lovecraft's own fascination with New England's vampire legends comes to the fore in "[Vampish Vapours in the Shunned House](#)" as we are taken "[Down to Dunwich](#)" in an excursion to Lovecraft Country's English counterpart. Finally, the inspiration for this volume comes under the same viewing glass in "[The Shadow Out of Lovecraft](#)." This last essay does not quite work, but then again it does. Its problem is that as fascinating as we find Lovecraft's life, he was still very ordinary, so in making the connections, Hite is almost overreaching himself in making too much of Lovecraft's life and pushing at the limits of his pattern recognition.

Of the other quartet, "The Trail of Dagon" breathes new life into the now non-fishy god, suggesting how a GM (in another conspiratorial game) or a Keeper could take him away from the shore, while "Irem, The City of Pillars" is an example of the process without easy application. Although a good read, how and where you would use it is not something it readily suggests. "Vampish Vapours in the Shunned House" brings together consumption, vampirism, and men of letters in a fascinating read just as "Down to Dunwich" explores the fascination held by various poets with the washed away medieval port on the Suffolk coast. Besides its history, it also ties the town into several legends of undersea cities, the overall effect making it particularly suited to a *Gloriana*-era RPG. It should be made clear though, that none of these essays have been annotated, something that we can wait for.

At 30 pages, "The Winslow Project" is the longest piece in the book. Originally intended for use in the still-unpublished *Cult of Transcendence* supplement for *Delta Green,* the author has unshackled the scenario from its original use to make it suited to a contemporary *Call of Cthulhu* campaign. Except in being almost a decade old, it shows its age. Or rather, our world has overtaken it, as the idea of being under near constant surveillance is less of a shock than it would have been in 1998. "The Winslow Project" focuses upon a town that is a perfect microcosm of the USA, intentionally so, since it has been used a test bed for decades to determine the reaction of America at large to "innovations" such as ATMs and "voluntary" drug tests. What draws the investigators to Winslow is the coincidence of four odd deaths tied to the town. The same four deaths are reason enough for the Project's masters, their exact identity being left up to the Keeper (although suggestions are certainly given), to close the Project down leaving no traces.

The focus of the scenario is not fighting the Mythos; indeed, the Mythos makes almost no appearance here. Instead, the investigators must find out what is going while under near constant surveillance and -- if the characters are Federal Agents -- up against helpful obstruction. "The Winslow Project" is suited to beginning characters as well as *Delta Green* agents or friendly associates, and as the jumping off point into a much larger conspiracy. The scenario's small scale and its conspiracy with a small "c" also makes it suited for use with other conspiratorial RPGs. Overall, "The Winslow Project" is a good *Call of Cthulhu* scenario, an even better *Delta Green* scenario, and pointedly obvious that Ken Hite should be being paid to write more *Call of Cthulhu* material.

The last section, "Criticism," contains only two pieces. The first is "The Shadow From The Right," a review of *H.P. Lovecraft: Against the World, Against Life* by Michel Houellebecq. Essentially, this is counter argument and a refutation of the French author's thesis that Lovecraft's writings were driven by his racism, xenophobia, and reactionary leanings. Despite not having read the book in question, this is still a fascinating read and a convincing argument.

Finally, the aptly named "The Man Who Shot Joseph Curwen" takes us out West to face the Mythos, though not to wear a white hat and gun down the black hat. No, Hite's core tenet is that *Call of Cthulhu* is the only RPG with a moral drive (that is, until the appearance of D Vincent Baker's *Dogs in the Vineyard,* itself a Western-set RPG). Just as the white hat gunfighter is forced to take up the gun to deal with the black hat outlaw to protect society and in doing alienates himself from society, so the investigator is forced to use the Mythos to stall the greater Mythos, and thus make themselves outcasts. In some ways, this is the most accessible of the anthology's essays, and really defines the role of the *Call of Cthulhu* investigator.

Published by Phil Reed's Ronin Arts, *Dubious Shards* was originally released as a book at Origins 2006 in a limited run, but is now only available in PDF format. The book is simply laid out, the only illustrations being those drawn by the author himself. This is his "Tarot of Cthulhu" (not the first Lovecraftian themed tarot though), a scratchy set of pen and ink drawings that surprisingly hints at the cosmic nihilism of the source. They are really not bad, but in suggesting that Mr. Hite not give up his day job, my intention is that he keep writing rather than drawing.

Enjoyable, thoughtful, and thought provoking, *Dubious Shards* is also an odd book in that it beings together degrees of Lovecraftian scholarship and Lovecraftian gaming in one volume. This may mean that there is not enough of either to completely attract either audience, though I suspect that *Dubious Shards* will appeal more to the Lovecraftian gamer, and then the Hitean scholar even more. This, at least, suggests an explanation of the anthology's title. Throughout Ken Hite's *Dubious Shards,* though, what shows is the regard with which he holds both game and author, and that regard deserves more space.

--Matthew Pook

Contrivance and Contrivability

In a way, your average RPG campaigns are lucky; they don't aspire to be great works of art. This isn't to say they *can't* rise to such ideals, but hate normal expectations of artistry -- even "bad" artistry -- don't apply. Thus players (and GMs) are much more accepting of elements and contrivances that, in most other forms of media, would elicit something between an eyebrow raise and outright guffaws of disbelief.

I thought bout this aspect on Tuesday night and Wednesday morning as the election results for our country started rolling in. Over in Mark Evanier's [blog](#) (which I've cited from time to time, and who has direct bearing on this column because he was the developer and one of the writers for the *Dungeons & Dragons* cartoon), he points out that -- if you were writing a political-type drama such as *The West Wing* -- you couldn't make up the nail-biting cliffhanger unfolding as happened, since audiences wouldn't believe it: "Oh, c'mon; you mean, one party needs to win three out of three Senate races to gain control of the entirety of Congress, and all three are too close to call, with differentials of a few thousand votes apiece?! Yeah, right . . ." (I was overcome with a similar feeling of dramatic unbelievability in 2000, when the ping-ponging election resulted in a handful of votes making the difference in my then-home of Florida, ultimately boiling down to a week-long drama unfolding in my city. I kept expecting a Carl Barks-esque revelation along the lines of, "According to a previously little-known law, a super-vote worth 1,000 votes is granted to the resident who owns the longest piece of string . . .")

Fortunately, the real world isn't constrained by the requirements of believable drama. And neither are RPGs. Your standard gaming campaign is filled with clichés and implausibilities that would make anyone with a literary bent roll his eyes. The hopes of the world hinge on finding the Amulet of Wernda, on discovering the antidote with 24 hours, on recovering the Fifth Element. (Boron?)

In what may be the ultimate irony, the reason RPGs are contrived is the same reason more literary fare isn't: the actions of characters (or PCs) are the most important thing. In non-contrived creations, the actions of the protagonists are presumed to be somewhat obvious; when the daughter of the main agent character in a movie happens to be suspected of going rogue with the nation's secrets, then it's a yawner to the audience when the agent himself goes rogue in an effort to track her down. But in an RPG, the actions of the players are *never* obvious. Sure, the GM might have a good idea as to what the folks on the other side of the duck blind are going to do, but he never knows for sure.

In fact, there's one ability the players have that the protagonists in other media hardly ever have: the option of saying, "No." Think about it: You go to the movies, sit down to see Gilly Terrium's new film *XII,* and the first 15 minutes detail the premise about how a dozen monks are going to be infected with an apocalyptic virus and released into the streets of New York City. And the heroes, listening to this tale, go, "Hmm . . . well, I think we're going to hide in New Jersey until this boils over."

Or, "Hmm . . . what's in it for us? Can we negotiate that reward higher?"

Or, "Hmm . . . I think we'll try to capture one of the monks and keep him in reserve for the future. Just in case."

In this hypothetical movie, it's entirely likely that anything the heroes end up doing will wind up having a certain "been there, done that" feeling to it. In the RPG version of this scenario, though, it's entirely likely that many actions the heroes attempt will feel fresh, either in the actions or the results. GMs and players aren't constrained by the need to wrap up tidily in two hours, or to tie up any loose ends, or definitively conclude storylines, or even make *sense.* (I've had more than one storyline where, in discussing the events with the players a few months later, none of us were exactly clear on what had happened.) In our "rogue daughter" scenario, maybe the heroes will go rogue themselves, or maybe they'll try to enlist the aid of their agency, or maybe they'll concoct a plot with the higher-ups with the organization to make it *seem* that they've gone rogue, but only in an effort to lure out the gal.

In many gaming groups (certainly most of the ones I've been in), contrived situations provide an ideal situation for acting against expectations. In a lot of ways, they provide an outlet for our movie-watching, book-reading selves to act in ways that their counterparts in fiction cannot: "Now look . . . there's a zombie horde attacking the city. Why doesn't

anyone try to capture one for research instead of fighting them ineffectively one at a time?" Well, nothing except GM fiat keeps them from trying in an RPG.

Remember: There's hardly any sense in trying to be [utterly original](#), and even the most contrived situation must have been a fresh innovation at some point (although, admittedly, this might around the same time that the Dead Sea Scrolls were still alive). But the reactions and interactions of characters -- like those provided by the players and GM -- can still provide a world of interesting situations and outcomes.

Even if it's an hour until the galactic senate is about to appoint the sinister Eve Ill to the post of Empress unless the 13 missing senators are returned . . .

Frazer's World

for *GURPS*

by Terry Carlino

In 1890 the greatest theoretical theurgist of the modern era, Sir James George Frazer, published his breakthrough description of sympathetic magic, The Golden Bough. Like his 20th century pupil Albert Einstein, Frazer possessed not a whit of the genetic makeup that would let an adept use the power of the universal mana to directly manipulate the laws of magic. His contribution was to codify the first two laws of magic. The direct result of Frazer's work was the advancement of magic from a poorer cousin of the burgeoning sciences to the preeminent roll in man's mastery of physical world, and his march into the modern age.

The principles of magic can best be described as embodied in the Law of Similarity and the Law of Contagion. These are systematized versions of the manipulations of symbols to cause effects in the physical world.

Basically, the Law of Similarity says that like produces like. So if a magician wishes to make it rain he can create a model of a location and use a sprinkling can of water to create an effect similar to rain and it will rain in that location. Except, of course, it won't.

That is where the Law of Contagion comes in. This law says that things which have once been in contact will continue to act, one on the other, after physical contact has been severed. So our magician, to achieve the effect he desired, must fill his watering can with rainwater -- that is, water collected directly from a rainstorm. Then he can cause a storm, limited to the time he can continue to pour the rainwater on his model.

Of course, Frazer did not merely state these laws; he mathematically inferred them, using the sigil representations he developed, most scholars agree, based on work he did while in Greece.

Any adept with a hope of being able to do magic must master at least a working knowledge of the laws of magic. Anyone hoping to create new magic techniques or devices must have a deep mastery of theoretical magic.

History

The introduction of magic into a world already mastering the physical sciences had a profound effect. Frazer's work was quickly verified by scientists and students of the occult throughout the western world.

The existence of magic had a great effect on the dominance of the wider world by western civilization. Already technologically inferior, the fairly ineffective hedge magic of the indigenous peoples of Sub-Saharan Africa and the Asian continent allowed strategic dominance by Western Europe and the Americas.

Advances in the United States in the mass production of enchanted articles was quickly copied in Europe, especially in Britain and the German Empire. This resulted in a magical arms race. Many times during the next decades the nations of Europe almost went to war.

However, the presence of magic as often prevented war as pushed the nations of Europe closer to it, as is attested by the attempted assassination of the Archduke Franz Ferdinand of Austria. Only the presence of his wife, Sophie, Herzogin von Hohenberg, a master magician, prevented a sure death and most surely a bloody war. The rapid discourse allowed via enchanted communication devices allowed war to be averted. Another side effect of Archduchess Sophia's actions was annulment of her morganatic marriage by the Vatican to allow a dynastic marriage, which resulted in the eventual ascension of their son Archduke Maximilian to the throne of Austria-Hungary-Croatia.

The peace was finally broken in 1933 when the National-Socialist German Workers Party seized power in German in response to Pius XI's 1932 encyclical *Ob Magicum.* The Vatican's acceptance of magic has been attributed to the progressive Jesuit Superior General Wlodimir Ledochowski, who had close ties to the Austrian aristocracy, as well as a strong strain of magery in his family. His sister was Saint Ursula Julia Ledchowska, foundress of the Congregation of Ursuline Magus Sisters of Agonizing Heart of Jesus, an order of magician clerics.

The Nazi attempts to seize power in the Triune Monarchy was initially taken through Englebert Dolfuss, who attempted to insinuate himself into the government of King Maximillian. Dolfuss was assassinated by elements of the Austrian Secret Police based on information obtained from Serbian nationalists.

The failure of the National-Socialist Party to seize power in Austria-Hungary-Croatia did not prevent them from persecuting adepts in Germany. The so called "religious wars" resulted in the establishment of concentration camps where mages and Jews were sent. Especially persecuted were clerical magicians, who were seen by the Nazi party as especially dangerous to the Government's ability to control information and as being unreliable, due to their connection to the Vatican.

The World War broke out when the Nazi German government moved overtly against the Triune Monarchy of Austria-Hungary-Croatia in 1938. The Germans were repelled by the might of The Magic Defenders of The Kingdoms and Lands Represented in the Imperial Council and the Lands of the Crown of St. Stephen. Germany quickly harnessed the talents of its captive magical population, turning its concentration camps into work camps where hapless mid-level mages were guarded by demons bound to the service of the Reich.

British support of the German move, based primarily on support of King George V of the suppression of both Catholics and adepts, extended the conflict into a wider war. France came to the support of the Triune Monarchy, as did Italy. The Russian Empire, which coveted lands along the Hungarian-Ukraine border, and which had long repressed its non-clerical adepts, entered on the German side in 1940.

The United States, at first a neutral provider of enchantments to both sides, joined on the side of the Triune Empire after the discovery of the famous Zimmermann dispatch, an encoded message being carried by a familiar to the German Ambassador in Canada, instructing her to propose an alliance with English Canada promising financial assistance in restoration of its former territories in Quebec and additional territory in New York and Michigan. The message itself was intercepted by Austrian agents and quickly passed to the Quebec and American governments.

With combat taking place on every continent, from the North American Great Lakes to the Indian subcontinent, the casualties among both the mundane and the adept were horrendous. Under the encouragement of his former student, the Hungarian-American master magician Le Szilrd, Albert Einstein sent his famous letter to President Joseph P. Kennedy urging the study of the advanced planar/apportation spell, under fears that the Nazi government would be the first to develop the ability to apportate hellfire from another plane. The development of these basic elemental weapons became the massive Oak Ridge project carried on in the research laboratory on Manhattan's Randall Island.

The United States use of this spell against the German city of Dresden and the Russian city of Volgograd in 1947 ended the war, but at horrific loss of life. Britain was able to make a separate peace in 1946, though it lost a good part of its western Canadian lands to the United States and of its eastern Canadian lands to Quebec. With the loss of India to American OSS (Office of Special Sorceries) backed rebels and its African territories (picked up in the early 1900s from the decaying Ottoman Empire) to the Vatican backed Italians, the British Empire effectively came to an end.

Frazer's World now sets in an uneasy period of reconstruction. The 1950s see Germany split between the American occupation force in the east and the French occupation force in the west. Italy is generally unhappy with this state of affairs, as the French government is not especially friendly to the Vatican. The 1956 election of Joseph P. Kennedy Junior, a decorated war veteran, master magician, and Catholic, speaks well for continuing good relations between the Italian Papal States and the United States. Russia was much too big for the Triune Empire to swallow, and -- though unhappy with the American forces arrayed on their border -- console themselves with the Slavic lands of Ukraine and Bellorussia. A shaky Russian Monarchy still holds its trained adapts in special villages and ghettos, while pressuring the Church to limit its number of magicians.

Personalities

The following individuals other than Frazer were key individuals in the development of the modern magical world.

Thomas Alva Edison

Edison started out working in the mundane sciences. He was one of the first to apply the principles of mass production to magical as well as mundane research, though he himself was only a mediocre magician.

His first mundane patent, the electric voice recorder, was granted in 1868. In 1876 he set up his Menlo Park Laboratory. In 1883 he hired Frank J. Sprague, an accomplished mathematician and engineer. In 1884 Nikola Tesla also came to Edison's New Jersey plant. Though both men only did mundane research for Edison during this period, which was prior to the publication of Frazer's research, both were later to make significant contributions to the study of Theurgy. Both left Edison's employ prior to 1890.

Edison prevailed on Frank J. Sprague to rejoin his organization in 1891 to investigate the new magical phenomenon detailed in Frazer's papers. Eventually Edison was award no less than 47 magical patents, truly the "Wizard of Menlo Park."

In 1891 Tesla also established his 35 South Fifth Avenue laboratory to investigate Sympathetic Magic. His work in this area was always groundbreaking, though in his later years Tesla became known as a Dark Magician. Though Tesla's official record ascribes his date of death as January 1943 there have been rumors for decades that he was still alive. What is known is that after his reported death the Federal Bureau of Investigation instructed the Office of Magical Affairs to take possession of his papers and property from his rooms at the Waldorf-Astoria Hotel in New York City. The present location of these articles is unknown, though they might be in one of the Smithsonian Institution's private storerooms.

Albert Einstein

In 1891, Albert Einstein taught himself Euclidean plane geometry and calculus at the age of 16. In 1894 he began studying Frazer's work, and in 1895 performed his famous thought experiment known as Einstein's mirror, which became the bridging postulate on the interaction of the Laws of Similarity and Contagion which he would later be formalized in special relativity.

In 1900 Einstein wrote his first paper titled *Folgerungen aus den hnlichkeittserscheinungen* ("Consequences of the observations of similarity phenomena").

Einstein's lack of any magical ability prevented him from finding a teaching post, despite his grasp of theoretical magic. The father of a classmate helped him obtain a employment at the Swiss Patent Office in 1902, where he served as a technical assistant examiner for magical inventions. (See the section on magical patents.)

In 1903 Einstein married Meleve Maric, who was both a talented theurgist and an accomplished master magician.

He obtained his doctorate in 1905 with *Eine neue Ermittlung der Ansteckung* ("A new determination of Contagion"). That same year he wrote several papers, one of which was on special relativity (that is, on the interaction of the Laws of Similarity and Contagion).

Most interestingly enough, though Einstein is better known for his work on relativity, it was his work in apportation that garnered him the Nobel Prize.

In 1915 Einstein presented his explanation on his theory of magical binding, known as general relativity.

The religious wars in German in the 1930s caused Einstein to emigrate to the United States, where he was teaching as

a guest professor at Princeton University. He accepted a position at the Institute for Advanced Magical Study in Princeton Township.

Einstein spent his time working on a unified field theory, whose purpose was to unify the laws of magic with the laws of physics. This was a universal mathematical approach to reducing the different phenomena to a coherent whole. He was ultimately unsuccessful in his attempts. He died in 1955 leaving the Generalized Theory of Fundamental Forces unsolved, or at least unpublished.

Henry Ford

Ford first worked with Edison in the perfection of magical devices. In 1903 he raised $28,000 in capital and started the Ford Enchantment Company. He perfected the process by which mages of poor to mediocre talents could produce devices with multiple enchantments via the use of the assembly line. This allow device which up to this time had to be produced by time intensive labor of master magicians to be mass produced.

The World

Magical Patents

Magical patents are granted on the basis of enchantments of magical objects. The most common of magical elements, binding compound, was made unpatentable, at least in the United States, by the Magical Properties Act of 1922. In order to secure a patent it must be proved that the enchanted item was produced using a magical method which could be followed by a person skilled in the art to make and use the item and which is not already either patented or in the public domain. In some countries, like the United States, it must also be novel, non-obvious, and useful, most notably for industrial application.

Mana

Frazer's World is a high mana world. For game purposes fully 2/3 of the population can be considered to have Magery at some level. Most have Magery 0. Anyone working as a magician should have at least Magery 2. A Master Magician will have at least Magery 4 as well as a new skill, theurgy, the Sympathetic Magic version of Thaumatology.

Theurgy *(IQ/Very Hard)*
Default IQ-6 Mathematics-4

This is the academic study of Sympathetic Magic. Anyone can learn this skill, and it is not easier for mages. Anyone can learn the elements of common spells, but unless they possess a high level of Theurgy they will be unable to create new spells. Theurgy is a highly mathematical skill, akin to quantum physics or nuclear engineering.

In the modern western world the study and use of magic is regulated. Testing of magical ability is routinely done while a child is still in elementary school. By high school it is quite common for programs to divide adepts of mediocre talents and mundanes from those destined to pursue more advanced study. A number of trade schools and vocational programs prepare low-level mages for work in the many enchantment factories which turn out the magical products that drive the U.S. and European economies. While many mundanes and less-interested adepts go on to study the mundane arts and sciences, it is a rare mundane who get a slot in the programs of the well-known programs of the top Theurgy Universities like MIT and William & Mary.

A PhD in Theurgy is not a prerequisite for a master magician's certification, but one would have to be very talented indeed to succeed in passing the Inquiry without one. In the United States every state but Virginia and South Columbia requires that an aspirant for a master magician's certification have a doctorate from a recognized university program. In those states a journeyman is still allowed to apprentice to an individual master for a proscribed time before facing the Inquiry, in lieu of university education.

A journeyman's license is all that is required to practice common magic and is easily obtained through any number of trade schools or the Magic Practitioners Union.

Most clerical magicians are certified through the church and their ability to practice is recognized by most governments under the Treaty of Montreal.

The Magician's Toolbox

Sympathetic magic requires that the practitioner use a number of otherwise mundane objects to achieve a magical effect. In this it is very like ritual magic. To cast a spell a sympathetic magician typically uses a combination of a wand or other focusing device, an incantation (either verbal or mental), and a number of mundane objects which fulfill the requirements of the Laws of Similarity and Contagion. These mundane objects are divided into two types. The elements are the object which fulfill the requirements of the Laws of Similarity and Contagion. For example, to prove that a bullet has been fired from a specific firearm the practitioner would need the bullet and the gun. This kind of spell is the most basic example of the Law of Contagion and simply requires the firearm be solidly held, as in a vice, and the bullet be able to return to the gun, and that the adept use a wand to focus the mana and a word to control it.

A more complicated spell -- such as one which would sever the contact between the bullet and the gun -- would require that the mage use a sharp knife, preferably of silver, to symbolically cut the connection. The knife is not itself a magical item, though it will work better if it is not also used for mundane tasks.

Professional magicians will always make their own tools. The task of creating the mundane object is relevant to its use in the magic. A magician could attempt to perform the spell of dissociation with a dull kitchen knife, but the spell might not work. It almost certainly would be detectable by a another magician.

A common magician's tool kit would contain the following items:

- Brazer, a vessel in which to create small fires or burn things.
- A sharp silver knife, typically used to perform spells of dissociation.
- A dull iron knife, capable of creating a jagged cut, primarily used in spells of similarity.
- A magnifying glass. Through the Law of Similarity capable of detecting magic and mana charged objects. Using the Law of Contagion capable of capturing light or heat from the sun or other source like a fire.
- Two small squares of silk. Edged with silk thread. One of white. One of black.
- A large blanket of plant fiber, typically flax or cotton. Un-dyed.
- Set of silver tongs, three sizes.
- Wooden dowels
- Length of hemp line. Used to bind.
- Chalk.
- Prism.
- Binding compound.

Magic

Common Spells

Common spells are the most basic ones, and are likely to be known by all mages. More powerful spells require higher levels. Mages cast spells at base skill, provided they have the correct elements. If they lack the elements they can not cast at all. If they must use elements which have been previously put to mundane use, rather than their own tools, they are at a -3 penalty. High skill increases the chance of success of a spell, but still requires the proper elements. Sympathetic magic has some of the aspects of Ritual Magic. Magic is not divided into colleges, and on Frazer's World other kinds of magic do not exist. Clerical magicians in this case do not refer to practitioners of religious ritual magic; it merely refers to members of the church, especially the Roman Catholic and Eastern Orthodox Churches who study

Sympathetic Magic. Both churches have both individuals and orders who concentrate on the study of magic. Other churches may have mages, but their formal position in the church is less related to it.

Elements are typically divided into mundane and enchanted. The most common enchanted elements of spells are a wand and binding compound. Most other elements are mundane.

Binding

Binding is the process by which two dissimilar objects, which must have at least one aspect in common are joined such that they will come under the sway of the Law of Similarity. It requires a wand, binding compound, the object to be bound and a sample of the target object. Common aspect can be material (wood for wood, metal to metal), shape (doll or homunculus to human, sphere to planet), function (rope to bind, spell to bind), etc.

Dissociation

This is the process by which object which are joined by the Law of Contagion can be separated. It requires a length of hemp and a sharp silver knife.

Enchantment

Enchantment is the process by which a mundane substance is endowed with mana force. It is the process for creating a magic item. Enchantments are performed using the rules from page 481 of the ***Basic Set,*** except Sympathetic Magic is used instead of Ritual Magic. Many items on Frazer's World are produced using mass production, which means adept factory workers with magery 1 or 2 labor in groups; these groups are fairly large in most modern factories so it's quite possible for a factory of 1,500 workers to produce 15 100 point magical devices in one day. Magic device are not rare. Enchantment requires the same mundane and magical elements required to cast the spell.

Air Spells

Purify air: Requires a vessel of air.

Create air: Requires a vessel of air and a fan.

Body Control Spells

Itch: Requires a homunculus, pepper or other abrasive substance, and something which as been in contact with the subject.

Pain: Requires a homonculus, a sharp object and something which as been in contact with the subject.

Hinder: Requires a homonculus, length of hemp line.

Deathstrike: Requires a homunculus, a sharp or blunt object, and something which as been in extended contact or was once part of the subject. This is a VH spell and will not penetrate a ward.

Fire Spells

Create fire: Requires a prism and a light source, or a magnifying glass and the sun (fire is started as a mundane fire but through Law of Similarity creates a large blaze remotely). Often a brazer is used to contain the fire.

Extinguish fire: Requires a stick or other flammable material and a vial of water.

Cold: Requires an ice cube or other small cold object.

Gate Spells

Planar summons: Requires something which has been in extended contact with the being to be summoned. The entity can appear bound using the proper binding spell.

Plane shift: Requires an object from the destination plane and a wand. This is a VH spell.

Healing Spells

Lend vitality: Requires a hemp rope, a knife (preferably silver) and a source, usually another living being (or the caster)

Healing: Requires a wand, binding compound and a source, usually another living being or the caster.

Knowledge Spells

Detect magic: Requires a magnifying glass.

Aura: Requires a magnifying glass and prism.

Seeking Spells

Locate object: One of the most basic of spells. Requires a needle, (typically in a compass frame, but not magnetized) and a piece of the object to be located.

Advanced locate object: Requires a needle as above, binding compound, a wand, and an object of the same nature as the one to be located.

Identify Spells

These require a magnifying glass and a prism.

Light and Darkness Spells

Light: Requires a wand and a mirror.

Continual light: Requires a wand, a mirror, and a prism.

Darkness: Requires a dark cloth and a prism.

Blur: Requires a lens and a white cloth.

Meta Spells

Counterspell:: Requires binding compound, a wand, a mirror and the elements of the spell your are tying to counter.

Dispel magic: Requires a wand and a metal dowel. The rod is sank into the ground. Can also use an existing metal object like a pipe or building frame with the usual penalties for use of a mundane object.

Movement Spells

Apportation: Requires a feather, a piece of the material to be moved or a similar material, a wand, and binding compound.

Lockmaster: Requires a key, binding compound, and a wand.

Banish: Requires an element of the home dimension or plane of the creature that the adept is trying to banish.

Protection and Warning Spells

Wards: Requires a way to circumscribe an exclusion area. Chalk or even a rope or line can be used. For protection against mundane threats a simple circle or arc will suffice. A power sigil, such as a pentagram, is required to protect against mystical beings or forces.

Bind: Requires the same elements as wards, but holds something in instead of keeping it out.

The creation of binding compound is an advanced type of magic requiring mastery of Enchantment. It is almost always created in factories and purchased for use by magicians at Magery Shops. Strictly speaking binding compound is not used up in performing magic, but under most circumstances it is not economical to recover. Factories, though have systems to recover and reuse binding powder, typically only replacing a small amount to make up for the inevitable losses during magic production.

Water Spells

Seek Water: Same as a locate spell using water as its element.

Purify water: Requires a vial of pure water.

Creating Spells

For a master magician the creation of new spells can be a long and dangerous endeavor. New spells are created using the technology invention rules from Chapter 17 of the ***Basic Set.*** The GM can create a new spell by using the Laws of Similarity and Contagion -- that is, by imaginatively tying together things which have similarities and constructing ways in which they come in contact, either metaphorically or physically.

Where Does Infinity fit In?

Magical worlds always leave Infinity uncomfortable. Magical worlds with Nazis even more so. The Penetration Service did not arrive on Frazer's World until 1952. There is no doubt that some of the Nazi war criminals escaped capture by the Triune Alliance, but did they escape to South America or to some other alternate, with perhaps outworld help?

As a Q4 world it is not easily accessible to Centrum. The world's odd, non-standard magic has confounded both Infinity's ISWAT mages and several Cabal members, who've found themselves stranded. The world's high mana levels resist efforts to tap it using conventional or even common ritual magic. Whether psionic worldjumpers could leave Frazer's World is still an unanswered question.

Infinity has only been operating on the alternate for five years. They have not opened it up to commercial exploitation; the locally made enchanted devices will not work on other alternates anyway. The U.S. tapping of energies from beyond this world makes UNIC nervous, but all transdimensional apportation research is classified. Both the French and the Triune Monarchy are trying to duplicate the research or steal it. Infinity is not anxious to jump in the middle of that spy game.

Outworld Operations

Surely You're Joking, Mr. Feynman!

ISWAT would like to get a look at advanced apportation research, to see if it has application for crosstime travel. The risk has been too great, but recently they've found a physicist on another line who is an alternate of one of the mundane theurgists working on a new version of the *weapon* spell, Richard Feynman. Feynman accidentally discovered the Secret and has been co-opted by ISWAT rather than sent to Covenrty. The agents find Feynman brilliant, but undisciplined. Is he brilliant enough to fool the mages on Frazer's World?

The Lost Generation

A scout collecting data in Quebec begins to suspect outworld smuggling when he finds a copy of Ernest Hemingway's *A Farewell To Arms* in the science fiction section of a bookstore. He reports to his local contact via drop but then disappears. A week later his body is found in an alley in Buffalo, New York. Time to send in a group of I-Cops!

Almost Reich 7?

Before the discovery of Frazer's World nine out of nine experts would have sworn that the National Socialist German Workers Party could not develop without the crucible of World War I and the onerous terms imposed by the Treaty of Versailles. Frazer's World had neither. The few experts who have been consulted would have bet that the Ottoman Empire would have ended up on the other side of any world war the the Triune Monarchy rather than Germany. But then none of them know about Reich 5.

Local Finds

The FBI's Office of Magical Affairs was folded into the Central Intervention Agency by the National Security Act of 1947. During the reorganization many of Tesla papers were lost, misplaced or stolen. The Agency wants them back. The CIA's mandate does not extend to domestic work, so any agents assigned will have to worry about the FBI, possible foreign agents and maybe a dark magician or two.

The third world has always lagged behind in magical talent. In the post-war world more than a few mercenary magicians have decided to try their luck in Africa, South America, or Asia. Some of the natives have been playing catch-up and are not the hedge magic pushovers they might have once been, making them perfect for a pulp adventure with a little Sympathetic magic added.

Any group of Frazer's World natives might find themselves going against Infinity. Logic would dictate that Sympathetic Magic would not work elsewhere, but Infinity has found that logic often does not come in to play where magic is concerned. Thus a really good master magician might find herself propositioned by ISWAT once he knows too much, or have the chance to find out if Coventry really is mana free.

-9

The Ahaggar Banestorm

by Paul Drye

The French Army knew something wasn't right about that stretch of desert. Men assigned to Fort Laperrine reported bizarre, electrically charged sandstorms and sometimes men disappeared. Of course, men always used to disappear in the Sahara. Hans-Matthias Kchert explored the local petroglyphs on behalf of Heidelberg University in 1863-4, but when Maurice Reygasse explored them in the 1930s many of them didn't match what Kchert had published. The German explorer was posthumously declared a fraud, but some people had doubts.

What little interest there was in the region faded away with the Algerian War and French decolonization. For thirty years it disappeared from the world's attention. An airport and a lonely two-lane road were built, and the oasis around the fort returned to its old name of Tamanrasset while it grew into a small, Tuareg-dominated city.

Then Paul Van Zandt discovered parachronics, and armed with new knowledge some people realized quickly that there really was something not right in the depths of the Sahara. On Homeline, Tamanrasset is no longer just a sleepy town. To the casual eye is hasn't changed very much, but there's a Patrol garrison in town, and it seems to live by the "boredom and terror" rule: most of the time there's nothing going on, but sometimes they go tearing off into the wilderness and it's impossible to find out why.

The Desert Visitors

Tamanrasset is the nearest settlement to Homeline's most active intermittent Banestorm. The Bermuda Triangle may be more famous, but that's only because of the press it gets. Only the utter isolation and inhospitability of the storm's locus, 15 miles east and a bit north of the town on the boundary between the Ahaggar Mountains and the deep sands of the T´ner´ region. Even worse, it's getting more active, apparently in relation to the amount of´parachronic activity now feeding Homeline. Now it's not just a matter of people getting at it, it's about preventing what it spits out from getting at people.

As well as being worried that something dangerous might get out, Infinity also wants to cover up the increasing frequency of the banestorm events. The concern is that, while there's no possible way Homeline will turn its back on parachronics just because it might be weakening spacetime, the events in Algeria could be used as a club against Infinity by their many political enemies. Rather than risk some interest group bringing them to heel, they look to keep a lid on things themselves. To that end, they've manned Tamanrasset's old fort.

Each time the banestorm kicks in, it modifies the landscape in an oval 198 by 94 feet, the center moving a little bit to the southwest each time. The base rock never changes, but sometimes a thin layer of soil or other substance will appear; once it was a three-inch deep slush of ammonia, liquid nitrogen and argon, which evaporated almost immediately. Sometimes the rock art changes. Most of the time it's just artifacts or living creatures that get dropped

off.

Storms come about every 16 days, with the longest gap since 2019 being just over 37 days. The shortest involved a quartet of Andronovo charioteers who were crushed to death by the rotting carcass of a plesiosaur 91 seconds later.

This leads to the next issue: the complete randomness of the banestorm's connections. It's not so much that what it drops off on Homeline is necessarily dangerous -- it usually isn't -- it's that Infinity has no idea what's going to pop out next. Many of the best minds at Paralabs worked on the problem for more than two decades and came up with nothing; whatever physical principles are at play, they look random to Homeline science. Since 2019, Infinity has focused on rolling with the punches, getting to the site first after each event and using military force on anything that might present a problem.

Tamanrasset Town

Modern-day Tamanrasset is the regional capital, with a small core that's pleasant by western standards and a much larger surrounding area that is fairly well-built, but poor. In theory it has a population of 60,000, but this includes about 20,000 Tuareg who wander the countryside in their old, nomadic lifestyle, who have been designated inhabitants by Algiers largely for political reasons.

Seen from the air, the city is egg-shaped, with the point of the egg oriented northwest. The only paved road outside of the town itself approaches from that direction, passing Aguemar airport before entering the city; not much south of town the blacktop ends and the "road" becomes a track through the sands. The nearest other towns of note are more than 10 hours drive away (Aïn Salah to the north, and Niger's Agadez to the south), so visitors usually fly in on Air Algeria from Algiers.

The main portion of the town is low-slung, with almost all buildings being single-storied, constructed from local stone and painted brownish-red in a time-honored manner. Algeria's oil wealth has stretched this far south, so that despite obviously being a town in an underdeveloped country there's good quality electricity and running water.

Both are welcome as the daytime temperature in the summer often exceeds 100°F and rarely goes below 65 even in the depths of winter. At night, though, it's not unusual to lose 20 degrees. As Tamanrasset is at altitude, descending into the desert makes the heat even worse, and of course there is no rain no matter where one goes, except for the occasional drizzle in summer.

Fort and Observatory

The first fort in the region was built in 1916 as Senoussi raiders took advantage of French military weakness during World War I. It was then built up into its present form in the 1930s; the remains of what was called Fort Laperrine were refurbished during the Algerian civil war in the 1990s, and Infinity took them over in 2001. They are in the northeast corner of the town.

The fort is a square oriented at a slight angle to the north, surrounded by an old clay wall; recent chain link fences topped with razor wire run along the outside and inside of the wall. Most of the interior area is open ground for training, with a barracks, a chow hall, and administrative offices at one side, and the garages and maintenance bays for the fort's vehicles on the other. The complement of buildings is rounded out by a large warehouse called the Oubliette in the middle of the base.

There are also two helicopters on pads which can get a total of 14 people (including four pilots) out to the banestorm site in about 10 minutes. The rest of the 80 armed personnel can follow in heavy APCs within an hour.

Tamanrasset has been the site of a geomagnetic observatory since the 1980s; when it was realized that Ahaggar had an intermittent banestorm, Infinity took over the observatory from the Algerian Centre de Recherche AAG. The building is just one room, small and square, ten minutes out of town along a side path that gets it away from the worst of the

electrical interference civilization brings these days. The observatory's instrumentation has been gutted and a parachronic detector installed. The balky machine, dubbed Handsome Dan, is simultaneously loved and loathed by its operators. The first warning of a new banestorm event is almost always from here, either through Dan or the less-glamorous directional radio receiver that picks up the electrical discharges which accompany them.

The Reaction Force

Being sent to Tamanrasset is a sign of official disapproval. This doesn't mean that the agents they get are useless, just that many of them are and the ones who aren't have a knack for annoying the important. They come from all over the world, though the Algerian government has requested that none of them be French -- even 60 years on, the memory of the Algerian War makes French soldiers in Algeria politically impossible. Ironically, this has isolated the fort's personnel, as only a few of them speak more than a bit of the local language.

As mentioned before, almost the whole complement of the fort turns out when the banestorm lights up. This is overkill for almost anything that can come through, but Infinity's general policy is "better safe than sorry." If it's decided that the intrusion is benign, 80 percent of the force returns to base, turning over the investigation to the remainder of them who have specialized training for figuring out what showed up this time: biology, forensics, archeology, and the like. Infinity avoids using civilian experts on these problems, bringing them in only if something completely stumps the people they've got on the scene.

The Oubliette

The variety of junk coming in through the banestorm is so random that, unless someone back in civilization wants to take a look at it, it gets stuck in storage at the fort. The Oubliette is Homeline's little brother to Warehouse 23, with more emphasis on the odd than the dangerous. Some of what they've got includes:

- A thousand-pound dog in full riding tack and saddle. The men call him "Speck" and keep him fed on enormous quantities of kibble and whatever meat is cheap at the town market on any given day.
- A broken hybrid analog-digital computer with the legend *Brasil Imp´rio* embossed on it.
- Several realistic life-sized clay statues dressed in a quasi-medieval manner. Everyone describes as inhuman, even though they've been measured a thousand times and always match up with perfectly normal values for arm length, skull size, and any other parameters people have thought to check.
- A wooden crate of dusty, crumbling scrolls, that apparently tell a distorted version of the Rig Veda in 6th-century Gothic.
- The rusted-out and sandblasted hulk of a 1951 Tucker sedan.

The Desert

North American visitors will find the landscape around the Ahaggar Banestorm eerily familiar -- the Dali-esque rock formations resemble something out of Road Runner cartoons. Those unfamiliar with the Warner Brothers' oeuvre will describe it as reddish stumps and spines of volcanic rock rearing out of the caramel-colored sands. The landscape to the north is extremely broken, which is problematic if something incoming heads in that direction. To the south and east are the stereotypical Saharan landscape of saffron dunes.

The Unwilling Invader

On an as-yet undiscovered timeline -- it will be called Lucifer-7 if a GM's players don't name it themselves -- the meteoroid that caused the Canterbury Event of 1178 missed the rim of the Moon and hit the Earth. Unfortunately for the inhabitants of that Earth, the incoming piece of rubble was carrying the spores of that timeline's most successful alien species: a microscopic, infinitely adaptable, collective intelligence that uses hosts to interact with the large-scale world. Within a few decades the last humans were infected and a stagnant but perpetual peace fell across the planet.

Life continued much as before, absent unnecessary things like art or emotion, as the Canterbury Plague piggy-backed on the agricultural societies of the world while it contemplated the mathematical and physical mysteries which interested it.

When the Banestorm momentarily connected Lucifer-7 and Homeline, nine farmers from what was once Almohad Spain were dropped into the Sahara. While the Tamanrasset garrison brought them into custody quickly, they missed the strange cargo the peasants brought. Fortunately the small portions of the alien presence in their bodies is not specialized to reproduce, and can only infect one new person a month after an initial burst of growth. It has also been busted down to less-than-human intelligence after being cut off from the bulk of its units. Instead of marshalling its forces so it can eventually grow exponentially, the Plague stupidly sends hosts back out into the desert when an opportunity presents itself, looking to contact home and usually dying. It's also very poor at picking hosts, and has so far only infected people near the bottom of the fort's chain of command.

Infinity's plan is to eventually send the farmers to Coventry, and in fact that should have happened by now. However, the Plague has managed to co-opt enough people that they can confuse the issue. For now, the collective is still in hiding on the base. However, while it can access the memories of those it rides, its lack of intelligence means that it's not very good at the jobs it has to handle if it wants to be inconspicuous. So far the fort's commander thinks the growing incompetence of his people is just a regular discipline problem, thanks to boredom from being stuck out in the middle of nowhere . . .

Being infected by the Canterbury Plague is a meta-trait. While on any timeline except Lucifer-7, victims are Hidebound [-5], Incurious [-5], have Low Empathy [-20], Time Sickness (Very Severe, Acute) [-20], and a Slave Mentality [-40], but in return receive Clairsentience (Increased Range ×2, Visible, Only through other Plague-infected -20%) [40] and Dominance (Bite, Only once per month -50%) [10]. The total point cost of this meta-trait is -40 points. In the unlikely event anyone ventures to Lucifer-7 while dealing with Tamanrasset, the millions of other Plague-infected remove the Hidebound and Incurious disadvantages and gain the Eidetic Memory and Enhanced Time Sense (1) advantages, turning the meta-trait into an advantage worth of 20 points.

Characters

Colonel Quentin Vermaak: A colonel in the South African army, seconded to Infinity, he has been a controversial choice as the fort's commander after being selected last year. The Algerian government had informally requested an African, and they didn't mean a Boer -- the three-decade old end of apartheid notwithstanding.

Worse, Vermaak is here for the same reason so many others are: his superiors were glad to get rid of him. He's a fussy, bureaucratic, rules-mad nightmare, slowly going crazy in this isolated post where discipline slides. His role is to apply these values to the players and make them as nutty as he is with his constant demands.

He is 38 years old, clean-shaven and with blond hair in a buzz cut. He dresses immaculately, which is quite an accomplishment in Tamanrasset.

Quentin Vermaak   *150 points*

Human; 5'10"; 180lbs.

ST 11 [10]; **DX** 12 [40]; **IQ** 12 [40]; **HT** 11 [10].

Administration-15 (IQ+3) [12]; Brawling-12 (DX+0) [1]; Computer Operation/TL8-12 (IQ+0) [1]; Driving/TL8 (Heavy Wheeled)-12 (DX+0) [2]; Explosives/TL8 (Demolition)-12 (IQ+0) [2]; First Aid/TL8 (Human)-12 (IQ+0) [1]; Guns/TL8 (Submachine Gun)-14 (DX+2) [4]; Law (Military)-11 (IQ-1) [2]; Leadership-13 (IQ+1) [4]; Savoir-Faire (Military)-13 (IQ+1) [2]; Scrounging-12 (Per+0) [1]; Soldier/TL8-14 (IQ+2) [8]; Survival (Desert)-13 (Per+1) [4]; Tactics-13 (IQ+1) [8].

Mezwar bin Amouzeg: The mayor of Tamanrasset, he is of two minds about Infinity's presence. For one, he's not party to the reason for them being here. That annoys him on a personal level, and he worries about what the danger must be for the outside world to intrude like this. On the other hand, he's noticed that the government in Algiers pays more attention to Tamanrasset when Infinity is involved, and it's easier to get things done as a result. He suspects, rightly, that the government is in on the secret, and that their helpfulness will evaporate if Infinity's operation is shut down.

Mezwar is a 56-year old Tuareg man, hatchet-faced with dark skin and eyes. He actually looks something like Bob Marley, but people won't notice this unless they meet him inside; like other adult Tuareg men he wears a dark blue veil slung from his turban when out and about.

Though a Muslim, and culturally conservative, he's more inclined towards the old-style syncretic Islam of the Tuareg and is more forgiving of idiosyncrasy than most other people with his background. His inclination to bend extends to typical Algerian government corruption, and he casually accepts bribes even if he isn't on the take to any serious extent.

Like many rural Algerians, he was caught up in the Islamic Salvation Front's rebellion in the 1990s. While the fighting never extended as far south as Tamanrasset, he did learn how to shoot and ride in case the rebels came calling. Those skills had been fading among the Tuareg for some time, but came back in the face of the new threat and still haven't disappeared again.

Adventure Seeds

The desert banestorm is a convenient plot device that excuses virtually any odd thought a GM has ever had, but to get started consider:

Hill People Are Trouble: A pack of neo-troodons are dropped in the desert, and unlike most other visitors they're hunter-gatherers actually familiar with living in that kind of environment. If anything, this part of the Sahara is nicer than their usual stomping grounds in Central Australia. They regroup very quickly and high-tail it for the broken mountains, where they'll put on a virtuoso performance of stone-spear violence if any humans catch up. On the other hand, the local Tuareg aren't pushovers either. Depending on how Infinity's pursuers handle things, the secret of what's going on in the desert might be blown.

No Return Address: A Paralabs attempt to sever the banestorm's connection to Homeline instead throws the group (and, for fun, a considerable number of locals) into who-knows-what timeline. It's unclear where they are, or how to even phone home for a ride.

What to Get For the Man Who Has Everything: A past patron of the agents, one still on good terms with them, has learned that a mummified unicorn (or a lascivious piece of rock art, or part of Amelia Earhart's plane, or any other object that dovetails with the patron's previous interests) has been stashed in the Oubliette. While his old friends might not have the authority to take the McGuffin, the patron persuades them to go to Algeria and try -- either out of the goodness of their hearts, or for a quid pro quo.

I Got Better: One of the party is infected with the Canterbury Plague, either during a visit to Tamanrasset, or by working with one of the banestorm artifacts that passed through the base. His change in state does not last long, though, as the first time he travels away from Homeline his unit of the collective intelligence can no longer communicate with the others. As an individual it is just weak enough to be fought off like a lowly common cold.

Now the character has the unshakable feeling that something was wrong with him for a few days -- why did he act so stupidly? -- and that Tamanrasset had something to do with it. The problem is convincing the rest of the world of it.

The Odor of Sanctity: Charles de Foucauld was a French hermit of some interest to the Vatican. He lived the last years of his life near Tamanrasset, and a few enthusiastic thinkers believe that whatever is going on in the desert is

related to his mystic presence. They would like very much to get on the scene and investigate. Infinity would like it very much if they did not -- preferably without their figuring out that Infinity cares.

Using the Ahaggar Banestorm in Other Settings

A close parallel of Tamanrasset already exists in fantasy form: **GURPS Banestorm.** The major difference is that Yrth's incoming problems are geographically diffuse. While a GM needs to keep those to maintain one of that setting's major foundations, it's not a great stretch to decree that some occur in one location only. Put that location somewhere in the Great Desert not too far from the border with Caithness, situate some Knights of the Stone to watch it, and you've got the necessary elements.

In other fantasy settings, the banestorm will be a new factor, but most fantasy settings have a complex metaverse to call odd visitors from. Declare some obscure spot in a desert to be a weak point into the outer planes, then start throwing elementals and dark dwarfs at your players.

A hole in Algerian space-time is similarly easy to use in pulp settings, though given the isolation of the area until the 1950s the emphasis will need to shift from protecting the world to protecting the fort and the people of the oasis (note that the oasis town was quite small back then). This particular take on the banestorm has a few unique advantages. Charles de Foucauld was an interestingly saintly man and scholar of the Tuareg, the backdrop is of the world preparing to tear itself apart in war, and one can use the *L´gion ´trangère* to man the fort.

SF settings can use the basic concepts of the Ahaggar Banestorm by translating them to deep space. Turn the fort into a formerly decommissioned military station floating many AU away from anything and the banestorm into a "rogue jump point" or whatever other terminology fits the campaign's terminology. Slew the incoming items away from Earth archaeology and history to mysterious artifacts of lost or unknown races and you're ready to go.

Contagion!

for *d20 System*

by Michael Tresca

The threat of disease is always a problem in medieval and Renaissance societies. Even with magic, the possibility of a plague raging out of control is ever present. In the *d20 System,* perhaps the only thing worse than an outbreak of the plague is an outbreak of undead.

A variety of undead have the ability to reproduce by killing living humanoids. In the case of the mohrg, any creature killed can acquire the zombie template, including animals. So what's to keep vampires from taking over the world?

Monster Spawn Rate Spawned Bodak 1 day Bodak Ghoul/Ghast 1 day Humanoid Ghoul/Ghast Mohrg 1d4 days Any Zombie Shadow 1d4 rounds Humanoid Shadow Spectre 1d4 rounds Humanoid Spectre Vampire 1d4 days Humanoid or Monstrous Humanoid Vampire Spawn Wight 1d4 rounds Humanoid Wight Wraith 1d4 rounds Humanoid Wraith

Outbreaks

There are many forms of outbreaks, graded progressively more and more dangerous.

Endemic

Endemic outbreaks are the typical number of undead encountered as per their description. Swarms or packs of undead vary in size, from 5 to 14 for mohrgs (four mohrgs and 10 zombies). The total humanoid casualties is at least equal to the number of undead created, but there can certainly be more, up to an additional 4d10 deaths. It takes 1d20 days to form an endemic.

For the most part, these outbreaks are restricted to lonely cabins, entire families, or several farmers spread out across a large swath of terrain (1d20 miles). The contagion is usually contained to natural borders. This sort of outbreak is still manageable by adventurers. There are the usual chances of encountering the undead in the area. The undead contagion should have a 20% chance of being encountered on any encounter table.

Epidemic

An epidemic outbreak takes place in a populated area. Multiply the undead's swarm, pack, or mob numbers by 1d10 to get the total number of undead. Living humanoid casualties are double the number of undead. It takes 1d100 days to form an epidemic.

At this point, the resident humanoid population will mobilize a major effort to control the contagion. The contagion extends over 1d100 miles. The undead contagion should have a 40% chance of being encountered on any encounter table.

Plaque

Plagues are bad news. When a plague strikes a fantasy world, the contagion undead outnumber the living. Multiply the undead's swarm, pack, or mob numbers by 10d10 to get the total number of undead. It takes 1d12 months to spread a plague.

A plague can be the basis for an entire campaign, as the undead plague rages out of control. It encompasses an entire

continent. The undead contagion has a 60% chance of being encountered on any encounter table.

Pandemic

A pandemic has taken over the entire fantasy world. Living humanoids are rare and waging a losing battle; only those who hide or are sufficiently powerful to keep the undead at bay can survive. The problem is that everyone has to sleep sometime. It takes 1d20 years to spread a pandemic.

Most beings that have an extraplanar means of escaping the world have left, leaving only a few defenders and the weak that have all but given up hope. This is a world that cries out for heroes. There is an 80% chance of the undead type appearing on any encounter table.

Vectors

Every undead is different. It's up to heroic characters to stop the spread. In fact, even evil characters that are not undead might find themselves working with the living just to survive.

Bodaks

Bodaks are powerful, extraplanar monstrosities capable of killing with a mere gaze. They are not native to the Prime Material Plane, but once summoned can wreak havoc on a community. They are invulnerable to normal weapons and resistant to most forms of damage.

Fortunately, bodaks are vulnerable to sunlight. They are also poorly organized beings, though they sometimes travel in gangs of up to four. With enough victims, bodaks can turn an entire town into a deadly, chaotic melee. It should be noted that spawned bodaks are not under the control of other bodaks, and thus do not necessarily share the same aims and goals as its creator.

Ghouls/Ghasts

Ghouls and their larger cousin, ghasts, are a highly dangerous contagion. They have no real weaknesses except the craving for living flesh. They're even resistant to turning by clerics. Ghasts are even worse, capable of incapacitating opponents before they come near.

The one saving grace of a ghoul/ghast contagion is that it takes one full day (at midnight) for the ghoul to rise as undead. Given that ghouls and ghasts are fond of eating corpses, they may often inadvertently eat their future spawn. Thus, ghouls and ghasts unintentionally control their own population. A risen ghoul or ghast is inevitably an accident, a creature suffering from ghoul fever that was able to escape but later died from the disease. Because the disease has an incubation period of 1 day, there is enough time for the contagion to be averted through judicious use of the Heal skill or a remove disease spell.

Mohrgs

Being the spirits of mass murderers, mohrgs are the most likely to go on a contagion spree, killing everything in sight until they are finally destroyed. This personality trait makes mohrgs the most likely to cause an undead plague.

The other attribute that makes mohrgs unique is their ability to turn any living creature into a zombie. Thus, mohrgs might turn rats, dogs, cattle, and virtually any other wildlife into zombies, creating a sort of zombie wasteland. Fortunately, it takes 1d4 days for a creature killed by a mohrg to rise up as a zombie. Unfortunately, if the creature has been slain it's very likely its allies are lying dead next to it.

The most dangerous mohrgs encountered are mohrg gangs. Mohrg gangs are usually the result of murderers who have

been hung en masse, and they immediately resume their murderous spree upon rising up from the dead. A town beset by multiple mohrgs has little hope of survival.

Fortunately, mohrgs are highly disorganized beings, generally uninterested in working together or ordering their zombies to do anything more than kill, kill, and kill some more.

Shadows

Shadows are not particularly organized and tend to attack the nearest living beings, thus discouraging the likelihood of a shadow army. Shadows are relatively weak undead, but they have the important trait of being incorporeal. As incorporeal beings, they are difficult for a community to ward off. Despite their name, shadows have no vulnerability to light. Shadow attacks have the added disadvantage of incapacitating their foes; a victim sufficiently drained of Strength can't move and can then be killed at the shadow's leisure. Shadows drain Strength, an attribute sometimes in short supply in civilized communities; strapping farmers and the like are less likely to fall prey to such attacks.

By far the best defense against shadows is a well-lit room. Though the light does not deter them, it certainly negates their biggest advantage: darkness. Though must undead are active at night because they loathe sunlight, shadows are almost undetectable in low light areas (+12 to Hide).

Spectres

Spectres are lawful, so they are fully capable of organizing themselves into large groups, strategizing, and planning long-term assaults against their enemies. Spectres combine the incorporeal traits with shadows with a higher hit dice and the ability to drain levels. Commoners aren't usually very high level, so a swarm of spectres (up to 11) can easily overwhelm a community. Worse, spectres create their own spawn within 1d4 rounds. Equipped with the ability to inflict grievous damage and a fast spawn rate, spectres are second only to mohrgs in their threat to a community.

The only saving grace is the spectre's vulnerability to sunlight. Still, that's not enough to stop a determined spectre. Since spectres fly, they can cover a lot of ground in one night. No natural obstacle can hinder them, making it possible for them to spread their contagion far and wide.

The spectre's unnatural aura should not be discounted. Spectres can disrupt communities not by slaying humanoids but by attacking two staples of humanoid society: cattle and horses. If the cattle are driven off, an important source of milk and meat is lost. If the horses are driven off, transportation grinds to a halt. Spectres seeking to take over a town go after the animals first, trapping the remaining humans and starving them to death.

Vampires

Of all the undead, vampires are the easiest to contain. Although this might seem strange, given the power of vampires, they have a myriad of weaknesses that contain the beings. For one, vampires must be invited into a dwelling, preventing them from attacking populated areas without careful planning. They can't stand the odor of garlic, don't like mirrors, and are held at by holy symbols. In populated areas, all three are in abundance, preventing vampires from getting very far. Finally, vampires can't cross running water; since many towns are on or near rivers, this limits the spread of vampires considerably.

Then there's the possibility that the vampire has no interest in actually turning the entire population into vampire spawn. Although it is not explicitly stated, vampires enjoy draining the blood of other creatures. They presumably can't drain vampire spawn, so any vampire populace requires its own \u201cherd\u201d of living beings. That said, vampires could subsist on farm animals if they so chose, as they are not required to drain humanoids.

Taking all these factors into account, most vampires prefer to work from behind the scenes. Although it's possible for a pack of vampires to gather in one place, it's unlikely they will spread their spawn very far unless it serves a purpose.

Wights

Wights are corporeal undead, stronger than ghouls but weaker than mohrgs. They are not vulnerable to sunlight, so wights can roam above ground at will. Generally, wights tend to be tied to their barrows, but there is no requirement that they stay in one place. Thus, a determined wight might venture beyond its tomb to terrorize the locals.

Wights drain energy upon attacking, making them extremely deadly to low-level commoners. An army of wights could easily be created as they roam the land, killing whomever they meet and adding the wights to their legions.

Fortunately, wights are physical beings; anything that prevents a living humanoid from traveling is likely to stop a wight (strong currents, dangerous precipices, strong thickets). On the other hand, wights never tire and can walk wherever their feet take them, be it a desert or even the bottom of the ocean floor.

Wraiths

Wraiths are almost exactly like spectres in every respect except one: They drain Constitution, making it more difficult for a wraith to slay and create a spawn. Their tactics are otherwise the same, targeting animals first. Like spectres, wraiths are lawful evil and thus entirely capable of organizing their spawn into armies.

Preventing a Contagion

Stopping an undead contagion is straightforward: destroying the source. Still, sometimes that sheer scope of the threat is impractical. By far the better method is to detect and destroy the outbreak before it spreads. Some spells are particularly useful in this regard, especially detect undead, which allows suspicious characters to detect the auras of undead. Incorporeal undead are fond of sitting in walls, waiting for citizens to go to sleep before pouncing on them.

Another useful spell is consecrate. Nightly castings of hallow spells help deter undead being spawned. This is one reason why crypts are often under churches, ensuring that the dead maintain their peaceful rest without interruption. Most hallowed are have daylight affixed to them, ensuring a perpetual sanctuary that few undead can approach.

Fighting a Contagion

The challenge in defeating an undead contagion is that negative energy spreads with little effort, often as a byproduct of violence against living humanoids. There is no equivalent in nature, requiring clerics and paladins to fill in the gaps. Undead can quickly outpace wielders of positive energy. That's why the elven wizard Haelosnae, after decades of research, came to a solution: the optim.

Optims are creatures summoned from the Positive Energy Plane. Haelosnae summoned optims specifically to reproduce at a rate that can match an undead outbreak. Since optims instinctively loathe undead and are capable of reproducing by feeding off of living beings, they can quickly route an undead army.

Size/Type: Small Outsider (Extraplanar)
Hit Dice: 9d8 (40 hp)
Initiative: +13
Speed: Fly 50 ft. (perfect) (10 squares)
Armor Class: 29 (+1 size, +9 Dex, +9 deflection), touch 29, flat-footed 20
Base Attack/Grapple: +5/-3
Attack: Shock +18 melee touch (2d8 positive energy)
Full Attack: Shock +18 melee touch (2d8 positive energy)
Space/Reach: 5 ft./5 ft.
Special Attacks: Positive energy aura, sunlight burst
Special Qualities: Create spawn, darkvision 60 ft., detect undead, flight, immunity to fire

Saves: Fort +6, Ref +15, Will +9
Abilities: Str 1, Dex 29, Con 10, Int 15, Wis 16, Cha 12
Skills: Heal +9, Hide +25, Knowledge (Arcana) +8, Knowledge (The Planes) +8, Listen +17, Move Silently +21, Search +14, Spellcraft +10, Spot +17, Survival +15. **Feats:** Alertness, Dodge, Improved Initiative, Weapon Finesse
Environment: Positive Energy Plane
Organization: Solitary
Challenge Rating: 6
Treasure: None
Alignment: Always neutral
Advancement: 10-18 HD (Medium)
Level Adjustment: --

Optims appear as brilliant, spiky spheres that are constantly rotating. They fly about with a sonorous hum. Each optim is believed to have a hum frequency that is unique. An optim's body sheds as much light as a torch.

Combat

Optims find undead offensive and immediately swoop in to attack them.

Create Spawn (Su)

An optim can drain the excess negative energy off of a living being to create another version of itself. On a successful attack, the target must make a Fort save (DC 18) or lose all of its excess hit points are drained. 1d4 rounds later, the optim reproduces via fission to create another optim.

Detect Undead (Su)

Optims can detect undead as per the spell as if cast by a 9th level cleric, at will.

Positive Energy Attack (Su)

An optim's attack actually heals living creatures of 2d8 points of damage. It only inflicts damage to negative energy beings, such as undead. If a being is at full hit points, it gains the hit points as temporary hit points. These temporary hit points fade after 1d20 rounds. If the creature' s hit points double its normal total, it must make a Fortitude save (DC 20) or explode in a riot of energy.

Positive Energy Aura (Su)

Every undead creature that comes within 15 feet of the optim is automatically affected as if the optim had turned it. This doesn't cost a turning attempt, and the optim doesn't have to roll turning damage (it automatically affects all undead in a 15-foot burst), but it only turns undead with Hit Dice equal to or less than the optim's effective Hit Dice as if it were a 9th-level cleric. Just as with normal turning, the optim can't affect undead that have total cover relative to him or her.

Sunburst (Su)

Once per day, an optim can give off a blast of energy equivalent to a sunburst spell as cast by a cleric of 9th-level.

Five Player Cards, 25 Kindred Cards, 30 Event Cards, 105 Blood/Regnancy Tokens, one 10-sided die; b&w, boxed; two to five players; $14.99

They may now have a partner in on-line gaming, but White Wolf is still branching out into other forms of tabletop play. Their long-standing World of Darkness RPG line *Vampire* now has a card game based on that property: *Vampire: Dark Influences.* The Prince, leader of the city's undead hordes, is tired of unlife after so many years and is entering a deep sleep to recharge his batteries. First, though, a successor must be chosen.

The object of the game is to gain the most influence among the vampires, making you the new Prince of the city.

The play area is a power structure, a six-row pyramid built from cards with six bloodsuckers along the base and a single vampire -- the retiring Prince -- at the top. They're laid out like a checkerboard so the cards only connect at the corners. Each player gets a clan (a "tribe" of vampires), an Event Card, and a set of 10 blood/regnancy tokens with their clan's symbol.

The game plays out over six turns, each divided into two parts: the Blood Placement and Blood Resolution phases. First, everyone takes turns placing blood tokens from their pool on Kindred Cards in the pyramid, though holding a few back is important. Then players alternate "activating" those tokens to gain support for their bid for Prince, or trying to oust opponents who have done the same. Die rolls determine success, though bonuses and other benefits are available from the Event Cards. A player can force another to play tokens where they want, prevent combat on certain Kindred Cards, or seize Initiative.

Each Player Card lists a clan Discipline, a power that assists in allegiance attempts or combat, though it costs a blood from the pool. Tokens also determine Initiative, so the pool with the most counters in it starts the phase. The pool grows as a contender goes up the pyramid, gaining more powerful allies. Each Kindred Card lists a bonus from +1 to +3, and this is added to their row number to get a scoring value -- that is, a +1 vampire in the first row is worth two points, but seven if he's the Prince on row six. Even without the Prince's trust, winning over a variety of clans or covenants spells a sizable point bonus, and when the sixth turn ends the rival with the highest score wins.

It must be nice to be one of the bigger gaming companies on the block and able to afford nice components, but it's even nicer to be the one buying those swell pieces. The Kindred and Player cards are more like slates, and they're big. The tokens are solid (though it's hard to pick out the right symbols in monochrome, and separation into baggies prevents fitting them all into the box), and while the Event Cards could have been one stock higher they're still nice.

The art is mostly pencil work, but the illustrations are easily on par with their RPG books. The only two points worth mentioning both relate to text: The stylized covenant and clan names listed on the Kindred Cards are difficult to read at any distance, and the rule book is tiny, like those folded into collectible card game tuck boxes. Beyond that, the production values on this set are first rate. You even get a 10-sided die even though the booklet (in contradiction with the box) suggests you must supply your own (it won't hurt to have a few more). There's a similar underestimation with the blood tokens -- but better too many than too few, right?

The rules seem pretty thorough, though they have to be given all the little things you have to remember. They fall into place after a game or two, but there's still a gray area or two that have "FAQ" written all over them (like what constitutes "adjacent" within the power structure). Space may be an issue as well: Laid out, the pyramid measures about 37" from side to side and another 30" top to bottom. Finally, the Disciplines on the Player Cards are, frankly, kind of boring. They're useful for combat or allegiance rolls, but nothing that really mixes up the dynamics in special ways. Only the player going first in Initiative matters because everyone goes clockwise from there, so striving for it feels less important than it ought to be.

Now that the criticisms are out of the way, this is a good game. It's competitive without involving mind-bending strategies that extend three turns forward; there's a small amount of resource management without crippling quantities of math; and there are enough surprises to keep any one tactic from handing the game to anyone (just climbing the pyramid straight to the Prince is no guarantee of victory). The Event Cards are delightfully subtle -- what looks at first like a dull and unimaginative addition to the deck could turn out to be the perfect card that saves your pasty white behind.

Vampire: Dark Influences is a fine game of cutthroat strategy and last-minute turnabouts. The designers have covered a lot of ground and given their audience a fairly fast and well-constructed card game that captures, if not the specific feel of the RPG, at least the better sensibilities of the thrilling power plays that go into it.

Pyramid Review

RuneQuest Companion

Published by [Mongoose Publishing](#)

Written by Greg Lynch, Kenneth Hite, & Ian Belcher

Cover by Bob Cram, Dan Howard, & Jeff Koch

Illustrated by Bob Cram, Jeff Cram, Rick Hershey, Ryan Horvath, & Colin Throm 98-Page Black & White Hardcover; $24.95

The new *[RuneQuest](#)* from Mongoose Publishing reinvigorated an almost three-decades-old RPG classic. Although slightly leaner, the new version of the rules offered sound, if slightly old school, game play. Though not as old school as other games of its age, nor as mechanically abstract, the *Basic Rules* contained everything needed to play, but still there were things missing in comparison to previous incarnations of the game.

Most notably magic. The only type of magic available in the *Basic Rules* was Rune Magic, the powering of magic through attuned runes of power. The *RuneQuest Companion* addresses this omission by detailing four new types -- Divine Magic, Sorcery, Enchantment, and Spirit Magic. It also has new spells for all four, plus new character options, a discussion of what to do between adventures, rules for travel, and temple details.

The new character options add six new cultural backgrounds: Civilized (slightly more educated and technologically advanced), Mariner (island dwelling rather than sea going), Nomad (Arctic, Desert, and Temperate), and Primitive (representing Stone Age cultures). There are four new professions: Healer, Knight, Peddler, and Scribe, along with new Advanced Skills for Artistic Expression, Courtesy, Lore (Specific Theology), and Oratory. Stone Age weaponry is also detailed for the Primitive character. Finally, the character is given three cults to enroll in. Brethren of the Hunter venerate the hunt; Lightbearers bring light to humanity, alleviating suffering and darkness; and the Moon Maidens are beloved of mystics, confidence tricksters, and prostitutes. All useful stuff, though the cults will clearly need more color than is given here.

Divine Magic is only available to cult initiates, who must possess the Lore (Specific Theology) for their cult, and then through prayer at their temple. If available, a player must dedicate actual POW to the spell, fighting to hold it in his head almost Vancian style. Each Divine spell is a one-shot spell that costs no Magic Points to cast, and if the spell has magnitude, or levels of power, it can be split. So for example, a Shield spell known at magnitude 5 can be cast at magnitude 2 and the rest saved for later. Finally, up against Rune Magic, Divine Magic is doubly powerful.

Sorcery requires a character to either research or be taught a spell, acquiring a skill for the spell at the same time. Relatively weak, basic Sorcery spells cost no Magic Points to cast. If a sorcerer wants to do more with a basic spell, using the Manipulate skill to increase its magnitude, duration, range, number of targets, or even combine more than one spell, then he must expend Magic Points. This is where Sorcery becomes both powerful and flexible, the rules for manipulation being simple, clear, and accompanied by decent examples. And all, of this can be accomplished with the one dice roll.

With Enchantment, a caster can work any spell known permanently into any object that he can inscribe runes onto. The result is a permanent effect that lasts until the object is broken. The process takes many hours and the spell can come from any discipline. Unfortunately, no examples are given.

For the Spirit World, the nature of a spirit is defined in game terms, and how combat works between characters and

spirits. This is of course, difficult, because spirits are incorporeal, and a character will need magic or enchanted weaponry to damage the spirit. Another danger is that of possession, which can be covert or overt. Only the Disease Spirit is detailed, long with the Ghost the Wraith.

How do these four magical disciplines relate to a player character? Well, he has new skills to learn. The Priest profession found in the Basic Rules could substitute the Lore (Specific Theology) for his Lore (Theology) Advanced Skill and thus start with a Divine spell, but that is only this review's suggestion. As to the other magical disciplines, the GM will have to come up with something similar, because no guidance is given on those either. As strictly written from both the **Basic Rules** and the **RuneQuest Companion,** the only method of casting spells for starting characters is still Rune Magic.

The other half of the **RuneQuest Companion** is devoted to time in-between adventures. Places to visit from hamlets to large cities; making money from means other than loot -- including crafting items, getting a job, performing, or stealing; item costs by region type; and even building a home. This is followed by chapters devoted to land and sea travel (plus a quick guide to nautical combat), and lastly temples. All of this is competently written, useful to have, and that is all.

Physically, the **RuneQuest Companion** is another slim hardback, again done in gray shades. Unfortunately, the artwork is not as good, the contents not quite as complete, and there is the feeling that this volume has been rushed. This shows in the four chapters on magic, which are not all equal. You get the full feel of how Divine Magic and Sorcery work because there are plenty of examples. None though are given for either Enchantment or the Spirit World. Why not include example enchanted items and show how they are so enchanted? As for the Spirit World, several spirits are given in game terms, a couple of spells to counter them, and a little about the dangers of possession, but what you are not told is how it relates to anything else, or indeed the point of it.

Then there is the matter of cost, because what you are getting in the **RuneQuest Companion** is not a companion volume to the **Basic Rules.** Rather, this is the other half of the Basic Rules. Put the two books together and what you have is a slim and expensive core book. When you compare the paired volumes with many other recent releases, those titles are usually cheaper, in color, and come with more content.

Overall, the **RuneQuest Companion** is not as satisfying as the **Basic Rules.** While such additions as Divine Magic and Sorcery are decently developed, much of this volume feels rushed. Nor does it help that the new forms of magic have not been wholly integrated with details found in the **Basic Rules,** making them accessible to beginning characters. Underdeveloped and disappointing where it really matters, the **RuneQuest Companion** contains the necessary rules to expanding magic in the game, but which should never have been separated from the **Basic Rules.**

Murphy's Rules

Happy Rails To You

Back in the 1990s, when arcades were more than a collection of *Dance Dance Revolution* machines and a thousand iterations of next-generation Whack-a-Moles, there was a type of game called the "rail" shooter. For those who aren't hep on the lingo that all the groovy kids are using nowadays, let me explain. In many ways, rail shooters resemble any other first-person shooter computer game, akin to **Halo, Half-Life,** or **Frogger.** Unlike those other games, however, rail shooters confine the players to a predefined path, akin to the old carnival rides where visitors would roll along in rickety carts along a rusty rail. In many of these games it's possible to influence decisions somewhat -- such as by shooting a particular wall to enable a shortcut, or killing all the enemies which opens a new way -- but mostly players are confined to their rail.

The disadvantages of a "rail"-type game are obvious. Primary among these is the fact that the riders of the rails have little to no say in their ultimate destination (although, in RPGs and rail-shooter video games alike, there's always the option of dying along the way).

The advantages of a rail game are a little less obvious. Primary among these is the ability to deliver a much "richer," more interesting experience than is possible through more freeform exploratory means. As an analogy, let me bring up the Haunted Mansion ride, which is itself in various Walt Disney theme parks. (I've only ridden the one in Walt Disney World, but I assume the experience is roughly the same wherever you go.) At this exhibit, riders are placed within a car (itself surprisingly similar to those found on other rides) and taken through the mansion, where they get to witness many unusual and interesting sites: a mirror that reflects unseen ghostly hitchhikers within the car the riders are in, a crystal ball with a head that seems to talk and follow the viewer, a dinner scene with spectral dancers and flying objects, and the George-Lucas-improved version of *It's a Wonderful Life* where Mr. Potter shoots first. (Just kidding about the last one . . . riders couldn't handle anything *that* horrifying.)

Although the existence of the car-riding aspect of the Haunted Mansion ride is somewhat incongruous -- most mansions, haunted or otherwise, tend to be devoid of light rail systems -- all other aspects of the attraction are a delight. Amazingly, the ride still holds up amazingly well over 35 years later. And the primary reason behind this (besides the creativity and thoughtfulness of the original developers) is because the rider is limited in their options and experiences. Exhibits that wouldn't withstand close scrutiny or viewing from anything but a specific angle are whizzed by in a few seconds, and all parts of the ride have been developed to ensure that participants wouldn't spoil the effects by encountering it at anything less than an optimum condition.

While a first-time rider might believe that the Haunted Mansion would be vastly improved if the visitor was permitted full freedom of movement and exploration (or, at least, more options for movement and exploration, as the original ride's concept called for), in reality the Full-Movement Haunted Mansion would have to be completely re-envisioned for the difference in experience; in all likelihood, I posit that such a ride would be unable to withstand over three decades of visitors.

Which brings me to RPGs.

Really, there are few terms that elicit a stronger reaction to many gamers than the notion of railroading. In fact, when presented with the choice of either participating in a game which admits to railroading or being whacked in the groin with a golf club, 87% of all gamers responded, "Driver or putter?"

But does railroading have more to offer than the agonized groans of gamers worldwide? (That's rhetorical.)

Before I answer myself, let me note that I tend to think of railroading in two broad classes. The first is the type that most people are familiar with, where the individual choices made by the players will have little effect on the larger adventure. The type of tale where the heroes opt against going to the sinister castle in lieu of visiting the town or exploring the mysterious barn but, no matter what choices they make, fate will mysteriously conspire to have them within that castle by hook or by crook.

But there's a larger form of railroading that, I believe, tends to be much more accepted, appreciated, and even expected by some fans: macro railroading. Especially in established (often licensed) universes, there's a certain desire among many -- although not by any means all -- players to follow in the footsteps of canon. Thus in a World War II campaign there's a joy that comes with knowing D-Day is coming, in a *Star Wars* game there's the expectation that there will be a Battle of Yavin, and in a **Torg** series the Space Gods and Tharkhold will eventually become major players.

This isn't to say that, in any of these games, the group couldn't decide to veer off the "rails" that the grandiose train of the campaign is taking. (Indeed, my first-ever published gaming article was about how to shake up a potential *Star Wars* campaign.) But I suspect part of the fun for many people is in being part of the larger whole, of knowing what's going to happen but not necessarily how they will fit into it. In fact, many campaigns have problems when the setting veers too much off the expected for too long. I know one trouble some folks have had with long-running **Deadlands** campaigns, for example, is that events transpire to create a world that is far afield from what participants expect. ("Okay; it's 1876 . . . who are the Presidents, what the heck is going on with the War, and . . . what's going on?")

But in defense of the micro-railroading, it's still possible to defend this in some situations. For example, an adventure based on the **Groundhog Day**-style "same day over and over" premise requires a *lot* of railroading, at least in the beginning, in order to make a lick of sense. And if the GM has certain tricks up his sleeves -- such as pre-planned scripts, real-world puzzles, or even meals -- then a certain amount of railroading can help ensure that the adventure runs smoothly. And it's also possible for the "rails" to be hidden from view, or at least make them less noticeable; the classic example is if the GM offers two doors for the players to choose from but he needs the heroes to meet Character A before meeting Character B. Well, regardless of which door is chosen, guess which character is behind it?

Ultimately, I think the nature of railroading often stems from the skill used by the conductor and the crafters. (How's that for a metaphor transition?) I've mentioned both the Haunted Mansion and the old trail-pulled carnival rides; while they both have riders and rails, the gulf between the two is so substantial that they can hardly be considered to be in the same league. With one type of railroad you can't wait to get off, while the other type you scarcely notice you're on . . . and even if you do, you may be counting the moments 'til you can get on again.

--Steven Marsh

The Omniscient Eye

When Standing To The Left of the Nobles, What Rights Did I Have Left?

> **In traditional fantasy worlds, you have lots of kings, queens, and sundry nobles running the show, but common-born adventurers have the freedom to move around, slay dragons, and sell the hoard. Well, disbelief has to be suspended in this regard; it is a fantasy.**
>
> **But many science-fiction backgrounds have monarchies and aristocracies as well, from the classic *Traveller* game and a certain galaxy far, far away to books by writers like David Weber, Lois Bujold, or Larry Niven (I'm thinking of *The Mote in God's Eye,* of course). Except for the right to elect your government, many of these fictional systems provide an amazing amount of personal and economic freedom to their common citizens.**
>
> **So my question is this: Is there a historical precedent for hereditary oligarchies (styled monarchies, aristocracies, or simply "juntas") where the common people had rights like the freedom of speech or the rule of law, but no political representation? Did any of these systems last long enough for a truly hereditary ruling class?**
> *--Onno Meyer*

There's usually a direct correlation between personal liberties and participation in the political process. The notion of what we'd call "civil" or "human rights," particularly with wits notion of people sharing a fundamentally equal worth, is alien to most historical political philosophies once you get into societies more sophisticated than nomadic tribes and small villages. Just about everybody, everywhere, had an implied right to hold property of various kinds (family often fell into that category; land might not, and is a complex question in its own right) and a right to compensation for damage to that property by others. One might even find an implied right to request judgment and mediation in case of disputes from a theoretically neutral third party. Beyond that, what rights one might have, member of the political establishment or no, are a patchwork.

The starting point for understanding what rights someone had is that there were few if any rights which any society regarded as applying to all humanity, or even everyone in the society. Any rights were arrived at by arrangements within or between limited groups, won through violence, negotiation, and the slow evolution of tradition, and outsiders were not party to those arrangements. This can be seen in the convention that foreigners and certain disadvantaged natives in many places had *no* rights of their own. Some might have indirect protection as the subjects of somebody else's authority (for example, a slave might not be able to file a suit against someone who struck him, but the slave's master could sue someone for damaging his property; the same could be the case for unmarried women and the head of a family), but others had no legal protection whatsoever.

Moreover, much of what we regard as civil rights weren't addressed one way or another in many places. Most ancient law codes were far simpler than modern ones, and more concerned with establishing legal forms (conduct of courts, law governing marriage, inheritance, and other family issues). Law pertaining to individuals outlined what was forbidden (murder, rape, theft, blasphemy) and what was obligatory (taxes, compulsory labor) rather than what was permitted but voluntary. Many political systems had limited statutory restrictions on many kinds of personal expression and patchy restrictions on economic activity. However, they didn't *protect* those kinds of rights either.

So without the idea of a "standard" package of rights, what kinds of rights were commonly held? Freedom of speech or, more broadly, freedom of expression, is a tricky one. One of the large factors behind that is that while a ruler wouldn't mind sending out Ye Olde Thoughte Police to clamp down on anyone who grumbled about him, he simply didn't have the bureaucracy to exercise that level of control or the resources to build one. Laws concerning expression

were largely concerned with what we'd regard as slander and libel. For example, early Roman law set out remarkably harsh penalties for notably boisterous public insults and scurrilous, defamatory poems. But it appears that these kinds of laws were as concerned with maintaining the public peace as much as protecting individuals. Of course, in places laws against insults were escalated to require deference to officials and members of the upper classes, but these were far from universal.

Moreover, even those laws might be circumvented in times of political unrest. A surprising level of invective went into any expression of disapproval. A petition protesting against a particular king or bishop might, in addition to listing legitimate grievances, label him a murderer, blasphemer, and sodomite as well. It was simply a part of how politics was conducted, and people making such declarations typically had angry mobs or armed troops behind them, so such a statement probably wouldn't be prosecuted.

However, even if it was technically legal to declare "The king is a fink!", to do so loudly and consistently was to attract the ire of a very powerful opponent. A peasant who spoke up frequently against his overlord would soon find his taxes assessed as extensively as possible, permission to do various things (borrow an ox and plow for his fields, marry off his daughter, etc.) usually granted in return for a fee, denied, and so on. Even participants in a relatively democratic regime could find themselves on the wrong end of government attention. The civic government of Florence, for example, was routinely used by its high officers to punish their enemies with heavy tax burdens. There might not be a statutory punishment for expressing an unpopular opinion, but there could be retribution nevertheless.

The few cases where there seems to be some kind of recognition of right to free expression were at least nominally democratic or representative governments. Certain Greeks held up the right to speak freely as an important one, as opposed to restrictions which might be imposed under a tyrant. That meant, at the time, a ruler who came to power by "extra-constitutional" means such as a violent coup, not necessarily as a synonym for a dictator or oppressor. A tyrant might hold dictatorial power, but usually got it through popular support rather than through maintaining a powerful governmental machine. Still, a tyrant had a definite interest in suppressing diversity of opinion, so members of a vocal but unpopular minority could get crushed by their fellow citizens.

After the collapse of Greek democracy, a formal right to free speech didn't appear in the west until the late 17th century (about a century after formal laws against sedition, as it happens), when it showed up in a specifically political context. Members of the English House of Commons were granted the right of free speech *while in Parliament.* They could speak as they wanted to, so long as it fell within the business of the day, without fear of retaliation. From there, it was a slow evolution to modern ideas of rights applying to broader and broader categories of people.

So much for freedom of speech. "Rule of law" is a similarly dubious matter. Just about everybody had recourse to mediation of disputes, either under a written law code or a commonly understood body of traditional law. Even in more aristocratic societies, most people had access to court systems and could file suits against their peers and even their betters, and it was even possible to get reasonably impartial judges, though it could take some searching to find them. In the later Middle Ages, the kings of England were able to enhance their power by making royal judgment (in the form of royally appointed judges) more available through the kingdom. This was primarily a venue for the lesser nobility and moneyed commoners, but it did give greater access to relatively impartial courts to people with relatively little stake in the political system.

Unfortunately, in most cases the law usually made no pretense of equality. As far back as the Code of Hammurabi, elders, heads of families, and members of upper classes were typically entitled to greater damages if harmed than members of the lower classes and reduced punishments if they caused harm in return. Courts in societies practicing one religion might not accept testimony from members of others (for example, the testimony of Christians was discounted in Muslim courts, that of Jews in Christian courts, and so on), and the testimony of members of particularly low classes might be discounted in suits against people far above them on the social ladder. Torture might be applied as a matter of course to very low class witnesses. And different people even had different bodies of law applied to them. The most obvious example of inequality under law is probably Medieval ecclesiastical courts. The church had its own body of law and its own courts which followed their own rules, which were extremely lenient towards defendants. The church was powerful enough to make civil authorities defer to ecclesiastical courts and allow priests, monks, and a few other fortunate groups to be tried only there. Shopping for jurisdictions (that is, finding a court

favorable to your cause), a practice discouraged in many modern legal traditions, was par for the course.

Related to both free speech and rule of law is the right to petition. A number of societies (for example, the Byzantine and Ottoman empires) granted everyone the right to petition their ruler as a final appeal for court cases and a way to express grievances against lesser officials. Clearly, though, this is a very limited right, which can only be exercised by people who can physically reach the royal court and make it through the press of other petitioners to get the ruler's ear during the limited time he makes himself available. Moreover, this is arguably more an expression of a ruler's right to listen to anyone he wants to, regardless of what his subordinates and lesser nobles might say, than a commoner's right to express himself, particularly since audiences with commoners were pointedly aimed at the activities of nobles and officials.

The right to travel was sporadically restricted. Members of some classes were, of course, tied to a particular plot of land, required to work it unless granted permission from their landlord. However, during many periods, a significant proportion of the population weren't restricted to their homes. Rome, Byzantium, and China closely regulated permission to use imperial roads, but that sounds far more restrictive than it actually was. Permission to use the roads in that context actually meant permission to use government-maintained roadside facilities, posts where couriers and other official travelers could change horses and rest for the night. Others might travel on imperial highways (and, in China, extensive networks of government-maintained canals) but had to fend for themselves when it came to food and lodging and get out of the way in a big hurry when official travelers came thundering down the road. Instead, the main restrictions on travel were practical. Even within a culturally homogeneous area, travel would be expensive, and moving between them, it could be difficult and dangerous as well.

Probably the most heavily regulated "rights" a character might have were economic. Many governments participated in maintaining monopolies. Production of particularly lucrative resources (for example, silk in the Byzantine empire or salt in Renaissance Venice) might be carried out by government-run companies or farmed out exclusively to a private concern. This would be done to ensure a strong source of revenue for the government. However, governments also helped maintain monopolies in which it had little direct interest. Guilds and chartered companies were given the right to control a particular trade or type of commerce. This was lucrative for the guild masters, purportedly established high standards of quality, and gave the government a single body to deal with in case it had a special need for ships, barrels, ironmongery, and so on.

Wage and particularly price controls also appeared sporadically. Rulers periodically set prices on various goods, usually in times of famine, warfare, and economic crisis, in an attempt to keep their armies supplied or, more often, to stave off bread riots and civil unrest. Controls on prices of bread and grain were occasionally useful for preventing price gouging during particularly hard times, but failed to prevent more widespread problems. The emperor Diocletian famously attempted to set the prices of just about every common commodity in order to prevent inflation, but his price edicts were widely ignored.

A set of rights probably not thought of today but widely controlled had to do with how one's wealth could be spent. Certain types of consumption and display were often governed by "sumptuary" laws. The purpose of sumptuary laws was purely to play up class distinctions, with upper classes typically having more choices in dress and other kinds of visible display available to them than those beneath them. Probably the best-know sumptuary regulation is the right of only the highest-class Romans to wear purple, but such laws were rampant through the Old World. Members of particular groups might have to wear particular emblems or styles of clothing (for example, Venetian Jews had to wear turbans, and prostitutes had to wear yellow), while the use of silk,

Recovered Hoard Tax Form 1066-Dragon, With Attached Schedule K

Of all the examples of questionable freedoms, the selling of a dragon's hoard is probably the most plausible. Looting is a time-honored fringe benefit for warriors. The leader of a dragon-slaying expedition would probably be able to claim the lion's share of the goods, but if the pile of treasure were legally considered the spoils of war, which seems likely, it wouldn't be subject to seizure or extraordinary taxation (*ordinary* taxation is another matter altogether). There are, though, some different legal possibilities. Many historical legal codes -- including English common law and Roman law -- recognized a difference between goods which have been lost and those which have been abandoned. Lost goods, if

cloth-of-gold, and other expensive materials might be an option limited to the upper classes.

So where does this leave PCs? The average person in any historical society is probably more restricted in his legal choices than someone in the modern West. However, he's also unlikely to be deprived of large blocks of rights. Rather, he'll be dealing with a patchwork of limitations where previous kings and legislatures have seen fit to enact them and unusual freedoms and privileges in areas they hadn't foreseen.

Following on the principle that rights are negotiated by groups within a society, it would probably be wise to build PCs as members of classes which had acquired at least some rights. Only slaves and the lowest peasants would have rights so restricted as to make an adventuring career completely impossible, and even in an aristocratic setting, relatively modern packages of rights might be available. Medieval guilds and civic governments (often the same thing), though usually under the vague general authority of a bishop or king, were granted the right to set their own laws and other procedures. Though technically commoners, city residents and guild members were allowed to create their own separate political context, in which they could exercise broader rights.

Depending on where they are, the right to be tried under one set of laws and regulations rather than another is a significant advantage. The right to be tried in an ecclesiastical court is one example. Being a Roman citizen provided similar advantages. Until the 3rd century, Roman citizenship was a privilege belonging to a minority of the empire's residents, and it granted better treatment from local authorities and quite possibly exemption from some provincial laws. In the Bible, Saint Paul used his Roman citizenship to avoid harsh treatment at the hands of the authorities. In areas with large communities of resident foreigners, rulers occasionally guaranteed them the right to settle their own affairs. In the later years of the Roman empire, the Roman emperor, who was at that point regarded as the ruler and protector of Christians worldwide, reached an agreement with the Sassanian Persian emperor to allow Christians living in Persian territory to have their own legal proceedings overseen by local bishops. A crime committed by a Christian against a non-Christian Persian would be handled under Persian law, but the Christians in Persia had the right to handle their internal affairs by themselves. Similar arrangements were reached in the late Middle Ages and Renaissance by small colonies of European merchants in Muslim areas.

The kinds of economic activity regulated by historical law were usually not terribly interesting for PCs: everyday craft work, running mills, and other enterprises necessary for the day-to-day operation of society. PCs are unlikely to have a strong desire to settle down and make a living as leather-workers or barrel-makers, and even if they do, it wouldn't be unreasonable to make them members of an appropriate guild anyway. Even where a government maintains a monopoly on a particularly lucrative and interesting type of production, PC might still be able to import their own (which, if they take it as loot, might be cheaper than conventional importation). About the only significant economic limitation adventuring PCs would face, beyond taxation, would be a local monopoly on trade with a given region, such as that granted to the British East India Company by Queen Elizabeth. Killing things and taking their stuff, particularly if done abroad, was largely unregulated.

Having rights can also be a factor of being in the right place at the right time in history. Civil rights for people outside of the ruling class tended to be fleeting because they usually appeared as part of a cycle leading towards either an aristocratic crackdown revoking them or an aristocratic collapse increasing them. It would be an unstable state of affairs stopping just short of coups and revolutions, but a GM could set a campaign in a place where commoners had successfully won rights from the ruling classes or the ruling classes had recently increased their power at the expense of the commons. The former happened by stages in England, leading through constitutional monarchy, increasing the size of the effective ruling class by fits and starts to more regions and broader classes of people (starting from the top

found, might be subject to claims from original owners or their heirs. It would be hard to establish prior ownership of a pile of gold coins, but notable heirlooms in a dragon's hoard might be the subject of lawsuits. Abandoned goods, though, can often be claimed by the people who find them. The contents of a dragon's hoard might be a mix of the two, lost goods where heirs of the former owners make themselves known and abandoned where they do not. No law code would require the finder of lost goods to assume the burden of proof, making him prove that there is no legitimate owner to what he has found, though he might be required to formally notify the government of his find so that appropriate taxes may be assessed.

of the economic ladder and trickling down), until becoming a more or less representative government a century or two ago. "The people" picked up rights along the way, but usually as a prelude or accompaniment to joining the voting classes. The latter has happened in a number of ways, most notably at the end of the Roman empire into the early Middle Ages. As a response to a collapse of law and government, people gave up freedoms to powerful magnates, who eventually crystallized into noblemen, in return for protection. Either of these situations seems most appropriate for a science-fictional monarchy or aristocracy.

Finally, there's a path particularly relevant to PC adventurers which can be used to go around most legal restrictions, and it's paved with gold, silver, and blood. While most rights and privileges may not be automatically *granted,* they can often be *purchased* or won on the battlefield. Remember, rights are gained through arrangements and agreements with people in a position to grant them. Most aristocratic and monarchical governments, while officially excluding the masses from circles of power, recognized a need for merchants, tradesmen, warriors, and others in their societies, which gave sufficiently competent commoners effective, if unofficial, power. Wealthy characters can buy freedom of speech. Mighty warriors can win respect and position through their deeds. If you don't have rights, go out and get them.

--Matt Riggsby

Sages theorize that the Omniscient Eye might actually be composed of a panel of Experts chosen through mysterious and arcane means. Regardless, the Omniscient Eye is benevolent, and every other week it is willing to share its lore to all. Or, at least, to all with valid *Pyramid* subscriptions.

The Omniscient Eye seeks to answer questions that are tied to knowledge of the real world, providing information with a perspective that is of use to gamers. The Omniscient Eye does not concern itself with specific game systems or statistics.

Do you have a question for the Omniscient Eye? Feel free to send it to pyramidquestions@yahoogroups.com, and the Omniscient Eye might answer it!

Like Masked Mother, Like Caped Child: The Amazonia Story

by Brian Rogers

Previously I described the concept of the super-continuum: a chart for tracking various types of supers presentations, how those presentations can work as games and how the iconic heroes average to the chart's center over time. While that article's sample character, Omniman, hits the supers sweet spot with a long personal story, there is another way: having a Legacy. Each generation has its own version of the hero, and each version has a well defined niche on the super-hero story chart.

Amazonia

Amazonia is a name adopted by women operating near the desert city of Palette over the last hundred years. It's hard to discern connections between them, in part because the desert sands hide many secrets, and in part because sometimes there isn't any.

The first Amazonia was the *Warrior Woman of the West,* the last of a line of Native American defenders who were remnants of the Anasazi. Members of that tribe were blessed with preternatural strength, speed, and animal speech as gifts from the spider goddess. When this last Anasazi settled near the mining town of Palette she raised the eyebrows of the local press. A weathered indigene horsewoman -- especially one with the speed of a horse and the strength of a bear -- was simply too good a story. Alas, their research was spotty, so the country received headlines and books on the newly Europeanized "Amazonia."

Amazonia aided the towns' eccentrics, widows, and tarnished roses against bandits, gunslingers, and unscrupulous miners, ultimately turning Palette into the "distaff boomtown." Over the next five decades Palette's history as a haven for prostitutes and artists made it "a Big Easy built on sand rather than mud." It was this liberalism and lack of local law that turned Palette into a rumrunner's haven and buried the city in a sandstorm of crime. Enter the second Amazonia, known as the *Sapphic Scourge of Suffragette City.*

Pricilla Starr was one of Palette's leading ladies; heir to a mining fortune, she spent her teen years in a British finishing school learning fencing, archery, and riding. Returning to a town in turmoil, Miss Starr adopted the legendary name, but dressed as a classic Amazon armed with technology (including a motorcycle and explosive or drugged arrows). She cut a swath through the underworld, acquiring information from nouveau riche mobsters as the British accented Miss Starr by day and disassembling their operations with a western twang by night. The pulps ate it up with a spoon: once again Amazonia was known from coast to coast. Miss Starr had the sense to step away from the role before it killed her. The war killed her instead, a Luftwaffe bomb cutting her life short as she aided the British war effort in 1940. Her secret revealed in her estate, Amazonia's adventures were adapted into a patriotic movie serial (convincing many that Amazonia had fought Nazis -- a myth continuing to this day).

The next Amazonia was less lionized: in 1951 Painted Sands Air Force Base went up perilously close to Palette, and an accident combining a prototype atomic plane, an arachnid alien spy, and an insecure mother had tragic consequences. Dorcas Cole's life as a *Firestorm Effect* started with super-human strength, animal speech, and an increase in self confidence. Over several months she became strident and territorial, lashing out at anyone who threatened her children -- starting with a local motorcycle gang, then the air force base, then the whole military, then all of "the damned warmongering men". At the end she was so powerful that the air force could not stop her, and she was contained by agents of THEM. While later generations cast Amazonia as a martyr, radiation had turned Dorcas Cole into the embodiment of society's fears of women in military geopolitics: headlines questioned if she was an *Altruistic Mother or Atomic Monster?*

In any event, her actions led to the closure of Painted Sands and a slump in the Palette economy. The city recovered as a haven for the counter-culture, a haunt of the hippies and artists through the 1960s and 1970s. The decision to re-open Painted Sands in 1983 (a pork project of the local Representative) set the city's liberal artistic chic against the state's conservative mores at the same time that Palette's new police chief set to quelling the town's drug trade. Tensions were running high and violence was in the air when the fourth Amazonia arrived -- a *Contemporary Cultural Costumed Crusader.*

Large animal veterinarian Anna Zone's research into her family tree revealed ties to the first Amazonia. Combining a medical mindset and her masters in Anthropology, Anna theorized that her animal empathy was the diluted remnant of Anasazi gifts, and experimented with a mix of hallucinogens to approach her lineage. This touched something primal, and once she came down Anna found she was superhumanly strong and fast, could talk to animals, see things outside of human perception, and slide into a "spirit realm" that surrounded Palette. That spirit realm has both practical aspects (Amazonia stores her bow and arrows within it for easy access) and wondrous ones, letting her traverse a shadowy reflection of this and other parallel realities. Amazonia now wears several masks -- icon, environmentalist, and super-hero -- but her real interest lies in exploring cultures and uncovering secrets, the greatest being the past of the women who share her name. She is often forced to use her powers to save the world, and to be perfectly honest she finds something satisfying in a good fight.

Since she is not as much of a crime-fighter as her peers, she shares Palette with two other heroes: Tunnel Rat (a mostly reformed were-rat with vigilante tendencies) and Coyote (a trickster whose powers are never quite what they seem). Anna retains an intermittent secret identity as a veterinarian-turned-hippie who hangs with the city's "mystical" crowd as a way to hone her own talents while avoiding the glare of fame. This community's unofficial head is Deacon Frost, Christian bookstore owner, and its mascot is Sarah Sands, an orphan with an incredible nose for trouble.

Amazonia in TSdX (215 points)

Body	16	**Mind**	nbsp; 7	**Soul**	13
Attack Value	14	**Defense Value**	12	**Health**	245

Characteristic Attributes

Features (2)	tall, leggy build gives appearance + increased run speed
Organizational Ties (6)	well connected to Palette "mystical community" (Moderate influence)

Firestorm Effect	**Description**
Special Movement (8)	Dimension Hop to the spirit real that overlaps Palette. From there she can dimension hop to other alternate Palettes.
Sixth Sense (2)	sense animal life and spirit realm fluxuations in a 1 Km radius (area 5)
Animal Control (2)	summon/control 5 animals in a 1Km area for 1 hour (area 5, duration 5)
Creation (2)	up to 5 kg of muscle powered weapons -- items stored in spirit realm
Telepathy (3)	animals only, read surface, transmit concepts. 1 mind in a 1Km range. (Targets 1, Range 3)
Combat Technique (2)	Blind Shooting; Steady Hand
Extra attacks (2)	has 3 attacks per round
Extra defenses (2)	has 3 defenses per round
Speed(3)	run at 1000 kph, +6 initiative
Attack Mastery (2)	gains +2 on all attack rolls
Defense Mastery (2)	gains +2 on all defense rolls
Divine Relationship (5)	can reroll 5 rolls per session, spirit real manipulation
Super-strength(5)	lift 30 tons, +50 on HTH damage; +20 on strength related rolls
Tough(5)	gains +100 health
Defects	**Description**

Marked (1)   Highly distinctive but small tattoo on small of back.
Nightmares (1)   Incomprehensible dreams of spiders and aliens.
Nemesis (1)   Arachnoid aliens

Skills

Animal Training -- horses (4)
Biological sciences -- zoology (2)
Medical -- Veterinary (3)
Riding -- horses (1)
Occult -- Native American rituals (2)
Wilderness survival -- desert (1)
Cultural Arts -- history, urban legends (1)
Etiquette -- mystic community (2)
Social Sciences -- sociology (3)

Other Legacies

Of course, there's also more than one type of Legacy hero.

Lineage: The hero is part of a line of heroes that stretches back a generation or two or hundreds of years. This is usually based on bloodline. The first and best example of this is the Phantom, but Starman works too.

Hero Worship: Upon a hero's retirement or death, someone takes on the mantle but not necessarily the powers. This might be a sidekick, fan, or just someone borrowing the mystique. Examples include the Flash and Astro City's Confessor.

No Relation: the hero has the same name and approximate powers, but isn't connected to previous or future versions. Where there is a connection, it is a secret for some time. An example is the shift from the golden age Green Lantern to the Green Lantern Corps.

Key aspect of Legacies carry across generations, but style might be different. Looking at four generations of Amazonia, we see:

- all are female heroes,
- all work in the same locale and
- they have either animal-powers, an archery motif, or both.

The *Warrior Woman of the West* was the end of a Legacy hero line; the *Sapphic Scourge of Suffragette City* is Hero Worship, with a direct attempt to emulate the original. The *Contemporary Cultural Costumed Crusader* is a continuation of the Legacy, but also has close ties to the *Altruistic Mother/Atomic Monster,* who on the surface has No Relation.

Legacy heroes have the advantages of history. The character has deep roots in the world, even if this generation is just starting -- a boon for players who like to feel connected. Old allies and enemies are in the wings, and secrets might have been passed along as part of the unusual background. Lineage heroes will be especially in-the-know, which is a nice solution for an experienced player alongside a group of newcomers to the genre or setting.

Amazonia in the Firestorm Effect Universe

One fact of the Firestorm Effect universe is that there is no magic; as an Atomic Horror setting, all its problems are scientific. However, the player requested a "warrior in a magical environment." We ended up threading this needle with the arachnid [shape-shifting aliens](#) that dot the FE timeline: if the Anasazi were born of arachnids in human form it explains the powers, opens the path for animal based superhumans (other terrestrial/arachnoid hybrids).

It also gives Amazonia access to the pocket dimension generated by the Arachnoid ship buried under Painted Sands. The original concepts for the Arachnoid aliens didn't include such a device, but it's a logical enough leap for people who possess "quantum fusion drives" to power their ships. The ship is generating a parallel realm that Amazonia can step into, travel through and store things in.

They are an excuse to design multiple characters, another [outlet](#) for players who overflow with ideas. For players who like switching styles, legacy hero flashbacks are great for stories within stories -- which also show the character concept at various points in the supers continuum. This can be disconcerting for the other players, who might not have a way for their characters to be involved, but there are solutions: old heroes might have worked with the previous generations (it's easy enough to see Omnilad and the third Amazonia having crossed paths at least once); time travel stories might leave the current generation to guard the present while the player picks up the previous incarnation to interact with his temporally altered teammates; or other players could make PCs for the new time frame, giving them a place in the world's history.

Finally, Legacy Heroes are a way to kill a favorite character without losing them. Plots don't have to be abandoned, as they just carry over. For casual players, when the current generation of the Legacy dies, the name on the character sheet can be altered, points reduced and swapped a little, and here comes their daughter/lost sidekick/heir to the curse to keep the story going with minimal interruption.

Let's face it; as a gaming concept, Legacy heroes have a strong pedigree!

Palette *feels* magical, but in truth is still rooted in Atomic Horror. It also links the first, third, and fourth Amazonia via the Arachnoids. The player character (and possibly the player) may never know the real truth about Amazonia's powers and origins, but for practical purposes the character is what was requested. Some players enjoy unraveling these mysteries, and some don't mind being left in the dark, but some really hate the idea of their character's origins being changed. Use this technique with caution!

The Sorcerer's Toolbox

for *GURPS*

by James L. Cambias

Most people are familiar with the basic tools of a fantasy magician: the wand, the staff, the pentagram, the enchanted dagger, and so forth. But any magician worth his pointy hat will have some better equipment in the toolbox. Here are some magical apparatus likely to be found in the laboratory of a practicing magician. Some are ancient, others are high-tech fusions of science and sorcery. They are based on real-world occult books, legends, and crackpot theories.

Blasting Rod

This is a very old type of magical weapon, described in many old books. It is a rod or wand enchanted with a spell which can blast and torment spirits. Magicians typically use them to threaten and control summoned spirits, and as a way to deal with supernatural beings sent against them by rivals.

A Blasting Rod is enchanted with the Spirit Lightning spell -- a variant of the spell Lightning (see page 196 of **GURPS Magic**), tuned to affect spirits only. The spell does 1d-1 damage to spirits only (even intangible ones) per energy point expended by the caster. Blasting Rods are seldom self-powered. Rods are typically enchanted to skill level 20. They cost $27,000 in a fantasy setting, $50,000 or more in a world where magic is not commonly known.

Crookes Disruptor

Invented by the English physicist Sir William Crookes, working in partnership with the medium Daniel Douglas Home in 1870, the Crookes Disruptor is a proton emitter tuned specifically to affect immaterial spirits. (Essentially a Disruptor is a technological equivalent of a Blasting Rod.) Early versions were large, power-hungry, and extremely malfunction-prone. Today, a century of improvement has made Crookes Disruptors portable, reliable, and quite effective. All Disruptors emit particle beams which can damage spirits, but are harmless to material beings. They are entirely legal in societies where magic is unknown, because in such places the authorities view Disruptors as harmless crackpot tech. In a magical setting they are likely LC 3.

TL5^ Crookes Disruptor

This is the original design. It is a large vacuum tube surrounded by focusing coils, which emits a 100-kilojoule charged particle beam. The device is large, bulky, and fragile: it has a malfunction number of 16. There is a tripod so that the user doesn't have to wrestle with it. It requires a 100 kilowatt power supply (usually in the form of a cable to a dedicated generator or a power main).

TL8^ Crookes Disruptor

This is the result of considerable refinement by later engineers making use of considerably better technology. Output is 90 kilojoules but damage is greater. The weapon is quite light, only 1 lb. without batteries, but the 3600-kilojoule energy pack increases the weight to 4 lbs.

TL	Weapon	Damage	Acc	Range	Weight	RoF	Shots	ST	Bulk	Rcl	Cost	LC	Notes
5^	Crookes Tube	3d	6	40/80	45	1/2	--	16T -9	--	$1,000	4	1,2
8^	Disruptor	4d	8	40/80	4/3	2	20	6 -4	1	$24,000	4	1

1 Damage only affects immaterial spirits.
2 Requires tripod and external power source.

Faerie Drops

These eyedrops have been used for centuries by the Faerie to give changeling children and occasional favored mortals the ability to see into the spirit world. The secret was stolen in the early 19th Century by an Irish physician called in to attend at a Faerie woman's difficult childbirth. He stole a sample and analyzed it, and was able to mail his findings to a colleague before being harried to death by the Wild Hunt. Alchemists working together with Faerie specialists and magicians were able to duplicate and improve the formula. The drops give the See Invisible (Faerie Glamour) advantage for up to 1 hour per dose. Cost is $1,000 for a bottle of 5 doses. (Since it doesn't require a magician to produce, the cost is the same in mundane and magical settings.)

Scrying Mirror

Mirrors as tools for scrying and divination date back to the ancient Etruscans. Beginning in Renaissance-era Venice, mages and alchemists have tried to improve the qualities of scrying mirrors, by using mystically vsignificant materials, unusual curvature of the reflecting surface, and other techniques. The best-quality mirrors were those made during the 1860s by the Italian-Armenian mystic Cuilna Vilmara. A mystic scrying mirror can give the magus a skill bonus of +1 to +3 when performing Divination by Crystal-Gazing. A +1 mirror costs about $8,000; +2 is $33,000; and a +3 mirror costs $165,000. (Double the price in a low-magic or secret magic campaign.) If you are using the Hermetic modifiers from *GURPS Cabal,* a enchanted mirror also gives its skill bonus for any spell associated with the Moon or the decan Iudal.

Spirit Lenses

Spirit lenses are made of specially alchemically-doped crystal, polarized and tinted to allow anyone looking through the lens to see spirits. Essentially a spirit lens gives the user the Detect (Spirits) advantage with the Precise enhancement. They are very useful but hard to make. Spirit lenses first became available in the 18th century, and do not get any benefit from improved technology. A spirit lens 1 inch across (suitable for use as a monocle or in a camera attachment) costs $1,000 in modern money. A matched pair of lenses (for use in goggles or glasses -- it is impossible to have one ordinary glass and one spirit lens in a pair of glasses) cost $2,500. Spirit contact lenses are extremely expensive and must be custom-fitted to the wearer, costing $5,000. They cannot be combined with ordinary corrective optics. Cost is unchanged by the campaign magic level.

Spirit Trap

Although designs for electrical spirit traps go back to the 1850s, they only became practical with the discovery of superconductors in the 1960s. Spirit traps use flows of electrical current along carefully-aligned channels to create a cone of force which attracts and then imprisons spirit beings. The effect is that of the spell Entrap Spirit. Note that a spirit trap must have a constant supply of power to maintain its containment field. Even a split-second flicker is enough to let the occupants get free. Constructing a spirit trap requires both Gadgeteering and Magery.

Tesla Spirit Trap (TL5^)

This is a box about the size of a telephone booth, surrounded by coils and magnets. When operating, its surface is covered with arcing bolts of electricity, and it is surrounded by a corona of blue plasma discharge. It can hold spirits with a combined ST and IQ of up to 20. It weighs 200 lbs. and requires a 2-kilowatt power supply (typically from a dedicated generator or a bank of batteries). Cost is $10,000 in 1927.

ECU-13 (TL8^)

This model is a folding plastic and aluminum framework creating a cube 2 yards on a side. It is powered by house current, drawing 400 watts, and can hold spirits with a total ST and IQ of 40. Weight is 50 lbs. Cost is $25,000. Multiple ECUs can be connected to hold physically bulky spirits, or to create a space which spirits cannot enter.

Pyramid Review

Venus Needs Men!

Published by Synelix Games

Created by John L. Velonis, artwork by Jeff Durham

20" by 20" playing board, 76 cards, 125 population chips, 30 spaceships, three 10-sided dice, rules sheet; $29.95 (USD)

"March, 1954: atomic tests by witless humans have destroyed the alien artifact which protected humanity from its hostile neighbors. Now, the races of the solar system are descending upon the Earth in droves. Their mission -- harvest humanity for their own needs. And with the destruction of the alien artifact, the only things that stand in their way are . . . each other!"

This is the setup for *Venus Needs Men!:* a strategic board game for two to six players that plays like someone watched too many grade-D flying saucer movies from the 1950's and turned them all into a game, with fun and hilarious results. While there are a few questions of power balance between the planets -- most notably Pluto and Earth -- my test-drives reveal the game to be challenging, amusing and very enjoyable.

The main goal of the game is to harvest (or save, in Earth's case) a majority of the Earth's population. Players can take on the role of Mars, Venus, Titan, Ganymede, Pluto, or Earth, each of whom have special abilities, as well as certain advantages and disadvantages. For example, Mars can use Mind Control to take over opposing players' ships, and use a Magneto Blaster to attack ships, pull them closer or push them away. Meanwhile, Venus can gather two population counters per ship per turn instead of one, but must use unstable "Q-Rays" to attack with, running the risk of losing their own ship, or being teleported elsewhere, in the battle.

During a planet's turn, players can choose to build more ships, move their ships, roll to attack opposing players' ships, research a Technical Upgrade, or use ships landed on Earth (or in orbit, if you're Pluto) to harvest population counters. What keeps this from being a simple "move, shoot, and grab" scenario is that players can perform only *one* of these actions per turn: some or all ships can move, or some or all ships can shoot, but some can't shoot while others move or perform other actions. Victory depends on thinking ahead, exploiting others' weaknesses with your advantages (and other players) and being very, very careful with your ships.

One possible key to victory -- especially for poor, beleaguered Earth -- is using the Technical Upgrade cards. Players can opt to perform a Research Action for their turn, which involves picking one of the three upturned Technical Upgrade cards, and rolling to see if their planet can learn the technology each card offers: possibly gaining better shields, weapons, movement, ship building or population gathering techniques. Research Actions are a risk, since you might effectively waste a turn by not rolling well enough to get one, but they can really pay off.

Another, more straightforward route to winning is the careful use of Zap Cards: fun strategy cards that aid and enliven play. They can be used to give or take away turns, blow up other player's ships, stop all players from performing certain actions, force other players to take actions, or affect the outcome of die rolls. Many can be played at any time as an interrupt, and some have to be played at specific times, such as when it's another player's turn, or when someone else plays another Zap Card. They can also be sacrificed to gain extra actions (another movement if you move, another ship if you build, and so on). Players start with an equal number of Zap Cards, but they can only have the top three cards in their hand at any time, and replace them from the top of the deck when they're used. So no one knows exactly what cards they have in reserve, and once their deck is used and discarded, they can't get any more.

One of the best things about the game, besides its play, is that it's very user-friendly. Not only are the special abilities and technical strengths of each player printed on separate, Special cards for easy reference, but there are also sets of reference cards that summarize the order and rules of play, give every planet's attack and defense scores and summarize their special abilities -- enough for each player. The Technical Upgrade cards all say what they duplicate, make obsolete, or are cumulative with. Also, the Zap Cards are all individually numbered, so that if there's ever a question of one card trumping the effects of another, the one with the higher number wins out, saving a lot of arguments.

(And if you have a question that can't be answered, the game's [website](#) has both an errata and a FAQ, as well as a forum to post questions no one's asked yet.)

Another nice feature is that you have a choice between playing a Basic Game or the Enhanced Game. In the Basic Game, the only special abilities are that some aliens start out with more ships than others, and can build more per turn, to make up for their planets being further away from Earth. Putting almost everyone on an even level makes for a faster game that still preserves the strategy and flavor of the normal, "Enhanced" option. There are also rules for adjusting Earth's population to allow for shorter or longer games, complete with adjusted goals to win for two to six players.

The only real problem with *Venus Needs Men!* is one of power balance. While most of the planets seem to be evened out fairly well, the deck is decidedly stacked against poor Earth. Its combat stats are the weakest, it starts out with no spaceships in either game, and it can't start moving people to the refuge until someone else attacks earth's spaceships or collects population. And even if people are in the refuge, they can still be attacked and harvested from orbit or land by aliens -- a severe disadvantage. They do get a free Research Action every time an alien spacecraft is destroyed in orbit or on land, yes, but I'm not convinced that ability truly makes up for these drawbacks.

Meanwhile, Pluto has too many advantages. They can teleport randomly and zap population from orbit, they get three dice to attack with, their ships take two hits to destroy, they're immune to Martian mind control . . . *and* they get to go first!

(If I was rewriting the game, I'd take away Pluto's teleportation abilities, let Earth start with two spaceships and let them start collecting population from the start, as though they had impending warning of alien attack. Give it a try and see what you think.)

Another quibble -- this one minor -- is that the cards all have the same art on the back. They are labeled on the upper left front corner, but it would be nice if the different kinds of cards had something other than the *Venus Needs Men!* logo, as this would make pre and post-game sorting a little faster.

That said, in the aftermath of several invasions, I find *Venus Needs Men!* to be intricate enough to be challenging without being too mind-numbingly complicated, and presented well enough to foil most headaches over the rules. While I'm concerned about the power imbalances, they don't kill the experience for me. So I'm still giving the game a good recommendation for strategic board game fans who like something fast-paced, fun and funny.

As of this writing the only way to get a copy is to order it from Synelix Games at [their website](#) -- I recommend preparing for invasion today!

--J. Edward Tremlett

Pyramid Review

Out in the Black (for the [Serenity Roleplaying Game](#))

Published by [Margaret Weis Productions](#)

Written & Designed by Tracy Hickman & Laura Hickman

Illustrated by Lindsay Archer, Dan Bryce, Larry Elmore, Tracy Hickman, & Ryan Wolfe

Cover by 11TH HOUR

104-page b&w softcover; $24.99

So 12 months in and we finally get some proper support for the ***Serenity Roleplaying Game.*** And even more amazingly, this support actually comes with an index (even if only a character index) and a character sheet, both of which the core rule book singularly lacked, along with several other elements.

To be fair, licenses are not always the easiest of things to handle for a games publisher. Nevertheless, it has been a long wait for *Out in the Black,* the first proper support and the first scenario for the game. In the meantime, several *Traveller* scenarios have appeared that could easily be run in the *Firefly* 'Verse. All they needed was a little western-afying. Plus all of them were cheap.

Out in the Black is not only of note -- important being too big a word to use here -- because it is the first scenario and supplement for the *Serenity Roleplaying Game,* but because it is co-written by Tracy Hickman and Laura Hickman, who happen to have a number of classic ***Advanced Dungeons & Dragons*** scenarios to their names, including ***I6 Ravenloft, DL1 Dragons of Despair,*** and the ***I3-5 Desert of Desolation*** series. The question is, can ***Out in the Black*** be as good as those scenarios were in their own way?

At the heart of the scenario are two things: a mystery and a McGuffin, the treasury of the Independents, reputedly lost in the final days of the Unification War. What it is, and where it is, has become a matter of rumor, scuttlebutt, and all manner of conspiracy theory. There are parties who do know where it resides and will do almost anything to get it back, including lie, cheat, and steal. At the head of the queue is a certain green-eyed, red-headed lass, whose name today could be Brigit, Elizabeth, Yolanda, or even Mrs. Malcolm Reynolds. And if her plans just happen to involve the PCs, then that is too bad for them.

The scenario takes place on Regina, the same world as the *Firefly* episode "The Train Heist." More specifically in Frisco, a town dominated by the Hornsilver Mine. Currently the town is under Alliance blockade at the bequest of the Corone Mining Consortium who want in and control. The blockade means no fuel to power the mine's generators and that is only available in frozen form from a nearby comet. Making a delivery is how the player characters or crew get involved.

Once there, the crew quickly become involved in the town's affairs, from kidnapping Frisco's leading figure to take him to a better shindig and standing in for an electric sideshow to the obligatory brawl and helping with a Miners' Union election. Getting involved with these events gains the crew favor with the town's factions -- the townsfolk, the miners, the mine owners, and the local Tongs. Gaining enough favor triggers events that further advance the scenario's storyline.

Divided into four acts, ***Out in the Black*** starts out in clever fashion by drawing upon Crew member's assets (advantages) and Complications (disadvantages) as the trigger for a flashback. It is a device well used in the television series, here taking the characters back to the original appearance of the mcguffin as well as to encounters with those whose lives it has touched. The five flashback scenes should be enough to involve at least one or more members of the crew. Each encounter or situation is pleasingly laid out in fashion that makes it easy to run.

In addition to the adventure, the town of Frisco and its inhabitants are all fully detailed, providing enough information for the GM to have the crew revisit or to help him model further settlements (though the ***[Knuckleduster Cow Town Creator](#)*** would also be helpful). There are also rules for the real card game of the Wild West, *Faro* and a surprisingly technical description of mines in general. In addition, footnotes link elements of the scenario back to ETW or Earth That Was, much of it actually based upon both the real history and tales of that history as told to Tracy Hickman by his family.

Physically ***Out in the Black*** is reasonably put together, and illustrated with a few pieces of decent art. The maps are well done, but clearly should have been in color as some clarity is lost in black and white. In terms of organization, it seems curious to have the sideshow events that gain the crew faction points in the section detailing Frisco. Why not have them in the adventure section where they obviously belong?

There is one final problem with ***Out in the Black.*** The adventure is written for use with Heroic Level characters, created by the players rather than the actual crew of the *Serenity.* And if the players do take the roles of Captain Reynolds et. al., what happens when they run into "Brigit" given the history they have with her? The GM advice admits that the possibility is a volatile mix, but does not offer any help. To be blunt, any player is going to take one look at her and walk the other way, knowing that she is trouble. The authors should have either recommended that the adventure as unsuitable for use with the *Serenity* crew or given some actual guidance, and certainly not left the GM hanging in the wind.

Certainly, though, ***Out in the Black*** is a busy affair that gives the crew plenty to do. Gun fights, bar room brawls, piloting a ship onto a comet, hire a Sheriff, deal with said plumb loco Sheriff, run around in a mine, and even wear a big frilly dress. Overall ***Out in the Black*** is more than a fitting tale to tell in the 'Verse with material enough for two to three episodes. It is the solid type of support that the game deserves and should have received in 2005.

--Matthew Pook

Thanks for the Road Trip

This week I'm writing this from the abode of the in-laws, about whom I cannot say enough nice things (and not just because they might read the screen while I go to tend the Child of Healthy Lungs). We got here via means of a six-hour road trip from Indianapolis to the outskirts of Rockford, Michigan which people around here note is outside of Greenville; Greenville, for its part, is pinpointed for nonlocals by noting that it's outside of Grand Rapids. Grand Rapids, childhood home of President Ford, is noteworthy to outsiders for belonging to the side of the state that isn't Detroit. Which is to say, beyond this point we start getting into landmarks that begin, "Do you know that planet next to Mars?"

Which is to say that we're a bit off the beaten path here.

We made the journey here via a more back route means, under the theory that being with a Child of Healthy Lungs in the middle of the Interstate when he decides that now is a good time to try a round of live-action Teething: The Hollering. So instead of traveling from rest stop to rest stop in 20-mile increments, we traveled from small town to small town in 20-mile increments, passing places with evocative names like "Restaurant" and "Closed." There's a certain sense of despair when you pass a billboard that says "10 minutes to McDonald's" and you realize that this means there's absolutely nothing of note before that point, and at that point there's . . . well, a McDonald's.

Fortunately, the Child of Healthy Lungs succumbed to the siren's song of the comfy warm vibrating car, so he really only woke up once when we needed to change his diaper (at a McDonald's) and he decided to ensure that his vocal abilities still worked by demonstrating a capacity for audibility usually reserved for Ewok widows beaten with baseball bats.

So even though we budgeted 10 hours for our five-hour trip, we made it in much less time. Now, the cynical among you might believe that the preceding pointless and eventless anecdote is merely a means of fulfilling my contractually obligated word count for a Thanksgiving column, but you'd be no more than 40% correct. (The cynical would be completely correct about believing such about the previous sentence. And that last one. Err . . . and that last one. Dang.)

Anyway, I'm about to tie it into gaming in mere sentences, as soon as I point out a complaint I read about recently the *Star Wars: Knights of the Old Republic* computer RPG.[1] It pointed out that the game was pretty enjoyable, except -- once an area has been cleared -- any backtracking or traveling is really boring. Many computer RPGs have this problem; in any game which involves trekking around, there are often points where Point A sends you to Point B (where you smite every problem along the way), get the chocolaty Whatchamacallit, and return to Point A . . . which, since everything was smitten earlier, means that leg of the journey is pretty boring.

Some computer RPGs resolve this problem in various ways. For example, many introduce rapid travel techniques (moongates, flying cuckoo birds, or what have you). Others merely allow a menu-choice option to go to a place you've already cleared (adding the appropriate amount of time in-game, but making the real-world part zip by).

While real RPGs can emulate either of these aspects, they (ironically) introduce another problem in so doing. For games that feature rapid travel abilities (especially of the "time passes, and you're in Paris" sort), it's very difficult to introduce new elements, information, or encounters along the way; if the GM does, it's immediately obvious that there's more going on here than a random encounter. If the heroes go from Foobar to Barfoo (taking care of any problems along the way), then if the players are expecting to just pop back in Foobar afterwords but the GM says, "Along the way you encounter a merchant . . ." then it's pretty glaring that this won't be some random dude.

Of course, I've encountered this before in my own games. While I might return to the idea of "instant transportation" or "rapid movement" in another column (because they're too meaty to take up the rest of this column), I thought I'd offer up some tips for how you might minimize this problem yourself.

First, I'm a big believer of the "no encounter is random" school. Classic *Dungeons & Dragons* notwithstanding, I feel

each encounter/battle/retreat should serve to advance the plot, characterization (for PCs or NPCs), or background. Now, each encounter doesn't need to be of paramount importance, and there's a lot of wiggle room in the "characterization/background" departments. But, in general, if the heroes encounter a dozen orcs wandering in the wilds, then there's a darn good reason for them to be hanging out (and a reason for the PCs to encounter them).

So, once the players realize that there aren't any random encounters, the question shifts in their mind from "Will this be an important encounter?" to "*How* will this be an important encounter?"

And it's that "how" where everything hinges. Because, obviously, not every encounter should be an attack, nor does every encounter need to advance the plot. Even those that do don't need to do so obviously or directly. So let's return to our "merchant on the way back to Foobar" example from above.

This merchant could be the proverbial polymorphed pit fiend prepared to pounce on passing PCs (although this should hopefully only happen if it's important to the story, such as he's a lieutenant of a major player, he's trying to stop the heroes, or so on). But what if it's really:

- A chance to advance the plot directly. The merchant has heard a rumor of strange brewings in Farbü, and wants the heroes to help.
- A chance to advance the plot indirectly. The merchant has heard a rumor of strange brewings in Farbü, and wants to see if there are any economic opportunities for him.
- A chance to introduce more background information. The merchant is on his way to Farbü, and is trying to steel himself to Farbüvians odd customs of speaking in a singsong voice and refraining from all activity for two hours a day.
- A chance for a romantic encounter (promoting characterization). The merchant takes a liking to one of the heroes, and proceeds to bust a move.
- A chance for a comedic encounter (promoting characterization). The merchant -- having heard of the heroes' exploits in Barfoo -- hopes to get the PCs' endorsements for his wares.

And so on. Note that *most* of these are "unimportant," in terms of a life-or-death struggle, but they are all "important" on some level. In this way, the players don't embrace a "shields up, red alert" mentality for every encounter, and the game can still advance quickly from place to place without needing to bog down in meaningless random encounters.

Because there's nothing worse than being two hours into a six-hour trip to Foobar, and seeing that "McDonald's in 10 Minutes" billboard.

--Steven Marsh

* * *

[1] Actually, as I was typing this, I realized I wasn't sure what I should call the ***Star Wars: Knights of the Old Republic*** game. After all, it existed for both Windows and Xbox, so calling it either a "video game RPG" or a "computer RPG" doesn't seem quite right. And merely calling it an "RPG" -- as those in the electronic entertainment biz are wont to do -- would no doubt confuse those of you looking for info on real RPGs.

Gene Genies: Alternate Bio-Techs

"Biotechnology cannot occur without a world and the people who inhabit it. It is easiest to think of biotech in a near or far future setting, but this does not have to limit the tech levels or types of worlds in which it can play a role."
-- David Morgan-Mar and David Pulver, ***GURPS Bio-Tech***

Well, ***GURPS Bio-Tech*** is here, and it's like a giant syringe of Captain America super-serum for any campaign you might imagine. But for campaigns that I might imagine, it's downright necessary. Because the three campaigns I imagine here are tributes to the two Davids and their mighty, mighty word plasm. So set up your setting centrifuge, and get ready for some chrono-chromosomal craziness of the most uplifting sort. You'll have a blastocyst.

"Here the grafter pays his vows with apple garlands, when the unwilling pear stock has borne fruit.
Be silent empty rumour: there's another pointer to my name: but believe the god who speaks about himself.
My nature is adaptable to every form: turn me into whatever you wish: I'll be noble.
Clothe me in Coan silk, I'll be no bad girl: and when I wear the toga who'll say I am no man?"
-- Propertius, "Elegy of the God Vertumnus," *Elegies* IV.2

In the wide, marshy part of the Tiber, the Romans found something underground. They weren't even Romans yet, technically -- it was two generations before Romulus. But they found it, and named it "Vertumnus," blending their word *vertere* (to change, as in "revert") and the chthonic god of the Etruscans, Voltumnus. It became the god of grafting plants, and of disguises. When they took it out of the ground, the ground solidified, and the Tiber flowed free, and Rome could be built. They set it up over the Forum, and every August they exposed their first fruits to it. And they ate those fruits and grew strong, and overthrew the Etruscans who foolishly kept their Voltumnus buried underground. And they expanded their film of empire across Italy. And their grain could grow in winter (as long as they shared seed with Vertumnus) and their fruits could grant men dark-vision and armor-skin (as long as they grew from Vertumnus' grafted stock), and their soldiers could join together in an unstoppable mass, a Legion to crush Rome's enemies (as long as their fathers and mothers drank from Vertumnus' fountain). The Legion has come to the East now, where the Jews call it *shaggath,* "the fornication," but they are merely fearful of Vertumnus' bounty, and jealous that its seed has made Rome truly a land of milk and honey.

This ***Imperial Rome-Bio-Tech*** campaign frame has perhaps more than a little bit of horror to it, but it's all in the way you present it. To the Carthaginians, Greeks, and Jews, the power of Vertumnus is a rapacious and demonic evil. To players of Roman PCs, Vertumnus is just a way to explain supersoldiers, biomods, rapid healing, gengineered plants and animals, and a whole raft of TL(2+n) magitech. (To tedious real historians, Vertumnus is just an obscure cultivation god, and the first eight sentences of this campaign frame are essentially accurate, if highly colored.) Whether Vertumnus is a leftover shoggoth from a crinoid outpost in upper Gondwanaland or an alien hive sponge or just a handy blob of wet nanoviruses surviving in a crashed UFO is up to the GM. What matters is that the Romans have a monopoly on Vertumnus, and that Vertumnus is "adaptable to any form," as Propertius reminds us.

"Legend has it that this mermaid appeared to Prince Shotoku as he was passing along the shores of Lake Biwa . . . The mermaid claimed that over many years it had come to a clear understanding of the horrors of destroying life, and that it was prepared to move on to the next world. As a final wish before dying, though, it asked the prince to establish a temple using the mermaid's body as a centerpiece, where it could be used to educate people . . ."
-- "Edo," "Mermaid Mummies" on pinktentacle.com

Whether Prince Shotoku actually built the Mermaid Temple in Shigu prefecture or not, by the Heian era, the monks had begun to use the mermaid body to educate people. Rather than destroy life, they would create it. They used the finest miniature metal tools made by Japan's greatest steelsmiths to cut the mermaid open, and saved the living roe inside. These, they learned slowly to implant into fish, and later into slave girls. They created special algae and kelp to produce humors essential to proper cultivation of these homunculi, and learned to exactly duplicate their most successful stock. The Mermaid Temple flourished in good times and suffered in bad with the rest of Nihon, but the breeding line continued. What, exactly, they accomplished may never be known. The shoguns who hated Buddhism, and imperial myths, and independent monasteries arose and burned the Mermaid Temple and scattered its monks. A

century or two passed. And then the saying began to circulate: "If you would live forever, eat mermaid flesh." And the *misemono* began to come to Edo, traveling shows featuring amazing feats of human acrobatics and strength. And in some *misemono* tents, you could see a mermaid, and when you left you would have good fortune and health. Even the more daring aristocracy began to keep mermaids in gardens and pools, idle curiosities and playthings for the rich and bored.

And the Tokugawa had forgotten the danger, but the mermaids had forgotten nothing. By now, they had seduced their guardians and creators, who had perhaps begun to yield to their own aesthetics in design and cultivation. (Also, with the Temple destroyed, the human seeds for more mermaids had to come from somewhere.) In 1867, the Mermaid Society declared the ascension of the Empress Sachiko, "Daughter of the Sun and Ocean." The Tokugawa, cut off from the modern world and outclassed in combat by the Mermaids' acrobatic *kappajin,* collapsed immediately. The Sachiko reign has lasted ever since then. The mermaids are everywhere, and their monks now turn their tools and cultivars on their fellow men. "Japan," Ambassador Warren said undiplomatically a while back, "is becoming a giant fish farm, where the people are the fish." A remark which gets fewer laughs now, in the 74th year of the Sachiko reign, 1941.

This **GURPS Japan-Bio-Tech-WWII** campaign frame is a straightforward contest of a truly alien culture created in the hothouse world of Heian Japan and the brawling diesel ethos of FDR's America. PCs might be American, Japanese (human, parahuman, or mermaid) or a fragile chimera of all. It can trend toward pulp, with OSS men dueling with gengineered samebito and kappa; toward horror (was that first mermaid perhaps a Deep One?); toward agonized anime-style cultural angst, as lovers are torn apart by inevitable war. It can be an examination of tolerance of (or within) a transhuman culture, or a pure war story of humans outclassed by a Frankenstein tyranny. It's a regular sashimi platter of possibilities, in other words.

"The primate station in Sukhum -- in retrospect, the real and lasting accomplishment of Ivanov's African expedition -- operated throughout the rest of the Soviet period and even greatly expanded after World War II . . . Since 1932 the station became part of the Institute of Experimental Medicine, and from then on, research focused on various biomedical topics and on Pavlovian studies of higher nervous activity. Later, some experiments were done there in connection with the Soviet atomic and space programs. . . . Unfortunately, the station did not survive in post-Soviet times, when Sukhum -- the capital of the self-proclaimed Abkhaz Republic -- became in 1992 the scene of severe fighting between the Georgian and Abkhazian paramilitaries."
-- Kirill Rossiianov, "Beyond Species: Il'ya Ivanov and His Experiments on Cross-Breeding Humans with Anthropoid Apes," *Science in Context* (2002) 15: 277-316

It's not widely known that as early as 1900 German biologists were speculating about the viability of ape-human hybrids. Hans Friedenthal got the idea from the similarities of ape and human blood sera. Elie Metchnikoff, the head of the Institut Pasteur, used those data to test apes' susceptibility to syphilis, and sponsored a Dutch zoologist, Hermann Moens, who projected a trip to Africa to inseminate humans with ape sperm. Ernest Haeckel, Darwin's successor, praised it in 1908. The Prussian Academy of Sciences established a pilot project in the Canary Islands in 1912 to teach chimpanzees German and to raise them as human children; the sexologist Hermann Rohleder planned his own "humanzee" project. And as Ilya Ivanov arrived in French Guinea in 1926 to breed "chumans" for Stalin, the pioneer ape researcher in America, Robert Yerkes, was supposedly breeding humanzees in a secret lab in Florida. All of this can be found with enough digging.

What can't be found is the truth. That the projects succeeded. That ape-human hybrids were successful. Wildly successful. They became the secret front in WWI, as the Institut Pasteur and the Yerkes National Primate Research Center worked to breed and train humanzees to counter the Prussian chumans churned out by the farms in the Canaries and Cameroon. Ivanov wasn't purged for his embarrassing experiments, he was purged for publicizing them -- and for "joining a counter-revolutionary movement." Stalin feared the apes of Sukhumi, but turned them over to the Pavlov Institute in 1932. Mengele reproduced the research of Haeckel and Rohleder; the old Ivanov humanzees came out of the cold and were sacrificed by the NKVD. The Yerkes chumans, reinforced by the Abuela ape farm in Cuba, joined the OSS, but couldn't keep Mengele from fleeing to Brazil with his research. Again, Sukhumi raised the bar -- Soviet chumans proved amazingly susceptible to somatic mutation. Wild stories spread in the Western spy networks, of Soviet psychic chumans who could start fires or turn invisible. Then the Russians took Cuba, and they took the Abuela farm,

and with it the Yerkes research. Mengele offered to turn over his papers to the CIA in exchange for immunity -- was the deal taken? Well, we won the Cold War, and Mengele died on the beach. And in 1992, the Soviet chuman labs in Sukhumi fell into a war zone, right on the fault line of Chechen and al-Qaida terrorism in the Caucasus.

This is a gritty, modern-day *GURPS Special Ops-Espionage-Bio-Tech* campaign frame with an appallingly silly premise. You can go all the way to the hard core edge, surgically grafting your tongue in cheek and probably making the PCs be chuman mercenaries, special ops or other shadow denizens. (Use the templates for uplifted chimpanzees from *GURPS Uplift,* or build your own from *Bio-Tech* allowing plenty of variations.) They try to carve out a place in a society that can't admit they exist in between deadly and deniable missions -- a distillation of the stresses and ethical questions of the "wetwork" and mercenary specialists in real life. Their "ape blood" represents the bestial, killing side of global politics that postmodern Western civilization would prefer not to think about. Or, of course, you can go almost all the way over to the other side, with *Lancelot Link* jokes aplenty. In that game, humanzee PCs are more likely on the run both from panicked human governments and evil chumans allied with terrorists or megalomaniacal Brazilian banana magnates. I don't recommend mixing the two flavors -- it would be chimerical, at best.

Those Who Pray

Medieval Clerics in *GURPS Fourth Edition*

by Brett Pasinella

Medieval people envisioned their society as divided into those who work, those who fight, and those who pray. Clerics in medieval society played a much greater role than simple prayer; they were scholars, teachers, lawyers, physicians, statesmen, architects, scientists, and musicians. Before the plagues, wars, and inquisitions of the late Middle Ages, the clergy helped unite and strengthen the otherwise disparate feudal states of western Europe.

This article presents a set of guidelines for creating medieval European clerics in *GURPS Fourth Edition.* These characters could play important roles in a historical setting such as *GURPS Middle Ages* or *GURPS Vikings,* a medieval-influenced Fantasy setting (such as Yrth), or one of the many echoes or alternate Earths of *GURPS Infinite Worlds.*

Building a Clerical Character

The medieval landscape was populated by a bewildering variety of religious people -- anchoresses, brother-sergeants, canons regular, canons secular, nuns' priests, and cardinal deacons, just to name a few. Detailing every possible type of cleric is far beyond the scope of this article; however, a set of common characteristics can be defined. By mixing and matching the options presented below, GMs and players should be able to reproduce almost any instance from history or fiction.

Clerk or Lay: Clerical Investment and a New Special Limitation

The fundamental aspect separating clerics from laymen is the Clerical Investment advantage; it is required for any clerical character and is a prerequisite for Religious Rank (see below). It set the clergy apart from the world, allowed them to live by different laws, but also placed additional responsibilities upon them.

A member of the clergy was said to be ordained in holy orders. There were seven orders, divided into four minor and three major orders (two other orders are also sometimes included, bringing the total to nine). The minor orders from lowest to highest were janitor (doorkeeper), lector (reader), exorcist, and acolyte. The three major orders were subdeacon, deacon, and priest. Additionally, tonsured clerks -- who were members of the clergy but had not taken any other orders (e.g., a university student, or a simple scribe) -- were sometimes described as a minor order below janitor. Bishop was also sometimes said to be a major order above priest.

Women were barred from taking holy orders (nuns were essentially equivalent to tonsured clerks). Churchmen in minor orders were free to marry, while those in major orders were usually required to take a vow of celibacy (see Vow below). The sacred vessels used in rituals could only be handled by someone in major orders. Only a priest could administer a sacrament such as matrimony, eucharist (mass), or penance. The powers to consecrate a new church, to ordain clerics, and to confirm lay members of the church were reserved for a bishop.

In the Middle Ages, being a priest was not a prerequisite for a successful career in the church, and many people -- including women, for whom ordination was not an option -- rose to prominent positions without being ordained (see Order and Office below).

GURPS, by default, uses a fairly abstract representation of ordination; usually reserving Clerical Investment for ordained priests and/or limiting monks and nuns to low levels of Religious Rank (see *GURPS Fantasy* Designer's Notes, and *GURPS Banestorm* for examples). This poses two problems from a historical point of view; first, since Clerical Investment is a prerequisite for Religious Rank, it makes it difficult create high ranking clerics who are not

ordained, such as an abbess or an archdeacon (see Religious Rank below), and second it prevents monks and nuns from receiving the +1 reaction bonus from coreligionists granted by Clerical Investment. On the other hand, Clerical Investment also includes the ability to officiate at religious ceremonies -- a capacity that unordained clerics did not possess. GMs looking for a more detailed treatment of ordination may wish to utilize the following new special limitation for Clerical Investment to represent clerics who are not priests:

Not ordained: You are a member of the clergy and receive the social benefits as such; however, you cannot preside over ceremonies as an ordained priest. You may purchase additional levels of Religious Rank, but you may be barred from certain ranks or positions in your church at the GM's discretion. In a campaign with functioning mystical abilities (see Prayer and Scared Places in *GURPS Fantasy*), the GM should decide if you gain the same abilities and bonuses as someone with the unlimited form of Clerical Investment. -40%.

Churchmen who can administer sacraments -- i.e., priests and bishops -- should take the full 5-point version of Clerical Investment. All other clerics should take the limited version.

This optional rule is used in the new meta-traits and templates that follow. Gamers who wish to use the simpler method should increase the cost of the packages by 2 CP.

Secular or Regular: New Meta-Traits

These collections of advantages and disadvantages are common to all official members of the church. They can be useful in creating a variety of religious characters, and can be listed as a single trait to save space on a character sheet.

Clerical Meta-Traits
Variable

The medieval clergy was divided into two bodies. Clerics who saw to the spiritual needs of laymen or to the mundane administration of the church were called secular clergy. Clerics who lived according to a monastic rule, such as the Rule of St. Benedict, were called regular clergy (after regulus, the Latin word for rule). They lived apart from the ordinary day-to-day world and dedicated themselves to prayer, work, and study. The monastic vows of poverty, chastity, and obedience were characteristic of regular clergy.

Secular Cleric: You are a cleric whose responsibilities include seeing to the spiritual needs of your followers or administering the day-to-day operation of your church. Clerical Investment (Not Ordained, -40%) [3]; Legal Immunity [5]; Patron (the church; multinational organization; Minimal Intervention, -50%; appears 6 or less) [8]; and Distinctive Feature (tonsure) [-1]. *15 points.*

Regular Cleric: You are a cleric who lives apart from the world, devoted to prayer and study. Claim to Hospitality (members of your order) [10]; Clerical Investment (Not Ordained, -40%) [3]; Legal Immunity [5]; Patron (the church; multinational organization; Minimal Intervention, -50%; appears 6 or less) [8]; Social Regard (Respected) [5]; Discipline of Faith (Monasticism) [-10]; Duty (Church; Nonhazardous; occurs 12 or less) [-5]; Vow (chastity) [-5]; and Distinctive Feature (tonsure) [-1]. *10 points.*

Ordained priests will have to pay an additional 2 points to raise Clerical Investment to the unlimited version. Record this as an "omitted racial trait" -- Clerical Investment (Ordained) [2] -- on their character sheet (see page 262 of the *Basic Set*).

Order and Office: Religious Rank

Holy orders (see Clerical Investment, above) represented spiritual initiation into the mysteries of the church. Office, on the other hand, was an administrative function that the cleric performed within the church hierarchy, essentially his "day job."

There is some degree of overlap between office and order, making it confusing to separate them. For example, the minor orders are also equivalent to an office (as their name implies). However, order and office are separate since most offices did not require the holder to be a priest.

Office is modeled with the Religious Rank advantage. Secular and regular clergy use a different system of ranks up to Rank 5. Above Rank 5, the offices have authority over both types of clerics. The ranks are outlined below.

Rank	Secular	Regular
0	clerk	novice
1	minor orders	junior monk/nun/canon/canoness
2	subdeacon/deacon	senior monk/nun/canon/canoness
3	priest/secular canon	obedientiary (e.g., cellarer, librarian, etc.)
4	dean	prior/prioress
5	archdeacon	abbot/abbess
6		bishop
7		archbishop
8		pope

The offices of dean, obedientiary, and prior were traditionally held by ordained priests. Being a priest was a prerequisite for Ranks above 5, and abbot.

Other Advantages and Disadvantages

Administrative Rank

Since the church had a monopoly on education, it was very common for government officials to be churchmen. Characters who hold a position in the royal bureaucracy should take Administrative Rank.

GMs should allow PCs to transfer points between Administrative and Religious Rank, or to hold both types of Rank simultaneously. It was not uncommon for a high-ranking royal official, but mere clerk (Religious Rank 0), to be appointed to a bishopric by the king (much to the annoyance of higher-ranking churchmen in Rome), or for a bishop to also be the royal chancellor or exchequer.

Courtesy Rank

Cardinals were clerics who officially held a position within the diocese of Rome, and would therefore take part in the election of the bishop of Rome, i.e., the pope. Since this was such an important function, powerful and influential churchmen from outside of Rome could be granted such a position, if only in name.

Cardinals should purchase a level of Courtesy Rank in addition to any levels of Religious Rank they may have. Examples: cardinal-deacon, cardinal-priest, or cardinal-bishop.

Independent Income

A churchman who controls a benefice -- an ecclesiastical fief, granting the holder the rights to all tithes in a parish -- but has the religious services in the parish administered by someone else (i.e., a vicar) has an Independent Income.

Medieval Education

Formal education in the Middle Ages was controlled by the church. Educated characters, including the vast majority of the clergy, would have been trained following the classical course of study called the seven liberal arts. The arts were divided into two courses of study: the trivium ("the three roads") and the quadrivium ("the four roads"). Most schools put more emphasis on the trivium. Studying the arts grants the following *GURPS* traits:

Trivium

- *Grammar:* Latin (Broken) minimum
- *Rhetoric:* Public Speaking
- *Dialectic (Logic):* Philosophy (Neoplatonism or Aristotelianism)

Quadrivium

Legal Enforcement Powers

Bishops and other churchmen who hold a court of canon law should take the 10-point version of this advantage with the limitation: *canon law only, -25%.*

Some clerics -- abbots and abbesses, for example -- were also feudal lords who administered justice for their lay tenants. They should take the 10-point version of Legal Enforcement Powers.

Legal Immunity

All clerics have a 5-point version of this advantage, called benefit of clergy, as part of the appropriate meta-trait. They could not be charged with any crime in a regular court of law, but were turned over to a church official for trial. Medieval canon law did not allow the death penalty in many crimes that would have ordinarily required it. In the early Middle Ages, anyone who could read Latin received benefit of clergy; later the requirements became more stringent.

Papal envoys and legates should add the "diplomatic pouch" option or take the Diplomatic Immunity variant.

Military Rank

PCs in religious orders of knighthood, such as the Knights Templar or the Hospitaliers, should take Military Rank (not Religious Rank) and the Regular Cleric meta-trait.

Military Ranks varied greatly in the Middle Ages. Below is a generic rank structure, roughly based on the ranks of the Knights Templar, that can be used as a model (note that the names of specific ranks would vary from order to order):

0. serving brother
1. brother-sergeant
2. knight
3. knight-banneret
4. knight-commander
5. master of the order
6. seneschal/marshal
7. grand master

Patrons

Any member of the clergy can claim the church itself as a Patron as reflected in the clerical Meta-Traits. This represents a cleric's ability to appeal to the church bureaucracy for help, or the possibility that the church might intercede on a cleric's behalf -- for example if a powerful noble was abusing the privileges of the clergy. This should be a remote possibility, and unlikely to achieve the exact results the character had hoped. GMs should not allow characters to buy off the Minimal Intervention limitation, or to improve the frequency of appearance.

Clerics are more likely to receive aid from a personal Patron who is a powerful member of the church or aristocracy (a local bishop, or an old friend in Rome, for example).

- *Arithmetic:* buy-off Innumerate
- *Geometry:* Mathematics/TL
- *Music:* Musical Composition
- *Astronomy:* Astronomy/TL

In addition to these subjects, most schools required the study of Theology. The trivium were taught thorough extensive reading and translation of classical texts. Therefore, it was common for most students to also learn History, Literature, and Expert Skill (Natural Philosophy) as part of a medieval education. Universities taught Law or Esoteric Medicine (substitute Physician/TL if the GM allows).

In the early Middle Ages (before 1050 AD), the tech level of Europe had stagnated at TL2 in science and reverted to TL1 in medicine. By the late Middle Ages (after 1250 AD), improvements such as the introduction of the astrolabe and positional mathematical notation, including zero, the rediscovery and enhancement of classical medical knowledge, and their dissemination through the new universities brought the TL up to 3 in all areas.

Power Investiture

GMs who allow mystical powers in their campaign should consider the relationship between the church and characters with such abilities. The establishment might take a dim view of "miracle workers," and historically many such people were outside the formal structure of the church and sometimes even in conflict with it. Alternatively, GMs may wish to restrict Power Investiture to ordained priests.

Status

Most clerics acquire their Status through Rank and Wealth. Powerful members of the secular clergy (such as the pope) should also purchase additional Status. Note that regular clerics are prevented from purchasing Status directly due to Disciplines of Faith.

Some monastic orders included lay brothers (conversi): monks drawn from the peasant classes. They were supposed to isolate the monks from worldly concerns, or to perform hard labor considered too difficult for nuns. Lay brothers should take Status -1 and the Regular Cleric meta-trait. They should not be allowed to purchase Rank, and are unlikely to be educated.

Tenure

Many positions within the church were granted for life (e.g., a bishop, the pope). GMs may wish to require this advantage for such positions. Also, university professors were members of the church (see Medieval Education box).

Vow

Celibacy and Chastity: In modern usage, chastity and celibacy are synonymous. In the Middle Ages, however, these terms had different meanings, and the issue of clerical marriage was highly controversial.

Chastity meant the complete renunciation of any sexual activity, and was required of all regular clergy. Symbolically, it represented the renunciation of the world -- the "mortification of the flesh" -- and complete devotion to spiritual pursuits. Chastity is a Minor Vow in *GURPS.*

Celibacy was the state of being unmarried, and was eventually required of those in major orders. Symbolically, it represented "marriage to the church" and the idea that clerical responsibilities outweighed family obligations. Legally, it meant that the children of a priest were automatically considered illegitimate, and therefore could not inherit. This was intended to keep church property under the control of church officials. Note that a priest who lived with a woman or had children was guilty of sinning, but not technically of breaking his vow (thus making it difficult to dismiss him from office). This bizarre -- and much abused -- quirk of medieval canon law arose out the centuries-long conflict between reformers who wanted all clerics to live like monks, and traditionalists who wanted the priesthood to remain like any other skilled profession: passed on from father to son. Celibacy is a Trivial (quirk-level) Vow in *GURPS.*

Silence: Most monastic orders required silence within certain areas of the monastery, such as the cloister or scriptorium, and at meal times. This should not count as a Vow, and can be assumed to be included in Disciplines of Faith. Some orders had more stringent requirements; follow the guidelines on page 161 of the *Basic Set.*

Poverty: Monastic rules usually forbad monks from owning personal property, but allowed the monastery to hold wealth in common. This type of vow is included in the Discipline of Faith disadvantage.

In the early 13th century, new orders of mendicant friars, such as the Franciscans, came into existence. These new orders prohibited members from holding wealth even in common. This is a Great Vow in *GURPS.* Note that characters cannot claim points from both Vow (Poverty) and Wealth (Dead Broke); see page 161 of the *Basic Set.*

Clerical Templates

The following three templates can be used to create common types of clerical characters. The templates are built on less then 75 points and therefore could be used in a 75-point campaign, or as low-powered NPCs in a more powerful campaign. In a higher powered campaign, these templates should be considered the bare minimum required for a heroic character built on the template, and the larger number of surplus points should be spent to improve the traits outlined below.

Monk   60 points

This template can be used to represent a member of a monastic community such as the Benedictines, Clunics, Cistercians, etc. The optional lenses can be added to create a female member of one for those orders, or to create a member of a mendicant order such as the Franciscans or Dominicans. The lenses may be combined to represent a female member of a mendicant order.

Attributes: ST 10 [0]; DX 10 [0]; IQ 12 [20]; HT 11 [10].

Secondary Characteristics: SM 0; Dmg 1d-2/1d; BL 20; HP 10 [0]; Will 12 [0]; Per 12 [0]; FP 11 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0]; Dodge 8.

Social Background: TL3 [0]; CF Western [0]; Language (Native) [0]; Latin (Accented) [4].

Advantages: Regular Cleric [10]; and 10 points chosen from Autotrance [1]; Charisma [5/level]; Common Sense [10]; Empathy [5 or 15]; Honest Face [1]; Intuition [15]; Less Sleep [2/level]; Pitiable [5]; Religious Rank [5/level]; Single-Minded [5]; Talent (Gifted Artist, Green Thumb, or Devotion) [5/level]; Talent (Healer) [10/level]; or Voice [10].

Disadvantages: -30 points chosen from Charitable [-15*]; Clueless [-10]; Compulsive Behavior [varies]; additional Disciplines of Faith [-5 to -15]; Fanaticism [-15]; Gullibility [-10*]; Hidebound [-5]; Honesty [-10*]; Incurious [-5]; Intolerance [-5 or -10]; Oblivious [-5]; Pacifism [varies]; Sense of Duty [varies]; Selfless [-5*]; Shyness [-5 to -15]; Skinny [-10 points]; Stubbornness [-5]; Truthfulness [-5*]; or additional Vow [-5 to -15].

Primary Skills: Religious Ritual-12 (IQ/H) [4]; Singing-12 (HT+1/E) [2].

Secondary Skills: Meditation-10 (Will-2/H) [1]; Theology-11 (IQ-1/H) [2]; and 3 points in Accounting (IQ/H), Administration (IQ/A), Artist (Calligraphy or Illumination) (IQ/H), Esoteric Medicine (Per/H), Farming/TL (IQ/A), First Aid/TL (IQ/E), Gardening (IQ/E), Law (IQ/H), Pharmacy/TL (Herbal) (IQ/H), Professional Skill (any) (DX or IQ/A), Research/TL (IQ/A), Teaching (IQ/A), or Writing (IQ/A).

Background Skills: Gesture-12 (IQ/E) [1]; Public Speaking-11 (IQ-1/A) [1]; 2 points in Astronomy/TL (IQ/H), Autohypnosis (Will/H), Expert Skill (Natural Philosophy) (IQ/H), History (IQ/H), Literature (IQ/H), Mathematics/TL (IQ/H), or Philosophy (IQ/H).

Nun: add Social Stigma (Second-Class Citizen) [-5]. 55 points.

Friar: add one of Vow (Poverty) [-15] or Wealth (Poor) [-15]. 45 points.

Priest   *65 points*

This template can be used to create a competent parish priest. Historically, many rural priests were barely competent and GMs should feel free to reduce skill levels or the comprehension level of Latin to represent incompetent NPCs. This template is also a good basis for high ranking secular clerics, such as bishops; simply increase Religious Rank

(and add enough Wealth to support the resulting Status).

Attributes: ST 10 [0]; DX 10 [0]; IQ 11 [20]; HT 10 [0].

Secondary Characteristics: SM 0; Dmg 1d-2/1d; BL 20; HP 10 [0]; Will 11 [0]; Per 11 [0]; FP 10 [0]; Basic Speed 5 [0]; Basic Move 5 [0]; Dodge 8.

Social Background: TL3 [0]; CF Western [0]; Language (Native) [0]; Latin (Accented) [4].

Advantages: Secular Cleric [15]; Clerical Investment (Ordained) [2]; Religious Rank 3 [15]; Status 1 [0]   †; Wealth (Comfortable) [10]; plus 10 points chosen from Charisma [5/level]; Common Sense [10]; Empathy [5 or 15]; Honest Face [1]; Independent Income [1/level]; Intuition [15]; Pitiable [5]; additional Religious Rank [5/level]; Talent (Green Thumb, or Devotion) [5/level]; or Voice [10].

Disadvantages: A total of -30 point chosen from Charitable [-15*]; Clueless [-10]; Disciplines of Faith [-5 to -15]; Fanaticism [-15]; Gullibility [-10*]; Hidebound [-5]; Honesty [-10*]; Incurious [-5]; Intolerance [-5 or -10]; Oblivious [-5]; Pacifism [varies]; Sense of Duty [varies]; Selfless [-5*]; Shyness [-5 to -15]; Skinny [-10 points]; Stubbornness [-5]; Truthfulness [-5*]; or additional Vow [-5 to -15].

Primary Skills: Public Speaking-11 (IQ/H) [2]; Religious Ritual-12 (IQ+1/H) [8]; Theology-11 (IQ/H) [4].

Secondary Skills: Administration-10 (IQ-1/A) [1]; Singing-10 (HT/E) [1].

Background Skills: 3 points in Accounting (IQ/H); Area Knowledge (IQ/E); Carousing (HT/E); Current Affairs (IQ/E); Detect Lies (Per/H); Diplomacy (IQ/H); Farming/TL (IQ/A); Law (IQ/H); Philosophy (IQ/H); Politics (IQ/A); Propaganda (IQ/A); Psychology (IQ/H); Savior-Faire (High Society) (IQ/E).

Warrior Monk   *60 points*

This template can be used to represent a member of a religious order of knights such as the Knights Templar or the Hospitallers..

Attributes: ST 12 [20]; DX 11 [20]; IQ 10 [0]; HT 11 [10].

Secondary Characteristics: SM 0; Dmg 1d-1/1d+2; BL 29; HP 12 [0]; Will 10 [0]; Per 10 [0]; FP 11 [0]; Basic Speed 5.50 [0]; Basic Move 5 [0]; Dodge 8.

Social Background: TL3 [0]; CF Western [0]; Language (Native) [0].

Advantages: Regular Cleric [10]; Military Rank 2 [10]; Fit [5]. *Disadvantages:* Code of Honor (Chivalry) [-15]; remove Nonhazardous from Duty (in Metatrait) [-5]; -15 chosen from among Fanaticism [-15]; Honesty [-10*]; Intolerance [-5 or -10]; Overconfidence [-5*]; Sense of Duty [varies]; Selfless [-5*]; Shyness [-5 to -15]; Skinny [-10 points]; Stubbornness [-5]; Truthfulness [-5*]; or additional Vow [-5 to -15]

Primary Skills: Lance or Spear-12 (DX+1/A) [1]; Riding (Horse)-12 (DX+1/A) [1]; Shield-12 (DX+1/E) [1].

Secondary Skills: Broadsword or Axe/Mace-11 (DX/A) [1]; Savior-Faire (High Society)-11 (IQ+1/E) [1].

Background Skills: Heraldry-10 (IQ/A) [1]; Leadership-10 (IQ/A) [1]; Religious Ritual-8 (IQ-2/H) [1]; Brawling or Jumping-11 (DX/E) [1].

Sample Characters

The following characters were designed for realistic *GURPS Middle Ages* campaigns. Brother Owain was created for a

Saxon campaign or for use with *GURPS Vikings*. The second character, Archdeacon Hugh, was designed for a Norman campaign. Both make use of the rules outlined in this article.

Brother Owain, Infirmarian of Shrewsbury

Owain ap Madoc was born into a minor noble family in the Kingdom of Gwynedd in the later half of the 10th century. At the age of seven he entered the monastic school at Glastonbury, a center of the monastic revival occurring at the time. Owain excelled in his studies and took a keen interest medicine at an early age. He had plenty of opportunity to learn, as the abbey served as one of the only hospitals in England, and the site of a pilgrimage for the sick. At the age of 18, Owain took his vows and became an official member of the infirmary staff.

The next year, an expedition was planned to try to reestablish contacts -- severed in the last century by Viking raids -- with the famous monasteries surrounding the Irish Sea, such as Iona and Kells. Owain eagerly volunteered to go, and the small group of monks set out on their journey.

After almost a year of success, the delegation ended in tragedy. The monks arrived at a small monastery along the northern coast of Ireland, just as a band of Norwegian raiders attacked. Owain fought alongside his brothers before being badly wounded. The monks were eventually overwhelmed. However, Owain managed slip away in a small boat, but lost and losing blood, he passed out and drifted out to sea.

Miraculously, he washed ashore on a small island inhabited by a hermit named Éamon. The old man had once been part of a band of monks who fled to the island after their monastery was destroyed. The refugees had managed to rescue some of the precious books and vestments as they fled. Over the years the brothers had dwindled to just the lone monk.

Owain stayed on the island for five years learning Greek from the old hermit, and studying the rare books -- which contained knowledge thought lost by the rest of Europe. When Brother Éamon died, Owain decided it was time to return to Glastonbury.

His return was considered a miracle, and his fame as a physician grew due to the ancient knowledge he had recovered. Owain eventually moved to the tiny abbey of Shrewsbury on the Welsh border to help expand their infirmary.

Campaign Uses

The PCs are most likely to encounter Owain in his capacity as a physician. His medical skills make him highly sought out, and he may also be useful as a Greek translator.

Owain ap Madoc of Gwynedd   *125 points*

Age 32. 5'9", 145 lbs. An active and energetic Benedictine with sandy brown hair and blue eyes. Often disheveled and rarely seen without his bag of medicine, herbs, and medical instruments.

ST 9 [-10]; DX 10 [0]; IQ 12 [40]; HT 11 [10].

Secondary Characteristics: SM 0; Dmg 1d-2/1d-1; BL 16; HP 10 [2]; Will 11 [-5]; Per 12 [0]; FP 11 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0]; Dodge 8.

Social Background: TL3* (TL2 Medical, -60%) [2]; CF Celtic [0]; CF Western [1]; Welsh (Native) [0]; Old English (Accented) [4]; Irish (Broken/None) [1]; Latin (Accented/Native) [5]; Ancient Greek (Broken/Accented) [3].

Advantages: Regular Cleric [10]; Religious Rank 3 [15]; Reputation +2 (as a skilled physician, by British intellectuals, small class, recognized 10 or less) [2]; Resistant to Disease (+3) [3]; Status 1 [0]   †; Talent (Healer) 2 [20].

Disadvantages: Insomniac (Mild) [-10]; Oblivious [-5]; Pacifism (Cannot Kill) [-15]; Sense of Duty (sick and injured) [-10].

Quirks: Attentive, Mumbles to himself while working, Humble, Dislikes Vikings, Messy (disheveled clothes and hair, often forgets to wash his hands, herbs and surgical instruments strewn all over his room or dumped at random in his bag) [-5].

Skills: Area Knowledge (Ireland)-12 (IQ/E) [1]; Area Knowledge (Wales)-12 (IQ/E) [1]; Astronomy/TL2-10 (IQ-2/H) [1]; Boating/TL3 (Unpowered)-10 (DX/A) [2]; Diagnosis/TL2-14 (IQ+2/H) [4] ‡; Esoteric Medicine (Hermetic)-15 (Per+3/H) [8] ‡; Expert Skill (Natural Philosophy)-12 (IQ/H) [4]; First Aid/TL2-14 (IQ/E) [1] ‡; Gardening-13 (IQ+1/E) [2]; Gesture-12 (IQ/E) [1]; Literature-10 (IQ-2/H) [1]; Mathematics/TL2 (Applied)-10 (IQ-2/H) [1]; Meditation-11 (Will/H) [4]; Naturalist-12 (IQ/H) [4]; Pharmacy/TL2 (Herbal)-14 (IQ+2/H) [4] ‡; Philosophy (Neoplatonism)-11 (IQ-1/H) [2]; Physiology/TL2-12 (IQ/H) [1] ‡; Public Speaking-11 (IQ-1/A) [1]; Religious Ritual (Catholic)-12 (IQ/H) [4]; Research/TL3-12 (IQ/A) [2]; Singing-12 (HT+1/E) [2]; Staff-11 (DX/A) [4]; Surgery/TL2-13 (IQ/VH) [4] ‡; Survival (Island/Beach)-11 (Per-1/A) [1]; Teaching-12 (IQ/A) [2]; Theology (Catholic)-12 (IQ/H) [4]; Weather Sense-11 (IQ/A) [1].

Archdeacon Hugh of Lincoln

Hugh was born in 1131 AD, the illegitimate but acknowledged son of a Norman knight, Henri de BÉthencourt, and Emma, a widowed dyer. He grew up in his mother's house with his older half-brother and sisters, helping out as much as possible in the family business. When in the city, his father would visit the family and fill the young boy's head with tales of valiant knights and glorious battles. At the age of seven his father arranged for Hugh to attend the cathedral school.

When his father was killed at the Battle of Lincoln in 1141, the young boy's prospects looked dim. Most of the father's wealth was inherited by his legitimate children, and Hugh's half-brother was set to inherit their mother's business. However, enough money was found to keep the boy in school, where he was already showing promise as a student.

On completing his studies, Hugh was able to secure a position as a clerk in the bishop's chancellery. His head for business, quick wit, and family ties to the local merchants soon made him invaluable to his employers. He rose quickly through the ranks acquiring several lucrative beneficences along the way, providing him with a stable income. By the time he was 25, the bishop had appointed him to one of the archdeaconries in the diocese.

Hugh's mistress is Edith, the daughter of a prominent wool merchant who handles the produce of the bishop's flocks. They share a posh townhouse, which Hugh much prefers over his few drafty rooms in the cathedral college. Edith has a growing wool trade in her own right, exporting wool out of Boston to Flanders. She and Hugh plan to use the land from his benefices to produce higher quality wool for their exports.

Though his wealth is secure, his political power is not. As the current bishop ages, Hugh fears he could be replaced when a new bishop is selected. His illegitimate birth, his relationship with Edith, and his close ties to the merchants of the city (including some in the Jewish community) make him extremely unpopular with the more pious members of the college. Fortunately for him, the current faction in power is much more concerned with the smooth operation of the diocese, than with the piety of its officials. But, Hugh knows the only way to safeguard his position and to ensure that his daughter will have a comfortable position in society is to secure a diocese of his own.

Campaign Uses

Hugh would be an ideal patron or enemy for a group of clerics or merchants. GMs could portray him as a sensible and pragmatic politician opposed by fanatical and intolerant enemies, or as a greedy and crass schemer who uses religious power to his own advantage.

Hugh Fitzhenry of Lincoln   *225 points*

28 years old. 5'11", 160 lbs. A handsome cleric with blonde hair, green eyes, and aquiline features.

ST 10 [0]; DX 10 [0]; IQ 13 [60]; HT 11 [10].

Secondary Characteristics: SM 0; Dmg 1d-2/1d; BL 20; HP 10 [0]; Will 12 [-5]; Per 13 [0]; FP 11 [0]; Basic Speed 5.25 [0]; Basic Move 5 [0]; Dodge 8.

Social Background: TL3 [0]; CF Western [0]; Norman French (Native) [0]; Middle English (Native/Broken) [4]; Latin (Accented/Native) [5].

Advantages: Secular Cleric [15]; Alcohol Tolerance [1]; Ally (Edith, 75% of point total, appears 12 or less; as Dependant, Loved one, appears 9 or less) [2]; Appearance (Attractive) [4]; Charisma 1 [5]; Contact Group (Merchants of Lincoln, business skills, effective skill 21, Somewhat Reliable, appears 12 or less) [8]; Independent Income 20 [20]; Patron (Robert de Chesney, Bishop of Lincoln, powerful individual, appears 9 or less) [10]; Religious Rank 5 [25]; Social Chameleon [5]; Status 3 [0] §; Talent (Business Acumen) 1 [10]; Talent (Smooth Operator) 2 [30]; Voice [10]; Wealth (Very Wealthy) [30].

Disadvantages: Dependant (Infant Daughter, 0 or fewer points, Loved one, appears 6 or less) [-15]; Duty (to the Bishop of Lincoln, Nonhazardous, occurs 12 or less) [-5]; Enemies (Political rivals, small group, Rival) [-5]; Greed (12) [-15]; Obsession (become a bishop, 9) [-15]; Obsession (find a noble husband for his daughter, 12) [-5]; Reputation -2 (unrepentant fornicator, pious Christians, small group, recognized 10 or less) [-2]; Selfish (15) [-3]; Vow (celibacy) [-1].

Quirks: Proud, Incompetence (Dancing), Wears brightly-dyed cloaks and hats over his clerical garb (-1 reaction from ascetics), Loves jewelry (particularly gaudy rings), Dislikes "the country" (unless he can go hawking) [-5].

Skills: Accounting-13 (IQ/H) [2]**; Acting-14 (IQ+1/A) [1] † †; Administration-15 (IQ+2/A) [4]**; Area Knowledge (Lincoln, city)-14 (IQ+1/E) [2]; Area Knowledge (Lincolnshire, county)-13 (IQ/E) [1]; Carousing-13 (HT+2/E) [1] † †; Current Afairs/TL3 (Regional, England)-15 (IQ+2/E) [4]; Detect Lies-14 (Per+1/H) [2] † †; Diplomacy-15 (IQ+2/H) [1] † † ‡ ‡; Falconry-12 (IQ-1/A) [1]; Fast-Talk-16 (IQ+3/A) [1] † † ‡ ‡; Finance-12 (IQ-1/H) [1]**; Games (Chess)-13 (IQ/E) [1]; Heraldry-12 (IQ-1/A) [1]; Law (Catholic Canon)-12 (IQ-1/H) [2]; Law (Norman England)-12 (IQ-1/H) [2]; Merchant-13 (IQ/A) [1]**; Philosophy (Neoplatonism)-11 (IQ-2/H) [1]; Politics-16 (IQ+3/A) [1] † † ‡ ‡; Propaganda/TL3-13 (IQ/A) [2]; Psychology-13 (IQ/H) [4]; Public Speaking-18 (IQ+5/A) [2] † † ‡ ‡ § §; Religious Ritual (Catholic)-11 (IQ-2/H) [1]; Research/TL3-12 (IQ-1/A) [1]; Ridding (Horse)-11 (DX+1/A) [4]; Savior-Faire (High Society)-15 (IQ+2/E) [1] † †; Theology (Catholic)-12 (IQ-1/H) [2].

The Omniscient Eye

Can We Make More Room For Our Stuff?

**In many a sci-fi story, one finds artificial planets and such having been constructed.
So my simple question is: in a reasonably realistic SF RPG, what would be required to
make an artificial planet, a Dyson Sphere, a Ringworld or even a Death Star?**
--H.B. Seba

In short: lots of mass in the right place.

The first stage of any large-scale construction project will probably use asteroids. They're abundant, and small enough to be plausibly moved with only moderate technological advances from the present day.

Just a single asteroid or comet may well be enough artificial world for a small population; habitats can be built on the surface or tunnelled in for protection against radiation and debris. In more extreme cases, a metallic asteroid may be converted into a larger useful area by explosive centrifugal forming: the asteroid is cored and the hollow filled with water, then the whole body is spun and heated with reflected sunlight until the metallic composition softens enough to let the water flash to steam, leaving a hollow metallic shell ten times the size of the original asteroid. (If everything goes well. If not, well, there are always more asteroids.) This is known as a Cole habitat, from Cole and Cox's 1963 proposal.

Raising the temperature of iron from space-background to its melting point takes 800kJ/kg even ignoring radiation losses during the heating process; an asteroid two miles long by one in diameter will need about 3e19J, and solar mirrors seem the most practical way to provide this even in the main belt (at 3AU or so from the sun). Since radiation losses in space should not be ignored, we can calculate that that asteroid will be radiating heat at about 12TW just before it melts; at least a 300km square of solar mirrors will need to be focused on it in order to keep pace with the radiation losses and get it up to the melting point.

The original "Death Star" was either 120km or 160km in diameter, depending on the sources one believes. Assuming a density around three-quarters that of water, this would require up to 2e18kg, which represents a single large asteroid (18Melpomene is around 3e18kg) formed by an explosive technique. Alternatively and probably more easily one could take an even larger asteroid, such as 9Metis at 235×195×140km, and hollow it out, throwing away much of its mass. While the propulsion and weapon systems may be fantastic, the size of the structure is not.

Actually constructing a habitat, rather than using a preexisting asteroid, presents more challenges, but if the basics of zero-G construction can be mastered it seems likely that smelting a metallic asteroid into steel is mostly a problem of size and manpower rather than theory. The three best-known designs to date are the Bernal sphere (Islands One and Two in Gerard O'Neill's proposal from 1977), which is easy to build but has a comparatively small area of useful gravity, the massive O'Neill cylinder (Island Three), and the Stanford Torus. The detailed design studies of sphere and torus planned for populations of around 100,000; the full-blown 20-mile-long cylinder was intended for tens of millions.

Of course, in most hard-science settings humans still require gravity to maintain their health; if not a full gravity, at least 0.25g or so. There are several main ways of providing gravity or a reasonable facsimile of it to an artificial world:

1) Mass. The way the Earth does it. The obvious drawback is that if the habitat is to be capable of maneuver, this will severely affect its performance.

If one could work with neutron-degenerate matter (neutronium), with a density of 4e17kg/m^3, one would need only a

very small amount to produce a livable gravity field. The smaller the habitat, however, the greater the problems with tidal forces (gravity gradients); a 1.5e15kg chunk of neutron-degenerate matter (which would occupy a cube 16cm on a side) would have a 1g field only 101m away from its center . . . but 10 stories up the gravity would have dropped to only 0.6g, which is bad news for any large machinery (and unlike the rotating habitat there's no nearby zone of zero-g). Quantum black holes, assuming they exist, suffer from similar problems.

Limiting oneself to conventional matter, the densest material is iridium at 22,650kg/m^3, or osmium at very slightly less. A 1g field would need a sphere of iridium 1,550km in radius, some 3.5e23kg. This exceeds by two orders of magnitude the total mass of the asteroids in the Main Belt; barring the discovery of unexpected iridium-rich Kuiper Belt objects, it seems likely that some technology for elemental synthesis would be required. A 0.25g field would need only a 400km radius sphere, 6e21kg, but again without interstellar shipping of iridium or a transmutation technology this will not be practical.

A slightly less dense material would be no more practical: for 1g, tungsten (or gold) at 19,250kg/m^3 would require an 1,820km radius sphere massing 4.9e23kg; silver, at 10,490kg/m^3, 3,340km and 1.66e24kg. Again, this would require more of the specific matter than exists in the solar system. For other materials, note that the radius needed is directly proportional to the surface gravity and inversely proportional to the material's density; going further down the density scale, the size of the habitat reaches something approximating that of Earth, a true "artificial planet." Unfortunately the mass of Earth is some 2,000 times that of all the Main Belt asteroids; to get the mass to build a second Earth would require the dismantling of existing planets. An artificial planet with a gravity of 0.25g made of Earth-like material (mostly iron) would have a radius of 1,600km.

2) Rotation. The only real problem is the coriolis effect: the deflection of moving objects inside a spinning body, caused by the rotating reference frame and the inertia of the objects. In a sufficiently small environment, this is likely to cause problems with balance; the threshold for most of the population seems to be a spin no faster than 2rpm, which implies a 224m radius for a 1g acceleration or 55m for 0.25g. This approach to artificial gravity seems the most likely to be practical; it lends itself to large ring-shaped or cylindrical habitats.

3) Acceleration. Putting a large drive on the habitat and accelerating constantly will produce a simulacrum of gravity. No real-world space drive, either extant or hypothetical, is capable of sustained acceleration at this level.

4) Tidal forces. A pair of habitats linked by a tether, in orbit round a much more massive body (e.g. two satellites orbiting Earth), will experience acceleration as the habitats attempt to follow different orbits but are constrained by the linkage. In the real world this is used to keep satellites pointed in a particular direction; the gradients are too small to produce useful artificial gravity for humans.

5) Magnetism. Assuming that vastly powerful magnetic fields are not harmful to human beings in the long term, this is a possible means of generating an attractive force. However, any non-diamagnetic materials (such as ferrous metals) would have to be removed completely from the habitat; no electrical systems would operate reliably; and current field generation techniques (which have successfully been used to levitate a frog) can only produce small spots of "neutralised gravity."

6) Gravity waves. Any artificial generation of gravity tends to take the world out of the realm of "reasonably realistic sci-fi."

Assembling multiple asteroids allows larger habitats than using them one at a time, but these are different only in scale, and do not approach the really large sizes of classical artifical worlds. Once one has the technology to disassemble gas giants, larger options become available.

A ringworld provides gravity by rotation; the classical model, at 2AU across with a star in the center, spins at around 1,200km/s for 1g. The ringworld needs some sort of propulsion system to keep it centered on its sun; it also requires strong materials -- indeed, the required tensile strength approaches that of the strong nuclear force, well beyond anything achievable with conventional matter, and even an estimate of the mass required is impossible. The sun is always directly overhead; providing darkness would require orbiting structures large enough to cast shadows.

Fortunately, a ringworld does not need to be that large to be useful; the required tensile strength is proportional both to radius and to spin gravity, so while a "one day" ringworld (300 times the size of Earth, spinning once in 24 hours for 1g) is still beyond currently-hypothesized materials, smaller ones might well be possible. The most that might be achieved with current materials assumes that carbon nanotubes live up to expectations; these would support a ring as wide as the Earth, spinning once in about 1.4 hours for 1g, or one four times the size spinning once in about 6 hours for 0.25g.

Even the classical Ringworld can coexist with others in a single solar system. The next step up most certainly cannot: this is the Dyson sphere, based on a misunderstanding of Freeman Dyson's 1959 paper "Search for Artificial Stellar Sources of Infra-Red Radiation," a shell which encloses a star completely. This requires construction on a massive scale, disassembling at least the mass of Jupiter in order to create the structure. Even all of the available 3e28kg of our own solar system other than the Sun, assuming it could be transmuted to the density of iron, would provide a structure a little under 20m thick at 1au from the Sun.

The solid Dyson sphere has several drawbacks. It needs some form of propulsion system to keep it centered on its sun; there is no gravitational attraction to the inside of the sphere (it could be spun to provide gravity at the equator, but just as with ringworlds this runs into problems of tensile strength), so anything inside it will slowly fall away into the star unless an inner, presumably transparent, sphere is provided to prevent this; as on the ringworld, it's always noon unless there's an inner shadow-casting structure (perhaps mounted on that transparent sphere); and one cannot see the stars. Most serious, though, are thermodynamic considerations: all the energy output of the star has to pass through and be radiated from the outer surface of the sphere (having presumably been used by humans first, and converted to waste heat), and even at 1AU that energy flux will be substantial, leaving the sphere itself at 120° Celsius. Since the absolute temperature varies as the fourth root of the star's energy output and the eighth root of the radius, expanding the sphere may well be adequate to solve the problem; at 2AU radius, Sol's Dyson sphere would be at 5° Celsius, and at 3AU radius -45° Celsius.

A more extreme version of this system, which generally ignores thermodynamic considerations, has multiple concentric Dyson spheres; Colin Kapp's *Cageworld* series and Charlie Stross' *Accelerando* both involve such a setup. Although the potential living area is immense, the energy available to the outer spheres would be of such low density that it is hard to see this working well for biological life.

Dyson's actual suggestion was for a swarm of smaller objects, on carefully calculated non-intersecting orbits (in practice each would need its own propulsion system, with consequent requirements for energy and reaction mass and hazards from waste propellant), which would collectively capture as much of the parent star's energy as was needed. This is somewhat more practical, not least because it can be constructed by stages as it is required and still be useful in its partial state, rather than needing the full-blown commitment of the solid sphere.

When a Dyson sphere does not provide enough surface area, perhaps an Alderson disc will. This is a solid disc surrounding the sun in one plane, thick

Equilibrium And Stability: Will It Crash Into The Sun?

Ringworlds, Dyson spheres, and Alderson discs are all symmetric around their sun. This means that assuming they're strong enough to withstand internal stresses, they will be in gravitational equilibrium -- to start out. But will they stay that way?

After some rather involved calculus, it turns out that Ringworlds and Alderson discs are antistable, like a marble balanced on top of a needle. If one of these structures is nudged even slightly off-center, the sun's gravitational pull will pull it further and further away from equilibrium, until one end of the world falls into the sun (if structural stresses don't tear it apart first). Preventing this from happening requires a lot of active correction -- giant rockets on the outside, or some such -- to keep the world balanced around its sun.

Considering only gravity, Dyson spheres are in neutral equilibrium, like a marble on a smooth floor. A Dyson sphere nudged off-center won't gain speed of its own accord, but it won't slow down either; left to its own devices it'll slowly drift. It will eventually need some correction to keep it from drifting into the sun, but not nearly as much as a Ringworld or an Alderson disc. However, thermal effects mean that a Dyson sphere is actually slightly antistable: the side closer to the sun gets hotter,

enough that local gravity is vertical, at least more than a few thousand miles away from the inner and outer edges; a wall round the inner edge prevents the atmosphere from drifting into the sun. Construction requires exotic matter and interstellar importation of mass, since the disc weighs rather more than the sun itself. To generate day and night cycles, the sun needs to be moved up and down through the hole in the middle of the disc (while not at all a trivial task, it's easier than moving the disc itself); the sun will still never be much above the horizon. Shadow generators in the style of a ringworld could also do the job, as would artificial light sources such as large mirrors orbiting or suspended over the surface of the disc. Only a relatively small area at the 1AU radius is habitable by humans, but perhaps aliens from hotter or cooler worlds might share the construction costs -- the useless edge zones make a narrower disc less cost-effective. While hard numbers on the Alderson disc are lacking, an ultra-strong material of the density of iron would need to be nearly as thick as the diameter of a planet with the same gravity.

radiates more thermal photons into space, and is thus propelled by photon pressure further towards the sun. (Most of the radiation directed inwards is caught by the other side of the sphere and so does not contribute enough net thrust to balance out this effect.)

The final macrostructure to be considered is Pat Gunkel's topopolis, a hollow tube (perhaps a few miles across) long enough to form a circle round the Sun at the 1AU radius. It spins for gravity; the torsion effects of curvature are effectively negligible. Much like ringworlds, multiple structures can coexist, and indeed be joined together; not only could the topopolis embed its parent star in a massive hairball, but if power were transmitted along it it could eventually stretch to multiple stars.

In summary, the main prerequisite for artificial structures up to the miniature ringworld size is the ability to move large amounts of mass round the solar system; to build larger than that, very substantial amounts of exotic materials are needed, implying matter transmutation and the disassembly of planets, and for the largest structures interstellar transfers of mass.

What Status Gets You

Subsidiary Privileges of Status in *GURPS Fourth Edition*

by Matt Riggsby

The description of the Status advantage notes that, in addition to reaction bonuses, it grants "various privileges," which must be determined by the GM. Unfortunately, except for a brief sample of the kind of lifestyle the cost of living associated with Status can buy, that's where the guidance on those privileges stops. While application of Status is moderately clear in feudal societies, where there are few organizations to complicate the picture with Rank and other advantages, it's rather less clear in more organized, bureaucratic societies (does a Byzantine logothete have Rank, Status, or both? And how much of each?). It's even possible to wonder if Status is still relevant in a modern, "democratic" society where there's no officially acknowledged and supported ruling class and other advantages, such as Rank, Reputation, and Wealth, could be feasibly be used to represent power and position. This article examines a number of privileges a GM might consider awarding as a result of Status, how they might manifest differently in a number of settings beyond the usual feudal system, and what the limits of those privileges might be, giving way to other distinct advantages.

Personal Staff

Someone with Status has "people." These may include domestic servants, secretaries and other junior bureaucrats, legal advisors, and the like. Their purpose is to take care of tedious everyday tasks which keep the character from getting on with more important work. They might deliver messages on the character's behalf, make arrangements for transportation or lodging away from home, keep an eye on the character's residence while he's away, and take on similar tasks.

At low TLs, a character with Status 1 or 2 will have a single full-time servant, with at least one more per additional level of Status. For modern societies, where full-time servants are rare, a character will probably have a lot of part-time help. That might include such things as a nanny for the character's children, maid and landscaping services, and a part-time cook for dinners and special meals. At higher levels of Status, one's staff may include professional advisors. A high-status Medieval nobleman may retain a priest or monk, an early modern traveler may bring his personal physician with him, and a modern businessman or politician might keep a lawyer, broker, or personal spokesman on retainer.

Followers or employees who come with Status aren't invariably reliable. Some may have deep loyalty to the high-status character, but for most, it's just a job, and they'll bail out if the going gets too rough for them. They will be reluctant to take on what they see as dangerous or potentially illegal tasks. For example, a servant might mail a package for the character if there's no reason to believe the act will endanger him, but might balk at it if he knew that he was mailing a bomb or a box full of drugs. They are also unlikely to participate in anything which could reasonably be regarded as an adventure. For more generally useful followers, particularly ones who would be useful in or around combat and illegal activities, a character must use the Ally advantage.

Group Membership

People with high Status can join organizations (the cost of which is likely covered by the regular cost of living) not open to those beneath them. The most obvious type for modern characters is an exclusive country or gentleman's club. Indeed, some country clubs could be described in terms of the minimum Status required to join. A modern game world could also include shadowy, semi-secret groups, somewhere between a fraternity and a conspiracy (Yale's fabled Skull and Bones society would qualify), where powerful individuals with similar interests and objectives meet for companionship and more formal business or political activities. High Status would be a prerequisite for membership

here as well.

Deferential Law Enforcement

The higher a character's Status, the more likely law enforcement is to give him the benefit of their discretion. This may be out of respect for the high-status character or simply because of the officer's desire not to make trouble for someone who could ruin his career. Someone with high Status will be able to make parking and speeding tickets go away with relative ease (for friends and relatives as well as for himself) by overawing the ticketing officer or by asking a sympathetic judge or senior officer to fix the problem. He will also receive more responsive service when he calls the police, taking priority when higher authorities hand out assignments.

As long as there's no strong reason for an officer to detain him, a high-status character may be able to escape questioning if he is discovered under mildly suspicious circumstances. For example, if a character with high Status is encountered near a bank which has just been burgled at 3 AM, an officer might send him off with a warning to watch out for dangerous thieves (not bothering to check his briefcase, which is full of $100 bills and a ski mask), whereas one without Status might be searched and arrested. He may also receive advance notice that he may be investigated for a crime, so long as the character is not a prime suspect.

There are limits, though. Status gives a character legal courtesies, but few lawmen could ignore someone strolling down the street with a loaded weapon and taking cheerful potshots at widows and orphans along the way. The ability to willfully ignore significant criminal laws requires the Legal Immunity advantage.

Access to Events

The higher a character's Status, the more other people will want him around. A character with Status 1-3 will regularly be invited to events of local importance: charity fundraisers, local political victory parties (assuming the character wasn't a notable opponent of the victor), theater openings, home-team sporting events, and the like. In settings where personal bonds are particularly important (say, anything resembling a feudal system or other system of personal patronage), weddings, rites of passage such as christenings and bar mitzvas, and religious ceremonies are part of the mix. He may even be asked to preside over such events.

Characters of higher Status are invited to such events *constantly* (or, if they haven't been invited, can get in anyway) to the point where they could never even think of attending all of them. They also start to receive invitations to events of regional and national significance: sporting championships, major theatrical events to which some connection to the character can be made (e.g.: starring someone from the character's home town), concerts by nationally famous performers, royal weddings, inaugurations, and coronations. By Status 6, a character can attend just about any event he cares to whether he has been invited or not.

High Status also means better treatment at such events. At many Roman theaters, high-status families and civic officials were guaranteed front-row seats. In many churches, high-status families were likewise visibly seated in front. At modern concerts and theaters, a high-status character might get good seats and enjoy backstage access, allowing him to meet artists who are otherwise protected from the general public. Clubs and parties might also have VIP rooms, where a high-status character can talk exclusively to other high-status or otherwise notable people.

Access To Peers

Although it may manifest in many different ways, many of the advantages of Status could be summed up as "access to peers." One of the biggest advantages of high Status is access to other people with high Status. The average man on the Medieval street is less likely to meet the Duke of Earl than the Count of Bassie is, even if that man happens to live across the street from the Duke while Count lives 50 miles away. The Count and the Duke, being members of similar social strata, will associate with the same people, attend the same parties, and consider one another's children as material for marriage alliances. Going by raw reaction penalties, someone with Charisma or Appearance is far more likely to impress someone with high Status than a character who has just Status. However, a character with Status is far more likely to be able to get close enough for that such advantages will matter.

Easy Credit

Financiers will be more likely to provide high-status characters with funds when asked. This is particularly the case in historical societies, where moneylenders were frequently in a precarious social position and bought security by accumulating obligations from needy noblemen and governments. Moneylenders will be driven by the hope that high-status debtors will have access to reserves normal people don't (a wealthy merchant with low Status may be conventionally a better credit risk, but a high Status nobleman might be able to confiscate somebody else's estates to pay off a debt) and the fear that not providing loans will trigger retribution. That can be useful in the short run and is very good for business-savvy characters who might need capital to start a business or outfit an expeditionary force to attack a loot-rich target, but historically this made it very easy for characters with Status to end up with a lot of points in the Debt disadvantage.

Extravagant Display

Status-based legal limits on display and consumption are essentially a thing of the past, but they were once common. Many historical societies were rife with sumptuary laws governing who could own or use certain kinds of clothing, vehicles, homes, symbols, and other items. Needless to say, the best things were reserved for people with higher Status. For example, the size and design of one's carriage, the number of horses allowed to pull it, and the number of footmen one could bring along might be governed by one's Status. Higher Status means a bigger carriage and more horses and retainers. Clothing colors, styles, and materials were regulated by a dizzying array of laws. Only Roman patricians could wear a particular shade of purple derived from murex shells, only Medieval knights and noblemen could have coats of arms, and only the upper class in Renaissance Venice was allowed to wear silk. This kind of distinction has largely vanished in the modern world, but in many historical societies, the powerful were easy to spot.

Offices

When it comes down to it, Status means power. Someone with Status probably holds an official position of power in his society, and if he doesn't, is in a good position to obtain one, or at least can influence who does reach such offices.

At lower levels of Status, the character may simply have the privilege of voting. Until the past century or so, republics from Athens to early modern Britain have had a middling-sized middle or upper class which was able to pick members of the government. In a society where eligible voters are limited by multiple significant factors (for example, two or more of sex, ethnicity, property or income, additional age past legal adulthood, religion, family membership) and voters are consequently a small minority, the right to vote is probably good reason to buy at least Status 1.

Someone at the top levels of Status for his society is a decision-maker with more direct authority over official policies and the lives of others. For characters without other advantages, this influence will be indirect or constrained. High-status characters may be legislators, who ultimately set rules for society but have little day to day control, or judges, who have considerable power over anyone brought before them but only within the bounds of the law. Characters in executive positions (this includes many historical noblemen as well as modern officials) are likely to have Allies, Law Enforcement Powers, Rank, and other advantages as well, though some may have Status only.

In societies where political rights are restricted by Status, Status is also a likely prerequisite for Rank, particularly Rank within official bodies. For example, a Renaissance city-state might employ anyone good enough with a sword as a guardsman or soldier (Rank 0), and senior men might become sergeants (Rank 1; historical organizations tend to have flat hierarchies and not many ranks). However, the captain of the guard and any officer in the army (Rank 2) would have to be at least Status 2 or 3. This can easily create a glass ceiling, with competent underlings stalled out at junior ranks while watching less competent aristocratic officers come and go. Administrative Rank is another area where Status is a likely prerequisite.

In modern societies, it's likely to be the other way around: a high level of Rank may confer Status as well. Any boy

can grow up to be President, but having become President, he retains influence and a number of social privileges for the rest of his life.

Pyramid Review

Ticket to Ride -- USA 1910

Published by [Days of Wonder](#)

Designed by Alan R. Moon

110 Train cards, 69 Destination Tickets, two bonus cards, & rules; full color, in a collectible tin; $15

Ticket to Ride may not have the little strategic touches that entered the line with the sequel games, but it has something the Europe and Marklin entries don't: a brand new supplement, *USA 1910.*

There's a whole lot of reprinted material here, and you've never been so glad to fork over $15 bucks for previously released stuff. First, for anyone who's ever had to suffer through the torments of shuffling the teeny-tiny cards from the original *Ticket to Ride* set, the Train cards have all been reproduced at a "normal" size, something you can get a grip on in your meaty paws. Same with the Destination Tickets -- they don't require a lot of mixing during the game, but they've been increased to match and the values have been corrected (some were found to be too valuable for the territory they covered). You get the Longest Route Bonus Card writ large, too.

The set contain a new bonus card, the Globetrotter. Instead of (or perhaps in addition to) creating the longest contiguous rail line, you can get 15 extra points if you complete the most Destination Tickets overall. Since you also get 35 new Destination Tickets for the mix, this scattershot approach is pretty doable. Predicting your opponents' moves isn't going to be the breeze that once it was, either. Add to all this a set of the four out-of-print Mystery Train supplement cards (they were in a freebie pack given away on the convention circuit), and you have a great mix of old and new.

It's another component success story, starting with the container. It may be one of the first instances in which the box is nicer than the pieces it holds. You get a swell little tin (a bit larger than, say, a paperback book) with a colorful face for holding the pieces. This won't fit easily into your core set so you may be stuck dragging both boxes to the table with you (and the tin doesn't lock down tight), but at least the elements are traveling in style. The cards inside are just a bit thinner than you might expect from a European-style board game, particularly a problem when dealing with the oft-shuffled Train cards. But hey, the illustrations are good and there are a lot of subtle visual things that have to be on those new cards, and they're all elegantly and clearly put in place. The one strange thing: Upon opening the container, one discovers the almost overpowering smell of the paints or inks or whatever was used to print the cards. Leave it open overnight or let it sit in a sunbeam for the afternoon and it ought to dissipate.

Although the winning conditions remain the same -- getting the most points by the end of the game -- the rules offer three new ways to reach your objective. The 1910 game uses only the new Destination cards and the Globetrotter bonus, so anything you've learned from overplaying the original set won't do you much good. You're going to be building more lines because the larger concentrations are of no use. The Mega Game uses all the cards and both the bonuses, but you have to draw and complete a lot more tickets throughout the game -- use those train cars sparingly, and be wary of using the "I'll draw another Destination -- maybe it's something I've already connected" gambit. The last wrinkle in the rules is the Big Cities game. A number of larger burgs are flagged in red (New York, Los Angeles, Miami, etc.), and only cards showcasing these goals are used as the ticket deck. Not only does this mix up the selection of old and new tickets in play, it means everyone is focused on trafficking through these hubs, making success much trickier. Get there early to at least some of the major junctions or be left behind. Interfering with opponents is not just practical or expected . . . it's necessary, something you can't usually get from the regular game.

It may grate on the buyer to shell out money for what is, in some ways, a correction to Days of Wonder's design oversights, but it feels awfully good to wrap your fingers around these cards. The lifespan of the game is extended, and the quick addition of three new involving-but-simple strategy sets (using only one slim page of rules, in nine different languages) makes **Ticket to Ride -- USA 1910** a pretty good purchase for long-standing fans who want to remain fans.

Pyramid Review

Dead of Night: The Little Book of Horrors

Published by Steampower Publishing

Written by Merwin Shanmugasundaram & Andrew Kenrick

Cover by Eric Lofgren

Illustrated by Eric Lofgren & Michael Cunliffe

224-page 4¼"×5½" b&w softcover; $19.95

The first thing that you notice about *Dead of Night: The Little Book of Horrors* is that "littleness." This is a pocket RPG, but still big enough to tackle the horror genre, and more specifically, the horror of the campfire tales, the B-movie, and the urban myth. Being pocket friendly, *Dead of Night* is designed to be played anywhere, and to that end is mechanically simple, and can be played with or without dice. Although it employs two 10-sided dice, the authors tell you how other dice can be used, and when no dice are available, both players and GM can stab a finger at the table of random numbers on the last page. Admittedly, I would have preferred to have a random number on each page so that the dice rolls would be generated by flipping pages, but *Dead of Night* also counters its portability by players still requiring characters sheets. That said, since one of the game's character sheets is the size of a Post-It note, this is less of a problem.

The table of random numbers is one several factors that make *Dead of Night* easy to pick up and play. The most obvious being the clearly marked "Quickboxes" that neatly summarize the rules, the creation and handling of both characters and monsters, the ready-to-play monsters and NPCs (both of which can double as player characters), and the five ready-to-play scenarios. And for the GM, there is Tension, a method of measuring and controlling the horror within a scenario from one scene to the next.

The book itself is decently illustrated and written. A nice touch is that the color fiction is used to illustrate the rules, and also, that the fiction, plus various character and monster write-ups are presented in different fount. That said, in places the book does expose the reader to rules before they are fully explained, which is disconcerting, but return to the explanations and they fall into place. Running throughout the book are almost 30 genre clichés, such as "Splitting up to explore the haunted house is never a good idea." and "Darkened woods and dead ends are the escape routes of choice." Obeying these clichés not only means that the players are sticking to the genre, it also rewards them with an aid to survival.

Characters are defined by four sets of paired attributes, Identify/Obscure, Persuade/Dissuade, Pursue/Escape, and Assault/Protect. To generate a character, 10 points are divided between each pair. A Specialization can be taken for each pair, equal to the highest attribute +2, and in return, two points have to be deducted from the pair. Thus a Park Ranger would start with Identify 7/Obscure 3, Persuade 6/Dissuade 4, Pursue 7/Escape 3, and Assault 4/Protect 6. With Specializations this becomes Identify 5/Obscure 3 Guide 7, Persuade 4/Dissuade 4 Position of Authority 8, Pursue 7/Escape 3, and Assault 3/Protect 5 Survive No Matter What 8. Beyond this, a character begins the game with five Survival Points and can have whatever description or deficiencies a player desires, although this has no mechanical effect.

Monsters use the same attributes as characters, but have access to Advanced Specializations such as Assimilation or Dead Already. These cost Survival Points to use, but a monster can negate this by taking a Vulnerability. For example,

Assault (the monster is susceptible to a particular type of attack, such as silver for the werewolf) or Inhibition (an attribute pair is reduced to zero under certain situations, for example, a demon trapped in a pentagram will have nothing for its Pursue/Escape attributes). The standard monsters are included in Dead of Night, but a GM can easily design his own using these mechanics.

Mechanically, Dead of Night is very simple. For any action two 10-sided dice are rolled and the result added to an appropriate attribute or Specialization to beat a Target of 15. This never changes except for a Conflict Check in combat, where the Target is ten plus an opponent's appropriate attribute or Specialization. For example, to successfully track the werewolf (which he merely thinks to be a wolf), the Park Ranger rolls the dice plus Pursue against his quarry's Escape 4 to give a Target of 14.

Combat is kept simple by only having the active player or monster roll the Conflict Check. Likewise, initiative is kept simple by having the players determine the order of their actions, and the danger is, anyone blurting out an action actually seizes the initiative and takes that action -- whatever it is!

What is at stake during the fight is Survival Points, both those of the characters and the monsters. Survival Points represent both hit points and a resource to spend on various effects. These include temporarily flipping the values of an attribute pair, re-rolling a check, interrupting another player's action, and to activate certain Advanced Specializations like sorcery. They are gained by rolling doubles on a successful check, meaningfully advancing the plot, playing to clichés, playing well, and resting. Plus surviving the scenario. They are lost whenever a Conflict Check is failed, but a monster can gain Survival Points if a player rolls 13 and fails it.

Where the players and monsters have Survival Points, the GM has Tension. Using this tool, a GM can measure and handle the horror within a scenario. It is on a scale from 1 to 15, with most scenarios starting at 5. As the GM increases the Tension, the horror grows until it is outright visceral and in your face at 15. One way of increasing Tension, at least temporarily, is by having the monster appear. When that happens, the Tension increases by an amount equal to the monster's current Survival Points. It lowers back down when the monster exits the scene. It also raises whenever a Survival Point is lost or expended. The GM will lower Tension by using it to modify a player's current task. The point of this is to advance the plot that the failed roll would otherwise stall. For example, the players need to find a clue vital to the scenario, but fail the roll. The GM spends a Tension point, modifies the player's roll, he succeeds, and the current tension is lowered.

This raises the question, why not just have the characters find the clue anyway? This rule sort of counters this problem by finding a mechanical way around it, but it still feels like an artifice. The balance between Survival Point loss and Tension increase is interesting, but throughout the description of the rules for Tension, you never quite get a feel for how they work. The guidelines feel underdeveloped and perhaps a fully worked would have helped. That said, the five scenarios do include suggestions as to the various moods and situations at the differing Tension levels.

Several types of horror and styles of play that can be run with *Dead of Night* are suggested and discussed. The horror types include Grim Fatalism, Traditional Horror, Dark Comedy, Slapstick Horror, and Schlock Horror, and each is given a solid thumbnail description. The suggested play styles include Tables Turned, where the players take the roles of monsters against the GM controlled victims; Target Countdown, in which the victims die in a pre-determined order; No Single GM, where there's no GM or where everyone referees; and Wolf in Sheep's Clothing, which has one or more PCs as a disguised monster. The descriptions for these play styles are more expansive than those for the horror types, and are consequently more useful.

The game comes with five scenarios, though they are more detailed outlines than full adventures, and the GM will need to use the monsters given earlier in the book. In turn, they trap the characters in a haunted house, have them hunted by a mummy, chased by a demon car, working on a film set where the zombies are a little too realistic and hungry, and attending a Halloween party at which somebody is not actually wearing a costume. In addition, each scenario suggests how it might be run in the various different styles. Whatever the style, each scenario is worth an evening's play.

As a game, *Dead of Night* is small but playable, giving a simple set of rules that are quick and easy. The dearth of Survival Points means that the game starts with players already nervous, and the monsters are pleasingly unfussy and

brutal. As a design, **Dead of Night** does not quite achieve its aims. First, its treatment of the horror genre is too generic and not specific enough to the genres it wants to emulate -- the B-movie and Hammer Horror. Second, the mechanics for Tension, while interesting, are not fully realized and feel forced. A more minor point is the price, which feels big given the game's size.

Although short on game types, **Dead of Night** offers an agreeable array of play styles and can be run with almost no reference to the rules. More generic than intended, **Dead of Night: The Little Book of Horrors** is not only likeable, but is also easy to play and easy to run with nicely handled pick up and play features.

--Matthew Pook

Reigniting Previously Blazed Trails

What do *Family Circus, Ultima V,* and *The Da Vinci Code* have in common?

Okay; for those of you whose skulls have not exploded and who haven't thrown up a bit in your mouth, allow me to continue.

Family Circus, the heartwarming drawn feature that Scott McCloud contends isn't a comic in its weekday one-panel iterations, has a recurring feature wherein one of the characters will take a convoluted path; we, the audience, merely see the squirrly loopy dotted line connecting the starting point and the end point, followed by a panel with a punchline. Thus the comic might begin showing an overhead map of the beach, with precocious five-year-old Billy wandering from a boardwalk vendor past a bunch of dogs, around a sand castle, hopping along the beach, roaming among some sunbathers on blankets, and finally ending up at his family's spot, with the final panel saying, "I don't know why your ice cream melted, Daddy; I came right here!" For the reader, the fun comes in retracing Billy's steps and witnessing the hijinks that skamp got into.

The plot of the game *Ultima V* (my first *Ultima* and one of my favorite games of the "golden era" of computer RPGs) revolves around the disappearance of the beloved monarch Mary Sue . . . err, Lord British. The noble king -- who, in previous installments had been impervious to all damage -- led an expedition to the Underworld, a newly discovered labyrinthine area under the kingdom. One of the documents in the game's packaging was an accounting of the expedition by someone else who was on the journey. Within the game it's possible to follow that document to retrace the steps of that doomed voyage; landmarks and directions are explicit without being obvious, and attempting to follow them brings about a paradoxical sensation: fear that you aren't following the directions correctly, and fear that you *are.* (Of course, following those directions early in the game would be a near-suicidal gesture, but it needs to be done at some point in the adventure . . .)

The Da Vinci Code (based on a true fabrication of the same name) follows something of a similar pattern, where the heroes retrace the steps of . . . oh, danged if I can remember. It involved a cheesy Rubik's Tube and a 17-chapter car chase. (The same basic pattern was also seen in author Dan Brown's earlier piece *Angels & Demons,* noteworthy because it contained illustrations that looked the same way upside-down or right-side up, a feature that some critics contend also applies to the book itself.)

Anyway, the common thread weaving these three digressions together is, of course, the following of a path. It's a technique I haven't used too much in my own gaming, which -- in thinking about it -- is surprising, since it's a natural shape for an adventure. The heroes find a journal or accounting of a journey, and they set out to retrace those steps to discover what happened, or what needs to be done to fix whatever they *know* happened. It's a natural shape for a mystery or horror story ("If you are reading this, it is because I have failed, My tale begins in the library where I hid the key to my laboratory . . ."). It also provided the basis for my suggestion to the inimitable Ken Hite when I said, "Wouldn't it be neat to retrace *Around the World in 80 Days?*" Technically any pirate-treasure-style map falls into this category, but most such maps aren't the same in my mind because they don't provide a richness or texture for following the journey.

Anyway, for those wishing to add this type of story to their own games, here are a few tips I came up with in analyzing the literature I could think of.

There needs to be a reason not to jump to the end. Heroes are often impulsive sorts, and if they're given a map to follow that they can figure out, there's little reason not to take alternate routes or shortcuts. Most often following this advice boils down to "you can't go there"; good reasons for this in-game include incomplete directions ("travel five miles east from the rock that's shaped like a fist" isn't too helpful if you don't know where that rock is) and an actual need to retrace the route taken ("Along the way I devised a contingency plan where I hid five portions of the amulet of power . . .").

The route needs to be evocative. Again, pirate treasure maps fail here (in my mind), since they don't promise much in

the way of adventure along the way. If the heroes feel like they're going to encounter nothing but tedium along the way, they might be tempted to try to jump ahead, outsource the dull bits, or otherwise "cheat." Ideally they'll feel like they have an inside edge in the final encounter(s) that others don't because they're following a route (akin to the protagonist of *Indiana Jones & The Last Crusade*).

The players should be comfortably uncomfortable following the route. This is true for mosey mysteries; the players should hopefully be intrigued enough to want to continue but not so frustrated that they can't. If nothing else, having the heroes following a source with lots of appendices or addendums can allow for additional clues to be introduced if necessary, or the stops along the way can offer more clues than originally planned. (When in doubt, have thugs burst in and say, "We're here to stop you from going on the Zebra Sheep Bridge, since we *know* that must be where you intend on going next!")

Remember your time scales. This can be a difficult one to get right, but remember that retracing someone's steps is different from more generalized clues. The more time passes, the greater the possible sense of mystery (since this great mystery has gone undiscovered for a longer period), but also creates a possibility of disbelief because the trail can remain more difficult to follow. Landmarks change, and can be moved, altered, or deleted; clues witnessed or left behind can be discovered or destroyed by others. (Of course it can be a great sub-adventure for the heroes to attempt to find out what happened to the Foobar of Finding that was *supposed* to be hidden in the old book of the library . . .)

Try to make sure others couldn't accidentally follow the trail. This one usually takes care of itself; in the case of a journal, there's little reason why someone else would take the exact path of the author (unless they're connected with or acting against that person, of course). But in the event that the trail creator is following an observable enough phenomenon, it seems possible that others might have moved along the same path, potentially making that portion more difficult to follow. (For example, if the journal writer witnesses a winged creature flying off with a townsperson, why weren't there other people chasing that event?) If the creator of the "breadcrumbs" has had a serious impact on the lands visited or witnessed a large enough phenomenon, then it's probably best to address why he wasn't followed or remembered.

End the journal (or whatever) evocatively. Nothing gets the heroes following the trail more than a final entry that goes something like, "If this is the last entry, then I have failed" or "I believe I have learned enough along the way to defeat the Great Evil. Tomorrow I shall know if I was correct."

Adventures often but the PCs in situations where they are blazing new trails and venturing off in bold, new directions. But perhaps a more evocative tale begins with going where one person has gone before . . . only, you don't know how that tale turned out.

Murphy's Rules

Icosahedron Adventures

A Cache of Cantrips

by Owen K. C. Stephens

One of the most popular kinds of supplements for *d20 System* fantasy rules is new spell collections. Designed to fill out spells of a particular theme or region, these books and articles generally have a good mix of 1st- through 9th-level spells. What they almost universally lack are any significant number of 0-level spells (also called cantrips). As a result, no matter how different spellcasters are once they begin to reach mid-level, low-level spellcasters have the same limited options when it comes to cantrips. To give low-level characters more options (and widen the possibilities when creating cheap magic items based on 0-level spells), this article presents an assortment of nothing but 0-level cantrip spells.

Some of these cantrips are based on obvious gaps in existing cantrip lists (there are 0-level spells that deal acid and cold damage, but there isn't one to deal fire damage, a much more common energy type; you can detect poison, but not disease). Others are based on popular ideas for low-level spellcasters of various specialties (with *create creeper,* a 1st-level necromancer can have an undead cat to do his bidding). All are designed to be significantly less powerful than even minor 1st-level spells, without being so limited no one ever uses them. Many are designed for a very specific situation, but unlike higher-level spells this isn't really a weakness in design. Few spellcasters actually use all their 0-level spells in a day, so having one or two set aside for unusual situations isn't as much of a strain on resources as a 3rd-level spell you rarely get to cast.

Even so, the broader collection of cantrips may call for a few rules changes if a GM wants them to see more common use. A feat that allows anyone to know three 0-level spells (each to be cast once per day at 1st caster level) allows characters to "dabble" in spells for magic-heavy settings. A rule allowing two cantrips to be prepared in the space of a single higher-level spell increases flexibility without boosting firepower of spellcasters. Finally, the simple act of allowing spellcaster to gain additional castings per day of cantrips for high ability score modifiers allows spellcasters to be increasingly relaxed about minor spells as they gain higher levels.

Bard Cantrips

- **Bell.** Place an alarm on a moving closure. (F)
- **Eye Spy.** Relocate your point of view.
- **Good Cheer.** Grant a +2 bonus to your next Diplomacy check.
- **Nerves.** One target with 4 HD or less is shaken.
- **Pelt.** Throw conjured fruit to deal 1d4 points of nonlethal damage.
- **Reprieve.** Next target to attack you must make Will save to do so.
- **Summon Monster 0.** Summon minor extraplanar creature to aid you.
- **To Arms!** Nearby allies are not flat footed.

Cleric Cantrips

- **Create Creeper.** Turn one dead animal into a minor undead.
- **Deflect.** Ready to turn away a ranged attack.
- **Detect Disease.** Locate diseased or infectious creatures and items.
- **Lifewatch.** Know the condition of a few visible allies.
- **Reload.** Reload one ranged weapon.
- **Reprieve.** Next target to attack you must make Will save to do so.
- **Summon Monster 0.** Summon minor extraplanar creature to aid you.
- **Temporary Creation.** Briefly create small, cheap, handheld item of vegetable material.

- **Warn.** Caution foe against a particular course of action.

Druid Cantrips

- **Detect Companions, Familiars and Steeds** Find lost allies.
- **Entwine.** Fire a net-like mass of vines at one Medium or smaller target.
- **Jolt.** Deal 1 point of electrical damage to one or more adjacent targets.
- **Pelt.** Throw conjured fruit to deal 1d4 points of nonlethal damage.
- **Quiet Manger.** Put 3 HD of animals to sleep.
- **Smouldering Fang.** Natural weapon deals 1 additional point of fire damage.

Sorcerer/Wizard Cantrips

Abjuration

- **Bell.** Place an alarm on a moving closure. (F)
- **Deflect.** Ready to turn away a ranged attack.

Conjuration

- **Mage Buckler.** Create a small shield of force that grants a +1 shield bonus to AC.
- **Pelt.** Throw conjured fruit to deal 1d4 points of nonlethal damage.
- **Summon Monster 0.** Summon minor extraplanar creature to aid you.

Divination

- **Detect Companions, Familiars and Steeds** Find lost allies.
- **Detect Disease.** Locate diseased or infectious creatures and items.
- **Eye Spy.** Relocate your point of view.

Enchantment

- **To Arms!** Nearby allies are not flat footed.

Evocation

- **Disarm.** Strike at a held object with a wave of force.
- **Flame Puff.** Create a 5-ft. diameter ball of flame that deals 1d4 points of damage.
- **Jolt.** Deal 1 point of electrical damage to one or more adjacent targets.

Necromancy

- **Create Creeper.** Turn one dead animal into a minor undead.
- **Nerves.** One target with 4 HD or less is shaken.

Transmutation

- **Reload.** Reload one ranged weapon.
- **Smouldering Weapon.** Weapon deals 1 additional point of fire damage.

Spell Descriptions

Bell

Abjuration

Level: Brd 0, Sor/Wiz 0
Components: V, S, F
Casting Time: 1 standard action
Range: Touch
Target: One door, chest lid or similar closure
Duration: 10 minutes/level (D)
Saving Throw: None
Spell Resistance: No

This spell is cast upon a movable closure of no more than Medium size, such as a door, chest lid, cabinet door, or even the drawstring of a purse. Whenever this closure is opened by anyone other than you the spell produces the sound of a hand bell, and anyone within 60 feet of the warded closure can hear it clearly. Reduce the distance by 10 feet for each interposing closed door and by 20 feet for each substantial interposing wall. In quiet conditions, the ringing can be heard faintly as far as 180 feet away. The sound lasts for 1 round.

The spell is not set off by creatures passing through the closure without opening it, touching the closure, or even bypassing it (such as by cutting a whole in a nearby wall, or cutting the bottom of a purse).

Focus: A tiny bell

Create Creeper

Necromancy [Evil]

Level: Clr 0, Sor/Wiz 0
Components: V, S, M
Casting Time: 1 standard action
Range: Touch
Targets: One animal corpse touched
Duration: Instantaneous
Saving Throw: None
Spell Resistance: No

This spell turns the bones or body of a dead animal into a HD undead zombie that follows your spoken commands. The undead can follow you, or remain in an area and attack any creature (or just a specific kind of creature) entering the place. It remains animated until it is destroyed. (A destroyed zombie can't be animated again.)

The undead you create remain under your control indefinitely. No matter how many times you use this spell, however, you can control only 4 undead creatures created by this spell at once. If you exceed this number, the newly created creature falls under your control, and one excess undead from a previous casting become uncontrolled. (You choose which creature is released.) If you are a cleric, any undead you might command by virtue of your power to command or rebuke undead do not count toward the limit. Each creeper you control through this spell counts as one HD of undead toward the limit of creatures you can control with the *animate dead* spell.

Material Component: You must place a black onyx gem worth at least 15 gp per corpse you intend to animate. The magic of the spell turns these gems into worthless, burned-out shells.

Deflect

Abjuration

Level: Clr 0, Sor/Wiz 0 **Components:** V, S **Casting Time:** 1 standard action **Range:** Close (25 ft. +5 ft./2 levels)
Effect: One ranged weapon attack deflected **Duration:** Instantaneous **Saving Throw:** None **Spell Resistance:** No

For this spell to be useful, you must ready an action to cast it in response to a ranged weapon attack made by an opponent. The target of the ranged attack must be within this spell's range. When you cast the spell as a readied action in this way, you make a Spellcraft check opposed by the attacker's attack roll. If you win this opposed check, the attack misses.

This spell has no effect on magical attack, or unusually massive attacks such as siege weapons or thrown boulders.

Detect Companions, Familiars and Steeds

Divination

Level: Drd 0, Pal 1, Rgr 1, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Medium (100 ft. + 10 ft./level)
Area: Cone-shaped emanation
Duration: Concentration, up to 1 min./level (D)
Saving Throw: None
Spell Resistance: No

You can detect the presence of an animal companion, familiar or paladin's steed of your own. If you cast this spell while touching up to six willing targets, you can also detect any animal companions, familiars or steeds of theirs. The detection is a cone emanating out from you in whatever direction you face. The amount of information revealed depends on how long you search a particular area or focus on a specific kind of animal or plant.

1st Round: Presence or absence of companions, familiars or steeds in the area.

2nd Round: Number of companions, familiars or steeds in the area, and the condition of the healthiest specimen.

3rd Round: The condition (see below) and location of each individual companion, familiar or steed. If a companion, familiar or steed is outside your line of sight, then you discern its direction but not its exact location.

Conditions: For purposes of this spell, the categories of condition are as follows:

- Normal: Has at least 90% of full normal hit points, free of disease.
- Fair: 30% to 90% of full normal hit points remaining.
- Poor: Less than 30% of full normal hit points remaining, afflicted with a disease, or suffering from a debilitating injury.
- Weak: 0 or fewer hit points remaining, afflicted with a disease in the terminal stage, or crippled.

If a creature falls into more than one category, the spell indicates the weaker of the two.

Each round you can turn to detect in a new area. The spell can penetrate barriers, but 1 foot of stone, 1 inch of common metal, a thin sheet of lead, or 3 feet of wood or dirt blocks it.

Detect Disease

Divination

Level: Clr 0, Drd 0, Pal 1, Rgr 1
Components: V, S
Casting Time: 1 standard action
Range: Close (25 ft. + 5 ft./2 levels)
Target or Area: One creature, one object, or a 5-ft. cube
Duration: Instantaneous
Saving Throw: None
Spell Resistance: No

You determine whether a creature, object, or area has been diseased or is infectious. You can determine the exact type of disease with a DC 20 Wisdom check. A character with the Heal skill may try a DC 20 Heal check if the Wisdom check fails, or may try the Craft Heal check prior to the Wisdom check.

The spell can penetrate barriers, but 1 foot of stone, 1 inch of common metal, a thin sheet of lead, or 3 feet of wood or dirt blocks it.

Disarm

Evocation [Force]

Level: Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Close (25 ft. +5 ft./2 levels)
Target: One creature
Duration: Instantaneous
Saving Throw: Reflex negates
Spell Resistance: Yes

You attempt to disarm a creature with a sudden blast of force. You make a ranged touch attack to effect a target. Then you make a Spellcraft check opposed by an attack roll by your target, using the item you are attempting to disarm. If the item is held with two hands, the target gains a +4 bonus to this roll. If your roll matches or beats you target's roll, the item is dropped at the target's feet.

Entwine

Transmutation

Level: Drd 0
Components: V, S, DF
Casting Time: 1 standard action
Range: Close (25 ft. + 5 ft./2 levels)
Target: One Medium or smaller target
Duration: 1 round/level (max 5 rounds) (D)
Saving Throw: Reflex negates
Spell Resistance: Yes

You fire a clump of twisting, writhing vines at the target, making a ranged attack roll. If the roll succeeds, the target must make a Reflex save or be entangled as if struck by a weak net (with no trailing rope). An entangled creature takes a -2 penalty on attack rolls and a -4 penalty on Dexterity, can move at only half speed, and cannot charge or run. If the

entangled creature attempts to cast a spell, it must make a DC 15 Concentration check or be unable to cast the spell.

A creature entangled by your *entwine* spell can escape with a DC 15 Escape Artist check (a full-round action). The vines have 5 hit points and can be burst with a DC 20 Strength check (also a full-round action).

Eye Spy

Divination

Level: Brd 0, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Close (25 ft. +5 ft./2 levels)
Effect: Magical sensor
Duration: 1 round
Saving Throw: None
Spell Resistance: No

This spell allows you to create an immobile magical sensor at some point within range to which you has line of effect. The sensor can be placed in mid-air at some point that has line of sight when you do not, allowing you to see around corners or into small spaces. For the duration of the spell, your vision originates at the point of the magical sensor, rather than your own eyes. You can use all your natural vision enhancements (such as low-light vision), but the spell does not allow vision enhanced through other spells or magic items.

Flame Puff

Evocation (Fire)

Level: Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Close (25 ft. + 5 ft./2 levels)
Area: 5 ft. diameter
Duration: Instantaneous
Saving Throw: Reflex half
Spell Resistance: Yes

With a gesture you cause a single five-foot space to be briefly consumed by a tiny puff of flame. Creatures in the area take 1d4 points of fire damage. The flame is so brief it fails to set anything alight, even highly flammable items such as oil-soaked rags.

Good Cheer

Enchantment

Level: Brd 0, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Personal
Target: You
Duration: 10 min./level
Saving Throw: None

Spell Resistance: No

You cover yourself in an aura of friendly, cheerful energy. This gives you some benefit when dealing with thinking creatures. The next Diplomacy check you make during the duration of the spell gains a +2 circumstance bonus. This only applies to checks made with creatures with an Intelligence of 6 or higher. Once you have made a Diplomacy check, the spell ends.

Jolt

Evocation (Electricity)

Level: Drd 0, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: 5 ft.
Targets: Up to one creature or object per level (max 8 targets)
Duration: Instantaneous
Saving Throw: Reflex negates
Spell Resistance: Yes

You crackle with electricity, and tiny bolts of lightning streak out to strike targets within 5 feet of you. Creatures struck take 1 point of damage, which is negated by a successful Reflex save.

Lifewatch

Divination

Level: Clr 0
Components: V, S, DF
Casting Time: 1 standard action
Range: Touch
Targets: Up to six willing creatures touched
Duration: 10 min./level
Saving Throw: None
Spell Resistance: No

You cast this spell by touching all willing creatures to be involved. For the duration of the spell, when you look at one of these targets you automatically know the condition of that target. You must be able to see the target clearly. While this spell does not normally require any time to determine the condition of a target, a GM may require you to make a Spot check if vision conditions are not optimal.

Conditions: For purposes of this spell, the categories of condition are as follows:

- Normal: Has at least 90% of full normal hit points, free of disease.
- Fair: 30% to 90% of full normal hit points remaining.
- Poor: Less than 30% of full normal hit points remaining, afflicted with a disease, or suffering from a debilitating injury.
- Weak: 0 or fewer hit points remaining, afflicted with a disease in the terminal stage, or crippled.

If a creature falls into more than one category, the spell indicates the weaker of the two.

Mage Buckler

Conjuration (Creation) [Force]

Level: Sor/Wiz 0
Components: V, S, F
Casting Time: 1 standard action
Range: Personal
Target: Caster
Duration: 1 minute/level (D)
Saving Throw: None
Spell Resistance: No

An invisible but tangible field of force hovers near you, blocking incoming attacks and providing you a +1 shield bonus to AC. Unlike a mundane shield, *mage buckler* entails no armor check penalty, arcane spell failure chance, or speed reduction. Since *mage buckler* is made of force, incorporeal creatures can't bypass it the way they do a normal shield.

Focus: A piece of a shield strap.

Nerves

Necromancy [Fear, Mind-Affecting]

Level: Brd 0, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Close (25 ft. + 5 ft./2 levels)
Target: One humanoid creature of 4 HD or less
Duration: 1 round/2 levels
Saving Throw: Will negates
Spell Resistance: Yes

You send a cloud of unease at the mind of a humanoid creature with 4 or fewer Hit Dice so that it is shaken. Humanoids of 5 or more HD are not affected.

Pelt

Conjuration [Creation]

Level: Brd 0, Drd 0, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Close (25 ft. + 5 ft./2 levels)
Target: One creature/object
Duration: Instantaneous
Saving Throw: None
Spell Resistance: Yes

A large, hard, rotten fruit projects from your pointing finger. You must succeed on a ranged touch attack with the fruit to deal damage to a target. The fruit deals 1d4 points of nonlethal damage. The damage from the fruit acts like weapon damage, and can be reduced by damage reduction.

Quiet Manger

Enchantment (Compulsion) [Mind-Affecting]

Level: Drd 0
Components: V, S, DF
Casting Time: 1 round
Range: Close (25 ft. + 5 ft./2 levels)
Area: One or more living animals within a 10-ft.-radius burst
Duration: 1 minute
Saving Throw: Will negates
Spell Resistance: Yes

This spell causes a magical slumber to come upon 3 Hit Dice of animals. Animals with the fewest HD are affected first. Among animals with equal HD, those who are closest to the spell's point of origin are affected first. Hit Dice that are not sufficient to affect an animal are wasted.

Sleeping animals are helpless. Slapping or wounding awakens an affected animal, but normal noise does not. Awakening an animal is a standard action (an application of the aid another action).

Reload

Transmutation

Level: Clr 0, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Touch
Effect: One ranged weapon reloads
Duration: Instantaneous
Saving Throw: None
Spell Resistance: No

When you touch a willing target that has an unloaded ranged weapon, and ammunition for that weapon, the weapon automatically reloads one round of ammunition.

Reprieve

Abjuration

Level: Brd 0, Clr 0
Components: V, S, DF
Casting Time: 1 standard action
Range: Personal
Target: You
Duration: 1 round/level
Saving Throw: Will negates
Spell Resistance: No

The next opponent attempting to strike or otherwise directly attack you, even with a targeted spell, must attempt a Will save. If the save succeeds, the opponent can attack you normally. If the save fails, the opponent can't follow through with the attack, that part of its action is lost. This spell does not prevent you from being attacked or affected by area or effect spells. You cannot attack without breaking the spell but may use nonattack spells or otherwise act. Once a single attack has been directed against you the spell, ends, whether it stopped that attack or not.

Smouldering Fang

Transmutation

Level: Drd 0
Components: V, S
Casting Time: 1 standard action
Range: Touch
Target: Creature touched
Duration: 1 round/level
Saving Throw: Will negates (harmless, object)
Spell Resistance: Yes (harmless, object)

This spell causes one natural weapon to deal an additional 1d3 points of fire damage on successful attacks. (This effect is negated if the natural weapon already deals acid, cold, electricity, fire or sonic damage for any reason.) The spell can affect a slam attack, fist, bite, or other natural weapon. (The spell does not change an unarmed strike's damage from nonlethal damage to lethal damage.)

Smouldering Weapon

Transmutation

Level: Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: Touch
Target: Weapon touched
Duration: 1 round/level
Saving Throw: Will negates (harmless, object)
Spell Resistance: Yes (harmless, object)

This spell causes a weapon to deal an additional 1d3 points of fire damage on successful attacks. (This effect is negated if the weapon already deals acid, cold, electricity, fire or sonic damage for any reason.) You can't cast this spell on a natural weapon, such as an unarmed strike (instead, see *smoldering fang*). A monk's unarmed strike is considered a weapon, and thus it can be enhanced by this spell.

Summon Monster 0

Conjuration (Summoning) [see text]

Level: Brd 0, Clr 0, Sor/Wiz 0
Components: V, S, F/DF
Casting Time: 1 round
Range: Close (25 ft. + 5 ft./2 levels)
Effect: One summoned creature
Duration: 1 round/level (5 rounds max)(D)
Saving Throw: None
Spell Resistance: No

This spell summons an extraplanar creature (typically an outsider, elemental, or magical beast native to another plane). It appears where you designate and acts immediately, on your turn. It attacks your opponents to the best of its ability. If you can communicate with the creature, you can direct it not to attack, to attack particular enemies, or to perform other

actions.

The spell conjures one of the creatures from the 0-level list on the accompanying Summon Monster table. You choose which kind of creature to summon, and you can change that choice each time you cast the spell.

A summoned monster cannot summon or otherwise conjure another creature, nor can it use any teleportation or planar travel abilities. Creatures cannot be summoned into an environment that cannot support them.

When you use a summoning spell to summon an air, chaotic, earth, evil, fire, good, lawful, or water creature, it is a spell of that type.

Arcane Focus: A tiny bag and a small (not necessarily lit) candle.

Summon Monster, 0-Level

- Celestial lizard LG
- Celestial toad NG
- Celestial weasel NG
- Celestial cat CG
- Fiendish rat LE
- Fiendish monstrous centipede, tiny NE
- Fiendish toad NE
- Fiendish snake, tiny viper CE

Temporary Creation

Conjuration (Creation)

Level: Clr 0
Components: V, S, DF
Casting Time: 1 full round
Range: 0 ft.
Effect: Unattended, nonmagical object of nonliving plant matter, up to 1 cu. ft.
Duration: 1 round/level (D)
Saving Throw: None

Spell Resistance: No

You create a nonmagical, unattended object of nonliving, vegetable matter with a gold piece value of no more than 10gp. The volume of the item created cannot exceed 1 cubic foot. You must succeed on an appropriate skill check to make a complex item. If the created object leaves your hand, it instantly disappears. Attempting to use any created object as a material component causes the spell to fail.

To Arms!

Enchantment

Level: Brd 0, Sor/Wiz 0
Components: V, S
Casting Time: 1 standard action
Range: 0
Area: 10 ft./level radius
Duration: Instantaneous

Saving Throw: None
Spell Resistance: No

When you cast this spell, all your allies within its area cease to be flat-footed against any foe.

Warn

Enchantment (Compulsion) [Language-Dependent, Mind-Affecting]

Level: Clr 0
Components: V
Casting Time: 1 standard action
Range: Close (25 ft. + 5 ft./2 levels)
Target: One living creature
Duration: 1 round
Saving Throw: Will negates
Spell Resistance: Yes

You give the subject a single warning, advising it not to take a particular course of action. If the target takes the action you advise against on its next round, it suffers a minor penalty. You may select from the following options for your warning.

Action: You may warn the target from taking any action that requires a specific skill check. If the target takes an action requiring that skill on its next round, it suffers a -2 penalty.

Attack: If the target makes an attack on its next round, it suffers a -2 penalty to its first attack roll.

Cast: If the target casts a spell on its next round, it must make a DC 10 Concentration check to successfully cast the spell. If it is already required to make a concentration check (to cast defensively, for example), it takes a -1 penalty to that skill check.

Move: If the target takes a double move on its next round, its movement rate is reduced by 5 ft. (resulting in a total of 10 feet less movement over the course of a double move).

The Wight Stuff

for *d20 System*

by William Blake Smith

"Trembling he looked up, in time to see a tall dark figure like a shadow against the stars. It leaned over him. He thought there were two eyes, very cold though lit with a pale light that seemed to come from some remote distance. Then a grip stronger and colder than iron seized him. The icy touch froze his bones, and he remembered no more . . . a Barrow-wight had taken him, and he was probably already under the dreadful spells of the Barrow-wights about which whispered tales spoke."
--J. R. R. Tolkien, *The Fellowship of the Ring*

"Wights are undead creatures given a semblance of life through sheer violence and hatred."
--Dungeons & Dragons Monster Manual 3.5

If you are a GM running a *d20 System* game and you're setting up an adventure for your players, this may have happened to you. You think to yourself, "What should I put in the cemetery for them to fight?" You look at your notes and find that you've got four third-level characters so you look for something that has an encounter level to match that, and is appropriate for the setting. You see that wights are CR-3, and without thinking much about it you throw a couple of them into the crypt where old Lord MacGuffin's treasure is rumored to be stored.

By putting wights out as random EL or CR based "dungeon dressing" you may be missing an opportunity to make this powerful and dangerous creature something your PCs will dread, and your players will remember and speak of in hushed whispers. Once you delve into the mechanics described in the 3.5 and SRD documentation, you may find yourself questioning how accurate that CR-3 really is.

Let's get one thing out of the way right up front. The word "wight" does not mean "zombie." Wight comes from the Old English word "wight" meaning "creature" or "thing." The name of Tolkien's maleficent creation really means "grave-creature," or "tomb-thing," or depending on your translation could even be as benign as "tomb-person." This nomenclature issue was included in the *AD&D Monster Manual,* but people introduced to Wights through the 3.5 version of *d20 System* will not see this mentioned in the creature's description.

If *The Fellowship of the Ring* can be considered the source material for the wight, the game monster varies greatly from its literary ancestor. Though the hobbits face many terrors early in their travels, the evil thing that lurks in the barrow is a terrifying encounter that they barely escape. But what is a wight? Well, in Tolkien's text it was a thing of evil and it lived in a grave. It resembled a ghoul in its choice of homes, and behaved somewhat like a vampire in its ability to mesmerize living. It bore a list of powerful spells, the nature of which is not revealed to us in the book; but one may safely assume they were not healing spells.

d20 System wights are illustrated and described as silent-moving undead creatures with huge claws and evil intent. As a brief historical gaming note, a few things have changed with the wight from the *AD&D Monster Manual* to the *Monster Manual 3.5.* The 2nd edition wight used to be found in packs running up to 16. It also shunned the light, and could be destroyed with a *raise dead* spell. The 3.5 wight is described as being encountered as solitary beings or in packs up to 11 in number, and like all of the undead creatures in the 3.5, the words "undead traits" are written in the stat-block. Pay attention to those words; we'll get back to them in a moment.

The wight has a slam attack, plus an energy drain that causes a negative level gain. Every time that slam successfully hits a character, they risk having another level drained. Every successful level-drain decreases the character's abilities and increases the chance that they'll be hit again. The wight gains 5 temporary hit points with each successful level drain, and this is added to its own hit points which average around 26 (based off 4d12). These temporary hits won't change a wight's "natural" hit point level, but can raise a wight's hit points to dangerous levels if the tide of battle turns

in the wight's favor.

Another thing about wights that you don't hear much about is how quiet they are. They get a +8 on their "move silently" checks. This gives them a +16 to moving around stealthily, before the GM rolls the die for their efforts. That's a very quiet, evil, hate-filled entity silently stalking through the shadow places.

So they're dangerous enough with their special abilities, but because they have "undead traits" many of the normal tactics that a party of adventurers would use to kill these beasts won't work. Wights have darkvision, immunity to all mind spells, immunity to poison, sleep, paralysis, stunning, disease, critical hits, non-lethal damage, ability drain, level drain, fatigue, and exhaustion. They don't eat. They don't sleep. They don't even need to breathe. They're intelligent, hate all life, and are completely evil. Does this still sound like a CR-3?

Anybody killed by a wight becomes a wight (under control of the wight that slew them) in 1d4 rounds. In the *d20 System* a round of combat lasts 6 seconds. So every person slain in combat by wights will rise as wights themselves in 6 to 24 seconds.

Consider how weak and pathetic most NPCs are, and you'll see what a perilous situation wights create in an urban environment. According to the *Player's Handbook,* the commoner NPC has d4 hit points. A warrior NPC has d8 hit points. As little as one or two hits from a wight will kill NPCs of this caliber. Then, those dead NPCs will become a full-powered wight in 6 to 24 seconds.

Let us consider a scenario for a moment. Evil Lothario is a bad man. He likes to hurt people. He hates beauty. He spits in the well. He steals from the poor. He doesn't pay his taxes, and he wears white shoes after Labor Feast. After living a short, bitter life of loathing he passes away and is given a pauper's funeral in the local cemetery. Nobody comes to his funeral but the grave-digger, and nobody sees Lothario the wight burst from the coffin while he is being interred. Nobody even hears the grave-digger's screams, or the sound of him rising up from the ground as a second wight 12 seconds later.

The grave-digger's wife comes out to find him when he doesn't come home for dinner. Two rounds of screaming later, and then an additional 24 seconds and there are three wights in the graveyard. Now here is where it gets interesting. If the three of them work together, they can break into The Miller's house. His family won't hear them come in, because as wights they all move more silently than cats. The three of them slam attack the family in their beds, and soon the Miller and his five kids join the wight army.

The nine of them head down to the docks where the drunken sailors are drinking and singing in the Cracked Tankard Tavern. As the sailors intermittently make their way back to the ship, shadows reach out of the foggy night and slam them into silence. In half of an hour, there are enough wights to make a full assault on the Cracked Tankard. Many leave the tavern that night, but none of them are human anymore. In less than six hours with just simple, methodical, and relatively slow attack-plan Lothario the wight has made friends (slaves) out of well over 50 townsmen. And that is a very conservative number.

So why aren't wights the most commonly encountered creatures in *d20 System* worlds? Here are a few suggestions on how you might answer that question in your gaming world:

- **Wight Supremists:** Handle wights like what they are -- an animated and intelligent virus. They are more dangerous than the plague, and wherever they spring up armies should be dispatched to burn infected cities to the ground, perform holy ceremonies, quarantine, and destroy sites that might house the evil beasts. Think *Night of the Living Dead* meets *28 Days Later,* only make it grim.
- **Pyramid Scheme:** Change the rules for wights in your game world to make them less virulent. One method is to create a situation where the main wight can spawn second-tier wights, and they in turn spawn third tier -- but each lower rank has less power. A simple way to do this is to have each subsequent tier of wight from the "prime" wight deliver one less point of HP draining with each successful slam, so that a 6th-tier wight couldn't drain energy and therefore couldn't spawn a new wight. That still leaves the wights as very powerful foes. If you add to this mix a house-rule stating that if the "prime" wight is eliminated, all his spawn will die then you'll accomplish two things. First, you'll make the wights more manageable by the PCs. Second, you'll give the

players a clear objective and possibly introduce some interesting tactics for dealing with these creatures.

- **The Wight to Bear Arms:** Sometimes hate spurs people to do terrible things. In others it spurs them to avoid people and shun contact. Make your wights evil, moody, intelligent and very anti-social. Your wights don't take over the world because they hate other wights too! They don't want more wights, and if at all possible will use a weapon rather than their slam attack to kill you so that none are spawned.
- **Holy Ground:** Have the church(es) handle wight propagation by ensuring that wherever possible, all burials are in holy ground. Each death is accompanied by a visit from local priests, and a blessing during the funeral rites. It doesn't matter if the deceased wasn't religious. In fact, the grieving family of the agnostic may find several forceful priests coming to the death-bed regardless of protests. If you're a GM introducing wights into your game, have several sessions where the elaborate burial rituals are observed and are pointed out to have always been a part of the culture for as long as the characters can remember. Then have a war break out and/or a plague as well. The vast numbers of unburied dead and unconsecrated mass graves for those who did get buried serve as a Petri-dish of evil.
- **Property Wights:** Wights usually live in graveyards. Your wights might not like to live anywhere else. Or, more importantly, they may have their numbers kept in check by other evil or undead creatures who don't want to encourage heroes to come and plunder the place. Perhaps a local vampire wipes them out if they get too numerous. Or perhaps they are the thralls of a powerful lich, and it keeps them on a very tight metaphorical leash. Whatever the reason, your wights are homebodies; very dangerous homebodies.
- **Wight Fight:** Another alternative to limit wight power would be that after a "prime" wight is slain, his first tier of created wights become free to start their own "line" of wights, and at that point can war between themselves and the other peers in their tier. Such bitter rivalries would allow the wights to limit their own numbers through in-fighting, and some of these tiers might exodus out to new territory to avoid being exterminated by their former co-slaves.

For the GM, these are a few ideas for how you can use wights, and a reminder that they're not just some low-level dungeon fodder if you use them properly. If you're running a classic-style *d20 System* module as the GM, it is easy to get into the mindset of trying to set up challenges for the players based on encounter-level to "flesh out" your dungeon, tomb or maze. Trying these variations out on your players might surprise them, and might even change your world.

And if you're a player and want to protect your PC, always ensure there is a cleric in your party. Wights may be your character's first exposure to negative levels, and if you're not careful they can be your last. On the bright side, if the cleric can't save you, and your party's skills can't overcome the onslaught of these silent killers, in the end your party will be all wight.

"Get out you old Wight! Vanish in the Sunlight"
J. R. R. Tolkien, *The Fellowship of the Ring*

Countermancy

A School Of Magick for *Unknown Armies*

by Ryan P. Macklin

You know the horror of the magick. It makes slaves of people, consumes them, and turns them into monsters that bring reality crashing down on the innocent. You understand their power, and use it against them. If you must become the monster to fight the monster, so be it.

For every person who is successfully brainwashed -- "trained" -- by an adept, there are a hundred students who "fail," and get ditched for the next punk who might have "an open mind." These poor souls are left battered and broken, having stared into the abyss and lost their minds, their souls. They're left unable to function in the real world, useless to the occult underground, and have nothing to show for it but a look of disappointment and pity.

You were almost one of those. When you stared into the abyss and saw it staring back, you didn't smile with newfound insight, nor did you cower or let yourself be consumed. You screamed "NO!" with every ounce of your being. Your mentor ditched you, but you didn't become another victim. You stood up, recognized the horror for what it was, and lashed out.

The Unnatural is anathema. You learned how to fight it, how to stop it, but to do so you had to become it. It doesn't matter anymore you can't ignore what you saw or try to pretend it didn't change you. The only alternative is to live as a broken shell. If you must become a monster to fight monsters, you'll drag as many of them down to Hell with you as you can.

The central paradox of Countermancy is using the unnatural to stop the unnatural. You are friend and foe to the occult underground at the same time. They're the only ones who can understand and accept you and your "curse," but they're also the ones you're fighting.

Countermancy Blast Style

Countermancers (also known in the occult underground as "buzzkills") don't have a blast. Instead, they have an "anti-blast" -- a spell that undoes the effects of a blast spell. This takes the form of a miraculous recovery when the damage isn't obvious to an outside observer. When there is visible physical damage, then the person recovers rapidly, but not unnaturally or alarmingly so. Dead people cannot be affected by an anti-blast.

If someone is hit with a blast and anti-blast at the same time, the blast is reduced or completely neutralized. A significant anti-blast will neutralize any blast. A minor anti-blast will neutralize a minor blast and reduce a significant blast into hand-to-hand damage.

Anti-blasts cannot be done with tainted charges (see Generating Tainted Charges below).

Stats

Countermancers must pick the school their teacher attempted to pass on, which may be any school except Countermancy. This is known as their Affinity School. Record this alongside the skill name: "Magic: Countermancy (Entropomancy) 55%".

Buzzkills also have at least two Hardened and two Failed Unnatural notches, rather than the standard one.

Generate a Minor Charge: Live the "normal" life. Every 24 hours spent without contact with magick or the

Unnatural generates a minor charge for a buzzkill, as long as he is able to keep magick out of his thoughts as well. Every day that the Countermancer remains abstinent from magick and the Unnatural, the GM secretly rolls against the buzzkill's Magick skill without flip-flopping or shifts. On a success, his inherent magick blocked the chare from forming. On a failure, he gains a charge -- but he doesn't know about it until he checks on his charges, which ruins his charge for that day. There are no additional effects for matches or critical successes or failures.

Countermancers can also gain tainted minor charges from their affinity school. See "Generating Tainted Charges."

Generate a Significant Charge: Stop an adept from gaining a charge, disrupt a charge ritual, or force a charged-up adept to break taboo. The Countermancer does not have to be the direct cause of the disruption. He could have a dipsomancer thrown out of a bar by talking to the bouncer, instead of slapping the drink out of his hand, but he must have instigated the disruption.

The buzzkill cannot gain any more charges from the same adept during the next hour. Since the adept can still try for more charges, the wise Countermancer subdues his target or gets the Hell out of Dodge.

The biggest drawback to intervening (aside from the lethality involved in getting between an adept and his charge) is that the Countermancer cannot stage it. He must truly be stopping an adept for the sake of keeping magick at bay, not to accumulate power himself. Others may stage this and trick him into getting a charge but he must fully believe in the act.

Countermancers can also gain tainted significant charges from their affinity school. See "Generating Tainted Charges."

Generate a Major Charge: Disrupt an adept from your affinity school from gaining a major charge, or force him to break taboo while he's holding the charge.

Countermancers cannot gain tainted major charges from their affinity school.

Generating Tainted Charges: Buzzkills who need power in a hurry can gain minor or significant charges by following the rituals for their affinity school. This is a dangerous, desperate act. First, any non-tainted (or "clean") charges he has are immediately lost since participating in a charge ritual breaks taboo. He cannot gain any more clean charges until he's rid himself of all the tainted ones and spends three days away living a normal life, as if generating minor charges. Gaining a tainted charge is a deliberate act -- a Countermancer of Plutomancy doesn't get a charge everyone he receives money, only when he does so with the intent of gaining a charge.

That's the good news. Tainted charges cause severe problems for those who utterly reject the Unnatural. The Countermancer suffers a negative shift on every stat and skill while holding the charge, -10% if only holding minor charges, -25% if holding any significant charges as him soul is rejecting the charge like a bad implant. This doesn't end until the adept loses all the tainted charges. Because of this, these charges are unstable. When using tainted charges, they are spent every time a spell is attempted, even if the Magick roll fails.

Regardless of whether the charges he is carrying are clean or tainted, he can only fuel Countermancy spells with them.

Taboo: Countermancers have two taboos. First, they may not be a willing participant in an unnatural effect, magick spell (aside from their own Countermancy spells) or ritual. Only clean charges are lost when breaking this taboo. Buzzkills may partake in the company of adepts and their ilk without breaking the taboo (if they can stomach each other in the first place), but that's as far as it goes.

Second -- and here's the kicker -- they share the same taboo as their affinity school. There is enough of an imprint of his former teacher's school that he is bound by those rules. This is a never-ending source of frustration for buzzkills. Breaking this taboo affects both normal and tainted charges.

Random Magick Domain: The cosmic status quo reinforcement of the Natural. Strange noises in your home? It's just old floorboards. Get mauled by some unspeakable thing? It was just a bear, and you're recovering a lot faster. Countermancy has no effect on avatar channels avatars are the paragons of the cosmic status quo.

Starting Charges: Newly created Countermancers start with as many charges, all clean, as new adepts in their affinity school start with.

Special Effect: If the Countermancer is holding any clean charges, an adept from his affinity school who attempts to affect his with a spell has their magick roll flip-flopped if it would make the roll fail or be less effective, even if the adept flip-flopped it already. This effect works against every spell, not just harmful ones. Only running out of charges turns this off. If the spell is suppressed, the Countermancer doesn't know he did it, and the adept treats it like a normal spell failure.

When the buzzkill is charged (clean or tainted), adepts from his affinity school sense him as a malevolent force when they see him. Those who have dealt with Countermancers before knows what this means, though the message is clear enough to those less educated.

Countermancy Minor Formula Spells

Unlike other adepts, Countermancers rarely give their formula spells interesting or inspiring names. Some even go as far as to not name them at all, to avoid the idea that they're actually doing something unnatural. The names below are as inspiring as most Countermancers get.

Peace and Quiet

Cost: 1 minor charge

Effect: The Countermancer can suppress a minor unnatural phenomenon or the effects of a minor artifact within visual range for a number of minutes equal to the magick roll. If the phenomenon or effect would expire by then, it does not return.

Soul Healing

Cost: 1 minor charge

Effect: The Countermancer can cause minor charge charges to leak out of an adept by pushing one of his charges in, causing them both to cancel and disappear. He must grab the adept flesh-to-flesh and focus -- not just mere casual contact or have any clothing in the way. He can only cause one charge to be lost at a time, but can continue until there are no charges left.

Soul Healing does not affect significant charges directly, but if the target doesn't have any minor charges left, any significant charges will be converted down until there are some minor charges to lose.

This spell does not work against Countermancers with clean charges, and cannot be done using tainted charges. If the target has no charges to affect, the spell fails and the buzzkill's charge is not lost.

But Fear Itself

Cost: 2 minor charges

Effect: The target of this spell becomes immune to Unnatural madness checks. He doesn't suddenly become fearless, but ignores non-threatening effects (even If they are shoved right in his face) or rationalizes any dangers as mundane threats. This lasts for the sum of the dice, in minutes.

If the target also recently failed an Unnatural check, this works like Psychological First Aid (p. 69), by having the target forget the unnatural event or rationalize it as something mundane. While many people do this on their own, this spell makes that concrete.

Since the target saw the event differently than others (or blocked it out completely), he may be subject to Self or Isolation checks if confronted aggressively by other witnesses.

NO!

Cost: 2 minor charges

Effect: This is the Countermancer's minor anti-blast. It may be used to heal damage done by a blast spell, whether the damage was done to Wound Points, Soul, or something else. The damage healed is the sum of the dice or the amount of damage done by the blast, whichever is lower. The anti-blast cannot heal anything but the damage taken from magickal blasts. It also neutralizes a minor blast thrown at the target at the same time, and turns a significant blast into hand-to-hand damage.

If the effects of the blast are not outwardly visible (like the pornomancers' blast), the healing is instantaneous. If the effect is outwardly visible (like the epideromancers', or any blasts that direct physical threats such as the dipsomancers' or urbanomancers'), the wound points are gained back immediately, but the physical evidence remains, though it heals faster than normal (bruises fade and cuts heal faster, etc.).

Anti-blasts cannot be done with tainted charges.

Minor Counterspell

Cost: X minor charges

Effect: Disrupt a minor spell as it's being cast. The cost is the same as the cost of the spell being nullified, though the buzzkill only finds out the cost after the fact. If he doesn't have enough charges to stop it, the spell goes off as normal and he doesn't lose any charges. The target adept spends his charges, even if the spell is nullified.

Against a minor spell from his affinity school, this only costs 1 clean minor charge, regardless of the target spell's cost.

Countermancy Significant Formula Spells

I Said Shut Up!

Cost: 1 significant charge

Effect: Like Peace and Quiet, but for significant unnatural phenomena and effects from significant artifacts. You can also use this against minor unnatural phenomena and effects from minor artifacts, for a number of hours equal to the sum of the dice.

Bring Peace Unto The People

Cost: 1 significant charge

Effect: Works as But Fear Itself, but for a group of people the Countermancer can see, up to the number the dice rolled.

Reality Correction

Cost: 2 significant charges

Effect: The Countermancer can undo the effects of any minor spell that has already been cast, as long as he knows a

spell was cast, and is either in the vicinity of where the spell effect took place or knows who the caster was. The target adept does not regain his charges. For every 10 people affected or witnessing the original spell (aside from any adepts), this costs another significant charge.

Note that the longer it has been since a spell was cast, the number of people affected by countering it increases. Practical limitations are usually around one hour for very obvious spells, a day for subtle spells that actually affected someone, to a week for information-gathering spells.

The Countermancer remembers the spell having been cast, and any events based on it, rather than the altered reality. This could result in Self or Isolation checks when dealing with people remembering the past differently.

This costs one less significant charge when used against spells from his affinity school.

That Didn't Happen!

Cost: 2 significant charges

Effect: This is the Countermancer's significant anti-blast. It works like the minor anti-blast, only the damage healed is equal to the dice rolled or the damage done from blasts, whichever is lower. It also neutralizes a minor or significant blast thrown at the target at the same time.

Anti-blasts cannot be done with tainted charges.

Punish the Traitors of Reality

Cost: 4 significant charges

Effect: Adepts near the Countermancer (within 33 yards) who are holding any charges take damage as the charges explode out of them. Adepts containing only minor charges suffer damage equal to the same of the buzzkill's Magick roll, just as if hit with a minor blast. Those who are holding significant charges are affected with firearms damage, as they would be by a significant blast. The damage manifests as trauma and burns from the charges literally exploding inside their body. Bystanders near the adepts are not physically affected, though they may be shocked to see people around them suddenly convulse or die.

No one is exactly sure what happens when an adept holding a major charge is affected. Theories range from them being immune to the magical equivalent of a nuclear weapon.

Countermancers are not affected by this spell, unless they are holding tainted charges. This includes the buzzkill casting this spell, if he's holding any taint. Adepts affected may make a Magick roll to feel something wrong with their charges, and can let them go before they're damaged -- provided they actually understand what's going on.

Significant Counterspell

Cost: X significant charges

Effect: As Minor Counterspell, but for significant spells and charges.

Countermancy Major Effects

Undo any spell. Permanently nullify any artifact or an unnatural phenomenon. Cause all practitioners of a school of magick to lose their charges. Remove an adept's ability to do magick. Remove all the memories of an unnatural event.

Plot Hooks

- There's a buzzkill hunting the Freak in Chicago. They've duked it out once, and he walked away with all his body parts in the right places. He's got quite a few people in Chicago nervous.
- Rumor has it that there are a number of Countermancers working for the Sleepers, but they don't do the run-of-the-mill jobs. If you're an adept, and you kill a Sleeper, you can expect a few to hunt you down, happy to rid the world of another abomination.
- A Countermancer in Vancouver is challenging the Godwalker of the Pilgrim. Most of them don't play the avatar game, but he's hoping to ascend and make magick more difficult, if not impossible.

Pyramid Review

Dungeons & Dragons Dungeon Tiles

Published by [Wizards of the Coast](#)

Designed by Andy Collins, Jesse Decker, David Noonan, & Christopher Perkins

Art by Jason Engle

38 tiles (two 8×10 (pub & store), two 4×8 (shattered columns & boneyard), four 4×4 (pit, pool, treasure hoard, & fountain/pentagram), two 2×8 (statuary & crevasse), 12 2×4 (stairs, crevasse, and darkness), six 2×2 (spiral staircase, pit, pentagram, obelisk, & blank), eight 1×2 (portcullis & doors), two 1×1 (trap door & suit of armor); full color, mounted; $9.95

There are some products any company can put out, knowing full well that some segment of the gaming community is going to find it appealing, and one such product is dungeon floors. Why it took Wizards of the Coast so long to milk this cash cow (or, more accurately, milk it anew) isn't clear, but in a field that, in the last six months, has turned positively lousy with mapping accoutrements and programs from several companies, you have to be cautious enough to wonder if *Dungeons & Dragons Dungeon Tiles* is worth it.

Note that Wizards isn't really new to customizable layouts. They've been providing the Map-A-Week service at their website for no small length of time now, their miniatures come with their own various floor plans, and RPG history is littered with everyone's shots at creating geomorphic boards and customizable cartography. This time, the product in question is a set of cardboard-mounted tiles.

The graphics merit mention up front, since it's at least half the product anyway, and buyers won't be disappointed. Overhead illustrations are tough to get right without them looking like someone's trying to, well, draw something from a top-down perspective. These tiles are done with a light touch, each with a delicate, artistic feel suggesting the shimmer of a rune carved into the floor or the haphazard scattering of a treasure hoard. There are some misses, but most of it consumers will find pleasing. The cardboard stock is thick and ready for action, and the broader room pieces, once placed, won't shift under your figures. The longer and smaller pieces like hallways don't have the breadth and weight to hold flush to the table, but if they're sandwiched between two or more other rooms anyway, the whole layout remains stable.

The floor tiles in this set range from the generic to the fairly specific, and there's not really a unifying theme. There's the Zen of it: If you have particulars in need of satisfying, you'll have to make do with what you get. If you want generic, some of the tiles may not fit your vision. To get around some of this, the reverse of most of the tiles is printed with a simple pattern of squares with the dungeon look, so unless all your adventures occur outdoors, you can inevitably find a use for the B-side. Furthermore, those tiles that picture something other than dungeon flooring don't spoil the effect with a grid-style overlay, instead showing tiny, unobtrusive cross-marks where the squares would normally intersect. These could have been made fainter still, but the attention to detail speaks well of the set.

Like other products (say, a referee's screen) that need advertising space while they sit on the store shelf but no longer need it when you've opened them, this one has only a small, thin wraparound sheath keeping it all together. (Once they're pressed into service, storage for all those pieces is your problem . . . a gallon zip-lock baggie should do the job.) The outside is just blurbs, but the inside does have a few suggested layouts to get the juices flowing (and a pointer to

the Web where you can get more). It's also impressive to see just how big a lair you can field from what looks like such a tidy little stack of pieces.

The whole kit comes tightly packed, and this is almost a problem since the punch-out tile sets are so compacted they threaten to stick to each other and the sheath. And just because they "only almost" did it on one sample doesn't mean other copies will fare as well . . .

The choices made regarding the areas and structures pictured do cover some standard fantasy needs: stores and pubs, magic places, some ruins and pits. Smaller tiles provide the completely necessary doors, portcullises, and random rubble. Taken altogether, you may have to let the tiles dictate some of your story (just how many crevasses do you need splitting your floors in twain?), but it's still a good mix. The **Dungeons & Dragons Dungeon Tiles** idea is obviously not novel, but what you get for your money is some handsome, well-made pieces that, if you haven't the patience or money for a roll-up erasable play mat in your game, allow quick and simple dungeon construction even as players are champing at the bit for the fight to start. The only other problem with the selection, if you like what you see, is having to wait for the next set's release.

Pyramid Review

Worlds of the Dead (for [All Flesh Must Be Eaten](#))

Published by [Eden Studios, Inc.](#)

Written by Evin Ager, Rob Boyle, Thomas D. Coster, Jr., Daniel R. Davis, Gordon Dritschilo, Darren Hardy, Nik Havert, John Karakash, Michael Kvorjak, Mark Freeman, Thom Marrion, Michael McConnell, Matthew McFarland, Jason Mical, Erin Mills, W. David Pattison, Andrew Peregrine, Dan Proctor, Dan Robichaud II, Tyler Sigman, Kelly Stack, Monica Valentinelli, & Michael Wallace

Cover by Jon Hodgson

Illustrated by Storn Cook, Dwayne Harris, Travis Ingram, Dan Oropallo, & George Vasilakos

144-page b&w softcover; $24

Although not short of a Dead World or two across the whole of the *[All Flesh Must Be Eaten](#)* line, there has never been a single book devoted to the post-apocalyptic zombie-fuelled scenario. Well, if it is Dead Worlds you are want, then *Worlds of the Dead* serves them up in several brain pans awash with ideas. There are 21 on show here, all of varying length and depth and making use as a whole of nearly all the titles in the *All Flesh Must Be Eaten* line. Further, there are Dead Worlds here that reference Eden Studios Presents, the magazine devoted to the publisher's various RPGs.

These Dead Worlds take the Zombie Master across time and space, but mostly time. In this, what *Worlds of the Dead* presents is a series of alternate histories wherein the divergent factor is the appearance of the corpse cavalcade. Each Dead World follows the standard format: an opening piece of color fiction, a history, an explanation of the present situation, followed by story ideas, character ideas, the zombie stats, and perhaps an archetype or two. The book is laid out in the line's usual fashion, so it is a decent enough looking affair, although one really silly error did get past the spell check.

It opens with "Aces High: World War I" by Daniel R. Davis (with Thom Marrion and Evin Ager), in which Manfred von Richtofen, the infamous Red Baron, has become a greater scourge of the skies because he is dead and cannot die. The pilots of his Jagdgeschwader have joined him in death, while the Germans have found a way of sending zombies into the trenches. This Dead World is supported with write ups for various flying aces and aeroplanes.

Other historical Dead Worlds include Mark Freeman's "Dead Men and Derring Do" which pits the Musketeers against the horde. Roman legionaries face Pictish zombies along Hadrian's Wall in Tyler Zigman's "Over the Wall." Darren Hardy puts the zombies to work in a dark future British Empire still ruled by Queen Victoria the Everlasting in his "Frankenstein 1935." W. David Pattison's "Our Zombies at War" gives an alternate World War II fought by both sides using zombie troops and dark magic, the Axis using Thule zombies, the USSR Psychotropic zombies, and the USA zombie super soldiers developed by Project West! "The Dread Menace" by Daniel R. Robichaud II twists McCarthyism to a deadlier threat.

These are all decent entities, but the longer the Dead World the better, and several of those are also historical. Matthew McFarland's "The Blighted Isle" takes the tragedy of Ireland's Potato Famine of 1846 and makes it nastier. As more die, more rise again, and they are very, very hungry. The British Government is forced to quarantine the whole of Ireland, but what happens if an outbreak happens on British soil? Or escapes by ship to the USA?

"The 47 Gaki" by Michael McConnell is also inspired by a historical incident in which 47 Ronin took revenge upon the lord who had driven their master to attack him. Although technically murderers, the Ronin are regarded as heroes for their loyalty and obedience and it is these themes that this Dead World explores. Admittedly from beyond the grave with the player cast of samurai facing the 47 returned Ronin who enact their revenge in creating and leading an army of zombies, making use of ***[Enter the Zombie.](#)*** This Dead World takes the story right from the outbreak through to dealing with the threat or even living under it.

Of the rest, Nik Havert's "The Not So Perfect Storm" is a one-shot affair that shipwrecks the cast members on an island, only to be besieged by zombies, and Jason Mical's "Tales of the Walking Dead: Arabian Nights" does The Thousand and one Nights with zombies. "The Crusade of the Damned" by Thomas D Coster Jr. feels similar to "The 47 Gaki" in that it brings back warriors as zombies, but this time it is templar warriors and the era is that of ***[Pulp Zombies.](#)***

Monica Valentinelli's "Sweet Zombie Treat" just confirms that dessert is not good for you, whilst "Welcome to Whimseyville" by Erin Mills turns a Florida theme park into a zombie hell. Finally "Necropolis Ascendant" by Andrew Peregrine presents a future of city states ruled by necromancers capable of holding off the zombie hordes, whilst the rest of humanity lives in state of nihilism. The only way to rise above humanity's malaise is to work for the city's necromancer.

The last few Dead Worlds look to the future and specifically towards the forthcoming *All Tomorrow's Zombies.* Mike Wallace's "Immortality" is set in a town of survivors just off the interstate, with political tensions, secrets, and the undead outside. "Panacea" by John Karakash is less interesting, offering a future in which technology has found a cure for most ills and injuries, giving perfect health until old age. Unfortunately, unexpected deaths turn corpses into mindless zombies although implants can control such urges and put them to work.

Daniel Proctor's "Legacy" is heavily inspired by *Do Androids Dream Of Electric Sheep?* with an Earth ravaged by zombies and humanity at war with its short lived creations, the Simulacra. This can be run as a pre-apocalypse dystopia, or as the Dead World given. The last Dead World is "The Dead of Space" by Rob Boyle, set aboard a giant colonization ship. This can be run with the cast members awakening suffering from amnesia -- it eases the shock of colonization -- and at the mercy of the zombies. Alternatively the cast could be tribe members living centuries aboard this very small world. The truth be told, these are the two entries of the collection given here, that grabbed my attention.

Not every Dead World quite works. These include Michael Kvorjak's "Dial Z for Hero," a Dead World in which its superheroes and villains are zombies! It suggests that you make use of the combat rules from ***[Zombie Smackdown!](#)*** and although it tries to adapt the rules to the superhero genre, it definitely needs further development. Gordon Dritschilo's "Peace, Love, and Zombies," which mixes hippies and the undead, suffers similarly. So does "Parallelium" by Kelly Stack, which feels more suited to the ***[Buffy the Vampire Slayer Roleplaying Game](#)*** in casting ordinary folk into an alternate fantasy-fuelled Dead World with an evil Wizard, trolls, wyrms, and zombies.

Worlds of the Dead, or George Vasilakos' "Big Book of Zombie Scenarios," does exactly what it says on the tin. With 21 Dead Worlds to choose from there has to be something here to whet the appetite of any Zombie Master. None of them are awful, though a few could have been dropped in favor of giving room for others to receive further development. Of those 21, "Immortality," "The Blighted Isle," "The 47 Gaki," "Legacy," and "The Dead of Space" all stand out as being the most playable or at best the most interesting. The Zombie Master is of course going to get the most out of this supplement, but *Worlds of the Dead* is not just a useful source of ideas for *All Flesh Must Be Eaten,* but the universal nature of the Dead Worlds it presents means that they can be run using any game system.

--Matthew Pook

Journals Redux

Over on the *Pyramid* message boards -- where everybody knows your name -- there was a lot of discussion over last week's installment. (Just to ground everyone who doesn't want to click on the hypertexted link, that was the one where I talk about retracing the steps of a previous expedition.) Never one to leave a possible column idea hanging in the ether, I thought I'd revisit the issue and offer more random thoughts; this installment's mixture is two parts hodge to one part podge.

First, Peter Dell'Orto (Metropolis, New York) expresses some surprise at my dislike of the dotted-line-style treasure map compared to my enjoyment of journals or more abstract representations. I explained that, in my experience, one of the problems with direct piratey-treasure-type maps is that they can provide enough information for the PCs to travel as they will, bypassing the bulk of the map and even jumping directly to the end. If the pirate map shows the path going past the Caverns of Despair, over the Treacherous Bogs, and continuing to the southern-most part of the Lake of Ennui, then the heroes might wonder, "Hey... can't we just go northwest around the caverns, bypass them entirely, scoot on by the Village of Frou-Frou Drinks, and make our way leisurely to the Lake?" (No doubt bypassing several planned encounters in the process . . .)

A journal, however, sidesteps these issues, without doing so in a way that feels cheap or forced. After all, if the journal says, "We walked east for two days, stopping outside a cavern with a bird-shaped opening before continuing northeast from there..." then they probably won't have much ability to jump over or around anything. Knowledge of maps isn't going to be very useful in these cases, since most of the info in a journal is subjective. ("What the heck does a 'bird-shaped opening' mean, anyway? Well, hopefully we'll know it when we see it...")

That's not to say that a map can't be made so obscure that the only way to reach the destination is to follow the map exactly, but the players I have are usually craftier than that, and given a chamber with "only one way out" they'll eventually decide on one of four possibilities they concocted.

Peter responded (not incorrectly) that this may be true of your typical back-of-the-cereal-box black-dotted-line treasure maps (a great turn of phrase), but not so "real" treasure maps. Now, I still contend that, unless done carefully or creatively, such maps require landmarks which the players might use to try to jump the turnstile. I've encountered both published adventures and computer RPGs that feature such maps, and there almost always exists a chance for the players to utilize the map to skip ahead, yet these adventures seldom take this possibility into account.

My favorite examples of this phenomenon are in computer RPGs, where the player has resolved a situation, and afterwords you're presented with detailed instructions about how to deal with that problem . . . usually via means of an interminable unskippable dialog tree:

Old Man: Young heroes, you are the only ones who can thwart the Sea Hag.

Party: What, you mean the one at the bottom of that pit? 'Cause we already whacked her a . . .

Old Man: First, you must find the secret passage near the ever-burning torches.

Party: Right. It's about 20 yards from here; if you look around the corner, you can se . . .

Old Man: Then, you must press the sigil on the wall that is a butterfly that is not a butterfly.

Party: Yeah; the caterpillar. Actually, we just pushed all of them and, after a few random stabbings and poisonings, we found the righ . . .

Old Man: After that, you must traverse the Spiral of Pain.

Party: Did that. Look, Gramps, we're just going to keep a dictionary on the space bar and play our Gameboy 'til you

finish talking, okay?

The following point could probably fill up its own column, but I'll at least get the ball rolling here: I have a hard time saying "No" to players. (In fact, I've written a column or two about learning how to say "Yes" as a GM.) So if they point to a promising-looking landmark on a map that's further along the predefined location and say, "I want to roll to find that spot; I've got a pretty good Tracking skill and I'm spending a Luck Point" . . . well, it feels lame and railroading to say, "Sorry; you don't find anything. You really need to follow the red dotted line." I could just be personal experience, but I've generally gotten the vibe that my players are more understanding if they know that the pieces won't make sense unless they're following them in the predefined order, and I usually have an easier time when that means a journal, verbal description, or other subject-to-interpretation information.

Having said that, there's one dotted-line map that I enjoy, and that's the "Map torn into X pieces" shtick. A well-designed jigsaw-puzzle map should be nearly impossible to follow without all the pieces in hand, and the players can't act on information they don't have yet, regardless of whether it's objective or subjective. The trick here is to make sure that the final goal is worth the effort; if a 16-part map ultimately leads to a small sack of copper coins, no jury in the world would convict the players for what they do to you. For example, the computer game *Ultima VI* forces the players to search for nine pieces of a treasure map, which leads to a dungeon (complete locked door), which leads to a tablet that you need to drag to someone else to translate for the adventure to continue. The first time I played it, I worked less to get my college degree.

Okay; moving on to our next random thought, Edward Elder (Savage Lands, Antarctica) asked, "How do out hypothetical journals get to the heroes in the first place, if journal writer dies or fails to complete the mission in the last 10 minutes he's writing it?" An excellent question, and one I would feel guiltier about overlooking if my installment last week wasn't already pretty long.

Anyway, there are a few classic means of getting the journal/map/instructions back to the heroes. Here are some ideas:

It was the journal writer himself, who recognized the danger that his ultimate encounter posed to him. This was the tack taken by the journal-writer in the graphic novel *Watchmen,* who mailed his compilation to a location he trusted. (Of course, the journal writer in question doesn't need to have the post office box number of the heroes; any third-party location or liaison who could theoretically know the writer and know how to contact the adventurers could serve.) Magic or supernatural means are also possible to get that McGuffin to the players at the last minute, or hide it from the victim's final fate.

The heroes can encounter the journal from the minions of the writer's target. Let's say the journalier got to the last encounter with Hawaiian horror C.T. Hulu, before being squicked like a bug. Hulu's unnatural minions run roughshod over the corpse, snatching interesting-looking bits before spiraling out into the night to spread more mayhem. Sneaking aboard a cruise ship, one creature (complete with the journal) causes mayhem, arriving in port six months later in a far-off land, where the heroes are sent to investigate the corridors of the ship . . .

Alternatively, the party might acquire the mapguffin from the enemies of their enemies. For example, if the dark elves hate the fish people (and both species are enemies of mankind), then the fish people might acquire Dr. McGuffin's journal in a raid on the dark elves, escaping with it as treasure. This situation might be especially intriguing if the heroes end up thinking the journal is about the wrong group. ("Waitaminute . . . I thought this was supposed to help us deal with the fish people; what are all these dark elves doing here?!")

And, finally, there's also always the possibility that the bad guy seeded it to the heroes himself. This is especially true if the journal-writer hid various objects or supplemental clues along the way (which the adversary can't access directly but hopes the heroes might).

If players hate railroading, they usually love giving chase, of feeling like they're peeling the onion themselves; many players also appreciate the challenge that *they* won't succumb to the problems that the journal-writer did. And so they go, following the path to the inevitable end . . .

--*Steven Marsh*

Appendix Z

Self-Control Mitigators for *GURPS Fourth Edition*

by Kelly Pedersen

The Mitigator limitation in *GURPS Fourth Edition* is a very useful one; it allows characters with "controllable" disadvantages to be built more easily. The nearsighted professor with his spectacles, the terminally ill hero holding off death with an experimental drug regimen, the mad scientist compensating for his blindness with a camera implanted in his brain -- Mitigator covers it all. However, one area Mitigator does not represent well is the disadvantage that is reduced, but not eliminated. This is particularly relevant to disadvantages with self-control rolls. In fiction and reality, drugs, esoteric treatments, or technological devices can often help a character cope with their personality problems, but total removal of those problems is rather less common. This rules variant aims to compensate for this hole in the *GURPS* rules, providing guidelines for Mitigators that help you deal with your problem, rather than simply eliminating it.

A Self-Control Mitigator acts much like a normal Mitigator -- as long as the character continues to use the drug, device, etc., the disadvantage that the Mitigator applies to is reduced in effect. However, instead of simply removing the effects of the disadvantage, the Self-Control Mitigator provides a bonus to all self-control rolls the character makes.

There are three levels of Self-Control Mitigator, providing +3, +6, and +9 to self-control rolls respectively. The value of the limitation, like a regular Mitigator, depends on how easy the mitigating condition is to use. The limitation values for the various levels of Self-Control Mitigators are as follows:

+3 to self-control rolls

Daily drug/breakable device: -40%
Weekly drug: -45%
Monthly drug: -50%

+6 to self-control rolls

Daily drug/breakable device: -50%
Weekly drug: -55%
Monthly drug: -60%

+9 to self-control rolls

Daily drug/breakable device: -60%
Weekly drug: -65%
Monthly drug: -70%

These values are further modified by the other conditions from the standard Mitigator limitation: +5% if the Mitigator requires a special prescription, or +10% if the Mitigator is only available from one specific source.

Example: "Knuckles" Johnson suffers from serious anger management issues; he has Bad Temper with a self-control number of 6, worth -20 points. After one too many brawls end up with someone seriously hurt, a judge orders Knuckles to undergo therapy. In the course of his counseling, the psychiatrist suggests that Knuckles try a new anti-aggression drug. Desperate to stay out of prison, Knuckles agrees. The drug grants +6 to self-control rolls; it must be

taken daily and requires a prescription, for a total limitation value of -45%. Knuckles' self-control number on Bad Temper is now effectively 12, and the disadvantage is now worth -11 points.

Of course, a character can still spend points in order to improve his self-control number independently of the Mitigator. In this case, the Self-Control Mitigator's bonus will simply apply to the new self-control number, making it all the more likely that he will resist his disadvantage.

Example: After a couple years of counseling, Knuckles has successfully reduced his aggressive impulses; his self-control number is now 9. He still takes the drug, however, since his psychiatrist is not yet convinced that Knuckles will never throw another punch in anger. His self-control number with the drug is effectively 15, and the Mitigated disadvantage is worth -8 points.

Using Self-Control Mitigators, it is quite possible to have a self-control number of 18 or higher. In this case, the character still fails self-control rolls on an 18. In addition, circumstances can impose penalties that bring a character's self-control roll down to more easily-failed levels. This distinguishes disadvantages that have been brought to only -1 point by Self-Control Mitigators from quirks; these should not be counted against the campaign quirk limit, if one is imposed.

Example: A decade after his original brush with the legal system, Knuckles has almost totally overcome his anger-management problems. His player has paid points to raise his self-control modifier to 15, and a new drug has come on the market that is even more effective than Knuckles' original prescription: it adds +9 to the self-control roll, and only needs to be taken monthly, for a limitation value of -65% (it still needs a prescription). Knuckles effectively resists his Bad Temper on a 24 or less, for a point value of -1.

However, it has been a very bad day for Knuckles; when he got to work, he was informed that he was being fired as part of a downsizing, his girlfriend left him a break-up message on his answering machine, and he got a letter from the IRS, informing him that he owes $500 in back taxes. For the past two hours, Knuckles has been drinking in his favorite bar, and he is now tipsy (-2 to self-control rolls). And someone has just knocked over his drink into his lap, and then insulted his hat. The GM rules that the general circumstances of the day, combined with Knuckles' tipsy condition, result in a -10 penalty to his self-control roll, for an effective target of 14. Knuckles' player rolls - and gets a 15. Oops. Looks like it's a trip to the emergency room for the idiot who bothered our hero, and back to therapy for Knuckles.

Terrible Beauties

for *GURPS Fourth Edition*

by Stephen Dedman

"'Twas beauty killed the beast."
--Carl Denham, *King Kong*

"I wish you would stop looking for beauty in things that want to kill us."
Tyr Anasazi, *Andromeda*

Beauty has been described as a fatal gift, but sometimes it can prove fatal to bystanders rather than the recipient.

With this in mind, here is a collection of beautiful people intended to make life more interesting -- and possibly much shorter, particularly for player characters with the Lecherousness disadvantage. Each one is designed with a particular cultural background in mind, but requires only minor changes to adapt for almost any setting.

Achilla

Achillia is a female gladiator from Gaul, famed for her skill as a dimachaeurus (two knife fighter). She has won enough matches to earn her freedom, but keeps returning to the arena because she enjoys the adulation and the adrenalin rush. When not fighting, watching fights or training fighters, Achillia can usually be found in wineshop below her small apartment, enjoying gossip and the company of her admirers.

Achillia plans to marry if she lives into her thirties and has to think about retirement, and is always on the look-out for husband material -- but in the interim, she's a serial monogamist, who's slept with even more men than she's killed. Getting her into bed is rarely difficult: even a critical failure on Sex-Appeal skill isn't likely to earn the suitor anything more deadly than a knee strike to the groin. The main problem with being her lover is that Achillia expects all of her men to remain faithful to her until she discards them, and may attack those she catches with other women. She also enjoys watching men fight over her.

Trying to end a relationship with Achillia is much more dangerous than starting one; the best thing to do is to either come up with a pretext for leaving Rome, or to wait until she finds someone else more appealing (which usually takes one to six months -- 1d, or one month for each point of the love object's positive reaction roll modifiers).

If provoked into a lethal attack, either in the arena or outside it, Achillia's usual response is to draw her knives and slash at a man's groin, giving him the choice of surviving as a eunuch or bleeding to death. She rarely uses her knife on women, preferring to punch them in the face repeatedly.

Campaign Uses: Achillia is intended as bait for characters with the Lecherousness disadvantage: a way of luring them into danger. She's not a particularly expensive mistress, though she does expect occasional gifts from lovers who can afford them (add 15-20% to cost of living for status of 1 or higher); less wealthy suitors may be asked for Favors (treat as a -2 point Duty disadvantage).

Other Settings: Achillia is designed for an *Imperial Rome* campaign, but she can easily be adapted to any setting with gladiatorial contests (legal or otherwise).

Achillia   *170 points*

Ht 5'7", Wt 145 lbs, Size Modifier 0, Age 26.

Appearance: Fair complexion, black hair cut short, blue eyes; a healthy-looking woman with a beautiful face and body, and heavily-scarred muscular arms.

Languages: Gaulish (Native) [0], Latin (Accented) [4]. TL: 2. Cultural Familiarity: Imperial Rome.

Attributes: ST 13 [30]; DX 12 [40]; IQ 10 [0]; HT 13 [30]. [100 points]

Secondary Characteristics: Dmg 1d/2d-1; BL 34; HP 13 [0]; Will 10 [0]; Per 11 [5]; FP 16 [9]; Basic Speed 7 [15]; Basic Move 7 [0]. [29 points]

Advantages and Perks: Ambidexterity [5]; Appearance (Beautiful) [12]; Combat Reflexes [15]; Fearlessness/2 [4]; High Pain Threshold [10]; Honest Face [1]; Less Sleep/2 [4]; Reputation: accomplished gladiator, +2 to gladiator fans (large group), always recognized [5]. [56 points].

Disadvantages and Quirks: Bad Temper (6)[-20]; Bloodlust (12)[-10]; Congenial [-1]; Impulsiveness (15)[-6]; Jealousy (9)[-15]; Lecherousness (15)[-7]; Social Stigma (Minority Group, -2) [-10]; Staid [-1]. [-70 points].

Skills and Techniques: Acrobatics (H) DX [4]-12; Area Knowledge (Rome) (E) IQ [1]-10; Body Language (A) Per [2]-11; Brawling (E) DX+1 [2]-13; Carousing (A) HT [2]-13; Current Affairs/TL2 (Sport) (E) IQ [1]-10; Elbow Strike (A) Brawling-1 [1]-12; Dual-Weapon Attack (Knife) (H) Knife [5]; Erotic Art (A) DX+1 [4]-14; Fast-Draw (Knife) (E) DX [2]-14 *; Holdout (A) IQ [2]-10; Knee Strike (A) Brawling [2]-13; Melee Weapon (Knife) (E) DX+3 [8]-15; Sex Appeal (A) HT+1 [4]-14; Streetwise (A) IQ-1 [1]-9; Survival (Woodlands) (A) Per-1 [1]-10; Swimming (E) HT [1]-13; Thrown Weapon (Knife) (E) DX+2 [4]-14; Wrestling (A) DX+1 [4]-13. [51 points]

* +1 for Combat Reflexes

Gear: Two large knives (fine quality).

Carrie Norris

Isaac Asimov once said that one saving grace of mad scientists is that they traditionally have a beautiful daughter, and Julian Norris is no exception.

Professor Norris is famed as an astronomer, but he is also known for being interested in the stranger fringes of science to the point of regarding the Theoretical Science Foundation as being conservative. Despite occasionally unethical behavior, he is tolerated by the orthodox scientific community because he keeps making remarkable discoveries in a variety of fields while looking for something else (usually signs of extra-terrestrial intelligence).

Norris's wife died when Carrie, their only child, was 14. Carrie soon took over the job of acting as her father's assistant and caregiver. As well as studying the stars, she was fascinated by nocturnal animals, particularly bats.

Carrie doesn't remember being bitten by a vampire, but once she'd risen from her grave near the observatory, she and her father adjusted very quickly: the only problem was obtaining enough human blood to keep her active. The Professor usually get supplies from unethical medical researchers, but sometimes these sources dry up and Carrie has to leave the observatory to hunt for drifters or campers -- or snack on visiting scientists and students. She prefers unconscious victims who she can leave alive, but either she or her father will kill to keep her safe.

Professor Norris tries to keep Carrie out of sight as much as possible (after all, she's legally dead), but PCs who visit his observatory would be well advised not to investigate any locked rooms.

Carrie dreams of finding a husband, but will react very badly to indecent propositions.

Campaign Uses: If Carrie Norris takes a liking to a PC, she may become a useful Ally. She could also be a dangerous

Enemy . . . and her father's friends include some of the Cabal's most ingenious mad scientists and gadgeteers.

Norris is also hoping to find a way to bring Carrie fully back to life -- even if it means transplanting her brain into another body (female, of course).

Other Settings: Carrie Norris is designed for an *Atomic Horror* campaign, but with minor tweaking she would fit into any setting from *Steampunk* to *Cyberpunk.*

Carrie Norris   *275 points*

Ht 5'5", Wt 120 lbs, Size Modifier 0, Age 24.

Appearance: A beautiful young woman, with a pale complexion, platinum blonde hair, and pale blue eyes.

Languages: English (Native). TL: 7. Cultural Familiarity: Western.

Attributes: ST 14 [40]; DX 11 [20]; IQ 12 [40]; HT 13 [30]. [130 points]

Secondary Characteristics: Dmg 1d/2d; BL 39; HP 14 [0]; Will 13 [5]; Per 15 [15]; FP 13 [0]; Basic Speed 6 [0]; Basic Move 6 [0]. [20 points]

Advantages and Perks: Absolute Timing [2]; Ally (Father, appears on 6 or less) [6]; Alternate Forms (Bat, Wolf) [30]; Appearance (Beautiful) [12]; Charisma 2 [10]; Doesn't Breathe [20]; Dominance [20]; Eidetic Memory [5]; Honest Face [1]; Immunity to Metabolic Hazards [30]; Injury Tolerance (Unliving) [20]; Insubstantiality (Costs Fatigue; 2 FP, -10%) [72]; Night Vision 8 [8]; Speak With Animals (Wolves and bats, -60%) [10]; Unaging [15]; Unkillable 2 (Achilles' Heel: Wood, -50%) [50]; Vampiric Bite [30]. [50 points]

* -1 for Shyness

Paula Chiang

Paula Chiang had grown up on Alardin, but was working as a security guard on Ironsides when a fuel tank exploded nearby. By the time she was rescued, her body was burned beyond recognition and fragments of the tank had destroyed her eyes and parts of her brain -- but she was still undeniably alive.

Because her medical insurance didn't cover such extensive injuries, her employer was about to opt for euthanasia, but one of their medical scientists convinced the accountants that Paula would be more valuable as an experimental subject. Over the next few years, they replaced her skin, eyes, and other damaged body parts with vat-grown

synthetics, and discovered that some of these had remarkable properties. Eventually, they had a cyborg able to impersonate any person of similar size.

Paula spent the next few years training to act as a spy for the corporate state. She didn't remember much about her past, so she was prepared to accept her employer's assurances that she was injured in an eco-terrorist attack and that the company had healed her at their own expense -- which she would now have to pay back. Once she'd gotten used to her new body, she came to enjoy what it could do. On and off-duty, she frequently shapes herself into a Very Handsome man or Very Beautiful woman... though when she needs to travel without being noticed, she does so as a very average-looking individual.

Paula now acts as much out of loyalty to the corporation as anything else; her debt rarely decreases, as she regularly agrees to more implants and modifications. She's mostly employed as an industrial spy and saboteur, but when she's asked to kill, she does so without compunction.

Campaign Uses: Paula will usually be encountered acting as an agent for the corporation (or whatever medium-sized group the GM chooses). She may be assigned to spy on the PCs, or to guard them, or to kill them. She likes using Sex Appeal to get close to her victims, preferring to rob them while they're asleep or naked, or to murder them in bed with no witnesses present.

Because Paula often mimics innocent bystanders when she wants to blend in, there's also a danger that she will take on the form of one or more of the PCs -- temporarily giving them a Mistaken Identity disadvantage that can prove very dangerous, especially if the same form is seen committing a murder and making a quick getaway . . .

Other Settings: Paula is designed for use in a *Space* or *Cyberpunk* setting, though with a slightly different origin story, she'd make a fine metavillain for a Supers campaign.

Sir Vyvyan Dumont

Gear: Fine Thrusting Bastard Sword; Lance; Large Knife; Dagger; Medium Shield; Steel Corselet, Plate Arms and Legs, Greathelm, Gauntlets, Sollerets; Heavy Cloak; Heavy Warhorse in Full Plate Barding and Head/Neck Armor, with War Saddle; Personal Basics; First Aid Kit.

Sir Vyvyan is widely esteemed as an example of the perfect gentil knight: handsome, brave, chivalrous, and skilled with weaponry. Much of his reputation comes from his performance in tournaments, where he always draws a crowd; he is also famed as a slayer of monsters, having brought back a good collection of severed heads, skins, and dragon hoards as trophies of his exploits. Bards and jesters have dubbed him Sir Vivor, because of his ability to return from the hunt without so much as a bruise on his handsome face. It's less often remarked -- at least, not at court -- that many of Sir Vyvyan's squires and other companions don't return at all, or that he spends more on new armor, weapons and warhorses than any other knight in the king's service.

Much of Sir Vyvyan's success comes from a powerful charm placed upon him at birth -- a spell that automatically teleports him to safety if he's in serious peril. Sometimes this is against his will; more often, he's unconscious when it happens, and wakes up naked miles from the battle or the monster's lair. Unfortunately, he can not take his companions with him. None have survived to tell of his miraculous escapes, and as Vyvyan is ashamed of his gift, he doesn't speak of it either: at most, he may try to discourage those who would follow him, but he will never ignore a call to arms or a perilous quest.

Sir Vyvyan believes in Courtly Love, but his vow of chastity gives him +4 to resist Sex-Appeal attempts.

Campaign Uses: If the PCs attach themselves to Sir Vyvyan in the hope of gaining glory and/or treasure, they are likely to find both -- but there may also come a time when they find that the strongest fighter of their team has disappeared, leaving the dragon chewing on an empty suit of armor. As a small consolation, when Sir Vyvyan disappears, he also leaves some very good weapons and other items behind.

While has obvious drawbacks as an Ally, Sir Vyvyan would make a very dangerous Enemy.

Other Settings: Sir Vyvyan is intended for use in a fantasy campaign, but could be encountered in any settings where magic works. In a no-mana zone, his protective charm won't work, and he'll have to fight alongside the player characters!

Wakana the Songbird

Wakana the Songbird is a Kyoto geisha famed for her musical performances as much as her beauty. Her concerts are always well-attended by Kyoto's wealthiest and most influential, and serve as advertisements for her private parties. Only the very fortunate get to sleep with her.

Wakana likes money, and what it can buy: unfortunately, more than 90% of her earnings go to her mama-san, and much of the rest goes on clothes, jewelry and cosmetics. She lives in hope of persuading someone to buy her contract (worth 4,000 silver), and uses all of her abilities to that end.

Campaign Uses: PCs with the Lecherousness disadvantage who meet Wakana and fail their self-control rolls will be offered a chance to attend one of her parties, at a cost of 200 silver pieces (no guarantee of sex, unless Wakana has an Excellent reaction to the character). PCs who lack the funds will have to make a Will roll to avoid being tempted into selling their belongings or joining risky money-making schemes (treasure hunts, robberies, etc.). Desire for Wakana can easily turn into an Obsession disadvantage (-5 points for wanting to sleep with her, -10 points for wanting to buy her contract).

Wakana also makes a dangerous Enemy: her devotees always include at least one daimyo with a retinue of samurai, and at least one wealthy merchant who hires sumo wrestlers as bodyguards. The easiest way to make her a PC's enemy is for her to think he's stolen from her, or broken a promise (particularly a promise of money).

Other Settings: With a little tweaking, Wakana can fit into any world that combines a sex industry with other forms of entertainment. In other times and worlds, she may have extra disadvantages such as Addiction or Social Disease, and be in debt to her drug dealer or other criminal figures, rather than being indentured to a mama-san.

Adventure Seeds

Now You See Him . . . *(Fantasy)* Prince Amar rightly suspects that his wife Talia is in love with Sir Vyvyan. He has no proof of infidelity, but he asks the PCs to watch the knight, to make sure that he's never alone with the princess. This means following him on his quests until the Prince feels sure that nothing untoward is going on. If his paranoia worsens, he might even arrange for Sir Vyvyan to be killed -- which will prove much more difficult than he thinks.

Farce Majeure *(Japan):* Wakana comes to believe that one of her clients has enough money to buy her contract, and that the only reason he doesn't do so is that he's already married. She persuades another of her lovers to send someone to kill the man's wife, Ryoko.

The PCs are recruited to guard Ryoko -- who is also Beautiful, has the Lecherousness disadvantage, and is quietly angry that her husband is spending so much on a geisha. She can't stop him, but she might take revenge by trying to seduce an appealing PC who's acting as her bodyguard. If she succeeds, the PCs will have to hide the affair from their employer, or be in more danger from his hirelings than they are from Wakana's.

Business and Desire *(Horror):* When aging millionaire Hugh Howe hears that Carrie Norris is a vampire, he offers Norris a small fortune if she will bite a few experimental subjects, to see whether they turn into vampires. If they do, and don't age, then Howe himself wants to be bitten. When the Norrises refuse, Howe arranges for Carrie to be abducted.

Norris escapes, and asks the TSF to rescue his daughter. Of course, the longer they take to find her, the hungrier she'll get.

Double-Edged *(Time Travel):* The PCs are visiting first-century Rome, when suddenly one of their group disappears. It turns out that they've inadvertently changed time, and Achillia has just castrated one of the team member's male ancestors, wiping out the family line. The PCs have to return to the previous day and find a way to protect the man -- but without killing Achillia, which would have an even greater potential to cause paradoxes.

The Best Defense (Space): When one of the PCs (preferably one with the Lecherousness disadvantage) is called as an important witness in a case against Paula Chiang's employer, the corporation decides that the ideal solution is for the PC to temporarily disappear and for Paula Chiang to replace him. To do this, she'll have to get him alone before the trial, immobilize him, and steal his clothes.

If she succeeds, the other PCs will have to try to work out why their friend is different, and why his testimony has changed. If Paula escapes, the witness will have a lot of explaining to do -- and may be facing a perjury charge.

English language version by Robert S. Carty, Jr., Coleman Charlton, Pete Fenlon, Will Niebling, William Niebling, Larry Roznai, Guido Teuber, & Alex Yeager

92 cards (84 band, seven hit parade, one blank) & rules; full-color, boxed, two to five players; $10.00

Have you ever wanted to be front man for a band? Charge onstage, axe in hand, and thrill the crowd with your hard-rocking or rhythmic strumming? Maybe you can't live that dream, but with the *Megastar* card game from Mayfair, you can pretend you're in charge of a radio station that selects those bands for their outlet.

The object of the game is to have the most popular radio station in the city by playing the best and most requested bands for points.

A set of bands is lined up randomly in the center of the play area; this is the hit parade. The group at the top of this totem pole is currently the best-rated act on the charts, with second, third, and so on beneath that. Each of the acts has a set of 12 band cards that are mixed together to form the draw deck. Some of these are removed before each game so no one knows just how popular any given band might become.

Several band cards are dealt to the right of the hit parade, forming the music market. The area on the left is the request area, and it stands empty to begin with. Players get a hand of cards, place one facedown in front of them, and play begins. On his turn, the player reveals his facedown band and places it in the request area next to its matching hit parade card. Then he gets a new card from the music market and another from the draw deck, then lays out a new facedown card. Yes, that means the hands grow by one each turn, and unfortunately that's the easiest bit of math in the game.

If any band gets three requests, it triggers a countdown. Everyone gets shifted depending on how popular they are, and groups are adjudicated from the top spot to the last (which, when one thinks about it, is the reverse of how they count the hits down on the radio, but . . .). The band in the number one spot can't go anywhere (they're topping the charts, after all), but the ones beneath it can. For every request next to the band, they go up the chart one space. So for example, if the second most popular act has no cards next to it, they also stay put, but it only takes one request for it to go up a spot, displacing the first band into the number two slot -- and the other, as-yet not altered bands may shove it down further still. Request cards become part of the music market once the bands move.

When everything settles down, play continues. By the time the last deck card is drawn, players hopefully have a hand (called a playlist) that reflects what's most popular on the charts. The band that ends in the top spot gives players five points for every matching card in their hands, the number two spot gives four points per card, and so on. With smaller groups of players not all bands are used, but if the game group is big enough to employ all seven bands, the sixth and

seventh acts score nothing. The highest total has his finger on the pulse of the industry and wins.

The cards are a bit thin, but they don't see a lot of "standard" activity during play. The real test is going to be whether the coating on the cards holds up. The band cards get shifted about a lot as the corresponding hit parade cards slide up and down the billboard, so the smoother the playing surface the more mileage the user gets out of them. The illustrations are terrific, though, and every effort has been made to make each band distinct from the others: their "CD cover," the instrument in the corner (similar to a suit), and even a symbol to go with that (kind of like, well, a second suit). That's important because, alas, a few of these colors are surprisingly close. The purple bleeds into the mauve that matches the brown . . . even if you're not colorblind, you may do a double-take.

The mechanics sound nifty on paper, but it's kind of hard to pin down the strategy. The more players, the more there is to remember and anticipate, but with fewer players the fewer bands you can use . . . you get the feeling some of the game's "teeth" have been lost, and it's already not terribly involving. It doesn't take much to dislodge something popular, and the top-rated band could become the lowest of the low on a single countdown. To get a band into the top spot requires the same cards a player earns his score from (and theoretically it's that balancing act that's supposed to drive much of the game), but even if you get them there it's almost impossible to second-guess what the other players are going to do. They can easily remove a favored band without even working to do so.

You can improve your card-counting, memorization, and math skills with *Megastar* -- you'd *better* work on those abilities -- but much of the process seems random and arcane, and that tends to bleed a lot of the fun out of something intended to be so casual. A strategy guide of some sort to help the probability-impaired players cope would be a welcome download, but for now the game hasn't earned the spotlight.

--Andy Vetromile

In Search Of Suppressed Boston: 23 Questions Groping Toward Bisociation Darkly

"For know you, that your gold and marble city of wonder is only the sum of what you have seen and loved in youth. It is the glory of Boston's hillside roofs and western windows aflame with sunset, of the flower-fragrant Common and the great dome on the hill and the tangle of gables and chimneys in the violet valley where the many-bridged Charles flows drowsily. . . . Seek out your marvellous city and drive thence the recreant Great Ones, sending them back gently to those scenes which are of their own youth, and which wait uneasy for their return."
-- Nyarlathotep, in *The Dream-Quest of Unknown Kadath,* by H.P. Lovecraft

Way back in the spring of 2004, the fine people at Pandemonium Books and Games in Cambridge, as befits a store named for the capital of Hell, asked me for a Suppressed Transmission on a Bostonian theme, while I was busily attending BookExpo America and writing about four other things. I agreed, but rather than bash out a pallid piece of hack work, I decided to present rather a work in progress. It was published in a lovely little pamphlet called *Underground Boston,* along with a terrifically creepy thing about spiders by our very own Jonathan Woodward. I've updated it for the Age of Wikipedia, and for one or two books that I've added to the old eliptony shelf since then. But as it did then, this piece still reflects, as closely as possible, the actual thought process (for want of a better term) that I go through while creating a Suppressed Transmission (or, say, an RPG campaign) about a given subject or setting. Hopefully, this look at the architectural drawings of the strange will be of some interest to those in the weirdness construction business themselves.

"It's my business to catch the overtones of the soul, and you won't find those in a parvenu set of artificial streets on made land. Back Bay isn't Boston -- it isn't anything yet, because it's had no time to pick up memories and attract local spirits. If there are any ghosts here, they're the tame ghosts of a salt marsh and a shallow cove; and I want human ghosts -- the ghosts of beings highly organized enough to have looked on hell and known the meaning of what they saw. The place for an artist to live is the North End . . . Don't you realize that places like that weren't merely made, but actually grew? Generation after generation lived and felt and died there, and in days when people weren't afraid to live and feel and die. . . . I can show you houses that have stood two centuries and a half and more; houses that have witnessed what would make a modern house crumble into powder."
-- Richard Upton Pickman, in "Pickman's Model," by H.P. Lovecraft

1. Okay, what do we know about Boston?

Puritans, which means witches, one devoutly hopes. Ben Franklin's birthplace. The Boston Tea Party, Paul Revere's Ride, and the Revolution. Transcendentalism. Poe's birthplace, and Nathaniel Hawthorne's stomping grounds. Lovecraft references, for header quotes, theme and feel. The Boston Strangler. The Big Dig, and those Pickmanian miles of tunnels and sewers underneath, going back four centuries. So far, we have a setting with a strong history, secret Masons (the Sons of Liberty were a Masonic lodge, essentially), and a hint of the numinous, plus dark places and a convenient harbor to drop bodies into. That's all good.

2. Are there ghosts in Boston?

According to Dennis William Hauck's *National Directory of Haunted Places,* there are two pleasant elderly women haunting the Boston Public Gardens (this doesn't seem very promising), a number of suicides and Satanic cultists in Charlesgate Hall in Back Bay (now we're cooking), a Lady in Black at Fort Warren on St. George's Island in the Harbor (aha!), and workers trying to get into Thayer Hall on the Harvard campus (a spectre is haunting Harvard . . .). This frankly doesn't seem enough to really build anything solid on, all told, but one or two of them might figure in somehow.

3. How about UFOs?

Rather than go through the indexes of fifty different books, or even Googling "Boston UFO," I reach out a long arm

for George Eberhart's indispensable *Geo-Bibliography of Anomalies.* It may be 26 years out of date, but it is the single best reference book for the budding Fortean GM, assuming she has the eighty bucks or whatever it costs. Each state or province in North America has its own chapter, subdivided by city or town, further subdivided by type of phenomenon. Not even looking at the suburbs, the entry for "Boston" is fourteen columns of six-point Courier type, from Alchemy to Witch trial (hex). I note, while paging through the entries looking for the UFO section, the alchemist George Starkey, and a "skyquake" in 1647, which just sounds cool. When we finally get past the seven-plus columns of Spirit Mediums (note to self -- look into that element if the game or column takes a strongly Transcendental turn), I find seven listed events, from 1641 (reported by John Winthrop in his diary) to 1972 (over Dorchester High School). There are two sightings in 1909, likely the [Airship], which returned around then.

4. What can Charles Fort tell us about Boston, if anything?

Not much. Of the four entries in the index to the *Books of Charles Fort,* one is the 1909 Airship sighting, one is a reference to the plane of Captain Mansell James, which disappeared over the Berkshires in 1913 while flying from Boston to New York, and one is a "phantom sniper" who injured three people in 1931. The fourth, however, is very interesting; in 1867 a fishing smack sailed out of Boston with a Portuguese sailor on board under the name "James Brown." Brown was discovered to be, well, a vampire, and President Andrew Johnson commuted his death sentence to life in prison. He was still alive -- in Federal custody -- in 1892. The possibilities are limited only by the lack of data, and the difficulty of Google searching on "James Brown" with any great efficacy. Have we stumbled on a Boston vampire cult? (In *Food For The Dead,* Michael Bell reports a -- similarly frustratingly undocumented -- "midnight cremation" in Boston in 1872 during the [New England vampire panic].) Federal vampire research in the 19th century? Robert Damon Schneck, in *The President's Vampire,* digs through the actual record to find not a vampire prisoner but a journalistic hoax. (Or was it all a cover-up? Hmmm.) Fort also has one index entry for "Boston, England," which reminds me that Boston takes its name umbilically from the Old World.

5. What about that "Boston, England," then?

It's in Lincolnshire. Wikipedia says its parish church has the highest steeple (nicknamed, with Midlands understatement, "the Stump") of any such church in England. Fort tells us about a fall of fish there in 1841, which seems pretty irrelevant. According to the Spencers' *Ghost Hunters' Guide to Britain,* there's a ghostly suicide that flings herself from "the Stump." St. Botolph provides the name for both Bostons, as said name is short for "St. Botolph's Stone."

6. So anything good about St. Botolph? He might be Boston's patron deity, after all.

Saxon saint (d. 680 A.D.) who founded a monastery called "Ox Island" (or "Ox Hill") in 654 A.D. His feast day is June 17th, and the *Catholic Encyclopedia* says he was exposed to the "molestations of evil spirits," which is nice and Lovecraftian. Interestingly, while Googling him, I notice that Ripper victim Catherine Eddowes was seen drunk near St. Botolph's Church, Aldgate, on the night of her murder. That church (also haunted, by a woman in the choir loft) was known as "Prostitute's Church," for what are probably obvious enough reasons.

7. Speaking of serial killers, what about the Boston Strangler?

Thirteen murders between 1962 and 1964; controversy remains over whether Albert DeSalvo was the killer in all (or any) of the cases. He may have also been the (evocatively named) "Green Man," a serial rapist in Connecticut. Rich, if highly charged and sensitive, material here for a horror game. For the conspiracy fan, DeSalvo served in an Army unit where (somewhat later) the CIA did MK-ULTRA mind control tests; one website calls him a "mind-controlled patsy."

8. So where were we?

The name of the city, and St. Botolph. The cow path streets, and the image of cows grazing on the Common in colonial times, call St. Botolph's "Ox Island" to mind, don't they? The first settler in Boston, William Blackstone, settled on the peninsula (which the Indians called *Shawmut,* which means, according to an unimpeachable source from 1822, "living fountains" -- God, I love Google) with a Brahma bull, which seems significant somehow. I think there's hidden Mithraism going on at the very least.

9. There's something about the city name you're holding back for a dramatic moment, isn't there?

I can conceal nothing from you. Boston (our Boston, not the English one) was first called "Trimountaine," after the three hills in the city, which triplicity should get everyone's ears pricked up. And to kick it up a notch, Google reveals to me that Oliver Wendell Holmes, Sr., let something slip in *The Professor at the Breakfast Table,* when he said that "The heart of the world beats under the three hills of Boston."

10. Jackpot.

You got it. If we had time, we'd research the life of Oliver Wendell Holmes, Sr. and look for any kind of mystical, Masonic, or other influence that we can pretend came from the scions of the Sacred Geometers who laid out Boston's eerie leys.

11. So what are the three hills?

Not so fast. Two of them (Mount Vernon and Pemberton Hill) were leveled and dropped into the Charles River swamps to make Back Bay, and Beacon Hill was shortened into "the flat of the hill" -- which means that Back Bay is actually on "tamed water" in the Tim Powers sense. Remember our Pickman quote? Boston's power structure has cleverly insulated itself from magical attack by living in an artificial landmass, or by castrating the earth energies beneath it in a nod to the Attis cultists of Cybele.

12. Your talk of earth energies intrigues me.

I'd postulate a "dragon current" (perhaps the "living fountains" themselves) under the Old Boston (downtown and the North End), probably flowing from the Common and the Old Elm, along the old Neck to the maypole in Merrymount (Quincy) that Cotton Mather so hated. Someone has connected Thomas Morton's Merrymount to the Dragon Society of Reptoid cultists; maybe the Adamses, America's first political dynasty, were Reptoids. Obviously, the Big Dig is tied in here somewhere, if not with the ghouls. (And speaking of St. Botolph's Church, Aldgate, and chthonic energies, 5,000 bodies were buried in a plague pit in that churchyard in 1665.) If I had to guess, I'd say the obelisk on Breed's Hill at the Bunker Hill memorial is another power node in the dragon current.

13. Dragon current -- any connection to the Green Dragon Tavern?

Glad you asked. That North End tavern was the central lodge (St. Andrew's Lodge) of American Freemasonry. Dr. Joseph Warren was the Grand Master of the lodge; Paul Revere was its Senior Grand Deacon. Sam Adams (a possible Reptoid?) and John Hancock (the richest man in America) were also members. According to Masonic legend, it was the site where the Sons of Liberty planned the Boston Tea Party. The Masons dressed as "Mohawks" for the Party; this may have some connection to the mysterious Hell-Fire manque known as the "Mohocks" in London two generations earlier, or to the deep connection in the mind of Puritan New England between the Indians and the Devil.

14. So the Masons control the dragon current?

I think rather that they tried to impose their own Enlightenment grid onto it; the streets they built are Roman-style, not meandering cow paths like in Old Boston. Interestingly, the proto-Mason Sir Christopher Wren, who laid out the sacred geometry of London after the Fire, redesigned all three of St. Botolph's churches in London.

15. So what are the Masonic nodes, then?

Things like Faneuil Hall, Old North Church, things like that. Tremont Street is a definite ley line; its name comes from "Trimountaine." Fenway Park would be a ley nexus, if this were an *Unknown Armies* game. The Massachusetts State House, which Holmes Sr. famously dubbed "the Hub of the Universe," is very tempting.

16. Give in to temptation.

For some odd reason, the State House has a Sacred Cod in it, which has definite Dagon overtones. Also, the copper for

its dome was rolled in Paul Revere's foundry, and Sam Adams laid the cornerstone. How's that for your Masonic Hub? The architect, Charles Bulfinch, like the Swedenborgian Daniel Burnham in Chicago, the Masonic Christopher Wren in London, and the mystical Baron Hausmann in Paris, dabbled in [urban planning](). He designed something with the eerie name of Tontine Crescent, with its overtones of ritual murder for prosperity's sake. Bulfinch also renovated Faneuil Hall -- and designed the new U.S. Capitol Building for President (wait for it) John Quincy Adams. This is all from the *Rough Guide to Boston,* by the way; travel guides are better game books than 90% of all game books.

17. Surely you must have something more than a tour guide on Charles Bulfinch.

Surprisingly, no. David Ovason's *Secret Architecture of Our Nation's Capital,* which one would expect to be the mother lode on such things, only confirms (if that's the word I want) that Bulfinch was a Mason, and that he was fond of the eagle symbol. Wikipedia just gives lots more details on Bulfinch's life and career, although it confirms that he studied Wren churches while in England on a Grand Tour in 1785. Interestingly, though, we find from Wikipedia that Charles Bulfinch was the father of Thomas Bulfinch, of *Bulfinch's Mythology* fame. That's indicative, if not proof positive, of some sort of mythic or arcane study in the family.

18. Looks like that's a dead end for now. How about the witches?

Eberhart gives us four cases; Alice Lake and Margaret Jones in 1648 (both executed), Anne Hibbins (executed in 1655), and a mysterious Mrs. Glover (the "Witch Glover") in 1688, this one investigated by that Fox Mulder of the black buckle-hat, Cotton Mather. Googling on "Boston witches Lake Jones Glover" turns up a website indexing the cases from John Putnam Demos' *Entertaining Satan,* which I suppose I could have looked up myself. But anyhow, it gives us some more witches: Jane Hawkins (indicted in 1638), Elizabeth Kendall (executed in Cambridge in 1647), Winifred and Mary Holman (both acquitted in Cambridge in 1659), and Mary Hale (acquitted in Boston in 1681).

19. That was informative, but not very productive. What else you got?

Well, looking around in the tour books for more on Bulfinch, I noticed that some of Boston's older (alchemical?) windows turned amethyst with age and light. The purple eyes of the old houses no doubt indicate Something; according to the *Moon Handbook Massachusetts,* Ralph Waldo Emerson had a "House of Odd Windows." You've got to watch these Transcendentalists every second, I tell you.

20. With my purple eyes, no doubt.

The Amitabha Buddha has purple eyes. So does Aqualad. And Elizabeth Taylor. Somewhat more game-applicably, a Google search turns up this Robert W. Chambers quote, from "The King in Yellow": "A pretty girl gave him a glance from a pair of violet eyes. He did not see her, but she, catching her own reflection in a window, wondered at the color burning in her cheeks." It still doesn't mean much, but it could make an interesting background element in something. And note the mention of windows again. Maybe ghouls have purple eyes, or members of the secret Reptoid-Bulfinch Lineage -- it would make an interesting element to track through a game via portraits and such.

21. You've mentioned alchemy twice now. Spill.

The first American scientist, George Starkey, may have published alchemical works under the pseudonyms "Cosmopolita" and "Philalethes." He attended Harvard College, and attained the Philosopher's Stone in 1645 while living in Boston. John Winthrop the Younger studied alchemy in Constantinople around the same time before going on to found Connecticut. The adept Charles Morton (any relation to Merrymount Morton?), a Puritan alchemist (!!) emigrated to Massachusetts in 1686. He trained Dorchester-born Samuel Danforth (Harvard, Class of 1715), who in 1773 wrote to Benjamin Franklin, offering him a piece of the Philosopher's Stone. All of Danforth's books (except, no doubt, for certain eldritch and dubious tomes) are in the Boston Athenaeum library.

22. Nathaniel Hawthorne ties into witchcraft, doesn't he?

Yes, but Salem witchcraft; his ancestor John Hathorne was one of the trial judges. He also put alchemy into a lot of his books, from *The Scarlet Letter* to *The Marble Faun;* his short story "The May-Pole of Merry Mount" indicates some

knowledge of the dragon currents. Googling around shows that Hawthorne spent only about two or three years in Boston all told, which seems a shame, because he's way less utilized than Poe or Lovecraft, and in his own way just as creepy. It's probably still worth more research, especially if you can tie a Tim Powers style nephilim-vampire into the "marble faun" somehow. That can bring us back to our putative Federal vampire cult coverup, too.

23. If only we had the space. End with something really weird.

The "one if by land, two if by sea" signal from the Old North Church was actually a two-slit experiment designed to collapse the probability wave of the Revolution and force the British imperial Order to "fuzz out" into Revolutionary American Chaos. Hail Eris, Hail Revere!

Pyramid Review

Recess!

Published by **Atlas Games**

Designed by Morgan Dontanville

Illustrated by Alexander Bradley

Four Six-Inch Square Full Color Game Boards, Full Color Circular Clock Board With Pointer, Two Full Color Two-Inch Square L-Shaped Entrance Sections, Two Full Color Two-Inch Square Safety Squares, 10 Wooden Boy Figures In Five Colors, 10 Wooden Girl Figures In Five Colors, Two Black Nun Pawns, 50 Yellow Wooden Coin Tokens, & eight by 10-Inch Black & White Four Page Rulebook; $24.95

Although Atlas Games have published boardgames before, the company is better known for its card games and RPGs. *Recess!* is different in that it is not really aimed at the gaming hobby. In subject matter, it is designed for a broader, younger, and more family-friendly audience. Its components match that audience, evoking the feel of a European boardgame.

The setting for *Recess!* is a parochial school and its subject matter is, as the title suggests, the period between morning and afternoon school. The 30 minutes in which each child has to get across the playground, beat the snot out of the other children for their lunch money, and maybe even steal a kiss from a sweetheart, all while trying to avoid the baleful gaze of the Nuns. If a child's stiff-arm tactics gets noticed, or another child tattles on him, then detention will surely follow.

Designed for three to five players, aged eight and upwards, *Recess!* consists of four square board sections, marked in squares and with various pieces of playground equipment -- swings, slides, climbing frames, and so on; and a brightly colored turn counter that depicts a strict nun ruler in hand. This is the Recess! clock. Both figures representing the boy and girl pupils are done in wood and full color, as are the coins. The figures are also flat so that they can be easily laid down.

Game set-up is simple. The four board sections are placed to form a large square and the two safety squares placed at opposite corners. The two L-shaped entrance sections, one pink and one blue, are placed around the same corners. One nun starts the game on each of the safety squares and each player receives four figures, two of each gender, plus 10 coins. These enter the playground through the appropriately colored entrance section, blue for the boys, pink for the girls. The Recess! clock is set so that the game lasts exactly 30 turns. Finally, the starting player is always the one who has been at school the longest.

Each turn begins with the player moving the clock on by a minute and turning over the sand timer. This prevents anyone suffering from "analysis paralysis" and helps speed the game along with each turn lasting just a single minute. He then moves three of the four figures he controls in the following sequence: "3, 2, 1, Nun." That is, he can move one pupil exactly three spaces, the next two spaces, and the last, just one. The Nun can be moved any number of spaces. Children can be moved orthogonally, but not diagonally, and can change direction. The Nun cannot change direction. All movement is blocked by playground furniture.

When a Nun lands on a child, she shoves him onto an adjacent square. If a child lands on another of a different color, a fight ensues and the attacker forces the defender to the ground. Simply, the defending figure is laid flat with the

attacker standing on it. The defending player must give a coin to the attacker. On subsequent turns, the attacker can either move away or keep pinning the victim down and extracting more coins. As long as the attacker remains, his player reduces his movement sequence from "3, 2, 1, Nun" to "2, 1, Nun." Each further successful attacker reduces his movement sequence until the only thing a player can do is move the Nun.

However, a fight cannot be started in direct line of sight of a nun. Obstacles do block line of sight, but other children do not. A fight is broken up when a third child lands on the same square, forcing the other two apart. It also ends when a nun moves into line of sight of the fight, forcing the fight to either break up on the attacker's next turn or sending the attacking pupil to detention on the Safety square and losing his movement for a turn.

A game lasts until the Recess! clock runs out. It can end earlier if a player can bring a boy pupil and a girl pupil together onto the same square where they can steal a kiss. This must be out of sight of the nuns and rewards the player with two coins each from the other players. This usually wins that player the game, the overall aim being the player with the most coins at game's end.

If **Recess!** has any problems, it is in the plain nature of the rules, which also come in French, German, and Spanish. True, they are easy to understand, but illustrated examples would have made it much easier to grasp by both adults and younger players.

The game also feels almost like the background to each bout of Atlas Games' well-regarded card game of playground fights, ***[Lunch Money.](#)*** Indeed, if you wanted to, you could resolve every playground assault with a round of the card game. While that would give the victim player a greater chance to defend himself, it would also make the game much, much longer, and make it less suited to a younger audience.

When we played **Recess!,** we found that because the children were clumped around the corner entrances, it was very easy to start and end fights. It was not so much a melee, more a distraction while we tried to use the three-square move to make a run for the side areas away from the entrances where we might complete that oh-so-desired boy-girl meeting. Moving the nuns also became a means to protect your pupils rather than using them to attack other players by shoving pupils and breaking up rival fights. Having to move both pupils and the nuns in sequence does constrain choices, but that is the point of the game, and it does force a player to consider his tactical choices. The addition of the sand timer nicely counters any penchant for over analysis, plus it forces the game to be played at a pace almost like the impulsiveness of the children it depicts.

With a quick playing time, **Recess!** makes for a good starter or filler game. It even offers a little opportunity for table talk as the children scrap. It certainly provides tactical choice and comes with a theme that will be familiar to many. As a family game it is more tactical, and more obviously tactical, than most, although it tries to hide this under a fairly soft theme. In this, **Recess!** can serve as a stepping stone to harder edged and more thoughtful hobby games.

--Matthew Pook

Fimhálsar

by Paul Drye

It's been more than four centuries since Scandinavians started colonizing the shores of North America. While Vinland has become an important nation, the process is far from complete. Midgard's great migration began while Europe was still behind the technology of Christopher Columbus, and without large sea-going vessels and gunpowder the continent's natives had a chance to regroup and slow the newcomers' advances. In 1412, the outer boundary of Vinland is only at the Mississippi to the west and the Great Lakes to the north. Near the corner of this angle is the new, up-and-coming city of Fimhálsar.

History

As outlined in *GURPS Alternate Earths 2,* Midgard's turning point was the Viking sack of Constantinople. One of its knock-on effects was more resources for the northern route to the New World, and Vinland was never abandoned. Most settlement has been on the coast, including the capital at Leifsholm, but the Gataström (St. Lawrence River) was an extremely useful water route into the interior. Towns sprung up along its length as far as the Island of Montreal where, like on Homeline, the Lachine Rapids blunted further exploration. The colonists could get smaller ships around them by portage, but generally didn't bother. The area beyond to the north and west became a sparsely populated marshland, Viking woods-runners mixing with the remaining native population to form a society of "Kvikindi," half-breeds that acted as the interface between their nominal Vinlander overlords and the Indian country beyond.

That country was rich in resources, including the traditional beaver pelts and copper. On the large island by the rapids, the same economics that developed Montreal on Homeline sparked Fimhálsar on Midgard. At first nothing more than a larger version of the other towns on the river, as western trade expanded Fimhálsar became by far the largest city in the northern interior. It cleared 11,000 people in the last decade.

All this growth comes at a time when the region is under stress. The Medieval Warm Period ended about a century ago, and the drop of a couple degrees Fahrenheit has been displacing people whose lives depended on plants and animals accustomed to warmer temperatures. Elders shake their heads at the snowfalls in Fimhálsar these days -- it used to be so much nicer when they were children. The younger generation think that's just typical oldster griping, but Homeliners know they're right.

As the town's rapid growth bumped up against the growing dislocations in the area, the local lords decided to invest in security. Forty years ago, the city took its largest leap forward when its permanent fortifications went up. For centuries Fimhálsar had relied on the river that surrounded it and a wooden palisade; now, the stone castle and walls of Hnífholt established that the area around the city had been permanently annexed by the Vinlanders.

Hnífholt

The enclosure is on Mount Royal (or, as the locals call it, Thokufell), running along the flat-topped ridge of the mountain. Altogether the walls circle an area about a thousand feet long, and anywhere from 50 to 100 feet wide. The strongpoint is a keep in the western end, while the majority is a single layer of dressed-stone wall, 15 feet tall and backed by an earth-and-timber palisade 10 feet deep. There is one route up to the top, and the local authorities have cut a ravine into the approach just before one reaches the walls. A wooden bridge, quite destructible, is the only way across and into the fort.

A couple of hundred people live within the walls, more when the spring and fall fur market is on; as well as the traders, there's extra men in the garrison to handle the flow of money and alcohol. The whole interior is filled with buildings, a crowded town supported by the surrounding farms. It's a typically medieval town to the dirt and smell. The most advanced attempt at sanitation is the main street running down the center of the ridge: it's paved with logs so it gets above the mud.

The town inside the walls is geared toward serving the occupants of the castle, which is to say the nobles and the garrison. Everyone who isn't doing that focuses on the closest thing Vinland has to finance, the long-term development of the interior trade. Traders oriented towards the Atlantic live down by the harbor instead.

While the fortified town is useful, the castle was the original point of Hnífholt, but the strongpoint may well be causing as much trouble as it solves. Many of the locals don't like what it represents, and in recent years they've been acting on that feeling.

Hafnar

"The Harbor," as its name literally translates, is the other urban part of Fimhálsar. Due south of Hnífholt on the shore of the island, it grew up on the placid basin at the foot of the rapids and is home to over half the town's population.

Hafnar is the commercial center of town, where almost all the shops and businesses may be found, as well as the warehouses containing the goods going out from and coming in to the region. There are also several establishments devoted to the needs of the guards who watch the most valuable items, beaver skins for export and tobacco and alcohol from the coast.

Most any TL3 and some TL4 items are available in Hafnar, though unusual items take a month or two to import after someone expresses a desire to buy.

The Steadings

The remaining population of the island, as well as quite a few people on the north and south shore of the river, are farmsteaders. Steadings are dominated by two longhouses, one for the extended family and one for livestock, and a number of outbuildings. The fields are large, as the island's soil is mostly clay -- the lands along the Gataström have long been outstripped by the ones along the Mississippi or southeast in the equivalent of the Homeline Carolinas. Most farms specialize in wheat with plenty of barley and oats. Lucky farmers with the right soil and exposure to the sun will grow some hops or tobacco, and vault in wealth because they find ready trading with their neighbors.

The word "stead" has a particular meaning in the Vinlander tongue, implying that the land is not held free-and-clear. In theory, all the land belongs to the king and the nobility, but for all of Vinland's history this has been nominal. Labor is at a premium in this vast continent, and the deals struck to attract settlers have left government controls very loose. Apart from several obligations and tithes that run about one percent of a farm's output, Vinlanders ignore their overlords.

This is changing around Hnífholt. The newer of the two families running Fimhálsar are using the old legal rules to tighten their control over the region. Customary inheritances and the like are sometimes denied when the nobles think they can get away with it. It's becoming clear to some that they are trying to get people used to the idea so it can be

used more often in future. Fimhálsar itself has been safe from these pressures so far, but the people in the outlands have had enough.

The Waenda Rebellion

The Norse have been in contact with the Waenda (in Homeline terms, the Hurons) since the 11th century, but it's only in the last few generations that the natives have been transformed from an associated nation to subjects. They and the half-Scandinavian, half-Huron Kvikindi are organized in a loose confederation of tribes, faring deep into the continent to trade Scandinavian goods to more distant natives and bringing back their riches for more goods. It's been a pretty good position, but the powers back in Leifsholm have come to the conclusion that it's no longer necessary to keep the Waenda in the middle now that Vinlander control is cemented.

In the past couple of decades, there have been numerous rulings from Hnífholt's rulers that have gone against the natives. Old treaties have been disregarded, and dishonorable traders from the south -- long established on the routes to Kahaukja and Theneyland -- have pushed north. Meanwhile, several properties and sinecures have been disposed in favor of Hnífholt's powerful -- and using ways that are legal-but-not-customary.

The Waenda responded by breaking into rebellion (or, from their standpoint, defending their independence) three years ago. The land to the north of the Five Lakes and the river as far as Fimhálsar is in their hands, though the Vinlanders can and do send expeditions to assert local control for a while. Both sides think Fimhálsar is the key to victory: as long as Vinlanders hold it, they can't be defeated permanently. The rebels have the advantage of space to maneuver and distance from the centers of power, but they're hampered by a lack of ruthlessness. The regular people living in Fimhálsar are more like hostages to the Hnífholters and the court back in Leifsholm than enemies of the Waenda, given the long-established links between the city and the lands to its west.

The Lords

Opposing the Waenda are two intermarried families, the Gellir and the Austmathr. The Austmathr are the new power in the city, founded by Utirik Sveinsson. Exiled from the other end of the Viking world for murky reasons, he's soared from being a penniless arrival to the leadership of a new clan in the last 40 years. Still alive, though over 70 now, his sons and daughters are an utterly ruthless faction in the northwest's politics. They are the ones pushing their old legal rights, and the Waenda, most strenuously.

The Gellir are the old money of Fimhálsar. Descended from one of the first families to settle in the region, and specifically descended from a distaff branch that found the mines 15 miles to the east of the town, which produce cheap gems like garnet and zircons, pyrite for flint strikers, and lead. While not as active as the Austmathr, they've followed their lead in recent events, greedy for more to control.

As well as being rich, leading numerous men, and holding much property, the lords of Fimhálsar have the advantage of being law-speakers. They have the time and resources to learn Vinland's laws backwards and forwards, which gives them an edge in any proceedings. In theory anyone can resort to violence and counter-violence in a dispute, but in time-honored fashion the Vinlanders usually submit to the will of the local *theng*. Every year, it will meet in Fimhálsar to settle lawsuits in the region. Profoundly conservative, the theng usually rules in the favor of whoever can muster the right precedents. This is invariably a member of either the Austmathr or the Gellir. Only cases where they end up against each other are ever in much doubt.

Bondsmen

The changing climate and Inuit expansion have severely affected the Greenland colony, with more than half its population emigrating to Iceland or Vinland. There are a couple of thousand ex-Greenlanders strung along the river, many in Fimhálsar. Almost all are in dire economic straits, and make up an underclass of poor and indentured servants. They're viewed with suspicion by most Vinlanders, and denied the vote and equal access to justice. In return,

many of them have been acting as a fifth column for the Waenda, which perpetuates the cycle of mutual antagonism with the Vinlanders.

Everyday People

Like any pre-industrial society, most people are poor or just getting by. Vinland's bounty has led to the development of a richer nobility (which Iceland never really developed on Homeline, and Scandinavia did only belatedly), but the difference is still smaller than is typical throughout the world. Looking at a noble or peasant, the group to which he belongs is not immediately obvious.

That said, farmers and typical merchants dress and act a particular way. While the shores of the Gataström are nicer on average than the Scandinavian core lands, they're still quite cool and wet, and northern Vinlanders have stuck to the typically Scandinavian snug, woolen and linen clothing. Men wear pants, while women wear dresses; women without servants wear an apron over that. Everyone wears a cloak, and during the winter the cloak has a hood. Bright dyes are *de rigeur* for all but the very poorest, though the Hvitakrister Christians -- a large fraction of the lower class and women -- often mute this down as a sign of piety.

Richer people are distinguishable by dress only through their ornaments. Everyone wears numerous objects threaded through loops in the clothes -- pockets and pouches not being part of Vinlander fashion. Average people wear practical objects like pipes and cutlery, with a few pieces of jewelry. The rich avoid the practical as a sign that they have servants and followers who will carry them instead.

Almost everyone, even people living in town, farm and raise livestock. In the urban areas of Fimhálsar this is vegetables along with rabbits or chickens, but on the farms it's cows, sheep, and wheat, the ruling triumvirate of Vinlander cuisine. Vinlanders have also acquired a taste for wild rice, introduced to them by the natives. Corn (maize) is considered food for animals.

Characters

Beinir Folkmarsson: There are many timelines that are echoes, and people on those lines who bear the same names and lives as historical figures on Homeline. Beinir Folkmarsson is an example of a less-common phenomenon, the personal echo: a person with many points of correspondence to a Homeline figure, but on a divergent timeline with no obvious reason for the connection.

Beinir is one of the most well-known personal echoes because his doppelganger is famous himself, Benjamin Franklin. He's been intensively studied, though there's currently a moratorium on that activity since Beinir is a very sharp fellow, and started to wonder about all the not-quite-right visitors he received from afar.

Like his Homeline equivalent, Folkmarsson is a writer, printer, and natural philosopher. He's one of the best known print-skalds in Vinland, or he would be if writing satire weren't life-threatening in this world: his pseudonymous "Scold of the North" is the one with the fame. The details of his life are similar to Franklin's too: the youngest son of an Icelandic immigrant, apprenticed in Leifsholm before jumping his indenture to come to Fimhálsar. There he set up shop as a printer and set up house with a widow whose husband had disappeared while on a raid to the south..

Now 37, he is a popular man in the city, particularly with women. When not working at his print shop or experiments, he can be found at one of several local halls, drinking and engaging in wide-ranging conversations.

Beinir is 5'10" tall, and weighs 190 pounds. His hair is light brown, long and loose, though he is starting to go bald. His eyes are gray.

Jessu Thorsson: The key figure in the Waenda Rebellion, Thorsson is the greatly feared "King of the Kvikindi" to his enemies. Before him, the widely distributed Waenda and Kvikindi were never able to ally against Vinland. His charisma and message have overcome the barriers of distance and thin settlement.

His unusual name is a clue to how he does it. He preaches a new mix of Thorism and Christianity, with himself as its prophet. His Vinlander father disappeared before he was born, and Jessu claims he was sired by Thor himself. After his Waenda mother died in his teens, he assumed the personal name Jessu, which is Vinlander for "Jesus." He actively teaches, and sincerely believes, that he is the Second Coming.

While his new religion hasn't swept his people entirely, it's become the sinews of the rebellion. With his followers fired up against Babylon (which is pretty much any power that gets in Thorsson's way), they can pull the rest of the Waenda and Kvikindi along on hopes of renewed freedom.

Jessu is a half-Scandinavian, half-Native American man, 6'3" in height and weighing 225lbs. He has long, coarse, brown hair. In imitation of the Byzantine tradition of Christ's appearance, he keeps meticulously shaven.

Runa Utiriksdottir: As her father's mental capacities have faded the last few years, "The Gray Lady" has become the de facto leader of the Austmathr clan, and so the most important political figure in Fimhálsar.

Runa is greatly feared. She is extremely harsh in her speech and behavior, and no-one dares call her on it. She is unmarried, and is rumored to be a virgin, but the last person to connect her personal life to her personality ended up dead in the Gataström missing two favorite organs. She was exiled by the theng, then several of its leading figures were murdered while she wasn't even in the region. After that she returned to Fimhálsar and is rarely challenged.

She is a Scandinavian female, 5'5" and 140lbs. She has long black hair, which she keeps covered with a head scarf. This is the Vinlander signal that a woman in married, so why she does this is unknown, or at least not widely distributed.

Taretandeh: A shepherd of what's left of the native Sturgeon tribe around Lake Champlain (*Fingravatn* in Vinlander), Taretandeh was once a wide-ranging traveler, who can tell people much about the lands around Fimhálsar. Unfortunately, he is a hermit of the first order, refusing to interact with others and staying high in the hills with his small flock. Local legend is that he retired home from his travels quite well-off, only to have his shoreline lodge destroyed and his family killed by some aquatic monster. Certainly he exhibits an unhealthy fear of open water.

He is a Native American man, 5'7" tall and 110lbs. His hair is black streaked with gray, very long and stringy. He presents as a nervous wreck, avoiding conversation and eye contact while muttering to himself and shying away from nothing,

Infinity and Fimhálsar

Infinity's agents consider Midgard a safe timeline -- which is not to say there isn't danger if one goes looking. The agents may leave it alone, but the town is of interest to White Star Trading, which most wants beaver pelts (beavers being protected animals on Homeline) and the local wool. Though superseded by water-repellent man-made cloth at home, Vinlander wool is used for agent costumes on low-tech worlds, and is a major trade item to pre-industrial timelines as well: descended from Icelandic sheep that grow fibers heavy in lanolin, Vinlander wool is prized by seamen and inhabitants of rainy climates alike.

Adventure Seeds

Git Along Little Woolies: The people in the low mountains both north and south of Fimhálsar engage in transhumance -- moving livestock from slopes to valleys on the changing of the seasons. Those moved are primarily sheep, and their meat and wool are most of the wealth of these peasants. Either because they've come to know the hill people (perhaps while investigating the Gellir mines), or to frustrate the lords putting pressure on them, the adventurers get to help move several dozen sheep from high to low more than a dozen miles.

It's Not What You Know, It's Who: The travelers come across an out-of-the-way location with the air of death about it in the course of some other task. It could be a grave and makeshift memorial, or a small, valueless shipwreck

with a skeleton within, among other possibilities. Once the adventure is over and they've returned to Fimhálsar, this encounter becomes known through casual gossip.

Not long after, violence comes to visit them. It gradually becomes clear that Runa Utiriksdottir is extremely angry that the outlanders have come across what they have.

No You Can't Have A Gun . . . Not Yours: There has been a recent upswing in Waenda successes against Fimhálsar's defenders, and it seems that somehow they are getting their hands on Outtime copies of powerful (if TL-appropriate) weapons. White Star Trading puts pressure on Infinity's law enforcement to look into it, and guess who draws the short straw?

Wise Man Bearing Gifts: Beinir Folkmarsson is notably well-spoken and flattering when he wants to be. The lords of Fimhálsar have charged him with a peacemaking trip to Jessu Thorsson's encampment upstream from Niagara Falls. It's a long and arduous journey, and it only gets more dangerous once he reaches the mercurial chieftain. Beinir rightly fears that the Austmathr want to sabotage his mission, and have only agreed to it for appearance's sake. Outlander companions may be the best option when he can't trust anyone in Fimhálsar to not back his noble foes.

Using Fimhálsar in Other Settings

Viking Montreal depends on its particular time and place, making it difficult to integrate into other kinds of campaigns. However, it does point the way toward a wrinkle that most fantasy settings don't have. There was quite a bit of exploration and colonization in the European Middle Ages, it's just that it gets forgotten in the wake of Christopher Columbus and followers.

The Vikings are popularly categorized as raiders, and that's a fair charge -- Western Europe teetered on the brink of collapse when they hit the north while the Magyars and Arabs triple-teamed it to the south and east. It's more accurate to say, though, that *viking* was four activities as well as raiding, it was trading, conquering, and colonizing.

Consider: Early medieval Scandinavians discovered Greenland, Newfoundland, and Jan Mayen, They may have discovered Svalbard, and were the first major colonists of Iceland. Russia from the Baltic to the Ukraine had Northman nobility imposed on it. The Channel coast of France was ruled by them and their ancestors until the 13th century, and they displaced the populations of the Faeroes, Orkney, and Shetland. They brought the coasts of the Irish Sea to heel; Sweyn Forkbeard later took all of England. Recognizable offshoots then conquered southern Italy, took England a second time, and helped wrest the Levantine coast from the Seljuks and Fatimids. Very few fantasy Northmen reflect those aspects of what were the most successful conquerors and colonizers in medieval European history.

So Fimhálsar is an avenue for exploring the expansionist parts of fantasy cultures without losing the setting's medieval feel. Many games have something like the Vikings in them somewhere; you are perfectly justified to move some of them out of their frozen homes into the bulk of the fantasy world, either as an alien set of rulers in a distant land, or as trader/colonizers in any region that hasn't a centralized government to keep them out.

Dork Tower!

Dork Tower!

More Game, More Toys, More Knowledge (Part I)

This week we're making column goulash, letting it simmer for a couple of weeks, and seeing what conclusion we have in a future column. (I already have the Soup Starter of this forthcoming column in the crockpot, ready and waiting.)

Okay; what elements are we looking at this week?

Element One:

In a lot of ways, I have usually spent time looking for ways to make my gaming more transparent from its gamerly roots. In many circumstances, I enjoy minimal dice rolling, freeform acting, in-character props and challenges, long walks on the beach, pina coladas, getting caught in the rain . . . wait, I digress.

Anyway, I enjoy that kind of stuff. However, in a lot of ways the trend for the past few years has been for many games to become *less* transparent, and more obviously a game. As one example, the ***d20 System*** strikes me at its core as a computer game in pencil-and-paper form (complete with a deep-bass voice bellowing, "Power **UP!**" whenever a new level is acquired). As another clear example, I note the global appeal of MMORPGs such as ***World of Warcraft,*** which attracts many of those who might otherwise be tabletop gamers, even though (or perhaps because) it emphasizes the game elements over the roleplaying aspects.

Element Two:

A certain part of me cringes as a GM whenever the players don't end up using their one-use goodies, especially if they're the sort of thing that are going to replenish or the PCs are likely to encounter again. Whether it's Luck Points, potions, favors, spells, and so on, it's hard to make the players feel like their characters are truly against the wall when they still have dozens of useful options or second chances (even if they're willing to let their characters die because they didn't understand the gravity of the threat until it was too late to use those goodies). I have a theory as to why this is, but I'll let is stew a bit longer before revealing it.

Element Three:

One thing that's always struck me about the efforts to render gaming as more cinematic or literary is the duality of what players are attempting to recreate. Oftentimes, such gamers want to experience both the experience of the characters and the experience of reading a book or watching a movie. Of course, the difference between the two is the difference between reading about the Dutch boy and putting your fingers in random . . . er, nevermind.

Probably the biggest single difference between those two realms is the audience's knowledge about when something will end versus the characters' lack of that same information. When consuming an entertainment option, we usually have a good idea about when it will end; through many years of observation we know when the midpoint of a 60-minute television show should be, when the climax of a two-hour movie is, and about how many pages the denouement will take up in a novel. But gamers seldom have this information . . . which is accurate from the point of view of the characters, but not to emulate those experiencing an entertainment medium.

There are some attempts to introduce elements from the audience side into the gaming world. Probably the biggest common example is the idea of soundtracks. (Presumably most people fighting for their lives in a tyrannical sci-fi universe do *not* hear the crashing sounds of a John Williams score as something exciting happens.)

Another common example is the Act/Scene structure of some games; again, most people don't know when they've changed scenes, and the only time someone is likely to use "Act II" in their real life is when it's followed by someone else saying, "Gesundheit!" (Ba-dum-bum . . .)

Okay; all the ingredients are in place. Can we mix all together and crank it up a notch?

One thing I experimented with in my *Star Trek* campaign was making sure the players were reminded constantly that they were "in" a *Star Trek* television series. To that end, I tried to structure adventures around the notion that they were episodes; each adventure began with pre-written scripts that led into the "first commercial break," followed by the episode's title (in the *Star Trek: The Next Generation* font, of course), and all the Acts were structured to end on some kind of cliffhanger, so that each "commercial break" would end with the "ominous horns" of the soundtrack. So successful were these techniques that I threw the players for a loop by making the last two "episodes" a two-parter, so that when the final cliffhanger occurred toward the end of the gaming session and I held up the pre-printed "To Be Continued . . ." sign, they almost fell out of their chairs.

Which seems as good a note as any to end this column.

--Steven Marsh

Breaking News

Political Fault Lines in *Transhuman Space*

by William H. Stoddard

The ***Transhuman Space*** setting includes a carefully worked out set of geopolitical relationships, designed around the concept of a balance of power. Half a dozen great powers share the leading role on the stage of the world: three single states, China, India, and the United States; and three multilateral alliances, the European Union, the Pacific Rim Alliance, and the Transpacific Socialist Alliance. Several lesser alliances have regional leadership roles, and a few unaligned states are also regional powers.

But even though the system looks stable, it has the potential for change. Hidden forces move nations to seek new alliances, or resist them. Seeing through the surface of the political landscape to the geopolitical stresses that create it reveals possibilities of drama -- and possible dramatic roles for adventurers who get caught up by the changes, or help create them, as diplomats, spies, or mercenaries.

The Existing Alliances

The world of 2100 A.D. has 10 multinational alliances. Based on the power ratings of their member states, these fall into three groups:

Blocs. Several alliances are actually based on a single state that is powerful enough to operate on its own, plus a few far weaker states that have special ties to it. China, India, and the United States all head such blocs. Russia, though much weaker that any of them, heads a fourth regional block in Eastern Europe and central Asia. In each of these blocs, the core state has virtually all the economic and military power. The smaller states are strategic assets; for example, the Ecuadorian spaceport handles most of space traffic of the United States.

Within the Pacific Rim Alliance, Australia is effectively the head of a similar bloc. East Timor and Maluku Selantan, both split off from Indonesia, are Australian client states in much the same way that Kachin and the Shan Republic, split off from Burma, are Chinese client states. The western half of New Guinea was also formerly part of Indonesia, and New Guinea as a whole is closely allied with Australia.

Dominated Alliances. Several alliances consist of one powerful state, together with a number of smaller states that together are roughly equally powerful. The Dominican Republic plays this role in the Caribbean Union, Saudi Arabia in the Islamic Caliphate, and South Africa in the South African Coalition. The leading state can't have things all its own way; it has to sell things to its partners through negotiation, and be prepared to give way on some issues. On the other hand, it gains a significantly greater influence on world politics, roughly doubling its effective power. It may not be accidental that the leaders of these three alliances are relatively small powers that can benefit from having clients.

Multilateral Alliances. On the other hand, the most powerful alliances are those with several strong member states. The European Union's core states are France and Germany; the Pacific Rim Alliance's are Japan and Korea; the Transpacific Socialist Alliance's is Indonesia. In each case, several major second-tier powers add population, wealth, or military strength to the alliance. The degree of internal integration varies, from the tight cultural bonds of Europe to the purely strategic cooperation of the Pacific Rim states, but each of these alliances has to work out its unified policies through negotiation.

The Unaligned States

These 10 alliances leave a substantial part of the world's nations on their own. Unaligned nations have three basic

options. They can continue to go it alone, they can negotiate to join existing alliances, or they can work to found new alliances.

The creation of an effective alliance has four main requirements. First, the potential allies have to be able to trade and communicate. Usually this means that they need to be close together geographically, but seagoing nations can form bonds across the oceans. The American Bloc, the Pacific Rim Alliance, and the Transpacific Socialist Alliance all depend on such bonds, and several of the European Union's member states are in North America and linked to Europe by the sea lanes. Second, they need to have a common concern, whether economic and political self-interest (as in the Pacific Rim Alliance), ideology (as in the Transpacific Socialist Alliance), or shared culture (as in the European Union -- though it also has economic interests and a shared ideology of preservationism). Third, they need to have effective leadership, and one or more states that can exercise it. Finally, they need a reason for other states to accept the leaders, rather than splitting off. This last issue works against alliances of two equal states; it's too easy for either state to deal with conflicts by breaking the alliance. Multilateral alliances mean that breakaway states lose many useful ties, not just one, and thus are more stable.

Several of the world's unaligned regions have states that are seeking to join existing alliances, or start new ones.

Europe. Europe is the least fertile region for new alliances. Only three European states of any significance remain outside of existing alliances: Koenigsberg, Switzerland, and Ukraine.

Switzerland already has a close alliance with the European Union; for example, it's a headquarters site for the Genetic Regulatory Agency. A growing minority of younger Swiss regard their country's refusal of formal alliances as archaic, but for the present the majority prefer it that way. Two members of the European Parliament are working out a proposal to offer Switzerland internal autonomy (including the all-important banking privacy) like that of Taiwan in China; this might tempt the Swiss, but whether the European administration would accept it is a different question.

Koenigsberg, as a free city, is doing very well as a middleman between Europe and Russia. Ukraine is less well off, but allying with either of its bigger neighbors would weaken its ability to bargain with both of them. Unless Russia joins the European Union, this is unlikely to change.

Asia. Pakistan is Asia's strongest unaligned nation, and could certainly benefit from alliances, given its long-standing conflict with India. Unfortunately, there are no very good prospects. Some Pakistanis favor joining the Islamic Caliphate, with which they share a common faith. Pakistan's history of sponsoring terrorism inside the Caliphate is an obstacle to this; so is Saudi Arabia's caution about admitting a new member that rivals its wealth and power. Within the Pakistani elite, especially its intelligence forces, there is support for a coalition with Iran, which has a similarly authoritarian government that subordinates Muslim beliefs to economic modernization; this might be enough to overcome the religious split between Shi'a Iran and Sunni Pakistan. However, the prospective junior partners, including Afghanistan, Turkmenistan, and Uzbekistan, really aren't enough of an asset to stabilize a lasting union. If the two countries do join together it may be only temporary.

Israel, Mongolia, and Singapore are all isolated and likely to remain so. Singapore is doing very well as a middleman between the Transpacific Socialist Alliance and the rest of the world.

Africa. Nigeria would like to become the leader of a new African alliance, centered in West Africa, as a rival to the South African Coalition, whose expansion most Nigerian leaders oppose. The addition of Gabon to the Coalition is an especially sore point. But Nigeria is in a poor position to assume leadership. Its own internal divisions between the Muslim and preservationist north and the Christian and transhumanist south place it constantly on the edge of civil war. Its Muslim factions would really prefer to join some larger Islamic alliance, which would plunge the country into chaos. And Nigeria's strong-arm approach to regional diplomacy has made it few friends.

In fact, two of its stronger neighbors, Cote d'Ivoire and Ghana, are currently working toward a new regional alliance, the West African Union. Participants in the talks include Burkina Faso, Casamance, Gambia, Guinea, Senegal, Sierra Leone, and Togo; a union of these countries would have wealth and armed forces comparable to Nigeria's. Nigeria is aware of the negotiations, though they have not been formally announced, and is bargaining with Mali and Niger over forming a regional union to manage the Niger River. On the other hand, Mali has ties with Cote d'Ivoire and Ghana

and could well join the West African Union, as could Nigeria's western neighbor Benin.

Further to the north, both Algeria and Egypt are active opponents of the Islamic Caliphate, and would like to create a regional alliance in the Maghreb to rival it. Inconveniently, the two states between them, Libya and Tunisia, both have ties to the European Union, and Libya is also favorable to the Caliphate, as is the western Maghreb nation of Morocco. Bringing in Libya, and perhaps Sahel nations such as Chad, Mali, and Mauretania, might produce a viable coalition, but is rather a long shot. Radical Nigerian Muslims have sought allies in Egypt and Algeria, but neither country wants to get drawn into a civil war.

On the Horn of Africa, both Eritrea and Somalia are sympathetic to the Islamic Caliphate and could easily join it.

Both in Nigeria and in its West African rivals, nanosocialist agitators from Madagascar are active. But geopolitically, the rest of the Alliance would have little support to offer any tropical African nation.

The Americas. In many ways, Central and South America ought to be the perfect site for a new regional alliance. They have two large states, Brazil and Mexico, both of which are on the lower rim of Earth's major powers. Working together, they ought to be able to form a hemispheric coalition, and editorialists regularly ask why they can't see the advantages of doing so.

The big obstacle is that too much of the area is already tied to other alliances. Mexico is cut off from the unaligned south by the Transpacific Socialist Alliance nations in Central America, and its major internal ideological movement is sympathetic to nanosocialism. Brazil has the power to dominate a South American Coalition, but it has enough differences from its neighbors to make them cautious about such a relationship, including its rain forest ecology, plantation-based economic traditions, and even its use of Portuguese rather than Spanish. Brazil's image with its neighbors hasn't always been good, either; an "ugly Brazilian" stereotype has emerged. Brazil might be able to create a Brazilian Bloc if it found one or two suitable junior partners.

Several South American nations have prospects of joining existing alliances. Chile has a prosperous Fifth Wave economy and an adversarial relationship with Bolivia and Peru, both members of the Transpacific Socialist Alliance. Chile's government has applied for membership in the Pacific Rim Alliance, which is expected to accept soon.

Argentina and Uruguay, in the meantime, are negotiating with the European Union. Both countries have almost entirely European populations and maintain European cultural traditions. Turkey is cautious about supporting their membership, partly because Argentina is just a little stronger than it is and would dilute its influence on Europe, and the United Kingdom is equally cautious, wanting to make sure that the Falkland Islands remain secure. But in the long run these questions can almost certainly be settled, taking the European Union a step closer toward becoming a world government.

If Mexico is unable to control its radical nanosocialist rebels, it could go over to the Transpacific Socialist Alliance. This would severely destabilize its relationship with the United States. The current government is very concerned to avoid this, as its American ties are one of Mexico's greatest assets.

The Pacific. Only one important state remains unaligned in the Pacific Ocean. New Zealand has close ties with the Pacific Rim Alliance, but has never formally joined it. Ideologically New Zealand is strongly preservationist, which does not fit well with the beliefs of most Pacific Rim states. A new movement has recently emerged in New Zealand politics: "correspondent societies" seeking closer bonds with English-speaking communities in the United Kingdom, Newfoundland, and the Maritimes, looking toward eventually joining the European Union.

Naturally, this looks very chancy to many Europeans; even in 2100, the logistics of defending a member state on the far side of the world could be a problem. However, most of New Zealand's neighbors are Pacific Rim Alliance members who are unlikely to seek conflict with Europe. And Europe already has commitments in French Polynesia, which aren't about to go away. It's quite possible that in a decade or so, New Zealand could formally ask to join -- and be accepted.

Broken and Shifting Alliances

Most of the existing alliances are fairly stable. In particular, neither the dominated nor the multilateral alliances have seriously unhappy members. Only two of the ten alliances offer some prospect of breaking up.

The Pacific Rim Alliance has a number of small island microstates as minor members, of which the most powerful is Fiji. A movement has begun to emerge on these islands that calls for a common governmental framework suited to their special needs, as opposed to their simply being unimportant members of an alliance of larger states. Many advocates call for bringing other islands that are currently part of the American Bloc (such as Micronesia) or the European Union (such as French Polynesia) into the same framework. The idea has begun to gain support on those islands as well. The movement looks toward the formation of a Pacific Islands Union modeled on the Caribbean Union, a similar alliance of small states.

If this alliance should come into being, it would probably do so peacefully. None of the major powers that have interests in Polynesia or Micronesia has a sufficiently urgent need for this territory to justify military intervention. This might change, though, if the proposed union came under the influence of the Transpacific Socialist Alliance, or if the American states of Guam and Hawaii moved toward joining it.

The Russian Bloc includes several central Asian states where Russian and Muslim populations are in conflict. If Muslim political movements gained power, they might want to break their ties to Russia. This separation would almost surely not be peaceful; see Voices Prophesying War, below.

The biggest potential shift in alliances would be India's going nanosocialist, and seeking to join the Transpacific Socialist Alliance. Openly, leaders of the TSA advocate this change. Privately, some of them will admit to reservations. India, by itself, has more people, more wealth, and more military strength than the entire existing alliance. Inevitably, it would become the leading nanosocialist power, diminishing the leadership roles of Indonesia and its smaller allies.

Within India itself, there are similar conflicts. Indian political traditions have long leaned toward socialism. However, one of India's most productive industries, and a major source of economic growth, is the entertainment media of Bollywood, which depend on strongly enforced intellectual property law for their profits. And that same industry employs some of the world's most skilled memetic design engineers. It's not an accident that Bollywood cranks out an endless series of adventure stories about heroic operatives thwarting TSA plots. A nanosocialist India is another of those geopolitical ideas that look as if they ought to happen, but that on closer examination seem increasingly hard to bring off.

Voices Prophesying War

The ultimate demonstration of international instability, and the ultimate source of new international alliances, is war. War could break out on a variety of scales in the current geopolitical system. Here are some possibilities for such outbreaks:

The Central Asian War. Iran and Pakistan agree on an alliance, and turn their efforts to fomenting rebellion in the Russian Bloc states with Muslim populations. Kazakhstan, Kyrgyzstan, and Tajikistan experience Muslim seizures of power and apply for membership in the new alliance. Russia sends in military aid -- but both Iran and Pakistan have stronger armies than Russia has. Troops from the European Union come in to protect Russian soil, but not to preserve Russia's rule of its client states.

The Andean War. With the growing number of South American states incorporated into larger alliances -- Argentina and Uruguay in the European Union, Bolivia, Colombia, and Peru in the Transpacific Socialist Alliance, Chile in the Pacific Rim Alliance, and Ecuador in the American Bloc -- the region becomes increasingly tense. The completion of the Kenya Beanstalk makes matters worse, as commercial traffic through Quito Spaceport falls off sharply, plunging South America into a depression. Eventually a trigger incident, minor in itself, plunges the continent into general

warfare, with American and PRA forces against TSA forces.

The Equatorial War. This starts off the same way as the Andean War, but a wider system of alliances turns it into conflict on a world scale. Radical nanosocialist takeovers in Mexico, Nigeria, and India spark general fears of global revolution. Nigeria's repressive treatment of its Christian and pagan populations brings reprisals from the West African Union, supported by Brazil and the Caribbean Union, which also have many adherents of voudoun and kindred faiths. The Islamic Caliphate favors the Nigerians; the Central Asian Federation, hostile to both the Caliphate and India, comes in on the other side. The likely result is a total rearrangement of the alliance system, as drastic as the one that replaced European global domination with the Cold War, with the leaders of the winning side emerging as the new dominant powers. Alert memeticists are well aware of the chance to shape the world's future, but they have to be riding the right tiger.

Campaign Seeds

All these potential changes and conflicts offer a starting place for scenarios and campaigns. Here are a few examples of things that could be done in the Transhuman Space setting.

Schism: Romania, a member of the European Union, has a relatively poor economy, and many Romanians are unhappy with their situation. A growing movement advocates separation from the European Union, largely to get out from under the Genetic Regulatory Agency so that Romania can upgrade its economy with bioroid labor. Many European Union officials belief that Romania no longer has the right to do this, but keeping it in by force would be bitterly unpopular.

To worsen the potential conflict, the nation of Moldova, part of the Russian Bloc, has old ties to Romania, though it was forcibly incorporated into the Soviet Union in the 20th century. Many Romanians advocate reunion, and so do a few Moldovans; an independent Romania might push hard for it.

Several different organizations might hire agents to head off the movement: Russia, the European Union, or the Genetic Regulatory Agency. They could select any kind of agents from old-fashioned covert operatives to subtle memetic engineers and researchers. If things go really badly, they could even send in soldiers.

Popular movements are also possible. What if citizens of the European Union start to boycott Romanian products, as a protest against Romania's intent to deal in bioroid slave labor? Conversely, what if other European nations demand a loosening of genetic regulation, and threaten to go the way of Romania if they don't get it? Greece, in particular, has strong popular support for genetic enhancement of children, and might favor letting parents choose their own enhancements without bureaucratic interference.

Meme Wars: The large Canadian preservationist movement, supported by advocates of bioroid rights and pansapientism, has come to favor Canada's joining the European Union. A national referendum is scheduled for the next election. Business leaders in Montreal mostly look unfavorably on the idea, which would lessen Montreal's role as a middleman city between the European Union, Canada, and the United States, and threaten its ability to remain independent. They hire a group of skilled meme designers and propagators to mobilize support for Canadian independence.

The catch is the strong populist streak in Canadian politics. Overt memetic influence from outside Canada would be unwelcome, and might even provoke a backlash driving Canada further toward the European Union. The memeticists will have to be discrete, either making their campaign appear to originate within Canada, or presenting it as an internal discussion in Montreal whose spread to Canada took place spontaneously. Or, if they can find evidence of *European* meddling in Canada's memetic environment, exposure of that influence could produce a backlash in the other direction.

An Old-Fashioned War: Top level officials in Iran and Pakistan have negotiated a strong alliance of their two nations, at the head of a federation extending into central Asia. But not all of their new allies, or even their own people, are happy with their modernizing policies or their suppression of Muslim traditions that impede modernization.

The federation government has chosen a risky course: proclaiming a jihad of liberation against the culturally Russian government of Sergei Maksimovitch Zarubayev in Kazakstan. The claim to be freeing the nation's Muslim population from totalitarian abuses casts the leaders in a favorable light in Muslim eyes, and the necessities of warfare can be used to justified suppression of criticism. Officially, the invaders are seeking to put an end to Zarubayev's unholy experiments in bioengineering, mind control, and memetics; but there are suspicions that some of them may want to results of his research for themselves. The war could involve Kazakstan's ally Russia, which is a risky policy, but on the other hand a victory over Russian would go a long way toward legitimizing the new alliance as a world power.

Player characters could be soldiers in any of the national armies, or mercenaries hired to lend support. Russia, in particular, might prefer subsidizing Kazakstan's defense to sending its own soldiers into a foreign war. Whatever side the soldiers are on, their position will be morally ambiguous: Kazakstan itself is a harsh dictatorship, Russia is fighting to defend that dictatorship for reasons of global power politics, and the "liberators" are only marginally less authoritarian than the tyrant they seek to overthrow. A campaign focused on the Central Asian War should emphasize the grim realities of modern battle and global power struggles.

Masks: The National University of Benin has announced a conference on Indigenous African Theology and Ritual, devoted to voudoun and kindred faiths around the world. Scholars from all over West Africa and several New World nations, including the United States, are coming together to present papers and workshops.

Naturally, the government of Benin is helping to sponsor the conference, and its support is no secret; among other things, it will bring some much needed foreign exchange credits to a country that desperately needs them. It's not public knowledge, but can be learned without too much trouble, that ministries of cultural affairs in several other nations are sending representatives, for a private parallel conference. Brazil, Cote d'Ivoire, Cuba, the Dominican Republic, Ghana, Sierra Leone, and Togo will all take part. If this is discovered by leaders of Muslim nations or factions, especially West African ones such as Nigeria, they'll almost certainly be opposed, and may try to discredit the event. And further behind the scenes, some of those "cultural affairs under-ministers" actually carry heavier credentials in their respective governments than is commonly known. The real agenda of the parallel conference is to lay the groundwork for a West African Union and mobilize support for it overseas.

Player characters can take part in this conference on several levels. They can be innocent scholars interested in theology, and looking forward to a trip to an exotic African city. They can be journalists trying to find an interesting story in a dull academic event—or suspecting that there's more than scholarship going on and trying to dig out the hidden truth. Or they can be the memetic or security teams hired to cover up the inner truths, while keeping their own presence concealed as well—because the involvement of anyone that good would itself be evidence that something was there to be hidden!

Pyramid Review

Arcane Corridors (Dungeons & Dragons Dungeon Tiles 2)

Published by [Wizards of the Coast](#)

Designed by Andy Collins, Jesse Decker, David Noonan, & Christopher Perkins

Art by Jason Engle

38 tiles (two 8×10 (tri-part pentagrams & tower sections), two 4×8 (statues & mystic fogs), four 4×4 (mystic eye, runes, flaming portal, pit, & rubble), two 2×8 (lightning path & church pews), 12 2×4 (book cases, flames, bones, heavy doors (intact and broken), mystic beam, & stairs), six 2×2 (runes, spider web, demonic mouth, braziers, & spike pit), eight 1×2 (rubble, doors, magic light (two colors), & altar), two 1×1 (skull pile & murky darkness); full color, mounted; $9.95

When Wizards of the Coast says they're going to do something, they usually do it. (Then again they've strangled a few game lines and supplements in the cradle, too.) In this case it's nice to see they've at least kept up one of their lines long enough to produce the promised next installment in their [Dungeon Tiles](#) line. *Arcane Corridors* offers a mystic bent in its selection.

As before, it's six panels of punch-out tiles, sized perfectly for your Dungeons & Dragons roleplaying game or its sister miniatures line. Those panels spill forth 38 tiles of varying sizes that can be configured several ways to make maps for exploration or perhaps even combat. The wraparound advertising sheath has a few suggested layouts inside, and you can go to the company website for many others.

There are similarities and differences when comparing the second with the first, some for the better, some not. Some observations in no particular order:

The sample maps inside the cover sheet aren't terribly impressive. Perhaps a comparison with the original assortment here is unfair since that was a more generic group of tiles, and using every piece in this set might give you dungeon packed to the gills with magical pentagrams and images, with every room a library or a portal to the Nine Hells. But since they use the same trick here -- putting a plain corridor on one side and a specific image on the other -- to increase utility, there's no reason they couldn't have developed some more intricate designs. Instead we're treated to overly simple arrangements that barely use what's included, as though the graphics team was working with an early prototype (or under a tight deadline). Time to hit that website.

On the gripping hand, there are a few more "double-sideds" here than in the first set, meaning sometimes a corridor isn't an option and you have to choose between bookshelves and the darkness, the pit or a desk. You are buying it for the arcane artifacts, but if you don't have the first set you'll lack some of the corridor/dungeon "connective tissue."

This leads to another mixed blessing -- the art selection. Some of the work is less than thrilling in its subject matter, and some isn't even legible. Is this bit a darkened corridor? A cloud of evil? Is it deliberately left vague? The tiles are a game aid, but most players can color in this kind of "nothing" themselves (and there's more than one plain dark tile). Then again, those featureless tiles are masterworks of ambiguous "Should I be impressed with this graphic?"-ness. Some have what looks like rubble that could also be dibbled bits of spilled paint, while others are just . . . red. A few

illustrations look like they belong to the first set -- spike traps, a skeleton in a pit -- so if the concentration is on the mystic, why include these? Do the creators assume buyers have the original or not?

Then there's the good news. If you think it'll be more plain-Jane corridors on those long pieces, check out the clever use of church pews, lined up and ready for worshippers. The old set gave you a spiral staircase, but this one gives you a whole building with two levels, one on each of the largest panels. Creative use of the medium like this is a bright spot. There are huge webs, gaping, toothy maws, corridors full of flame and lighting, and portals and places of power. Some similar elements did appear in the first product, but here they have a sense of urgency, purpose, and interactivity . . . and if you can convey that just with static art you're doing well.

The tiles are comparable in quality to the first set -- good art, good mounting, solid construction -- and they don't stick together like the first set. Alternately (and like the compression of the punch-out panels, this could be an "oops" that varies from one person's copy to the next), this set has one misprint on a one-by-two (the squares are off). But physically and aesthetically, it's still a first-rate job even if a few tiles lack real impact.

You're still out of luck if you want to take your team too far into the great outdoors (***Arcane Corridors*** does almost nothing to reinforce the paltry outdoor pieces Wizards of the Coast has already released), but that is no doubt the subject of yet another tile set. And if the joy found in compiling a stack of these useful, convenient, and durable tiles is any indication, when such a release presents itself it will be met with righteous enthusiasm.

--Andy Vetromile

Pyramid Review

The Esoterrorists

Published by [Pelgrane Press](#)

Written by Robin D Laws

Cover & Illustrations by Jérôme Huguenin

88-page b&w softcover; $19.95

The Esoterrorists is the second RPG to be released by British publisher Pelgrane Press, best known for *[The Dying Earth Roleplaying Game](#)* and *[The Book of Unremitting Horror.](#)* Designed by Robin D Laws, the man behind other games such as *[Feng Shui,](#) [Rune,](#)* and *HeroQuest,* the first game powered by the new GUMSHOE system, a modular rules set that sets out to combine a foolproof method of handling investigative games and a means to create such games, with a sound set of General abilities. Significantly it is this same game system that will power the new version of *[Call of Cthulhu,](#)* to be written by Ken Hite.

The Esoterrorists is also designed to be several things. It is meant to be easy to learn, teach, and play, fun to play, as well as innovative, approachable, and sustainable. A GM should be able to learn the game in 30 minutes, its nuances in 60, and be able to teach the game in 15. These make up a design dogma that future releases are also intended to live up to.

Fundamentally though, what the GUMSHOE system (and also *The Esoterrorists*) is designed to do is counter a problem in all investigative RPGs, particularly *Call of Cthulhu.* Which is this: "What happens when a player character fails the roll and thus fails to get the clue?" Does the GM let the game run its course, and if the missed clue is important, have the investigation fail at best, and at worst have the world end? Or does he give the clue out despite the failed roll, thus negating the need for the roll in the first place?

The GUMSHOE system's counter is simple. If a character has the appropriate ability, then he gets the clue; if he wants more than this, then his player spend points to gain special benefits. The point of this is twofold. First, it emphasizes the fact that the characters are competent professionals. Second, it shifts an investigative game's emphasis away from the finding of clues and firmly on to what a character does with a clue and how he interprets it.

Characters under the GUMSHOE system are defined not by the traditional attributes and skills, but by abilities. These are divided into two types, Investigative abilities and General abilities. The first type includes academic disciplines such as Anthropology and Forensic Accounting, interpersonal skills like Bullshit Detector and Reassurance, and technical skills such as Document Analysis and Forensic Anthropology. General abilities represent a mix of physical skills and attributes. Thus they include Health and Stability (the GUMSHOE system's answer to sanity), as well as Athletics, Scuffling (brawling), Shooting, and Surveillance.

Mechanically the GUMSHOE system is kept simple. Each ability also grants a pool of points equal to its value that are spent in game. Those from Investigative abilities are spent to gain the special benefits beyond the desired clue. Those from General abilities are spent to modify dice rolls.

To attempt a simple task, a player rolls a six-sided die, and tries to beat a difficulty number set by the GM. This can be anything between two and eight, but the default is four. To play up the brutality and horror of *The Esoterrorists,* the GM is encouraged not to reveal the difficulty number before a roll. Spending from either type of pool enables a player to buy time in the spotlight for his character. He may still fail for General abilities, but failure is intrinsic to the genre.

Combat continues the brutal, gritty tone. The average person has Health and Stability ratings of four each, so with a handgun doing 1d6 damage, death is a strong possibility. Heavier guns and monsters are deadlier because they add a modifier to the damage roll. If a character's Health pool is reduced to zero or below, consciousness rolls are required, which may require further expenditure of points to make. If a Health pool reaches -12, the character is dead. Stability works on the same scale and can be lost for violent encounters as well as horrifying ones. Recovering Health uses the Medic ability, Stability the Shrink ability, but recovering either takes time. Whilst Investigative pools are refreshed at the end of each case, most General pools are refreshed after a day's rest.

Character generation is a matter of deciding upon a role in the game and assigning 60 points to General abilities, and a variable number to Investigative abilities. The more players there are, the fewer the number of points for Investigative abilities.

Unsurprisingly, the GUMSHOE system really only supports the one type of scenario. To that end, the advice for the GM is devoted to writing the investigative game. The method suggested being to start with what the villain wants and work backwards, fitting clues to the characters' Investigative abilities. It is also suggested that the game be run in an episodic fashion like a television series. The most radical step towards this is having the GM hold up a card with "SCENE" written on it to stop the players wasting time.

If that is the GUMSHOE system, what is *The Esoterrorists?* It is a contemporary post-Cold-War setting in which the major threat comes not from mundane forces, but from a conspiracy of occult terrorists working to weaken the fabric of reality and let the monsters in. Although magic is hard, it can be strengthened by making it part of the global consensus. Operating against the Esoterrorists is the "Ordo Veritatis," reality's last defender. This secret organization is part-paranormal investigation agency, part-paranormal clean-up department, and is sanctioned by virtually every government world wide.

The Esoterrorists setting is lightly sketched, but it is designed to fit a contemporary world. This sketchy nature means that the GM has room to create his own game, and to keep it more contemporary, it is suggested that the GM draw from news stories. It is supported by "Operation Slaughterhouse," a more detailed scenario than would introduce other RPGs.

Physically *The Esoterrorists* is a well-presented easy read. The artwork tends towards the gritty and the cartoon style, though it is gruesome in places. If the game has any weakness it is in the lack of monsters, and in the slight nature of the background. The lack of monsters is more of a problem, but inspiration can easily be found elsewhere, from *Fortean Times* to other roleplaying supplements. The background though is more of a framework for the GM to fill in.

For the most part, *The Esoterrorists* and the GUMSHOE system lives up to its intended goals. It only innovates in rejecting the dogma of having to roll to find clues, but this only makes play easier. During a convention game I picked up the rules in five minutes along with the basic background and what we were meant to be doing. I suspect that it will be as easy with my own gaming group. The setting feels like the reverse of *The X-Files* or *Delta Green,* possessing a pop-culture sensibility.

The Esoterrorists is a light game through and through, from mechanics to setting. This enables it to achieve its aims -- easy to learn, play, teach, and so on, with scenario design being more focused than easier. It will be interesting to see what the GUMSHOE system will power, but *The Esoterrorists* adroitly counters a problem to let you get on with the game.

--Matthew Pook

A Jerk for 114 Minutes

This week's installment was going to be about the evolving history of holidays, but I think I might have written that column 1d6 Christmases ago, and even if I didn't I'm sure it's an obvious enough idea that I'll remember it again next year.

However, this week has found me at the In-Laws home, a magical wonderland of unlimited snacks and cable television. The latter is the subject of this week's verbiage. In particular, my mother-in-law (the wonderful and inimitable Maryelna, about whom I can say nothing bad, and not just because it'd be a bummer to spend the holiday outside shivering in the slush) is a big fan of the various made-for-television holiday movies, which all have utterly indistinguishable titles such as *Lifetime Presents Hallmark Cinema's Christmas Miracle Angel Tale to Remember From the Heart.* So they've been running near-nonstop in the household for the past week save for some *CSI* reruns and a random episode of the new *Doctor Who* (a better random hour of watching I've not had this year).

Anyway, two nights ago I saw the first half of a particularly challenging installment of such a movie: [Christmas at Water's Edge.](#) Starring Keshia Knight Pulliam (formerly of *The Cosby Show*), the movie provided a truly painful experience to watch. This is not merely because of the finite-monkeys writing or the more-wooden-than-Kevin-Costner-in-a-forest performances by the entire cast (including Tom "the guy who played a father on both *Happy Days* and *Father Dowling Mysteries*" Bosley, an actor I generally enjoy). Rather, it's because of a trend of a great number of holiday movies: the need for redemption. Curiously, it's a problem related to most *Cinderella* iterations as well.

Now, normally I'm a huge fan of redemption. Indeed, from a gaming standpoint, the need for redemption (of various forms) is one of the strongest and most visceral themes you can have for a character concept. In the world of PCs, the need to be redeemed from some sin -- untrustingness, a violent temper, cowardice -- makes a great long-term goal from which you can hang many subplots (and, from a mechanical standpoint, a source in many games for extra points at character creation). And from an NPC standpoint, many players go ga-ga over the notion of a bad guy who can be redeemed (c.f. "Vader, Darth").

Unfortunately, in your standard movie or television episode permutation of the redemption cycle, the audience is subjected to 95% horridness followed by 5% redemption. In other words, in a two-hour movie you're forced to endure 114 minutes of the main character being an awful human being followed by six minutes of "Golly gee, I've finally learned the real meaning of Christmas!" (Same problem with Cinderella.rand() -- in almost all cases, the audience has to accept the morsel of a few minutes of comeuppance for the stepmother/stepsisters in return for enduring the preceding hours of Cinderella being treated like a second-hand *Planet of the Apes* piñata by her family.)

And this was the crime of *Christmas at Water's Edge.* The Keshia Knight Pullman character played a horribly spoiled student who was able to elevate the flatter-than-flat material of the script to unfathomable heights of horridness, vibrating each sentence's syllabic superstrings to new levels of nail-grating selfishness matched only by the unimaginably deep levels of shallowness. It mattered not what level of redemption her character reached at the end; the only just reward for the suffering audience involved the front end of a fast-moving bus. (Whether this bus is best suited for the Pullman character or the audience is left to the imagination.)

From a gaming standpoint, this is merely an expression of the previously detailed notions that [quirky doesn't need to equal annoying](#). Just because a character is in need of redemption doesn't mean that the character needs to be an insufferable twit until that point. Probably the quintessential example in cinema is George Bailey, played by James Stewart in the classic *It's a Wonderful Life.* In this case, because of the movie's storytelling techniques, we aren't subjected to the 95%-horrid-to-5%-redeemed ratio. No, the bulk of the movie depicts Bailey as a sympathetic, warm, and likable character, even though he possessed the traits for which he needed to be redeemed (namely, the desire to escape from Bedford Falls). It's only for about 30 minutes of the movie (at most) that we're exposed to the Needs-Redeeming-Bailey, and through most of that, he's being quiet and enduring a parallel timeline owing to a worldjumping "angel."

Or, as another holiday example, consider the novel's depiction -- as well as most cinematic portrayals -- of Ebenezer

Scrooge from *A Christmas Carol.* While on the surface this seems to be an example of the 95%/5% rule, in actuality the breakdown of the story is such that we -- as an audience -- witness a number of scenes in which Scrooge is happy or doesn't necessarily require redemption (in this case, told via flashback through the Ghost of Christmas Past). And Scrooge makes a number of steps toward redemption along the way; he struggles with the issue, avoiding the last-five-minute epiphany by so doing. (In fact, in many movie portrayals, one gets the impression that the Ghost of Christmas Future is almost unnecessary, with the visitations of the first three ghosts[1] proving almost effective enough.)

Continuing on this theme with another holiday movie (albeit not the holiday that quickly looms), check out Phil Connors (played by Bill Murry) from 1993's *Groundhog Day.* Again, this is a character that could have been utterly horrible to observe on screen, but was only truly obnoxious for about 20 minutes or so; he starts learning lessons early on, and keeps learning them until the end when he's fully redeemed.

For gamers, probably the biggest lesson to take away from these examples is the notion that redemption is not a switch; it's a road. It's not usually something where someone gets whacked with a brick and then vows never to do ill again. No, it's a process by which it's possible for characters to take baby-steps toward the light. For games with point-level disadvantages, this process might even be representable by slowly paying off those (going from, say, a 15-point "Paranoid" to a 10-point "Untrusting" to a 5-point "Skeptical"). By having multiple steps, it allows a character to develop in a more natural way, *and* has the possibility of allowing a player to play variations on the character's theme. ("Okay; first I was a bloodthirsty psychopath out for vengeance at all costs. Now I'm a bloodthirsty schemer who exacts his sense of vengeance on others. Perhaps next month I'll finally evolve into a professional assassin who's prone to moments of rashness.") And, of course, it helps not to make the matter of redemption so egregious that the other characters (and players) are counting the moments until you stop acting that way.

Another great thing about a road (from a storytelling standpoint) is that it's possible to go backwards . . . to regress. Maybe our "Untrusting" character has had a few rough months where a half-dozen supposed allies have betrayed the heroes, and he slides on back to "Paranoid."

In much the same way that redemption is often a fuller experience when prolonged, so, too, is the comeuppance experienced when things fall apart for a wicked-doer. Assuming the heroes don't force the ne'er-do-well to meet his end at the extremities of a pointy object -- by no means a foregone conclusion -- the lengthy downfall of a villain can prove to be truly satisfying to the players, especially if that evildoer proved to be a thorn in the side of the heroes for a considerable length of time; a good example from the world of comics is the Kingpin from the *Daredevil* series. (And, again, a prolonged fall allows for a comeback . . . just like the Kingpin did . . .)

Regardless, just because you're crafting a redemption story doesn't mean that the character needs to be an insufferable jerk until his epiph gets kneed. And if you're looking to get a last minute gift for your players, try to make sure the punishment the villains receive is proportional to the length of misery they caused the heroes.

And if you start watching any holiday movies where, after the first hour, you want every character to die, consider just turning it off. Try the eggnog . . . it's special.

--Steven Marsh

[1] Four other ghosts in one cinematic version of the story, the identity of which I leave as a trivia question for the reader.

Designer's Notes for [Transhuman Space: Changing Times](#)

or,
Making Changes

by Phil Masters

"The utter antithesis between the modern world and the old is determined by all those things that formerly did not exist. Our lives have been enriched by elements the possibility of whose existence the ancients did not even suspect. Men have identified material contingencies, and revealed spiritual attitudes, whose repercussions are felt in a thousand ways."
-- *Manifesto of Futurist Architecture*, Antonio Sant'Elia (1914)

It would normally be unbecomingly immodest to describe one's own work as "keenly anticipated," but in the case of *Changing Times*, I have hard evidence; this PDF publication was selling well, with downloads in three figures, before its publication had even been formally announced. Of course, one might expect *Transhuman Space* fans to be forward-looking and Internet-aware . . . And I should also admit that this publication had been pre-announced and then unavoidably delayed in a rather teasing way. But these reactions were still flattering.

Not that I can claim more than fragmentary credit here. *Changing Times* is a guide and update for the *Transhuman Space* universe, which isn't my creation; all of us who've worked on the line must acknowledge the vast inspiration provided by David Pulver, whose setting this is. I was mostly adding footnotes. For that matter, as part of *Changing Times* is a set of rules-related updates to *GURPS* Fourth Edition, I inevitably drew on the manuscript versions of the new editions of *GURPS Bio-Tech* and *Ultra-Tech,* which were still under development at the time. It's not that technology in the *Transhuman Space* setting exactly matches the assumptions in those books in every particular -- when you're making guesses about the future, some variation is part of the fun -- but there were also points of close contact, and I tried to use the same game mechanics where possible.

(Though I should say that *Changing Times* readers are very, very strongly recommended to acquire those two books, if and when possible -- along with *GURPS Powers,* for that matter. All three provide countless ideas which can be imported in their entirety or with minor adjustments. For example, one thing I almost borrowed from *Powers* was the "Burst" enhancement for Telecommunication, which I think should fit a lot of military telecommunication devices and implants that'll show up in *Transhuman Space*.)

Guidance Systems

"The rapid progress true *Science now makes, occasions my regretting sometimes that I was born too soon . . . Agriculture may diminish its labor and double its produce: all diseases may by sure means be prevented or cured, not excepting even that of old age, and our lives lengthened at pleasure . . . Oh that moral science were in as fair a way of improvement, that men would cease to be wolves to one another, and that human beings would at length learn what they now improperly call humanity."*
-- Benjamin Franklin to Joseph Priestly (1780)

But anyway . . . These footnotes to David's masterwork did seem to be *wanted,* and I don't just mean the new rules

stuff. The first half of **Changing Times** consists of a GM's guide, and the fact is, those of us involved with the line have kept hearing gamers say that they're impressed with **Transhuman Space,** but they feel lost and overwhelmed by the huge, detailed world of 2100, and can't see hooks for adventurous plots. Actually, there are plenty of such hooks, but they may need a little more finding than those seen in straightforward kill-the-monsters games.

After all, in 2100, the question of what or who is a "monster" is wide open for debate -- and that debate can easily form part of a campaign. So I sat down and went over the setting looking for options, from the depths of Earth's oceans to the Kuiper Belt, and from deadly espionage games to weird sitcoms. A lot of this is categorization and cataloguing, but that's always a good first step. I hope that I'll get people not only playing more **Transhuman Space** games, but a greater diversity of such games.

The Continuing Career of Tanith Tokamura Hecate

"In the long history of humankind (and animal kind, too) those who learned to collaborate and improvise most effectively have prevailed."
--Charles Darwin

One concept which I openly borrowed from David is that of Mutable Point Totals, which *Pyramid* readers will recognise as having first appeared in his own [Designer's Notes Article](#) for the line's original core book, but which I felt deserved restatement and re-emphasis. It's actually an interesting option and approach for any campaign in any setting, but it has special resonance and usefulness in the wide-open worlds of **Transhuman Space;** it tells nervous GMs that, rather than worrying about the wilder possibilities of the setting, they should emphasize and embrace them.

Among other things, I preserved the original illustrative story -- the adventuring career of Tanith Tokamura Hecate. I tweaked the text a very little to reflect the numerical facts of *Fourth Edition,* but then, unfortunate editorial necessity meant that Tanith's recalculated history in the published text was truncated, ending with the loss of her hand and her becoming a 153-point character. Of course, loss of a hand is hardly a permanent problem in this setting, and David's original account had one more big twist, so in fact, the new text can continue:

In Tanith's fourth adventure, she's on Luna, hanging around the Moonshadow spa waiting for her new hand to grow, while Grimalkin prowls the bars. However, the GM decides to make things interesting. In the spa, Tanith runs into a tall, dark, and handsome stranger who turns out to be an Amortality Assassin. Tanith discovers and foils the assassin's plot (one-handed!), and the GM awards her 2 character points. He also tells her that a local reporter, who got a good story out of this incident, qualifies as a 3-point Contact. She also gets her hand replaced, eliminating the One Hand disadvantage. This interlude has thus seen a net gain of 20 points; she's now a 173- point character.

In the party's fifth adventure, Tanith and Grimalkin go to L5 to salvage a nuclear reactor from an abandoned plague-struck space habitat. Unfortunately, it's not abandoned: they discover a nest of Maple Syndicate data pirates. In the ensuing firefight, Tanith is shot dead. Grimalkin rushes Tanith's corpse to hospital and arranges for it to be brainpeeled. The operation succeeds, and Tanith is now a ghost.

Grimalkin can't afford a new body for Tanith, but she remembers the cyberdoll they captured, and has it repaired. Tanith wakes up in that. It's worth 127 points -- 40 more than her old Tennin body (which was worth 27 for the template plus 60 for +2 ST and +4 HT), while being a ghost is worth 86! She earned 1 character point during the adventure, while Grimalkin had to take out a loan to cover the cost of all that work, which leaves her with a Debt [-2], so she's now a 298-point character. But she's no longer human . . .

Template Tweaks

Did I request thee, Maker, from my Clay
To mould me Man, did I sollicite thee
From darkness to promote me, or here place
In this delicious Garden?

-- Paradise Lost, John Milton

But along with the GM's guide chapters, there is indeed the *Fourth Edition* update material, tying the wondrous technologies and concepts of the world of 2100 to the new rule mechanics. This, as it turned out, couldn't be "complete," in the sense that we didn't, for example, have room for all the templates from all the supplements (some of which are a bit specialized, if truth is told). I squeezed in everything from the original core book, plus some useful bits and pieces from elsewhere or from out of my own head; hopefully, that'll provide plentiful guidelines to any GM who wants to use anything out of the other books before anyone gets around to producing an appropriate official conversion. But by way of further illustration, let's look at a couple of templates from Jon Zeigler's excellent ***[Fifth Wave.](#)***

Transhuman Space has various categories of "racial" template to consider; parahumans/bioroids, uplifted animals, infomorphs, cybershells, and so on. The *Fourth Edition* version of ***Bio-Tech*** tackles a lot of relevant organics, providing direct conversions of some (though not all) ***Fifth Wave*** content, so we'll focus elsewhere.

Infomorphs

"There are three classes of intellects: one which comprehends by itself; another which appreciates what others comprehend; and a third which neither comprehends by itself nor by the showing of others."
-- The Prince, Niccolo Machiavelli

Infomorphs are generally the most limited of these categories in terms of options, and ***Changing Times*** actually covers almost all of this subject. However, ***Fifth Wave*** does have one more type: the Free Meme.

This pretty closely resembles the standard NAI-4, so we can use the new templates for that as a basis for the free meme template, making changes to parallel the differences in the *Third Edition* versions; see the notes on the NAI templates in ***Changing Times*** for more details. (Incidentally, many free memes may have Clueless *as well as* No Sense of Humor.) However, there are three problems or points of variance worth mentioning.

1. As a bit of detail color, this version of the template is permitted to take Obsession or Extreme Fanaticism in place of standard Fanaticism, if desired; the exact form taken by a free meme's motivations can surely vary quite a bit.

2. The original template has the Parasite disadvantage, to represent its dependence on an existing AI system; unlike "regular" AIs, free memes can't function as standalone computer operating systems. However, Parasite no longer exists in *Fourth Edition* games. To represent this requirement, the template is given a Dependency. Having an AI or similar to manage the cybershell on which the free meme is running can be treated as "Very Common" (AI-run systems are that pervasive in 2100), and the free meme is clearly Constantly dependent. If the managing AI shuts down, the GM can simply apply the standard effects for such a missed Dependency -- 1 HP lost per minute, representing progressive system failures in the cybershell or something; alternatively, one can rule that, just as a machine which misses its fuel requirements just stops going until refuelled rather than suffering progressive damage, a cybershell without a governing AI simply shuts down until something appropriate is reinstalled and rebooted.

3. The original template also included Computer Hacking as a racial skill; however, that's now classed as cinematic, and won't be permitted in a lot of "realistic" ***Transhuman Space*** campaigns. Free memes *have* to be able to subvert and infiltrate computer systems, but can do this in a wide variety of ways. Hence, unusually for a "racial" template, this one is given a choice of skills on which to spend some of its points. At the GM's option, these points might also be assigned to appropriate Contacts, Perks to represents knowledge of crucial access codes or "back doors" into various system, and so on.

Free Meme   *36 points*

Attribute Modifiers: IQ-2 [-40].

Advantages: AI (without Reprogrammable) [42]; Enhanced Time Sense [45]; Indomitable [15]; Possession (Digital, -40%) [60]; Single-Minded [5]; Unaging (IQ only, -75%) [4]; Unfazeable [15].

Disadvantages: Automaton (without Slave Mentality) [-45]; Dead Broke [-25]; Dependency (Presence of another, controlling AI on the same system; Very Common, Constantly) [-25]; Extreme Fanaticism, Fanaticism, or Obsession (long-term) (9) [-15]; Social Stigma (Subjugated) [-20].

Racial Skills: Computer Operation/TL10 (E) IQ+3 [8]-11, and 12 points in any of Computer Operation/TL9, Computer Programming, Electronics Operation (Communications or Media), Fast-Talk, or improvements to Computer Operation/TL10 -- or Computer Hacking in cinematic games.

Features: Complexity 4 program; Taboo Traits (Self-Awareness).

Note: Some free memes may be Reprogrammable, having been designed to be brought back under control by their original creators if necessary, or being closely based on a standard NAI design -- but most people who choose to create free memes deliberately make them as hard to control as possible. Unlike properly designed AIs, free memes not only *can* have a wide range of mental disadvantages, but often *do* -- but they also occasionally have interesting advantages, such as the Full Memory Access enhancement on their Possession advantage. Some also "buy off" the Incurious disadvantage (included in Automaton); indeed, their interest in the world in general can be intense, if quirkish or erratic.

A free meme's "Subjugated" Social Stigma is something of a variant case. On the one hand, nobody (except possibly its original creator) regards it as a servant or a slave, and it has rather more freedom of action than most subjugated entities; on the other hand, almost everyone regards it as a minor nuisance at best, a deadly menace at worst, and will probably delete it without a second thought; it can very easily find itself marked down for elimination.

Cybershells

Machines take me by surprise with great frequency.
-- Alan Turing (1950)

While there are relatively few really distinct infomorph categories, there is a huge assortment of cybershell types on which infomorphs can run. *Fifth Wave*'s "wingbot" is a handy option for adventuring types, albeit mostly as a tool or remote-operated drone -- its computer is just about big enough to run some fully-sapient software, given use of expensive high-end options, but it's a bit flimsy and short of features for most PCs to want it as a primary shell. Most of the template's features convert straightforwardly, but it's worth going over a few of the details.

1. The *Third Edition* version has ST 4, which converts to ST 6 in *Fourth Edition.* The original also has 2 HP, which sounds a bit weak for a 45 lb., ST 6 machine, even one which is described as "physically delicate" and which is built for high-agility flight -- even the buzzbot, a flying cybershell which weighs just 5 lbs., is given 3 HP in both editions. So we'll allow ourselves a bit of flexibility in the conversion and grant the new treatment HP just one less than its ST. Other attributes convert straight over (and this thing's DX is highly respectable -- it's evidently *very* agile).

2. While most armed cybershells simply take Weapon Mount or Payload rather than Innate Attack or whatever, the wingbot's electroshock device really does look like a valid exception; it's completely integral to the machine. This is of course an Affliction, identical to the shock glove as discussed in *Changing Times*. Its drug injector, on the other hand, is the equivalent of a cheap hand- held device, and needs to be charged with whatever drug is to be injected, so it can be treated as a simple Accessory Perk. (Admittedly it can be used in combat, which isn't normal for an Accessory, but we'll stretch a point here -- we're already adding significantly to the template cost for that electroshock thing, after all.)

3. The wingbot is described in the text as using "batteries," but has Filter Lungs rather than Doesn't Breathe. The most plausible interpretation of this is that it uses some kind of fuel cell system, requiring oxygen from the atmosphere but generating electricity to power its various systems. The details of the template can be set accordingly.

4. It's also described as having just two hours' endurance when in flight, but can stretch that to 30 hours if it stays on the ground -- and it's far from useless in the latter case. It'd be nice to represent that feature, though it's a little fiddly. The best approach seems to be to give it Reduced Consumption 2 (which strictly speaking only gives 24 hours of operation; it's up to the GM whether to enforce this strictly or stretch it to 30 hours, but a higher level of Reduced Consumption would take the period out to a full week) -- and then give its Flight and Enhanced Move (Air) a Temporary Disadvantage limitation, with the "disadvantage" consisting of replacing Reduced Consumption with Increased Consumption 2, a net -24 point modification and hence a -24% limitation.

So, finally, here's the *Fourth Edition* wingbot template. It's expensive, but you get versatility, speed, impressive agility, a powerful visual sensor array, and built-in weapons:

Wingbot   *240 points*

Attribute Modifiers: ST-4 [-40]; DX+4 [80]; HT+2 [20].

Secondary Characteristic Modifiers: HP -1 [-2]; SM -2.

Advantages: Absolute Direction (Requires Signal, -20%) [4]; Acute Vision 3 [6]; Affliction 3 (Stunning; Armor Divisor (2), +50%; Melee Attack, Reach C, -30%) [36]; Damage Resistance 3 (Can't Wear Armor, -40%) [9]; Enhanced Move 2 (Air) (Temporary Disadvantage, replace Reduced Consumption 2 with Increased Consumption 2, -24%) [31]; Enhanced Move 1 (Ground) [20]; Filter Lungs [5]; Flight (Cannot Hover, -15%; Small Wings, -10%; Temporary Disadvantage, replace Reduced Consumption 2 with Increased Consumption 2, -24%) [21]; Machine [25]; Night Vision 9 [9]; Payload 5 [5]; Peripheral Vision [15]; Reduced Consumption 2 [4]; Telecommunication (Cable Jack; Video, +40%) [7]; Telecommunication (Laser Communication) [15]; Telecommunication (Radio; Video, +40%) [14]; Telescopic Vision 4 [20]; Temperature Tolerance 3 [3].

Disadvantages: Cybershell Body [-15]; Maintenance (Electronics Repair and Mechanic skills, 2 people, Monthly) [-4]; Mute [-25]; No Sense of Smell/Taste [-5]; Restricted Diet (Common, hydrogen or refined hydrocarbon fuel) [-20].

Perks: Accessory (Drug Injector); Accessory (Small Computer) [2].

Features: Individuals of the same model closely resemble each other.

Tomos, the Divided Land

Fantasy Planehopping for *GURPS*

by William J. Keith

Shadows twisted along unseen dimensions, and the sorceress stepped out of a pool of darkness. Her green eyes flashed with anger. "Utrecht you old bookworm, aren't you ready yet? I walk across three worlds to take you to dinner for your birthday and here I find you still hunched over that oddity we picked up."

"Patience, Vail," said the balding sage studying his crystal ball. "Anyway, you say that as if it was more than 10 minutes from your place to mine. . . here we are." Vail watched the crystal pick up an aura from the rune-incised blade of strange blue metal. Images of its history formed in the crystal. The blade pierced flesh, withdrew; the holder shuddered from some blow and dropped it. Utrecht paused the vision and skillfully turned the viewpoint.

Fleeing comrades. A tall female archer looking distraught. A mage tracing out a banishing. And the enemy the weapon had bitten -- Vail gasped. "Void Below. . . it's him. Or a double of him." But no, that one didn't have doubles. He'd eaten them. "We have to alert the Academy, get the containment spell worked up."

Utrecht nodded. "I'll do that. You and Ks'sik need to coordinate with the folk of the latest planet he's invaded. Take the blade and use it to track down a gate to their world. Every enemy of that one is a friend of ours."

He glanced at the blade and winced. "Though you may want to warn them that metal doesn't work on him."

* * *

You want to play in a fantastic setting, one where mysterious sages and canny loremasters match wits against horrors too impossible for physics. You want your campaign to span the infinite worlds, letting bold explorers stride across the endless realities, seeking fortune or kicks. There's just one problem, if you're using *GURPS* mechanics: magic is far more limited in its flexibility than a conveyor when it comes to jumping worlds. Any Plane Shift spell or item is limited to a single destination plane; dimensional highways have fixed exit ramps.

Not that a canny loremaster would let that stop him.

The Divided Land

The Divided Land first manifests to travelers as a series of unlit caverns with uncertain gravity and twisted dimensionality. From here, a traveler can access a number of planes -- which some mages argue are other worlds, others describing them as states of existence -- that strongly reflect pure forms of traditional magical characteristics, such as elemental Water, powerful meteorological processes, or icy dark voids. The collection of such worlds has been named the Elemental Complex by Tomosic mages. The Complex contains numerous gates that lead to more normal worlds, where humans (or other, as the case may be) live their own lives on solid ground under sunlit sky. Some of these worlds even feature near-twins of people from back home, living lives eerily similar to the originals.

The Complex can be accessed in multiple ways: by Plane Shift, by the Jumper advantage, and by natural gate. This latter is the most important method, for the Divided Land seems to hold at least one natural gate to every mana-positive world *somewhere* on that world.

For planar travel, first enter the Divided Land via any preferred means; mages can plane shift, but if a world has enchanted a known, permanent gate, any muledriver with a wagon can waltz in. Next, locate your destination: if that muledriver has a load of Gabrook sparkseeds heading for a trade center on Olokun he can follow a paved road, but if

you want to find the gate to the world that made this sword you're holding, magic is required. The spells Seek Gate and Pathfinder are the most common method, but various methods of divination can occasionally give good results. Finally, you have to get to the gate you've found -- either teleport, or walk. The Divided Land has a famously flexible notion of "distance" and, for that matter, "space," so paths from one gate to another can take a turn around a stone pillar and end up in a new cavern that reads as hundreds of miles away. Any number of gates can crowd within a few days' hiking distance of a single gate for travelers who know the right turns.

Quirks of the Divided Land

Sometimes the shortest path between two gates runs across a cave-in or takes a side trip through a world of raging fires, so pathblazing explorers in the Complex tend to have either short or well-paid lives. The difference is usually in how well they're prepared. The very first step is to know the basic lay of the ground:

The region of the Divided Land in which most interplanar travel takes place manifests as a series of dry, chilly (39° on average) caverns lacking natural light sources. Air is fed through the gates, and can be still and stale when travelers are a long way between sources of fresh air. Gravity in these caverns is very low, as little as one-tenth g, and vanishes in some places -- when earth and stone surround you in all directions, local gravity is mostly a function of nearby concentrations of mass. The material of the plane is primarily dry stone, with strata of various kinds of stone appearing in orders unconstrained by geological necessity. The caverns appear to have been carved not by water but usually by lava or rockfall, and the ground can be treacherous and broken, making for slow going.

Adventurers that must travel to a previously uncharted gate must take everything needed for survival: food, water, light, and means of warmth. Wise precautions include means of moving or passing through large quantities of stone, as cave-ins do occasionally block or change routes. For that matter, cavern-combed portions of the plane, while the easiest ways to travel, do not make up the bulk of the plane -- if a traveler can reliably pass *through* stone, or simply teleport his party directly to a scryed destination, travel is significantly eased. Between much-traveled gates within its sphere of influence, Tomos has sponsored the creation of a network of roads, with stops for rest and supply, and even teleport gates for worlds whose gates are inconveniently far apart for business travel. (Tomos is a "home timeline" suitable for crossplanar fantasy adventuring. For a thumbnail sketch of Tomosic culture, see the material below.)

The Elemental Complex is mostly normal-mana, though near gates to low- or high-mana worlds some leakage can occur. If a GM features aspected mana in his setting, the caverns most travellers see are high-mana with respect to Earth spells, meaning that even non-mages can find it useful to know simple survival spells such as Earth to Air, Seek Pass, Predict Earth Movement, and Walk Through Earth. Other parts of the Complex feature other elemental primacies that have differently-aspected mana and require different safeguards, and particular sites in the Complex feature materials or powers of industrial or military interest that have undergone settlement and development. For a few of these sites, see later in the article.

Tomos: The Homeland

The culture that is generally regarded in the Divided Land as having first explored the Complex and proposed multiworld alliance is Tomos. Many planehopping mages still hail from that land and its confederated nations.

Tomos is a single large island-state on a world called Amalle, with geography significantly different from Homeline. As Amalle is orbited by an additional moon, the likely explanation is multiple meteorite impacts in prehistory. The world lacks large continents; most of the land, which covers 20 to 25 percent of the planet's surface, comes in hundreds of islands ranging between Puerto Rico and Cuba in size, with thousands more uncharted specks dotting the seas. The restrictions of island ecosystems mean

The Ways of the World(s)

The trappings of The Divided Land are not the only way to run this sort of game, of course. The core assumption a GM needs to make in order to facilitate crossworld fantasy gaming in this style is that there exists a single world or timeline -- that is, a "plane," as defined by the Plane Shift spell -- which has gates to indefinitely many and potentially all mana-positive worlds reasonably accessible. It is a bonus, allowing for multiworld interaction, if this plane has some obvious feature which makes it a natural consequence of magical theory, so that it can be independently accessed

that Amalle boasts a biologist's dream of biodiversity, each island bearing a unique niche in climates ranging from tropical to arctic. Only large deserts and plains lack representation.

Tomos sits on an island divided by a mountain ridge (hence the name, the Divided Land, which was carried over to the Complex). The nation has a TL3 culture that Homeline would find vaguely Greek, if the Greek Golden Age had never been interrupted by Rome and continued to progress toward Renaissance technology without an intervening Dark Ages. It elects a national legislature called the Convention and a head of state called the Executor; the island's precincts and each outlying island that has sworn loyalty to the Tomosic Confederation elect smaller versions. The vote is restricted to literate citizens of Status 1 or higher. This status is achievable by paying a significant one-time fee, passing a literacy test, and taking an oath of loyalty with other citizens as character witnesses. Religion constitutes veneration of four Gods, one of each primary element: Amalkur of Earth, Lyn of Water, Whess of Air, and Zikti of Fire, each with an opposing Devil. Tomos practices debt- and prison-slavery, always for finite terms, and slavery is not inherited. Tomosics are fairly broad-minded about foreigners and foreign cultures, though women suffer one level of Social Stigma. (They *can* vote, if they qualify, but none has yet been elected to office.)

The presence of magic has retarded some areas of practical applications, such as agriculture and medicine. On the other hand, mathematics has been leaping ahead and the tentative beginnings of TL4 calculus are being explored to support magic, astrology, and the well-respected arts. The written word is equally honored, with many poets and orators employed in the nation. The study of magic in the Tomosic style means Tomosic mages must be literate and have at least 1 point spent in Mathematics/TL4; the tradition is academic, and "hedge wizards" are fairly rare. Peasant girls who show Magery are usually quietly taught a few rustic versions of healing and plant spells (not requiring math or literacy), while rich girls can get a complete education.

Mages are rare enough that they are not expended as artillery in military maneuvers. Tomos depends less on military magic than on national secrets to protect its preeminence among its world's cultures. It is the sole holder on Amalle of the knowledge of the techniques necessary to properly smith orichalcum, and employs military force to guard deposits found in the Complex. For centuries it protected the secrets of making gates, but that knowledge has been disseminated to foreign cultures of Amalle via mages from other worlds. The advantage lasted long enough, however, to establish Tomos as the point of contact for travelers to Amalle, and it intends to continue building on that head start. At present, knowing Smith/TL3 (Orichalcum) requires Security Clearance (Tomos) for someone from Amalle, and either Security Clearance or Unusual Background (taught by offworlder) [5] for someone from this planet to know any of the spells Seek, Scry, Control, or Create Gate. Tomosic mages who learn Gate spells are often inducted into the Order of the Tetrahedron and make a living travelling the Complex and the Atlas.

Conquest is difficult on a world consisting of a series of islands, so military aggression between island groups is rare. Instead, Tomos and the other major cultures on Amalle struggle to gain the loyalties of expanding spheres of influence

from many worlds.

The Divided Land was created to be compatible with material in *GURPS Cabal,* in which the material world holds an entrance to the Plane of Earth beneath the island of Crete on that timeline. It further describes the planes of the elemental decans as meeting within Hod, upon the Astral, and the *GURPS Fourth Edition* sourcebook *Infinite Worlds* describes the Astral as touching all worlds. The only serious addendum needed to complete the setup is the notion that each mana-positive alternate Earth has such a gate below Crete, or more generally, that each mana-positive alternate timeline has some such gate. This done, the GM has merely to decree that travel time on the Astral portion of the trip is within reason to make magical crossplanar travel feasible.

What is "really" going on, as the Cabal would describe the Complex, is that Tomosic mages are physically entering Yetzirah, usually along the decan of Ieropaêl, via a natural area of strong tangency featured on all or most mana-positive worlds. They walk through a restricted portion of Yetzirah that does not bend well to the usual methods of manipulating ectoplasm, heading to that point the sphere of Mercury where the four elemental planes meet. They use their knowledge to draw on the raw energies of Iudal in that place, moving across the boundaries between worlds. The "Gods" they worship are the four Archangels, who may or may not know about the theurgic veneration coming their way; Tomosics certainly do not have much conception of Briah or Atziluth.

in a protracted contest that their philosophers have come to call the "polonis psûkhes," the clash of minds. This struggle has broken into armed conquest in the past, most notably in the Enlightenment War, but today Tomosic garrisons exist mainly for defense and the soldiers of the clash of minds are orators and merchants who spread Tomosic ideals of democracy and progress.

A clash of minds requires opponents. The Varen Union, a theocratic regime bound together by its monotheist Church of Oneness, sends forth missionary priests from the cold north to inspire the fervent loyalty of foreign islands, and the writ of the Church's leader, Great-Grandfather, holds sway in the second-largest sphere of influence on the planet after the Executor of Tomos. They call the holy mission "da selekirg," the war of souls. The Sanguine Alliance reached peaceable terms of equality with Tomos during the Enlightenment War after Tomosics were impressed by the technological know-how of the Sanguine's air defenses (silk, in the form of balloons and hang-gliders, serves the Sanguine as well as orichalcum serves the Executor), and has maintained the bulk of its territory. To the east of Tomos, the Azarin League, a TL0-1 region bound together mostly by a desire not to become subservient to foreign powers, has steadily seen its compact erode as islands along its edges switch loyalties. And the Wild Islands yet rebuff all attempts at settlement.

Other Worlds

Tomos has good relations with a number of worlds inhabited by other intelligent beings that are less elemental and more familiar. Trade and diplomacy take place between these worlds, whose physical collection and structure of relationships are collectively called the Atlas by Tomosics. Loren'dil, Gabrook, and Olokun are three fantasy worlds Infinity has yet to contact. These worlds fed fantastic creatures to Yrth via the Banestorm, which has not continued to draw residents from them. Thus, they make excellent candidates for worlds to align with Tomos to form the oldest core of the Atlas. Tomos would have contacted these worlds some time after the Banestorm hit and would extend the hand of the Enlightenment along with trade and diplomatic relations.

Gabrook is the desert home of kobolds and reptile men; Olokun is a watery world home to merfolk; Loren'dil is a temperate planet of halflings, centaurs, and giants. Merfolk would be right at home in the seas of Tomos' archipelago homeworld, and their habitat would render them essentially immune to the more aggressive moves in the Enlightenment War; centaurs being creatures of Greek mythology, they may have independently produced democratic forms and thus qualified as immediate equals in Tomosic eyes, while relations with Gabrook would be strained, occasionally breaking out into transplanar warfare with the reptile men. Little detail is set for these worlds, so the GM has a free hand in building their geography and cultures. For the few paragraphs of basics that *have* been set down about these worlds and templates for many of their inhabitants, see GURPS Banestorm.

The GM may set the number of reliably charted gates to alternate normal-worlds wherever he pleases; having a hundred or more would make crossworld travel a typical part of life on Tomos and leave plenty of room for his own worlds, and as always an infinite expanse beyond for new exploration, new threats, and new rewards.

Offworld Sites of Interest

The City of Mirrors

The center of the Tomosic network of roads and teleport gates to sites of interest in the Complex is the City of Mirrors. Its name comes both from its access to multiple worlds and from its physical nature. Situated in the paraelemental region between Earth and Air, the entire settlement is carved from a stratum of glassy stone. Siting the transport hub here provides the features of a temperature warmer than Earth, a steady supply of breathable air, and great beauty: the lights of the city reflect off of the faceted dome above and flash rainbow reflections across the Grand Spiral where the teleport gates cluster. Whole buildings are carved from the native glass, etched and sculpted with geometric precision and artistry of which the Greeks would have been proud.

The City of Mirrors boasts a permanently enchanted double-width gate to the capital city of the Tomosic Confederation

on Terra. The gate is guarded at all times by a detachment of soldiers on the lookout for attempts to destroy this economically valuable highway. Surrounding the wide plaza are the major trade highways leading to other sites in the Complex and the gates to nearby friendly worlds. Rising above this is the Grand Spiral, a slow-rising ramp dotted at regular intervals with teleport gates to useful sites too far away to conveniently walk. As new sites are found, more of the Spiral is carved out of the rock and the dome above is expanded.

Elaia, the City of Lamps

Deeper in the Plane of Earth can be found all manner of soil and stone, even Essential Earth appearing naturally and replenishing itself out of the plane's energies. Materials can be mined here and physically brought back to Tomos via the gate network, whereupon the earth from the Astral often exhibits curious and valuable properties. Orichalcum arms Tomosic soldiers, worked by smiths initiated in the secrets necessary to fashion the metal; Essential Earth helps the island nation feed a larger population than its soils could support; precious gems adorn jewelry and are worked into sizable powerstones; naturally charged manastones of impressive sizes are sometimes found and auctioned off for high prices.

Elaia sits near all this industry, housing its workers and serving as a market town. It is carved out of the Plane of Earth, the city sitting inside an upward-opening cone pierced by pillars and crisscrossed by bridges full of houses and shops. The natural cold and darkness there are banished by lamps on every corner, fueled with pitch dug easily nearby, the flames flickering all around one's field of view. This is the place in the Complex to get your hands on high-quality raw materials, and to find craftsmen in stone who work close to nature.

Blib

Water is life. Where there is liquid water and any sort of organic chemical, it seems life can arise and some kind of adaptation survive. Where the Plane of Water receives liquid oils and fats, natural life has arisen even in the unnatural conditions of the Elemental Complex: flora, fauna, and even intelligent life. "Blib" is the best approximation human travellers make of the native name of the Bubble Kingdom, where humans are confined to carefully-maintained pockets of air while their octopus hosts swim around them. The two species mostly bemuse each other; Tomosic tools and magic adapt poorly to usage submerged in water, though some teaching in mathematics has been well received. A small outpost of the octopi has taken up residence in the Ring Sea, the largest freshwater body on the Tomosic homeworld. From there, they occasionally venture forth into alien air as carefully swathed as humans back home.

(A saltwater race mentioned in **GURPS Banestorm** may be cousins that evolved in a region of this plane with higher salinity.)

Storm

As far from the solid earth as it is possible to be in the Complex, the elemental region called Storm appears as planetoids of water floating through atmosphere, lit by incessant lightning flashes and whipped to frothing fury by howling winds. Air, fire, and water are at play here unconstrained by stubborn stone, and Weather College spells work at peak efficiency. At the center of one of these spheres of water is said to be fabled Eye of the Hurricane, an object (or site, or creature -- the rumors are vague) capable of unleashing militarily devastating weather on a foe's homeland. It's also a great place to challenge your sailing skills. The few sea monster fisheries that survive here can always use brave pilots.

Adventure Seeds

Impostor!: The notion of doubles has disturbing implications for religion and philosophy. At present, only a few people have reliably documented doubles (someone on another timeline physically similar, with a similar name

and life history). The Order of the Tetrahedron has begun investigating reports that multiple known doubles on worlds beyond Amalle are turning up dead. There are some citizens on and off Tomos and the Varen Union who would be more comfortable if their alternates just went away; but are the citizens of Amalle perpetrators or targets?

Attack of the Reptile Men: Tomos' philosophical overtures never went over very well with the reptile men of Gabrook, and their culturally expansionist outlook is threatening to local rulers and religions who don't want their history to be washed away in a foreign tide. A large-scale military campaign between two worlds would center on the chokepoints of invasion at the gates, with the kobolds seeking to mediate peace as trade drops drastically while the humans struggle with the followers of Bozdaag. Ultimately, a Tomos threatened by superior barbarian numbers might simply *destroy* the natural gate as best it could, collapsing the caverns for miles around it. War creates all manner of opportunities for adventures in this vein.

Everyday Miracles: Trailblazing explorers face all kinds of dangers and opportunities for untold riches in the Complex. Members of the Order of the Tetrahedron steadily scout out new worlds and make contact in roles very similar to Infinity's Penetration Service, skipping any niceties about keeping the Secret; meanwhile, economically-motivated prospectors and natural scientists find room for nearly every motivation of humanity within the Complex and its colonies.

Greetings from Earth, and Earth, and Earth: Putting Tomos on Quantum 1 sets it comfortably far away from Reich-5, Homeline, and Centrum, making these crosstime powers mutually inaccessible to each other, except for Reich-5 (which is low-mana). Of the three, if Reich-5 is Tomos' first introduction to a high-tech society deep paranoia will be likely to set in once any serious examination of the social consequences is carried out; vice versa, if Reich-5 ever gains knowledge of the Divided

world has yet to occur to Tomosics. The broader tracts of Yetzirah, Briah, the Abyss, and Atziluth remain unguessed territory. The theory of alternate timelines has not occurred since the worlds to which Tomosics travel lack significantly parallel geographies or histories, though philosophers discuss the implications of the occasional doubles found and the fact that the stars are similar everywhere. Tomosic cartographers *are* beginning to notice that large continents are the rule rather than the exception, and that similar continental outlines appear to be common as well.

Indications of high technology are only vaguely coming to the attention of perceptive analyzers of offworld rumors. In a pattern similar to the worlds encountered by Infinity, Tomos has first encountered "nearby" worlds where magic and technology are similar to its own, gradually getting stranger as the hike from the City of Mirrors gets longer. Should it ever encounter a high-tech world, it would quarantine travel there and endeavor to obscure its own existence while understanding the technology and underlying science required to replicate it. Stealing educational textbooks and hastily re-engineering high technology would be the most palatable solution; spells of Steal Skill and Permanent Possession on kidnapped foreign technologists are ethically unpleasant but could be perceived as necessary against a high-tech threat. (Such spells are little studied in Tomos; necromancy is more likely to be found in the Varen Union and Communication & Empathy mages have advanced their art most in the Sanguine Alliance, meaning that Tomos could find itself required to admit a deficiency of knowledge and request assistance from former enemies against a worse threat.)

Land and Gate spells, the Infinite Worlds are in serious trouble. Happier consequences could ensue if Tomosics make contact with a Q5 magical alternate that Infinity can contact, though Infinity's few intelligence agents in German technical laboratories on Reich-5 could learn of contact with the Divided Land and risk an attempt to make contact with Tomos, directing them to a more convenient location. One of the few advantages Tomos would have fighting the Reich would be a possible effect of the Astral on high-tech equipment; an optional rule in *GURPS Cabal* gives devices beyond TL4 severe penalties for use as the loose physics of the plane plays havoc with their internal workings.

O For A Muse of Fire: *Henry V*

"O for a muse of fire, that would ascend
The brightest heaven of invention,
A kingdom for a stage, princes to act
And monarchs to behold the swelling scene!
Then should the warlike Harry, like himself,
Assume the port of Mars; and at his heels,
Leash'd in like hounds, should famine, sword and fire
Crouch for employment."
-- William Shakespeare, *Henry V,* Prologue:1-8

'Tis not Crispin, but Christmas, come round at last, but 'twill do, 'twill do. Once more I call on [Shakespeare's muse](#) to light our Yule fires of speculation and wonderment, examining the dramaturgical underpinnings behind the Great Work of English literature. Once more, we see the vague outlines of magical workings behind a fog of blood and smoke. Once more, then, into the breach . . .

"Vouchsafe to those that have not read the story,
That I may prompt them; and of such as have,
I humbly pray them to admit th'excuse
Of time, of numbers, and due course of things,
Which cannot in their huge and proper life
Be here presented."
-- William Shakespeare, *Henry V,* V:0:1-6

As the play opens, the Archbishop of Canterbury and the Bishop of Ely, worried that King Henry V will confiscate their property, decide to buy him off by funding his upcoming war on France. Henry demands an arcane legal justification from the churchmen for his claim to the French throne as a way of tying them to his campaign. He then orders the execution of three noble traitors in French pay. Meanwhile, his old companion Falstaff lies dying offstage, discussed by his cronies Nym, Bardolph, Pistol, and the former Mistress Quickly. In France, the Dauphin and his Constable discuss Henry; the Constable urges the Dauphin not to underestimate the young king, and eventually the French try to buy Henry off with an offer of marriage to Princess Katherine.

Henry will not be turned aside, however, and invades France. His army includes Bardolph, Pistol, and Nym, under the command of the doughty Fluellen, a comic Welshman. Henry besieges and sacks Harfleur and marches deeper into France, incidentally hanging Bardolph and Nym for looting a church. In Paris Princess Katherine attempts English lessons for her potential husband, while the French again try to dissuade Henry. Undaunted, he vows to accept battle even in his weakened state if the French have the courage to offer it. Near Agincourt, the French stay up late boasting and gambling, while King Henry goes among his men in disguise, nearly getting into a brawl with one Williams at one point. The next day, after a stirring speech by Henry, the English win an overwhelming victory. After some more byplay with Henry, Williams, Fluellen, and Pistol, the scene shifts to Henry's successful courtship of Katherine, although the Epilogue points out that their son will be the feckless Henry VI, who will lose everything his father gained and more.

"Then shall our names,
Familiar in his mouth as household words,
Harry the king, Bedford and Exeter,
Warwick and Talbot, Salisbury and Gloucester,
Be in their flowing cups freshly remember'd.
This story shall the good man teach his son;
And Crispin Crispian shall ne'er go by,
From this day to the ending of the world,

But we in it shall be remembered."
-- William Shakespeare, *Henry V,* IV:iii:56-64

The printer James Roberts entered *Henry V* in the Stationer's Register on August 4, 1600 in a (failed) attempt to prevent pirated manuscripts from circulating, but Shakespeare most likely wrote the play the year before. Not only does the famous "wooden O" in the Prologue call to mind the Globe Theatre, new-built in the spring of 1599, but the reference in Act V to "the general of our gracious Empress/. . . from Ireland coming/Bringing rebellion broached upon his sword" is universally considered a reference to the Earl of Essex' campaign in Ireland, which began in March of that year. Since he returned after a miserable failure in September, the lines celebrating his "welcome" were probably written some time before that. Admittedly, this argument wobbles a bit, since the Curtain (Shakespeare's previous stage) could also be described as a "wooden O," and the lines in Act V don't actually appear in the pirated edition of 1600. The first documented performance wasn't until January of 1605, for King James, but longstanding academic tradition holds that *Henry V* was the first play shown at the Globe when it opened in June of 1599.

Shakespeare took the story from English history (even English hagiography) via his old workhorse, Holinshed's *Chronicles* of 1587, with some bits thrown in from Edward Halle's *The Union of . . . Lancastre and York* and Robert Fabyan's *New Chronicles* of 1516. He may have lifted even more of the play from a "Harey the Vth" listed in Henslowe's diary and possibly performed (illegally) by Shakespeare's troupe in the mid-1590s. Parts of *that* play may be in the anonymous *Famous Victories of Henry V* entered in the Stationer's Register on May 14, 1594, and parts of that play show up in Shakespeare. Shakespeare's *Henry V* is also, of course, a sequel to his own, very popular, *Henry IV Part I* and *Part II,* which introduced Pistol, Nym, Mistress Quickly, and Bardolph, as well as the figure whose spirit, exorcised but lingering in death, hangs over Henry V and *Henry V* -- Falstaff.

"Not to-day, O Lord!
O! not to-day, think not upon the fault
My father made in compassing the crown.
I Richard's body have interr'd anew,
And on it have bestow'd more contrite tears
Than from it issu'd forced drops of blood.
Five hundred poor I have in yearly pay,
Who twice a day their wither'd hands hold up
Toward heaven, to pardon blood; and I have built
Two chantries, where the sad and solemn priests
Sing still for Richard's soul."
-- William Shakespeare, *Henry V,* IV:i:181-191

The through-line of the two *Henry IV* plays is the jovial brotherhood of "Prince Hal" and his companion in sin and revelry, Sir John Falstaff. At the end of *Part II,* Hal, now crowned King Henry V, forcibly and famously separates himself from his anima -- "I know thee not, old man" and categorizes him as not a knight but "a fool and jester." In *Henry V,* Falstaff is broken by the separation, and dies (offstage) as Henry orders the execution of three of his other friends, the traitors Cambridge, Scroop, and Grey. By this act, Henry is reversing the action of Richard II (and Shakespeare is reversing the action of *Richard II*) who left traitors alive, and was killed by three of them. Unfortunately for Henry V, one of the traitors spared by Richard was his father, Henry Bolingbroke, who usurped the throne as Henry IV.

Henry V continuously tries to shed his sins, be they the personal sins of Falstaff or the royal sins of his father. He weeps "contrite tears" over Richard II, re-inters the body, and pays for ritual intercession by both commoners and clerics. Like Richard II, he puts aside his crown for a common cloak, attempting to re-connect to the true blood royal of England. This act is also a sort of mystical disguise, of hiding from judgement -- as Williams puts it, "Your majesty came not like yourself." And even then, Henry fears retribution, ritually transferring his fault (in the shape of Williams' glove, taken as a token of offense) to Fluellen, his new, noble, non-Falstaffian twin. (Fluellen spends much comic dialogue comparing himself to Henry, and Henry to "Alexander the Pig.") Henry's whole invasion of France (like Alexander's invasion of Persia) can be seen as an act of atonement, both crusade (remember his insistence on Church support) and scapegoating, carrying blood sin overseas to be washed away in patriotic gore, or to be left on France's

"tawny ground."

"A largess universal, like the sun
His liberal eye doth give to every one,
Thawing cold fear. Then mean and gentle all,
Behold, as may unworthiness define,
A little touch of Harry in the night."
-- William Shakespeare, *Henry V,* IV:0:44-48

And for a while, it worked. In the play, Henry is not just Alexander reborn in war, but a fair, firm, monarch with just enough of the common touch -- the perfect dream of English kingship. He effortlessly bends the Church to his will, spies out treason in an eyeblink, and wins over the Princess of France in a single narration, in common soldier's prose no less. The play refers to Henry as "like the sun," and while wooing Katherine Henry compares himself to the sun in constancy. The Duke of Exeter compares Henry to "the former lions of your blood," implying none too subtly that Henry is just such a lion.

Interestingly, the real, historical Henry created much of this legend and imagery himself, just as the play's Henry confidently asserts that he (and his "band of brothers") "from this day to the ending of the world" will be remembered as latter-day heroes of the mold of Gideon. The historical Henry identified himself with the Trojans and their legendary descendants the Romans, using the emblem of "the sun in splendor" as well as the heraldic lions of England. Henry's glorious legacy inspired Edward IV, who identified himself with King Arthur and (despite being a York rather than a Lancaster) with King Henry V. This overlay of Henry and Arthur echoes back down through Shakespeare's play when Mistress Quickly tells how Falstaff has died and gone "to Arthur's bosom." On the surface, this is a comic malapropism for "Abraham's bosom," the colloquial term for Heaven -- but it also implies that Falstaff is reunited in death with his beloved "Prince Hal," King Arthur reborn, despite Henry's desperate evasions.

"HEN. . . . I cannot so conjure up the spirit of love in her, that he will appear in his true likeness.
BUR. Pardon the frankness of my mirth if I answer you for that. If you would conjure in her, you must make a circle; if conjure up Love in her in his true likeness, he must appear naked and blind."
-- William Shakespeare, *Henry V,* V:ii:149-150

The lines above are the most explicit magical exchange in the play, as Henry and the Duke of Burgundy discourse, almost idly, on the proper methods of magically invoking love between Henry and Katherine, between England and France. Henry deprecates his magical abilities -- or is he asking a question, asking "How?" Burgundy (who represents a kind of Mercury, apparently, changing sides and politics with ease) responds with a clear statement of the Agrippan rules of decanic magic: Henry must conjure with the proper emblem or icon or aethyr of Love, which is to say Cupid, "naked and blind." (Or is he referring to those enigmatic [cherubim](#), who seemingly embody just the sort of very intermingling that Henry desires?) And Henry responds with "naked" prose (rather than courtly iambic pentameter) and "blind" expression of love rather than hints or coquetry -- and it works. Elsewhere in the play, Nym (whose name actually means "thief" -- another Mercurial reference?) denies Pistol's "solus," (a pun, among other things, on solace -- and on the Sun) saying "I am not Barbason, you cannot conjure me." Nym is inert, he says, to magic -- and he is hung, expelled from Henry's Working.

And of course the most famous conjuring, the most famous invocation perhaps in all of Shakespeare begins the play: "O for a muse of fire!" In other words, Shakespeare himself (who traditionally is ascribed the part of the Chorus) invokes an elemental, a "Muse of fire." This calls to mind, perhaps, the alchemist's quest to spark the "philosophical fire" (also called "the secret fire"), a fire of magical potency, in order to complete the Great Work. Which is interesting, not least because Edward IV, our would-be avatar of Henry V, kept one alchemist (Sir George Ripley) as a some-time advisor on ceremonial and another (Ripley's protégé Sir Thomas Norton) as his actual privy councilor. Ripley famously separates the Great Work into twelve stages, one for each sign of the Zodiac -- and counting the Prologue, there are 24 scenes in *Henry V.* As Shakespeare "twins" Henry and Fluellen, has he set a twin Working aboil?

"RAM. My lord constable, the armour that I saw in your tent to-night, are those stars or suns upon it?

CON. Stars, my lord.
DAU. Some of them will fall to-morrow, I hope."
-- William Shakespeare, *Henry V,* III:vii:31-33

The battle of Agincourt -- fought, by the way, on the saint's day of twins, Crispin and Crispinian -- thus becomes the "Torment of the Metals," the tumult in which all ingredients are melted in the secret fire. There are hints in the play of this: during Agincourt, Pistol refuses "brass" and captures "Monsieur le Fer" -- Fire has taken Iron. Even more evocatively, the Duke of Orleans greets the morning of the battle with "the sun doth gild our armour," a clear reference to the solar Henry transmuting their base iron to gold. Ripley refers to the Torment of Metals as sublimation, fermentation (literally, the addition of a spirit), and exaltation -- a process recapitulated in Henry's "St. Crispin's Day" oration, and in the battle itself.

Calcination, the initial burning, is easily seen as Henry's flaming up at the Dauphin's insult in Act I. The solution, or thinning, might be both the exorcism of Falstaff (the very emblem of "base matter") and the execution of the traitors. Ripley's "separation by water" is so clearly the invasion itself, crossing the Channel; while putrefaction may be either the Act II scenes in Mistress Quickly's brothel or the scenes in the French court or both. As we begin Act III, Henry (and Shakespeare) unites England, Wales, Scotland, and Ireland in his army (through Gower, Fluellen, Jamy, and Macmorris) -- Ripley's coagulation? Cibation, the feeding with liquid, runs throughout, from Henry's tears watering Richard II's body (the true Stone?) to the blood soaking into the battlefield. The play ends with Henry filling Williams' glove with gold (multiplication, inherent also in Henry's frantic identity-shifting) and returning to France (projection) to pursue the [Chemical Marriage](#) of Red King and White Queen with Princess Katherine. Henry refers in his wooing to "sun and moon," to seal the deal.

"The flat unraised spirits that hath dar'd
On this unworthy scaffold to bring forth
So great an object: can this cockpit hold
The vasty fields of France? or may we cram
Within this wooden O the very casques
That did affright the air at Agincourt?"
-- William Shakespeare, *Henry V,* Prologue:10-15

And all of that Work occurs "within this wooden O," inside a carefully constructed and aligned spheroid. Inside, that is, an athanor, which is the Globe itself, fed by "a muse of fire." And once more we have a royal alchemist, this time Robert Fludd, to conjure with. Fludd and Shakespeare shared the patronage of King James I, and Fludd recapitulated his Hermetic arts in an engraving he called the *Theatrum Orbi,* the "theatre of the world," which is to say, the Globe Theatre. We may note, in this context, that Elizabeth's magus John Dee had designed stage sets and machinery while at Oxford, and would have been familiar with Vitruvius' "perfect stage," designed to faultless [sacred-geometrical](#) patterns. We also know that the second Globe (built in 1613 on the burned ruins of Shakespeare's Globe) was [aligned](#) to the midsummer sunrise axis -- just like Stonehenge -- and that likely therefore so was Shakespeare's "wooden O." Shakespeare, in other words, built an egg (round, like Stonehenge) on the [midsummer](#) alignment, quite possibly using Dee's Vitruvian sketches, and then invoked "a muse of fire," powering the Great Work through the already alchemically-potent Henry V to complete his athanor, possibly on its debut performance. A tradition that somehow has remained vital -- the first performance at the new Globe in 1997 began with the Prologue and Act IV's torment of metals from *Henry V.*

Pass It Here: Four Fantasy Themed Drugs

for *GURPS Fourth Edition*

by R. Ciulla

While these substances were designed under the assumption that they were to be used for a fantasy campaign, there is no reason such substances cannot be easily converted for use in other genres. Whether new, secret drugs of a modern day campaign; hot, synthetic chemicals on the mean streets of a dystopian cyberpunk world, dangerous substances of strange new planets; or odd chemicals found in the back alleys of far-flung future space stations, the GM is encouraged to use them as he sees fit.

Dream Smoke

Dream Smoke is an addictive substance harvested from a type of latticed fungus. Like most fungi it grows best in warm, damp places . . . usually the wetter, the better. Dream smoke crops are often grown in cellars. A simple cellar with a wood burning stove (for warming the room) and water tossed on the floor now and again (to keep things nice and damp) will work. To achieve greater yields, more serious growers use complicated steam blowers and small water fed tubing that continuously spray the room with water, producing a humid, damp environment. The most commonly used food source for the fungus are wood chips scattered across the floor. The fungus begins to spore within days, forming baseball-sized spheres which slowly change into open air latticed structures. The mature lattice is very fragile and must be picked with great care in order to avoid damage. Total time to maturity ranges from 10 days in the best warm, wet environments to over 30 days in common wood-burning, water-bucket cellars. Recreational growers often don't even use their entire cellar floor, simply growing a small crop in and around the wood stove, wetting the floor and the wood chips around it.

Once picked, the fungi must be stored in a cool, dry place (usually in a metal container or large clay pots) for no less than three to five days depending on temperature and humidity. The latticed body of the fungi shrivels, collapsing in on itself into a long tangle of root-like structures with a tough fibrous texture. Normally chopped up for convenience, the shriveled fungi is roughly half a meter in length, one of them typically yielding 20 doses on average size. Each dose is one chopped piece of the plant, and when burned produces a thick, pale blue smoke, for roughly 10 minutes before the piece of the plant is consumed. Users inhale the smoke.

Dream Smoke is a mild depressant that causes euphoria and a faint feeling of drowsiness. Normally used as a relaxant to aide in sleep, it sees casual use as well for the pleasant feeling it produces along with its characteristic warm, drowsiness. Users often place their bit of the fungus is a small bowl to set it alight. More private use is normally seen in the bed chamber by way of a small, squat, round table vase. Styles vary wildly, but all of them incorporate small open slats at the top to allow smoke to escape. Dream Smoke vases can be as ornate and as unique as anyone can image. Coming in a variety of fashionable styles and shapes, these vases sell briskly in marketplaces near regions where Dream Smoke is common.

Overdose potential: There is very little risk of overdose with this substance.

Dream Smoke is a highly addictive, cheap substance. Legality varies. Users gain the irritating afflictions euphoric and drowsy, if they fail a HT-2 roll, for 10 minutes times the margin of failure. An HT-2 roll is normally required after 10 minutes of exposure.

Grit Eye

Grit Eye, simply known as Grit, is a thick, viscous liquid permeated with dark, abrasive particulates. Grit is a popular -

- but dangerous and expensive -- stimulant. Users are characterized by watering eyes and prevalent blinking. Habitual use has been known to cause eye damage up to and including blindness. Many a broken, blind beggar can trace their current woes back to Grit. Grit's origins lie with the Vendu plant. A high altitude scrub bush that bears a waxy yellow, but juicy fruit. The scrub bush's leaves are thick, tough, and abrasive frequently requiring a knife to separate them from the plant. Vendu does not grow in low altitudes and flourishes best between altitudes of 6,000 to 8,000 feet. Once the fruit and leaves have been picked, the fruit is chopped into several pieces and tossed, along with several of the thick leaves, into a pot of water. Once the mixture begins to boil, the heat must be reduced and the mixture allowed to simmer for no less than half a fortnight. The result is a thick, viscous layer of yellow liquid that slowly rises to the top of the water. The layer is skimmed off and poured into a large bowl. Draining the pot leaves a fine layer of an abrasive, silty substance from the boiled leaves which is added to the viscous yellow liquid. Grit is often stored in one-inch glass vials, and is easily identifiable by its deep amber color and the dark particulate matter that lay suspended inside it. Six fruit and a double handful of leaves will produce a dozen vials of Grit. Each vial houses four doses.

Users administer Grit by drawing some of the substance out of whatever it's kept in, dropping a bit of the thick, gritty liquid onto each open eye, shutting them, and moving them back and forth to give maximum saturation. In a pinch, a user can dab a bit on his thumb, and gently swipe it across the open eyes. Users must make an HT-4 roll to resist the effects, which typically takes effect within thirty 30 due to saturation so close to a mucus membrane. The effects of Grit last a number of hours equal to the HT-4 roll's margin of failure. Users immediately gain 1 fatigue point (if any are lost), one level of Overconfidence (or an increase in level if Overconfidence is already possessed), and High Pain Threshold (as the drug stimulates the subject's nerves to give a continuous warm sensation across the body and pain receptors are muted). The only irritant are the subjects eyes which continuously feel as if they have sand in them giving users a -1 to all vision rolls.

Once the drug wears off, users become mildly depressed and irritable (1 level of bad temper and chronic depression which will add to any existing conditions), and suffer the loss of two fatigue points along with a continuing -1 to all vision rolls for a number of hours equal to the previous hours that the user was under the effects of the drug. Concurrent use of the drug for a number of days equal to the user's HT, without a dry period of the user's HT in days, requires a HT-2 roll to avoid permanent eye damage (user gains farsighted or nearsighted, at the GM's choice). Continued use in the above fashion will require another roll as described above and, if failed, the acquisition of the previous bad vision option that was not picked by the GM. A third failed roll, after continued use, will result in permanent blindness with a failed aforementioned HT-2 roll.

Overdose potential: Taking more than one dose of Grit within a 24 hour period has the possibility to cause a fatal heart attack, if an HT roll is failed. In addition, each additional dose past the first counts against total days for concurrent use of the drug resulting in an HT-2 roll to avoid permanent eye damage.

Grit is an expensive -- but only mildly addictive -- substance. Legality varies.

Cacophony

Commonly referred to as Caw or Blackbird, this substance is derived from the highly poisonous berries of the Nak'tid bush. Nak'tid bushes grow only in temperate climates around shallow, brackish lakes. The juice of the berries make an excellent contact poison, and must be gathered and crushed very carefully. Contact with the juice of the berries can be fatal. The juice must be boiled over high heat in a well ventilated room, as part of the juice goes to gas. The fumes can lead to lung irritation (HT-1 roll to avoid coughing; critical failure on this roll leads to a severe allergic reaction causing the throat to close up; treat as choking). Once the boil off has taken place, what's left is a thin white liquid that can be ingested orally or rubbed into the skin. Cacophony is a hallucinogen whose primary effect is to induce a very specific form of synethisia which manifests auditorily from colors that the user of the drug looks at. In effect, the user is able to "hear" colors. Secondary effects include a general lowering of inhibitions (User gains Lecherousness (9) and a temporary suspension of any mental disadvantages that would interfere with social interaction such as, but not limited to, shyness), and a slight inebriation (user is tipsy). Two handfuls of berries crushed for juice, then boiled, yield about two hundred milliliters of the drug.

Cacophony takes effect in one minute if the user fails a HT-4 roll, and lasts a number of hours equal to the margin of

failure (minimum one hour). Once the effects of the drug have ended, users are afflicted with a mild headache (moderate pain). The very mild side effects make this drug more dangerous as users often throw caution to the wind regarding its possible long term effects.

Long Term Effects: Habitual use of Cacophony for a period longer than HT weeks without a user going off the drug for a number of weeks equal to 20-HT weeks (minimum one week) must make two HT associated rolls. The first roll at HT+4 checks for damage to two parts of the the brain, the first being Broca's area and the second the auditory lobe of the brain. Failing this roll will produce consistent auditory hallucinations. At first the voices are merely an irritant, but continued abuse of Cacophony can lead to more serious hallucinations (users gains Phantom voices/1 on a failed roll). Auditory hallucinations take the form of a babbling voice when looking at colors. The second roll is at HT. Failure indicates the development of acute episodes of migraines, that have the potential to grow progressively worse if the drug is continuously abused. [user gains chronic pain mild severity two-hour interval (-15)].

If the user continues in this fashion without going off the drug for the above stated increment of time, then the next two HT checks (after a further HT number of weeks) will be at HT+2 and HT-2 respectively. If the previous rolls failed, auditory hallucinations and migraine episodes will increase in severity [Users gain Phantom voices/2 and Chronic pain severe severity 4 hour interval (-15)].

Users of the drug continue to make HT rolls in this way but HT rolls can go no lower than HT-4 for both rolls. Critical failure at late HT-4, for Chronic pain increases, will result in epilepsy as well as an increase in chronic pain (if the user has not reached the maximum level of chronic pain).

The pain experienced by long-term users of the drug often leads to abuse of secondary pain management drugs. Cacophony is widely known to be kept in small containers that resemble miniature wine or water skins. Small pieces of animal bladder or skin are cut and sewn tightly together so that users can gently squeeze the container and squirt the drug into their mouths or onto their skin. Containers for the drug are roughly the circumference of a half dollar. Each container of Cacophony contains about a dozen doses.

Overdose potential: Taking more than one dose of Cacophony in a 24 hour period requires the user to roll vs. HT with a -2 penalty for each dose past the first. Failure indicates possible violent delusions (roll vs. will or experience the equivalent of a severe level delusion: "Anything with color is trying to kill me!"), and pin-prick hemorrhaging in the brain (mild pain affliction with increases in severity per each additional dose of cacophony taken in a 24 hour period). Critical failure indicates an aneurysm and death.

Cacophony is a cheap, mildly addictive substance. Legality varies.

Quint

A bastardization of the word Quiescent, meaning "calm." A dangerous perversion of a common nervous system depressant, Quint partially suppresses the part of the brain known as the amygdala. Users of the drug find it quite difficult, but not impossible, to experience fear response. This results in an overall improvement in combat efficiency for anyone with the skills to back up such an advantage, but can result in a terrible death for those that don't have the skills to back up their new, fearless nature. Quint's parent drug is processed from a hardy type of canyon scrub grass called Nordok. When boiled over high heat, between two and three hours, then diluted Nordok produces a strong, very commonly employed relaxant. If the parent drug is not diluted (the standard practice in the legal drug's manufacture), the resulting chemical is a bitter fluid tasting faintly of dry pecan and burnt rubber. For this reason, the drug is often added to some other strong substance in order to kill the taste. Any strong-tasting liquid will do. Oral ingestion of Quint without adding it to another liquid requires an immediate HT-3 roll to avoid vomiting. Popular with soldiers, mercenaries, and those in violent professions, Quint is often added to strong ales, meads, beers, wines, juices or the like. Quint is often referred to in the vernacular as liquid courage, fearless beer, or murder juice. Quint comes in vials of single doses, and it's rare for it to be packaged any differently.

Quint takes effect in HT minutes if orally ingested or HT seconds if injected. The user gets a HT-6 roll to resist. Quint remains viable in an average user's system for five hours before it begins to break down (HT/2 hours). Users under the

effects of Quint suffer a generalized suppression of their fear response, gaining five levels of the Fearless advantage, and any self control rolls for disadvantages that evoke a fear response (such as phobias) are only triggered on a roll of 17 or 18 on 3d. Users also gain Overconfidence (-15), or have their overconfidence resistance roll worsened by one level (to -12, -9, or -6 respectively) if they already possess the disadvantage.

Quint can be dangerous with repeated use, eventually damaging the subject's ability to process their fear response as well as other emotions. Make an HT-3 roll after HT months to avoid a permanent addition of one level of fearless, one level of overconfidence (at -15 to begin or worsened by one level if overconfidence is already one of a character's disadvantages) and the callous disadvantage. A character must roll against their HT-3 every HT months, or pick up one additional level of fearless, and one additional level increase of overconfidence. Five eventual failures of this HT-3 roll will add the Killjoy disadvantage as the drug ravages the brain.

Overdose: Taking more than one dose in a 24 hour period requires a HT-2 roll with an additional -2 to HT with each successive dose. Failure indicates damage (1d toxic; Two one hour cycles) to the subject's nervous system and brain, resulting in a permanent -4 DX penalty (possible recovery only with spent character points), and gaining the Epilepsy disadvantage. Failure by 5 or more gives the character Killjoy as well. Critical failure means immediate coma and possibly death along with the usual 1d toxic, DX penalty, Epilepsy, and Killjoy if the character pulls through the coma.

A Decidedly Different Dwarf

for *d20 System*

by Caias Ward

Tamak and Azioc Stormhammer stood in Axwyrd Pass, side by side. The passage was 10 feet wide, opening to a chamber 50 feet on a side. They each claimed half the passage, half the way that none of the Sea Baron raiders would pass.

And try to pass they did. A force of a hundred strong, their Rahavin Shock Troopers, armed with long spears, set themselves upon the brothers. The Sea Barons sought the prize of mithril from the Axwyrd Mines, sought to destroy the two who guarded the Deep Below. But the brothers would not be pushed aside. They set themselves in place, their long chain axes cutting deep into the invaders. Many were the wounds they brothers took, but they would not topple. Their blood flowed silver, and the guard of dwarves that stood behind them, the ones that watched the brothers dispatch a hundred men without falling, knew the clan had been blessed by the Forge Father.

He has sent two of his ForgeBorn, the dwur, to protect them. Thus, this day, Hammerstrike 7 of the Year of Receding Rust, marks the blessing of the Forge Father upon the Kessel Clan.

--Chronicle of Thangrim Axwyrd, Scholar of Clan Axwyrd, Voice of the Forge Father

* * *

Dwarves are a staple of many fantasy worlds. Fierce warriors, dour and grim at times, they mine much wealth from the earth and have a great devotion to family and clan. They have a great hatred for giants and goblinoids, and their feelings towards elves are less than cordial. Supposedly crafted in the workshop of the Forge Father, they are workmanship and dedication personified.

But the dwarves may have not been the first gift of the Forge Father to the world. He made another gift, a race with skin of stone painted ruddy and blood of oil and mithril. They were strong of body and will, but as perfect as they were, the Forge Father knew they were not suited for this world. While they were industrious, their passion was not in crafting and family but in simply serving the Forge Father. While they were warriors, they fought not for clan and family but for the pure joy of fighting. Their hatred of giantkin was not from wrongs upon them but because the Forge Father ordered it so.

So back to the Eternal Forge the Forge Father went, breathing life into his new creations, the dwarves. They were not as strong, not as friendly, but they had passion and souls. They would fit in well with the rest of the young world the Forge Father sought to populate.

Still, his first creation, the dwur, still had purpose. He knew they were simple-purposed creatures, but they were good of heart and loyal. While not passionate, they were curious and honest. He gave the dwur a new edict, to hide themselves among the dwarves and foster them. They would show the dwarves the secrets of mining, the art of warfare, and the value of clan and family by questioning the foundations of dwarven society. In time, the dwur would retreat from the world, to be called upon again should the need be great.

What Calls a Dwur?

Dwarf elders and thanes don't know what calls a dwur to a clan. Sometimes, whole clans can fall without assistance, yet a single child's prayer can brings two dwur to help in some great undertaking. However, the dwarf scholar Thangrim Axwyrd has, through extensive research, narrowed down several conditions that were in common with all

recorded appearances of the dwur:

- the calamity against a clan of dwarves often is not the clan's fault
- the dwarves have expended great resources of their own in order to combat the threat against them but still need help
- an innocent or faithful dwarf has suffered greatly at the hands of oppressors and has made a call for aid
- dwarves have rejected a means to end their suffering when it would have harmed innocents, even though it would have saved dwarven lives.

Should a dwarven clan prove worthy in one or more of these ways, a dwur will arrive under various guises: a young dwarf adventurer, a merchant, or a host of other dwarven guises. They will often find an innocent and faithful dwarf and strike up a friendship. Not revealing himself, the dwur will help the clan as though he were an ordinary dwarf. Soon, however, the minor abilities of the dwur will show; dwur blood is silver and any object he polishes will stay clean for days, no matter how dirty its surroundings. He will start calling for more action against a threat, often inspiring the dwarves to greater deeds. So long as the dwarves seek a good purpose, the dwur will stand by them.

Heart of Mithril

Even as they focus on the protection of dwarves, the dwur are curious creatures. Sometimes, they will strike up romantic relationships with dwarves that run quite counter to dwarven traditions of courtship and ritual. These relationships grow in passion far beyond was is normal for a dwur; these relationships often cause mixed feelings as a dwur attracts and is attracted to a married man or woman, especially since these relationships invariably result in the birth of a child. Many keep these dalliances hidden, hiding the true parentage of the child as long as they can. Still, a child born from a dwur and a dwarf eventually stands out on his or her own and carves a unique place in dwarven society.

Even in their normal relationships, the dwur cause no end of confusion to dwarves. The dwur constantly question tradition, from the need to follow dwarven leadership to holding to doctrines of faith in the Forge Father. Some dwarves have even called the appearance of a dwur heresy and sought to drive them from their clans. These are sad times, for the reasons that dwur question is twofold: first, because they themselves do not understand always why dwarves act the way they do and they wish to learn, and second because they seek to strengthen the resolve the dwarven clans. By questioning tradition, the dwur hope to make dwarves understand why what they hold as tradition is so important.

After the crisis that brought a dwur to a clan is averted, the clan will many times find itself subject to another upheaval as artisans are inspired, young dwarves seek the adventuring life and old beliefs are turned on-end. These changes will shape a clan for generations to come.

Using The Dwur In Your Campaign

A player character dwur often finds himself in the world with no knowledge of his task other than what his heart and beliefs dictate. Such dwur gravitate to dwarves in particular and good people in general. An adventuring lifestyle allows them to fulfill their duty, experience the world and satisfy their curiosity; they often do non-dwarven things such as fishing or painting while out among the world.

For campaigns looking to add a touch of a divine, a dwur is an ideal gateway for a combat character to be part of a holy mission. A dwur is also a good counterpoint for dwarves, often inquiring about the sense of what a dwarf considers "normal" behavior and confounding them with "undwarfly" behaviors. As mentioned before, the appearance of a dwur is often a sign of great things, and an easy way to thrust a character and his companions into the center of any story.

Dwur

Medium Construct (Dwarf, Extraplanar, Good, Lawful)
Hit Dice: 4d10+39 (67 hp)
Initiative: +1
Speed: 20 ft. (4 squares)
Armor Class: 26 (+1 Dex, +6 natural, +9 Full Plate +1), touch 11, flat-footed 18
Base Attack/Grapple: +3/+9
Attack: One slam +9 1d6+9 or masterwork dwarven warchain +10 1d10+9
Full Attack: One slam +9 1d6+9 or masterwork dwarven warchain +10 1d10+9
Space/Reach: 5 ft. /5 ft. (10ft. with dwarven warchain)
Special Attacks: Dwarf traits, Construct Traits
Special Qualities: Damage reduction 5/adamantine, darkvision 120 ft, dwarf traits, fast healing 5, low light vision, will to flesh
Saves: Fort +5, Ref +2, Will +2
Abilities: Str 22, Dex 13, Con -, Int 13, Wis 12, Cha 18
Skills: Listen +8, Sense Motive +8, Spot +8
Feats: Cleave, Endurance (B), Power Attack, Toughness (B), Exotic Weapon Proficiency (Dwarven Warchain) (B)
Environment: Any
Organization: Solitary or Pair
Challenge Rating: 6
Treasure: Double standard
Alignment: Always Lawful Good
Advancement: By Character Class
Level Adjustment: + 4

Dwur as Characters

- +6 Strength, +2 Wisdom, +4 Charisma. A dwur, being a construct, has no Constitution score.
- Medium size. This grants a dwur a bonus 20 hit points due to being a construct.
- A dwur's base land speed is 20 feet.
- Darkvision out to 120 feet.
- Racial Hit Dice: A dwur begins with four levels of construct, which provide 4d10 Hit Dice, a base attack bonus of +3, and base saving throw bonuses of Fort +1, Ref +1, and Will +1.
- Racial Skills: A dwur's construct levels give it skill points equal to 7 × (2 + Int modifier). Its class skills are Listen, Profession (any), Sense Motive, and Spot. Racial Feats: A dwur's four construct levels give it two feats.
- +6 natural armor bonus.
- Natural Weapons: Slam 1d6 + 1 ½ times Strength bonus.
- Special Qualities: Construct traits, dwarf traits, Damage reduction 5/adamantine, darkvision 120 ft, dwarf traits, fast healing 5, low light vision, will to flesh.
- Will to Flesh (Ex): A dwur may use his Charisma score (if positive) in place of Constitution for calculation of hit points, Fortitude saves and skill checks. Also, dwarven casters worshipping a dwarven god may heal dwur with curing spells as though the dwur were mortal.
- Dwur gain Endurance, Toughness and Exotic Weapon Proficiency (Dwarven Warchain) as bonus feats.
- Dwur are proficient in Heavy Armor and Shields as well as all martial weapons, and the dwarven warchain.
- Automatic Languages: Common, Dwarf, Celestial. Bonus Languages: Giant, Orc, Goblin
- Favored Class: Paladin.
- Level adjustment +4.

Blood of the Dwur]

Sometimes, the dwur, fascinated by their dwarven charges, will end up having affairs with young dwarven maidens or men. Such passionate relationships are short-lived as the dwur vanishes as quickly as he appeared, either leaving a pregnant dwarven woman or a child left at a young dwarf's doorstep a time later. The legacy of such a relationship is a child with dwur blood. These children often become paragons of faith even though they stand apart from their own

clans.

Mithril Soul

You discover you are a child of a dwarf and a dwur, either left with a clan at birth or raised by your dwarf mother. Such an unusual birth is not shunned but honored, although other dwarves always consider the child strange. He often follows the path of the paladin and is more open-minded than other dwarves.

Prerequisites: Dwarf
Benefit: your favored class is now Paladin and may freely multiclass back into Paladin should you take other classes. You must maintain your alignment restriction, however.

Way of Hammer and Hearth

You are a child of a dwarf and a dwur, one who possesses the skills of a peacemaker as well as a warrior. Languages come easily to you and other races find you to be very agreeable.

Prerequisites: Dwarf
Benefit: Speak Language and Diplomacy are considered class skills for you, and you gain a +1 racial bonus to Charisma skills when interacting with other races.

Sample Character: Ransha Hearthfire

"She was pretty as dwarves go, with a strong stance and dark eyes. Ransha smiled a lot, a simple smile for simple joys. She loved children, often producing candy for them while impacting some small wisdom. Some dwarves would question and argue with her, but she would always lower her voice the more they raised their voices. She was a young lady of peace and maidenly virtue.

"She was also a lady of mithril blood, a dwur, whose warchain cut 20 giants down and whose touch ensured that the Thane did not die the night the giants crushed his bones. She stayed to drive off the giants and to assure the dwarves were safe. When the Thane not asked but ordered her to stay to war against the elves, her eyes grew darker still. Her face hardened, her voice deepened and she seemed to grow in size with each word.

"'I am no instrument of war but a singer of peace. I play the song of salvation but not the bitter tune of hate. My music ends for you, Thane. You will play this march to needless war alone.'

"Ransha left the Thane to his war; his clan, saved by her before, was destroyed in a generation by senseless war."

- Thangrim Axwyrd, "The Fall of the Stoneheart Clan"

Sample Item: Dwarven Warchain

The dwarven warchain is a fearsome weapon that has fallen out of favor with dwarves. Still, it is a favored weapon of the dwur and the dwur use it to devastating effect. The dwarven warchain is a thick chain with a dwarven waraxe head on the end, swung out towards an enemy with devastating effect. The dwarven warchain is a two-handed reach weapon that may be used against adjacent targets and requires an Exotic Weapon Proficiency to wield.

Pet Shop of Wonders

for *GURPS Fourth Edition*

by Orion Gates

Almost everyone has owned a pet of some kind or another at some point in his or her life, whether it was a shaggy little puppy or a short-lived firefly-in-a-jar. Some people love their pets so much they'll spend more money on their cat than they do on themselves. In the interest of obsessive pet-lovers everywhere here are a few magic items for a new way to spend cash on Princess. The stats are made using **GURPS** *Fouth Edition,* and the costs are calculated as Slow and Sure Enchantment based on page 22 of *Magic.*

Pet Clothes

Tiny clothes for tiny people. Or in this case, tiny clothes for small, annoyed animals. However, with the application of judicious enchantment pet clothes can be used for far more than just embarrassing the hairiest member of your family. Most pet clothing also has the Adjustable Clothing enhancement (the cost is negligible compared to the full price and an owner may go through several pets in a lifetime). This often has the unintended side effect of making pet clothing usable by children or anyone close to the pet's size.

Sweater of Comfort: The most basic of magical pet clothing, this is a garish knit sweater designed to keep the animal comfortable in a variety of conditions. Because most pets are quite comfortable with their natural coats the sweaters are an extravagance usually commissioned only by the tastelessly wealthy or those who plan on dragging their animal companion through the harshest of environments. The sweater is reversible: one side a bright cherry red, the other is a more subdued blue color with little snowflakes picked out in white thread. When the red side is worn outward the pet is subjected to the Warmth spell. When the sweater is reversed the pet is subjected to the Coolness spell. Both enchantments have been made permanent through the use of the Power enchantment and the alternating effect is produced by the Link enchantment. *Cost:* $52,000

Scarf of Freshness: Pets are the source of a staggering variety of odors that can quickly permeate the owner's house. This scarf (available in a variety of garish and clashing colors) is used to solve just that problem. A combination of the Power Enchantment and the No-Odor spell keeps any pet wearing it blessedly stench-free. The tiny gold and silver pin used to hold the scarf in place is the true focus of the enchantment. *Cost:* $47,850

Hat of Grooming: This item takes the form of a "darling" cap, sized for a dog or cat. The hat is the focus of an always-on modified Haircut spell that keeps nails short, hair perfectly manicured in a pre-selected style and prevents the pet from shedding. A Hex spell means that the hat will not fall off no matter how determined the animal is to be rid of its embarrassing headgear. The Password for the Hex is usually the pet's name and is embroidered on the front of the hat so the owner cannot forget (the pet can't read it after all). It often includes a small, fuzzy bobble on the top of the hat. *Cost:* $21,450

Spaying Collar

Nothing is more embarrassing than when dear little Rex attempts to molest your guest's legs in the middle of dinner. Or even worse, when you find Princess in the closet surrounded by a pile of mewling little fur-balls. For those owners without the stomach for a more . . . organic solution, there is this enchanted collar. It uses a variant of the Strike Barren spell that not only makes the subject infertile but suppresses sexual urges and responses as well (animals react as though spayed or neutered). Removing the collar allows the owner to breed the pet when desired but suppress unwanted urges the rest of the time. *Cost:* $26,500

Doggie Door

A pet's freedom is important and many resent being cooped up inside all day, so many considerate owners install small flaps to allow their furry friends to enter and exit as they wish. However it takes only one clever gnome thief before the security flaws in such a design become obvious. The Doggy Door was created for owners who want their pets to have free reign of the outdoors but are too lazy to open a door (and have excess cash lying around). No flaps are installed at all; instead, the entire door is magically enchanted to be insubstantial to your pet. The door is enchanted with a Walk Through Wood spell, an exclusive Powerstone (4 energy points), and a Link enchantment that activates the door's magic when the pet approaches. The link is often actually keyed to a small charm or talisman on the pet's collar (which can be stolen by a particularly knowledgeable thief) and activates the spell for as long as the pet remains in the area. It takes a bit of training to get a pet used to this bizarre method of exit. Particularly dim pets may bump their heads attempting to run through other doors in the house. *Cost:* $33,425

Dog Flute

Expanding on the theory of the dog whistle, this instrument is the ultimate in pet obedience. It appears to be a short rune-carved ivory flute with four holes. Holding a finger over a hole and blowing will produce no audible noise, but will activate one of the flute's many enchantments. Despite its name many of the flute's abilities will function on any type of animal. Those abilities that affect specific animals are usually attuned to common domesticated animals such as dogs or cats.

First Note: This produces the effect of the spell Beast Soother.

Second Note: Blowing this note creates the effect of the spell Beast-Rouser

Third Note: Blowing a sustained note produces the effect of the Master spell . . . however the enchantment only lasts for as long as the user can keep blowing.

Fourth Note: The final note creates a Beast Summoning spell. Most of the time this is limited to one type of animal.

Some more potent flutes have a fifth effect: When all four holes are blocked and the flute is blown it creates the effect of a Control Animal spell. If the flute has a downside it is that the magic prevents it from ever being used as a normal instrument, no matter how much anyone blows into it no noise is produced. *Cost:* $ 75,900 (standard)

Pet-Golem

It is sad but true that many people cannot own the pet of their dreams. Due to allergies, environment, or just perpetual forgetfulness (regular feeding is important) it is impossible for them to have a tiny companion of their very own. Or perhaps they want a pet just not the biological by-products of pet-ownership. After all, cleaning up the litter box gets tiresome after a while.

The pet golem is a solution to all of these problems and more. In addition to being waste-free and needing no feeding it is effectively immortal, so the owner will never have to explain to the children why their beloved pet isn't going to be around anymore. The downside is that most (see below) pet-golems have the automaton meta-trait preventing them from behaving totally like real pets since they lack any sense of curiosity, playfulness, or any of the other charming instincts that make pets so lovable.

Pet-golems can be purchased with a variety of "packages" adding on to the basic pet golem. Most of these packages do not alter the pet's stats although many owners purchase larger "guard" pet-golems to provide protection.

Basic Package: This is a simple body of wood or clay, carved into the likeness of the animal desired. The level of craftsmanship can vary widely depending on the creator. For an additional charge of $75 a layer of real (or perhaps imitation) animal fur can be used to cover the golem to give a more life-like appearance. *Cost:* $ 4,290 or $5,082 for

the guard dog golem.

Illusion Shells: This feature involves built-in Illusionary Disguises of different levels, allowing customization of a pet-golem's appearance and a more realistic "pet simulation" experience. Simple, Complex, and Perfect illusions can all be imposed over the pet-golem. *Cost:* +$ 4,950 (simple); + $9,900 (complex); + $16,500

Pet-Intelligence: While Pet golems are actually more intelligent than average domesticated animals they lack many of the qualities that make animals so attractive to humans: a dog's cheerful loyalty and playfulness or a cat's aloofness and sense of grace. This package removes the Automaton, Cannot Learn, and Reprogrammable disadvantages from golem through the use of a variant of the Weapon Spirit spell, transferring the mind of an actual animal into the golem body. This is also a popular way to keep a dead pet "alive" for those who can afford it since it allows a pet's personality quirks to remain. Usually these golems have the full IQ of the pet (5 or so). *Cost:* Typically +$16,500 (also note change to golem point cost)

Dog Golem   *-148 points*

Attribute Modifiers: ST-3 [-30]; DX+1 [20]; IQ-4 [-80]; HT+4 [40].

Secondary Characteristics: SM \u20133; +5 HP [10]; +4 Per [20]; +2 Basic Move [10]

Advantages: Claws (blunt) [1]; Doesn't Breathe [20]; Doesn't Eat or Drink [10]; Doesn't Sleep [20]; Injury Tolerance (Homogenous, No Blood) [45]; Single-Minded [5];Teeth [1]; Unaging [15]; Unfazeable [15]; Vacuum Support [5].

Features: Does not have or spend Fatigue Points [0]

Skills: Dog Golems often come with no skills.

Cat Golem   *-125 points*

Attribute Modifiers: ST-5 [-50]; DX+3 [60]; IQ-4 [-80]; HT +4 [40].

Secondary Characteristics: SM \u20134; +7 HP [14]; +4 Per [10]; +1 Basic Move [5].

Advantages: Catfall [10]; Claws (sharp) [5]; Doesn't Breathe [20]; Doesn't Eat or Drink [10]; Doesn't Sleep [20]; Injury Tolerance (Homogenous, No Blood) [45];Single-Minded [5]; Teeth [1]; Unaging [15]; Unfazeable [15]; Vacuum Support [5].

Disadvantages: Automaton [-85]; Cannot Learn [-30]; Quadruped [-35]; Reprogrammable [-10]; Social Stigma (Valuable Property) [-10]; Unhealing (total) [-30]; Unnatural [-50]; Wealthy (Dead Broke) [-25].

Features: Does not have or spend Fatigue Points [0].

Skills: Cat Golems often come with no skills.

Guard Dog Golem   *-56 points*

Attribute Modifiers: ST +3 [30]; DX+1 [20]; IQ-4 [-80]; HT+4 [40].

Secondary Characteristics: SM -1; +4 HP [8]; +6 Per [30]; +2 Basic Move [10]

Advantages: Claws (sharp) [5]; Damage Resistance 4 [20]; Doesn't Breathe [20]; Doesn't Eat or Drink [10]; Doesn't Sleep [20]; Injury Tolerance (Homogenous, No Blood) [45]; Single-Minded [5]; Teeth [1]; Unaging [15]; Unfazeable [15]; Vacuum Support [5].

Disadvantages: Automaton [-85]; Cannot Learn [-30]; Quadruped [-35]; Reprogrammable [-10]; Social Stigma (Valuable Property) [-10]; Unhealing (total) [-30]; Unnatural [-50]; Wealthy (Dead Broke) [-25].

Features: Does not have or spend Fatigue Points [0]

Skills: Guard Dog Golems usually have 8 points of skills, mostly in Brawling and other useful skills.

Deluxe Dog House

This is truly the ultimate extravagance for any wealthy pet owner. The Dog House is the perfect, magical home for any pet (dog or otherwise) at a cost slightly less than constructing a large mansion. The appearance of the Dog House is decided by the owner and can be as elegant as his or her budget allows, but there are those who take a perverse pleasure in knowing that the crude collection of boards in their backyard actually costs more money than most people will ever see. The house has several features:

Expansive: The house is much bigger inside than outside. The exterior is usually no more than 10 to 20 cubic feet with an entrance large enough to allow the animal inside. The interior is much bigger: 1000 cubic feet. The ceiling is sized for pets but big enough that a person can get inside if need be (5'). This is done using the Hideaway enchantment.

Hygienic: Anywhere a pet stays long enough tends to begin to smell pretty strongly and eventually they'll need to answer the call of nature. Fortunately the house is equipped for such necessities. A No-Smell spell keeps odors at bay, and a constant, high-powered Clean (three-yard radius) spell eliminates shedding and natural waste. It also cleans anything outside of the pet's food bowls. Dirt and grime tracked inside is handily removed as well.

Self-Sufficient: The house provides the pet with a constant supply of food and fresh water. Large, ivory bowls inside the house are kept constantly full (never to overflowing) and are replaced as soon as the pet eats. The "standard" set up is a combination of Create Water, Create Food (four meals a day total), and Season (to add flavor). Each spell has a Link to prevent it from overflowing the bowls. Owners worried about their pet's health or appearance may opt for less 'meals per day' from the Create Food spell.

Opulent: The interior of the house is often richly decorated and even carpeted. Decorations can be whatever the owner desires and are kept clean by the constant Clean spell in operation. Delicate objects are not recommended unless extra money is spent to provide Repair or Toughen spells. The price of decorations is not included in the final cost since it is mostly mundane.

Additional Features: The pet is cared for and kept fed, but it must be kept comfortable as well. The interior of the house is lit by a permanent Continual Light spell (of torch strength) modified by a Link spell that shuts the light off during the night. The interior of the house is also kept warm (or cool) by a set of Linked Warm and Cool spells which operate to raise or lower the temperature towards a comfortable 72 degrees. The temperature can only be altered by 40 degrees.

Obviously no one would buy the Deluxe Dog House for practicality, but if they were to make a purchase it would cost $ 8,913,600 plus any expenses for decoration (and the price of a pet to live in luxury). All spells that require it are sustained by the Power spell.

Champ

To outward appearances "Champ" is a Finely crafted thrusting broadsword. The blade has the inscription "Champ" just above the handle. The pommel design is unusual, it is in the shape of a bloodhound with its mouth open and tongue

lolling out. Beyond these unusual decorations the weapon is a quality piece of work.

History: Champ's life started as a loyal and very shaggy bloodhound owned by the famous huntsman Lenard Gerdes. For years Gerdes and Champ battled poachers, bandits, orcish invaders, and the occasional plump pheasant. Unfortunately, like so many loyal pets, Champ died well before his master. Old age's slowness and a pair of orcish arrows brought Champ down. Rather than journey without his loyal companion Lenard chose to keep him by his side. Calling in several old favors and using most of his savings Lenard was able to secure a new "home" for Champ and a powerful weapon for himself. Champ's spirit was bound into a custom forged blade that Lenard keeps near at all times.

Powers: Champ's mind and soul are bound to the weapon by the Weapon Spirit spell. The spell grants the blade an IQ of 5 and the ability to 'speak' or at least to bark, whine, howl, and growl. Champ also retains the following advantages and disadvantages: Higher Purpose (aiding his master), Intolerance (orcs and other "beastial" humanoids), and the 5-point version of Chummy.

Champ also possesses the Track skill of 14 (Per +4). Although he no longer has a sense of smell he is able to "catch the scent" of his prey another way. Against any subject whose blood is on his blade, although he need not have drawn the blood himself it must be relatively fresh. This allows him to track and sense the subject as though he had Discriminatory Smell (including the +4 bonus to track). Champ still loves the hunt and will enthusiastically track anyone his master wishes.

Finally, the blade Champ calls home now is enhanced in several ways. First it has the Loyal Weapon enchantment, a +1 enhancement to both skill rolls and damage from Accuracy and Puissance. To ensure that he never loses his companion a second time Gerdes also had Shatterproof used on the blade. Unlike most Loyal Weapons Champ only returns to the hand of a master he likes (at least a Good reaction roll) and his loyalty cannot be transfered simply by selling the weapon. He may also be commanded to "stay" by his master. Should his preferred master not be present he may allow himself to be weilded by another individual he likes but will immediately return to the side of the master who had the highest reaction roll when possible (Gerdes obviously trumps any other wielder).

Hooks: These are a few possible adventure hooks that could lead players to an encounter with Champ.

- If Gerdes is still alive but somehow impossible for Champ to reach he may attempt to get help from others. He cannot move except to return to his master, or he might be immobilized already, but the sound of barks, growls and howling might draw the players to its location where he will immediately attempt to get their help for his master. Since Champ can't actually speak this may lead to a "Lassie" moment ("what's that boy? Timmy fell down the well?").
- The PCs are drawn to the scene of a battle by mournful baying howls. When they arrive there is no animal to be found just a dead man (and quite a few foes) and a strange blade at his side. After the death of his master Champ may not be in the mood for new companionship (penalty to the initial reaction roll) however, finding and slaying those who killed his last owner may improve his disposition immensely.
- The PCs may find themselves on the wrong end of Champ. After escaping a skirmish with a man with an odd, growling sword they find that man chasing after them endlessly. Champ's tracking ability is excellent (skill of 18 when tracking by blood) and is hard to prevent. Champ's owner would make a nearly inescapable foe.
- In a less serious campaign the PC's might find Champ a hard weapon to get rid of. Should he roll particularly high on a reaction for a new weilder he may refuse to leave his or her side . . . no matter how much they attempt to get ride of him. While Champ is a useful weapon he can also be an inconvenient one: barking or howling when stealth is needed, trying to sleep at his master's feet without a sheath, growling at those he doesn't like, and so on. Getting Champ to leave the player alone may be an adventure in itself.

Weapon	Damage	Reach	Parry	Weight	ST
Champ	sw+3 cut	1	0	3	10
	Thr+4 imp	1	0	-	10

Pyramid Review

Catan Event Cards (for Settlers of Catan)

Published by Mayfair Games

Designed by Klaus Teuber

Art by Tanja Donner

44 cards (36 event cards, six scorekeeping cards, one New Year card, & one rules card); full color; $5

Something's brewing in the idyllic land of Catan. Several somethings, in fact. The people there are used to a regular rotation of seasons, shearing the sheep here and chopping down the wood there, with the occasional cutthroat invader nipping off with their wheat. All of a sudden, though, things seem to be happening every tur . . . uhm . . . throughout the year. *Catan Event Cards* have arrived to liven up their days.

The cards in this set, first and foremost, supplant the dice in regular *Settlers of Catan* games. You no longer roll for the robber or resource production; instead you draw a card each turn and use the number printed thereon. Before you do that, however, you have to resolve the event. Each card has some occurrence listed on it. Most of them are non-events, telling you your workers toiled away and you receive your resources as usual. Since you've lost the die mechanic, the robber is listed on a number of them as well, and he steals cards, cleans out anyone flush with resources, and blocks additional production as normal.

The rest of the set has something else. The robber, for a start, may simply flee back to the desert with his tail between his legs (something he didn't do in the basic game). It's a mix of good and bad, and some give one player an advantage over the others. For example, the Epidemic reduces resources for your cities . . . they only collect goods as if they were settlements. The wealthy might have to give trade goods to the less fortunate players, or those with harbors may benefit from Calm Seas.

And oh, are you going to get sick of repairing your roads after the Earthquake. Worse than living on the coast. Since the numbers that come up on the cards are a constant, a New Year card is placed just near the bottom of the deck each time. When drawn, the whole thing is reshuffled without the last five cards being seen; this prevents anyone from counting cards and knowing what results to expect as the stack dwindles. The cards available mean you'll be reshuffling them about once every eight rounds in a four-player game.

The victory conditions remain the same (and for the *Cities & Knights* supplement you still roll the event die in addition to using these).

The card quality is awful. They feel like flattened slugs. These are the mushiest, floppiest items in recent memory, and the only thing that permits is easier shuffling. Since you do this often enough, something sturdier would have been better. It may keep the company costs down, but if you have to purchase this deck again every time one of your pieces bends, it's not going to do your pocketbook any good. The graphics on the cards they include for tracking your victory points (see below) are small, so when they say to use something like coins to track your total, they mean use dimes (or foreign currency, if they have anything smaller). Any other coin may cover two spaces. Everything else about the graphic quality is fine -- small but clear text, good headers (though having every one against a stark red background makes you think you've drawn something horrible), and colorful art (they've moved to a more dynamic style compared to the almost woodcut-like pieces from the original set).

If you're willing to play with "open" winning conditions, the set has six cards that let you track your victory points on a meter using beads or some knickknack. These come in the appropriate colors, but they're a pretty weak add-on unless you've got a heavy token with a small base that won't move much (and no one can field, say, paper and pencil).

The wisdom of bringing the *Catan Event Cards* to your table depends on the disposition of your play group. If playing the base game seems a little too staid or predictable, it's an excellent way to shake things up (it's certainly the right price for doing so). There's a fancy thrill to pulling from the pile that the dice simply don't offer, and it's just the right amount of not-so-fast-fellah to prevent dependable plays. If you already get too giddy worrying that the robber is going to pop up, you might want to stick with the old standby. It's not that there's too much going on here or that the results they offer are so onerous, but the deck does keep you on your toes and the perfect hand is less likely to survive a round from all the "give a card up" and "trade a card away" that comes up. Purists may find added considerations like "Will I be forced to take more cards than I planned, and suffer from the robber?" provide too much randomness.

Cartography by Paul Daly & Ryan Wolfe

226-page b&w hardcover; $34.95

The origins of Green Ronin's *True20 Adventure Roleplaying* lie in the publisher's award winning *[Blue Rose: The Roleplaying Game of Romantic Fantasy](#)* whose mechanics gamers began using in other more traditional roleplaying settings, such as *Star Wars* or *The Lord of the Rings.* Although the origins of the *Blue Rose* mechanics clearly lay in the *d20 System,* their lighter, smoother style of play deemphasized the *d20 System's* tactical elements and added more modern elements that encouraged roleplaying.

True20 Adventure Roleplaying offers all of that and more. It has been developed into a relatively low-powered generic class-and-level roleplaying game intended to cover a variety of game styles and genres. This is seen in the four "Worlds of Adventure" included in this book, and a further five to be found in the supplement, *True20 Worlds of Adventure.* Eight of these nine settings are winners of Green Ronin's "*True20* Setting Search," which called for other publishers to submit settings that would showcase the *True20* system. Certainly what the four display is the mechanical ease with which the *True20* system can be added to without the tinkering that the *d20 System* would require, as well as *True20's* versatility.

A *True20* character still has the same attributes as the *d20 System,* but essentially only the attribute bonuses matter. So instead of the usual 3 to 18 scale, True20 uses -5 to +5. Instead of race, a character has a Background, which provides

attribute modifiers, free feats and skills, and favored feats and skills. The Backgrounds given cover the six standard fantasy races, also serving as models for more.

Instead of Alignment, a character has his Nature, consisting of a virtue and a vice. In a fashion similar to *[The World of Darkness Storytelling System Rulebook,](#)* these are not just roleplaying and story hooks, but also a means of regaining Conviction. Similar to luck or action points, Conviction is spent to re-roll any die, activate a class ability, ease a task, gain an extra action or move, and to recover from damage. A first level character begins with three Conviction points, the maximum he can have increasing every other level.

True20 replaces the *d20 System's* multitude of character classes with just three. Each provides skills and feats, a core ability powered by Conviction, and is designed to emulate various archetypes. The Adept can use supernatural powers like Fire Shaping or Teleport, modeling magicians or psychics. He spends Conviction to temporarily use a supernatural power he does not have. The Expert possesses more skills than the other classes, and could be anything from an adventuring scholar to a rogue. He spends Conviction to temporarily gain extra skill ranks. The Warrior is the least complex class, beginning the game with either weapons or firearms training. He spends Conviction to erase any light damage taken. Although a character is free to multi-class, he can never change the core ability gained at first level.

Feats work as expected, many being specific to each class. A character has more of them than in the *d20 System,* gaining another at each level. The selection and greater number available gives a player wider choice in designing his character. Plus it is easy to gain those from another class by taking a level in it. Even so, this feels restrictive compared to generic RPGs.

Skills are slightly different in that initially each rank is equal to maximum possible at a character's level. Thus at first level, all of a character's skill ranks will be 4. Only at later levels can any skills ranks vary from this. There are no restrictions upon what skills a character can have.

Broad in scope, *True20's* treatment of skills raises some minor issues. First, with only a few skills available, the choice can easily be exhausted, especially for the Expert class. This becomes more obvious for characters with higher Intelligence as this increases the number known. Second, because there is relatively little variation in skill ranks, the only way to really improve a character's skills is by possessing a high Intelligence or feats such as Skill Focus. In this *True20* favors feats and attributes slightly more than skills.

The Adept class can opt to choose a supernatural power instead of a feat. There is a diverse selection of powers given, modeling spell or psionic like effects. All are relatively low powered, and all can be used as often as a character wants. The only downside is that some require intense concentration or are fatiguing. Using such a power too often and failing a fatigue check will affect the Adept physically.

Mechanically, *True20* is essentially the same as the *d20 System* -- roll the die, applying any attribute, skill, and situation modifiers to beat a difficulty target. Where it is different, is that it uses only the 20-sided die and none other. The rules cover both undertaking a routine task without rolling and making it more difficult to do it with panache. Combat is also different. Instead of Armor Class, a character has a Defense Bonus, which is different if a character parries using his Strength or dodges using his Dexterity. Instead of Hit Points, a character saves against the damage hoping to reduce or ignore its effects. Armor adds to this saving roll, whilst all weapons do a set amount of damage. Any damage done, lethal or non-lethal, will affect a character directly with various penalties.

Like weapons, equipment is treated in a generic fashion and purchased using an abstract wealth mechanic. The bestiary includes many of the *d20 System* standards, plus oddities like the Blood Pudding and the Bear-Shark. Advice for the Narrator is short and pertinent, the most notable aspect being the game's method of handling advancement. *True20* eschews experience points, instead having the Narrator decide when a character acquires a new level.

As written, *True20 Adventure Roleplaying* feels like a generic fantasy game, whether classic fantasy or space opera. Can it do horror? Or superheroes? The latter is doubtful, the former probable, but not direct from the book. So the Narrator will need to develop this *True20* genre himself. Yet there is no advice to help the Narrator develop this or any other setting. For these reasons it is not truly flexible or generic.

Fortunately, the four "Worlds of Adventure" showcase what *True20* can do. The first is Paradigm Concepts' "Caliphate Nights," an Arabian Adventure setting inspired by *One Thousand and One Nights* more than Hollywood and set during the Golden Age of Islam. It includes everything needed to play, including scenario hooks, archetype descriptions, feats, and background details. Players are encouraged to emulate the storytelling tradition, spending Conviction to tell and narrate short in-game tales to influence and inform the main game. Alternatively, Weaving can influence smaller situations, but the outcome can go against the player just as it can help him. The accompanying Narrator advice is excellent, and overall, "Caliphate Nights" is elegantly exact, though leaving you wanting more.

BlackWyrm Games' "Lux Aeturnum" mixes sci-fi and fantasy, complete with aliens, androids, space pirates, musketeers, mystic powers, ancient aliens, and various historical elements all exiled to a distant space sector. This does not read as well, and needs both more space and development.

"Mecha vs. Kaiju" from Big Finger Games does exactly what it suggests, sending young anime archetypes forward to defend Japan from giant monsters. With a plot involving North Korean espionage, this setting is played at two scales, normal and aboard the huge Mecha, which are controlled through various feats. With just three mecha and three kaiju types, this setting again needs more, though not to the same extent.

Finally, Electric Mulch offers not so much a setting but a feat package that can be added to any setting. With "Borrowed Time" the idea is that time can be manipulated on a micro scale, a character making small eddies within the river of time to gain extra actions, bonuses, or even freeze an enemy. Also given are several factions fighting a secret war for control of time. Cinematic in feel *Matrix*-style, "Borrowed Time" places an emphasis upon looking good and brand name recognition.

Clearly the best of the quartet, "Caliphate Nights," pushes the *True20* system in a more modern narrative direction, while serving as a good model for any setting. Of the other three, "Lux Aeturnum" interestingly reorganizes the supernatural powers along disciplines, while "Mecha vs. Kaiju" and "Borrowed Time" add a raft of interesting feats. "Borrowed Time" manages to be cooler and more interesting than the other two.

True20 Adventure Roleplaying is not quite the broad game it wants to be. Not wholly flexible nor fully generic, it is still hampered by limitations upon character and the insufficient advice on moving the mechanics out of the default fantasy and sci-fi genres. Only in the four settings are the rules allowed to blossom and then only one is a prize bloom. However, they do show that the *True20* system is more easily adaptive than its ancestor, the *d20 System.* Plus *True20 Adventure Roleplaying* offers a more streamlined, easier, less cluttered gaming experience.

Murphy's Rules

More Game, More Toys, More Knowledge (Part II)

How many times has this happened to you in your games (on either side of the equation as a player or a GM)?

The players are having a good time, but they haven't been entirely focused. Perhaps they've been cracking jokes, or getting involved in tangents, or other activities that have been enjoyable for all involved (the whole point of getting together for games, in my opinion), but the actual pace of the adventure has not been what the GM envisioned.

After a while the GM takes a glance at the clock and realizes, to his horror, that he only has about 30 minutes left, and four scenes before the adventure ends (one more information gathering session, a minor skirmish that will affect the final outcome, a moral dilemma, and the big climactic fight).

The gears of the GM's mind start spinning: What to do? He might be able to get some more time from the players, but he knows half the group needs to get up early in the morning for Something Important, so he probably can't eke too many more minutes out of them. He might be able to cut one or two of the scenes, but which ones? They all build on each other, and it might take away from the players' accomplishments if the GM just automatically adjudicates what happens in those scenes, regardless if it's with a "You win!" or "You lose!" decision. The GM might be able to lock himself in the bathroom and cobble together a solution, but it would subtract valuable minutes away from the quickly fleeting session. He might be able to just end the game now, but the session hasn't had much of an "up" beat to end on, and he knows that everyone would probably be vaguely dissatisfied with the whole (even if they've been enjoying the parts).

What to do?

Digression: In my writing class back in my college days (days which speed ever more swiftly into the past, like a missed school bus controlled by a vengeful driver), people would often bring in short stories and ask, "How can I fix the ending?" And Dr. Taylor, who I believe was quoting someone else, would sometimes say, "The problem with the last page is often in the first page." In other words, it's not merely enough to tweak the last few paragraphs or two, but it instead may be necessary to rework the piece from an earlier point; perhaps even the premise itself is flawed. While this advice has scads of implications in the gaming world, today I'm using this idea to illustrate our 30-minues-left scenario from above.

In this case, the need to solve the problem of running out of time actually has its roots much earlier in the session. And this problem exists because, while the players know how much time is left, they don't know how much *adventure* is left. The situation is similar to an oddly paced suspense/dramatic movie, where, 90 minutes in, you decide you really need to use the restroom, only to discover upon your return that you missed the bit where it's revealed that Kaiser Soze is a transvestite sled. Well, if you'd known that the movie was going to get interesting, you wouldn't have gone at that point, right?

Two weeks ago, in [Part I](#) of this installment (Hah! I bet you thought I'd forgotten about Part I!), I was going to propose a possible solution to the problems presented there. I should stress that this solution has not been tried yet (at least by me . . . someone else out there may have developed this independently).

What if, before game starts, players were presented with a checklist? In computer games, novels, movies, and many other forms of entertainment, the audience has some idea about where in the greater whole it is at any given point (how many pages are left, how close it's been to two hours, and so on). Even audiences in other (non-roleplaying) games have a sense about the pace. In a game of **Munchkin,** for example, once a few players get to level 9, you know the game's probably going to end soon. But this isn't the case with RPGs; you might know how much time exists to play, but that doesn't have any more relation to how much *game* is left than deciding you're going to read for an hour means you're going to have a satisfying experience. On the other hand, knowing that you're going to read until the next chapter break *should* help ensure that the experience is more satisfying (presuming the writer knows what he's doing).

But let's interrupt this pontificating with a worked example of what I envision (in this case, a *Star Trek* adventure):

Adventure: "If This Be Method, There Is Madness To It"

Three-act adventure designed for one evening

- ___ **Introduction (Opening Script)**
- ___ **Act I**
    - ___ Scene I (Interaction, Investigation)
    - ___ Scene II (Minor combat) [Optional]
    - ___ Scene III (Interaction, Problem solving)
- ___ **Act II**
    - ___ Scene I (Interaction, Significant combat)
    - [Note: Scenes II to IV are optional, and the order may vary, although at least one of them should occur]
    - ___ Scene II (Exploration, Investigation)
    - ___ Scene III (Problem solving)
    - ___ Scene IV (Interaction, possible significant combat)
    - ___ Scene V (Interaction)
- ___ **Act III**
    - ___ Scene I (Major combat)
    - ___ Scene II (Problem solving) [optional]
    - ___ Scene III (Interaction) [Optional]
- ___ **Resolution**
    - ___ Final Scenes (Optional)
        - ___ Player A
        - ___ Player B
        - ___ Player C
- ___ Experience, Wrap-Up (Optional)

I envision this checklist being on a publicly viewable spot -- say, a dry-erase board or one of those big pads of paper on an easel. (I'd probably also mark off a section of the upper-left corner with something like "Left Field" and make random checkmarks in that region whenever the players were off on tangents.)

And then, true to its name, I'd check off relevant sections as they were accomplished (or cross them off if they became moot), as the adventure continued. In this way, the entire gaming group knows where they stand in the larger whole; if there's an hour left of game time and one-and-a-half acts, then the players (and GM) are all on the same page about what sort of effort will be required to keep the game on track. (And if they're on the last scene with 30 minutes left, they know they can drag out their roleplaying for quite a while without worrying that the GM is going to spring a last-minute plot development.)

This checklist system can be modified depending on how much or how little information the GM wants to give the players. For example, it would be easy to add a mood "theme" to each scene (such as "Generally optimistic," "neutral," "tense") so that players who endure a particularly depressing or disruptive scene know how long they need to "hang in there" before they get some relief. (This can help avoid a scene similar to the "We Need To Talk . . .") The GM might even provide information related to how he gauges the danger level (such as "10% chance of success, 75% chance of survival"), perhaps going so far as to give the point totals or challenge ratings of the threats in question. This can help players realize that they may not be expected to win a challenge

Why Tell?

Some might be asking why information about the type of encounter is given in the sample checklist. My gaming groups usually consist of players with varying types of

(as per my earlier column "Appropriate Challenges? Hah!") or, conversely, when they're expected to pull out all the stops and rely on resources they might not normally (eliminating the quirk discussed two weeks ago about players conserving their stuff even when perhaps they should be using it).

Of course, this technique isn't without drawbacks. First, it's only suitable for certain kinds of campaigns: Those with a strong dramatic pull (in other words, there's an overarching storyline that encourages the players to stay on track) and/or adventures with a closed environment (such as a dungeon crawl). In the case of the latter, such a checklist could literally be analogous to some computer games, with "checkpoints" as milestones are reached: "Level cleared!"

Second, many GMs (and more than a few players) likely don't want their fun spoiled with meta-knowledge of the adventure; they feel that knowing, say, an information-gathering scene is coming up might take away from some of the surprise. However, if the labels are broad enough, there's nothing to keep the GM from mixing up what those labels mean: For example, let's say the players know an "Interaction" scene that leads into a "Combat" scene. Does that mean the person they're interacting with is going to attack them? Does it mean the person they're talking to is going to direct them to their next battle? Does it mean the heroes are going to be attacked as they step out of the bar they're talking to the person? Really, even knowing *what* is going to happen doesn't necessarily mean they'll know *how* it's going to happen.

interests; in campaigns past I've had success telegraphing to, say, a combat fan that -- though these are pretty talky sections of the adventure now -- in a bit there should be something more interesting to him. This merely codifies that tendency, (hopefully) helping to ensure that no players tune out completely. It should also help with bathroom breaks or the like; if this scene is only listed as an investigative one, then the player of the character who's really bad at investigation can go and get a snack without feeling he's going to miss something.

As I said before, I haven't tried this technique yet. There may well be hidden pitfalls to using checklists. But I'll almost certainly try it at the next convention I'm a guest at, and it may well find its way into my regular gaming sessions. Hopefully my players will check it out.

--Steven Marsh

Naval Warriors: The Officers And Men Who Fought The Great Square-Riggers

Part I: The Men
for *GURPS Fourth Edition*

by Nicholas Lovell

"Mr Caldicote, I would be much obliged if you would assemble the men by divisions."

"Aye, aye, sir." Caldicote touched the brim of his bicorne hat and called in a voice that could reach the foretop even in a double-reef storm. "All hands! All hands!"

The bosun's whistle carried the message throughout the ship. Men tumbled up from below in freshly-washed clothes, their queues plaited and retied at the nape of their necks. Within a few moments, the disordered chaos dissolved into disciplined rows as six hundred men placed their feet along the deck seams.

"Toe the line, there, toe the line!"

The starboard and larboard watches stood on either side of the waist, the idlers behind them, while the warrant and commissioned officers clustered on the quarterdeck.

Caldicote touched the brim of his hat again. "The crew is assembled for your inspection, sir."

* * *

The naval vessels of the 18th and 19th centuries required enormous manpower. The only source of energy for adjusting the sails, loading the guns, and undertaking the myriad tasks required to maintain a ship in peak fighting condition was the muscle power of the crew. A ship of the line could carry up to 800 men including marines, working as a cohesive unit to explore the globe, protect trade and confound the enemy.

This series of articles will look at the men who constituted these crews, and give ideas of how to create them in *GURPS* terms.

Roles and Rankings

The sailors were divided into four grades, based on their expertise and experience at sea.

Able Seamen (AB): Could "hand, reef and steer," meaning they understood the duties of a sailor, could be trusted to reduce the sails in heavy weather and could take a spell at the wheel of a large ship. They were in fact highly skilled, with a particular awareness of rope-handling.

Ordinary seamen: Competent, but less capable of independent action than the able seamen and typically with less than two years at sea.

Landsmen: Essentially incompetent as sailors, were used mainly for heaving on ropes or the capstan.

Boys: less strong than the landsmen, they were used as messengers or to carry powder to the great guns.

The seamen could also be distinguished by the roles that they played in the ship. This was not a formal title, but it

reflected their usual tasks on board ship.

Topmen tended to be young and nimble. Their role was to climb the masts, crawl out along the yardarms and release or gather the sails. They were required to do this in all weathers, rain, ice or snow, climbing masts that could reach up to 200 feet in the sky, and which rolled in enormous, dizzying circles as the ship pitched through the waves.

Forecastlemen and members of the afterguard were older, experienced sailors. They remained on deck, adjusting the sheets, halyards, braces, and other ropes that controlled the set of the sails. Waisters tended to be landsmen, working in the waist of the ship (in the middle), pulling on ropes, manning the capstan, and other manual tasks. These three groups were also the primary members of the gun crews.

Idlers were seamen with special expertise that did not require them to handle the sails or the great guns. This included the cook and his mates, the carpenter's mates, the sailmaker's mates and the cooper's mates. Unlike the topmen and forecastlemen, they were able to get uninterrupted sleep on most nights as they were not required to keep watch.

The topmen, waisters, forecastlemen and afterguard were divided into two "watches," called starboard and larboard (larboard has been called port by most sailors since 1844). The day was also divided into seven "watches":

Noon to 4pm: the afternoon watch
4pm to 6pm: the first dog watch
6pm to 8pm: the second dog watch
8pm to midnight: the first night watch
Midnight to 4am: the middle watch
4am to 8am: the morning watch
8am to noon: the forenoon watch

The men assigned to either the larboard or the starboard watch would be on duty for each watch, meaning that for example, in the evening, one would be on duty for the first night watch until midnight, then sleep for four hours until 4am when they were back on duty for the morning watch. The following day, the roles would be reversed.

When the ship was in action, all hands were called. Aside from men dedicated to sail handling, any of the hands might work the cannons, which had to be sponged, reloaded and run out again after each shot, and required up to eight men to handle. Similarly, if the captain managed to bring his ship alongside an enemy vessel, any crew member might be expected to board the enemy and engage in hand-to-hand fighting.

Recruitment

Sailors were recruited in many ways. The Royal Navy found such difficulty in maintaining its manpower levels that it relied heavily on impressment. Any able-bodied man within 50 miles of the sea was at risk of being forcibly taken on board ship, unless he had a certificate granting him immunity. Once on board ship, he was immediately subject to the taut discipline of the Royal Navy, and faced execution for desertion. Other sources of crew included volunteers, recruitment drives in market towns, and petty criminals who chose naval service ahead of jail or transportation.

The American navy mainly used volunteers, and crews frequently included men who had deserted from other navies. In 1807, for example, *HMS Leopard* fired seven broadsides into the unprepared US frigate *Chesapeake* and boarded her to recover four deserters (three of whom were American citizens who had previously been impressed by the Royal Navy.)

Many seamen had skills from their former lives before they were pressed. It was not unusual to find farmers, smiths, carpenters, ostlers and teamsters in a crew.

Characteristics

The fighting sailors of the navies of the age of sail were unwashed, aggressive, tight-knit, frequently hidebound and highly superstitious. In the capricious world of wide oceans and lee shores, sailors believed that you could whistle for the wind, that any number of talismans brought good luck, and that there were such things as "Jonah's" -- men who brought ill-fortune on a vessel.

But they were also generous, gregarious, competent and easy-going. Living in such close confines with so many men, fitting-in was a skill learned quickly and well.

Physically, sailors were typically short. A survey of men on board *HMS Bellerephon* in the early 19th century showed that the average height was 5'5," no crew member was over 6', and there were several men who were shorter than 5'. They were often fit and nimble, but the physical ravages of years at sea and battles with the enemy were common.

Templates

Ordinary Seaman   *90 points*

You are a sailor who knows the basics but has been at sea for less than two years.

Attributes: **ST** 12 [20]; **DX** 12 [40]; **IQ** 11 [20]; **HT** 13 [30].

Secondary characteristics: Dmg 1d-1/1d+2; BL 29 lbs.; HP 12 [0]; Will 11 [0]; Per 11 [0]; FP 13 [0]; Basic speed 6.25 [0]; Basic Move 6 [0].

Advantages: Languages (One accented or two broken, both spoken only) [2], Patron 5 (major nation, 9 or less) [30].

Disadvantages: Code of Honour (Sailor's) [-5]; Duty (extremely hazardous, 12 or less) [-15]; Enemy (utterly formidable group, 9 or less) [-40], Illiterate [-3].

Skills: Boating (Unpowered) DX-1 [1]-11; Brawling DX+1 [2]-13; Broadsword DX-1 [1]-11; Carousing HT+0 [1]-13; Climbing DX-1 [1]-11; Gunner (Cannon) DX+0 [1]-12; Guns (Pistol) DX+0 [1]-12; Hobby skill (Whittling, Scrimshaw, Hornpipe dancing, etc) DX+0 [1]-12; Knot-tying DX+0 [1]-12; Seamanship IQ+0 [1]-11.

Optional Advantages, Skills, and Disadvantages

Choose 15 points of advantages and skills and -15 points of disadvantages from the following list. Many of the skills are more suited for landsmen, and reflect the historical truth that many sailors were pressed from land-based jobs.

Advantages: Acute Hearing/Eyesight [2*]; Appearance: Attractive [4]; Absolute Direction [5]; Ambidexterity [5]; Catfall [10]; Combat Reflexes [15]; Cultural Familiarity [1 per culture]; Fit [5] or Very Fit [15]; High Pain Threshold [10] Languages (spoken only): Native [3], Accented [2], Broken [1]; Literacy (Native) [3]; Night Vision [1*]; Perfect Balance (15).

Skills [2 points in each]: Animal Handling-11 (IQ+0); Area Knowledge-12 (IQ+1); Axe/Mace-12 (DX+0); Carpentry-12 (IQ+1); Cooking-11 (IQ+0); Farming-11 (IQ+0); Filch-12 (DX+0); Fishing-12 (Per+1); Fortune Telling (Palmistry)-11 (IQ+0); Gambling-11 (IQ+0); Guns (Musket)-13 (DX+1); Leatherworking-13 (DX+1); Lockpicking-11 (IQ+0); Musical Instrument-10 (IQ-1); Packing-11 (IQ+0); Search-11 (Per+0); Singing-14 (HT+1); Smith-11 (IQ+0); Smuggling-11 (IQ+0); Swimming-14 (HT+1); Teamster-11 (IQ+0); Weather Sense-11 (IQ+0).

Disadvantages: Alcoholism [-15]; Appearance: Unattractive [-4] or Ugly[-8]; Bad Temper [-10]; Berserk [-10*]; Bully [-10]; Chronic Pain (Mild) [-5]; Chummy [-5]; Compulsive Gambling [-5*]; Gullibility [-10*]; Hard of Hearing [-15]; Hidebound [-5]; Innumerate [-5]; Lecherousness [-15]; Missing Digit [-2]; Missing thumb [-5]; One Eye [-15].

Able Seaman   *105 points*

You are an experienced sailor with at least two years experience at sea.

As Ordinary Seaman above, but with the following changes:

Skills: Boating (Sailboat) DX+0 [2]-12; Boating (Unpowered) DX+0 [2]-12; Broadsword DX+1 [4]-13; Carousing HT+0 [1]-13; Climbing DX+0 [2]-12; Gunner (Cannon) DX+2 [4]-14; Guns (Pistol) DX+1 [2]-13; Knot-tying DX+1 [2]-13; Seamanship IQ+2 [4]-13.

Optional Advantages, Skills, and Disadvantages

Choose a total of 20 points of advantages and skills and -20 points of disadvantages from the Ordinary Seaman list.

Sample Character

James Johnstone grew up on a farm near Winchester in Hampshire. He demonstrated an ability to work with the draft horses and pack animals at an early age, and before long took responsibility for taking the family's goods to market. James was bored at home, and frequently took the excuse of the weekly visit to Winchester to spend the evening in a tavern, laughing, talking and gambling (mainly losing)

He thought he was safe from the press so far inland, but one evening, after heavy losses and much drinking, he fell asleep in his cart when he should have been setting out on the slow journey home. A press gang found him still unconscious and added James to their collection of miserable unfortunates.

18 months later, James is adapting to his new life. He has become a popular member of the larboard watch, with his ready wit and desire to make new friends. He often thinks wistfully of his horses and the farm, but he knows that he is committed to the sea now, and seeks to make the best of it.

James Johnstone, Ordinary Seaman   *90 points*

5'4" 155 lbs., brown hair, brown eyes, tanned forearms and weathered face. Open, honest demeanour.

Attributes: **ST** 12, **DX** 12, **IQ** 11, **HT** 13.

Secondary characteristics: Dmg 1d-1/1d+2, BL 29 lbs., HP 12, Will 11, Per 11, FP 13, Basic speed 6.25, Basic Move 6.

Advantages: Absolute Direction, French (broken, spoken only), Spanish (broken, spoken only), Patron 5 (Royal Navy, 9 or less).

Disadvantages: Chummy, Code of Honour (Sailor's), Compulsive Gambling, Duty (extremely hazardous, 12 or less), Enemy (French and Spanish Navies, 9 or less), Illiterate.

Skills: Animal Handling (Horse)-11; Boating (Unpowered)-11; Brawling-13; Broadsword-11; Carousing-13; Climbing-11; Gunner (Cannon)-12; Guns (Pistol)-12; Hobby skill (Hornpipe dancing)-12; Knot-tying-12; Packing-11; Seamanship-11; Teamster (horses)-11.

Quirks: Loses his sealegs (i.e. gets seasick again) after being on shore for only 8 hours or more.
